Foreword

The creation of an encyclopedia is a true sign of the coming of age of a new and significant field of study. The publication during the eighteenth century of France's celebrated *Encyclopédie* not only reflected the rise of the Enlightenment but testified to the remarkable progress of the West in a wide array of fields—and stimulated further progress. Two centuries later, at perhaps a less imposing level, this encyclopedia not only captures the vast accumulation of ideas and data on its subject—leadership—but will surely influence future work on the theory and practice of leadership.

From the earliest times, people have been entranced by stories about leaders, whether Greek city-state rulers, Roman consuls, Chinese emperors, religious potentates, military conquerors, or famous party politicians. A huge mass of empirical data has driven countless biographies and memoirs. But increasingly during the twentieth century, scholars recognized that many of the studies told us much about individual lives but far too little about the broader significance of those lives and the contextual and psychological forces shaping them. This recognition helped foster the study of leadership—the study not only of individual leaders but of followers, the analysis not only of individuals' ambitions but of the mystery and complexity of ambition itself, the exploration not only of the psychological influences affecting leaders but of the rational or irrational feelings of the "masses" as potential followers, the investigation not only of the impact of humanity's great ideas and values on leaders but in turn their validation or invalidation of those received ideas. In knitting together these multiple, interacting, and ever shifting currents, the study of leadership places individual life histories in a much broader flow of causal forces.

As an emerging discipline, leadership has the benefit of drawing heavily from long-established ones. From history, the study of leadership gains understanding of the complexity of human events that variously offer opportunities and stumbling blocks to political actors. From philosophy, leadership derives knowledge of moral and ethical principles that direct day-to-day decisions and choices. From sociology and anthropology, leadership learns about the central roles of kinship and community that often ward off influences from the broader society. From political science, leadership draws concepts about power and its rootedness in economic, military, and other resources, its manifestations in subtle as well as dramatic forms, its channeling and manipulating of people, and its crucial role in the processes of change. From psychology, leadership grasps the central role of motivation in all human endeavors.

If the emerging discipline of leadership draws heavily from established disciplines, it also contributes mightily to them. The study of leadership subjects the loftiest philosophical ideas to the acid test of applicability in the "real world" of everyday economic and political activity—a test that may challenge or modify those great philosophical ideas. The study of leadership insists that historians take into account not only the roles of highly visible actors such as presidents and generals but also the invisible leadership in families and communities relating to the wants and needs, the hopes and expectations of people at the grass roots. Leadership studies can remind anthropology and sociology of the political and power relationships within tribes, neighborhoods, and interest groups—relationships that may critically affect social protest and political activism. Leadership can bring to the attention of political scientists the "X factor" that

seems to elevate attitudes toward certain institutions, such as the U.S. presidency, and negatively affect attitudes toward others, such as the legislature. Leadership reminds psychology of the powerful emotional and ideological forces that not only transcend people's day-to-day motivations but may variously enflame, distort, or obliterate those motivations.

This remarkable breadth and depth is reflected in the impressive growth in leadership studies and institutions in recent years. There are nearly nine hundred leadership programs in U.S. postsecondary institutions and a proliferation in the international community as well. There are leadership studies majors and minors, certificate and Ph.D. programs in the United States, Belgium, the United Kingdom, Japan, and elsewhere.

The study of leadership touches so many areas that there is a risk of fragmentation in analysis and understanding. The entries in the following pages, however, seek to unify different aspects of many subjects, because the study of leadership ultimately seeks,

more than do other disciplines, to bring concepts and data together in some kind of general—or at least integrated—theory. That goal offers students of leadership an imposing challenge and a huge opportunity.

As you leaf through the pages of these volumes, you may spot seemingly odd entries, such as “The Beatles,” “E-Commerce,” “Friendship,” and “Green Parties.” Do not be surprised. The most remarkable aspect of the study of leadership is its sheer scope and diversity.

Leaders in today's world face enormous challenges: the rise of militant followings that often seek to displace established leadership; the intensified need for collective leadership in the face of such global conditions as massive poverty; the struggle of women, minorities, and other long-suppressed people to rise to leadership positions; the heightened demand for moral, principled leadership. All these dynamic forces, both new and old, make this encyclopedia timely—and timeless.

—*James MacGregor Burns*

Preface

Leadership is a challenge and an opportunity facing leaders and followers in their professional and personal lives. The *Encyclopedia of Leadership* brings together for the first time most of what is known and what truly matters about leadership as part of the human experience. Nearly four hundred entries written by leading scholars and experts from seventeen countries explore leadership theories, leadership practice, and the effects of leadership in the real world. Recognizing that leadership is a process and not a person, much of the encyclopedia examines leadership in its rich and complex situational context. We also recognize that the leadership story is often revealed through individuals. About a third of the work—some 150 entries—is devoted to biographical essays focused on leaders (and their followers) and on case studies of leadership events and moments. These entries and another three hundred sidebars of primary text show leadership in action in corporations and state houses, schools, churches, small businesses, neighborhoods, and nonprofit organizations.

The *Encyclopedia of Leadership* is an unprecedented learning resource. It provides general and specific entries for students and teachers in courses as various as history, psychology, anthropology, and law. Students and active citizens as well as scholars and professional people can turn to the encyclopedia for guidance on the theory and practice of leadership, for the stories of great leaders, and for the tools and knowledge they need to lead in the twenty-first century.

The encyclopedia contains 1.2 million words in 373 substantive entries (ranging in length from 1,000 to 6,000 words), 150 photographs and other illustrations, and 300 sidebars drawn from public records, newspaper accounts, memoirs, and ethnography. Four appendixes provide users with additional information:

(1) Bibliography of Significant Leadership Books, (2) Directory of Leadership Programs, (3) Primary Sources: Presidential Speeches on Foreign Policy and War, and (4) Primary Sources: Sacred Texts.

Questions the *Encyclopedia of Leadership* seeks to answer include the following:

What is leadership?

What is a great leader?

What is a great follower?

How does someone become a leader?

What are the types of leadership?

How can leadership theories help us understand contemporary situations?

How can I learn to be a good, and perhaps even a great, leader?

LEADERSHIP STUDIES

Human beings have always been keenly interested in leaders and in leadership. The small hunting and gathering bands that formed human society over a period of more than 2 million years were led by men (and sometimes women) who were adept at hunting and able to communicate with the supernatural world. As human communities became larger and more permanently settled, those with superior communication skills were valued as leaders. In many societies, leadership was based on heredity and a special relationship with the gods and spirits. As larger societies became states, the first treatises on leadership were written. In ancient China, Confucius sought laws of order between leaders and subordinates. Plato described an ideal republic with philosopher-kings

providing wise and judicious leadership. Plato and his colleagues also established the Paideia, a school for leadership in early Greece. In the sixteenth century, the Italian Niccolò Machiavelli illuminated another side of leadership—one that continues to draw much attention even five hundred years later.

The word *leader* first appeared in the English language in the 1300s; it stems from the root *leden* meaning “to travel” or “show the way.” The term *leadership* followed some five centuries later. The study of leaders, particularly by historians and psychologists, preceded the systematic study of leadership, with the scientific study of leadership developing primarily in the United States and almost exclusively since the beginning of the twentieth century.

Leadership is now a truly interdisciplinary field, with contributions from political science, psychology, education, history, agriculture, public administration, management, community studies, law, medicine, anthropology, biology, military sciences, philosophy, and sociology. In many of these disciplines, leadership is now an established subfield.

The heightened scholarly interest in leadership has brought with it rapid growth in leadership studies. In 2003, there were nearly a thousand leadership programs at U.S. postsecondary institutions, more than double the number six years before. There are leadership resource centers and graduate degree programs in leadership studies. Leadership courses and programs are found primarily in management and behavioral and social-science schools and departments, with education schools also showing a growing interest in leadership in recent years. Beyond the United States, schools and programs of leadership have been founded in Canada, Great Britain, Germany, Italy, Sweden, China, Japan, and Tanzania, to name a few. And beyond academe, there are hundreds of leadership development and training programs offered by management and organizational development firms around the world.

While certainly not the cause, perhaps the key event in the emergence of leadership studies was the publication of *Leadership* by the historian James MacGregor Burns in 1978. Prior to Burns’s synthesis, much of the descriptive study of leadership was conducted by research psychologists who tested relationships among sets of affective, cognitive, and behavioral variables to develop theories of leadership. Much (but not all) of the research focused on the traits or characteristics of leaders to see how leaders differed from

nonleaders. This line of research produced few firm conclusions and brings to mind Keller’s Law (Marc Keller was for years the editor of the *Journal of Studies on Alcohol*): For any trait measured, alcoholics will have more, less, or the same amount of it as other people.

Burns’s work and that of those who followed him (many of whom have contributed to this encyclopedia) led the way forward in four key ways. First, these scholars called for an interdisciplinary approach that took leadership research out of the laboratory. Second, they brought to people’s attention two important aspects of leadership: leadership is relational, and the motivations of leaders and followers are keys to understanding leadership and change. Third, they expanded the normative definition of good leadership beyond effectiveness to also include a moral dimension and the pursuit of values such as liberty, justice, and equality. Fourth, Burns drew a distinction between transactional and transformational leadership, a distinction that has become one of the core constructs of modern leadership studies.

Despite the rapid growth of leadership studies, or perhaps because of it, the field has not been without its critics. One concern is that leadership studies may be elitist or reflect an interest in achievement that will leave some people behind. Another is that leadership studies is not a true scholarly discipline because it has no unifying theory and therefore should exist only within traditional departments such as management, political science, or history. A third line of criticism is that the rapid growth of leadership studies has led to the development and marketing of leadership training and development programs, the effectiveness of which has never been adequately tested.

SCOPE AND COVERAGE

The encyclopedia’s entries fall into eleven general topical categories. The Reader’s Guide at the front of each volume classifies the entries in accordance with this scheme and includes several additional categories that direct readers to related entries. The eleven general topical categories are

- Biographies
- Case Studies
- Domains
- Study of Leadership

Followership
 Women and Gender
 Personal Characteristics of Leaders
 Power
 Situational Factors
 Leadership Styles
 Leadership Theories

Biographies

The encyclopedia contains profiles and analyses of approximately 150 leaders. These leaders, most of whom are well-known persons whose actions have had a major impact on history, are a sample that represents different times, cultures, and domains. There are leaders from politics and government, business, the military, social change movements, the arts and entertainment, religion, and communications. We do not suggest that these are the “greatest” leaders of all time; what we do promise is that each leader was selected because his or her story tells us something unique about leadership and its effects. These entries focus on each individual’s actions and influence as a leader. In choosing the leaders to be included, we considered the person’s impact on contemporary and later events, what her or his story tells us about what it means to lead, and whether there was a conscious intention to lead. In this section, we particularly wanted to explore what it means to be a leader, how leaders are different from other influential or powerful people, and how leadership is defined in different domains and at different times in history. Other entries, especially the case studies (see below), provide information about many additional noteworthy leaders.

Case Studies

These entries focus on situations or events of major historical importance in which the leadership exercised or not exercised by an individual or group was a key element. These entries describe the situation or event, explain its significance, note the key decisions made, and identify the key actors. The decision-making processes and the leadership behavior of the key actors and groups are described, including contingencies and alternative paths. The consequences of both individual and group choices and acts are evalu-

ated in terms of the implications for leadership theory, training, and modeling.

Domains

It is common in leadership studies and practice to approach leadership in different domains of human activity from somewhat different perspectives. Thus, there is often talk of presidential leadership, political leadership, nonprofit leadership, women’s leadership, and youth leadership. The entries on domains define the domain and indicate its size, scope, and significance to the human experience. The entries list and define the leadership roles within the domain and indicate areas of responsibility and key leadership characteristics and situational factors.

Study of Leadership

Leadership is an interdisciplinary field of inquiry and practice, and its work is informed both by those in leadership studies and by those in more traditional disciplines such as management, psychology, political science, education, and sociology. These entries define the emerging discipline and outline its methods, concepts, and theories as it makes strides in establishing itself at the nexus of interdisciplinary inquiry.

Followership

It is only relatively recently that scholars have recognized that to fully understand leadership one must also understand the nature and behavior of followers. These entries consider the many aspects of followership, including the characteristics of followers, theories about the relations between leaders and followers, situational factors that affect the way people both lead and follow, and the dynamics of the leader-follower relationship.

Women and Gender

Systematic attention to women and gender issues, like systematic attention to followers, is relatively recent in leadership studies. These entries provide an evaluation of the current research regarding women as leaders across domains.

Personal Characteristics of Leaders

These entries summarize what we know about those

personal attributes of leaders that are thought to be related to leadership success. The entries define and describe the personal characteristics, traits, and innate abilities associated with leadership and discuss the research or other evidence linking those traits to leadership success.

Power

These entries explore the sources of power, the use of power by leaders and followers, the effects of power on others, and the nature of power. The focus is on power in the context of leadership.

Situational Factors

These entries cover group, organizational, ethical, cultural, marketplace, or societal factors that influence leadership, including choice of leaders and leadership style, as well as leaders' behavior and success or failure. These entries consider many situational and historical factors, alone and in combination, and show how they relate to leadership both in positive and negative ways.

Leadership Styles

This general category includes entries that provide overviews of a major leadership style, such as democratic leadership or socio-emotional leadership. The entries define the style and list its key features, citing examples of leaders and organizations that typify the style.

Leadership Theories

These entries cover more than forty theories or models set forth over the years that seek to explain leadership or some significant aspect of leadership. Some of these models or theories claim to explain not just leadership but much of human behavior; others bring leadership behavior into sharp focus from a single perspective. The focus of these entries is on the theory's applicability to leadership.

APPENDIXES

The entries are supplemented by four appendixes: (1) Bibliography of Significant Books on Leadership, (2) Directory of Leadership Programs, (3) Primary

Sources: Presidential Speeches on Foreign Policy and War, and (4) Primary Sources: Sacred Texts. The Bibliography of Significant Leadership Books provides citations to major books on leadership studied selected from the works cited throughout this encyclopedia. They are divided into four categories: leadership in general, leaders and leadership events, specific aspects of leadership, and other topics relevant to leadership.

As noted above, there are nearly 1,000 leadership programs in the United States and many others in other nations. There is no one central directory for these programs and maintaining one would be extremely difficult as new programs appear almost every day. This Directory of Leadership Programs appendix lists some 250 programs which have active web sites as of 23 October 2003. Included here are some general programs and those aimed at specific domains including education, youth, community, sports, executives, nonprofit, environment, health, science, criminal justice, women, minority, and the arts. The appendix also provides trustworthy information about where to find out about leadership programs and courses housed in MBA and MPA programs.

The third and fourth appendixes provide carefully selected and organized primary source material that supplements several dozen entries in the encyclopedia centered on two themes: U.S. presidential leadership and religion and leadership. The Primary Sources: Presidential Speeches on Foreign Policy and War appendix provides the texts of major speeches by American presidents concerning foreign relations and war. These speeches are especially timely in the presidential election year of 2004, in which foreign relations and war are major issues. The Primary Sources: Sacred Texts appendix supplements the general entries of religion and spirituality and the biographies and case studies on religious leaders with extracts of sacred texts relevant to leadership (examples of leadership or guidelines for leaders) from Judaism, Christianity, Islam, Hinduism, and Buddhism.

NAVIGATION AIDS

To assist readers in finding the entry or entries they want, we have included several navigation tools. The front matter contains an alphabetical list of all entries, a list of contributors with the entries they contributed, and a detailed reader's guide which classifies the

entries into several dozen different topical categories. For example, the reader will find here a list of all biographies, a list of all entries about business, and a list of all entries discussing leadership theories. There is also a list of sidebars telling the reader where each appears and providing their titles. Finally, there is a comprehensive index in Volume IV. Within the volumes are “blind” entries that direct the reader to a relevant entry, as well as extensive cross-references at the end of many entries.

GLOBAL COVERAGE

Efforts to develop leadership studies as a field have been concentrated in the United States, although there are important centers for leadership studies and active scholars in many other nations. While the U.S. or Western perspective is predominant in this work, we purposefully sought to make the encyclopedia as global as possible. We did this in several ways. First, we included scholars and experts from seventeen nations on the editorial board and as contributors; second, we featured several dozen non-U.S. and non-Western leaders and situations in the biographies and in the case studies; third, we included primary-text material from non-Western societies to balance entries that reflect mainly research in the West; and finally, we tried to acknowledge and include non-Western ways of knowing and leading.

THE ENCYCLOPEDIA'S AUDIENCE

As the first and only comprehensive reference work on leadership, the encyclopedia was designed with the needs of several possible user communities. These include scholars of leadership and related topics; practitioners and citizens who want to put knowledge into action; students of leadership and related topics such as management, political science, education, and sociology; leaders and managers themselves; and the general public, which has a stake in leadership at many levels and in many domains. Among college and university scholars, the encyclopedia is especially useful for those working in anthropology, economics, education, management, philosophy, political science, psychology, religion, and sociology. However, the work is decidedly interdisciplinary, so scholars in other disciplines, including art, classics, library science, music, theater, and ethnic and women's studies will find it a welcome tool as well. Among practitioners, those in

business, government, the military, nonprofits, and religious and lobbying organizations will find much of relevance. Among the public, anyone concerned about improving his or her community will learn a great deal. For all these people, the key to benefiting from the knowledge presented is being able to find what they are looking for with ease.

In addition to being a compilation of organized knowledge, an encyclopedia should also be a directory of additional knowledge. To that end, the Further Reading section at the end of each entry directs readers to additional literature (usually books) on the topic.

HOW THE ENCYCLOPEDIA WAS PREPARED

Rolf Janke, publisher of Sage Reference, first proposed the idea for an encyclopedia of leadership. Karen Christensen and David Levinson began shaping the idea into a reference work. A key early step was asking the social psychologist George R. “Al” Goethals at Williams College to become involved in the project. A longtime student of leadership, he is also the founder of the Program in Leadership Studies at Williams. With some hesitation about taking on such a large project in such a short time frame, Al consulted two colleagues: political scientist Georgia J. Sorenson, an architect of the leadership studies field, and James MacGregor Burns, the Woodrow Wilson Professor of Government emeritus at Williams and Senior Fellow at the University of Richmond's Jepson School of Leadership Studies. The three of them decided that an encyclopedia of leadership was extremely important and timely. As a team, working in collaboration with distinguished leadership scholars from around the world and in cooperation with the staff of Berkshire Publishing Group, they believed the project could indeed be accomplished. Al and Georgia, working with Berkshire Publishing, ultimately suggested the editorial structure reflected on the title page: Al and Georgia would serve as editors, Jim would serve as senior editor, and they would work with an editorial board of scholars and experts representing various approaches and interests in leadership studies. Al and Jim were especially pleased with the happy coincidence that Williams College and Berkshire Publishing Group are both located in Berkshire County in western Massachusetts. The many contributors and editors from all over the world certainly enriched the project. In short, we had the happy circumstance of being able to think globally, edit virtually, and lunch locally.

THE FUTURE

As the first encyclopedia for a relatively new field of inquiry, this encyclopedia serves as a diagnostic tool that can tell us much about where leadership studies are in 2003 and where they need to go in the future. It seems clear that leadership studies as a research enterprise remains firmly rooted in psychology, especially social psychology. Sociology, anthropology, history, and (most surprising) political science continue to make fewer than might be expected contributions to the growth of our knowledge about leadership. One key need is to continue to push for leadership research in more disciplines and for continuing interdisciplinary cooperation. Anthropology, in particular, as well as cross-cultural psychology can make important contributions in the future by testing ideas that originated in the West in non-Western cultures and nations. A second need is better integration of what is already known across disciplines; here the work of the General Theory Group and others will be of increasing importance. A third need is for greater transfer of new knowledge and for diffusion and synthesis of ideas and programs developed in one domain to others. For

example, in recent years leadership in education, sports, and youth groups has drawn much attention, but ideas formulated in those areas tend not to move out to other domains. Leadership journals and conferences can take the lead in attracting entries and presentations that represent leadership studies as broadly as possible. Fourth, leadership studies could benefit from the publication, distribution, and translation of work by leadership scholars across the global community and from a journal that enriches and encompasses the global dialogue on leadership. Lastly, there is a need for more rigorous testing of leadership development programs. The popularity of leadership development as a concept and a goal in many organizations has created a huge demand for leadership development education and training, as evidenced by the many new executive leadership programs offered by colleges and universities around the world. As yet, however, there is little study of the notion of leadership development education in general nor of specific approaches.

—*Karen Christensen, David Levinson,
George R. Goethals, and Georgia J. Sorenson*

Acknowledgments

As is usual for a project of this magnitude, there are many to thank for its creation. The contributions of many hardworking, dedicated individuals are what made this project a success. We began with an editorial board that represented many of the key programs and perspectives in leadership studies, and the work of each of the editorial board members—which varied depending on their other commitments—has been much appreciated. We are grateful for their early support and advice.

James MacGregor Burns learned of the encyclopedia through his Williams colleague, George R. Goethals, whom Berkshire contacted soon after being asked to develop the *Encyclopedia of Leadership*. His enthusiasm for the project was both inspiring to us and an undoubted source of encouragement to our 280 contributors. Jim Burns is a Pulitzer-Prize-winning presidential biographer and a pioneer in the study of leadership. His theory on transformational leadership has been the basis of more than 400 doctoral dissertations. He has authored more than a dozen books, including *Leadership*, published in 1978, which is still considered the seminal work in the field of leadership studies. Jim is now eighty-five years old, still active as an author (his *Transforming Leadership: A New Pursuit of Happiness* was published in 2003), and active in a project to develop a general theory of leadership. When he agreed to be senior editor, and began writing an introduction to the work that would show why an encyclopedia like this is so important to the field of leadership studies—and indeed to humanity in general—we knew that the project was off to an ideal start. We are exceedingly grateful for his support of our endeavors.

The encyclopedia's general editors, George R. (Al) Goethals (Williams College) and Georgia J. Sorenson (University of Richmond and University of Maryland), helped define the overall shape of the encyclopedia,

recruited many of the editorial board members, and suggested articles to be included. Al was especially adept at coming up with practical ways to balance theory and practice in our coverage. We are grateful for Al's recruitment of some authors who are leaders in their own professional arenas, including Fay Vincent (who wrote the article on sports) and Roberto Eisenmann (who wrote a case study on the creation of a free press in Panama). Al also invited us to a summit on the development of a general theory of leadership at Mount Hope Farm in Williamstown, Massachusetts, which was very helpful in the initial shaping and visioning of the encyclopedia.

Our sincere thanks go out to each member of the editorial board: Laurien Alexandre (Antioch University), Bruce J. Avolio (University of Nebraska, Lincoln), Martin M. Chemers (University of California, Santa Cruz), Kisuk Cho (Ewha Womans University, South Korea), Joanne B. Ciulla (University of Richmond), David Collinson (Lancaster University, U.K.), Richard A. Couto (Antioch University), Yiannis Gabriel (Imperial College, U.K.), Zachary Gabriel Green (Alexander Institute and University of Maryland), Keith Grint (Oxford University, U.K.), Michael A. Hogg (University of Queensland, Australia), James G. (Jerry) Hunt (Texas Tech University), Barbara Kellerman (Harvard University), Jean Lipman-Blumen (Claremont Graduate University), Lorraine R. Matusak (LarCon Associates), Ronald E. Riggio (Claremont McKenna College), and Jürgen Weibler (University of Hagen, Germany).

Some members of the editorial board were simply stellar in their dedication to the encyclopedia and deserve special recognition.

Jerry Hunt took responsibility for a number of articles early on and saw them through to publication. He recruited authors to write all the articles on his list and

then reviewed them all once they were written. We knew that if Jerry was working on an article, we didn't have to worry about it.

Michael Hogg took extraordinary responsibility in making sure that we had knowledgeable, well-written scholars to author each article. On a few occasions, when we were having trouble finding the right person to write an entry, Mike took it on himself, adding to his already heavy workload.

Ronald Riggio has the distinction of reviewing the most articles of any editor, and he remained throughout a thoughtful, congenial supporter of the encyclopedia. He also introduced us to some excellent writers, including Craig Parks, who made a very significant contribution to the encyclopedia.

Martin Chemers was always available for consultation, providing quick, clear, thoughtful responses that helped us guide contributors who had questions about their articles.

Keith Grint, the first of our U.K. editors, was enthusiastic and truly committed throughout the project and willingly wrote several important articles in addition to his editorial duties. Keith organized the December 2002 conference at Oxford that Berkshire's Karen Christensen attended. This conference—like the November 2002 ILA conference in Seattle—provided much food for thought as we developed the encyclopedia and enabled us to identify topics and contributors.

Keith also introduced us to David Collinson and Yiannis Gabriel, two gifted writers who ended up joining the editorial board mid-project, each making his own significant contribution to the encyclopedia. Jürgen Weibler similarly joined the board mid-project and spent an incredible amount of time and effort on his editorial tasks.

Laurien Alexandre was an extraordinarily helpful contributor throughout the project who joined the editorial board late in the process—just in time to review a last few articles. Laurien came through when we needed her most and, with her colleague Richard Couto of Antioch University, has become a much-valued colleague. Dick Couto was incredibly helpful from the first day he signed onto the project until the day the encyclopedia went to press. He and Laurien Alexandre coordinated the contributions of a number of fine writers at Antioch University—a process that occupied much of their time, ensuring the quality and accuracy of each article before it was submitted to us. Dick also made a great contribution to the encyclopedia with his advice on what passages to include in the appendix of sacred texts.

Some of the encyclopedia's contributors were also instrumental in making this project a success. Lewis Gould (University of Texas, Austin) has provided much guidance in the area of U.S. presidential leadership. Besides writing the overview article in this subject area, as well as two others on specific presidents, Lewis also helped to shape the appendix of presidential speeches on foreign policy and war.

Terry Price, at the University of Richmond, was one of the first authors to sign onto the project, and his ongoing work helped to define the scope, particularly in the arena of leadership ethics.

John Nirenberg (Shinawatra University, Japan), an excellent writer, kept coming up with great new topics to write on, including highly original entries on Corporate Social Responsibility and on Eupsychian Management.

Craig Parks of Washington State University took it upon himself to write most of the articles on group performance in the encyclopedia. This contribution provided for a real cohesion to the coverage in this subject area.

Michael Harvey's (Washington College) work on leadership in literature and the arts added a vital dimension to the encyclopedia, along with the other articles he wrote on topics ranging from Moses to Total Quality Management.

Douglas Hicks, at the University of Richmond, wrote quite a few articles for the encyclopedia, particularly in the areas of religion and economic justice. Doug offered helpful advice on coverage in these areas on numerous occasions.

It was extremely gratifying to have a number of important writers on leadership who have many commitments in the business and professional world take time to contribute to this major scholarly endeavor. Among leadership and management experts who wrote for the encyclopedia (their articles are noted in parenthesis) are Warren Bennis (Management), Cynthia Cherrey (International Leadership Association), Jay Conger (Charismatic Theory and Transformational and Visionary Leadership), Ronald Heifetz (Adaptive Work and Self-Management), Barry Posner and Jim Kouzes (Follower-Oriented Leadership), Kenneth Ruscio (Trust), Edgar Schein (Organizational Climate and Culture), and Gary Yukl (Influence Tactics and Team Leadership).

Eminent scholars in other fields whose work informs our understanding of leadership also contributed articles to the encyclopedia. These experts include Akbar Ahmed (Saladin), John Chandler (Higher Education), Bob Edgerton (Mau Mau Rebel-

lion), Gene Gallagher (Religion), Betty Glad (Tyrannical Leadership), Lewis Gould (United States Presidential Leadership, Woodrow Wilson, and Lyndon Johnson), Allen Guttman (Modern Olympics Movement and Women's Olympics), David Malone (Billy Graham), Martin Marty (Martin Luther), Robert Solomon (Friedrich Nietzsche), Robert Sternberg (Verbal Intelligence and Tacit Knowledge), and Fay Vincent (Sports).

We also want to acknowledge a few of the leadership programs that have been most important in supporting and sustaining the growth of the field of leadership studies. The International Leadership Association's efforts are central to this growing field, and our relationships with ILA leaders have expanded the encyclopedia's scope. Cynthia Cherrey, who wrote the entry on the ILA, and executive director Shelly Wilsey are working with great effectiveness to develop the networks on which a major reference project like this depends.

We are grateful to the Program of Leadership Studies at Williams College, the Jepson School of Leadership Studies at the University of Richmond, and the James MacGregor Burns Academy of Leadership at the University of Maryland, which over the years have provided institutional support necessary to develop the intellectual structure and empirical data that inform this work. We would also like to acknowledge the W.K. Kellogg Foundation for its leadership in supporting the development of a community of leadership scholars through the Kellogg Leadership Studies Project (1992–1997).

A major undertaking like this encyclopedia draws on the talents of virtually every employee in a small company like Berkshire. Project editor Sarah Conrick took charge of a particularly challenging project with grace and good humor. She developed great rapport with editors and authors and earned the trust of everyone involved. Associate editor Marcy Ross took special care to ensure the quality of the encyclopedia's content. In addition to her work with the articles, Marcy engineered and compiled the primary source appendices of sacred texts and presidential speeches on foreign policy and war. She also managed the copyediting process and our team of freelance copyeditors with great skill and her usual kind manner. The key member and senior editor of the copyediting team was Francesca Forrest, who is exceptionally talented at presenting scholars' ideas in a framework that makes them accessible and engaging to all readers. The careful and thorough work of Marcy, Francesca, and the entire Berkshire copyediting team was invaluable to the quality development of this major reference work. Project coordinators Emily Colangelo,

Elizabeth Eno, and Courtney Linehan, along with freelance help from Benjamin T. Conrick, performed crucial editorial tasks, including final manuscript checks. The tireless Berkshire technology department—Debbie Dillon, Cathy Fracasse, and Trevor Young—stepped in with practical assistance at every stage and always with great patience and an assuring smile.

Because the *Encyclopedia of Leadership*—at least in its print edition—will be used primarily in libraries, we were eager to include coverage of leadership within the library profession. Our thanks to Donald Riggs, who wrote the article on leadership in libraries and to Joyce Ogburn, Tom Gilson, and Katina Strauch, who helped us locate Don.

Development of an online knowledge center for leadership studies is underway. This electronic resource will include a variety of tools for students, including case studies, a 5,000-entry master bibliography of leadership texts, and much more of the primary and ethnographic content on leadership we have used to illustrate our original articles. We will be turning to members of the library community and leadership associations such as the ILA, as well as to our contributors and editors, for assistance in creating various integrated resources for the leadership community in the years ahead.

Berkshire's mission is to illuminate the human experience and contemporary issues by developing reference resources with a global perspective. Leadership studies started in the United States, but the subject is and has always been important in countries and cultures around the world. Berkshire's efforts to internationalize coverage include non-Western biography and case study articles, such as Jomo Kenyatta, Mao Zedong, Shaka Zulu, the Xian Incident, and Truth and Reconciliation Commissions, and more general articles on topics like the GLOBE Research Program, Indigenous Societies, and Cross-Cultural Leadership, to name a few.

We want to close by noting that as this work goes off to press several of us are heading to the ILA conference in Guadalajara, Mexico. The location of the conference is an important statement about the global importance of leadership and leadership studies.

—Karen Christensen and David Levinson

A Note from the Editors:

We would especially like to thank our friends and colleagues at Berkshire Publishing Group. We are grateful to them for initiating this project, for helping us structure it, and for showing uncommon professionalism,

competence, and kindness at every stage of the work. Their experience and skill made something that initially seemed impossible not only possible, but also edifying and gratifying. We thank Karen Christensen and David Levinson for their wisdom in shaping the project at the outset, and for their patience and good

judgment in steering it to conclusion. Finally, we cannot say enough about our tireless and talented project editor, Sarah Conrick. She has been a wonderful partner in putting the pieces together. Our experience working with all of you has been most rewarding.

—*George R. Goethals and Georgia J. Sorenson*

About the Editors

General Editors

George R. (Al) Goethals is Professor of Leadership Studies at Williams College and Visiting Scholar at the Jepson School of Leadership Studies at the University of Richmond. In addition to his teaching duties, he has served Williams as Chair of the Department of Psychology and founding Chair of the Program in Leadership Studies. He was Acting Dean of the Faculty in 1987–1988 and Provost from 1990 to 1995. Dr. Goethals has been visiting professor or visiting scholar at Princeton University; the University of Virginia; the University of Waterloo in Ontario, Canada; the University of Massachusetts; the University of California, Santa Barbara; and Amherst College. He has served as Chair of the Executive Committee of the Society for Experimental Social Psychology and Secretary-Treasurer of the Society for Personality and Social Psychology. He has coauthored textbooks on basic psychology, social psychology, and the psychology of adjustment and has published numerous articles on attitude change, social perception, and social comparison processes, including articles for such reference works as *Psychological Inquiry* and *The Encyclopedia of Human Behavior*. His research has been supported by the National Institute of Mental Health and the Andrew Mellon Foundation. His current research interests concern how college students educate each other and the ways in which leadership is enacted and perceived.

Georgia J. Sorenson is a Visiting Senior Scholar at the Jepson School of Leadership Studies, University of Richmond, and a Senior Scholar and Founder of the James MacGregor Burns Academy of Leadership, University of Maryland. A presidential leadership scho-

lar, she is on the graduate faculty of the Department of Government and Politics at the University of Maryland. She also serves as Adjunct Professor at Williams College and Ewha Womans University in Seoul, South Korea; Professor and Advisor to The National School of Administration of the People's Republic of China; and is on the International Board of Tokyo Jogakkan University in Japan. Before joining the faculty of the University of Maryland, Dr. Sorenson was a Senior Policy Analyst in the Carter White House for employment issues and worked as a consultant to the Executive Office of the President. She continues to be politically active, and has served as a speechwriter or consultant to three presidential campaigns. Her latest work, *Dead Center: Clinton-Gore Leadership and the Perils of Moderation*, is coauthored by James MacGregor Burns. She has published in professional journals such as the *Harvard Educational Review* and *The Psychology of Women Quarterly* and is a frequent contributor and commentator on social issues in the popular media.

Senior Editor

James MacGregor Burns is a Pulitzer-Prize-winning presidential biographer and a pioneer in the study of leadership. Author of more than a dozen books, he has devoted his professional life to the study of leadership in American political life. He received his doctorate in political science from Harvard, attended the London School of Economics, and taught at Williams College. Dr. Burns was a Democratic nominee for the 1st Congressional District of Massachusetts in 1958 and also served as a delegate to four Democratic National Conventions. He is a former president of both the American Political Science Association and the International Society of Political Psychology. His

theory on transformational leadership has been the basis of more than 400 doctoral dissertations. His most recent book is *Transforming Leadership: A New Pursuit of Happiness* (2003). Prior to that he published, with Susan Dunn, *The Three Roosevelts: Patrician Leaders Who Transformed America* (2001) and, with Georgia Sorenson, *Dead Center: Clinton-Gore Leadership and the Perils of Moderation* (1999). Burns won the Pulitzer Prize and the National Book Award for his biographies, *Roosevelt: The Lion and the Fox* (1956) and *Roosevelt: The Soldier of Freedom* (1970). His book, *Leadership*, published in 1978, is still considered the seminal work in the field of leadership studies.

Associate Editors

Martin M. Chemers is Campus Provost and Executive Vice Chancellor of the University of California, Santa Cruz. He is a social psychologist with interests in leadership and team and organizational effectiveness. Much of his work has addressed how cultural and personality characteristics of leaders and followers affect the intrapersonal and interpersonal processes that give rise to highly motivated and effective teams. Also of interest are factors that influence the leadership effectiveness of “nontraditional” leaders such as women and minority group members. His current research is focused on the construct of “mettle,” which refers to confidence in one’s leadership capability and optimism about the outcomes of one’s efforts. His most recent book is *An Integrative Theory of Leadership* (1997).

Keith Grint is Director of Research at the Saïd Business School and a fellow of Templeton College at Oxford University. He worked in various industries for ten years before becoming an academic. He taught industrial sociology at Brunel University for six years before coming to Oxford, where he has taught since 1992. He has published eight books and more than seventy-five articles and chapters in books on topics ranging from business process re-engineering to Japanization, appraisal schemes, organizational theory, the sociology of work, and leadership. His most recent books have been *Leadership: Classical, Contemporary and Critical Approaches* (1997); which he edited; *Fuzzy Management: Contemporary Ideas and Practices at Work* (1997); *The Arts of Leadership* (2000); and *Organizational Leadership* (2004, with John Bratton and Debra Nelson).

Michael A. Hogg is Professor of Social Psychology and an Australian Research Council Professorial Fellow at the University of Queensland, Australia. He is also a fellow of the Academy of the Social Sciences in Australia. From 2000 to 2003, he served as Associate Dean, Research, for the Social and Behavioral Sciences at the University of Queensland. He serves on or has served on the editorial board of most of the main social psychology journals, including *Journal of Personality and Social Psychology*, *Personality and Social Psychology Bulletin*, *European Review of Social Psychology*, and *British Journal of Social Psychology*. With Dominic Abrams, he is the foundation editor of the journal *Group Processes and Intergroup Relations*. Dr. Hogg’s research focuses on group processes, intergroup relations, and social identity. Recently he developed a social identity theory of leadership and has been extensively involved in promoting and conducting social identity research on leadership. His 200 publications include two books—*Rediscovering the Social Group: A Self-Categorization Theory* (1987, with John Turner and others) and *Social Identifications* (1988, with Dominic Abrams)—and two introductory social psychology texts, with Graham Vaughan, which are now in their third editions—*Social Psychology* and *Introduction to Social Psychology*.

James G. (Jerry) Hunt is a Paul Whitfield Horn Professor of Management, Trinity Company Professor in Leadership, and Director of the Institute for Leadership Research at Texas Tech University in Lubbock, Texas. He received his doctorate from the University of Illinois. His research interests include leadership (especially process-oriented aspects), organizational behavior, and organization theory. He has authored such publications as *Leadership: A New Synthesis* (1991), nominated for the 1992 Academy of Management award for outstanding scholarly books; *Out-of-the-Box Leadership: Transforming the 21st Century Army and Other Top-Performing Organizations* (1999, with G. E. Dodge and L. Wong, Eds.); *Basic Organizational Behavior* (1998, with J. R. Schermerhorn and R. N. Osborn); and *Managing Organizational Behavior* (2000, 8th edition, with J. R. Schermerhorn and R. N. Osborn). He has contributed to journals such as the *Academy of Management Journal*, *The Leadership Quarterly*, *Journal of Management*, and *Administrative Science Quarterly*, has served as editor of the *Journal of Management*, and serves as the current senior editor of *The Leadership Quarterly*. He also founded, edited,

and contributed to the eight-volume Leadership Symposia Series from 1971 to 1988.

Ronald E. Riggio is the Henry R. Kravis Professor of Leadership and Organizational Psychology, and Director of the Kravis Leadership Institute, at Claremont McKenna College. He has published more than seventy-five journal articles and book chapters, and has authored or edited a dozen books, including *Introduction to Industrial/Organizational Psychology* (2003, 4th ed.), *Multiple Intelligences and Leadership* (2002), and the forthcoming *Improving Leadership in Non-profit Organizations*. His research interests include communication processes in leadership and in organizational settings, prediction of leadership and managerial potential, and using assessment center methodology for leadership selection and development. He is a fellow of the American Psychological Association and the Western Psychological Association, and a member of the Academy of Management.

Editorial Board

Laurien Alexandre is Director of Antioch University's Ph.D. program in Leadership and Change and serves as professor and member of the core faculty. During her twenty years in higher education, she has served in leadership roles at Antioch as well as the Immaculate Heart College Center, an ecumenical institute devoted to research and training on peace and justice concerns. She also taught for more than ten years at California State University, Northridge, in the Department of Mass Communications/Journalism, where her focus was on graduate courses in media analysis. She has long been committed to interdisciplinary inquiry, especially in her teaching and writing on media and international affairs. She has published books and articles on the media for both academic and popular audiences and has also translated several scholarly books and articles for publication. Most recently, her research has focused on media coverage of presidential and national politics in the Spanish-language press.

Bruce J. Avolio is the Donald O. and Shirley Clifton Chair in Leadership at the University of Nebraska-Lincoln. He has published more than eighty articles and book chapters on topics related to individual, team and organizational leadership. He coauthored, with Bernard Bass, *Improving Organizational Effectiveness Through Transformational Leadership* (1994), and has

written *Full Leadership Development: Building the Vital Forces in Organizations* (1999). His latest book is entitled *Made/Born: Putting Leadership Development in Balance* (2004). He has conducted training workshops in the United States, Canada, Israel, Korea, Italy, Australia, Mexico, New Zealand, Spain, England, South Africa, Sweden, Austria, Hong Kong, and Belgium and is coauthor of two widely used leadership measures: the *Multi-factor Leadership Questionnaire* and *Team Multi-factor Leadership Questionnaire*. He has worked with colleagues around the globe to set up a global network of Centers for Leadership Studies.

Kisuk Cho is a professor in the Graduate School of International Studies at Ewha Womans University in Seoul, South Korea. She is a political scientist specializing in elections and public opinion, as well as an active political commentator and columnist. She is currently an editor of the *Korean Political Science Review* and serves on the advisory board to the Ministry of Foreign Affairs. Dr. Cho gave the keynote address "Do Women Lead Differently: A Study of 12 Female Prime Ministers and Presidents" at the 2000 International Leadership Association conference in Toronto, Canada, later published in *Building Bridges* (2001). She also serves as CEO of the university-based venture company Leadership Frontier.

Joanne B. Ciulla is Professor and Coston Family Chair in Leadership and Ethics at the Jepson School of Leadership Studies, University of Richmond. She is one of the founding faculty members of the school. She has also held the UNESCO Chair in Leadership Studies at the United Nations International Leadership Academy, and academic appointments at La Salle University, the Harvard Business School, and the Wharton School. In 2003, she won the Outstanding Educator Award from the Virginia State Council of Higher Education. Her books include *Ethics, The Heart of Leadership* (1998), *The Working Life: The Promise and Betrayal of Modern Work* (2001), and *The Ethics of Leadership* (2003). She has also coauthored a textbook called *Honest Work: A Business Ethics Reader* (2004) and edits a series of books for Edgar Elgar, Ltd., called New Horizons in Leadership. She also serves on the editorial board of *The Business Ethics Quarterly* and on the board of directors of the Desmond Tutu Peace Foundation.

David Collinson is Professor of Strategic Learning and Leadership and head of the Department of Management

Learning at Lancaster University Management School in Lancaster, UK. He also serves as a member of the Management Research Advisory Forum to the National College for School's Leadership and the Advisory Group for LSRC projects on leadership. In December 2002, he co-organized a conference on "Researching Leadership" at Said Business School-Oxford University. Formerly at the University of Warwick where he worked for ten years, he was appointed to the Foundation for Management Education (FME) Chair of Strategic Learning and Leadership in January 2002. In 2001 he was elected as the Hallsworth Visiting Professor at Manchester Business School. He has published five books and more than fifty articles and chapters that seek to contribute to the development of critical approaches to organizational and management studies. His current research focuses on the development of critical approaches to the study of leadership and learning, looking particularly at the relationship between "leaders" and "led."

Richard A. Couto is a Professor and Founding Faculty Member of the Antioch University Ph.D program in Leadership and Change. Previously he was a founding faculty member of Jepson School of Leadership Studies at the University of Richmond where he held the George M. and Virginia B. Modlin Chair. He has published books and articles on leadership in community health, community change efforts, the Appalachian region, and civil rights. His most recent books are *Making Democracy Work Better: Mediating Structures, Social Capital and the Democratic Prospect* (1999) and *To Give Their Gifts: Health, Community, and Democracy* (2002).

Yiannis Gabriel is Professor of Organizational Theory at The Business School, Imperial College London, with a doctorate in sociology from the University of California, Berkeley. He has served on the editorial board for numerous leadership journal publications, such as *Management Learning*, *Organizational Studies*, *Human Relations*, *Journal of Management Studies*, and *Marketing Theory*, and has contributed numerous articles to these journals. His research interests lie in the areas of storytelling, narratives, emotion, and fantasy in organizations; consumption and consumerism in relation to identity and the organization-consumer interface; and management learning, pedagogy, and the nature of management knowledge. His recent books are *Storytelling in Organizations: Facts, Fictions and*

Fantasies (2000) and *Myths, Stories and Organizations: Premodern Narratives for Our Times* (2004), an anthology he edited.

Zachary Gabriel Green is the Executive Director of The Alexander Institute for Psychotherapy and Consultation in Washington, D.C., a position through which he has become an executive coach for the World Bank Group, chief consultant for the Synergy Project, and contractor for the USAID global AIDS monitoring and evaluation system. Green is also a Senior Scholar at the James MacGregor Burns Academy of Leadership at the University of Maryland, where he serves on the graduate faculty of the School of Public Affairs. Dr. Green specializes in diversity training, group dynamics, strategic organizational planning, leadership training, and crisis intervention. He has written and coauthored several publications, including the manual *Racial Reconciliation Dialogue*. He has earned the American Psychological Association Minority Fellowship and the Albert V. Danielsen Clinical Fellowship. He has worked as a project consultant at the Center for Applied Research and as a lecturer at Catholic University and George Washington University.

Barbara Kellerman is Research Director of the Center for Public Leadership and a lecturer in Public Policy. From 2000 to 2003 she served as the Center's Executive Director. She has held professorships of Political Science at Fordham, Tufts, Fairleigh Dickinson, George Washington, and Uppsala Universities. She also served as the Dean of Graduate Studies and Research at Fairleigh Dickinson and as Director of the Center for the Advanced Study of Leadership at the Academy of Leadership at the University of Maryland. She has been awarded a Danforth Fellowship and three Fullbright Fellowships. She appears frequently on CBS, NBC, PBS, and CNN, and has contributed articles and reviews to, among others, the *New York Times*, *Washington Post*, *Boston Globe*, and *Los Angeles Times*. She has authored and edited eleven books, most recently *Reinventing Leadership: Making the Connection Between Politics and Business* (1999) and *Bad Leadership* (2004). Currently, Kellerman serves as coeditor (with David Gergen) of a new leadership publication, *Compass: A Journal of Leadership*.

Jean Lipman-Blumen is the Thornton F. Bradshaw Professor of Public Policy and Professor of Organizational Behavior at the Peter F. Drucker Graduate

School of Management, Claremont Graduate University. She is also a Cofounding Director of the Institute for Advanced Studies in Leadership. She has served as special advisor to the domestic policy staff in the White House and has consulted to various governments and private-sector organizations. She has published more than seventy articles on leadership, management, public policy, and gender issues. Her latest book, *Hot Groups: Seeding Them, Feeding Them, and Using Them To Ignite Your Organization* (with Harold J. Leavitt), received the 1999 Best Book Award from the Association of American Publishers, Professional/ Scholarly Division. Her other work includes *The Connective Edge: Leading in an Interdependent World* (1996), which was nominated for a Pulitzer Prize. Her forthcoming book focuses on why followers tolerate bad leaders.

Lorraine R. Matusak is the Executive Director of LarCon Associates, a consulting agency that specializes in organizational design, leadership development, and executive coaching, as well as a Senior Scholar at the James MacGregor Burns Academy of Leadership at the University of Maryland. She is also a Trustee of the Leadership Institute, Los Angeles, and graduate advisor and mentor for the Fielding Institute of Graduate Studies in Santa Barbara, California. She has served as a Program Officer for Leadership and Education at the W.K. Kellogg Foundation, where she was named the Foundation's first Leadership Scholar. She also directed

the Foundation's National Leadership Program for more than ten years. She was the recipient of the 1996 International Morris T. Keeton award for her contributions to adult learning and leadership, as well as the Outstanding American Educator award from the Medical College of Augusta, Georgia. Her many publications include *Finding Your Voice: Learning to Lead . . . Anywhere You Want to Make a Difference* (1996).

Jürgen Weibler is Professor of Business Administration, Leadership and Organization at the Fernuniversität in Hagen (University of Hagen), Germany. He served for many years as the research director of the Institute for Leadership and Human Resource Management at the University of St. Gallen, Switzerland, and was Professor of Management at the University of Constance, Germany. He has researched extensively in the areas of leadership, human resource management, and organizational change and has developed an approach for theorizing leadership at a distance. He has served on the review board or as an advisory reviewer for many journals, has written some 70 journal articles, and is the author of three books, including *Personalführung [Leadership]* (2001), and is coeditor of a series on organization and leadership. His current research focuses on outstanding leadership in various cultures, measurement of efficient leadership, and the development of critical approaches to the study of leadership and leadership ethics.

ACHIEVEMENT MOTIVATION

Achievement motivation is the desire to achieve a personal or public standard of excellence, to do well for the sake of doing well rather than for extrinsic reward or for some other goal.

MEASURING ACHIEVEMENT MOTIVATION

Achievement motivation is usually measured by content analysis of spoken or written text because people are often unable or unwilling to report directly on their own motives. Because *achievement* is a socially valued term (in U.S. culture, at least), people may exaggerate their intrinsic concerns with doing well; hence, the content analysis measure does not usually correlate with direct questionnaire measures. Verbal images scored for achievement motivation involve being concerned with public or personal standards of excellence, or winning (nonaggressive) competitions (rather than having impact, which would be power motive imagery). Many people (perhaps especially U.S. citizens) confuse achievement and power. Perhaps the distinction can be highlighted by the old adage attributed to the U.S. essayist and poet Ralph Waldo Emerson: “Build a better mousetrap [achievement], and the world will beat a path to your door [power].” An achievement-motivated person would be more concerned with mousetrap quality than with

the world’s reaction, whereas a power-motivated person could devise many ways of drawing the world’s attention—including renting, buying, or even capturing a better mousetrap.

ACHIEVEMENT MOTIVATION AND BEHAVIOR

People scoring high in achievement motivation are drawn to intrinsic, task-related incentives rather than the social incentives that might result from successful performance. They are restless and innovative, seeking and using new information and advice from experts. They learn from their previous performance—even their failures—and are not afraid to modify their behavior on the basis of results. They take moderate risks, can delay gratification (probably because they experience time as moving relatively fast), and have an unobtrusive, even somber personal style. They bargain in a rational, cooperative way. They strive for upward social mobility. For all these reasons it is scarcely surprising that achievement-motivated people are often successful in business—particularly as salespeople or as heads of small, innovative high-technology firms. In other words, achievement motivation appears to drive specifically entrepreneurial leadership. This finding has been confirmed in a variety of cultural settings and economic systems. At the national or cultural level, high

God put me on Earth to accomplish a certain number of things.

Right now I'm so far behind I will never die!

—Unknown

levels of achievement motivation in cultural documents such as popular fiction or schoolchildren's readers are associated with subsequent levels of economic performance and development.

Thus, achievement motivation, as measured by content analysis, is specifically economic or entrepreneurial: It is usually unrelated to academic or scientific achievement or success in large bureaucratic organizations.

THE STRANGE RELATIONSHIP OF ACHIEVEMENT MOTIVATION TO POLITICAL LEADERSHIP

In politics, however, achievement motivation has a quite different and substantially negative relation to successful leadership. Among U.S. presidents, for example, achievement motivation is not associated with historians' ratings of greatness, and it is negatively associated with ratings of charisma derived from analysis of subordinates' memoirs. Achievement-motivated presidents of the modern era are viewed by scholars of the presidency as lacking political skills, organizational capacity, and emotional maturity. The political scientist James David Barber categorizes such presidents as "active negative"—active in promoting their idealistic programs but not enjoying the office of president. Frustrations and impatience drive them, surprisingly, to rigidity and failure to compromise, so that their administrations often end in failure. Thus, in 1919 U.S. President Woodrow Wilson failed to reach his political and foreign policy objectives through a refusal to compromise and then ruined his health by attempting to go over the heads of members of Congress and take his case "to the people." In the judgment of history many of Lyndon Johnson's domestic accomplishments disappeared into the quagmire of Vietnam. Richard Nixon took unethical, unconstitu-

tional, and illegal steps to prop up faltering policies and programs. Jimmy Carter tried to micromanage.

Why should achievement motivation have such different effects—in many respects almost a reversal—on political leadership and success as compared with entrepreneurial success? The answer may lie in consideration of how politics is different from business. In business (particularly small research and development businesses), achievement-motivated entrepreneurs usually are in charge and are thus in a position to bring about their personal vision of "the best." In politics, however, different people have different ideas about what is "the best," both in oligarchic (relating to government in which a small group exercises control) as well as democratic political systems. Some people may even prefer outcomes that are not "the best" in that they maximize the difference between their own returns and those of others, rather than the total return to all concerned parties. The leader's own convictions are by themselves usually not enough to force a policy; that is, there are always other people—even in totalitarian systems—with their own constituencies and power bases; they have to be cajoled and compromised. Thus, in politics "the best" must give way to "the possible." To an achievement-motivated leader who is concerned to reach the "one best solution," however, such compromises may seem like selling out.

"The best" also often costs too much and so must be fought for and eventually scaled back. In politics "the best" also usually has to be implemented by "less than best" officials—people whom the leader did not appoint, does not fully trust, and cannot remove. The problems of pure achievement motivation in politics can be summed up in the words of political journalist Patrick Wintour:

[It is] a relatively simple process to think up and launch a new policy. But in government there are interest groups to fix, budgets to agree, White Papers to publish, legislation to pass, pilot studies to implement and then sometimes many years before the impact is felt on the ground. It is altogether a slower and more grinding business. (Wintour 1999, 21)

Each of these regular features of political life is aversive to a leader high in pure achievement moti-

vation; together, these features can be seen as causing the leader to die a little bit each day in office.

Success in the “grinding business” of politics depends on the balance between achievement motivation and power motivation. Thus, U.S. presidents whose power motivation was higher than their achievement motivation often found ways around problems. Indeed, problems may not even have been experienced as “problems” but rather as what makes political life interesting. Presidential power motivation is probably linked to a whole series of political skills. For example, Franklin Roosevelt dealt with the problem of uncooperative subordinates by assigning the same task to several people, which made him the final judge of everyone’s performance, so that subordinates often competed to win his favor. Findings about sense of humor suggest that power-motivated political leaders are able to take pleasure from the process of politics—maneuvering, “schmoozing,” compromising, trading—as well as from its results. In contrast, presidents whose achievement motivation was higher than their power motivation seem to have been worn down by the process of implementing the lofty goals with which they began their administrations.

In psychological terms the essential difference between the leadership role in small-firm entrepreneurs and political leaders involves the issue of personal responsibility or control. Achievement-motivated entrepreneurs are accustomed to situations in which they have substantial control over the relevant

Achievement and Morality

The high premium placed on individual achievement so characteristic of American society is not found in all societies. The following tale concerns the Garo, an ethnic group in India, and tells of one of the ways Garo women sought to accommodate Western ideals of achievement with adherence to traditional values.

The publication of the A'chik Ku'rang magazine had set in motion the process of change in Garo literature and its turn towards modernisation. Over and above, it also affected a change in the social life of the Garos.

Phoebe W. Momin, a poetess of good standing, composed a beautiful poem, Rongtala Cholon Mingnama Bimung or “Noble character, noble name” and got it published in the March, 1941 issue of the A'chik Ku'rang. She said that along with the upliftment of the Garo society in the field of education, there should be corresponding attainment of higher moral standard as well. Attaining academic achievement, without attaining balanced rise in the moral standard, will be detrimental to the healthy growth of the society. The A'chik Ku'rang was widely circulated and every subscriber was found to have read the contents with critical appreciation. Copies of that journal, which I have with me, have so many marking and comments on the margin almost in each article.

The poem, Rongtala Cholon Mingnama Bimung, had so much influence and impact on the women that the poetess herself convened a meeting of the women at her resident at Proper Chandmary, Tura in November 1941. In course of their meeting, they unanimously resolved to form a union of Garo women based on the general principles of Christianity, to be referred to as the “Mothers’ Union.” The Union was to function within the perimeter of the following aims and objects:

1. To work together to bring up their children in the best of moral character and conduct.
2. To work together to provide decent dresses to their children; to educate and encourage Garo women, who come to Tura almost exposing their entire anatomy on market days or for some court cases, to dress decently.
3. To educate and encourage the womenfolk to respect their husband and parents in order to set a good example to their children to show the same respect to their parents, elders and teachers.

The Mothers’ Union, one of the most powerful women organizations in the northeast, was formed based on moral principles mentioned in the poem Rongtala Cholon Mingnama Bimung. This Union has been instrumental in bringing about a great change in the social life of the Garos. Today, it has expanded its horizon of activities, with Literature Wing, Education Wing, Agriculture Wing and Weaving Wing added to its fold. Currently, this Union actively involves itself in the civic sense awareness campaign within the town of Tura.

resources and personnel. (The same is true of many people in political campaigns and even some local or state governments.) As suggested earlier, however, leaders may have little tight control over many national political issues and arenas. Thus, Woodrow Wilson was confronted by implacable enemies of his League of Nations vision, Lyndon Johnson found that nothing he could do would move the Viet Cong and North Vietnamese to compromise, and Richard Nixon worried about possible “leaks” of vital knowledge to his enemies.

The experience of having absolutely no control may in fact be traumatic for achievement-motivated people. Because achievement motivation is built on a foundation of strict early training for voluntary control of bodily processes (McClelland & Pilon, 1983), later situations may arouse memories of childhood experiences of having “no control”—a paralyzing nightmare experience when confronting danger.

ACHIEVEMENT-MOTIVATED LEADERS IN A GLOBALIZED ECONOMY

These considerations have important consequences for understanding political leadership in an age of globalization. With the rise of a globalized economy and corresponding political systems and political cultures, politics in many regions may increasingly come under the sway of “technician” corporate leaders, trained in the entrepreneurial domain rather than in the political domain. Such leaders would be tempted to short-cut the “frustrations” and “quagmires” of politics in order to “turn the country around” and “get things done.” Often they do not come to power through election. (In a sample of world leaders of the 1970s, those who came to power by means of a coup d’etat scored significantly higher than average in achievement motivation but not in power motivation.) Contemporary examples include national leaders, often with successful corporate experience, who have turned to politics in a spirit of impatient reform and desire for rapid economic growth, such as Lee Kuan Yew of Singapore, Vicente Fox of Mexico, and perhaps even the U.S. candidate Ross Perot, who ran unsuccessfully for president and founded the Reform Party.

Study of such leaders suggests that latent authoritarianism may be a kind of “shadow” of achievement motivation in politics—a shadow that could well lengthen in an era when traditional political institutions are being supplanted by the supranational structures of globalized market capitalism, such as the economic controllers of the European Union, International Monetary Fund, and World Bank.

An achievement-motivation analysis can explain some twists and turns in the tortuous path of Bill Clinton’s presidency. Both in the 1992 campaign and in his 1993 inaugural address, Clinton clearly scored higher in achievement motivation than power motivation, a profile that was clearly demonstrated by the early fiasco of his health-care reform: A panel of “experts,” meeting in secret, produced a lengthy document covering every feature of health care without paying any attention to politics and power—that is, recognizing obstacles, building alliances, recognizing powerful stakeholders (people affected by an outcome) with different perceptions, holding public interest, and rallying support through exhortation and compelling images. This leadership style is more characteristic of the “command and compliance” corporate world, in which an achievement-motivated leader, situated at the top of a hierarchy, has a relatively untrammelled path toward the “single best way.”

After the Republican midterm election victory of 1994 and the Newt Gingrich-led challenge of shutting down the government in the winter of 1995–1996, however, a “new Clinton” emerged. He skillfully challenged and attacked his opponents; he presented attractive presidential policy proposals, and so (with an assist from the strong economy) his popularity soared during and after the 1996 election, enabling him to withstand even the challenge of impeachment. This “new Clinton” was characterized by speeches with a transformed motive profile, in which power was greater than achievement.

ORIGINS OF ACHIEVEMENT MOTIVATION

As noted, evidence suggests that achievement motivation grows out of early voluntary control of bodily

processes. High parental standards for performance, along with warmth and encouragement—independence training, in short—provide the setting for the development of internal standards. However, it is important that parents (in a patriarchal society, particularly fathers) “stand back,” avoiding overly explicit specification of goals and excessive interference with their child’s own efforts. Although early experience is important, evidence suggests that achievement motivation can be developed in later life through training courses.

The word *achievement* is a broad one, with many meanings. Achievement motivation, however, is related to only specific kinds of achievement. It drives highly successful economic leadership in entrepreneurial settings. Successful political leadership requires that the desire for excellence be tempered with a desire for and appreciation of power, lest the leader become restless and frustrated with the processes of politics.

ACTOR NETWORK THEORY

Actor Network Theory (ANT) developed in the 1980s, initially through the works of sociologist Michel Callon (1986) and sociologist Bruno Latour (1988), as an alternative to conventional explanations of the way leadership works. ANT suggests that leadership works not through individuals or groups of people and their separate, compliant, and deterministic technologies and that leadership therefore poses a radical problem for people’s views about leadership: Is leadership restricted to humans? ANT suggests two alternative foundation stones: first, that leadership is made up not of arrays of separate elements—people, ideas, machines, animals, chemicals, and so on—but rather of active hybrids composed of networks of associations; second, that people should understand these hybrids on the same analytical basis—in other words, not give priority to the human over the nonhuman. The consequences of this theory for understanding leadership are threefold: (1) that people should abandon their concentration on “the leader” as a discrete element because there are, in reality, no naked leaders (that is, leaders without any artificial supports) but rather leaders in

clothes surrounded by all forms of technical devices, natural resources, and other humans; (2) that the tracing of cause and effect in such a complex equation is an impossible task and that therefore the best that people can hope for is a rich description; and (3) that leadership can be exerted by nonhumans.

Taking the naked leader element first, it should be obvious that leaders are seldom naked—hence all the concern for dressing in a culturally appropriate manner for a leader, whether that is a pinstriped suit, a sports jersey, or a sari (a garment of southern Asian women). Indeed, it is because leadership is conventionally clothed that an inversion of the convention can prove such a powerful symbol. When six hundred Nigerian women occupied the Chevron-Texaco oil terminal at Escravos in southern Nigeria (which produces 400,000 barrels of oil a day) in July 2002, people might have assumed that the occupiers' demands for schools, health clinics, electricity and water supply systems, jobs, and the cleanup of oil-polluted rivers would be brushed aside. However, when the women threatened to take their clothes off, the company agreed to their demands, concerned about the embarrassment caused by the "curse of nakedness" (Branigan & Vidal, 2002, 8). The French emperor Napoleon, as another example, did not achieve his successes by appearing naked on the battlefield alone, but rather as resplendent in his uniform, on a horse, and supported by other clothed and armed soldiers, complete with the support of thousands of animals, food, cannon, ammunition, poor weather, good timing, and so on.

The issue of cause is also important: Napoleon may have been the formal leader of the French army, but this does not mean he was the sole or even the primary cause of its successes and failures. In the ANT approach, people should abandon the notion of human "actors" supported by various bit-part "extras," such as technology, and instead consider how the technology is also an "actant"—having apparent causal consequences in conjunction with the other elements of particular networks of hybrids. These networks are not robust and wholly material—such as a telephone network, for example—but rather fragile, fluid, and complex. They may involve vacillating humans, unreliable technologies, and

ambiguous ideas, all of which need constant replenishment for their reproduction.

This switch to incorporate the human with the nonhuman into hybrid actants then allows people to reconsider the extent to which leadership is unnecessarily restricted to humans. For instance, sociologist Richard Edwards (1979) argued that the explanation for the development of what he called "technical control"—assembly lines and the like—was a form of nonhuman persuasion that developed in response to the problems of personal control in factories. After bullying supervisors and factory bosses became counterproductive—because of the resistance they generated among the labor force—technical control replaced human control because subordinates were less resistant to being "led" by things than to being led by people. This, of course, begs the question: What does it mean to be "led"? If "to lead" implies "to set goals and alter behavior to achieve those goals," then people could still argue that assembly lines "lead" people. That is, the machinery sets the required output of widgets and then persuades its human operatives to exert effort in specific ways to achieve this output. Of course, there is a human behind the machinery—because the machinery is part of the hybrid—but Edwards's claim is that machines embody superior persuasive techniques to humans in these circumstances. What is important for human leaders to consider, then, is how they can incorporate the diverse elements that comprise a hybrid network.

MOMENTS OF TRANSLATION IN THE MOBILIZATION OF A NETWORK

For Callon (1986) accomplishing such a feat of heterogeneous engineering involves persuading the various elements that their future lies with one's network, rather than another's, and this occurs through four "moments of translation." The first "moment" is problematization, in which, for people's purposes, a human leader persuades other actants (human and nonhuman) that he or she is indispensable to them by redefining things as problems that can be resolved only through a (temporary) alignment to the leader. An example is the German politician Adolf Hitler's

account of the “Jewish conspiracy” as *the* problem for Germany that could be resolved only by supporting him and his network. The second “moment” captures their interests—*interessment*—and occurs when the leader tries to reconstruct the identity of the new hybrid network such that it is differentiated from competitor hybrids. An example is Hitler’s attempts to persuade all non-Jewish Germans that their Aryan identity both distinguished them from all other groups and entitled them to enslave others. *Enrolment* (French for enrollment) is the third moment, in which strategies are deployed and roles are allocated: For Hitler the incorporation of Europe was devised, the SS (Schutzstaffel, Protective Corps) was trained to round up the Jews, the tanks were trained to break through ground defenses, and the dive bombers were trained to immobilize the civilian populations and destroy communications. Finally, for Germany the fourth “moment,” mobilization, occurred when the “silent actors”—the passive German civilians, the tanks, the SS, and the dive bombers—accepted that Hitler had the right to speak for them, to drag them into war.

In effect, ANT works on the principle of hybrids, not humans, and on a form of recruitment in which the leader operates as an engineer of heterogeneous elements, drawing them into a temporary unity, channeling their concerns through a single causeway, and isolating them from all others. Hence, a person did not need to be a Nazi to support Hitler, but the network was constructed and held in place so that the only way to achieve anything was to fall in line with Hitler’s demands. The power of Hitler, though, derived from his temporary control over the hybrid of people, flags, ideas, songs, uniforms, tanks, guns, oil, and so forth; it did not derive from him alone, however charismatic he may have appeared to some.

HYBRID LEADERSHIP

If people can establish that viewing leadership as hybrid is a legitimate view, then the conceptual space that “leadership” inhabits becomes significantly more open to debate. On the one hand this view may make the debate even more complex and confused, but on the other hand it might also explain why that

debate is so contested—because what counts as leadership cannot be shaped into a consensual form.

If a human can lead others by being a guide, by showing the way, then it seems that hybrids can, too. A dog, for example, can lead a person home—providing the dog knows where home is—and is therefore part of a home-human-dog hybrid; a lighthouse can do the same, as can a satellite navigation system. However, can an “ideal” also offer leadership? This seems a reasonable extrapolation; for instance, many of the Marxist guerrillas of the 1960s and 1970s were “led” by the ideal of equality: a nonhuman that had little formal authority over them. Similarly, many members of the German SS were “led” by the racist ideals of National Socialism or by their “oaths of obedience” to Hitler. Here the oath, the verbal utterance, led them—even if most people would insist that it led them “astray.” That ideal might also be materialized as a flag or symbol—the Hammer and Sickle, the Swastika, the Stars and Stripes, or the Union Jack, hence the perceived “desecration” by burning. Indeed, the Regimental Colors, the British military unit flag, is often regarded as “leading” soldiers, as were the Roman legions’ standards, because they symbolized in dramatic and intense form all that the legions stood for. The leadership symbol itself, not just what it symbolizes, is critical. If this were not the case, then when the Roman legions lost their standards they would simply have replaced them with new ones—rather than disband the legions, as they tended to do.

However, is the volitional element an insurmountable problem here after all? That is, is the inability of the flag to invent a future and to act in a volitional manner the issue that marks the boundary between leadership and symbolism? Certainly the flag can represent a future, but it cannot invent one. Thus, if leadership is defined as the invention of a future and the mobilization of followers to achieve that future, then surely the flag can lead only in the second sense? A flag might well embody the future, as cultural historians Orlando Figes and Boris Kolonitskii suggest, at the beginning of the Russian Revolution: “Each faction fought to control the symbolic system of the revolutionary underground. . . . Whoever mastered the red flag, or monopolized the meaning of its

lexicon, was in pole position to become the master of the revolution too” (Figes & Kolonitskii 1999, 1–2). Of course, *what* particular future is embodied in the flag is still up for debate, so it is not that the flag leads because of *what* it symbolizes but rather that its followers attribute to the flag a future that they find attractive—even if that attribution is not consciously agreed on by the followers.

Yet, one could still argue that nonhuman leadership fails because the nonhuman element of the network does not instigate the changes and does not act as a mobilizer of networks: Human leaders are not naked, but naked technologies cannot lead because they do not instigate the vision or mobilization. Thus, it is the pivotal creative role played by humans in these collaborative hybrids that distinguishes them *primus inter pares* (first among equals). However, this is a little like saying the driver is the most important part of a car; in some sense that might be true, but without a car a person cannot drive. Precisely what is the creative force of the network is debatable: God, alcohol, human emotion, destiny, culture, and genes are all potential culprits here. Moreover, because invented futures have to be inscribed and communicated, and because humans are never without technological supports, one might still argue that human-nonhuman networks are critical for leadership. One might suggest that the search for an essence is irrelevant because the important element is the hybrid, and neither the elements that comprise the hybrid nor any alleged network is the essence.

If this is right, then people should reconsider how people strengthen the links in the hybrid networks because, of course, this also means that people cannot consider the nonhuman as a leader in isolation either, not because nonhumans do not embody volition but rather because nonhuman leadership is as mythically pure as human leadership. There lies the rub—according to ANT it isn’t the consciousness of leaders that makes them leaders; it’s their hybridity.

—Keith Grint

ADAPTIVE WORK

Our language fails us in many aspects of our lives, entrapping us in a set of cultural assumptions like cattle herded by fences into a corral. Gender pronouns, for example, corral us into teaching children that God is a “he,” distancing girls and women from the experience of the divine in themselves.

Our language fails us, too, when we discuss, analyze, and practice leadership. We commonly talk about “leaders” in organizations or politics when we actually mean “people in positions of managerial or political authority.” Although we have confounded leadership with authority in nearly every journalistic and scholarly article written on “leadership” during the last one hundred years, we know intuitively that these two phenomena are distinct when we complain all too frequently in politics and business that “the leadership isn’t exercising any leadership,” by which we actually mean that “people in authority aren’t exercising any leadership.” Whether people with formal, charismatic, or otherwise informal authority actually practice leadership on any given issue at any moment in time ought to remain a separate question answered with wholly different criteria than those used to define a relationship of formal or informal authority. As we know, all too many people are

skilled at gaining authority, and thus a following, but do not then lead.

Moreover, we assume a logical connection between the words *leader* and *follower*, as if this dyad (pair) were an absolute and inherently logical structure. It is not. The most interesting leadership operates without anyone experiencing anything remotely similar to the experience of “following.” Indeed, most leadership mobilizes those people who are opposed or who sit on the fence, in addition to allies and friends. Allies and friends come relatively cheap; the people in opposition have the most to lose in any significant process of change. When mobilized, allies and friends become, not followers, but rather activated participants—employees or citizens who themselves often lead in turn by taking responsibility for tackling tough challenges, often beyond expectations and often beyond their authority. They become partners. When mobilized, opposition and fence-sitters become engaged with the issues, provoked to work through the problems of loss, loyalty, and competence embedded in the change they are challenged to make. Indeed, they may continue to fight, providing an ongoing source of diverse views necessary for the adaptive success of the business or community. Far from becoming “aligned” and far from having any experience of “following,” they are mobilized by leadership to wrestle with new complexities that demand tough trade-offs in their ways of working or living. Of course, in time they may begin to trust, admire, and appreciate the person or group who is leading, and thereby confer informal authority on the person or group, but they would not generally experience the emergence of that appreciation or trust by the phrase “I’ve become a follower.”

If leadership is different from the capacity to gain formal or informal authority, and therefore different from the ability to gain a “following”—attracting influence and accruing power—then what can anchor our understanding of it?

Leadership takes place in the context of problems and challenges. Indeed, it makes little sense to describe leadership when everything and everyone in an organization are humming along just fine, even when processes of influence and authority will be

virtually ubiquitous in coordinating routine activity. Leadership becomes necessary to businesses and communities when people have to change their ways rather than continue to operate according to current structures, procedures, and processes. Beyond technical problems, for which authoritative and managerial expertise will suffice, adaptive challenges demand leadership that can engage people in facing challenging realities and then changing at least some of their priorities, attitudes, and behavior in order to thrive in a changing world.

Mobilizing people to meet adaptive challenges, then, is at the heart of leadership practice. In the short term, leadership is an activity that mobilizes people to meet an immediate challenge. In the medium and long terms, leadership generates new cultural norms that enable people to meet an ongoing stream of adaptive challenges in a world that will likely pose an ongoing set of adaptive realities and pressures. Thus, with a longer view, leadership develops an organization’s or community’s adaptive capacity.

Adaptive work may be described in seven ways.

First, adaptive work is necessary in response to problem situations for which solutions lie outside the current way of operating. We can distinguish technical challenges, which are amenable to current expertise, from adaptive challenges, which are not. Although every problem can be understood as a gap between aspirations and reality, technical challenges present a gap between aspirations and reality that can be closed through applying existing know-how. For example, a patient comes to his doctor with an infection, and the doctor uses her knowledge to diagnose the illness and prescribe a cure.

In contrast, an adaptive challenge is created by a gap between a desired state and reality that cannot be closed using existing approaches alone. Progress in the situation requires more than the application of current expertise, authoritative decision making, standard operating procedures, or culturally informed behaviors. For example, a patient with heart disease may need to change his or her way of life: diet, exercise, smoking, and the imbalances that cause unhealthy stress. To make those changes, the patient will have to take responsibility for his or her health and learn a new set of priorities and habits. (See Table 1.)

Table 1: Technical and Adaptive Work

<i>Kind of Work</i>	<i>Solutions and Problem Definition</i>	<i>Primary Locus of Implementation</i>	<i>Responsibility for the Work</i>
Technical	Clear	Clear	Authority
Technical and Adaptive	Clear	Requires Learning	Authority and Stakeholders
Adaptive	Requires Learning	Requires Learning	Stakeholder > Authority

Source: R. A. Heifetz (1994, 76).

Second, adaptive work demands learning. An adaptive challenge exists when the people themselves are the problem and when progress requires a retooling, in a sense, of their own ways of thinking and operating. The gap between aspirations and reality closes when they learn new ways. Thus, a consulting firm may offer a brilliant diagnostic analysis and set of recommendations, but nothing will be solved until that analysis and those recommendations are lived in the new way that people operate. Until then, the consulting firm has no solutions, only proposals.

RESPONSIBILITY SHIFT

Third, adaptive work requires a shift in responsibility from the shoulders of the authority figures and the authority structure to the stakeholders (people with an interest in an outcome) themselves. In contrast to expert problem solving, adaptive work requires a different form of deliberation and a different kind of responsibility taking. In doing adaptive work, responsibility needs to be felt in a far more widespread fashion. At best, an organization would have its members know that there are many technical problems for which looking to authority for answers is appropriate and efficient but that for the adaptive set of challenges, looking primarily to authority for answers becomes self-defeating. When people make the classic error of treating adaptive challenges as if they were technical, they wait for the person in authority to know what to do. He or she then makes a best guess—probably just a guess—while the many sit back and wait to see whether the guess pans out. Frequently enough, when it does not pan out, people get rid of that person in authority and go find

another one, all the while operating under the illusion that “if only we had the right ‘leader,’ our problems would be solved.” Progress is impeded by inappropriate dependency, and thus a major task of leadership is the development of responsibility taking by stakeholders themselves.

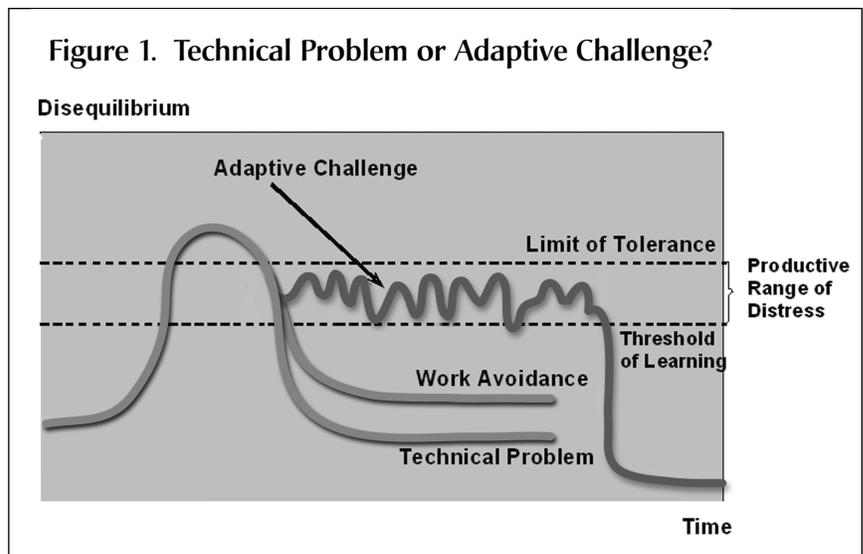

Fourth, adaptive work requires people to distinguish what is precious and essential from what is expendable within their culture. In cultural adaptation the job is to take the best from history, leave behind that which is no longer serviceable, and through innovation learn ways to thrive in the new environment.

Therefore, adaptive work is inherently conservative as well as progressive. The point of innovation is to conserve what is best from history as the community moves into the future. As in biology, a successful adaptation takes the best from its past set of competencies and loses the DNA that is no longer useful. Thus, unlike many current conceptions of culturally “transforming” processes, many of which are ahistorical—as if one begins all anew—adaptive work, profound as it may be in terms of change, must honor ancestry and history at the same time that it challenges them.

Adaptive work generates resistance in us because adaptation requires us to let go of certain elements of our past ways of working or living, which means to experience loss—loss of competence, loss of reporting relationships, loss of jobs, loss of traditions, or loss of loyalty to the people who taught us the lessons of our heritage. Thus, an adaptive challenge generates a situation that forces us to make tough tradeoffs. The source of the resistance that people have to change isn’t resistance to change per se; it is resistance to loss. People love change when they

know it is beneficial. Nobody gives the lottery ticket back when he or she wins. Leadership must contend, then, with the various forms of feared and real losses that accompany adaptive work.

Anchored to the tasks of mobilizing people to thrive in new and challenging contexts, leadership is not simply about change; more profoundly leadership is about identifying that which is worth conserving. It is the conserving of the precious dimensions of our past that makes the pains of change worth sustaining.

Source: Ronald A. Heifetz and Donald L. Laurie

IMPROVISATION

Fifth, adaptive work demands experimentation. In biology, the adaptability of a species depends on the multiplicity of experiments that are being run constantly within its gene pool, increasing the odds that in that distributed intelligence some diverse member of the species will have the means to succeed in a new context. Similarly, in cultural adaptation, an organization or community needs to be running multiple experiments and learning fast from these experiments in order to see “which horses to ride into the future.”

Technical problem solving appropriately and efficiently depends on authoritative experts for knowledge and decisive action.

In contrast, dealing with adaptive challenges requires a comfort with not knowing where to go or how to move next. In mobilizing adaptive work from an authority position, leadership takes the form of protecting elements of deviance and creativity in the organization in spite of the inefficiencies associated with those elements. If creative or outspoken people generate conflict, then so be it. Conflict becomes an engine of innovation rather than solely a source of dangerous inefficiency. Managing the dynamic tension between creativity and efficiency becomes an ongoing part of leadership practice for which there exists no equilibrium point at which this tension disappears. Leadership becomes an improv-

isation, however frustrating it may be to not know the answers.

Sixth, the time frame of adaptive work is markedly different from that of technical work. People need time to learn new ways—to sift through what is precious from what is expendable and to innovate in ways that enable people to carry forward into the future that which they continue to hold precious from the past. Moses took forty years to bring the children of Israel to the Promised Land, not because it was such a long walk from Egypt, but rather because it took that much time for the people to leave behind the dependent mentality of slavery and generate the capacity for self-government guided by faith in something ineffable. (See Figure 1.)

Because people have so much difficulty sustaining prolonged periods of disturbance and uncertainty, people naturally engage in a variety of efforts to restore equilibrium as quickly as possible, even if it means avoiding adaptive work and begging the tough issues. Most forms of adaptive failure are a product of our difficulty in containing prolonged periods of experimentation and the difficult conversations that accompany them.

Work avoidance is simply the natural effort to restore a more familiar order, to restore equilibrium. Although many forms of work avoidance operate

across cultures and peoples, two common pathways appear to exist: the displacement of responsibility and the diversion of attention. Both pathways work all too well in the short term, even if they leave people more exposed and vulnerable in the medium and long terms. Some common forms of displacement of responsibility include scapegoating, blaming the persistence of problems on authority, externalizing the enemy, and killing the messenger. Diverting attention can take the form of fake remedies, such as the Golden Calf of the Bible's Book of Exodus; an effort to define problems to fit one's competence; repeated structural adjustments; the faulty use of consultants, committees, and task forces; sterile conflicts and proxy fights ("let's watch the gladiator fight!"); and outright denial.

Seventh, adaptive work is a normative concept. The concept of adaptation arises from scientific efforts to understand biological evolution. Applied to the change of cultures and societies, the concept becomes a useful, if inexact, metaphor. For example, species evolve, whereas cultures learn. Evolution is generally understood by scientists as a matter of chance, whereas societies will often consciously deliberate, plan, and intentionally experiment. Close to our normative concern, biological evolution conforms to laws of survival. Societies, on the other hand, generate purposes beyond survival. The concept of adaptation applied to culture raises the question, "Adapt to what, for what purpose?"

In biology the "objective function" of adaptive work is straightforward: to thrive in new environments. Survival of the self and one's gene-carrying kin defines the direction in which animals adapt. A situation becomes an adaptive challenge because it threatens the capacity of a species to pass on its genetic heritage. Thus, when a species multiplies its own kind and succeeds in passing on its genes, it is said to be "thriving" in its environment.

Thriving is more than coping. Nothing is trivial in biology about adaptation. Some adaptive leaps transform the capacity of a species by sparking an ongoing and profound process of adaptive change that leads to a vastly expanded range of living.

In human societies "thriving" takes on a host of values not restricted to survival of one's own kind. At

times human beings will even trade off their own survival for values such as liberty, justice, and faith. Thus, adaptive work in cultures involves both the clarification of values and the assessment of realities that challenge the realization of those values.

Because most organizations and communities honor a mix of values, the competition within this mix largely explains why adaptive work so often involves conflict. People with competing values engage one another as they confront a shared situation from their own points of view. At its extreme, and in the absence of better methods of social change, the conflict over values can be violent. The U.S. Civil War changed the meaning of union and individual freedom. In 1857 fulfilling the preamble to the Constitutional goal "to insure domestic tranquility" meant the return of escaped slaves to their owners; in 1957 it meant the use of federal troops to integrate Central High School in Little Rock, Arkansas.

Some realities threaten not only a set of values beyond survival, but also the very existence of a society if these realities are not discovered and met early on by the value-clarifying and reality-testing functions of that society. In the view of many environmentalists, for example, our focus on the production of wealth rather than co-existence with nature has led us to neglect fragile factors in our ecosystem. These factors may become relevant to us when finally they begin to challenge our central values of health and survival, but by then, we may have paid a high price in damage already done, and the costs of and odds against adaptive adjustment may have increased enormously.

Adaptive work, then, requires us to deliberate on the values by which we seek to thrive and demands diagnostic inquiry into the realities that threaten the realization of those values. Beyond legitimizing a convenient set of assumptions about reality, beyond denying or avoiding the internal contradictions in some of the values we hold precious, and beyond coping, adaptive work involves proactively seeking to clarify aspirations or develop new ones, and then involves the hard work of innovation, experimentation, and cultural change to realize a closer approximation of those aspirations by which we would define "thriving."

The normative tests of adaptive work, then, involve an appraisal of both the processes by which orienting values are clarified in an organization or community and the quality of reality testing by which a more accurate rather than convenient diagnosis is achieved. For example, by these tests serving up fake remedies for our collective troubles by scapegoating and externalizing the enemy, as was done in extreme form in Nazi Germany, might generate throngs of misled supporters who readily grant to charlatans extraordinary authority in the short run, but they would not constitute adaptive work. Nor would political efforts to gain influence and authority by pandering to people's longing for easy answers constitute leadership. Indeed, misleading people is likely over time to produce adaptive failure.

AKBAR (1542–1605) *Mughal emperor*

Akbar was the grandson of Babur (1483–1530), who founded the Mughal rule (1526–1857) in India. Babur was succeeded by his son Humayun (1508–1556), during the first portion of whose reign (1530–1540) the territories conquered earlier by Mughals was lost to the Afghans. After an interregnum of rule by the Afghan dynasty of Sur, the Mughals were again able to set foothold over Delhi in 1555; yet until his death in 1556, Humayun was fighting on many fronts to recapture the empire. After Humayun's death the Afghans under their Hindu Prime Minister Hemu reoccupied Delhi. It was left to Akbar, Humayun's son, to build up the empire from scratch and raise it to glorious heights. Akbar was only fourteen years old when he was coronated, and under his command, Mughals defeated Hemu in the second Battle of Panipat (November 5, 1556) that is considered landmark in reestablishment of Mughal rule in India.

Akbar's leadership skills were not limited to war or to the expansion and consolidation of the Mughal empire; indeed, his most important contribution was the way that he molded the Mughal empire and created legitimacy for his rule that was based not on brute force, but on the consent of the governed. Despite Mughals being Sunni, Akbar refused to

identify with any creed and followed an independent policy of enlightened toleration.

RELIGIOUS TOLERANCE

Mughal rule under Akbar was largely an extension of his personality. Personally, Akbar was tolerant of other religions. He married Hindu Rajput princesses, but did not force them to convert to Islam; they were free to practice their own religion. In fact, Akbar was interested in exploring the essence of different religions, and to this end he built an *ibadat-khana* (house of worship) in his capital at Fatehpur-Sikri, near Agra to which he would invite spiritual leaders of different faiths for inter-faith dialogues. Akbar also showed respect for other religions by celebrating their festivals. Perhaps the most significant signs of his religious tolerance were that he abolished the *jizia*, the tax that only non-Muslims were required to pay, and rescinded many of the restrictive laws regarding non-Muslim religious worship. His spiritual curiosity later translated into his founding a faith called *din-i-ilahi* (also called *tahud-i-ilahi*), meaning divine faith. This faith was in many ways a distillation of the teachings of the various religions to which Akbar had been exposed, and it was tolerant in nature. It laid stress on individual purity and ethical behavior.

Akbar never forced anyone to become a member of his *din*, and according to the *Ain-i-Akbari* (Laws of Akbar), written by Abul Fazl, there were only eighteen full-time adherents and no more than a few thousand followers.

ADMINISTRATION OF THE MUGHAL EMPIRE

Akbar conquered all but the southernmost parts of the Indian subcontinent; his empire stretched from present-day Afghanistan to present-day Bangladesh. The most significant aspect of his extension of Mughal power was that in many of the areas formerly under Hindu Rajput rule, he would not annex the kingdoms, but on the princes' acceptance of Mughal sovereignty, he would let them rule their kingdoms as vassals of the Mughals. Further, he recruited the Rajput princes into the ranks of the Mansabdari, his military system of government administration. By thus incorporating his former enemies into his government, he won acceptance for his imperialism. In many of the subsequent campaigns of the Mughals, Rajput princes commanded the Mughal armies. The Rajputs also proved to be an important bulwark against the conservative Islamic elements in the Mughal court.

Under the Mansabdari system of administration, all government officials were incorporated into the ranks of the military, even if their functions were not military, and all were paid through the imperial army. This systematized government functions, and bureaucratized its operation, all the way from the imperial level down to the local level. Rule by whim was replaced by rule according to standardized procedures. For instance, the land tax structure was systematized on a scientific statistical basis with the objective to increase productivity and revenue. Also, procedures were developed for recruitment, for communication, and for a system of checks and balances between the government functionaries. Officials were regularly transferred to maintain the efficiency of the administration, but also to keep up the imperial control. An important aspect of Akbar's administration was that people of ability were assigned high ranks irrespective of their religious affiliation.

Consequently, even Shias and Hindu Rajputs held important government positions.

POLITICS, LAW, AND THE ARTS

The most important aspect of Akbar's kingship was that unlike other Muslim rulers, he did not consider the caliph (the supreme Islamic religious authority) to have political authority over him. Akbar did not consider himself subordinate to anyone. Although empires are often associated with particular religions (for example, the Byzantine empire is associated with Eastern Orthodox Christianity, the Ottoman empire with Sunni Islam, the Persian Safavid dynasty with Shi'a Islam, and so on), Akbar liberated the Mughal regime from any such religious affiliation and placed his subjects on an equal footing. He created a state of *sulh-i-kul*, that is, a state of peace and reconciliation among all. This was quite in contrast to the wishes of orthodox theologians, whose power was undermined by such measures. Until Akbar's time, the highest title an Islamic king had claimed for himself was *zil-i-allah-fil-'arz* ("shadow of God on earth"). Akbar went further and adopted the title *farr-i-izdi* ("divine effulgence or light of God"). Thus Akbar claimed to derive his power directly from God.

In an empire in which Qur'anic laws took precedence, Akbar took the innovative step of assuming the powers of religious interpretation. By a proclamation Akbar was certified to be an *imam-adil* (just ruler), and by virtue of that status his interpretation of religious law was declared to be superior to that of the *mujtahid* (learned scholars or jurists). In other words, the monarch, not the *ulama* (Islamic scholarly community), was the source of legislation and of interpretation of that legislation should any dispute arise. This appropriation of religious as well as legal authority made it possible for Akbar to restrict the influence of the orthodox *ulama*.

A similar universality of outlook is visible in Akbar's patronage of the arts. It is very interesting to note that during his reign painting were totally devoid of religious symbolism. He would patronize artists without being concerned with their religious affiliations. It was in his time that a form of Indo-

Another View: The Real Akbar, the (Not So) Great

The addition of the adjectival phrase "the great" to the names of famous leaders such as Akbar, Alexander, and Peter is rarely without controversy. What is great to some is horrible to others. Akbar is a good example of this, as he is revered by Muslims but considered less than great by some modern Hindus as indicated by the text from a website reprinted below.

Akbar is considered as the great Mughal emperor who put the Mughal empire on a firm and stable footing, with a reliable revenue system and with expansion of its borders deeper into Indian heartland. There is a belief prevalent in the present day India that Akbar's rule was secular and tolerant of the native Hindu faith. This belief is fostered by the Indian history texts, Hindi movies like Mughal-e-Azam, a TV serial on Doordarshan and the fictional tales of Akbar and his Hindu court jester Birbal. Although Akbar did abolish two obnoxious taxes on Hindus namely the pilgrimage tax in 1563 CE and Jizya (a tax stipulated in the Koran to be paid by Zimmis or unbelievers) in 1564 CE, his rule was better compared ONLY to the other Mughal and Turko-Afgani rules. This article illustrates this with two specific historical events. First, Akbar like all Mughal rulers had the holy Muslim title of GHAZI (SLAYER OF KAFFIR—infidel). Like Timur Lane and Nader Shah, AKBAR HAD A VICTORY TOWER ERECTED WITH THE HEADS OF THE CAPTURED/SURRENDERED ARMY OF HEMU after the second battle of Panipat. Later, AKBAR AGAIN SLAUGHTERED MORE THAN 30,000 UNARMED CAPTIVE HINDU PEASANTS AFTER THE FALL OF CHITOD ON FEBRUARY 24, 1568.

Islamic architecture that was a synthesis of Islamic as well as Hindu traditions became part of the landscape. Thus in every aspect of life Akbar promoted religious tolerance and liberalism. He not only had a deep impact on the Mughal empire, he furthered a liberal Indian tradition that has been present in Indian civilization over the centuries.

**ALEXANDER THE GREAT**

(356–323 BCE)

King of Macedonia

Alexander the Great was king of the ancient dynasty of Macedonia in northern Greece. Alexander built the largest empire to that time in the world by conquering Asia Minor (the peninsula forming the western extremity of Asia), Persia (Iran), central Asia, and northern India. The battles that he fought during his short life, his innovations in warfare, and his ability as a military commander have provided generations of scholars and leaders with much to debate and emulate since.

AN IMPRESSIVE INHERITANCE

Alexander was born in Pella, the capital of Macedonia, as the son of King Philip II of Macedon (382–336 BCE, r. 359–336 BCE) and Queen Olympias, one of Philip's many wives. As a constitutional monarch, Philip was not just a figurehead, but also the chief statesman and military commander. Philip was an ambitious leader who used his skills at warfare and diplomacy to improve the fortunes of his declining kingdom. In the year of Alexander's birth Philip defeated a coalition of northern barbarians and set about uniting the Greek-speaking world under his command. He also taught his son the art of warfare in addition to the education that the young Alexander received between the ages of thirteen and sixteen from the Greek philosopher Aristotle.

Alexander excelled at hunting and sport, and his

favorite text was the *Iliad* by the Greek poet Homer. Alexander hoped to emulate the heroism of the Greek mythological warrior Achilles, to whom he believed he was related through his mother. At age sixteen Alexander won his first battle, against a tribe from Thrace (a region on the eastern Balkan Peninsula), and acted as regent while Philip was away fighting at Byzantium. Probably Philip's best-known victory was won in 338 BCE against an army of allied Greek states at Chaeronea, where Alexander, age eighteen, commanded the left wing of the Macedonian army as a cavalryman. After his victory Philip reformed the Greek army, combining the excellent cavalry of northern Greece with the disciplined and effective infantry of the southern city-states. This reformation gave him a formidable force that had both the mobility of elite horsemen and the attacking prowess of the hoplites (heavily armed infantry soldiers) in phalanxes (bodies of heavily armed infantry formed in deep, close ranks and files), armed with 4.2-meter pikes named *sarissas*.

However, the relationship between father and son deteriorated, possibly because of arguments about military matters and Philip's remarriage. Alexander made derisive comments about his father's abilities, and a rift grew between them. Some scholars have even suggested that Alexander was complicit in Philip's assassination at the hands of a disgruntled bodyguard named Pausanias in July 336 BCE. Certainly Alexander had become worried about his status as the legitimate heir, and his father's untimely death allowed him to grasp power ahead of other siblings. Although he was ambitious and hungry for power, it seems unlikely that he was directly involved in the assassination plot. After becoming Alexander III, he slaughtered the accused conspirators and any man who dared question his authority as the new king. A rebellion broke out among the Greek tribes and city-states at news of Philip's death, but Alexander quelled it ruthlessly. When the city of Thebes (in Egypt) left the Macedonian-led Hellenic League, he massacred the city's defenders, killing six thousand and enslaving thirty thousand. This violent action reunited the Greek people in fear of similar reprisals, paving the way for Alexander's later campaigns, although he later always treated the

other Greeks with respect, recognizing their role in his plans.

Like Philip, Alexander was an almost absolute commander, making his own appointments and promotions, issuing all orders, and controlling payments and discharges. Therefore, by the age of twenty Alexander had inherited from his father a large, highly trained and well-organized army, a plan for a Greek invasion of the mighty Persian empire, and the ambition and ability to carry it out.

A TEMPLATE FOR LEADERSHIP: THE BATTLE OF GRANICUS

His enemies in southern Greece subdued, Alexander was free to carry out the original intention of both himself and Philip: to conquer the Persian empire to the east. Between 335 and 325 BCE Alexander and his army were almost constantly marching or fighting, with either a major battle or a siege taking place in each of those years. Alexander crossed into Asia with forty thousand infantry and five thousand cavalry in the spring of 334 BCE; his first notable fight was the Battle of Granicus (a river in Turkey) in May. The Persian force of forty thousand was led by Memnon, a Greek mercenary general, who selected an excellent defensive position near to a river crossing. Alexander attacked Memnon at his strongest point, surprising him and using brute force to smash through his cavalry. Memnon's forces were soundly defeated. The Persian army was devastated, and some sources suggest that Alexander lost fewer than a hundred men.

Granicus provided a template for Alexander's leadership in many of his later battles. The tactical move was bold, reckless, and innovative. Characteristics of his leadership style became apparent, even that early in his campaigning. He was, according to historian John Keegan, the epitome of the "heroic" leader, happily risking his life in the heat of the conflict alongside the men he commanded and not asking of them anything he would not do himself. In terms of battlefield bravery, Alexander had no equal. Keegan pointed out that "There is no hint, in any of the ancient biographies, that he ever showed fear at all, or that he appeared to feel it" (Keegan 1987, 90).

Commanders often took to the field in those days, but Alexander went to almost theatrical extremes.

As scholar Nicholas Hammond said, "he courted every danger—fighting at the head of any formation, leading any wild adventure, and scaling first the parapet of a besieged city" (Hammond 1981, 255). The risks were certainly considerable. At Granicus alone, where Alexander personally led his elite cavalry, his horse was killed almost immediately, his helmet was broken, and he was nearly killed at least once. Still, his men appreciated his presence on the battlefield and grew to love him for his willingness to fight with them. He may have acted so boldly as much to emulate the achievements of his hero Achilles as to earn the respect of his troops. Also, he may have believed himself to be the immortal son of the Greek god Zeus and therefore invulnerable in battle. He also clearly tried to ingratiate himself with his men by diplomatic acts of friendship. After Granicus he went among his men and "showed much concern for the wounded, asking them how they came by their wounds and giving them a chance to boast of what they had done in battle" (Fox 1980, 143).

During the winter of 334–333 BCE Alexander allowed many of his men to return home to their families, which improved morale and also increased his popularity. Furthermore, although an autocratic leader, he listened to wise counsel when it was offered to him. He was not always popular—many people were appalled when he killed his friend, Cleitus, in a drunken brawl in 329 BCE, and he was also the subject of at least three assassination plots against him. Nonetheless, more often than not he displayed a great empathy in his handling of his troops, for which he was revered.

STRATEGIC INGENUITY

Alexander showed common sense in developing his strategies around his strengths and the weaknesses of his enemy. Realizing that the Persians would be on the back foot following their surprise defeat at Granicus, Alexander pressed ahead through Asia Minor as rapidly as possible. After passing through Sardis, Ephesus, and Priene and then besieging Miletus in the summer of 334 BCE, he approached Halicarnassus. Recognizing

Speech of Alexander the Great

Arrian, a Greek historian living in the second century CE, created a multivolume biography that is still regarded as the premier work on Alexander. Below is a speech delivered by Alexander, as recounted in Arrian's The Campaigns of Alexander:

I observe, gentlemen, that when I would lead you on a new venture you no longer follow me with your old spirit. I have asked you to meet me that we may come to a decision together: are we, upon my advice, to go forward, or, upon yours, to turn back?

If you have any complaint to make about the results of your efforts hitherto, or about myself as your commander, there is no more to say. But let me remind you: through your courage and endurance you have gained possession of Ionia, the Hellespont, both Phrygias, Cappadocia, Paphlagonia, Lydia, Caria, Lycia, Pamphylia, Phoenicia, and Egypt; the Greek part of Libya is now yours, together with much of Arabia, lowland Syria, Mesopotamia, Babylon, and Susia; Persia and Media with all the territories either formerly controlled by them or not are in your hands; you have made yourselves masters of the lands beyond the Caspian Gates, beyond the Caucasus, beyond the Tanais, of Bactria, Hyrcania, and the Hyrcanian sea; we have driven the Scythians back into the desert; and Indus and Hydaspes, Acesines and Hydraotes flow now through country which is ours. With all that accomplished, why do you hesitate to extend the power of Macedon—*your* power—to the Hyphasis and the tribes on the other side? Are you afraid that a few natives who may still be left will offer opposition? Come, come! These natives either surrender without a blow or are caught on the run—or leave their country undefended for your taking; and when we take it, we make a present of it to those who have joined us of their own free will and fight on our side.

For a man who is a man, work, in my belief, if it is directed to noble ends, has no object beyond itself; none the less, if any of you wish to know what limit may be set to this particular campaign, let me tell you that the area of country still ahead of us, from here to the Ganges and the Eastern ocean, is comparatively small. You will undoubtedly find that this ocean is connected with the Hyrcanian Sea, for the great Stream of Ocean encircles the earth. Moreover I shall prove to you, my friends, that the Indian and Persian Gulfs and the Hyrcanian Sea are all three connected and continuous. Our ships will sail round from the Persian Gulf to Libya as far as the Pillars of Hercules, whence all Libya to the eastward will soon be ours, and all Asia too, and to this empire there will be no boundaries but what God Himself has made for the whole world.

But if you turn back now, there will remain unconquered many warlike peoples between the Hyphasis and

the Eastern Ocean, and many more to the northward and the Hyrcanian Sea, with the Scythians, too, not far away; so that if we withdraw now there is a danger that the territory which we do not yet securely hold may be stirred to revolt by some nation or other we have not yet forced into submission. Should that happen, all that we have done and suffered will have proved fruitless—or we shall be faced with the task of doing it over again from the beginning. Gentlemen of Macedon, and you, my friends and allies, this must not be. Stand firm; for well you know that hardship and danger are the price of glory, and that sweet is the savour of a life of courage and of deathless renown beyond the grave.

Are you not aware that if Heracles, my ancestor, had gone no further than Tiryns or Argos—or even than the Peloponnese or Thebes—he could never have won the glory which changed him from a man into a god, actual or apparent? Even Dionysus, who is a god indeed, in a sense beyond what is applicable to Heracles, faced not a few laborious tasks; yet we have done more: we have passed beyond Nysa and we have taken the rock of Aornos which Heracles himself could not take. Come, then; add the rest of Asia to what you already possess—a small addition to the great sum of your conquests. What great or noble work could we ourselves have achieved had we thought it enough, living at ease in Macedon, merely to guard our homes, accepting no burden beyond checking the encroachment of the Thracians on our borders, or the Illyrians and Triballians, or perhaps such Greeks as might prove a menace to our comfort?

I could not have blamed you for being the first to lose heart if I, your commander, had not shared in your exhausting marches and your perilous campaigns; it would have been natural enough if you had done all the work merely for others to reap the reward. But it is not so. You and I, gentlemen, have shared the labour and shared the danger, and the rewards are for us all. The conquered territory belongs to you; from your ranks the governors of it are chosen; already the greater part of its treasure passes into your hands, and when all Asia is overrun, then indeed I will go further than the mere satisfaction of our ambitions: the utmost hopes of riches or power which each one of you cherishes will be far surpassed, and whoever wishes to return home will be allowed to go, either with me or without me. I will make those who stay the envy of those who return.

the superiority of the Persian navy that would defend the city if he attacked by sea, he approached across land, sending his ships home and subduing the city without risking a naval battle that even he was likely to lose. Next Alexander took the unusual step of dividing his army into two in order to protect his supply lines, his subordinate Parmenio attacking the locals to the north while Alexander destroyed the bases of the Persian fleet on the coast. He told Parmenio that he intended to “conquer the Persian fleet from the land” (Keegan 1987, 27). Both operations were successful, and the two forces met up again in April 333 BCE to continue the conquest of Persia.

THE BATTLE OF ISSUS

After the defeat by Alexander at Granicus, the Persian emperor Darius III had decided to head the army himself. He marched from Babylon with 140,000 men to confront the Greek upstart. In November 333 BCE, after a rare lapse of strategic judgment, Alexander found himself cut off from his supplies and therefore needing to attack Darius in a place of the latter’s choosing. Darius wisely chose a seemingly impregnable position that Alexander nonetheless attacked wholeheartedly, this time leading the infantry. At the Battle of Issus (an ancient town in Asia Minor), Alexander went straight for the Persian units rather than the Greek mercenaries fighting for Darius. The enemy’s line collapsed so quickly that Darius was forced to flee, leaving his family behind to be captured by Alexander. With half of the Persian empire conquered, Darius offered to leave it to Alexander if Alexander returned Darius’s family and made do with the land that Alexander had already won. Against Parmenio’s protestations, Alexander scornfully refused and turned again to destroying the Persian fleet, besieging the cities of Tyre and Gaza in 332 BCE on his way south.

EGYPT, THE BATTLE OF GAUGAMELA, AND THE FINAL CAMPAIGNS

Alexander and his men liberated Egypt from Persian rule and founded the city of Alexandria there in 331 BCE. Alexandria quickly became the center of

the Greek world. He then resumed his offensive and crossed the Tigris and Euphrates Rivers. Still refusing any attempts at peace, Alexander again met Darius on the battlefield at Gaugamela and again swept his opponent aside with his belligerent tactics despite numerical inferiority. He chased Darius with his cavalry, but the emperor escaped, only to be murdered by his own generals a year later. Alexander marched into the enemy’s capital, Persepolis, triumphant. A period of consolidation of his new empire followed, and by the end of 330 BCE Alexander controlled all of Asia Minor and Persia—he had achieved all that his father had ever set out to do in less than five years. Yet, Alexander again went on the march, and in the next three years invaded central Asia, including northern India. He defeated and overthrew the Indian ruler Porus at the Battle of the Hydaspes River in May 326 BCE, employing cavalry and phalanxes intelligently against an army that included two hundred war elephants. In an attempt to unite east and west, Alexander took a Persian wife and conducted the marriage of ten thousand Macedonian soldiers to Persian women. Although Alexander was eager to continue campaigning, his troops begged to go home after eight years of nearly constant warfare, and he consented. He left conquered territories in the hands of men he trusted and headed back home. Despite his claims of divine birth, he died of an illness, possibly malaria, in Babylon on 10 June 323 BCE at the age of just thirty-two.

ALEXANDER’S LEGACY

The empire that Alexander had built essentially died with him. He named no heir, and in any case no other person had the power to control such a vast empire, which disintegrated into warring successor states. Alexander did leave a legacy in other ways, however. Apart from his naval innovations, he employed an overall strategy and a tactical maneuvering to defeat his enemies, both of which he practically invented. He never lost a battle despite often being outnumbered. Before Alexander, battles normally had been won by the side with the most men slugging it out, but after Alexander war became more of an art, with the skill of the practitioner often making the differ-

ence. His military campaigns have been studied and admired for their stunning success for over two millennia, and his name still evokes images of great military leadership.

—David Deverick

ruled them, or felt that their lives lacked meaning. It is in such times that spellbinding leaders—often religious leaders—with stirring oratory are likely to emerge from the ranks of the dispossessed. The sociologist Max Weber (1864–1920) described this style of leadership as charismatic: By dint of personality or lifestyle a leader arouses powerful emotions in the surrounding population and inspires them to follow him or her. Charismatic leadership typically appeals to the powerless and marginal people in the lower echelons of the society—those most likely to experience alienation.

ALIENATION AND LEADERSHIP

Alienation became important for social analysis after Karl Marx (1818–1883) used the concept to describe the consequences of capitalism in its early industrial phase. He felt that when workers sold their labor to produce commodities for markets, they became estranged from the product of that labor; they themselves became commodities, dehumanized, powerless, lacking meaning in their lives, and bereft of a sense of community with others. A century later, alienation had entered the political lexicon to describe the state of mind of people who may be either indifferent to politics or, conversely, likely to embrace radical politics. Studies of support for Adolf Hitler (1889–1945) show that his appeal was to the more alienated segments of German society, who tended to be the most fatalistic and, prior to the rise of Hitler, least likely to become politically involved. The radical psychoanalyst Frantz Fanon (1925–1961) called the victims of colonization the wretched of the earth; he noted that their alienation, experienced as destructive self-hatred, limited political mobilization. It is also true, however, that one expression of the politics of hopelessness is terrorism, a weapon of the weak. It appears that one consequence of hopelessness is willingness to die for a cause.

The relationship between leadership and alienation raises several questions, especially in the context of religiously inspired late-twentieth-century and early-twenty-first-century terrorism. The link between alienation and terrorism requires us to take

ALIENATION

Most broadly defined, alienation is estrangement, a sense of not belonging, not feeling a part of some group or organization. From the dawn of history, there have been times when large numbers of people have felt alienated from the systems of power that

more cognizance of the importance of alienation in fostering certain kinds of leaders and to pay attention to the trajectories those leaders follow and the goals they set. Alienated, but dynamic, charismatic leaders can attract equally alienated followers; the result may be benevolent societal transformations or malevolent fascisms.

The politics of alienation has typically taken a religious form, as is evident from a quick survey of the history of Christianity. In the faith's nascent years, the followers of Christ thought of themselves as Jews listening to another in a long line of prophets. The conditions of Roman conquest made the new prophet's appeal particularly cogent. Christianity in its earliest forms preached a gospel of charity, forgiveness, and salvation. Those with a higher morality than the conquerors would have better lives in the next world. Proselytizers such as Saul of Tarsus, known as St. Paul (d. 65 CE), traveling along trade routes, began to spread Christ's message of salvation throughout the Roman empire. In almost every city, alienated, marginal artisan classes came together to form communities that embraced those teachings, and Christian sects began to flourish throughout the empire. When Emperor Constantine (after 280–337) embraced Christianity, it began its transformation from a religion of the alienated to a religion of the rich and the powerful; it became so powerful that many of the Roman army's foreign mercenaries embraced it—only to overthrow Rome itself later.

About six hundred years later, the medieval Church, the guardian of feudal power, had become a bastion of corruption and nepotism. The growth of trade that began after the Crusades (twelfth and thirteenth centuries), meanwhile, had led to the rise of a new merchant class that initially felt alienated from the rich and powerful feudal elites. Struggling to survive, this class was both structurally and emotionally disposed to criticisms of the Church's support for the rich, its corruption, and its profligate ways. This class had what Max Weber called an elective affinity—a predisposition—to accept a practical religion of a disenchanting everyday life over a religion of magic and miracles. As this class began to grow, so too did conflicts and schisms within the ranks of the

Church. In the early 1400s, Jan Huss (1374–1415), a priest and theologian, made scathing critiques of the practices of the Church. In 1412 he was excommunicated, and later he was burned at the stake for heresy. About a hundred years later, Martin Luther (1483–1546) made similar criticisms, but Luther, supported by large numbers of alienated peasants and small merchants, avoided the stake, becoming instead an important leader of the Protestant Reformation and the founder of the Lutheran denomination. Other Protestant reformers, notably Huldrych Zwingli (1486–1531), John Calvin (1509–1564), and, later, John Wesley (1703–1791), became part of the chorus, with their doctrines of asceticism, their focus on the importance of industriousness as a sign that one might be among the saved, and their advocacy of a methodological orientation to everyday life and a rational orientation to the world. Within a few generations, the marginal members of Protestant sects had become the leaders of the new and powerful bourgeois class.

With the Industrial Revolution of the eighteenth and nineteenth century, increasing numbers of peasants began to flock to the cities seeking work in the growing commercial and industrial sectors. These were the groups that Marx considered the alienated workers and surplus populations created by capitalism. At the same time, many intellectuals also became disaffected with the system and sympathetic with the plight of the underclasses. In the industrialized world, the charismatic leaders of the twentieth century were more likely (though this was not universally the case) to offer nonreligious than religious messages of hope, seeking to gain for their followers a better life in this world rather than the next. They advocated everything from reform to revolution, and included such notable figures as the Communist revolutionaries Vladimir Lenin (1870–1924), Leon Trotsky (1879–1940), and Mao Zedong (1893–1976); the labor organizer Eugene Debs (1855–1926); and the social reformers Jane Addams (1860–1935) and Dorothy Day (1897–1980).

It is clear from this quick history that alienation often plays a key role in the rise of leaders and the transformation of society. Unfortunately, the relationship between alienation and leadership can also

Alienation, Migration, and New Communities

In the contemporary world, rapid social, economic, and political change often causes a sense of alienation in some groups, both from their society and from their leaders. One reaction to this alienation is to move to a new place where a new community—based on old and new values—can be formed. The following example describes such a process for Middle Eastern Arab settlers in Montreal and Toronto, Canada.

The third most important contribution to post-war emigration from the Arab world is the factor of political estrangement. The specifics of this factor varied, of course, from one respondent to another and from one Arab country to another. Such terms as political instability, insecurity, loss (or fear of loss) of freedom, political repression, discriminatory treatment, and government policy (e.g., socialism) illustrate the nature of push factors involved. Respondents from Palestine added another element to the issue of political instability, and that is expulsion from and inability to return to the homeland.

The effects of political instability could be random, in the sense that they would prompt disparate individuals at different levels of the occupational hierarchy to migrate, or nonrandom, in the sense that they would prompt certain occupational groups or categories of people to migrate. Both types of effects were observed among our respondents. The first type of situation is exemplified by an immigrant from Lebanon who gave, as reasons for immigration, "political instability at home, democracy in Canada, and wish to join relatives." Reflecting further on the situation in Lebanon, he said: "The government is unjust. Each regime prefers its people and its own group and pays no attention to the needs of the masses." It is not easy to determine, in this case (or in other similar cases), whether political instability was a primary or a secondary reason for emigration.

The second type of situation involved instances in which the incidence of political estrangement or instability was not randomly distributed throughout the population. Leaving aside the issue of Palestinian refugees, these were typically associated with a fundamental restructuring of the political economy of a given country. A prime example is the Egyptian government's adoption of a socialist path

under the late President Gamal Abdel Nasser. Not surprisingly, the political-economic reconstruction of Egypt led to the alienation of many people whose property, work, or means of livelihood were threatened by the socialistic measures of the early 1960s. At that time, the Egyptian government additionally imposed severe restrictions on imports, luxury goods, foreign travel, and export of Egyptian currency. As a consequence, the disaffection in Egypt spread to include such occupational groups as industrialists, entrepreneurs, financiers, businessmen, large landowners, professionals, and some white-collar workers in the tertiary sector of industry. These are upper-level occupational categories, which helps explain the select nature of Canada's immigrants from Egypt, educationally and occupationally. There was a heavy representation of Eastern Christians in these occupations. Since 1961, increasing numbers of alienated Egyptian nationals have been emigrating to different parts of the world, and a significant number of them have been Coptic and descendants of Lebanese-origin Maronites.

The results of my survey indicate that immigrants from Egypt tended to verbalize political disaffection and hopes for a higher standard of living and better future more frequently, and family reasons less frequently, than immigrants from other Arab states. In some cases, respondents attributed their migration, and that of their compatriots, partly to what they considered to be discriminatory treatment of non-Muslims in Egypt, and partly to lack of opportunities for advancement. The infrequent reference to family as an underlying reason for immigration is due to the short history of this stream of immigration to Canada, as well as the tendency among immigrants from Egypt to come as family units.

be contradictory—the alienated often lack leadership, or are so alienated that they are unlikely to be moved by any leader and refrain from embracing any cause. Sometimes we see someone rise from the ranks of the alienated to become a powerful leader who appeals to great masses of the disenchanting and dispossessed by offering visions of meaning and

hope. Sometimes a religious vision of social justice joins with a political agenda—as happened, for example, in the civil rights struggle led by Martin Luther King, Jr., a Baptist minister. In the late twentieth and early twenty-first century, globalization and rapid social change have alienated many traditional groups, especially rural populations, some of which

have reacted by embracing highly conservative, fundamentalist religions. In the United States, for example, while membership in mainstream religions has declined, conservative fundamentalist congregations have grown and now wield considerable political influence.

EXPLAINING ALIENATION AND LEADERSHIP

How then can one explain some of these relationships? It requires a consideration of general historical circumstances, the particular groups from which the leaders emerge, and the populations that support the leaders. It often happens, for example, that a disaffected person from the higher classes attracts a mass following, as with Siddhartha Gautama (560–480 BCE), the historical Buddha, and Fidel Castro (b. 1926), the leader of Cuba's socialist revolution. At other times, a poor person with outstanding leadership ability ascends to power, as with Genghis Khan (c. 1160–1227), who unified the nomadic Mongolian tribes into a powerful empire, or Joan of Arc (c. 1412–1431), who rose from peasant roots to lead the French army against the British in the Hundred Years' War.

Social psychological factors pertaining to leaders, followers, and their interaction also need to be considered. Sigmund Freud (1856–1939), the founder of psychoanalytic theory, made perhaps the first attempt to analyze the attraction a leader has for followers. Freud hypothesized that the leader acted as a parent figure who offered followers love and affection in exchange for obedience. Freud and others argue that the leader embodies and articulates the values and goals of the group. The publicly declared, self-assured confidence of the leader is a key ingredient in mobilizing the alienated, who might otherwise remain hopeless and apathetic. The structural position of the group in society, the group's collective values, its mood (for example, of empowerment or fatalism), and the degree of alienation in society at large also influence whether or not its leader will be broadly accepted. Although the leader of a particular group, whether a religious sect, military unit, or business organization, may not have power outside his or her immediate sphere

of influence, charismatic leaders typically have broad appeal.

Erich Fromm's Theory

How might we explain the process whereby the powerless gain cultural, political, and economic power? Following on Marx and Freud, the Frankfurt school of critical theory attempted to explain the rise of Hitler by considering historical, sociological, and psychological factors. The psychologist Erich Fromm (1900–1980) suggested that in the face of social crises and changes, some people become alienated, lonely, and powerless. To ameliorate their anxiety, loneliness, and emptiness, these people may choose to submit to powerful, parent figures who will give them love, power, and perhaps most important, who will forge powerful ties among followers. By giving up freedom and independence in favor of conformity and submission, people find comfort. However, groups thus formed typically depend on external enemies who are different; these enemies can be blamed for misfortune and aggression can be directed at them. By denigrating a common enemy, the people are united in hatred and gain a feeling of superiority.

The Case of Hitler

Adolf Hitler and his followers are perhaps the classic example of that pattern. In the aftermath of the Versailles Treaty ending World War I, which required Germany to pay reparations, and with the advent of global recessions and depressions, vast numbers of German workers lost their jobs and businesses. Hitler, a failed artist and ne'er-do-well, yet a powerful orator, joined the National Socialists (the Nazis), one of a number of petit-bourgeois reactionary political parties that were challenging the German government from the right while socialists, Communists, and anarchists challenged it from the left. Hitler inspired the alienated, assured the powerful, and condemned relatively new as well as traditional enemies—the Bolsheviks and the Jews, whom he blamed for Germany's defeat in World War I. Hitler was seen as both everyman—the man down the street—and as an

invincible force. The alienated and dispossessed believed that by submitting to the Nazi party, by following Hitler, they could help a new and powerful Germany arise that would destroy its enemies.

The most ardent support for the Nazis came from unemployed veterans of World War I, lower-echelon state officials, and petit-bourgeois shopkeepers, all suffering great economic adversities. With a small number of the better-paid proletarians also voting for them, the Nazis won the largest number of seats in the Reichstag (parliament), and Hitler was asked to form a government. Twelve years later, millions had died and Europe lay in ashes.

ISLAMIC FUNDAMENTALISM

In the twenty-first century the same pattern is at work in parts of the Muslim world. From the ranks of the dispossessed, new leaders, themselves often alienated from an advantaged class position (as is the case with Osama bin Laden, leader of the al-Qaeda terrorist group), offer a message of spiritual renewal through the establishment of a moral state. The roots of today's Islamic fundamentalism are to be found in the growth of Wahabbism as a response to political decline. As the Ottoman empire began to wane, Al-Wahab (1703–1792) claimed that only through a very rigid, austere version of Islam could people find fulfillment. Today, many schools of Islamic fundamentalism preach that message, insisting that a return and adherence to strict religious codes will provide a redeemed moral community. For a number of historical reasons, including indigenous cultural barriers, innovation following the decline of Islam's political and economic power in the fifteenth century, its creativity and innovation waned, leaving behind stagnant societies that were eventually overtaken by the West. Following the legacies of European colonialism, and the nature of contemporary globalization, much of the Muslim world has remained at the margins of modernity and fringes of economic progress. Most Muslim countries are poor, with the exception of those with oil revenues. At the same time, as was the case in Europe during the Industrial Revolution, vast numbers of peasants have moved from small, isolated, traditional rural villages

to vast sprawling cities such as Cairo in Egypt, Jakarta in Indonesia, and Tehran in Iran, seeking better fortunes. In those cities there are scarcely enough jobs for small segments of the educated, let alone for uneducated farmers and pastoralists. As a result, there are vast numbers of unemployed and underemployed people who are marginal to the modern economy, facing economic strains, unschooled in participatory politics, and who are highly affronted by exposure to the Western values of individualism, hedonism, gender equality, and a popular culture that celebrates self indulgence. Moreover, not having had traditions of political democracy and pluralism, most Muslim governments tend to be autocratic and allow little or no political redress.

Such conditions are ripe for the emergence of charismatic leaders who can offer comfort, solace, and dignity to followers. In many mosques, especially those located in the teeming slums of major cities and even in European countries where Muslims are found in the underclasses, fundamentalist leaders find ready audiences for rigid, authoritarian doctrines that provide a sense of community, dignity, and meaning as mechanisms of escape. But, in accordance with Fromm's theory, fundamentalist doctrines often divide the world into two categories: friend and foe. The same, it should be added, can be said for fundamentalism in other religions, such as Christianity and Hinduism.

TO THE FUTURE

Today alienated, powerless masses facing political, economic, and moral challenges are embracing fundamentalism in response. In a few cases, some people move from religious fundamentalism to political terrorism as an empowering agenda. Many scholars have noted that fundamentalism is typically a short-term response to complicated problems, and that terrorism is usually an admission of failure to attain political or economic ends. Thus many think fundamentalism will wane. While some among the alienated are joining violent, reactionary movements, other segments of the alienated are joining nonviolent, progressive movements that are challenging globalization by demanding greater freedom, equal-

ity, an end to human-rights abuses, pollution, and other social, political, and environmental ills in a vision of globally based justice. The future directions of humanity will be shaped in part by which segments of the alienated become empowered.

ALINSKY, SAUL (1909–1972)

U.S. reformer

Saul Alinsky was a charismatic founder of community organizations in cities across the United States.

He is widely credited with developing a style of aggressive community organizing that confronts powerful interests and seeks to build political power among grassroots constituencies. Alinsky used the “action”—a form of visible protest against powerful people and institutions—to maximize media attention and embarrass his targets. He focused on organizing residents of lower-income neighborhoods to help them build political and economic power. He was perhaps best known for co-founding the Back of the Yards Neighborhood Council (BYNC) in Chicago in a neighborhood south of the Chicago Stockyards and the Industrial Areas Foundation (IAF), a national trainer of community organizers. The BYNC became a substantial political force in Chicago and one of the few organizations that could stand up against the city’s political machine.

Alinsky was born in the Maxwell Street area of Chicago—a crowded immigrant community on Chicago’s Near West Side. His father was an orthodox Jew who had emigrated from Russia to New York and then to Maxwell Street, where he was remarried to Sarah Tannenbaum, Alinsky’s mother. When Saul was about six, his family moved to the more middle-class Douglas Park-Lawndale area on the city’s West Side. His mother and father divorced when he was about thirteen.

In 1926, Alinsky entered the University of Chicago and studied in the renowned sociology department. Alinsky struggled in his first two undergraduate years and was put on academic probation. In his junior year he took a course in social pathology with E. W. Burgess, who, along with Robert Park, was a founder of the Chicago School of Sociology. Alinsky also met Helene Simon from Elkins Park, Pennsylvania, at the university. She later became his wife.

After graduating in 1930 Alinsky remained at the University of Chicago to do graduate work in sociology. During this time he began to do fieldwork with Clifford Shaw, who ran the Institute for Juvenile Research on the city’s near West Side, in the same neighborhood in which Alinsky was born. In his fieldwork Alinsky interacted with the likes of Al Capone’s gang. In 1933 Alinsky began working for the Institute for Juvenile Research at the Illinois State

Saul Alinsky (extreme left) on the picket line of the United Packing House Workers at the Chicago stockyards on 16 January 1946.

Penitentiary in Joliet, an hour and a half southwest of Chicago. It was a tough place, and no doubt his experiences there had something to do with the development of the tough, openly confrontational style for which he became known.

Alinsky had clearly been left of center in terms of political ideology but had not been particularly active in politics at a young age. His hatred of the German Nazi leader Adolf Hitler and fascism led him to support the antifascist International Brigade during the Spanish Civil War. However, he never became a member of the Communist Party, as did some of his activist contemporaries.

SOCIAL DISORGANIZATION

Alinsky's mentors at the University of Chicago had developed a theory of "social disorganization" as a cause of delinquency. However, Alinsky asserted that economic defects in the social order are the cause of the social disorganization.

Contrary to popular belief, Alinsky's first work in neighborhood organizing was not with the BYNC. In 1932 Clifford Shaw had started the Chicago Area Project (CAP) and had sent Alinsky into South Chicago, on the city's far Southeast Side, to a neigh-

borhood known as the "Bush." Shaw's vision, which clearly influenced Alinsky, was of community organizations that are built primarily by empowering local residents. CAP was a reaction against professionals who dominated the treatment of juvenile delinquency—doctors, psychologists, and social workers. Shaw proposed a nonjudgmental and accepting method of working with delinquents. The work through CAP was to grow out of community, not be superimposed onto it. Shaw favored stimulating a "by-the-bootstraps," self-help approach. At the time the dominant form of community organizing was the model developed by the social work establishment, following the work of the social worker Jane Addams's Hull House. The social work notion of community organizing was one

in which outsiders with good will enter a neighborhood with an established notion of needs, goals, and strategies. Shaw's notion was more oriented toward enabling communities to identify their own needs and goals and to use their own capacities and assets in pursuing those goals.

Alinsky went beyond working with youth. He worked with the Russell Square Community Committee in the Bush, involving adults in efforts to improve the community. If they felt they could change local conditions, he reasoned, they would feel empowered. While following the indigenous organizing approach, Alinsky added concerns with larger structural economic issues to his model of organizing. The CAP approach in Russell Square was "safely conventional" and apolitical. It had no involvement, for example, with union activity at the nearby steel mills. However, Alinsky began to feel the limits to what local action alone could do. He began more and more to recognize the need to deal with citywide problems and structural economic issues.

In 1938 Shaw sent Alinsky to an area on the city's Southwest Side called the "Back of the Yards," named for its proximity to the stockyards and for its housing of many packinghouse workers. The area

was mostly Polish but also Lithuanian and Irish. About the same time Alinsky began working in the Back of the Yards, the Committee for Industrial Organization's (CIO) Packinghouse Workers Organizing Committee (PWOC) began to try to organize packers at Armour, Swift, and the other big packinghouses. After all, meatpacking was the second-largest industry in the city after steel. Alinsky soon met Herb March, the charismatic leader of the PWOC, and the two hit it off from the start.

COMMUNITY ORGANIZING

Alinsky soon also met Joseph Meegan, director of Davis Square Park in the Back of the Yards neighborhood. Meegan and Alinsky worked together to build the BYNC, which became the most powerful neighborhood organization in the city. Alinsky and Meegan built an organization that was seen as the political center of the neighborhood—a place where decisions were made by and for the people of the neighborhood. Local merchants supported the organization, in part because they feared what would happen if they did not. At the same time a large part of Alinsky's success was due to connections to powerbrokers outside the neighborhood. Meegan's brother, for example, was Bishop Bernard Sheil's secretary. Sheil was sympathetic to the plight of poor immigrants—especially Catholic ones—and the Catholic church was a significant force in local and state politics.

Alinsky refined his theory and practice of community organizing at BYNC. He developed a theory of problem solving based on the active participation of ordinary people. At the same time Alinsky viewed the organizer as a critical factor in successful organizing. The organizer was not to lead so much as to facilitate and catalyze. Empowering residents as leaders was important, but this required the involvement of a skilled and intelligent organizer.

BYNC became a formidable force in Chicago, so formidable, in fact, that Mayor Ed Kelly, who led the strong Democratic machine, was threatened by it. BYNC had become a place for people to take their problems instead of to the machine. The city transferred Joe Meegan out of Davis Park, making it hard for him to lead the council, and put an end to the

Alinsky's Rules for Radicals

1. Power is not only what you have but what the enemy thinks you have.
2. Never go outside the experience of your people. It may result in confusion, fear and retreat.
3. Wherever possible go outside the experience of the enemy. Here you want to cause confusion, fear and retreat.
4. Make the enemy live up to his/her own book of rules.
5. Ridicule is man's most potent weapon.
6. A good tactic is one that your people enjoy.
7. A tactic that drags on too long becomes a drag.
8. Keep the pressure on, with different tactics and actions and utilize all events of the period for your purpose.
9. The threat is usually more terrifying than the thing itself.
10. The major premise for tactics is the development of operations that will maintain a constant pressure upon the opposition.
11. If you push a negative hard and deep enough it will break through into its counterside.
12. The price of a successful attack is a constructive alternative.
13. Pick the target, freeze it, personalize it and polarize it.

Source: Alinsky, Saul. (1971). *Rules for Radicals: A Practical Primer for Realistic Radicals*. New York: Vintage.

organization's use of the park. Alinsky took to newspapers and his church connections to fight the machine. Meegan then quit the city to become full-time director of the council.

Bishop Sheil introduced Alinsky to Marshall Field III, who lived in New York. Field—whose grandfather, the Chicago merchant, had not been known to be kind to the working class—funded the beginning of Alinsky's Industrial Areas Foundation (IAF), a national platform to support community organizations such as BYNC in lower-income communities around the country. The IAF helped establish organizations in Kansas City, St. Paul, Minnesota, Rochester, New York, and elsewhere. Later in Chicago, Alinsky helped establish the Organization for the Southwest Community (OSC) during the late 1950s and early 1960s.

Alinsky was heavily influenced by national labor leaders—in particular the charismatic leader of the early CIO, John L. Lewis. Alinsky's interactions with the CIO clearly influenced his interest in economic justice issues. Alinsky's allegiance to Lewis became so strong that he quietly supported Lewis in his endorsement of the Republican candidate Wendell Willkie over Franklin Roosevelt in Roosevelt's bid for a third term as president in 1940.

Although Alinsky's politics were always somewhat enigmatic, they generally remained left of center. He tended to sympathize with communists and socialists but was too pragmatic to join them. Moreover, he was always opportunistic. An example of his opportunism was his supporting Willkie against Roosevelt. Alinsky probably did not favor Willkie personally but wanted to cement his good relationship with Lewis.

In 1945 Alinsky published *Reveille for Radicals*. The book was an attack on liberal politics and called for a new set of people's organizations around the country as the vehicle for a new populism. Perhaps reflecting some disillusionment in unions, he criticized organized labor as greedy, selfish, and often bigoted. His people's organizations would fill the void to replace or reinvigorate organized labor.

The book also was a prescription for building people's organizations such as BYNC and a how-to for community organizers. In it he argued that an organizer needs to be nonpartisan *within* the community but always partisan *for* the community. There are limits, though, to what an organizer should tolerate. Racial discrimination was key among these to Alinsky. An organizer will find it most productive, Alinsky advised, not to attack discrimination among a community he is organizing from the start but rather to look for openings to encourage or compel people to modify their prejudices by recognizing that it is in their own self-interest to do so.

RACE AND HOUSING

The issue of race and housing proved a key weakness in Alinsky's organizing strategy. In fact, BYNC became somewhat known as an anti-integrationist organization, and OSC became bitterly divided over

the issue. In 1954 Alinsky met Father Jack Egan, a Catholic priest, and they soon became friends. Egan was a socially conscious priest who went on to become well known for social and racial justice activism in the city, including marching with civil rights leader Martin Luther King, Jr., on the city's white Southwest Side. Egan encouraged Alinsky's concern over racial segregation. BYNC had by then begun earning a racist reputation in its efforts to keep out blacks. Late in 1958 Alinsky floated a plan to allow modest integration in places such as the Back of the Yards, and Meegan exploded. Egan broke off his relationship with Meegan, but Alinsky did not.

Alinsky went on to publish *Rules for Radicals* in 1971, shortly before his death. Overall, his theories and practices can still be seen—perhaps in modified forms—in a variety of community organizations around the country. The IAF, led by one of Alinsky's protégés, continues its work in a number of places, perhaps most successfully in the Southwest, such as in San Antonio, Texas, where Citizens Organized for Public Service (COPS) has achieved important victories. Cesar Chavez, the farm worker leader, was an IAF organizer in his early days. Tom Gaudette, who led the Organization for Better Austin (OBA), was trained by Alinsky. Gaudette worked at OBA with Gale Cincotta, a mother on Chicago's West Side who went on to be a leader of antiredlining (opposition to discrimination in housing) campaigns and led the fight for the federal Community Reinvestment Act.

Groups such as Cincotta's National People's Action, the Association for Communities for Reform Now (ACORN), Citizen Action, and many other community organizations, community development groups, and social advocates can be traced to Alinsky or his disciples. In Chicago alone, one count in 1990 put the number of active neighborhood organizations founded by Alinsky or his followers at roughly one hundred. Most of these organizations continue to adopt many of Alinsky's tactics. In scholarly discussions of organizing, terms such as *neo-Alinsky* have evolved to describe different types of approaches. One would have difficulty suggesting another person who had more impact on the mobilization of political power at the neighborhood level than Saul Alinsky.

—Daniel Immergluck

 **ALTRUISM**

There is broad agreement that the word *altruism* describes behavior that benefits or helps another person and that the helping behavior is not motivated by self-interest; in fact, by definition, altruistic helping is an end in itself and not a means to an end. What is controversial is the motive ascribed to a specific helpful act: How can we know for sure that the helpful person has really abdicated all self-interest? This controversy may be summed up by what the field of social psychology calls the “altruism question”: Is it possible for a person to have another person's welfare as an ultimate goal (altruism), or is helping simply an instrumental means of obtaining one or another form of self-benefit? As Daniel Batson and Adam Powell note, a plethora of self-focused or egoistic motives can and do motivate helping behavior. For example, numerous rewards are commonly associated with helping another person, including thanks, praise, increased self-esteem, and even, at least among religious individuals, the promise of a fulfilling afterlife. Furthermore, as people are often distressed to see another person in need, they may act to relieve a person's suffering to eliminate their own distress. Moreover, people who view themselves as kind-hearted may initiate helping behavior to nourish and sustain this positive

view (for example, “I'm not the kind of person who just stands idly by when someone clearly needs my assistance”). Finally—and perhaps with most relevance to leadership in organizational contexts—helping behavior may be initiated to repay people who have helped us in the past.

THE DIFFICULTY OF ASSESSING MOTIVES

Although the “altruism question” has been debated fiercely by religious, moral, and political philosophers for centuries, Batson and his colleagues were among the first to examine the issue in the controlled world of the psychological laboratory. These experiments, cleverly designed as they are, operate on the basis of a rather simple premise: If people help others for self-oriented reasons, then helping will not occur when such reasons or motives are eliminated. However, if helping is driven by other motives, it will persist in the absence of self-interest. In the laboratory, Batson and his colleagues created a situation in which participants were exposed to a person needing help and a justification for not helping was provided—for example, participants were led to believe that the person in need deserved his or her problems, that helping would be extremely difficult, or that, when asked to help, most other people would decline. One experiment induced empathy for the person in need by asking participants to alter their perspective (for example, participants were told, “Try to imagine how the person feels” or “Put yourself in the victim's shoes”). When participants felt more empathy, they helped others, even in the face of plausible reasons not to extend help. Such results led Batson to propose the empathy-altruism hypothesis, which holds that empathic emotions such as sympathy, compassion, and tenderness evoke a desire to help the person for whom the empathy is felt. Results from dozens of similar experiments have supported this hypothesis.

However, it is important to note that other researchers suggest plausible, non-altruistic explanations for these results. For example, Robert Cialdini and his colleagues argued that the conditions that lead to empathic concern also lead to a blurring of the distinction between self and other. In a series of studies,

these authors demonstrated that a perceived oneness with a victim is a powerful predictor of helping behavior and that empathic concern increases helping because it is related to this perceived oneness. From this perspective, helping behaviors occur because the victim is, in a sense, integrated into the helper's perceived sense of self.

ALTRUISM IN ORGANIZATIONS

Rabindra Kanungo and Jay Conger note that altruism has not received systematic attention from organizational behavior theorists and researchers and suggest that this neglect may be due to the potent individualistic and competitive elements of contemporary Western society. In addition, Elliott Sober posits that egoistic or self-oriented explanations for helping behavior may be common because our culture is focused on individuality and economic competition. Over a century and a half ago, Alexis de Tocqueville observed that "Americans . . . enjoy explaining almost every act of their lives on the principle of self-interest" (1835/2000, p. 526). In support of these views, survey research indicates that respondents tend to believe that most people are primarily motivated by self-interest.

The research of Batson, Cialdini, and their colleagues demonstrates the difficulty, even in the controlled world of the laboratory, of determining why an individual engages in helping behavior. Batson's work appears to suggest that, if only in cases where empathy is felt for a person in need, the motive to help may in fact be altruistic. However, in organizational contexts, the motive that underlies helping behavior generally remains a mystery to all but the helper. For example, did Cathy stay late to help Pam finish a report because they are both single mothers and Cathy felt empathy for Pam? Or would she really prefer to work late rather than go to dinner with her in-laws? The same kind of question could be asked of a leader. When Jeff took a pay cut was he acting altruistically or did he think that that was the only way to prevent his company from going bankrupt?

This ambiguity of motive may represent another plausible explanation for the dearth of altruism-

based research in the organizational literature. Perhaps with an implicit nod to this dilemma, Kanungo and Conger have specified two forms of altruism. The first, *utilitarian* or *mutual altruism*, represents a concern for others that is combined with a concern for self, whereas the second, *genuine* or *moral altruism*, is thought to occur when helping behavior involves either self-sacrifice or no regard for self-interest. The authors note that contributing money to a charity to enhance a corporate image would be an example of the former, whereas choosing leadership practices that empower employees exemplify the latter. Furthermore, because of the difficulty of ascertaining a motive for helping behavior, the study of altruism in leadership and organizational contexts tends to dodge the question of motives by focusing almost exclusively on observable helping behaviors.

LEADERSHIP AND ALTRUISM

History is rife with examples of leaders thought to have distinguished themselves by acting altruistically: Mahatma Gandhi, Mother Theresa, Martin Luther King, Jr., and the storied soldier who lost his life but spared his company after covering a hand grenade with his body. Altruistic and self-sacrificial leader behaviors have also received attention, especially in the theories of transforming/transformational leadership by James MacGregor Burns and Bernard Bass, which posit that leaders must at times forgo their immediate self-interest for the sake of a collective good, a moral principle, or a compelling vision of the future.

Work by Yeon Choi and Renate Mai-Dalton indicates that self-sacrificial leader behaviors cause followers to want to reciprocate such behaviors (self-sacrifice is similar to altruism, but focuses more narrowly on the costs of such behavior to the helper). Furthermore, followers tend to view self-sacrificial leaders as both legitimate and charismatic. Thus, through self-sacrifice, leaders may strive to set up a "culture of reciprocity" in which followers are motivated to follow their leaders' example. Choi and Mai-Dalton also note that the cultivation of this type of work environment may be

critical in times of organizational crisis, when extreme acts of altruism or self-sacrifice may be necessary. In a workplace, such behaviors are likely to satisfy both other- and self-oriented needs and therefore should probably be cast as acts of *utilitarian/mutual altruism*.

ALTRUISM AND FOLLOWER BEHAVIOR

To reciprocate a leader's self-sacrificial or altruistic behavior, Choi and Mai-Dalton suggest that followers may engage in "organizational citizenship behavior (OCB)." Dennis Organ defines OCB as "performance that supports the social and psychological environment in which task performance takes place" (1997, 95). In addition, he has called the one facet of OCB that entails helping another person with an organizationally relevant task or problem "altruism" (though his recent writings refer to this facet simply as "helping" or "helpfulness" to avoid the attribution of a selfless motive to such behaviors). Research indicates that leaders play a clear role in eliciting follower OCB. For example, in a meta-analytic review of fifty-five studies, job attitudes (for instance, satisfaction and commitment) and leader behavior emerged as robust predictors of the altruism facet of OCB. Further, recent theories agree with the view that OCB tends to occur when employees form a "covenantal relationship"—a bond characterized by open-ended commitment, mutual trust, and shared values (Van Dyne, Graham, & Dienesch, 1994). In many cases, the leader behaviors that foster this type of relationship include clarifying expectations, exchanging assistance and guid-

Altruism and Self-Interest

It is often difficult to see whether it is altruism or self-interest or perhaps some of each that motivates human behavior in many situations where both parties to the activity may benefit. Often, the party in control seeks to present itself as acting out of altruism although self-interest may also be obvious. Here are two examples of this complexity; the first concerning adoption of children on the island of Chuuk in the South Pacific and the second a rule followed by the Hudson's Bay Company in regard to the treatment of the Blackfoot Indians in colonial Canada.

As we have noted, helping a relative who has many children is given as one of the three main reasons for adoption. Here, as in other kinds of adoption, the adopting parents are characteristically childless, but their stated reasons for adopting tend to emphasize altruism rather than self-interest. Such adoptions often come about after the adopting parents have lived with the real parents and helped them with their children. They may take care of the youngest child when his mother becomes pregnant again or over the period when a new baby is born. It is not a large step from this kind of helping-out to an actual adoption; and a mother of many children appears to be relieved, rather than threatened, when such a couple agrees to take on the full care of a particular child. It is not always easy to feed and clothe a large family of growing children, and parents with many children often look upon adoption not only as a help to themselves but as an opportunity for the child. It is interesting that ten living mothers gave up two or more children for adoption, accounting for a total of twenty-two children in our sample.

That the Indians be treated with kindness and indulgence, and mild and conciliatory means resorted to in order to encourage industry, repress vice, and inculcate morality; that the use of spirituous liquors be gradually discontinued in the very few districts in which it is yet indispensable; and that the Indians be liberally supplied with requisite necessaries, particularly with articles of ammunition, whether they have the means of paying for it or not, and that no gentleman in charge of district or post be at liberty to alter or vary the standards or usual mode of trade with the Indians, except by special permission of the Council.

ance for effort, providing teaching and development, and considering each subordinate's unique needs, abilities, and aspirations. Leaders may also work to promote the view that OCB is a natural part of the job and general organizational culture, because research indicates that employees are more likely to

engage in OCB when such behaviors are considered in-role rather than extra-role.

Although the following examples of OCB are in a reciprocity-based context, this context does not preclude cases in which such behaviors might qualify as acts of genuine altruism. For example, leadership behaviors including charisma, inspiration, and intellectual stimulation are thought to be transformational precisely because they compel followers to transcend narrow self-interest. Although preliminary, recent research indicates that transformational leader behaviors do, in fact, activate higher-level needs and a belief in a purpose associated with the work; in turn, this process leads to increased satisfaction, effort, and work performance.

THE DARK SIDE OF ALTRUISM

At this point, altruism's potential dark side may not be immediately apparent. Nevertheless, recent research has allowed for greater insight into the mechanisms through which altruistic behavior may, at times, lead to negative outcomes. Work by Batson and his colleagues has demonstrated that altruism may lead individuals to violate moral principles such as equity and justice. When instructed to allocate money and valued services to needy victims, individuals not induced to feel empathy-based altruism tend to act in accordance with the principle of justice: They divide the money and services equally among those in need. Conversely, individuals induced to feel empathy for one victim in particular treat that person preferentially—for example, by allocating services to him or her when other victims either have been waiting longer or are objectively more needy. Such behavior is a clear demonstration of the partiality that altruism may induce; this partiality may, in turn, promote the sort of us-versus-them attitudes that drive group conflict. Espousing similar views with regard to the evolution of altruism, Sober noted that group selection (and by implication, altruism) “doesn’t always lead the lion to lay down with the lamb; it can lead lions to cooperate with each other to bring down lambs” (2002, 26).

Similar concerns have been raised in leadership contexts. For example, Terry Price recently noted

that acting altruistically is not synonymous with acting ethically: In fact, altruistic leaders may make moral exceptions of themselves precisely because they are blinded by their own other-oriented altruistic values. As an antidote to such tendencies, Price argues that leaders' understanding of the collective good and of the morality of the processes required to reach that state must always be evaluated in light of general moral and ethical requirements, at least partially to protect the interest of outsiders. Expressing a similar perspective, Batson and Powell suggest that one of the best ways to ensure that altruism does not violate a moral principle is to elicit it in the context of that principle—such as encouraging empathy for victims of injustice. In such situations, the two motives then work in tandem rather than in opposition.

THE BRIGHT SIDE OF ALTRUISM

Philosophers, theologians, political theorists, and, most recently, social scientists have wrestled with the issue of whether helping behaviors are ever truly selfless. An extensive program of research indicates that they can be, at least when the helper feels empathy for the person in need. The previous discussion (“The Dark Side of Altruism”) noted that empathy can induce *partiality* and can cause people to violate ethical norms (such as equity), but not to act selfishly per se. They are still acting with another person's interests in mind (rather than their own), and it is this myopic “other focus” which may cause them to violate moral principles (such as allocating more to the person they feel empathy for than to others who may be equally needy). Because a multitude of self-oriented motives may generate helping behaviors in work contexts, it is difficult to determine when such acts are truly altruistic. However, by offering support and guidance to subordinates, leaders can do much to elicit helping, altruistic behaviors, and by fostering a work-oriented culture that promotes values such as fairness, caring, and equity, leaders can help ensure that the potential for partiality at times associated with altruism remains well within ethical bounds.

**ANTHONY, SUSAN B. (1820–1906)***U.S. reformer*

Susan B. Anthony was a feminist leader and trailblazer for women's rights who spent her life working for positive social change. Anthony dedicated her life to various reform movements, including abolition of slavery and temperance, which eventually gave way to her leading the fight against society's overall oppression of women. Anthony sought legal reforms of restrictive marriage and divorce laws of the nineteenth century that left divorced women without property or a means of support. Likewise, nineteenth-century laws denied divorced women custody of their children and afforded women little or no legal recourse over domestic disputes. These oppressive social conditions for women were too much for Anthony to bear. Along with other like-minded early feminists, Anthony appealed to local and state legislatures of the Northeast to consider the plight of women, especially the most vulnerable who had little or no means of support or way of seeking restitution in a society favoring men and restricting the lives of women. Anthony led the way for general social reforms and fought for equal voting rights for women against opponents who supported disenfranchisement of women. She demonstrated a tenacity and commitment to improving women's lives not typical of most nineteenth-century women, although throughout her long life Anthony did share the limelight with many notable figures such as the U.S. women's suffrage leader Elizabeth Cady Stanton.

Anthony believed that obtaining voting rights

Susan B. Anthony and Elizabeth Cady Stanton, leaders of the women's suffrage movement in the United States, c. 1881.

would be the best first step in eradicating other oppressive conditions for women and that women's public activism would help level the playing field in the domestic, social, economic, and political arenas. Everything she did was deemed to be for "the cause," which she regularly referenced as being the central force of her being—to gain the vote so that future generations of women could break free of the chains of oppression and openly participate in public life.

A NATIONAL HEROINE IS BORN

Susan Brownell Anthony was born to Quaker parents, Daniel and Lucy Read Anthony. Anthony was born an ordinary female in a typical working-class household. Her father was a devout Quaker, and her mother was a Baptist. Anthony's father, like other Quakers, based his beliefs on egalitarian principles and valued education as a worthy endeavor for both

boys and girls. With their father's guidance, the Anthony children briefly attended public school and then were home schooled. As a young girl attending a public school, Susan was denied the opportunity to learn long division because the schoolmaster did not believe that girls should learn mathematics. At this point in her life, Anthony's outraged father removed her from public school and began the process of home schooling under the tutelage of Mary Perkins. In 1837 Anthony's father enrolled Susan in a Quaker female seminary school ran by Deborah Moulson. Anthony's formal schooling was not remarkable; however, her earliest written correspondence and diary reflect Anthony's personal rejection of the overemphasis placed on female piety and morality, which Anthony found were too often taken to the extreme. Like all good Quakers, Anthony found these qualities acceptable within reason and practiced them personally; however, she became more interested in focusing on social and civil responsibility as a way of showing human morality. Throughout her long career as an activist against vice and the ills of society, Anthony demonstrated a natural inclination to stand by her convictions and take on roles of leadership in hopes of improving society.

Although the nineteenth century has been referred to as the "Era of the Common Man," the common woman gained little notoriety for her commonness. Economic dependency and restrictive marriages dictated the common woman's role in society, which led to Anthony's challenging the status quo at an early age. For example, as a girl of about eleven in 1831, Susan asked her father why a young and competent woman in his mill was not made overseer instead of a less-competent man named Elijah. Daniel Anthony explained to his young daughter that society simply would not accept such an arrangement and left her question largely unanswered. Her father's vague reply did not appease Anthony, who continued to question the unequal society she grew up in. By the time Anthony had finished seminary, she had met Lucretia Mott, who had spoken at the seminary in 1837. Mott, a Quaker and an avid abolitionist, was one of the founders of the Philadelphia Female Anti-Slavery Society. She spoke with a passion that stirred Anthony's soul and solidified her conviction

to support abolition. Such a turn of events would be a challenge to Quakers because during the early years of abolition reform, many remained ambivalent about the institution of slavery. As a result, the Hick-site Quakers, who supported abolition and with whom Mott had affiliated, broke away from the mainstream Quakers.

Undoubtedly Anthony's new convictions regarding abolition posed a conflict within her family as to whether or not the cotton processed in her father's mills was produced by slave labor. However, her father was spared the conflict because the family business went bankrupt during the Panic of 1837, and he was forced to auction off the family's fifteen-room house, furnishings, and nearly every personal possession they owned. By 1839 Daniel Anthony had moved his family from Battenville, New York, to the impoverished town of Center Falls. In this small town Anthony's family eked out a living by taking in boarders, and the senior Anthony earned a meager income as a postmaster. At this point Susan B. Anthony took up teaching and severed the close bonds she had enjoyed with her parents and siblings. Although she wrote numerous letters and visited home as often as she could, Anthony became a *femme sole* (woman alone) because marriage had taken her sisters in different directions, and her career as a teacher took her in another. As a teacher, Anthony began to hone her skills of leadership by establishing herself as an individual and as an agent for social change.

EARLY YEARS OF LEADERSHIP

Teaching was one of the few professions available to nineteenth-century women. Many of Anthony's contemporaries had taken up teaching but had abandoned the profession after marriage. Susan B. Anthony vowed never to marry and to encourage women to shun the social institution of marriage until full rights of citizenry were granted to women. Through teaching Anthony gained a sense of autonomy and independence that she would have never realized as a married woman. An ordinary woman such as Anthony became remarkable because she practiced her own advice and dedicated her life to reform. Because Anthony took

her cause so seriously, she never allowed her personal life to interfere with her public ambitions. Until her death Anthony remained the staunch and principled leader of the women's suffrage movement and continued to support other avenues of reform for the benefit of women and men alike.

By 1845 Anthony had carved out a life as a teacher and reform activist and had broadened her circle of friends to include many abolitionists and temperance reformers. During the 1840s Anthony was involved with abolition and the Daughters of Temperance, which effectively placed her in the spotlight. She gained public notoriety and was sought out to speak at temperance gatherings. Through the many speeches she gave and the many gatherings she attended, Anthony became acquainted with many prominent leaders who helped her develop her natural inclination for leadership. One such person was Stanton, who became a lifelong friend and partner in the fight for equal rights. The duo attended temperance, abolition, and women's rights conventions together, and by 1855 Susan B. Anthony had become one of the nation's most outspoken leaders in the reform arena.

Until 1854, Anthony's work had been conducted in New York. As Anthony became more active in the public sphere, her connection to the prominent literati and reformers became extremely important to her leadership development. For example, prominent abolitionists William Lloyd Garrison and Samuel May sought her out as a traveling agent for their abolition society, which led her to widespread speaking engagements and national notoriety. Likewise, Anthony continued to work for temperance and women's rights, with women's suffrage at the epicenter of her work. Her leadership captured the attention of the nation, with many newspapers expressing opinions ranging from praise to condemnation that a woman would speak so forcefully in the public arena. Anthony humbly accepted the praise and steeled herself against the condemnations of newspaper editorials and outraged ministers who reminded Anthony to remember her place as a woman. At times she even had to deflect criticism from men who were members of reform societies she belonged to. However, she did not become discouraged.

Remarks of Susan B. Anthony at Her Trial for Illegal Voting (19 June 1873)

In 1873, Susan B. Anthony was tried for illegal voting by the Circuit Court of the United States for the Northern District of New York. There exist several versions of Anthony's statement to the judge after her motion for a new trial had been dismissed, recorded by reporters at the time of the trial. The version below is the one set down by Anthony herself later in the year.

Judge Hunt—(Ordering the defendant to stand up), Has the prisoner anything to say why sentence shall not be pronounced?

Miss Anthony—Yes, your honor, I have many things to say; for in your ordered verdict of guilty, you have trampled under foot every vital principle of our government. My natural rights, my civil rights, my political rights, my judicial rights, are all alike ignored. Robbed of the fundamental privilege of citizenship, I am degraded from the status of a citizen to that of a subject; and not only myself individually, but all of my sex, are, by your honor's verdict, doomed to political subjection under this, so-called, form of government.

Judge Hunt—The Court cannot listen to a rehearsal of arguments the prisoner's counsel has already consumed three hours in presenting.

Miss Anthony—May it please your honor, I am not arguing the question, but simply stating the reasons why sentence cannot, in justice, be pronounced against me. Your denial of my citizen's right to vote, is the denial of my right of consent as one of the governed, the denial of my right of representation as one of the taxed, the denial of my right to a trial by a jury of my peers as an offender against law, therefore, the denial of my sacred rights to life, liberty, property and

Judge Hunt—The Court cannot allow the prisoner to go on.

Miss Anthony—But your honor will not deny me this one and only poor privilege of protest against this high-handed outrage upon my citizen's rights. May it please the Court to remember that since the day of my arrest last November, this is the first time that either myself or any person of my disfranchised class has been allowed a word of defense before judge or jury

Judge Hunt—The prisoner must sit down the Court cannot allow it.

Miss Anthony—All of my prosecutors, from the 8th ward

corner grocery politician, who entered the complaint, to the United States Marshal, Commissioner, District Attorney, District Judge, your honor on the bench, not one is my peer, but each and all are my political sovereigns; and had your honor submitted my case to the jury, as was clearly your duty, even then I should have had just cause of protest for not one of those men was my peer; but, native or foreign born, white or black, rich or poor, educated or ignorant, awake or asleep, sober or drunk, each and every man of them was my political superior; hence, in no sense, my peer. Even, under such circumstances, a commoner of England, tried before a jury of Lords, would have far less cause to complain than should I, a woman, tried before a jury of men. Even my counsel, the Hon. Henry R. Selden, who has argued my cause so ably, so earnestly, so unanswerably before your honor, is my political sovereign. Precisely as no disfranchised person is entitled to sit upon a jury, and no woman is entitled to the franchise, so, none but a regularly admitted lawyer is allowed to practice in the courts, and no woman can gain admission to the bar hence, jury, judge, counsel, must all be of the superior class.

Judge Hunt—The Court must insist the prisoner has been tried according to the established forms of law.

Miss Anthony—Yes, your honor, but by forms of law all made by men, interpreted by men, administered by men, in favor of men, and against women; and hence, your honor's ordered verdict of guilty, against a United States citizen for the exercise of "that citizen's right to vote," simply because that citizen was a woman and not a man. But, yesterday, the same man-made forms of law, declared it a crime punishable with \$1,000 fine and six months' imprisonment, for you, or me, or any of us, to give a cup of cold water, a crust of bread, or a night's shelter to a panting fugitive as he was tracking his way to Canada. And every man or woman in whose veins coursed a drop of human sympathy violated that wicked law, reckless of consequences, and was justified in so doing. As then, the slaves who got their freedom must take it over, or under, or through

HOPE FOR FUTURE GENERATIONS OF WOMEN

Although Anthony remained single her entire life, she had several suitors and turned down many proposals. Anthony felt that marriage would interfere

with her beloved reform work. At times she became frustrated with the women around her and often expressed deep regret when one by one most of her female friends married and had children. However, married women such as Elizabeth Cady Stanton

the unjust forms of law, precisely so, now, must women, to get their right to a voice in this government, take it; and I have taken mine, and mean to take it at every possible opportunity.

Judge Hunt—The Court orders the prisoner to sit down. It will not allow another word.

Miss Anthony—When I was brought before your honor for trial, I hoped for a broad and liberal interpretation of the Constitution and its recent amendments, that should declare all United States citizens under its protecting aegis that should declare equality of rights the national guarantee to all persons born or naturalized in the United States. But failing to get this justice—failing, even, to get a trial by a jury not of my peers—I ask not leniency at your hands—but rather the full rigors of the law.

Judge Hunt—The Court must insist
(Here the prisoner sat down.)

Judge Hunt—The prisoner will stand up.
(Here Miss Anthony arose again.)

The sentence of the Court is that you pay a fine of one hundred dollars and the costs of the prosecution.

Miss Anthony—May it please your honor, I shall never pay a dollar of your unjust penalty. All the stock in trade I possess is a \$10,000 debt, incurred by publishing my paper—*The Revolution*—four years ago, the sole object of which was to educate all women to do precisely as I have done, rebel against your man-made, unjust, unconstitutional forms of law, that tax, fine, imprison and hang women, while they deny them the right of representation in the government; and I shall work on with might and main to pay every dollar of that honest debt, but not a penny shall go to this unjust claim. And I shall earnestly and persistently continue to urge all women to the practical recognition of the old revolutionary maxim, that “Resistance to tyranny is obedience to God.”

aided Anthony’s rise to prominence as a leader. Many historians have noted that Stanton was an eloquent writer, whereas Anthony became a dedicated orator. Both women wrote and gave speeches; however, Anthony, being single, could put more time and

energy into her work. Anthony’s growth as a leader was not an easy process. At times she felt ill at ease in the limelight; however, her dedication to reform gave her a strong voice and an air of dignified composure that was often noted by those who heard her speak.

As a Quaker, Anthony spoke directly to her audiences without mincing words. When possible she spoke with other prominent reformers in order to add impact to speeches and public forums. She sought liaisons with important people who could impress their reform goals on society. After the Civil War freed thousands of slaves, she turned her full attention to women’s suffrage and other women’s rights issues. During the 1870s, women canvassed the nation in hopes of gaining support for the vote. Many women were heckled, some were arrested, and others became discouraged and abandoned the suffrage movement. Anthony refused to give up and again demonstrated her daring and leadership by illegally voting in a New York election in 1872. She was arrested and brought before Judge Hunt, who fined her for the infraction; Anthony refused to pay and appealed to the court. The outraged judge could not subdue the determined suffragette whose pleas for equality filled the courtroom. The case was dropped because the judge did not want Anthony tried by a jury who might have had sympathy for the plight of women who sought the vote. This was yet another example of Anthony’s leadership. By 1900, Anthony’s leadership came full circle as she stepped down from her post as leader of the National American Woman Suffrage Association (NAWSA), which began in 1848 and lasted until 1921. Anthony quietly died in 1906 as her friend Anna Howard Shaw held her hand, but not before her leadership had inspired a nation of women to press on in order to gain the vote in 1920.

APARTHEID IN SOUTH AFRICA, DEMISE OF

The demise of apartheid (racial segregation) in South Africa and the coming to power there of a

democratic government, headed by Nelson Mandela, were events of world historical importance.

Some people who have sought to explain the transition from apartheid to democracy in South Africa have emphasized the crucial role of leadership. Other people have looked elsewhere for explanations—to the impact of sanctions on the South African economy, say, or to the threat posed by the armed struggle launched in 1961 and intensified after the Soweto Uprising of 1976, a rebellion against apartheid that began in Soweto township, Johannesburg, in June 1976. Although a definitive account of the reasons for the collapse of apartheid in South Africa cannot yet be written, experts generally agree that no single factor can explain so complex a development as the relatively sudden collapse of the world's most highly developed system of racial segregation, a system built up over three centuries and intensified by the National Party (NP) government that took office after the general election of 1948. However, most people who have written on the transition agree that leadership did play a vital role. Although the exact nature of that role requires examination, one can say that South Africa was fortunate in having, at a crucial time in its history, a number of key individuals prepared to rise above their narrow self-interest and work with former enemies to achieve what they and their opponents came to see as common goals.

Although apartheid unraveled from the late 1970s, the pillars of the apartheid system remained in place into the early 1990s and were then done away with rapidly as part of a process that took South Africa to a new democratic order. To understand the demise of apartheid we need to focus on the decade prior to the transfer of power from the white minority, apartheid government to a majority, democratic government in 1994. That transfer of power signaled the formal end of apartheid rule. In the decade before that key turning point, the ending of apartheid was greatly aided by the leadership of three remarkable men. Two were politicians, the third a cleric.

THREE KEY FIGURES

The cleric, Desmond Tutu, was small in stature but large in dynamism. He exerted great moral authority

and used oratorical skills to speak out against the evils of apartheid, yet he retained an impish sense of humor, which made it difficult for his critics to condemn him out of hand. Rising through the ranks of the Anglican church, he became general secretary of the South African Council of Churches in 1978 and in 1984 won the Nobel Peace Prize for his stand against apartheid. That prize, followed by his selection as archbishop of Cape Town in 1986, gave him effective immunity from state action, and he was able to call for sanctions against the apartheid regime and make repeated moral statements against atrocities being perpetrated by that regime. In the mid-1980s, during a rebellion against apartheid known as the “township revolt” that began in 1984 and soon embraced a number of townships throughout the country, he gave important moral support to the main internal resistance organization, the United Democratic Front. After the apartheid monolith began to crack, he stressed the common humanity of all the “rainbow people” of South Africa. After welcoming Nelson Mandela to his home after Mandela’s release from prison in February 1990, Tutu was not involved directly in the formal negotiations that followed, but he remained an influential voice urging reconciliation and the creation of a new nation in which all South Africans would feel at home. From 1995 to 1998 Tutu played a key role as chair of the Truth and Reconciliation Commission (TRC). As head of the TRC’s Human Rights Violations Committee, he listened to numerous witnesses speak of their suffering under apartheid and then helped put together the multivolume report that the TRC presented to Mandela in 1998 detailing the extent of human rights violations under apartheid.

The second key figure, Nelson Rolihlala Mandela, is generally regarded as the most important individual in bringing about the collapse of apartheid. Tall and regal in bearing, Mandela had by the mid-1980s been incarcerated on Robben Island and then in Pollsmoor Prison for more than twenty years. His harsh prison experience had given him resilience and an unusual depth of understanding of human nature. Although a man of great personal presence and authority, he was willing to work in a collegial style and always emphasized that he was a loyal member of the African

National Congress (ANC). He came to believe that all people can change, and so he urged reconciliation with former enemies. Meeting with warders and government officials, he showed no bitterness. When the minister of justice, Kobie Coetsee, met Mandela in 1985, Mandela appeared as “an old Roman citizen, with dignitas, gravitas, honestias, simplicitas” (Sparks 1994, 72).

Mandela had long realized that the only solution for the country was a negotiated settlement, and from the mid-1980s he threw himself into the task of bringing about that settlement by urging the government officials whom he met to open a dialogue with the ANC. In prison he learned the language of his jailers, Afrikaans, and when he eventually met President P. W. Botha in Cape Town in July 1989, Mandela was able to talk to Botha about how Afrikaners, like black Africans, had once taken up arms in the cause of freedom. Most of those people who met Mandela in these years saw him as a future president of the country.

What, then, was Mandela’s contribution to the end of apartheid and the advent of democracy? Isolated in Pollsmoor Prison, he might have succumbed to pressures from the government to make compromises. In 1985, Botha offered Mandela his release if Mandela foreswore violence. However, Mandela held firm to his beliefs and would not abandon the armed struggle. Although not himself a member of the Communist Party, Mandela refused to cut his ties with the Communists, with whom he had worked closely before his incarceration. The ANC leadership-in-exile in Lusaka, Zambia, feared that he might fall into a trap and sell out to the government, which was trying to play him off against his colleagues. However, to fear such an outcome was to misunderstand Mandela, who always emphasized that he remained a loyal and disciplined member of the ANC.

After being released from prison, Mandela assumed effective leadership of the ANC and carried it to victory in the election of April 1994. The transition years were difficult ones for him personally because his marriage to his wife, Winnie, broke down, and he had to deal with a government in power that he believed to be engaged on internal destabilization. He had first viewed President F. W. de Klerk, with whom

On 15 January 1961, South Africans demonstrated against apartheid during talks in Pretoria between UN Secretary General Dag Hammarskjöld and the white South African government.

he met regularly, as a man of integrity, but Mandela came to despise De Klerk and accused him of deliberately doing nothing to put an end to the political violence that wracked the country from mid-1990. Yet, at key points in the negotiation process, Mandela decided that the moment was right to make concessions, such as when in August 1990 he agreed to suspend the armed struggle. In December 1991, he replied forcefully when De Klerk at the first meeting of the Convention for a Democratic South Africa (CODESA) accused the ANC of having an army in waiting. In September 1992, Mandela was able to force De Klerk to make important concessions in what became known as the “Record of Understanding,” an agreement between the ANC and the government that paved the way for the resumption of multiparty negotiations early in 1993. Then followed the detailed discussions over the nature of the new, interim constitution, finally agreed to by the multiparty negotiating forum in November 1993. With the interim constitution agreed to, Mandela helped persuade General Constand Viljoen, a former head of the South African Defence Force, to participate in the election process by agreeing that the new Parliament

could discuss self-determination for Afrikaners. Vijoen was then elected to the first democratic parliament. After Mandela became president, he continued to promote reconciliation, especially by such high-profile actions as donning the jersey of the South African captain when the South African team won the Rugby World Cup (1996) and visiting the widow of Hendrik Verwoerd, the architect of apartheid, at her home in the Afrikaner settlement of Orania. In other ways, too, such as his informality in dress and approach to people, Mandela endeared himself to almost all sections of South African society and played a major role.

The third key figure is F. W. de Klerk. P. W. Botha, prime minister from 1978 and president of South

Africa from 1984 until 1989, he must be credited with some major reforms in apartheid—most importantly the decision to recognize black trade unions in 1979 and to abandon the legislation known as pass laws that provided that all Africans should carry a “pass” or identity document at all times in 1986—but he did not bring down the pillars on which apartheid rested, such as the legislation that classified the population by race and prevented black people from owning land in much of the country. Above all, Botha was not prepared to move to a democratic system in which every person could vote, which would mean the end of white minority rule. De Klerk, who took over from Botha as president in August 1989, had been brought up in the heart of the Afrikaner establishment, and long remained ignorant of the lot of the majority of the people. When chosen as Botha’s successor, De Klerk had a reputation as a conservative. Yet, he made the major decisions to end apartheid and usher in a democratic order.

De Klerk began taking careful steps to liberalize the political situation in the country almost immediately on taking office as president. He allowed a mass march through the streets of Cape Town and

Compassion and Forgiveness

The following text is taken from Alan Paton's Cry, the Beloved Country. The text is a passage of a manuscript written by the character Arthur Jarvis before his murder and read following his funeral by his father, James Jarvis. In reading it, James Jarvis begins a journey of forgiveness and compassion, which includes donations that help the people of South Africa and a friendship with Stephen Kumalo, the father of Absalom, the man responsible for Arthur's death.

The truth is that our Christian civilization is riddled through and through with dilemma. We believe in the brotherhood of man, but we do not want it in South Africa. We believe that God endows men with diverse gifts, and that human life depends for its fullness on their employment and enjoyment, but we are afraid to explore this believe too deeply. We believe in help for the underdog, but we want him to stay under. And we are therefore compelled, in order to preserve our belief that we are Christian, to ascribe to Almighty God, Creator of Heaven and Earth, our own human intentions, and to say that because He created white and black, He gives the Divine Approval to any human action that is designed to keep black men from advancement. We go so far as to assume that He blesses any action that is designed to prevent black men from the full employment of the gifts He gave them. Alongside of these very arguments we use others totally inconsistent, so that the accusation of repression may be refuted. We say we withhold education because

the black child has not the intelligence to profit by it; we withhold opportunity to develop gifts because black people have no gifts; we justify our action by saying that it took us thousands of years to achieve our own advancement, and it would be foolish to suppose that it will take the black man any lesser time, and that therefore there is no need for hurry. We shift our ground again when a black man does achieve something remarkable, and feel deep pity for a man who is condemned to the loneliness of being remarkable, and decide that it is a Christian kindness not to let black men become remarkable. Thus even our God becomes a confused and inconsistent creature, giving gifts and denying them employment. It is strange then that our civilization is riddled through and through with dilemma? The truth is that our civilization is not Christian; it is a tragic compound of great ideal and fearful practice, of high assurance and desperate anxiety, of loving charity and fearful clutching of possessions. Allow me a minute . . .

then released a number of leading political prisoners. After dismantling the system that had given the army and police major powers in government, he was ready to make the crucial decision: the announcement on 2 February 1990 that the apartheid system would be dismantled and an inclusive democracy established. This decision was the breakthrough that P. W. Botha had not had the courage to allow. De Klerk knew that he was taking a great risk and that he might not be able to control the forces he was unleashing, but he decided that taking the risk was better than not acting. Although he acted under great pressure—from the international community, which threatened greater sanctions, and from an internal resistance movement that was becoming ever more ready to challenge the government—he could nevertheless have decided to use the security forces, who remained loyal to the government, to try to keep the

resistance in check. Few people doubt that he could have done this successfully in the short run, but, as he told his electorate, the whites of Zimbabwe had made the mistake of waiting too long to negotiate with the nationalist forces, and he had decided that he would not make the same mistake. The new situation in eastern Europe, where communism collapsed in late 1989, gave De Klerk the opportunity to say that there was no longer any risk in allowing the Communist Party in South Africa and that the ANC had been gravely weakened by the ending of the Cold War. He knew that his own government would no longer be seen in the West as an ally in Cold War terms and that he had to end apartheid to bring South Africa's isolation to an end and regain respect in the rest of the world.

In going much further than P. W. Botha had, De Klerk acted with courage. The ending of apartheid

I am a leader by default, only because nature does not allow a vacuum.

—Bishop Desmond Tutu

was linked to the decision to release Mandela from prison unconditionally, and Mandela's release paved the way for the first formal talks between the ANC and the government in May 1990. When De Klerk opened Parliament on 1 February 1990 he announced that the remaining key apartheid laws would be repealed. By the end of 1991 CODESA had met to begin negotiating a new constitution for a fully democratic country. When the National Party lost the election in April 1994, De Klerk conceded defeat graciously. Yet, more than Tutu or Mandela, De Klerk has been criticized from different quarters. Some critics emphasize what they call his "double-dealing"—on the one hand, negotiating but, on the other hand, not taking action to end the political violence that wracked the country throughout the transition. Some critics even accuse De Klerk of fomenting that violence—an accusation he has always denied. Other critics, within Afrikanerdom, accuse De Klerk of misleading his followers and of unnecessarily leaving the Afrikaner people without political power in the new order.

LEADERSHIP IN TRANSITION

Not being a politician, Bishop Tutu could act without having to consider a constituency, other than the Anglican church. Remarkably, both Mandela and De Klerk took a diverse constituency with them as they embarked on major changes of course. Into the early 1990s Mandela and the ANC continued to maintain that their policy was nationalization and major state intervention in the economy; yet, by 1994 they had accepted that they would, when they came to power, continue the existing economic policy, in which nationalization had no place, and that they would not seek to impose a top-down transformation of socioeconomic life. A large section of the radical youth who had taken the lead in the township revolt of the mid-1980s had hoped that the end of

apartheid would mean the end of capitalism as well, and those in the ANC's armed wing, Umkhonto weSizwe (MK) expected that after a military victory would come massive transformation of South African society. Mandela knew that this expectation was unrealistic—not least because of the opposition it would arouse—and through his personality was able to persuade the youth and those in MK to continue to support the ANC.

In a similar way De Klerk showed a remarkable ability to keep his constituency with him. The NP was, after all, the party that had introduced apartheid, and most of its members remained committed to apartheid in some form. Yet, De Klerk was able to persuade his followers that there was no realistic alternative to the abandonment of apartheid, even if it meant that the NP would lose power. (At times during the transition, De Klerk held out to his supporters the possibility that the ANC would split or that something else would happen to enable the NP to retain power, but he must have known that such a possibility was highly unlikely.)

All three of these key figures were fortunate in the circumstances in which they exercised their leadership. Amid the violence of South Africa, assassination was always possible, and had Mandela been killed the whole transition would have been aborted. When Chris Hani, the charismatic leader of the South African Communist Party, was assassinated in April 1993, De Klerk wisely let Mandela appear on national television, and Mandela was able to still the outrage among Hani's supporters. Both leaders feared the abyss of racial civil war, which most commentators had thought inevitable in South Africa. That fear concentrated the minds of the negotiators, and after Hani's death they were quick to set a date for the first democratic election.

Fortuitous events helped leaders make their mark in history. Both Mandela and de Klerk benefited greatly from the winding down of the Cold War, which made the idea of an ANC government acceptable both in the West and among De Klerk's own supporters. Had P. W. Botha not had a stroke in January 1989, De Klerk might never have had the opportunity to act as he did a year later. All three men seized the opportunities offered them, and acted

boldly. All three looked ahead and were prepared to put past differences behind them.

One must not, however, overemphasize the role of key figures in any profound process of change. On the one hand, many other remarkable leaders at lower levels played unsung roles but, cumulatively, were also important in ensuring that the transition was successful. On the other hand, one must not overemphasize the role of leadership compared with other factors. The mass resistance of the mid-1980s gave Mandela the opportunity to move toward negotiating with the regime; that resistance led De Klerk and others to begin to see that apartheid must end. Do leaders emerge at key points in history because of the need for leadership, or do they emerge merely fortuitously?

—Christopher Saunders

ARISTOTLE (384–322 BCE)

Greek philosopher

Few philosophers have influenced ideas about so many subjects in so many parts of the world as Aristotle. While some of his writings have been lost, what remains of his work is impressive in its size and

scope. Aristotle's research ranged from meteorology to metaphysics and from poetics to ethics. He wrote on sleep, dreams, colors, plants, animals, memory, the senses, the soul, rhetoric, metaphysics, aesthetics, and the universe. He was, among other things, a scientist, moralist, logician, poet, psychologist, and political scientist. Aristotle was not only a leader through his ideas, but the founder of three schools and tutor to one of the greatest leaders of his time.

Aristotle was born in Stagira in 384 BCE. His father, Nicomachus, was a physician in the Macedonian court at Pella. Nicomachus died when Aristotle was quite young and Aristotle went to live with relatives in Atarneus in Asia Minor. When he was seventeen, Aristotle was sent to study at Plato's Academy in Athens. Aristotle studied and then taught at the academy for twenty years. When Plato died in 348/347 BCE, Aristotle accepted an invitation from the ruler Hermias of Atarneus to settle there.

Hermias was a eunuch of lowly birth who gained favor with the Persian administration and was made a prince. He slowly accumulated political power and land, and entered into treaties with King Philip II of Macedon. Hermias studied geometry, ethics, and dialectic with Aristotle, and Erastus and Coriscus (two colleagues from Plato's Academy). Under the influence of his teachers, Hermias, an avid student, softened his tyrannical rule and introduced new laws and reforms that followed the precepts of the Academy.

Hermias expressed his admiration and friendship for Aristotle by offering him his niece and adopted daughter, Pythias, as a wife. Aristotle and Pythias had one daughter who was also named Pythias. Hermias also gave Aristotle money to start a new school at Assos in the Troad. It is doubtful that Aristotle wrote anything during this period, but he continued his scientific studies on marine life there. Aristotle left Assos after a year or so and founded another school on the island of Lesbos. He was only on Lesbos a few years when, in 343/342 BCE, Philip II invited Aristotle to Pella to tutor his thirteen-year-old son Alexander.

Aristotle tutored Alexander for three years and then moved back to Stagira. Philip II had totally destroyed Stagira eight years earlier, but he had the

Aristotle on Authority

There is no difficulty in distinguishing the various kinds of authority; they have been often defined already in discussions outside the school. The rule of a master, although the slave by nature and the master by nature have in reality the same interests, is nevertheless exercised primarily with a view to the interest of the master, but accidentally considers the slave, since, if the slave perish, the rule of the master perishes with him. On the other hand, the government of a wife and children and of a household, which we have called household management, is exercised in the first instance for the good of the governed or for the common good of both parties, but essentially for the good of the governed, as we see to be the case in medicine, gymnastic, and the arts in general, which are only accidentally concerned with the good of the artists themselves. For there is no reason why the trainer may not sometimes practice gymnastics, and the helmsman is always one of the crew. The trainer or the helmsman considers the good of those committed to his care. But, when he is one of the persons taken care of, he accidentally participates in the advantage, for the helmsman is also a sailor, and the trainer becomes one of those in training. And so in politics: when the state is framed upon the principle of equality and likeness, the citizens think that they ought to hold office by turns. Formerly, as is natural, every one would take his turn of service; and then again, somebody else would look after his interest, just as he, while in office, had looked after theirs. But nowadays, for the sake of the advantage which is to be gained from the public revenues and from office, men want to be always in office. One might imagine that the rulers, being sickly, were only kept in health while they continued in office; in that case we may be sure that they would be hunting after places. The conclusion is evident: that governments which have a regard to the common interest are constituted in accordance with strict principles of justice, and are therefore true forms; but those which regard only the interest of the rulers are all defective and perverted forms, for they are despotic, whereas a state is a community of freemen.

town rebuilt and repopulated in Aristotle's honor. Aristotle lived there until 335/334 BCE and then returned to Athens. In Athens Aristotle leased a house with an adjoining covered walk (*peripatos*) attached, and established a school called the Lyceum. Aristotle used to teach while walking with students under the *peripatos* and, hence, his followers came to be called the *peripatetics*.

After Alexander died in 323 BCE, some Athenians became suspicious of Aristotle because he was Alexander's friend. Resentful factions in Athens accused Aristotle of impiety—the same charge leveled against Socrates. Aristotle retired to Chalcis, his

mother's birthplace, where he died in 322 BCE at the age of sixty-two. One tradition says that Aristotle left Athens because he did not want Athenians to sin against philosophy twice.

WHAT WAS LOST

Aristotle, like all members of Plato's academy, wrote dialogues. They are all lost to us, except for a few fragments and commentaries on them by other ancient writers such as Cicero, Plutarch, and Diogenes Laertius. Aristotle also wrote poetry. Scholars mourn the loss of Aristotle's account of 158 constitutions of cities and tribes. We are, however, fortunate to have the one remaining part of this work, the *Constitution of Athens*.

In his surviving works Aristotle says practically nothing about his famous student Alexander. One of the great losses to leadership scholars is a memoir that Aristotle wrote late in life called *Alexander or On Colonization*. As Werner Jaeger tells us, "this work would have introduced us to the late period when the royal pupil [Alexander] was breaking and making empires in Asia,

while the philosopher followed the dizzy flight of his fortunes with anxious eyes" (1934, 259). Also lost is a book called *Monarchy*, which Aristotle wrote after he tutored Alexander. Ancient commentators tell us that Aristotle tried to give a new spiritual and ethical content to the idea of monarchy in this book.

THE RELATIONSHIP OF ETHICS TO POLITICS

Aristotle's books the *Nicomachean Ethics* and *Politics* are of particular interest to leadership scholars. These books are intimately related to each other. His book on ethics tells us about virtues, human behav-

ior, and the ends that people seek in life. His *Politics* is a systematic and empirical study of how various societies are organized. To understand what Aristotle has to say about leadership, we first need to look at what he says about ethics.

Aristotle's *Nicomachean Ethics* (named after his father, Nicomachus) begins with the proposition that all actions aim toward the good and that politics is the master science of the good. He says, "Thus it follows that the end of politics is the good for man. For even if the good is the same for the individual and the state, the good of the state clearly is the greater and more perfect thing to attain and to safeguard" (Aristotle 1094b, 7, 1962a, 4). But since each action aims at a different good, so we have to look for a good that is self-sufficient. That good is happiness and happiness means different things for different people. Aristotle uses the word *eudaiemonia* for happiness. *Eudaiemonia* has a slightly different meaning than the English word *happiness*. Aristotle tells us that a happy life is where one lives well, acts well, and people flourish. The two best forms of life, according to Aristotle, are private lives of contemplation and public lives of politics. Since happiness or flourishing is the ultimate purpose of all action, it is the end of life and of politics. Aristotle's idea of the state as a place where people can pursue individual happiness appears almost two thousand years later in the American Declaration of Independence (1776).

Aristotle believed that to live well people must have virtue (*areté*). Aristotle's notion of virtue is different from the way people use the word today. A virtue is an excellence that one needs to do something well. Doctors need one set of virtues, soldiers need another set, musicians another, and so forth. All people must have moral virtues, which are rational choices that we make with the intended desire to do good. Virtues are also habits, but not in the rote sense of the term. Aristotle says that virtues are a *hexis*, which means "a having," "a holding," or being in some condition. It is a characteristic of the agent. Aristotle accounts for the ability of an agent to practice virtues based on the mean. Since virtues are concerned with emotions as well as actions, a virtuous person knows the proper degree of how to act and to feel.

Aristotle says, "To obtain the right training for virtue from youth up is difficult, unless one has been brought up under the right laws" (*Nicomachean Ethics* 10.1179b32, Aristotle 1962a, 296). People learn virtues from laws, society, and from role models in society. According to Aristotle, people are political animals and moral acts can only take place in the context of a society. Hence, a hermit is incapable of acting virtuously. The *Nicomachean Ethics* begins and ends with a discussion of politics because Aristotle believed that the moral state is necessary for virtue and for people to flourish as human beings.

THOUGHTS ON LEADERSHIP

Political theorists from St. Augustine to Thomas Jefferson are indebted to the *Politics*. Since Aristotle's focus is on examining the best forms of government, he pays less attention to the leader as an individual. He does, however, talk about the importance of thoughtful followers or citizens and the leader/follower relationship. Aristotle notes, "Practical wisdom is the only excellence peculiar to the ruler: it would seem that all other excellences must equally belong to ruler and subject. The excellence of the subject is certainly not wisdom, but only true opinion; he may be compared to the maker of a flute, while his master is like the flute player" (*Politics* 1277b28–30, Aristotle 1984, 2027).

In *Politics* Book III, Aristotle examines six types of rule. They are the rule by one, by the few, and by the many. The next three are variations on these, based on whether leaders rule for the common good or for their self-interest. A leader who rules in his self-interest is tyranny. A group of people who rule in their own interest, the interest of the wealthy, is oligarchy. When the many rule in their self-interest, the interests of the poor, it is democracy. Like leadership scholars today, Aristotle realized that different groups and situations required different kinds of leadership. He says, "there is by nature both a justice and an advantage appropriate to the rule of a master, another to kingly rule, another to constitutional rule; but there is none naturally appropriate to tyranny" (*Politics* 1287b37–40, Aristotle 1984, 2043–44).

Aristotle is against the one ruler who rules over

everything or what he calls a *pambasileia* or “all-over ruler.” He argues that it is not possible for even the most ethical and talented person to run everything well. Aristotle observes that rulers cannot do their jobs without good advisors or subrulers. These advisors should be friends who are equals, not subordinates to the ruler. Aristotle says friendship is about concern for others, mutual interests, and joint activity. When good people are friends, “they become better as they are active together and correct one another: from the mould of the other each takes the imprint of the traits he likes, whence the saying: ‘Noble things from noble people’” (*Nichomachean Ethics* 1172a12–14, Aristotle 1962a, 272–3). Aristotle believed when leaders rely on such friends as advisors, their rule is likely to be just.

Aristotle argues that aristocracy or rule by the best people (judged by merit) is the most desirable regime, but he offers some caveats to this kind of rule. First, they need good advisors and the help of citizens, who are not mindless followers. Second, leaders need good laws and should be subject to those laws. Ideally the most gifted and virtuous people should rule, but Aristotle is also willing to settle for leaders who are not the best and the brightest, as long as they are just and rule under just laws.

CRITICISMS AND INFLUENCE

Aristotle is most criticized for his defense of slavery in Book I of the *Politics* and his inclusion of slavery as part of the best regime. Out of all the arguments in the *Politics*, this is the weakest. Aristotle argues that some people are best disposed to be masters and others are natural slaves who benefit from having masters. As Mary P. Nichols points out, however, Aristotle also acknowledges, “that it is doubtful that any slave system enslaves only those who deserve to be enslaved, and even more doubtful whether those who deserve to be slaves would even be useful as slaves” (1992, 24). Aristotle expresses certain reservations about slavery in his work, but never morally condemns it. He also seems to abandon ethics in books IV through VI of the *Politics*. In these books he does not seem concerned with some of the unethical aspects of winning favor and staying in power.

Aristotle’s influence in the arts, sciences, and politics shows up in the work of a variety of great thinkers. Among them are Cicero, St. Thomas Aquinas, Dante, Thomas Hobbes, Machiavelli, Francis Bacon, Thomas Jefferson, and al Farabi, the tenth-century Muslim philosopher and founder of the Islamic philosophic tradition. Aristotle’s physics and cosmology dominated the Western world until the early Renaissance, despite the fact that they were wrong. Perhaps his greatest legacy is his method of observation, data collection, and analysis that became the bedrock of the sciences and the social sciences.

It is difficult to sum up the life and work of someone like Aristotle. He not only possessed a brilliant, hungry mind, but he must have had considerable leadership skills to organize schools, influence leaders, and animate his ideas for his students and future generations of scholars.

ARTS

Conventionally art and aesthetics seem incompatible with corporate situations and relationships. There appear to be unbridgeable differences between aesthetic and economic modes of thinking and acting; subjective experiences of art and aesthetics do not fit into the economic imperatives of an objective-ridden rationality, with its orientation toward control and its goal of maximizing profit. Supposedly irrational, art and aesthetic processes have come to be seen as irrelevant to the business world and have been neutralized or repressed. When not excluded outright, art has been placed in a subordinate or economically functional role (for example, treated as an investment or an asset). Art and aesthetics represent the “other” of functional, rational, and utility-oriented economic reasoning and leadership acting. When one views the worlds of art and leadership in this superficial, stereotypical manner, they appear to have very little in common: They appear to differ in motivation, in methods of operation, in responsibility, and in manner of interaction with others.

However, under the surface of these apparently opposite worlds there exist genuine similarities. The leadership scholar Abraham Zaleznik believes that business leaders have more in common with artists, scientists and other creative thinkers than they do with managers. While management is instrumental and purpose-driven, leadership can be interpreted as an art form, in and of itself. It is characterized as much by its artfulness as by its skills and technical sites (De Pree, 1989; Vaill, 1991).

Much artistic form and many artistic processes are unrecognized as such because they address issues and preoccupations of everyday life in the business world implicitly rather than explicitly. If we are to explicate and realize them more consciously, we need to push the limits of aesthetics by looking at the intersection of art and daily life. It becomes necessary to rethink the conception of the relations between art and life in a way that considers more

adequately the role that art and enacted aesthetics play in the performed lives of leaders of organizations and in the performance of leadership. Given this pragmatic perspective, art and aesthetic experiences are present as a part and source of potential value for everyday organizational life, in both work settings and leadership practice.

Despite the potential significance of art and aesthetics in organizational life and leadership, relatively little theoretical and empirical research has addressed these neglected dimensions. Notably absent from the agenda of “modern” organization research and practice so far are studies of the phenomenological roles of embodiment, emotions, and the significance of expressive aesthetic processes for the organizational culture.

Since the last decade of the twentieth century, however, there has been a growing interest in aesthetics in organizations. Several significant streams of research indicate that aesthetically rich experiences are relevant for organizations and leadership. Beyond the use of art as artifact or metaphor for different aspects of corporate life, participation in and interpretation of artistic practices have been advocated by theorists and practitioners in a variety of contexts, including analyses of organizational skills, creation of narratives, cultivation of intuition, strategizing as creative action, improvisation, and innovation.

UNDERSTANDING ART AND AESTHETICS

Etymologically deriving from the Greek *aisthesis*, aesthetics comprises expressions that designate embodied sensation and perception taken as a whole, prior to the assignment of any cognitive or artistic meaning. The Greek verb *aisthanomai* denotes the capacity to perceive with the senses. According to Gregory Bateson, having an aesthetic experience means being responsive to the pattern that connects, giving the subject a feeling of wholeness and of belonging to an expanded reality. Phenomenologically, art and aesthetics are constituted by embodied-perceptual, emotional-responsive, and expressive-communicative relationships. Aesthetic knowledge comes from embodied and perceptive faculties of hearing, sight, touch, smell, and taste. Thus aesthet-

ics requires full engagement and refinement of sensibilities in support of human perception. Implicitly, then, aesthetics relates to experiential and transformative processes. This implies that the essence and value of art are not in artifacts per se but in the dynamic and developing experiential activity through which those artifacts are created and perceived. As the philosopher John Dewey expressed it, aesthetic experience simultaneously engages body, mind, and sensibility, thereby connecting reason and emotion in a synthetic way.

For having an aesthetic experience, an “aesthetic attitude” has been proposed as a basic requirement. The aesthetic attitude is one of openness and attentiveness to experiencing an object or process aesthetically. It suggests that there is a certain way to look, hear, feel and perhaps imagine an object or process that lends itself to a more profound experience. The aesthetic attitude is qualitatively one of detachment from purpose. Thus to experience an object or process truly aesthetically is to experience it for its own sake, and not for any practical or ulterior motive. The aesthetic attitude is thus characterized by disinterestedness and distance from any instrumental relation to the object or process. An aesthetic experience has a value in itself and not only as a means for some other purpose or experience. However, despite the romantic ideal of appreciating art for art’s sake, people cannot ignore who they are and where they have come from in their experience of art. In the pragmatic spirit of breaking barriers between imagination and reason, it can be argued that art can be experienced simultaneously for its social, moral, and intellectual value, and not just for its own sake. An aesthetic lens simply shifts the attention to that which is sensuous and pleasing in an object or process, a focus that does not deny or exclude other valid aspects of perception. As for the existence of an aesthetic attitude, it is important to place emphasis on the attentiveness and openness that one must have in experiencing an object or process aesthetically. The form and content of aesthetic experiences are response-dependent, qualitative, or expressive dimensions of the object or process. Aesthetic responses can then be followed by aesthetic interpretations, aesthetic judgments, and

aesthetic communication, for a tremendous overall transformational potential.

CRITICAL, UTOPIAN, AND PRAGMATIC DIMENSIONS OF ART

The transformational potential of aesthetic processes, both as creation and reception, refers to its capacity to call into question one’s sense of what is real and its ability to offer a sense of what is possible. Hence, artistic processes and experiences are productive irritants (the critical dimension) that offer a vision of what can be (the utopian dimension), and with that vision, access to creative changes that can lead to a different-shaped practice (the pragmatic dimension). What leaders can learn from art is that reality extends beyond conscious rationality. Art’s non-rational elements give it the power to go beyond instrumental rationality. By using the fantastic, leaders may reveal unrecognized assumptions and neglected visions: Art can help people see beyond the taken-for-granted meanings of things. Art’s critical dimension makes it possible for people to escape established principles of reality. The encounter with art makes perceptible, audible, visible and expressible that which is no longer, or not yet, perceived, heard, seen or said in everyday life. In doing so, art can make people aware of new and different perspectives on familiar or novel phenomena. What the playwright Bertolt Brecht called the “estrangement effect” of art can free people from ordinary ways of thinking that blind them to the strangeness of the familiar. Art does this by breaking the habits of organized routine and making it possible to see the world as though for the first time. In this way art provides a sense of new possibilities, particularly when old solutions are no longer effective.

With its utopian potential, aesthetic experience provides those involved with a taste of qualities of experience that are typically not accessible or available in corporate contexts, dominated as they are by exchange value and instrumental reason, the profit motive, and the performance principle. By being “unreal,” art awakens people to the possibility that things could be otherwise; art provides an emancipatory opportunity to play, giving the mind’s eye and sensibility free rein. An aesthetic experience frees

people to examine particulars without the pressure to classify them under a general concept or purpose.

When one uses metaphor and imagination as tools to explore the realms of “as if,” it becomes possible to probe the particular for its possible meanings. One can construct alternatives, and one is open to diverse passing sensations rather than being preoccupied with the effort to corral the experience under a single determinate concept. Being valuable intrinsically, aesthetic experiences and deployed imagination offer a relative freedom from the governance of concepts and from predetermined interests, whether moral, practical, financial, or other.

LEADERSHIP AND AESTHETIC PROCESSES

Leadership is typically defined today as noncoercive, accepted influence—that is, leadership is the exercise of interpersonal influence in a given situation, directed toward the attainment of goals or objectives. To accomplish extraordinary things, leadership challenges accepted organizational processes by searching for opportunities, experimenting, and taking risks. Leaders inspire a shared vision by envisioning the future and enlisting others; they enable others to act by strengthening them and by fostering collaboration. Leaders set a good example, plan small wins, and encourage their followers by recognizing contributions and celebrating accomplishments.

Art or aesthetic processes are relevant for most of these leadership activities. Seen as a perceptual practice, aesthetic processes pervade the fabric of organizations and everyday leadership activities, experiences, responses, judgments, and communications.

Because artistic forms of leadership often involve attempts to envision organizational life differently, and because that vision may lead to alternative practice, aesthetic processes of leadership need to be considered as transformative forces capable of reshaping people, structures, and whole worlds in an ongoing process of interrelating and creation.

CREATIVITY AND CREATIVE LEADERSHIP

Etymologically the word creativity can be traced back to the Indo-European word *kere*, meaning “to

make something grow” (Weiner, 2000, 8). In today’s context, creativity can be seen as a social construction, and as such, cannot be a unitary, universal, or fixed trait possessed by only a few people. Creativities vary in time and space. In the twenty-first-century business world, work and leadership take place in intensified interpersonal relations, and creative activity occurs in non-routine settings. These exigencies in turn require creative forms of labor—workers who are able to produce and leaders to manage the process. This is why leadership needs to instill or evoke creative processes, and it is this that explains the intensified quest for creativity. “Creative leadership” has acquired buzzword status in recent years. An increasing number of seminars on creative leadership are held at executive programs and trade fairs; textbooks used in MBA programs deal explicitly with the phenomenon; recruitment ads for managerial positions give elaborate job descriptions stressing the necessity of creativity; and, perhaps most importantly, managers have begun to describe themselves as creative leaders. Leaders are seen and see themselves as “homo creativiticus,” as creative actors, causers of creativity. Creative leaders not only take an active part in the (re)production of a creative field, but also (re)affirm their own creative identities: Their creative becoming is an act of (self) consecration that gives them the legitimacy that allows them to define creativity. Critically one can ask what happens to the creative potential if it is aligned and adapted to appropriateness and orientated toward particularly business (financial) objectives.

ENVISIONING AND IMAGINATION

One important task leaders undertake is to offer and instill visions, describing concepts and ideas through exciting images. Pictures fill in the conceptual void when words fail to express what leaders are trying to relate. Envisioning and imagination can be interpreted as the capacity to intuit possibilities. They can serve to arrest attention and inspire the imagination and creative expression, with many possible positive ramifications for the organization. Central practices for envisioning and imagination is first creative perception—that is, seeing differently, then sensing

how the emergent pattern can inform future possibilities, and finally presencing, which describes the accessing of inner sources of creativity and will. The resulting vision of the future permeates all decisions and actions, energizing, aligning, and empowering organization members to make the vision real. With an artistic sense of imagination, leaders can empower followers to feel wonder and awe and to fantasize—to see something that is not real or present, to see new possibilities and paths. It is the capacity to imagine new possibilities for action that allows leaders to respond to unfamiliar and surprising circumstances or information.

In other words, leaders must use their emotions, think metaphorically, and read life experiences for their meaning. Imaging calls for facility with all kinds of images—pictures, stories, metaphors, and visions—to make sense of information and communicate effectively. It is imagination that organizes the vast array of embodied experiences into schemata and structures that enable leaders to achieve coherent, patterned, and unified representations of the world around them. It is indispensable for their ability to make sense of experience and to find it meaningful. Thus imagination provides the basis for deep and creative exploration and is an essential element for any sense making. Integrating emotional and rational capacities, imagination helps people find connections, draw inferences, and solve problems.

THE ART OF LEADERSHIP PERFORMANCE

Performance can be understood as learned, learning, and re-created constitutive acting and achieving of all kinds. If we think of organizations and leadership as a form of performance art and drama, we can undertake a significant study of the stage upon which the performance is enacted and of the plot, setting, theme, construction of character and roles, and interaction, failures, and conflicts of daily organizational life.

Leaders are actors who play roles and characters with a “theatrical consciousness” (Mangham and Overington, 1987, 221) in the theater of organizations. The theater in which the drama unfolds is not

a contextual play but fundamentally influenced by the organization’s history and culture.

With this, performed action can actually mean different things at different times and to various agents in diverse relational constellations. The leadership scholar Patricia Pitcher identified three types of leaders: artists, who are people-oriented, open-minded, intuitive, and visionary; craftspeople, to whom the adjectives humane, dedicated, and wise best apply; and technocrats, who are detail-oriented, rigid, methodical, self-centered, and, when left in control, pose a serious threat to corporate competitiveness. The power struggles between these types are dramas being played out in companies everywhere. According to Pitcher, whether the drama has a happy or an unhappy ending depends entirely upon which type gets top billing.

IMPROVISATION

Improvisation is an aesthetic competence that is becoming more and more important in the current business world of complexities and ambiguities. Improvisation is a situational process and an artistic performative action taken in a spontaneous and intuitive fashion. It is flexible and highly contingent upon emerging circumstances and action. Improvisation stresses the importance of adapting and reflecting while acting, rather than just following plans (scripts, routines, standard processes and so on). In improvisation, composition and execution converge, and therefore it requires mindfulness and responsiveness for unfolding opportunities and problems in real time. In other words, improvisation depends highly on the ability to go with the flow of the situation. Improvisers do make the best use of the entities and energies present at the time, instead of imposing control. Improvisation is an ecstatic experience, an irruption, which is characterized by a sense of immediacy, suddenness, surprise and transgression of predetermined plans and predictability. Because improvisation is part of the practice of an “aesthetics of imperfection” (Weick, 1995), it defies measurement and method. Nevertheless, although improvisation happens on the spur of the moment, it can still be purposefully prepared and triggered.

Lewis Mumford on Artists of a New Generation

*Lewis Mumford (1895–1990) wrote on topics ranging from urban planning to literary criticism. In this excerpt from his book *In the Name of Sanity* (1954), he reflects on the importance of artists leading the way in helping new generations understand themselves.*

So, instead of furthering the present processes of automatism, instead of submitting to a love-denying and life-strangling routine, our hope lies in restoring to the very center of the mechanical world the human personality, now lost and bewildered and hungry in the jingle of mechanisms it has created. Where our ancestors sought power alone, we must seek control; where our predecessors were interested only in causes and means, we must become equally interested in purposes and goals. That is why art and religion and ethics have a significance for the present generation that they did not enjoy even a decade ago; and that is why the arts themselves, precisely because they are among the central expressions of the personality, have a peculiar importance in helping us to understand our present predicament and to find a way out of it.

It is against this broad general background that I should like to place the more immediate problems of our time. Already, through the artists, we begin to catch a gleam, if only from a distance, of new manifestations of life, warmed by a humanity we were almost ashamed to confess, guided by ideals that had long been deflated and cast aside. If the changes we have been discussing were only a minor eddy, only a passing fashion, it is probable that the mood of the new generation, with its fresh respect

for the traditional, the classical, the intelligible, the communicable, with its acceptance of ethical norms and civic responsibilities, with its unabashed embracement of emotions it had hitherto concealed as if shameful—if these changes were only on the surface, they would probably be followed by another outbreak of revolt. But if a much more sweeping redirection of human life actually impends, then perhaps the new movement will become even more central, because it will help, in time, to redefine the nature of the creative act, and will, by example, unite men in a common effort to make the expression of love and beauty, significance and order, the core of all human endeavor. In a somewhat weakly retrospective, if not reactionary, form, we have long seen this change taking place in older writers like Aldous Huxley and T. S. Eliot, who were among the first to explore the bleak Waste Land of the soul left at the end of World War I. The younger artists are now carrying their example even farther, in taking a more responsible attitude toward their audience; in accepting, in the spirit of Sophocles, the arduous duties of citizenship, and in cleaving to the great ethical issues of our time, they will in turn find their intuitive attitudes confirmed by a more conscious formulation of our common problem.

Source: Mumford, Lewis. (1954). *In the Name of Sanity*. New York: Harcourt, Brace and Company, pp. 114–116.

Therefore improvisation is a “disciplined craft,” whose skills can be learned through continual practice and study and applied as needed (Crossan et al. 1996, 25). The entrepreneur and innovation scholar John Kao notes that improvisation is a blend of discipline and art, that it entails being able to move between that which is established and that which is new, between form and openness, between the security of the familiar (standards) and innovation (experimentation), and between expertise and freshness (naïveté).

Effects of improvisation refer to its altering usage of structures in creative ways that enable the re-figuring of structural foundations of performance (Hatch 1999), not only reading the world in a novel way, but favoring discovery and engaging into truly entrepreneurial action (Kirzner 1979) and to engage

people and groups (Lowe, 2000). Accordingly, improvisation has been suggested as a model for more-spontaneous strategic decision making and change management. It would, some theorists have suggest, be an effective means of circumventing intra- and interorganizational political resistance in situations of time pressure, change, and uncertainty, particularly when the optimal information and resources are not available. Furthermore, the act of improvisation lets leaders learn from real events and test imagined solutions on the spot. In this way, improvisation facilitates the synthesis of learning and imagining.

PRACTICAL IMPLICATIONS

As we have seen, art and aesthetic processes can contribute beneficially to the practice of leadership. But

how can one enhance a leader's aesthetic capacity through artistry and art practically, and what does it take to support artistic processes?

To practice artistic forms of leadership requires special encouragement. Creativity and risk taking must be valued, uncertainty tolerated, and operational flexibility supported. Generally, there are no ready-made recipes for artful and creative leadership. But leaders can be facilitators of aesthetic processes and of employees' creativity by adopting such practices as considerate and supportive supervision and the provision of complex, challenging jobs that offer high levels of personal satisfaction. Leaders can encourage involvement, give positive feedback, and support skill development. They can also develop appropriate rewards structures. On an organization-wide level, leaders can help create a more arts-friendly environment (e.g., by supporting an entrepreneurial culture (Pinchot & Pinchot, 1999)). For themselves leaders need to learn from and cultivate an artist's facility for finding fascination, allure, and attractiveness in everyday events and things.

Leadership education, in addition to teaching specialized skills and providing knowledge, ought to develop potential leaders' artistic capacities as well. Integrating art, artist and artistic process into training can serve as sensual, visual or conceptual media and catalysts for educating future leaders. For enhancing creativity in leadership, practical improvisational theater techniques as described by Koppett (2001) and artistic excursions (for example, to experience dance, music, theater, poetry and literary arts, or visual arts and architecture) are useful. Aesthetic competencies can be developed by engagement of the senses or by experimenting with physically making artifacts (pottery, drawing, photography), as well as through the mindful use of games, storytelling, and forms of collaborative inquiry.

Artistically oriented leadership education stimulates deep learning (Quinn, 1996) in concert with innovative or generative learning, and contrived experiences (e.g., simulations and role-plays). As for leadership development, art and leadership are close in actual practice (Smith, 1996; Palus and Horth, 1996).

PERSPECTIVES

Aesthetic experience of artworks and aesthetic processes can be used as an instructive guide for fashioning everyday experiences and lives of leaders and leadership differently. It can contribute in releasing those qualities and competencies, much needed in the current and future business world.

Aesthetically reflective and artistically oriented leaders enlarge their sense of what is possible for managing to lead, more creatively. Integration of the arts into leadership not only results in multiple ways of knowing and experiencing the world, it also aids social coherence, supports to practice emotional competencies, and encourages critical thinking and visionary capacities. Leadership inspired and guided by art integrates learnable qualities of "artful making" (Austin & Devin, 2003) collaboration and play as tools for dealing with complexity, embraces ambivalences and uncertainties, and innovates reliably under deadline pressure. Art facilitates work with overlapping or multiple meanings, contributing thereby also to a tolerance for ambiguity. The effective executive, then, should be well versed not only in the analytical and logical-rational patterns of leading but also in non-logical, intuitive, and aesthetic patterns of leading.

There are, however, limitations and ambivalent qualities associated with art and aesthetics in the context of leadership. One limitation comes from the character of artistic processes themselves: Artistry can be disruptive, deconstructive, deceptive, delusional, and just plain boring or wrong. Furthermore, art and aesthetic processes are often idiosyncratic and evanescent and tend to be non-calculative and unpredictable—one reason why leaders sometimes block aesthetic processes and creative actions (genuine creativity) proposed by their subordinates. Integrating more aesthetic processes can threaten leaders' status and power, and they will be blamed if new practices, strategies, or goals have a negative effect on the organization. Furthermore, art can be not only innovative, it can also be conservative. It can be used for validating and reinforcing already practiced actions, beliefs, and events. In order to realize the potentials and reap the full benefits of integrating art and context-sensitive

leadership, our very understanding of leadership itself must change. What is needed is a kind of transformation of leadership towards an aesthetically responsive leader-follower relationship based on a relational understanding of those involved. In such an approach, the individual person of the leader and each individual follower and their situated context are the emergent products of relational processes. With the focus on relationship instead of leadership, it becomes possible to shift attention to what transpires between people, as opposed to focusing on what is contained within them. This implies that one can move away from the heroic-leadership stereotype, with its dyadic perspective and unidirectional power orientation, and towards a more reciprocal-influence processes associated with shared or distributed leadership. By taking into account art and aesthetics, an integrative and more holistically oriented understanding of the leadership practice can be attained. This can lead to truly authentic transformational leadership, in which all parties share an interest in mutual development and in the development of the organization as a whole. Essentially, learning and practicing art can be a source of potential transformation and added value for the corporation. In the future, leaders who understand how art and artists work and who develop a sense of artful practice themselves will have an advantage over leaders who do not. The integration of art and leadership takes a circuitous and spiral path rather than a linear one because the very nature of artistry transcends much of the myopic, one-best-way approach that characterizes much of conventional leadership. Therefore the integration of art and leadership should itself be understood as a work of art, as an open-ended process of continual creation.

ATATURK, MUSTAFA KEMAL (1881–1938)

Founder of modern Turkey

Born into a lower-middle-class family in Turkey as the Ottoman Empire crumbled, Mustafa Kemal Ataturk became one of the most respected, or detested, leaders in modern history. He was respected for leading the creation of a secular government in Turkey and detested for the same reason.

As a boy, Ataturk displayed signs that he would become a leader. He frequently strived to be better than his playmates and often, during games, would rather watch his playmates play and accept challenges only from the strongest or fastest boys. At age twelve Ataturk quit attending the local Islamic mosque-run school. His rebellious thoughts and sense of superiority became too challenging for religion-based learning. Soon after, however, Ataturk gained the confidence of a neighbor boy who attended the Military Secondary School in Salonika and whose army officer father could arrange for Ataturk to attend the military school. Ataturk had been intrigued by the self-confidence displayed by military officers who strutted around town and decided that he, too, must become a military man.

During his education at the Military Secondary School, Ataturk was exposed to the Western writings of French political philosophers such as Jean-Jacques Rousseau, Voltaire, and Montesquieu. Exposure to contemporary writings from the Enlightenment (the period during the 1700s in Europe and the United States when the West was emerging from centuries of ignorance into an age of reason, science, and respect for humanity) and

strictly secular teaching at the military school created in Ataturk a desire for national progress. Born “Mustafa,” Ataturk was given the second name of “Kemal” (the perfect) by a mathematics teacher at the military school who was impressed by Ataturk’s superior performance as well as his rapid ascent to the rank of pupil-teacher.

During his teenage years Ataturk revealed to his closest associates his disgust with Turks who viewed the West and its political and societal progress as an affront to Turkey’s future. His education and daily exposure to turn-of-the-century Constantinople (now Istanbul), which grew richer and more exciting because of Western influences, further enflamed his desire to bring his country out of what he felt were the dark ages and up to the standards of contemporary civilization.

After graduating from Military High School (1899), the War College (1902), and the War Academy (1905), Ataturk, now a staff captain, was assigned to various commands where his military professionalism and outspokenness earned him the reputation of being a nationalist visionary and a dangerous rebel. Ataturk earned military respect by leading several victorious military campaigns, some of which were assigned to him by Ottoman government officials—who were displeased with his successes—in order for him to fail. Having established his credibility as a leader through battlefield successes such as his bayonet charge at a battle at Gallipoli (1915) in World War I and having stretched his superior’s comfort level with his success and criticism of the Ottoman sultanate, Ataturk resigned from the army to become a civilian in 1919.

During the next five years, Ataturk survived arrest orders, assassination attempts, and political rivalries and helped establish the rival government Turkish Grand National Assembly (TGNA) as the diplomatically recognized and leading authority on Turkish interests. During these years, Ataturk signed various peace treaties with, and defeated in battle, countries that initially attempted to parcel out and control Turkey. He signed peace treaties with Italy, Russia, Germany, Armenia, France, and Azerbaijan. He defeated Greece and Great Britain in battle.

FIRST PRESIDENT

In 1923 Ataturk was elected the first president of Turkey. He immediately sought, and the TGNA passed, sweeping reforms to create a secular government to ensure Turkey's future. Ataturk believed in "using your head and not religion" as a guide for progressive and successful government. In 1924 the TGNA decreed the sultanate abolished and deported the Ottoman family. During the same year the new Turkish government, under Ataturk's leadership, also abolished the religious education system and replaced it with a uniform civil education system. Shari'a (Islamic law) offices were systematically closed to prevent religious influence on politics, and soon after religious and sectarian convents were closed. Above everything else instituted by Ataturk's secular government, the halt of all religious encumbrances upon the business of the state still is a divisive topic in Turkey.

Given that a leader's success or failure can be measured by how his or her actions affect an individual or group of individuals, Ataturk's reformist measures to convert the Ottoman Empire into Turkey directly affected two groups: Orthodox or radical Muslims and non-Orthodox Muslims. Assessments of the specific changes implemented by Ataturk to

develop Turkey into a contemporary with Western powers are mixed.

CULTURAL CHANGES

To further Turkey's advance into modernity, Ataturk ensured that the Turkish Grand National Assembly ordered adoption of the international calendar (replacing the Islamic calendar) as well as adoption of Western-style civil, penal, and commerce codes. Regarding communication, Ataturk felt that the use of archaic Arabic script kept many Turks from learning to read and write. Ataturk ordered that a new "Turkish alphabet" similar to the Latin alphabet be created and

that a plan of implementation be presented to him. When the plan was returned to him for review, Ataturk deemed the five-year timetable too slow and ordered that all Turks learn the new alphabet in three months or not at all. Soon the entire nation was learning the new alphabet, and Ataturk, acting as the chief instructor, ordered other national leaders to teach as well. Ataturk realized that a citizenry with a literacy rate of less than 15 percent could easily be manipulated by ignorant or morally objectionable people. Today Turkey has a 94 percent literacy rate for males and 77 percent for females and has some of the top universities in the world.

In 1934 the TGNA adopted a law requiring surnames for all Turks and bestowed the surname of "Ataturk" (father of Turks) on Mustafa Kemal. One of the last progressive reforms during Ataturk's governance occurred the next year: In 1935 the TGNA granted voting rights to women in parliamentary elections.

Throughout the reformation of the Ottoman Empire into Turkey, Ataturk was respectful of religion but demanded separation of mosque and state. With more than 95 percent of Turks claiming a single religion, only a leader with Ataturk's vision and diplomatic skills could have led the separation of

religion from government. Whether Ataturk was a visionary with great diplomatic skills who gained the support of Turkish executive and military leaders, or a dictator/tyrant who demanded complete loyalty is and will always be a topic for debate. What cannot be questioned, though, is his ability to lead. He strengthened his goals by welcoming and soliciting ideas and plans for Turkey's reconstruction even if they were contrary to his vision. He successfully countered ideas that were not in line with his goals. His firm belief and unshakable faith in his vision of creating a secular state from an Islamic-dominated frontier gained followers who at times viewed him as a deity among men.

describes those perceptual and cognitive processes used to understand the causes of human behavior. After observing another's behavior, perceivers often try to make sense of it by ascribing different motivational tendencies, causes, and underlying characteristics to the actor. The observer's beliefs about the causes of the actor's behavior then determine not only the observer's reactions, but also the observer's future expectations for the actor. Attribution theory offers insights for the study of leadership: If an observer perceives the causes of another's leadership behavior to be due to the actor's leadership qualities, a leadership attribution will occur and leadership behavior will be expected in the future.

DEFINITIONS OF LEADERSHIP

Organizational leadership has been conceptualized as one person's influence over others in ways that affect the work of that other person. In their classic text *The Social Psychology of Organizations* (originally published in 1966), Daniel Katz and Robert Kahn note that influence based on leadership is distinct from influence based on authority that may stem from one's position in the organization or from job demands. The cognitive psychologist Howard Gardner has defined leaders as those who "significantly influence the thoughts, behaviors and/or feelings of others" (Gardner, 1995, 6). In the organizational research domain, leadership is often defined as "the interpersonal influence exercised in situations and directed, through the communication process, toward the attainment of a specified goal or goals" (Tannenbaum, Weschler, & Massarik, 1961, 24). Leadership effectiveness is then measured by the achievement (or nonachievement) of these goals, as well as by followers' satisfaction with such goals. One commonality underlying these different definitions of leadership is the importance of follower perceptions and attributions in the recognition of a leader. In fact, from a social-cognitive perspective, leadership can be defined as "social perception, grounded in social-cognitive psychological theory, that produces an influence increment for the perceived leader" (Lord & Smith 1999, 195), which is the definition adopted in this entry.

ATTRIBUTION PROCESSES

One of the most frequently studied areas of person perception is attribution theory. Attribution theory

Attributions play a major role in leadership perceptions. It is the perceptions of observers and the attributions they make regarding the causes of the leadership behavior, as well as their perceptions of the causes of the outcomes obtained, that make observers perceive other as leaders. The scholars James Meindl and Sanford Ehrlich underline the importance of the process of attribution when they observe that leadership is a social construction process centered in the perceiver, as does Katherine Farquhar when she states that “leadership emerges from follower attributions over time” (Farquhar, 1995, 165). Though followers’ perceptions of leadership are born of the attributions they make for the behaviors they observe, it is also clear that a leader’s personal characteristics have a major impact on this process.

ATTRIBUTIONAL PROCESSES AND LEADERSHIP

In their seminal article on attributional processes in the leader-member relationship, Steve Green and Terry Mitchell stress that there is a cyclical, mutually influencing process of leader attributions, leader behavior, follower attributions, and follower behavior. While this entry focuses on only half of this process—the attributions followers make concerning leaders—many of the same principles apply when considering a leader’s attributions regarding followers.

Consider the following example. If a new business executive takes charge of a corporation that is already performing well, and that company continues to perform well, its profitability is often attributed to stable forces outside the leader’s control: The leader is often not given full credit for the success. If, however, a leader is put in charge of an organization that is performing poorly and organizational performance improves, the leader, rather than external forces, is usually seen as causing the shift in the organization’s performance, and attributions of leadership ability increase. In other words, an organizational leader is considered successful based not only on the outcomes he or she achieves, but also on how and why people perceive those outcomes to have come about.

ATTRIBUTION THEORY

People explain organizational events or observed behavior by attributing those events and behaviors to certain factors. In addition to identifying the immediate cause of an event, attributions can focus on who or what was responsible for the event, be it an individual or the constraints of the situation. Attributions can also pertain to the personal qualities of the actors in question. Similarly, attributions can be made regarding one’s own behavior (self-attributions), with consequences for both future expectations and satisfaction.

Many studies have examined how people use attributions to decide if an actor’s behavior was successful or not. One guiding framework for study was proposed by the psychologist Bernard Weiner and his colleagues, who suggested that attributions could be classified in terms of what caused the behavior, the stability of the behavior, and its controllability. The causality dimension examines whether the observer perceives the actor to be causing the event or outcome in question or whether the perceiver believes the event or outcome to be beyond the actor’s control. The stability dimension notes whether the perceiver believes that the cause of the event or outcome will remain stable over time. Finally, the controllability dimension addresses whether or not the actor can control his or her behavior regarding the event or outcome in question.

Using this framework, attributions then fall into one of eight categories determined by the interrelation of their causality, stability, and controllability dimensions. Factors and characteristics that are given an attribution of uncontrollable include ability (internal, stable), mood (internal, unstable), task difficulty (external, stable), and luck or chance (external, unstable). Analogous controllable factors and characteristics include effort (internal, stable), temporary effort (internal, unstable), consistent help or bias from others (external, stable), and unusual help from others (external, unstable). When events or behaviors are viewed by observers as being due to internal, stable, and controllable factors, they are thought to reflect an actor’s intentions and underlying disposition. Actors, in turn, can use the fact that

their accomplishments are seen as resulting from internal, stable characteristics as a way to generate expectations for the outcomes they hope to produce.

CAUSAL SCHEMATA

Observers may attribute causality to others via the activation of causal schemata. Causal schemata, as conceptualized by the social psychologist Harold Kelley, are general conceptions about patterns of cause and effect that can apply in a wide range of circumstances. These schemata develop as a result of our day-to-day interactions with others and represent the ways in which we understand how specific effects develop from specific causes. They act as causal shorthand, allowing the observer to infer cause with little information or evidence: They help people to make causal inferences when information is incomplete.

One causal schema is the discounting principle, which states that a perceiver will discount the effects of one potential cause of an event if other potential causes are available. Often perceivers insufficiently discount actor-related causes when there are adequate situational explanations for an event (that is, they make a fundamental attribution error), causing an increased tendency to make dispositional inferences such as leadership attributions. Another is the augmenting principle, which states that when both an inhibitory cause and a facilitative cause are present, perceivers give the facilitative cause more weight. These two causal schemata are important in understanding the relation of performance outcomes to leadership perceptions.

In an article published in 1985, Randal D. Hansen and Christine A. Hall reported that discounting generally had a greater effect on causal attributions than augmentation. Their study found that a candidate who won an election by a large margin was more likely to be expected to win again in the future than a candidate who won by a smaller margin. However, the candidate who lost by a large margin was judged no more likely to lose again than a candidate who lost by a narrow margin. When winning by a narrow margin, it seems the candidate's personal potential was discounted because other explanations were

available for his or her winning (luck, for example, or poor competing candidates). In contrast, augmenting schemata tend to be used with large victories. When the candidate lost (whether by a large or small margin), observers could think of many reasons for his or her not winning, but the effects of these factors did not work together to strengthen (augment) the belief that he or she would lose again.

SALIENCE IN THE ATTRIBUTION PROCESS

Research has shown that causal attributions correlate with attention such that when observers attend to a certain individual in any situation, they tend to ascribe causality to the observed individual. In their classic article "Salience, Attention, and Attribution: Top of the Head Phenomena" (1978), Shelly Taylor and Susan Fiske discuss the salience hypothesis, which states that the more salient an actor is, the more an observer will ascribe a causality to him or her rather than to external stimuli or to other less salient actors. In a situation with a clear leader, an observer's attention is focused on the leader, and he or she is often seen as the cause of an event, even when that is not the case. This may be because perceivers spend little time thoroughly examining causal agents; instead they rely on the most salient information to make snap judgments, what we colloquially describe as making a judgment off the top of the head.

When perceivers search for the cause of any event, they will often stop their search when a simple, sufficient cause is found. Due to the salient nature of a leader's role, the leader is often seen as a sufficient cause for events, and the perceiver looks no further. This top-of-the-head process may be closely related to leadership categorization. That is, if one is looking for a single, sufficient cause of performance, and one can categorize a person as a good or bad leader, then a sufficient causal explanation has been automatically created and no more processing is necessary.

Observers also tend to attribute proportional causes to proportional effects. That is, an observer will most likely attribute a large effect to a large cause. Because of the salient nature of leaders, they

are often thought of as large causal factors. In choosing between alternative causes, however, people do not simply select the most salient one. Rather, they may use a more complex process of weighting different forces, making use of the discounting and augmenting principles discussed earlier.

SPONTANEOUS TRAIT INFERENCES

Some of the most commonly studied attributions are based on inferences made about an actor's underlying disposition based on his or her behavior. Referred to as dispositional attributions, these are at the heart of social-cognitive psychological principles such as the correspondence bias and the fundamental attribution error. These principles maintain that an individual's behavior is often assumed to reflect his or her underlying personality or disposition, even when situational explanations for behavior are readily available. That is, the observed behavior is thought to be due to the stable personality of the actor. While that assumption is sometimes erroneous, inferring dispositions from behavior helps people describe and understand others, gives them an idea of what to expect, and prepares them for interactions with those others. Often these attributions regarding disposition are not made consciously, but rather are made spontaneously when information is gained and initially encoded. Hence, these attributions are referred to as spontaneous trait inferences (STIs). Because leadership attributions are made in the same manner as other attributions, the perception that someone possesses leadership qualities may well be a type of STI.

Empirical research has shown that STIs are associated with both the actor and the action that he or she is performing, and that these inferences will disappear if information becomes available that negates a personal causal attribution. That is, if the situational constraints are visible to the observer, the observer will take those limitations into account when assigning causality to the resulting behavior or event.

Although STIs are spontaneous, they are not automatic. Research has consistently shown that certain contextual preconditions must be in place before STIs are made. Without the right context cues, or

without a minimal amount of attention being paid by the observer, STIs will not occur. The biggest precondition for STIs is that the actor be deemed responsible for his or her actions and for the outcome of the situation. It is important to realize that when we automatically recognize someone as a leader, we are making a type of STI. However, this process has often been described by leadership researchers in terms of perceivers' implicit leadership theories.

IMPLICIT LEADERSHIP THEORIES

Judging the leadership capabilities of others may also depend on the observer's own implicit leadership theory (ILT). ILTs most likely develop from consistent exposure to leaders and leadership situations. After repeated interaction with leaders, category prototypes may develop. These category prototypes represent the traits that typically occur together in a given domain, and once these traits become linked, the observer need only be exposed to a subset of them to activate the entire prototype and make an STI of leadership.

An ILT perspective explains how observers categorize actors as leaders or non-leaders. When an actor's behavior matches the schema an observer currently holds regarding what a leader is and does, that person will be classified as a leader. When events are attributable to the situation rather than the actor, or when the actor is engaging in behavior that does not match the observer's ILT, the observer does not perceive the actor to be a leader. This leadership perception process is perhaps more explicitly understood in the context of the leadership categorization theory as developed in the early 1980s by Robert G. Lord, Roseanne J. Foti, and James S. Phillips. This theory states that when recognizing leaders, observers first recall leader prototypes and then match the current leader to the prototype. In this way the prototypes provide a structure for the observer to encode or retrieve information.

Implicit theories are recognition based, in that we recognize a leader because of his or her similarity to a schema or an implicitly held theory. This idea diverges from Kelley's original notion of person per-

ception, in which observers were thought to operate as naïve scientists, making judgments based on an examination of the situation rather than based on preconceptions. In his 1967 covariation model of attribution, Kelley suggested that people examine the distinctiveness, consistency, and consensus of the situation to decide whether to make a situational or a dispositional attribution. It seems, however, that people are more primitive in their perceptions of others and use implicit theories of others' behavior to help them recognize and understand others' behavior rather than relying on more comprehensive, scientific processes.

Followers often have a normative prototype of a stereotypical leader to which they then compare the actor they are observing. In 1995 Farquhar found that although individuals do share ILTs, or leadership schemata, situational constraints also affect follower perceptions. He also emphasized the importance of early attributions, as they seem to shape later leadership attributions.

THE ROLE OF ATTRIBUTIONS IN LEADERSHIP PERCEPTIONS

An attributional model of leader behavior examines the process by which followers assign leaders responsibility for the outcome of a situation. More specifically, this research focuses on how observers decide if the outcome was due to the leader's behavior or to situational factors. Research indicates that observers will hold a leader responsible for those outcomes only if certain preconditions are in place. As mentioned earlier, if forces outside of the leader's control led to a successful outcome, the leader would not be given credit for this result. However, if the outcome is seen as arising from stable, internal qualities in the leader, a causal attribution is more likely to be made.

The process of attributing an outcome to a leader's behavior is illustrated by the performance cue effect described in 1977 by Terence R. Mitchell, James Larson, and Stephen G. Green. In this paradigm, subjects are given false information on the performance of a hypothetical or real leader's subordinates or organizational unit, and then the sub-

jects are asked to rate the leader. Subjects judge the leader to be more effective and more leader-like if the performance information they were given was positive rather than negative. These results are explained in terms of the subjects' retrieving leadership information in a biased fashion, consistent with the performance cue. Performance cue effects also interact with causal attributions, being greater if the leaders were perceptually salient and, thus, more causally important.

The belief structures of individuals can also act like perceptual salience to increase causal leadership attributions. This process is discussed in Meindl and Ehrlich's 1985 theory on the romance of leadership. Their research revealed a bias on the part of followers toward viewing leadership as a causal force in situations where performance is extremely good or extremely poor. Observers seem to overestimate the amount of influence leaders have in these types of situations, especially successful situations. These findings resonate with the traditional attribution research that posits that observers tend to ascribe causality to a particular target person rather than taking the effects of the situation into account.

Leaders may also receive more causal attributions because of their assumed effects on others. In organizations, causal attributions are particularly important for top-level leaders, who may influence followers through indirect effects that are distributed throughout company channels, or that are distributed over many years. Because such effects are hard to trace, followers may substitute ILTs for careful causal analysis of outcomes and as a consequence may overestimate the causal effect of top-level leaders.

RECENT AND FUTURE LEADERSHIP RESEARCH

Recent leadership theories have again turned their focus to the attributes of the leader, especially the charismatic qualities of leaders. Charismatic leaders are those leaders who, in communicating their vision to their followers, actually shift followers' foci from the followers' individual needs and aspirations to collective aspirations. Leaders who use charisma in this manner are often called transformational leaders.

Transactional leaders, in contrast, develop a transactional relationship with their followers in which followers exchange compliance for a lower-quality leadership relationship.

Although these leadership theories may seem similar to traditional trait theories of leadership, they are better understood by examining the attributional processes involved. When a leader is perceived as charismatic, that perception is actually an attribution of charisma on the part of followers. Those leaders with an organization-changing vision or who act in unconventional ways are likely to be more salient and are therefore more likely to be seen as charismatic. Further, leaders who make personal sacrifices for the good of their followers are likely to activate augmenting causal schemata that lead to perceptions of internal causality for their actions. Thus on those grounds too they are more likely to be seen as charismatic.

Problems with Attribution and Leadership Research

One major problem associated with the application of attribution theory to leadership theory is its lack of precise conceptualization of leadership. Attribution theory aids in the understanding of leadership, but it is hard pressed to thoroughly explain, define, and measure leadership by itself. Rather, it helps explain the cognitive processes underlying leadership perception. Attributional theory can lend prototype matching, the use leadership schemata, and reliance on ILTs to the study of leadership, but none of these tools provide guidelines that specify how leaders should behave in order to be effective.

A second problem with the study of attributions in leadership research is that our own intuition may lead us in the wrong research direction. That is, intuitively we may feel that we understand what a good leader is, or what a good leader does, and we may simply wish to study the qualities we associate with a good leader. The danger is that those implicit and heuristic applications of “common sense” may not in fact be the products of common sense at all.

A third area of concern centers on how to design research that taps these implicit processes. It is always a challenge to get at perceptual processes that

happen quickly and unconsciously on the part of the observer. Unfortunately, implicit processes are often studied with explicit measures, yielding inconsistent results that are difficult if not impossible to interpret.

A fourth problem with attribution theory may be the assumption of a top-down perspective. ILTs, leadership schemata, and prototype matching research all suggest that leadership perception may operate more as a data-driven sense-making process than as a traditionally viewed attribution process in which attributions occur before one attempts to make sense of behaviors. Researchers should rather recognize that bottom-up and top-down perceptual processes combine to influence leadership perceptions.

Future Research Avenues

This entry has focused on the attributions followers make regarding leaders and has avoided two-way causal analyses connecting leaders and followers. For a more complete understanding of the role of attributions in leadership perception, one should examine leaders' causal attributions as well as those of followers, as attributions in both directions are likely to affect the dyadic relationship between any leader and follower. Practical research by Wofford and colleagues even suggests that leaders may change their behavior based on attributions for poor subordinate performance or the accessibility of transformation and transactional leadership scripts.

Future research on attributions and leadership may also want to take more dynamic modeling systems into account when it comes to explaining human cognitive processes. Traditional attribution approaches based on naïve-scientist models of perception appear less successful than the primitive, perceptually guided approach. Research techniques that better tap these implicit rather than explicit processes are required to gain a better understanding of the role of attribution in leadership perception.

One of the most intriguing research areas may be examining the point in time when the observer's perception of the actor changes—when the actor moves from a leader to non-leader category, or vice versa. Such shifts may be the result of an accumulation of

information causing a rapid change in the way the actor is perceived rather than resulting solely from a discrete event. Thus, to an outside observer such discontinuous change may seem to come out of nowhere, while at other times the shift may be brought about by a clear stimulus or behavior.

Similarly, more advanced statistical analyses may explain the leadership categorization process more effectively than traditional linear modeling does. By considering leadership perceptions and category prototypes as mental attractor states (stable patterns of interpretation that people settle into over time) people's shifts in attributions of leadership or non-leadership may be better understood.

Research on attractor states has shown that once an individual settles into an attractor state (for example, categorizing another as a leader), it is very difficult to change this attractor. (In this example, it would be very difficult to change the observer's attribution of leadership to the actor.) Changing the attractor requires increased effort, attention, or additional information. More recent research, done in the late 1990s and early part of the twenty-first century, has also begun to look at attractor states created through dyadic interactions and has examined the stable attractor regions that interpersonal relationships may settle into. These dyadic attractors may cause each actor to engage in behavior that he or she would not normally engage in outside of that particular relationship. Future research may want to examine attributions as attractor states, the conditions necessary to categorize someone as a leader, and then the conditions needed to change these attributions. Only by examining social-cognitive phenomena as dynamic systems shaped by the attention, knowledge, and biases of the observer, constraints of the situation, and actions of the actor, can the role of attributions in leadership perception be fully understood.

AUTHENTICITY

Authenticity is the condition or quality of being authentic, trustworthy, and genuine, free from hypocrisy. An authentic person must actually possess the apparent attributes that others see, so that if you appear to be sincere, you would actually be sin-

care on the inside as well as in the persona you present to the outside world. Authenticity in leaders has important positive implications for others in the organization and in the organization's culture.

Today, authenticity is critical to leadership, yet there are so many examples in politics, corporations, nonprofit organizations, and in daily relationships where this quality is missing. The Enron scandal brought the authenticity of the corporation's leaders into question with its employees, shareholders, and the public. Political leaders who have said one thing but done the opposite cause people to be cynical or skeptical about their trustworthiness. In a time when few secrets can be kept for long, members of organizations look to people in positional leadership and evaluate their behavior based on whether they should be believed, and therefore whether they deserve their active cooperation and support.

A leader's behavior impacts those around them. Persons who hold a management position are metaphorically in the spotlight to their employees. Others watch them more closely and use their actions as justification for their own behaviors. The next section details examples of how a leader's behavior elicits responses in others and affects the organization's environment. When positional leaders choose to engage in their own journey toward greater authenticity, their modeling affects others and their organization.

THE IMPACT OF AUTHENTIC BEHAVIOR ON OTHERS AND ON THE ORGANIZATION'S CULTURE

Authenticity is made up of a cluster of behaviors. It is somewhat like "quality"—hard to define but recognized when experienced. This section identifies a

Executives and Personnel Managers on Executive Traits

*In his book *The Organization Man*, sociologist William H. Whyte, Jr., examined the emerging clash between individuality and conformity in American society. The following extract reports on his study of what executives and personnel managers looked for in executive talent.*

"Because the rough-and-tumble days of corporation growth are over, what the corporation needs most is the adaptable administrator, schooled in managerial skills and concerned primarily with human relations and the techniques of making the corporation a smooth-working team."

"Because the challenge of change demands new ideas to keep the corporation from rigidifying, what the corporation needs most is the man with strong personal convictions who is not shy about making unorthodox decisions that will unsettle tested procedures—and his colleagues."

The response was spirited. Many of the hundred who answered jumped on me for asking such a question, but most of them did choose one way or the other and, more importantly, they went into their reasons at length. The vote: presidents voted 50 per cent in favor of the administrator, 50 per cent in favor of the other type; personnel men: 70 per cent for the administrator.

variety of behaviors and qualities that support and make up authenticity.

When individual leaders practice *integrity* between their actions and beliefs those around them perceive them to be authentic. When others view their leaders' invitation to engage with them and the organization to be genuine, it gives them permission to be authentic as well. This enriches the dialogue between organizational members and raises the quality of their relationships with each other.

Authenticity is not an end goal but rather a lifelong journey—a commitment to a journey of greater and greater integration between words and actions. Being authentic allows people to be fallible human beings, because authentic behavior by definition acknowledges the wholeness that makes up an individual—the strengths and gifts, as well as the areas that need improvement. As individuals become more authentic, their ability to be candid about their faults and mistakes increases the honesty in an organiza-

tion. The overall impact of leaders modeling authenticity is the creation of a climate of authenticity within the organization.

Trusting behavior is defined by the degree an individual is willing to share his or her thoughts and feelings with others. Trustworthiness is measured by others being willing to share their thoughts and feelings with another because they know that what they say will not be used against them. Authenticity implies being both trusting and trustworthy because authentic individuals will share their responses with others and their promises will hold an honesty and integrity that can be proven over time. When leaders model trusting behavior, it invites others to trust them in return. As both trusting and trustworthy behavior becomes a part of the way people relate to one another, it allows people to talk frankly with each other. Authenticity cannot be learned or practiced without honest conversation. Speaking truth therefore helps authenticity and integrity to develop among people and in organizational cultures.

The degree to which individuals can practice authentic behavior is related to their ability to know themselves. This self-awareness is necessary to an understanding of one's motives and ability to be candid and honest with others. Self-awareness is developed in part through disciplined reflection and being present to what is occurring in the moment. In September 2003, a spoof on National Public Radio reported the development of a new psychological disorder, the "functional executive disorder." This disorder was said to occur when executives become so focused on getting their tasks done that they lose sight of the deeper meaning in their work and their impact on others. Other symptoms include forgetting conversations and not seeing the implications of their actions over time. While this disorder is mythological, we have all seen these symptoms in our workplaces. Being present to others makes others feel appreciated. This appreciation and focus helps slow others down so they too can live in the present moment. Helping others live in the present supports their own efforts to become more authentic through self-awareness and reflection, activities that need time to cultivate.

Another behavior that emerges out of living more

authentically is the ability to laugh at oneself and the situation. When one does not have to protect a false image, the willingness to be candid and truthful about the situation increases. When a leader can see the *humor* in a situation, it allows other individuals to see humor in their own behaviors and reminds them not to take themselves so seriously. Laughter opens up people to positive emotions and facilitates personal change by decreasing defensiveness. The presence of joy and humor in the workplace allows people to work with each other in positive ways and diminishes cultures of judgment.

Part of authenticity is the transparency of personal motives. Authentic individuals are not without motives, but their motives are not hidden. The absence of hidden motives enhances the quality of dialogue about actions and decisions. Usually authentic individuals are seen as not being driven by self-interest. Rather, they are seen as "having their hearts in the right place," as transcending self-interest. The impact on others is significant. First, it gives individuals permission to contribute to the larger community without need for self-protection and defense. Second, it contributes to the development of a culture that has integrative power. Integrative power is the power to integrate a system so that it works together without silos, departmental empires, or self-protection. When integrative power exists in an organization, people in that organization or system are predisposed to trust, care, and be willing to collaborate with one another to get things accomplished. This tends to reorient the work to something larger and more meaningful than just getting the job done or earning the sales quota. The shift from self-interest to more meaning and purpose connects the individual and the organization to something larger than themselves. In this sense, they begin to hold more altruistic beliefs.

Authenticity invites a different quality of relationship into an organization. When relationships are built on integrity, trust, honesty, and meaning, the nature of relationships becomes more like a covenant than a transaction. In a covenant framework, others are treated as sacred, demonstrated in part by treating others with care and respect. This generates relationships that are mutually enriching. A *covenant*

relationship, by definition, transcends legal obligations and employee contracts and goes beyond minimum standards. This standard of relationship can also extend to the larger community and nature, so that decisions are made from the framework of their impact on others, the larger community, and the environment. When people experience covenant relationships, they feel valued and safe. Over time, this creates an organizational culture that models care of employees and enables a community to form within the workplace.

The journey toward authenticity is linked with one's spiritual journey. As one comes to know oneself in deeper ways, the search for greater meaning and the development of a relationship with a transcendent power usually follows. Many of the processes linked with increased spirituality, like reflection, genuineness, being present, and searching for meaning, are similar to the qualities and processes that support the development of authenticity. When a positional leader pursues knowledge and practices related to spirituality, it impacts others by inspiring them and the organization to create deeper meaning for their work.

Being genuine in one's interactions with others lends a legitimacy and validity to the actions and decisions that arise from those interactions. This legitimacy increases trust in interpersonal relationships and spreads throughout the organization's culture. An organization that pulls a defective product off the shelves, despite the cost to their bottom line, actually increases the legitimacy of their organization over the long term.

IMPLICATIONS FOR LEADERSHIP

The concept and associated qualities of authenticity are applicable to the practice of leadership for many reasons. In times when positional leaders—whether they be politicians, corporate leaders, police commissioners—are viewed with widespread cynicism, people tend to search for authentic leaders. When employees see inauthentic behavior in their organizational leaders, they will be self-protective, cautious in their dealings, tend toward self-interest, and offer feigned responses when asked their opinions. If

these kinds of behaviors become widespread, they can lead to the eventual failure of the organization. In studies of significant failures and scandals associated with disasters like the Three Mile Island nuclear power plant accident, the Enron and Andersen accounting scandals, and the 11 September 2001 terrorist attacks, there is evidence that knowledge existed within the system or outside the systems that could have prevented the size of the disaster. This knowledge was either not spoken about by the observers who saw the problem or, if it was spoken about, superiors failed to listen because of issues related to authenticity.

If employees believe that it is unsafe to speak the truth in an organization, they will often choose self-protection and remain silent. Or if they do speak up, their supervisors may not want to listen because the information may make them look bad or unsupportive of larger agendas of their supervisors. This silencing of disturbing feedback would be lessened if a culture of authenticity existed. An organization that valued authenticity in its leaders and employees would encourage the sharing of honest feedback even if it was difficult to hear, because maintaining appearances and egos would not be as important as being true to one's values, beliefs, and perceptions.

Authentic leadership can have a startling effect on the quality of an organization or community. What would happen if we treated each other with honesty and respect? What would happen if we could trust and believe in the genuineness of our positional leaders? Or if we believed that our leaders were not operating from self-interest? What would happen if we were able to laugh at our mistakes and learn from them? And what would happen if leaders were candid about what was happening, instead of spinning information for the best effect? The amount of organizational waste of time, money, and energy that emanates from inauthentic behavior is enormous. Authenticity either in pockets or throughout an organization could transform not only the interactions and relationships among people but have a long and lasting effect on the overall value and success of the organization and the communities and nations it touches.

AUTOCRATIC LEADERSHIP

A popular saying, often seen these days on T-shirts worn by suburban matrons, reads: “Because I’m the Mommy, that’s why!” This innocently humorous slogan contains a core of truth, and it also expresses what many scholars regard as the essence of autocratic leadership: “Do as I say, because I’m telling you to do it!”

The first systematic study of leadership styles was undertaken by Kurt Lewin and his colleagues and published in 1938. Using as subjects a group of ten-year-old children at a YMCA, Lewin examined the reactions of the children to adult leaders who had been instructed to use one of three leadership styles: *autocratic* (the leader makes all decisions), *democratic* (decision making is shared by leader and fol-

lowers), and *laissez-faire* (the followers make all decisions themselves).

Most research in leadership has focused on autocratic and democratic leadership styles, since *laissez-faire* leadership is usually perceived as the lack any meaningful leadership (except in cases where the followers are motivated and knowledgeable experts concerning the task at hand). Traditionally, the distinction between the other two forms of leadership has involved a dichotomy between people and task. Democratic leaders have been seen as those who are principally concerned with the people they lead; autocratic leaders are perceived as being primarily concerned with the accomplishment of a job or mission.

More precisely, autocratic leadership is usually seen as having four characteristics: (1) the leader makes all important decisions; (2) the leader is primarily concerned with task accomplishment, not the happiness or satisfaction of followers; (3) the leader maintains considerable social distance from followers; (4) the leader motivates followers by punishment (or the threat thereof), rather than by rewards.

Although the autocratic approach was once the dominant form of leadership in human affairs, it has fallen out of favor in the present age (with some notable exceptions), often replaced by more democratic or humanistic styles. But it is unacceptably simplistic to say that autocratic leadership is “wrong” at all times and in all circumstances, and it is just as inaccurate to argue that democratic leadership is always “right.” This entry examines autocratic leadership in its psychological, social, and organizational contexts in order to provide a clearer understanding of what this form of leadership is, when it may be effectively used, and when it should be avoided.

PSYCHOLOGICAL PERSPECTIVES

In tests measuring various facets of personality, persons identified as highly autocratic also tend to score high in Abasement (they feel depressed when they cannot handle a situation), Aggression (they are quick to attack, blame, and take revenge on others),

and Achievement (they are strongly motivated to do their best, and are very results oriented). Conversely, they tend to score low on intraception (they rarely think about their own motives or those of others), Nurturance (they are often unsympathetic and unfriendly), and Social Values (they do not regard the love of people as important). Of course an autocratic leader who also scores high in Machiavellianism (which combines a tendency toward calculation with a low regard for other people) will usually strive to conceal these personality characteristics from others, since manifesting them can reduce the leader's ability to exercise control.

Autocratic leadership is closely tied to the authoritarian personality type. The concept of the authoritarian personality, which was developed by Theodore Adorno and his colleagues in 1950, posits a personality that tends toward religious and political conservatism, a desire for power, resistance to change, emotional coldness, and hostility toward out-groups. Adorno and his colleagues devised a psychological test, the F Scale, that measured personality between the polar opposites of Authoritarianism and Egalitarianism.

There is a strong positive correlation between authoritarianism and autocratic leadership behavior. Leaders scoring high in authoritarianism are much more likely to prefer punishment over reward as a motivator, to function well in highly structured situations, and to discourage participation by followers in decision making. Some studies also suggest that high authoritarianism tends to correlate with other personality traits such as political and social conservatism, racism, anti-Semitism, and high levels of religious devotion.

However, authoritarianism plays a role in followers' behavior, as well. Just as authoritarian leaders are most likely to manifest autocratic behavior, so too are authoritarian followers most likely to indicate preferences for such leadership. The research demonstrating this tendency goes back at least half a century. In 1952 a number of college students were surveyed as to their preferences for a presidential nominee in that year's election. Those who scored high on the F-scale (demonstrating a high degree of authoritarianism) overwhelmingly picked General

People ask the difference between a leader and a boss. The leader works in the open, and the boss in covert. The leader leads, and the boss drives.

—Theodore Roosevelt

Douglas MacArthur, a highly authoritarian public figure, as their preferred candidate. Since then, a large number of studies have reached essentially the same conclusion: Persons high in authoritarianism strongly preferred a leader (whether political, religious, social, or job-related) who was task oriented, structuring, directive—and autocratic. Moreover, when asked to discuss their own work situations, highly authoritarian employees reported the greatest satisfaction working for supervisors who were also high in authoritarianism and the lowest degree of satisfaction in situations where the leader was perceived as low authoritarian.

SOCIAL PERSPECTIVES

The practice of, and preference for, particular forms of leadership (autocratic, democratic, or laissez-faire) are strongly influenced by social factors. Widespread social anxiety, for example, seems to provide a popular desire for (or, at least, tolerance of) autocratic leadership. Western culture continues to maintain the myth of the “Man on the White Horse,” the strong, heroic, autocratic figure who arises during a time of great crisis, takes control, and saves the day.

Although this phenomenon of social anxiety has been observed in the origins of both Fascist Italy and Soviet Russia, the classic modern example is the rise of Nazism in Germany during the 1920s and early 1930s. Following its defeat in World War I, Germany began to deteriorate as a nation on almost every level. National pride had been devastated by both the loss of the war and also by the Treaty of Versailles, which required Germany to admit guilt for the war, pay huge reparations, suffer military occupation, and severely limit the size of its military. The economy was a shambles, with both rampant inflation and high unemployment. Various political parties were

agitating for change, which often led to riots in the streets. As a result of these conditions, the average German of the period was angry, depressed, and anxious. Along came Adolf Hitler and his fringe political party, the National Socialists (Nazis). Hitler did not offer Germans democracy as the solution to the nation's problems. Instead, he promised strong, autocratic leadership that would, he claimed, restore national pride, reinstitute law and order, and crush those allegedly responsible for Germany's difficulties. He received widespread support and was named chancellor in 1933, in part as a result of his party's electoral successes.

During roughly the same period, the United States also underwent an economic and social crisis, but with a different result. Although the economic depression that began in 1929 devastated the economy, created massive unemployment, and led to a host of social problems, Americans did not exchange their democratic form of government for a system of autocratic leadership. This is not to say that some were not tempted, however. Around the country, demagogues tried to take advantage of the widespread anxiety and resentment by promising to solve the nation's problems in return for unlimited political power. Most of these would-be leaders had only regional appeal at best, but one had national appeal, Huey P. Long, the charismatic senator from Louisiana. Long claimed that he could cure the economic crisis by confiscating wealth from the nation's millionaires and redistributing it to those in need—an autocratic approach if ever there was one. A dynamic public speaker, he made effective use of radio to sell his "Share Our Wealth" plan and generated considerable national support. Only his assassination in 1935 prevented him from mounting a serious challenge to President Franklin Roosevelt in the 1936 election. But the autocratic appeals of demagogues never seriously endangered the nation's political fabric, partly because (1) America had a longstanding tradition of democracy, (2) President Roosevelt's New Deal programs were seen as a genuine effort to improve the lives of the economically afflicted, and (3) U.S. entry into World War II in late 1941 united the country, provided the economic stimulus needed to blunt the effects of the

Depression, and made criticism of the government seem unpatriotic, if not treasonous.

Other cultures foster different approaches to leadership. As William Ouchi noted in 1981, Japanese society has produced an approach to business management that combines democratic and autocratic elements. On the one hand, Japanese corporations actively involve employees in decision making. Through the use of "quality circles," for example, these companies bring employees together from all levels—production workers to vice presidents—and each member has a chance to affect corporate policy. Japanese firms also expect a great deal from their employees in terms of working hours, loyalty, and obedience to authority figures within the organization.

Another important social dimension of leadership involves gender. Unlike biological sex, gender is a social construction, and a considerable body of research addresses the relationship between gender and leadership style. It is worth noting that traditionally the most autocratic institutions (the military, law enforcement, organized religion, and the corporate world) have tended to be the most resistant to the admission and the advancement of women.

Much early research was marred by cultural biases. A number of studies concluded that women were not effective leaders because the prevailing culture held as a given that women could not lead effectively. The next generation of leadership research included many studies that found that women tended to be nurturing and democratic leaders, often because cultural assumptions were that women were more nurturing and democratic than men. More recent research has tended to demonstrate that the relationship between gender and leadership style is not cut and dried. Rosenfeld and Fowler concluded that, although gender seemed to manifest itself differently in democratic leadership (male democratic leaders tended to be analytical, forceful, and in need of the love of people, while female democratic leaders were nurturing and open-minded), there was no significant difference found between the personalities of male and female autocratic leaders.

Other studies have found that women managers are actually more autocratic than their male counter-

parts and are frequently perceived as such by their employees, including other females.

ORGANIZATIONAL PERSPECTIVES

It should be clear by now that there is no clear-cut answer to the question of whether a particular leadership style produces greater organizational efficiency, higher profits, or increased employee satisfaction. A variety of factors determine which form of leadership is likely to be more effective.

Organizational culture plays an important role. Some organizations are characterized by autocratic leadership. Their members have learned to expect it, and those who join such organizations anticipate, and may even prefer, such a leadership approach. The military provides a good example. Military organizations have as their essential goal the conduct of war. Combat often calls for quick decisions, and it requires leaders to give orders that put subordinates' lives at risk. These conditions would seem to require autocratic leadership, at least a good deal of the time. Consequently, military organizations in all nations and eras have evolved a culture emphasizing discipline, order, and unquestioning obedience. Those who enlist in the military expect as much, and those who choose military careers are likely to have a strong preference for autocratic leadership, or at least a high tolerance for it.

Other organizations, such as those involving religious hierarchies, are based on the assumption that the organization takes its authority directly from God, and that its leaders are the designated interpreters of God's will. Leadership in such organizations tends to be autocratic, since God's will, once expressed and interpreted by the leadership, ought not to be the subject of debate. Not all religions have adopted a hierarchical structure that encourages autocratic leadership. But some have—most notably the Catholic Church, along with several of the larger Protestant denominations.

In the business world the picture is less clear. Although many businesses, especially large corporations, tend toward hierarchy, the forms of leadership exercised tend to vary widely, as do the theoretical prescriptions for the ideal leadership approach.

To a large extent the form of leadership exercised in the workplace is a function of the employer or leader's view of the workforce. In Douglas McGregor's classic paradigm, a manager subscribing to Theory X believes that employees are lazy, untrustworthy, and motivated mostly by their wages. Such a viewpoint generally leads to autocratic leadership. Conversely, a Theory Y leader sees employees as interested in their work and motivated by a variety of factors, including pride, comradeship, and approval. A manager with this perspective would gravitate toward more democratic leadership.

The extant literature on leadership in the business world suggests that autocratic leadership is useful in some contexts and should be avoided in others. Autocratic leadership leads to more accurate decisions when the leader is well versed in the subject under discussion. It can increase worker productivity—but only when the leader is present. Such leadership improves worker performance, but only on relatively simple tasks. It also tends to reduce communication problems.

Autocratic leadership seems to be most appropriate in cases in which employees are new and untrained in their jobs. It works best with larger groups. It also seems to be called for when detailed instructions or high-volume production are necessary. It can be appropriate in situations where time is limited, employees challenge the leader's authority, or a business or department has been mismanaged by a prior leader. Autocratic leadership is also useful when work frequently must be coordinated with other divisions of the company.

But autocratic leadership has its downside. It is associated with higher turnover rates and with increased aggression among employees. It decreases employee performance on complex tasks and seems to hamper creativity. This approach also tends to increase employee alienation and resentment and to decrease morale, employee satisfaction, and loyalty. An autocratic approach often leads to lower morale and consequent increased absenteeism. Further, it tends to be less effective with the current generation of employees than it was with those raised in a more traditional and structured culture.

Autocratic leadership should not be imposed in

situations in which a high level of employee creativity is called for or where a democratic leadership model has already been established. It should be avoided in cases where employee resentment is already high or where there is a recent history of work stoppages or other rebellious behavior.

It can thus be seen that autocratic leadership is multifaceted. Like all leadership choices, it must be considered carefully and applied judiciously, if it is used at all.

B

BANK OF AMERICA

In 1945, with \$5.6 billion in assets, Bank of America Corporation (BOA) became the largest private sector bank in the world. This distinction, attained forty-one years after its establishment in 1904, is largely attributable to the vision, drive, and strategies of one man, A. P. (Amadeo Peter) Giannini, the bank's founder and de facto leader for almost all that period.

FOUNDING A BANK FOR THE SMALL INVESTOR

Bank of America, founded under the name Bank of Italy in San Francisco, California, was created out of Giannini's frustration and entrepreneurial drive. Giannini (1870–1949), the son of Italian immigrants, was already a successful businessman. He had built his family's wholesale produce company into the largest in the region and, at age thirty-one, had sold out his interest and semiretired. He became interested in banking in 1902, after inheriting his father-in-law's position on the board of Columbus Savings and Loan in North Beach, San Francisco's Italian enclave.

At that time, the working class hid their savings, often in gold, in their homes, and when they needed money, they went to loan sharks. Most of North Beach's immigrant population did not speak or

write English and had never been inside a bank. There were several Italian-owned banks, but they did not see any value in doing business with individual customers who had minimal assets and financial needs.

Giannini saw something else when he looked over North Beach. He saw the collective value of tens of thousands of small depositors and borrowers and he saw the credit worthiness and reliability of the hard-working immigrants. As a director, he began pressuring the bank's leaders to actively solicit those customers he labeled "the little people."

Columbus Savings and Loan's leaders did not share Giannini's vision nor would they extend their services to the bulk of North Beach's residents. Frustrated and confident in his own ideas and abilities, Giannini decided to organize his own bank. He gathered a group of local Italian businessmen, including three former directors at Columbus, and one non-Italian, an experienced banker named James Fagen, to lead the new bank.

The men launched the bank with \$300,000 in capital raised by the sale of 3,000 shares of stock to 160 investors. In an era when banks were typically closely held, Giannini tried to ensure that no one individual would have undue influence by suggesting that the directors and officers limited to owning one hundred shares. On 15 October 1904, the first branch of Bank of America opened for business.

SERVING THE IMMIGRANT MARKET

The bank was organized in keeping with Giannini's vision. While most bankers worked behind closed doors, Giannini and his managers took to the streets to solicit business from the local residents. From its earliest days, Bank of America was also an aggressive advertiser. It specifically offered loans under \$100. Giannini shrugged off the criticism of local competitors who felt such aggressive marketing was unseemly. He believed, and often said, that business worth having was worth pursuing.

When the Italians of North Beach entered the bank, they discovered that Giannini had located his bank's managers' desks out in the open on the lobby floor. He himself worked there, greeting customers as they entered the bank, answering questions, and often, taking a moment or two to socialize. The bank employed Italian-speaking tellers, who filled out deposit slips and loan paperwork for those customers who had not yet learned English. These strategies worked and the bank began to grow. By the end of 1905, the bank's first full year in business, it boasted an asset base of \$1.02 million.

THE PATERNAL LEADER

Giannini demanded that the bank's employees follow his lead and treat customers with respect. Employees were also expected to maintain high ethical standards. At the time, it was common for loan officers and other bank employees to maintain personal business ties with individuals and companies that were customers of their bank. Anxious to avoid conflicts of interest and the potential for fraud, Giannini forbade these relationships.

He exhibited the paternalistic attitude of that era's enlightened executives. For instance, he called employees "his boys and girls" and actively discouraged divorce, gambling, and anything other than a staid, conservative lifestyle. At the same time, Giannini won the fierce loyalty of the employees who toed the line with a merit-based system of advancement, generous benefits, profit sharing, and one of the nation's early employee stock ownership

plans. Employees owned 40 percent of the bank's stock by 1949.

OPPORTUNITY IN DISASTER

It was Bank of America's response to the Great Earthquake and Fire of 1906 that secured its future in San Francisco. On 18 April 1906, the city was rocked by an earthquake, which ignited fires that raged out of control for the next few days. One third of the city, including the bank's offices and 3,700 of North Beach's 4,000 residences, was destroyed. A quarter of a million people became homeless and property losses were estimated between \$350 million to \$500 million.

Giannini had reacted quickly to the earthquake and removed the bank's cash and its records to his home outside the city. When the fires died down, he ensured that Bank of America was among the very first to reopen by placing a bag of gold on top a makeshift counter of barrels and planks set up on the Washington Street wharf. The bank immediately started making the loans needed to rebuild the community. Giannini also pressed loans on the local ship captains, urging them to bring in the lumber that would be needed to rebuild the city.

Thanks in large part to the bank's support and Giannini's aura of strength and confidence, North Beach was rebuilt in less than a year, the first section of the city to be restored. Its residents, grateful for the financial assistance, chose Bank of America as their bank. Net assets rose to \$1.89 million in 1906. Giannini later said it was the response of North Beach's residents that convinced him to remain a banker for life.

Because of Giannini's astuteness, Bank of America also prospered through the Panic of 1907, which produced a run on San Francisco's banks. Early in the year on a trip to New York, he had seen warning signs of economic instability and on his return quietly began to build the bank's reserves of gold. When the bank run began in San Francisco in October, Giannini had the gold stacked in the teller's cages and offered it to customers who wanted to withdraw their deposits. The gold had a calming effect that enabled Bank of America to weather a storm that caused the

failure of sixteen local banks and to end the year with another gain in net assets to \$2.22 million.

BRANCHING OUT

The San Francisco branches of two large Canadian banks also navigated the Panic of 1907 with ease. Their performance stimulated Giannini's interest in the concept of branch banking, a business structure that would become his greatest ambition and challenge. In 1908, he traveled to Canada to learn more about the concept and practice of branch banking.

In Canada, Giannini observed how the branch system spread from community to community, creating a wide and ever-growing customer base for a bank. The opportunity to collect deposits and make loans grew proportionally with the bank's expansion. Branch banking was also good for smaller cities and towns, which instead of being restricted to the locally generated financial power, now gained access to the combined assets of the entire system. Giannini decided that Bank of America would establish a statewide system of branches to serve California.

This was a radical idea for a U.S. banker. Although branch banking is an accepted industry practice today, in the early twentieth century, most banks were locally held independent businesses. Typically, the only branch banks that existed were offices located in the same city as the parent bank. A more elaborate or extensive system of branches was illegal in many states. In others, such as California, branches were not expressly forbidden, but required the permission of state regulators.

Nevertheless, in October 1909, the bank acquired the ailing Commercial and Savings Bank of San Jose and established it as its first branch outside of San Francisco. The purchase set in motion a strategy of acquisition and expansion that would make Bank of America the world's largest bank as well as place it at odds with its industry and state and federal governments for decades to come.

FLEXIBLE STRATEGY, ONE VISION

The story of how Bank of America grew over the next two decades provides a case study in corporate

strategy and ultimately, industry transformation. At first, Giannini worked through the state's Superintendent of Banks, gaining permission to "save" banks that were failing and to open branches in underserved communities. By 1912, in this cooperative fashion, Giannini was able to establish four branches and grow the bank's assets to \$11.2 million.

In 1913, Giannini expanded into Los Angeles. That city's bankers organized stiff resistance to the competitive incursion, but they were unable to successfully counter Bank of America's business model, which continued to appeal to customers of all classes. Flush with success, Giannini expanded still further. By 1919, the bank had twenty-four branches and assets of \$137 million. It became California's fourth largest bank.

At the same time, Bank of America's fast rise had created a storm of criticism, especially from competitors. They helped persuade the state banking regulators that Bank of America's rapid branch growth was not financially sound. Convinced, California regulators notified the bank that it would no longer approve its requests for additional branches.

To solve this dilemma, Giannini turned to the federal government. He created holding companies and continued his expansion under the Federal Reserve System, over which California's regulators had no control. Then, in 1927, he used the auspices of the McFadden Act, which extended membership in the Federal Reserve System to all nonmember banks, to unite the separate units into one entity. Bank of America now had 289 branches and \$765 million in assets. It became the third largest bank in the United States.

BANK OF AMERICA DURING THE GREAT DEPRESSION

In 1929, Giannini formed Transamerica Corporation, a holding company that was utilized to expand Bank of America's statewide chain of branches into a nationwide chain by purchasing banks across the United States. The bank was so strong that the Great Crash of October 1929 and onset of the Great Depression had little effect on its fortunes.

In 1930, at age sixty, Giannini gave up his position at the bank and retired. He turned the leadership

over to two bankers, Elisha Wood and Jean Monnet, who had been expressly recruited for just that purpose. Neither, it turned out, had the ability to carry the bank through the deepening economic depression. As conditions worsened through 1930 and into 1931, the bank's growth faltered and its new leaders decided to abandon Giannini's vision of a nationwide system of branches. Further, they announced plans to sell off major pieces of the banking empire already established.

Infuriated, Giannini announced his intention to regain control of the bank and began a proxy battle aimed at ousting the new leadership. The long-term policy of encouraging small and widespread stock ownership paid off in the pitched battle that followed. In February 1932, Giannini and his management platform won control of the company. Giannini fulfilled his promise of reviving the bank. He led the effort to rebuild the business, using marketing techniques, service, and new products such as installment loans. By the next year, the bank was growing again. At the outbreak of World War II, Bank of America had \$2.09 billion in assets.

Giannini's vision of nationwide branch banking was harder to regain. The New Deal was not meant to foster business empires, and throughout the late 1930s and the war years, Bank of America fought a running battle with the federal government. In 1936, the bank had 466 branches and a decade later, in 1945, it had increased that number by only 29. Nevertheless, with over \$5 billion in assets, Bank of America was the world's largest private sector bank.

Giannini retired again that year, turning over control of the bank to his son Mario, a long-time bank executive. Even as a retiree, he continued to fight both the Federal Reserve Board and the Security and Exchange Commission, which was attacking the bank on antitrust grounds. He did not live to see the bank exonerated, but died at age seventy-nine on 3 June 1949.

Bank of America remained the world's largest bank until 1980, when defaults on international loans cost it billions of dollars in losses. The bank began growing again in the 1990s, and in 1998 it merged with the nation's third largest bank, Charlotte, North Carolina's Nations Bank. The new bank boasted

assets of \$617 billion. In 2002, Bank of America had 4,200 branch banks in 21 states and the District of Columbia—the largest retail branch network in the nation. A. P. Giannini's vision of a nationwide chain of branch banks had been achieved.

BARRIERS TO WOMEN'S LEADERSHIP

The women's movement has challenged the notion of predetermined gender roles as "natural." Gender roles are instead socially constructed classifications that are inspired and furthered by the overarching influence of patriarchy within society, communities, and families. It is thus imperative that these fundamental, patriarchal classification schemes are challenged and deconstructed. The fundamental structure of Western patriarchal society depends upon an understanding that males are superior, more powerful, and that they represent the "norm," whereas women are understood as inferior, lacking in power and autonomy, and secondary. The power of socialization that underlies this system cannot be ignored. In fact, sexist, patriarchal values are so deeply engrained in society's consciousness that they are largely invisible. The very fabric of social organization has been woven by males, for males, to support males. In many bureaucracies, whether they are governmental or corporate, most of the upper positions are held by men. Women are generally concentrated

in the lower, supportive positions necessary to keep this male leadership in power. Thus, the power, prestige, and privileges of those in positions of power, generally males, depend on the subordinate position of women. This ordering of power thus has serious consequences for women's leadership.

Numerous strategies have been attempted to overcome these barriers to women's leadership, particularly within the workplace. The goal is fair representation of women within corporations, politics, the professions, religious organizations, and unions. But there are limits to promoting equality within the structures that are maintained by patriarchal values. Through existing male-dominated organizations, men have come to view their perspectives and norms as being representative of wider, gender-neutral human organizations. With this perspective comes an assumption that the structure is asexual. This results in an undervaluing of women's knowledge and experiences. Even when women move into leadership positions, they are conditioned by the perspectives and power structures to maintain the status quo; while gender composition may be changed, the underlying structure of power, knowledge, status, and wealth is not challenged. Simply put, male dominance is the main obstacle to women rising to top positions in corporations and politics. Furthermore, traditional gender roles, still widespread in society, are barriers to women climbing corporate ladders. Current value systems largely support the notion that it is better for the family if the father is employed and the mother takes care of the majority of parental responsibilities. Unsupportive attitudes from family, friends, and co-workers may have negative effects on women's work and their roles in society.

THE GLASS CEILING

To understand the limited movement of women into prominent positions of leadership, concepts such as the "glass ceiling" have come into wide use. The term is commonly used to describe the invisible barrier that blocks women's chances of further promotion or advancement up the corporate ladder. The glass ceiling is not simply a barrier for individual women, but it also applies to women as a group, who

are kept from advancing simply because they are women. Subtle, indirect obstacles as a result of labeling or stereotyping place stumbling blocks in the career paths of many women.

There are numerous causes of the glass ceiling for women. One important cause is occupational segregation. The labor market, and especially executive positions, remain segregated by gender. Women executives are largely concentrated in specific areas, such as personnel, public relations, and even finance specialties, which seldom lead to the most powerful top-management posts. The route to power generally taken by presidents and chief executive officers is that of the business mainstream, an arena within which the numbers of women remain largely insignificant. While there are indeed women who have reached high management positions, they are often viewed, given their scarcity, as simply "tokens" so that corporate management cannot be accused of discrimination.

Many women in positions of leadership insist that the most important career strategy for advancing to senior levels is to consistently exceed performance expectations. In other words, for women to move up the corporate ladder, they must work harder and longer than their male counterparts. A standard excuse given by the male power structure is that, as a group, women have not moved into the most powerful positions because there are too few women with the right combination of training, education, and seasoning. In other words, doors have not been open long enough for women as a whole within the top leadership milieu. Bureaucracies that consistently reveal a dearth of women in choice executive positions insist that it is merely a matter of time before women close the equality gap with men in terms of leadership. But many women who are on the climb up the corporate ladder disagree. They believe that the lack of gender equity in leadership positions exists because of the patriarchal values that undergird the structure of leadership. In essence, women fail to get to the top because of systemic discrimination against them.

THE OLD-BOY NETWORK

Another barrier, and perhaps the most significant to women, is that the "old-boy network" shuts women

out of top management. This old-boy network consists of males who have been educated at the same institutions or who have climbed the corporate ladder together. The “old boys” tend to promote individuals who are like themselves. Men who are in these top decision-making roles often look to former colleagues and friends to fill these positions. Women frequently are not even considered when it comes to promotions because they are outside these networks. Although corporations claim to be meritocracies—institutions in which advancement up the corporate ladder is based on performance and skill—the reality is that, despite men and women’s similar educational attainments, ambitions, status, starting salaries, and commitments to their careers, men generally progress faster, attain higher-status positions, and receive significantly higher compensation than women. Men’s associations with their male peers play a significant role in their rise to power and prestige. Given that women traditionally have not been an integral force within corporations, they simply have not developed similar networking systems.

EXCLUSION FROM INFORMAL SOCIAL GATHERINGS

Related, but different in its ramifications, is the issue of women executives being excluded from informal social activities where the groundwork is subtly laid for corporate advancement. This is a barrier to women in terms of developing rapport with their colleagues, potential clients, and male bosses. Corporations may further handicap women by sponsoring explicitly male-only gatherings. These social activities become ritualized and take on meaning as spaces where positive relationships are created. A significant consequence of women being excluded from these informal networks of communication is that women remain “the other,” the “outsider.” Golfing, for instance, has long been viewed and used as an important tool in developing business relationships. Deals are advanced on the golf course and sealed in the boardroom. If women are not a part of these invaluable networking scenarios, they are denied the possibility of climbing the corporate ladder. Moreover, stumbling blocks remain even if women do

join their male counterparts on the green. Some golf courses are not female friendly; others restrict times when women can play, based on the assumption that they will slow down the field. Other clubs are overtly discriminatory in that they bar women from membership. Given the importance of networking through these and other informal social gatherings, women are at a distinct disadvantage. This seriously undermines women’s strivings for equality within the workforce and in their progression into positions of leadership in particular.

SEX DISCRIMINATION

Sex discrimination is a serious obstacle facing women in leadership. Unique barriers that affect women’s ability to shatter the glass ceiling involve career assumptions by management about women as a group and contradictory expectations for women. Discriminatory attitudes are often veiled in inaccurate “facts” about women’s capacity for leadership. Women are presented as not aggressive enough, lacking the self-confidence required for the job, and not being serious enough about their careers to climb the corporate ladder. But prejudices and gender stereotypes persist because they allow males to protect their privileged status and keep women in their place. Despite overwhelming evidence that these stereotypes are wrong, they persist. Many female executives are convinced that they are not taken seriously by their male colleagues; many have reported being mistaken for secretaries at business meetings. While few women in executive positions report serious anti-women attitudes at work, the forces of discrimination are far more subtle: Women are simply ignored more than men. Furthermore, female executives are generally paid less than their male counterparts with similar responsibilities. Women’s status in the leading professions of health, education, law, accounting, and engineering is similar to those in corporate settings. Female health professionals are concentrated in low-status and less prestigious positions. In higher education, an insignificant number of women fill the positions of president, chancellor, or provost.

Initiatives that must be put in place to rectify

prevailing attitudes toward women include training in gender awareness, diversity, and combating sexual harassment.

SEXUAL HARASSMENT

Sexual harassment is another serious problem for women in bureaucracies. Harassment is used as a form of power by an employer; sexual harassment intimidates and demoralizes women and creates an atmosphere of silence, because many women fear that reporting sexual harassment will jeopardize their careers. Indeed, patriarchal value structures allow men to believe that they have a right to control women. Feminists insist that preconceived notions of gender roles are central to this understanding; these lead to a wide range of rules pertaining to gender-determined behaviors and expectations. Society's acceptance of these rules sets up the rationale for male supremacy and the potential for male harassment or violence against women.

LACK OF MENTORS

Another barrier to women in leadership is the lack of a critical mass of senior or visibly successful female role models and mentors. Mentoring is an arrangement whereby an individual who has experience and knowledge in a particular field can actively guide and offer support to facilitate the learning or development of another person. The arrangement generally involves a person in a leadership position providing guidance and assistance to an individual in a more junior position. While corporations or institutions of higher learning have recognized the importance and value of mentoring for their employees and have put formal structures in place to support this process, mentoring generally occurs on an informal basis. Given the old-boy network that has been central to men's mentoring and advancement, women traditionally have had fewer mentoring opportunities open to them than their male colleagues. Women in executive positions stress that the lack of mentoring among women has been detrimental to their climb up the corporate ladder. Because men generally occupy the highest positions of leadership, men are more

likely to be in powerful positions to open doors for those with inferior status. This is a serious barrier to women's advancement. Since the basis of patriarchy has been organized through men's relationships with other men, a similar unity among women is an effective means by which to combat institutional forms and norms that largely exclude women.

ALTERNATIVE APPROACHES TO LEADERSHIP

For many women who are within reach of executive positions, the costs of consistently outperforming men and the lack of rewards in the race to the top are simply too high. Women-owned businesses are growing dramatically both in number and in economic viability. Women are leaving the corporate world and are drawn instead to business ownership because it allows for greater control over their time, productivity, and advancement. As a result, corporations are under pressure to find ways to retain their most talented women.

Given the barriers to women's advancement, theorists are questioning the very structures of leadership dominant in society. Alternative organizational structures and, by extension, alternative modes of leadership call for questioning the patriarchal values that underlie leadership and long-accepted leadership ideals. The type of leadership that is exercised by many in executive positions is not the style of leadership that attracts and sustains women, nor is it necessarily just and effective. The classic leadership role involves power over another, and women in particular traditionally have been secondary, subordinate, and disempowered. Alternative modes of leadership—in essence, a contra-bureaucratic model—reject classical, patriarchal, hierarchical systems that are composed of vertical positions of authority, be those legally or traditionally defined. This approach attempts to counter competitive, patriarchal, and individualistic values that are intrinsic to the hierarchical process with alternative modes that focus instead on communication and participation at all levels as the basis of leadership. Leadership is thus understood as a process of reaching consensus and following through on group decisions. The goal of such leadership, in which relationships are primary, is under-

standing rather than persuasion. In this scheme, individuals can be both followers and leaders at different times or even simultaneously. The goal is a horizontal and consensus-based process that focuses on a more democratic, egalitarian method of participation and communication.

Communicative leadership is truer to women's styles of leadership; historically, women have been in positions and played roles in which dialogue, nurturing, and problem solving are central. Since patriarchal, hierarchically based positions of leadership have traditionally been closed to women, women may be more open to alternative approaches that are more communicative and participation-based. Horizontally based leadership, in aiming to involve the broadest range of individuals in the process of decision making, cannot be restricted to women. This more interactive approach must reorient both women's and men's approaches to leadership.

BAY OF PIGS

The failed attempt to overthrow the Cuban regime of Fidel Castro in April 1961 by landing 1,400 Cuban exiles at the Bay of Pigs had consequences that reached far beyond the deaths of 140 of the rebels and the capture of more than 1,000 others. With Washington's involvement in the operation obvious to all, the debacle weakened President John F. Kennedy right before his crucial first meeting with Soviet General Secretary Nikita Khrushchev at the Vienna summit. Seeing Kennedy as weak and inexperienced, Khrushchev was emboldened to present him with an ultimatum over West Berlin, triggering a series of events that led to the construction of the Berlin Wall. The episode also strengthened Castro's position at home, enabling him to consolidate his regime, and pushed him into the Soviets' arms as he looked for protection against the United States. As a result, the Bay of Pigs turned out to be a critical step that led to Castro's decision to allow the Soviets to base missiles in Cuba and to the subsequent Cuban missile crisis. By the same token, however, the les-

sons Kennedy gleaned from his poor decision making in the Bay of Pigs episode led to more thorough and cautious procedures during that crisis.

In the rest of the world, the fiasco undermined U.S. credibility, as well as other countries' faith in the new administration's judgment. Finally, the failure at the Bay of Pigs led Kennedy to adopt Operation Mongoose, another covert operation aimed at overthrowing Castro, which led to various ill-conceived plots involving exploding seashells and poisoned cigars.

THE ORIGINS OF THE PLAN

The plan for what became known as the Bay of Pigs was originally conceived during the Eisenhower administration. After Castro came to power on 1 January 1959, the Eisenhower administration watched with trepidation to see what sort of policies he would pursue. Once Castro began leaning toward Communism and instituted land reform, Washington decided that he posed a significant threat to U.S. national security by providing a base for Soviet influence and exporting radicalism to the rest of Latin America. Eisenhower formally approved "A Program of Covert Action Against the Castro Regime" on 17 March 1960. The plan involved creating a covert intelligence and action organization within Cuba and developing a paramilitary force outside the country. What the planners envisioned was a guerrilla force of 300 men who would infiltrate Cuba in small teams, connect with the opposition within the country, and spark a revolt. Soon after the plan was approved, the CIA began training Cuban exiles in guerrilla warfare at camps in Guatemala.

By the fall of 1960, however, the CIA realized that its efforts to develop a guerrilla network inside Cuba were failing and that the planned infiltration of three hundred exiles would not be able to trigger a mass uprising. In addition, Castro's forces, bolstered by arms shipments from Czechoslovakia, were fast becoming better armed and more proficient at combating guerrilla activity. As a result, the CIA changed its approach from an infiltration to an amphibious assault with 1,500 men, which was designed to achieve a "minimum critical mass" that

would spark an islandwide revolt. The change in plan also meant that the Cuban exiles received no further guerrilla training.

Eisenhower approved the change, although he was out of office by the time the CIA produced a detailed operational plan. Kennedy was first briefed on the plan in November 1960, during the transition, and raised no objections to the operation. Moreover, neither he nor any of his advisers contacted the outgoing administration regarding any aspect of the operation during the two-month transition period. Thus, once Kennedy took office, a considerable amount of momentum had built up behind the plan.

KENNEDY INHERITS THE OPERATION

Kennedy received his first briefing as president on 28 January 1961. The CIA explained that the exile brigade would stage a daylight amphibious assault at the town of Trinidad. During the attack, the exiles' air wing would destroy Castro's air force. Once the exiles had secured a beachhead, they would announce a provisional government, which the United States could then recognize, paving the way for overt American assistance and the hoped-for mass revolt. The CIA's recommendation of the plan carried considerable weight with Kennedy. Both CIA Director Allen Dulles and the official in charge of the operation, Richard Bissell, had close ties to the Kennedy administration, and the new president was impressed by the Agency's efficiency and can-do attitude relative to the more ponderous State Department.

Kennedy was also susceptible to their arguments for other reasons. The new administration saw Cuba as just as much of a threat as Eisenhower's had, and its view was colored by domestic political considerations. During the campaign, Kennedy had taken Eisenhower to task for having "lost" Cuba and had openly pledged his support for the Cuban "fighters for freedom." Having won the election by a scant 118,000 votes, Kennedy felt that aborting an anti-Castro operation that Eisenhower had put in motion would make him look weak. Moreover, halting the operation would create what became known as the "disposal problem": what to do with, by then, around five hundred Cuban exile trainees who desperately

wanted to overthrow Castro. Administration officials thought there was a high probability that the frustrated exiles would spread the word that the U.S. government had been training them and then pulled the plug on the operation.

Bissell and Dulles were strong and effective advocates of the plan. Bissell later conceded that after having spent over a year on the plan, the CIA officials involved had become heavily invested in it emotionally. In addition, Bissell himself had an interest in scoring a notable success because Kennedy was considering him as Dulles's successor as CIA director.

The CIA also pressured Kennedy to move quickly, warning that delay could be fatal to the operation because Castro's continued buildup of security forces decreased the chances of a successful popular revolt. Castro also continued to receive Soviet arms and was expecting to receive Soviet jet fighters, which would greatly increase his air capability. CIA officials also argued that the Cuban exiles were well trained and ready to go, but that the fast-approaching rainy season in Guatemala would soon put a stop to the training. Finally, the publicity the training camps had attracted sparked a revolt against Guatemalan president Ydigoras, leading him to plead with Washington to move the exiles out by March.

The Military Weighs In

At Kennedy's request, the Joint Chiefs of Staff evaluated the operational plan two separate times. Both times, they identified serious problems, including the exiles' lack of amphibious training, poor logistics, and the lack of secrecy concerning the training camp in Guatemala, which had been described in the *New York Times* as well as in the Latin American press. Both times, however, the Joint Chiefs buried their specific criticisms in annexes to their reports, and hedged their assessments in the more visible cover letters or executive summaries. In an oral summary of one of their reports at a White House meeting in early February, Bissell said, "Despite the shortcomings pointed out in the assessment, the Joint Chiefs consider that timely execution of this plan has a fair chance of ultimate success" (U. S. Department of

State 1997, 35). What Bissell either did not realize or did not pass on to Kennedy was that "fair" meant no more than a 30 percent chance of a favorable result. General Lyman L. Lemnitzer, Chairman of the Joint Chiefs, was present at the meeting but did nothing to clarify Bissell's characterization of the report. Similarly, their investigative team concluded in late February that the odds were 85 to 15 against achieving surprise, and that without surprise, the air mission would probably fail, which meant that Castro would have at least some aircraft available to destroy part or all of the invasion force. Once again, though, instead of calling attention to the specific negative conclusion in their cover letter to Secretary of Defense Robert McNamara, the Joint Chiefs suggested only that the CIA should try to improve security around the brigade and that if they could not enhance it, the plan's chances of success "should be reevaluated." Ultimate success, they noted, would depend on the political part of the plan, the triggering of a popular revolt.

The Joint Chiefs' reticence to speak out against the operation has been attributed to their having been made very aware that it was a CIA, not a military, plan. The CIA purposely kept the military out of the planning process, even after the Joint Chiefs warned that their expertise was needed once the operation developed from a guerrilla-type action into a military-style invasion. The Joint Chiefs offered to provide logistical experts for support, but Kennedy repeatedly told them: "No. This is a CIA operation. It is not a military operation. You will not become involved in this. I do not want the United States to appear to be an aggressor" (Vandenbroucke 1993, 23). Consequently, the Joint Chiefs were even less inclined to challenge the CIA's dominant position in the administration. However, as several participants in the discussions later noted, by not speaking up against the plan, the Joint Chiefs gave the civilian officials the impression that they approved of it.

Dissenting Voices?

One of the most distinctive features of the Bay of Pigs episode was the lack of dissenting voices beginning with the military's muted reactions. Part of the problem was that the administration was still so new

that its members were unfamiliar with each other as well as with the president. Consequently, many of his advisers were cautious about openly criticizing the plan, particularly since Kennedy had made clear his admiration for the CIA.

Special Assistant Arthur Schlesinger, for example, opposed the plan, both skeptical that it would trigger the needed uprising and fearful that it would damage the new administration's standing in the international community. However, he was still unsure of his status within the administration; so, aside from sending Kennedy some memos detailing his opposition, he refrained from speaking up at the policy meetings. Similarly, Secretary of State Dean Rusk was skeptical of the plan's ability to spark a popular revolt or to remain covert, as well as the ramifications of it at the United Nations and the Organization of American States but, like Schlesinger, he did little aside from telling Kennedy privately of his concerns. Rusk was reluctant to criticize the CIA because he knew he had not yet established a power base within the administration and was unsure of Kennedy's level of confidence in him. He also felt that as head of the State Department, it was not his role to evaluate the military aspects of the plan.

Psychologist Irving Janis has described the behavior of Kennedy's advisers as a good example of his groupthink hypothesis: He argued that the individual policymakers' instincts for critical appraisal and debate were sublimated by the group's tendency to seek consensus as a way of building group solidarity.

At a meeting on 8 February, Kennedy expressed his own doubts about the invasion plan. He feared that it was too visible and asked about making it more of a guerrilla-infiltration operation; he made it

It Might Have Been Worse if They Had Succeeded

Analysis of the failure of the Bay of Pigs invasion has focused on failures in leadership, planning, and coordination. As the text that follows suggests, even if the invasion had succeeded and Castro had been removed from office, major political and economic differences in the Cuban-American community posed a whole host of other problems that would have sorely taxed American leadership.

It was also from south Florida that emigrés waged their war against Castro, a paramilitary and propaganda campaign to discredit the Cuban leader and undermine his government that at times received financial and institutional support from the United States government. However, the Cubans were as diverse politically as they were socioeconomically. While opposition to Fidel Castro's government was the *raison d'être* of the community, the Cubans had different political visions for their country's future. The emigrés all claimed to want "democracy" for their homeland, but they had different ideas of what democracy entailed, and their visions were shaped by the successes and failures of Cuban politics. Some favored an authoritarian, non-communist government that would establish social and economic order, modeled in part on the Batista government that Castro's July 26th Movement overthrew. Others advocated an open, multiparty electoral system, modeled after that of the United States or the parliamentary systems of other western democracies. In economics, some were free-market capitalists, while others favored some variation of socialism that would address the social and economic inequalities that had plagued *la patria* since the creation of the Republic. Some wanted to continue their country's symbiotic relationship with the United States, while others, more staunchly nationalistic, favored political and economic independence. Represented within the emigré population were supporters of the various political parties, factions, urban resistance groups, and guerrilla groups of pre-1959 Cuba, as well as literally hundreds of new political organizations that emerged in exile, each coalescing around either some charismatic individual or a particular political concern.

The debates between these different groups contributed to a heated and often violent political climate in south Florida. A segment of the emigré community even came to adopt a more tolerant view of the Castro government and dedicated its efforts to trying to ameliorate U.S.-Cuba relations.

clear that he would not approve any overt U.S. intervention. The CIA's answer was that trying to land many small groups was impractical as it increased the risk of one of them being discovered. Moreover, it maintained that there needed to be a big enough

operation to induce the hoped-for popular revolt, particularly since Kennedy's prohibition on U.S. involvement meant that there would be no immediate assistance for the provisional government. Throughout the next two months, Kennedy went back and forth with the Agency on this issue, but the answer was always the same. As a way of alleviating Kennedy's unease with the landing operation, the CIA stressed that even if the invasion did not go according to plan, it would not be a failure because the rebels would be able to retreat into the Escambray mountains and connect with other guerrillas to stir up civil unrest. They neglected to tell him, however, that the exiles were no longer being trained in guerrilla tactics and had been assured that the U.S. military would assist them if the need arose.

From Trinidad to the Bay of Pigs

In mid-March, Kennedy's continued dissatisfaction with the Trinidad plan as too "spectacular" forced the CIA to present him with three hastily conceived new options. Of these, he chose a night amphibious landing at the remote and barely inhabited Bay of Pigs on the Zapata peninsula. The Joint Chiefs had reported that the Zapata plan was the best of the new options, which seemed to indicate their acceptance of it; however, they failed to make it clear that they still thought the original Trinidad plan was the most likely to succeed. General David Gray, the Joint Chiefs' main liaison to the CIA for the project, later conceded that the Zapata plan was devised so quickly that the Joint Chiefs never had time to "war-game" it to determine the differences it made in the operation. The most significant difference was that the new site was 80 miles away from the Escambray mountains and surrounded by impassable swamps, which effectively removed the "fail-safe" option of the rebels disappearing into the mountains to fight a guerrilla war. When Kennedy approved Zapata, he thought the guerrilla option was still viable. Another important difference not explained to the president was that moving the landing away from the town of Trinidad, where there was already some dissension against the regime, to the nearly uninhabited Zapata peninsula, reduced the chances of triggering mass

political action, the acknowledged key to the whole operation.

THE FIASCO PLAYS OUT

The operation began with the first of two planned air strikes on 15 April, two days before the invasion. Three B-26s took off from Nicaragua with their U.S. markings painted over with Cuban ones to make it look like they were being flown by defectors from Castro's air force. The bombing raids had little impact on the Cuban air force, but did have a significant impact in alerting Castro. In addition to readying his defenses, the Cuban leader took the crucial step of imprisoning suspected regime opponents, a number which quickly reached 200,000. The air raid also had important reverberations within the administration. Because the air raid, which was quickly attributed to the United States, caused so much trouble at the UN for Adlai Stevenson, the U.S. ambassador to the UN, Rusk convinced Kennedy to cancel the second air strike, scheduled for 17 April, the morning of the invasion. The CIA pleaded with Rusk to reinstate the strike but he refused. Notably, neither Rusk nor Kennedy consulted the Joint Chiefs before making the military decision to cancel the second air strike.

The invasion itself was a string of mishaps and disasters. The exiles had been led to believe that the landing beach would be deserted but they were met by a Cuban militia that alerted its command. Many of the motors of the launches intended to transport the troops to land malfunctioned. CIA intelligence had not identified an offshore coral reef that sank some of the launches and marooned the crafts carrying tanks and heavy equipment until high tide at dawn. With the first light, the remaining Cuban air force hit one troop and supply ship and sank another ship that was carrying most of the supplies and the communication equipment. Castro's planes also shot down two B-26s that were giving air cover to the exiles.

Although the exile brigade fought with determination and a few Cuban militiamen and local residents joined them, they were soon facing tens of thousands of Cuban troops armed with tanks and heavy artillery. In Washington, at an emergency White House meet-

ing on the night of 18 April, Bissell argued vociferously for U.S. forces to intervene to prevent a disaster. Kennedy refused, relenting only to authorize six unmarked Navy jets to protect a B-26 mission for one hour the following morning so that they could strike the Cuban army forces advancing on the beachhead. As it happened, there was a miscommunication and the B-26s arrived an hour before the Navy jets. Two of the B-26s were shot down and the rest fled before the Navy jets ever arrived. At that point, the exiles began to surrender. A few tried to flee into the swamps but were rounded up. In the end, 140 were killed, while 1,189 were captured, and 26 were rescued offshore by the U.S. Navy.

ENOUGH BLAME TO GO AROUND

Publicly, Kennedy accepted full responsibility for the fiasco, but privately he and his advisers blamed the CIA and the military. Both certainly share a large measure of the blame. Dulles and Bissell advocated the plan so forcefully that they were unable to evaluate it objectively. They overlooked negative information, such as the obvious lack of secrecy surrounding the operation, and purposely kept other information from the president, such as the fact that the exiles were not trained to become guerrillas if the need arose.

Moreover, in their zealotry to preserve secrecy, they cut many relevant experts out of the decision-making process. Most notably, they did not consult the Cuba experts in the CIA's own directorate of intelligence or the State Department's Bureau of Intelligence and Research, who could have told them that there was very little anti-Castro sentiment within Cuba and would have pointed out the problems with the landing site. There was also more than a trace of bureaucratic politics in the CIA's refusal to use the military's expertise in planning the invasion. Bissell and Dulles also made it hard for those involved to give the project their considered attention; for instance, they demanded that meeting participants hand their briefing papers in at the end of meetings.

For their part, the Joint Chiefs clearly served Kennedy poorly by not being more forthcoming about their significant doubts concerning the operation. In their own bureaucratic political response, the

Joint Chiefs determined that because it was a CIA operation they would not get too involved. In addition, both the CIA and the military should be faulted for agreeing to Kennedy's requests to change the plan to ensure that the U.S. role remained covert but not telling him how those changes were handicapping the mission. Finally, although Kennedy had clearly stated that he would not commit U.S. troops to the operation, in retrospect it is clear that both the CIA and the military assumed that if things began going badly once it was underway, Kennedy would, in the end, intervene to save the mission. The CIA and the military were conditioned by Eisenhower's dictum that once you commit the flag, you must ensure that the operation will be a success. They assumed that Kennedy would reason the same way.

However, Kennedy and his other advisers should not escape blame either. Kennedy had doubts about the plan all along, but allowed himself to believe the illusion that the U.S. role could remain covert as long as U.S. troops did not actually participate, even in the face of clear evidence to the contrary. He also did not very actively question the briefings he was given or ask for competing opinions. He later ruefully acknowledged that he had assumed "that the military and intelligence people have some secret skill not available to ordinary mortals" (Vandenbroucke 1993, 36). Schlesinger has also theorized that the complacency of Kennedy and some of his advisers stemmed from his long record of career successes; the assumption that he had the Midas touch probably played a role in helping them all ignore their doubts. Since then, several advisers have expressed regret that they did not voice their doubts and question the CIA more forcefully.

LESSONS

The Bay of Pigs fiasco had a lasting impact on Kennedy's decision making, and the changes were evident in his approach to the Cuban missile crisis. He no longer trusted government bureaucracies, particularly the military, whom he never forgave for not speaking out. He brought in his own outside advisers, challenged the Joint Chiefs, and made a habit of talking to lower-level officials to prevent their supe-

riors from screening out information. In addition, he made sure that all his advisers felt free to speak out. Finally, when he did receive advice from experts, he relied on his own instincts to question their opinions and evaluate information.

changed the course of popular music and influenced and inspired many who came after them. The Beatles’ influence over millions of fans was rooted in their storytelling and their vision. In addition to being leaders in the world of popular music, the Beatles, collectively and individually, had an impact on fashion, language, politics, marketing, and social issues.

OVERVIEW OF THE BEATLES’ CAREER

A working-class neighborhood in Liverpool, England, was the backdrop for the Beatles. Inspired by the music of Buddy Holly, Elvis Presley, and Jerry Lee Lewis, John Lennon formed The Quarry Men in 1957. Among the seven members were Paul McCartney and George Harrison. Between 1957 and 1960, John, Paul, and George played in various musical groups and formed the Beatles prior to a trip to Hamburg in August 1960.

Although the group had various membership combinations, John Lennon (1940–1980), Paul McCartney (b. 1942), George Harrison (1943–2001), and Ringo Starr (b. Richard Starkey, 1940), who joined in 1962, were the lasting incarnation of the Beatles. The Beatles released their first single “Love Me Do,” in 1962; it was successful. The Beatles rose to world superstardom in 1963 and 1964. In 1965, they toured the United States for the first time and appeared on the *Ed Sullivan Show*, a television variety show that often featured musical acts. These years were marked by “Beatlemania”—worldwide fan recognition, merchandizing, and commercialism.

The Beatles gave their last public concert in 1966, after which the members became increasingly interested in other endeavors. During the late 1960s the band existed primarily in the studio; the group’s last live appearance took place on the roof of Apple Records in January 1969. In May 1970, The Beatles released their final album of new material, *Let It Be*, and a month later Paul McCartney announced his departure from the group.

All four members of the Beatles went on to successful solo careers and were busy through the 1970s. John Lennon and his wife Yoko Ono (b. 1933) made music and became involved in the peace move-

BEATLES, THE

The Beatles were a rock and roll band from Liverpool, England. Their popularity in the 1960s

ment. Along with wife Linda (1941–1998), Paul McCartney began a band called Wings. Ringo Starr and George Harrison also enjoyed modest success as solo artists.

THE BEATLES' DOMINANCE OF THE MUSIC CHARTS

Throughout their career, the Beatles established milestones that assured their place in the history of popular music. They had seventeen number-one singles in the United Kingdom, twenty number-one singles in the United States, fifteen number-one albums in the United Kingdom, and nineteen number-one albums in the United States. They spent 1,278 weeks on the British charts (more than any other act), 175 weeks at number one on the British charts (more than any other act), and in 1965 produced the first British album to debut at number one (*Help!*). They had the highest album sales in the United States of any group ever, with close to 107 million albums sold. Further, the Beatles' *Sgt. Pepper's Lonely Hearts Club Band* (1967) remains the United Kingdom's all-time best-selling album.

The Beatles were among the first artists to use sound and studio effects in production and orchestration in pop music; they were also the first group to develop the concept album. In every sense, the Beatles were second to none in the domain of 1960s pop music. Within the band, it is hard to say who was the leader. Both John and Paul were major forces, and George and Ringo often felt left out of the decision-making process. Some feel that manager Brian Epstein had a significant impact on the group and helped maintain the relationships between band members prior to his death in 1967.

THE BEATLES AS VISIONARIES

The Beatles shared their vision with fans. Whether the topic was simple or complex, they consistently challenged their fans to look at life through a new lens. For instance, early in their career, the Beatles had an impact on what was a socially acceptable "mop top" for men. Later in their career, the Beatles' interest in Eastern culture introduced the sitar and

They were doing things nobody was doing. Their chords were outrageous, just outrageous, and their harmonies made it all valid. Everybody else thought they were for the teenyboppers, that they were gonna pass right away. But it was obvious to me that they had staying power. I knew they were pointing to the direction where music had to go.

concepts such as transcendental meditation and spiritual regeneration to the West. The scholar Warren Bennis, who has studied leadership for many years, calls this phenomenon management of attention, the ability to draw others to them. In Bennis's words, they had the ability to "manage attention through a compelling vision that brings others to a place they have not been before" (Bennis 2000, 17). In all phases of their career, their vision, ability to speak to the hearts and minds of fans, physical appeal and friendly personalities, and avant-garde fashion sense affirmed their stature as icons. The Beatles' success also took the industry to new places, as they became the model of what a successful band should be.

THE BEATLES AS STORYTELLERS

Above all else, the Beatles told stories and shared their vision through their music. According to the developmental psychologist and cognitive scientist Howard Gardner, "stories of identity—narratives that help individuals think about and feel who they are, where they come from, and where they are headed—that constitutes the single most powerful weapon in the leader's literary arsenal" (Gardner 1995, 43).

The music of the Beatles experienced a dramatic evolution in their approximately ten years together. Although their songs of love and relationships are perhaps their most popular works, their range of song topics grew over the years and appealed to a wider range of fans. One of their biographers, Marvin Martin, notes: "their studio production, espe-

Excited Beatles fans in October 1965 outside Buckingham Palace in London are held back by police officers. The fans have gathered hoping to see the Beatles who are scheduled to be named members of the order of the British Empire by Queen Elizabeth II.

cially as represented in such works as ‘Revolver’ and ‘Sgt. Pepper’s Lonely Hearts Club Band,’ reflected many themes of the human condition: the foibles of man, the disaster of war, the power of love, loneliness, futility and hope” (Martin 1996, 188–189).

LASTING INFLUENCE

The Beatles impacted fashion with mop-tops, mohair suits, Cuban-heeled boots, velvet-collar suits, Eastern clothing, and granny glasses. Popular usage of words such as “gear” and “fab” is also attributed to the group. In the studio, the Beatles were among the first to release a concept or “themed” album; use sitars, orchestration, and quartets in a pop song; use intentional feedback; fade songs directly into one another; and produce backward vocal and guitar sounds—all techniques that are commonplace today.

A quote by folk singer and songwriter Bob Dylan may sum up the Beatles best. He said, “They were doing things nobody was doing. Their chords were outrageous, just outrageous, and their harmonies made it all valid. Everybody else thought they were for the teenyboppers, that they were gonna pass right away. But it was obvious to me that they had staying power. I knew they were pointing to the direction where music had to go” (Scaduto 1973, 203–204).

Quantitative and qualitative data support Dylan’s account of the Beatles. Countless groups have followed the Beatles, but none have achieved the success of John Lennon, Paul McCartney, George Harrison and Ringo Starr.

🌐 BEETHOVEN, LUDWIG VAN (1770–1827)

German composer

Few artists have so fascinated their own and future generations to the degree that Beethoven has. As a figure of legend, he is equalled among his contemporaries only by Napoleon (1762–1821), whose early triumphs as a revolutionary leader inspired Beethoven and many other artists of the time. More generally, Beethoven is one of the artists who shaped Romantic consciousness. Within this consciousness, willingly and unwillingly, he became the supreme model of the artist as moral and symbolic leader.

It is no exaggeration to talk of a Beethoven

myth—the myth of the artist who triumphs over all the woes that fate places in his path, whether social and political adversities or personal tragedies and debilitating illness, through the extraordinary power of his musical creation. The triumph does not come easily; it requires sacrifices, isolation, privations, and heroism on a truly cosmic scale. This artist becomes a romantic symbol of the independent spirit, a symbol of all humanity and its unending struggles. The adjectives *promethean*, *titanic*, *heroic*, *colossal*, and *transcendent* are frequently used to describe Beethoven the man as well as his art. His artistic legacy comprises nine symphonies, sixteen string quartets, thirty-two piano sonatas, the opera *Fidelio*, five piano concertos, a violin concerto, two masses, and numerous chamber music compositions, songs, choral works and orchestra overtures. Virtually none of Beethoven’s mature works can be regarded as anything other than a masterpiece, and his influence on many musical genres was truly revolutionary.

LIFE AND WORKS

Fact and fiction in Beethoven’s life are very difficult to separate. Born in Bonn to a family of musicians, he had a difficult childhood, though his musical ability at thirteen impressed his teacher, Neefe, who wrote that “this young genius . . . will undoubtedly become a second Wolfgang Amadeus Mozart if he progresses as well as he has begun” (Quoted in Robbins Landon 1992, 43).

He moved from Bonn to Vienna in 1792, the year after Mozart’s death, and he remained there to the end of his life. His early career in Vienna as a piano virtuoso caused a stir. His powerful percussive technique was quite at odds with Mozart’s fluid use of the instrument. His early piano sonatas all start with powerful recurrent musical phrases that instantly command listeners’ attention. From his earliest works, Beethoven was an artist who demanded to be heard. Unlike Haydn (1732–1809), Mozart (1756–1791), and other composers who had aristocratic patrons or were commissioned to create works for specific occasions, Beethoven composed and performed for bourgeois audience who paid for the privilege.

By 1800, Beethoven had established himself as a serious composer with sets of string quartets, string and piano trios, several piano sonatas, a highly popular septet, and a symphony. “My compositions bring me in a considerable amount, and I can truthfully say that I receive more offers of commissions than I can possibly accept. Moreover, for every composition I have six or seven publishers and could have more if I should want them. People no longer bargain with me: I state my price and they pay” he wrote to Dr. Franz Wegeler in June 1801 (Robbins Landon 1992, 87).

It was then that the first signs of deafness appeared, and a few years later he was almost entirely deaf. His letters and notebooks from the period offer testimony of a profound psychological and even spiritual crisis, from which he emerged into his “heroic phase” in 1803. His musical creativity reached astounding new heights with the Third Symphony, called the *Eroica*, a work which revolutionized the symphonic genre; the opera *Fidelio*; the Fifth and Sixth Symphonies; the *Appassionata* piano sonata; the Fourth and Fifth Piano Concertos; and the transcendental Violin Concerto. It is to these middle-period works with their infinite melodic richness, rhythmic audacity, and sweeping emotional power that Beethoven the Promethean owes his reputation. This is music that grabs the listener from first hearing and is capable of eliciting an extraordinary range of emotional and spiritual responses. The scale of many of these works is truly epic, in duration, in deployment of musical forces, and above all in dynamic and expressive range. They demand concentration and could not be further from entertaining or relaxing; instead, through the use of dissonances and discontinuities they question and challenge the performer and listener alike. This is music for all humanity and for all time, proclaiming universal and absolute ideals.

Beethoven’s late-period works include the last five sonatas and the *Diabelli Variations* for piano, the *Missa Solemnis*, the famous Ninth Symphony, and the last five string quartets. These were composed when he was profoundly isolated through deafness. They may lack the melodic invention of earlier works, but they attain levels of musical perfection

rarely matched by any other artist. These late works represent a true consummation of Beethoven's art, combining the most diverse musical forms, including fugues, variations, recitatives, seamless lyrical passages, and violent percussive sections. Abstract musical meditations alternate and merge with the most personal and intimate expressions. Beethoven continued to compose until the last months of his life, by which time he was viewed as the greatest composer, living or dead, and a major celebrity of his age. When he died at fifty-seven in 1827, obituarists reported a terrible storm raging over Vienna and unleashed torrents of superlatives.

CHARACTER, RELATIONSHIPS, AND IDEALS

Beethoven's character has been a source of endless fascination. Uncompromising, rude and disputatious, he could nevertheless display considerable sensitivity and gentleness. His courage and pride were legendary, yet it is said that when the French troops marched into Vienna in 1803, he hid under the kitchen table with a towel over his head. His dedication to his art was complete, though he would probably have considered musicians of the twentieth century to be intolerably pompous and self-serious.

Arguably, the two most widely discussed features of his character are his problematic relation with authority, especially of the aristocratic sort, and his inability to settle in a marriage. It is generally acknowledged that Beethoven viewed himself as somehow above conventional morality and norms. "The devil take you," he wrote to a friend in 1798, "I refuse to hear anything about your whole moral outlook. *Power* is the moral principle of those who excel, and it also mine" (Solomon 1978, 86).

Beethoven's relation to conventional authority is summed up in a famous story told by the writer Bettina Brentano von Arnim (1785–1859), who claimed to have heard it from Beethoven himself. During his stay in Teplitz Spa in 1812, Beethoven met the philosopher and poet Goethe (1749–1832) for the first time. One day they went for a walk together, and as they were walking down an avenue they came across the Empress of Austria and her entourage. Goethe at once stood on one side and

took off his hat; Beethoven, for his part, strode on staring ahead of him and pushing his hat lower down his head. The story, never authenticated, squares with Beethoven's comment in a letter that "Goethe delights far too much in the court atmosphere, far more than is becoming in a poet" (Jones 1998, 117).

As a rebel, Beethoven had since his youth identified with the ideals of the French Revolution. His Third Symphony was conceived, on a massive scale, as a tribute to Napoleon, the liberating hero, who brings freedom and unites humanity. The heroic first movement is followed by a funeral march that epitomizes the tragic in music, a scherzo (one of Beethoven's great innovations in the symphonic genre), and a Promethean finale of extraordinary energy. Upon learning that Napoleon had crowned himself emperor, Beethoven tore up the title page in disgust and dedicated the piece to Prince Lobkowitz of Vienna. The printed edition carried the subtitle "Heroic Symphony [Sinfonia Eroica] composed to celebrate the memory of a great man." In spite of Beethoven's clear fascination with figures of nobility and grandeur, his music was from its conception nourished by the emerging democratic ideal of his age, and he is seen in our times as the composer par excellence of universal brotherhood and sisterhood. It is not accidental that his Ninth Symphony, with its unprecedented choral finale based on Schiller's "Ode to Joy," was performed in Berlin shortly after the fall of the Berlin Wall (1989) and is regularly heard on symbolic occasions marking reconciliation, freedom, and common humanity.

In spite of his endorsement of a universal human ideal, Beethoven found it hard to make lasting relations, repeatedly fell out with his closest friends and relatives, and never settled into marriage or a stable partnership. His sexual conquests were numerous, as indeed were his unconsummated romantic attachments, most famous among them the one to his "Immortal Beloved." It is interesting, then, that the twin themes of resistance to tyranny and marital love lie at the heart of his opera *Fidelio*. It is in this work, which eschews most operatic conventions, that we get a close look at Beethoven's conception of leadership. The story unfolds in a prison, where Flo-

restan is unjustly held by Pizzaro, the despotic prison governor and classic representative of the ancient regime. Leonore, Florestan's wife, attempts to free him by entering the service of Pizzaro dressed as a man, Fidelio. Her bravery eventually saves her husband, yet the prison is not liberated by a revolutionary crowd; instead it is the representative of the enlightened ruler who arrives in the time-honored *deus ex machina* tradition to free the prisoners and dismantle the prison. The opera concludes with a jubilant affirmation of faith in the universal human values of freedom and justice.

BEETHOVEN AS ARTISTIC LEADER

Beethoven's standing as an artist has survived all subsequent musical developments as well as the inevitable process of personal demythification. But what about Beethoven's standing as a leader? Unlike Arnold Schoenberg (1874–1951), a seminal composer of a later generation, Beethoven never sought to create followers or to lead a new artistic wave or school. In this sense he can hardly be said to have led anyone. Yet his influence on other artists cannot be overestimated. His music inspired and intimidated in equal measures artists who followed him, including Schubert (1797–1828), Berlioz (1803–1869), Schumann (1810–1856), and especially Brahms (1833–1897). It was only in the twentieth century that it became possible for the first time to speak of Beethoven in terms other than reverential: He was dismissed by the French composer Ravel (1875–1937). Yet, it is telling that the composers Richard Strauss (1864–1949) and Dmitri Shostakovich (1906–1975) both quote Beethoven's works in some of their final and most profound works. Perhaps even more important is Beethoven's influence as a role model for creative artists who do not merely seek to impress or entertain their social superiors, but, through their art, discover a powerful voice with which to comment, castigate, and critique their age and to proclaim gripping new ideas and visions. In this sense, Beethoven's leadership style is like that of a biblical prophet, an uncompromising outsider who not only demands to be heard but believes that he has a God-given right to be

heard, because he can see what others cannot. By communicating this vision, the artist irreversibly alters the way everyone else sees.

BEN & JERRY'S ICE CREAM

On 5 May 1978, two young men named Ben Cohen (b. 1951) and Jerry Greenfield (b. 1951), originally from Merrick, New York, started an ice cream business called Ben & Jerry's Homemade, Inc., in Burlington, Vermont. Beginning with only \$12,000 and a great liking for food, they have since become internationally famous business leaders, best known perhaps for their philanthropic style of business. They are also among the chief early contributors to a growing business movement that promotes "socially responsible business." For this achievement Ben Cohen and Jerry Greenfield were named the U.S. Small Business Persons of the Year in 1988 by President Ronald Reagan.

The business, Ben & Jerry's Homemade, Inc. (hereafter Ben & Jerry's), is considered a good example of the classic entrepreneurial success—with a twist. What makes Ben Cohen and Jerry Greenfield stand out from the entrepreneurial crowd is that they

Maybe there's a chance. Ben and Jerry and Unilever, I wish you success, measured in more than money. But if it doesn't work, if five or twenty years from now there's nothing more than a Ben & Jerry's historical marker in Vermont, maybe we will be willing to rethink the system that rewards corporations for seeking the cheapest raw materials, workers, and environmental standards in order to produce the fastest growth. Maybe, instead of being cynics, we'll become activists in forging a corporate environment that measures success, as Ben and Jerry's did, in more than money.

—Environmentalist Donella Meadows

advocate a business philosophy called “caring capitalism.” Indeed, this philosophy is thought by many to be the most significant factor in their successful climb to the top of the ice cream business world.

Ben & Jerry's is perhaps the best-known corporate representative today of a movement in business that adopts a “new corporate concept of linked prosperity” (Ben & Jerry's 1993 Annual Report). This “new concept” places an equal emphasis upon both the repercussions a business has on its surrounding society as well as on the conventional economic priorities of a business (survival in a competitive market). Ben Cohen has from the beginning maintained that business has a responsibility to give back to the community. This ideal, established during the early days of Ben & Jerry's, embodies the idea that a business can prosper as the community around it prospers.

THE EARLY PERIOD, 1978–1985: COMMUNITY INTEGRATION AND SOCIAL RESPONSIBILITY

In the beginning, the business was all about the local community of Burlington, Vermont. Fred “Chico” Lager, former CEO of Ben & Jerry's, offers this quote by Caryl Stewart, who sublet the gas station that was to become their very first scoop shop: “They had *connected* with their customers, who felt like they were an integral part of what was happening, not merely a source of revenue to some faceless

businessmen.” Lager continues, “They truly believed that the joy was in the journey, and were determined to seize upon every opportunity to have fun that came their way” (1994, 36). A no-frills, down-to-earth style also appealed to consumers and became a basic element of the Ben & Jerry's company culture.

From the very beginning of Ben Cohen and Jerry Greenfield's careers as capitalists, they wanted to achieve a sense of community by using the business as their catalyst. They began by giving away free ice cream. Soon they were holding movie festivals and began an annual community celebration. But as they became more economically successful and much busier, the two characteristics of Ben & Jerry's social program that were emphasized were the amount of the donations they began to give and the recipients of those donations. Ben Cohen was not satisfied with a 5 percent pretax donation figure. He wanted to make it 10 percent. Lager disagreed, comparing their 5 percent to the average contribution from corporate America in the 1980s, a figure of 2.1 percent pretax profits, most of which went to arts organizations or the United Way (Human Resources Network 1975, 25).

There was no question by six or seven years into the development of the business that Ben & Jerry's was not a typical corporation with respect to where their profits were going. Although one criticism of the business has been that the social program is simply a marketing tool, Lager insists that the motivation for giving back had always been genuine. In response to an increasing concern regarding the direction in which the company was headed as it continued to grow, the board of directors at Ben & Jerry's concretized the values inherent in the early projects of the company into the Statement of Mission in 1987. The statement was an effort to institutionalize the idea of the “new corporate concept.” The mission of Ben & Jerry's Homemade, Inc., focused specifically on three areas: product quality, economic success, and contribution back to the community. The quality of their product was always first on their minds; they were in business to create a super-premium ice cream, and they were confident that they could sustain a niche in the market at a competitive price within their grade of ice cream.

Little did they imagine how large was the niche they would fill.

In fact, due to a satisfactory corporate climate in general and their socially conscious mission in particular, they at times seemed to be growing too fast. True to their communitarian roots, the financial rewards were initially distributed in a very egalitarian way: the ratio of highest-paid worker to lowest-paid worker showed the fairness of the financial reward gained by the individual employees of the company. In 1985, the five-to-one compressed salary structure policy was formalized, in which the highest paid employee could get paid no more than five times the lowest paid employee. One of the incentives of adopting such a policy was to recognize the contribution made to the company's success by people throughout the organization.

Their penchant for irreverence toward traditional market economics was embodied in the down-to-earth style of Ben & Jerry's. But despite this "nose-thumbing" attitude toward traditions of business procedure and bureaucracy, the "new corporate concept" has gained respectability. Ben Cohen and Jerry Greenfield chose to use the power position they gained through their increasing notoriety and economic leverage to manipulate the market toward the social good, with conscience as their motive. This is what the third part of their mission statement addresses.

THE MIDDLE PERIOD, 1985–1994: MANAGING GROWTH VS. COMMITTING TO THE MISSION

Several socially conscious projects followed the arrival of the mission statement. The first was Peace Pops, a chocolate/popsicle confection that came about in response to the introduction of a similar product by their major competitor, Häagen-Dazs. Cohen took it upon himself to integrate a "socially responsible" aspect into the release of the product as well. He decided he was going to start a nonprofit organization called 1% for Peace, a proposal originally offered by Paul Snyder, a friend of the company's lawyer, in 1983. According to Cohen, "the organization would try to get Congress to pass a law

allocating one percent of the annual military budget toward activities focusing on peace through understanding." (Lager 1994, 174).

Another early initiative involved the use of the Greyston Bakery of New York City as a supplier. "The bakery hired the homeless and the hard-core unemployable to make cheesecakes and fancy torts that sold in gourmet shops and restaurants throughout the New York area. Profits from the bakery were used to provide transitional housing, counseling, and training for its employees—all intended to break the cycle of homelessness" (Lager 1994, 186). The Greyston Bakery continues to supply the company today.

The end of the Cold War changed the ideological stance that the 1% for Peace issue used as its premise. It changed its name to Business Partnership for Peace and in 1993 was merged into Businesses for Social Responsibility, which counts such Fortune 500 companies as Reebok and Stride-Rite among its members. Ben & Jerry's decided to begin a project with a new focus toward a more domestic concern. The Call for Kids was established in the place of 1% for Peace, as the board made the decision to focus the social mission into a single area and integrate it formally into the company's marketing and promotions.

All these initiatives are representative of the efforts that Ben & Jerry's made to contribute not only to the community that supported the production of their ice cream but also to society in general. The community has grown for them to an international scope as they have expanded into new markets. The later social initiatives continue to encompass a strong emphasis on politicization in their programs. Social responsibility to Ben & Jerry's means doing more than what may traditionally be known as "social work," "compassionate" giving to the unfortunate through Partnerships (Ben & Jerry's shops that are owned and operated by nonprofit groups) or donations to nonprofit organizations aimed at counseling or guidance. It means making an attempt to change the larger, well-rooted and institutionalized structures of society. Social programs that were politically motivated were 1% for Peace, the Call for Kids, and the setting up of "scoop shops" in Russia.

What is perhaps most striking about Ben & Jerry's program of social responsibility is its straightforward

attempt to actively support political opinions that offer alternatives to the hyper-rationalized and individuated business world that is too often separated from its community. As the business grew, however, it became harder and harder for the cofounders to maintain their ideals. In 1982, after deciding to sell the business and then declining all of the offers they received, they realized that they were too close to their work to let its unique style be changed by the multibillion-dollar candy company that was intent on purchasing Ben & Jerry's. The process of change had already begun, however, because they were compelled to deal more and more with the "real" business world.

In 1985, their third new plant opened in Waterbury, Vermont. The move to the new plant was a significant step in the process of change. "In Waterbury we were suddenly separated. The production and warehouse crews were in one part of the plant, the office workers in another. The up side was that more work was getting done. The down side was that as people became more task-oriented, they began to lose their connection to the whole of the organization" (Lager 1994, 143). While the founders suspected that these changes might impact their internal organization, they never anticipated the extent to which that impact would affect their social mission.

THE LATE PERIOD, 1994–2003: THE GROWTH ETHIC AND THE BUYOUT OF BEN & JERRY'S

Slowly, the nontraditional values that were upheld earlier were replaced by an ethic that incorporated efficiency, predictability, calculability, and control as primary values. An evolution took place, infusing the previous style with a bureaucratic temperament. It was the growth of the company that pushed this reform. Any plans to limit the growth of the company were thoroughly washed away in the early to mid-1990s. But in 1994 the company saw their first annual loss. Shareholders were not happy.

Robert Holland, Jr., hired as the CEO of the company in the spring of 1995, stated in a press release that the company would double its revenue from \$150 million by expanding distribution overseas and

by increasing the number of retail outlets. Despite an unconventional search for a CEO (titled, "Yo! I'm Your CEO!"), where anyone could write a one-hundred-word essay explaining why they would be the correct choice, Holland was found by an executive search firm due to his experience in the global marketplace (Holland was a thirteen-year veteran at McKinsey & Company and consultant to several Fortune 100 companies). Holland abandoned the five-to-one pay ratio (which had since expanded to a seven-to-one ratio).

In the early and middle period of the company, attention to the social mission had been the priority. But given the dwindling sales of 1994, Holland was hired "not so much as to clean house, but to get the house in order," said Mitch Curren, "Info P.R. Queen," in 1995. "His main priority will be to concentrate on the economic mission" [personal interview]. The expansion was created by Holland and the "new" Ben & Jerry's Homemade, Inc., followed the trend in the corporate world of international investment. International direct investment during the period when Ben & Jerry's was growing had increased by over 1,000 percent, and the number of transnational corporations grew from 7,000 in 1975 to 37,000 in 1995. A wave of economic globalization was cresting and it could be said that Ben & Jerry's was swept away with the tide.

In April 2000, the Ben & Jerry's franchise was purchased for \$326 million by Unilever, a \$45 billion multinational company. Although part of the buyout agreement was a continued commitment to the Statement of Mission, including the social mission, that contractual agreement was made for only two years. As Jeffrey Kanter, senior food analyst at Prudential Securities, said in a National Public Radio interview (13 April 2000): "It's tie-dye versus capitalism and capitalism won" (Baron, 2000).

In December 2000, when it came time to appoint a new CEO for the company, Unilever ignored the suggestions of Ben & Jerry's advisory board and appointed a twenty-four-year Unilever veteran. In response, company cofounders Cohen and Greenfield put out the following statement: "We strongly supported a different candidate, a longtime member of Ben and Jerry's Board of Directors, whose commitment to our social policies was clear and estab-

lished. As owner, Unilever of course has the legal right to manage Ben & Jerry's in the way it sees fit. We have not decided whether or not to remain with the company" (as reported in AlterNet.org, 2 January 2001).

Today, holding the title cofounders, Ben Cohen and Jerry Greenfield carry on their progressive mission outside of the context of the business, but because of name recognition and the political volatility of the issues of war and peace, the company has attempted to distance itself from the cofounders. According to a posting in 2003 to the Ben & Jerry's website, "When they speak they do so as private citizens or as representatives of one of the organizations they are involved with like True Majority, Business Leaders for Sensible Priorities, or the Peace and Justice Center in Burlington, VT."

THE FUTURE OF BEN & JERRY'S HOMEMADE, INC.

What had changed between 1982, when Ben Cohen and Jerry Greenfield could not bring themselves to sell the company, and 2000, when they did? Certainly, the massive amount of time and energy that the two had put into building the business had taken its toll. But beyond any personal explanations of exhaustion or boredom, it is clear to see that Ben & Jerry's Homemade, Inc., had changed over the years as the business grew and succumbed to the increasingly global forces of the mainstream economic world. Nonetheless, the leadership of Ben & Jerry's Homemade, Inc., has had a strong influence on the development of a corporate ethic of social responsibility, as well as on the organization of consumer awareness and support for this ethic. The basis for this ethic of social responsibility lies in a recognition of the intertwined relationship between economic, political, and social forces. Economic actors do not operate in a void. By changing some basic business practices and making a greater contribution of profits to philanthropic causes, a company can ultimately improve its chances of success in the long-term by creating a connection between business and community.

BIG FIVE PERSONALITY TRAITS

The Big Five Model of personality provides a framework for identifying and structuring personality traits

using five dimensions: extraversion/surgency (assertiveness), agreeableness, conscientiousness, emotional stability, and intellect/openness to experience. This model is based on seventy years of statistical research on the structure of peer ratings, which started with Louis Thurstone (1934). Thurstone summarized his research on the structure of adjectives used to describe acquaintances by stating, “It is of considerable psychological interest to know that the whole list of sixty adjectives can be accounted for by postulating only five independent common factors” (Thurstone, 1934, 13). Digman (1996) traces the history of Big Five personality research, identifying the work of Tupes and Christal (1961) as providing the first definitive demonstration of a five-factor solution extracted from correlations among personality scales.

EVIDENCE FOR THE BIG FIVE PERSONALITY DIMENSIONS

Research stimulated by Tupes and Christal provides compelling evidence for the robustness of the Big Five personality dimensions. This is the basis for the recent interest in personality assessment in applied psychology. The evidence indicates that the five-factor structure of personality is consistent across different theoretical frameworks (Goldberg, 1981; Johnson and Ostendorf, 1993; McCrae and Costa, 1996), using different measures (Conley, 1985; Costa and McCrae, 1992; Lorr and YOUNISS, 1973), in different cultures (Bond, Nakazato, and Shiraishi, 1975; Borkenau and Ostendorf, 1989; Digman and Takemoto-Chock, 1981), using ratings from different sources (Digman and Inouye, 1986; McCrae and Costa, 1987; Norman, 1963; Watson, 1989), and across different methods of data accumulation (Borgatta, 1964). The Big Five is a structure for organizing the natural language of human attributes; it is not a theory of personality or an explanation of behavior. However, McCrae and Costa (1996) point out that these factors provide the nucleus for a theory of personality, and they describe certain distinctive elements of such a theory.

The word *personality* has two definitions, and the distinction between them is important. On the one

hand, *personality* can be defined from the viewpoint of an actor and concerns a person’s identity. On the other hand, *personality* can be defined from the viewpoint of an observer and concerns a person’s reputation. Reputation reflects the distinctive features of another’s behavior; trait words are used to describe how a person is perceived by others. Each person’s reputation can be described using the Big Five personality dimensions in the following terms:

1. Quiet and unassertive versus active and outgoing (extraversion/surgency)
2. Hard-nosed and tough versus tactful and sensitive (agreeableness)
3. Impulsive and careless versus dependable and conforming (conscientiousness)
4. Nervous and moody versus calm and assured (emotional stability)
5. Narrow and unimaginative versus curious and imaginative (intellect/openness to experience)

One answer to the question of what to include, when measuring personality, is to assess the major components of reputation—the Big Five. Some personality inventories assess Big Five constructs, although scale labels are not consistent with the Big Five terminology. Only a few recently developed inventories explicitly measure the Big Five, and these usually have different scale labels for the same constructs (Costa and McCrae, 1992; Hogan and Hogan, 1995; Mount and Barrick, 2001). Before 1990 many researchers doubted the validity of personality measures for predicting occupational performance. However, when the Big Five structure is used to organize personality scales across studies, accumulated results indicate that personality measures significantly predict of a wide range of performance for virtually every job in the world of work (Hogan and Holland, 2003). The study of personality and leadership is a specific instance of this state of affairs.

A CONTEXT FOR DEFINING LEADERSHIP

Leadership is one of the most frequently studied topics in management and applied psychology; the

interest comes from the fact that, as members of collective enterprises, everyone is affected by who is in charge. Students of leadership seek to understand characteristics that contribute to leadership success and positive impact on organizations. We can make a fundamental distinction between leadership and organizational status that confounds the study of leader effectiveness. People who climb to the top of large bureaucratic organizations may owe their positions more to their political skills than to their leadership capabilities. Consequently, leadership research that focuses exclusively on high-status individuals may have little relevance for understanding real leadership.

What is leadership? We define it in the following context (Hogan, 1996). First, we think about leadership from an evolutionary perspective. People evolved as group-living, culture-using animals. People live (and work) in groups, and every group has a status hierarchy. Second, a status hierarchy implies an ordering of people based on factors important for group survival, with those people at the top contributing the most to group viability. Third, people in a group need, at an unconscious level, social acceptance from other group members, and they need status; acceptance and status ensure individual reproductive success. In short, people are motivated to get along—which facilitates group living and enhances individual survival—and to get ahead—which facilitates preferential opportunities for reproductive fitness. Fourth, there is an inherent tension between the processes of getting along and getting ahead. Actions that enhance acceptance tend to reduce status, and, conversely, actions that enhance status can reduce acceptance because success often comes at the expense of another individual or group. Finally, the success of any group involves balancing individual self-interest against the welfare of the group. Absent external threats, individuals typically pursue their short-term self-interest; in contrast, actions that promote long-term individual self-interest also enhance group longevity.

Leadership involves persuading people to set aside, for a time, their individual concerns and to pursue a common goal that is important for the welfare of a group (Hogan, Curphy, and Hogan, 1994).

LEADERSHIP AND PERSONALITY: BIG FIVE AND OTHER CHARACTERISTICS

Until recently, researchers doubted that any personality traits were reliably associated with leadership effectiveness. The first major indication of this skepticism appears in Stogdill's (1948) influential book, which concluded that leadership is not a "mere possession of some combination of traits" (Stogdill 1948, 66). The alternative view—that leadership is a function of the situation—prevailed from the 1960s forward. Some scholars branded the search for personality traits associated with leadership as simplistic and futile (Conger and Kanungo, 1998; House and Aditya, 1997). Nonetheless, even Stogdill (1948), despite his overall conclusion, noted that measures of dominance, extraversion, sociability, ambition or achievement, responsibility, integrity, self-confidence, mood and emotional control, diplomacy, and cooperativeness are positively related to emergent leadership.

Any review should distinguish between leadership emergence and leadership effectiveness. Emergence concerns being perceived as leader-like. Much of the research on this topic comes from studies of students and military personnel (Judge, Bono, Ilies, and Gerhardt, 2002). Effectiveness concerns a leader's ability to influence a work group to perform. Thus, evaluating effectiveness requires metrics (measurements) associated with work group performance. Judge, Bono, Ilies, and Gerhardt (2002) use this distinction to organize a definitive meta-analysis of the personality traits associated with leadership. Using 222 correlations from seventy-three studies and classifying the personality variables in the Big Five framework, Judge and associates conclude that extraversion/surgency is the most consistent predictor of both leadership emergence and effectiveness criteria. Statistically, the estimated true validities for leadership emergence and effectiveness, respectively, are extraversion/surgency (.33; .24); agreeableness (.05; .21); conscientiousness (.33; .24); emotional stability (.24; .22); and intellect/openness to experience (.24; .24). Regressing all Big Five personality measures on overall leadership yielded a multiple correlation of .48, with extraversion/surgency (.33; .24); agreeableness (.05; .21); conscientiousness (.33; .24); emotional stability (.24; .22); and intellect/openness to experience (.24; .24).

sion/surgency, intellect/openness to experience, and conscientiousness as the best predictors when using the Big Five as a test battery. Judge and associates provide an answer to the question of what personality traits distinguish leaders from non-leaders. The next question concerns why.

The links between personality and leadership can be summarized in terms of four points. First, recalling the distinction between the actor's and the observer's view of personality, leadership can be defined only as regards a group of followers, and it is best defined in terms of the leader's reputation. Reputation is attributed to an individual by others based on the performance that they observe during a period of time. Reputation is easily studied and reliably assessed. Second, implicit leadership theory indicates that a well-defined reputation is associated with effective leadership. Specifically, people expect leaders to be trustworthy, competent, decisive, and visionary (Dirks and Ferrin, 2002); those who are not perceived in these terms will not be viewed as leaders, regardless of their position in an organization. Third, although all people want acceptance and status, individual differences exist in people's ability to acquire acceptance and status, and effective leaders have the social skill necessary to negotiate successfully for both.

Fourth, taking a theory-based approach to the study of leadership, the Austrian neurologist Sigmund Freud and the German sociologist Max Weber both defined (at about the same time) the essential features of leadership in terms of charisma. They described charismatic leaders as having unusual interpersonal appeal and the ability to rally people to a cause based on the sheer force of their personalities. Charismatic theories of leadership (Conger and Kanungo, 1998) are, by definition, personality-based theories of leadership. House (1977) developed a rating form based on Weber's descriptors and found that persons with high ratings were seen as effective leaders. Bass's (1985) theory of charismatic leadership draws on Burns's (1978) influential book, in which Burns distinguishes "transformational" from "transactional" leadership; transformational leadership is the same as charisma. Judge and Bono (2000) summarize the distinction between transfor-

mational and transactional leaders as follows: Transformational leaders inspire followers to adopt a vision that involves more than individual self-interest, whereas transactional leaders appeal to followers' self-interest. These discussions also refer to laissez-faire (non-interfering) leadership, in which the leader does nothing.

Avolio, Bass, and Jung (1995, 1999) developed a measure to assess transformational, transactional, and laissez-faire leadership styles; meta-analyses showed that transformational leadership is positively related to leadership effectiveness (Lowe, Kroeck, and Sivasubramaniam, 1996). Laissez-faire style is negatively related to transformational leadership (Bass, 1997).

During the past twenty years, transformational leadership theory has dominated the leadership literature (Eagly, Johannesen-Schmidt, and van Engen, 2003; Judge and Bono, 2000), and ratings for transformational leadership (e.g., a kind of leader reputation) predict a range of effectiveness outcomes (Avolio, Bass, and Jung 1995; Judge and Bono, 2000). Transformational leadership is a function of three broad personality traits: extraversion/surgency (Judge and Bono, 2000); agreeableness (Bartone, Snook, and Tremble, 2002; Hogan and Holland, 2003); and intellect/openness to experience (Hogan and Hogan, 2002; Hogan and Holland, 2003). The links between personality and leadership can be traced to individual efforts to acquire acceptance and status. To gain the acceptance of others, leaders must be seen as sensitive to the needs of followers, concerned, considerate, and generous. Such traits are all tapped by the Big Five agreeableness dimension. To achieve status in a group, leaders must be seen as dominant, expressive, persuasive, and willing to take initiative to get things done. Such traits are the core of the Big Five extraversion/surgency dimension. Transformational leaders also achieve status by articulating a vision, which is the essence of charismatic and inspirational styles, and this is associated with Big Five openness to experience. Considerable empirical support exists for these personality-leadership linkages and a persuasive conceptual rationale for the results.

BIRTH CONTROL

Throughout history, women have actively sought safe and effective methods of birth control. Using folk medicine to prevent unwanted pregnancies, women often suffered real physical and psychological illness. The birth control movement was fueled by the desire for effective, mass-produced contraceptives, and it gathered strength from the efforts of women like Margaret Sanger. Commercialized by the mid-nineteenth century, contraceptives were readily available, however, their effectiveness was often dubious. Nonetheless, early attempts to control births prevailed with some success, and by the 1870s the overall birthrate dropped significantly. In contrast, however, by the 1890s the U.S. Catholic population dramatically increased because of eastern European Catholic immigration and strict mandates from the Catholic church that made using birth control a sin. Typically, historians note socioeconomic concerns and health-related issues as guiding factors in the emergence of the American birth control movement, specifically the health hazards brought about through multiple pregnancies and the hardship of rearing numerous children on meager resources. During colonial times women quietly practiced birth control, keeping the topic a private matter. Some practiced a variety of home remedies to prevent pregnancy, and others resorted to abortion as a means of controlling birth, a practice that went unnoticed in a largely rural environment.

As immigration swelled the American urban population during the nineteenth century, poverty

became part of the national landscape. Overcrowded tenements were commonplace, and underemployment and unemployment plagued the poor. Maternal and children's health and the need for effective and affordable contraceptives emerged as prominent issues for many American citizens, although not for prosperous industrialists and business owners who benefited from the massive immigrant labor pools. Lower-class individuals could barely afford daily subsistence let alone proper medical treatment. At best, the poor could obtain minimal medical treatment through charitable agencies, such as the public health departments, which some of the larger city governments sponsored. Public health entities, however, often failed to provide substantial health care or offer advice on birth control. And abortions concerned nineteenth-century conservatives, with some state legislatures seeking to restrict or outlaw the procedures.

In urban America, multiple pregnancies, poor health care during gestation, and overwork from childrearing left poor women in precarious health. To complicate matters, mothers were often forced by necessity to hold jobs outside the home, a situation that further eroded their health and led to child neglect. As a result, desperate women who found themselves pregnant repeatedly sometimes resorted to harmful self-induced abortions or abortions performed by the unskilled, which often resulted in severe bodily trauma or death. Women who could afford them used purgatives, plant abstracts, salts, salves, douches, and other agents designed either to prevent pregnancy or to induce menses, thus aborting unwanted children. Abortion practitioners were often arrested and jailed as restrictive laws became more pervasive by midcentury. Some physicians who merely gave out birth control advice or devices were shut down and sometimes jailed. Not only were doctors who attended the working class unwilling to recommend contraceptives, but poor women could not afford available contraceptives like vulcanized rubber condoms that were readily available by the 1830s. Bound by social mores and religious restrictions, especially those for Catholics, men remained reluctant to take charge of birth control. By 1873, restrictive federal laws were in place that forbade the

public distribution of contraceptive literature and materials, a situation that resulted in a political control of women's bodies under the guise of controlling vice in society. Yet, many upper- and middle-class women had fewer children and managed to control the number of their births, which suggests that certain classes of Americans were able to obtain the most effective contraceptives throughout the nineteenth century.

OPPOSITION LEADERSHIP: ANDREW COMSTOCK

Dedicated and determined leaders led both sides of the nineteenth-century birth control controversy. At one end of the continuum were the moralists who sought to suppress all forms of birth control, which they labeled as a companion of vice. At the other end were the reformists who sought to liberate women from the hardships of overwork and multiple pregnancies. Both groups of reformers hoped to create a better society where families could grow and create future generations of successful citizens. The moral reformers did little to alleviate the suffering of poor women and instead punished them for seeking birth control alternatives. Among the most ardent moralist and self-righteous spokesmen for the anti-birth control movement was Anthony Comstock, a devout Christian who emerged as a leader during the 1860s and continued the fight well into the twentieth century. Unfortunately for poor women needing birth control, Comstock's early campaigns were very effective in controlling the distribution of contraceptive devices and literature about avoiding pregnancies. Prior to the passing of the federally mandated Comstock laws in 1873, vice control was a matter left up to various city and precinct leaders. For example, during Comstock's reign in New York, the local Young Men's Christian Association (YMCA) created a Committee for the Suppression of Vice. The group regularly purchased and destroyed birth control goods, shut down book dealers of supposedly erotica-based literature, and at times committee members took over clinics that supplied contraceptives. Eventually the YMCA became an independent operation, and Comstock went on to become the

head vice investigator for the New York Society for the Suppression of Vice. By gaining the support of New York's elite citizens, Comstock effectively created an institutional base.

THE AGE OF COMSTOCKERY AND THE LEADERSHIP OF MARGARET SANGER

During the 1870s, President Ulysses S. Grant appointed several men as vice agents for the U.S. Postal Service. The job of the agents was to screen mail for pornography, literature suspected of encouraging vice, and contraceptives. Andrew Comstock was instrumental in getting Congress to pass legislation that was dubbed the Comstock laws. This legislation effectively gave the postal service the ultimate authority to suppress vice and to investigate and arrest individuals for using the federal mail services to distribute items such as birth control literature and contraceptive devices. Once the restrictive legislation was in place, Comstock arrested numerous individuals, ordered the destruction of thousands of books and pamphlets deemed erotica and the confiscation of thousands of contraceptive devices. Comstock had little sympathy for the plight of the poor, blaming them for the presence of vice in society because he believed that they lacked proper self-control.

Comstock and his supporters did not meet their goals without resistance. In the late nineteenth century, women actively sought effective contraceptives, helping to pave the way for a full-scale birth control movement in America. Among the handful of physicians, nurses, and laypersons involved in the movement was Margaret Higgins Sanger, who fought for legal and publicly available birth control.

Sanger was born Margaret Higgins in Corning, New York, in 1879. She was one of eleven children born to first-generation Irish Americans Michael and Anne Purcell Higgins. Her mother was a dedicated Catholic, and her father was a freethinking, atheist stonecutter prone to drinking alcohol. Interesting enough, religious differences did not destroy the Higgins marriage, which lasted until Mrs. Higgins's death at age fifty in 1899. Margaret Sanger believed that her mother's early death occurred because of the hardships she suffered from eighteen pregnancies,

Margaret Sanger's "The Case for Birth Control"

Everywhere we look, we see poverty and large families going hand in hand. We see hordes of children whose parents cannot feed, clothe, or educate even one half of the number born to them. We see sick, harassed, broken mothers whose health and nerves cannot bear the strain of further child-bearing. We see fathers growing despondent and desperate, because their labor cannot bring the necessary wage to keep their growing families. We see that those parents who are least fit to reproduce the race are having the largest number of children; while people of wealth, leisure, and education are having small families.

It is generally conceded by sociologists and scientists that a nation cannot go on indefinitely multiplying without eventually reaching the point when population presses upon means of subsistence. While in this country there is perhaps no need for immediate alarm on this account, there are many other reasons for demanding birth control. At present, for the poor mother, there is only one alternative to the necessity of bearing children year after year, regardless of her health, of the welfare of the children she already has, and of the income of the family. This alternative is abortion, which is so common as to be almost universal, especially where there are rigid laws against imparting information for the prevention of conception. It has been estimated that there are about one million abortions in the United States each year.

To force poor mothers to resort to this dangerous and health-destroying method of curtailing their families is cruel, wicked, and heartless, and it is often the mothers who care most about the welfare of their children who are willing to undergo any pain or risk to prevent the coming of infants for whom they cannot properly care.

There are definite reasons when and why parents should not have children, which will be conceded by most thoughtful people.

First—Children should not be born when either parent has an

inheritable disease, such as insanity, feeble-mindedness, epilepsy, or syphilis.

Second—When the mother is suffering from tuberculosis, kidney disease, heart disease, or pelvic deformity.

Third—When either parent has gonorrhea. This disease in the mother is the cause of 90 percent of blindness in newborn babies.

Fourth—When children already born are not normal, even though both parents are in good physical and mental condition.

Fifth—Not until the woman is twenty-three years old and the man twenty-five.

Sixth—Not until the previous baby is at least three years old. This gives a year to recover from the physical ordeal of the birth of the baby, a year to rest, be normal and enjoy her motherhood, and another year to prepare for the coming of the next.

We want mothers to be fit. We want them to conceive in joy and gladness. We want them to carry their babies during the nine months in a sound and healthy body and with a happy, joyous, hopeful mind. It is almost impossible to imagine the suffering caused to women, the mental agony they endure, when their days and nights are haunted by the fear of undesired pregnancy.

Seventh—Children should not be born to parents whose economic circumstances do not guarantee enough to provide the children with the necessities of life.

A couple who can take care of two children and bring them up decently in health and comfort, give them an education and start them fairly in life, do more for their country and for mankind than the couple who recklessly reproduce ten or twelve children, some of them to die in infancy, others to survive but to enter the mill or factory at an early age, and all to sink to that level of degradation where charity, either state or

Source: Sanger, Margaret. (1924). "The Case for Birth Control." *Woman Citizen* 8, 17–18.

and that her parents' ignorance of birth control contributed to her family's poverty and social estrangement. By the time Sanger had finished her public school education, she had concluded that poor women desperately needed birth control in order to preserve their health and to adequately provide for their children. A natural leader who defied convention, Sanger went on to attend Claverack College

and the Hudson Institution, where she received a liberal arts education for three years. She relished relationships she developed with upper-class women at Claverack and made many important social connections that would aid her future leadership role. After a brief stint of teaching, Sanger entered nursing school in White Plains, New York, which helped solidify her determination to promote birth control.

private, is necessary to keep them alive. The man who cannot support three children should not have ten, notwithstanding all pleas of the militarists for numbers.

Eighth—A woman should not bear children when exhausted from labor. This especially applies to women who marry after spending several years in industrial or commercial life. Conception should not take place until she is in good health and has overcome her fatigue.

Ninth—Not for two years after marriage should a couple undertake the great responsibility of becoming parents. Thousands of young people enter marriage without the faintest idea of what marriage involves. They do not know its spiritual responsibilities. If children are born quickly and plentifully, people consider that the marriage is justified. I claim that this is barbaric and wrong. It is wrong for the wife, for the man, for the children.

It is impossible for two young people to really know each other until they have lived together in marriage. After the closeness and intimacy of that relation there often comes to the woman a rude awakening; the devoted lover becomes careless and dissatisfied. If she becomes pregnant immediately, she becomes physically disturbed, nervous, and irritable. The girl has changed, and the boy who knew her as a happy smiling sweetheart finds her disagreeable and disgruntled. Of course thousands of people learn to adjust themselves. Nevertheless, I maintain that young people should marry early and wait at least two years to adjust their own lives, to play and read together and to build up a cultural and spiritual friendship. Then will come the intense desire to call into being a little child to share their love and happiness. When children are conceived in love and born into an atmosphere of happiness, then will parenthood be a glorious privilege, and the children will grow to resemble gods. This can only be obtained through the knowledge and practice of Birth Control.

As a young nurse working the night shift, she saw poverty and destitution at its worst. She witnessed women suffering from puerperal infections, uterine disorders, and other illnesses brought about from exhaustion from overwork and childbearing. During her early years of nursing, she assisted doctors who attended births and practiced midwifery herself in the immigrant tenements. Sanger wrote in her auto-

biography about the desperate women who begged her for birth control advice.

Although Margaret vowed she would never marry, by the time she neared the end of her nursing training at the age of twenty-two, she had married architect William Sanger, with whom she had three children.

However, she did not abandon her nursing career or her mission of promoting birth control. In July 1912, Sanger nursed back to health Sadie Sachs, a Russian immigrant who had given herself an abortion and nearly died. The impoverished woman chose the abortion because she already had several children whom she and her husband could barely afford. The physician attending Sach offered the suffering woman no advice about birth control, and about a year later Sanger witnessed Sachs's death after a second self-induced abortion. At that point, Sanger vowed that she would work to put an end to the unnecessary suffering and poverty brought about from unwanted pregnancies and poor family planning.

EARLY BEGINNINGS OF THE BIRTH CONTROL MOVEMENT

In spite of Comstock's efforts, birth rates continued to decline, women continued to use birth control and obtain abortions, and publishers continued to produce sexually explicit literature that was eagerly purchased by the public. Yet, effective and affordable birth control was not fully available, and the Comstock agents continued to deter public clinics from opening for fear of retribution. In 1916, despite legal obstacles and fear of prosecution, Margaret Sanger, along with her sister Ethel Higgins Byrne and her friend Fania Mindell, opened a birth control clinic in one of the poorest neighborhoods of Brooklyn, New York. All three women were arrested and taken to jail; Mindell was released, but the sisters served prison sentences for breaking the Comstock laws.

Sanger fought for legalized birth control for over fifty years. By 1921, Sanger had founded the *Birth Control Review*, and in the same year, Sanger and her friend Mary Windsor were arrested during the first

American Birth Control Conference. In spite of legal repercussions Sanger continued to gain support worldwide. Sanger went on to found the American Birth Control League. However, emerging clinics and birth control meetings were routinely shut down during the 1920s and numerous birth control reformers were arrested. By the 1930s, birth control regulations began to ease and male-dominated hospitals and other health institutions began openly supporting birth control and formed alliances with the league. A key factor in this support was the 1936 decision in *U.S. v. One Package* by the Second Circuit Court of Appeals in New York, allowing physicians to legally import contraceptive devices for medical purposes. Then, in 1937, the American Medical Association endorsed birth control after years of urging by progressive physicians such as Dr. William J. Robinson and Dr. Abraham Jacobi, an eminent physician and former AMA president.

Through the league, Sanger reached thousands who supported family planning. Outreach clinics sprung up across the nation. In 1939, the American Birth Control League and the Clinical Research Bureau merged and became the Birth Control Federation of America (BCFA). By the end of the 1930s, the federation successfully reached the nation's poorest in the rural South, with W. E. B. Du Bois serving on an advisory board that led to county health departments supporting family planning.

The 1940s ushered in a host of progressive developments in birth control and several leaders like Kenneth Rose and Dr. Gregory Pincus emerged as prominent supporters of birth control. Rose became the national director of the Federation, and in 1942 BCFA changed its name to Planned Parenthood Federation of America. Pincus spent several years conducting steroid research in order to create an effective injection or birth control pill that completely modernized contraceptives. His diligent research led to production of the birth control pill by 1960, the most successful method of birth control of the time, which would become the leading form of birth control in America. Physicians practicing in Catholic hospitals, however, were routinely fired for not abiding by contraceptive bans, and federally mandated legislation made it virtually impossible to obtain a legal abortion.

During the 1950s and 1960s, the organization previously led by Margaret Sanger became the International Planned Parenthood Federation. By 1970, Congress had repealed most of the Comstock laws, and birth control gained the acceptance of most Americans. This acceptance was echoed by President Richard Nixon who, in 1970, signed into law Title X of the Public Health Act, which provided funding for national family planning and established the Center for Population Research. The bill had been cosponsored by George Herbert Walker Bush, then a congressman, who noted at the time, "We need to make family planning a household word. We need to take the sensationalism out of the topic so it can no longer be used by militants who have no knowledge of the voluntary nature of the program, but rather are using it as a political stepping stone. If family planning is anything, it is a public health matter" (Planned Parenthood Federation of America History:1960s).

The topic of abortion remained a hotly contested issue among clerical leaders and became a subject of partisan politics. Despite the 1973 *Roe v. Wade* decision that paved the way for legalized abortion, opposition continued against family planning and abortion. Following Sanger's example, leaders like John D. Rockefeller began funding and organizing worldwide conferences on population control, which continue to be funded to promote family planning globally. The United Nations World Population Conference gained support from most countries for population policies and programs that would positively enhance social and economic growth. Only the Vatican continued to reject family planning, the use of contraceptives, and any type of abortion regardless of circumstances.

During the last decades of the twentieth century, birth control information and products became increasingly available to Americans; at the same time, however, pro-life supporters continued to stymie family planning organizations' activities and to fight for antiabortion laws. The leadership of Ronald Reagan and George Herbert Walker Bush aided opponents of birth control and effectively decreased funding for national family planning organizations, thus encouraging the activities of pro-

life supporters. Both presidents actively curtailed funding for family planning. Reagan's executive orders included cutting funds to third-world organizations that performed abortions. The most prominent measure was dubbed the "Mexico City Policy," which successfully limited funding for family planning clinics and made it illegal for these organizations to perform abortions or fight politically for legalized abortions—a policy continued by Bush who had once been a strong supporter of family planning.

As a result, many abortion and family planning clinics were attacked. Doctors, nurses, and supporters were verbally harassed, assaulted, and several people were murdered. The conservative leadership during the 1980s created a negative backlash that effectively discouraged legalized abortion. Although conflicting views continue to exist in the twenty-first century, without the strong leadership of women like Margaret Sanger, the freedom to choose birth control over maternity might not exist in modern America. Regardless of extremist views on family planning and abortion, the gains made by Sanger and her followers have made permanent marks on history that have benefited women and men alike worldwide.

BODY SHOP, THE

Anita Roddick (b. 1942), founder of The Body Shop cosmetic company, has long had an understanding of how to play the media. Her first encounter with the media came in 1976 as she was opening her first shop in a down-in-the-heels alley in Brighton, an English south coast resort town. No one, certainly not Roddick herself, foresaw that this hole-in-the-wall, inopportunistically situated across from a funeral parlor, would become a fifty-country empire of two thousand stores with annual revenues of more than a half-billion dollars.

Roddick said that when she put up "The Body Shop" sign, the funeral parlor owner demanded that

she change the name and even threatened her. He was afraid that it would confuse his customers. Roddick rang up the local newspaper, the *Evening Argus*, and landed a sympathetic column, creating a publicity stir. Much to everyone's surprise, The Body Shop's cash register was soon ringing.

It's a heart-warming tale, but according to friends and colleagues, as with many of Roddick's tales, it's a tall one. There was no threat. Beginning a pattern of stretching the truth that would serve her well for many years—but that would also challenge the ethical claims that became The Body Shop's calling card—Roddick simply concocted the story of a naïve woman entrepreneur under siege. The understaffed newspaper ran with it. It was a lesson in media gullibility that Roddick would never forget.

Operating on a skimpy budget, Roddick sold soaps and shampoos with no-frill promises in no-frill plastic bottles. Well before the “natural” craze had caught on, she struck a responsive chord among the hippies who dominated the scene in Brighton by claiming that her fragrances and lotions were “100 percent pure.” Neither she nor her customers were sophisticated enough to know that the bright colors, heavy scents, and preservatives in her products were made with synthetic chemicals.

While her husband Gordon masterminded the company's fast expansion through franchising, the charismatic Anita emerged as a media favorite with a tart tongue. She took shots at mainstream cosmetic companies, run almost exclusively by men, who, she charged, “lie,” “cheat,” and “exploit women.” She vowed she would never hire an executive with an M.B.A., particularly from Harvard, one of many promises she would make to great fanfare and break to little notice. She was quick to play the beleaguered female card. “Business practices would improve immeasurably if they were guided by ‘feminine’ principles—qualities like love and care and intuition” (Roddick & Prokop, 1994), she often said, a quip from a speech that found its way into almost every adoring feature story written about her.

In its early days, The Body Shop thrived on the idealism of young women such as Anne Downer, a British citizen living in Singapore. On a visit home in 1981, Downer wandered into a Covent Garden,

London, store and fell in love with The Body Shop concept. The twenty-two-year-old hopped on a train to company headquarters in Littlehampton, eventually coming away with rights to markets in eight Asian countries for a few hundred British pounds. “I thought Anita was quite a maverick,” said Downer. “I liked her wacky sense of ‘let's do it differently’” (interview by author, 1993).

The wackier Roddick came across, the more her popularity—The Body Shop sales—grew. A mocking critic of the “pin-striped” dinosaurs of the London Stock Exchange, this anticapitalist icon sold stock in her fast-growing company in 1984. She and her husband Gordon, who together owned one-quarter of the shares, became instant multimillionaires.

The Body Shop myth is a confection of such quixotic and contradictory themes. Roddick would go on to help inspire the “socially responsible” business movement by promoting herself as a new breed of “caring capitalist.” However, she built her ethical myth on a pattern of exaggerations and sometimes ruthless business practices. It's a combustible mix that sparked a blaze of free and overwhelmingly positive publicity in The Body Shop's early years only to transform into a firestorm of critical press that left her company financially limping and her reputation in tatters.

Roddick's reputation as a social activist, which emerged two years after the company went public, was ironically tied to a sales promotion. At the time, Roddick marketed her popular line of jojoba oil as a substitute for whale spermaceti-based cosmetics, which The Body Shop misleadingly implied were sold by competitors. That provided a natural tie in with Greenpeace in the United Kingdom, which had just launched a “save the whales” campaign. The Body Shop printed catchy fundraising posters. The effort generated a blizzard of publicity and new customers. Roddick “the social activist” was born.

By the late 1980s, Roddick had become a renowned gadfly, promoting the latest politically correct cause: ending animal testing of products, saving the rain forest, encouraging recycling, AIDS awareness. She boasted of pioneering trade links with third world producers, from Amazonian natives who collected Brazil nuts to people in Nepal who made

paper. Young women idolized her, snapping up her not-tested-on-animals, Brazil nut hair conditioner.

ACCOLADES

U.S. consumer advocate Ralph Nader anointed Rod-dick “the most progressive business person I know” (interview by author, 1993). *People* magazine, NBC News, and the *New York Times* produced enthusiastic profiles. *USA Today* headlined one story “The Mother Teresa of Capitalism.” She was awarded an Order of the British Empire, and the Audubon Society bestowed its top environmental honor on her. The Baby Boom generation seemed to have found its voice. Here was a harbinger of the new age, weaned on can-do chutzpah (self-confidence) and do-right values.

Eventually touted by such stock gurus as Merrill Lynch’s Peter Lynch, The Body Shop rode the green wave, opening cookie-cutter franchises in suburban malls around the world. However, beneath the socially responsible patina there was growing trouble. Although The Body Shop continued to open profitable stores in marquee locations, it was mostly a wholesaler supply cosmetics to franchisees, who shouldered the startup costs. Over the years The Body Shop gradually increased fees, pocketing hefty chunks of others’ risk capital. Franchisees in the United States can pay as much as \$775,000 plus a 5 percent sales royalty—far more than The Body Shop’s franchised competitors charge.

However, by the early 1990s the market began to change as competitors such as Boot’s in Britain and Bath and Body Works in the United States copied the formula. At first The Body Shop felt little pain because it continued to profit from hefty franchise fees. However, soon often-naïve entrepreneurs, leveraged to the edge with loans to support their venture, saw their margins evaporate. Many franchisees failed or were barely surviving, touching off disputes. All told, in recent years The Body Shop has shelled out more than \$130 million to settle dozens of disputes with dissident franchisees in North America, Asia, and Europe. Once the goose that laid the golden egg, The Body Shop’s formerly impregnable business model of franchising had become a liability.

Values Mission Statement of the Body Shop

The Body Shop Values Mission commits the Company to the pursuit of social and environmental change. Our Trading Charter defines the principles by which we will trade in order to deliver profits with principles. This includes instituting appropriate monitoring, auditing and disclosure mechanisms to ensure our accountability and demonstrate our compliance with our principles.

The Body Shop is committed to maintaining high standards of social and environmental performance. We believe in doing business with integrity and transparency. This means using our ethical principles to inform the way we do business, setting for ourselves and our business partners clear standards of practice. It also involves engaging stakeholders behind our business aims, and reporting on our performance and our intent to improve within the overall context of our business strategy.

The Body Shop Foundation complements our approach by giving financial and in-kind support to innovative, pioneering groups or projects who work to achieve sustainable progress in the areas of human and civil rights and environmental and animal protection.

Source: The Body Shop. Retrieved September 11, 2003, from www.bodyshop.com/web/tbsgl/values_approach.jsp

Some of the embarrassing situations were public and ugly. Downer collected \$6.2 million to settle a dispute after The Body Shop occupied her Singapore stores, snatched her Asian franchise rights, and tried to force her into bankruptcy on Christmas Eve. The Body Shop paid \$878,900 to its former Norwegian head franchisee, who alleged breach of contract. The Body Shop was permanently barred from operating in Israel after being accused of financial and ethical shenanigans. “Rebels vent anger over ethics of Body Shop,” screamed a headline in *The Sunday Times* of London in yet another high-profile wrangle with British franchisees. Operations in France, Spain, and Germany were in turmoil. Most recently, in Canada in 2001 an Ontario judge blasted The Body Shop for “egregious breach of widely accepted commercial morality . . . not consonant with our system of justice and general moral outlook” (Entine, 2002). The

Canadian Court of Appeal later joined in, accusing The Body Shop of engaging in “dishonest and unconscionable” (*Body Shop v. Lambert*, 2002) practices in dealings with its former franchisee.

Roddick herself tacitly acknowledged the problems, deriding her creation as a “dysfunctional coffin.” After trying to sell the troubled company for years, the Roddicks pulled it off the market in early 2002, announcing that they were reducing their management roles—for the third time in five years—and hiring a new CEO—the fourth corporate makeover in a decade. The Roddicks still control the board, however. Whereas husband Gordon has retired, Anita said she has no intention of stepping into the shadows. “Being now a non-exec is going to be much more fun for me because you can be much more a tyrant” (Entine, 2002), she said. Roddick then named herself “creative consultant” and is paying herself \$320,000 annually to offer “essential expertise in product, marketing and values”—the very issues at the heart of The Body Shop’s problems.

Touted a decade ago as the “shares that defy gravity,” The Body Shop’s stock has long since rediscovered the English physicist Isaac Newton’s *Principia*, (the book of proofs of the law of the universal gravitation) losing more than 75 percent of its value, peak to trough, a loss in valuation of more than \$750 million. The company is bleeding cash. According to the London-based securities firm Investec Henderson Crosthwaite, The Body Shop is “barely profitable” on an ongoing basis. “Their extraordinary expenses, reorganization charges, and costs of acquiring failing franchises have become recurring and commonplace” (Entine 2002).

“Body Shop hasn’t had positive net cash flow for more than five years,” added ING Barings Charterhouse, another London securities company. “As an innovative leader and growth company, they’re a dead concept” (Entine 2002).

Although details in each case are different, franchisees have broadly contended that the growing financial troubles have reflected deterioration in ethics as the company evolved from an idealistic startup into a hard-edged multinational company and as Roddick emerged as a celebrity. In recent years,

The Body Shop has been dogged by public ethical blowups on everything from product quality to its once-admired third world trading ventures to its reputation for philanthropy.

The Body Shop’s products have faced unusually harsh criticism. The U.S. publication *Women’s Wear Daily* has called its cosmetics “low-end at a premium price” (*Women’s Wear Daily* 1996). The Body Shop’s eye gel has come under attack from *Consumer Reports*, which noted that chemical fumes that irritate the skin create the gel’s cooling sensation. The eye gel, moisturizer, and baby cream were the subject of scathing exposes by German consumer magazine *Öko-Test* (Green Test), which found cancer-causing formaldehyde. The investigating scientist said the formaldehyde resulted from overuse of synthetics to control systemwide bacterial contamination. In contrast to its claims of being environmentally friendly and its self-promotion as a “natural” beauty company, The Body Shop has relied on bright artificial colors and heavy synthetic scents, created in the laboratory, often with petrochemicals.

QUALITY PROBLEMS

Quality has also been a problem. The Body Shop’s pumice foot scrub was regularly contaminated, according to founding cosmetologist Mark Constantine, a finding confirmed by managers and internal company memos. The U.S. Food and Drug Administration cited The Body Shop for eight health violations in 1993 after employees complained that the company suspended standard microbiological procedures to increase production before Christmas. The company shipped and sold hundreds of bottles of contaminated banana shampoo before getting wind of the FDA investigation.

The Body Shop has maintained that it has overhauled its products and quality control practices. However, as recently as 2001 Denmark’s *Green Guide* blasted The Body Shop’s two best-selling cosmetics for containing chemicals that it scorned as “poison.”

Roddick’s reputation for charitable giving has also stirred resentment among franchisees, who often give generously in time and money but see the

head office garner credit. Roddick has claimed that she “gives most of our profits away.” However, reviews of company records show that The Body Shop did not contribute to charity over its first eleven years and did not increase donations to even average corporate levels until a wave of negative publicity in 1994. Roddick countered the critics by claiming that The Body Shop’s social campaigns, which often have been tied to product promotions, are a form of philanthropy.

Controversy also has centered on the company’s “Trade Not Aid” hair rinse promotion, particularly use of Brazil nuts as a source. The former face of the promotion, a Kayapo Amazon chief, successfully sued The Body Shop for exploiting his image. University of Chicago anthropologist Terrence Turner ridiculed the promotion as a gimmick, calling it “Aid Not Trade”—aid by developing peoples to The Body Shop with no real trade in return. Stephen Corry of Survival International (a worldwide organization supporting tribal peoples), who once partnered with The Body Shop in the Amazon, went so far as to characterize the company as “sleazy and no more ethical than a heap of beans” (personal correspondence with author, 1994).

Much of The Body Shop’s good publicity flowed from its self-reporting of its internal social and environmental practices. However, even here the story is mixed. The Body Shop quashed at least two environmental audits after embarrassing problems turned up. David Brooks, a former U.S. Environmental Protection Agency lawyer and The Body Shop’s U.S. environmental director in the early 1990s, dismissed the company’s environmental initiatives as “window dressing.” He detailed lackluster recycling practices and regular discharges of hazardous waste into the water system near the company’s headquarters in New Jersey, which was then covered up by executives.

Few people doubt Anita Roddick’s idealism about broad principles, from achieving human rights to empowering women. The company has become a respected world corporate leader in issuing environmental and social accounting statements. However, Roddick, the symbol of the brand, has been dogged by ethical questions that began

with the founding of the company. Just how ethical is her company at its core?

For years Roddick posted a sign on her office: “We will be the most honest cosmetics company around.” Yet, The Body Shop started as a lie. According to Roddick, she personally hatched the idea of a no-frills cosmetic shop. The Body Shop name, she said, was inspired by auto repair garages she noticed during a visit to the San Francisco area with Gordon in 1970.

However, it is now widely documented that Roddick fabricated her founding myth. She was indeed in the United States in 1970. Anita and Gordon stayed with Gordon’s best friend, David Edward. Edward’s former wife, Alma (now Dunstan-McDaniel), remembered taking Anita to her favorite shop, filled with tie-dyed decorations and redolent with incense. “That was *the* place to buy shampoo and body cream,” Dunstan-McDaniel recalled (interview by author, 2002). She remembered watching as Anita bought armfuls of hand-cut soaps, loofah sponges, and cosmetics in small plastic bottles with handwritten labels. The store had been a sensation when it had opened, housed in an abandoned garage. Its owners, sisters-in-law Peggy Short and Jane Saunders, had called their store “The Body Shop.” Roddick frequented the second store, which had just opened at Union Square.

When Roddick debuted her copycat version six years later, she mimicked almost every aspect of the original Body Shops—including the hand-sketched logo, color scheme, plastic bottles, and “break-through” recycling policy.

Comparisons of the brochures of the original and Roddick’s copycat version are telling. “Four O’clock Astringent Lotion” was changed to “Five O’clock Astringent Lotion.” “Korean Washing Grains,” developed by women who sewed kimonos for the U.S. market, appeared later in Roddick’s Body Shop as “Japanese Washing Grains.” Roddick even lifted the blurb on the original brochure masthead, which noted: “All of our products are Biodegradable & made to our specifications,” “Bottles 20 cents or bring your own.” Roddick’s version read: “All our products are biologically soft and made to our specifications,” “Bottles 12p, or bring your own.” Roddick copied

Anita Roddick, founder of *The Body Shop* brand and chain of stores, in 1986.

product descriptions word for word, including grammatical errors.

For years, Short and Saunders were unaware of the duplication. As a result, when the Roddicks approached them in 1987 to buy the copyright to *The Body Shop* name in the United States for \$3.5 million, they jumped. Short and Saunders became instant millionaires but got to keep their stores, which they renamed “Body Time.” Only later did they stumble upon the Roddicks’ copycat brochures. “What really got them angry,” said a colleague “was the ongoing deception, Anita’s lie that she originated the idea, the products, all the things that gave the company its unique identity. Never in our wildest imagination did we think that Roddick, with all her claims about being so honest, would keep this fabrication going” (author interview, 2002).

DENIALS

The Roddicks denied “any knowledge” of the duplication. Dunstan-McDaniel dismissed the Roddicks’ claim that they had no knowledge of the original store. She talked to Roddick there herself, she said. “She had a number of those products in her suitcase to go home. She made sure she had one of each. It was a lie from the start. Anita ripped them off” (interview by author, 2002).

Roddick would later embellish her founder’s myth with claims that she had come up with exotic

products during wanderlust travels when in her twenties. According to Mark Constantine, her original cosmetologist, and public relations director Janis Raven, these stories were fiction. “I was fully aware that she hadn’t had the idea about wandering in Polynesia,” said Constantine. “The wonderful joke with Janis Raven was always: ‘Janis, can’t you do something about Anita? You created all this bloody publicity thing.’ You create the monster you can’t control” (interview by author, 1993).

Ironically, the myth and exaggerations were typical of a cosmetic industry built on hyperbole. Of course, Roddick was not the first person to steal someone else’s idea and do it better. Competitors, notably Bath and Body Works, would rip off Roddick’s copycat version and flourish. The issue is the hypocrisy and exploitation of the idealism of *The Body Shop*’s customers, mostly teenaged girls who paid far higher prices—an integrity premium—for *Body Shop* products because they believed that the products were natural and that the company operated at a higher standard of ethics.

Raven chose her words carefully when asked to assess Roddick’s ethics. “I think Anita Roddick is a very brilliant woman,” Raven said. “You know, Anita’s gone over the top. We used to joke that I’ve created this Frankenstein. If you start believing all this stuff that is written about you, you have got to go dotty, haven’t you? She started to believe her own publicity and this is always the death knell to anybody” (interview by author, 1993).

Now in business more than a quarter of a century, *The Body Shop* has long since graduated from the ranks of feisty upstart to staid multinational company. Mark Constantine, who went on to found the British-based cosmetic firm Lush, which tried to acquire *The Body Shop* a few years ago, had mixed feelings about Roddick’s legacy. He thought back to the early days, mixing weird potions in his kitchen while Anita and Gordon Roddick looked on like kids in a candy store. “There is still a mass of innocence to those two despite it all,” he observed (interview by author, 1993).

The Body Shop story—its inspiring initial success and its troubled present—reflects the contradictory personalities of its founders, who still control

more than half the voting stock and a toothless board. Even with all the problems, no one can take away Roddick's success in building a cosmetics empire. However, it is increasingly doubtful that she will be remembered as the world's most socially responsible entrepreneur. "Roddick stands full square between Estée Lauder and Elizabeth Arden," noted Constantine, "They all wrote their own stories" (interview by author, 1993). Although she has been a powerful and often inspiring figure, Anita Roddick's legacy rests in her ethical contradictions as much as her vision. She is, after all, one more beauty baroness who created her own myth to make her entrepreneurial dream come true. While the mainstream cosmetics industry packaged beauty in a bottle, Roddick misleadingly peddled idealism and integrity.

BOUNDARIES AND AUTHORITY

Everything in the universe is organized or delineated by boundaries. Boundaries can be viewed essentially as dividing lines or limits that define what is “in” and what is “out.” Paradoxically, this view also makes boundaries privileged places (or means) of contact and relatedness. As such they are crucial places for learning and innovation.

Systems theory maintains that all living systems, including social systems, preserve their vitality by importing resources across a permeable boundary, transforming those resources into life-sustaining products and then exporting some of the transformed products back across the boundary into the larger environment. A college, for example, can be thought of as a social system that imports students by means of an admissions process, transforms them by offering courses and activities aimed at helping them learn and develop, and then exports them at the time of graduation.

The well-being of a system depends to a significant degree on the “fit” between the needs of the system for resources and the permeability of its boundary with the surrounding environment. If the boundary is too rigid or impermeable, the system suffocates or becomes excessively isolated from its environment; if the boundary is too porous, the system loses energy and, perhaps, even its identity. For example, if the admission requirements of a college are so steep that it cannot pay its bills because not enough students qualify for admission, then there is a “mismatch” between the college’s boundary permeability and its need for resources in the form of tuition-paying students. If the admission requirements are too loose, then the college loses prestige, and its identity begins to change as it becomes less attractive to talented students and faculty. Decisions and actions governing boundary permeability at the overall level of organization as well as within units or subsystems are linked to the practice of authority.

Authority, whether formal or informal, is a bargain or exchange by which power is conferred (or entrusted) in return for a service or benefit. For example, the power to issue traffic citations is conferred on police officers by the citizens of the state in

exchange for the service of being protected from reckless drivers. Thus, the exercise of authority is fundamentally a practice, something that people do for and with one another. The practice of authority—what those people who are exercising authority *actually do*—consists primarily of managing key group or organizational boundaries such as those that define, protect, or regulate purpose, task, membership, role, procedures, resources, time and space in order to promote the work of the system. Managers, for example, engage in the activity of managing membership and role boundaries when they hire, fire, and promote personnel. People manage resources by setting boundaries that determine salaries, product pricing, advertising budgets, dividends, and so forth.

BOUNDARIES

Boundary is a fundamental notion that at once is simple and complex, logical and paradoxical. Boundaries give shape and form (or the perception of them) to everything on Earth—land masses, bodies of water, nations, families, individuals, actions, thoughts, and feelings. In groups boundaries function as a kind of “glue” by protecting and preserving networks of connection, shared traditions, common purposes, and modes of operating. Yet, conceptualizing and defining the notion of boundary are elusive tasks despite a great amount of theoretical discussion on the subject. This elusiveness is especially true with regard to the ways the term *boundary* is used in the social, behavioral, and administrative sciences, where the term is used to describe everything from physical infrastructure and flow charts to processes of goal setting and values clarification, dynamics of interaction, and symbolic realms of significance.

The essential functions of boundaries are separating, defining, containing, limiting, and distinguishing. They thereby become places of contact, bridging, relationship, exchange, conflict, and conversion from one form to another. (Someone has suggested that the in many cases the term *interface* or something like it should replace the term *boundary* because *interface* better conveys this dual function of a boundary as something that both separates and connects.)

All groups and social institutions have boundaries. These boundaries come in various types, shapes, and sizes. Broadly speaking, they can be conceptualized as physical and spatial (e.g., a fence, city limits, headquarters) or non-spatial (e.g., roles, tasks, ideas, perceptions, etc.). The most obvious boundaries are physical and can usually be readily observed, although not always (the physical boundaries that determine race and gender, for example, are usually but not always apparent). Categories used to ascribe status or intelligence, on the other hand, are mostly intangible. They can be even more abstract, such as boundaries that define patterns of relational processes and work flows. Some are subjective and connected to human feelings, such as those that determine the degree to which a participant feels included in conversation, develops a sense of territoriality about a certain space or task, or experiences a touch or joke as a form of sexual harassment. These latter examples call attention to the fact that boundaries may resemble more of a region or zone, with “fuzzy” borders, than a precisely defined line.

Complex social systems (e.g., families, clubs, organizations, and governments) are composed of many kinds of interdependent and overlapping subsystems, all of which need to be managed. The ongoing challenge of authority is to determine how permeable to make various boundaries and where to place them. The quality of boundary management in an organization as a whole, including its subsystems, ultimately determines whether the overall organization is vital, effective, cohesive, and linked or stressed, inefficient, disorganized, and isolated. (Of course, causality in human systems is never unidirectional, and the condition of system boundaries will influence the way authority is exercised within a system as well as vice versa.)

BOUNDARY MANAGEMENT

Organizational boundaries can be as impenetrable as the walls of a nuclear reactor or as permeable as city limits; they can be managed tightly like “no smoking” regulations in a hospital’s intensive care unit or loosely like the “no spitting” rules that are

on the books in most cities but rarely enforced. The effective practice of authority involves matching boundary permeability with a deep appreciation for the situation being addressed. Dysfunction occurs when boundaries are managed too tightly or too loosely.

All interactions occur at some kind of boundary. Thus, boundaries can be highly charged sites where energy gets generated, confined, channeled, or released. Social systems rely on human energy for a significant portion of their work, and system boundaries provide a means for creating, channeling, or discharging energy. Energy in the form of enthusiasm or inspiration may be generated, for example, by contact across an organizational boundary in the form of an exchange with a colleague working in the same field at another organization. Transferring an employee across an internal organizational boundary to another department might serve to confine, channel, or release energy that erupts in the form of a personnel conflict.

The vitality and effectiveness of a group depend in large measure on whether the group’s boundaries are sufficiently permeable to access needed resources and respond flexibly, but not so permeable that either outside influences become disruptive or that energy and resources are drained from the group. Clayton Alderfer (1980), former professor of applied behavioral science at the Yale School of Management, coined the terms *overbounded* and *underbounded* to designate two types of problematic systems he encountered in the course of his consulting practice. Overbounded systems are those with less-than-optimal boundary permeability, and underbounded systems are those with excessive boundary permeability.

Authority in overbounded systems, according to Alderfer, is typically highly centralized and autocratic. Boundaries are clear and managed tightly. The primary threat to overbounded systems, according to Alderfer, is that they lose the capacity to respond adaptively to change. In underbounded systems, boundaries are often diffuse and unclear. “Instead of a single, centralized authority to whom everyone must ultimately answer, there are multiple authorities and unclear lines of reporting. Responsibility often

rests with several individuals or groups or with no one (Alderfer 1980, 271). Underbounded systems run the risk of being disorganized and chaotic and in more serious cases may lose their sense of coherence and identity.

We could easily draw a simplistic conclusion that resembles the refrain from “Goldilocks and the Three Bears”: This group manages boundaries too tightly, this one too loosely, and this one “just right.” Empirical studies suggest that a more nuanced conclusion is in order (Vroom and Yago, 1998; Monroe, 2002). The solution to proper management does not seem to be one overall style of exercising authority that strikes a “happy medium” between tight and loose boundary management, but rather a contingency approach tailored to the particular situation or problem being faced. When a problem is routine or technical, a more “tightly bounded” approach is often appropriate. A more complex problem, however, calls for more of a cooperative effort, and effectiveness thus requires that boundaries be managed more “loosely.” This suggests that there is no one “best model” for managing boundaries. The demands of particular kinds of situations and problems determine the effectiveness of exercising authority in a more autocratic or more participatory mode—that is, managing boundaries more tightly or more loosely.

AUTHORITY

Authority occupies a central place in the literatures of philosophy, religion, political science, psychology, law, and business. These disciplines, however, have no shared definition of *authority*, and authority is often treated in various ways. Is authority, for example, an entity? A quality or characteristic? A role or position? Philosophical studies tend to treat authority as if it were an object—something that can be acquired, possessed, held, or delegated by someone by virtue of his or her status or position. Much of the literature in political science grapples with issues of the legitimacy, location, and distribution of authority. The difficulty with this approach is that it tends to identify authority with the role of the superior, thereby ignoring the struc-

tures, processes, and actions by which authority is generated and exercised.

The organizational literature does not place a high premium on definitional clarity regarding the notion of authority. This low premium is attributable in large part to two factors. First, those writing in the field tend to be less interested in the philosophical aspects of authority than in its practicalities. Second, those writing in the field are more interested in studying the process and dynamics of authorizing and deauthorizing than the essential nature of authority as a property or entity.

One composite working definition of *authority* in the organizational behavior literature offered by Kahn and Kram (1994, 17) is “the right to do work within the confines of a particular *role*.” The notion of authority as a “right” implies something that has to be legitimated, sanctioned, or conferred by others and thus avoids a simple identification of authority with the person who exercises it. Further, this notion acknowledges that authority has a relational aspect and directs attention to the dynamics involved in the authorizing process. The notion of role implies that authority will be exercised within certain constraints rather than in an arbitrary fashion.

Kenwyn Smith and David Berg define *authority* as “sanctioned power” (Smith and Berg 1987, 135). This definition represents an advance because it identifies power as an essential element of authority. The notion of power that is sanctioned captures the dynamic and relational qualities previously suggested by right, minus the confusing and complicating associations to political theory. Moving away from the notion of right also helps people think more in terms of the job or task to be accomplished than in terms of the person making the decision.

Many leadership theorists stress the relational and reciprocal nature of authority as something “conferred” by followers (Gould, 1994; Heifetz, 1994; Monroe, 2002). The notion of “conferral” captures the same dynamic and relational qualities as the notion of “sanctioned” but perhaps better conveys the idea that authorization can be informal and implicit as well as formal and explicit, whereas the word *sanction* suggests something more official and codified. In fact, as Heifetz (1994) points out, the

conferral of power is not always deliberate or even conscious, but sometimes happens when people fail to comprehend the extent to which they are the source of authority's power and adopt a pattern of habitual deference or unquestioning obedience (Milgram, 1974).

Heifetz (1994, 57) defines *authority* as "conferred power to perform a service." Including the notion of service in the definition helps to distinguish authority from simple dominance or coercion—a common confusion. He points out that not all exchanges of power are authority relationships. Although a victim may defer to a mugger with a gun, it is not an act of authorization.

The notion of service also calls attention to authority as a way of making power responsible to some common standard or value or purpose (e.g., fairness) that is shared by both those who exercise authority and those over whom authority is exercised. "The best leaders get their orders obeyed because they, too, are obeying" (Follett 1994, 172). The notion of service is also a reminder that defaulting on the agreement by failing to perform the service puts one at risk of losing one's authority. Even in the most hierarchically structured organizations, cooperation is usually sought in the preliminary study of situations—the gathering of statistics and other information, the formulation of interpretations and recommendations—before an executive makes a final judgment on a substantive policy matter. By the time all of this information has been gathered and passed on to the person in authority, the decision has at least been framed, if not already determined (e.g., Follett 1994). Thus, we would be mistaken to think that orders get their validity solely in the moment of consent. They often

Boundaries and Authority—Not Always Clear

The following description of the authority wielded by the rulers of the Zande people of the southern Sudan makes very clear that the boundaries of a leader's authority can vary and that what look like clear boundaries (in this case, rivers and streams) may not be social boundaries at all.

The authority of the ruler of a province extended between certain streams, and anyone who lived between those streams was his *vuru*, subject. The prince ruled (*zoga*) him and he was the man of (*ra fu*) the prince. People who lived outside that area were subjects of other provincial governors, and a man could not live in one province and be the man of a ruler of another province. But though the *aligbu* were responsible for the various parts of a province, these were not exactly defined in terms of rivers; and it seems also that not all who lived in a district necessarily followed the deputy responsible for it, though in the nature of the case the great majority must have done so. When I was in Zandeland most of the Sudan Azande had been moved into settlements along government roads, and their attachment to a prince's deputy was determined by the settlement they lived in, each settlement being in charge of a deputy. In the past, according to the information I was given, when men moved from one district to another they often retained their attachment to the deputy predominant in the district in which they formerly lived, though they presumably did so only if the districts were not very distant from each other. The reason for this seems to have been that the military organization crossed the territorial organization, so that a man who moved from one area to another might still wish to remain a member of his *vura*, "company", for purposes of fighting, laboring on the royal estates, and paying tribute. The whole following of a *ligbu* would therefore only come together in fighting and hoeing the king's cultivations; and some Azande have told me that, as far as their distribution is concerned, they were *wunzuguwunzugu*, "all over the place". This may have been the case, but I believe that in all matters other than war, labor, and tribute a man recognized the authority of the deputy of his district. If this were so, we have to distinguish between the two roles of a deputy, his role as leader of a senior company and his more general role as the prince's representative in a district.

Source: Evans-Pritchard, E. E. (1971). *The Azande: History and Political Institutions*. Oxford: Clarendon Press, pp. 209–210.

gain validity long before that from a process to which both order givers and order receivers have contributed.

THE PRACTICE OF AUTHORITY

In the end, when definitions of *authority* are isolated from actual practice, they are of little help to practitioners. From a practical perspective, the meaning of authority is best discovered in the processes, prac-

tices, and relationships that constitute authority. The notion of authority as “boundary management” provides a helpful theory-practice linkage.

Most of the significant activities that occur within an organizational system or subsystem can eventually be traced back to the management of boundaries. All the decisions made and actions taken by managers to promote the work of the organization essentially boil down to activities that establish, maintain, regulate, adjust, and span boundaries. The very act of defining the mission, for example, can be thought of as establishing a boundary that stakes out a particular arena of competence—“This college will focus on educating undergraduates in the liberal arts and therefore will not build a medical school.” A decision to cap enrollment at present levels serves to maintain the college’s size boundary. Stepping up recruiting efforts may be aimed at regulating or adjusting the enrollment boundary. Signing a cooperative agreement with a nearby college to allow “cross registration” between the two colleges is an example of boundary spanning.

Authority can be exercised formally or informally. The practice of formal authority is associated with a role, position, or office. Authority is power granted or conferred in the expectation that the officeholder will provide the services specified in his or her mandate or job description. The formal authority to manage course boundaries by assigning certain readings, for example, is entrusted to a professor in exchange for providing the service of teaching a certain course. That authority is also “decision specific.” The professor, for example, may have the power to adjust time boundaries by deciding to adjourn class early on the first day of the semester, but he or she cannot prescribe that another professor do the same.

When people seek to influence others in areas where the people don’t have formal authority, their effectiveness is governed by the degree of their informal authority. Informal (or personal) authority is power conferred in anticipation that someone will be able to meet implicit expectations and hopes for factors such as trustworthiness, competence, strength, intelligence, sincerity, decisiveness, kindness, physical appearance, persuasiveness, and so

forth. A professor, for example, may have the formal authority to teach a particular class but lack the informal authority (gained by meeting students’ expectations of a “good professor”) necessary to persuade students to take another elective class from him or her.

CONTEMPORARY DEVELOPMENTS

Authority is often identified in the popular imagination with rigid hierarchies and tightly managed boundaries and thereby is easily confused with dominance, imperialism, patriarchy, and oppression. The trend today is toward flatter organizations with more fluid, flexible, and permeable boundaries. Distinctions of title, role, and function are deemphasized, and getting work done often requires superiors, subordinates, and peers to collaborate and thereby share authority.

Collaborative organizations have not a condition of “no boundaries,” but rather the experience of shifting boundaries. Just as authority is still being exercised when a professor manages the grade boundary “loosely” by giving a large number of high grades, so, too, is authority being exercised in more horizontal and collaborative organizations. These organizations are referred to in the literature by a variety of terms—*boundaryless*, *high involvement*, *high commitment*, *horizontal*, and *postmodern*. Boundaries in these organizations are more permeable, fluid, and mobile and, therefore, require increasingly sophisticated strategies to manage.

Many practitioners grasp the fact that contemporary conditions require more horizontal and inclusive organizational designs, but some practitioners are confused about how authority operates or should operate in these settings. As a general rule, excessively “tight” boundary management no longer serves new organizational realities—crucial perspectives, information, and stakeholders (people with an interest in an outcome) can easily be overlooked in the name of efficiency. At the same time, excessively loose organizational boundaries can result in chaotic conditions that undermine coordination and leave groups vulnerable to fragmentation and eventual disintegration.

We cannot escape the need for authority in the

form of boundary management. No family or group has ever existed without some form of it. If no formal authority is established, then informal authority will inevitably emerge and begin to provide the service of orchestrating some kind of boundary management. Wise authority in the form of boundary management requires a deep appreciation for the nature of the problem or issue at hand as well as for the subtleties of the context or culture. The crucial guiding questions are not “Should there be authority?” but rather “What kind of boundaries are needed?” and “How should they be managed?”

—Theresa Monroe

BRIGHTON DECLARATION

The Brighton Declaration is a statement of principles about women and sport that has gained worldwide acceptance since it was first developed in 1994. It is an example of leadership in the genesis of an international women and sport movement that aims to change sporting culture to one that enables and values the full involvement of women in every aspect of sport.

DEVELOPMENT OF THE BRIGHTON DECLARATION

In 1994, the first World Conference on Women and Sport—aimed at policy and decision makers in sport—was held in Brighton, England. It was organized and hosted by the British Sports Council and supported by the International Olympic Committee. The aim of the conference was to address the issue of how to accelerate the process of change so as to redress the imbalances women faced in their involvement in sport. The conference was attended by 280 delegates from 82 countries representing governmental and non-governmental organizations, national Olympic Committees, international and national sport federations, and educational and research institutions.

The conference agenda embraced a range of issues including culture, gender, disability, and sexuality along with discussions on leadership, the management of change, marketing, mentoring, and networking. A major outcome of the conference was the Brighton Declaration that conference organizers believed could be used as a way of raising awareness of gender issues in sport and gaining the commitment of governmental and nongovernmental organizations to work toward gender equity in sport.

The process of developing the Brighton Declaration was organized to facilitate input from conference delegates through feedback from workshops,

collective discussion of a draft declaration and individual submissions to a drafting group. An initial draft was developed by Sue Baker-Finch of the Australian Sports Commission before the conference, and she was then joined by Julia Bracewell and John Scott of the British Sports Council and the Honourable Pendukeni Iivula-Ithana, Minister of Youth and Sport from Namibia, on the drafting group, which worked through the conference. Revisions and amendments were made to align the document with other international women's rights and human rights agendas as well as to include issues and concerns of conference delegates from all parts of the world. This small drafting group demonstrated leadership in the way they worked to gain input and ownership to the document from conference delegates. The four members of the group brought different skills and types of experience to the table. Sue Baker-Finch had considerable experience of women and sport policy development in Australia, Julia Bracewell was a former international fencer and a practicing lawyer, John Scott had significant experience of international relations in sport, and Pendukeni Iivula-Ithana had knowledge of the struggle for human rights in Africa and the workings of the United Nations. A final draft was distributed to delegates on the last day and unanimously endorsed.

Though the group was responsible for the development of the document at the conference, the decision to stage the conference that provided the context for the Brighton Declaration's development is important. The British Sports Council (a governmental organization) was the instigator and organizer of the conference. It was active not only in developing national sports policy and programs but also in international sports policy (for example antidoping), and it had strong links with both European and Commonwealth networks. In the early 1990s, it had provided leadership of the European Women and Sport Working group through Margaret Talbot, and this group had already embarked on a series of biannual conferences in Europe. By enlisting the support of its Commonwealth networks, the Sports Council was able to widen the conference to make it a world event. Its partner sports councils in Canada, New Zealand, and Australia were all leading organizations in the

women and sport field, having developed national policies and programs to combat gender inequality in sport. Their experience, together with that of the Europeans, particularly the Scandinavian countries, provided the expert resource base needed to initiate the international women and sport movement at the Brighton Conference. The success of the conference was due to the vision and determination of a number of influential women leaders in Europe and the Commonwealth backed by organizations that had the power, networks, human, and financial resources to stage a successful conference. Women provided the necessary leadership—working collectively (though not without some conflict) and being supported by men in powerful institutional positions who respected the ideology of their work and recognized the need for the sports world to address gender issues.

ADOPTION OF THE BRIGHTON DECLARATION

A key measure of the success of the Brighton Declaration as a leadership tool is the extent of its adoption and endorsement. This is monitored by the International Working Group on Women and Sport (the IWG). National and international organizations that have endorsed the declaration are listed on its website (www.iwg-gti.org).

It is interesting to consider the range of organizations that have adopted the Declaration. Starting with international government coalitions or organizations, and given the origins of the women and sport movement, it is not surprising to see Europe and the Commonwealth well represented. European ministers of sport and the Council of Europe together with Commonwealth heads of government, Commonwealth ministers of women's affairs and Commonwealth ministers of sport have all adopted the declaration. However, adoption is not confined to European and Commonwealth coalitions; the multicultural appeal of the declaration is demonstrated by its adoption by Arab ministers of youth and sport and the Supreme Council for Sport in Africa. Moving on to the international nongovernmental sector, most people would agree that the two most influential international multisport organizations in the world are the Interna-

tional Olympic Committee and the International Paralympic Committee. Both have adopted the declaration, as has the Commonwealth Games Federation. The declaration has apparently had less impact with international sports federations, though some (for example, track and field athletics and field hockey) have been very active in its implementation. Many leaders in the women and sport movement come from a background in physical education and sport research and education, so it is not surprising that they have submitted the declaration to the lead international organizations for adoption, such as the International Council for Sports Science and Physical Education. This organization has also been active in trying to implement the declaration by drawing up a gender equality plan that is regularly monitored. At the national level, more than 150 national organizations from all parts of the world have adopted the declaration. They include national Olympic committees, sports federations, ministries of sport, culture, youth and women, and women's sports associations.

In nearly every case, adoption of the declaration has been due to the initiative, determination, and persistence of individuals who are part of the women and sport movement. They have been helped by the fact that the basis of the declaration is grounded in human rights and women's issues, which are increasingly acknowledged in the governmental sector. Although the sports world has sometimes been slow to shed its "malestream" culture, the example of the IOC in adopting the declaration and developing women and sport initiatives has set an example that others have followed.

Adoption of the declaration however is only the first step—more important are implementation and action to make the changes that are needed to translate the principles of the declaration into practice. This is much more difficult to monitor, though an attempt has been made by the IWG, which publishes quadrennial progress reports on its website.

DEVELOPMENT OF THE INTERNATIONAL WOMEN AND SPORT MOVEMENT

Leadership of the international women and sport movement is diverse but coordinated. At an interna-

The Text of the Brighton Declaration on Women and Sport

Background

Sport is a cultural activity which, practiced fairly and equitably, enriches society and friendship between nations. Sport is an activity which offers the individual the opportunity of self-knowledge, self-expression and fulfillment; personal achievement, skill acquisition and demonstration of ability; social interaction, enjoyment, good health and well-being. Sport promotes involvement, integration and responsibility in society and contributes to the development of the community. Sport and sporting activities are an integral aspect of the culture of every nation. However, while women and girls account for more than half of the world's population and although the percentage of their participation in sport varies between countries, in every case it is less than that of men and boys. Despite growing participation of women in sport in recent years and increased opportunities for women to participate in domestic and international arenas, increased representation of women in decision making and leadership roles within sport has not followed. Women are significantly under-represented in management, coaching and officiating, particularly at the higher levels. Without women leaders, decision makers and role models within sport, equal opportunities for women and girls will not be achieved.

Women's experiences, values and attitudes can enrich, enhance and develop sport. Similarly, participation in sport can enrich, enhance and develop women's lives.

A. Scope and Aims of the Declaration

1. Scope

This Declaration is addressed to all those governments, public authorities, organizations, businesses, educational and research establishments, women's organizations and individuals who are responsible for, or who directly or indirectly influence, the conduct, development or promotion of sport or who are in any way involved in the employment, education, management, training, development or care of women in sport. This Declaration is meant to complement all sporting, local, national and international charters, laws, codes, rules and regulations relating to women or sport.

2. Aims

The overriding aim is to develop a sporting culture that enables and values the full involvement of women in every aspect of sport. It is the interests of equality, development and peace that a commitment be made by governmental, non-governmental organizations and all those institutions involved in sport to apply the Principles set out in this Declaration by developing appropriate policies, structures and mechanisms which:

(1) ensure that all women and girls have opportunity to

participate in sport in a safe and supportive environment which preserves the rights, dignity and respect of the individual; (2) increase the involvement of women in sport at all levels and in all functions and roles; (3) ensure that the knowledge, experiences and values of women contribute to the development of sport; (4) promote the recognition of women's involvement in sport as a contribution to public life, community development and in building a healthy nation; (5) promote the recognition by women of the intrinsic value of sport and its contribution to personal development and healthy lifestyle.

B. The Principles

1. Equity and Equality in Society and Sport

a. Every effort should be made by state and government machineries to ensure that institutions and organizations responsible for sport comply with the equality provisions of the Charter of the United Nations, the Universal Declaration of Human Rights and the UN Convention on the Elimination of All Forms of Discrimination against Women.

b. Equal opportunity to participate and be involved in sport whether for the purpose of leisure and

Source: International Working Group on Women and Sport. Retrieved February 4, 2003, from: <http://www.iwg-gti.org>

tional level coordination and leadership is provided by the IWG. It includes representatives from each continent and the two international voluntary organizations for women and sport (WomenSport International and the International Association of PE and

Sport for Girls and Women), as well as individually co-opted members. The IWG has deliberately adopted feminist styles of leadership with an emphasis on sharing, cooperation, openness, informality, networking, and mentoring. Since the Brighton Con-

recreation, health promotion or high performance, is the right of every woman, regardless of race, color, language, religion, creed, sexual orientation, age, marital status, disability, political belief or affiliation, national or social origin.

c. Resources, power and responsibility should be allocated fairly and without discrimination on the basis of sex, but such allocation should redress any inequitable balance in the benefits available to women and men.

2. Facilities

Women's participation in sport is influenced by the extent variety and accessibility of facilities. The planning, design and management of these should appropriately and equitably meet the particular needs of women in the community, with special attention given to the need for childcare provision and safety.

3. School and Junior Sport

Research demonstrates that girls and boys approach sport from markedly different perspectives. Those responsible for sport, education, recreation and physical education of young people should ensure that an equitable range of opportunities and learning experience, which accommodate the values, attitudes and aspirations of girls, is incorporated in programs to develop physical fitness and basic sport skills of young people.

4. Developing Participation

Women's participation in sport is influenced by the range of activities available. Those responsible for delivering sporting opportunities and programs should provide and promote activities which meet women's needs and aspirations.

5. High Performance Sport

a. Governments and sports organizations should provide equal opportunities to women to reach their sports performance potential by ensuring that all activities and programs relating to performance improvements take account of the specific needs of female athletes.

b. Those supporting elite and/or professional athletes should ensure that competition opportunities, rewards,

incentives, recognition, sponsorship, promotion and other forms of support are provided fairly and equitably to both women and men.

6. Leadership in Sport

Women are under-represented in the leadership and decision making of all sport and sport-related organizations. Those responsible for these areas should develop policies and programs and design structures which increase the number of women coaches, advisers, decision makers, officials, administrators and sports personnel at all levels with special attention given to recruitment, development and retention.

7. Education, Training and Development

Those responsible for the education, training and development of coaches and other sports personnel should ensure that education processes and experiences address issues relating to gender equity and the needs of female athletes, equitably reflect women's role in sport and take account of women's leadership experiences, values and attitudes.

8. Sport Information and Research

Those responsible for research and providing information on sport should develop policies and programs to increase knowledge and understanding about women and sport and ensure that research norms and standards are based on research on women and men.

9. Resources

Those responsible for the allocation of resources should ensure that support is available for sportswomen, women's programs and special measures to advance this Declaration of Principles.

10. Domestic and International Cooperation

Government and non-government organizations should incorporate the promotion of issues of gender equity and the sharing of examples of good practice in women and sport policies and programs in their associations with other organizations, within both domestic and international arenas.

ference regional networks, groups, associations have been set up in Africa, Asia, and Arab nations. Knowledge and experience from the longest established regional group in Europe was used to inform the establishment of other groups. At the national level,

many countries have followed the example of the United States and established women and sport organizations. The Women's Sports Foundation in the United States continues to be a leader in this field along with the Canadian Association for the

Advancement of Women in Sport and both have been generous in sharing resources and ideas internationally. All these are examples of the development of new structures to address the challenges of bringing about change in sport and improving the status of women.

A different but complementary strategy has been to mainstream gender equality within existing sporting organizations and structures. The IOC and IPC both have working groups on women and sport that report to their respective executive boards and many national Olympic Committees and federations of sport have followed suit. Their work focuses on raising awareness and bringing about change within existing sporting culture and practice.

Momentum from the Brighton Conference has been sustained not only by the activities of these organizations, groups and networks, but also through quadrennial world conferences held under the auspices of the IWG. The second conference was held in Windhoek, Namibia, in 1998, the third in Montreal, Canada, in 2002, and the fourth is planned for Kumamoto, Japan, in 2006. In all these activities the Brighton Declaration remains the cornerstone statement of values and guiding principles.

A TOOL FOR THE DEVELOPMENT OF WOMEN'S LEADERSHIP IN SPORT

The development of the Brighton Declaration in 1994 is a good example of strategic feminist leadership in a field that is traditionally male dominated. Women leaders throughout the world have used the Brighton Declaration as a political tool to raise awareness of women and sport issues and gain commitment of powerful institutions to gender equity in sport. The timing of the initiative was crucial for although there were pockets of women and sport work going on in the early 1990s, there was little international co-operation and communication on the issue. As a result of the Brighton conference and its outcomes, women and sport is now firmly on the agenda of sporting and other agencies throughout the world and a strong network has been created. Some creative tensions exist between different factions, for example governmental and nongovernmental organ-

izations, radical and liberal feminists, and between different cultural approaches. However this diversity is managed partly through the agreement on fundamental principles set out in the Brighton Declaration and the acknowledgment that there are different ways of working to achieve the universal aims and principles contained within it.

 **BUDDHA** (c. 463–c. 383 BCE)
*Religious leader and founder
of the Buddhist tradition*

The term *Buddha* refers to a fully awakened and enlightened being. According to the Buddhist tradition, there have been many such beings, but the term most commonly refers to Siddhartha Gautama, an influential religious leader in ancient Nepal and India. He was born into the ruling and military class, but at about the age of twenty-nine, he left his comfortable palace life on a religious quest to find a way out of suffering. After six years of searching, learning, and meditating, he was transformed by an experience of enlightenment and then spent about forty-

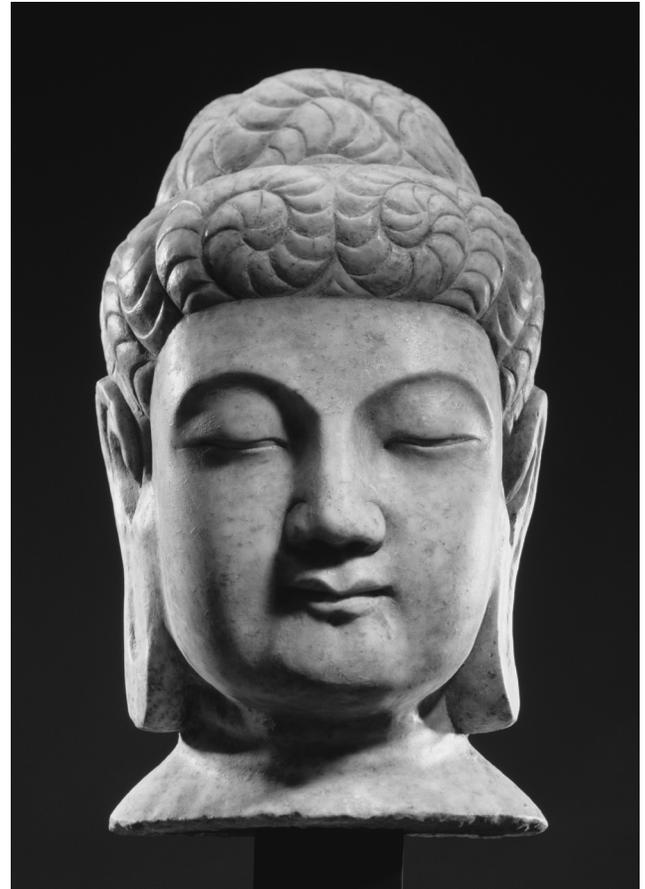

five years teaching, advising laypeople, and forming monastic communities in northern India and Nepal. The Buddhist tradition reveres him as the great teacher of wisdom and compassion, the discoverer of the true nature of existence and the way to overcome suffering; in some Buddhist perspectives he is venerated as the manifestation of ultimate reality itself. The entire human community can recognize that Siddhartha Gautama, who became Shakyamuni Buddha, is one of the most influential religious leaders in all of history, the founder of a tradition that has influenced cultures across south, central, and east Asia for centuries and that is practiced by millions of people throughout the world today.

To distinguish him from other Buddhas, Buddhists refer to Siddhartha Gautama after his enlightenment as Shakyamuni Buddha. His personal name, Siddhartha, means “goal attained.” Gautama (spelled “Gotama” in the Pali language of ancient India) was the name of his family; Shakya was the name of his clan. “Muni” literally means “the one who keeps silent” and commonly refers to a sage. Thus Shakyamuni is the sage of the Shakya clan. His father, Suddhodana, is often called a king by the later Buddhist tradition, but he may have been the elected head of a clan.

Like Socrates, Jesus, and Muhammad, Shakyamuni Buddha left behind no writings of his own. The earliest written accounts of his life and teaching come from the Buddhist scriptures written in Pali, composed long after his death, and contain legendary elements, and so it is difficult to be certain of the exact details of his historical life; indeed, even the dates of his life are in dispute. Most American, European, and Indian scholars have traditionally dated his birth about 566 BCE and his death about 486 BCE; Theravada Buddhists in Sri Lanka and southeast Asia place his birth in 624 and his death in 544 BCE; however, many recent Japanese and Western scholars believe his dates were later, variously from 448 to 368 BCE, or from 463 to 383 BCE. This article will examine his life and teaching as remembered and revered by the later Buddhist tradition.

THE EARLY LIFE OF SIDDHARTHA GAUTAMA

The traditional narrative of the life of Shakyamuni Buddha hinges on a choice between two forms of

A white marble sculpture of the head of Buddha made between 618 and 960 BCE during the Tang Dynasty in China.

leadership. As soon as Siddhartha was born, a religious seer named Asita came to see the child and proclaimed to his father, Suddhodana, that the newborn boy would become a very important leader. According to the later Buddhist tradition, however, it was not clear if he would be a great religious teacher or a mighty political and military ruler. Eager to have a powerful heir who would extend the might of the kingdom, Suddhodana resolved to shelter the young Siddhartha from any awareness of suffering, fearing that such knowledge could prompt him to a religious quest. The prince reportedly grew up surrounded by worldly pleasures, unaware of illness, old age, or death. The later Buddhist tradition would see the conditions of his youth as representative of a widespread problem: Humans often block out awareness of suffering because it is unpleasant. For Siddhartha and his

The Noble Eightfold Path

This is the Middle Path which the Perfect One discovered and expounded, which gives rise to vision and knowledge, which leads to peace, wisdom, enlightenment, and nirvana—the Noble Eightfold Path:

1. Right Understanding: of suffering, of its origin, of its cessation, of the way leading to the cessation of suffering.
2. Right Intention: of renunciation, free from craving; of good will, free from aversion; of compassion, free from cruelty.
3. Right Speech: abstaining from false speech, abstaining from malicious speech, abstaining from harsh speech, abstaining from useless speech.
4. Right Action: abstaining from taking life, abstaining from stealing, abstaining from sexual misconduct.
5. Right Livelihood: giving up wrong livelihood, one earns one's living by a right form of livelihood.
6. Right effort: to prevent unarisen unwholesome evil states of mind from arising by making effort, stirring up energy and exerting mind.
7. Right mindfulness: mindful contemplation of the body, mindful contemplation of feelings, mindful contemplation of the mind, mindful contemplation of mental objects.
8. Right Concentration: Quite secluded from sense pleasures, secluded from unwholesome states of mind one enters and dwells in the first *jhana* (meditative absorption), which is accompanied by applied thought and sustained thought with rapture and happiness born of seclusion.

With the subsiding of applied thought and sustained thought one enters and dwells in the second *jhana*, which has internal confidence and unification of mind, is without applied and sustained thought, is filled with rapture and happiness born of concentration.

With the fading away of rapture, one dwells in equanimity, mindful and discerning; and one experiences in one's own person that happiness of which the noble ones say: "Happily lives one who is equanimous and mindful"—thus one enters and dwells in the third *jhana*.

With the abandoning of pleasure and pain, and with the previous disappearance of joy and grief, one enters and dwells in the fourth *jhana*, which has neither-pain-nor-pleasure and has purity of mindfulness due to equanimity.

palace during which, despite his father's best efforts, he encountered in succession an old man, a sick man, a dead man, and a holy man. Puzzled by each of these encounters, he asked his charioteer about old age, sickness, and death and learned that these are part of the human condition and come to all human beings. These discoveries prodded him to ponder the transience and fragility of existence and the inevitability of suffering. The fourth encounter with an ascetic holy man taught him that an alternative lifestyle was possible and challenged him to undertake a religious search to resolve the problem of the unsatisfactory character of existence.

After much internal reflection, Siddhartha informed his father and wife that he would leave them to find an end to suffering. They entreated him to stay and perform the duties of his class as a political and military leader, but he insisted on pursuing his goal. He left the palace, cut his hair, and went to study with renowned Hindu religious masters, first with Arada Kalama and later with Udraka Ramaputra. He learned as much as they could teach him about meditation and wisdom, but he was frustrated that they did not teach how to attain full freedom from suffering. He joined a group of ascetics and undertook extreme fasts, but he eventually decided this was not

the way to genuine liberation. Instead, he pursued a middle way, neither the luxury of the palace nor extreme asceticism.

Abandoning other teachers, he sat under a tree, determined to stay there until he reached his goal. Mara, a supernatural spirit who rules over the world

followers, this restriction of consciousness is the first and most formidable obstacle to genuine leadership.

When he was sixteen or seventeen, Siddhartha married a beautiful woman, Yasodhara, who bore a son, Rahula. After this, according to the Buddhist tradition, Siddhartha made four trips outside the

of suffering and tempts human beings, reportedly came and tried to frighten him into abandoning his quest, but Siddhartha remained firm and sat unmoved. As Mara continued his efforts but only became more frustrated, Siddhartha put his hand on the earth, calling the spirit of the earth as a witness that his resolve was unshaken and his resistance to temptation was firm. This began the process of his enlightenment. That night Siddhartha became a Buddha, sitting through the night, remembering his past lives, and understanding for the first time the cause of suffering and the path of liberation.

THE TEACHING OF THE BUDDHA

Immediately after his enlightenment, Shakyamuni Buddha reportedly doubted that anyone else could understand what he had learned. According to later Buddhist tradition, the Hindu god Brahma came and implored the Buddha to share his wisdom with others. Shakyamuni then went to the Deer Park in Varanasi (Benares) and met the ascetics with whom he had earlier lived. His first sermon to them expressed the central content of his enlightenment in the Four Noble Truths.

The First Noble Truth is that life as ordinarily lived is *dukkha*, unsatisfactory and marked by suffering because it is impermanent and leads to decay and death. Even the greatest pleasures come to an end. The Second Noble Truth teaches that the cause of this unsatisfactoriness lies in *tanha*, a word often translated as “desire,” but probably better understood as “craving,” as in an addiction. This craving comes from the illusion that we possess a permanent, substantial self, and it leads us to grasp at things that cannot ultimately satisfy us. Craving leads to endless forms of unnecessary suffering. The Third Noble Truth promises that there is an end to suffering; this is called nirvana, the blowing out of the flame of craving. This is an indescribable state. Images and concepts can only point toward it but cannot convey its true meaning. The Fourth Noble Truth teaches the Eightfold Path, which leads to liberation and enlightenment. The Four Noble Truths are similar to a doctor’s analysis of a disease, diagnosis of the cause, promise of a cure, and prescription for recovery.

The Eightfold Path includes three interdependent stages: wisdom, ethical conduct, and meditation. The first stage consists of Right Understanding and Right Intention. Right Understanding is the transformative recognition of the truth of the Buddha’s teaching; it is not simply understanding a concept but fully realizing for oneself the Buddha’s insight. At the center is the realization of interdependence; nothing exists as a separate and permanent entity unto itself. Right Intention renounces all ill will and violence. The second stage includes Right Speech, Right Action, and Right Livelihood. This stage centers on the Five Precepts taken by all Buddhists, monastic and lay: not to kill or injure any living being; not to take what is not given; not to indulge in sensual pleasure, especially sexual misconduct; not to speak in ways that are false or unkind; and not to use intoxicants or drugs that affect one’s consciousness. The third stage embraces Right Effort, Right Mindfulness, and Right Concentration. This stage is the practice of meditation, which leads from ethical conduct to a fuller comprehension of transformative wisdom. Most Buddhist traditions trust that a proper practice of meditation will lead eventually to overcoming illusions and cravings and will bring peace and tranquility even amid difficulties. While there is a wide variety of forms of meditation, many focus on following one’s breath and being aware of the present moment without judging, grasping, or resisting what arises in consciousness.

THE BUDDHA AS LEADER

After his enlightenment, the Buddha became one of the most influential leaders in northern India and Nepal. He organized a monastic community called the Sangha for men and women who wished to dedicate themselves completely to the path he taught. Monastics from all classes of society came together and lived as equals. Buddhist monks would go out to beg for food from the surrounding community. The virtue of generosity, *dana*, allowed lay Buddhists to support and share in the benefits of the monastic community.

Shakyamuni Buddha also taught many principles for ruling society. He saw the reordering of con-

sciousness through meditation and ethical conduct as inextricably linked to reordering social relations. He believed that poverty was a cause of immorality and crime. He rejected punishment as not an effective way to suppress crime, and he called for adequate wages for workers to prevent crime. He urged workers, in turn, to be skilled and energetic in their professions, earn their wages in righteous ways, and spend reasonably in proportion to their income, neither too much nor too little.

The Buddha, coming from the ruling class himself, served as an advisor to kings, and the principles he set forth have shaped the vision of political leadership in Buddhist cultures for centuries. The king had a special responsibility to be an agent for the eternal dharma, the order of truth that is the basis for human duties. The king should give his wealth and reputation for the good of his people and be willing even to give his life for his people. The Buddha was the supreme realization of spiritual authority; the ideal monarch was to be the righteous ruler in the secular sphere.

At the center of Shakyamuni Buddha's life and teaching are the twin virtues of wisdom and compassion. His teaching, example, and the practice of Buddhist meditation have enriched the lives of countless people from many cultures and religious traditions.

BUREAUCRACY

Nearly everyone experiences bureaucracy at work, at school, or at the Department of Motor Vehicles. These experiences include filling out forms, standing in line, going up the chain of command, climbing the corporate ladder, and getting the runaround.

For academic purposes, *bureaucracy* can be thought of as the word for a cluster of experiences attributable to certain types of complex organization.

WHY BUREAUCRACY MATTERS TO LEADERSHIP

Leadership takes place within a social context. That social context influences leadership. What works in one context will not work in another, just as different flowers thrive in different climates. The effectiveness of leadership varies, depending on the context. Social context is, in other words, one of the contingencies of leadership.

Part of the social context is organizational structure. This is true even if the leader rises up in opposition to an organization. Thus, in order to understand leadership thoroughly, one has to consider organizational structure. Former Secretary of Health, Education, and Welfare John W. Gardner (1912–2002) made this explicit: “The first thing that strikes one as characteristic of contemporary leadership is the necessity for the leader to work with and through extremely complex organizations and institutions” (Gardner 1990, 81).

This is not to say that organizational structure is fixed and absolutely determines what people will do. Organizational structure certainly influences individual behavior, but individual behavior also influences organizational structure. Organizational structure is itself the result of what people have been doing. Accordingly, just as leader effectiveness depends on organizational structure, organizational structure depends on leadership.

As a practical matter, therefore, in order to exploit a given situation, an effective leader will recognize the prevailing organizational structure and appreciate its needs and constraints. A leader will also learn

how, and at what points, the leader can alter the structure to get things done.

WHAT IS BUREAUCRACY?

Bureaucracy is the term given to certain organizational structures. Frequently in ordinary language it is a term of abuse, yet the unbiased student of leadership will recognize that *bureaucracy*, as a term of art, is analytically useful. It has a specific value-neutral range of meanings. In the abstract *bureaucracy* is neither good nor bad.

Bureaucracy is by no means restricted to government agencies; bureaucracy as a structure can arise in any sector. Nevertheless, people frequently associate bureaucracy with government for two reasons: Bureaucracy originated as part of governmental structure, and certain writers argue that government is the only appropriate locus of bureaucracy.

What then is bureaucracy? Bureaucracy is what is known as a sociological form with distinct structural properties and a pattern of development. In other words, bureaucracy can be understood by means of a static (or structural) model and a dynamic (or procedural) model.

THE STATIC MODEL OF BUREAUCRACY

Instead of abstract phrases, images offer a more vivid way to understand bureaucracy. Gareth Morgan prefers the metaphor of organizations as machines. Another perspective known as archetypal psychology identifies deep and basic images or metaphors we all share to make sense of the world. These images are represented using the imagery of ancient gods, in this case, the Greek and Roman god Apollo. Apollo was, in the words of the British writer Charles Handy, “the god of order and rules, [assuming] that man is rational and that everything can and should be analyzed in a logical fashion” (1995, 17). Apollo was the champion of organization, security, and efficiency. These are not the only representations. Some of the most arresting images of bureaucracy reside in literature and other works of art. The Austrian writer Franz Kafka especially (1883–1924) depicted bureaucracy as “some vast, ominous, shad-

owy realm . . . that has severed all connection with human need” (Matthews 1992, para. 18, 20). The Russian writer Alexander Solzhenitsyn (b. 1918), in his short novel *For the Good of the Cause*, underscored the dilemma of bureaucratic leaders caught between their followers and the uses of power by those in higher positions of authority (1964). Films with similar themes include:

- *Catch-22* (1970/2001, Paramount Home Video)
- *1984* (1984/2003, MGM, UA Video)
- *Brazil* (1985/2003, Universal Studios)
- *Article 99* (1992/2001, MGM, UA Studios)

Many experts have described bureaucracy by listing its attributes. Words often associated with bureaucracy include *routine*, *regimented*, *uniform*, *standardized*, and *centralized*. The classic work was done by the German sociologist Max Weber (1864–1920). The following paragraphs in this section derive from his book titled in English *Economy and Society* (1956/1978).

“The basis of every system of authority . . . is a *belief*” in its legitimacy (Weber 1956/1978, 263). In comparison to traditional and charismatic bases, the legitimacy of bureaucracy rests on the application of reason and impersonal laws. People regard bureaucracy as legitimate because of claims that bureaucracy is indeed more rational and impersonal. The demands of bureaucracy rely on the authority of disinterested reason exercised by professional experts, sometimes referred to as the “administrative staff.” Large and complex systems require “the existence and continual functioning of an administrative staff” (Weber 1956/1978, 264). Bureaucracy is simply the most rational, efficient, stable, and therefore indispensable order for an administrative staff, no matter what purpose it serves.

Of what does bureaucracy consist? The founder of a bureaucracy (e.g., an entrepreneur) and its topmost authority (e.g., stockholders) are not themselves part of bureaucracy. Otherwise, participants interact in a formal way, within prescribed spheres of competence determined by qualification as to a person’s technical knowledge and experience. Thus, bureaucracy depends on “domination through knowledge”

(Weber 1956/1978, 225). Then, alongside bureaucracy is a parabureaucracy to monitor compliance. This would include government inspectors and bureaus of internal affairs.

Bureaucracy is a hierarchy determined by a system of impersonal rules. Participants are not meant to obey *people*. They obey written rules issued by the prescribed office, for which the occupant is (1) appointed based on qualifications signifying competence and then (2) held strictly accountable. Participants then apply these rules to prescribed cases. Ideally, bureaucrats discharge their obligations “precisely, unambiguously, continuously, and with as much speed as possible” (Weber 1956/1978, 974). Because they are not owners or dilettantes, participants will regard their participation as a phase in a career with salaries and the freedom legally to quit.

Bureaucrats also tend to prevent scrutiny, hiding their work from criticism. Some information is legitimately secret. Bureaucracy was also designed to monitor itself, despite the interest of third parties, such as customers, politicians, and the media to exercise oversight over so powerful an institution.

THE DYNAMIC MODEL OF BUREAUCRACY

To understand the dynamics of a sociological form, we should examine its origin. Bureaucracy began as a response to alternate organizational structures based on individual leaders and managers whose longevity, talent, and interest varied so much that large and complex projects suffered. The Macedonian king Alexander the Great conquered the known world, only to have the empire collapse within a generation of his death because it had no enduring structure. A society cannot take root and grow without some kind of organization. To last, an organization has to reflect the collective vision, energy, and skills of that society.

Bureaucracy in one form or another has existed since the beginning of recorded history. As a distinct form, bureaucracy really came into its own with the reign of the French King Louis XIV (1643–1715) and then spread to other continental monarchies, especially to Prussia at the onset of the Enlightenment (a philosophic movement of the eighteenth

century marked by a rejection of traditional social, religious, and political ideas and an emphasis on rationalism).

This proliferation occurred for two reasons. Both reasons appear in a quotation by the Prussian King Frederick II (1712–1786):

A well-conducted government ought to have a system as coherent as a system of philosophy, so that all measures are well reasoned, and finance, policy, and the army are coordinated to the same end: namely, the integration of the state and the increase of its power. (Manuel 1951, 100)

First, the so-called Age of Reason emphasized the importance of bureaucratic traits, such as logic, order, and coherence. Previous authority depended on non-rational foundations, for example, blood relation among the nobles, power among the armies, and divine sanction within the Church. Their administration seemed arbitrary. When it came to expertise, bureaucracy contrasted favorably with organizations run by volunteers and elected officials, who are frequently dilettantes. Thus, rational bureaucracy was perceived to be an improvement.

Second, the simultaneous rise of monarchs and the nation-state required that kings gather power in one place while distributing their influence directly over large territories. Existing power structures tended to serve smaller territories, such as cities, or larger ones, such as the Roman Catholic Church. Existing organizational structures also tended not to defer to the wishes of the king because their base of support was independent. The new class of bureaucrats, on the other hand, owed its position plainly to the king. As the influence of bureaucracies grew, they tended to drain away the available talent for administration, which only accelerated the process of solidifying the preeminence of the state and creating a new class of nonhereditary nobles.

National bureaucracies provided clear accountability, rewarded expertise, overcame non-uniform, irrational administration among the little fiefdoms, promoted fairness throughout the territory, and answered some emerging issues that were truly national in scope.

When the era of continental monarchs came to a

close in bloodshed and war, the bureaucracies survived as the only credible source of order. Today they are pervasive.

In the same way that societies require organization, organizations cannot grow without some kind of coherent structure, or what the U.S. economist Ludwig von Mises called an “administrative apparatus” (von Mises 1944/1983, 17). The sheer size and complexity require coordination. According to Weber, bureaucracy is more likely to emerge when the system is especially large, relies on technical expertise, or needs to continue indefinitely (unlike a transitory political campaign or a fund drive). Such an organization has to sort priorities, achieve efficiency in multiple phases of the operation, and distribute rewards.

To the extent that an organization at any level depends on the limitations of a single individual, that organization is at risk. In other words, every organization feels pressure “to limit the discretion of subordinates” (von Mises 1944/1983, 49). Organizations must figure out a way to exploit the strength of individuals without becoming vulnerable to their weaknesses. That is to say, society must evolve a functional and durable administrative form that is impersonal.

To do this, society must establish a system of checks and balances, operating according to a set of rules plus a budget. Bureaucracy does not contain the simple measure of a leader’s success that one finds, for example, in a free market, that is, profit. In this sense, administration without “cash value on the market” can serve as one definition of bureaucracy (von Mises 1944/1983, 51). Consequently, because other performance measures do not exist, leaders will be measured by their adherence to the rules and budget to the exclusion of all else.

Once it exists, bureaucracy tends to preserve itself, growing in scale and intensity, without contemplating its own dissolution. Why should this be the case?

Any organization has three leadership tasks. One is to ensure the operation of the system. Another is to alter the system for the sake of its purpose. A third is to define or amend the purpose of the system. Bureaucracy exists to make the first task easy, the second task difficult without explicit justification, and the third task nearly impossible because the pur-

Principles of Classic Management Theory

Unity of command: an employee should receive orders from only one superior.

Scalar chain: the line of authority from superior to subordinate, which runs from top to bottom of the organization; this chain, which results from the unity-of-command principle, should be used as a channel for communication and decision making.

Span of control: the number of people reporting to one superior must not be so large that it creates problems of communication and coordination.

Staff and line: staff personnel can provide valuable advisory services, but must be careful not to violate line authority.

Initiative: to be encouraged at all levels of the organization.

Division of work: management should aim to achieve a degree of specialization designed to achieve the goal of the organization in an efficient manner.

Authority and responsibility: attention should be paid to the right to give orders and to exact obedience; an appropriate balance between authority and responsibility should be achieved. It is meaningless to make someone responsible for work if they are not given appropriate authority to execute that responsibility.

Centralization (of authority): always present in some degree, this must vary to optimize the use of faculties of personnel.

Discipline: obedience, application, energy, behavior, and outward marks of respect in accordance with agreed rules and customs.

Subordination of individual interest to general interest: through firmness, example, fair agreements, and constant supervision.

Equity: based on kindness and justice, to encourage personnel in their duties; and fair remuneration which encourages morale yet does not lead to overpayment.

Stability of tenure of personnel: to facilitate the development of abilities.

Esprit de corps: to facilitate harmony as a basis of strength.

These principles, many of which were first used by Frederick the Great and other military experts to develop armies into “military machines,” provided the foundation of management theory in the first half of this century. And their use is very widespread today.

pose has already been set by an external authority. Critics argue that in actual practice bureaucracy makes the first task so narrow and complex that participants lose sight of the purpose, with the result that bureaucracy becomes an end in itself. Whatever it would have been created to do, over time it simply works to perpetuate itself. According to Weber, "Once fully established, bureaucracy is among those social structures which are the hardest to destroy" (Weber 1956/1978, 987).

Ralph Hummel understands bureaucracy this way. Bureaucracy exists to achieve some limited, discernible end. Toward that end, it limits the tasks it will perform in a limited class of cases. The tasks it will perform are its processes. Participants are relevant only to the extent they assume roles within these processes. Everything else is a distraction and threatens efficiency. Management exists to align the roles and cases with the predetermined end by ensuring the execution of processes. In other words, managers put a limited range of human predicaments into a predesigned box and ignore the rest. Their role is preserving that box. They see it as their job to *cultivate* leadership that serves the box and to prevent leadership that threatens the box. This tendency led John Gardner to complain that "Just about everything in large scale organization seems to militate against leadership" (Gardner 1990, 91).

As a result, bureaucracy promotes a certain type of person and discourages other types.

We usually experience bureaucracy when we interact with a bureaucrat, otherwise known as a "clerk," "administrator," or "civil servant." After repeated experiences, we may form an impression of the kind of person who works in bureaucracies, even if the impression is in truth a stereotype. The stereotype says a lot about the way people imagine bureaucracy. In fact, many of our most descriptive words originate from these experiences—words such as *officious*, *careerist*, and *bossy*.

What then is the profile of a bureaucrat? The research conflicts. What remains constant is that a bureaucrat will be suited and adapted to the system because bureaucracies create or promote bureaucrats by a process of selection and socialization. Those who do not fit do not stay, and they certainly do not

advance. Organizational practice, through time, further shapes the persona of participants who do stay.

How does this shaping occur, according to Hummel? Whenever new participants in bureaucracy ask themselves certain existential questions, they find the same answer. "Who am I?" That is defined by the system (role). "What am I doing?" That is defined by the system (process). "Why should I care?" That, too, is defined by the system (purpose). "Is what I am doing morally right?" That is defined by the system, as well, namely to obey the rules and budget.

Communication in bureaucracy, therefore, is one-directional down a chain of command; dialogue about such existential issues of identity, process, purpose, and morality with those in positions of authority is impossible. Rather than assert oneself and critique the system, a participant learns not to think critically at all and devotes attention to the system's ritualistic processes. In other words, participants all work to perpetuate the system because bureaucracy provides them with identity and purpose, grounded in claims of rationality.

While participants labor to perpetuate the system, they engage in processes established and monitored by their managers. To the extent that the work of these managers has been separated from the work of the owners, they find a way to operate independently and assume greater importance over the lives of everyone. James Burnham conceived of managers specifically as a new power elite: the interchangeable autocrats of powerful independent organizations.

The dynamic model indicates that bureaucracy is the tendency of human organizations to order themselves indefinitely, according to rational principles.

CRITICISMS OF BUREAUCRACY

Bureaucracy is powerful, pervasive, and irrepressible—a juggernaut. There is a reason for its success. At the same time, people complain about bureaucracy and use the term as an epithet. Their arguments fall into three types.

First, they argue that bureaucracy is less useful than alternatives, such as organic models, networks, and team structures. One accusation against bureaucracy is that because of its size, formality, and com-

plexity, it adapts to change slowly—which in a manner of speaking is also one of its strengths.

Organizations assume a structure as a result of the interplay of competing interests, in a set of tensions. Many critics simply want balance. Centralization has its merits, but so, too, does decentralization. Uniformity can be appealing, except to the extent it frustrates experimentation and a sense of local ownership. Expertise makes sense, but then so does self-determination. Otherwise, organizations become vulnerable to social engineering by a technical elite.

Second, bureaucracy has unintended consequences. For example, bureaucratic activity has been accused of draining talent from productive activities, especially in the private sector. The specialization inherent in bureaucracy keeps participants from developing their complete personality and talents, leaving them reasonably ignorant of the wider world. These unintended consequences interfere with other values, such as individual freedom and dignity. Weber himself called the prevalence of bureaucracy an “iron cage.”

Third, bureaucracy becomes an end in itself and prevents critique.

Finally, the impersonal nature of bureaucracy can be construed as dehumanizing—“eliminating from official business love, hatred, and all purely personal, irrational, and emotional elements which escape calculation” (Weber 1956/1978, 975)—which is why John Gardner advised leaders to soften this effect by engaging directly in the lives of others and paying attention to them as unique individuals, no matter how large and complicated the organization where they live and move and have their being.

BUREAUCRACY VERSUS LEADERSHIP

Leaders create and reform bureaucracies. In some systems leaders exercise oversight. Nonetheless, in its ideal form, bureaucracy resists and discourages leadership, both from within its ranks and from the outside. This is an inconvenient truth. Weber, for example, noted that under bureaucracy “qualities of political leadership have never been born and brought to fruition anywhere in the world” (Weber 1956/1978, 1413).

That is why so many leaders look for other outlets, such as entrepreneurship, where their talent and ambition can flourish. As ideal types, bureaucrats stand in direct contrast to leaders. For this reason, Weber urged leaders to become “the countervailing force against bureaucratic domination” by entering electoral politics (Weber 1956/1978, 1417).

This is not to say that bureaucrats lack the capacity for leadership and never exercise leadership in small ways within the system, but the forces at work to preserve and expand bureaucracy itself oppose leadership. Leaders must overcome the system and are likely to suffer in the attempt. Nevertheless, for the sake of accountability and the system’s ongoing vitality, bureaucracy requires infusions of leadership. Leadership within bureaucracy can succeed at this despite the bureaucrats. As bureaucracy increases in power, opportunities for leadership diminish.

It is a paradox. Bureaucracy *consumes* leadership as a fox consumes chickens.

BUSINESS

The United States is, more than anything else, a business society. Although millions of U.S. citizens participate daily in religious worship, governance, national defense, schooling, leisure, and sports, no activity more thoroughly defines U.S. culture and U.S. institutions than the quest for entrepreneurial and corporate success. Office buildings—not cathedrals or (outside of Washington, DC) great civic structures—dominate urban skylines. Suburbs are honeycombed with strips of small stores and air-conditioned office modules. Even the countryside bears abundant evidence of the business impulse, from “agribusiness” corporate farms to modest roadside vegetable stands. Even ostensibly non-business preoccupations, such as those mentioned, are infused with business practices and business sensibilities. Many churches are now housed in shopping malls (for better “spillover” traffic) and funded by aggressive, televised fundraising; government and national defense increasingly are “outsourced” to private-sector subcontractors; public

schools are under increasing pressure to perform like their private counterparts; and, of course, much of sports, leisure, and entertainment is big business.

Business came to dominate U.S. society in large measure because of the nature and public image of its leaders. More than that, U.S. business leaders historically have defined a great deal of U.S. culture and institutions. During some periods business leaders have stood at the apex of power and respectability, whereas during other periods the general reputation of the business community, along with the personal reputations of some of the most prominent figures in business, has fallen into disrepute. However, whether celebrated or derided in the headlines and opinion polls, business leaders have never been far from the center of power and influence in U.S. history. Indeed, according to many authorities, they have never left that center.

A historical perspective on U.S. business reveals dramatic changes in the styles and methods of business leadership, as well as some notable continuities.

ELITE MERCHANTS AND PLANTERS IN COLONIAL AMERICA

Business and religion coexisted sometimes comfortably, sometimes uncomfortably, in the early colonies. However, within a generation or two after the first Puritans settled in Massachusetts in 1607, business elites had emerged in New England and, in a different guise, in the middle Atlantic colonies. New England’s business leaders were general merchants situated in port cities such as Boston, Salem, Newburyport, and Providence. The volume of commerce did not encourage specialization, so these merchants engaged in a wide range of activities: as shippers and ship owners, retailers and wholesalers, commission agents, money lenders and issuers of credit, and insurance underwriters.

Trust was a prized commodity among New England’s elite merchants. Given the lack of timely and reliable market information in the colonial period, merchants had to entrust their ships and cargos to others for months or years at a time. The key figure aboard ship was the supercargo, who was empowered by the merchant to negotiate on his behalf dur-

ing the long and unpredictable trading voyages. Merchants also relied on networks of agents at foreign ports. Not surprisingly, New England's elite merchants preferred supercargos and foreign agents who were related by blood or marriage. The general merchant's typical day began with some drinking and hobnobbing at a local tavern or coffee shop to gather information about recently arrived ships and market conditions. Then came a stint in the counting house, where transactions were entered by quill pen into ledger books, and correspondence was posted. The more successful merchants typically employed a clerk, one or two bookkeepers, and a couple of apprentices. Two dozen transactions a day were considered busy.

Initially, New England Puritans were wary of, and at times outspoken against, the region's burgeoning commercial spirit. During the 1640s, a Boston merchant named Robert Keene was fined by the General Assembly and sanctioned by the church for charging too much for a bag of nails. The case exemplified the clash between commonwealth-centered notions of "just price" (dating back to medieval times) with more recent capitalist sensibilities. For the most part, Puritan strictures encouraged economic development because prosperity was seen as a sign of God's approval, and saving was valued over consumption. By the end of the seventeenth century, the region's leading seaport merchants were not only the leading economic actors in their communities but also the most influential figures in politics. Many sat on general assemblies, town councils, and judges' benches. They also played major roles in the church—as deacons, parishioners, and donors.

In the middle Atlantic and southern colonies, large planters emerged as the leading business figures. Early British settlers in Virginia gained an economic foothold by cultivating and exporting tobacco as a cash crop. Half the working population was composed of indentured servants, but during the middle of the seventeenth century planters increasingly relied on African slaves for labor. Rice, indigo, sugar, and then cotton emerged as major cash crops. Cotton cultivation migrated farther south, where production was increasingly concentrated in plantations. The middle-Atlantic economy began to diver-

sify, but in the South cotton was king, and large planters effectively ruled the society. They enjoyed much greater wealth than northern elites and exercised considerable political power and total autonomy among the members of their households. Their patriarchal control extended over business relations, family, and slaves alike.

Business elites played a central role in the American Revolution. In the North, leading merchants who were squeezed by a surge of British imports during the 1760s and early 1770s mobilized for independence. In the South, planters were angered when Scottish merchants became dominant intermediaries in the cotton trade. Everywhere, business leaders had attained a strong sense of their own interests apart from the prerogatives of British imperialism.

BUSINESS LEADERSHIP IN NINETEENTH-CENTURY INDUSTRIALIZATION

U.S. business and business leadership evolved dramatically during the nineteenth century. In 1800, nine of ten U.S. citizens farmed the land. However, as the economy grew it also became more specialized, giving rise to firms devoted to insurance, banking, securities trading, commodities trading, and the like. In 1822, a group of New England investors known as the "Boston Associates" founded the nation's first industrial town at Lowell, Massachusetts. Early factory owners and managers in the United States strived hard to avoid the squalid working conditions and moral decay that too often accompanied factory life in Great Britain; and for awhile they succeeded. Lowell and its imitators closely supervised the young farmwomen who worked in their mills to ensure their religious training and moral rectitude. However, by the 1840s, as Irish and other immigrants displaced the "mill girls," factory conditions at Lowell became more like those of their Old World counterparts.

Entrepreneurs in the middle of the nineteenth century typically were religious, aggressive, flexible, mobile, and optimistic. Firms sprang up, changed names and partners, and failed with amazing rapidity. Those people who participated in building the nation's transportation and communication infrastructure—its roads and turnpikes, canals,

steamships, railroads, telegraphs, and postal services—cooperated closely with public officials, who in turn offered an array of state incentives. This public-private collaboration suffered a major setback when many of the nation's major canal projects faltered, leading to a backlash against public promotion of internal improvements that forced the railroads to rely chiefly on private (especially British) investment capital.

The coming of the railroads ushered in a new era in business leadership. The rapid expansion of railroad lines from local affairs running fewer than 50 miles to regional and interregional lines spanning hundreds or thousands of miles required a new breed of professional manager. As the railroad corporations built multilayered bureaucracies staffed with professional managers, business ownership and control were separated for the first time in U.S. business history. At the top were leaders who ranged from the efficiency-minded J. Edgar Thomson of the Pennsylvania Railroad to the more speculative Jay Gould of the Erie and other railroads. During the 1860s and 1870s railroad managers drew criticism from the farmers, shippers, and merchants who relied heavily on their services yet saw railroad rate-setting practices as fundamentally unfair.

After the Civil War several major manufacturing industries grew and consolidated to become giants, and with them emerged a highly visible cohort of industrial multimillionaires. In iron and steel Andrew Carnegie dominated the scene. Rising from poverty as a Scottish immigrant, Carnegie eventually accumulated a fortune worth \$500 million, most of which he gave away before he died. John D. Rockefeller controlled 90 percent of U.S. oil refining by the 1880s, making him the richest man in the world. Devoutly religious, watchful of every penny, and hard-nosed in his dealings with competitors, Rockefeller was both admired and despised. Few attained the wealth and power of Carnegie and Rockefeller, and few rose as they did from rags to riches. The great majority of manufacturing leaders during this period was Protestant, descended from northern and western Europe stock, Protestant, well educated, and from well-to-do families.

The great power of the trusts (as the giant corpo-

rations were called) was a major political issue by the late nineteenth century. During the Progressive Era (which lasted until World War I), the federal government put into place a host of corporate regulatory controls. However, these were not simply imposed on the railroads and giant manufacturers; business leaders participated in crafting them. Many industry leaders actually welcomed the coming of federal regulation, seeing it as both inevitable and a preferable alternative to a patchwork of state laws. By World War I business leaders were learning to work with an emerging system of administrative government that placed some constraints over their actions but still left them considerable independence.

BUSINESS LEADERSHIP IN WAR, PROSPERITY, AND DEPRESSION

U.S. business leaders were tested during the years 1914–1945 by three major national crises. The period was bracketed by world wars in which business leaders played a key role in mobilizing the nation's industrial might for victory. During the interwar decades the reputation and influence of the U.S. corporate world swung from an apex during the prosperous Roaring Twenties to a nadir during the depths of the Great Depression.

The United States entered World War I as a combatant with great reluctance and after long delay. Although hostilities broke out in Europe in August 1914, U.S. troops didn't enter the war until April 1917. After the war some people would claim that “merchants of death”—mainly munitions makers as well as bankers who made large war loans to the British and Germans—undermined the nation's neutrality. Although some people profited, most U.S. business leaders were concerned about the disruptive effects of war on trade and international stability.

In spite of the long lead-up to U.S. direct involvement in the war, the United States was largely unprepared to engage in a large-scale war. Inventories of battle-ready warships, planes, tanks, bombs, and ammunition were thin. Moreover, the federal government lacked an effective administrative apparatus to coordinate the flow of essential materiel and the conversion of major industries to war production.

In 1916 the Council of National Defense (CND) and the U.S. Shipping Board handled most wartime economic coordination, but shortages of critical fuels, transportation, ships, and matériel were commonplace. In July 1917 the CND created the War Industries Board (WIB) to set priorities and increase production of critical matériel. This was the first formal attempt at central economic planning in U.S. history. The WIB became much more effective after President Woodrow Wilson appointed Wall Street financier Bernard Baruch as its new head in 1918. Baruch brought legions of corporate managers to Washington, where they volunteered their services on behalf of the war effort as “dollar-a-year” men. In return for their altruism, business leaders gained considerable influence over the setting of national economic priorities. Not surprisingly, these priorities often favored the companies and industries that had been, and would again be, run by the dollar-a-year men.

Business people also played a critical role in the nation’s propaganda campaigns. The federal government’s Committee on Public Information—which churned out millions of advertisements, banners, and flyers promoting war bonds, bashing the Germans, and whipping up patriotic sentiment—was headed by advertising executive George Creel, who staffed his committee with advertising talent. In many ways the modern public relations industry was born during World War I.

Not all business leaders were eager to switch to war production. The government’s constitutional power to compel cooperation was murky at best. However, through a combination of cajoling, threatening, appealing to patriotism, and using moral suasion, the federal government motivated corporate leaders to convert to war production on a massive scale. In time, the government’s control over industrial United States reached unprecedented levels. In 1918, the WIB took over the operation of the nation’s railroads, and later it assumed control of the telegraph and telephone industries. Many business leaders viewed these moves with great trepidation—as a dangerous step in the direction of socialism.

Their gravest fears proved to be unfounded. Overall corporate profits during the war were generous, and the federal government relinquished its controls

over key transportation and communication sectors with the return of peace. For the most part business leaders emerged from the war well regarded by the public, and they carried with them a newfound appreciation for what a business-government partnership could accomplish.

A severe but brief economic recession followed the war, after which the economy entered a decade of robust expansion. Several glamour industries helped propel the economy forward: automobiles, radio, motion pictures, electric appliances and other consumer durables. Many of the men who headed the leading firms in these industries became household words, including David Sarnoff of RCA, Alfred P. Sloan of General Motors, and Robert C. Wood of Sears, Roebuck. They were seen as stewards of progress, bringing modernity—in the form of new products and services—to the lives of middle-class citizens at affordable prices. Advertising became much more sophisticated in its use of color, design, and psychological themes that played on consumers’ desires and insecurities. A few women reached the upper echelons of the advertising business, most notably Helen Resor of J. Walter Thompson, the nation’s largest advertising agency. Resor was expected to comprehend the “female point of view” much more effectively than did her male counterparts. The decade’s fascination with advertising at times reached absurd levels, as when adman Bruce Barton’s book, *The Man Nobody Knows*, hit the best-seller lists. The supersalesman featured in the book who “picked up twelve men from the bottom ranks of business and forged them into an organization that conquered the world,” was none other than Jesus Christ.

A few of the nation’s most prominent business leaders, such as Gerard Swope and Owen D. Young of General Electric, achieved statesmen status during the 1920s. In the pervasive confidence of the decade, many business leaders attempted to address the chronic problem of competition and overcapacity by cooperating more systematically and openly through trade associations such as the National Association of Manufacturers. The federal government agreed to take a backseat to business efforts to coordinate wages, prices, and output in a movement that became

I used to think that running an organization was equivalent to conducting a symphony orchestra. But I don't think that's quite it; it's more like jazz. There is more improvisation.

—Warren Bennis

known as “associationalism.” Herbert Hoover, a wealthy engineering contractor, played a key role in these efforts, first as secretary of commerce in the laissez-faire (non-interfering) administration of President Calvin Coolidge and then as president himself from 1928 to 1933. However, associationalism rested on the rather naïve notion that big business, in watching out for its own interests, also would serve the best interests of consumers, small business, and the larger society.

The great Wall Street crash that began in October 1929 redefined U.S. business leadership for a generation. Although economic historians now understand that the Depression was deepened and prolonged by failures of economic policymaking, most Depression-era citizens held corporate leaders chiefly responsible for the economic debacle. Many culprits were responsible. Herbert Hoover had captured the presidency—his first elected office—with the promise that he would bring business-like efficiency to federal government; but his response to the onset of the Depression appeared tepid and narrow-minded. The financial community was chided for falsely inflating the value of stocks and for erecting complicated and highly leveraged holding company structures that collapsed like houses of card as soon as the market turned bearish. The dramatic economic reversal seemed to many citizens to smack of a grand morality play in which they would now pay the price for a decade of heavy borrowing, overconsumption, and high living.

All of this contributed to a rise in the power and authority of government leadership at the expense of business leadership during the 1930s. The charismatic presidency of Franklin D. Roosevelt stood at the center of the shift. Roosevelt asserted a positive role for the state as a source of relief from economic hardship, recovery from economic depression, and

reform of the economic system. During the first few years of his New Deal, Roosevelt followed in Hoover’s associationalist footsteps by seeking business cooperation under the guidance of the National Industrial Recovery Act (NIRA, which set industry codes for wages, prices, and production levels). However, after the Supreme Court struck down the NIRA in 1935, Roosevelt became more adversarial toward big business in both his rhetoric and his use of antitrust laws against business combinations.

Although most businesses suffered during the 1930s, chemical manufacturing, aircrafts, and a few other sectors made gains by buying up failed competitors, improving technology, and consolidating. However, few business leaders had national prominence. The relative position of U.S. business leadership was eroded further by the passage of the National Labor Relations (Wagner) Act in 1935, which strengthened the position of organized labor. Even so, the fundamental legitimacy of corporate capitalism was never severely challenged during the Great Depression. Roosevelt never attempted to socialize banking or other key sectors (apart from an experiment with rural electrification in the Tennessee Valley), and no widespread civil unrest or great surge in communist membership occurred.

The coming of World War II, rather than Roosevelt’s economic policies, finally lifted the economy out of the Depression in the late 1930s. Once again the United States entered the war largely unprepared, and once again successful mobilization of the U.S. industrial base proved to be a decisive factor in winning the war. Roosevelt organized the war effort much as he had organized the New Deal—in a dizzying array of “alphabet agencies” that sometimes created administrative confusion and duplication of effort. Corporate leaders flocked to Washington, D.C., again, although business leaders did not eclipse their government partners as in the previous world war.

The mobilization effort earned back much of the status and authority of the business sector. Full employment for non-drafted or enlisted men combined with millions of new factory jobs for women to fill the pockets of the middle class after more than a decade of deprivation. Industrialist Henry Kaiser

epitomized the World War II industrialists who contributed mightily to the war effort while profiting handsomely himself. Kaiser operated large aluminum, cement, and steel plants, manufactured automobiles and ships, and founded a large health maintenance organization. He was as entrepreneurial in his relations with the state as he was with large-scale industry.

POSTWAR BUSINESS LEADERSHIP: FROM CONFIDENCE TO CRISIS

U.S. business leaders again enjoyed popularity and prominence in the generation after World War II. The leaders of the nation's largest industrial corporations brought a level of professional training to their jobs not seen before. Many held advanced degrees from business schools, engineering schools, or both. Depression-era antagonisms were distant memories; the new "technocrats" were eager to cooperate with the state in its global campaign to contain communism. When President Dwight D. Eisenhower spoke of the "military-industrial complex" in his 1961 farewell address, he referred to the tight linkages between the military establishment and the electronics, aerospace, nuclear, and other critical industries that supplied it.

Public opinion polls during the 1950s and 1960s showed favorable ratings for U.S. business in all categories. When Charles E. Wilson of General Motors declared that what was good for General Motors was good for the United States, few questioned the legitimacy of the declaration. Corporate executives embraced bureaucracy and the new technology of computers as tools for modern managerial efficiency. New consumer and producer goods improved the quality of life for millions—from chemical pesticides and herbicides that boosted agricultural output to "miracle" petrochemical plastics such as polyester and polypropylene that replaced cotton, wool, and other natural fibers in clothing, upholstery, and rugs.

Confidence among the nation's corporate leaders at times shaded into hubris (exaggerated pride). This was perhaps most apparent in the conglomerate movement of the 1960s. Conglomerates were sprawling combinations of scores or even hundreds

of firms in unrelated businesses that were acquired and sold much like shares in a stock portfolio. Even firms that remained chiefly in one business frequently diversified into unrelated areas during the 1950s and 1960s. The trend was driven by a philosophy that general management principles were equally valid in all businesses.

However, undercurrents of discontent about the postwar corporate world and its leaders were growing. Several prominent public intellectuals from across the ideological spectrum—William Whyte, John K. Galbraith, David Riesman, Ayn Rand, and Vance Packard, among others—derided the stultifying effects of business bureaucracy on creativity and individuality. According to such critics, big corporations—with their personnel departments and career escalators—were exerting too much pressure on their workers and managers to conform in all manner of dress and behavior. Sloan Wilson's 1955 novel, *The Man in the Gray Flannel Suit*, became a bestseller.

In retrospect, these critiques contained some truth. When U.S. business confronted serious external and structural challenges during the late 1960s and early 1970s, most of its leaders were at a loss for how to respond. One major challenge came from overseas as Japanese, German, and other foreign competitors began to make serious inroads into U.S. markets for textiles, steel, machine tools, automobiles, and consumer electronics. The onset of high rates of inflation beginning during the mid-1960s (as President Lyndon Johnson's administration scaled up the Vietnam War) placed additional pressure on the economy, as did the Organization of Petroleum Exporting Countries (OPEC) oil embargo and the subsequent global energy crisis of 1973.

It was a new age for corporate leaders, who no longer could focus their attention almost exclusively on maximizing profits while keeping workers reasonably content. Now they had to work with a variety of stakeholders (persons with an interest in an outcome) such as regulators, environmentalists, and consumer groups. This placed a premium on corporate image, and new public relations specialists devised "softer" techniques that spoke of strategic partnerships, "going green," and "corporate social responsibility."

U.S. economic stagnation extended into the late 1980s. This prompted both painful reexamination and finger pointing by business leaders. Some appealed to the federal government for protection against allegedly unfair foreign competitive practices that at times escalated into outright “Japan bashing.” Others blamed the new wave of federal consumer product, workplace, and environmental regulation put into place during the late 1960s and early 1970s for placing U.S. business at a competitive disadvantage. Still others indicted organized labor for driving up manufacturing costs. As during the 1930s, few corporate leaders played visible and prominent roles on the national stage. The most popular business leader of the period was Chrysler President Lee Iacocca, whose greatest career achievement was to negotiate a government bailout when his company faced bankruptcy.

The process of business recovery was long and painful—especially for the nation’s middle managers and lower-level employees. During the 1980s, millions of U.S. workers were laid off as the U.S. corporate world underwent a process of “restructuring” that often entailed “downsizing.” Much of the restructuring was called for, and ultimately beneficial, particularly the massive shedding of unrelated business units acquired during the conglomerate era. This restructuring restored much of the focus on production and marketing fundamentals that had long been missing.

However, corporate restructuring of the 1980s had a number of insidious dimensions as well. In their desire to escape regulations and cut labor costs, many corporate leaders set up plants outside U.S. borders. In addition, at least two massive merger waves swept through the decade, each involving a prominent number of “leveraged buyouts” and hostile takeovers. A new breed of financiers—most notably the “junk bond king” Michael Milken of Drexel Burnham—devised innovative methods of raising billions of dollars of investment capital in order to take over firms that were undervalued in the financial markets. Whereas some of these takeovers ousted poor management regimes and resuscitated companies, others led to the partial or complete dismantling of once-stalwart companies. Dealmakers

captured the popular imagination during the 1980s. *The Bonfire of the Vanities*, author Tom Wolfe’s satire of young “masters of the universe” bond traders, topped the best-seller lists, and the lead character in the Hollywood film *Wall Street* declared infamously that “greed is good.”

A different breed of twenty- and thirtysomething business leaders appeared to come to the rescue of the U.S. business system during the final decade of the twentieth century. Although the economic boom of the 1990s had many causes, the high-tech sector—particularly microcomputing hardware and software, the Internet, and (later in the decade) the World Wide Web—was perceived to be the driving force behind the economic recovery. The heroes of the so-called “new economy” were the entrepreneurs of Silicon Valley, California, and other high-tech regions. They attracted venture capital to found “dot.com” start-ups at an astonishing rate. Their model of success was Bill Gates, founder and chairman of the software giant Microsoft. In spite of being the richest man in the world, running a massive corporation, and spending much of his time fighting antitrust litigation, Gates affects the boyish demeanor of the hapless computer “nerd” with tousled hair and khaki pants.

At the turn of the twenty-first century, U.S. business leadership endured another crisis of confidence and legitimacy. Middle-class citizens watched in horror as roughly half the value of their retirement portfolios evaporated in a massive “dot.com” meltdown. A wave of accounting scandals—exemplified by the \$67 billion collapse of the energy trading company Enron and its auditor, Arthur Andersen—has sparked a wave of government investigations. Unemployment is high, yet some corporate executives continue to garner compensation packages that run into the tens or hundreds of millions of dollars a year. Few prominent figureheads represent and defend U.S. business.

Yet, robust continuities undergird this latest metamorphosis in the reality and perception of U.S. business leadership. The United States remains at its core a business society, where each day millions of small proprietors and middle managers of every ethnicity take on the task of competing and possibly succeeding as industrial leaders, colorful entrepreneurs, cor-

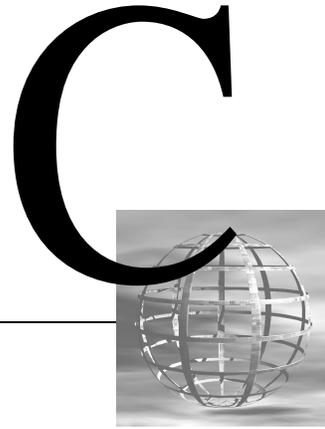

porate scoundrels, and celebrity CEOs define the era's culture of business leadership.

 **CARNEGIE, ANDREW**
(1835–1919)

U.S. industrialist, author, and philanthropist

One of the most influential leaders in history, Andrew Carnegie essentially created the modern steel industry, which in turn fostered U.S. global economic preeminence. Authoring a new ethic in corporate social responsibility, Carnegie pioneered the philanthropic industry. A prodigious writer, he was outspoken, often radical. He endures symbolically as both hero and villain in the controversial era that the writers Mark Twain (1835–1910) and Charles Dudley Warner (1829–1900) dubbed “The Gilded Age.”

A LEADING PARADOX

Paradoxes defined Carnegie’s life. Born in Dunfermline, Scotland, the child of parents thrown into unemployment because of industrial technology, Carnegie exemplifies the prepotency and efficacy of industrial innovation. The quintessential symbol of U.S. rags-to-riches folklore, he was also an elite business entrepreneur who personified the unprecedented power of big business. Having created one of the most powerful vertically integrated companies in the world, he nonetheless criticized the protective tariff and corporate trusts, championing instead competition and the limited partnership form of business

organization. Innovative in bureaucratic management systems, he developed an unrivaled method of systematic cost accounting, which he oversaw personally. Ironically, when the financier J. P. Morgan (1873–1913) challenged Carnegie’s steel empire, Carnegie opted to sell the enterprise to his rival for \$480 million (worth about \$10.1 billion in 2002 dollars but equivalent to an astounding \$238 billion to equal the same percentage of GDP), effectively making him, as Morgan dubbed him, “the richest man in the world.” Though he respected select Judeo-Christian values, he was not religious. Rather, he “came fortunately upon Darwin’s and Spencer’s works,” which inspired him to get “rid of theology and the supernatural” in favor of “the truth of evolution” (Carnegie 1986, 327). Social Darwinism’s doctrines of extreme individualism and devotion to survival of the fittest helped him justify his hard-nosed acquisition of wealth, his merciless industrial competition, and his heavy-handed treatment of his workers. Nevertheless, in his controversial “true Gospel concerning Wealth” Carnegie emphasized—to the disdain of his wealthy peers—that the rich were morally obligated to practice bountiful and altruistic philanthropy, for “the man who dies thus rich dies disgraced” (Carnegie 1889a, 664). To this end, he engaged in unprecedented philanthropy toward educational institutions and public libraries and in support of medical research and world peace.

While the Vanderbilts, Rockefellers, Morgans, and others passed unprecedented fortunes from one generation to the next, the renegade Carnegie argued for an inheritance tax, and, even more radically, that the wealthy should not burden their children with great fortunes, as “great sums bequeathed oftener work more for the injury than for the good of the recipients” (Carnegie 1889a, 658). While his wealthy peers conspicuously championed what his contemporary, the economist Thorstein Veblen (1857–1929), disdainfully called “conspicuous consumption,” Carnegie called for “modest, unostentatious living, shunning display or extravagance” (Carnegie 1889a, 661). Nevertheless, Carnegie had a magnificent mansion in New York City (now the Cooper-Hewitt National Design Museum), the Skibo Castle in northern Scotland, and a hundred-room summer home in Lenox, Massachusetts. Optimistic, combative, supremely self-confident, even arrogant, Carnegie also had times of crisis of conscience and self-doubt, harboring a strong need to be found exceptional, to be noticed. Loyal to friends, he still found it difficult to share power.

As the author of *Triumphant Democracy* (1886/1971), Carnegie trumpeted U.S. democracy and capitalism, becoming celebrated as a defender of the common laborer. Yet Carnegie’s workers toiled grueling twelve-hour shifts seven days a week, their only holiday the Fourth of July. Carnegie’s image as a friend of the worker was tainted further by his participation in the crushing of the 1892 Homestead strike. It took the wages of nearly 4,000 steelworkers to match the earnings of Andrew Carnegie. Devoted to caring for his strong-willed mother, Carnegie did not marry until her death, wedding Louise Whitfield in 1886. The couple’s only child, Margaret Carnegie Miller, publicly remembered her father as a kind benefactor. Yet in private she expressed weariness about the one-sided romanticism of this image of her father. Certainly there seems enough evidence for whatever “Carnegie” one wishes to portray.

A LEADER OF IRON—AND STEEL

Carnegie’s life is divisible into five periods, each demonstrating remarkable leadership. The first

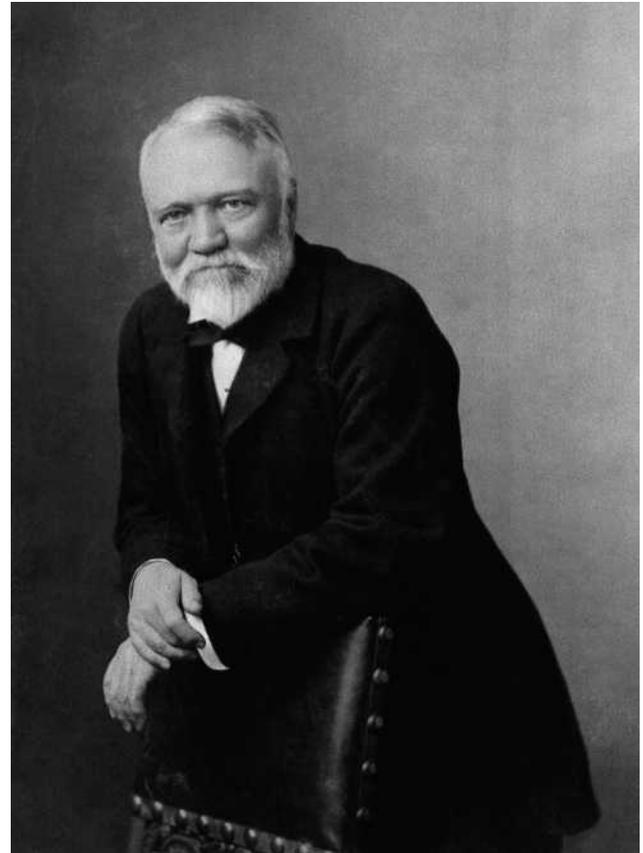

period (1848–1852) began with Carnegie’s immigration at age thirteen from Scotland to the United States, where he found employment in 1848 as a bobbin boy in a Pittsburgh textile mill, studying accounting in night school after his arduous twelve-hour workday. With characteristic quickness and hard work, he soon became a messenger boy in a telegraph office, where he learned telegraphy on his own time, resulting in a promotion in 1851 to telegraph operator. This led to his big break and the second period (1852–1865), when he worked for the Pennsylvania Railroad, initially as the personal telegrapher and secretary to Thomas Scott, a superintendent. Carnegie’s purchase of dividend-rich stocks and bonds revolutionized his business sense, as his early investments in a sleeping car company and oil quickly supplied him with earnings far greater than his salary as a railroad superintendent. His first fortune was made when he not only bought into a company that manufactured iron railroad bridges—which were in high demand during the Civil War and as heavier trains became more commonplace—but also sold bonds on commission in New York and Europe to fund the construction of bridges as well as railroads. Carnegie’s gift for utilizing vertical organization led to his buying iron production facilities to supply his bridge building, which became so successful that he left the Pennsylvania Railroad in 1865, never to work for salary again. His innovations in the iron industry included new technologies, exacting cost accounting and efficiency measures, and vertical integration to ensure constant supply and to manage the specialized stages of iron production within one organization—all of which increased production and lowered costs. Later, the daring and radical Carnegie became convinced that the future of railroads was in steel production; he and other investors founded the Edgar Thomson Works in 1873, thus beginning his age of steel (1873–1892).

Carnegie’s leadership skills included surrounding himself with intelligent partners or advisers such as Henry Clay Frick (1849–1919) and Charles Schwab (1862–1939), reinvesting profits into more efficient technologies (such as the Bessemer process for converting pig iron to steel) even during times of eco-

conomic downturn, pursuing vertical integration and meticulous supervision, and retaining ownership in all his enterprises. Under Carnegie, U.S. steel production jumped dramatically; his ability to supply unlimited, inexpensive steel for railroads, skyscrapers, and bridges was unrivaled. His efforts to make production more efficient and to foster vertical integration cut his companies' costs by more than half—and Carnegie's wealth continued to increase exponentially. In 1892 Carnegie merged his various steel companies into the Carnegie Steel Company, an industrial colossus whose profits ballooned from \$6 million in 1896 to \$21 million in 1899 to \$40 million in 1900. Even then, at age sixty-five, Carnegie considered building a huge new plant and expanding production. Yet his desire to retire, combined with the challenge of J. P. Morgan's energetic move into the steel industry and Charles Schwab's advice that the industry needed specialization and consolidation, prompted Carnegie's famous handwritten offer to his rival—\$480 million—which Morgan accepted, resulting in the formation of United States Steel in March 1901, and the last phase of Carnegie's remarkable career: full-time philanthropy (1901–1919).

LEADING PHILANTHROPY

On the walls of his study surrounding his massive desk were the mottoes that had inspired him and that now spurred his massive drive to become the greatest of all philanthropists: “Let There Be Light,” “The Kingdom of Heaven Is Within You,” “The Gods Send Thread for the Web Begun,” “All Is Well Since All Grows Better,” “Thine Own Reproach Alone Do Fear” (American Experience Online 1999). Here Carnegie decided on what he believed to be the wisest disposal of his fortune, based on a plan he had published in 1889 as “The Best Fields for Philanthropy.” First he gave money to educational institutions, then to create free libraries (which appealed to his sense of democratic and self-educated idealism), then to hospitals, parks, concert halls, and swimming pools, and lastly, to churches. By 1917, Carnegie had invested \$68,333,973 (equivalent to about \$956 million in 2002) in 2,811 libraries worldwide, including 1,946 in the United

Andrew Carnegie in 1896.

States. By the time of his death in 1919, he had given away \$324,657,399—an astounding amount worth about \$3.36 billion in 2002 dollars, though the equivalent of \$44.1 billion today to equal the same share of GDP. It represented 90 percent of his fortune.

Carnegie's leadership in establishing the industry of philanthropy met with mixed reviews. Clergy lamented being last on the list. Carnegie's exhausted workers might value the free libraries, but many had neither time nor energy to use them, and their pent-up resentment often kept them stubbornly away regardless. Although he won praise from the industrialist John D. Rockefeller (1839–1937), who was also a philanthropist, as well as from Mark Twain and Elihu Root (1845–1937), a diplomat and eventual Nobel Peace Prize winner, Carnegie was criticized by the union organizer Eugene V. Debs (1855–1926), the social reformer Jane Addams

An Excerpt from Andrew Carnegie's "The Best Fields for Philanthropy" (1889)

The aim of the first article ["Wealth"] was thus to lead up to the conclusion that there is but one right mode of using enormous fortunes—namely, that the possessors from time to time during their own lives should so administer them as to promote the permanent good of the communities from which they have been gathered. It was held that public sentiment would soon say of one who died possessed of million of available wealth which he might have administered: "The man who dies thus rich dies disgraced."

The purpose of this article is to present some of the best methods of performing this duty of administering surplus wealth for the good of the people. The first requisite for a really good use of wealth by the millionaire who had accepted the gospel which proclaims him only a trustee of the surplus that come to him, is to take care that the purpose for which he spends it shall not have a degrading, pauperizing tendency upon its recipients, and that his trust should be so administered as to stimulate the best and most aspiring poor of the community to further efforts for their own improvement. It is not the irreclaimably destitute, shiftless, and worthless that it is truly beneficial or truly benevolent to attempt to reach and improve. For these there exists the refuge provided by the city or the state, where they can be sheltered, fed, clothed, and kept in comfortable existence, and—most important of all—where they can be isolated from the well-doing and industrious poor, who are liable to be demoralized by contact with these unfortunates. One man or woman who succeeds in living comfortable by begging is more dangerous to society, and a greater obstacle to the progress of humanity, than a score of wordy Socialists. The individual administrator of surplus wealth has as his charge the industrious and ambitious; not those who need everything done for them, but those who, being most anxious and able to help themselves, deserve and will be benefited by help from others and extension of their opportunities at the hands of the philanthropic rich.

Carnegie, Andrew. (1889). "The Best Fields for Philanthropy." *The North American Review*, 149(397), 682–699.

(1860–1935), and the social activist and clergyman Walter Rauschenbusch (1861–1918), who decried the "Christ-less" manner with which he had obtained his fortune. Carnegie's philanthropic activities were also self-serving. He believed that unless the wealthy class returned a portion of its wealth to society for the good of everyone, the appeal of socialism would be too strong among the poor and the working class. Some of his writings were devoted to showing the interrelationship of laissez-faire capitalism, philanthropy, and social Darwinism; these argued that capitalists must spend their fortunes for the public good to prevent serious social unrest, because such unrest could lead to the loss of fortunes. Wise philanthropy

not only protected individual survival of the fittest, it also guaranteed the fittest society.

This ideology, arising from his own experience, fueled Carnegie's leading philanthropic passion: the building of public libraries as educational institutions. These efforts undergirded his belief that the United States was best served by a "meritocracy"—by leadership based on effort and ability, not the status of one's family. Likewise, though any community could apply for a library grant, Carnegie required matching capital from communities in the forms of donated land and annual operating funds of at least 10 percent of the value of his grant. In this way the fittest both emerged and survived. By 1917, Carnegie had invested \$68,333,973 (equivalent to about \$946 million today) in 2,811 libraries worldwide, including 1,946 in the United States.

A LEGACY OF LEADERSHIP

An indefatigable author, Carnegie published eight books, sixty-three articles, and ten public addresses from 1882 to 1916. His practical

aphorisms, like those of Benjamin Franklin, commanded credibility because of his own manifest success. The man of steel certainly saw himself as a role model for aspiring entrepreneurs, and the advice he shared was the very wisdom by which he himself had been guided. Nevertheless, the personal resolve, positive attitude, and devotion to individual merit reflected in his writings ultimately can neither be reduced to simple formulas nor divorced from Carnegie's unique place in history.

How effective was Carnegie's leadership? While the influence of his own largess in philanthropy is without dispute, he generally did not inspire his peers to follow his example. Some, like the Rocke-

fellows and Julius Rosenwald (1862–1932), established foundations that still benefit the public today. Others, like J. P. Morgan and the Vanderbilts, thought Carnegie to be foolish. Typically, the enormous fortunes of the Gilded Age remained family inheritances rather than being emptied back to society, as Carnegie prescribed. Likewise, Carnegie's business principles of competition, efficiency, and meeting the demands of the market were overshadowed by the business structure of Rockefeller's Standard Oil and Morgan's United States Steel, which favored consolidation and the creation of trusts. His philanthropy notwithstanding, Carnegie continued to be caricatured as a grossly wealthy and uncaring robber baron whose fortune was built on the exhausted backs of his workers. His outspoken opposition to U.S. imperialism and support of international arbitration and world peace were eclipsed by the nation's involvement in the Spanish-American War, the Philippines, and World War I.

Nevertheless, Carnegie's defense of the gold standard was used in William McKinley's victorious 1896 presidential campaign to counter the "free silver" bimetallism position of William Jennings Bryan. Carnegie's arguments on central banking played a role in Woodrow Wilson's creating the Federal Reserve System, and his dedication to encouraging global peace inspired support for the League of Nations. His commitment to funding education and libraries benefited countless people, including African-Americans, whose cause he championed. Although intensely devoted to hands-on management, when he set up his philanthropic foundations, he wisely gave his trustees the freedom to adapt to changing situations. As the quintessential success story, his bold example still holds out the promise of the ideal of the self-made man. As the United States' most conspicuous philanthropist, he emerged as "Saint Andrew" (as Mark Twain dubbed him) to most, though others regarded him as a sham. What remains is Carnegie's sheer magnitude, whether saint or sinner, friend or foe, sage or fool. When Mark Twain died in 1910, Carnegie published a moving tribute in the June issue of the *North American Review* (Carnegie 1910). His poignant words are likely those he would have wished for his own

legacy: "‘If there's another life, he lives in bliss. If there be none, he made the best of this.' Let us follow his example."

—Craig H. Roell

CARSON, RACHEL (1907–1964)

U.S. scientist and environmentalist

With her 1962 book *Silent Spring*, scientist Rachel L. Carson alerted postwar America to the hazards of synthetic chemical pesticides and established herself as a major intellectual leader of the contemporary environmental movement. *Silent Spring* focused primarily on the dangers posed by DDT to wildlife and human health. Only eighteen months after the book's publication, Carson died from breast cancer, but her insights—in particular, that humans and nature are inextricably connected ecologically—have lived on. The first annual Earth Day in 1970 officially launched the current U.S. environmental movement, and many successes followed—in environmental legislation and activism, conservation efforts, and the growth of organic agriculture, for example. Carson's ideas helped to guide these trends. However, Rachel Carson did not fit traditional models of leadership.

EARLY YEARS

Growing up in western Pennsylvania, Carson spent comparatively little time with other children her age. Her mother believed that Carson had a frail constitution, and often kept her out of school. As a follower of the nature study movement—a teaching method which held that direct experience of nature could lead a child to both an aesthetic and scientific appreciation of the environment—Carson's mother

tutored her according to these beliefs. The two spent hours roaming the land around their small farm, identifying birds, plants, and animals. This early upbringing later helped Carson to envision herself as not only a member of a human community, but also of the nonhuman environment.

When she entered Pennsylvania Women's College (now Chatham College), Rachel Carson decided to become a member of the scientific community as well. She began college with the intention of becoming a writer, but then found herself fascinated by biology and the life sciences. With the encouragement of her mentor and science instructor, Mary Scott Skinker, Carson majored in English and biology. In 1929 Carson entered graduate school in zoology at Johns Hopkins University. At this time much bias and discrimination existed against women in the sciences. Most people believed that women were not intellectually or physically capable of pursuing scientific careers. In the scientific professions, few if any women ever rose to positions of power.

Her difficult family situation, compounded with this discouraging atmosphere, had a negative impact on Carson's graduate career. As she began graduate school, the Depression had also just begun. Jobs and resources were scarce. Because of age or health problems, few of her family members could hold full-time jobs. At one point while a graduate student, Carson was financially responsible for five only partially able-bodied family members. To accommodate her outside employment, she was forced to drop to part-time student status. As a result, her research moved slowly as well. More and more, she found herself on the margins of academic life. Finally Carson was forced to acknowledge that she could not both go to graduate school and support her family. After finishing her thesis and receiving a master's degree, Carson gave up her dream of pursuing a doctorate and started looking for a job instead.

A SCIENTIST AND A WRITER

The gender bias against women in science followed Carson into employment. Luckily, however, given the dire economic climate, she did find a position.

She began working in 1936 as a science writer for the U.S. Bureau of Fisheries (later the U.S. Fish & Wildlife Service). Although trained to perform scientific research, Carson instead found herself editing and summarizing the research of others. At this time, it was not uncommon for female scientists to find themselves supporting the work of male scientists, rather than directly participating in or directing fieldwork or experimentation. However, the low-paying job did have some advantages. Carson had access to a vast realm of scientific literature, much of it unavailable to the general public. Later in her career as a writer, she would draw on the background and expertise provided by this job.

For over fifteen years Carson stayed with the Fish & Wildlife Service. To help supplement her income—she now supported a household that included her aging mother and two young nieces—Carson also began writing science articles for local, regional, and eventually national publications. In her day job, she also began to move into positions of more responsibility, coordinating researchers, artists, and writers on various publication projects. While the career paths for a non-research scientist in government employment were limited, Carson still found opportunities to develop her leadership abilities. In particular, she learned to balance the often different perspectives of creative and scientific people.

To the casual observer, Carson's gender, upbringing, employment, and to some extent her personal inclination—she often displayed the solitude-loving characteristics of a writer—would seem to have worked against her becoming a leader. In fact, her life simply demonstrated a less traditional route toward leadership. Early in life Carson assumed a guiding role within her family. Her mother took care of the home, and Carson became that home's primary connection with the outside world. Even within the somewhat constrained world of government employment, Carson developed many close friendships with other women in similar positions. Her most important connections were immediate, intimate, and supportive. She and her community of friends also learned to negotiate the hierarchical structure of the government bureaucracy that

employed them. From these experiences, Carson developed a canny sense of politics and power.

These years immersed in scientific literature also added new dimensions to Carson's sense of membership in a larger ecological community. Moreover, the Fish & Wildlife Service was the home of the conservation movement in the federal government. This movement, begun around the turn of the century and focused primarily on issues of land and game management and wilderness preservation, was the precursor to the environmental movement. From these conservation contacts, Carson gained an in-depth understanding of the nature advocates whom she would eventually inspire with *Silent Spring*. When she did take on a leadership role, it would not be to exercise power over the natural world, but to become an advocate on its behalf.

BECOMING A LEADER

Carson made her first impression on the public mind as a science and nature writer. After the success of her 1937 article "Undersea" in the *Atlantic Monthly*, she wrote *Under the Sea-Wind* (1941). However, the book was published only one month before the attack on Pearl Harbor. In the rush of America's entry into World War II, it quickly disappeared from sight. Disappointed, Carson decided to focus on writing articles. However, in part because of her dissatisfaction with her job, by 1948 she had begun conceiving her second book, a natural history of the earth's oceans. *The Sea Around Us* (1951) was an enormous success. It won the National Book Award, and by the end of 1951 had sold over 250,000 copies. Carson was able to quit her job at the Fish & Wildlife Service and become a full-time writer.

As a best-selling author, Carson began her first ventures into public speaking. Some of her favorite themes included the beauty and complexity of nature, as well as the respect that it deserves from humanity. She also discussed the dangers of science and technology, and the need for science to be accessible to all citizens, so that they might make informed decisions on the risks posed by industrialized society. As she told one audience in 1952, "Mankind has gone very far into an artificial world

Dorothy Freeman to Rachel Carson

This letter from her close friend Dorothy Freeman to Rachel Carson speaks to Carson's prominence and significance in the world in the 1960s.

May 15 [1963]
Darling [Rachel]

For I am denied the big things, the biggest of which would be to be with you in this triumphal hour. To see you last night (I am now writing at 6 A.M.) on the screen gave me a sense of frustration that I could not touch you! And how I should have enjoyed seeing you descend the curving stairs in the spotlight and hearing the applause. If you were a surprise to most of them, as you think, I can imagine what an impact it was—Rachel Carson!!! No wonder you couldn't hear the organ. But their tribute must have been sweet music.

Thank you for giving us the delightful details. It seemed like old times. For I have missed so much of the intimate events—just at a time when the events are Big Ones.

Well, I mustn't complain for I am so thrilled, so proud, so humble to know that I am near you in your thoughts during all these momentous happenings. And I am quite overcome knowing that I am so close to a national figure. I almost wish at times I had the old sense of awe I had when there was the abyss between that separated me from the famous author. But there isn't, and I think perhaps you are glad. Of course, you are still on a pedestal but that position is for what you've accomplished—my worship is for what you are, darling, in spite of all your fame.

A thought struck me last night, that suddenly the dear old Sea Around Us has been displaced. I never dreamed that it could ever happen—that now I think your game will rest on *Silent Spring*—when people talk about you they'll say "Oh yes, the author of *Silent Spring*," for I suppose there are people who never heard of *The Sea Around Us*, strange as that may seem to us, but surely, I doubt if there is a household in this country where your name is unknown. How could it be from "Peanuts" to "CBS Reports"—not to mention all the lawns which have become a major concern now—what to do for crabgrass because Rachel Carson says!

A mountain of love,
Dorothy

of his own creation. He has sought to insulate himself, in his cities of steel and concrete, from the realities of earth and water and the growing seed. Intoxicated with a sense of his own power, he seems to be going farther and farther into more experiments for the destruction of himself and his world" (quoted in Lear 1997, 221).

Indeed, this statement introduced one of the major

themes that would make Carson such an important intellectual leader for the contemporary environmental movement: the idea that man was wrong to try to dominate nature. Such efforts would only result in self-destruction, she held, since man too is a part of the environment. In her third book, *The Edge of the Sea* (1955), Carson emphasized the importance of humans gaining direct, immediate experience of the natural world. Such intimacy with nature, she believed, would make destroying the environment all but impossible.

SILENT SPRING

Carson originally intended her fourth book to focus on evolution, not pesticides. However, during the late 1950s, several events turned her attention toward these synthetic chemicals. Carson had first become interested in the environmental hazards of pesticides in the mid-1940s while working at Fish & Wildlife. After World War II, chemical manufacturers released the wartime chemical DDT (dichlorodiphenyl-trichloroethane) into domestic markets. Several wildlife biologists had expressed worries over DDT's impact on wildlife populations. Other scientists were concerned with its potential effects on human health. As the public and agribusi-

ness enthusiastically welcomed the chemical, however, such worries were pushed aside.

But a decade later the public mind, at least, had begun to change. Increasingly, the postwar environment seemed saturated with synthetic chemicals. These included food additives and various pollutants as well as pesticides. A group of Long Island residents sued their local government for an injunction

to prevent aerial spraying of their homes, farms, and livestock. Disturbing reports began to surface from the South, where the U. S. Department of Agriculture's aerial spraying campaign had wreaked devastation on wildlife and domestic animals. Grassroots anti-pesticide campaigns began to organize around the country.

Carson too found herself disturbed by environmental damage from pesticides. Originally she only meant to write an article on the topic, but could find no magazine to publish it. Thus the project evolved into a book. Beginning in 1957, Carson meant to write quickly, but instead *Silent Spring* took almost five years to complete. One reason was that the research fascinated and absorbed her. However, Carson suffered many health problems during this time as well. The most severe came in late 1960: a diagnosis of advanced breast cancer.

Finally published in 1962, the message of *Silent Spring* was alarming. As a scientist, Carson pointed to ecological principles to communicate the dangers of synthetic chemical pesticides. All living creatures, humans included, are made up of cells, she pointed out. All of them live embedded in habitats composed of air, water, soil, and plants. All depend on a fragile genetic code to perpetuate their communities. Pesticides disrupt and damage this fragile ecology. The long-term effects of pesticides on both wildlife and human health would prove the danger of man dominating, rather than accommodating, nature.

The reaction to *Silent Spring* was immediate, enormous, and widespread. The public was horrified; few had realized the dangers of the pesticides that permeated their everyday lives. The chemical and pesticide industries were outraged, countering that their products *saved* lives by increasing agricultural production and preventing the spread of epidemic disease. Other reactions were more mixed. Scientists split over whether Carson was right. The Department of the Interior rejoiced at the opportunity to mitigate the effects of these chemicals on wildlife, but the Department of Agriculture dug in its heels at any new attempts to regulate agricultural chemicals. Politicians called Senate hearings, where pesticide policy reform found itself deadlocked.

In the controversy over *Silent Spring*, a public

unnerved and alarmed by the potential long-term effects of pesticides—not only on their environment but on themselves—became Carson's followers. *Silent Spring* touched off a storm of debate that lasted long past Carson's 1964 death from breast cancer, barely eighteen months after the book's publication. Rachel Carson led a new way of thinking about the environment, one that launched a revolution in public opinion aimed at eliminating the hazards of industrial chemicals. Her example tells us that leadership not only comes from within organized groups, but also can come from the outside. Speaking truth to power—in this case, the entrenched powers of the agribusiness lobbies and government bureaucracies—is just as important as the exercise of power. Rachel Carson's leadership took the form of speaking up for nature.

CASTRO, FIDEL (b. 1926) Cuban leader

Fidel Castro has been the leader of Cuba since overthrowing the pro-U.S. dictator Fulgencio Batista in a Communist revolution in 1959. As a leader, Castro exudes the aura of being of the people, by the people, and for the people while suppressing, coaxing, or neutralizing by intimidation or by forced or encour-

A View of Fidel Castro in the Cuban–American Community

As the excerpt below indicates, Cuban-Americans still await the day when Fidel Castro's leadership comes to an end.

September is a time for Cuban commemorations of the patron saint. The story of Nuestra Señora de la Caridad, Our Lady of Mercy, is a Cuban myth of the Virgin Mary. According to one woman, the story goes that during colonial days when Cubans were struggling against the Spaniards, people began to leave the island. Three men, one freed black slave and two white men, got in a boat to leave. When they got out on the water, a hurricane struck and almost killed the men. They prayed and the sky opened up and the Virgin saved them, and kept them from leaving the island. She also saved all the Cuban people from death in the storm. The Virgin then went from the sea to the mountains, where the Cuban people built a Shrine for her.

The woman who told this myth was not only very involved with preparations for Cuban celebrations in Washington, but also very anti-communist. She had relatives remaining in Cuba who could not leave, and grieved for them. In recounting the tale of Nuestra Señora de la Caridad she laughed ruefully when she mentioned the mountains. The mountains in which the Virgin took refuge are the same mountains from which Castro came. She went on to say that there is an updated version of the story, but she does not know "whether it is true or not." It is said that the Virgin's shrine was stolen when Castro took over, and will be returned only when communism is overthrown on the island. Therefore, for Cuban exiles the Virgin is not only a religious figure, but a political one. She saved Cuba not only from a natural holocaust, but from Spanish rule, and will symbolize the return of "Cuban rule" when Castro leaves power. The updated version repeats the same dual importance of the patron saint.

aged exile any viable opposition to his decades-long regime. Castro rules with charisma, bravery, tireless work, and ambition. He manipulates his subjects, international institutions such as the Catholic church and the United Nations, and foreign dignitaries such as Pope John Paul II and Jimmy Carter with brinkmanship (the art of pushing a dangerous situation to the limit of safety) toward the demonized United States and alliances with global powers such as the former Soviet Union. He also projects a populist appeal worldwide to a progressive audience who admires his revolutionary credentials. This global stature, especially in Latin America and in the devel-

oping world, confers upon Castro an aura of grandeur and invincibility at home and abroad.

Although from a middle-class background, Castro became a radical activist while studying law. In July 1953, he began leading violent attacks against Batista, whose oppressive, inept, and corrupt regime impoverished and disenfranchised most Cubans but received military and financial help from the United States. Castro demanded substantial reforms in political, agrarian, and economic policies, endearing him as a courageous, outspoken, and visionary leader to ordinary Cubans aspiring to liberty and affluence. The realization of Castro's agenda was practically impossible under Batista, under whose leadership Cuba was beholden to U.S. interests, as was the pattern since Cuban independence in 1903.

Initially unsuccessful in his agenda in an authoritarian police state, Castro was jailed but did not recant his ambitious goals. He fled to Mexico to reorganize. In December 1956, he returned to Cuba secretly with his brother, Raul, and the Argentine-born revolutionary Ernesto "Che" Guevara. Pursued by

the Batista regime but receiving support from Cuban exiles, especially in the United States, Castro based the troops he led in the countryside, intermittently attacking military targets. This tenacious guerrilla warfare was coupled with intensive recruiting of dedicated followers. Positioning himself as a national leader with a progressive agenda, Castro curried favor with wide groups in the population, in contrast with the oppressive conduct of Batista's "liquidation campaign," which was a brutal attempt by his regime to destroy Castro's forces through torture, murder, and destruction.

Castro toppled Batista in 1959, forcing him into

exile. Castro promised democracy and freedom—promises that he broke within months in favor of his own version of an authoritarian police state. Castro also gradually marginalized the old guard who had brought him to power, forcing insubordinate activists into exile, especially to the United States, thus securing that the most potent opposition would be based abroad and be tainted with its connection with U.S. power.

Castro displayed leadership through personal contact with an obedient public, enabled by orchestrated mass gatherings and long speeches castigating the United States while glorifying his own achievements. He revealed himself as Marxist through egalitarian economic and social policies. Castro survived by distributing lands to peasants, providing free access to education and free universal health care, nationalizing U.S.-owned property, and substituting Soviet aid for U.S. markets. Castro trampled any opposition through strict control over the media and the political system, coupled with imprisonment and his ultimate safety net of forcing his opponents into exile.

Castro denounced U.S. policies and personally insulted President Dwight D. Eisenhower. Castro also demanded the return of control of Guantanamo Bay naval base (established by the United States after the Spanish-American War of 1898), and as a result the Eisenhower Administration, in one of its last acts before JFK became president, severed diplomatic relations in January 1961. After the failed invasion of Cuba by U.S.-trained Cuban exiles at the Bay of Pigs in April 1962, Castro used this victory to consolidate his control over all matters of state, legitimizing oppression of any dissent through fears of a supposedly impending U.S. invasion. He also convinced the Soviets that using Cuba's close proximity to Florida would improve Soviet leverage against the United States, provoking the October 1962 missile crisis between the United States and the Soviet Union. Whereas the Soviets had to withdraw their nuclear weapons from Cuba, Castro emerged as a world-class leader who could stand up to a superpower and be treated with respect.

Castro used his new prestige to increase the power of the Cuban armed forces—which are totally

dependent on his regime and commanded by his brother, Raul—as the custodian of the revolutionary spirit in his nation and as a major employer of young people. A larger army, financed, trained, and equipped primarily with Soviet aid, became the backbone of Castro's governance structure, helping Castro to strengthen his image as a competent, indomitable warrior.

The military and logistical services that Cuban troops performed as agents of incursion for the Soviet Union in Africa, however, diminished Castro's claim to be independent in the 1970s. He was able to leverage this challenge to his political potency at home by enhancing domestic social, educational, and medical services while cultivating regional revolutionaries in places such as Nicaragua in Central America and Grenada in the Caribbean. In addition, when internal pressures for more freedoms grew, Castro in 1980 both encouraged and forced dissidents (and criminals) to flee Cuba from the port city of Muriel.

As the Communist bloc collapsed in the 1980s and 1990s and as the Cuban economy shrank considerably, Castro increased his nationalistic tone—primarily anti-American—and improved relations with the Catholic church to counter the demise of his ideological doctrine. Castro legalized the use of the U.S. dollar in 1993 to encourage tourism and to facilitate contributions from exiled Cuban-Americans to their impoverished brethren, enhancing his own stature as a caring father to his struggling nation. His regime enacted laws that protected foreign investments from nationalization. He also allowed direct elections to the provincial and national assemblies of popular power while refusing to lessen the monopoly of power that the Communist Party has enjoyed in Cuba, with its consequent control of public life and total loyalty to his leadership.

🌐 CHANEL, COCO (1883–1971)

French fashion designer

A pioneer in women's fashion, Gabrielle "Coco" Chanel founded a business empire in the early twentieth century, leading women away from impractical clothing to designs that emphasized comfort and functionality as well as high style.

Born into poverty in the French town of Saumur in central France, Chanel learned to sew while attending a local convent school. In 1902, she took her first job as a dressmaker; she became a milliner around 1908. Chanel's simply trimmed hats were a sharp contrast to the extravagant styles prevalent in the first years of the century. Fascinated by her unconventional approach to fashion, society women joined actresses and courtesans as customers of the rising designer. In 1910, Chanel opened her first shop, Chanel Modes, in Deauville, France. Her lease prevented her from competing with another dress-

Coco Chanel at 79.

making shop, but the women who bought Chanel hats admired the dresses worn by the milliner and requested copies. Sometime around 1910, Chanel also began selling clothing.

RISE OF THE HOUSE OF CHANEL

Although Chanel's artistry is indisputable, much of her success can be credited to timing. With the arrival in 1914 of World War I, conspicuous consumption suddenly became in extremely poor taste, and women pared down their attire. The many women who labored in support of the war effort sought versatile yet elegant clothing, and Chanel's designs satisfied these new dressing requirements by focusing on loose-fitting styles. She often favored masculine styles, elements of which were to survive even into her formal collections, in particular the small boater-shaped hats, neat collars, and shirt cuffs fastened with cuff links. Sleeves became a career-long obsession as the couturier constantly sought a design that would allow movement without distorting the line of the garment. By 1917, her loose sweater with a sailor collar and long, easy line had become a general fashion.

A shrewd marketer, Chanel anticipated the popularity of sportswear for outdoor living. During the war, she visited Biarritz, a fashionable resort in southwestern France that catered to the idle rich fleeing the ravages of war. Realizing that these moneyed refugees still wanted luxury in their lives, Chanel marketed her designs to them. War shortages in materials such as serge forced the couturier to use knitted jersey as a replacement, but she soon made it into a high-fashion item. Knitted jersey eventually became such a Chanel favorite (because of its comfort and shape) that the fashion magazine *Vogue* nicknamed her couture business "The Jersey House." Many of her later wool and cotton jersey fabrics were enhanced with silk to provide additional luster for added luxury.

CELEBRITY MARKETING

By the 1920s, Chanel had become a celebrity with much-copied designs. While she never sold cheap

goods, she did believe that her success depended in large part upon the dissemination of her styles. Her use of inexpensive textiles such as jersey and the minimal amounts of cloth her styles required reduced the cost of duplication for the ready-to-wear market, while the loose shapes of her suits and dresses overcame sizing problems in manufacture.

To increase sales, Chanel exploited her personal celebrity status by using look-alike models in advertisements and cultivating an air of mystique. She also became the first designer to capitalize on her fame by marketing a perfume, Chanel No. 5, which launched in 1921 in a modernist bottle designed by Chanel herself. The simple name and bottle represented another break from tradition by moving away from the exotic titles and decorative flacons that had characterized perfume in the years before the war. To sell the perfume, Chanel sprayed samples in her fitting rooms, told her clients that only a small amount had been made up as gifts, and asked them if they thought it would sell. With a personal stake in the success of the perfume as a result of Chanel taking them into her confidence, these socialites helped promote Chanel's new luxury good and made it into an immediate success.

FASHION INNOVATIONS

An innovative leader, Chanel saw her business boom in the 1920s. In 1924, she branched into costume jewelry and became the first designer to gain social acceptance for these adornments. Pearls were a particular Chanel favorite, with her workshops producing masses of fake beads that defied nature in size and color. In 1926 Chanel introduced the "little black dress" that would eventually become a staple of women's wardrobes. While black had always been a popular choice for evening wear, Chanel became the first to exploit the elegance and flattering qualities of the color with fabrics such as satin and silk velvet. She broke taboos by designing and wearing two-tone shoes and loose sailor-style trousers that ended above the ankle. The dramatic use of a combination of black and white in shoes as well as clothes became a Chanel trademark.

Chanel notoriously paid her workers little and

It's amazing how many cares disappear when you decide not to be something, but to be someone.

—Coco Chanel

gained a reputation as an irascible and autocratic leader. Chanel leadership as a couturier led her into manufacturing. Many of the designers of this era endorsed products and designed textiles for manufacture as a means of gaining additional publicity and revenue. In 1928 Chanel opened her own factory, Tricots Chanel, in Asnières, northwest of Paris, to control production of her products better. The couturier would choose materials, explain her ideas to staff members, and then rely upon them to monitor production. She never drew designs but created them on a model, in the manner of a tailor. In 1930 she employed 2,400 workers in her factory and workrooms, with this number rising to 4,000 by the end of 1935.

Although Chanel had sold clothing during World War I, she closed her shop three weeks after the start of World War II in 1939 with the declaration that this was not a time for fashion. She continued to sell perfume and remained in Paris throughout the conflict. In 1953, Chanel reopened her business in an effort to help the sales of her perfume in a highly competitive marketplace. Her multicolored tweed suits in pastels as well as beige and white became favorites of society notables. On 10 January 1971, Chanel died in Paris.

A groundbreaking designer who combined elegance with ease of movement, Chanel changed the look of twentieth-century women's wear through shrewd marketing and an ability to capitalize on emerging needs.

CHANGE MANAGEMENT

People often say that the only thing in life that people can be certain of is change. The last half of the twentieth century brought great changes to organizations and organizational leadership. The initiation of total quality improvement programs (efforts designed to decrease production errors and waste or to improve services), the impact of globalization, changing demographics and worker values, a greater emphasis on participative and higher employee involvement strategies, new information, and manufacturing technology were just a few of the trends that caused organizations to focus on change management, which is the practices, models, and theories that leaders use to help individuals and groups adapt to changes in their environment.

DEVELOPMENT OF CHANGE MANAGEMENT THEORIES

Kurt Lewin, a German sociologist, played a major role in shaping thinking about leadership and change management. Lewin was one of the first to describe organizational change processes in terms of a three-stage model of unfreezing, changing, and refreezing. Unfreezing can be understood as those processes designed to break up the status quo. Changing is the transition process from the old state to a new state. Refreezing is cementing the new changes in place, creating a new state of equilibrium. In addition, Lewin noted the presence of driving and restraining forces in relation to change (1951). Driving forces are those forces that support change, and restraining forces are barriers that inhibit the acceptance of change. Although his simple typology (classification) has been criticized since the 1990s as being inadequate to accommodate the rapid pace of change in the current environment, it has shaped the landscape of change management theories and practices. It has provided the backdrop against which future

change management theories are reflected and measured. As the pace of technological and organizational change quickened in the last three decades of the twentieth century, a variety of conceptual models appeared. Among these might be termed the “organic models,” “the organizational stage models,” and the “interactionist models.” These models have likely reflected the disciplinary background of their proponents.

Organic Models

An emerging approach uses natural phenomena as metaphors for understanding how organizational change takes place. This approach has come in various forms, but it is based on how decay, growth, and adaptation take place in the physical and biological worlds. This approach can be seen in the work of Erich Jantsch, who examined the connection between biological concepts and their link to socio-cultural levels (1980). A related approach was used by Margaret Wheatley (1992), Lawrence G. Hrebiniak and William F. Joyce, which applied variations of evolutionary concepts to organizational life (1985). What have these models contributed? First, they have emphasized the complexity of change processes and the impact of interrelated systems. Second, they have served as metaphors or images to help leaders approach change management processes. For example, to entertain the notion that an organization or an industry might have a self-organizing capacity or to understand how cellular matter transforms itself by activities at the outer boundaries of the cell structure might influence how a leader approaches the change management process within an organization. This approach has also led to the introduction of complexity theory, as illustrated by Ralph D. Stacy (1995). Complexity theory emphasizes an open systems approach to thinking and focuses on the complexity of interaction between system components.

Organizational Stage Models

Change management has also been linked to organizational life-cycle models (Van De Ven & Poole, 1990). Organizational life-cycle models focus on

whether products and services are toward the beginning or end of the development cycle—close to discovery and introduction or closer to maturity and obsolescence. These models were exemplified by organizational behavior theorists in the late 1960s using organizational phase concepts, such as that developed by Larry Greiner (1967). Greiner's research was focused on distinguishing between successful and unsuccessful responses to change and identifying different phases that an organization goes through depending on whether the change is being reacted to or initiated by leaders. The selection of change management strategies and approaches may also be determined by an organization's position on the growth or decline curve, as noted previously. Additionally, organizational stage models have focused on the internal capacity of the organization to transform itself. Attention is directed to the interpersonal, group, and organizational processes needed to create adaptive responses in the organization. External environmental forces are taken into account but less so than in interactionist models.

Interactionist Models

This model focuses on the interaction between the environment and the organization. Change management strategies are selected on the basis of the particular competitive challenges faced, the specific technological innovations being introduced or phased out, and the nature of the strategic choices being considered. These are exemplified in the readings put together by organizational behaviorists Michael Tushman and Philip Anderson (1997). Change management strategies may vary depending on the variables identified. Paul Strebler, an organizational management theorist, outlines different strategies depending on the nature of the change and the internal resources available to the organization. For example, an organization facing an anticipated large-scale technological change but having a nonsupportive employee base might select a strategy of restructuring instead of an alternative approach such as grassroots experimentation, those experiments undertaken at the lowest staff levels within organizations. Strebler contends that the key variables are the

strength and intensity of the change forces (such as external environmental or technological forces) and the state of support or resistance within the organization (1997).

CHARACTERIZING CHANGE FORCES

As change management theories have evolved, greater emphasis has been placed on an analysis and characterization of change forces themselves. Understanding the nature of change forces faced influences the approach taken to manage change from a leadership perspective. Theorists and practitioners have used three approaches to create a change force map: a technical versus adaptive approach, a systems approach, and an incremental versus discontinuous changes approach.

Technical versus Adaptive Approach

In this approach, organizational theorists Ron Heifetz and Donald Laurie draw a distinction between problems that are technical and changes that are adaptive (1997). Technical problems in organizations may be solved by more traditional leadership approaches. An example of a technical problem is the need of an organization to design a new product delivery system for an existing product. An example of an adaptive problem is the need to design a completely new product because consumer needs have changed. Different leadership approaches may be called for in each situation. An interesting observation made by Heifetz and Laurie is that in most organizations, people look to leaders to be more technical problem solvers.

Systems Approach

This approach has been drawn from the work of organizational behavior and systems thinkers Chris Argyris and Peter Senge. Argyris focused on the difference between single- and double-loop learning (1994). Single-loop learning refers to efforts aimed more at solving a specific problem rather than at understanding the root causes and contexts for what created the problems in the first place. The latter is

more characteristic of double-loop learning, which aims at changing the system so similar problems don't occur in the future. Senge developed broad organizational learning strategies and the explanation of archetypal patterns in organizations (1990). In this approach the distinction is not so much between technical and adaptive change forces as between the degree of new learning required to approach the change force and the interconnection of organizational problems and solutions. Although these terms originated with the development of organizational learning and systems thinking, they are relevant to the management of change. Whereas the technical-versus-adaptive approach focuses on the nature of the challenge faced, the systems approach focuses on the interdependency of all organizational actions.

Incremental versus Discontinuous Approach

This approach focuses on the pace and intensity of changes and the resulting impact on organizations. Every organization faces some kind of change management issue. A static organization will soon be a dead organization. However, there is a fundamental difference between change management strategies utilized when an organization is fine-tuning practices to deal with smaller, incremental changes and having to respond to change forces that have a short but intense duration. The pace of change accelerated exponentially in the last half of the twentieth century. This is why critics have suggested that Lewin's three-stage model is no longer adequate to deal with contemporary issues, namely because there is no time for a refreezing process to occur. Organizations, faced with discontinuous change, are in a permanent state of transition.

RESOURCES AND MODELS

Two types of resources are generally available to leaders. The first type is numerous case studies (Tushman & Anderson 1997; Jick & Peiperl 2003). These case studies allow people to observe the actual change management issues either facing or having been faced by numerous organizations. The

second type of resource focuses on organizational change management processes and models. This type of resource is typified by the work of organizational management and behavior theorists John Kotter (1996), Jay Conger, Gretchen Spreitzer, and Ed Lawler (1996) and by Conger, Spreitzer, and Lawler (1999).

Practical change management models cluster in three general areas: general adaptation and learning, transitional management skills, and organizational diagnosis and cultural development models.

The *general adaptation and learning model* focuses on increasing the general adaptation and response capabilities of individuals within organizations (Senge, 1990; Tichy & Devanna, 1986). The theory behind this model is that change occurs at such a rapid rate and in such unpredictable ways that individuals simply have to acquire the ability to be more agile in both spotting key changes and responding quickly and appropriately to these changes. When individuals master this ability, the specific nature of the changes faced is less critical.

The *transitional management skills model* focuses on how leaders may help their organizations deal with transitions (Bridges, 1991; Beckhard & Harris, 1987). In many respects this is an interpersonal relationship model. The focus is on facilitating individuals through the adjustment processes that change inflicts. Models also focus on changing power and political relationships during change processes (Oshry, 2003). In some ways the criticism directed at Lewin might also be directed at practitioners and theorists of this model because a turbulent environment may leave people in a constant state of transition. However, even in a turbulent environment, transitional management skills may be valuable.

The *organizational diagnosis and cultural development model* is represented by the work of Kotter, Tushman, and Nadler. In this model organizational leaders assess the fit between such elements as organizational structure, nature of the technology, composition of the workforce, communication systems, and organizational policies and procedures. The key to successful change management under this model is to identify incongruities and points of tension

between aspects of organization design. Those incongruities can emerge either as internal conflicts that will impede successful adaptation or as conflicts between the current state of alignment and the changes required from the external environment.

These three models may be used in combination with each other. However, organizations have finite resources to assist them in managing change, and the choice of one model or another will influence the end results. Organizational outcomes will vary depending on the model or models selected.

CHANGE MANAGEMENT LEADERSHIP SKILLS

An abundance of material is available on the skills of leaders. What student of management has not been exposed to profiles of individuals such as former General Electric CEO Jack Welch, Southwest Airlines co-founder Herb Kelleher, civil rights leader Martin Luther King Jr., and countless other women and men in leadership positions? The personal change management skills of individual leaders are an important variable in the change management process. These skills may include building a vision, networking, communicating powerfully, identifying and dealing with differences, creating leverage to motivate people, and conceptualizing alternative strategic paths.

Change management is a complex process. The future of many organizations in today's environment will depend on the organizations' ability to recognize change forces and respond adaptively to opportunities. The leading organizations will likely be the ones that can capture the knowledge that they gain from addressing each successive change and anticipating what different approaches might be required in the future.

CHARISMA

Charisma is the special quality some people possess that allows them to relate to and inspire others at a deep emotional level. Persons possessing charisma tend to be attractive to others, to be influential and inspirational, and to be characterized as brilliant and effective communicators. Although charisma has been widely discussed in sociology, psychology, political science, communication, and other disciplines, it is a very elusive construct, and has been defined in a number of ways. Currently, there is no generally agreed-on definition of charisma.

Although there are many definitions of charisma, people tend to agree on famous historical figures who possessed charisma, and on those who did not. Yet just as definitions of charisma differ, some of these well-known charismatic figures do not appear to have much in common—except for the great impact they have had on others. For example, commonly mentioned charismatic heads of state include India's Mohandas Gandhi; Israel's Golda Meir, the U.S. presidents Franklin Delano Roosevelt, John F. Kennedy, and Ronald Reagan; Great Britain's Winston Churchill; and China's Mao Zedong. The list also includes infamous individuals such as Germany's Adolf Hitler, Russia's Rasputin, the terrorist leader Osama bin Laden, and leaders of various cults and religious movements, such as Jim Jones, the instigator of the 1978 mass suicide at Jonestown, Guyana.

Originally used in a religious context, charisma can mean “a divine gift of grace,” and the term has connections to so-called charismatic religious movements. However, the majority of researchers of charisma do not believe that it is an inherited or inborn quality. Rather, charisma is believed to be a constellation of personal characteristics that enable an individual to have impact on others by inspiring them, influencing them, and affecting their feelings, emotions, and behaviors. Since its beginning, charisma has been closely associated with certain types of leaders.

THEORIES OF CHARISMA

The earliest mention of charisma occurs in religious writings. Religious prophets and leaders such as

Moses, Buddha, Jesus, and Mohammed were believed to possess special characteristics that captivated and inspired followers. Most often, these characteristics included divine or magical powers, including the power to heal, perform other miracles, and foresee the future.

Social-science interest in charisma began when the German sociologist Max Weber (1864–1920) examined what he termed “charismatic authority.” For Weber, charismatic individuals possess an extraordinary quality that captivates others, but it is in the relationship between the leader's qualities and the followers' devotion to the leader and belief in the leader's cause that charisma lies. This notion that the leader-follower relationship is the key to charisma permeates many of the modern theories of charismatic leadership. Weber also believed that the leadership context was important, with charismatic leaders more likely to emerge during times of crisis and social upheaval.

The psychoanalytic theory of charisma also tends to emphasize the role of the follower in charisma and charismatic leadership. According to the psychoanalytic theory, followers idolize a chosen individual in much the same way that a young child idolizes a parent, imbuing the charismatic individual with great qualities and projecting their own needs onto an individual whom they perceive as able to satisfy those needs. In addition, however, psychoanalytic theorists note certain characteristics that accompany charisma, qualities such as physical attractiveness, an air of mystery, or something such as a physical flaw, a foreign accent, or a striking birthmark that draws attention to the person. According to the psychoanalytic model, the charismatic leader, through the use of authority and capitalizing on the followers' strong identification with the leader, induces the followers' unquestioning devotion and allegiance.

More recent psychological theories of charisma focus primarily on the personal qualities of charismatic individuals (as opposed to charismatic leaders). This approach focuses on the role that emotional communication and social skills play in determining an individual's personal charisma. Charisma is defined as a combination of highly developed communication skills, including skills in

emotional communication, verbal communication, and social role-playing. In these theories, perhaps most important to perceptions of charisma is emotional expressiveness—the ability to convey feelings and emotions accurately and effectively to others. Charismatic individuals use their emotional expressiveness to arouse and inspire others and to spur them to action. It is also this spontaneous emotional expressiveness that causes people to describe charismatic individuals as animated, emotionally charged, and full of life. However, emotional expressiveness is only the most visible component of charisma, for truly charismatic individuals are also skilled at reading the emotions of others and at regulating or controlling their emotional communications (in other words, charismatic persons are skilled emotional actors). For example, when speaking before a crowd of followers, a charismatic leader can successfully read the crowd's reactions and determine if they are accepting or rejecting the message. The charismatic leader can then alter the message, or the emotional tone, in order to manipulate the crowd's reaction. These emotional skills are components of the larger construct of emotional intelligence. In addition to these emotional skills, personal charisma also includes speaking skill (eloquence), the ability to engage others in conversation, knowledge of social rules and customs, and the ability to adopt various important social roles, such as the leadership role. Personal charisma, then, is a constellation of a number of highly developed communication and interpersonal skills.

Although these theories of charisma are different from one another, there are certain common themes: the charismatic individual's ability to attract attention, to communicate effectively, and to affect followers at an emotional level. This ability to attract attention and arouse emotions elicits followers' strong devotion to charismatic leaders.

SIX CHARACTERISTICS ASSOCIATED WITH CHARISMA

Independent of any particular theory of charisma, a review of the empirical research on charisma from its roots to the present day suggests that there are seven

characteristics that are most often associated with charismatic persons. Individuals with charisma are emotionally expressive, enthusiastic, driven, eloquent, visionary, self-confident, and responsive to others.

As mentioned earlier, charismatic individuals use emotional expressiveness to arouse, inspire, or motivate others. Emotional expressiveness is perhaps the most recognizable characteristic of the charismatic person. Research has demonstrated that emotionally expressive persons are evaluated more favorably in initial encounters, that they have more friends and acquaintances than unexpressive individuals, and that they receive more support from others.

Clearly the most successful charismatic leaders are those who are motivated, possess high levels of energy, and are committed to a cause. Enthusiasm and drive work together with the charismatic leader's emotional expressiveness to spur followers to action and keep them loyal.

Almost without exception, charismatic individuals are effective verbal communicators. In addition to being eloquent, gifted speakers, people with charisma are good conversationalists—they are able to initiate conversations with strangers, make meaningful contributions to discussions, and keep the conversation going.

Charismatic leaders are most often described as visionary, but this aspect of charisma is most effective when combined with some of the other characteristics. For example, a charismatic individual may have a clear vision of where he or she wants to go, but without the ability to articulate that vision (eloquence) and the ability to infuse it with emotion and energy (emotional expressiveness; enthusiasm), the charismatic leader will not be able to convey the vision to followers appropriately and effectively.

Charismatic individuals are self-confident. This is likely a result of being skilled communicators and being effective and influential in social situations, qualities that lead to a form of social competence, or social intelligence, that allows the charismatic individual to feel confident and efficacious in a variety of social situations.

Finally, charismatic individuals are responsive to others. Because they are skilled emotional communicators, charismatic persons can easily read the feel-

Charisma and *Tsav* in a West African Society

Charisma is a difficult concept to apply to real people in real world situations. It become even murkier when we attempt to use in non-Western cultures. The following text discusses the concept of *tsav* in the Tiv society of Nigeria. *Tsav* involves some of the elements commonly lumped under charisma but also some different ones.

None of the literature translates the word *tsav*. We find that we can best explain *tsav* to non-Tiv speakers by examining it in connection with the range of meaning of four English words, none of which is alone an adequate translation: (1) witchcraft substance, (2) power, (3) talent, and (4) ability.

Tsav is a substance which grows on the heart of human beings and of some animals. Akiga says that it looks like the liver, only much smaller, and that it is of two kinds: one kind which is rounded at the edges and is the good kind, and the other which is notched at the edges and is the bad kind, made bad by a diet of human flesh. Our informants add that *tsav* may be of three colours: red, black, and white (the worst shows a mixture of colours); and that *tsav* grows claws in the last stages of degradation.

Tsav can be either good or bad. East stressed the fact that *tsav* itself is of a neutral character, because there is no real distinction between good and bad *tsav*, save these surface characteristics of the substance itself. We would agree that *tsav* encompasses both good and bad, but to say that it is neutral is misleading. *Tsav* is a positive not a neutral force, but it is a supra-moral one.

Tsav may thus be regarded as a witchcraft substance, since it is a physical attribute of the human body which endows its possessor with certain potentialities. As is usually the case where the potentiality for witchcraft is believed to adhere to such a substance, its possessor may be unaware of it and (as in the case of great physical strength) it may lend his actions a greater force than he consciously intended. The phrase is an inadequate translation mainly because, although no one not

possessed of the substance can become a witch, the potentialities given by the substance *tsav* stretch far beyond the field of witchcraft.

Power, particularly personal power (charisma), is a good translation of some aspects of *tsav*. In some of its aspects *tsav* is very like *mana* or *wakanda*. That aspect of personality which enables a man to dominate a situation, to turn events the way he wishes them to go, to command obedience and attract loyalty—be it through charm, persuasion, bullying, or whatever means—is evidence of *tsav*. *Tsav* then gives power over other people and, in a furiously egalitarian society like that of the Tiv, such power sets a man apart; it is distrusted, for Tiv believe firmly that no one can rise above his fellows except at their expense. Furthermore, *tsav* in this sense of power can be kept at bay only by greater *tsav*. Thus all old people, by definition, have *tsav*; if they did not, they would have succumbed to the *tsav* of someone else at an earlier age.

Tsav means talent. Any man who is particularly good with his hands, or who can perform any technological process better than the average man, has *tsav*. His possession of *tsav* is proved by his talent for carving, weaving, farming, or lovemaking. Jealousy thus often leads to accusations of *tsav*. Talent is something which is present in some people at birth, but must be developed: so with *tsav*. It may develop slowly, as the man's personality develops, without apparent or sudden loss to his neighbours. But it may be developed by a diet of human flesh, which causes the substance *tsav* to grow with abnormal rapidity and thus to form serrated edges or claws. Taken as a parable, this belief refers to people of small talent who get ahead by misuse of the substance of others; there are, of course, other levels at which interpretations can be made.

The word ability in English comes nearer than either talent or power, for it tends to imply both. There are also obsolescent meanings of the word ability referring to wealth or affluence which should be recalled here. For Tiv, to have *tsav*

Source: Bohannon, Laura, & Bohannon, Paul. (1953). *The Tiv of Central Nigeria*. London: International African Institute, pp. 84–85.

ings, emotions, and attitudes of others. It is this ability to be responsive to followers' needs and desires that helps form the strong bond between charismatic leaders and followers.

CHARISMA AND SOCIAL EFFECTIVENESS

As might be expected, because of their emotional expressiveness, their high levels of energy, their

eloquence, and their social self-confidence, charismatic individuals tend to make very positive first impressions. Moreover, charismatic individuals tend to be judged more physically attractive than their noncharismatic counterparts, not so much because of any static physical characteristics of beauty but because their high levels of energy and emotional expressiveness create a sort of dynamic attractiveness.

means to have ability in all these senses: to have talent, leadership, and affluence. Such a "man of ability" has many wives and children, large farms which provide him with large harvest; he attracts many people; game falls into his nets and fish into his traps; through his power (given by tsav) of manipulating kombo he can promote the health and fertility of those under his protection and through his tsav he can ward off the attacks of their enemies. The meanness, selfishness, or misuse of his ability would, however, be immediately fought by tsav—be it the combined tsav of the tiv or that of some single individual. The duration and degree of his prosperity and ability would then demonstrate his tsav to be the greater.

Above all, tsav is mystically dangerous (bo), and this aspect is undoubtedly its most vivid one. Tsav is witchcraft substance, though possession of tsav does not necessarily indicate a witch. Only a man with tsav can bewitch (tambe) another; only a man with tsav can send evil omens, including dreams (both are called mnyam); only a man with tsav can make poisons effective to kill a man. Tsav renders both good and evil effective. That tsav will be used for evil purpose—at least sometimes—is confirmed by Tiv beliefs in human nature and human relationships. In itself, tsav merely endows a man with great potentialities; but it is the man himself who directs and controls these potentialities. In Tiv belief any sane man chooses to benefit "his own"; a good man extends the connotation of "his own" through a wide range of kinsmen. Nevertheless, every benefit to "his own" is matched by someone's loss, and even "his own" are never sure that sometime it might not be theirs. A man of probity may never have taken anything from his kith and kin. Yet a man of ability has more wealth than his neighbours and more influence than his peers. One cannot make something out of nothing; he must have got this somewhere; therefore, he did get it from his kith and kin, if not by daylight then "by night," that is, by witchcraft.

In addition to the charismatic person's personal appeal, there is some research evidence that charismatic individuals appear more credible. For example, in studies of ability to successfully deceive, it was found that charismatic individuals tended to be judged as more honest or credible, regardless of whether they were lying or telling the truth. Further analyses suggested that charismatic individuals' verbal fluency, emotional expressiveness, and other-

oriented behavior, such as greater eye contact, outward gestures focused toward the audience, and the use of inclusive pronouns ("we," "our"), coupled with an absence of stereotypic nervous cues (for example, head scratching, shifting posture and eyes), led to their being judged more credible and honest.

As one might imagine, charismatic individuals are unlikely to characterize themselves as lonely, shy, or socially anxious. Charismatic individuals tend to have large social networks, to be successful in school and in work, and to describe their social lives and lives in general as satisfying. There is also some evidence that charismatic individuals are better able to cope with the stresses of everyday life because they can more easily rely on their large, supportive network of friends to help them deal with stress and challenges.

CHARISMA AND LEADERSHIP

Charisma is obviously a core component of both charismatic and transformational leadership theories, as well as being implicated in other leadership theories. It is important to note, however, that personal charisma does not guarantee that one will be capable of charismatic leadership.

Most theories of charismatic leadership view it as an interaction between the leader's personal charisma, the followers' reactions to the charismatic leader, and situational characteristics. The followers' relationship to the leader is also important; when all these elements interact well, then charismatic leadership can develop. Specifically, to be successful, the charismatic leader needs to have loyal and devoted followers, but certain situational characteristics, such as a time of crisis or situational stagnation (a situation that is ripe for change), tend to be more conducive to charismatic leadership.

Very little research has been done on the possibility of increasing personal charisma, despite the fact that there is an entire industry devoted to increasing the appeal and charisma of political leaders (and just about anyone else). Theoretically it should be possible to train a person to be more charismatic, given that many of the components of charisma, such as communication skills, self-confidence, and appear-

Charisma becomes the undoing of leaders. It makes them inflexible, convinced of their own infallibility, unable to change.

—Peter F. Drucker

ing enthusiastic, can be developed. The success of certain leadership programs is likely due to the fact that the training emphasizes developing communication and interactional skills.

A dissertation project conducted at the University of California, Riverside, focused on improving participants' verbal and nonverbal communication skills as a means of increasing personal charisma. Ratings of the participants made before and after their training suggested that trained individuals were more animated, more influential and persuasive, and more effective communicators following the training session. In addition, trained participants reported greater social self-confidence and reported receiving positive feedback from family and friends following their training.

THE FUTURE

The concept of charisma draws great popular attention. People are captivated by the notion of gifted, charismatic individuals who can arouse and inspire followers. Yet, charisma has been largely neglected as a serious topic of study by social scientists. Charisma, as opposed to charismatic leadership, has been both understudied and difficult to define. The most promising line of research has focused on the common, core characteristics possessed by persons identified as charismatic, particularly elements such as emotional expressiveness, communication skills, and an air of self-confidence. However, a great deal more work needs to be done before charisma is understood to the same degree as other personal qualities that are commonly associated with leadership.

—Ronald E. Riggio

CHARISMATIC THEORY

Certain leaders, such as Winston Churchill, Mohandas Gandhi, Martin Luther King, Jr., and Franklin Delano Roosevelt, inspired their followers to throw heart and soul into creating a better world. Other leaders led their followers down paths of destruction and disaster—perhaps the most notable being Adolf Hitler. Whatever history's judgment on their goals and the outcome of their efforts, these leaders all share the quality of charisma. Defined as a special power to attract and inspire followers through a compelling vision and perceptions of extraordinary capabilities, the phenomenon of

charisma is based in followers' perceptions, as described below.

The German sociologist Max Weber (1864–1920) was the first to apply the adjective *charismatic* to leaders. He posited three forms of authority in society (the traditional, the rational-legal, and the charismatic), with charismatic authority being based on people's collective perception that a given individual is extraordinary and therefore worthy of leading. In contrast to leaders whose authority derives from tradition or rules or elections, leaders whose authority derives from charisma are "set apart from ordinary men and . . . treated as endowed with . . . exceptional powers and qualities . . . [which] are not accessible to the ordinary person but are regarded as of divine origin or as exemplary" (Weber 1947, 358–359).

While Weber did not give a detailed explanation of the behaviors associated with this form of leadership, his writings do provide us with elements of the character and the course of charismatic leadership. Weber describes the condition under which it typically arises (distress), one requirement for its maintenance (success), its likely outcome over time (institutionalization), and some of the means by which charismatic leaders exercise their authority (powers of vision, speech, heroism). Because of Weber's sociological perspective, however, he largely overlooked the issues of personal attributes and relational dynamics between the leader and followers. Only later in the twentieth century did organizational theorists turn their attention to those particular gaps in our understanding.

THE DISTINGUISHING BEHAVIORS OF CHARISMATIC LEADERS

Most social psychological theories consider leadership to be a by-product of the interaction between members of a group. As members work together to attain group objectives, they begin to realize their status in the group as either a leader or a follower. This realization is based on observations of their relative influence within a group. The individual who exerts maximum influence is perceived to be playing the leadership role. That leadership is affirmed by group members' continuing interactions with and

deference to that person. In other words, leadership qualities are attributed to an individual on the basis of his or her influence.

Similarly, followers characterize a leader as either charismatic or not charismatic on the basis of his or her behavior. But what are the behavioral components responsible for such an attribution? What attributes are charismatic and what attributes are not? A simple process model of leadership allows us to highlight the distinctions.

To learn the distinguishing behaviors of charismatic leaders, we can examine how leaders approach and solve a problem. In the initial stage, the leader must evaluate the existing situation or status quo critically. Deficiencies in the status quo or poorly exploited opportunities in the environment lead to formulation of future goals. Before devising those goals, however, the leader must assess what resources are available and what constraints he or she faces. In addition, the leader must assess the inclinations, the abilities, the needs, and the level of satisfaction experienced by his or her followers. Having completed this evaluation, the leader formulates the goals. Finally, in stage three, the leader demonstrates how the goals can be achieved. As leaders move through these three stages, we can identify behavioral components unique to charismatic leaders.

Stage One: Sensitivity to the Environmental Context

We can distinguish charismatic leaders from non-charismatic leaders in stage one by their sensitivity to environmental constraints and by their heightened sensitivity to deficiencies and poorly exploited opportunities in the status quo. For this reason, we find that entrepreneurs are often charismatic leaders. Entrepreneurs are very critical of the status quo. They tend to be highly sensitive to the social and physical environments in which they operate. Charismatic leaders also tend to be highly sensitive to the abilities and the emotional needs of their followers—who are the most important resource for attaining the leaders' goals. This is especially true of leaders of social movements, such as Gandhi, Martin Luther King, and César Chávez. A non-charismatic leader is less likely to pay a great deal of attention to the short-

comings in their environment and to see these as platforms for action.

In the business context, a charismatic leader's increased sensitivity to deficiencies in the environment lets him or her perceive strategic opportunities. For example, a charismatic entrepreneur can see the retail potential of the Internet, as did Jeff Bezos, the founder of Amazon.com, the online bookstore that grew into an online department store. The charismatic business leader may also recognize internal organizational deficiencies and advocate radical internal change. During periods of relative tranquility, charismatic leaders often foster a need for change by actually creating the deficiencies or exaggerating existing minor ones. A non-charismatic leader, by comparison, is more likely to accept and work within the status quo—making improvements but not fundamentally challenging the system.

Because of their emphasis on deficiencies in the system and their high levels of intolerance for them, charismatic leaders always act as agents of innovative and radical change. The attribution of charisma is dependent not on the outcome of change but simply on the fact that the leader demands that action be taken to bring about that change.

Stage Two: The Future Vision

After assessing the environment, a leader will formulate goals for achieving the organization's objectives. Charismatic leaders can be distinguished from others by the nature of these goals and by the manner in which they articulate them. For example, charismatic leaders tend to aim for an idealized future. In stage two, it is their formulation of that idealized future vision, their ability to evoke it in the imagination of their followers, that sets them apart from other leaders. Steven Jobs, founder of Apple Computer, and Fred Smith, founder of Federal Express, are two examples of charismatic leaders who articulated compelling visions of a future filled with opportunity.

The more idealized or utopian the future goal advocated by the leader, the greater the discrepancy with the status quo, and the greater the discrepancy between the goal and the status quo, the more likely

followers are to attribute the leader with extraordinary vision. Moreover, by presenting a very discrepant and idealized goal to followers, a leader provides a sense of challenge and a motivating force for change. Psychologists have suggested that within a certain latitude of acceptance, the greater the discrepancy between reality and the goal, the greater the pressure on followers to shed their resistance and accept the advocated change. Since the idealized goal promises to meet followers' hopes and aspirations, it tends to be within this latitude of acceptance in spite of its extreme discrepancy. Leaders become charismatic as they succeed in winning followers' support for the advocated vision. They are charismatic when their vision is an idealized embodiment of a perspective shared by followers.

It is the fact that they can articulate a shared vision with the potential for satisfying followers' needs that make charismatic leaders so attractive. Furthermore, the fact that the vision is idealized (and therefore discrepant) makes the leader who champions it an admirable person in the eyes of the followers, one deserving of respect and worthy of identification and imitation.

To be charismatic, leaders not only need to have visions and plans for achieving them, they must also be able to articulate their visions and plans effectively so as to influence their followers. Here articulation involves two separate processes: articulation of the context and articulation of the leader's motivation for leading. Articulating the context involves explaining the nature of the status quo and its shortcomings, describing the vision of the future, and explaining how, when realized, the new reality will have eliminated existing deficiencies and fulfilled the hopes of followers. Finally, articulating the context means articulating the leader's plans for realizing the vision.

In articulating the context, the charismatic leader is careful to emphasize only the positive features of the future vision and only the negative features of the current status quo. The status quo is usually presented as unacceptable, while the vision is presented in clear, specific terms as the most attractive alternative and, though deeply challenging, attainable. The charismatic leader attempts to create among follow-

ers disenchantment or discontentment with the status quo, a strong identification with future goals, and a compelling desire to be led in the direction of the goal in spite of obstacles.

In articulating their motivation for leading, charismatic leaders are highly expressive. They convey strong conviction, emotions, self-confidence when communicating. They use colorful phrases and descriptions along with engaging gestures. As masters of rhetoric, charismatic leaders choose words that convey assertiveness, confidence, expertise, and concern for followers' needs. These same qualities may also be expressed through their dress (for example, Gandhi's dhoti, or loincloth, which conveyed simplicity and unity with the common people of India), their appearance, and their body language. Charismatic leaders' use of rhetoric, their high energy, persistence, unconventional and risky behavior, heroic deeds, and personal sacrifices all serve to articulate their high motivation and enthusiasm, which then become contagious among their followers.

Stage Three: Achieving the Vision

In the final stage of the leadership process, an effective leader inspires followers with confidence in his or her abilities and clearly demonstrates the tactics and behaviors required to achieve the shared goal. The charismatic leader does this by building trust through personal example and risk taking, and through unconventional or innovative expertise (for example, Steven Jobs's success with the personal computer in an era dominated by mainframe computers). It is critical that followers trust the leader's vision, otherwise they will not follow. Generally, leaders are perceived as trustworthy when they advocate their position in a disinterested manner and demonstrate a concern for followers' needs. However, in order to be charismatic, leaders must make these qualities appear extraordinary. They must transform their concern for followers' needs into a total dedication; they must engage in exemplary acts that are perceived as involving great personal risk—for example, the possible loss of personal finances, the possibility of being fired or (in a political context) jailed, and the potential loss of formal or infor-

mal status, power, authority, and credibility. The higher the manifest personal cost or sacrifice for the common goal, the greater is the trustworthiness of a leader. The more leaders are able to demonstrate that they are indefatigable workers prepared to champion the shared vision regardless of cost to themselves, the more they are perceived as charismatic.

Finally, charismatic leaders must appear to be knowledgeable and experts in their areas of influence. Some degree of demonstrated expertise, as reflected in successes in the past, may be a necessary condition for the attribution of charisma. For example, Steven Jobs's success with the Apple I personal computer and Lee Iacocca's responsibility for the Ford Mustang made them both more credible with employees at Apple Computer and Chrysler Corporation, respectively. First, charismatic leaders use their expertise to demonstrate the inadequacy of the traditional technology, rules, and regulations of the status quo. Then they use their expertise to devise effective but unconventional strategies and plans of action. We can say that leaders are perceived as charismatic when they expertly transcend the existing order through unconventional or countercultural means. For instance, Gandhi chose to use nonviolent actions to lead his revolution in sharp contrast to the conventions of a revolution using combat.

As hinted at above, the attribution of charisma to leaders also depends on followers' perceptions of their leaders as revolutionary or countercultural. The countercultural qualities of leaders are partly manifested in their discrepant idealized visions. But more important, charismatic leaders adopt unconventional, countercultural, and therefore innovative plans and strategies for achieving desired changes, and their exemplary acts of heroism involving personal risks or self-sacrifice are novel and unconventional. Their uncommon behavior, when successful, evokes in their followers emotional responses of surprise and admiration—and the attribution of charisma.

THE CHARISMA CONSTELLATION

Charismatic leadership is not a mysterious force. It is the product of a distinct collection of behaviors and activities on the part of the leader. While we have

identified many of the critical dimensions that distinguish this remarkable form of leadership, it is important to note that charismatic leadership is a constellation of behaviors. In other words, as a leader manifests a growing number of the behaviors described above, the likelihood of an attribution of charisma increases. Thus, a leader who is only skillful at detecting deficiencies in the status quo is less likely to be seen as charismatic than one who not only detects deficiencies but also formulates future visions, articulates them, and devises unconventional means for achieving them.

Besides the total number of manifested behavioral components, leaders may differ in the intensity or frequency (or both) with which they exhibit a given behavioral component. The greater the intensity or frequency of a behavior, the more likely it is to reflect charisma. Finally, certain behaviors are critical and effective sources of charisma in some organizational or cultural contexts, but not in others. For example, in some contexts, unconventionality may be less valued as an attribute of charisma than articulation skills, while in other contexts it may be more valued. For example, in highly individualistic organizations or societies, unconventionality might be more the norm and so would be less appealing. The constellation of behaviors and their relative importance as determinants of charisma will differ from one organization to another and from one culture to another.

CHARLEMAGNE (742–814)

First emperor of the Holy Roman Empire

Charlemagne (Charles the Great) is considered by many to be the “father of Europe.” His political, military and cultural leadership decisively reshaped the early medieval West, uniting most of Western Christendom, contributing to the preservation of the classical Latin heritage of learning, and laying the foundations for political developments for centuries to come. He must be counted among the most influential leaders in European history.

CHARLEMAGNE’S CAREER

Charles was the elder son of Pepin the Short, son of the Charles Martel who had famously defeated an Arab raid at Poitiers in 732. When Charles was born, Pepin held the position of Mayor of the Palace to the last Merovingian king, Childeric III. That real power rested with the descendants of Charles Martel was recognized by Pope Stephen III in 754 at Pepin’s request, and the Carolingians (from Carolus, Latin for “Charles”) assumed the full royal dignity. The child Charles and his younger brother Carloman accompanied their father on a number of military expeditions as they grew up, which served to prove their mettle to Pepin’s followers and to educate them in the ways of ruling.

Pepin died in 768, having arranged for his kingdom to be partitioned between his sons—the Franks did not practice primogeniture in this period. Ideally, the brothers would have cooperated in ruling their parts of the Frankish *regnum*, but Carloman showed signs of fractiousness, and Charles prepared for a struggle by winning the support of powerful friends

and relatives including his mother Bertha, daughter of the count of Laon. Fortunately for Charles and the kingdom, Carloman died in 771 and Charles assumed control of the entire realm.

Charles then embarked on the career of conquest and consolidation that would posthumously earn him the nickname “the Great.” Nearly forty years of campaigning brought large new areas under Frankish rule, with most of the gains coming before about 790, after which time the king engaged more in consolidation and suppression of rebellion than in new offensive actions. Appeals for protection from Pope Adrian led to war with the Lombard kingdom in northern Italy, and the peninsula to just south of Rome came under Frankish rule. Campaigns in the Pyrenees stabilized the frontier with Muslim Spain; it was during the return from one of these that a Basque ambush on the Frankish rearguard took place, an incident that became transformed into a heroic battle against the Moors immortalized in *The Song of Roland*. The conquest of Bavaria brought the Franks into contact with the Avars along the upper Danube. But the crown jewel in Charlemagne’s conquests was Saxony, a pagan territory in northern Germany that fell to persistent campaigning, including rare winter operations, and was finally pacified after Charlemagne’s forces subdued three major revolts. The conquests of Bavaria and Saxony together added significantly to the world of Roman-influenced Latin Christianity; it was during this period that the Catholic Church first became established in Germany. Charlemagne’s efforts were crowned, quite literally, on Christmas Day of 800 when Pope Leo III bestowed the title of Emperor of the Romans on him. Even the Byzantines, to whom that title had previously been reserved, had to acknowledge Charlemagne’s position as emperor in the West, for by this time he ruled virtually all western Europe outside Iberia and the British Isles. He died in January 814, leaving his Empire intact to his only son Louis.

CHARLEMAGNE AS A POLITICAL AND MILITARY LEADER

Charlemagne’s qualities as a leader may usefully be examined in two areas: his role as a political and mil-

itary leader (politics and military action being virtually inseparable in his time, especially for a secular king); and his role as a cultural leader.

To evaluate Charlemagne as a political and military leader, it is necessary to understand the context within which he operated. Since the height of the Roman Empire, the economy of western Europe had become underdeveloped and currency was in short supply. Communications were slow and difficult. Literacy was at a low ebb. Political power in these circumstances had become both fragmented and privatized—military power, especially, was concentrated in the personal retinues of important landowners, followings that constituted essentially private armies, though the king was recognized to have some call on the forces of his magnates. Building and holding together a large empire within the constraints these conditions imposed was a difficult task, and it speaks to Charlemagne's will and skill that he was able to consolidate the disparate factions.

He drew on a number of tools in forging a coherent kingdom. First, he looked the part, no small matter in an age when visual symbolism was crucial to the projection of a convincing image of power. He was tall (over six feet), well-built, and handsome, and is said to have taken good care of himself. Charlemagne's deliberate echoing of the Roman empire in his persona—as in the use of Roman titles at court and in official positions or through his portrayal on coinage—was imitated in the Latin of his biographers and court writers, creating a vivid but misleading picture of pervasive *Romanitas* that sometimes obscures to later eyes the less-than-Roman reality below.

Projecting the image and reality of his personal power beyond the confines of the royal court required that itineration be another of his tools of leadership. Charlemagne and his court traveled constantly to cement the personal relationships that were crucial to the political unity and stability of the kingdom, to impose his will directly on recalcitrant subjects, and not incidentally to make provisioning the court easier—moving people to the food gathered at scattered royal estates was easier than trying to transport food to the court. So despite his founding of a capital city at Aachen, Charlemagne ruled from

horseback. And *ruled* may, in this context, convey too strong a sense of the king's power. Given the independent military force available to powerful men, politics for Charlemagne was as much or more about persuasion and the creation of a common set of interests among the Frankish ruling class as it was about command and automatically obeyed authority. Although fear was one of the ways in which Charlemagne could persuade, friendship and generosity formed indispensable elements of the king's political calculus. Generosity took two major forms. One was the distribution of the spoils of war, which encouraged (though it did not determine) offensive campaigns—the Frankish empire was always going to be easier to build than to maintain in stasis for this reason. (But slow communications over a large empire eventually limited the scope of possible offensive action.) The other was rewarding his supporters and officials with land, which (unlike money) was in abundant supply. Finally, to make up for the lack of a bureaucracy created by the shortages of literate men and money, Charlemagne relied on the church as the only real source of administrative continuity and literacy in the Frankish realm. Here too friendship and cooperation were the keynotes, as Charlemagne's role as protector of the church clearly benefited both sides, though the king was apt at times to be a bit more imperious with church leaders, whose weapons for resisting the royal will were moral rather than military, than with his magnates. All these tools were harnessed to what must have been a clear idea of what he wanted to accomplish, though exactly how that idea was formulated in the king's mind is impossible to say, given the paucity and character of the sources we have for his life and thought and the dangers of teleology and anachronism that bedevil post hoc interpretation of what he did accomplish.

Thus, the king's physical presence, tirelessness, personal and political persuasiveness, and ability to improvise systems of administration from limited resources allowed him to create a large empire. Use of military force was central to this process, and the same qualities that made Charlemagne a successful political leader also contributed to his military victories. For Charlemagne seems not to have been a

Selection from Einhard's *The Life of Charlemagne*

Saxon War

At the conclusion of this struggle, the Saxon war, that seems to have been only laid aside for the time, was taken up again. No war ever undertaken by the Frank nation was carried on with such persistence and bitterness, or cost so much labor, because the Saxons, like almost all the tribes of Germany, were a fierce people, given to the worship of devils, and hostile to our religion, and did not consider it dishonorable to transgress and violate all law, human and divine. Then there were peculiar circumstances that tended to cause a breach of peace every day. Except in a few places, where large forests or mountain ridges intervened and made the bounds certain, the line between ourselves and the Saxons passed almost in its whole extent through an open country, so that there was no end to the murders, thefts and arsons on both sides. In this way the Franks became so embittered that they at last resolved to make reprisals no longer, but to come to open war with the Saxons [772]. Accordingly war was begun against them, and was waged for thirty-three successive years with great fury; more, however, to the disadvantage of the Saxons than of the Franks. It could doubtless have been brought to an end sooner, had it not been for the faithlessness of the Saxons. It is hard to say how often they were conquered, and, humbly submitting to the King, promised to do what was enjoined upon them, without hesitation the required hostages, gave and received the officers sent them from the King. They were sometimes so much weakened and reduced that they promised to renounce the worship of devils, and to adopt Christianity, but they were no less ready to violate these terms than prompt to accept them, so that it is impossible to tell which came easier to them to do; scarcely a year passed from the beginning of the war without such changes on their part. But the King did not suffer his high purpose and steadfastness—firm alike in good and evil fortune—to be wearied by any fickleness on their part, or to be turned from the task that he had undertaken, on the contrary, he never allowed their faithless behavior to go unpunished, but either took the

field against them in person, or sent his counts with an army to wreak vengeance and exact righteous satisfaction. At last, after conquering and subduing all who had offered resistance, he took ten thousand of those that lived on the banks of the Elbe, and settled them, with their wives and children, in many different bodies here and there in Gaul and Germany [804]. The war that had lasted so many years was at length ended by their acceding to the terms offered by the King; which were renunciation of their national religious customs and the worship of devils, acceptance of the sacraments of the Christian faith and religion, and union with the Franks to form one people.

Saxon War (continued)

Charles himself fought but two pitched battles in this war, although it was long protracted one on Mount Osning [783], at the place called Detmold, and again on the bank of the river Hase, both in the space of little more than a month. The enemy were so routed and overthrown in these two battles that they never afterwards ventured to take the offensive or to resist the attacks of the King, unless they were protected by a strong position. A great many of the Frank as well as of the Saxon nobility, men occupying the highest posts of honor, perished in this war, which only came to an end after the lapse of thirty-two years [804]. So many and grievous were the wars that were declared against the Franks in the meantime, and skillfully conducted by the King, that one may reasonably question whether his fortitude or his good fortune is to be more admired. The Saxon war began two years [772] before the Italian war [773]; but although it went on without interruption, business elsewhere was not neglected, nor was there any shrinking from other equally arduous contests. The King, who excelled all the princes of his time in wisdom and greatness of soul, did not suffer difficulty to deter him or danger to daunt him from anything that had to be taken up or carried through, for he had trained himself to bear and endure whatever came, without yielding in adversity, or trusting to the deceitful favors of fortune in prosperity.

“great captain” in the mold of Alexander, Caesar, or Hannibal, but rather a true heir of Roman-style military expansionism, relying on superior numbers, engineering skill, and sheer determination as against brilliant battlefield exploits. The king showed no lack of bravery, but his armies in fact fought relatively

few pitched battles. Rather, they conducted determined sieges and could often deploy enough men to advance into enemy territory along several axes, stretching and overwhelming the opposition. Clearly, large forces that were willing to stay in the field for many months were a by-product of the king’s politi-

cal achievements in building a loyal and coherent network of supporters among the Frankish leadership class.

The edifice proved fragile in one way. The empire began to suffer from Viking invasions even before the king died, and factionalism increased during his son's reign. When Louis died in 840 the empire split into three warring sections, each led by one of Louis's sons, and disintegrated rapidly after that under combined internal and external stress. Clearly, the fate of the empire is further evidence of the central role that the king's person and personality had played in creating and maintaining it. But some of Charlemagne's administrative techniques, especially the use of land in return for service and royal inspectors, survived in fragmented form as building blocks for the rulers of later ages. Above all, the emotional legacy of a powerful, just ruler and a unified Christendom survived as a political ideal for most of medieval Europe. This emotional legacy was reinforced by Charlemagne's even more lasting achievements as a cultural leader.

CHARLEMAGNE AS A CULTURAL LEADER

Charlemagne seems genuinely to have believed in his duty to rule for the benefit of his subjects, and the intellectual and spiritual welfare of his realm was the beneficiary of his leadership efforts in this direction. He attracted scholars from across Europe to his court, the most prominent being his biographer Einhard and the British monk Alcuin; he promoted church reform as well as supporting missionary activity in conquered lands; he instituted educational reforms, especially at the level of monastic schools, whose copying activities were responsible for the preservation of many classical texts; and his court instituted an important reform in handwriting, as the script of the time was nearly illegible. The Carolingian miniscule script invented at this time was such a model of clarity that it became, through its revival by Renaissance scholars, the basis for modern print typefaces.

Charlemagne's leadership in cultural affairs was perhaps even more striking than in the political and military realms, because he was trained to the latter

but not the former. He learned to read only as an adult and never learned to write, yet took a keen interest in literature, learning, and even Church doctrine. In addition to his native Germanic tongue, he knew Latin and a bit of Greek. Through his personal example and by providing a hospitable environment for scholars he fostered what historians have come to call the Carolingian Renaissance, a crucial episode in the continuity of western culture and in the formation of a western European cultural identity. It was this achievement—given prestige by the extent and immediate influence of his empire—that justifies his reputation as the “father of Europe.”

—Stephen Morillo

CHILDREN, SOCIALIZATION AND LEADERSHIP DEVELOPMENT IN

All societies, organizations, and institutions depend for their success and progress largely on their leaders. The study of children and their socialization provides valuable insight into how societies prepare

and nurture individuals to become leaders. Studies of the development of children as leaders throughout their childhood years would be most valuable in identifying characteristics and environments most conducive to producing leaders. However, this would require longitudinal or systematic retrospective studies. Any cursory look at the literature in developmental psychology reveals no such study of children and the socialization of leadership in children. Over the last century however, there have been many studies of child leaders, their characteristics, styles of leadership, and to a much smaller degree environmental antecedents of their leadership. Therefore it is possible to talk about what we know about leadership in children and its development.

At the outset, it is important to mention that the body of literature on leadership in children is disparate and noncohesive, spread as it is over almost a century. Although the study of leadership has been a popular topic, the majority of research has focused on adults.

CHILDHOOD LEADERSHIP AND ITS RELATION TO POPULARITY AND DOMINANCE

Childhood leadership has often been studied as a construct imbedded in other concepts, such as dominance and popularity. When relating popularity to leadership, it has been shown that not all popular children are identified as leaders, although child leaders are among the most popular. Most child leaders who are popular are found to be elected and appointed leaders. Regardless of their sociometric status, emerging child leaders are more likely to be effective leaders (for example, in managing the group's task well and attending to the group's emotions and needs) than the popular children who are not leaders. Based on these results, we can safely say that although childhood leadership and popularity are connected, they should initially be studied as separate constructs.

Studies of dominance have primarily concentrated on characteristics such as toughness and the ability to get one's way. Ethological studies (studies examining how human character forms) conducted

in nursery schools have kept the notions of leadership and dominance closely related. In adults, some aspects of dominance, such as directing and organizing, are related to a leadership style that is a controlling and structuring rather than supportive and considerate. In a study published in 2001, Ryoko Yamaguchi found that the task conditions that promote more dominance in children are different than those that promote leadership, with performance-based tasks bringing about dominance and mastery tasks increasing leadership and positive behavior. Mastery conditions promoted both group cohesion and focus on the study's math task, whereas the performance conditions led to the emergence of one child who overpowered the group process. Dominance, like popularity, is related to but not synonymous with leadership, and should be considered a separate construct.

TRENDS IN THE STUDY OF LEADERSHIP IN CHILDREN

Studies focusing specifically on leadership in children, although small in number and disparate in focus, are similar to those focusing on adults. Paralleling a similar trend in studies of adult leaders, studies of leadership in children from the 1930s through the 1950s tried to tease out specific personality characteristics of the child leaders. These characteristics included high intelligence and a desire for achievement, as well as confidence, popularity, and sociability. Child leaders were found to have a greater sense of humor, versatility, and strong social skills in general. Many studies found that student leaders were often boys who were active in sports; these boys were healthier and had more vitality than their non-leader peers.

The 1960s through the early 1980s saw a move away from the examination of traits and toward studies of children's leadership behaviors and styles. Some of the earliest work of this type resembled trait studies, specifically those contrasting a task orientation with a people orientation. In the 1970s, R. C. Hardy, continuing in the tradition of the contingency model of leadership effectiveness, found that children who were task-oriented leaders were more

“Girl Mapping” Project Teaches Leadership Skills to Young Women

CHICAGO (ANS)—Clutching clipboards and clad in purple shirts, 30 teen-age girls hit the streets of Chicago recently to investigate exactly what services, programs and opportunities their communities offer girls.

The “girl mapping” project is part of a two-year study into teen-age girls’ lives. The goal is to provide communities with information about the needs of young women aged 13 to 19 and how those needs are being met. At the same time, the mappers are broadening their knowledge of their neighborhoods and learning leadership skills.

“We see girls as strong and bold and powerful and wanted to create a research initiative where teen girls themselves became the researchers,” said Betsy Brill, executive director of the Girl’s Best Friend foundation, the study’s sponsor and one of a handful of organizations across the country dedicated exclusively to funding programs for girls and young women.

Before hitting the streets in the mapping project, girls from three Chicago communities spent months in case study discussion groups and took tape recorders home to interview their friends on issues important to them. They also kept journals of their perceptions of home and school.

Then, in a two-week mapping blitz, the girls canvassed their communities block by block, surveying young people, adults, businesses and organizations about their attitudes and perceptions toward youth and about their sense of what resources were available and what was needed in the community.

The girls themselves helped develop the surveys and went through intensive training to learn how to approach people on the street. They produced more than 700 surveys, which are currently being analyzed.

Youth mapping, where young people canvas their communities to record resources available to youth—including everything from schools to the YMCA to video stores—has become popular, and such projects are under way in places from Des Moines, Iowa, to Detroit to Pinellas County, Fla.

“The mantra in communities is, ‘There are not enough things for young people to do,’” said Raul Ratcliffe, a program director at the Center for Youth Development and Policy Research in Washington, D.C., who is assisting 32 cities across the country with youth mapping projects. “But nobody knows what exists. This is getting the lay of the land. What currently exists and what are the gaps?”

More than that, said Ratcliffe, mapping can be a way to mobilize communities. Baltimore used youth mapping as a means to bring youth and adults together. Denver used youth mapping to determine where it should locate beacon schools. Detroit made the information it gained through youth mapping available at kiosks, where young people can locate everything from help with their math homework to internship or employment opportunities.

Chicago’s girl mapping project is the first to focus specifically on girls. “Too often, when programs are designed for youth in general, they are designed with boys in mind,” said Lynn Phillips, a psychology and women’s studies professor at the New School for Social Research in New York City and a researcher on the Girl’s Best Friend initiative.

“Even in the research literature I’ve seen, far too often when people study youth, all of their subjects are male. They’re getting the perspectives and the needs of boys and assuming that that’s going to translate into the needs and perspectives of girls, but it doesn’t necessarily.”

Phillips and Brill say they hope the information they’re gaining will be used to direct funding and to design programs for girls that focus on their strengths and well-being. The next phase of research will involve girls from downstate Illinois in the same process of case study discussion groups and mapping. A preliminary report is scheduled to be released in early 2000; the final report should be out a year later.

“By the end of this we’ll have a good sense of the needs and expectations and strengths of girls not only in Chicago but in Illinois, and that will give us a springboard for looking

effective in highly favorable and unfavorable situations, whereas relationship-oriented leaders were most effective in moderately favorable situations.

Observational studies of leadership behavior in preschool-aged children in the context of their peer interactions in nursery classrooms have found different styles of leadership. As early as 1933, for example, Mildren Parten found two distinctive directive leadership behaviors: “artful” (tactful),

and “forceful” (aggressive). Research by A. P. Hare published in the 1950s revealed similar patterns among thirteen-year-olds. Hare found that leaders were either self or group oriented, participatory or supervisory. He also found that these different types of leaders worked differently with their groups and developed different kinds of relationships with the other group members. In a study published in 1963, Dexter Dunphy identified two types of leaders in

at other communities around the United States," said Phillips.

Meanwhile, it's clear that the girls involved in the project are already benefiting. "Youth mapping is really about creating information that empowers young people to be more involved," said Renae Ogletree, co-researcher on the Girl's Best Friend study and executive director of the Chicago Youth Agency Partnership, a nonprofit group that's teaming up with the city of Chicago to undertake youth mapping with girls and boys throughout the city. "Do you know how many girls said to me, 'I didn't know this was in my community!' It exposes the neighborhood in a much broader way."

Ogletree recalled, "One of the girls came back to me and said, 'We're not going to this store anymore. He didn't talk nice to me. He didn't have time for me.' That becomes very powerful information in the hands of kids."

By participating in the project, said Phillips, the girl mappers get training and experience in public speaking, talking to the media and associated skills like thinking critically about how they want to present themselves.

One of the explicit goals of the research is to make girls aware that they are experts in their own lives, encourage them share this information with their communities and become advocates on their own behalf.

Eighth-grader Lorena Nelson said participation in the girl mapping project and other girl-only programs sponsored by a local community organization has given her self-confidence. "It's made me more able to talk about what I want to talk about and tell people my opinion without feeling like, 'Oh, I shouldn't tell them.'" Nelson said surveying her community made her realize that "a lot of people want to help out their community but a lot of people don't know how."

Now that this phase of the project is over, said Ogletree, the challenge for social service agencies is to figure out how to keep young people engaged in the community.

—Linda Lutton

adolescent groups. The first were crowd leaders who were the group representative to the outside, and the second were clique leaders who were the coordinators within the group. In 1959 Cassel and Haddox reported that gifted children who were in positions of leadership tended to use parliamentary patterns of leadership rather than authoritative or laissez-faire styles. Most studies, including those with preschoolers, have found that leadership positions and domi-

nance ranks gained by children remain relatively stable over time.

From the early 1980s and to the present, there have been very few studies of leadership in children from any perspective. Studies of this period can be categorized in three broad areas: There are studies inspired by Piaget's cognitive theory, showing the relation between children's developmental level and their descriptions of leaders; there are studies interested in training and application of leadership in children; and there are studies on the socialization of leadership and parental influences on leadership in children. In none of these areas can one find large numbers of studies or a systematic approach that yields conclusive results. However, there are a handful of very valuable studies in each area that are important to review and bring to mind.

Piaget-Inspired Studies: Leader Schemata

In the 1980s the study of leadership in children was influenced by Piaget's theory and an increased interest in cognitive psychology in general. Tina Daniels-Beirness (1986), Matthews, Lord, and Walker (1988), and Robert Selman (who focused on interpersonal awareness in children in works published in 1979 and 1980 and with Jaquette in 1978) described a structuralist view of the development of leadership concepts in children. This body of research suggests that children define their understanding and expectations of leaders differently at different ages, with the differences paralleling Piaget's stages of development. When comparing children from kindergarten to sixth grade, it was shown that younger children used more physical characteristics in defining leaders while older children used more affective and motivational characteristics.

Concerned about theoretically imposed approaches to studying children's perceptions of leadership, Saba Ayman-Nolley, Roya Ayman, and Jeffrey Becker conducted research in 1993 that examined children's implicit theory of leadership through children's own drawings of leaders. While they found that children in kindergarten through eighth grade mostly had a schema of a leader that was a white male, this was not uniformly true; there were grade, gender, and ethnic-

ity effects. About half the girls drew female leaders, and their drawn leaders were more likely to be smiling. The older children's leaders were more autocratic with fewer smiles and distinctly larger bodies. Saba Ayman-Nolley and Roya Ayman conducted a second study in 1995 that looked at children's verbal descriptions of their schema of a leader and found results very similar to the drawing data. A small number of parents in this study returned a parent questionnaire about their schema of a leader; analyzing these revealed that more sixth-grade responses agreed with those of their parents than did third-grade responses (50 percent as opposed to 30 percent). Girls' responses agreed more with their parents than did boys' (63 percent as opposed to 33 percent). The African-American children's responses were more likely to agree with their parents' responses than were the white children's (70 percent as opposed to 35 percent). Data have recently been collected for a ten-year replication of the drawing studies that should shed light on the effects of sociocultural changes on children's schema of the leader.

Socialization and Familial Influence

Although the question of the antecedents of leadership and its development in children is a very important and valuable one, the body of work devoted to this topic is very small. In 1983 Bruce Klonsky published results of the most comprehensive work in this area—his study of sport leaders in a New York high school. One of his many findings was that the socialization process that yielded male leaders was different from the one that produced female leaders. Males seemed to benefit from intense socialization such as high parental achievement demands, maternal principled discipline, and parental authority discipline. For female leaders the family factors that seemed to play influential roles were having a major voice in the familial decision-making processes, low-intensity socialization, and low to moderate parental warmth.

Almost ten years later, James Whorton and Frances Karnes examined the relationship between parent and child leadership styles and their perceptions. They concluded that those parents who desire their children to assume positions of leadership

should engage in a parenting style that they called "delegating." Of course the children would have to be able and willing to do things on their own. In a 1992 article, Hartman and Harris reported that parents had a greater influence on boys' leadership than on girls' leadership; interestingly, the boys' perception of their parents' leadership seemed to have had more of an influence than parents' actual behavior (as reported by the parents). In a study published in 1995, Frances Karnes, Suzanne Bean, and J. C. McGinnis found that female students in a leadership program saw their immediate family as the greatest influence on their leadership potential. This overwhelming ranking of familiar antecedents was followed by influences from their teachers and their opportunities for involvement in student government.

There is a reasonable body of literature that has shown that there are more political leaders among first-born males than any other birth-order ranking. Joan Newman, Jill Pettinger, and J. B. Even have hypothesized that "Perhaps family practices provide girls with the skills required for face-to-face interpersonal leadership and conciliation rather than training in competition and aggressive assertion which may be required for the confrontations of many political offices" (Newman, Pettinger, and Even 1995, 126).

Another area of work on children and leadership in the last two decades has been in developing leadership training programs. There is, however, very little conclusive data and systematic inquiry on the effectiveness of these programs.

GENDER DIFFERENCES

Although almost every study reports significant differences between boys and girls, gender differences in children's leadership, as in other areas, are inconclusive. The differences across all studies and factors seem to equal out, with boys and girls possessing different strengths. Among early studies, Madaline K. Remmlein (1938) showed boy leaders to be endowed with scholarship, intelligence, and socioeconomic status; Caldwell and Wellman (1926) obtained somewhat similar results for girl leaders who rated high in scholarship, citizenship, and I.Q.

When dominance and leadership are viewed together, more striking differences appear. Overall, dominance in boys tended to be identified more in the domains of athletics and intelligence; dominance in girls, on the other hand, was related to domains of being fashionable, well groomed, and attractive.

In looking at gender differences in leader behavior, a 1978 study by Hynes, Richardson, and Asher showed social sensitivity to be a predictor of self-reported leadership for boys and not girls. This was further supported the following year by Victoria Fu, who demonstrated that both boys and girls were more likely to be identified as successful leaders if they acted in gender-appropriate ways. Klonsky, Phillips, Piato, and Blanchet reported in 1991 that girls more frequently assumed leadership roles in social and classroom activities in contrast to boys' interest in more instrumental leadership roles. In 1976, Lockheed presented evidence that even in children's groups, when males are present there is suppression of female verbal expression and less possibility of leadership behavior from female group members. In 1990 Singer suggested that overall girls "attached a greater value or significance to being in leadership positions" (Singer 1990, 152). Along those lines, Morris (1991) found that adolescent school leaders tended to be girls.

In a study published in 1996, Ganz reported that male adolescents indicated that they were drawn to positions of leadership mostly because of a sense of competence or a desire to have control over an activity, whereas the girls were more likely than boys to choose leadership positions out of a sense of duty. ("Somebody has to do it.") Ganz also found that female students in decision-making positions were more likely than boys to engage in the ethic of care and response. Not too different from these results are those of Moore (1988), who found that overall, teachers were more likely to perceive girls as having more leadership skills than boys. These researchers also found that high-equity environments in desegregated schools are better environments for nurturing leadership in females and minorities than their low-equity segregated counterparts.

It is interesting to note that Karnes, Bean, and McGinnis found that females who were attending a

leadership training program believed that in the future there would be more female and minority leaders in our society. These same girls strongly disagreed with the generalized statement "Males make better leaders than females." When looking at children's image of a leader, Ayman-Nolley and colleagues found that girls were just as likely to draw male leaders as female leaders, whereas boys drew solely male leaders. Other research supports that pattern in boys' and girls' choices of heroes.

OUTLOOK FOR THE FUTURE

As a result of the discontinuity and nature of methodology used to examine leadership in children over the last half of the twentieth century, major questions remain unanswered. The use of adult categories and measures has made it difficult to arrive at conclusive findings about many aspects of leadership in children. It is clear that there is a need for more studies of leadership in children in almost every area, especially in leadership styles, leadership concepts, leadership development, and socialization. It is important that the field moves toward a multimethod, multitheory approach. Furthermore, it is crucial that those interested in this field support a steady and systematic approach to unraveling the mysteries of how some people become great leaders and some do not. Understanding children's concepts of leadership and how they construct associated schemata will help us develop strategies to cultivate in them the skills to be great future leaders. It must be remembered in all these attempts, however, that it is essential to keep cultural and gender variations in mind. To date we know very little about cultural differences in children's concepts and styles of leadership. This is probably one of the least-studied areas of childhood leadership. The coming century is ripe with numerous possibilities for important scholarly research into the development and socialization of leaders.

THE CHRISTIAN RIGHT

For roughly ten years, beginning in 1978, the Christian Right was led by a coalition of conservative evangelical ministers and New Right political figures. The most prominent ministers were Jerry Falwell (1933–), Pat Robertson (1930–), and Timothy LaHaye (1932–). By 1979 Falwell was a popular televangelist and the church and university he founded, Thomas Road Liberty Baptist and Liberty University (both located in Lynchburg, Virginia) were flourishing. Robertson was well known through his nationally syndicated television show *The 700 Club* and through the Christian Broadcasting Network he founded in 1961. LaHaye led a thriving ministry in San Diego, California that included a church, an elementary school, and a high school. The important New Right political figures were Paul Weyrich (1942–), Richard Viguerie (1933–), and Howard Phillips (1941–). Leaders who bridged the New Right and the Christian Right included Connie Marshner (1951–) and Phyllis Schlafly (1924–). Marshner, a Catholic, opposed feminism and worked for various New Right organizations. Schlafly, also Catholic, was active in right-wing politics for many years before founding Stop ERA, the organization that helped defeat the Equal Rights Amendment.

THE CHRISTIAN RIGHT/ NEW RIGHT COALITION

These two groups came together in the late 1970s when Weyrich, Phillips, and Viguerie asked Falwell to organize conservative evangelicals through an organization called the Moral Majority. Falwell

During the scandal involving evangelist Jim Bakker in 1987, Jerry Falwell (third from right) leads the new PTL (Praise the Lord) board of directors in prayer.

agreed, and several of the evangelical ministers who joined the Moral Majority later formed their own organizations.

The Christian Right/New Right coalition was characterized by two different kinds of leadership that, by the end of the 1980s, would be synthesized by the Christian Right into an effective leadership strategy that coordinated grassroots politics with national appeals. The first kind of leadership reflected the leaders' common experience as evangelical ministers. The second kind of leadership reflected the New Right experience as a political force contending with an entrenched two-party system of government.

The leadership of evangelical ministers emphasized entrepreneurial spirit and aggressiveness. Evangelical church-building is based on an entrepreneurial model wherein each minister starts his own church (sometimes in his living room) and growth comes from his ability to attract and keep a congregation. Building a congregation large enough and committed enough to pay a salary and maintain church buildings fosters the development of a set of skills and abilities—rhetorical and leadership skills, the ability to establish community boundaries, charisma—that are easily transferred to social movement mobilizing. Sharing similar professional backgrounds contributed to the consensus among the early leadership that rank-and-file members had lit-

tle to do with governance decisions. Their vision assumed that financial resources would flow upward while organizational and tactical decisions would be made at the top.

The second leadership style, based in the political experience of the New Right, emphasized building networks of powerful politicians, selecting hot issues, and building stable funding bases through foundations, think tanks, and political action committees. New Right strategists established groups that met regularly to discuss agendas and strategy, and these groups gradually became durable networks connecting the New Right to a wider set of receptive political figures. Library Court and the Kingston Group were two such groups. Both were little known outside of New Right circles and were rarely mentioned in the press. Library Court began meeting in 1979 and took its name from the Capitol Hill location of its regular meetings. Connie Marshner, then director of the Family Policy Division of the Free Congress Foundation (a think tank headed by Paul Weyrich), led the group and also included Christian Right leaders in strategy meetings.

New Right leaders deliberately decided upon “social issues” (meaning issues of morality, family life, and gender) as the issues highlighting liberalism’s vulnerability. Attention to social issues represented the clearest break between the New Right and the Old Right. The Old Right had always focused on a strong national defense, nativism, anticommunism, and defense of free market principles. For Weyrich to say in a 1980 *Conservative Digest* piece that social issues were the future of the American Right marks the ideological point where common cause with the Christian Right made sense to the New Right leadership.

WOMEN IN THE CHRISTIAN RIGHT

Despite the emphasis on traditional gender roles within the movement, women have, from the beginning, played important leadership roles. In the late 1970s, before Falwell got the idea for the Moral Majority from the New Right leadership, Phyllis Schlafly and Beverly LaHaye (1929–) were building and leading effective political organizations that

continue to be politically important. Though Schlafly's organization, Eagle Forum, targets conservative women, she also regularly engages the predominantly male conservative leadership. She has spoken at important events, such as the annual Road to Victory meetings hosted by the Christian Coalition (that have taken place annually since 1991), has run for Congress three times (unsuccessfully), and regularly wins battles for extreme positions on key issues of the Republican Party Platform. Beverly LaHaye founded Concerned Women for America (CWA) in 1979, several months before Falwell announced the Moral Majority. In interviews she has claimed that she was not sure who would respond to her call for a mass meeting of women against the ERA and that the turnout (of several hundred) surprised her and inspired her to form CWA. At that time, her husband, Timothy LaHaye, was minister to a large church and, through the family business (running family and marriage counseling seminars) she was a well-known and well-loved figure among evangelical Christians. She organized the women at that first meeting into prayer chapters and the prayer chapter structure is still an effective strategy for recruiting new members and retaining veteran activists.

Both of these leaders recognized that women could be organized to do the routine work necessary for a long-term campaign to redeem America. Women were first organized around already-familiar tactics like phone trees and rotating monthly or weekly prayer meetings and around new tactics like calling or writing letters to politicians by following a model sent out in the organization's newsletter. LaHaye called it "kitchen table" activism and it was extraordinarily effective.

THE CHRISTIAN RIGHT LEADERSHIP REGROUPS

By the end of the 1980s, the Christian Right leadership was in retreat. Falwell had withdrawn to Lynchburg, Virginia, to focus on his ministries. Robertson's presidential campaign had failed. The LaHayes lost their close connection to the grassroots by moving CWA to Washington, D.C., and were struggling to make the organization known on Capitol Hill. The

heads of many national-level Christian Right organizations disappeared when their organizations closed down while others publicly called on conservative Christians to retreat from politics and tend to their families and communities. Colonel Doner (his first name, not a military title) is one example. His call to retreat was published in leading Christian periodicals and carried some weight because he was lauded as the founder of Christian Voice, an organization that successfully organized ministers into a well-funded political force that popularized the strategy of "moral report cards" (evaluations of the morality of positions taken by elected officials).

But the retreat of national-level leaders did not bring down the movement. Instead, the Christian Right was reinvigorated from below by the many tireless local and state-level leaders who founded a plethora of organizations focused on local referenda, school board and city council seats, and the like. More of these leaders were not ministers, reflecting both the maturity of the movement (activists had worked their way up into leadership) and the new dispersion of the movement across mostly local and state-level battles. Activists who were now leaders included Michael Farris (who started as the Washington state Moral Majority chapter leader and also served as legal counsel to CWA) and Kay Cole James (1949–). James is one of the very few African-Americans holding a leadership position within the Christian Right. She started as a prayer chapter leader for CWA and, after many years of activism, became the Virginia Secretary of Health and Human Resources in 1993. Important local leaders included Lon Mabon, an Oregon businessman who founded the Oregon Citizens Alliance that sponsored Measure 9 (a ballot initiative aimed at prohibiting state protections for gays and lesbians), and Will Perkins (a Colorado car salesman), the founder of Colorado for Family Values (sponsor of Amendment 2, the anti-gay measure that was eventually declared unconstitutional by the Supreme Court). These leaders brought a new repertoire of tactics to the Christian Right. First, these leaders were more sensitive to the nuances of political language and they set about tempering and modifying the movement's rhetoric. Second, many of these people had been grassroots

activists and appreciated the fervor of newly active members. Third, they brought to the movement a vision of the Christian Right as a central player in the Republican Party.

CHANGING RHETORIC OF THE CHRISTIAN RIGHT

The Christian Coalition, founded by Pat Robertson and led by Ralph Reed (1961–), led the move toward tempering movement rhetoric. The organization debuted in 1990 with full-page advertisements in national publications decrying the National Endowment for the Arts. These advertisements had broad appeal to Catholics, Jews, and Protestants (signaling the coalition's commitment to ecumenism). Subsequent public statements by the Christian Coalition and by Reed continued to advance a temperate and modified rhetoric that contrasted with the earlier bombastic style of Falwell and Robertson (Robertson, in a fund-raising letter, claimed that feminism is an "anti-family political movement that encourages women to leave their husbands, kill their children, practice witchcraft, destroy capitalism, and become lesbians"). Perhaps the most important instance of the new language came in an article written by Reed and published in the Heritage Foundation's *Policy Review* in 1993. Reed's position became widely known through long excerpts reprinted in the *New York Times* and in the Christian Coalition's own publication, *Christian American*. Reed called on Christian activists to "cast a wider net" and focus on issues that matter to "the average voter" in the areas of crime, taxes, government waste, health care, and financial security. Though this language succeeded in appeasing the Republican leadership (wary of the Christian Right as a political liability), Reed's advice to quiet the rhetoric around abortion and homosexuality offended some conservative evangelicals.

ORGANIZATIONAL INNOVATIONS

James Dobson (1936–), who founded Focus on the Family (now located in Colorado Springs, Colorado, with a 2000 budget of \$128.8 million) in 1977, leveraged activist fervor through state affiliates that are

identifiable by having the words "council" or "forum" or "policy" in their names. These state affiliates (there are now approximately thirty-six nationwide) connect new activists with local and state-level issues and provide policy information to state legislatures. Legally independent, these organizations host "Citizen Impact Seminars" that use a Focus-produced training manual to train activists in political action. The affiliates make it possible for Focus on the Family to indirectly support direct political action (lobbying state legislatures, for example) while concentrating on producing its very popular resources for families, such as videos, books, magazines, and radio programs.

ASSESSMENT OF CURRENT LEADERSHIP

In contrast to the ministerial leadership of the early Christian Right, the current leadership pool is more ideologically diverse and includes a wide range of professions. This leadership is also much more pragmatic about political realities. Based on the failure of Moral Majority to achieve religious coalitions, the leaders that emerged within the movement in the 1990s dealt proactively with the political reality that a movement comprised of many religious traditions would have difficulty organizing as a national body. The Christian Coalition took up the long-range vision of these leaders to organize the nation "precinct by precinct." Christian Coalition state chapters (sometimes hundreds in one state) were charged with identifying all the voters who would support Christian Right candidates. At election time, these voters were encouraged to cast their votes according to Christian Coalition recommendations.

The Christian Right is also benefiting from "movement entrepreneurs," activists who form their own organizations to pursue interests that are narrower than the movement's interests as a whole. These entrepreneurs bring new tactics, new organizational structures, and new recruits to the movement, thus serving a revitalizing role even if their particular efforts fail. Additionally, movement entrepreneurs are very likely to also hold more extreme views than the established leadership. Their radicalism serves the movement by attracting the zealous

who can be a tremendous (albeit short-lived) resource to fuel specific campaigns. An example of this is Lon Mabon, whose organization, Oregon's Citizens Alliance, did not win passage of their anti-gay legislation but did bring in funds, new recruits, and publicity, and in addition to training large numbers of people in grassroots activism.

RESOURCE FLOWS

Christian Right organizations responded to the failing fortunes of the movement at the end of the 1980s by seeking to stabilize their financial base. Both long-time leaders and newcomers saw that the organizations that were thriving had a reliable financial base in membership dues. In this regard, CWA and Focus on the Family are exemplars. The organizations that flourished in the 1990s also provided enormous purposive incentives by linking members (through regularly received publications, radio and television shows, letter and phone-call campaigns, and the like) to a morally charged community *without* requiring members to subscribe to a particular theology.

However, with the breakdown of the Christian Coalition in the late 1990s, the movement lost a key national-level organization that had nurtured many politically savvy efforts. Additionally, a few long-time leaders have called for a retreat from politics, declaring that Christians should focus on their own families, churches, and communities—leaving the field of politics completely. New national-level organizations have not emerged, and the movement appears to be experiencing a political lull that, given the incredible productivity on the cultural side of organizations like Focus on the Family, Promise Keepers, and the many men's and women's fellowship groups, is most likely only temporary.

CHURCHILL, WINSTON (1874–1965)

British statesman and prime minister

Winston S. Churchill is among the select group of individuals whose name has become synonymous with historic, indeed heroic, leadership. Churchill's life spanned the Victorian era to the 1960s. After an accomplished, tumultuous preparatory public career, he became prime minister of Great Britain at the age of sixty-five, in May 1940—at the moment of supreme threat to his nation's survival from Adolf Hitler's (1889–1945) German war machine, then invading westward with unprecedented speed. Even more isolated than the nation he led, Churchill stood nearly alone—against the judgment of most of his cabinet and conventional “establishment” opinion—in refusing to negotiate “peace” terms with an apparently invincible Hitler. Amid these dire circumstances, Churchill's greatest hope was realized in December 1941, when the United States entered World War II, bringing the New World to the rescue of the Old. Against the backdrop of declining British power, Churchill joined U.S. President Franklin D. Roosevelt (1882–1945) and Soviet Premier Joseph Stalin (1879–1953) as one of the victorious “Big Three” Allied commanders.

BIRTH AND EARLY YEARS

Winston Churchill was born on 30 November 1874 at Blenheim Palace, the hereditary seat of one of Britain's great families, the Marlboroughs. His father, Randolph Churchill, the younger brother of the Duke of Marlborough, was a rising politician. His mother, Jennie Jerome Churchill, was a celebrated, spirited beauty from America, whose father was a well-known financier.

Though Winston's birth was reported "premature"—in retrospect a portent of his titanic energy—his promise was not unmistakably evident in his early years. Of little apparent interest to his parents, young Winston was sickly, physically awkward, and an indifferent student. Sent to Harrow, he was, as historian and educator John Keegan reports, "consistently incompetent" in the core subjects—though he did excel in English composition and history, and showed formidable mnemonic powers, winning a prize for reciting Macaulay's *Laws of Ancient Rome*.

Seeking a military career, Winston required three tries before passing the tests for entry to military academy at Sandhurst. Surpassing his father's declared expectations, Winston excelled, building both his physical and mental capacities. He was accepted into the prestigious 4th Hussars cavalry regiment.

Churchill's entry into the professional military was fateful. On his twenty-first birthday he found himself, for the first time, in the line of fire and was exhilarated. He strove to use his military experience to launch a career as a writer and politician. As he overcame a slight speech impediment, so too he would educate himself, in compensation for his not possessing the university education customary

among political leaders of the time. As he later wrote in *My Early Life*, he pored over books relating to "history, philosophy, economics, and things like that" (Churchill 1958, 111). In languorous, sun-drenched encampment at Bangalore, India, he devoured Edward Gibbon's *Decline and Fall of the Roman Empire*, the historian Macaulay, and other contemporary and classical authors. Though he wrote, "[A] man's life must be nailed to a cross either of Thought or Action," Churchill sought to fuse action and thought in his preparation for, and

pursuit of, leadership (Churchill 1958, 113).

Churchill's ongoing learning benefited from the entrée provided by his aristocratic lineage, as well as his mother's use of her wide connections on his behalf, reflecting her belated interest and appreciation of her son's increasingly evident gifts. His mother's assisting hand can be seen in several key military assignments, as well as his introduction to major figures. Among the most notable was Bourke Cockran (1854–1923), an American politician recognized as one of the great public speakers of the day—who, in turn, made yet additional introductions possible, such as a meeting with the young governor of New York, Theodore Roosevelt (1858–1919).

Churchill's military service would take him to vital parts of the British Empire, which encompassed fully one-quarter of the earth's land mass and population. He thereby gathered a first-hand sense of war, other nations and cultures, and other social classes from his own nation. He presumed to publicly evaluate and criticize his military superiors in books about his wartime exploits—the first of which was published when he was twenty-three. This accentuated critics' sense—and there were many, including Lord Kitchener, perhaps the best-known military com-

mander of the time—that Churchill was an “adventurer,” excessively ambitious and self-promoting. In this he resembled his father, who died in 1895 following the humiliating, poignant, public ravaging of his physical and mental capabilities by syphilis. Randolph’s truncated political career had been marked by spectacular failure, borne of insufficient judgment to govern his energy, capacity, and ambition—a decidedly mixed legacy for his rising son. Still, there was no question of his son’s courage. At Omdurman, near Khartoum, he participated in one of the last great cavalry charges of history, in 1898. Churchill put himself at considerable risk, leading his troops from the front, killing several dervishes while evading close-range fire.

Returning to England, Churchill made his first bid for Parliament in July 1899, as a Conservative, but did not prevail.

METEORIC RISE IN EARLY POLITICAL CAREER

Reckoning that an entrepreneurial career as a writer would yield opportunities for advancement far greater than possible in the bureaucratic lockstep of the military, Churchill became a journalist. In October 1899 the Boers (Afrikaners) of South Africa commenced hostilities against their British colonial masters. Churchill, credentialed as a war correspondent, was captured. He soon escaped, garnering publicity that made his name famous. He was elected to the House of Commons in the October 1900 “Khaki Election” won nationally by the Conservatives. He served in the House for fifty-two of the next fifty-four years.

Churchill’s maiden parliamentary address was well received, though he was soon at odds with his party. His magnanimity toward the Boers, his suspicion of military expenditure, his sympathy with working-class political aspirations, and, most importantly, his support for free trade, led to his crossing over to the Liberals in 1904.

His most enduring Liberal tie was established in 1908 when he married Clementine Hozier, with whom he had five children (one daughter died tragically from sudden illness prior to her third birthday).

The straitened circumstances of Hozier’s youth made her much more attuned to household economies than her extravagant husband. She possessed more reliable instincts about the character of Churchill’s sometimes disappointing companions and colleagues, tempering his susceptibility to flattery, flash, and mountebanks.

As a Liberal, he was selected as under-secretary of state for the colonies (1906), moving up rapidly to become president of the Board of Trade (1908), and, at the age of thirty-five, Home Secretary (1910–1911). In the latter two posts, Churchill played a critical role in advocating and securing reforms limiting the power of the House of Lords vis-à-vis the Commons, and expanding employment and health protections to workers.

THE GREAT WAR AND ITS AFTERMATH

In 1911, Churchill became the First Lord of the Admiralty, responsible for the world’s greatest navy at a time when navies were generally viewed as the key to military power. The advent of World War I in August 1914 found the navy—as well as Churchill—well prepared. Characteristically, he supported the development and application of new technologies, including the tank and the airplane. Recoiling from the senseless slaughter of thousands in the deadlocked trench warfare in France, he sought a strategic breakthrough. His conception, an invasion of Turkey at Gallipoli, was a blood-drenched debacle, occasioning hundreds of thousands of casualties—and his humiliating departure from the admiralty in May 1915.

Politically adrift, Churchill chose to go to France as a soldier at the front, serving from November 1915 until May 1916. Throughout he lobbied for a return to office, aided by the determined assistance of his wife Clementine. Finally, in the aftermath of the armistice, in early 1919, Churchill was appointed secretary for war and air. Recognizing the novel threat posed by the communist regime established under the leadership of V. I. Lenin (1870–1924) in October 1917, Churchill unsuccessfully sought to strangle it in its cradle, through aid to opposing armies in the ongoing Russian civil war. In 1921 he

became colonial secretary, where his negotiations included the partition of Ireland, the creation of Jordan and Iraq, and the implementation of the Balfour Doctrine, guaranteeing an international homeland for the Jews in Palestine.

The Liberals' position deteriorated as the Labour Party emerged as the primary party of the left. Churchill, never a conventional or sentimental party politician, changed parties, successfully standing for Parliament as a Conservative in 1924. His newly adopted party was victorious nationally, and, to widespread surprise Prime Minister Stanley Baldwin (1867–1947) tapped him to be chancellor of the exchequer, the position held by his father Randolph at the apogee of his career. Although Churchill's budget presentations were highly praised, his policy of returning Britain to the gold standard was highly criticized, most notably in the economist John Maynard Keynes's (1883–1946) critique, "The Economic Consequences of Mr. Churchill."

WILDERNESS YEARS

Churchill lost his cabinet position in 1929 with the general election defeat of the Conservatives. Thus began an extraordinarily challenging period for Churchill, including financial losses in the stock market crash of 1929, various health problems, and increasing isolation and irrelevance on the political scene (though he continued to serve as a member of Parliament at a nominal salary, he was merely a "backbencher," distant from direct participation in the course of events). Unencumbered by the management responsibilities of office, Churchill distinguished himself in other realms—as an historian, journalist, lecturer, sportsman, painter, and raconteur. He was dismissed by many as a relic of Victorian England, outdated in expressing verities destroyed in war, oblivious to the political implications of increasingly well-articulated class consciousness, and stylistically self-dramatizing. His judgment was brought into further question by his unwavering support for the monarchy (most notably supporting King Edward VIII before his abdication in favor of American divorcee Wallis Warfield Simpson in 1937), and his vociferous opposition to colo-

nial India's bid for "dominion" status as a way station en route to inevitable independence.

Churchill's isolation was reflected and accentuated by his visceral opposition to Hitler's Nazi regime, which achieved power in January 1933. He was unrelenting and uncompromising in his criticisms of the rearmament of Germany, from its development of air power and its reintroduction of conscription to the annexation and conquest that were its ultimate aim. Churchill sensed the ominous forebodings of future war. Many more, traumatized by the horror of the World War I, and perhaps guilty at draconian terms imposed at Versailles in 1919, sought to avoid renewed conflict by granting Hitler concessions.

Backed by no institution, beginning with almost no support among Parliamentary colleagues or the public, Churchill unremittently warned of the German menace—expressing contempt for Hitler and his "grisly gang." His experience gave life to an unpublished, aspirational essay he wrote in 1897: "Of all the talents bestowed upon men, none is so precious as the gift of oratory. He who enjoys it wields a power more durable than that of a great king. He is an independent force in the world. Abandoned by party, betrayed by friends, stripped of his offices, whoever can command this power is still formidable."

Hitler's lust for conquest finally triggered British and French resistance after the German invasion of Poland on 1 September 1939. Having reluctantly entered the war he had so long fought to avoid, Prime Minister Neville Chamberlain (1869–1940) tapped Churchill to return to his former post as First Lord of the Admiralty. On 10 May 1940, with Nazi troops streaming west, Churchill acceded to the premiership, leading an inevitably unconventional and unstable all-party coalition.

HIS FINEST HOUR

Churchill in power remained almost alone within his own government in refusing to enter negotiations with "That Man." As historian John Lukacs argues, it was Churchill who held his government intact against coming to terms with Nazi Germany—and it

Excerpts from Churchill's "This is Their Finest Hour" Speech to the House of Commons, 18 June 1940

During the first four years of the last war the Allies experienced nothing but disaster and disappointment. That was our constant fear: one blow after another, terrible losses, frightful dangers. Everything miscarried. And yet at the end of those four years the morale of the Allies was higher than that of the Germans, who had moved from one aggressive triumph to another, and who stood everywhere triumphant invaders of the lands into which they had broken. During that war we repeatedly asked ourselves the question: "How are we going to win?" and no one was able ever to answer it with much precision, until at the end, quite suddenly, quite unexpectedly, our terrible foe collapsed before us, and we were so glutted with victory that in our folly we threw it away.

We do not yet know what will happen in France or whether the French resistance will be prolonged, both in France and in the French Empire overseas. The French Government will be throwing away great opportunities and casting adrift their future if they do not continue the war in accordance with their Treaty obligations, from which we have not felt able to release them. The House will have read the historic declaration in which, at the desire of many Frenchmen—and of our own hearts—we have proclaimed our willingness at the darkest hour in French history to conclude a union of common citizenship in this struggle. However matters may go in France or with the French Government, or other French Governments, we

in this Island and in the British Empire will never lose our sense of comradeship with the French people. If we are now called upon to endure what they have been suffering, we shall emulate their courage, and if final victory rewards our toils they shall share the gains, aye, and freedom shall be restored to all. We abate nothing of our just demands; not one jot or title do we recede. Czechs, Poles, Norwegians, Dutch, Belgians have joined their causes to our own. All these shall be restored.

What General Weygand called the Battle of France is over. I expect that the Battle of Britain is about to begin. Upon this battle depends the survival of Christian civilization. Upon it depends our own British life, and the long continuity of our institutions and our Empire. The whole fury and might of the enemy must very soon be turned on us. Hitler knows that he will have to break us in this Island or lose the war. If we can stand up to him, all Europe may be free and the life of the world may move forward into broad, sunlit uplands. But if we fail, then the whole world, including the United States, including all that we have known and cared for, will sink into the abyss of a new Dark Age made more sinister, and perhaps more protracted, by the lights of perverted science. Let us therefore brace ourselves to our duties, and so bear ourselves that, if the British Empire and its Commonwealth last for a thousand years, men will still say, "This was their finest hour."

was Britain's holding out that proved to be the crucial factor in winning the war.

In his first speech as prime minister, he declared: "I have nothing to offer but blood, tears, toil and sweat." His war aim was unambiguous: "Victory at all costs, victory in spite of all terror, victory however long and hard the road may be; for without victory there is no survival." As Hitler's total war made every Briton a soldier, Churchill evoked the spirit of "olden times," maintaining morale in the face of terror, bombing, and an anticipated German invasion. CBS News correspondent Edward R. Murrow marveled, "Churchill mobilized the English language and sent it into battle."

Finally, in December 1941, the United States

declared war on Japan in response to the surprise attack on its fleet at Pearl Harbor. Within days, Hitler's mercurial judgment impelled him to declare war on the United States as well, eliciting an immediate reciprocal response. With America's entry, and with agreement that defeating Hitler be given top priority, Churchill's greatest hope for national deliverance was realized.

If the victory was now conceivable, it remained far from inevitable. The year 1942 began with a string of Japanese conquests across the Pacific (including the vivid humiliations of the Bataan Death March and the fall of Singapore), and German progress into the Russian interior and across North Africa. As 1942 moved into 1943, the Allies—from

I am certainly not one of those who need to be prodded. In fact, if anything, I am the prod.

—Sir Winston Churchill

Russia in the East to the United States and Britain in the West—began to turn the tide. On D-Day, 6 June 1944, the Allies began the liberation of Europe, culminating in the joining of the Americans, British, and associated troops with the Russians in Germany, where the Nazi regime surrendered unconditionally in May 1945.

FAITHFUL BUT UNFORTUNATE

Unresponsive to the widespread demand for social reform that was muffled in the wartime “national government,” the Conservative Party was swept from office in the national election of July 1945. Churchill was thereby removed as prime minister, making apt the motto of his family’s coat of arms: Faithful but Unfortunate. When all citizens considered themselves soldiers, Churchill’s temperament, character, and experience uniquely suited him for leadership; in peacetime, the same qualities combined to make him distant from the daily needs of the mass of people. He never seemed to grasp that ordinary Britons, having performed heroically in defense of the nation at its moment of maximum peril, demanded increased economic and social power as their due—not on sufferance from the aristocracy whose stewardship resulted in Britain’s catastrophic decline from global power in the course of two world wars.

He retreated to write history. His landmark, six-volume *The Second World War*, begun in 1946, earned him the Nobel Prize for Literature in 1953. Looking to the future, he deployed words to help set the course of world events, as in his “Iron Curtain” address to Westminster College in 1946, warning of Soviet expansionism.

In 1951 Churchill led the Conservatives to victory, becoming prime minister until his retirement in 1955. His health was in visible decline, his government correspondingly less consequential. He attempted, without result, to craft a broker role for

Britain in the Cold War between the United States and the former U.S.S.R., his wartime allies in the “Big Three.”

Churchill died, following a stroke, on the seventieth anniversary of his father’s death, 24 January 1965.

HISTORICAL SIGNIFICANCE

Sir Isaiah Berlin’s words stand the test of time: Churchill was “a man larger than life, composed of bigger and simpler elements than ordinary men, a gigantic historical figure during his own lifetime, superhumanly bold, strong, and imaginative . . . an orator of prodigious powers, the savior of his country, a legendary hero who belongs to myth as much as to reality, the largest human being of our time.”

—James M. Strock

THE CIVIL RIGHTS ACT OF 1964

Considered the greatest of all civil rights legislation, the Civil Rights Act of 1964 has become the standard by which civil rights policies and legislation are measured. It also served as the beginning of true legal equality for millions of American citizens.

CIVIL RIGHTS LEGISLATION BEFORE 1964

The most prominent provisions of the U.S. Constitution regarding civil rights are the Thirteenth, Fourteenth, and Fifteenth Amendments passed following the U.S. Civil War. The Thirteenth Amendment abolished slavery in the United States, the Fourteenth Amendment guaranteed equal protection under law for all U.S. citizens (including the recently freed slaves), and the Fifteenth Amendment guaranteed universal manhood suffrage. In response to these amendments, many states, mostly Southern, enacted legislation that restricted the mobility of the former slaves, placed restrictions and qualifications on vot-

ing rights, and established creative ways of bypassing rights that were nominally guaranteed in the U.S. Constitution.

In 1866, the Republican-controlled U.S. Congress passed over President Andrew Johnson's veto a civil rights act, which declared all persons born in the United States as citizens, with the full privileges of citizenship, including right to own property, enter into contracts, sue and be sued. In 1875, the Republican controlled Congress passed a sweeping civil rights act, which forbade segregation in public facilities, much like the 1964 law. However, in 1883 the U.S. Supreme Court ruled the 1875 Civil Rights Act unconstitutional (*Civil Rights Cases* 1883) as an overreach of the federal government's power and a violation of the Fourteenth Amendment.

For nearly eighty years little legislation was passed through the Congress with regard to civil rights. In 1896, the U.S. Supreme Court rendered *Plessy v. Ferguson* (1896), which made segregation constitutional as long as such was separate but equal. And with the disfranchisement and control of African-Americans in the South all but complete, little political pressure existed to dictate otherwise. Significant action by the federal government with regard to civil rights did not occur until 1943 when President Franklin D. Roosevelt, facing pressure from civil rights groups, established by executive order a Fair Employment Practices Commission (FEPC) to guarantee that minorities received equal opportunity for wartime jobs. In 1948 President Harry S. Truman desegregated the U.S. military for the first time in U.S. history. But little was done legislatively until 1957. That year, Democratic Senate majority leader Lyndon Baines Johnson spearheaded a movement whereby congress enacted the Civil Rights Act of 1957. Yet this law offered little more than a sign that the government recognized that millions of African-American voters were disfranchised. It authorized the Department of Justice to study the problem of African-American voting rights and empowered the Justice Department to obtain court injunctions against those individuals denying the right to vote.

As the civil rights movement gained momentum following the landmark Supreme Court ruling, *Brown v. Board of Education* (1954), public pressure

Selection from Lyndon B. Johnson's Remarks upon Signing the Civil Rights Bill, 2 July 1964

My fellow Americans:

I am about to sign into law the Civil Rights Act of 1964. I want to take this occasion to talk to you about what that law means to every American.

One hundred and eighty-eight years ago this week a small band of valiant men began a long struggle for freedom. They pledged their lives, their fortunes, and their sacred honor not only to found a nation, but to forge an ideal of freedom—not only for political independence, but for personal liberty—not only to eliminate foreign rule, but to establish the rule of justice in the affairs of men.

That struggle was a turning point in our history. Today in far corners of distant continents, the ideals of those American patriots still shape the struggles of men who hunger for freedom.

This is a proud triumph. Yet those who founded our country knew that freedom would be secure only if each generation fought to renew and enlarge its meaning. From the minutemen at Concord to the soldiers in Viet-Nam, each generation has been equal to that trust.

Americans of every race and color have died in battle to protect our freedom. Americans of every race and color have worked to build a nation of widening opportunities. Now our generation of Americans has been called on to continue the unending search for justice within our own borders.

We believe that all men are created equal. Yet many are denied equal treatment.

We believe that all men have certain unalienable rights. Yet many Americans do not enjoy those rights.

We believe that all men are entitled to the blessings of liberty. Yet millions are being deprived of those blessings—not because of their own failures, but because of the color of their skin.

The reasons are deeply imbedded in history and tradition and the nature of man. We can understand—without rancor or hatred—how this all happened.

But it cannot continue. Our Constitution, the foundation of our Republic, forbids it. The principles of our free-

dom forbid it. Morality forbids it. And the law I will sign tonight forbids it.

That law is the product of months of the most careful debate and discussion. It was proposed more than one year ago by our late and beloved President John F. Kennedy. It received the bipartisan support of more than two-thirds of the Members of both the House and the Senate. An overwhelming majority of Republicans as well as Democrats voted for it.

It has received the thoughtful support of tens of thousands of civic and religious leaders in all parts of this Nation. And it is supported by the great majority of the American people.

The purpose of the law is simple.

It does not restrict the freedom of any American, so long as he respects the rights of others.

It does not give special treatment to any citizen.

It does say the only limit to a man's hope for happiness, and for the future of his children, shall be his own ability.

It does say that there are those who are equal before God shall now also be equal in the polling booths, in the classrooms, in the factories, and in hotels, restaurants, movie theaters, and other places that provide service to the public.

[. . .]

So tonight I urge every public official, every religious leader, every business and professional man, every workingman, every housewife—I urge every American—to join in this effort to bring justice and hope to all our people—and to bring peace to our land.

My fellow citizens, we have come now to a time of testing. We must not fail.

Let us close the springs of racial poison. Let us pray for wise and understanding hearts. Let us lay aside irrelevant differences and make our Nation whole. Let us hasten that day when our unmeasured strength and our unbounded spirit will be free to do the great works ordained for this Nation by the just and wise God who is the Father of us all.

Thank you and good night.

increased for the government to enact meaningful civil rights legislation. In campaigning for the presidency in 1960, John F. Kennedy made civil rights a major campaign issue, but he failed to act on such

promises until 1963. Then, facing pressure from the civil rights movement, especially the Rev. Dr. Martin Luther King, Jr., Kennedy submitted a civil rights bill to Congress, where it became mired in commit-

tee when Kennedy died at the hands of an assassin in November 1963.

LEGISLATIVE HISTORY

Determined to make the civil rights bill a tribute to the late president (and to use national sympathy for Kennedy to ensure its passage), President Lyndon Baines Johnson put the full power of the White House behind the bill. In fact, much of the force that moved the bill out of committee in the House of Representatives was driven by public opinion that at once mourned the death of Kennedy and called for the government to ensure civil rights. Most polls showed that a growing majority of Americans supported the bill.

Modified in committee in the House of Representatives, the civil rights bill, then known as H.R. 7152, was passed out of committee on 20 November 1963. Howard W. Smith (Democrat from Virginia), an opponent of civil rights and chairman of the House Rules Committee, attempted to sabotage the bill by amending it to expand the bill's provisions to prevent discrimination toward women. Before his amendment, the bill prohibited discrimination on the grounds of race, color, creed, religion or national origin. Smith added the word *sex*, intending to make the bill unpassable. Because of Smith's efforts, the government granted women equal rights with men for jobs and protected them from discrimination in public accommodations. Other modifications strengthened the bill by extending the power of the Justice Department to enforce the bill's provisions, prohibiting discrimination in federal programs, and establishing an Equal Employment Opportunity Commission.

Cleared for debate on the House floor on 30 January 1964, H.R. 7152 was debated for almost two weeks and withstood repeated attempts by opponents to add almost one hundred unfriendly amendments to the bill. On 10 February 1964, the House approved the bill by a vote of 290 to 130. Republicans voted 138 to 34 for the bill, and Democrats supported the bill by a vote of 152 to 96. The vote fell along regional lines as virtually all the Southern members of Congress voted against the bill.

Leadership should be born out of the understanding of the needs of those who would be affected by it.

—Marian Anderson

The bill's supporters knew that the House of Representatives battle paled in comparison to the hurdles the bill faced in the U.S. Senate, where individual senators enjoyed more authority to delay or kill bills outright and where the so-called Southern bloc of senators held a larger share of power and influence. No single senatorial privilege is greater than the power of the filibuster, whereby an individual senator can hold up the business of the Senate gain the senate floor and not relinquish it for as long as a senator, or group of senators, can hold the floor by talking unceasingly. To end filibusters, the Senate in 1964 requires a two-thirds vote to invoke cloture, ending debate and scheduling a vote. Although supporters of the civil rights bill held a majority in the U.S. Senate in 1964, they lacked the votes necessary to invoke cloture. The battle for cloture was the most important battle the Civil Rights Act of 1964 faced. To prevent further attempts to kill the bill or delay its debate, bill supporters voted to bypass committee placement and place the bill directly on the senate calendar for a vote—leaving only the cloture battle.

Appointed by President Lyndon B. Johnson to marshal the bill through the Senate, Senate Majority Whip Hubert H. Humphrey (Democrat from Minnesota) directed strategy development for passage of the bill. A liberal with a deep desire to become Johnson's 1964 vice presidential running mate, Humphrey saw successful leadership of the bill as the means of gaining Johnson's trust and establishing himself as a national political leader. Not only did the civil rights bill mean a potential watershed for the rights of African-Americans and for race relations in the United States, it also would go along way in determining the fate of Humphrey's national political aspirations. In short, Humphrey's leadership of the civil rights bill would determine his political legacy.

If Humphrey, in his role as majority whip and floor leader, needed to keep Democratic supporters

Provisions of the Civil Rights Act of 1964 (U.S. Statutes at Large 78 1964: 241)

The Civil Rights Act of 1964 comprises several sections, each addressing a specific area. Title I addressed the unequal application of voting registration procedures and requirements. It mandated that no person could be prevented from voting because of omissions or errors on voter registration forms. It also standardized the application of literacy requirement procedures by requiring that such instruments be administered in writing with a copy of the examination returned to the applicant within twenty-five days. Southern states had, using a strict interpretation of the Fifteenth Amendment, used such literacy tests and registration forms to disfranchise blacks and poor whites from voting. The 1964 law ended that practice.

Title II struck at the heart of Jim Crow segregation laws in the South by barring discrimination in public accommodations such as theaters, restaurants, clubs, hotels and motels that engaged in interstate commerce. Tying the application of this law to interstate commerce provided the government with the authority and reach needed to overcome segregation. Since virtually all businesses engaged in some form of interstate commerce, such as travel, trade, traffic, transportation or communication, few if any areas were left uncovered by the law.

Title III encouraged public school and college desegregation and gave the Justice Department authority to file suits on behalf of those unable to do so in order to force school desegregation, still incomplete ten years after the landmark Supreme Court decision *Brown v. Board of Education* (1954). Title II did not, however, prescribe the means to achieve school desegregation. In the end that task was left to federal judges to order specific school systems to desegregate and to prescribe the methods with which to meet those orders, including the use of busing.

Title IV provided the government with the authority to enforce public school desegregation. The law gave the government the power to withhold federal funds from any public school or institution of higher learning that practiced discrimination in admissions or in the provision of benefits. This remains perhaps the most powerful element of the Civil Rights Act relative to education because of the importance of federal funds to education.

Title V established a Commission on Civil Rights to carry out a host of duties including investigation of claims of discrimination, deprivation of voting rights, appraisal of federal laws and policy with respect to civil rights. The commission was also designed to serve as a clearinghouse regarding equal protection under law.

Title VI forbade discrimination by or within any program or organization that received federal funds, including

any organization that received from the federal government funds in the form of grants, loans, financial aid, contract or any other sort of activity from the federal government. Recipients of such funds could not on the basis of race, creed, color, sex, national origin, or religion exclude individuals from participation, discriminate in enrollment or hiring, or deny benefits.

Title VII prohibited employment discrimination on the basis of race, color, religion, sex, or national origin. No one could be denied an interview or a job on the basis of discriminatory considerations. Nor could businesses or organizations (labor unions were expressly included in the legislation) segregate employees on such considerations. Title VII also created an Equal Employment Opportunity Commission, which began operating on 2 July 1965. The commission monitors employment discrimination claims, federal hiring practices with regard to discrimination, and aids state agencies in preventing employment discrimination on the basis of race, color, sex, creed, national origin, or religion.

Title VIII instructed the Department of Commerce to survey and accumulate statistics on registration and voting in geographic areas recommended by the Commission on Civil Rights. Such statistics included the number of people of voting age by race, color, and national origin, and the extent to which those persons had registered to vote, or had voted in any statewide election in which members of the United States House of Representatives were nominated or elected since 1 January 1960.

Title IX authorized the United States Attorney General to intervene in any case before U.S. court that sought relief from a discriminatory situation if the Attorney General believed that the case was one of general public interest. If the Attorney General intervened in such a case the remedy prescribed by the court would also be applicable to the rest of the nation.

Title X established as part of the Department of Commerce a Community Relations Service to assist those persons seeking relief from a discriminatory situation. The service also was instructed to form relationships with and seek cooperation from the states involved in such actions.

Title XI was a miscellaneous clause that ensured a jury of peers, due process of law and other constitutional guarantees to those individuals brought before the courts accused of violating any of the above Titles. Title XI also authorized Congress to appropriate whatever funds were necessary to carry out the provisions of the law.

—Gordon E. Harvey

organized and on task, he also had to cultivate and court Republican votes. For without Republican votes, the bill would fail to get past a filibuster. Humphrey also had to coordinate a national lobbying program by religious and civic groups to pressure Senators to approve the measure. Key to gaining Republican support for the measure was the support of Senate Minority Leader Everett M. Dirksen (Republican from Illinois). Aiding in this effort was the fact that Republicans were more unified for civil rights than were Democrats in the Senate, and passage of the bill required widespread Republican senatorial support. After more than a hundred votes on the Senate floor on opposition amendments, on 10 June 1964 the Senate voted 71 to 29 to invoke cloture and schedule a final vote for the bill. Among Republicans, twenty-seven voted to support cloture; forty-four Democrats voted in the affirmative. Nay votes were led by twenty-three Southern Democrats and six Republicans, including Arizona Senator George McGovern. This marked the first instance in American history where the Senate had invoked cloture on a civil rights bill. On 19 June 1964, the Senate adopted Civil Rights Bill 73–27. Lyndon Johnson signed the bill into law on 2 July 1964 in a White House ceremony.

AFTERMATH

Following the passage of the Civil Rights Act of 1964 there was marked decline in discrimination, but the nation also witnessed the rise of resistance to the act and its provisions. Many public facilities transformed themselves to private clubs, since the law exempted from coverage such closed institutions. The backlash to the act carried over into national politics as conservatives and segregationists derided the bill while others challenged the bill's constitutionality in federal court. On 14 December 1964 the U.S. Supreme Court upheld the bill's public accommodations provisions as constitutional (*Atlanta Motel v. United States* 1964). The following year, to further address the need for increased voter registration and protection, Lyndon Johnson supported and signed into law the Voting Rights Act of 1965.

CIVIL RIGHTS MOVEMENT

Although most frequently discussed in terms of the years 1954–1964, the civil rights movement for African-Americans in the United States arguably could have begun during the abolition movement to end slavery. Certainly the struggle for civil rights for African-American citizens began following the emancipation from slavery in 1863. Many people were influential in their attempt to gain educational equality, voting rights, and full integration into society.

EARLY LEADERS

African-Americans did not voluntarily immigrate to the United States but rather were forced through slavery to come there. As slaves they were not accorded civil rights as citizens of the country, and in most cases they were not even accorded basic human rights. Abolitionists such as Sojourner Truth and Frederick Douglass fought for an end to slavery and for the establishment of citizenship rights for African-Americans. Civil war ensued (1861–1865) between the North and South over the issue of slavery. During the Civil War, President Abraham Lin-

coln issued the Emancipation Proclamation, freeing all slaves in 1863. As much as this freedom was a step toward progress for African-Americans, it was also a military strategy that supplied the Union Army with soldiers, ensuring the North's victory.

After the war, Thaddeus Stevens and Charles Sumner, leaders of a group in Congress and a larger political group known as the Radical Republicans, pushed Congress to pass civil rights legislation for freed slaves, including the Civil Rights Act of 1866, which granted full citizenship to those born in the United States and thereby allowed for entering into contracts, the ability to sue and be sued, provide evidence in court, and private property rights. The follow-up Civil Rights Act of 1875 guaranteed equal accommodation for blacks and whites in public facilities other than schools; the fourteenth amendment to the Constitution (1868) provided for equal protection under the law; and the fifteenth amendment (1870) guaranteed the right to vote regardless of race. Under their Reconstruction Act, despite southern retaliation and violence, some political and civil rights progress occurred. Blacks began to participate in the political process, to hold political offices, serve on juries, and work in federal positions. The Radical Republican leadership was marked by their uncompromising belief in full and immediate civil rights for freed slaves, which often brought them into intense opposition with presidential authority. The Compromise of 1877 formally ended Reconstruction (1865–1877) and any federal protection of the civil rights of African-Americans. In 1883, the Supreme Court overturned the Civil Rights Act of 1875, claiming it was unconstitutional.

Black leaders carried on the struggle for civil rights despite the absence of federal assistance. Booker T. Washington (1856–1915) founded the Tuskegee Institute in 1881, a training school for blacks in Alabama that became internationally known. Washington favored accommodating southern ideas about blacks and therefore placed an emphasis on industrious behavior to achieve progress rather than full civil rights. He came to wield much power, seen as an acceptable spokesperson for the needs of African-Americans and only pri-

vately supporting civil rights causes. Despite the popularity of Washington and his non-threatening approach, however, blacks were still subject to extreme violence, murders, and especially lynching by whites. Jim Crow laws brought an increase in disenfranchisement, the repeal of civil rights, and increasing segregation. By 1896, in the case of *Plessy v. Ferguson*, segregation became law under the “separate but equal” doctrine.

Not all black leaders chose to accept the accommodating philosophy of Booker T. Washington. Ida B. Wells (1862–1931) became a writer for several newspapers, attacking the policies of segregation and disenfranchisement, and then in 1889 became editor and co-owner of the *Free Speech and Headlight*. She launched an influential national and eventually an international campaign against lynching and helped found the National Association for the Advancement of Colored People (NAACP).

W. E. B. Du Bois (1868–1963), author of *The Souls of Black Folk* (1903), was openly critical of Booker T. Washington for accepting less than full equality. Du Bois was influential as an intellectual of his time and held a teaching position at Atlanta University. He was also one of the founders of the Niagara Movement in 1904, the first black civil rights organization. The Niagara Movement was a precursor to the NAACP, founded in 1909 by Du Bois, Wells, Mary White Ovington, and others. Du Bois resigned from Atlanta University to become editor of *The Crisis*, the NAACP’s newspaper.

The early years of the NAACP focused on an anti-lynching campaign. Walter White (1893–1955) became chief investigator of lynchings, traveling throughout the South, passing for white and speaking with locals to gather information on these murders. White became president of the NAACP in 1929. Under his leadership, not only lynching but also the issue of segregation was addressed. By the 1900s segregation had moved into almost every segment of life throughout the country, including President Woodrow Wilson’s segregation of federal institutions. After Franklin Roosevelt became president in 1933, First Lady Eleanor Roosevelt (1884–1962) worked closely with White and others on civil rights issues. Eleanor Roosevelt became a lifelong cham-

pion for civil rights and in 1945 served on the NAACP Board of Directors.

Eleanor Roosevelt was greatly influenced by her friendship with Mary McLeod Bethune (1875–1955), who founded the Daytona Institute for black girls in 1904. In 1924 Bethune was president of the National Association of Colored Women and in 1935 founded the National Council of Negro Women. Women’s associations were instrumental in civil rights struggles. Bethune’s civil rights work through women’s clubs led her to other prominent positions. She became the first black woman to run a federal agency when she was appointed to the National Youth Administration, and in 1940 she served as vice president of the NAACP.

FIGHTING THE LEGAL BATTLES

Walter White appointed Charles Houston (1895–1950), dean of Howard University Law School, as chief legal counsel for the NAACP in 1935 for the purpose of addressing the legacy of the earlier doctrine of “separate but equal” institutions for blacks. Houston realized that one way toward ending segregation would be to force the issue of separate institutions where there were none. Houston had already documented the conditions of separate schools in

W. E. B. Du Bois's Criticism of Booker T. Washington

Mr. Washington represents in Negro thought the old attitude of adjustment and submission; but adjustment at such a peculiar time as to make his programme unique. This is an age of unusual economic development, and Mr. Washington's programme naturally takes an economic cast, becoming a gospel of Work and Money to such an extent as apparently almost completely to overshadow the higher aims of life. Moreover, this is an age when the more advanced races are coming in closer contact with the less developed races, and the race-feeling is therefore intensified; and Mr. Washington's programme practically accepts the alleged inferiority of the Negro races. Again, in our own land, the reaction from the sentiment of war time has given impetus to race-prejudice against Negroes, and Mr. Washington withdraws many of the high demands of Negroes as men and American citizens. In other periods of intensified prejudice all the Negro's tendency to self-assertion has been called forth; at this period a policy of submission is advocated. In the history of nearly all other races and peoples the doctrine preached at such crises has been that manly self-respect is worth more than lands and houses, and that a people who voluntarily surrender such respect, or cease striving for it, are not worth civilizing.

1935, and he knew that they were not equal. He also knew that most states did not have separate graduate or professional schools for blacks and so decided to proceed with higher education cases.

In the first case, Donald Gaines Murray won the right to attend the University of Maryland in 1935. Houston's student Thurgood Marshall (1908–1993) helped argue this case, and the two worked together in future cases, Marshall eventually replacing Houston as chief legal counsel for the NAACP. Houston and Marshall's next case was especially significant, as it was argued in front of the U.S. Supreme Court in 1938. Lloyd L. Gaines had been denied admission to the University of Missouri Law School. The Supreme Court ruled in favor of Gaines's admission, a victory for educational integration.

One of the most significant cases to end educational segregation in secondary schools began with the actions of a young student. In 1951, sixteen-year-old Barbara Johns (1935–1991) organized a strike protesting the inadequate conditions in her school in Virginia. She arranged for an assembly without the principal or teachers present and convinced 450 other students to strike. They maintained the protest for two weeks. Johns addressed the Board of Education and contacted the NAACP for assistance. The NAACP presented the case in federal court in 1953 (*Davis v. The County School Board of Prince Edward County*). Although experiencing defeat at the federal level, the NAACP then combined this case with similar cases and appealed to the Supreme Court. This in turn became the landmark decision of *Brown v. Board of Education* (1954), which effectively struck down the separate but equal doctrine.

Even though school desegregation became law in 1954, there was still resistance to carrying this out on a local level. In 1957, courage and leadership challenged the Little Rock, Arkansas, school system's noncompliance. A group of students, who came to be known as the Little Rock Nine, integrated Central High School. Federal intervention became necessary because of violence by local whites and the Arkansas governor's fierce rejection of the integration plan, including his use of the Arkansas National Guard to prevent the black students from entering the school. Daisy Bates became an organizer and guardian of the students, gathering them at her house so they could be escorted to school by federal troops. Bates had been involved in civil rights as president of the Arkansas NAACP in 1952 and, with her husband, owned the *Arkansas State Press*, which addressed civil rights issues.

LEADERS OF THE CIVIL RIGHTS MOVEMENT IN THE 1950s AND 1960s

Many of the events of the civil rights movement were organized and influenced by women and local leaders. The literature on leadership has begun to recognize the contributions of previously overlooked leaders. Women have played an important role throughout the civil rights struggles, as evidenced by

the work of specific individuals, women's clubs, and political organizations. Local leaders have initiated and sustained movement activities, including negotiation with or resistance to the local power structure, placing them at risk without media attention or federal intervention.

The Montgomery Bus Boycott of 1955–1956, the first significant protest of the later civil rights years, illustrates the involvement of women and local leaders. This boycott was developed by Jo Ann Robinson (1912–1992). Many women had been thrown off Montgomery, Alabama, buses when they defied segregation, including Robinson herself. When Robinson was president of the Woman's Political Council she formulated plans for a boycott to coincide with a solid legal case to be taken to court. Rosa Parks was chosen by local NAACP leader E. D. Nixon as a woman whom he felt would make a strong legal case against transportation segregation. In December 1955, Parks, a secretary for the NAACP, made a conscious decision to resist being moved from the front of the bus, which was set aside as a “whites only” area. As soon as Parks was arrested, Robinson made handbills to publicize the boycott and Nixon contacted the Reverend Ralph Abernathy, as well as other local ministers and the press, for more publicity. After the success of the one-day boycott, the local ministers called a meeting to decide whether to continue the strike. From that meeting the Montgomery Improvement Association (MIA) was created, and Dr. Martin Luther King Jr. was elected president. In his new role as head of this organization King spoke to a large crowd gathered to vote on the continuation of the strike. The Montgomery Bus Boycott was successful after a thirteen-month boycott. The Supreme Court ruled against transportation segregation in 1956.

The Charismatic Leadership of Martin Luther King Jr.

Coming into the movement at the time of the Montgomery Bus Boycott, Dr. Martin Luther King Jr. (1929–1968) went on to become one of the most prominent national leaders of the civil rights movement. King fits the definition of the charismatic leader much discussed in the literature on leadership qualities. He was most known for his powerful

I glory in conflict that I may hereafter exult in victory.

—Frederick Douglass

speeches, including the famous “I Have a Dream” speech given at the March on Washington in 1963. King became a focus for the media, thereby increasing visibility for the struggle every time he led a march, was arrested, or spoke out on civil rights.

King's philosophy of nonviolence became a crucial strategy and hallmark of the civil rights movement. He had been guided to accept this philosophy through his contact with Reverend Glenn Smiley, Bayard Rustin, and James Lawson of the Fellowship of Reconciliation (FOR) and their application of the teachings of Indian leader Mohandas Gandhi. King's adoption of nonviolent principles infused the quality of his leadership, and he was awarded the Nobel Peace Prize in 1964. As president of one of the major civil rights organizations, the Southern Christian Leadership Conference (SCLC), King exerted much influence on the direction of the movement. Martin Luther King Jr. was assassinated on 4 April 1968, becoming a martyred hero of the civil rights movement.

RELIGION AND LEADERSHIP IN THE MODERN CIVIL RIGHTS MOVEMENT

The civil rights years of the 1950s and 1960s appear to be interwoven with religion through its leaders and their ability to shape philosophies and tactics. Scholars and activists have acknowledged the significance to the movement of black churches in creating spaces to meet and providing an organizational network. The Reverend T. J. Jemison, one of the founders of the SCLC, noted that the organization was created to highlight the leadership of the Baptist church, which set the SCLC apart from the NAACP. The SCLC was influenced by Christian ideals and brought in a moral imperative for change in the status of black citizens. That the most well known leader, Martin Luther King Jr., was a minister certainly had an impact on bringing a feeling of religiosity to the movement. His speeches and writings evoked spiritual images.

Selection from *Brown v. Board of Education*, 347 U.S. 483 (1954)

We come then to the question presented: Does segregation of children in public schools solely on the basis of race, even though the physical facilities and other “tangible” factors may be equal, deprive the children of the minority group of equal educational opportunities? We believe that it does.

In *Sweatt v. Painter*, supra, in finding that a segregated law school for Negroes could not provide them equal educational opportunities, this Court relied in large part on “those qualities which are incapable of objective measurement but which make for greatness in a law school.” In *McLaurin v. Oklahoma State Regents*, supra, the Court, in requiring that a Negro admitted to a white graduate school be treated like all other students, again resorted to intangible considerations: “. . . his ability to study, to engage in discussions and exchange views with other students, and, in general, to learn his profession.” Such considerations apply with added force to children in grade and high schools. To separate them from others of similar age and qualifications solely because of their race generates a feeling of inferiority as to their status in the community that may affect their hearts and minds in a way unlikely ever to be undone. The effect of this separation on their educational opportunities was well stated by a finding in the Kansas case by a court which nevertheless felt compelled to rule against the Negro plaintiffs:

Segregation of white and colored children in public schools has a detrimental effect upon the colored children. The impact is greater when it has the sanction of the law, for the policy of separating the races is usually interpreted as denoting the inferiority of the negro group. A sense of inferiority affects the motivation of a child to learn. Segregation with the sanction of law, therefore, has a tendency to [retard] the educational and mental development of negro children and to deprive them of some of the benefits they

would receive in a racial[ly] integrated school system.

Whatever may have been the extent of psychological knowledge at the time of *Plessy v. Ferguson*, this finding is amply supported by modern authority. Any language in *Plessy v. Ferguson* contrary to this finding is rejected.

We conclude that, in the field of public education, the doctrine of “separate but equal” has no place. Separate educational facilities are inherently unequal. Therefore, we hold that the plaintiffs and others similarly situated for whom the actions have been brought are, by reason of the segregation complained of, deprived of the equal protection of the laws guaranteed by the Fourteenth Amendment. This disposition makes unnecessary any discussion whether such segregation also violates the Due Process Clause of the Fourteenth Amendment.

Because these are class actions, because of the wide applicability of this decision, and because of the great variety of local conditions, the formulation of decrees in these cases presents problems of considerable complexity. On reargument, the consideration of appropriate relief was necessarily subordinated to the primary question—the constitutionality of segregation in public education. We have now announced that such segregation is a denial of the equal protection of the laws. In order that we may have the full assistance of the parties in formulating decrees, the cases will be restored to the docket, and the parties are requested to present further argument on Questions 4 and 5 previously propounded by the Court for the reargument this Term. The Attorney General of the United States is again invited to participate. The Attorneys General of the states requiring or permitting segregation in public education will also be permitted to appear as amici curiae upon request to do so by September 15, 1954, and submission of briefs by October 1, 1954.

It is so ordered.

Although nonviolence was adopted from the teachings of Gandhi, the theory and practice was embraced as an approach compatible with the religious perspective of leading civil rights leaders in the United States. Besides the Baptist leaders of the Southern Christian Leadership Conference, many leaders from other denominations eventually became involved in the civil rights struggle. Leaders sometimes utilized religion in their movement tactics, such as staging pray-ins and adapting spirituals to express movement messages. Certainly not all organizations within the movement were religious in

nature, nor did they all engender religious principles. The moral appeal of the civil rights movement, however, and the use of nonviolence in the face of brutality were strong spiritual aspects of the movement that had an impact on society and eventually on the success of some movement goals.

1963 MARCH ON WASHINGTON . . . AND MILES TO GO

In the early 1960s, civil rights leaders began to believe that a large event was needed that would

provide organizing on a mass scale and visibility and articulation of the movement's agenda on a national stage. A. Philip Randolph (1889–1979) had previously proposed a march on Washington in 1941 during the Roosevelt administration. Roosevelt gave in to the movement's wartime employment demands thereby circumventing the need for the march. But in 1963 a march was held, despite the initial reservations of President John F. Kennedy. Randolph organized the march and Bayard Rustin (1912–1987) served as deputy director. Both Randolph and Rustin had been active in other organizations and civil rights actions and were top advisors to King. The March on Washington was a success and drew 250,000 people, with leadership coalitions that were interdenominational, interracial, and included powerful interest groups such as labor. Some believe that pressure from the march resulted in the Civil Rights Act of 1964 and the Voting Rights Act of 1965.

Although the march was a success on a national level, on the local level violence and resistance remained intense, at times culminating in tragic deaths. Medger Evers, a field secretary for the NAACP in Mississippi who had organized boycotts and voter registration drives, was shot in 1963. Weeks after the march, a church bombing by Ku Klux Klan members in Birmingham, Alabama, killed four girls. The dead bodies of missing civil rights workers Andrew Goodman, Michael Schwerner, and James Chaney became a symbol of the reign of terror that still existed in the Deep South. Many others were killed and injured as well. There was still a need for activist leaders to secure voter rights and enforce desegregation, especially in parts of the South. Students and local leaders were instrumental in this aspect of the civil rights movement.

STUDENT LEADERS

Student leaders were influential through their engagement in direct action tactics, providing gains that otherwise may not have occurred. Beginning in 1961, students staged sit-ins and initiated the integration of lunch counters. Many students became involved in the civil rights movement through their involvement with sit-ins, and the Student Nonviolent

Coordinating Committee (SNCC) emerged out of the popularity and effectiveness of sit-ins.

Although she was not a student herself, it is fitting to mention civil rights leader Ella Baker (1903–1986) in conjunction with the student movement. Her philosophy of participatory democracy and development of local grassroots leadership found its greatest expression in her advisory role with SNCC. She played an integral part in SNCC's formation. She also had significant organizational involvement in the NAACP and the Southern Christian Leadership Conference, which she had helped found. In 1943, as director of branches for the NAACP, she developed leadership training and pushed for more local involvement.

Members of SNCC and the Congress of Racial Equality (CORE) coordinated the Freedom Ride in 1961, which challenged transportation segregation. James Peck, Diane Nash, and James Farmer, executive director of CORE, organized bus rides through the South, gathering together an interracial group. They brought national attention and federal action to the issue due to the violent opposition they encountered. The Freedom Riders succeeded in integrating buses and bus stations throughout the South.

John Lewis, the chair of SNCC, and James Forman, its executive director, and others decided to attempt civil rights work in the state of Mississippi in 1964. SNCC organized the Freedom Summer Project, with some collaboration from CORE and student volunteers from the North. The objectives of the project were voter registration, establishment of freedom schools, and the creation of the Mississippi Democratic Freedom Party (MDFP), an alternative to the all-white Democratic Party in Mississippi. Bob Moses and local leader Amzie Moore organized the voter registration drive. Student volunteers and SNCC workers staffed the freedom schools. Delegates for the MDFP came from local leadership, such as Aaron Henry, NAACP president in Mississippi and the outspoken Fannie Lou Hamer. Student leaders faced extreme danger in Mississippi, yet they accomplished the goals of Freedom Summer by registering voters, establishing schools, and bringing awareness to the need for political representation through the creation of the MDFP.

A CHANGE IN LEADERSHIP AND GOALS

The civil rights movement came to an end partly because of changes in leadership philosophies. Malcolm X, although assassinated in 1965, had planted the seeds of a black separatist movement before his death. Some civil rights leaders, such as Stokely Carmichael, member and later chair of the Student Nonviolent Coordinating Committee, began to advocate militant goals and tactics, creating a new group called the Black Panther Party. The movement ceased also when it had accomplished some of its goals with the signing of the Civil Rights Act of 1964 and the Voting Rights Act of 1965. Yet, despite many gains stemming from civil rights leaders and the existence of civil rights laws, African-Americans still face discrimination. Organizations such as the NAACP continue to fight for the enforcement of hard-won civil rights.

COACHING

The phrase “greatness in coaching” conjures many images. There is Vince Lombardi stalking the sidelines, extolling his players; the reserved John Wooden quietly watching his team dismantle opponents; the boastful and vociferous Percy Cerutti, who preached the value of a Spartan lifestyle; James E. “Doc” Counsilman, whose athletic facilities were as much a laboratory as a place to train; Pat Summit, who has demonstrated that great coaching is not gender-specific; and Brutus Hamilton, whose selection as head coach of the United States Track and Field Team at the 1952 Olympics had as much to do with his dig-

nity and poise as with his ability to bring out the best in each athlete. In spite of the diverse personalities and styles of great coaches, a closer look reveals that they share certain common leadership qualities. By examining these qualities more closely in the light of coaching and leadership theories, this entry creates an integrated model for effective coaching leadership.

Under the umbrella of social psychology, cognitively based leadership models appeared in the mid 1970s, and in the mid 1980s the theory of transformational leadership, which now dominates leadership research, was developed by political scientists. Not surprisingly, discussions of leadership in sports followed a similar path. In 1994, W. J. Weese reported that “leadership has become the most ‘popular’ subject in the field of Sports Management.” However, to date, no one has attempted to develop a comprehensive model of leadership in coaching.

THE COACHING LEADERSHIP MODEL

The ultimate goal of all coaches is to generate positive transformations in an athlete or group of athletes. The foundation of these transformations lies in the coach/athlete relationship, and both participants have to work together in order to achieve the desired changes. The defining feature that separates great coaches from others is the ability to achieve these positive transformations consistently. In spite of inconsistencies such as personnel changes, assistant coach changes, support staff and management changes, rule changes, equipment changes, and league changes, great coaches manage to influence their athletes in positive ways.

In this model, a coach must first inspire an athlete to “buy in” to a particular concept, vision, or organizational goal. This can be done in either a personal manner or by using the format and characteristics of the team. The athlete then becomes enthusiastic about the sport and the challenges of training and competition. This enthusiasm provides the energy which, in turn, allows for the work required to make the necessary changes. However, hard work is not enough. This work must be well directed and imaginatively taught by the coach in order for positive results to occur. In this model, the coach has two pri-

mary responsibilities. The first is to inspire the athlete to “buy in.” The second is to imaginatively guide and teach athletes once they have fully committed to the goal. Coaches will vary their approaches based on personal strengths and the unique circumstances of their particular challenge. However, a firm understanding of leadership theory and research can help coaches achieve success in these two areas of responsibility.

Inspiring Athletes

Great coaches are extremely successful at mobilizing their athletes. They possess great capacity to inspire. This capacity is perhaps one of the most overlooked or misunderstood qualities possessed by all great coaches. In sports the term *inspiration* is often used to describe fiery half-time speeches, such as the “Win one for the Gipper” offered to Knute Rockne’s Fighting Irish football team, or a singular physical effort put forth by one particular athlete or team, like the U.S. Men’s Olympic Hockey team when it defeated the Russians in 1980. However, the inspiration required for greatness in athletics must be omnipresent, constantly fueling the athletes’ enthusiasm. It must be deeply imbedded in the athletes and motivate them every day, at every practice, in every play.

In some instances, coaches have proven themselves to be personally inspiring. Their manner and personal characteristics impact their teams in such a way that the team begins to reflect and amplify that coach’s personality. One of the most notable charismatic coaches was Vince Lombardi. A man of dignity and passion, Lombardi would preach to his men, “The quality of a man’s life is in direct proportion to his commitment to excellence, regardless of his chosen field of endeavor.” Lombardi’s teams reflected this attitude in every practice and in each play of every game. As well, many of Lombardi’s players reported that their coach’s words and his credo dramatically impacted the way they lived their entire lives, on and off the football field.

In contrast to Lombardi’s personally charismatic style of leadership, John Wooden used his “pyramid of success” as a system for inspiring athletes. It has been noted that Wooden, “a soft-spoken man of Mid-

western heritage, ingrained with old-fashioned salt of the earth ideals and values” (Walton 1992, 45) often had difficulty relating to some of his players personally in the 1960s and 1970s, particularly to some minority players. In fact, Wooden appeared to be so disconnected from the values of southern California in the mid 1960s that Jim Murray, a *Los Angeles Times* correspondent, was inspired to write, “He’s so square, he’s divisible by four” (Chapin & Prugh 1973, 320). Yet every athlete was inspired to play for UCLA and trusted the system that Wooden had created. Regardless of their personal feelings about their coach, every athlete respected the system, believed in the system, and was inspired to achieve athletic greatness. The result was an unprecedented string of ten NCAA Basketball Championships in a twelve-year period.

Wooden’s tactics differed greatly from Lombardi’s. Both coaches utilized their personal strengths. These strengths were unique to the man, but the results were the same. The athletes on both teams were inspired to work hard and pursue excellence. Woody Hayes may have said it best when he said, “The will to win is not nearly as important as the will to prepare to win.” On game day, everyone is motivated, everyone is inspired. Great coaches are those who inspire during the essential periods of preparation, away from the thrill of crowds and competition. The coaches that motivate their athletes to work hard during these periods are the ones who consistently meet with success.

Transforming Athletes

Early leadership theory looked at the traits of great leaders, including physical stature and vocal force, for “leaderlike qualities.” Contingency theories attempted to develop functionally applicable models to help leaders understand how to behave given a certain set of circumstances. Cognitive theories later attempted to study how follower perceptions and biases affected leadership efficacy. However, something seemed to be lacking in all these theories. They were unable to explain how one leader could transcend extremely difficult circumstances and mobilize an organization or team to greatness while another

leader failed. In 1977, R. J. House published a theoretical analysis of charismatic leaders, analyzing how men such as Gandhi and Martin Luther King had managed to elicit such extraordinary levels of devotion and commitment from followers. The following year, James MacGregor Burns wrote a book in which he differentiated between transactional leaders, whose relationship to followers was based on mutually beneficial transactions, from *transformational* leaders, “who influenced followers to transcend personal interests and transform themselves into agents of collective achievement” (Chemers 2000, 35). B. M. Bass expanded upon Burns’s theory of transformational leadership, developing the multi-multifactor leadership questionnaire, which yielded seven leadership factors. Of these seven factors, three transactional factors were associated with low levels of follower motivation and poor leadership effects, and the following four transformational factors were associated with high levels of subordinate motivation and organizational success:

1. idealized influence (charisma)—reflects extremely high levels of leader competency, trustworthiness, or both;
2. inspirational motivation—involves the articulation of group goals in emotional, moral, or visionary terms;
3. intellectual stimulation—encourages followers to think independently and creatively, continually challenging the status quo; and
4. individualized consideration—possess a comprehensive understanding of each follower’s situation and desires.

In his 1992 book *Beyond Winning, The Timeless Wisdom of Great Philosopher Coaches*, economic history scholar Gary Walton included the following characteristics in his description of great philosophical coaches:

1. Committed to individual integrity and personal growth.
2. See themselves as educators.
3. Well-educated (formally or informally).
4. Have a long-run commitment to their athletes and institutions.

5. Willing to experiment with new ideas.
6. Value the coach-player relationship, winning aside.
7. Understand and appreciate human nature.
8. Love their sport and their work.
9. Honest and strong in character.
10. Human and therefore imperfect.

These characteristics, embodied by great coaches like Vince Lombardi and Woody Hayes and Brutus Hamilton, would also comfortably describe John F. Kennedy, Earnest Shackleton, or Joan of Arc. In Burns's words, great teams are the ones that transcend personal interests and transform themselves into agents of collective achievement. Great coaches are those who inspire athletes to do just that. An understanding of transformational leadership can help coaches be more successful in achieving this goal.

THE ROLE OF TRUST

As the volume of transformational leadership research continues to grow, certain aspects of leadership behavior are starting to distinguish themselves as essential to leadership success. Several studies (Hogan, Curphy, & Hogan 1994; Yukl 1998; Dirks 2000; & Judge and Bono 2000) indicate that trust in one's leader mediates the effects of transformational leadership and leader efficacy. Kurt T. Dirks (2000) reports that "trust in leadership allows team members to suspend their questions, doubts and personal motives and instead throw themselves into working towards team goals" (p. 1011). Judge and Bono note that "agreeableness," which consists of tendencies to be kind, gentle, trusting, and trustworthy, elicits the strongest relationship between transformational leadership and the five-factor model of personality.

Agreeableness is also the trait most strongly associated with charisma. Hogan et al. (1994) define leadership as persuasion, not domination, and state that "a leader's credibility or trustworthiness may be the single most important factor in subordinates' judgment of his or her effectiveness" (p. 497). It should also be noted that the first of Bass's four fac-

tors, idealized influence, cites high levels of leader competency and trustworthiness as essential aspects of transformational leadership. Thus, while some leaders will have "position power" based on their title and the official capacity to reward and punish followers, this power lacks the strength to inspire followers to transcend personal concerns and become agents of collective achievement. Because the trust of followers is the key to legitimizing a leader's power, coaches should do everything within their power to foster the trust of their athletes. Only when a coach obtains an athlete's complete trust will the athlete truly "buy in" and be inspired to work selflessly toward team goals.

THE ROLE OF ENTHUSIASM AND INDUSTRIOUSNESS

John Wooden listed enthusiasm and industriousness as the foundational cornerstones of his "pyramid of success." Enthusiasm provides the energy that fuels the work, which, when well directed, results in positive transformations. Without athletes who are enthusiastic about their sport and the challenges before them, it is unlikely that any coach will succeed. Wooden spoke of enthusiasm as a window to the heart of each athlete. He stated, "On the other side of the Pyramid foundation is my second powerful cornerstone: enthusiasm. By that I mean simply that you have to like what you're doing; your heart must be in it. Without enthusiasm you can't work up to your fullest ability" (Walton 1992, 47). In Wooden's mind, it is the love of hard work, of the sport itself, and of the challenges that one's sport presents which fuels the consistent efforts necessary for success in athletics. Just as inspiration is an essential component of successful leadership, enthusiasm is a crucial characteristic of successful athletes. It is the spiritual fuel that drives the work necessary for positive transformations. Yet Wooden and other notable coaches differentiate between hard work and "industriousness."

Wooden was quick to point out, "You can work without being industrious, but you cannot be industrious without work." To Wooden, the term "industrious" described the most conscientious, assiduous, and inspired type of work. It is interesting to note

Brutus Hamilton on Coaching

Brutus Hamilton coached the 1952 U.S. Olympic men's track team, which garnered an amazing fourteen gold medals. Below he explains his formula for successful coaching.

I wish I could point out some easy road, some primrose path up the road to athletic success. But after more than thirty years of coaching young men, I'm afraid that I have nothing more romantic to suggest than creating within the athletes an interest and enthusiasm for the events...then directing that interest and enthusiasm along the lines of sound fundamentals, taught imaginatively, intelligently, purposefully and inspirationally. It sounds rather easy and simple, but it isn't.

Source: Walton, Gary. (1992). *Beyond Winning: The Timeless Wisdom of Great Philosopher Coaches*. Champaign, IL: Leisure Press.

that Wooden himself used the term “inspired work” to describe the first foundational cornerstone of his pyramid.

Brutus Hamilton also referred to directing work inspirationally. Hamilton remarked that success in coaching is a result of imbuing one's athletes with enthusiasm and “then directing that interest and enthusiasm along the lines of sound fundamental, taught imaginatively, intelligently, purposefully and inspirationally” (Walton 1992, 121). It is here that the second primary function of our coaching model—to imaginatively guide and teach athletes once they have fully committed to the goal—asserts itself. Once the athletes have committed to applying themselves to a goal, it is up to the coach to guide the athlete's work in a manner that will ensure industriousness.

APPLYING CONTINGENCY AND COGNITIVE LEADERSHIP THEORIES

People who possess the capacity to truly inspire others are unique. They own a rare set of skills that allows them to generate a vision, to communicate that vision, and to interact with others in a manner that engenders trust and encourages people to “buy in” to that vision. If a coach can do this, he or she

will be rewarded with a group of highly motivated athletes. However, inspiring others is only the first step in coaching leadership. Athletes who are enthusiastic about working hard are essential to athletic success, but do not ensure it. To achieve success, coaches must guide that work towards the accomplishment of team goals.

To be effective, coaches must possess another specific set of skills. They must be extremely knowledgeable (well-educated either formally or informally in all aspects of their sport); well-organized (so they can develop an effective plan of action to achieve their vision); excellent communicators (so they can convey that plan and effectively manage people); and persistent (in possession of the will and energy to overcome any obstacle and respond to any challenge undaunted).

One researcher points out that “once a leader has established credibility and mobilized follower motivation, the resultant energies, knowledge, skill and material resources must be harnessed and directed to achieve success in the group's mission” (Chemers 2000, 39). He cites two components as essential aspects in the achievement of this goal: follower empowerment and an effective match of resources with situational demands. Both aspects are heavily influenced by contingency and cognitive leadership theories.

Empowerment: Helping People Achieve Their Potential

The third factor associated with effective leadership in Bass's theory, intellectual stimulation, indicates that encouraging followers to think independently and creatively and to move away from past ideas and limitations leads to greater success. Creativity is essential if coaches are to advance a sport. James E. Counsilman, head coach of the Indiana University swimming team and author of *The New Science of Swimming* (1994) was one of the most prolific innovators in any sport. Counsilman made advances in every area possible. In training he revolutionized the sport by introducing “intervals” as a means of increasing the quality of the swim workouts without overtaxing the swimmers' energy systems. In technique he altered certain stroke patterns of for greater efficiency. He developed sport-

specific weight-training devices for both his swimmers and Bobby Knight's basketball players. In short, Doc, as he was called, was a tireless innovator, always thinking of a better way to do things. He may have put it best when he said, "There are people who advance our sport. Other people, less inspired and creative, adopt their techniques" (Walton 1992, 79). It is clear that empowering independent and creative thinking is good for a team or organization. The question then becomes, "How do you do it?" Research on both contingency and cognitive leadership theories offers some concrete suggestions about how to empower others.

Leader self-confidence encourages creativity. Cognitive theory indicates that leaders who are self-confident are more receptive to suggestions from subordinates. Coaches lacking in self-confidence tend to see suggestions as challenges to their authority. When suggestions are perceived this way, reactions tend to be defensive and nonproductive. Coaches who possess confidence in their ability to lead tend to welcome suggestions, which empowers their assistant coaches and athletes to be creative. For example, Phil Jackson is credited with bringing the "triangle offense" to the NBA. Running this offense in both Chicago and Los Angeles resulted in seven World Championships. However, the triangle offense is not Jackson's creation. Assistant coach Tex Winter developed this offense and was the primary teacher during Jackson's tenure in Chicago. The concept of this offense had been in existence for years and it had been utilized in leagues other than the NBA. It took a man of both vision and self-confidence to allow an assistant coach to design and teach the offense. Coaches who eagerly accept suggestions from assistants and athletes are likely to double, even quadruple, the creative output of the organization.

Perceived motivational climate is another cognitive factor that leads to athlete empowerment. Recent research has shown that compared to a "performance climate," which emphasizes competitive outcomes, a "mastery climate," which focuses on achieving excellence, significantly reduces that amount of negative athlete stress—a primary cause of athlete burnout. Many will argue that the current national obsession with performance and victory at all levels of competitive sports would prevent coaches from

adopting this type of motivational climate. However, when reviewing the histories of great coaches it is clear that winning was not their ultimate focus. Lombardi once said, "The quality of a man's life is in direct proportion to his commitment to excellence, regardless of his chosen feel of endeavor" (Walton 1992, 15). Famous Packer quarterback Bart Starr reflected on this statement:

I consider this to be the finest statement he ever made to the Packer squad. It is typical of the man: direct, sharp, inspirational, encompassing. Notice that the word "football" is not mentioned. He never treated football as an end result, but rather a means to an end. He was concerned with the full, total life. It emphasized his commitment and flaming desire to excel. . . . He was also compassionate and understanding. For he recognized that absolute perfection is never obtainable. . . . as he put it "The will to excel and the will to win, they endure. They are more important than the events that occasion them. (Walton 1992, 16)

Lombardi's statements clearly indicate that he favored a mastery climate over a performance climate, and Starr's reaction to his words demonstrates the profound effect this philosophy had on him and the entire Packers team.

Deployment: Matching Resources with Situational Demands

In recent years the NFL Draft has become a widely publicized event. The draft order is determined by the teams' records from the prior year; the worst teams are given first choice. Teams are given five minutes to select an athlete. A team that fails to select in the allotted period forfeits its selection. Teams are also permitted to alter their selection ranking by trading with other teams. From a contingency perspective, the draft is very interesting. Teams have two basic choices. They can opt to select the player that best suits their needs in a given position, or they can select the "best player on the board," regardless of the player's position. Those who opt to fill positions are attempting to meet the needs of a predetermined vision for their team. Those who choose to select the best athlete must be willing to alter their team concept based on the par-

ticular skills and talents of the players they select. Those are the choices that all leaders must make. They can either select people who are well suited to the required tasks and leadership style of an organization, or they can alter their organization and leadership style in a manner that best suits the skills and talents of the followers. Effective leadership typically involves a well-balanced combination of both.

It has been documented that leadership style can have a strong effect on the productivity of a team. Contingency theories argue that certain styles of leadership result in greater success in certain specific contexts. The life-cycle model suggests that a leader will alter his or her style based on the maturity of the followers. In this model the followers are said to move through four stages of leadership readiness: unready, ready, mature, and professional. Supporters of this model argue that as maturity levels increase, leaders should shift their style from more autocratic to more democratic. It is also suggested that as follower maturity increases, leader behavior should become less task-oriented and more relationship-oriented. Placing this in sport-specific terms, it makes sense that a coach for a high school baseball team would approach his duties differently than a manager at the professional level.

Research comparing team-sport athletes to individual-sport athletes indicates that athletes in independent sports (like running, swimming, and skiing) preferred more democratic behavior and less autocratic behavior than athletes in interdependent sports (like hockey, soccer, and basketball). Cognitive theories have also contributed in this area. P. C. Terry suggested that female athletes preferred more democratic behavior and relation-oriented leadership, while males preferred autocratic behavior and training-related leadership. It seems clear that an understanding of contingency and cognitive leadership theories can improve coaching effectiveness.

CHOOSING A PERSONAL LEADERSHIP STYLE

Coaches need to realize that there is not just one successful leadership style. Coaching styles will vary depending on the makeup of the coach and the circumstances of the particular coaching challenge.

What remains constant is that the foundation of successful coaching lies in the coach-athlete relationship, the conduit through which every facet of effective coaching behavior flows. Our model suggests that there are two main factors associated with effective coaching: inspiring athletes to set aside personal interests in favor of becoming agents of collective achievement, and effectively guiding the energy of enthusiastic athletes toward the achievement of the desired goal. A thorough understanding of leadership theory can help coaches meet these challenges. Coaches can only inspire if they are acutely aware of each individual athlete's circumstances and needs. As well, they will only be able to effectively match athletes and training to the needs of the team if they have a complete understanding of the strengths, weaknesses, and desires of each athlete. The most recent school of leadership thought, transformational theory, lights the way to athlete inspiration and offers suggestions about how to empower athletes. Contingency and cognitive theories offer practical suggestions about which leadership styles are best suited for a coach's particular situation. The coaches who understand these leadership principles will possess another tool that will help them in their pursuit of excellence.

COALITIONS

In the world of political leadership, bigger is almost always better. For democratic processes, successful leaders must engage public will, community voices, and individual votes. In more autocratic environments, top-down leaders demonstrate their power through mobilizing large numbers of followers who represent many different interest groups. Similarly, leaders who resist the powers that be (whether they are loyal opposition or insurgents) know they must demonstrate broad support to be taken seriously. These leaders build power bases and enhance their effectiveness by creating coalitions made up of individuals and organizations with similar goals and interests. The word *coalition* comes from the Latin word *coalescere*, meaning “to grow together.” Over time, the concept of “growing together” has been applied to the combined action of multiple parties with diverse interests seeking to combine resources to work toward a common goal. Coalitions occur at every level of society, uniting constituencies on a global scale or on a neighborhood scale, addressing issues as large as achieving world peace and as intimate as welcoming a newborn into the world. Whatever the purpose, the process is the same: A successful coalition creates synergy (combined action) due to the combined power of its members. The power of numbers, economies of scale that lower costs or increase efficiency, and the joy of affinity make building coalitions a reliable strategy for dealing

with what the eminent political scientist John W. Gardner calls “those vexing circumstances in which equally worthy groups want mutually incompatible things” (Gardner 1990, 42).

A coalition is one of many possible forms of collaboration. Imagine a continuum that ranges from communication on one extreme to merger on the other extreme, and coalitions fall in the middle (see Figure 1, below). Although organizational boundaries remain firm, coalition members frequently find that their operations and culture are influenced by the experience of participating in the coalition’s work.

Coalitions typically begin when a leader or potential partners identify opportunities to enhance their power or influence through collaboration. Initial meetings may occur in a variety of activities, such as conferences, faith settings (conventions for the purpose of worship or missionary work), round tables, and communities of practice (an informally structured group convened around shared interests; Wenger 1998, 55). Although these activities may lead to the creation of true coalitions—and some may be sponsored by existing coalitions—they are not in themselves coalitions. The border between conversation and coalition is a voluntary commitment among the members regarding the exchanges that will characterize their relationship. Members seek sustainable commitments, that is, they expect to get more than they give. Coalition leaders seek loyal constituents, ready to advance common goals.

After common goals are set, members of a coalition expect to review and coordinate coalition activities with their home organizations. As a result, a coalition with a broad-based agenda or a commitment to diversity will move to action more slowly than will a coalition with a narrow-based agenda because of the time needed for members to engage their own constituents. A coalition with a narrow-

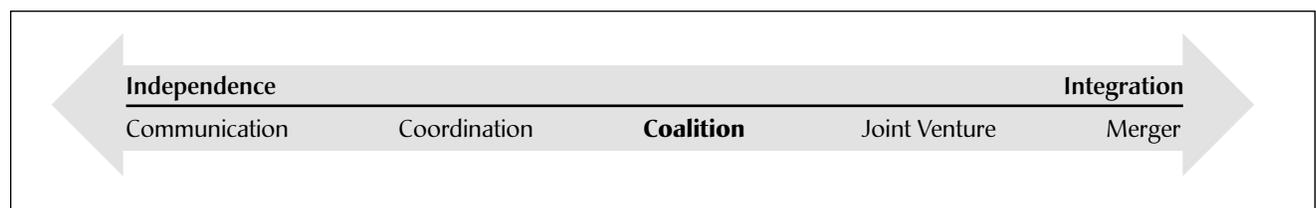

Figure 1.

based agenda may involve fewer members but will also be more nimble and responsive in its strategy and decision making.

EXAMPLES OF COALITIONS

The media are replete with reports of geopolitical coalitions such as the United Nations, North Atlantic Treaty Organization (NATO), Southeast Asia Treaty Organization (SEATO), European Common Market, and Organization of Petroleum-Exporting Countries (OPEC), each formed to advance a purpose shared by the nation-signatories of a formal agreement. Similarly, the United States has its origin in a coalition—a federation of independent states forming, as the Pledge of Allegiance states, “one nation, indivisible, with liberty and justice for all.” The example of the United States illustrates how a coalition may transform itself over time.

Nongovernmental organizations (NGOs) and large nonprofit organizations as diverse as the American Cancer Society, Arthritis Foundation, American Association of Retired Persons (AARP), American Society of Association Executives, YWCA of the USA, Rotary International, and Association of Fundraising Professionals depend on coalitions of state and local chapters to do their work. These organizations may also convene coalitions of their members and other interested parties in an advocacy coalition to advance the interests of their constituents. For example, the AARP has engaged its state and local chapters as well as organizational partners and individuals in advocating Medicare coverage for prescription medications.

On a smaller scale social change or community coalitions are alliances of related community organizations seeking to address issues such as homelessness, drug and alcohol addiction, economic development, and the environment. In business, coalitions frequently form to create economies of scale through joint purchasing of insurance, supplies, or management services. Relationship marketing strategists propose to build coalitions of suppliers and customers, and occasionally competitors, to strengthen relationships, increase customer satisfaction, and manage business risks for all parties.

In some cases leaders may use coalition tactics without actually forming a durable organization. Seeking to persuade others of her point of view, the leader may enlist help in the form of testimonials, endorsements, or general appeals. Coalition tactics create the impression of broad-ranging support, which may in turn persuade others to join forces in addressing the matter at hand.

ELEMENTS OF A COALITION

A coalition has five basic elements. First, its members are individuals who combine forces and who are typically represented by their elected or appointed leaders or people designated by those leaders. Second, the coalition should have a clearly defined purpose, delineating the outcome that the members hope to achieve by their combined effort. Third, members should agree upon operating principles and use these as ground rules to frame how they will work with each other and how the coalition as a whole will do its work. Fourth, exchanges define what each member expects to give to other members and to the coalition and what each member expects in return for participation in the coalition. Exchanges are expressed in contributions of resources, ideological support, and power sharing by members of the coalition. Fifth, the coalition has leadership made up of skillful individuals who organize the different voices within the coalition and represent the coalition to the outside world. Each of these elements is a negotiating point for leaders as they recruit members and align expectations of individual members with the expectations of the group as a whole.

SUCCESS FACTORS

Conditions, commitment, and competence are critical success factors for coalitions.

Conditions are the political and economic realities that underlie the coalition’s formation. These can include resource concerns, community climate, experience, the urgency of the goal, and environmental factors. The more urgent the conditions, the more impetus there will be to coalesce around a clearly defined goal.

Commitment directly reflects the balance between self-interest and shared interests for the members in the coalition. A strong coalition will have compelling benefits for its members and a compelling strategy for achieving its goal. In coalitions that champion unpopular goals or have few resources, the incentives to stay must outweigh the temptation to leave.

Competence is a trait of leaders who must move the coalition toward its goals, create and maintain internal relationships among the members, and develop trust with, accountability to, and contributions from the coalitions members. Coalitions measure the success of their leaders by their ability to achieve goals and establish lasting networks.

INTERACTIONS WITHIN A COALITION

An effective coalition depends on collaborative capacity. Leaders foster collaborative capacity within individual members, among relationships that members undertake on behalf of a coalition, within the organizational structure of the coalition itself, and across the coalition's programs. A coalition demands a lot from members. Where possible, a coalition should reciprocate by creating resources that strengthen member programs and organizations.

Building collaborative capacity in a dynamic environment may require the assistance of a facilitator (an expert in group development and dynamics, usually a consultant or staff expert). Facilitation can be most helpful in the early stages of the development of a coalition. If members do not find productive ways to work with each other and with outsiders, the coalition is not likely to develop sufficiently to address structural and program and service delivery issues. The challenge for leaders is to decide when to make the transition from doing facilitated work to doing the work themselves and taking full ownership of the project and the process.

The metaphor of a starfish is helpful in visualizing the role of the facilitator in coalition building. In nature, the starfish can have up to twenty arms, or rays, which act as sensors as the creature moves in its undersea world. The activities of these rays are integrated and coordinated by a neural ring in the center

of the starfish's body. While that ring is intact, the starfish acts as an integral being. If the ring is severed, the starfish cannot communicate between its rays, increasing its risk of harm or even death. Using the image provided by internationally renowned psychologist and former professor at the University of Michigan Norman R. F. Maier, facilitation (whether by the leader or by a professional facilitator) helps a coalition develop a central neural ring that can integrate and coordinate the interests and activities of the members. If the coalition is unable to achieve such integration and coordination, like a starfish with a severed neural ring, the coalition has few prospects for long-term survival.

The notions of indirect and direct participation are helpful in determining how best to organize and manage coalitions. Indirect participation occurs when people who are not members of a group speak for those who are members of the group—for example, a physician who has never had cancer speaking for cancer patients and survivors. Direct participation occurs when people act for themselves or represent an organized group to whom they are accountable. For example, residents of a senior center represent themselves at a zoning hearing. Research suggests that coalitions experience higher participation when there is direct representation and lower participation when there is indirect representation of members.

LIFE CYCLE OF COALITIONS

Like any other social organizations, coalitions develop over time, with fairly predictable life-cycle stages, with different leadership requirements at each stage. Coalition leaders should frame their approach depending on the stage of life of their coalition.

Start-up coalitions require high-energy leaders with strong visions and the necessary influence, negotiating skills, and persuasiveness to inspire and engage members in common pursuit. These leaders are frequently the staff of the coalitions, as well, providing hands-on support for day-to-day work.

Growing coalitions require leaders who can think strategically, engage others and build consensus, and help members balance divergent interests without losing sight of the overall goal.

Established coalitions require leaders with expertise in the issue at hand as well as operational skills in management, resource development, and public relations. The established coalition may be an institution in its own right. One would hardly call the United States a coalition, yet, more than two hundred years ago that is exactly what it was. Similarly, major non-profit organizations such as the American Cancer Society, Arthritis Foundation, and United Way of America have their institutional roots in coalitions of state and/or local organizations that joined forces to fight for a cause. In many cases one observes the emergence of coalitions seeking institutional change within organizations such as these as members embrace a return to democratic participation as a strategy for institutional reform.

Declining coalitions may be on the wane because they have achieved their goals or alienated their members or because changes in the environment have obviated the need for their existence. At this stage in the life cycle leaders should find strategies for organizational renewal and/or strategic exits in order to preserve the assets that the coalition has created during its lifetime.

OUT OF MANY, MANY

The seal of the United States has the words “*E Pluribus Unum*” (out of many, one). Such is the coalition ideal. A search of the Internet turns up nearly 4 million entries for the word *coalition*. Such a search suggests that the reality is more like *E Pluribus Pluribus* (out of many, many). This proliferation of coalitions may reduce their effectiveness as a leadership strategy as current and potential members become overcommitted and underengaged. Coalition leaders should be realistic about this high level of competition for member time and resources. They should make sure there are valuable incentives such as networking, learning, access to information, economies of scale, and political advantage. They should provide appropriate boundaries and structural support, including shared goals, ground rules and norms, and staffing as needed. Finally, they should further define boundaries by celebrating group milestones and by initiating external relationships that advance the goals of the

group and clarify the distinction between those who are coalition members and those who are not. In those ways, leaders can ensure that the coalition lives up to its definition, helping members “grow together” as they work for common goals.

COERCION

Coercion is the use or threatened use of physical or psychological force (especially punishment) to get one's way and to affect the behavior and/or emotions of others. In everyday language, coercion is “naked power.” The targets of coercive power “respect it solely because it is power, and not for any other reason” (Russell, 1938, 66). Coercion is most vividly expressed by a statement in Thucydides's “Melian Dialogue” (in *A History of the Peloponnesian Wars*) that “the strong do what they have the power to do, and the weak accept what they have to accept.”

At the political and social level, coercive power typically occurs in two social-political situations, often closely related: (1) Military conquest and the resulting social transformations; for example, the careers of Alexander the Great and Julius Caesar, the capture and enslavement of Africans in the New World, the world

empires of the European countries, and the U.S. treatment of Native Americans in the nineteenth century; and (2) the decay or collapse of traditional, organized, and restrained forms of power, as in the case of the regimes of Hitler, Stalin, or the Cambodian Khmer Rouge in the early 1970s, and Iraq immediately after the U.S. invasion in 2003. Under such conditions, illegal or extralegal entities employing coercive tactics (gangsters, extortionists, paramilitary forces, and those who plot military coups) often become prominent. The political philosophies of fascism, authoritarianism, and communism are often characterized by their use of coercion and even their attraction to it. At the opposite ideological pole, anarchism and libertarianism by definition disavow any necessity for coercion in theory and oppose it in practice.

Many forms of coercion also occur at lower levels of society. For example, people thought to be “deviant” are coerced through incarceration and enforced psychiatric commitment. Religious “heretics” are persecuted, and “different” minorities are subject to prejudice and “ethnic cleansing.” In small face-to-face groups, coercion takes the forms of bullying, rape, sexual coercion and sexual harassment, domestic violence, and child abuse. Many milder (even socially acceptable) forms of coercion take place in everyday settings such as families (especially with respect to childrearing), schools and other institutions, and workplaces. Other forms of power, such as economic power, can easily become coercive when they involve asymmetrical or one-sided distribution of resources. (Karl Marx pointed out the fundamental asymmetry of capitalist production: The owners have the factories and the machines, while the workers have only their work to “sell.”)

Perhaps it is even possible to speak of a “coercion of the weak”—for example a crying baby, a beggar, or even a leader such as Mahatma Gandhi. In these cases, however, there is usually an explicit or implicit appeal to the conscience, sense of responsibility or morality, or simply prudence of the stronger party.

COERCION AS A BASE OF POWER

Coercion was identified by French and Raven in “The Bases of Social Power” (1959) as one of the six

“bases” of social power—that is, a relationship between power holder and target that constitutes the source of power. Coercion involves using punishment or the threat of punishment to get someone to do something. It requires access to the means of punishment, that is, to force. (Of course there are more subtle forms of coercion, as in brainwashing and mind control.) The other bases, or methods of obtaining power, are as follows: rewarding others, legitimacy, “referent power” (that is, charisma, prestige, or glamour), expert knowledge, and information.

The use of coercion often implies that the power holder lacks (or is unwilling to use) more “positive” resources such as charismatic persuasion, reward, or expert knowledge. It also implies some active or passive resistance on the part of the target of power. Thus coercion can be seen as a relatively crude or “primitive” form of power and leadership. Alternatively, leadership may be thought of as a series of skills, techniques, and processes that make coercion unnecessary. Coercion often connotes illegitimate or immoral power; nevertheless, the *possibility* of coercion usually exists in the background of legitimate and positive forms of leadership. For example, many people’s experience of the police and military is confined to traffic jams and parades. However, they—and only they—can also legitimately use coercive force, if necessary and within certain guidelines. Yet even when it is legitimate, coercion is viewed as a “last resort,” resorted to only when other bases of power are lacking or have failed. Power and leadership can be understood as largely social constructions, analogous to the elaborate financial systems of “paper assets” and credit. Coercion would then be analogous to the “flight to gold” that often occurs in a crisis, or when a financial system collapses.

Psychologically, our mental images or “prototypes” of power may involve fantasies of coercion, even if we go on use that power in more refined and positive ways. That is, exercising *any* kind of power over someone else may arouse inner feelings (perhaps unconscious or only partly conscious) of coercion—that we are controlling their actions and feelings, thereby figuratively reducing them to nonliving substance that totally obeys our will. Such

images of coercion may “lurk” in the deep recesses of our minds, unconscious and unnoticed, even as we try to channel the exercise of power in positive directions. These images may be ever ready to subvert more positive forms of power and leadership, turning them into dominance, coercion, cruelty, and abuse. Thus Lord Acton’s famous dictum about power applies especially to coercive power: “Power tends to corrupt, and absolute power corrupts absolutely.” This process of corruption was vividly expressed by the nineteenth-century Russian novelist Dostoevsky in his novel *House of the Dead*: “Anyone who has once experienced this power, this unlimited mastery of the body, blood and soul of a fellow man made of the same clay as himself . . . will unconsciously lose the mastery of his own sensations . . . till at last they come to relish them” (Dostoevsky, 1961).

David Kipnis in *The Powerholders* (1976) studied these metamorphic effects of power—that is, how power changes people for the worse by altering their attributions, attitudes, judgments, and moral thinking. However, he came to believe that these metamorphic effects are mostly characteristic of “strong” power tactics (i.e., those that involve coercion), rather than “weaker” power tactics such as reasoning, expertness, or information.

ANTECEDENTS OF COERCION

What factors determine whether someone will resort to coercion in the attempt to gain power? Under what circumstances do what kinds of leaders tend to be or become coercive? If coercion is the prototypical psychological “image” of power, then it follows that people especially motivated to get power would be likely to use coercion as a power tactic, especially if they lack more refined power skills, power resources, or a sense of responsibility and self-control (see Winter and Barenbaum, 1985). As an example, psychologist Eileen Zurbruggen in “Social Motives and Cognitive Power-Sex Associations” (2000) found that men scoring high in power motivation, especially if they also had a cognitive link between power and sexuality, were relatively more likely to report having sexually coerced women.

However, other motives can also lead to coercion. For example, achievement motivation (or the desire to meet or exceed standards of excellence) usually is associated with cooperative bargaining and economic and entrepreneurial success. Among political leaders who must deal with the uncertainties, compromises, and “quagmires” of the political process (where different people have different ideas about what is “best”), however, achievement motivation sometimes leads to frustration, impatience, and a resort to coercive and authoritarian means.

There is some evidence that a disposition to use coercion—in everyday language, to be a “bully”—grows out of early attachment difficulties and related insecurities, as well as early experience of coercion at the hands of parents and others. On the other hand, the principles of learning theory would suggest that a coercive disposition can (also) grow out of early reinforcement and indulgence. In either case, coercion is viewed by developmental psychologists as an early (i.e., “childish”) way of settling conflicts and disagreements (see Laursen, Finkelstein, and Townsend Betts, 2001).

People’s general beliefs about how power ought to be exercised and with what constitutional (consent of the governed) or moral constraints, as well as their perceptions of the specific situation (issues, distribution of power, availability of different kinds of resources) affect their use of coercion. Thus people scoring high in measures of authoritarianism and social dominance orientation, who are prejudiced toward other groups perceived to be “different” or “deviant,” are especially predisposed to coerce them in the service of enforcing obedience to conventional behaviors and styles of life. They become “willing executioners,” in Daniel Goldhagen’s (1996) vivid phrase from his book *Hitler’s Willing Executioners*. Coercion, then, tends to follow lines of established “difference,” although Catherine MacKinnon in “Difference and Dominance” (1984) has argued the reverse: that coercion *creates* differences, in order to justify itself.

In *The Use and Abuse of Power*, edited by Lee-Chai and Bargh (2001), the authors suggest several other individual-level factors that can predispose power holders toward coercive, strong, or “hard”

The Coercion of Native Americans

Throughout history and across cultures coercion has been commonly used by more powerful peoples to subjugate less powerful ones. The following account is an example of a recurrent theme for at least 500 years—European peoples coercing non-Europeans into subjugation. The example concerns the Jesuit missionary activity among the Guarani-speaking peoples of Paraguay, Argentina, and Brazil from the 1500s into the 1800s.

The Jesuits used corporal punishment to influence and control the natives' behavior in the reducciones. The Jesuits' use of corporal punishment does not appear to be as harsh as the methods employed on the Indians in Franciscan missions in California during the late eighteenth century. In the California missions, the Franciscans used a combination of whippings and confinement, as well as shackles and stocks on the Indians. The Jesuits never used shackles or stocks on the Guarani. The Guarani usually voluntarily entered the missions, unlike the Californian Indians. The Jesuits did not treat the Guarani as slaves but more like a strict father would treat his own children or in the same manner in which a schoolmaster would use corporal punishment to correct the behavior of schoolchildren. Nevertheless, these methods must have been demeaning to the adult Indians, especially since these were exemplary punishments administered in front of their peers in the public plazas of the missions. Because this indigenous culture had lived freely in the jungle and greatly valued a spirit of independence, the use of confinement, above all, was a brutal punishment for the Guarani. Imprisonment of the Indians, whether it be in the mission jail for men or in the coto guazú for women, most likely destroyed their sense of freedom and independent spirit. However, life for the Guarani mission Indians was never as brutal as it was for Negro slaves on a plantation in the southern United States or in Latin America because the mission Indians were never bought and sold, their family members were not usually separated, and the Jesuits were never known to take native women as their mistresses.

[. . .]

The Jesuit missionaries justified their actions by writing that after being whipped, the Indians would kiss the priests' hands and tell him: *aguiyebete che Ruba, chemboaraqua a haquera rehe*: "God will repay you, my Father, because you have given me understanding." The missionaries claimed that the Indians understood that they received beatings "for their own good," not out of any hatred for them or a sense of boredom. The number of lashes the Guarani received for minor offenses, such as missing mass, is unclear. According to the Law of the

Indies, however, which was in effect in the missions, an Indian *alcalde* could punish an Indian with one day of confinement and six or seven lashes for missing mass, and in case of intoxication, the Indians could be punished even more severely. The Jesuits' need to use force to compel some of the mission Indians to participate in the ceremonies of the church indicates that not all the mission Indians embraced the new Catholic beliefs and practices.

[. . .]

"[H]ippings, "like the kind of whippings they give to children," on their buttocks, was the primary punishment for correcting Indian misbehavior in the missions. Indian *alcaldes* administered the corporal punishments, not the priests. These Indian policemen also patrolled the streets ready to take anyone to the mission jail who was wandering around at night. The evenings were almost always quiet in the missions, since the Jesuits prohibited the Indians from going out at night and visiting other Indians. Indian *alcaldes* also frequently visited the Indians' lands, both their individual family plots and the communal lands, to see if the Indians had planted their fields. They would inform the Jesuits in the event they were neglected. If the mission Indians refused to work in the fields, then they faced corporal punishment administered by these policemen. According to a missionary's account, "they punished them with lashes as they would a boy."

[. . .]

Perhaps more important than coercion, the missionaries altered the natives' behavior through incentives and a system of rewards. Following the morning mass, the Indians who attended received their daily rations of *caámini* (finely ground yerba maté), salt, and tobacco from the priests at the door of the church before returning home for breakfast. The Indians drank their yerba maté tea right before leaving for work in the fields or at one of the artisan workshops. The ration was sufficient enough to last the Indians until the afternoon rosary, when the priests again distributed new rations of *caámini* to the Indians. [. . .] By distributing rations, the Guarani became dependent upon the missionaries, who could then induce the Indians to give up more aspects of their native culture.

power tactics. People whose specific power goals are selfish or personalized (rather than prosocial or socialized), people with a sense of self as an independent, skin-bounded body (rather than as part of a larger group), and people who relate to others as a form of exchange (rather than having a genuine communal concern with their welfare) tend toward coercion. People who process information in “effortless” (rather than “effortful”) ways—either because they are cognitively lazy or because they enjoy the luxuries of privilege and position—are relatively more likely to turn to coercion and other hard power tactics. Nevertheless such conclusions must be drawn with caution. Many communal relationships conceal subtle forms of “parentalistic” exploitation—especially if there is an imbalance of power resources between the parties to begin with (see Pratto and Walker, 2001). Thus coercive dominance can easily be clothed in the garments of “nurturance” or “chivalry.” And a strongly communal, group-based sense of self may only deflect coercion and aggression onto those outside the group in the form of intercommunal wars.

Situational factors exert considerable influence on whether power is expressed through coercive means. Expectations—both the expectations of power holders and those of the targets of power—are often critical. Thus highly structured situations can easily generate self-fulfilling expectations and stereotypes that lead ordinary people to become coercive. For example, in the famous Stanford Prison Experiment (see Haney, Banks, and Zimbardo, 1973; Zimbardo, Haney, Banks, and Jaffe, 1973), students randomly assigned to the role of “prison guard” became so coercive and abusive toward other students randomly assigned to be “prison inmates” that the experiment itself had to be terminated prematurely. The famous Milgram obedience experiments (see Milgram, 1974) are another example. Once people—ordinary everyday people—take on a role that may involve either demands or permission for using coercion, they often go along and enact their role with surprisingly little resistance. (In her analysis of the Holocaust Hannah Arendt [1963], characterizes such effects as the “banality of evil.”) Stanley Milgram’s studies focused on situational factors that increased

coercive aggression (such as distance between power holder and target, or prestige of the higher person giving orders to the power holder) and factors (such as the support of other power holders to resist commands from above) that reduced it.

Cultural and religious teachings can affect people’s readiness to use coercion. For example, the Confucian concept of *jen* holds that power should be exercised for the collective good. Sometimes Christian beliefs are viewed as moderating coercive power. Perhaps this derives from the biblical story of the devil’s offer to Jesus: “All this power will I give thee.” To which Jesus replied, “Get thee behind me, Satan” (Luke 4:5–8).

Nevertheless, considerable caution about the restraining effect of religious and moral constraints on coercive power is in order. The brutally coercive Inquisition, the advance of Islam through forced coercion, the Crusades, the Catholic-Protestant religious wars of the seventeenth century, and the continuing Hindu-Muslim violence were all the result of religiously based moral teachings directed (or seduced) into the service of coercive power. The insidious way in which religion can be subverted by coercive power is illustrated by the Bishop of London’s description of World War I as “a great crusade—we cannot deny it—to kill Germans . . . to kill the good as well as the bad, to kill the young men as well as the old, to kill those who have shown kindness to our wounded” (Mews, 1971). Such re-emergences of coercive power from the controls of religion illustrate Freud’s concept of the “return of the repressed,” whereby a repressed wish or act gains expression by taking over the very mechanisms (such as religion) that were established to defend against and repress it.

EFFECTS OF COERCION ON THE TARGET

The effects of coercion on targets of power can vary widely (see the discussion by Schmookler, 1984). Sometimes targets of coercion try to imitate those at higher levels of power who coerce them, as in the case of “kapos” in concentration camps (as documented in Bruno Bettelheim’s 1943 study, “Individual and Mass Behavior in Extreme Situations”), prefects in boarding schools, people who stay with

coercive and abusive partners, and some forepersons of work crews. Such examples illustrate the defense mechanism of identification with the aggressor (see Anna Freud, 1937/1946), which may be activated by several factors: sheer drive for survival on the part of the target, coercion judiciously laced with consideration by the power holder (the “good cop/bad cop” routine), and the target’s simple envy of the coercer’s control of resources. Generally, identification with the aggressor is more likely to occur when the target is unassertive or has low self-esteem.

Most often, however, coercion decreases the attractiveness of the power holder in the eyes of the target. As a result, coercion produces obedience—but only with respect to the limited range of actions under surveillance, and only as long as the coercer maintains that surveillance (as discussed at length in Michel Foucault’s 1980 analysis of power). In Herbert Kelman’s (1961) terms, coercion usually produces compliance, rather than identification (targets obey because of they have regard for or attachment to the person of the power holder) or genuine internalization (targets obey because they believe in the legitimacy of the command and/or the power holder). Furthermore, coercers, to the extent that they realize that targets are obeying only because they must, may develop paranoid anticipations about incipient rebellion: that somewhere, somehow, surveillance (hence obedience) is breaking down, or perhaps the targets escape. In *Crowds of Power* (1962), Elias Canetti called this the “fear of recoil” of coercive power. For all these reasons, coercive power systems must devote considerable resources to policing compliance, as well as preventing sabotage during gaps in surveillance. To keep down the cost, coercive leaders may actually carry out only a few selected—but highly visible and impressive—acts of violence: for example, public executions of a few ringleaders, or a spectacular “shock and awe” bombing of an enemy’s capital city. These measures, however, require a loyal staff of devoted followers who are not themselves coerced. Thus in the long run coercion often becomes inefficient and vulnerable.

Frequently targets of coercion resist, rebel, or fight back. (A more specific related psychological term is *reactance*, the motivational counterforce

He who cannot agree with his enemies is controlled by them.

—Chinese proverb

aroused by loss of freedom due to coercion.) In social and political situations, the tendency toward reactance and fighting back is enhanced by increased solidarity within the target group—the so-called rally effect observed in many instances of attempted military coercion (see Horowitz and Reiter, 2001). That is, when the target is a group, the shared social identities of members enhance the tendency to rebel against (or at least endure) coercion. Where reactance is strong and the resource differential between coercer and target small, therefore, coercion and punishment may precipitate a power struggle. For all these reasons, some psychologists (for example, B. F. Skinner and his followers) dispute the effectiveness of coercion and punishment.

Some targets are able to rise above coercion. Leaders such as Mahatma Gandhi, Martin Luther King Jr., and Nelson Mandela responded to coercive, brutal power not with identification with the aggressor, flight, or retaliation, but rather with a transcendence that was often born of a religious commitment to nonviolence (see Erikson, 1969).

EFFECTS OF COERCION ON THE POWER HOLDER

As suggested in the quotation from Dostoevsky above, compared to other bases of power, coercion is more likely to bring about psychological transformations in the power holder (see Kipnis, 1976)—what Lord Acton called the “corruptions” of power. For if power holders are able to coerce every action (or inaction) of the target, they are in effect learning the sequence “I command and others obey.” As a result, they may readily develop an inflated sense of their importance and power, while coming to view the target as less than human, an object to be manipulated by force. This can easily lead to a degradation of the moral sense (see Fodor and Smith, 1982, for a research example).

Boredom and a loss of the capacity for pleasure is another effect of power that may be especially likely in the case of coercion. In the words of the novelist J. M. Coetzee in his work *Dusklands* (1982), having unlimited coercive power can make the world seem like a “desolate infinity”: “Here and everywhere else on this continent there would be no resistance to my power and no limit to its projection. My despair was despair at the undifferentiated plenum, which is after all nothing but the void dressed up as being” (pp. 101–102).

As the ultimate expression of power, coercion throws some of the contrasts and paradoxes of power into the sharpest relief. Like power in general, coercion can be effective—that is, it *can* change other people’s behavior. (Not always, however: a study of aerial bombing—surely one of the most massive and spectacular forms of coercion—suggests that it is only “successful” about a third of the time; see Horowitz and Reiter, 2001.) Yet at the same time, coercion also embodies many of the limits and dangers of power, both to the power holder and the target. Thus while coercion is part of the repertoire of leadership, for leadership to be effective in the long run coercion must be used with care and caution.

COGNITIVE STRUCTURES

How is knowledge of the external world mentally represented by the human mind? One theory, widely endorsed by psychologists, is that human knowledge is organized around symbolic, cognitive structures that form interconnected sets, which together represent what is referred to as a “schema.” For example, each person likely possesses separate symbolic, mental representations for the symbolic knowledge structures teacher, lecture, textbook, desk, pen, paper, classroom, and chalkboard. In combination these symbolic knowledge structures form a single coherent schema, which represents people’s knowledge of a class. Thus, a schema is a “cognitive structure that represents knowledge about a concept or type of stimulus, including its attributes and the relations among those attributes” (Fiske 1995, 161). Conveniently, schema can be subdivided on the basis of the type of cognitive structure under consideration. In this regard, researchers have investigated scripts (i.e., representation of a sequence of events), person schemas (i.e., representation of a person), relational schemas (i.e., representation of an individual’s behavior toward another), self-schemas (i.e., representation of one’s self), and prototypes (i.e., representation of a category).

Regardless of their form, functionally schemas perform a similar set of operations for people. Schemas allow people to direct their attention to relevant aspects of their surroundings, assist them in forming judgments about stimuli in their environment, and assist them in generating adaptive responses to their current circumstances. For instance, without the prerequisite schema for the symbolic knowledge structures teacher, lecture, and blackboard, a student may not know where to direct his or her attention during a lecture (e.g., information written on the blackboard), nor may he or she understand what behavior is appropriate and inappropriate

within this setting (e.g., raising one’s hand to ask a question). As a result, schemas are critical when attempting to understand how humans regulate their interactions with the external world.

Under the general rules of information-processing theories, investigators have applied current knowledge regarding schemas to help understand leadership phenomena. Unlike the focus of other leadership approaches, the focus of information-processing work has been to discern how the acquisition, storage, and use of particular schemas influence relevant leadership processes (e.g., a leader’s behavior or a follower’s perceptions).

IMPLICATIONS OF COGNITIVE STRUCTURES FOR UNDERSTANDING LEADERS

What dictates the behavior that a leader will exhibit toward his or her followers? According to information-processing researchers, a leader’s behavior is dictated both by the form and content of the schemas possessed. For example, J. C. Wofford and Vicki Goodwin (1994) have argued that the distinction between different leadership styles stems from the schemas that each type of leader possesses for behavior (i.e., script), followers (i.e., person schema), and himself or herself (i.e., self-schema). For example, the script of a leader with a transformational style (i.e., inspirational, charismatic) would be to motivate followers to perform at a higher level, whereas the script for a leader with a transactional style (task-oriented, focused on mistakes) would be to correct followers when they make mistakes. Operationally, these different schemas cause leaders to perceive their current circumstances differently, which in turn results in behavioral displays that are distinctively transformational or transactional. Coinciding with this logic, leadership development and training scholars have argued that the success of leadership interventions is contingent upon the creation of new schemas.

Beyond establishing linkages between schemas and leader behaviors, researchers have also investigated both the structural features of a leader’s schema and the factors that influence schema acquisition. Coinciding with contemporary findings in the

literature about the nature of expertise, leadership researchers have concluded that individuals with better and more broadly developed schemas perform more effectively in leadership positions relative to those who have poorly developed leadership schemas. Such differences can be credited to the fact that expert leaders have developed richer, more sophisticated mental representations of their current environment, which enable them to encode a larger quantity of information, understand problems at a conceptual level, and retrieve solutions from memory that match the current context. In addition to the demonstrated relationship between the structure of a leader's schema and leadership performance, research has shown that expert knowledge structures develop with experience in leadership positions, a finding that concurs with research on expertise in other domains.

As with their examination of the nature of leaders' schemas, researchers have examined the factors that cause leaders to apply a particular schema. Perhaps most representative of this examination has been the literature outlining the conditions under which a leader will attribute a given follower's ineffective performance to either external or internal factors. For example, suppose that an employee's performance on a task is substandard. How does his or her leader determine the cause of this performance? Drawing upon attribution theory, which deals with how individuals draw causal inferences about behavior, work in this realm has shown that leaders consider whether the behavior exhibited by the employee in this circumstance is also exhibited by the employee in similar circumstances (i.e., consistency), whether other employees behave similarly (i.e., consensus), and whether the employee behaves similarly in different circumstances (i.e., distinctiveness). Depending on the combination of these factors (e.g., high consistency, low consensus, low distinctiveness), the leader may apply two schemas for the employee's poor performance (i.e., behavior was caused by the employee or behavior was out of the employee's control). As a result, attributional information can lead to two highly discrepant behavioral responses (e.g., punish the employee because he or she is responsible or ignore the

episode because the behavior was due to circumstances out of his or her control).

IMPLICATIONS OF COGNITIVE STRUCTURES FOR UNDERSTANDING FOLLOWERS

What causes one individual to follow the lead of a second individual? One explanation posited by scholars who study follower information processing is that followership is dependent upon the schemas that observers apply to an individual. According to this explanation, each person possesses a large and well-elaborated list of traits that people consider to define a leader (i.e., their leadership schema). The decision to follow in any given situation depends upon the degree to which people perceive that an individual possesses the traits that comprise their leadership schema.

Research indicates that the schemas that people tend to hold of a leader, typically called "leader prototypes," are large, well-elaborated cognitive structures. In fact, research suggests that people's leader prototypes contain upward of fifty-seven distinct traits that themselves are organized into eight broad dimensions: sensitivity, dedication, tyranny, charisma, attractiveness, masculinity, intelligence, and strength. Typically, a leader prototype is deemed to be fuzzy and ill-defined such that although each of the traits comprising the leader prototype may be typical for category members (i.e., most leaders possess this trait), no single trait defines membership in this category (i.e., someone who is sensitive is not necessarily a leader). Similarly, the absence of any single trait does not eliminate a person from the leader category; instead, it simply implies that the person is less prototypical of what people consider a leader.

Developmentally, the leader prototype appears to form throughout childhood. Initially, children base their leadership judgments on specific actions, outcomes, and exemplars (e.g., parents). As they age, however, children begin to base their judgments on a highly elaborated leader prototype. Through repeated exposure to leader exemplars, children extract the underlying leader prototype, which then comes to serve as the standard against which leadership judgments are made.

Research examining the nature of people's leader prototypes indicates that the content of these prototypes may shift across different contexts. Work has shown that people possess different prototypes in contexts such as finance, education, religion, sports, national politics, world politics, labor, media, and military. More recently, scholars interested in cross-cultural leadership have shown that although the nature of the leader prototype remains largely consistent across cultures, certain aspects may change as one moves from one nation to another. The variability of prototypes across cultures indicates that leaders may experience some degree of difficulty if they attempt to transition into an unfamiliar domain because the traits they exhibit may be prototypical of a leader in their native country but not in the new country in which they work.

Beyond documenting the nature and development of the leader prototype, researchers have investigated two processes that lead perceivers to apply the leader prototype to an individual. In the first process the extent to which one person (perceiver) might label another (target) as a leader is contingent upon the degree to which the target's features overlap with the features that are contained in the perceiver's leadership schema (referred to as "recognition processes"). The greater the overlap that is perceived to exist, the more strongly the leader category will be applied to the target. In the second process, which reflects what are referred to as "inferential processes," people's beliefs about leadership are strongly intertwined with their beliefs about the success of the groups that leaders lead. People assume that leaders have the capacity to control the fate of the groups that they lead, and as a result, when a group succeeds people automatically infer that the group's leader must be effective (i.e., he or she fits the leader prototype). Although the literature suggests that group performance has a dramatic impact on people's perceptions of leadership, the extent to which observers rely upon inferential versus recognition processes depends partially on the observers' position relative to a leader target. For example, if the leader in question is the CEO of an organization, an observer may have little direct contact with him or her, thus having to rely on inferential processes to form leadership

judgments. On the other hand, if the leader target is an employee's direct supervisor, the employee can form leadership judgments based on recognition processes.

Researchers have also begun to examine what effect a leader's actions can have on followers' self-schemas (i.e., the schemas that describe the self). Some researchers have noted that the effect that a leader has on group outcomes is dependent upon whether or not a leader can actually transform the manner in which followers conceptualize themselves. For example, a hard-working, conscientious leader can inspire his or her followers to behave more conscientiously, and this happens because the leader actually changes the schemas of followers so that they include conscientiousness as a self-descriptive trait (i.e., followers view themselves as more conscientious). Conscientiousness has been shown to predict employee performance; therefore, the more conscientious the followers, the higher their performance will be, which should then translate into increased organizational performance. Because schemas serve to guide behavior, perceptions, and judgments, by shifting the self-schemas of followers, leaders can exert a powerful effect over group events.

THE FUTURE

The study of leadership has benefited from the investigation of leader and follower cognitive structures. Research has documented how cognitive structures serve as the source of a leader's behaviors and the standard against which followers judge a leader's behavior. Research also has highlighted that both leaders and followers possess multidimensional schemas that are acquired through experience. This literature has documented the instrumental role that context plays in schema usage. Despite these advances, changing conditions suggest that several avenues of research warrant future consideration. For example, technology is dramatically transforming the manner in which people communicate. Advances have lessened the need for face-to-face interactions between leaders and followers, creating a need to better understand how follower perceptions are formed in a virtual environment. Similarly, the

demographic composition of the workforce continues to shift, creating greater numbers of demographically dissimilar leader-follower dyads (pairs). The manner in which leadership perceptions form in such dyads has not been considered but should become increasingly important as the workplace diversifies.

COLLECTIVE ACTION

Collective action occurs through the decision of individuals, who are regarded as rational actors seeking to maximize self-interest, to participate in an activity with the purpose of achieving common or group interests. The study of collective action therefore provides valuable insight for understanding the dynamics of activities or movements generated and sustained by a group of cooperating individuals.

THE PROBLEM OF COLLECTIVE ACTION

Collective action may be a one-time incident, such as the payment of contributions by members of a community to renovate their town hall, or a long-term process, such as participation in a decade-long struggle for the improvement of civil rights. Regardless of the duration of the action and the degree of commitment required for its sustenance, the main feature of collective action is that it rarely occurs in natural conditions. This problem is commonly explained through the logic of what is known as the Prisoners' Dilemma.

The Prisoners' Dilemma is based on the fundamental assumption that individuals are self-inter-

ested in the sense that they maximize utility. The following scenario provides an illustration of the concept:

Tanya and Cinque have been arrested for robbing the Hibernia Savings Bank and placed in separate isolation cells. Both care much more about their personal freedom than about the welfare of their accomplice. A clever prosecutor makes the following offer to each. “You may choose to confess or remain silent. If you confess and your accomplice remains silent I will drop all charges against you and use your testimony to ensure that your accomplice does serious time. Likewise, if your accomplice confesses while you remain silent, they will go free while you do the time. If you both confess I get two convictions, but I’ll see to it that you both get early parole. If you both remain silent, I’ll have to settle for token sentences on firearms possession charges. If you wish to confess, you must leave a note with the jailer before my return tomorrow morning.” (Kuhn 2003)

To summarize, if Tanya and Cinque both choose to remain silent, they will both achieve the most positive outcomes. If both confess, they will face somewhat more negative results. But if one chooses to confess while the other remains silent, the one who remains silent will suffer the most negative consequences while the one who confesses will enjoy the most positive outcome. Although remaining silent seems to be the best choice for both players, the individuals are likely to end up choosing confession for two reasons. First, confession is the strategy that offers a better outcome regardless of the other player’s choice. Second, due to the lack of trust, individuals choose confession in order to avoid potential exploitation by the other player. In other words, confession will be the desirable strategy for the rational, self-interested individual. The important discovery here is that what is in the best interest of the group differs from that which is in the best interest of the individual.

When the Prisoners’ Dilemma is applied to a group setting (this is called the N-Person Prisoners’ Dilemma), individuals will be reluctant to cooperate for similar reasons. Each individual will have the choice to either contribute or not contribute for a collective (or public) good. The best outcome for the

group as a whole will be produced when all members of the group decide to contribute. Everyone will have paid the same cost and will receive equal shares of the collective good in return. But the best outcome for the individual, on the other hand, will be to not contribute and exploit the contributions made by other members instead, since through this choice the individual will be able to reap benefits without paying the cost. This phenomenon is called the “free-rider problem,” and it would be logical for self-interested individuals to become free-riders since their goal is to secure maximum gain. Consequently, individuals will be reluctant to engage in collective action for two reasons. First, the strategy of non-contribution offers a better outcome than the strategy of contribution. Second, individuals attempt to avoid possible exploitation by other players in the group.

THE NATURE OF PUBLIC GOODS

It is necessary to look into the nature of public goods to better understand the reason why individuals find it difficult to participate in collective action. Public goods are beneficial resources that are shared by members of a group or community. Public goods have two characteristics: jointness of supply and the impossibility of exclusion. This means that public goods are made available through collective contribution, but noncontributing members cannot be excluded from enjoying the public good: contributors and non-contributors alike will become beneficiaries of the public good. Using the example of the town hall above, we can imagine a situation in which half of the members of the community have contributed for renovation but the other half have not. The town hall will have been renovated through the collective contribution of the cooperating members of the community only, but because the town hall is public property (a public good), even noncontributing members of the society will be able to enjoy and freely access the renovated facility. Some other examples of public goods are natural resources such as air and water, and different kinds of public property such as parks, playgrounds, and stadiums. The nonexclusive nature of these public goods has the effect of encouraging free riders, since individuals

*It is better to have one person working with you,
than three working for you.*

—Unknown

are able to harvest the fruits of the public good without having to sow any seeds.

THE CONSEQUENCES OF NON-COOPERATION

As demonstrated above, the problem of collective action is that it is unlikely to occur because individuals have the incentive to act selfishly rather than serve the common interest. Yet, the more serious problem is that when individuals decide to pursue their self-interest, the collective outcome turns out to be disastrous. Non-cooperation and non-participation in collective action will result in either the absence of public goods (the problem of creation), or the exhaustion of already-existing public resources (the problem of depletion). Without active participation in a civil rights movement, there will be no equal and fair rights for the minority people to enjoy. Without contributions for renovation, the town hall will remain shabby, defunct, and may even end up collapsing over the night. Phenomena such as pollution, environmental degradation, and energy shortages also are examples of the negative consequences of non-cooperation.

In other words, without cooperation, every member will be worse off than he or she would have been if each had contributed a fair share and the public good been provided.

MOVING FROM INDIVIDUAL INACTION TO COLLECTIVE ACTION

The unfavorable consequences of non-cooperation and inaction transform collective action from a choice into a necessity. The question then is how to induce self-interested individuals to participate in collective action, going against their natural inclinations.

Olson, in *The Logic of Collective Action*, named two catalysts for collective action: selective incen-

tives and entrepreneurship. Collective action may occur when the payoff attached to choices made by the individual are altered through external intervention. An example would be the provision of selective incentives such as material rewards, monetary compensation, and the enhancement of one's social reputation. Real-world examples include health insurance benefits exclusively offered for the members of a labor union, consumer guidebooks for the members of consumer organizations, and the like. If one has a selective incentive to gain through his or her participation in collective action, he or she would be more willing to cooperate.

Olson also noted the importance of entrepreneurs in the production of public goods. Entrepreneurs play a facilitating role as the means of pursuing a personal ambition, such as running for office. This might explain how collective action occurs in the first place, but it fails to give an appropriate account of how groups are maintained and collective goods are sustained.

Negative measures such as threats, punishment, fines, and sanctions also enforce collective action by significantly reducing the well-being of those who decide to not cooperate. These measures, however, are not welcome in democratic society, since they incur enormous sanctioning costs.

The most idealistic way of generating collective action is for members of a community or group to reach a voluntary agreement for sustaining or producing public goods, and utilizing the function of peer pressure to inhibit free-riders. This will work only in small and tightly knit groups where peer pressure has visible influence over other members, and large groups will find it difficult to overcome the free-rider problem.

THE ROLE OF LEADERSHIP

The most effective driving force behind collective action may come from within, not outside of, a group. Historical examples of effective and long-running public-spirited movements—such as the Indian Independence Movement of the early 1920s, the American civil rights movement of the 1960s, and the antiapartheid struggle in South Africa, which

lasted for three decades—shed light on the significant role of leadership in the mobilization of collective action. In most cases, leaders will initiate and involve themselves in collective action for a different reason. Unlike other members of the group who painstakingly calculate the pros and cons of each available option by conditioning their choices upon the possible response of the other, leaders will have an independent interest, one that lies in the achievement of the common good pursued by the movement he or she has authored or sponsored. Leaders will thus act autonomously when committing themselves to the collective action.

Such visionary and transformational leadership (“leading by example”) becomes a contagious force over the other members of the group. Effective and committed leadership not only creates momentum in favor of a movement, but also sets forth a greater possibility of its success, to which followers will respond by jumping on the bandwagon. This, of course, increases the possibility for ultimate success (meaning the achievement of the common purpose). There is no doubt that the inspirational influence of leaders such as Mahatma Gandhi, the Reverend Martin Luther King Jr., and Nelson Mandela was crucial to the mobilization and success of the social movements mentioned above. In the American civil rights movement, for instance, Martin Luther King Jr.’s moral values stemming from his Christian faith and a firm commitment to nonviolence as a strategy for creating social change had the impact of encouraging numerous followers to participate voluntarily in important historical events such as the Montgomery bus boycott (1955–1956) and the March on Washington (1963). The fact that he held fast to the movement facing constant harassments and attempts at assassination targeted not only toward himself but also toward his family members and his most trusted colleagues, which ultimately resulted in his death, provides a fine illustration of “leading by example.”

THE ROLE OF FOLLOWERSHIP

Leadership plays a powerful role in stimulating collective action, but it would not be complete without an active followership. On the outset, followers may

not seem to be of much significance since they are belittled under the towering presence of leadership. But without the collaboration of followers no movement or action would be possible, even with the most committed and passionate leadership.

The Montgomery bus boycott could not have been successful had the whole African-American population in Montgomery failed to follow and wholeheartedly support the decisions made by the leadership. The leadership had expected about 60 percent of the black population to participate in the boycott, but were surprised to find that there was nearly a 100-percent rate of cooperation: this was an undeniable blow to the bus company, which relied on the African-American population, who accounted for 60 percent of the riders, for profit.

Such cases reveal that followers are not doomed to remain captives of self-interest, but are just as capable of realizing and pursuing the common interest as leaders are. Education and promotion of the purposes of the collective action by the leadership will encourage active followership. Experience may also teach lessons worth remembering: if a community continuously suffers the negative consequences of inaction, there will be a rising awareness among its members of the necessity of cooperation. Followership that goes hand-in-hand with leadership is essential for successful collective action.

LEADERSHIP, FOLLOWERSHIP, AND COLLECTIVE ACTION

Rational and self-interested individuals do not spontaneously engage in actions that aim to achieve a common interest. If interests are shared, individuals would prefer to become free-riders and leave it to other members of the group to pay the cost for the provision of public goods that would benefit all. This tendency of rational actors to act selfishly results in a worsened collective outcome, and in order to prevent such situations other measures should be employed to gear the desire of individuals toward cooperation. Incentives and disincentives prove to be useful in suiting this purpose, but academic research and social experience draw attention to the transformational power of leadership and the important sup-

porting role of followership as the keys to effective and sustainable collective action.

COMMUNICATION

The capacity to communicate—usually denoted by people's ability to make sense of things and articulate about them, share ideas, manage meaning and symbols, and persuade or influence others—is probably one of the few common themes across the multitude of definitions of leadership that have been generated

during the centuries. In other words, because “leadership is enacted through communication” (Barge, 1994a, 21), and communication is often considered to be “the central function of leadership” (Fairhurst and Sarr, 1996, xiv), only with difficulty can we discuss leadership processes or outcomes without considering issues associated with communication.

Central to most contemporary perspectives in the study of leadership and communication is the notion that leadership is symbolically or socially constructed. In other words, leadership is viewed as an ongoing “conversation” between leaders and followers in which “talk” or communication can be conceived of as doing the work of leadership, that is, reducing uncertainty and ambiguity and facilitating a group toward accomplishing shared goals and objectives. Thus, whether in communicating his or her vision of the future to a large group of followers or in conducting his or her everyday and routine interactions with others, the leader is inescapably involved in the communicative processes of managing meaning and “framing” reality.

COMPONENTS OF COMMUNICATION

Most communication theories and models typically incorporate a number of basic elements, including message (verbal and nonverbal cues being conveyed), channel (medium of message transmission), sender/receiver, transmission (sending/receiving of a message via a channel), encoding/decoding (message creation, transformation, and deciphering), meaning (message interpretation), feedback (message response), and communication effects (results/outcomes of message exchange) (Krone, Jablin, and Putnam, 1987). Specific definitions of these elements usually vary depending on the particular perspective to communication and leadership that one assumes.

COMMUNICATION PERSPECTIVES

Major theoretical perspectives in the study of communication include the mechanistic, psychological, interpretive-symbolic, systems-interaction, and critical perspectives (Fisher, 1978; Krone, Jablin, and

Putnam, 1987; Littlejohn, 1992). Although these perspectives can be presented as distinct from one another, when appropriate they are often combined in studies of communication and leadership (for instance, the mechanistic and psychological perspectives and the symbolic-interpretive and critical perspectives).

Mechanistic Perspective

The mechanistic perspective focuses on the channel and transmission of messages and tends to view communication as a “conduit” (Axley, 1984) in which messages flow in a linear fashion, and various factors such as noise, breakdowns, gatekeepers, and barriers affect the fidelity or accuracy of sent and received messages. Research examining the effectiveness of the media and channels that leaders use in communicating information to followers often assumes a mechanistic perspective (e.g., oral versus written, locating specific linkages in networks in which communication breaks down). From this perspective the messages a leader sends have an objective quality to them, and thus a leader who communicates effectively is one who is “transferring” his or her ideas to followers in the manner that he or she intended (misunderstandings are viewed as communication breakdowns in the transfer of information); followers are conceived of as fairly passive, reactive receivers of messages.

In sum, to a large extent the mechanistic perspective casts leadership as “monologue” and communication as a tool for a leader to use to accomplish goals. Leaders are viewed as the central authors or organizers of meaning through the messages they generate, such as vision and missions statements (Bennis and Nanus, 1985). The meanings (for example, visions) created by leaders “remain largely uncontested by constituents” (Fairhurst, 2001, 387) as they are “transferred” with varying levels of fidelity among them.

Psychological Perspective

The psychological perspective draws attention to the “conceptual filters” or “lenses” (Putnam, Phillips,

and Chapman, 1996) that affect what individuals attend to and convey in communicating with others, as well as how they interpret or process information. Communication is receiver oriented (versus sender and transmission focused, as in the mechanistic perspective) and is located in individuals’ attitudes, perceptions, schemata, attributions, cognitions, and all other unobservable states that “significantly affect not only what information is attended to, conveyed, and interpreted but also how this information is processed” (Krone, Jablin, and Putnam, 1987, 25). “The emphasis is always on subjective reactions to so-called objective messages” (Fairhurst, 2001, 384). For example, misunderstandings in communication are considered in terms of psychological processes associated with interpretation versus fidelity issues in the message exchange process between leaders and followers. Thus, whereas in the mechanistic perspective obstacles to effective communication such as “noise” and gatekeeping arise from message transmission processes, from the psychological perspective these obstacles stem from the conceptual filters that individuals consciously or unconsciously apply in attending to, conveying, and processing message stimuli in their information environments.

Studies examining differences in how leaders and followers perceive messages that they exchange with another, how followers’ perceptions of their leaders’ communication affect their upward communication, and how leaders scan and interpret their information environments are usually associated with the psychological perspective to communication (Jablin, 1979). From the psychological perspective, effective leadership communication occurs when leaders and constituents share relatively congruent perceptions or interpretations of their information environments and the messages they exchange with one another.

Interpretive-Symbolic Perspective

“The interpretive-symbolic perspective posits that by virtue of their ability to communicate individuals are capable of creating and shaping their own social reality” (Krone, Jablin, and Putnam 1987, 27). This perspective is heavily influenced by the symbolic-inter-

Leadership Communication in Shakespeare

This famous speech, delivered by Marc Antony in Shakespeare's Julius Caesar, is a classic example of communication about leadership and infamous leaders.

Friends, Romans, countrymen, lend me your ears;
 I come to bury Caesar, not to praise him.
 The evil that men do lives after them;
 The good is oft interred with their bones;
 So let it be with Caesar. The noble Brutus
 Hath told you Caesar was ambitious:
 If it were so, it was a grievous fault,
 And grievously hath Caesar answer'd it.
 Here, under leave of Brutus and the rest—
 For Brutus is an honourable man;
 So are they all, all honourable men—
 Come I to speak in Caesar's funeral.
 He was my friend, faithful and just to me:
 But Brutus says he was ambitious;
 And Brutus is an honourable man.
 He hath brought many captives home to Rome
 Whose ransoms did the general coffers fill:
 Did this in Caesar seem ambitious?
 When that the poor have cried, Caesar hath wept:
 Ambition should be made of sterner stuff:
 Yet Brutus says he was ambitious;
 And Brutus is an honourable man.
 You all did see that on the Lupercal
 I thrice presented him a kingly crown,
 Which he did thrice refuse: was this ambition?
 Yet Brutus says he was ambitious;
 And, sure, he is an honourable man.
 I speak not to disprove what Brutus spoke,
 But here I am to speak what I do know.
 You all did love him once, not without cause:
 What cause withholds you then, to mourn for him?
 O judgment! thou art fled to brutish beasts,
 And men have lost their reason. Bear with me;
 My heart is in the coffin there with Caesar,
 And I must pause till it come back to me.

Source: Shakespeare, William. *Julius Caesar*. Act 3, Scene 2.

actionist tradition (Blumer, 1969; Mead, 1934) and focuses on how role taking and shared meaning allow leaders and followers to coordinate their activities. The ways in which cultural factors affect interpretive processes are emphasized, as are processes

by which individuals construct meanings by negotiating consensual interpretations of reality. In other words, individuals “take an active role in creating knowledge through language and communication . . . [and] are neither passive nor reactive, but intentional and reflexively self-aware” (Fairhurst, 2001, 385). Communication is “both behavioral and symbolic, with a simultaneous emphasis on action and sense-making” (Putnam, Phillips, and Chapmani, 1996, 384).

Leadership communication is cast as more dialogic than monologic (as in the mechanistic perspective); through interaction, feedback, and sharing, leaders and constituents co-construct, contest, and co-author meanings associated with their relationships and the current status and future possibilities of the collectives in which they are embedded. Thus, from the interpretive-symbolic perspective, “shared” visions are not simply created by leaders and “shared” with constituents, but rather are a product of the ongoing conversation or dialogue among leaders and followers about each other's dreams for the collective. Similarly, from this perspective, when a leader tells a story to constituents to highlight a “shared” value, storytelling is not cast as a monologue but rather as a dialogic discourse process in which leader and constituents are simultaneously co-constructing the story and the leader-constituent relationship. Thus, effective leaders do not necessarily orchestrate visions and stories but rather act more as leaders of jazz bands in which members are actively engaged in improvising and meshing the sounds of their competing instruments into coherent music.

Systems-Interaction Perspective

In the systems-interaction perspective, the locus of communication is patterned sequential message behaviors of individuals as part of an interactional system. In other words, communication is understood in terms of recurring categories and forms of contiguous messages exchanged among individuals and not in terms of particular messages or the specific messages of an individual at any point in time. From this perspective “an individual doesn't ‘do’

communication, he becomes part of communication” (Birdwhistell 1959, 104).

In brief, the perspective draws heavily from information theory (especially with respect to relationships between redundancy and uncertainty reduction) and general systems theory (especially with respect to the properties of interdependence and wholeness) and is distinguished by its emphasis on

- (1) time, namely that communication acts recur in meaningful ways and change gradually over time;
- (2) communicative acts, interacts and double interacts, that is, a recurring sequence of three contiguous messages exchanged by communicators;
- (3) the probabilities with which sequences of interacts and double interacts occur in social interaction (a measure of the structure and function of the communication system) and
- (4) phases or patterns of interaction and recurring cycles. (Krone, Jablin, and Putnam, 1987, 31)

Accordingly, from this perspective the “locus of leadership is not the individual but in the patterned sequential communication of leaders and constituents who form an interactional system” (Fairhurst, 2001, 383). Along these lines, for instance, researchers have explored how leaders and followers define and direct their relationships through “control moves” that are often evidenced in symmetrical or complementary interaction patterns that evolve during time (Watson, 1982; Fairhurst, Rogers, and Sarr, 1987; Fairhurst, Green, and Courtright, 1995). In turn, other researchers have employed operant models of supervision to explore leader-follower interactional processes (Komaki, 1998). In brief, from the systems-interaction perspective, barriers to effective leadership communication arise from recurring interactional properties and structures that evolve as leaders and constituents exchange messages with one another.

Critical Perspectives

Critical perspectives apply values to make judgments about communication behavior, structures, and processes. Two streams of critical perspectives are (1) rhetorical criticism, which is perhaps the oldest approach to understanding the quality of persuasive discourse, language, reasoning, and argumentation in

society, and (2) a number of loosely related theories concerned with conflicts “of interests in society and the ways in which communication perpetuates domination” (Littlejohn, 1992, 16). Both streams recognize that communication is central to defining culture and that language and discourse play major roles in affecting experience.

Rhetorical criticism focuses on analyzing the means of persuasion that individuals employ in communicating with others and understanding the “art of using language to help people narrow their choices among specifiable, if not specified, policy options” (Hart, 1990, 4). By studying written and oral texts, researchers “infer meanings through subtexts of discourse” rooted in the circumstances and contexts (rhetorical situations and audiences) associated with messages (Putnam and Fairhurst, 2001, 109). Critics use a variety of standards in evaluating persuasive discourse, including moral, historical, political, and artistic criteria. General forms of rhetorical criticism include the analysis of speech acts (the functions of language such as promising, asserting, and requesting), *topoi* (topics/themes from which ideas are derived), semiotics (the study of signs and symbols), narratives (stories, myths, and legends), logic (reasoning and evidence), persuasive forms and structures, syntax and imagery, rhetorical roles, motives, and dramatic and ideological features of rhetoric (Hart, 1990).

In the study of leadership, rhetorical criticism has frequently been applied to political leaders (for instance, presidents) and their public communication (Hart, 1987). Leadership studies have also employed various forms of language and rhetorical analysis in exploring charisma and visionary leadership in organizations (Den Hartog and Verburg, 1997; Fiol, Harris, and House, 1999).

Critical social theories provide critiques of society generally; with respect to communication in particular, they focus on the expression and suppression of “voices” in society. These theories (e.g., neo-Marxist and feminist) draw attention to interconnections among power, meaning, and communication and how ideology, hegemony, unobtrusive control, and the like affect the ability of individuals to be heard and understood in society.

Generally speaking, critical perspectives consider communication and language as constitutive of power relations in collectives; power is “conceptualized primarily as a struggle over meaning,” with the group “that is best able to ‘fix’ meaning and articulate it to its own interests” as the group that will be best able to maintain and reproduce power (Mumby, 2001, 601). When one group “fixes” its meanings or ideology over another, hegemony arises, “a process of domination, in which one set of ideas subverts or co-opts another” (Littlejohn, 1992, 247), resulting in the distortion and/or suppression of alternative voices and the institutionalization of discursive practices that echo the voice of the dominant group. Along these lines Mumby (1987) demonstrates how organizational stories about leader-follower relationships can function to reproduce power relationships in work organizations.

Among other things, feminist criticism considers the ways in which male language domination affects relationships and constrains communication for women and how women resist and accommodate male language patterns and speech (Littlejohn, 1992). For example, analyses of communication in organizations have shown how leader storytelling and conversational practices often produce and reproduce gender inequality (Bullis, 1993; Martin, 1990).

COMMUNICATION, LEADERSHIP, AND THE PERSPECTIVES

Each of these perspectives offers a different lens for viewing communication and leadership. Accordingly, the perspective that one assumes will affect the extent to which leadership in any particular situation is judged “effective.” This is illustrated next by two studies in which similar incidents were examined but in which, because of the different communication perspectives employed in the analysis of the incidents, distinctive conclusions about leadership effectiveness were drawn. Both of the examples involve analyses of cases of self-led/self-managed teams in organizations in which the teams/team leaders discipline a member.

The first example is drawn from the work of

Manz and Sims (1990) and represents an interaction that the researchers suggest reflects effective discipline in a self-led/self-managed team. In the incident they describe a situation in which a worker had been absent because of his wife’s illness. Manz and Sims describe the group meeting as follows:

The team leader addressed one of the members: “Jerry, we want to talk to you now about your absenteeism.” He then went on to recount Jerry’s record of absenteeism. . . . He asked Jerry if he had anything to say about the absenteeism. Jerry briefly talked about his wife’s illness. The team leader then went on to talk about the effect of absenteeism on the other team members—how others had to work harder because of Jerry’s absences and how the absences were hurting team performance. He stated unambiguously that Jerry’s absences were “unacceptable. We won’t allow it to continue.” He said that if he were absent one more time, Jerry would face a formal disciplinary charge that would be entered into the record. The team leader concluded by asking Jerry about his intentions. Jerry replied, “I guess I’ve been absent about as much as I can get away with. I guess I better come to work.” (Manz and Sims, 1990, 191)

Although not explicitly stated by the researchers, their assessment that the preceding interaction reflects an effective display of team leadership appears to reflect a mechanistic perspective of communication. The message exchange process is generally linear in nature, the message recipient, Jerry, is framed as a fairly passive, reactive receiver of the group’s perspective, and there is little practical opportunity for Jerry to contest the “meanings” that are being communicated to him. Based on Jerry’s response, however, it appears that he “got the message” and thus was effectively disciplined by the group.

In the second example, Mumby and Stohl (1992) also examine an interaction in a self-led/self-managed team in which the team disciplines a member for absenteeism due to a non-work-related problem. The particular interaction they analyze involves a meeting in which the team is discussing its productivity levels. The meeting has gone on for about thirty minutes already when members consider the problem of Lindsay’s absenteeism. The

team leader, Fraser, initiates the interaction, as indicated in this transcript:

Fraser: Lindsay, where are the numbers on the steels?

Sal: He can't get it, he's been out for the last three . . .

Fraser: Yeah, that's right, we need to discuss this today, why we need that . . .

Lindsay: I couldn't make it.

Les: The regulations say—we only have to miss meetings if the production line will be stopped—surely Libby's (the plant manager) not pulling that.

Fraser: Yeah, we promised we'd come if they paid, you didn't.

Lindsay: No . . . that's not it, none of it. I wasn't at work at all, it's other stuff . . .

Sal: (interrupting) Come on, there isn't other stuff—we can't fix this up if we don't have you doing the Pareto—they just won't buy the answer otherwise. . . . Nobody cares, nobody may worry, but sooner or later the machine is gonna stop completely—we need info about the steels. If you're not here to do it, I say we get another joker. Two more misses and we go somewhere else. Everyone agree?

After a few seconds of awkward silence the group nods in agreement, and they move on to the next topic. (Mumby and Stohl 1992, 321)

In considering the discourse of the team meeting, Mumby and Stohl framed the incident from a critical perspective and offered an analysis in which they questioned the monolithic nature of team member identity promoted by the self-led team design—"team member first and foremost." Among other issues, they suggested that the team design, under the guise of neutrality, had constructed a definition of absence associated with the dominant interests of the organization; as a consequence, what were once legitimate accounts of absence (such as an ill wife) were no longer accepted as legitimate and meaningful. In sum, the Mumby and Stohl analysis suggests that within the group alternative voices are muted and marginalized and that the group and its leader may be unwittingly producing and reproducing "meanings" that systematically privilege certain articulations of

reality over others. From a critical perspective this is not an example of effective leadership.

In sum, the preceding examples, although depicting relatively similar incidents, reflect different assessments of effective leadership as a consequence of the underlying perspectives to communication that were assumed in evaluating the incidents. One analysis is not right and the other wrong; rather, they illustrate the importance of articulating assumptions about communication when studying leadership processes.

To conclude, researchers often apply distinctive perspectives in their efforts to unpack the characteristics of leader-constituent communication associated with particular leadership theories and models. Thus, for example, some studies of charismatic leadership have employed rhetorical criticism to analyze the manner in which leaders communicate vision in public settings, whereas others have employed the mechanistic and psychological perspectives in examining the message delivery styles of leaders and the influence tactics they use in communicating with constituents (Fairhurst, 2001). These perspectives vary with respect to their philosophical assumptions and their focus on the "ostensively displayed" versus "internally experienced" characteristics and dimensions of messages and interaction (Stohl and Redding, 1987) and on "surface" versus "deep-structured" systems of meaning (Czarniawska-Joerges and Joerges, 1988; Putnam and Fairhurst, 2001). Exploring leadership communication from one perspective is not more valuable than from another; rather, studies from each perspective are necessary to obtain a rich understanding of the complexities associated with leader-constituent communication.

—Fredric M. Jablin

COMMUNITY DEVELOPMENT

Community development is the process by which groups of people define themselves as belonging to each other, create a set of shared, formal commitments, and, through an informal, emotional sense of belonging, work to enhance their collective lives.

The empowerment that people need to enhance their collective lives is brought about by leadership that creates and transfers knowledge between the sectors of society most able to assist the community. In reality “no more than one percent of the population is involved in community decision making in most American cities” (Nix 1983, 238). Community development activities are typically carried out by a small group of people who are interested in and dedicated to providing community-based leadership.

People most commonly study leadership by examining the individual person as leader and the leader’s authority, influence, and capacity to direct actions of followers. The study of the psychology of the leader and the leader’s resulting psycho-social-political ability to create, control, and maintain power were the chief avenues of inquiry for those who used traditional leadership methods often called “top down” approaches because the authority and direction of the initiative originate in official actors and not in the people and their community life. However, to meet the growing demand of urban and immigrant communities that are expanding in the United States, new emphases on bottom-up leadership required interdisciplinary conversations between the philosophy, sociology, anthropology, and pedagogy of community leadership. In addition, there is new interest in the “community as leader,” sometimes called “indigenous,” or “collaborative” leadership. In what is referred to as “bottom up” leadership, the authority and direction of the initiative originates in the people and their community life. The challenge that people face is that their understanding of the individual leader is oriented in schools of thought called “theoretical orientations,” whereas the new focus on community leadership is oriented in a people’s commonsense understanding of the world around them and is still lacking a theoretical orientation.

Leadership is enhanced by the articulation of its philosophy. Philosopher Christopher Hodgkin argues that “Philosophically speaking, the formal leader has a specialist function in that he is expected to gain a position of value perspective which affords him a degree of detachment, non attachment and affective disinterest different from and greater than that to be

A sign along a road in Puerto Princesa, Palawan, the Philippines, promoting civic pride and safety.

expected in other organizational roles” (Hodgkin 1983, 209). If people do not understand leadership, they may see this function as crude or unpolished when in fact the leader has developed a rather sophisticated, clear-eyed, and imperturbable leadership style. The leader’s obligation to protect the people, from wandering away from or losing their focus on community development goals, keeps the leader alert, aware, and oriented toward what Buddhists have called “mindfulness.”

In a context of power the relationship between leaders and the people is one of exchange: The people elect their leaders, who are empowered to speak and act in their name. In a context of domination the

people's leadership is suppressed, and the people are oppressed by others who are not elected but who have seized the ability to control the people's lives. True leadership is found in a democracy. In a democracy a "surplus" of benefits—not the least of which are emotional surpluses such as "devotion" to one another (Rich 1980, 574–575)—is exchanged between leaders and the people.

CONCEPTS, MODELS, AND THEORIES

Successful community development leadership is characterized by the leader's commitment to developing the people's self-determination and by improving. Leadership entails honor. Preserving honor in leadership often "costs us our lives" (Villegas 1999, 63). Why, then, do individuals and collectives offer themselves as leaders? When one looks at individuals as leaders, the rewards of leadership are often thought to be the primary reason why leaders emerge: Leaders have devoted followings, and leaders acquire a sense of personal satisfaction with a progress that pleases the people. The costs of leadership may be just as significant and may contribute to the decline of leadership: The long and often voluntary hours, the high risks of political life, and the fickleness of politics may not provide the benefits sought by leaders.

Collaborative leadership faces similar challenges because collectives are made up of individuals. To balance the rewards and the costs in both collectives and individuals, leadership develops strategies for understanding occasions when people gather and methods for using these occasions to shape the attitudes that produce the change or the vision that the community seeks.

Leaders name the problem that is being addressed while articulating the people's vision. Under good leadership the strength of the people's vision is amplified to the right "immensity" (Bolling 1996, 1), which challenges the people's capacity to accomplish the vision in accountable ways. Good leaders also work to prevent fear and negativity from destroying the vision and the good solutions that bring it about. They do this by keeping the river of truthful communication flowing among the people,

sometimes using "the grapevine." The grapevine, however, is not always the best form of communication, so the standards and indicators for community success must be available in many formats—the most effective standards and indicators tend to be community media sources such as newspapers. Community journalists are leaders who report on events and remind people of their goals.

A critical component of leadership strategies is the use of community-wide, high profile, well-attended activities often called "trigger events" (Japp 1989, 213) to bring about the changes that are sought. After a community development goal is accomplished, leaders make a prompt announcement followed by immediate articulation of what the community has to do to adjust to the changes it sought.

Community development leadership depends on finding leaders in the community. However, if the community has been depleted of its natural leadership—its intellectual, creative, and visionary people—then leadership skills and the capacity to dream must be taught to a willing but secondary group. This dire context of a "society without dreams" often produces a sense "that leaders can't lead" (Bennis 1989, xiv). This hero-less context is ripe for picking by outside villains.

Models

Collaborative leadership strategies for community development are indebted to the international redrawing of the power map by grassroots women's organizations. A collaborative leadership that clearly articulates tasks, timetables, and expectations and then evaluates its work, letting everyone participate, has been widely successful in struggling communities. For example, the Country Women's Association of Nigeria (COWAN) has become a global model for communities empowered by bottom-up planning in a context where young people are continually attracted away from villages. Because leaders are socially produced in context, the COWAN example argues that social development is a critical component of economic development: "Social development consists of interventions aimed at providing the conditions whereby human

beings change existing social relations by using resources to express their creativity as they grow to their full potential” (Lucas 2001, 186). COWAN as a nongovernmental organization is successful because it is not dependent on the uncertainty of government but rather on women’s popular participation that grows into an indigenous leadership that understands the macroeconomic (large-scale) realities that are faced by communities and against which communities raise young leadership.

Scotland provides yet another kind of collaborative model that is linked to public administration and the public’s desire to see an efficient provision of fragmented services. Some Scots see their urban environment as “devolving” (Lloyd 2002, 147) and have established regional planning partnerships to produce leaders and modernization in underdeveloped communities. One might see this more balanced model as existing halfway between the top-down and bottom-up models. In the Scottish example the boundaries between state directives and the local economic markets are diminished by regional “reference to social justice milestones” (Lloyd 2002, 149). These accomplishments are products of a supportive and balanced partnership between local communities and official representatives who are committed to advancing the community, region, and state.

China’s entrepreneurial rural community development strategies produced the Wenzhou development model is like that of Scotland (creating regional associations) and that of Nigeria in that it realized the connection between social development and economic development: “Wenzhou was named as a national ‘model’ [when] the total product of society (the sum of the gross output value . . .) increased from 3 billion yuan in 1980 to 13 billion yuan in 1988” (Liu 1992, 698). These models became a success after scholars, journalists, and local activists teamed up to promote them.

The developing U.S. model of federal support for grassroots empowerment through a collaboration with faith groups is based on the success of the African-American church in producing leadership from the most abandoned and estranged neighborhoods. Sociologist James Cavendish finds that the

“racial composition of the parish significantly influences its probability for engaging in social service . . . leadership training has a stronger more positive effect in black churches than in white churches” (Cavendish 2000, 382). Worldwide, direct collaboration with the poor has become “both an ideology and a prescriptive tool” producing effective ways to conserve resources while developing sustainable advancements in economic and political life (Selin, Schuett, & Carr 2000, 735).

Theories

Theories attempt to explain social behavior. Social scientists have long understood leadership as a kind of authority that is produced through interactions that evaluate a person’s integrity. Yet, there are many ways to understand this authority, how it is acquired, and put into practice. The German sociologist Max Weber (1864–1920) theorized that society legitimates social order through three types of authority: (1) rational authority that is established by a group’s laws, (2) traditional authority that comes from historical beliefs and obligations such as to a chief, a rabbi, or a grandparent, and (3) charismatic authority that comes from within the particular person. In all three types, people must believe in the authority of the leader whose actions find approval in the collective value system. The degree of power that the leader is given is directly related to the leader’s integrity.

Weber’s view is one view; it is important to understand that there are many theories that originate out of our worldviews. Weber is often seen as a moderate, middle, or liberal theorist who competed for community attention with the radical and conservative voices of his time. It is impossible to name all the operating theories that exist in community development work, but it is critical for communities to articulate an understanding of how social life is produced.

CONTROVERSIES

Community development is highly charged emotionally because few people are involved in community

Cathedral Building as a Model for Social Change

(ANS)—Social entrepreneur Bill Shore believes the time is right for building a new type of cathedral, not out of bricks and mortar but out of leadership, innovation and community wealth put to creative use for lasting social change.

"The great cathedrals did not grow skyward because their builders discovered new materials or suddenly found the necessary financial resources," he writes in his book *The Cathedral Within*. "Rather, they had a unique understanding of the human spirit that enabled them to use those materials in an entirely new way."

Shore's design for a "new architecture" for how society uses its resources to strengthen communities, and especially help children, revolves around five principles he discovered through research on the builders of the great European cathedrals. These are long-term commitments, collaborations among many segments of society, building on the foundations laid by others, generating new community wealth and telling stories that illustrate shared values.

Shore is the founder and executive director of Share Our Strength, a national organization that mobilizes industries and individuals to contribute their talents to fighting hunger and poverty. He is also chair of Community Wealth Ventures, a for-profit subsidiary that provides consulting services to corporations, foundations and nonprofit organizations interested in developing profitable enterprises to promote social change.

His book is part memoir, part social commentary, part biography of other social change visionaries and part how-to guide.

Shore profiles several individuals in cities around the

country who are leveraging the market economy to improve community life and the future for children.

The meat of the book, however, is his argument that nonprofit organizations need to move from reliance on redistributed wealth, in the form of grants and donations, to creating their own wealth. He describes this shift as putting the marketplace to use for community purposes instead of for personal enrichment.

"Creating new wealth is the only answer for nonprofits and community-based organizations struggling to meet social needs," Shore writes. Creating such wealth frees up these organizations to make monumental progress and to run their programs as they feel is right, even if it is not popular, he argues.

Shore explains how an organization can take stock of assets that can be transformed into a money-making enterprise and develop partnerships with businesses for licensing and cause-related marketing.

He cites a program that provides housing, health care and other services for individuals with HIV and AIDS in New York City through revenue generated by thrift stores and a used bookstore-cafe. He cites a soup kitchen that developed a catering business, and an organization for the mentally ill and homeless that operates a gourmet bakery as well as landscaping and janitorial services.

Dozens of organizations that Shore writes in some way "exemplify the principles of cathedral building" are listed in a resource directory at the back of the book. This directory includes addresses, web sites (where available) and a short description of each group.

leadership, making them well known to each other. Such familiarity often creates intense positive and negative interactions as these leaders often anticipate each other's actions with remarkable predictability. Often community dissatisfaction is rightly attributed to the leadership's racism, sexism, homophobia, or classism. However, the community often complains unfairly about leadership when the community is itself the problem. For example, urbanist William Sites examines New York City regimes under mayors Koch, Dinkins, and Giuliani. All three favored community collaboration, but all three stopped community-based programs from operationalization

when they discovered that the programs did not have the economic base to support a weak community leadership base. Sites writes, "Community groups have not created a powerful political alliance capable to generating a sustained challenge to neo-liberal growth priorities at the citywide level, and it is not clear under what conditions they might do so" (Sites 1997, 552). Without strong social movements supporting community-based housing initiatives, for example, these mayors would not invest public monies. The problem for New York City community leaders is that after three regimes, community collaborators begin to disappear as their programs go

unfunded. Community indifference to community need grows with unmet expectations.

THE REAL WORLD FUTURE OF GLOBAL LEADERSHIP

Community development networks are fragile because they are impacted by day-to-day events that restructure the leadership network, its authority, and its ability to act. The societal disruption in China caused by its 1966–1976 Cultural Revolution hampered knowledge transfers between Chinese community and university leaders as China's scientific community deteriorated. China's ensuing knowledge gap cannot be narrowed by China alone. China needs international help to stabilize its young scholarly leadership, which has not received the mantle from a previous generation but which must have experience and authority to pass on to its own students. Without legitimized authority, the young scholarly leadership cannot create the attitudes, values, and culture that make for a collective professional life and hence a "normative consensus . . . for a more self-governing community" (Cao & Suttmeier 2001, 960). Without a sense of self, young scientists cannot be leaders in their country.

The international scientific community can more easily help China narrow its knowledge gap than the international scientific and professional communities can help the many local settings that are struggling with modernization problems. Universities share an international language that does not exist on the local level.

Rebuilding in communities where leadership has been devastated by political revolutions, HIV/AIDS, or migration of the young to urban areas requires science to have more knowledge about leadership knowledge transfers and community collaborative development. It is important for scholars not to assume that communities have had the experience of intentionally reflecting on their actions, thereby arriving at an articulated understanding of why they do what they do. The David Gegeo and Karen Watson Gegeo anthropological study argues that the Kwara'ae people of the Solomon Islands make a distinction between knowledge that comes from the out-

side and is made indigenous and traditional knowledge that is passed down through history from ancient times. The Kwara'ae are well aware of their work of re-creating, reformulating, retheorizing, and restructuring knowledge in order to raise a new generation and its leadership.

In the Gegeo framework, for scientists not to engage the indigenous process of community development raises moral questions. The morality of intervention by, and the spirituality of, academic and community-based development leaders are cutting-edge issues for community development studies of leaders who tend to fight for others instead of themselves.

COMPETITION

Competition where individuals and groups try to outperform each other is an everyday occurrence in most people's lives. Excellence is often defined in terms of a person's performance relative to others. The language of business, politics, and even education is filled with "win–lose" terms. A person "wins" a promotion, "beats" the other sales clerks, "outsmarts" a teacher, becomes a "superstar," "defeats" enemies, and is the "best" student. Organizations must develop their "competitive" advantages if they are going to prosper in the "competitive" marketplace.

Competition and its value have very much influenced Western thinking. Darwin proposed that survival of the fittest was the key dynamic in the natural world. Freud argued that psychology could be understood as contests between an individual's impulses, rationality, and morality. Marx theorized that class warfare over irreconcilable interests drove the development of societies.

The value of competition, especially compared to cooperation, has stimulated many debates (Kohn 1992). Theorists have proposed that leaders must themselves be highly competitive if their organizations are going to succeed in the competitive marketplace. The demanding marketplace requires leaders to be competitive and tough. Others though have argued that leaders must model the way as they build the cooperative relationships between people and units that promote success. Indeed, teamwork within and between organizations has been considered a very valuable competitive advantage that allows organizations to earn better than average returns.

Diffused, diverse understandings of the nature of competition and cooperation have fueled these debates. Theorists have considered competition as the motivation to succeed, the desire to outperform others, the clash of diverse ideas, and the underlying dynamic of the free market system. On the other hand, cooperation has referred to conflict avoidance, a desire to get along with others, interacting with others, having the same goal, and a socialist economy. Discussions on competition have relied on ideology. Debaters have used "first principles," "human nature," and "common sense" in making their arguments.

Fortunately, we can draw upon considerable research conducted by a wide range of social scientists. They have conducted hundreds of studies in psychology laboratories, educational classrooms, work organizations, and community settings. They have used the quantitative methods of laboratory and field experiments and large-scale surveys as well as qualitative methods of interviews and observations. Late twentieth-century meta-analyses have shown that the findings, while not uniform, are consistent and can directly inform discussions about competition and practice (Johnson and Johnson 1989; Johnson, Maruyama, Johnson, Nelson, and Skon 1981).

This entry addresses four related areas where competition can be applied to leadership. The first has to do with the personal motive and drive of leaders themselves. To what extent should leaders be competitive and in what situations? The second level involves the extent to which they should relate to their own employees competitively. Should they try to develop a competitive relationship with their followers? The third level is the extent to which leaders should foster competition among their followers so that they are productive. Should they work to have employees compete against each other? The fourth level involves how leaders should structure their groups vis-à-vis other groups. When and to what extent should leaders have their groups and organizations compete with other units?

Leaders are assumed to operate on a contingent basis in that they decide how to proceed based on the specific situation's demands and opportunities. Sometimes they want to compete; at other times, to cooperate. In some situations, they should foster

competition and in others cooperation. Ideally, research would reliably identify the conditions when leaders should be competitive and cooperative. But research has not developed sufficiently to support this contingency approach, though it can provide very useful general guidance. Studies taken together suggest that the value of competition for leaders is much more restricted than is commonly supposed. Often, but not always, competition is a critical obstacle for leaders as they try to develop a strong, high performance team.

DEFINING COMPETITION

Developing consensus definitions of competition and cooperation with their strong connotations has proved difficult. But it is critical to define competition explicitly. In their study of leadership, Robert Helmreich and his colleagues discovered that their idea of the competitive desire to achieve was not just one thing but had three distinct parts: Competitiveness as the desire to win in interpersonal situations in which others must lose, mastery as the desire to take on challenging tasks, and work as positive attitudes toward working hard. Contrary to their original expectations, successful leaders were not high on three parts of a competitive desire (Helmreich, Beane, Lucker, and Spence 1978; Helmreich, Sawin, and Carsrud 1986; Helmreich, Spence, Beane, Lucker, and Matthews 1980).

Beginning in the 1940s, Morton Deutsch (1949, 1962) theorized that competition and cooperation could be understood in terms of how people believed their goals were related and that these understandings very much affect how they interact and the effects of their interaction. People self-interestedly pursue their goals, but their understanding of how their goal achievements are related to the goal achievements of others influences their expectations and relationships. Results of over 575 experimental and 100 correlational studies conducted mostly in North American when taken together in meta-analyses support the utility of defining competition in terms of goal interdependence and the theorizing on the effects of goal interdependence on interaction and outcomes (Johnson and Johnson 1989).

In competition, people believe their goals are negatively related. As one moves toward goal accomplishment, others are less likely to reach their goals. Goal achievements are negatively correlated: each person perceives that when one achieves his or her goal, others fail to achieve their goals. As one runner wins the race, the other runners cannot attain their goal of winning the race and they lose. Their understanding of competitive goals leads people to be negatively oriented toward the other's effective actions. One runner does not want another runner to sprint fast to the finish line. In competition, people work against each other to achieve a goal that only one or a few can attain. Thus, they are tempted to frustrate and obstruct others from performing well and reaching their goals.

In contrast, people in cooperation perceive that they can reach their goals only if the others also reach their goals—they have a vested interest in the others performing effectively. One runner's completing a part of the relay directly helps other relay team members reach their goal of winning the race. As people in cooperation succeed to the extent that others succeed, they encourage and support each other's efforts.

People may also have independent goals. Here there is no correlation among goal attainments. Each person perceives that he or she can reach his or her goal regardless of whether other individuals attain their goals. They seek an outcome that is personally beneficial without concern for the outcomes of others.

It is understood that most situations are mixes of these goal interdependencies and that perceptions of goal interdependence change over time. However, whether goals are primarily considered competitively, cooperatively, or independently related is expected to affect expectations and interactions.

Competition has often been confused with conflict. Deutsch (1973) defined conflict as incompatible activities, where one person's actions are interfering, obstructing, or in other ways making the behavior of another less effective. Conflict can occur in both competitive and cooperative situations. Competitors often frustrate each other's actions to make them less effective. Cooperators conflict over the

best means to reach their goals, the division of the costs and benefits of their common effort, and many other issues.

Considerable research has demonstrated that whether conflict is handled in ways that emphasize competitive or cooperative goals very much affects whether conflicts have constructive or destructive outcomes (Tjosvold 1998). Recognizing that the success of one promotes the success of the other, protagonists who emphasize cooperative goals tend to view a conflict as a mutual problem that needs common consideration and solution. The emphasis on cooperative goals leads to mutual exchange and an open-minded discussion that in turn help develop useful, mutually beneficial resolutions that reaffirm the relationship. With this mutual affirmation and success, protagonists are confident that they can handle their conflicts and continue to deal with conflicts successfully. Repeated effective conflict resolutions lead to high-quality, implemented solutions that result in team productivity. Emphasizing competitive goals results in conflict avoidance and, if conflict surfaces, in strong attempts to impose one's solution on others.

THE LEADER AS COMPETITOR

Leaders themselves are often thought to be competitive. After all, they have successfully become leaders. Organizations select people for management positions based on comparison of candidates and selection of the one best suited to be a leader. Many managers believe that they must outperform other managers if they are going to reach their goals of promotions and becoming an executive. It is common to conclude that leaders are successful competitors who are able to demonstrate their superiority.

Although being compared to others is common throughout organizational and social life, are people who are oriented toward competition effective leaders? Robert Helmreich and his colleagues originally theorized that the competitive desire to achieve characterized successful leaders (Helmreich et al. 1978; Helmreich et al. 1986; Helmreich et al. 1980). As they conducted studies, they realized that mastery as the desire to take on challenging tasks and work as

positive attitudes toward working hard operated independently of the desire to win in interpersonal situations. They were not surprised to find that male Ph.D. scientists who were most successful as measured by citations of their work were high on mastery and work. However, they were surprised that successful scientists scored not high but low on interpersonal competitiveness. Competitive scientists apparently get distracted by attempts to outshine others and produce research that is more superficial and less sustained than less competitive scientists.

Subsequent studies confirmed the basic findings. Successful (as measured by salaries) business leaders in large corporations did have higher mastery and work scores than less-successful ones. However, they had lower competitive desires to outdo others. Similarly, less-competitive airline pilots, airline reservation agents, supertanker crews, and students were all more effective than highly competitive ones. The researchers were unable to identify any profession in which more competitive persons were more successful. Indeed, it is when competitiveness is low that the desires for challenges and hard work result in success.

David McClelland and his colleagues wanted to document the motivations that lie behind successful leaders, specifically, whether they had high or low achievement, power, and affiliation needs. Achievement is the desire to complete challenging but attainable tasks at a standard of excellence that helps them feel an internal sense of accomplishment. Affiliation involves the desire to associate and feel recognized and accepted by others. Social power involves the satisfaction of having an impact on others and to influence them; personal power is the desire to control others.

It is tempting to conclude that effective leaders are high on achievement, affiliation, and power motives. They develop relationships so that they can have an impact so that their group achieves. However, results indicated that many effective leaders are high on social power, but low on personal power, achievement, and affiliation (McClelland 1975, 1970; McClelland and Boyatzis 1982). Effective leaders are interested in influencing other people; they do not try to do it all themselves or hide in their

office. They are not overly concerned about being liked; they are able to confront conflict and make tough decisions and insist on the same high standards for everyone. At the same time they avoid expressing their power needs for personal control but channel them into mutual goal accomplishment.

High social power needs managers find leading personally valuable and help employees become committed. They relish the give-and-take of managerial life and enjoy the self-control that working in organizations demands. They also want employees to develop self-discipline and at the same time show concern for their employees. These results further substantiate that effective leaders are motivated to work with and through others, not to outdo them.

THE LEADERSHIP RELATIONSHIP

Researchers have emphasized that managers develop distinct relationships with employees and whether that relationship is inclusive and high quality has been considered key to successful leadership (Gerstner and Day 1997; Graen, and Uhl-Bien 1995). Developing quality relationships with employees has been found to be an important antecedent to employee performance and citizenship behavior (Hui, Law, and Chen 1999).

Studies in the 1990s have complemented this research by documenting that whereas competitive goals undermine this leadership relationship, cooperative goals is a key ingredient. These studies also show that these effects occur in Asia as well as in the West. For example, in a survey study in southern China (Tjosvold, Law, and Hui 1996), structural equation analysis suggest that strong cooperative goals as measured by the employees, but not competitive or independent ones, promote a high quality relationship between leader and employee, which in turn leads to high levels of job performance and citizenship behavior as described by their manager. In an experiment, managers with cooperative, compared to competitive, goals with their employees used their valued resources to assist and support employees, especially employee who demonstrated high needs by being unable to complete the task themselves (Tjosvold, Coleman, and Sun, 2003).

When Competition and Rivalry Are Dysfunctional

Conflict, rivalry, and competition among individuals and groups exist, of course, everywhere. [Anthropologist] Max Gluckman has postulated that certain kinds of institutionalized conflict have an integrative effect for society as a whole, and Americans take for granted the proposition that competition is a constructive force resulting in increased production and progress. It seems clear that the expression of hostility and conflict is culturally determined, at least in part, and that each society imposes certain limits on behavior aimed at maximizing the wealth and power of one individual or group at the expense of others.

Nevertheless, in Korea, endemic pervasive factionalism often has been blamed for most of the country's ills, past and present, while almost no systematic study has been made of its basic sociological elements and how they operate. Until very recently leaders of large political units or organizations seem to have been unable to find appropriate symbols or methods that would stimulate a sense of identity and common purpose capable of unifying the loyalties of diverse groups of people. The limits of solidary association have remained the small face-to-face community, the kinship organization (or segment thereof), and the unstable political faction, whereas the common interests of members of a community, an association, a class, a region, or the country as a whole often have been obscured or forgotten in the intensity of the struggle between competing groups. Frequently a contest for political and economic spoils has been waged in terms of moral issues that introduced an aura of religious fanaticism, providing additional emotional bonds among members of the warring factions.

Source: Brandt, Vincent S. R. (1971). *A Korean Village Between Farm and Sea*. Cambridge, MA: Harvard University Press, pp. 239-240.

Cooperative compared to competitive goals have helped leaders open-mindedly consider the ideas of employees (Tjosvold 1982).

Hong Kong senior accounting managers were found to be able to lead employees working in the mainland of China when they had cooperative goals, but not when their goals were competitive or independent (Tjosvold and Moy 1998). Managers in the Hong Kong parent company and new product spe-

cialists in Canada who developed cooperative links and engaged in constructive controversy were able to develop productive, trusting relationships despite their cultural differences and geographic separation (Tjosvold 1999). Chinese employees with cooperative goals with their American or Japanese manager open mindedly discussed their views that led to productive collaborative work and strengthened relationships (Su, Chen, and Tjosvold, 2003).

LEADER'S USE OF COMPETITION

Competition has long been considered a highly effective motivational device. Having employees compete against one another should encourage them to work hard and smart as they try to outdo others and demonstrate their superiority. Although some studies support this view (Brown, Crown, and Slocum 1998; Miller and Hamblin, 1963), meta-analyses of hundreds of studies has failed to document the conditions under which having people compete against each other reliably improves performance (Johnson and Johnson 1989; Johnson et al. 1981). Indeed, cooperative goals were found much more promotive of achievement, especially on complex tasks, as well as relationships, social support, and self-confidence. Competition appears to undermine the exchange of information, the discussion of ideas, and support for continued effort needed to complete many tasks.

Encouraging their group to compete against other groups is a popular leadership strategy. Leaders of nations as well as departments have sought to build group cohesion and effectiveness by viewing another group as the enemy that their followers must work hard together to defeat. Despite the strong beliefs that fostering this kind of competition can be successful, results of meta-analyses reveal that intergroup competition generally is less effective than intergroup cooperation for promoting team productivity (Johnson and Johnson 1989; Johnson et al. 1981).

The studies included in these meta-analyses are typically conducted within an organization rather than between multiple organizations. The groups then often depend upon each other for information and assistance; rather than provide them in a timely

manner, groups in competition are tempted to use their information and assistance to obstruct each other's goals as they try to win. It may be that when groups are highly independent of each other, intergroup competition is more viable leadership strategy (Crombag 1966; Raven and Eachus 1963).

DEVELOPING A CONSTRUCTIVE ROLE FOR COMPETITION

Despite the ongoing controversy about the value of interpersonal competition in organizations, little research has explored the conditions under which competition can be constructive. The search for benefits of competition, defined as negative goal interdependence, has not been very fruitful whereas cooperative goals have been found to promote achievement and relationships across a wide range of situations, tasks, and people. But, especially given its obliquity and popularity, competition must surely be useful under certain conditions. There are tasks, such as athletics and motor performance, where competition is not only useful but also more promotive than cooperation.

Previous theorizing and research have suggested conditions under which competition is constructive (Stanne, Johnson, and Johnson 1999). Competition has been thought particularly useful for fostering motivation; conditions have been proposed to realize this potential. Wanting to win the competition, an internal commitment to winning, and acceptance of the competition would appear to make competition productive. Competition should also be more motivating when all the participants believe they have a reasonable chance to win; striving to win without any clear prospect of doing so can be demotivating.

More generally, the competition should be fair with known rules and procedures. Competitors who believe that standards are biased against them are likely to be alienated and withdraw. Why should they strive hard when their victory will be arbitrarily made more difficult or even eventually denied?

Studies have shown that competition can be useful for the performance of motor tasks (Miller and Hamblin 1963). Completing these tasks should

depend a great deal upon motivation and the desire to win should strengthen incentives to perform well. Competition should be promotive of tasks whose completion does not require the assistance of others; means independence should be a condition that favors competition. On the other hand, more complex and intellectual tasks benefit more from the joint consideration and application of several perspectives in cooperation.

Typically, people compete with those with whom they already have a relationship. However, it is not clear how the prior relationship might affect competition. Competitors may feel more able to obstruct the goals of others and find winning more motivating and less ambiguous when competing against those toward whom they have few positive feelings and attitudes. However, it might be that competition is more involving and motivating with friends. The esteem of friends because one has won may be very much valued. In addition, people may expect competition with friends to be contained and managed whereas with out-group members the competition could escalate dangerously. Competing as a team against other groups may be more motivating than individual competition because people feel they will have the support of their team members, can celebrate winning together, and are more prepared to handle any escalation.

Empirical support for documenting these conditions has proved elusive. Indeed, a late-twentieth-century meta-analysis failed to confirm the superiority of competition for motor tasks; even on these tasks, cooperative goals have been found more promotive of performance (Stanne et al., 1999). It may be that it is necessary to move away from the dominant research approach of comparing competition with cooperation. As the benefits of cooperation are quite robust, documenting constructive competition has proved difficult. A more viable research strategy for understanding the constructive role of competition may be to compare different types of competition.

In an initial study, sixty-three managers and twenty-six employees from mainland China organizations described specific competition incidents and then rated these experiences (Tjosvold, Johnson, Johnson, and Sun, 2003). Fairness in knowing the rules and knowing that they will be applied in an

unbiased manner was found to be quite useful for making competition productive. Motivation issues were also important. Having a motivation to win and indeed believing that one had an advantage were found to contribute to constructive competition. Findings also reveal that a strong prior relationship where the competitors respected each other also helped them make good use of competition.

Competition is appealing and useful in some situations. Our research methods though are not subtle and sophisticated enough to have made much progress in documenting these conditions. Research comparing aspects of competition rather than competition with cooperation may help identify the nature and conditions of constructive competition.

IMPLICATIONS FOR LEADERS

Research has developed a useful way to define competition. Findings have been cumulative and have consistently challenged the theorizing that competition has powerful, general benefits for leaders. Leaders' desire to win in interpersonal situations, their development of competitive relationships with employees, their structuring of competition among employees and against other groups do not appear to be viable strategies across a variety of situations. Research is much more supportive of the implication that leaders should develop cooperative relationships with and among employees and with other groups.

But it should not be concluded that this implication makes leadership easy. Developing the understanding, attitudes, skills, and procedures of a cooperative leader who is able to develop a strong team organization is an enduring challenge (Tjosvold, 1991; Tjosvold and Tjosvold, 1995, 1993, 1991). Developing a productive cooperative relationship with one employee is not the same as with another employee. Cooperative goals so that team members feel that they are in this together must be continually strengthened. For example, developing common tasks, recognizing the necessity for joint effort, and shared rewards for success can convince managers and employees that they have cooperative goals so that they feel that they are "on the same side" and are "in this together." Cooperators must also be able to

resolve many issues if they are going to maintain their belief that they are positively interdependent. They can develop skills and procedures to voice and integrate their different views but these ways should be acceptable to leaders and their followers. Although open, effective conflict management is required if leaders are to foster a cooperative team, managing in this way has proved quite difficult (Argyris and Schon 1996). However, developing these cooperative skills and avoiding the deceptive allure that competition is a generally viable strategy should prove highly valuable for leaders and their followers.

CONFLICT

Because people have different personalities, goals, and values, conflicts often occur between individuals as well as between groups. Leaders of organizations can use a variety of strategies to manage conflict. The best approach for any particular conflict depends on a number of factors, including the importance of winning.

CONFLICT-MANAGEMENT STRATEGIES

Conflicts can be divided into two broad types: *task* and *relational*. Task conflict occurs when organizational members express or experience disagreements about work responsibilities, problems, and procedures. This type of conflict may help individuals and groups define responsibilities, determine the most effective ways to accomplish work, and find the best solutions to organizational problems.

Moderate amounts of task conflict are desirable because they indicate that individuals are willing to discuss their differences openly and to find solutions that have broad acceptance. Indeed, a moderate amount of task conflict has been called *constructive controversy* because it often produces competing

solutions along with critical assessments of those solutions, which can lead to a preferred solution. In other words, moderate conflict contributes to constructive problem solving.

In contrast, both low and high amounts of task conflict can be counterproductive. Low levels of task conflict may indicate that individuals are keeping issues to themselves. One dysfunctional result is that important problems may not be solved. High levels of task conflict may also be dysfunctional, as individuals or groups may spend more time arguing than producing constructive outcomes. High levels of task conflict often indicate that individuals or groups have not found a way to manage conflict. Indeed, high levels of task conflict may actuate relational conflict, adversely affecting relationships between groups and among individuals.

Relational conflict arises from differences in personalities, personal dislikes, and disagreements over roles or boundaries. This type of conflict tends to be negative, personal, and destructive. Relational conflicts often escalate and hinder individuals and groups from managing task conflicts and solving problems. Unless individuals can find ways to resolve relational conflicts, they are unlikely to experience productive task conflict.

When leaders have goal or value differences with other leaders inside and outside their organization, they should develop a strategy to achieve *desired outcomes*. The outcome might be a desired *relationship* with another leader, it might be a *substantive goal*, or it might be both. A leader's approach to a conflict will depend on whether a leader desires a substantive or relationship outcome.

Collaborate

When both the substantive and relationship outcomes are important, a leader should collaborate. Collaboration means that the leader cooperates with others in attempting to find a satisfactory solution. Some refer to this approach as “win/win” problem solving. A popular book called *Getting to Yes* (Fisher, Ury, & Patton 1991) describes the collaboration process in depth.

The primary idea in collaboration is that a leader understands the underlying goals of all parties

involved and then uses creative problem solving to find solutions that achieve each party's goals. Collaboration requires openness and trust, and it creates mutual understanding. This approach to conflict also tends to build positive relationships. In addition, of all the approaches to handling conflict, collaboration most readily obtains substantive goals.

Competition

When substantive outcomes are important and relationship outcomes are not, a leader should consider competing. Competition may be the preferred strategy in a one-time transaction in which the substantive outcome is very important. It may also be preferred when a leader distrusts, dislikes, or does not desire a long-term relationship with another person. Competitive tactics include very high demands of, or very minimal concessions to, the other party, as well as bluffing, intimidating, or threatening the other party. These tactics are often employed to disguise a leader's actual goals and needs. Competition is most effective when practiced by a leader or an organization that has the most power in a relationship.

Contrary to popular belief, competition is not as effective in achieving substantive goals as collaboration. The limitation of competition is that it tends to stimulate similar strategies in others. When all the parties in a conflict compete, levels of both task and relational conflict tend to escalate, often increasing animosity and stalemates. For example, management-labor union negotiations have traditionally used competitive tactics.

Compromise

Leaders might adopt a compromise strategy when both substantive and relationship outcomes are important but they cannot find a true "win/win" solution. Compromise means that each party in a negotiation achieves a portion of its goals. Like collaboration, compromise demonstrates a willingness to cooperate and to meet the needs of both parties. However, because compromise does not completely fulfill the needs of involved parties, it is not as effective as collaboration in obtaining satisfactory sub-

stantive or relationship outcomes. While compromise can be used either cooperatively or competitively, it is most often associated with a competitive strategy. For example, leaders may use competition and take an extreme position even though they anticipate that the subsequent use of compromise will achieve the desired substantive outcomes.

Accommodation

When establishing a good relationship is more important than obtaining a substantive outcome, a leader should consider accommodation. An accommodating leader helps others obtain desired substantive outcomes in order to build good will and sustain or build a positive relationship. By engendering positive feelings in others, this strategy helps develop interdependent relationships and a desire in others to sustain the relationship. When a leader accommodates others, especially when the leader is very effective in helping, over time the accommodation can make others feel dependent upon the leader to achieve their goals. When others become dependent, the accommodating leader develops a level of power in the relationship. Thus, accommodation is one way to build a relationship with another powerful individual, group, or organization.

Avoidance

Avoidance is the best strategy for leaders who desire neither substantive nor relationship outcomes. The leader simply refuses to negotiate or discuss the conflict. This strategy can be used when a leader does not want to become embroiled in a conflict or when there is nothing to be gained. However, refusing interaction may be off-putting to others, resulting in a poor relationship. Thus, before electing to use this strategy a leader must be certain that the likely outcomes are desirable.

MANAGING CONFLICTS BETWEEN INDIVIDUALS

As leaders think about strategies, they also need to consider the strategies others might use. Two condi-

tions are likely to influence another party's choice of strategy—self-interest and the nature of the existing power relationship. If the other party in a conflict is dependent upon the leader, as would be the case with an employee, the other party is likely to accommodate the leader's wishes. If the nature of the relationship is interdependent, the other party is likely to collaborate or compromise. If the leader is dependent upon the other party, the other party is likely to use a competitive strategy. In cases where a leader is dependent on the other party and desires to collaborate, the leader may need to develop coalitions with others or find other ways to equalize power relationships in order to build the climate for a cooperative strategy.

Another condition that influences the choice of a conflict strategy is emotion. Generally, individuals are more likely to use the cooperative strategies of collaboration or compromise when they feel positive emotions. They are more likely to compete when they feel negative emotions. Thus, leaders hoping to cooperate with another party need to assess the emotional state of the other party, and when necessary, to attempt to engender positive and trusting feelings. Leaders often have the responsibility of resolving or managing conflicts between two individuals. In these instances, leaders might apply the strategies outlined above. However, when managing others' conflicts, the leader must not only choose but also implement strategies. The following guidelines summarize the leader's role in implementing strategies to facilitate dyadic conflicts.

Collaboration/Compromise

When individuals must interact to fulfill their roles in a group but find themselves in conflict, leaders must help them resolve the conflict so that task conflicts are constructively addressed and relational conflicts do not escalate. Ideally, the conflict-management strategy should actually improve relationships so that the involved individuals can work together more effectively. Leaders might use the following guidelines to resolve a conflict.

If necessary, separate the parties to allow anger to subside. Individuals will have difficulty finding a collaborative solution when they are angry. Separating the

parties to allow them to get control of their emotions will improve the likelihood of cooperating to find a solution.

Bring the conflicting parties together in the leader's presence. Getting the parties together in the presence of a neutral third party encourages them to avoid escalating relational conflict and to focus on task conflict. Thus, having a neutral third party present is an important element in promoting collaboration. If either of the conflicting parties believes the leader is not neutral, the leader should find another neutral party to be present.

Facilitate the discussion to identify the goals or interests. When the intent of the discussion is to collaborate, the leader should encourage both parties to be open and attentive to each other's comments. In addition, the leader should help participants avoid promoting a specific solution. Instead, the two parties should discuss goals, needs, and interests. Once these are understood, they can more easily find solutions.

Find a solution both parties can accept. When the conflicting parties understand one another's interests and goals, they are in a position to find a collaborative solution that satisfies both parties. The leader should ensure that the solution selected is satisfactory to both parties.

Competition

Leaders and their subordinates commonly encounter conflicts when contracts and agreement are being negotiated. These negotiations are frequently competitive because the importance of the substantive outcomes outweighs the relational outcomes. In such situations, leaders should prepare those involved in negotiations to use effective bargaining strategies. The following are general guidelines for effective bargaining.

Identify and rank issues. Because numerous issues are often involved, competitive negotiators should enter discussions knowing which issues are most important. Listing all the issues that will be on the table during a negotiation and ranking their importance will help negotiators determine when to hold firm and when to make concessions.

Young People from the Middle East Come Together

(ANS)—Roy Cohen believes for real harmony to prevail in the Middle East, it will take peace between people, not just between governments. “It was a bureaucratic peace with Egypt,” said the Israeli Jew. “I hope peace would be something between people, not just governments. Not just ‘We give them Gaza, and now we don’t have to look at them anymore.’”

At age 16, Cohen may not have the diplomatic experience of his country’s leaders as they seek to hash out a lasting peace between Jews and Arabs. But he has other experience they probably don’t.

Cohen is spending his third summer at Seeds of Peace International Camp in Otisfield, ME, where he lives, eats, plays and sometimes argues not only with other Israeli teenagers, but with Palestinians, Jordanians, Egyptians, Moroccans, Tunisians and Qataris. He knows about face-to-face peace among individuals.

They don’t necessarily come to agree with each other or change the others’ points of view, he said, but they learn to see each other as people nonetheless, even to become friends.

Since 1993, more than 1,000 young people such as Cohen, chosen by their governments for their academic achievement and leadership potential, have come together for about three and a half weeks. They enjoy traditional camp activities at the same time they coexist with peers they would never meet in their daily lives.

Founded by author and journalist John Wallach, the camp aims to serve as a means for breaking the age-old cycle of fear and hatred, said Adam Shapiro, director of development.

The camp is privately funded by individuals and foundations and does not take money from government sources.

“The camp brings young people together and gives them a chance to get to know each other on neutral, common ground,” Shapiro said, adding that the groups include young people from every strata of society. “Some come from refugee camps and others from the wealthiest families in Tel

Aviv. They represent the demographics of the region.”

In addition to play, the groups engage in daily issue-oriented discussions, dubbed “coexistence,” which are led by professional facilitators. Here they discuss issues of daily life and often find themselves at odds with their new friends.

“There’s a pattern to camp that seems pretty consistent,” Shapiro said. “Initially, they are very interested in meeting new people, and they’re on their best behavior. No one wants to start a disagreement; they seem to be getting along right away.”

After a few days, however, the facilitated sessions become more political and personal. “They get more honest with themselves and take stronger positions. But because of the relationships they’ve formed, they can still play, eat and share cabins together. They put differences aside when it’s time to play games.”

While some tense moments can develop during the coexistence sessions, Shapiro said, most campers leave with the positive feeling that they have been heard, even if they didn’t change another’s perspective. “That’s a big accomplishment.”

Dina Jaber, 16, of Palestine Nablus on the West Bank, said she experienced her share of tense moments last summer, her first year at Seeds of Peace camp. “Last year it was hard to meet Israeli teen-agers, talk to them, coexist with them. We yelled at each other a lot at first.”

But over time she was able to consider the perspectives of her new friends. She understood, she said, many issues from the Palestinian perspective but now can see them from the Israeli side. For example, she didn’t know much about the Holocaust before her camp experience but learned a great deal about it from her Israeli friends.

After a summer of arguing, listening, contemplating and playing, Jaber said she counts many Israelis she met in Maine among her closest friends. And because the Seeds of Peace mission extends beyond the summer camp experience, she has been able to visit her friends’ homes and host them

Source: “Young People From Middle East Play, Eat and Argue Together.” The American News Service, July 29, 1999.

Gather information about the other party. Before entering into negotiations, a leader should understand the other party’s issues, positions, and arguments. This type of information gives a negotiator an advantage in bargaining to maximize the likelihood of obtaining a desired substantive outcome.

Frame arguments. Researchers at Northwestern University found that the way arguments are presented

influences how persuasive they are. For example, asking for a concession of \$200 in a contract worth over \$10,000 is quite different from asking for a concession of the same amount in a contract worth \$400. Although the amount of the concession is the same, the concession seems less when compared to \$10,000 and is therefore more acceptable. Thinking through how arguments are presented will help negotiators be persuasive.

at her own.

"When I first told friends that I had an Israeli friend that slept over, they couldn't believe it," she said. "It's not something normal. Without Seeds of Peace, I could never imagine having an Israeli friend, even knowing an Israeli teen-ager."

Although some of her Palestinian friends have been skeptical about Jaber's relationships, most view coexistence and exchange of opinions in a positive light. Family members—her father in particular—were extremely interested in her Israeli friend and spent hours talking to her about her life in the camp, Jaber said.

Because of travel restrictions, Jaber could not make some of these visits without Seeds of Peace intervention. Camp administrators consider such efforts a critical and natural extension of the summer program.

Shapiro said the organization recently obtained a building in Jerusalem where they can set up offices. From there, two staff members help camp alumni keep in touch by arranging visits, publishing a newsletter and maintaining an e-mail network as well as holding workshops and seminars.

"When an Israeli kid visits a friend in Gaza," Shapiro added, "all the family and friends have the opportunity to meet someone they never would have known. So we're affecting thousands of communities." He added that campers' leadership training makes them particularly effective representatives of their respective groups.

Staff members helped Cohen arrange a visit to his school and a presentation by a Palestinian friend from camp. Though he received some negative reaction from some students, he said, this was to be expected. "Most people were really enthusiastic about the idea." He said he feels compelled to carry out the work of Seeds of Peace throughout the year, to expose others to the humanity of those they consider enemies. He added, "The major thing is really what you do when you get home."

—Karen Pirozzi

Actively listen to understand the other party's interests and positions. Most novice negotiators mistakenly approach competitive situations by immediately attempting to take control and argue their positions. Alternately, experienced negotiators devote much more time to actively listening and gathering information about the other party's interests and positions. They ask more questions and make fewer arguments. These experienced negotiators have found that when

they truly understand the other party's arguments and positions, they build understanding and gain knowledge that promotes effective bargaining.

Identify solutions that achieve the interests of both parties. Negotiations are likely to become contentious and to break down when either party feels that their goals or interests are ignored. Negotiations get on track and are productive when the parties involved have a good sense of one another's interests and work toward achieving them. Thus, negotiators should see that the interests of both parties are addressed during negotiations.

MANAGING GROUP OR TEAM CONFLICTS

Often leaders may find that conflict exists within or between the groups they lead. A moderate amount of task conflict is healthy. Leaders may actually want to be a devil's advocate and promote controversy when not enough open discussion exists. However, when either relational conflict or task conflict becomes pronounced, the leader should step in and attempt to manage the conflict. In these cases, the leader should act as an outside party to promote resolution. Depending on the situation, the leader could play one of the roles described below.

Facilitator

A facilitator brings the conflicting parties together, helps to promote discussion, and encourages collaboration and compromise. To avoid creating defensiveness and to be successful, leaders should be neutral and objective. They should not allow the expression of relational conflict but should stay focused on task-related issues. Ground rules may need to be established, such as one person speaking at a time. A facilitator does not actively participate in offering solutions, but promotes discussion so that participants come to a mutually satisfactory decision themselves.

Mediator

Mediation may be the best approach when conflicting parties have hostile feelings and find it difficult to

communicate face-to-face—that is, the relational conflict is very high. A mediator may have the parties in dispute talk directly to one another at the beginning or end of the negotiation. However, a mediator typically separates the parties in a dispute and talks with each party alternately. Separating the parties takes the negative emotional edge off the negotiations so that the mediator can promote collaboration and compromise to enable the disputants to make progress toward finding a solution that is satisfactory to everyone. This approach enables a leader to control how information is presented. A mediator does not misrepresent either party, but frames arguments and presents information in a manner that moves negotiations forward. For example, a mediator gives each party a sense of how the other party is reacting and whether proposed solutions will be accepted. When negotiations are stalled, a mediator may offer solutions that the parties may not have considered. A mediator may also promote resolution by pointing out the consequences of not reaching a solution.

Arbitrator

Arbitration is a competitive approach to resolving conflict. Involved parties present their cases, including arguments and proposed solutions. The leader reviews the information and chooses a solution. Because a solution is chosen from those presented, involved parties do not communicate directly, blocking any opportunity to create a collaborative or compromise solution. However, the pressure of putting the decision into a third party's hands influences the involved parties to present the most objective information, highly persuasive arguments, and reasonable solutions.

Director

Leaders of groups that experience consistently high levels of task or relational conflict should consider creating a set of norms to guide behavior. They may consider reviewing roles and responsibilities to clarify both the group's structure and the relationships among team members. They should also consider

creating policies, procedures, and rules. These structuring mechanisms can prevent conflicts and provide guidance for resolving differences when they occur. Clarified structures and procedures help prevent or avoid conflict. Thus, a directive approach includes an element of avoidance. Note, however, that when procedure, precedent, and rules are applied to resolve conflicts, the approach is competitive in that conflicting parties either win or lose. There is not an opportunity for collaborating and creating unique solutions.

CHOOSING THE BEST STRATEGY

Whether faced with task or relational conflict, all leaders must manage conflict with others sooner or later. Leaders have several strategic choices when managing conflicts between individuals or groups of individuals, and these choices may be associated with whether a leader desires to achieve substantive or relational outcomes. A collaborative win/win strategy is most likely to achieve both substantive and relational outcomes, but requires both openness and trust. In contrast, a competitive strategy focuses on achieving a substantive outcome, typically at the expense of a positive relational outcome and with the likelihood that it may result in a stalemate. Perhaps because of this potential outcome, competition is often accompanied by compromise, whereby both parties make concessions. The accommodative strategy is the opposite of a competitive strategy, focusing on substantive concessions in order to achieve positive relational outcomes. Finally, the avoidance strategy places little weight on either substantive or relational outcomes and distances the leader from the conflict. However, it may actually result in a negative relational outcome.

When making these strategic choices in conflict management, leaders are well advised to take into account their relative power and the intensity of the conflict situation. Reducing negative emotions is important if cooperative strategies such as collaboration and compromise are favored. At the same time, if a leader has less power than the other party, it is more likely that he or she will face competitive strategies from the other party.

In addition to one-on-one conflict situations, leaders must often intervene when two or more individuals are in conflict. As facilitators, leaders can help resolve these conflicts using either cooperative or competitive approaches. The latter approach is most appropriate when individuals are most concerned with substantive outcomes—that is, when they are entering into a short-term or temporary agreement. While leaders may also facilitate group or team conflicts cooperatively, they sometimes have to intervene more prominently as either mediators or arbitrators. As mediators, leaders can exert more influence to shape potential solutions than they would as facilitators. In contrast, as arbitrators, leaders act as judges, choosing solutions for resolving conflicts that emerge through the competitive process of each party making a case for its preferred solution. Finally, leaders can sometimes avoid personal intervention through directive means—that is, by establishing policies, procedures, and rules for handling conflicts.

Making the conflict management choices we have reviewed can represent some of the hardest decisions that leaders will make. Choosing wisely among the array of strategies and tactics for managing conflict requires immense interpersonal and persuasive skills. In many ways, how a leader handles conflict situations is a true reflection of the leader's values and expertise.

CONFORMITY

A central goal of leadership theory and research is to understand the factors that dispose others to follow the vision or ideals, suggestions (explicit or implied), expectations, or demands of a leader. In other words, leadership theory attempts to identify the factors that affect someone's capacity to attract and influence followers. The psychologist Martin Chemers defined leadership as "a process of social influence in which one person is able to enlist the aid and support of others in the accomplishment of a common task" (2000, 27). Chemers's emphasis on social influence opens the study of leadership to the theories and rich empirical storehouse of experimental social psychology, which for decades has focused on the variables that advance or retard the process of social influence.

CONFORMITY WITHOUT PRESSURE

Research on social influence, or conformity, has been a part of the social psychological landscape since 1936, when Muzafer Sherif, one of the central figures of twentieth-century social psychology, made use of the autokinetic effect, an illusion that relies on a pervasive human perceptual shortcoming, to study the process of norm formation and, ultimately, the processes underlying conformity. The autokinetic effect requires a perceiver to fixate on a small pin-

point of light in an otherwise completely dark room. After focusing on the light for a short time, it appears to move. The movement, however, is completely illusory. Making use of this illusion, William Hood, a student of Sherif, provided an example of social influence that is not based on threats or interpersonal pressure and reconnaissance. Their study paired a naïve participant with a confederate. Their task was to estimate the length of light movement over a series of trials. In the initial phase of the study, the confederate made a series of judgments of the extent to which the light moved, while the naïve participant simply observed. These confederate-based judgments were either consistently high or consistently low (relative to a control group's). Then the confederate was dismissed and the naïve participant was asked to make an independent series of judgments. It turned out that the judgments of participants who were paired with confederates who made high estimates were significantly higher than those of participants paired with low-responding accomplices.

Participants followed the lead of the confederates even though the confederates were not present. Noteworthy leaders who similarly induced others to follow their vision and ideals without threat or surveillance include Mother Teresa, Mohandas Gandhi, and Martin Luther King Jr.

COMPLIANCE UNDER PRESSURE

Of course, successful leadership often relies on a real or implied threat. Solomon Asch, another giant of 20th century social psychology, provided a classic example of the effects of social pressure on simple judgments. In his 1955 research, participants viewed a stimulus line and a set of three comparison lines. Their job was to judge which of the three comparison lines matched the stimulus. The judgments were exceptionally easy. However, when participants were paired with three or more experimental accomplices who gave obviously incorrect answers on six (of twelve) judgment trials, more than 75 percent of them agreed with an erroneous judgment *at least once*. Analyzed another way, about one-third of all influence attempts were successful, even though the correct answer was transparently obvious and in

spite of the fact that the errant judgments did not represent the participants' true perceptions. In postexperimental interviews, many participants admitted that they merely had gone along with the confederates to avoid conflict or in order not to appear stupid to their (supposed) peers.

This form of influence is quite different from the sort exemplified in Hood and Sherif's study, and as actualized by Mother Teresa. As his films of the experiment show, Asch's participants perceived enormous social pressure to adopt responses compatible with those of their peers. In response to this pressure, they reported judgments at variance with both reality and their own perceptions.

In some ways, the process Asch studied does not seem to involve true leadership. Yet the influence process at work in his research did result in people following the implicit directions of others (or at least, agreeing with their apparent perceptions). Examples of people under threat following leaders even when they do not agree with them are commonplace. Adolf Hitler, Joseph Stalin, and Saddam Hussein—the unhappy list could be extended almost indefinitely—commanded allegiance, even from people who did not accept their goals or visions.

FOLLOWERSHIP

To understand how these two different processes operate, we will adopt a bottom-up approach. Rather than focus on the features of leaders that induce willing or begrudging allegiance, we will instead consider the factors that appear to call forth one or the other kind of allegiance in followers. Using the related concepts of conformity and compliance, drawn from social psychology, we will reflect on the ways in which individuals have actualized these factors in their leadership styles.

The degree of conformity a person exhibits in a particular context is dependent on the extent to which socially supplied information is integrated with direct sensory inputs and prior experience in coming to a judgment or action (Crano 1970, 2000). Conformity is thus a dynamic process that depends on a person's judgment of the relative reliability of

his or her own perceptions versus the reliability of data supplied by others, and the costs and rewards entailed in placing greater or lesser weight on one or the other information source. By definition, the greater the weight accorded to data supplied by others, the greater the conformity. In some circumstances (for example, those that involve little prior experience, high stakes, and high levels of ambiguity), some degree of conformity makes sense—two (or more) heads are better than one, especially if the individual supplying the information has had prior experience in the setting or in some other ways appears more expert than we are.

In other circumstances, overweighting socially supplied cues represents an attempt to ingratiate the self with attractive or powerful others, to avoid sanction, or to maintain a favored position in a group. In these cases, which involve compliance rather than conformity, the underlying cognitive dynamics are quite different.

COMPLIANCE VERSUS CONFORMITY

Although best known for his work on the theory of cognitive dissonance, the social psychologist Leon Festinger also studied processes of compliance and conformity (Festinger, 1957). He defined public compliance as behavior involving acquiescence to the demands of an influence source without acceptance of the source's position. Public compliance occurs because an influence source has power or control over the fate or resources of another person and can monitor actions to ascertain whether or not the desired behavior is enacted. People are motivated to be consistent with the influence source (be it an individual or a group) because of the source's power to reward and punish. Public compliance, in short, involves people bringing their public behavior (but not their beliefs) in line with the demands of an influence source.

Conformity, or private acceptance, involves the internalization of an influence source's position. It occurs when characteristics of the influence source suggest that its information is valid and can be believed. This information is then accepted, or internalized, and becomes a part of the individual's reper-

Personality Tests to Ensure Conformity

In his examination of individuality and conformity in American society, sociologist William H. Whyte Jr. identified personality tests as a tool businesses use to select employees who will conform.

If personality tests are the voice of the organization it is not that testers mean them to be. A few are lackeys, but the great majority cherish the professional's neutrality; they try hard to be objective, and "value judgments" they shun. And this is the trouble. Not in failing to make the tests scientific enough is the effort; it is, rather, in the central idea that the tests can be scientific.

They cannot be, and I am going into quite some detail in this chapter to document the assertion. I do so because the tests are the best illustration of the underlying fallacies of scientism—and the underlying bias. As in all applications of scientism, it is society's values that are enshrined. The tests, essentially, are loyalty tests, or rather, tests of potential loyalty. Neither in the questions nor in the evaluation of them are the tests neutral; they are loaded with values, organization values, and the result is a set of yardsticks that reward the conformist, the pedestrian, the unimaginative—at the expense of the exceptional individual without whom no society, organization or otherwise, can flourish.

What I am examining is not the use of tests as guides in clinical work with disturbed people, or their use in counseling when the individual himself seeks the counseling. Neither is it the problems of professional conduct raised by the work of some practitioners in the field, interesting as this bypath is. What I am addressing myself to is the standard use of the tests by organizations as a gauge of the "normal" individual, and the major assumptions upon which the whole mathematical edifice rests.

toire of beliefs. In the absence of forces to the contrary, this internalized information will continue to guide actions even in the absence of the source that provided it. Conformity behavior is persistent because it represents an individual's perception of appropriate behavior; hence, unlike compliance, con-

If you obey all the rules, you miss all the fun.

—Katharine Hepburn

formity behavior will persist even in the absence of surveillance by the influence source.

The distinction between public compliance and private acceptance is important in predicting the persistence of induced behaviors. As the Harvard social psychologist Herbert Kelman showed in a 1958 study on conformity and compliance, a person who advocates a position solely in response to social pressure, or solely because of the attractiveness of a source, will cease to do so when the pressure is removed or when the influence source is unable to monitor his or her behavior. However, those who advocate a position because they have been persuaded of its validity will continue to advocate it even when the agent of influence is no longer present and has no reconnaissance capacity. Leaders who possess skills relevant to the task at hand, who understand how to make a system operate, in short, who can persuade others of the correctness of their position, are likely to be followed even in their absence. This model of leadership suggests that even if conditions change, the leader will still hold sway. On the other hand, leaders who use force to obtain acquiescence can succeed if they possess sufficient power to punish resistance and can monitor the behavior of their followers. However, if these leaders lose the power to punish or to monitor adherence, their desires will no longer be able to affect the behavior of their followers. Leaders who are followed because of their expertise, because of their knowledge of how things work, will be followed even when they cannot monitor adherence, because their followers believe that their vision is correct. However, if conditions change in such a way that a leader's expertise is rendered obsolete, he or she may be replaced. There are many examples of this form of transformation. In the ill-fated dot-com revolution, many entrepreneurs were wonderfully effective in developing companies from scratch. Once the companies had been established, however, these leaders often did not have the skills to cope with the

trials of day-to-day management. Many were replaced, or their companies failed. Fidel Castro provides a good example of a leader whose expertise became obsolete. A fine revolutionary leader, he proved to be a relatively ineffective leader, of a mature society. Reflections on the standard of living in Cuba suggest that Castro did not possess the necessary expertise to guide his country through the dangerous political waters that surround his island. His power now appears to be based more on threat than on a widely held acceptance of his revolutionary dreams.

Is leadership then almost completely situation- or context-dependent? Are there no traits or characteristics that spell certain success or failure for a would-be leader? Trait- or character-based approaches dominated early theories of leadership, but research has not provided strong confirmation for these models. Although successful leaders may be more likely to display characteristics like extraversion, openness, and low neuroticism, it seems obvious that simply possessing these traits will not make someone a leader. Some researchers have attempted to integrate personality-based models with context-dependent models—the transactional leadership approach, for example, attempts to relate the quality of a leader-follower relationship to the success of the leader. Such attempts, if they are to succeed, require understanding the personal qualities of the leader, the leader's particular expertise, the relevance of these skills and abilities to the task at hand, and the fit of these skills and abilities with the needs of the followers. This is a tall order, but to understand a leader's capacity to induce conformity, it may be necessary to understand the needs of the followers as well.

CONFUCIANISM

Confucianism, as viewed by Max Weber, is a doctrine similar to Hinduism, Christianity, and Islam, which laid down the fundamental principles for establishing a social and political system, as well as

for pursuing the values of life; it thus inevitably is not only concerned with leadership, but also elaborates on it deliberately. Although scholars have different opinions on the religiousness of Confucianism, they commonly recognize its humanistic aspect. As one of the most ancient mainstream ideologies in the history of human civilization, Confucianism's impact on the modern or postmodern ages has increasingly been demonstrated. In the study of leadership, therefore, Confucianism can be a resource for development as well as a body of basic knowledge. To understand Confucianism on leadership, it is necessary not only to study the canons of Confucian thought, but also to examine the evolution of Confucian theories, and the implementation and institutionalization of Confucian ideas in social and political life.

THE ORIGINS OF CONFUCIANISM

The Western term *Confucianism* stems from the name of Confucius (551–479 BCE). This term is misleading because Confucius is not, at any rate, the founder of the doctrine. The correspondent Chinese term is *Ru Xue*, meaning the doctrine of scholars, and the origins of the doctrine go further back than Confucius's lifetime. The earliest classic work of Confucianism is *I Ching* (The Book of Change), a book with sixty-four diagrams of divination supposedly drawn by Fu Xi, a legendary figure living about five thousand years ago. Philosophical and political explanations of these diagrams were given by Wen Wang, the founding father of the Zhou Dynasty (eleventh century–256 BCE), his son Zhou Gong, and later by Confucius. The essence of Confucianism is already clearly there in *I Ching*: the significance of every human life, as well as the goal of society, can be achieved only in the harmonic unity between self and others, and between human beings and nature. All Confucian opinions on leadership are based on this belief. Confucius once said about himself that “I am fond of ancient culture and faithful to it; I transmit out yet never innovate randomly.” (*Analects*, 7:1). The two figures often taken by Confucius as the best examples of leaders were Yao and Shun, both of whom lived in the twenty-first century BCE,

“On Government by Moral Force” from *The Analects of Confucius*

I, 5 The Master said, “A country of a thousand war-chariots cannot be administered unless the ruler attends strictly to business, punctually observes his promises, is economical in expenditure, shows affection towards his subjects in general, and uses the labour of the peasantry only at the proper times of year.”

II, 3 The Master said, “Govern the people by regulations, keep order among them by chastisements, and they will flee from you, and lose all self-respect. Govern them by moral force, keep order among them by ritual and they will keep their self-respect and come to you of their own accord.”

III, 19 Duke Ting asked for a precept concerning a ruler’s use of his ministers and a minister’s service to his ruler. Master K’ung replied saying, “A ruler in employing his ministers should be guided solely by the prescriptions of ritual. Ministers in serving their ruler, solely by devotion to his cause.”

XII, 11 Duke Ching of Ch’i asked Master K’ung about government. Master K’ung replied saying, “Let the prince be a prince, the minister a minister, the father a father and the son a son.” The Duke said, “How true! For indeed when the prince is not a prince, the minister not a minister, the father not a father, the son not a son, one may have a dish of millet in front of one and yet not know if one will live to eat it.”

XII, 19 Chi K’ang-tzu asked Master K’ung about government, saying, “Suppose I were to slay those who have not the Way in order to help on those who have the Way, what would you think of it?” Master K’ung replied saying, “You are there to rule, not to slay. If you desire what is

good, the people will at once be good. The essence of the gentleman is that of wind; the essence of small people is that of grass. And when a wind passes over the grass, it cannot choose but bend.”

XIII, 2 Jan Yung, having become steward of the Chi Family, asked about government. The Master said, “Get as much as possible done first by your subordinates. Pardon small offences. Promote men of superior capacity.” Jan Yung said, “How does one know a man of superior capacity, in order to promote him?” The Master said, “Promote those you know, and those whom you do not know other people will certainly not neglect.”

XIII, 6 The Master said, “If the ruler himself is upright, all will go well even though he does not give orders. But if he himself is not upright, even though he gives orders, they will not be obeyed.”

XIII, 10 The Master said, “If only someone were to make use of me, even for a single year, I could do a great deal; and in three years I could finish off the whole work.”

XIII, 11 The Master said, “‘Only if the right sort of people had charge of a country for a hundred years would it become really possible to stop cruelty and do away with slaughter.’ How true the saying is!”

XIII, 13 The Master said, “Once a man has contrived to put himself aright, he will find no difficulty at all in filling any government post. But if he cannot put himself aright, how can he hope to succeed in putting others right?”

XV, 14 The Master said, “To demand much from oneself and little from others is the way (for a ruler) to banish discontent.”

and Confucius’s hero was Zhou Gong, who established the *Zhou Li*, namely, the ritual system of the Zhou Dynasty.

There were hundreds of feudal states under the central court of Zhou Dynasty, organized by the feudal ritual system. Central and local leadership was maintained, and social solidarity was achieved neither by military force nor by legal constraint but by ritual observance. When it came to Confucius’s time, the ritual system had been shaken. The rulers of powerful feudal states no longer respected or obeyed the authority of the central court, and they

fought against each other in wars and plots to expand their own power and territory. Some dominant ministers in these feudal states, in turn, had overthrown their masters and taken over or divided the states. This is why Confucius considered reestablishing the ritual system *li* of the first priority in restoring social order and leadership, and he made great efforts, although unsuccessfully, to achieve it.

In his thoughts of *li*, however, Confucius fundamentally developed the doctrine of *Ru Xue*, and in doing so, constructed his theory of leadership. For Confucius, *li*, as the regulation of people’s behavior

and the foundation of social order, could only be achieved and maintained by awaking people's consciousness of *ren*, that is, kindness, benevolence, and care for others. A person acquiring the quality of *ren* and observing *li* is a *junzi*, namely, a nobleman. Whereas anyone can become a *junzi* by self-cultivation, only a *junzi* should be in position of leadership. An ideal leader in the Confucian tradition is the so-called inner sage and outer king who, first of all, is a moral model for his people because conviction and admiration, rather than coercion and discipline, are the solid basis for obedience.

In his analysis of human relationships, Confucius stressed the function of family, and applied it to community, society, and government. According to Confucius, an established man should first begin his family, and a leader should treat his people as a parent treats his children. He should not only be benevolent to them, but also inspire them with the family spirit to motivate their interest in public affairs. Rooted in Confucius's thoughts, the word *country* in Chinese is literally "the family of nation"; *we* is often used to mean a "big family"; and a magistrate or a governor in China is called *fu-mu-guan*, meaning "father-mother official."

Confucius's doctrine was not the prevalent one among the many extant during his lifetime and this situation remained for more than three centuries. Four years after Confucius's death, the Warring States Period (475–221 BCE) began in Chinese history, when the seven remaining feudal states fought in endless wars. Eventually, the state Qin exterminated the other six states and established the first empire in China. Confucius's doctrine was banned by the Qin Dynasty, and the court once buried four hundred Confucian scholars alive. Yet Confucianism survived, and some Confucian scholars became outstanding figures in this part of history, among whom were Mencius (371–289 BCE) and Xun-Zi (300–230 BCE), with the former regarded in the Confucian tradition as the "Second Sage" only next to Confucius himself. Focusing his thoughts on political philosophy, Mencius preached explicitly that the people are more important than the state and the state more important than the ruler. The ruler who does not act accordingly, Mencius argued, is unfit to rule, and

should be criticized, rehabilitated, or even deposed. Although rarely successful in persuading the rulers of the powerful states to follow his teachings, Mencius kept moral optimism by persisting in his belief that human nature is good. Xun-Zi, a versatile and maybe the most prominent scholar of his time, sharply disagreed with Mencius. He believed that human nature is evil, thus society must be governed by strict laws that punish bad behavior. Based on Xun-Zi's opinions, two of his pupils, Han Fei-Zi and Li Si, developed the school of Legalism which was the guiding philosophy for the state Qin in unifying the whole of China. Since then, Legalism has constituted a component of the traditional Chinese political philosophy—"externally Legalist and internally Confucian," that is, using laws to rule people's behavior while upholding morals to rule their mind.

THE HISTORICAL DEVELOPMENT OF CONFUCIANISM

The Qin Dynasty (221–205 BCE) existed for only less than two decades, but the Chinese empire it established lasted for more than two thousand years. Through such a long history, Confucianism became the core of Chinese culture and the official doctrine of all the dynasties to follow. Meanwhile, this doctrine kept evolving both in theory and in practice.

It was in the early Han Dynasty (206 BCE–220 CE) that the Confucianization of government and society was realized. Wu Di (141–87 BCE), one of the most influential emperors in Chinese history, accepted the suggestion of his prime minister Gongsun Hong (d. 121 BCE) and formally announced Confucianism to be the unique official doctrine. Ever since then, Confucius has been honored by all Chinese emperors as the paradigmatic sage. Wu Di's court scholar Dong Zhongshu (179–104 BCE) made his contribution to Confucianism similar to that which St. Augustine (354–430) made to Christianity. By combining Confucius's moral principle with the five elements theory and the categories *yin* and *yang* in Taoism, he established a Confucian ontology and epistemology and made Confucianism a complex theoretical system.

While scholastic study of Confucianism never ceased, the most important later development of

Confucian theory emerged in the Song (960–1279) and Ming (1368–1644) dynasties. This is the movement of Song Ming Rationalism, known as Neo-Confucianism in the West. There were two schools in this long lasting movement, namely, the school of Xin and the school of Li. *Xin* refers to the learning of the mind, and *Li* refers to the learning of the principles of the universe. The former emphasized the function of the mind in exploring life and the world, and the latter stressed the importance of the principles underlying the existence and change of everything. Together the scholars in both schools developed a comprehensive Confucian vision in which the cultivation of self and the understanding of the world were integrated. The rationalism of their theories characterized a pro-scientific style of the Neo-Confucianism, which coincided with the great achievements in science and technology in the Song and Ming dynasties. The most important figure in this historical phenomenon was Zhu Xi (1130–1200), who systematically synthesized all the scholastic works in his time, and selected four books from the Confucian classics and gave them his own conscientious interpretations, which were later used as the basic texts for primary education in China until the twentieth century.

The magnitude of the scholastic work of Confucianism can be viewed by looking at one set of books published by the court of Qing Dynasty (1644–1911) in the late nineteenth century—*Si Ku Quan Shu* (The Complete Library of the Four Treasures), which has more than 36,000 volumes of the selected important works of the four fields in Confucian culture—classics, history, philosophy, and literature.

More significant than the philosophical development, in terms of the study of leadership, is the practice of the Confucian theory of leadership, and its institutionalization. Since Confucianism was taken as the official doctrine in the Han Dynasty, a recommendation system based on Confucius's principles was established. Those who were outstanding in moral behavior or in scholarship would be recommended by local authorities to the court to be appointed as government officials. In the Sui Dynasty (581–618), while recommendation was still part of the system, examination became the major

means of selection, with the contents of the examination primarily related to Confucian classics and policy issues. Such a system was further improved during the Tang Dynasty (618–907) and developed into a standard format: Most government officials were, from that time, selected from the nationwide examinations of different levels, which were open to all people. Although it underwent changes in time, the examination system was carried on by all dynasties to come. As some research has shown, European countries borrowed the traditional Chinese examination system in establishing their own modern civil bureaucratic systems.

What coexisted with the examination system was the social class of “*shi-da-fu*,” that is, the intelligentsia. Most Chinese intellectuals were not aristocrats or necessarily wealthy. But they were well educated since the examinations they had to go through to be selected were rigorous. Whether serving in government or not, these intelligentsia, following Confucius's teaching, were supposed to have high moral principles, and broad interests and knowledge, and were thus usually taken as role models by the people in their communities. Regarded as the pillars of the traditional Chinese society, the intelligentsia formed the foundation of leadership not only in government, but also in almost every corner of social life.

There were more than thirty dynasties in China's long history, some of which were established by foreign invaders. During the periods of dynasty change, the position of Confucianism was often weakened. Yet whenever a new dynasty was established, Confucianism was always restored, even by the foreign rulers, as the official doctrine. Hence there is a saying: Whoever conquered China would be conquered by Chinese culture, or more precisely, by Confucianism. History may have shown that the Confucian philosophy of leadership is not for the conquerors who believe that force can only be overcome by force, but for the social constructors who conceive that people's minds are the bases for stable order.

Since the Han Dynasty, Confucianism has been introduced to Japan, Korea, and Vietnam, and was adapted by many of the rulers in these countries as

the official doctrine. With the impact of Confucianism, the social and political systems in East Asian countries had many similarities, while each nation maintained its own culture.

CONFUCIANISM IN MODERN TIMES

The “Opium War” (1839–1842) marked the beginning of modern Chinese history, and led to a century of humiliation and disasters in the nation. When China, which literally means in Chinese “The Center of the World,” lost a series of wars against the invading Western powers and Japan, it also lost faith in its culture. Confucianism became the target of a new generation of Chinese intellectuals who blamed it for China’s backwardness in the world. “Down with Confucianism” was the slogan in the “New Culture Movement” paralleling the patriotic “May Fourth Movement” in 1919. There were, nonetheless, a few individuals who defended Confucianism. Sun Yat-Sen, the leader of the “Republic Revolution” in 1911, considered his own revolutionary philosophies to be “a development and a continuation of the ancient Chinese doctrines of Confucius” (Gregor 1981, 51). His opinions were in agreement with those of the scholars who advocated reformation rather than abandonment of Confucianism.

When “The People’s Republic of China” was established in mainland China in 1949, it took Marxism as its official doctrine, and kept a critical attitude towards Confucianism, while still recognizing certain of its values. During the “Cultural Revolution” (1966–1976), however, things went to the extreme. Confucianism was regarded as the source of all reactionary forces; books were burned, and intellectuals were considered a type of “class enemy.” After the death of Mao Zedong (1893–1976), who claimed himself a rebel against Confucianism, mainland China underwent tremendous changes with its “Reforming and Opening” policy. Confucius has been restored as the symbol of the great Chinese culture that the nation is now proud of; Confucius’s teaching is again taught in schools, and the research of Confucianism has become an important academic field with an increasing number of institutions and scholars.

The traditional examination system ended in 1906, and a new examination system in modern education was soon established (i.e., the entrance examinations for middle school and high school, which are provincial, and for college and graduate schools, which are nationwide). These examinations are very strict and highly competitive, and the new system has the same function as the traditional one, that is, to select the best educated to be leaders in government, academia, industry, and in all areas in society. The system exists today in both mainland China and Taiwan, and also in Japan, Korea, Vietnam, and Singapore.

The economic achievements in Japan in the 1960s and 1970s, in the “Four Little Dragons” (i.e., Hong Kong, Taiwan, Singapore, and South Korea) in the 1980s, and in mainland China in the last two decades of the twentieth century have drawn much attention from the world. This is the so-called Confucian Cultural Region. As researchers have pointed out, Confucianism played a positive role in the region’s economic development, with its tradition of community and working for mutual benefit, and its expansion of family solidarity into management and administration. The experiences in this region may be worth examining in the study of leadership.

In Europe, there is a tradition of admiration for Chinese culture and Confucius, as seen in the works of Baruch Spinoza (1632–1677), Gottfried W. Leibniz (1646–1716), Voltaire (1694–1778), among others, and Confucianism has been credited by historians with triggering the Enlightenment movement in the eighteenth-century Europe. In the United States, Confucius was admired by thinkers such as, Ralph W. Emerson (1803–1882), Henry D. Thoreau (1817–1862), and Louisa M. Alcott (1832–1888). Although the image of China as an oriental paradise as described by Marco Polo (c. 1254–1324), who lived in the capital of the Yuan Dynasty (1271–1368) for years, diminished in modern times, the study of Sinology never ceased in the West. In the late twentieth century, rediscovering the values of Confucianism in the postmodern times became a focus in different academic fields, and a group of scholars, many of whom are in the West, today advocate “The Third Epoch” of Confucianism.

In an age when the world is becoming a “global village,” all cultures should be respected as the treasures of human civilization. Confucianism, with its emphasis on family and community, unity and collaboration, may provide ideas and experiences different from that in the mainstream of today’s Western culture which, to a large extent, is based on individualism. The differences can only enrich the diversity of human cultures, and so does the Confucian theory enrich the study of leadership.

CONFUCIUS (551–470 BCE)

Chinese philosopher

Confucius is more important than any other single person in China’s five-thousand-year history. Similar to Christ for Christianity, Buddha for Buddhism, and Muhammad for Islam, Confucius is the symbol of a great cultural tradition—Confucianism—that still exerts great influence on the lives and the social ethics of a large population, mainly in East Asia. As a scholar, philosopher, teacher, academic leader, and government minister, Confucius was naturally concerned with leadership and deliberated about it deeply. His thoughts on leadership constitute an important part of his doctrine; they laid a theoretical foundation for the establishment and development of China’s political system and the management of social life for more than two thousand years. The significance of Confucius’s thoughts has not diminished with time, and a close reading of them has much to offer today’s study of leadership.

THE LIFE OF CONFUCIUS

The word *Confucius* is the Latin rendering of the Chinese term *Kong Fuzi*, meaning Master Kong. Confucius’s name in Chinese is Kong Qiu; following the style of Chinese names, *Kong* is the family name and *Qiu* is the personal name. Confucius lived during an era of Chinese history called the Spring and Autumn Period (770–476 BCE). During this time,

although China was in name ruled by the court of the Eastern Zhou dynasty (770–256 BCE), the power of government had actually fallen into the hands of the hundred or so feudal lords, each of whom controlled his own state. Confucius was born in the state of Lu which is in Shandong Province in today's China; while his ancestors supposedly had aristocratic roots in the state of Song, when Confucius was born, his family had lost much of its fortune as well as its social status. His father died when Confucius was only three, and Confucius started his learning with his mother. (There was no formal schooling at that time; youngsters were usually taught by private tutors if their families could afford it.) From childhood, Confucius had an insatiable desire to learn everything, a desire that lasted throughout his life, whether in his early years, when he had to make a living playing musical instruments in a band and working as the manager of a warehouse, or in his later years when he was commonly recognized as an academic authority. Mostly through self-education, though he always sought good teachers, Confucius mastered the six arts that were required for a fully educated person—ritual, music, archery, charioteering, calligraphy, and arithmetic.

All these skills and his special interests and knowledge in poetry and history made him a well-known scholar at a young age, and he started teaching in his thirties. He set up a school that was open to all people regardless of their social class; historians consider it to be the first school in Chinese history. With a style similar to that of Socrates, Confucius taught his students through storytelling and conversation, often debating with them. It is said that he had three thousand students, some of whom later were also regarded as sages in the established Confucian tradition.

Confucius was not only a scholar and teacher, however; he was determined to participate in politics and to put his ideas into action. He dreamed of seeing a world in which a justified social order was established and people's consciences were awakened and fully cultivated. Such a social order would mean the realization of *li* (righteous social order) and *ren* (love for humanity), the two most essential values in Confucius's doctrine.

In his forties and fifties, Confucius held several government posts in his home state of Lu, including magistrate and minister of justice. Unfortunately, his service in the Lu government did not provide him with the opportunity to carry out the political ideas he advocated; although the King of Lu admired Confucius's scholarship, he was not really interested in his political advocacies. Confucius then left Lu and, accompanied by a group of loyal students, started a twelve-year journey, attempting to find a feudal state where his ideas would be not only heard but also practiced. But there was no place in China, then mired in wars and conspiracies, for Confucius to fulfill his visions. After experiencing many disappointments, frustrations, and even great dangers, Confucius returned to his hometown of Qufu in his late sixties and died there several years later. In the last years of his life, Confucius concentrated on writing and editing books on history, philosophy, ritual, poetry, and music. Some of his works have been lost, but most have remained as classics of Chinese culture.

CONFUCIUS'S THOUGHTS ON LEADERSHIP

While it is a complex system, Confucius's doctrine can be understood basically as a philosophy of life and a social ethic, both based in *ren*. Confucius believed that human nature endowed human beings with *ren*, but that each individual needs to cultivate it. *Ren* is the essence of humanity and thus the foundation for any individual's self-development, and for any just social order, or *li*. *Li*, a key principle for Confucius, literally means "ritual" but also refers in a more general sense to order and justice. "The realization of *ren* is to conquer oneself and reestablish *li*" (*Analects* 12:1): This fundamental relationship between individuals and society is profoundly reflected in Confucius's thoughts on leadership.

Becoming a Junzi

Confucius tried in many different ways to get involved in local and state leadership; he also encouraged his students to do so, and some did become

A highly idealized portrait of Confucius, dating to about 1650.

leaders on different levels. One of his purposes in running his school was to train potential leaders to carry out his political ideas. Whether one was destined to be a leader or not, Confucius emphasized that one should cultivate oneself to be a *junzi*, or noble man. Like Plato's philosopher-king, only a *junzi* can be a leader in an ideal society. Yet, whereas a *philosopher* can only be decided, according to Plato, by a "divine dispensation," any human being can become a *junzi*. This difference characterizes the humanistic nature of Confucius's doctrine.

According to Confucius, being a *junzi* required

certain virtues. First was *ren*, the love for mankind. That love is specific and practical for Confucius. Since the people one loves most dearly are one's parents, *xiao*, or filial piety, is the core of *ren*. Next to *xiao* is *ti*, one's care and feelings for siblings; then *yi*, friendship. Thus, *ren* is presented in ever wider circles from family to community, state, and eventually the whole world. To strengthen the belief in *ren* and enhance its practice in life, a *junzi* should also have the virtues of *cheng*, honesty to oneself and to others; of *zhong*, loyalty to community and society; of *zhi*, intelligence and rationality; of *xin*, credibility and reliability; of *lian*, cleanness in service; and of *chi*, the sense of shame. These qualities having been acquired, a *junzi* is "one whom riches and honors cannot taint, poverty and lowly station cannot shift, majesty and power cannot bend" (*Menzi* 3B2). So said Mencius (372–289 BCE), the second-most prominent figure in the Confucian tradition.

Further Requirements for Leadership

Confucius believed that a leader, in addition to needing to be a *junzi*, needed to fulfill other requirements as well. Above all, leadership requires commitment to and responsibility for others and in a broader sense for the world. A leader must have the persistence to maintain that commitment no matter how difficult. As Zeng Shen, one of Confucius's favorite students, put it, "A leader must be resolute and steadfast, for his burden is heavy and his road is long. To practice the virtue of benevolence in the world is his burden, is that not heavy? Only with death does his journey come to an end, is that not long?" (*Analects* 8:7). Leadership also requires comprehensive education, since Confucius implied that only the learned are to rule. On the other hand, a leader "does not have to be an expert of specific skills" (*Analects* 2:12) but must acquire fundamental knowledge. A leader should be a diligent person. Confucius took himself as an example: "Wherever people live, there are honest and trustworthy people like me; yet they may not be as diligent as I am in learning" (*Analects* 5:28). Hence, a leader would "never feel bored in study, and never get tired of teaching others" (*Analects* 7:2). Another basic qual-

ity is modesty, for a good leader should always try to learn from others. “Wherever there are three people,” said Confucius, “there must be one who can be my teacher” (*Analects* 7:22). A good leader can also “work with people who have different ideas” (*Analects* 13:23); a leader “does not recommend a man on account of what he says, neither does he dismiss what is said on account of the speaker” (*Analects* 15:23). Along with modesty comes self-criticism: “When you meet a man of virtue, turn your thoughts to becoming his equal; when you meet a man without virtue, look within and examine your own self” (*Analects* 4:17). Zeng Shen was put forward as a good example for engaging in introspection three times a day.

All these requirements for a leader illustrate Confucius’s axiomatic belief that although law and rules, rewards and punishment are necessary for order and formality in any community and society, government and leadership can be built only upon *ren*, love for humankind, because the underlying function of any society and organization is to promote it. To govern is not only to regulate people’s behavior, but more importantly, to guide their minds. The art of leadership, accordingly, requires first a virtuous leader. To lead others, one must be morally a good example for others. “To govern is to be upright. Who dares not to be upright if the leader is upright?” (*Analects* 12:17). To urge people to work hard, “the leader should work hard first” (*Analects* 13:1). “If the leader acts in an upright way, the people will obey him without being ordered to; if the leader does not act uprightly, the people will not obey him even after repeated injunctions” (*Analects* 13:6). “Why should a leader have any difficulty in administering if he himself is upright? How could a leader correct others if he himself is not upright?” (*Analects* 3:13). When a state minister asked Confucius how he could make people respect and be loyal to their superiors and inspire each other in service, Confucius replied, “Be upright in their presence, and they will hold you in respect; be filial and benevolent, and they will be loyal to you; use the righteous and instruct the unqualified, and they will inspire each other in service” (*Analects* 2:20).

THE CONFUCIAN GOLDEN RULE

The art of leadership requires respecting and understanding people. “You do not have to worry that others do not know you well; you may worry that you do not know others well” (*Analects* 1:16). And respecting and understanding lead to forgiving and encouraging. When Zeng Shen was asked by his fellow students what was the real key that he had learned from Confucius, he answered, “Nothing but honesty and forbearance!” (*Analects* 4:15). Understanding and forgiving, nevertheless, are not the means in leadership, but the display of *ren*. The golden rule of Confucius is “Do not do unto others what you would not want others to do unto you!” (*Analects* 15:23). Logically, the other side of the rule also holds: “A man of humanity, wishing to establish himself, also establishes others, and wishing to enlarge himself, also enlarges others” (*Analects* 16:28).

A poetic passage in *Analects*, the most revered work of Confucius, expounds vividly Confucius’s general view on leadership and serves as fitting concluding words here (*Analects*, 2:1): “A leader who rules society on a moral basis would be supported by the people, just as the Polar Star is encircled by all the other stars.”

CONGRESSIONAL LEADERSHIP

Congressional leadership takes place within an institution that serves two primary functions: making laws and representing citizens. Leaders play essential roles organizing the United States House of Representatives and the United States Senate—they set the schedule for debating bills and resolutions; formulate proposals to address public problems; represent their party’s priorities through the media and in relations with leaders of the opposing party; support or oppose the president’s initiatives in the legislative process; and build coalitions to pass legislation. The main challenge of congressional leadership is to advance the collective interests of the nation or of the leader’s political party, while enabling individual members of Congress to represent their constituents. This entry describes the roles and responsibilities of congressional leaders, reviews the relevant theories for explaining congressional leadership, identifies notable congressional leaders in various historical situations, and raises key issues for further study.

LEADERSHIP POSITIONS: ROLES AND RESPONSIBILITIES

There are two types of formal leadership positions in the United States Congress: party leaders and committee chairs. These types of leaders can be distinguished by their roles and responsibilities, which have varied over time, and by institutional differences between the House and Senate.

Party Leaders in the House of Representatives

Party leaders hold the most widely recognized positions, and chief among these is Speaker of the House of Representatives. The Speaker is elected by the House of Representatives and is the only House leadership position mentioned in Article I, Section 1 of the Constitution. Though formally recognized as the presiding officer of the House, the Speaker has always been a political figure. After the Civil War, with the solidification of the two-party system, the Speaker’s role was geared

more toward serving the interests of the House majority party. In fact, from 1890 to 1910, beginning with Thomas B. Reed (R-ME) and ending with Joe Cannon (R-IL), the Speaker of the House developed into perhaps the most powerful leadership position in government. During that period, the Speaker had various formal means of leading the House, including making committee appointments, controlling the legislative schedule, recognizing members who wished to make motions or address the House during floor debate, and overruling delay tactics by the minority party. Over time those powers eroded, but the House witnessed a resurgence of the Speaker’s office beginning with the speakership of Thomas P. “Tip” O’Neill (1977–1986). Today the Speaker plays a major role in appointing members of the majority party to committees, controlling the legislative agenda through the House Rules Committee, articulating the priorities of the majority party through the media, raising money for the party and its candidates, and negotiating the terms of major legislation with Senate leaders and the President.

The majority party selects a floor leader, whip, and conference chair, each of whom performs various roles and, combined with the Speaker, constitute a leadership team. These leadership positions emerged after 1910, when the House voted to restrict the power of the Speaker after a majority of members agreed that Speaker Joe Cannon (R-IL) had abused the powers of the office. The majority leader, sometimes referred to as the Speaker’s main lieutenant, is primarily responsible for scheduling legislation and managing business on the House floor. Next in line is the majority whip, who takes “whip counts” (polls of party members to determine support for major bills) and persuades wayward members to support the leadership’s position. The majority whip appoints a chief deputy whip to assist the whip in managing a large network of deputy and regional whips, selected members of the party who help to conduct whip counts. While Congress is in session, the majority whip holds weekly meetings where members voice their support for, or raise concerns about, bills about to come to the House floor. Finally, the party’s conference, or caucus, chair

(Republicans refer to their party organization as a “conference,” while Democrats call theirs a “caucus”) is mainly responsible for formulating and disseminating the party’s message.

Taken together, the majority party leadership team seeks to advance the majority party’s policy agenda and political goals, especially maintaining majority control of the House. Toward these ends, party leaders decide which legislation goes from committee to the House floor, organize meetings of key members, communicate frequently with members, mediate differences between members or between committees, raise money for the party, solve problems with pending legislation that may endanger a member’s chances for reelection or unduly compromise the members’ position on policy issues, and speak on behalf of the party to reporters and interested organizations.

Notwithstanding the Speaker who, by default, is the leader of the majority party, the House minority party’s leadership structure mirrors that of the majority party. The minority party elects a minority leader, minority whip, and a conference (or caucus) chair. The roles of the minority whip and conference (or caucus) chair are similar to their counterparts in the majority. Like the majority leader, the minority leader manages the floor for the minority party, but unlike the majority leader, the minority leader has virtually no role in scheduling legislation. The minority leader is the *de facto* “opposition party leader,” the primary spokesperson and representative for the House minority party. Since minority leaders have almost no formal authority to influence the policy agenda, they must choose from among three general strategies of leadership: (1) cooperate with the majority party leadership and seek compromises consistent with the policy goals of the minority party; (2) split the majority party on specific issues in order to build a coalition of the minority party and a faction of the majority party; or (3) combat the majority leadership and attempt to obstruct the majority party’s agenda. At the outset of the 108th Congress (2003–2004), the Democrats elected Nancy Pelosi of California to be minority leader, making her the first woman in history to serve as a floor leader for either party in Congress.

Sam Rayburn, Speaker of the House of Representatives and one of the most powerful men in the United States, speaks with President John F. Kennedy in Austin, Texas in November 1960.

Committee Leaders in the House of Representatives

Much of the legislative work of Congress is done in committees and subcommittees. After a bill is introduced, it is assigned to a standing committee where, in most cases, its fate is decided. The bill can be ignored, but if it’s given a hearing, it may be debated, marked up, and amended in committee prior to being scheduled for action by the whole House. Thus, committee and subcommittee chairs in the House of Representatives, who are always members of the majority party, also perform important leadership roles. The main responsibilities of a committee chair is to organize the committee’s legislative agenda, formulate policy proposals, build coalitions among committee members, advocate for the committee’s bills when they go to the House floor, negotiate policy details with Senate leaders and executive branch officials, and represent the House position in conferences with the Senate. The House committee system offers a plentiful number of committee leadership positions; in the 108th Congress (2003–2004), there are nineteen standing committees and ninety-two subcommittees, each led by a chair.

Senate Leadership

The Constitution (Article I, Section 3) gives the Vice President a formal role as “President of the Senate,” and identifies a “President pro tempore” to preside in the absence of the Vice President. But neither of these two positions has been conducive to strong institutional or party leadership. Unlike the House, which has always had a Speaker, the Senate did not develop a structure for party leadership until the end of the nineteenth century. Prior to that time, individual senators occasionally performed leadership roles by taking strong positions on major issues or fashioning compromises in order to pass legislation. Floor leaders for the parties emerged in the 1880s from the party caucuses and policy committees that developed after the Civil War. Yet neither party formally elected floor leaders until 1913, when the Democrats elected John Kern of Indiana as the first majority leader.

Today the Senate is led by various party leaders (floor leaders, whips, and conference chairs) and standing committee and subcommittee chairs, who perform some of the same roles as those in the House. The parties have developed somewhat different structures. Writing in the 1950s, political scientist Donald R. Matthews observed that the Democrats have more “personalized, informal, centralized” leadership, whereas Republican leadership is more “formalized, institutionalized and decentralized” (1960, 123–124). Thus, the Democratic floor leader also chaired the party conference and the steering and policy committee, whereas Republicans divided responsibilities for these positions among several senators. This distinction has blurred since that time, though Republicans still offer a broader range of leadership opportunities than Democrats. The key party leaders in the Senate, the majority and minority leaders, organize their respective parties, negotiate the legislative schedule, and serve as the chief spokespersons for their parties. Committee chairs carry out tasks similar to those of their counterparts in the House. As in the House, Senate committee and subcommittee chairs are members of the majority party, and thus the majority party leaders and committee chairs have influence over the legislative agenda.

Yet the legislative process in the Senate is very different from the House process, and the differences affect the roles and responsibilities of party leaders. The Senate has nothing comparable to a Speaker of the House; it has no Rules Committee to determine the length of debate and number of amendments to bills that go to the floor; it has no rules that require amendments to be germane to the legislation before it; and it grants rights to individual members and to the minority. Whereas the majority party leadership in the House can virtually dictate the floor schedule through the Rules Committee, the Senate operates on the basis of unanimous consent agreements. Thus, the majority party dominates House procedures, but a single senator can block progress by putting a hold on a bill, and a single senator can offer amendments that are not germane to bills under consideration on the Senate floor. A minority of senators can conduct a filibuster (an endless debate on a bill or a resolution), and it takes sixty votes, more than half of the hundred senators, to end a debate and enable the Senate to vote on the final passage of a bill or a resolution. Though the Senate majority leader enjoys the right of first recognition on the floor, he is rarely in a position to control the agenda. The major role of the Senate majority leader is to negotiate with the minority leader to develop daily floor schedules and accommodate the wishes of individual senators.

Whereas the size and rules of the Senate limit the roles of party leaders, they create leadership opportunities for virtually every senator. In the 108th Congress, there are twenty committees and sixty-eight subcommittees in the Senate, enough positions for all senators of the majority party to chair at least one committee or subcommittee. Moreover, rules that grant individual senators leverage in the legislative process enable *all* senators, even those in the minority party, to pursue informal leadership roles. Personal motivations to achieve policy goals, regular opportunities to appear on television, large staffs that can conduct policy analysis, an expansive number of interest groups seeking elected officials to advance their causes, and the regular chance to offer floor amendments give senators incentives to exercise leadership on multiple issues. In a notable recent

example of informal leadership, John McCain (R-AZ) and Russ Feingold (D-WI) successfully championed campaign finance reform.

THEORIES OF LEADERSHIP

In addition to describing the leadership roles, political scientists have sought to explain leadership styles, strategies, and strengths. Some theories of leadership are based on political concepts, institutional features of Congress, and situational forces that affect the legislature and the legislative agenda. Other political scientists have applied theories developed in economics to explain leadership. The various theories explain leadership selection; limitations on strong leadership in a representative body; the relationship between leaders and members; the conditions that are most conducive to centralized party leadership and which are most likely to favor decentralized, committee leadership; and the role of individual qualities in explaining leadership style. Most theories are based on House leadership, though there are several important studies of Senate leadership.

Contextual Theory

Political scientists have stressed the importance of “contextual” factors, referring to the key conditions or the situations that affect leadership behavior. Among the most significant contextual factors are the importance individual members put on representation, the degree of party unity, the policy agenda, and the formal powers of the leader’s office. One of the most influential studies of House leadership, which was done by political scientist Charles O. Jones in 1969, illustrates the limits of centralized leadership in a representative body by describing how a majority of members revolted against Speaker Joe Cannon (R-IL) in 1910. Accusing Cannon of autocracy, a coalition of progressive Republicans and minority party Democrats voted to remove the Speaker from the Rules Committee, expand the size of the Committee, and require that Committee members be elected by the House rather than appointed by the Speaker. Jones argues that leaders must be responsive to the expectations of the elected mem-

Four Rules of Leadership in a Free Legislative Body

First, no matter how hard-fought the issue, never get personal.

Second, do your homework. You can’t lead without knowing what you are talking about.

Third, the American Legislative process is one of give and take. Use your power as a leader to persuade, not intimidate.

Fourth, be considerate of the needs of your colleagues, even if they are at the bottom of the totem pole.

—George H. W. Bush

bers or they will ultimately be sanctioned by the members.

Scholars who apply “principal-agent” theories, derived from organizational economics, to study leadership have adopted the premise that leaders must respond to member expectations. Using the principal-agent model, leaders (agents) have incentives to accommodate the policy preferences and expectations of their followers (principals). Some argue that followers will repudiate and/or sanction leaders who repeatedly ignore their wishes, whereas others suggest that leaders have some leverage to take risks or even pursue strategies to coerce the followers without fear of being removed or rebuked.

Whereas Jones sought to explain the limits on power, others seek to explain why Speakers might be granted extensive powers at certain times and how that affects leadership style. One of the key conditions defining leadership style and strength is the degree of party unity among party members, measured in terms of their agreement on policy preferences. In 1981 political scientists Joseph Cooper and David W. Brady argued that when party unity is high, members are more likely to encourage and tolerate strong party leadership; when party unity is low, members seek to distribute power away from a central leadership position. Thus, the centralized, hierarchical leadership style of Thomas B. Reed (R-ME), who served two times as Speaker (from 1889–1891

(text continued on p. 266)

and 1895–1899) during the period of “czar speakers” (from 1890–1910), was based on the high levels of agreement on policy goals among party members. The Speaker chaired a Rules Committee with only five members; appointed members to committees; had the power to recognize members from the floor; and blocked attempts by the minority party to obstruct legislative business. The so-called “Reed rules” allowed the Speaker to count all present members as part of quorum, limit quorums to one hundred members, and ignore motions from members designed to delay the process. Republican members viewed a powerful Speaker as the way to advance the party’s national agenda of economic expansion, a goal they all shared, rather than a hindrance on their ability to represent their particular constituencies.

Cooper and Brady observed that a high degree of party unity among the members is derived from the policy preferences of the members’ voting constituencies. In simple terms, if voters in different congressional districts share similar views and elect members from the same party to represent those views, then the elected representatives of those parties will also hold similar policy preferences. Thus, when individual members agree on the direction of the party, they are more willing to cede power to a central leader who can use that power to advance the individual and collective goals of party members. On the other hand, when members of the party represent diverse constituencies and hold different policy preferences, they are less likely to vest power in the hands of a central leader, and power is decentralized among committee chairs or individual members. In this situation, the speakers must be skilled at bargaining with the factions within the party and among committee chairs who have considerable power in their own right. As Cooper and Brady illustrate, Speaker Sam Rayburn (D-TX), who served as Speaker on three different occasions (1941–1947, 1949–1952, and 1955–1961), mastered this style of leadership.

Scholars have noted that increases in internal party unity and interparty conflict over key issues, as well as other institutional and policy conditions, explain a resurgence in the speakership since the

1980s. In 1995 political scientists Barbara Sinclair argued that in addition to the degree of party unity, reforms passed in the 1970s that strengthened the Speaker’s role in making committee appointments and referring legislation, divided government, and budget deficits created renewed expectations for strong party leadership. Those conditions encouraged members to give leaders the resources to solve problems and capitalize on opportunities.

Context and Individual Leadership Styles

Several theories of House party leadership have argued that leadership is a function of both the context within which leaders are operating and the individual qualities of the leaders. One concept of “conditional party leadership” refines contextual theories by arguing that the strength of party leadership depends on both the context and the style of individual leaders. When the majority party is internally unified and its positions are strongly opposed by the minority party, the conditions favor strong party leadership. But the strength of party leadership also depends on an individual leader’s qualities; aggressive leaders are more likely to use the powers granted to them by the members. Theories that explain committee leadership also tend to rely on a combination of contextual and individual factors.

Senate Leadership

Theories of Senate leadership also focus on institutional and political conditions, though scholars agree that personal factors are very important. In 1969 political scientist Randall Ripley developed three types of power distribution that affect Senate leadership: centralized, decentralized, and individualism. Conditions that centralize power give party leaders critical roles in managing the legislative agenda; decentralized power structures distribute leadership opportunities among committee chairs; and individualism further weakens party leadership and extends leadership opportunities to subcommittees and individual senators.

Though all three models have been at work at different times in history, given the norms and rules of the Senate, the center of gravity is toward individualism.

This was certainly true during most of the nineteenth century. As Senator Daniel Webster of Massachusetts remarked: “This is a Senate, a Senate of equals, of men of individual honor and personal character, and of absolute independence. We know no masters, we acknowledge no dictators” (Quoted in Peabody, 1981, 64). Thus, in the 1830s and 1840s, talented individuals like Webster, Henry Clay of Kentucky, and John C. Calhoun of South Carolina led Senate debate on major issues related to slavery and state rights.

A form of centralized party leadership emerged in the Senate at the end of the nineteenth century and at the beginning of the twentieth century during the heyday of the two-party system. The Senate developed party caucuses and policy committees to represent the collective interests of the parties after the Civil War. Yet, as a testament to the importance of personal qualities and informal leadership in the Senate, “centralized party leadership” developed mainly through the will of two men, William Allison (R-IA), Chair of the Appropriations Committee, and Nelson Aldrich (R-RI), Chair of the Finance Committee. Allison (served in the Senate from 1872 to 1908) and Aldrich (served in the Senate from 1881 to 1911), with Aldrich playing the major role, emerged as de facto leaders of the Senate Republican Party from 1890 to 1910. The two men formed a leadership team that included Orville Platt (R-CT) (served in the Senate from 1879 to 1905) and John Spooner (R-WI) (served in the Senate from 1897 to 1907), which directed the legislative business of the Senate. The formal position of majority floor leader was not created until after Aldrich left office in 1910.

Another important period of strong Senate party leadership emerged with Lyndon Johnson, Democratic majority leader from 1955 to 1960. In 1961 political scientist Ralph K. Huitt explained how Johnson used his personal talents, and the few powers available to him as majority leader, to advance legislation through the Senate. Johnson was a pragmatist and an expert at parliamentary procedures, and he was tenacious in seeking votes to pass legislation. He used his position as chair of the steering committee to see to it that every Democratic senator, including freshmen, was appointed to an important committee. He gathered extensive knowledge of each senator’s priorities

U.S. Senate Majority Leaders

<i>Majority Leader</i>	<i>Years</i>	<i>Congress</i>
Henry Cabot Lodge (R-MA)	1920–1925	66–68
Charles Curtis (R-KS)	1925–1929	68–70
James E. Watson (R-IN)	1929–1933	70–72
Joseph T. Robinson (D-AR)	1933–1937	73–75
Alban W. Barkley (D-KY)	1937–1947	75–79

George J. Mitchell (D-ME)	1989–1995	101–103
Robert Dole (R-KS)	1995–1996	104
Trent Lott (R-MS)	1996–2001	104–107
Thomas A. Daschle (D-SD)	2001–2003	107
Trent Lott (R-MS)	2001–2002	107
Bill Frist (R-TN)	2003–	108

and used that knowledge when it came time to lobby them. Johnson was famous for giving individual members the “treatment,” a one-on-one session where he appealed to them by cajoling, educating, persuading, and, if necessary, threatening them to get their attention and support. Johnson used the position of majority leader like none before or since to move legislation through a highly fragmented and individualized institution.

KEY CONGRESSIONAL LEADERS

Many leaders have played prominent roles in shaping the institutions of the House and Senate, setting the policy agenda and advancing legislation through the Congress. Following is a short list of the most important congressional leaders:

Henry Clay of Kentucky was elected Speaker of the House three times and served a total of ten years (1811–1814, 1815–1820, and 1823–1825). Clay was a popular and effective politician during the formative years of the House of Representatives. He was

the first Speaker to be elected to advance a policy agenda, and he played a key role in the development of the committee system.

Thomas B. Reed, Republican of Maine, was Speaker of the House during a period of strong party government (1889–1891 and 1895–1899) and is regarded as the most powerful Speaker in history.

Sam Rayburn, Democrat of Texas, was the longest-serving Speaker of the House in history (1941–1947, 1949–1952, and 1955–1961). Rayburn developed a system of informal gathering called the “Board of Education” in which he gathered information and discussed House business with powerful committee chairs over whiskey and branch water. As noted above, his bargaining skills were outstanding.

Lyndon Johnson served as minority leader (1953–1955) and majority leader (1955–1961) in the United States Senate. By his forceful personality, Johnson is responsible for turning the majority leader’s office into a powerful position. Johnson instituted the “Johnson rule” whereby freshman senators are given prize committee appointments. He is also famous for the “Johnson treatment”.

Newt Gingrich, Republican of Georgia, Speaker of the House from 1995 to 1998, is principally responsible for returning the Republican Party to the majority after forty years as a minority party. Gingrich used effective organizational skills to raise money and recruit Republican candidates and aggressive tactics to criticize Democratic leaders and liberal policies. His movement to overturn the Democratic majority culminated in the “Contract with America,” a ten-point agenda of policy initiatives that formed the basis of the 1994 congressional elections, when the Republicans won a majority. Gingrich’s effort to transform the role of government through the budget process was ultimately stymied by President William Clinton in 1995 and 1996, and he later resigned from Congress after the Republicans lost seats in the 1998 midterm elections.

FUTURE RESEARCH

Though many areas of congressional leadership are ripe for further research, a few deserve urgent atten-

tion. First, now that the Republicans have held control of the House for at least ten consecutive years, there is sufficient information to study the effects of party on House leadership. Most recent accounts of congressional leadership are derived from observations of Democratic leaders; we may now consider whether and why Republican leaders behave differently and what difference it makes. Second, since we know that conditions affect leadership, we should consider whether and how the increased use of technology affects leadership in the House and Senate. Finally, at a time of intense two-party competition, scholars should explore more carefully how the size of the majority affects leadership, especially in the Senate. These questions and others will continue to occupy scholars interested in congressional leadership.

CONNECTIVE LEADERSHIP

The connective leadership model asserts that a new era is emerging. This model, conceptualized by Jean Lipman-Blumen, describes an emerging environment in which traditional approaches to leadership limit a leader’s effectiveness. The connective leadership model outlines a repertoire of nine behavioral strategies called “achieving styles” that can dramatically increase leaders’ effectiveness in this new environment. The major components of this model are the nine “achieving styles” or behavioral strategies leaders use to accomplish their tasks. A thorough discussion of the basis for the model and stories of connective leaders, both past and present, can be found

in paperback in *Connective Leadership: Managing in a Changing World* or hardcover in the *Connective Edge: Leading in an Interdependent World*.

A NEW ERA OF LEADERSHIP

This connective era is governed by two contradictory forces: interdependence and diversity. These two forces demand conflicting behavioral responses and pull leaders in opposite directions. In this connective era, the tension between these two forces renders traditional leadership behaviors, such as authoritarianism, competitiveness, and rugged individualism, far less relevant. Because organizations, groups, and communities work and live interdependently, leadership decisions affect everything and everyone everywhere. At the same time, groups and individuals worldwide are affirming their distinctive identity and embracing diversity. To act effectively, leaders must be able to integrate these contradictory trends. The clash of these two forces creates unprecedented problems to which leaders who rely solely on traditional approaches are unable to respond effectively.

The connective era is further marked by constant shifts in the connections among people, organizations, and ideas, and, in this era, leaders must alter the way they have traditionally made decisions. Leaders whose skills are limited to the more traditional leadership approaches of dominating, competing, or collaborating will not be effective. The connective leadership model offers a more complex range of behavioral strategies by which leaders can integrate these oppositional forces.

ACHIEVING STYLES

As children, we develop a set of strategies for getting what we want—“personal technologies” for accomplishing our tasks and achieving our goals. The connective leadership model terms these personal technologies “achieving styles.” Through trial and error, success and defeat, we develop preferences for particular strategies and then tend to use them predominantly.

Eventually, we learn to call upon those achieving styles that have brought us the most success. Conse-

quently, most individuals develop a relatively limited range of approaches for accomplishing tasks, consistently relying on only two or three strategies, rather than using the entire range of achieving styles. There are, however, nine achieving styles and many combinations of strategies upon which an individual can rely. "Connective leaders" use a broad spectrum of these behavioral strategies to accomplish their goals. They tend to read the situational cues and select the appropriate achieving styles for the task at hand.

The connective leadership model outlines three sets of behavior styles: direct, relational, and instrumental. People who prefer the direct set like to confront their own tasks individually and directly, emphasizing mastery, competition, and power. People who prefer to work on group tasks or help others attain their goals emphasize the relational set. Individuals who use themselves and others as instruments for accomplishing mutual goals prefer the instrumental set.

Within each of these three sets lie three more specific achieving styles behaviors, for a total of nine achieving styles. Figure 1 depicts the nine achieving

styles in a deliberate order that represents their theoretical proximity. In addition, based on statistical analyses, the highest correlations are between contiguous styles, with correlations generally decreasing the farther one moves away from a given style on the diagram. Thus, the diagram represents both the theoretical and statistical adjacency of the nine achieving styles.

Whereas individuals rarely rely entirely on one style to accomplish their tasks, for explanatory purposes, the nine styles will be described as if individuals utilize only a single style. Within the direct set, the three achieving styles are intrinsic, competitive, and power. People who prefer intrinsic behaviors are attracted to challenging and important tasks. The challenge of mastering the task on their own excites them. People with a preference for the intrinsic achieving style evaluate their performance against an internal standard of excellence, that is, their own past attainments. Individuals who prefer competitive behavior use an external standard of judgment and compare themselves to the performance of relevant others. They have a passion to outperform others and structure tasks as competitive encounters. People who prefer the power style like to take charge, coordinate, and organize situations, events, resources, and other people. These individuals may delegate tasks to others, but retain control over how those tasks are accomplished.

Within the relational set, the three achieving styles are collaborative, contributory, and vicarious. People who tend to use the collaborative style enjoy working with others on teams and joint projects, sharing both rewards and responsibility. People who prefer the contributory style derive their satisfaction from helping other people complete their tasks. Finally, people who consistently call upon the vicarious style do not actually participate in others' activities. Instead, they encourage or facilitate others' accomplishments, perhaps by acting as a facilitator or mentor, offering wisdom or advice, or cheering them on.

The third set of achieving styles, the instrumental set, includes the personal, social, and entrusting styles. The personal style involves using every aspect of oneself to draw others into one's cause. For

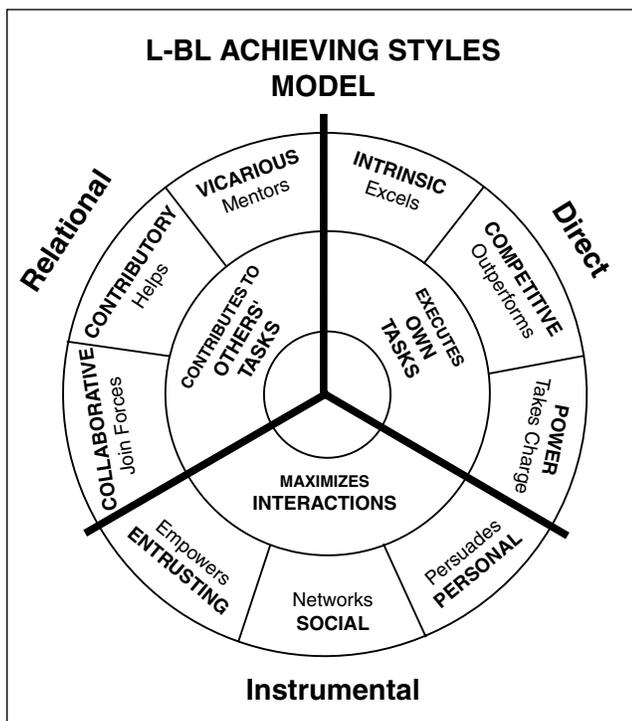

Figure 1. Achieving Styles Model

Source: Lipman-Blumen (1988).

example, individuals who rely on this style may use their wit, charm, attractiveness, family background, or other aspects of themselves to attract supporters to help them accomplish their task. People who prefer the social style often rely on “contacts” or their “networking” skills to engage the appropriate people to help them accomplish their tasks. They call upon others who have the specific skills, experience, or contacts needed for the project. Finally, people who tend to utilize the entrusting style expect everyone to help them accomplish their tasks. They select capable individuals, regardless of whether those people have the relevant skills or experience necessary, to assist in attaining their goal.

CONNECTIVE LEADERS

As noted in the previous section, connective leaders utilize a wide range of achieving styles in accomplishing their tasks. They have developed the capability to utilize all nine achieving styles in a wide range of situations. This behavioral model rests on the assumption that each person learns to use achieving styles successfully through past experiences. Consequently, by extension, individuals can learn through practice to use a broader range of achieving styles.

In particular, through using one of the tools developed in conjunction with this model, the individual achieving styles inventory (which will be discussed in the next section), individuals can identify which of the nine styles they use most often and which they tend to ignore. In that way, an individual can target the underutilized styles for future development. By developing and expanding their profile to include all or most of the achieving styles, individuals can become more effective connective leaders.

AVAILABLE TOOLS BASED ON THE CONNECTIVE LEADERSHIP MODEL

Several inventories currently exist that allow individuals to assess their connective leadership profile. The first tool, the individual Achieving Styles Inventory (ASI), is a forty-five-item Likert-type survey. The respondent answers a series of questions indicating

Assessing Achievement Styles

According to the Achieving Style Institute, “Achieving styles are characteristic behaviors individuals use to achieve their goals and connective leadership emphasizes connecting individuals to their own, as well as others’, tasks and ego drives. The Achieving Styles Model includes three sets of achieving styles (direct, instrumental, and relational), each subsuming three individual styles, resulting in a full compliment of nine distinct achieving styles.” To help individuals and organizations assess their leadership styles, the institute has developed an inventory that can be completed at the institute’s website. Responses on a seven-point continuum range from “Never” to “Always.” Listed below are sample questions from the Achieving Style Individual Inventory:

1. For me, the most gratifying thing is to have solved a tough problem.
2. I get to know important people in order to succeed.
3. I achieve my goals through contributing to the success of others.
4. For me, winning is the most important thing.
5. When I want to achieve something, I look for assistance.

Source: Achieving Styles Institute. <http://www.achievingstyles.com>

how frequently he or she performs stated behaviors and receives a score for each of the nine achieving styles. The scores indicate the frequency with which each style is used. The specific, computer-generated, narrative feedback the respondent receives describes each achieving style, along with the advantages and disadvantages of the degree to which the respondent uses each achieving style.

A second tool, the organizational achieving styles inventory (OASI), is a survey taken by the individual to determine the extent to which various achieving styles are rewarded by a specific organization. Thus, an individual can examine to the fit between his or her approach to accomplishing tasks and the achieving styles (or connective leadership) profile that is rewarded by that organization.

Both instruments have been subjected to reliability and validity testing. In addition, they have been

translated into seventeen languages, including Japanese, Chinese, Spanish, Thai, French, Bulgarian, and Portuguese. The Achieving Styles Institute houses a web-based database containing responses from more than sixteen thousand respondents from a variety of occupations, industries, and countries, collected beginning in 1984.

A third tool, the achieving styles situational evaluation technique (ASSET), is currently being revised for web use. This tool allows an individual to analyze key aspects of a given task or project to determine which achieving styles would be most effective to address the particular task. Comparing the individual Achieving Styles Inventory (ASI) of potential team members and the achieving styles situational evaluation technique (ASSET) provides a useful method for selecting an optimal team for a given task. This method assumes that the cadre from which team members are drawn have the requisite technical background. (The Achieving Styles Institute website at www.achievingstyles.com offers more detailed information on the Model and the instruments.)

RESEARCH DIRECTIONS

Approximately 150 papers have been written based on the connective leadership model and achieving styles. Although the majority of these were presented at conference or are unpublished dissertations, reference information for these works can be obtained by contacting the Achieving Styles Institute. The topics studied include cross-cultural leadership, decision making in educational settings, achieving styles of women leaders, students' achieving styles, the relationship between achieving styles and job satisfaction, person-organization fit based on achieving styles, product development teams, and many more.

In the early twenty-first century, a team of researchers at the Achieving Styles Institute is working on publishing a series of articles discussing the relevance of achieving styles to the analysis of various types of leaders. For example, one paper examines the differences in achieving styles profiles for male and female managers, while another paper

examined differences in achieving styles profiles among managers from various countries. In addition, one paper investigates the differences in achieving styles profiles between entrepreneurs and corporate managers, while another paper investigates different approaches taken by public sector and private sector managers.

The connective leadership model presents a framework for viewing the role of leaders in a new, connective environment. Related tools have been developed for leaders to assess their current approach to accomplishing tasks. The connective leadership model also offers conceptual possibilities and a nonjudgmental vocabulary for resolving person to person and person to organization conflicts. Moreover, the model presents developmental possibilities that leaders can use to become more effective in a new era of leadership.

CONSTRUCTIVISM

Constructivist approaches to leadership invert the traditional focus upon the objective “truth” of a leader and/or situation and followers; instead, they suggest that we consider apparent accomplishments as relative achievements, brought off by the actors and “constructed” through alternative accounts that vie for domination. Instead of asking, for example, what unique qualities Napoleon or Gandhi had that explain their leadership successes and failures, constructivism seeks to understand why we attribute causal success to these individuals and how particular accounts come to dominate. In short, constructivism is more concerned with how we recognize the phenomenon we call leadership, why we regard it as important, and why certain models of explanation occur at specific points in time and space, than with “discovering the truth” about leadership.

The roots of constructivism, sometimes called social constructivism, lie generally in postmodernism but particularly in the works of Michel Foucault, Jacques Derrida, and especially Kenneth J. Gergen. Much of the initial empirical work has been undertaken in the sociology of science and technology but more recently the ideas have spread to many other areas, including leadership. The approach contends that language plays a critical role in our understanding—words both enable us to think and constrain the way we think. In effect, we can never know what counts as “reality” except through our accounts of it. But the words we use, our accounts, do not just describe “reality”—they constitute “reality,” to the point where relativism prevails. For example, if an orthodox account suggests that the world is flat, then

to believers the world is indeed flat. And if that orthodox account changes to the extent that the person believers took to be a god isn’t actually a god, then that becomes the (temporary) truth for the believers.

The same holds for technologies and other allegedly objective phenomena. At its most extreme, what counts as death can be regarded as a social construction rather than an objective fact. For example, we used to define death as not moving, then not breathing, then having no pulse, then having fixed dilated pupils, and then having no brain activity. In every case, the development of technologies to help define death actually made the decision more and not less obscure, to the point where death is now frequently defined by the medical authorities at a hospital after they have given up trying to “revive” an ambiguously defined body and decided, literally, to pull the plug that keeps the body “alive.”

THE CONSTRUCTION OF CHARISMA

Such an approach runs directly counter to a series of traditional—that is, scientific—approaches to leadership. Charisma, for example, is traditionally regarded as an objective characteristic of an individual: Some leaders are charismatic and others are not. Abraham Lincoln, for example, was a charismatic leader and created the greatest speech of the nineteenth century at Gettysburg. But a constructivist approach would remain skeptical of both these “objective” claims. Did all of Lincoln’s contemporaries recognize his charisma? If not, then might his charisma be a product of a retrospective construction designed to suit the needs of the Union after his assassination? It is certainly intriguing that many leaders acknowledged to be charismatic died young and often violently. Could this charisma be part of the explanation and a valuable aspect of the construction of a myth such that the weaknesses of such leaders either do not surface over time or are submerged by the social grief that follows assassinations? If so, then we need to consider to what extent assassinated leaders were as perfect as is often implied and to what extent their lives were reconstructed to fulfill the needs of those left behind.

If some people did not perceive Lincoln as charis-

matic, were they confused or was his charisma in the eye of the beholder? In effect, is charisma a social construct generated by followers, observers, and writers, rather than an objective characteristic possessed by individuals? In the case of Admiral Nelson, it is now well-known that he was very adept at generating positive public images of himself, to the point where he wrote battle accounts in the first person that, naturally, focused on his pivotal bravery, and then got junior officers to edit them, altering the first person to the third person, such that “I” became “Admiral Nelson.” They then sent the altered accounts to the British newspapers as if they rather than Nelson had written them. Similarly, whether the Hawthorne experiments conducted between 1924 and 1933 by sociologist Elton Mayo and his research team were quite as clear-cut as his own summary suggests is now rather dubious—but Mayo certainly led us to certain conclusions about leadership, supervision, and group behavior through his manipulation of the data and the research team.

Another valuable question to ask when discussing charismatic leaders is whether a crisis is a necessary precondition for the emergence of their charisma. “Come the moment come the man (or woman)” is one way of understanding this conjunction because under situations of great danger or stress, people look to great men and women to solve their problems and protect them. We might still retain the idea that a charismatic person is objectively endowed with remarkable powers but that these only mature under certain objective conditions—a crisis, for instance. But the constructivist approach also remains skeptical of such assumptions: What makes a “situation” into a “crisis”? Who says we are in a crisis anyway? Usually it is the very leaders who insist that we exert ourselves or sacrifice our children who also define the situation as a crisis. For example, do we really know whether we are under an extreme terrorist threat, or that the company is in grave danger of collapse?

And when we ask for independent and objective information to confirm the analysis of our leaders that we are in a crisis, all too often that cannot be released without allegedly compromising the source and making matters worse. In other words, the very

people who call upon us to sacrifice ourselves are the ones most likely to benefit. Moreover, our understanding of the situation often changes over time: Subsequent investigative journalism may reveal that the “crisis” was manufactured for political advantage or that the mysterious “misunderstandings” were not just fortuitous but a conspiracy. It is for such reasons that the reputations of leaders are constantly changing over time.

LEADERSHIP, CONSTRUCTIVISM, AND CULTURE

Another feature of constructivist approaches lies in the way they view the importance and relative status of contemporary culture. In other words, these approaches believe that what counts as “good” or “bad” leadership lies less in any alleged objective assessment of the case and more in the way particular leaders replicate conventions. For example, Churchill’s reputation as a leader depends upon not just who you ask but when you ask the question. In the 1930s Churchill was commonly regarded as an out-of-date warmonger, but during the war his leadership was considered a critical symbol of British resilience. Recent analyses suggest that both views are plausible and perhaps we shall never agree on an “objective” assessment of him because our assessment is inevitably colored by our own political preferences and biases.

Beyond personal biases there are significant social and cultural formations that constrain the way we understand leadership. For example, during the 1930s and early 1940s, when Nazism and Soviet Communism dominated the global stage, it seemed evident that the control of an irrational mass by a ruthless charismatic leader was the “best” way to lead—and such modes of behavior were replicated in Western factories as well as Eastern barracks. But after the victory of the Western allies in 1945, it seemed to make more sense to construct leadership patterns around the self-realizing needs of individuals—a reflection of the dominant culture of the victors.

And of course at the time it made sense to talk of leaders as male, indeed, so much so that it did not require writers to talk of “him or her” because to

pontificate about the nature of gendered leadership was equivalent to assuming that women should engage in armed combat during wartime. In the Soviet Union, large numbers of women served as infantry soldiers, tank crews, and fighter pilots and as combat officers and leaders, but there were no equivalents in the ranks of the Allies because such things appeared “unnatural.” In short, radically different appreciations of leadership appear to be just common sense at different points in space and time.

This might also explain how certain managerial systems come to lead at different times. For example, it may not be coincidental that Business Process Reengineering came to the fore at roughly the same time that the Berlin Wall fell and with it Soviet Communism. At that point the idea that the way we had organized factories and offices for the last fifty years should be completely rethought and redesigned from a blank sheet, often in an economically aggressive way. Furthermore, the collapse of the communist bloc released certain forms of language because from that point on managerial gurus—leaders—began to talk of managerial “revolutions”—without fear of appearing politically left-wing.

What should be clear, then, is that constructivism is antithetical to all forms of “essentialism,” or put another way, that the search for the essence of an individual leader, a situation, an organization, or even a technology is misplaced because what counts in a leader, a situation, and so on, lies in the conflicting accounts of the protagonists. Perhaps a useful way to illustrate this is to relate the request for essences to the labeling of terrorists—for this is surely one of the most important issues for political leadership at the beginning of the twenty-first century. British journalist Robert Fisk insists that linguistic gyrations around the word “terrorism” are common and contemptible on the part of all involved in such conflicts. In other words, the problem is not using the word “terrorist” to say what we mean, but that competing leaders try to delineate their followers’ “legitimate” acts in contrast to the “terrorism” imposed by the other side. In most cases both sides seem to be involved in acts of terrorism. For example, in most cases where “terrorists” and “armies” vie with each other, both sides recognize

only their opponents as “terrorists” and see their own actions as legitimate acts of self-defense. Hence, as Fisk (2003) suggests:

. . . when Israeli soldiers were captured by Lebanese guerrillas they were reported to have been “kidnapped,” as if the Israeli presence in Lebanon was in some way legitimate. Suspected resistance men in southern Lebanon, however, were “captured” by Israeli troops. . . . By the mid-1980s, the AP [Associated Press] used “terrorists” about Arabs but rarely about the IRA in Northern Ireland, where the agreed word was “guerrillas,” presumably because AP serves a number of news outlets in the United States with a large Irish-American audience. The BBC, which increasingly referred to Arab “terrorists,” *always* referred to the IRA as “terrorists” but scarcely ever called ANC bombers in South Africa “terrorists.” . . . *Tass* and *Pravda*, of course, referred to Afghan rebels as “terrorists.” . . . In September 1985 a British newspaper reported that a [Soviet] airliner carrying civilian passengers [over Afghanistan] had been “downed by rebels.” “Terrorists” are those who use violence against the side that is using the word. The only terrorists whom Israel acknowledges are those opposed to Israel. The only terrorists the United States acknowledges are those who oppose the United States or their allies. The only terrorists Palestinians acknowledge—for they too use the word—are those opposed to the Palestinians. (Pp. 438–441)

Note here that a constructivist account does not seek to divide the actions between moral and immoral but concentrates on the way the legitimations occur and the role this has in explaining the success or failure of leadership. Of course, this then runs the risk of “sitting on the fence”—in this case, between terrorism and “legitimate” force. Nonetheless, the point is not to maintain any alleged political neutrality but to highlight the role of language in the construction of the world and, for our purposes, leadership.

CONTINGENCY THEORIES

“One, if by land, and two, if by sea . . .” These famous words in Henry Wadsworth Longfellow’s 1860 poem *Paul Revere’s Ride* illustrate that the revolutionary colonial army had a contingency plan for defending against the expected British invasion—one plan of action for a land invasion, another for an incursion from the sea. In leadership theory, contingency theories refer to approaches that posit that the particular leadership style or behavior that will be most effective depends (i.e., is contingent) upon crucial aspects of the task situation or mission environment. However, early research on leadership did not envision such complex determinants.

PRE-CONTINGENCY: FOCUS ON THE INDIVIDUAL

The scientific study of leadership began in the early part of the twentieth century when the development of intelligence and personality trait measures commanded the attention of many psychologists. Early leadership researchers searched for a “leadership trait,” that is, some stable aspect of an individual’s personality that would make them a good leader. Leaders and followers in many types of organizations were compared on many different traits, such as intelligence, dominance, social sensitivity, introversion-extroversion, and originality, among others.

After several decades of trait research, Ralph Stogdill completed a comprehensive review of those

studies. He found very few strong relationships among the traits and measures of leadership emergence or effectiveness and little consistency of findings across studies. In a prescient analysis, Stogdill concluded:

A person does not become a leader by virtue of the possession of some combination of traits, but the pattern of personal characteristics must bear some relevant relationship to the characteristics, activities, and goals of the followers. Thus, leadership must be conceived in terms of the interaction of variables which are in constant flux and change. (1948, 63–64)

Leadership researchers did not abandon the focus on individual aspects of the leader, but shifted their inquiry away from personality toward behavior. Early studies by Kurt Lewin and his colleagues reported findings indicating that “democratic” leadership styles, allowing for more follower input in decisions, were superior to “autocratic” styles in which a leader made all decisions without consultation. However, follow-up studies revealed that the relative effectiveness of autocratic and democratic leadership depended in part upon the degree of independence desired by the followers—again revealing complex interactions between leader and follower characteristics.

Another popular approach was to identify the specific behaviors used by leaders and to determine which behaviors were most effective. A group of Ohio State University investigators led by Carroll Shartle developed the leader behavior description questionnaire (LBDQ) to measure and categorize leader behavior. The two most prominent categories of behavior were called “Consideration,” which referred to a leader’s attention to the feelings, needs, and morale of subordinates, and “Initiation of Structure,” which referred to leader behaviors focused on task accomplishment. Similar categories of behavior were found in studies employing interviews of workers and observations of students working in groups. Unfortunately, the consistency of research in identifying task-focused and interpersonally focused behavioral categories was not matched by consistent findings relating the categories to important leadership outcomes.

PRE-CONTINGENCY: FOCUS ON THE SITUATION

The failure to find individual leader characteristics that predicted leadership effectiveness led to research about situational variables. It was found, for example, that people were more likely to become chosen as leaders of a group if they occupied a central rather than peripheral position in the group's communication structure.

A study of factors influencing the behavior of naval officers found that the leader's role in the organization (i.e., rank and responsibilities) was a more powerful determinant of the leader's behavior than were attitudes, personality, or even previous behavior. Research on group tasks also revealed strong effects of task requirements as determinants of leader behavior.

These and other studies made it clear that the situation was an important contributor to leadership dynamics, but it failed to explain how two different leaders might have dramatically different levels of performance in the same situation. The scientific stage was set for a drastic shift to a much more complex conceptualization of leadership effects.

CONTINGENCY THEORIES

Contingency theories address the relative effectiveness of leader behaviors, style, or orientations in different situations. Situational variables typically include the degree of support and trust between leader and followers, the nature of the task (most often the degree of clarity, structure, and predictability), the leader's formal or informal authority, the ambiguity of organizational roles, and so forth. These situational variables are hypothesized to create an environment in which certain behaviors or strategies will be more effective than others. However, the various contingency theories differ in whether it is the leader or the follower that is the focus of attention and for whom the situational variables are most important.

LEADER-FOCUSED THEORIES

Fred Fiedler's contingency model was the first theory integrating leader, follower, and situational character-

istics, and it is difficult to overstate its profound impact on the field. Fiedler did not set out to construct a contingency model, but was led to it by his data.

The early centerpiece of Fiedler's studies of leadership effectiveness was a leader characteristic measured by the "least-preferred coworker (LPC)" scale. The LPC scale asked the respondent to rate on a series of bipolar adjective scales (e.g., intelligent-unintelligent, friendly-unfriendly, harmonious-quarrelsome) the worst coworker in the rater's work history—specifically the "one co-worker with whom you had the hardest time accomplishing the task assigned to you" (Fiedler 1967, 16)

Although the meaning of the LPC construct has been open to multiple interpretations, the most widely accepted view is that the scale reflects the relative importance the respondent places on task versus interpersonal success. The reasoning behind this interpretation is that because a person with a low score on the scale has given a very negative description of a poor coworker, work (i.e., task success) is very important to the respondent, and they are labeled "task-motivated" or "task-oriented." A person who describes a poor coworker in relatively positive terms is assumed to be less interested in task success than other aspects of the leadership situation, that is, interpersonal success. Such individuals are referred to as relationship motivated or relationship oriented.

Early studies relating a leader's LPC orientation to measures of team or organizational success (e.g., games won by basketball teams, tonnage of steel produced by mill crews, profits earned by farming cooperatives, etc.) resulted in conflicting findings. Sometimes groups led by task-oriented leaders outperformed those led by relationship-oriented leaders, but sometimes the opposite was true. The contingency model resolved this conundrum by positing that each type of leader could be effective, but in different kinds of situations.

In most of the early studies, data on situational variables were collected that reflected (a) the degree to which the leader felt accepted, respected, and supported by subordinates; (b) the clarity, structure, and predictability of the group's task; and (c) the amount of formal authority or power given to the leader.

These three variables were combined into a dimension that came to be known as situational control. Situational control reflected the predictability and controllability of the group situation from the leader's perspective.

The results relating leadership orientation (i.e., LPC) and situational control to group performance followed a complex, but replicable pattern. Task-motivated leaders had the highest performing teams in situations of high control (good support, a clear task, and sufficient authority), but also in situations of very low control (poor relations with subordinates, an ambiguous task, and weak authority). The relationship-motivated leader performed more effectively in moderate control situations (i.e., good support but an ambiguous task, or poor support but a structured task).

The explanation given for these results was that the directive, task-focused style of the task-oriented leader worked best when the situation was very predictable, because member support and task clarity made it easy for the leader to see the correct direction to take and how to structure the work of subordinates. Directive leadership was also relatively effective when the complete lack of predictability or control made it incumbent on the leader to supply some structure through clear and strong direction. In situations of ambiguity (i.e., moderate control), a style that emphasized a concern for followers and greater participation of all group members in decision making had a higher potential for fostering an atmosphere conducive to the creativity and consensus necessary to solve complex problems and take action.

The interpretations of the contingency model have generated considerable controversy and criticism, but the empirical research has generally supported its predictions. The contingency model has also generated other related research approaches. Martin Chemers and his colleagues applied the leader match model to the prediction of job stress. Results indicated that the same principles useful in predicting team success, and were capable of predicting leader stress and stress-related illness. Cognitive resources theory, developed by Fred Fiedler and Joseph Garcia, revealed that the relative effects

of a leader's intelligence or experience on group performance was contingent on the degree of stress experienced by the leader, with intelligence having its most positive effects in low stress situations and experience being most valuable when high stress made thinking more difficult and increased reliance on the lessons of experience.

However, the greatest contribution of the contingency model to leadership and organizational theory was that it freed researchers from "one-best-way" approaches and made them sensitive to the subtle and complex ways in which leaders, followers, and situational variables combined in group and organizational performance. Other contingency theories soon followed the promulgation of Fiedler's breakthrough.

One of the most important functions of leadership is the facilitation of group decisions, and an enduring argument concerns the relative importance and effectiveness of subordinate participation in decision making. Victor Vroom and his associates brought a contingency perspective to the question with the normative decision theory (NDT). NDT identifies three general decision-making strategies used by leaders. Autocratic decision making does not involve seeking advice or consultation from subordinates. Consultative decision making allows subordinates to take part in the process by considering information and offering advice to the leader who retains the final authority to make the decision. The group decision-making paradigm is fully participative with the leader sharing all information with followers and fully sharing decision authority. NDT posits that the relative utility of these paradigms for group and organizational success depends on a number of situational variables.

The most important of these variables (similar to the contingency model discussed earlier) concern relationships between the leader and subordinates and among subordinates as well as the degree of clarity and structure in the group's task or mission. The underlying theoretical principles that inform the theory are that participation of subordinates in decision making increases (1) their commitment to carrying out the chosen solution and (2) the amount of information available to the leader by tapping into the knowledge and advice of the subordinates.

Autocratic leadership patterns, which can be very efficient in time saving, should work best when subordinates are very supportive and cooperative (i.e., their commitment is assured) and when the task is clear and structured (i.e., their advice and counsel is not necessary). However, if the task is not clear, the leader must at the least tap into subordinate information (i.e., use a consultative technique). When cooperation cannot be assured, the more participative approaches increase subordinate commitment and enhance the chances for success. The theory makes a number of other predictions; for example, which style is most effective when conflict among subordinates might lead them not agree on the best course of action. Empirical support for NDT is generally good. When leaders who are asked to rate the utility of the different decision strategies under varying situational conditions, those leaders who follow the predictions of theory are rated highly by supervisors and subordinates. When managers are asked to recall successful decisions and the conditions surrounding the decisions, the strategy used more often conforms to the model than when decisions were unsuccessful. Interestingly, subordinates appear to give high ratings to supervisors who use more participative techniques even when they are not the most effective according to the theory.

A comparison of the contingency model and normative decision theory reveals some similarities and some differences. The situational variables are quite similar, primarily relating to follower support and cooperation and task clarity and structure. The models also make somewhat similar predictions; that is, that more directive approaches will be more effective when support is high and tasks are clear, but less effective when the complexities of interpersonal relations or ambiguous tasks require more input and more consideration of other viewpoints.

One major difference between the two theories is the way in which the leader variable is conceptualized. In the contingency model, the leadership orientation is similar to a personality trait over which the leader has limited control. In normative decision theory, the decision strategy is seen as solely under the control of the leader to be adapted to the situation as necessary.

FOLLOWER-FOCUSED THEORIES

Although a number of follower-oriented contingency theories have been proposed, only path-goal theory (PGT) developed by Robert House and his colleagues has generated much empirical research. PGT argues that a leader's main function is to motivate the follower by clarifying the paths (i.e., behaviors and actions) by which the subordinates can reach their goals. The theory specifies which leader behaviors are most likely to engage a subordinate's motivation and to help them accomplish their tasks.

The theory focuses on the two classes of leader behavior identified in the leader behavior description questionnaire. These are *structuring* behaviors, by which the leader directs the task-related activities of the subordinate, and *consideration* behaviors by which the leader addresses the personal and emotional needs of the follower. Implicit in the theory's predictions is the notion that the most effective leader behaviors supply what is missing from the situation to enable the subordinate to function effectively.

Structuring behaviors like direction and feedback will be most effective and welcomed when the subordinate does not know how to accomplish the task, because the task is new, difficult, or ambiguous. However, when tasks are well understood, structuring behavior will be interpreted by a subordinate as overly close monitoring or pushing for production and will have negative effects. Consideration behaviors will have their most positive effects when the subordinate's task is aversive by virtue of it being boring or uncomfortable. Consideration behavior directed toward an engaged and interested subordinate is unnecessary and distracting.

The empirical support for PGT is mixed. Many studies support some or all of the predictions, but validation evidence is not consistent. One reason for mixed results may be explained by a study that included the role of subordinate personality as a moderator of the effects of leader behavior and situation. Specifically, subordinates had a strong need to grow and develop on the job and liked challenges—they actually welcomed complex and difficult tasks and did not appreciate leader attempts at structuring under those conditions. On the other hand, subordi-

nates who were low on the need for growth did not seem to mind an unchallenging task and did not require leader consideration under those conditions. These findings remind us that the contingencies surrounding effective leadership are many and varied and that follower characteristics may be just as important to the leadership equation as are leader characteristics.

IMPLICATIONS

The contingency theories awakened leadership researchers to the complexity of the leadership phenomenon. Leader personality and behavioral style, follower needs and values, and situational parameters of task, hierarchy, and organizational environment must all be included in our understanding. Although the contingency theories each have their own particular perspective, measure, and predictions, they are more complementary than contradictory. They help to place leadership in a social context.

It is tempting to see leadership in simple terms—to see organizational effectiveness as the result of a leader's decisive decision-making style for example, but simple explanations are not helpful in complex situations. In response to criticism that his theory was too complicated, Fred Fiedler often said, "One needs a pretzel-shaped theory to explain a pretzel-shaped universe."

CORPORATE SOCIAL RESPONSIBILITY

Many of the world's largest businesses rival nation-states, religions, and even nature itself as agents of change. Multinational corporations have become the primary force shaping human material well-being. They determine our collective values and shape our shared experience; they create our future. Fifty-one of the world's hundred largest economies are businesses. For example, Wal-Mart Stores, number one on *Fortune* magazine's list of the five hundred largest U.S. corporations in 2002, had sales just short of \$220 billion. The combined gross national products of New Zealand, Greece, Costa Rica, and Cuba was \$212 billion that same year. To put it another way, "One hundred and sixty-one countries have smaller annual revenues than Wal-Mart does" (Derber 1998, 3). Since there are approximately 190 nation-states in the world at present, that means Wal-Mart has greater revenues than all but some 29 nations. The spread of globalization and the daily influence of business on the lives of billions of people make businesses a social as well as an economic force.

Until the late 1980s the prevailing model of modern corporate behavior was to maximize profits for stockholders. Milton Friedman (b. 1912) the Nobel Prize-winning economist and author of *Capitalism and Freedom* (1962) legitimized the stockholder-centered view of business. According to Friedman, "Few trends could so thoroughly undermine the very foundations of our free society as the acceptance by corporate officials of a social responsibility other than to make as much money for their stockholders as possible" (Friedman 1962, 133). The book still serves as the theoretical defense of the unregulated free market system.

Opponents of that view claim that in the absence of a regulatory environment, it is dangerous for the stockholder to be the sole interest of the corporation

Former Enron CEO Jeffrey Skilling (with current President and COO Jeffrey McMahon in the rear) testifies before the Senate Committee on Commerce, Science, and Transportation on 26 February 2002.

as it leads to unethical and even illegal behavior in the pursuit of profit. They claim that a stakeholder view is more realistic and accounts for the expanded role of business and its enormous influence on the lives of people. Stakeholders are defined as virtually anyone who has an interest in the organization or is affected by the organization. They include not only stockholders, but also employees, members of the communities in which the corporation is located, suppliers, customers, and nongovernmental organizations (NGOs) that look out for environmental and social abuses.

CORPORATE SOCIAL RESPONSIBILITY: AN ETHOS

Corporate social responsibility (CSR) is an ethos for business articulated by people who want the huge and growing influence of business on the world to be a positive one. Supporters of CSR wish to broaden business's responsibility and role in society and ask that it move from exploiting resources for the sole purpose of maximizing profit for shareholders to husbanding resources for the benefit of employees, society, and the future well-being of the planet. They demand that business be held accountable for a triple bottom line: In addition to its concern for profits, business must also be measured on

its environmental impact and on its performance on matters of social justice.

CSR ON THE PUBLIC AGENDA

The idea of corporate social responsibility was, accordingly, a fundamental assumption about expected corporate behavior. Failure to serve the public would result in cancellation of the corporate charter—its license to operate. Later in the 19th century, as corporations won self-serving privileges and drifted beyond practical oversight by legislatures and the public, critics of increasingly abusive corporate behavior during the robber-baron era sought regulation as the answer. Thus, in turn, populists, progressives, and liberals sought to reign in corporate privilege and by the 1960s began using the term *corporate social responsibility* to indicate that corporations, whether or not chartered to serve the public, have a public (social) impact and therefore a duty to behave in a manner consistent with societal norms.

The recent impetus to demand CSR arose with the first Earth Day held on 22 April, 1970. Millions of people throughout the United States demonstrated for the environment and held consciousness-raising activities highlighting deteriorating air, water, and soil quality largely as a result of indiscriminant corporate pollution. The creation of NAFTA (North American Free Trade Agreement) in 1994 stimulated the current concern because as jobs moved to Mexico, labor standards deteriorated. Low wages and the proliferation of sweatshop conditions in the textile industry in Mexico and elsewhere producing garments for high-profile, high-cost apparel companies such as Nike gave rise to consumer boycotts and the call for CSR by major companies producing many kinds of goods overseas for the American market.

In the United States, CSR received increased attention in the first few years of the twenty-first century as large corporations such as Enron declared bankruptcy after years of dubious financial practices. Other major U.S. corporations whose business practices came under scrutiny included the media giant AOL Time Warner, the pharmaceutical company Bristol-Myers Squibb, the financial-products company Citigroup, and the telecommunications com-

pany WorldCom, among many others. The major charges were fraud, misleading financial reports, actions to artificially raise the price of company stock, excessive executive compensation unrelated to performance, unauthorized loans to top executives, unpaid taxes and shady trading practices. In the wake of those scandals, the cry for CSR has grown increasingly strong.

After U.S. companies came under intense scrutiny, so too did companies in Europe, Asia, and elsewhere. Many NGOs such as Amnesty International, World Wildlife Fund, Oxfam, and Accountability brought the ideas of CSR to virtually all nations of the world. In 1999 Kofi Annan, Secretary-General of the United Nations, proposed a Global Compact on Human Rights, Labor, and the Environment, which asks that businesses everywhere agree to support the nine principles of the compact. The principles include respecting and protecting human rights, eliminating child labor, and establishing initiatives to promote greater environmental responsibility by corporations.

LEADERSHIP IN A STAKEHOLDER ENVIRONMENT

As the world's industrial democracies struggle with deregulation and shrinking governments, stakeholders must now provide the checks on businesses that were once provided by government regulations. To be effective in this dynamic environment, business leaders should develop a stakeholder engagement strategy: They should think through the issues, the key relationships, and the various stakeholders' interests while not losing sight of the company's goals and priorities.

The challenge is to anticipate the competing and conflicting interests of the various parties and chart a strategic course through this veritable minefield of demands. Employees want higher wages and a safe and satisfying working environment; stockholders want bigger dividends and reduced costs; consumers want better service and higher quality; communities want civic donations of time and money to support local needs; suppliers want predictable demand and timely payment; professional groups want adherence

to ethical standards and codes of practice; investors want full disclosure and responsive management; government wants compliance with the intent of the law as well as the letter of the law. And all the stakeholders want transparency: They want accountability in the form of annual audits of the triple bottom line and public reporting of the results.

THIRD-PARTY AUDITING AND REPORTING

NGOs have filled the vacuum left by retreating governments that, having accepted the principles of unfettered market forces, have privatized public services and the development of natural resources. The NGOs are pressuring multinational corporations to apply the highest home-country standards to their overseas operations; they want corporations to support environmental sustainability and end the various workplace abuses of their subcontractors, suppliers, and business partners.

NGOs are filling the regulatory void by organizing consumer campaigns that put pressure on corporations to sign internationally recognized agreements concerning environmental responsibility, fair treatment of labor in overseas plants (whether the plants are their own or their suppliers'), and behavior on a number of social indicators. However, while the NGOs are effective at applying pressure on corporations globally by organizing media campaigns, boycotts, and legal action, most are not in a position to provide an unbiased assessment of an individual company's performance or to help them come into compliance with international standards.

A growing number of organizations now fill that demand. Neither corporations nor advocacy groups, these third-party organizations provide disinterested, fair, and reliable assessment for companies wanting to know (or needing to verify) where they stand on internationally accepted standards of behavior.

Among the first to articulate a set of principles to guide corporate behavior was CERES (Coalition for Environmentally Responsible Economies), a coalition of environmental groups, investors, and advocacy groups that had its start in 1988, when a group of socially responsible investment firms and public pension funds joined with a number of environmen-

Corporate Social Responsibility

By endorsing the CERES Principles, companies not only formalize their dedication to environmental awareness and accountability, but also actively commit to an ongoing process of continuous improvement, dialogue and comprehensive, systematic public reporting. Endorsing companies have access to the diverse array of experts in our network, from investors to policy analysts, energy experts, scientists, and others.

Principles

Protection of the Biosphere

We will reduce and make continual progress toward eliminating the release of any substance that may cause environmental damage to the air, water, or the earth or its inhabitants. We will safeguard all habitats affected by our operations and will protect open spaces and wilderness, while preserving biodiversity.

Sustainable Use of Natural Resources

We will make sustainable use of renewable natural resources, such as water, soils and forests. We will conserve non-renewable natural resources through efficient use and careful planning.

Reduction and Disposal of Wastes

We will reduce and where possible eliminate waste through source reduction and recycling. All waste will be handled and disposed of through safe and responsible methods.

Energy Conservation

We will conserve energy and improve the energy efficiency of our internal operations and of the goods and services we sell. We will make every effort to use environmentally safe and sustainable energy sources.

Risk Reduction

We will strive to minimize the environmental, health and safety risks to our employees and the communities in which

we operate through safe technologies, facilities and operating procedures, and by being prepared for emergencies.

Safe Products and Services

We will reduce and where possible eliminate the use, manufacture or sale of products and services that cause environmental damage or health or safety hazards. We will inform our customers of the environmental impacts of our products or services and try to correct unsafe use.

Environmental Restoration

We will promptly and responsibly correct conditions we have caused that endanger health, safety or the environment. To the extent feasible, we will redress injuries we have caused to persons or damage we have caused to the environment and will restore the environment.

Informing the Public

We will inform in a timely manner everyone who may be affected by conditions caused by our company that might endanger health, safety or the environment. We will regularly seek advice and counsel through dialogue with persons in communities near our facilities. We will not take any action against employees for reporting dangerous incidents or conditions to management or to appropriate authorities.

Management Commitment

We will implement these Principles and sustain a process that ensures that the Board of Directors and Chief Executive Officer are fully informed about pertinent environmental issues and are fully responsible for environmental policy. In selecting our Board of Directors, we will consider demonstrated environmental commitment as a factor.

Audits and Reports

We will conduct an annual self-evaluation of our progress in implementing these Principles. We will support the timely creation of generally accepted environmental audit procedures. We will annually complete the CERES Report, which will be made available to the public.

tal groups to channel investment dollars to environmentally responsible companies. They took the name CERES in 1989, and that year created the CERES principles, a ten-point environmental code, in response to the oil spill from the *Exxon Valdez* off the coast of Alaska. At present more than fifty companies, including thirteen Fortune 500 companies, have endorsed the CERES principles. In 1991, the

International Chamber of Commerce formally launched the Business Charter for Sustainable Development, which contains sixteen principles for environmental management. The charter aims to help businesses adhere to national and international environmental standards so that they can be responsible stewards of the environment.

Additional charters and reporting initiatives in the

areas of human rights, labor, and work processes are represented by organizations such as Social Accountability International and the International Organization for Standardization; they now offer a way for stakeholders to assess an organization's performance on the triple bottom line.

CSR REPORTING IN PRACTICE

AccountAbility, a British professional institute, is "dedicated to the promotion of social, ethical and overall organizational accountability" (AccountAbility n.d.). It outlines processes organizations should follow to account for their performance, but it does not establish recommended performance levels. Standards such as SA8000 establish performance targets, and many organizations voluntarily report their social and environmental performance to the public.

Novo Nordisk, a pharmaceutical company that manufactures insulin for diabetes patients, was ranked by *Fortune* magazine as the best company to work for in Europe in 2002. That same year the company was the second-place winner in a competition for corporate reporting, according to the *Financial Times*. Their report was a sixty-eight-page statement of what they had achieved and where they fell short regarding social and environmental issues. It also included the company's plans for improvement. The report raised such difficult questions as how it could improve access to health care and make its products affordable while continuing to operate profitably, and how it could respect animals' welfare while testing its products on animals in order to be sure the products met safety requirements.

Chiquita Brands, famous for its bananas, is a company that has tried to become more socially responsible in recent years. As the successor to United Brands and United Fruit Company, it had to undo more than a hundred years of strong-arm policies in Central America. In May 2000, the company began a conscious program of increased responsiveness to stakeholders and began to forge a new reputation to reflect the shared values and concerns of its employees. Chiquita stated in its code of conduct that it intended to "incorporate integrity, respect, opportu-

nity to grow, and responsibility" into its daily operations. In 2001, Chiquita Brands issued its first corporate responsibility report and credited the Rainforest Alliance's Better Banana Project with helping it make its business more environmentally sustainable. The report also mentioned the company's commitment to achieving Social Accountability International's SA8000 labor standard. That standard accommodates all international labor agreements on the conditions of work and the treatment of workers.

THE FUTURE OF CSR

The rise of the many activist organizations calling for corporate compliance with internationally recognized standards is a very real effort to make corporations accept the principles of social responsibility. The obligations that these organizations want companies to fulfill are voluntary, not mandated by government regulations—at least for now. But thanks to the power of moral suasion, more and more corporate leaders are choosing to work with the company's stakeholders rather than risk diminishing the reputation, financial prospects, and goodwill that the company earns through compliance.

CREATIVITY

What makes human beings different from the primate species with whom they share 95 percent or more of their genetic makeup is the fact that humans are able to come up with new ways of thinking and acting that can then be passed on to the next generation as a new baseline on which to build. This process, which we ordinarily call “creativity,” has accelerated exponentially over the last few thousand years.

Understanding and managing creativity has become one of the most important survival requirements for the human species, and one of the most important sources of competitive advantage for firms and institutions. Therefore an acquaintance with creativity is now a necessary condition of leadership.

LEADERS AS GATEKEEPERS TO CREATIVITY

According to the “system model,” the term *creative* may be used to describe a new idea, process, or product that is socially valued and pursued to completion. For creativity to occur, three elements must be present. The first is a cultural *domain*—that is, a set of

procedures for thinking and acting. Domains are likely to consist of a symbolic system with its own notation and codified rules. Music, mathematics, religion, and engineering are a few of the many thousands of domains that make up a culture.

The second element necessary for creativity is a *person* who, after learning the rules of a particular domain—for example, religion—decides to introduce some novelty into it. Most persons are content to reproduce the information they learn from a domain without changing it. But there are always a few individuals who feel that the domain needs improvement, and who are willing to put out the effort necessary to implement the desired change. For instance, Martin Luther, who was ordained as a Catholic monk, was unable to accept the religious rules laid down by Rome and after many struggles developed his own version of Christianity.

The third element is a social *field*. Fields are made up by the gatekeepers of specific domains. The function of a field is to evaluate the novelties proposed for introduction into a domain, to reject those that it believes are not an improvement on what already exists, and to select for inclusion into the domain those changes that are better than what existed before. In the case of Martin Luther, the field that evaluated his ideas was the Papal curia and its various offices, including the Inquisition. Rejected by them, Luther was forced to recruit a new set of gatekeepers from dissatisfied clergymen and nobility who were seeking autonomy from Rome. This resulted in the Protestant church, which soon developed into a domain and a field with its own dogmatic and procedural rules. The system model thus implies that creativity cannot occur even in very creative people unless their ideas are accepted and implemented by the relevant gatekeepers.

As this example shows, the choices a field has to make in deciding whether a new idea is heretical or creative often reflect political, ideological, and financial conflicts. This is true even in domains that are more abstract than religion. In mathematics or physics, for example, it may take a few years to ascertain whether a scientist’s claim is fraudulent, mistaken, or truly new and valid and thus worthy of recognition. Only then will it be included in the

domain—the journals, the textbooks, and the growing knowledge base that future mathematicians or physicists will learn.

According to the system model, a leader can play two different roles. A leader may be directly involved in introducing novelty into a system. More frequently, however, he or she will act as the gatekeeper who stimulates creativity in others and then selects the best new ideas for implementation. Thus a leader contributes to creativity by supporting individuals who are likely to change existing ways of doing things, by providing conditions for the generation of novelty and by recognizing and supporting the best that is produced. Some of the most creative leaders are innovators in their own right and also contribute to creativity as gatekeepers. Most military leaders, from Alexander the Great to Generals Montgomery, Rommel, and Patton, were successful because of their unexpected tactics which confounded the enemy. General George C. Marshall was not himself an original field commander, but as a visionary gatekeeper of the armed forces he contributed to creative solutions in World War II and later in the economic reconstruction of Europe. It bears remembering that the role of the gatekeeper is just as important as that of the innovator because without a competent field, the chances of implementing creativity would be almost as dim as they would be without original thinkers.

LEADERS AS CREATIVE INNOVATORS

Much has been written about leaders who were themselves innovative, especially in the areas of warfare and business. Some authors list the main traits that such leaders are said to possess, such as imagination, inspiration, sagacity, and foresight. Others discount personal characteristics and stress the procedural steps taken by leaders that led to successful innovation, such as monitoring sources of innovative opportunity.

Leaders have to be fluent in at least two domains. One is the domain of their specific expertise—for example, religion, business, engineering, or the military. A certain amount of domain-specific knowledge is necessary to anticipate new trends and to rec-

ognize possible opportunities. The second domain is the domain of leadership itself. A leader by definition can channel the energy and motivation of a group of people towards his or her own goals. Whether the followers are soldiers, monks, or engineers, the task of motivating them is essentially similar.

For a leader to be creative in the domain of leadership, it helps to understand what motivates people (both as relatively unchanging biological organisms and as constantly changing beings conditioned by culture). It helps to realize what ideas will move people to action, to understand their fears and hopes. A creative leader is, in part, someone who can tell new stories that will help people make sense of their lives under changing conditions. As institutions become increasingly horizontal rather than hierarchical, leaders must learn to motivate collaboration rather compliance.

LEADERS AS CREATIVE GATEKEEPERS

Quite often leaders achieve creative results not by being innovative themselves, but by recognizing and encouraging the innovations of others, thus acting as gatekeepers to innovation. Leaders who contribute to the creative process as gatekeepers must fulfill three major tasks. The first is to hire, nurture, and promote potentially creative members of their staff. The second is to stimulate novelty in the organization and recognize potentially valuable ideas. The third is to back the best ideas with resources until they become part of what the organization does. If any of these tasks is not fulfilled, an organization is unlikely to be creative, no matter how many original thinkers it employs.

Selecting and Retaining Creative People

People who are likely to be creative have the following traits: They know their domain very well; they are curious, passionate, and more interested in doing their job well than in career advancement or in pleasing the boss; and they have a record of originality in at least one domain. In addition to these positive traits, they also have some less desirable ones: Because of their single-minded drive they may

appear arrogant, self-centered, and stubborn. Combined with their tendency to take unorthodox perspectives, these traits make it difficult for a leader to recognize the value of such individuals and to utilize their skills. A leader needs patience and a delicate hand on the reins if he or she wants to attract and keep potentially creative employees.

Most organizations cannot use more than a few such people at any given time. Potentially creative individuals are eager for change and in routine positions will become easily bored or disruptive. On the other hand, if they are segregated into a separate think tank or research and development division, they may become irrelevant to the rest of the organization. It is not easy to recognize and hire original people; it is even more difficult to integrate them productively once they are onboard.

Recognizing and Rewarding the Most Useful Ideas

If a leader is able to attract original thinkers, they are likely to start producing novel ideas. It would be a mistake to expect, however, that the amount of creativity in an organization will be a direct function of the amount of novel ideas it produces. Generating new ideas is relatively easy; the difficult part is recognizing the good ones. This is where a leader's judgment becomes an integral part of the creative process. Many business firms have started training their employees to "think outside the box" with the hope of enhancing creativity; almost none have tackled the more difficult problem of how to select the most useful ideas among those proposed. After all, few organizations can adopt more than a few new ideas per year. If they are suddenly confronted with hundreds of suggestions, they need sound strategies for vetting the ideas in order not to waste brainpower or demoralize the staff.

Individuals who tend to generate new ideas are usually as interested in the solution of problems as they are in material rewards like pay and promotion. Allowing them to range freely and to contribute to communal projects is essential. At the same time, they are quick to detect when others use their work for their own aggrandizement. Therefore a leader who fails to give proper credit to innovative staff members is sure to lose them.

Adopting New Ideas

Recognizing and rewarding promising new ideas is useless unless a leader can bring the ideas to a productive conclusion. And a great deal of uncreative work is usually required to translate valuable new ideas into useful products and practices. Thomas A. Edison's aphorism that creativity consists in "one percent inspiration and 99 percent perspiration" reflects the fact that without a great deal of political preparation, benchwork, and trial-and-error, few good new ideas survive long enough to be remembered.

To make organizations more responsive to the requirements for creativity, new forms of leadership may be required. For instance, the thousands of hackers who contribute to Open System Software are able to produce new codes, evaluate the proposed changes, and adopt the best solutions into the operating system without reliance on formal management and leadership. Perhaps this example foreshadows the emergence of new organizational forms better adapted to an increasingly knowledge-based society.

CRISIS

Crisis situations present leaders with an unusually difficult collection of challenges. Leaders must simultaneously try to help maintain the positive outlook of those around them; assist people (often both workers and the public) in dealing with the emotional shock and trauma associated with the situation; maintain a high level of excellence in the cognitive processes of developing and maintaining an understanding of the situation, reasoning through and choosing among alternative courses of action, planning responses, and improvising based on available resources and routines; and direct the implementation of the chosen responses. Crises are by their nature highly stressful and demanding, both emotionally and physically, so such leadership challenges must be undertaken by people who are themselves under stress, and who are trying to organize, mobilize, and direct others who are under stress.

Part of the essence of a true crisis is that there can be no fully planned, practiced, and prepared response available—for if there is, the situation is not truly a crisis. Though a situation may be a severe and challenging emergency, the availability of a pre-planned response that can produce acceptable outcomes significantly changes the nature of the leadership challenge. Leadership in a true crisis requires an unusual degree of creative and improvisational cognitive work as well as the coordination of existing capabilities and the execution of available operational routines. Thus, leaders in true crises must help organize and direct a combination of intellectual, physical, and emotional work.

HIGH-STAKES SITUATIONS THAT ARE NOT CRISES

The word *crisis* is used in ordinary discussions to cover a very wide range of situations. In general, it is associated with urgent, high-stakes challenges in which the outcomes can vary widely (and are very negative at one end of the spectrum) and will depend on the actions taken by those involved. But in some high-stakes circumstances—a fire department dealing with a modest single-family house fire, for exam-

ple—there are available organizational routines and resources, plans, training, and accumulated experience that permit a reasonably orderly and structured response to the situation. While the fire may constitute a crisis for the family involved, it should not ordinarily be a crisis from the perspective of the fire department.

The leadership challenges of dealing with *routine high-stakes circumstances* and *routine emergencies* differ from those of dealing with *true crises*. Since the term *crisis* is often applied to both types of situations, we will describe the main leadership challenges associated with each type.

Routine High-Stakes Circumstances

Many organizations routinely deal with high-stakes situations and activities that, in spite of their importance and urgency, are *not* properly described as “crises.” Aircraft carrier flight decks, nuclear power plant control rooms, and airport control towers present circumstances where (a) stakes are high (“high stakes”); (b) the range of possible outcomes is wide (and at least one possible outcome is viewed as very negative) (“high variability”); and (c) outcomes are markedly affected by the quality of decision making and the execution of tasks and activities (“high contingency”). Leadership in such settings focuses on mobilizing and inspiring effort, coordination (often of quite complex routines and activities), command and control, the issuance of instructions, and the monitoring of performance. Generally the problem or challenge is well-defined and the approach has been carefully engineered (sometimes over a long period and guided by substantial empirical experience). Situations of this kind are often termed “technical” challenges.

Routine Emergencies

When in addition to high stakes, high variability, and high contingency, the circumstances also include a substantial unplanned or accidental element and a high degree of urgency, the situation is commonly termed an *emergency*. Many organizations deal routinely with emergency situations. Firefighters, police

officers, hospital emergency room employees, and rescue workers are all frequently called upon to address urgent, high-stakes challenges the general character of which can be foreseen, but the details of which are inherently unknowable in advance.

When a serviceable approach to a definable class of emergencies has evolved and organizations have been designed and adequately staffed, trained, and supplied to implement the general routine (customizing it to the specific incident in question), we can describe the situations thereby covered as “routine emergencies.” Part of the purpose of designing organizations with these capabilities is precisely to convert what might otherwise be more serious emergencies into routinely manageable situations.

The leadership challenge in organizations dealing with routine emergencies is similar to that in organizations dealing with planned high-stakes, high-variability, and high-contingency operations and circumstances. The additional features of urgency and of unplanned or accidental characteristics imply that the organization and its people and its leaders must have the capacity for rapid adaptation, combination, and customization of the existing routines. But this process of adaptation itself becomes a routine—one of the first things that the command team at a fire does is to conduct an assessment of the situation and then develop, from an available repertoire of existing approaches and routines, a plan (composed of a combination of known and practiced routines) that is specific to this particular fire. Thus, a well-practiced organization will be able to face its routine emergencies and manage them as technical challenges, requiring only modest specific adaptations to a given particular situation.

Effective leadership *prior to* such events requires the development of (or adoption of) well-designed routines, training for their operational deployment, and the provision and stockpiling of necessary resources. Effective leadership *during* such circumstances emphasizes mobilizing workers, operating an efficient detailed planning and adaptation process, issuing clear instructions and coordinating assigned activities, monitoring ongoing performance and progress, and reassessing the situation and adapting the approach as conditions change or if

expected progress is not being made (Carroll, Rudolph, and Hatakenaka 2002, 92).

The decision-making and response actions undertaken in routine emergency situations can be thought of as mainly of a form that has been described as “recognitional.” Decision making in recognitional responses is dominated by participants seeing patterns in the situation that are consistent with situations and events they have previously trained for, witnessed, and/or experienced. The identification of these patterns then calls forth patterned responses—actions that have been taught, trained, practiced, and/or utilized before and that have worked in similar situations. Leadership in routine emergency situations is thus largely the leadership of recognitional work.

The urgency and accidental or unplanned nature of the situation—together with the potential for a very bad outcome—will also generally imply that both the leadership and the activities will be conducted in an atmosphere of heightened stress. While planned high-stakes activities (like air traffic control) can involve high levels of chronic stress, routine emergencies often produce sudden increases in stress levels. Understanding how people will respond to stress—in particular, how high stress and/or sudden stress will affect their performance—is an important part of leadership in routine emergencies.

CHARACTERISTICS OF TRUE CRISES

True crisis situations lie beyond the boundaries of routine emergencies. Crises involve high stakes, high variability, high contingency, urgency, and unplanned or accidental or unforeseeable elements, in such a form or combination that the routine application of existing routines will not be adequate to produce effective or acceptable performances or outcomes. The essence of a crisis is thus that it requires a substantially greater degree of adaptation and improvisation to deal with an essentially new situation and, therefore, constitutes a significantly different challenge of leadership. True crisis situations invalidate the approach of simply activating existing routines or common and practiced combinations of routines.

Crises can transcend routine emergencies in a variety of ways. They can be of an unprecedented scale, to which existing routines cannot simply be adapted or scaled-up, but instead require major innovations in organizational structure or operations. In a well-prepared city in an earthquake zone, a modest earthquake should be a routine emergency; existing organizational routines, adapted to the specific location and nature of the damage sustained, should suffice as a response. But an unexpectedly massive earthquake, causing widespread damage on an unprecedented scale, might require the rapid integration and coordination of responses by a variety of different jurisdictions—including federal, state, county, and municipal agencies—and organizations of many different types, including law enforcement, public health, emergency services, and search and rescue from all sectors (government, nonprofit, and private). If such a response had not been extensively planned and practiced in advance, it would not constitute a routine that could simply be activated and deployed.

Alternatively, a crisis situation might arise because some aspect of the situation invalidates or interferes with the application of a previously developed and practiced routine, and therefore requires broader adaptation, redesign, and innovation. For example, if an earthquake destroyed a city's emergency operations center, the routine coordination and command and control that had been planned, developed, and practiced would not be available, and an improvised command and communications structure might have to be constructed on short notice and with little prior design.

Finally, a situation would be a crisis if it were a wholly novel circumstance—for instance, damage or the prospect of damage from a previously unknown source, significantly outside the reasonable expectations or past experience of those called upon to respond to it. A crisis of confidence in the government, economy, and currency of a country in transition from an authoritarian system to a democratic system might present so many features outside the experience of the participants that it would constitute a true crisis. The appearance of a new, damaging, and poorly understood biological agent, or the discovery

of widespread environmental damage from an industrial chemical previously thought to be benign might also constitute true crises.

Significant Novelty as the Central Challenge

Since crises lie beyond routinely manageable emergencies in one or several dimensions, a key feature of crisis situations is that they involve significant novelty for those involved in them—in scale, form of damage, source, or some other major element. People involved in crises are intrinsically operating outside their usual experience, preparation, and expectations. They cannot simply deploy existing routines; if those routines fit or were adequate to the situation, it would not be a crisis. Thus, the essence of crisis leadership is that—in addition to all of the aspects of leadership required in other high-stakes settings—it requires innovation and improvisation, often urgently. New approaches need to be formulated. Often elements of existing routines must be rapidly adapted and combined in new forms.

Novelty as a Cognitive Demand

In a routine emergency, the existence of deployable routines requires that leaders be able to recognize the situation, identify the relevant routines, and activate and execute them. By contrast, the cognitive challenge of crisis situations—recognizing the elements of novelty, creatively engaging them and improvising new approaches suited to them, and drawing on existing routines as appropriate—demands powers of abstraction, analogy, and imagination (Klein 1996, 50; Beach and Mitchell 1978).

The cognitive challenge of leadership in a true crisis goes beyond that of routine emergencies in at least six important ways: (1) recognizing the elements of novelty in the situation and assessing their significance; (2) reasoning about the implications of the situation and of the ways in which it departs from situations for which routines exist; (3) creating and examining new options; (4) improvising new responses and/or new combinations of existing responses; (5) foreseeing (to the extent possible) the likely results of implementing these newly conceived

The Recurrent Crisis

*In the extract below from his book *The Effective Executive*, Peter Drucker instructs managers in solving the problem of recurrent crises in an organization.*

The first task here is to identify the time-wasters which follow from lack of system or foresight. The symptom to look for is the recurrent "crisis," the crisis that comes back year after year. A crisis that recurs a second time is a crisis that must not occur again.

The annual inventory crisis belongs here. That with the computer we now can meet it even more "heroically" and at greater expense than we could in the past is hardly a great improvement.

A recurrent crisis should always have been foreseen. It can therefore either be prevented or reduced to a routine which clerks can manage. The definition of a "routine" is that it makes unskilled people without judgment capable of doing what it took near-genius to do before; for a routine puts down in systematic, step-by-step form what a very able man learned in surmounting yesterday's crisis.

The recurrent crisis is not confined to the lower levels of an organization. It afflicts everyone. For years, a fairly large company ran into one of these crises annually around the first of December. In a highly seasonal business, with the last quarter usually the year's low, fourth-quarter, sales and profits were not easily predictable. Every year, however, management made an earnings prediction when it issued its interim report at the end of the second quarter. Three months later, in the fourth quarter, there was tremendous scurrying and company wide emergency action to live up to top management's forecast. For three to five weeks, nobody in the management group got any work done. It took only one stroke of the pen to solve this crisis; instead of predicting a definite year-end figure, top management is now predicting results within a range. This fully satisfies directors, stockholders, and the financial community. And what used to be a crisis a few years ago, now is no longer even noticed in the company—yet fourth-quarter results are quite a bit better than they used to be, since executive time is no longer being wasted on making results fit the forecast.

options and combinations; and (6) choosing among newly created (and, therefore, imperfectly understood) alternatives.

Stress and Leadership Performance

The additional cognitive challenges associated with true crises are important because of an endemic feature of emergency and crisis situations: stress. All high-stakes, high-variability, and high-contingency activities involve elevated stress levels, and stress has

an important impact on the performance of both leaders and followers. But the impact of stress varies with the type of task that is being undertaken. Elevated stress tends in most people to reduce cognitive functions, especially higher-order cognitive functions (like creativity and abstract reasoning). By contrast—at least up to the point of moderate stress—additional stress can *improve* recognitional decision-making and response. (The ability of highly practiced athletes to make a "clutch play"—an especially difficult catch or a particularly powerful kick at a key moment—is an example.) Although at some point, additional stress tends to reduce both cognitive and recognitional performance, if it can be kept within moderate bounds, stress need not reduce the operational capacities of those engaged in recognitional responses and tasks, and may actually improve performance by getting participants to focus and to call forth greater effort, and by activating hormonal responses like the release of adrenaline (Klein 1996; Useem 1998, 60; Rudolph and Repenning 2002).

This difference in the nature of the work that needs to be done in routine emergencies and in true crises—and the different effects of stress on the performance of that work—have profound implications for the challenge of leadership in these two settings. Leaders operating in a routine emergency have a repertoire of available, planned responses and executable routines; they need to ensure that stress levels do not become dysfunctionally high, but they can rely on their trained and experienced personnel to be able to perform reasonably reliably and well in recognizing what needs to be done and being able to do it. By contrast, leaders in a true crisis face novel con-

ditions and circumstances. The crisis will elevate stress, which tends to reduce the cognitive abilities that are central to developing an understanding of the situation and of its novelties, to creating options for responses, and to choosing effectively among them. Precisely at the time when excellent cognitive function is especially crucial, stress makes it less likely that participants will notice the novelties that demand cognitive engagement, less likely that they will be able to accurately assess the situation and to create a range of alternatives, and less likely that they will choose effectively among them.

Stress-Related Cognitive Deficits

Many common deficits in cognitive processing are exacerbated by stress. Behavioral psychologists, organizational theorists, and economists, among others, have studied common errors of reasoning and perception and their prevalence under conditions of stress. Often referred to as “cognitive biases,” many different forms of errors have been identified and labeled. A general finding is that, for most individuals and groups, reasoning under elevated levels of stress leads to a narrowing of cognitive processes—a reduction in the range of possibilities and alternatives imagined or considered, a tendency to focus on a restricted range of elements or symptoms, causes or diagnoses, and options, responses, and actions. Common cognitive biases (frequent in many circumstances, but exacerbated by stress) include a tendency toward overconfidence, a tendency not to observe data or evidence contrary to the currently prevailing understanding of the situation (“ignoring disconfirming evidence”), a tendency to remain committed to the existing approach in the face of evidence that it is not working (“escalation of commitment”), and a tendency to personalize the situation and objectives or to behave as though the objectives had changed (“migration of objectives”). These tendencies can actually be helpful when a situation has been well-diagnosed and the response is well-adapted and the main challenge is to develop enough commitment and energy to execute what may be arduous actions to deal with the situation; these are, of course, the circumstances that tend to prevail in

routine emergencies. But in situations of true crisis these cognitive biases can be disastrous. At precisely the time when a *wider* range of alternatives needs to be imagined, stress acting on individuals and groups is likely to create cognitive *narrowing* instead. Crucial aspects of how this situation is different from those previously encountered may be missed; options that might provide improved responses may be overlooked; creative thought that could help achieve and maintain more comprehensive awareness of the situation and produce adaptive responses to it may be blocked.

Cultural Conflicts within Teams during Crises

Often teams assembled to address crisis situations will include a diverse collection of members with different skills and backgrounds. For example, the team responding to a natural disaster is likely to include high-ranking political officials as well as operational commanders of police, fire, rescue and emergency services, and other operating units (possibly from multiple jurisdictions). The salient novelties of the situation—the significant ways in which the situation at hand does not fit into patterns that have been seen and addressed in the past—are likely to be more apparent to some members of the team than to others. Operational commanders have generally been schooled in the importance of prompt action in situations involving dangerous conditions, and will often (and sometimes rightly) want authority to begin operational deployments immediately; their experience and training tell them that windows of opportunity will be open only briefly.

By contrast, others who are more focused on the important differences between the current situation and past circumstances may have exactly the opposite fear; they may want more time to understand the situation fully and to develop a wider range of options, and they may resist the impulse to deploy capabilities early for fear that doing so will foreclose potentially valuable options that will only come to be available later. Developing and communicating a comprehensive perspective on the situation, from which a coherent and well-designed set of options can be constructed and from which effective actions

can be selected, becomes an essential leadership challenge for effectively addressing a true crisis situation. Mediating conflicts between those with an inclination for immediate action and those who are inclined to more careful and longer consideration of options and consequences before actions are chosen is also commonly a significant leadership challenge in crises.

IMPLICATIONS FOR LEADERSHIP

In routine emergencies, leaders have access to a repertoire of capacities and executable operational routines that, with modest customization and adaptation, can provide an appropriate response to the situation. Both the leader and the other participants will have to operate under stress, but ideally their preparation, planning, training, and experience equip them to recognize their circumstances accurately and to deploy their practiced responses effectively. In true crises, leaders cannot have a previously planned, developed, tested, and deployable routine available to them that will adequately address the situation they face. By definition, they will have to improvise new approaches or combinations of existing routines. Much of this work is conceptual and cognitive in nature, and is therefore especially difficult to do—and to inspire others to do—in circumstances of elevated stress, like those likely to prevail in a crisis situation.

Leadership Challenges of Routine Emergencies

A leader's central challenges in a routine emergency will include the following:

1. assess the situation with accuracy;
2. promote effective customization and adaptation of existing routines to the specific circumstances of the given incident;
3. mobilize and inspire the efforts of the participants;
4. coordinate the potentially quite complex collection of customized, pre-planned responses;
5. organize and ensure support and a flow of requisite resources to those operationally engaged in the response;
6. communicate effectively to those participating and to others involved outside the responding organization(s) about the situation and what they should do.

Leadership Challenges of True Crises

The central leadership challenges of addressing true crises include the following:

1. accurately and quickly assessing the ways in which the current situation is significantly different from past circumstances;
2. resisting more comfortable (but inaccurate) diagnoses and assessments of the situation that ignore the significant elements of novelty;
3. mediating potential cultural conflicts among those with a bias for immediate action and those with an inclination to delay choices and deployments until a deeper understanding of the situation and analysis of the options can be developed;
4. developing and maintaining a “big picture” perspective of all the salient features of the situation (including its significant novelties);
5. communicating, both internally and externally, relevant and comprehensible understandings of the situation that allow others to understand and organize their work and efforts productively;
6. orchestrating creative imagining, design, and development of new approaches and/or new combinations of existing routines;
7. maintaining high quality in reasoning and choosing among new, untested, risky, and relatively poorly understood courses of action;
8. coordinating the rapid development of new plans and details of operational action for the chosen approach;
9. mobilizing and inspiring the required effort from the participants, including their attention to the cognitive work that is essential but that they will find difficult given their elevated stress levels;
10. overseeing the execution of newly designed (and, therefore, probably imperfectly functioning) actions and deployments; and
11. performing all these tasks while the leaders are themselves operating under elevated stress.

The volume and nature of adaptive work that must be rapidly undertaken by the leaders in a setting of high stakes, high uncertainty, and high stress make leadership in true crisis situations both profoundly difficult and profoundly important. Understanding the challenges presented by true crisis situations is the first important step toward being able to address them successfully.

CROMWELL, OLIVER (1599–1658)

British statesman and soldier

Oliver Cromwell is an important figure in the historical development of England and the United Kingdom. As a soldier, politician, and statesman Cromwell played a significant part in changing the constitutional power of the monarchy in the United Kingdom forever. He was born in 1599 into a strict Puritan family living in Huntingdon, England. He was educated at Sidney Sussex College Cambridge and became a member of Parliament for Huntingdon in 1628. As a military and political leader, his rise

from the middle ranks of English society was spectacular. Cromwell was a key person in the English Civil War (1642–1646), significantly influencing the strategic plans of those rebelling against the dictatorial rule of Charles I (1600–1649). Despite his lack of military experience, Cromwell became a captain in 1642 when the civil war began. He then swiftly rose through the military ranks. Early in 1643 he was promoted to colonel.

Throughout his life, Cromwell was driven by a deep-seated religious conviction arising from his Puritan beliefs. In the civil war he instilled in his soldiers a sense of higher purpose, a belief that, under his leadership, they were doing God's work. In 1645, Cromwell was made lieutenant general of the New Model Army and then became lord general of the army for the campaigns in Ireland (1649–1650) and Scotland (1650–1651). He brutally crushed uprisings in Wales (1647), Ireland (1649), and Scotland (1650). By 1653, Cromwell became the first non-royal Lord Protector of the Commonwealth of England, Scotland, and Ireland. He died in 1658 having taken a leading role in the trial and subsequent execution of Charles I in 1649. Within two years of his death, however, the Protectorate crumbled and the monarchy was restored in the person of Charles II (1630–1685). In 1661 the new king had Cromwell's corpse exhumed and dangled from a gallows at Tyburn.

CROMWELL THE MILITARY LEADER

Like many English monarchs before him, King Charles I believed that the king's power and authority was "God-given" and thus unassailable (the "Divine Right of Kings"). Charles's concern to crush any challenge to his "divine" authority brought him into conflict with the English Puritans. His persecution of the Puritans (he had their ears cut off and their noses slit) led to a clash with Parliament, culminating in the English Civil War that began in 1642. The Puritans, known as the "Roundheads," led the civil war against the king and his troops, known as the "Cavaliers." Throughout his life Cromwell held radical puritanical views that brought him into direct conflict with the king.

During its early stages, the civil war did not go well for the Roundheads. In the Battle of Edge Hill, in 1642, they were defeated by the Cavalier army. Cromwell was quick to see the weaknesses of the Roundhead army and, although he had not been trained in warfare, he made himself captain of the cavalry and began to organize his troops. Cromwell proved to be an inspirational leader. His leadership skills were clearly demonstrated when, in 1644, his New Model Army routed Cavalier forces at the Battle of Marston Moor and his regiment earned the name "Ironsides." Their reputation as a fighting force grew. Although in many battles they were greatly outnumbered, sometimes three to one, Cromwell's regiment was never beaten. Cromwell took part in five of the ten major battles of the English Civil War. In June 1645, at Naseby in Northampton, his New Model Army crushed the opposing forces. Within a year of this defeat, the Royalist cause was finished and Charles I surrendered to the Scots, who turned the king over to Parliament. By 1646 Parliament ruled England.

A crucial strength in Cromwell's military leadership style was his ability to inspire in his soldiers a deep-seated belief in the righteousness of their cause and to convince them to share in his own conviction that God was with them in battle and guiding their quest for victory. He created the only body of hand-picked Puritan troops. Under Cromwell's leadership, discipline was of paramount importance. In an age when armies usually consisted of soldiers, mercenaries, and lawless men who indulged in every conceivable vice, Cromwell's Ironsides prayed, paid fines for drunkenness and profanity, and went into battle singing hymns. As a leader, Cromwell demonstrated care and respect for his men. In contrast with other commanders, he became personally involved in ensuring that his troops were well fed and regularly paid—a difficult achievement during military campaigns. Cromwell created a civilian support structure and organization designed to ensure the flow of money and supplies to his troops.

Despite his great success as a military leader during the civil war, any discussion of Cromwell's leadership in battle must also acknowledge the controversial conquest of Ireland. His actions in this

campaign have been widely recognized as extremely brutal. From the outset, Cromwell's orders were clear. He was to put Ireland under English control and then, in order to ensure the continuation of this control, he was to supervise the confiscation of lands belonging to all "rebels." In the summer of 1649, he successfully stormed the town of Drogheda. During this battle, approximately twenty-five hundred soldiers were killed. To demonstrate the consequences of resistance, Cromwell had all the surviving officers, all Catholic priests and friars, and every tenth common soldier killed, some clubbed to death. These ruthless tactics went further at Wexford, in Ireland, where Cromwell oversaw what historians have described as a massacre. These actions spread terror throughout Ireland and, as a consequence, most towns surrendered on his approach.

Once again Cromwell's religious belief that he was doing "God's work" provided him with justification for his actions, as this statement after the storming of Drogheda demonstrates: "This is the righteous judgement of God upon these" (Partington 1996). After such a ruthless conquest, Cromwell's actions following the surrender of each town were equally surprising for the times. Upon surrender, Cromwell scrupulously observed all surrender articles and also spared the lives of the civilians and soldiers. This conquest of Ireland resulted in almost 40 percent of Irish land being redistributed from Catholics born in Ireland to Protestants born in Britain. The repercussions of this action for the Irish people can still be seen today.

Cromwell's strength as a military leader was that he could think beyond established structures and cultures within the army. In an age in which the majority of soldiers were viewed as little more than rabble brought together through necessity for fighting, Cromwell handpicked his soldiers, treated them with respect, and turned fighting into a holy mission.

CROMWELL THE MEMBER OF PARLIAMENT

From 1640, Cromwell was an active member of Parliament. He was vocal and had a high profile whenever he took his seat, between military campaigns. He served in the Short Parliament (April 1640) and

the Long Parliament (August 1640 through 1660). In the first months of the Long Parliament, he made clear his views on the need for "root and branch" reform of the church and was the first person to call for the outright abolition of bishops. The Triennial Act of 1641, which ensured the summoning of Parliament every three years, was a serious challenge to royal prerogative. Prior to this, only the king had the power to summon Parliament. Later in 1641 another Act of Parliament made the Court of the Star Chamber and the Court of High Commission illegal. In 1642 episcopacy was abolished, virtually stripping Charles of the last remnants of royal prerogative. The army and the navy were also placed directly under the control of Parliament. After a thwarted attempt by Charles to regain control by entering Parliament to arrest those whom he saw as the ringleaders, Charles left London and traveled north to recruit an army. Isolated battles escalated into civil war. At this time, Cromwell was one of the members of Parliament sent to the provinces to raise troops to fight the Royalist forces.

By 1644, Cromwell was disillusioned with the leadership of the parliamentary generals. He wanted to see the promotion of "lowborn" men who, like himself, held radical religious views which informed their passion for victory in battle. As he wrote in a letter to Sir William Spring in September 1643, "I had rather have a plain russet-coated captain that knows what he fights for, and loves what he knows, than that which you call a gentleman and is nothing else" (Partington 1996). He viewed the "gentlemen" supported by the generals as more interested in negotiating peace through compromise. In the winter of 1644–1645 he returned to Parliament to challenge the leadership for its half-heartedness and elitism.

When Parliament took power in 1646, various factions emerged within English society. Representatives of these factions in Parliament, which included the remaining Cavaliers and religious and political radicals, argued about the way forward for the country. As a result of this conflict, the army took control by forcibly removing 110 members of Parliament. Another 160 members refused to take their seats as an act of resistance to the action. The remaining mem-

The Triennial Act of 1641

The Triennial Act of 1641, passed while Oliver Cromwell was a leader in Parliament, is significant because it mandated when Parliament would meet, rather than leaving it to royal prerogative. The following is an excerpt from the text of the act.

An act for the preventing of inconveniences happening by the long intermission of parliaments. Whereas by the laws and statutes of this realm the parliament ought to be holden at least once every year for the redress of grievances, but the appointment of the time and place for the holding thereof hath always belonged, as it ought, to his majesty and his royal progenitors; and whereas it is by experience found that the not holding of parliaments accordingly hath produced sundry and great mischiefs and inconveniences to the king's majesty, the church, and commonwealth: for the prevention of the like mischiefs and inconveniences in time to come, be it enacted by the king's most excellent majesty, with the consent of the lords spiritual and temporal and the commons in this present parliament assembled, that the said laws and statutes be from henceforth duly kept and observed. And your majesty's loyal and obedient subjects, in this present parliament now assembled, do humbly pray that it be enacted, and be it enacted accordingly by the authority of this present parliament, that, in case there be not a parliament summoned by writ under the great seal of England and assembled and held before the 10th day of September which shall be in the third year next after the last day of the last meeting and sitting in this present parliament . . . —and so from time to time and in all times hereafter, if there shall not be a parliament assembled and held before the 10th day of September which shall be in the third year next after the last day of the last meeting and sitting in parliament before that time assembled and held . . . —that then . . . the parliament shall assemble and be held in the usual place at Westminster in such manner and by such means only as is hereafter in this present act declared and enacted, and not otherwise, on the second Monday which shall be in the month of November then next ensuing. And in case this present parliament now assembled and held, or any other parliament which shall at any time hereafter be assembled and held . . . shall be prorogued or adjourned . . . until the 10th day of September which shall be in the third year next after the last day of the last meeting and sitting in parliament . . . , that then . . . every such parliament so prorogued or adjourned . . . shall from the said 10th day of September be

thenceforth clearly and absolutely dissolved, and the lord chancellor of England, the lord keeper of the great seal of England, and every commissioner and commissioners for the keeping of the great seal of England, for the time being, shall within six days after the said 10th day of September, in every such third year as aforesaid, in due form of law and without any further warrant or direction from his majesty, his heirs, or successors, seal, issue forth, and send abroad several and respective writs to the several and respective peers of this realm, commanding every such peer that he personally be at the parliament to be held at Westminster on the second Monday which shall be in November next following the said 10th day of September . . . ; and shall also seal and issue forth . . . several and respective writs to the several and respective sheriffs of the several and respective counties, cities, and boroughs of England and Wales . . . , and to all and every other officers and persons to whom writs have used to be directed, for the electing of the knights, citizens, barons, and burgesses of and for the said counties, cities, Cinque Ports, and boroughs of England and Wales respectively, in the accustomed form, to appear and serve in parliament to be held at Westminster on the said second Monday, which shall be in November aforesaid; which said peers, after the said writs received, and which said knights, citizens, barons, and burgesses chosen by virtue of the said writs, shall then and there appear and serve in parliament accordingly. And the said lord chancellor, lord keeper, commissioner and commissioners aforesaid, shall respectively take a solemn oath upon the Holy Evangelists for the due issuing of writs according to the tenor of this act [. . .]

And it is lastly provided and enacted, that his majesty's royal assent to this bill shall not thereby determine this present session of parliament, and that all statutes and acts of parliament which are to have continuance unto the end of this present session shall be of full force after his majesty's assent, until this present session be fully ended and determined. And if this present session shall determine by dissolution of this present parliament, then all the acts and statutes aforesaid shall be continued until the end of the first session of the next parliament.

bers, known as “the Rump,” set about an agenda of social change. The Rump, however, followed the pattern of previous Parliaments and became rigidly self-interested.

As always, Cromwell's religious convictions directed his actions. In his capacity as lord general, Cromwell concluded that the Rump Parliament had lost credibility and that its members were not fit to

lead the country. In 1653, Cromwell disbanded the Rump Parliament in what he considered the most appropriate way, which was at the point of a sword and with these words: “You have been sat too long here for any good you have been doing. Depart, I say, and let us have done with you. In the name of God, GO!” (Partington 1996).

In the search for a worthy group to sit as members of Parliament, Cromwell chose what he considered to be the 140 “godliest men” and gave them the task of creating a constitution underpinned by the values of the gospel. But again the Parliament could not meet Cromwell’s expectations and power was returned to Cromwell’s hands. On 16 December 1653, Oliver Cromwell formally accepted the title of Lord Protector of the Commonwealth of England, Scotland, and Ireland: “Thus was the transition complete of Oliver Cromwell, by birth a gentleman, through the dour ranks of the Army to Lord General and so to Oliver Protector” (Fraser 1993).

CROMWELL’S LEGACY

Cromwell’s legacy was both positive and negative. On the one hand, he established the principle of the accountability of rulers to the people that has informed the democratic principles that shape current practices in many Western societies today. On the other hand, his reign left the English suspicious of religious extremism and with an aversion to soldiers’ involvement in politics. His campaign in Ireland escalated the long-term instability of the country and created a land where the Catholic people were oppressed by an English Protestant elite.

Cromwell’s leadership style, based on strict religious principles, appeared simple, but on closer inspection it was quite complex and contradictory. As a leader of soldiers he established his authority through strict discipline. He created an army of soldiers who subscribed to his own radical Protestant religious beliefs. They were a group with a common cause who would follow his orders, no matter how extreme (as in Ireland), in the belief that they were doing God’s work. As a member of Parliament, however, he did not blindly follow the objectives of the political radicals who wanted to eliminate monarchy

and promote a major redistribution of wealth and social and economic power.

Initially, Cromwell’s intent was not to eliminate monarchy. Indeed, in 1652 and 1653 he discussed with colleagues the possible restoration of the House of Stuart. After defeating Charles I, Cromwell had trusted what he perceived as the king’s willingness to agree to his key proposals, but in 1648 Charles I entered into an alliance with the Scots and called on Royalists and Parliamentarians to rise up against the new regime. Following this betrayal, Cromwell was adamant that the king must be executed.

In contrast to his own rigid Puritan persuasion, Cromwell’s views on the religious life of the country could be considered liberal. Contrary to what might have been expected, his approach to religious preferences was to allow people to practice their beliefs without being disturbed or disturbing others. Although a strict Puritan, Cromwell did not support the Puritan radicals who wanted religious freedoms curtailed. Under his reign as lord protector, Cromwell believed in what he referred to as “liberty of conscience,” which allowed considerable freedom for a range of different religious groups and faiths. Catholics, Quakers, and Jews were allowed to follow their conscience and worship privately. His main objective was to make England a truly Christian nation. Cromwell also championed the expansion of access to education. Previously membership in the state church was a qualification for entry to universities, the professions, and any public office. This qualification was abandoned during the period 1649 to 1660, only to be reinstated following the return of the monarchy.

Clearly Cromwell could be considered a charismatic leader. In appearance he is often described as a very plain man, and much is made of his having warts on his face. Indeed, his death mask, which is on display in Warwick Castle (near Stratford-upon-Avon in England), confirms this. In a time when monarchs and leaders used portraits as a way of disguising flaws and presenting themselves to the people as powerful and glamorous, Cromwell despised this practice. When sitting for portraits, he demanded that his true likeness be painted and that nothing be disguised. To one portrait painter he stated, “Mr. Lely, I desire you would use all your skill to paint

your picture truly like me, and not flatter me at all; but remark all these roughness, pimples, warts, and everything as you see me; otherwise I will never pay a farthing for it” (Partington 1996).

For all his plain appearance and dress, Cromwell earned the respect and loyalty not only of his soldiers but also of intellectuals such as John Milton (his personal secretary, who wrote the epic poem *Paradise Lost*) and John Bunyan (the author of the popular prose allegory *Pilgrim’s Progress*, who served under his command). As was demonstrated after his death, however, character and charisma cannot automatically be transferred to the next generation. After Cromwell’s death in 1658 his son and successor, Richard, found it impossible to halt the disintegration of the coalition of interests which had been held together primarily by his father’s force of conviction and leadership skills. In 1660 the monarchy was restored and Charles II returned from France to take the throne. Yet, although the English monarchy was reinstated, it would never again exercise the kind of power and authority that it had enjoyed before the English Civil War.

CROSS-CULTURAL LEADERSHIP

Technological advances in communications and transportation have dramatically increased cross-

cultural interactions in all types of organizations. Scholarly and popular press attention to cross-cultural leadership in organizations has also risen dramatically in recent decades. For example, the discussion of cross-cultural leadership in the three editions of widely acclaimed *Bass and Stogdill’s Handbook of Leadership* rose from one page (1974) to fourteen pages (1981) to a full forty-page chapter (1990). Popular publications such as the *Wall Street Journal*, *Business Week*, *Forbes*, *Fortune*, and the *New York Times*, and their international counterparts regularly recount the increasing need for cross-cultural leadership. Many consulting firms now offer to deliver or develop leader-competency models to help organizations identify, prepare, and develop leaders for cross-cultural interactions and responsibilities.

Collectively, this rush of attention has increased our knowledge of cross-cultural leadership. Yet this same frenetic attention, characterized by different perspectives and approaches, has also introduced considerable confusion in terminology and consequently in understanding. For example, is cross-cultural leadership different from global leadership, international leadership, or transnational leadership? Is an expatriate leader (a leader working in a country other than their home country) a cross-cultural leader? Does a person have to be managing across multiple countries simultaneously to be a cross-cultural leader? How do we know what we know about cross-cultural leadership? Are there leadership behaviors that are effective in all cultures or is effective leadership manifested differently in each culture? By answering these questions we begin to define the parameters of cross-cultural leadership and the current state of theory and practice.

WHAT IS LEADERSHIP? WHAT IS CULTURE?

It has been said that there are as many definitions of leadership as there are individuals studying leadership. Though there is no agreed-on definition of leadership, two themes consistently emerge. First, leaders influence the behavior of others. Second, this influence is intentional and directed toward some desired objective such as developing a new product, achieving a sales goal, building a home for orphans,

Cross-Cultural Confusion and Leadership Failure

One of the major hurdles in any cross-cultural leadership situation is for the members of each cultural group to develop a full understanding of what leadership means to the other group. The following description of British attempts to appoint effective local leaders from the Tiv ethnic group during the period of British colonial rule in Nigeria indicates just how difficult a hurdle this can be.

The white man demanded the election of clan chiefs, or "district heads," as they were called after the pattern of the northern emirates, and chiefs were elected. It was quite in accordance with precedent that the elders should appoint a younger man of no especial standing to carry out the administrative duties required by the white man, and not one of the men who wielded the real authority, that is to say, a senior elder, who was master of the Poor and other great *akombo*, and had all the power of supernatural sanction behind him. This fundamental difference in conception of the nature of chieftainship caused much misunderstanding between the Tiv and the British Administration. The men who were put forward by the elders to be the 'white man's chief' (*tor u Butel*) often were not backed by the consent even of their own group, far less of the clan over which they were supposed to rule. In consequence, they either completely failed to fulfil the function for which they were appointed by the Administration, being mere

puppets in the hands of their seniors, as indeed the latter intended them to be, or else they used the power given them by us for their own ends, and defied the authority of their natural leaders, bringing down much odium upon themselves and the new régime. As Downes says, "We cannot escape our share of the responsibility for the position as it exists now, and it is, to a large extent, our fault that the Tiv authorities have remained in the background. We have seen that many of the real authorities are not capable of carrying out the duties of village head, supervising the census, collecting the taxes in the way we would like to see it done. We have not liked their arrogant claims to supernatural powers and we have ignored them, and they, not understanding, have preferred to be ignored and have elected a man of no importance to be the '*or koghor kpandegh*' (tax collector) and to take the kicks of a District Head who, in many cases, they consider to be inferior to them in position.

or raising student exam scores. Dean Keith Simonton of the University of California at Berkeley, in his seminal work *Greatness: Who Makes History and Why*, defined *leadership in general* as "that group member whose influence on group attitudes, performance, or decision making greatly exceeds that of the average member of the group" (Simonton 1994, 17). The Global Leadership and Organizational Behavior Effectiveness (GLOBE) international research project defined effective *organizational leadership* as "the ability of an individual to influence, motivate, and enable others to contribute toward the effectiveness and success of the organizations of which they are members" (House et al. 1997, 184). Another definition of [global] organizational leadership states that "leadership involves people in business settings whose job or role is to influence the thoughts and actions of others to achieve some finite set of business goals...usually displayed in large,

multicultural contexts; that is, not just from one nation's perspective" (Gessner & Arnold 1999, xv).

As in the case of leadership, there is no agreed-upon definition of culture. At a broad pragmatic level, culture is defined by social scientists as a set of characteristics or descriptors that differentiate groups in a consistently identifiable and meaningful way (e.g., Hispanic, French, Hindu, Republican, Southern, Generation X). Prominent social psychologists Florence Kluckhohn and Fred Strodtbeck described culture as a patterned way of thinking, feeling, and reacting, acquired and transmitted mainly by symbols, and constituting the distinctive achievements of human groups, including their embodiments in artifacts. The prominent organizational scholar Geert Hofstede defined culture as the collective programming of the mind that distinguishes one human group from another. Yet another scholarly definition is offered by anthropologist Clifford Geertz, who

defined culture as a historically transmitted pattern of meanings embodied in symbols, a system of inherited conceptions expressed in symbolic forms by means of which men communicate, perpetuate, and develop their knowledge about and attitudes toward life. Common to these definitions is the notion that culture involves shared knowledge and meaning systems among its members.

WHAT IS CROSS-CULTURAL LEADERSHIP?

Since there is no consensual agreement on the terms leadership or culture, it would seem impossible to define the term *cross-cultural leadership*. Yet, as discussed earlier, definitions of culture and leadership each share common themes. To the terms *leadership* and *culture*, we now add *cross*. The “cross” in “cross-cultural leadership” refers to the leader’s (the influencer) culture being different from the follower’s (influence target) culture. By combining the thematic definitions of “leadership” and “culture” with the qualifier “cross,” we define cross-cultural leadership as “the ability of an individual (the leader) to intentionally and unequally influence and motivate members of a culturally different group toward the achievement of a valued outcome by appealing to the shared knowledge and meaning systems of that culturally different group.” In reviewing this definition, it becomes clear that what separates cross-cultural leadership from simple leadership are the words “culturally different.” What separates simple leadership from cross-cultural leadership is the need for leaders to consider the implications of the differences in the knowledge and meaning systems of their followers and to incorporate these differences into the influence process.

This definition provides a foundation for answering several of the questions posed in the introduction. Is an expatriate leader always a cross-cultural leader? The answer is yes only if there are significant differences in the knowledge and meaning systems of the leader and the followers. Does a person have to be managing across multiple countries to be a cross-cultural leader? The definition suggests that working across multiple countries is not required. In fact, some countries may be characterized by extensive within-country regional cultural differences. An

example of this would be the substantial ethnic and cultural differences between the states of the former Soviet Union or the significant religious differences across groups in some Middle Eastern countries.

It must be acknowledged that some scholars will object to including within-border leadership as cross-cultural leadership. For example, Hollenbeck (2001) has argued that the key distinction between traditional international managers and the current transnationally competent managers is the cross-border nature of the tasks and skills. Adler and Bartholomew (1992) have defined the “global leader” as an executive who executes global strategies across, rather than within, borders of time and geography, nation, function, and product. Yet another author defines world-class executives as “cosmopolitans” not based on where they go but on their mindsets being attuned to world-class concepts, competencies, and connections. These differences in terminology (cosmopolitan, global leader, international leader, and transnational leader) are characteristic of a relatively new academic area of study such as cross-cultural leadership.

These differences in scholarly opinion may also be traced to differences in the interests of researchers and commentators. Strategists tend to be interested in the tasks to be done, the accountabilities accepted, and the results anticipated. Human resources scholars tend to be interested in determining the knowledge, skills, abilities, and attitudes required to accomplish the tasks, meet the accountabilities, and produce the expected results. The definition of cross-cultural leadership provided here encompasses both perspectives by recognizing that cross-cultural leadership can occur within a single set of borders and that management across multiple borders (i.e., global leadership and transnational leadership) may not be sufficient to classify as cross-cultural leadership. For example, a Korean leader based in New York managing a group of Korean employees in Seoul and a group of Korean employees in Bangkok may not be engaging in cross-cultural leadership because the leader and the led are separated by physical space and not by cognitive space.

The definition of cross-cultural leadership provided here offers an approach to, rather than a definitive rule for, identifying cross-cultural leadership.

For example, someone might argue that a United States Southerner leading a group of from the northern United States would be exercising cross-cultural leadership because of regional differences in attitudes, values, or intra-state regulatory systems. What is missing from such an argument is that the shared meanings and knowledge systems are more common across U.S. regions than different. The situation where meaningful differences exist but are smaller than the shared meaning and knowledge systems is more appropriately referred to as leadership of cultural diversity.

The inability to develop an easily applied and inviolate rule to identify cross-cultural differences may be why so many scholars, especially organizational scholars, have relied on national boundaries as proxies for cultural differences. National boundaries are easily identifiable, have identifiable differences in legislative laws and processes, and are often formed along cultural differences in the citizenry. But as the Soviet example introduced earlier illustrates, these boundaries are often inexact. Imagine someone who was “just a leader” in the former Soviet states awakening to find that he or she is now regarded as a cross-cultural leader simply because the political boundaries have been redrawn such that Bosnia, Serbia, and Croatia are politically separate nations. With no change in the followers (targets of influence), it would be difficult to argue convincingly that the mere redrawing of political boundaries is the dominant factor impacting attempts to exert influence. The more appropriate conclusion is that the person was a cross-cultural leader (managing multiple mindsets) both before and following the redrawing of political boundaries. While the redrawing of national boundaries is consequential to the work group, the change is more appropriately characterized as a change to the task environment (problems and opportunities faced by the group) than it is a new cross-cultural leadership (influencing targets with a different worldview) challenge.

HOW WE KNOW WHAT WE KNOW

Studies of cross-cultural leadership have followed two basic approaches. One approach, called the emic

approach, seeks to investigate one culture at a time to determine those leadership behaviors that appear to be linked to the effective attainment of group goals. For example, a study investigating leadership behavior in Austria might associate follower evaluations of leadership effectiveness with objective group outcomes such as higher profits, higher student examination scores, or the attainment of fund-raising objectives. Conclusions would then be reached about how a leader should behave to be effective in Austria.

The second approach, called the etic approach, seeks to investigate multiple cultures simultaneously to determine those leadership behaviors that appear to be linked to the effective attainment of group goals across most of them. For example, a study might attempt to determine if a leader lavishing praise on followers is positively linked to group outcomes in most cultures or if the public scolding of employees is negatively linked with leader effectiveness in most cultures. Conclusions would then be reached about how leaders should behave to be effective in most cultures. Etic studies often demonstrate differences. For example, it has shown that talking critically about an employee to that employee’s peers when the employee is not present is considered to be undesirable in the United States (because of a value for open communication) and is considered to be desirable in Japan (because the employee “saves face” by not receiving the criticism directly). A series of emic studies can be used to make etic-like comparisons across cultures, but these comparisons are often less reliable than simple etic studies.

The obvious benefits of an emic (single culture often operationalized as single country) perspective are that it is more likely to reveal what leadership behaviors should be exhibited locally. Emic studies often provide very fine details about a culture that could be overlooked when designing a study to measure attributes across a number of cultures. The advantage of the etic approach (multiple cultures) is that it provides leaders who must migrate through multiple cultures, often in rapid succession, with information about which behaviors are likely to be well received in most cultures and which ones will typically have a negative impact. Though scholars disagree on whether the best approach is to deduce

similarities and differences from etic studies or to induct similarities and differences from emic studies, the literature on cross-cultural leadership has been enhanced by both approaches. Greater confidence in what to do may be warranted when the conclusions of emic studies and etic studies agree.

The touchstone for most attempts to conduct cross-cultural leadership research has been the pioneering work of organizational scholar Geert Hofstede. Hofstede proposed the following four dimensions (actually continuums) of culture that can be used to explain similarities and differences in leader behaviors and follower reactions: (1) High Power Distance–Low Power Distance: The degree to which members of a society expect power to be shared equally; (2) High Uncertainty Avoidance–Low Uncertainty Avoidance: The degree to which members of a society feel uncomfortable in unstructured, ambiguous, and uncertain situations, and create beliefs and institutions intended to minimize the occurrence of such situations; (3) Individualism–Collectivism: The degree to which individuals function independently of one another or are integrated into groups; and (4) Masculinity–Femininity: The degree to which cultures look favorably on assertiveness, aggressiveness, and the striving for personal success, or to which they stress supportive behavior, nurturance, and service.

FINDINGS FROM RESEARCH ON CROSS-CULTURAL LEADERSHIP

The final question posed in the introduction was whether some leadership behaviors are effective in all cultures or whether leadership is manifested differently in each culture. The answers to this two-part question are yes and yes. Research has identified several leadership behaviors that are associated positively or negatively with effectiveness across most cultures (universals). Research has also identified some leader behaviors and attributes which are culturally dependent (contingencies). Representative findings of both categories are discussed in brief below, and details and additional findings can be found in comprehensive reviews of the leadership literature.

Bernard M. Bass, author of the *Handbook of Leadership*, provides a number of assertions based on cross-cultural research of the transformational/transactional leadership paradigm. First, transformational leaders are those who provide inspiration in the form of an enticing vision, give individualized consideration to followers, and intellectually stimulate followers to perceive problems in new ways and are more likely to induce followers to transcend their own interests to achieve a higher cause. Second, transactional leaders are those who clarify work expectations, provide rewards contingent on specific outcomes, and closely monitor employee behavior and are more likely to produce followers motivated primarily by self-interest. Bass explains that there is a consistent relationship between leadership style and various outcome measures (effectiveness, subordinate satisfaction, and subordinate effort).

According to Bass, transformational leaders appear to be more effective than leaders who rely on contingent reward, leaders practicing active management by exception, and leaders practicing laissez-faire management. The latter, laissez-faire management, includes frequently avoiding responsibilities and shirking duties. The findings for laissez-faire management are etic in nature, with negative associations to leadership effectiveness across all cultures. Bass also states another etic conclusion, that across cultures transformational leadership augments transactional leadership in predicting important outcomes. He believes that this relationship pattern is consistent across cultures because prototypes (conceptions of model leaders) for leadership across cultures are generally transformational rather than transactional. Such findings are characteristic of the universal view of cross-cultural leadership.

Contingencies

Research has shown that sensitivity to norms was a more critical component of leader behavior in Mexico and Iran than in the United States. Managers who maintained a distance from their employees used rules and procedures more than managers who valued a closer relationship, and managers who placed a high value on interpersonal trust preferred partici-

participative and democratic leadership while leaders in countries low in trust preferred a more authoritarian style. There is substantial evidence for a correlation between a leader's consideration of followers and subordinate satisfaction, although the results of these studies are inconsistent.

Transformational leadership behavior had more dramatic effects in the People's Republic of China and Taiwan than did transactional leadership. Providing an appropriate model and demonstrating high performance expectations significantly influenced the attitudes of Chinese employees, while leader-individualized support and fostering collaboration significantly influenced the job attitudes of Taiwanese employees. Similar differences were found for leader-contingent rewards. While several aspects of leadership were universally endorsed (i.e., charismatic and values-based leadership), researchers have found that collective value orientations are positively related to team-oriented leadership endorsement, and that the distance of a leader from a follower is negatively related to participative leadership endorsement. Such findings are characteristic of the contingent view of cross-cultural leadership.

IMPLICATIONS

Terms such as "global leader," "transnational leader," "international leader," and "expatriate leader" have served as a point of departure for discussing issues related to cross-cultural leadership. This lack of precision in terminology can be traced to the lack of consensus regarding the terms "leadership" and "culture." By laying semantics aside and focusing on cross-cultural leadership thematically, it can be seen that the challenge of cross-cultural leadership for leaders is to motivate members of a culturally different group toward the achievement of a valued outcome by appealing to the shared knowledge and meaning systems used by a culturally different group.

A great deal of progress has been made in recent decades toward understanding cross-cultural leadership. The increasing rate of globalization will undoubtedly continue to accelerate calls for more research on cross-cultural leadership (see Lowe and

Gardner 2000). While a comprehensive understanding of the relationship between leadership and culture is a distant vision, an understanding of the etic or universal findings can be expected to become more multifaceted and pragmatic over time.

—Kevin B. Lowe

CUBAN MISSILE CRISIS

The Cuban Missile Crisis of 1962, an intense nuclear face-off between the United States and the Soviet Union concerning the Soviet build-up of medium-range missiles in Cuba, marked the height of the Cold War era and a point when the world was brought to the brink of a nuclear war. The way U.S. President John F. Kennedy and his staff handled the crisis is still controversial. On the one hand, President Kennedy was praised not only for having helped avoid such a war, but also for having provided one of the best models for the exercise of national leadership and decision making in times of crisis. On the other hand, recent scholarship ascribes Kennedy's foreign policy success to good luck. Nevertheless, Kennedy's leadership in this foreign affairs crisis undeniably was successful.

PRELUDE TO THE CRISIS

The Soviet Union installed missiles in Cuba to buttress Soviet political clout in world affairs at a time when the balance of power seemed to tip in favor of the United States. A growing "missile gap" between the two superpower competitors had existed as the United States surpassed the U.S.S.R. in the development and production of intercontinental ballistic missiles (ICBMs): The farthest that Soviet missiles could reach was Europe, but U.S. missiles could

reach Soviet territory. Thus, the Soviet Union redressed the imbalance by deciding to deploy medium-range missiles in proximity to U.S. territory. The United States had already based missiles in Turkey against the Soviet Union following this logic, and thus the counterdeployment of missiles seemed justifiable to the Soviet Union. Soviet Premier Nikita Khrushchev thought that although this counterdeployment would initially cause much commotion, Kennedy, whom Khrushchev viewed as being young and inexperienced as the result of Kennedy's earlier failure in the 1961 Bay of Pigs incident, would eventually get used to the idea of having missiles situated near U.S. territory. The strategic balance would shift, benefiting the Soviets.

Khrushchev developed the idea of deploying missiles in Cuba in May 1962. Subsequently, the Soviet Union began clandestinely shipping missiles to Cuba and installing them. In July 1962 the first Soviet ship, loaded with nuclear missiles and troops, set sail for Cuba. An agreement on military and industrial assistance was signed on 2 September 1962, between Khrushchev and Cuban leader Fidel Castro, who wanted the missiles to strengthen Cuba's posture of defense against the United States. Ever since the Bay of Pigs incident, in which the United States had tried to invade Cuba, Castro had been wary of a second invasion and had been looking for a way to defend Cuba from U.S. forces.

The Soviet Union and Cuba had planned to keep the agreement secret until the nuclear missiles were installed. However, on 4 September 1962, the U.S. government began to receive intelligence information indicating that the Soviet Union was shipping missiles to Cuba and constructing missile sites. President Kennedy sent two public communications to Moscow on 4 and 13 September 1962, warning against any offensive weapons the Soviet Union might introduce. Yet, prior to the discovery of the missiles, Kennedy had rebuffed all claims that the Soviets were bringing missiles into Cuba and had reassured the U.S. public that such missiles did not exist. Moscow, in response to Kennedy, stated that the missiles being shipped to Cuba were defensive in nature and were no threat to the United States.

CONSIDERED COURSES OF ACTION

The U.S. Central Intelligence Agency's (CIA) discovery and confirmation of Soviet missile sites in Cuba on 15 October 1962, escalated the mounting tensions into a full-fledged crisis. Contrary to the Soviet Union's public explanation, U.S. U-2 surveillance photographs had spotted sites for SS-4 medium-range missiles a mere 90 miles from the U.S. mainland. The launch pads at the sites were capable of firing ballistic missiles up to a thousand miles, which meant that the deployment was an offensive one. This information was reported to U.S. National Security Adviser McGeorge Bundy and to President Kennedy. The "thirteen days" of the Cuban Missile Crisis had begun.

Kennedy's first reaction to learning of the presence of Soviet missiles in Cuba was his exclamation, "He [Khrushchev] can't do this to me" (Neustadt 1964). Kennedy had asserted that the Soviets would not place offensive weapons in Cuba. Moreover, Khrushchev had assured Kennedy that he would do nothing to worsen the problem because Khrushchev was aware of Kennedy's domestic political problems.

U.S. advisers spend the first week of the crisis canvassing the possible courses of action and weighing the costs and benefits that those courses entailed. Initially, advisers presented two courses of action: the "do nothing" approach and the "diplomatic" approach. U.S. vulnerability to Soviet missiles was not new. U.S. overreaction could aggravate the situation. The "do nothing" approach, however, failed in two respects: First, the Soviet Union would attempt to reverse the strategic imbalance in its favor by installing cheaper, shorter-range missiles rather than more expensive, longer-range missiles. Second, the Soviet Union challenged Kennedy's warning. In case of inaction, the United States would lose its credibility.

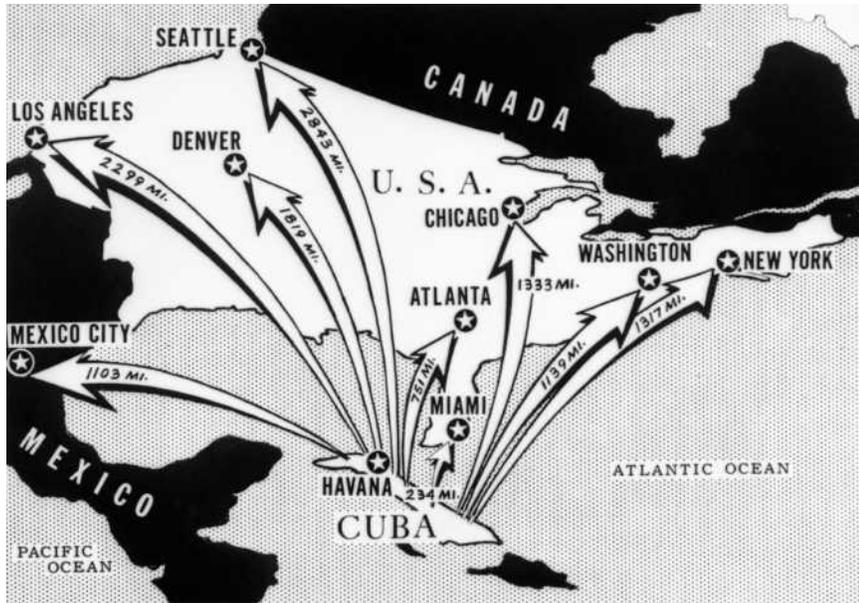

Several forms of diplomatic pressure were considered: "an appeal to the U.N. or the Organization of American States (O.A.S.) for an inspection team, a secret approach to Khrushchev, and a direct approach to Khrushchev, perhaps at a summit meeting" (Allison 1969, 696), including trading U.S. Jupiter missiles in Turkey and Italy for the Soviet missiles in Cuba. Each form of diplomatic pressure

seemed to have its own drawbacks. Additionally, other courses of action were considered, such as a secret approach to Castro, an invasion, a surgical air strike, and a naval blockade.

President Kennedy acted quickly on 16 October 1962 by summoning a handful of senior military, diplomatic, and political advisers, a group who became known as the "Executive Committee of the National Security Council" (ExComm). Members of the committee included Secretary of State Dean Rusk, Secretary of Defense Robert McNamara, McGeorge Bundy, CIA Director John McCone, Presidential Counsel Ted Sorenson, Undersecretary of State George Ball, Deputy Undersecretary of State U. Alexis Johnson, Secretary of the Treasury Douglas Dillon, Chairman of the Joint Chiefs of Staff Gen. Maxwell Taylor, Assistant Secretary of State for Latin America Edward Martin, Adviser on Russian Affairs Llewellyn Thompson, Deputy Secretary of Defense Roswell Gilpatric, Assistant Secretary of Defense Paul Nitze, and occasionally Lyndon B. Johnson, U.N. Ambassador Adlai Stevenson, Special Assistant to the President Ken O'Donnell, and Deputy Director of the U.S. Information Agency Don Wilson. The ExComm was ordered to set aside all other tasks to promptly consider all possible courses of action.

Initially the president and most of his advisers supposedly preferred a clean, surgical air strike on Cuba. On the first day of the crisis, the president mentioned only two alternatives: "I suppose the alternatives are to go in by air and wipe them out, or to take other steps to render them inoperable" (Abel 1966, 49). Through a process of active debate and discussion, a U.S. naval blockade emerged as a way to impede Cuba without an air strike or invasion. After spending the next six days devising strategies to counter the threat posed by the Cuban missile sites, members of ExComm were split into two groups over possible courses of action: a surgical air strike or a naval blockade.

The conservatives and military hardliners (including Gen. Taylor, McCone, and Nitze) pressed for the air strike. They were backed by the Republican members of Congress who were critical of the Kennedy administration for not having taken a hard

stance against Cuba prior to the crisis. The members of ExComm in favor of the air strike appealed to President Kennedy by emphasizing his responsibility as the leader of the free world, saying he had the obligation to destroy the missiles, whatever the cost.

At first President Kennedy and a majority of the ExComm members favored an air strike as an option, but soon a coalition of the most influential members in the ExComm (including Attorney General Robert Kennedy, Robert McNamara, Adlai Stevenson, and Ted Sorensen) began to support a naval blockade. They had a number of reasons for preferring a blockade. First, no one was certain that an air strike could be surgical or successful; second, an air strike (the use of force) would not be justified under international law, whereas a blockade would be authorized by international institutions such as the OAS; third, because human lives were at stake, military action would be immoral and damage the image of the United States over the world; fourth, an air strike would excessively provoke the Soviet Union; fifth and most important, an air strike would greatly increase the possibility of the use of nuclear weapons. The arguments for and against an air strike and a naval blockade created tensions that could be

felt within the ExComm and by President Kennedy.

In the meantime, the Soviet Union denied all charges regarding the missile sites. Khrushchev informed the U.S. ambassador in Russia, Foy Kohler, that the Soviet Union had no interests in Cuba and was helping the Cubans only to build a “fishing port.” Andrei Gromyko, the Soviet foreign minister, met with Kennedy on 18 October 1962, to assure him that Soviet military actions in Cuba were purely defensive. Kennedy had decided, at this point, not to tell Gromyko that the United States already knew of the missile sites under construction in Cuba.

Kennedy spent 19 October 1962 preparing two speeches—one on an air strike and the other on a blockade. However, in the end he and ExComm chose to abandon the air strike option because of the moral and legal implications and the awareness that an air strike would surely lead to a nuclear war between the two world powers. Thus, on 20 October 1962, Kennedy decided on a naval blockade and scheduled an address to the U.S. public on 22 October 1962. However, he ordered the U.S. Air Command to be ready to carry out an air strike against Cuban bases any time after the morning of 22 October 1962.

On 22 October 1962, U.S. personnel were evacuated from Cuba’s Guantanamo Naval Base, and U.S. forces in Florida and around the world were put on a DEFCON-3 (defensive condition) alert. At 7 P.M. President Kennedy delivered a seventeen-minute speech on national television, informing the public of the discovery of the nuclear missile sites and announcing a naval blockade (or “quarantine”) to prevent the delivery of offensive weapons to Cuba. Kennedy urged the Soviet Union to dismantle its missile sites immediately and withdraw all missiles from Cuba. Kennedy warned that if the quarantine should fail, further action would be justified. Shortly

Selection from the Cuban Missile Crisis Debate between Adlai Stevenson and V. A. Zorin in the United Nations Security Council, 23 October 1962

Mr. Stevenson (United States of America):

Let me make it absolutely clear what the issue of Cuba is. It is not an issue of revolution. This hemisphere has seen many revolutions, including the one which gave my own nation its independence.

It is not an issue of reform. My nation has lived happily with other countries which have had thorough-going and fundamental social transformations, like Mexico and Bolivia. The whole point of the Alliance for Progress is to bring about an economic and social revolution in the Americas.

It is not an issue of socialism. As Secretary of State Rusk said in February, "our hemisphere has room for a diversity of economic systems."

It is not an issue of dictatorship. The American Republics have lived with dictators before. If this were his only fault, they could live with Mr. Castro.

The foremost objection of the States of the Americas to the Castro regime is not because it is revolutionary, not because it is socialistic, not because it is dictatorial, not even because Mr. Castro perverted a noble revolution in the interests of a squalid totalitarianism. It is because he has aided and abetted an invasion of this hemisphere—an invasion just at the time when the hemisphere is making a new and unprecedented effort for economic progress and social reform.

The crucial fact is that Cuba has given the Soviet Union a bridgehead and staging area in this hemisphere; that it has invited an extra-continental, antidemocratic and expansionist Power into the bosom of the American family; that it has made itself an accomplice in the communist enterprise of world dominion.

The President [Mr. V. A. Zorin] [translated from Russian]:

I should now like to make a statement in my capacity as the representative of the Union of Soviet Socialist Republics. . . .

I must say that even a cursory examination of Mr.

Stevenson's statement reveals the totally untenable nature of the position taken by the United States Government on the question which it has thought necessary to place before the Council, and its complete inability to defend this position in the Council and before world public opinion.

Mr. Stevenson touched on many subjects. . . . He spoke about the history of the Cuban revolution—although it is difficult to understand what the United States has to do with the internal affairs of the sovereign State of Cuba—and he drew an idyllic picture of the history of the Western Hemisphere for the past 150 years, seeming to forget about the policy of the "big stick" followed by the United States President McKinley, the Olney Doctrine, the actions taken by Theodore Roosevelt in connexion with the Panama Canal, the boastful statement made by the American General Butler to the effect that with his marines he could hold elections in any Latin American country.

He made no mention of all this. The United States is even more attempting to apply this policy of the "big stick." But Mr. Stevenson apparently forgot that times have changed. . . .

Yesterday, the United States Government placed the Republic of Cuba under a virtual naval blockade. Insolently flouting the rules of international conduct and the principles of the Charter, the United States has arrogated to itself—and has so stated—the right to attack the ships of other States on the high seas, which is nothing less than undisguised piracy. At the same time, the landing of additional United States troops has begun at the United States Guantanamo base in Cuban territory, and the United States armed forces are being placed in a state of combat readiness.

The present aggressive actions of the United States of America against Cuba represents a logical stage in that aggressive policy, fraught with the most serious international consequences, which the United States began to pursue towards Cuba in the days of the Eisenhower Administration and which has been continued and intensified by the present United States Government, in the era of the "new frontier" that it proclaimed at the outset of its activities.

before Kennedy's speech, Cuba had declared a combat alarm and had moved anti-aircraft batteries and artillery along the Havana waterfront.

Kennedy called for other measures, such as con-

vening an OAS meeting and calling an emergency meeting of the United Nations Security Council to gather support for the United States.

Initially the Soviet Union rejected the U.S.

demand to remove the missiles, saying that the demand violated Cuba's rights to self-determination. In a speech in Cuba, Fidel Castro emphasized Cuba's right to strengthen defenses with any weapon of its choice, without clarifying whether nuclear missiles were present in Cuba. Nonetheless, on 23 October 1962, President Kennedy officially signed Proclamation 3504, declaring the creation of a naval blockade.

SUCCESS OF THE NAVAL BLOCKADE AND THE END OF THE CRISIS

The "quarantine" took effect at 10 A.M. the following day. On 24 October 1962, the U.S. Joint Chiefs of Staff raised the national alert level to DEFCON-2 for the first time in U.S. history. The next level up would be DEFCON-1, which meant war. On the same day Soviet ships with missiles on board could be seen approaching the U.S.-drawn line, and tensions reached their peak but eventually subsided as the ships stopped in the water at the last moment instead of crossing the line.

Between 26 and 27 October the Soviet Union conveyed its decision, through United Nations Secretary-General U Thant, to order Soviet merchant ships not to violate the U.S. naval blockade. Khrushchev also sent two letters to the White House offering to withdraw missiles from Cuba and pledging that the Soviet Union would not interfere in the internal affairs of Turkey if the United States were to end the naval blockade, pledge not to invade Cuba, and remove U.S. missiles from Turkey. However, on 27 October 1962, a U.S. U-2 spy plane was shot down over Cuba (although who gave orders to shoot down the plane is not clear, Soviet and Cuban officials later identified a Soviet officer as being responsible).

Notwithstanding the U-2 incident, Kennedy sent a letter to Khrushchev proposing that the Soviet Union immediately begin withdrawing its missiles and that the United States would end the naval blockade and pledge not to invade Cuba. This would be the public agreement. Behind the scenes Attorney General Robert Kennedy delivered a private assurance to Soviet Ambassador Anatoly Dobrynin that the United States would withdraw its missiles from Turkey.

On 28 October 1962, Moscow Radio broadcast Khrushchev's acceptance of Kennedy's proposal. The Soviet Union began dismantling its missile sites and withdrawing missiles without consulting the Cuban government. This ended the thirteen days of crisis.

STRATEGIC VICTORY

The successful containment of the Cuban Missile Crisis can be ascribed to the strategic ingenuity of the naval blockade: It was an effective strategy when both the U.S. and Soviet governments were skating on thin ice. The blockade was advantageous in that it was a middle choice between inaction and aggression and in that it shifted to Khrushchev the burden of making the choice of whether or not force would be used. After the blockade was announced, the Soviet Union had the choice of whether or not to violate the blockade, and if the Soviet Union were to violate the blockade, Khrushchev, not Kennedy, would be recorded as the instigator of armed conflict (and a possible nuclear war). Although this was a heavy challenge to the Soviet Union, the blockade allowed "face saving" in the sense that the Soviet Union was given the choice of making a graceful concession: Removal of the missiles was a voluntary decision on Khrushchev's part and thus less humiliating. The Soviet Union also benefited from the crisis by being assured that the United States would withdraw its missiles from Turkey.

LESSONS FOR LEADERSHIP

Although some scholars criticize Kennedy's handling of the Cuban Missile Crisis because the blockade might have led to a nuclear war, this crisis is often cited as an example of successful leadership in the domain of foreign affairs. The greatest success of Kennedy's leadership in the crisis is that he didn't repeat his mistake of the Bay of Pigs. After he made a mistake in the Bay of Pigs invasion by accepting the advice of a group of experts who were overconfident that the mission would succeed (and failing to put the invasion plans under careful scrutiny), he reshaped his foreign policy decision-making

process. He called on a wide array of advisers to get unfiltered and multifaceted information rather than call on a narrow array of advisers.

Kennedy achieved success by allowing his staff members to freely discuss the options. At the initial stage of the crisis, only two options—inaction or an air strike—appeared to exist. In the process of debating and canvassing all the options, a blockade emerged as another option. Discovering this new option was the key to successful foreign policy in resolving the crisis.

Kennedy also effectively communicated with the American people on the crisis. He did not attempt to cover up the crisis. He genuinely delivered his speech to the public on television. Before and after the crisis, he also skillfully used televised press conferences to express his vision and to excite young people to believe that politics is interesting business and worth pursuing. Largely because of his handling of the Cuban Missile Crisis, Kennedy is still remembered as a charismatic leader by the U.S. public.

D

D-DAY

The amphibious assault by the Allies on the beaches of Normandy, France, on 6 June 1944 —D-Day— was the largest military operation of World War II, perhaps the largest in all of modern warfare. Although the cost in money, materiel, and lives was high, the assault was a success, and it spelled the beginning of the end for Germany’s Third Reich.

The assault, code named “Overlord” by the Allies, involved two years of planning and preparation. The basic concept was simple but bold: to defeat Germany in western Europe, where it was strongest, and thus to inflict massive damage on the Nazi war machine and open the way for a thrust into the German heartland. At the same time, a successful invasion would take pressure off the Soviets on the eastern front, allowing the Soviet leader Joseph Stalin to organize an effective counteroffensive against the German invaders there. The Allies had sufficient resources to launch only a single invasion, so Overlord involved the rolling of some large dice. The logistical nightmare aside, invasion planning was complicated by the necessity of integrating a multinational fighting force and command structure, by the problem of overcoming the intricate coastal defenses that the Nazis had constructed everywhere an invasion might be possible, and by the Nazis’ certain knowledge that the Allies were

coming—even if the Nazis did not know exactly when or where.

The success of the Allies and the failure of the Germans at Normandy hinged on a variety of factors. One of the most important of these—on both sides— was leadership.

THE ALLIES

The head of the committee planning Operation Overlord, and also the commander of the invasion itself, was U.S. Gen. Dwight D. Eisenhower. Because the United States was providing the largest component of the invasion force (sixty divisions, compared to the twenty provided by Britain and Canada together), U.S. President Franklin D. Roosevelt and British Prime Minister Winston Churchill had agreed that a U.S. military leader must assume command. Eisenhower, as it turned out, was an inspired choice.

A graduate of West Point, Eisenhower had been unable to secure a combat command during World War I and spent the war training armored units in the United States. During the 1930s he served on the staff of Gen. Douglas MacArthur, and as war loomed in the early 1940s he was assigned to Gen. George C. Marshall, Army chief of staff. As early as March 1942 he wrote a memorandum for Marshall that urged that the primary Allied target be Germany and suggested that the surest road to victory lay through western Europe.

Eisenhower's Order of the Day to the Soldiers, Sailors, and Airmen of the Allied Expeditionary Force

Soldiers, Sailors and Airmen of the Allied Expeditionary Force!

You are about to embark upon the Great Crusade, toward which we have striven these many months. The eyes of the world are upon you. The hopes and prayers of liberty-loving people everywhere march with you. In company with our brave Allies and brothers-in-arms on other Fronts, you will bring about the destruction of the German war machine, the elimination of Nazi tyranny over the oppressed peoples of Europe, and security for ourselves in a free world.

Your task will not be an easy one. Your enemy is well trained, well equipped and battle-hardened. He will fight savagely.

But this is the year 1944! Much has happened since the Nazi triumphs of 1940–41. The United Nations have inflicted upon the Germans great defeats, in open battle, man-to-man. Our air offensive has seriously reduced their strength in the air and their capacity to wage war on the ground. Our Home Fronts have given us an overwhelming superiority in weapons and munitions of war, and placed at our disposal great reserves of trained fighting men. The tide has turned! The free men of the world are marching together to Victory!

I have full confidence in your courage, devotion to duty and skill in battle. We will accept nothing less than full Victory!

Good luck! And let us all beseech the blessing of Almighty God upon this great and noble undertaking.

(Signed)

Dwight David Eisenhower

Source: "General Dwight D. Eisenhower's Order of the Day (1944)." National Archives and Records Administration. Retrieved September 11, 2003, from <http://www.ourdocuments.gov>

Eisenhower commanded "Operation Torch," the British and U.S. assault on North Africa in November 1942. The initial assault was a success, but as Eisenhower's forces moved inland they came up against the German Afrika Corps led by the formidable Gen. Erwin Rommel. In February 1943, Rommel's forces attacked at the Kasserine Pass and inflicted a disastrous defeat on the Allied forces. However, the test of a true leader is not that he makes no mistakes, but rather that he learns from those he does make. Eisenhower was a true leader.

Although military culture fosters authoritarian leadership, Eisenhower understood that planning and carrying out Operation Overlord would require more than simply issuing orders. A task so immense would require cooperation, consensus, and the delegation of a certain amount of responsibility. From the start, Eisenhower's watchword for Overlord was *teamwork*. He was determined that the U.S. and British soldiers work together, despite all the cultural differences and potential rivalries involved. Indeed, Eisenhower's skills as a diplomat were equally as important as his military ability in President Roosevelt's decision to give Eisenhower command of the operation.

Eisenhower had set a system of unified British and U.S. command during Operation Torch, and he employed a similar system (although on a much larger scale) in organizing for Overlord. U.S. and British officers were integrated into a single staff and encouraged to work as a team. He is known to have said, "I don't care if somebody gets called a son of a bitch. That's natural. But I'm damned if he'll be called an *American* son of a bitch, or a *British* son of a bitch" (Ambrose 1994, 62). When some U.S. officers complained about their British superiors (such as the notoriously difficult British Gen. Bernard Montgomery), Eisenhower told them to grin and bear it and to do their jobs.

Eisenhower was a brilliant administrator. He could be patient when required (which was often), but he would allow himself to lose his famous temper if he thought someone needed shaking up. He emphasized the need for consensus among the planners, but he recognized that the ultimate responsibility was his alone. He could be stubborn when he felt the operation was being endangered. When the Royal Air Force balked at being under his command, Eisenhower told Churchill that either the command would be unified or it would have to look for a new commander. Churchill gave in and issued the necessary orders.

By and large, historians agree that Eisenhower's leadership leading up to the D-Day invasion was masterful and that the decisions he made were the right ones: to select Normandy, rather than Pas de Calais, as the invasion site; to put U.S. Gen. Omar

Bradley rather than U.S. Gen. George Patton in charge of the First Army; to insist on bombing the French railway system in the weeks prior to the landing; to postpone the invasion, scheduled for 5 June, because of bad weather; and to decide the next day, as he told his staff, “Okay, we’ll go.” Yet, Eisenhower was not absolutely sure that the invasion would succeed. Prior to D-Day he prepared two brief statements for the press. One, announcing that the invasion had succeeded, was later released; the other, which remained in Eisenhower’s pocket, announced that the invasion had failed, that the surviving troops were being withdrawn, and that the decision to send them had been his and his alone.

One of the greatest challenges to Eisenhower’s concept of teamwork was posed by Gen. Montgomery, who was commander of the land forces deployed on D-Day. As head of the British Eighth Army in North Africa, Montgomery had defeated Rommel’s Afrika Corps at El Alamein and had driven the Nazis out of the theater of operations. His later campaigns in Sicily and Italy were less successful, but Montgomery’s reputation for brilliance remained untarnished. He was a master of the set-piece battle, where he could marshal his forces and plan their disposition with precision. He was less effective in adapting to changing situations and missed more than one opportunity for victory as a result.

Montgomery was a professional soldier who was utterly dedicated to his job and largely indifferent to all other aspects of life. He cultivated a rather folksy image with his berets and baggy sweaters, and this made him popular with the common soldiers. However, Montgomery’s peers and immediate subordinates know him to be cold, brusque, and egotistical to the point of insufferability.

Eisenhower both admired Montgomery’s tactical acumen and resented his imperious manner. Montgomery found fault with every battle plan but his own. He criticized Eisenhower’s suggestions constantly and not always politely. However, Montgomery did make valuable contributions to the planning for Overlord, and his leadership of his troops during the invasion cannot be faulted—even though he did make his share of errors during the subsequent fighting in France and Germany.

THE NAZIS

The Nazi defense of the French coastline against invasion was commanded by Gen. Rommel, with whom both Eisenhower and Montgomery had contended in the past. Rommel had been a highly decorated infantry lieutenant in World War I. Although never a Nazi Party member himself, Rommel was willing to serve the German Nazi leader Adolf Hitler after the former Austrian corporal came into power. Before World War II began Rommel commanded Hitler’s personal bodyguard detachment. Later he rode a tank and held a general’s rank while the blitzkrieg (lightning war) raged across France. From there he went to command the Afrika Corps, having early successes but eventual defeat. In January 1944 he was given the job of preparing the western coast of France against the inevitable Allied invasion.

Rommel inspected the defenses and found them woefully inadequate. He immediately ordered the installation of a network of land and sea mines, steel obstacles designed to stop landing craft, and concrete pillboxes with overlapping fields of fire. He also had to make decisions concerning the disposition of troops at his command.

Rommel believed that the Allies had to be stopped at the water’s edge, if they were to be stopped at all. He wanted to have all his reserve troops stationed close to the coast so that they could be deployed to shore up the defense wherever the Allies attacked. However, on this issue he came into conflict with his immediate superior, Field Marshal Gerd von Rundstedt.

Von Rundstedt was a legend in the German army, the Wehrmacht. Almost seventy years old in 1944, he had retired twice but each time had been called back to active service by Hitler himself. As commander-in-chief of the western front, von Rundstedt was ultimately responsible for the defense against the forthcoming Allied invasion. Although von Rundstedt liked and respected Rommel, von Rundstedt believed that any coastal defense, no matter how well prepared, would only slow the Allies, not stop them. He wanted to hold most of the German reserves well back from the coast, out of range of the Allied naval guns that would be sending in devastating fire from the sea in

support of the invasion. Then when the Allies headed inland, von Rundstedt planned to launch a massive counterattack that would crush the invaders. Unlike Rommel, von Rundstedt believed that the invasion force would almost surely land at Pas de Calais, the usable site that was closest to the British coast.

The two men took their professional disagreement to Hitler himself—neither wanted the whole responsibility resting on his shoulders alone. As Hitler typically did with his military decisions, Hitler tried to have it both ways.

The Fuhrer (leader) had already made Rommel's job more difficult by mixing the lines of command and authority for those units involved in the defense of the French coast. Although Rommel was nominally in charge of the entire defensive apparatus, Hitler denied him command of the German naval and air forces in the area. Nor did Rommel have the authority to direct the SS (Schutzstaffel, elite guard) Panzer divisions in southern France—they remained under control of Hitler himself. So when presented by his commanders with alternate scenarios of invasion, Hitler decided to cover both possibilities. The result satisfied neither of his commanders. Von Rundstedt was given a reserve to keep inland, but it was half the size that he had requested. Rommel was granted additional troops for the coast, but he considered their numbers and equipment inadequate to the task. Hitler further handicapped his generals on the day of the invasion itself. When the Germans saw that the Allies were landing at Normandy, von Rundstedt urgently requested that Hitler deploy the SS Panzer divisions to that area to support the planned counterattack (Rommel, having been informed that the bad weather meant no invasion was possible, had returned to Germany to celebrate his wife's birthday). However, when von Rundstedt radioed Hitler's headquarters, von Rundstedt was informed that Hitler had taken a sleeping pill and gone to bed, with strict orders that he not be disturbed. By the time Hitler finally released the Panzers, it was too late to make a difference.

Many factors contributed to the Allies' victory and the Germans' defeat on D-Day. The difference in leadership was surely one of them.

DECISION MAKING

Decision making is what most managers do much of their time. Many of the decisions are minor, but some are consequential, such as launching a project or hiring a staff. A few decisions are momentous: blowing a whistle or redirecting a career—or even launching an enterprise or saving a firm.

Made well, decisions are a foundation for managerial advancement. Made poorly, decisions can scuttle an otherwise promising career. However, regardless of personal calculus, effective decisions are also the most tangible foundation of effective leadership. Those people who carry responsibilities for the fate of others—whether a team, an agency, or a company—are constantly confronted with vexing issues that they must resolve, and resolve well, if the organization is to achieve its aims.

Although good decisions are among the most important features of good leadership, they are also among the least visible. Most decisions are made behind closed doors, yet they often define an individual's leadership better than public appearances. U.S. President John F. Kennedy inspired a nation with his inaugural rhetoric, "Ask not what your country can do for you; ask what you can do for your country." However, his decisions inside the Oval Office during the thirteen-day Cuban Missile Crisis more profoundly characterized his presidency.

Effective decision making is an essential although often less visible foundation of leadership. How decisions are framed, informed, and executed thus has much to do with the quality of leadership that results. The self-confidence and foresight that a leader brings to the decisions can be essential as well.

FRAMING FOR TRANSCENDENCE

Most personal decisions are framed around private utility: What are the individual gains and losses associated with one outcome or another? Most managerial decisions are similarly framed around a division's purpose: What are the benefits and costs for a team or division if one product is launched rather than another?

Predisposition, anxiety, and naiveté cloud the calculus, and pure utility is rarely maximized in practice, as has been confirmed by a host of academic assessments ranging from Max Bazerman's *Judgment in Managerial Decision Making* and J. Edward Russo and Paul J. H. Schoemaker's *Winning Decisions: Getting It Right the First Time* to Gary Klein's *Intuition at Work* and Kenneth R. Hammond's *Judgments under Stress*. Still, personal and divisional calculations provide a theoretical benchmark for framing decisions.

Leadership decisions, however, necessitate a distinct framing because they are made for the unique purpose of advancing the entire enterprise, regardless of personal concerns or divisional interests. They depend upon a capacity to transcend private agendas and parochial objectives. That capacity must be exercised even though—and especially when—self-interest conflicts with what the enterprise requires.

One pragmatic method for transcending private and parochial bias in leadership decisions at any level of an organization is to draw upon the same criteria in the decision making that ought to be drawn upon by the person at the ultimate level. The criteria must be adapted and made specific to the manager's specific tasks. However, if the midlevel manager thinks as if he or she were the country president or chief executive, the midlevel manager will have a well-defined set of criteria for reaching a leadership decision at his or her lesser post.

By way of illustration, consider the decisions of Joshua Lawrence Chamberlain, a Union officer who accepted the ceremonial surrender of the Confederate army of Gen. Robert E. Lee at Appomattox on 12 April 1865. As the U.S. Civil War was coming to an end, Union President Abraham Lincoln had made reconciliation a national priority, and the reintegration of Confederate soldiers was of enormous concern.

Although only a midgrade officer, Chamberlain guided his own decisions by much the same concerns as his president's, even though there had been no direct communication. "Before us in proud humiliation," Chamberlain said of the surrendering soldiers, were those "whom neither toils and sufferings, nor the fact of death, nor disaster, nor hopelessness could bend from their resolve" (Chamberlain 1994, 260). As the bugle sounded, Chamberlain issued an order for his federal troops to strike a respectful pose as the Confederate regiments filed onto the field, a posture that would normally be accorded only a Union general. In doing so, Chamberlain had acted with no order from above, appreciating through his own anticipation what the president would want under the circumstance: "Was not such manhood to be welcomed back into a Union so tested and assured?" (Chamberlain 1994, 260). Chamberlain's grand gesture was instantly recognized by the surrendering troops, and it helped initiate the reintegration that Lincoln sought to achieve.

At times, however, country presidents and chief executives themselves are not thinking as leaders should, instead more concerned with provincial gain than collective agenda. When leadership thinking falls short at the top, the midlevel decision framing can be built upon the criteria that the top should have been using—and against which the leadership shortcomings had become evident.

Consider the moment faced by Enron Corporation vice president Sherron Watkins when she met with CEO Kenneth Lay on 22 August 2001. She warned that his company would "implode in a wave of accounting scandals" ("Enron's Ken Lay" 2002) from the partnerships that the chief financial officer, Andrew Fastow, was using to hide debt and enrich himself. Lay proved unable to challenge the ruinous

practice or to make the other leadership decisions that he should have made to save the company. However, regardless of the CEO's decisions, Watkins had valiantly acted to avert the impending disaster by thinking as if she were responsible for the company's fate even though the chief executive officer was evidently not rising to the challenge.

Leadership decisions, whether made on the front line or in the executive office, are thus distinctively defined by whether they transcend personal and parochial concerns. The criteria for choosing one course over another are those that a country president or chief executive would or should have used. As Jim Collins confirmed from his study of a dozen companies that rose from "good to great," the most successful business leaders are those who make authoritative decisions and always put enterprise interests ahead of their own.

INFORMATION FOR ACTION

The right criteria for decision making open the leader's door; the right information lets the leader walk through it. With timely data, a leader is well positioned to make a decision, but without the essential information, even the best decision criteria are of little value.

The disaster of the U.S. space shuttle *Challenger* on 28 January 1986 illustrates the point about as well as any leadership failure can. The night before *Challenger's* scheduled launch, temperatures in central Florida plummeted to record lows. NASA flight directors called the top managers of Utah-based manufacturer Morton Thiokol to ask if its solid-fuel booster rockets for the space shuttle would function reliably under the freezing conditions. Faced with the need for a fast decision—launch time was just hours away—the Thiokol managers recommended a "go." At 11:38 the next morning, when the space shuttle lifted off with seven astronauts on board, the ground temperature registered just 15 degrees colder than on any prior takeoff. Seventy-three seconds later, an O-ring made brittle by the cold cracked in the booster rocket, causing the main rocket to explode.

Later analysis would reveal that ample data had

existed in the Thiokol files that evening to tell Thiokol senior managers that the O-rings were almost certain to fail in the cold conditions sure to prevail the next morning. However, the managers had not asked for the data because they had not known they were available—the information was buried in a flawed filing system. They had made a timely decision, but in the absence of good information, they had made a flawed one—the most fateful of their careers.

In business markets, quality information in the hands of decision makers can be key as well. In her comparison of fast-moving and slow-moving computer firms in Silicon Valley, Kathleen Eisenhardt found vast disparities in the capacity to reach timely decisions. Although in the same industry, fast firms required half the time to reach decisions on product innovations and joint ventures compared with their slower rivals: two to four months for the fast movers versus six to eighteen months for the slow movers.

A key difference, Eisenhardt found, lay in the use of real-time data. Managers at the fast movers put a premium on having rich and reliable data on their products and customers, far more so than did the slow movers. The fast movers possessed fine-honed measures of their internal operations, and their managers met often to mine the data for fresh insight. They had better intelligence with which to appraise their own performance and to appreciate where the market was moving. The slow movers, by contrast, tended to engage in tedious planning and forecasting exercises that sometimes required months for completion.

As a case in point, the Internet equipment manufacturer Cisco Systems built a system during the late 1990s for compiling and retrieving detailed data on every major aspect of its business operations. In 1995 Cisco required two weeks to consolidate its year-end results, but by the end of the decade it was closing its financial books in a single day.

With 36,000 employees and sales of \$19 billion in 2002, Cisco managers have access to hourly information on revenue, discounts, and margins for all products. They can evaluate backlog order or selling expenses for any operating unit or account manager. The result, observed chief financial officer Larry

Carter, who drove the building of the real-time financial management system, is that “you empower all of your management team to improve decision making” (Mehta 2001, 104). Chief executive John Chambers explained why Cisco decisions improved: “First-line managers can look at margins and products and know exactly what the effect of their decisions will be” (Mehta 2001, 104) The real-time data at their fingertips, for instance, permitted Cisco managers to anticipate an increase in the Japanese economy in time to put people and resources in place to respond to rising demand for Cisco products.

Cisco’s information system did not prevent the company from being blind-sided by an abrupt downturn in demand for its equipment in 2001. Although not a fail-safe management device, the system nonetheless gives company leaders at all levels the wherewithal to make decisions that are as informed as possible.

EXECUTION WITH SPEED

The right information makes for informed decisions; decisiveness makes for timely actions. With good information, a manager is well positioned to make a decision, but with-

out a personal determination to execute the decision, it may come too late. “Shooting from the hip” is an oft-observed leadership mistake because relevant information is ignored, but “analysis paralysis” is equally an error when timely execution is required.

For risky and consequential actions—what leaders are inherently focused upon—preventing paralysis requires that leaders constantly strive to reach their “go” point as soon as possible. After twenty years at the helm of General Electric Co., Jack Welch rarely regretted doing so: “I could scarcely remem-

Decision Making: Too Much Talk May Backfire

ITHACA, N.Y. (ANS)—When small groups of workers meet to make decisions, all of them want the chance to share their opinions, and that’s no bad thing, says Randall Peterson, assistant professor of organizational behavior at Cornell University’s Johnson Graduate School of Management.

But letting group members have unlimited “air time” can backfire, according to Peterson’s new study, “Can You Have Too Much of a Good Thing? The Limits of Voice for Improving Satisfaction with Leaders,” published in the March 1999 issue of the *Personality and Social Psychology Bulletin*.

The study outlines ways that all groups, from business meetings to family dinner-table conferences, can function more efficiently. Peterson’s research aimed to identify some situations in which small group “free speech” is best reined in by leaders.

“It is always useful to get everyone’s point of view on the table,” Peterson said. But while consensus decision making results in greater satisfaction and acceptance among group members, it doesn’t work when members have fundamental differences. “At some point the leader needs to decide whether to push the group to a consensus or not,” he said. “When people fundamentally disagree, more and more talking doesn’t get you anywhere.”

Therein lies the art of leadership, Peterson said. When trying to decide if a consensus is possible when there is strong disagreement in a group, Peterson suggests looking at some nonverbal cues, such as arm crossing, ignoring the person in disagreement or actually turning away.

This is the point when the leader needs to step in and put an end to the “air time,” he said. This is important because if the group leader does not intervene, he or she will bear the brunt of the group’s displeasure. “People expect the leader to cut that person off and move on,” he said. At this point, consensus may not be possible, and the majority may have to rule.

While it is the responsibility of the group leader to cut the person off who is dominating the discussion, the leader must do this in a tactful way. “People are looking for an acknowledgement that they have a valid point of view,” he said. “The leader must acknowledge the reasonableness of his or her position and then move on.”

ber a time when I said, ‘I wish I’d taken six more months to study something before making a decision’” (Welch 2001). Going too slowly for Welch was almost always worse than going too quickly: “When I asked myself, ‘How many times should I have held off on a decision? versus How many times do I wish I’d made that move faster?’ I inevitably found that the latter won almost every time.” Former IBM chief executive Louis Gerstner offered the same prescription: “Whatever hard or painful things you have to do, do them quickly” (Gerstner 2002, 68). U.S.

President George W. Bush exhibited an analogous capacity for getting to his go point. The “president has got to be the calcium in the backbone” for action, Bush said, and during the war in Afghanistan, he seldom hesitated to decide or doubted a decision afterward.

The U.S. Marine Corps specializes in risky and rapid assaults, and as a result it has long worked to build and reinforce a tempo that fosters fast decision making. It warns its officers that bureaucratic and autocratic leadership styles get in the way of swift action, and it trains its officers to do the following (Freedman 2000):

1. seek a “70 percent” solution rather than one with 100 percent certainty or consensus,
2. distribute decision-making authority among subordinates,
3. explain unambiguous objectives and then let subordinates work out the details,
4. prepare everybody, including the frontline, to lead,
5. tolerate mistakes and even encourage them if learning from errors will result in better decisions next time,
6. view indecisiveness as a fatal flaw, one that is even worse than making a mediocre decision because a suboptimal action, especially if swiftly executed, stands a chance of success, whereas no action stands no chance, and
7. instill pride and confidence in the mission and organization through personal discipline, shared culture, and common values.

The product of Marine Corps training programs is officers who are capable of taking swift leadership actions when the battlefield requires it. Company environments are less forgiving and the stakes less consequential, but these same principles can be found in many organizations whose leaders are known for execution with speed.

SELF-CONFIDENCE WITHOUT OVERCONFIDENCE

Transcendence, information, and velocity are all essential for decision making, but their effective application also depends on the leader’s personal

self-confidence. Much decision making is distressing, even painful, and without self-assurance about oneself and the need to delve into the decision, equivocation or avoidance is the paralyzing result.

Still, preparing to pull the trigger on hard decisions poses a psychological dilemma. Without confidence, self-questioning can delay a necessary action. Overconfidence, though, can result in underanalysis and an equally faulty result. The physicist Albert Einstein had the right idea when he talked about the challenge of physics: “Things should be made as simple as possible, but not any simpler.” Secure, yes; foolhardy, no.

Jack Welch of General Electric illustrated one end of that spectrum: He has said that he never regretted any decisions he made. He confessed that some of his decisions were wrong, even disastrous, but he did not doubt the need to make them in a timely fashion nor his own obligation to do so.

Whereas self-assurance breeds momentum, excess confidence can breed excessive risk. That is what transpired at the investment bank Salomon, where a can-do culture among the leadership team nearly brought the bank to ruin. Salomon bond trader Paul Mozer had made an illegal \$3.2 billion bid for U.S. treasury securities on 21 February 1991. Mozer confessed his act to his boss, John Meriwether, more than two months later, and Meriwether immediately took it up to top management on 28 April. Chief executive John Gutfreund, however, failed to report the act to government authorities for more than three months.

Salomon’s culture had stressed taking financial risks to the limit, placing big bets as near the edge as possible, and its aggressive attitude had helped it become one of Wall Street’s biggest and most successful players of the era. Yet, that same mind-set also encouraged Paul Mozer to cross the line and senior managers to look the other way. John Meriwether and chief executive Gutfreund were so discredited by the delay in reporting the malfeasance that they were forced out within days of its public disclosure.

The Salomon board called upon one of its own members—investor Warren Buffett—to resurrect the company and its shattered credibility. With personal humility and executive resolve, Buffett forced out the

entire management team and completely revamped the company culture. Just three days after taking office, for instance, Buffett told all Salomon officers, “You are each expected to report, instantaneously and directly to me, any legal violation or moral failure on behalf of any employee” (quoted in “Enron’s Ken Lay” 2002). He provided his home telephone number and added that parking tickets were among the few exceptions to his new disclosure requirements.

Although Salomon paid dearly for the hubris of its prior management—customers fled, shares dropped, fines topped \$290 million—the company survived and prospered under a new team who emphasized calculated bets instead of reckless risk taking. A company that had nearly gone bankrupt in 1991 when overconfidence prevailed was sold to Citibank in 1997 for \$9 billion after self-confidence was restored.

CLEAR-MINDEDNESS AND FOREHANDEDNESS

Thinking like the president of a country or a CEO, acquiring the right information, executing with speed, and acting with self-confidence but not overconfidence provide a platform from which leaders can make the decisions that will define their leadership.

When the pressure intensifies, even the most self-effacing, informed, fast-acting, and self-assured leaders can experience acute anxiety or even panic attacks, both of which interfere with effective decisions making. Leaders with responsibilities for others have thus developed a host of remarkably simple but effective devices to assure undistracted focus on solving thorny problems under the most trying of circumstances. Medical surgeons take their own pulse, jet pilots look at the clock, mountain climbers study the rope, and firefighters put a steadying hand on panicked fellow firefighters. These acts are small, but all serve to restore and preserve clear-mindedness.

A leader’s decision making also depends on a capacity to see far ahead for the division, company, or country. What should go right, what can go wrong, and what are the decisions that need to be made now to build for the best and avoid the worst? A commander on a ship’s bridge is thus always obligated to think strategically, to anticipate the most

likely contingencies. “The single most important attribute for boating,” warns one set of naval guidelines, is “forehandedness,” that “quality of insight coupled with experience that enables you to predict what will happen” so that you can “see what you want to do, and see the ways things are going, and accomplish your task while visualizing and avoiding danger” (U.S. Navy 2001). Effective decision making is only one component of leadership. Other critical components include persuasive communication and personal integrity. However, without good and timely decisions premised on clear-mindedness and forehandedness, a manager’s ability to marshal others will not long survive.

DECISION MAKING: THE VROOM–YETTON–JAGO MODELS

Leadership and decision making are typically treated as different processes in management textbooks. Leadership is linked with topics such as teams, influence, and motivation—issues of great relevance to social and organizational psychology. Decision making is linked with topics such as risk, uncertainty, information processing, and heuristics (learning)—issues integral to management science and cognitive psychology.

Leadership and decision making merge when one begins to focus on a particular aspect of leadership style: participation in decision making. Participation refers to the opportunity that a leader affords team members to influence decision. Autocratic leadership provides no opportunity for such influence. Democratic or participative leadership provide high levels of team influence. Empirical work on autocratic and participative leadership styles has an interesting beginning. After escaping from Nazi Germany just prior to World War II, the German psychologist Kurt Lewin sought to study the effects of autocratic and democratic leadership styles in the laboratory. Largely due to Lewin's influence, participation in decision making became an important explanatory variable not just among Lewin's many

disciples but also among social scientists interested in the management of large-scale organizations (e.g., Maier, Likert, Hersey, and Blanchard; Tannenbaum and Schmidt).

Most of these management theorists were strong advocates of participative decision making, based largely on its superior motivational properties. However, reviews of the evidence concerning its effects on performance were mixed, casting doubt on the generality of these effects. In 1969, writing in a chapter for the *Handbook of Social Psychology*, Victor Vroom, then professor at Carnegie-Mellon University, concluded that “The critics and proponents of participative management would do well to direct their efforts toward identifying the properties of situations in which different decision-making approaches are effective rather than toward wholesale condemnation or deification of one approach” (Vroom 1969, 40).

1973: THE VROOM–YETTON MODEL

A few years later Vroom picked up his own challenge and, working with a graduate student, Philip Yetton, formulated a normative model of leadership style that sought to specify what degrees of participation were likely to be effective in different conditions. They distinguished five degrees of participation, which they referred to as “AI” (the leader solves the problem or makes the decision using information available at the present time); “AII” (the leader obtains any necessary information from subordinates and then decides on a course of action); “CI” (the leader shares the problem with relevant subordinates individually, getting their ideas, and then makes a decision); “CII” (the leader shares the problem with subordinates in a group meeting, getting their ideas and suggestions, and then makes the decision); and “GII” (the leader chairs a group meeting with subordinates aimed at reaching consensus on a solution). “A” stands for “autocratic,” “C” stands for “consultative,” and “G” stands for “group.”

The situational factors in the Vroom-Yetton model were aspects of a specific problem or decision faced by a leader. There were eight situational factors, including whether the information needed to

solve the problem was possessed by the leader, subordinates, both, or neither, and whether subordinates were to play a key role in the implementation of the decision. These factors were evaluated by the leader as either present or absent in a specific problem, and those decision-making processes deemed a threat to decision effectiveness were eliminated by applying seven rules. For example, the goal congruence rule eliminated GII from the “feasible set” of appropriate behaviors when the subordinates did not share the organizational goals as represented in the problem. Similarly, the leader information rule eliminated AI when the leader lacked needed information.

The Vroom-Yetton model received a great deal of attention and inspired many studies aimed at determining its validity as well as its usefulness in the training of leaders. The validity data have been summarized by Vroom and Jago, professor of management at the University of Missouri. The data show that the incidence of successful decisions was about twice as high when the decision process was consistent with the model as when it was inconsistent. However, the model has been aptly criticized for its frequent failure to make any recommendations about what to do. In a vast majority of decision-making cases, the application of the seven rules did not yield a singular solution. In many cases all five decision processes remained viable, and in others, four, three, or two alternatives remained in the feasible set. How useful would *Consumer Reports* be if it rated all or nearly all alternatives equally? This structural difficulty was conveniently resolved by treating the most autocratic alternative as the model’s choice because it, typically, consumed the least amount of time. Thus, decision trees, an analytic device borrowed from the decision sciences, containing the Vroom-Yetton “time-driven model,” became ubiquitous in management textbooks.

1988: THE VROOM-JAGO MODEL

In the ensuing fifteen years much research was carried out investigating the Vroom-Yetton model, and extensive experience with training managers in its use led to a major revision. The Vroom-Jago model, published in 1988, retained the taxonomy (system of

classification) of decision processes of its predecessor. However, it discarded the system of rules, each containing a prohibitory (thou shalt not . . .) quality, for a new system that sought to maximize a set of three decision-making outcomes (decision quality, commitment to the decision by subordinates, and development of subordinates) while minimizing the time costs incurred in decision making. This fundamental change from the avoidance (prohibitory) orientation of the Vroom-Yetton model to a positive orientation that guided managers to maximize the effectiveness of their decisions and the efficiency of their processes in making them. This distinction has seldom been recognized in management textbooks but was necessary to enable Vroom and Jago to incorporate new factors into their model.

The Vroom-Jago model is different from the Vroom-Yetton model in three ways. (1) The number of situational factors was raised from eight to twelve to accommodate concerns raised by users or researchers. (2) Most factors were allowed to vary not just dichotomously, as in the Vroom-Yetton model, but rather over five levels. (3) The rules were eliminated and were replaced by mathematical functions relating joint effects of participation and specific situational attributes on each of the four decision outcomes: quality of decision, commitment to decision, time, and development.

The full complexity of the Vroom-Jago model cannot be represented by a decision tree, as was the case with the Vroom-Yetton model. To be sure, decision trees have been drawn, but they reduce the multiple level attributes to dichotomies and ignore certain attributes by holding them constant at a specified level.

The true power of the Vroom-Jago model required computer software. In 1988 Jago wrote a computer program that was amazing for its time. A user with a decision problem to solve was asked twelve questions about the problem and its context. The analysis was then entered, and a bar graph appeared showing the relative expected effectiveness of each of the five processes. If desired, separate evaluations of the consequences of participation on each of the four outcomes (quality, commitment, time, and development) could be obtained permitting investigation of tradeoffs.

Table 1. Taxonomy of Decision Processes (Vroom 2000)

<i>0</i> <i>Decide</i>	<i>3</i> <i>Consult (Individually)</i>	<i>5</i> <i>Consult (Group)</i>	<i>7</i> <i>Facilitate</i>	<i>10</i> <i>Delegate</i>
Make the decision alone and either announce or “sell” it to the group. One may use expertise in collecting information from the group or others that one deems relevant to the problem.	Present the problem to group members individually, get their suggestions, and then make the decision.	Present the problem to group members in a meeting, get their suggestions, and then make the decision.	Present the problem to the group in a meeting. Act as facilitator, defining the problem to be solved and the boundaries within which the decision must be made. The objective is to get concurrence on a decision. Above all, take care to ensure that one’s ideas are not given any greater weight than those of others simply because of one’s position.	Permit the group to make the decision within prescribed limits. The group undertakes the identification and diagnosis of the problem, developing alternative procedures for solving it and deciding on one or more alternative solutions. Although one plays no direct role in the group’s deliberations unless explicitly asked, one’s role is an important one behind the scenes, providing needed resources and encouragement.

THE PRESENT MODEL

Computer technology has increased by leaps and bounds since 1988, and research continues although at a somewhat reduced pace from the period following 1973. No account of the Vroom-Yetton-Jago models would be complete without a description of the latest version. The taxonomy of participation has been modified. (See Table 1.)

The changes are not merely semantic. AI and AII have been subsumed under “Decide”; CI and CII are now referred to as “Consult (Individually)” and “Consult (Group)”; and GII has been separated into “Facilitate” (which requires the leader’s active participation in the process) and “Delegate” (in which the group is self-managing).

The situational factors resulting from the use of the five leadership styles are substantially the same, as are the equations relating participation to quality, implementation, time, and development. A simpli-

fied version of the model can be represented on a single sheet of paper, but it now takes the form of a related analytical tool that we term a decision matrix rather than the earlier decision tree.

Perhaps the greatest difference can be found in the computer software. It is now a CD and includes a complete bibliography, detailed explanation of the theory and the equations, definitions and examples of each of the situational factors, and other segments for learning the model and using it intelligently. The most critical component is an “expert system” to permit managers to analyze a specific decision problem and estimate the consequences of their actions for particular decisions that they face.

SCIENTIFIC IMPLICATIONS

People have said that a theory should be evaluated not only in terms of its validity but also in terms of

the questions it raises and the quality of research it stimulates. Jago has recently compiled a list of almost 150 studies in scientific journals and over forty doctoral dissertations dealing directly with the Vroom-Yetton-Jago models. The models have also stimulated the development of a novel measure of leadership style that has proven useful in both research and leadership development. The concept of a problem set—a set of real or realistic cases, each depicting a manager faced with a decision to make that would impact his or her team—was introduced in the Vroom-Yetton model and continues to be refined. The cases are not selected on a random basis but rather on the basis of a powerful multifactorial experimental design in which each of the relevant situational factors is varied independently of one another across the cases. This property makes it possible to systematically determine how people change their behavior as elements of the situation are changed. This measurement tool has made it possible to draw some conclusions about leadership differences among managers based on culture, gender, functional specialty, and hierarchical position. It has also been used to determine the effectiveness of training in the Vroom-Yetton-Jago models.

This type of instrument, which measures differences within persons as well as across persons, has also shown that it is more appropriate to talk about autocratic and participative situations rather than autocratic and participative managers. Certainly people are different. However, by a ratio of about 3 to 1, people display greater similarity than differences in behavior. Certain situations evoke an autocratic response among most people, whereas other situations evoke a more participative response from the same people.

PRACTICAL IMPLICATIONS

Apart from the impact that the Vroom-Yetton-Jago models and derivative tools have had on the science of leadership, it is safe to say that they have had an even greater impact on the practice of leadership. Over 100,000 managers around the world have been trained in the models in programs ranging from one to five days in length. Typically such training has

included feedback or responses to problem sets showing how managers compare to peers and to the model as well as the analysis of the situational factors that are seemingly most important in governing the managers' behavior and, conversely, those factors that the managers seem to ignore.

Research associated with the Vroom-Yetton-Jago models provides a classic example of the futility of attempting to classify such research as either basic or applied. The evidence of the last three decades shows substantial impact of this line of inquiry upon worlds of both science and practice.

DEEP CHANGE

Deep change refers to the process of transformation or radical alteration that occasionally occurs in people, groups, and organizations. One element of the process concerns leadership. From the study of people in the process of making deep change comes a concept called the fundamental state of leadership (Quinn 2004). It refers to a psychological state or condition that an individual might enter in order to become the catalyst of transformation in a group or organization. It suggests that to make deep change in

an organization, we begin by making deep change in ourselves. The concept of the fundamental state of leadership redefines much conventional leadership thought and also serves as an applied tool for those who seek to stimulate organizational transformation.

DEEP CHANGE OR SLOW DEATH

Energy is the capacity for doing work and overcoming resistance. From the second law of thermodynamics we learn that all systems tend toward increasing entropy. Increasing entropy means that energy in the system is being dispersed and therefore that the system is becoming more disordered. Less energy is available to do the work of the system. In a parallel fashion both the social structure of organizations and the psychological structure of individuals tend toward increasing entropy. Unless work is done to the contrary, natural processes will move the organizational culture or the individual ego toward stagnation and decay. The pull toward entropy gives rise to a pattern known as the “deep change” or “slow death” dilemma (Quinn 1996).

The slow death of an individual ego or a collective culture is natural. It results from a number of tendencies. The first tendency is our unconscious conservatism; we adjust our behaviors and aspirations to preserve the status quo. Behaviors become habits, and we act unreflectively, choosing familiar methods without thinking about why we choose them (Bargh and Chartrand 1999). Moreover, we normally adjust our goals to match past performance; we judge our current state by comparing it to what we have accomplished in the past (Cyert and March 1963). The result is that most behavior is conservative and recapitulates the past. The second tendency relevant to the slow death is the desire for control; we need to feel that we understand and shape our lives (Depret and Fiske 1993). Our self-concepts hinge upon our sense of control. We are uncomfortable in situations that we do not understand or that we cannot influence. The third tendency is for the environment to change. Regardless of our personal desire for predictability and control, the external environment is constantly changing, demanding new responses from us.

Together, these three tendencies combine to create the deep change or slow death dilemma. We rely on old behaviors, even though the environment is constantly changing. As a result, we fall out of alignment and receive signals suggesting the need to change. Nevertheless, we need to feel that we are in control; thus, our natural reaction to demands for change is to practice denial. Such denial is a defense mechanism. It defends against the pain of anticipated personal or collective change. However, this denial is a form of closure, which increasingly shuts out some aspect of the evolving external world. As we close down, we increasingly lose information, energy, and other resources. We experience slow death.

Although such denial is potentially destructive, it is quite common. Following the natural laws governing physical systems, individuals and organizations travel along the path of least resistance (Fritz 1989). We do the easy things first. We leave the path of least resistance only when we make commitments, take risks, and move to new levels of performance. We then plateau. At first the plateau is a positive time of consolidation and success, but it eventually becomes a zone of comfort. At that point external signals begin to call for change. However, we react by practicing denial because we want to continue using the strategies that worked in the past. We choose slow death over deep change.

As a result, most of us normally live in a reactive state (Fritz 1989). We are trying to preserve our ego or current self. We do this by denying signals for change. To practice this form of denial is to practice self-deception. In this sense we are all hypocrites; there are gaps between what we espouse and what we practice (Argyris 1988, 1991). We espouse change, dynamism, and learning, but we practice preservation, resistance, and denial. Therefore, it is normal for us to live in hypocrisy while denying that we do.

Because of this hypocrisy, our organizations and social systems, like us, are unconsciously but systematically designed to remain in a reactive state; they ignore change, seeking to preserve the status quo and to maintain order. Consequently, they become systems of fear, orchestrated to deny the need for change. We design them in our normal, reactive state

to motivate people who are also in the normal, reactive state; they thus give rise to patterns of slow death.

However, individuals and organizations do not have to experience slow death. The alternative to slow death is deep change. The dilemma that we continually face, both personally and organizationally, is the choice between deep change and slow death, between integrity and hypocrisy.

INDIVIDUAL TRANSFORMATION

The normal individual state is a reactive state in which we seek to stay on the path of least resistance, where we seek to preserve our present zone of comfort. Individuals can leave the reactive state by making fundamental or foundational commitments, by having the courage to face the gap between their performance and what is needed, by ceding their illusions of control. Such commitments give rise to deep change. Fritz (1989) argues that the most powerful question a person can ask is “What result do I want to create?” Asking that question may create a vision that has the power to draw us out of the reactive state and off the path of least resistance. When we clarify our aspirations and values, when we commit to a higher purpose, we are no longer focused on the past. We leave our comfort zone and begin to move forward through uncertainty. When we do this, we are no longer reactive. We become more concerned about accomplishing our desired result than we are about preserving our current self. We tend to become proactive.

At the individual level, deep change is a process in which we increase our integrity. It occurs when we stop denying the pressures to change and commit to a result that we truly want to create. Knowing what we want to create and committing to do so mean that we have clarified our values and that we are moving into the uncertain world that exists outside our zone of comfort. The movement from the normal state to the fundamental state of leadership is represented in Table 1.

Our normal state has four characteristics. First, we normally are comfort centered; we stay in our rou-

Table 1. Normal State and the Fundamental State of Leadership

<i>Normal State</i>			<i>Fundamental State of Leadership</i>	
Comfort centered		to	Purposed centered	
Externally directed		to	Internally directed	
Self-focused		to	Other focused	
Internally closed		to	Externally open	

tines and react to forces that might influence and distort our equilibrium. When we are purpose centered, we become intentional, choosing to create a unique result. Second, it is also normal to be externally directed, to respond to the social pressures that demand conformity. Therefore, to become internally directed is a courageous choice. We must exercise the courage to act on own values and thus express our unique self. This choice reverses the normal deterministic relationship between the individual and the social system; as we change we distort the expectations in the people around us. The third characteristic of the normal state is to be self-focused, to be concerned with our own needs, our own results. In contrast, to be other focused is to act out of concern for the welfare of a relationship or the collective good. Such concern creates conditions in which others can grow with us in a mutually enhancing and unique way; the relationship is more energized. Finally, in the normal state, we are internally closed; we avoid connections that require change. To be externally open is to move forward in uncertainty, searching out all forms of feedback and learning from them. A person who has made the commitment to deep change pursues a unique purpose while personally unfolding the self in a unique way, creating unique relationships, and learning unique things. To be in such a unique and dynamic state is to be transformational; it is to be in the fundamental state of leadership.

This state, with the commitment and integrity it involves, transcends traditional boundaries. Although changes often involve renewed effort and performance in a work setting, committing to a higher purpose does not always mean embracing an organizational goal. For example, for some executives a needed deep change may be a commitment to spend less time at work and more time caring for personal

Exodus 6:1–13 (King James Version)

A biblical example of leadership responsibility for creating deep change is God's message to Moses about his covenant with the Israelites and Moses' charge to lead them out of Egypt.

- 1: Then the LORD said unto Moses, Now shalt thou see what I will do to Pharaoh: for with a strong hand shall he let them go, and with a strong hand shall he drive them out of his land.
- 2: And God spake unto Moses, and said unto him, I am the LORD:
- 3: And I appeared unto Abraham, unto Isaac, and unto Jacob, by the name of God Almighty, but by my name JEHOVAH was I not known to them.
- 4: And I have also established my covenant with them, to give them the land of Canaan, the land of their pilgrimage, wherein they were strangers.
- 5: And I have also heard the groaning of the children of Israel, whom the Egyptians keep in bondage; and I have remembered my covenant.
- 6: Wherefore say unto the children of Israel, I am the LORD, and I will bring you out from under the burdens of the Egyptians, and I will rid you out of their bondage, and I will redeem you with a stretched out arm, and with great judgments:
- 7: And I will take you to me for a people, and I will be to you a God: and ye shall know that I am the LORD your God, which bringeth you out from under the burdens of the Egyptians.
- 8: And I will bring you in unto the land, concerning the which I did swear to give it to Abraham, to Isaac, and to Jacob; and I will give it you for an heritage: I am the LORD.
- 9: And Moses spake so unto the children of Israel: but they hearkened not unto Moses for anguish of spirit, and for cruel bondage.
- 10: And the LORD spake unto Moses, saying,
- 11: Go in, speak unto Pharaoh king of Egypt, that he let the children of Israel go out of his land.
- 12: And Moses spake before the LORD, saying, Behold, the children of Israel have not hearkened unto me; how then shall Pharaoh hear me, who am of uncircumcised lips?
- 13: And the LORD spake unto Moses and unto Aaron, and gave them a charge unto the children of Israel, and unto Pharaoh king of Egypt, to bring the children of Israel out of the land of Egypt.

issues (Quinn 2004). The necessary deep change may be having the courage to commit to spending more time with a family member, to resuming an old hobby, or engaging in a community activity.

People sometimes report the surprising discovery that making a deep change in one area of their lives has positive impacts in other areas. By committing to

resume an old hobby, an individual may find, paradoxically, that she or he is more effective at work. Likewise, people who make the commitment to engage more fully at work often report an improvement in the quality of relationships at home. We must transcend ourselves to make deep change, and doing so affects every aspect of our lives.

In part, this spillover occurs because the dynamics of deep change generate reflection and commitment that lead to an increase in positive emotions. Whereas negative emotions have a narrowing effect on human processes, positive emotions broaden awareness, expand thinking, and result in increased vision and understanding. Moreover, positive emotion and positive thought are mutually reinforcing, creating what is called an “upward spiral.” In the spiral our new perspective leads us to experience positive emotions, which further broaden our awareness, creating more insight, and so on.

Such upward spirals may be called “virtuous cycles.” They are reciprocating relationships in which new structures and patterns are emerging. These new patterns allow for the expanded flow of information and energy. When we personally experience such expansion in awareness and energy, we tend to initiate more effective patterns of behavior. Because we see new

aspects of reality, aspects that others cannot see, we can interact with changing reality in ways that are more effective. We tend to exhibit virtues such as confidence, hope, optimism, and resilience.

Typically, virtuous cycles are ones in which desirable patterns are amplified, leading to better performance. They thus tend to fit the meaning of virtue

as generalized excellence. However, this increased performance or generalized excellence in the social realm can be traced to increased virtue in the moral realm. The Greek philosopher Aristotle considered courage the first of all virtues because the exercise of courage is necessary to activate the other virtues. By clarifying the result we want to create, by becoming internally directed, other focused, and externally open, we exercise the courage to reduce our hypocrisy. As described, this act of courage may activate positive emotions and increased performance. Thus, movement in the moral realm triggers various physiological and psychological processes that can spread to create general patterns of excellence.

ORGANIZATIONAL TRANSFORMATION

Over time, an organization turns various patterns and processes into routines. Roles, identities, and power patterns emerge. As denial continues, the organization loses alignment with the external environment and secures fewer external resources. As denial occurs, trust, cohesion, and coordination decay. As the gap between the internal capacity and the external demands increases, conflict also increases. People begin to lose hope in the collective purpose. They turn to preserving their self-interest and collude in the slow death of the organization. This unconscious conspiracy results in increased entropy. When this happens, change can occur only if someone cares enough for the collective good to risk his or her personal good. That person must take the risk of trying to change a system that does not want to change. This kind of commitment is rare. Such commitment requires the exercise of integrity and courage and may give rise to the fundamental state of leadership.

In entering the fundamental state of leadership we begin to transcend the normal or creative state. In place of denial and resistance, we practice choice and action; we have begun to genuinely *lead* our lives, rather than merely respond. In doing so, we tend to engage in the co-creation of our external world. By entering the fundamental state of leadership, we overcome our fears and become far more

aware of what is possible. By acting on possibility, we change not only ourselves but also the world around us.

In addition, an individual's deep change and entrance into the fundamental state of leadership can affect others. Interaction with a person in the fundamental state of leadership can have transformational effects. In seeking a desired result instead of simply solving a problem, we see things that others cannot see. In particular, we may see potential in others that they cannot see in themselves. When they are reactive and in denial, stuck on the path of least resistance, they cannot see potentialities. If we are in the fundamental state of leadership, we see the potential, and we tend to call others to a higher standard while providing increased support for them to risk pursuing that standard.

A basic assumption of the social sciences is that individuals seek their own self-interest, a dynamic that is at the heart of the slow death phenomenon in organizations. As organizations move toward entropy, more and more people tend to pursue self-interest, and the process of slow death is accelerated. The only way to break the downward spiral is to transform the system. Just as an individual emerges from deep change with new awareness and capability to work in the current emerging reality, so it is with organizations. People become more hopeful and more committed. Trust increases. More information flows through the invigorated network of relationships. Everyone has more energy. The collective interest and the individual interests tend to become a common set. People are then more willing to sacrifice for the good of the organization. The organization acquires new collective capacities, and performance tends to increase.

At this point, at least two reciprocal upward spirals are unfolding. The first spiral is within the individual. In the committed state positive emotions and positive thoughts may begin spiraling upward, giving rise to new awareness. The second spiral is within our relationships. We are joining with others, igniting one another's positive emotions, and moving each other towards increased hope, exploration, and discovery. The two spirals themselves now join in a reciprocating relationship. The group may thus

increase in purpose, integrity, connection, and emergent and spontaneous learning.

In this way, entering the fundamental state of leadership may give rise to emergent, spontaneous, or unplanned patterns of organizing. In the first of the reciprocal upward spirals, we experience the emergence of a more unique and complex self. We are simultaneously becoming more differentiated and more integrated than we were previously. We are becoming more differentiated because we are developing new awareness and new capacities; we become increasingly different from others. However, we are also becoming more integrated or aligned with the dynamic, external environment and with our internal values. We are becoming more connected to our purpose; the result we want to create tends to become more of a calling. We are also becoming more connected to the people who journey with us.

The second spiral gives rise to emergent organization. In the transformational state of leadership, we become disruptive of the status quo. We represent a new set of assumptions and perspectives. The old, recalcitrant organization is challenged. Because we are in an abnormal condition, we engage in acts of positive deviance. We become a disruptive signal to others, a distortion in their expectations of how things should be. They must stop to make sense of our altered state, broadening their own awareness by doing so (Nemeth 1986). We become a living invitation to change. We entice people to join us in the fundamental state of leadership. To do so they must transform themselves. This joining is also a dance of co-creation. As it unfolds, a new organization emerges. We do not plan it. It emerges through a process of interpersonal contagion and interaction.

Being in the fundamental state of leadership requires commitment and intense focus. It is a temporary state. In it we experience expanded awareness and expenditure of energy but we eventually return to the normal state. This shift provides a period of consolidation, sense making, and recovery. Eventually the new plateau becomes our normal state, our new zone of comfort. To leave it we must again enter the fundamental state of leadership. It is normal to resist the need to move back into the fundamental state of leadership, yet the experience of having been there

once may serve as a facilitator of reentry. Multiple episodes of moving in and out of the fundamental state of leadership contribute greatly to our development as human beings and as leaders of change because we gain intellectual and emotional assets that improve performance and broaden awareness.

IMPLICATIONS

In summary, deep change is transformational change. Observations of people making deep change give rise to the concept we call the fundamental state of leadership. The concept deviates from normal thinking about transformational leadership and also provides a tool for leaving the normal state and entering the fundamental state of leadership.

Unlike most approaches to leadership, this one does not put heavy emphasis on position and authority, on traits or behaviors, or on techniques for changing others. Much work on leadership focuses on people in positions of authority and automatically defines them as leaders. The CEO, for example, is normally referred to as the leader of the company. Since most of the time most people are not in the fundamental state of leadership, most of the time most authority figures, including CEOs, are not leading. On the other hand, anyone can choose to enter the fundamental state of leadership and thus become a leader. Anyone can be transformational. This suggests extreme accountability. We are all responsible for the creation of the world in which we choose to live.

Most leadership approaches seek to identify those traits and behaviors that make leaders effective. This approach does not. It suggests that when we enter the fundamental state of leadership, we develop new patterns of behavior uniquely matched to the context in which we operate. Transformational success cannot be imitated. It must, in each case, be created.

Nearly all leadership and management approaches suggest techniques for changing others. This one does not. It suggests that the key to transformation is self-change. We can only transform others by becoming more centered on results, more internally directed, more other-focused, and more externally open. When we do these things, we distort the context and gain attention. We model increased integrity

and moral power. We attract some people to greater challenge, higher self-regard, enriched relationships, and significant personal growth. The same cues repel others and give rise to resistance and conflict. As these things happen, we experience new patterns of organizing.

The concept also serves as a practical tool. We can increase the probability of exercising transformational influence by asking ourselves four key questions: What result do I want to create? Am I internally driven? Am I other-focused? Am I externally open? Truthful answers to these questions tend to change our perspective and our behavior and tend to impact the context in which we operate. We begin to lead deep change.

DEMOCRATIC LEADERSHIP

Before we can understand and evaluate different aspects of democratic leadership, it is necessary to explain the roots and intention of democratic thinking. People are social entities, interacting in groups and societies. Evolution selected communities as the favorable environment because more advantages existed for members of communities than for isolated individuals. The strongest communities have been the ones that are able to maximize benefits for their people (or at least some of them) and are capable of defending themselves against the claims of others. However, communities face inherent problems, because although individuals have common goals (such as security), they also have different needs, motives, interests, and values, and these differences can provoke conflicts. The probability of conflicts increases if scarce resources (whether tangible or intangible) cannot be divided in such a way that all claims can be fulfilled.

Given the situation described above, it makes much sense to establish regulations that protect each individual from unjustified attacks by others and to guarantee a fair procedure for resolving conflicts. Different answers have been formulated during human history to satisfy this need for regulation. More than two thousand years ago the idea of handling one's own affairs as an individual responsibility arose: "From ancient times some people have conceived of a political system in which the members regard one another as political equals, are collectively sovereign, and possess all the capacities, resources, and institutions they need in order to govern themselves" (Dahl 1989, p. 1). This idea, the transformation of rule by the few to rule by the many, was put into action in the first half of the fifth century BCE among the Greek city-states (*polis*). This political order has been called democracy, although this type of democracy differs quite a bit from current understanding and practice. The word is derived from the Greek words for "people, nation" (*demos*) and for

“power, control, authority” (*kratein*). So, the political term *democracy* means nothing less than the power of the people, or the dominion of the many, whereby the people may participate in power directly or representatively. One necessary requirement for the idea of representation is that transferred power has to be used for the well-being of the people.

Democracy has not always carried the positive connotations it does today. The majority of philosophers and political scientists viewed democracy with suspicion for a long time, in large part because of their view that the mindless masses were capable only of creating riots and following false prophets. Democracy therefore appeared to be an unstable social system that would degenerate into tyranny. Even the great philosopher Plato (c. 428–c. 347 BCE), living next to the cradle of the origin of democracy, was critical of democracy, which he felt lacked order and responsibility. Later thinkers raised similar arguments. The French social psychologist Gustave Le Bon (1841–1931), for example, observed that in groups or masses, individual differences vanish and make it possible for strong leaders impose their will on others. For him and other thinkers, a leader’s legitimacy came from wisdom, birth, property, or God. These sources have lost much but by no means all their power to grant legitimacy, and their influence waned only gradually.

The most prominent changes that led to the displacement of those sources of a leader’s legitimacy were (a) a growing mistrust of an alleged divine order; (b) the success of the heliocentric worldview, which had serious consequences for existing political and social regulations; and (c) the overwhelming need to justify a lack of equality if it were to be allowed to persist. Important material changes occurred as populations and economic prosperity increased. Economic success for more and more people shifted values and provoked the claim that they had a political right to codetermination. However, not before the twentieth century was democracy seen in an increasingly positive light in such regions or countries as Western Europe, the United States, Australia, India, and Japan, to name but a few. Many countries—or at least their governments—still have different conceptions about regulating political and social order.

Nor should readers leave with the impression that democratic societies face no problems or that they are on all points superior to alternative conceptions. On the question of the relative merits of democracy, political scientists give different, often balanced answers. However, to mention some essentials of modern-day democracies, it is typical for democracies to have free, equal, and secret periodic elections, competition of parties, authentic freedom of thought and information, the possibility of coalition building, different kinds of checks and balances, protection of minorities, and the embeddedness of all procedures in justified and constituted law. Political leadership—which is outside the scope of our considerations here—can be, for most political theorists and probably for most people, characterized as democratic when it is based on institutional distributed power that is on the whole accepted.

Starting with the theories of Aristotle (384–322 BCE), many different normative or empirical theories about democracy have gained influence that specify requirements, contents, and procedures of and in democratic societies or that inform us about varieties of democratic cultures. Two very important threads in this discussion are whether subsystems of societies should, like the society at large, be evaluated by democratic standards and whether democracy should strive for participation as far as possible, beyond representative, mandatory forms. When it comes to legitimizing political systems, some theories focus more on the normative aspect of legitimation (these are characterized as input oriented), while others define desirable performance requirements for political systems first and then define corresponding conditions for them (these are characterized as output oriented).

LEADERSHIP AND ITS PROBLEM WITH DEMOCRACY

Like democracy, the phenomenon of leadership has been studied since antiquity, and different approaches characterize the landscape of research. Many articulate positions from the leader’s perspective. Starting with trait theory in the early 1930s and ending in the 2000s (at least temporarily) with trans-

formational and neo-charismatic theories, the focus has been on the person of the leader. Special traits or a combination of traits (such as energy, intelligence, and prosocial behavior) or a distinctive behavior (such as initiating structure) generate particular effects that are associated with leadership. Sometimes situational variables are taken into account, too, as with path-goal theory. Only very few approaches, such as attribution theory or implicit leadership theory, consider the follower position and try to answer leadership-related questions from the followers' perspective.

Conventional views of leadership assume a kind of natural downward gradient of maturity, according to which the leader as a superior person leads followers to the goal. Those who are led are seen as less active, less knowledgeable, and less willing to take responsibility. Although the (moral) superiority of the leader is not theoretically and empirically reasoned (consider, for example, the fact that in most organizations most leaders are also followers), it dominates leadership thinking, teaching, and practice. Certain myths are passed from one generation to the other. The presence of these seldom questioned presuppositions shows that democratic ideas are not central to the understanding of leadership yet. Rather, a relationship is constructed in which autocratic leader behavior—or at the very least behavior that is determined by the leader's values, attitudes, and aims—seems to be functional. Accordingly, most leadership approaches that are action oriented try to develop techniques by which the leader's intentions can be realized. This thinking is—or was—very compatible with the functioning of social entities, particularly business organizations, in which the hierarchical principle is seen to be necessary for the coordination of divided work and for efficiency.

Destoolment of a Chief

The following extract of ethnographic text describes how and why an Ashanti chief in Ghana might be removed from office. Although the Ashanti political system is not democratic in general, democratic principles are used to ensure that the chief is effective and competent.

The Ashanti had a constitutional practice which ensured that the will of the people was given consideration. They had ultimately the constitutional right to destool a chief. As the fundamental principle was that only those who elected a chief could destool him, a destoolment required the consent of the elders. Sometimes they initiated a destoolment themselves when, for example, a chief repeatedly rejected their advice, or when he broke a taboo, or committed a sacrilegious act. The kind of offences for which chiefs were destooled may be gathered from the following instances of destoolments recounted in the traditional histories of the Divisions.

Chiefs Kwabena Aboagye of Asumegya, Kwabena Bruku, and Kwasi Ten of Nsuta were destooled for drunkenness; Kwame Asonane of Bekwai for being a glutton (adidifurum); Kwame Asona, also of Bekwai, for dealing in charms and noxious medicines; and Akuamoa Panyin of Juaben for his abusive tongue, and for not following the advice of his elders. In Kokofu, Osei Yaw was destooled for being fond of disclosing the origin of his subjects (i.e. reproaching them with their slave ancestry), and Mensa Bonsu for excessive cruelty.

A chief was also destooled if he became blind, or impotent, or suffered from leprosy, madness, or fits, or if his body was maimed in a way that disfigured him.

This dominating view has been challenged for two reasons. First, from an economic point of view, some have suggested that more democracy could, under specified conditions, lead to more efficiency. Second, from a moral point of view, some are of the opinion that democracy is not a principle that is only valid in certain areas (such as political leadership) and not in others (such as organizational leadership). While the first point addresses the risk of suboptimality in performance, the second point, which questions the presupposed superiority of leaders, leads to a debate about ethics that is grounded in moral philosophy. In the first case, democracy is an instrument that supports economic organizational goals; in the second case, democracy is a moral value.

CLOTHING LEADERSHIP IN DEMOCRATIC VESTMENTS

Bearing the previous discussion in mind, it is not surprising that there is no clear definition of *democratic leadership* within academia. On the contrary, there is a conceptual ambiguity and operational inconsistency: Content, degree, form of, and pretension to democracy differ. This has led to the same phenomena being discussed under different terms (for instance, consensual leadership or superleadership). However, everyone seems to agree that democracy has something to do with self-determination. In this context, the Kantian principle that every man should be treated as an end and not as a means is to be remembered. Self-determination itself implies (primarily) participation in decisions about one's own affairs. It is a question of distributing power.

The term *participation* is used here in its original, political meaning because within the leadership discussion participation is often downgraded to mean a form of mere articulation or a standpoint. Articulating something is different from deciding something. The psychologists Edwin Hollander and Lynn Offermann argue that the area of subordinate participation is "one of the clearest bridges between the study of power and leadership in organizations" (1990, 183). This leads to the conclusion that if one wants to know something about the influence of democracy on leadership, one has to question the leadership discussion about the integration of participation (as well as delegation), which in turn requires an understanding of the main streams of leadership theory. Grounded in the logic of traditional leadership, the aspect of performance and efficiency dominate these theories directly or indirectly.

THE BEGINNINGS

It was the social psychologist Kurt Lewin who, at the end of the 1930s, introduced scientific research into the thinking about democracy in leadership. The main idea in a series of studies was to investigate "democracy" and "autocracy" as group atmospheres and observe the consequences for different social and performance behaviors. Lewin and his col-

leagues at the Iowa Child Welfare Research Station shared the opinion that success in the classroom depended not only on the skills of the teacher but to a great extent on the atmosphere that was created. The atmospheres of the two experimental groups was manipulated as follows: In the authoritarian group, which was seen as the opposite of a democratic group, all decisions were made by the authority. In the democratic group, common determination was preferred; explanations and advice were given by the authority, and children were free to work with one another. The findings indicated that in the democratic group more cooperative and constructive behavior was found, the feeling for group property and group goals was higher, and the group structure was more stable. In addition, the products of the democratic group were superior.

The scholars Robert Tannenbaum and Warren Schmidt offered a more conceptual approach at the end of the 1950s. They tried to enrich the polarized spectrum of leadership styles by introducing gradations between the extremes. They stated that direction (authoritarian style) and participation (democratic style) are only two halves of a continuum, and they differentiated between the behavior of leaders who make and announce decisions without offering reasons and leaders who permit followers to function freely within limits. This opened the way for a more sophisticated discussion.

THE SPREAD OF DEMOCRATIC LEADERSHIP THEORIES

The organizational psychologist Rensis Likert, who advocated democratic approaches in organizations in the late 1960s, had not only leadership but also organization structure and climate on his agenda. The so-called human relations movement proposed that democratization could increase effectiveness and satisfaction, particularly in the long run. Empirical studies supported the satisfaction hypothesis but could not demonstrate overall superior effectiveness.

Also in the sixties, the scholars Robert Blake and Jane Mouton presented their renowned managerial-grid model. They, like many others, built on the find-

ings of the so-called Ohio school and Michigan school of leadership, where two main independent dimensions of leadership behavior were identified empirically: initiating structure (task orientation, concern for production) and consideration (relations orientation, concern for people). For Blake and Mouton, the ideal leader scored a 9.9 on their “management grid.” This style is characterized not only by participation, but also by openness, trust and respect, mutual support, and much more. The authors are convinced that this style has a positive effect on many performance criteria.

Around 1970, the scholars Paul Hersey and Kenneth Blanchard introduced a situational leadership model in which the maturity of followers was connected with four different leadership styles: telling, selling, participating, and delegating. The maturity level of followers differs by task and experience. What is required is a match between the leadership style and the followers’ maturity. It is worth mentioning that the maturity level is defined by the leader, and that he or she has the undisputed power to determine the amount of follower participation. In this sense, participation is treated as purely functional.

A few years later, the theorist Fred Fiedler proposed his contingency model of leadership. Using the attitude of the leader’s least-preferred coworker as a measure, leaders are characterized as being either task or relations oriented. Taking into account three situational variables (position power, task structure, leader-member relationship), the theory proposes that in favorable situations in which the leader has full control over the situation and in unfavorable situations in which the leader has little control, task-oriented behavior promises higher success. In situations that fall between those extremes, a relational style should be effective. This is, Fiedler notes, the conclusion of many empirical studies. In short, it appears that follower participation is a necessity under certain conditions if the leader wants to be effective. However, participation has no value on its own.

The path-goal theory of leadership, strongly associated with the management scholar Robert House, tried to reconcile conflicting empirical findings concerning task- and relations-oriented behaviors. The

problem was that the effects of prescribed style recommendations were found to be contradictory. To address the problem, new situational moderators of the relationships between the main behavior dimensions and their effects were developed. In sum, four leader behaviors (including participative style); a number of moderators of task, environmental, and follower traits; five intervening variables; and two dependent variables were used. Nevertheless, in this theory too, the focus is on the functionality of the leader’s behavior.

The decision process theory put forward by Victor Vroom, Philip Yetton, and Arthur Jago is probably the most explicit leadership style theory that includes participation. This prescriptive model indicates when leaders should be directive and when they should be participative. The overall question is in which situations the superior can take complete responsibility for decisions and in which situations the subordinates should take part in the decision. The effectiveness of a decision depends basically on two, not completely separable variables: the quality of the decision and the degree to which the decision is accepted. The decision procedure will affect these two variables differently. In 1988 more outcome variables were considered (concern for subordinate development and concern for the time it took to make a decision). A basic assumption of this model is that subordinates’ participation increases the degree of acceptance of the decision—assuming acceptance is necessary. Thus, acceptance will be low for autocratic decisions and high for joint decision making. A functional perspective assumes that acceptance is a must when the subordinates are to implement the decision or when the decision has long-term effects on motivation.

The question of decision quality, in contrast, relates to how well the decision helps the organization meet its goals. The authors take five types of decision making into consideration: two varieties of autocratic decision making and consultative decision making, and one variety of joint decision making. Joint decision making, in this theory, involves generating and evaluating solutions to problems and attempting to reach a consensus on a solution. In some situations there is more than one acceptable

decision-making style; in those cases, the leader's preferences are significant.

CURRENT DEVELOPMENTS

New organizational developments—in particular, market competition—in the late 1980s forced renewed thinking on the topic of follower participation. Organizations were finding they lacked the ability to adapt and respond successfully; qualities previously associated with effective management were insufficient. Leadership theorists answered in two ways. First, whereas the previously effective behaviors had required leaders simply to react to changes in markets and competition, theorists now proposed that leaders needed a more proactive stance. It would also be necessary to elicit from followers higher levels of loyalty, trust, and performance. The theory that addressed that angle, well-known under the label *transformational leadership*, envisions a more skilled, more fulfilled follower, but doesn't address the question of democratic leadership. Rather, the downward gradient of maturity mentioned earlier is presumed: The leader is acting on behalf of the followers.

Second, some theorists suggested that more decision making and responsibility should be decentralized and delegated to followers. Empowerment and superleadership are important catchwords for this development. Although it is assumed that leaders control this process and have, accordingly, the power to determine the amount of shifting of decision power down the hierarchy, the aim is to enable another person to act more strongly on his or her own. One might call this a form of paternalistic democratization in social relationships. However, this development too is forced by the desire to achieve greater efficacy. Moral aspects may be an additional motive but are not the driving force.

The situation is seen totally differently by people who claim a moral right to participation. They stress the principle that all who are affected by a decision have a right to participate in the decision making. Their claims are grounded in moral philosophy. Ethics, they argue, are not a matter of situational variance or economic success. The only important point

is that one person, the leader, due to his or her hierarchical position, can fall back upon the right to exercise power that is denied to followers. Because this course of action has empirically provable consequences regarding subordinates' personal work satisfaction, it cannot be ignored. "The key question is how to ensure that such significant consequences are positive and beneficial to all concerned" (Singer 1997, 147). From the days of Aristotle in the fourth century BCE, philosophers have asked what obligations result from an asymmetrical dependency relationship, particularly for the stronger party. For the most part these days, however, that line of thought is passed over in favor of one in which steps toward more participation are required and always positively valued, and contingency factors are worked out to increase the probability of successful participation. It is fair to state that a clear normative position lacks wide support in the leadership discussion. This is, of course, not proof against its appropriateness.

FUNCTIONS AND REQUIREMENTS OF DEMOCRATIC LEADERSHIP

In addition to the two developments mentioned above, there is a growing body of literature that focuses on the active roles of followers in the leadership process. This literature is not about democratic leadership, but it indirectly builds foundations for a stronger regard for it, because it asks how followers perceive leaders and under what conditions legitimacy is ascribed. This is an old question. Historically, following the famous German sociologist Max Weber, three types of legitimate power are identified: legal (for example, an elected government), traditional (for example, a monarchy), and charismatic (personal). It is important to stress that all these forms are based on the hierarchical principle but that this does not determine how the internal control processes work. For instance, both in a legal and in a traditional order, democratic coordination is allowed to occur. The amount differs. In contrast, command and total control represent only a very extreme position.

What we can learn from this is that followers' perceptions constrain the behavior of the leader.

Suppose that—and there is empirical evidence for this, for instance, in value research—followers expect to be able to participate. The attribution of leadership depends on how far people are allowed to set goals, make decisions, solve problems, and are involved in change processes. In this sense, leadership is a socially accepted influence process, with followers defining if and when it occurs. Leadership becomes democratic when this acceptance relies on “basic democratic principles and processes, such as self-determination, inclusiveness, equal participation, and deliberation” (Gastil 1994a, 956). John Gastil identifies three primary functions that a democratic leader should fulfill: distributing responsibility, empowering others, and aiding others in their deliberations. These obligations are equally valid for both large and small social groups. Members differ in needs, skills, time, and availability. Therefore, a variety of opportunities for involvement should be built into the structure of the organization. Leaders and other members of the organization must tolerate some members’ refusal to take their full share of responsibility.

Leaders should help members to develop technical and emotional maturity and should avoid a know-it-all attitude. Leaders should foster the emancipation of consciousness and pursue the ideal of making members into leaders. Problems must be analyzed by the group, and therefore information must be shared. Disagreement has to be dealt with in an open and constructive way. Groups must make concerted efforts to address existing inequalities based on gender, age, race, or formal education and must try to consider the consequences any solutions they propose will have. Possible solutions should be reflectively discussed without using coercion. The collective interest of the group should be revealed. A spirit of congeniality should be developed, and accepted norms must be actively in the collective mind. Because no leader will be able to act on this alone, the narrow (organization) and broader context (society) should assist leaders in this task. Here it is important to remember that behavior is produced by values, motivation, skills, and structures. Bearing that in mind, clear, accountable and transparent structures, the democratizing of knowledge, better

communication techniques, and deliberate leadership development programs make sense.

LOOKING AHEAD

This entry has shown that democratic leadership can be viewed from both an economic and an ethical perspective. Both perspectives are vibrant in the leadership discussion although the economic viewpoint prevails. At present it is not clear how widely democratic behavior is practiced or what effects it has under various circumstances. Nor is it known how willing either leaders or followers are to embrace it, or what behavior and institutional precautions support or inhibit democratic leadership in different situations. Nevertheless, there is ample evidence that the democratic style of leadership fits quite well with personal values and organizational necessities. This may be a practical consequence of the statement of the philosopher John Dewey (1859–1952), who declared that democracy was not a mere political form but a way of being, living, and relating.

We must bear in mind, however, that democratic leadership is an ideal toward which an organization can strive but that may not be entirely achieved, as serious barriers to success exist. Moving toward democracy means that some people lose their advantages, and for others leading becomes more difficult. This is not easy to accept and not easy to manage; there is evidence that it will take time for people to learn new leader and follower roles (rights and duties). There is no doubt that certain social, economic, and political environments increase the chances for democratic solutions. In any case, one need not be a prophet to predict that the clamor for democratic leadership in organizations will not fall silent.

DIRTY HANDS

Leaders are said to get their hands dirty when, for the sake of what might be called a “higher cause,” they engage in behavior that is generally thought to be morally wrong. Accordingly, immoral action that makes a leader’s hands dirty cannot be just any kind of wrongdoing. Purely self-interested leadership behavior, for example, will not constitute cases of dirty hands, even if this behavior is clearly immoral. For an instance of wrongdoing to be characterized as a case of dirty hands, it must be true that the leader did what he did in the service of something larger than himself. The defining feature of this particular kind of wrongdoing is that leaders who get their hands dirty do so for the good of others, in much the same way that anyone working for a common goal might roll up his or her sleeves and undertake distasteful or objectionable work in order to get the job done.

The analogy to manual labor is not perfect, of course, because it is ultimately moral muck into which leaders dip their hands. Dirty hands cases thus give rise to conflicts between what common morality requires of leaders and the other demands that positions of leadership bring with them, not to conflicts between what leaders would rather be doing and what they must do for leadership effectiveness. From the standpoint of ethics, the potential for conflicts between morality and goal achievement is worrisome enough in its own right. But the problem of dirty hands presents a deeper worry, one arguably central to the very nature of leadership. According to advocates of dirty hands analyses, leadership ethics necessitates this kind of behavior. Meeting the ethical demands of leadership, specifically, doing what

really is morally right by followers, often leaves leaders nevertheless having done a moral wrong. The ethical reality of leadership is such that leaders cannot be expected to keep their hands clean.

CATEGORIZATION OF DIRTY HANDS CASES

Dirty hands cases can be roughly categorized in terms of the parties that are potentially wronged by such leadership behavior: other leaders, followers, or outsiders. The defense of dirty hands cases in the first category finds its origin in Machiavelli's *The Prince*. Machiavelli (1469–1527) argues that “a ruler who wishes to maintain his power must be prepared to act immorally” because he is almost certain to be surrounded by “many unscrupulous men” (Machiavelli 1532/1988, 54–55). Max Weber (1864–1920) similarly holds that “[since] the world is governed by demons . . . it is *not* true that good can follow only from good and evil only from evil, but that often the opposite is true.” Weber concludes, “Anyone who fails to see this is, indeed, a political infant” (Weber 1946/1958, 123). The point of these authors and others like them is that leaders, especially political leaders, find themselves in an environment in which adherence to standard moral principles would put them and, more to the point, their followers at a significant disadvantage. Unfortunately, sometimes engaging in dirty hands behavior when dealing with other leaders is the best available option.

The second category of dirty hands cases identifies potential wrongs done to followers. In some circumstances, leaders pursue group goals by treating followers in ways that are generally thought to be morally wrong. Kenneth Winston of the Kennedy School's Center for Public Leadership appeals to “the necessity of moral opportunism” to define this category: “The public official cannot always wait. And since others may not agree, indeed may not even understand what is being proposed, prudent officials find it necessary sometimes to resort to manipulation, deception, even coercion—for the public good” (Winston 1994, 38). Admittedly, in this category of dirty hands cases, the potential wrong done to followers lends itself to the counterclaim that, in the end, the behavior in question is for their own good.

That said, proponents of dirty hands analyses contend that these leaders are still left having done a moral wrong to followers, despite whatever good might have been achieved for the group as a whole.

The third category of dirty hands cases draws our attention to potential wrongs done to outsiders. This category is characterized by cases of straightforward conflict between the good of a leader's group and the good of one or more individuals outside the group. Maintaining that there is a moral dilemma at the core of the problem of dirty hands, commentators on cases within this category defend the significant partiality embodied in the choice of the former good over the latter and yet deny that leaders keep their hands clean when they make this choice. As political theorist Michael Walzer articulates this line of reasoning, the dilemma of dirty hands is indicative of the fact that there is not complete “coherence and harmony of the moral universe” (Walzer 1973, 161). One result of this metaphysical disunity is that leaders will sometimes face choices for which complete justification of their behavior is not forthcoming. No matter what they do, they will be left having done a moral wrong.

RESPONSES TO THE PROBLEM OF DIRTY HANDS

There are three possible responses to the problem of dirty hands, one of which is a straightforward realist response and two of which are standard idealist responses. The realist response says that we have no choice but to embrace the problem of dirty hands; in fact, leadership ethics would be unrecognizable without it. In contrast, idealist responses hold either that leadership behavior in dirty hands cases is immoral or that the immorality of this kind of behavior must be explained away by appeal to the dictates of idealist moral theory itself. The first version of the idealist response advocates a strategy of absolutism. Leaders should keep their hands clean by adhering to standard moral principles, and they have full justification for their behavior when they do so. The second version of the idealist response suggests a strategy of reconciliation between dirty hands cases and what morality really requires of leaders. For exam-

ple, consequentialist moral theories such as utilitarianism allow that behavior generally thought to be morally wrong can be fully justified when it maximizes happiness or well-being. The wide range of possible responses to the problem of dirty hands means that choices between them will have important implications for an understanding of the moral demands on leadership behavior.

DISCOURSE ETHICS

People—and, in context, leaders—have to make decisions. Leaders make decisions that significantly affect the integrity and autonomy of other people. However, as Joanne Ciulla notes at the start of her treatment of leadership ethics, “We live in a world

where leaders are often morally disappointing. Even the greats of the past . . . are diminished by probing biographers who document their ethical shortcomings” (Ciulla 1995, 5). This might be even truer for leaders in everyday life, such as organizational leaders. Pressure for profits, increasing in companies as a consequence of globalization worldwide, requires acknowledgment. Pressure on managers often leads them to focus only on things that bring in money and ignore the needs, goals, and rights of those being led. Ethical questions and reflections about morality are—as a consequence—not on the agenda. Although for-profit organizations are of higher interest in this situation, nonprofit organizations are similarly affected by ethical questions because leadership relations occur in every type of organization.

Leadership relations are interactions and as such subject to moral rules and ethical reflections. Nevertheless, rarely has leadership research asked whether the form and extension of influencing subordinates have any limitations. *Limitations* here does not refer to boundaries given by law; these are obvious and can easily be handled in principle. Rather, limitations here refers to those boundaries grounded in morality. This invisible boundary of action is likewise important. Every community and every group relies on it and cannot fulfill its task efficiently if standards of moral behavior are disregarded. Moreover, because people—and, in context, subordinates—have value in their own right, questions of moral behavior are always present. However, because most leadership approaches have been articulated from the leader’s perspective and are concerned mainly with efficient organizational goal attainment, moral behavior remains in the shadow. Only a few approaches consider the follower position and, as such, allow thinking confined to effects of behavior besides efficiency. These include attribution theory (which explains both the process by which persons are distinguished from others as leaders and how individuals systematically search for different causes of their behavior and the behavior of others) and implicit leadership theory (which deals with cognitive processes of the people being led—perceptions, evaluations—when confronted with leaders and leadership attempts). Ethics is con-

cerned with *moral behavior*, which refers to an act that is to be valued as good, hence justified. Ethics is concerned with perspectives and criteria of moral behavior without giving valued answers for a concrete situation itself or at all. Three main streams of research are distinguishable: normative ethics, descriptive ethics, and meta-ethics. Normative (or prescriptive) ethics is concerned about the correctness of statements with regard to moral values and action norms. Two parts are worth mentioning: On one side exists a material ethics that presents values and norms that should be fulfilled. On the other side exists a formal ethics that deals with procedures about finding solutions in conflict situations. Descriptive ethics examines the psychological, biological, social, and historical bases of judgments. It especially examines practiced norms and interprets them. Finally, meta-ethics—often called “analytical ethics”—deals with the problem of separating moral from non-moral questions and asks about the epistemological (relating to the study of knowledge), ontological (relating to existence), and philosophical foundations of statements of values and norms. Meta-ethics helps us to understand why and when differences between different ethics exist and—importantly—whether and how it is possible if at all to justify a (universal) truth of moral judgments.

Such judgments are important for leadership. Everyday life contains a lot of situations where morality matters. Are politicians allowed to temporarily ignore morality in a crisis? Are employees to be treated as a means and not as subjects in pursuit of profit? Are leaders allowed to make decisions on their own and, if so, without any restrictions? Are organizational goals considered to be more important than individual goals? Is there any limitation? Where are the limitations? These are only a few questions that should demonstrate that all of us are affected by these sorts of questions. Conflicts, such as “You must do this for me” versus “I need give you only this much for the money I earn,” or critical situations such as “Weekend overtime is required” are the daily life in organizations. Unfortunately there are no easy answers. However, this does not mean that we cannot find some guiding paths that can help us more consciously to bridge the gap

between “right” and “wrong.” Normative ethics is concerned precisely with this.

MORAL BEHAVIOR

To start, we should take a deeper look into the development of moral behavior. The Swiss biologist Jean Piaget (1896–1980), who is famous for his work in developmental psychology, explains the adoption of morality as follows: Children learn from their parents. They learn which behavior is allowed and which behavior is forbidden. At the beginning stage children experience rules by obeying instructions, regulations, and necessities. So, the learned duties are heteronomous (Greek: *heteros* = extraneous; *nomos* = law). In a phase of transition children obey rules not because obedience is authorized by their parents but rather because obedience is required by the rules themselves. Children have learned that rules are not an accidental product, made by their parents, but rather something that is formed in and socialized by culture. Gradually the range of valid rules expands. In the end—and this is the stage of morality—children are able to reflect on rules critically with respect to their moral content. Here autonomy takes place. For the German philosopher Immanuel Kant (1724–1804), the intellectual pioneer of the eighteenth-century period known as the Enlightenment (marked by the belief that reason is the source of all knowing), maturity (*Mündigkeit*) is the prerequisite for autonomy.

Piaget’s most important point is that morality is learned but that children know that sometimes morality has no value in itself but rather helps to coordinate activities between humans justly and peacefully. Only a rule that guarantees the freedom of action for everyone in a community in the best possible way can be qualified as a moral rule at all. Everyday we judge others or ourselves: We condemn politicians for their decisions, we honor a young person who respects elderly people, and we encourage a colleague at work to articulate his or her position to the superior, or we feel guilty about doing or not doing something. Following James R. Rest, moral behavior consists of at least four elements: moral sensitivity (analyzing and interpreting a situation),

moral judgment (deciding between right and wrong), moral motivation (preferring certain values), and moral character (doing what corresponds to beliefs and intentions). If we ask ourselves whether and how such evaluations of events or behaviors can be reasoned and justified, the time for ethics has come.

ETHICS IN LEADERSHIP

In general, ethics has no real tradition in leadership studies. Following Rabindra Kanungo, this is true of even the most cited theory in organizational leadership research of the last decade, namely transformational leadership (leadership behavior that transforms followers' attitudes and values to so-called higher-order levels and achieves extraordinary standards of motivation, commitment, trust, and performance). However, there were always impressive exceptions. John W. Gardner's *On Leadership* (1993), written from the perspective of a practitioner, is one example; James MacGregor Burns's renowned *Leadership* (1978) is another. Both books reflect on the moral dimension of leadership. Joanne Ciulla's more recent *Ethics, the Heart of Leadership* (1998) discusses essential basics in greater detail. With respect to transformational leadership, the writing of Bernard Bass and Paul Steidlmeier at the end of the 1990s deserves special attention.

The consequence of this remarkable deficit of ethical reflection is that the leading discipline of ethics, moral philosophy, is not taken into consideration for leadership issues as it is for other disciplines such as sociology or politics. This limits our understanding because developments in these disciplines are not discussed in leadership. Moreover, mostly only one—the traditional stream of moral philosophy—is pursued. This is a shortcoming. If we consider the approaches that have emerged within the history of ethics so far and that dominate the controversy about “correct” ethics, we have to conclude that traditional ethics is only one part. Traditional (also called “premodern”) ethics covers basically two separate “ethics.” On the one hand is theological ethics, which claims to be the “revealing knowledge” of original religious texts (e.g., the Bible), which are given to humans by a higher authority (God) and

contain (material) action standards (e.g., the Ten Commandments). On the other hand is so-called goods or virtue ethics, which proceeds from a higher objective (Greek *télos* = a goal) founded on the “nature of humans” and/or “highest values and goals,” which each human should strive for and which can be attained in particular by “virtuous” acting. Frequently at its center are found the “cardinal virtues” of temperance, courage, justice, prudence, fortitude, and moderation, as described by the Greek philosopher Aristotle (384–322 BCE).

Both traditional ethics are justified metaphysically. This means that nonhuman arbiters (God, nature) and detailed do's and don'ts guide action. If leaders develop a “correct understanding” of these guidelines, such as Aristotelian virtues, and transform them into an “action standard,” then a true moral behavior is executed. The legitimation of the position taken is based on value decisions. Other theoreticians could approach the subject with other value references to other attitudes. The German philosopher Jürgen Habermas speaks of an “ethnocentric fallacy” (Habermas 1995, 75). Further, traditional ethics and its most prominent part, virtue ethics, are person-centered and do not regard the character of leadership as a relation.

In this perspective the leader is seen as a morally superior person who knows if he or she is guided by a certain metaphysical prescription. Those who are led are thereby seen “as less active, less knowledgeable and as having less access to the (privileged) goals and interests possessed by the leader” (Dachler and Hosking 1995, 11). However, why must we see a follower in this way? We should not forget that a leader in one leader-follower relationship is a follower in the next. So, is he or she less responsible in the latter?

This and other general questions have already been addressed by Kant. He expresses one of his ideas in a famous maxim: “Act in such a way that you honour humanity in each person as much as that of any other person, always as an end, and never simply as a means” (Kant [1785]1947, 54). Everyone who wants to act ethically has to think about the general validity of the intended action. Accordingly, each person has to make decisions compatible with

his or her conscience. The consequence of this egalitarian philosophy for leadership is that leadership actions are ethically responsible when the leader is able to justify his or her action and the implications for the work and life quality of the follower in relation to his or her conscience. This position is a remarkable step forward but disregards the social ties that are typical for human beings. Consciousness—even self-identity and personality—is determined particularly by others and the culture we live in. In this sense the relational aspect of leadership is given little consideration, even though establishing in principle norms of agreement acceptable to all rational beings ought to be essential. We do not explicitly assume that someone has to make sure that he or she regards the interests of the other adequately. So, do we have a guarantee that the conscience of the leader and the follower provokes an identical moral behavior that is accepted from both sides? If this were not the case who would have morality on his or her side?

THE DIFFERENT VIEW: DISCOURSE ETHICS

Habermas offered an important theory. A member of the Frankfurt, Germany, School of Critical Theory, Habermas is decidedly Kantian in his orientation to reason but tries to overcome the aforementioned deficits of Kantian moral philosophy. Besides the formulation of a meaningful concept of the rationality of actions and of an appropriate theory of action, he developed a concept of social order and submitted proposals for the democratization of contemporary societies in his book *Between Facts and Norms*. Habermas advocates the Enlightenment project, where he and others feel obliged to strengthen their efforts to formulate reasoned and universal valid norms of moral—justified—action. He states that the only alternative for a reasonable foundation of ethical norms and ethical conflict solution is so-called discourse ethics. In contrast to virtue ethics, discourse ethics is a formal normative theory in practical ethics that can be seen as a kind of moral argumentation standard. Habermas agrees with the postmodern position that totalitarian knowledge (which expresses the thesis that no one is able or has the right to decide/define what reality is or what

knowledge is valid and which is not valid) does not exist but argues that this does not imply that a “theory of rationality” could not be universal.

Habermas concludes that we cannot formulate concrete (material) norms. As a proponent of the model of learning in interactions he articulates the view that—under certain ideal circumstances (so-called ideal speech situation)—the “unforced force” (that is, a free exchange of ideas without coercion or manipulation) of the better argument will prevail. This better argument is recognized by all who participate in that discourse. However, even people who cannot participate in that discourse but are substantially affected by the consequences should be considered as fairly as possible. Accordingly, Habermas prefers a thinking based solidly on “good reasons,” which are themselves the product of a reasoned discussion. Accordingly, a communicative community (at least two persons) is constructed in which the reciprocal recognition of individuals as subjects of argumentation is acknowledged. In this sense, not only the individuals’ interests but also their proposals for moral solutions are equally relevant until the better argument prevails. In this context, the hermeneutic (relating to the study of the methodological principles of interpretation) philosopher Hans-Georg Gadamer is often quoted as noting, “What others are saying could be right.” Gadamer’s admonition makes the case for individuals to maintain a respectful, reflective discourse since people can never be sure that their particular point of view is the best reasoned one. The rationality of communication is “oriented to achieving, sustaining and reviewing consensus—and indeed a consensus that rests on the intersubjective recognition of criticisable validity claims” (Habermas 1985, 17). Consequently, the agreements are open to challenge when new reasons are detected. This “communicative action” is opposed to so-called strategic action, where one participant seeks to influence the behavior of another by threatening sanctions or promising gratifications.

This advanced moral theory, of course, has both philosophical and practical criticism. The philosophical criticism is formulated equally by traditionalists and postmodern proponents with totally different arguments. The practical criticism relates mainly to

issues of feasibility and implementation; that is, that the ideas of discourse ethics cannot be put into real interactions. It has to be said that discourse ethics has two aims: First, to reason an ethical position. Second, to help to shape dialogues about the solution of moral problems. So, the practical criticism refers to the second part. The discourse ethics prefers to describe a situation in which the discourse works best. But the theorists of this position know that all elements of the description are formulated in such a way that there is no equivalent in reality. So a discourse situation is sketched as a guideline. The task is to work for conditions where the elements in reality (for instance, resources, qualifications, settings) come closer and closer to the best framework.

However, for leader-follower relations the consequences of discourse ethics—in contrast to virtue ethics approaches and pure Kantian positions—are evident. Discourse ethics stresses the right of self-determination of and respect for followers and demands that the leader explore and accept their legitimate interests. The leader is not able to define a situation with respect to appropriate moral behavior alone. No moral superiority can be claimed by anyone with reference to formal position. Leaders do not have to be moral heroes, and logically they cannot systematically be. Best moral intentions are fine, and we should be thankful that persons try to give them life, but they cannot have the status of a liability in a leadership relation a priori (relating to reasoning from self-evident propositions).

It is important to stress that a discourse ethics approach is not generally required in routine daily operations and is not necessary for every decision; a question about logistics or changing a production line is usually not a moral issue. Instead, first, discourse ethics demands that leaders take the moral point of view as a matter of course, and, second, discourse ethics concentrates itself primarily on the question of how decisions are made between the leader and the follower, possibly with different procedures for different decision situations. Furthermore, in every moral conflict situation where at least the leader and one follower are affected, the requirement to start such a discourse is justified.

Discourse ethics offers a fresh perspective for decision situations and relationships between leaders and followers where morality is involved. This approach, which is heavily attacked by traditionalists, neo-Aristotelian philosophers, and proponents of postmodern thinking, has consequences in practice. Taken-for-granted assumptions—such as hierarchical decision making (i.e., decisions made by upper management), the defining of situations solely by the leader, the moral superiority of the leader, and involuntary changes (transformations) or individual development when no one has been asked—are suddenly questioned. Movements such as employee empowerment and superleadership (a method of leadership that makes the leader less necessary over time) are—in the logic of normative ethics—only a starting point for breaking traditional structures in thinking. Discourse ethics is related to democratic leadership in its pure definition. Leadership with respect to discourse ethics stresses dialogue and mutuality instead leadership that relies only on position power.

Leadership that reflects discourse ethics requires a leader to show respect, emancipation, and participation in situations that call for moral behavior. Such leadership could provide an orientation for distributed or shared leadership (that is, given formally and informally into the hands of many instead of one). Whatever the mode of leadership, however, moral behavior cannot be replaced by economic success; further, morality can be an important component in business success. Accordingly, Joanne Ciulla can be supported in her view that good leadership “has two senses, morally good and technically good or effective” (Ciulla 1995, 13). Discourse ethics provides leadership research with significant insights and offers a sound basis on which to broaden ethical perspectives on leadership.

DISNEY, WALT (1901–1966)

Founder of Walt Disney Company

Walter Elias Disney is an iconic figure in twentieth-century entertainment. He was a driving force in the history of animation, creating the world's best-known animated figure, Mickey Mouse, and the first animated feature film, *Snow White and the Seven Dwarfs*. In 1955, he pioneered the modern theme park industry when he opened Disneyland. The founder and builder of an entertainment empire over four decades, Disney is also an example of the creative leader.

EARLY YEARS

Disney's intuitive understanding of the entertainment desires of the U.S. family has roots in his midwestern childhood. He was born on 5 December 1901 in Chicago. His family lived in Marceline, Missouri, and then Kansas City, Missouri, before returning to Chicago in 1917.

Disney was the fourth of five children and the family's youngest son. His mother, Flora (née Call), doted on him; his father, Elias, was a disciplinarian.

Walt Disney poses with a toy Donald Duck while reading *Alice in Wonderland in London in 1951.*

Elias was also a hard worker with an entrepreneurial spirit: two traits that Disney inherited. The family's moves were often driven by Elias's business ventures, but none of them provided more than a lower-middle-class existence for the family.

Disney discovered his talent for drawing as a boy and dreamed of becoming a political cartoonist. As a teen, he worked as a delivery boy, snack vendor on the railroad (the root of his lifelong affinity for trains), security guard, and post office employee. Disney left high school after his junior year at age sixteen when, over his father's objections, he lied about his age to enlist as a driver in the American Ambulance Corps, a World War I division of the American Red Cross. As he was sent to Europe, the war ended, and in 1919, after a year abroad, he returned to United States.

THE BUDDING ANIMATOR

Shortly after returning home, Disney left his parents for Kansas City, where he lived with his brother, Roy O. Disney (1893–1971) and pursued his goal of earning a living as an artist. Within a few months the young entrepreneur started his first business, a short-lived commercial art partnership with cartoonist Ub Iwerks (1901–1971), the beginning of a long creative collaboration between the two men.

In early 1920, Disney took a job at the Kansas City Slide Company, where he learned to make crude advertising animations. He was soon moonlighting, creating short animated cartoons with borrowed equipment in a jury-rigged studio at home. He brought his first short cartoon to a local movie chain and earned a contract to produce one Laugh-O-Gram cartoon per week.

By 1922, Disney had established a reputation for creativity and was ready to strike out on his own again. In May of that year, he launched Laugh-O-Gram Films with \$15,000 in local investment capital. The company, which employed Iwerks and five other animators, got off to a promising start with a multicartoon contract. Disney delivered the films, but the buyer never paid, and his young company began a fast decline that ended in bankruptcy. In July 1923, a despondent Disney left Kansas City and cartooning for Hollywood, where he planned to become a director.

STARTING OVER IN HOLLYWOOD

Unable to find steady employment in the movie industry, Disney returned to animation. In October 1923, he sold the idea for a series of short films he had conceived in Kansas City featuring a child actress, Virginia Davis, whose image was superimposed on a cartoon. With a contract in hand for twelve of these cartoons, known as Alice Comedies, Disney and brother Roy (who served as business manager) founded Disney Bros. Studio.

The innovative Alice films were a success, and Disney convinced Ub Iwerks to come west to join the new studio as it expanded. In July 1925, Disney married Lillian Bounds, whom he had employed as an inker.

By the mid-1920s, the popularity of the Alice films began to wane, and Disney needed a new vehicle for growth. At the suggestion of his distributor, Disney created a new animated character, Oswald the Lucky Rabbit, who soon earned critical and popular acclaim.

Because Disney had not retained ownership of the character, Oswald's success also precipitated the company's first major crisis. In 1928, as the series'

contract was being renewed, Disney's New York distributor decided to force him to lower his prices by threatening to steal the studio's animators and produce the cartoons himself. Disney refused, and the distributor hired away most of the Disney animation team.

THE BIRTH OF A MOUSE

Mickey Mouse was born out of Disney's urgent need for a new moneymaker. Loyal Ub Iwerks first drew the mouse, and Lillian Disney named it. In a prodigious solo effort, Iwerks created the first Mickey cartoon, *Plane Crazy*, in just two weeks.

Disney was unable to secure a distributor for the first two Mickey films. The third, *Steamboat Willie*, marked a historic innovation in animation. Disney had decided that the future of movies lay in "talking pictures" and created the first cartoon with a soundtrack. Still, Disney could not convince distributors of Mickey's value, so he took Mickey directly to the public. *Steamboat Willie* was first shown in a New York theater on 18 November 1928. It was a smash with moviegoers and critics. Now the distributors pursued Disney.

Learning from past errors, Disney refused to sign the standard distribution agreement of the day. Instead, the studio remained independent and contracted with a distribution agent who was paid a percentage of gross sales. Disney was also wary of dependence on one series of cartoons, and he started a new series named "Silly Symphonies" that was also a success.

By 1931, Mickey Mouse was an international celebrity, and the company was earning a substantial income for merchandising rights to the mouse. In what would become a pattern, Disney invested the studio's earnings in the expansion of facilities and staff. He also began providing art classes for his employees and intensified his focus on the quality of the cartoons, insisting that each be better than the last.

In 1932, Disney released the first color cartoon, a Silly Symphony titled *Flowers and Trees*. The innovation earned him the first Academy Award ever given for animated film. In 1933 he released *The Three Little Pigs*, another Academy Award-winning

cartoon that drove the public into theaters and became a rallying point during the Great Depression.

THE PUSH INTO FEATURE FILMS

In 1934 the ever-ambitious Disney conceived the greatest challenge the studio had ever undertaken. He began work on the first feature-length animated film, *Snow White and the Seven Dwarfs*. The eighty-three-minute film required 2 million drawings. It consumed three years of effort and all of the resources of the studio. Disney borrowed almost \$2 million from Bank of America to complete the film, which was nicknamed "Disney's Folly" and which many predicted would never produce a profit. His resolve paid off, and *Snow White's* first run, beginning in December 1937, earned \$8 million.

Characteristically, Disney invested the proceeds in expansion. He bought fifty-one acres in Burbank, California, for a new studio and hired more employees. He pushed on with animated features, releasing *Pinocchio* in 1940, the year that Walt Disney Productions made its initial public stock offering. Uncharacteristically, Disney pushed too far ahead of popular tastes with *Fantasia*, a film that was a box office failure in 1940 but that today is considered a masterpiece of animation art. *Bambi* followed in 1942.

WAR AND RECOVERY

World War II hit the studio hard, and its international revenues dried up. Scaling back on commercial production, Disney produced training and propaganda films for the government. The studio's debt grew throughout the period; Disney owed \$4 million to his bankers by the war's end.

Money restrictions may have slowed Disney down, but they could not stop him. The studio continued to produce cartoons and animated features. In 1948 he released the studio's first live-action film, *Seal Island*, the first in the True-Life Adventure series. In 1950 the animated feature *Cinderella* became the studio's first major hit since *Snow White*, and Disney was able to cut the studio's debt by more than half. That same year he created a Christmas special for television, a program that presaged a long,

productive relationship with the emerging entertainment medium.

A NEW KIND OF AMUSEMENT PARK

In the early 1950s Disney began considering a new challenge. He wanted to reinvent the amusement park and create a safe, enjoyable environment that would appeal to the entire family. Disney was unable to convince his brother Roy to finance an amusement park from company coffers, but he would not give up the idea. In December 1952 he formed WED Enterprises and committed his personal resources to Disneyland. He borrowed against his life insurance policies and sold a vacation home to finance the planning of the project.

In 1954, a time when Hollywood studios viewed television as their competition, Disney used it to create his dream. Roy cut the deal in which the American Broadcasting Company (ABC) invested \$500,000 and guaranteed \$4.5 million in loans in return for a weekly, one-hour Disney television series and a 35-percent stake in the proposed amusement park.

The television series *Disneyland* (which eventually became *The Wonderful World of Disney*) began airing in October 1954. It opened a whole new business for the company and was followed with popular series such as *The Mickey Mouse Club* (1955) and *Zorro* (1957).

Disney also used television to promote his amusement park, and when Disneyland opened in Anaheim, California, on 17 July 1955, it was an instant sensation. One million people visited Disney's park in its first two months; by October 1956 more than 5 million people had visited.

THE DISNEY EMPIRE

Disney's expansion from film into television and amusement parks laid the foundation for an entertainment empire. His timing could not have been better; the Baby Boom was in full swing, and the demand for family entertainment was exploding. The company's gross income increased more than ten times, from \$6 million in 1950 to \$70 million by the decade's end.

As was his habit, Disney invested both creatively and financially on all fronts. As always, he looked for new challenges. He solicited corporate sponsorships to finance attractions for the 1964 World's Fair in New York. For Disney it was a gigantic marketing test to determine whether the East Coast was ready for a Disneyland of its own. The attractions were the most popular of the two-year fair. In 1965 Disney quietly purchased more than 27,000 acres outside Orlando, Florida, and began planning a colossal theme park.

DISNEY'S LEGACY

Walt Disney never saw the fruition of his last dream. He died on 15 December 1966, two months after surgery for lung cancer. His passing was mourned worldwide. His unceasing drive to innovate made him a larger-than-life figure in the history of animation and Hollywood. During his career he was nominated for sixty-four Academy Awards and won thirty-two—individual records in both categories. In addition, he was the father of the modern theme park industry.

Roy Disney completed Walt Disney World for his brother and died two months after it opened in October 1971. Over the next fifteen years the company the brothers left behind lived off of its past triumphs, a victim of changing tastes and mediocre management. In 1984 a new management team led by Michael Eisner and Frank Wells took control, and the creative spirit of Disney was revitalized.

By 2001, Walt Disney's one-hundredth birthday, the company he founded was the second-largest entertainment conglomerate in the world. Its major businesses included television, radio, film, publishing, and theme parks; its annual revenues reached \$25 billion.

DISTINCTIVE COMPETENCE APPROACH

The organizational psychologist Philip Selznick introduced the world to the term *distinctive competence* in his 1957 book *Leadership in Administration: A Sociological Interpretation*, which became a classic within the academic literature on leadership. Selznick's term embodies those distinctive resources and capabilities within an organization that give it a competitive edge and allow it achieve and maintain a leadership position in a field. (By contrast, a "core competence" is considered by some management experts to be an internal capability that adds to an organization's success, though may not in and of itself add to its competitive edge and leadership position.)

In *Leadership in Administration*, Selznick tried to clarify the theoretical perspective that he had used in two earlier works. The first, *TVA and the Grass Roots* (1949), was a study of how the organizational character of the Tennessee Valley Authority was formed and how the TVA adopted strategies that later affected its capacity to uphold standards of environmental protection. The second, *The Organizational Weapon* (1952), examined how organizational methods in Marxist-Leninist political parties created a distinctive competence for turning members in a voluntary association into disciplined and deployable organizational agents. In both cases, the organiza-

tions under study were able to develop their distinctive competences because of their leaders' ability to infuse the organizations with meaning.

LEADERS HELP ORGANIZATIONS BECOME INSTITUTIONS

Leadership in Administration was written at a time when, according to the sociologist W. Richard Scott, there were two major perspectives on organizations: the rational-system perspective and the natural-system perspective. The rational-system perspective considered organizations to be no more than formal systems of rules and roles with a fixed set of goals. Organizations were consequently viewed as technical instruments for mobilizing human resources in order to reach given goals. The most important job within such an organization was to secure the best possible allocation of resources; that is, the focus was on obtaining static efficiency. From this perspective, organizations were seen as mechanical systems and therefore studied as if they were entities without any history.

Selznick felt that seeing organizations in that light limited one's understanding of them. Besides being formal systems, organizations are also informal social systems. They may therefore also be studied from what Scott calls a natural-system perspective. The natural-system perspective acknowledges that people in an organization are "whole persons" who have a broader repertoire of behavior than is called into play by the expectations associated with their formal roles in the organization. In most organizations, social relationships emerge alongside formal ones.

In *Leadership in Administration*, Selznick distinguished mere organizations, that is, entities that function at Scott's rational-system level, from institutions, which are more complete, natural-system entities. In setting up his distinction between an organization and an institution, Selznick made a corresponding distinction between managers and management on the one hand and leaders and leadership on the other. Managers would assume that the goals of an organization are something that they should take as given; leaders, by contrast, are those who

define the goal of the organization by defining what type of organization it will be, what identity it should have, and what mission it should pursue.

Turning an organization into an institution requires infusing the organization with value: The organization is given a sense of larger purpose by taking on a special organizational character or special role in its environment. This may happen when the organization voluntarily commits itself to accept certain constraints not by acting in an opportunistic or short-term way but by being committed to its organizational character and long-term strategy. For instance, this may happen when a organization avoids following a profitable, but nonrelated diversification strategy in order to stay within its core competences and maintain its organizational character

LEADERS RECOGNIZE THAT ORGANIZATIONS GROW AND CHANGE

According to Selznick, an institutional (natural-system) perspective on leadership “requires a genetic and developmental approach, an emphasis on historical origins and growth stages. There will be a need to see the enterprise as a whole and to see how it is transformed as new ways of dealing with a changing environment evolve” (1957, 141). Selznick’s emphasis on the need to understand organizations from a genetic and developmental perspective is most apparent in his rather critical attitude toward the Nobel Prize-winning social scientist Herbert Simon’s behavioral perspective, which saw an organization as the outcome of a rather complex equilibrium process. In Simon’s theory, the leader of the firm was conceptualized as an “interpersonal agent” whose primary function was to secure a truce among the organization’s different stakeholders. Selznick criticized that approach for not permitting analysis of how basic values infuse an organization and how long-term character-defining commitments are formulated. Instead of seeing the leader as an interpersonal agent who mediates between conflicting interests, Selznick suggested that we conceptualize the leader as an “institutionalization agent” who shapes the identity of an organization through character-defining commitments.

Further, Selznick felt one should study the organization over time, so one could analyze how the organization’s mission and identity emerge over the long term through the process of institutionalization—that is, through the process of infusing value into the organization. Leadership therefore consists of “accepting the obligation of giving direction instead of merely ministering to organizational equilibrium; in adapting aspiration to the character of organization, bearing in mind what the organization has been will affect what it can be and do; and in transcending bare organizational survival by seeing that specialized decisions do not weaken or confuse the distinctive identity of the enterprise” (1957, 149). In choosing a genetic and developmental model, Selznick goes beyond the traditional functionalist model. Selznick did not see organizations as solutions to well-defined problems; for him an organization was rather dependent upon its former history.

LEADERS BUILD ORGANIZATIONAL IDENTITY AND LOOK TO THE LONG TERM

Viewing organizations from an institutional point of view can be seen as analogous to the study of personal identity in clinical psychology. An organization that becomes infused with value is like a person who deliberately limits his or her own future freedom of choice by making character-defining commitments in order to construct a specific identity or character. By binding him- or herself to some rule or moral principle and thereby limiting his or her own freedom of choice (that is, limiting his or her ability to make decision on a case-by-case basis), a person can build a specific identity.

In stressing the importance of moving away from case-by-case decision making, Selznick saw himself as a voice of resistance to the culture of shortsightedness that he thought was predominant in U.S. business life, whether manifested in unproductive conglomerations or in rewards tied to short-term financial gains. In fact, Selznick was warning about shortsightedness in general if a technical rather than an institutional form of leadership was adopted. Technical leadership was, according to Selznick,

characterized by “the pursuit of immediate short-run advantages in a way inadequately controlled by considerations of principle and ultimate consequence” (1957, 143). Organizations were therefore just adapting to short-run problems internally and externally rather than trying to construct an organizational identity for the long run. Selznick considered this kind of case-by-case adaptation to be irresponsible, since it does not leave the organization with any kind of autonomy in relation to its environment; the organization in effect lacks willpower. An institutional form of leadership, by contrast, “look[s] to the long-run effect of present advantage . . . and how changes affect personal and institutional identity” (1957, 143).

The only way for a decision-making unit to overcome its self-command problems is to set up and follow a set of precommitment strategies. We use such strategies as individuals when we are split between our short-term and long-term interests. For example, in order to avoid the temptation of staying in bed when the alarm clock rings at six o’clock in the morning, in the evening we deliberately place the clock out of our reach so we will have to get out of the warm bed in the morning. By such precommitments we are constraining our future decision-making situations, thereby trying to influence our future choices. In a similar way, the responsible leader will use precommitment strategies to build the character, identity, and distinctive competences of his or her organization in order to solve the organization’s self-management problems. Or as Selznick argues: “Our major institutions—political, legal, educational industrial—are under pressure to perform in the short run and have little support, from within or without, for a longer view of what they are doing and where they are going” (1957, vi).

TAKING A CONSTITUTIONAL VIEW OF LEADERSHIP

So far we have focused on Selznick’s analysis of organizations from the perspective of the clinical psychologist. However, such a view may be rather limited, since organizations are not individuals but collective institutions. Selznick prefers instead to view organizations as institutional arrangements that

emerge to solve a mixture of interpersonal and time-related self-command problems. He suggests studying an organization and its problems of leadership as if it were a constitution, that is, as if it were a multi-lateral contractual system that constrains the holders of power within an organization in order to secure individual members’ human-capital investments in the organization. The analogy is to a political constitution that sets up certain restrictions on what type of policies the majority in a parliament may pass. For instance, a majority will be unable to violate the civil rights of its inhabitants. These precommitments constitute the values of the society; similarly, the precommitments that private organizations accept construct its organizational identity, character, and distinctive competences.

DISTRIBUTION OF LEADERSHIP

In the last half-century’s history of ideas, few concepts have had stronger and more popular currency among both the general public and scholarly com-

munity than “leadership.” In both of these domains, the contemporary dominant conception of leadership is “exceptionalism.” The antecedents of exceptionalism were evident in the now discredited “great man” theory of history and in the trait theory of leadership, which prevailed until about the late 1940s.

LEADERSHIP BY EXCEPTION

Exceptionalism reemerged during the early-1980s with the gradual supplanting of command-and-control line managerialism by rhetorics of integration and control achieved through the management of culture. The idea of exceptionalism assumes that leadership is the monopoly of individual position-holders or a handful of strategically located actors in organizations. This doctrine is legitimated by a discursive normative split—a conceptual distinction that is often drawn between managers and leaders—between leadership and management that constructs leaders as visionary champions who, unlike managers, add value to organizations.

Leadership that is exceptional is presumed to be manifest behaviorally in individual deeds of heroic proportions, as is evident in an accompanying discourse of transformation that attributes states of organizational turnaround, revitalization, and performative excellence to high profile, larger-than-life figures. Exceptional leadership, then, is “focused” leadership. The totality of the behavior that is deemed to count as leadership by exemplars, proponents, and observers alike is presumed to be concentrated in one or at best a very few hands.

The popularity of focused exceptionalism has resided mostly in its attraction as a presumed solution to the problem of motivation, that is, how to secure enhanced levels of employee output and productivity in a competitive global economy. Exceptionalism puts the bar very high. It says, in effect, “If you want to be a leader, then this is how high you have to be prepared to jump.” Its status is also fuelled by a wider culture of narcissism and romanticism in which control by so-called ordinary functionaries has proven incapable of representing popular fantasies of organizational leadership (Gabriel 1997, 338). Despite its seductive appeal, however, focused

exceptionalism generates a number of unintended consequences. First, while canonizing leaders, its proponents are inclined to downplay or demonize the work of managers (Krantz and Gilmore 1990).

Second, while highlighting the claimed superiority of leaders, exceptionalism has residualized and infantilized so-called followers. For this reason, the experience of nonleadership induces feelings of disempowerment and alienation (Gabriel 1997). Such outcomes create strong incentives for prospective and aspiring leaders to disengage from the career pursuit of leadership roles. Exceptionalism puts the bar very high. Many people reason that since not everyone can be—nor would they want to be—a hero-like figure, a leadership role is not worth the intense effort required to achieve it.

Third, and perhaps most importantly, in foregrounding the work of leaders, exceptionalism glosses the complexities of the division of labor in the workplace and the processes by which the totality of an organization’s work is accomplished (Gronn 2003, 28–43).

DISTRIBUTING LEADERSHIP

An alternative to focused exceptionalism, is a conception of leadership grounded in the actual division of workplace labor: dispersed, shared, or distributed leadership. It was Gibb (1954) who first articulated the possibility of “distributed leadership.” Initially, his idea attracted remarkably little scholarly attention. Recently, however, it has been developed conceptually by both Spillane, Halverson, & Diamond (2000) and Gronn (2002).

Unlike focused exceptionalism, which is the creature of a discursive world of hierarchically prescribed binaries (e.g., leader–follower, superior–subordinate), distributed leadership is grounded in a representation of the workplace as a community of practice. Communities of practice are the products of flexibilized work arrangements. As such, they may be located within conventionally defined organizational structures, or across interorganizational fields as a result of coalitions, joint ventures, strategic alliances, and partnerships between organizations within an industry sector. Potentially, organizational

personnel may be members simultaneously of a number of cross-cutting and interconnected communities. Typically, communities of practice are of varying membership size and duration, and they coalesce around regular, seasonally defined activities (e.g., annual budget preparation), ongoing portfolios of responsibilities (e.g., marketing, research and development) and one-off major workplace projects (e.g., restructuring). Role relations in such communities of practice tend to be fluid rather than fixed, and lateral rather than hierarchical, with terms such as “interdependence” and “reciprocity,” rather than “dependence,” more accurately reflecting the members’ patterns of working engagement. In these kinds of circumstances, the conventional dualism of leader–followers, which presupposes a bifurcation of influence (the core defining attribute of leadership for most commentators) into fixed categorical quantities and directional flows (i.e., leaders exercise preponderant influence over followers), proves manifestly incapable of corraling the actualities of emergent practice.

In contrast to the false promise of exceptionalism, then, distributed leadership offers an expanded view of how organizations are led and the place of leadership in the articulation of work. Distributed leadership exists in a number of guises. First, in its simplest form, it means, potentially, that every single organization member may be influential and display leadership, for at least some of the time and in a variety of ways, as noted by Yukl (1999, 292–293). Within a particular theater of operations, therefore, distributed leadership may be understood as the aggregated influence of numerous individual agents. Even though the influence of some of these agents may turn out to be

Distribution of Leadership in a Hierarchal Society

Korea is a society where age, kinship, and education determine who are the leaders and who are the followers. However, in day-to-day life, other factors often matter more, as indicated by the following account of the informal leadership based on skill and knowledge that was apparent on a trip on a Korean boat.

An example from my field notes illustrates the situation on one boat:

It was four o'clock in the morning, and we went a couple of miles across the bay to pick up a friend of the captain's before leaving for Incheon. The coastline was dark with no easily distinguishable features, and there was neither light nor voice to guide us. Soon we were aground in the mud. There was a lot of poling and shouting from the bow and a great deal of starting, stopping, and reversing of the propeller as we hunted for a channel that would take us right up to the rocks. Changes of course, plan, and even helmsman took place rapidly without any apparent coordination, all accompanied by a constant stream of shouted warnings from the bow and insistent suggestions from everyone else. Judged by New England standards the atmosphere on the boat was one of chaotic excitement bordering on panic.

Throughout the episode, however, nothing occurred that really upset the skipper or crew, or that even seemed noteworthy enough for them to talk about afterwards. No serious mistake in seamanship was made, and the boat was worked reasonably effectively. There was no visible evidence of the captain being in command except that he held the tiller more than anyone else. Everyone seemed to operate independently according to his own whim, and yet it all fit together somehow to produce the desired result. When we finally did get near the rocks and located our passenger, the boat handling was impressive. Considerable surge of the sea and jagged half submerged rocks made it a nasty spot. I still don't know if the captain's impassivity amidst pandemonium was fatalism or expert knowledge of the "landing."

Source: Brandt, Vincent S. R. (1971). *A Korean Village between Farm and Sea*. Cambridge, MA: Harvard University Press, p. 104.

more consequential in determining task outcomes than others, this acknowledgment of the possibility of multiple agency suggests that the spirit of distributed practice is broadly democratic. That is, while expectations of absolute parity or equality of causal effects on performance by every employee may be unrealistic, the existence of dispersed sources of influence represents a shift in recognition from one focused, preponderant voice toward the possibility of multivocal leadership.

Second, at the same time as there may be multiple individual agents, other agents also act concertively

in multimember work units. Here, the leadership agency is conjoint. That is, the members blend or fuse their plans and purposes to such an extent that, for all practical purposes, they appear to act as a “shared mind” (Schrage 1990), with understanding and cognition distributed among the members.

This conjoint agency in the workplace tends not to be mandated, but emerges spontaneously, as people “rub shoulders” with one another and discover their interests or capacities in common. This may explain why the bonding and synergies between members tend to be stronger in “bottom up” workplace teams than in project teams mandated from on high as part of the managerial prerogative. There are numerous examples of conjoint agency (Gronn 2002, 436–437). Most entail strong working partnerships formed by two or more people with complementary skills and temperaments, and who, over time, have developed a depth of mutual trust and implicit understanding. They include not only hierarchically positioned executives and their deputies or support staff, but also coworkers, musicians, sportsmen and women, and part-time board chairs and managers.

In every instance, the agents are interdependent and they negotiate their shared role space to coordinate their work-related activities. The tandem-like quality of their working partnership is sufficient to render meaningless any attempted disaggregation of their respective contributions into “leader” and “follower,” for together they constitute a distributed leadership unit.

Fixed a priori dualisms, such as leader–follower, then, provide remarkably little analytical purchase—analytical insight, understanding, or help—in trying to come to grips with the dynamism of the circumstances just outlined. Gibb (1958, 103) himself dismissed the search for hard and fast distinctions between leaders and followers as akin to drawing arbitrary lines on a behavioral frequency continuum. Likewise, Follett (1973/1926, 120–121), previously, had inveighed against the exaggerated significance of an authority figure’s order or command as “a larger part of a whole process than it really is” for, she maintained, all the actions of others that led up to and followed the moment of decision making also

needed to be acknowledged for a realistic appreciation of organizational conduct. For these reasons, resort to a dualism such as leader–follower, as a means, ostensibly, of simplifying understanding of workplace complexities, serves merely to silence awareness of the realities of the labor process. This act of invisibilization, as Shapin’s (1989) historical analyses of the division of labor in scientific laboratories indicate graphically, is most clearly evident in the reduction of the collective processes of knowledge construction to the product of an individual mind, and their authorial attribution to an exceptional figure of history. And when a variety of hagiographers and publication media collude in this process of attribution making, a mythology of “genius” is afforded cultural legitimacy.

FUTURE DIRECTIONS

The field of leadership, unlike the cognate terminology in the areas with it is most closely associated conceptually, in particular, influence and power, has spawned a discourse of exceptionality. Curiously, whereas for students of power, such as political scientists and historians, resort to a phrase such as “the distribution of power” is commonplace in their analyses of organizations, social structures, and societies, commentators in leadership have shied away from the use of words like “distribution” or dispersal.

Although the alternative idea of “the distribution of leadership” proposed in this entry in no way denies the existence of and social significance accorded exceptional individuals, it has taken issue with the oversimplification of workplace reality legitimated by attributions of leadership exceptionality. As an antidote to invisibilization, distributed leadership is offered, less as a celebration of the mundane and unexceptional than as an acknowledgment that organizational viability and the satisfactory accomplishment of work is dependent on the capability of many hands, not just the presumed greatness of a few.

 **DOMINANCE AND SUBMISSION**

Dominance is exercising controlling power or influence over something, usually other people; persons who are dominant command and rule. Consequently, dominance is closely related to leadership. Submission, on the other hand, is obeying—willingly carrying out the wishes of others. In ordinary language dominance concerns issuing orders, and submission concerns complying with those orders.

One should distinguish between dominance as a characteristic of a person and dominance as a characteristic of a role. It is easy to visualize the problems that would occur when a nondominant person occupies a dominant role or when a dominant person occupies a subordinate role. Similarly, one should

distinguish between submission as a characteristic of persons and of roles.

Dominance and submission are not necessarily antonyms (opposites); rather, they seem to be orthogonal (uncorrelated). Thus, depending on the circumstances, a normally dominant person might submit to another person's authority—a sergeant follows the orders of a lieutenant—and a normally obedient person might disobey authority—an accountant refuses the request of a senior executive to falsify his books. The idea that dominance and submission are orthogonal, not antonymic, is crucial for understanding the psychology of dominance and submission.

THE ORIGINS OF DOMINANCE

Dominance as a characteristic of individuals almost surely has a genetic basis. This conclusion is supported by three lines of evidence.

First, it is possible to breed for dominance. Behavior geneticists developed strains of dominant mice and rats after World War II. Moreover, terriers dominate beagles, and every tropical fish fancier knows that certain fish species dominate other species.

Second, every flock of chickens has a pecking order, every herd of cows has a lead cow, and every wolf pack has lead males and females. All troops of social primates are organized in terms of dominance hierarchies. The principal social dynamic in a chimpanzee troop concerns coalition building as subordinates try to overthrow the lead male. The fact that chimpanzees are humans' nearest living primate relatives—the two share over 90 percent of their genes—makes this an interesting perspective on human social behavior.

One should note that in animal interactions, from lizards to chimpanzees, dominance is almost identical to aggressiveness. Animals establish dominance by intimidating or physically defeating their competitors. Among the primates and especially the chimpanzees, matters are more complex. Two male chimpanzees can always defeat a single animal; the lead chimpanzee is the one who can attract the most support from other chimpanzees in his aggressive encounters with competitors.

Third, developmental psychologists Patricia Haw-

*An army of deer would be more formidable
commanded by a lion, than an army of lions
commanded by a stag.*

—Viking Proverb

ley and Ted Little (1999) studied toddlers in New Haven, Connecticut, in free-play situations. They report three important findings. First, almost as soon as the toddlers were mobile, some tried to dominate others, largely by taking their toys away from them. Second, at some point in the three-to-four-year-old age range, a kind of status hierarchy developed, and the high-status (popular) children were defined as the ones the other children watched. Third, about this time, the children who tried to preempt the toys of the others (i.e., the dominant children) separated into two groups. The first group of dominant children continued to take toys away by force, and these children were not well liked by the others. The second group, the popular children, would approach another child and say something like, “Let’s you and me play with your toy.” The approached child, happy to play with the popular child, would then be willing to share his or her toy. This seems to reflect the origins of something like prosocial and antisocial dominance, where prosocial dominance is associated with social skill, and antisocial dominance is associated with raw aggression.

The facts that dominance hierarchies are universal in mammalian groups, that it is possible to breed for dominance, and that dominance behavior appears spontaneously in human toddlers strongly support the notion that dominance has a genetic basis. In humans, however, naked aggression and prosocial dominance quickly separate, with the latter being associated with popularity. What are the developmental origins of prosocial dominance? It is probably learned from caretakers through the modeling process.

THE ORIGINS OF SUBMISSION

Submission is defined in terms of obedience to another’s rules, usually another person who is in a higher-status role. Consequently, the origins of sub-

mission are identical to the origins of socialization—the process by which children come to comply with the wishes of parents and community. Compliance seems to be an interaction between genetics and child rearing. Human infants are innately predisposed to some compliance—which is why they are able to learn language so quickly. Similarly, infants of many other mammalian species seem innately prepared to respond to warning signals from their mothers. Researchers in child development suggest that parent-child relationships have two major dimensions—warmth and restrictiveness. Children raised by parents who are warm and restrictive have two characteristics in common compared to children raised in other ways: (1) They seem compliant; and (2) they seem mature.

DOMINANCE AND LEADERSHIP

One of the most carefully developed and extensively validated measures of dominance that is commercially available is the dominance scale of the California Psychological Inventory (CPI). This measure was developed empirically by comparing the responses of persons with high and low ratings for dominance across a large pool of items. The scale has been shown repeatedly to predict various measures of leadership using both ratings and performance indicators. Furthermore, in CPI-based studies of leadership, the adjective that is most frequently used to describe persons with high ratings for leadership is “dominant.”

Since the early 1980s, the world of personality measurement has undergone a framework shift associated with the so-called Five-Factor Model (FFM; also known as the Big Five Personality Traits). The principal research agenda of the advocates of the FFM has been to show that the same five factors can be recovered from virtually any set of personality data, and they have been largely successful in this effort.

Despite the popularity of the FFM, it has not been particularly useful for the purposes of this discussion of dominance and submission for two reasons. First, the standard version of the FFM is defined in terms of the following dimensions: extraversion, agreeableness, conscientiousness, emotional stability, and

intellect/openness. Dominance is not part of this taxonomy. Some people might argue that dominance is part of extraversion, which they characterize as combining sociability (the love of social interaction) with an active and adventurous engagement with the world. This is a serious reinterpretation of the concept of extraversion as the concept is normally understood. So, the first problem with trying to incorporate the concept of dominance into the FFM is that it doesn't fit with the taxonomy—the fit is arbitrary at best. The second problem is that the FFM is typically used to organize data rather than predict performance outcomes, and the dominance scale of the CPI predicts leadership criteria better than extraversion from the FFM. Nonetheless, in a meta-analytic (aggregating results across studies) study of the links between the FFM and two indices of leadership, industrial-organizational psychologists Timothy Judge, Joyce Bono, Remus Ilies, and Megan Gerhardt (2002) report a correlation of .33 between extraversion and leadership, indicating a modest but reliable link.

Personality psychologists Robert Hogan and Joyce Hogan (1995) argue that the extraversion dimension of the FFM is too broad, that it confuses two not closely related components—sociability and ambition—and that the ambition component, and not sociability, predicts leadership. The ambition scale of the Hogan Personality Inventory (HPI) is designed to assess the components of status seeking covered by several CPI scales, including dominance and capacity for status. The correlation reported by Judge and associates (2002) almost certainly reflects the influence of ambition, not extraversion.

SUBMISSION AND LEADERSHIP

Submission is not the opposite (antonym) of dominance; rather it is orthogonal to (uncorrelated with) dominance, and a better term for *submission* might be *conformity*, as indicated by the standard definition of *submission*. Some evidence indicates that measures of conformity are also related to leadership. The Judge et al. (2002) study of leadership reports a correlation of .33 between the conscientiousness dimension of the FFM and two indices of leadership; this is

the same value that they report for the extraversion dimension. Thus, the only major study dealing with the issue suggests that measures of dominance and submission predict leadership equally well, a finding that makes good conceptual sense. A standard line in the military is, “You have to know how to be a good follower before you can be a good leader,” and that is what the data of Judge and his colleagues indicate.

Not only is conformity related to measures of leadership, but also it is a strong predictor of status in bureaucratic hierarchies. Psychologists Leonard Goodstein and William Schrader (1963) and Harrison Gough (1984) developed and refined a CPI-based measure of managerial potential. The psychological and psychometric core of this CPI-based measure is conformity. The following adjectives characterize persons with high scores: *responsible, reasonable, reliable, organized, and stable*; the following adjectives characterize persons with low scores: *rebellious, immature, careless, and irresponsible*.

DOMINANCE, SUBMISSION, AND PERSONALITY THEORY

Developmental personality psychologist John Digman (1997) provides a wide-ranging review of the role of dominance, submission, the FFM, and personality theory. His argument can be summarized in terms of three points. First, he argues that the FFM can be organized in terms of two superordinate factors. The first factor is defined by the FFM dimensions of extraversion (which Digman refers to as “ascendance”) and intellect. The second factor is defined by the FFM dimensions of agreeableness, conscientiousness, and emotional stability.

Second, Digman states that these two orthogonal dimensions concern different psychological themes. The first dimension concerns active engagement with the world and defines a continuum from passivity and avoidance to activity and engagement. The second factor resembles the socialization process, the movement from rebellion and independence to conformity, compliance, and maturity.

Third, Digman states that these two dimensions are common themes in traditional personality psychology. They have been referred to as “striving for

superiority and social interests” (Alfred Adler, “fear of life and fear of death” (Otto Rank), “aggression and love” (Sigmund Freud), “agency and communion” (David Bakan), “status seeking and approval seeking” (Hogan), and “power and intimacy” (Dan McAdams).

Dominance and submission are archetypal dimensions of personality psychology, and both are related to leadership. A review of the literature surrounding these two dimensions suggests the following conclusions:

- Dominance and submission are orthogonal, not antonymic, dimensions.
- Dominance predicts leadership.
- Submission (conformity) predicts managerial potential.
- Dominance fits uncomfortably in the FFM, suggesting a limitation in that taxonomy.
- Dominance and submission seem to be higher-order factors arising from the FFM.
- Dominance and submission are archetypal dimensions in personality theory.

DOT-COM MELTDOWN

During the late 1990s, enthusiasm over the possibilities of doing business using the Internet attracted entrepreneurs and investors to participate in what the media called the “new economy.” The new economy generated new heroes, such as Jeff Bezos, the founder of Amazon.com and *Time Magazine*'s 1999 man of the year. Business schools began developing new e-commerce programs to teach the next generation how to succeed in the new economy. Some of the newly formed Internet companies, often called dot-coms, launched initial public offerings (IPOs); their stock values soared with little relation to their business performance. For example, Akamai Technologies, founded in August 1998 by a professor at Massachusetts Institute of Technology (MIT), was valued at \$13 billion at the time of its IPO though its revenues were only \$1.3 million. As early as the middle of the year 2000, the short dot-com boom turned into a “dot-bomb” wave. Investors and venture capitalists were realizing that their investments were highly risky, and companies were burning through the remains of their working capital. Stock values declined, companies began laying off employees, and the period that the U.S. Federal Reserve Board Chairman, Alan Greenspan, had

characterized back in 1996 as one of “irrational exuberance,” ended.

Preliminary research into the dot-com meltdown found poor business models, a lack of competitive advantage, and problems in organization and execution contributed to the young companies’ demise. However, while earlier analyses have focused on organizational factors and poor strategic leadership as reasons for the dot-com meltdown, this entry focuses on the role of leadership within the company in the dot-com demise.

BACKGROUND: LEADING IN INTERNET TIME

During the mid-1990s, many in the business world and media began emphasizing the need for fast-acting, fast-thinking leaders who were capable of dealing effectively with a constantly changing business environment. With the rise of the Internet, people began to speak of managing in “Internet time,” implying that effective leaders were highly dynamic individuals who emphasized speed. This was the background for the evolving dot-com culture.

In addition to speed, the new culture emphasized other values of youth, including the need to rebel against traditional management. Internet companies were led by a younger generation. Sydney Finkelstein, a professor of strategy, found that dot-com executives were on the average ten year younger than executives in other companies. Denouncing the old economy, the new dot-com leaders developed their own language of business with terms such as *space* and *business models* replacing *market* and *strategy*. The dot-com culture was celebrated by the press, which portrayed its young leaders as heroes of a new industrial revolution and further mystified the Internet and its business potential; the soaring stock market confirmed popular perceptions that the new leadership style was anything but traditional.

The new leadership style that prevailed in Internet companies deemphasized the need for structure and planning and the dangers of failing. Many dot-com leaders viewed organizational structures and procedures, necessary for the success of any business, as useless or ineffective. Successful startups and failures were equally disdainful of bureaucracy; con-

trary to the myth, a lack of bureaucracy was not a reason for success even in the high-paced Internet economy. The dot-com leaders also took the notion that failure breeds innovation to unwarranted extremes. Finkelstein quotes Marc Andreesen, the founder of Netscape, who said, “The bottom line for me is I fail, like, let’s say, six months after I launch the company. I just absolutely fail. So what’s going to happen? I’m going to apply to business school and have an incredible application. Failure is, like, part of the business plan” (Finkelstein 2001, 180). While leadership that tolerates failure is important, it is also important for leaders to assure that followers learn from their failures.

The attitude of dot-com leaders toward the economy, principles of management, and business success also affected the way they led their employees. Liberal approaches that emphasized employee satisfaction, high intrinsic but also very often extrinsic rewards, and “innovative” cultures were all in line with new theories of leadership that were popular at the time and that avoided discussing traditional aspects of effective leadership. The following two case studies—of a company that failed and a company that is struggling—reveal facets of the leadership styles that prevailed in the new economy.

SMARTTECH.COM: DOES TECHNOLOGY MAKE THE DIFFERENCE?

Smarttech.com began as an idea of two PhD students at MIT’s prestigious Media Laboratory. The MIT Media Lab, founded by Nicholas Negroponte, a professor of media technology and an Internet guru, was where many founders and employees of dot-com companies got their start. A January 2002 *Forbes* article described the Media Lab of the 1990s as a “white beacon for a shining high-tech future filled with gadgets, gizmos and seemingly endless funding. Its legions of techies have eagerly spent money donated by corporate sponsors since the lab opened its doors in 1985. The money—an annual budget of about \$40 million—went not only to sometimes wild ideas like ‘smart’ potholders, dice, chairs and animal building blocks, but also apparently to fund some dot-com-style largesse” (Herper 2002).

Smartech.com evolved in the Media Lab in late 1997. The Lab was also the source for the company's management team, which included Karin Dunkin, the company's first CEO; Matthew Flynn, the main founder; and Kevin Heins, who joined later from the Lab. All were in their late twenties. In order to impress potential investors, the team hired Barry Weiner, an older fellow, who had already published a prominent book in the field of media technology. With about \$1 million in seed funding, the team hired employees to develop a product designed to aid web shoppers' interaction with e-commerce websites.

Leadership at Smartech.com

In 1999, a year after the company's launch, a venture capitalist invested a significant amount of money in the company but insisted that professional management rather than the "creative" staff run the company. Consequently, the founders hired Jennifer Eng, a new CEO with a glorious background as a CEO of a major portal that she led to a successful IPO. Eng introduced the "matrix management style" that divided managerial responsibility between Heins and a new administrator, John Green, who was hired with the intention of freeing Heins from dealing with employees' personal issues. This innovative management style was intended to allow research and development teams to spend maximum time on product development, unhindered by other organizational or bureaucratic tasks. As one employee said, "this structure allowed Kevin [Heins] to focus on product development which is what really mattered."

The Leadership Style of the Innovation Guru

In early 2000, things still looked good for the company. They had been able to attract their first client, an e-commerce website, and to negotiate a good deal with a major portal. Following these first signs of success, Smartech went on a hiring frenzy, hiring mainly friends of the founders and graduates of the MIT Media Lab. By early 2000 the company had more than sixty employees. It was a highly homogeneous company, composed almost entirely of graduates from MIT and other prestigious private univer-

sities. Heins's decision to hire only programmers who were familiar with a rather rare and unpopular computer language further contributed to the highly homogeneous culture. As one of the employees noted, "it was a cohesive and exciting culture but yet very restricted to certain types of people."

The main force behind this culture and atmosphere was Heins, Smartech's innovation guru. An employee who reported to him described him as "charismatic yet friendly and down to earth, extremely tech savvy but also open-minded." A visionary leader, Heins was determined to grow the company exponentially and to win with technology; technology was the drive and source of inspiration for his research and development team. The development of innovative technology was the collective goal that aligned team members. The team adored Heins, who recognized their effort and work, listened, and gave advice. His leadership provided the foundation for Smartech's culture of cooperation and peer support. His total devotion to technological competence together with enthusiasm and openness allowed him to transform competitive individuals into a cooperative team committed to innovation and technological mastery.

The Challenges

However, Heins's charisma was not enough; leading Smartech.com's research and development required something more. Even highly committed team members who shared Heins's enthusiasm were frustrated with his lack of organization. One of them said, "Kevin was an idea guy but not an implementer. . . . the meetings he ran were slow and inefficient, many questions remained unanswered, there was little planning and even that was unrealistic." He was lenient with the team regarding meeting deadlines. "It was frustrating to see how he could not cut people when they were so unfocused." Under Heins's management, communication between team members was poor, and there was an overall lack of focus.

Barry Weiner, who had both reputation and knowledge, was even less organized than Heins; team members perceived him as "slow, detached, and idiosyncratic." The administrative team was not

very helpful either. Eng, the CEO, was concentrating on getting Smartech to the IPO stage rather than paying attention to the actual challenges.

At that point, the company had a burn rate of \$500,000 a month, no new customers, and generated little interest with potential investors. It was only a few months after the peak of enthusiasm that Eng asked for a meeting of the research and development team. Such meetings were rare given that Eng was hardly involved with internal affairs. Even when things looked very bad, her focus was on the IPO. She started the meeting by announcing that all those in attendance were fired. There was no notice; there had been no sense of urgency in the company prior to the meeting. Three weeks after the meetings the remaining employees were laid off and the company shut down.

MEDIANEXT.COM: A TALE OF NARCISSISTIC LEADERSHIP

In May 1998, David Kelly, Jerry Stern, and Mona Kim graduated from the Interactive Telecommunication Program at New York University's Tisch School and started a web design company. At that time New York City's newly formed "Silicon Alley" was beginning to establish itself as the hub for new-media companies—companies specializing in information technology and especially Internet-related technologies. The booming New York economy attracted artsy people to join the new wave of startups that were focused on bringing music, design, and other arts to the Web. The market for new-media product seemed endless at the time, as companies raced to create and maintain fancy websites in order not to be left behind. Kelly and his colleagues were able to enlarge their web business to take further advantage of the dot-com market. In early 1999 they transformed their company into a software company, with a goal of developing video applications for websites that used animation to convey advertising and other messages. They aimed to attract potential clients mainly from the entertainment industry.

The Magnet

Early in the process of forming the company, Kelly emerged as a leader. His leadership manifested in

both his ability to obtain crucial resources and his "magical" influence on fellow team members. Kelly's first step was to approach a family member who agreed to provide initial funding of \$5 million. Kelly also reached out to a friend in the entertainment industry and recruited him for the management team. The success of the company as well as the atmosphere in the New York media business led to euphoria in the early days of MediaNext.com. It became a part of the Silicon Alley community, notorious for its parties and celebrations but also for its culture of nonstop work. "It was like a family," recalled a former employee. "We were so enthusiastic about the product, about being artists in the coolest media. . . . it seemed irrelevant that some of our loyal web shop customers were unhappy with the new direction that the company was taking." Every product launch was a major party. One of these parties took place in a major club in Manhattan and featured balloons with the company logo and product name; all the guests were given fancy gifts. The company engaged in intensive recruiting when it was difficult to hire computer programmers—after a short conversation with Kelly, candidates rushed to join the company. By mid-1999 the company had more than fifty employees. It also started to have clients, though it was never profitable. Kelly's enthusiasm was contagious, and he had the ability to use language to inspire—he was a true magnet.

"David Is the Company and the Company is David"

As magnetic as he was, it didn't take long for Kelly's weaknesses to surface. He insisted on being copied on all e-mail messages and was very impatient with others, including his partners. Only a few months after the company was formed, his two partners, Jerry Stern and Mona Kim, left the company, and so did the new hire from the entertainment industry. The former chief financial officer (CFO) described how meetings with company directors were managed. "Meetings would begin with a typical question that David [Kelly] would address to participants, however, he would not wait to hear the answer, rather he often burst towards participants with comments such as 'you don't understand the technology, why am I

wasting my time listening to you?” Kelly not only hated listening to others, he also had no patience to teach them; mentoring was a waste of time for him. His narcissistic leadership style was too much even for the financial backer and family friend who had supplied the company’s initial funding.

Following the burst of the dot-com bubble in mid-2000 and the consequent decline in investment in Internet companies, the company quickly deteriorated, though it was still able to maintain its web design business. The financial backer hired a professional CEO to replace Kelly, and managed to persuade Kelly that Kelly’s lack of business management experience was a problem. David agreed to be the research and development director. However, in effect he continued to manage the company. Employees, afraid to lose their job, continued to listen to him, gradually eroding the status of the new CEO. The new CEO resigned after a few months, and so did the one who replaced him. In 2003 the company was still struggling, moving more into its original web design business, where David’s talents are strongest.

CRITICAL REVIEW OF THE LEADERSHIP STYLES AT SMARTECH.COM AND MEDIANEXT.COM

Four factors stand out as contributing to the failure of Smartech.com and the lack of success of MediaNext.com.

A Dangerous Context

Leadership emerges and is evaluated in context, and a key element of the context for the dot-com rise and meltdown was the idealization, if not idolization, of technology. In that context, technology-oriented leaders were bound to emerge, but their perceived strength—mastery of the technology—was also their weakness. In the case of Smartech, a homogeneous, technology-focused culture put Heins in an ideal leadership position, but also restricted creativity and deemphasized necessary business skills. Similarly, the turbulent late 1990s were the context for Kelly’s emergence at MediaNext as a charismatic leader

who attracted new people and investors. However, his leadership style did not allow others’ input thus decreasing the company’s ability to change.

The Insufficiency of Charisma

Both Smartech and MediaNext had charismatic leaders. While charisma is useful for influencing others, leaders need more than charisma to manage a company. Bernard Bass and Bruce Avolio, two scholars who have studied leadership, have suggested that effective leadership requires attention to goal setting and rewards as well as to personal charisma.

Lack of Business Skills

Many of the entrepreneurs who started Internet companies had technology background but not enough business education. Although Smartech hired a professional CEO, she was more focused on the IPO than on running the business and left the actual management of the company to the “techies.” MediaNext’s Kelly also lacked the business skills that would have complemented his charismatic personality.

Individual versus Collective Goals

Effective leaders focus on collective rather than individual goals. The dot-com leaders, by comparison, were largely interested in themselves. Kelly’s style, for example, was narcissistic. The psychoanalyst and anthropologist Michael Maccoby has suggested that such leaders, “although they say they want teamwork. . . [actually] want a group of yes-men” (Maccoby 2000, 72). Leaders are responsible for aligning their organization by emphasizing collective goals—and they themselves must be the first to fall in line.

IMPLICATIONS FOR THEORY AND PRACTICE

Many leadership theorists and researchers have argued that effective leaders are charismatic, especially during crisis periods. Although the evidence presented above is anecdotal, it sounds a cautionary note. Future research should examine the role of

charisma in evolving companies, especially during times of economic prosperity. Does charisma stimulate innovation? If not, what leadership style does lead to innovation and success? Meanwhile, leadership training programs should emphasize that collective goals and teamwork are essential components of a successful startup operation.

DU BOIS, W. E. B. (1868–1963)

*African-American scholar and
civil rights leader*

William Edward Burghardt Du Bois was one of the most important African-American leaders in the United States in the first half of the twentieth century. He was a man of many talents who made significant contributions as a journalist, research scholar, sociologist, historian, novelist, pamphleteer,

civil rights leader, and teacher. Among his many publications are sociological studies, ground-breaking histories of the slave trade and Reconstruction, a biography of John Brown, as well as fictional works such as *Quest of the Silver Fleece* (1911). Biographer David Levering Lewis characterizes Du Bois's life as a collective portrait of the African-American intelligentsia in the mid-twentieth century. It is almost impossible to undertake a study of African-Americans without encountering W. E. B. Du Bois's name at every turn.

Du Bois has been portrayed as an overconfident, uncompromising, and arrogant man, but he could also be modest and self-effacing. In his autobiography he publicly questioned his effectiveness as a leader. Nevertheless, Du Bois's leadership qualities are well documented. He was instrumental in the formation of the Niagara movement—an organization that was the precursor to the National Association for the Advancement of Colored People (NAACP). He was also a major promoter of the NAACP publication program and served as editor of its magazine, *The Crisis*, from 1910 to 1934. As editor of *The Crisis*, Du Bois exercised considerable influence on African-American politics and thought.

During a long (ninety-five years) and productive lifetime, Du Bois changed his opinions on issues of the day many times. A complex and unpredictable personality, he could appear as assertive, accommodative, practical, obtuse, an activist, a joiner, and a loner. Despite his many personal and intellectual inconsistencies, Du Bois's thoughts and actions were united by a single goal: to achieve what he saw as the betterment of all “people of color”—African-Americans and Africans alike.

DU BOIS'S EARLY LIFE AND CAREER

W. E. B. Du Bois was born on 23 February 1868, on Church Street in Great Barrington, Massachusetts. In 1884 he graduated as valedictorian of Great Barrington High School. He married (twice) and had two children. Only one child—a daughter—survived to adulthood. In 1888, Du Bois graduated from Fisk College (now Fisk University), a historically black institution in Nashville, Tennessee.

Du Bois on the Veil

After the Egyptian and Indian, the Greek and Roman, the Teuton and Mongolian, the Negro is a sort of seventh son, born with a veil, and gifted with second-sight in this American world,—a world which yields him no true self-consciousness, but only lets him see himself through the revelation of the other world. It is a peculiar sensation, this double-consciousness, this sense of always looking at one's self through the eyes of others, of measuring one's soul by the tape of a world that looks on in amused contempt and pity. One ever feels his twoness—an American, a Negro; two souls, two thoughts, two unreconciled strivings; two warring ideals in one dark body, whose dogged strength alone keeps it from being torn asunder.

The history of the American Negro is the history of this strife—this longing to attain self-conscious manhood, to merge his double self into a better and truer self. In this merging he wishes neither of the older selves to be lost. He would not Africanize America, for America has too much to teach the world and Africa. He would not bleach his Negro soul in a flood of white Americanism, for he knows that Negro blood has a message for the world. He simply wishes to make it possible for a man to be both a Negro and an American, without being cursed and spit upon by his fellows, without having the doors of Opportunity closed roughly in his face.

Source: Du Bois, W. E. B. (1903). *The Souls of Black Folk*. Retrieved September 11, 2003, from <http://www.bartleby.com/114/1.html>

Growing up in Great Barrington, he experienced subtle discrimination, but it was in Tennessee that Du Bois first experienced overt racial discrimination. Du Bois earned a second bachelor's degree (1890) and a master of arts degree (1892) from Harvard University in Cambridge. From 1892 to 1893 he studied at the University of Berlin where he was greatly influenced by the socialist scholar Edward Bernstein. He also studied with the eminent sociologist/economist Max Weber. In 1895 W. E. B. Du Bois was awarded the first doctorate ever to be granted to an African-American by Harvard University. He would have preferred to have earned his Ph.D. from the University of Berlin and attempted to distance himself from Harvard by later claiming that he was "in" Harvard but not "of" Harvard. The bulk of his personal papers are archived at the University of Massachusetts at Amherst.

The significance of Du Bois's brief period of study in Berlin should not be underestimated. First, his experiences in Berlin forced him to consider the "race problem" in America from a global perspective. Second, his Berlin training influenced him

politically. As Manning Marable has suggested, Du Bois was introduced to Marxism in his twenties and remained sympathetic to Marxism for much of his adult life. His socialist leanings in later life should not be seen as an abrupt departure from previously held beliefs.

Du Bois was very much a public figure who divided his time equally between intellectual pursuits and the political arena. He spent much of his career in academe. After receiving his doctorate from Harvard, Du Bois served as professor of Latin and Greek at Wilberforce University (1894–1896) and as an assistant instructor of sociology at the University of Pennsylvania (1896–1897). But he is best known for his long and productive association with Atlanta University, where he was a professor of economics

and history from 1897 to 1910 and served as the chair of the sociology department from 1934 to 1944.

Du Bois's doctoral dissertation, "The Suppression of the African Slave Trade to the United States of America, 1638–1870," was published in 1896. It constitutes a pioneering application of economic analysis to history. Previous studies of slavery had examined the development of Southern slavery from the standpoint of social ethics but had given little attention to slavery's indissoluble connection to the cotton market.

Although Du Bois's Ph.D. was in history, he was broadly trained as a social scientist and conducted numerous empirical studies of the social and economic conditions affecting African-Americans. He approached social research with a great sense of urgency and believed that compact communities such as the African-American ghetto and the "Black Belt" were crying out for sociological analysis. Between 1897 and 1914, Du Bois completed sixteen sociological investigations of rural African-Americans. In addition, he authored *The Philadelphia Negro: A Social Study* (1899). *The Philadel-*

phia Negro is the first case study of an urban African-American community ever undertaken in the United States.

In tracing Du Bois's thought, it is clear that he initially hoped that the social sciences could provide a knowledge base that would solve the "race problem" in America. Over time, however, he came to recognize that within a climate of racism and segregation, social justice ultimately could only be accomplished through agitation and protest.

THE "TALENTED TENTH" AND ITS PROGRAM

Du Bois held contradictory opinions concerning the role of democracy in bringing about the betterment of African-Americans. He suggested in *The Philadelphia Negro* that intense political activity in the United States between 1892 and 1912 had placed the African-American electorate in a decisive position: "With the right to vote goes everything; freedom, manhood, the honor of your wives, the chastity of your daughters, the right to work, and the chance to rise" (p. 32). While championing the power of the ballot, Du Bois also developed a concept of what he termed the "Talented Tenth"—his ideal of an elite group of African-American leaders who, he believed, were obligated to lift the illiterate and poverty-stricken African-American masses.

He postulated that one of the most striking characteristics of the African-American upper class was that it paralleled the white middle class rather than the white upper class. African-American elites, he contended, remained isolated from both rural and urban blacks. Thus, Du Bois's "Talented Tenth"—with a keen sense of history and exalted mission—was poised to fill a vacuum in American class relations. The "Talented Tenth" would serve as a buffer and a bridge between white American elites and the African-American masses. Nevertheless, a number of critics suggested that Du Bois's notion of the "Talented Tenth" could become a limiting, restraining, and subordinating concept for the African-American masses. Du Bois was acutely aware of this possibility and became a passionate advocate of higher education for African-Americans. He warned that it was only through education that

"demagogic" leadership of the African-American masses could be avoided.

W. E. B. Du Bois was one of the first advocates of feminism in the early twentieth century. He praised African-American women for their great courage in the face of oppression, and in a 1917 essay supporting women's suffrage, he asserted that much of the actual work of the world was performed by women—not men.

CRITICISMS OF BOOKER T. WASHINGTON

Du Bois's views on civil rights clashed with those of another prominent and influential black leader of the period, Booker T. Washington. Washington promoted a philosophy of accommodation to racism, urging African-Americans to accept discrimination—at least for the time being. Washington encouraged African-Americans to elevate themselves through hard work. In this Washington followed Frederick Douglass and other nineteenth-century African-American leaders who pressed for industrial training for African-Americans. Initially, Du Bois agreed with Washington. He applauded Washington's famous Atlanta speech in 1895 in which Washington argued for "segregated equality." But changes within the African-American world militated against Washington's position. African-American migration from South to North accelerated the growth of ghettos, and these urban enclaves witnessed the birth of a professional class that was far removed from its Southern roots. The futility of Washington's position became more evident, even in the rural South. Washington believed that the education of African-American sharecroppers and tenant farmers in scientific agriculture would be a major means of creating independent African-American farmers, but as it turned out, the scientific revolution in agriculture only served to increase poverty for agricultural producers.

As a sociologist, Du Bois himself had conducted a study of African-American farms in Alabama in 1906. The study was sponsored by the United States commissioner of labor, and it concluded that African-American farmers were losing ground. The study was never published on the grounds that it "touched on sensitive political matters." But Du Bois's

conclusions were vindicated. By 1910, 75.3 percent of African-American farmers in the South were either tenants or sharecroppers.

It should be emphasized that Du Bois was not the first to publicly criticize Booker T. Washington. Earlier, Washington's agenda had been questioned by William Monroe Trotter and other civil rights leaders. But it was the chapter that dealt with Washington in Du Bois's widely known book—*The Souls of Black Folk* (1903)—that set the tone and outcome of the debate. Du Bois's chapter on Washington cogently argued that Washington's strategy could only serve to perpetuate the further oppression of African-Americans.

In *The Souls of Black Folk*, Du Bois also gave first expression to his most abiding theoretical contribution to African-American studies. He underscored the characteristic dualism of African-Americans: "One ever feels his 'two-ness'—an American, a Negro; two souls, two thoughts, two irreconcilable strivings; two warring ideals in one dark body, whose dogged strength alone keeps it from being torn asunder. . . . He simply wishes to make it possible for a man to be both a Negro and an American, without being cursed and spit upon by his fellows, without having the doors of opportunity closed roughly in his face" (1996, 58–59).

Ultimately, Du Bois's analysis crystallized opposition to Booker T. Washington among African-American intellectuals and polarized African-American leaders into two major factions: "conservatives" who supported Booker T. Washington, and "radicals" who were inalterably opposed to Washington.

THE NIAGARA MOVEMENT AND BIRTH OF THE NAACP

In 1905, Du Bois founded the Niagara Movement dedicated primarily to criticizing the platform of Booker T. Washington. This small organization, which met annually until 1909, was seriously weakened by internal squabbles. Nevertheless, it is significant as the forerunner of the NAACP.

As noted, Du Bois played a major role in founding the NAACP in 1909 and became the association's director of research. He was one of few blacks

to occupy a leadership position within the organization and also the founding editor of its magazine, *The Crisis*. In his role as editor of *The Crisis*, he wielded considerable influence over NAACP affairs and among middle-class African-Americans and progressive whites between 1910 and 1934. His often strident editorials resulted in a number of changes to public policy; for example, admission of African-Americans to officers' training school, establishment of legal procedures against those accused of lynching African-Americans, and creation of a federal work plan to benefit returning African-American veterans. His writings during this period also evidence a willingness to compromise his "true" feelings in order to attain organizational goals and foster organizational harmony. Within both the Niagara Movement and the NAACP, Du Bois officially adopted the stance of a "capitalist" and an "integrationist." Meanwhile, his non-NAACP writings more accurately reflected his socialist and Pan-African views.

"PAN-AFRICANISM" AND NATIONALISM

Du Bois's nationalism took a variety of forms. He was a strong advocate of "Pan-Africanism"—the belief that all people of African descent had common interests and should work together in a common struggle for freedom. In 1900, Du Bois served as an organizer of the first Pan-African Conference, held in London. He was also the architect of four subsequent Pan-African Congresses, held in London.

Always an independent thinker, Du Bois was critical of Marcus Garvey and the "Back to Africa" movement (a movement that advocated the repatriation of African-Americans to Africa). Du Bois's notion of Pan-Africanism never embraced the idea that all peoples of color should be gathered in one place. It is ironic that of the many prominent African-American leaders who actively participated in the back to Africa debate, only Du Bois—who opposed the Back to Africa movement—actually ever moved to Africa.

In addition Du Bois was a passionate supporter of cultural nationalism. As editor of *The Crisis*, he encouraged the development of African-American

art and literature. He also encouraged economic nationalism among African-Americans. His economic nationalism took the form of his assertion that African-Americans needed to develop a separate “group economy” of producers and consumers. He saw cooperatives as an effective way of battling poverty and economic discrimination. Others did not see it this way. His promotion of economic nationalism brought about an intense ideological split within the NAACP. As a consequence Du Bois resigned as editor of *The Crisis* and, in 1934, resigned from the NAACP. Du Bois later complained that the NAACP had become more concerned with the interests of a select group of African-American elites than with helping the African-American masses.

After leaving the NAACP, Du Bois again returned to Atlanta University where he devoted the next ten years of his life to teaching and research. In 1940 he founded the magazine *Phylon: The Atlanta University's Review of Race and Culture*. In 1945 he published a “preparatory volume” for a projected African-American encyclopedia for which he hoped to serve as editor-in-chief.

He also produced two major books during this period. *Black Reconstruction: An Essay Toward a History of the Part Which Black Folk Played in the Attempt to Reconstruct Democracy in America, 1860–1880* (1935) and *Dusk of Dawn: an Essay Toward an Autobiography of a Race Concept* (1940). *Black Reconstruction* provided an innovative and exhaustive treatment of this pivotal period in African-American history. *Dusk of Dawn* was autobiographical and recounted Du Bois's role in the civil rights struggle. In *Dusk to Dawn*, Du Bois attempted to view his career abstractly, as a “case study” illustrating the complexities of interracial conflict.

Following a fruitful decade of teaching at Atlanta University, Du Bois returned once again to a research position at the NAACP (1944–1948), but this affiliation ended in yet another bitter quarrel.

THE LATER YEARS: CAPITALISM AND COMMUNISM

In the 1890s, Du Bois had been an outspoken supporter of capitalism. He urged African-Americans to

support African-American businesses. But still he had reservations about the capitalist system. By 1905 he had become thoroughly convinced of the advantages of socialism. He joined the Socialist Party in 1912 and remained sympathetic to Marxist ideals for the rest of his life.

After 1948, Du Bois moved further leftward politically. He publicly identified with pro-Russian causes and was indicted in 1951 as an “unregistered agent for a foreign power.” Although acquitted of all charges, Du Bois became increasingly disillusioned with the United States. In 1962, he renounced his U.S. citizenship and moved to Ghana, where he was to serve as editor-in-chief of *Encyclopedia Africana*, a project to be sponsored by the then president of Ghana, Kwame Nkrumah. The encyclopedia was never completed. W. E. B. Du Bois died on 27 August 1963, in Accra, Ghana.

Du Bois possessed an independent spirit. He could never confine himself to any one ideology, party, or organization. Nevertheless, he was both willing and able to compromise his beliefs in order to attain a higher goal: the betterment of all peoples of color. Whenever the occasion warranted, Du Bois could be charming and accommodating. But much of his effectiveness as a leader rested with his single-minded persistence. Du Bois stated things bluntly. While he was not known for his wit, he did possess a keen sense of irony. His leadership style became a model for twentieth-century African-American activist/intellectuals like Henry Louis Gates Jr., Cornel West, and Manning Marable, who followed him. He also has influenced other African-American leaders like Malcolm X, novelists like Richard Wright, and a generation of African-American comics like George Wallace and Chris Rock.

DYSFUNCTIONAL LEADERSHIP

A 2003 cartoon in the *International Herald Tribune* shows two fighting children being pulled apart by their mother. One child points at the other, protesting “She called me a CEO first!” Until recently, when leadership scandals such as those at Tyco, Enron, and WorldCom had begun to reveal leadership’s underbelly, American business leadership was viewed as an essentially benign activity, with leaders working for the good of the organization and all of its stakeholders. Most studies of leadership have emphasized its positive, transforming aspects, assigning an almost moral dimension to the task—one that involves a calling to a higher plane. But such perceptions, laudable though they may be, ignore leadership’s shadow side, that part of the leadership equation which thrives on the power that comes with the role. This “Darth Vader” aspect of

the role, which grows out of personality traits such as self-aggrandizement and entitlement, thrives on narcissism, self-deceit, and the abuse of power.

PSYCHOLOGICAL PRESSURES

In the psychopathology of leadership, the combination of neurotic personality and personal power can—and almost inevitably does—create social and business disasters. Despite the potency of this shadow side, many leaders are unwilling to face it. They hesitate to look inside themselves, and when they do, they refuse to acknowledge their weaknesses; they are unwilling to face up to how their defensive structures and character traits can negatively affect their organizations. They are all too quick to deny that the pressures that come with leadership can contribute to dysfunctional behavior and decisions. The psychological pressures of leadership can be formidable, however, contributing to dysfunctional behavior to the detriment of both leader and organization. Among such pressures are:

- *The loneliness of command*. Once a man or woman reaches a top position in an organization, stress and frustration often develop as old relationships and support networks change and previous colleagues become distant.
- *Addiction to power*. The fear of losing what has been so difficult to gain—a top leadership position—sometimes motivates people to engage in malevolent acts.
- *Fear of envy*. Some people find being the object of envy very disturbing. That fear can reach the point where dysfunctional self-destructive behavior “snatches defeat out of the jaws of victory.”
- *The experience of “What now?”* After achieving a lifetime’s ambition, leaders sometimes suffer from a sense of depression, feeling that they have little left to strive for.

All these psychological pressures may cause stress, anxiety, and/or depression, which may in their turn provoke irresponsible and irrational behaviors that affect an organization’s culture and decision-making patterns (Kets de Vries 1993, 2001). But what lies behind them? Many of the

pressures leaders experience derive from the ways they have learned to cope with the vicissitudes of narcissism.

THE ROLE OF NARCISSISM

Human development is shaped, in part, by responding to frustration. Before birth, human beings are, in effect, on automatic pilot: One's needs are met immediately and automatically. This situation changes the moment a baby makes its entry into the world. In dealing with the frustrations of expressing needs and wants, and to cope with feelings of helplessness, the infant tries to retain the original impression of the perfection and bliss of intrauterine life by creating both a grandiose, exhibitionistic image of the self and an all-powerful, idealized image of the parents (Kohut 1971). Over time, and with what psychiatrist Donald Winnicott termed "good enough parenting," these two configurations are "tamed" by the forces of reality—especially by parents, siblings, caretakers, and teachers, who modify the infant's exhibitionism and channel the grandiose fantasies. How do the major caretakers react to the child's struggle with the paradoxical quandary of infancy—that quandary being how to resolve the tension between childhood helplessness and the "grandiose sense of self" found in almost all children? The answer is of paramount importance to the child's psychological health. The resolution of that tension is what determines a person's feelings of potency or impotency. Inadequate resolution often produces feelings of rage, desire for vengeance, and hunger for personal power. If that hunger is not properly resolved in the various stages of childhood, it may be acted out in highly destructive ways in adulthood.

Much depends on the "good enough" parenting mentioned above. Children exposed to extremes of dysfunctional parenting often believe that they cannot rely on anybody's love or loyalty. As adults, they remain deeply troubled by a sense of deprivation, anger, and emptiness, and they cope with this by resorting to narcissistic excess.

From a conceptual point of view, a distinction can be made between two varieties of narcissism: constructive and reactive (Kets de Vries 1993). Con-

structive narcissists are those who were fortunate enough to have caretakers who knew how to provide age-appropriate frustration—that is, enough frustration to challenge but not so much as to overwhelm. These caretakers were able to provide a supportive environment that fostered feelings of basic trust and to a sense of control over one's actions. People exposed to such parenting tend to be relatively well balanced, have a positive sense of self-esteem, a capacity for introspection, and an empathetic outlook; they radiate a sense of positive vitality.

Reactive narcissists, on the other hand, were not so fortunate as children. Instead of receiving age-appropriate frustration, they received over- or understimulation, or chaotic, inconsistent stimulation, and thus were left with a legacy of feelings of inadequacy and deprivation. To master their feelings of inadequacy such individuals often develop an exaggerated sense of self-importance and grandiosity and a concomitant need for admiration. To master their sense of deprivation they develop feelings of entitlement, believing that they deserve special treatment and that rules and regulations apply only to others. Furthermore, having not had empathic experiences, these people lack empathy; they are unable to experience how others feel. Typically they become fixated on issues of power, status, prestige, and superiority. They may also suffer from what has been called the "Monte Cristo complex" (after the protagonist in Alexandre Dumas's *The Count of Monte Cristo*), becoming preoccupied with feelings of envy, spite, revenge, and/or vindictive triumph over others. In short, they become haunted by the need to get even for real or imagined hurts.

TRANSFERENTIAL RELATIONSHIPS

Transference, the act of using relationship patterns from the past to deal with situations in the present, is a common phenomenon. In fact, all of us act out transference (or "historical") reactions on a daily basis. The boss who shares our mother's unwillingness to listen, or the colleague whose stealth reminds us of our father, inspires in us the same feelings that those original caregivers did. The psychological imprints of crucial early caregivers—partic-

There is no such thing as a perfect leader either in the past or present, in China or elsewhere. If there is one, he is only pretending, like a pig inserting scallions into its nose in an effort to look like an elephant.

—Liu Shao-ch'1

ularly our parents—cause confusion in time and place such that we act toward others in the present as if they were significant people from the past. These imprints stay with us and guide our interactions throughout our life.

Two subtypes of transference are especially common in the workplace (and are often exaggerated in reactive narcissists): mirroring and idealizing. It is said that the first mirror a baby looks into is the mother's face. A person's identity and mind are heavily shaped by contact with the mother, particularly during the early, narcissistic period of development. Starting with that first mirror, the process of mirroring—that is, taking our cues about being and behaving from those around us—becomes an ongoing aspect of our daily lives and relationships. Idealizing is another universal process: As a way of coping with feelings of helplessness, we idealize people important to us, beginning with our first caretakers, assigning powerful imagery to them. Through this idealizing process we hope to combat helplessness and acquire some of the power of the person admired.

When idealizing and mirroring show up in organizational settings, these transference patterns accelerate a process whereby followers no longer respond to the leader according to the reality of the situation, but rather as if the leader were a significant figure from the past, such as a parent or other authoritative person. The followers' emotional legacy drives them to transfer many of their past hopes and fantasies to people in positions of power and authority. This idealizing transference creates in the follower a sense of being protected and of sharing in "reflected" power.

Reactive narcissistic leaders are especially responsive to such admiration, often becoming so

dependent on it that they can no longer function without this emotional fix. It fatally seduces such leaders into believing that they are in fact the illusory creatures their followers have made them out to be. It is a two-way street, of course: Followers project their fantasies onto their leaders, and leaders mirror themselves in the glow of their followers. The result for leaders who are reactive narcissists is that disposition and position work together to wreak havoc on reality-testing: They are happy to find themselves in a mutual admiration society—or indeed in a hall of mirrors that lets them hear and see only what they want to hear and see. When followers rebel against a leader's distorted view of the world, the leader, perceiving such disagreement as a direct personal attack, may react with an outburst of rage. This "tantrum," if you will—a reenactment of childhood behavior—originates from earlier feelings of helplessness and humiliation. Unlike in childhood, however, the power that such leaders now hold means that the impact of their rage on their immediate environment can be devastating.

Such outbursts compound the problem by intimidating followers, who then themselves regress to more childlike behavior. To overcome the severe anxiety prompted by the leader's aggression, followers may resort to the defensive reaction known as "identification with the aggressor," thus transforming themselves from the threatened to the threatening.

Within this climate of dependency, the world is seen as starkly black and white. In other words, people are either for or against the leader. Independent thinkers are removed, while those who hesitate to collaborate become the new "villains"—"deviants" who provide fresh targets for the leader's anger. Those "identifying with the aggressor" support the leader in his or her destructive activities as a rite of passage. They help deal with the leader's "enemies." The sharing of the guilt can be endlessly fed with new scapegoats, designated villains on whom the group enacts revenge whenever things go wrong. These scapegoats fulfill an important function: They become to others the external stabilizers of identity and inner control. They are a point of reference on which to project everything one is afraid of, everything perceived as bad.

This frightening scenario can have various outcomes—all negative. In extreme cases, it can lead to the self-destruction of the leader, professionally speaking, and the demise of the organization. Before the “fall,” however, there sometimes comes a point when the organizational participants recognize that the price for participating in the collusion is becoming too high. The endgame may include a palace revolution whereby the leader is overthrown when the cycle of abusive behavior becomes unbearable. Followers may come to realize that they are next in line to be sacrificed on the insatiable altar of the leader’s wrath. The attempt to remove the leader becomes a desperate effort to break the magic spell.

NEUROTIC ORGANIZATIONS

Although reactive narcissism is the most salient factor in dysfunctional leadership, a number of other personality configurations can contribute to leader and organizational dysfunction. In organizations that have a strong concentration of power, those personality configurations can result in a parallel organizational “pathology.” In what can be called “neurotic organizations,” one is likely to find a top executive whose rigid, neurotic style is strongly mirrored in inappropriate strategies, structures, organizational cultures, and patterns of decision making.

The five most common types of neurotic organizations can be labeled dramatic, suspicious, detached, depressive, and compulsive (Kets de Vries and Miller 1984).

Table 1 outlines how, in each type of organization, the leader’s personal style and “inner theater” interrelate with the organization’s characteristics. Each of the five organizational patterns has strengths as well as weaknesses, just as every difficult emotion has a silver lining. In many cases a solid strength becomes a weakness over time. For example, a leader’s careful attention to the actions of rivals can shade from a healthy wariness to an unmitigated sense of suspi-

cion that pollutes the atmosphere of the organization. When that happens, change is needed if the organization is to survive. Unfortunately, with corporate styles deeply rooted in history and personality, change never comes easily.

The first step toward change is recognition of the danger signs of dysfunctional leadership and dysfunctional organizations. This necessitates a willingness on the part of leaders to look within themselves and make an honest (and often painful) appraisal. Because it is difficult to identify problems and make new choices when the entire organization is caught in a self-destructive pattern, leaders in this position would do well to summon the courage to ask for help. Caught in a psychic prison, they need the keys to their release. By encouraging them to see what they are doing to themselves and the organization, and by offering workable behavioral alternatives, trained outsiders offer those keys.

Napoleon once said that leaders are merchants of hope. They succeed best when they speak to the collective imagination of their people and create a sense of purpose and meaning. To effectively accomplish those tasks, they must mute the calls of the narcissistic sirens by looking deep within and acknowledging their own imperfections. They need to develop a sense of emotional intelligence, a process that starts with self-awareness. This is not news, of course; it is what the Oracle at Delphi and Sigmund Freud have been telling us all along.

Table 1. The Five “Neurotic” Styles: An Overview

<i>Type</i>	<i>Organizational Features</i>	<i>Executive</i>	<i>Culture</i>	<i>Management Strategy</i>
Dramatic/ Cyclothymic	Overcentralization hinders the development of effective communication systems; organization too primitive for its many products and broad market; second-tier executive level lacks influence.	Seeks attention; craves excitement, activity, and stimulation; touched by a sense of entitlement; tends toward extremes. Guiding theme: <i>“I want to get attention from and impress the people who count in my life.”</i>	Subordinates’ dependency and leader’s protective instincts reinforce each other, leading to “idealizing” and “mirroring”; leader serves as catalyst for subordinates’ initiatives and morale.	Hyperactive, impulsive, venturesome, and dangerously uninhibited; favors executive initiation of bold ventures; pursues inconsistent diversification and growth; encourages action for action’s sake; nonparticipative decision making.
Suspicious	Elaborate information processing; abundant analysis of external trends; centralization of power.	Vigilantly prepared to counter attacks and personal threats; hypersensitive and distrustful; cold and lacking emotional expression; overinvolved in rules and details to secure complete control; craves information; sometimes vindictive. Guiding theme: <i>“Some menacing force is out to get me. I’d better be on my guard. I can’t really trust anybody.”</i>	Atmosphere fosters intimidation, conformity, and mistrust; information is powerful; subordinates may fear attack and prepare for “fight-or-flight” mode.	Reactive and conservative, overly analytical, diversified, secretive.
Detached	Internal focus, insufficient scanning of external environment; hindered by self-imposed barriers to free flow of information.	Withdrawn and uninvolved; lacking interest in present or future; sometimes indifferent to praise or criticism. Guiding theme: <i>“Reality doesn’t offer any satisfaction. Interaction with others is destined to fail, so it’s safer to remain distant.”</i>	Atmosphere lacks warmth or emotion; conflict-ridden; subordinates plagued by insecurity and jockeying for power.	Vacillating, indecisive, and inconsistent; vision comes from narrow, parochial perspectives.
Depressive	Ritualism, bureaucracy, inflexibility; excessive hierarchy; poor internal communications; resistance to change.	Lacks self-confidence; plagued by self-esteem problems; afraid of success and therefore tolerant of mediocrity and failure; dependent on “messiahs.” Guiding theme: <i>“It’s hopeless to try to change the course of events. I’m just not good enough.”</i>	Passive; lacks initiative or motivation; ignorant of markets; avoidant—resulting in a sense of leadership vacuum.	Plagued by “decidophobia”; focuses inward; lacks vigilance over changing market conditions; drifts with no sense of direction; confined to antiquated, mature markets.
Compulsive	Rigid formal codes; elaborate communication systems; ritualized evaluation procedures; excessive thoroughness and exactness; hierarchical structure.	Tends to dominate organization from top to bottom; insists that others conform to strict rules in lockstep fashion; dogmatic or obstinate; obsessed with perfectionism, detail, routine, rituals, efficiency. Guiding theme: <i>“I don’t want to be at the mercy of events. I have to master and control all the things affecting me.”</i>	Rigid, inward-directed, and insular; peopled with submissive, uncreative, insecure employees.	Tightly calculated and focused; characterized by exhaustive evaluation; slow and non-adaptive; reliant on a narrow, established theme; obsessed with a single goal—such as cost-cutting or quality—to the exclusion of other factors.

EAST TIMOR, FOUNDING OF

With the lowering of the flag of the United Nations Transitional Administration (UNTAET) on 20 May 2002, the Indonesian island of East Timor (Democratic Republic of Timor-Leste) gained its independence after twenty-five years of political and military struggle against its occupier. It is no accident that the group of East Timorese who accepted the transfer of power from U.N. stewardship were also members of the group that created the first pro-independence party in 1974. Just as U.N. peacekeepers had intervened in September 1999 to prevent a humanitarian disaster and to both honor the results of the U.N.-conducted poll under which East Timorese rejected integration with Indonesia and ensure that the results were honored, so former rebels and exiles joined with UNTAET in preparing the nation for independence.

THE FRETILIN HERITAGE

The timing of independence and the rhetoric and symbolism of the independence ceremony were evocative of the role of the Frente Revolucionária do Timor-Leste Independente (Fretilin) party and its precursor party, Associação Social Democrática Timorese (ASDT), founded in 1974. As inscribed in the East Timor constitution, the day of Fretilin's unilateral declaration of independence, 28 November

1975, just ahead of an Indonesian invasion, is honored as the new nation's independence day. For Fretilin, the long and costly struggle was vindicated.

In fact, during the years after the Indonesian invasion, key Fretilin members were captured or killed, including Commandante Nicolau Lobato, leaving but one surviving central committee member to assume the leadership of Falintil, which was the armed resistance. That member was future East Timor President José Xanana Gusmão, who in March 1981 founded the umbrella National Council of Maubere Resistance (CNRM) above party affiliation.

However, where military struggle had its limits against an adversary who virtually sealed off the island to outside contacts, José Ramos-Horta (Fretilin external affairs spokesperson and future East Timor foreign minister) became a spokesperson for East Timor independence, making his youthful debut at the U.N. Security Council in 1976. Other central committee members then outside the country gained the support of Portugal's former African colonies of Mozambique and Angola. The future prime minister of East Timor, Mari Alkatiri, a scion of East Timor's small Arab community, long traveled with a Mozambique diplomatic passport.

However, just as the armed struggle by a ragged resistance became almost mythical in the minds of Timorese at home as well as abroad, communications between the external and internal wings of the

resistance ruptured. Relations among leaders in the diaspora, especially Portugal, Australia, and Mozambique also frayed over tactics and personalities. This fraying became apparent in a clash in Maputo (Mozambique) in 1978–1979 between left-wing exile Abilio Araujo and fellow exile Rogerio Lobato against the Social Democratic wing of the party as represented by Ramos-Horta. In October 1989, Ramos-Horta resigned from Fretilin; Abilio Araujo, accused of corruption, was expelled in 1993.

CNRT AND THE RISE OF THE “CLANDESTINE”

Attempts to coordinate the diplomatic struggle led to convergence of former adversaries of the short civil war of 1975: the Timorese Democratic Union (UDT) party under João Carrascalão and the Fretilin party. The decision to bury the hatchet led to the formation in April 1998 of the Timorese National Resistance Council (CNRT), an umbrella organization that also included the Church. Until it was dissolved at a congress in the capital city of Dili in August 2000, CNRT was the major interlocutor organization between the East Timorese and the U.N. As one among many voices in the CNRT, Fretilin would resurface as a force only in the run-up to East Timor’s first free elections held under U.N. auspices in August 2001.

The gap between the internal and external wings of the resistance was eventually bridged by a generation of East Timorese schooled by Indonesia. Working out of universities in Bali and Java as well as inside East Timor, the youthful “clandestine” under the umbrella Renetil movement increasingly coordinated assistance and links between external resistance, their foreign activist supporters, and the armed resistance. Some of the early youth leaders, such as Constâncio Pinto, carried on the struggle from exile in the United States, while others, such as National Resistance of East Timorese Students (Renetil) leader and future East Timor Vice Foreign Minister Fernando d’Araujo, operated inside prison alongside Gusmão. Undoubtedly Gusmão’s decision to leave the mountains for the city, leaving himself vulnerable to capture, was problematic but good strategy in the context of the broadening political movement.

The importance of the external resistance increased as East Timor’s fate gained international exposure after the Dili massacre of November 1991. This importance became apparent with the awarding of the 1996 Nobel Peace Prize to two sons of East Timor: Bishop Carlos Ximenes and Ramos-Horta. While committing the Church to the defense of the religion, culture, and people of East Timor, the bishop had also lobbied the U.N. to rescue his people. Without the moral support of the bishop and the Church, East Timor’s plight would undoubtedly have been even worse.

REENTER THE UNITED NATIONS

U.N. Secretary-General Kofi Annan’s appointment of a special representative for East Timor, Pakistani diplomat Jamsheed Marker, in 1995 quickened the pace of East Timor’s progress to independence. By seeking to engage East Timor leaders from across the political spectrum in a series of meetings in Austria called the “All-Inclusive East Timorese Dialogue,” U.N. interlocutors also brought together for the first time a second generation of leaders, certain of whom are now prominent in government.

East Timor leaders reacted to the situation created by the 1997 Asian economic crisis, the collapse of the New Order government of Indonesian President Suharto on 21 May 1998, and the advent of the reformist government of President B. J. Habibie. Taking its cue from the pro-democracy movement in Indonesia, the Dili-based Student Solidarity Council headed by Antero Bendito da Silva spearheaded unprecedented demonstrations throughout East Timor between June and September 1998 in support of a U.N.-supervised referendum.

After Habibie agreed on 27 January 1999 to the principle of an internationally supervised consultation on whether East Timor would accept special autonomy within Indonesia, the ball was once again in the U.N.’s court. In a 5 May 1999 agreement signed in New York by the foreign ministers of Indonesia and Portugal, Portugal conceded sovereignty to Indonesia pending the results of the ballot eventually held on 30 August 1999 in which East Timorese were asked to accept or reject integration

Preamble to the Constitution of the Democratic Republic of East Timor

The Constituent Assembly of East Timor, in a plenary session on 22 March 2002, approved and decreed the Constitution of the Democratic Republic of East Timor. Following is the Preamble.

Following the liberation of the Timorese People from colonisation and illegal occupation of the Maubere Motherland by foreign powers, the independence of East Timor, proclaimed on the 28th of November 1975 by Frente Revolucionária do Timor-Leste Independente (FRETILIN), is recognised internationally on the 20th of May 2002.

The preparation and adoption of the Constitution of the Democratic Republic of East Timor is the culmination of the secular resistance of the Timorese People intensified following the invasion of the 7th of December 1975.

The struggle waged against the enemy, initially under the leadership of FRETILIN, gave way to more comprehensive forms of political participation, particularly in the wake of the establishment of the National Council of the Maubere Resistance (CNRT) in 1987 and the National Council of Timorese Resistance (CNRT) in 1998.

The Resistance was divided into three fronts.

The armed front was carried out by the glorious Forças Armadas de Libertação Nacional de Timor-Leste (FALINTIL) whose historical undertaking is to be praised.

The action of the clandestine front, astutely unleashed in hostile territory, involved the sacrifice of thousands of lives of women and men, especially the youth, who fought with abnegation for freedom and independence.

The diplomatic front, harmoniously carried out all over the world, enabled the paving of the way for definitive liberation.

In its cultural and humane perspective, the Catholic

Church in East Timor has always been able to take on the suffering of all the People with dignity, placing itself on their side in the defense of their most fundamental rights.

Ultimately, the present Constitution represents a heartfelt tribute to all martyrs of the Motherland.

Thus, the Members of the Constituent Assembly, in their capacity as legitimate representatives of the People elected on the 30th of August 2001;

Based further on the results of the referendum of the 30th of August 1999 organised under the auspices of the United Nations which confirmed the self-determined will for independence;

Fully conscious of the need to build a democratic and institutional culture proper of a State based on the rule of law where respect for the Constitution, for the laws and for democratically elected institutions constitute its unquestionable foundation;

Interpreting the profound sentiments, the aspirations and the faith in God of the People of East Timor;

Solemnly reaffirm their determination to fight all forms of tyranny, oppression, social, cultural or religious domination and segregation, to defend national independence, to respect and guarantee human rights and the fundamental rights of the citizen, to ensure the principle of the separation of powers in the organisation of the State, and to establish the essential rules of multi-party democracy, with a view to building a just and prosperous nation and developing a society of solidarity and fraternity.

with Indonesia. Although this concession was a high-stakes gamble for Portugal, East Timor leaders were not directly involved in the tripartite Indonesia-Portugal-United Nations negotiations, even if they were briefed. However, inside and outside East Timor expectations ran high because the Habibie government was viewed as providing a window of opportunity that might not be repeated.

In another throw of the dice the Falintil leadership was again tested. As Indonesian militia attacked an unarmed population, Lu Olo (Francisco Guterres), next-ranking survivor of the armed resistance, was faced with the dilemma of taking action to protect the people or maintaining the de facto ceasefire to

avoid massive Indonesian military retaliation. Controversially, Falintil commander-in-chief Gusmão overruled armed action on the grounds that it would provoke the kind of civil war that Indonesia falsely claimed it was defending.

U.N. SECURITY COUNCIL INTERVENTION OF SEPTEMBER 1999

With the specter of another Rwanda in the making, where the U.N. failed to intervene to stem mass killings, Ramos-Horta was brought into consultation at the Asia Pacific Economic Cooperation (APEC) summit meeting in Auckland, New Zealand, on

12 September 1999. There U.S. President Bill Clinton, Japanese Prime Minister Kazuo Obuchi, South Korean President Kim Dae-jung, and Australian Prime Minister John Howard, among other regional leaders, reached broad consensus on the urgency of humanitarian intervention backed by a peacekeeping force. The U.N./World Bank and Western embassies were then in close contact with Gusmão and other members of CNRT pending their triumphal reentry into Dili in September–October as U.N. forces commenced to deploy.

While U.N. forces met resistance from Falintil, which was reluctant to disarm, CNRT leaders quickly moved to fill an administrative vacuum at the district and subdistrict levels. Although the CNRT had hastily drafted economic plans, there was a sense that from the beginning the World Bank moved to preempt or redirect Fretilin radicals from replaying their socialist dreams. Ramos-Horta and Gusmão were early visitors to the World Bank and the U.S. Pentagon. Still, the incoming UNTAET administration, headed by Brazilian diplomat Sergio Vieira de Mello, had little choice but to work with CNRT leadership, just as from early on CNRT leadership made it plain that the U.N. mandate would not hold in East Timor without the highest levels of CNRT participation. Rather than confronting utopian radicals, the World Bank confronted no less prickly, albeit more malleable, pragmatic nationalists.

TOWARD INDEPENDENCE

UNTAET was also concerned with institution building, including preparing East Timor for independence. Just as preparation for democratic elections had become one of the key components of U.N. peacekeeping after the U.N. experience of conducting elections in Cambodia in May 1993, so under the stewardship of the Independent Electoral Commission the U.N. mounted two elections in East Timor. The first, held in August 2001, was to elect a constituent assembly that would write the new nation's constitution. The second, held in April 2002, was to elect a president. With the promulgation of an electoral law, political parties blossomed, not surprisingly dominated by names and symbols of the past.

Freed from the old CNRT structure, Fretilin began to make its play as the historic party of freedom and liberation. However, a new centrist social-democratic party, led by a scion of the Carrascalão family, and a “youth” party led by Fernando d’Araujo sapped Fretilin’s strength. A major destabilizing factor was the obstruction mounted by a faux Fretilin party (a fake party of troublemakers) that disavowed the U.N. process by upholding the unilateral declaration of independence by Fretilin on 28 November 1975. From the left, veteran resistance figure Avelino Coehlo headed a small urban-based socialist party. In the end Fretilin triumphed, and an old adversary, UDT, emerged as the greatest loser. Mari Alkatiri became chief minister pending independence, with Lu Olo appointed speaker of parliament. Bolstered by its majority, Fretilin steered the country’s new constitution.

Few people doubted that Gusmão would be elected president, even though he had to be convinced to run. In another throwback to the past, Fretilin founding president Xavier do Amaral returned from “house arrest” in Indonesia and emerged as the only opponent, drawing major support from his Mambae-speaking compatriots. The fact that Fretilin did not endorse Gusmão for president suggested to many that bad blood sullied the office of the president and the ruling party, boding ill for future unity. Gusmão had also been critical of the appointment of Rogerio Lobato to the post of minister of the interior. However, victory for Gusmão in East Timor’s first presidential election appeared to confirm the role of a big man in history.

THE FUTURE

The U.N. remained in East Timor in an advisory capacity for good reason. East Timor still faced a lack of administrative workers, especially in such specialist areas as legal services, finance, and policing. Under UNMISSET (the U.N. Mission of Support in East Timor), the U.N. retained a large peacekeeping contingent tested by a number of outbreaks of violence stemming from internal and external origins. The most serious challenge to the new nation occurred in December 2002 with an assault on the

parliament, the destruction of property (including the prime minister's house), and loss of life in an action attributed to agent provocateurs linked to disaffected people. Although the administration has gained its legitimacy at the ballot box, the challenge for leadership in the future is to create jobs and address other social and economic issues. However, even the acquisition of oil revenues from the Timor Sea will require good governance and wise leadership for years to come. The surprise resignation of Bishop Carlo Belo in November 2002 left a large gap in moral leadership. As an axiom, leadership without success will not last long; but in East Timor a rebellious opposition is short on both ideas and talent in a new nation bereft of experienced lawmakers and entirely lacking in democratic traditions.

E-COMMERCE

Electronic commerce, or “e-commerce,” is a broadly used term to describe transactions conducted over the Internet, whether completed by individuals, organizations, or companies. E-commerce is usually used to represent individual purchases made via the World Wide Web, though it is also applicable to business-to-business applications, such as selling inventory online or general procurement activities.

Before e-commerce could become a phenomenon,

the general public first had to become acquainted and comfortable with the Internet. Marc Andreessen and a team of computer scientists at the University of Illinois cleared the first hurdle to mass acceptance in 1993 when they introduced the Mosaic browser. Mosaic married graphics and images to the predominantly text-based World Wide Web and made usage easier through point-and-click access.

EXPANDING AND SELLING THE INTERNET

After Mosaic, Internet traffic increased 341,631 percent as more than one million users downloaded the software for free. In 1994, Andreessen joined with computer industry veteran Jim Clark to form Netscape, one of the Web's pioneering companies. That same year, *Time* magazine ran its first cover story on the Internet. By early 1995, a *Business Week* survey estimated that 27,000 websites existed, with the number doubling every two months.

The Web grew so quickly that commercializing it seemed inevitable. Countless entrepreneurs founded Internet-based start-up companies, funded by Silicon Valley venture capitalists headquartered near Stanford University on famous Sand Hill Road, such as Sequoia Capital, Draper Fisher Jurvetson, and Kleiner Perkins Caufield and Byers.

The feeding frenzy for start-ups reached a peak after several early innovators filed initial public offerings (IPO) and turned its founders into paper millionaires. In early August 1995, Netscape went public and Clark's shares were worth \$565 million, making him one of the wealthiest people in America and coining the phrase “Internet billionaire.” By the end of the year, the company's stock reached \$170 a share, making it worth nearly \$6.5 billion. Netscape's IPO success turned the Internet into the new Wild West, a place where fantastic wealth could be created—a capitalist nirvana on the western edge of the country, similar to the gold rush days in the mid-1800s.

AMAZON SPARKS DOT-COM REVOLUTION

The company that embodied both the Internet stock market bubble and the promise of the dot-com revolution was Amazon.com. Founded by Jeff Bezos, a

former investment banker, the Seattle-based company sold books online, then later expanded into other consumer goods, including music, movies, clothing, and much more. Initially, Bezos thought that selling books via the Web would exploit the power of the Internet, since the company would not have to stock inventory.

Bezos adopted a “get big fast” mentality that emphasized building Amazon’s brand name, despite the negative effect it had on earnings. Bezos saw the battle as one of market share, not profitability, and other Web entrepreneurs and investors followed suit. Soon, nearly every industry had Internet-based startups fighting with traditional competitors and any corporation on the Fortune 500 was suddenly deemed stodgy if it lacked a viable Web component.

Bezos became the most celebrated New Economy cheerleader, particularly after being deemed *Time*’s “Person of the Year,” the fourth-youngest individual ever named to the list. His story was considered the quintessential e-commerce fairy tale. Amazon’s lasting significance may be as a cultural force. By getting on the Web early, Amazon enabled millions of people to become comfortable with the Internet as a purchasing tool.

Based on Amazon’s early success, others founded companies to capitalize on the phenomenal growth rate of the Web. College-age entrepreneurs were some of the earliest innovators. For example, Stanford University students David Filo and Jerry Yang decided that the Web required a directory to organize the plethora of new sites. In response, they founded Yahoo!, the first major portal, which attracted millions of visitors. Another young computer enthusiast, Pierre Omidyar, believed that a web-based community could use the Internet as a giant flea market. He founded eBay so that people could buy and sell collectibles and other goods. eBay is one of the few dot-com companies to become profitable and has since become the crown jewel of the Internet.

As consumers became more Web-savvy, e-commerce grew rapidly, doubling every year throughout the late 1990s. In 1998, online retailers sold \$7.2 billion in merchandise, up 50 percent over the previous year. Amazon alone topped \$1 billion in 1998. These figures scared traditional retailers into pushing their

own online capabilities. The thought was that if a company did not find a way to sell goods and services online, it would be destined for history’s dustbin.

DOT-COM REVOLUTION

The dot-com “revolution” refers to the period spanning the late 1990s through the spring of 2000, when Wall Street, corporate America, the general public, and the media caught a wave of euphoria generated by the Internet and the use of high technology for business purposes. Numerous factors all came together to create an “Internet bubble” of market speculation and frenzied investment, primarily among small investors who could use web-based trading sites to buy and sell stocks easily.

The ensuing stock market boom revolutionized the way businesses operated by providing the capital to invest in new technology. Perhaps more important, the dot-com revolution fundamentally changed the way people communicated through Internet-based technologies, such as e-mail, message boards, chat rooms, and others. Thus, despite the failure of most dot-com companies, the transformation continues through the use of technology and the Internet for business purposes.

In its broadest sense, the dot-com revolution served as a massive growth engine for the U.S. economy. For the first time in recent memory, the power and mystique of small, entrepreneurial companies dwarfed that of established corporations. Given the public’s willingness to invest in Internet-based startups, their valuations soared.

Finally, given the chance at riches gained from stock options and participation in initial public offerings (IPO), workers flocked to dot-coms, despite the risk involved. Added to the possibility for quick riches, the quirky, decentralized culture of dot-com companies drew Generation X workers in droves. The media added fuel to the mass exodus from the Fortune 500 by regaling readers with stories of office foosball tournaments, game rooms, and company-sponsored espresso machines. Dot-com entrepreneurs also promoted work as a way of achieving a more spiritual or fulfilling state, which appealed to the sullen masses of workers confined in endless

rows of drab, gray cubicles in the nation's large companies. Start-ups were seen as antiauthoritarian and laid-back, mirroring the lifestyle exuded in northern California since the 1960s.

BUSINESS-TO-BUSINESS E-COMMERCE

Corporations also rushed to establish e-commerce sites in the late 1990s. Business-to-business (B2B) e-commerce, or electronic transactions between companies, was hyped as the future of corporate America. America's business bellwether, General Electric (GE), grasped the significance of the Internet, despite some early resistance. GE chief executive officer Jack Welch caught e-commerce fever with a vengeance. In early 1999, he demanded that the company become an e-business and directed the company's top five hundred executives to execute on that goal within several months.

GE's Global eXchange Services (GXS) assembled online exchanges and auctions. Welch fueled the growth of GXS by investing several hundred million dollars in the unit, which provides software, infrastructure systems, and consulting services to companies that want to build online exchanges. GXS became the largest B2B community in the world, with 100,000 trading partners, including 17,000 suppliers, and handling 1 billion transactions and accounting for \$1 trillion in goods and services a year.

In 2000, U.S. Census Bureau analysts showed that B2B e-commerce accounted for 94 percent of all e-commerce transactions. The manufacturing arena alone reported \$777 billion in e-commerce shipments for the year. E-commerce is an attractive method for selling goods and services for companies of all sizes because it reduces the overhead costs associated with conducting business transactions. Sending an order online over the Internet is cheaper, faster, and more convenient than completing the same deal via the mail or phone.

GLOBAL RECESSION SLOWS GROWTH

The economic recession gripping the United States in the early years of the twenty-first century slowed e-commerce, despite the geometric growth in the late

1990s. Some estimates show online retail sales falling for the first time in the third quarter of 2002, basically keeping in line with the sluggish state of the world economy.

The definition of what constitutes e-commerce is broad, hindering accurate statistics about its overall impact on the economy. Different analysts use varying methods for calculating total sales, but general estimates were that online sales accounted for approximately \$50 to \$60 billion in revenue in 2001. Experts expect the figure for 2002 to top \$72 billion, a 41 percent increase from the previous year. E-commerce leaders anticipate sales to continue expanding through 2007, but at a more measured pace than experienced through the early years of the new century.

HYPE VERSUS REALITY

The Internet is a technological marvel, but as the Web was commercialized, the hype overtook reality. Too many people began viewing the Internet as a way to quick riches. Rather than use the Web as an additional tool for selling goods and services, start-ups believed that they were revolutionizing business.

Backed by venture capitalists and a general public willing to buy technology stocks, e-commerce companies soon realized that a sustainable business required much more than a jazzy website. When the Internet bubble burst, many of these companies were exposed as empty shells. It is little wonder that some of the best examples of how e-commerce has transformed business are from large corporations, like General Electric, Hilton Hotels, and Home Depot. Using size to their advantage, these companies utilized e-commerce to squeeze costs out of their infrastructures and make their organizations more efficient.

THE BUBBLE BURSTS

Dot-com mania reached a peak in the late 1990s, when venture capitalists started funding dot-coms based on the ability to take the company public, thus cashing in on the IPO shares. Seemingly ludicrous businesses received millions of dollars in seed money, despite having little more than a bright idea.

The list of now defunct dot-coms reads like a comedy sketch, ranging from fashion site Boo.com, which burned through its \$135 million investment before declaring bankruptcy, to online toy retailer eToys, online newspaper LocalBusiness.com, and the self-descriptive FurnitureAndBedding.com. Online grocer Webvan may be the biggest failure in Internet history, burning through an estimated \$1 billion before shutting down.

The companies that flamed out at the tail end of the New Economy bubble were like kindling for the recession wildfire that gripped the United States at the dawn of the new century. Over the course of one month (10 March 2000 to 6 April 6 2000), the Nasdaq stock market lost \$1 trillion in value. The tsunami destroyed the dreams of many dot-coms in its wake and startled technology investors back to reality. For employees at start-ups, from the chief executive officer (CEO) on down, stock options ended up “under water,” worthless scraps of paper that would never regain their luster.

In retrospect, people should have seen the downfall coming sooner. Flying in the face of multiple warning signs, too many people still sought a shot at Web wealth and glory, unable to pass on the gamble, despite the long odds. Even after the Nasdaq crashed in the spring of 2000, investors rushed in to buy shares of depressed stocks, many of which rebounded slightly before falling for good. The media (fueled by business cable stations, like CNBC, which turned Internet CEOs into celebrities, and the plump ad-soaked tech magazines) made folk heroes out of people like Amazon.com’s Bezos and Yahoo!’s Yang. So many Internet legends were tales of rags-to-riches glory or college students coming up with an idea in their dorm room that by focusing on them, the media made it seem easy.

Seemingly educated people (doctors, lawyers, and professors) started writing dot-com business plans in their spare time, figuring that they might be able to strike it rich by riding the venture capital wave out of Silicon Valley and into the IPO spotlight. With enough cash, anyone could become a venture capitalist in the late 1990s, even if they had never set foot inside a high-technology start-up and knew nothing about building a thriving business.

By the end of 2001, thousands of dot-com companies went bankrupt and tens of thousands of employees lost their jobs. The massive failure of the New Economy and the subsequent trickle of new investments in technology companies, combined with corporate governance scandals and the September 11 2001 terrorist attacks, sparked a recession that plagued businesses in the early years of the twenty-first century. High-tech centers, such as Silicon Valley, San Francisco, Austin, Washington, D.C., and New York, have been especially hard-hit by the failure of the dot-com revolution.

Despite the dot-com meltdown, the high-tech revolution continues, though on a much more modest scale, as traditional businesses use e-commerce and the Internet to meld online and physical storefronts. Companies are using web-based services and technologies to become more efficient and profitable. It is nearly impossible to find an industry that has not been improved through Internet-based technology, whether it is in education and nonprofits or financial services and manufacturing.

The dot-com revolution ended in early 2000, but innovation continues to propel companies into novel areas that mix business and the Internet. Figures released by the United Nations reveal that there were 655 million registered Internet users worldwide in 2002 and that global e-commerce will top \$2.3 billion, doubling the figure from the previous year.

In the future, e-commerce will remain a vital part of the economy as technological innovations push into new areas. Wireless communications over the Web, nanotechnology, and online gaming are some examples of industries that will necessitate an e-commerce infrastructure. Both start-ups and established companies are looking at these opportunities, along with a host of others, to generate new e-commerce business.

ECONOMIC JUSTICE

The moral philosopher and political economist Adam Smith asserted that “justice . . . is the main pillar that upholds the whole edifice [of society]. If it is removed, the great, the immense fabric of human society . . . must in a moment crumble into atoms” (Smith 1976a [1790], 86). What this pillar should look like, and how it should be constructed, are perennial questions that scholars and practitioners of leadership have debated before and after Smith.

In disparate contexts, political leaders and social-movement activists have pursued the goal of a more just economic system. Examples of such efforts include the Peasants’ Revolt in the fourteenth century CE; the American Revolutionary leaders’ rejection of “taxation without representation”; Marx and Engels’s call for “workers of the world [to] unite!”; President Lyndon Johnson’s declaration of a “war on poverty”; César Chávez’s leadership of the United Farm Workers’ struggle; organizing in factories and beyond to secure a decent wage and safe working conditions; and coordinated efforts to secure gender equity in the workplace.

Economic justice is not only a worthy end; it is also instrumentally valuable in the quest for other valuable social ends. Proponents of a minimum wage, for instance, have argued that some level of income is necessary for citizen-workers to be full participants in the life of their society. Societies in which persons do not receive their due are likely to be marked by unrest, fragmentation, or even violence. Stated positively, citizens who feel they have a

stake in their society are able to be active agents in various spheres of life.

MEANINGS AND FUNDAMENTAL QUESTIONS

Understandings of economic justice fit within wider conceptions of a good and just society, about which there is vigorous intellectual and practical disagreement. Economic justice has to do with conditions of a society that enable individual persons to receive their due within their society, under conditions of finite material resources. One of the most basic questions in economic justice concerns which parties have moral status within a society—do all women and men, children, adults, and elderly people, persons of all races, IQs, and sexual orientations have equal claims within the society? Do foreign workers and national-citizen workers have the same (or different) status in terms of economic justice? Do members of future generations have any claim to economic justice? (For example, should their interests be considered in shaping a social security system or in deciding what forms of pollution are morally acceptable?) Finally, do nonhuman beings have claims in justice?

Whether economic justice should focus on opportunities, capabilities, resources, utilities, outcomes, or some other dimension or level is an additional matter of debate. So, too, is how broadly the term “economic” should be taken, since the economic system is closely related to political, social, cultural, religious, and familial arrangements in a society. The criterion of economic justice is another fundamental question: Should a society determine what is due to individuals according to inherent worth, need, social class, merit, work, prior possession, or in some other way?

Yet another issue in economic justice concerns the way in which the analyst relates an ideal conception of justice to the current injustices of a particular actual society. Justice as an end, arguably, is not fully attainable in any human society, and thus a key issue for any view of justice is how to prioritize leadership actions against various forms of injustice in order to approximate conditions of justice more fully.

William Bradford, Governor of the Massachusetts Bay Colony, on Property

At length, after much debate of things, the Governor (with the advice of the chiefest amongst them) gave way that they should set corn every man for his own particular, and in that regard trust to themselves; in all other things to go on in the general way as before. And so assigned to every family a parcel of land, according to the proportion of their number, for that end, only for present use (but made no division for inheritance) and ranged all boys and youth under some family. This had very good success, for it made all hands very industrious, so as much more corn was planted than otherwise would have been by any means the Governor or any other could use, and saved him a great deal of trouble, and gave far better content. The women now went willingly into the field, and took their little ones with them to set corn; which before would allege weakness and inability; whom to have compelled would have been thought great tyranny and oppression.

The experience that was had in this common course and condition, tried sundry years and that amongst godly and sober men, may well evince the vanity of that conceit of Plato's and other ancients applauded by some of later times; that the taking away of property and bringing in community into a commonwealth would make them happy and flourishing; as if they were wiser than God. For this community (so far as it was) was found to breed much confusion and

discontent and retard much employment that would have been to their benefit and comfort. For the young men, that were most fit and able for labour and service, did repine that they should spend their time and strength to work for other men's wives and children without recompense. The strong, or man of parts, had no more in division of victuals and clothes than he that was weak and not able to do a quarter the other could; this was thought injustice. The aged and graver men to be ranked and equalized in labours and victuals, clothes, etc., with the meaner and younger sort, thought it some indignity and disrespect unto them. And for men's wives to be commanded to do service for other men, as dressing their meat, washing their clothes, etc., they deemed it a kind of slavery, neither could many husbands well brook it. Upon the point all being to have alike, and all to do alike, they thought themselves in the like condition, and one as good as another; and so, if it did not cut off those relations that God hath set among men, yet it did at least much diminish and take off the mutual respects that should be preserved amongst them. And would have been worse if they had been men of another condition. Let none object this is men's corruption, and nothing to the course [ownership arrangement] itself. I answer, seeing all men have this corruption in them, God in His wisdom saw another course fitter for them.

UTILITARIAN FOUNDATIONS OF ECONOMIC THEORY

Standard neoclassical economics is firmly rooted in utilitarianism. “Utility”—variously understood in terms of satisfaction or happiness—is the metric of analysis. In theorizing, economists assume individuals are motivated by their own self-interest, generally understood in terms of the maximization of their own utility. At base, economic modeling is not distribution focused but, rather, productivity focused. That is, the chief concern is how utility can be maximized for a population. Each individual's utility is valued equally in standard models, though the question of whether (and how) interpersonal comparisons of utility can be made remains unanswered.

The standard economic framework avoids normative evaluation of the initial distribution of utilities

(or of incomes or other goods). Thus, any assessment of justice or injustice of the initial distribution must be done outside of the standard economic approach, according to economist Amartya Sen and others. Social welfare analysis in economics is focused, instead, on unambiguous improvements (or declines). A condition known as “Pareto optimality” defines an improvement in social welfare as the increase in the utility of at least one individual without the reduction in utility of any individual. This kind of improvement does not allow cases of trade-offs—that is, a small amount of utility reduction on the part of well-off persons coincides with a massive increase in the utility of poor or needy persons (if, say, they were saved from starvation or natural disaster).

While Pareto improvements reflect clear progress, they do not address the many politically difficult

situations, such as in policies of redistribution, in which one party stands to gain and another party stands to lose in the policymaking process. Critics of the standard economic approach thus assert that it unduly privileges the status quo in socioeconomic distributions.

The utility-based economic frame has an additional noteworthy dimension. Since the assumption of decreasing marginal utility of income is commonly made, there is some egalitarian bias (in terms of income) in seeking to maximize overall utility. That is, assuming identical utility functions and the possibility of making interpersonal comparisons of utility, an additional dollar would have a greater utility impact on a poor person than on a wealthy person. For a fixed amount of income, then, and equivalent and comparable utility functions for all persons, the utility-maximizing distribution would be full income equality. As long as strict Pareto optimality is maintained, however, transfers of income from one person to another are still not viewed as an unambiguous social improvement.

LAISSEZ-FAIRE ECONOMICS AND COMMUTATIVE JUSTICE

Advocates of the free-market (or laissez-faire) economic system have argued, in different ways, that the most appropriate form of justice for the economy is commutative justice, or the justice of the transaction or exchange. In 1974 philosopher Robert Nozick offered his now-famous Wilt Chamberlain example, in which millions of persons happily pay \$0.25 to see Chamberlain play—and, consequently, Chamberlain gets rich (161–163). Nozick’s thought experiment emphasizes the justice of the exchange, and he argues that if we are to protect the freedom of consumer choice, we cannot meddle with the outcome of greater income inequality (presumably as long as the exchanges themselves do not involve fraud, coercion, or “external” costs to third parties).

Nozick’s view fits within a wider group of defenders of a laissez-faire economic system. In this century, economists F. A. Hayek and Milton Friedman have been articulate defenders of such a position. Libertarians defend market exchange not only as an

efficient mechanism but also as a reflection of human freedom. In this approach, besides government’s minimal role of enforcing the laws of contract, providing national defense, and perhaps subsidizing education, additional involvement by the government is considered “intervention.” This “negative-freedom” view, in which individuals should be free from government’s reach, contrasts with the understanding of freedom presented in the works of John Rawls, Amartya Sen, Michael Walzer, and others, discussed below.

Like the utilitarianism of economic analysis, the libertarian defenses of free-market justice do not worry a great deal about unequal distribution. The assumption that the process of just exchange will lead, by definition, to just outcomes tends to accept as given the present distribution of income, wealth, and opportunities. Often libertarians present a desert-based argument about private-property holdings in order to suggest that the present distribution of property is a result, along with voluntary exchanges, of the fair (if unequal) efforts of humans. One classic argument of this kind, put forth by John Locke in 1690, argues that property should be understood as the outcome of individuals who mix their labor with the land. As discussed in the following two sections, however, a strong commitment to freedom of property and exchange is not necessarily incompatible with distributive justice.

PERSPECTIVES ON DISTRIBUTIVE JUSTICE: RAWLS AND SEN

No approach to justice has received more scholarly or public attention in recent years than the framework presented by John Rawls in his 1971 book *A Theory of Justice*. Rawls offers his theory as one that is morally preferable to utilitarianism (and other conceptions of justice). Rawls’s approach allows for reflection upon the “initial” distribution of endowments to individuals and, in so doing, it reflects a much stronger form of egalitarian justice than utilitarianism or libertarianism.

Rawls’s theory of justice is based upon a “thought experiment” that asks what kind of society a person would choose if he or she did not know his or her

own position, status, race, gender, occupation, or educational opportunities or attainments. Behind such a “veil of ignorance” in what Rawls calls the “original position,” and given some risk-aversion, Rawls asserts that individuals would concur to two principles of justice. This approach builds upon the social-contract model of liberal-democratic society, in which individuals must be allowed to consent to their form of government. The operation of the two agreed-upon principles would, within certain assumptions, guarantee a “just basic structure” of society. A key result would be a just distribution, among citizens, of “primary goods”—a set of all-purpose goods, including wealth and income, liberties, powers, and opportunities, and the social bases of self-respect.

Rawls’s first principle of justice establishes the “priority of liberty” in the theory and grants an equal set of liberties to all citizens. The second principle defines what kinds of social and economic inequalities are just (and which are not). In order to be just, any inequalities must be consistent with a fair equality of opportunity and “they must be to the greatest benefit of the least advantaged members of society” (Rawls 1993, 291). This latter condition, known as the “difference principle,” grants strong moral priority to poor or marginalized members of society. Despite Rawls’s insistence that his theory be understood as a whole, the difference principle has often been considered, in isolation from the rest of his theory, as a principle of economic justice. But the overall framework’s strong demand for basic liberties and fair equality of opportunity are even more fundamental preconditions than the difference principle for economic justice.

Philosopher and Nobel-prize-winning economist Amartya Sen has joined Rawls in the rejection of much of utilitarian (and libertarian) approaches to economic justice. Sen has broken down the components of utilitarianism (Sen 1987, 39) and emphasized multiple ways in which utility-based analyses do not account for “internalized” effects of oppression on disadvantaged persons, via so-called adaptive preferences. Sen has also offered a critical response to Rawls’s own framework. Most significant on this front, Sen asserts that Rawls’s principles, to the extent that they deal with the distribution of a

certain set of all-purpose means known as “primary goods,” do not focus as directly as they should on the intrinsic ends of human freedoms and achievements. Sen argues that social and moral analysis (of justice, equality, freedom, well-being, and so on) should be on intrinsically valuable ends, not on means to those ends (Sen 1999).

Sen, along with philosopher Martha Nussbaum, suggests the perspective of “human capability,” with an emphasis on those things that people are actually able to do and to achieve in their society. Because human beings have different capacities to translate basic goods (such as income or schooling) into ends (such as being in good health or having adequate education), attention to persons most in need requires a focus on their actual capability, and not only on what goods they possess. For instance, a pregnant woman has greater nutritional needs than a woman who is not pregnant in order to achieve the same state of being well-nourished. In addition, persons born with physical or mental disabilities may need additional medical or educational care in order to achieve the same capability as other members of society.

Sen thus rejects—along with Rawls’s emphasis on primary goods—the 1981 focus on resources of philosopher Ronald Dworkin and Robert Nozick’s 1974 view of entitlements because they do not adequately focus on ends. As part of a conception of justice, Sen has called for an equality of basic capability, although he leaves to citizens in particular societies to determine precisely what basic capability and economic justice entail in their respective contexts. Sen acknowledges the instrumental and the intrinsic importance of the freedom of exchange, but there are other important aspects, such as being free from hunger, that are part of economic justice. He argues that his capability-based approach is a fuller conception of freedom in its multiple forms than utilitarian, libertarian, or Rawlsian accounts.

COMMUTATIVE AND DISTRIBUTIVE JUSTICE

Commutative justice and distributive justice are not unrelated, and a system of economic justice can attend to both forms. Many scholars who focus

(almost) exclusively on commutative justice acknowledge, in various ways, that distribution is important. But, in some of these views, redistribution is a matter not properly of economic justice, but of the political order. That is, economic justice per se should focus only on commutative justice—that is, on assuring that there is an honest and non-coercive transaction among the parties. As social ethicist Jon Gunnemann (1985) discusses, however, if there is no “mutual competence” or shared meanings among the parties—for instance, in a case of extreme cultural or geographic distance or in a situation of severe inequality—then commutative justice is easily violated. Assuring such mutuality may require public attention (whether it is called political or economic) to economic distributions.

Political philosopher Michael Walzer, in his account of *Spheres of Justice* (1983), offers a view of complex equality that is suggestive of the relationship between the economic “sphere” and other spheres of life. Walzer calls for “complex equality” that operates among various spheres—the economy, politics, education, family, religion, and so forth—in which no good from any sphere is allowed to “dominate” goods in other spheres of life. For example, a just society would not permit money, which belongs in the economic sphere, to have an undue influence on political, religious, or familial life. The concern for domination by money justifies “blocked exchanges”—for instance, laws against the buying and selling of political votes or of educational degrees. If, and only if, domination is blocked (through political and other forms of leadership, presumably), then in that case Walzer sees little reason for moral concern about inequalities in income, political power, or educational attainment. In other words, if a system of basic justice were in place, then, given the diversity of human abilities and experiences, the remaining inequalities would be acceptable.

INEQUALITIES, DIFFERENCES, AND INJUSTICES

In actual, current societies, Walzer and others assert, many inequalities do exist that reflect not differences, but injustices. Genuine differences can be

consistent with justice and equality, but they are not necessarily so. For instance, the fact that—in the United States—among full-time, year-round workers, the average salary for women is only 0.75 times that of men, is arguably a matter not only of difference, but of injustice.

Critics of this claim point out that women tend to work in less lucrative fields and are more likely (for child rearing and other reasons) to move in and out of the labor market. The fact of unequal wages, these critics are right to point out, is a matter of more than merely individual discrimination. These more “systemic” or “cultural” factors are surely at play. Yet it is not clear that there is only a one-way causality—that is, that women’s wages are lower because they work in lower-paying fields. It is also possible that some fields are low-paying because they employ mostly women. This debate suggests that both individual-level and system-level analysis should be part of the reflection upon economic justice.

GENDER AND FAMILY

This discussion leads back to the fundamental question of how wide the analysis of economic justice should be. Clearly, economic justice pertains to more spheres of society than merely the economy. Rawls asserts that the subject of justice is the “basic structure” of a society, which entails the political, public sphere. Sympathetic critics such as feminist philosopher Susan Moller Okin have contended that Rawls’s view should be broadened to attend to justice within the institution of the family. In particular, gender inequalities are masked behind the wall created when the family is considered part of the “private” sphere, and thus protected, except in matters of direct harm to the vulnerable, from government intrusion. Views about gender-based roles are commonly developed and taught in familial settings, and Okin argues that there is good reason to expand a theory of justice to reflect more directly on family life.

Standard economic approaches, not unlike Rawls’s theory in this sense, typically stop at the household or family level, seeing life within that “private” context as a black box. As an exception, Nobel laureate Gary Becker explores the “economics

of the family,” but he assumes a harmony of interests among family or household members and an altruistic head of the house. Sen, noting empirical data that shows gender-based discrimination in very typical household activities such as food intake and basic health care, suggests that gender relations within the household be modeled and understood as having both cooperative and conflictual elements. Nussbaum undertakes a closer examination of the role of traditional beliefs and practices within the household on the capabilities of girls and women. In all these approaches, economic justice relates to family and culture as well as to the political and economic spheres (2000; see also Nussbaum & Glover 1995).

INTERNATIONAL AND ENVIRONMENTAL ECONOMIC JUSTICE

Whether and how claims of justice can be made across political boundaries is currently a matter of widespread discussion. In a world in which almost half of the population lives below two dollars a day of income, reflection upon global economic justice takes on practical urgency. Yet most theories of justice take as given the sovereign nation-state as a starting point. The most significant example here is Rawls’s theory of justice, envisioned for liberal democracies; Rawls’s “law of peoples” provides a very thin (though not empty) account of the demands of justice at the international level. “Cosmopolitan” or global accounts of ethics, such as those put forward by bioethicist Peter Singer, philosopher Martha Nussbaum, and theologian Hans Küng, understand political boundaries of nation-states to be of little moral significance. Any approach that upholds justice claims beyond political borders must consider which national or international bodies have obligations to respond to injustices. International, or even fully global, justice has increasingly become part of the agenda of national and international political leaders.

How best to expand discussions of justice beyond human beings to other beings, or to the environment itself, challenges the classic understanding of justice as based on claims of humans upon each other and their human institutions. One way to expand justice

is to assert the rights, including the equal rights vis-à-vis human beings, of all other animals, as Peter Singer argues. Another is to understand the earth itself as having legitimate claims as a living entity, a position taken by theologian John Cobb, World Bank economist Herman E. Daly, and cultural historian Thomas Berry. More “anthropocentric” approaches, including many in environmental economics, devise ways in which to “internalize” into human transactions the costs of environmental damage or resource depletion. Concern about the natural environment also reminds leaders and citizens of the implications of economic processes upon future generations of human beings and other animals, an awareness that should be part of a wide view of economic justice.

ECONOMIC JUSTICE AND POLITICAL LEADERSHIP

Writing in the late eighteenth century, Adam Smith did not foresee the complexities of the contemporary global economy, and he did not envision the extensive social welfare systems that mark (to differing degrees) the most developed societies. Smith was primarily interested in commutative justice, but he also emphasized the moral significance of public education and he asserted that higher wages for workers would increase productivity (Smith 1976b [1776]). In overall terms, Smith’s assertion that justice is the main pillar of society is still a critical insight for relating leadership to economic justice. Economists are correct to state that, in general, business leaders, workers, investors, savers, and consumers tend to pursue their own interests in economic life. It remains the task of society as a whole, especially through deliberation in civil society and voting and policymaking in the political sphere, to decide what economic justice requires for its citizens. Once a process of good leadership establishes those standards, or rules of the game, then individuals and organizations can pursue their ends in freedom. Although there is clearly no sovereign political authority at the global level, to the extent that there is an emerging global society, individuals as well as governmental and nongovernmental institutions can

create a web of structures that work toward a more just global economy as well.

EDDY, MARY BAKER (1821–1910)

Founder of the Church of Christ, Scientist, and The Christian Science Monitor

Mary Baker Eddy made her mark as a leader through the establishment and promotion of Christian Science, known for its doctrine of healing through prayer. Born in Bow, New Hampshire, she was sickly from an early age and therefore received much of her early education at home. She began publishing poetry and prose while still young. In December 1843, she married George W. Glover, but was widowed six months later. In 1853, she married a second time, this time to Daniel Patterson, a dentist, and the couple eventually settled in Lynn, Massachusetts.

ILLNESS AND THE IDEA OF SPIRITUAL HEALING

Having been brought up in a family that prized Puritan values, Eddy read the Bible daily for consolation and healing of the ailments that continued to plague her, but to little effect. She also tried the various medical treatments of her time, but found no permanent help there either.

Source: Bettmann/Corbis; used with permission.

The treatments she received from Phineas Parkhurst Quimby (1802–1866), however, improved her health markedly and deeply influenced her ideas on healing. Quimby was an advocate of medicine-free healing. Under Quimby's care, Eddy went from being an invalid to being virtually pain-free and active; this experience led her to research theories of disease and cure. Eddy not only read essays on health, she wrote her own, submitting them to Quimby for correction. These essays attracted attention, and Eddy began to give public lectures on Quimby's healing system in Warren, Maine.

THE FOUNDATION AND SPREAD OF CHRISTIAN SCIENCE

Quimby died in 1866, and shortly after Quimby's death, Eddy found herself an invalid again as a result

of a fall on an icy sidewalk. The physician who attended her told her she would never walk again. Believing she was dying, she asked for her Bible and read an account of one of Jesus's healings. She felt a spiritual transformation and got up from her sickbed feeling reinvigorated and ready to spread the word.

Following her miraculous recovery, however, Eddy was fearful that she would suffer a relapse. She asked a fellow patient of Quimby's for help, but when he failed to respond, she realized that she had to work out her own interpretation of spiritual healing. It was through those efforts that she came to understand the "Science of Christianity," or Christian Science, both terms Eddy acknowledged that Quimby used at least once in her presence. Also in 1866, the year of her great breakthrough and of Quimby's death, Eddy separated from George Glover, divorcing him in 1873. In 1877, she married again, to Asa Gilbert Eddy, a follower of her new faith.

In the months and years following Eddy's breakthrough, she began to rework Quimby's ideas and to actively spread them. Her leadership style was one of persistence, a persistence that wore down the opposition. She took all questions, often denying any inconsistencies within her teachings and insisting that Quimby had had only a limited influence on her work. She declared that those who argued otherwise were simply opponents of her movement seeking to discredit it. She felt that being associated with Quimby would discredit her movement because she felt she had gone beyond the earlier teachings of her mentor.

Her persistence and obvious deep conviction worked to win converts to her cause. She led by offering examples of the power of Christian Science's healing, her own, which she elaborated over time, being the foremost. Other converts added their own stories, which she was able to integrate into an emotional and coherent whole for Christian Science teachings.

In 1875, Eddy wrote the textbook of Christian Science, *Science and Health with Key to the Scriptures*, which over the following century was published in seventeen languages and Braille and sold more than 10 million copies. Although *Science and*

Selection from Mary Baker Eddy's *Science and Health*

Chapter VI: Science, Theology, Medicine

But I certify you, brethren, that the gospel which was preached of me is not after man. For I neither received it of man, neither was I taught it, but by the revelation of Jesus Christ.
—Paul

The kingdom of heaven is like unto leaven, which a woman took, and hid in three measures of meal, till the whole was leavened.
—Jesus

In the year 1866, I discovered the Christ Science or divine laws of Life, Truth, and Love, and named my discovery Christian Science. God had been graciously preparing me during many years for the reception of this final revelation of the absolute divine Principle of scientific mental healing.

This apodictical Principle points to the revelation of Immanuel, "God with us,"—the sovereign ever-presence, delivering the children of men from every ill "that flesh is heir to." Through Christian Science, religion and medicine are inspired with a diviner nature and essence; fresh pinions are given to faith and understanding, and thoughts acquaint themselves intelligently with God.

Feeling so perpetually the false consciousness that life inheres in the body, yet remembering that in reality God is our Life, we may well tremble in the prospect of those days in which we must say, "I have no pleasure in them."

Whence came to me this heavenly conviction,—a conviction antagonistic to the testimony of the physical senses? According to St. Paul, it was "the gift of the grace of God given unto me by the effectual working of His power." It was the divine law of Life and Love, unfolding to

me the demonstrable fact that matter possesses neither sensation nor life; that human experiences show the falsity of all material things; and that immortal cravings, "the price of learning love," establish the truism that the only sufferer is mortal mind, for the divine Mind cannot suffer.

My conclusions were reached by allowing the evidence of this revelation to multiply with mathematical certainty and the lesser demonstration to prove the greater, as the product of three multiplied by three, equaling nine, proves conclusively that three times three duodecillions must be nine duodecillions,—not a fraction more, not a unit less.

When apparently near the confines of mortal existence, standing already within the shadow of the death-valley, I learned these truths in divine Science: that all real being is in God, the divine Mind, and that Life, Truth, and Love are all-powerful and ever-present; that the opposite of Truth,—called error, sin, sickness, disease, death,—is the false testimony of false material sense, of mind in matter; that this false sense evolves, in belief, a subjective state of mortal mind which this same so-called mind names *matter*, thereby shutting out the true sense of Spirit.

My discovery, that erring, mortal, misnamed *mind* produces all the organism and action of the mortal body, set my thoughts to work in new channels, and led up to my demonstration of the proposition that Mind is All and matter is naught as the leading factor in Mind-science.

Christian Science reveals incontrovertibly that Mind is All-in-all, that the only realities are the divine Mind and idea. This great fact is not, however, seen to be supported by sensible evidence, until its divine Principle is demonstrated by healing the sick and thus proved absolute and divine. This proof once seen, no other conclusion can be reached.

Source: Eddy, Mary Baker. (1875). *Science and Health with Key to the Scriptures*. Boston: The First Church of Christ, Scientist; pp. 107–109.

Health is her most famous work, Eddy also wrote several other books laying out her ideas on religion.

In 1879, she officially founded the Church of Christ, Scientist. She was also responsible for establishing its various organs, including its newspaper, the *Christian Science Monitor*, which she established in 1908, when she was eighty-eight years old. The *Monitor* came to have a reputation for journalistic excellence. By the time of Eddy's death in 1910, Christian Science was found throughout the world. She had become an important and respected public

figure. In 1995, she was inducted into the National Women's Hall of Fame for her contributions to society, religion, and journalism.

CONTROVERSY AND FINAL ASSESSMENT

Once she had formulated the idea of Christian Science, Eddy took on the role of itinerant teacher, going from place to place giving lectures, writing, tutoring individual pupils, and conducting classes. Over the years she moved from a strong reliance on

Quimby's writings to introducing more of her own ideas and terminology.

Nonetheless, *Science and Health* bears a striking resemblance to a manuscript of Quimby's. In 1904, *The New York Times* published a facsimile of Quimby's manuscript with changes in Eddy's handwriting. The *Times* pointed out the parallels between Quimby's teaching and hers. This article came after a long controversy about who was truly the originator of the ideas of Christian Science.

The controversy continued to rage for years. It seems fairly clear that Eddy took many of Quimby's ideas, but it is also clear that she continued to revise them for each new edition of her textbook, so that in the end they bore but slight resemblance to his original ideas. She was able to present the ideas of Christian Science in such a fashion through writing, teaching, and lecturing that it spread throughout the world by her death in 1910. Eddy's personality was clearly the motive force for the spread of Christian Science. Mary Baker Eddy was a great synthesizer and teacher. Deep belief in the rightness of her cause gave her an evangelical fervor. Eddy was able to use her great persuasive and literary powers to enlist those eager for a new message. She appealed to many who had not been cured by traditional means and who were open to nonmedical cures. Although many of her early followers today would probably be considered victims of psychosomatic or hysterical diseases, it is to Eddy's credit that she was able to offer them a means to ease their pain.

EDISON, THOMAS (1847–1931)

U.S. inventor and entrepreneur

Thomas Alva Edison was the greatest inventor in modern history. Since his rise to fame in the 1870s he has been one of history's most mythologized figures. The richness and complexity of his work, combined with the legends that have surrounded it, make Edison's career an especially challenging puzzle for those who seek to recover the "real" Edison. However, because of the availability of millions of pages of Edison laboratory notebooks, correspondence, and other documents, historians now have a much clearer understanding of Edison's life and work. If anything, writings based on the Edison papers have only reinforced the remarkable nature of his career; Edison remains a towering figure in the history of modern technological and business development. At the same time, the "new" Edison differs in several significant ways from the Edison of late nineteenth- and early twentieth-century hagiography (a worshipful or idealized biography). How he established and operated scores of businesses; how he recruited, motivated, and collaborated with other technologists; how he organized and supervised employees; and how he cultivated and leveraged his own public image—in short, how Edison functioned as a leader—have emerged as central themes of his career.

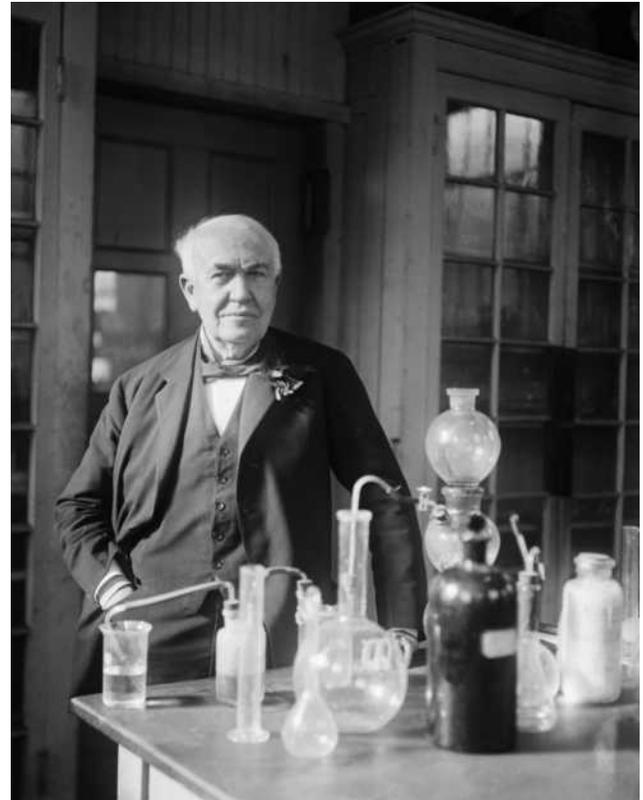

Edison was issued 1,093 U.S. patents and made major contributions to the development of several of the modern world's most important industries—telegraphy, telephony, electric light and power, recorded sound (the phonograph), motion pictures, chemical energy storage (batteries)—as well as less sweeping but still notable contributions to the fields

of mimeography, railroads, cement, automobiles, ore separation, and others. His discovery of the so-called Edison effect laid the groundwork for the development of radio. However, Edison was as much an entrepreneur and innovator as he was an inventor. That is, he was centrally occupied not only with creating but also with commercializing. According to many historians of technology, the process of innovation entails both invention and commercial application. This process typically involves applying new ideas to build working prototypes, then (with continual modification) scaling up production for sales. In this way theories, concepts, and designs are first embodied in the physical world, as technology, and then launched in the marketplace, as products. Edison devoted considerable attention to all stages of this process—conceptualization, design, model building, and commercialization—which involved him with a variety of individuals, including scientists and mathematicians, craftsmen and mechanics, investors, politicians, and customers. In his interactions with each kind of stakeholder (a person having an interest in an outcome), Edison exhibited a distinctive and usually quite effective leadership style.

Born on a farm in Milan, Ohio, Edison began his professional career as a telegrapher, which gave him a decent income and plenty of mobility. He hung out his shingle as an inventor and began to attract modest corporate capital in Boston during a stint there in 1868–1869. His initial work focused on improving telegraph, fire alarm, and facsimile telegraph systems. Edison soon moved to New York City, expanded his work into new areas, and achieved some notable success—along with additional venture capital. In 1876 he opened what he called an “invention factory” in the northeastern New Jersey farm community of Menlo Park. It was a predecessor of the twentieth-century research and development laboratory, an institution devoted to controlling the pace and direction of technological development.

A LEADER OF CRAFTSMEN

As an inventor, Edison worked much more pragmatically than theoretically—by present-day standards—but this was largely a consequence of the

Thomas Alva Edison in his laboratory in Menlo Park, New Jersey.
Source: Bettmann/Corbis; used with permission.

times in which he lived. Edison often relied on scientific research to guide his work in mechanics and electricity but had to rely more on trial and error in the chemical domain. Much Edison mythology has been based on the premise that Edison virtually plucked inspiration out of thin air. (Thus, a light bulb illuminating over one’s head became the standard metaphor for the flash of a brilliant idea.) Edison mythology also has been based on the premise that Edison actively spurned the contributions of people formally trained in the natural sciences. Probably the most popular quotation attributed to Edison has been his remark that invention is 99 percent perspiration and 1 percent inspiration. However, at his research facilities at Menlo Park (1876) and West Orange, New Jersey (1887), Edison assembled the largest technical library in North America, its sprawling stacks filled with scientific and technical journals (some from Europe), academic books, and patent reports. Francis Upton, one of Edison’s chief collab-

Hell, there are no rules here—we're trying to accomplish something.

—Thomas Edison

orators in electric lighting, was a brilliant mathematician educated at the Andover Academy, Bowdoin College, and Princeton University who also attended lectures by the German physicist Hermann von Helmholtz at Berlin University. In short, Edison exploited theoretical understandings as best he could; but the ends he sought quite often outran the limits of theory, forcing him and his researchers into uncharted terrain, where laborious trial-and-error protocols were the only practical solution.

The staff of craftsmen, mechanics, and model builders at Menlo Park grew to sixty-four by 1880. Later, at West Orange, Edison worked with hundreds of specialists in the main laboratory and in the large phonograph works as well as in smaller laboratories devoted to electricity, chemistry, chemical storage, and metallurgy. These men (as was common at the time, Edison's operations employed no women as skilled craftspeople or professionals) looked to Edison for direction and inspiration, and "the Old Man" did not disappoint. Edison flitted from workstation to workstation, giving directions, sounding out ideas, and proposing solutions. It was a two-way interaction, but Edison retained the clear leadership role. Although assistants exercised a high degree of autonomy, Edison—by dint of his enormous talent and creativity—usually took the lead in both defining and solving problems. When he departed the laboratory for more than a couple of days, work slowed noticeably without his direction.

Edison defined the work ethic within his laboratories by example. A "workaholic" (to use modern parlance) under normal conditions, he worked ceaselessly when in the crucial stage of a project, sneaking short naps on virtually any horizontal surface, and expected his assistants to keep pace. The long absences from home strained his associates and took a heavy toll on Edison's personal life (especially his first marriage, which was to Mary Stilwell). Even so, the work culture among Edison and his "muckers"

fostered a sense of camaraderie, much like Edison had experienced among the telegraphers and machinists of his young adulthood. It was an informal, masculine culture in which colorful stories and off-color jokes were valued as much as hard work and independent initiative. Edison's crews were kept within loose bounds and motivated, not by bureaucratic managerial systems, but by their enthusiasm for working with the greatest mucker of them all.

Managing Factories, Investors, and Celebrity

Even though inventive activity gave Edison the greatest intellectual satisfaction, he was also determined to profit from the fruits of his creativity. He founded multiple corporations in most of the areas of his research to produce the technological components and systems that flowed from his laboratories. In the field of electric light and power, for instance, the Edison Electric Light Company controlled the rights to several hundred patents that together comprised the "Edison system." Major system components were manufactured by the Edison Electric Lamp Company, the Edison Company for Isolated Lighting, the Edison Machine Works, and the Edison Tube Company. Edison Electric Light Company, in turn, licensed to a variety of local Edison illuminating companies in which Edison held a financial interest.

Throughout his career Edison had to court investors to keep the capital flowing in. To launch his career as an independent inventor, he garnered the support of major telegraph companies. Leading financiers such as J. Pierpont Morgan (the first North American to install electric lights in his home) and Henry Villard were strong supporters of Edison's electric light and power endeavors. Although Edison came through with promised innovations much of the time, he also displayed a propensity toward overly optimistic projection. In September 1878, for instance, he announced that he had solved the incandescent light challenge, although more than a year passed before he produced a practicable lamp, and it wasn't until 1882 that the first lighting station went on line, at Pearl Street in lower Manhattan, New York. Edison was supremely confident, but he also

recognized—and cultivated—the art of posturing for the press and for his financial backers.

Journalists were eager to comply. Edison's reputation began to soar in the 1870s, thanks in large measure to his successes with the phonograph. The device's power to capture and reproduce voices and music awed and enchanted the press and the public. For the most part thereafter, journalists uncritically reported Edison's claims and reveled in his eccentricities, a fact that Edison exploited. He was happy to play the part of the homespun genius who napped under his desk and was ready to take on virtually any technological challenge. On one occasion Edison jokingly claimed to have invented a machine that would feed the world. The news services ran the story straight, and millions of newspaper readers found it perfectly credible.

In spite of his celebrity Edison's relations with his financial backers often were strained. Although he was extraordinarily foresighted in identifying areas of opportunity, at times he proved to be stubbornly committed to what proved to be technological and entrepreneurial dead ends. Edison's electrical systems operated on direct current (DC), but when George Westinghouse and others introduced alternating current (AC) systems that were more economical for long-distance transmission and distribution, Edison dug in his heels and pushed DC even harder. AC ultimately prevailed. Similarly, Edison never succeeded in developing a commercially viable electric vehicle; he failed to envision the commercial possibilities of recorded sound; and in the 1890s he spent most of his fortune on a behemoth electromagnetic ore separation gambit that ultimately failed.

Nor did he fully control the interests that bore his name, especially as the scale of his various manufacturing enterprises grew large. By the 1880s, Edison's manufacturing and utility interests were simply too numerous and geographically dispersed for him to play much of a direct role in management. In 1892, his electrical interests were merged with those of Thomson-Houston to form General Electric, but Edison played a marginal role in the merger itself and in the company it created. He was by then one of the most renowned and admired figures in the world, his reputation on par with those of Theodore Roose-

Genius is one percent inspiration and ninety-nine percent perspiration.

—Thomas Edison

velt and Abraham Lincoln. In his twilight years Edison sustained his image through interviews and historical reenactments. Unlike many who attained his level of celebrity, however, Edison demonstrated few ambitions as a social philosopher.

Edison thus devoted much of his professional life—especially after opening the West Orange facilities in 1887—to founding and operating manufacturing facilities. Historians continue to debate how effective he was as an industrialist, although there is little question that he was strong, if not exceptional, as a businessman, especially given the range and complexity of his various enterprises. Edison's greatest business strength was in marketing—in both perceiving and shaping demand for mass consumer products.

However, in his own day and today, Edison chiefly stands as an example of a heroic inventor and, more broadly, a heroic U.S. citizen. His lack of much formal education, his strong practical bent, his independent habits, his apparent willingness to take on virtually any technical challenge—all resonated deeply with a nation that was becoming more and more bureaucratic, scientific, and professionalized yet feeling ambivalent about the transition. Edison left an enormous legacy. He was simultaneously a one-of-a-kind “wizard” and an everyman who aspired to greatness through hard work and creativity. In the popular imagination he served as a great inspiration more than a leader. However, those who explore the new Edison scholarship will find many valuable leadership lessons about how to organize and motivate creative teams, how to move technological ideas into the marketplace, and how to cultivate a potent public image.

EDUCATION, HIGHER

Colleges and universities generally provide society with the education and training necessary for social, economic, and technological progress. Institutions of higher education must themselves be led effectively if they are to produce the leaders needed for the common good.

While some consideration will be given to higher education in other parts of the world, the United States will be the primary focus of this entry. The United States has more students enrolled in higher-education institutions than any other country in the world.

Higher education is not a unified system. It comprises both public and private institutions, both non-profit and for-profit. For the purposes of this article, higher education will refer to all the types and categories of postsecondary institutions included in the Carnegie Classification. Last revised in 2000, the Carnegie Classification includes all colleges and universities in the United States that grant degrees and are certified by an accrediting agency recognized by the U.S. Secretary of Education. The Carnegie Classification includes six primary categories of institutions:

Doctoral or research universities. These institutions typically offer bachelor's and master's degrees in a broad array of fields as well as doctoral degrees in a range of subjects.

Master's colleges and universities. These typically offer baccalaureate (bachelor's) degrees in a variety of fields and graduate education through the master's level.

Baccalaureate colleges. These institutions specialize primarily in undergraduate education, offering bachelor's degrees in liberal arts subjects and other fields.

Associate colleges. Usually characterized as community colleges or junior colleges, these institu-

tions offer primarily two-year associate's degrees and certificate programs.

Specialized institutions. Specialized institutions are usually free-standing institutions that offer degrees, from bachelor's to doctoral degrees, in a single field, such as medicine, theology, engineering and technology, business and management, art, music, and so forth.

Tribal colleges and universities. American Indian tribes control these institutions, almost all of which are located on reservations.

RECENT STATISTICS

The U.S. Department of Education and the U.S. Census Bureau are principal suppliers of information about higher education in the United States, although there are other sources as well. The statistics in this entry are from the 30 August 2002 issue of the *Chronicle of Higher Education*. The most recently available statistics for various categories of information are not always for the same year. In 2000–2001 the total U.S. higher-education enterprise comprised 4,182 institutions, including 1,698 in the public sector and 1,695 in the private or independent sector. In fall 1999 the combined total number of students enrolled at all categories of U.S. postsecondary institutions was 14,791,224. Comprehensive financial statistics are available only for the nonprofit institutions. In 1996–1997 the public nonprofit institutions had revenues of more than \$130 billion and expenditures of almost \$126 billion, while in 1995–1996 the private nonprofit institutions had revenues of approximately \$74.5 billion and all expenditures totaling almost \$71 billion.

India, with a population almost four times that of the United States, has the second-largest higher education enrollment, with 7,780,000 students in the year 2000. In 1998 China, with a population approximately five times that of the United States, enrolled 3,408,800 students. The United States and Japan have the world's highest percentage of high school graduates who continue their formal education, with slightly more than 65 percent of Japanese continuing and slightly less than 65 percent of Americans.

Transnational developments in higher education

Dorm Life as a Leadership Study

COLLEGE PARK, MD. (ANS)—In place of the usual rough and tumble of dormitory life, students at the University of Maryland are turning their residences into a laboratory on civility.

A new project beginning this fall called the CIVICUS Living and Learning Program will compare modern citizenship with historic ideals, encourage students to come up with solutions to age-old incivilities and establish a model community in a dormitory.

"The most important thing I'd like to see is a free exchange of ideas while maintaining respect and civility for each person," said Sue Briggs, who directs the two-year, residential program in Somerset Hall. "Our biggest task is trying to corral energy and focus on a few distinctive programs to make a difference."

The 121 freshman and upper-class participants in the project were invited to apply based on their academic and public service records. They will take several classes together and work on independent projects related to democracy, leadership and community building.

The students may need this classroom learning when they head back to the dormitory. In other university housing, students generally rely on paid resident assistants to enforce house rules and broker conflicts, according to University of Maryland spokesperson Jean Reuter. Instead, CIVICUS residents are expected to come up with their own rules of civility for dorm life and to develop systems for resolving everyday dorm hassles like a neighbor's blaring music or messy roommates.

In the first month of the program, there has been ample evidence of ideas, energy and commitment, administrators said. On their first weekend on campus, CIVICUS students made 1,200 sandwiches for the hungry, loaded produce onto trucks for delivery to food banks and hauled compost on an organic farm.

"No one was required to be there, but we got 85 students up and ready at 8:30 in the morning," said Rachel Philofsky, a sophomore from Portland. "That gave me a lot of hope for the rest of the year."

But the program will cover more than community service. Agenda items for the students range from examining the criteria for respectful relationships to coping with small irritants like toothpaste in the sink to figuring out how best to govern themselves.

"I think the main idea is to try and build a civil society within this dorm," said Benny Anand, a freshman economics major. The building itself was renovated to accommodate the program and includes lots of classrooms, common areas and plenty of windows.

Anand admits he was first attracted to CIVICUS because of its great living space and location next to the library and dining hall. He since has become enthused about the group's diversity—28 percent are students of color—and its emphasis on generosity and trust.

The program is getting lots of attention, Briggs added, and receives daily phone calls from students interested in enrolling.

Source: "Students Take Lead in Turning Dorm Life Into Study in Civility." American News Service, October 7, 1999.

complicate the comparisons among nations. The Erasmus program, created by the European Union, effectively makes the higher-education resources of virtually all of Europe available to all qualified European students. Similarly, U.S. colleges and universities enroll more than half a million foreign nationals.

THE COMPLEXITY OF LEADERSHIP IN HIGHER EDUCATION

Especially since the beginning of the last quarter of the twentieth century, and continuing into the twenty-first century, there have been many calls for bolder leadership in U.S. higher education and criticism of college and university presidents for being

too timid. Those admonitions cite specific problems that need addressing—athletic excesses, binge drinking, curricular incoherence, grade inflation, "political correctness" run amok, and so on. The calls for stronger leadership frequently cite examples of presidents from past eras who demonstrated the qualities of character, personality, and intellect that made for effective leadership.

Those who demand bolder leaders almost always fail to acknowledge the vast differences in scale and character between today's colleges and universities and those of the late nineteenth or even early twentieth century. The post-Civil War era was of vast importance in U.S. higher education, and many of the celebrated leaders emerged during that period.

But in 1870, there were only slightly more than 50,000 college students in the entire United States. Today, Ohio State University enrolls on its main campus alone some 55,000 students. “College presidents of a century ago often were arbitrary in dismissing faculty members whose behavior or views offended them. It was only in 1915 with the creation of the American Association of University Professors that faculty members began to assert their collective power” (Menand 2001, 412–417). Not only is the scale of the enterprise today vastly greater, it is also much more complex. Authority and power in a typical university are diffused widely throughout the organization. Different units of an institution typically have distinctive missions. An academic medical center with hospitals and laboratories has little in common with the college of arts and sciences or the law school in the same university. The measures of success in one unit are likely to be at variance with the measures in another. In addition to a large degree of autonomy among the principal academic units, there is also great freedom for faculty members to determine what they will teach and what research interests they will pursue. Often, the president’s salary is well below that of the football coach, the manager of the endowment, professors of cardiac surgery, or Nobel Prize–winning professors.

Given those facts, leadership theories that explain the dynamics in earlier U.S. higher education institutions may not be as applicable to today’s environment. In his book *The Leadership Challenge of a College Presidency: Meaning, Occasion, and Voice*, Francis Oakley, a former president of Williams College, notes that the current literature on leadership in higher education tends to slight theories of leadership. For example, certain character or personality traits and intelligence are still important in academic leaders, but they are no longer considered the guarantors of success that they once were. The transformational leader—one who transforms his or her organization through the power of his or her vision—as described in *Leadership* (1978), the celebrated work of the historian James MacGregor Burns, still has great credibility, especially in small institutions such as liberal arts colleges, or among deans in professional schools within universities.

But it is much less applicable in large, complex, decentralized universities. Burns distinguishes between the “transforming” and the “transactional” leader. The transactional leader generates a following and effects change by exchanging benefits for support. The transforming leader is able to elevate and transform the aspirations of followers by providing a framework of moral purpose that energizes them and elicits their best efforts. It is important to note that Burns does not present the transforming and transactional models as mutually exclusive, and he notes that success for the transforming leader may require many practical political steps.

CLASSICAL AND COLONIAL HEADWATERS OF U.S. HIGHER EDUCATION

Bruce Kimball, the author of *Orators and Philosophers: A History of the Idea of Liberal Education* (1986), does not employ Burns’s leadership categories, but his portraits of Plato and Isocrates of the fifth and fourth centuries BCE qualify them as transforming leaders whose contrasting concepts of liberal education continue to define battle lines of debate twenty-four centuries later. Plato sided with his mentor Socrates in holding that the highest learning consists of *philosophia*, which discerns the essence of things, the final truth, through dialectical reasoning. Isocrates, by contrast, was skeptical of speculation. He insisted that the aim of education was to use oratory or public persuasion to promote personal and civic virtue. Despite the growth of undergraduate professional and preprofessional programs, especially since the mid-1970s, liberal arts education continues to flourish. Plato and Isocrates would feel at home today in many faculty debates about the content and aims of liberal education. Like many later leaders, they influenced the course of history decisively by articulating powerful and compelling ideas. Liberal arts higher education in the United States in the twenty-first century usually borrows from the traditions of both Plato and Isocrates, and most institutions represent an amalgam of their approaches.

Harvard College, founded in 1636, was the first American colonial college. It was modeled on Emmanuel College in England’s Cambridge Univer-

sity, and Harvard in turn became the model for many subsequent colonial colleges. Education at Harvard, as at Oxford and Cambridge, emphasized the formation of a learned aristocracy who would master classical Greek and Latin texts and go on to provide ecclesiastical, professional, and civic leadership. But Harvard departed from the Oxford and Cambridge model when it followed the example of the Calvinist universities at Leiden and Geneva by vesting final authority in a lay board of trustees instead of the faculty. That scheme of governance remains a hallmark of U.S. higher education.

The classical ideal of higher education that was brought over from England remained dominant for more than two centuries, but it gradually made way for various forms of applied and practical learning suitable for those whose primary interest was the development of the potential of a vast continent. The aristocratic presuppositions of the colonial colleges and their European antecedents conflicted increasingly with democratic impulses that demanded broader access to educational opportunities.

NINETEENTH-CENTURY LEADERSHIP OF HIGHER EDUCATION

As a principal architect of U.S. independence and as a child of the Enlightenment, Thomas Jefferson (1743–1826) founded the University of Virginia in 1819 to embody an explicitly U.S. ideal of higher education. Jefferson's University of Virginia subordinated the legacies of Athens, Jerusalem, and Rome to the mastery of subjects that could be applied to contemporary problems. Thus the eight schools that comprised the curricular foundation of the University of Virginia included ancient languages, modern languages, mathematics, natural philosophy, natural history, anatomy and medicine, moral philosophy, and law.

In 1828 the faculty at Yale, under the leadership of Yale's president at that time, Jeremiah Day (1773–1867), launched a vigorous counterattack against Jefferson and all other would-be reformers. The Yale Report staunchly defended classical learning, with its emphasis on Greek, Latin, and Hebrew, and advocated an understanding of the human psy-

che and of the physical world that was thoroughly grounded in Aristotle. Aristotelian, too, was the pedagogy that understood the mind to be a static receptacle for content received from textbooks and teachers. The Yale Report served as the mission statement and curricular blueprint for most of the hundreds of church-founded colleges that sprang up (and often perished soon thereafter) as Americans spread out across the continent. But although the voices of reform were muffled, they could not be stilled. One of the most effective was that of Francis Wayland (1796–1865), the president of Brown University from 1826 to 1856. Wayland called for greater attention to practical and applied studies and noted the absurdity of basing U.S. education on the Oxford and Cambridge models that were created to train medieval clergy and that continued to serve the aristocratic classes of England.

Jefferson's grand scheme for the University of Virginia was not fully realized, and Wayland experienced more frustration than success in trying to reshape Brown to fit his vision. By the time of the Civil War, however, reform messages began to find a response that would indeed reshape the enterprise of U.S. higher education. Congressman Justin Smith Morrill (1810–1898) of Vermont was never a college president or the leader of any educational organization, but he envisioned a national system of colleges and universities that would focus on scientific agriculture, engineering, and other applied studies. The Morrill Act of 1862 established federal grants of lands that would provide endowment and operational funding for that system. Many of the nation's great state universities were built on that foundation.

Long before the Land Grant universities took shape, a number of colleges introduced courses of study that provided students with an alternative to the classical model, offering the practical and applied subjects that the reformers were calling for. Perhaps the college to do so most successfully was Union College, in Schenectady, New York. Under the remarkable leadership of Eliphalet Nott (1773–1866), who presided for an astonishing sixty-two years (1804–1866), Union's alternative curriculum made that institution the second-largest college in number of students in the nation (after Yale). It also became

the nation's richest college, thanks to Nott's genius at making money and his generosity to Union.

THE RISE OF THE RESEARCH-ORIENTED UNIVERSITY

Following the Civil War and the greater recognition of the importance of colleges and universities as providers of intellectual capital, U.S. educators were no longer enamored of Oxford and Cambridge as models. Instead, they were interested in German universities. Established in 1810 by Wilhelm von Humboldt (1767–1835), the University of Berlin put the discovery of new knowledge on a par with the dissemination of knowledge. The professors at Berlin and similar institutions understood that scholarship was at least as important as teaching. The German Ph.D. became the world's most prized academic credential. As scores of Americans with that credential began to leaven the faculty ranks of U.S. colleges and universities, those institutions began to take scholarship and research far more seriously. During the forty-year presidency (1869–1909) of Charles W. Eliot (1834–1926), Harvard became a preeminent center of research. Eliot's great expansion of student elective freedom in the choice of courses and programs facilitated and encouraged independent inquiry and acknowledged that student aptitudes and talents varied greatly.

While Eliot was transforming Harvard from a provincial college into a great university, other leaders were building ambitious new universities de novo. Johns Hopkins University was founded in 1876 explicitly on the German university model. Daniel Coit Gilman (1831–1908), its founding president, set out to establish a university whose central work was the creation and discovery of new knowledge through faculty scholarship. Teaching was secondary in importance. Recruiting professors who were prepared to carry out this mission, Gilman succeeded admirably. Johns Hopkins became a major producer of Ph.D. degrees and a model whose influence was widespread.

Founded in 1865, Cornell University was another bold venture that illustrated the primacy of research, as well as the importance of applied learning. Cornell

also illustrated the power of the combination of educational vision and philanthropic generosity. Andrew D. White (1832–1918), the first president, supplied educational vision and imagination. The financier and philanthropist Ezra Cornell (1807–1874) supplied generous financial support and political connections that brought in additional dollars from state and federal sources. Their university earned designation as New York's Land Grant college, and a panoply of programs emphasizing applied research developed. Cornell also became a major center for pure scientific research. Although the term *multiversity* did not arise until a century later, it is an apt description of what Cornell aspired to become, and succeeded in becoming.

Andrew D. White viewed religion as hostile to scientific progress and intellectual openness. By contrast, William Rainey Harper (1856–1906), a Yale professor of Hebrew and a Baptist layman, respected the piety of John D. Rockefeller (1839–1937), whose oil millions enabled Harper to transform a struggling little Baptist college into the University of Chicago. The combination of Harper's educational leadership and Rockefeller's financial support was remarkable. Frederick Rudolph, in his *The American College and University: A History* (1990), describes how Harper built the faculty of the University of Chicago by staging the "greatest mass raid on American college faculties in history" (Rudolph 1990, 350). Of the 120 faculty members hired in Harper's first year (1891), eight were former college or seminary presidents, five came from the Yale faculty, and fifteen of Clark University's most distinguished professors left their old institution reeling when they left for Chicago. As with Johns Hopkins, the Chicago faculty understood that scholarly investigation was their primary work and that instruction was secondary. Consistent with that mission, Chicago designated the first two years of the college experience as junior college, in which the faculty prepared students for scholarly work. The last two years, designated as senior college, were devoted to scholarly inquiry and the mastery in depth of a major field. The Chicago model attracted widespread attention and emulation in U.S. higher education. John D. Rockefeller's example of enlightened philanthropy,

which combined generosity with noninterference, also attracted much attention. By contrast, Leland Stanford (1824–1893) and his wife hobbled the development of Stanford University for years by inserting themselves deeply into administrative decisions.

BROADENING ACCESS TO HIGHER EDUCATION

As U.S. colleges and universities became more attuned to the needs of the general population, pressures for wider access naturally grew. Oberlin College (1833) opened its doors to women as well as men. Although there was strong agitation for educational opportunities for women, the focus had been largely on elementary and secondary education until after the Civil War. The pioneering role of the state universities in the Western states was particularly important in opening up to women the same college opportunities that were available to men. Emma Willard (1787–1870) and Mary Lyon (1797–1849), the latter of whom founded Mount Holyoke Seminary (1837), which eventually became Mount Holyoke College, were leaders in expanding the educational opportunities for women, but their emphasis was largely on secondary education.

A hundred and forty years after the Emancipation Proclamation ended slavery, Americans of African descent continue to be underrepresented in higher education. Booker T. Washington (1856–1915) founded Tuskegee Institute in 1881 with little encouragement or support from whites and criticism from some African-Americans, who believed that he was too yielding to the prejudices and stereotypical views of the times. Morehouse was founded soon after the Civil War, in 1867, but its preeminence today owes much to Benjamin Mays (1895–1984), who presided from 1940 to 1965. Under the leadership of Mays, Morehouse came to pride itself on educating young men (such as Martin Luther King, Jr.) who would combine intellectual competence with the courage to challenge laws and customs that denied African-Americans equal opportunity.

One of the most significant advances in the expansion of access to U.S. higher education came through

the so-called GI Bill of Rights, or the Servicemen's Readjustment Act of 1944. Many of the titular leaders of higher education at that time, and especially presidents of the more prestigious institutions, resisted the proposal for federal scholarships for war veterans. They feared that a huge influx of students who had not previously aspired to attend college would lower standards. The American Legion deserves principal credit for passage of the bill, and the Legion's faith in the ability and seriousness of the veterans was dramatically vindicated. The role of the American Legion in assuring enactment of the GI Bill is but one of the many instances of significant leadership from generally faceless organizations. One can also point to the role of the League for Innovation. Founded in 1968 and with a current membership of more than 700 institutions, the League for Innovation in the Community College provides model curricular programs and sponsors programs to nurture institutional leadership. Its influence has helped make community colleges a dynamic force in American higher education, and they account for more than 35 percent of higher education enrollments in the United States.

LEADERSHIP CHALLENGES IN THE TWENTY-FIRST CENTURY

In the United States at the beginning of the twenty-first century, the average tenure of college and university presidents is only about six-and-a-half years. That brief tenure attests to the difficulty of the job and raises troubling questions about the ability of presidents to provide the needed leadership. The strength of U.S. higher education owes much to the role of lay boards of trustees, whose role in supporting presidents and buttressing them against unwarranted interference and criticism is more important than ever. Still, the trend in public university state systems in the last three decades of the twentieth century has been toward systemwide boards and away from boards that are responsible for single institutions. The systemwide boards often demonstrate greater loyalty to the political agendas of governors and legislative bodies than to the colleges and universities in the system.

Such preeminent late-nineteenth-century leaders of U.S. higher education as Daniel Coit Gilman, Andrew D. White, William Rainey Harper, and Charles W. Eliot were, first and foremost, educators. They were part of a long leadership tradition that expected presidents to have the major voice in shaping educational programs and choosing the faculty to carry out those programs. Even well into the twentieth century the educator-president tradition remained vibrant, as illustrated by Robert Maynard Hutchins (1899–1977) of the University of Chicago (president from 1929 to 1951) and James B. Conant (1893–1978) of Harvard (president from 1933 to 1953). Those presidents were known both as the leaders of their institutions and as public intellectuals who took stands on important public issues: Conant, for example, strongly influenced U.S. secondary education. But especially after World War II, the increasing complexity and decentralization of the university made it increasingly difficult for university presidents to dominate the discussion about the aims and content of the education their institutions provided. The presidents of the larger research universities, in particular, are essentially the chief executive officers of complex federations of quasi-autonomous academic units. The skills and experience that presidential search committees seek in the leaders of such institutions rarely focus on educational vision. Moreover, the demand increasingly is for presidents who are persuasive with legislative bodies, foundations, and wealthy alumni. Curriculum questions have become the responsibility of faculty committees and academic deans, but the academic training of faculty members provides little preparation for forming overarching views of the kind of educational experience that is best suited for students. The result has been great growth in the requirements for students' major field and relatively little attention to the general-education component of the undergraduate curriculum. Often, students are provided great elective freedom based on the questionable assumption that they will make wise choices and bring coherence into their undergraduate experience.

An encouraging aspect of the leadership picture in U.S. higher education at the beginning of the twenty-first century is the rapidly growing presence

of women and members of underrepresented minority groups in the ranks of presidents. The leadership of the preeminent private research universities was a male preserve until 1993, when Nannerl Keohane left the presidency of Wellesley to become president of Duke University. Since then, Judith Rodin at the University of Pennsylvania and Shirley Tilghman at Princeton have joined those ranks. Brown University president Ruth Simmons, the daughter of sharecroppers, is the first African-American to head an Ivy League University.

There is now almost universal recognition that higher education is the principal source of the intellectual capital that is essential for personal fulfillment and for the technological and social progress of humankind. That recognition is leading to greater care in the selection of leaders of institutions of higher education and to more systematic evaluation of their performance. The political culture that is widely prevalent in colleges and universities makes difficult the kind of leadership succession planning that is common in other kinds of organizations. That is one of the principal leadership challenges facing U.S. higher education early in the twenty-first century.

—John W. Chandler

EDUCATION, K–12

Educational leaders are those people who guide, manage, and, when need be, transform schools. Sometimes educational leaders have been chosen and given power (superintendents, principals, chancellors) and sometimes they are people within the school community who gain power or influence through their personalities and actions (students, parents, teachers). In some few cases, people outside the school system or community lead through their ideas (influential authors, for instance). Schools present unique challenges to their leaders, and understanding educational leadership requires a deep and detailed understanding of how schools work.

A school principal is certainly at the core, if not always the leader, of a school. One principal tells the following story about her job and her school.

In high school, lunch is big. I mean, lunch is very, very big. It's all about who you get to eat with, and whether you have time to hang out, whether you have the good lunch period or the bad lunch period. It's big for the teachers too. Do they have time off at lunch, or do they have lunch duty? Will they have a place to sit with other teachers and talk, or do they have to be around the kids? Will they have a good lunch period, and can they smoke while they eat and talk? At our school, we have three different staggered lunch periods. This means many of the students couldn't eat lunch with their friends. This was a big, big problem. So recently we made a change. All the students would have the same lunch period. But that created a new problem. Not all of the students could fit into the cafeteria at one time, which meant we had to let them eat lunch wherever they want. The students were ecstatic. The teachers were happy. But the janitors were in a fit. So for the last few weeks I've had a janitor in my office almost every day, complaining about the mess everywhere left from lunch. We made a decision that was good for the students, but bad for the

janitors. And anyone who doesn't think janitors are essential to the running of school has never spent much time in a school. So now we are trying to figure out some ways to make the janitors more comfortable with the new lunch plan. (Author interview)

Although the above example does not capture a moment of educational leadership that brings tears to one's eyes or astonishes one with the leader's vision, strength of mind, or charisma, it does convey what is special about educational leadership. The direction of a school often is determined by many seemingly mundane decisions. Vision, in most schools, is manifested in oblique ways, and often reveals itself only implicitly. For this principal, the overriding goal of every decision, big and small, is to ensure that students are learning as much and as well as possible, and that the conditions of the schools are conducive to that goal. From her perspective, the students' dissatisfaction with lunch was distracting them from their work, and from their ability to attend classes (when those classes conflicted with their friends' lunch period), be prepared for classes, and get to classes on time. She felt that the lunch issue had a direct bearing on the students' ability to learn, and therefore she changed the lunch schedule to optimize the students' learning. In so doing she affected the lives of everyone who spends time in the school building. Thus the quote demonstrates at least one of the ways in which schools differ from other institutions: Schools serve one constituency (in the case of K–12 schools, young people), but involve many different people. Often an educational leader's crystalizing moments unfold in the most unlikely spots, such as the cafeteria.

Schools are often at the epicenter of a community, whether rural, suburban, or urban, and they reflect the political forces and the tensions of the community as well as those of the larger society. As the lunch story reveals, each group of participants has a different stake in the shared enterprise (the students want a better education, or more freedom, or more fun; the teachers want better work conditions, or high standards for their students; the janitors want a more manageable system; the parents want their children to be safe, and so forth). This means that the leader

(in this case the principal) has to appeal to the interests of all the participants to get to his or her goal—in this case, a lunch period that will, in the end, get the kids to be more invested in their classes.

WHO LEADS IN A SCHOOL SETTING?

Although there is a hierarchy in most schools, the hierarchy is neither as clear nor as powerful a force as it is in some other settings. There is almost always a head (often a superintendent) who delegates power to others (such as principals, teachers, and so forth). Superintendents and principals are accountable to community members—that is, to school committees and school boards. The people who serve on these boards are not professional educators. As one New York City liaison between the chancellor of New York City schools and the city's many school boards said, "You have a group of people who are making the decisions, without knowing much about what they are in charge of. They want the power but not the responsibility to become knowledgeable" (author interview). In most public-school settings, at least, everyone feels like an expert because everyone has been to school, sent children to school, been on the school committee, paid taxes, or voted for a school referendum.

But it is not only the principal who leads a school. Because there is a rarely a strong, visible, and stable hierarchy shaping a public school, leadership is often up for grabs. While there always is a superintendent and a principal, any one of the constituents or constituent groups can also assert leadership. A teacher may be the driving force in an important change in educational practice within a school, for example.

Every once in a while it is the students who lead the way to change. For instance, in 2000 and 2001 students across the United States mounted a strong movement to protest the use of standardized tests as a requirement for graduation. These students, mainly juniors and seniors in high school, met, brought in experts to advise and support them, and organized widespread demonstrations, letter-writing campaigns, and boycotts of the tests themselves.

Because of the weakness of school hierarchies, the person who has the official role of leader may not

be the most powerful person in the system. The act of leading is much more powerful in a school setting than having the designated role of leader. The person in the head job (for instance, the superintendent) may spend his or her time and energy managing the system, without taking any steps to guide the school community in solving problems, moving in new directions, or improving some aspect of school performance.

MEASURING SUCCESSFUL LEADERSHIP IN A SCHOOL SETTING

The success of the leadership in schools in the K–12 range can be measured in several different ways, often somewhat incompatible.

Tenure as a Measure of Success

Superintendents and principals of public schools often consider themselves successful if they keep their jobs—no small task when the job involves satisfying groups of people who are often in conflict with one another (school committees and community members, teachers and students, union officials and parents). Take for example a superintendent of a regional school system in a rural area of Connecticut. For thirty-two years he remained the head of the school system. The school suffered a bad reputation in terms of delinquency, low test scores, and college admissions. His tenure, however, is remarkable in an era when the average tenure of a school superintendent is seven years. What did he do to maintain power, without actually articulating clear goals, guiding teachers, parents or students towards new achievements, or solving educational problems facing the school system? He kept people apart, so that there was little communication between various individuals or between groups. For instance, the school committee, made up of twelve representatives of the five member towns, had not met to discuss his performance in over fifteen years. Instead, he had instituted a tradition of having each member write him a letter evaluating him, which he alone received, read, and possibly discussed with that member. (Though public institutions such as schools often appear to have

clearly stated guidelines and practices, in reality there is much distance between policy and practice.) It had been years since anyone had looked to see whether or not the evaluation process was being conducted according to policy. He gave teachers a lot of freedom to do what they wanted, so they supported him: Good teachers liked him because he gave them freedom to initiate good practice, and bad teachers liked him because he didn't lean on them for showing up late, teaching poorly, or behaving inappropriately with students. This is an example of a superintendent whose success can be measured by the fact that he kept his job rather than by the job he was doing. His leadership resulted in a certain kind of stability rather than change.

More than most settings, schools are small communities, with representatives of different age groups, interests, levels of expertise, and in many cases conflicting needs. Given the community-like feel of many schools, principals often find themselves leading through an implicit policy of what one history teacher, Matthew Wohl, calls, "leading through proximity." This entails spending a lot of time with the people you want to influence and being influenced by the people with whom you spend the most time (for example, teacher leaders). Those who lead through proximity create strong networks of personal loyalties that ensure their role and that generate tight cohesion among an inner circle, but often (because of the centrality of the attachment) don't leave any room for top-down decisions, for radical changes, or for imposing strong standards on reluctant teachers.

Change as a Measure of Success

At the opposite end of the spectrum are those educational leaders whose main goal is to create

Frank Mickens, principal of Boys and Girls High School in Brooklyn, New York, poses with student Kareem Phillips. He is showing the gold caps on his teeth that Mickens has banned from the school along with miniskirts, large jewelry, and shearling coats. Mickens argues that "Somebody has to say, 'Hey, let's get back some values.'"

change in a school system even if that makes their position extremely vulnerable. During the 1980s, one such leader, Dennis Littky, precipitated such radical change in a small New Hampshire community that members of the community sued him, and the case went to the Supreme Court. At the time Dennis Littky came to the New Hampshire town, he was already known for turning things around in schools, finding novel ways to engage students in academic work, and creating teams of teachers to teach in unorthodox ways. However, he found himself up against local residents who were strongly opposed to the changes he wanted to make. His leadership was visible and strong; he changed the school and won the Supreme Court case—but had to leave the community. The success of his leadership would have to be measured by the changes he brought about rather than by his popularity or tenure.

In some cases, leaders are faced with taking over institutions that are on the brink of demise. In those cases, their actions can be judged on their own merits or in terms of the survival of the institution. For instance, in 1990, when Elizabeth Coleman took

over as president of Bennington College, a small, private liberal arts college, it was in serious financial trouble, with a dwindling student body and a fractured faculty. By 2000 the school was on the upswing: It was stronger financially; its faculty were more productive and visible, and its admissions had increased, with higher admissions criteria. However, in the process Coleman had not renewed contracts for many faculty, drawn a censure from two national academic institutions (the Modern Language Association, and the American Association of University Professors). Some considered her actions and policies to be draconian. Some considered them to be strong and inspired. One might argue that though her individual actions were tough, harsh, in some cases off the mark, her alternative was to let the school sink. It is impossible, of course, for anyone to know how another leader might have handled things. But it is worth noting that the measure of a leader's success depends in part on what the evaluator thinks the alternatives are. This is no less true in K-12 schools, where the trade-offs are much the same.

Some would argue that a school leader can facilitate, manage, keep his or her job, and create change. But people who can actually do all these things are few and far between. People who manage all these tasks might articulate their mission in words like those of a principal from the Bay Area in San Francisco: "I never lose sight of my goal, which is to educate young people. But I know that in order to do this I have to keep everyone on board: parents, teachers, support staff, community members and, last but not least, the students themselves. That means always listening, remembering that each person has a perspective and a role that shapes their concerns and their take on a situation. I spend a lot of time listening."

Public schools in the United States have always vacillated between setting up strong hierarchies that put great faith in a leader and granted him or her great autonomy on the one hand and supporting the principle of bottom-up decision making on the other. William Glasser has described the ideal leader in schools as one who seems to combine the power and charisma of a strong manager with the listening

skills and openness of someone simply facilitating a more laterally organized group:

A boss drives. A leader leads.

A boss relies on authority. A leader relies on cooperation.

A boss says "I." A leader says, "We."

A boss creates fear. A leader creates confidence.

A boss knows how. A leader shows how.

A boss creates resentment. A leader breeds enthusiasm.

A boss fixes blame. A leader fixes mistakes.

A boss makes work drudgery. A leader makes work interesting.

(Glasser 1998, XI)

Schools more than most places depend for success on a comfortable, confident, happy workforce. It is hard for teachers to be encouraging, gentle, creative, and optimistic with their students if they feel criticized, disenfranchised, or inept. Hence the great emphasis—as in the quotation above—on the importance of creating an atmosphere of support, collegiality, and mutual respect. At the same time, however, the bulk of writing on schools and school environments during and after the 1990s has focused on the need to raise standards of performance in schools. Sometimes these two goals are in conflict and present the leader with a seemingly insoluble problem. How can one be a cheerleader and a tough coach at the same time? Playing both parts may be school leaders' toughest challenge outside of the fiscal challenges that are usually beyond their control.

THE GOALS OF THE SCHOOL LEADER

Schools are places of ideas, but also of outcomes. Students graduate or they don't. They go to college or they don't. The economically advantaged can leave for private schools or remain in the system. The school can become a center of community life or be a roadblock to members of the community. A school can reflect the values and habits of its community or act as an agent of change. To a great extent, the leader, whether principal, teacher, or superintendent,

Teaching about Leadership

The following is a case study assignment distributed by the University of Virginia to teachers to be used in teaching about leadership and about the English settlement of Virginia.

Assignment:

Picture yourself in Tower of London, in the court of James I. You are a member of the Privy Council, an adviser to the king. The English crown government wants to help the men in the Virginia Company establish a colony in the Chesapeake region of the New World, in a place they had named Virginia. The English government will raise the necessary money and supplies for the first colonists and help advertise in order to attract people to live there. James I, the English king, will also be the ruler of the colony; however, Jamestown lies across the Atlantic over 2,000 miles away from London and the king. He will be too far away from the settlers to be an effective leader. The colony will be impossible to control from London alone. In order for the colony to be successful, Jamestown needs its own leader, a strong authority. Another problem is that the Virginia Company has never attempted to colonize the New World before. They expect to find gold and lots of free, farmable land. (But Virginia in the 17th century was a wilderness with no roads, and populated with native American people who had already lived there for about 400 years!) If the colony is to survive, there must be able leadership. The leader should be an experienced person, someone who can make good decisions—lifesaving decisions. The leader must be able to lead (and sometimes discipline) men. He should also have vision, and be loyal to the mission of the company and its goals. Last but not least, the leader must be a person who could be diplomatic with the native peoples or know how to defend the colony if they became hostile.

Your group's mission is to select the first leader of Jamestown settlement. Debate the relative merits of each applicant, and make a ratings analysis chart for the three candidates. Then defend your selection in front of the king (or your teacher). You must give at least one reason why you chose your selected leader. Remember, you are responsible for picking a leader who will get the settlers through the hardships of the first years of the colony.

Source: Center for Technology & Teacher Education, University of Virginia. 1999. <http://www.teacherlink.org/content/social/instructional/jameslead/leadership.html>

Candidate A:

- served as an apprentice to a merchant
- read books on warfare and leadership
- survived a shipwreck
- served several years in the English army—was taken into slavery but killed his master to escape
- had contempt of men who could not work and pull their own weight
- traveled to the Netherlands, France, Egypt, and Austria (and joined the Austrian imperial army)
- was captured by the Turks and escaped
- killed three Turks at one time in hand-to-hand combat

Candidate B:

- sailed with Sir Francis Drake as a freebooter who raided Spanish ships
- searched for gold and the nonexistent Anian Strait for England
- survived a shipwreck
- has great skill in maritime matters
- was a soldier in the English army
- has a financial stake in the colony because he is a member of the Virginia Company
- was knighted by the Queen for service provided to England
- has traded goods with native American Indians

Candidate C:

- served in the English army
- fought in Ireland (which was colonized by the English long before the New World)
- served on the King's Privy Council (The Privy Council is similar to the American president's cabinet but it could also issue executive orders)
- studied at Oxford University
- is a nobleman (he inherited his title from his father)
- had served in Parliament
- is distantly related to James I on his father's side

will determine what role the school plays. As is true for leaders in other settings, a great deal of the school leader's success will depend on his or her force of

personality, ability to articulate a vivid and compelling picture of what he or she wants, and ability to draw others into that picture. Schools are meant to

serve everyone in a community, but in a heterogeneous society, a school often serves the interests and needs of some groups better than others (the teachers may have to work harder but the kids do better; the kids who are college bound may have great experiences, but those with different abilities or aspirations have a less successful experience; the middle-class families who have always dominated the community may feel frustrated, but an underrepresented group of families finally feels their voices are heard, and so on. This is an inherent conflict for any school leader.

One school leader known for creating fairly radical change is Deborah Meier. Some aspects of her work are worth noting for what they reveal about educational leadership. In her written and spoken statements, Meier, most famous for the Central Park East school in Harlem, New York City, has been clear about her belief that schools have to reflect the needs and desires of their communities, and that everyone has to have a say in the way the school functions. Because she is an articulate leader who is powerful whether she is in a role of power or not, she has sometimes set up consensual, collaborative, pluralistic structures but ended up wielding inordinate influence because of her other leadership qualities—determination, clarity and force of vision, and personal charisma.

WHAT LIES AHEAD

A central dilemma for those concerned about educational leadership is the fact that powerful people (the kind who lead armies, colleges, and big businesses, for instance) are often not the people drawn into the world of K–12 education or administration. Changing conceptions of schools, changing economics, and other social forces may mean that the twenty-first century sees a growth in the number of ambitious, powerful people who end up in K–12 leadership positions. That, in turn, could mean an improvement in schools. In recent years there has been some focus on creating programs to teach people how to lead as opposed to simply how to manage. Prescott College is one such institution. However there are some, such as Dennis Littky, who argue that educational leadership is best learned through the master

apprentice model. His program seeks to place young school principals and would-be superintendents as interns with established school leaders for two years, so they can learn alongside an experienced person. Programs like his should make the education and training of school leaders much more effective, and again attract a group of applicants more fundamentally suited for the task.

Because the hierarchies of schools are subtle and often implicit, and because the relationship of schools to communities, state government, and federal government is complex and ever shifting, what constitutes successful leadership is also in flux. If the United States succeeds in making the job of teaching a more satisfying, interesting, and valued job, a different kind of person will end up becoming a teacher. Stronger teachers may demand different kinds of characteristics in their leaders.

A school is an institution that has the capacity both to perpetuate societal values and habits and to provide a possible avenue for change. Perhaps it is this dual capability that often makes schools lightning rods within communities. Though schools are ostensibly for children, they actually must serve the needs and goals of a wide range of citizens. All schools are managed, but not all schools are led. Educational leadership can come from any sector within the school community. While many schools do not have strong leaders, the ones that do stand out far above the others.

EDUCATION: OVERVIEW

In general, scholars of leadership in education have proceeded on an assumption that education leadership is best understood by situating studies in

schools, colleges, and universities, by treating these organizations as discrete and relatively impermeable institutions, and by focusing on the behavioral repertoires and characteristics of administrators, trustees, and boards of education. While there is nothing inherently wrong with this approach, we suggest that education leadership will be incompletely understood and inadequately envisioned if studies fail to take account of the mediating role that education has played in the political, economic, social, cultural, and moral development of the rising generation, especially in places like the United States, where authority over education is decentralized and where education leaders are effectively required to help learners manage transitions over a life course. Like leadership in other areas, educational leadership takes place in the context of local, national, and global processes. It is affected by religious and secular belief systems, and its influence is felt in formal institutions and informal arenas and in large and small structures of association found within and beyond the boundaries of formal systems of schooling. Considered in this light, educational leadership is necessarily diffuse, complex, and laden with possibilities.

PREDOMINANT TRADITIONS

Traditional studies of leadership in education have tended to focus on two dimensions: the traits of individuals who occupy high-level administrative roles, and the nature of the organizations within which they do their work. Indeed, research on leadership in education has yielded a high volume of largely descriptive writings on college presidents, deans, and department chairs, and on superintendents, principals, and, since the 1980s, teachers who assume quasi-administrative roles as teacher leaders. This body of literature has proceeded on an assumption that the work of education leaders is best understood in organizational terms, that is, as molded, if not essentially determined, by the nature of the formal institutions within which they carry out their roles. Taken together, these defining characteristics constitute a now sixty-year-old tradition of work that has tended to bind studies of leadership to school- or

university-based, role-related, organizationally insular processes. Additionally, while some scholars have attempted to address the orientations, experiences, and insights of women and minorities in various administrative positions, the bulk of the mainstream literature has accepted rather than problematized the prevailing power structures that have dominated educational administration at all levels of the U.S. education system. The result has been a literature that focuses on a relatively narrow sampling of white men in formal institutional settings.

Beyond this sampling limitation, the literature on leadership in education also reflects theoretical constraints that have limited scholars' ability to capitalize on the full range of opportunities that the field of education offers. For example, studies begun in the 1940s and continuing to the present have focused on identifying and analyzing the individual traits, organizational tasks, and characteristics and behaviors that distinguish leaders from non-leaders or effective leaders from ineffective leaders. But this approach has yet to produce the theoretically consistent, empirically verifiable profile of individual qualities and task competencies that proponents of this approach had hoped to develop, notwithstanding the emergence in the 1970s and 1980s of a line of work that incorporated more complex, contingency-oriented constructions of leadership that took account of situational conditions as well as individual traits and specified tasks. What has emerged instead is an array of mix-and-match models that indicate which "leadership styles" might be more or less effective in various organizational circumstances. Through this construction, leadership becomes a function of the fit between the traits and behaviors of individuals, features of the task, and characteristics of the organization, including at times the organization's relationship to its broader, external environment. While this type of work has generated a great deal of research and debate, it has also reinforced the tendency to concentrate on formal actors, notably school administrators, in fairly traditional institutional contexts.

Another stream of work, evident in the 1960s and 1970s and extended in the 1980s and 1990s, expanded the notion of leadership to include configurations of actors working collectively and collabo-

ratively to carry out various leadership roles and responsibilities. Deploying notions of shared or distributed leadership, this more-open systems approach enlarges the numbers and types of leaders and emphasizes the ways in which leaders engender consensus rather than procure compliance. Studies of elementary and secondary schools in which teachers and parents as well as administrators become part of a leadership structure designed to develop school improvement teams and to respond to external mandates illustrate this more inclusive approach. Scholars such as Betty Malen and Rodney Ogawa have suggested that these new leadership configurations tend to preserve rather than transform the professional-patron relationships typically found in schools. Nonetheless, scholars continue to search for sites where the transformative potential of new leadership configurations may emerge.

The fruits of multiple lines of scholarship on leadership in K–12 school settings were summarized in a 2003 American Education Research Association publication, “What We Know About School Leadership.” This review identifies the functions of “successful leaders” and suggests that these individuals are engaged in “identifying and articulating a vision . . . creating shared meanings . . . creating high performance expectations . . . fostering the acceptance of group goals. . . monitoring organizational performance . . . [and] communicating” with multiple stakeholders “through participatory communication strategies . . . that will lead to productive discourse and decision making” (Leithwood and Reile 2003, 3–4). These leaders also construct concepts of professional community, develop prescriptions for improved practice, and engage in efforts to improve school performance by “strengthening school culture . . . modifying organizational structure . . . building collaborative processes . . . [and] managing the environment” (Ibid., 4–5). According to this view, education leaders are conductors managing lengthy lists of processes that, despite rhetoric to the contrary, tend to go on within relatively stable, hierarchical structures of authority.

As we have seen, traditional approaches to education leadership, while rich in the capacity to reveal the ways in which school administrators at all levels

do their work, are only beginning to examine the important and independent capacity of teachers to take on leadership roles in schools. Reflecting a broader and more professionally nuanced view of school authority, researchers have begun to integrate teachers into their thinking, especially as researchers, policymakers, and educators seek to discover ways to restructure and reform schools and to delegate and diffuse leadership, with the goal of empowering individuals to transform schools in the United States and other parts of the world into dynamic, productive organizations. The emphasis is on how leaders (often but not always individuals in formal administrative roles) develop “shared purposes . . . [and] work through and with people” in formal and informal roles to attain organizational goals (Leithwood and Reile 2003, 2). But even in these more teacher-sensitive constructions, teachers emerge as subordinates in a system of hierarchical relationships. Not only has this assumption denied teachers leadership agency, it has also blinded researchers, as Robert Croninger and Barbara Finkelstein point out, to the many ways in which teacher leadership is organized and fashioned in the corridors and classrooms of schools and acknowledged in families and communities.

EVOLVING TRADITIONS

As we have suggested, traditional research in education leadership has not fully capitalized on the rich opportunities that the field of education presents. We believe that education leadership will be better understood if we broaden and deepen programs of research in at least four ways.

Education Leadership Is Diffuse

It is important to recognize the essentially diffuse character of leadership within and outside schools through studies that investigate leadership in all the possible places in which teaching and learning occur. These studies should map the contours and expressions of education leadership in families, communities, museums, and newsrooms as well as

in formal schools, government agencies, corporate board rooms, nonprofit organizations, and international development institutions. The sociologist Howard Becker, in a pointed and powerful critique of traditional assumptions about the locus of authority in education, called attention to the insular constructions of education when he wrote, “If we think of education and learning as generic social processes, there is no reason to think that those processes take place only in schools. There is no reason, for that matter, to think they take place in schools at all, even though that is the story schools tell about themselves and the story that well-socialized members of our society believe, or at least, pretend to believe so they won’t appear to be nuts” (Becker 1990, 236). If, as he suggests, education leadership may be more powerfully enacted outside rather than inside schools, researchers should begin to focus on these sites of previously invisible sources of leadership and on the full panoply of human relations that constitute education.

Education Leadership Involves a Wide Range of People and Processes

Scholarship should include the full array of participants and processes that constitute leadership in education. As earlier noted, teachers exercise leadership not only in schools, but in their dealings with families and the local community. Unfortunately this form of leadership is rarely examined in studies of leadership in education. Nor have students been visible actors in the leadership literature. Like teachers, they emerge as subjects to be controlled rather than active agents with a potential to influence the scope and character of the curriculum, the climate and dynamics of classrooms, and even the tone and tenor of the broader organization. In a similar vein, traditional studies have tended to treat community power structures as groups that require supervision, direction, and regulation by professionals, rather than as groups possessed of insight, expertise, and wisdom that can fruitfully be brought to bear on education deliberations, policy decisions, and daily practices. Writers who seek to understand education leadership might work to develop more robust ways to explore

If we don't model what we teach, we are teaching something else.

—Unknown

the subtleties of teacher-student dynamics and the multiple and powerful roles that parents and community groups play in the formulation of school purposes, priorities, practices, and outcomes.

Education Leadership Is Transcultural

Researchers should recognize the transcultural nature of education leadership in all contexts. No matter what the sponsorship, location, or focus of education effort, teaching and learning inevitably structure status and identity, nurture communication habits, and cultivate what the nineteenth-century historian de Tocqueville called habits of the heart. Administrators, teachers, students, professors, parents, museum curators, textbook writers, government officials, teacher educators, curriculum planners, tribal leaders, storytellers, and youth advocates are all leaders in education: Together they and others construct distinctions of generation, class, race, ethnicity, nation, and gender as well as distinctions between one kind of knowledge and another. The context and ethos of education, perspective taking, reciprocal authority, and locally and globally constituted constructions of leadership are indispensable ingredients for twenty-first-century leadership studies in education.

Education Leadership Is Complex and Multifaceted

Those who study leadership in education should emulate such leadership authorities as Geneva Gay, Flora Ida Ortiz, James MacGregor Burns, Lawrence A. Cremin, Pierre Bourdieu, and Alan Peshkin, who recognize the force of social, political, economic, and cultural circumstance, the crucial roles that education plays in the forming of cultural arrangements, processes, and identities in all their facets, and the interactive and reciprocal character of leadership purposes, processes, and outcomes. Such comprehensive

and sophisticated treatments of context, structure, and agency reveal the broad range of possibilities embedded in constructions of education leadership. In our view, this more challenging approach will both broaden and deepen our capacity to discover the foundations of leadership in education.

—Barbara Finkelstein and Betty Malen

EFFICACY

Efficacy is the power people have to produce an effect. People hold beliefs about their own efficacy and about the efficacy of people with whom they work. Such beliefs define a crucial basis for several aspects of leadership, including how much effort a leader devotes to social influence and how effectively a group responds to leadership influence. This psychological quality indicates a person's conviction (or lack thereof) that he or she can enact behaviors leading to desired outcomes. Motivated behavior is purposive, based on personal reflection, foresight, and planning. Based on this reflection, people choose goals to attain. Their choices depend in large part on their confidence that they can do what they need to do to meet their goals. Although people often choose to accomplish tasks for which they believe they have limited competence, such choices are often driven by external constraints and contingencies. On the whole, when having complete freedom of choice, people choose behaviors and tasks that they are at least somewhat confident they can accomplish. Efficacy, therefore, reflects psychological processes related to a person's choice of particular goal paths, the amount of effort devoted to attainment of chosen goals, and the persistence of effort when progress toward goal attainment is thwarted.

People's beliefs about their own efficacy—self-efficacy—pertain to specific tasks and circumstances. Self-efficacy reflects competency beliefs about one's ability to accomplish a particular set of tasks in a defined situation. Thus, people have beliefs in their ability to drive a car, lose weight, quit smoking, handle a sailboat, play an instrument, and so on. Some efficacy beliefs may reflect a broader class of activities, such as believed competency in raising children, accomplishing one's job, or playing a sport. These activities typically reflect a large number of distinct behaviors, all bearing on more

abstract goals (e.g., raising well-behaved, responsible children; achieving high job performance, winning a tournament). This distinction is particularly relevant to leadership because leadership reflects a generalized class of behaviors pertaining to individual and group accomplishment of a range of tasks. So one's efficacy beliefs regarding leadership competence are likely to reflect believed competency at a variety of subtasks.

Some researchers have described generalized notions of efficacy as reflecting beliefs extending across many kinds of tasks. As such beliefs become broader and more diffuse, they tend to lose their ability to predict effectiveness and behavior in specific situations. However, leadership efficacy has been shown to predict a variety of tasks to denote the broad category of leadership performance, suggesting that it reflects a more general sense of efficacy.

ANTECEDENTS OF EFFICACY

Where do efficacy beliefs come from? Perhaps the most important basis for efficacy beliefs resides in a person's experience in similar task situations. If a person experiences a consistent pattern of success at a task, he or she will approach future accomplishment of this task with a high degree of perceived efficacy; if failure has been the typical experience of past task engagements, then the person will experience low task efficacy beliefs. Although such direct performance experiences provide quite potent sources for efficacy beliefs, they cannot serve as the only sources; otherwise individuals will need to experience every task before establishing beliefs about their own competence.

Efficacy beliefs can emerge from a variety of other experiences and events. People can form beliefs about their own competency at a task by observing others performing the same or similar tasks. The power of such vicarious experiences to influence personal efficacy beliefs depends upon how similar the performers are to the person observing them, the number of experiences observed, the status of the observed individuals, and the similarity of the task to the one about which the observer is forming an efficacy belief. Individuals may form efficacy beliefs by

A competent leader can get efficient service from poor troops, while on the contrary an incapable leader can demoralize the best of troops.

—U.S. Army General John J. Pershing

imagining themselves being effective at the task. Sports psychologists often use imagery devices to help athletes envision themselves displaying effective behaviors and thereby increase their chances for success in performance. Researchers have applied such self-success imagery to improving leadership effectiveness.

Efficacy beliefs can also emerge from verbal persuasion and from physiological and emotional cues. An effective technique that fosters employee empowerment centers on the leader or manager providing encouragement and expressions of confidence in the abilities of subordinates. Such encouragement and expressions of confidence raise the efficacy beliefs of followers, increasing their commitment and performance. Efficacy varies according to physiological and emotional cues. Individuals may report lower efficacy when feeling in pain or in a weakened physical condition. Also, lower efficacy beliefs emerge from negative affect (the conscious subjective aspect of an emotion considered apart from bodily changes) or poor moods. These cues, though, are less powerful as determinants of efficacy than are past performance or vicarious experiences.

CONSEQUENCES OF EFFICACY BELIEFS

Higher efficacy beliefs result in stronger task performance. Indeed, efficacy beliefs predict performance, even after controlling for actual prior performances. This situation mitigates the argument that efficacy beliefs are a surrogate for task skills and past performance.

Efficacy beliefs influence performance by giving rise to several psychological processes. High-efficacy individuals will choose more difficult goals, commit more deeply to those goals, and persist longer in reaching those goals. High-efficacy individuals focus their attention and effort on planning how to attain set

*Fail to honor people,
They fail to honor you;
But of a good leader, who talks little,
When his work is done, his aims fulfilled,
They will all say, "We did this ourselves."*

—Lao-Tzu

goals and solving problems that arise along their goal path. Low-efficacy individuals spend more time preoccupied with their perceptions of inadequacy, with the attendant motivational consequences; they ruminate over failure scenarios.

Low efficacy can produce strong negative affective reactions, particularly stress, anxiety, and depression, especially when the performance of a task or demonstration of a skill has strong positive value for the individual. High efficacy can produce a sense of exhilaration in task accomplishment.

Efficacy beliefs determine what situations and environments individuals will choose to join. In free-choice conditions, people will generally choose performance situations in which they have an acceptable level of perceived competence and avoid those situations in which they do not have confidence of success. Thus, efficacy beliefs can affect choice of colleges, occupations, careers, and jobs as well as the myriad of separate task choices that occur throughout these larger choices.

LEADERSHIP AND EFFICACY

Efficacy beliefs pertain to most task situations. However, for leaders such beliefs pertain not only to the leaders' accomplishment of particular tasks, but also to their perceived competence as leaders. In essence, leadership efficacy represents a leader's confidence in his or her ability to lead others to perform well and to help his or her group succeed. Effective leadership requires a strong positive image and a sense that one can meet individual and group challenges. Often leaders pull their groups, organizations, and nations through crises by displaying a strong sense of confidence and optimism. U.S. President Franklin Roo-

sevelt displayed such efficacy in his speech to the nation during the Great Depression in which he asserted that "We have nothing to fear but fear itself."

Leadership reflects the undertaking of several kinds of tasks, including understanding environmental demands, decision making, organizational problem solving, group planning, motivation of others, coordination of the activities of others, and resolution of conflicts among one's subordinates and with other groups. Thus, leadership efficacy represents a more general form of efficacy that pertains to a broad class of tasks and situations. Indeed, measures of leadership efficacy have assessed a leader's perceived self-competence in performing as many as sixteen activities under the heading of "leadership."

Leadership efficacy influences an individual's leadership performance. Highly efficacious leaders set higher goals for themselves and their group and establish more effective individual and group strategies for attaining these goals. Such leaders also seek more readily to implement required group and organizational changes. Research has also demonstrated that the effects of leadership efficacy on behavior and performance become even stronger in stressful and demanding circumstances.

Strong leadership efficacy has a positive effect on another type of efficacy beliefs—those shared among the members of a leader's group. Such beliefs refer to the group's "collective efficacy"—a collective sense that members have that, together, they can perform a particular task. This definition emphasizes that collective efficacy is a property of the group; it represents a belief of collective competence (or incompetence) that is strongly shared among all group members to the point that it becomes a defining characteristic of the group as a whole. Although most research has limited the investigation of collective efficacy to groups, the U.S. psychologist Albert Bandura, who first offered and defined this concept, argued that it extends to large organizations, communities, nations, and cultures.

The consequences of collective efficacy resemble those of individual efficacy. Thus, when members feel confident of their group's capabilities, they work harder on behalf of the group, collectively set more difficult group goals, persist in the face of goal

obstacles, and display higher commitment and cohesion than when they have less collective efficacy. Efficacious groups allocate more of their collective attention and effort to task performance. Such groups will also display more effective processes where group interactions are more tightly linked to group performance requirements.

Leaders have a fundamental responsibility to raise the collective efficacy of a group. As noted, efficacy beliefs can emerge from a history of success, observations of successful task completion by others, and verbal persuasion. Simply by engaging in effective leadership, leaders increase the likelihood that groups will accumulate a history of success, thereby increasing the members' sense of collective competence. Research has shown that the goals and strategies that a leader develops for a group have a direct effect on the group's subsequent task efficacy and that efficacy beliefs affect future group performance. Leaders may also improve the ability of group members to work well together by modeling appropriate task strategies. They may model acceptable interaction processes, such as the most effective way to communicate ideas, offer constructive comments on offered ideas, and request and give information to the group. Such processes in turn improve the coordination and interaction of group members and thereby increase the group's collective efficacy.

Finally, leaders can improve the group's collective efficacy by persuading members that they can accomplish a task well or by exhorting them to do so. Such persuasion lies at the heart of charismatic or transformational leadership, whereby a leader by force of personality and strength of vision convinces followers of the correctness of a particular course of action and, more importantly, raises their individual and collective senses of efficacy that they can achieve desired outcomes.

While leadership efficacy and collective efficacy are important for group performance, a third form of efficacy that relates leadership to group processes pertains to the leader's efficacy for the competence of his or her group. This form of efficacy differs from leadership efficacy in that the latter reflects the leader's beliefs about his or her personal competence. It also differs from collective efficacy because

beliefs are not shared among group members; the leader holds the beliefs about the group.

A leader's beliefs about the competence of his or her followers play an important role in how he or she interacts with followers. How the leader evaluates the abilities of group members influences the level of goals established for the group, the complexity of strategies developed to accomplish these goals, and the amount of sense-making communications the leader delivers to the group. The leader's sense of collective efficacy will also determine where he or she will target group training and development efforts.

Research has demonstrated the potency of individual efficacy, leader efficacy, collective efficacy, and a leader's sense of collective efficacy in predicting the strength of individual, leader, and group performance. This research links efficacy beliefs to key psychological and social processes that occur within an individual and within a group. These processes include goal setting, strategy development, the exertion of effort, and persistence in the face of obstacles. Research has found that leadership efficacy has even stronger effects when the leader and the group are trying to accomplish a complex task. Such efficacy also has stronger influence early in the group's tenure when the group does not have a reservoir of success experiences. Taken together, this research confirms that efficacy represents a critical component of understanding leadership and its effects on groups and organizations. Efficacy also provides a basis for distinguishing strong and weak groups and organizations.

EISENHOWER, DWIGHT DAVID (1890–1969)

U.S. Army general and president

Military leaders are—naturally enough it would seem—usually known for what they do or achieve on the battlefield. Dwight D. Eisenhower, on the other hand, began his career as a staff officer and rose through the ranks in the U.S. Army to become the most prominent American general in the most important war of the twentieth century. By the end of World War II, he was the supreme commander of all Allied forces on the continent of Europe, and his influence and responsibilities were nearly beyond measure. Eisenhower’s long military career became a testament to the notion that decisive military leadership can be exercised on the planning tables just as surely as on the battlefield. He gained worldwide fame as the man who orchestrated the Allied effort, kept bickering and egotistical generals working alongside one another, and ultimately led the coalition to defeat Nazi Germany. Unlike many of his contemporaries, however, his career as a leader did not end with the surrender of the enemy. Just a few years after the end of the war, Dwight D. Eisenhower

became one of the most popular presidents the United States ever had. In each of his two careers, the man known simply as “Ike” was noted for his distinctive leadership.

HISTORY

Eisenhower was born in Denison, Texas, in 1890 and grew up in the prairie town of Abilene, Kansas, one of six brothers. In elementary and high school, he was known for his high spirit and fiercely competitive nature, especially in sports. After high school graduation, he won a coveted appointment to the U.S. Military Academy at West Point in 1911. Even though Eisenhower graduated from West Point shortly before the United States entered World War I, he was not among those who crossed the Atlantic and took part in the fighting. Instead, Eisenhower acted as a training officer at various army posts in Georgia, Kansas, and Pennsylvania. (His most lasting wartime achievement was setting up a training program for tank soldiers at Gettysburg, Pennsylvania.) After the war and a short stint serving in the Panama Canal Zone, he entered the army’s Command and General Staff College and graduated at the top of his class. He clearly had a particular ability for staff work, planning, and organizing. For six years in the 1930s, he served under the outspoken and flamboyant General Douglas MacArthur, serving for four years as MacArthur’s aide in the Philippines. The month that Japan bombed Pearl Harbor, Eisenhower was back in Washington, D.C., working in the Army War Plans division under General George C. Marshall. By the summer of 1942, he was in charge of U.S. forces in Europe and from that November onward, Eisenhower had direct command of tens of thousands of American officers and soldiers deployed from North Africa to England.

WARTIME LEADER

Eisenhower’s greatest wartime challenge, and consequently the clearest manifestation of his leadership abilities, came in his task of overseeing and holding together the military planning efforts for the Allied coalition. From 1942 through the end of the war, it

fell to Eisenhower, who eventually rose to supreme commander of all Allied forces in Europe, to keep military personnel with their clashing personalities and contradictory ideas about military operations all working toward the same end. And it was Eisenhower's leadership that kept the planning on track. His energetic personality and electric grin may have dominated his public image, but his strong will and keen insight made him effective behind the scenes. He was able to keep numerous alternatives straight in his head and see the faults and opportunities with each. He was a forceful man whose fiery temper could and did erupt at a moment's notice and who, once he made a decision, brought even his most recalcitrant subordinates along with him. Most who were exposed to his anger never wanted to cross him again.

Despite his position and responsibility, few people considered Eisenhower arrogant or egotistical. Most people liked him immediately and thought him genuine and a man utterly without airs. He was, by all accounts, a humble man whose character never strayed far from his Abilene roots. He was intensely loyal to his subordinates, who hated to disappoint him. All these personal attributes, combined with his determination and his abilities, made him a person who was easy to follow and one who was a natural leader.

In one sense, his leadership was not unlike that of an orchestra conductor, but, of course, he operated with infinitely higher stakes. "In a war such as this," he wrote in his diary, "when high command invariably involves a president, a prime minister, six chiefs of staff, and a horde of lesser 'planners,' there has got to be a lot of patience—no one person can be a Napoleon or a Caesar" (Ambrose 1991, 146). In particular, his two most egocentric and brilliant commanders—British General Sir Bernard Montgomery

Selection from Eisenhower's Speech on the Military-Industrial Complex, 17 January 1961

Our military organization today bears little relation to that known by any of my predecessors in peacetime, or indeed by the fighting men of World War II or Korea.

Until the latest of our world conflicts, the United States had no armaments industry. American makers of plowshares could, with time and as required, make swords as well. But now we can no longer risk emergency improvisation of national defense; we have been compelled to create a permanent armaments industry of vast proportions. Added to this, three and a half million men and women are directly engaged in the defense establishment. We annually spend on military security more than the net income of all United States corporations.

This conjunction of an immense military establishment and a large arms industry is new in the American experience. The total influence—economic, political, even spiritual—is felt in every city, every State house, every office of the Federal government. We recognize the imperative need for this development. Yet we must not fail to comprehend its grave implications. Our toil, resources and livelihood are all involved; so is the very structure of our society.

In the councils of government, we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military industrial complex. The potential for the disastrous rise of misplaced power exists and will persist.

We must never let the weight of this combination endanger our liberties or democratic processes. We should take nothing for granted. Only an alert and knowledgeable citizenry can compel the proper meshing of the huge industrial and military machinery of defense with our peaceful methods and goals, so that security and liberty may prosper together.

and American General George S. Patton—each had a tendency to think of himself as either a Napoleon or a Caesar. That Eisenhower kept the two hammering away at the Germans more than at each other spoke to his great ability with people.

Eisenhower was, in many respects, a politician-warrior. He was patient, tactful, and willing to compromise when the situation allowed, but he was just as able to dig in his heels, cut off debate, and hold his ground. Rarely did British ideas for a particular campaign blend perfectly with American ideas, and varying and contradictory ideas abounded from all corners. Even British Prime Minister Winston Churchill was prone to make various demands and suggestions that sometimes reflected a distinctly British interest rather than an Allied interest. Conversely, and to his

Leadership: The art of getting someone to do something you want done because he wants to do it.

—Dwight D. Eisenhower

credit as an Allied leader, Eisenhower sometimes had to put the overall Allied effort before any strictly American concerns, leading George Patton more than once to conclude that Eisenhower had forgotten his nationality. Such harping had no effect. Eisenhower's focus was remarkable at times, for he never lost sight of the finish line, and refused to let anyone around him redefine it.

A few hours over the course of the war illustrate well some particular facets of Eisenhower's leadership. When the time at last came for the Normandy landings in June 1944, it was Eisenhower's decision alone to give the "go" order—already postponed for twenty-four hours. Eisenhower stared out the window at a driving rain that his weather forecasters promised would break for a short window of opportunity. He gave the order to go. He then sat down by himself and wrote a note he hoped never to use. It explained that the invasion had failed and the troops had been withdrawn. The choice to launch the operation, however, had been entirely his. Responsibility for its failure was equally his. He folded the note and put it away. He never had to use it, but it indicated how seriously he saw his leadership and his individual responsibility for the decision to invade. Later that evening, he drove out to see the soldiers from the 101st Airborne Division who would be among the first into France. He walked among them, chatting and giving encouragement, shaking hands and looking each man squarely in the eye. His warmth, energy, and concern were buoyant and his enthusiasm was contagious.

Some of his detractors during World War II complained that for all his duties of leadership, he never heard a shot fired in anger. Such derisions are hollow, however. Dwight D. Eisenhower had one of the toughest jobs in World War II—that of keeping a fractious coalition together and focused on a distant goal, and in this he was remarkably successful.

When V-E Day came in the late spring of 1945, much of the credit belonged to Eisenhower. In the wake of the war, though, his career as a leader was only half-finished. Within a handful of years, he would be president of the United States.

PRESIDENT

As president of the United States, Eisenhower led the country through a difficult decade during the Cold War, and presided over one of the longest stretches of peace in the post-World War II era. When he took office, the Korean War was dragging toward the middle of its third long year, having been a bitter stalemate since the end of 1950. After the Korean War ended, potential crises in the Middle East, Southeast Asia, and Europe punctuated the years. Behind them all loomed the possibility of conflict with the Soviet Union. Eisenhower stood up to America's French and British allies during the Suez Crisis to prevent a regional crisis from possibly becoming an East versus West standoff. He also refused to take action on behalf of the surrounded French garrison at Dien Bien Phu in Vietnam unless the French would end their colonial presence in that country, a step he knew they would not take. He was perfectly willing at other times, however, to send U.S. Marines to Lebanon as a show of American resolve. His ability to be decisive once he had all the information he needed set him apart from many who could grow paralyzed by indecision.

Domestically, Eisenhower's plate was equally full. The civil rights era really began in earnest during Eisenhower's presidency, and it was punctuated in 1954 by the *Brown vs. Board of Education* case. When the Supreme Court ordered that schools be desegregated, Eisenhower personally doubted whether a Court fiat would be able to overturn decades and decades of segregation. Nevertheless it was the Court's order and the president enforced it. When Arkansas governor Orval Faubus used the Arkansas National Guard to prohibit a handful of black students from attending Little Rock Central High School, Eisenhower angrily took command of the guard, ordered in a thousand troopers from the 101st Airborne, and directed them to escort the students to school as long as was necessary.

In delivering his farewell address, Eisenhower simply followed the pattern of one of his heroes, George Washington. It was Washington's "stamina and patience in adversity," that Eisenhower had always admired, characteristics easily credited to Ike himself at many times in his career (Burk 1987, 10). In his farewell address, Eisenhower famously warned Americans of the influence of the "military-industrial complex" on policymaking. Many people then and since seemed to think this was one of his boldest actions, given his background as a military man and his presumed closeness to whatever such "complex" did exist. His warning was by no means out of character, though. It was simply a product of his ability to see possible problems down the road and take steps to avoid them. Both Eisenhower and Washington became even more renowned for the way they left the stage after years of dominating it.

AFTERWARD

In the 1960s, the standard assessment of the Eisenhower presidency was negative. Eisenhower's critics portrayed him as a simple man who took no firm stand on any of the issues and who let his subordinates act without his overview. But what was apparent on the surface was not reality. Eisenhower's presidential leadership was like his wartime leadership. He was a realistic leader who had a good sense of what was possible and what was not. He tried to lead the nation in a way that fostered stability, encouraged economic growth, and kept the world free from another devastating war. That, just as once had been the defeat of Germany, was Eisenhower's goal, and the nation attained it in the 1950s. Since the 1980s, there has been a substantial amount of reassessment about Eisenhower as president. Eisenhower, it seems, was a far more effective president than many historians earlier believed. The world situation was fraught with dangerous problems yet somehow America remained at peace. There were powder kegs of domestic challenge, yet the tumultuous riots and breakdown of social order lay in the decade to come. As a planner, he was often behind the scenes during the war, but his influence was no less real. As president, he led in the same way.

E-LEADERSHIP

The proliferation of information technology (IT) is creating a new context for leadership. Leaders must be proactive in the implementation and management of IT; to realize the benefits of IT deployment most fully, changes may be required in leadership style, corporate culture, and organizational structure. Challenges and opportunities are arising as organizations' stakeholders obtain, store, categorize, retrieve, and use information in new and faster ways. Customized relationships with stakeholders, made possible by advances in IT, are pressuring leaders to be more selective about their stakeholders and more responsive to them. The increasing use of electronic communication in organizations is also affecting leader-

ship. Virtual teams, whose members communicate electronically because they work at a distance from one another—sometimes even on different continents—are increasingly common. While the basic functions of leadership found in conventional teams are not altered, the locus, relative importance, and performance of these functions are different in virtual teams.

In this entry, e-leadership is defined as a process of social influence that takes place in an organizational context where a significant amount of work, including communication, is supported by IT. That process of social influence is aimed at producing a change in attitudes, emotions, thinking, behavior, or performance. Let us consider e-leadership in five areas that Fred Dansereau and Francis Yammarino, experts in the field of organizational behavior and leadership, have identified as important in the study of leadership.

The first area, fundamental human processes, covers the set of psychological and related processes without which leadership would not be possible or, perhaps, relevant. It includes basic affective, cognitive, interpersonal, group, collective, and communication processes and factors. The second area, leadership core processes, covers what a leader does to exercise leadership. The third area, leadership outcomes, covers the ways in which leadership core processes are put together; examples include team building, delegation, and participatory decision making. The fourth area, second-level leadership outcomes, covers the effects of leadership core processes on performance, satisfaction, absenteeism, and turnover, among other variables. The last area, substitutes for leadership, presents enhancers, neutralizers of, or replacements for the leadership core processes.

E-LEADERSHIP AND FUNDAMENTAL HUMAN PROCESSES

IT proliferation is changing when, how, and with whom organizational members, including leaders, communicate, as well as who can access what information at what time, how, and from where, and who has access to information media.

Communication Processes

Thanks to the increased communication that IT offers, leaders can spread their messages more easily. For instance, the CEO of Cisco Systems, John Chambers, doubled the number of Cisco employees who view his quarterly address by making it available on employees' desktops via Cisco's intranet (internal computer network). Communication flexibility is also making geographic, time, and organizational boundaries fuzzier, as seen in the growth of virtual teams. Such teams provide new challenges to leaders. The lack of face-to-face contact in virtual teams severely restricts a leader's ability to monitor and regulate members' performances, implement solutions to problems, and perform typical mentoring and developmental functions. Therefore, in virtual teams a leader must share these functions with the team itself.

Virtual teams are also challenging for leaders because they operate within an altered social context. Members from different cultures meet electronically; in the absence of prior interaction, the initial level of cohesion and trust among team members is typically low. These conditions make it challenging for a leader to maintain unity and cohesiveness and to motivate team members to achieve a common goal.

Leaders of virtual teams are also challenged by the variation in technology skills among team members, by the inherent difficulty in coordinating electronic messages that appear at different times, and by the consequent lack of a sequential build-up of ideas. Leaders will be more effective if they display appreciation for the technical challenges team members face and if they create suitable processes for dissemination and collection of ideas.

While the use of electronic communication systems such as e-mail is increasing, leaders need to reflect on whether electronic communication is appropriate for the purpose at hand. Electronic communication is considered to lack richness because of its relative lack of nonverbal cues and its inability to provide rapid feedback. Accordingly, it is recommended for situations that lack a socioemotional component and are relatively clear. Rich communication is suggested for relationship-building or for

issues that are complex, ambiguous, or equivocal. It is worth noting, however, that the richness of communication may not be determined entirely by the communication system employed—the context in which communication takes place may also play a role. For instance, prior use of e-mail with someone over a long period of time may make e-mail suitable for resolution of ambiguous issues. Leaders need to consider the fit between the context, the communication issue, and the communication medium when considering the use of a computer-mediated communication system.

Another good reason for the leader to exercise control over electronic communication is that electronic communication can be easily stored and circulated over the Internet—as many leaders who are not discreet in their electronic communication have discovered to their dismay. Drawn by the convenience of e-mail, a leader may e-mail remarks that he or she would otherwise reserve for private situations.

Access to Information

Access to information is affecting power dynamics within organizations. Open-access databases allow members of the organization to access useful information easily. While quick and easy access to a greater amount of information has put a greater onus on leaders to adjust rapidly and frequently to changes, it has also enabled them to have a complete view of what is going on in their organization, thereby altering their power vis-à-vis their followers. For instance, Lorenzo Zambrano, the CEO of Mexico's Cemex (a cement manufacturer), logs on to the corporate database at least once or twice a week and checks the oven temperatures at Cemex's nearly fifty plants, because a faulty kiln means lost business. When Zambrano sees something wrong, he skips several layers of executives and shoots an e-mail directly to the plant manager, questioning the problem. While this type of oversight can be effective, leaders have to exercise it carefully because followers who feel under constant scrutiny may become alienated.

The other side of the coin is that leaders are challenged by their followers' greater access to informa-

tion. A senior industry leader in Singapore recently said to one of the authors of this article "How can I lead when everyone else has the same information that I have, and oftentimes sooner than me?" Consider another example. Military leaders who brief their staff in the early morning often find themselves contradicted by one of the many web-based news sources by lunchtime. The inconsistent information received can cause a soldier to question whether he or she has the latest mission-related details. And this doubt places a burden on the military leadership system to disseminate accurate information as quickly as possible and to verify that the disseminated information has been received. It also has changed the command system to one in which military officers are trained to communicate the intent underlying a commander's order. What is happening in the military needs to happen in every organization facing a dynamic environment. Employees need to be aware of their leader's intent, while having the flexibility to make independent decisions at the point of contact with their customers.

Leaders are in a quandary over how much access to the Internet to give to workers. While unfettered access is believed to contribute to worker learning, it is also believed to reduce productivity, as workers are tempted to access their e-mail frequently, to go to sites unrelated to work, or to copy their e-mails unnecessarily. To curb loss of productivity caused by employees' e-mail use, in the mid-1990s Charles Wang, CEO of Computer Associates, mandated that company e-mail had to be shut down at specified times during the day.

Access to Information Media

Greater access to information media is accelerating the trend towards networked organizational structures in which employees at lower levels and stakeholders such as customers and investors have an increased leadership role. Online support groups emerge almost spontaneously today, enabling groups to organize a challenge to powerful leaders who in the past could have kept individuals in these groups apart. The site www.companycommand.com was created by U.S. army officers in 2000 who felt they

needed additional support as they assumed new command positions. This spontaneous effort, which was eventually adopted by the U.S. Army, is being used as a model for promoting organizational learning and cultural change.

Today, a dissatisfied employee can take action much more easily than in the past. With a few clicks of the mouse, the employee can contact the top management team or send a message with a story to the entire organization or the local media. Technology savvy employees may even set up gripe websites. Message boards that are shared by customers, investors, and employees are proliferating, and organizational leaders need to keep an eye on them to get a sense of the stakeholders' pulse and act quickly to quell any misinformation. There are so many channels through which information flows today, however, that leaders can no longer control releasing the most important information.

E-LEADERSHIP AND LEADERSHIP CORE PROCESSES

When work is supported to a significant extent by information systems, what core leadership processes are important? To answer this question, let us consider how a leader's actions can complement the application of information technology, how they can affect the assimilation and management of information systems, and how they can improve the functioning of technology-supported teams.

Complementary Processes

Successful IT assimilation requires complementary changes in an organization's leadership, culture, rewards, and structure. If the complementary changes do not occur, there will be little or no gain from IT investments. With increasing IT deployment, leaders need to be willing to delegate and let the organization be less hierarchical. Because knowledge work tends to accompany IT deployment and it becomes difficult to know whom to credit when it comes to knowledge creation, leaders may have a hard time motivating employees through the use of rewards. Rewarding some players and not oth-

ers may also lead to mistrust among the stakeholders involved. In such circumstances, leaders will need to focus more on team building and goal alignment and less on offering rewards to motivate beneficial behaviors.

Assimilation and Management of IT

Leaders can affect IT assimilation and management in several ways. By offering a vision for the organization and explaining how IT fits into that vision, they can make IT assimilation meaningful. By believing in IT, participating in IT strategy and projects, and using IT, leaders can be role models and legitimize participation in IT projects and adoption of IT. Finally, leaders can issue mandates and policies requiring IT adoption and use.

It seems that senior leaders' perceptions and attitudes concerning IT determine progressive use of IT to a greater extent than their actual participation in IT planning, development, implementation, and maintenance.

Virtual Teams

The way in which a leader helps the functioning of a virtual team depends on the nature of the team. A leader is most likely to need to manage performance by initiating structure and coordinating communication if team members are temporally distributed, team membership is dynamic, members hold multiple roles, and the team itself is temporary. In such teams, the performance management function becomes critical because the leader receives information from members on a delayed basis and risks losing touch with—and influence over—events. On the other hand, when a virtual team's members are working synchronously in time with each other, membership is stable, members hold single roles, and the team has a lengthy life cycle, a leader will invest more energy on the team's development. Teams of this type are more likely to be able to manage and regulate themselves, reducing the leader's need to manage performance and increasing the time the leader can spend on developing cohesion and effective long-term relationships among members—

which will enable the team to sustain itself and perform effectively over its lengthy lifecycle.

Conventional Teams

Conventional teams may be supported by communication technologies known as group support systems (GSS). These systems are designed to overcome such barriers to communication as fear of evaluation or domination of the team by a few members. They do so by providing features that enable team members to offer comments or messages anonymously (allowing for more open and honest communication than might be given in a face-to-face meetings) and enabling more than one member to communicate at the same time. They may also include features such as agenda setting and suggestions for sequences of steps that the team should follow. When GSS are employed, leaders play a crucial role in facilitating the use of all their complex features. Leaders must decide whether use of GSS will be restrictive (that is, only a fixed sequence of activities based on GSS features will be allowed) or adaptive (such that GSS features are applied flexibly depending on how the group's interaction is emerging).

E-LEADERSHIP OUTCOMES, SECOND-LEVEL OUTCOMES, AND SUBSTITUTES

The relationship of leadership processes to outcomes in the form of IT assimilation and management was implicitly presented in the last section. It appears to be the case that no studies have systematically examined the outcomes of complementary leadership processes in the area of IT deployment or of leadership in virtual teams. There are, however, a number of studies that report outcomes of leadership processes in teams aided by GSS. We divided those studies into two groups based on whether or not they manipulated leadership behavior.

GSS Studies of Group Leaders without Leadership Manipulation

In these studies, leaders were either elected by group members or designated by the researchers. These

studies indicate that the presence of leaders in groups aided by GSS, by itself or in interaction with GSS features, can affect participation, attempts to exercise influence, satisfaction with the process, decision quality, agreement among members, and willingness to disclose information. Though GSS tend to promote equality of participation and attempts to exercise influence in leaderless groups, they do not stop a leader from participating or exercising influence to a greater degree than others. In one study, the presence of a leader was associated with higher-quality decisions. In another study, assigned leadership reduced the level of agreement in the group in the presence of statistical feedback provided by the GSS. In a study in which a team was assigned a task involving negotiations between members with different motives, the presence of a leader lowered the willingness of group members to disclose information. Leadership had mixed effects on satisfaction; the mixed results may have been due to the interaction of leadership with GSS features, which were dissimilar across studies.

Because these studies did not manipulate leadership behaviors systematically, they offer little guidance in prescribing leadership behavior that would be helpful for groups making use of GSS. They do, however, suggest that GSS features may interact with leadership and, in some cases, substitute for leadership. For instance, the process structure provided by a GSS in the form of a normative set of steps to follow may undermine a leader by rendering the process structure provided by the leader redundant.

GSS Studies of Group Leaders with Leadership Manipulation

Researchers at the Center for Leadership Studies (CLS) at Binghamton University in Binghamton, New York, have conducted several experiments with groups whose members were present in the same place and communicated at the same time to examine the effects of participative, directive, transformational (the leader offers followers a transcendent purpose and encourages consideration and intellectual stimulation), and transactional (the leader views leadership as a transaction with followers) leadership styles in a GSS context. In one of the studies compar-

ing the consultative form of participative leadership to directive leadership, they found that for a task requiring creativity and in which participants provided input anonymously, participants made more supportive remarks when guided by participative leadership. Furthermore, participative leadership generated more solution proposals for a semistructured problem, while directive leadership generated more solution proposals for a more highly structured problem. In another study, transformational leadership led to higher levels of group potency—that is, the group's collective belief that it can be effective—than transactional leadership. Group potency in turn was positively associated with group effectiveness. Transformational leadership's superiority over transactional leadership in producing group potency diminished when there was anonymity in the group's brainstorming phase, which relied on individual effort, but increased when there was anonymity in the report generation phase, which required collective effort.

Two other studies produce similar findings that suggest that anonymity may enhance the effects of transformational leadership by creating a condition that is consistent with the transformational leader's emphasis on the collective. In one study, transformational leadership was found to limit social loafing—that is, decline in task-oriented activity—by encouraging all members to work for the good of the group. In another study, flow (a psychological state characterized by high levels of concentration, enjoyment, and intrinsic motivation) mediated team perceptions of transactional and transformational leadership only in the anonymous condition: Anonymity led to marginally more positive associations between perceptions of transformational leadership and flow.

In a study of the effects of transformational leadership on creativity, higher levels of transformational leadership were associated with higher levels of elaboration and originality. In groups whose members were identified, higher levels of transformational leadership were associated with greater flexibility. Under conditions of anonymity, however, leadership effects disappeared, probably because anonymity substituted for leadership by encouraging flexibility of thinking.

When examining the effects of components of

transformational and transactional leadership in another study, the CLS researchers found that both transactional goal setting and inspiring leadership had a positive impact on group creativity. Intellectual stimulation and individualized consideration had negative effects on group creativity. Participants may have perceived the leader's intellectual stimulation as critical or judicial and therefore curbed their input or became more cautious in generating ideas.

The above studies suggest that leadership style indeed does make a difference in a GSS context. Anonymity interacts notably with the transformational and transactional leadership styles to influence group outcomes.

E-LEADERSHIP AS AN EMERGING AREA OF STUDY

It appears that traditional patterns of leadership effects do not necessarily hold up in IT-supported contexts. We are beginning to learn more about the IT-enabled context, but a lot of ground remains to be covered in the future. We expect that future work in this area will begin to address such questions as these:

- How do increasing virtuality and greater use of mobile technologies influence the effects of e-leadership?
- Will e-leadership lead us into conflicts more quickly due to the rapid exchanges IT technologies make possible across complex issues and problems?
- How will new generations of employees respond to leadership that is more virtual than face to face?

Finally, the overarching question is whether the human element in organizations will be able to keep up with these advances and use them to achieve greater effectiveness.

not be said for elites. Especially in democracies, people tend to recoil from the whole notion of elites, thinking of them as repositories of privilege or as cabals plotting to overthrow institutions. The words *elitist* and *elitism* carry negative connotations. Nonetheless, leadership and elites are intertwining concepts.

WHAT IS ELITE THEORY?

Elite theory is a distinct strand in the development of sociological theory. Interestingly, this particular strand was developed primarily by Italians, such as Vilfredo Pareto (1848–1923), Gaetano Mosca (1858–1941), Roberto Michels (1876–1936), and Antonio Gramsci (1891–1937), with perhaps one of the earliest elite theorists being Niccolò Machiavelli (1469–1527). More recent Italians, such as Guido Dorso, Norberto Bobbio, and Giovanni Sartori, have also contributed to elite theory.

Together, these theorists argue that all groups, organizations, and societies separate into layers or strata. The layer that serves as the ruling political class is an organized minority, and it exists in one form or another within every form of political regime, even in monarchies and democracies. Based on their own observations and on examples from history, these theorists believed elites to be inevitable. The logic is straightforward. Masses of people need organization to get anything done. Organizations need leadership. The class of leaders constitutes an elite.

Elite theory begins with ruminations about the inescapable differences among individual human beings. Simple observation demonstrates that some individuals are better equipped for one task and some are better equipped for another. This variation is without debate. Elite theory derives from thinking about these differences.

More specifically, elite theory considers the tendency for societies to separate within themselves into layers or strata. (Different writers use different terms, such as circle, class, and status group.) This is not to say that the dividing line between one stratum and another is altogether distinct, like an impenetrable boundary. It does not have to be so formal as a caste system or apartheid. Nonetheless, a neutral

ELITE THEORY

While people generally consider leadership to be a good thing, a thing worth improving, the same can-

observer should be able to abstract from any community the presence of two or more strata, even when a certain amount of interpenetration does take place. Mosca goes so far as to say that the division into an elite and masses “is apparent to the most casual eye” (Mosca 1939, 50).

Even more specifically, elite theory reflects on the tendency of certain strata to amass a disproportionate amount of goods, whether tangible goods such as wealth or intangible goods such as power, fame, and leisure. Members of these strata can be said to constitute the elite. With few, if any, exceptions, every society has at least one elite, if not more than one. An elite stands opposed conceptually to those who are excluded from it: namely, the masses. It is their relative share of desirable goods that determines who belongs to which stratum, and vice versa. Thus, the elite is smaller and more powerful than the masses.

The Fairness of Inequality

A distinction between elites and the masses, like any social distinction, automatically raises the issue of fairness. Is one class, the elite, destined to be in charge of the other? Why is that? Should the elite enjoy greater autonomy and greater responsibility? As a class, what exactly does the elite owe the masses? What do individual members of the elite owe the masses? What do the masses owe the elite, as a class or as individuals?

It is this sense of unfairness that renders the word *elite* controversial. People often react strongly to the word because of what it implies. To many, “elite theory” refers to an offensive social arrangement based on some pernicious tendency on the part of the rich and strong to perpetuate themselves in privilege. Unlike the proponents of elite theory, these people do not accept that an elite is inevitable, and even when they concede the point as a matter of empirical fact, they do not like it. Out of this spirit of resentment, politicians find energy and focus for various causes, using the word *elite* to heighten the emotion that already exists. People in a democratic culture customarily sneer and hiss at members of the elite.

Terminology

This baggage of connotation led Bobbio to conclude that the word elite is probably unsuitable for scientific usage. The theorist Dante Germino was not so sure. It probably does increasingly serve as a symbol for ideological struggle, he thought, just as Bobbio claimed, yet it has also served for decades as a concept in theory, stripped there of all the value judgments and rhetorical distractions. The word has had a legitimate academic use, argued Germino, and scholars cannot afford to abandon every word that is appropriated by partisan debate. Guido Dorso and Giovanni Sartori responded to the challenge by developing a neutral set of terms, grounded in the work of their predecessors, that scholars can use to minimize the bad feelings and ill will associated with the word *elite*. For precision, the following terminology is useful.

There is a ruling class made up of elites in all sectors of society, such as organized religion, the entertainment industry, the military, and so forth. The term *ruling class* is relatively precise and less provocative than the term *elite*.

A subset of the ruling class is the political class, made up of those who exercise political power, such as party activists, candidates, judges, and cabinet members. Some of these persons exercise authority directly, while others wield their influence indirectly. The political class is further subdivided into those in power and those who aspire to displace them, members of what we might call the opposition—a rival elite so to speak. This division is clear in the United States because of its two-party system of Republicans and Democrats. Those outside the ruling class may become part of the opposition, creating or joining an elite that may well displace those in the political class who currently hold power. Many who join the political class are pushing their way up from the bottom, in the role of labor leader, for example, or community activist, or entrepreneur. Some may rise up from humble beginnings, as did a number of U.S. presidents such as Richard Nixon, Ronald Reagan, and Bill Clinton. Although their backgrounds would not seem to make them “eligible” for the ruling class, as president, they were each extremely powerful members of the ruling class.

The rest of those falling outside the ruling class we refer to as alienated. This group constitutes the bulk of the masses. The masses are predominantly indifferent to the daily struggle for preeminence and power. They tend to be uninvolved. The masses pay little attention to political conflict, in part because they are busy doing other things.

Distinguishing Elite Theory from Racism

On the issue of fairness and the connotation of words, one caveat needs to be added. Elite theorists observe that an elite of some kind dominates every society, but that does not have to mean that they endorse domination per se. They simply make observations. It is especially wrong-headed to say that they endorse dominance based on biology or race. Elite theory does not posit a master race; it merely observes that elites are present in societies and notes the characteristics of the elites. Even when race is a determining factor in who may belong to an elite, elite theory merely studies the phenomenon; it does not condone it. Indeed, critics of existing leadership and of power structures would be advised to consult elite theory, as did the black writer W. E. B. Du Bois (1868–1963). Feminists, populists, labor unions, Marxists, egalitarians, and multiculturalists all should find elite theory helpful in framing their critiques.

MODELS OF ELITE THEORY

There are two ways to depict elite theory: by means of a static model and by means of a dynamic model. The static model is like a snapshot; it reveals a structure frozen in time, showing the levels of domination, higher and lower, and the subdivisions within each level, such as the presence of rival elites competing for dominance. Observers can detect in the static model configurations, hierarchies, and alliances as they separate the various elements and place them in relation to one another. This process alone would be helpful for leadership studies.

Antonio Gramsci, for example, described a kind of pyramid with intellectuals at the narrow top, lieutenants communicating their vision, true believers to carry out orders, and a relatively dull and amorphous

mass at the bottom to be converted. In the contemporary scene, Mosca found three dominant types of elite. There are bureaucrats, constituting a special class of civil servants dedicated to their agency (and to their careers within the agency). These are the leaders who exemplify efficiency above all in their quest for meeting performance standards, because that demonstrates value to the agency. There are eminent persons, such as celebrities, who are notable in some way—for their beauty, their wealth, their athletic ability, or their intelligence, for example—and who thereby garner more than their share of attention. Finally, there are partisans, dedicated to a cause, pushing an agenda and by that method (whether intentionally or not) elevating themselves above the rest. In summary, bureaucrats pay attention to their careers and adapt themselves accordingly. The notables pay attention to whatever it is that makes them notable—their portfolio or their golf game, whatever the case might be. Partisans pay attention to their cause.

In pragmatic fashion, Gramsci ignored the notables, presumably since they are not direct participants in the struggle for preeminence. They are off doing their own thing. Instead, Gramsci was interested in the more extreme “ideal types” of a bureaucrat anchored too much in the real and a fanatic lost in the ideal. Someone has to harness them to form an effective cadre for social change. That organization of different people into a coherent force is what he considered the task of leadership. This leadership cadre or party is better suited than any single individual to serve as an embodiment of collective will, a concrete form of mass desire, the carrier of a myth. Many individual leaders serve merely as symbols, images, or rallying points for the cadre. In fact, if there is a role for notables in the change process, it would be as figureheads.

In contrast to the static model, the dynamic model shows how things change over time. It traces the rise and fall of elites, their coming together and their falling apart. As Bobbio put it, the elite has a lifespan. By zooming in to take a closer look, one sees all the little episodes of leadership—up and down the structure—that in the aggregate Pareto referred to as the circulation of elites. Examining leadership helps

to explain how elites form. Do new leaders rise from the bottom up by their own talent and initiative, as they do in liberal regimes, or are they selected from the top, as in authoritarian regimes?

There are several explanations for what starts the process of elite formation. At certain moments, an organization may require rapidity in its leadership, or specialty, or stability. As groups become sufficiently large and complex, they require coordination. Such groups fare better when they can work through representatives. In other words, according to the Italian tradition, “the good of the collectivity depends crucially on capable leaders ensconced in a hierarchical structure” (Levine 1995, 249). This at least is the elite’s purported function and frequently its justification.

The assumption seems to be that elites have won some kind of competition and the masses lost. This is not entirely fair, of course. According to elite theory, people are not driven exclusively by an impulse to struggle. They also seek solidarity and form groups of like-minded individuals. Leaders of these groups struggle on behalf of their members, and the elite tends to take the lead in framing and conducting these struggles.

From this it follows that the elite must seem to bear “onerous duties” (Germino 1967, 118) and make sacrifices for the sake of the group, lest the group collapse completely or turn that elite out in exchange for one that *will* make those sacrifices. Some rival elite with compatible values and an air of competence is always eager to step forward to take the place of preeminence. Being willing to make sacrifices for the community is part of the bargain that permits an elite to become an elite to begin with. The idle rich, the self-aggrandizing politician, and the demagogue are all likely to be accused of taking but not giving. All leaders must lead for the sake of the group or defer to someone else; leadership is a process of endless struggle for preeminence, if not for survival. Pareto saw this nonstop struggling as a good thing, since competition is “instrumental to the progress of society” (Bellamy 1987, 24).

The forces engaged in struggle are rarely equal. The prevailing elite, referred to earlier as the ruling class, enjoys tremendous advantages, and it has a

stake therefore in concentrating power and marginalizing threats to its hegemony. Hegemony is a term of art developed by Gramsci to denote structured class inequality, based on consent, in the midst of ongoing contestation. The ruling class preserves its hegemony in three ways. First, Mosca described how the ruling class tries to rationalize its status:

Ruling classes do not justify their power exclusively by de facto possession of it, but try to find a moral and legal basis for it, representing it as the logical and necessary consequence of doctrines and beliefs that are generally recognized and accepted. (Mosca 1939, 70)

Thus, they attempt to make it an article of faith that they are the ones to govern. If enough people believe in the legitimacy of the ruling class, they give it tacit consent to persist in power.

Second, in true Machiavellian fashion, elites manipulate appearances to make sure the masses continue to defer. Occasionally this means emphasizing appearance over reality. Leaders sometimes lie outright and rationalize privately that the lies are necessary.

Third, when necessary, the ruling class will resort to coercion, including outright violence. In other words, the ruling class relies on some combination of faith, fraud, and force to stay in power. Elite theory argues that the ruling class does so not because it is evil, but simply because that is what it takes to prevail. In elite theory, judging elites as good or evil is secondary to determining what they do as a matter of fact.

THE CONNECTION BETWEEN LEADERSHIP AND ELITES

In ordinary conversation, people distinguish leadership from elites in certain ways. For instance, leadership occurs on a smaller scale for a shorter period of time; the elite is an entrenched part of the structure of an entire society. Leadership describes the process, directed outward, of changing followers; elite theory describes the influx of goods to a privileged minority. Leadership suggests direct, even face-to-face involvement, which means specific behaviors in mutual orientation, whereas the elite

progressively distances itself from the masses and employs indirect techniques for channeling resources. Often, leaders work to close the gap between leader and led, whereas the elite reinforces the gap between itself and the non-elite.

However, leadership is also the movement of people into positions of increasing influence and authority, and therefore can be thought of as the means whereby elites constitute themselves. The formation of an elite is the eventual consequence of patterns of leadership.

According to Gramsci, in terms of elite theory, “the essential task [of the leader] is that of paying systematic and patient attention to forming and developing this [social] force [i.e., the cadre], rendering it ever more homogeneous, compact, conscious of itself” (Gramsci 1992, 173). So, speaking roughly, ideas are born in individuals, taken up and given form by groups, and then sold to masses. Leaders oversee this process.

An elite engages in leadership in order to establish and maintain itself, and leadership tends to consolidate itself in the conservation of power—an idea encapsulated by the sociologist Roberto Michels (1876–1936) as the “Iron Law of Oligarchy.” It is undoubtedly true that simple leadership does occur all the time among the masses, in even the smallest and lowliest group, and it is also true that many among the ruling class lead scarcely anyone at all in actual practice, but over time these facts contribute to the famous circulation of elites, as leaders from among the masses emerge to challenge the ruling class and as the lethargic or incompetent elite tumbles from its place of privilege. Leadership can be thought of as movement in a thousand associations—creating, sustaining, and ultimately destroying a ruling class—in a manner similar to boiling water sending bubbles to the surface. One recent book on elite theory even refers to elites as “leadership groups” and “leadership cadres” (Lerner, Nagai, and Rothman 1996, ix). This is a particularly useful way to understand the relationship.

IMPLICATIONS FOR DEMOCRACY

Is elite theory antidemocratic? Elite theory and democracy might seem to be antithetical concepts.

When a society commits itself to democratic principles such as equality and participation, the whole notion of an elite seems contrary. Democracy means that the people govern; the presence of an elite suggests an aristocracy or oligarchy.

Democracies openly tolerate nonpolitical elites, such as in the entertainment industry and the business world. Michels’s Iron Law of Oligarchy suggests that an elite of any kind tends to coalesce and create political power. Actors and celebrities frequently become politically influential and sometimes even stand for election. More importantly, however, in every historical example elite theorists have examined, democracies have some kind of political elite, whether an official elite, such as an upper chamber in the legislature and a supreme judiciary, or an unofficial elite, such as one formed by party bosses or rich lobbyists. The philosopher Jean-Jacques Rousseau (1712–1778) has been quoted in support of this view: “To take the term in its fully rigorous meaning, there has never existed a true democracy and one will never exist. It is against the natural order of things that the great number governs” (Michels 1949a, 89, citing Rousseau’s *The Social Contract*).

Democracies may abhor elites, yet empirically they tolerate them. What explains this discrepancy? Elite theorists disagree among themselves on the answer to that question, and several possible answers have been proposed.

Democracies Use Leadership to Counter Elites

Democracies cry for leadership to balance a countervailing power, to prevent a ruling class from getting too comfortable and monopolizing the franchise. Gramsci suggested that Machiavelli revealed the secrets of wielding power in the hope that no one could then use them on a populace that is caught unawares. It is a move toward democracy to foster leadership, because the rising leaders offset the tendency of the prevailing elite to convert democracy into an oligarchy.

Democracies Want Leadership to Create Better Elites

A democracy requires competent leadership, and the cry for leadership can be thought of as a cry for a

more competent and more principled elite. According to this theory, democracies condone elites not so much to counter the ruling class from outside as to improve it from within.

Democracies Want Leadership on a Small Scale

Then again, the cry for leadership could be a cry for discrete relationships and episodic moments of leadership, in other words, for leadership that does not rise to the establishment of an elite. If this is the case, then asking for leadership and getting an elite is like asking for a drink of water and getting a flood.

Democracy Will Not Work; Leadership Ameliorates It

Of course, some who cry for leadership do not object to an elite in the first place and are willing to give up on democracy as a pure, egalitarian ideal. Mosca noted that trying to repair democracy with even more democracy frequently makes matters worse. For many elite theorists, democracy is problematic. Leadership helps to soften or nullify the ill effects of democracy.

Democracy Exists to Create an Elite

The drama critic Eric Bentley saw no contradiction between democracy and an elite. “Democracy, to justify itself, must *include* aristocracy. . . . Aristocracy is one of the goals of democracy” (Bentley 1957, 264f.). It is, in other words, a mistake to imagine democracy and aristocracy—that is, democracy and an elite—as opposing concepts. Democracy is the manner by which people determine who becomes the elite. It is through the exercise of leadership that the members of the elite become the elite.

Democracy and Leadership—or Democracy and Elites—Are Simply Incompatible

By way of contrast, some theorists argue that democracy and leadership are simply incompatible, and others argue that democracy and elites are incompatible. This view holds that elite theory and leadership studies are inherently antidemocratic.

Many would argue, however, that rather than rejecting leadership studies and elite theory as anti-democratic, those disciplines should be embraced for the knowledge they offer to democracies about the nature of elites.

ELIZABETH I (1533–1603)

Queen of England

Elizabeth I was Queen of England from 1558 to 1603. During her reign, she demonstrated considerable leadership skills, surviving in an environment that was often extremely hostile and threatening. Popular culture flourished during the reign of Elizabeth; her court was a focal point for writers, musicians, and scholars such as William Shakespeare (1564–1616) and Francis Bacon (1561–1626), and explorers such as Francis Drake (c. 1540–1596) and Walter Raleigh (c. 1554–1618). Elizabeth encouraged a spirit of free inquiry that in turn facilitated the scientific revolution and the age of enlightenment. During her reign, the English economy expanded massively. The queen herself came to be known as Gloriana, a name that reflected the triumphs of the age she oversaw.

The England Elizabeth had inherited was blighted by bankruptcy, roaring inflation, disastrous wars, and religious conflict. Poverty, disease, and deprivation were rife. From childhood, Elizabeth's life was fraught with danger. When she was only two years old, her father (Henry VIII, 1491–1547; reigned 1509–1547) executed her mother Anne Boleyn (his second wife), and Elizabeth was declared illegitimate. After her father died, her brother Edward (1537–1553; reigned 1547–1553), the son of Henry's third wife, inherited the throne but lived only for a short time. In 1553, Elizabeth's Catholic half-sister Mary (1516–1558; reigned 1553–1558), Henry's daughter by his first wife, became queen. In March 1554, Elizabeth was incarcerated in the Tower of London, accused of plotting against Mary

and of refusing to embrace the Catholic faith. She was released in May but remained under suspicion and was carefully watched until Mary died childless in 1558.

In the context of these threats, deprivations, and indignities, it is remarkable indeed that Elizabeth ever became Queen of England, let alone that she then reigned for forty-five years. Elizabeth had been forced to learn the arts and skills of survival at a very early age, and this knowledge stayed with her throughout her life, significantly influencing her approach to leadership. The life of Elizabeth tells us a great deal about leadership and about the effective exercise of power and authority.

ELIZABETH AND GOVERNMENT

Elizabeth recognized that, unlike her father, she could not adopt an autocratic approach to leadership based on absolute power. She would have to lead in a rather more sophisticated way. Her powers of oratory (which age did not diminish) became legendary and enabled her to obtain the support of the Privy Council, the bishops, Parliament, and the people. Elizabeth's speech to a deputation from Parliament about her repeal of monopolies in 1601 became known as her "Golden Speech." In 1601, Parliament debated the outlawing of monopolies. This constituted a significant challenge to the Queen's royal prerogative to grant monopolies. However, aware of the strength of feeling within Parliament on this matter, Elizabeth decided to preempt any unwelcome legislation by sending a message to Parliament that she herself would reform affairs. Her superb timing defused the agitation: "The House was overjoyed . . . not by its own victory, but at their Queen's magnanimity" (Williams 1967, 346). Parliament requested leave to send a deputation to thank her and it was to this deputation that Elizabeth gave her Golden Speech. Elizabeth's consummate skill as a leader had turned the possibility of a humiliating defeat into a great victory.

Still a relatively young woman of twenty-five when she took the throne, Elizabeth recognized the value of wise counsel. She created a small circle of trusted advisers, the most influential of whom was William

The “Golden Speech” to Parliament Delivered by Queen Elizabeth I

Of the various versions of the speech that survive—including one thought to have been edited by Elizabeth—this one is the version produced by Hayward Townshend, a member of Parliament when it was delivered on 30 November 1601. Its “golden words” were Elizabeth’s last address to Parliament before her death in 1603.

Mr Speaker,

We have heard your declaration and perceive your care of our estate. I do assure you there is no prince that loves his subjects better, or whose love can countervail our love. There is no jewel, be it of never so rich a price, which I set before this jewel: I mean your love. For I do esteem it more than any treasure or riches; for that we know how to prize, but love and thanks I count invaluable. And, though God hath raised me high, yet this I count the glory of my Crown, that I have reigned with your loves. This makes me that I do not so much rejoice that God hath made me to be a Queen, as to be a Queen over so thankful a people. Therefore I have cause to wish nothing more than to content the subject and that is a duty which I owe. Neither do I desire to live longer days than I may see your prosperity and that is my only desire. And as I am that person still yet, under God, hath delivered you and so I trust by the almighty power of God that I shall be his instrument to preserve you from every peril, dishonour, shame, tyranny and oppression, partly by means of your intended helps which we take very acceptably because it manifesteth the largeness of your good loves and loyalties unto your sovereign.

Of myself I must say this: I never was any greedy, scraping grasper, nor a strait fast-holding Prince, nor yet a waster. My heart was never set on any worldly goods. What you bestow on me, I will not hoard it up, but receive it to bestow on you again. Therefore render unto them I beseech you Mr Speaker, such thanks as you imagine my heart yieldeth, but my tongue cannot express. Mr Speaker, I would wish you and the rest to

stand up for I shall yet trouble you with longer speech. Mr Speaker, you give me thanks but I doubt me I have greater cause to give you thanks, than you me, and I charge you to thank them of the Lower House from me. For had I not received a knowledge from you, I might have fallen into the lapse of an error, only for lack of true information.

Since I was Queen, yet did I never put my pen to any grant, but that upon pretext and semblance made unto me, it was both good and beneficial to the subject in general though a private profit to some of my ancient servants, who had deserved well at my hands. But the contrary being found by experience, I am exceedingly beholden to such subjects as would move the same at first. And I am not so simple to suppose but that there be some of the Lower House whom these grievances never touched. I think they spake out of zeal to their countries and not out of spleen or malevolent affection as being parties grieved. That my grants should be grievous to my people and oppressions to be privileged under colour of our patents, our kingly dignity shall not suffer it. Yea, when I heard it, I could give no rest unto my thoughts until I had reformed it. Shall they, think you, escape unpunished that have oppressed you, and have been disrespectful of their duty and regardless our honour? No, I assure you, Mr Speaker, were it not more for conscience’ sake than for any glory or increase of love that I desire, these errors, troubles, vexations and oppressions done by these varlets and lewd persons not worthy of the name of subjects should not escape without condign punishment. But I perceive they dealt with me like physicians who, ministering a drug, make it more acceptable

Cecil (1520–1598). On formally appointing Cecil as her secretary of state, she told him, “This judgement I have of you, that you will not be corrupted by any manner of gift, and that you will be faithful to the state, and that without respect of my private will, you will give me that counsel you think best, and if you shall know anything necessary to be declared to me of secrecy, you shall show it to myself only” (Luke 1973, 28). She relied on Cecil to speak frankly and to give his opinion even when it conflicted with her own. Together, they forged a unique partnership. Over the

next forty years the queen rarely took an important decision without consulting Cecil first, although she did not always defer to his advice.

Highly intelligent, Elizabeth made herself thoroughly familiar with all aspects of policy within and outside her realm. Accordingly, it was very difficult to deceive her. Being multilingual, she was able to converse directly with ambassadors from many different countries, and this ensured that no information could be accidentally or deliberately lost in translation. Cecil’s admiration and respect for his queen’s

by giving it a good aromatical savour, or when they give pills do gild them all over.

I have ever used to set the Last Judgement Day before mine eyes and so to rule as I shall be judged to answer before a higher judge, and now if my kingly bounties have been abused and my grants turned to the hurt of my people contrary to my will and meaning, and if any in authority under me have neglected or perverted what I have committed to them, I hope God will not lay their culps and offenses in my charge. I know the title of a King is a glorious title, but assure yourself that the shining glory of princely authority hath not so dazzled the eyes of our understanding, but that we well know and remember that we also are to yield an account of our actions before the great judge. To be a king and wear a crown is a thing more glorious to them that see it than it is pleasant to them that bear it. For myself I was never so much enticed with the glorious name of a King or royal authority of a Queen as delighted that God hath made me his instrument to maintain his truth and glory and to defend his kingdom as I said from peril, dishonour, tyranny and oppression. There will never Queen sit in my seat with more zeal to my country, care to my subjects and that will sooner with willingness venture her life for your good and safety than myself. For it is my desire to live nor reign no longer than my life and reign shall be for your good. And though you have had, and may have, many princes more mighty and wise sitting in this seat, yet you never had nor shall have, any that will be more careful and loving.

"For I, oh Lord, what am I, whom practices and perils past should not fear? Or what can I do? That I should speak for any glory, God forbid." And turning to the Speaker and her councilors she said, "And I pray to you Mr Comptroller, Mr Secretary and you of my Council, that before these gentlemen go into their countries, you bring them all to kiss my hand."

grasp of policy and politics can be clearly seen from his remark that

there never was so wise a woman born, for all respects, as Queen Elizabeth, for she spake and understood all languages; knew all estates and dispositions of Princes. And particularly was so expert in the knowledge of her own realm and estate as no counsellor she had could tell her what she knew not before. (Somerset 1997, 64)

Although Elizabeth never left the shores of England, she was by no means an insular queen. Indeed,

she was an expert on foreign policy, and one of her legacies was the establishment of England as a maritime nation. Although she never formally condoned piracy on the high seas, Elizabeth informally encouraged (partly through financing) Francis Drake and other sailors to plunder and pirate on her behalf. During her reign, English merchant ships challenged Spain's seafaring preeminence, and the first English settlers were sent to North America.

Elizabeth maintained a pragmatic approach to international affairs. Very careful with money, she was highly reluctant to fight wars, as their cost inevitably drained her treasury. However, when forced into battle against the Spanish Armada, Elizabeth was an unflappable leader. Her inspirational speech to the troops at Tilbury Docks again demonstrated her oratory skill and great courage.

Elizabeth appreciated the value and indeed necessity of managing her reputation. Courtiers frequently used propaganda and "political spin" on her behalf. In matters of international politics, monarchs were always very aware of their image. Their position and status within the international arena also reflected directly on their courtiers, especially ambassadors who were resident in foreign courts (i.e., "prestige by association"). As a female, Elizabeth was at a disadvantage within the international hierarchy. However, her intellect, judgment, and grasp of foreign policy became legendary. Consequently, as Elizabeth's reign unfolded, the reputation of both the Queen and of England increased significantly. Visual images of Elizabeth were also tightly controlled, with paintings presenting Elizabeth as a very powerful and glorious ruler. These images cultivated the idea of Elizabeth as an eternally youthful virgin queen who was married to England and her subjects. Elizabeth used her yearly progresses around the country to make herself visible to her subjects. Her courtiers were often amazed at how she allowed the common people to approach her.

Along with these great strengths, Elizabeth, like all great leaders, also had weaknesses. She was very vain and could be extremely temperamental. She had a furious temper, and many of her courtiers lived in fear of her rebukes. As one ambassador noted, "She seems to me incomparably more feared than her sis-

ter, and gives her orders and has her way as absolutely as her father did” (Somerset 1997, 60). She could also be very indecisive, a trait that frustrated her close advisers. Two of the great issues of government that dominated much of Elizabeth’s reign were the question of religion and of Elizabeth’s possible marriage. In both cases, Elizabeth was able to manage the ambiguities of her situation in highly effective ways.

ELIZABETH AND RELIGION

Throughout Elizabeth’s reign religious divisions were a central concern. Elizabeth’s father, Henry VIII, had rebelled against the pope and rejected the Catholic Church, which at that time dominated Europe. Subsequently, Queen Mary, Elizabeth’s half-sister, had returned England to Catholicism and married the Catholic King of Spain. Mary had persecuted those who resisted the Catholic faith. Elizabeth was acutely aware of the religious polarities within England and sought to walk the more inclusive, less extreme path of toleration. Although she returned England to Protestantism, Elizabeth recognized the dangers of encouraging the extreme elements of Protestantism. Despite insisting on changes in church services, she retained many trappings of Catholic worship, including candlesticks, crucifixes, and clerical robes.

Forging a religious middle ground, she brought a degree of peace to England that was not echoed in continental Europe, where religious fanaticism and turbulence ran rampant. In Spain there were the Inquisitions, while in France heretics were being burned at the stake. By contrast, Elizabeth attempted to defuse religious tensions by gaining outward compliance with the Protestant services. Anyone not attending church was subject to a fine. In the first part of Elizabeth’s reign those Catholics who either attended the parish church, or paid their fines for non-attendance, could usually still practice their faith privately without fear of persecution. In contrast with the Queen’s more relaxed attitude toward religious matters, Elizabeth’s counselors were fearful that Catholic religious extremists would attempt to assassinate the queen. Francis Walsingham

(c. 1532–1590), acting under the direction of Cecil, was in charge of information gathering through the extensive network of spies considered necessary to obtain information about any potential threats to the queen. Walsingham, who held extreme Puritan views, operated a sophisticated counterespionage organization using double agents and torture to obtain information. Although Elizabeth considered Walsingham to be an extremist in terms of religion, she admired his shrewdness and never doubted his commitment to her well-being.

Elizabeth’s policy of religious moderation was tested to its limits when her cousin Mary Queen of Scots (1542–1587) sought sanctuary in England in 1568 following an uprising in Scotland. Mary was Catholic, and there were some Catholic factions at the national and international level who believed that she was the rightful queen of England. Cecil and Walsingham were concerned that Mary’s presence in England threatened Elizabeth’s safety. After almost twenty years in captivity in England, Mary was executed for treason in 1587.

ELIZABETH AND MARRIAGE

Like many leaders, Elizabeth had a strong sense of destiny. She had no doubt that her rise to the throne was God’s doing. When informed that her half-sister Mary had died and she was now queen, Elizabeth stated, “This is the Lord’s doing; and it is marvelous in our eyes” (Marshall 1991, 47). Elizabeth viewed the advantages she derived from her sovereign status as far outweighing the disadvantages that she saw accruing from her sex. For Elizabeth, being a woman was not so much a handicap as an irrelevance, as she stated “my sex cannot diminish my prestige” (Somerset 1997, 60). In the sixteenth century, the first duty of a monarch was to marry and have children, thereby ensuring the succession. Cecil in particular was very keen to secure the succession and create a Protestant heir to the throne.

However, Elizabeth’s experiences in childhood and her knowledge of international politics led her to believe that marrying would be disadvantageous both to her and the realm. As a queen it was expected that she would marry someone of royal blood. Eliz-

abeth understood that marriage to a foreign prince offered some security from other hostile states within Europe. However, she knew that the English people were notoriously suspicious of and antagonistic toward foreigners. Mary Tudor's marriage to Philip of Spain had caused great disruption within the realm. The other option was marriage to an English nobleman. Elizabeth considered that such a marriage would create jealousies within the nobility and could lead to civil war. From the queen's perspective, having to share power with a husband conflicted with her sense of her own destiny. Although at that time an unmarried queen was considered unnatural, Elizabeth turned her single status into a strength. With great leadership skills, she created the image of the virgin queen who sacrificed personal happiness for the welfare of her people.

Elizabeth's policy of remaining single did leave the problem of who would succeed her. The loss of such a charismatic leader as Queen Elizabeth left a vacuum that resulted in deep-seated internal conflict. On her death, Elizabeth was succeeded by the son of Mary Queen of Scots, James I of England (1566–1625; reigned as James VI of Scotland 1567–1625 and as king of England 1603–1625), who had been raised a Protestant. This subsequent period in English history was characterized by religious strife, social turmoil, and a civil war.

Respected abroad and celebrated at home, Elizabeth I was an extraordinary woman. Four hundred years after her death we still recognize the legacy she bequeathed. Elizabeth became one of the greatest monarchs in English history—perhaps the greatest. Her reign was a time of increasing prosperity, peace, and a significant strengthening of England's international interests. Many consider the Elizabethan era to have been a golden age. After the highly turbulent years of Henry VIII's reign, the relative stability that England enjoyed during Elizabeth's long reign was of enormous benefit to the development of English society and culture. Elizabeth's reign led to the emergence of the British Empire. This included the colonization of Virginia (named after the virgin queen). Sailors such as Drake and Raleigh took the English language abroad; today it is the preeminent language of world communication. A highly skilled and pro-

gressive leader, Elizabeth utilized strategies of religious and political tolerance effectively. She encouraged learning and merriment, which in turn facilitated free speech and creativity. Her policies encouraged further development of parliamentary democracy, a moderate Church of England and, for the times in which she lived, a relatively prosperous, peaceful, and stable society and economy.

EMPOWERMENT

In organizational contexts, empowerment typically involves sharing of power, whereby a hierarchically superior leader gives some of the authority and decision-making latitude previously in his or her purview to one or more followers, thus expanding the follower's sphere of influence. Once "empowered," the follower can engage in decision making within the expanded boundaries without the need to check back with the leader for permission to act.

True empowerment increases the follower's sense of self-worth and provides personal fulfillment. Leaders can delegate without empowering, either by delegating only menial tasks that will produce no increment in the follower's sense of mastery or purpose, or by inappropriately giving tasks to followers who are not able to succeed at them. Research on psychological empowerment suggests that four key components determine whether people feel empowered: meaning (consistency with values or ideals; care about the work), self-determination (behavioral choice or autonomy), self-efficacy (self-confidence about one's ability to perform well on a task), and the belief in the prospect of significant impact on the work or organization. Although many leaders feel that it is their job to control, and resist empowering their staffs, research is accumulating on the value of

leaders sharing power through the psychological empowerment of followers.

WHY SHOULD LEADERS SHARE POWER?

The ability to speed up certain processes by allowing decisions to be made at hierarchically lower levels can have some distinct advantages for staff, organizations, and leaders.

Greater education, capabilities, and expectations of staff. As the education levels of staff rise, options for empowerment increase. Research indicates that most leaders will not delegate to incompetent staff, nor would their organizations want them to. But many leadership theories have suggested that talented and motivated staff members do not require the same kinds of leadership guidance as unskilled and uninterested staff, and, in fact, respond negatively to too much leadership structure as "micromanagement." Having professional staff substitutes for the need to have a structuring leader, and such staff often expect to be empowered to act within the bounds of their skills. Leaders who fail to empower skilled staff risk losing their talents, motivation, and commitment.

Increase in knowledge and service sector employment. As the U.S. economy increasingly depends on the expanding knowledge and service sectors, empowerment becomes even more vital. Knowledge and information demands require the involvement and commitment of all staff members, not just leaders. Service quality occurs at the point of service contact, where the customer or client interacts with staff. The inability of staff to satisfy customer demands promptly and without "checking with a manager" yields customer dissatisfaction and the potential loss of return business. Empowering staff within predetermined limits allows them maximum flexibility to provide a satisfying customer experience.

Freedom for the leader to focus on broader strategic issues rather than primarily day-to-day management. Although leaders are often wary of sharing power, in fact it is the primary way that they can expand their own ability to focus on how to really add value to their organizations. Freed from a myriad of time-consuming actions now under staff oversight, the

leader can focus more on strategic vision, on new and creative business options and prospects, and on expanding their client base and profit margins. They must also focus on coaching and developing staff to succeed in their newly empowered roles.

Thus, for both leaders and staff, successful empowerment can result in increased motivation, satisfaction, and learning, while organizations benefit from increased flexibility, superior client service, and better job performance. Unfortunately, these benefits are not always realized in practice.

WHY ARE LEADERS RELUCTANT TO SHARE POWER?

Implementing empowerment initiatives has proved more difficult than many organizations expected. Numerous organizational attempts at empowerment have failed because of a leader's unwillingness or inability to engage in appropriate empowering behaviors. Research suggests that one reason for this may be a self-enhancement bias: leaders have a higher regard for work that they control or in which they have high input, even if others see no quality difference with or without leader input. Further, when leaders exert more control, they attribute greater success to themselves than to staff, and may denigrate subordinates as incapable. This self-fulfilling prophecy of perceived staff failure then leads to increased leader resistance to empowering staff, since the leader fears that lower quality work may result.

Even leaders who sincerely want to develop and empower their subordinates may find it difficult to do so. Empowerment can change the entire leader-follower relationship from one of hierarchical superiority/inferiority to a more egalitarian relationship built on mutual trust and support. For leaders, there is an element of risk: If subordinates can do what the leader used to do, what then is the leader's role? Empowerment does not just change the follower's job, but it changes the leader's job as well. And unless leaders are confident about their own abilities to move forward into a new and expanded role, it is likely that they will continue to do what

they know how to do—at least some of which should now be their subordinate's job.

BECOMING AN EMPOWERING LEADER

Delegation is often one of the hardest leadership behaviors to execute well. At one extreme, leaders are reluctant to give up influence to staff, and either fail to delegate meaningful work or interject themselves unnecessarily with staff for whom delegation is appropriate and desired. On the other extreme, some staff complain that “delegation” means desertion, where a project is dumped on them with little discussion of parameters or expectations before a leader completely removes him or herself from further involvement, even as a consultant or monitor. Neither extreme will produce feelings of psychological empowerment in followers. Effective empowerment requires an accurate assessment of staff capabilities and “growing” staff into positions of increasing responsibility. It means providing inspiring goals as well as needed resources and information, removing organizational constraints, encouraging participation in decision making, and rewarding staff initiative and accomplishment. Leadership becomes less about direction and control, and more about making full use of subordinate capabilities in service of organizational goals.

Effective empowering leaders must learn new roles as visionaries, coaches, team builders, champions, and facilitators, to name a few. They need to determine the boundaries of staff autonomy, and work with staff over time to expand those boundaries as staff competence and confidence grows. Ideally, empowerment begins with top-level leaders, who model empowering behaviors for lower-level leaders and support leaders in their efforts to master empowering behaviors. Some companies have gone so far as to virtually mandate empowerment by expanding the leader's areas of responsibility to the point that the leader cannot succeed without delegating and empowering staff. In these situations, leaders either empower others or face personal exhaustion and ineffectiveness. Investing in training for empowered staff—including leaders—can be of significant value. Dealing with supervisory fear of

Give us the tools, and we will finish the job.

—Winston Churchill

job loss and clarifying new leader role expectations can help allay fear that empowering others means losing one's own job.

CAUTIONS ABOUT EMPOWERMENT
