Despite its attractions, empowerment is not for every subordinate. First of all, not everyone wants to be empowered; some people may be perfectly content to have others make all the decisions, and dislike taking on more responsibility. Unfortunately, some leaders seem to overestimate the number of such empowerment-averse staff, and underestimate the percentage of staff who would welcome additional challenge and responsibility in their jobs. Nonetheless, individuals need to be ready to be empowered, both in terms of their skills and their motivation levels, and leaders need to ensure that important goals are being achieved in an ethical and effective manner. Part of an empowering leader's job is to develop staff to the point of their being able to assume increasing responsibility with the leader's confidence and support.

In order to effectively empower staff, the organizational system itself needs to embrace and support empowerment. Specifically, research suggests that empowerment is most appropriate for skilled professional staff with high needs for achievement, who work on complex and non-repetitive tasks, in decentralized, less formalized, more flexible organizations that emphasize individual learning and participation. The core values of the organization must be clear to all employees, whose empowered actions then operate within the bounds of those values. The relationship between leaders and their empowered staff needs to be characterized by mutual trust and respect in order for empowerment to grow and flourish.

Cultural differences need to be considered as well. Employee reactions to particular managerial or leadership practices, including empowerment, may vary depending on cultural background. In terms of

empowerment, a recent study by Robert et al. (2000) predicted that empowerment would be a better fit in more egalitarian societies (low on the cultural dimension of power distance) than in societies in which unequal power for different members of society is both accepted and acceptable (high power-distance cultures). Since high power-distance societies endorse hierarchical structures and members expect decisions to be made by those in higher-level positions, empowerment in high power distance societies may be seen as weak leadership. The authors found that empowerment was negatively associated with job satisfaction only in the highest power-distance society studied, India, while positively associated with satisfaction in the United States, Mexico, and Poland. Although the mechanism needs further study, this and other cross-cultural research does support the contention that it is dangerous to assume that empowerment will always be seen as a good thing by all followers in all cultures.

Finally, there is an ethical issue surrounding what has been called bogus empowerment, where leaders promise more responsibility than they actually give staff. Past research on participative management has suggested that many leaders consider themselves to be more participative than their subordinates do. Bogus empowerment is quickly discerned by staff, with negative results. True empowerment requires the moral courage to change the power relationship that leaders have with followers, and an acknowledgment that empowerment does not necessarily mean agreement. And what a leader promises in terms of empowerment, he or she needs to be prepared to deliver.

Empowerment can result in new opportunities for both leaders and followers, as well as increased organizational productivity and satisfaction when it is used appropriately with staff who are ready for it, by leaders who truly embrace it and are willing to expand their own roles as well as those of their staffs. In learning to unleash the creative power of staff through empowerment, modern leaders can discover the wisdom of ancient Chinese philosopher Lao-Tzu (cited in Bynner 1976, p. 46): "But of a good leader who talks little, when his work is done, his aim fulfilled, they will all say, 'We did this ourselves.'"

ENRON SCANDAL

On the eve of its spectacular collapse in the autumn of 2001, the Enron Corporation of Houston, Texas—a diversified energy trading company—was the seventh-largest corporation in the United States. More than that, Enron was touted as one of the greatest successes in U.S. business history. However, soon the success was over: The company's share price, which had traded at more than \$80 early in the year, plummeted to less than \$1 in late November, and Enron filed for Chapter 11 bankruptcy on 2 December. In a matter of months Enron became one of the greatest corporate failures—and one of the greatest corporate scandals—in U.S. business history.

Enron's leaders were chiefly responsible for the corporation's meteoric rise and breathtaking disintegration. They devised the corporation's unconventional business strategy; secured enormous infusions of investment capital; recruited legions of young, aggressive business school graduates; forged political ties with influential government officials across the political spectrum; and moved Enron's assets into increasingly speculative, legally dubious, and opaque investment instruments. Perhaps more significantly, Enron's top executives created an internal corporate culture and an external corporate image that transformed it into a juggernaut. Their leadership style was at once highly effective and deeply deceptive.

Enron was born in 1985 when InterNorth, a leading natural gas pipeline company, acquired one of its chief competitors, Houston Natural Gas, for \$2.6 billion. The next year the company's name was changed to "Enron," its headquarters were moved to Houston, and Kenneth Lay (the former chairman of Houston Natural Gas) was elected chief executive officer. Lay's initial strategy was to build Enron into the leading integrated natural gas corporation in the nation by pushing and exploiting opportunities created by the ongoing deregulation of the natural gas sector.

Lay ultimately stood at the center of the Enron scandal. He grew up on a farm in Tyrone, Missouri,

earned B.A. and M.A. degrees in economics from the University of Missouri, then (while working at Exxon USA) earned a Ph.D. in economics from the University of Houston in 1968. From there, Lay worked for the federal government in a variety of posts, including deputy undersecretary of energy in the U.S. Department of Interior. While in government, Lay lobbied aggressively to deregulate natural gas markets. Returning to the private sector, he headed the Florida-based Continental Resources Company and (beginning in 1981) Transco Energy Company. Lay moved to Houston Natural Gas, as chairman and CEO, in June 1994. At Enron during its early years, he adeptly encouraged and exploited the emergence of spot markets (highly competitive temporary markets) for natural gas.

A second major figure in Enron's management—and later in the scandal investigation—joined the company in 1990. Jeffrey K. Skilling joined Enron as chairman and chief executive officer of Enron Finance Corporation (an Enron subsidiary that raised capital). A native of Pittsburgh, he had graduated from Southern Methodist University in Dallas with a B.A. in 1975 and from the Harvard Business School with a master's of business administration (M.B.A.) degree in 1979. Skilling subsequently held various positions in banking and finance. In 1982, while working as an energy and chemical specialist for the leading consulting firm McKinsey & Company, he began to consult for Enron as well. Skilling believed that people could make enormous profits from energy trading—that gas and electricity supply contracts, among other things, could be packaged as securities and traded in the financial markets.

By 1996, when Skilling became Enron's president and chief operating officer, the corporation was expanding aggressively in the electricity supply business. That year it formed Enron Energy Services (EES) to serve commercial and light industrial customers. The next year Enron bought Portland General Electric (PGE) in the Pacific Northwest for \$3 billion, and in 1998 it acquired 1,300 megawatts of electric capacity to meet demand peaks by running jet engines on natural gas. The latter was quite profitable, but Enron soon divested PGE. EES turned profitable in late 1999, by which time it had nearly

five thousand employees operating 16,500 facilities worldwide. In addition to its considerable U.S.-based assets, Enron had a strong presence in Europe and Latin America.

NEW CORPORATE CULTURE

To go along with its unconventional strategy in the energy business, Enron's top executives cultivated a new kind of corporate culture. For an energy corporation, Enron employed an unusually high percentage of people with M.B.A. degrees, many of them trained in finance. Transactions, rather than the operation of pipelines and plants, were becoming the dominant focus as Enron transformed itself into "wholesale energy operations and services." Although Skilling would claim that the incentives within Enron were designed to minimize risk and conflicts of interest among its traders, the corporation exercised loose oversight and encouraged aggressive trading. For as long as anyone could remember, the energy sector had been seen as mature, complacent, even stodgy. It had few technological breakthroughs, and the industry structure in natural gas and electricity had changed little in decades. Enron was radically different. In its hands, the energy business was competitive, fast-paced, entrepreneurial, even glamorous.

Most of all, it was profitable. Each year Enron reported generous and steadily rising profits and set higher and higher earnings expectations. When the corporation's share price hit \$80—grossly overvalued in the eyes of many analysts—Skilling confidently asserted that \$126 would be a more fitting price. Revenues climbed from \$13 billion in 1998 to more than \$100 billion in 2000.

The business community couldn't seem to get enough of Enron. For an astonishing five consecutive years, from 1996 to 2000, *Fortune* magazine ranked Enron as the most innovative corporation in the United States. In 2000 the Harvard Business School produced a case study of Enron that quickly became a classic assigned at business schools across the country and internationally. Skilling was in high demand as a speaker. Two of his favorite subjects were the "loose-tight" oversight and incentive structure within Enron and its culture of "integrity."

The Lessons of Enron

To learn what went wrong at Enron and how such devastating problems can be avoided in the future, a number of congressional hearings have been convened. Below are excerpts from the testimony of Erik Olsen, a member of the AARP Board of Directors, before the Senate Committee on Governmental Affairs, 5 February 2002, dealing with issues faced by employees who incurred severe losses in their company-stock-laden 401(K) plans.

Disclosure

Among the allegations concerning Enron is that participants did not receive complete, accurate and timely information concerning their plan and the employer stock in which they invested. The shift of risk and responsibility to employees makes it imperative that employees receive complete, accurate and timely disclosure of information to help them make more informed decisions about their retirement security. This includes defined contribution benefit statements on no less than a quarterly basis, detailing the status of participants' investments and investment activity. Similarly, defined benefit plans should be required to furnish regular benefit statements to participants on an automatic basis, without the current-law requirement that the participant first request the statement.

Employees must also be given prompt and accurate information about their company's financial performance. Employees should not only receive this information on a regular basis, but they should also be affirmatively informed when there is new information or a material change. This information should be required automatically, without requiring employees to request it. Although most courts agree that a failure to provide material information even without an inquiry is a breach of fiduciary duty, the Fifth Circuit (where Enron is located) has called this proposition into question. We believe that any legislation should affirm the position that a majority of courts have taken.

Other improvements in disclosure are needed to help address the problems that are highlighted by the Enron debacle. If a plan intends to implement a temporary suspension, limitation, or "lockdown" of participants' normal

ability to exercise control over their plan accounts, it must provide participants with ample advance notice. In addition, the Department of Labor should be directed to facilitate effective disclosure by publishing a model benefit statement that plan administrators could use or adapt. In addition to information on the participant's accrued and vested benefits, the statement would include information on the percentage of the participant's account that is invested in employer stock (and real property), on the importance of diversification, and other information relevant to the employee.

In addition, in order to minimize the risk of errors in determining pension benefits, participants who are ready to receive a distribution of their benefits should have the right to request an explanation of how the benefits were calculated. Such disclosures will help participants to confirm that they are in fact receiving the full benefits to which they are entitled.

Diversification of Risk

The Enron, Lucent, Polaroid, and other unfortunate cases illustrate the danger of defined contribution plan participants overinvestment in company stock. There is no more basic and fundamental principle of sound investment practice than diversification. That is why few financial planners or investment advisors would recommend investing more than a limited percentage of a client's portfolio in a single stock. This is true even where the portfolio is not the plan on which the individual's retirement security depends, and is especially true when that single stock is also the one on which the individual's job security and wage check depends.

However, not all analysts were enamored with the Enron phenomenon. Some expressed bewilderment at Enron's business model. To the investment community, the corporation seemed less "transparent" than most—less willing to divulge and discuss the intricacies of its operational and financial architecture. In 2001 doubts within the investment community set in motion a process that led to Enron's spec-

tacular collapse by the end of the year. Early in the year Jim Chanos, a well-regarded securities analyst with Kynikos Associates, openly raised questions about how Enron actually worked. He also pointed out that Enron appeared to be booking income from the sale of assets as recurring revenue as well as including in its own revenues those revenues of companies in which it owned a partial share. However,

Skilling, along with the company's soon-to-be-infamous chief financial officer, Andrew Fastow, continued to emphasize reported earnings while stonewalling about returns on capital from the trading business.

The darling of Wall Street began to unravel in the summer of 2001. On 14 August, just six months after he took the helm as Enron's president and CEO, Skilling abruptly announced his resignation from the corporation. He cited personal reasons but refused to explain further. Lay again took over, assuring employees that Enron's prospects for continued growth as sound as ever. However, the next day he received a troubling memo from the corporation's vice president of corporate development, Sherron Watkins. Enron, she warned, was likely to "implode in a wave of accounting scandals" (Duffy and Dickerson 2002).

Even though Kenneth Lay had sold off \$21 million worth of his own Enron stock since January, he continued to reassure employees of Enron's strength in the weeks that followed. Skilling was selling his Enron stock as well. The thunderclap came on 16 October, when Enron announced a \$638 million third-quarter loss and a \$1.2 billion reduction in shareholder equity. Its explanation for the massive reduction was the early termination of a number of outside investment partnerships with shell companies (companies created strictly on paper for financial reasons). Enron had created thousands of these "special purpose entities" (SPEs) in order to hide massive amounts of debt and shield much of its derivatives trading and hedging (a form of outside trading to reduce risk) from the scrutiny of investors. The SPEs multiplied so quickly within Enron that Fastow and his staff, who earned millions of dollars overseeing them, started naming them after movie characters. (Two of these outside partnerships, inspired by the movie *Star Wars*, were named "Chewco" and "JEDI".) On 24 October Fastow announced that he was taking a "leave of absence." A week later the federal Securities and Exchange Commission launched an investigation into Enron's financial practices. More bad news followed in early November when Enron revised its five-year financial reports by reducing profits \$586 million while increasing its reported

debt a staggering \$2.5 billion. In January 2002 the Justice Department and the General Accounting Office also launched Enron investigations.

EMPLOYEES HIT HARD

Enron employees were especially hard hit by the collapse. Compelled to invest their retirement funds back into the corporation, many lost their life savings at the same time they lost their jobs. (About five thousand Enron employees in the United States and Europe were fired in October 2001 alone.) According to one estimate, \$67 billion of investor value was wiped out by Enron's demise. More than that, energy analysts calculated that Enron, along with Reliant Energy and other energy companies, manipulated the energy markets in California to create a false "crisis" that cost residents approximately \$11.3 billion in excess rates.

The investigations of Enron continue, but several significant features of its executive leadership and its role in the collapse have come into focus. As noted, Enron's top executives—most notably Lay, Skilling, and Fastow—apparently misled investors (including employees) on a grand scale by inflating the value of Enron's assets artificially and hiding massive amounts of debt with thousands of special-purpose entities. The mountain of debt that Enron was carrying was not reflected on its balance sheet, which in turn would have made Enron's financial performance look much less appealing to the investment community.

Kenneth Lay's culpability remains a matter of debate. In spite of his reassurances to investors and employees in the face of mounting evidence of crisis—while he quietly dumped his own Enron shares—some experts wonder if Lay was fully informed about, or even truly understood, the corporation's elaborate techniques for concealing debt and inflating its performance numbers. Even that generous assessment is not much of a defense: As chairman, CEO, and president of Enron (at various times), Lay should have known what was going on because he was ultimately responsible for Enron's legal, ethical, and financial behavior. Skilling and Fastow continue to defend their behavior, and, as of

this writing, both have avoided prosecution. Two years after the collapse the only former Enron executive prosecuted has been company treasurer Ben Glison Jr., who was sentenced to five years in prison and fined more than \$1 million after pleading guilty to federal charges of conspiring to commit wire and securities fraud.

Why the Enron scandal happened and what wider implications it holds for U.S. business leadership are related questions. Internally, the corrosion that developed within Enron largely was the product of its top executives, Skilling probably most of all. Although Enron's leaders seem to have started out with a creative strategy in an otherwise static industry, in time their focus shifted decisively toward financial manipulation. Enron began by supplying natural gas, electricity, and related services; it ended as a hedge fund (a highly speculative form of securities trading) and commodifier of a broad range of real and projected assets. (In 2000 and 2001 the corporation began to diversify further: into information technology and cyberspace with EnronOnline and Enron Broadband Services.)

A disjunction grew between Enron's professed values—particularly when limiting risk and agency conflict (conflicts of interest between investors and the agents who represent them)—and the incentive systems and cultural signals that Enron's leaders conveyed to traders and middle managers. Executive compensation often was based on internal estimates of market value, which gave executives incentive to inflate the value of contracts. As the corporation grew to unwieldy dimensions, its corporate culture became even more important as a mechanism for defining corporate behavior.

However, Enron did not act alone. It was aided by a variety of powerful outside interests and stakeholders (persons with an interest in an outcome).

First, as noted, business journals (such as *Fortune* magazine) contributed to the hype that continued to propel the Enron phenomenon. So did academics, in the form of business school professors. The Harvard Business School professor who wrote the popular and celebratory case about Enron a year before its collapse, Pankaj Ghemawat, was earning a \$50,000-per-year retainer from Enron at the time he wrote the

case. After Enron's collapse, the case mysteriously disappeared from the HBS case catalogue.

Second, the government played a major role in Enron's rise. At least ten key figures in the administration of President George W. Bush, including the president himself, had close ties with Enron. Thomas E. White, for example, had been a high-ranking executive and heavy investor in Enron for a decade before Bush appointed him secretary of the army. Vice President Dick Cheney or members of his energy task force met with Enron executives half a dozen times before the administration released its 2000 energy plan, although Cheney has refused to discuss the substance of those meetings. Suspicions also have been raised about ties between some influential Democrats and Enron.

Third, Enron's dubious accounting practices were facilitated by major interests in the accounting and consulting profession. Investigations into Enron's financial reporting practices led, in turn, to a major investigation of its auditors, the accounting and financial consulting giant Arthur Andersen. In 2000 Andersen earned \$25 million in auditing fees from Enron but also \$27 million from consulting services—raising serious questions about possible conflicts of interest. More importantly, investigators discovered evidence that Andersen instructed Enron employees to shred documents in October 2001. The next March, Andersen was indicted for willfully and illegally obstructing justice, and on 3 August the stalwart giant closed its doors forever. Later, forty of Andersen's major clients restated their 2002 earnings less favorably. Meanwhile, the investment banking community, most notably the esteemed house of J. P. Morgan and Company, was implicated in the Enron debacle as well. To many observers the lack of due diligence on the part of major investment firms appeared to have reached epidemic proportions.

LOTS OF COMPANY

Enron's transgressions and failure proved to be one of several similar corporate debacles at the turn of the twenty-first century. Global Crossing, WorldCom, Tyco, HealthSouth, ImClone, Adelphia, and other giants either collapsed spectacularly or saw

their top executives indicted, fined, and imprisoned for accounting practices that were deceptive, illegal, or both. WorldCom's failure alone cost seventeen thousand jobs and the loss of \$140 billion in investor wealth. Responding to rising political pressure, the Bush administration signed into law the Sarbanes-Oxley Act in July 2002. Among other provisions, it created a public oversight accounting board and compelled corporate CEOs to personally vouch for the accuracy of their firms' financial reports. For its part, the accounting profession launched a wave of reforms to restore confidence in its legitimacy as objective auditors. In addition to the major corporate collapses of the era, serious questions were raised about the reporting practices of a wide range of otherwise conservative, blue chip firms. Some experts saw the wave of investigations and reforms as healthy steps toward restoring public and investor confidence in corporate United States over the long run but feared that the greater scrutiny over corporate governance would constrain executive decision making too much in the short run.

The Enron scandal occurred at the end of an era of economic and financial enthusiasm often referred to as the "new economy." Enron's corporate culture exemplified the youthful, mold-breaking headiness of the era—its stock soaring to seventy times earnings, whereas twenty times earnings had been considered exceptional. It was an era when even the most traditional industries could plausibly claim to have become the most "innovative." Not surprisingly, many U.S. citizens saw Enron's collapse as the fitting consequence of an era of excess. Enron was neither the first nor the last in the wave of major corporate scandals at the turn of the twenty-first century. However, it played a large role in defining—indeed, gave its name to—a tumultuous and unforgettable period in U.S. business history.

Perhaps even more remarkable than the colossal failures of the "Enron era" have been the consequences that did not follow. Although Lay, Skilling, Fastow, and their counterparts at WorldCom, Tyco, and the others attracted considerable public scorn, the overall reputation of business leaders did not suffer a major setback. In fact, a surprising number of business specialists and finance professors came to

Enron's defense, at least in principle, by arguing that its special purpose entities (or similar instruments) are both legal and in accord with "generally accepted accounting principles." Enron and its cousins have not produced a regulatory response anything like the waves of corporate legislation that followed earlier corporate crises during the Progressive and New Deal eras. This may suggest that business leadership in the early twenty-first century rests on a solid foundation. Still, with the "Enron era" still unfolding and the final chapters of the Enron scandal itself still to be written, we cannot know yet.

ENTREPRENEURSHIP

Entrepreneurs as social actors are not hermits; they do not introduce innovations to themselves or work in isolation. Although isolation has its place, individuals move from philosophical contemplation, detached observation, and laboratory invention into entrepreneurial behavior when they engage stakeholders (people who have an interest in an outcome) and build organizations. Entrepreneurship is marked by the taking of initiative through social interaction. As Schumpeter and the Physiocrats before him observed, entrepreneurs are the primary agents of change, of disruption, of disequilibrium in those social activities we call "economic" (Schumpeter, 1934). (Physiocrats were members of a school of political economists founded in eighteenth-century France and characterized by a belief that government

policy should not interfere with the operation of natural economic laws.)

Entrepreneurs are people acting in an entrepreneurial way. That definition includes the people we normally think of—the initiators of new and growing firms—as well as people doing the same kinds of organizational functions in other sectors and roles. We give thanks for entrepreneurs in our not-for-profit sector who enrich our lives with new cultural, sports, and religious activities (Whyte and Whyte, 1991). Our lives are also enriched by corporate entrepreneurs (sometimes called “intrapreneurs”) who introduce new ideas, products, and services in large established organizations, including companies, government, and churches (Abodaher, 1982; Block and MacMillan, 1993; Green, Bush, and Hart, 1999; Hitt et al., 1999; Katzenbach et al., 1995; Pinchot, 1986; von Hippel, 1988; Welch and Byrne, 2001; Zahra, Nielsen, and Bogner, 1999).

The degrees and dimensions of entrepreneurship can vary widely (Bhidé, 1999). In some important respects the effectiveness of an entrepreneur is a measure of his or her leadership skills. During the last twenty-five years the field of entrepreneurship research has increasingly focused on the factors that increase success, differentiating strongly between the average start-up businesses that have mediocre or poor results and the “gazelles” that grow rapidly and create incremental new wealth (Birch, 1987; Huizenga and Sexton, 2001; Ireland, Hitt, Camp, and Sexton, 2001).

By nature of their roles as founders and developers of organizations, entrepreneurs are leaders (DeCarlo and Lyons, 1980). This type of leadership is most visible in three primary impact groups: suppliers of resources, employees and partners, and customers.

RECYCLING RESOURCES

One of the key functions of entrepreneurs is recycling resources—moving resources such as money, intellectual property, tangible assets (buildings, equipment, inventories, etc.), and people from lower to higher economic value (Brush, Greene, and Hart, 2001). Entrepreneurs add value, and are economi-

cally successful, when they are able to combine such resources in ways that create more wealth than those resources had in their previous uses. Investment capital, for example, flows out of declining or low-yield activities into higher-yield activities. If an entrepreneur is unable to convince the owners of those resources to change their application, transferring resources to the new activity, then it will fail to launch, fail to grow.

Because entrepreneurs organize their ventures in the present, with the promise of future benefits, they must overcome an uncertainty differential. Owners of the resources that entrepreneurs seek tend to know the present and past performance of those resources. What entrepreneurs offer the owners is uncertain, to varying degrees, because the expected returns are subject to many factors that may occur in the future. One of the critical leadership activities of entrepreneurs is to convince those resource owners to make that “leap of faith,” to transfer their resources from their present known application to the less certain promises of the proposed venture. At these critical junctures entrepreneurs must be effective leaders, or else the resource owners will not follow.

Yet, the entrepreneurs’ resource-recycling tasks are further complicated by the need to not only inspire confidence in an uncertain future, but also to gather those resources at a discount. If entrepreneurs paid full price for all the required resources, relative to the known present uses of those resources, they would be unlikely to create the advantages they need to launch and grow their ventures. In effect, entrepreneurs must convince people to switch resources from known present outcomes to uncertain future ones—at a near-term discount. This requirement raises the stakes further. To offset those switching costs, entrepreneurs’ supporters must expect significantly greater longer-term rewards.

BUILDERS OF ORGANIZATIONS

Because entrepreneurship must integrate many functions, few entrepreneurs can develop their business innovations fully as solo operators. The vast majority of entrepreneurs need to build organizations, differentiating tasks and extending their vision through

Day Care Problem Becomes a Business Opportunity

CHICAGO (ANS)—Maribel Navarrete, mother of four, had a job at a radio station, but when the station closed down and her babysitter also moved on, Navarrete was faced with a hard choice.

If she looked for another job she'd have to find child care, but if she stayed at home with her children, she feared her family wouldn't be able to make its mortgage and credit card payments.

The answer for Navarrete was a project that is making child care a business opportunity for women. Navarrete now watches her children in a day care business she runs out of her home.

With her business turning 1 year old this month, Navarrete employs a full-time assistant and makes twice what she used to at the radio station. She's the president of a fledgling association of child care providers, and she has achieved something she never dreamed would be possible—owning her own business.

Community organizations across the country working to solve problems in child care and employment problems see the day care field as a promising job opportunity for women looking for both work and child care.

On Chicago's Northwest Side, the Logan Square Neighborhood Association is recruiting and training women like Navarrete on the ins and outs of opening a home day care business. Thirty-four women have graduated from the organization's six-week, 29-hour Incubator Without Walls course, which covers everything from childhood development to the state licensing process to how to run a business.

Anibal Miranda, project coordinator of the Incubator Without Walls project for the neighborhood association, said the association collaborates with a local day care advocacy group and an economic development organization to provide training.

Participants, most of whom were not previously in the workforce, receive assistance in writing a business plan and applying for a loan, and a local bank has agreed to loan up to \$3,000 in start-up money to every program graduate,

regardless of income or credit history. Graduates of the training have started a child care providers association as a way of sharing support and information.

The idea of converting child care from a problem to a business prospect has taken off in recent years, but it's by no means new.

In Brooklyn, N. Y., the Cypress Hills Child Care Corp., a subsidiary of a local nonprofit development corporation, has helped recruit and train 40 women to become home-based child care providers since 1994 through its Family Daycare Network.

In Philadelphia in the late 1980s, three women started a worker-owned day care center that offered women the ability to enroll their children at the center where they worked. Childspace Management Group now employs 41 women at two sites and is planning to hire 10 more when it opens a third site this fall. Projects modeled after Childspace are under way in Denver and in Richmond, Calif.

About 20 percent of the workers have their own children enrolled at Childspace. Since its inception the group has focused on providing quality jobs; they offer higher wages than the industry average and are supportive of workers who need time off to deal with family problems or to go back to school.

"In our mind the quality of the job is linked directly with the quality of the care," says Wendy Epstein, executive director of Childspace Cooperative Development, Inc., a nonprofit arm of the Childspace Management Group. "Yet, because we cater to low- and moderate-income families, we can't offer higher wages by relying on revenue alone."

One of the key problems in achieving quality care is high employee turn-over. Childspace in Philadelphia has an annual average employee turnover rate of about 15 to 20 percent, compared with a national average of 40 to 60 percent, according to Epstein. "Because our ability to offer high wages is limited, what Childspace has tried to do is to restructure the job into a worker cooperative, and to create a work culture that supports participation in decision-making and leadership," she said.

partners, employees, and associates. When we consider entrepreneurs as wealth creators, their success is defined to a significant degree by their abilities to lead other people to replicate what the entrepreneurs would do personally if they could be in many places, serving many customers at once.

Entrepreneurs' ability to build organizations that

translate their sense of an improved business model into something that many people share is a strong measure of the impact that entrepreneurs' ideas will have on the economy and society. Their ability to translate their visions of outstanding enterprises into practices understood and implemented by other people has a profound effect on their social effective-

To make it feasible to offer better wages, the group also seeks foundation funding and negotiates with partner organizations for free rent. The newest Childspace center, slated to open this September in West Philadelphia, will provide on-site day care for homeless families in a rent-free space provided by the nonprofit group HEALTH-Philadelphia.

Job quality has been a focus of the Chicago program as well, as emphasis is placed on women being business owners and child care providers, not low-paid babysitters.

With low unemployment rates and more people entering the job market due to welfare reform, demand for quality day care is higher than ever. According to a study done by the Government Accounting Office, 30,000 new child care spaces will be needed in Chicago alone to meet the increased demand brought on by welfare reform.

That demand has meant a booming business for new providers. "I was not even licensed and I had a waiting list," says Navarrete. "I had to take my sign down because I couldn't handle all the phone calls."

Encouraging women to start their own businesses has not come without challenges. So far in Chicago just two of the 34 women who have gone through the training are licensed and operating. Miranda says that's due to the long time it takes the state to complete the licensing process, which involves site visits, interviews and background checks on all family members. Another obstacle has been that most women who have gone through the training do not own their own homes and need to get permission from their landlord before they are able to open their businesses.

But the training has also brought unexpected rewards, including increased self-confidence and widened horizons for the women involved. Navarrete's new career inspired her to go back to school; she's currently working on an associate's degree in child development and early childhood education and says she's headed for a bachelor's, a master's and then a Ph.D.

"I feel like I can accomplish anything now," she says.

—Linda Lutton

ness. That ability is one of the prime differences between inventors and entrepreneurs and between successful and unsuccessful entrepreneurs.

In family firms leadership roles and development processes can take many forms. Although few people would argue that the founders of such firms are entrepreneurs, the roles and natures of successive

generations vary widely. More recently, as attention has focused on these issues, deliberate strategies of leadership development have become more common (Beckhard, 1998; Brown, Fiegenger, File, and Prince, 1993; Paisner, 1999; Syms, Lebenthal, and Sheehan, 1993).

ACTION TAKERS AND RISK MANAGERS

The word *entrepreneur* comes from the French word *entreprendre* (to take action). While relatively few people in the English-speaking world present business cards with "Entrepreneur" as their job title, it is more common in the French-speaking world. There, *entrepreneur* means a person who takes on responsibility for getting things done. Its most common use would translate into English as "general contractor." These are people who organize things, take action, get things done. In taking responsibility and action, in making decisions about what to do, when, with what and whom, they lead.

One of the important phenomena emerging from research in the field of entrepreneurship is a better understanding of the learning behavior of entrepreneurs. The common mythology of entrepreneurship often casts entrepreneurs as the risk takers in the economy. Yet, much of the early research on entrepreneurs repeatedly uncovered the counterintuitive findings that successful entrepreneurs are either risk neutral compared to the rest of the population, or even slightly risk averse (Brockhaus, 1980; Filion, 1989; Lamont, 1972; Lowe, 2000; Sexton et al., 1997; Shaver et al., 1996; Shrader, Oviatt, and McDougall, 1996; Wentzell, 1995). As those findings continue to be affirmed, a different model of entrepreneurial behavior is emerging.

Entrepreneurs prepare and then act. The most successful ones appear to know when they are not sufficiently prepared to act, and they demur until they are ready. When they are ready, they often are not certain about the outcomes but have confidence that they can deal effectively with whatever outcomes result. That stance requires them to test and evaluate, adapt and respond. After risks have been reduced to a manageable level, they take action and continue to reduce risks through active experimentation and adaptation

(Filion, 1989; Lamont, 1972; Sexton, Upton, Wacholtz, and McDougall, 1997; Wentzell, 1995; Zahra, Kuratko, and Jennings, 1999).

LEADERS OF CUSTOMERS

When entrepreneurs introduce new firms, products, or services to a marketplace, they lead customers. They make potential customers aware of the new offering, try to convince people that the new offering is superior to existing offerings, and challenge people to compare and improve. Entrepreneurs initiate change, or at least the consideration of it, on the part of potential customers. In this respect entrepreneurs lead customers to change.

As their ventures become established and grow, entrepreneurs need to attract new customers—and retain existing ones. The marketing and sales functions are important in these activities. Existing customers also need to be led. They need to be shown how to make good use, including additional uses, of the products they purchase. They need to be sold on improved versions being introduced by the maturing firm. To the extent that these jobs are done well, the firm will continue to grow and flourish.

LEADERSHIP DEVELOPMENT PROGRAMS

Even as leadership development programs and entrepreneurship development programs have proliferated in the last twenty-five years, a special class of programs designed to enhance entrepreneurial leadership has also emerged (Grant, 1992). Some programs are designed to support young people exploring entrepreneurial career options (Bryant, 1991). Others are designed more for university or postgraduate adult learners (Chia, 1996; Harrison and Leitch, 1994; Wacholtz, Edwards, and Thompson, 1999).

ETHICAL CHOICES

The ethical choices made by entrepreneurs can have a substantial effect on the growth potential of their firms (Bryant and Bryant, 1998). The choices can also alter relationships within their firms, as

well as between their firms and their critical stakeholders up and down the supply chains that surround them.

A contradictory tension exists between the boldness and the degree of innovation introduced by entrepreneurs and conformity to accepted social norms. Those norms, eventually enshrined in the formal legal system, are based on the judgments of many individuals, accumulated through repeated exposure to a product or service. The most established norms apply to the most mature, widespread products.

Entrepreneurs tend to work at the other end of the familiarity spectrum, trying to introduce new products and services that have not been seen or tried before—and which therefore have not yet been judged by society. By presenting opportunities to us, for which there is yet no formal determination of value, entrepreneurs challenge us to form judgments about things for which we have relatively few reference points. At the extreme they introduce “new-to-world” products (Cooper, 2001) such as video cameras, television, cell phones, margarine, “junk” corporate bonds, online pornography, mutual funds, and genetically modified corn.

Most potential customers shy away from radical innovations, so entrepreneurs cannot effectively introduce such products with an indiscriminant marketing strategy. They must identify the “mavens” and “early adopters” and concentrate on them until they find a successful market formula. Because those types of people are market leaders, entrepreneurs must work with them to introduce innovation. The mavens and early adopters try the new products and react to their experiences. More hesitant customers follow their leads. To be effective, entrepreneurs must gather, understand, and respond to those reactions until they get a product that those leading customers encourage others to adopt.

In this way entrepreneurs lead some aspects of norm formation in society. In their experiments to find out what customers will prefer, they stimulate normative judgments by society.

The ethical choices made by entrepreneurs, especially at times of crisis early in the life of their organizations, have important consequences.

The first consequence is that poor choices can lead to failure of an organization. Illegal activities can lead to police action and the enforcement of court orders, lawsuits, and other sanctions that can drive an organization out of business. Less severe offenses can also be fatal to an organization. Failures to respect creditors can lead to ever more stringent financial terms, until the firm is operating at a severe disadvantage. Offended customers, suppliers, and employees leave unhappy, tell others, and key stakeholders withdraw.

The opposite consequences attend successful choices. Difficult decisions, made well, attract people who are willing to give extra credit to the new organization, making it easier for that organization to survive its early challenges. More generous credit, forgiveness for early mistakes, keenness of potential employees and partners to join, good relationships with suppliers and key accounts—all of these advantages are more likely to accrue to an organization with a reputation for positive ethical values.

People cannot always easily “do the right thing.” In times of crisis entrepreneurs must make difficult trade-offs between such fundamental values as good customer relations and positive cash flow (Seeger and Ulmer, 2001). Entrepreneurs cannot always make decisions that are right on all dimensions. Yet, as those tough decisions are made successfully, a firm grows (Timmons, 1989). Stories about the choices and priorities established by the entrepreneur in making those critical trade-offs become part of the firm’s mythology, its corporate culture—repeating values that become enshrined in the accumulating belief system of the firm and its employees.

How do entrepreneurs make those difficult moral and ethical choices? What is the difference between those choices that help firms grow and those that cause firms to decline? Research is just beginning to probe that question (Teal, 1999; Zimmerman and Zeitz, 2002). In the early stages of a firm’s development, those values have yet to be crystallized. Entrepreneurs must base their decisions on other sources, including their own religious or moral precepts.

Sometimes a new firm is founded as a direct result of a clash between the entrepreneur’s beliefs and val-

ues and the practices in an antecedent firm. Some entrepreneurs create their firms as direct reactions against practices they abhor in the preexisting firm. They disagree so strongly with the values that underlie those abhorrent practices that they take the unusual action of leveling the organization and starting a competing firm with opposite values. Although such a formative process makes those specific values clear, it does not always help with the myriad of other value-based trade-offs that have to occur as the new firm’s operations grow.

ENVIRONMENTAL JUSTICE

Environmental awareness and several environmental movements in the United States, dating back to the country's beginnings and flowering in the nineteenth

century, have derived from the actions and efforts of charismatic and determined scientific, political, and social leaders of both genders and many races and from both private and public institutions. The conservation and preservation movements, the modern environmental movement, and the environmental justice movement, along with and the environmental awareness that prompted them, occurred because of the persuasive actions taken by societal and political leaders like William Penn, George Washington, Henry David Thoreau, Theodore Roosevelt, Rachel Carson, Lois Gibbs, Barry Commoner, Paul Ehrlich, Richard Nixon, Jimmy Carter, Benjamin Chavis, and Bill Clinton. These same environmental movements were also arrested or curtailed by environmental leaders, political leaders, and institutions who did not agree with their opponents' agenda or philosophy and were able to persuade others or the government to move away from their opponents' positions.

All of these individuals were leaders in the classical sense of the word, since they were able to induce by persuasion groups within society or society itself to pursue the environmental objectives and the visions they or the group they represented held (Gardner 1990, 1). They all demonstrated many of the six leadership attributes articulated by academic John W. Gardner in his monograph *On Leadership*, including the ability to think in the long term, to think globally, and to reach and "influence constituents beyond their jurisdictions, beyond boundaries" (Gardner 1990, 4). The local and concomitant global impact of environmental degradation has been a universal and perennial concern among environmental leaders.

EARLY ENVIRONMENTAL LEADERSHIP AND MOVEMENTS

This vision of long-term environmental impact from human activities was first evident under the leadership of William Penn in the Plymouth Colony, who in 1681 set aside 1 acre of land for every 5 acres of land cleared to preserve the region's natural resources. Forest preservation would become an "entrenched principle of colonial management in the seventeenth century" (Switzer and Bryner 1998, 2).

Environmental and ecological concerns continued to be a part of the American conscious, in large part motivated by writings and observations of individuals like the scholar and conservationist George Perkins Marsh and his 1864 book *Man and Nature*, essayist and philosopher Henry David Thoreau's *Walden* (1854), and conservationist Aldo Leopold's *A Sandy County Almanac* (1949). It would be the vision and actions, however, of environmental leaders like John Muir and Gifford Pinchot that would create the impetus for the first environmental movements in the United States: the preservation movement and the opposing conservation movement.

The preservation movement, led by John Muir (1838–1914) during the Victorian era, advocated the use of the environment for "recreation and educational purposes." Muir was a champion of Yosemite Valley and vehemently opposed and "crusaded against the development of the Yosemite's Hetch Hetchy reservoir which he viewed as a misuse of the region's natural resources" (Switzer and Bryner 1998, 5). All parks and forests, for Muir, were off limits for economic development. Muir's environmental philosophy was accepted most by middle-class Americans. Muir promoted the idea of the protection of a "sublime nature" that would energize modern men and women (McGreer 2003, 164). Although the opposing conservation movement had more of an influence at the national level, Muir's preservation movement had a lasting impact on American society. The Sierra Club, which he founded in 1892, became one of the strongest and most influential environmental nongovernmental organizations in the world and continues almost one hundred years later to shape environmental policies around the world.

The success of the conservation movement during the Progressive Era was due to the leadership skills of Gifford Pinchot (1865–1946), who became the nation's "most publicized environmentalist" (Switzer and Bryner 1998, 5). Pinchot advocated the responsible use of natural resources for "efficient economic development" (McGreer 2003, 165). A Yale graduate who trained at the National Forestry School in France, Pinchot became the chief of the U.S. Forest Service (1898–1910). His conservation efforts were

Animal rights and environmental protesters gather in Sydney, Australia, in October, 1986.

supported by President Theodore Roosevelt, a fellow conservationist who became instrumental in turning conservation ideologies into national policies. The zenith of the conservation movement under Pinchot's leadership was the 13–15 May 1908 White House Conference on Resource Management, attended by one thousand national leaders. Roosevelt later created a National Conservation Commission, headed by Pinchot, at the request of the leaders from the 1908 conference. Within one year of the commission's creation forty-one states created similar organizations (Switzer and Bryner 1998, 5). Conservation organizations like the National Audubon Society (1905), the National Parks Association (1919), the Izaak Walton League (1922), and the National Conservation Association (1909) emerged during this era under the leadership or influence of Pinchot.

THE MODERN ENVIRONMENTAL MOVEMENT

The planting of the philosophical and ideological seeds that contributed to the emergence of the modern environmental movement is credited to Rachel

Carson and her book, *Silent Spring* (1962), and to Paul Ehrlich's book, *The Population Bomb* (1968). Of the two books, Carson's was considered the most influential in launching the modern environmental movement. Carson (1907–1964), a biologist, was born in Springdale, Pennsylvania, and attended the Pennsylvania College for Women and Johns Hopkins University. She also did graduate work at the Woods Hole Marine Biological Laboratory in Massachusetts. *Silent Spring* convincingly conveyed to a worldwide audience her concern for the potentially devastating ability of pesticide use to severely alter and damage the world's ecosystem.

It was so successful in its objectives that it persuaded President John F. Kennedy to call for a federal investigation into the use of pesticides (Switzer and Bryner 1998, 8). Political scientists Jacqueline Switzer and Gary Bryner point out that Carson's "dire warnings of what might happen if pesticide use was not controlled served to avert the potential ecological disaster she foretold and . . . inspired the environmental protection revolution that followed" (Switzer and Bryner 1998, 8). The first Clean Air Act was signed in 1963, the Water Quality Act in 1965, the Endangered Species Conservation Act in 1966, and the National Environmental Policy Act in 1970. Within ten years of the publication of *Silent Spring* the first national Earth Day was celebrated, on 22 April 1970.

MARTIN LUTHER KING JR. AND THE POOR PEOPLE'S CAMPAIGN

Although Carson's work called attention to ecological and implied human costs associated with industrial activities and practices, a later phase of the environmental movement—the environmental justice movement—began in the 1980s to focus on people,

their socioeconomic status, and the human environment. The first national leader to address the systemic disenfranchisement of the poor in this country and the concomitant environmental consequences was the civil rights activist and Baptist minister Reverend Martin Luther King, Jr. (1929–1968). To address these issues King proposed a multiracial Poor People's March on Washington, D.C., planned for 22 April 1968, two years before the first national Earth Day. A critical issue in the Poor People's campaign was the need to address the problem of the poor living in unsanitary housing conditions. King's commitment to environmental issues impacting the poor and racially marginalized was also apparent when he traveled to Memphis, Tennessee, in 1968 to lend his support to a largely black group of striking sanitation workers. His work, and the Poor People's march, were ended by King's assassination in April 1968.

King's concern over the inequitable distribution of wealth and poverty in the United States and the environmental consequences are still echoed by today's environmental justice activists. By the 1960s isolated researchers discovered that environmental hazards had a disproportionate impact on people of color and low-income people. Activists in the environmental justice movement, which began in the 1980s, continually lament the fact that it is the poor who bear the costs of environmental pollution because they lack the economic power to eliminate or avoid the costs of industrial production in their impoverished communities.

THE TOXICS MOVEMENT AND LOVE CANAL, 1978

Although the cry for environmental justice often invokes images of poor minority communities living on toxic waste sites, class has also been a key factor in citing the cause for environmental inequities. Poor and working-class whites historically have been and still become toxic victims, carrying the brunt of inequitable environmental costs. Like racial minorities, their environmental problems are inseparable from their economic condition. Many scholars believe that the environmental justice movement, begun in the 1980s, actually spun out of the leader-

ship and efforts of the toxics movement, which started on 2 August 1978. This was the day that the CBS and ABC networks first carried news of the effects that toxic waste were having on the health of Love Canal residents. The New York State health commissioner had announced during this month that the landfill over a toxic waste dump created by the Hooker Chemicals and Plastics Corporation carried an extremely dangerous public health threat.

Love Canal was a predominantly white working-class neighborhood in Buffalo, New York, that found itself in an environmental nightmare created by the Hooker Corporation. Hooker had dumped thousands of drums of toxic waste into an abandoned navigation canal, which was filled in 1952. The company then sold the land to the Niagara Falls Board of Education and eventually a school was built and houses erected. After people moved in, alarming health problems and birth defects began to occur. Pesticide residues and other chemicals began bubbling up onto the surface. The residents' children and pets received chemical burns from playing with dirt in the schoolyard and in their backyards. The community had become so poisoned that many of the residents' lawns would not grow and, where plants would grow, people got sick after eating vegetables and fruits grown in their gardens.

Grassroots activism—now so common and characteristic of the environmental justice movement—was critical to the successful resolution of the environmental disaster at Love Canal. This activism was led and personified by neighborhood resident Lois Gibbs, whose three-year-old child, Michael, developed a respiratory illness that was tied to the toxic waste present in the Love Canal development. Gibbs, moved by the illnesses of many children in the community, created the Love Canal Homeowners' Association and took residents' complaints to the state capital in Albany for resolution. This activism led to an investigation by state epidemiologists in 1978 that found abnormally high rates of birth defects, miscarriage, epilepsy, liver abnormality, rectal bleeding, and headaches. Continued activism by Gibbs and her organized community of residents convinced the U.S. government that they should investigate.

By the late 1970s, President Jimmy Carter declared

Lois Gibbs and Love Canal

Lois Gibbs was a mother and housewife who became one of the best-known environmental campaigners of the 1970s and 1980s. She became widely known for her involvement in the Love Canal situation. Below is a chronology of key events, followed by her own account of the campaign.

- Gibbs established Love Canal Homeowner's Association in August of 1978.
- On August 2, 1978, the New York State Department of Health closed the local elementary school, and moved 239 residents out of the area.
- For several days in May 1980, Gibbs and her neighbors held two EPA officials hostage until the state agreed to move all residents out of the area.
- On October 1, 1980, President Jimmy Carter declared an emergency evacuation and moved 900 families out of Love Canal in 1980.
- In 1981 Gibbs formed the Citizens Clearinghouse for Hazardous Waste (which later became the Center for Health, Environment and Justice) to help other communities fight environmental injustice.

Here is a part of her own story:

I decided to go door-to-door with a petition. It seemed like a good idea to start near the school, to talk to the mothers nearest it. I had already heard that a lot of the residents near the school had been upset about the chemicals for the past couple of years. I thought they might help me. I had never done anything like this, however, and I was frightened. I was afraid a lot of doors would be slammed in my face, that people would think I was some crazy fanatic. But I decided to do it anyway. I went to 99th and Wheatfield and knocked on my first door. There was no answer. I just stood there, not

knowing what to do. It was an unusually warm June day and I was perspiring. I thought: What am I doing here? I must be crazy. People are going to think I am. Go home, you fool! And that's just what I did.

It was one of those times when I had to sit down and face myself. I was afraid of making a fool of myself, I had scared myself, and I had gone home. When I got there, I sat at the kitchen table with my petition in my hand, thinking. Wait. What if people do slam doors in your face? People may think you're crazy. But what's more important, what people think or your child's health? Either you're going to do something or you're going to have to admit you're a coward and not do it. I decided to wait until the next day, partly to figure out exactly how I was going to do this but more, I think, to build my self-confidence.

As I proceeded down 99th Street, I developed a set speech. I would tell people what I wanted. But the speech wasn't all that necessary. It seemed as though every home on 99th Street had someone with an illness. One family had a young daughter with arthritis. They couldn't understand why she had it at her age. Another daughter had had a miscarriage. The father, still a fairly young man, had had a heart attack. I went to the next house, and there, people would tell me their troubles. People were reaching out; they were telling me their troubles in hopes I would do something. But I didn't know anything to do. I was also confused. I just wanted to stop children from going to that school. Now look at all those other health problems! Maybe they were related to the canal. But even if they were, what could I do?

Source: Gibbs, Lois. (n.d.). "Love Canal, 1978." Retrieved September 29, 2003, from <http://www.miracosta.edu/home/llane/courses/hist111/pw/docs/gibbs.htm>

Love Canal a disaster area and evacuated its residents. As a disaster area, Love Canal residents were entitled to federal aid that could be used for their relocation and a new start in other communities. By 1980, the government had identified 248 chemicals in the dump site, and today more than 400 have been found. Lois Gibbs's successful environmental activism would eventually be reproduced across the country, with various levels of success, by other female environmental leaders, like Sue Greer, Hazel Johnson, Cathy Hinds, Marie

Sosa, Patsy Oliver, Kaye Kiker, Penny Newman, and Guadalupe Nona.

THE ENVIRONMENTAL JUSTICE MOVEMENT

Scholars and activists saw the birth of the environmental justice movement in one of the first protests over the location of a hazardous waste site, in Warren County, North Carolina, in 1982. The protest was mounted by African-Americans against "Hunt's Dump," named for North Carolina's governor, James

As I continued going door-to-door, I heard more. The more I heard, the more frightened I became. This problem involved much more than the 99th Street School. The entire community seemed to be sick! Then I remembered my own neighbors. One who lived on the left of my husband and me was suffering from severe migraines and had been hospitalized three or four times that year. Her daughter had kidney problems and bleeding. A woman on the other side of us had gastrointestinal problems. A man in the next house down was dying of lung cancer and he didn't even work in industry. The man across the street had just had lung surgery. I thought about Michael; maybe there was more to it than just the school. I didn't understand how chemicals could get all the way over to 101st Street from 99th; but the more I thought about it, the more frightened I became for my family and for the whole neighborhood.

Everything was unbelievable. I worried that I was exaggerating, or that people were exaggerating their complaints. I talked it over with Wayne. Luckily, he knew someone who might be able to help us—a Dr. Beverly Paigen, who is a biologist, geneticist, and cancer research scientist at the Roswell Park Memorial Institute, a world-famous research hospital in Buffalo. We went to see Dr. Paigen. She is a wonderful, brave person who, like Wayne, had been involved in environmental-pollution fights. She asked us to bring some soil samples so she could do an Ames test. The Ames test is a quick way of determining potentially dangerous effects of chemicals. When bacteria are exposed to mutagenic chemicals, Dr. Paigen told us, they reproduce abnormally.

I continued to go door-to-door. I was becoming more worried because of the many families with children who had birth defects. Then I learned something even more frightening: there had been five crib deaths within a few short blocks

Hunt. The environmental justice movement shifted the argument about natural resources and social justice toward race, from the class-based origins of the modern environmental movement.

Governor Hunt had selected 142 acres of land in Afton, a small black community in Warren County, as the disposal site for 32,000 cubic yards of dirt contaminated with toxic polychlorinated biphenyls, or PCBs. The soil had been removed from 217 miles of North Carolina state highway, where it had been illegally dumped, in fourteen counties, by the

Robert Burns and Ward Transfer Company. Burns and Ward had transported the waste from Buffalo, New York, and dumped it illegally rather than storing it according to federal, state, and local regulations.

Hunt claimed that his reasons for selecting Warren County as the disposal site were based solely on technical reasons, after a survey had been made of ninety-three sites in thirteen counties. This claim was later refuted by the chief of the Environmental Protection Agency's (EPA) hazardous waste implementation branch, William Sanjour, a supporter of Warren County residents. Sanjour argued that the siting decision had been purely political, and that only political pressure would impact the decision. Protests against the locating of the toxic dump in Warren County were organized and led by Afton residents Ken and Deborah Ferruccio. They organized the grassroots activist group Warren County Citizens Concerned About PCBs. Their protest actions included peaceful protests and attempting to physically block the path of over six thousand truckloads of PCB-contaminated soil. The local group was eventually joined by members of nationally prominent civil rights advocacy groups, such as the United Church of Christ (UCC) Commission for Racial Justice and the Southern Christian Leadership Conference, and by religious leaders, environmental activists, and political officials. Lois Gibbs, Love Canal resident and activist, joined them as well.

Their actions caused Warren County to become a national news story and resulted in the arrests of more than 500 people. Two of those arrested were civil rights activists who would prove instrumental in the national recognition and future of the environmental justice movement: Walter E. Fauntroy, delegate to the U.S. Congress from the District of Columbia, and Reverend Benjamin Chavis, executive director of the UCC's Commission for Racial Justice and later executive director of the National Association for the Advancement of Colored People (NAACP).

The 1982 protests by Warren County Citizens Concerned About PCBs ultimately did not prevent the siting of the landfill, but they made environmental racism a national concern and influenced future poli-

cies dealing with environmental inequities in communities of color. As the environmental sociologist Robert Bullard noted, “Although the demonstrations in North Carolina were not successful in halting the landfill construction, the protests, brought sharper focus to the convergence of civil rights and environmental rights and mobilized a nationally broad-based group to protest these inequities” (Bullard 1990, chap. 2). Governor Hunt later agreed not to build additional landfills in Warren County and to monitor their well and body water for PCB contamination.

In 1983, Walter Fauntroy persuaded the U.S. General Accounting Office (GAO) to study the 1983 siting of hazardous waste landfills in EPA Region IV, which included Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, and Tennessee. The resulting GAO report, *Siting of Hazardous Waste Landfills and Their Correlation with Racial and Economic Status of Surrounding Communities*, concluded that African-Americans and ethnic minorities were more likely than the general population to live near a commercial waste treatment facility or uncontrolled waste site. It also found that three out of four landfills were located near predominantly minority communities.

The GAO report and the problems in Warren County spurred the 1987 study sponsored by the UCC Commission for Racial Justice, *Toxic Wastes and Race in the United States: A National Report on the Racial and Socioeconomic Characteristics of Communities with Hazardous Waste Sites*. This study concluded that race was the best predictor of hazardous waste site location.

THE 1990S AND BEYOND

In 1990, a group of academics (who came to be known as the Michigan Group) convened at the University of Michigan’s School of Natural Resources and Environment to discuss their most recent findings on the relationship between race and environmental hazards. This conference led to the formation of the Michigan Environmental Justice Coalition. Prompted by their findings, the Michigan Group wrote letters to Louis Sullivan, secretary of

the U.S. Department of Health and Human Services, and to William Reilly, head of the U.S. Environmental Protection Agency (EPA). A meeting between Reilly and seven of the professors resulted in the creation of the Work Group on Environmental Equity. Its primary objective was to examine the agency’s negligence or insensitivity to issues of environmental racism.

Meanwhile, environmental justice activists, disgusted by the policies and practices of traditional environmental groups, issued a public challenge in 1990. Richard Moore of the Southwest Organizing Project and Pat Bryant of the Gulf Coast Tenants Organization drafted a letter and sent it to the ten largest traditional environmental groups. The letter, signed by more than one hundred community leaders, accused the traditional groups of racism in their hiring and policy development processes. It created a national media frenzy when an article about it appeared in the *New York Times*. The political stir caused by this event influenced Benjamin Chavis, a signatory of the letter and at the time head of the United Church of Christ’s (UCC) Commission for Racial Justice, to call for an emergency summit of environmental, civil rights, and community groups. The UCC spearheaded the planning of the summit under the direction of Charles Lee, director of their environmental justice program. The summit took eighteen months to plan and involved Lee, Pat Bryant, Moore, Dana Alston of the Panos Institute, the Indian activist Donna Chavis, and the academic Robert Bullard. Their plans led to the historic First National People of Color Environmental Leadership Summit in Washington, D.C., in October 1991. The summit concluded with a demand for a response from the EPA that would address their environmental justice concerns. Two of the summit’s organizers, Chavis and Bullard, were appointed to President-elect Clinton’s transition team to help formulate national policies concerning environmental inequalities.

Environmental justice leaders have maintained the movement’s momentum since its inception in 1982. Despite the horrific September 11 terrorist attack on the United States in 2001, they organized *The Second National People of Color Environmental Leadership Summit*, held 11 years after the first international sum-

mit of 1991. The summit, international in membership and scope, took place October 23–27 in Washington, D.C. It drew over 1000 leaders from countries ranging from Canada, Mexico, Peru, Ecuador, India, and Guatemala gathered together in plenary sessions, workshops, and roundtables to discuss “a wide range of issues facing the [environmental justice] movement including globalization, biotechnology, sustainable agriculture and local food security, indigenous rights, land grants, and the all-important issue of growing the movement and maintaining its grassroots character and impetus in the face of professionalization” (Environmental justice 2002).

This summit concluded with the leaders adopting the “Principles of Working Together” and their initiation to discuss and critique the movement’s historical emphasis on environmental racism and its movement toward proactive measures for sustainability and justice. The leaders at this summit summarily condemned through a resolution the Bush administration’s “War on Terrorism” “as an attack on civil liberties, social justice, and the environment” (Environmental justice 2002).

Within a year of the summit, in the summer of 2003, two historic environmental justice settlements would be made in the United States in Chicago, IL and Anniston, AL. Altgeld African-American communities who had filed lawsuits in the 1990s for PCB contamination stemming from environmental racism would be awarded a total of \$600 million. These lawsuits would be derived from the decades-long activism of grassroots environmental justice leaders like Hazel and Cheryl Johnson of the People for Community Recovery in Chicago’s Altgeld Gardens.

ENVIRONMENTAL PROTECTION AGENCY

Established in 1970, the Environmental Protection Agency (EPA) brought together under one agency fifteen programs that had previously been scattered among the multitude of federal programs. The new agency included research, monitoring, enforcement, and regulation programs and had a staff of more than 5,700 and a budget of \$1.2 billion. Originally designed to set and enforce pollution-control standards, EPA saw its responsibilities expand during the 1970s as new concerns such as toxic waste arose and made environmental protection one of the more powerful roles of the federal government. It was the only regulatory agency that answered directly to the president.

EPA’s regulatory power derives from legislation that became law before the 1970 establishment of EPA and after. EPA’s mission is determined largely by such landmark environmental legislation as the Clean Air Act (1970), the Water Pollution Control Act (1972), the Federal Insecticide, Rodenticide, and Fungicide Act (1972), the Endangered Species Act (1973), the Energy Policy and Conservation Act (1975), the Resource Conservation and Recovery Act (1976), the Toxic Substances Control Act (1976), and the toxic waste cleanup Superfund (1980).

ORIGINS

EPA's establishment was a direct result of growing disquiet among the American people about their environment, a concern that grew out of the student movement of the 1960s and continued throughout the 1970s. In fact, EPA's first Administrator, William D. Ruckelshaus, asserted that without the public's growing concern for the environment, EPA would not exist. Politicians in the late 1960s realized the political prudence of capitalizing on the public's environmental concerns and that to seize the initiative and take control of the movement would pay off politically among a highly concerned public. With that in mind, newly elected President Richard M. Nixon appointed several key committees and commissions in 1969, one of which was the Council on Environmental Quality, which later recommended creating the Environmental Protection Agency.

But EPA was not the beginning of the federal government's role in protecting the environment and regulating its use. Beginning with the 1948 Water Pollution Control Act, the federal government assumed an increasingly larger role in environmental protection. The Water Quality Act (1956) allowed states to set water quality standards, but made them subject to approval by the Secretary of Health, Education and Welfare (HEW). It also created a Federal Water Pollution Control Administration that administered these programs. With passage of the Water Quality Improvement Act (1970), the federal government's role in regulating and protecting the environment grew larger and so did its scope of concern.

Thanks to President Nixon's political acumen, the environment became a central concern of the Federal government, although EPA was not always consistently administered. Nixon realized that to seize the momentum in environmental protection was politically advantageous. Protecting the environment would not only place his administration in a positive light, but it would enable him to remove one more potentially damaging issue from possible presidential campaign opponents in the U.S. Senate. Thanks largely to the work of Nixon aide John Ehrlichman, the Nixon administration became a forceful advocate for the environment until 1973, when Nixon was

safely reelected to the presidency and no longer saw political value in environmental activism. That EPA continued to exist made environmental protection, by many estimates, a powerful function of the federal government.

EARLY YEARS

After winning relatively easy congressional authorization, EPA was formally established by Nixon on 2 December 1970. Finding the first administrator was more difficult. The administration finally settled on a former Assistant Attorney General in the U.S. Justice Department, William Ruckelshaus, after concluding that then-Texas Congressman George H. W. Bush was too closely associated with oil interests. Ruckelshaus had environmental concerns but was also not one to make political trouble for the White House. He made a safe but significant choice for Nixon's first EPA administrator. The key to EPA's success, Ruckelshaus concluded, was to determine exactly what the agency's mission would be and where its responsibilities would lie. Ruckelshaus envisioned EPA assuming the role of the gorilla in the closet to remind states to enforce existing environmental laws lest the federal government intervene and enforce such laws for them. By and large, states had not rigorously enforced such laws because they had competed so fiercely against one another for industrial investment and business development that to enforce environmental law rigorously was to threaten economic growth. To Ruckelshaus, EPA existed to assure that each state enforced environmental regulations equally, thereby removing any competitive advantage gained from ignoring such laws.

EPA was created out of political necessity and it was not immune to national politics. EPA administrators found it difficult to balance the political demands of each presidential administration with concerns of the environment and with the competing interests of environmental groups and industry. Nor did EPA enjoy good relations with the U.S. Congress. Between 1972 and 1974, Nixon's Watergate woes directly affected his administration's ability to govern. EPA was no exception to this difficulty. The relationship between the Nixon administration and

the Congress, and later the voters, turned to one of outright distrust. EPA had not been enjoying a healthy relationship with states or the businesses that it regulated, and Watergate did nothing to better the situation. In fact, the crisis damaged EPA in several ways, not the least of which was that it forced Ruckelshaus to fashion new leadership strategies. It also led to Ruckelshaus's departure from EPA to become acting Director of the Federal Bureau of Investigation and then Deputy Attorney General. Later, during the Watergate scandal's "Saturday Night Massacre" of October 1973, President Nixon fired Deputy Attorney General Ruckelshaus for refusing to dismiss Special Watergate Prosecutor Archibald Cox.

Assuming leadership of EPA after Ruckelshaus was Russell E. Train, a former member of Nixon's Council on Environmental Quality. Train introduced to EPA a "risk assessment" strategy, whereby EPA focused on the potential risks and costs to human life associated with environmental regulation, versus nonregulation. Framing environmental protection in terms of human life and the quality of life provided EPA with a higher moral plane on which to launch regulation and protection efforts. The most notable by-product of Train's new risk-assessment strategy was the formation of a Cancer Advisory Council that assessed the cancer-causing aspects of certain environmental threats such as toxic waste and polluted water supplies. EPA also formed an economic analysis department to argue the virtues of environmental protection in dollars and cents and provide economic impact data for certain environmental thrusts.

Continuing Ruckelshaus's strategy of making strong stands to make broader points regarding environmental protection, Train's EPA opposed the construction of the Miami Jetport, a huge facility planned for land just north of the Florida Everglades that rested within the Big Cypress Swamp, which supplied Everglades National Park with its water supply. EPA and the Nixon Administration opposed this jetport on the grounds of the environmental, health, and economic impact of destroying the Everglades. As home to dozens of endangered species of animals, the 1.4 million acre park was a national treasure and a major source of tourist visits to

Florida. As planned, the jetport complex would occupy a space of thirty-nine square miles, as large as the combined airports of Los Angeles, Washington, D.C., and New York, and service over 200,000 flights per year. After successfully negotiating relocation of the jetport, the Nixon Administration also supported purchasing most of the Big Cypress swamp and watershed outright in the interests of preserving the water supply for South Florida and Everglades National Park.

SHIFTING FOCUS

The world energy crisis of the late 1970s forced the government to shift its focus from environmental protection to energy development. Under the Nixon and Ford administrations, EPA's budget reflected such a shift in priorities. And so did the difficulty EPA encountered from an indifferent Nixon and a disinterested Gerald Ford after 1974. Train remained administrator through the Ford administration but found that Ford was not as intrigued by the environment as Nixon was. Nixon may have held purely political interests in establishing EPA, but he realized how environmental problems could affect entire economies and economic subsystems. The late 1970s also saw a rise in toxic waste awareness and incidents, which refocused EPA's attention to include toxic waste cleanup and monitoring as well as species and environmental protection.

Another factor forcing a shift in EPA focus was the toxic waste scandal of the late 1970s. Love Canal, Valley of the Drums, and Three Mile Island all made for sensational headlines and for an increased emphasis on waste cleanup and on monitoring those companies that produced it. As a result, Congress enacted the Superfund legislation, which dedicated more than a billion dollars to clean up such notorious sites.

RETREAT FROM PROTECTION

In the 1980s, under the leadership of Presidents Ronald Reagan and George H. W. Bush, EPA assumed the role of "neutral broker" and became less regulatory. Appointed EPA administrator in 1981,

Anne Gorsuch, a former Colorado legislator with little interest in environmental regulation, took on the task of reducing EPA's visibility and budget. In 1981, EPA's budget was just over \$1.35 billion. By 1982, it had been cut by more than half, with a 1982 budget of just \$515 million and a cut in personnel of almost 25 percent. Under Gorsuch, EPA reduced by half the number of cases it brought against violators of environmental law, allowed timber cutting on federal land, and suspended regulations restricting the dumping of liquid waste in landfills. In a further effort to rein in the power of EPA, the Reagan administration also required that all major regulatory policies first be approved by the president's Office of Management and the Budget (OMB) after a cost/benefit analysis. The administration also returned a number of EPA enforcement responsibilities to the states, which then replicated the problems of nonenforcement of environmental policies and laws that had helped establish the need for EPA.

After Gorsuch resigned in 1983 following her mishandling of toxic waste cleanup funds, William Ruckelshaus returned as the administrator of EPA. Ruckelshaus wasted no time in trying to resuscitate EPA's image in Congress and among the people. He also reintroduced the policy of risk assessment. Under George H. W. Bush, little changed within the federal government with regard to environmental concerns. Reauthorization of the Clean Air Act in 1990, which proved a more powerful and comprehensive piece of legislation than its 1970s predecessor, was one of the few bright spots for EPA during the Bush administration. But as the 1980s concluded, EPA continued to grow to the point of becoming almost unwieldy bureaucratically. This unwieldiness mainly resulted from the large budget and staff and the myriad of regulations that EPA was placing on environmental matters.

Under President Bill Clinton and administrator Carol Browner, EPA attempted to balance its relationship with industry and environmental concerns by promoting partnership over conflict. But much like the two presidents preceding him in office, Clinton shied away from sweeping environmental policy reforms or regulation. Ironically, EPA under Clinton found itself in a position similar to what it had experienced

during the Nixon Watergate era when scandal had damaged the administration's ability to govern.

Continuing in its role as a political soccer ball, EPA found itself under heavy criticism from the Republican-controlled Congress in 1995. A conservative backlash against its large budget, tremendous regulatory power, and tremendous bureaucracy stung the Agency. So too did the fact that only a tiny portion of every dollar in the EPA budget went to actual environmental cleanup. Much like all elements of the federal government except for defense and social security, EPA found itself a candidate for contraction after 1995.

However, by 2002 EPA had grown to become one of the largest and most powerful agencies in the federal government with an annual budget in 2000 of more than \$7.5 billion and 18,000 employees. After the 1994 congressional elections, conservatives targeted "big government," especially EPA, and tried to remove its powers either by not renewing legislation that gave EPA its regulatory authority or by giving the states such regulatory power. The EPA budget for the 1995 fiscal year had declined by more than \$1.3 billion, but following President Clinton's election it grew by more than \$2 billion. Public opposition to scaling back EPA and Clinton's re-election resulted in conservatives backing away from contraction, and the EPA budget returned to pre-1994 levels. Even though the agency's role has varied depending on the presidential administration in office, EPA remains a bastion of environmental regulation and protection in the United States.

individual characteristics influence people's behavior and values at work, so also do organizational factors such as incentives, information, and the example set by others. The influence of role modeling in organizations, the tendencies of subordinates to defer to authority, and a concentration of ethics policies aimed primarily at lower-level employees are also congruent with this line of thinking. It is clear that organizational factors shaped by management possess great potential to support or undermine ethical actions. Consequently, it is common to hear that a crisis in organizational leadership is at the heart of unethical decisions and behaviors in the workplace.

PAST PERSPECTIVES ON LEADERSHIP AND ETHICS

In modern times, writings focusing specifically on the ethical nature of management begin most notably with the classic 1938 text, *The Functions of the Executive*, by the businessman Chester Barnard (1886–1961). Barnard advocated adherence to personal moral standards and viewed the creation of moral codes for others as an executive's greatest responsibility. By creating a moral code, the executive ensures that the influence of organizational norms will help guide employees who must make decisions within ethical gray areas.

In a similar vein, the business writer William Whyte Jr. (1917–1999) argued in the 1950s that the predominating social ethic in U.S. culture takes the burden of moral judgment and responsibility off the shoulders of the individual and places it on the organization (a social body, it should be noted, more than willing to assume such a role because of the advantages it provides). In acquiescing, the individual puts his or her faith in the organization as moral navigator and becomes susceptible to its influence, ethical or unethical.

Clearly, the moral success of either Barnard's or Whyte's vision ultimately rests on organizational leaders as ethical guides and role models. But do the most moral individuals get promoted to the top of their organizations? Evidence on that score is contradictory.

The psychologist Lawrence Kohlberg (1927–1987) conceptualized individuals as progressing

ETHICS, CONTEMPORARY

On the whole, the swarm of scandals in business and politics in the early 2000s appears to point to systemic, rather than isolated, ethical problems. While

through three levels (preconventional, conventional, and postconventional) of cognitive moral development. According to Kohlberg and his contemporaries, most adults fail to achieve postconventional moral reasoning. Rather, the majority of adults reason at a conventional level in which a viewpoint that supports the norms of the established system (be it organizational, political, or otherwise) defines the roles and rules that guide individual judgment. Consequently, an individual's sense of morality becomes heavily biased by those leaders who shape the system and who are, in turn, just as susceptible to conventional, rather than postconventional, moral reasoning.

RESEARCH ON LEADERSHIP AND ETHICS

In the theoretical realm of ethical decision making, the widely cited frameworks incorporate a combination of individual and situational moderators. The business ethicist Linda Treviño's person-situation interactionist model specifies an individual's cognitive moral development, locus of control, immediate job context, and organizational culture, among other factors, as having moderating effects on the ethical decision-making process. Shelby Hunt and Scott Vitell's general theory of marketing ethics follows similar lines, but with a greater focus on the various environments in which the individual is embedded as well as on the individual's internal evaluations of probability and desirability of consequences and the notion of inherent rights. Finally, the issue-contingent model developed by Thomas Jones, a scholar of management and organization, expands these theories, noting that previous models failed to take into account the various characteristics of the ethical issue to be resolved. Jones proposes that the characteristics of the ethical issue, which determine its "moral intensity," affect every stage of moral decision making and behavior.

Despite the amount of published theory on ethics, empirical research has been hampered for numerous reasons. However, some studies have focused on how reward contingencies, organizational policy, and leadership influence ethical decision making. The results of these studies indicate that ethical or

unethical behaviors recur when rewarded, that employees are more likely to intend to engage in ethical rather than unethical behaviors when organizational leaders espouse ethical values, that those operating at a higher level of cognitive moral reasoning tend to make more-ethical decisions, and that employees exposed to ethical codes of conduct and social cues are more likely to intend to engage in moral behaviors. It should be noted, however, that a drawback to many (but not all) of these studies is that they were conducted in the artificial setting of the lab environment. The question, then, is how these research results compare with the experiences of executives operating in the real world.

HOW ETHICAL ARE MANAGERS?

In 1961 and again in 1977, the *Harvard Business Review* (HBR) published results from surveys that asked the question "How ethical are businessmen?" Respondents to both surveys believed that they were much more ethical in their actions than "average" managers. This cynical view of what others would do was corroborated in the 1961 survey with the result that four out of seven executives reported that businessmen "would violate a code of ethics whenever they thought they could avoid detection" (Baumhart 1961, 19). Similarly, one-half of the executives in the 1977 study felt their superiors did not want to know how their subordinates obtained results as long as they achieved the desired objectives. Conflicts between the various roles executives play caused a number of the ethical dilemmas that were evident in the responses, with the most common dilemma being how to choose between being an "economic man" and an "ethical man."

With respect to ethical codes, the executives felt that codes had been ineffectual in the past mainly due to a lack of enforcement and because the codes tended to have an overly general nature and no specific guidelines. Despite these criticisms, the executives did believe codes were a good thing; it was agreed that codes help to establish the boundaries of ethical behavior on the job.

Since those surveys were conducted, one would be hard-pressed to give wholehearted support to the

statement that executive attitudes toward business ethics have improved across the board; on the contrary, the wave of ethical problems involving Enron, WorldCom, Adelphia, and several others in the U.S. corporate world in the early 2000s appears to signal a continuing (if not escalating) trend in immoral behavior.

RECURRING ISSUES IN THE LEADERSHIP AND ETHICS INQUIRY

In the present capitalist business environment, there exist tensions between immediate pressures and future, but less evident, considerations. The widespread view among U.S. companies that success can be measured by return on investment, quarterly earnings, and stock prices forces those companies to sacrifice long-term intangibles for short-term tangibles. Time and again the problem of placing higher priority on economic rather than ethical value in the workplace resurfaces. Employees often find themselves pressured to achieve as much as they can at the expense of ethically sound decisions.

The development of ethical codes, whether within entire industries or individual organizations, is viewed as a good thing. The common suspicion, however, is that development of such codes will accomplish little if there is no enforcement mechanism. Additionally, the prevalence of decision-making logic at Kohlberg's conventional level of cognitive moral development appears to feed into many of these problems. In doing their best to uphold social order in an established system, many people find themselves caught between the conflicting demands of economics and ethics, particularly when influenced by unethical leaders.

Finally, the complexity associated with ethical decision making and behavior, especially as it applies to leadership and the workplace, makes the construct extremely difficult to research. Measuring an individual's level of ethical decision making is challenging, particularly because the measurement instruments that are available have problems with priming and social-desirability effects; that is, questionnaires or other similar modes of data collection cue respondents to give answers that they believe are

Eight Global Values

Research by Rushworth Kidder and his colleagues with leaders in a sample of nations around the world identified eight core values that seem to be universal. They are:

Love: spontaneous concern for others; compassion that transcends political and ethnic differences.

Truthfulness: achieving goals through honest means; keeping promises; being worthy of the truth of others.

Fairness (justice): fair play, evenhandedness, equality.

Freedom: the pursuit of liberty; right of free expression and action and accountability.

Unity: seeking the common good; cooperation, community, solidarity.

Tolerance: respect for others and their ideas; empathy; appreciation for variety.

Responsibility: care for self, the sick, and needy, the community, and future generations; responsible use of force.

Respect for life: reluctance to kill through war and other means.

socially acceptable rather than answers that truly reflect their own actions or opinions. Furthermore, much empirical research to date has been primarily quantitative and relies heavily on deductive logic. Consequently, it is unlikely to have captured the complex nature of workplace ethics and is not yet able to offer a comprehensive explanation of the relationship between workplace ethics, behaviors, and other processes.

THE CHALLENGES AHEAD

Because of the difficulties described above, there is reason to advocate for the increased use of qualitative methods and inductive logic in researching ethics and leadership, which will allow researchers to dissect and better understand the depth and detail associated with the topic. In addition, research would greatly

benefit from analysis that takes into account all stages of ethical decision making. Whereas the current state of research emphasizes factors preceding ethical dilemmas and those influencing the specific decision-making process itself, there is little research investigating the link between decision making and behavior, and virtually no research looking specifically at consequences of ethical decision making. And yet it is important to know how those who make courageous ethical decisions (whistleblowers, for example) are affected by their choices. In what ways can we make organizational environments more conducive to such actions when they are appropriate?

It is true that in the current work environment, executives assume a hefty responsibility when they take the reins of their positions. Their decisions, particularly in our increasingly globalized environment, now carry greater consequences than ever before. For their part, researchers face an equally challenging task: to investigate the various factors influencing leadership and ethical decision making in the hope of pointing out how to avoid catastrophes and not repeat history's devastating mistakes.

ETHICS: OVERVIEW

Ethics is the study of right and wrong, good and evil, and virtue and vice. Constructing and analyzing arguments about what actions are morally right, what goals are morally good, and what aspects of character are morally virtuous, those engaged in ethical inquiry ultimately seek to determine how we ought to respond to morally relevant features of the world. In this standard understanding of the subject matter of ethical inquiry, there is no meaningful distinction

between ethics and morality. However, there is an important distinction between ethics and values, in the sense that this latter term is commonly used. What people happen to value can contrast sharply with what ethics would have them value. For example, valuing efficiency or gourmet food is significantly different from valuing justice or honesty. It is for this reason that studies of value responses lend themselves better to descriptive analyses in the social and behavioral sciences. Although work in the social and behavioral sciences attends carefully to the beliefs that people hold about morality, the values that motivate them to action, and their readiness to conform their behavior to social norms, such analyses nevertheless stop well short of the prescriptive theorizing that characterizes the core of the field of ethics.

Familiar problems in ethics are made concrete in the exercise of leadership. As in moral evaluation more generally, assessing the ethics of leaders requires that we consider the rightness of their means, the goodness of their ends, and the virtue of their characters and intentions. For example, we might ask whether deception is a morally permissible way to get follower compliance, whether profit is a morally legitimate goal, and whether egoism is a morally acceptable attribute in leaders. But leadership also highlights special moral problems. Many of these problems derive from the central place of power in the relationship between leaders and followers. Whatever the ends of the group, leaders need power to achieve them, giving power a strong claim to being the very currency of leadership. At the same time, power makes it possible for leaders to advance their own interests, sometimes at the expense of the interests of the group. Accordingly, much of leadership ethics is preoccupied with the interplay between the leader's self-interest on the one hand and the group's interests on the other. Because of the risks that power creates for leaders, ethicists who study leadership take the determination of power's proper limits to be one of their fundamental tasks.

THE DEFINITION OF LEADERSHIP

One approach to solving the special moral problems of leadership has been to use ethical considerations

to delimit the subject matter itself. If leadership is moral by definition, unethical behavior by those in power must be something other than leadership. This approach goes back to Plato (428 BCE–347 BCE), who argues that “every kind of rule, insofar as it rules, doesn't seek anything other than what is best for the things it rules and cares for, and this is true both of public and private kinds of rule” (Plato 1992, 21). In this respect, Plato suggests, leadership is akin to shepherding. When a shepherd looks to his own good rather than to the good of the sheep, he is more like a “guest about to be entertained at a feast” or “a money-maker” than he is like a shepherd (Plato 1992, 21). The view that true leadership, like true shepherding, is concerned with the good of the led, not the good of the leader himself, finds twentieth-century expression in the work of James MacGregor Burns. Indeed, Burns goes so far as to deny that Adolf Hitler (1889–1945) was a leader because “leadership, unlike naked power-wielding, is . . . inseparable from followers' needs and goals” (Burns 1978, 19), and Hitler was “an absolute wielder of brutal power” (Burns 1978, 27).

Concentrated focus on any human relationship is grounded in the belief that we have particular moral reasons to care about that relationship, and these reasons differentiate it from other kinds of relationships. Perhaps what advocates of normative definitions of leadership have right, then, is that this particular relationship is distinguished from other relationships by the ethical parameters within which leaders and followers operate. Completely coercive relationships, for instance, fall outside these parameters and hardly count as leadership. Because the behavior of coerced agents is involuntary, the relationship between the coercer and the coerced is closer to the relationship between master and slave than that between leader and follower. That being the case, descriptive analyses of leadership, like analyses of other human relationships, will be constrained by general normative considerations that mark off the domain of inquiry. There is nevertheless a large conceptual gap between this claim and the conclusion that behavior that deviates from morality is not leadership at all. Even if the relationship of leadership assumes significant follower agency, a notion that has substantial moral

content, it would not follow that leadership always shows proper respect for the agency of followers or that leadership always puts it in the service of ethical ends.

Leadership ethicist Joanne Ciulla contends that these definitional approaches to leadership conceal particular normative positions regarding the nature of the relationship between leaders and followers. In effect, they are misguided attempts to specify what constitutes good leadership, where *good* means both “morally good and technically good or effective” (1995, p. 13). This distinction helps us understand what Ciulla calls “the Hitler problem.” Those who contend that Hitler was not a leader exploit the ambiguity in the question of whether he was a good leader. Since Hitler was at most technically good or effective, he can have been a good leader in only one sense of the term. Understanding the Hitler problem is therefore a prerequisite to doing the real work in leadership ethics, namely, articulating and defending particular normative positions regarding this relationship. This is the real problem ethicists faced all along. Simply calling some individuals leaders and others by a different name does not change the fact that people in power sometimes engage in unethical behavior. That is to say, regardless of whether we call them leaders or not, we want to be able to identify unethical behavior and give an argument for why it is morally wrong.

NORMATIVE THEORIES OF LEADERSHIP

Commentators who make their normative commitments explicit by offering recommendations for how leaders ought to behave often identify good leadership with what thinkers from Plato to Burns hold is necessary for leadership itself, namely, concern for the good of followers. Aristotle (384 BCE–322 BCE) distinguishes correct from deviated constitutions on these grounds, claiming that “whenever the one, the few, or the many rule with a view to the common good, these constitutions must be correct; but if they look to the private advantage, be it of the one or the few or the mass, they are deviations” (Aristotle 1981, 189–190). Appealing to God’s exhortation in Ezekiel, “Ho, shepherds of Israel who have been

feeding yourselves! Should not shepherds feed the sheep?” (Ezekiel 34:2, RSV), the theologian Thomas Aquinas (1224?–1274) similarly makes concern for the good of followers both sufficient and necessary for morally good leadership: “If a ruler should direct a community of free persons for the common good of the people, there will be a right and just regime, as befits free persons. And if the governance of a ruler be ordained for the private good of the ruler and not for the common good of the people, there will be an unjust and wicked regime” (Aquinas 2001, 398). Even the political theorist Machiavelli (1469–1527), who is known for the amorality of *The Prince*, defends a historical cycling between good and bad leadership in his *Discourses*, with the former being characterized by leaders who “[put] their own interests second and the public good first” (Machiavelli [1532] 2001, 472).

Contemporary observers of leadership have been no less inclined to make the opposition between concern for self and concern for others the defining distinction in leadership ethics. For example, the essayist Robert Greenleaf recommends a form of leadership on which the leader “is *servant* first. . . . That person is sharply different from one who is *leader* first, perhaps because of the need to assuage an unusual power drive or to acquire material possessions” (Greenleaf 1977, 13). Leadership scholars Jane Howell and Bruce Avolio come to the same conclusion about the ethical use of power by way of an appeal to David McClelland’s distinction between personalized and socialized power motives, suggesting that leaders should be motivated by a concern for the common good. Some leadership scholars believe that such motivations make a leader’s behavior both ethical and effective and, thus, that the Hitler problem is not so problematic after all. According to organizational theorists Rabindra Kanungo and Manuel Mendonca, “leadership effectiveness is ensured only by altruistic acts that reflect the leader’s incessant desire and concern to benefit others despite the risk of personal cost inherent in such acts” (Kanungo and Mendonca 1996, 35).

James MacGregor Burns’s theory of transforming leadership, easily the most influential normative conception of leadership, also holds that leadership

should take us beyond self-interest, ultimately raising leaders and followers to “higher levels of motivation and morality” (Burns 1978, 20). In fact, Burns claims that “the ultimate test of moral leadership” resides in its “capacity to transcend the claims of the multiplicity of everyday wants and needs and expectations” (Burns 1978, 46). However, critics of this theory, especially in its organizational incarnation, charge that the very characteristics that make leaders transformational, “the gifts of charisma, inspiration, consideration, and intellectual strength,” can be “abused for the self-interest of the leader” (Carey 1992, 232). In response to these criticisms and others like them, management scholars Bernard Bass and Paul Steidlmeier fall back on the idea that leaders can choose either to show a concern for self or to show a concern for others. Using this distinction, these authors draw a very sharp contrast between what they call *authentic transformational leadership* and *inauthentic or pseudotransformational leadership*. As Bass and Steidlmeier make the argument, “the exclusive pursuit of self-interest is found wanting by most ethicists. Authentic transformational leadership provides a more reasonable and realistic concept of self—a self that is connected to friends, family, and community whose welfare may be more important to oneself than one’s own” (Bass and Steidlmeier 1999, 185–186).

What these normative theories of leadership have in common with traditional ethical theory is a firm commitment to the conflict between the demands of self-interest and moral requirements that protect the interests of others. To be sure, not all ethicists acknowledge this conflict. Ethical egoists such as Ayn Rand (1905–1982) argue that our highest moral

Selection from *Utilitarianism* by John Stuart Mill

I must again repeat, what the assailants of utilitarianism seldom have the justice to acknowledge, that the happiness which forms the utilitarian standard of what is right in conduct, is not the agent’s own happiness, but that of all concerned. As between his own happiness and that of others, utilitarianism requires him to be as strictly impartial as a disinterested and benevolent spectator. In the golden rule of Jesus of Nazareth, we read the complete spirit of the ethics of utility. To do as you would be done by, and to love your neighbour as yourself, constitute the ideal perfection of utilitarian morality. As the means of making the nearest approach to this ideal, utility would enjoin, first, that laws and social arrangements should place the happiness, or (as speaking practically it may be called) the interest, of every individual, as nearly as possible in harmony with the interest of the whole; and secondly, that education and opinion, which have so vast a power over human character, should so use that power as to establish in the mind of every individual an indissoluble association between his own happiness and the good of the whole; especially between his own happiness and the practice of such modes of conduct, negative and positive, as regard for the universal happiness prescribes; so that not only he may be unable to conceive the possibility of happiness to himself, consistently with conduct opposed to the general good, but also that a direct impulse to promote the general good may be in every individual one of the habitual motives of action, and the sentiments connected therewith may fill a large and prominent place in every human being’s sentient existence. If the impugnors of the utilitarian morality represented it to their own minds in this its true character, I know not what recommendation possessed by any other morality they could possibly affirm to be wanting to it; what more beautiful or more exalted developments of human nature any other ethical system can be supposed to foster, or what springs of action, not accessible to the utilitarian, such systems rely on for giving effect to their mandates.

obligation is to act in our self-interest, and, following Rand, leadership scholar Edwin Locke claims that leaders should be selfish, not altruistic. Given the typical connections between leader self-interest and the interests of followers, Locke’s defense of the morality of self-interested behavior by leaders turns out to be more plausible than it might initially seem. But even ethical theorists who allow that morality sometimes makes it necessary to sacrifice self-interest would be reluctant to accept that acting out of concern for followers is sufficient for meeting all the demands of morality. First, acting in the interests of followers does not preclude showing insufficient

moral respect for their agency or, for that matter, for the leader's own agency. Second, acting in the interests of followers can often be consistent with showing less than morally appropriate concern for the interests of outsiders. The arguments for both these claims are located squarely within the field of philosophical ethics.

PHILOSOPHICAL ETHICS: KANTIANISM

Deontological ethical theory holds that only features of actions themselves are relevant to morality. As such, these theories are committed to the view that moral assessment precludes consideration of consequences. Actions are right or wrong independent of their results. For Immanuel Kant (1724–1804), the primary historical exponent of deontological ethics, the feature of an action that determines its morality is its connection to reason. Reason demands that we act only in ways that it would be possible for everyone to act and, moreover, in ways that we would be willing to have them act. In Kant's words, "*Act as if the maxim of your action were to become through your will a universal law of nature*" (Kant [1785]1964, 89). Another way to articulate this demand of reason is to say that we must respect the rational faculties of persons, treating them "*never simply as a means, but always at the same time as an end*" (96). Our moral duties are thus determined not out of concern for their interests but out of respect for the law of reason. In fact, according to Kant, actions have moral worth only when they are done out of this kind of respect, only when they are what he terms autonomous. By contrast, the influences of altruism, no less than the influences of self-interest, make actions heteronomous.

To take an example, Kantian ethics considers deception and manipulation to be morally wrong. First, any attempt to universalize these behaviors gives rise to what Kant calls a contradiction in conception. In a world in which deception and manipulation are the rule, there is no incentive to deceive and manipulate others, because deception and manipulation work only if people generally refrain from these behaviors. Second, deception and manipulation bypass the rational faculties of others, thus

treating them simply as means to an end. Treating others as ends in themselves would entail that they give their consent to being deceived and manipulated, which is not possible with respect to these kinds of behaviors. Of course, despite the purported immorality of deception and manipulation, leaders sometimes engage in these behaviors, most obviously when they are motivated by self-interest. It is worth noting, however, that Kant would not be any more impressed by a leader's use of deception and manipulation if the goal was to advance the interests of followers. Though this kind of behavior can be perfectly altruistic, it nevertheless shows less than morally appropriate respect for followers' agency. In other words, the claim that a leader's deceptive and manipulative behavior was for the good of followers does not answer the charge that the leader failed to engage their rational agency. Accordingly, altruistic motivation does not meet the demands of Kantian morality.

The ethics of altruism is also incompatible with a Kantian commitment to the value of leader agency. Kant holds that we owe ourselves the same kind of respect that we owe others. Again, the moral respect he has in mind is essentially unconnected to any concern for our interests. Although Kant defends a duty to make ourselves happy, this duty is indirect in nature. Since miserable people are fairly poor at attending to the requirements of morality, we should make sure that we are happy enough to discharge our more direct duties, as these duties are defined by reason. Yet Kantian ethics makes plenty of room for the pursuit of our own ends, as well as for our helping others with the pursuit of their ends. Since we invariably need the help of others when it comes to the pursuit of our ends, it would contradict reason to expect this kind of help from others but be unwilling to give it ourselves. That is to say, the duty we have to help others in need, the closest thing to altruism in Kantianism, assumes the morality of pursuing the ends that we ourselves adopt as rational agents.

For Kantian ethicists, normative theories of leadership such as servant leadership pay too little attention to the agency of leaders. The moral risk of making service the defining ethical attitude for leadership derives from the close conceptual con-

nection between serving and servility. While some leaders could certainly stand to do more to advance the interests of followers, adherents of Kant's moral philosophy have good reason to worry about the loss of agency that adopting a stance of servitude implies. This form of leadership may be particularly out of place for members of oppressed communities in which serving and servility, not agency and self-respect, are the norm. For these leaders at least, Kantians would argue that it hardly seems appropriate to ask that they meet the "unrelenting demand that each of us confront the exacting terms of our own existence, and, like Sisyphus, *accept our rock and find our happiness in dealing with it*" (Greenleaf 1977, 11). Even for leaders who are not subject to conditions that encourage complacency, acting exclusively as an agent in service of the interests of others leaves no room for agency in the pursuit of one's own ends. Kant's ethics therefore highlights a tension between servant leadership and the moral idea that leaders and followers are equally deserving of respect for their autonomy.

PHILOSOPHICAL ETHICS: UTILITARIANISM

Consequentialist ethical theory holds that the morality of an action is determined by that action's results. Utilitarianism, as developed by philosophers such as Jeremy Bentham (1748–1832), John Stuart Mill (1806–1873), R. M. Hare (1919–2002), and Peter Singer (1964–), assesses these results in terms of overall happiness or well-being. According to utilitarianism, leader self-interest counts no more and no less than the interests of any particular follower or, for that matter, any other person. But self-interest still figures in the moral calculus, since happiness or well-being—no matter *whose* happiness and well-being—ultimately drives moral assessment. In marked contrast to Kantian ethics, then, most varieties of utilitarianism allow that behaviors traditionally taken to be morally wrong—deception and manipulation, for example—are morally right when the good produced by these behaviors is greater than that produced by refraining from them. Of course, leaders often have good utilitarian reasons not to behave in these ways. Most important among these is

that deception and manipulation can erode the trust of followers, making it difficult to maximize utility in the long run. Nevertheless, considerations of happiness or well-being on the whole decide whether these behaviors are morally wrong for leaders and, in at least some circumstances, would permit them.

On the surface, ethical theories that focus on consequences seem well suited to moral analyses of leadership. After all, leadership is a goal-directed activity, and leaders are assessed primarily in terms of whether and, moreover, how well they achieve their goals. This conceptual connection prompts Joanne Ciulla to note a parallel between the ethics and effectiveness questions and the theoretical divide between deontological and consequentialist ethical theories (Ciulla 2001, 315). However, it is only a parallel. Consequentialist ethical theories such as utilitarianism, no less than deontological ethical theories, tell us what makes an action morally right or wrong, not what makes it technically good or effective. Still, the consequentialist logic of leadership readily lends itself to comparisons between moral rightness and technical goodness or effectiveness, especially when technical goodness or effectiveness is defined in terms of meeting the interests of others. From a utilitarian point of view, however, one moral problem with most examples of leadership is that leaders' ends do not always embody other-regarding aspirations. Leaders' ends are just as often defined in terms of profit and productivity, and the behavior conducive to the achievement of these ends is not particularly likely to conform to the dictates of utilitarianism.

Despite the fact that normative theories of leadership encourage altruistic ends, not even they are immune to utilitarian critique. This is because the altruism championed by such theories typically extends no farther than to the interests of followers. According to Kanungo and Mendonca's ethical analysis of leadership, for example, the others in whose interests leaders should act are "the organization and its members" (Kanungo & Mendonca 1996, 35). However, since utilitarianism counts the interests of all persons equally, it demands that leaders have a much broader moral perspective, one that fully includes the happiness or well-being of others

Leadership is a combination of strategy and character. If you must be without one, be without the strategy.

—U.S. General H. Norman Schwarzkopf

outside of their particular group, organization, or society. Somewhat surprisingly, not even Greenleaf's servant leadership requires that leaders show this kind of concern for outsiders. Like most normative theories of leadership, it looks primarily to the effects on the led, asking whether "those served grow as persons? Do they, *while being served*, become healthier, wiser, freer, more autonomous, more likely themselves to become servants?" (Greenleaf 1977, 13–14). While Greenleaf does say that minimally the least privileged should "not be further deprived" (14), merely sustaining the status quo for these individuals is inconsistent with the dictates of utilitarianism. In particular, it is counter to the view that the least privileged have the most to gain in terms of utility and, as a result, could likely make better utilitarian use of whatever resources might otherwise be expended on insiders.

PHILOSOPHICAL ETHICS: VIRTUE THEORY

The philosophical division between deontological ethical theories and consequentialist ethical theories maps onto an important distinction that James MacGregor Burns makes in his 1978 book *Leadership*. According to the main argument in this work, leaders should attend to modal values such as honesty, trustworthiness, and reciprocity as well as to the end values of liberty and equality. When these two categories of values come into conflict, however, Burns sides with the consequentialists, suggesting that important end values must win out. As he puts it, "Transformational leadership is more concerned with *end-values*" (Burns 1978, 426). However, exactly twenty years after the publication of *Leadership*, Burns's restatement of the values of leadership adds what he calls ethical values, which include "old-fashioned character tests" (1998, x). This third category of leadership values corresponds closely to

the main object of moral assessment in the virtue theory of ethics. As intellectual descendents of Plato and Aristotle, advocates of this theory argue that ethical leadership depends more on developing habits or dispositions to act virtuously than on adhering to general principles for action or on overall utility maximization. Being moral takes precedence over acting according to universal moral requirements.

As compared with Kantianism and utilitarianism, virtue ethics creates considerable moral space for leadership. First, in contrast to the universalism of Kant, the foundational assumptions of virtue theory allow that leaders might be justified in making exceptions of themselves when it comes to generally applicable moral requirements. For example, the philosopher Bernard Mayo argues that "the subordination of exemplars to principles . . . fails to do justice to a large area of moral experience" (Mayo 1958, 214–215). The "'black-or-white' nature of moral verdicts based on rules" conflicts with the fact that qualities of character come in degrees and, as a consequence, does not allow us to "set [heroes and saints] apart from the rest of humanity" (Mayo 1958, 215). Second, in at least some versions of virtue theory, what constitutes an ethical life is highly dependent on context. Virtue for a given individual derives from the particular relations that define the context in which he or she lives and works. One consequence of this feature is that a virtuous leader need not be expected to sacrifice the interests of his group, organization, or country for the sake of overall utility. By rejecting the universalist commitments of utilitarian philosophers, virtue ethics is in a position to embrace the special relations of leadership.

Virtue ethics also rules out attempts at moral compartmentalization that plague leaders who believe that their immorality can be isolated. Because it gives pride of place to habits and dispositions, this ethical theory cannot allow for a sharp differentiation between the private morality that governs "personal conduct" (Burns 1998, x) and the public morality that applies to leadership behavior. Since habits and dispositions are formed by behavior without regard to whether it is private or public, character-affecting action in either realm is bound to spill over into the other realm as well. But this gen-

eral commitment to behavioral consistency does create difficulties for virtue theory when it comes to making sense of the ethical failures of leaders with long records of moral success. If these leaders have developed proper habits and dispositions, how can their virtues ultimately fail them? One explanation questions whether character traits are predictive of human behavior after all. Philosophical critics who draw on experimental evidence in social psychology charge that the moral psychology behind this ethical theory ignores evidence supporting the view that behavior is determined by features of the situation, not by the habits or dispositions of the individuals in these situations. According to this criticism, since virtuous character traits are hardly sufficient for ethical leadership, attempts to rely heavily upon them are recipes for ethical failure.

GENERAL ASSESSMENT

All of the three most highly regarded theories in philosophical ethics are vulnerable to objection. Kantianism lends itself to the charge that it values rules more than people, demanding that leaders adhere to generally applicable moral requirements even when a deviation would greatly advance human flourishing or when conformity would come at a great cost in terms of human suffering. Standard opposition to utilitarianism focuses on a different ethical prioritization. By placing no limits on the utility losses that individuals might be required to withstand for the sake of overall utility, this moral theory is open to the criticism that leaders who tolerate or promote these losses do not accord proper value to the individual. Finally, even if virtue ethics is correct in its assumption that character determines behavior, this moral theory faces the objection that a commitment to role differentiation and contextualism increases the moral risk that leaders will overestimate the importance of their leadership positions and their relations with followers. Still, philosophical ethical theories show that there is more to the ethics of leadership than adjudicating between leader self-interest and the interests of followers. Even leaders who subordinate their interests to group interests can nonetheless fail to show proper respect for moral agency, to advance the legit-

imate interests of outsiders, and to demonstrate virtuous character traits besides self-sacrifice.

—Terry L. Price

of a hierarchy of human needs, developed the theory of eupsychian (good psychological) management, which creates a work environment conducive to collective psychological health.

After a lengthy study of management and a term as a visiting fellow at Non-Linear Systems, Inc., in California in 1962, Maslow reported in the opening chapter of his journal regarding the experiences that

only recently has it dawned on me that as important as education is, perhaps even more important, is the work life of the individual, because everybody works. If the lessons of psychology, of individual psychotherapy, of social psychology, etc., can be applied to man’s [sic] economic life, then my hope is that this too can be given a eupsychian direction, thereby tending to influence in principle all human beings.” (Maslow 1965, 2)

This philosophical shift was of great importance because it recognized the institutional impact of the workplace on the psychological well-being of the individual. In some ways Maslow’s recognition of this impact stimulated the use of social science in management consulting. Maslow came to believe that “Psychotherapy tends to focus too exclusively on the development of the individual, the self, the identity, etc. I have thought of creative education and now also of creative management as not only doing this for the individual but also developing him via the community, the team, the group, the organization—which is just as legitimate a path of personal growth as the autonomous paths” (Maslow 1965, 3).

Based on Maslow’s reading of management theorists such as Peter Drucker (b. 1909), Rensis Likert (1903–1981), Chris Argyris (b. 1923), and Douglas McGregor (1906–1964), Maslow suggested thirty-six assumptions about people that serve as the foundation for eupsychian management in practice:

1. Assume everyone is to be trusted.
2. Assume everyone is to be informed as completely as possible of as many facts and truths as possible.
3. Assume in all your people the impulse to achieve.
4. Assume that there is no dominance-subordination hierarchy in the jungle sense or the authoritarian sense.

EUPSYCHIAN MANAGEMENT

Abraham H. Maslow (1908–1970), a founder of humanistic psychology most famous for his theory

5. Assume that everyone will have the same ultimate managerial objectives and will identify with them no matter where they are in the organization or in the hierarchy.
6. . . . assume good will among all the members of the organization rather than rivalry or jealousy.
- 6a. Synergy [combined action] is also assumed.
7. Assume that the individuals involved are healthy enough.
8. Assume that the organization is healthy enough.
9. Assume the "Ability to Admire."
10. . . . assume that the people in eupsychian plants are not fixated at the safety-need level.
11. Assume an active trend to self-actualization.
12. Assume that everyone can enjoy good teamwork, friendship, good group spirit, good group harmony, good belongingness, and group love.
13. Assume hostility to be primarily reactive rather than character based.
14. Assume that people can take it.
15. . . . assume that people are improvable.
16. Assume that everyone prefers to feel important, needed, useful, successful, proud, respected, rather than unimportant, interchangeable, anonymous, wasted, unused, expendable, disrespected.
17. Assume that everyone prefers or perhaps even needs to love his boss (rather than to hate him), and that everyone prefers to respect his boss (rather than to disrespect him).
18. Assume that everyone dislikes fearing anyone (more than he likes fearing anyone), but that he prefers fearing the boss to despising the boss.
19. . . . assume everyone prefers to be a prime mover rather than a passive helper, a tool, a cork tossed about on the waves.
20. Assume a tendency to improve things, to straighten the crooked picture on the wall, to clean up the dirty mess, to put things right, make things better, to do things better.
21. Assume that growth occurs through delight and through boredom.
22. Assume preference for being a whole person and not a part, not a thing or an implement, or tool, or "hand."
23. Assume the preference for working rather than being idle.
24. Assume all human beings, not only eupsychian ones, prefer meaningful work to meaningless work.
25. Assume the preference for personhood, uniqueness as a person, identity (in contrast to being anonymous or interchangeable).
26. . . . assume that the person is courageous enough for eupsychian processes.
27. . . . assume non-psychopathy (a person must have a conscience, must be able to feel shame, embarrassment, sadness, etc.).
28. . . . assume the wisdom and the efficacy of self-choice.
29. . . . assume that everyone likes to be justly and fairly appreciated, preferably in public.
30. . . . assume the defense and growth dialectic for all these positive trends that we have already listed above.
31. Assume that everyone but especially the more developed persons prefer responsibility to dependency and passivity most of the time.
32. . . . assume that people will get more pleasure out of loving than they will out of hating (although the pleasures of hating are real and should not be overlooked).
33. Assume that fairly well-developed people would rather create than destroy.
34. Assume that fairly well-developed people would rather be interested than be bored.
35. . . . assume at the highest theoretical levels of eupsychian theory, a preference or a tendency to identify with more and more of the world, moving toward the ultimate of mysticism, a fusion with the world, or peak experience, cosmic consciousness, etc.
36. Finally we shall have to work out the assumption of the meta-motives (the ways in which a person whose lower needs are met pursues the realization of self-actualization and the B-values) and the meta-pathologies (resulting from the lack of meeting the meta-needs), of the yearning for the "B-values," i.e., truth, beauty, justice, perfection, and so on.

(Maslow 1965, 17-33)

These assumptions are reflective of McGregor's Theory Y (a trusting, participative leader-follower relationship) as well as participative, democratic, enlightened, and transformational leadership. However, they are more than simply a reflection of an underlying belief about the nature of people explained by McGregor's theory. For Maslow, the uniqueness of one's humanity is expressed in the individual's pursuit of self-actualization—striving to attain the “pluralism of ultimate values” (Maslow 1965, 119). The ultimate values are a panoply perhaps best represented by a multifaceted diamond in which the whole consists of the sum of various aspects, in this case the B-values or being values: “truth, beauty, wholeness, dichotomy-transcendence, aliveness-process, uniqueness, perfection, necessity, completion, justice, order, simplicity, richness, effortlessness, playfulness, and self-sufficiency” (Maslow 1971, 106). This list was derived from Maslow's research with people after a peak experience. “What you feel and perhaps ‘know’ when you gain authentic elevation as a human being . . . is a coming into the realization that what ‘ought to be’ *is* in a way that requires no longing, suggests no straining, to make it so” (Henry Geiger, cited in Maslow 1971, xvi–xvii). People often experience this state when they “are so involved in an activity that nothing else seems to matter; the experience itself is so enjoyable that people will do it even at great cost, for the sheer sake of doing it” (Csikszentmihalyi 1990, 4).

SELF-ACTUALIZERS AND EUPSYCHIA

When self-actualizing people work together they create eupsychia. Thus, if an organization utilizes its power to develop a good society, to make a commitment to build and maintain a psychologically healthy place for its workforce, the organization can release enormous innovative and productive potential unimaginable in a typical organization.

The most interesting quality of the self-actualizers whom Maslow studied is that each was involved in a cause outside of himself or herself. They all were striving to achieve the good, the realization in the society at large of the B-values through their personal contribution to the common good.

Whereas most people seem mired in desire—the perpetual state of wanting, of feeling inadequate, of not being satisfied, of feeling deficient in something important for their well-being—self-actualizers struggle with expressing a higher part of their capabilities to create a state of being as well as a state of mind that results in the ability to overcome challenges with others. Their goal is not happiness or self-fulfillment in the selfish sense of the terms. Rather, their goal is to contribute to the manifestation of the B-values in the world and to help others do so as well.

To some people eupsychia management is a utopian dream and does not sufficiently reflect the reality of evil, deviousness, fear, destructive competition, deception, Machiavellianism (referring to the theories of the Italian political philosopher Niccolò Machiavelli), the prevalence of office politics in workplaces, and the many varieties of noncooperation and self-serving behavior that interfere with collective success in workplaces.

Although Maslow did not fully grapple with this criticism beyond assuming that organizations will choose healthy employees, several rights of organizations make it possible to create a eupsychian organization. Namely, organizations have the right to choose their employees and can apply psychological screening devices to do so. They may also train employees, reprimand them, and expel them. Because of these rights, organizations can filter the psychologically unhealthy, untrustworthy, unfit, or unwilling. Thus, eupsychian management, although difficult to achieve, is certainly possible.

ORGANIZATIONAL EXEMPLARS

Several organizations, although not eupsychian in name, may be exemplars of the eupsychian workplace in fact. One can consider the lists of the “Best Companies to Work for in America” and “Best Companies to Work for in Europe” published annually by *Fortune* magazine based on research by the Great Place to Work Institute. Reading the narrative and individual company descriptions, one can see that many of Maslow's assumptions are operable and that managers and employees are proud co-partners in the development of their organizations.

Qualities of the Best Places to Work

Fairness, camaraderie, credibility, respect, pride, and—most important—trust characterize the best places to work. Are these workplaces eupsychian? It is hard to say. There is no research on eupsychian workplaces per se. However, SAS, a provider of business intelligence software, has made the top twenty on *Fortune* magazine's annual "The Best Companies to Work For" survey. SAS has not had layoffs in its twenty-seven years of being in business and prospered through the tech bubble. SAS describes its workplace environment this way:

If you treat employees as if they make a difference to the company, they will make a difference to the company. That's been the employee-focused philosophy behind SAS's corporate culture since the company's founding in 1976. At the heart of this unique business model is a simple idea: satisfied employees create satisfied customers. (www.sas.com/corporate/worklife/index.html).

Among its many recent awards SAS was also among the "top 100 companies to work for," according to *Working Mother* magazine.

Another exemplar is Novo Nordisk pharmaceutical company, which is focused on treating and eventually curing diabetes. Its charter reads in part:

Each of us shall be accountable—to the company, ourselves and society—for the quality of our efforts, for contributing to our goals and for developing our culture and shared values.

We shall set the highest standard in everything we do and reach challenging goals.

We shall conduct our business in a socially and environmentally responsible way and contribute to the enrichment of the communities in which we operate.

We shall seek an active dialogue with our stakeholders to help us develop and strengthen our businesses.

Our business practices shall be open and honest to protect the integrity of the Novo Group companies and of each employee.

We must foresee change and use it to our advantage. Innovation is key to our business and therefore we will encourage a learning culture for the continuous development and improved employability of our people.

We will maintain an open dialogue with our stakeholders and comply with international reporting standards.

We will work to continuously improve our environmental performance by setting high objectives and integrating environmental and bioethical considerations into our daily business.

We subscribe to the International Chamber of Commerce's Business Charter for Sustainable Development.

We support the United Nations Convention on Biological Diversity.

We will work to continuously improve our social performance by setting high objectives and integrating social, human rights and health & safety considerations into our daily business. We will maintain an open dialogue with our stakeholders and report annually on our social performance.

We support the United Nations Universal Declaration of Human Rights. (www.novonordisk.com/about_us/about_novo_nordisk/the_charter.asp).

Judging from these business practices and aspirations one can assume that self-actualizing people would find Novo Nordisk a nurturing environment in which to work. Although it does not recognize creating a eupsychian environment as one of its purposes, it is nevertheless doing so.

Another workplace conducive to a eupsychian approach is that of W. L. Gore. The company claims: "We've been in business for more than 40 years, practicing an unusual form of management (some call it 'unmanagement') that has paid off. We believe our unique corporate culture is a key factor in our success. Our workplace lacks the typical barriers of more traditional companies. We've done away with titles and special entitlements. We encourage direct, one-on-one communication. Multi-disciplined teams in clustered plants organize around technologies and market opportunities" (www.gore.com).

This kind of attitude lends itself to taking the next step: deliberately attempting to become fully eupsychian.

Leadership for a Eupsychian Workplace

For a leader in a eupsychian workplace, the challenge is to contain and focus energy, keep required resources available, mediate interpersonal conflicts,

prevent bureaucratic encroachment, ensure that the B-values flourish, and be responsive to the collective mind of the group. Of the available leadership models perhaps Greenleaf and associates' (1998) idea of servant leadership would be best to use with self-actualizing employees. Self-actualizers after all rarely consider themselves employees. They are professionals in service to a larger cause not easily confined within an organization's profit picture or shareholder objective. The leader must emphasize the confluence of interests and show the value and appreciation that the company has for the efforts made to build both a better world and a more effective company.

—John Nirenberg

Reader's Guide

This list is provided to assist readers in locating entries on related topics. It classifies entries into nineteen general categories: Arts and Intellectual Leadership, Biographies, Business, Case Studies, Cross-Cultural and International Topics, Domains, Followership, Military, Personal Characteristics of Leaders, Politics/Government, Power, Religion, Science and Technology, Situational Factors, Social Movements and Change, Study of Leadership, Theories, and Women and Gender. Some entry titles appear in more than one category.

FAMILY BUSINESSES

Family businesses are businesses that are owned or controlled by a family. They are found in almost every country. In industrialized countries family businesses make up 75 to 80 percent of businesses. In some European countries—Germany, France, Spain, Italy, and Scandinavia—and in Japan, this percentage rises to 90 to 95 percent.

Family businesses are important not only because of their pervasiveness but also because of their contributions in terms of capital absorbed, employment generated, and sales and exports generated. For example, in Italy at the beginning of the 1990s, 13 percent of capital, 12 percent of total sales, and 15 percent of employees were in family-controlled businesses.

DEFINITIONS

Such pervasiveness raises several problems of definition. What exactly are family businesses? The definition provided earlier is broad. It can be used to describe a family business with a few employees in which the owners-entrepreneurs take an active role in day-by-day production or an artisan workshop run by a single skilled worker helped by, say, her or his children or even a large integrated business producing and selling goods for billions of dollars all over the world. We can more easily define, for example, a

managerial enterprise as a business run by managers, that is, hired professionals who manage a fraction of the production process, a division, or a function of the enterprise in complete autonomy. Managerialization of businesses dates back to the second industrial revolution, which took place during the last quarter of the nineteenth century, spreading from the United States to Europe. The increase of the average business's size and the rise in capital intensity in industries affected by the technologies of the second industrial revolution took place in the shadow of scale and scope economies (i.e., the diminution of the average cost in front of an increase in the scale of production), which, in turn, brought new business forms. The ownership structures changed as well, accelerating the process of separation between ownership and control, which was described by Adolph Berle and Gardiner Means (*The Modern Corporation and Private Property*, 1932) and later by Edith Penrose and Alfred D. Chandler Jr. This process, however, is determined not only by technology but also by a wide array of institutional and cultural determinants.

The convergence toward a model of business that is run by managers and is publicly owned (which is often implicitly considered more efficient than other forms of business organization) is far from being demonstrated, especially when capital-intensive and technology-intensive industries (the loci of the managerial revolution) are considered. This is particularly

evident for the largest businesses in the most advanced countries. In fact, even if there are considerable differences among different countries and geographical contexts, depending on which definition of *ownership* is used, large family businesses are prevalent in industrialized economies at the beginning of the twenty-first century. Unless we limit the definition of family businesses to those businesses wholly owned and managed by a single family, the issue of control (i.e., the right to make decisions concerning the business's strategies and to allocate the resources at the top decisional level) is more relevant than that of ownership. A business can be, in fact, only partially family controlled or only partially run by managers, and there is enormous variety between the two archetypes of the managerial business and the family business. Many family businesses are family owned but not family controlled; in Europe, even if the family influence is negligible in terms of share ownership, family control and influence over the business's strategies can be noteworthy. Only with difficulty can we provide an exhaustive and exclusive definition of family businesses because huge differences exist across space, time, and institutional contexts. Surely, however, to assess family businesses we must go beyond the traditional dichotomy of family businesses and managerial businesses.

CONTEXTS

To be more precise, we must contextualize the diffusion of family businesses in modern economies. As suggested, the form and the degree of diffusion of family businesses depend on a complex array of forces that explain not only the existence but also the persistence of such an institutional form. From this perspective we see that the degree of diffusion, as well as the form of the family business, is the consequence of a nonexclusively economic motive. Like many other institutions defined and regulated by culture, family businesses are shaped by many elements, which explains the structure and dynamics of family businesses over time as well as their relationships with the rest of the economic, political, and social system.

A relevant issue is the relationship between the degree of diffusion and the nature of the family busi-

ness and the stage of the industrialization process. Since the beginning of industrialization, family businesses have played a relevant role, helping to reduce transaction costs and uncertainty thanks to the close relationships and trust among their members. In many countries, family businesses were prevalent in manufacturing, trading, and finance during the first phase of industrialization. Particularly telling in this respect is Japan, where family-owned conglomerates (the *zaibatsu*) were from the beginning the most relevant actors in modernization. In this respect the family business is an essential device in the first phase of industrialization, alongside other elements such as the state or the financial system, especially in latecomer economies.

In sum, the evolution in organizational structures and the successful separation of ownership and control do not depend on purely economical and technological variables. The presence of family businesses is, in fact, connected to other variables, such as environmental uncertainty and institutional disequilibrium (an uncertain legal framework), as well as local culture and traditions. In other words, the presence of family businesses (namely, big family businesses) is only partially the outcome of particular conditions of backwardness in terms of technologies employed and of the industries involved. We must consider the general climate in which the economic action takes place. This is why family businesses were the dominant form during the first industrial revolution; but we also should understand why, in the late industrializers committed to capital-intensive industries, from Korea to Latin America, family businesses remain one of the dominant forms of industrial organization. The relevance of context in explaining the persistence of family businesses emerges when nonmanufacturing activities are considered; family businesses are extremely persistent. Take, for instance, finance and banking, where social networks are a strategic asset inherited within certain dynasties.

For a complete understanding of the reasons for the persistence of family businesses in particular contexts, we must consider other institutions that can, in turn, influence the strength of family businesses. The structure of the financial market is important and can be considered largely responsible

for the persistence of forms of personal/family capitalism in the most advanced economic systems.

In this respect, Italy is significant. The structure of this country's financial system is historically characterized by a reduced role of the stock exchange and the banking system. However, a firm's main shareholders, mostly families (which according to the Italian tradition usually coincided with the inside directors), succeeded in controlling most of the main businesses with reduced investments but also with a low risk of losing control, mainly thanks to devices such as "Chinese boxes" and pyramids (i.e., chains of holding companies). However, in Germany, as well as in other European countries, we can explain the persistence of large family businesses by the relevant role played by large institutional investors, such as the main universal banks (*Grossbanken*), which found it easier to establish a strict relationship with a single, large shareholder than with the independent management of a publicly owned corporation.

OTHER INSTITUTIONAL DETERMINANTS

Other institutional determinants play a role. Among the most important is the legal framework, from which can derive constraints that can explain the persistence of family businesses. For instance, fiscal legislation more or less favorable toward inheritance duties and taxation can support or obstruct family businesses within certain national contexts. One example is the transformation of British industry into a true corporate economy after the 1950s, in coincidence with a radical restrictive change in the fiscal treatment of inheritance duties.

In other aspects, the relationships between the institutional sphere and family businesses are extremely close. In countries that industrialized more recently, we can detect a strict relationship between private and public interest, the result of which is that the interests of the state and those of some powerful families are so intertwined that we cannot easily distinguish between them. For instance, in South Korea the strict relationship between national political power and a few influential families backed the industrial evolution of the country until recently.

Culture—that is, the common characteristics influencing the behavior of individuals and groups—is relevant as well. Culture can, in fact, help to explain the way in which businesses in a system are managed and the way in which the relationships among the owners, managers, and workers are conceived. This is true, for instance, in many European countries: The diffusion of paternalism is, from a certain perspective, a way to identify the family-like nature of the relationships established inside the business itself. From a certain point of view, all of this can help to explain the way in which authority and power are distributed inside the business, who is in charge of allocating the resources, and the enduring (or not) presence of family members at the top decisional level.

FROM FAMILY BUSINESSES TO MANAGERIAL BUSINESSES

Given all this, the affirmation of the large, publicly owned business of the second industrial revolution challenged the nature and structure of family businesses. The advent of capital-intensive and scale-intensive industries brought a significant dualism between labor-intensive, traditional sectors, still mainly craft based and skill oriented, and the capital-intensive sectors in which large dimensions require large organizations. In many industries, the convergence pattern toward the managerial business has been incontestable. However, much more frequently the continuum between labor-intensive and craft-intensive industries, characterized by the presence of small- and medium-sized family businesses on the one side and the capital-intensive sectors dominated by giant corporations on the other, is populated by different organizational forms, in which strong family control is mixed with managerial authority. The evolution of production technologies and corporate downsizing in capital-intensive and scale-intensive industries (those characterized by large scale of production, high-throughput, and energy intensive processes of production) is, in this perspective, another major force backing the persistence of family businesses and increasing diffusion of family businesses in the most developed economies.

OPEN QUESTIONS

The transition from family businesses to managerial businesses, and the presence of many intermediate forms between the two extremes, stress the important issue of power delegation. The way in which this issue is managed is crucial for the survival of the business itself. The coexistence of family members and hired managers is a difficult and frail equilibrium to maintain; in many cases, a failed managerialization stops the growth of the business, limited by the human resources that the entrepreneurial family makes available.

Leadership transition in family businesses also remains a problematic issue. Many of the medium-sized and large family-run businesses try to handle carefully the issue of internal succession, mainly through training programs designed for the young generations. Nevertheless, the correlation between family businesses and poor business performances in terms of longevity is high.

 **FAMILY LEADERSHIP**

Although families have existed since the dawn of time, only recently have social scientists from the

disciplines of family sociology, family therapy, family and consumer science, and family psychology viewed families as an arena for studying leadership. Using terms such as *family power*, *family decision making*, *family governance*, and *family organization*, these researchers have accumulated a substantial body of knowledge about how leadership emerges and evolves in families.

A DEFINITION OF FAMILY

Traditionally, families were defined as “networks of people who live together over a period of time and who have ties of marriage and kinship to one another” (Burr, Day, and Bahr, 1993, 15). However, current family researchers and theorists tend to emphasize the generational as well as the contemporary aspects of family life. Hence, Carter and McGoldrick (1989) define a *family* as a “small social system made up of individuals related to each other by reason of strong reciprocal affections and loyalties, and comprising a permanent household (or cluster of households) that persists over years and decades and shares a common history of life experiences” (Carter and McGoldrick, 1989, 5). This common history of life experiences is composed of predictable changes—such as children entering a family, growing up, and leaving the household—each of which requires a reorganization of family relationships and responsibilities. In addition, unpredictable stressors experienced by the family—such as job loss, divorce, chronic illness, or the death of a parent—may also demand reorganization of family life.

NATURE OF FAMILY LEADERSHIP

How is leadership demonstrated in families? Like any other human organizations, families are groups of people who must organize and coordinate their activities to deal with the fundamental issues of all human organizations—issues such as continuity and change, tradition and innovation, individuality and group membership, and unity and diversity. A substantial body of research has now accumulated describing how families organize themselves to manage their children during the child-rearing years

and how such organization correlates with positive child outcomes (Avenoli, Sessa, and Steinberg, 1999; Clark, 1983; Dornbush and Ritter, 1992). We have discovered that across ethnic and economic groups, well-functioning children are likely to come from families whose organization is clear and whose relationships between family members are appropriate and well defined. In such families parents assume an active leadership role in forging a strong caregiver alliance with adults inside and outside the family. This caregiver alliance is characterized by clear agreement among family members as to who is in charge and who has what responsibilities and by regular communication among these adults about their expectations concerning their own and their children's behavior.

Furthermore, parents and children have distinctly different role expectations and power differentials. Parents declare themselves in charge and on the top of the power hierarchy and assert their "legitimate right" to set house rules. They demonstrate their ability to delegate role responsibilities for each child, to consistently supervise and monitor the children in the performance of these activities, and to enlist their children's voluntary and enthusiastic adherence to parents' rules, standards, and expectations for responsible behavior. Parents in these families also create opportunities for children to assume responsible leadership roles in which other family members are required to rely on them for assistance. Children may be asked by their parents to assume leadership while engaged in home academic tasks, leisure tasks, or household maintenance tasks. In asking their children to assume a leadership role, parents carefully organize and clearly explain the children's roles and functions for particular activities in ways that the children perceived as legitimate. This type of routine leadership role enactment enables the children to develop greater skill in accepting and meeting adult expectations while learning to adjust to a more expansive variety of role responsibilities. Furthermore, in these families parents give conscious attention to developing orderly and cooperative status relationships among the children of the family by (1) being acutely sensitive as they set role prescriptions for siblings to the individual differences in status and

power among their children, (2) providing evaluations for how a role is being performed by a child, and (3) using their own power to delegate responsibility to their children so as to structure and support the organization of orderly and cooperative status relationships. In addition, parents organize family space and time in predictable ways. They ensure that the family home is clean and organized, that family activities are routinized, and that they provide definite and consistent guidelines to children and actively monitor their children's activities both in the home and outside the home.

FAMILY LEADERSHIP STYLES

Researchers (Baumrind, 1973, 1983; Dornbush and Ritter, 1992) have identified four styles in which parents demonstrate leadership during the child-rearing years. These styles—labeled "authoritative," "authoritarian," "laissez-faire," and "neglectful"—represent various combinations of parental warmth and demandingness characterizing parent-child interactions. In most well-functioning families, parents demonstrate an authoritative leadership style. Parents take the initiative in setting definite and consistent time and space limits on children's behavior while in school and other community settings, yet they also attempt to make these demands reasonable to their children by explaining them rather than demanding blind obedience. Although these parents may wield considerable time-space control—even through the adolescent years—they explain and justify their expectations so that their children understand and respect their parents' perspective and thus feel more compelled to follow parental wishes.

Disputes among siblings or between parents and children are given due process so as to resolve them in a fair and loving way. Parents attempt to get to the bottom of conflicts and trace the source of conflicts to the child's needs. During those times when enforcement of rules is needed to get the child back into line with his or her role responsibilities, parents warn the child of impending punishment and then mete out the punishment in a predictable and consistent way. Hence, the authoritative leadership style requires that parents demonstrate a high level of

A Son's Leadership Responsibilities in the Traditional Korean Family

Under traditional norms the eldest son inherits the largest share of his father's property, and with it the duty of organizing and conducting ancestor rites for his father and for all earlier ancestors to whom he may stand in a direct line of eldest sons. He must also bear the prime responsibility of caring for his parents while they are living and of rearing his younger siblings, *in loco parentis*. He must arrange the marriages of younger sisters and provide an ample dowry, if his parents are dead or too old to do so, and he has some obligation to see that his younger brothers get an amount of education suited to the family's finances and the brothers' intellectual capacities. He must also supervise the selection of wives for his brothers if his parents cannot do so.

The eldest son inherits his father's fields, but is consequently often "bound" to them and "doomed" to spend his life as a farmer. The younger sons are often forced to be more mobile. This is especially true if the family farm is too small to divide in such a way that they receive enough land to support their families after their eldest brother has received the largest share. They may be driven to seek their fortunes outside their local community, and they frequently make their way to the capital, center of the nation's economic life, in search of better opportunities.

Other, more fortunate younger sons may be given a better education than their elder brother to prepare them for a good job away from the farm. These, too, often gravitate to the capital where the greatest opportunities for employment in teaching, government, or other high status roles can be found. Eldest sons, especially those from better-off families, may also become residentially mobile and move away from the family home leaving their ancestral responsibility in the hands of a younger brother, as in the case of the sublineage heir in Pagoda Mountain Village, for example. Their movement appears to be prompted more often by individual opportunity than by any extreme pressure of economic necessity at home.

Younger sons, according to the traditional norms, have no obligation to initiate the ancestor rites for their fathers or other ancestors. They have a duty to be present at such rites, when possible, and to take an appropriate role in them, but their obligation is far less than that of their eldest brother. We feel it safe to say, subject to statistical confirmation, that in most cases the valuation of and concern about ancestor rites on the part of younger sons is generally far less than that felt by eldest son.

warmth and responsiveness to their children and a high level of demandingness. The authoritative leadership style is characterized by (1) an expectation of mature behavior from the child and a clear setting of standards by the parents, (2) firm enforcement of rules and standards, (3) the use of commands and sanctions when necessary, (4) encouragement of the

child's independence and individuality, (5) open communication between parents and their child with encouragement of verbal give-and-take, and (6) recognition of the rights of both parents and child. Children of authoritative parents demonstrate high levels of independence and social responsibility and perform successfully in academic and social settings (Baumrind, 1973, 1983; Dornbush and Ritter, 1992).

In contrast, in poorly functioning families, parents are either embroiled in a constant "tug-of-war" with their children; they nurture their children but provide little clear leadership, or avoid interaction with their children and leave their children to determine their own direction. Parents embroiled in a constant tug-of-war with their children typically utilize an authoritarian leadership style. They often demand obedience from their children with little consideration of the effect on the children's development. Hence, the authoritarian leadership style is characterized by a high degree of demandingness coupled with a low level of responsiveness and warmth toward children. Authoritarian parents attempt to shape, control, and evaluate the behavior and attitudes of their children in accordance with an absolute set of standards. These parents emphasize obedience, respect for authority, work tradition, and

the preservation of order. Verbal give-and-take between parent and children is discouraged. Researchers report that the authoritarian leadership style is associated with low levels of independence and social responsibility in children and lower levels of academic achievement and personal adjustment than are found in children led by author-

itative parents (Baumrind, 1973, 1983; Dornbush and Ritter, 1992).

The third style, the permissive or *laissez-faire* leadership style, is one in which parents demonstrate a high level of warmth and responsiveness to their children but a low level of demandingness. Parents who use a *laissez-faire* style are tolerant and accepting toward their children's impulses, use as little punishment as possible, make few demands for mature behavior, and allow considerable self-regulation by children. Researchers report that children of parents using a *laissez-faire* style are immature, lack impulse control and self-reliance, lack social responsibility and independence, and demonstrate a poorer record of academic achievement and personal adjustment than do children led by authoritative parents (Baumrind, 1973, 1983; Dornbush and Ritter, 1992).

The fourth leadership style, neglectful (Dornbush and Ritter, 1992), is characterized by low levels of parental warmth and responsiveness to children and low levels of parental demandingness. Parents using a neglectful leadership style do not routinely "take charge" or manage their children's activities, nor are they consistently responsive to their children's needs and demands. These families have few predictable role expectations of how parents and children are to interact with one another. Instead, family patterns of decision making and communication are chaotic and inconsistent. In contrast to the authoritative leadership style of parents in well-functioning families who try to build up their children and treat them with respect as they are correcting them, parents using a neglectful style abdicate responsibility for directing their children's activities.

These reported relationships between various parental leadership styles and child outcomes have held consistently across gender, diverse family structure (that is, for biological two-parent, single-parent, or stepfamily structure), ethnic groups, student age, and family social class. Hence, we can conclude that parents who assume leadership over their children and exercise that leadership by clearly and regularly delineating their standards and rules for their children's conduct and attempting to make these standards reasonable to their children tend to raise chil-

dren who not only understand what to do at home but also more easily understand and follow the instructions and requirements of adults in the larger community.

FACTORS AFFECTING FAMILY LEADERSHIP ACROSS THE LIFE COURSE

Scholars have done considerable theory development to describe who becomes a leader in a family and how a family develops and modifies its leadership structure over time. Some theorists see family leadership as a dynamic phenomenon, whereas others see it as a stable characteristic. Hence, some theorists suggest that families change their leadership structure as they adapt to the increasing competence of their younger members (Aquilino, 1997; Clark, 1983). These theorists believe that a situational model of leadership might be useful for understanding who becomes a family leader. Other theorists (Constantine, 1986, 1987, 1993; Fitzpatrick, 1988; Gottman, 1994; Peplau, 1983) contend that families structure their leadership roles to fit their shared idiosyncratic beliefs regarding the allocation of family work tasks and power relations and that this paradigm (framework) remains relatively constant across the family life course. Constantine (1993), for example, described four family paradigms with characteristically different expectations for leader behavior: (1) the open family, (2) the closed family, (3) the individualistic family, and (4) the synchronous family. The open family values mutuality and expects family leaders to foster it through collaboration and negotiation; the closed family values stability and expects the family leader to promote it by emphasizing obedience and conformity to the family group; the individualistic family values individuality and expects family leaders to manage in a *laissez-faire* style; and the synchronous family values harmony and expects leadership to be exercised through tacit agreement and mutual identification.

Similarly, Peplau (1983) described three role patterns depicting the power relations and the role specialization between the spouses in a family. Although such typologies (classifications based on types) usu-

ally represent “ideal” types, the value of these typologies lies in their attempt to describe how family roles fit together in interrelated patterns and to depict the diversity of family leadership patterns that exist in U.S. culture.

In all likelihood, future theory development and research on family leadership will continue to explore which leadership styles and structure produce the most positive child and family outcomes and which types of family leadership arrangements are associated with particular beliefs about family life and the gendered roles of men and women in families.

FARM WORKER MOVEMENT

Early efforts to organize farm workers in the southwest United States were stymied by the migratory and temporary nature of agricultural labor as well as by an inability to bridge cultural and ethnic divides. However, emerging from the Chicano movement (civil rights actions taken to counter racial and economic inequalities directed against U.S. residents of Mexican descent) of the 1950s, the leadership of César Chávez (1927–1993), Dolores Huerta, and Gilbert Padilla provided the vision for a farm worker movement that continues to this day.

The United Farm Workers (UFW) organization was created to build a sense of community that would empower farm workers to recognize their rights as well as allow them to take an active role in the farm worker movement rather than the passive role of following orders from some distant labor leader. Holding tightly to their religious and ethnic Chicano and Mexican heritages, Chávez, Huerta, and Padilla drew upon the organizational skills they had learned from Fred Ross and his Community Service Organization (CSO)—a grassroots program to educate and empower local citizens—and also took cues from successful demonstrations and political achievements of the civil rights movement and Martin Luther King Jr. Although the traditional labor tactic of strike (*huelga*) was often utilized, new tactics of nonviolent protest, national and international boycotts, and hunger strikes were introduced to bring widespread attention to the hardships faced by farm workers. Such attention provided the wellspring of support needed to successfully challenge the economic and political power of agribusiness.

LARGE-SCALE AGRICULTURE

The farm worker movement originated in California. An exception to the egalitarian ideology and the small-farm model of frontier agricultural development, California agribusiness received a head start by emulating the *rancheros* of the Mexican territory. During the late nineteenth century the shift to specialty crop—citrus fruit, grapes, lettuce, sugar beets—production by large-scale estate farms solidified an agricultural system that required a cheap and flexible workforce. The need for a large supply of manual labor was reinforced by the fragility of the specialty crops; such crops rarely withstood the abuses of machine processing. As a result, profits to the growers were realized through “sweating” the labor by forcing competition for jobs.

A virtual army of docile laborers willing to work for low wages and in undesirable conditions could be found in the socially marginal groups within the Chinese, Filipino, Mexican, and Japanese communities. The growers quickly learned to keep the farm laborers migratory—following the harvest season across the California countryside—and isolated to discourage attempts at collective action. They also learned the tactic of playing ethnic groups against one another to keep labor costs low. Economic downturns for the country were beneficial for the growers because they could then utilize Anglo workers to undercut migrant workers and effectively drive down wages.

Even with the rise of labor movements in the early twentieth century, the lack of power among farm workers was exemplified by their exclusion from the worker benefits and protections established under the Wagner Act of 1934, the Social Security Act of 1935, and the Fair Labor Standards Act of 1938. By contrast, the political influence of the growers was readily apparent in the development of the *bracero* (a Mexican laborer admitted to the United States) system. With U.S. involvement in World War II, the growers successfully argued that the uninterrupted production of their crops was necessary for national security. Working with the U.S. Department of State and with Mexico, the growers were able to draw upon a new labor force consisting of Mexican work-

ers allowed to enter United States to work the fields during harvest season on condition that they return to Mexico at the end of the season. *Braceros* were ideal in that they had no ties to the local communities, were available on short notice, and provided the cheap and docile labor sought by the growers. *Braceros* who complained or sympathized with striking domestic farm workers were labeled “undesirable,” sent back to Mexico, and not allowed to return to the United States. Even after the end of the war in 1945, the growers were able to extend the *bracero* program for another twenty years.

Throughout the 1940s and 1950s attempts to unionize farm workers met with limited degrees of success. The National Farm Labor Union (NFLU) found initial support among Anglo workers, mostly “Okies” (Oklahoma migrant workers) from the Depression era, who held permanent positions crating the produce in the packing sheds located on the various farm operations. The division of labor among farm workers as well as language barriers resulted in Mexican field workers continuing to harvest crops despite walkouts and picketing by packing shed employees. Later, translators were used to broaden the base of worker support; subsequent strikes were often broken through the growers’ ability to utilize local law enforcement to intimidate the pickets as well as the ability to draw upon *bracero* labor to cross picket lines. With the demise of the NFLU, new efforts at farm worker unionization were taken up by the Agricultural Workers Organizing Committee (AWOC). Cultural barriers remained problematic for the AWOC. However, the main reason for the inability to achieve widespread collective action lay in the organization’s emphasis on the wage strike. Although at times successful, the wage strike yielded only short-term gains, leaving workers without extended contracts and benefit guarantees. The AWOC strike against Coachella vineyards in 1965 marked a shift in the effectiveness of farm worker efforts.

CÉSAR CHÁVEZ AND *LA CAUSA*

The roots of the farm worker movement are intertwined with those of the civil rights and Chicano movements of the 1950s. Social change was being

César Chávez, founder of the National Farm Workers Association, talks with strikers in Delano, California, during the 1980s grape-pickers strike.

Source: Ted Streshinsky/Corbis; used with permission.

effected throughout California's urban centers as a result of collective action sparked by the Community Service Organization (CSO). César Chávez began his career as an organizer in 1952 after meeting Fred Ross and becoming a community leader for the CSO. With the rhetoric of empowerment calling upon individuals to build their communities from the ground up rather than rely on change to filter down from the bureaucracies of state and local government, Ross's words resonated with Chávez. Through his involvement with Ross and the CSO, Chávez came to know other community organizers such as Dolores Huerta and Gilbert Padilla.

As Chávez refined his organizational skills, he turned his attention to the plight of farm workers. In addition to facing wage exploitation, farm workers

lived under deplorable conditions while on the farm site, were not covered under the Social Security Act, and had no benefits to cover health care, which was much needed, given both the hazardous nature of the work and the chronic conditions associated with repetitive tasks. Many factors—the structure and seasonality of agribusiness, the power and influence of the growers, misuse of the bracero system, ethnic divides among farm workers—led many people to conclude that the workers could not be brought together for collective action. Chávez believed the contrary; however, repeated attempts to garner support from the CSO for programs to aid farm workers met with rebuke because the concerns of rural workers were not seen as relevant to the plans of urban programs. Leaders in the CSO felt that farm workers should better themselves by leaving the fields and not by seeking to reform conditions in the fields. Realizing that farm workers were marginalized even within minority communities, Chávez left the CSO in 1962 to establish the National Farm Workers Association (NFWA).

Chávez selected Delano, California, as the location for the headquarters of the new association because the community was centrally located among numerous farm operations. Thus, workers in the area were more established, having to travel only nominal distances to harvests rather than having to follow the crops around the countryside of the southwestern United States. For Chávez, this location was ideal for an organization that would be built by farm workers. Using lessons learned from the CSO, Chávez laid the foundation for a community of action. Sharing the vision that power and change are most effective when they emanate from within the community rather than from a distant bureaucracy, Dolores Huerta and Gilbert Padilla joined Chávez in Delano.

After only six months of organizing, the time was right for a convention to formalize the NFWA. In September of 1962 Chávez was elected president of the new association; Huerta, Padilla, and Julio Hernandez were elected vice presidents. Although the structure of the association mirrored that of a union, the word *association* was used for fear that farm workers would have a negative reaction to the word *union* in light of past failures to achieve substantive

collective action. Relatively steep monthly dues were set for association members to help fund burial programs and establish a credit union. Unlike a union, the association had no local chapters, thereby allowing migrant farm workers to register grievances and seek assistance no matter where they were working at the time.

Chávez knew that a strong organization would take years of nurturing and that a solid foundation must be built with resident farm workers before the association could have any hope of finding support among migrant farm workers. The leadership of the NFWA realized the importance of gaining the trust of skeptical individuals, and there was no better way to gain trust than by the sharing of experiences. The association relied mostly upon volunteers who lived and worked with farm workers. For the association to be successful, the volunteers had to understand the needs of farm workers, and they could not do this by working a normal eight-hour day and then returning to the comforts of a middle-class home.

In September 1965, the NFWA had to prove the effectiveness of its organizational efforts and its mettle as an association. Earlier that year, AWOC organizer Larry Itliong had headed a strike of Filipino farm workers against grape producers near Coachella. As the harvest season progressed northward, Itliong called upon his past associate, Dolores Huerta, to ask Chávez for NFWA support in a strike against grape producers in the Delano area. Although Chávez felt that it was too soon for the NFWA to become involved such a large mobilization, the farm workers of Delano did join the cause of the Filipino workers. This decision exhibited the charisma of Chávez to the nation and showcased the power of the NFWA.

NEW STRATEGIES FOR SUCCESS

Chávez, Huerta, and Padilla were well aware that wage strikes, the mainstay strategy of labor unions, are rarely successful in gaining any long-term benefits for farm workers. Short harvest seasons, the ease with which striking farm workers could be replaced, and little or no financial support from national organizations for strike funds all conspired to make this strategy ineffectual. An astute observer of social

movements, Chávez learned from the accomplishments of the civil rights movement and drew upon the undercurrent of social activism that ran throughout the country at the time to successfully challenge the control of the large growers in California. Given that the grape strike was already engaged, Chávez demanded that the NFWA take a position of nonviolence. As the nation came to see the intimidation and violence perpetrated against farm workers, the farm worker movement gained support from the Catholic church, the Congress of Racial Equality (CORE), the Student Nonviolent Coordinating Committee (SNCC), other labor unions, and student organizations. SNCC organizer Marshall Ganz joined the NFWA campaign and became a longtime member of the association.

Drawing attention to the plight of the fieldworkers (*la causa*) was paramount for the success of the farm worker movement. Emulating the civil rights demonstrations in Alabama, Chávez utilized marches to capitalize on media coverage and to present a show of strength to the California state legislators in Sacramento. More than mere political spectacle, the marches were considered *perigrinación* (a pilgrimage) and came to symbolize the solidarity of those fighting against injustice; the penance of grueling marches embodied the commitment and sacrifice required to affect social change. The dedication to *la causa* can be seen in the importance that Chávez placed on the marches. Each night Chávez would mark the spot where he stopped for the day, and each morning he would locate the exact spot to continue the march; there were no shortcuts in his mission.

Ironically, the exclusion of farm workers from the protections guaranteed by the National Labor Relations Act allowed the NFWA to utilize strategies unavailable to labor unions. Boycotts were initiated to take the message of *la causa* worldwide in attempts to apply pressure to those large growers seemingly unaffected by strike efforts. The NFWA sent hundreds of association members across North America—Jessica Govea to Toronto and Montreal, Huerta to New York City and the East Coast, Padilla to Texas and the Southwest—to elicit support for the farm worker struggle. As the public became aware of the injustices and violence inflicted upon the

Selection from the 2000 Annual Report on Labour Rights: Agricultural Workers

The success of the Farm Workers Movement in the United States has encouraged similar movements around the world. The following text is from a report issued by the World Federation of Agriculture, Food, Hotel, and Allied Workers.

Women Workers and Agriculture

The role of women workers in the rural world is crucial. Rural women workers are responsible for half of the world's food production. In third world countries, they produce between 60 percent and 80 percent of food output.

According to the FAO, women farm workers are mainly responsible for the production of staple foods, such as rice, wheat, and corn, which represent 90 percent of the food consumption among poor people living in rural areas.

In spite of the existence of the ILO Convention, which establishes salary equality between men and women, the latter almost always receive wages inferior to those of men. In most countries, this convention is infringed. Minimum wage rates in the agricultural sector are different between men and women who perform the same tasks. Wages for women are always lower.

Farm women workers sow, apply fertilizers and pesticides, recollect and thresh. They also work on secondary crops, like legumes and vegetables.

The knowledge women have on the genetic resources applied to agriculture make them special guardians of biological diversity.

In the livestock sector, women feed and milk large animals, raise fowl and other small animals like sheep, goats, rabbits, and guinea pigs.

Once the harvest is done, women also participate in storage, manipulation, elaboration and trading.

Although women farm workers are evermore important in agriculture, they remain an unprivileged minority. Due to military conflicts, male migration to urban areas in search of jobs, and increasing mortality caused by AIDS, the number of families led by women is growing in developing countries.

Despite the fact that women are significant producers and suppliers of food, they are considered as "invisible" associates. Women possess valuable knowledge regarding the importance of genetic resources and its use in agriculture and food.

In the sub-Saharan Africa, women cultivate up to 120 different vegetable species within open spaces right next to commercial crops planted by men.

In the Andean regions of Colombia, Bolivia and Peru,

women keep seed stockpiles in order to guarantee food production.

In Rwanda, women are the main producers of beans, also known as "the meat" of the rural areas. Beans supply a fourth of the calories consumed by the population and half its protein intake.

A phenomenon known as the "feminization of agriculture" is becoming a trend in many areas of the world. The role of women in agriculture is becoming more crucial, as men keep leaving this economic sector.

For example, in Africa, male population in rural areas is descending rapidly, whereas female population remains relatively steady. In Malawi, rural male population decreased 21.8 percent between 1970 and 1990. During that same period, female population only declined 5.4 percent.

According to several studies, women who are the head of their families are usually younger and less educated than their male counterparts. Often, women have less farmland, financial resources and additional labor force to harvest.

Due to the lack of labor force and capital, female heads of families are forced to modify their harvesting systems. These adjustments have caused the reduction of agricultural output and, in some cases, the adoption of less nutritional crop varieties. Therefore, it is no surprise to find these families undernourished and more food insecure than other families.

In most developing countries, farmers in general do not have access to adequate resources. Women, however, have even less access than men, due to traditional sociological and cultural factors.

Union Martyrs

Many female unionists have lost their lives because of their union activities.

Lidia Madariaga, who belonged to the Nicaraguan Autonomous Trade Union Movement (Movimiento Sindical Autónomo de Nicaragua—MOSAN), from the administrative district of Leon, in Nicaragua, was murdered on April 22, 1966.

Florinda Soriano Muñoz, a union leader also known as Mamá Tingó, was assassinated on November 1, 1974, in Gualey, Dominican Republic for defending her freedom of association.

picketers, support for the boycotts grew. However, it was the “secondary boycotts”—a threat to the distributors, wholesalers, retailers, and restaurants—that began to tip the scales for the movement. Ultimately, the mere threat of calling for a boycott would be enough for the NFWA to bring growers to the bargaining table. The ability to mobilize so quickly and effectively, coupled with the charisma of Chávez, established the NFWA as the dominant organization in the farm worker movement. In 1966 the AWOC and NFWA were combined to form the UFW. Although recognized and supported by the AFL-CIO, leaders of the UFW agreed that the association would not officially join the national labor organizations but rather would remain a grassroots effort.

With violence escalating along the picket lines and at association offices, some farm workers believed that the strikes and boycotts were ineffective and that the nonviolent position of the UFW should be set aside. Frustrated by these beliefs, Chávez in February 1968 began his first hunger strike. Lasting twenty-five days, the initial hunger strike drew much national attention to *la causa*, but more importantly it illuminated the charisma of Chávez as well as his sacrifice to the movement. This sacrifice galvanized the association members in their pledge to peaceful action. During his time with the UFW, Chávez’s hunger strikes became longer and more life-threatening, and although the growers and the nation became less interested in them, each hunger strike would reinforce the solidarity of association members.

As the political mood of the country changed throughout the 1970s and the 1980s, so did the strategy of the UFW. Adopting the position of a political action committee, the UFW fought the growers in Congress and the courts. For Padilla and other UFW members, this change was antithetical to the original goals of the movement. In 1981, tensions arising over which direction the UFW should pursue—bureaucratic or grassroots organization—led Jerry Cohen, Ganz, Govea, and Padilla to resign from the association. Chávez regrouped with the tried and true strategies of the farm worker movement and focused national attention on the use of hazardous pesticides

and the deplorable living conditions of undocumented farm workers.

FEMALE LEADERSHIP IN THE UFW

Dolores Huerta may be the most recognizable female leader of the UFW, and her early organizational experience as a lobbyist for the CSO helped her to become one of the most effective negotiators for the association. Like Chávez, Huerta was tireless in her dedication to *la causa*. Yet, she saw the farm worker movement as only one part of the mass organization to build a moral social consciousness. Her nontraditional role in the union movement set her apart from other women; however, the success of the movement would not have occurred without the efforts of women such as Huerta.

The struggles of Chicana farm workers are worsened by the double standard of the overarching patriarchy that permeates the Chicano culture. Little consideration is given to the contradiction that women working in the fields are regularly discouraged from participating in the decision-making processes of the association. Assuming a more traditional role in the movement, César’s wife, Helen Chávez, supported her family by returning to work in the fields and by participating in the picket demonstrations. Only at the behest of César did Helen reluctantly accept an appointment as manager of the association credit union.

The traditional and supportive roles that Chicanas played in the farm worker movement should not be taken lightly. The strategy of nonviolent activism promoted by the UFW often resulted in women being placed at the front of the picket lines. During times of confrontation the women were subjected to battery from the fists and clubs of job foremen and Teamster members. Although the sacrifices made by these women to *la causa* garnered respect from male members of the movement, the sacrifice of moving one’s family across the nation to organize boycotts was not as respected. The experiences and dedication of women such as Jessica de la Cruz, Jessica Govea, Hope Lopez, and Juanita Valdez were vital to carrying the spirit of *la causa* to the public.

NEW CHALLENGES

Arturo Rodriguez became the second president of the UFW after the death of Chávez in April 1993. Holding to the visions of the original leaders of the movement, Rodriguez is carrying on the efforts to ban pesticides, combat deplorable living conditions, and restrict the use of child labor. The changing demographics of farm workers are leading the UFW to forge new alliances with other movements and ethnic associations, highlighting the continued commitment of a grassroots organization interested in the concerns of all individuals.

Although the UFW remains a formidable advocate for the rights of farm workers, it is unclear what effects the global economy will have on the farm worker movement. Importation of specialty and other crops presents a significant threat to the jobs and wages of domestic and undocumented farm workers. The boycotts of the 1960s and 1970s had support from international unions in the form of European dock workers refusing to off-load California grapes. Although the boycott remains a powerful tool for the UFW, only time will tell if labor movements are strong enough to marshal international collective action to weather the storm of globalization.

 **FILM INDUSTRY**

There are two things you always hear about Hollywood from people who work in Hollywood: 1) There are no rules, only success and failure, and 2) Hollywood is high school with money.

While somewhat flip, these clichés accurately describe a volatile environment created by a group of individuals who are continually chasing the intersection of commerce and fantasy. Any discussion of leadership within this industry requires first a brief history of the business, as well as an overview of modern Hollywood. Once an historical context is provided, one is able to analyze the different spheres that exist in Hollywood as they pertain to leadership.

BRIEF HISTORY OF HOLLYWOOD

The original leaders of the film industry who created the Hollywood system—Carl Laemmle, Adolph Zukor, William Fox, Louis B. Mayer, and Benjamin Warner—developed the first film studios, which still

operate today (Universal Pictures, Paramount, Fox, MGM, and Warner Brothers respectively).

Although they did not know each other before arriving in Hollywood, it is striking how much they had in common: they were predominantly Jewish immigrants or sons of recent immigrants of Eastern European origin. They describe themselves as coming from unstable and dysfunctional homes with weak or absent fathers. Most of their relatives were in retail businesses so that they had some basic familiarity with the concept of public taste, merchandising, market swings, and competition. They were eager to assimilate in an anti-Semitic and xenophobic post-World War I American climate.

Something drove them to a ferocious, even pathological, embrace of America. . . . [and] to deny whatever they had been before settling here. . . . within the studios and on the screen, they could simply create a new country—an empire of their own, so to speak—one where they would not only be admitted, but would govern as well. They would fabricate their empire in the image of America as they would fabricate themselves in the image of prosperous Americans. They would create its values and myths, its traditions and archetypes. It would be an America where fathers were strong, families stable, people attractive, resilient, resourceful and decent. This was their America, and its invention may be their most enduring legacy. (Gabler 1998, 4–6)

From the beginning, leadership was connected to perception in Hollywood. When the studio founders successfully projected the image they sought on the screen, it somehow reflected back to them. They began emulating the world they created on film: lavish homes, glamorous cars, and parties. Creating a perception of power often became as good as having the real thing. This notion holds true in contemporary Hollywood as well.

OVERVIEW OF CONTEMPORARY HOLLYWOOD

Hollywood is a nexus of commerce, art, entertainment, and wish fulfillment. Making films is a collaborative art form involving hundreds, and sometimes thousands, of people.

In addition, there is usually a huge amount of

money at stake every time a feature film is made. In the modern age of the blockbuster (each with a production cost of from 75 to 200 million dollars), feature-length filmed entertainment is responsible for roughly 35.5 billion dollars a year or 0.4 percent of the U.S. gross domestic product (GDP). If one were to include all entertainment media and ancillary markets (television, DVD/VHS, publishing, music, etc.) the number would exceed 5 percent of the GDP. As a result, commercial and financial interests increasingly influence the filmmaking process, determining everything from subject matter, to budget, to actor choice. This leads to an inevitable conflict between commercial and artistic interests.

It is, as with all consumer industries, difficult to predict what will connect with audiences and therefore constitute a hit. Studio executives are desperate to capitalize on the newest trend and replicate success (e.g., a slew of teen horror movies went into development after the success of *Scream*, Westerns were snatched up after *Unforgiven*, and *Gladiator* prompted every studio to focus on historical epics).

LEADERSHIP SPHERES IN MODERN HOLLYWOOD

There are three primary spheres within contemporary Hollywood that are pertinent to a discussion of where and how leadership exists within the industry. The first is the business itself: the studios (which finance and distribute many of the world's feature films), producers, and talent agencies. The leaders in this sphere are individuals who have proven to have a combination of good instincts regarding material and ways to “package” that material with writers, directors, and actors. They also have financial acumen, an instinct about how much to spend on a given project given its potential yield. They have consistently made money as a result.

The second arena involves the talent/artists: the writers, directors, and actors who regularly think up ideas for films and are responsible for putting them on screen. Even though they often have no intention of being leaders, these people can become leaders in the community because of their innovation and/or integrity as artists. They do not seek or necessarily

This publicity photo taken in the late 1950s shows two major forces in the film industry: director Alfred Hitchcock at the wheel and the MGM Studio.

Source: Bettmann/Corbis; used with permission.

acknowledge their followers but they have followers nonetheless.

The third is the film set whose hierarchy places the director at the top. Whether or not this director actually is or remains the leader of typically between two hundred to three hundred people for the duration of production (typically anywhere from 45–120 days) largely depends on his/her leadership abilities and how much power the movie stars, the studio executives, and the producers have. Aside from his or her talent, a director's passion, clarity of vision, and ability to make decisions (even if they turn out to be wrong decisions) are perhaps the most important traits when it comes to inspiring and leading on the set. Combined with a certain level of diplomacy, these qualities are helpful not only in earning the crew's trust, but also in negotiating the many egos and obstacles to creativity that arise during the course of the production.

BUSINESS SPHERE

Hollywood is a fickle and fluid environment in which people are frequently fired and recycled within the studio system. It is not uncommon for someone to lose and regain success several times

within a single career. Some well-known Hollywood failures and rebounds include the career of Jeffrey Katzenberg, who was famously ousted from his role as Disney's studio chief and then went on to cofound DreamWorks SKG with Steven Spielberg and David Geffen. Michael Ovitz was also publicly forced out of his stint at Disney following a long, successful run at talent agency CAA. He then bounced back with his creation of a successful new management company named AMG (which later fizzled). Another notable example of the Hollywood rebound is Robert Evans, who took the leap from struggling actor to head of Paramount Pictures in the 1970s, where he revitalized the fledgling studio, only to lose it all amidst drug charges. He later returned as a producer and most recently as a modern-day film legend, having written a popular autobiography and narrated the book's adapted documentary, *The Kid Stays in the Picture*. It is difficult to maintain success steadily. Those who manage such success, however, are not always effective leaders.

Even though much of the business has changed with the advent of new technologies (video, digital FX, DVDs, and satellites) and even though most studios are now owned by huge conglomerates (e.g., Sony and AOL/Time Warner), the infrastructure within the day-to-day operations of any given studio remains the same as it has for seventy-five years. There are a chairperson, a president responsible to him/her, copresident(s), several vice presidents subordinate to the copresident(s), creative executives, and so on.

These are institutionalized positions of power. Whether or not a person merits the position by virtue of his or her skills and talent, he or she can exert enormous influence and lead—with varying degrees of success—hundreds (sometimes thousands) of people for the duration of a job tenure.

For example, Peter Guber and Jon Peters were considered hugely successful film producers when they were hired to run Sony Pictures in 1989. They had just produced *Batman*, the largest grossing film of all time for Warner Brothers, and had their names on Academy Award-winning films such as *Rain Man* and *The Color Purple*. Yet their ability to win fans and attract followers was already in question.

It was known within the industry that Steven Spielberg “had a provision in his contract explicitly barring them from the set of *The Color Purple*” (Griffin and Masters 1996, 127). They only visited the set of *Rain Man* once. During that now infamous drop-by, Peters reportedly asked Dustin Hoffman, “Are you playing the retard or the other guy?” (162).

Regardless of their reputations as hands-off producers, Sony hired them to run the studio and agreed to pay them the largest compensation package that had ever been negotiated. “For five years, Sony executives in New York and Tokyo would stand by while the studio lost billions and became a symbol for the worst kind of excess in an industry that is hardly known for moderation. There were box office bombs, lavish renovations, extravagant parties against a backdrop of corporate intrigue, expensive firings and even a call girl scandal” (Griffith and Masters 1996 9–10).

As a result of the frequent turnover in executives, it is often an executive’s ability to survive over time that earns them the respect of their peers and affords them the opportunity to have a real impact on the industry. Sherry Lansing is one such executive. In 1980, she was a pioneer as the first woman to be made head of production in Hollywood. She ascended the ranks at Twentieth-Century Fox and is, today, the longest ranking female chair of a studio (Paramount Pictures). She was promoted to that job in 1992.

Lansing is a legend already for her remarkable endurance. One of the reasons she is so well liked in the community is that she remains true to herself and her personality. She did not imitate conventionally male behavior in order to get to the top. Nor did she feel the need to deny her femininity once she was there. She is famous for giving “the nicest no in the business” (Sellers 1998) and for being supportive and nurturing to filmmakers. She championed many controversial projects, including female-themed, contentious films that ultimately succeeded, such as *The Accused*, *Fatal Attraction*, and *Sleeping with the Enemy*. She has also always made a point of consistently using her position of power to raise money for countless charities and fundraisers.

There are also certain entrepreneurs who, rather than merely assuming responsibilities in a preexisting structure (i.e., a studio), have devised a novel business concept and successfully motivated others in pursuit of that idea. They built huge and profitable companies from the ground up because the ideas combined with their personalities allowed them to flourish. Walt Disney was one such person; Mike Ovitz was another.

Mike Ovitz had a “new” idea for a talent agency and had the leadership qualities to pull it off. Unlike the traditionally competitive environment created in most talent agencies, Ovitz built his Creative Artists Agency on a Japanese model, creating a system in which no single personality became so powerful as to threaten the good of the whole group. He formed teams of agents responsible for managing the careers of their clients so no one agent could become indispensable to the actor.

In addition, he became the first agent to “package” movies successfully. In other words, he would coordinate his clients such that a writer, director, and movie stars, all represented by CAA, would be attached and sold as a single package to a studio. Thereby he became the controlling entity, the most powerful person in the equation.

Mike Ovitz was a superb leader. And smart. He knew the secret that great leadership is predicated on great followship. He knew how to pick people that needed that. . . . Ovitz made everybody feel special and just a little bit insecure at the same time. His whole thing was “You are the chosen people and I am your magnanimous leader. You are all on a train. You don’t know where that train is going, but that’s not what’s important. What’s important is that you’re on the train for a reason, because you’ve been selected, because you’re the very best.” (Rensin 2003, 256)

TALENT

It is difficult to get any movie made, much less a good movie. There are filmmakers who persevere in spite of huge odds. These role models provide inspiration for the legions of others who need to be reminded to hang onto their artistic convictions despite industry pressure.

When Orson Welles made *Citizen Kane*, he intended it to be both controversial and groundbreaking. The movie was a thinly veiled attack on newspaper magnate William Randolph Hearst. Hearst tried relentlessly to kill the project. The film combined many elements and filmmaking techniques that nobody had imagined could be used in concert. Welles sampled from all of the major film movements: Surrealism, French Impressionism, German Expressionism, Soviet Montage, and Classic Hollywood Style.

He used a technology called deep focus camera (all of the images in the frame were in focus rather than distant and very close objects being fuzzy). He used documentary reel newsreel introduction, flashbacks, and deep space imagery (where there are many things happening in the background and foreground as well as where the main action is taking place). He utilized sound technology to create abrupt changes in sound (e.g., echoes to mimic vast spaces in the Kane mansion in the film). The film also used ambitious tracking shots (when the camera moves independently of the characters) to set up sequences in the film (Erickson 2003). For years to come, his film stylistically influenced thousands of filmmakers worldwide including Brian de Palma, Martin Scorsese, and Steven Spielberg.

Like Welles, Spike Lee uses controversy to his advantage. It adds luster to a larger-than-life personality. Lee shot his first film *She's Gotta Have It* in ten days in 1985 for \$175,000, raising money from every possible personal source. Films with African-American actors about race issues were hardly in vogue. He had to prove to white financiers that there was an audience for his films, and that both black and white people would appreciate them. In the early twenty-first century, Lee's films are accepted as both financially and artistically viable projects. He is largely responsible for changing the contemporary film community's understanding of and interest in films by and about African-Americans. He has made many independent films as well as studio films and is one of the few who has credibility in both worlds.

In addition to making films with and about black characters, Lee makes a point of hiring African-

Americans behind the scenes on his film crews. He has inspired a legion of young black filmmakers and recognizes the influence he has.

I just try to lead by example. . . . I remember at the first LA premiere of *She's Gotta Have It*, a skinny black kid walked up to me and said, "Hi, my name is John Singleton (*Boyz in the Hood*) and I'm in high school now but I'm going to make movies just like you." For me, that's where the reward is, though that is not to say that I am the father of black cinema. I'm just going down the same road that Ossie Davis, Oscar Micheaux, and Melvin Van Peebles went down. Their success made it easier for me, and every success I have makes it easier for others. Young black kids need concrete examples of people like them who make films, because until you see someone like you doing something, you can never imagine yourself doing it. (Verniere and Fuchs 1993, 82).

George Lucas was also an innovator who changed filmmaking through technology. He created the first blockbuster with visual effects when he made *Star Wars*. He met with extreme opposition in trying to get the film made. Nobody could decipher the thirteen-page treatment he had written. It had no precedent, no sci-fi epic genre to fall back on. Finally, Alan Ladd Jr., who was running Fox at the time, agreed to make the film simply because he believed in Lucas, not because he understood the concept for the film any better than anybody else. It was Lucas's passion and skill as a filmmaker, which he exhibited in his first two films (*American Graffiti* and *THX 1138*), that gave Ladd the confidence to support the young director.

Lucas developed the technology needed for his film. And because the movie was such a success, he simultaneously created a marketplace—an appetite—for the kind of film he was capable of delivering. He parlayed his innovative technology into several technology companies: ILM, Skywalker Sound, LucasFilm, and a digital film editing company.

Lucas also asked for an unprecedented deal, especially given that he had only made two films. He wanted his own company to produce the film, he wanted final cut, merchandising rights, publishing rights for any *Star Wars* books, music rights, and most importantly, sequel rights. He got some, though

not all, of these requests. But it was the first time anybody had ever envisioned the future of the blockbuster and all its ancillary markets.

By many accounts, Lucas is a near recluse who lives in Northern California with little or no interest in traditional Hollywood. However, he changed the face of both movie making and deal making for talent. He had tremendous vision and perseverance. He had a seismic effect on Hollywood and is a leader as a result.

FILM SET

A film set is a world of its own. It is a traveling city, complete with the drama, conflicts, chaos, and triumphs of its people. The director is supposed to be in charge, but his/her personality and charisma play a large part in whether that person maintains control over hundreds of people or not. Roman Polanski, a director of films such as *Rosemary's Baby* and *Chinatown*, says:

Directors are like generals, political dictators, aggressive people. You don't have to be aggressive in a malevolent way, in a hostile disagreeable way. Actually, you have to be the opposite way. You have to be a real leader. That's to say you have to let those who are doing their work do their work. You are a guide, and you're a "tell it to," and you're a prophet, and you're a boss and you're a slave, and, in the end, it's your fault. And everyone in the film is always grateful if you tell them what to do. (The Film Director 2003)

To complicate matters, movie stars make more money than anyone else on a movie (the superstars make 20–25 million dollars per film). They can refuse to do a scene, lock themselves in their trailer, or otherwise profoundly affect the mood on a set. In Sidney Lumet's (*Dog Day Afternoon*, *12 Angry Men*, *Network*) book, *Making Movies*, he talks about the kinds of tests that actors occasionally give to directors on the first or second day of production. Usually, it is only the most powerful and highly paid actors who feel entitled to engage in this manner in front of an entire film crew. Nonetheless, the extent to which the director passes or fails determines whether or not the director remains in charge of his

or her set and earns the respect of the actor and/or the rest of the crew.

What Brando does is to give you two apparently identical takes. Except that on one, he is really working from the inside; and on the other, he is just giving you an indication of what the emotion was like. Then he watches which one you decide to print. If the director prints the wrong one, the "indicated" one, he's had it. Marlon will either walk through the rest of the performance or make the director's life hell, or both. (64)

Lumet wrote that he rarely leaves the set while the crew is lighting as it is "good for the crew morale. They work harder" (Lumet 1995, 111). It is a smart and special kind of director who understands that the more you respect and support the people on your crew the harder they will work. There are other successful methods of directing: intimidation and fear can get the job done and is a common tactic for many directors. But this leadership style does not cultivate a willing, enthusiastic, and loyal crew and/or group of actors.

Luck, persistence, and talent play equal parts in one's ability to flourish in Hollywood. It is far easier to have power than it is to be a leader in Hollywood. This is because perception (both inside and outside of the Hollywood community) plays such a large role in success or failure (e.g., Guber/Peters), similar to high school. If you are perceived to be the hot new director of the moment (even if you have directed nothing) you can wield influence and yet achieve nothing concrete. Luck can carry a director toward success. Talent without persistence, however, will get a director nowhere.

The bottom line is that it is incredibly difficult to get movies made. Because of the cost, movie stars' being in favor one minute and out favor the next, and the studios' ever changing appetite, making any movie is a challenge. Therefore, anybody who is able, on a regular basis, to get movies made (let alone get good movies made) is a success story in the industry. They have managed to do something that everybody else is merely trying to do.

To be a real leader in Hollywood is to have an impact on the industry, to change it in some meaningful way. Leadership means fostering innovation in a business in which it's difficult to have a lasting

influence. A leader in this community has a combination of qualities that cannot be separated from one another:

1. unusual passion and instinct, like the founding leaders of Hollywood, who had a sense for what the public wanted while simultaneously being driven by a burning personal wish fulfillment;
2. the ability to persevere;
3. the charisma and ability to persuade a large group of people to believe you for long enough such that you can get what you want; and
4. the ability to consistently identify and capitalize on opportunity and good fortune.

—Jenno Topping

FOLLOWER-ORIENTED LEADERSHIP

Leadership is a symbiotic relationship between those who choose to lead and those who choose to follow. Any discussion of leadership must attend to the dynamics of this relationship. Strategies, tactics, skills, and practices are worthless unless the fundamental human aspirations that connect leaders and their constituents are understood (the word *constituents* is preferred to *followers* because the former connotes a greater sense of engagement and commitment than the latter term). What leaders say they do is one thing; what constituents say they want and how well leaders meet these expectations is another. For a balanced view of leadership, one must consider the expectations that people have of their leaders: What do they look for and admire in a person they would willingly follow?

WHAT PEOPLE LOOK FOR AND ADMIRE IN THEIR LEADERS

We began our research in the early 1980s on what constituents expect of leaders with surveys of several thousand business and government executives. In response to the open-ended question “What values (personal traits or characteristics) do you look for and admire in your leaders?” more than 225 different values, traits, and characteristics were identified. Subsequent content analyses by several independent judges reduced those items to twenty categories (each with a few synonyms for clarification). In current surveys respondents select the seven qualities that they “most look for and admire in a leader, someone whose direction they would *willingly* follow.” The key word in this question is *willingly*. What do they expect from a leader whom they would follow not because they have to, but because they want to? The results of these studies—now numbering over 75,000 respondents around the globe—have been striking in their regularity over the years.

A person must possess several essential characteristics before others are willing to grant that individual the title *leader*. Table 1 shows which characteristics respondents chose in three different years as most crucial for a leader. Because we asked respondents to choose seven characteristics, the totals add up to approximately 700 percent.

What is most striking about the results summarized in the table is that only four characteristics have continuously been chosen by more than 50 percent of the respondents. In order for them to follow someone willingly, it appears that the majority of constituents want the leader to be honest, forward-looking, competent, and inspiring. Not only is this finding consistent over time, it is consistent across continents, as shown in Table 2.

To gain further insight into people’s assessments of follower-oriented leadership, we conducted a series of additional studies. Respondents’ answers to questions about leaders with whom they had had personal experience gave us actual examples of the actions of admired leaders, information on the affective nature of leader-constituent relationships, and details about the types of projects or programs involved.

Table 1. Characteristics of Admired Leaders

<i>Characteristics</i>	<i>Percentage of Respondents Selecting Each Characteristic</i>		
	<i>1987</i>	<i>1995</i>	<i>2002</i>
Honest	83	88	88
Forward-looking	62	75	71
Competent	67	63	66
Inspiring	68	68	65
Intelligent	43	40	47
Fair-minded	40	49	42
Broad-minded	37	40	40
Supportive	32	41	35
Straightforward	34	33	34
Dependable	33	32	33
Cooperative	25	28	28
Determined	17	17	24
Imaginative	34	28	23
Ambitious	21	13	21
Courageous	27	29	20
Caring	26	23	20
Mature	23	13	17
Loyal	11	11	14
Self-controlled	13	5	8
Independent	10	5	6

Note: Respondents came from North America, Asia, Europe, and Australia, but the majority were from the United States.

Table 2. Cross-Culturally Desirable Characteristics of a Leader

<i>Country</i>	<i>Percentage of Respondents Selecting Each Characteristic</i>			
	<i>Honest</i>	<i>Forward-Looking</i>	<i>Competent</i>	<i>Inspiring</i>
Australia	93	83	59	73
Canada	88	88	60	73
Japan	67	83	61	51
Korea	74	82	62	55
Malaysia	95	78	62	60
Mexico	85	82	62	71
New Zealand	86	86	68	71
Scandinavia	84	86	53	90
Singapore	65	78	78	94

The studied attributes reveal consistent and clear relationships. When leaders are performing at their peak, they are doing more than just getting results. They are also responding to the expectations of their constituents, underscoring the point that leadership is

a relationship centered on service to a purpose and service to people. It is worthwhile to take a closer look at the four top-ranking attributes of a leader.

A Leader Should Be Honest

In almost every survey, honesty has been selected more often than any other leadership characteristic. It emerges as the single most important ingredient in the leader-constituent relationship. The percentages vary, but the final ranking does not. It's clear that if people are to willingly follow someone—whether it be into battle or into the boardroom, into the front office or onto the front lines—they first want to assure themselves that the person is worthy of their trust. Constituents want to know that the person they are following is truthful, ethical, and principled. They want to be fully confident of the integrity of their leaders, whatever the context. Nearly 90 percent of constituents want their leaders to be honest above all else.

How do constituents measure a characteristic as subjective as honesty? Focus groups and in-depth interviews indicate that the leader's behavior provides the evidence. In other words, regardless of what leaders say about their own integrity, people wait to be shown; they observe the behavior. Consistency between word and deed is how someone is judged to be honest. Employees' perceptions of their managers' honesty has been demonstrated to have considerably more impact on organizational profitability than more traditional measures like employee satisfaction and commitment. For example, a recent survey of over 7,000 employees from 76 hotels (ranging from economy to upper mid-price range) showed that perceptions of their managers' integrity—both keeping promises and demonstrating espoused values—was strongly linked with the hotel's profitability (Simons, 2002). An increase of just one-eighth of a point, on a five-point scale, could be expected to improve the hotel's annual profits by over 2.5 percent (for an average full-service hotel, that translates into over \$260,000 to the bottom line).

Honesty is strongly tied to values and ethics. Constituents appreciate people who take a stand on important principles. They resolutely refuse to fol-

low those who lack confidence in their own beliefs. Confusion over where the leader stands creates stress; not knowing the leader's beliefs contributes to conflict, indecision, and political rivalry. Constituents simply don't trust people who cannot or will not reveal their values, ethics, and standards.

A Leader Should Be Forward-Looking

More than 70 percent of the recent respondents selected the ability to look ahead as one of their most sought-after leadership traits. Leaders are expected to have a sense of direction and a concern for the future of the organization. Whether this ability is called a vision, dream, calling, goal, or a personal agenda, the message is clear: Leaders must know where they're going if they expect others willingly to join them on the journey.

Other surveys over the years have reinforced the importance of clarity of purpose and direction. For example, more than a decade ago, executives rated "developing a strategic planning and forecasting capability" as their most critical concern. When asked to select the most important characteristics in a CEO, these same senior managers ranked "a leadership style of honesty and integrity" first and "a long-term vision and direction for the company" second (Korn/Ferry International, 1989). We recently asked several hundred executives these same questions and their responses were nearly equivalent. By the ability to be forward-looking, people do not mean the magical power of a prescient visionary. They mean something far more down-to-earth: the ability to choose a desirable destination toward which the company, agency, congregation, or community should head. Vision is the magnetic north that provides others with the capacity to chart their course. Constituents ask that a leader have a well-defined orientation toward the future. They want to know what the organization will look like, feel like, and be like when it arrives at its goal in six months or six years. They want to have it described to them in rich detail so that they will know when they have arrived and so that they can select the proper route for getting there.

One significant finding about the quality of being

forward-looking is that the impact of this characteristic varies by organizational level. Around 95 percent of senior executives, but only 60 percent of frontline supervisors, desire their leader to be forward-looking. This wide gap indicates an important difference in expectation that is clearly tied to the breadth, scope, and time horizon of the job. Senior people see the need for a longer-term view of the future more so than managers at the front lines of operations. Moving up in organizations clearly requires a broadening of perspective, in terms of both time-span and strategic focus.

A Leader Should Be Competent

To enlist in another's cause, constituents must believe that the person they will follow is competent to guide them. Leaders must be capable and effective. When constituents doubt the leader's abilities, they are unlikely to enlist in the cause. *Competence* refers to the leader's track record and ability to get things done. Competence inspires confidence that the leader will be able to guide the entire organization, large or small, in the proper direction. It does *not* refer to the leader's abilities in the core technology of the organization. In fact, the type of competence demanded seems to vary more with the leader's position and the condition of the organization. While people demand a base level of understanding of the fundamentals of the industry, market, or professional service environment, they also know that leaders cannot be expected to be the most technically competent in their fields. Organizations are too complex and multifunctional for that ever to be the case. This is particularly true as people reach senior levels.

For example, those who hold officer positions are definitely expected to demonstrate abilities in strategic planning and policymaking. If a company desperately needs to clarify its core competence and market position, a CEO with savvy in competitive marketing may be perceived as a fine leader. But at lower levels in the organization, where people expect guidance in technical areas, these same strategic marketing abilities will be insufficient. A leader on the line or at the point of customer or client contact will typically have to be more technically competent

And when we think we lead, we are most led.

—Lord Byron

than someone less engaged in providing services or making products. Yet it is not necessary that even the frontline leader surpass his or her constituents in technical competence. Much more significant is that the leader takes the time to learn the business and to know the current operation.

A Leader Should Be Inspiring

People expect their leaders to be enthusiastic, energetic, and positive about the future. They expect a leader to be inspiring—a bit of a cheerleader, as a matter of fact. It is not enough for a leader to have a dream about the future. A leader must be able to communicate the vision in ways that encourage people to sign on for the duration. When leaders breathe life into dreams and aspirations, people are much more willing to enlist.

In his book *Working*, the writer Studs Terkel quotes Nora Watson, an editor: "I think most of us are looking for a calling, not a job. Most of us . . . have jobs that are too small for our spirit. Jobs are not big enough for people" (Terkel, 1974, xxiv). Her words underscore how important it is to find some greater sense of purpose and worth in the day-to-day routines of working life. While the enthusiasm, energy, and positive attitude of a good leader may not change the content of work, they certainly can make work more meaningful.

Not only does an inspiring leader fulfill people's need to have meaning and purpose in their lives, an inspiring leader offers people hope. This is crucial at any time, but in times of great uncertainty, leading with positive emotions is absolutely essential to moving people upward and forward. When people are worried, discouraged, frightened, and uncertain about the future, the last thing they need is a leader who feeds those negative emotions. Instead, they need someone who communicates in words, demeanor, and actions that she or he believes in a better future. Emotions are contagious, and positive

emotions resonate throughout an organization and into relationships with other constituents. Enthusiasm and excitement are essential, and they signal the leader's personal commitment to pursuing a dream. If a leader displays no passion for a cause, no one else is likely to, either.

PUTTING IT ALL TOGETHER: CREDIBILITY IS THE FOUNDATION

Constituents' desire for honest, forward-looking, competent, and inspiring leaders has remained constant during two decades of growth and recession, the surge in new technology enterprises, the birth of the World Wide Web, the further globalization of the economy, and the expansion and burst of the Internet-based enterprises. While the relative importance of the most desired qualities has varied over time, there has been no change in the fact that these are the four qualities people want most in their leader.

Taken together, these characteristics bear a striking resemblance to those communications experts use for determining what they call "source credibility." In assessing the believability of sources of communication—whether newscasters, salespeople, physicians, or priests; whether business managers, military officers, politicians, or civic leaders—researchers typically evaluate people on three criteria: their perceived trustworthiness, their dynamism, and their expertise. The more highly one rates on those dimensions, the more one is considered a credible source of information.

Those three dimensions comprise three of the top four characteristics constituents desire in their leaders. The conclusion is inevitable: Follower-oriented leadership requires leaders who are credible. Credibility is the foundation of leadership; above all else, people must be able to believe in the people they follow. They must believe that the leader's word can be trusted, that the leader will do what he or she promises, that the leader is personally excited and enthusiastic about the direction in which the organization is headed, and that the leader has the knowledge and skill to lead. The quality of being forward-looking is what transforms a credible individual into a leader; it adds to credibility a sense of direction and intentionality.

The significance of leaders' credibility and its impact on organizational performance has been well documented. Studies show that when they perceive their immediate managers as credible, employees are significantly more likely to be proud to be part of the organization, feel attached and committed to the organization, feel a strong sense of team spirit, have a sense of ownership of the organization, and see their own personal values as consistent with those of the organization. When people perceive their manager to have low credibility, on the other hand, they are significantly more likely to produce only if they are watched carefully, are motivated primarily by money, say good things about the organization publicly but criticize it privately, consider looking for another job if the organization experiences problems, and feel unsupported and unappreciated.

The credibility of an organization's leaders influences not only the loyalty of employees but also that of customers and investors. At the center of loyalty, say researchers, "Whether it be the loyalty of customers, employees, investors, suppliers, or dealers—is the personal integrity of the senior leadership team and its ability to put its principles into practice" (Reichheld, 2001, 6).

In analyzing and practicing leadership, an appreciation of the perspective of constituents underscores the fact that leadership is a relationship. This relationship builds upon the character and actions of leaders in meeting and responding to the needs, expectations, and aspirations of their constituents. The most effective leaders cherish this relationship, realizing that the work of the organization rests in the hands, minds, and hearts of their constituency.

influence over a larger number of people on a continuous basis. Most theories and concepts of leadership exclude from this definition instances of coercive influence, when people are forced to follow a ruler or a superior. The term *leadership* is reserved for instances that involve voluntary followership. Therefore, leadership depends on followership. Hence, to understand the leadership process one must understand the motivation to follow.

Why do people follow leaders? Leadership theories provide several answers to this question, here classified according to different follower motivations: position-based followership, calculated followership, safety-based followership, meaning-based followership, and identity-based followership.

POSITION-BASED FOLLOWERSHIP

In some cases, followers are motivated to accept the leader's influence simply because of the leader's position in some social institution. Thus followers comply with the requests or orders of kings, heads of families or tribes, ministers, mayors, managers, and army officers because of those people's position in the relevant institutional hierarchy. The voluntary motivation to follow in these cases is based on followers' acceptance of the legitimacy of the institution and its hierarchy. If they accept the hierarchy as legitimate, they also accept that the leader will make requests and issue instructions within certain limits, and they regard their compliance with these requests and instructions as part of their roles as subordinates in the social system. The scholars John French and Bertram Raven, who discussed several bases of power in social relations, referred to the power of leaders over followers in this case as legitimate power.

The pioneering sociologist Max Weber (1864–1920) suggested that followers' acceptance of the legitimacy of the institution and hence their compliance with the leader's requests or orders may rest on two bases: a traditional base and a rational-legal base. In some societies, kings, heads of tribes, or priests are leaders by virtue of tradition. Individuals who have been socialized in these societies have internalized the legitimacy of the tradition and consequently accept the leader. In other cases, individu-

FOLLOWERS, MOTIVATION OF

According to most definitions, leadership is a social-influence process. It exists when an individual or a small number of individuals have disproportionate

Morality, Loyalty, and Reasons for Following

The following text describes the motivation of followers to follow political leaders in Thailand. It shows how personal loyalty and ties to a person who represents the moral and social order is the key element of the leader-follower relationship.

Apart from the role of individual moral awareness, keeping society in good order is definitely the task of the government, culminating in a personalized leader, a "man of prowess" capable of dominating the external world. He enforces desirable order, and what is good for him, as a father, should be good for all. It is, therefore, loyalty to him, and the collectivity he stands for, that is far more important than law as a means of maintaining good order. Consequently, the seeking of patronage defines political behaviour, while the group "nation, state, region, country, people" is seen and defined in moral rather than in legal terms; society is a moral construct.

Trust in hierarchy and loyalty to leadership are basically moral acts that agree with the highly personalized image of social life, in which the unknown areas of the external world are somewhat alarming and definitely awe-inspiring. In a way, it is like nature, filled with mysterious forces and spirits, but also a field of opportunity; socially it is the arena of competition for power and position of the grandees and bosses, often rather violent, where an unobtrusive little man may also appropriate an occasional prize.

It is this understanding of the external, "public" world that provides the matrix in which the ideas of democracy and human rights must be localized. The identifying marks of that world appeared to be that it is not seen as a public trust but rather as a field of opportunity where people are concerned with their personal interests first of all. There the high and mighty claim their "rights" and function as patrons vis-à-vis those in lesser positions. This "personalizes" the external world, and makes it moral; it is seen in the familial terms of basic inequality and the ethics of

place. Before we can dwell on the transformations this matrix causes to the ideas and practice of democracy and human rights, we should briefly consider the premises of the latter two.

Premises of Democracy and Human Rights

In their self-proclaimed "new world order," the Americans apparently push to institute "free and fair elections" in all the countries of the world as a sign that democratic government prevails. Yet, democracy is part of a complex set of ideas; some of its related procedures are easily adopted at the same time as its spirit and participatory practices fail to acquire local meaning.

The ideas of democracy and human rights stem from an environment that grounds morality in equality: individual people matter, they have a right to their opinion, are morally autonomous, and equal before the law; they have the right, and the duty, to be informed and to partake in the public discourse. Practically, this highlights the role and function of a free press, and implies the freedoms of expression and association, alongside the right to vote.

As a means of regulating wider society, democracy involves the people, thus making that society the public world. It sees that world in a sociological manner "as an abstract structure of institutions and power relationships, of conflicting interests and ideas, that are subsequently discussed in a frank fashion and that can be influenced by policy decisions and the implementation of law." Society is neither static, nor merely subject to contingent forces, but governable and constructable, most often in the name of the public interest or common good.

Source: Mulder, Niels. (1996). *Inside Thai Society: Interpretations of Everyday Life*. Amsterdam: The Pepin Press, pp. 167–169.

als may accept the legitimacy of an institutional hierarchy because they view the institutional structure as rational. For example, citizens may regard democracy as a rational form of government. They therefore accept the authority of democratically elected leaders even if they did not vote for them. Similarly, organizational members may regard the organizational hierarchy as a rational method of coordination. In a company, for example, they will regard it as rational that a higher-level manager will issue

requests and instructions to a lower-level employee; in the military, they will accept that an higher-ranking officer will issue orders to a lower-level soldier. If they occupy a subordinate position in these systems, their motivation to follow the leader is based on this rationality. In many cases, the rational order is backed by laws or formal regulations; hence the term *rational-legal* that Weber coined.

Many theories regard leadership as influence that does not stem from the formal position of the leader.

These theories exclude position-based followership from the domain of leadership, and regard it as falling under such domains as managership or rulership or headship. However, since many—perhaps most—leaders do occupy a formal position, and since position-based followership is not based on coercion, it is important not to forget this type of motivation to follow.

CALCULATED FOLLOWERSHIP

Individuals may follow a leader because they expect the leader to help them achieve their goals, or provide them with desired rewards. Thus people may elect a politician and support him or her because they believe he or she will reduce crime or improve educational standards in their community. Similarly, subordinates may obey their boss because they believe the boss will reward them with a bonus or a promotion. The basis of followership in such instances is an explicit or implied deal between the leader and the followers, according to which the followers agree to follow the leader in exchange for certain outcomes that the leader promises to deliver. Accordingly, this type of relationship has been called transactional leadership by such scholars as James MacGregor Burns and Bernard Bass.

Several leadership theories are based on this notion of exchange between leaders and followers. For instance, the path-goal theory of leadership assumes that followers have certain goals they wish to achieve. However, there may be some obstacles in their path. The role of the leader, according to this theory, is to remove those obstacles and thus assist the followers in achieving their goals. When the leader removes the most relevant obstacles, followers will be motivated to follow him or her, and he or she will become an effective leader. For instance, if the followers' task is unclear, a leader will be most effective if he or she provides directive leadership that clarifies the task and the action required. Similarly, if the work is stressful or boring, a leader will be most effective if he or she provides supportive leadership to the followers. In both cases, the leader's influence is based on followers' expectations that the leader will help them achieve their goals.

*It is not the horse that draws the cart,
but the oats.*

—Russian proverb

Another theory that is based on exchange is the leader-member exchange (LMX) theory, which describes the development of leader-member relationships in several stages. In the first phases, both sides have calculated the advantages of participating in the relationship: The leader needs support, assistance, and compliance from the followers, who in turn depend on the leader for various rewards. The leader makes requests of the followers, who comply with these requests because of the leader's formal role and because the leader controls desired rewards, such as better task assignments or financial bonuses. The motivation of followers at these early stages is self-interest. According to LMX theory, other motivations develop at later and more mature stages of the relationship.

When the motivation to follow is based only on followers' calculated assessment of what will be most advantageous to them, the leader's influence is limited. Followers who are motivated by expected rewards comply with the leader only to the extent that is needed to gain those rewards; they have no reason to invest any extra effort or resources to support the leader or the leader's cause. Furthermore, the leader's influence is restricted to behavioral compliance, because followers do not need to change their values, attitudes, thoughts or beliefs to gain the expected rewards.

In calculated followership, the power of the leader over followers depends on the leader's ability to provide the desired outcomes to the followers. French and Raven called this type of power "reward power." In some cases, individuals may follow leaders not because the leaders control material rewards but rather because the leaders have special expertise or control privileged information; French and Raven termed this type of power "expert power." It should be noted that the motivation to follow experts is also calculated. Followers let the expert lead them because they believe he or she knows better than they do how

to achieve certain goals. When followers achieve the same level of expertise or the same access to knowledge, their motivation to follow is reduced.

SAFETY-BASED FOLLOWERSHIP

Individuals may follow leaders in order to satisfy their need for safety or security. When people feel insecure or threatened, they may associate themselves with a leader in order to reduce their anxieties. This motivation could be included in the calculated followership discussed above, because as in the case of calculated followership, followers' compliance is based on the expectation that the leader will satisfy some need, in this case their need for safety. However, calculated followership is largely rational and at least partially realistic. In contrast, safety-based motivation is often irrational, less calculated, and less realistic.

When individuals feel insecure or threatened, as in times of war or economic crisis, they seek comfort from an association with a person who seems to be particularly strong or knowledgeable. According to psychoanalytic theories, this tendency is an extension of small children's instinct to turn to their parents or other significant adult for protection and safety. This motivation to follow may be irrational, in that it involves unrealistic perceptions of the leader. Small children's perceptions of their parents' qualities are often exaggerated; they often attribute to the parents more power and knowledge than the parents actually have. Similarly, followers who are motivated by a need for safety often attribute to the leader qualities that the leader does not possess. Therefore, in contrast with exchange-based followership, which is usually calculated and limited, a safety-based motivation to follow may result in unlimited acceptance of the leader's influence and blind followership.

MEANING-BASED FOLLOWERSHIP

Some theorists assume that the desire for order and meaning is a fundamental human need. According to these theorists, people fear chaos and need to have a coherent view of the world around them in order to

feel that their existence has some meaning. They may therefore follow a leader whom they perceive has the ability to provide that order and meaning. For instance, people may follow religious or spiritual leaders because those leaders present a coherent view of the world that gives meaning to people's existence and activities. A rabbi or a priest may be perceived to have the answers to questions of meaning because of his or her special learning or training or due to a degree of devotion that has brought him or her closer to God. Similarly, a guru or an ideologue may be perceived as someone who has developed such answers through learning and reflection. In all these cases followers are motivated to follow the leader because the leader presents them with answers to their existential quest for meaning.

The management scholars James Meindl, Sanford Ehrlich, and Janet Dukerich have presented a version of meaning-based followership that is based not on the existential quest for meaning but rather on a more mundane motivation. According to this version, individuals feel they need to make sense of their often complex and ambiguous environment if they are to have some sense of control over that environment. Therefore, individuals tend to explain events and circumstances in their environment by attributing them to the actions of leaders, thus gaining a simple explanation for complex events. Members of organizations, for instance, tend to credit (or blame) the organization's leaders for the success (or failure) of the organization. This perspective, known as the romance of leadership, has some radical implications. According to this view, leadership is a totally follower-driven phenomenon: In most cases, those salient individuals will be the formal leaders of the organization.

IDENTIFICATION-BASED FOLLOWERSHIP

Related to both security-based and meaning-based followership, but more specific, is identification-based followership. Individuals tend to identify with other individuals as well as with groups and larger collective entities. Every person needs a sense of identity, and this identity is derived in part from one's self-definition in relation to other individuals

(personal identification) and larger social entities such as groups, organizations, and movements (social identification).

Several leadership theories attribute the motivation to follow to the needs for personal and social identification. Psychoanalytic theories see people's identification with leaders as an extension of children's identification with their parents. According to these theories, identification with the parents is a mechanism for combating the feelings of helplessness and inferiority the child experiences. Similarly, by identifying with leaders and other powerful or attractive figures, such as star athletes, individuals may enhance their sense of power and self-esteem. In a similar vein, social-identification theory, which focuses on identification with groups, explains this identification on the basis of its benefits to the individual in terms of an enhanced sense of potency and self-esteem.

People may therefore follow leaders because the leaders appear powerful and attractive, and the followers want to be associated with them. According to French and Raven, when people are influenced by a leader for this reason, the leader has "referent power" over the them. People may also follow a leader because the leader represents the group with which they identify. According to a theory presented in 2001 by the psychologist Michael Hogg, this is the primary mechanism for the emergence of leadership. Hogg suggests that when individuals identify with a certain group, they are likely to be attracted to the most prototypical member of the group, the one who embodies the aspirations, attitudes, and identity of the group. This individual will be endorsed by the group and imbued with the prestige and status of a leader.

The self-concept-based theory of charismatic leadership put forward by the scholars Boas Shamir, Robert House, and Michael Arthur states that individuals want to express their self-concept, including their cherished values and identities, and enhance their self-esteem and self-worth. A leader's charisma depends on behaviors that link members' self-concepts to himself or herself, the mission, and the group or organization. When followers view the leader, the group, and the mission as representing important components of their self-concepts, espe-

cially their values and identities, followers have a particularly high motivation to follow, which is evidenced in a high level of internal commitment to the leader and the group and a willingness to make personal sacrifices for the leader and the group.

IMPLICATIONS

Followership is an act of faith. The followers accept the leader's influence and comply with his or her requests or instructions because they believe in the leader. Therefore, all motivations to follow a leader depend on followers' trust in the leader. Position-based followership is based on followers' trust in the institution that the leader represents and in its mechanisms for appointing leaders. The other motivations depend on followers' attribution of ability, benevolence, and integrity to the leader.

Leadership is a relationship that is jointly produced by leaders and followers. One implication of this statement is that leaders cannot fully control the motivation of their followers. Leaders can influence followers' motivation in various ways, and many leadership theories are concerned with that aspect of leadership. However, this discussion of followers' motivations suggests that followers bring their own motivations to the leadership relationship, and some of those motivations are outside the leader's influence. For instance, followers may reject a leader and choose not to follow him or her because they do not accept the legitimacy of the institution that the leader represents, or because they do not accept the leader's values and identities. Followers may also be inspired and influenced by a leader when the leader is absent (for example, when he or she is in exile or in prison), and in extreme cases even when the leader is dead, when clearly the leader no longer has any control over their motivations.

Another implication is that followers' motivation may influence the leader and determine the leader's effectiveness. For instance, when followers' motivation is based on identification with the leader and the group, followers are likely to share the group values and identity. Leaders may feel more comfortable to include such followers in their decision-making processes than to include followers whose motiva-

tion is largely based on calculated self-interest. Furthermore, followers are likely to participate in decision making more effectively when they identify with the leader and the group and share their values.

While the motivations to follow discussed in this chapter are not independent of one another, and while many leadership relationships are based on more than one type of motivation, it is important to separate them not only for analytical purposes but also because they have different implications. We have already noted that calculated followership is likely to be more limited than other types of followership. Another implication concerns the partial responsibility of followers for the nature and consequences of the relationship they develop with the leader. For instance, followers whose motivations are based on the need for safety or personal identification with the leader may be more inclined to tolerate unethical behavior on the part of the leader and to follow the leader blindly, sometimes with harmful consequences to themselves and the organization or movement. Followers whose primary motivation is calculative or based on social identification are more likely to exercise independent judgment and follow the leader only as long as he or she fulfills his or her promises and represent the values and identity of the group. The consequences of leadership thus depend not only on who the leader is and what he or she does, but also on the nature of followers' motivation.

FOLLOWERSHIP

The concept of followership and its relationship to leadership was popularized by the business professor and management consultant Robert Kelley in his 1988 *Harvard Business Review* article “In Praise of Followers” and his 1992 book *The Power of Followership*. These works thrust followership center stage into what had previously been a leader-centric world.

DEFINITION

Followership is active engagement in helping an organization or a cause succeed while exercising independent, critical judgment of goals, tasks, potential problems, and methods. In an organization, star followers have the ability to work cooperatively with a leader to accomplish goals even when there are personality or workplace differences. They are key players both in planning courses of action and in implementing them in the field. Followers as thus defined contrast sharply with the common negative stereotype of followers as passive sheep in need of a strong leader to motivate and direct them.

The word *follower* has its etymological roots in Old High German *follaziohan*, which meant “to assist, help, succor, or minister to.” This parallels the Old High German root of *leader*, which meant “to undergo, suffer, or endure.” In the original meaning, followers helped take care of leaders; the relationship between them appears to have been a symbiotic one between equals.

Over time, *follower* came to mean “to go or be full in number,” as in a crowd. If someone, a leader perhaps, was issuing an edict, appearing in a public forum, or traveling a distance, the people in attendance were called followers. This did not denote any inferior standing; on the contrary, to be a follower was an honor. Christ chose his disciples, just as King Arthur chose the knights for his Round Table. In these cases, the follower gained prestige rather than lost it.

Only in the last hundred years or so have the terms *leader* and *follower* taken on their current connotations. Kelley ascribed the “great person” leadership notion to the British philosopher Thomas Carlyle (1795–1881). He and other proponents of a leadership-centric world believe that leaders create or shape the events and institutions that define society. Without leaders, the (negative) status quo

would continue until entropy pushed society into chaos.

As for the negative stereotype of the follower, it is attributed to social Darwinism. Survival of the fittest pits contenders against one another; to struggle and compete is natural, good, and right. The winners, by definition, are leaders; the losers are everyone else. For example, Kelley found that when he asks training seminar participants whether they would rather be a follower or a leader, most quickly choose leadership. The result is a hierarchical social topography, as if only leaders matter, while the remaining 90 to 99 percent of the world is inferior and not worth mapping.

And yet, that assessment makes no sense when one considers that followership and leadership are a dialectic. Just as there can be no front of an object without a back, there can be no leaders without followers and no followers without leaders. Each depends on the other for existence and meaning. They can never be independent. But unlike front and back, it is not always so easy to sort out who is leading and who is following.

FOLLOWERSHIP STYLES

Just as there are different leadership styles, there are different followership styles. In Kelley’s model, illustrated in Figure 1, followership style is determined by how one performs in two behavioral dimensions. The first is independent, critical thinking; the second is a

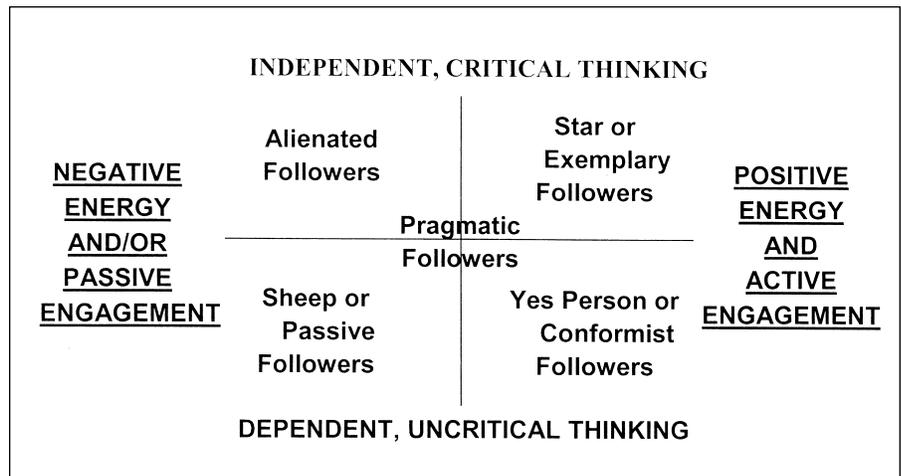

Figure 1. Followership Styles
Source: Robert E. Kelley; used with permission

ranking on an active-positive, passive-negative scale. Depending on a person's performance, he or she will fall into one of five separate styles of followership. Keep in mind that these labels categorize how one carries out the followership role, not one's personality traits. A person may use one followership style in one situation and different style in another.

Star Followers

These followers think for themselves and actively engage with the leader to make the organization a success. Star followers do not follow blindly, but when they disagree with the leader, they do so constructively, with the organization's best interest at heart. They carry out their assignments with great energy, paying attention to the implications current actions have for the future and to the details of implementation. Star followers are self-starters and creative problem solvers; they use their talents for the benefit of the organization even when confronted with bureaucratic inanities or nonproducing colleagues. Because they have these qualities, they get consistently high ratings from peers as well as leaders.

Star followership brings enthusiasm, intelligence, and self-reliance to the implementation of an organizational goal, while less effective followers are more passive, withholding their best thinking or efforts. Star followers are those who can take on a project with minimal preparation. Leaders trust them enough to turn their attention elsewhere; they rely on star followers to do the job in the best way possible (even if it's not the way the leader originally had in mind). A leader who has a star follower on staff doesn't need to worry about hands-on supervision, time-consuming explanation of assignments, or being visited with problems along the way to implementation. Star followers are independent and responsible members of the team, and they recognize that they add as much value to the organization as anyone in upper management.

Alienated Followers

These followers are critical thinkers and very independent in relations with leaders, but they are pas-

sive or negative in the workplace. They have a personal dislike for leaders in the organization or they are unhappy with their work situation. Alienated followers are often cynical and skeptical. They tear down what the leader is trying to build up. Their energy is channeled into fighting against the leader or organization rather than toward their work or a mutually desired future.

Kelley found that many alienated followers begin as star followers. Some negative experience or event alienates them; they become angry and withdraw from those around them. Some see themselves as victims; others project themselves as the conscience of the group battling against unfair organizations, power-hungry leaders, mindless yes-followers, and stupid ideas. However, their negative attitudes and actions often create a cycle of resentment or retaliation that engenders further negativity.

Sheep, or Passive Followers

These followers are passive and rely on others to think for them. These people are often viewed as rudderless and mindless; they need to latch on to a leader. In the extreme, passive followers may have a herd instinct, like sheep. However, unlike sheep, passive followers can require substantial motivation and direction from their leader.

Yes-People, or Conformist Followers

These followers are also in the negative section of the critical-thinking chart. They are more enthusiastic and involved than their sheep coworkers, but they are aggressively dependent on leaders for direction. They will do whatever the leader says, but they need the leader to say it.

Yes-followers are all too eager to take orders, to defer to the leader's authority, and to yield to the leader's views or judgment. They assume that the leader's position of power entitles her or him to obedience and accommodation from the subordinate. Yes-followers know their place and do not question the social order. They find comfort in structure and in having someone above them. This can create a follower-leader dynamic in which followers tell lead-

ers what they want to hear, not what they need to know. Although in some cultures (both outside of and within the United States), this style of followership is emphasized, expected, and rewarded, it has led to many fiascoes when the followers give up their capacity for independent, critical thinking.

Pragmatic Followers

In the center of Figure 1 are the pragmatic followers. Sometimes these are capable subordinates who eschew their independence for political expediency. Sometimes they are system bureaucrats who carry out directives to the letter, even though they might have valuable ideas for improving them. Sometimes they are gamespeople who manipulate others and the system to their benefit. They avoid taking a strong position that crosses powerful people. They are constantly monitoring the wind direction, and their motto is “better safe than sorry.” They keep conflict to a minimum and always have a ready excuse with a corresponding paper trail for any failure. They manage to survive even the most sweeping changes in the workplace.

CHOOSING FOLLOWERSHIP: THE VARIOUS PATHS

Why would anyone of perseverance, spirit, and intelligence slow a career before reaching the top or choose not to strive for the top in the first place? How did Aristotle (384–322 BCE) choose to follow Plato (c. 428–348 BCE)? What led Ellen Gates Starr (1859–1940) to

Francis Bacon on Followers

In this excerpt from his essay “Of Followers and Friends”—written in the late sixteenth century—Francis Bacon alerts his readers to be watchful of certain types of followers.

Costly *Followers* are not to be liked; Lest while a Man maketh his Train Longer, hee make his Wings Shorter. I reckon to bee Costly, not them alone, which charge the Purse, but which are Wearisome and Impertune in Sutes. Ordinary *Followers* ought to challenge no Higher Conditions, then Countenance, Recommendation, and Protection from Wrongs. Factious *Followers* are worse to be liked, which Follow not upon Affection to him, with whom they range Themselves, but upon Discontentment Conceived against some Other: Whereupon commonly ensueth, that Ill Intelligence, that we many times see betweene Great Personages. Likewise Glorious *Followers*, who make themselves as Trumpets, of the Commendation of those they Follow, are full of Inconvenience; For they taint Businesse through Want of Secrecie; And they Export Honour from a Man, and make him a Returne in Envie. There is a Kinde of *Followers* likewise, which are Dangerous, being indeed Espials; which enquire the Secrets of the House, and beare Tales of them to Others. Yet such Men, many times, are in great Favour; For they are Officious, And commonly Exchange Tales. The *Following* be certaine *Estates* of *Men*, answerable to that, which a Great Person himselfe professeth, (as of Soldiers to him that hath been employed in the Warres, and the like,) hath ever beene a Thing Civill, and well taken even in Monarchies; So it be without too much Pompe or Popularitie. But the most Honourable Kinde of *Following*, is to be Followed, as one that apprehendeth, to advance Vertue and Desert in all Sorts of Persons. And yet, where there is no Eminent Odds in Sufficiencie, it is better to take with the more Passable, then with the more Able. And besides, to speake Truth, in Base Times, Active Men are of more use, then Vertuous. It is true, that in Government, it is Good to use Men of one Rancke equally: for to countenance some extraordinarily, is to make them Insolent, and the rest Discontent; Because they may claime a Due. But contrariwise in Favour, to use Men with much Difference and Election, is Good; For it maketh the Persons Preferred more Thankfull, and the Rest more officious; Because all is of Favour. It is good Discretion, not to make too much of any Man, at the first; Because One cannot hold out that Proportion. To be governed (as we call it) by One, is not safe: For it shewes Softnesse, and gives a Freedom to Scandall and Disreputation: For those that would not Censure, or Speake ill of a Man immediately, will talke more boldly of Those; that are so great with them, and thereby Wound their Honour. Yet to be Distracted with many is Worse; For it makes Men, to be of the Last Impression, and full of Change. To take Advice of some few Friends is ever Honourable; *For Lookers on, many times, see more than Gamesters; And the Vale best discovereth the Hill.* There is Little Friendship in the World, and Least of all betweene Equals, which was wont to be Magnified. That that is, is between Superiour and Inferiour, whose Fortunes may Comprehend, the One the Other.

follow the social reformer Jane Addams (1860–1935) in the establishment of Hull House, an internationally recognized achievement as a settlement center for Chicago's poor immigrants?

Understanding why people follow is important to leaders and followers alike. Knowing these motivations, one can design organizational environments to attract, accommodate, and retain followers. Leaders who understand their followers' motivations can respond to those motivations and avoid losing their followers.

Misunderstanding motivations can lead to disaster even when leaders have good intentions. For example, too many leaders believe that people follow a leader because of his or her charisma or vision. Thus, leaders will often expend great effort in trying to become charismatic or in shaping a vision. In reality, only some followers look for these characteristics. Others are motivated by their own personal vision, and many are wary of charisma. Instead, they prefer their leaders to be fellow adventurers who facilitate the achievement of a goal.

Why do people decide to forgo the leadership role? The followership paths people choose are characterized by different sets of motivations. As shown in Figure 2, a follower chooses one based on his or

preferences on two points: first, whether the follower prefers self-expression or self-transformation, and second, whether the follower puts more emphasis on relationship bonding or on personal goals.

Followers choose certain followership paths in order to express themselves. Individuals who choose these courses are generally comfortable with their talents, lifestyle, and personal accomplishments. They are motivated by a desire to contribute their skills toward organizational goals.

Other paths help followers transform themselves. People who choose these routes are not satisfied with who they are; they want to become different and better people. For example, G. I. Gurdjieff (c. 1872–1949), the Russian philosopher and teacher, kept himself open to new ideas and belief systems so that he could continually transform himself. He traveled throughout Asia and Europe in search of teachers from whom he could learn, viewing rebirth as an essential part of living that should happen continually rather than as a onetime event.

Some followers appreciate the interpersonal involvement of followership. People who value these bonds follow people rather than goals or dreams. Others are more inwardly focused; they see followership not primarily as a relationship with others, but as a vehicle for achieving personal dreams. Many of the early NASA engineers worked together for ten years to put a person on the moon. But the goal, not their relationships with the leader, motivated them to follow.

Based on these two pairs of dimensions, seven major followership paths emerge: The apprentice's path, the disciple's path, the mentee's path, the comrade's path, the path of loyalty, the dreamer's path, and the life-way path. Each person is likely to follow one or more of these paths during life; indeed, a person can travel

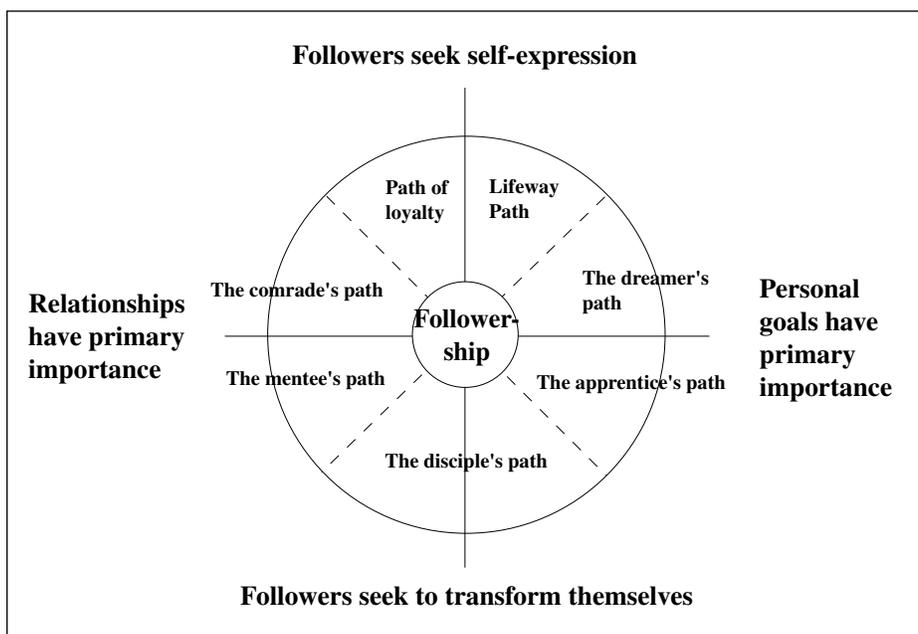

Figure 2. *The Seven Paths of Followership*
Source: Robert E. Kelley; used with permission.

down some of them simultaneously. The paths are not mutually exclusive.

The Apprentice's Path

Perhaps the most easily identified path is the one chosen by those aspiring to be leaders. They understand the need to learn the ropes and pay their dues. By proving themselves in the follower's role, they hope to win the confidence of peers and superiors. They accept the value of doing a good job in the role, studying leadership from the followers' perspective, and polishing followership skills, such as teamwork and self-management, that will always stand them in good stead. Many women residents of Jane Addams's Hull House, for example, saw Hull House as a community center where they could learn the professional skills necessary to launch careers in government, industry, and universities.

In his *Politics*, Aristotle observed that Greece's would-be leaders, like many graduating students today, wanted to start at the top rather than work their way up. Decrying their power lust, Aristotle insisted that training as a nonleader was a necessary part of growing to leadership. He advised those who wanted to lead to learn first how to obey and to experience being a subject before becoming a ruler. In fact, most large bureaucracies treat followership as apprenticeship. In China's civil service, which dates back to the Han dynasty (206 BCE–220 CE), the candidate's ascent to leadership depended upon their performance in lower ranks. China's civil-service system became a model for other large bureaucracies that would follow it in history, indirectly influencing the U.S. military, where future leaders must spend time in the ranks, learning what it is like to be directed and commanded, before they are allowed to issue their own orders.

The Disciple's Path

Discipleship is seldom discussed in today's secular world, except when celebrity cults spill across the media headlines or religious fanaticism results in political fiascoes (as when the confrontation between the U. S. government and the Branch Davidian reli-

Never follow the crowd.

—Bernard Baruch

gious group in 1993 in Waco, Texas, resulted in the deaths of eighty-two Davidians). Nowadays associated almost exclusively with religion, discipleship conjures up images of crowds gathered at a master's feet, hanging on every word. Yet some remarkable followers in the secular world began as disciples. For example, having read Plato's dialogues, the seventeen-year-old Aristotle left his hometown for Athens to study in Plato's Academy. For the next twenty formative years, Aristotle worked and studied with a brilliant group of disciples under Plato's leadership.

The word *disciple* comes from the Greek. Its original meaning was "one who is learning from a teacher." Generally, it involved intellectual, not emotional or spiritual, development. Nor did it involve indoctrination in any set of beliefs. Although Aristotle clearly loved and was greatly influenced by Plato, he felt free to criticize him, and did.

Over time, discipleship took on another dimension. It moved beyond learning to mean "one who believes." It implies an act of conversion to a certain viewpoint. This conversion moves beyond intellectual judgment to an emotional commitment and obedience, where one breaks old ties and adheres exclusively to the new. It also leads to witnessing—that is, spreading to others what has been learned.

Although discipleship is generally placed in the context of religion, it permeates many fields. For example, Sigmund Freud (1856–1939) attracted disciples to his psychoanalytic theories and practices, and disciples of John Maynard Keynes (1883–1946), a champion of social welfare economics, argue with the disciples of Milton Friedman (b. 1912), a proponent of free-market economics. Disciples often represent the leader, serving as missionaries who carry the message to others.

The psychology behind this form of followership is identification. Followers want to bond with and emulate the leader. They are willing to become a part of something that is bigger, better, or more important than they are individually. Disciples give up their

current persona to take on a new one—one that the followers feel enlarges them.

The Mentee's Path

Mentoring is different from apprenticing in that it involves an intensive one-on-one relationship between mentor and follower, which enables the follower to mature. Mentees entrust themselves, emotionally and developmentally, to someone who perhaps perceives them as a “diamond in the rough.” The mentor helps shape the diamond so that it sparkles. The mentor in this case often directs the mentee’s talents toward goals that will bring him or her great satisfaction.

The psychological readiness of an individual to benefit from this form of followership depends upon the individual’s ability to surrender to the mentor’s influence. Often, some experience in life—the death of a loved one, getting fired from a job—triggers this readiness.

Like apprentices, mentees choose to be followers so that they can transform themselves. Whereas the goal of apprenticeship is mastery of skills, however, the goal of mentoring is personal maturation. People who follow a mentor do so for personal benefit. But the followers who seek out mentors are not always trying to become leaders. They may simply see the mentoring relationship as a way of bettering themselves. Mentees hope to be better people, which will then allow them to be better contributors.

The Comrade's Path

Sometimes being part of a community shapes followership. The reason for following may have nothing to do with getting ahead, personal growth, or intellectual development. Instead, it may be about the intimacy and social support that develop when people bond.

Comradeship is found in any endeavor that requires the effort and talents of more than one person, whether sports, orchestral performances, or the construction of a supercomputer. People also band together as a way of coping with stress. The bonds formed in study groups that help members get

through the first year of law school last long after graduation. In these situations, people follow for mutually reinforcing reasons: your feeling of goodwill toward the group and the belief that survival is more likely if you collectively share and watch out for one another.

Nor is comradeship forged only during stressful times. Sometimes it happens when people are working together for a good cause. For example, Jane Addams, Julia Lathrop (1858–1932), and Florence Kelley (1859–1932) formed the inner circle of Hull House during the early years. Unlike the disciples and apprentices who gathered around Addams, Lathrop and Kelley were comrades-in-arms. They addressed each other in their letters as “Dear Sister” and developed a sense of camaraderie, of dedication to an ideal that was based on respect, commitment, and love.

The psychology behind comradeship is one of intimacy that comes from belonging. Once you feel part of something, you transcend feelings of isolation and even feelings of self. This explains why people follow rather than seek personal glory, and why they give their all so that their comrades can succeed.

The Path of Loyalty

Some people follow out of personal loyalty to the leader. Leonard Peikoff (b. 1933), the protector of objectivism, the individualistic philosophy of Ayn Rand (1905–1982), proudly described himself as the “feudal serf” of Ayn Rand’s cause.

For some, this loyalty is an inherent obligation of existence. Fierce loyalty was expected of Japan’s samurai. In the code of Bushido—the “way of the warrior”—loyalty is of paramount importance. Chinese Confucian ethics made obedience to parents the primary human duty, but Japanese Bushido gave precedence to loyalty to the leader.

The path of loyalty, like that of comradeship, requires emotional commitment to another. Deep within, you choose to follow this leader. You give your word. Unlike comradeship, the bond is one to one—follower to leader. Unlike in mentoring relationships, the follower motivated by loyalty is not concerned with personal maturation. The primary characteristic of the path of loyalty is commitment,

willingly given and unshakable from the outside. Only the two people can tear it asunder.

The Dreamer's Path

Many of the best followers are committed to their personal dream rather than to a particular leader. They are so focused on achieving their dream that it does not matter whether they are in the leader or follower role. These people may follow a leader not because of who the leader is but because the leader embodies the idea or the cause. David Newell, a longtime follower of Fred Rogers, the creator of the children's television program *Mister Rogers' Neighborhood*, summarized the reason that he and others there followed.

"Most people think we're in the TV business. But we're not. We're in the child development business. Our goal is to help children and families grow. Everything we do has the message at its core. That's what has kept me here for so long. If Fred or this organization ever moved away from these, then that's when I'd probably leave" (Kelley, 1992, 75). This follower is interested in the message first and the leader second. The dream is the guiding force.

William Broyles describes how, during the Vietnam War, the Viet Cong saw the war with the United States as the transcendent challenge. In their mind, they were fighting for a great goal, one worth dying for. They had traded in the rice paddy and were riding on the wind of history.

When people follow because of their dream, the psychology is called internalization. Followership occurs because individual goals are the same as the organization's or leader's goal. In other words, follower and leader believe in the same thing and want to make the same things happen. These followers control their ego drives and accept another's authority in their overriding desire to accomplish the goal. However, when the bond created by the dream withers, these people cease to play the follower role and the leader has no power over them.

The Lifeway Path

A final type of followership is taken by those who follow out of a conviction that no other lifeway is as

rewarding. These people follow out of personal preference or because followership is compatible with their personal make-up. For example, they may be inherently altruistic or naturally skilled at following. Or, the follower role may be most consistent with their outlook on life.

For some, following is a way of serving, harking back to the original definition of the word follower. Unlike followers who are pursuing a particular dream, these followers make helping others their goal. Today's Peace Corps volunteers, who are trying to be of service to their Third World neighbors, are examples of the latter; their predecessors, who were following the dream articulated by John F. Kennedy, were examples of the former. Of course, someone could have a dream of having a lifeway of followership, but for the most part, these are different paths. Kelley has related this "servant followership" to "servant leadership," as described by Robert Greenleaf (1904–1990), the founder of the Center for Applied Ethics (now the Greenleaf Center for Servant-Leadership).

Others consciously decide that they are better suited to play the follower role all or part of the time. They are uncomfortable being leaders. They don't like being the one that everyone looks to for a vision, for inspiration, or for the final judgment. Being Number Two suits them much better than being Number One. It is the doing, not the directing, that they enjoy.

An intriguing subset of lifeway followers are those who have leadership instincts and skills but choose the follower role in certain circumstances. They may be leaders in other fields who do not have the time or emotional energy to take on a new leadership role but who still want to contribute. Some are leaders who know how important star followership is to them, and so they return the favor when they follow. In some cases their leadership talents are simply not suited to a particular situation, as when a corporate leader feels out of place in government meetings. These individuals are followers because they have rationally decided that following is what they want to do. They realize that they will be happier and the outcome will be more positive if they complement rather than compete with the leader.

EXTERNAL FACTORS AFFECTING FOLLOWERSHIP

As described above, followership style is highly affected by personal motivation and skill set. However, at least three external factors also come into play: leadership styles, rewards, and culture.

Leadership Styles

When the political theorist Bertrand de Jouvenal (1903–1987) said that a nation of sheep will bring about a government of wolves, he expressed dramatically how leadership and followership styles interact with each other, with cause and effect going in both directions. Autocratic leaders direct their followers without consulting them. They give orders that are not to be questioned, only implemented. Autocratic leaders are most likely to attract or encourage those followership styles that look to the leader for thinking and guidance, namely, the yes-people and the sheep. Likewise, those types of followers will either search for or elicit autocratic leadership. In essence, they demand it, even if the leader might prefer a different leadership style.

In a similar way, leaders can interact with the follower's chosen path. For example, appeal to those followers seeking transformation, such as those following the disciple's, the mentee's, or the apprentice's paths. If followers and leaders understand each other's styles and motivations, then they are more likely to understand their own behavior and more likely to pair off correctly

Rewards

Followers, like leaders, respond to rewards. If yes-follower behavior is expected by the leader and rewarded by the organization, then people are likely to fulfill the followership role using that style. It is not unusual for organizations undergoing difficult economic times to lay people off. In the face of this economic uncertainty and sense of betrayal by the organization—essentially the removal of rewards—many followers migrate to the pragmatic style.

Culture

The terms *follower* and *leader* carry strong cultural connotations. Various cultures view them differently and have different expectations for them. In the United States, leadership is considered better than followership. The U.S. culture encourages leadership development from a very early age, and sends negative signals about followership. In other countries, such as Japan, followership is strongly reinforced, while leadership is given less societal weight.

ETHICS OF FOLLOWERSHIP: COURAGEOUS CONSCIENCE

In the traditional leader-follower dynamic, the leader makes the decisions and sets the ethical framework for the group, while the follower is expected to do as told. But that is not how it works with the best followers. Instead, star followers spend considerable time and effort worrying about the ethics of their actions.

In some cases, leaders are forced to choose from among a series of bad options. Or, they are forced to make their decisions under enormous pressures that followers don't have. In such situations, ethics is seen as just one of many factors that must be considered in the final decision; it may get short shrift. But that is precisely why conscience is included in the range of skills that make up star followership. Even though there are times when it can be very inconvenient, leaders need their star followers to act as ethical watchdogs. The organization's future can depend on how effectively followers heed their consciences.

Star followers exhibit courageous conscience. Having courageous conscience means they have the ability to judge right from wrong and the fortitude to take steps toward what they believe is right. It involves both conviction and action, often in the face of strong pressures to abstain from acting.

Some followers are faced with a leader who asks them to do something they believe is wrong or to stop doing something they believe is good for the organization. In most cases are the request will not be extreme; it will not jeopardize people's lives or con-

stitute a gross legal violation in which millions of dollars are at stake. Rather, it will be something more ordinary, like altering a time sheet, withholding relevant information from another department in the company, padding a customer's bill, or producing products that have not been thoroughly tested for safety. Or they may have been working on a product to they were personally committed, only to have the boss kill the project and reassign them to something else.

Under these circumstances, the best followers follow the dictates of their courageous conscience. When people talk about ethical conduct, they first think of one side of the ethical coin—avoiding or correcting existing wrongs. So, when the boss asks subordinates to do something unethical, star followers take steps to help the leader see that it is wrong or, failing that, will refuse to carry out the order. But the courageous conscience goes beyond acknowledging and correcting wrong. The flip side motivates them to make positive contributions—for example, championing a new idea in the face of strong organizational resistance, dealing with a problem before it grows into a crisis, or arguing for the reinstatement of a worthy program that has been cut. Their courageous conscience may put their position at risk, but it is risk required of star followers.

THE CHANGING CONTEXT OF FOLLOWERSHIP

In 1977 a review of literature on followership turned up only three articles on the topic. In 2003, a Google Internet search on the term *followership* produced 10,589 hits, and *followership research* produced 3,930 hits. While not all of these hits will be completely relevant to the topic, it is still clear that in a little over twenty-five years, the field has changed substantially. Followership is now considered an important part of the followership-leadership equation.

FORD, HENRY (1863–1947)

Pioneering American industrialist

Henry Ford did not invent the automobile, he democratized it, bringing it within reach of millions of workers. At Ford Motor Company in the early years of the twentieth century Ford devised a new kind of commercial enterprise—the large-scale, mass-production industrial factory—and with it new modes of labor, organization, authority, and control. Ford played a critical role in bringing forth a new capitalist culture based on mass production, large-scale organization, and mass consumption of low-cost industrial goods. Fordism, a system of work and social organization typified by rationality, economies of scale, efficiency, and division of labor, became the mark of modernity in the twentieth century. Ford's promise of liberation—"Man plus the machine," he said, "is a free man"—came to be seen by critics as a curse and a shackle, tying men to the assembly line and dehumanizing the experience of labor for millions of industrial workers.

Henry Ford grew up on a farm near Dearborn, Michigan, obsessed with mechanical toys, clocks, and machines. His mother died when he was twelve, leaving his home, as he recalled, "like a watch without a mainspring." At sixteen, Ford walked to Detroit and found work as a mechanic's apprentice. Over the next twenty years, he juggled increasing responsibilities as an engineer (rising to become chief engineer at Edison Illuminating Company) with his passion for tinkering, to which he gave rein during his leisure time. Ford built his first automobile, the Quadricycle, in 1896, and attracted \$150,000 in capital to start the

Detroit Automobile Company in 1899. The company failed within a year. Undaunted, and determined to have greater control over his next venture, Ford attracted enough investors to open Ford Motor Company in 1903.

For the infant automobile industry, it was an age of wild growth. The Duryea brothers had built the first gas-powered American automobile in Springfield, Massachusetts, in 1889. In 1903, alongside Ford Motor Company, fifty-six other new car companies started up—and twenty-seven failed, as well. Ford's innovation was less technological than cultural: "I will build a motorcar for the multitudes," the young Ford boasted. His vision was the same rationalist dream as that of Elias Howe and Eli Whitney a century earlier, and of Adam Smith before them—the rational division of labor to maximize efficiency, the transformation of a craft into an organized process. "The way to make automobiles," Ford said in words that echoed the famous opening of Smith's *Wealth of Nations*, "is to make one automobile like another automobile, to make them all alike, to make them come through the factory just alike, just as one pin is like another pin when it comes from the pin factory." When Ford hit on the Model T in 1908, he had achieved his dream—a sturdy, powerful, reliable, and inexpensive car for the masses. By 1913,

Ford produced almost half the cars sold in the United States.

It was in 1913, with the innovation of the assembly line, that Ford hit his stride. Within a year of the installation of the assembly line at Ford's Highland Park factory, the time required to build a Model T dropped 90 percent, from 12.5 hours to 1.5 hours. Such a radical reformulation of work produced massive stress among workers, and in 1914, in response to chronic absenteeism and high turnover, Ford doubled the company's minimum wage to a famous five dollars a day. Daily absenteeism dropped from 10 percent to less than .05 percent. To many, Ford's cheap machines and high wages seemed to offer a utopian solution to the ancient clash of capital and labor.

Ford himself was a man of paradox, equal parts visionary and crank, radical and antiquarian, populist and tycoon. He built the mightiest industrial complex the world had ever seen, the River Rouge plant, where more than forty thousand workers toiled in a fantasy of control almost pharaonic in its grandeur—and next to this vast industrial conurbation he built an idealized museum town, Greenfield Village, to capture the lost Jeffersonian America of his youth and dreams. His youthful vision and tinkering spirit gradually hardened into a rigid, backward-looking authoritarianism, so that he clung to his great invention, the Model T, until 1927, long after it had lost its luster. He threw himself into lawsuits and politics, launching a Peace Ship to Europe in 1915 and a Senatorial campaign in 1918, and then as quickly abandoned those efforts. Perceiving himself a self-made man and a friend of ordinary Americans, he disdained bankers and financiers, a mistrust that soured into a conspiratorial, splenetic anti-Semitism he trumpeted on the pages of his newspaper, the *Dearborn Independent*.

Ford's mode of control, always impulsive and authoritarian, became increasingly dictatorial after he bought out his minority stockholders in 1919 and became the sole master of his industrial empire. He fired those who challenged him. His relations with his son Edsel were a psychodrama of manipulation and control. The company developed a Byzantine power structure and a virtual cult of personality around the tycoon the *New York Times* called "an

If you think you can do a thing or that you cannot do a thing, in either case you are right.

—Henry Ford

industrial fascist—the Mussolini of Detroit.” Ironically, the supremely rational enterprise, weakened by its success, turned increasingly irrational. By the 1920s Ford, disdainful of research, innovation, and marketing, began to be passed by GM and other competitors more sensitive to the complex appetites of car buyers.

Ford’s relations with his workers had always been uneasy. The democratic promise of the Model T was counterbalanced by the brutal pace and numbing conditions of the assembly line, as depicted in films like Chaplin’s “Modern Times” (1936) or the recollections of an auto worker: “If you were to think about the job itself, you’d slowly go out of your mind” (quoted in Terkel, 1972, 160). Early on, Ford’s paternalistic Sociological Department had investigated the character and home lives of workers, part of a constant effort to measure and control every work input and output. For years, the company held out against the logical response to the factory environment, unionization. In 1937, Ford goes brutally attacked union organizers and sympathizers handing out literature outside the River Rouge plant. Photos of the bloody assault excited national attention. Finally, in 1941 Ford workers voted to join the CIO.

Fordism, the set of ideas that Henry Ford characterized as “power, accuracy, economy, system, continuity, speed and repetition,” today drives not only industrial behemoths but also firms as diverse as Wal-Mart (retail sales), Hallmark (greeting cards), and Novartis (pharmaceutical and genetic research). Even so-called post-Fordism, with its emphasis on flexible production, lean inventories, and total quality management, represents only an evolution of Ford’s basic ideas: the harnessing of machines (even computers and emerging nano-technologies), economies of scale, and the ceaseless quest for rational control of work.

🌐 FREE PRESS IN PANAMA, CREATION OF

The editors are privileged and pleased to include in this encyclopedia the following entry on the creation of the free press in Panama, written by the man who created it, I. Roberto Eisenmann. Mr. Eisenmann showed uncommon courage and extraordinary leadership in the establishment of La Prensa (“The Press”). His story highlights the importance of vision, strategy, and execution in enabling groups to accomplish their goals.

—George R. Goethals, Georgia J. Sorenson.

I believe I have a unique, multidimensional experience and vision with regards to journalism and its frontline position in the continuing battle for democracy. I would like to share the Panama experience, which I believe may prove useful in countries where democracy is nonexistent, at risk, or stable but where independent journalism as a cornerstone of freedom of expression is at peril.

I entered the profession of journalism in 1979 at a mature age, totally unaware of what it encompassed, motivated simply by my overpowering desire to turn the light on in my country—which had been living in total darkness—and by the profound conviction that freedom of expression and information is the root of all other freedoms and, as a consequence, the front line in the battle to reclaim a democratic system of government in the face of a prolonged military dictatorship.

We of the founding group of *La Prensa* looked for the best people in every area of the profession. We traveled to meet with them wherever they happened

to be and told them what we sought to accomplish, namely, to create a world-class newspaper in the midst of dictatorship, despite lacking money and experience, and with the specific mission of creating democratic infrastructure and becoming—in five years’ time—Panama’s leading newspaper. We asked them to teach us the ropes, and listened. Our ignorance became an asset as we listened and learned from the best, with no preconceived biases, allowing our “maestros” to suggest every possible new and modern idea, something almost impossible to do in well-established and entrenched media organizations.

HISTORICAL BACKGROUND

First, allow me to describe the situation in Panama in 1979. We had been living under the military dictatorship of General Omar Torrijos (1929–1981) for eleven years. There were four daily newspapers (all under the regime’s control) and two television stations that were indirectly controlled by the regime, as were all radio stations. Political parties had been legally dissolved. “Enemies of the regime” (as anybody with an opposing view was labeled) were killed, “disappeared,” or arrested and expatriated. I, as a businessman critical of the regime and active in intermediate organizations of my sector, was one of the fortunate “enemies,” for after being arrested while driving my children to school, I suffered no more than some roughing up before being put on a military aircraft—with twelve others—and dropped in Guayaquil, Ecuador. There I started the first of what would be two forced exiles of three-and-a-half years each—seven years’ exile in total. At this time in Panama’s history negotiations over the Panama Canal treaty were starting; Carter was the U.S. president at the time. Once the treaty documents were initialed, President Carter started an uphill battle to have them ratified by the Senate. Votes were hard to come by, and for the “human-rights president,” Panamanian political exiles running around the halls of Congress were very inconvenient. Carter therefore persuaded Torrijos to announce an *apertura*, or opening, allowing the return of all Panamanian exiles; I was in that group.

THE IDEA FOR A NEWSPAPER

It was on that very emotional flight back home that I thought to myself, “Now what? I’m on the list of ‘enemies of the state’; I will not get off it. How can I put my entrepreneurial talents to work for the return of democracy in my country?” The answer came to me immediately: I must establish an independent and free press.

Upon return I shared the idea with family and a few close friends. All were excited, as all previous (and unsuccessful) attempts had been made by intellectuals with no business experience. We made a few important decisions:

- The founding group, or board, would be small; no more than five people.
- The board would have to be courageous, of the highest personal integrity, willing to risk their lives for the project, and representative of all democratic political movements so as to avoid political labeling of the paper.
- They would have to be willing to contribute one-half day’s work, every day, to the project.
- Each would have to put up or collect \$5,000 as seed capital to start the project.

With this profile, I set out to talk with a selected few and formed the founding board of directors with a Social Democrat, a Christian Democrat, a Democratic Socialist, and two independents. We collected the \$25,000 in seed capital and started traveling to find our “maestros.” Carlos Castañeda, from El Nuevo Día of Puerto Rico, agreed to design our paper, and Armando Gonzalez of the Miami Herald gave us a tour of the Herald (our first visit to a newspaper; it was an overpowering experience). Armando promised us a feasibility study with an estimate of the capital we would require, and we started discussing and deciding the important elements of our project. We chose the name *La Prensa* for our paper as it evoked the memory of previous antidictatorial examples in journalism in Latin America. We decided to make the paper a broadsheet, as serious journalism in Panama has traditionally been published in that format.

Armando’s feasibility study determined that we

would require \$1 million to get our paper under way. The figure floored us, but we came up with an idea: Instead of looking for “heavies” to put up the money (as was traditionally done in Panama), we would have many people put up small amounts, with a maximum investment of \$5,000 (and no minimum). This way the paper wouldn’t be owned by one person or group, but by many, thus guaranteeing editorial independence and, more importantly, making it impossible for the dictatorship to kill the project by targeting a few owners. Furthermore, because no one would have invested a large sum, the paper would be able to hit the dictatorship hard without owners incurring personal risk. Collecting the money would be an enormous task, as every potential shareholder would have to be approached individually in a semiclandestine way, but we decided to go ahead with the plan.

STARTING UP

We refined the numbers in the feasibility study, arrived at an estimate of an initial eighteen months of projected operational losses, printed our model “Number 0” in Miami, brought it to Panama inside our suitcases, made up a list of people each one of us would visit, made up our sales pitch and went to work, meeting every day to compare notes and deposit checks. In pitching the paper to potential investors, we stressed that we were not asking them to do anything that we ourselves had not already done—we pointed out that we had all put up \$5,000 already. Rather than playing on any sense of moral obligation to contribute to the project, we stressed that we intended to create a world-class paper. Finally, we promised that if we had not raised the necessary capital in six months, we would return all the investors’ money, with interest. In the meantime, all money would go into an escrow account. To our great surprise, in four months we had raised the complete amount needed from 1,300 small shareholders.

We then set out to pre-sell advertising and home delivery subscriptions (a first for Panama), while making up charts and timetables of what we would need when in terms of buildings, equipment, paper, staff, and so on. We planned to open on 4 August

1980, exactly one year after having put the idea together. We were able to meet all our own deadlines.

During the process we had many scares from the regime; it is impossible to discuss them all in this entry, but it is important to answer the logical question of why the dictatorial regime allowed us to open at all. Our information is that Torrijos had a few meetings with his advisers on what to do with us. At a certain point in the discussions he asked how much the regime, which owned three newspapers that were the sole recipients of all government advertising dollars, was losing per year. Upon hearing that the government was losing a million dollars a year, the general decided to let us open, no doubt thinking that we would go broke within the year, while at the same time he would be able to boast of allowing freedom of expression in the country. He did not know that we had enough money to cover eighteen months of losses or that with our pre-sold advertising and home delivery, we projected breaking even on Month 19—a goal we actually achieved.

SUCCESS

We thought about how we should open. In our criticism of the regime, should we start warm and increase the heat as we went along, or should we open with guns blazing from the start? We decided on the second approach. Did we ever ask ourselves if publishing this particular story or that one might bring a violent reaction that could close us? That thought never crossed our minds; as mentioned earlier, no single person had that much at risk. As for editorial independence, there was no “owner’s line,” no prohibited subjects, no favorite subjects or persons. We had a code of ethics that we made public, and we asked our readers to hold us accountable. We started Panama’s first investigative journalism team, which uncovered massive regime corruption to the tune of hundreds of millions of dollars.

We endured many life-threatening situations, physical attacks, arrests of our journalists, closures, and destruction of our equipment, but every attack boosted our circulation and the support from the community. As we had planned, in five years we were the nation’s leading newspaper, with a circula-

tion three times that of the regime's papers, and we had definitely become the most important democratic institution in the country.

In 1989, the U.S. invaded Panama and arrested General Manuel Noriega (b. 1938), at that time the de facto ruler of Panama. Our paper had been closed by Noriega and its offices occupied by his troops, and most of our plant was destroyed. With the help of many we were back in print in a week's time, at double our normal circulation.

Most of the new government's positions were filled by people who had been at *La Prensa*. The logical question was, Do you now become a pro-government newspaper? Our answer was no; our mandate, from our many small shareholders, was to be an independent news organization, and independent means first and foremost independent from any government. We held to our mandate, then faced the hardships of a free press critical of a democratic government. This brought on a proxy fight to oust me, promoted by a cabinet minister and founder of *La Prensa*, but fortunately a great majority of our 1,300 small shareholders voted for continued independence, and the paper continued, with a strengthened resolve to carry out its original mandate.

In 1995, after fifteen years running the paper, I did not submit my name for reelection and retired from the paper, though I still write weekly op-ed pieces. The institution, now under the leadership of its fourth publisher, is still by far the dominant media organization, owned by the community and all its employees, and it continues to be a financial success. Shareholders receive dividends that have reached 50 percent per year on their original investment, and employees have received profit-sharing bonuses of up to eight months' wages, making journalism not only an honorable but also a well-paid profession. As a consequence of *La Prensa's* example, all other media have become more independent, and Panama has a vibrant free press.

WIDER APPLICATIONS

What we must ask ourselves is whether this experience has possible applications in other countries, or whether it is unique, for some reason, to Panama.

Personally, I feel it is definitely possible to transfer *La Prensa's* success to other countries with dictatorial regimes, be they military or "elected" autocracies. But taking it further, I believe the formula is even possible in countries such as the United States, where freedom of the press is alive, but not well, as media outlets have become properties owned by large multimedia corporations and dominated not by community needs but by the bottom line as dictated by the stock market. Most U.S. cities are now one-paper cities where the dominant paper is resented by large portions of the communities they serve and is constantly facing dropping circulation and advertising numbers.

I wonder if the time is not ripe for *Prensa*-like new media outlets widely connected to their communities to give the giants a run for their money, regaining the independent journalistic values that the United States showed the world, but that today many U.S. journalists are deeply concerned are on the wane.

—I. Roberto Eisenmann, Jr.

FREUD, SIGMUND (1856–1939) *Physician and psychoanalyst*

Sigmund Freud was the most prominent and visible leader of the psychoanalytic movement. More than sixty years after his death, he remains the individual most closely associated in the public mind not just with psychoanalysis but with psychiatry in general.

Sigmund Freud was born in Frieberg, Moravia (now the Czech Republic), on 6 May 1856. (Freud shortened his name to Sigmund in 1877.) Freud's father, Jacob, was a lower-middle-class, Jewish wool merchant. Freud was the first of eight children born to Jacob and his third wife, Amalia Nathansohn Freud. The family moved to Vienna, one of the most cosmopolitan cities in Europe, when Freud was four, hoping that anti-Semitism would be less severe there

than in the countryside. The family recognized that Freud was a brilliant student and supported his education. He earned a medical degree in 1881 from the prestigious University of Vienna and pursued a career in psychiatry after anti-Semitism prevented him from finding a position in neurology. Throughout his career Freud regarded himself as a scientist and viewed psychoanalysis as a science. He first worked with hysterics—physical disorders such as paralyzed limbs that had no physical cause—and was introduced to hypnosis and the “talking cure” by the Austrian physician Josef Breuer and French neurologist Jean-Martin Charcot. In 1886 Freud married Martha Bernays, and the couple had three sons and three daughters. Their youngest child, Anna, was analyzed by Freud and became his most loyal follower and strongest advocate later in his life. In 1891 Freud moved to Berggasse 19 in Vienna and opened his private practice. The house became the Freud Museum Vienna in 1971.

Freud developed his initial theories and method of treatment, which he labeled “psychoanalysis” in 1896, using a unique methodology that combined self-analysis and dream interpretation with analysis of several key patients, followed by discussions in his home with a small circle of fledgling analysts. By 1906 the circle included William Stekel, Alfred Adler, Otto Rank, Abraham Brill, Eugen Bleuler, and Carl Jung, and later Sandor Ferenczi and Ernest Jones. In 1908 it became the Vienna Psychoanalytic Society. This society served as an organizational mode for local and regional psychoanalytic societies in Europe, Great Britain, and the United States.

Over the course of his lifetime, Freud and his colleagues amplified, revised, and added to their initial insights and extended psychoanalytic theory to encompass virtually all elements of the human experience, including jokes, accidents, religion, creativity, and even civilization itself. Freud and his followers also set forth guidelines for the conduct of psychoanalysis that have been revised substantially by others over the years. Freud was not tolerant of dissent, and Adler and Jung were forced to leave the group and went on to lead psychoanalytic schools of their own, with Jung’s being especially popular in the last decades of the nineteenth century. Later, Freud

also broke with Otto Rank. In the 1930s and 1940s, subsequent generations of analysts such as Karen Horney, Harry Stack Sullivan, and Erich Fromm were labeled neo-Freudians in that they followed many of Freud’s basic ideas but added new insights that often considered social factors in personality formation and relationships to them.

In 1923 Freud, a lifelong cigar smoker, was diagnosed with cancer of the jaw. Over the next sixteen years, he endured thirty-three operations and radiation treatments and had to wear a prosthetic device that made it difficult for him to speak clearly. (He was nursed by his daughter Anna, who also became his professional assistant and then colleague.) Freud’s fame protected him and his family when the Nazis first came to power in Germany and Austria, but in 1938 the family was forced to flee to London. Freud died on 23 September 1939 in his home at Marshfield Gardens, which became the Freud Museum London in 1986.

“A CLIMATE OF OPINION”

Upon Freud’s death, the British poet W. H. Auden noted that Freud was no longer a single person but rather now a “whole climate of opinion” that influences how people conduct their lives. Auden’s remark was hardly an overstatement as many social commentators place Freud among the top four individuals whose ideas most influenced life in the twentieth century. The other three who often make this list are British naturalist Charles Darwin, who developed the basics of biological evolutionary theory; German political philosopher Karl Marx, one of the founders of communist thought; and German-American physicist Albert Einstein, best known for his theory of relativity.

Sigmund Freud developed psychoanalytic theory as an explanation of human behavior, personality, and society, and he developed the psychoanalytic method of treatment for emotion problems and disorders. Always seeing himself as a scientist, Freud was a brilliant, insightful, and creative thinker whose ideas about the structure and function of the mind, human emotional development, social relations, religion, and other matters changed how people viewed

themselves, raised their children, and related to one another. Freud's ideas and methods, first developed in Vienna, Austria, in the late nineteenth century and then expanded and reshaped for some forty years, were and remain highly controversial. There seems to have never been much middle ground about Freud and his ideas; one is either with him or against him. To some extent, this was a situation that Freud himself created, for as the leader of the psychoanalytic movement he had little tolerance for those who disagreed with him. As mentioned, those who publicly differed with him such as Alfred Adler and Carl Jung found themselves expelled from his Vienna circle of followers and off on their own, in their cases to found alternative psychoanalytic movements.

FREUD AS INFLUENCER AND LEADER

Like much else about him, his life, and ideas, Freud's relationship to leadership is a complex topic and one open to considerable interpretation. Freud was the founder and leader of a major intellectual movement, leader of small group of followers, leader of his family in patriarchal Viennese society, developer of a theory of personality with implications for leadership study, and initiator of the method of historical study called psychohistory. His influence went far beyond psychology and psychiatry and stretched deep into education, anthropology, history, and literary and film theory.

Freud was considered one of the leading public intellectuals of the first third of the twentieth century. His ideas were closely followed in the liberal intellectual circles of the United States and Britain, and not a few intellectuals and wealthy patrons sought to undergo psychoanalysis with him in Vienna. His open discussion of sexuality and his preference for explanation through science rather than religion were attractive to many liberal thinkers and social reformers of the time.

Freud was not shy about sharing his ideas and he did so through a never-ending progression of lectures, articles, papers, and books. His collected written works fill twenty-four volumes. He spoke and wrote in German, but his works were soon translated into English and French by followers. As a result,

psychoanalysis became popular in England, France, and the United States. Freud considered his book *The Interpretation of Dreams* (written after his self-analysis) to be his most significant work. He delayed actual publication until the year 1900 as he viewed it as a pathbreaking work and wanted it to be associated with the new century. Many experts agree with his evaluation of this work. His rich collection of writings has created a cottage industry that continues in the twenty-first century, populated by supporters, critics, and more impartial biographers and commentators who continue to debate his ideas and methods in particular, and his life and psychoanalysis in general.

Freud's methods and ideas were controversial from the beginning. His open discussion of sexuality shocked many in Victorian Europe, and his approach to understanding and treating emotional illness was rejected at first by the medical establishment. It became widely popular only in the second decade of the twentieth century when his ideas were brought to America, Britain, and other nations of Europe. Although the United States became and remains a center for psychoanalysis (although less so now than in the past), Freud visited America only once—when he gave five lectures at Clark University in Massachusetts in 1909.

Since the 1950s, Freudian theory and method and Freud himself have been the objects of continuous criticism and also numerous defenses. These criticisms have emerged in the context of gross changes in the methods and theories of psychology and the treatment of mental illness. Behavioral, cognitive, genetic, neurobiological, and chemical approaches have to a significant extent displaced psychoanalytic and psychodynamic ones, and many emotional disorders and problems are now treated with psychoactive drugs. To his credit, Freud expected that his theories would be replaced eventually with a broader and deeper biological explanation of such disorders, and it appears that there is movement in that direction.

CRITICAL VIEWS OF FREUD AND HIS WORD

There are several major criticisms of Freud and his ideas and methods. First, and most telling is the

Betty Friedan on Freud

Freud, it is generally agreed, was a most perceptive and accurate observer of important problems of the human personality. But in describing and interpreting those problems, he was a prisoner of his own culture. As he was creating a new framework for our culture, he could not escape the framework of his own. Even his genius could not give him, then, the knowledge of cultural processes which men who are not geniuses grow up with today.

The physicist's relativity, which in recent years has changed our whole approach to scientific knowledge, is harder, and therefore easier to understand, than the social scientist's relativity. It is not a slogan; but a fundamental statement about truth to say that no social scientist can completely free himself from the prison of his own culture; he can only interpret what he observes in the scientific framework of his own time. This is true even of the great innovators. They cannot help but translate their revolutionary observations into language and rubrics that have been determined by the progress of science up until their time. Even those discoveries that create new rubrics are relative to the vantage point of their creator.

Much of what Freud believed to be biological, instinctual, and changeless has been shown by modern research

to be a result of specific cultural causes. Much of what Freud described as characteristic of universal human nature was merely characteristic of certain middle-class European men and women at the end of the nineteenth century.

For instance, Freud's theory of the sexual origin of neurosis stems from the fact that many of the patients he first observed suffered from hysteria—and in those cases, he found sexual repression to be the cause. Orthodox Freudians still profess to believe in the sexual origin of all neurosis, and since they look for unconscious sexual memories in their patients, and translate what they hear into sexual symbols, they still manage to find what they are looking for.

But the fact is, cases of hysteria as observed by Freud are much more rare today. In Freud's time, evidently, cultural hypocrisy forced the repression of sex. (Some social theorists even suspect that the very absence of other concerns, in that dying Austrian empire, caused the sexual preoccupation of Freud's patients.) Certainly the fact that his culture denied sex focused Freud's interest on it. He then developed his theory by describing all the stages of growth as sexual, fitting all the phenomena he observed into sexual rubrics.

Source: Friedan, Betty. (1963). "The Sexual Solipsism of Sigmund Freud." *The Feminine Mystique*. Retrieved September 30, 2003, from <http://www.marxists.org/reference/subject/philosophy/works/us/friedan.htm>

argument that Freud's methods were hardly scientific and that psychoanalytic theory is unscientific and unsupported (even unsupportable) by scientific research. Specific criticisms point out the few patients Freud used in developing his ideas, biases on his part, the continual revision of theory to fit new facts, the rejection of contrary evidence, and the fuzziness of such a general theory that claims to explain everything.

Second, there is much evidence dating to the 1950s that psychoanalysis is not an effective treatment. Psychoanalysis was never a treatment for the average person (it takes too much time and money for that) and is now typically entered into by people who are free of major emotional problems as a vehicle for self-exploration and personal growth.

The third major line of criticism comes from feminist scholars and others who describe Freudian theory as a patriarchal one that displays minimal under-

standing of women and their lives. Despite his openness in discussing human sexuality, Freud's ideas about women are imbedded in the intellectual and moral values of late-nineteenth-century Victorian Europe. But, some defenders note that women played a key role both as patients and research subjects—and also as analysts. Key early women analytic pioneers included Anna Freud, Melanie Klein, Helen Deutsch, and Karen Horney, although the last three were neo-Freudians who developed ideas of their own that went beyond traditional Freudian theory.

A fourth line of criticism goes beyond Freud's ideas and methods to attack him personally: that he deliberately misrepresented data to support his theories, had a family life that was less fulfilling than he claimed, had an affair with his wife's sister, was cold and distant, and was dictatorial and could not accept criticism from colleagues.

One recent public manifestation of the debates

about these criticisms was the controversy surrounding the October 1998 exhibit at the Library of Congress about Freud's influence. The exhibit was delayed for several years by critics who wanted to see criticisms as well as praise exhibited.

FREUD AND LEADERSHIP STUDIES

Within modern leadership studies, Freud today garners little attention, his theories never really competing with more recent behavioral, cognitive, and contingency models. While still popular with the general public, the psychohistorical approach to understanding leaders that he pioneered with his study of Leonardo da Vinci has lost favor in academia.

Freud's *Group Psychology and the Analysis of the Ego* (1921) is his one work that has attracted some attention in leadership studies. A key point of the book is that strong leaders and their ideas have a major and lasting influence on groups and followers. Freud saw a leader's influence as being based on emotion. The idea of emotional ties between leaders and followers as a key element of leadership is now widely accepted by leadership scholars. Freud also emphasized that a leader's continuing power often rests on all followers believing that the leader loves each of them equally. Freud's work on narcissism has also drawn some attention, especially in a revised form in which at least some narcissistic traits, such as wanting to change the world, are seen as positive traits in leaders. Others, however, see narcissism in leaders as a form of dysfunctional leadership.

FREUD'S LEGACY

Freud's ideas—and psychoanalysis—continue to have significant influence in contemporary life. Perhaps Paul Kline best explained Freud's continuing popularity when he noted that Freud's ideas about many matters make sense to many people because many of his ideas fit with people's own life experiences and insights. Part of Freud's legacy is that many concepts and terms from psychoanalysis—unconscious, ego, superego, id, castration anxiety, Oedipus complex, denial, repression, talking cure,

and Freudian slip—are now part of the lexicon of daily life in the United States and elsewhere.

FRIEDAN, BETTY (b. 1921)

U.S. feminist leader

Betty Friedan helped begin the second feminist movement in the United States in the 1960s by writing *The Feminine Mystique* and cofounding the National Organization for Women (NOW).

Born Bettye Naomi Goldstein in Peoria, Illinois, on 4 February 1921, the future feminist displayed formidable intelligence and strong opinions in an era when beauty mattered most in girls. After graduating summa cum laude from Smith College in 1942, Friedan pursued graduate study in psychology at the University of California at Berkeley.

RUMBLINGS OF DISCONTENT

In 1943, Friedan won the prestigious Abraham Rosenberg Research Fellowship, the largest grant available at Berkeley and one sufficient enough to last through the end of her doctoral studies. Rather than being overjoyed, she regarded the award with conflicting emotions. Noting that most women with doctoral degrees remained single, Friedan feared that accepting the fellowship would end her hopes of a family life. Adding to the pressure, Friedan's boyfriend reminded her that he would never win such an award and pushed her to decline the honor. She did so but would later use this episode in *The Feminine Mystique* as an example of the hostile forces weighing down women struggling to reach their full potential.

Moving to New York City in 1943, Friedan found work as a labor journalist with the left-wing Federated Press. In 1946, the United Electrical, Radio, and Machine Workers hired her away as a reporter for their official house organ. In June of the next year, she embarked on a tumultuous marriage to Carl Friedan, an entrepreneur and advertising executive. In 1952, the United Electrical, Radio, and Machine Workers fired Friedan, then pregnant with her second child. In 1956, she would bear her third and last child.

A community activist in her suburban New York City neighborhood, she spent the 1950s employed as a freelance author for mass-circulation women's magazines. Plagued by guilt that she had not lived up to the glorious future forecast for her, she sought a reason as to why so many of the best and brightest women of her generation also felt dissatisfied.

BIRTH OF THE FEMINIST MOVEMENT

Friedan's experiences of gender-based discrimination combined in 1957 to lay the groundwork for *The*

Feminine Mystique. In this year, her Smith College class held its reunion and Friedan distributed a detailed questionnaire for classmates that would become the germ of the book. Most of the alumnae professed to be happy with their lives, but 60 percent did not find fulfillment in their role as homemaker. Friedan had discovered what she would term "The Problem That Has No Name," the deep-seated and confused dissatisfaction her classmates felt but could not fully articulate. *The Feminine Mystique*, so named because it challenged the myth of feminine fulfillment, appeared in print on 19 February 1963.

With a focus on white, middle-class suburban women, Friedan provided a coherent explanation for the routine belittlement that such women had experienced all their lives. She argued that the feminine mystique required women to renounce their brains and deny their senses, retreat to a childlike state, and immolate themselves on the altar of their family's needs to find satisfaction in life. A distinctive aspect of the book was Friedan's use and gendering of contemporary psychology, particularly the theories of Abraham Maslow. She took what psychologists had written about men and turned it to feminist purposes by arguing that people developed a healthy identity not through housework but through commitment to purposeful and sustained effort.

The book became an instant bestseller. For years afterward, women would tell Friedan that reading it had changed their lives. But society as a whole did not receive Friedan's message warmly. Interviewers focused on her appearance, her personality, and her life story to trivialize her findings. Partly in response, she became defensive and combative.

LEADER OF THE FEMINIST MOVEMENT

In 1966, the Equal Employment Opportunity Commission (EEOC) treated women's complaints about sex discrimination as a joke and instead focused on the problems of black men. Convinced of the need for an organization to fight on behalf of women's concerns, Friedan helped cofound the National Organization for Women (NOW). Already the public face of feminism, she served as the president of NOW until 1970. To make an impact, NOW needed

Selection from *The Feminine Mystique* by Betty Friedan

When *The Feminine Mystique* was published in 1963, Betty Friedan gave voice to a generation of women who felt that something was inexplicably wrong with their lives. In this excerpt from the "The Problem That Has No Name," the first chapter of the book, Friedan spells out the nature of the problem women were facing.

The suburban housewife—she was the dream image of the young American women and the envy, it was said, of women all over the world. The American housewife—freed by science and labor-saving appliances from the drudgery, the dangers of childbirth and the illnesses of her grandmother. She was healthy, beautiful, educated, concerned only about her husband, her children, her home. She had found true feminine fulfillment. As a housewife and mother, she was respected as a full and equal partner to man in his world. She was free to choose automobiles, clothes, appliances, supermarkets; she had everything that women ever dreamed of.

In the fifteen years after World War II, this mystique of feminine fulfillment became the cherished and self-perpetuating core of contemporary American culture. Millions of women lived their lives in the image of those pretty pictures of the American suburban housewife, kissing their husbands goodbye in front of the picture window, depositing their station wagons full of children at school, and smiling as they ran the new electric waxer over the spotless kitchen floor. They baked their own bread, sewed their own and their children's clothes, kept their new washing machines and dryers running all day. They changed the sheets on the beds twice a week instead of once, took the rug-hooking class in adult education, and pitied their poor frustrated mothers, who had dreamed of having a career. Their only dream was to be perfect wives and mothers; their highest ambition to have five children and a beautiful house, their only fight to get and keep their husbands. They had no thought for the unfeminine prob-

lems of the world outside the home; they wanted the men to make the major decisions. They gloried in their role as women, and wrote proudly on the census blank: "Occupation: housewife."

For over fifteen years, the words written for women, and the words women used when they talked to each other, while their husbands sat on the other side of the room and talked shop or politics or septic tanks, were about problems with their children, or how to keep their husbands happy, or improve their children's school, or cook chicken or make slipcovers. Nobody argued whether women were inferior or superior to men; they were simply different. Words like "emancipation" and "career" sounded strange and embarrassing; no one had used them for years. When a Frenchwoman named Simone de Beauvoir wrote a book called *The Second Sex*, an American critic commented that she obviously "didn't know what life was all about," and besides, she was talking about French women. The "woman problem" in America no longer existed.

If a woman had a problem in the 1950's and 1960's, she knew that something must be wrong with her marriage, or with herself. Other women were satisfied with their lives, she thought. What kind of a woman was she if she did not feel this mysterious fulfillment waxing the kitchen floor? She was so ashamed to admit her dissatisfaction that she never knew how many other women shared it. If she tried to tell her husband, he didn't understand what she was talking about. She did not really understand it herself.

Source: Friedan, Betty. (1963). "The Problem That Has No Name." *The Feminine Mystique*. Retrieved September 30, 2003, from <http://www.h-net.org/~hst203/documents/friedan1.html>

Friedan's boldness and disdain for rules, but once the organization had matured it no longer tolerated her temper and histrionics.

In 1969, men trying to make abortion legal for doctors to perform invited Friedan to a meeting in hopes that her fame would bring publicity to their movement. At the founding of the National Association for the Repeal of Abortion Laws (NARAL—later called the National Abortion Rights Action League), Friedan suggested that the right of a

woman to control her body lay at the heart of abortion rights movement and persuaded the men to change their focus to a woman's choice. However, she was not subsequently active in NARAL.

The qualities of independence and combativeness that enabled Friedan to shatter societal presumptions about the proper place of women also made it impossible for her to work collaboratively to sustain her leadership of the women's movement throughout the 1970s. She managed to offend virtually everyone

with whom she worked. Other women's leaders, notably the more photogenic Gloria Steinem, assumed leadership of the movement as Friedan lost followers.

By the 1980s, Friedan had returned to her journalistic roots. Her 1981 book, called *Second Stage*, focused on working collaboratively with men to better the world. *The Fountain of Age*, about the myths of growing old that prompt some people to withdraw from life, made the bestseller list in 1993. *Beyond Gender: The Real Politics of Work and Family* appeared in 1997. Still enormously active, Friedan published her memoir *Life So Far* in 2000.

Friedan had the vision and determination to establish the women's movement. The mother of American feminism, she gave women the opportunity to choose the direction of their lives and encouraged them to reach their full potential.

FRIENDSHIP

For the ancients, friendship was “the happiest and most fully human of all loves; the crown of life and the school of virtue” (C. S. Lewis, 1960, 69). Today, by contrast, it is seen as just another interpersonal relationship. Exclusively located in the private sphere, its significance in relation to ethics, justice, and public affairs is seldom discussed. Despite its vital contribution—for better or for worse—to the working atmosphere of groups, teams, and even whole organizations, friendship seldom features in textbooks or training courses—or on the agendas of management meetings.

Several major historical trends have served to make friendship seem at best irrelevant to organizational life, or, at worst, a threat to order and efficiency. These include Fordism and Taylorism, bureaucracy,

utilitarianism, individualism, and the influence of the romantic movement. In contrast to these, the contribution of friendship to our understanding of leadership is precisely that it emphasizes the relational over the technical, connectedness over separation and individualism, and truth over power and control.

For example, a pivotal leader in the history of Western society is David, the king of Israel, who became the model for both Jewish and Christian leadership. His leadership is contrasted with that of Saul; the key difference between them being the friendship between David and Jonathan, Saul's son. Where Saul attempted to rule on the basis of power alone, David's leadership was modeled on friendship. Because friendship has its own order, it is also effective as an organizing principle for leadership (French & Moore, 2004).

The classical tradition describes different levels of friendship. The most basic is friendship based on *utility*, an exchange relationship, where both sides have something to gain. In turbulent times—and our own may be a case in point (Pahl, 2000)—friendship has acted as a kind of “glue” to hold together unstable social and political structures. Following the death of Alexander the Great, for example, the new monarchies of Egypt, Macedonia, and Greece lacked a traditional aristocracy on which they could rely. Instead, leaders chose from among the most able men around them a group of close advisors to support them in the day-to-day running of their kingdoms, a kind of inner cabinet. These were called “The Friends.” To think of such alliances as a form of friendship, rather than as micropolitics or “networking,” can shed a different light on one's own behavior or motivation, as well as that of others. However, the emphasis in our day on the democratization of the workplace and on equality of opportunity, has led to a deep suspicion of elitism, favoritism (nepotism), and “patronage,” with which such alliances can be associated.

The second level of friendship is pleasure. To enjoy the company of friends, people will choose a career, stay in a job they do not like, move location, or start up a new enterprise. The pleasures of friendship can also be fraught with danger, however, as is clear from the gossip columns of newspapers and

Samuel Johnson on Friendship

British writer Samuel Johnson (1709–1784) commented on a vast range of subjects, including marriage, money, virtue, and vice. Here he discusses the nature of friendship.

Life has no pleasure higher or nobler than that of friendship. It is painful to consider, that this sublime enjoyment may be impaired or destroyed by innumerable causes, and that there is no human possession of which the duration is less certain.

Many have talked, in very exalted language, of the perpetuity of friendship, of invincible constancy, and unalienable kindness; and some examples have been seen of men who have continued faithful to their earliest choice, and whose affection has predominated over changes of fortune, and contrariety of opinion.

But these instances are memorable, because they are rare. The friendship which is to be practiced or expected by common mortals, must take its rise from mutual pleasure, and must end when the power ceases of delighting each other.

Many accidents therefore may happen, by which the ardour of kindness will be abated, without criminal baseness or contemptible inconstancy on either part. To give pleasure is not always in our power; and little does he know himself, who believes that he can be always able to receive it.

Those who would gladly pass their days together may be separated by the different course of their affairs; and friendship, like love, is destroyed by long absence, though it may be increased by short intermissions...

No expectation is more frequently disappointed, than that which naturally arises in the mind, from the prospect of meeting an old friend, after long separation. We expect the attraction to be revived, and the coalition to be renewed; no man considers how much alteration time has made in himself, and very few enquire what effect it has had upon others. The first hour convinces them, that the pleasure, which they have formerly enjoyed, is for ever at an end; different scenes have made different impressions,

the opinions of both are changed, and that similitude of manners and sentiment is lost, which confirmed them both in the approbation of themselves.

Friendship is often destroyed by opposition of interest, not only by the ponderous and visible interest, which the desire of wealth and greatness forms and maintains, but by a thousand secret and slight competitions, scarcely known to the mind upon which they operate. There is scarcely any man without some favourite trifle which he values above greater attainments, some desire of petty praise which he cannot patiently suffer to be frustrated. This minute ambition is sometimes crossed before it is known, and sometimes defeated by wanton petulance; but such attacks are seldom made without the loss of friendship; for whoever has once found the vulnerable part will always be feared, and the resentment will burn on in secret of which shame hinders the discovery...

Friendship has other enemies. Suspicion is always hardening the cautious, and disgust repelling the delicate. Very slender differences will sometimes part those whom long reciprocation of civility of beneficence has united. Lonelove and Ranger retired into the country to enjoy the company of each other, and returned in six weeks cold and petulant; Ranger's pleasure was to walk in the fields, and Lonelove's to sit in a bower; each had complied with the other in his turn, and each was angry that compliance had been exacted.

The most fatal disease of friendship is gradual decay, or dislike hourly increased by causes too slender for complaint, and too numerous for removal. Those who are angry may be reconciled; those who have been injured may receive a recompense; but when the desire of pleasing and willingness to be pleased is silently diminished, the renovation of friendship is hopeless; as, when the vital powers sink into languor, there is no longer any use of the physician.

magazines. Rumors of the abuse of friendship, or its "descent" into a sexualized relationship, and the envy of those who see others enjoying friendship, mean that all organizational members must behave with care. This can contribute to the sense of isolation that often accompanies the role of leader.

However, the ancient world understood friendship as more than for utility and pleasure. Rather than just a relationship, it was seen as a disposition; that is, as the state of mind from which relationships flow, an attitude toward the other, and indeed toward all creation. By *disposition* (Greek, *hexis*), Aristotle indi-

cated an inherent aspect of human nature. Rather like the capacity for language, a *hexis* is something all humans are born with, which develops with use, but can also shrink with neglect. Hence appears the link between virtue and friendship, suggested by C. S. Lewis: It is by practicing friendship and following its disciplines that we learn to live well as human beings. At this, the highest level of friendship, one lives for the sake of the other and in full identification with the other's needs. This level of commitment allowed Jonathan to support to the death his own father as king, while, at the same time, giving up his own claim to the throne for the sake of his friend. Through the eyes of friendship, he could see David was more suited to lead than he was.

Friendship as a disposition toward self and others is an idea that for leaders is of particular significance. It defines friendship in impersonal—or transpersonal—terms. It can enable one to treat others *as if* they were friends, even—in an extreme formulation—where one does not actually like them. Thus, with or without affection, the disposition of friendship ultimately means treating others as a part of oneself, being unable to see them as the means to an end, but only as an end in themselves. An organizational culture of friendship, therefore, is not necessarily dependent on the kind of intimacy normally associated with friendship. Instead, is based on the disciplines of friendship: hospitality, generosity, mutuality, support, respect, trust, and self-knowledge.

Central to these disciplines, in the classical friendship tradition, was the notion of *parrhesia*, that is, frankness of speech or “fearless speech” (Foucault, 2001). This is the fulcrum around which the organizational implications of friendship revolve. The last thing leaders need is flatterers. They need critical friends, prepared to point out flaws in their thinking and behavior, even at risk to their own position and

safety: “Better be a nettle in the side of your friend than his echo” (Emerson, [1841] 1992, 103). The development of a mature culture or ethos of *parrhesia* depends on three elements. First, there is the ability, readiness, and, not least, courage of organizational members to talk frankly to leaders—to “speak the truth to power” (an often-quoted Biblical admonition). Then, there is the leader's capacity to discriminate between flattery and the honest criticism, which is the mark of a friend. Crucial to both, however, is the leader's readiness to reject flattery, and his or her commitment to listening to uncomfortable truths, spoken in friendship: As the poet William Blake put it ([1790] 1972, 157), “Opposition is true friendship.”

 **GANDHI, MOHANDAS K.**
(1869–1948)

Leader of independence movement in India

Mohandas Karamchand Gandhi, leader of Indian nationalism and the most prominent advocate of non-violent resistance, was born in 1869 in the small princely state of Porbandar in Gujarat, where British influences were slight. His father, Karamchand, served as prime minister to the Rajah. While Gandhi's father provided a model of political integrity, his devoutly Hindu mother, Putlibai, introduced him to religious and moral principles including religious fasts and nonviolence (*ahimsa*). Although Gandhi subsequently abandoned his faith in orthodox Hinduism, he retained his mother's insistence on self-control, absolute truth, and abstinence from tobacco and alcohol throughout his life. His childhood heroes were drawn from Hindu paragons of truthfulness, filial duty, and self-sacrifice.

CHILDHOOD AND FEELINGS OF INADEQUACY

The young Gandhi was shy and diffident. He entered school and by most accounts, including his own, was a mediocre student. Gandhi believed that in addition to having a sluggish intellect he was a coward who was afraid of the dark. However, the feelings of per-

sonal inadequacy coexisted with an iron will, a desire to serve his parents and reform others, and an unbending commitment to truth. He married at the age of thirteen to Kasturbai, and in the first years of the marriage was overwhelmed by the joys of sex with his child bride. He also went through a brief phase of adolescent rebellion. Gandhi made friends with an outgoing Muslim classmate who introduced the vegetarian Gandhi to eating meat and smoking, and even took him to a brothel, although Gandhi changed his mind once there. When Gandhi later wrote, "I wished to be strong and daring and wanted my countrymen also to be such, so that we might defeat the English and make India free," he made the first of many connections between his personal problems and those of India.

One day during his father's fatal illness in 1884, Gandhi left his father's side and went to have sexual intercourse with his wife. While he was with his wife, Gandhi was informed his father had died. The "shame" of allowing "carnal lust" to get the better of his duty to study and his "devotion to my parents" strongly influenced his ideas about the need for self-control.

A new stage in Gandhi's life began when his family decided to send him to England to be trained as a lawyer in order to assume family duties as prime minister of Porbandar. In going he ignored the opposition of his caste council, which feared travel

overseas would break caste, but promised his mother not to indulge in wine, women, or meat.

STUDYING LAW IN ENGLAND

Arriving in England in 1888, Gandhi assimilated new sets of ideas that provided the foundations for a broader conception of public duty and offered a modern rationale for some of his traditional beliefs. At first, he sought to escape his feelings of unworthiness by adopting the traits of an English gentleman. He took speech lessons, studied the violin, wore fashionable clothes, went to teas, and played cards, but he discovered the orthodox British persona did not fit and was too expensive for his budget. Visits to vegetarian restaurants soon introduced him to the company of English nonconformists, pacifists, and vegetarians. He found philosophic support for vegetarianism, read the *Gita* for the first time, and was exposed to Western critiques of modern industrial society.

He returned to India as a lawyer in 1891, but was so shy that he became almost inarticulate when presenting evidence. A failure in India, in 1893 he accepted an invitation to go to South Africa on behalf of an Indian firm.

GANDHI IN SOUTH AFRICA

The twenty years Gandhi spent in South Africa were the turning point in his life. The transformation began when Gandhi was thrown off a train in the middle of the night for refusing to give up his seat in a first-class coach. As a British-trained lawyer and someone who had not experienced racial discrimination in England, Gandhi reacted sharply to these and other racial affronts to his personal dignity. In the process he became a leader in the community's fight for justice and refashioned his own identity. In June 1894, he decided to remain in South Africa in order to lead the opposition to a bill to disenfranchise Indian voters. He unexpectedly became an effective political organizer with an ability to personally impress friends and foes alike. In the following years he established a permanent organization modeled on the Congress Party in India, organized petitions, and led demonstrations. Gandhi appealed to the common people by his per-

sonal example, by his willingness to go to jail for his beliefs, and by encouraging pride in Indian culture. The shy failure in India had become a highly successful lawyer and undisputed leader of the Indian community's continued fight against discrimination for another two decades. His limited successes confirmed his faith in the power of reason and law as well as the good intentions of the British Empire. During the Boer War and the Zulu War, he even formed an ambulance corps on behalf of the British.

SATYAGRAHA, NONPOSSESSION, AND CIVIL DISOBEDIENCE

Meanwhile, Gandhi's personal and spiritual life was evolving. He read widely in Christian, Muslim, and Hindu texts, seeking the truths in each religion. Religion became the basis for his life; he treated religion as a way of life and a search for Truth. In the process, he began to abandon a concern for material possessions and markers of superior social status. The dapper young man with an annual income of £5,000 a year and who dressed in careful English fashion changed into a self-reliant man who wore Indian clothes and did his own laundry. As part of his experiments in simplifying his life, he established a communal farm, Phoenix. There a small number of families, including Europeans, shared in the manual work and agreed to a strict Spartan existence, including vegetarianism and sexual abstinence.

In 1906–1907, Gandhi discovered the technique of civil disobedience as the ideal means for seeking justice. When the Transvaal government demanded the registration and fingerprinting of all Indian residents, he initiated his first “nonviolent resistance” campaign in which Indians deliberately violated “unjust” laws. He adopted the term *satyagraha*, or the “truth force.” For Gandhi, *satyagraha* was a total program of existence, which included proper food, dress, vegetarianism, celibacy, and sanitation, not just a political technique.

GANDHI IN INDIAN POLITICS

In early 1915, Gandhi returned to India where he intended to spend his remaining years in an ashram,

the Hindi term for a religious community, conducting constructive social work to regenerate India. His travels through India had convinced him that foreign rule and the degeneration of India had left Indians cowardly, divided by caste and religion, and lacking a sense of public duty. Instead he found himself drawn in to local political causes. In 1917, peasants invited him to Champaran, where he led a successful nonviolent campaign against English indigo planters who had made the peasants into virtual slaves. At Kaira he had his followers harvest onions from a field confiscated by the British. At Ahmadabad Gandhi resorted to the use of fasting to strengthen the flagging will of the strikers.

In 1919, Gandhi moved onto the national stage to become the most important leader of the Indian National Congress. He reshaped the ideology of the nationalist movement, reorganized the party, and brought mass mobilization to unparalleled heights. His calls for nonviolent resistance refuted the British stereotype that the Indians were childish, physical cowards, effeminate, and passive by showing that reliance on nonviolence and nurturing was morally superior to violence. Indians responded to his courage, his adroit use of cultural symbols, his call to action, and their sense that he possessed special spiritual powers. At the age of thirty-seven, after fathering children, he became a *brahmacharva* (a celibate). His dress, vocabulary, and an ascetic lifestyle emphasizing celibacy, vegetarianism, and self-control convinced many followers that he was a spiritual guru. They flocked to him for *darshan*, the miraculous blessings that derived from seeing a holy man or visiting a holy shrine.

In 1919, Gandhi launched his first national satyagraha campaign. In response to passage of the

Source: Bettmann/Corbis; used with permission.

Rowlatt Bill, which extended wartime powers of arbitrary arrest, Gandhi called for a *hartal* or day of fasting and prayer, which amounted to a general strike. Days later in Amritsar, British troops fired repeatedly on a crowd without warning, killing 379 people and wounding more than a thousand. This convinced Gandhi that the time to end British rule had come.

REORGANIZATION OF THE CONGRESS PARTY AND THE NON-COOPERATION MOVEMENT

Prior to 1920, the Congress Party had been a relatively small organization dominated by Anglicized elites. Gandhi transformed the organization into a political party capable of leading mass movements. He established provincial Congress committees based on linguistically homogeneous areas and conducted meetings in the local languages to enable non-Western-educated groups to participate in Congress politics. The move to agitational politics and the use of Hindu-oriented symbolism made the Congress a formidable force, but it led many in the

Muslim community to see the Congress Party as Hindu dominated.

From 1920 to 1922, Gandhi directed a national “Non-Cooperation Movement” to promote Indian independence. Since Gandhi believed that the continuation of British rule was based on the cooperation of the Indians, he proposed to oust the British by withdrawing their cooperation. The Congress launched a series of noncooperation activities, including resignation from the army and bureaucracy and the boycott of foreign cloth, elections, law courts, and government schools.

The agitational techniques of the Congress had a remarkable impact on the general Hindu population. People came in increasing throngs to see, hear, and touch him. Introduction of the spinning wheel and homespun cloth as symbols of self-reliance and determination to free India from dependence on foreign imports captured the imagination of millions. Bonfires of foreign goods and the hand spinning of cloth swept across India. Gandhi always harbored doubts whether Indians were ready for his message and feared that violence was inevitable. When at Chauri Chauraa a mob led by Congress volunteers killed twenty-two Indian police constables, Gandhi immediately ended the civil disobedience campaigns. Many in the Congress felt that Gandhi had given up at the moment of success.

Noncooperation coincided with agitation among the Muslims of India, who feared the dissolution of the Turkish Empire and the disestablishment of the caliphate. Gandhi, believing that this was “such an opportunity of uniting the two communities as would not arise in a hundred years,” urged the Congress to support the Khilifat movement on behalf of a unified Indian nationalist movement. However, Muslims continued to see the Khilifat as a Muslim cause, and the movement itself collapsed when the Turks abolished the caliphate themselves.

THE SALT MARCH

Gandhi was sent to jail 10 March 1922 for two years. Although some of his followers expected him to fly out of jail through supernatural powers, he remained incarcerated until May 1924. Upon his release,

Gandhi turned from politics to what he considered the more important “constructive work” in his ashram. If the ashram could be emulated, he thought, India would experience a bottom-up revolution that would free individuals from Western-style exploitation and return India to its roots.

When Britain rejected the Congress’s demands for dominion status, the Congress scheduled a civil disobedience campaign for 1930. For Gandhi, the problem was how to agitate against the Raj without encouraging violence. With a stroke of genius he decided to focus civil disobedience on the insignificant issue of the salt tax. Many were bewildered by identifying a national struggle with salt, but understood it could become a potent symbol.

On 12 March 1930, the Salt March to the sea began with Gandhi leading the march in almost biblical style with staff in hand, drawing massive crowds. As he marched through the countryside, Gandhi called for the resignation of the village headmen. Large numbers of educated women joined the march. The Salt March itself concluded on 6 April, when Gandhi picked up some salt from the shore. Once again Gandhi’s personal charisma elicited a mass response that went far beyond the members of the Congress Party. Tens of thousands of Indians followed his example, making their own salt or purchasing homemade salt from Congress volunteers. The most dramatic of these protests was the march on the Dharasana Salt Works where police charged the protesters with metal-tipped nightsticks, injuring hundreds. On 4 May 1930, the government arrested Gandhi, but protests continued with tens of thousands going to jail.

In response to the success of civil disobedience, Gandhi and the other Congress leaders were released from prison to go to London for negotiations. Nothing came of these or further meetings, partly because the Muslims and untouchables rejected his claim to speak for all India and demanded their own separate electorates.

When Gandhi returned to India, the government arrested him and many of the Congress leaders. Sporadic noncooperation efforts languished in face of this repression and were finally officially ended by the Congress in 1934. Released from jail in 1933,

Gandhi again retired from politics to continue his search for moral improvement and social reforms on behalf of the untouchables. But even from his ashram he continued to serve as a mediator, intervening to hold together the divergent wings of the Congress.

THE PARTITION OF INDIA

By the outbreak of World War II, Gandhi's commitment to nonviolence had become more absolute. He opposed efforts to cooperate with the British war effort in return for promises of independence, and recommended the Jews of Germany respond to Hitler with nonviolent resistance. In March 1942, following British military failures against Japan, he demanded the immediate British withdrawal from India, thereby prompting the British to arrest him and other Congress leaders.

The last years of Gandhi's life were spent watching the disintegration of his hopes for a united, independent India. During World War II, the Muslim League under M. A. Jinnah (1876–1948) had taken advantage of the Congress to establish mass support that it hitherto lacked. In 1946–1947, the British announced their intention to leave India. In the midst of complex negotiations between the Congress and the Muslim League over future constitutional arrangements, communal riots between Hindus and Muslims spread. Gandhi was sickened by the slaughter and remained convinced that a single Indian identity was possible, but ultimately he was ignored by Jawaharlal Nehru (1889–1964) and other colleagues in the Congress Party who concluded that partition was inevitable. As the communal conflict intensified, Gandhi traveled the country trying to bring the slaughter to an end. Twice his fasting ended riots in Calcutta and Delhi, but many in the Hindu community now regarded him as a traitor to Hindu nationalism and an appeaser of Muslims. On 30 January 1948, Gandhi was shot by Nathuram Godse, a Hindu nationalist associated with paramilitary organizations.

GANDHI AS A LEADER

For much of his adult life, Mohandas Gandhi combined the roles of political leader, social reformer,

We must become the change we want to see.

—Mohandas K. Gandhi

and religious leader. Political activity was but one part of a larger effort to regenerate Indian society and to find God. His insightful critique of British rule and of the structure of modern society met the psychological and political needs of his day. But his conservative, antimodern vision had little room for a strong state, industrialization, or radical change based on legal or physical coercion. Nor did his political colleagues believe that the new India could be built on the ideals of the ashram. They did not share his hostility to modern industrial economics or his conviction that the path to social justice lies primarily in morality and controlling passions. Many of those whose interests he championed, women and the untouchables, found that he insisted on defining their grievances and how to redress them according to his own standards of judgment.

Many factors contributed to Gandhi's capacity to remain the dominant leader over two decades. His personal charisma and ability to communicate with the common people through emotions and through rational argumentation made him indispensable during periods of all-Indian mass mobilization. He was a shrewd politician who could manipulate Indian National Congress factions and invoke committee rules to ensure the outcome of a proposal. His personal warmth and nobility of spirit drew individuals and factions to him, even if they did not share his views. When necessary he used moral coercion, although he always denied it was coercion. When Gandhi threatened to fast to death, his opponents usually gave way even if unconvinced by his arguments.

Gandhi channeled Indian nationalism into nonviolent directions and inspired a new generation of leaders such as Nelson Mandela and Martin Luther King, Jr. However, his antimodernism, puritanism, and moralistic approach could not easily be institutionalized within a modernizing state and a conventional party system. Even before his death, it had become clear that his successors would not adopt his

vision for regenerating India, while more recently the Indian leadership has looked to a more “masculine” or assertive version of national identity.

GANGS

The growth of street gangs across the United States has focused attention on the prevention of new gang membership and on intervention with existing gang members. This entry reviews current definitions of gangs and describe the historical context in which gangs in the United States have grown. It then examines the links between gang membership and involvement in crime and delinquency, particularly violent crime and drug sales, and concludes with a discussion of gang processes and the correlates of gang membership.

DEFINITIONS OF GANGS

One of the key features of gangs is that there is no accepted definition of what a gang is. However, every definition includes some reference to a group. That said, since most delinquent acts or crimes committed by juveniles are done in groups, it is important to distinguish between groups and gangs. Unlike most groups, most gangs also have symbols of membership—for example, distinctive clothes, hand signs, and ways of wearing certain clothes. While many groups of young people come and go with great fluidity, gang membership also includes some level of permanence. Most definitions of gangs also require that a gang be in existence over a prolonged period of time, generally a year or more. A number of definitions of gangs also include turf- or gang-identified territory as a part of the definition. A key element used to distinguish a gang from a group is involvement in crime. Without this feature, a gang resembles many other groups, such as Boy Scouts or a fraternity.

THE EVOLUTION OF GANGS IN THE UNITED STATES

Gang development in the United States has been more cyclical than linear in that gangs have tended to come and go rather than be a constant feature of society. In the late 1800s, youth gangs emerged in the slums of New York, Philadelphia, Boston, Chicago, St. Louis, and Pittsburgh during periods of

rapid immigration. These gangs roamed the streets of their neighborhoods engaging in petty forms of property crime and small conflicts with members of rival gangs. Gang activity declined between the turn of the century and the 1920s.

However, youth gang activity increased during the 1920s. These gangs were very different organizationally from the adult gangs of the Prohibition era, though many organized crime figures (including Al Capone) were members of delinquent youth gangs before moving into organized crime. During the Depression and World War II, gang activity declined. When gangs reemerged in the 1960s, they included large numbers of African-American, Puerto Rican, and Mexican-American youths. In addition, levels of violence were higher than in previous periods of gang activity, which can be attributed to the presence of guns and automobiles.

The 1980s saw dramatic increases in gang activity. At the beginning of that decade, gang problems were recognized in only a few large cities, particularly in Chicago and Los Angeles. However, by the end of the decade, gangs appeared in large and medium-sized cities as well as in many rural areas. Levels of violence were much higher than any previous wave of gang activity, and as in the 1960s they were made worse by the widespread availability of automobiles and firearms. The recent spread of gangs has been attributed on the one hand to the emergence of an urban underclass and on the other hand to the effects of a popular culture that makes gang symbols, clothing, and language commodities available almost anywhere in the United States.

THE LINK BETWEEN GANGS AND CRIME

Gang members are heavily involved in a large number of serious delinquent and criminal acts. The distinctions between gang-related crimes, other crimes committed by gang members, and crimes committed by non-gang members are important. We know that gang members are responsible for greater levels of crime and delinquency than their non-gang counterparts. Studies also demonstrate that involvement in crime increases while an individual is a member of a gang and declines once the individual leaves the gang.

The 1927 book by Frederic Thrasher, *The Gang*, found that gangs emerged from the spontaneous group activity of adolescents and that their patterns of association were strengthened by their conflicts over time. In its earliest stage, the gang Thrasher describes was not very well organized, had little leadership, and was short-lived. Conflict with other gangs played a notable role in helping to define group boundaries and strengthen the ties between members, uniting them in the face of threats from rivals. In the 1960s, while working in Chicago, Jim Short and Fred Strodbeck distinguished the following three factors as important influences on the degree to which gangs varied in their level of conflict orientation: community context, relationships among gang members, and the social characteristics of gang members. Two concepts central to their perspective on gangs were threat and status, and both contributed to gang crime. Because gang members faced threats on the street they formed groups that developed cohesion over time. In addition, belonging to the gang conferred status on the members.

Working with gangs in Los Angeles in the 1960s, Malcolm Klein found that delinquency increased among gang members who received the most group-oriented services, and that solidarity among gang members seemed to increase as a result of the attention paid to the gang by street workers. Based on these results, he concluded that gang intervention programs might actually make the problem worse. Interventions seemed to increase the attractiveness of gangs, and therefore they increased their cohesion. Most importantly, Klein found that the offending of gang members was what he termed “cafeteria-style”—gang members rarely specialized in committing certain forms of crime; instead, they generally committed a variety of offenses, picking car theft one time, burglary the next, assault yet another, and drug sales on another occasion.

Joan Moore and Diego Vigil examined both the role of Chicano culture and the position of Mexican-Americans in the cultural and institutional life of East Los Angeles to explain gang formation and activities in the 1970s. They saw the detachment of Chicano culture from mainstream social and political life as the foundation of gang life and criminal

involvement. Vigil emphasized the role of Chicano culture in the formation of gangs, pointing to *choloization*, the process by which Chicano youth are marginalized from mainstream society. From this perspective, the street provides an alternative socialization path for these youths, although it is a path that leads to increased involvement in crime and delinquency and cuts them off from other social institutions.

Gangs emerged in many Midwestern cities in the 1980s. Milwaukee was one such city, and John Hagedorn explained the origin of Milwaukee gangs by noting that most of them emerged on a more or less spontaneous basis from groups of young men who hung out together in their neighborhoods. Other gangs emerged from dancing groups that experienced physical threats and fighting, which strengthened their alliances. The formation of these gangs was greatly affected by the presence of an underclass in which young men were cut off from legitimate institutions such as jobs and schools.

In St. Louis, another Midwestern city, gangs emerged in the late 1980s and early 1990s. Scott Decker and Barrik Van Winkle conducted a field study of gang members in St. Louis in the early 1990s. They described gang structures and processes that combined local neighborhood dynamics and the national-level diffusion of gang cultures. St. Louis neighborhood rivalries that dated back for decades and contemporary friendship networks were transfigured into a system of conflict structures that bear the names and symbols of California's longstanding conflict between the Bloods and Crips, with occasional symbolic manifestations of Chicago gang culture. Decker and Van Winkle's research underscored the cafeteria-style offending patterns of gang members, while emphasizing the ever-present violence of gang life. In their research, the threat of violence is a crucial factor in the formation of gangs as well as in the levels of violence between gangs.

Gang homicides have received considerable attention from researchers. Cheryl Maxson, Margaret Gordon, and Malcolm Klein examined Los Angeles police and sheriff department records. They found that gang homicides were more likely to involve minority males and automobiles, take place

in public places, involve the use of firearms, and use a large number of participants. Richard and Rebecca Block used Chicago police department data to study patterns of lethal and non-lethal gang-related violence over time. They found that (1) gang violence is more likely to be turf-related than drug-related; (2) the patterns of violence of the four largest established street gangs and smaller less-established gangs were different; and (3) guns were the lethal weapons in practically all Chicago gang-related homicides between 1987 and 1990.

One of the most important sources of information about the link between gangs and crime has been surveys of populations of at-risk youth. High school students and dropouts were interviewed by Jeff Fagan and his research team in Chicago, Los Angeles, and San Diego. They found that gang members committed more delinquent acts and more serious offenses than non-gang members did. In a longitudinal survey of at-risk youth in Denver, Colorado, Finn Esbensen found that while gang membership was rare among the Denver respondents, gang members reported two or three times as much delinquency as non-gang members. From longitudinal survey results on a representative sample of Rochester, New York, youth, Terry Thornberry and his colleagues found that gang-involved youths were significantly more likely to report involvement in violence and other delinquency. Their analysis showed gang involvement to be a transitional process with delinquent activity increasing during gang involvement and declining afterward.

GANG PROCESSES

The gang experience is a dynamic process that is highly variable over time and across individuals. This variability includes issues such as joining the gang, being initiated into the gang, advancing in rank, and exiting the gang.

Joining the Gang

One of the important things to understand about gangs is how individuals come to join them. Most young people who are pulled into membership have

been attracted to a gang by the promise or expectation of friendship, opportunities to make money, or the ability to provide something for the neighborhood. Most of the available evidence supports the view that individuals are pulled toward their gang because of what they see as the positive features of gang involvement such as friends or the need to affiliate. A number of observers report that a gang may also be a magnet for prospective members because it offers the prospect of making money. Cultural pride or ethnic identification may also play a role in the decision to join a gang.

Initiation

The initiation into a gang is the clearest point of demarcation between gang members and non-gang members. Most gangs have some sort of an initiation process, though these processes can vary between different gangs and within the same gang. Most initiations have few formal aspects to them and involve some form of violence, typically by current members of the gang directed against the initiate. The most common form of initiation reported is that of being beaten. In other circumstances, a recruit will be required to go on a "mission" against a rival gang. While this can take a variety of forms, it typically requires the recruit to fight or shoot a rival gang member, or to conduct a crime such as robbery in rival gang territory. Most observers of the female gang scene report that females tend to be initiated in the same way that boys are, through beating, often by both boys and girls. A number of highly publicized reports document rapes of prospective female gang members. However, there is not widespread support for this as the typical way girls are initiated into their gangs.

Roles in the Gang

Youth gangs tend not to have a strong organizational structure, although there are usually distinctions within a gang between the status and functions of different members. While a few gangs in chronic gang cities like Chicago have well-defined distinctions between roles, this is not generally the case in most cities. The process of acquiring rank is based

primarily on length of time in the gang, blood relationships with current leaders, and level of criminal activity. In emerging gang cities, gangs tend to have fewer roles, and those roles are not very well defined.

Participating in Gang Violence

Understanding the role of violence in a gang is one of the keys to understanding gangs. Not only are gang members active as perpetrators of crime, they are also victims of high levels of crime. Some cities (Chicago and St. Louis) report that about one in four homicide victims are gang members; Los Angeles County reports that nearly half of its homicide deaths are gang members. Homicides committed by gang members are more likely than other crimes of violence to involve firearms, particularly handguns. And the victims of gang homicides are likely to be of the same race, age, sex, and neighborhood of residence as the people who kill them. Violence helps to hold the gang together. Most studies of gangs conclude that the sources of gang solidarity are usually external to the gang and almost never come from inside the gang.

Leaving the Gang

A large number of individuals leave their gangs every year, and not just as a result of death or a prison sentence. However, a large mythology exists that claims that it is not possible to leave a gang. Most of the available evidence dispels this myth and documents a considerable number of ex-gang members. Few of the individuals who leave a gang report that they faced physical consequences for doing so, though some are threatened with violence. The obligations that come with growing older, such as a job, becoming a parent, or getting older, are the key reasons cited for ending a relationship with a gang.

CORRELATES OF GANG INVOLVEMENT

One of the strongest correlates of gang membership is age. While gang members range across a wide variety of ages, typically they are teenagers. It is not easy to pinpoint a single age as the average age of

Gang Leadership in Chicago

In his famous study of the Vice Lords in Chicago in the 1960s, anthropologist R. Lincoln Keiser outlines the leadership structure of the gang.

Formal offices are found in various branches, age groups, and sections of the Vice Lord Nation. Before the latest reorganization, there were seven named offices, although all were not found in every subgroup. These offices are: president, vice-president, secretary-treasurer, supreme war counselor, war counselor, gunkeeper, and sergeant-at-arms. The information I was given concerning these offices can be summarized in the following manner:

The president conducts meetings, in some cases makes the decision whether or not to fight another group, and is responsible for leading successful raids. He symbolizes the group's power, and in feuding and warfare his injury is the prime objective of enemy force.

The vice-president is the president's assistant. He has few formally recognized duties. When the president has been arrested, or otherwise cannot or will not fulfill his duties, the vice-president succeeds to the office of president.

The war counselor is the president's main assistant when the group is involved in fighting. He is specifically charged with the responsibility of deciding whether or not to begin a fight in a confrontation between two rival groups. No one is supposed to begin fighting until the war counselor throws the first punch, or, as the case may be, fires the first shot. In the Albany Midgets there are three war counselors: a supreme war counselor and two regular war counselors. The war counselors, along with the president, form a war council which decides whether or not the group will fight when one of its members has been attacked by individuals outside the group. All decisions have to be approved by a majority of the council. If a decision to fight is made, the supreme war counselor organizes and leads the raid. Much of the fighting that informants discussed followed accidental encounters between enemy cliques, and in such cases war counselors have no institutionalized responsibilities.

Source: Keiser, R. Lincoln. (1969). *The Vice Lords: Warriors of the Streets*. New York: Holt, Rinehart and Winston, Inc., p. 17.

gang members, but a number of studies identify seventeen or eighteen as the average age of members in their sample.

Racial and ethnic minorities are overidentified as gang members, largely as a consequence of the use of police data to identify gang members. National surveys of police departments indicate that racial and ethnic minorities, particularly African-Americans and Hispanics, are the majority members of gangs. However, school survey data reveal higher percentages of white gang members.

Just as official statistics underestimate the level of

gang involvement among whites, they also underestimate the level of gang involvement among females. The conventional view has been that females comprise about ten percent of all gang members. However, school-based surveys show that the correct figure may be closer to thirty percent. Regardless of the number, female involvement in gangs and gang activities appears to be increasing.

It is not surprising that the majority of gang members come from the lowest socio-economic groups in American society because this was also the case in the three earlier gang cycles. The current cycle of gangs began in cities and neighborhoods with large concentrations of urban poor, often the urban underclass. This observation seems a logical consequence of the historical characteristics of gangs, but the emergence of gangs in suburbs and rural areas now presents a challenge to the view that gang members are drawn exclusively from the poorest members of society.

CHARACTERISTICS OF GANG ORGANIZATION

There are two competing views of the nature of gang organization.

One view holds that gangs are vertically organized and have a formal structure that enforces rules and acts in the same ways that a business may act. The alternative view argues that most gangs are horizontal and lack the formal-rational character of organizations with established leadership structures and well-defined roles and missions. Most of the research supports the latter view.

Like most groups, most gangs have leaders. However, in most cases gang leaders are less likely to resemble corporate executives and more likely to be like the captain of a sports team, a role that can

change from one circumstance or one day to another. Most organizations need rules, and gangs are no exception to this. A relatively small number of gangs have written sets of rules and created constitutions; most gangs simply have a set of rules that are understood among the members.

There are also distinctions between different members of the gang. In the least organized case, this distinction is only between core and fringe members, with the former participating more fully in decisions about what activities to pursue. A final aspect of gang organization is what happens to the money made in gang-involved crime. In some cases, all the money is reinvested in the organization so that it can grow. In other cases, the money raised by individual members of an organization is kept for their own use. The first model is the corporate model, and the second is a model of individual entrepreneurship. With few exceptions, gang members function as individual entrepreneurs, selling drugs or committing crimes for their own benefit, and rarely, if ever, reinvesting their profits into the larger gang.

SIGNS OF CHANGE

There is considerable diversity among gangs with regard to their nature, origin, and activity. They are also dynamic, changing in their structure, membership, and activities over time. This entry has highlighted these features of gangs and gang members in the United States. We noted that gang definitions include a common set of elements, such as involvement in crime, permanence of membership, a group context, and the use of symbols. Gang membership increases not only involvement in crime and delinquency but also the seriousness of such involvement. When individuals leave their gangs, their level of crime decreases significantly. Historically, gangs have been associated with cities, particularly with ethnic minorities in economically disadvantaged positions. However, there is evidence that this may be changing. Gang structure and organization are variable, though there is little evidence to suggest that gangs are well organized anywhere but in a small number of cities.

GENDER AND AUTHORITY

The consideration of gender's relationship to authority is important because aspects of gender overlap with the location of authority in society. It is important in the context of leadership because leadership incorporates concepts of authority as well as characteristics associated with gender. Although all cultures and societies have had and continue to have authority figures of both genders, there have traditionally been more male authority figures than females in most cultures at most times. In general, males have held authority in the public arena, whereas if females did hold authority it was in the domestic realm (as mothers), the field of education (as schoolteachers), and in the literary world.

GENDER AND THE DEVELOPMENT OF GENDER ROLES

The researchers Eleanor Maccoby and Carol Jacklin write, "the simple fact that a child is, and is known to be, a boy or girl sets powerful forces in motion" (Maccoby and Jacklin, 1987, 283). They argue that gender classification is one of the two major and most primitive bases for classification among human beings (the other is age). If differential treatment of children according to gender begins at birth and is established in early childhood, as many argue, then this is a highly significant factor in children's developing leadership attributes and choosing authority figures. Walter Mischel, a social learning theorist, believes that sex-typed behavior is learned, like any other behavior through a combination of reward, punishment and models ranging from mothers and fathers, siblings, teachers, peers, television and book characters, to state leaders.

The researcher Carol Martin identifies gender

schemata that individuals use to help organize incoming information and filter out what they will not process: The resulting gender knowledge consists of gender stereotypes and the attributes associated with females and males. Gender knowledge is used in different ways depending on its salience, the values of the individual concerned, and situational demands.

A gender stereotype is one in which categorized ideas of the individual are based on their gender. Female stereotypes include being compliant, caring, soft, and relational; male stereotypes include being strong, powerful, dominant, confident, and authoritative. Gender stereotypes teach children that boys are generally the authoritative ones in the public sphere.

WHAT IS AUTHORITY?

Authority is the power to influence or command thought, opinion, or behavior. Authority is possessed or seen in relation to others; it has to be made legitimate by others. People gain authority in modern Western society through occupying roles or positions, by dominating the media, and through having expert knowledge. They might be an authority in a subject area or in an organization. To be a figure of authority one requires and gains power. Factors such as culture can play an important role in how authority is interpreted. An example of this is the concept of *mana* (a concept of the Maori of New Zealand), meaning power, prestige, or spiritual essence. For the Maori all things have *mana*, irrespective of gender.

Traditionally, positions of authority have been gendered; in Western cultures members of police forces, priests, and military commanders, for example, have been male. Women have been allowed to be leaders in the home, but being "authoritarian" carries negative connotations for a woman. The scholar and novelist Carolyn Heilbrun remarks, "Unfortunately power is something that women abjure once they perceive the great difference between the lives possible to men and to women and the violence necessary for men to maintain their position of authority" (Heilbrun, 1988, 16). The poet Adrienne Rich

suggested that authority implies a stereotypically male style of relating to others.

Among the early voices resisting women's relegation to the domestic realm was Mary Wollstonecraft (1759–1797), an essayist who wrote passionately on the rights of women. She confronted and resisted gender stereotypes, and in her writing she attacked the tendency to treat women as perpetual children. For over two centuries, her arguments have been appropriated by women as a means of speaking about their own confrontations with social prejudice and political authority. From the 1980s on, a number of theoretical approaches have extended her work.

NANCY CHODOROW'S SOCIOLOGICAL THEORY OF GENDER

The sociologist and psychoanalyst Nancy Chodorow argues that women's female gendered personality is the result of girls' relation to their mothers, which leads girls to develop a sense of self in relation, whereas boys' relation to their mother leads them to develop a sense of self that denies relatedness. This psychoanalytic analysis asserts that boys emphasize separation, difference, independence, and individual autonomy, while girls emphasize sameness, continuity, merging, dependence. The result is that females occupy the domestic or private sphere, where qualities such as caring and empathy are important, and males the public domain, with the attendant values of success, status, hierarchy, and autonomy.

It also implies that for a woman to be an authority in public arenas, society must change its attitudes towards mothering and fathering. In the past women have found it difficult to have children and hold down traditional authority positions and either went childless or experienced considerable conflict.

THEORIES OF SOCIAL CONSTRUCTION

The psychologist Mary Gergen writes that people are constructed in the process of their telling their personal history. Gender becomes relevant to this understanding as Gergen shows how men and women tell success stories differently. Heilbrun claims that

scripts for telling life stories (other than reflecting men's stories) seldom existed in the lives of eminent women and that "well into the twentieth century it continued to be impossible for women to admit into their autobiographical narratives the claim of achievement, the admission of ambition, the recognition that accomplishment was neither luck nor the results and generosity of others" (Denzin and Lincoln, 1990, 300).

The philosopher Michel Foucault argues that individual selves are created from the multiple subjectivities arising from the relations between each individual and various discourses. Discourses control and distribute knowledge, direct the individual toward acceptable social positions, and produce desires, goals, and values. The driving force is power. Foucault argues that power is not a commodity or the possession of an individual, a group, or a class; rather, he argues, it circulates through the social body and is exercised through a netlike organization in which we are all caught. It is through relations of power and knowledge that human beings are transformed into subjects in modern society. Whereas traditional theory and common sense might assume that in taking up a position in society a person is the creator of that position, in Foucault's view structures such as occupational roles, clan positions, and so on have created the position. This argument implies that there is nothing essential or biological about gender and authority relations.

A FEMINIST PERSPECTIVE

A feminist perspective recognizes that women's worldviews and experiences are positioned in a different social structure from men's, and that women have not had the automatic authority associated with being male. The psychologist Carol Gilligan has shown that questions used in research on children's moral development were gender biased and foreshadowed the outcome. By altering the questions she revealed that rather than being behind boys in moral development, girls were just as morally sophisticated, but different. Girls were relational in their approach to moral decision making rather than theoretical and absolutist. Boys tended toward general

Gender and Authority in West Africa

The following report is based on research among Asante women traders in Ghana. These women command considerable authority compared to women in many other societies due in part to their role as traders in the largest market in Ghana.

The Asante lineage and chiefship system provided for some respected leadership roles for women, but fewer than for men. Each level of community organization had a female leader, a male leader, and a council of male elders. The woman leader or *ohemma* (conventionally translated as queen mother) had important powers and influence not dependent on the male leader, or *ohene* (conventionally translated as chief). Both were chosen from the same royal family, and each nominated the successor when the other died or was removed from office (*destooled*). Those at the village and town levels were located precisely within a hierarchy that culminated in the *Asantehene* and *Asantehemma* for all of Asante. Each male chief presided over a council of male elders to handle routine public affairs, such as land allocation and civil disputes. The *ohemma* was present at these meetings, but elder women did not attend, although they were respected and consulted on major decisions.

Gender boundaries in these hereditary offices were less absolute than in the appointive bureaucratic offices. The town of Juaben had a renowned succession of women occupying its male *ohene* office, while another woman occupied the *ohemma* office. They kept their female names and identities in office. In contrast, Manuh reports that women occupying male chiefships in Nzima, an Akan area on the Ivory Coast border, take men's names in office and wear men's clothing and behave like men when performing chiefly duties (Manuh 1992).

Besides these rare exceptions, women still gained as Asantes from the military and diplomatic initiatives that extended Asante influence.

principles such as justice, which seemed authoritative, while girls tended toward narrative-based, particularized responses.

In 1979, Adrienne Rich suggested that education for women has been based on a male view of the world, that Western education presents how men have perceived and organized their experience, their history, and their ideas about social relationships. More recently, however, multiple-gendered positionings for females have become possible. In 1993, the scholar Bronwyn Davies looked at the nature of femininities and masculinities as they are experienced by primary school children and concluded that "There is not one masculinity or one femininity but many ver-

sions of each both within and across class and cultural boundaries and that the observable failure of women to make their way forward in the public world need no longer be explained in terms of their own individual shortcomings" (Davies, 1993, x).

INFLUENCES ON WOMEN GAINING AUTHORITY

In addition to convention, there are a number of factors that influence a woman's perception of herself, her attitudes toward authority and leadership, and hence whether she appropriates authority for herself. In a patriarchal world, the father-daughter relationship is relevant. Some scholars have suggested that fathers' expectations of their daughters may influence female achievement. These scholars emphasize the importance of girls' identifying with their fathers so that they learn important achievement traits such as independence and self-esteem. Fathers' gender-stereotyped expectations of girls and women (particularly domineering and authoritarian fathers) appear to have a negative

effect on girls' achievement.

The father's view of women and the way in which he relates to his daughter defines her view of the male "other." Thus, the father-daughter relationship has the potential to free a daughter from the constraints of a traditional gender role. A daughter with an encouraging, open-minded father is free to find out and pursue what is meaningful for her in the world and attain a high level in her particular talent area. She is able to compete in the public sphere unhampered by a subconscious sense of a "glass ceiling" limiting women's achievements.

Howard Gardner quotes Margaret Thatcher as saying, when selected to be the United Kingdom's

prime minister in 1979, “Well of course I owe almost everything to my father. He brought me up to believe all the things that I do believe, and they’re just the values on which I fought the election.” And of her mother, “We had nothing to say to each other. It wasn’t her fault she was weighted down by the home” (Gardner, 1996, 227).

For some women, however, mothers are extremely important. In a 1997 interview study of U.S. feminist intellectual world leaders, including Marilyn French, Gloria Steinem, Betty Friedan, Alice Walker, Kate Millett, and Germaine Greer, among the common themes expressed was the importance of their mothers in their lives.

Some women also credit single-sex schools for giving them an opportunity to gain confidence and develop leadership abilities, because in that setting girls are seen to be in positions of authority and possibly freed from the limiting forces of boys’ views of girls.

Women leaders may see their leadership as outside the authoritarian or hierarchical model. For example New Zealand’s prime minister, Helen Clark, stresses that she “emerged” from the group as its leader, rather than being given authority. Women’s favored style of leadership also seems different from that of men, with much more emphasis on leading by example and playing down power differentials.

THE FUTURE: WILL AUTHORITY BE GENDER NEUTRAL?

In the future, authority may not be as directly linked to gender as it is today. Even now women occupy many more positions of authority and are able to get access to those positions with less opposition than in the past. Now we have female bishops, female surgeons, and female CEOs of major companies. Although there are still cultures where authority is very clearly gendered, the relation of gender to authority is changing, and preconceptions underlying gendered imbalances in leadership are changing and being challenged.

GENDER GAP

Gender gap is a catch-all phrase that refers to the existence and significance of gender differences in a variety of areas. Scholars, researchers, and analysts

speak of a gender gap in employment and earnings, in education, in workplace authority, in leadership, and in opportunities available over the course of one's life, not to mention attendant social attitudes. This article identifies the social construction and interpretation of gender differences in one sphere in which leadership plays a highly visible role: politics.

BRIEF HISTORY

The term *gender gap* came into currency in the United States in the 1980s, with particular reference to electoral and partisan issues. Despite the political enfranchisement of women in the United States in 1920s, for the rest of the century women had less political power and fewer political leadership positions, but higher rates of political participation and policy preferences that differed from those of men.

The 1980 presidential election brought voting women's political agenda to public and scholarly attention. Specific issues included the Equal Rights Amendment (ERA), the politics of the Republican Party, and the increasing feminization of poverty during the 1970s, as women became more dependent on and more supportive of social-welfare programs. Efforts to ratify the ERA in the states after congressional passage in 1972 witnessed intensive statewide electoral strategies throughout most of the decade. Pollsters to begin to cross-tabulate voting results by sex, and this became an important consideration henceforth.

The notion of a "women's vote," a gender difference, was about to be taken seriously. Kathy Bonk, who has written on the gender gap, noted in "The Selling of the Gender Gap: The Role of Organized Feminism," a chapter in Carol Mueller's 1988 *The Politics of the Gender Gap*, that Ronald Reagan's 1980 presidential victory was characterized by an 8 percent gender gap: Women were almost equally divided, with 46 percent for Reagan and 45 percent for Carter, whereas men were 54 percent for Reagan and 37 percent for Carter. In looking to describe the difference in attitudes of men and women, the notion of a gap between men and women came to mind. The term first appeared in a U.S. newspaper in the *Washington Post*, on 16 October 1981, when the

columnist Judy Mann wrote, "Last November there was a gender gap of 8% in the *New York Times*/CBS exit poll in the presidential election" (Bonk 1988, 89). By mid-1982, the National Organization of Women (NOW), the nation's largest and most active women's advocacy group, began regularly using the term to describe gender-based differences in voting behavior. The organization started releasing a monthly column, *Gender Gap Update*.

Scholars and journalists continued to watch the gender gap, attributing it to Reagan's opposition to abortion and the ERA, which, they theorized, made women less likely than men to vote for him. Bonk noted that as Reagan's second-term campaign went into gear, one-third of all men stated they had a lot of confidence in Reagan's ability to provide leadership, whereas only 22 percent of women expressed similar confidence. An effort to widen the gender gap in favor of the Democrats became a major goal of the 1984 campaign, and the Democratic Party chose a female candidate for vice president: Geraldine Ferraro. But the expected gender landslide did not happen, perhaps because Americans cast their votes on the basis of presidents, not vice presidents. In addition, the Reagan Administration had made some symbolic actions, such as nominating Sandra Day O'Connor for the Supreme Court and filling several cabinet positions with women, which may have swayed some women voters.

The gender gap continued to be present in electoral and partisan participation in the subsequent decades. Women have voted at higher rates than men in every presidential election since 1984. Not only is voting behavior different, but the partisan gap continues to exist as well. As recently as November 2002, *Business Week* reported that the gender gap is "fast becoming a gender chasm" (Dunham, 2002), as the stalled economy has produced more uncertainty in women, who are more likely to reject Republican social conservatism.

It is an oversimplification, however, to say that more women vote Democratic and more men vote Republican. It is true that many studies of the gender gap have focused on the greater attraction the Democratic Party holds for women than for men. However, there is more complexity than meets the

Small-Wins Strategy Promotes Gender Equity

PALO ALTO, Calif. (ANS)—While women have made progress in achieving positions of responsibility and leadership, subtle biases still keep them from high-ranking jobs in many organizations, says a study in the current issue of the *Harvard Business Review*. But, adds the study, there may be a strategy to overcome this.

Biases favoring men generally include company attitudes about leadership and what it takes to get ahead, ways of identifying talent, and definitions of competence and commitment.

Changing these ingrained biases is difficult, but easier when a “small-wins” strategy is employed, researchers said.

“Our research shows that the small-wins strategy is a powerful way of chipping away the barrier that holds women back without sparking the kind of sound and fury that scares people into resistance,” said Debra Meyerson, who co-authored the study with Joyce Kubiak Fletcher, both Simmons Graduate School of Management professors at Stanford University.

The small-wins technique, modeled after the principles in 1930s community activist Saul Alinsky’s book “Rules for Radicals,” relies on small but meaningful changes individuals can make toward a larger cause. “Each small win is a trial intervention and a probe for learning, intended not to overturn the system, but to slowly and surely make it better,” Fletcher and Meyerson wrote.

While the small-wins technique used in a company works best with the support of upper management, it also can work if co-workers band together. The first important step is to get together with other women and share experiences.

“It is important to differentiate what is you and what is bigger than you,” Meyerson said. “This is a reality check. . . . It is helpful to know that you are not alone and not imagining things.” Informal meetings with co-workers over lunch or

coffee help to identify the problem and possible solutions.

“It’s surprising how quickly people can come up with ideas for small wins—and how quickly they can be put into action,” Meyerson said. Small wins are not formulaic, and each organization is unique in the way it expresses gender inequality. Most of it is unintentional, she noted, but simply rooted in the culture.

For example, in one case study for the report, the finance department of a large manufacturing company had a habit of overdoing work. Even when upper management wanted a back-of-the-envelope answer to a question, an analyst felt compelled to provide a full-scale report.

Analysts feared that asking “How much detail do you want?” might look like a way to avoid working late. This was particularly hard on women analysts, who, in an industry dominated by men, felt they had to work extra hard to demonstrate their competence and commitment. Many women with families found it difficult to stay late at the drop of the hat because of responsibilities at home.

To address the problem, the analysts designed a one-page form that asked senior managers to describe the parameters of each request. “The form simply took the onus off individuals to ask taboo questions, relieving women of the fear that they might appear less than committed and allowing all the analysts, not just women, to use their time more productively,” the authors noted.

“This technique requires patience,” Meyerson said. “Things won’t change overnight. But what we are talking about is chipping away at many of the foundational processes going on in an organization that discriminates against women. It’s not just the ceiling that’s holding women back, but it’s the foundation, the beams, the walls, the air. . . . Small wins is about ferreting out the hidden barriers to inequality and effectiveness one by one.”

Source: “Small Wins Can Shatter Glass Ceiling for Women,” American News Service, February 24, 2000.

eye. First, there are regional differences in the gap which mitigate against a straight male-female divide. Partisan preferences have been greater in the South than in the rest of the nation, so the gender gap may have some special quirks there. Second, men have a greater tendency than women to self-identify as independents rather than as members of a political party. The political scientist Barbara Norrander discovered that an independence gap, in which men are more likely to consider themselves

political independents and women are more likely to identify as partisan, averages six percentage points. Thus, women could be more prevalent in political party affiliation, but this majority in absolute terms would need to take into account the male independents and independent leaners.

Similarly, the political scientist Daniel Wirls, writing in the mid 1980s, suggested that the gap could be explained not by women’s rejection of Ronald Reagan, but as the result of unequal rates of male and

female defection from liberal values and the Democratic Party. From this perspective, the greater movement by men toward conservative positions and the Republican Party produced the gender gap and, consequently, the Republicans were not the victims of the gender gap but in fact beneficiaries of it.

THE GENDER GAP IN POSITIONS OF POLITICAL LEADERSHIP

There is no question that a gender gap in positions of political leadership exists: Women do not hold office in numbers that reflect their percentage of the population; women face different challenges in campaigning; and there is debate over whether women lead differently or set different priorities from men once they win office. Whether those differences are the result of institutional barriers, long-held stereotypes, or women's personal choices, the fact remains that women are underrepresented.

Increasingly, however, since the time of 1984 campaign of Geraldine Ferraro, more women candidates have run and secured state and national office. The researcher Barbara Burrell noted in her 1994 book on women who successfully campaigned for the U.S. Congress that in 1966, women accounted for 2 percent of congressional membership, while two decades later, in 1991–1992, they accounted for 6.6 percent. She further noted that globally, women on average made up 11 percent of democratically elected national parliaments.

The year 1992 was a significant historical moment with reference to gender and political leadership. The year was popularly referred to as the Year of the Women, and the climate was a favorable for women candidates because a pool of experienced female politicians existed at local and state levels, and more female candidates were running for elected office. Nineteen women won major party nominations to run in California's fifty-two congressional districts. Significantly more women than men voted for the women candidates who were running in 1992. Burrell noted that the number of congressional women in California went to 11 percent and the number of women in state legislatures increased fivefold from 4 percent in 1971 to

20 percent in 1993. Yet despite these gains, the numbers remain low.

Why the gender gap in public office? Stereotyped gender roles reaffirm that women's place is in the home. Politics has been regarded as a male domain and political leadership as a masculine endeavor. Political leadership is often considered antithetical to women's roles, so female candidates have to persuade the public that they have the same leadership qualities as men, or else they have to transform public notions of leadership. A generation of studies show that public "support for the idea of women in public office has grown, [but] that gender-based stereotypes have not faded away" (Burrell, 1994, 16).

If we consider political leadership only at the level of office-holding, however, we would be failing to take into account other aspects of gender-differentiated political behavior. Some scholars explore in depth how the gender gap in political activity has been exaggerated by the emphasis on particular modes of participation. Early findings that there are gender differences in political participation and activity indicated that men were more likely than women to take part in political life, but that finding should be viewed critically, because some of the studies failed to take into account factors such as access to political resources, lower levels of education, and less money or free time to devote. In addition, those early studies often failed to question the very definition of political involvement, overemphasizing office holding, for example, in which men are significantly more represented, and underestimating grassroots community activity, in which women have always taken part to an equal or greater degree than men

THE GENDER GAP IN POLITICAL VALUES

Is there a gender gap in political values and policy preferences? Although women's influence ebbed and flowed during the twentieth century, the agenda that differentiated women's political behavior from men's showed a strong pattern of continuity around two broad concerns: equality for women and humanitarian social reform. Robert Shapiro and Harpreet Mahajan analyzed twenty years of data in "Gender

Differences in Policy Preferences: A Summary of Trends from the 1960s to the 1980s,” published in 1986 in *Public Opinion Quarterly*. Their analysis reveals persistent differences in attitudes toward issues involving the use of force, and growing differences toward policies concerning regulation, social welfare, and traditional values. The increasing conservatism of men and women’s greater support for so-called “compassionate” government programs may explain why men have become more attracted to the Republican Party while women feel more comfortable remaining within the Democratic Party.

Here too, the gap must be interpreted in ways that take into account its complexity. Some entertain the notion that women take a nurturing, caring stance, whether because of intrinsic biology or because of women’s traditional roles as mothers. Instead of seeing this as a source of inadequacy, some scholars, such as Carol Gilligan, argue that women could be the source of higher-order values for society.

That approach, however, is controversial and open to debate. The feminist scholar Pamela Conover argues that there is no significant difference in value orientation between men and women when it comes to the principles of egalitarianism, individualism, and symbolic racism; however, women do differ from men in having, on average, greater sympathy for the disadvantaged. Conover suggests that the gap between men and women is really a gap between men and *feminist* women. “When men are compared to feminist women, there is a significant gender gap on every type of issue: however, on most foreign policy issues and many domestic issues, this gap evaporates when men are compared to non-feminist women” (Conover, 1988, 1005). Thus, there are enough feminist women to create the appearance of a gender gap. The finding assumes that feminism is associated with distinctive values and policy preferences that both men and women can identify and can identify with; that feminism “awakens in both men and women support for a woman’s perspective that consists of egalitarian values and generally liberal policies” (Cook and Wilcox, 1991, 1120).

Other scholars have pursued this line of thinking and found only a limited gender gap in basic politi-

cal values. Elizabeth Cook and Clyde Wilcox report in “Feminism and the Gender Gap: A Second Look,” that on policy issues, women were significantly more liberal than men on policy issues, women were more liberal than men on certain items, but the differences were relatively small. Gender differences were largest on support for spending to aid the unemployed, and on war and peace issues. In a study of gender-specific reactions to the 1991 Gulf War, Pamela Conover and Virginia Sapiro concluded that gender orientations toward war and foreign policy are more complex than many feminist and other theorists might have supposed. In the abstract, the authors say, “women are more afraid of the prospects of war and more wary of foreign involvements” though given justifications, they are as willing as men to ponder the use of force (Conover and Sapiro, 1993, 1095). When moved from the abstract to the concrete, an actual war, women reacted more negatively on every measure. The authors warn, however, that while the differences are important, they are not large enough to warrant sweeping statements differentiating women and men into stereotypic camps.

Understanding a gender gap in political values as well as partisan and electoral issues needs to be viewed also within the light of differences across groups defined by their race or ethnicity. For example, Burns noted that issues connected to civil rights are higher priorities among African-American and Latino men than they are for women as a whole. Men and women’s agendas for political action were also differentiated along socioeconomic lines, and cleavages of class, race, family status differentiate women’s and men’s experiences within gender categories.

SOURCES OF THE GENDER GAP IN POLITICS

As the sections above have indicated, gender gaps do exist in electoral behavior, partisan preferences, and political leadership. While the gaps’ existence has become a permanent fixture of our country’s political, economic, and social landscape, the significance and explanation of the gender gap differences remains contentious. There is no agreement as to the

The Leadership Gender Gap

Although women's advancement to positions of leadership has been increasing in recent decades, women in top leadership roles are still very much the minority. As of the year 2000, in more than 190 nations of the world, only thirteen were headed by female prime ministers or presidents. Within these countries, there were nine other major women leaders in government, including vice presidents, governor-generals, and opposition leaders. Some 14.5 percent of the members of national parliaments and 7 percent of the world's total cabinet ministers were women. These ministers tend to be concentrated in social areas of work in the government (14 percent) more than the executive (3.9 percent), political (3.4 percent), economic (4.1 percent), and legal (9.4 percent) branches.

In the economic and business sector, women's participation in leadership has been on a rapid increase since the early 1970s, especially in the last two decades of the twentieth century. Yet, not many women can be found in the highest levels of economic decision-making: Only five women have become CEOs in Fortune 500 corporations, and a mere 1 percent of the world's assets are registered under the name of women. Approximately 33 percent of women are serving in managerial and administrative posts in the developed world, 15 percent in Africa, and 13 percent in Asia and the Pacific. Although the numbers have doubled over the past twenty years in Africa and Asia, women still remain under-represented in the more competitive and influential sectors of work.

sources of gender differences on many of these issues. In fact, there is no single explanation for the varied sources, experiences, and manifestations of gender differences.

One approach to understanding value differences between the sexes takes as its basis biological differences and gender socialization. This would include the notion that women are biologically more cooperative than men (with the hypothesis being that this trait is evolutionarily desirable for the sex that bears children), and that the biological difference is reinforced by traditional socialization that goes along

with women traditionally having primary responsibility for children. The result, according to supporters of this approach, is that women have a greater concern with preservation of life and a stronger tendency toward cooperative decision making than men. Gilligan, for example, posits that men and women have dissimilar conceptions of justice and that men are more oriented toward rights while women are more concerned with caring. Proponents of this view hold that men and women's political behavior will remain different even after controlling for other economic, cultural, and political variables. Certainly it is widely accepted that the fact that men and women are socialized differently has an impact on men and women's values.

Another explanation for gender gap differences is that socioeconomic status partially explains gender differences in political opinions and electoral behavior, in that women tend to earn less than men and are more likely to live in poverty. In other words, their situational constraints might explain why women and men differ on policies and values. The increasing number of women in the workforce and continued inequality of wages and employment may affect political attitudes.

A third explanation combines socioeconomic and gender variables and posits that women who are the most autonomous from men tend to differ the most from men in their political attitudes. Thus, women with higher education and occupational status, as well as unmarried women at all socioeconomic levels, diverged the most from men in their attitudes and voting behaviors. Relatedly, some explain the gap as connected to the growth in feminist consciousness—the growing awareness of inequalities and collective action to address these grievances. The argument here is that feminism increased to such a degree in the 1980s that there came to be noticeable gap, because feminist women were more liberal than men. The causal relationship in this explanation is difficult to determine, because it is unclear whether feminism exists prior to issue orientation or whether issue orientation is what leads to feminist consciousness. However, Conover and others do document that the gender gap is greatest between feminist women and all men.

However one explains it, the gender gap in partisan leanings, political leadership, and values orientation does exist and has become a factor in the civil, political, and economic life of the United States. In the future, it will be important for scholars and students of the gender gap to continue to probe in which nations and among which women and men this gap is most evident, and in what life circumstance those men and women find themselves, and at what historical moment.

GENDER STEREOTYPES

Preconceived notions regarding who a leader is and who should be an effective leader often impact the leadership process, perhaps determining who becomes a leader, how the leaders are perceived, and how they are evaluated. The low number of women in leadership and decision-making positions, as compared to the figures for men, have been associated with traditional thinking (United Nations 1999) and presence of gender stereotypes (Bethion Antal and Izraeli 1993; Heilman 2001). With the influx of diversity in the workforce, people in positions of leadership now come from a variety of social and cultural groups. Those who interact with them view these leaders through the filter of their stereotypes, expectations, and implicit theories (Ayman 1993).

It is both reality and stereotype that many women spend much of their time in the role of mother. Here, a young woman with twin babies in Shanghai, China, in May 1996.

IMPLICIT THEORIES AND STEREOTYPES

An implicit theory is an unspoken assumption regarding the world and others (Ashmore and del Boca, 1979). An individual's implicit theories affect their expectations and their interpretations of the world around them. Stereotypes are a subset of implicit theories that are used to organize expectations of others (Wegner and Vallacher 1977). Stereotypes are usually overgeneralized attributes that differentiate groups of people. Although stereotypes often have negative connotations, stereotypes can be positive or negative and they may be accurate or inaccurate (Aries 1996; Glick and Fiske 1999).

Stereotypes effect both an individual's perceptions and their subsequent reactions toward others. For example, when an individual first meets another person, the individual assesses the new person—as a means of self-protection—to determine whether the new person should be considered a friend or a foe (Fiske and Ruscher 1993; Henley 1975). Stereotypes allow people to infer quickly, if not always accurately, another person's attributes and whether they should be considered trustworthy (Glick and Fiske 1999). Individuals who respond automatically to stereotypes are not always aware of their action or its cause.

As implicit theories and stereotypes are developed within their social and cultural milieus, individuals vary in the content of their stereotypes and

their use (Aries 1996). However, research demonstrates some degree of agreement regarding gender stereotypes and the characteristics and expectations associated with them, especially in the realm of leadership.

GENDER ROLES, NORMS, AND STEREOTYPES

Women have traditionally been stereotyped as more socially sensitive and interpersonally capable than men (Korabik 1999). In various studies, the traditional stereotype of women included attributes such as being less competent and less effective in tasks that are required for jobs outside the home (Glick and Fiske 1999), nurturing, compassionate, considerate, weak, and subservient (Bem 1974), and emotional, subjective, tactful, aware of other's feelings, and having feelings that are easily hurt (Broverman, Vogel, Broverman, Clarkson, and Rosenkrantz 1972). Stereotypes associated with men, on the other hand, typically included traits such as leaders, dominant, aggressive, independent, objective, and competitive (Broverman, Vogel, Broverman, Clarkson, and Rosenkrantz 1972).

These gender stereotypes extend into almost every facet of daily life for both men and women. People interpret communications and speech characteristics through the filter of gender stereotypes (Carli 1990; Hawkins 1988; Kramer 1977; Orcutt and Harvey 1985; Siegler and Siegler 1976; Tannen 1990, 2001). Research has demonstrated that gender stereotypes regarding communication patterns and styles develop early (Andersen 1986; Edelsky 1977; Fillmer and Haswell 1977) and continue on through adulthood (Hawkins 1988; Orcutt and Harvey 1985; Siegler and Siegler 1976). Other aspects of interpersonal interactions are subjected to gender stereotypes. Others also interpret interpersonal persuasion methods or strategies through the lens of their stereotyped expectations (Burgoon, Dillard, and Doran 1983; Carli 1990, 2001; Johnson 1976). In addition, gender stereotypes regarding interpersonal interaction have proven to be relatively stable over time (Fecteau, Jackson, and Dindia 1992; Heilman, Block, Martell, and Simon 1989; Spence and Buckner 1998).

Some theorists have posited that stereotypes can be prescriptive or descriptive (Glick and Fiske 1999). Prescriptive stereotypes describe what group members *ought* to be like. Descriptive stereotypes merely *suggest* what group members are like. These distinctions are important when discussing gender stereotypes in leadership because women in leadership roles tend to deviate from the prescriptive stereotypes that have historically affected women, yet they are often viewed negatively based on descriptive stereotypes (Heilman 2001).

IMPLICIT LEADERSHIP THEORY AND WOMEN

Implicit leadership theory (Eden and Leviathan 1975; Lord and Maher 1991) contends that individuals have expectations associated with leaders. The extent to which one individual perceives another as a leader depends upon the perceiver's expectations about the characteristics and behaviors of leaders, and the degree to which the person being observed possess those characteristics.

Research has demonstrated that these implicit leadership theories can impact the perception that others have regarding a leader's behavior (for review see Ayman 1993; Chemers 1997). A series of studies in the 1980s showed that when observers have expectations regarding a person's behavior, they tend to report behaviors that match their expectations. For example, if they are told a leader is effective, they describe that leader as engaging in behaviors they would associate with an effective leader, even if their description of the leader does not match the actual behaviors of the leader (for more detail see Lord and Maher 1991). Studies on implicit leadership theory established that observers report perceiving behaviors that match their implicit leadership theory.

To establish a presence of implicit leadership theories, several studies have explored this phenomenon by examining the similarity between the expectations for different categories of leaders (Lord, Foti, and DeVader 1984) and those traits that were associated with leaders versus non-leaders (Lord, DeVader, and Alliger 1986). Although different leaders activate different expectations in the mind of the respondents,

across studies the traits that had the highest association with individuals who were leaders were identified as intelligence, masculinity, and dominance. These traits seem to fit the traditional stereotype of a man more than that of a woman.

Furthermore, over the last thirty years, research in the area of implicit leadership theories and expectations of managers within the United States has predominantly yielded a masculine image of leaders (Schein, Mueller, Lituch, and Liu 1996). This research demonstrated that the typical description of men and the typical description associated with managers were more similar than the typical description of women and the typical description that was associated with managers. These descriptions of managers included terms such as *aggressiveness*, *rationality*, *self-confidence*, *independence*, and *competitiveness*. Research in the last quarter of the twentieth century has substantiated those findings across age, gender, culture, and experience (Ayman-Nolley, Ayman, and Becker 1993; Schein 1973, 1975; Schein, Mueller, and Jacobsen 1989; Schein, Mueller, Lituch, and Liu 1996). More recently, Schein (2001) and Ayman-Nolley, Ayman, and Becker (1993) found that across ages, although observers associate a male image with leaders, women tend to be more open toward woman leaders. Therefore, women in leadership positions are likely to find they do not fit the implicit leadership theories of men, in particular. This perceived lack of fit would likely affect how they are perceived in the leadership position and how others evaluate them. Leadership emergence and the perception as well as the rating of women leaders are two main areas that can be influenced by gender stereotypes.

GENDER STEREOTYPES AND LEADERSHIP EMERGENCE

Eagly and Karau (1991) demonstrated that overall, men were perceived as being more competent and were more readily accepted as leaders when they acted in a confident and assertive manner. Although the nature of the task moderated this relationship, men were more likely than women to be thought of as leaders and emerge as leaders (Eagly and Karau

1991). For women, the same qualifications of assertiveness and confidence could be detrimental when they are faced with traditional gender stereotypes. Carli and Eagly (1999) in their summary of the research on influence and leadership emergence highlighted the double bind that faces women in leadership. Studies conducted in the United States have demonstrated that self-efficacy and self-promotion are advantageous in hiring and promotion practices for men. However, both men and women consider women who engaged in these behaviors as undesirable (e.g., Rudman 1998). It seems that the only time it is socially appropriate for a woman to boast without repercussion is when the task is seen as traditionally feminine.

In task groups, Mullen, Salas, and Driskell (1989) summarized their meta-analysis by stating that frequency of participation in groups is strongly related to leadership emergence. Carli and Eagly (1999) further clarified this; stating that when an individual's contributions are related to the group's task, the previous findings are supported, but when a person's contributions are related to social issues, the relationship between the amount of contribution and leadership emergence is weaker. Research has also demonstrated that, in general, women's task contributions are more likely to be ignored and potentially lead to negative reactions. Butler and Geis (1990) demonstrated that team members provided more negative and unsupportive responses to women solo leaders, than men who were solo leaders or women who co-led. Therefore, gender stereotypes play a critical role in limiting the opportunities for women to emerge as leaders—decreasing women's access to leadership roles and increasing the obstacles they must overcome in order to become leaders (Eagly and Karau 2002).

GENDER AND LEADERSHIP STYLE AND EFFECTIVENESS

Once in leadership positions, women leaders confront questions both about the similarity of their style to that of men in same situation and about how effective they are as leaders. The distinction between these two questions has not always been clear in

leadership research. Leadership style refers to the occurrence of the leader's behavior. Observers' implicit leadership theories affect what they see or remember when they evaluate a leader's leadership style. Leadership effectiveness is concerned with the evaluation of the leader's behavior or the outcomes against an expected standard. Thus, in this situation, the implicit theories and the norms of effectiveness are activated when an observer assesses the leader. Many performance appraisals are behaviorally worded, so the line between leadership style and leadership effectiveness can become indistinct. However, a critical distinction between these two different approaches is that in studying the style, researchers ask about the frequency and occurrence of leadership behaviors. In measuring leadership effectiveness, investigators ask how well the leader performed leadership behaviors.

Gender Stereotypes and Leadership Style

The literature and research on leadership behavior and style is quite extensive and incorporates multiple paradigms. Three main paradigms of leadership behavior that have received attention are the Ohio State two-factor model of leadership behavior (Bass 1990), the decision-making model (Vroom and Yetton 1973), and transactional and transformational leadership model (Avolio, Waldman, and Yammarino 1991; Bass 1998). The leader behavior approach focuses on two categories of behaviors: (1) task-related behaviors (i.e., initiating structure) and (2) behaviors that maintain the relationship between the leader and the subordinates or the team members (e.g., considerate behavior). These behaviors are also presented in contingency models of leadership such as path-goal theory and situational leadership (Ayman 2004). The decision-making model focuses on the leader's choice of decision-making strategies—it is only critical to acknowledge that this model refers to two categories of decision-making styles: autocratic ones and participative ones (Ayman 2004). Finally, the more recent paradigm in the study of leadership styles is the transactional and transformational model of leadership behaviors. The transactional model focuses

more on an exchange relationship between the leaders and the subordinates or team members, and the transformational model centers on developing a relationship between the leader and the subordinates or team members.

When women and men leaders' behaviors and styles are assessed, typically one of these paradigms is employed. Eagly and Johnson's (1990) meta-analysis included studies that had been conducted with the first two models mentioned above. The findings demonstrated that across studies, no difference was found in the perception of men and women leaders engaging in considerate behaviors or initiating task structure behaviors. However, they did report a slight but significant finding in which women leaders were perceived as being more participative than their men counterparts. They also highlighted that the source of the perception (self or subordinates) may have an impact on the results. In addition, factors such as the gender of the study's author, the type of study (laboratory vs. field), and the date of the study had some moderating effects for the results. The aforementioned study demonstrated that in more traditional settings, where the male stereotype was more dominant, gender differences were more pronounced. Thus, studies that were conducted earlier showed more differences between men and women leaders. Also, in studies conducted in the field, where the women participants were handpicked or self-selected, the differences were noticed less.

More recently, Eagly and colleagues have augmented this classic work (Eagly and Johannesen-Schmidt 2001) and reported meta-analytic results regarding the role of leader's gender in transactional and transformational leadership styles (Eagly, Johannesen-Schmidt, van Engen, and Vinkenburg 2003). These studies found that women leaders, when compared to their male counterparts, were perceived as slightly (but significantly) more likely to engage in transformational behaviors and contingent reward behaviors. They also found that men leaders, when compared to women leaders, were perceived as more transactional leaders. Specifically, they avoid giving direction and changing the status quo when performance goals are being met.

Therefore, one could conclude that men and

Extract from *Little Women* by Louisa May Alcott

More than a century ago, author Louisa May Alcott balked at stereotyped gender roles in her classic novel Little Women (1867), said to be based on her own family. Jo March, the heroine of the novel, bitterly resents having to act the part of a "young lady," as this exchange between Jo and her sisters Meg and Beth indicate.

"You are old enough to leave off boyish tricks, and to behave better, Josephine. It didn't matter so much when you were a little girl, but now you are so tall, and turn up your hair, you should remember that you are a young lady."

"I'm not! And if turning up my hair makes me one, I'll wear it in two tails till I'm twenty," cried Jo, pulling off her net, and shaking down a chestnut mane. "I hate to think I've got to grow up, and be Miss March, and wear long gowns, and look as prim as a China Aster! It's bad enough to be a girl, anyway, when I like boy's games and work and manners! I can't get over my disappointment in not being a boy. And it's worse than ever now, for I'm dying to go and fight with Papa. And I can only stay home and knit, like a poky old woman!"

And Jo shook the blue army sock till the needles rattled like castanets, and her ball bounded across the room.

"Poor Jo! It's too bad, but it can't be helped. So you must try to be contented with making your name boyish, and playing brother to us girls," said Beth, stroking the rough head with a hand that all the dish washing and dusting in the world could not make ungentle in its touch.

Source: Alcott, Louisa May. (1867). *Little Women* (Ch. 1, "Playing Pilgrims").

women are perceived somewhat differently due to the presence of traditional gender stereotypes. To ascertain if these findings have any bearing on women's professional lives or their success as leaders, a critical question remains, "Are men and women equally successful?" Logic would dictate that if transformational leadership is an effective style of leadership (Lowe, Kroeck, and Sivasubramaniam 1996), then it is reasonable to assume that because women tend to engage in this style more often than men, women should also be considered

more effective. However, is this the conclusion that studies on leadership effectiveness present?

When reviewing the research findings on leadership effectiveness, one should keep the following methodological facts and their consequences in mind. The majority of these studies describe the behaviors of women leaders and men leaders through the eyes of their subordinates. Thus, if the observers are more traditional in their stereotypes of women, this could cause them to perceive men and women behaving dissimilarly. Also, in conditions where traditional male roles are dominant, more differentiation between genders is likely. For example, Becker, Ayman, and Korabik (2002) compared women and men leaders in a managerial environment to those in a school administration environment. In the managerial environment, women who tried to act according to the norms of management faced more disagreement with their subordinates on how they behaved than women in the school administration environment. So, the answer to the question, "Are men and women leaders behaving similarly or differently?" may be contingent upon the eyes of the perceiver, who is influenced by his or her stereotypes, expectations, and the social norms around them. The perceivers of these women leaders are faced with challenges of their mixed expectations regarding gender stereotypes and implicit leadership theories (Ayman 1993; Eagly and Karau 2002), which could affect their memory.

Gender Stereotypes and Leadership Effectiveness

Leadership effectiveness is an evaluation process. The scope of the question can be general such as, "How effective is the manager?" or very specific such as, "How well does he or she do in specific activities and show specific competencies?" The results of two meta-analyses have addressed these questions and demonstrated that women are rated slightly less favorably as leaders than their men counterparts in situations that are more traditionally dominated by men (Eagly, Makhijani, and Klonsky 1992; Eagly, Karau, and Makhijani 1995).

The Eagly, Makhijani, and Klonsky (1992) meta-analysis included both field studies where the

respondents observed the leader in action and studies that used paper-people, where respondents rated leaders described in a vignette. They found gender differences in evaluations of leaders when the task of the group was more masculine, when the majority of raters were men and when the leaders were perceived as acting with agentic qualities (e.g., decisive, resilient, proactive, strategic) rather than engaging in interpersonal and communal behaviors (Eagly & Karau, 2002). Specifically, they found only a small tendency for subjects to evaluate women leaders less favorably than men leaders. However, this tendency was more pronounced in situations when men evaluators rated women occupying male-dominated roles, such as in college athletics, business, and manufacturing (Eagly et al. 1992).

The Eagly, Karau, and Makhijani (1995) meta-analysis examined studies where the respondents assessed leaders in leadership roles, predominantly in organizational settings. The results determined that gender differences existed in leader effectiveness when the leader functioned in a male-dominated or gender-balanced organization. This meta-analysis demonstrated that men and women leaders were equally effective leaders on the whole (Eagly, Karau, and Makhijani 1995). Yet, men leaders were evaluated as more effective than women leaders in roles that were defined in more masculine terms (military settings, settings dominated by men, roles congruent with their gender), and women were evaluated more effective than men in roles that were defined in less masculine terms (social service settings, settings dominated by women, roles congruent with their gender) (Eagly et al. 1995).

Therefore, in examining the performance of a woman leader, the salience of her noticeable characteristics should also be considered. The salience of a woman leader's physical appearance is dependent on the uniqueness of her physical characteristics within context of the environment. In a situation where a woman leader is performing her job among leaders who are mostly men, or the woman leader is in an organization where traditionally men have occupied leadership roles, the woman's physical characteristics will be salient. However, in gender-balanced organizations, where neither gender has been tradi-

tionally dominant (Ayman 1993; Eagly, Makhijani, and Klonsky 1992), the salience of a woman leader's physical appearance is less likely to be an issue. When women leaders are working in settings where men and women have been present equally, the chances that her physical appearance will be considered is diminished. Thus, the likelihood that her behavior would be considered out-of-role is reduced when compared to a situation where a woman leader is the only woman in a position of leadership throughout the organization.

In measuring leaders' effectiveness, particularly when dependent on subjective measure, the gender stereotypes held by the rater and the traditional nature of the setting is a concern. In one study, women leaders in business and manufacturing organizations showed less agreement between how they rated themselves and how their subordinates rated them compared to women leaders and their subordinates in traditionally gender-balanced organizations and men leaders and their workers regardless of the organization (Speron, Ayman, and Korabik 2000). It appears that women are out of touch with the expectations of their raters when the setting has masculine factors.

NEW TRENDS

One of the key evolutions in leadership and leadership development is self-awareness. Many scholars have acknowledged that 360-degree feedback is a great source of information that allows leaders to improve their skills and abilities (Atwater and Waldman 1998; Atwater, Waldman, and Brett 2002; London 2002; Day 2000). Therefore, women leaders can benefit from this method of assessment to become more in tune with the existing expectations from various constituencies.

In addition, this technique of leadership measurement and development is dependent on the popular multirater approach in assessing leaders. Initially it was assumed that women leaders would be more sensitive and responsive to others' perceptions than men leaders. However, early-twenty-first-century studies of men and women leaders found that high-self-monitoring women in traditionally male envi-

ronments experienced less agreement between their self ratings and their subordinate ratings than did their low-self-monitoring women counterparts. Compared to the low-self-monitoring women, the high-self-monitors saw themselves as more effective on expressive competencies (e.g., interpersonal and listening skills) than their subordinates viewed them (Speron, Ayman, and Korabik 2000). Becker, Ayman, and Korabik (2002) found that when compared to men leaders, women leaders who were high-self-monitors in business organizations (i.e., traditionally masculine) were more likely to disagree with their subordinates regarding the frequency in which they, the leaders, engaged in task-related behaviors. However, subordinates and women leaders were more likely to agree regarding the frequency of their considerate behaviors when compared to their men counterparts (Becker, Ayman, and Korabik 2002). These findings suggest that women's psychological characteristics and the gender type of the organization can moderate the effects of stereotypes.

Furthermore, the use of multirater approaches has received attention from psychometric researchers. They have explained that when measures are used to assess differences between different groups of individuals (e.g., self versus others ratings or women versus men), it is important to establish measurement equivalence (Raju, Laffitte, and Byrne 2002). In studying women and men leaders effectiveness based on multirater approach, the preliminary findings suggest that neither source (self or subordinate), nor the leader's gender affected the stability of the instrument (Frame, Ayman, Raju, and Goff 1999). These preliminary findings give more credence to any gender effects found in the styles and performance.

REFLECTIONS

The ability to effectively lead people has traditionally been a highly prized skill. Leadership ability is typically rewarded with higher pay and additional benefits. Historically there have been women leaders who have been both effective and popular (Leon 1995, 1997). Until the 1970s, leadership had been the province of men, and even now men dominate the highest positions of leadership in U.S. organizations.

The important thing is not what they think of me, but what I think of them.

—Queen Victoria

Much has been written regarding the “glass ceiling” that holds women back from leadership positions, the career progression of women, and role of gender stereotypes in leadership (e.g., Ayman 1993; Catalyst 1998; Eagly and Karau 2002; Heilman 2001; Lyness and Thompson 1997; Schein 2001), yet de facto conclusions have not been reached.

We notice two issues about gender stereotypes and leadership. First, subordinates perceive women leaders as acting in a more participative and transformational manner than male leaders. Second, women leaders are rated as being less effective than male leaders when these women are rated by men, when the women are leaders in masculine settings, and when they are engaged in agentic behaviors (those displayed by an agent). The presence of traditional gender stereotypes affects our society’s perception and evaluation of women leaders. Stereotypes of women and their effect on the perceptions of subordinates and leaders on female leadership roles, will affect women’s access to leadership positions, particularly in nontraditional fields.

Expectations, however, are changing for leaders. In the past, leadership was assumed as masculine, with emphasis on dominance as an attribute. The number of self-help books for women exhorting them to become more assertive and to learn men’s ways of leadership and management are numerous. The result of this movement, coupled with equal employment policies and affirmative action in selection, may have increased the number of women in leadership positions and created a norm that dictated that women leaders had to be tougher than their men colleagues.

Beginning in the late twentieth century, research showed a backlash for women who are perceived as agentic (Rudman and Glick 1999, 2001; Rudman 1998). One explanation for this backlash could be gender-role spillover (Guteck, Morasch, and Cohen 1982). Gender-role spillover occurs when women act like men and are perceived as being out-of-role.

These out-of-role behaviors could be an impetus for an unfavorable rating (Eagly and Karau 2002). Another explanation of this backlash could be that the world of work has endorsed transformational leadership as an effective leadership style. This leadership style gives credence to and emphasizes interpersonal sensitivity and mentoring in leadership. This could be the beginning of a significant change in the image of effective leadership. Therefore, the image of a decisive, domineering leader is being replaced with the image of a leader who balances decisiveness with relationship building and caring for his or her team members.

It appears that the role of leader is becoming more acceptable for women and friendlier toward some of the feminine values held by women’s culture (Yonder 2001). Men, however, can engage in extreme behaviors, and although most may agree that radical behavior is not appropriate, such men are not likely to be condemned for it. For women leaders to succeed, they must choose from among a very narrow range of behaviors in order to be accepted. This is a state of transition—new sets of expectations are evolving with new norms. Gradually the old norms and expectations are being challenged, and all participants—women and men leaders and their observers—will benefit from not making automatic responses and from reexamining their reactions.

Researchers and theorists concluded that while gender stereotypes have an impact on leadership, that relationship is more complex than first hypothesized. Gender stereotypes are still prevalent partly due to the diverse roles women fulfill within organizations and society as a whole. From the traditional generic stereotype of women, relatively new subtypes of stereotypes have developed. The obvious barriers, which used to confront women leaders, are diminishing, yet the subtle effect of stereotypes and implicit theories are still present. Leaders should be chosen and evaluated based on their ability to lead rather than on stereotypes based on their gender.

GENDER-BASED STRUCTURE OF WORK

In the pre-industrial period, most people—women, men, daughters, and sons—worked in homes, small workshops, and on farms close to home. Although tasks were divided along age and gender lines, nearly everyone was considered a worker. Beginning in the 1820s in the United States (earlier in Britain and France, later in Germany and Italy), paid labor markets developed on a large scale, as businesses increasingly separated from homes and new types of employers sought new sources of labor—people who were free to work for wages. In general, since industrialization, labor markets have been divided, structured, or segmented along gender and racial-ethnic lines. Labor markets are “rife with hierarchical distinctions between different categories of work and different groups of workers” (Figart 2003, 379).

In the United States, some of the earliest wage workers were young, single, white daughters of

farmers, since they could be spared from the farm. In factories, they often performed work that they had been doing in the home, such as spinning thread. But with the development of so-called “heavy” industry (iron, steel, railroads, and oil refining), paid employment was increasingly considered a male domain. Being a breadwinner became central to (white) men’s identity. White women, if they could afford to, were expected to focus on home and family. Marriage bars, or employer policies or practices that terminate women’s employment upon marriage, remained common up through the 1930s and helped to enforce the norm that married women should focus on home and family care.

In large part, this cultural mandate never applied to married working-class women, many of whom were recent immigrants or the daughters of immigrants. Nor did the dominant ideal of male breadwinner and full-time homemaker reach African-American women, either working class or middle class. The scholar Jacqueline Jones has effectively shown that black women typically began paid work as teenagers, remained in the paid labor force when they married and had children, and worked through middle age. Few African-American men earned a family-sustaining wage.

GENDER-BASED JOB SEGREGATION IN THE TWENTIETH CENTURY

Over the course of the twentieth century in the United States, women of all racial-ethnic groups, but especially white, married women, increased their participation in the labor force. Yet most work, both paid and unpaid, is still segregated along gender lines, and many specific race and ethnic groups can also be found in specific clusters of jobs. Overall, women and men remain clustered in distinct sets of occupations and industries. In fact, six out of ten women are employed in female-dominated occupations, while eight out of ten men work in male-dominated occupations. Those occupations that are integrated on the surface, like management, become less so as specific jobs titles and tasks are examined.

A job is typically considered female dominated if at least 70 percent of the incumbents are female.

A New Spin on "Women's Work"

ALBUQUERQUE, N.M. (ANS)—Magdalena Garcia has endured her share of low-wage jobs. But today, the future is looking up for the domestic worker. Now a certified childcare provider, Garcia takes care of three children half the day. The other half, she earns money as a worker-owner of a women's cleaning cooperative.

"This work has allowed me and my family to progress," said Garcia. "I now have a stable income."

Founded almost three years ago, La Mesa Cooperative provides full- and part-time work for Garcia and 10 other immigrant women. The members charge customers \$12.50 per hour to clean homes, offices and yards. The cooperative advertises its services by flyers and word of mouth.

La Mesa is one of a growing number of business cooperatives established by immigrants in New Mexico and other parts of the United States during the past few years. Although cooperatives enjoy a long history in the United States, especially in rural areas, the enterprises started by urban immigrants in the 1990s represent a relatively new phenomenon.

"It's a community that has one of the most serious income needs," said Claudia Isaac, professor of community and regional planning at the University of New Mexico. "Co-ops create a space to create different economic relationships." Isaac, who has studied cooperatives worldwide, advises members on networking, planning and marketing.

Typically, a cooperative is incorporated as a for-profit business, but some groups are discovering that by incorporating as a nonprofit, tax-exempt 501(c)3 organization, they are eligible to receive foundation grants for training purposes, an important goal of many immigrant cooperatives.

Martha Dominguez, who coordinates the newly formed Self-Help Cooperative here, advises several different groups who are in the process of forming landscaping, urban gardening, catering and auto mechanics businesses. Dominguez, who first gained exposure to cooperatives in her native Honduras, said the business model is meant to transmit more than just money.

"People become leaders and learn all the aspects of the business. There are no managers above. People run things," said Dominguez.

"I think that if people are in a place in their lives where they're in poverty, they can become leaders in the community by becoming members of the cooperative. And the kids are watching the parents doing something that is demonstrating leadership skills."

Still, like any other business in today's competitive economy, cooperatives require top-notch administrative skills and marketing savvy. Producing a service or product is one thing; convincing the public to purchase it is quite another.

Women in Action, another small cooperative that began

here three years ago, found out the hard way that teaching victims of domestic violence how to make ceramic items wasn't enough to set them on the road to financial independence away from abusive spouses. Finding the ceramics market saturated, the group was left with a pile of unsold pottery piggy-banks.

But instead of folding, Women in Action went back to the drawing board and came up with a new product: food to go. For the past several months, the group's kitchen has simmered with the aromas of chile and other spices used in the tamales and Mexican food the women cook.

Eva Varela, a young woman with two small boys, said the project helped her break away from a violent husband. She now wants to drive the truck the six-member cooperative is planning to purchase and turn into a mobile food stand to peddle food at area parks and sporting events.

Varela said her involvement with Women in Action has not only taught her how to prepare new kinds of foods but, more importantly, given her a new sense of self-worth. "I would like to continue in this program because it helps women a lot," she said. "It helps them emotionally and it helps them learn new things."

Business cooperatives are also grooming a new generation of community leaders. Garcia of La Mesa Cooperative is a case in point. Once trapped in a dead-end cycle of poor-paying jobs and substandard living arrangements, she is now satisfied with her work and the modest apartment she shares with her family. What's more, she is taking an active role in the cooperative movement.

At a recent meeting of Albuquerque co-ops, Garcia sat down with others to analyze how their businesses could better prosper. She now passes her days figuring out how her cooperative will attract new customers, maintain a quality service and equitably divide up the income.

One common feature of Albuquerque's new cooperatives is that they were developed by immigrants themselves after a host of community-based organizations and public agencies that went into schools and neighborhoods with broad goals of creating self-empowerment around civil rights, day care and health issues. In the course of meeting, the immigrants themselves identified their most pressing needs, economic development being on top of the list. Accordingly, cooperatives have spun off from other initiatives.

Women in Action, for example, began as a group of women meeting under the auspices of the University of New Mexico's Family Development Program. Originally funded with a grant from the Netherlands-based Van Leer Foundation, the UNM program gathered low-income, immigrant women together to discuss common concerns such as domestic violence and a lack of day care.

Claudia Medina, program manager of family support services for the Family Development Program, said the women suggested some kind of income-generating business to learn skills and achieve a degree of financial freedom. Medina then contacted churches, the Salvation Army and any other individual or organization that was willing to donate ceramics-making equipment.

The goal, said Medina, was to create a new group autonomous from the parent organization. "Even though it was created by this program, [Women in Action] makes its own decisions," she said.

Besides marketing, seed financing is probably the other great problem facing cooperatives. Many are looking to the growing microlending movement in the United States for funds and assistance with business training and planning. One institution that meets such needs is Accion International, an organization that began in Latin America and now counts branches in Albuquerque, San Diego, El Paso, San Antonio, Chicago and New York City. Its American base is Somerville, Mass.

As in New Mexico, the demand for nontraditional loans is likely to grow in the coming years. Immigrant-based cooperatives are also appearing in places such as Chicago, where a group of Latino construction workers is active.

Like the immigrant cooperatives themselves, microlending outfits spread to this country partly because of the achievements of the movement elsewhere. "Interestingly, it's been because of the success of programs in the developing world," said Marisa Barrera, Accion New Mexico's lending officer. "We usually think of technology transfer as coming from here, but this has been the other way around."

Nonetheless, cooperatives aren't for everybody. Often operating on the margin, co-ops with minimal cash flows and maximum meeting times could prove frustrating for many individuals. But for some, cooperatives are a real solution to a vexing problem.

Take, for example, Lola Gaytan. Exhausted by fieldwork and family responsibilities, Gaytan joined with several other women in the small community of Columbus, N.M., and founded Women in Progress. Assisted by the nonprofit Colonias Development Council, the group began taking care of children for free in members' homes.

Ultimately, Women in Progress seeks to open a day care center with a formal educational program. Currently a network of state-certified day care providers receive reimbursement for food expenses from the federally funded Community Action Agency. A portion of the money is saved and spent on bottled water, high chairs and other necessities.

"My biggest challenge is to move ahead in life. I know I can do it," said Gaytan. "I want to be someone special in life. That's why we're trying to open the day care center."

—Kent Paterson

Conversely, an occupation is male dominated when 30 percent or fewer of the incumbents are female. Integrated occupations contain between 30 percent and 70 percent women. Private household work, for example, has remained well over 90 percent female for the past century. Clerical work, previously done mainly by men, who were called clerks, became increasingly female-dominated secretarial work over the course of the twentieth century. Blue-collar work in the skilled trades—electrical work, plumbing, painting, and carpentry, for example—has remained a male domain; trade work is still less than 10 percent female. Management and the professions are integrated when the general, aggregate category is considered, but many specific managerial and professional jobs are performed predominantly by men or women, with, for example, more women than men being English teachers and more men than women being engineers.

In addition to limiting an individual's opportunity to pursue the work that may be of greatest interest to him or her, segregation in the labor market affects pay and promotion prospects, with members of socially disadvantaged groups generally working in less appealing jobs and earning less. Studies have shown that as the percentage of an occupation's incumbents who are female rises, the average wage falls, even when controlling for other factors affecting wages. Thus the gendered structure of labor markets can refer just as much to the structure of pay in the labor market as to who works where. In the twentieth century, women have frequently challenged the tendency for women's jobs to have lower pay, and advocates have developed the concept of comparable worth, also pay equity, as shorthand for the demand that women's jobs not be devalued because women do them. Advocates of comparable worth argue that jobs should be compared on the basis of the skill, effort, and responsibility they require as well as the working conditions under which they are performed, and pay should be set accordingly, rather than by custom or tradition, which likely incorporates the effects of discrimination on pay rates.

One of the most puzzling aspects of the gender-based wage gap and job segregation in labor markets is that they remain strong despite enormous eco-

conomic changes. Entire occupations and industries come and go, competition increases on a global scale, labor markets are continuously changing and restructuring, yet the phenomena of segregation and the wage gap remain, re-forming themselves in new labor market conditions. In fact, both white women and women of color have often entered professional and technical fields as those fields were changing. Women of color became computer operators for large mainframe computers as those were being phased out and computing was moving to individual desktops; similarly they became telephone technicians as more of that work became automated. White women increased their representation in medical schools and law schools in the 1970s, just as autonomy in these professions began to decline. A major study by Michael Carter and Susan Carter, published in 1981, documents how large law firms, medical and legal clinics, and health maintenance organizations (HMOs) tend to push out sole practitioners, reducing their autonomy and profit margins. Men retain the best positions in the profession (partnerships at Wall Street law firms, for example), while women take the newly open jobs in the less privileged part of the profession. The field of pharmacy also changed as women entered, as large chain store pharmacies employing more women replaced local pharmacist entrepreneurs, who had been mostly men. As many law and medical schools now approach or exceed 50 percent in female student enrollment, men, presumably, are moving on to greener pastures elsewhere.

Within management, men predominate in line positions in financial management and production management, areas on the fast track to the executive suite. Women managers, and especially African-American women, are disproportionately concentrated in specialties such as human resources, public relations, and marketing, fields which lead less readily to the top executive positions. Such intra-occupational segregation is one reason that women have hit a “glass ceiling” in corporate America.

The term *glass ceiling* was coined by two reporters at the *Wall Street Journal* to describe the widespread phenomenon of women getting within reach of the top executive jobs—being situated in the

jobs just below the top tier, where they can see the top jobs, as if through a glass ceiling, but not reach them. According to the 2002 report from Catalyst, a nonprofit organization that issues an annual report on women in top jobs in the Fortune 500 companies, women held only about 1 percent of CEO jobs in those 500 companies; nevertheless even this small number represents a substantial increase from the time of the first study. The glass ceiling has been used to suggest that something, perhaps invisible, is still keeping women from attaining the top spots, years after they have entered the professional and managerial labor force in large numbers and the pipeline has been full of talented women who could have been promoted up into these slots in greater numbers.

Causes

Occupational segregation and wage discrimination can be the result of overt actions by employers or subtle forms of institutional discrimination. Institutional discrimination connotes a situation in which structural features of labor markets and employment practices, while limiting opportunities, are seen as normal. Of course, what is normal in one period can be challenged and changed in another. For example, prior to the passage of the Civil Rights Act in 1964 and subsequent litigation, help-wanted classified ads were routinely listed under the headings “Help Wanted Female” and “Help Wanted Male.” And overt discrimination can be transformed into less overt discrimination, as when women are offered less overtime, less responsibility, or fewer cross-department assignments that would increase their visibility and help prepare them for promotions. According to feminist scholars, discrimination is deeply embedded in social institutions and culture. Indeed the roots of occupational segregation can be seen to predate industrialization. The anthropologist Margaret Mead has famously said that although the jobs women and men do differ from society to society, in all societies men and women do different work and everywhere the work women do is valued less.

The extent of sex segregation and the size of the

wage gap have both fallen since the 1960s. The index of segregation, frequently used to assess women's progress in the U.S. labor market, fell some 15 percentage points, from 68 to 53, between 1970 and 1990. The wage gap, using data from the U.S. Current Population Survey, fell from about 40 percent in 1960 to 23 percent in 2002. (That is to say, women who work full-time, year-round, used to earn 60 percent of what full-time, year-round working men did; now they earn about 77 percent of what men do.) While these declines certainly represent progress for women in breaking out of narrow confines in the labor market, progress has not been steady and may even be slowing down. With the wage gap, for example, far more progress was made in the 1980s than has been since.

Competitive market forces alone are not likely to cause institutional discrimination to evaporate in the long run. In fact, employers may even profit from engaging in discrimination. If discrimination lowers the wages of less powerful groups of workers, rather than (or in addition to) raising the wages of preferred groups, many employers likely profit from the situation and would have to increase the wages of underpaid workers to eliminate pay discrepancies.

Feminist economists and sociologists have advanced several theories of institutionalized discrimination: crowding, queuing, dual labor market, and segmentation theory.

Crowding

In a ground-breaking 1974 article, the feminist economist Barbara Bergmann proposed that discrimination "crowds" women and racial minorities into a smaller subset of occupations. According to the crowding hypothesis, the oversupply of workers in these occupations depresses their wages, due to the competition for limited job openings. Women, especially women of color, are overcrowded into female-dominated occupations; these occupations pay less, on average, than jobs with similar education and experience requirements that are not open to them. White male workers have always had more occupational choices, so they do not face crowding. Since women face barriers to moving into these

jobs, the limited labor supply keeps wages high in the male sector.

Queuing

Queuing theory treats the hierarchy between groups of workers as an institutionalized aspect of the social fabric. According to this approach, employers rank workers by order of preference and workers rank jobs based on their desirability. The workers higher up on an employer's queue get first choice at the most desirable jobs.

Dual Labor Market

According to dual labor market theory, pioneered by the economists Peter Doeringer and Michael Piore in 1971, the economy is divided between a primary sector and a secondary sector that do not allow much mobility of workers between them. The primary sector comprises traditional manufacturing jobs and skilled trade occupations. These jobs are highly unionized and offer promotion opportunities, in a well-organized internal labor market. In contrast, occupations in the secondary sector are low-wage and dead-end. Male workers are concentrated in the primary sector and female workers in the secondary sector, complementing the image of separate labor markets in crowding models. Dual labor market literature is largely inductive, drawing inferences from case studies of specific firms and analyses of the structure of labor markets in the economy of a particular time and place. Other theorists have further distinguished labor market segments as upper primary, lower primary, upper secondary, and local secondary, or similar demarcations, but these observations are still descriptive. While labor markets in the United States have changed significantly since this theory was first developed (the unionized workforce has declined as a share of the labor force, for example), the basic idea of good jobs and bad jobs still provides a perspective for understanding labor markets that appeals to many. Studies of temporary and contingent work (work without job security and benefits), for example, typically point out that women, people of color, and immigrants, often the most dis-

advantaged members of the labor force, hold these jobs disproportionately.

Segmentation

Segmentation theory has been developed to explain why the labor market is divided. Employers are motivated to maintain gender and race hierarchies in order to “divide and conquer” workers. Employers benefit from mirroring the local culture’s race and gender hierarchies and keeping workers divided against one another: Their union densities are less, their wage bills are lower. One strand of segmentation theory implies that white male workers could be better off if they joined with their coworkers to demand higher wages for all. Theorists have also examined the role of alliances between employers and white male workers in the establishment of discriminatory employment practices.

TASK SEGREGATION

Within the social sciences, gender theory has augmented these heterodox, mainly economic, theories by acknowledging the cultural devaluation of female-dominated occupations, the tasks and skills associated with “feminine” qualities, and workers with family responsibilities. These cultural values lead employers to create segregated jobs and informal task segregation. Employers maintain gender and race hierarchies, and thus occupational segregation, because cultural assumptions about women of all races and about men of color shape their economic decisions. Many of these processes occur, and can be observed, at the level of the organization. For example, even if women and men are employed in a position with exactly the same job title, employers may structure their work differently by task. This is task segregation.

Studying clerks in supermarkets, the sociologists Martin Tolich and Celia Briar uncovered informal forms of discrimination that do not show up in hiring statistics or paychecks, but do result in differential promotional opportunities and quality of working life. Male supermarket clerks, they found, have more freedom of movement on the job; they leave the

checkout lanes to restock products and clean the aisles. Access to more varied tasks is the gateway to a possible promotion. Female supermarket clerks, on the other hand, are more tied to their registers and more often assigned to the “express lane.” Employers treat the male and female clerks differently not because it is necessarily profitable or divides their work force. They simply carry, and act out, unspoken assumptions about men’s impatience with staying in one place, women’s greater emotive skills, and which employees need to be cultivated for promotions.

GENDER-RELATED WORK PREFERENCES

Increasingly in the labor economics and business literature, women’s and men’s preferences and private decisions about family care are cited as the main causes of segregation and other differential outcomes observed in the labor market. Suppose women want to work fewer hours, travel less, or have less responsibility on the job because they want to have more time and energy available to take care of children, other family members, homes, and communities? If women prefer less demanding positions on average, then are employers discriminating when they assume all women want such positions and structure their personnel decisions accordingly? And since much preparation for the labor market takes place before people enter the labor market, especially in schools and colleges, are employers responsible for there being few male nurses and few female engineers in the United States today? Questions such as these suggest that many aspects of the gendered structure of labor markets are influenced by what happens outside the labor market, yet employers cannot be excused from the roles they play in perpetuating stereotypical ideas through employment policies and practices. Just as what women do in the workplace may be conditioned by decisions made elsewhere, what happens in the workplace can affect women’s and men’s decisions concerning how to divide their energies between paid employment and family care. Lower pay for women in the labor market, a lack of publicly funded child care and paid family leave, and income tax policies that discourage second earners in families all help steer many men

and women toward decisions regarding work and family care that support the status quo.

SOLUTIONS

Like the causes, the remedies needed to reduce the gendered structure of labor markets and to increase opportunities for women are many and intertwined. Active enforcement of antidiscrimination and equal-opportunity laws in both employment and education is essential. Access to many jobs is still essentially denied to women. New laws to encourage comparable pay in women's and men's occupations would more fairly compensate women for working in traditionally female jobs and at the same time encourage more men to take those jobs. Subsidized child care, paid family leave, and flexible work arrangements would all help families to mesh work and family demands and to divide family care more equitably. Tax policies that treat dual-earner and single-earner couples more equitably are also needed. In short, the gendered structure of labor markets results from both internal and external factors, and both need to be addressed for change to occur. While much remains to be done if the labor market is to provide equal opportunity for everyone, social changes as profound as increasing gender equity can be expected to take a long time. In the United States, women organized actively for seven decades before gaining the vote, and by 2003, they still have only about 14 percent of the seats in the U.S. Congress. Looked at from the long-term perspective, a surprising amount of change has occurred in the labor market in a relatively short time period.

GENGHIS KHAN (1162–1227)

Mongol conqueror

Genghis Khan merged several warring tribal confederations in the steppes (level and treeless land in southeastern Europe and Asia) of Mongolia and united Mongolia into a single nationality, establishing the largest contiguous empire in history. He received the title of “Genghis Khan” first as the khan (leader) of his own tribe, the Mongols, and then as the emperor of all the tribes of Mongolia after almost twenty years of conflict. In the process, Genghis Khan avoided the traditional method of building a tribal confederation built solely on kinship ties as well as promises of plunder and wealth

and instead forged a new identity for the nomadic tribes. Rather than remaining individual tribes, they were reorganized into one huge tribe known as the “Yeke Mongol Ulus” (great Mongol nation). With this unity, Genghis Khan led his tribesmen into northern China and then into central Asia and Persia (Iran), accumulating more conquered territory than any other leader. His successors continued the conquests until the Mongol empire stretched from the Pacific Ocean to the Carpathian Mountains and Mediterranean Sea. Yet, Genghis Khan’s achievements off the battlefield are perhaps an even greater legacy.

EARLY LIFE

Genghis Khan—or Temüjin, as he was known in his youth—assumed leadership early in his life. After the murder of his father, Yesügei, who was also a tribal leader, in 1175, the Mongol tribes abandoned Yesügei’s family. Scholars are unsure whether the ten-year-old Temüjin was the logical successor because he had two half-brothers from Yesügei’s second wife, Ko’agchin, who may have been older. Nevertheless, none of Yesügei’s children held enough seniority to lead the Borjigin clan of the Mongols. Still, a power struggle did ensue between the sons of Ho’elün, the mother of Temüjin, and those of Ko’agchin. The result of the struggle in 1180 was that Temüjin and his brother Jochi Qasar murdered Bekhtar, the eldest of Ko’agchin’s sons, but spared Belgütei, the younger son. Scholars think it likely that the murder was the result of the power struggle for leadership in the family of Yesügei. In 1180 Temüjin reached the age of fifteen, essentially attaining his majority (typically males aged fifteen to sixty fought in warfare, thus a fifteen-year-old would be considered a man and not a boy).

Temüjin gradually won the loyalty of others and increased his following. In addition, he became the vassal (a person under the protection of a feudal lord) of Toghriq Ong-Khan, the khan of the Kereit tribal confederation. Through his relationship with Toghriq, Temüjin gained a reputation for respecting merit over heredity and status as well as rewarding loyalty.

UNIFICATION OF MONGOLIA

Because tribal society tended to be fairly fluid, Temüjin gained supporters from other tribes. One method by which he gained supporters was dividing plunder from warfare among all of those who participated. He ordered that anyone who stopped to gather booty during a raid would be punished. Temüjin insisted that all fighters should continue fighting until victory was secured. Traditionally, plunder tended to be divided among the leaders, who then distributed it among their men. Thus, in order to gain a better share, fighters had incentive to take what they could on a raid and not necessarily fight. Although the immediate companions of Genghis Khan and his commanders received a larger share of the plunder, this practice of waiting until the battle ended to plunder ensured that there would be more plunder to divide among all involved in a battle. The creation of a rigid system of discipline among the Mongol troops gave them a decided advantage over their enemies.

Although Genghis Khan remained loyal to Toghril for several years, tensions built as Genghis Khan's influence and power increased. In 1203 the two former allies clashed, with Genghis Khan's army emerging victorious. With Genghis Khan's defeat of the Kereit, the Mongols now controlled eastern and central Mongolia. The only significant force that remained in Mongolia was another tribal confederation known as the "Naiman."

Initially the Naiman sought to defeat the Mongols by invading their territory. Genghis Khan, however, led his army into western Mongolia and defeated the Naiman in 1204. This conflict was perhaps the most significant of Genghis Khan's career. If he had been defeated by the powerful Naiman, he would have been unlikely to regain power or maintain the cohesion of his following.

The victory over the Naiman gave Genghis Khan complete control over Mongolia. In 1206 a *quriltai* (congress) was held at the Onan River; the Mongols declared Genghis Khan the supreme ruler of the steppes. At this time, Genghis Khan organized his newly won empire in a more formal manner. He assigned commanders to the military units *mingans*

(thousands) and *timens* (ten thousands). Furthermore, he established the *keshik* (a ten-thousand-man bodyguard). The *keshik* also served as a military academy and training school for men who later became the generals and upper-level officials within the empire. Not all who went through the *keshik* became officers, though. In one instance, Genghis Khan noted that one warrior was tireless, felt neither cold nor hunger, and could ride and fight for days on end, surpassing all others. Yet, because of the attributes that made him a great warrior, he could not become an officer because he could not understand the sufferings of other men.

Just as the army was organized in a decimal fashion, so, too, was society. In order to maintain unity among the various tribes a new supraentity—a new identity given to a number of preexisting policies or groups in order to unite them under a common name—had to exist. Thus, Genghis Khan created the Yeke Mongol Ulus. Tribes that had been loyal to him through the years maintained their integrity. Those whom he had defeated, however, were divided up and dispersed throughout the new military units.

WORLD CONQUEROR

With the unification of Mongolia, Genghis Khan turned his attention to outside the steppes. Some people think Genghis Khan launched a campaign of conquest and world domination out of megalomania and greed; however, this notion is inadequate. The reasons for his expansion beyond the steppes are more complex.

Indeed, Genghis Khan's expansion had more to do with leadership strategies than desire for world domination. With the exception of his invasion of central Asia, Genghis Khan's wars were more to maintain power than to achieve conquest. His initial invasions of central Asia and the medieval kingdom of Xi-Xia (northwest China) were motivated by his pursuit of tribal leaders who had taken refuge outside of Mongolia. As Genghis Khan had learned, security in the steppes was ephemeral while a viable alternate leader remained. While these threats of an alternate leader remained, they served as rallying points for discontented elements in Mongolia.

The Power of Genghis Khan

The History of the World Conquerer, completed by the Persian historian Ata-Malik in 1260, chronicled the reign of Genghis Khan (Chingiz-Khan). The excerpt below is from the chapter "Of The Laws Which Chingiz-Khan Framed and the Yasas Which He Promulgated After His Rise to Power."

God Almighty in wisdom and intelligence distinguished Chingiz-Khan from all his coevals and in alertness of mind and absoluteness of power exalted him above all the kings of the world; so that all that has been recorded touching the practice of the mighty Chosroes of old and all that has been written concerning the customs and usages of the Pharaohs and Caesars was by Chingiz-Khan invented from the page of his own mind without the toil of perusing records or the trouble of conforming with tradition; while all that pertains to the method of subjugating countries and relates to the crushing of the power of enemies and the raising of the station of followers was the product of his own understanding and the compilation of his own intellect. And indeed, Alexander, who was so addicted to the devising of talismans and the solving of enigmas, had he lived in the age of Chingiz-Khan, would have been his pupil in craft and cunning, and of all the talismans for the taking of strongholds he would have found none better than blindly to follow in his footsteps: whereof there can be no clearer proof nor more certain evidence than that having such numerous and powerful foes and such mighty and well-acquainted enemies, whereof each was the *faghfur* of the time and the Chosroes of the age, he sallied forth, a single man, with few troops and no accoutrement, and reduced and subjugated the lords of the horizons from the East unto the West; and whoever presumed to oppose and resist him, that man, in enforcement of the *yasas* and ordinances which he imposed,

he utterly destroyed, together with all his followers, children, partisans, armies, lands and territories. There has been transmitted to us a tradition of the traditions of God which says: "Those are my horsemen; through them shall I avenge me on those that rebelled against me," nor is there a shadow of doubt but that these words are a reference to the horsemen of Chingiz-Khan and to his people. And so it was that when the world by reason of the variety of its creatures was become a raging sea, and the kings and nobles of every country by reason of the arrogance of pride and the insolence of vainglory had reached the very zenith of "Vainglory is my tunic, and pride my cloak," then did God, in accordance with the above-mentioned promise, endow Chingiz-Khan with the strength of might and the victory of dominion—"Verily, the might of the Lord is great indeed"; and when through pride of wealth, and power, and station the greater part of the cities and countries of the world encountered him with rebellion and hatred and refused to yield allegiance (and especially the countries of Islam, from the frontiers of Turkestan to uttermost Syria), then wherever there was a king, or a ruler, or the governor of a city that offered him resistance, him he annihilated together with his family and followers, kinsmen and strangers; so that where there had been a hundred thousand people there remained, without exaggeration, not a hundred souls alive; as a proof of which statement may be cited the fate of the various cities, whereof mention has been made in the proper place.

Additionally, the raids that Genghis Khan made outside of Mongolia served as a release for his newly organized army. Having the majority of adult males under arms in a highly organized and disciplined army made them effective; however, they were potentially a powder keg. By sending them outside Mongolia to chase rival leaders or merely to raid, Genghis Khan kept his army and his generals trained and occupied in other matters.

In 1205 Genghis Khan invaded the kingdom of Xi-Xia. The Mongols raided Xi-Xia several times before they conquered it in 1210. Xi-Xia, however,

was not fully incorporated into the empire until 1227, after the Mongols put down a rebellion led by its Tangut leaders. Prior to that Xi-Xia served as a vassal state that provided the Mongols with tribute as well as troops; yet, the Mongols made little effort to govern Xi-Xia as long as it fulfilled its duties as a vassal state.

The Mongols also invaded northern China, then ruled by the Jin dynasty. As with Xi-Xia, Genghis Khan did not attempt to conquer northern China, at least initially. His invasion had as much to do with economics as with vengeance for past grievances. In

the past the Mongols and the Jin had warred on several occasions. After 1206 Genghis Khan no longer viewed himself as inferior to the Jin emperor. Beginning in 1211 the Mongols raided the Jin on numerous occasions. Only over time did the Mongols begin to hold the territory they conquered as more groups within the Jin empire sought the protection of the Mongols. However, before the Mongols could complete the conquest of northern China, Genghis Khan's attentions were directed toward central Asia.

As part of their effort to destroy potential rivals, the Mongols acquired much of what is now Kazakhstan at the same time that one individual, Güchülüg, had taken refuge in the Qara Qitay empire and eventually usurped power. The Mongols invaded and pursued Güchülüg to his death in 1218. With the acquisition of the Qara Qitay territories, the Mongols now came into contact with the Khwarazmian empire, which dominated much of central Asia, Afghanistan, and Iran. Initially the Mongols only sought trade with the Khwarazmian empire; however, greed and perhaps ambition ended commercial activity just as the Khwarazmians massacred a Mongol-sponsored caravan in the city of Otrar. Muhammad Khwarazmshah II, ruler of the Khwarazmian empire, then rebuffed diplomatic efforts of the Mongols to settle the dispute peacefully, perhaps believing that he could plunder Mongol-sponsored merchants while Genghis Khan campaigned in China.

Genghis Khan, however, left his lieutenant Muqali in charge of a small army of Mongols while Genghis Khan led the bulk of the Mongol army to central Asia, over 1,600 kilometers away, in 1219. The actions of Muhammad Khwarazmshah II could not be ignored. If Genghis Khan could not protect officially sponsored caravans, then his vassals on the periphery of the empire might also have doubts about the extent of Mongol control. Thus, in a brilliant campaign Genghis Khan conquered the Khwarazmian empire in a relatively short time, finishing in 1224 before returning north to deal with his rebellious vassals in Xi-Xia. The Mongols, however, did not attempt to occupy territory south of the Amu Dar'ya River, thus holding only a fraction of the former Khwarazmian empire. Nevertheless, Muhammad Khwarazmshah II

died in flight, and the remnants of his empire no longer threatened the Mongols.

ACHIEVEMENTS

Although Genghis Khan's conquests certainly gained him recognition among historians as a military and organizational genius, perhaps his cultural achievements transcended his military achievements. Indeed, he played a major role in five significant achievements in the development of Mongolian society. The first was that he united the tribes of Mongolia into one nation. The second was that he introduced a writing system into Mongolian society and forced the Mongolian nobility to become literate. The last three achievements were institutions that he imposed on the Mongols that lasted well beyond his death. The first of these three was the *Yasa* (law code), which he imposed over the empire. The second was creation of an army with absolute discipline out of the unruly tribes. With this army he was able to forge an empire that stretched from the coasts of China to the shores of the Caspian Sea in his lifetime. The empire continued to grow after his death, a phenomenon in nomadic empires. The third cultural achievement was an administration to govern his empire.

In regards to the writing system, Genghis Khan, although illiterate, recognized the importance of writing. The writing system that he adopted—one adapted from the Uighur Turks of central Asia—came from the Naiman. Its script is still used today in the Inner Mongolian Autonomous Region of China.

Although scholars debate the content of the *Yasa* (law code) of Genghis Khan as well as to whom it applied, a law code of some form did emerge. Much of what it contained pertained strictly to the nomads of the empire because the settled regions tended to be governed by their existing laws, whether secular or religious. The *Yasa* continued to affect the nomadic world after the death of Genghis Khan and indeed after 1260, when the Mongolian empire split into four smaller empires.

The administration of the empire developed by Genghis Khan evolved in a curious fashion. Genghis Khan did make appointments in 1206 after the

unification of Mongolia was completed. These appointments included commanders of regiments and divisions but also civil appointments. In addition, Genghis Khan recognized the talents of various administrators of the empires he conquered, whether they were from China, central Asia, or Persia. He used these individuals to run his empire, a practice that was perfected by his successors.

LEGACY

The impact of Genghis Khan's leadership is less obvious than it should be in the twenty-first century. The most obvious impact is the country and nationality of the Mongols. Prior to his ascension to power, tribal confederation rose and fell in cycles. However, Genghis Khan's family remained the aristocracy of the nomads of Mongolia into the twentieth century. Furthermore, even after the Mongolian empire declined, rulers such as the Turkic conqueror Timur (Tamerlane) and even Ivan IV of Moscow attempted to establish a connection between their rule and Genghis Khan in an attempt to legitimize their claim to power. The establishment of the Mongolian empire also opened the door for intercontinental trade on a grand scale. Merchants could travel from Europe to China and points in between on an unprecedented scale. Although one should not believe that it was a glorious period for all, the safety given to merchants opened the doors for exchanges in science and science. Today Genghis Khan is still revered as the founding father of Mongolia, and a religious cult in his honor exists in Mongolia and Inner Mongolia.

GLOBALIZATION

Few current topics are more contested than globalization—its definition, causes, and economic, political, social, and moral implications. Some critics maintain that globalization is a faddish term that encompasses too many ideas to be coherent. Yet it is

hard to deny that some kinds of global interaction are taking place that are significantly reshaping life for many human beings. Debates swirl around how globalization can be most efficiently and equitably steered or constrained, if indeed it can be guided in some way. At whatever level (local, national, and international), leaders in various sectors face effects of globalization.

Globalization is better understood as a set of processes—sometimes competing; sometimes complementary—than as a unified process. It refers to economic, political, technological, social, cultural, and ethical developments. The term is most often employed in relation to developments after 1980, even though many scholars now assert that earlier periods of history also contained elements of globalization. In general, globalization refers to the incorporation of the global level into activities or frames of reference that would otherwise remain local, national, or regional in scope.

ECONOMIC ASPECTS

Although globalization can and does entail a variety of dimensions, the term commonly refers to economic links and processes. Economic globalization concerns the expansion of production, trade, consumption, savings, and investment to markets beyond national and regional ones. Although trade has always crossed national boundaries, from spice routes to the East, to trade in the Roman Empire, to international shipping between Europe, Africa, and the Americas, the level of international trade has skyrocketed since about 1980.

With strong encouragement from leaders in private enterprise, political leaders have pushed for the reduction in tariffs on the trade of goods and service across national lines. The Uruguay round of trade talks (1986–1994) of the General Agreement on Tariffs and Trade (GATT, established in 1947), created the World Trade Organization (WTO). The WTO, which began officially in 1995, is an international institution consented to by various partner countries. It has the power to enforce agreed-upon treaties and to mediate trading disagreements among member countries. Critics maintain that the WTO governance

is not democratic and privileges an ideology of the free market over social values. In this view, economic globalization that promotes free trade and growth of production comes at the expense of weaker economies and nations (who consent to membership out of a very limited set of options), the rights and protections of laborers, and environmental health.

The increased international flow of commodities is a visible form of globalization, but the rise in global financial markets dwarfs the markets in goods. With the technological developments discussed below, trillions of dollars change hands every day electronically. In unprecedented ways, global capital and currency markets have reshaped economic investment. This is not to say that investment across national lines is new; foreign investment as a share of total investment is not larger today than it was in the pre–World War I period. Concerned about speculation as well as seeking to finance a global infrastructure, some economists, activists, and policymakers have called for a tax (like the so-called Tobin tax) to be levied upon global financial transactions.

Globalization has not occurred as readily for human labor as it has for capital. On the labor front, political questions of national sovereignty confront globalizing economic trends. A number of nations have addressed the labor issue through legalized migrant- and guest-worker programs. Some permit immigration and offer citizenship to persons who can fill certain kinds of gaps in the national labor force. Yet, the majority of persons are not able readily to move their labor power across national lines, as they would be able to do in a fully globalized society.

TECHNOLOGICAL CHANGES

Late-twentieth-century technological innovations are a major component of globalization. A series of developments in the telecommunications and computer industries has made immediate, coordinated, and sustained communication possible among multiple geographic locations in the world. The cost of a one-minute phone call from New York to London has dropped precipitously, by about 99 percent, over the

past seven decades (United Nations Development Programme 1999, 30). Cell phone technology promises to make communication to remote areas affordable; entire nations appear poised to skip a generation of wired technology and adopt wireless communication systems.

The Internet, developed as a way of communication within the military and university sectors, has made instant interaction and a common pool of information potentially available to persons around the world. Internet access and usage vary by country and socioeconomic status, but at its best, the Internet promises a cheap and reliable medium for global interaction. Critics call attention to the downfalls of this sort of interaction, including inequalities of access and influence, the over-commercialized use of the World Wide Web, and the lack of genuine, personal human-to-human communication.

The decline of prices of international air travel, in addition to contributing to the global trade of time-sensitive products, has increased international tourism. Persons who can afford this form of travel comprise a global tourist industry. Yet, the cost of a standard coach-class seat on a round-trip transatlantic flight exceeds the average annual per capita income of almost half of the world's nations.

AN EMERGING GLOBAL INFRASTRUCTURE

A different kind of globalization, of a political nature, has taken place more slowly and less directly than the economic and technological dimensions. Market structures can readily transform themselves from a national to an international level, but a political system based on national sovereignty will, by definition, face structural issues in international contexts. The founding of the United Nations (UN) in 1945 offered the promise of a global community of nations working together to address the social ills and, at a minimum, to reduce the probability of conflict on a global scale. The UN charter did not usurp national sovereignty—indeed, it was built upon it. Although the Security Council, whose five permanent countries hold veto power, ensures that a set of dominant countries has undue influence, the UN structure is still more democratic and participatory

than international financial institutions such as the World Bank, International Monetary Fund, and World Trade Organization. The UN's efforts to forge global peacekeeping alliances and to avoid political-military conflict have had mixed results. The current Secretary General, Kofi Annan, of Ghana, has questioned the absolute right of national sovereignty when it comes to issues of the violation of human rights within national boundaries. The degree to which his leadership efforts will erode national sovereignty, however, remains to be seen.

The UN has had some success in its promotion of human rights. The UN Universal Declaration of Human Rights, adopted by the Security Council in 1948 and now ratified by at least 140 countries, set the stage for a series of human rights conventions and treaties, including international statements on civil and political rights; economic, social and cultural rights; and the rights of women, racial minority groups, and children. A group of nongovernmental human rights organizations, including Amnesty International and Human Rights Watch, endeavors to protect human rights around the world. Scholars now discuss the emergence of a global culture and structure of human rights.

Other multinational efforts have contributed to a global political and juridical order. The formation of an International Criminal Court, despite objections by the United States, is reshaping the understanding of justice across national boundaries. International treaties and protocols, relating to the environment, military weapons, fishing, and so on, contribute to a global order. Some of these international efforts have resulted not from a formal political structure, but through the leadership of persons in nongovernmental organizations that are committed to addressing a particular issue. The awarding of the Nobel Peace Prize to Jody Williams and the International Campaign to Ban Landmines is a recent example of such citizen leadership that seeks to create a global order.

The globalization of human rights and international treaties is distinct from economic understandings of globalization that focus on the growth of production and the expansion of trade and investment. Yet a set of economic institutions has played a

prominent role in an emerging global infrastructure. The International Bank for Reconstruction and Development, or the World Bank, and the International Monetary Fund (IMF) have become highly influential international financial institutions (IFIs) in the emerging international order. These institutions were envisioned at the Bretton Woods Conference in 1944 (and organized the following year), under enlightened leadership of the economist John Maynard Keynes, who believed in the importance of building an improved economic system in the post-war period.

The World Bank is charged to provide development assistance through loans for development projects and the IMF is directed to provide emergency assistance to national governments for macroeconomic stability and structural adjustment loans to make national economies more market oriented. Even beyond these important roles, these IFIs wield significant power in the shaping of national economic development strategies, and their evaluations influence commercial banks in their own lending decisions. As mentioned in the discussion of economic globalization above, the World Trade Organization also has become increasingly significant as an IFI; its critics point out that its policies affect not only production and trade of goods and services, but also environmental, labor, and social policies.

One intentional leadership effort to shape a global economy has been the World Economic Forum (WEF), an independent organization that brings together elite financial, political, and social leaders to address issues related to globalization that arise because of the discontinuities, gaps, and flaws in the global order. This organization does not claim to be representative or democratic in its processes; rather, it provides a forum for discussion among persons who are powerful in their own sphere but might otherwise not communicate with one another. Some observers are critical (or suspicious) of the very effort of economic and political elites to get together, since they might create a global infrastructure that favors persons already in power and give corporations additional public influence. In intentional opposition to the WEF's elite approach, the

Forum Social Mundial, or World Social Forum (WSF), has organized open international meetings in Porto Alegre, Brazil, for scholars, activists, and policymakers who see the economic dimensions of globalization as a process of exclusion of poor and marginalized persons.

CULTURES AND GLOBALIZATION

Some commentators understand cultural difference to be a significant barrier to any form of global community. Samuel Huntington's thesis about a clash of civilizations has received significant attention. Huntington asserts that a set of civilizations—no longer national boundaries or Cold War alliances—has created and will maintain the fault lines of the global order. These so-called civilizations—the West, Islam, Confucianism, and so on—are not easily reconciled, integrated, or transcended via any global political or economic process. A particularly important tension, Huntington maintains, is between the West and Islam. Respondents have questioned his framework, particularly the simple categorizations of civilizations, the assumption that cultural difference necessitates (often violent) conflicts, and the thinly veiled preference for “Western” civilization.

A second significant discussion of culture and globalization centers around Benjamin Barber's thesis that two forces—“McWorld” and “Jihad”—are undermining democracy around the world. McWorld, as Barber describes it, is the process of creating a global “monoculture” based upon consumer values and practices. McWorldization is driven by U.S. commercialism, including the tremendous global influence of multinational corporations like Coca-Cola and Nike, the Hollywood film industry, and media-entertainment conglomerates like Disney and AOL-Time Warner. McWorld threatens the richness and diversity of less powerful cultures around the world. Barber defines Jihad as those movements away from multicultural, multiethnic democracies toward ethnic or religious enclaves of self-determination. Such efforts are aided by the global communications and media technologies of McWorld. Barber thus asserts that globalization, paradoxically, is aiding both Western economic dom-

inance and balkanizing movements around the world, both to the detriment of democratic participation.

GLOBAL CITIZENSHIP?

In addition to tangible transformations on economic, technological, political, and cultural fronts, globalization entails a less visible transition in persons' frames of reference, or ways of thinking, concerning identity and affiliation, time, and geography. The concept of *neighbors* changes as technology and communication make people who are geographically far away become, in real senses, proximate. For many persons, an international or even truly global perspective is added to other frameworks such as family, neighborhood, city, and nation. As leaders seek to address problems—even apparently very local ones—it is important to understand the ways in which the relevant issues have global dimensions. The popular activist slogan, “Think Globally, Act Locally,” captures only some of the complexities of thinking and acting at various levels (see Robertson 1992).

Since the 1970s, moral and political philosophers have renewed an interest in global justice and the rights and responsibilities of a global community. The philosopher John Rawls adapted his famous work *A Theory of Justice* (1971) to identify certain limited transnational duties that are contained in a “law of peoples” (Rawls 1999). Marxist and post-colonial scholars have emphasized the need to understand struggles in various parts of the world as part of a common fight against forces of oppression and for human dignity. Hardt and Negri's book, *Empire* (2000), portrays globalization as a complex movement that creates a hegemonic global order but that also provides opportunities for mass resistance to it. Other scholars, including Martha Nussbaum (1996), Peter Singer (2002), and Hans Küng (1998), have offered “cosmopolitan” visions of moral obligation and global community. In cosmopolitanism, national citizenship has very little relevance to the rights and duties that humans share with and toward one another. Some analysts have retorted that global citizenship is an interesting concept, and perhaps a worthy ideal, but it is only the “global class”—those

who can afford to debate such ephemeral topics—who have the privilege to dream of such a condition.

PROTESTERS OF GLOBALIZATION

Some activists, scholars, and citizens oppose various dimensions of globalization. The most highly visible protests reject current economic processes and, specifically, those international financial institutions seen to be pushing for it—the IMF, the World Bank, and the WTO. High-profile demonstrations have taken place since 1999, outside meetings of IFIs in Seattle, Prague, Quebec City, and Washington, DC. Other protests have disrupted meetings of leaders of the most powerful economies, such as the G-8, or Group of Eight, meetings in Genoa, Italy, in 2001.

These protests, like globalization itself, are multivocal events, bringing together citizens concerned about labor practices, poverty, and the environment. The vast majority of efforts to place social concerns on the public agenda have been nonviolent. At almost every protest, however, a few protesters gain the attention of the media by using violence. Leadership within the “antiglobalization” movement struggles to unite disparate voices concerned about developments that accompany globalization in its current forms. Organizations that are pro-labor, pro-environment, and advocates of impoverished people face the challenge of working together when their short-term interests might not be aligned completely. Although it is difficult to assess directly the success of such efforts, all three of the IFIs have recently (if gradually and to varying degrees) shifted their discourse to incorporate concern for poor persons, social policies, and environmental protection.

Paradoxically, the successful organizing efforts against economic globalization tend to be highly global in terms of technology and communication. That is, leaders in the anti-globalization movement employ the Internet and international networking as principal means for organizing. While some groups of genuine anti-globalizers prefer communal separatism, or autonomy, the majority of organizations embracing the term *anti-globalization* are actually protesting specific forms of globalization (viz., models that are based upon, or perpetuate, existing dis-

parities of economic wealth and political power).

It is important to note an additional aspect of globalization in the current international arena. Terrorist networks such as al-Qaeda purport to be fighting the hegemonic political and economic power of the United States (and its allies). Its leaders claim to resist a global economic system that imposes Western values upon all persons and cultures in the world. The terrorist attack of 11 September 2001, against the World Trade Center in New York City and the Pentagon, targeted the global economy. Yet, even as al-Qaeda fights the forces of globalization, it is itself a profoundly globalized institution, dependent upon the electronic media for its internal communication and dissemination of its message. Thus, even the most radical forms of protest against globalization are also affected by the realities of the phenomenon.

INEQUALITY AND INCLUSION

One of the central issues in globalization debates is the relation of globalization to inequality. Economists debate the question of whether and by how much the process of globalization—specifically, in this case, the expansion of international trade and capital movement—has increased inequality. Although there is no broad consensus, scholars generally agree that technological changes have had at least as significant an impact on inequality as trade. Many economists agree that the level of global inequality increased during the 1970s and 1980s, but the degree of that rise turns on a number of technical factors, including currency conversion rates. There is no consensus about the more recent period—or, importantly, the causal relationship(s) between globalization and equality or inequality.

Selection from the Marrakesh Agreement Establishing the World Trade Organization, 1994

The *Parties* to this Agreement,

Recognizing that their relations in the field of trade and economic endeavour should be conducted with a view to raising standards of living, ensuring full employment and a large and steadily growing volume of real income and effective demand, and expanding the production of and trade in goods and services, while allowing for the optimal use of the world's resources in accordance with the objective of sustainable development, seeking both to protect and preserve the environment and to enhance the means for doing so in a manner consistent with their respective needs and concerns at different levels of economic development,

Recognizing further that there is need for positive efforts designed to ensure that developing countries, and especially the least developed among them, secure a share in the growth in international trade commensurate with the needs of their economic development,

Being desirous of contributing to these objectives by entering into reciprocal and mutually advantageous arrangements directed to the substantial reduction of tariffs and other barriers to trade and to the elimination of discriminatory treatment in international trade relations,

Resolved, therefore, to develop an integrated, more viable and durable multilateral trading system encompassing the General Agreement on Tariffs and Trade, the results of past trade liberalization efforts, and all of the results of the Uruguay Round of Multilateral Trade Negotiations,

Determined to preserve the basic principles and to further the objectives underlying this multilateral trading system,

Agree as follows: [The sixteen articles of agreement follow.]

Source: World Trade Organization. Retrieved October 15, 2003, from http://www.wto.org/english/docs_e/legal_e/04-wto.doc

At least one additional relationship is frequently overlooked in these discussions. Even if global inequality did not increase in the past two or three decades, communications and media innovations have broadened the “frame of reference” beyond national borders to see global inequality as a more relevant and pressing issue. Currently, the level of income inequality in the world stands at least as high as inequality in the most unequal nations. Although in earlier eras this fact may not have been acknowledged, today’s increasingly interconnected citizens are more likely to take note of inequality, and its implications, at the global level (Hicks 2001).

One key question of globalization and inequality

concerns who the agents of globalization are. Do common local citizens in the United States, Australia, Venezuela, or India have the ability to influence, even in a small way, the globalizing world in which they increasingly live? The vastness of a global process makes any individual agency seem remote at best, and this is a fact unlikely to increase a person's leadership initiative. To the extent that globalization is disproportionately shaped by political and economic elites, it can neglect (at best) or diminish the agency of local citizens.

Movements on behalf of labor, the poor, and the environment share a concern about the loss of agency by non-elites in the globalization process. Scholars and advocates now speak about *glocalization*, a term that once referred to a kind of marketing (Robertson 1992, 173–174) but now also denotes a process whereby actors at the local level are able to shape their own experience of globalization. “Glocal” leadership, in other words, helps individuals and groups to influence their context, given the wider situational realities of globalization.

LEADERSHIP FOR, AGAINST, AND AMID GLOBALIZATION

Few leaders in political or economic sectors claim to be pursuing (or, for that matter, resisting) globalization intentionally as one of their direct ends. (Exceptions are individuals and organizations such as the WEF and the WSF.) Rather, globalization is a systemic outcome of various actors who are seeking their more limited ends to benefit themselves, their institution, or their constituency. The vast majority of leaders confront global and globalizing realities as contextual factors that they must negotiate in their work: Business leaders adopt an international horizon on their would-be customers, competitors, investors, and potential labor force; political leaders carve out their place in the international order as a piecemeal global infrastructure develops; and leaders of civil society expand their mission to new countries and contexts.

Even as leaders focus on the needs of their followers and constituents, intentional efforts are needed, however, to develop globalization, as possible, in

directions that are effective and ethical. It is clear that the interactions between and among the peoples of all parts of the world will increase in the decades ahead, but it is not clear what the quality of those relationships will be. It remains to be seen whether the leadership processes associated with globalization will be top-down and exclusive or, rather, will include the voice and contribution of many persons and organizations around the world. Determining the meanings of globalization is more than an academic debate about definitions; it requires multifaceted leadership efforts on financial, political, social, and cultural fronts to shape a world in which all persons have the opportunity to be agents of their own lives.

GLOBE RESEARCH PROGRAM

The GLOBE (Global Leadership and Organizational Behavior Effectiveness) research program is a worldwide multi-phase, multi-method project whose purpose is to explore the relationship between culture and leadership. In the last decades of the twentieth century, globalization of business and technology has resulted in an unprecedented level of peacetime contact among cultures. Globalization of industrial organizations presents numerous organizational and leadership challenges, including how to design multinational organizational structures, how to select leaders appropriate to the cultures in which they will be functioning, how to manage organizations with culturally diverse employees, and how to conduct successful cross-border negotiations, sales, and mergers and acquisitions. Unfortunately, the literature provides little guidance for leaders facing these challenges. One purpose of the GLOBE research program is to correct that problem.

In 1991, Robert J. House, a scholar at the University of Pennsylvania's Wharton School, came up with the idea of a global research program focusing on leadership, organizational practices, and societal culture. Among the key questions driving the GLOBE project are the following:

- Are there leader behaviors, attributes, and practices that are universally accepted and effective across cultures?
- Are there leader behaviors, attributes, and practices that are accepted and effective in only some cultures?
- How do societal and organizational cultures influence whether specific leader behaviors will be accepted and effective?
- How do societal and organizational cultures affect selected organizational practices?
- How do societal cultures affect the economic, physical, and psychological welfare of their members?
- What is the relationship between a society's culture and its international competitiveness?
- How does a society's culture help determine its conceptions of effective leadership?

STRUCTURE OF THE GLOBE PROGRAM

GLOBE was initially funded in October 1993 by the U.S. Department of Education, with Robert House acting as principal investigator. In addition to House, three co-principal investigators and more than 170 country co-investigators (CCIs) from more than 60 countries representing all major regions of the world are currently engaged in this long-term series of cross-cultural studies.

The CCIs, together with the principal investigators and research associates, comprise the GLOBE community. The CCIs lead the project in a culture in which they have expertise. Their activities include collecting quantitative and qualitative data, ensuring the accuracy of questionnaire translations, writing country-specific descriptions of their cultures, interpreting the results of quantitative data relevant to their culture, and contributing insights from their unique cultural perspectives. In most cases, CCIs are natives of the countries from which they are collecting data and participate in that country's culture. Some of the CCIs have extensive experience in more than one culture. Most cultures have a research team of between two and five CCIs working on the project.

The GLOBE project employs a variety of methods to make cross-cultural comparisons. The primary data are responses of middle managers in three industries—financial services, food processing, and telecommunications—to questionnaires. In total,

over 17,000 questionnaires were collected from middle managers in over 900 organizations throughout the world, with at least three cultures in each major region of the world being represented. The managers' responses taken in aggregate provide measures of the practices and values of their cultures. Empirical assessment of the validity of the GLOBE scales reveals that meaningful patterns of relationships emerge when the GLOBE scales are compared with other cultural indices. For example, GLOBE's Future Orientation values scale is correlated with the World Values Survey indicators dealing with spiritual orientation and Future Orientation practices scale is positively correlated with measures of national savings.

SOCIETAL AND ORGANIZATIONAL CULTURE

The first significant question addressed by the GLOBE program was how societal and organizational cultures differ. In August 1994 the first GLOBE research conference was held at the University of Calgary in Alberta, Canada. Fifty-four researchers from thirty-eight countries met to develop a collective understanding of the project and to initiate its implementation. Participants agreed to define culture as "shared motives, values, beliefs, identities, and interpretations or meanings of significant events that result from common experiences of members of collectives and are transmitted across age generations" (House, Javidan, Hanges, et al. 2002, 6).

Based on earlier literature in the field of cross-cultural studies, the researchers identified nine different dimensions of culture:

Uncertainty Avoidance. Uncertainty Avoidance in a society or organization is the act or practice of striving to avoid uncertainty by relying on established social norms, rituals, and bureaucratic practices. People in cultures with high levels of uncertainty avoidance actively seek to decrease the unpredictability of future events, as unpredictability is seen as adversely affecting the operation of the organization or society.

Power Distance. Power distance measures the degree to which members of an organization or society

expect and agree that power should be stratified and concentrated in the organization or society's upper levels. The more members of a society agree that power and status should be concentrated in the upper levels, the greater the power distance in the society.

Collectivism I, or Institutional Collectivism. Institutional collectivism is institutional-level encouragement and rewarding of collective action and collective distribution of resources. When organizational and societal institutional practices support collective action and collective distribution of resources, we say that the society or organization is characterized by high levels of institutional collectivism.

Collectivism II, or In-Group Collectivism. This is distinguished from institutional collectivism by its focus on small groups such as family and circles of close friends. While institutional collectivism reflects the extent to which a society's institutions favor collectivism, in-group collectivism reflects the strength of ties within small groups.

Gender Egalitarianism. Gender egalitarianism is the state or condition of minimizing gender role difference and promoting gender equity and equality.

Assertiveness. Assertiveness is the quality of aggressive directness in social relationships. Some societies or organizations encourage it; others discourage it.

Future Orientation. Future orientation is a focus on the future and engagement in future-oriented behaviors such as planning, investing, and delaying individual or collective gratification.

Performance Orientation. Performance orientation is a focus on excellence in the performance of one's tasks or duties. The more an organization or society encourages and rewards group members for performance improvement and excellence, the more it can be said to have a performance orientation.

Humane Orientation. A humane orientation is a focus on fair, altruistic, friendly, generous, caring, and kind behavior. The more organizations or societies encourage and reward individuals for those traits, the more they can be said to have a humane orientation.

For each of these cultural dimensions, the researchers developed two original scales. One scale measured managers' reports of the extent to which a culture has practices that reflect the underlying dimension, while the other scale measured the extent to which the managers believed that the cultural dimension *should* be emphasized. For example, while the GLOBE countries are reported to have a wide range of power distance practices, they all believe that there should be less of a power distance in their countries than there currently is.

A second major question addressed by the GLOBE researchers concerned how these cultural dimensions related to several dependent variables, including life expectancy, educational attainment of citizens, and variables relating to societal economic prosperity (for example, gross national product per capita), as well as overall measures of citizens' psychological and physical welfare and other, additional variables related to the human condition. For example, power distance and in-group collectivism practices are both negatively correlated with various measures of economic success and national competitiveness. A third major question GLOBE researchers asked was how specific characteristics and actions of leaders are viewed in different cultures. Considerable time was spent generating a working definition of leadership, with the result being that leadership was defined as "the ability of an individual to influence, motivate, and enable others to contribute toward the effectiveness and success of the organizations of which they are members" (House, Javidan, Hanges, et al. 1996, 6).

The researchers identified 112 specific leadership attributes that the two GLOBE pilot studies indicated could be useful for identifying leadership scales that differentiated cultures from one another. Middle managers were asked to rate the extent to which each of those attributes facilitate or impede effective leadership. The first round of factor analysis of their responses resulted in 21 basic leadership scales. The second round of factor analysis of the 21 basic scales resulted in the following six global leadership scales. They are called global because they are generated as a result of factor analysis of responses of all managers in GLOBE countries and

they consist of several leadership items from the questionnaire.

Charismatic, or Value-Based. This scale measures the degree to which leadership has the ability to inspire, motivate, and expect high performance outcomes from others based on firmly held core values. This leadership scale includes six subscales that measure leadership's vision, inspiration, self-sacrifice, integrity, decisiveness, and performance orientation.

Team Oriented. This scale measures the degree to which leadership emphasizes effective team-building and directs team members' energies toward a common purpose or goal. This scale includes five subscales that measure leadership's collaborative team orientation, ability to integrate members of a team, diplomacy, malevolence (a reverse-scored subscale), and administrative competence.

Participative. This scale measures the degree to which leaders involve others in making and implementing decisions. Its two subscales measure how much leadership encourages participation and to what degree leadership is autocratic (a reverse-scored subscale).

Humane. This scale measures the degree to which leadership is not only supportive and considerate but also compassionate and generous. Its two subscales measure modesty and humaneness.

Autonomous. This scale measures leadership's independence and individualism. Its single subscale measures autonomy.

Self-Protective. This scale consists of five subscales from the first round of factor analysis. It reflects the extent to which the leader is worried about himself or herself and the extent to which he or she is self-centered and engages in face-saving behavior to protect personal interests. It also reflects the leader's interest in status consciousness, inducing conflict, and following procedures.

The above six global leadership scales comprise what is called the Culturally Endorsed Implicit Leadership Theory (CLT). GLOBE compares countries and cultural clusters in terms of their CLT scores. Furthermore, from among the 112 leadership items,

GLOBE identified twenty-one specific leader attributes or behaviors (for example, integrity) that are universally viewed as contributing to effective leadership and eight that are universally viewed as impediments (for example, irritability). Finally, thirty-five specific attributes or behaviors were found to contribute to effective leadership in some cultures but to hinder it in others. For example, sensitivity is viewed as a positive leadership attribute in the United States but as a negative attribute in Russia. Some of these items are included in the six global leadership scales and others are not.

THE GLOBE THEORETICAL MODEL

The central proposition of the theory guiding the GLOBE research program is that the attributes and entities that differentiate a specified culture are predictive of that culture's organizational practices and leader attributes and behaviors that are most effective in that culture. The integrated theory also incorporates the following propositions:

- Societal cultural values and practices affect leaders' behaviors.
- Leadership affects organizational form and cultural values and practices.
- Societal cultural values and practices also affect organizational cultural values and practices.
- Organizational cultural values and practices also affect leaders' behavior.
- Societal cultural values and practices and organizational cultural values and practices influence the process by which people come to share implicit theories of leadership. Over time, implicit leadership theories are developed in congruence with both societal and organizational cultural values and practices.
- Strategic organizational contingencies (organizational environment, size, and technology) affect organizational form and cultural values and practices. Organizational cultures are influenced by the requirements imposed by organizational contingencies.
- Strategic organizational contingencies affect leader attributes and behaviors. Leaders are selected to meet the requirements of organizational contingencies.
- Relationships between strategic organizational contingencies and organizational form and cultural values and practices will be moderated by societal cultural forces. For example, in low uncertainty avoidance societies (that is, cultures that have a high tolerance for uncertainty), we expect that forces toward formalization will be weaker, and therefore there will be less societal cultural pressure on the organization to formalize practices.
- Whether or not a leader is accepted depends on how well the leader's attributes and behaviors fit with the culturally endorsed implicit leadership theories. The better the fit, the more accepted the leader will be.
- How effective a leader is depends on how well the leader's attributes and behaviors fit with strategic organizational contingencies. The better the fit, the more effective the leader will be.
- Leaders who are accepted by their followers are more effective than leaders who are not.
- An effective leader will, over time, be increasingly accepted because a leader's demonstration of competence improves followers' attitudes toward the leader, resulting in increased acceptance.
- Societal cultural practices are related to economic competitiveness of nations. We expect societies that are high on power distance (hierarchical societies) and low on uncertainty avoidance (societies that tolerate uncertainty) and performance orientation (societies that tolerate poor performance) will be less competitive internationally, because we assume that these dimensions of culture impede competitive performance.
- Societal cultural practices are related to the physical and psychological well-being of their members. Cultures that are high on power distance and low on humane orientation practices will have members who are dissatisfied with life in general.

Aspects of the GLOBE project's findings have been presented in more than eighty conference papers and more than thirty working papers, journal articles, and book chapters. Mark Chadwin, the director of The Weissman Center for International Business at Baruch College, has called GLOBE "the sin-

gle most important piece of cross-cultural research in a quarter of a century.”

GOLDMAN, EMMA (1869–1940)

U.S. anarchist and feminist

Russian-born Emma Goldman, who immigrated to the United States in 1885, stands as a major figure in American radical and feminist history. As an impassioned advocate and intellectual leader, she used her pen and voice to influence, engage, and inspire others for social change in the early decades of the twentieth century. “Red Emma,” as she was often called at the time, advocated for birth control and women’s sexual emancipation, criticized mandatory conscription into the military during World War I, preached atheism, lectured on drama and the arts, fought for an eight-hour workday, and defended the ideals of anarchism in print and in lecture halls around the country—and around the world. For this she was harassed, imprisoned and ultimately deported.

Perhaps Goldman’s greatest strength as a leader lay in her ability to inspire and influence society’s disenfranchised; her domain was that of the “dissenting groups,” in Howard Gardner’s terminology. While Goldman had limited crossover appeal to society’s more privileged elements, the strength of her indirect leadership through her writing and speaking across the country gave her a reputation as one of the most dangerous women of her time. A visionary propagandist and activist, she promoted ideas aimed at liberating body, spirit, and mind. Her story is one of a woman leader who used her skills, energy, and compassion tirelessly, and in the face of tremendous opposition, to bring forth an alternative vision—and an alternative story—for the “American century.” Emma Goldman used her impassioned writing and

Emma Goldman at age 64 after she was expelled from the United States but allowed to return for a visit of up to ninety days.

speaking to spread a radical vision of a new social order. Her words affected and inspired those who heard her, as well as generations who read her words subsequently. The radical and feminist movements have spawned gifted leaders since her time, but few as influential and notable as Emma Goldman was for her generation and for those to come.

THE EARLY YEARS

Born on 27 July 1869, Emma Goldman lived as a child in a small Russian city of Kovno, now in Lithuania. Her first experiences of injustice can be traced to her family's poverty and the ruthless and omnipresent anti-Semitism of the time. Moreover, her father's violent manner and authoritarian rule prompted Emma's earliest rebellions. At twelve, she moved with her family to St. Petersburg, where she

glimpsed new movements for new social orders—Czar Alexander II was assassinated during Emma's brief stay in the city. She soon left Russia to pursue a "modern" education in Germany, where she developed an appreciation of classical music, drama, opera, and great literature. This early exposure gave her a lifelong appreciation for the role of the arts in elevating the human condition. Although Goldman was to be best known for her writings on behalf of anarchism, she also wrote and lectured extensively on the arts, poetry, and literature. Among the writers she admired were George Bernard Shaw, Ralph Waldo Emerson, Walt Whitman, Anton Chekov, and Henrik Ibsen.

When she returned to Russia several years later, her father sent her to work in a corset factory and began pressuring her into an arranged marriage—whereupon sixteen-year-old Emma and her favorite half-sister, Helena, set sail for the United States in 1885. Like so many immigrants of the time, she looked toward the new land as a place of hope, justice, and freedom. Upon seeing the Statue of Liberty, Emma Goldman was inspired by its symbols of hope and freedom for all. But her high hopes were dashed by the horrific working-class realities of her factory job in Rochester, New York. She also married a Russian immigrant and entered into a brief, unhappy marriage.

THE TURNING POINT

The year 1886 was pivotal in Emma's evolution as an anarchist leader. Labor and radical activists held a rally in Chicago's Haymarket Square to protest the recent police brutality against McCormick Harvester workers striking for an eight-hour workday. A bomb was thrown at the rally, injuring people and killing one police officer. The media and authorities blamed Chicago's anarchist leaders and, amidst the hysteria of the times, condemned seven to death on flimsy evidence. Four were executed on 11 November 1887. Inspired by the stirring defiance of the imprisoned and doomed leaders, the outraged Goldman—still in her teens—became an active anarchist. Six years later, in 1893, the then-governor of Illinois, convinced of the Haymarket defendants' innocence,

pardoned the remaining imprisoned anarchists. Goldman would fight for the rest of her years against the kind of hysteria that had led to the conviction and death of innocent people because of their unpopular political ideas. Indeed, the incident inspired her to a lifelong commitment to freedom of speech and of the press.

With her political development came changes in her personal life as well. Risking the stigma of divorce, she left her husband in Rochester and moved to New York City, joining the anarchist community there. She quickly found a prominent place in the largely male labor and radical movements. Her eloquence and communication skills were soon apparent, and her speaking tours, for which she was known throughout her life, began during this period. She also met and fell in love with Alexander Berkman, a Russian émigré and “chum of a lifetime,” in Goldman’s words; together they vowed to dedicate their lives to anarchism. Although her love for Berkman was profound and public, she also had passionate affairs with other known radical men of the time.

CONTROVERSY FOLLOWS GOLDMAN

In 1892, Carnegie Steel’s manager Henry Clay Frick provoked a bloody confrontation with workers at the company’s Homestead plant in Pennsylvania. Goldman and Berkman plotted to retaliate. When Berkman shot and injured Frick, he was convicted and sentenced to twenty-two years in prison. Although Goldman was involved in the plot, and verbally justified the attempted assassination, there was insufficient evidence to indict her. Berkman spent fourteen years in prison, and Goldman was tireless in her efforts to seek his release. In later years, she denounced political violence.

The imprisonment of her colleague did not stop Goldman from her role as a spokesperson for unpopular ideas. Arrested in 1893 for urging a crowd of unemployed workers to demonstrate rather than rely on the electoral process for relief, she spent ten months in jail. Later, she chained herself to a podium to make it physically impossible for the police to remove her before she finished speaking. When President William McKinley was assassinated by

Leon Czolgosz in 1901, police immediately tried to implicate Goldman because Czolgosz had attended one of her lectures. Although arrested, she was ultimately released, again due to lack of evidence against her.

After a brief withdrawal public life, Goldman re-emerged with a strong presence, writing and editing her free-spirited monthly magazine *Mother Earth* from 1906 to 1917. She wrote and spoke on topics ranging from political theory and her own socialist brand of anarchism to drama and the arts to sexual emancipation. Her words inspired radicals across the country, but enraged and outraged authorities. Anti-radical, anti-immigrant hysteria was reaching a fever pitch.

As the United States moved toward war in late 1916, Goldman and others opposed the government’s military preparations, believing that wars were fought on behalf of the rich at the expense of the poor. *Mother Earth* was Goldman’s forum. However, in a government-sponsored pro-war crusade, *Mother Earth* and other antiwar periodicals were banned. Goldman wasn’t silenced. She pressed on with her antiwar activities and within weeks of America’s entry into World War I, she helped launch the Non-Conscription League to encourage conscientious objectors.

In 1917, Goldman and her comrade Berkman were charged with conspiring against the draft and sentenced to two years in prison. Shortly after her release, she was re-arrested by a then young J. Edgar Hoover, who referred to Goldman as “one of the most dangerous women in America.” On 21 December 1919, Goldman, Berkman and over two hundred other foreign-born radicals were deported and forced to set sail to the Soviet Union.

IN EXILE

Goldman’s remaining years were very difficult. With the exception of a ninety-day lecture tour granted during the Roosevelt administration, Emma Goldman never set foot on U.S. soil again, spending the last twenty-two years of her life in Russia, Sweden, Germany, France, England, and Canada. The years in exile away from family and friends, the estrangement

Emma Goldman on the Right of Free Speech

On 17 October 1893, Emma Goldman was sentenced to one year in prison after being convicted of unlawful assembly. She had planned to give a speech at the hearing, but choose not to do so. The text of the speech was printed in the account of the hearing in the New York World on 17 October 1893. Goldman's original version was lost.

I speak not to defend myself, but to defend my right of free speech, trampled upon by those who have caused the curtailing of my liberty.

I know that the right of free speech was once guaranteed to every man and woman in this land.

What do those who have brought me here understand by the right of free speech? Does it give a right to all to say what appears to the individual good or bad, or has it been granted to permit the expression of only that which to a certain class of the citizens appears right?

Is free speech solely for the purpose and use of the Government and its officers, are individuals prohibited from say[ing] that which is true, even though hardly to the taste of a certain class or portion of the public? Can I only say that in which I do not concur, and must I say it?

I am positive that the men who shed their blood for the independence of this land, and who offered up their lives to secure the liberty and rights of the American people, must have had a very different understanding of the right of free speech than those who to-day represent the Government, and who so interpret the right as to permit the expression only of that which is conducive to their benefit.

According to such an interpretation of the right of free

speech I must call them despots, and as such, without the right to commemorate in celebrations the memory of those who fell in the fight for Independence, for the former deliberately trample under foot the principles of those heroes, and when decorating their graves commit blasphemy.

Why don't the representatives of the State drop the so-called mantle of free speech, discard the mask of falsehood and admit that absolutism reigns here?

Under such a condition of things the American citizen has no shadow of right in pointing the finger of contempt at European institutions and in speaking of the downtrodden hungry of the Old World.

The sorrowful condition of the workingmen of the Old as well as the New World increases from day to day, and it reached a high point in its horizon this very year.

Devoid of all means of sustenance, the workingmen assemble to consult, to devise means to remedy their need. Those who throughout the year utilize the people and gather riches at their cost perhaps feel that it would not go well with them should the workingmen become half conscious of their exigencies, and in their terror the latter seek the aid of government. Innumerable policemen and spies are sent into the meetings of the unemployed, to control all their deliberations, to control the speakers.

Source: *New York World* (1893, October 17), p. 7.

she felt in these countries, and the lack of money and legal rights, weighed heavily on Goldman. While exiled in her native Russia, she was outraged by the authoritarianism and over-bureaucratization of the Bolshevik state, its repression of anarchists, and the limitations it placed on individual freedom. Although she defended the Russian Revolution, she also argued against its excesses, most notably in her books *My Disillusionment in Russia* and *Further Disillusionment in Russia*. Her outspoken criticism of the Soviet state alienated her from many of her European and American radical colleagues. Hoping to secure a place to live with the rights and privileges of British citizenship, she married an elderly Welsh coal miner in the mid-1920s, despite her

principled objections to the institution of marriage. In 1931 she published her two-volume autobiography *Living My Life*, which is still in print and read widely today.

At age sixty-seven, with the promise of an anarchist revolution in Spain, Goldman hurled herself into the Spanish cause. After Franco's triumph in 1939, she moved to Canada where she devoted the last year of her life to securing political asylum for the refugees of the Spanish war. Goldman died in Toronto on 14 May 1940. After her death, the U.S. Immigration Service allowed her body to be readmitted to the United States, where she was buried at Waldheim Cemetery in Chicago near the Haymarket anarchists who had inspired her.

GOLDMAN'S LEGACY

Freedom of speech was a cause Emma Goldman championed throughout her life. As a powerful anarchist orator, she faced constant threats from police and vigilantes. Undeterred, she continued to find the courage of her convictions—but she paid dearly for her outspokenness.

The attempts to suppress Goldman and her unconventional views led many, even those who disagreed with her, to support her right to express her ideas. As a leader for “dissenting” groups, she promoted a broad range of issues and in so doing, influenced those even outside her immediate circle. Emma Goldman was unwavering and fearless; she stood up for unpopular causes and devoted her life’s work to speaking and writing about injustice. Her vision was so profound that it inspired generations of women—and men—decades later. For example, Goldman’s unwavering and fearless commitment to freedom of expression influenced Roger Baldwin, founder of the American Civil Liberties Union, who heard her speak in 1908. Later he told Goldman in a letter, “You always remain one of the chief inspirations of my life, for you aroused in me a sense of what freedom really means” (*The Emma Goldman Papers* 2002, <http://sunsite.berkeley.edu/Goldman/Exhibition/freespeech.html>). Emma Goldman’s advocacy in defense of unpopular ideas (and her right to speak her views in public) helped keep secure the right of freedom of speech in the United States by inspiring others to champion free speech causes throughout the twentieth century.

But perhaps it was on issues of women’s emancipation that Goldman spoke and exemplified the most unconventional opinions of the time. As an activist, she placed the personal sphere on a par with the economy, the state, and war. Goldman wrote about passionate love and reproductive freedom, advocating for birth control, which she believed was essential for women’s freedom. She smuggled contraceptive devices into the United States and lectured frequently on the “right of the child not to be born.” Several times she was arrested and charged with violating the Comstock Law, which prohibited the distribution of birth control lit-

erature. In Goldman’s mind, only anarchism could set women free.

For her impassioned intellectual vision, Emma Goldman is also viewed as an influential leader of the feminist movement in the United States. To her is attributed the quote inscribed on the T-shirts of many 1960s young feminists, “If I can’t dance, I don’t want to be part of your revolution.” In reality, as she wrote in her autobiography after being reproached by a fellow radical who felt her dancing was inappropriate for a political agitator (Goldman 1934, 56), “I insisted that our cause could not expect me to behave as a nun and that the movement should not be turned into a cloister. I want freedom, the right to self-expression, everybody’s right to beautiful, radiant things. Anarchism means that to me.”

—Laurien Alexandre

GOMPERS, SAMUEL (1850–1924)

Leader in the early U.S. labor movement

The founder of the American Federation of Labor (AFL), Samuel Gompers changed the direction of the labor movement by abandoning efforts to organize employees across industries in favor of a craft-based unionism that focused only on skilled, white, male workers. While his policy of “business unionism” helped the labor movement grow, his reluctance to participate in the political process weakened the impact of organized labor in the first decades of the twentieth century.

Samuel Gompers in 1908.

Source: Bettmann/Corbis; used with permission.

BEGINNINGS

Gompers was born in the working-class East End section of London to Dutch Jewish immigrants Solomon and Sarah Rood Gompers. The family's economic situation meant that as the oldest son Sam could only attend school for four years before being forced to enter the world of work. At the age of ten, he apprenticed as a shoemaker, but soon switched to his father's profession of cigarmaker. Unfortunately, the poor economic climate of the early 1860s led to little demand for luxury products like cigars. The Gompers family continued to struggle and, hopeful of better opportunities, immigrated to New York City on 29 July 1863 with financial aid from Solomon's union, the Cigarmakers' Society.

Gompers initially worked alongside his father rolling cigars in their tenement apartment on New

York's Lower East Side. While others were working in factories, the Gompers were able to work out of their home because Solomon's skill at cigarmaking enabled them to produce cigars without the aid of a mold. By 1865 he had found work in a factory as a skilled cigar roller and he would remain in a succession of shops into the early 1880s. If Gompers had worked in a noisy factory, it is likely that he never would have had the chance to develop his own theories of labor. However, cigar rollers typically took advantage of their quiet work environment by hiring one of their fellows to read aloud the literature and periodicals of the day and by compensating him in cigars. In this manner, Gompers acquired an introduction to current political issues, the conditions of labor worldwide, and the work of such political economists as Karl Marx, Ferdinand Lassalle, Edward Kellogg, and Ira Steward.

LABOR ACTIVISM

The cigar trade changed dramatically in the years after the American Civil War, reflecting the technological advances that would transform the relationship of labor to management. The cigar mold, introduced in 1869, reduced the amount of skill needed to produce cigars and permitted New York manufacturers to switch most production from factories to tenements. The workers typically leased apartments from the manufacturers, purchased supplies to carry home, rolled the cigars in the tenements, and then resold them for credit at the company store. Entire families had to work long hours every day to make ends meet. The Cigarmakers International Union (CMIU), dominated by members in Chicago and Detroit who did not work under the tenement system prevalent in New York, refused to permit the organization of the unskilled cigar makers. As a result, Gompers's local union chapter dropped from hundreds of members to fewer than fifty by 1872.

Determined to maintain a New York union for cigar makers, Gompers continued his CMIU membership but also created a new union, the United Cigarmakers. By forming a new union in a trade where an old one still existed, Gompers violated one of the long-held tenets of trade unionism. He justified his

actions by stressing the importance of the issue, a defense that Gompers would trot out often in subsequent years to excuse questionable actions.

With the United Cigarmakers, Gompers focused on developing a strategy and an organization. He recruited full-time workers while pushing for increased pay and better working conditions. By 1875, Gompers headed the largest cigarmakers local in the United States with 245 members. In that same year, the CMIU agreed to admit all workers and Gompers' upstart chapter joined the national organization as Local 144.

The triumphant Gompers became an official CMIU organizer in 1875. A pragmatic and tenacious man with a stentorian voice that could easily be heard from some distance, he overcame a speech impediment to become a skilful and frequent public speaker. In shops and tenements, he spoke to laborer after laborer. To reach the many immigrant workers in New York, he wrote union pamphlets in English and German that were then translated into Bohemian. All the while, Gompers continued to work a ten-hour day as a cigar maker because he received no pay for his union activities.

Gompers's success with the union made him into a target and, in 1878, employers placed him on a do-not-employ blacklist. After some months, Gompers managed to find work with a renegade factory owner. He remained undeterred by the blacklisting. He regarded every defeat as temporary and took strength from every victory, no matter how small.

THE KNIGHTS OF LABOR

As he advanced in the union ranks, Gompers organized workers in an effort to avoid repeating past mistakes. While he noted that the strikes between 1869 and 1872 against the introduction of machinery failed as did strikes for an eight-hour day and better pay, Gompers focused much of his attention on the Knights of Labor. The first mass organization of the working class, the Knights counted Gompers among their membership thereby allowing the man to observe their rise and fall from an inside position.

The AFL that Gompers subsequently formed had a narrow focus because the failed Knights had a wide

focus. The Knights permitted non-working-class elements to belong to the labor union. This meant that some workers were in the same union as their bosses. As a result, these laborers were frequently deterred from seeking better pay, hours, and conditions for fear of antagonizing their employers and losing their source of income.

The Knights also did not focus solely on getting benefits for their members. The union divided its energies between a range of causes—including temperance—that were only tangentially related to labor. Additionally, the Knights barred only a handful of occupations from membership qualification, thereby allowing intellectuals and reformers of all stripes to join the Knights to push for their vision of America. In Gompers's view, these radicals did not understand that to experiment with the labor movement was to experiment with human lives. He believed that violence and extremism on the part of union members did nothing except galvanize opposition and set back the cause of labor.

BUSINESS UNIONISM

Gompers argued that labor needed to shake off parasites, the political agitators who wanted to antagonize the establishment as a way of pushing society toward a utopian revolution. Accordingly, he booted the socialist faction from his New York Local 144 in 1881, thereby splitting the chapter but strengthening it in the long run by narrowing its focus to job-related issues such as pay and hours. If an idea offered the promise of additional members or victory in a confrontation with business, then Gompers would support it, but he would not embrace notions that had no prospect of immediate gains for labor. He had no desire to restructure society and tried to keep the AFL from getting tied to politics.

Drawing elements from both American and European labor thought, Gompers devised a new type of strategy that would become a crucial element in the rise of trade unionism. Business- or job-conscious unionism addressed only pay, hours, and benefits. To be a success at business unionism, an organization needed to have certain elements in place: the equalization of funds among locals according to the num-

Emma Goldman on Samuel Gompers

Several months after the death of Samuel Gompers in 1924, Emma Goldman published the following article assessing his leadership skills in The Road to Freedom, an anarchist journal.

The numerous tributes paid to the late President of the American Federation of Labor, emphasized his great leadership. "Gompers was a leader of men," they said. One would have expected that the disaster brought upon the world by leadership would have proven that to be a leader of men is far from a virtue. Rather is it a vice for which those who are being led are usually made to pay very heavily.

The last fifteen years are replete with examples of what the leaders of men have done to the peoples of the world. The Lenins, Clemenceaus, the Lloyd Georges and Wilson, have all posed as great leaders. Yet they have brought misery, destruction and death. They have led the masses away from the promised goal.

Pious Communists will no doubt consider it heresy to speak of Lenin in the same breath with the other statesmen, diplomats and generals who have led the people to slaughter and half of the world to ruin. To be sure, Lenin was the greatest of them all. He at least had a new vision, he had daring, he faced fire and death, which is more than can be said for the others. Yet it remains a tragic fact that even Lenin brought havoc to Russia. It was his leadership which emasculated the Russian revolution and stifled the aspirations of the Russian people.

Gompers was far from being a Lenin, but in his small way his leadership has done a great harm to the American workers. One has but to examine into the nature of the

American Federation of Labor, over which Mr. Gompers lorded for so many years, to see the evil results of leadership. It cannot be denied that the late President raised the organization to some power and material improvement, but at the same time, he prevented the growth and development of the membership towards a higher aim or purpose. In all these years of its existence the A. F. of L. has not gone beyond its craft interests. Neither has it grasped the social abyss which separates labor from its masters, an abyss which can never be bridged by the struggle for mere immediate material gains. That does not mean, however, that I am opposed to the fight labor is waging for a higher standard of living and saner conditions of work. But I do mean to stress that without an ultimate goal of complete industrial and social emancipation, labor will achieve only as much as is in keeping with the interests of the privileged class, hence remain dependent always upon that class.

Samuel Gompers was no fool, he knew the causes underlying the social struggle, yet he set his face sternly against them. He was content to create an aristocracy of labor, a trade union trust, as it were, indifferent to the needs of the rest of the workers outside of the organization. Above all, Gompers would have none of a liberating social idea. The result is that after forty years of Gompers' leadership the A. F. of L. has really remained stationary, without feeling for, or understanding of the changing factors surrounding it.

ber of members; a payment fund for strikers; and sickness, death, and traveling benefits for members. The funds for these programs came from high dues. Gompers believed that high dues attracted members because the men could see that small premiums bought comprehensive insurance and that employers were less likely to challenge a strong union with a big strike fund at its disposal.

Local 144 gradually accepted all the aspects of Gompers's business unionism. As a result, the membership in the union jumped dramatically in just a few months. By 1881, Gompers had also persuaded the national union to accept business unionism. As a leading light within the union, he served as the represen-

tative of the cigarmakers at the 1881 National Labor Congress that led to the founding of the Federation of Organized Trades and Labor Unions (FOTLU).

THE AMERICAN FEDERATION OF LABOR

When a general strike in 1886 against the railroads failed to achieve an eight-hour day, many of the Knights lost faith and changed their allegiance to the AFL. This new union, founded by Gompers and a few others in Columbus, Ohio, in 1886, was an amalgamation of FOTLU and several national unions that had abandoned the Knights. The AFL aimed to be more effective than the old federation by

operating on the principle of controlling job opportunities and job conditions in each craft. It was organized into units of workers who performed the same job and, in the absence of collective action, would have competed against each other to their economic detriment.

The AFL was designed to work for the organization of all workers, skilled and unskilled, male and female, white and African-American. In practice, prejudice reigned and the union never welcomed anyone but skilled, white, male workers. Gompers, displaying an attitude common to men of his class, categorized untrained workers as lacking the intelligence, courage, and vision to be union members and declared that factory employment degraded women. Gompers served as the first president of the union and would be reelected annually (except 1894–1895) until his death in 1924.

The expiration of the Knights made the AFL into the only powerful mass organization of workers in the waning years of the nineteenth century. The union protected its members from termination without just cause, mandatory unpaid overtime, and hazardous working conditions. In its first year of existence, the union had 140,000 members. The roll rose to 264,000 by 1897, to 578,000 in 1900, and to a peak of 1.7 million in 1904. Gompers believed that these numbers gave confidence to the members as well as reassuring outsiders of the respectability of the movement.

To win gains for his members, Gompers depended upon strict discipline by the unionists and the greed of employers. He concentrated his attacks on shops and factories with the lowest paid workers. Such businesses had the most difficulty attracting strike-breakers and provided the stiffest challenge to better-paying competitors who then had little incentive to offer assistance. To prevent indiscriminate wildcat strikes, every strike proposal had to be approved by secret ballot with the shop organization and receive local union approval. This approval would permit the dispersal of funds to strikers. If a wildcat strike occurred, Gompers would punish the rebel unionists by supplying the employer with loyal unionist workers to break the strike.

As this approach indicates, Gompers did not see

strikes as a first resort. He argued that if an employer's action, such as a pay cut, could not be successfully challenged, then a strike or other job action should not be attempted. Any loss would weaken the strength of the trade union movement by dispiriting workers and encouraging employers.

Gompers consistently focused on enrolling members to work for better pay, shorter hours, and better conditions. By the turn of the century, he believed that a worker could achieve all of his social, political, and economic ambitions by winning this trifecta. Distrustful of politicians and suspicious of anything that drew power away from the trade unions, he opposed such legal measures as making employers responsible for worker safety, unemployment compensation, old age pensions, or compulsory health insurance. This refusal to participate in politics resulted in workplace victories that were only temporary and only for AFL members.

CONTRIBUTION

Gompers set the pattern for the labor movement of the late nineteenth and early twentieth centuries. He accepted industrialization as a fact of life and simply wanted to gain a larger share of the benefits from that system for the AFL's membership. His focus on economic matters and exclusion of political concerns allowed the AFL to flourish but not to make any long-lasting gains. The majority of workers, the less-skilled men and women who did not belong to the AFL, did not benefit at all from Gompers's leadership.

 **GRAHAM, BILLY** (b. 1918)
U.S. evangelical leader

Evangelist Billy Graham has spoken personally to more people—roughly 210 million—than any other individual. He has had relationships with every U.S. president since Truman. Graham has received nearly every major national and international award except for the Nobel Peace Prize. Since the 1950s he has been ranked amongst the top in popular admiration and achievement polls, and in one ranked second to God for achievement in religion. Graham's leadership is something that Graham has not promoted or acknowledged himself, but something that others have recognized. Along with a strong sense of humility, Graham has exhibited a simplicity that communicates real integrity. His life and ministry have coincided with substantial cultural changes: the globalization of war, the advent and growth of mass media, and social turmoil. He was initially promoted through newsprint and has continued on through the growth of Madison Avenue advertising and Nielsen ratings. Graham's response to these changes created an organization that has influenced Christians and their practice of religion around the world.

FORMATIVE INFLUENCES

Billy Graham was born 7 November 1918 as William Franklin Graham, Jr., or "Billy Frank" to distinguish him from his father. Frank and Morrow Graham were conservative Presbyterians who practiced a private faith; however, during Billy's childhood they experienced changes in their faith and the Graham home became one in which the Bible was central and it was applied to all aspects of life. Though the parental home was not stifling, Billy's childhood was a disciplined one and his parents did not shrink from punishing social or personal infractions. Though they adopted a more pietistic faith, the elder Grahams didn't forsake their Presbyterian roots. Billy and his three younger siblings were encouraged to memorize Scripture and to participate in family devotions. By age ten, the children memo-

rized all 107 questions and answers in the *Westminster Shorter Catechism*.

Throughout his childhood, Graham passed through expected religious milestones like church membership, but he didn't allow this to keep him from his own amusements. This eventually led his father to become concerned about Billy's soul. When fundamentalist evangelist Mordecai Ham began a revival in Charlotte, North Carolina, Billy was urged to attend and was brought to Ham's attention as one needing his preaching. After many weeks of attendance and, at times, avoidance, Billy responded to the evangelist's call and recommitted his life to Jesus.

Presbyterians, like the Grahams, believe in an educated clergy. Billy's parents had hopes of his entering the ministry, but Billy worked hard on the family dairy farm, rising early to milk cows before school and returning to that task afterwards, and his grades did not reflect his intellect or aptitude. It didn't help that Billy didn't see the purpose in "science or algebra or all that" (Frady 1979, 61). As a boy, Graham enjoyed reading the Tarzan series for the excitement and adventure; as he grew older the lure of a larger world entered his mind and he began to devour history books and biographies, absorbing tales of the human experience and condition. Before he completed high school he had read Gibbon's *Decline and Fall of the Roman Empire*, which influenced his view of humanity and culture.

After graduation, Billy was off to college. Bob Jones, Sr., had spoken at Billy's high school and his parents were impressed with the biblical focus of his school and had hopes that Billy could receive the necessary training for ministry. After enrolling in Bob Jones College, Graham found nearly every area of his life regulated and the teaching dogmatic and not open to question or dialogue—he did not like being told what to think. Graham left the college—labeled a failure by Jones—and enrolled in the Florida Bible Institute. Here Graham felt the call to preach and practiced it every chance he got. After completing the program, Graham enrolled at Wheaton (Illinois) College. Much to his frustration he received little credit for the work completed in Florida and started in as a second-semester fresh-

man. Despite this setback Graham found Wheaton a spiritual and intellectual turning point.

Graham's youth and education were well entrenched in conservative Protestantism with its emphasis on the Bible, personal religious experience, and a strict moral code. His religious experiences were a product of the revivalism rooted in the tradition of the great nineteenth-century American evangelist Dwight L. Moody and later Billy Sunday. Graham is regularly compared to Moody and Sunday, but he owes his organizational success to the strategies utilized by Moody nearly a century before.

Early in his ministry, Graham was in mainstream fundamentalism following the practices of its evangelists and preachers. His message, delivery, and fund-raising strayed little from its norm. However, after graduation from college while working with Youth for Christ, Graham's travels brought him into contact with a broader sphere of the Protestant community as the line between fundamentalist and evangelical began to blur. Graham continued to erase these lines as his ministry grew, eventually creating an ecumenism that became a flashpoint for his conservative supporters and detractors. Another flashpoint was Graham's support of the *Living Bible*, a paraphrase written in contemporary English. Graham sought to be more inclusive than the fundamentalists, stating, "Fundamentalism has failed miserably with the big stick; now it is time to take the big love approach" (Aikman 1998, 37). Mordecai Ham later noted with remorse that he wished he could restart his ministry and "love people" as Graham had.

Graham's shift in ministry philosophy was evident in his preaching and became a point for contention. Some scholars found his message to be anemic and fostering a civil religion that coupled America with the Christian gospel or left out important doctrines; others complained that his preaching was anachronistic and was simply a refined "old-time religion" that was bland, exploitive, and literal. But, Graham's sense of calling to preach is deep-rooted to the point that it became a burden, even causing him to feel alone during his preaching. Graham feels driven to preach "the *whole* thing *every* night" (Frady 1979, 317) (emphasis his), but over the years he has worked hard at creating a simple style

that integrates headlines and contemporary illustrations. Incorporating the "big love approach," his message emphasizes the pervasiveness of sin versus a particular individual's sins, stressing a broader condition that results in actions—the ultimate versus the specific—and illustrating the adage "hate the sin but love the sinner."

Graham's broad message enabled him to reach across religious boundaries that have divided people for centuries. Casting aside any religious bias without losing his own distinctives, Graham attracted a Catholic following and eventually received support from noted Catholic clergy—causing one writer to say that Graham had done more to heal the wounds of the Reformation schism than anyone in five hundred years.

LEADERSHIP STYLE

Graham's ministry expanded, in part, because of his singular vision. This vision, or calling, was the sole driving force, so much so that diversions into a pastorate and a college presidency were short-lived. His work, and failures, as a pastor and an educator reinforced his sense of calling as an evangelist. Graham transferred this vision to others as he led a multimillion-dollar organization that included *The Hour of Decision*, a weekly radio program broadcast on over nine hundred stations, and the monthly magazine *Decision*, reaching 5 million subscribers, supported by a staff of hundreds.

Despite all outward success, Graham maintains a sense of humility. Graham consistently deflects any praise of his efforts to his staff, which he calls the "team." Graham has stated that he is no great intellectual and that there are "thousands of preachers" (Paul 1978, 4) better than him; he always credits God for his successes. For Graham, success is a matter of perspective: "perhaps the scrubwoman or . . . factory worker . . . serving God in their own way as best they know how may be far more successful than I am" (Frost 1997, 150). Though to some this may seem disingenuous, these remarks display the consistent comments of Graham decade after decade. This consistency is in part due to Graham's acknowledgment of pride's lure—pride is the temptation he struggles

with most. His comments are an ever-present effort to combat this temptation.

Though attached to a massive organizational infrastructure that has been described as a mix of IBM, Sears and Roebuck, Blue Cross, and vacation Bible school, Billy's name has been central throughout its history and Graham's work wouldn't happen without his team. For decades, his core team has consisted of the same handful of men, with his larger team including over two hundred associates. One writer noted his organization didn't exhibit the usual "toadyism" found in some corporations, and "pity the man who tells Billy Graham what he thinks Graham wants to hear" (Strober 1976, 89). Graham's team leadership is also exhibited in the organization and execution of his evangelistic crusades. Graham and his staff work at creating coalitions and building networks at the grassroots level, resulting in his receiving support from nearly 80 percent of the churches in crusade cities.

Along with a team approach, a significant component of Graham's leadership style is his liberality. An outsider looking in may state that Graham's conservative message of salvation in Christ alone is less than liberal, but Graham has worked effectively at broadening his message and his appeal. In college Graham chose anthropology as his major, recognizing that this would help him "obliterate any condescending notions [he] might have toward people from backgrounds other than [his] own" (Graham 1997, 65). His ecumenism has sought to bring people in rather than keep people out and his "big love approach" has sought to affirm rather than denounce. In an age of de jure segregation in the South, Graham threatened to close meetings that weren't integrated.

Graham's ministry has not been without its detractors. Despite numerous attempts to malign his intentions, few have been able to cast even a doubt of suspicion in Graham's direction. Early in his ministry, Graham and his team developed a set of guidelines, informally called the Modesto Manifesto, to provide accountability to their work. Graham recognized that he could be attacked in three areas: finances, morals, and pride—described more crassly as the "three G's: gold, girls, and glory" (Aikman 1998, 30). This manifesto called for open financial

statements, accurate gathering of statistics, and over-protective procedures to avoid accusations of sexual impropriety. Graham's biggest divergence from his fundamentalist past was to cease the practice of "love offerings" (large offerings taken at the end of revivals) and place himself and his team on a modest salary. He resolved to never answer mud-slinging and rarely made efforts to correct misleading or erroneous newspaper reports. All this resulted in the statement by hotel-chain mogul J. Willard Marriott that Graham was "the leading religious man of our time—and he is noncontroversial" (Paul 1978, 3). This is not to say that Graham has been able to abate all controversy, but that he has been willing to adapt when criticism warranted.

In recent years, as research materials emerge from unreleased presidential files and as Graham has transitioned his ministry responsibilities to his son, Franklin Graham, opportunities for criticism have increased. In 1994, with the publication of Nixon chief of staff H. R. Haldeman's diaries, Haldeman charged that Graham had made anti-Semitic comments in his hearing. Because of Graham's long-standing relationship with Jewish leaders and because he was a recipient of the Torch of Liberty plaque awarded by the Anti-Defamation League of B'nai B'rith, the charges were seen as unfounded and untrue. Graham denied ever saying anything anti-Semitic, and said the words cited were not his. However, in early 2002, a thirty-year-old White House recording of a private conversation Graham had with President Richard Nixon and Haldeman was released. The recording documented Graham's agreement with Nixon's private statements that left-wing Jews dominated the media, particularly the news media, and that "they're the ones putting out the pornographic stuff." Graham continued to say that if the Jewish "stranglehold" was not eliminated, the country would go "down the drain." He further asked what the Nixon administration could do to reduce it. When this was made public Graham apologized for his comments and stated that he had not recalled saying them. Generally, his apology was accepted.

The religious division that Graham's anti-Semitic statements created has been augmented by his son, Franklin's undeterred promotion of the Christian

gospel and experiences as a leader of two Christian organizations, one an international aid organization, have demonstrated that he is quite different from his father. The younger Graham is less ecumenical than his father, who generally sought to build bridges across religious diversity. After the tragedies of 11 September 2001, Franklin did not shy away from pointing out the differences between Christianity and Islam and highlighting statements in the Qur'an encouraging violence against unbelievers. This brought charges of intolerance. Franklin has demonstrated that he is less uncomfortable with division and discord than his father may have been—preferring to highlight differences rather than ignore or minimize them.

IMPACT

Billy Graham's work and ministry have taken him around the world and given him access to heads of state across the globe. He has met with presidents, kings, queens, generals, and cultural icons. Former Texas Governor John Connally once said of Graham, "he is more than a preacher, more than an evangelist, more than a Christian leader. In a greater sense he has become our conscience," calling him one of the few remaining authoritative personalities (Strober 1976, 42–43). Graham has received numerous honorary doctorates and in 1996 he and his wife Ruth were awarded a Congressional gold medal.

Beyond his over 200 crusades worldwide in over 185 countries, Graham has been a Christian statesman. His efforts at supporting the Christian church globally has resulted in numerous international conferences on evangelism aimed at educating and training the next generation of evangelists. His example has served to change the nature of Protestant evangelism forever. "The test of Graham's soul, indeed, lay not in adversity, but in how he coped with success" (Aikman 1998, 58). Graham with his team has weathered a half-century of ministry with a singleness of heart and vision, never being overcome by the "corrosive effects of hostility of those who refuse to listen" (Gillenson 1967, 23).

GRAHAM, MARTHA (1894–1991)

U.S. dancer and choreographer

Martha Graham was instrumental in founding modern dance in America, and her artistic work ranks as one of the great cultural achievements of the twentieth century. The modern dance movement was part of the avant-garde direction of the arts in the early twentieth century that broke away from traditional, classical forms and stressed the invention of new artistic means of expression. Modern dance aban-

doned the stylization inherent in ballet for freer, more expressive movement of the body. More than any other dancer, Martha Graham captured the spirit of modern dance by uniting her unique technique with her portrayal of emotional power. Her struggle against great odds to create and sustain this new form of dance could only have been possible with strong determination and leadership.

FORMATION OF A DANCER

Martha Graham was born in Allegheny, Pennsylvania (near Pittsburgh) on 11 May 1894. She was the eldest child of George Graham, a physician who was an early specialist in mental health, and Jane (Jenny) Beers. In 1908, she moved with her parents and two younger sisters, Mary and Georgia (Geordie), to Santa Barbara, California. Although her father wanted her to return east for college, she instead attended the Cumnock School, a junior college in Los Angeles, where she studied aspects of the performing arts. Graham had seen a dance concert by Ruth St. Denis, an early modern dance pioneer, and at age twenty-two began to study at the new Denishawn dance school in Los Angeles. She danced and taught with the Denishawn company until 1923, and was known for exotic roles inspired by cultures of Asia and the native Americas—such as the Aztec maiden she portrayed in *Xochitl* (1921).

Her dissatisfaction with the lack of opportunity for artistic development in the Denishawn company led to her departure in 1923 to perform with the *Greenwich Village Follies*, a New York City vaudeville revue. She began to teach dance at several places including the Eastman School of Music in Rochester, New York, and the Neighborhood Playhouse in New York City. She displayed a steadfastness of purpose in her pursuit of a dancing career, and an independent spirit in seeking her own unique path of artistic expression.

CREATING MODERN AMERICAN DANCE

By 1926, Graham began presenting recital performances in New York. She was joined by a small group of women, some of whom were drawn from her dance

classes. These women—“the Group”—became the nucleus of the Martha Graham School of Contemporary Dance. The Depression years of the 1930s were difficult times, especially for a woman advancing a revolutionary new form of dance. Although Martha Graham and her dancers worked long hours in difficult conditions, her belief in her vision was so powerful and compelling that the Group followed her lead almost like religious devotees.

Through teaching and preparation for performances with her all-female dance corps, Martha Graham evolved her new dance technique. In classical ballet the focus of movement is on the arms and legs, but in the Graham technique known as “contract and release,” movement arises from the pelvic area and expands outward, following the exhalation and inhalation of the breath. The Graham technique also claims contact with the floor as an essential element. Graham, who designed and made all of her costumes, accentuated this organic movement with simple garments that stretched and moved with the body. Her dances focused with intensity on the body as a vehicle for expression as it moved through space. Initially, audiences had difficulty understanding this new approach to dance, but gradually its emotive power, elevated by Graham’s sure instinct for spare choreographic design, won acclaim. Her maturing artistic expression was evident in the solo *Lamentation* (1930)—in which the seated dancer’s movement expressed a poignant sense of grief, further articulated through a simple tubular costume of Graham’s own design—and in *Primitive Mysteries* (1931), an ensemble work depicting the spiritual transformation of a virgin.

THE MATURE DANCER AND HER COMPANY

During the 1940s and 1950s, Graham reached the heights of her creative genius. Men became part of her dance company, and their inclusion, along with her wide-ranging literary and intellectual interests, enabled her to explore a wide range of human emotions. She continued a working relationship with the artist Isamu Noguchi, who designed many of her sets, and she choreographed to music by contemporary composers. Her most renowned dance,

Appalachian Spring (1944), with Noguchi's scenic design and music by Aaron Copland, celebrated the freedom and spirit of pioneer life. By the 1950s she turned to the darker side of human character drawing material from Greek myths. This exploration culminated in *Clytemnestra* (1958), a psychological portrayal of the unfaithful Greek queen embroiled in murder and revenge.

As Graham's fame and artistic reputation grew, the demands of maintaining her dance school and performing company multiplied. The intensity of her vision along with her mounting achievements attracted patrons such as Bethsabée de Rothschild, and her dancers remained fiercely loyal to the integrity of her dances. However, Graham's desire for complete artistic control made it difficult for her to delegate authority and sometimes clouded her judgment of character. Fortunately, during this period, as earlier with her reliance on the artistic advice of Louis Horst, people such as her de facto manager Craig Barton handled these increasingly complicated affairs with skill and tact.

By the 1960s, Graham was wrestling with a dancer's body now crippled by arthritis. Her last dance performance was in 1968 in *A Time of Snow*, a portrayal of the medieval monk Abelard and nun Heloise in their old age. For several years in the early 1970s, she struggled with serious illness and alcoholism. When she regained her strength, a new friend and manager, Ron Protas, aided her. From the mid-1970s until her death at age ninety-six on 1 April 1991, she reshaped the Martha Graham Dance Company and continued as choreographer to create works as original as her earlier dances. *Maple Leaf Rag* (1990), a humorous satire on herself and her dance, set to the music of Scott Joplin, was her last work. Again, her personal strength, determination, and the force of her creative spirit were decisive elements in forging the last phase of her career and maintaining her position as a leader of the modern dance movement.

THE MARTHA GRAHAM LEGACY

As long as Martha Graham was living, she used her personal drive to provide the impetus to keep her the-

Three members of the Graham Company perform in 1945.

atrical creations alive. However, just as she had explored through her dances both the light and dark sides of human character, her strongest leadership asset became a liability in preserving her creative legacy for the future. She was ambivalent about making systematic provisions to record or preserve documents about her life and work and to maintain her dance school and company after her death. The U.S. Library of Congress has acquired some of Graham's archives, but much of her work remains entangled in litigation. The legal issue concerns whether the rights to her choreography, which Graham never took steps to protect by copyright, belong to her sole heir, Ron Protas, or to the Martha Graham Center of Contemporary Dance. Court rulings have designated ten of her works, including *Appalachian Spring*, to be in the public domain, and they have awarded property rights of the dances to the two organizations that bear her name, thus enabling the Martha Graham Dance Company to perform her dances. A new generation

will have to take the initiative to preserve the remarkable achievement of Martha Graham, whose legacy of over 180 dances attests to her pioneering leadership in modern dance.

—Karen Gould

GRANT, ULYSSES S. (1822–1885)

U.S. general and president of the United States

Ulysses S. Grant was born Hiram Ulysses Grant in Point Pleasant, Ohio, on 27 April 1822, into a relatively prosperous frontier family. His father forced his reluctant son to attend the United States Military Academy at West Point, where his name was changed due to an administrative error. He graduated from West Point in the middle of his class and was commissioned into the infantry. He served as an able regimental quartermaster during the war with Mexico (1846–1848), and, despite his position as an organizer of supplies, he saw enough of the conflict to distinguish himself on the battlefield. For more than a decade after this, however, Grant's life sug-

gested that he had no particular propensity for leadership. He grew tired of the tedious life of a peacetime soldier at remote outposts in Oregon and California and resigned in 1854, his reputation tainted by allegations of drunkenness. As a civilian he failed at a number of enterprises, including farming and selling wood in St. Louis, and he barely made enough money to support his young family. In his thirty-ninth year, when the Civil War broke out between the Northern Union states and the Southern Confederacy, he was working as a clerk in his father's leather goods store in Galena, Illinois.

THE CIVIL WAR

In the early stages of the war, Grant helped recruit Union soldiers and muster regiments in Illinois but found difficulty securing a commission for himself. Once given a command in the western theater, however, Grant's rise was meteoric. In both word and deed, he displayed a determination to end the war as soon as possible. He harried his superiors with requests to advance upon the enemy, and he willingly took advantage of any reasonable opportunities to advance against or harm his opponents.

He first came to prominence after the capture of Fort Donelson in February 1862. The surrender of 14,000 Confederate troops provided the Union with its first major victory of the war and brought Grant to the attention of the nation. He suffered a setback in April when attacked at the Battle of Shiloh, but his rallying of retreating troops and stabilizing of officers and men under fire helped stave off the attack until reinforcements arrived the next day and drove the enemy back. Nonetheless, it is Grant's capture of the important Confederate town of Vicksburg in July 1863 that is often regarded as his finest hour. He risked cutting his army off from its supply base and being trapped between two armies to approach his target, but then he defeated one army and forced the other back into Vicksburg, leading to its surrender. This success, combined with his victory at Chattanooga in November 1863, led to Grant's being promoted to the rank of lieutenant general, with the title of general in chief, and put in charge of all the Union armies the following spring. This pitted him against

Robert E. Lee's feared Confederate Army of Northern Virginia in the eastern theater. Unlike his predecessors Grant would not allow his distinguished opponent to get the upper hand. He launched a campaign of simultaneous advances on several fronts, insisting there would be no turning back. Continual pressure forced Lee to retreat south. After a long siege, Lee met Grant at Appomattox Court House to surrender on 9 April 1865.

PRESIDENCY AND FINAL YEARS

With the Republican Party looking for a new candidate to replace Lincoln's successor, the embattled Andrew Johnson, Grant ran successfully for president himself in 1868 and was reelected in 1872. His administration is frequently rated among the lowest of American executives due to corruption, although none of it was ever linked directly to Grant himself. After leaving the White House, he traveled the world with his family, meeting monarchs and statesmen, and also being cheered by vast crowds of less-privileged admirers. It was estimated that 80,000 people crowded to see him in Newcastle, England, alone. Returning home in late 1879, Grant failed in an attempt to secure the nomination for a third term. He was later swindled by a brokerage firm and left bankrupt, and wrote his memoirs to recoup his wealth. He died of throat cancer on 23 July 1885, shortly after completing them.

GRANT AS LEADER

Grant was transformed from an unknown clerk in a small Illinois town, to the most important general in the country, and finally to the president in less than eight years. His career has sometimes been seen as a distinctly American triumph, in that a middle-aged man of modest accomplishments was able to rise from obscurity to lead his country during the most difficult period in its history. Grant's rise to leadership was due more to his own successes than to an

Statue of President Ulysses S. Grant on horseback at the Mall in Washington, D.C.

accident of birth. Considering that it was America's democratic structure that allowed for his ascent, it is fitting, as John Keegan has written, that Grant was himself the ideal democratic leader. He considered himself no better than the men he led, and unlike many of his fellow generals, he recognized the importance of civilian authority over the military. With Grant, there was none of the insubordination and political ambition of George B. McClellan, and he did not rage against the vitriol of the popular (and often partisan) press like his friend William T. Sherman. Joseph Hooker had suggested that a military dictatorship would bring the war to a close, but such ideas were anathema to Grant. A year into the war, he wrote of his beliefs: "I am sure that I have but one desire in this war, and that is to put down the rebellion. . . . If Congress pass any law and the President approves I am willing to execute it. . . . I do not believe even in the discussion of the propriety of laws and official orders by the army. One enemy at a time is enough and when he is subdued it will be time enough to settle personal differences" (Simon 1973, Vol. 5, 264).

He rebuffed talks of being a presidential candidate in 1864 and understood the importance of public opinion in winning the war. Grant certainly did not look like a great leader. He was unremarkable in appearance, was not a man for military pageantry,

and lacked the dash or charisma of some of his contemporaries. He believed he had been controlled by events rather than the other way around and began his celebrated memoirs with the words, “‘Man proposes and God disposes.’ There are but few important events in the affairs of men brought about by their own choice” (Grant 1982, vii). Still, he played a vital part in the Union victory. Grant combined the modesty required to serve his civilian commander in chief with the confidence and ability to fight and defeat the enemy. As Philip Sheridan, one of his cavalry commanders, said (quoted in Smith 2001, 15), “He was the steadfast center about and on which everything else turned.”

GREEN PARTIES

Green Parties are political organizations that focus on a wide range of social, economic, and environmental issues in their party platforms. They have grown from a tiny fringe movement into a significant voting block in many parts of the world, though

almost entirely in developed countries. Greens have had the greatest political influence in Germany—although they have suffered dramatic setbacks in the course of reaching a fairly well-established place in the political sphere—largely thanks to the popularity and political acumen of a single person, Joschka Fischer.

In the United States, the Greens remain a fringe party, but they have been able to carve out the possibility of becoming a significant, long-term third party, which would be an achievement in a country dominated by two parties for over a century. They achieved considerable prominence—and notoriety—during the 2000 United States presidential elections due to the candidacy of the well-known consumer rights advocate Ralph Nader. Their critics are as likely to be liberal as conservative, because Greens generally take votes from Democratic candidates and are stridently dismissive of mainstream Democrats. These liberal critics claim that the Greens cost Al Gore the 2000 presidential election by taking crucial votes. The Green Party strongly denies this, insisting that Nader drew voters from across the political spectrum. In any case, the Greens attracted far more media attention in 2000 than ever before because they put forward a nationally known person as the party’s presidential candidate.

Leadership has often been a contentious issue for Greens, and some of the major fractures within the Green Party movement, in the United Kingdom, in Germany, and in the United States, have been connected with widely different views about leadership, the role of prominent individuals, and the structure of the party’s public presence and its spokespeople. The Greens’ belief in grassroots democracy and gender equality has led to the development of internal systems and rules, in Green Parties around the world, to minimize the prominence of individuals.

Some Greens have been explicitly opposed to political involvement, on the basis that the existing political system is corrupt and irreformable. In the United States, the Green movement split over this issue, leaving the pragmatists, who were willing to work within the system, free to establish state Green Parties. This article focuses on the history of Green Parties and on three key events, in three different

countries, in which differing views about leaders and leadership led to conflict.

EMERGENCE OF GREEN PARTIES

Green Parties exist in many countries, but have been more influential in Europe than anywhere else. There is a Mongolian Green Party and, according to the Global Greens website, an African Federation of Green Parties. The first environmental party, called the People Party, began in Britain in 1972. The idea was launched, the story goes, in a Warwickshire pub by a husband-and-wife team of solicitors, Ton and Leslie Whittaker, who had read an article about ecological disasters in *Playboy* magazine. The party was later renamed the Ecology Party, a name it kept until 1986.

The German Greens (*Die Grunen*) were formed later, in 1979, but are considered the mother of all Green Parties because they have had a strong national presence since 1983. Green Parties have generally been more successful in nations where there is proportional representation in parliament (under proportional representation, a party receives a share of seats proportional to its share of the popular vote), and they have had moderate success in European Parliament elections. In the United States, Green candidates have been successful at the local level, and have developed a public presence in Western states in particular, notably in California and New Mexico.

The United States Green movement began in 1984 with the formation of local groups in Maine and elsewhere. By 1989, there was a loosely formed national organization called the Green Committees of Correspondence, after the Committees of Correspondence that organized in the years before the American Revolutionary War.

Green Party Principles

Over the years, local and national gatherings have spent a great deal of time debating the meaning of what became known as the Ten Key Values, which were originally assembled at the United States Greens first national meeting, held in St. Paul, Min-

nesota, in August 1984. The Ten Key Values were originally drawn from the “Four Pillars” of the then West German Greens: Ecological Wisdom, Social Justice, Grassroots Democracy, and Nonviolence. (In 2000, Equal Opportunity was added to the list of Pillars.)

In addition, there are three other sets of principles agreed to by the Greens, each with two related values: respect for diversity and feminist values; decentralization and community economics; and global responsibility and sustainability (or “thinking to the seventh generation”—the idea, said to come from Native American tradition, that our decisions should take into account the effects on our descendants some two hundred years from now). The exact terminology has changed over time. Although the term “Green” strongly connotes environmental concern—the color representing nature and the Party’s symbol being the sunflower—in the 2003 United States Green Party literature, “ecological wisdom” is listed third—no longer first—appearing after “grassroots democracy” and “social justice and equal opportunity.” This broader perspective alarms some, who see the Greens’ unique ecological perspective being diluted, but it no doubt adds to the Party’s potential to become a viable third party in the United States and elsewhere.

“Don’t Beat the Government, BE the Government!”

The transition from a Green movement to a national Green Party was complex and hotly contested over a period of years, and debates were acrimonious. The most drawn-out and bitter fight was between proponents of social ecology and deep ecology. The social ecologists were led by Murray Bookchin, based in Vermont, and the deep ecologists were inspired by Arne Naess, a Norwegian ecophilosopher. Social ecologists believed that it was necessary to liberate human beings—through improved welfare and opportunity—before saving the natural world. Deep ecologists, on the other hand, believed that the human exploitation of nature was a core problem, and that changing the human relationship with nature would lead to the needed improvements in human well-being.

It is not surprising that those who felt most strongly about changing the world by taking political positions from the existing parties would sometimes find themselves in conflict with those who saw social change as dependent on resolving interpersonal problems before moving out into the world. Curiously enough, it was those on the deep ecology side of the debate who took the lead, after a bitter split in 1991, in forming the Green Politics Network, which would eventually help to form the United States Green Party. Social ecologists tended to be anarchists or libertarians, unwilling to participate in the political process. They did not agree with the more mainstream Greens whose slogan became “Don’t beat the government, BE the government!”

Environmental issues continue to be important to Green Party members, but it would be a mistake to see the protection of the natural world as the primary focus of this movement. Social and economic justice has come to dominate the platforms of many Green Parties their political candidates, while organizations focused on the protection of wilderness, energy conservation, and so on, largely direct their lobbying efforts towards the major political parties. Internal debates continue over whether Greens should support capitalism or socialism, reform or revolution. But the argument of the Greens is that the destruction and degradation of the environment cannot be dealt with apart from other pressing human concerns, and that long-term problems require creative, integrated solutions like those proposed by the Greens.

MANAGERIAL TENDENCY IN THE UNITED KINGDOM

The first “green” party was born in the United Kingdom, but the United Kingdom Greens did not get the political traction that *Die Grunen* had until the late 1980s. A number of things coincided at that time to bring the Greens—at least momentarily—into the mainstream.

First, a number of environmental disasters—including the Chernobyl disaster in 1986, with fall-out over Britain that had a severe effect on farming in Wales, and the death of half the seals in the North

Sea in 1988—began to attract significant media attention. Second, a book written by a longstanding environmental campaigner and consultant, John Elkington, and his colleague Julia Hailes, the *Green Consumer Guide* (September 1988), struck a chord with people who felt they ought to do something about the environmental threats they were reading about daily.

The *Green Consumer Guide* went to the top of the bestseller list and inspired events like Green Consumer Week and the *Observer* newspaper-sponsored Green Books Fortnight, which ran for several years. At about the same time, Anita Roddick’s Body Shop was setting growth records after a highly successful and highly publicized initial public offering (IPO) in 1984.

The women who had camped at Greenham Common, protesting the United States deployment of nuclear cruise missiles in Europe, got to go home when the United States withdrew, finally leaving Greenham Common in 1992. And Friends of the Earth (FOE), a campaigning organization, had a new lease on life under the leadership of Jonathon Porritt, a former teacher and Ecology Party candidate. Porritt, who had gone to school at Eton and came from an upper-class background, became, and remains, the best-known and most influential of British environmentalists. He was articulate, affable, and reasonable—not characteristics of all Green activists—and, even more importantly, he was politically astute and media-savvy. FOE became a major force, with a huge growth in membership, and its research was widely quoted in the press as scientifically sound.

Meanwhile, the Green Party, too, had savvy, attractive, and personable spokespeople who presented the Greens as a fresh and viable alternative. The co-chairs were David Icke, a well-known figure in Britain in non-Green circles because he had been a BBC football (soccer) commentator, and Sara Parkin, a former nurse with a fine command of policy issues, a forthright style, and a pragmatic attitude about political battles. Her poised 1989 interview on the mainstream political television program “Question Time” was considered a landmark in Green respectability.

As a result, in the 1989 European Parliamentary

elections the Green Party won the highest percentage of the popular vote ever won, in any country, by a Green Party—15 percent (2.5 million votes). A memorable television advertisement (allowed in Britain under strict guidelines as a “party political announcement”) starred former Monty Python actor John Cleese with the theme, “Do you want your world to turn grey? Vote Green.” (As Cleese spoke, gray sludge was poured on his head.)

While observers pointed out that the British didn’t consider a European election of any great importance, certainly not a measure of how they would vote in a domestic election, the major political parties in Britain—the Conservatives led by Prime Minister Margaret Thatcher, the Labour Party, and the Social and Liberal Democrats (SLD)—panicked. Thatcher called her ministers to Chequers, her country estate, to discuss how to get the environmental vote. All the parties, from Conservatives to Labour to the SLD, began to “green” their platforms—something some Greens see as a victory, while others feel that voters are being misled because social and environmental problems can be solved only by drastic changes.

In 1990, Porritt left FOE to pursue other activities, including popular television programs about environmental issues. It was widely suspected that he would go into politics himself, and his sticking with the Green Party was considered a coup for the party and also a sign of its new strength. He commented on his experiences with the Greens and leadership:

In essence, the Green Party undoubtedly suffered from a chronic case of tall poppy syndrome. The antipathy towards individual leaders originated from two sources: from those who simply had a different model of political organisation, and believed that the Green Party should be an expression of what political organisation in the future would look like. Hence no leaders. On the other hand there were quite a lot of people in the party who simply disliked the idea of anyone else assuming leadership responsibilities, particularly in terms of dealing with the media or the external world. (personal communication, October 2003)

The “tall poppy syndrome”—the tall poppy is in

danger of being cut off—is a British expression that has particular significance for Greens, though it is comical that the international symbol for the Green Party is the sunflower—of all garden flowers, perhaps the one with the largest single head. Leadership had brought the Green Party to a position where it had a fighting chance to become a real force in British politics. But leadership was not a concept that many Greens were comfortable with, and things soon began to fall apart.

First, David Icke’s move away from the mainstream veered into the New Age. He announced that he was a reincarnation of Jesus, the “Son of Mankind,” and appeared on television to explain that his travels with his young personal assistant, during which she became pregnant, were aimed at spiritual healing. (Icke was married and had two sons.) Newspaper articles of the period refer to Icke’s purple and turquoise tracksuits, millennial prophecies (he said the world would end in 1997 unless people changed their ways), and alien lizard fantasies. The United Kingdom Green Party is still haunted by the Icke debacle, which proved—to some—the danger of prominent individual leaders. Today, Icke continues to be controversial with a bizarre mix of New Age and anti-Semitic beliefs.

Sara Parkin, intent on bringing the Green Party to center stage with well-organized internal systems and a clear, practical, and visionary platform, was besieged with questions about her co-chair’s new-found religion and at the same time had to face a movement in her own party aimed at limiting her role. She and Porritt were at first successful with a proposal called Green 2000, securing overwhelming support for organizational reforms that included reducing the twenty-four-member executive committee to eleven people. But after disappointing election results, other Greens took the opportunity to fight back, with endless procedural disputes and counterclaims—similar to some of the wranglings among Greens in the United States—that eventually led to Parkin’s resignation. Parkin and her group were snidely referred to as the “managerial tendency,” an allusion to the extreme wing of the Labour Party known as “Militant Tendency.” The dismissive tone of some Greens toward the idea of

Leadership Issues in the Greens

Ecofeminist Charlene Spretnak, author of The Spiritual Dimension of Green Politics (1986), and physicist Fritjof Capra, author of The Tao of Physics (1975) and The Turning Point (1982), did extensive interviews with German Greens in the early 1980s and identified attitudes toward leadership as a significant issue.

If a Green movement is to become a political reality in this country [the United States], it will have to overcome several initial problems, both internal and external. The first is the issue of who may become a member. . . . Unfortunately, in nearly every country where a Green movement has been established, it has also attracted opportunistic persons from unsuccessful political groups on the right and the left who enter the new movement with hidden agendas and dishonest tactics. . . . One of the first orders of business during the movement's founding stage should be the creation of a statement of principles and goals, more detailed than the "four pillars," to which all members would adhere. Although allegiance to such a declaration would not preclude the possibility of dishonesty, it would clarify the movement's expectations of its members. If infiltration actually occurs, additional means would have to be devised to address it.

A second internal problem is that the movement may be heir to unconstructive personal attitudes that should be addressed. As Green politics attracts a broad spectrum of citizens interested in developing possibilities beyond the limits of left and right constructs, it is important that people actively work at recognizing the positive aspects of all proposals and perceiving the genuine concerns behind them.

A Green movement could avoid a failure-prone posture by tapping the enormous amount of ethical, moral, and spiritual power that is inherent in Green ideals. The struggle is not to smash "bad guys" or to fight for short-term gains for one group or even one class but to effect systemic change that will yield a better life for all people, all our partners in nature, and all the generations that may follow us.

Another destructive attitude might be negativity towards people with leadership abilities. In an effort to find more democratic models than the traditional pyramid structure, many of us experienced the "tyranny of structurelessness" in political groups in the early 1970's where unofficial channels of information, and hence control and power, developed to fill the void. Groups in the feminist, peace, anti-nuclear-power, and ecology movements since then have found small steering committees and well-defined positions—such as facilitator, note-taker, correspondent, agenda-maker and timer, and process-watcher—to be effective. These positions are rotated not to thwart potential monsters in our midst, but to encourage as many people as possible to take a central role and develop leadership skills. Competent leaders are essential for the success of a movement. They should be supported and encouraged at all levels.

Source: Spretnak, Charlene, & Capra, Fritjof. (1985). *Green Politics: The Global Promise*. London: Paladin Grafton Books, pp. 207–208.

management presents a pattern of mixed attitudes towards leadership. Political effectiveness is a much-desired goal, but there continues to be debate about how to achieve it—most recently in 2003 when there was a hot debate about changing the party's current one-male-plus-one-female speaker-ship to a pair of "co-leaders."

In the press, Parkin's resignation was treated as the end of the Green Party's chances to be a significant political force, and much of the extensive coverage focused on Green attitudes towards anyone within the party who gets special attention from the media, and especially towards anyone who is treated as a party leader—rather than just a spokesperson—by those outside it.

SPOILING THE PICNIC IN THE UNITED STATES

The United States Green Party's annual convention in 2002 was held in Philadelphia and included delegates from thirty-four state Green Parties and plans for the development of a system for selecting a presidential candidate for 2004. Ralph Nader's candidacy in 2000 was seen—typically for the Green Party—as both a success and a disaster for progressives, contributing, some claimed, to the seizing of the White House by the Republicans. In another twist typical of the Greens, Nader was not even a member of the party before he became its candidate. (This is not a unique case: Independent candidates in

local elections sometimes negotiate the support of a Green committee and then run as a Green candidate.)

For a time in 2000, it seemed possible that Ralph Nader, the Green candidate chosen by the Greens because of his prominence as a consumer advocate since the early 1960s (not as a social reformer or environmentalist), would get at least 5 percent of the popular vote. This would have meant more than \$10 million in public funding for a Green presidential campaign in 2004. In the end, after an exceptionally close race between Republican George W. Bush and Democrat Albert Gore Jr. (once known, incidentally, as a strong environmental candidate and the author of *Earth in the Balance*), the Greens claimed that many who would have voted for Nader voted for Gore instead. (Nader did, nonetheless, receive 3 percent of the popular vote.)

Critics contend that the Greens are a spoiler in close elections, throwing the vote to the more conservative party by splitting the progressive vote. There are also those who believe that it is more effective to influence parties in power than to work outside the system. Greens—and the many smaller parties that thrive in European and other countries—contend that a two-party system is essentially unrepresentative and, ultimately, undemocratic because it presents such a limited choice to voters. They believe that innovation and reform are far more likely to come from outside the parties in power, and claim a vital role for themselves in a truly democratic, responsive political process.

LEADERSHIP IN GERMANY

The German Greens, *Die Grunen*, have been the most successful Green Party. Arising out of student protests and the peace and anti-nuclear movements, they achieved early success but floundered for a time, in part due to internal leadership issues.

On 22 March 1983, a group of twenty-seven Germans entered political life, as parliamentarians in the Bundestag, for the first time. They were representatives of *Die Grunen*, and their number was based on their percentage of the vote in national elections. Among them was Petra Kelly, an intense and attractive young woman who spoke excellent

English and became the symbol of the Greens for much of the world. Later that year, she visited the United States and appeared on *Meet the Press*, *The Today Show*, and *The MacNeil-Lehrer Report*, and spoke before the Council on Foreign Relations and the National War College as well as at many colleges and universities.

This no doubt inspired the United States citizens who soon formed a Green organization, but back in Germany it presented serious problems. Serving as a parliamentarian for *Die Grunen* was on a rotation system, with parliamentarians rotating out after two years to give other Green Party members a chance. Those in waiting, known as *Nachrücker*, moved to Berlin to act as assistants while waiting their turn to serve, though they had no legal protection regarding the jobs they left, as did other members of parliament. “These positions are rotated not to thwart potential monsters in our midst, but to encourage as many people as possible to take a central role and develop leadership skills” (Spretnak and Capra, 208).

Before the first two years were up, a new Green Party rule allowed original parliamentarians to remain in office if they got at least a 70 percent vote in their home state. This was intended as a compromise between those who believed that effective government depended on having experienced people stay in a position for some time and those who wanted strict rotation. No one seemed happy with the result, but it did enable prominent politicians like Kelly and her companion Gert Bastion to stay in office. (Bastion and Kelly died together in 1992; it is thought that Bastion shot her before killing himself.)

Greens often seem to prefer leadership by committee, and when it is necessary to have individual speakers there are generally two or three at a time. A memorable situation was when one of three appointees, Ott Schily, who was a popular radical Green, proposed that he be the speaker for the *Fraktion* (the Green Party parliamentary group) and that his female co-speakers, Marieluise Beck-Oberdorf and Petra Kelly, be his assistants or vice-speakers. This was, not surprisingly, voted down because it violated Green principles.

In 1983 the *Fraktion* group had a business manager as well as a parliamentary manager, Joschka

Reflections on Leadership in the Green Party in Britain

Jonathan Porritt—chair of the U.K. Sustainable Development Commission and a well-known environmentalist, author, and television presenter—reflects on Green Party leadership in Great Britain.

From my own perspective, in the four or five years that I was effectively party leader (1979 to 1984), the whole thing was “results-based.” If it continued to do the job in terms of increasing party profile, bringing in new supporters and so on, then the level of concern from the ideologues was muted.

On the internal front, it was a little bit more complicated. I think at that time we actually had a system which went under the name of “rotating co-chair.” There was definitely no formal party leader! However, there were a large number of people in the party and on the governing council (or whatever it was called at the time!) who pragmatically welcomed leadership, and a certain element of decisiveness to stop the inbuilt capacity for drift. In that respect, it wasn't so much a question of leadership as of herding cats, playing a variety of different roles: facilitator, mediator, catalyst, inspirer, lightning rod and so on.

But behind a lot of these difficulties were very strong friendships, which meant that the dilemma of leadership was essentially finessed rather than confronted. From my own perspective, as long as there was constant sensitivity to the need for consensus, I never really found it that difficult acting as leader without being leader. For instance, when it was a question of writing the two election manifestos (in 1979 and 1983), the detailed drafting actually fell to me to do on both occasions, despite all sorts of cumbersome policy committees that were really meant to be doing this. It meant a constant process of re-drafting, over many weeks, but in the end it really wasn't that painful—and I suspect no more painful than the process which any other party (with strong leadership inclinations!) would have gone through. Again, friendships helped a lot here.

Fischer, who “maintain[s] direct communication with the president of the Bundestag and keeps track of the Greens’ turns to speak there” (Spretnak and Capra 1985, 224). Fischer became Germany’s Foreign Minister and came to international prominence when the German Green Party, which he led (inasmuch as any Green Party accepts the idea of having leaders), won 6 percent of the vote in the 1998 election. He was consequently invited to join a coalition government by the Social Democrats.

As Foreign Minister, Fischer had to deal with the decisions that had to be made after the 2001 attacks on the World Trade Center in New York, including

the war against Afghanistan and, in 2003, against Iraq. Without question the most prominent and mainstream politician ever to have come from the ranks of a Green Party, Fischer had to contend with dissension in his own party, traditionally pacifist, as well as with criticism from those outside it. Although attempts have been made to tar him with his radical past, he remains popular and is seen as a pragmatic, responsible politician by most Germans.

GREEN LEADERSHIP DEBATES

Like the environmental movement in general, Green Party membership, in the United States as well as elsewhere, has been mostly affluent, middle-class, and white. In its early days it was dominated by men, but concerted efforts to address issues of environmental justice and to attract both women and people of color have had some success. Green Party politicians tend to be younger and more diverse than mainstream party politicians, and unlike American politicians in general, relatively few are lawyers by trade. This could, conceivably, be a

significant political advantage.

Consensus decision making, gender balancing, and other organizational rules have, however, provided challenges to the growth of an effective national movement. In 1990, for example, at the Green Gathering in Boulder, Colorado, every small group meeting required men and women to speak alternately. On a practical basis, this presented a great challenge and while perhaps of some long-term social value (encouraging women to speak up and men to listen), it did not facilitate effective—or speedy—decision making. But for Greens, the process has generally been far more important than the outcome.

The successes of United States Greens on both local and national levels may be attributed to the fact that this third party, unlike the Reform Party and others in the past, is connected to an international political movement. This fact, in itself, may be the most important thing about Greens today: While their leadership is regional and national, in the years ahead their international efforts—and perhaps international leadership—may provide unique capacities and a unique appeal to voters.

GREGORY I, SAINT (c. 540–604 CE)

Roman Catholic pope

Gregory I, pope from 590 to 604 CE, was distinguished for both his spiritual and temporal leadership and is credited with the conversion of England.

EARLY LIFE

Gregory came from a wealthy and aristocratic background. He was a patrician and at age thirty became prefect of Rome, the highest civil office in the city. Gregory's father was Gordianus, who owned a number of properties, including large estates in Sicily and a mansion on the Caelian Hill in the city of Rome. Similarly, Gregory's mother Silvia came from a patrician family. Gregory's mother and two of his paternal aunts have been named saints.

The years of Gregory's youth were turbulent. The

Goths captured Rome a number of times between 546 and 552. Some writers have attributed Gregory's tinge of sadness and his expectation of a speedy end of the world to these early experiences. Certainly he was a quick student who, according to contemporary accounts, had no peer in grammar, rhetoric, and dialectic. He also appears to have studied law. His home provided him with a profound religious education. His education and innate skills prepared him for a public career in which after holding a number of subordinate offices he rose to the position of prefect of the city of Rome.

Around 575, he felt a vocation to the monastic life. He converted his home to a monastery. This and other houses he owned became Benedictine convents. His Sicilian estates, for example, were used to establish six monasteries. His Caelian Hill home became Saint Andrew's monastery, where he took the cowl of the Benedictine monk. In 578, he became a Benedictine abbot and a deacon of Rome. He served as an ambassador at Constantinople from 579 to around 586. After that he became Pope Pelagius II's chief adviser.

Gregory intended to go as a missionary to England, but he was recalled to Rome. There the Roman people elected him pope by acclamation. He reluctantly accepted his election. Not only did he feel spiritually unworthy, he also suffered from chronic poor health.

PAPACY

The period just before Gregory became pope was one of great disasters. In 589, for example, there were great floods. The Tiber overflowed, destroying buildings including church granaries. Pestilence accompanied the floods. Economic disaster followed. Rome took on the appearance of a ghost town.

Pelagius II died in February 590. At that time, the clergy and people of Rome chose the pope, the bishop of Rome. Gregory, abbot of Saint Andrew's and adviser to Pelagius, was their choice. Gregory refused the honor, preferring his cloister. He asked the emperor not to confirm his election, but the letter never reached the emperor in Constantinople because the prefect of Rome suppressed it.

Gregory filled the duties of pope while expecting the emperor to refuse to confirm his election. He led

a procession that started at each of the seven regions of Rome and joined at the Basilica of the Blessed Virgin. The purpose of the procession was to beg relief from the plague. According to legend the archangel Michael was seen at the tomb of Hadrian, now called Sant'Angelo, sheathing his sword to show that the plague was over.

Six months later, the emperor's confirmation of Gregory's election as pope arrived. Gregory thought of fleeing to avoid serving as pope. The population seized him and took him to the Basilica of Saint Peter, where he was consecrated pope on 3 September 590. Interestingly, Gregory always regretted that he had become pope.

Despite his poor health, Gregory was a dynamic pope. He lived in great simplicity, getting rid of all lay attendants and splendor. He replaced lay attendants with clerics.

Over the course of years, the pope had become responsible for military matters. Additionally, he had to take care of refugees, at the time resulting from the action of the Lombards. He called on the office of alms to feed these refugees from the church's estates in Sicily. In part to provide spiritual solace to go along with physical aid, Gregory instituted the stations of the cross. Gregory was a great preacher and his sermons drew large crowds. In them, he used Scripture to supplement his messages.

In July 595, Gregory called his first synod, or meeting with the bishops. The synod produced six decrees dealing with ecclesiastical discipline. These reformed areas that had grown lax and stressed priestly celibacy. Under Gregory the synod also brought about changes in the way in which the Mass was said.

Gregory was also an excellent estate manager who administered Peter's patrimony well. He brought order to the vast church property, collected fees from tenants, and spent the money wisely, generally for the welfare of the poor and the defense of the areas.

During his papacy, Gregory had two significant accomplishments. He established papal supremacy in the church and the temporal position of the pope. Gregory was a careful administrator. He was ready to interfere outside Italy whenever he deemed it nec-

essary. For example, he worked to end Donatism in Africa (the belief that sanctity was a requisite for church membership and the administration of sacraments) and to combat simony (the buying and selling of church offices) in Gaul. Gregory also would not permit the patriarch of Constantinople to add the title "ecumenical" to his list of titles because the bishop of Rome, the pope, reserved that title for his own use.

When the representative of the Byzantine emperor failed to aid Rome when the Lombards attacked it, Gregory began negotiations himself. By so doing Gregory gave notice that he was ready to become independent of the empire. This led to the role of popes in the defense of Rome, saving it from total barbarian destruction. In spite of his willingness to assume de facto responsibility in the temporal sphere for the safety of Rome, Gregory was a major advocate of divided power between church and state. The pope was Christ's vicar on earth for spiritual affairs and the emperor for secular ones.

It was Gregory who insisted on clerical celibacy for priests in the Western church. He also encouraged monasticism, an action of great importance in European history. Moreover, he fought to keep clergy from being tried by civil courts. In addition, he reformed church music, encouraging the use of the plainsong (Gregorian chant) that bears his name.

LEADERSHIP STYLE AND CONTRIBUTIONS

Gregory displayed his leadership style in the achievement of his major accomplishments. He was responsible for the mission of Saint Augustine of Canterbury to convert England to Christianity. He expanded the secular power of the pope. He popularized monasticism and encouraged its spread. Somehow in the midst of an active career he found time to write numerous letters, a book entitled *Pastoral Care*, and his *Dialogues*, a collection of stories of the saints, miracles, and other tales.

The Roman people elected Gregory against his will in 590. When the Byzantine representative failed to help him defend the city against the Arian Lombards, he found that he had to use food grown on church lands, Saint Peter's patrimony, and find a way to defend the city. In the process, Gregory accom-

plished two things: he not only strengthened the pope's temporal or secular power, he also managed to convert the Lombards from Arianism to Catholic Christianity. Gregory decided to use the institutions of monasticism to renew and strengthen the church. In the confusion of the early Middle Ages, the monastic institutions were the only ones that could provide a foundation for such a design. Learning was still strong in the monastery, as was discipline and the importance of work. For example, Gregory used the monk Augustine to convert England to Catholicism, a goal he had before he became pope.

Gregory had seen some Anglo-Saxons (Englishmen) one day in Rome. He asked who they were; when told they were "Angles," he replied that one day they would be called angels.

In his book *Liber pastoralis curae*, or *Book on the Office of a Bishop*, Gregory provides a key to understanding his leadership style. The bishop is mainly a physician of souls. He is a healer. The bishop must lead a disciplined and ordered spiritual life. Moreover, the bishop is a teacher. He must make tough decisions, admonishing those under his care to do better. Success, furthermore, is a dangerous thing because it tends to hide from the bishop the fact that he is weak. Gregory basically lived what he wrote, putting these guidelines into operation in his own life.

Gregory was not an abstract thinker. He was a Roman lawyer and administrator who became a monk, missionary, and preacher. He shaped the medieval papacy in that image. He was filled with missionary zeal, eager for conversions.

Gregory was a leader who upheld the argument that the church of Rome was preeminent among all the churches. The conversion of Britain was among his great achievements, vital for the success of the medieval church. During his reign he was able to exert his influence not only among the Western churches but also in the Eastern ones. Gregory established the system of appeals to Rome and he freely exercised his right to accept or veto decrees of various synods. He annulled actions of patriarchs and set punishments for those not in conformity with Rome's teachings.

Gregory also exerted his power in temporal or secular affairs. It was Gregory who made the pope

the major power in Italy, filling the gap left by the emperor's failure to act. The various ethnic groups in Italy looked to the pope for guidance and aid. The repercussions of his actions were felt in ways he could not have realized. Gregory's work prevented the early unification of Italy. But, then again, there might not have been an Italy to unite without Gregory's decisive actions. Certainly, the empire had no great desire or means to defend Italy from the various barbarian invasions to which it was subject in the seventh and eighth centuries. Neither did it wish to expend resources in feeding the poor and hungry of Italy, something Gregory organized quite efficiently and expeditiously.

Although not a great theologian, Gregory was a great synthesizer and a systematic thinker. He summed up the works of earlier Church Fathers and brought them into harmony such that the later Middle Ages looked to them for guidance. He was a great system builder. These various talents earned him the title of "the Great." Quite simply put, without Gregory I the papacy of the Middle Ages would not only have been quite a different institution, it is probable that it might not have continued to exist at all.

GROUNDED THEORY

Grounded theory is a method for rigorously and qualitatively analyzing data to generate explanatory

theory. Grounded theory draws upon the epistemological underpinnings of a range of methodologies, including ethnography, phenomenology, social interactionism, hermeneutics, heuristics, and systems theory. The data are usually qualitative, but increasingly from the early 2000s, quantitative data are being analyzed along with qualitative data in grounded theory analysis. However, the analysis is fully qualitative.

Historically, grounded theory analysis has mainly been used in the study of nursing practice and in educational research. Since the 1980s, however, it has been popular in social science research, including research on leadership.

Some components of the grounded theory method, such as open coding, theoretical sampling, and the comparison of categories, are used in much qualitative social science research. However, the full grounded theory method also involves the generation of high-order categories and the emergence of a basic social process and explanatory theory. The generally agreed-on stages of grounded theory analysis are the following:

Initial data collection. This stage comprises interview, observation, participation, documentary, and questionnaire data.

Open coding. The responses are coded into abstract categories (or variables).

Theoretical sampling (sampling patterns and new data sources are determined by the emerging theory, not predetermined) from subsequent iterations of data collection. This stage is ongoing.

Comparison and reduction of categories. For the sake of parsimony and to make the emerging categories as explanatory as possible, lower-level categories are merged and/or replaced by new categories that have greater theoretical relevance. This too is ongoing.

Saturation of categories. This stage is reached when no new properties or dimensions of categories are found.

Theoretical coding. This stage involves seeking the properties of categories and the relationships between them. It is at this point that researchers determine which categories are causes, consequences, contingencies, covariances, intervening conditions, and contexts.

Emergence of high-order categories.

Emergence of basic social processes. This takes place at the highest level of abstraction, where the phenomenon is investigated in its entirety.

Theory generation.

ORIGINS

Grounded theory was developed through the 1950s and 1960s. The seminal work on this method was *The Discovery of Grounded Theory* (1967), by the sociologists Barney Glaser and Anselm Strauss. Glaser and Strauss have been the main authors on the grounded theory method since that time. The two main texts on the use of grounded theory for management audiences are *Grounded Theory in Management Research* (2000), by Karen Locke, a professor in organizational behavior, and *Grounded Theory: A Practical Guide for Management, Business and Market Researchers* (2002), by Christina Goulding, a professor of consumer research.

With emergence of sophisticated software in 1990s, grounded theory analysis became more rigorous. For example, rather than relying on complex files of physical memo cards, researchers could access and interpret data much more quickly and efficiently. A number of software programs help facilitate grounded theory analysis; prominent among them is NUD*IST NVivo. This and other programs help with the accessing, categorizing, and even the modeling of data, although theorizing is still and will always be the task of the researcher.

RELEVANCE TO STUDY OF LEADERSHIP

Leadership has been defined as a social process of influence between people, and grounded theory readily lends itself to the analysis of such processes. The penultimate outcome of grounded theory analysis is the emergence of a basic social process, which is the category (or variable) that explains the leadership processes that are evident in the substantive context being investigated.

Glaser has observed that grounded theory, in particular, is useful to “researchers and practitioners in fields that concern themselves with issues relating

to human behavior in organizations, groups, and other social configurations” (Glaser 1992, 13). Because leadership is a social process of influence within organizations, groups, and other social entities, this implies that grounded theory can have a significant role to play in the study of leadership, and some of the studies outlined in this article illustrate its potential.

When it comes to the study of leadership, while mainstream approaches using quantitative methods tend to generalize across the frequencies of occurrence of predetermined manifest variables, grounded theory tends “to generalize in the direction of theoretical ideas, thus emphasizing theory development rather than testing of a theory” (Hunt and Ropo 1995, 381). The scholars Jerry Hunt and Arja Ropo have noted that grounded theory identifies the processes or forces that give rise to activity, whereas mainstream organizational research methodology concentrates on abstract elements and their relationship to activity, and that, in this regard, grounded theory emphasizes dynamism, whereas mainstream analysis emphasizes a more static structure. Mainstream approaches have a bias toward static, cross-sectional analysis. On the other hand, grounded theory is useful for analyzing processes, and such analyses in turn can enhance our understanding of leadership.

Grounded theory makes significant contributions to well-worked areas of research, and leadership is one such area. Glaser has noted that the contribution of grounded theory to well-worked areas of research is not the generation of a new concept or pattern—since in well-worked areas concepts and patterns are usually plentiful—but a better conceptual grasp of the basic social processes, which might be missing. For example, the traits, behaviors, functions, roles, and outcomes of leadership have been well established by many years of research.

Leadership is a complex interplay between the actions of the leader, the reactions of the followers, and the context within which the influence occurs. Therefore, leadership is more of a phenomenon than a set of traits or behaviors, another fact that makes it a suitable object of grounded theory analysis. Moreover, grounded theory is implicitly longitudinal

because of the iterations associated with the constant comparative nature of theoretical coding. Because leadership, too, is a longitudinal phenomenon, grounded theory analysis is relevant.

Using grounded theory analysis, Lessey Sooklal saw the political leader as a broker of dreams; Ken Parry found that leadership was a matter of enhancing adaptability of both leaders and followers; and Melanie Kan found leadership at times of organizational change to be a matter of identifying paradox.

FUTURE DIRECTIONS

Several future directions for grounded theory and associated methods of researching leadership and associated phenomena have been posited. The first is to research leadership as not just an organizational phenomenon, but as a wider societal phenomenon. Such work would include greater use of biographical, autobiographical, and historiographical analysis.

Another direction is further data triangulation and methodological triangulation within grounded theory analysis. As an example, the scholars Jay Conger and Ginka Toegel have proposed greater use of qualitative questionnaires to complement quantitative questionnaires as well as the more orthodox data that come from interviews, observation, and participation. Conger and Toegel propose asking respondents to provide two or more adjectives to describe their leader, and to indicate an analogy for their leader (for example, drawing an analogy between their leader and a certain color, food, animal, or object). Those responses could be analyzed in conjunction with ratings against conventional measures of leadership behavior, providing deeper insight into the nature of leadership being manifest.

Susan Herman and Caroline Egri have demonstrated how interactive reflexivity between researcher and subject in the context of grounded theory could bring about a richer explanation of the leadership processes in question. Kan has used the grounded theory method to seek a theoretical explanation of the apparent incompatibilities represented by the very different conclusions drawn from analyses of questionnaires on the one hand and interview and observation data on leadership on the other. The

grounded theory method seeks to resolve such incompatibilities by searching for explanations at a higher level of abstraction. Latent constructs are at a higher level of abstraction than the manifest variables obtained from the initial coding of observational, interview, or questionnaire data.

A third future direction is toward greater use of models to visually represent the hierarchies of abstraction that are generated by grounded theory analysis. Grounded theories have been criticized for being insufficiently visual and overly verbose in their expression; hierarchy-of-abstraction modeling is seen as one way to answer such criticism.

CONTROVERSIES

In the early 1990s, controversy emerged between the two originators of grounded theory. Glaser believed that Strauss was being overly prescriptive and insufficiently emergent in the generation of categories and processes—moving into theory-testing rather than letting the theory emerge from theoretical coding and constant comparison—and the subsequent debate became known as the Glaserian versus Straussian debate. In reality, most researchers view their own work from both perspectives when researching.

Another controversy is that of the use of full or partial grounded theory. Much social science research, including some leadership research, is called grounded theory by its authors, but really only draws upon primary elements of the grounded theory method for analyzing data. Researchers are distinguishing between full and partial grounded theory to resolve this confusion. A final controversy relates to the validity and reliability of grounded theory research. Much of the debate mirrors arguments about the differing approaches to validity and reliability one finds in qualitative and quantitative fields generally. However, in 2002 Parry used questionnaire data and structural equation modeling to partially validate the reliability of grounded theories of leadership. Parry operationalized several grounded theories of leadership in questionnaire format to gauge the manifestation of leadership processes in workplaces, establishing convergent validity with

existing measures of leadership. More importantly, a psychometric hierarchy of abstraction was derived (a visual representation of the relationship between manifest variables at the lowest level of abstraction up through smaller numbers of latent constructs to the highest-order latent construct), which reflected adequately the hierarchy of abstraction that emerged from the grounded theory analyses.

NEW LEADERSHIP VISTAS

So much leadership research has been undertaken through the latter twentieth century, yet so little consensus had emerged. Grounded theory is one tried-and-true research method, borrowed from other research domains, that has and will continue to shed new light on leadership processes through the twenty-first century. It will complement the huge amount of mainstream leadership research already undertaken. Sophisticated software applications will continue to add rigor to the analysis and consequent validity and reliability to the findings.

GROUP AND SYSTEMS THEORY

In a description of the first Tavistock Group Relations conference, which was held in collaboration with the University of Leicester in 1957, two researchers wrote:

Professional workers and managers have always had to deal with group problems. During the last few decades, there has been a rapid growth of interest in small face-to-face groups and in the influence such groups exert both on their individual members and on the larger organizations of which they form part. Instead of seeking explanations for social phenomena solely in terms of individual idiosyncrasies it is becoming more common . . . to think also in terms of group characteristics. The group has a reality of its own. To mobilize the resources of groups demands an understanding in many ways different from that required to work with individuals. (Trist and Sofer 1959)

EARLY RESEARCH ON GROUPS

Understanding groups was the principal research preoccupation of the early pioneers of the Tavistock Clinic and the Tavistock Institute of Human Relations, a novel interdisciplinary, action-oriented research organization founded in London in 1946 with the aid of a grant from the Rockefeller Foundation. The sociological studies by Elton Mayo in the 1930s demonstrated that productivity in groups rose when group members took responsibility for the

evaluation of their own work and for the standards of the working group. Other studies by Kurt Lewin and his associates showed that authoritarian leadership had a disintegrative effect on the structure of a group and a negative effect on its achievement. Lewin demonstrated that a decision made collectively by a group was of greater effectiveness in bringing about change in the behavior of individual members than was a request from an authority. During the late 1930s and 1940s, Lewin raised to a new level the social psychological study of group behavior. Other contributions to this field of study were Moreno, who introduced the idea of role-playing in 1947, and Bales, who pioneered techniques of interaction recording in 1943.

On the other side of the Atlantic, different kinds of insights into group behavior were developing out of the work of the Tavistock Clinic. This was partly in response to the huge need for psychological treatments of large numbers of discharged wartime soldiers and partly because of the independent advantages gained from creating conditions in which members of groups could together study the relations that developed in the treatment situation. Within British group psychotherapy at that time, an argument raged over whether a group was mainly the forum in which treatment of the individual took place, or whether, in assembling patients for treatment in a group, a deeper understanding was possible of the processes of groups of human beings engaged in common tasks. The most far-reaching formulations, which extended hypotheses about group processes to a level of explanation similar to that of psychoanalysis, were presented by British psychoanalyst Wilfred R. Bion in 1961.

Training programs in the study of group behavior developed along more or less parallel lines in the United States and Britain. In the United States, these occurred at the National Training Laboratory in Group Development at Bethel, Maine; Western Training Laboratory in Group Development at the University of California, and the Research Center for Group Dynamics at the University of Michigan. In Britain, a key role in studying group behavior and its application to the workplace was played by the Tavistock Institute of Human Relations in conjunction

with the University of Leicester through the establishment of a series of residential conferences to study group dynamics, and with the European Productivity Agency, which was concerned with improving industrial training methods. Other organizations, like Ministry of Labour, the National Health Service, the British Institute of Management in the United Kingdom, and the Episcopal Church in the United States, were interested in the new knowledge on group behavior and in applying it to the study of organizations and the wider society.

GENERAL SYSTEMS THEORY

This interest coincided in the 1940s with the emerging general systems theory of Ludwig von Bertalanffy, a biologist, who claimed that studying the smallest elements of phenomena was disadvantageous because that way one lost sight of the whole, which is often greater the sum of the parts. Phenomena could therefore be best understood by using a multidisciplinary approach, with each discipline contributing its own theory, concepts, and formulas. Von Bertalanffy therefore sought meta-concepts that would facilitate the “unity of science.” He also saw that real-world systems are open, that they interact with their environments and acquire new qualitative properties. They evolve. Therefore, rather than reduce a phenomenon to its elements, general systems theory focuses not only how the parts are arranged and what they do, but also on the relations that connect the parts into a whole (holism). He stressed that the organization of the whole defines a system, which in itself as a phenomenon can be considered independently of the physical or conceptual manifestation of its elements. Common concepts and principles of systems underpin and unify a range of disciplines such as physics, biology, technology, sociology, and psychology. Such systems concepts include the following:

- System inputs
- System hierarchies
- The idea of a system-environment
- System functions and processes
- System outputs
- Goal-directed behavior
- A definable boundary
- Information and information flows

Excitement about von Bertalanffy’s ideas lay in the applications of general systems thinking to engineering, computing, ecology, management, and psychotherapy. Systems analysis principles could be applied to decision-making processes and behaviors, identifying, manipulating, optimizing, and controlling systems that may be socio-technical organizations. Systems analysis accounted for multiple objectives, constraints, and resources, and identified courses of action, risks, costs, and benefits.

INDIVIDUAL, GROUP, AND SYSTEM

Since its inception, a core objective of the Tavistock Institute has been to create a unified theory that links knowledge of the individual, the group, the community, and society into a whole that could help to explain the overt systemic and covert or unconscious relationships between them. The early pioneers of the Tavistock Institute understood that the systems theory of organization they were attempting to apply to individual and group behavior was normally used for the analysis of enterprise processes. Their use of such theories would inevitably have to concentrate on the more mechanistic aspects of human relationships, but they hoped that the approach would help them to clarify some of the differences and similarities among individual, group, and systemic behavior. This would have to be accompanied by a discussion on the nature of authority, the role of technology in moderating human systems, and notions of “relatedness,” ideas which were central to the theoretical interests of the Tavistock social scientists. For example, in 1990 the following definition of “relatedness” emerged: “relatedness—the processes of mutual influence between individual and group, group and group, and group and organisation, and beyond that the relatedness of organisation and community to wider social systems, to society itself” (Miller 1990).

The Individual

Group and systems thinking would necessarily start with understanding an individual in terms of “system”—that is, that in order to survive, an individual would need to relate to its environment, taking in

basic resources, transforming them into energy and waste, and then exporting the waste. Later development in terms of engagement with others—first the family, then at school, the wider family, and social networks—would also be defined in terms of sets of relationships that provided gratification and avoided threat. These behaviors, feelings, defenses, values, expectations, beliefs, attitudes, and perceptions as they are aligned internally ultimately come to form the personality.

According to psychoanalytical object-relations theory, these phenomena are regarded as forming part of an individual's internal world which contains, besides the skills and capabilities that have been developed, the primitive inborn impulses and primitive controls over them that derive from the child's earliest relations with authority, together with the modifications and adaptations made in growing up. Object-relations theory holds that no distinction can be made by the as-yet undeveloped infant between what is "inside" and what is "outside" its world. It has no ego that can differentiate feelings and their causes. What the infant feels about an object that is outside becomes an attribute of the object itself. He "projects" his feelings onto it. Insofar as the object gratifies him, it is a "good" object; insofar as it frustrates or hurts him, it is a "bad" object.

Individuals, groups, organizations, society, and systems cannot therefore be regarded as entities with an objective reality; they are ideas or constructs that we hold in our minds and onto which we project aspects of our internal worlds of feelings, attitudes, and beliefs. A particular group or system is a construct substantially shared, explicitly or implicitly, by a number of individuals. Miller puts it very well when he says that "except in the restricted biological sense, the individual too can similarly be conceived as a construct, a reification. Thus the relatedness and the associated tension, is more appropriately conceptualized as connecting not two entities, but two processes—individuation and incorporation—moving towards, but never reaching, individual autonomy on the one hand and submergence in the group on the other" (Miller 1990).

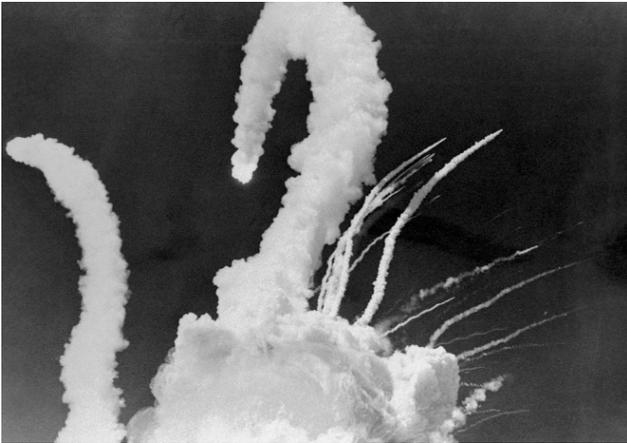

For human beings, the many import-conversion-export processes of enterprise systems cannot be eas-

ily defined, nor is productivity a simple measure of the difference between known intakes and known outputs. But this way of thinking about an individual may help to clarify some of the problems of role taking when we have to consider group and systems processes. The ego-function has to control not only transactions across the individual/environment boundary but also between role and person. When the ego-function fails to locate boundaries precisely and fails to control transactions across those boundaries, confusion results—confusion in roles and in the authorities exercised in roles. Authority and responsibility appropriate in one role may be used inappropriately in other roles. To be continuously confused about the role/person boundaries or completely unable to define and maintain boundaries is to undermine the viability of the system.

The Group

It has been axiomatic in Tavistock thinking that "individual" has little meaning as a concept except in relationships with others. Individuals use others to express views, take action, and play roles. The individual is a creature of the group, the group a creature of the individual. Individuals, according to their capacity and experience, carry within themselves the groups of which they have been and are members. Experiences as infant, child, adolescent, and adult, within the family, at school, and at work, and the cultural setting in which an individual has been brought up will thus affect, by the way in which they are molded into the personality, the contemporary and future relationships the individual makes in the family, at work, and in socially.

A group always meets to do something. In this activity the members of a group cooperate with each other, and their cooperation calls on their knowledge, experience, and skills. Because the task for which they have met is real, they have to relate themselves to reality to perform it. The members of the group have, therefore, to take roles and to create role relationships with each other. The work group is now a task system. But the work group also contains sentience—that is, the attitudes and feelings group members have about each other and the group has

The explosion of the space shuttle Challenger on 28 January 1986 over Cape Canaveral, Florida, is often cited as a classic case of groupthink, in which capable people together make a poor decision—in this case, one leading to disaster.

Source: Bettmann/Corbis; used with permission.

about itself and about other groups play a part in the group's behavior and task performance. According to Rice, controls are then required to regulate transactions of the whole as a task system, with the environment, and of the constituent systems with each other; to regulate sentient group boundaries; and to regulate relationships between task and sentient groups.

But the role taken by each member of a group is also a task system, and the management of each of these (the ego-function) has to control the relations between the task and the sentient systems of the individual. So long as the role taken by each individual member is supported by that member's own individual sentient system, the task group and the sentient group tend to coincide.

Tavistock thinking about groups and systems has relied on the theories of Bion, who describes the sentience of the roles taken by the members of a group in the task system. These may or may not be stronger than other possible sentient systems. If the sentient systems of the individual members coalesce, that is, individual members find a common group sentience, then the group can be said to be behaving as if it had made a "basic assumption." If the common group sentience is opposed to task performance, that is, if the control is not maintained by task leadership, other leaders will be found. Bion points out that the capacity for cooperation among the members of a

task group is considerable; that is, role sentience in a task group is always likely to be strong. Hence, while the group maintains task definition, the strength of the sentience supporting task performance at the reality level makes the life of any leadership that opposes this task performance precarious.

A pair who have met to perform an agreed-upon task can hardly provide alternative leadership and remain a task system. With three, an alternative leader is rapidly manifest and either immediately outnumbered or at once destroys cooperation in task performance—that is, the three cannot easily remain a task group. A quartet can provide some support for alternative leadership by splitting into pairs, but cannot sustain the split for very long without destroying the quartet as a task system. In groups of five and six, the interpersonal transaction systems are still relatively few and task leadership can be quick to recognize alternative leadership, usually before it can manifest powerful opposition to task performance. Above six, the number of interpersonal transactions becomes progressively larger, and hence it may be more difficult to detect their patterning.

In general, the larger the number of members of a group, the more members there are to find an outlet for their non-task-related sentience, and hence the more powerful its expression, and the more support it can give an alternative leader. Equally, because of the large number, group behavior can appear even more futile and useless when there is no sentient unanimity among the membership either in support of, or in opposition to, group task performance. In other words, the larger the group the more opportunities members have to divest themselves of their unwanted or irrelevant sentience by projecting it onto others.

The System

In the development of ideas about systems, a place has to be found for individuals and roles. All transactions, even the intra-psychic transactions of the individual, have the characteristics of a systems or inter-group process. As such, they involve multiple problems of boundary control of different task systems and different sentient systems and control of

relations between task and sentient systems. Each transaction calls into question the integrity of the boundaries across which it takes place and the extent to which control over transactions across them can be maintained. Every transaction requires the exercise of authority and calls into question the value of and sanction for that authority. In order for groups to accomplish a task, they must interact with other groups. In order to do this, negotiating mechanisms need to be established. These are usually based on authorized representation. Therefore, in the examination of a simple inter-group transaction between two groups in which individuals represent the two groups, account has to be taken of a complex pattern of inter-group processes: within the individuals who represent their groups, within the transactional task system, between the groups and their representatives, within the groups, and within the environment that includes the two groups. Even a simple inter-group transaction is, therefore, affected by a complex pattern of authorities, many of which are either partially or completely covert. If the analysis is extended to more than two groups, each with more than one representative, the pattern becomes still more complex. For example, in a meeting of pairs of representatives from four groups, transactions across seventeen different pairs of boundaries have to be controlled: four pairs for each pair of representatives as a group. To understand the nature of the authority of a representative, or of a group of representatives, appointed to carry out a transaction on behalf of a group, involves the understanding of multiple and complex boundary controls. In other words, the appointment of a representative or representatives is never just a simple matter of representing a task system to carry out a task-directed transaction with the environment. Representatives are invariably chosen not only to carry out the specific transaction, but also to convey the mood of the group or system about itself and about its representative and its attitude, not only to the specific part of the environment with which the transaction is intended, but to the rest of it as well.

Another dimension of complexity has to be mentioned: time. We have referred to the problems of the control of the representative's own boundaries, of the boundaries between the representative and the group

and of the relative strengths of the individual, group, and transactional task-system boundaries. It will be rare for them all to be perfectly controlled in the interests of task performance. Even if they are, a transaction takes time, and during the transaction the individual, group, and task-system sentences may change. Indeed, in any critical negotiation they are almost bound to change, as hopes and fears of the outcome increase and decrease.

The number and complexity of the boundary controls required for even comparatively simple transactions between groups make any negotiation precarious. The reality is, of course, that the preponderance of inter-group transactions take place in settings in which the conventions are already established and mutual payoffs understood. Nevertheless, this complex authority pattern, imperfectly comprehended, together with a need to defend each of the boundaries in the multiple transactional systems against uncertainty, chaos, and incipient disaster, gives rise to the futility of many negotiations and to the unexpected results that often emerge. The conventions and payoffs for the majority of inter-group transactions are defenses against chaos and disaster. In new kinds of negotiations without established defenses, the fear of chaos and disaster often makes procedure more important than content.

BOUNDARY

A key connecting concept derived from Lewin and developed further in general systems theory by von Bertalanffy and the Tavistock workers, is that of *boundary*. The existence of all systems, human and technical, depends upon their continuous interchange with their environment, whether of materials, people, information, ideas, values, or fantasies. The boundary across which these "commodities" flow in and out separates any given system from, and links it to, its environment. It marks a discontinuity between the task of that particular system and the tasks of the related systems with which it transacts "because these relations are never stable and static, and because the behaviour and identity of the system are subject to continual renegotiation and redefinition, the system boundary is best conceived not as a line but as a region" (Miller 1990, quoting Lewin 1935; 1936).

The region is that location of those roles and activities that are concerned with mediating relations between inside and outside. In systems this is the function of leadership; in individuals it is the ego function. The leadership exercised in this region can protect the internal subsystems from the disruption of fluctuating and inconsistent demands from outside, but it can also promote those internal changes that will enable the system to be adaptive, and indeed proactive, in relation to its environment. The health and ultimately the survival of a system therefore depends on an appropriate mix of insulation and permeability in the boundary region.

THE ROLE OF LEADERSHIP

Leadership can be conceived of as a special case of representation: representation with plenary powers. As a member of a task group, every individual has to take a role and through it control his or her task transactions with colleagues individually and collectively; the leader as a person also has to control his or her own person/role transactions as well as interpersonal relationships with colleagues. In addition to these, a leader has to control transactions between the group and relevant agencies in the environment in the interests of task performance; without such control, task performance is impossible. In this sense, the role taken by the leader and the boundary-control function of the group must have much sentience in common. For the leader, at least, the sentient group and the task group must reinforce each other. So far as task performance is unsatisfactory, by reason either of inadequate resources or of opposing group sentience, transactions with the environment are likely to be difficult and the task sentience of the leader weakened, if not destroyed.

More generally, since transactions with the environment can only be based on adequate task performance, the leader's authority has to be based on group sentience that is sufficiently supportive of such performance. It follows that the mobilization of group sentience for any other reason than task performance—for example, personal loyalty, friendship, or ideology—always leaves a task group vulnerable. It also follows that any change in the group

task, either in the environment or in the group, changes not only the internal transactions between the members but also those with the environment, and hence the role of leadership and the appropriate sentience that have to be mobilized.

In practice, groups use all kinds of feelings and attitudes to maintain cooperation in task performance: love, affection, friendship, hatred, dislike, and enmity as well as commitment to the group task. So far as a group is committed to its task, contrary sentience, including a leader's own, can be contained and controlled within the group; so far as commitment is tenuous, so far will the group find it impossible to control the contrary sentience. Under such circumstances, task leadership is undermined, and the task is redefined or irrelevant transactions with the environment have to be used to cope with the discordant feeling and attitudes. Therefore, solutions to the problem of maintaining a system's adaptiveness to change must depend on helping the system's constituent parts to develop greater maturity in controlling the boundary between their inner worlds and the realities of their external environments.

GROUP COHESIVENESS

Group cohesiveness refers to the interpersonal dynamics that exist among group members. Specifically, cohesiveness describes the general sense of community within the group, including attraction (in the platonic rather than romantic sense) of each group member to the others in the group. This definition may seem rather vague; in fact, experts on cohesiveness cannot agree on exactly how to define the concept, or even if it is a unidimensional or multidimensional construct. Cohesion is ubiquitous, arising in all but the most temporal of groups. Further, while its impact on certain aspects of group life are unclear, on other aspects, cohesion is definitely influential. For these reasons, anyone who is engaged in the leadership of a group, be it in a task-performing or fraternal sense, needs to be aware of the principles and issues surrounding cohesiveness.

COHESION: UNIDIMENSIONAL OR MULTIDIMENSIONAL?

Researchers are unclear as to whether cohesiveness is a unidimensional (i.e., cohesiveness is a concept in and of itself) or multidimensional (i.e., cohesiveness is actually a collection of more specific concepts) construct. The answer to this question is important, not only for theoretical reasons but also because a clearer definition would help practitioners determine the aspects of cohesiveness that need to be altered in order to improve particular aspects of the group experience. Early twenty-first-century evidence suggests it is multidimensional, with the most likely elements of cohesion being, in no particular order, strength of within-group norms, ability to resist externally caused disruptions, extent of member commitment to the group and its members, and degree of member interest in the group's goals and social relationships.

Being committed to a group does not imply that one is committed to its members, and vice versa. One can accept the group's reason for existence yet feel that some or all of its members are not good work partners; one can be attracted to all members of a group yet feel that the reason for the group's existence is bogus. Cohesiveness is strongest when the person is attracted to both the group and its members. There may be some additional factors that are important for some groups but not others. For example, some groups subject new members to initiation rites, and these rites can sometimes involve some degree of unpleasantness, usually connected with physical and/or emotional discomfort. The assumption, and there is some research evidence to back this, is that having to suffer to gain entry into a group will strengthen your commitment to that group. In such groups, then, pre-entry suffering would be yet another factor that influences cohesiveness.

WHAT AFFECTS COHESION?

That cohesiveness is likely multidimensional implies that no single factor determines its level. Indeed, research evidence shows that cohesiveness is affected by many things: the extent to which group members like each other, the extent to which the group's goals match one's personal goals, satisfaction with how the group is performing, and the existence of outside factors that discourage a member's exiting the group. Group members emphasize different aspects of these factors, explaining why some people will be happy within a group where a particular factor may be undesirable to others. For example, a person might put up with some unpleasant colleagues if the group's reason for existence is consistent with his/her interests and needs, if the group performs this function well, and if there is no other group that provides a similar service.

The biggest impediment to fostering a sense of cohesion is the temporal instability of a group. All else being equal, cohesion will be least in groups in which there is frequent member mobility into and out of the group. This is one of the primary reasons why experts on group composition discourage the frequent transferring of members, and instead recommend that

well-functioning groups be kept together as long as possible. The military, which has long taken an active interest in the dynamics of cohesiveness, has attempted to deal with the mobility issue by developing the concept of “battle rostering,” under which transfers are kept to a minimum and are formally scheduled so that all persons know when a transfer is coming. Some theorists have argued that the basic principles of battle rostering could be extended to other types of groups, and the airline industry has begun implementing some of its principles.

WHY IS COHESION IMPORTANT?

A common perception is that groups perform poorly when the members do not get along with each other. No consensus in the research evidence exists to indicate that cohesiveness impacts group performance; however, some evidence reveals that cohesion may be more important for certain, very particular types of groups (e.g., flight crews) than for others. Additionally, conformity tends to be higher within cohesive groups than within more fractious groups. This includes conforming to group norms of task productivity. This can be beneficial if the group norm is to work hard and always strive for maximum production, but if the group norm prescribes a willful reduction in effort, conformity will be problematic. As an example of the latter, studies have documented norms within actual work groups dictating that high-ability members will perform at a reduced rate so as to mask the poor performance of low-ability members. Thus, if a leader feels that increased cohesion will lead to increased production, there is a good chance this expectation will be violated.

There is also some argument that high cohesiveness can be detrimental to decision-making groups. In particular, theory on groupthink, which refers to the phenomenon of a group of very capable members making a disastrous decision, suggests that highly cohesive groups that have a dynamic leader and are insulated from outside opinion are most susceptible to groupthink. (Detailed examples of this phenomenon are provided in the “groupthink” article included in this volume; for this discussion we sim-

ply note that the 1960 decision by President John F. Kennedy and his cabinet to invade Cuba at the Bay of Pigs is often held up as the classic example of (presumed) groupthink.) However, actual empirical support for this theory is scant, and in particular researchers have not yet been able to demonstrate that high cohesiveness contributes to its occurrence.

Many people who are learning about cohesion are surprised by the assertion that cohesiveness may not improve group performance. Some real examples may be helpful in demonstrating the point. Cohesion is often put forth as important for sports teams (usually under the guise of “team chemistry”). The National League representative in Major League Baseball’s 2002 World Series was the San Francisco Giants, on which the two best players, outfielder Barry Bonds and second baseman Jeff Kent, openly disliked each other, to a degree that they actually physically fought in the dugout during the regular season. Further, Bonds was known to be aloof, with little interest in interacting with his teammates or adhering to team norms, and many players reacted negatively to his distant nature. Despite this, the team came within three innings of actually winning the series and set several postseason offensive records as well.

Cohesiveness seems to impact the stability of group composition regardless of type of group. The less cohesion, the more likely it is that group members will move to other groups if opportunities to move become available. There is also some evidence, taken primarily from studies of military units, that cohesiveness enhances trust in colleagues and superiors, as well as a sense of personal well-being within individual group members. Historically, being concerned about individual-difference factors within groups, of which the latter is an example, has been downplayed among groups researchers, but there is now an abundance of evidence demonstrating that personal reactions to the group experience can have long-term repercussions. As such, it is now generally recommended that group managers attend to both the group itself and the needs of individual members, and addressing issues of cohesion is a way for managers to simultaneously attack both types of issues.

ENHANCING COHESION

How can a group leader enhance cohesion within his/her group? It is not clear from the research evidence that there exists a single, uniformly effective method. Besides minimizing turnover, such strategies as reducing the size of the group, emphasizing a common goal, and reducing perceived differences in member status can all improve cohesion. There also exist some structured methods of enhancing cohesion, employed usually with very particular types of groups but suggested for use with more general groups. In particular, the United States Army has developed a program called COHORT (COHesion, Operational Readiness, and Training), which is designed to keep battle units intact and encourage a sense of cohesiveness within the unit. In a different vein, most commercial airlines now employ a type of flight crew training called LOFT (Line-Oriented Flight Training). Flight crews change members very rapidly, sometimes as frequently as twice a day—the crew that flies from Boston to Washington, D.C., in the morning may have a different engineer for the afternoon return flight, and that group may replace its copilot for the evening flight back to Washington. Such rapid turnover is necessitated by federal rules regulating the total amount of time a crew member spends in the air during a given time period, and as such COHORT-style maintenance of a crew is not practical, because if one member of the crew has met his/her flight time limit and needs time off, the whole crew would have to be grounded. As such, the goal of LOFT is to foster a sense of cohesion among all flight crew members within the airline, so that one feels a bond with the other crew members no matter who they happen to be. Both COHORT and LOFT have been suggested as tools for enhancing cohesion within other layperson groups.

The group supervisor needs to balance a desire for cohesion with group composition issues. Sometimes, typically for reasons of expertise, it is necessary to include in a group individuals who are known not to get along with each other. In such situations, the leader must determine which is more important: harmony or breadth of skill. To give a real example, research on medical teams has shown that doctors,

Group Cohesiveness in Leading a Village in Korea

The following description of how a leader must behave in order to be effective in a Korean fishing village shows the importance of group cohesion in achieving group goals.

A prominent member of one of the Kim lineages, an aggressive and successful fishing entrepreneur, also thinks of himself as a potential leader in promoting economic activity.

In all these cases ambition is expressed in terms of a role where the emphasis is not on personal aggrandizement but rather on the promotion of community welfare and goals. The orientation or frame of reference is collective, and such men see themselves as organizers of group activity, human catalysts promoting cooperative self-help. Success and prestige for them exist in being at the center of energy and movement and thereby gaining the esteem of their fellow villagers. They do not disassociate their own personal fortunes from those of the village as a whole; or at least they are unwilling to express their goals in wholly egoistic terms. Once economic security is achieved and additional resources are available beyond those necessary for bare subsistence, it is still far more prestigious in Sokp'o to align oneself with administrative functions such as leadership of the village, school teaching, or economic development rather than with amassing wealth and living luxuriously.

nurses, and allied health professionals (e.g., x-ray technicians, pharmacists, anesthesiologists) have very different viewpoints on how group decision making should be conducted, with doctors favoring an autocratic style (with them as the decision makers) and nurses and professionals favoring a democratic style. This difference of opinion frequently produces conflict, yet the exclusion of a doctor, nurse, or technician from a medical team is never considered an option. If cohesion can be improved by replacing one member with a different person of comparable expertise, this should be done, but if no such replacement is available, the supervisor will

ultimately need to deal with the conflicts as best he/she can, and anticipate that some group members will exit the group as soon as is feasible.

IMPLICATIONS

The practical implication of the research on cohesiveness is that cohesion can help group leaders who are concerned with the welfare of their group members, and want to make the group environment supportive and the group stable. Whether such an environment will also positively impact production, however, is an open question. The group leader needs to carefully analyze the dynamics within the group, especially the prevailing group norms, and determine whether high levels of cohesiveness will lead to decreased productivity. If so, the leader must decide whether production or satisfaction is the element of the group that should be emphasized.

GROUP DECISION RULES

A group decision rule is a formal rule that specifies how group members' preferences regarding a set of alternatives are to be aggregated so as to produce a decision among the alternatives. Examples of the use of group decision rules include a high school class electing its president by majority vote and a jury reaching a verdict according to unanimity rule. Group decision rules have been the subject of both analytical and empirical studies.

ANALYTICAL STUDIES: SOCIAL CHOICE THEORY

Analytical studies focus on the logical implications of using various group decision rules. For example, the decision rule a group uses has obvious implications for the decisions that it makes. One reason why some universities require a two-thirds favorable vote to award academic tenure is to create a decision bias. It is deemed better to err by denying tenure than by granting tenure. Similarly, the requirement that three-fourths of the states must ratify an amendment to the U.S. Constitution provides a safeguard against amending the Constitution too easily.

In addition to such obvious effects on decisions, group decision rules can have effects that are counterintuitive and problematic. Consider an example regarding majority rule: A group composed of three people—*A*, *B*, and *C*—is to decide an issue involving three alternatives—*x*, *y*, and *z*. Person *A* most prefers *x*, followed by *y*, and then *z*, whereas *B* prefers *y* to *z* to *x*, and *C*'s preference is *z* over *x* over *y*. Suppose that the voting procedure involves pairwise voting, beginning with a vote between *x* and *y*, with the winner then being placed against *z*. By majority rule, the first vote yields *x*, and the second vote yields *z*, which is therefore the group decision. Now suppose

that a different agenda (voting sequence) were used, with y and z being voted on first, and the winner then being placed against x . This agenda results in x as the group decision, a completely different outcome.

This example thus reveals a paradox: The use of majority rule can yield different group decisions, depending on the sequence in which votes are conducted. In general, an alternative is advantaged by entering the voting sequence as late as possible. This paradox of voting is sometimes called the Condorcet paradox, after the French mathematician, philosopher, and economist who discovered it in the late 1700s. Over the years, Condorcet's result was independently discovered by others, and in 1951 it was extended by the Noble Prize-winning economist Kenneth Arrow to show that any non-dictatorial decision rule can lead to mutually contradictory (intransitive) outcomes. Arrow's work served as an impetus for later analytical attempts to understand group decision rules and for the development by economists and political scientists of what is called social (or public) choice theory.

The Condorcet paradox suggests two ways in which the outcome of group decision making may be manipulated. One way is by the strategic misrepresentation of preferences. Consider again the above example and the voting sequence x versus y first, and then the winner versus z —a sequence that results in z as the group decision. This is A 's least preferred alternative, so clearly A would like to avoid such a decision. A might try to do this by misrepresenting his or her preference in the vote between x and y . Instead of voting for x , which is his or her real preference, A could vote for y . Alternative y would thereby obtain a majority against x and, upon being placed against z , would defeat z and emerge as the group decision. In this manner, A would obtain his or her second-preferred, rather than least-preferred, alternative. Of course, to adopt such a strategy of misrepresentation, A would need some knowledge of the preferences of B and C . Furthermore, nothing would prevent B or C from trying to employ a similar strategy.

Another way in which A could manipulate the group decision, even if all group members were to vote sincerely, is through agenda setting. If A were in a position of leadership in the group and could deter-

mine the group's agenda, then A could schedule a first vote between y and z , followed by a vote between the winner and x . This would cause x , A 's most-preferred alternative, to be the group decision. It is worth noting that, in fact, committee voting procedures typically involve pairwise voting. For example, a motion is put forward, and an amendment to the motion is proposed. There is then a vote on amending the motion, followed by a vote on whichever wins—the motion or the amended motion. (Effectively, the winner is voted on against the alternative of “no change.”) The power to set the agenda is therefore of practical and not just theoretical significance, and is one reason why leadership positions such as committee chair are sought so eagerly in Congress and other legislative bodies.

EMPIRICAL STUDIES: THE PSYCHOLOGY OF DECISION RULES

Empirical work on group decision rules is more recent in origin than the work on social choice and is largely the product of psychologists. This work has been almost entirely experimental, has involved small ad hoc groups, and has focused on how the decision rules that are assigned to groups affect the behavior, thoughts, and feelings of group members, and how group members evaluate the use of different decision rules. Two characteristics of group decision rules are of particular importance with regard to empirical effects of the rules: The strictness of a rule refers to the extent to which group members must express similar preferences in order to reach a group decision. Unanimity rule is a strict rule; it requires that to make a decision all group members must express agreement on the same alternative. Majority rule is less strict; it requires agreement by just over half of the group members to make a decision. The distribution of power under a decision rule refers to how similarly the rule treats group members with regard to their formal influence on the group decision. Majority rule is an egalitarian rule: it gives every member equal power in making the group decision. Dictatorial rule is highly authoritarian: It allots all decision-making power to a single group member or leader.

Empirical studies of group decision rules have concentrated more on strictness than on the distribution of power. Interest in strictness is largely an outgrowth of rulings by the U.S. Supreme Court in the 1970s holding that, in certain cases, less-than-unanimous jury verdicts are constitutional. Many studies using mock juries have compared variations of majority rule (simple, two-thirds, three-fourths) with unanimity rule. Relatively few studies have compared egalitarian rules such as majority rule with more authoritarian rules such as rule by dictator.

Like analytical studies, empirical studies have yielded some findings that seem relatively obvious, and others that seem less so. One of the more obvious and frequent findings is that group decisions are more difficult to reach under stricter decision rules. The use of unanimity, as compared to a majority, requirement is more likely to result in a group failing to reach a decision. Moreover, when the group does reach a decision, the decision-making process tends to take longer, and group members are likely to regard the process as more uncomfortable, difficult, and contentious, but also as more adequate and thorough.

Stricter decision rules are also more likely to result in decisions that represent some sort of compromise. As an example, consider a situation in which a six-person civil jury has agreed that a plaintiff should be awarded damages and is trying to decide on the amount of damages. Suppose the six jurors' preferred damages are \$150,000, \$150,000, \$200,000, \$230,000, \$280,000, and \$650,000. When the preference distribution of group members is skewed, as in this instance, unanimity rule is more likely than majority rule to result in a decision that takes account of the preferences of more extreme members. Under majority rule, the member who prefers a \$650,000 award can more easily be ignored, and an award of, say, \$200,000 might be made. Under unanimity rule, the more extreme member cannot be disregarded so readily, and an award that lies closer to that member's preference (i.e., a larger award) is more likely.

Use of stricter decision rules is also more likely to result in individual group members changing their preferences during the decision-making process.

Such changes involve not just members' publicly expressed preferences—as may be necessary with a stricter decision requirement—but also their privately held opinions. The changes tend to be in the direction of both greater agreement with other group members and greater agreement with the eventual group decision. Several studies further suggest that group members tend to be more satisfied with decisions reached under unanimity rule than with those made under majority rule. This is probably because, as a number of studies have also found, satisfaction with the group decision is determined primarily by agreement with the decision. Thus, in leading to more agreement with the group decision, stricter decision rules may also lead to more satisfaction with the decision.

A rather non-obvious empirical finding is that group decision rules, in conjunction with the preferences of group members, may affect members' liking for one another. The more that group members agree with each other, the more they tend to like each other. By creating greater agreement among members, stricter decision rules may lead to more liking among the members. Studies also suggest that liking for a group member is influenced by the extent to which the member is seen as being responsible for making a group decision that is unrepresentative. The greater a member's perceived responsibility for an unrepresentative decision, the more the member tends to be rejected. Moreover, the "credit" one receives for making a decision that is representative does not seem to offset the "blame" that attaches to making a decision that is unrepresentative. Non-egalitarian decision rules that assign a single group member to a position of authority or leadership thus appear to leave that member especially vulnerable to rejection. There is some evidence, however, that leaders may be able to overcome this by making sure that other group members are treated with dignity and feel respected.

Not surprisingly perhaps, group decision rules differ in regard to how they are evaluated by group members. Some rules are seen as fairer or better than others, and given an opportunity, group members prefer making decisions according to such rules. Several studies have shown that the perceived fair-

ness of a group decision rule depends, in part, on whether the decision that results from use of the rule is representative of members' preferences. If the decision is representative, the rule tends to be seen as fair; if the decision is unrepresentative, the rule tends to be seen as unfair. Decision rules that are stricter or more egalitarian are more likely to result in representative decisions, and thus more likely to be seen as fair. Even rules that are neither strict nor egalitarian, however, may be seen as somewhat fair so long as they lead to representative decisions. Indeed, even a dictatorial decision rule may be perceived as fair when the dictator makes decisions that are representative of member preferences.

Moreover, group members may be willing to adopt an essentially dictatorial rule if it seems necessary to solve a problem, and if no better decision method is available. This is shown by the results of several studies involving resource dilemmas. In a resource dilemma, group members share access to a common, replenishable pool of resources. Each member can harvest resources from the pool, but if too many harvest too much too quickly, the resource cannot replenish rapidly enough, and it will be depleted. It is in each member's self-interest to harvest as much of the resource for himself or herself as possible, but it is in the collective interest to maintain the pool for as long as possible. When group members believe the resource pool is being over-harvested, they are often willing to solve the dilemma by foregoing access to the pool and electing a single member as leader, with the formal power to determine who gets to harvest how much. Still, if given the opportunity, members are also likely to choose more egalitarian methods of solving the dilemma, such as deciding harvest allocations by majority vote.

Preferences regarding the use of group decision rules are undoubtedly acquired beginning at an early age, in the normal course of childhood development and socialization. Children as young as six to seven years old (first graders) have been shown to evaluate egalitarian systems of governance (rule by majority or unanimity) as better than authoritarian systems, and to prefer egalitarian systems over authoritarian systems even when the authoritarian system is described as one in which decisions are made only by the wisest peo-

ple. Children this young tend to evaluate decision methods based on their own peer group experiences, and perhaps because of this, they believe that consensus procedures, in which everyone must agree, are as good as or better than various sorts of majority rule. As children grow older, their evaluations of decision rules change and grow more sophisticated. Fifth-grade children have been shown to have an even stronger preference for egalitarian systems over authoritarian ones than do first graders, and to have a better understanding of the pragmatic problems associated with the use of consensus procedures, and so to have a distinct preference for using majority rule.

FUTURE DIRECTIONS FOR EMPIRICAL STUDIES

To date, empirical studies of group decision rules have focused on relatively egalitarian decision rules, often comparing the effects of assigned majority and unanimity rules in mock juries. Yet many other rules are in everyday use in a variety of situations. For example, the use of relatively authoritarian rules, in which one or a few persons hold the formal power to make decisions, is common in the workplace. Undoubtedly, different decision procedures exist because of social norms sanctioning their use. Instead of assigning decision rules to groups, future research might usefully explore the development of norms regarding decision rules by attempting to identify the conditions under which various decision rules "naturally" emerge (i.e., under which groups typically adopt certain rules). To the extent that future research continues to focus on assigned decision rules, it might benefit from comparing a greater variety of rules in a broader assortment of settings. This would also provide a way of beginning to understand which group decision rules are normative in what situations, and to enhance the ecological validity of the research.

GROUP EFFECTIVENESS

Group effectiveness refers to the quality of a task-oriented group's performance. Although the task can involve either decision making or physical performance, "effectiveness" is usually employed to describe just decision-making groups. Group effectiveness is crucial for any group leader to consider, because if the group is not effective, there is little point in continuing to use the group.

RESEARCH ON GROUP EFFECTIVENESS

Interest in the quality of group decision making extends back to the 1932, when Marjorie Shaw published the first empirical comparison of the effectiveness of decision-making groups against individuals. She had groups and individuals complete a series of problem-solving tasks, and found that groups did better (i.e., got more right answers) than individuals. Groups took longer to complete the task, but Shaw attributed this to error checking and consideration of alternative solutions, both desirable

features that an individual generally cannot realize. Subsequent research over the next three decades largely confirmed Shaw's results, though the problem of time-to-completion grew larger, and many researchers could not confirm that the time lag was due solely to attempts at quality control. Researchers were also observing time being spent socializing; duplication of effort; and failure to adequately coordinate member abilities. Theorists began talking not only about the group's effectiveness, but also about its *efficiency* in completing a task. Then, in 1955 Dorothy Marquart compared interacting groups against "statisticized groups," which consisted of a set of independently working members in which a correct "solution" simply meant that at least one person had solved the problem. In other words, if one member solved the problem, the entire group got credit for it, even though every group member worked alone. Marquart found that the statisticized groups performed at least as well as the interacting groups. Today, theorists generally agree that interacting groups actually perform about as well as would the best member of the group working alone, but potentially could considerably outperform the best individual, if their inefficiencies could be reduced.

What causes group inefficiency? In 1966, Ivan Steiner proposed the concept of process loss to explain the problem. Steiner argued that groups suffer from two types of inefficiency: "coordination loss," which occurs when group members fail to adequately organize their efforts, and "motivation loss," which occurs when group members lose interest in the group task. In theory, group effectiveness would increase if the group leader could determine whether one or both of these are causing his/her group's inefficiency and could minimize the losses. Unfortunately, subsequent research has identified numerous contributors to coordination and motivation loss, many of which seem to be specific to particular types of tasks, and resistant to intervention. The number of contributing factors is too numerous to list here (interested readers should consult any of the books listed in the "Further Reading" section), but an example can be provided. The phenomenon of biased sampling occurs when interacting group

members confine discussion to information that all members already know. When a group member tries to share relevant information that only he/she possesses, the attempt is greeted with skepticism, and further discussion of that new information is suppressed. Assuming that the purpose of discussion is to broaden the set of information that group members can draw upon to make an informed decision, it follows that biased sampling is a type of coordination loss—group members are not taking advantage of the benefits of discussion, and as a result they base their collective decision on about the same set of information as any one individual would use. Unfortunately, biased sampling has proven very hard to eradicate or even minimize.

IMPROVING EFFECTIVENESS

Many theorists are interested in the question of how group effectiveness can be improved. There is evidence that ineffectiveness can sometimes be caused by poor leadership practices, and sometimes result from within-group factors that are not caused by the leader. Of course, both can occur simultaneously. It seems that many of these problems can be corrected by the leader, though as we will see in a later section, fixing the problem is not always as straightforward as one would think given the nature of the problem.

Regarding how poor leadership can produce ineffectiveness, Richard Hackman has delineated a number of ways in which a group leader can err. The leader can assign to the group a task that is better completed by an individual; the leader can label a collection of individuals as “the group” without letting them function as one; the leader’s management style can be too dictatorial or too laissez-faire; the leader can fail to provide needed structure to the group and its task; the leader can fail to provide the resources necessary for the group to achieve its goal; and the leader can fail to provide assistance to individual group members who need to learn or refine task-relevant skills. In all of these situations, the group’s overall effectiveness will be suboptimal. One would think that, from this perspective, improving group performance would be simple—just deter-

I long to accomplish a great and noble task, but it is my chief duty to accomplish humble tasks as though they were great and noble. The world is moved along not only by the mighty shoves of its heroes but also by the aggregate of the tiny pushes of each honest worker.

—Helen Keller

mine the errors that the leader is making, and correct the leader’s behavior. However, some very real obstacles exist when correcting leader errors. In the next section, we will discuss impediments to the implementation of measures designed to correct the group’s actions.

There are also a number of within-group factors that can impact effectiveness. For example, ill-defined or inappropriate goals, member conflict, flawed task processes, and failure to employ task-relevant skills can all compromise performance. How these factors arise is a multifaceted question, and, at this point, it is close to impossible to predict with any accuracy which factor will arise, and when, and how severely they will impact the group. Further, unless the leader is an active member of the group, he/she will not be aware of the development of these problems until they have fully manifested themselves. To help the leader identify and correct internal flaws, a technique known as “reflexivity,” or team self-correction, has been suggested and studied.

IMPEDIMENTS TO IMPROVING EFFECTIVENESS

There are a number of obstacles that can make the improvement of group effectiveness more difficult than it seems it should be. For example, as noted above, the correction of leader errors is not as straightforward as simply coaching a leader on what to do and not do. For example, ideological issues can often co-opt attempts to improve leadership of a group. Though “bureaucracy” is considered undesirable by many, in fact a number of the leader errors documented above result from the absence of bureaucracy—too little structure, too little supervi-

sion, too little intervention. Organizations that have a “no bureaucracy” philosophy may find themselves with unproductive, inefficient groups. An often cited example of this is People Express Airlines, a regional airline founded in the 1980s and organized completely around self-managing groups. Self-management worked well when the company was small, but as it grew, work group performance began to slip. Company founders resisted recommendations to impose structure and direction on the groups, and eventually the airline collapsed.

A related problem is that the leader behaviors that are producing the errors may be dictated by organizational policy. In this situation, to change the leader one has to change the policy, and this is often a difficult task, especially if the policy has been in place for a substantial period of time.

At the member level, internal problems can potentially be corrected by employing team self-correction procedures. Unfortunately, the leader who wants to follow this approach may immediately have to deal with group members who do not perceive themselves as performing at a suboptimal level, who are willing to tolerate a certain amount of inefficiency in order to perform the task in a preferred fashion, or who cannot agree on the best way to correct the errors. If the leader can get past these hurdles, and it is not at all clear from the research literature how best to do this, then he/she can engage the group in self-correction. This process requires having group members compare their performance to date with their ideal level of performance, which allows them to identify errors and plan for the future, and then alter their procedures so as to reorient themselves toward the group goal. Some research suggests that self-correction is most likely to be successful if the leader provides explicit feedback on the quality of the group’s performance, if the group is moving toward a specific goal that was established pretask, if group members have a common understanding of that goal and of the strategies necessary for achieving that goal, and if group members agree on the nature of the errors and how to correct them. The first two of these factors are directly under the leader’s control; the latter two are not, but the leader can work with the individual members to foster

agreement and mutual understanding of the group’s aims and mistakes.

IMPLICATIONS

There are many factors that can disrupt a group’s efficient progression toward its goal. It is important to understand that, despite over seventy years of research on these factors, complete understanding of what disrupts groups, when disruptions occur, and how to avoid or minimize disruptions is not evident. Instead, the early twenty-first-century state of the science requires that we allow the inefficiency to arise, and then correct it. This will understandably be frustrating to the reader who is trying to put these principles into practice. But what should also be clear is that, at least for groups with an identified leader who has power, there are a number of interventions that have the potential to correct performance and make the group more effective. Correction of suboptimal performance of groups without a formal leader, or with just a nominal leader, is another subject entirely, one about which even less is known.

GROUP NORMS

Group norms are the standards that largely govern behavior within a group. The norms may be explicit and carefully recorded for all future members to see and learn, but just as often they might be implicit, in which case transmission to a new member will be dependent upon the ability and motivation of senior group members to accurately convey the norm. Norms have a strong influence on group-based behavior and are difficult to change. More troublesome for the group leader who wants to alter a group norm, implicit norms can be difficult to even detect.

THE INFLUENTIAL POWER OF NORMS

All groups have some system of norms that govern the behavior of its members. Indeed, a normless group would be chaotic and anarchic because there would be no boundaries for proper behavior. Norms help group members determine what to do in unfamiliar situations, and for many groups norms are vital to their very success—many companies would go bankrupt if the norm “do your job well” did not exist, for example. Norms of course exist in large groups and societies, but small groups that exist within these larger ones also have their own sets of norms, and these norms can, and often do, exist at odds with those of the larger group. For example, many retailers have policies against male employees wearing facial hair, though society as a whole takes no position on whether beards are appropriate. Within a group of delinquents, it may be acceptable to shoplift. Further, norms can be formal, in that they are officially and unambiguously recorded for all

members to see, or informal, in that they are held in the collective conscious but not permanently recorded. Informal norms are at once harder to detect, more susceptible to inaccurate transmission, and more likely to change than formal norms. Examples of informal norms abound. Societal groups maintain many such norms regarding fashion, for example. What is considered a fashionable hairstyle for a woman changes frequently, yet there is never an official declaration that a certain style is “out” and women with that style need to immediately visit a stylist. Some women learn of the change more quickly than others, some never learn, and those who do change sometimes go in the wrong direction, and adopt a style that is less rather than more fashionable. All of this is characteristic of an informal norm.

Norms, then, perform a regulatory and often a survival function. For these reasons alone they are influential. Despite these definite values, however, group members will often be tempted to violate a norm in order to maximize their own gain. Such deviance could potentially harm the group, so to guard against it occurring, most groups will have developed a sanctioning system designed to punish non-normative behavior. The familiar example is the system of punishments most societies create for lawbreakers (e.g., the fine associated with exceeding the speed limit), but punishments can be intangible as well. Ostracism, or the social shunning of group members, is a common, and often effective, means of keeping deviants in line. Sanctioning systems, however, are largely ineffective if they are inconsistently applied, because this implies that punishment is probabilistic rather than deterministic (e.g., speeders are sometimes but not always fined); if the sanction itself is weak and has no real negative impact (the fine for speeding is only 25 cents); or if continued group membership is not especially attractive to the deviant (the speeder who loses his driver’s license is willing to ride public transportation). Interestingly, evidence suggests that groups can be distinguished by the breadth of their sanctioning systems. In some groups any deviation from any norm will result in swift and sure retribution, while in other groups some deviance will be tolerated, as long as it is not too severe, and does not involve a crucial norm.

Group Norms and Group Boundaries

Group norms both create unity within the group and create boundaries between groups. The following text describes how group norms among the Santals, a non-Hindu ethnic group in India, help differentiate Santals from Hindus and how adherence to Santal norms gains one acceptance in the group.

When distinguishing themselves from Hindus, Santals make use of some relative criteria. These are bonga (nature spirits), handi (rice-beer), and khasi (pork). These are, incidentally, also the practices for which the Santals are despised by the Hindus.

As pointed out above, belief in bongas and witchcraft is deeply rooted in their lifeways, so much so that "bonga" is a password for Santal. We have noted above that non-tribal Santal call their tribal brothers as bonga-hor. Similarly, handi (rice-beer) has very important place in Santal life. In rituals, social gatherings, festivals, informal visits, ceremonies, meetings, in fact at every important occasion, rice-beer is necessarily passed. It is a form of social obligation. It is a sacred libation to bongas. It is a "fine" imposed by the village council. Handi and dancing, for the Santal, is a symbol of happy, prosperous, ideal life. Characterizing the Hinduized Santals once K. Hemrom of Kuapara said, "Are they Santals? They do not even drink. How can they be Santal?" Not drinking rice-beer is associated with Hindu norms in contradistinction to the Santal norms. I myself had great difficulty in establishing rapport with them, until I started accepting rice-beer from them. This, I later learnt, was the greatest qualification of friendship they ascribed to me. "He sits and drinks with us", they would very proudly inform their visitors, and I was soon given cordial smile even by the Santals I never knew. Khasi (pork) is similarly another quality which they think distinguishes them from Hindus, although pork does not have such important place in their life as handi. Zeal for handi, dancing and pork is shared by the detribalised Santals also.

Source: Kochar, Vijay. (1970). *Social Organization Among the Santal*. Calcutta: Editions Indian, pp. 35-36.

The particular problem for the group leader is the situation in which a small-group norm conflicts with the larger-scale norm. For example, there is evidence that many blue-collar workers perceive safety gear (goggles, helmets, steel-toed shoes, ear plugs, safety guards) as not "macho," and as such an informal norm can develop to not employ these devices. This is at odds with the company's norm of accident prevention, and sets the stage for serious problems.

NORM TRANSMISSION

What should be evident from the preceding discussion is that norms serve an informational function, in

that they indicate to members what is and is not appropriate. Consequently, it is especially important that norms be accurately transmitted to incoming members of the group. The process of norm transmission is typically referred to as "socialization." Formal norms, because they are recorded, are relatively easy to transmit, though someone must take the time to provide the documentation to the new member and clarify any ambiguities that exist in the written record. Rather than engaging in rigorous education, groups will sometimes ask an experienced member to explain the formal norms. This method, however, can be problematic, in part because it assumes that the experienced member correctly understands the formal norm, and in part because the member may convey some bad habits designed to partially circumvent the norm, or behavioral shortcuts that only work for experienced individuals. Because of these, it is generally recommended that group leaders take the time to explain explicitly formal norms to new members. This is best accomplished by conducting a new member orientation.

Informal norms tend to be shared verbally or by means of new members observing the behaviors of experienced members. Knowledge of the informal norms is typically confined to members of an ingroup and it can be very difficult for an outgroup member to receive acknowledgement that the norm exists. Thus, if the outgroup member desires to change the informal norm, he/she often has to act on simple perceptions that the norm exists.

CHANGING NORMS

Once established, norms retain their influence for a substantial period of time. In a famous study in the

early 1960s, R. C. Jacobs and Donald Campbell created a laboratory group that would perform a visual perception task. They instilled in the group a norm to falsely report the experience of the visual stimulus. The task was repeated many times, and on each repetition a member of the group was replaced by a new member until all of the original members were gone. The experimenters then commenced replacing this second generation of members with a third generation, and so on for many generations. Jacobs and Campbell observed the original “false report” norm to be influential across many generations, though each succeeding generation altered it slightly, and eventually the norm matched that observed in a control group. The key idea here, though, is that no generation simply created a new norm as its own; rather, it adopted the one employed by the previous generation, sometimes in a modified version. And it is important to remember that the perpetuated norm was a deviant one. This demonstrates that norms are durable.

But what do we do if we want to alter a norm? Certainly a deviant norm needs to be changed, but there are also situations in which once-acceptable norms are now outdated and need to be changed. Examples of the latter are seen in once-thriving companies that failed to change their business practices with the times. How can we effect such change if norms persist as strongly as they seem to?

The Jacobs and Campbell study suggests one possible method—rotation of group membership. In this way, members whose behavior is entrenched in the unattractive norm are removed, and new members who can be trained in the desirable norm are added. However, often it is impractical, or even impossible, to remove established members, and, even if membership changes can be executed, there may well be significant performance drawbacks associated with the exchange of experienced members for novice ones. A compromise is to identify the member who most strongly enforces the norm and remove him/her. Other strategies that have been suggested are demonstration of the fallibility of the norm; providing incentives for adherence to the new norm; and punishing those who follow the old norm. No one of these techniques; however, seems

to be uniformly successful. In fact, the most successful “intervention” for altering a norm seems to be the group’s experiencing a failure as the result of adhering to the established norm, because this “failure” provides evidence that the norm simply does not work anymore. For example, though company insiders had been trying for a decade to change it, General Motors’ pattern of avoiding issues of fuel efficiency was finally altered in the late 1970s after sales of General Motors’ cars was surpassed by sales of fuel-efficient imports. (Automotive historians generally treat 1980, when the company initiated a \$40 billion redesign program, created the vice president for quality and reliability position, and suffered its first financial loss in 60 years, as the turning point.) Note, however, that experienced failure does not necessarily indicate how the norm should be changed. Groups that desire change will often need to solicit outside information to assist with development of the new norm.

Implicit in this discussion is the value of flexible norms, or norms from which some deviation will be tolerated. There is some evidence that norm flexibility reduces the likelihood that subgroups will adopt their own standards of behavior. Also, as the original norm becomes less applicable, its flexibility will allow it to be altered more easily, thus helping the group avoid the more radical changes that occur if a prevailing norm has to be abandoned and replaced by a completely new standard.

IMPLICATIONS

No group can easily exist without a set of norms. Group leaders, however, need to remember that the norms within a smaller group do not have to correspond to the norms of the larger group within which it is embedded. Simply assuming that members of the smaller group will act in a particular way because the larger group subscribes to that behavior is dangerous. The leader needs also to be aware that the efficacy of norms can change over time. What has worked historically may no longer be what is needed now. For these reasons, overseeing an effective and productive group requires monitoring the prevailing group norms, and intervening when, for

whatever reason, the norm is contributing to suboptimal performance.

GROUP PROCESS

Leadership is a function of the group. Beyond the person or the process, leadership is an expression of the actions or intentions of a human collective. Without the group, leadership is hypothetical. While one may argue that leadership is noted in an individual who mobilizes the needs and aspirations of the group, such mobilization first requires the presence of the group's collective desires. The primacy of the group in the construction of leadership is generally

understated, however, with much more attention given to the reciprocal relationship between the leader and the follower or to the characteristics of the leader.

THE NATURE OF THE GROUP

A group becomes a group when a human collective takes some form of action. At this moment of action, a group's members may recognize one another as well as be recognized by others outside the group. This fact as well as a shared sense of commonality that stems from the action taken or to be taken creates the identity of the group. Once a group is a group, its survival depends on attending to some task to which the aggregate of individuals collectively attributes meaning and primacy. If there is a lack of clarity about meaning, sustained inactivity, or disagreement about the primacy of the task, the individuals who constitute the group are likely to exercise the freedom to devote their attention to other groups through which their needs can be expressed. Such attention can be direct, as in specific allegiance to a group, as well as indirect, as through identification with some group for its mission and purpose. In either case, the key is that individuals who constitute a group expend some form of energy toward the collective to give the group its identity and existence.

Leadership becomes a function of the group through how the group understands and seeks to carry out its task. Once the task is understood and delineated, the capacities of the various members of the group and the means by which the task is to be approached determines the emergence of leadership. This moment of emergence is what the psychoanalyst Wilfred Bion (1897–1979), a pioneer in the study of groups, called the creation of the work group. Such a group has a task to which some form of allegiance is established. The group continues to exist so long as its members recognize its primacy and the group affirms the members' needs. The quality of the group's leadership depends on the capacity of those who emerge to represent what the group understands itself to be and the action the group seeks to take.

According to Bion, the group has a fickle uncon-

scious relationship with its leadership. Alongside the work group is the basic assumption group—the basic assumption being that the group is still attending to the task to which it has given primacy. What Bion observed is that the anxiety of sustaining attention on that task generates conflicts that are often left unexpressed and become enacted in characteristic task-avoidant ways.

TASK AVOIDANCE

Perhaps the most common form of task avoidance is dependency on the group's consciously or unconsciously designated leadership. Through this process, the group gives over its sense of responsibility for the collective task to the leadership. The leadership, having been entrusted with that responsibility, develops a sense of grandiosity and omnipotence. The task becomes lost when those in leadership mistake the power conferred on them for some inherent, irreplaceable capacity within themselves. In the worst cases, leadership is replaced by despotism and the original task is lost, the leadership's aim having become instead the repressive maintenance of power. In other instances, the group withdraws its support from the leadership because of collective disappointment resulting from the leadership's inability to meet the needs of the group. In either instance, the task and the meaning that brought the group together are lost.

The group may also avoid dealing with the task that brought them together by expending their energies on internal fights and threats of dissolution. The classic fight-flight dilemma, also outlined by Bion, provides a focus for leadership that is alien to the primary task of the group. Often when there is a leadership vacuum or there are differences in perceptions about the aspirations of the group, the fight—sometimes veiled in polite discussion and other times visible as bald, destructive aggression—appears. Factions align themselves with one or another side, with the dominant voice of the moment prevailing. It must be understood that this dominance is *not* leadership. Though the moment may last a millennium, the tasks taken on by such powers are necessarily secondary to the primary aims that brought the collective together initially. Often in the course of history, this primary

A Norwegian tour group in Venice.

purpose is lost or subverted. The evidence of its continuous presence, often at a collective unconscious level, is in the eruption of the fight again and again in transformed forms. Those who opt out of the fight, especially in larger-scale groups, become refugees from the insurgency. In smaller groups, where the actual act of fleeing is more visible and less possible, the departure can come in the form of psychological absence and withdrawal.

The most pernicious forms of the fight-flight process have two equally destructive expressions. The first is assassinations and coups to topple those who have taken leadership roles, often concurrent with the slaughter of those who supported them. In the second expression, alienation from the group is so pronounced that the group forced to subordinate its aspirations “flees” through self-destruction. Suicide, within-group violence, addictive behavior, and early mortality are examples of that self-destructive expression. Self-destructive expressions of the fight-flight process are especially likely when all sense of connection to the initial group identity and purpose are lost.

In two other forms of group task avoidance, members of the group either pair off in small alliances (a phenomenon called pairing) or they fall into a cult-like oneness where differences are obliterated for the sake of staving off conflict. In the former case, this pairing can be idealized to the point where messianic

Leader Status and the Group Process

The following example from the Santal ethnic group in India shows a process common to all groups; that status differences between leaders and followers will inhibit free communication between the two.

I have heard other Santal remark that they could not sing or talk freely before a certain educated Santal who was a village leader because his bearing made them ill at ease. It seems particularly difficult to carry on the normal "pleasure" activities such as dancing, singing, drinking, and even convivial conversation, before such august Santal. The same gap seen from the vantage point of the educated is expressed in the following remarks of an educated woman:

I am happy now to be living in the city because both my child and I were sick from "envy" [i.e., being "envied" by others] when we lived in the *bustee*; all are healthy here. I never danced or sang in the village though I liked to watch; my mother and sister danced but I didn't. When very young I did, but after I started going to school, I didn't. Some don't send their children to school because others will have "envy" and say that highly educated girls will be outcasted for marrying into other castes; that is not true. Why shouldn't we study as high as money allows? Diku girls do.

expectations are placed on what the pairs will produce. Historically, tribal, dynastic, and monarchical systems have perpetuated pairing to produce the next and the next heir. Those unable to discern their own motivations with clarity may become attracted to the unity that appears present in oneness groups. The leadership that emerges takes on messianic dimensions, casting a long shadow in which the membership of the group chooses to dwell. Having lost connection with the paradox of group life that calls for the group's affirmation of the individual member, diversity of expression is harshly limited. The false messiahs reign in lieu of leadership as the group seeks comfort in the illusion of secure community.

LEADERSHIP IN GROUPS

Leadership exists in the context of a group. With the exception of leadership in the mind, which is an intrapersonal, subjective process, leadership requires at least two people, which means that it also becomes a group dynamic. These two individuals must determine the task they share in common. Once

they have done so, they have constructed another entity—the group. In doing so they have also constructed another identity for themselves that reflects their membership in this group.

The scholar Leroy Wells notes that the group as a whole has its own qualities that differ from the qualities of its individual members. The group has its own voice, its own boundaries, and its own task. However, the voice of the group is expressed through individual members. What is key in this formulation is that when group members speak through their words or action, it is the *group* that is speaking. Those who hold leadership roles are necessarily entrusted to be temporary representatives of the will, desire, and motivations of the group. So long as the group's lead-

ers continue to reflect the will of the group, the group's defining meaning, and the focus on the primary activity that brought the group together, they may continue to represent the group. The clearest example of this may be the election of officials in democratic societies. Elected representatives remain in office so long as the majority continues to believe that they represent the majority's will.

The example of elective office, however, does not amply illustrate the richness of the dynamic nature of leadership as a function of the group. Such leadership is powerfully fluid, seldom contained by formal roles. Further, leadership may also take much more minute forms, such that at any given moment any individual may become the expression of the group's understanding of itself. Accordingly, an analysis of the group process may be a necessary step in understanding the nature of leadership.

GROUP SATISFACTION

Group satisfaction refers to the general emotional tenor among members of the group. In particular, the term addresses the extent to which members are satisfied with their experiences within the group. Satisfaction is one of the more vexing concepts within psychology because its impact on other behavioral and cognitive phenomena is not straightforward. For example, the common belief that a dissatisfied group member will leave the group rather than continue to have unpleasant experiences is not necessarily true. In fact, dissatisfaction all by itself is not especially predictive of any specific behavior. Rather, psychologists are concerned with satisfaction because it seems to increase the likelihood of the occurrence of a variety of negative outcomes.

PROCEDURAL JUSTICE

Displeasure with the group experience can be caused by myriad factors. The shift can be as particular as a misfit among the various personalities within the group. Features of the group environment can also trigger widespread dissatisfaction; for example, a common feature is the way in which group member input is solicited. The principle of procedural justice refers to the desire of group members to have their preferences considered in the decision-making process. Research on procedural justice has shown that group members will react

very negatively if they feel that leaders were not aware of member concerns and that no mechanism existed by which those concerns could be aired. Chronic failure on the part of the leader to learn about group member concerns usually provokes broad and strong feelings of dissatisfaction. Most important: achieving procedural justice does not require that group member preferences be integrated into the final decision; rather, procedural justice is perceived when group members feel that their concerns were fairly and thoroughly considered before a decision was rendered, even if the decision ultimately is at odds with what members would have liked. The group leader, then, should whenever possible solicit the opinions of members about a decision issue, and give them serious consideration. If the opinions have merit, it will be beneficial to integrate them into the final decision, but the leader should not attempt to force baseless ideas into the decision simply because they were produced by the group members.

INEQUITY AND DEPRIVATION

Another common contributor to dissatisfaction is perceived inequity. When this occurs, group members believe that the group leader maintains inconsistent standards for the amount of effort required in order to receive a specific reward. For example, a group member who works hard on a task may receive lavish praise from the group leader, but a second member who works equally hard may get only passing recognition from the leader. Inequity is psychologically uncomfortable and those who experience it are motivated to eliminate it. Some of the commonly observed techniques for dealing with inequity, like cognitive distortion of the situation or selection of a new standard of comparison, have little impact on group functioning. Others, however, like reduction of effort, attempting to get others to increase their efforts, and departure from the group, can all be disruptive to group life. Further, it is hard to predict which of these options the inequity-perceiving group member will select. For this reason, the group leader needs to ensure that rewards are commensurate with effort, and that all members who

expend the same effort receive the same magnitude of reward.

Related to the concept of inequity is relative deprivation. Whereas inequity is based on an objective comparison of one's outcomes, relative deprivation arises from subjective comparisons that lead us to the conclusion that we are doing subjectively worse than others. It is important to note that objectively, our outcomes could be highly desirable—we will still feel deprived if we believe that others are doing better than us. One of the first published studies of group satisfaction addressed relative deprivation. Conducted in 1949 by Samuel Stouffer and colleagues, this research looked at (among other topics) the satisfaction of military personnel during World War II. Stouffer and his colleagues observed that airmen, who had a high rate of promotion, were nonetheless dissatisfied with their promotion system, whereas members of the military police (MP), who had a slow rate of promotion, were quite satisfied with their system. Objectively the airmen should have been more satisfied because they were all advancing more rapidly than the MPs, but the airmen instead were focusing on the fact that, within their group, some people were promoted more quickly than others. By contrast, among the MPs, promotions tended to be awarded at the same time. To give a concrete example, imagine that Soldier Smith moved from airman to technical sergeant, a move that requires five promotions, in 18 months. This would objectively be an very fast rate of promotion, but if another airman had made it to technical sergeant in sixteen months, we would expect Smith to be unhappy with the promotional system. (And interestingly, if a third soldier made it to technical sergeant in twenty-two months, we would expect him to be dissatisfied because he had not moved as quickly as Smith. Thus, the dissatisfied person can simultaneously be a cause of dissatisfaction.) The MPs, though not advancing much at all, would have more of a “we are all in the same boat” outlook.

Research suggests that relative deprivation can best be dealt with by providing group members with a justification for why the process functions as it does, or by demonstrating that the deprived person will be able to receive the desired outcomes in the

near future. Continuing with this example, the air force might have been able to improve satisfaction among the airmen by explaining why promotions occurred at differential rates, by reassuring the deprived airmen that they too would soon receive promotions, or both. Note the similarities between these remedies and those we discussed associated with procedural justice. Fairness of procedures is critical for avoiding dissatisfaction among group members, and that none of the recommendations associated with relative deprivation demand that procedures be altered. The air force should not have changed their promotional schedule to mollify the airmen, but rather group members should have been consulted, informed, and thus respected. For the group leader, this would have meant asking for input before a decision was made, and explaining afterward why a particular course of action was selected.

LEADER-MEMBER INTERACTION

Dissatisfaction can also arise from the nature of the interaction patterns within the group. In particular, there is some evidence that the way that group members are treated by the group leader impacts their degree of satisfaction. There is some evidence that leaders develop an ingroup and an outgroup of members. Those in the ingroup tend to be given considerable latitude to function as they please and have good relations with the leader, whereas those in the outgroup are usually required to behave within a structure and have formal and distant relations with the leader. Research shows that outgroup members report general dissatisfaction with the group experience.

It is not clear what the group leader can do about dissatisfaction that results from low-quality interactions. Discouraging the leader from creating an ingroup and outgroup is a possibility, but the psychological identification of such groups is a basic fact of social life and might even be described as a “natural” feature of a social being. We could recommend that the leader make it easy to move from outgroup to ingroup, but research shows that people are generally resistant to such mobility—people do not easily become close to someone whom they historically

held at a distance. The best recommendation that can be offered at this point is that the leader be aware of the existence of the two groups, and show some courtesy to the outgroup members. This will probably not eliminate the interaction-based dissatisfaction, but it will help to minimize such feelings.

WHY WORRY ABOUT GROUP SATISFACTION?

Dissatisfaction seems to increase the likelihood of the occurrence of some negative behaviors. Group members whose dissatisfaction is the result of inequity might engage in theft, reduce their contribution to the group, or harangue other members about their levels of effort. Dissatisfaction can also provoke conflict among members, and general disengagement from the group, because the unhappy member associates with the group only as much as necessary. Interestingly, dissatisfaction does not necessarily lead to exit from the group. There are many reasons why a dissatisfied member might nonetheless choose to remain in the group—the group offers attractive benefits that outweigh the costs; there is no better group with whom the person can affiliate; and the group, dissatisfying as it is, may still be the most satisfying group to which the person has ever belonged. The group leader should thus be less concerned that dissatisfaction will lead to attrition, and more concerned that it will lead to suboptimal group performance and/or disharmonious relations among members.

IMPLICATIONS

Dissatisfaction can result from phenomena that a group leader might consider innocuous (e.g., seeking input about a rather low-level decision) or even beneficial (e.g., providing more rewards than is typical). Because of this, it can often be a surprise to the leader when there is general dissatisfaction among group members. A leader can produce increased levels of satisfaction without having to sacrifice power or control over decisions. To do so requires the leader to be attuned to procedural nuances about how decisions are made, how rewards are distrib-

uted, and how the leader interacts with outgroup members. The leader who fails to care about group member satisfaction runs the risk of performance decrements (and possibly even destructive behavior), interpersonal squabbling, and group member attrition. As it is usually the charge of the leader to minimize the occurrence of such things, the leader who attends to the satisfaction of group members will make considerable progress toward accomplishment of these goals.

GROUPTHINK

Groupthink refers to the process that leads a group of capable and talented members to render a poor, often disastrous, group decision. The term was coined by Irving Janis in 1972 as a result of his investigations of famously bad group decisions in recent history, most notably the decision by President John F. Kennedy and his cabinet to invade Cuba at the Bay of Pigs in 1960. Kennedy’s cabinet, arguably the best educated in American history, recommended that Kennedy send a squad of Cuban dissidents to invade

Cuba and overthrow Fidel Castro. The dissidents were poorly trained and armed with World War I surplus arms, and they had been sent in a leaking boat. The mission was so badly executed that, by the time the squad arrived at the bay, Castro's troops were waiting for them, took them hostage, and ransomed them back to Kennedy. More recently, authors have identified a number of other real-world situations that may well have resulted from groupthink: the decision to launch the *Challenger* space shuttle despite engineers' warnings that a launch was not wise, the decision to alter the formula for Coca-Cola despite the fact that it was the best-selling soft drink in the world, and a series of promotional campaigns by Burger King that produced hundreds of millions of dollars in losses and contributed to its losing market share in the fast food industry.

PRECURSORS OF GROUPTHINK

The phenomena that act as precursors to groupthink are many, but they can be grouped into three distinct categories. Structural faults refer to flaws that are inherent within the group and that affect the decision-making process: insulation from outside opinion; active advocacy of a particular option by the group leader; toleration of options that have not been rigorously analyzed; and lack of members who have diverse viewpoints and approaches to problem solving. High cohesiveness, while often a desirable feature of groups, can also act to suppress criticism and dissension within the group. Finally, external pressure to act, exerted by outside agents, can lead group members to favor a quick decision instead of a carefully analyzed one. When groupthink occurs, individual group members display some telltale traits: ostracism of dissenters, false perceptions of consensus, interpretation of silence as agreement with the prevailing viewpoint, a tendency to rationalize, and a sense of invulnerability.

It is crucial to note that the mere existence of these features does not guarantee that a poor decision will result. Other factors may act to shake the group out of a groupthink mindset, or the choice option that the group is oriented toward may in fact be the appropriate course of action to take. Janis sim-

ply argued that, if the above factors are present, groupthink could occur, but it will not necessarily occur. If one is associated with a group that seems to favor an objectively bad decision, one would want to determine if these factors are indeed present, but mere observation that they are present is not by itself cause for concern.

RESEARCH ON GROUPTHINK

Groupthink is a difficult topic to study, because it was originally intended as a descriptive, after-the-fact model for explaining an event that had already occurred. Of course, if the poor decision has already been made, unless explicit recordings of the entire group process exist there is no way for researchers to determine conclusively exactly how the decision was rendered. Further, it is very hard to simulate groupthink conditions in a laboratory. Finally, the model as a whole is sufficiently complex that, even if a real group could be observed in the process of making a decision, there are more aspects of the process that would have to be carefully observed than researchers could reasonably manage. As a result, there exist very few scientific tests of groupthink. The research that does exist has not always been in support of Janis's propositions. In fact, to date the only proposition that has relatively clear support is the notion that insulation from outside opinion is problematic. Decision quality can be improved by obtaining input from individuals who are not group members and who have no stake in the quality of the decision. If such individuals are not readily available, the group members can employ a devil's advocacy technique under which one member presents realistic arguments against the favored position, and forces other group members to defend the position against these criticisms. If the position cannot be credibly defended, it is abandoned or another choice option is submitted to the same attack. Devil's advocacy has been shown to positively impact decision quality.

Two additional factors, group cohesiveness and biased leadership, have also received a fair amount of research attention, but to date the findings regarding each are inconclusive. There are studies showing

The Eight Symptoms of Groupthink, as Identified by Irving Janis

In order to test generalizations about the conditions that increase the chances of groupthink, we must operationalize the concept of groupthink by describing the symptoms to which it refers. Eight main symptoms run through the case studies of historic fiascoes. Each symptom can be identified by a variety of indicators, derived from historical records, observer's accounts of conversations, and participants' memoirs. The eight symptoms of groupthink are:

1. an illusion of invulnerability, shared by most or all the members, which creates excessive optimism and encourages taking extreme risks;
2. collective efforts to rationalize in order to discount warnings which might lead the members to reconsider their assumptions before they recommit themselves to their past policy decisions;
3. an unquestioned belief in the group's inherent morality, inclining the members to ignore the ethical or moral consequences of their decisions;
4. stereotyped views of enemy leaders as too evil to warrant genuine attempts to negotiate, or as too weak and stupid to counter whatever risky attempts are made to defeat their purposes;
5. direct pressure on any member who expresses strong arguments against any of the group's stereotypes, illusions, or commitments, making clear that this type of dissent is contrary to what is expected of all loyal members;
6. self-censorship of deviations from the apparent group consensus, reflecting each member's inclination to minimize to himself the importance of his doubts and counterarguments;
7. a shared illusion of unanimity concerning judgments conforming to the majority view (partly resulting from self-censorship of deviations, augmented by the false assumption that silence means consent);
8. the emergence of self-appointed mindguards—members who protect the group from adverse information that might shatter their shared complacency about the effectiveness and morality of their decisions.

When a policy-making group displays most or all of these symptoms, the members perform their collective tasks ineffectively and are likely to fail to attain their collective objectives. Although concurrence-seeking may contribute to maintaining morale after a defeat and to muddling through a crisis when prospects for a successful outcome look bleak, these positive effects are generally outweighed by the poor quality of the group's decision-making. My assumption is that the more frequently a group displays the symptoms, the worse will be the quality of its decisions. Even when some symptoms are absent, the others may be so pronounced that we can predict all the unfortunate consequences of groupthink.

Source: Janis, Irving L. (1972). *Victims of Groupthink*. Boston: Houghton Mifflin, pp. 197–98.

that each can indeed be problematic, but only under particular conditions. Regarding cohesiveness, problems can arise when the group is clearly pointed in the wrong direction. High levels of cohesion can discourage group members from criticizing each other's ideas, for fear of harming relations within the group, yet such critiques are crucial if the group is favoring a poor choice. Such fears are less likely in less cohesive groups, and critiquing of choice options is thus more likely. However, if the prevailing preference within the group is for the best choice, then high cohesiveness fosters the adoption of this option, and in less cohesive groups the anticipated criticisms and disagreements may distract the group from making the best choice. Overall, then, the research suggests

that high cohesiveness is problematic sometimes, and beneficial at other times.

The data are similar regarding biased leadership. The group leader's active advocacy of a course of action will typically be detrimental if the action is suboptimal, but can be beneficial if he/she favors the best course of action. Further, research also shows that leader advocacy all by itself will not necessarily have an impact. "Weak" leaders, or those who have little credibility or respect with group members, tend to have a minimal impact on the group's decision, and can actually turn group members away from a particular action simply by advocating it. Ironically, because of this very complex web of relations between the leader, the group members, and the

quality of the leader-preferred action, some theorists follow Janis's lead and generally recommend that the leader remain neutral and not reveal his/her preference. Some evidence indicates that, within long-standing groups where the leader has a history of favoring a particular type of action, group members will try to infer what a neutral leader's preference must be, so even neutrality can cause problems in particular situations. Researchers have studied the impact of group members accepting a choice that has not been methodically analyzed. To date no support has been found for such acceptance being detrimental to the decision outcome.

Very little is understood about the groupthink model. In fact, some theorists believe that Janis's model is too simplistic and needs expansion. Such factors as collective self-esteem, time pressure, and availability of group decision support systems have all been suggested as possible contributors to groupthink. No empirical evidence yet exists to support the inclusion of any of these variables.

IMPLICATIONS FOR GROUP LEADERS

A group leader can play a potentially active and complex role in the occurrence of groupthink. Given this, what can a group leader do to help his/her group avoid making a disastrous decision? The group leader might typically do well to conceal his/her preference, recognizing that the group members may nonetheless attempt to infer it, but a strong leader who favors the objectively best option may actually harm the process by remaining silent. The most straightforward advice is for the leader to tolerate dissent, actively encourage discrepant viewpoints, and support critiquing of one another's ideas. This will not guarantee a quality decision will be reached, as the group decision-making process is affected by a host of factors, but it can help the group avoid abject disasters. Returning to the example of John F. Kennedy, with regard to decisions about policy in Vietnam, we find that he was careful to have in his advisory group individuals with a range of opinions, ranging from Dean Rusk, an ardent advocate of military engagement, to McGeorge Bundy, a vocal opponent of such engagement and an advocate of

diplomatic intervention. The members of the advisory group clashed severely at times.

The leader should also not hesitate to seek out opinion from individuals outside of the group. Often this is not practical, particularly if the group is dealing with an issue of a sensitive or classified nature, but often the issue can be presented to outsiders in a general enough manner that generates accurate feedback without the true nature of the issue being revealed. A famous example of the impact of outside opinion again comes from the political arena, and again from the Vietnam conflict. In 1968, newscaster Walter Cronkite broadcast an editorial condemning President Lyndon B. Johnson's administration for its conduct of the conflict. Johnson's cabinet members of course did not discuss classified policy information with the general public, and so had no real sense of to what extent their preferences matched those of the public. Upon hearing the editorial, Johnson concluded that his policies were not congruent with the preferences of the general public, and largely because of this, Johnson withdrew from consideration for re-election. In this case, then, the leader's response to the poor performance of his decision-making group was to dissolve the group, an extreme response to be sure, but one that might sometimes have to be implemented, if in the judgment of the leader the group is not salvageable.

Overall, then, groupthink is a phenomenon that seems definitely to occur, but which cannot be predicted because its preconditions do not guarantee its occurrence. Further, it is not clear which supposed preconditions are more or less important to its occurrence. Group leaders who actively participate in the group's decision-making process can watch for the preconditions, and at least for those which research suggests might affect the process, take steps to eliminate them. Whether the other preconditions also require the leader's attention and efforts is an issue to be decided by future studies.

GUEVARA, ERNESTO "CHE" (1828–1967)

Argentinean-born revolutionary leader

Known simply as "Che" or "Che Guevara," Ernesto Guevara de la Serna is considered one of the most important leaders and icons of the Cuban revolution—Fidel Castro being its lasting and prominent director. The nickname "Che" comes from an Argentinean expression connoting a "friend" or "buddy" and was given to Ernesto Guevara during his time in Guatemala in 1953.

Many scholars have pointed out early evidence of leadership in his childhood; many of these traits developed further in his adult personal life to the extent of transforming him into an international icon, comparable to Christ. However, his extensive writings and deeds show a man who, living in a time of amazing sociopolitical transformations after World War II, constantly learned from his experiences and mistakes, and consequently changed his political and ethical perspectives. According to Jean-Paul Sartre, Guevara was "not only an intellectual but also the most complete human being of our age" (Anderson 1997, 468).

CHE GUEVARA BUILDS HIS OWN PERSONALITY

Che was born into a middle-class family in Rosario, Argentina, and was trained as a doctor. He became a revolutionary leader after joining Fidel Castro in

Mexico in the mid 1950s, when a group of Castro's disciples decided to overthrow the dictatorship of Fulgencio Batista in Cuba.

In his childhood, and in spite of his chronic asthma and the snobbery in his family's social and cultural background, Che revealed signs of rebellion against despotic authority and institutions while developing a lucid sensibility to social injustice and economic inequality. After his graduation with a medical degree from the University of Buenos Aires in 1953, he resumed his travels across Latin America. Traveling and writing were two linked activities in Che's life. He wrote many diaries in which readers today can reconstruct Che's daily life in almost every detail. In his early writing, before joining Fidel Castro around 1955, Che transformed himself and his ideological views when confronting Latin American inequalities and socioeconomic discrimination. He was shocked by what he had witnessed during his trip across Latin America, namely poverty, injustice, destruction of the natural environment, and illness caused by capitalism. Very quickly he decided to go to Guatemala to participate in the left-wing transformation promoted by Jacobo Arbenz. By signing the land reform decree, Arbenz had initiated his struggle against *latifundia* and the oligarchy domination and, consequently, he had earned the "enmity of Guatemala's conservative elite and of the powerful United Fruit Company" (Anderson 1997, 122). Che's experience in Guatemala and his thoughts after reading Marx and other socialist and communist authors, but mainly his exposure to Fidel Castro's personal activism and inspiration, radically changed Guevara's political views and aspirations. By the time he arrived in Guatemala—Anderson says—"Ernesto seems to have undergone a political conversion" (1997, 123). He became an expert in Marxism, a philosophy he permanently embraced and discussed, while refusing to accept uncritically the Russian or Chinese versions of it or the radical left's debates that circulated during the 1960s—a time when the beatniks, the Vietnam War, rock-and-roll, the hippies, and the existentialist, Cold War, and Third World liberation movements defined the cultural and political context of Che's deeds, speeches, and writings.

Although Marxism had a powerful impact on Che (as a Cuban ambassador, as a head of the Department of Industry, and as the president of the Cuba's National Bank), this philosophy also molded his approach to revolutionary ethics and his moral definition of the "New Man." Che always supported the idea that a revolutionary change had to be generated and promoted by a small group of *guerrilleros* able to inspire the entire society with their actions and values in a fight for freedom and social justice. This controversial viewpoint is known as *foquismo*, and Che's speeches and writings, which were based on it, constituted his contribution to his ideal of the New Man and the avant-garde revolutionary group.

In 1956, Fidel Castro and Che Guevara, along with eighty-two other members, arrived in Cuba aboard the yacht *Granma*. Che was supposed to help as a doctor, but promptly became involved in guerrilla attacks in Sierra Maestra. From then until 1959, when Castro's troops victoriously entered Havana, Che participated in many battles and recorded his experiences, which are collected in his *Guerrilla Warfare* (1961), *Reminiscences of the Cuban Revolutionary War* (1963), and *Guerrilla Warfare: A Method* (1963). These works and other essays reveal him to be the most important theoretician and tactician of mid-twentieth-century guerrilla warfare. His writings—which attacked colonialism and challenged U.S. foreign policies—inspired many leftist liberation movements all over the world. His manuals, which were rapidly translated and read by many, chronicled the long history of guerrilla warfare (Laqueur 1984).

CHE'S VIEWPOINTS ON LEADERSHIP

As soon as the revolutionists took power in Cuba, Che started working passionately for the reconstruction of the island's society. This task allowed him to put theory into practice. At the moment that his ideal concept of society confronted reality, he began his transformation into a leader, and also, paradoxically, into an inimitable model. Che's leadership should be understood as a convergence of aspects of his personal life: his study of literature, his extensive travels, his practice of medicine, the influence on him of Roman Catholicism, and his leftist politics.

Although neither he nor his family were fervent Catholics, Che's vision of leadership—and many twentieth-century Latin American leaders'—was based on the values instilled by the Jesuits in their schools. Sacrifice, particularly self-sacrifice, abnegation, renouncement, moderation, austerity, celibacy, and monogamy—and conversion, faith, redemption, devotion, and revelation—are altogether the most frequent terms in Che's own writing and in the books written about him. From this perspective, a leader is the archetype, the pure example, given to the people in order to produce revolutionary change—not only for economic amelioration, but also for a moral framework for debating equity and justice. Grounded in the same Jesuit spiritual view was Che's defense of a strict, "iron" discipline and obedience. In his *Episodes of the Cuban Revolutionary War*, and also in his *Socialism and Man in Cuba* (1965), and, particularly, in his last and dramatic work, *Bolivian Diary* (published posthumously), Che pointed out the importance of obedience and discipline. He believed that a strong social movement required a conductor who, like Fidel Castro, had to be obeyed unquestionably. He also advocated a communist morality based on the annihilation of the ego and the emergence of the collective "we." This controversial relationship between leader and disciples—almost apostles—reproduces the dramatic paradigm between father and son, with the father as authority figure and the son as the subordinate figure.

In his diaries and essays, Che always emphasized the prophetic dimension of Castro as indisputable leader. He manifested Castro as master and teacher, and positioned him as the perfect guide to be emulated. But Che, like many other leaders, was trapped in a problematic situation—masters, fathers, or leaders cannot be completely imitated or continuously and uncritically followed. Sooner or later, a moment of disagreement emerges. Che was happy when Castro, as early as 1957, promoted him to commander and head of the second Rebel Army column in Sierra Maestra. However, when in November 1966 he began his own "new stage" in Bolivia (*Bolivian Diary*, 1994 77), he refused to be only the doctor. During his dispute with Mario Monje Molina—the

leader of the Bolivian Communist Party—Che wrote that this time, he “would be the military leader and would accept no ambiguities on this score” (102).

In this sense, Che, although acknowledging his loyalty to Castro, at the same time calibrated the distance between his master and his own personal achievement as a leader. According to his biographer Jon Lee Anderson, “in Che’s mind, leadership was a sacred duty granted to an individual ‘chosen’ by the people on the basis of trust” (Anderson 1997, 488). Of course, this relationship between leader and disciples has to be established on loyalty, honesty, and bravery. For Che, a leader was the confluence of a natural quality, of the people’s faithful attribution, and the individual’s own awareness of the moral dimension of his role. A leader emerges as an exceptional convergence between personal capabilities and a process of self-construction.

Che perceived Castro’s leadership in an interesting way. For example, in his “Socialism and Man in Cuba,” under the title “Fidel gave the first impulse,” Che enumerates qualities that define a good leader’s personality. First of all, a leader emerges from the masses and shows them the right way to achieve revolutionary goals. Of course, the leader’s disciples also participate in this revolutionary process, and faith is the principal bond between leader and disciples, between leader and the masses, and finally between disciples and the masses. Leader and disciples know how to interpret the people’s hopes. Once again, the leader knows of sacrifice and his task is at once magnificent and filled with suffering. Che’s final definition of a revolutionary leader’s achievement is love: “The true revolutionary leader is guided by great feelings of love.” In this sense, it is difficult for a leader, as it has been difficult for Castro, to unite his passionate spirit to his cold mind, “and to take painful decisions without contracting a muscle” (Guevara 1996, 193).

Che’s influence continues to be felt around the world as indicated by these T-shirts on sale in a tourist stall in the Plaka section of Athens, Greece in 2003.

Drawing from his medical expertise, Che defined the leader by means of a curious analogy. In his speech to the General Assembly of Workers at the Textilera Ariguanabo on 24 March 1963, he said: “The example, the good example, as the bad one, is very contagious, and we have to contaminate [society] with good examples” (Guevara 1996, 175).

From his experience as a traveler, and probably inspired by many classic works—especially Miguel de Cervantes *Don Quixote*—Che portrayed the figure of a leader as someone who takes risks, is adventurous, and is absorbed by utopian ideals. His trips and his experience in the jungle can be read as an evocation of his favorite book, the Argentinean epic *Martin Fierro*, where the gaucho (the cowboy), in the middle of the desert and in exile, undergoes a radical transformation of his identity and cultural values. In his *Notas de viaje* (1992), Che explained how his journey from Argentina to the United States on *La Poderosa*, his motorcycle, transfigured him: “The person who wrote these notes died upon stepping once again onto Argentina soil, he who edits and polishes them, ‘I,’ am not I; at least I am not the same I was before. That vagabonding through our ‘America’

The Death of Che Guevara

The U.S. government considered Che Guevara a major threat because of his revolutionary beliefs and activities, so government officials had a vested interest in making sure that Guevara was indeed dead. Below is the now declassified text of the official confirmation of Guevara's death sent to the U.S. State Department by the U.S. Ambassador to Bolivia, Douglas Henderson.

On October 16, 1967, the High Command of the Bolivian Armed Forces released the following communiqué, together with three annexes, on the death of Che Guevara:

"1. In accordance with information provided for national and international opinion, based on documents released by the Military High Command on October 9 and subsequently, concerning the combat that took place at La Higuera between units of the Armed Forces and the red group commanded by Ernesto "Che" Guevara, as a result of which he, among others, lost his life, the following is established:

Ernesto Guevara fell into the hands of our troops gravely wounded and in full use of his mental faculties. After the combat ended, he was transferred to the town of La Higuera, more or less at 8 p.m. on Sunday, October 8, where he died as a result of his wounds. His body was transferred to the city of Vallegrande at 4 p.m. on Monday, October 9, in a helicopter of the Bolivian Air Force.

Two medical doctors, Dr. Moises Abraham Baptista and Dr. Jose Maria Cazo, director and intern respectively of the Knights of Malta hospital, certified the death (Annex No. 1)

and recorded the autopsy ordered by the military authorities of Vallegrande (Annex No. 2).

With regard to the identification of the deceased and the authentication of the diary that belonged to him, the government requested the cooperation of Argentine technical organizations, which sent three experts, one handwriting specialist and two fingerprint specialists, who verified the identity of the remains and certified that the handwriting of the campaign diary, captured by our troops, coincides with that of Ernesto Guevara (Annex No. 3).

The campaign diary and the book of doctrine (*libro de concepciones*) are documents that contain an account of activities, from the date of his entry (into the guerrilla area) until October 7, and (justify) the judgments that this chief of subversion, the members of the guerrilla bands, and the people, both in this country and abroad, who collaborated with them, deserved. As a consequence, they are documents exclusively for the use of the military.

2. By this means the Military High Command considers complete all information relating to the death of Che Guevara. La Paz, October 16, 1967".

has changed me more than I thought" (Anderson 1997, 96). Traveling was for him a mysterious process of unlearning and learning. And he traveled a lot: not only all over Latin America, but also to Europe, Asia, and Africa; he especially was influenced by visits to Russia, India, China, Congo, and Guinea.

THE LEADER AND THE NEW MAN

His ideal of the leader and the New Man played an important role in the way Che envisioned the future of the revolutionary society. For him, the guerrilla group was mostly an active place for men. According to testimonies written by his disciples (Peredo, Pombo, Benigno), Che was generous, collaborative, always the first in taking risks or in dealing with the most difficult tasks. He seemed to be possessed by a strong inspiring conviction. Some of his friends also

remember how Che, as Minister of Industry, used to be among the workers under the sun for many hours and how he always refused a salary for his job. Che knew how important education was for the new revolutionary society. According to his conviction, he promoted, even during difficult moments of the war, the study of important matters such as Marxism-Leninism. Sometimes in the middle of a battle, he lectured his disciples on decisive economic, political, scientific, and educational problems that the revolution had to solve after winning the war.

Che conceived the guerrilla group mostly as a fraternal bond among men and his most beloved illusion was a world envisioned as "a global fraternity of socialist nations" (Anderson 1997, 523). Therefore, in the world of guerrillas, very few women were admitted and once again his arguments were mostly those of the Jesuits (Geirola 2000). When he thought

of a leader, it was always in masculine terms. In this sense, Che reproduced the long tradition of *caudillismo* in Latin America. The *caudillo* is a strong male figure who exercises his power by means of paternalistic and oppressive strategies. The Latin American novel of the 1960s and 1970s—its popularity was known as the Latin American Boom—particularly explored the image and politics of Latin American *caudillos*, and the way they dominated women, nature, and society by seduction, torture, violence, and fanaticism. Novels by Carlos Fuentes, Augusto Roa Bastos, Gabriel García Márquez, and Mario Vargas Llosa are among the clearest portrayals of this appalling cultural tradition.

After a long persecution by the CIA and his assassination by the Bolivian Army in Vallegrande, Bolivia, on 9 October 1967, and due to the fact that his corpse disappeared for many years, Che Guevara became a sacred ghost. Even after the discovery of his remains in 1997, Che's specter still promotes a certain mystical quality. Many plays, novels, poems, posters, and biographies were created after his death, and much academic research has been done. Some scholars and writers see Che Guevara as a martyr and a saint; others, as an unambitious and ascetic leader; and still others, as a great politician and an astute economist. Anderson (1997), for example, goes to the extremes of portraying Che as a man enraptured more by social change than by power; fascinated more by camaraderie than by leadership.

His most publicized image, the famous photograph taken by Alberto Korda in 1963, can be seen all over the world on posters and T-shirts. As Marcos Mayer (1996) notes, Che's writings promote a complex image that persists beyond the history and

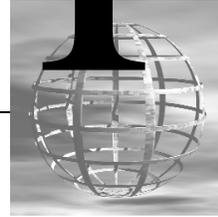

thoughts of a particular historical character who responded to concrete historical circumstances.

H

🌐 **HAILE SELASSIE (1892–1975)**
Emperor of Ethiopia

Emperor Haile Selassie was born on 23 July 1892 and through his marriage to the daughter of Emperor Menelik II and regency to the Empress Zaudita was able to ascend the throne in 1930, as the apocryphal 111th emperor since Solomon. The great irony of his life remains that the tools he used to consolidate power—modernization and development—were, in their absence, those that led to his ignominious downfall in 1974.

Through timely and astute imperial gifts to his competitors in the 1920s—roads, hospitals, schools—he was able to tame a querulous tribal country and consolidate power. Though his coronation was satirized in the West (in Evelyn Waugh’s famous novels and dispatches), there was no doubt that in Ethiopia there was one ruler firmly on a throne. He secured international recognition by other progressive acts: The 1923 freeing of slaves paved the way for Ethiopia’s entry to the young League of Nations.

THE STRATEGIST

Would-be colonials sought to reestablish themselves in that corner of Africa; Italy, for example, still smarted from its defeat at Menelik’s hands in

1895–1896. For all his astute statecraft in conquering vassal tribes and ascending Ethiopia’s throne, no event in Haile Selassie’s life brought him greater note, or indeed honor, than his response to the loss of power at the hands of Mussolini’s increasingly aggressive armed forces. The emperor’s stirring attack, from the podium of the League, on both the Italian victors and the European appeasers, brought him great sympathy and support. He was *Time*’s Man of the Year for 1936. Working with an allied expeditionary force, he was able in 1941 to make a triumphal return to Addis Ababa.

The League speech aside, there was more to note. When the short man arrived at London’s Victoria Station to start his bleak exile, newspaper pictures showed the tall and grand sight of a much younger African—the black Kenyan student Jomo Kenyatta, who was, with the emperor, laying the basis for an alliance that would come to be thirty years later. They both had the same enemies in the 1930s, and in a different way, in the form of the five-starred Somali nation, they were to have the same one in the 1960s. Haile Selassie had opportunities for skillful statecraft throughout his life and used them.

Later, before the powerful forces of African nationalism would have made such an action inconceivable, he was able to forge a quiet alliance with the increasingly powerful United States, allowing him to extend his rule. Once he had forcibly secured

Haile Selassie's Telegram to the League of Nations

Following the invasion of Ethiopia by Italian dictator Benito Mussolini in 1935, Haile Selassie appealed to the League of Nations for help on several occasions in 1936. Below is the text of a telegram he sent to the Secretary-General of the League of Nations on 10 May 1936.

We request you to be so good as to convey the following to the member States. We have decided to put an end to the most sweeping, the most unjust, and the most inhuman war of modern times by leaving the country in order to avoid the extermination of the Ethiopian people, and to be able to devote ourselves freely and peacefully to the preservation of the age-old independence of Ethiopia and the principles of collective security and the sanctity of international obligations, all of which are threatened by Italy. From the outset we have made every effort to avoid the disturbance of peace, we have loyally defended our soil until as a result of Italy's raining of gas it became obvious that our resistance could only lead to the extermination of the Ethiopian people, and we now ask the League of Nations to pursue its efforts to ensure the respect of the Covenant and to decide not to recognize territorial extensions or the exercise of an alleged sovereignty resulting from illegal recourse to armed force and many other violations of international obligations.

(Signed)
HAILE SELASSIE I, *Emperor*

the state of Eritrea as part of his "empire" in 1962 and discerned Washington's intense interest in the high ground Asmara (Eritrea's capital) offered for its world communications network, he was able to sleep easily for a while. He knew how to play off younger strategists against one other. As between Ethiopia and the United States, there was never any doubt who played whom more successfully in the 1950s and 1960s.

ORGANIZATION OF AFRICAN UNITY (OAU)

Now at the apogee of power and in middle age, Haile Selassie however resisted real development in

Ethiopia and any lessening of his power, little contemplating any form of democratic reform for the empire and concentrating instead on its further consolidation. A stunning attempted coup during his absence in Brazil in 1960 nearly succeeded and failed only with the emperor's courageous and direct return to his capital. He was famously quoted as telling his son that he was delighted to find him alive, but that he would have been prouder had his son died honorably, fighting the rebels.

The emperor was already in his twilight years when he had his greatest triumph. The survival of his Amharic-dominated state was no longer in doubt as long as he survived; at least it seemed no longer at risk—from within. But the question of its survival amidst the winds of change that were blowing through black Africa had begun to be a legitimate subject of concern. It is not as if any neighbors, no matter how one extrapolated their growth in strength in the years to come, could pose a military danger to Ethiopia; it had become a matter of identity. Once again the Lion of Judah was at a crossroads, but this time it was strictly geographic and geopolitical: now completely "liberated" Arabic Africa to the north and black states to the south. No matter that vast Sudan to the south had a black minority that would be fighting for its autonomy for at least decades more. Sudan was aligned with its Islamic neighbors identifying with Arab causes. There was little to expect from that direction.

That left only the newly independent black states to which to turn. In the first few years of their independence—Ghana's coming in 1957, Kenya's in 1964—these countries aligned themselves in loosely ideological alliances and counteralliances, to some extent reflecting their own geopolitical location and to some extent their colonial ties. Haile Selassie, as always, saw beneath the proclaimed ideologies to the real interests at stake and began to reach out for friends on the basis of common interests.

Ironically, the leader he found most capable and willing to join with him in an effort to pull the almost completely independent continent together was Sékou Touré, the firebrand Marxist leader of small Guinea on the opposite side of Africa. Touré knew something about pretenses himself; he had formerly

allied himself with Ghana's showy president, Kwame Nkrumah, siphoning off some of that country's alone riches in the process. In Francophone Africa, Touré alone had voted against a continued French association in a 1958 referendum that led directly to independence for all former French colonies.

At Asmara, Touré and the emperor saw their respective needs and the underlying basis for an intimate alliance. Their joint call for a summit of all the continent's independent black or Arab-dominated states was brilliantly timed and undercut all attempts of factions to remain separate. In May 1963, the historic Addis Ababa summit, at which the Organization of African Unity (OAU) was founded, was held. The picture of the old emperor and the young Marxist hugging in celebration of the feat they had pulled off dominated world television screens that day. In the short run, the outcome was predictable: Touré got the new organization's secretary generalship, in the appointment of his diplomat Diallo Telli; Haile Selassie got the OAU headquarters, such as it was, for Addis Ababa.

True, the OAU was no bureaucratic miracle and lacked the force to implement the brave resolutions of its first summit. Addis Ababa and even newly independent Tanganyika, as it then was called, were a long way from South Africa, whose white minority the OAU wished to depose. But now black Africa had leaders and a headquarters and all opponents were thenceforth on the defensive.

THE RISING TIDE OF DEVELOPMENT

But if the emperor knew statecraft abroad, knew how to divide and conquer warring factions and ethnic groups at home, and had quieted all African criticism through his domination of the OAU, he failed utterly to grasp the other great new language of the continent and indeed of all the poor, or third world: development and its exigencies. What had served him well in coming to power was now the force causing him to lose it. Aid agencies—particularly those of the United States—came to Addis Ababa offering technical assistance, development loans, and a clarion call to bring “progress” to Ethiopia's masses, among the poorest of Africa. And progress the emperor could not

wholly avoid, but it arrived in spite of his sternest efforts to prevent it. He gave lip service to the needs of his people, but then seemed to do all he could to impede progress. After all, he knew Washington was beholden to him for the continued use of its Asmara communications station and thus he could largely ignore their urgings to make the empire more progressive and responsive. Those who tried to buck his conservative regime found themselves in jail—or in exile.

Nonetheless, opposition to Selassie not only grew but was stimulated from outside—either directly by rebels operating on the fringes of empire or in the form of the very same forces of development that had forced the pace of African liberation itself. But the ruling family was united in its self-confidence and indifferent to the tide of change; like so many autocracies throughout history, it “couldn't happen” to *them*. A grandson and likely successor to the emperor, interviewed in 1964, stated confidently to his interlocutor that what would happen “in the fullness of time,” namely at the (unmentionable) end of the emperor's life, “was exactly what has happened during his life: we shall rule and we shall continue to rule, in the empire's interest.” Though he was educated in England, he had apparently paid little attention to the demands of developmental economics.

THE END OF “EMPIRE”

Meanwhile, opposition grew and grew, in places and spaces where a traditional autocrat would not be accustomed to look for it. Because the ruling family suppressed any news inimical to its rule, it was ignorant of the most lethal threats to its own survival. Thus when the so-called Dergue (the Provisional Military Administrative Council) emerged with its “creeping coup,” a step-by-step assertion of power, it was almost impossible to discern its direction and goals—though any student of the fate of backward-looking religious autocracies would hardly have doubted where the new and powerful officers would end up.

There was still time for most of the imperial family to make a deal or get out of the country, but they were still blind—and blinded—to the danger to their persons, and their regime. The emperor himself must have known that his time was up, once he was per-

mitted to pretend to rule but not allowed to give any effect to his edicts. After all, he had spent a lifetime noticing the slightest whiff of insubordination. When his grandson was herded into a compound to be mowed down with over a hundred of his relatives, the grandson must not have known what was coming. Many of his friends abroad had begged him to leave while there was still a chance. But as for the old man, he surely knew what was in store, though perhaps not that death would come with so little dignity—his remains were later found under a toilet in the palace.

The end of the empire was widely noted in the world, but little regretted. It was primarily the events of 1935 that were cited in the emperor's favor. In more sinister fashion, Marxists everywhere noted something ignored in most of the world: The rebels had executed a great king and assassinated his family. Soon they would take the great Leninist step, when the emperor's successor, Colonel Mengistu, cut down all his conspirators. The comparison of these events with those of 1917 in Moscow was ominous, leading to an attempt to make the country a Marxist state, something as unlikely as its being an "empire." But then extremes beget extremes, something for which the old warlord turned enthroned emperor was responsible.

HANDSOME LAKE (1740–1815)

Native American chief and prophet

During the late 1700s and early 1800s, Handsome Lake revitalized the traditional religion of the Iroquois. Visions he experienced in 1799 led to his preaching a coherent message of reform to the dispirited Iroquois communities, which were being swamped by a wave of non-Indian settlement. His teachings are still recited among followers of the

Longhouse religion on reserves and reservations in Canada and the United States.

Handsome Lake was born sometime around 1740, probably in the Seneca village of Canawaugus (now Avon, New York). He was the elder half-brother of another Seneca chief, Cornplanter. The Senecas were the westernmost member of the famed Iroquois Confederacy, whose territory stretched from the Mohawk Valley to Niagara and whose sphere of influence was much wider.

RISE TO PROMINENCE

In 1777, the Senecas and most other Iroquois entered the American Revolution fighting on the side of the Crown. Handsome Lake, not yet a chief, fought throughout the conflict as an ordinary warrior. While the Senecas and their allies were largely successful when on the offensive, an American army under General John Sullivan invaded their homeland in 1779 and burned their towns and fields. No provision was made for Britain's native allies in the peace treaty ending the war. Facing the victorious new United States, the Senecas made substantial concessions in the treaties of Fort Stanwix (1784), Fort Harmar (1789), Canandaigua (1794), and Big Tree (1797). The Big Tree treaty left the Seneca with a few relatively small reservations in New York, including the Allegany Reservation on the Allegheny River.

Cornplanter had moved to the Allegheny River during or shortly after the American Revolution. For his facilitating role in the postwar treaty negotiations, Pennsylvania awarded Cornplanter a personal land grant on the river just south of the New York border. Handsome Lake and his daughter's family shared with Cornplanter the largest house in the village of Jenuchshadego on the Cornplanter Grant. Handsome Lake had by then been selected for a position on the council of the Iroquois Confederacy.

The residents of Jenuchshadego were a demoralized Seneca population that had suffered heavily during the war and its aftermath. Excessive alcohol consumption was both a symptom of social stress and a factor that exacerbated social conflict. In May 1799 a drinking bout following the spring sale of deerskins

in Pittsburgh seems to have worsened Handsome Lake's already poor health and mental outlook.

In mid-June, Handsome Lake lay bedridden. Physically he was very weak—so much so that when he collapsed at the door of his cabin, his daughter was convinced he was dead. Handsome Lake's nephew, Governor Blacksnake, found a warm spot on his uncle's chest. The sick man revived and told those gathered around him what he had just experienced.

Handsome Lake had been visited by three angels, Indian men dressed in traditional fashion, their faces painted red. Each fed berries to Handsome Lake as a cure. Part of their message was that the rituals of the traditional ceremonial cycle must continue. Also, four evils made the Creator unhappy. These were the consumption of alcohol, witchcraft, love magic, and medicines that caused abortions and sterility. Handsome Lake was told to expect a visit from a fourth angel soon.

The prophet fell into a second trance on 8 August 1799. This experience, in the view of Wallace (1970, 243), "would become the core of the new religion's theology." Led by the fourth angel, Handsome Lake encountered many persons on "the sky journey." The prophet observed a wide road to hell and a narrow one to heaven. Senecas suffered torments in hell for sins committed in their lives. The idea of punishment for sinful behavior had not previously been part of Seneca religion.

POLITICAL CAREER

While many of the reforms preached by Handsome Lake had been suggested earlier by Cornplanter, Handsome Lake's message had, for the Senecas, a spiritual sanction lacking in his brother's secular

The Message of the Four Beings

Now the messengers spoke to me and said that they would now tell me how things ought to be upon the earth. They said: "Do not allow any one to say that you have had great fortune in being able to rise again. The favor of the four beings is not alone for you and the Creator is willing to help all mankind."

Now on that same day the Great Feather and the Harvest dances were to be celebrated and at this time the beings told me that my relatives would restore me. "Your feelings and spirits are low," they said, "and must be aroused. Then will you obtain power to recover." Verily the servants of the Creator (Hadio ya geono) said this. Now moreover they commanded that henceforth dances of this same kind should be held and thanksgiving offered whenever the strawberries were ripe. Furthermore they said that the juice of the berry must be drunk by the children and the aged and all the people. Truly all must drink of the berry juice, for they said that the sweet water of the berries was a medicine and that the early strawberries were a great medicine. So they bade me tell this story to my people when I move upon the earth again. Now they said, "We shall continually reveal things unto you. We, the servants of him who made us, say that as he employed us to cure unto you to reveal his will, so you must carry it to your people. Now we are they whom he created when he made the world and our duty is to watch over and care for mankind. Now there are four of us but the fourth is not here present. When we called you by name and you heard, he returned to tell the news.

"This will bring joy into the heaven-world of our Creator. So it is that the fourth is not with us but you shall see him at another time and when that time is at hand you shall know. Now furthermore we must remind you of the evil things that you have done and you must repent of all things that you believe to have been evil. You think that you have done wrong ... because you partook of strong drink. Verily you must do as you think for whatsoever you think is evil is evil."

policies. He recited the story of his encounters with the four angels to an appreciative audience in public councils, and soon Handsome Lake overshadowed his brother in the political arena. In 1802, it was Handsome Lake who led the Seneca delegation to the new capital city, Washington, D.C. While Handsome Lake had concerns about land issues, he also wanted to convince the American president that he had been ordained as the fifth angel to lead a spiritual reformation and "to direct the People on earth" (Wallace 1970, 268). President Thomas Jefferson found it prudent to endorse the teachings of Handsome Lake.

When federal and New York state officials con-

vened a council at Buffalo Creek in June of 1802 to negotiate land issues, to the assembled Senecas the message of Handsome Lake had priority. Handsome Lake preached his message to the chiefs over several days, delaying the start of the negotiations. Under Handsome Lake's influence, the chiefs refused to sell land to New York. Handsome Lake's mark is at the top of the list of chiefs who signed the two treaties negotiated with the federal government.

The political alliance between the prophet and Cornplanter unravelled. Handsome Lake moved from the Cornplanter Grant to Coldspring on the Allegany Reservation sometime around 1803, but was forced to leave Allegany in the fall or early winter of 1809. Two of Handsome Lake's policies eroded his support at Allegany. One was his persecution of witches. A central concern of the Senecas was personal health, which could be threatened by evil intentions of witches and witchcraft was punished by death. Handsome Lake interpreted illnesses among his followers as being caused by witches, and several thought to be witches were executed. These actions met with disapproval among an increasing number of Allegany residents as the toll of convicted witches rose. A second policy that eroded his support was his campaign against the performance of the rituals of the medicine societies. The restricted membership of these societies and their meetings in private led Handsome Lake to fear the powers they commanded might be used for malevolent purposes. However, a large portion of the Senecas viewed these medicine societies as indispensable in the curing of many diseases. The growing hostility he experienced at Allegany led the prophet to move to another Seneca reservation, Tonawanda. He was told by his messengers that Tonawanda was the second stage of his journey and that he would not die until he entered the third stage.

In 1815, Handsome Lake set out for the Onondaga Reservation (near Syracuse, New York). Two dreams he experienced on the long walk from Tonawanda to Onondaga provided Handsome Lake with an indication of his approaching death. Outside Onondaga, alone and searching for his missing favorite knife, the prophet suddenly became severely ill, such that he reached the community only with great difficulty. Unable to attend council, he

remained bedridden in a cabin. It was there that he died on 10 August 1815.

The political career of Handsome Lake had been linked to that of Cornplanter. This at first served Cornplanter's purposes, for he favored many of the reforms advocated by his brother. Handsome Lake soon amassed considerable political power, rivalling his half-brother as leader. Cornplanter withdrew his support for his half-brother on the issue of witches, so Handsome Lake left Cold Spring for Tonawanda. Handsome Lake's political power later declined, but his influence on religion remained high through his lifetime and continues today through speakers who repeat his message in Iroquois communities in both Canada and the United States.

HAPPINESS

Although the subject of happiness has captured the interest of philosophers since the time of the Greek

philosopher Aristotle and the interest of laypeople perhaps even longer, only recently have behavioral scientists incorporated the scientific study of happiness into their disciplines. The science of happiness is new, and the study of how happiness connects to leadership is even newer, but possible connections can be made. First, however, the term *happiness* must be clarified.

SUBJECTIVE WELL-BEING

Colloquially used, the term *happiness* can have a number of meanings. It might refer to a momentary burst of joy when one hears good news, a sense of satisfaction at a job well done, or an abstract goal that one pursues. Because so many feelings and states can be implied by the word *happiness*, researchers who study happiness usually talk about *subjective well-being* instead. This term captures a specific sense of the term *happiness* and conveys how behavioral scientists think about happiness—as an evaluation made by an individual that his or her life is positive. The subjective nature of happiness is emphasized by this term because it is conceptualized as a judgment resulting from an individual's own personal criteria and experience. Thus, when people describe “happy people” in this entry, they mean people high in subjective well-being.

A person's sense of subjective well-being might derive from a cognitive sense of satisfaction with life as a whole or with specific life domains such as education, work, or family. Or it might derive from a person's affective experience—moods and emotions—with positive emotions (e.g., sociable, calm) and negative emotions (e.g., depressed, sad). The three main ingredients for high subjective well-being are a sense of satisfaction with one's life and life domains, the experience of positive emotions, and a relative absence of negative emotions. Considering positive and negative emotions separately has proven to be an important advance in understanding subjective well-being. The amount of positive affect and the amount of negative affect that one experiences, although intuitively opposites, turn out to be somewhat independent of one another. For instance, some people might experience a lot of both positive affect and negative

affect, whereas others might experience little of each, and still others more of one type than the other.

MEASURING SUBJECTIVE WELL-BEING

Determining how to best assess and measure subjective well-being is important for a scientific understanding of the subject. Yet, the phenomenon of subjective well-being poses some unique challenges. For instance, how can something subjectively experienced by one individual be measured objectively by another? Fortunately, researchers have developed a sophisticated battery of techniques for assessing whether a person is happy or not.

The first technique is to simply ask the person whether he or she is happy. Such “self-report” measures are widely used in the field for a variety of reasons. First, on a conceptual level, they are perhaps the only measures that really make sense given that subjective well-being includes the individual's experience. Second, self-report measures are easy and inexpensive to administer and score. Third, self-report measures are widely used because they generally work. They are relatively reliable, yielding responses that correlate across time and situations. In addition, the fact that self-report measures of subjective well-being correlate with other indicators of happiness (are higher when something good happens to a person and lower when something bad happens) suggests that such measures possess a degree of validity.

One commonly used self-report instrument for assessing life satisfaction—a component of subjective well-being—is the Satisfaction with Life Scale. This scale poses a series of five statements with which an individual might agree or disagree. Upon considering each statement (e.g., “I am satisfied with my life”), the person rates the degree to which he or she agrees or disagrees with the statement using a seven-point scale on which a “1” indicates strong disagreement and a “7” indicates strong agreement. The agreement with each statement is summed to attain an indicator of an individual's global satisfaction with his or her life. The Satisfaction with Life Scale has been found to be both reliable and valid.

Innovative techniques in self-report measures also have an important role in the assessment of

subjective well-being. In one such technique, *experience sampling*, a person provides a series of self-reports about his or her momentary thoughts and emotions over an extended period of time. For example, to assess a college student's subjective well-being during a spring break vacation, the student might carry an electronic personal data assistant (PDA), programmed to page him or her at random times. When paged, the student might report how much he or she is feeling various positive and negative emotions at the time. By summing across occasions, a random sample is obtained of the student's experience that is representative of the spring break as a whole.

One advantage of experience sampling is that each time a person is prompted, the person reports his or her thoughts and feelings at that moment. These reports are sometimes called "online" measures and have the advantage that they are simple and easy for people to respond to. Presumably, people know if they are feeling joyful or worried or calm. Online measures can be contrasted with retrospective measures, which pose a much more difficult assessment. For instance, asking a student how much joy he or she experienced during spring break after it has ended requires that the student recall all the times he or she felt joy and its intensity and then mentally compute the average. Retrospective measures might therefore be more prone to error than online measures. This makes online measures preferable in many cases—except, perhaps, when people's future behavior is of interest. When deciding whether to go on spring break again, students might consider how much they enjoyed their last spring break experience as a basis for their decision. Because people typically do not have a record of their online experience to refer to, they likely base their decision on a quick retrospective summary of their last spring break, making such recall-based measures the best predictor of future choices.

Although the preponderance of research on subjective well-being relies on self-report measures or on variations such as experience sampling, other methods do assess how happy a person is. Informant reports (peer reports) rely on other people, such as friends, family, or coworkers, to indicate how happy

the person in question is. Although a person's friends, for example, do not have direct access to the person's phenomenological experience, they probably have a pretty good sense of whether a person is overall high or low in subjective well-being. Other methods assess subjective well-being based on theories of cognitive psychology—perceptions, memories, thoughts, and judgments—such as reaction time or memory for positive and negative events. An outgrowth of these cognitive methods are implicit measures, which may offer a way to assess subjective well-being when a person's explicit responses might diverge from the person's implicit feelings.

Ultimately, no single method perfectly measures subjective well-being. The assessment of subjective well-being is best accomplished by choosing the method most appropriate for the question of interest and, when possible, augmenting one type of measure with others. When, for instance, an individual reports that he or she is happy, and reports from friends and family agree, evidence would indicate that the measures converge, making a better case than either method alone.

CAUSES OF SUBJECTIVE WELL-BEING

Which people are happy, and what makes them that way? Considerable attention has been devoted to finding out which variables are—and are not—associated with being happy. From characteristics as fundamental as age and gender, to an individual's personality, to his or her cultural milieu, researchers have used a multitude of approaches to understand what might lead to subjective well-being. Often, establishing causality is difficult, but experimental and longitudinal research (in which the same participants are followed over time) on the correlates of subjective well-being point to some likely causes.

Age and Gender

Do people of one age group enjoy greater happiness than those of another? Although the predictors of subjective well-being change over time, so that different things are associated with being happy at different ages, overall levels of happiness show little

difference across different age groups. Knowing a person's age yields little information about his or her happiness. A person's gender is a similarly weak clue to his or her subjective well-being. Although women have been found to report slightly higher levels of negative affect, they also tend to report slightly more positive affect, making overall levels of subjective well-being similar for men and women.

Income

Another variable is income. The relation between income and subjective well-being has been examined in a number of ways. Wealthier nations have happier citizens than poorer nations, but other variables—such as health and democracy—also increase with wealth, making it difficult to determine whether wealth alone is responsible for the greater happiness. Income relates most strongly to subjective well-being in poorer nations, where having money might mean having necessities such as food or shelter. In wealthy nations income relates only weakly to subjective well-being. Although whether income leads to happiness is somewhat unclear, happiness may lead to greater income.

Marriage

Whereas age, gender, and income have not been consistent predictors of who is happy, a person's marital status has proven a consistent predictor of happiness. Married men and women are generally happier than unmarried men and women. As in the case of income, however, the causality is probably bidirectional: People high in subjective well-being probably are also more likely to marry. The effects of marriage may then further enhance their happiness.

Personality and Temperament

A person's personality has shown a strong and consistent relation to his or her subjective well-being. The personality traits of extraversion and neuroticism are closely linked to the experiences of positive and negative affect, respectively. Individuals

high in extraversion are more likely to experience positive emotions, and individuals high in neuroticism are more likely to experience negative emotions. Like positive and negative affect, extraversion and neuroticism are independent. A person's level of extraversion is not related to his or her level of neuroticism.

A person's inborn temperament is a precursor to later personality and also is related to happiness. Genetic studies examine twins who are raised in the same versus different environments in order to determine which effects are due to genes and which to the environment. These studies suggest that a genetic predisposition toward happiness exists because sharing the same genes makes a greater difference in the amount of positive and negative affect experienced than does sharing the same environment.

Goals

Making progress toward one's desired goals is a source of positive affect, just as setting unattainable or conflicting goals is a source of negative affect. Researchers have found that people with many goals that they consider to be important report greater positive affect and life satisfaction but sometimes also more anxiety.

Culture

The goals that people set are influenced by the culture in which they live. Living in a culture that emphasizes independence and autonomy (i.e., an individualist society) or in a culture that emphasizes interdependence and harmony (i.e., a collectivist society) is likely to influence the nature of the goals that a person sets and therefore the causes of subjective well-being. Culture has proven to have a strong relation to subjective well-being in other ways as well. Norms for the experience of positive and negative emotions vary from culture to culture and can influence an individual's experience of emotion within a culture. Latin American cultures value positive affect more than do east Asian cultures, for instance, and also report experiencing more positive affect.

OUTCOMES OF SUBJECTIVE WELL-BEING

The experience of subjective well-being is associated with a variety of positive outcomes, many of which have been associated with leadership. For example, happy people report better social relationships, greater resistance to stress, and greater productivity at work. Experimental and longitudinal studies allow researchers to identify a number of variables that likely result, at least in part, from being happy.

Sociability

The trait of extraversion is linked to the experience of positive affect. However, extraversion is a consistent predictor not only of subjective well-being, but also of leadership. A meta-analysis—a technique for statistically aggregating findings from two or more studies—of a large number of studies found extraversion to be the strongest correlate of leadership, suggesting that extraverts make better leaders. Extraversion was related to both leadership emergence and leadership effectiveness and remained so across several types of situations.

Sociability is one facet of extraversion and has also been associated with leadership. Some evidence suggests that happy people are more sociable. Laboratory studies show that putting people in a positive mood makes them more sociable, likely to seek out social interaction and to view others positively. These people are in turn viewed well by others—as appealing candidates for social interaction. Appearing happy to others can be perceived as a cue that one is receptive to social engagement.

Self-Efficacy

Not only are individuals high in subjective well-being highly regarded by others, but they regard themselves positively as well. Happy people have greater feelings of self-efficacy (the power to produce an effect), self-esteem, and self-confidence. Laboratory studies offer support for the idea that making people happy leads to positive self-perceptions. Longitudinal research supports this idea and suggests that positive self-perceptions in turn contribute to subjective well-

being. A number of studies have linked self-perceptions, especially self-confidence, to leadership.

Stress

Some evidence suggests that people high in subjective well-being have superior stress tolerance, another variable that has been related to leadership. This tolerance is due in part to the fact that some of the outcomes associated with high subjective well-being, such as social support and self-esteem, also serve as buffers against stress. These outcomes make happy people less susceptible to sources of stress and better able to cope with stressors. Happy people appear to choose more effective methods of coping—such as actively engaging the stressor or focusing on finding positive outcomes in otherwise stressful experiences.

Creativity

Creativity can be defined as “flexible, novel, or original thinking.” Some studies suggest that creativity is a characteristic associated with leadership and happiness. People placed in a positive mood in the laboratory, compared with those people in a neutral mood, do better on tasks measuring creativity. Researchers are not sure how being happy leads to enhanced creativity, but such findings are compatible with a “broaden and build” model of positive affect. This model suggests that, in contrast to negative emotions—which serve to narrow a person’s thoughts and actions to focus on the source of the negative affect—positive affect broadens one’s thoughts and actions, leading to divergent and possibly creative thought.

A host of studies have examined the effects of subjective well-being in the workplace and may be relevant for the study of leadership in an organizational context. One study that used a managerial simulation to assess a variety of skills found that those people high in positive affect were rated more highly in leadership by an objective panel of judges. Positive affect has also been related to organizational spontaneity, which relates to acts that are not part of one’s job description but that benefit the organization. These acts include helping coworkers, protect-

ing the organization, making constructive suggestions, developing oneself, and spreading goodwill. Indeed, happy people report a greater inclination toward assisting others at work.

FUTURE DIRECTIONS

Behavioral scientists have made a great deal of progress in measuring subjective well-being and understanding its causes and consequences. Little study, however, has been devoted to subjective well-being as it relates to leadership. Because both happiness and leadership have been linked to many of the outcomes here, one could easily speculate about direct connections between happiness and leadership. Positive affect, in particular, likely may cultivate a constellation of characteristics associated with active leadership. Future research is needed to understand how the multiple components of subjective well-being relate to different aspects of leadership, such as leader emergence and leadership effectiveness, and how these relations function in different cultures. In addition, researchers should clarify the processes by which subjective well-being influences leadership—whether it has a direct influence or one that is mediated by other variables.

HARRIS, WILLIAM WADE
(c. 1850–1929)

Liberian religious leader

William Wade Harris was a Liberian prophet who started the Harris Movement in the 1920s along the west coast of Africa. Harris had a strong Africanist ideology and insisted on strict adherence to the Ten Commandments and a strong work ethic. Usually attired in a white robe, he was a charismatic figure and a great speaker.

HISTORY

William Wade Harris founded the largest mass movement of Christian conversion in west African history. In the second decade of the twentieth century, Harris founded the Harris Church in Liberia. The church attracted people from Ghana and Ivory Coast as well as Liberia. Although a number of his followers, especially in Ghana and Ivory Coast, later joined mainstream Christian religions, the Harris Church kept many of its converts and in 1998 became a member of the World Council of Churches.

Harris was a member of the Grebo tribe. He entered an American mission school, becoming an Episcopalian. He found work as a teacher, an interpreter, and a seaman, traveling widely along the west coast of Africa.

Around 1910, authorities jailed Harris for his plot to replace American control over Liberia with British control. Harris said that while he was in prison, the angel Gabriel came to him in a vision, bringing him a message. Harris believed that Gabriel had come to call him to the work of preparing the people of west Africa for the return of Jesus Christ.

MESSAGE AND LEADERSHIP STYLE

Harris preached a straightforward version of Christianity. First, he rejected all Africanisms. There were to be no amulets or fetishes. African religious practitioners were condemned. The Bible became the only recognized authority. He called on people to follow the Ten Commandments, abjure adultery, practice monogamy, and refrain from lying and theft. It was an old-fashioned version of Christianity.

In either 1912 or 1913, Harris began his second journey along the west coast of Africa. His purpose was clear. He was out to convert the population to Christianity. Harris realized the importance of catching people's attention and so he presented a striking scene on his travels. Two women accompanied him. The women sang, danced, and banged rattles along the way. Harris wore a white turban and a full robe and carried a cane cross, a jug filled with water for baptism, and a Bible.

Harris attracted people from many different eth-

nic groups to his movement. In all, he converted around 120,000 people. Harris operated on the principle of getting converts while they were interested. There was immediate baptism for interested parties. Instruction came later, either through established mission churches or the churches his twelve apostles founded, in which Harris incorporated some African ideas and used African leaders.

The greatest success came in the Ivory Coast, where Harris had the support of the French colonial government because of his advocacy of hard work, self-help, and obedience to authority. In 1914 the French realized that the Harris Movement posed a threat to continued French control. The government expelled Harris and destroyed his new churches.

Harris returned to Liberia, spreading the gospel. However, by 1915 his greatest success was behind him. Catholic and Protestant missionaries took advantage of Harris's success and converted many of his followers to their denominations. A number of the Harrisites, as they had come to be called, continued in the new independent Harris churches. At the close of the twentieth century, these included the Church of the Twelve Apostles in Ghana and the Eglises Harrisites and the Deima Movement in the Ivory Coast.

Harris insisted that women as well as men be converted to Christianity, a practice that distinguished him from other Christian missionaries. Because he was African, Harris understood the role of matrilineal descent in a person's spiritual life and the great power women have in many west African societies. He encouraged women to become active in church affairs. In distinction to many other independent churches, Harris accepted people of different faiths and ethnic groups into his church.

Harris's criticism of some local customs and beliefs further differentiated his movement from other indigenous movements. His willingness to criticize African culture was a product of Harris's Liberian heritage, where American values were held to be superior to African ones.

IMPACT OF THE HARRIS MOVEMENT

The influence of the Harris Movement went far beyond converting a large number of Africans to

Christianity. It did much to help prepare the people of the western coast of Africa for the modernizing innovations brought by missionaries and colonialists. The opposition of the French government to Harris's church, moreover, gave the movement an association with reform and African independence that Harris himself did not actively seek. Harris's cooperation with other Christian religions—Catholic and Protestant—encouraged among his followers an openness to new ideas that promoted an ecumenical spirit. The movement also attracted foreign support for African goals, including, eventually, independence. His stress on the importance of the Bible encouraged literacy among his followers. That Harris churches still exist is a testimony to his leadership in establishing churches that have been successful as a means to modernization and as bridges between traditional African beliefs and Christianity.

HIROSHIMA

Just how controversial the atomic bombing of Hiroshima, Japan, in 1945 remains was shown by the turmoil surrounding the proposed exhibition of the U.S. bomber *Enola Gay* at the Smithsonian Institution in Washington, D.C., on the fiftieth anniversary of the bombing. Although the turmoil encompassed multiple points of political, social and cultural importance and reflected both memory of the past and changes in historical perspective, it also was a reminder that the use of such weapons is always a possibility. Knowing how the leaders made a number of decisions during and immediately after World War II is not merely interesting as a case study but

also gives us pause as we contemplate the continued survival of humanity. Although the decision to drop the atomic bomb on the city of Hiroshima is of paramount interest here, we also should consider decisions leading to the creation of the bomb in the first place, the decision to drop a second bomb on the Japanese city of Nagasaki, the Japanese response to both bombs, and how those people who condemn or defend the use of the bombs reach their conclusions.

THE MANHATTAN PROJECT

Initial research on an atomic bomb in the United States was prompted by the fear that Germany was developing its own atomic weapons. Beginning in 1939, when the U.S. government was first apprised of the possibility of producing highly destructive atomic weapons and the possibility that the Germans were working to produce them, until the closing months of World War II, when U.S. troops captured and talked to German scientists and learned that Germany had no such weapons, the fear was real. After the Germans surrendered, there was ostensibly no need to continue the Manhattan Project, which was the U.S. project to develop an atomic bomb. However, the project not only continued, but also was put on the fast track.

The possibility of a Japanese atomic bomb program was not an issue because all involved believed that Japan did not possess the uranium, the scientists, or the technical facilities to produce an atomic threat. Nevertheless, the U.S. project shifted from a defensive posture—with the initial goal of creating the bomb as a “potential weapon”—to an offensive posture.

One reason for this shift was the fact that the U.S. government had devoted massive effort and financial resources (\$2 billion) to producing the weapons, and U.S. leaders would have been hard pressed to justify this tremendous expense and diversion of scarce wartime supplies to this project and then not have a product to show for it.

After the bomb was produced—and its use was placed alongside a costly invasion of Japan as an option—there was further momentum toward

What Did Truman Know?

The wisdom and the process used to make the decision to bomb Hiroshima remain highly controversial and the subject of ongoing debate. One issue is what Truman knew when he made the decision. In a diary entry of 25 July and a radio speech on 9 August 1945 (see text below), Truman referred to Hiroshima as a "military base," raising the possibility that he did not know it was a city filled with civilians.

The world will note that the first atomic bomb was dropped on Hiroshima, a military base. That was because we wished in this first attack to avoid, insofar as possible, the killing of civilians. But that attack is only a warning of things to come. If Japan does not surrender, bombs will have to be dropped on her war industries and, unfortunately, thousands of civilian lives will be lost. I urge Japanese civilians to leave industrial cities immediately, and save themselves from destruction.

Source: *Public Papers of the Presidents of the United States: Harry S. Truman, Containing the Public Messages, Speeches and Statements of the President April 12 to December 31, 1945.* (1961). Washington, DC: Government Printing Office, p. 212.

employing it. After V-E (Victory in Europe) Day, some people were unwilling to risk unnecessary U.S. casualties to get Japan to surrender. Troops who had survived north Africa, Italy, and D-Day (the Allied invasion at Normandy, France) were not eager to take on the entrenched Japanese, and there was pressure to end the Pacific war as quickly as possible. The battles to take the Pacific islands of Iwo Jima, mid-February to mid-March 1945, and Okinawa, 1 April to 2 July 1945, indicated just how fiercely the Japanese would fight, and the United States suffered approximately 27,000 in the former battle and close to 50,000 in the latter.

Experts vary widely on estimates of casualties if the United States had invaded the Japanese island of Kyushu, scheduled for 1 November 1945, and then the mainland Honshu, and on how those estimates were reached. After the war, a casualty estimate of 500,000 U.S. deaths was mentioned, but the consensus among experts now is that this estimate was never substantiated and that the planners of the invasion estimated casualties totaling 193,500

(40,000 killed, 150,000 wounded, and 3,500 missing) on 15 June 1945.

An important unknown in any estimates of invasion casualties was the Japanese willingness to commit suicide rather than to surrender because surrender was considered dishonorable. If Japanese troops were willing to fight to the last man, then invasion would be a high-risk option, especially if the entire populace followed suit. No one knew, for example, how Japanese would fight with their backs to the wall and for the first time on their homeland, how effective kamikaze planes and suicide boats would be, or how great an impact lone soldiers would be if they were willing to die in a bombing attack.

The important point here is not the accuracy of these estimates but rather the perception that the use of the atomic bomb—after it became available—would eliminate the need for unnecessary further losses of U.S. troops. Nevertheless, one should note that on 18 June 1945, U.S. President Harry S. Truman approved full-scale planning for the invasion of Kyushu to commence, even while the atomic bomb was being produced. That is, at that point both the bomb and full-scale invasion were being considered.

WHEN DID TRUMAN KNOW?

Prior to his death, U.S. President Franklin D. Roosevelt seems not to have decided whether to use the bomb in combat against Japan, but his vice president, Truman, did not even know what the Manhattan Project was all about. Truman learned about the existence of the atomic bomb project from Secretary of War Henry Stimson on becoming president when Roosevelt died in April 1945, and two significant factors came into play. First, it appears that from the moment when Truman learned of the existence of the bomb program until the actual bombing, he never reexamined the original assumption that it was a legitimate weapon and that it should be used to end the war as soon as possible. In effect, all other things being equal, he had no strong reason to halt the deployment of the bomb. Second, with the successful test explosion at Alamogordo in New Mexico on 16 July of that year, there was less reason for policy

advisers to pursue other alternatives or modify their demand for “unconditional surrender.”

BREAKING A TABOO ON BOMBING OF GENERAL POPULACES

Prior to the decision to use atomic weapons, a change occurred in what was considered morally acceptable in warfare. That change resulted from the technological progress that made air power an important factor. Whereas nations had previously refrained from bombing cities and noncombatant populations, the German bombing of London, the Japanese bombing of Chungking, China, and the U.S. firebombing of Tokyo led step by inexorable step toward using any kind of weapon on any kind of enemy population. In a brutal conflict, the thinking went, killing civilians was a highly effective way to get citizens to urge their government to bring resistance to an end.

THE ALTERNATIVES

We often assume that Truman’s options were limited to either using the atomic bomb or moving ahead with the plans for what was anticipated to be a full invasion of Japan, with huge U.S. losses, but some recent studies contend that this was not the case. The revisionists point to other considerations that might have—singly or in some combination—brought about surrender without the atomic bomb and without an invasion.

First, there was the option of waiting for the Soviets to enter the war and exert pressure on the Japanese from the mainland, as they eventually did with a massed force along the border of Manchuria and Korea. Truman at first welcomed that option as a means of reaching an early surrender but later hoped to prevent it for political reasons.

Second, experts considered first issuing a warning and then dropping the atomic bomb on an uninhabited area of Japan, thus getting the attention of Japanese decision makers. This was not a new idea because experts in charge of selecting potential targets had all along recommended bombing a small, strictly military facility to show the bomb’s devastat-

ing power for psychological effect without destroying major civilian populations.

Objections to this option included the possibility that the Japanese might move Allied prisoners of war into the announced bomb site or that, if the bomb turned out to be a dud, this would embolden the Japanese to hold out longer. These possibilities—and the assumption that a warning would be given—made this alternative seem high risk and therefore not attractive. After the 16 July atomic bomb test in New Mexico was successful, no one suggested this alternative again.

A third alternative was to not cling to the demand for “unconditional surrender,” which gradually grew from a kind of rallying slogan into a formal policy. Knowledgeable policymakers such as U.S. acting Secretary of State Joseph Grew (1880–1965), who had from 1932 to 1941 been ambassador to Japan, advised that to the Japanese the threat of the removal of the emperor and/or the imperial institution was an insurmountable barrier to accepting “unconditional surrender.” Those experts who followed Grew’s line of thinking pointed to the Atlantic Charter’s promise to respect the rights of each people to select the form of government that they wanted and concluded that it was reasonable to allow the Japanese to keep the imperial system under a “conditional surrender.” Some observers hold that if the Japanese had either been offered assurance in writing—as suggested by Grew in preparing the Potsdam Declaration—or had been convinced by implicit evidence that the Allies would allow Emperor Hirohito to remain on the throne, surrender would have come earlier—before the bombing of Hiroshima. However, the evidence for this view is not fully convincing.

A fourth alternative was for the United States to pursue the feelers that the Japanese had communicated to the Russians and that were conveyed to Truman at Potsdam. Here, too, “unconditional surrender” was an issue, and with Russia rapidly preparing to enter the war against Japan anyway, this alternative was not viable.

The fifth alternative was to continue using only conventional weapons and continue reliance on bombing and blockading. From mid-March 1945, the major cities of Japan had been devastated by fire-

bombing, with considerable psychological effect on the civilian population and major impact on production and transportation facilities. The major mainland cities that had not been damaged were those that had been listed as potential atomic targets.

The air and sea blockade was becoming increasingly effective during 1945. Regarding the situation leading up to the planned 1 November invasion of Kyushu, *The U.S. Strategic Bombing Survey*, "Japan's Struggle to End the War," published by the U.S. Government Printing Office in 1946, concluded: "Certainly prior to 31 December 1945, and in all probability prior to 1 November 1945, Japan would have surrendered even if the bombs had not been dropped, even if Russia had not entered the war, and even if no invasion had been planned or contemplated."

In the end leaders decided that these five alternatives—or some combination of them—were riskier and less desirable than the two remaining choices: invasion or the atomic bomb.

FACTORS LEADING TO TRUMAN'S DECISION

Beginning with the assumption that we will never know exactly which elements were foremost in Truman's mind when he made the ultimate decision to employ the atomic bomb, documents recently made available raise a number of issues.

First, to what degree did Truman's personality affect his decision? Although Truman repeatedly said that he refused to regret a decision after he had made it, there is another view. "Behind Truman's exterior of confidence and conviction, however, was an intricate personality, driven by an inferiority complex, notions of race, a need to be resolute and masculine, and feelings of ambivalence, as well as remorse" (Takaki 1995, 10).

Second, within the larger context—specifically in regard to the Soviet Union—Truman had to think about the future. After assuming the presidency in April 1945, he seemed to be at least as concerned about the intentions of Russia after Japan's defeat as he was about the actual ending of the war with Japan. The successful use of an atomic bomb by the United States would let the Russians know how

strong the U.S. military was and inhibit further advances by Russia in eastern Europe.

THE BOMBING

Hiroshima was demolished on 6 August 1945. The United States did not expect sudden capitulation and therefore did not delay the bombing of Nagasaki three days later, perhaps in an effort to carry out orders before the bad weather that was predicted to continue for several days after 9 August. In hindsight, it may have been that the Hiroshima bombing was so devastating that word of just how bad the devastation was took longer than expected to reach Tokyo.

WAS THE BOMB NECESSARY?

Setting aside the issue of whether dropping either bomb was morally defensible, it is helpful to discuss one bombing at a time. In regard to the bombing of Hiroshima, there has always been a clear division between those people who believed it was at the very least unnecessary and those who believed that it was necessary. Truman's published diary indicates that the Soviet leader Joseph Stalin promised to enter the war against Japan on 15 August 1945, and from this one could conclude that the bomb was not needed to end the war. Another interpretation is that after the bomb was tested, from Truman's point of view, the potential entry of the Russians into the war was not only unnecessary but also actually undesirable because their entry would allow the Russians leverage in the postwar decision making.

Among those people who felt that the bomb was not necessary from a military perspective was none other than U.S. Gen. Douglas MacArthur, who was the acting supreme commander of the Allied forces in the Pacific but was not involved in discussions of whether the bomb should be used and was not notified of the decision until forty-eight hours before the actual flight. MacArthur's view was based on the knowledge that the Japanese had asked Russia to negotiate a surrender with the United States. Given this request, he and other experts assumed that the Japanese would surrender by autumn 1945 no matter what.

Potsdam Declaration, 26 July 1945

The Potsdam Declaration, issued by U.S. President Harry Truman, British Prime Minister Winston Churchill, and Chinese Generalissimo Chiang Kai-shek at a meeting in Potsdam, New York, spelled out the terms for ending the war against Japan.

(1) We—the President of the United States, the President of the National Government of the Republic of China, and the Prime Minister of Great Britain, representing the hundreds of millions of our countrymen, have conferred and agree that Japan shall be given an opportunity to end this war.

(2) The prodigious land, sea and air forces of the United States, the British Empire and of China, many times reinforced by their armies and air fleets from the west, are poised to strike the final blows upon Japan. This military power is sustained and inspired by the determination of all the Allied Nations to prosecute the war against Japan until she ceases to resist.

(3) The result of the futile and senseless German resistance to the might of the aroused free peoples of the world stands forth in awful clarity as an example to the people of Japan. The might that now converges on Japan is immeasurably greater than that which, when applied to the resisting Nazis, necessarily laid waste to the lands, the industry and the method of life of the whole German people. The full application of our military power, backed by our resolve, will mean the inevitable and complete destruction of the Japanese armed forces and just as inevitably the utter devastation of the Japanese homeland.

(4) The time has come for Japan to decide whether she will continue to be controlled by those self-willed militaristic advisers whose unintelligent calculations have brought the Empire of Japan to the threshold of annihilation, or whether she will follow the path of reason.

(5) Following are our terms. We will not deviate from them. There are no alternatives. We shall brook no delay.

(6) There must be eliminated for all time the authority and influence of those who have deceived and misled the people of Japan into embarking on world conquest, for we insist that a new order of peace, security and justice will be impossible until irresponsible militarism is driven from the world.

(7) Until such a new order is established and until there is convincing proof that Japan's war-making power is

destroyed, points in Japanese territory to be designated by the Allies shall be occupied to secure the achievement of the basic objectives we are here setting forth.

(8) The terms of the Cairo Declaration shall be carried out and Japanese sovereignty shall be limited to the islands of Honshu, Hokkaido, Kyushu, Shikoku and such minor islands as we determine.

(9) The Japanese military forces, after being completely disarmed, shall be permitted to return to their homes with the opportunity to lead peaceful and productive lives.

(10) We do not intend that the Japanese shall be enslaved as a race or destroyed as a nation, but stern justice shall be meted out to all war criminals, including those who have visited cruelties upon our prisoners. The Japanese Government shall remove all obstacles to the revival and strengthening of democratic tendencies among the Japanese people. Freedom of speech, of religion, and of thought, as well as respect for the fundamental human rights shall be established.

(11) Japan shall be permitted to maintain such industries as will sustain her economy and permit the exaction of just reparations in kind, but not those which would enable her to re-arm for war. To this end, access to, as distinguished from control of, raw materials shall be permitted. Eventual Japanese participation in world trade relations shall be permitted.

(12) The occupying forces of the Allies shall be withdrawn from Japan as soon as these objectives have been accomplished and there has been established in accordance with the freely expressed will of the Japanese people a peacefully inclined and responsible government.

(13) We call upon the government of Japan to proclaim now the unconditional surrender of all Japanese armed forces, and to provide proper and adequate assurances of their good faith in such action. The alternative for Japan is prompt and utter destruction.

Source: Potsdam Declaration. (1945, July 26). Retrieved October 8, 2003, from <http://www.isop.ucla.edu/eas/documents/potsdam.htm>

Truman and his policymakers concluded that there was no incentive to pursue any of the five alternatives and that, between the alternatives of the bomb and invasion, there was no reason to avoid

using the bomb. The bomb was the better alternative, they concluded, because it would end the war, save U.S. lives, and, as a bonus, enable the United States to gain political concessions from the Soviets.

JAPAN'S RESPONSE TO THE BOMBINGS

The Japanese government, on 27 July 1945, received the Potsdam Declaration demanding “the unconditional surrender of all Japanese armed forces” and declaring that the alternative would be “prompt and utter destruction.” Scholars are divided over how deeply involved Emperor Hirohito was in the next series of events, but they generally agree that Japanese government officials were sharply split over the possibility of attaining a negotiated peace, with one essential condition being a guarantee of the imperial system.

Those officials who were disposed to accepting the demands of the Potsdam Declaration believed that the guarantee was not stated but rather implicit. The hardliners held out for an explicitly stated guarantee under a “conditional surrender” and insisted that Japan hold out and make a final stand against the anticipated invasion of the mainland in an effort to guarantee the emperor’s position.

Whether due to the emperor’s strongly expressed wishes, an inability to reach a consensus, or the belief that the Potsdam Declaration did not amount to a new strengthening of demands, the Japanese leadership did not accept the Potsdam Declaration demands. Instead, by default or by actual choice, the leadership’s stance was to wait for some word to come via the Russians regarding previous peace feelers from the Japanese side.

The Hiroshima bomb was so devastating that the Japanese government did not receive a full report on the damage until 8 August, and on that day Russia declared war on Japan. Had Japanese leaders had more time to digest these two facts, some experts speculate, they might have surrendered at that point. However, the second bombing, which was originally scheduled for 11 August, was moved forward two days in an effort to avoid the cloudy weather that had been forecast to continue from 9 August for the next five days. The day after the destruction of Nagasaki on 9 August, government leaders in Tokyo realized the urgency of their situation and issued a statement of their willingness to abide by the Potsdam Declaration, but with the proviso that imperial rule not be compromised. U.S. Secretary of State James Byrnes

responded that “the ultimate form of government of Japan” would be determined by “the freely expressed will of the Japanese people.” This reply has been interpreted as both a strong renewal of the demand for unconditional surrender and as an implicit message that the victors would leave the imperial system intact. The Japanese government remained deadlocked, and the decision was finally left up to the emperor himself, and he decided to surrender unconditionally. In a broadcast of 15 August 1945, the emperor brought the war to an end. Needless to say, the ultimate decision by the Allies was to allow the imperial throne to continue and to allow the current emperor to occupy it.

HIROSHIMA IN HINDSIGHT

The decision to drop the atomic bomb on Hiroshima was the result of factors ranging from scientific investment and weather forecasts to Truman’s personality and concern about the postwar political situation. In hindsight, one tends to see the gradual building of momentum from the beginning of World War II and the commencement of the Manhattan Project leading to that predestined event. However, with all the contingencies involved—on both sides of the Pacific—one cannot help but wonder whether the change of a single factor somewhere along the process might have made that decision an unnecessary one.

HISTORY

The word *history* comes from the German verb “to happen.” History is more than a name for what has already happened, however. One must not think of history simply as the sum of all past events. History is a story about those events. According to Eric Voegelin, the historian selects events that show a pattern. History itself is obviously incomplete; nobody knows how it ends, so nobody can know its meaning. Nonetheless, historians can detect patterns such as patterns of social and political change. Leadership appears to be part of those patterns and therefore is an element within history.

This is not to suggest that historians all see the same pattern. For instance, Oswald Spengler, Arnold Toynbee, and Voegelin made an effort to get away from the dominant view of history as a linear progression, from dark ages shrouded in myth toward enlightenment and ultimately some kind of future utopia. That pattern is simply inadequate, yet they disagreed among themselves about what to put in its place.

One reason for such disagreements is that historians begin from different assumptions. Hannah Arendt once explained that ancient history attempted

to preserve the memory of human achievement against the ravages of time. Its subject matter tended to be extraordinary leadership worthy of preservation. In a world of fixed laws and unchanging nature, leadership was memorable and rare. Modern history takes a different approach. Because people tend to believe that nothing is fixed, modern historians attempt to describe the process by which things evolve. Leaders are part of a process. What they do is a process. The subject matter of modern history, therefore, is not the leader. Rather, it is the process in which leaders participate.

Since the eighteenth century, a number of historians have gone further, rejecting leadership because it is a guise for impersonal processes such as economic production, biological evolution, and disenchantment. Their creed is known as determinism.

THE CHALLENGE OF DETERMINISM

Determinism rejects the idea of leadership. A determinist might explain stories about leaders as childish personifications of abstract forces, psychological projections of frustration, or at most descriptions of a role that somebody was bound to play. For instance, if Napoleon Bonaparte had not become emperor of France in 1804, somebody else would have. At the least, a determinist will argue that a leader is merely a product of past circumstances and could not be other than a leader when circumstances become ripe.

In 1943, Sidney Hook claimed that most historians avoid the extremes of determinism because leaders and their circumstances work together to shape event; yet Fernand Braudel and contributors to the journal *Annales* continued to assault the “idea that history is best seen as a narrative of the deeds of individual political actors”—preferring instead impersonal forces and extended timelines measured in hundreds and thousands of years (Clark 1985, chap. 10).

Determinists argue that studying history through the lens of leadership oversimplifies reality. More is at work than the influence of certain prominent individuals, whether captains or kings. There are other factors. Historians distort their understanding when they pluck one thread from the fabric. A controversial

claim along these lines is that leadership studies perpetuates a myth that individual human beings can make a difference; people are flattered to believe in human efficacy when we are, in the words of Leo Tolstoy, but history's slaves. Determinists are therefore unlikely to see the point in studying history as the record of leadership.

REASONS FOR LEADERS TO STUDY HISTORY

There are three conventional reasons for studying history. First, some people are simply curious about the past. They find it fascinating. Barbara Tuchman has written: "Readers want to see man shaping his destiny or, at least, struggling with it, and this is the stuff of history" (1981, p. 54). Second, the study of history is a good discipline, sharpening the mind to contemplate the evidence and its interpretations. Third, people study history to learn something of practical use today. Together, these are like taking a walk to go exploring, get exercise, and reach a destination.

This third reason was subdivided by Friedrich Nietzsche into three practical uses for studying history. The first use is to be inspired by the exploits of noteworthy predecessors. Their fame makes people want to imitate them. The second use is to venerate tradition, preserving the past and showing piety. Knowing where you come from anchors you and helps to stabilize you. The third use is to expose and remedy past errors, as the first step toward reform. A person cannot transcend what he or she does not even know.

Interestingly, Nietzsche insisted that at some point leaders have to forget history and forge ahead. People can become, in his words, "oversaturated" with the past, to the point that one's life suffers. History has its uses, but then life is lived forward. Leaders are advised to study history while keeping it all in perspective.

Some writers take the extreme position that history is totally irrelevant to leaders today, inasmuch as circumstances have changed. What happened in the past has little or no bearing on the future. In the words of industrialist Henry Ford, "History is bunk." What worked in previous eras will not necessarily

work today, so that studying what leaders did once upon a time—before the technological revolution, for example, widespread emancipation, and globalization—has "merely historical interest." Leadership is a practical activity, requiring more practical lessons. The past is over.

Historians cannot agree with this position. They have to believe that their stories mean something for people today. From the beginning their stories have included a role for leaders, that is, for actors who precipitate and channel change. Through the centuries these stories have emphasized different types of leader, from patriarchs to presidents, but there is a pattern across the discipline about individuals to whom significant change can be ascribed. Homer recited the exploits of heroes and gods. Ancient empires recorded the annals of the king. The *Torah* tells of Moses, Joshua, and the judges. Alban Butler compiled *The Lives of the Saints*. Thomas Carlyle wrote about "Great Men." Vilfredo Pareto and W. E. B. DuBois described the role of elites. Leadership studies continues in that tradition, by attempting to explain the role of leaders in shaping events.

Just as leadership helps to explain history, so also history helps to explain leadership. Leadership studies and historical studies are mutually dependent. What are the conditions out of which leadership emerges? Where do individual leaders come from? What threat or tension does the leader attempt to resolve? These and a host of other questions arise during the study of leadership. History attempts to answer them.

If leaders shape events, then leadership studies can be understood as training to alter the course of history. Karl Marx wrote that "philosophers have only interpreted the world in various ways; the point is, to change it" (Marx 1978, 145). This ambition to change the world runs counter to another tradition, which says leaders are to attune themselves and their followers to an unseen order. According to this tradition, the unseen order is not for humans to change. Some reforms should never be attempted. One of the controversies within leadership studies, therefore, has to do with the existence and authority of this unseen order, whether natural or divine. What, if any, are the moral and practical boundaries

surrounding leadership? What *cannot* be done? What *should not* be done? Is there in fact an unseen order? People disagree.

THE WORK OF HISTORIANS

1. Interpreting Symbols

The study of leadership is composed of symbols, such as vocabulary and abstract models, that allude to real-world experiences in politics, war, and commerce. An understanding of leadership has to be grounded in experience. Experiences of leadership are never identical, of course, which means that these experiences are only equivalent in some way. Part of the problem then is deciding which symbols and experiences to study and which to set aside. What experiences are equivalent? English-speaking persons, for example, interpret foreign languages to find that other nationalities experience leadership, even if they use different words for it. It is perfectly acceptable to study their experiences. In the same manner, historians study the past to find that people from previous eras experienced leadership; thus, their experiences may be studied as well.

Studying leadership from the past requires a firm sense of the symbols people used to describe their experiences because many of their symbols are no longer used today, much less in the same way people use them now. Latin, for example, is a dead language. It is important for an historian to appreciate the circumstances in which symbols were used, because the same symbol can change its meaning over time. The word *Führer* (literally: leader) had a different meaning for Germans before the rise of Adolf Hitler.

If all that historians do is interpret symbols, cynics will argue that there really is no such thing as history at all, but rather only historians. They hold that history is a version of events told by its victors, who ensure that only certain interpretations prevail. What passes as history, therefore, is regarded as propaganda suitable to the purposes and vanity of the dominant class, race, or gender. Symbols are tools to promote an ideology. What these critics frequently seek are alternative histories (or “her-sto-

ries”), that is, rival accounts to keep from losing critical perspectives.

2. Gaining Sufficient Distance

Studying leadership from the past becomes increasingly difficult as the experiences become more remote. Today, historians retain fewer artifacts and have less in common with ancient and obscure societies, so that beyond a certain point their studies become less reliable. They also become less applicable. Paradoxically, some experiences are so near in time or so familiar that historians cannot achieve sufficient distance to interpret them objectively. It might still be too soon, for example, to study the leadership of U.S. President Richard Nixon properly. Historical distance increases the likelihood of objectivity. Thus, students of history work to gain sufficient distance while at the same time gaining familiarity with the subject matter. That is not easy. They cannot afford to be too close or too distant.

3. Classifying Historical Materials

One reason to study history is to find out what was said in the past about leadership. One can organize these materials along two dimensions. First, one can separate materials about specific leaders (e.g., biography) from materials of a more theoretical nature about leadership generally (e.g., political studies). Second, one can separate materials left by practitioners from materials left by observers. In this way one constructs four categories. For materials about specific leaders from practitioners, one might include the memoirs of Ulysses S. Grant, for example. For materials about specific leaders based on observation, one might include Plutarch’s *Lives of the Noble Romans* or more recently the book *Certain Trumpets* by Garry Wills. For materials about leadership generally from practitioners, one might consult the *Meditations* by Marcus Aurelius. One can also read John Gardner’s book *On Leadership*. And for materials about leadership generally from observers, one might prefer Plato or James MacGregor Burns.

Some of the richest material falls into more than one category, such as the writings of Niccolò Machiavelli,

who was both a practitioner and a keen observer of his time, interested in describing concrete examples as well as drawing broad conclusions.

4. Penetrating the Obvious

A word of caution seems appropriate. Leadership studies does tend to focus on extraordinary humans, such as the hero or genius, and to dismiss the rest of humanity as inconsequential. This focus on the extraordinary overlooks other types of leader, such as invisible leaders, servant leaders, and smaller-scale leaders in ordinary situations. There is a kind of leadership that is barely detectable, despite its power. The remedy to decades of oversight is not to reject the study of leadership but rather to expand it. History offers a rich supply of evidence that accumulates daily.

HITCHCOCK, ALFRED (1899–1980)

British film director

Born in London, England, Alfred Joseph Hitchcock claimed not to have had aspirations of becoming a film director. Yet, by the end of his life he had become a critically and commercially successful director, a familiar name, face, and profile, and he did it primarily by making suspense-laden thrillers, a genre not commonly associated with artistic innovation. He accomplished this success through a carefully maintained level of control and leadership, which he exerted on his cast and crew, and, to some degree, even his employers and himself.

Hitchcock was the third of three children. His next-oldest sibling, Nellie, was seven years his senior. As a result of the difference in their ages, Alfred did not spend much time with his sister and older brother, William, when he was young. Their father, William Hitchcock, who died in 1914, was a London businessman and devout Roman Catholic who sought to protect his children from the corrupting influences of the world. As a result, Hitchcock was schooled at several boarding schools, where it is reported that he was quite solitary, preferring the role of spectator to that of player.

HITCHCOCK'S EARLY YEARS

In 1919, Hitchcock learned that the Hollywood-based production company Famous Players-Lasky was setting up a studio in England. He obtained a position with the company writing and designing title cards, the decorated text cards that were used in place of

spoken dialogue in silent movies. Hitchcock's position writing titles gave him a starting place; he eagerly watched and learned the various processes going on around him. He started writing scripts, simply as an exercise, and as his employers grew to trust him more, he began taking on many different roles in the production of the company's films. In 1923, on the set of *Woman to Woman*, he met Alma Reville (1899–1982), who was serving as the film's editor. They began dating (it was Hitchcock's first-ever romantic relationship), and on 2 December 1926, they were married. Two years later, on 7 July 1928, their only daughter, Patricia, was born.

Although Hitchcock helped direct the unreleased *Number Thirteen* and *The Pleasure Garden* (1925), *The Lodger* (1926), based on the story of Jack the Ripper, was the first of the thrillers with which his name came to be synonymous. He brought to the film all the technical skills that he had gained by watching those around him, which made him somewhat of a rarity: a director who understood, and could, in a pinch, perform, many of the technical processes involved in making a motion picture. His technical prowess and know-how also helped him lead the cast and crew more effectively.

HITCHCOCK IN HOLLYWOOD

After directing a series of films in England during the remainder of the 1920s and the 1930s, most notably *The Man Who Knew Too Much* (1935) and *The Thirty-nine Steps* (1936), Hitchcock and his family relocated to the United States in 1939 to join the filmmaking community in Hollywood, financed by a new deal with the famous producer David O. Selznick (1902–1965).

By the time that he made *Rebecca* (1940), his first film for Selznick, Hitchcock had developed a formula for making movies. The formula entailed a large degree of forethought and scripting, with the desired result being that each step was planned well before it was to take place. Thus, when it came time to shoot, Hitchcock would usually film only what was in the script, rather than filming a wide variety of shots and angles and then editing those together once shooting had been completed, which was the pattern

The shower scene in Psycho is considered one of the scariest and greatest scenes in cinema history. Here actress Janet Leigh (playing the character Marion Crane) screams in terror as Norman Bates tears open the shower curtain before stabbing her to death.

for most directors. Hitchcock's technique led to disagreement with Selznick, who liked being able to assemble the final product from a mess of different shots rather than having to rely on the limited options for rearrangement that Hitchcock's style allowed. Eventually, however, Selznick not only overcame his frustration, he declared that Hitchcock was the only director to whom he would entrust a film. The degree of scripting also brought Hitchcock into conflict with his cast; he is alleged to have referred to actors and actresses as cattle. His interactions with the actors—and even more so his interactions with actresses, since he was known for giving them far more attention—were colored by his stubbornly pre-set conceptions of the film and by his low-key leadership approach (an approach that he used in his role both as director and as father), which avoided direct confrontations and displays of temper. For example, the actress Doris Day (b. 1924), who starred in his remake of his own *The Man Who Knew Too Much* (1955), expressed concern that although he was friendly and talkative off the set, he would not comment on her performance. In response he told her that the only reason he was not saying anything was because he had no complaints. Kim Novak (b. 1933), however, who starred in *Vertigo* (1958), claimed that

“Hitchcock was very exact in telling me exactly what to do . . . how to move, where to stand.” (Quoted in Ebert 2002, 481).

Throughout his career, Hitchcock had become associated with actresses who fit a certain profile: blonde-haired women with cold, hard-to-crack surfaces, surfaces which Hitchcock seemed to enjoy chipping away at during the course of his films until the characters eventually broke down in scenes of emotional vulnerability. During the later stages of his career, Hitchcock began trying to exert a greater influence over the lives of the actresses that he cast, most notably Vera Miles who starred in *The Wrong Man* (1957), and Tippi Hedren, who starred in *The Birds* (1963) and *Marnie* (1964). He took them under personal contract and sought to direct their careers, choosing other roles for them, and even selecting colors and hairstyles that he thought they should wear. During the filming of *Marnie*, Hedren finally thought he had gone too far when he forbade her to leave the set for a weekend to attend a charity event, and she loudly and emotionally castigated him in front of the rest of the cast and crew.

HITCHCOCK LEADING THE AUDIENCE

In addition to the casts and crews he worked with, Hitchcock also strove to direct his audiences, experimenting with their preconceptions and deliberately manipulating their reactions. As he told the French director François Truffaut (1932–1984) during a series of interviews, “If you manage to get a solid grip on the audience, they will follow your reasoning” (Truffaut 1967, 74). Included in Hitchcock’s bag of tricks was what he called the “MacGuffin,” the object with which everyone in the movie was concerned, such as a secret map or stolen diamonds. The identity of the MacGuffin was unimportant; only its existence mattered.

Similarly, Hitchcock was not overly concerned about plausibility, knowing that, to a point, an audience would willingly follow him. Hitchcock enjoyed playing with an audience’s preconceived notions and testing just how far their belief could be stretched. He tested these beliefs not just in the plots of his

films, but even in their casting. He would cast actors in roles that did not appear to fit with their images, taking great pleasure, for example, in casting the young and attractive Anthony Perkins (1932–1992) as the title murderer in *Psycho* (1960).

In the way in which he presented himself to his cast and crew and to the world, Hitchcock also maintained a great level of control. Always at least somewhat sensitive about being overweight, Hitchcock turned his rotund profile into an easily recognizable symbol in his television series, *Alfred Hitchcock Presents* (1955–1962; known as the *Alfred Hitchcock Hour* for its last season), and through the small cameos that he made in each of his pictures from *Blackmail* (1928) on (although his first onscreen appearance in one of his own films was in *The Lodger*), the world came to know him by sight.

On the sets of his films, he always dressed in deliberately formal attire, which varied little, even when filming in climates that did not lend themselves to such dress, such as the extreme heat of Marrakech, Morocco, during the remake of *The Man Who Knew Too Much*. In another example of his carefully maintained image, despite becoming a U.S. citizen in 1955 and returning to the country of his birth only for short periods of time, most notably during the final years of World War II, Hitchcock presented himself, in manners and in speech, as British. In the U.S. popular imagination he is remembered as a slightly eccentric foreigner whose knack for injecting humanity and even humor into films of murderers, thieves, and spies, was spellbinding.

HITLER, ADOLF (1889–1945)

German Nazi leader

Adolf Hitler led the German Third Reich (the Nazi Party's regime from 1933 to 1945) to become the predominant political and military state in Europe between 1933 and 1941. By August 1941 he had annexed various German-speaking areas that were outside the original German borders (Sudetenland and Austria in particular), overthrown the Versailles Agreement completed at the end of World War I, incorporated Poland, France, Belgium, the Netherlands, Denmark, and Norway into the German empire, forced the British back into Britain, and was on the brink of defeating the Soviet Union. From that point he oversaw the unraveling of all his achievements and witnessed Germany's defeat in 1945. He committed suicide on 30 April 1945, by which time 7.5 million Germans had died, as had over 6 million Jews and perhaps as many as 40 million Soviet soldiers and civilians.

PERSONAL BACKGROUND

Adolf Hitler was born in Braunau, on the Austrian side of the border with Bavaria, on 20 April 1889 (he did not acquire German citizenship until 1932). Alois Hitler, his alcoholic father who had been brought up as "Alois Schicklgruber" (his mother's maiden name), was a fifty-two-year-old customs officer when Adolf was born; Adolf's mother, Klara Pölzl, was the twenty-nine-year-old second cousin of Alois and also his third wife. Alois died in 1903 when Adolf was fourteen and, although Klara doted on her son, his general arrogance and laziness ensured that he failed to take his school-leaving certificate when he was sixteen. He then spent two years in Linz, posing as an artist, but failed to gain entrance to the Vienna Academy of the Arts. In 1907 his mother died of cancer following an anesthetic provided by a Jewish doctor, and it has been suggested that this provoked a deeply rooted, but unconscious, connection between Jews and the death of the only thing dear to Hitler. However, recently uncovered evidence shows that the family doctor, Ernest Bloch,

a Jew, had tried to help Hitler in 1895 when he was suffering from nightmares, possibly brought on by beatings from Alois. Bloch had suggested that Hitler be sent to a psychoanalyst in Vienna (possibly Sigmund Freud), and although Alois forbade it, Bloch appears to have been the only Jew whom Hitler personally saved from death, instructing the Nazi leader Martin Bormann to grant Bloch safe passage to Switzerland in 1938.

Following his mother's death Hitler became a vagrant in Vienna, eking out a living from his meager inheritance by selling postcard sketches before drifting to Munich in Germany. There he was arrested for evading military service but was excused on the grounds of physical weakness. Yet, when the war came in 1914, he eagerly joined the Bavarian army as a regimental runner; although he did not rise above the rank of corporal (he was considered lacking in leadership skills), his bravery earned him an Iron Cross. In many ways the time in the trenches was the crucible for Hitler's character formation, and he often looked back to this period of *kampfgemeinschaft* (community of warriors) born in the struggle at the front.

CONTEXT

Germany was, for many people, the last place to expect someone of Hitler's ilk to emerge: It was the cultural and intellectual center of Europe and, as the largest single nation in continental Europe, also had one of the most sophisticated labor and socialist movements. However, World War I left almost 10 million dead, a quarter of these German. It also left a huge financial debt. By 1923 the mark-dollar parity had risen from a ratio of 4 to 1 in 1914 to 4.2 trillion to 1. In this economic cauldron extremist political parties proliferated. By February 1921 the German Workers' Party was renamed the "National Socialist German Workers' Party" (Nazi) to appeal to socialist and nationalist supporters. Hitler remained employed by the German army for a brief period after the end of the war but soon left to become a full-time politician in the Nazi party. The "socialist" element was Hitler's interpretation of the trench camaraderie in which class and status had been

Adolf Hitler was considered a master speaker, able to use words and gestures to inspire the German people into following his leadership. Here, a highly animated Hitler addresses an audience in Berlin during the 1930s.

stripped away to leave just “Germans.” The party was “nationalist” because it opposed all those who disagreed with the rise of Germany. This blend of concerns is important because it enabled Hitler and the Nazis to recruit from a much more heterogeneous—and therefore larger—audience than any “purist” right-wing party could have done.

By 1922, Hitler’s world was wholly Manichean (dualistic) in origin: Everything was either good or evil, right or wrong, which mirrored his ceaseless drift toward rabid extremism, exemplified in his emotional mastery of public speaking and spells in jail, where he wrote *Mein Kampf* (My Struggle). Thus, if there was an extreme option Hitler would prefer to take it because he believed that only through extreme measures could his most feared and despised enemy, “Jewish Bolshevism” manifest in the Soviet Union, be subdued.

As the early 1930s progressed, the economic problems of the Weimar Republic (the name of the German government from 1919 to 1933) provided the unstable platform upon which the antidemocratic

policies of both the Nazi and the Communist Parties expanded. Eventually, as the conservative voters retreated into the arms of the Nazis, and the Communists continued to believe that the Social Democrats were just social fascists, German business and conservative political leaders assumed they could appoint Hitler as chancellor but control him as a puppet. They could not, and although Hitler took power constitutionally in 1933, he immediately undermined democracy and banned all political opposition and the trade union movement. He also eliminated his rivals within the Nazi Party, who were murdered in the “night of the long knives.”

Despite all this apparatus of terror, the Nazis never achieved more than 44 percent of the vote, although a majority of Germans voted for antidemocratic parties, and after he

was in power many Germans appeared either supportive of Hitler or at least acquiescent to his demands. Indeed, there is a strong argument that such support developed a mystical and spiritual aspect as Nazism became transformed into a state “religion.” It was but a short step from here to the cultivation of the “Führer [leader] myth”—not only was Hitler the savior of the nation, but also he could do no wrong, and consequently any wrongdoing by the Nazis must have taken place without his knowledge. Only thus could Hitler distance himself from what was actually happening.

By 1935, the Nuremberg Laws prevented Jews from holding citizenship of Germany and from marrying “Aryans,” and the legal attack was buttressed by terror, but until September 1941 it still appeared that no systematic genocide was intended for all Jews. However, by the winter of 1941–1942, 500,000 Jews had already been shot, and by 1942, extermination camps (as opposed to concentration camps) were opened in Sobibor, Treblinka, Majdanek, and Belzec, and an extermination extension was built at the Auschwitz concentration camp: Birkenau. By

March 1942 about three-quarters of all the 6 million victims of the Holocaust were still alive; a year later about three-quarters were dead, most of them murdered in Poland.

Yet, the German state was not the epitome of Nazi productivity, primarily because Hitler's political ideology undermined such productivity. Hence, while German business and engineers sought to rationalize production before and especially during the war, Hitler's fervent belief in a Darwinian struggle of the fittest was translated into an approach in which Hitler preferred not to make decisions and to allow the stronger party to emerge from the chaos of his indecision. This policy—or lack of it—allowed his subordinates to make decisions and to make policy that sometimes contradicted those of others as they “worked towards the Führer” (Kershaw 2001, 194), and critical strategic decisions were often delayed by Hitler until too late.

MILITARY LEADERSHIP

Hitler had little of the military genius he was credited with; he was a motivator, not an organizer. He could secure lightning victories by breaking the will of his opponents, but this was the limit of his “genius”—after his victim refused to cower before him he had no solution, political or military, to the problem. Hence when first Britain and then the Soviet Union did not sue for peace, even when the situation was dire, Hitler was unable to develop a coherent strategy. In fact, Hitler's attack upon the Soviet Union *had* paralyzed Soviet leader Joseph Stalin temporarily: Stalin did not address the Soviet people for two weeks, and contemporaries noted his ashen and shaken face. In a speech in May 1945, Stalin even thanked the Soviet people for *not* dismissing him at the time—although quite how

Hitler on the Use of Propaganda

Before Adolf Hitler rose to power in Nazi Germany, he served as head of propaganda for the Nazi Party. This excerpt from his book Mein Kampf spells out how he felt leaders should use propaganda.

All propaganda has to be popular and has to adapt its spiritual level to the perception of the least intelligent of those towards whom it intends to direct itself. Therefore its spiritual level has to be screwed the lower, the greater the mass of people which one wants to attract. But if the problem involved, like the propaganda for carrying on a war, is to include an entire people in its field of action, the caution in avoiding too high spiritual assumptions cannot be too great.

The more modest, then, its scientific ballast is, and the more it exclusively considers the feeling of the masses, the more striking will be its success. This, however, is the best proof whether a particular piece of propaganda is right or wrong, and not the successful satisfaction of a few scholars or “aesthetic” languishing monkeys.

This is just the art of propaganda that it, understanding the great masses' world of ideas and feelings, finds, by a correct psychological form, the way to the attention, and further to the heart, of the great masses. That our super-clever heads never understand this proves only their mental inertia or their conceit.

[. . .]

It is wrong to wish to give propaganda the versatility of perhaps scientific teaching.

The great masses' receptive ability is only very limited, their understanding is small, but their forgetfulness is great. As a consequence of these facts, all effective propaganda has to limit itself only to a very few points and to use them as slogans until even the very last man is able to imagine what is intended by such a word. As soon as one sacrifices this basic principle and tries to become versatile, the effect will fritter away, as the masses are neither able to digest the material nor to retain it. Thus the result is weakened and finally eliminated.

they could have done so is unclear; but Hitler never knew this.

When Stalin did not sue for peace the only “strategic” solution for Hitler was greater violence, and this simply induced the Soviets to even greater counter-violence. As historian Michael Geyer concludes, “The challenge of total war was to calibrate the increase of violence to the decline of the enemy's resolve. The unpremeditated outcome of the German practice of war was to escalate force and terror to the point that it stiffened the resistance of old enemies and created new ones” (Geyer 1986, 593).

Then, on 7 December 1941, the Japanese attacked the U.S. naval fleet at Pearl Harbor—much to Hitler’s glee, because he had been trying to get Japan to divert U.S. interests toward the Pacific and away from the Atlantic for months. Four days later, and quite unnecessarily—because there was no German-Japanese pact—Hitler declared war on the United States. Hitler had always intended to attack the United States, but at a future date when the Soviet Union was conquered and in alliance with Great Britain or in control of it. However, the difference between Hitler’s ultimate ambitions and his strategic skill at the time was becoming ever more visible.

Public support for Hitler, as measured by the SD (German Security Services), remained buoyant until the summer of 1942 and thereafter dropped in line with each German defeat and withdrawal. By July 1944, the public opinion reports were stopped because even their collection had become counter-productive. Among the troops, though, not until March 1945 did morale waver, and research among captured soldiers of the German army consistently showed around two-thirds strongly committed to Hitler.

Hitler’s health rapidly deteriorated after 1943; he became increasingly isolated and decreasingly successful. A failed assassination attempt in July 1944 merely increased his distrust of the military elite and encouraged him to interfere more disastrously with the development of new tanks, the V1 and V2 rockets, and the new Messerschmitt ME262 jet fighter. On all three counts Hitler demanded that designs for defensive weapons be reconstructed for offensive weapons, but the result was merely to delay their eventual production until it was too late.

Hitler’s leadership resided in the voluntary support of millions, but that was buttressed by the ever-present danger of imprisonment, torture, and death for many other millions. Whether Jews, Gypsies, Communists, Soviet Red Army commissars (Communist party officials), Red Army soldiers, political opponents, gays, the disabled or the mentally ill, all were fodder for the grisly machines of extermination. Here lies the irony: Hitler did not succeed so far as he did just because he was an individual will-

ing to undertake or legitimate *any* activity in the pursuit of his aims; rather he succeeded because millions of others *wanted* to help him. In Geyer’s terms, “the Nazi state did not require that everyone become a Nazi as long as the National Socialist leadership could convince Germans of the benefits of racist rule. Ideological politics were thus the promise of participation in the domination of others for one’s own and the common German benefit” (Geyer 1987, 62). As late as 1951, half of the citizens of the (West) German Federal Republic still regarded the period between 1933 and 1939 as the best in German history. It would appear, therefore, that far from Nazi propaganda constructing a German identity—and an identity for all those deemed enemies of the state by the Nazis—that misled a substantial proportion of the population into either supporting the Nazis or at least not standing up to them, Nazi propaganda, in novelist Aldous Huxley’s words (1936, 39), “canalize[d] an existing stream, [for] in a land where there is no water he digs in vain.”

HOPE

Hope is a positive motivational construct that is related to effective goal attainments in a variety of life arenas—one of which is leadership. In this regard, hope (as defined by clinical psychologist C. R. Snyder [2002]) is a pattern of thinking in which the person has clearly defined goals, along with the perceived ability to identify effective strategies for attaining those goals (called *pathways* thinking) and the motivation to implement those strategies (called *agency* thinking).

CHARACTERISTICS OF HIGH-HOPE PERSONS

To comprehend high hope as applied to leadership, it is useful to examine the advantages of high- as compared to low-hope thinking. High-hope individuals have a large number of clear, well-articulated goals. Their goals are personally important and valuable. Moreover, they prefer *stretch goals*—challenging goals that push the limits of their personal abilities. Having such goals, high-hope persons are able to identify specific routes for attaining them.

If a goal is large, complex, or distant in time, the high-hope person can break this goal into subgoals that can be clearly conceptualized and easily obtained. In turn, as these smaller subgoals are attained, the success experiences foster a sense of agency, or goal-directed determination. As goals are pursued, therefore, successes along the way promote positive emotions that feed back and further energize the goal-striving, high-hope person. High-hope persons also are energized by their memories of past successes that further motivate them to use their pathways to reach desired goals. Furthermore, when an impediment is encountered in the pursuit of a goal, the high-hope person can think of alternative pathways to go around the obstacle and continue the quest toward the desired objective.

Not only are high-hope persons focused on attaining their goals, but they also are invested socially in their interactions with others. Not surprisingly, hopeful thinking develops in the context of secure and trustworthy childhood relationships with positive adult role models. Accordingly, high-hopers are

secure in their relationships with others, they support others' goals, and they take pleasure in others' accomplishments. Likewise, by providing support, high-hope people often are able to instill hope in others.

WHY HIGH-HOPE PEOPLE ARE EFFECTIVE LEADERS

There are several reasons why high-hope people are effective leaders. They are able to clearly conceptualize goals, they can articulate these succinct goals to others, and they can forge subgoals to complex goals that are large and temporally distant. As such, subgoals are the pathways (strategies or action plans) through which high-hope leaders are able to facilitate the attainment of large goals. In the organizational context, the high-hope leader's clear goal setting and facile communication provide lucid short- and long-term objectives for the group. Through their capacities to identify achievable subgoals, high-hope leaders increase the work motivation of group members and thereby enhance the likelihood of subsequent successes in reaching the larger organizational goals. Thus, the hopeful leader sparks the agency thinking of his or her "followers." Furthermore, because high-hope leaders are invested in and enjoy "social commerce," they are likely to take an active interest in the personal goals of their followers and act as "coaches" or mentors. In this way, high-hope leaders model hope for other workers. In turn, the followers eventually will be able to take on leadership roles themselves, thereby contributing even more to the group's success.

HOPE IN THE CONTEXT OF EXISTING THEORIES OF LEADERSHIP

To apply hope theory to existing leadership theories, we first must define leadership. This is a daunting task, for few scholars agree on a concise definition. Some have suggested that leadership is a process involving the "collaboration between a leader and responsive followers" (Hollander & Offermann 1990, 83), and we agree with this view. According to this model, the leadership functions of decision making, goal setting, communication, and conflict reso-

lution are accomplished through delegation of goal-directed activities to followers. Leadership implies a reciprocal interaction between those who lead and those who follow. On this point, the effectiveness of a leader depends largely on the leader's ability to create an environment where goals are well articulated and shared, where people know the routes to be used in pursuing those goals, and where people have the requisite motivation to see goals through to fruition. In short, effective leaders are able to create environments of hope.

Another view is that the hopeful leader provides a transformational model for followers. The *transformational leader* works toward attaining group goals by (1) imparting a clear conceptualization to the followers of the group's goals and gaining the followers' support for the means of attaining those goals (clear and shared goals, along with pathways); (2) convincing followers to place their own self-interests second to those of the group (shared goals); and (3) stimulating the motivation of followers (agency thinking). Hope fits each stage of this model. Such transformational leadership would seem to produce strong efforts by followers, fulfillment of the subordinates' job-related needs, and subordinates' satisfaction with their leaders.

Followers are motivated by the awareness that their own needs will be met through supporting the success of the group. In this regard, transformational leaders have three primary characteristics: (1) They are charismatic and inspiring; they are goal focused, engender trust, and energize their followers by arousing excitement and enthusiasm; (2) they give individual consideration to their followers; tasks are assigned to individuals based on the highest level of achievement of which the individual is capable; the role of the leader is one of "coach" and "mentor" in meeting the needs of subordinates; and (3) they provide intellectual stimulation; such leaders stimulate their follower's thoughts and imaginations so that followers come to view themselves as being capable of conceptualizing alternative problem-solving approaches to impediments. Each of these characteristics closely parallels the attributes of the high-hope person who takes a leadership role.

Other researchers have developed conceptualiza-

tions of leadership based on what leaders do. Accordingly, successful leadership can be summarized according to five practices, each of which contains two basic strategies. In the following table, the specific leadership processes identified by Posner and Kouzes (1990) are listed in the left column, with the corresponding hope theory component displayed in the right column:

<i>Posner & Kouzes Processes</i>	<i>Hope Theory Processes</i>
1. Challenging the process a. Searching for opportunities b. Experimenting and taking risks	1. Choosing challenging goals
2. Inspiring shared vision a. Envisioning the future b. Enlisting the support of others	2. Setting shared group goals
3. Enabling others to act a. Fostering collaboration b. Strengthening others	3. Instilling a sense of agency
4. Modeling the way a. Setting examples b. Planning small wins	4. Instilling pathways thinking
5. Encouraging the heart a. Recognizing contributions b. Celebrating accomplishments	5. Taking pleasure in successes so as to reward continued hopeful thinking

Clearly, a large part of effective leadership involves being a success-oriented individual who takes pride in the accomplishments of his or her group. This may not be enough, however. To be a truly effective leader, one also must attend to the needs of followers and nurture those relationships. Effective leaders are high in achievement *and* affiliation motivations. Sorrentino and Field (1986) posited that persons high in achievement motivation were high in the motive to succeed, but relatively unconcerned about avoiding failure. Persons high in affiliative motivation were posited to "seek friendship from others and have little fear of social rejection" (Sorrentino and Field 1986, 1092). Again, we find corollaries to hope theory. In this regard, approach goals foster positive emotions, whereas the

attainment of avoidance goals yields little in the way of benefits. High-hope persons are achievement oriented, but they also have secure attachments to others. As such, they actively pursue mutually supportive and collaborative relationships with other people.

Similarly, De Cremer and Van Vugt (2002) found that effective leaders fulfilled both instrumental needs (technical skills used to increase group efficiency) and relational group needs (perceptions of group belongingness fostered through fairness and commitment to the group). This theory is very similar to the achievement motivation (corresponding to technical skills) and affiliative motivation (corresponding to interpersonal skills) model, and both relate to the agency and pathways components of hope theory. Persons high in achievement motivation possess the technical skills to meet the instrumental needs of the group. In other words, they are able to identify clear pathways for meeting the goals of the group, all the while taking into account the group members' achievement needs. Persons high in affiliative motivation are able to instill in others the sense of trust, predictability, confidence, and an ethic of reciprocity. These latter processes then energize group members and instill the agency to actively support and pursue the group's goals.

HOPE, LEADERSHIP, AND THE FUTURE

Leaders play a crucial role in that they help to chart the directions of the groups of people who form societies. Thus, they help to produce the agenda for the future. That such leaders typically have high hope is encouraging in that such thinking is a robust predictor of successful goal attainments. It is likely that people become leaders in large part because of their abilities in imparting hope to others. In turn, hopeful leaders provide positive models for those people who carry out the many activities that make societies function.

—C. R. Snyder and Hal S. Shorey

HOT GROUPS

Hot groups are relatively small groups of individuals characterized by an impassioned state of mind that is sharply focused on their task. The challenge of the task—not the relationships among the members or the structure of the group—is a hot group's compelling reason to exist.

The primary leader of any hot group is its task. The hot group's task is to its members as a charis-

matic leader is to his or her followers. The task inspires and impassions. It infuses the group members with dedication. Of course, human leaders are also present in most hot groups.

Hot groups work in a state of continuous combustion, soaring imagination, and endless effort, hence the label “hot groups.” The members’ conviction that the successful completion of their task will “change the world” spurs their all-out efforts. Because of the task’s potential to make this substantial difference, the hot group perceives its undertaking as an ennobling challenge, regardless of the dissenting opinion of others.

Hot groups are usually quite diverse in their composition, save for common interest and capacity to contribute to the task. Hot groups can be found in any imaginable setting, and they can form to address any imaginable task, as long as the members see the task as worthy. Rank, IQ, and personality may vary enormously among and within hot groups, but the members share an uncompromising standard of excellence.

BACKGROUND

Hot groups are not new. They have existed since humans first came together in groups. They are of particular interest now, however, because of their increasing importance in “startups” and large organizations whose life-blood is innovation. They are relevant to the leadership literature because of the intriguing and distinctive ways in which leadership is exercised within them. Hot groups, which tend to form organically, may involve several types of leaders, internal as well as external, and, in some cases, may have no designated leaders at all.

The internal leadership function in hot groups may rotate among the group members as the sequential stages of the task call for different types of expertise. When expertise that does not exist among the participants is required, new members may be introduced. These new members may then become group leaders for that stage of the task or may simply participate in the hot group until their part of the task is completed.

The leadership dynamic of hot groups sets them apart from more traditional groups, such as commit-

tees, teams, task forces, and other appointed or elected groups, where the leadership structure is clearer and more stable. In fact, hot group members often seem oblivious to the existence of the leader, focusing instead on the self-propelled activity of all the members. The organic and usually informal manner in which hot groups develop further differentiates them from other, more highly organized groups with more traditional structures, membership recruitment, and member-expulsion methods.

Hot groups usually originate from an innovative idea put forth by one or more individuals, who then informally recruit other members on the basis of their interest, specific expertise, and potential contribution to the task. Paradoxically, hot groups are simultaneously democratic and elitist in that they welcome anyone who can contribute, regardless of organizational rank but, by the same token, vigorously reject any would-be members who cannot help advance the hot group’s progress.

THREE TYPES OF LEADERS

Hot groups have three types of leaders: conductors, patrons, and keepers of the flame. Conductors are hands-on leaders who participate as active members of the group. In many instances a conductor is the individual who had the initial idea around which the hot group has coalesced. Like other more traditional leaders, the conductor initiates the agenda but does not have complete authority over its substance. The group sets the timetable as well as the criteria by which the members’ contributions and the quality of the outcome will be evaluated. The conductor moves things along, nurtures the group, and ensures that the members do not suffer burnout in this high-intensity, high-excitement environment.

Patrons, the second type of leader, serve as the interface between the hot group and its external environment, be that the larger, formal organization or a general community to which the members belong. The patron is usually someone with recognized status and high credibility within the hot group’s extended environment. Acting as an ambassador or champion for the hot group, the patron interprets its purpose and progress to the parent organization. The

patron also garners resources from that larger context for the hot group. Moreover, the patron explains the occasional “over the top” behavior of the hot group to the frequently perplexed or resentful external environment. Whereas the conductor is ordinarily responsible for calming the internal waters of the hot group, the patron calms the larger organizational or community sea on which the hot group sails.

The keeper of the flame, the third type of hot group leader, is the magnetic core for sequential hot groups. Most hot groups dissolve when their task is completed. During the course of their intense activity, however, new sparks of hot group ideas begin to glow. The keeper of the flame fans those sparks and initiates follow-on hot groups. The new groups may or may not include other members of the original group. The keeper of the flame may continue with various offshoots of the original hot group over a considerable length of time, sometimes decades, as in the case of research groups.

SPECIAL CHALLENGES FOR LEADERS OF HOT GROUPS

Hot groups develop organically, live short, intense lives, and then disperse. Their leaders thus face special challenges, quite different from the challenges faced by leaders of appointed or elected groups, which have a specifically designated and often longer term.

First, potential leaders need to adopt an agricultural, rather than an engineering, paradigm. This means leaders of hot groups must develop methods for seeding, feeding, and weeding their groups, so they can take root and produce their harvest.

Second, the leaders—particularly patrons but also conductors—need to tend the hot group’s relationship to its parent organization so that, when its task is complete, the hot group’s product will be adopted, utilized, and promoted by the larger group. This is a particularly important leadership challenge because the hot group’s laser-like focus on its task, its voracious absorption of resources, its rejection of inappropriate would-be or nonproductive members, and its general propensity to ignore organizational norms often cause widespread ripples and resentments that

the engrossed hot group members barely notice. The leader needs to balance the single-mindedness of the hot group so that it does not inadvertently abuse those parts of the organization from which it needs to attain human, budgetary, and other resources. Because the hot group is frequently unaware of the organizational feathers it has ruffled, patrons and conductors need to engage in considerable feather smoothing.

Third, because hot groups are seedbeds of innovation, leaders need to recruit, but keep in reasonable check, “wild ducks,” those highly individualistic, creative members who resist organizational grooming. Leaders must maintain a balance between keeping on track their hot groups, with their complement of wild ducks, and giving them the freedom to pursue new, creative strategies, particularly when their original plans may prove fruitless.

A fourth and related challenge involves striking another balance: between encouraging the greatest expression of members’ individuality and creativity and protecting those members from retribution by the parent group. This equilibrium enables the group to pursue innovations that nurture the larger organization.

REWARD SYSTEMS AND THE LEADER’S ROLE

Two related rewards are most central for hot groups and their leaders. Both are group, rather than individual, rewards. The first is the very process of working on the task. Hot groups get paid off in “flow,” the joy of simply engaging in a task that every member sees as worthy, even ennobling, regardless of how trivial it may seem to outsiders. The second reward follows from the successful completion of the task. The first reward, the flow, is always there. The second, successful completion, is, of course, an uncertain reward, bringing immense pleasure with success and punishing pain with failure.

Rewards offered by those outside the group may have either positive or negative effects. The key is whether the rewards go to the whole group or to the individuals within it. Rewards—bonuses, promotions, and prizes—given to the entire group by the parent or other organizations are likely to have positive effects on hot groups. Individual rewards are

almost always divisive and disruptive. They introduce intragroup competition where previously there had been collaboration and common purpose. The exception—and it is rare—is a reward given to an individual member *by* the whole hot group.

The leader's role (for those hot groups who have clearly identified leaders) is not to offer formal rewards, but rather to reassure, pick up the group in down times, and, on occasion, inspire. The hot group leader's responsibility is *not* to reward individual group members for their contributions. The group may or may not choose to do that. If group leaders do elect to reward the whole group for its progress, they should do so with caution. Group members know when they have made progress, so rewards that do not match real advances may be seen as hypocritical game playing.

LIMITATIONS

Hot groups in organizations do not always go the way their parent intends them to go. Hot groups respond to targets better than to predefined plans for achieving them. They do not stick to blueprints. If one plan doesn't seem to be working, they will drop it and try another. They stay fixed on task but flexible about process.

Hot groups may deliberately identify an enemy or a competitor in order to increase their own heat. Often that "enemy" is the organization in which the hot groups are embedded, which the groups may see as stodgy and rule bound. Or the enemy may be some entity in the larger external environment. Patrons and conductors need to make certain that hot groups' strategies for "psyching" themselves to creative heights do not backfire by making real enemies out of straw enemies.

Hot groups are usually short-lived, and they dissolve when the task is completed. Although this brief life span is not necessarily a drawback, in large organizations it requires grouping and regrouping. Human resources officers must be prepared to find new, equally challenging assignments for members when their group ends.

Hot group experiences may be so fulfilling that some members may become hot group "junkies."

After a hot group experience, they find normal routines dull and uninspiring. Consequently, they go searching for new hot groups to join, even when that means leaving the parent organization.

Hot groups must be farmed, rather than engineered. That is, organizations must create a milieu that will permit hot groups to grow, conditions that include easy communication within and across organizational levels, and an atmosphere that encourages imagination and experimentation. It is difficult to design a hot group in the way one might design a task force or a committee.

Hot groups have become particularly relevant in our rapidly changing organizational world. They are fast and flexible and, therefore, effective in crisis situations. They are also the seedbeds of creativity and innovation. Hot groups are excellent mechanisms for helping people find meaning through work. Members of hot groups invariably feel that they are engaged in something meaningful and important that justifies their vigorous dedication and work ethic.

IMPLICATIONS AND RESEARCH DIRECTIONS

Hot groups probably will become more commonplace and useful in the future. They are fast, innovative, responsive, and short-lived, all appropriate qualities for a world increasingly beset by crises, changes, and uncertainties. Hot groups can be thought of as flexible, imaginative "rapid response" units for dealing with the unexpected.

Hot groups in the past have arisen most frequently in small organizations, such as high-tech startups. Large, traditional organizations will have to modify their cultures in significant ways to encourage and integrate such groups into their operational systems.

Research is needed to answer these and other questions:

1. What are the most significant characteristics of effective hot group leaders?
2. What are the conditions most conducive to the growth of hot groups?
3. How can large, hierarchical organizations integrate open, nonhierarchical hot groups into their "normal" operations?

4. What conditions are necessary for virtual hot groups to form and work in cyberspace? What kinds of individuals can initiate and lead them?

HUMAN RIGHTS

Human rights leadership in the twenty-first century is developing in the midst of worldwide debate about which institutions should predominate globally in the

governance of human organizations. Innumerable actors are involved in these interrelationships—national, subnational, and transnational—representing widely varied views. These actors also have widely varied capacities and commitments regarding the exercise of personal example, peaceful persuasion, manipulation, coercion, or even overwhelming violence toward those people appearing to oppose them.

In significant ways, current conditions for human rights leadership are similar to those in which the human rights movement first greatly expanded at the end of World War II. Widespread horror at recent spectacles of mass human suffering and organized cruelty led many people then, as now, to determine that all humans deserve the rights of freedom, dignity, and safety because they are human and that these rights must be asserted around the world. Too many people had seen with their own eyes or learned in the media about events so terrible that they felt that no human being should ever again be treated like that. More world leaders were concluding also that if there is to be hope in this increasingly interdependent world for long-term humane conditions of life for people anywhere, there must be worldwide-agreed goals, standards, institutions, and enforcement for how all people must be treated. Influential people were beginning to believe that for there to be peace in the world, the world must build human rights.

After World War II, however, many leaders also were deciding that modern technology provides so much danger of extreme damage to whole populations and their protective governing structures, from sudden attacks by armed aggressors, that new structures and methods for national, regional, and worldwide security must be developed to prevent and defend against such attacks. National security structures developed during World War II were expanded, and even the United States and other democracies substantially increased secret government information and activity that ordinary citizens were not allowed to know. Within the new world security structure, the United Nations Security Council, measures were backed selectively by leaders of the five major powers and nonpermanent members according to the individual national security needs they perceived in differing situations as they lined up

on the two major sides or attempted to stay neutral during the “Cold War,” which lasted until nearly the twentieth century’s end.

Some of the most important security goals during the Cold War and since, such as the prevention of nuclear war, have coincided with the goals of human rights leaders. Some of the most important human rights goals, such as the prevention of genocide, in most specific cases have been assessed by national security leaders as not sufficiently important to their own nation’s security to be worth spending the political, economic, military, and human assets to prevent. This was true for twentieth-century genocides in Cambodia, Iraq, Rwanda, and other countries.

By the twentieth century’s end, however, political leaders had begun more publicly expressing regret after failing to counter ongoing genocide. U.S. Presidents Bill Clinton and George W. Bush, in leading military interventions, in, respectively, Kosovo (1999) and Iraq (2003), justified those actions to some extent in regional security terms, citing the countering of genocide as a grave, related matter. Governmental and nongovernmental political and human rights leaders do not yet agree on what scale of human rights atrocities within a sovereign state justifies outside military intervention. Some observers at the time believed the United States to have less-principled reasons for the Kosovo and Iraq interventions. Other observers believed that less-principled reasons in other world capitals helped explain why U.S.-led military intervention in those cases received less than the clearest U.N. authorization.

During the twenty-first century’s first decade, to be sure, struggles for influence among national, subnational, and transnational structures are more complex than during the two-sided Cold War, although U.S. leaders are backed by more force than much of the rest of the world combined. Furthering the complexity, increasing technological capacity has enabled fewer individuals to cause more suffering and damage, creating more terror on behalf of whatever cause, with smaller weapons of “ordinary” and mass destruction. Transnational and small groups now more easily can cause massive damage to human rights and national security in the same blows.

Therefore, as when modern national security structures were developing after World War II, the most serious contemporary challenge for human rights leadership is to improve human rights in a worldwide context of intensely increased focus on national and international security. The present security context amplifies sovereign state responsibility to prevent small or transnational groups from instigating international violence from within their borders. As sovereign states perceive their own interests threatened also by such groups—or in some countries by legitimate opposition—they are motivated or further emboldened to control or eliminate them. One major result is considerably increased pressure on civil and political rights in many countries. Affected in varying degrees are rights to privacy, government information, free expression and association, and legal representation, the right to be charged or released, the right to open and fair trials before a jury, and rights against torture and inhumane treatment.

Human rights leaders, therefore, first must continue to demonstrate to world leaders how decreases in human rights have initiated downward spirals in which reciprocal damage to security and human rights has led to armed conflict, chaos, and finally to major security threats from seriously dysfunctional and failing states. More challenging to human rights leaders, they must bring to bear an enormous range of knowledge, skills, and capacities of character to demonstrate in a great range of situations how legitimate, effective security can be realistically maintained and increased while maintaining and improving human rights.

In the best case, twenty-first-century human rights leaders can help lead the world to soundly based transformations in which national, regional, and international security mind-sets become increasingly congruent with human rights and human security standards set forth in the world’s foremost human rights document, the Universal Declaration of Human Rights. In the worst case, far more pessimistic, coercive, and ultimately unrealistic security views among world leaders might prevail. In such a scenario, even some human rights now seen as basic could be perceived as affordable only at unaccept-

able expense to national and international security. As technology continues to develop, such pessimistic security views could lead to widespread degradation in conditions of human existence.

In addition to this long-term, conceptually based security challenge to human rights leadership, the majority of worldwide human rights leaders have immediate security problems that the fewer who enjoy political freedom and relative safety do not have. This higher proportion of human rights leaders must struggle under severe political oppression and personal danger. For them especially, human rights leadership decisions can have major effects on their collective and personal security. At this writing, Burma's (Myanmar's) Nobel Peace Prize-winning heroine Aung San Suu Kyi is perhaps the most famous human rights leader who, along with the great majority of Burma's peoples quietly supporting her as they live together under military dictatorship, must make crucial decisions with momentous implications for human security and suffering.

The tremendous variety of conditions that human rights leaders in various situations must deal with leads to the proposition that such leaders, to achieve maximum human rights improvement with least suffering, must excel in the variety of approaches they understand, in their judgment about which methods to use in what situations, and in their ability to inspire in others clear thinking and long-term loyalty to the effort. Fortunately for potential human rights leaders, previous examples provide many cases to examine. Careful students can use these cases to identify which basic approaches and supporting methods might best produce specific human rights improvements, in what time frames they might do so, how much additional human damage and suffering various means might involve, and in which cultural, political, and technological circumstances particular strategies might function best.

For open-minded leaders many possibilities exist to further human rights. These possibilities suggest that all persons who want to improve human rights can find some way to lead in that direction, on however small a scale, whatever their circumstances. For those who might make human rights leadership a central commitment, the rich possibilities, along

with the skills and character development their use implies, point to a deeply engaging and productive, if at times difficult, way to use one's life for the benefit of humankind.

HISTORICAL EXAMPLES

Looking back to major pre-World War II examples of human rights leadership, one remembers that political leaders of the U.S. and French revolutions asserted civil and political rights for ordinary persons not previously anywhere guaranteed. Leaders of both drew on common European visions of human nature and rights articulated by the English philosopher John Locke, the French philosopher and author Jean-Jacques Rousseau, and others, in the historic U.S. Declaration of Independence (1776) and the French Declaration of the Rights of Man (1789). However, the level of ferocity and human suffering associated with the French Revolution was markedly higher than with the U.S. revolution.

Students of human rights leadership can find significant differences between the U.S. and French examples to explain the different results. One important difference was that educated, landed leaders of the U.S. colonies had more than one hundred years of experience in relative self-governance at a meaningful distance from decisive English imperial force. Even ordinary U.S. colonists had more experience than did ordinary French persons in practical freedoms, on their relatively large farms and in their independent small businesses, less supervised by traditional aristocracy in the expanding U.S. colonies.

Due partly also to less-intense experience of abuse from those above them, U.S. revolutionists demonstrated less pent-up rage than did the French. Leaders of contemporary oppressed groups often have extracted the principle, from these and more recent examples, that participants in their causes may need considerable training to stay within agreed limits in their own approach toward violence so as to further their long-term human rights goals, regardless of strong feelings that particular situations might provoke.

During the second quarter of the twentieth century, Russian revolutionary leaders presided over a

(text continued on p. 684)

Universal Declaration of Human Rights

Article 1.

All human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act towards one another in a spirit of brotherhood.

Article 2.

Everyone is entitled to all the rights and freedoms set forth in this Declaration, without distinction of any kind, such as race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status. Furthermore, no distinction shall be made on the basis of the political, jurisdictional or international status of the country or territory to which a person belongs, whether it be independent, trust, non-self-governing or under any other limitation of sovereignty.

Article 3.

Everyone has the right to life, liberty and security of person.

Article 4.

No one shall be held in slavery or servitude; slavery and the slave trade shall be prohibited in all their forms.

Article 5.

No one shall be subjected to torture or to cruel, inhuman or degrading treatment or punishment.

Article 6.

Everyone has the right to recognition everywhere as a person before the law.

Article 7.

All are equal before the law and are entitled without any discrimination to equal protection of the law. All are entitled to equal protection against any discrimination in violation of this Declaration and against any incitement to such discrimination.

Article 8.

Everyone has the right to an effective remedy by the competent national tribunals for acts violating the fundamental rights granted him by the constitution or by law.

Article 9.

No one shall be subjected to arbitrary arrest, detention or exile.

Article 10.

Everyone is entitled in full equality to a fair and public hearing by an independent and impartial tribunal, in the determination of his rights and obligations and of any criminal charge against him.

Article 11.

(1) Everyone charged with a penal offence has the right to be presumed innocent until proved guilty according to law in a public trial at which he has had all the guarantees necessary for his defence.

(2) No one shall be held guilty of any penal offence on account of any act or omission which did not constitute a penal offence, under national or international law, at the time when it was committed. Nor shall a heavier penalty be imposed than the one that was applicable at the time the penal offence was committed.

Article 12.

No one shall be subjected to arbitrary interference with his privacy, family, home or correspondence, nor to attacks upon his honour and reputation. Everyone has the right to the protection of the law against such interference or attacks.

Article 13.

(1) Everyone has the right to freedom of movement and residence within the borders of each state.

(2) Everyone has the right to leave any country, including his own, and to return to his country.

Article 14.

(1) Everyone has the right to seek and to enjoy in other countries asylum from persecution.

(2) This right may not be invoked in the case of prosecutions genuinely arising from non-political crimes or from acts contrary to the purposes and principles of the United Nations.

Article 15.

(1) Everyone has the right to a nationality.

(2) No one shall be arbitrarily deprived of his nationality nor denied the right to change his nationality.

Article 16.

(1) Men and women of full age, without any limitation due to race, nationality or religion, have the right to marry and to found a family. They are entitled to equal rights as to marriage, during marriage and at its dissolution.

(2) Marriage shall be entered into only with the free and full consent of the intending spouses.

(3) The family is the natural and fundamental group unit of society and is entitled to protection by society and the State.

Article 17.

(1) Everyone has the right to own property alone as well as in association with others.

(2) No one shall be arbitrarily deprived of his property.

Article 18.

Everyone has the right to freedom of thought, conscience and religion; this right includes freedom to change his religion or belief, and freedom, either alone or in community with others and in public or private, to manifest his religion or belief in teaching, practice, worship and observance.

Article 19.

Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.

Article 20.

- (1) Everyone has the right to freedom of peaceful assembly and association.
- (2) No one may be compelled to belong to an association.

Article 21.

- (1) Everyone has the right to take part in the government of his country, directly or through freely chosen representatives.
- (2) Everyone has the right of equal access to public service in his country.
- (3) The will of the people shall be the basis of the authority of government; this will shall be expressed in periodic and genuine elections which shall be by universal and equal suffrage and shall be held by secret vote or by equivalent free voting procedures.

Article 22.

Everyone, as a member of society, has the right to social security and is entitled to realization, through national effort and international co-operation and in accordance with the organization and resources of each State, of the economic, social and cultural rights indispensable for his dignity and the free development of his personality.

Article 23.

- (1) Everyone has the right to work, to free choice of employment, to just and favourable conditions of work and to protection against unemployment.
- (2) Everyone, without any discrimination, has the right to equal pay for equal work.
- (3) Everyone who works has the right to just and favourable remuneration ensuring for himself and his family an existence worthy of human dignity, and supplemented, if necessary, by other means of social protection.
- (4) Everyone has the right to form and to join trade unions for the protection of his interests.

Article 24.

Everyone has the right to rest and leisure, including reasonable limitation of working hours and periodic holidays with pay.

Article 25.

- (1) Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood,

old age or other lack of livelihood in circumstances beyond his control.

- (2) Motherhood and childhood are entitled to special care and assistance. All children, whether born in or out of wedlock, shall enjoy the same social protection.

Article 26.

- (1) Everyone has the right to education. Education shall be free, at least in the elementary and fundamental stages. Elementary education shall be compulsory. Technical and professional education shall be made generally available and higher education shall be equally accessible to all on the basis of merit.
- (2) Education shall be directed to the full development of the human personality and to the strengthening of respect for human rights and fundamental freedoms. It shall promote understanding, tolerance and friendship among all nations, racial or religious groups, and shall further the activities of the United Nations for the maintenance of peace.
- (3) Parents have a prior right to choose the kind of education that shall be given to their children.

Article 27.

- (1) Everyone has the right freely to participate in the cultural life of the community, to enjoy the arts and to share in scientific advancement and its benefits.
- (2) Everyone has the right to the protection of the moral and material interests resulting from any scientific, literary or artistic production of which he is the author.

Article 28.

Everyone is entitled to a social and international order in which the rights and freedoms set forth in this Declaration can be fully realized.

Article 29.

- (1) Everyone has duties to the community in which alone the free and full development of his personality is possible.
- (2) In the exercise of his rights and freedoms, everyone shall be subject only to such limitations as are determined by law solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirements of morality, public order and the general welfare in a democratic society.
- (3) These rights and freedoms may in no case be exercised contrary to the purposes and principles of the United Nations.

Article 30.

Nothing in this Declaration may be interpreted as implying for any State, group or person any right to engage in any activity or to perform any act aimed at the destruction of any of the rights and freedoms set forth herein.

longer and more massive reign of terror than had leaders of the French revolution. Before that time, Russian opposition leaders, peasants, and proletariat had experienced even less exposure to self-governance and more intense abuse than had their French counterparts. Many human rights advocates would now note that the Marxist vision of economic and social human rights, although producing the first leadership commitment by a large nation to economic, social, and cultural provisions in the later Universal Declaration of Human Rights, was fatally flawed, as led by the Soviet leaders Vladimir Lenin and Joseph Stalin, in its practical rejection of civil and political freedoms for “dictatorship of the proletariat.” By the twentieth century’s end, while demands for economic, social, and cultural rights had greatly strengthened worldwide, Stalin’s role regarding human rights was more widely viewed as monstrous than monumental.

The principle learned from Stalin’s Soviet leadership, however, is suited not only for political leaders who might emphasize economic, social, and cultural human rights at the expense of civil and political ones. Those political leaders, in contrast, who champion civil and political rights, with too little attention to economic, social, and cultural rights for all, are now widely recognized to risk mounting rage from young people growing up in deprivation while watching the privileged on television, however politically free those young people might be to gather and speak.

One illuminating example of human rights leadership was set by Eleanor Roosevelt in leading the new United Nations Human Rights Commission’s effort, soon after the twentieth century’s most devastating war, to forge an international bill of human rights. Mrs. Roosevelt had benefited greatly from close exposure to the thinking and executive action of her husband, President Franklin D. Roosevelt, in response to the Great Depression of the 1930s and to the horrors of World War II. She understood well his legacy of “four freedoms” (freedom of speech and expression, freedom of worship, freedom from want, and freedom from fear) and the influential human rights legacy of World War I President Woodrow Wilson. Mrs. Roosevelt recognized also that the world of that time was divided roughly among lead-

ers and constituencies emphasizing civil and political rights; those emphasizing economic, social, and cultural rights; those emphasizing freedom from colonial rule; and those who felt threatened by human rights concepts in general. In presiding over the drafting committee Mrs. Roosevelt exercised leadership principles well gauged to deal with these and other complex constituent priorities.

First, Mrs. Roosevelt facilitated open, fair, inclusive, but well-disciplined process. The committee considered drafts from a broad base of ideas and proposals from sources around the world. Participants in the committee were free to express themselves on each issue fully but not so repetitively as to prevent the committee from proceeding to decision.

Second, Mrs. Roosevelt managed important accommodation in substance among philosophically divided committee members. She had to deal with the essential principle, if agreement were to be reached, of inclusion in this major world document of the most important human rights concepts from both sides of the Cold War. On the other hand was the equally essential principle, if the rights were to be enforceable, of binding agreements for the rights enumerated. Mrs. Roosevelt was painfully aware, however, that no member of the committee would accept binding provisions for all of the rights that were considered so essential, by one or more other committee members, as to prevent committee approval of a document without them.

Therefore, Mrs. Roosevelt encouraged the drafting committee toward reaching realistic compromise without sacrificing principle. One subcommittee would draft a world universal declaration. That document would assert for all humankind the fullest enumeration of human rights that the entire committee could be persuaded to accept in principle but that no country at the time would fully meet. To increase acceptance of a fuller range, the rights would be phrased in general terms rather than in binding language that might seriously endanger passage by the U.N. General Assembly. Another subcommittee would begin work on a binding covenant, especially important to small nations feeling comparatively defenseless among larger ones.

Work on the binding covenant went slowly

because nations perceived many obstacles to signing legal commitments. However, with Mrs. Roosevelt's leadership the committee managed to keep up momentum to finish the nonbinding Universal Declaration, with a quite comprehensive human rights blueprint drawn from each side of the Cold War.

Third, Eleanor Roosevelt pinned her long-term strategy on encouraging worldwide creation of cultures of human rights. Personally, she focused much of her later work, after serving as drafting committee chair, on assisting African-American efforts to secure equal rights. Overall, her goal was to empower ordinary people everywhere to develop human rights cultures supporting both enactment and implementation of binding human rights documents. These cultures would continue to reflect the many differences among human traditions, but they also would support in common the spread of respect and voluntary observance of all the rights in the Universal Declaration. Mrs. Roosevelt's inspiring conceptualization has reached a wide audience: "Where, after all, do universal human rights begin? In small places, close to home—so close and so small that they cannot be seen on any maps of the world. Yet they are the world of the individual person; the neighborhood he lives in; the school or college he attends; the factory, farm, or office where he works. Such are the places where every man, woman, and child seeks equal justice, equal opportunity, equal dignity without discrimination. Unless these rights have meaning there, they have little meaning anywhere. Without concerted citizen action to uphold them close to home, we shall look in vain for progress in the larger world" (Roosevelt 1958).

The final document agreed to by the United Nations on 10 December 1948 as the Universal Declaration of Human Rights is a magnificent accomplishment of human rights leadership, not only by Mrs. Roosevelt and the small number of drafting committee framers, but also by all the governmental and nongovernmental organizations; world leaders; representatives of world religious, philosophical, and political traditions; and ordinary people who pressed for and contributed to its content. The declaration is simply and clearly expressed. It is written for and completely accessible to the ordinary person, thereby

helping to emphasize that human rights are basic to the organized human condition and can be accomplished largely through leadership and practical self-determination by all of the ordinary people to whom the rights belong.

Since passage of the Universal Declaration, governments, international organizations, and people in difficult circumstances everywhere have exerted human rights leadership by asserting Universal Declaration provisions where there have not yet been legally binding agreements. In that way, the declaration has become recognized as the preeminent world human rights document and has achieved some meaningful legal force in itself. Therefore, a simple, important act of human rights leadership, available to everyone who can read and who has access to a copy of the Universal Declaration, is to memorize its relatively short text of thirty crucial universal human rights. Those people who cannot read can be helped orally to learn it. A second simple, important act that can be repeated often is to share the declaration's contents with others and engage in respectful dialogue about their meaning. A third simple, important act, easily a lifetime practice, is to act in whatever spheres one can to increase respect, voluntary observance, and enforcement when necessary of each Universal Declaration right.

MANY POSSIBILITIES

Since the U.N. agreed to the Universal Declaration of Human Rights, individuals and groups all over the world have demonstrated an astounding number of ways to increase respect, voluntary observance, and enforcement of human rights. For example, when adopting the goals of the Universal Declaration, the United Nations also achieved agreement on one major binding agreement. Responding to the Nazi campaign to exterminate all Jews and others they deemed "inferior," and greatly spurred on by the tireless human rights leadership of Polish Jewish Holocaust survivor Raphael Lemkin, the U.N. General Assembly passed the Convention on Prevention and Punishment of Genocide one day before it agreed to the declaration. Since then, the continuing strong leadership of dedicated individuals and groups,

A man tries to hold back the crowd in Tiananmen Square in 1989 as citizens demonstrate for increased individual rights and political reform.

working with many governmental and nongovernmental constituencies, has secured U.N. enactment of additional binding international agreements. Primary have been the International Covenant on Civil and Political Rights and the International Covenant on Economic, Social, and Cultural Rights (1966). Human rights and political leaders working together have succeeded also in passing the International Convention on Elimination of Racial Discrimination (1965); the International Convention on Elimination of Discrimination against Women (1979); the International Convention on Rights of the Child (1989); the International Convention against Torture (1984); and others.

At the national level, U.S. President Jimmy Carter led the U.S. executive branch in early explicit efforts to fit foreign policy measures to human rights standards. Persons organizing legislative human rights groups, such as U.S. Congressman Tom Lantos and his wife Annette (both Hungarian-American Jewish Holocaust survivors saved by Swedish hero Raoul Wallenberg) have fostered legislative environments increasingly conducive to enacting laws supporting human rights. Most human rights advocates would agree on the importance of continued leadership in legislatures worldwide, not only to adopt binding documents reflecting the rights in the Universal Declaration, but also to monitor executive branch implementation.

Since the declaration was signed, citizens' organ-

izations to support human rights have arisen in large numbers. The founders of Amnesty International led the world in organizing global citizen capacity to end torture and free prisoners of conscience. World War II resistance heroine Ginetta Sagan, rescued from torture herself, exercised dynamic leadership in expanding Amnesty International's activity. Amnesty International members flood the offices of dictators with polite letters, citing accurate documentation of a prisoner's nonviolence and the human rights violations alleged toward him or her. They keep writing until the prisoner is freed. Amnesty International has carefully expanded its scope; its membership has grown exponentially; and many organizations now emulate the Amnesty International model. Human Rights Watch, another prominent nongovernmental organization, has led in conducting research on nations with serious human rights violations and in publicizing U.S. and other influential policies toward those nations. Their model also has been widely followed.

Beginning in 1920, before the Universal Declaration, Indian anti-colonialist and Hindu pacifist leader Mohandas Gandhi set the world's most famous example of mass nonviolent civil disobedience, leading the people of India toward human rights and freedom from British colonial rule. Several times Gandhi stopped violence, by his own supporters or between Indian Hindus and Muslims, only by refusing to eat, on occasion for weeks, until respect for his action ended the violence. In the United States, Reverend Martin Luther King Jr. followed Gandhi's example, leading a mass nonviolent movement during the 1950s and 1960s to gain civil rights for African-Americans. Tragically, his personal example ended in assassination, as did Gandhi's, but like Gandhi's moral influence, Dr. King's lives on.

U.S. labor leader César Chávez, leading a mass nonviolent movement to gain farm worker labor rights, is thought to have shortened his life through hunger strikes that influenced employers and the public. Like Gandhi, King, and others since, Chavez used economic pressure to further his human rights cause. From his prison cell in South Africa, before he was president (1994–1999), Nelson Mandela

inspired continued national and international resistance to end apartheid, combining nonviolent actions and economic boycott to reduce perceived need for violent resistance while increasing pressure against the violent regime. In the end, leading the African National Congress, he oversaw peaceful regime change, adoption of a democratic South African constitution, successful nuclear nonproliferation, and a Truth and Reconciliation Commission process that helped South Africa's peoples begin to heal from apartheid.

Mass nonviolent movements, often with strong student leadership, have helped tame oppressive regimes also in Asia, central and eastern Europe, and elsewhere. The peaceful, principled human rights leadership of Czech author Vaclav Havel is one of the late twentieth century's most admired examples. Nonviolent movements are currently the widest accepted method to achieve human rights and self-determination, partly because many people believe that they add up to less total suffering and more effective action against authoritarian regimes than do dynamics of armed resistance.

Some people who reject violent resistance in every case are criticized by others who note that successful nonviolent resistance movements often have coexisted in their political environment with movements using some degree of violence. Although the nonviolent movement may honestly denounce all armed action, some people who have supported armed groups have believed those groups assisted a nonviolent movement, in the "good cop, bad cop" tradition, in gaining leverage against an oppressive regime. This uneasy question is not yet entirely resolved within some early twenty-first-century groups seeking to escape oppression through efforts toward self-determination.

However, because increasing technology and expanded munitions trafficking during the twentieth century added greatly to devastation wreaked by armed conflicts on civilians, and because more people now believe war to be irrational in the context of nuclear and other weapons of mass destruction, more European and U.S. citizens are concluding that armed conflict is almost never justified. They see war in itself as causing massive deprivations of human

rights and in the modern context as unacceptably multiplying risks of mass injury and annihilation.

Many persons, whether or not they would ever justify armed action, exercise human rights leadership by learning and teaching conflict prevention and resolution. Others lead by helping dissipate psychological trauma caused by torture and other abuse, so that abused persons can regain some inner peace and better avoid passing trauma on to others. Yet others educate the public about how relationships among humans and other living beings, international trade arrangements, capital markets, energy sources, defense alliances, labor rights, toxic waste management, environmental conditions, equal empowerment of women, media ownership, corporate shareholder activism, human diet, and other factors can affect development of armed conflicts or development of peace.

So many members of so many groups have devised ways to exercise human rights leadership that it truly seems that everyone can do so. Doctors, lawyers, psychologists, journalists, and many more have organized to document human rights conditions and support human rights improvements in their areas of specialty. Professors and teachers engage in research and develop curricula at all levels. Some business leaders develop practices to support human rights in other countries where they invest. Clergy preach and help victims and activists toward spiritual comfort. Essayists, fiction writers, and poets write movingly about human rights conditions, and cartoonists pierce public denial while making the public laugh. Truck drivers played a key role in the largely peaceful overthrow of Serbian ruler Slobodan Milosevic in 2000.

Theater workers have developed subspecialties to promote political and economic rights, amusing while educating literate and illiterate alike. Musical performers initiate human rights fundraising concerts. Celebrities travel the world raising consciousness toward prevention of land mines and treatment for AIDS. Foundations and philanthropists fund relevant projects. Children learn human rights principles and defend them in their neighborhoods. Internet, computer, and media specialists help the world understand human rights more thoroughly through TV,

radio, film, and the Internet and organize electronically in large numbers to support their improvement.

Altogether these efforts and many more have greatly increased worldwide understanding of the importance of human rights for groups formerly despised, ignored, or forgotten. Human rights leaders have supported the rights of women, children, racial and ethnic groups, and everyone else to civil, political, and religious freedoms. They also have organized to support the rights of—and directly to assist—the elderly and dying; the homeless and hungry; the disabled; indigenous peoples; lesbian, gay, bisexual, and transgendered persons; persons in slavery; convicted inmates; refugees and the internally displaced; and those who lack decent housing, health care, work, and education. Rights for all of these persons are not universally accepted, and some are asserted in situations where they appear to conflict with others.

Therefore, there will continue to be crucial roles for human rights leaders who engage in careful research and facilitate respectful dialogue to reconcile differing views about human rights among people of different nationalities, political philosophies, races, religions, and many other characteristics. Many such leaders contribute incalculably in every role in society. Some globally influential examples are South African Christian Archbishop Desmond Tutu, Vietnamese Buddhists Thich Nhat Hanh and Sister Chan Khong, Romanian-American Jewish Holocaust survivor and author Elie Wiesel, Sudanese Muslim human rights scholar Abdullahi Ahmed An-Na'im, and U.S. Sioux native religionist and legal scholar Vine Deloria, Jr. Perhaps best known is Tibet's fourteenth Dalai Lama, Tenzin Gyatso, who continues to frame Tibet's long, peaceful struggle for productive dialogue with China regarding his Five-Point Peace Plan, in the areas of politics, the environment, security, and human rights, to help bridge gaps in understanding around the globe.

Human rights leadership from World War II until the present has achieved far wider acceptance of all of the goals in the Universal Declaration of Human Rights than was the case in 1948. Nevertheless, the goals' universal fulfillment appears far removed in a modern world plagued with unconscionable human

rights violations and vicious armed conflicts. Most human rights advocates would agree on the great need for dedicated human rights leaders of all ages in every human environment.

Some human rights advocates are encouraged, however, that the number of people worldwide who deeply desire to adapt human institutions to serve human rights cultures continues in rapid growth. They believe there is reason to hope that careful and cooperative leadership by everyone who understands the importance of human rights to the future of humanity gradually will adapt security and other crucial human institutions such that increasingly they will interrelate to support realistic, worldwide fulfillment of all of the Universal Declaration of Human Rights.

HUMOR

Leadership dynamics constitute a fertile site for the emergence of humor. Incongruities, paradoxes, and contradictions in leadership practices can be ideal source material for humor, irony, and laughter. Furthermore, leadership humor is not only significant, but also more complex and ambiguous than it may at first appear.

Typically, leadership is viewed as a highly rational process, concerned with serious issues such as strategic vision, decision making, inspiration, and the effective exercise of power. Historical evidence reinforces this view. Leaders throughout the ages have frequently tried to retain a rather somber demeanor. In their concern with social control, they have sometimes viewed jocularity as uncivilized or dangerous and have sought its censorship through exhortation or legal imposition, or both.

SUPPRESSING HUMOR

Religious leaders in England from the late fifteenth century through the seventeenth century censored many forms of humor, especially jests against the clergy. As part of a wider civilizing process, this repression of laughter also became central to the maintenance of a particular kind of identity that dis-

played dignity, encouraged others' deference, and distinguished the elite from the common folk. The rationale behind the censorship mirrored the ideas of the ancient Greek philosophers Plato and Aristotle, who argued that amusement caused people to lose control of their reason. Plato prohibited laughter in his academy, while Aristotle associated excessive laughter with vulgarity and the lower classes.

Leaders in totalitarian dictatorships have often taken very seriously the idea that jokes are potentially subversive and revolutionary. For example, the Nazi regime attempted a systematic prohibition of critical forms of humor both in Germany and occupied countries such as Czechoslovakia. Immediately after becoming chancellor in 1933, Hitler made anti-Reich jokes a criminal offense and satirical books were banned and burned.

Early industrial capitalists implemented a strict work ethic based on Calvinist Protestantism's puritanical doctrines of predestination, self-control, and avoidance of pleasure in favor of a somber, calculated rationality. In the 1930s and 1940s, managers at Henry Ford's River Rouge plant in Dearborn, Michigan, prohibited workers from talking and fired some employees for smiling and laughing with colleagues. In the contemporary workplace, leaders are often concerned that employees' Internet use and cyberhumor may be unhelpful distractions that might result in lawsuits against the company if they involve potentially offensive jokes.

MANUFACTURING HUMOR

Clearly, in certain historical contexts leaders have sought to suppress humor. Yet research also suggests that leaders themselves frequently use humor. Joking is often the prerogative of those in authority, and leaders can use humorous situations to clarify status and power relations in ways that facilitate their exercise of power and control. Conversely, in the presence of superiors, subordinates tend either to refrain from joking or to make their humor non-threatening. Studies have emphasized the importance of humor for leaders in negotiating paradox and ambiguity and in facilitating leadership decision making. They also suggest that leaders' humor may establish in subor-

dinates a feeling of belonging. In addition, leaders' humor in certain circumstances can mask the authoritarian content of a message, while also defusing opposition.

Political leaders and their speech writers have recognized the value of utilizing humor for political purposes. It can help politicians to be seen as warm, relaxed, and approachable. The U.S. presidents Reagan, Ford, and Clinton all used self-deprecating forms of humor in order to build a sense of community, defuse criticism, and disarm political enemies. They understood that making voters laugh can also help to secure their votes. In the United Kingdom, some politicians have developed reputations for their ability to use wit, irony, and satire as weapons of political conflict on the floor of the House of Commons.

In contemporary organizations, there has also been a growth of interest in humor as a tool for increasing employee motivation. Leaders and managers have increasingly identified a positive connection between employee humor, laughter, and productivity. In the United States especially, there are now a significant number of so-called humor consultants who encourage leaders to recognize the workplace benefits of laughter and humor. Writers and consultants have promoted the view that leaders should use humor as a tool of persuasion to solve problems and exercise discipline. They suggest that humor can make for more effective leadership. Not only can jocularity foster divergent thinking, creative problem solving, and a willingness to take risks, but it can also humanize the hierarchy by making leaders more approachable. Writers also suggest that humor can provide a discreet way of sanctioning deviant behavior while disarming aggressors. It may help to defuse tense situations, make difficult messages more agreeable, and build teamwork. Equally, it has been argued that humor can revitalize corporate cultures and build momentum for organizational change.

Research also suggests, however, that leaders can become the objects of followers' irony and sarcasm. For example, the organization researchers Suzana Rodrigues and David Collinson found that workers in a Brazilian telecommunications factory ridiculed

company leaders through satirical images, cartoons, and metaphorical representations within the trade union newspaper. Intended to highlight the perceived inconsistencies between leaders' rhetoric and practice, workers' cartoons depicted the company's leaders as autocratic, nepotistic, incompetent, and chaotic. These findings suggest that a good deal of contemporary joking at work may constitute a satirical debunking of leadership pretensions.

The lampooning of religious leaders, monarchs, and politicians through popular satire and cartoons has a long history. Wit has been used as a weapon in various countries, particularly where groups are oppressed within authoritarian regimes. The satirical debunking of leadership is also a common feature of more liberal societies where, historically, the adult cartoon has been influential in providing humorous social comment and critique in journals, newspapers, and on television. British magazines such as *Punch* and *Private Eye*, the anthropomorphic cartoons of Gary Larson, and the workplace cartoon *Dilbert*, by Scott Adams, are all examples of this genre of social satire. The *New Yorker* magazine frequently carries cartoons that poke fun at the ludicrous world of top corporate executives, investment bankers, stockbrokers, and attorneys. These cartoons are filled with caricatures of self-important CEOs, faceless middle managers, aspiring yuppie executives, and stone-faced middle-aged secretaries; like *Dilbert* cartoons, they frequently are posted on the walls and doors of contemporary organizations.

Some writers, like J. L. Barsoux, recommend that leaders encourage subordinates' oppositional humor, no matter how critical this may be. They subscribe to a safety-valve theory of humor that views employees' oppositional joking as a way of letting off steam

Humor About Leaders

With the advent of e-mail, jokes about political leaders of the day rapidly circulate around the world. The joke below made the rounds in 2003.

Recently George Bush was in England and while there he and Queen Elizabeth were talking about leadership. . . .

The Queen says, "You know, George, the secret to good leadership is just to surround yourself with smart people."

George says, "Yes, Madame, but how do you know if they are smart?"

The Queen says, "I ask questions to see if I get the right answers. Watch and I will demonstrate." She gets on the phone and dials Tony Blair. "Tony, it's the Queen. I have a question for you. If your mother and father had a child and it was not your brother or your sister, who would that child be?" Tony says, "Well, that is easy, Madame. It would have to be me." "Very good, Tony. Have a nice day." She looks at George and says, "See how I did that?"

George says, "Cool, I'll try that when I get home."

Back in the States George decides to call Tom DeLay. . . . "Tom, I have a question for you. If your mother and father had a child and it was not your sister or brother who would that child be?"

Tom ponders the question and, unable to answer it, he asks the President if he can get back to him. He then gathers some of his House colleagues and poses the question to them but none can figure it out. Then they decide to call Colin Powell because he for sure is smart and can help them. . . .

"General, if your Momma and Daddy had a child and it was not your sister or your brother, who would it be?" Colin immediately figures it out and says, "Well, if it is not my brother or my sister then it must be me, you stupid cracker."

Tom, now hurriedly calls George back and says, "Mr. President, I have your answer. . . . It's Colin Powell!"

Bush answers in disgust. . . . "Wrong! It's Tony Blair!"

without threatening the status quo. From this perspective, a humorous managerial response to employee satire affirms leaders' power because it implies that those in authority are strong enough to tolerate criticism. This view interprets employee resistance in a similar way to that of the dissenting voice of the court jester. Able to speak the unspeakable, the jester's nonconformist clowning reduced hostility and social tension. The very existence of jesters implicitly affirmed the ruler's tolerance. Similarly, writers like M. Kets de Vries contend that those employees who take on the role of "organizational fool" and operate as a questioning truthsayer are able to moderate leaders' tendencies toward nar-

cissism and hubris. The fool's humor is more easily accepted because it is articulated through a self-deprecating kind of teasing. It has been proposed that management consultants use humor to soften resistance and facilitate organizational change at the companies that hire them.

This view of subordinate humor as a safety valve or an inversion of the usual power hierarchy was also evident in the medieval culture of the carnival. By inverting prevailing hierarchical relationships, the carnivalesque culture of laughter could be seen as a subversive satirizing of authority by those in subordinate positions. Yet the temporary nature of this inversion had the broader effect of reinforcing the status quo. The office Christmas party, where subordinates can take the opportunity to lampoon their seniors, is a present-day example of such temporary inversion. A number of corporate leaders have deliberately tried to generate a carnivalesque culture within their organizations. In the United States, Southwest Airlines actively rewards employees who use humor at work. In the United Kingdom, the National Health Service created a Laughter Clinic in 1991, and professional comedians now act as jesters to the sick and elderly. The Meadowhall shopping center in Sheffield, England, employs clowns to entertain shoppers and trains employees to joke with customers. It is also increasingly common for managers on both sides of the Atlantic to encourage employees to wear silly hats or pajamas on special dress-down days. Typically, these "fun days" are organized toward the end of the working week to improve productivity when motivation might otherwise be flagging and absenteeism increasing.

THE "FUN"CTIONALIST PERSPECTIVE ON HUMOR

Leaders' increasing interest in the use of humor also reflects the contemporary impact of postmodernism, with its focus on irony, parody, and paradox. Humor itself is frequently characterized by a playful treatment of the distinction between reality and unreality. But perhaps the most influential perspective on the growing interest in the motivational value of humor is the functionalist perspective of the social

anthropologist A. R. Radcliffe-Brown (1881–1955). Radcliffe-Brown argued that joking relations in tribal societies were vitally important to social order because they reduced tension and conflict, particularly between those individuals who have competing interests but who must also cooperate to accomplish certain tasks. In his view, the joking relationship was a "peculiar combination of friendliness and antagonism. . . . The relationship is one of permitted disrespect" (Radcliffe-Brown 1965, 90–91). Radcliffe-Brown found that teasing was especially likely between a husband and his wife's brothers and sisters. This sham conflict of permitted disrespect was an important means of sustaining social stability.

Despite its considerable influence in humor studies, functionalism has been criticized for its preoccupation with the regulated nature of social life and its alignment with the interests of the powerful. Radcliffe-Brown's research was based on a specific kind of tribal kinship relationship. Attempts to transpose his findings to quite different empirical settings may be too great a stretch for the original research. In contemporary Western organizations, joking relations are often characterized by much more aggressive teasing that can lead to dysfunctional feuds.

Various studies suggest that, in practice, leaders' manufactured joking relations are likely to be much more ambiguous and potentially more destabilizing than humor consultants and functionalist theorists acknowledge. The classic case of leadership humor backfiring occurred when Gerald Ratner, the head of the family-owned U.K. jewelry chain Ratner's, joked about the quality of the company's products. In 1991 Ratner's was the largest jewelry chain in the world, with 2,500 outlets, a stock market value of £650 million and a profit in 1990 of £120 million. Gerald Ratner was the managing director, earning £600,000 a year. However, in a speech to the institute of directors, Ratner joked that some of the products sold in his jewelry stores were "total crap." Heavily criticized by the tabloid press, Ratner was forced to resign in 1992, and eventually the company had to be sold off.

Leadership humor may also backfire by providing an opportunity for subordinates to demonstrate resistance. Employees may refuse to respond to leaders' humor. In a study of a U.K. engineering factory

shop, stewards refused to engage in the joking relations that the new U.S. senior managers were trying to develop. Hence resistance may be expressed not only in satire, but also in silence. Employees may also resist by rejecting the artificiality of manufactured happiness and the corporate smile that is central to customer care. For example, airline attendants may engage in “surface acting” by smiling “less broadly with a quick release and no sparkle in their eyes” (Hochschild 1983, 127). Insurance salespeople may resist managerially prescribed standard jokes because customers dislike their insincerity (Leidner 1993). Paradoxically, in seeking to manufacture humor, leaders may actually suppress it.

Humor can be extremely damaging when it is the vehicle for expressing prejudices or when it is used as a form of harassment. For example, before and during World War II, the Nazis extensively used anti-Semitic cartoons portraying Jews as either manipulative capitalists or subversive Communists. Similarly, numerous studies describe how male corporate leaders use sexual innuendo, “off-color” jokes, and flattery in everyday interactions with female employees, and how this sexualized joking can subordinate women. Sexual joking can also have negative consequences in customer relations. M. P. Filby reported in a 1992 article that managers in a betting shop found that their policy of encouraging women employees to develop sexual joking routines with customers created such problems of control that it was abandoned. There are a growing number of anti-discrimination lawsuits claiming that sexual joking in the workplace is a form of sexual harassment. Research suggests that some leaders are reluctant to get involved, preferring to turn a blind eye to oppressive humor, but the failure to intervene may result in negative publicity and costly court cases for the organization.

THE MERCURIAL NATURE OF HUMOR

Leadership humor is significant, complex, and ambiguous. On the one hand, leaders’ use of humor can be a highly positive and creative feature of workplace life, enhancing dialogue and communication. On the other hand, it can backfire. Leaders’ attempts to manufacture humor may generate employee

*It matters not what goal you seek
Its secret here reposes:
You’ve got to dig from week to week
To get Results or Roses.*

—Edgar Guest

resistance or offer an opportunity to express pent-up resentment. Oppressive forms of joking, whether on the part of the leader or subordinates, can result in lawsuits. Hence, while it may generate stability and a sense of belonging, leadership and workplace humor can have highly disruptive effects. In seeking to construct a fun workplace, leaders’ joking practices may inadvertently have the opposite effect.

IDIOSYNCRASY CREDIT

Traditionally, little attention has been given to followers, who accord or withdraw support to leaders. The idiosyncrasy credit (IC) model, proposed by the psychologist Edwin Hollander in 1958 and elaborated in later years, deals with the latitude followers provide a leader for action by giving or withdrawing their support. It treats a leader's status in the eyes of followers as a credit balance that the leader can draw on to take innovative actions on behalf of group goals. This model emphasizes the important role of followers in defining and shaping the latitudes of a leader's action.

CREDIT AND LEGITIMACY

The idea of credit is embedded in everyday language in such general phrases as "receiving credit," "taking credit," and "being discredited." One early precursor of the idea that a leader must have a degree of credit to be able to lead was the acceptance theory of authority (1938), articulated by Chester Barnard, a phone company executive and writer on executive leadership. That theory stated that the follower has a pivotal role in judging whether an order is authoritative. Followers will accept an order insofar as they understand it, believe that it is not inconsistent with organizational or personal goals, have the ability to

comply with it, and see the benefits of complying as outweighing the costs.

Based on Barnard's acceptance theory, a following can come about in various ways. For the moment, the focus here will be on legitimacy and credit as two significant factors. Legitimacy is the more usual, external way of acknowledging someone as leader and validating the basis for his or her attainment of authority. Legitimacy plays a pivotal part in the leader-follower relationship because it is the base on which followers perceive and respond to the leader. In 1970, and again in 1978, Hollander and James W. Julian presented research findings demonstrating that followers' expectations and evaluations of leaders differ depending on whether the leaders are elected or appointed, a finding confirmed by subsequent research by other researchers. Legitimacy is a fundamental factor determining whether or not followers accept a leader's authority.

Credit is another, more psychological way of considering the leader-follower bond. It manifests itself in such binding elements as trust and loyalty, based on attributions that make a behavior acceptable from one group member that would be seen as unacceptable from another. Whether through the extension of credit or the recognition of legitimacy, followers affect the strength of a leader's influence, the style of a leader's behavior, and the performance of the group or larger entity. In short, influence and power flow

from followers' attributions of characteristics to the leader and from their perceptions and judgments of the leader's behaviors and intentions.

HOW THE IC MODEL WORKS

The IC model deals with innovative leadership and the latitude for action that followers give a leader beyond that accorded by legitimacy of authority. The model describes a dynamic process of interpersonal evaluation in which the effects of a leader's authority are not fixed but determined significantly by the support of followers. It does not tell how things ought to be; rather, it explains how they seem to operate in relatively non-coercive situations in which power is dependent on the context and persons there.

The model defines credits as positive perceptions one earns from others by showing competence in helping to achieve the group's task goals and conformity to the group's norms, which is taken as a sign of loyalty. Credits may then be drawn on to take innovative actions such as are expected from a leader. In other words, early signs of competence and conformity permit later nonconformity to be better tolerated. Hollander first tested this formulation in 1960 and 1961 in a set of experiments with groups of engineering students confronting a task that required a joint decision. They were asked to arrive at a series of common judgments about the next column to select, on each trial in a payoff matrix, by recognizing an underlying sequential system. It has subsequently been supported in various ways and settings, with certain qualifications and refinements. In 1968, for example, the researcher Rodolfo Alvarez found that a leader's nonconformity resulted in significantly less loss of credit in terms of esteem when the organization was successful rather than failing.

Additionally, the model postulates that unused credits can be lost by failing to live up to followers' expectations. The drainage may be compounded by overpromising and then appearing not to act in the face of stated need. Self-serving and other negatively viewed behaviors can also drain credits, as can perceptions that the leader has weak motivation, is incompetent, or responsible for failure.

As a refined model, the idiosyncrasy credit concept indicates how credits accumulate and how they permit innovations that would be perceived as unacceptable deviations if introduced by a person with less credit. Seniority can contribute to the accumulation of credits, but without uniform impact. A person may also benefit from derivative credit—for example, if he or she comes from another group with a favorable reputation, or by possessing high socioeconomic status. The latter element shows a parallel to Joseph Berger's theory of status characteristics developed later.

Generally, a new member of a group is in a poor position to assert influence, especially in the direction of change, unless he or she has a unique qualification, such as a needed skill or knowledge, or by virtue of providing a solution to a major group problem. In these circumstances the new member gains credit by maximizing on the competence factor. Credit may not accrue as readily to new members who are perceived to be different—for example, to a woman joining an otherwise all male group. A new member must learn the rules of the group, as occurred when a new manager was told by his boss, after a first group meeting with the others, not to speak up to disagree. A new leader, whether appointed or elected, must still build credits by establishing a following. This is especially necessary where the legitimacy of his or her authority is weak, as in a narrow election victory.

The IC model emphasizes some essential features of a relational approach to leadership and followership. It is an alternative to the traditional solar-system model, which placed the leader at the center of attention and power. Though a long way from that time, "leader-centrism" still continues to have a powerful allure. The qualities of leaders are obviously important, but only insofar as the leaders use those qualities to engage followers in productive and satisfying pursuits. Rather than seeing a leader's qualities as possessions, we should think of them as interpersonal links to others involved in shared activities. It is important to understand and overcome leaders' tendency to resist involving followers in decision making. One major reason for leaders' resistance is the problem of shared responsibility and

the inevitable question, often unstated, of who will be accountable.

A body of research shows that inattention to mutual leader-follower involvement, such as reciprocal influence, can lead to dysfunctional outcomes. For instance, a 1990 study by Robert Hogan, Robert Raskin, and Dan Fazzini found that studies of organizational climate from the mid-1950s onward showed that 60 percent to 75 percent of organizational respondents considered their immediate supervisor to be the worst or most stressful aspect of their job. In 1992, psychologist David DeVries made use of ten years' worth of data to estimate the base rate for executive incompetence to be at least 50 percent. Robert Lord and Karen Maher say that followers' perceptions of a leader's incompetence are based on measuring the leader against prototypes and related expectations of how leaders should perform; that is, they are based on implicit leadership theories.

HOW ELECTED LEADERS GAIN LEGITIMACY AND CREDIT

As indicated, legitimacy depends upon followers perceiving the leader's source of authority, and then responding positively to that leader. The pattern of acceptance when the leader is elected is very different from the pattern when the leader is appointed since the followers have a greater role in the former process.

With elected leaders, the pattern more closely approximates the IC model. Moreover, election usually creates a heightened psychological identification between followers and the leader, with followers having a greater sense of responsibility for and investment in the leader. One explanation is to view the process of election as a social exchange in which the group gives the leader a reward in advance, by electing him or her, and then group members feel a claim on him or her to earn the reward by producing favorable outcomes.

Correspondingly, it is also true that the followers of an elected leader place higher demands on the leader. Elected leaders who fail to perform well have been found to be more vulnerable to criticism than appointed leaders, particularly if they are initially seen to be competent. For their part, even appointed

organizational leaders can learn from the experience of elected leaders and can work to attain a following by doing more than merely exercising authority. Daniel Katz and Robert Kahn, authors of *The Social Psychology of Organizations* (1966), speak in terms of leadership being "the influential increment over and above mechanical compliance with the routine directives of the organization. Such an influential increment derives from the fact that human beings rather than computers are in positions of authority and power" (302).

IDIOSYNCRASY CREDIT AND CHARISMATIC LEADERSHIP

Recent decades have seen renewed interest in the concept of the charismatic leader. Max Weber (1864–1920), the eminent sociologist, coined the term *charismatic* based on the Greek word *charisma*, meaning divine gift. Such a leader, Weber said, has considerable emotional appeal to followers and a great hold over them, especially in a time of crisis when there is a strong need for direction. Weber contrasted this mode of leadership with the traditional kind, which is handed down, and the legalistic kind, which is based on a constitutional process. He observed that charisma provides a personal authority that evokes an awe in followers that is less likely to be present in the other forms. Alternatively, charisma can be seen as a vast amount of idiosyncrasy credit at the leader's disposal. Indeed, one could consider charisma to be a quality with which followers endow a leader and which they may also withdraw. Weber himself stated that if the leader was "long unsuccessful, above all if his leadership fails to benefit followers, it is likely that his charisma will disappear" (Weber 1946, 360). Credit, similarly, is inevitably transitory insofar as it relies heavily upon the perception of the leader's performance and loyalty to group goals.

THE ARTIFICIAL DIVISION BETWEEN TRANSFORMATIONAL AND TRANSACTIONAL LEADERSHIP

Interest in charisma is now mostly associated with the concept of transformational leadership. Such

leadership, according to James MacGregor Burns, the noted political scientist who originated the term, seeks to elevate the follower's motivation. He sees it as having a moral dimension insofar as "leaders engage with followers on the basis of shared motives and values and goals. . ." (1978, 36). Regarding the political arena, he states further that "only the followers themselves can ultimately define their own true needs. . . (and only when they). . . can make an informed choice among competing 'prescriptions'" (36). Psychologist Bernard Bass (1985) has sought to carry this concept over to the work setting by emphasizing the need to give individual attention to followers, among other benefits. Unsurprisingly, this has long been considered a good leadership practice. Moreover, the importance of the followers' perspective has become more evident, whether in transactional or transformational terms. As already noted, Weber originally conceived of charismatic leaders as attracting followers because of the leaders' strong appeal and extraordinary determination, especially in time of crisis; however Weber also acknowledged that charismatic leaders depended on followers' affirmation.

In the business world and in politics, charismatic leaders are still sought as saviors. But charismatic leaders may present difficulties, such as tendencies toward narcissism and unethical behavior. Unethical leaders are more likely to use their charisma for power over followers, directed toward self-serving ends, usually in a calculated, manipulative way. Ethical leaders, by contrast, put their charisma to work in the service of others.

In transactional leadership, the leader gives something to followers and receives esteem and latitude for action in return. While charisma is often associated with transformational leadership, it may also be associated with transactional leadership: "More transactionally oriented activities by a leader may also contribute to a leader's charismatic appeal" (Ehrlich, Meindl, and Viellieu 1990, 242).

Transformational leaders, like transactional leaders, do provide rewards to followers, as Bass noted. However, the followers' reciprocation is usually unacknowledged, since acknowledgment would support the view that a transaction has occurred—and

once one acknowledges that transformational leadership, like transactional leadership, involves an exchange, the artificial separation between the two types of leadership would be breached. In actuality, however, there appears to be no sharp division between the two types of leadership. In a 1993 study of ratings cadets at the U.S. Air Force Academy gave their officers, the psychologist Gordon Curphy found that transformational and transactional leadership were not independent, but were highly related.

The actuality of this transaction between leader and followers is usually denied in accounting for the transformational phenomenon. Instead a rigid dichotomy between transactional and transformational leadership is maintained by considering only tangible rewards and failing to acknowledge the intangible ones followers receive from transformational as well as transactional leaders. But Martin Chemers, who takes an integrative approach to leadership, contends that intrinsic rewards of "self-esteem, a sense of purpose, or salvation. . . become highly attractive and supremely motivating" when followers' needs are intense enough. "Under such circumstances charismatic or transformational leadership may be seen as a special, elevated case of the more mundane transactional exchange processes that are the basis for all, person-to-person, team leadership" (Chemers 1993, 312).

Furthermore, leaders wishing to bring about transformational change need transactional qualities to establish a trust-based relationship with followers. In a 1993 study, for example, Estela Bensimon found that new college presidents who were successful had the ability to adapt by displaying transactional qualities initially, before introducing changes.

The common elements shown in good leadership and not in bad, whether one calls that leadership transactional or transformational, are positive relational factors including intangible rewards. The findings of research into IC theory are consonant with this view of the basis for motivation to follow, particularly when people are engaged in compelling mutual pursuits. In sum, transformational leadership can be seen as an extension of transactional leadership, in which there is greater leader intensity and follower arousal. To use the language of IC theory, in

transformational leadership followers accord the leader a large fund of credits, thereby granting esteem and influence. But to achieve such a responsive following, it is essential first to establish and then build upon transactional leadership before moving to create change through transformational leadership.

The IC Model therefore shows the ramifications of other realms of leadership, such as the way that reciprocal influence permits adaptation and change by both leaders and followers, each influenced by the other. The dynamism inherent in moving from stability to change and back is very much in accord with some of the mid-twentieth-century ideas of the social scientist Kurt Lewin regarding group and organizational processes.

—Edwin P. Hollander

IMPLICIT LEADERSHIP THEORIES

In the past quarter century, leadership research has examined leadership processes from a social-cognitive perspective. Within this research, attention has focused on implicit leadership theories (ILT), knowledge structures or beliefs regarding a construct or target. ILTs are created over time by learning mechanisms that automatically incorporate patterns of traits or behaviors related to leadership that an individual experiences. ILTs play an important role in (a) leadership perceptions and the meaning associated with a leader's actions; (b) leadership inferences drawn from the knowledge of group performance; and (c) the structure and accuracy of leadership questionnaires.

We will first explain ILTs in terms of cognitive theories of leadership categorization. Then we will use newer information-processing theories to explain how ILTs can be learned and flexibly adjusted to specific contexts by the automatic operation of neural networks. We then address the universality of ILTs across cultures. Finally, we analyze their implications for measures of leadership behavior and explore the current challenges facing ILT researchers.

WHAT IS AN ILT?

Early research on ILTs equated them with lay theories about leadership processes. However, it was

soon realized that ILTs were essentially cognitive categories and that leadership perceptions were guided by these cognitive categories. In other words, leaders were categorized as such using the same type of process involved in learning and applying other types of cognitive categories (for instance, birds, vehicles, and furniture). Categories can be defined by specific examples of category members, a perspective labeled “the exemplar view” of categories. However, when a domain becomes sufficiently familiar, categories tend to be defined in terms of a category prototype, an abstraction of characteristics common to category members. (Since most adults have extensive familiarity with leadership, prototypes are thought to underlie most leadership categorization. Thus, ILTs became equated with the leadership prototypes that allowed individuals who are familiar with leadership to classify others as leaders.

ILTs were thought to be implicit because they could be learned and used without intent and without much conscious attention. Two types of implicit processes have been shown to produce leadership perceptions based on ILTs. One relatively fast and automatic process was likened to the common categorization process that is used to recognize many types of stimuli as being category members. This *recognition-based* leadership perception process simply involves the automatic comparison of the features exhibited by a stimulus to a perceiver's category prototype or ILT. This leader recognition process generally occurs automatically (without conscious attention), and it allows perceivers to make very fast judgments regarding leadership. If a sufficient match occurs between a potential leader and a leadership prototype—then the target is likely to be seen as a leader. Once this prototype has been activated and used to categorize a given target, behavioral information regarding the target is assimilated with general knowledge about leadership, providing a cognitively efficient but somewhat inaccurate means of encoding and remembering leadership behavior. In fact, participants often have difficulty correctly differentiating behaviors that are actually observed from those that are simply consistent with the prototype applied to a specific leader. Leadership

perceptions can also be formed using a second type of implicit process, an *inference-based* process that attributes leadership to an individual based on knowledge of their performance. Thus, perceivers may infer effective leadership based on knowledge of good performance, and knowledge of poor performance may tend to lower leadership perceptions. Although inference-based leadership perceptions make effective use of contextual information (such as the difficulty of a leadership task) in forming attributions, they need not involve conscious causal reasoning. Research has convincingly demonstrated that such inference processes are widespread by showing that knowledge of performance can impact on leadership perceptions and behavioral or group-process descriptions in a variety of situations—a phenomenon known as the “performance cue effect.” It is important to note that these two types of leadership processes, recognition (based on behaviors and traits) and inferential (based on knowledge of outcomes), can act together to impact our leadership judgments. Most leadership perceptions are dynamic and change over time as new characteristics of leaders are revealed or knowledge of their performance changes. Thus, both recognition-based and inferential processes can be applied to the same leader, either simultaneously in forming initial leadership perceptions or sequentially as perceptions are revised over time. For example, Roseanne Foti, Scott Fraser, and Robert Lord showed in 1982 that perceptions of the leadership of U.S. presidents changed over time, and as general leadership evaluations changed, so did the extent to which presidents were described in the prototypical terms that supported their categorization theory of leadership.

CONTENT AND STRUCTURE OF LEADERSHIP CATEGORIES

Research by Lord and his colleagues in 1986 and Lynn Offerman and his colleagues in 1994 suggests that the actual composition of leader prototypes may be trait based. This suggestion helped to assimilate early research on the characteristics associated with leadership emergence with work on ILTs and leadership categorization. For example, Lord, Christy

De Vader, and George Alliger performed a meta-analysis of early research on leadership emergence and found that several traits, such as intelligence and dominance, were strongly associated with leadership emergence and were highly prototypical of leadership categories.

In addition, Offermann and his colleagues were able to identify eight trait-like factors that comprise leadership prototypes. In their research, an initial sample of 192 students generated traits or characteristics of effective leaders, and based on these characteristics, a 160-item questionnaire was created and administered to 763 additional student raters. Eight factors for ILTs emerged from their analysis of responses to questionnaire items. These researchers also conducted a confirmatory factor analysis using their student sample and using additional data from 260 working adults, and found more support for their eight dimensions. They also found that the gender of raters did not change the factor structure of ILTs. Although these eight factors were synthesized into multi-item measurement scales, they can be subsumed under trait terms. The research of Offermann and his colleagues has identified sensitivity, tyranny, charisma, intelligence, masculinity, strength, attractiveness, and dedication as the critical traits (dimensions) defining ILTs.

The 1984 research of Lord and his colleagues suggested that leadership categories were hierarchically organized. At the highest level of the hierarchy, the cognitive category contains abstract or very generalized knowledge about leadership. At this level, when an individual is confronted with a stimulus against which to compare the prototype, a very general decision regarding leader/non-leader is made. The midlevel category is more specific, incorporating information on context such as military, political, or organizational leaders. At the lowest level, categories are the most specific, adding additional information such as the leader’s level in an organizational hierarchy. For example, at this level, perceivers would differentiate among generals, majors, and lieutenants within military contexts. Thus, leader prototypes are organized in terms of several types of categories, and depending on the context and the level in an organization, a different cognitive category will be acti-

Leadership is much more an art, a belief, a condition of the heart, than a set of things to do. The visible signs of artful leadership are expressed, ultimately, in its practice.

—Max DePree

vated in order to interpret leadership behavior in any particular situation.

CONNECTIONIST NETWORKS AND ILTS

Though categorization-based theories of leadership perceptions and ILTs were quite useful, developments in cognitive science in the late 1980s and 1990s provided a basis for a more sophisticated understanding of how prototypes were learned and used. This work proposed that a type of preconscious cognitive structure called a “connectionist network” can be used to explain the learning of category prototypes, the sensitivity of prototypes to context, and the adaptability of leaders to current situations.

Connectionist networks are used to represent the flow of activation or inhibition through layers of units that, in combination, can be used to create meanings, define constructs, or otherwise process information. In such networks, activation flows from inputs (receptors activated by environmental stimuli) through units that assimilate patterns of inputs such as prototypes or scripts to outputs such as affective reactions, trait perceptions, or actual behavior. The linkages between units in such networks can be conceptualized as constraints between units, and they are represented by weights that change slowly over time as new patterns of features are encountered.

Though some networks have a unidirectional flow of activation or inhibition from inputs to outputs (*feedforward networks*), the type of network used to represent category prototypes allows activation to flow back and forth among all units that define a prototype (*recurrent networks*). Such recurrent networks are developed through experience by a process that slowly changes the weights connecting units to reflect patterns in experienced stimuli.

These recurrent networks are capable of explaining

leadership categorization processes. When a stimulus (that is, a possible leader) is encountered, features of the leader serve to activate associated nodes within the network. Activation flows through this network, and based on the satisfaction of various constraints in the recurrent layer of the network, a prototype is activated. Importantly, the activated prototype is sensitive to contextual constraints, providing a process-based explanation for the cross-situational flexibility of prototypes. This process also generates a measure of how well the prototype matches the input stimuli. Thus, it determines whether the stimulus can be appropriately categorized in terms of the abstract category represented by the recurrent network. In short, it is theorized that a context-specific definition of leadership is created by connectionist networks, and if this definition matches the target stimulus, the target is recognized as a leader. Similar reasoning applied to the script-like aspects of ILTs that leaders use to generate leadership behavior also can explain how leaders flexibly adjust behavior to situational demands.

One implication of connectionist models of leadership prototypes is that leadership will be defined in terms of an entire pattern of traits or features, not by the separate examination of specific characteristics. Support for this theory of leadership perceptions is provided by Jeffrey Smith and Foti (1998), who maintain that leadership prototypes are best understood as a pattern of traits rather than a series of independent traits. Examining leadership emergence in newly formed experimental groups, Smith and Foti found compelling support for their prediction. Individuals who were high in intelligence, self-efficacy, and dominance tended to emerge as leaders, while individuals who were low in all three traits were least likely to emerge as leaders. Furthermore, Smith and Foti’s results revealed a three-way interaction, indicating that emergent leaders tend to be high on all three traits. This suggests that it is not just the presence of certain traits, but rather the entire pattern of these traits that is important in leader-categorization processes.

CONSTRAINTS ON PROTOTYPE MATCHING

If we explain leader prototypes in terms of a connectionist network, then it is clear that the prototype

that is matched to the potential leader is flexible. Because the network is sensitive to various inputs from the environment, the pattern of activation that defines leadership prototypes is thought to change depending on the context. In this manner, then, prototype activation and leader recognition can be tuned to the context. Whether an individual is recognized as a leader is affected by the characteristics of the leader, the characteristics of the follower, and the features of the task and environment. These types of constraints are discussed in the next three sections.

Characteristics of the Leader

The gender of the leader can serve as an important constraint in leader recognition. To illustrate, consider the 1998 study of Rosalie Hall, Judd Workman, and Christopher Marchioro, who examined how the gender of a leader and the nature of experimental tasks influenced leadership emergence in groups. They found significant gender effects that showed that women were much less likely to emerge as leaders than men—71 percent of the emergent leaders were men and 29 percent were women. However, this effect was moderated by the nature of the task. These findings strongly suggest that the gender of a leader serves as a strong constraint in leadership perceptions, but they also show an adjustment of leadership prototypes to reflect task demands.

In 2002 Alice Eagly and Steven Karau reached similar conclusions working from a different theoretical perspective—role congruity theory. They theorized that knowledge about gender and leadership roles is assimilated when perceivers use gender as well as other information to form leadership perceptions. Because ILTs are closer to typical male than female features, Eagly and Karu maintain that the assimilation of gender knowledge and ILTs produces prejudice against female leaders. Their meta-analysis showed small but significant tendencies for women to emerge as leaders less often than men. In addition, when women behave in a manner that is consistent with leadership roles but inconsistent with gender roles, they are evaluated unfavorably, which results in further discrimination. One reason for this backlash may be that the constraints from a leader's gen-

der changed the prototype of effective leaders who were female. This explanation reflects the “shifting-standard” model of social perceptions of Monica Biernat and Kathleen Fuegen.

Characteristics of the Follower

The accessibility of leadership categories is a difference among followers that should impact leader recognition. Mahzarin Banaji and Deborah Prentice reported that if information is self-relevant, it is more likely to be elaborated (and to be used when making judgments; furthermore, the information should be quickly accessible and widely applicable in many situations. Thus, individuals who are self-schematic in terms of leadership are more likely to activate leadership categories when judging others, according to Wendy Smith, Douglas Brown, Robert Lord, and Elaine Engle.

Follower personality characteristics can also serve as a constraint on leader recognitions. Specifically, Tiffany Keller demonstrated that follower personality traits, as measured by scores on Big Five factors, impact the manifestation of ILTs. The Big Five represents a personality classification system, whereby all individual differences can be captured by five general trait categories: neuroticism, extroversion, conscientiousness, openness, and agreeableness. Participants with high scores on agreeableness, conscientiousness, and extroversion had ILTs with higher scores on sensitivity, dedication, and charisma. In sum, follower personality as well as their self-schema can constrain ILTs, creating differences across perceivers in how leadership is defined.

Characteristics of the Environment

One burgeoning area in ILT research concerns leader perceptions during crisis situations. Cynthia Emrich determined that in crisis situations, the ILTs of followers were automatically activated. In her study, participants were asked to play the role of managers making selection decisions for applicants who would be managing teams. She found that participants reported more significant leader characteristics for applicants who were to be selected to manage a team

in crisis than for applicants who would be managing teams that were performing well, even though the information provided about applicants was the same. In a related study, James Hunt and his colleagues determined that while vision-based charisma resulted in charisma perceptions during crisis and non-crisis situations, crisis-responsive charisma behaviors only led to charisma perceptions during a crisis. Furthermore, crisis-responsive perceptions of charisma faded soon after the crisis was over. Finally, in 1996 Rajnandini Pillai found that participants exposed to a real crisis situation provided higher charisma ratings of leaders than those participants not exposed to a crisis. This series of findings suggests that crises can serve as another contextual constraint that affects ILTs. Future research should continue to explore this phenomenon from a connectionist network perspective, viewing crises as a source of activation for leadership prototypes.

UNIVERSALITY OF ILTs

Research clearly shows that ILTs structure leadership perception processes. However, because ILTs have typically been studied using American participants, two questions regarding ILTs must be answered before generalizing these findings to other cultures: (1) Is the existence of ILTs universal? and (2) Are underlying leader prototypes similar across cultures? Most research has concluded that the process of leadership perceptions is constant across different cultures. That is, perceivers have ILTs and use prototypes learned from experience to define leadership. However, this same line of research also suggests that the composition of prototypes differs across various cultures

The GLOBE research project, a worldwide attempt to understand leadership in different areas of the world, has reported similar findings regarding the leadership prototypes. In 1999 Deanna Den Hartog and his colleagues examined whether leadership items would be endorsed by participants from sixty different cultures around the world as effective or ineffective qualities for good leaders. Their results revealed that certain qualities, such as charisma, team orientation, and participativeness, were univer-

sally endorsed as effective leadership qualities. However, other items differed across various cultures, including those items that tapped the aforementioned qualities. Thus, it appeared that the manner in which charisma, team orientation, and participativeness manifest themselves in effective leaders may differ culturally.

ILTs AND MEASUREMENT ISSUES

Researchers' growing awareness of ILTs raises concerns regarding traditional pen and paper measures of leadership. Because people use ILTs to guide behavioral ratings and ILTs can be influenced by contextual constraints as well as knowledge of group or leader performance, many of the results thought to reflect real leadership processes may instead be effects resulting from raters' ILTs. Furthermore, the structure of popular leadership questionnaires has been shown to be consistent with the structure of ILTs, raising the possibility that behavioral scales tapped implicit perceiver structures rather than the actual behavioral patterns of leaders. For example, studies show that when participants were provided very little leadership information and then were asked to rate a leader, a factor structure emerged across participants that was consistent with the ILTs used to rate actual organizational supervisors. Indeed, they found that similar factor structures emerged for ratings on the Leader Behavior Description Questionnaire (LBDQ) across five different samples that varied in the amount of behavior observed (for example, no behavior, video tapes of behavior, raters participated in laboratory groups, or raters were subordinates of leaders in organizations).

The performance cue effect discussed previously creates another area of concern pertaining to the validity of leadership questionnaires. This effect occurs when performance information biases ratings of individual or group processes. These findings have serious implications for conclusions based on leader questionnaires, for in typical survey research it is impossible to determine whether prototypical leader behavior actually resulted in successful performance outcomes or whether knowledge of successful performance outcomes merely biased a

rater's memory for prototypical leader behaviors. In other words, memory regarding leadership cannot be considered fixed; it is not like a computer file that can be retrieved in the exact form in which it was saved. Rather, memories regarding past leadership behaviors are influenced by current information; through a rater's ILTs, memories and ratings may be "reconstructed" to be consistent with known information regarding a leader.

ILT RESEARCH CHALLENGES

Historically, ILT research has focused on the structure and content of the knowledge structures and the role these structures play in leadership perceptions. Indeed, in this review, we emphasized the important role ILTs serve in leadership perceptions, leader emergence, and the structure and accuracy of leader questionnaires. However, we also suggested that these structures are not static—rather, they are dynamic and susceptible to the influence of the current context. Characteristics of the leader, the follower, and the environment itself serve as constraints in leader recognition and emergence processes. Consequently, gender, the nature of group tasks, follower schemas, and crisis situations are just a few contextual characteristics that can vastly alter leader perceptions and the prototypes on which they are based. Myriad other elements including goals, values, or norms can impact our perception of leaders.

Connectionist networks are cognitive mechanisms that can begin to explain how these numerous constraints can operate in unison to impact our leadership perceptions. This research, however, is just the beginning, and future ILT researchers face several challenges. They will need to continue to look beneath the surface to examine the role that information processing plays in leadership perceptions. Researchers should continue to examine how connectionist cognitive architectures operate to define leadership beliefs, while also examining in greater detail various contextual constraints. Attention should also be given to the script structure leaders use to generate behavior and to how these structures change with situational constraints.

INDIGENOUS SOCIETIES

See Traditional Societies

INDIVIDUALISM AND COLLECTIVISM

Etymologically, individualism and collectivism allude to the individual- and collective-centric worldviews and ways of life. When people act to maximize their personal gains, they are referred to as individualists, whereas when people behave to help the community or society, they are referred to as collectivists. These terms have been used by social scientists in much the same way. However, following the work of Geert Hofstede, Harry C. Triandis and his collaborators developed a program of research in the 1980s that led to the terms becoming popular psychological constructs used at

the individual as well as cultural levels. At the cultural level the terms *individualism* and *collectivism* are used, and cultures are referred to as being individualistic or collectivist. At the individual level the terms *idiocentrism* and *allocentrism* are used to denote individualism and collectivism respectively and are thought of as personality types. However, idiocentric people are found in collectivist cultures, and allocentric people are found in individualist cultures. The literature on these constructs has developed further in the last twenty years, and many people have started to refer to these ideas as the theory of individualism and collectivism.

The supporters of the theory of individualism and collectivism find clear antecedents and consequences of these constructs, and they also find this culture theory useful in explaining and predicting human behavior in many social contexts. Measurement instruments for these constructs have been demonstrated to be reliable and valid in many areas of social research. Hundreds of journal articles have been published using these constructs, and much practical application for cross-cultural psychology, communication, marketing, and international management have also been found, making these constructs extremely popular. However, some critics find the empirical evidence wanting. Others have complained about their catchall nature and how researchers use them as residual concepts to explain cultural differences in many social behaviors. Criticism aside, the theory of individualism and collectivism is likely to find many more applications, and here we discuss its value for leadership theory and practice.

CONCEPT OF SELF AND LEADERSHIP

The core of individualism and collectivism lies in the concept of self. It is generally accepted that in individualist cultures people view themselves as having an independent concept of self, whereas in collectivist cultures people view themselves as having an interdependent concept of self. An individualist's concept of self does not include other people, roles, situations, or elements of nature. On the other hand, a collectivist's concept of self includes other members of family, friends, people from the work-

place, and even elements of nature. People in Western countries like the United States, Great Britain, Australia, and Germany, have an independent concept of self, and they feel a more pronounced social distance between themselves and others, including the immediate family. People in Asia, Africa, Latin America, and elsewhere have an interdependent concept of self, and social distance between an individual and his or her parents, spouse, siblings, children, friends, neighbors, supervisors, subordinates, and so forth is small.

Concept of self can be viewed as *digital* or *analogue*: digital for individualists and analogue for collectivists. When individualists think of themselves and others, they are clear that their self only includes themselves. "This is me, but that is not me. My mother is not a part of me. My child is not a part of me. They are separate from me." There is no overlap between their selves and others. In other words their view of themselves is digital. On the other hand, when collectivists think of people in their family (e.g., parents, spouse, children, siblings, and so forth), they feel these people are a part of their selves. For example, one's thinking may proceed like this: "My father is a part of me, not completely me, but somewhat a part of me. My child is a bigger part of me compared to my father, not completely me, but, yes, a good part of me." The same feeling holds in case of other relatives, friends, and even neighbors. Thus, they have an analogue self. Of course, the biological self is digital for individualists as well as collectivists. It is the socially constructed self that is digital or analogue.

Concept of self impacts the leadership styles found in different cultures. In collectivist cultures leaders are expected not only to be task focused but also to be nurturing in their relationship with the subordinates. This finds support in indigenous leadership research in countries like India, Japan, Philippines, and Mexico. It is also reflected in such cultural concepts like *simpatia* or being *simpatico*, which means being pleasant and interpersonally sensitive in Latin America and among Hispanics and Latinos in the United States. Similarly, in the Philippines the word *pakikisama*, which includes managerial characteristics like understanding, concern for employee

welfare, kindness and helpfulness, and a pleasant and courteous disposition toward subordinates, indicates a people focus in leadership. In Japan, *amae*, which means presuming that one will be indulged by a person with whom one has an intimate relationship, suggests that subordinates will expect to be supported by supervisors even if the behavior of the subordinates is not perfect. This is not the situation in individualistic cultures, where leaders are not expected to nurture the subordinates beyond maintaining a professional relationship. In fact in these cultures, both superiors and subordinates prefer to keep each other at arm's length.

Task focus and people focus have been researched in leadership literature, starting with the early work at Ohio State University and the University of Michigan. The theory of individualism and collectivism helps explain why in collectivist cultures there is a more pronounced focus on people and relationships because of the collectivists' sense of interdependence and their need to keep harmony among people with whom they interact closely. On the other hand, in the individualist cultures there is a clear emphasis on task, even at the expense of relationships. Further support for cultural difference in interdependence is found in the acceptance of paternalism in various cultures. For example, 80 percent of the Japanese and about 65 percent of the samples from middle European countries accepted paternalism, whereas only 51 percent of representative American samples did so.

RATIONAL AND RELATIONAL SOCIAL EXCHANGES AND LEADERSHIP

A second critical difference between individualism and collectivism focuses on the interpersonal relationships or the nature of social exchange between self and others. In individualist cultures social exchange is based on the principle of equal exchange, and people form new relationships to meet their changing needs based on cost-benefit analysis. Thus, individualists are rational in their social exchange. But in collectivist cultures people have an interdependent concept of self and they inherit many relationships. Therefore, people in collectivist cultures

view their relationships as long term in nature and are unlikely to break even a poor (i.e., not cost effective) relationship. Thus, collectivists value relationships for their own sake and nurture them with unequal social exchanges over a long period of time.

Individualists tend to use exchange relationships, while collectivists tend to use communal relationships. In an exchange relationship, people give something (a gift or a service) to another person with the expectation that the other person will return a gift or service of equal value in the near future. The characteristics of this type of relationship are "equal value" and "short time frame." People keep a mental record of exchange of benefits and try to maintain a balanced account, in an accounting sense. In a communal relationship people do not keep an account of the exchanges taking place between them; one person may give a gift of much higher value than the other person, and the two people may still maintain their relationship. In other words it is the relationship that is valued and not the exchanges that go on between people when they are in a communal relationship.

In collectivist cultures usually there are a series of exchanges between two people in which what is given never quite matches what is received. Thus, the exchange goes on for a long time unless the series is broken by some unavoidable situation. In this type of relationship people feel an "equality of affect" (i.e., when one feels up, the other also feels up; and when one feels down, the other also feels down). In contrast, in individualist cultures people exchange goods and services when they have common interests, and only if the benefits justify the costs. Individualists move on to new relationships when a relationship does not meet their needs.

The rational versus relational differentiation in social exchange has important implications for leadership. According to Leader-Member Exchange (LMX) theory, managers are able to influence their subordinates to produce beyond formal organizational expectations by developing "mature leader relationships," which are characterized by extracontractual behavior, mutual trust, respect, liking, superordinate goals, in-kind type of reciprocity, indefinite time span of reciprocity, and high leader-member exchange. However, those managers who do not

develop mature leader relationships focus on cash and carry type of reciprocity, immediate time span of reciprocity, and low leader–member exchange. They often indulge in formal, contractual, mostly unidirectional downward influence processes. The exchange relationship obtains the desired behaviors from subordinates by exacting behavioral compliance through external control, while the communal relationship promotes an internalization of values and goals by the subordinate, and desired behaviors from subordinates are obtained through the subordinates' self-control. It is evident that mature leader relationships are developed over a long term and resemble the communal relationship, whereas "immature" leader relationships reflect a short-term perspective of managers and focus on exchange relationships. Since people are socialized to value long-term relationships in collectivist cultures, the High LMX style of leadership is preferred in these cultures. In individualist cultures, though many managers do develop High LMX styles, in the long run people prefer to maximize their individual gains, and so a Low LMX style of leadership is more prevalent.

George Graen and colleagues have found many cultural differences in leadership styles in their studies of Japanese and American managers in multinational organizations in the United States and Japan. For example, the American managers were found to have an underdeveloped sense of obligation to their co-workers and company. Therefore, the absenteeism rate among American managers was comparable to that of the workers. This lack of commitment is attributed to the individualists' exchange relationship perspective of the job, and the preference for a Low LMX style of leadership. According to the Japanese philosophy, the managers and workers invest in their mutual relationships and build mutual obligations over a number of years, usually a lifetime, of work contact. This mutual obligation completely rules out the possibility of insubordination. In effect, if workers are resisting a manager's decision, the manager may have committed a mistake and is better off discussing the problem with the workers rather than imposing disciplinary sanctions. Again, the difference results from the preference for a High LMX leadership style in Japan.

FUTURE DIRECTIONS

There are two other important attributes of individualism and collectivism. However, their implications for leadership are not yet clear. One focuses on the relationship between self and groups of people. Collectivism requires the subordination of individual goals to the goals of a collective, whereas individualism encourages people to pursue the goals that are dear to them, and even change their in-groups to achieve those goals. Divorce is frequent among individualists because people are not willing to compromise their careers, personal goals, and desires, whereas collectivists often sacrifice career opportunities to take care of their family needs (i.e., in-group goals), and derive satisfaction in doing so. Collectivists also favor their in-groups over out-groups in reward allocation or in negotiation tasks, whereas individualists do not make such strong distinctions between in-groups and out-groups. Thus, collectivists use the equality principle in reward allocation among in-group members, whereas they use the equity principle (i.e., reward is proportional to the amount of work done) when dealing with out-groups. Individualists use the equity principle all the time. Finally, collectivists are also found to indulge less than individualists in social loafing (e.g., a tendency to take less responsibility in a group situation or to free ride).

The in-group versus out-group differentiation has important implications for group dynamics in organizations. However, it is not clear how this will influence leadership style. In GLOBE, Global Leadership and Organizational Behavior Effectiveness, a recent major study of leadership in sixty-two cultures, an attempt has been made to measure collectivism at the organizational level. This is a good beginning, but much more research is needed to understand and predict the impact of this attribute on leadership style.

The other important characteristic of individualism and collectivism whose leadership implications are not clear focuses on how the self is viewed vis-à-vis the larger society. Those with an independent concept of self do what they like to do, or what they think is good for them; that is, they pursue their individual desires, attitudes, values, and beliefs. How-

ever, people with an interdependent concept of self inherit many relationships and learn to live with these interdependencies. Part of managing the interdependencies is to develop goals that meet the needs of more than one's own self. In the process of taking care of the needs of one's in-group members, a social mechanism evolves in collectivist cultures that is driven by norms. Thus, those with an interdependent concept of self resort to methods that have been tried in the past for interacting with people at large. For example, Americans are independent minded, inner-directed, and resentful of conformity, whereas the Chinese are inclined to conform. In China conformity tends to govern all interpersonal relations and has social and cultural approval. Consequently, in individualist cultures there are fewer norms about social and workplace behaviors, whereas in collectivist cultures there are many clear norms. Also in individualistic cultures the few norms that exist are not severely imposed, whereas in collectivist cultures not only are norms tightly monitored and imposed but also anti-normative behaviors are often hidden from public eyes. Thus, the difference in following own attitude versus norms of the society becomes a salient difference between individualist and collectivist cultures.

Again, the implications of norm versus attitude differentiation for leadership style, beyond what was presented earlier, is not clear. It is plausible that in collectivist cultures once leadership norms are formed, it may be difficult to change them. For example, after Gandhi created the culture of *Satyagraha* (i.e., civil disobedience) in India, union leaders have used it effectively to negotiate with management. However, this method is likely to be viewed as a pressure tactic in the United States or other individualistic cultures, and may not help the negotiation process. In the absence of conclusive research, we can only theorize that perhaps due to the ease of acceptance of conformity in collectivist cultures leaders are likely to obtain much conformity from their followers. On the contrary, in individualistic cultures leaders will have to use much persuasion to win over their followers, and even a hint of pressure to conform may lead to rejection of leadership.

INFLUENCE TACTICS

Leadership involves influencing other people to facilitate the performance of collective work. To be effective, a leader must influence others to carry out requests, support proposals, and implement decisions. In large organizations, a leader must be able to influence superiors and peers as well as subordinates.

The success of an attempt by one person (the “agent”) to influence another person (“the target”) will depend to a great extent on the agent’s influence behavior. The most common form of influence behavior in organizations is a “simple request” based on legitimate power. Target compliance is likely for a simple request that is clearly legitimate, relevant for the work, and something the target person knows how to do. However, if the requested action would be unpleasant, inconvenient, irrelevant, or difficult to do, then a “proactive influence tactic” may be necessary to gain target compliance or commitment.

Since the early 1980s, researchers have attempted to identify specific influence tactics and assess their effectiveness. This article will describe 11 proactive tactics that are commonly used by leaders and the conditions in which they are most likely to be suc-

Not the cry, but the flight of the wild duck, leads the flock to fly and follow.

—Chinese proverb

cessful. The findings are supported by studies involving the use of several different research methods.

RATIONAL PERSUASION

Rational persuasion uses explanations, logical arguments, and factual evidence to show that a request or proposal is feasible and relevant for attaining task objectives. A weak form of rational persuasion may include only a brief explanation of the reason for a request, or an undocumented assertion that a request is desirable and feasible. Stronger forms of rational persuasion include a detailed explanation of the reasons why a request is important and presentation of evidence that it is feasible.

Rational persuasion is more likely to be effective when the target person shares the same task objectives as the agent but does not recognize the proposal is the best way to attain the objectives. Along with facts and logic, a rational appeal usually includes some opinions or inferences that the target person is asked to accept at face value because there is insufficient evidence to verify them. Thus, the success of the influence attempt also depends in part on whether the agent is perceived to be a credible and trustworthy source of information, inferences, and predictions.

APPRISING

With this tactic the agent explains why a request or proposal is likely to benefit the target person as an individual or help to advance the person’s career. For example, a requested task may provide opportunities to learn new skills, meet important people, or gain more visibility as a competent professional. Like rational persuasion, apprising often involves the use of facts and logic, but the benefits described are for the target person rather than for an organization in which they are both members. Apprising is more likely to be successful if the agent understands the

target's needs and how a request or proposal may be relevant for satisfying them. To use this tactic successfully, an agent must be perceived as credible.

INSPIRATIONAL APPEALS

An inspirational appeal is an attempt to develop enthusiasm and commitment by arousing strong emotions and linking a request or proposal to a person's needs, values, hopes, and ideals. Some bases for an ideological appeal include the desire to accomplish something worthwhile, to perform an exceptional feat, to be a member of the best team, to support values such as freedom and justice, or to participate in an exciting effort to make things better. An inspirational appeal is more likely to be successful if the agent understands the values, hopes, and fears of the persons to be influenced. Effectiveness also depends on communication skills, such as the agent's ability to use vivid imagery and metaphors, manipulate symbols, and employ voice and gestures to generate enthusiasm and excitement.

CONSULTATION

Consultation occurs when the target person is invited to participate in planning how to carry out a request or implement a proposed change. Consultation can take a variety of forms when used as an influence tactic. One example is to present a proposed policy or plan to discover if the target person has any doubts or concerns about implementing it, or suggestions for improving it. Another example is to present a general strategy or objective (instead of a detailed plan), then ask the target person to suggest specific action steps for implementing it. Consultation is more likely to be effective if a target person perceives that the objectives of the requested task or proposal are worthwhile, and the invitation to provide inputs is sincere.

EXCHANGE TACTICS

This type of influence tactic involves the explicit or implicit offer to provide something the target person wants in return for carrying out a request. This tactic

is especially useful when the target person is reluctant to comply with a request because it would involve considerable effort and inconvenience. Exchange tactics are a way to increase the benefits enough to make it worthwhile to comply with the request. An essential condition for effective use of exchange tactics is control over something the target person desires (e.g., a pay increase or promotion, assistance on another task, political support). Sometimes the promise may be implicit rather than explicit. That is, the agent will offer to return the favor in some unspecified way at a future time. An exchange tactic will not be effective unless the target person believes the agent is willing and able to deliver the promised benefits.

COLLABORATION

This influence tactic involves an offer to provide necessary resources and/or assistance if the target person will carry out a request or approve a proposal. Unlike exchange, which usually involves an impersonal trade of unrelated benefits, collaboration involves a joint effort to accomplish the same objective. Collaboration provides a way to reduce the difficulty or costs of carrying out a request. This tactic is especially appropriate when compliance would be difficult for the target person.

PERSONAL APPEALS

A personal appeal involves asking someone to do a favor out of friendship or loyalty to the agent. It follows that this influence tactic is not feasible when the target person dislikes the agent or is indifferent about what happens to the agent. Personal appeals are most likely to be used when asking for something that is not part of the target person's regular job responsibilities (e.g., provide assistance, do a personal favor).

INGRATIATION

Ingratiation is behavior that makes the target person feel better about the agent. Examples include giving compliments, doing unsolicited favors, acting defer-

ential and respectful, and acting especially friendly. When making a proactive influence attempt, a very useful form of ingratiation is to state why the target person is especially qualified to carry out a request (e.g., based on exceptional skills or prior achievements). When ingratiation is perceived to be sincere, it tends to strengthen positive regard and make a target person more willing to consider the agent's request. However, ingratiation may be viewed as manipulative when it is used just before asking for something. Therefore, ingratiation is usually less useful for an immediate influence attempt than as part of a longer-term strategy to improve relationships with people.

LEGITIMATING TACTICS

Legitimizing tactics involve attempts to establish the agent's legitimate authority or right to make a particular type of request. Compliance is more likely when a request is viewed as legitimate and proper. Legitimacy is unlikely to be questioned for a routine request that has been made and complied with many times before. However, legitimacy may not be evident for a request that is unusual, or when the target person does not know what authority the agent has. There are several different types of legitimating tactics. Examples include providing evidence of prior precedent, showing consistency with organizational policies and rules, showing consistency with professional role expectations, and showing that the request was approved by someone with proper authority.

PRESSURE

Pressure tactics include threats, warnings, and assertive behavior such as repeated demands or frequent checking to see if the person has complied with a request. Pressure tactics are sometimes successful in inducing compliance with a request, particularly if the target person is just lazy or apathetic rather than strongly opposed to it. However, pressure is unlikely to result in commitment, and the use of this tactic may have serious side effects. The harder forms of pressure (e.g., threats, warnings, or demands) are likely to cause resentment and under-

Influence Tactics in a Korean Village

Korea is a society marked by considerable concern over status, face, and group cohesion. The following example of a woman "leader" in a Korean village makes clear that she must behave in a way that accords with all these concerns in order to maintain her influence.

May one say that the chairwoman of the club was merely a figurehead because she, as head of the meeting, did not seem to have any distinctive influence? If one retains the idea of a "western political model" based on a democratic structure, she is a figurehead for the group. To carry the idea through, however, the procedure of discussion and decision-making is not based on an idea of democracy but rather on that of unanimity. In this context, the "leader" does not have to be a person of marked influence in the decision-making process. She is not a figurehead but rather a middleman in the meeting, functioning, in effect, as a go-between for the group. There is no despotic idea in the context of a total consensus in this essentially egalitarian society. The chairwoman stands as a middleman between the government and the village. Although the government may call her a "leader" in the village, she properly does not occupy this role.

mine working relationships. Sometimes pressure tactics are necessary to obtain compliance with a rule or policy that is important to the organization, such as safety rules and ethical practices. However, in most cases, a softer form of pressure (e.g., persistent requests, reminders that the person promised to do something) is more likely to gain compliance without undermining the agent-target relationship.

COALITION TACTICS

Coalition tactics involve getting help from other people to influence the target person. The coalition partners may be peers, subordinates, superiors, or outsiders. When assistance is provided by the superior of the target person, the tactic is usually called an

“upward appeal.” A distinct type of coalition tactic for gaining target support for a proposal is to cite the prior endorsement of it by people whom the person likes or respects. Coalition tactics are usually used in combination with one or more of the other influence tactics. For example, the agent may bring along a supporter when meeting with the target person, and both agents may use rational persuasion to influence the target person.

EVALUATING PROACTIVE TACTICS

Each influence tactic can be useful in an appropriate situation, but some of the tactics are generally more effective than others. The most effective tactics include rational persuasion, inspirational appeals, consultation, collaboration, and apprising. Sometimes, a combination of tactics is necessary to influence the target person. Regardless of what tactics are used, however, there is no guarantee they will be successful. In addition to the type of tactics used by the agent, the outcome of any particular influence attempt is affected by other examples such as the power and authority of the agent, the type of influence objective, the perceived importance of the request, cultural norms about the use of the tactics, and the amount of mutual trust and friendship between the agent and target. An influence tactic can result in resistance if it is not used in a skillful manner, or if it is used for a request that is improper or unethical. Effective leaders understand what tactics are appropriate in a particular situation and how to use them.

INNOVATIVE LEADERSHIP

Innovation introduces something new or makes changes in something already established. In the world of work, leadership in innovation is needed especially in reacting to competitive markets, in designing new products for existing markets, in reacting to changes in work processes as technology improves, and in encouraging employees to increase their levels of expertise and organizational commitment. The challenge for leaders is to maintain the cutting edge in their areas of responsibility so as to keep their organizations in the forefront, either through new or renewed processes.

OVERVIEW OF THE INNOVATIVE PROCESS

Margaret Wheatley supplied an overview of innovation for leaders: “Innovation is fostered by information gathered from new connections . . . from active, collegial networks . . . from ongoing circles of exchange, where information is not just accumulated or stored, but created. Knowledge is generated anew from connections that weren’t there before” (1992, 113). This overview details a need for information, collegial networks, circles of exchange, and knowledge generation. Another important innovative process is called competence building, in which employees are encouraged to “take charge” of their organizational lives by taking on more responsibility,

asking for training in areas in which they see needs, and by learning from their mistakes. Competence building is an empowerment strategy (Dessler 2004). Employees who get needed information and exchange information freely with colleagues generate knowledge to fuel innovation. At the same time as employees increase their levels of expertise, they increase their commitment to the leaders who fostered their knowledge creation and to the colleagues with whom they formed new connections in their organizations.

THE ROLE OF INFORMATION TECHNOLOGIES IN INNOVATION

The idea of innovation may bring to mind information technologies (IT): microelectronics, computer systems, and telecommunications. These technologies have created competition for bureaucracies, an organizational model in which work is coordinated “vertically” by specialized administrative and clerical personnel who gather and summarize information for use in decision making. As an example, consider an organization grouped by product into divisions. One division may be responsible for developing and testing a new component of the company’s product. One department within the division might design the new component, another might produce the component, and another department might be responsible for evaluation/testing. The task calls for interdependent work and large amounts of information exchange. In a hierarchical organization such as a bureaucracy, communication would flow up the chain of command from the workers to their supervisors to department managers. Department managers would consult one another and the division manager to decide how work gets done, and the instructions would flow back down to the workers through the hierarchical channels of information. This vertical approach creates delays and idled workers waiting for decisions—an inefficient process at best. A more efficient and effective process is the authorization of lateral connections, in which information is communicated directly between participants in departments rather than through vertical channels. Some organizations would see this as vio-

The marksman hitteth the target partly by pulling, partly by letting go. The boatsman reached the landing partly by pulling, partly by letting go.

—Egyptian proverb

lating the unity-of-command principle, since department heads would not be in full control and could not be held accountable for workers’ behavior.

More and more, however, other work structures are being used, especially in uncertain economic times when inefficiencies more glaringly affect productivity. Task forces, in which workers with specialized skills from several departments and levels come together for a short time to execute a specific task, provide a more efficient structure. Project teams also provide more efficiency. In this structure, workers from several departments are released by department heads to the authority of a project manager who plans and coordinates the work of the team. In some organizations, the organization of work centers around project teams. Workers with diverse skills are assigned goals that change as the teams learn from their experiences. Finally, matrix structures set aside unity of command to allow workers home bases in functional departments but work responsibilities to on-demand projects (Scott 2003).

The foregoing organizational structures are characteristic of the industrial age, although bureaucracies still function effectively in certain instances. Newer transmission and data-reduction systems designed for “online” information have substituted for the bureaucratic model, in which staff personnel assist line personnel in information-processing capacities. Finally, although IT increases the ability to record, transmit, and analyze information over time and distance barriers, information technologies cannot enhance the “sense-making” abilities of people. Interpreting and creating shared meanings from information are essentially human functions. Thus, it is not just having information that counts; what’s important in the workplace is using information to increase competencies. According to Margaret Wheatley, “In organizations, we aren’t suffering from

The Best and Worst of Twentieth-Century Innovations

(ANS)—Telemarketing, or the fine art of interrupting someone about to eat dinner with an offer of a great deal on windshield glass, was named one of the worst business innovations of the twentieth century in a survey of students and professors at the Owen Graduate School of Management at Vanderbilt University. Other innovations on the bad-idea list included pagers, business conglomerates and office cubicles.

The best creation in the business world this century, students and teachers agreed, was the computer. Assembly lines, the Internet, financial markets and the telephone also rated high on their best-of lists.

Administered by the school's communications office, the survey polled 50 faculty members and 458 graduate students. One administrator also participated. He disagreed with the majority and said having women in the workforce was the most important development.

"I think women are the engine that's driving the current prosperity," said Joel Covington, associate dean for external affairs. "You generate wealth through work. And despite limitations (put in their way) and disparity in salaries, they've got to be a key component."

That women are able to walk to work more comfortably was on the mind of one respondent who said the dressy pump that made use of sneaker technology ranked right up there with the best innovations. Other creations given the high five were voice mail, e-mail and the fax machine.

Telemarketing was joined in the worst category by neckties, the BETA format videocassette recorder and carbon paper, according to faculty responses. Students lambasted the thermal fax machine and the Yugo, Pinto and Gremlin automobiles. Both groups listed New Coke as a loser this past century.

Office cubicles garnered a large share of students' votes for worst inventions, according to Juliana Deans, director of communications. While many of them are looking forward to leadership positions after they graduate—and presumably a nice office—they abhorred what working in a small box did to morale, she said.

Generally, students seemed to focus on the latter part of the century for their answers, which may simply reflect their age, Deans said. The average age of a student at Owens is 27.

information overload just because of technology. . . . However long we may drag our feet, we will be forced to accept that information—freely generated and freely exchanged—is our only hope for organization" (1992, 145).

KNOWLEDGE MANAGEMENT IN INNOVATION

At the end of World War II, a team of researchers at the Tavistock Institute of Human Relations in England conducted studies of different work organizations designed to improve productivity and morale. Their focus was on the interface of social and technical systems. Their systems emphasized work group autonomy, internalized regulation, and discretionary behavior for employees, so that human values were served while technical efficiencies were accomplished. Then, in the early 1960s, general research was focused on resources, both human and

technical, and the concept of knowledge management came into being. Peter Drucker, describing a postcapitalist society, wrote, "Innovation, that is, the application of knowledge to produce new knowledge is not . . . best done by loners in their garages. It requires systematic effort, and a high degree of organization" (1993, 190).

This systematic effort and organization is supported by the research of Dr. Marleen Huysman, Associate Professor of Information Systems, Marketing, and Logistics at Free University, Amsterdam, and Dirk de Wit, Coordinator New Media, Brussels 2000. They studied knowledge-sharing practices of ten companies with over one thousand workers each. Three basic types of knowledge sharing emerged: knowledge retrieval, knowledge exchange, and knowledge creation. In knowledge retrieval, individuals learn from the organization; in knowledge exchange, individuals share their knowledge with others and learn from this exchange. In knowledge

creation, new knowledge is generated from “new combinations of existing individual, shared, or organizational knowledge” (Huysman and de Wit 2003, 32). This echoes Wheatley’s view of innovation for leaders, that of generating knowledge “from connections that weren’t there before” (1992, 113). Huysman and de Wit summarize their work: “We perceive the success of knowledge management as related to the degree in which sharing knowledge has become a taken-for-granted part of the routine practices within the organization” (2003, 34).

LEADING INNOVATION IN ORGANIZATIONS

Getting individuals in organizations to learn and then share their knowledge in order to accomplish organizational goals probably has been going on informally since work was invented. In setting up an online, multi-user network to support group communication, called “Babble,” Tom Erickson and Wendy A. Kellogg at IBM’s Watson Research Center found that usage was determined by five points: (1) not all types of knowledge get written down; (2) interpersonal interaction facilitates social resources such as contacts and referrals; (3) people do not necessarily need access to an expert with facts when contextual experience is needed; (4) networks of personal relationships reinforced by interpersonal conversation support knowledge-sharing; and (5) even trivial talk goes beyond professional exchanges and increases trust between people (Erickson and Kellogg 2003).

Leadership calls for creating a social context, of which knowledge management is a part. Wenger, McDermott, and Snyder write that “communities of practice are a practical way to frame the task of managing knowledge. They provide a concrete organizational infrastructure for realizing the dream of a learning organization” (2002, x). Communities of practice consist of practitioners generating and sharing knowledge they need through a social forum.

The challenge for leaders then becomes establishing a collegial atmosphere for Wheatley’s “circles of exchange” (1992, 113). Command-and-control techniques are not likely to yield results, since dictating cooperation will only work to a certain

extent. Joseph Rost, in *Leadership for the Twenty-First Century*, premised that leadership is “an influence relationship among leaders and followers who intend real changes that reflect their mutual purposes” (1993, 102). He described leadership relationships as the process of persuading other people by using power resources, such as prestige, personality, interpersonal and group skills, motivation, and give-and-take behaviors. He maintained that followers can persuade leaders and that leaders and followers can change places—and do. He reiterates the Tavistock Institute’s emphasis on work group autonomy and discretionary behavior for employees. Gone is all notion of coercion through power, which Rost termed dictatorial: “People, groups, and organizations that are persuaded to change may be transformed; those that are coerced to change are rarely transformed” (Rost 1993, 124). He encouraged collaborative leadership and suggested, “Transformation happens in groups, organizations, and societies when people develop common purposes. In leadership writ large, mutual purposes help people work for the common good, help people build community” (Rost 1993, 124). Leaders, then, are responsible for clarifying visions and values of organizations and disseminating these common purposes to everyone.

FUTURE DIRECTIONS

Peter Drucker, the preeminent business and management writer of our time, advanced the notion that employees need to think like entrepreneurs to guarantee a forward-looking organization: “Successful entrepreneurs . . . try to create value and to make a contribution [through change]. . . . Thus the discipline of innovation . . . is a diagnostic discipline: a systematic examination of the areas of change that typically offer entrepreneurial opportunities” (Drucker 1985, 34–35). He offers these source areas in which to look for changes that can be made to happen with little effort: (1) the unexpected (success, failure, event); (2) incongruity (what should be but is not); (3) innovation based on process need; (4) changes in markets or industries; (5) population changes; (6) changes in perception or meaning; and (7) new knowledge (of all

kinds). Drucker's ideas give us much to consider about the future of innovative leadership.

INTEGRATIVE THEORY

The theoretical literature on leadership effectiveness is often described as fractured and contradictory. However, that description is misleading. When viewed from a broad perspective that emphasizes the functions of leadership, the body of empirical findings provides many consistent themes that can be integrated into a comprehensive theory of leadership effectiveness. Psychologist Martin Chemers' integrative theory of leadership presented here brings together the disparate themes in the leadership literature to provide a comprehensive overview of small group leadership.

Organizations are human constructions designed

to overcome the limitations of individuals working alone. Organizations benefit from the collective knowledge, skills, and effort of numerous individuals but suffer the costs of coordinating the individual contributions. A successful organization must attend to two central functions that determine its viability.

The first function of a successful organization is internal maintenance, which addresses the essential need of organizations to create reliable systems for dealing with routine events. Highly efficient, predictable, and reliable systems can be developed to address well-known and well-understood organizational demands. Standard operating procedures, rules and policies, and norms and expectations help to create internal stabilizing mechanisms.

Although internal stability and predictability are fundamental for organizational viability, not all of the demands on organizations are predictable and clear. Dynamic environments confront organizations with ambiguous, changing, and sometimes poorly understood exigencies (circumstances that make urgent demands).

The second function of a successful organization is external adaptability, which is the organization's ability to sense and react to changing conditions. Flexibility and responsiveness depend on being open to new information that can be integrated into decision making as a basis for reacting to change. It is not always clear when an organization must emphasize one or the other of these two functions, and it is not always easy to accommodate their sometimes contradictory patterns. Factors that increase reliability and predictability may limit flexibility and responsiveness and vice versa.

Organizational-level functions of internal maintenance and external adaptability have parallels at the group level or team level within the organization. Effective leaders must create cohesive and smoothly interrelated teams that give members of sense of stability and order but must also encourage those teams to be sensitive to changes in tasks or environments that call for adaptation.

In a sense, the effects of leadership on the performance of a small group can be compared to the role of intelligence in individual human functioning.

Psychologist Robert Sternberg has described intelligence as the process by which individuals test their knowledge and skills against situational demands. When a good match between demands and cognitive resources exists, reactions become routinized and highly efficient. When changing situations create new demands, intelligence is the process by which the gap between current knowledge and needed knowledge is recognized, leading to the acquisition of new knowledge until responses can again be made on a routine basis. Similarly, effective leaders direct the capabilities of group members for the performance of assigned tasks, utilizing standard procedures and routine processes, until changing demands are detected and call for flexible reanalysis and the development and deployment of new knowledge and skills.

ELEMENTS OF EFFECTIVE LEADERSHIP

The description of leadership functions given earlier leads to the question of what leaders must do to fulfill the two central functions. What are the characteristics of leaders whose groups perform at the highest levels over extended periods? This question is complex but answerable. A review of almost a century of empirical research yields three essential elements of leadership. These elements reflect the realization that leaders must harness the internal resources of the group to deal with an external mission. In order for leaders to enlist the support of others, harness their capabilities and efforts, and use them to accomplish the collective goal, leaders must be able to (1) establish credibility for influence and authority, (2) build relationships that motivate and encourage cooperative effort, and (3) deploy the collective resources of the group to accomplish the mission.

In other words an outstanding leader must project an image that makes others (i.e., followers) eager to accept the leader's influence. After influence is accepted a leader must establish relationships with each team member and with the team as a whole that motivate and direct the efforts of followers toward task accomplishment. After a leader has motivated a group of followers, she or he must apply the collective resources of the group to the task effectively.

IMAGE MANAGEMENT

Psychologist Edwin Hollander recognized that leadership is a status differentiation in which one member of a group is singled out for special responsibilities and authority. Status is a collective phenomenon. An individual's status in a group depends on the evaluations of other members of the group. So, whether status is initially assigned formally (e.g., by superiors) or informally (e.g., by common affirmation), to be maintained it must be earned and reearned. Hollander and his associates (Hollander, 1958; Hollander & Julian, 1970) found that leaders earn the status to influence others by demonstrating (1) trustworthiness (through loyalty to group values and conformity to group norms) and (2) task-relevant competence (through displays of knowledge and intelligence and through performance on tasks).

Psychologist Robert Lord and his associates have presented a comprehensive program of research that indicates that people judge the leadership capacity of others through two mechanisms. First, people compare the observed characteristics and behavior of the target person with their stereotypical expectations for how leaders should look and act. Second, people seek and process information connecting a leadership figure to successful or unsuccessful group outcomes. Different types of leaders (e.g., corporate, military, religious, athletic, etc.) might have different leadership traits or behaviors associated with the role, but all share the overarching and quintessential characteristics of trustworthiness and competence described by Hollander.

Social identity theory makes the point that groups function not only to complete tasks and accomplish missions, but also to provide social identity and meaning for group members. Psychologist Michael Hogg argues that groups are likely, then, to evaluate their leader on the basis on how much the leader's appearance, expressed attitudes, and behaviors reflect the core values and prototypical characteristics defining group membership. In this way the leader demonstrates loyalty to the group and perhaps trustworthiness as well.

For example, a study was conducted to see if a leader's display of the prototypical characteristics

pertaining to the specific group was more or less important than the display of characteristics associated with more universal aspects of leadership such as task-relevant competence. Results indicated that the relative centrality of prototypical or universal characteristics in leader evaluations depended on the relative importance of actual group performance. In other words the importance of having a leader whose behaviors are comforting and reassuring may diminish as task-relevant success becomes more important.

RELATIONSHIP DEVELOPMENT

To harness the capabilities of group members for mission accomplishment, a leader must use influence to establish a relationship that motivates follower effort and develops follower effectiveness. Good leader-follower relationships are based on (1) the leader's awareness and understanding of the follower's ability, needs, and desires, (2) coaching and guidance, which challenge the follower to develop greater mission-relevant competency, and (3) the creation of a sense of fairness in the exchange between leader and follower.

Research on psychologist Robert House's path-goal theory of leadership reveals that leadership is most motivating when it helps followers see a clear path to goal attainment. An essential element for clearing the path is helping the follower to perform assigned tasks effectively. Coaching or instructing in task performance (i.e., direction) is one way to help the follower improve performance. Providing support and showing consideration for a follower's feelings may also be motivating. Path-goal theory argues that the relative benefits of direction versus support will depend on the degree to which they are complementary rather than redundant to the follower's experienced situation.

A follower will welcome direction or instruction when the task is too difficult for the follower to perform well without help. However, if the task is within the follower's capability, additional direction may be regarded as giving overly close supervision or as pushing for production, with negative effects on follower motivation. On the other hand, support

and consideration can be comforting to a follower when an unpleasant and boring task makes life miserable, but such well-meaning attention can become unwelcome and distracting when the follower's situation is interesting, involving, and satisfying.

The relationship between leader behavior and follower reaction is further complicated by differences in follower personality. Followers who highly value personal growth and challenge are resistant to leader direction even when they are slightly overwhelmed, preferring to develop the necessary capacity on their own and to reap the attendant sense of achievement and satisfaction. On the other hand, followers who are less adventurous and less achievement oriented are likely to require closer supervision and more guidance in many situations.

Coaching that will motivate intellectual challenge and growth for a follower is based on an individualized understanding of each follower's situation and needs. Thus, good coaching and guidance depend on accurate interpersonal judgments.

Research has shown that leaders base their judgments about follower abilities and effort on observing performance and trying to infer whether the follower's success or failure was caused by such factors as ability, effort, task difficulty, or the adequacy of organizational support. Leaders take action with respect to followers, such as punishment, training, or job redesign, based on these judgments of the causes of success or failure. Good coaching, then, depends on making accurate judgments about followers.

Unfortunately, strong factors can contribute to poor judgment on the part of the leader. A follower's performance often has important implications for evaluations of the leader. Poor performance may be the result of inadequate supervision or support rather than a lack of ability or motivation. This situation can incline leaders toward ego-defensive judgments that lead to inaccurate and destructive feedback to followers.

The relationship between leader and follower can be characterized as an exchange in which each partner makes contributions and receives rewards, both tangible and psychological. An important characteristic of good relationships is a sense of fairness. When leaders listen carefully to follower opinions and provide

explanations and justifications for actions taken, followers feel like respected partners in a valued relationship and are more committed to the leader.

RESOURCE UTILIZATION

The resources provided by a motivated group of followers must be effectively utilized for mission accomplishment. Effective resource utilization has two aspects: getting the most out of each individual's efforts and deploying the collective resources strategically.

Maximum group performance depends on each individual (including the leader) maintaining motivation, commitment, and focus over time. A program of research by psychologist Martin Chemers and his associates have shown that a major contributor to these three conditions is confidence in one's capability. Individuals who express high levels of "leadership efficacy" (i.e., confidence in the ability to lead others) are seen as more effective by peers, superiors, and subordinates; maintain coolness under pressure; and create similar feelings of confidence and capability among their followers.

As noted, the mission environment in which a group functions can vary from being well understood and predictable to dynamic and ambiguous. Research shows that leader-guided internal processes (e.g., decision making) must match the environment for best results. When situations are orderly, specific, and authoritative, and task focused leadership can be effective, but when situations are unclear more flexible strategies emphasizing flexible and complex decision making will be more successful.

IMPLICATIONS

Effective leadership in groups requires leaders who can garner influence by creating an impression of trustworthiness and competence. Influence provides the basis for motivating relationships with followers. The key elements of such relationships are a sensitive understanding of follower needs that allows for coaching and guidance that ties follower needs to group goals in an atmosphere of fairness and respect. Finally, the resources developed in these relation-

ships can be most effectively applied when confident leaders and followers match their behaviors to the demands of the mission environment. This situation implies that the training of individuals for effective leadership should involve (1) the development of task-related competence and efficacy, (2) the facilitation of awareness of a leader's own needs and desires, and (3) the development of communication and decision-making skills.

INTELLECTUAL LEADERSHIP

See Aristotle; Carson, Rachel; Du Bois, W. E. B.; Education; Education, Higher; Libraries; Marx, Karl; Mead, Margaret; Nietzsche, Friedrich; Plato; Science and Technology

INTELLIGENCE, EMOTIONAL

Of all of the ephemeral qualities of leadership, none has been more difficult to define than a leader's emotional qualities. Yet it is likely that emotional qualities differentiate the leader who inspires confidence, motivates followers, and creates a shared vision from the leader who infects an organization with negativity and fear. A theory developed in the 1990s that integrates emotion and thought may offer a way to define, understand, and measure these emotional qualities better. This is the theory of emotional intelligence (EI).

SCIENTIFIC BASIS FOR EI THEORY

The theory of emotional intelligence was developed by Peter Salovey, a psychologist at Yale University, and his colleague, John D. (Jack) Mayer, a psychologist at the University of New Hampshire. In a 1990 scientific publication, they defined EI as “the ability to monitor one's own and others' feelings and emotions, to discriminate among them, and to use this information to guide one's thinking and action” (Salovey and Mayer 1990, 189).

Mayer and Salovey later revised their theory to focus more specifically on the intersection of emotion and thinking. This updated model, encompassing four broad, emotion-centered abilities, defined EI as “the ability to perceive accurately, appraise, and express emotions; the ability to access and/or generate feelings when they facilitate thought; the ability to understand emotion and emotional knowledge, and the ability to regulate emotions to promote emotional and intellectual growth” (Mayer and Salovey 1997, 10).

ALTERNATIVE CONCEPTIONS OF EMOTIONAL INTELLIGENCE

Five years after Salovey and Mayer first proposed their theory of emotional intelligence, a popular trade book by Daniel Goleman, a psychologist and *New York Times* science writer, was published. It is on this book, *Emotional Intelligence*, that most people base their understanding of EI. This book described five components of EI: knowing one's emotions, managing one's emotions, motivating one's self, recognizing emotions in other people, and handling relationships. These components, while largely derived from Salovey and Mayer's work, went well beyond the scope of what they had proposed.

In the popular understanding of EI, almost any trait or skill that was not analytical intelligence could be considered a component of EI. An unintended result was that existing approaches to stress, coping, leadership, and personality were relabeled theories of EI. For example, a dissertation on psychological well-being that described a broad range of personal-

ity traits became the basis for a test of EI. Reuven Bar-On's EQ-i is a self-report test that includes five broad categories: intrapersonal (covering the subject's self-regard, emotional self-awareness, assertiveness, independence, and self-actualization), interpersonal (covering empathy, social responsibility, and interpersonal relationship), adaptability (covering reality testing, flexibility, and problem solving), stress management (covering stress tolerance and impulse control), and general mood (covering optimism and happiness).

In Goleman's later work (1998), he defined emotional intelligence as a set of leadership competencies, drawn from decades of competency modeling research and application. Goleman considered an emotional competence to be an acquired or learned skill that is based upon emotional intelligence. This competency approach to EI included five clusters of skills: self-awareness, self-regulation, motivation, empathy, and social skills.

DOES EMOTIONAL INTELLIGENCE EXIST?

There is a good deal of controversy regarding whether or not EI actually exists. When researchers have examined alternative models of EI, they have found that most do not offer anything new or unique that is not already offered by traditional models of personality. Characteristics such as optimism, assertiveness, and self-awareness have been part of personality trait theories for decades. Critics argue that calling these constellations of traits emotional intelligence is merely old wine in a new bottle and does not advance our understanding of human capabilities. In addition, Salovey and Mayer's original approach has been criticized for not offering reliable measures of EI.

Claims for the importance of EI also appear to be exaggerated. Specifically, Goleman's (1995) claim that EI is twice as important as IQ in predicting success has been misrepresented. It is possible to claim that EI is much more important than IQ for predicting success only if EI is used as an umbrella term encompassing a very broad array of skills and traits, and only if you examine success for those who have already entered a given occupation. IQ is

still an important predictor of which people first enter an occupation.

CAN THE EMOTIONAL INTELLIGENCE OF LEADERS BE OBJECTIVELY MEASURED?

Just as there are several ways to define EI, there are also several ways to measure EI. Self-report tests are one method. In self-report tests, subjects are asked to indicate how they feel, or how they evaluate themselves. An example of a self-report test for EI is the Bar-On EQ-i. This test asks subjects to report their self-perceptions regarding aspects of their personality such as how happy they are, how assertively they act, and whether they believe that they are emotional aware. The problem with using this method to measure EI is that people's self-reports of their skills, abilities, or intelligence are not always very accurate.

Another type of assessment is the 360-degree assessment, which typically obtains ratings from a number of sources. In a business context, those sources might include the subject, the subject's peers, customers who come in contact with the subject, the subject's direct reports, and his or her supervisor. The Emotional Competence Inventory (ECI) is such a 360-degree assessment. Items on the ECI were drawn from three sources: the 1991 Self-Analysis Questionnaire, a rating survey designed to measure management competencies of MBA students; a listing of general competencies; and additional competencies listed in the second Goleman book on EI. Despite the fact that data is drawn from sources other than the subject, 360-degree assessments suffer from the same problem as self-reports: Both are poor predictors of a person's actual ability level.

Ability tests are a third type of assessment. An ability test measures a person's capacity to solve certain kinds of problems and compares the person's performance with some type of reference group. Early ability measures often were unreliable and the abilities they measured were ambiguous. The newest such ability measure, the Mayer-Salovey-Caruso Emotional Intelligence Test (MSCEIT) (2002), appears to have resolved many of these

issues. The MSCEIT measures people's emotional intelligence by asking them to solve a series of emotional problems. For example, the ability to identify emotions accurately is measured by having subjects view a face and indicate what emotions the face is expressing.

IS EMOTIONAL INTELLIGENCE NECESSARY FOR EFFECTIVE LEADERSHIP?

It should be apparent that one cannot ask a question about EI without specifying *which* EI one is referring to. In the context of leadership studies, there are three EI approaches. We have known for many years that personality traits such as conscientiousness are important predictors of workplace performance. Other traits, such as optimism, have been found to be significant predictors of certain forms of sales success. When EI is defined as traits such as optimism and drive, we find that it does, indeed, predict certain occupational outcomes.

If you call EI emotional competence and describe it as consisting of skills such as leadership and team building, it should come as no surprise that it does indeed relate to leadership outcomes. It has been reported that star performers, top sales people, and effective team leaders can be differentiated from their peers on one or more of these emotional competencies.

The Mayer-Salovey ability model of EI includes a narrow set of abilities that are generally unrelated to personality traits or previously defined abilities. Research using this approach does not support the broad contention that EI is critical to leadership effectiveness. In fact, some research suggests that emotionally intelligent professionals may gravitate towards non-business careers and that if anything there is a slight negative relationship between emotional intelligence and the desire to control or lead others. On the other hand, studies of team leaders find some support for the importance of emotional intelligence to team performance.

Other research on leadership has shown a strong relationship between EI and various effective leadership styles. It has also been hypothesized that EI is a trait of transformational leaders.

LEADERSHIP AND THE ABILITY MODEL OF EMOTIONAL INTELLIGENCE

Because the ability model of EI describes a unique set of abilities, it is useful to examine it and the relationship it posits between EI and leadership in greater detail. The ability model describes four related abilities: the ability to identify emotion, the ability to use emotion to facilitate thinking, the ability to understand emotion, and the ability to manage emotion.

Identifying Emotion

Emotions contain data, and attending to such data may provide leaders with important clues regarding the environment and how people are reacting to the environment. Leaders who attend to and accurately identify emotion will have much more complete information.

Although teleconferencing, e-mail, and other technologies are being used more frequently to communicate, important meetings and negotiations are still carried out face to face, in part because business leaders want to "look into the eyes" of their counterparts—doing so helps them identify their counterparts' emotions.

Military leaders know the importance of accurate data and information, including emotional data: "It is well that those who command men in war should have known such moods. . . if they recognize them for what they are, that they may the better detect them in others. The imaginative man in war pays a price which is not exacted from his more stolid brother, but his men are the more ready to follow his example when they divine that he has read their secret thoughts" (Moran 1967, 47).

Using Emotion To Facilitate Thinking

Emotions direct our attention to important events, and emotions influence the way we think and what we think about. Leaders can use emotion to facilitate thinking by setting the right emotional tone for effective communication and by creating the emotion or mood that is most conducive to solving the problem at hand. For example, leaders who have the ability to

use emotion effectively know that if the task at hand is to search for errors, it is more useful to have people in neutral or slightly negative moods than in happy, positive moods, as people in neutral to negative moods tend to focus more on details.

Bill Clinton, the forty-second president of the United States, was well-known for his ability to connect with people. He is known for the expression “I feel your pain,” and it is likely that he did indeed feel what other people were feeling. It may be that his charisma was based in part upon his ability to use emotion to facilitate thinking.

Understanding Emotion

Being able to understand what causes people to feel the way they do and knowing how emotions change over time can provide a leader with information about how people will respond to a changed direction or a new event.

Leaders are sometimes surprised at people’s reactions to events or circumstances, yet because emotional reactions are relatively predictable and changes in emotions follow logical patterns, if we know a person or group’s emotional tendencies, we should be able to predict how they will feel given some future event.

Understanding emotions accurately can have important implications. In the realm of politics, for example, the decisions leaders make are often influenced by their reading of the emotional state of their constituencies. To take an example from foreign policy, U.S. policy makers may take one approach to terrorism if they feel that a major cause of anti-American terrorism is anger toward the United States. However, they may take a different approach if they feel that envy, rather than anger, is the stronger motivating force for terrorism. Political strategies to confront terrorism that are based upon incorrect understanding of emotion could, in this context, have drastic consequences.

Managing Emotion

By remaining open to emotion, leaders will be able to utilize this source of data and integrate it into their

thinking, decisions, and actions. A leader who manages emotion successfully engages or disengages emotions as appropriate and necessary.

Prior to becoming the forty-third president of the United States, George W. Bush may have had problems managing emotion. However, following the terrorist attacks of September 11, 2001, Bush was able to engage his emotions, stay open to them, and integrate them into his thinking: “In the chaotic first day of the episode, he came across to some observers as being less than fully confident. But from then on, he radiated a sense of self-assurance and calm determination” (Greenstein 2001, 101). His adept management of his emotions no doubt contributed to his soaring popularity in the months after the attacks.

LEADING THE WAY WITH EMOTIONAL INTELLIGENCE

There are at least three steps that should be followed in order for EI to make a positive contribution to leadership. First, researchers and practitioners should constrain the definition so that it focuses on emotion and intelligence only, rather than being a catch-all for any trait that is not analytical intelligence. Second, measurement approaches must be based on that constrained definition of EI and should utilize a variety of approaches, including objectively scored, ability-based measures. Third, we must clarify just what it is that EI should predict in terms of leadership behavior, and under what circumstances such skills are not required.

INTELLIGENCE, SOCIAL

Social intelligence was first defined by the psychologist Edward L. Thorndike in 1920 as the ability to think and act wisely in social situations, and to understand and manage people. In a general sense, social intelligence can be viewed as intelligence that is derived from experience with people and from experience and success in social settings—what might popularly be referred to as common sense, tact, or street smarts. Social intelligence has also been referred to as social competence. Because social intelligence involves both understanding people and understanding how to manage them in social situations, it is easy to see how social intelligence is connected to leadership. Assuming that social intelligence involves understanding social situations and managing people, leaders would need to possess social intelligence to be effective.

While verbal, or academic, intelligence is concerned with basic mental processing, social intelligence is more experientially based and may be acquired nonverbally, through observation of, and experience in, social situations. Academic (verbal) intelligence is developed through formal education, while social intelligence typically develops more informally. Like academic intelligence, social intelligence is multidimensional in nature.

COMPONENTS OF SOCIAL INTELLIGENCE

The psychologist J. P. Guilford, working in the 1960s, proposed that social intelligence was composed of thirty factors, including such components as the ability to interpret gestures and facial expressions, the ability to perceive others' intentions, and the ability to follow a sequence of events in social situations.

The ability to understand social situations is an important element of social intelligence. In order to do this, a socially intelligent person needs to possess interpersonal awareness, which allows him or her to read, or decode, others' nonverbal cues. Social intelligence also includes the ability to convey emotions, attitudes, and ideas to others effectively. These basic communication abilities help to build strong interpersonal connections that create a sense of unity and trust in social relationships.

Social intelligence also includes knowledge of the various social rules that apply in different social contexts and settings—similar to understanding social etiquette, but much broader. Knowing how to act, how to respond, and being able to follow appropriate social scripts—even knowing how to dress in different settings—are all valuable components of social intelligence. For example, it is social intelligence that keeps a person from acting at or dressing for a business meeting with superiors in the same manner he or she would when attending a sporting event with friends. Knowledge of social rules and social settings is a key to how social intelligence affects leadership. For example, socially intelligent leaders use their knowledge of appropriate social behavior to establish and maintain norms within a group of followers—they set up guidelines for how group members should behave in given circum-

stances and model that behavior to set an example for followers.

MEASUREMENT OF SOCIAL INTELLIGENCE

In many instances, the measures used to assess social intelligence have affected how social intelligence is defined, in that researchers have focused on measuring a particular construct and then modified their definition of social intelligence based on their findings. Measures of moral reasoning, involving the ability to make correct choices in various moral dilemmas, have been, and are still occasionally used, to assess aspects of social intelligence, as have measures of empathy, social skills, and self-efficacy. Another line of research uses measures of social insight and measures of empathy to conceptualize social intelligence. However, both those measures deal with only the decoding skills that allow socially intelligent individuals to read others' cues, and not with the ability to behave appropriately in social settings.

In the 1960s, J. P. Guilford and Maureen O'Sullivan developed dozens of separate tests to measure the components of social intelligence. Many of these tests involved nonverbal tasks, such as interpreting pictures of different facial expressions, interpreting different voice tones, choosing the opposites of certain sorts of nonverbal expressions, and rearranging the order of events in a panel of cartoons to tell a story. Some of these social intelligence tests became outdated or had poor psychometric properties, but a few of these are still available and used to measure specific components of social intelligence, but a general battery of tests that measures all aspects of social intelligence is not currently available. Another approach views social intelligence as composed of basic social skills, including both the nonverbal decoding skills mentioned earlier and also the ability to read and understand social situations. One measure of these decoding skills developed in the 1970s shows video clips of people interacting in natural social situations. The dimensions of social intelligence are measured by having the respondents determine the relationships of the people in the video to one another, whether the people in the video are lying or telling the truth in different communications,

and what the outcomes or consequences of the videotaped interactions will be. Other important social-skill components of social intelligence include the ability to convey nonverbal messages to others, the ability to regulate and control one's own emotional communications, and verbal speaking skill, ability to engage others in social interaction, and social role-playing skill.

In the 1980s, intelligence researcher Robert J. Sternberg proposed a different approach to measuring social intelligence, which Sternberg prefers to call *practical intelligence*. He suggests that a major component of social (or practical) intelligence is tacit knowledge—knowledge about the social environment that is acquired experientially and that may never be verbalized. To measure tacit knowledge, respondents are presented with a complex social situation and must develop what they feel is an appropriate course of action for that situation. The respondent's action plan is then compared to the plans of experts to determine the respondent's level of tacit knowledge. Sternberg and his associates have developed tacit-knowledge tests for people in specific occupational roles, such as a military officers or business leaders.

One major problem has plagued research on social intelligence, regardless of the measurement methods: the inability to demonstrate the independence of social intelligence measures from measures of academic intelligence. In fact, the very early research on social intelligence was nearly abandoned because of unacceptably large correlations between early measures of social intelligence and measures of academic intelligence (for example, IQ tests). However, given that both academic and social intelligence involve higher-level cognitive processing, some degree of overlap should be expected. Today, social intelligence researchers are less concerned with this issue, and most accept that social intelligence is indeed a distinct construct, independent of, but correlated with, academic intelligence.

SOCIAL INTELLIGENCE AND LEADERSHIP

Early scientific research on leadership in the 1920s and 1930s focused on the importance of academic

A New Index for Workplace Effectiveness

OXFORD, Miss. (ANS)—Getting along with others smoothes life in grade school, and scoring well in that category as an adult may be the best indicator of professional success, too.

According to University of Mississippi business professor Gerald Ferris, social astuteness and political savvy outweigh traits like conscientiousness, and even intelligence, in predicting whether or not an employee will be effective on the job.

Observing that the corporate trend of flattening management structures means employees need to interact with each other more effectively, Ferris came up with the Political Skills Inventory (PSI). He theorized that talent in dealing with other people would be essential to working successfully in teams and in fluid work structures.

The PSI is constituted of six traits: the ability of people to imagine themselves in the role of others, make people feel comfortable around them, develop an easy rapport with others, understand people, get others to respond positively to them and find common ground with others.

People scoring high on the index are more likely to be

successful on the job than those who cannot, Ferris believes.

He tested the index in five different organizations, including a group of computer programmers. While social skills are not considered essential to programming prowess, how well the workers scored on the PSI was the single strongest predictor of their job performance, Ferris said. His findings were based on a comparison of the workers' PSI outcomes with job ratings by their supervisors.

Ferris admits he's not the first to promulgate the notion that skill in working with people is essential to getting ahead. The Center for Creative Leadership in Greensboro, N.C., has found that social skills, or lack of them, is one of the most important factors in whether or not a manager succeeds. Other researchers have pointed to the importance of emotional intelligence for success.

Ferris' work is new because it defines how to be effective in the new business world, he says. Recruiters often tell him they're looking for someone who "fits" but they can't articulate exactly what that means.

"I would argue 'fit' can be managed by people who have good social skill," Ferris says.

Source: "A New Index for Workplace Effectiveness," American News Service, August 12, 1999.

intelligence for leadership and found that although leaders did tend to be more intelligent than followers, the relationship between a leader's academic intelligence and his or her effectiveness was surprisingly small. It was not necessarily the case that effective leaders needed to have exceptionally high levels of academic intelligence. Because so much of leadership involves social and interpersonal skills, it seemed obvious that social intelligence would be more strongly predictive of leader effectiveness than would academic intelligence. Early research was hampered, however, by a lack of adequate measures of social intelligence. Although many different measures and techniques have been used to try and gauge social intelligence, there are no agreed-upon measures that seem to capture the complex nature of social intelligence.

In the late 1990s, and continuing to the present time, there has been a renewed interest in the role of social intelligence in leadership. This new research suggests that two general components of social intel-

ligence are critical for effective leaders. One of these components is the leader's ability to perceive and understand various leadership situations—what might be called social perceptiveness. The other is the leader's ability to alter his or her social behavior to suit the demands of the social situation. This has been referred to as behavioral flexibility. Even very bright, experienced leaders can fail because they lack social perceptiveness and either misread the requirements of the social situation or fail to realize how their actions will be perceived by followers. Similarly, a leader may be socially perceptive, understanding how he or she should behave in a given situation, but lack the behavioral flexibility required to enact the appropriate behavior.

Research has suggested that both social perceptiveness and behavioral flexibility are related to leader effectiveness, although the majority of studies have usually focused on one or the other of these general components, with a variety of instruments used to measure the components. There is also some

evidence that social intelligence becomes more important as one moves up the organizational hierarchy to higher and higher positions of leadership. For instance, a study published in 2003 by Riggio and colleagues found that the social intelligence of front-line supervisors (as gauged by a social competence/skills measure) did not predict either their performance or how satisfied their subordinates were with them. However, there was a much stronger relationship between social intelligence and both leader performance and follower satisfaction in higher-level managers and leaders. This makes sense because the complexity of the leadership situation increases as one moves up the chain of command, and it is social intelligence that helps the leader read and interpret the complex social situation and enact the complex roles and behaviors needed to be successful.

CURRENT STATUS AND THE FUTURE

There is general agreement that the construct of social intelligence is an important component of general intelligence, and that it has particular relevance for leadership. The problem continues to be the lack of agreed-upon measures of social intelligence and its various components. Although it is always difficult to make predictions, there are a number of reasons to expect that research on the connection between social intelligence and leadership will greatly increase in the next several years. First, after a long period of dormancy, beginning in the 1990s there have been a number of studies that have explicitly explored the role of social intelligence in leader effectiveness. Second, strides have been made toward finding useful measures of social intelligence, although there are still few instruments that measure social intelligence per se. Most instruments measure related constructs, such as tacit knowledge, interpersonal acumen (ability to judge others' attitudinal or emotional states), self-monitoring (ability to monitor one's own behavior and alter it as necessary to accommodate the social situation), or social skills. Third, there has been a revival of interest in multiple domains of intelligence, as evidenced by the work of the psychologist Howard Gardner, who, in the 1980s, came up with a

theory of multiple intelligences that includes social intelligence. Finally, the tremendous popular interest in the much newer construct of emotional intelligence may fuel increased attention to the older, but related, construct of social intelligence.

INTELLIGENCE, VERBAL

Leadership is an influence relationship that depends upon effective communication. A successful leader

creates vision or direction, communicates that vision through words, symbols, or actions, and motivates and inspires people to move in that direction. One of the most powerful ways that a leader communicates is through the spoken word.

Pivotal moments in leadership occur when a leader is able to unite people who are divided by what they say during times of uncertainty and crisis. These words are often remembered long after the crisis and even after the leader has passed. Consider, for example, Martin Luther King's "I Have a Dream" speech, Abraham Lincoln's Gettysburg address or Jesus' Sermon on the Mount. These words delivered for different reasons at different points in time continue to be meaningful and inspire people today.

Given the central role of communication in leadership, it would seem likely that verbal intelligence would be a very important personal characteristic. But how important is it? Leaders who deliver speeches that are remembered throughout the ages are exceptional leaders. Is verbal ability characteristic of only exceptional leaders or does it apply to leaders generally?

WHAT IS VERBAL INTELLIGENCE?

Verbal intelligence involves the ability to learn language and use it to accomplish certain goals, an important aspect of all theories of intelligence. The way that verbal intelligence is conceptualized, measured and researched depends upon the particular approach undertaken to study intelligence. The psychometric approach, which focuses on uncovering through statistical methods the latent psychological structure of measured abilities, has contributed significantly to the understanding of verbal abilities. This approach has had enormous influence on traditional intelligence theory, which defines and measures intelligence in terms of academic skills (i.e., verbal, spatial, analytic, and memory).

Verbal Abilities

Successful verbal performance requires the ability to understand what others communicate verbally and to

verbally express oneself to others. These two related aspects of verbal ability are of equal importance. L. L. Thurstone was one of the first investigators to identify two related but distinct verbal abilities, namely verbal comprehension and word fluency, which he proposed are primary mental abilities. *Verbal comprehension* refers to the ability to understand words and verbal information. *Word fluency* refers to the speed and ease with which words, sentences, and other linguistic responses can be generated. Subsequent psychometric theorists of intelligence focused more on Thurstone's verbal comprehension rather than word fluency. For example, R. Cattell described intellectual functioning as comprised of two broad abilities, fluid and crystallized. *Fluid ability* is the capacity to think flexibly and reason abstractly, whereas *crystallized ability* is the accumulated knowledge base developed as a result of fluid ability. In this model, crystallized abilities have been associated directly with the products of verbal comprehension. However, no connection has been made between crystallized or fluid abilities and word fluency.

More recently, J. Carroll has proposed a psychometric model that is comprised of three strata or hierarchical levels of ability, which range from broad to specific. At the top of the hierarchy is general ability; in the middle, various broad abilities including fluid and crystallized abilities, learning and memory processes, visual and auditory perception, facile production, and speed. The bottom of the hierarchy contains fairly specific abilities. With respect to verbal ability, different types and levels of abilities are involved depending on the particular verbal task performed.

Is It Ability or Intelligence?

Some scholars argue that the traditional views of intelligence, which emphasize academic skills and abilities, are narrow and incomplete. Two contemporary theories advanced to extend it are the theory of multiple intelligences and the theory of successful intelligence. H. Gardner's *theory of multiple intelligences* suggests there are independent types of intelligence, such as linguistic, musical, emotional, and

so forth, which explain competency in a particular domain. For example, a poet's sonnet would be considered a manifestation of verbal or linguistic intelligence, whereas a composer's symphony would be attributed to musical intelligence. R. J. Sternberg's theory of *successful intelligence* posits that intelligence is a function of the interaction of creative, practical, and analytic abilities. From this perspective a poet's sonnet and composer's symphony is the result of a combination of these fundamental processes. So while the poet may use verbal knowledge or talent and the composer, musical knowledge or talent, both efforts rely largely on these fundamental cognitive processes. According to this theory, the term *verbal intelligence* is a misnomer because it cannot be separated from other components that compose intelligence.

VERBAL INTELLIGENCE AND LEADERSHIP

The investigation of attributes, such as verbal intelligence, that distinguish leaders from followers or effective leaders from ineffective ones has a long history in the scientific study of leadership. It is referred to as the *trait approach*, which was originally grounded in the assumption, that leaders are "born" not "made." This assumption, called the "great man" theory of leadership, was once very popular and highly controversial. Today trait theorists do not make assumptions about whether leadership traits are inherited or acquired. The trait approach continues to be of interest to leadership researchers particularly to inform leader assessment and development in modern organizations such as business and government.

Traditional intelligence tests, which include measures of verbal ability, as described above, are found to be modestly associated with a leader's performance. Some psychologists who study intelligence argue that if intelligence were measured in ways that reflect broader or different theories, stronger associations may be found. It has been shown that leaders are likely to be more intelligent but not much more intelligent than the people they lead. One reason may be because followers must be able to understand what leaders are saying. To more fully understand the specific role of verbal intelligence in leadership,

it is worthwhile to consider the research evidence that competence in communicating is associated with leadership performance.

Leadership and Communication

Studies of leader behavior emphasize a number of communication skills that leaders share in common. They actively solicit new ideas and feedback from others, persuade others about the quality of their ideas, and enlist their support. One of the primary roles of an organization leader is to effectively communicate within and outside the organization. A key way that leaders fulfill this role is through verbal communication. Communication has been found to be one of the most significant contributors to leader effectiveness in organizational management, as measured by the perceived quantity and quality of performance and subordinate satisfaction and commitment. Competence in communicating, particularly in speaking, is found to be associated with leadership in general as well as with exemplary leadership. Competence refers to a specific aptitude, ability, or knowledge that a person brings to a situation. Because the vast majority of leaders engage in frequent verbal communication either face-to-face or on the telephone, verbal ability can be considered a significant component.

A positive association has been found between talkativeness and leadership. A number of studies have shown that the person who talks the most in leaderless groups tends to be the one who emerges as the leader. Moreover, frequency of talking seems to affect whether or not people are perceived as leaders. Critics of research on talkativeness, which they call the "babble" hypothesis of leadership, argue that quantity is an insufficient explanation of the relation between talking and leadership because in groups people compete for attention and will usually silence a "babbling." Research demonstrates that, indeed, other factors are also important.

Early studies support a positive relationship between fluency of speech and leadership, although in some of the studies fluency is conflated with vividness, originality and frequency. Subsequent research has demonstrated that the quality of one's

talk, a trait which is closely related to fluency, is also associated with leader emergence. Quality includes being explicit, persuasive, and creative in communicating.

The ability to convey meaning and enhance retention has been associated with leader communication. To convey the meaning of a message, ideas and feelings must be transmitted in a way that they will be remembered. Memorable messages often take the form of succinct statements that capture complex ideas, such as “Work smart, not hard.” These statements convey information about norms, values, expectations, rules, requirements, and rationality of an organization’s culture. An illustration of this type of statement made by an exemplary leader was President Theodore Roosevelt’s declaration of his foreign policy: “Speak softly but carry a big stick.”

Exemplary leaders seem to differ from leaders in general in the extent to which they are highly skilled in verbal communication. These leaders not only communicate effectively but they communicate a “story” that resonates with followers. An effective story touches upon people’s emotions, thoughts, values, and beliefs. It reminds people of who they are, where they come from, and where they are going. Eminent leaders tell stories that engage followers in a journey with them. Martin Luther King’s “I Have a Dream” speech is an eloquent example of these points. Through the story the leader expresses and awakens basic human themes, such as justice, liberty, or righteousness. President Ronald Reagan conveyed such a story with his “Star Wars” initiative in the 1980s, an effort to build a defensive shield that would protect the United States from nuclear attack by the Soviet Union. The Star Wars image evoked the human struggle between the forces of good and evil. Though simplistic, this story marshaled the necessary domestic support for the Reagan’s defense initiative.

Leader Communication and Verbal Intelligence

To what extent does verbal intelligence account for the competence in communication associated with leadership? To some extent the answer depends upon how verbal intelligence is conceptualized. It

appears traditional definitions of verbal ability (i.e., verbal comprehension and fluency) are prerequisites for the talkativeness and fluency associated with leader communication. The theory of successful intelligence would suggest that message quality would also require creative abilities to come up with messages, analytic abilities to evaluate if they are worthwhile and practical abilities to communicate them effectively to a particular group of followers in a particular situation. Multiple intelligence theory would suggest that the ability to deliver a message or create a story that excites, convinces, stimulates, and conveys information verbally would be a function of linguistic (or verbal) intelligence.

Leader communication clearly requires ability and knowledge that goes beyond verbal intelligence no matter how it is conceptualized. For example, to communicate persuasively, a leader must understand and identify with people’s feelings, needs, and desires. To perceive emotions, access and generate them to assist thought, and regulate them effectively are components of emotional intelligence. Furthermore, a leader must be able to understand and recognize the impact of the social system in their communications. Sensitivity to social cues, awareness of social systems, and the ability to respond to them are components of the social intelligence. Ultimately leader communication must be considered in the context of the larger framework of interpersonal competence and the overlap with other characteristics associated with it.

FUTURE DIRECTIONS

Since the 1990s, the trait or individual differences approach to leadership has enjoyed renewed interest and enthusiasm. Current models emphasize the integration of multiple personal characteristics rather than focusing on static, isolated traits. Furthermore, our approach to the study of traits has shifted in focus from qualities that are associated with fixed behavior across situations to dispositions that are associated with variability in behavior depending upon situations. How does this apply to verbal intelligence? To understand the role of verbal intelligence in leadership, we must examine the ways in which it

relates to other leader characteristics such as emotional and social intelligence. Furthermore, we must understand how situation-specific communication, such as being able to speak the language of particular people in a particular situation, is associated with verbal intelligence. Finally, as intelligence theory develops so will our conception of the role of verbal intelligence in the multidimensional phenomenon we call leadership.

INTELLIGENCES, OTHER

Modern research on human intelligence has focused on the multifaceted nature of intelligence. Rather than viewing intelligence as a single ability, many researchers believe that there are a number of types of intelligence. The most well known and well researched is often referred to as verbal, academic, or general intelligence, and is represented by and popularly identified with intelligence test scores known as the intelligence quotient, or IQ. Another type of intelligence that has been studied for nearly a century is social intelligence—the kind of intelligence that allows individuals to understand and behave effectively in social situations. A type of intelligence identified in the 1990s that has received a great deal of popular attention is emotional intelligence, or the ability to perceive, use, understand, and manage emotions. But still other types of intelligence have been identified, and some of them have implications for leadership.

MODELS OF MULTIPLE INTELLIGENCES

Although early intelligence researchers recognized multiple types or facets of intelligence, the most comprehensive model of multiple intelligences was that of the psychologist J. P. Guilford, who in the 1960s proposed a complex, multifaceted model of intelligence that he called the Structure of Intellect model. Included among the many facets of intelligence in Guilford's model were many abilities to understand behaviors, such as reading facial expressions and other nonverbal behavior, as well as understanding behavioral events.

The most popular recent theories of multiple intelligences are those of the psychologists Howard Gardner and Robert J. Sternberg. In the 1980s, Gardner specified seven types of intelligence, including two (linguistic and logical/mathematical) that are typically associated with general intelligence. The others are musical, spatial, bodily-kinesesthetic, and interpersonal and intrapersonal intelligences. The last two correspond roughly to social and emotional intelligences, respectively.

Sternberg, also writing in the 1980s, proposed a triarchic theory of intelligence, the three components of which correspond to general intelligence (which he calls componential intelligence), social intelligence (which he calls contextual intelligence), and a form of creative intelligence that he calls experiential intelligence. Creative intelligence relates to a person's ability to create new ideas or pull together seemingly unrelated information in new ways.

OTHER INTELLIGENCES AND LEADERSHIP

One type of intelligence that has received attention from evolutionary scientists is Machiavellian intelligence. The theory behind Machiavellian intelligence suggests that this form of intelligence developed as a result of the need to influence and manipulate others in social groups. In many ways, Machiavellian intelligence is similar to social intelligence, but it is limited to the intellectual skills that make it possible for a person to come out on top in various social situations.

A related construct, proposed by the psychologists Joyce and Robert Hogan, is sociopolitical intelligence (SPIQ), which the Hogans define as generalized role-taking ability. They suggest that to be successful in social life individuals need both to get along with one another and to try to get ahead. According to the Hogans, the two core components of sociopolitical intelligence are the ability to see things from another's perspective and the ability to play various roles. It is these abilities that leaders draw on to recruit team members, motivate them, and guide them to specific outcomes.

Using self-report measures such as are common on personality tests, the Hogans have measured

SPIQ and demonstrated that it is important in determining a person's social status and the degree to which he or she is accepted, and that these qualities are important for determining leadership potential. However, it is the leader's ability to use sociopolitical intelligence to create and maintain a team that can compete successfully against other teams that ultimately leads to successful team, and leader, performance.

An additional form of intelligence, labeled cultural intelligence, has been proposed by researchers Lynn R. Offerman and Ly U. Phan, who define it as "the ability to function effectively in a diverse context where the assumptions, values, and traditions of one's upbringing are not uniformly shared with those with whom one needs to work" (Offerman and Phan 2002, 188). In essence, cultural intelligence is the ability to adapt to persons of other cultures without allowing one's own cultural background to interfere.

Cultural intelligence is important in today's multicultural, global society, in which leaders are responsible for teams of followers who are culturally diverse, and in which leaders must interact with peers and constituents from a variety of nations and cultures. Offerman and Phan argue that cultural intelligence is a multifaceted construct that involves understanding oneself and one's own culture and cultural values, understanding others' cultures, and adapting oneself and one's leadership to the needs of culturally diverse followers.

CONTROVERSIES AND FUTURE DIRECTIONS

Perhaps the most fundamental controversy surrounding these other intelligences—Machiavellian intelligence, sociopolitical intelligence, cultural intelligence, but also emotional and social intelligence—is whether they do indeed constitute distinct forms of intelligence. Some critics argue that some of these other intelligences are not clearly defined and are not clearly differentiated from one another or from general intelligence.

There are also problems with the measurement of these other intelligences. Unlike verbal intelligence, whose measurement (in IQ) has had more than a century of scrutiny and refinement, many of the

newer intelligences are measured via self-report instruments, which are usually relatively brief and may be inaccurate.

The past dozen years has seen a revival in research on non-IQ forms of intelligence, most notably interest in emotional and social intelligences. However, the other forms of intelligence discussed here—Machiavellian, sociopolitical, and cultural—seem particularly relevant to leadership in a world of empowered followers, intense media focus on political leaders and heads of companies and organizations, and increasing diversity and globalization. It is clear that in such a world, forms of intelligence that involve having social, political, and cultural influence with diverse groups of people are going to be particularly important. Future research will no doubt continue to explore these different domains of intelligence, and as more sophisticated means of measuring these intelligences are developed, we will begin to understand better both their distinct natures and the areas in which they overlap.

INTENTIONAL COMMUNITIES

Intentional communities are groups of people whose members have chosen to live together, to follow a common purpose, and to intentionally create a better society at least for themselves if not for everyone. Leadership is a contentious issue within these communities because issues of power, hierarchy, and equality are often central to why people joined these communities. Ideas, beliefs, and dreams about how to live in purely egalitarian (relating to a belief in human equality) ways, however, may not be congruent with the challenges that members face in functioning as a social group in the real world of neighbors, local government regulations, financial realities, and human nature.

Leadership can be discussed with two meanings: as providing governance and as establishing and guiding people along a spiritual and/or cultural direction. Leadership and intentional communities can be discussed in three ways: leadership within single groups, leadership within the global intentional communities movement, and leadership as setting the agenda and leading the way for the world in social and political change.

DEFINITIONS

Examples of intentional communities (in the past called “communes,” “alternative lifestyle groups,” and “alternative communities”) include cohousing communities in major cities, Israeli kibbutzim, fundamentalist Christian communes, and ecovillages. Ecovillages are intentional communities in which people can live, work, buy food and other things they need, socialize, and pursue their spiritual or religious interests on-site; and these activities are harmlessly integrated into the natural landscape and can be continued into the indefinite future. Most aspiring ecovillages intend to one-day grow or raise their own organic food and use passive-solar natural buildings, off-grid power, wastewater recycling, and so on.

The first known intentional community was probably Homakoeion, established near Crotona, Italy, by the Greek philosopher and mathematician Pythagoras about 525 BCE. Other writers argue that Indian

ashrams (small communities with a guru and his or her followers), in about 1500 BCE, should have this honor, although the evidence is unclear. The oldest operational intentional community in the world is probably Sabbathday Lake, a Shaker commune established in 1794 near Poland, Maine, United States. Sabbathday Lake had about 150 members in the early nineteenth century, with membership slowly declining to a dozen but now growing again.

The Fellowship for Intentional Community describes an intentional community this way:

A group of people who have chosen to work together in pursuit of a common ideal or vision. Most, though not all, share land or housing. Intentional communities come in all shapes and sizes, and display amazing diversity in their common values, which may be social, economic, spiritual, political, and/or ecological. Some are rural, some urban. Some house members in a single residence, some in separate households. Some communities raise children; some don't. Some are secular, some are spiritually based, and others are both. (Christian 2002, 6)

Bill Metcalf (2004) derived a widely used formal definition of an intentional community:

Five or more people, drawn from more than one family or kinship group, who have voluntarily come together for the purpose of ameliorating perceived social problems and inadequacies. They seek to live beyond the bounds of mainstream society by adopting a consciously devised and usually well thought-out social and cultural alternative. In the pursuit of their goals, they share significant aspects of their lives together. Participants are characterized by a "we-consciousness," seeing themselves as a continuing group, separate from and in many ways better than the society from which they have emerged.

Many indigenous groups live communally but are not considered to be intentional communities because they live according to their social norms rather than according to any consciously devised intention. For the same reasons prisoners and other people in institutions do not live in intentional communities even though they live communally.

Thousands of intentional communities exist

around the world, with an estimated 100,000 members (an estimated 2,000 to 10,000 members in the United States alone). Israel, with 268 kibbutzim, has the highest proportion of its population (about 2 percent) living in this way. About five hundred intentional communities operate in the United Kingdom, about fifty in New Zealand, perhaps two hundred in Australia, as well as many throughout Europe, Japan, and India.

Traditionally, intentional communities have been a Western movement, although they can be found throughout eastern Europe, Russia, Latin America, and parts of Asia. Intentional communities seem to be adaptable to many economic, political, and cultural contexts.

LEADERSHIP WITHIN INDIVIDUAL INTENTIONAL COMMUNITIES

Intentional communities, like almost all other social groupings, function best with, rather than without, leadership. This does *not* mean, however, that intentional communities should have top-down, hierarchical leadership structures nor that they should have a designated manager or boss. Intentional community members tend to be too creative and independent minded to follow what they consider to be such outmoded models of leadership.

Some intentional communities concentrate leadership and are led by a single person or small group, whereas other communities disperse and share leadership between all members.

FOCUSED LEADERSHIP

Leaders within focused leadership in intentional communities generally hold their positions because of either their charisma or their acknowledged spiritual or religious seniority. In spite of media myths to the contrary, relatively few intentional communities have charismatic leaders, that is, people who become leaders simply through the magnetic power of their personalities. Charismatic leaders need not be the smartest or the most capable person in the intentional community, but other members will admire, respect, and, at times, almost worship them and are

only too willing to follow their leadership. In most cases charismatic leaders of intentional communities are benign people who help the communities by their ability to unify and motivate members toward selecting and achieving shared goals. Generally, the same charismatic leader will govern and provide and embody the collective vision or spirit of the group. The group becomes almost an extension of the charismatic leader's magnetic personality.

Occasionally, charismatic leaders of intentional communities let power go to their heads and become dangerous despots. Although rare in terms of the actual numbers of intentional communities worldwide, such despotism can lead to such widely publicized disasters as the mass suicide of followers of Jim Jones at Jonestown, Guyana, in South America in 1978; the siege and shootout involving David Koresh (Vernon Howell) and the Branch Davidians in Texas in 1993; Luc Jouret and the Solar Temple in 1994–1997; Asahara Shoko and Aum Shinrikyo (Aum Supreme Truth Religion) in 1995; and Marshall Applewhite and Heaven's Gate in 1997.

Several of the best-known intentional communities began with charismatic leadership: Findhorn Foundation (United Kingdom), the Farm (United States), and Damanhur (Italy). Fortunately, in all these cases, the charismatic leaders had enough wisdom to step aside and let all members work out their own directions. As a rule of thumb, charismatic leadership can be helpful to a group during its early years; however, leaders can then benefit the group by stepping down in order to help members grow and develop their own leadership skills. Few charismatic leaders, however, prepare other members to take control after them, so these groups often face a serious succession crisis.

Another example of focused leadership within intentional communities is people who are selected by the group because of their generally acknowledged greater understanding of the spiritual and religious principles of the group. Such "theocratic" leadership makes great sense within spiritually and religiously based intentional communities simply because members are there in order to advance along some path of belief, and why would one not follow those more advanced along that path? As well

as governing the intentional community, such theocratic leaders provide the community's vision or spirit, as with charismatically led groups.

Most theocratic leaderships within intentional communities are reasonably healthy and lead to what members consider to be positive outcomes. This form of leadership, of course, will break down as soon as members disagree about relative positions on a spiritual and religious hierarchy. Intentional communities such as the Hutterites (a German-speaking Protestant sect with over 360 colonies in western Canada and the western United States) and the Bruderhof (a Protestant sect begun in Germany in the 1920s with several communities in the United States and England) have followed this leadership model for many years with only occasional problems.

The key difference between theocratic and charismatic leaders of intentional communities is that charismatic leaders hold their positions because of their personalities, whereas theocratic leaders are empowered by their vision and interpretation of the divine or sacred. Although charismatic and theocratic leadership are quite different in principle, in intentional communities the lines are blurred. Often, charismatic people are able to convince their fellow community members that they also have divine superiority, and equally often a spiritually advanced person will be given theocratic respect only if she or he also has a degree of charisma.

SHARED LEADERSHIP

The vast majority of members of secular intentional communities want to share the duties of leadership and are unwilling to follow top-down leadership models. They follow a democratic approach, governing themselves through fair, participatory decision-making methods such as majority-rule voting (51% or more must agree), "super-majority" voting (a specified percentage higher than 51%, such as 66% or 75%, must agree), or some form of consensus decision making.

In some Israeli kibbutzim and some rural ecovillages that use a form of voting, members nominate and vote for people to hold leadership roles for set periods and generally accept those leaders not because

of their charisma or spiritual qualities but rather simply because they democratically represent the group. In other such groups, all members meet regularly to discuss and vote for decisions, generally after a simple majority-rule vote for ordinary decisions and a super-majority vote (such as 75 percent or “all but two” of those voting) for crucial decisions such as to accept new members or change the group’s rules or constitution.

Far more common in secular intentional communities are consensus leadership and decision making. Consensus decision making results when all members are considered to have, as the Quakers say, “a piece of the truth” and the group encourages each person to express his or her opinions. Issues are discussed and decided by the group but without voting. A proposal might be modified several times to meet members’ concerns, or it might be deferred. Eventually members agree to, “stand aside,” or “block” the proposal. To “stand aside” means one does not agree but will let the proposal proceed, whereas even one person blocking stops a proposal. If everyone agrees (and if a few stand aside), the proposal is passed. If done correctly, this method spreads decision-making power throughout the group.

Although on the surface a consensus-based intentional community might appear to lack leaders and leadership, as commonly understood, such a community shares leadership, in terms of decision making, with all members. Intentional communities following a consensus model are not antileadership but rather want to ensure that leadership is shared and empowers everyone collectively.

During the late 1960s and early 1970s, many intentional communities formed with the goal of avoiding leadership, governance, and rules. They soon faced what has been called “the tyranny of structurelessness,” whereby members found that, far from being liberated by a lack of leadership and governance, they were oppressed, disempowered, and unable to act. This recognition helped spur the interest in consensus. Some groups, however, stumble around in what Diana Christian calls “pseudo-consensus” in *Creating a Life Together: Practical Tools to Grow Ecovillages and Intentional Communities* (2003). Groups use “pseudoconsensus” when,

without proper training from an experienced consensus facilitator, they assume they know how to use this method, often frustrating and exhausting themselves in the process. One of the best guides on how to make consensus leadership work is *Introduction to Consensus* by Beatrice Briggs.

LEADERSHIP WITHIN THE INTENTIONAL COMMUNITIES MOVEMENT

The intentional communities movement is almost a worldwide phenomenon, with great commonalities and a few regional variations. Evangelic Christian groups in Russia, survivalist groups in New Zealand, cohousing groups in Denmark and the United States, New Age spiritual groups in Italy and the United Kingdom, ecovillages in Australia and Brazil, and polyamorous communes (where members are encouraged to have many lovers) in Germany all share roughly the same issues, problems, and potentials. They are all trying to create a better way of living for their members and to avoid the perceived ills of capitalistic, hierarchical, globalized modern society.

Although intentional communities comprise a social movement, the movement has no central leadership or control. Instead, movement leadership operates through the models of a few of the best-known intentional communities around the globe and through the communication process of specialist media, plus organizations and research bodies.

A few intentional communities, such as Findhorn Foundation in Scotland, Twin Oaks and the Farm in the United States, Damanhur in Italy, Crystal Waters in Australia, and ZEGG (*Zentrum für Experimentelle GesellschaftsGestaltung* [Center for Experimental Culture Design]) and Kommune Niederkaufungen in Germany, are commonly regarded by other groups around the globe as being significant models, groups from which others can learn. Books and articles are written about these intentional communities, and many people starting intentional communities look to them for ideas and inspiration. These communities can be said to lead the movement by serving as models. In particular, Findhorn Foundation has set much of the language, agenda, and actions of New Age

spirituality around the globe, whereas Twin Oaks has served the same leadership role for communal economics.

Many countries have organizations that provide some leadership to this movement. These organizations include the Fellowship for Intentional Community in the United States, Come Together and Kommuja in Germany, and the United Kibbutz Movement (Takam) in Israel. By far the most important of such organizations is the Global Ecovillage Network (GEN), with a worldwide network of offices and supporters. GEN does not direct or control the constituent ecovillages, but rather provides leadership by promoting communication, education, and strategies for economic and social development. Most intentional communities do not call themselves “ecovillages,” but they all benefit from the networking leadership of GEN.

Several directories of intentional communities provide some leadership to this movement. The three best known of these are *Communities Directory: A Guide to Intentional Communities and Cooperative Living* (mainly covering North America), *Diggers & Dreamers: The Guide to Communal Living* (mainly covering the United Kingdom), and *Eurotopia: Directory of Intentional Communities and Ecovillages in Europe*. No global magazine or newspaper exists for this movement; the closest approximation is *Communities* magazine, published in the United States but with some global coverage.

The International Communal Studies Association provides some leadership to the intentional communities movement by bringing together information, scholars, and practitioners from around the world. This function serves to inform people about what works or does not work in what sort of intentional community and helps to raise both the self-perception and the public acceptance of intentional communities.

SOCIETAL LEADERSHIP BY INTENTIONAL COMMUNITIES

Historically, intentional communities have often seen themselves as being models for the future of almost everyone in the world. With utopian enthusiasm (and

naivete?) they often believed that they had only to establish and demonstrate a more equitable, ethical, and prosperous lifestyle, and then everyone else would follow their example. New Australia (1891–1907) in Australia and Paraguay, Oneida (1848–1881) and Amana (1843–1932) in the United States, Federative Home (1889–1903) in New Zealand, and New Lanark (about 1800–1828) in the United Kingdom all saw themselves as serving as a model not only for a like-minded minority, but for everyone.

Such aspirations to global societal leadership are less common today within intentional communities, although occasionally the public statements of, for example, ZEGG in Germany, Findhorn Foundation in Scotland, and Damanhur in Italy appear to suggest utopian aspirations.

Although one might easily poke fun at what appear to be pretensions of global leadership, reality suggests that in some ways intentional communities often really do play a crucial agenda-setting, societal-leadership role. The human relations school of management can perhaps be traced back to the New Lanark community of Robert Owen. Findhorn Foundation, Scotland, has been called “the Green Party at Prayer” and has, in fact, initiated, or at least clarified, much of the current spiritual basis for ecospiritual forms of environmentalism. The ecovillage movement has had significant effects on regional land-use planning in countries such as Australia, Canada, and the United States, whereas the cohousing movement has similar effects on urban planning and architectural design in many countries, particularly in northern Europe. One could argue that the “free love” ideology and practice of late 1960s and early 1970s hippie communes translated into greater sexual openness across much of Western society. Such influences are, of course, far from unidirectional and are only part of any explanation.

THE FUTURE OF LEADERSHIP IN INTENTIONAL COMMUNITIES

As we increase our understanding of both the potential problems of consensus decision making and of the ways to avoid these problems, and as profes-

sional consensus facilitators become more widely available, this form of leadership becomes more widespread within intentional communities.

On the other hand, although kibbutzim have always had democratic leadership, today more power is being assigned or delegated to professional managers in kibbutzim. Although one could argue that real leadership of the group remains with the members, that appears not to be how it works out in practice, with many kibbutzim members reporting unsatisfactory experiences with “managerial” leadership.

The current trend in intentional community development is away from intensive communes and toward rural ecovillages and urban cohousing. Both of these options have the perceived advantage of allowing members to retain much individual property, rights, and social space while also enjoying many social and economic benefits from communal sharing. Ecovillage and cohousing models are now being adopted or co-opted by property developers in many Western countries who recognize that these intentional community models can also become popular with people who do not seek to take part in an intentional community. Whether these people will also seek to take advantage of the leadership initiatives of intentional communities remains to be seen.

Few social groups have, throughout history, devoted so much thought to leadership questions or tried so many experiments in refining leadership solutions as have intentional communities. Some of these leadership initiatives have become commonly accepted within the wider society, whereas others have been almost forgotten. Much can be learned about leadership by studying the social laboratories provided by the wide-ranging intentional communities movement.

INTERGROUP PROCESSES

The term *intergroup processes* refers to what happens between groups of people or between people who are in different groups—how they behave and relate towards one another. Wherever you have groups, small groups such as sports teams, medium-sized groups such as organizations, or large groups such as nations, you have intergroup processes. Intergroup processes affect all aspects of our lives. They play a significant role in prejudice, discrimination, social disadvantage, stereotyping, social protest, political competition, team sports, organizational mergers, and so forth, and even affect the way we define ourselves and form a concept of who we are, an identity. The most widely adopted definition of intergroup processes and intergroup relations comes from the social psychologist Muzafer Sherif: “Intergroup relations refers to relations between two or more groups and their respective members. Whenever individuals belonging to one group interact, collectively or individually, with another group or its members in terms of their group identifications, we have an instance of intergroup behavior” (Sherif 1962, 5).

Relations among people differ dramatically depending on whether those people belong to the

same group or to different groups. Within the same group relations tend to be positive: People like, support, and help one another in a general atmosphere of solidarity and cooperation. Relations between groups are entirely different: They tend to be competitive, ethnocentric, and often hostile. The sociologist William Sumner's description of ethnocentrism comments eloquently on the nature of intergroup relations:

. . . one's own group is the centre of everything, and all others are scaled and rated with reference to it . . . Each group nourishes its own pride and vanity, boasts itself superior, exalts its own divinities, and looks with contempt on outsiders. Each group thinks its own folkways the only right one . . . Ethnocentrism leads a people to exaggerate and intensify everything in their own folkways which is peculiar and which differentiates them from others (Sumner 1906, 13).

From the perspective of leadership it is worth noting that leaders lead groups in the context of intergroup relations and often lead groups against other groups. It is very difficult to have a complete analysis of leadership that is divorced from some consideration of intergroup processes.

PERSONALITY AND INDIVIDUAL DIFFERENCES

Intergroup relations are often characterized by hatred, prejudice, and harmful discriminatory practices. Since many researchers argue that people who behave in this way have dysfunctional personalities, it is not surprising that there are many explanations of intergroup processes that invoke personality dynamics and individual differences. The best known of these types of explanations is the authoritarian personality theory put forward by the social scientist Theodor Adorno and his colleagues (1950). Parents who rear their children in a harsh, disciplinarian, and emotionally manipulative manner, the theory says, produce people who are obsessed by status and authority, are intolerant of ambiguity and uncertainty, and are hostile and aggressive toward weaker others. These people have an authoritarian personality that predisposes them to extreme forms

of intergroup negative behavior. Other personality explanations focus on the fact that some people have dogmatic and closed-minded personalities, or orientations toward social dominance and myths legitimizing hierarchy, that enduringly predispose them to prejudice and intergroup discrimination.

GOALS AND INTERDEPENDENCE

Explanations for intergroup relations that are based on personality and individual differences are often criticized for failing to account for the widespread nature of prejudice and its context-specificity, and for focusing only on extreme intergroup phenomena. The argument is that all people, largely irrespective of personality, can be prejudiced against some groups in some contexts, so perhaps contextual factors play a more significant role.

This approach has been championed by Muzafer Sherif, who proposed a realistic-conflict or interdependence theory of intergroup relations, which was predicated on the belief that behavior is driven by goals and by people's perceptions of their relationship to one another with respect to achieving goals. If two groups have the same goal (for example, prosperity) but the goal can only be attained by one group at the expense of the other (there is a zero-sum goal relationship, with mutually exclusive goals, and negative interdependence between groups) then intergroup relations will be competitive and disharmonious. If two groups have the same goal and the goal can only be achieved if both groups work together (there is a non-zero-sum goal relationship, with a superordinate goal, and positive interdependence between groups) then intergroup relations will be cooperative and harmonious. At the interpersonal level, mutually exclusive goals lead to interpersonal conflict and group dissolution, whereas superordinate goals lead to interpersonal harmony, group formation, and group cohesion.

Sherif tested his theory in a series of naturalistic field experiments with boys at summer camps in the United States. He created different interpersonal and intergroup goal relations and was able to enhance or diminish intergroup conflict, and cause group formation or dissolution. Others have replicated these

findings in other field experiments, for example with business executives. The idea that goal relations and competition over scarce resources determine the complexion of intergroup behavior is a powerful theme in the explanation of intergroup phenomena, for both small ad hoc groups and large-scale social categories.

SOCIAL CATEGORIZATION, SOCIAL PERCEPTION, AND STEREOTYPING

Other research has proposed that although goal relations influence intergroup behavior, the very existence of groups, irrespective of goal relations, may be sufficient to generate intergroup behavior; this research suggests that wherever there is a social categorization into groups, there is intergroup behavior.

Minimal-Group Studies

Such intergroup behavior was tested by Henri Tajfel and his associates in 1971. School pupils who were divided into anonymous non-interactive ad hoc groups by a completely minimal picture preference criterion were found to discriminate in favor of their own group. There have now been thousands of these minimal-group studies. They reliably show that being categorized as a member of a group can be all that is necessary to produce intergroup discrimination, in-group bias, ethnocentrism, in-group solidarity, and a sense of in-group belonging and identity.

Categories and Categorization

Social categorization also underpins stereotyping. People cognitively represent categories as schemas or prototypes that describe the attributes of the category and the relationships among those attributes. Schemas accentuate in-group similarities and intergroup differences to keep the categories clear and distinct. On the basis of perceptual cues, especially distinctive visual cues, we assign a person to a category and then assign the category attributes to that person—we stereotype them. The person is perceptually imbued with all the attributes of the category schema; we see them not as unique individuals but as

relatively interchangeable representatives of a social category. Social categorization accentuates perceived similarities among people within the same group and perceived differences between people in different groups. This intragroup homogenization effect is more marked for out-groups than in-groups. The social categorization process can be slow and deliberate, but usually it is automatic and very fast. We are often completely unaware of it and therefore unable to control it. Social categorization is a highly adaptive process; it simplifies the social world in meaningful ways that allow us to predict behavior and plan effective action.

Social Stereotypes

Schemas and prototypes are the cognitive dimension of stereotypes. However, out-group stereotypes are also shared intergroup attitudes: The members of one group agree that the members of the other group have certain properties. Stereotypes serve social explanatory and justificatory functions; they are theories that explain why “they” are like they are and why “we” relate to them in the way we do. For example, stereotypes justify actions that have been committed or planned by one group against another group: If one group exploits another group, it may be useful to justify this action by developing a stereotype of the exploited group as unsophisticated and dependent. Stereotypes become more extreme and more resistant to change under conditions of intergroup conflict.

Out-group stereotypes are generally unfavorable and can range from merely unflattering to destructively dehumanizing. They attribute favorable out-group characteristics to transient situational factors but unfavorable out-group characteristics to underlying dispositions or essences. This process transforms negative intergroup attitudes into immutable properties or essences of out-groups and their members. The social psychologists Dale Miller and Deborah Prentice argue that intergroup perceptions that rest on such essentialism create insurmountable category divides that can make it extremely difficult to improve intergroup relations. They cite the Balkans and the Middle East as examples.

Once established, stereotypes are very difficult to change. Indeed, research on racial stereotypes suggests that the less racist normative and legislative environment of recent decades in the United States has not caused racial stereotypes to disappear. Rather, it has caused them to change their form and the way that they are expressed, producing modern forms of racism that are less overt and more subtle.

SELF-CONSTRUAL AND SOCIAL IDENTITY

Social categorization perceptually transforms the social world from many individuals into a smaller number of groups. It transforms people into group members, personal identities into group identities, and our relations with others into in-group or intergroup relations. How this occurs is explained by the social-identity perspective, developed by Henri Tajfel, John Turner, and others over the past thirty years.

People define and evaluate themselves in terms of the groups to which they belong—groups provide people with a collective self-concept, a social identity. Because social identities define, prescribe, and evaluate who one is and how one should think, feel, and act, people have a desire to establish or maintain the evaluative superiority of their own group over relevant other groups: There is an intergroup struggle for evaluatively positive group distinctiveness. The way in which this struggle is enacted is influenced by people's understanding of the nature of the relations between their group and relevant out-groups. In particular, people pay attention to status differences and the stability and legitimacy of such differences, to the permeability of intergroup boundaries and thus the possibility of passing psychologically from one group to another, and to the existence of achievable alternatives to the status quo.

Social categorization is the cognitive mechanism responsible for social identity phenomena. Social categorization of others produces, as described above, stereotypic perceptions and expectations. Social categorization of self produces in-group identification, positive in-group regard and solidarity, and a transformation of attitudes, behavior, and feelings to conform to the prescriptions of the in-group prototype. Social categorization of self and others, then,

depersonalizes self-conception, perceptions, feelings, attitudes, and behavior so that they conform to the relevant group prototype.

MOTIVATIONS FOR GROUP MEMBERSHIP

Since people must belong to groups for there to be intergroup behavior, the question of why people join groups is an important one. There are many motivations for group identification. Human beings are fundamentally social and need to affiliate with others in order to survive. There is a basic need to belong and also a need to obtain social validation for the correctness of one's perceptions, attitudes, and feelings. Some researchers have suggested that fear of death is a powerful motive for humans to affiliate, and others that group identification resolves a basic need to reduce uncertainty about who we are and how we relate to others. People may also join groups for instrumental reasons, that is, to do things that they cannot do on their own.

People's decisions about what groups to belong to are also multiply motivated. Three particularly important motives, based on the self-definitional role of groups, are uncertainty reduction, self-enhancement, and optimal distinctiveness. Uncertainty motivates people to belong to well-defined groups that are distinctive and have clear prototypes and norms to govern self-definition and behavior—in extreme cases such groups may be highly orthodox with hierarchical leadership structures. Self-enhancement motivates people to belong to positively distinct groups that are held in high social regard and have high status in society. Optimal distinctiveness motivates people to belong to groups that optimally satisfy people's contrasting needs for assimilation and inclusiveness on the one hand and for differentiation and uniqueness on the other.

Relations between and within groups take different forms depending on which of these motivations is most strong. A challenge to group distinctiveness produces uncertainty reduction and distinctiveness enhancing behaviors, whereas a challenge to group prestige produces self-enhancement and status protection or promotion behaviors. The psychologist Claude Steele's self-affirmation theory (1988) describes how

people whose identity in one domain is evaluatively threatened engage in practices that publicly affirm a favorable identity in another domain.

PREJUDICE AND DISCRIMINATION

Negative intergroup behavior (discrimination) and intergroup attitudes (prejudice) do not always correspond very closely—a manifestation of the general lack of correspondence between people's attitudes and their behavior. An oft-cited 1934 field study by the sociologist Richard LaPiere found that although a young Chinese-American couple was almost never denied service at hotels and restaurants across the United States, almost all those same establishments subsequently expressed the strong anti-Chinese sentiment that they would not serve Chinese people.

Because the absence of overt discrimination may not indicate the absence of underlying negative intergroup sentiments, the challenge is to be able to detect prejudice in environments in which the expression of prejudice is normatively (often legally) prohibited. The key is to use unobtrusive measures, because if people do not know they are being observed or measured, they are more likely to behave in accordance with their attitudes. Other methods involve analysis of the subtext of what people say in natural conversation or analysis of behaviors that people have little conscious control over.

Overt discrimination is more easily obtained in minimal group studies, probably because the groups have no history, and thus no social norms exist to proscribe discrimination against other minimal groups. However, even in these settings people do not discriminate unless they actually identify with a minimal group, and then they are more likely to discriminate against out-groups when they are giving rewards, rather than punishments, unless their group is under threat by being disadvantaged or being in a minority position.

Groups can also carefully consider their strategic options before deciding whether and how to discriminate—discrimination may not be a viable option if it is unlikely to be effective in promoting or protecting the group's status or distinctiveness. Although discrimination is considered to be undesir-

able and unjust, in-groups generally view it positively because intergroup discrimination indicates in-group loyalty and commitment (groups do however expect intragroup treatment to be procedurally fair). Group members can often strategically and overtly discriminate against an out-group to bolster their own in-group credentials and standing. Jingoistic rhetoric and overt out-group discrimination on the part of leaders may serve this function.

STIGMA AND DISADVANTAGE

The essential problem of intergroup relations is inequality: There are almost always power, status, prestige, and resource inequalities that disadvantage one group to the advantage of another. Dominant, majority groups do well out of this arrangement, and their members have a positive sense of identity and esteem. Subordinate, minority groups do not do so well, and their members can carry a stigma that has profound effects on self-conception. According to Jennifer Crocker and her associates, "Stigmatized individuals possess (or are believed to possess) some attribute, or characteristic, that conveys a social identity that is devalued in a particular social context" (Gilbert, Fiske, and Lindzey 1998, 505). Stigmas can be visible (race) or concealable (sexual orientation) and can vary in perceived controllability (race has low controllability, whereas obesity has high controllability). Stigma visibility and perceived controllability affect the extent and form of prejudice or discrimination that a member of a stigmatized group suffers.

Because stigmatized groups know the negative stereotypes that others have of them and know that others may judge and treat them stereotypically, they can experience what Claude Steele and Joshua Aronson call stereotype threat. On tasks that really matter to them, stigmatized individuals worry that through their behavior they may confirm the stereotypes. This worry interferes with and impairs task performance. Above all, stigmatized groups suffer material and social disadvantage, and find that their goals and aspirations are frustrated relative to other groups. A sense of reduced efficacy and motivation can set in, and rather than fight for change, groups can acqui-

esce to these conditions—some groups may prefer disadvantage to the uncertainties and dangers of fighting for social change.

Although stigmatized individuals are vulnerable to low self-esteem, diminished life satisfaction, and sometimes depression, most members of stigmatized groups weather the assaults and maintain a positive self-image. According to the social psychologist Brenda Major, one way they do this is by denying any personal experience of being discriminated against or disadvantaged.

COLLECTIVE ACTION AND SOCIAL PROTEST

Disadvantaged groups do sometimes rise up. When deprivation is very acute and a recipe for effective social change is available, disadvantaged groups eagerly challenge the status quo by political means, or through social protest or other collective behaviors, including demonstrations, riots, and uprisings.

Crowds and Riots

Traditionally, riots and crowd behavior have been attributed to people being deindividuated, that is, to their feeling a loss of personal identity and regressing to primitive, unsocialized, and impulsive behaviors. More recent analyses view crowd behavior as a more strategic and rule-governed affair. For example, the social psychologist Stephen Reicher argues that crowd behavior is a set of deliberate and logical actions that are directly related to the goals and objectives of the group that defines the social identity of the crowd. The volatility of crowd behavior is less extreme than reports convey, occurs within limits set by the crowd's identity, and represents a search for situation-specific behaviors that reflect the wider identity of the group. Crowd events are a form of collective action aimed at social change.

Collective Action and Social Change

Although disadvantage can translate into short-lived riots and demonstrations, it also sponsors enduring campaigns for social change that can last decades or even centuries. Disadvantage is most likely to spawn

social action when people suddenly become aware that their expectations and attainments have parted company, particularly when there is a sudden drop in attainments against a background of rising expectations. Social action also arises from intergroup comparisons that produce a sense of collective relative deprivation, a sense that “we” are deprived relative to “them.”

However, collective relative deprivation alone may not be enough to tip the scales towards protest. According to social identity theory, disadvantaged groups engage in direct competition with the dominant group if they perceive intergroup boundaries to be impermeable, and if they perceive their lower status to be illegitimate and unstable, and if they can conceive of a new status quo that is achievable. For example, if members of a disadvantaged group believe that entry to an advantaged group is even only remotely open (only a token percentage of people can pass), they shun collective action and instead individually try to gain entry to the advantaged group. Collective action is most likely when entry to the advantaged group is closed, and then only among those who believe they were closest to entry, because they feel the strongest sense of relative deprivation. Collective action is only likely to be extreme (taking the form of riots or terrorism, for example) when socially acceptable means (such as peaceful protest, lobbying) are unavailable.

Social Protest and Active Minorities

The study of social protest is the study of how individual discontents or grievances are transformed into collective action; it asks how and why sympathizers become mobilized as activists or participants. Bert Klandermans, who has written extensively on social movements, argues that mobilization reflects the attitude-behavior relationship: Sympathizers hold sympathetic attitudes towards an issue, yet these attitudes do not readily translate into behavior. Participation also resembles a social dilemma. Protest is generally for a social good, such as equality, or against a social ill, such as oppression, and as success benefits everyone irrespective of participation but failure harms participants more, it is tempting to be a free rider,

that is, to remain a sympathizer rather than become a participant, and thereby possibly receive the benefit of the social action without any risk or effort. The role of leadership is critical in mobilizing a group to take action.

Social protest is usually the province of minorities who actively try to change majority attitudes and practices. To be successful, active minorities need to present a consistent and consensual message, be seen to have made some sacrifice for their cause, be seen to be acting out of principle, and be seen by the majority to be to some extent in-group members. This behavioral style, particularly consistency, creates cognitive conflict in the mind of majority members between majority and minority views. Majority members are not immediately influenced, but experience a sudden and enduring deep-seated conversion to the minority point of view at a later time. Minorities that are inconsistent have little impact because their message is easily disregarded.

LEADERSHIP IN AN INTERGROUP CONTEXT

Intergroup relations affect and are affected by leadership in many different ways. After all, leaders almost always lead their groups against other groups or in ways that are framed by the presence of other groups. For example, leadership is, as mentioned above, critical to social mobilization. The nature and extremity of intergroup relations affect the extent to which group members identify with their own group and the content and extremity of the in-group prototype, norm, or schema. When members identify strongly with the group, leaders need to be seen to be highly representative of the group and need to be trusted to be acting for the group. Marginal members may find it more difficult to lead under these circumstances.

Leaders also use out-groups and intergroup relations as a mechanism to structure their own position within the group. For example, they can pillory marginal group members, dissidents, or contenders for leadership as deviants or traitors who are betraying the group to the out-group; they can arouse fear of an out-group that strengthens in-group identification and their own unassailable position of authority; and

they can structure intergroup relations in ways that ensure that the in-group prototype or schema makes them appear highly prototypical.

THE QUEST FOR SOCIAL HARMONY

The practical goal of research on intergroup relations is to be able to improve intergroup relations and build social harmony. The psychologist Gordon Allport suggested that equal status and cooperative and pleasant interpersonal contact between members of different groups within a supportive normative and legislative climate would do this. Although this idea was a central plank in the 1950s desegregation of the U.S. school system, half a century of research has concluded that the conditions for contact to build harmony are almost impossible to satisfy. Interpersonal contact has a depressing tendency either to confirm and strengthen prejudices or to merely make possible interpersonal friendships that have little impact on intergroup perceptions (interpersonal relations do not easily generalize to intergroup relations).

Ways to get around these problems include decategorization (encouraging people to treat one another as unique individuals), which has been shown to worsen attitudes toward the in-group, and recategorization (encouraging people to recategorize themselves as members of a shared superordinate identity), which improves attitudes toward out-groups. Decategorization can be difficult for the reasons given above. Recategorization can be difficult for other reasons: It requires people to abandon their former social identity and take on a new social identity that joins them to an erstwhile out-group. Social identities are cherished and distinctive aspects of who we are, and attempts to make us abandon them can be threatening and can produce fierce resistance. Attempts at recategorization can backfire to amplify intergroup conflict.

One possible way out of this dilemma is to encourage diversity by structuring relations in such a way that distinctive groups have positive role relations within a superordinate identity. At the societal level this is multiculturalism. Multiculturalism and diversity provide a glimmer of hope in an area of

human life, intergroup relations, which is more typically associated with conflict and human suffering.

INTERNATIONAL LEADERSHIP ASSOCIATION

The International Leadership Association (ILA) was established with the recognition that the global community of those with a professional interest in leadership is sufficiently large, diverse, curious, and

committed to justify the establishment of an association dedicated to the subject. It was created in 1999, the culmination of a grant given by the W. K. Kellogg Foundation, to serve practitioners in business, communities, governments, organizations such as health care facilities and schools, scholars from a wide variety of disciplines, educators (whether professors, researchers, teachers, consultants, trainers or coaches) and students at the undergraduate, graduate, and professional development levels.

MISSION

The mission of the ILA is to promote a deeper understanding of leadership for the greater good of individuals and communities worldwide. The ILA brings together leaders from the public and private sectors, scholars, and educators and consultants from many disciplines and many nations. The ILA seeks to:

- strengthen ties between those who study and those who practice leadership;
- serve as a forum in which people can share ideas, research, and practices relating to leadership;
- foster the evolving capacity for effective and ethical leadership in individuals, systems, organizations, and governments in the global community; and
- facilitate interdisciplinary research and the development of new knowledge and practices for the benefit of all.

GLOBAL LEARNING COMMUNITIES

For the convenience of its members, the ILA provides specialized communities, called global learning communities (GLCs) for its members. The GLCs provide a meeting place where people with similar interests can come together for the purpose of collective learning, problem solving, and to exchange ideas and resources.

The current GLCs are Applied Leadership, Business, Education, Public Service, and Scholarship. Each GLC attracts a combination of leaders, students, and educators. Following is a description of each constituency

Applied Leadership

A large and diverse number of participants are consultants and trainers who study, practice, and teach. Their consulting and training may vary from working with entities such as public service, business, and education through various approaches such as speaking, group facilitation, or executive coaching. The ILA provides a forum in which this diverse constituency can share resources and learn from one another.

Business

Business leaders have many opportunities to attend leadership programs and seminars that are designed specifically for them. The ILA offers them something different: unique access to a global network of people interested in the study and practice of leadership, contact with scholars in the field of leadership, and a focus on international leadership principles.

Education

The last years of the old century and the first years of the new have seen a significant increase in leadership programs on college campuses, in primary, secondary, and trade schools, and in youth programs. Members of the education GLC include college professors, researchers, those involved with student affairs, and primary, secondary, and youth educators who teach and administer leadership programs. The ILA provides a professional forum for all academic and cocurricular programs.

Public Service

For a number of years, elected and appointed officials have been working on programs and training to enhance the effectiveness of public officials and to address the public cynicism that has been directed at their institutions. A partnership between ILA, these public officials, and their organizations enhances the effectiveness of these leadership programs.

Scholarship

Scholars in the field of leadership typically conduct research from the perspective of a single discipline

and often without working with practitioners—actual leaders. However, leadership is interdisciplinary in focus and applied in nature. The ILA offers scholars the opportunity to meet and work with other scholars and educators in varied disciplines. It brings together those who teach theory with practitioners who both inform their scholarship and research and benefit from the knowledge provided and created.

HISTORY

Guided by the vision of the political scientists James MacGregor Burns and Georgia Sorenson at the University of Maryland, the W. K. Kellogg Foundation supported a four-year initiative (1994–1998) to create for the first time a community of scholars in the field of leadership studies. The goal of the Kellogg Leadership Studies Project (KLSP) was to produce and disseminate knowledge that advanced leadership theory, education, and practice.

The KLSP produced a series of working papers written by some of the most renowned scholars in the field. It also helped to legitimize an area of inquiry that had previously languished—despite its apparent importance to the course of human affairs—at the margins of the academy. Toward the completion of the KLSP Project, the Center for the Advanced Study of Leadership (CASL) was established at the University of Maryland's Academy of Leadership, under the direction of Barbara Kellerman and Scott Webster. CASL was created to facilitate the academic study of leadership and to support the network of leadership scholars that had been established by the initial Kellogg grant. One of its initiatives was to sponsor a meeting that would be dedicated, at least in part, to leadership scholarship. It also sought to create a meeting of the minds among those who studied and practiced leadership.

The resulting meeting took place on 13–15 November 1998 at the University of Southern California. An overwhelming majority of those present at this meeting strongly supported establishing an organization permanently committed to those with a professional interest in leadership. The 1998 meeting served as the springboard for the creation of the International Leadership Association.

The year 1999 marked the beginning of the International Leadership Association. A board of directors was established by the founding members to give direction to the newly formed organization. The board announced the inaugural membership campaign in 2000, approved a constitution and bylaws in 2001, and developed a five-year strategic plan in 2002. Beginning in 1999, the ILA also held an annual conference. The first, held in Atlanta, featured panels, roundtables, and workshops, with 250 in attendance. Nearly two dozen scholarly and academic publishers (including Jossey-Bass, Harvard University Press, Oxford University Press, and United Nations Publications) also participated, making close to 150 titles available for purchase.

The second annual ILA conference was held 3–5 November 2000 in Toronto, Canada. Holding the conference outside the United States demonstrated the board's commitment to becoming an international organization, as did its effort to select members from Africa, Europe, and Asia. This conference, attended by three hundred participants, featured a scholars' roundtable pre-session at which ten scholars presented their latest research to small discussion groups. There were also more than fifty panels and workshops. The Kellogg Foundation again awarded a grant to support the ILA; the grant included funding for international fellowships that helped to ensure international representation.

The third annual conference was held in Miami, Florida, one month after the September 11 terrorist attacks in New York City and Washington, D.C. While many organizations postponed or canceled their conferences, ILA leaders thought it was imperative to hold the conference at that turbulent juncture. The conference provided many opportunities for participants to discuss leadership in times of crisis and to share their experiences on the subject. The ILA also took the opportunity to acknowledge the New York Fire Department by awarding its members the ILA Distinguished Leadership Award.

The fourth annual conference, held 14–16 November 2002 in Seattle, Washington, saw a significant increase in participants, with more than five hundred in attendance. New to this conference were a conference weaver, who gave the participants an ongoing

presentation throughout the conference on common themes, shared experiences, and thought-provoking questions, as well as a mind-mapper, who presented visual reflections of the conference activities and highlights. After the death of the social reformer John Gardner in February 2002, the ILA Board voted to dedicate the Seattle conference in his honor and to name an annual keynote address after him.

The ILA commitment to holding conferences in alternate years outside the United States is evident in the upcoming conferences: in Washington, D.C., in 2004, and Europe (Amsterdam or Brussels) in 2005. The ILA met in Guadalajara, Mexico in 2003.

THE PRESENT AND FUTURE

Today, the ILA has a formal organizational structure with a board of directors, an executive director, conveners for each of the GLCs and a conference chair and planning committee. It is staffed by a full-time associate director, located at the University of Maryland. More than five hundred individuals and institutions from around the world are members. In the future the ILA hopes to continue promoting a deeper understanding of leadership. It will continue to serve as a forum for students, practitioners, and educators and will continue to disseminate its work through various media, including its annual conference publication, *Building Leadership Bridges*. It will also continue to build a diverse membership base, hold an annual conference, present local seminars, and establish regional chapters around the world. It offers a home for groups and individuals who have hitherto worked in isolation but who seek to deepen their understanding of effective and ethical leadership.

INVISIBLE LEADERSHIP

Can a common purpose truly inspire people to engage in leadership? The leadership scholars Georgia Sorenson and Gill Robinson Hickman maintain that a common purpose can spur individuals to act using their own leadership agency. *Invisible leadership* is a descriptive term used to denote a process in which major organizers and change leaders often are unknown to those outside the endeavor; as a result, their source of motivation, valuable contributions, and personal agency also go unnoticed by outside observers. Yet not all individuals remain invisible within this leadership process. Certain participants volunteer or are selected by the group to articulate and represent the common purpose publicly, while others engage in leadership behind the scenes, invisibly. Participants may move in and out of visible and invisible leadership roles or work primarily in one mode.

The management consultant and social activist Mary Parker Follett (1868–1933) explained the term *invisible leader* in an article written in 1928 and published after her death. She viewed the common purpose as the influential invisible leader that led both leader and followers.

Invisible leadership emerges when people become advocates and embodiments of the common purpose. Individuals strive to achieve a shared and valued end without regard for their own visibility or recognition. Their willingness to work, either invisibly or visibly as needed, results in a type of self-transcendence. Follett's work suggests that the "leader's role in these situations is to see the unifying thread or 'total inter-relatedness' between all the different factors in a situation" (Fox and Urwick 1982, 244). Sorenson and Hickman call this unifying thread *charisma of purpose*. They contend that its powerful effect on group members is a direct result of the worthiness and attraction of the purpose itself.

COMPONENTS OF COMMON PURPOSE LEADERSHIP THEORY

Sorenson and Hickman propose a theory of common purpose leadership to advance the study of this phe-

nomenon. Common purpose leadership occurs when individuals, without regard for recognition or visibility, are motivated to take action by a passionate commitment to achieve a common purpose that is greater than the group's members' individual self-interest and, in certain cases, even greater than the group's overall self-interest. Key components of this type of leadership are the common purpose; a passionate commitment to and ownership of the common purpose; opportunity to act; self-agency; the ability to rise above self-interest; and fluidity of leader and follower roles, which may be either invisible or visible. Causes that inspire common purpose leadership frequently involve social action or movements, although social causes are not the only inspiration. Common purpose leadership can also develop, for example, in companies whose employees are inspired by a visionary mission, or among creators of civil or faith-based communities.

Participants initiate leadership for a common purpose based on a perceived opportunity to act and based on individual or collective self-agency. Opportunity occurs when resources (financial, human, intellectual, or social capital) become available or when a precipitating event provides the catalyst for action. Participants may then defy existing authorities and institutions that are unresponsive or unjust and may create new approaches, power structures, or institutions.

Deeply committed to the common purpose, participants come to the process with a willingness to serve as either leaders or followers, with or without personal recognition (visibility). Furthermore, as noted earlier, visible and invisible roles are flexible; a person may have a high-profile role at one point and be working behind the scenes at another, although it is also true that some people may occupy certain roles for the long term, based on their willingness and capacity to serve.

The group may pick someone (or someone may volunteer) to act as a representative who will articulate the common purpose to the wider public, and individuals outside the process may attribute the motivation, processes, and collective action of the group to this visible, public, or newsworthy individual or group of individuals. However, unlike heroic

leaders, these spokespeople are not using personal charisma or the influence of their position to motivate the group to act.

PRELIMINARY RESEARCH

Sorenson and Hickman arrived at their initial conception of invisible leadership by analyzing situations in which leadership appeared to be inspired by the purpose as much as or more so than by the influence of particular people. They studied written accounts of social movements in autobiographies and biographies, examined interviews with activists, initiators of change, and organizational founders, and probed case studies of organizations. They also explored the concept with focus groups of leadership scholars.

Illustrations from Social Movements

The work of the Women's Political Council (WPC) provides an example of invisible leadership committed to achieving an inspirational goal. A group of black women activists who were members of the WPC began the fight against segregation in their city by targeting segregated bus seating practices in Montgomery, Alabama. Jo Ann Robinson played a key role in initiating the WPC-orchestrated boycott. David Garrow's description of Robinson captures the essence of her innately invisible style and the invisibility of the WPC.

Robinson remains generally hesitant to claim for herself the historical credit that she deserves for launching the Montgomery bus boycott of 1955–1956. Although her story fully and accurately describes how it was she, during the night and early morning hours of 1–2 December 1955, who actually started the boycott on its way, it is only with some gentle encouragement that she will acknowledge herself as “the instigator of the movement to start the boycott.” Even then, however, she seeks to emphasize that no special credit ought to go to herself or to any other single individual. Very simply, she says, “the black women did it” (Robinson 1987, p. xv).

The study of leadership often focuses on individuals. Initiators of change are individuals, but in common purpose leadership they are instruments of

larger processes. Wilma Mankiller, former principal chief of the Cherokee Nation, is a case in point. She was the first woman ever to be elected chief of a major Native American tribe. As a leader, she sought inspiration in the vision of the Cherokee people rather than in her own personal vision. Although Mankiller was publicly visible during her time in office, she was not enamored of her public role or of the idea of remaining in the top leadership position. Instead she saw herself as a serving the common purpose of her people, and she intended to pass the leadership baton to a new leader when the time came. During her term of office, the Cherokee Nation grew from a net worth of \$34.6 million to nearly \$52 million, and membership ballooned to the point that some 119,000 individuals claimed membership in the Cherokee Nation in the early 1990s. When Mankiller was ready to vacate the leadership position, she actively campaigned for her successor. She continued to live and work in her community after the election of the new chief.

Illustrations from Business and Nonprofit Organizations

Inspiring purposes are not limited to social movements. Brian Lamb started C-SPAN to provide unfiltered broadcasts of public policy matters to the U.S. people so that they could decide key issues for themselves. In all the years he has been broadcasting, Lamb has never spoken his own name on the air. Lamb, those who fund C-SPAN, and the founding members of the organization believe wholeheartedly in its purpose and persevere in their quest to bring public issues to the people. C-SPAN has gained tremendous respect and popularity since its inception in 1975. Even so, Lamb, in keeping with the role and style of invisible leadership, intends to have less and less influence on C-SPAN as the years go by.

In addition to individuals, groups can provide examples of invisible leadership. The Orpheus Chamber Orchestra is a conductorless ensemble founded on the belief that musicians can create extraordinary music when an orchestra uses the full talents and creativity of every member. Instead of a traditional conductor, the musicians use a demo-

cratic leadership process in which leader and follower roles rotate, permitting members of the ensemble to share equally in the group's leadership. Orchestra members select a leadership team of five to ten players called the core, which replaces a conductor for each piece of music. All the while, the group's leadership remains invisible to the public. The driving force of the orchestra is its common purpose:

Above all, Orpheus Chamber Orchestra is marked by our passionate dedication to our mission. That passion drives every musical and business decision that we make. Our organization's mission isn't imposed from above but is determined—and constantly refined—by the members themselves. (Seifter and Economy 2001, 16)

BUILDING ON EXISTING THEORIES

A prevailing assumption of many leadership theorists is that leaders are the ones who exert the most significant influence on followers to take action toward reaching a common goal. Given this assumption, leadership research typically focuses on how, and under what circumstances, leaders influence followers. This rich body of scholarship examines and identifies specific functions, behaviors, influence, characteristics, and responsibility of leaders in the leader-follower relationship. The power of the common purpose often receives less emphasis than the influence of leaders or leader-follower relationships, even in theories that acknowledge the common purpose as an important factor. Common purpose leadership theory does not replace current theories of leadership, nor is it a leadership substitute. It contends that a compelling common purpose, held individually and shared collectively, often influences people to engage in leadership.

The political scientist James MacGregor Burns asserts that transforming leadership is nothing if not linked to collective purpose. He holds that the effectiveness of leaders must be judged not by their press clippings but by actual social change. "Whatever the separate interests persons might hold, they are presently or potentially united in the pursuit of 'higher' goals, the realization of which is tested by the achievement of significant change that represents

the collective or pooled interest of leaders and followers” (Burns 1978, 425–426).

Burns defines leadership as “leaders inducing followers to act for certain goals” that represent the collective values and motivations of both the leaders and followers (19). Transforming leadership assumes that leaders must first persuade followers to act. The central focus of Burns’s theory is on raising the level of motivation and morality of the individuals in the process. He says that “transforming leadership ultimately becomes *moral* in that it raises the level of human conduct and ethical aspirations of both the leader and the led, and thus it has a transforming effect on both” (20).

In describing the concept of servant leadership, the essayist and consultant Robert Greenleaf used the term *goal* to mean the common purpose, the big dream, the visionary concept. In his conception, that goal is always out of reach, but it is something to strive for and to move toward. In servant leadership, the leader shows the way, induces others to follow, provides structure and models risk-taking behavior. Greenleaf proposed that both individuals and institutions can act as leaders for the purpose of serving one another to build a good society. Even when institutions are servant leaders, the trustees acting as leaders, rather than a common purpose, ultimately exerts the strongest influence.

Mutuality of purpose among leaders and followers is a general factor in transforming, servant, and common purpose leadership theory. What is special about common purpose theory is that it broadens the spectrum of leadership beyond the seminal influence of a single leader or group of trustees serving as leaders to include the many individuals, seen and unseen, who willingly adopt either leader or follower roles, as needed, based on the powerful appeal of a common purpose.

Certain group theories help to explain elements of this type of leadership. Convergence theory contends that certain personal characteristics lead people in collective processes to join groups. The social psychologist Donelson Forsyth explains that these groups are not unrelated collections of dissimilar people, but “the convergence of people with compatible needs, desires, motivations and emotions” who

join together to satisfy their needs (Forsyth 1999, 455). He cites studies that shed light on the concept of self-agency in collective processes. Researchers have found that individuals who join social movements are higher in personal efficacy and believe that their action can make a difference in the outcome. Another study discovered that “self-confidence, achievement orientation, need for autonomy, dominance, self-acceptance and maturity are positively correlated with social activism” (Werner, cited in Forsyth, 1999, 455).

The moral and ethical aspects of common purpose leadership theory can be examined both prescriptively and descriptively. The prescriptive approach has participants champion ethical causes and use ethical means to improve conditions for themselves and members of society while doing no harm to others. A descriptive approach examines the full range of common purpose initiatives, from those that are ethical and helpful to others (such as the civil rights movement) to those that are unethical and harmful to others (such as white supremacy).

FUTURE DEVELOPMENT OF THE THEORY

Common purpose leadership is a developing theory and requires further testing of its components and further examination of its significant processes. Qualitative approaches, including interviews, case studies, and focus groups are likely tools for the next stage of development. Ultimately, surveys and longitudinal studies will inform the development of theory and practice. Common purpose theory is not a leadership substitute or theory of leaderless groups. Rather, it reveals a process that Mary Parker Follett called “multiple leadership,” in which both seen and unseen participants are committed to achieving a common goal.

IRANIAN HOSTAGE CRISIS

The Iranian hostage crisis began 4 November 1979 when Iranian students and members of the Revolutionary Guards (Iran's elite forces) violently took over the U.S. Embassy in Tehran and captured seventy-one U.S. diplomats and support staff. The Iranians retained fifty-two people as hostages, violating internationally recognized immunities and ignoring U.N. resolutions. A military mission to rescue the hostages was aborted in April 1980. The crisis culminated with President Jimmy Carter's electoral defeat that November.

The foreign and domestic context of the crisis merit detailing because the context dictated in many dimensions its outcome. Indeed, personal leadership

played a minor role amid overwhelming historical trends. The roots of the embassy takeover were planted in an internal struggle for power in the ruling circles of Muslim fundamentalists preceding local elections. The regime of Ayatollah Ruhollah Khomeini had taken over Iran merely nine months earlier. Although control of the immense political and economic resources of Iran was an Iranian affair, the consequences were felt in the United States.

The initial demand of the embassy attackers was the arrest and extradition of the ousted shah of Iran, Mohammad Reza Pahlavi, to allow a public trial for the human rights violations of his regime. The shah was dying of cancer in the United States, which had granted him permission to come to New York City for medical treatment. He had arrived in the United States in October. The Carter administration refused to extradite the shah, suspecting that he would be given a show trial and then executed. The Iranian government controlled the negotiations while persistently claiming that the activists in the embassy compound would decide the fate of the hostages.

The Iranian government endorsed this act to challenge the superpower status of the United States. President Carter, a Democrat from Georgia who won election in 1976 without any significant foreign policy experience, was particularly vulnerable. He already faced accusations from the right that his nonviolent approach to the role of the United States in the world betrayed long-term allies and that his focus on human rights exhibited weakness rather than strategic power. Carter also suffered from his failure to resolve the severe economic and energy problems that had begun in the early 1970s. His perceived mishandling of the Iranian assault on the embassy tapped into a reservoir of criticism and mistrust that had a devastating effect on the Carter presidency, sabotaging his reelection in 1980.

Carter resisted calls to use U.S. force to prevent the fall of friendly regimes. These regimes included those of the Iranian shah in the winter of 1979, Nicaragua's Anastasio Somoza, and the democratic regime of Eric Gairy in Grenada in the following summer, months before the hostage crisis began. Although it is doubtful that such use of force would

have salvaged these regimes, Carter claimed to have deduced from the failure of the Vietnam War the limits of military and economic force, on the one hand, and the power of moral leadership devoid of materialistic and hegemonic interests, on the other. He was also trying to counter his nation's reputation for orchestrating military coups and installing puppet regimes abroad, especially in Latin America.

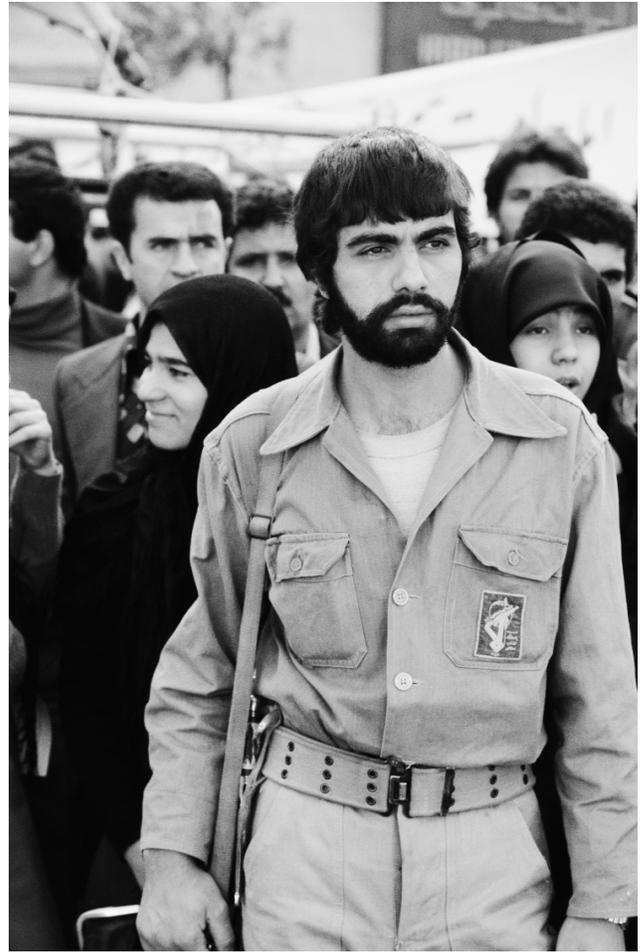

Mohammad Reza Pahlavi came to office in 1941 after his father, Reza Shah, who was pro-German, was forced into exile by the United States, Great Britain, and the Soviet Union during World War II. U.S. agents, moreover, saved the shah's regime in 1953 from a progressive-nationalistic popular uprising. The arrival of the ailing shah in the United States was thus used by factions within the Iranian regime to score political points domestically, the unlikelihood of a repeated U.S. intervention notwithstanding.

INEFFECTUAL LEADER

Carter was widely perceived as a helpless and ineffectual leader. The rising price of oil compounded a recession. Carter was honest about the severity of the problems he faced and the complexity of the solutions he was considering as viable, but he could not end the hostage crisis abroad nor revive the economy at home. Carter—and some of his advisors—hoped that caution, patience, diplomacy, and fortitude would solve the hostage crisis and strengthen the hand of the United States during and after the Cold War; when no immediate positive results followed, this ostensibly sophisticated strategy backfired.

As has been the pattern since nineteenth-century conflicts, collective solidarity and internal cohesion strengthened during a national security crisis that threatened the integrity and pride of the United States. Public opinion in the United States unified in the face of adversity. Citizens initially rallied to their symbolic and actual political leader, President Carter. Carter's rating in the polls rose nineteen points at the start of the hostage crisis as he seemed resolved to conclude the crisis expeditiously.

Carter, however, did not make good use of the bully pulpit that a president commands at such a

Iranian students outside the American Embassy in Tehran, Iran, which they had taken over and in which they held 66 hostages.

Source: Setboun/Corbis; used with permission.

troubling time. He was somber and avoided deception but did not connect well with his people, often seeming aloof and dispassionate. Too concerned about mastering minute strategic scenarios and logistical details to be able to weigh every conceivable option on equal terms with the advice of the learned experts in his staff, Carter was unable to exude enough confidence at home and decisiveness abroad. The majority of Carter's intense White House work was not visible to the public. Instead of garnering more respect and support from the media and the people, his above-the-fray "Rose Garden Strategy" made Carter seem weak and detached from his citizens rather than appearing as their competent commander-in-chief.

The Weak Leadership Label

Jimmy Carter's presidency was a linchpin in the continuing success Republicans had and continue to have in painting Democratic presidential candidates as weak leaders who cannot be trusted to stand up to enemies overseas and criminals at home. Carter's contribution was his failure to resolve the Iranian hostage crisis, his weak handling of the energy crisis (equating it with war), and his lackluster campaigning in 1979.

The "weak leadership" label probably first began to stick in the 1951 election, which pitted the intellectual Adlai Stevenson against the war hero, Dwight David Eisenhower. Of course, it is Eisenhower who is now lauded for keeping the United States out of war in the 1950s and who warned about the military-industrial complex in his farewell speech to the nation. The image of weak Democrats diminished with John F. Kennedy, who was portrayed as a war hero and a dashing, charismatic figure, and then it reappeared with the riots in Chicago at the 1968 Democratic Convention. The Democrats never completely freed themselves from this weak-kneed theme that was used by the Republicans in 1984 against Walter Mondale, and in 1988 against Michael Dukakis.

Of course, reality had an inconsistent relationship with image. Ronald Reagan—Mondale's opponent—never served in World War II, and George H. W. Bush (whom many did not consider as strong a leadership figure as Reagan)—Dukakis's opponent—had been a decorated Navy pilot in the war. Ironically, the theme emerged after the presidencies of Franklin Delano Roosevelt, who led the nation through the Depression and World War II, and Harry Truman, who approved dropping two atomic bombs on Japan that ended World War II. The label had less resonance during the Clinton presidency after the demise of the Soviet Union and the end of the Cold War in 1989, but it has again been used by Republicans during the War on Terrorism.

—David Levinson

Carter suffered from the lack of immediate results from his deliberate approach. His caution was not understood as being one derived from knowledge, planning, or direction. Carter miscalculated that his officious, statesman-like image would inspire U.S. citizens. The failure to secure the safe return of the hostages within a year of their capture played a major role in the precipitous decline of his national popularity and in a considerably diminished international stature.

Carter had to lead his country through a time of national humiliation and personal anguish with insufficient diplomatic, intelligence, and military resources. The collective anxiety was embodied in wounded patriotism, in the display of yellow ribbons, and in the massive audience for the ABC News show *America Held Hostage*, which became *Nightline*. Many U.S. citizens felt that Ted Koppel, the

veteran anchorman, projected more knowledge and control of events and communicated more persuasively than Carter.

Carter and his national security team worked on several tracks, keeping the public informed through regular appearances, including speeches and news conferences, and relying on Carter's strong religious convictions. While trying to secure the safe release of the hostages through indirect negotiations and mediation by the United Nations, he also authorized a review of military options while severing diplomatic relations with Iran, imposing economic sanctions, and freezing Iranian bank accounts totaling billions of dollars. Simultaneously, Carter was running for reelection, facing a challenge by the left-leaning Democrat Senator Edward Kennedy and by the right-wing Republican Ronald Reagan, both of whom castigated Carter for his inability to resolve the hostage crisis.

In April 1980, Carter authorized the deployment of helicopters and troops to rescue the hostages. The rescue was aborted due to difficult conditions in the desert where the initial landings occurred, which caused technical malfunctions. An accident caused the deaths of seven U.S. soldiers and marked the end of any viable military option.

FINEST MOMENT

Carter took full responsibility for the failed rescue mission in a nationally televised news conference. This conference was probably his finest moment during the crisis; he seemed genuinely humble and reflective while accepting full blame for the failure and grieving over the deaths of U.S. troops, the only combat-related losses the U.S. Army suffered during his four years in office. His secretary of state, Cyrus Vance, who objected to the military rescue attempt, resigned.

Carter's act of contrition, however, was soon remembered as another testament to his weakness rather than as a reflection of strength and personal vigor.

The shah died in August 1980. Saddam Hussein's Iraq attacked Iran in September. Carter lost his reelection on 7 November. Through Algerian diplomats, Carter's staff, led by Deputy Secretary of State Warren Christopher, worked to secure the safe release of the hostages in exchange for the lifting of the financial and diplomatic sanctions employed against Iran. The hostages left Iran for Algeria as Ronald Reagan became U.S. president on 20 January 1981.

Jimmy Carter won the 2002 Nobel Peace Prize thanks to the universal recognition of his benign leadership of U.S. foreign policy and his legacy of respect, cooperation, and support with regard to weaker nations well beyond his White House years. Critics, however, claimed that Carter's policy of restraint (some construed it as appeasement) during the Iranian hostage crisis launched the Islamic terrorist movement in two key respects: It portrayed the United States as weak and as ill-prepared. Iran evolved into the primary sponsor of Islamic terrorism.

Carter's major failure of leadership during the hostage crisis was his inability to distance himself from the endemic problems of history thrust upon him: the self-serving U.S. conduct abroad; the inadequate level of military preparedness and intelligence gathering in the United States since the Vietnam War; the global disparity of wealth and power that was seen as a humiliation in traditional societies such as Iran; the shah's inept handling of his affairs of state that led to his own demise; and, last but not least, Iran's problematic transformation from a monarchy to an Islamic republic.

Neither Carter nor his administration could deter or resolve severe challenges, even had Carter been a more effective communicator to the public and his military a successful planner and executioner of rescue plans.

ISRAEL, FOUNDING OF

Scholars differ widely as to the weight of the leader's personality in shaping historical events. Opinions range from that of the nineteenth-century Scottish historian Thomas Carlyle, who said that history is simply the biography of leaders, to the argument put forward by Karl Marx and Friedrich Engels, who said that historical processes are deterministic and that leaders are simply borne along on the waves of history. The story of Israel's establishment is a rare example of a case in which the leader was indubitably the decisive factor in the historical event. Without the leadership of David Ben-Gurion (1886–1973), the sequence of events would almost certainly have been different, and the State of Israel might never have been established.

HISTORICAL BACKGROUND

“If I forget thee, O Jerusalem, let my right hand forget her cunning” (Psalms 137:5 JPS). For centuries these words were uttered by Jews in their prayers in the more than seventy countries of the Diaspora. The yearning for the homeland was expressed in prayers and rituals, in the written and oral heritage. True, such themes exist in the collective consciousness of many emigrant communities, but the Jews' return to their ancient homeland more than two thousand years after they were forcibly exiled has no parallel in the history of nations. This unique historical phenomenon was made possible in large measure because of the efforts of two men. The first was Theodor Herzl (1860–1904), a Viennese Jew and one of the darlings of the western Europe intelligentsia, who reached the conclusion that the growing problem of anti-Semitism had to be solved by political measures—by the establishment of a Zionist movement that would serve as a tool for returning Jews to their historical homeland. The second was David Ben-Gurion, who fulfilled Herzl's vision fifty years

David Ben-Gurion, one of the founders of the State of Israel, planting a tree in 1963.

after the latter's death. Herzl is seen as the prophet who predicted the rise of the State of Israel and Ben-Gurion is regarded as the builder of the state.

No metaphor for Ben-Gurion's leadership could be more apposite than "builder of the state." The process of building includes designing and sketching the entire building, planning the stages of building, and executing the plan while constantly dealing with problems that arise in the process. The equivalent in terms of leadership consists of charting a clear course (derived from a vision) and motivating the people to stride resolutely along that course even if it is fraught with difficulties and dangers. In the case of Ben-Gurion, his weight was decisive both in sketching the future picture and in steering the people along the path, although many, including most of his partners in leadership, sometimes experienced moments of despair. Ben-Gurion's leadership at those moments was the only thing that prevented the total loss of hope.

PROCLAMATION OF THE STATE

After the Holocaust, in which six million Jews lost their lives, the victors in World War II, headed by the

United States, assented to the Zionist movement's request to establish a national home for the Jews. This propitious hour was reflected in the United Nations' recognition of Israel's right to statehood on 29 November 1947. Between this date and 15 May 1948, when the British, who had controlled the region for many years, were to leave and Israel was to become an independent state, hundreds of events threatened to scuttle the fragile boat that was the nascent state. It was clear to all that the months between the United Nations' recognition and the departure of the British would be filled with struggle. The Arabs made every effort to forestall the establishment of a Jewish state, while the Jews attempted to create the conditions for implementing the United Nations resolution. The odds were heavily against Israel. The entire Jewish population numbered only 600,000, and it could muster only a few militia units composed of people who had undergone only partial military training. For the most part they were armed only with rifles and small amounts of ammunition; until the outbreak of war they had no artillery or airplanes. Since it was evident to both sides that the months preceding the departure of the British were critical, the sporadic fighting that gone on for many years became more focused and violent. During the struggle, Ben-Gurion's unwavering persistence, his ability to make difficult and painful decisions, and above all his ability to see the long vista and motivate people to reach it, shone forth.

Perhaps there is no better example than his determination that the proclamation of the State of Israel should go ahead on schedule, despite the fact that that meant sure war. At the time, in the beginning of May 1948, the Egyptian government had just decided to join the Arab invasion of Israel, and Ben-Gurion and his followers received word that Saudi Arabia was about to join the war as well. Ben-Gurion hoped that the animosity that existed between the other Arab leaders and Jordan's King Abdullah II would keep Jordan from joining the invasion, but unfortunately that proved not to be the case. With the whole area of Jewish settlement encircled by menacing armies and cracks in international support for the proclamation of Israel beginning to appear, notably in the U.S. stance (U.S. sec-

The Hogarth Conversation with King Hussein in 1918

The following selections indicate the Arab attitude toward an independent Jewish state shortly after the idea was first supported by Britain. The British government dispatched Commander D. G. Hogarth from the British Arab Bureau in Cairo, Egypt, to discuss the issue with King Hussein of Jordan.

The Hogarth Message to King Hussein

(1) The *Entente* Powers are determined that the Arab race shall be given full opportunity of once again forming a nation in the world. This can only be achieved by the Arabs themselves uniting, and Great Britain and her Allies will pursue a policy with this ultimate end in view.

(2) So far as Palestine is concerned, we are determined that no people shall be subject to another, but—

In view of the fact that there are in Palestine shrines, Wakfs, and Holy places, sacred in some cases to Moslems alone, to Jews alone, to Christians alone, and in others to two or all three, and inasmuch as these places are of interest to vast masses of people outside Palestine and Arabia, there must be a special regime to deal with these places approved of by the world.

As Regards the Mosque of Omar, it shall be considered as a Moslem concern alone, and shall not be subjected directly or indirectly to any non-Moslem authority.

(3) Since the Jewish opinion of the world is in favour of a return of Jews to Palestine, and inasmuch as this opinion must remain a constant factor, and, further, as His Majesty's Government view with favour the realization of this aspiration, His Majesty's Government are determined that in so far as is compatible with the freedom of the existing population, both economic and political, no obstacle should be put in the way of the realization of this ideal.

In this connection the friendship of world Jewry to the Arab cause is equivalent to support in all States where Jews have a political influence. The leaders of the movement are determined to bring about the success of Zionism by friendship and cooperation with the Arabs, and such an offer is not one to be lightly thrown aside.

Hogarth's Record of His Interview with King Hussein.

I passed to Formula No. 3 (Jewish Settlement in Palestine) prefacing it by statement of growth of Zionism during war and great value of Jew interest and alliance. King seemed quite prepared for formula and agreed enthusiastically, saying he welcomed Jews to all Arab lands. I explained that His Majesty's Government's resolve safeguarded existing local population.

Some of Hogarth's Notes on His Discussion with King Hussein

... *International control of the Palestine Holy Places.*—The King left me in little doubt that he secretly regards this as a point to be reconsidered after the Peace, in spite of my assurance that it was to be a definitive arrangement. He compared ourselves and himself (in his habitual homely way) to two persons about to inhabit one house, but not agreed which should take which floors or rooms! ... I doubt if he has any fixed plan or foresees his way; but I have no doubt that in his own mind he abates none of his original demands on behalf of the Arabs, or in the fullness of time, of himself.

Settlement of Jews in Palestine and common cause among Arabs, Jews and Armenians in Syria—The position in regard to this matter is, I think, very much the same as in the preceding case. The King would not accept an independent Jew State in Palestine, nor was I instructed to warn him that such a State was contemplated by Great Britain. He probably knows little or nothing of the actual or possible economy of Palestine and his ready assent to Jewish settlement there is not worth very much. But I think he appreciates the financial advantage of Arab co-operation with the Jews.

January 15, 1918

Source: Great Britain Foreign Office. Miscellaneous No. 4 (1939). Statements Made on Behalf of His Majesty's Government during the Year 1918 in Regard to the Future Status of Certain Parts of the Ottoman Empire (London, 1939), Cmd. 5964.

retary of state George C. Marshall was pushing for a postponement of the proclamation), the situation was dire. When the Civil Administration (the Jewish governing body before the establishment of the state) convened on 12 May to decide what to do, some members favored a postponement of the declaration and others hesitated. Yigael Yadin, the chief opera-

tions officer (later chief of staff), arrived straight from the battlefield and presented a grim picture.

Only Ben-Gurion was convinced that they should declare the establishment of the state in defiance of all the odds. When each member had spoken, Ben-Gurion got up. He described the situation, but added that in spite of everything, he believed deeply that

now was the time to proclaim the state—in other words, to go to war. He believed that it was a historic moment, and that the battle would end in an Israeli victory. Much has been written about that meeting. According to all the reports, those present were not convinced—they assented solely because of their faith and trust in Ben-Gurion, trust built up over years of leadership, during which they had seen constant proof of his personal integrity and incorruptibility, and had come to acknowledge the rightness of his decisions, many of which had been controversial in their time. On 15 May 1948, Ben-Gurion stood in the Tel Aviv museum, holding in his hands two typed pages, and read: “In the Land of Israel the Jewish people came into being. In this land was shaped their spiritual, religious, and national character. Here they lived in sovereign independence. Here they created a culture of national and universal import, and gave to the world the eternal Book of Books” (Bar-Zohar 1975, 287). He read on, recounting the historical developments, and ended, “Accordingly we, the members of the National Council. . . have assembled on the day of the termination of the British Mandate for Palestine, and by virtue of our natural and historic right and of the resolution of the General Assembly of the United Nations, do hereby proclaim the establishment of a Jewish state in the Land of Israel—the State of Israel” (Bar-Zohar 1975, 287).

BEN-GURION’S LEADERSHIP: AN ANALYSIS

“Man is only great when he acts from the passions,” said the nineteenth-century British statesman Benjamin Disraeli, and indeed, passion and unwavering belief that one’s course of action will be successful are consistent themes that appear in the analysis of great leaders in history (quoted in Wilson 1995). Profound knowledge and inner conviction of where to go have deep psychological significance both for the leader himself, imbuing him with resolution, and for followers, who absorb that conviction. This element goes beyond mere problem solving; it distinguishes leaders who are merely successful problem solvers from those who effect a transformation in people’s expectations and inspire them to see a dif-

ferent picture of reality, which they set out to achieve. All Ben-Gurion’s considerations and decisions were guided by his goal of establishing a Jewish state in the land of Israel. All his everyday tactical decisions and responses were subordinate to the fulfillment of this vision. For example, it was clear that President Truman would not support the constitution of a Jewish state in the whole area of the historical land of Israel. Therefore, to gain the support of the United States, Ben-Gurion agreed to a compromise and accepted the idea of partition of the country between Arabs and Jews, despite his dream of returning to the whole of the historical homeland and although many of his partners in leadership opposed this compromise.

In every chapter of his life he sensed precisely what sphere of action would best serve the realization of his vision. In 1906 he immigrated to Israel and was involved in building a pioneer force to engage in farming, construction, and road building. He sensed that the pressing need of the time was to build the physical infrastructure of the national home to be established. This endeavor also had symbolic value, in striving to change the character and image of the Diaspora Jew from that of a merchant and a biblical scholar to someone doing productive physical labor, working on the land, and fighting for his land. In the 1930s and 1940s he understood that the sphere of action should be statesmanship. As elected chairman of the Zionist Executive, he concentrated his efforts on mustering international support for the establishment of the state. At the end of World War II, long before most people thought that war might break out in the region, he understood that it was necessary to prepare for a future military struggle. For years he acted intensively throughout the world, supported by donations and covertly purchasing weapons and airplanes to prepare for eventual conflict—matériel that arrived a few days after the outbreak of the war. A retrospective analysis of Ben-Gurion’s intuition, revealed in his journals and other writings, demonstrates that it was grounded in profound understanding of historical processes.

However, while foresight can make someone a prophet, it does not necessarily make one a leader. To be a leader one also needs to apply the vision and

harness the people to execution of the task. Ben-Gurion was able, in his daily actions and behaviors, to motivate people to perform the thousands of small tasks that were part of the big picture—the vision of the state. To explain the influence of his leadership, it is useful to use the metaphor of credit, articulated by the leadership scholar Edwin Hollander. Just as banks are prepared to give more credit and take greater risks with their money for clients who have proved their reliability over time, people are prepared to give more psychological credit to leaders who have proved themselves over time. In this sense, the ultimate test of leadership—or the strictest measure of the extent of a leader’s credit—is a state of crisis. Then the leader undergoes a dual test: Will he or she behave as a leader (in terms of resolution, decision making, and so forth)? And will his or her accumulated credit be sufficient to recruit followers’ active involvement? In the case of Ben-Gurion, the scores of years during which he had proved himself in his

daily activities spoke in his favor when he stood before the Civil Administration and tried to persuade its members to vote for the proclamation. Most of the members of the Civil Administration were attentive to the voices of harsh reality, which by all logical criteria seemed to justify postponing the proclamation. The only one present who was in favor of it and confident of success was Ben-Gurion himself. In the end they decided in favor of proclamation of the state solely because of the credit that stood in his favor. At first sight, this might seem like a singular moment of leadership, but in fact it was only possible because of the scores of years of leadership Ben-Gurion had demonstrated up to that moment. “The decision to proclaim the state in those conditions was exclusively that of David Ben-Gurion,” Yigael Yadin was

Selection from United Nations General Assembly Resolution 181 (Partition Plan), 29 November 1947

PLAN OF PARTITION WITH ECONOMIC UNION

Part I.—Future Constitution and Government of Palestine

A. Termination of Mandate, Partition and Independence

The Mandate for Palestine shall terminate as soon as possible but in any case not later than 1 August 1948.

The armed forces of the mandatory Power shall be progressively withdrawn from Palestine, the withdrawal to be completed as soon as possible but in any case not later than 1 August 1948.

The mandatory Power shall advise the Commission, as far in advance as possible, of its intention to terminate the mandate and to evacuate each area. The mandatory Power shall use its best endeavours to ensure that an area situated in the territory of the Jewish State, including a seaport and hinterland adequate to provide facilities for a substantial immigration, shall be evacuated at the earliest possible date and in any event not later than 1 February 1948.

Independent Arab and Jewish States and the Special International Regime for the City of Jerusalem, set forth in Part III of this Plan, shall come into existence in Palestine two months after the evacuation of the armed forces of the mandatory Power has been completed but in any case not later than 1 October 1948. The boundaries of the Arab State, the Jewish State, and the City of Jerusalem shall be as described in Parts II and III below.

The period between the adoption by the General Assembly of its recommendation on the question of Palestine and the establishment of the independence of the Arab and Jewish States shall be a transitional period.

later to remark. “That decision was equal in importance and influence to a thousand actions” (Bar Zohar 1975, 282).

The major characteristic of so-called transformative leadership is that it has a strong moral dimension. Thus for Mohandas Gandhi, moral considerations demanded that India’s struggle for independence from the British be nonviolent. Similarly, moral considerations led South Africa’s Nelson Mandela to seek reconciliation with South Africa’s whites, despite decades of black suffering under white rule. Ben-Gurion also had a moral vision. He believed it was Israel’s destiny not only to be a refuge and a home for Jews, but also a universal moral example—a biblical theme that appears in almost every one of his texts and speeches. Like other trans-

forming leaders, he knew how to turn ideas into acts of leadership. For instance, he considered it a task of primary importance “to make the desert bloom” (half the area of Israel is desert), so he went to live in the desert in order to serve as an example to others. He ascribed supreme importance to the creation of a just society embracing universal moral values while fostering its own social and cultural values. In his stubborn insistence on using the Hebrew language, he contributed to its revival: From a virtually dead language used only for prayer it was transformed into the living language of a vibrant society.

The psychological elements of Ben-Gurion’s leadership can be understood using a theoretical approach known as symbolic interactionism. The essence of this approach is that many of people’s actions and interactions are driven by the need for meaning. Places, events, people, and even certain objects have expressive meaning. Ben-Gurion knew how to invest decisions with symbolic meaning that touched his followers’ hearts and spurred them to action. For example, he decided to focus the war effort on freeing the road to Jerusalem, which was under siege, a decision that was opposed by the heads of the army, who saw the main danger in other areas. Ben-Gurion was adamant. After a failed attack (ending in a bloodbath) on the Latrun fortress, which controlled the road to Jerusalem, Ben-Gurion stubbornly insisted on two further attempts to take the fortress. He explained in a sharp discussion with the military leaders that Jerusalem was the symbol of Hebrew eternity and sovereignty, the target and symbol of thousands of years of longing. None of the commanders or local leaders could see matters from this historical perspective. The ability to see

things in such overall historical perspective when most others are not highlights another characteristic of many leaders: loneliness. And yet for the sake of their vision, great leaders such as Ben-Gurion persevere despite loneliness, and the world is the richer for their perseverance.

—Micha Popper

 **JEFFERSON, THOMAS** (1743–1826)
U.S. president

For his tomb at his home at Monticello, Virginia, Thomas Jefferson composed the following epitaph by which he wished most to be remembered:

Here was buried
Thomas Jefferson
Author of the Declaration of Independence
of the Statute of Virginia for religious freedom
and Father of the University of Virginia.

This simple epitaph, although incomplete, indicates the scope of Jefferson's leadership: political, intellectual, cultural, and symbolic. Indeed, the range of Jefferson's interests—the breadth of his contributions—is striking. There is Jefferson the philosopher, the defender of democracy, the champion of limited government and of religious and political liberty. There is Jefferson the scientist, the architect and inventor, with an insatiable curiosity about the physical world around him. There is Jefferson the politician and statesman, who spent some thirty-five years in almost continuous public service.

Notably missing from his epitaph is any mention of those many offices of state that Jefferson occupied with distinction—legislator, governor, diplomat, sec-

retary of state, vice president, and president—omissions that reveal much about his attitude to public leadership. The man whose historical reputation centers upon his contributions to the commonweal (general welfare) professed to prefer the cloistered life of the scientist and intellectual. Upon his retirement from the presidency in 1809 he confided to an old friend, “Never did a prisoner, released from his chains, feel such relief as I shall on shaking off the shackles of power. Nature intended me for the tranquil pursuits of science, by rendering them my supreme delight. But the enormities of the times in which I have lived, have forced me to take a part in resisting them, and to commit myself on the boisterous ocean of political passions” (Lipscomb and Bergh 1903, 269–270).

EARLY CAREER

Thomas Jefferson was born at Shadwell, the family home in Albemarle County, east of the Blue Ridge Mountains in western Virginia. His father, Peter, was a planter and local official of moderate social standing. His mother, Jane, on the other hand, was a Randolph, a member of one of the most prominent families in colonial Virginia, providing the young Jefferson with a network of social and political connections that was to serve him well in his early years.

Statue of Thomas Jefferson stands in the Jefferson Memorial in Washington, D.C.

Little of detail is known of Jefferson's childhood. After attending several boarding schools, he entered the College of William and Mary at Williamsburg shortly before his seventeenth birthday. Later he studied law under George Wythe (1726–1806), the most prominent lawyer in the colony. He was admitted to the bar in 1767 and entered into the practice of law. Soon, however, through his contacts with the leading figures in the colonial controversies of the day, his interests were drawn to politics. In 1768, at the age of twenty-five, he won election to the Virginia House of Burgesses.

As a member of the House of Burgesses, Jefferson rarely spoke in debate but was recognized for his

work in committee and in drafting legislation, a style of leadership behavior that was to be a pattern throughout his legislative career. He sided, nonetheless, with those who were in the forefront of the struggle for colonial rights. In 1774 he produced the first of his great state papers, "A Summary View of the Rights of British America," a bold statement of grievances and defense of resistance that thrust him into prominence beyond Virginia.

After the battles at Lexington and Concord, Massachusetts, in the spring of 1775, Jefferson was chosen as a delegate to the Second Continental Congress. In June 1776, he was named, along with John Adams (1735–1826), Benjamin Franklin (1706–1790), Roger Sherman (1721–1793), and Robert R. Livingston (1746–1813), to a committee to write the Declaration of Independence. Because of his demonstrated gift for the pen, Jefferson was chosen to prepare the draft that, with modifications, was approved by Congress. Although his authorship was not immediately known to the public, his masterly summary of fundamental principles has since won him his most enduring fame. Through the Declaration of Independence, Jefferson came to symbolize, more than any other founder, what Thomas Paine called "the birthday of a new world."

After independence was declared, Jefferson returned to the Virginia, where he took a seat in the new state Assembly and labored to reform the legal code of Virginia and drafted bills for the abolition of primogeniture (relating to the inheritance rights of the firstborn), for religious freedom, and for a system of public education. Few of these reforms were enacted at the time, but they reveal the versatility of his political imagination. His Statute for Religious Freedom would become law in 1786.

Jefferson was elected governor of Virginia in the summer of 1779, during the darkest days of the American Revolution. As governor, Jefferson had few effective powers with which to defend a poorly prepared Virginia against an expected invasion by British forces. At one point the state government was forced to flee from a British raiding party who nearly captured the governor. To Jefferson's chagrin, the Assembly established an inquiry into his conduct of office. Although he was cleared of all charges, his

performance as governor was to remain a question mark on his reputation.

During a brief retirement from public life, Jefferson wrote his only book-length work, *Notes on the State of Virginia*. This wide-ranging treatise was to become “one of the most important scientific and political works written by an American in the eighteenth century and one of the most famous products of the Enlightenment in America” (Cunningham 1987, 76). The Enlightenment was the period during the 1700s in Europe and the United States when humanity was emerging from centuries of ignorance into an age of reason, science, and respect for humanity.

THE NATIONAL STATESMAN

In 1783, Jefferson was elected to the Confederation Congress, where he drafted a plan that was to become the Northwest Ordinance of 1787. In 1785, he succeeded Benjamin Franklin as minister to France. From Paris, he criticized certain aspects of the new U.S. Constitution—notably the absence of a bill of rights—but ultimately gave it his approval. Jefferson witnessed the first events of the French Revolution, indeed advising some of its early leaders. He had high hopes for its outcome as a “progress of reason” and a reaffirmation of the principles of the American Revolution.

Jefferson returned from France in late 1789 to become secretary of state in the first cabinet of President George Washington (1732–1799). During Jefferson’s three years in that office, he came into increasing conflict with the forceful young secretary of the treasury, Alexander Hamilton (1757–1804). The two men represented widely different conceptions of politics: Hamilton stood for a strong central government and an alliance between government and capitalism, whereas Jefferson defended the rights of the states, the freedom of the individual, and an agrarian economy. In foreign policy, “[w]hile Jefferson sought to nurture relationships with France and to counter commercial subservience to England, Hamilton looked for opportunities to lessen ties with France and to develop links with England” (Cunningham 1987, 164).

“We hold these truths to be self-evident: That all men are created equal; that they are endowed by their Creator with certain unalienable rights; that among these are life, liberty, and the pursuit of happiness.”

—The Declaration of Independence

These differences soon led to the formation of an opposition faction in Congress, led by Jefferson’s friend and colleague, James Madison (1751–1836). True to form, Jefferson preferred to work behind the scenes, subsidizing a party press and privately encouraging his followers to oppose the government’s policies. Jefferson resigned from the cabinet in 1793 and assumed a more public leadership of the new Democratic-Republican Party. In 1796 he became its candidate for president. He lost to John Adams by three electoral votes, but under the then-governing constitutional provisions he became vice president. Never a part of the new administration, Jefferson soon took issue with his old friend Adams over a number of issues, most notably the enactment in 1798 of the Alien and Sedition Acts. He joined with Madison in authoring the Virginia and Kentucky Resolutions, arguing that the states could nullify such unconstitutional measures as the Alien and Sedition Acts.

THE PRESIDENCY

Jefferson soundly defeated Adams in the election of 1800. Because he and his running mate, Aaron Burr (1756–1836), each received the same number of electoral votes, the final result had to await a vote of the House of Representatives. Jeffersonians also won majorities in both houses of Congress.

In later years, Jefferson referred to this election as a second U.S. “revolution.” In the political scientist Stephen Skowronek’s insightful schema, Jefferson’s presidency marked a “politics of reconstruction,” that rare but fortuitous situation where the previous regime’s programs and values had made it “vulnerable to direct repudiation.” Given such conditions, a “great opportunity for presidential action was har-

In matters of style, swim with the current; in matters of principle, stand like a rock.

—Thomas Jefferson

nessed . . . to an expansive authority to repudiate the established governing formulas” (Skowronek 1997, 37–38).

Despite the relatively free rein for innovation, however, Jefferson’s approach to power was a cautious one. His policies were to prove reformist rather than radical, with no sweeping alterations in constitutional arrangements. He sought to reduce if not eliminate party divisions. However, he intended to remold the presidency into a more popular instrument of government. Jefferson united his powers as chief executive with his new role as party leader in order to assert his own policy leadership.

As president, Jefferson cultivated his image as a popular leader. He reduced the “pomp and circumstance” of the office, relaxed protocol, and abandoned the “kingly” custom of delivering his annual message to Congress in person (he was never an effective public speaker, in any case). In his first term he reduced the scale of the national government, repealing internal taxes while trimming the national debt. His most notable achievement was the acquisition of the vast territory of Louisiana (1803). For the price of a few cents an acre, the Louisiana Purchase nearly doubled the size of the nation. Jefferson also commissioned the 1803–1806 expedition of Meriwether Lewis and William Clark to explore the new lands.

Although Jefferson provided the essential principles upon which his reform policies were based—the substance of his “transforming” leadership (reforming leadership that seeks high or transcendent goals of change)—he was also a gifted “transactional” leader (maintaining leadership that engages in bargaining for the exchange of valued things). His control over his strong-minded but loyal cabinet was unquestioned. In line with his customary style, he led Congress through conciliation rather than confrontation. Jefferson always sought harmony in his personal relations, and in politics he pre-

ferred persuasion to command, the “flanking movement to the frontal assault.” His advice to others was to “take things always by the smooth handle” (Johnstone 1978, 34). His was, in the scholar Fred Greenstein’s term, a “hidden hand” presidency, in which only his closest associates were privy to his operations (Greenstein 1982). To his enemies, this “hidden hand” leadership was duplicitous. However, his style proved an effective tool in mastering the art of political bargaining in a polity (political organization) with a deep suspicion of power. Jefferson would have understood the political scientist Richard Neustadt’s well-known maxim, “presidential power is the power to persuade” (Neustadt 1960). An independent-minded Congress could best be led by cultivation rather than coercion. Although publicly deferring to Congress, Jefferson guided it from behind the scenes.

Unlike his first term, Jefferson’s second term was fraught with difficulties, notably in relations with warring England and France. Hoping to preserve U.S. neutrality without recourse to war, Jefferson persuaded Congress to adopt an embargo on U.S. trade with both nations. The embargo proved a disaster for the domestic economy. To enforce the unpopular embargo, Jefferson resorted to increasingly forceful measures, but to no avail. Congress repealed the embargo effective on the last day of his presidency.

Jefferson retired from office in 1809. His greatest achievement in his last years was in founding the University of Virginia. He guided the entire project, designing its architecture as well as its curriculum. Jefferson died a few hours after John Adams, on the Fourth of July 1826, a half-century to the day after adoption of the Declaration of Independence.

THE LEGACY

Lord Charnwood, a biographer of Abraham Lincoln, wrote of Jefferson:

He imparted to the very recent historical origin of his country, and his followers imparted to its material conditions, a certain element of poetry, and the felt presence of a wholesome national idea. The patriotism of an older country derives its glory and its pride from

influences deeply rooted in the past, creating a tradition of public and private action which needs no definite formula. The man who did more than any other to supply this lack in a new country, by imbuing its national consciousness—even its national cant—with high aspirations, did—it may well be—more than any strong administrator or constructive statesman to create a Union which should hereafter seem worth preserving. (Charnwood 1917, 34–35)

As a strong administrator and constructive statesman, Jefferson used a leadership style facilitated by his symbolic identity with that national consciousness. “Through the skillful application of his personal persuasive talents, the pioneering cultivation of new presidential roles, and the employment of additional resources and techniques of influence, Jefferson helped greatly to make the presidency and indeed the entire machinery of government more reflective of that consciousness” (Johnstone 1978, 314).

JESUS (c. 4 BCE–30 CE)

Religious leader and founder of Christianity

Jesus has figured centrally in the shaping of two thousand years of Western and, indeed, world history. The life of Jesus and beliefs about him are fundamental to Christianity, currently the largest religious tradition worldwide, with about 2 billion adherents. Islam also recognizes Jesus as an important prophet. Even beyond religious institutions, however, political, social, and business leaders have made wide-ranging appeals to Jesus as a source of authority for their own leadership. That the programs undertaken in the name of Jesus appear to be mutually incompatible—military campaigns versus pacifist nonviolence and corporate management versus humble presence with the poor—attests to the complexities of Jesus and leadership, even as a significant part of the world’s population seeks to live as followers of Jesus.

HISTORICAL CONTEXT AND DEBATE

Analyzing Jesus as a leader in his own time and place is hampered by limited historical information. The four canonical New Testament Gospels of Mark, Matthew, Luke, and John are the principal sources of historical knowledge about Jesus. Even the oldest Gospel, Mark, was written at least thirty years after the death of Jesus, and the respective contexts of the Gospel authors shaped their narratives. A few other

early sources, including the Jewish historian Josephus (c. 37–100 CE) make reference to Jesus, but they offer little additional information about his life and work. The second-century-CE Gospel of Thomas also provides a collection of sayings attributed to Jesus.

Given the dependence upon the Gospel accounts, knowledge of the historical figure of Jesus is undeniably linked to the theological beliefs about him by the early and later church. One Gospel writer notes his desire to record the events surrounding Jesus “so that you may know the truth” (Luke 1:4, New Revised Standard Version), and another explicitly states that he has “written so that you may come to believe that Jesus is the Messiah, the Son of God, and that through believing you may have life in his name” (John 20:31 NRSV). This issue is frequently cast as the relationship between the “Jesus of history” and the “Christ of faith.”

Despite the difficulty of culling away theological beliefs about who Jesus was or is, the confidence placed in scientific and historical methods of biblical scholarship has fueled concerted attempts, since the latter part of the nineteenth century, to discover the essential basics about the life and death of Jesus. The most classic of these works is the French theologian and philosopher Albert Schweitzer’s *Quest of the Historical Jesus* (1906, trans. 1910). Schweitzer’s book and the myriad other writings on Jesus disagree vehemently on many points of historical and theological interpretation. Yet all of these works have the virtue of exploring the Gospel stories within the wider context of Jesus’ social, political, religious, and economic milieus. Recently, members of the “Jesus Seminar,” a group of scholars pursuing the historical Jesus, have sought systematically to determine what parts of the Gospel texts can be attributed to Jesus himself, and with what degree of certainty. Critics have rejected this exercise as a misplaced attempt to evaluate the modern historical accuracy of ancient texts that did not communicate truth as scientific fact.

THE GOSPELS

What can be known about Jesus’ life and times? Scholars generally agree that Jesus was born and

lived in Galilee, a marginal backwater of the Roman Empire. The authors of the “synoptic” Gospels (Mark, Matthew, and Luke) emphasize Jesus’ connection to and knowledge about Jewish scriptures and traditions. Aside from the birth narratives in Matthew (Matthew 1:18–2:23) and Luke (Luke 2:1–40), little is known about Jesus’ life until his year or two of public ministry at about the age of thirty. The birth narratives agree that he was the son of Mary, who was engaged to Joseph. Scholars have variously portrayed Jesus, in his public role, as a religious reformer, a prophet, a wisdom teacher, a miracle worker and healer, a charismatic leader, or a leader of a resistance against political, economic, and religious powers.

While it is impossible to answer many questions about his life, it is clear, according to the Gospels, that Jesus drew upon the prophetic strands of Jewish tradition to call his fellow Jews to live more justly and righteously as a community. The author of Luke reports that Jesus’ first public act is to read from the scroll of Isaiah in the synagogue: “The Spirit of the Lord is upon me, because he has anointed me to bring good news to the poor. He has sent me to proclaim release to the captives and recovery of sight to the blind, to let the oppressed go free, to proclaim the year of the Lord’s favor” (Luke 4:18–19). His public sayings urge his listeners to welcome outcasts into their community, and his deeds are directed to assist those in need—whether they are facing hunger, sickness, imminent threat of violence or disaster, or death. Jesus’ sayings, collected as the Sermon on the Mount (Matthew 5:1–7:27) or the Sermon on the Plain (Luke 6:17–49)—which are generally accepted as authentic statements by Jesus—call for various forms of social reversal, in which vulnerable, needy, and despised persons, not the powerful, gain God’s favor. From these sayings and other parables and accounts of Jesus, many interpreters understand Jesus to have called for a form of leadership as service (or “servant leadership”) toward God’s kingdom, or God’s reign. Jesus had many followers surrounding him in his public ministry. The canonical Christian tradition has attributed special status to his twelve apostles, although other figures, including women such as Martha and Mary, Mary Magdalene,

and Jesus' mother Mary, also play prominent roles in Jesus' band of followers.

The Gospels offer a complex picture of the self-understanding of Jesus and the perceptions that others had of him. In the famous passage between Jesus and his follower Peter, Jesus asks Peter, "Who do people say that I am?" (Mark 8:27) (the answer being "the Christ"). Multiple titles were attributed to him, including, most notably, the Messiah (from Hebrew) or the Christ (from Greek)—the chosen one or the anointed one of God. This term had been employed for earlier Israelite leaders, including David. But the early Christian community came to understand Jesus as uniquely, in some way, the chosen (and "only-begotten") Son of God, and thus not merely as a son or daughter of God in the way that all of God's people were believed to be. Other titles, including the "suffering servant" from the Book of Isaiah and the apocalyptic title of "Son of Man," are also employed to describe Jesus. The Gospel writers even use the title "Lord," generally reserved for God, to name Jesus. In Mark's Gospel, marked by a "secrecy motif," Jesus is portrayed as reticent to claim the role of Messiah. In contrast, in John's Gospel Jesus performs signs and wonders in order to demonstrate that he is God's chosen one.

All of the Gospels report that Jesus was arrested and executed by crucifixion in Jerusalem by the political authorities of the Roman Empire. All four Gospel accounts mention that Pontius Pilate, the Roman prefect of Judaea, gave the order for his crucifixion. However, the Gospel accounts themselves, as well as later commentators, disagree about the respective roles of religious and political leaders in the death of Jesus. The charge on which he was convicted—claiming to be king of the Jews—could have been understood as both blasphemy and sedition, and thus Jesus could have been a threat to both institutional Judaism and the Roman Empire, and their respective leaders.

RESURRECTION AND THE PEOPLE OF THE WAY

The events of the birth, life, and death of Jesus are interpreted by the Gospel writers in light of the expe-

riences of the Jesus community, or "people of the Way," after Jesus' crucifixion. All Gospels in their handed-down forms include accounts of the Resurrection of Jesus, by which Jesus came to life again after burial in an undeniable and life-transforming way for his followers. The Gospels include stories of his appearance several times among his followers until he ascended again to be with God (Acts 1:6–11).

The Gospel accounts and other texts collected in the Christian New Testament record early attempts to understand who Jesus was, and how his birth, life, death, and resurrection should shape his followers' lives. Christians from the first century CE until the present have also sought to make sense of Jesus and, indeed, to follow him. The description of how Jesus was uniquely chosen and sent by God, but remained a human being living among his community, has led Christians to develop a number of theological beliefs about him. Jesus the Christ came to be understood as both fully human and fully divine in nature—a view clarified by the Council of Chalcedon (451 CE). Jesus was God incarnated, taking on human form, but still God. Although the concept of the Trinity is not present in the New Testament, later theologians would come to understand Jesus Christ, Son of God, as the second person in the Trinity, along with God the Father and God the Holy Spirit. In the same way that controversy has ensued over how Jesus Christ can be fully human and fully divine, so too have Christian theologians debated how the one God can be triune, that is, existing in three persons.

APPEALS TO JESUS AS A LEADER

For many persons—and not only Christians—Jesus has served as a paradigm of a leader. Yet the historical limitations and the theological complexity surrounding Jesus together make it difficult to understand Jesus as a human leader. From Jesus' calling of his first disciples (Mark 1:16–20 and parallels), he directed his followers to heal and teach in his name. Yet the ideal of Jesus, fully divine as well as fully human, is unattainable. Leaders and theologians, in the past and in the present, have frequently lifted up his model of self-giving and strong regard for others,

Selection from the Sermon on the Mount

(Matthew 5, King James Version)

- 1: And seeing the multitudes, he went up into a mountain: and when he was set, his disciples came unto him:
- 2: And he opened his mouth, and taught them, saying,
- 3: Blessed are the poor in spirit: for theirs is the kingdom of heaven.
- 4: Blessed are they that mourn: for they shall be comforted.
- 5: Blessed are the meek: for they shall inherit the earth.
- 6: Blessed are they which do hunger and thirst after righteousness: for they shall be filled.
- 7: Blessed are the merciful: for they shall obtain mercy.
- 8: Blessed are the pure in heart: for they shall see God.
- 9: Blessed are the peacemakers: for they shall be called the children of God.
- 10: Blessed are they which are persecuted for righteousness' sake: for theirs is the kingdom of heaven.
- 11: Blessed are ye, when men shall revile you, and persecute you, and shall say all manner of evil against you falsely, for my sake.
- 12: Rejoice, and be exceeding glad: for great is your reward in heaven: for so persecuted they the prophets which were before you.
- 13: Ye are the salt of the earth: but if the salt have lost his savour, wherewith shall it be salted? it is thenceforth good for nothing, but to be cast out, and to be trodden under foot of men.
- 14: Ye are the light of the world. A city that is set on an hill cannot be hid.
- 15: Neither do men light a candle, and put it under a bushel, but on a candlestick; and it giveth light unto all that are in the house.
- 16: Let your light so shine before men, that they may see your good works, and glorify your Father which is in heaven.
- 17: Think not that I am come to destroy the law, or the prophets: I am not come to destroy, but to fulfill.
- 18: For verily I say unto you, Till heaven and earth pass, one jot or one tittle shall in no wise pass from the law, till all be fulfilled.
- 19: Whosoever therefore shall break one of these least commandments, and shall teach men so, he shall be called the least in the kingdom of heaven: but whosoever shall do and teach them, the same shall be called great in the kingdom of heaven.
- 20: For I say unto you, That except your righteousness shall exceed the righteousness of the scribes and Pharisees, ye shall in no case enter into the kingdom of heaven.
- 21: Ye have heard that it was said by them of old time, Thou shalt not kill; and whosoever shall kill shall be in danger of the judgment:
- 22: But I say unto you, That whosoever is angry with his brother without a cause shall be in danger of the judgment: and whosoever shall say to his brother, Raca, shall be in danger of the council: but whosoever shall say, Thou fool, shall be in danger of hell fire.
- 23: Therefore if thou bring thy gift to the altar, and there rememberest that thy brother hath ought against thee;
- 24: Leave there thy gift before the altar, and go thy way; first be reconciled to thy brother, and then come and offer thy gift.
- 25: Agree with thine adversary quickly, whiles thou art in the way with him; lest at any time the adversary deliver thee to the judge, and the judge deliver thee to the officer, and thou be cast into prison.
- 26: Verily I say unto thee, Thou shalt by no means come out thence, till thou hast paid the uttermost farthing.

but few persons have been willing and able to exercise the kind of self-giving and other-serving leadership that Jesus exercises in the Gospels.

Notwithstanding the difficulties of reaching Jesus' ideal, theological understandings of Jesus Christ as the founder and head of the church have made him a paradigm for ecclesiastical leaders. The Christian Church as a whole, and local manifesta-

tions of the church, are understood theologically to be the body of Jesus Christ in the world. In many churches, certain of Jesus' attributes (such as maleness, celibacy) have been lifted up as requirements for church leaders, even as other features (language, ethnicity, height) have been regarded as less essential elements of Jesus and therefore of church leaders. Many church institutions and denominations who

permit only men to be called as clergy invoke an argument about Jesus' maleness, while some have shifted their theology to allow men who are married or noncelibate to serve as clergy. Proponents of allowing qualified women to serve as clergy appeal, in contrast, to Jesus' actions in welcoming women into his own circle and into Galilean society. Debates over gender and church leadership continue to be shaped, on both sides, by such competing understandings of and appeals to Jesus.

The historian Jaroslav Pelikan (in *Jesus through the Centuries*, 1985) has shown that political as well as religious leaders across the ages have referred to some aspects of Jesus as leader (for example, "king of kings" or "the prince of peace") to justify their own authority, even as Jesus has been portrayed variously in ways consistent with prevailing ideas and concepts. In contrast to the persecution and marginal status of Christians in the early church, Constantine the Great won control of the Roman Empire (312 CE) under the motto "One God, one Lord, one faith, one church, one empire, one emperor." Ever since that time, many political leaders in the West and elsewhere have claimed the Christian cross as part of their legitimacy.

At the end of the nineteenth century, and coinciding with the discovery of the "historical Jesus," liberal and conservative Christians alike showed a renewed interest in leading like Jesus, or following Jesus, in the newly industrialized world. Walter Rauschenbusch, the best-known "social gospel" theologian, wrote his *Social Principles of Jesus* (1916), among other works, in an effort to communicate how modern society could be made more just if Jesus' commitment to ushering in the Kingdom of God were taken on by the people. From a more conservative, evangelical standpoint, Charles Sheldon's bestselling *In His Steps* (1896) offered a fictionalized account of a church in which successful industrialists took seriously the question, What would Jesus do if he were in my situation? The pioneering advertising executive Bruce Barton claimed in his book *The Man Nobody Knows* (1925) that the "real Jesus" was an entrepreneur who can show business managers how to lead well. These attempts expressed a conviction that Jesus' will could readily be determined (though

Rauschenbusch would disagree significantly with Sheldon and Barton on the substance of Jesus' will) and that its context—from an agrarian preindustrial society on the margins of the Roman Empire—could be readily translated to the contemporary world.

One vocal critic of such efforts to employ Jesus as a paradigm for ethical action was the U.S. theologian Reinhold Niebuhr, who insisted that sinful human beings who seek to be leaders in a sinful world should not employ Jesus' ethic in any direct way. Jesus, rather, stands as an impossible ideal that calls persons to act compassionately, especially in their personal relationships, but whose demands cannot be kept in the public sphere. Given the power struggles of contemporary political and economic systems in a competitive, hard society, it is incumbent for leaders to employ all of the power at their disposal on behalf of the interests of their constituents. For Niebuhr, approximating justice, not following the love ethic of Jesus, is the best that imperfect and self-interested human beings can do in society.

Despite such realist arguments that discount the direct relevance of Jesus' life and message, attempts to lead like Jesus have continued across the twentieth century. Social and political movements have appealed to Jesus as a nonviolent peacemaker or as a radical figure standing up for justice in the face of political and economic oppression. In the management and leadership fields, in contrast, Jesus has been invoked as a paradigmatic manager. Laurie Beth Jones's 1995 book *Jesus CEO* portrays Jesus as a great leader with the strengths of "self-mastery" (p. 1), "action" (p. 79), and "relationships" (p. 175). Rather than attending to the prophetic dimensions of Jesus' thought that criticized the powers of his day, these texts attempt to cull basic insights from the Gospels, such as "take risks," "be patient," and "empower followers."

Similarly, contemporary evangelical Christians in the United States and elsewhere have renewed an interest in Sheldon's question, What would Jesus do? A host of books on "servant leadership" and "Christ-like leadership" apply Jesus' message to contemporary life. These models of leading like Jesus, whether in the church or in society, however, tend to pay little attention to contextual or historical factors.

CONTEMPORARY DEVELOPMENTS AND PROSPECTS

The interest in Jesus by New Testament scholars, ethicists, and students and practitioners of leadership continues to fuel widespread discussion about Jesus for church and society alike. Scholars within and beyond the church pursue an understanding about the “historical Jesus.” Despite the small likelihood that fundamentally new insights will come from the discovery of lost texts, the ongoing quest to understand Jesus within the first-century Palestinian and Roman worlds promises to shed new contextual understanding about Jesus. Within the church, discussion of Jesus remains present in cross-denominational and ecumenical dialogue, ordination debates, and biblical interpretation. The interreligious dialogues, within the so-called Abrahamic faiths (Judaism, Christianity, and Islam) and beyond, face challenges about the identity and teachings of Jesus. Political leaders in countries with large numbers of Christians continue to appeal to the teachings or example of Jesus in their own efforts. Scholars and practitioners of leadership can learn from the careful efforts of New Testament scholars to take into account the cross-contextual complexities when relating Jesus to contemporary leadership.

🌐 JOHN XXIII, POPE (1881–1963)

Pope of the Roman Catholic Church

John XXIII was the 259th pope (earthly head of the Roman Catholic Church and bishop of the diocese of Rome) and served as pope from 28 October 1958 to 3 June 1963. Born Angelo Giuseppe Roncalli in the Italian village of Sothe il Monte near Bergamo on 25 November 1881, he was dubbed “Shepherd of the Modern World” (Hebblethwaite 1985, title) primarily because he called the Second Vatican Council (Vatican City, 1962–1965), through which the Roman Catholic Communion actively and explicitly engaged modernity. Pope John XXIII has been described as “the most significant pope of the twentieth century” (Küng 2002, 190); along with Gregory the Great (590–604 CE) as one of only two “outstanding popes” and as “the most beloved, ecumenical, and openhearted pope in history” (McBrien 1997, 430); and as the pope with an “authentically

human face” (José Oscar Beozzo, quoted in Alberigo & Komonchak 1995, 381). He is most commonly known as “good Pope John” because of his warm, humble personality and personal engagement particularly with the people of the city of Rome. He returned to ancient Christmas practices of visiting the prisoners at Regina Coeli and of visiting patients in local hospitals.

The Second Vatican Council under the leadership of John XXIII can hardly be understood apart from the Second Vatican Council (most commonly known as Vatican II): this is the council that was his own idea, that he called and implemented in order to deal with the challenges to Catholic Christianity in the mid-twentieth century. In retrospect, his life experiences are displayed by his leadership at this council. This leadership manifest itself in his transformation of the papacy into a voice for universal human rights and in the revitalization of the Catholic church’s self-understanding particularly with regard to its relationship to other Christians and people of other religious traditions as well as with the outside world. Leo XIII (served as pope 1878–1903), John XXIII’s predecessor, began in earnest the tradition that is now called “Catholic Social Teaching” with his encyclical on the rights of workers, *Rerum Novarum* (Of New Things), “On the Condition of the Working Person,” (titles of documents from the teaching magisterium of the Catholic Church are often taken from the first few words, hence “Of new things”; the topic of the encyclical is the condition of laborers). It is John XXIII, however, who laid the foundation for the current international status of the Catholic papacy. His legacy is displayed in the response to Pope Paul VI at the United Nations in 1965, where Pope Paul proclaimed, “Never again war!” and the recognition of John Paul II as a religious leader whose voice is taken seriously by the international religious and political communities. This recognition of the Catholic pontiff as a spokesperson for peace is the legacy of John XXIII.

CUBAN MISSILE CRISIS

In October 1962, when the United States and the former U.S.S.R. were involved in the Cuban missile cri-

sis, Pope John acted as a neutral third party in the dispute in such a way as to allow both U.S. President John F. Kennedy and Soviet Premier Nikita S. Khrushchev to back away from war without either one acknowledging defeat. Norman Cousins, who was then the editor of the *Saturday Review*, acted as a liaison between President Kennedy and Pope John in order to solicit a message addressed to the world calling for peace. Pope John had previously been working to thaw the frosty relationship between the Vatican and the Soviet bloc that was a result of several decades of anticommunist teachings coming from the Vatican. He had received Khrushchev’s son-in-law for a papal audience in order to indicate his desire for reconciliation between the East and West, especially the Communist East. In that speech he said, “We beseech all the rulers not to remain deaf to this cry of humanity. May they do all that is in them to safeguard the peace” (Zizola 1978, 8). Pope John expanded this message born of crisis into his greatest encyclical, *Pacem in Terris* (Peace on Earth). Up to this time, encyclicals had been letters from the pope to the Catholic community in order to clarify teachings or to address special concerns of the day. Pope John addressed this letter to “all people of good will,” thus signaling his desire to speak as a religious leader to the entire human community.

EARLY CAREER AND ITS INFLUENCES UPON JOHN XXIII’S LEGACY

Angelo Roncalli was a church diplomat for most of his career, which began at the seminary in Bergamo in 1892 and continued in Rome in 1900. Roncalli was still studying for the priesthood when his studies were interrupted by military service in 1901 and 1902, a time to which he credited learning both “strict discipline” and the discovery of “practical ways” of drawing people to “all that is good” (John XXIII 1965, 415). He received his doctorate in church history in 1904 and was ordained in August of the same year at Santa Maria in the Piazza del Popolo in Rome. In April 1905, he returned to Bergamo after ordination as secretary to the bishop Radini Tedeschi. While he worked closely with Tedeschi he learned the value of episcopal visits to

Excerpt from Pope John XXIII's Radio Address during the Cuban Missile Crisis

We remind those who bear the responsibility of power of their grave duties. With your hand upon your heart, may you listen to the anguished cry that from all points of the land, from innocent babes to the old, from people to communities, rises towards heaven: peace! peace! We today renew this solemn invocation. We beseech all rulers not to remain deaf to this cry of humanity. May they do all that is in them to safeguard the peace. They will thereby keep the horrors of war from the world—a war whose horrible consequences no one can foresee. May there continue to be discussions because this loyal and open attitude testifies to each party's conscience and stands as evidence before history. To promote, favor, and accept discussion at all levels and in all times is a rule of wisdom and of prudence that will call down the blessing of heaven and earth.

all the diocesan parishes. During this time he also taught in the seminary at Bergamo and first encountered the difficulty of the Roman church's stance toward what it then labeled "modernism." In the early years of the twentieth century, the institutional church in Rome was hostile to the growth of rationalism as it was developing as an intellectual framework. Roncalli was teaching in 1907 when Pope Pius X condemned the attempts to reconcile Christian faith with rational philosophy and the adjacent developments in science, technology, and industrialization and with the democratizing movements that flowed from the embrace of rationalism. Pius saw them as threats to the idea of the supernatural and as a rejection of a particular metaphysics upon which much of Catholic theology up to that point had been based. The emerging "historical criticism" of Scripture that would become the official method of Catholic biblical interpretation was particularly suspicious to Pius X and his fellows. In November of 1907, the statement was issued from the Vatican stating that those who opposed the teaching of Pius X, in particular the encyclical *Pascendi Dominici Gregis* (Feeding the Flock), would be excommunicated. Then a twenty-six-year-old professor of church history, Roncalli was asked to lecture in commemoration of a third-century church historian who had attempted to reconcile the secular and rational with

the sacred and the supernatural. He worked his way through this ecclesiastical minefield using tools that he would come to be famous for: his use of the Catholic tradition of renewal and reform to deal with the changing situations and contexts that the church found itself in as it became a global reality and his keen understanding of the difference between a truth and its various expressions. Perhaps his most famous and surely most cited statement follows in this tradition. He said it fifty-five years later at the opening of the Second Vatican Council, which was the assembly of the worldwide bishops in the Vati-

can to confront the challenges that the mid-twentieth century brought to Roman Catholicism. He said, "The substance of the ancient doctrine of the deposit of the faith is one thing, and the way in which it is presented is another." This statement is a lapidary summary of Pope John's fundamental theological stance as well as the signal statement that the Catholic hierarchy embraced at the Second Vatican Council in order to usher in the reforms that Pope John intended. He was determined to find ways to proclaim the gospel of Jesus Christ in keeping with the needs of the present time while remaining faithful to the essentially humane message of that gospel. He sought collaboration and dialogue with people involved in the various developments for human rights during this period. He did not see these social movements as a threat, and certainly did not see them as inherently anti-Christian or antireligious as some did. He was convinced that Christianity possessed a message that could serve the world.

During World War I, Roncalli was conscripted as a hospital orderly in 1915. In this work we find another experience that has an echo later at the Second Vatican Council. In a homily he gave in 1920, he reflected upon the war: "War is and remains the greatest evil, and he who had understood the meaning of Christ and his Gospel of human and Christian brotherhood can never detest it enough" (Hebbleth-

waite 1985, 83). Previous to Vatican II, which was the twenty-first ecumenical (worldwide) council of the Catholic church, it had been typical to issue condemnations of teachings that the council found erroneous or heretical; these condemnations were called “anathemas.” In the manner of the distinctive spirit of Vatican II, the only condemnation it made was of war.

DIPLOMATIC SERVICE

In 1921, Roncalli was appointed to a curial office (the Roman Curia is the bureaucracy composed of various agencies in the government of the institutional Catholic church in Rome); he went on to be a career diplomat for the Vatican. In 1925, he was appointed as apostolic visitor to Bulgaria; for this purpose he was ordained as an archbishop. He served there for ten years and during that time his desire for reconciliation between the Eastern and Western Christian churches was sharpened. Roncalli’s sensitivity to the issue of inter-Christian dialogue and acceptance can be traced to the time he spent as a Vatican diplomat first in Bulgaria, and then in Turkey (1934) and Greece (1941–1944). There he worked with the Orthodox and with Muslim leaders to deal with the effects of war and famine. He also tried to prevent the deportation of Jews during this time.

In 1944, he was appointed nuncio (a specific delegate who represents the Vatican to a civil government and to the local Catholic church in the same nation or state) to France. Here he had to deal with the end of the World War II and its aftereffects in France. The French Catholic Church was suspect to many in the Roman Curia because of the historical tensions between this culturally and politically powerful church and the Vatican. In addition, several reform movements, the worker-priest movement and the liturgical movement in particular, that were percolating in the Catholic community were very active in France. Roncalli acted as a calming presence while in France. The shadow of anti-Semitism and failure of Pius XII (the pope during World War II and Pope John’s immediate predecessor) to publicly condemn Nazism, as well as the collaboration of some French bishops with the Nazis, hung over postwar

Europe. Roncalli sought to find ways to heal the rift between Christians and Jews, especially the seeds of anti-Semitism that were still found in Christian preaching and liturgy at mid-century. Later, during his pontificate, he had his driver stop in Rome to bless Jews on their way to synagogue. This *bella figura* is just one of many similar symbolic actions for which Pope John became known. In a papal audience with a group of Jews, he greeted them saying, “I am Joseph, your brother.” A similar action was his removal of the offensive phrase “treacherous Jews” (*perfidis Judaeis*) that had been a part of Catholic Good Friday liturgy for centuries. During his time as nuncio to France, he was also the Vatican’s first permanent observer to the United Nations Educational, Scientific, and Cultural Organization (UNESCO). In 1953 he was made patriarch of Venice, where he served until he became pope.

JOHN XXIII’S LEGACY

Pope John XXIII’s particular legacy for Catholic theology and practice is his pastoral style that placed what he called the “medicine of mercy” above rules and regulations. This characteristic emerged early on and can be credited in part to his first assignment while a priest as secretary to Radini Tedeschi, who was himself a compassionate man who placed Christian love and care before institutional forms. Another influence upon Roncalli was Charles Borromeo, who was also a Bergamese bishop and who worked to instantiate the reforms of the Council of Trent (1545–1563), where distortions and abuses of Catholic doctrine and practice were addressed. John XXIII became famous for repeating the adage that “history is the teacher of life.” He caused the Catholic church to finally shed the Counter-Reformation mentality that had obtained since the Council of Trent, whereby Catholicism defined itself primarily in opposition to the Protestant movement and defined those churches not as churches per se but as schismatic and/or heretical communities. Pope John began the process that at Vatican II put an end to this way of thinking. He introduced the irenic language of “separated brethren” to describe these communions.

John XXIII brought the institutional Catholic

church into active dialogue with the modern world. He gave pride of place to the method of dealing with teaching and with specific timely issues by starting with the concrete human experience of the persons involved. This move to the inductive method in contrast to beginning with supposedly timeless principles, as so many of his immediate predecessors had done, is his signal legacy in the Catholic church. He died of stomach cancer on 3 June 1963. He had made his last appearance on May 23. There was a death watch in St. Peter's Square from then until his death to honor the "most beloved pope in history" (McBrien 1997, 375).

JOHNSON, LYNDON (1908–1973) U.S. president

Lyndon Johnson was the architect of the Great Society—U.S. federal social program—and commander in chief of the U.S. military during the escalation of the Vietnam War. His life illustrated both the possibilities of a democratic leader and the tragic consequences when a president deceived his constituents about military involvement in southeast Asia.

THE HILL COUNTRY LEGACY

Lyndon Johnson was born in the rural Texas Hill Country, where people set high expectations for him as a future political leader from childhood. His father was a member of the Texas Legislature, and his

mother hoped that her son might rise to be a U.S. senator. Although he later liked to stress his family's poverty, young Lyndon grew up in decent circumstances with connections to the state's political hierarchy. When he attended Southwest Texas State College in San Marcos, he was active in campus politics and ingratiated himself with the college's president. By 1930, he was running political campaigns for legislative candidates in Texas, coaching high school debating teams, and eyeing a career in elective affairs. Soon he was hired as an aide to Congressman Richard Kleberg and was off to Washington.

During the next four years, Johnson's energy and determination carried him to a position of influence on Capitol Hill beyond his years. He was elected head of the "Little Congress," an association of congressional aides, and made valuable contacts within the Texas congressional delegation. Friendship with Congressman Sam Rayburn was especially useful. In 1934 Johnson married Claudia Alta "Lady Bird" Taylor. A year later he was offered the position of director of the Texas branch of President Franklin Roosevelt's National Youth Administration (NYA), which was established to provide work for unemployed youths.

FROM TEXAS TO WASHINGTON

Johnson used the NYA position to construct a statewide organization of friends and political allies. He impressed President Franklin D. Roosevelt with his administrative ability. Within the limits of a segregated society, he sought to assist black Texans with NYA programs. Then, in February 1937, the death of the representative for the Tenth Congressional District near Austin gave Johnson his chance. In a special election, he defeated seven other rivals to gain a seat in the U.S. House of Representatives. At the age of twenty-eight, he had the chance he coveted to exercise power on the national stage.

The next eleven years were frustrating for an aspiring leader such as Lyndon Johnson. He was an excellent representative in obtaining appropriations and contracts for his central Texas constituents. The slower pace of the House and the difficulty of moving into an influential position caused Johnson to

look toward a move to the Senate. When a special election occurred for a vacancy in the Senate in 1941, Johnson made a strong campaign for the seat but lost to the popular governor, W. Lee "Pappy" O'Daniel. When war broke out in December 1941, Johnson went on active duty with the Navy and flew as an observer on one combat mission in the Pacific, for which he was awarded the Silver Star. Throughout the remainder of the war and into the peace that followed, Johnson prepared himself for another Senate race in 1948.

That race was a turning point in Johnson's career. After securing a place in the primary runoff with Coke Stevenson, a former governor, Johnson eked out a narrow eighty-seven-vote victory in an election marked by court battles, charges of fraud, and a bitter dispute with his rival. The episode won Johnson the derisive title "Landslide Lyndon." However, when the furor died away, Johnson took his seat in the Senate in January 1949.

THE SENATE LEADER

Johnson adapted readily to the practices of the Senate and soon mastered its rules and procedures. By 1952, he was elected minority leader of the Democrats. In 1954 Johnson was an important force in achieving the censure of Senator Joseph R. McCarthy of Wisconsin, whose campaigns against alleged Communists had made him both powerful and controversial. McCarthy had attacked fellow senators, and Johnson skillfully managed the minority Democrats so that McCarthy was rebuked.

After the 1954 elections, when his party regained the majority, Johnson became the Senate majority leader. For the first time he now occupied a post that gave him a chance to direct national policy. The three years that followed were probably the happiest of Lyndon Johnson's life. He was a superb manager of the Senate and his colleagues. He knew more than anyone else about opinion among senators, and he scheduled votes and debate with a keen eye for the ultimate result. Johnson devoted endless hours to tracking the mood of the Senate and accommodating the needs of his members. Within a year, he was regarded as the master of the Senate.

With a membership closely divided between Republicans and Democrats, the Senate did not enact much significant legislation while Johnson was leader. The most important was the Civil Rights Law of 1957. Although it made only a modest advance in ensuring civil rights for African-Americans, the law was the first legislation to deal with the subject in three-quarters of a century. Johnson's skill and tenacity moved the Senate to take an important symbolic step toward the civil rights revolution of the 1960s. In the process, Johnson took some of the edge off his own record of defending segregationist laws as a southern senator.

NATIONAL AMBITIONS

By the mid-1950s, Johnson's ambition to be president took him into Democratic politics beyond Texas. A try for the party's presidential nomination in 1956 flopped, and it was evident that his southern roots would be a handicap in another race in 1960. In that race, Johnson started late and never made an all-out run for the nomination. He counted on the support of fellow senators to deliver their states to him at the national convention. Meanwhile, John F. Kennedy of Massachusetts pursued the nomination through party primaries and by the time the national convention was held in Los Angeles was on the verge of a first-ballot victory. Once nominated, Kennedy asked Johnson to be his running mate. Although many of Johnson's advisors counseled him against accepting second place on the ticket, Johnson knew that this was his best chance at presidential leadership in the future. If Kennedy won, Johnson would be the designated successor after what everyone assumed would be two terms for the winner of the 1960 election. Should Kennedy lose, Johnson would have done his best for the Democrats. The Senate offered Johnson no real future. The vice presidential nomination did. To the surprise of everyone, perhaps including Kennedy, Johnson went on the ticket and campaigned hard for Kennedy in the South.

The resulting victory left Johnson in the uncomfortable role of vice president for the next three years. He chafed under the scorn of the people around Kennedy, and he found little constructive to

Selections from Lyndon B. Johnson's Address to the Nation, 31 March 1968

At the end of a 1968 television address in which he announced steps to limit the war in Vietnam, President Lyndon Johnson stunned the nation with his announcement that he would not seek reelection.

Good evening, my fellow Americans:

Tonight I want to speak to you of peace in Vietnam and Southeast Asia.

No other question so preoccupies our people. No other dream so absorbs the 250 million human beings who live in that part of the world. No other goal motivates American policy in Southeast Asia.

For years, representatives of our Government and others have traveled the world—seeking to find a basis for peace talks.

[...]

I cannot promise that the initiative that I have announced tonight will be completely successful in achieving peace any more than the 30 others that we have undertaken and agreed to in recent years.

But it is our fervent hope that North Vietnam, after years of fighting that have left the issue unresolved, will now cease its efforts to achieve a military victory and will join with us in moving toward the peace table.

And there may come a time when South Vietnamese—on both sides—are able to work out a way to settle their own differences by free political choice rather than by war.

[...]

Our objective in South Vietnam has never been the annihilation of the enemy. It has been to bring about a recognition in Hanoi that its objective—taking over the South by force—could not be achieved.

[...]

So, I repeat on behalf of the United States again tonight what I said at Johns Hopkins—that North Vietnam could take its place in this common effort just as soon as peace comes.

Over time, a wider framework of peace and security in Southeast Asia may become possible. The new cooperation of the nations of the area could be a foundation-stone. Certainly friendship with the nations of such a Southeast Asia is what the United States seeks—and that is all that the United States seeks.

One day, my fellow citizens, there will be peace in Southeast Asia.

[...]

Finally, my fellow Americans, let me say this:

Of those to whom much is given, much is asked. I cannot say and no man could say that no more will be asked of us.

Yet, I believe that now, no less than when the decade began, this generation of Americans is willing to “pay any

price, bear any burden, meet any hardship, support any friend, oppose any foe to assure the survival and the success of liberty.”

Since those words were spoken by John F. Kennedy, the people of America have kept that compact with mankind's noblest cause.

[...]

Throughout my entire public career I have followed the personal philosophy that I am a free man, an American, a public servant, and a member of my party, in that order always and only.

For 37 years in the service of our Nation, first as a Congressman, as a Senator, and as Vice President, and now as your President, I have put the unity of the people first. I have put it ahead of any divisive partisanship.

And in these times as in times before, it is true that a house divided against itself by the spirit of faction, of party, of region, of religion, of race, is a house that cannot stand.

There is division in the American house now. There is divisiveness among us all tonight. And holding the trust that is mine, as President of all the people, I cannot disregard the peril to the progress of the American people and the hope and the prospect of peace for all peoples.

So, I would ask all Americans, whatever their personal interests or concern, to guard against divisiveness and all its ugly consequences.

[...]

Believing this as I do, I have concluded that I should not permit the Presidency to become involved in the partisan divisions that are developing in this political year.

With America's sons in the fields far away, with America's future under challenge right here at home, with our hopes and the world's hopes for peace in the balance every day, I do not believe that I should devote an hour or a day of my time to any personal partisan causes or to any duties other than the awesome duties of this office—the Presidency of your country.

Accordingly, I shall not seek, and I will not accept, the nomination of my party for another term as your President.

But let men everywhere know, however, that a strong, a confident, and a vigilant America stands ready tonight to seek an honorable peace—and stands ready tonight to defend an honored cause—whatever the price, whatever the burden, whatever the sacrifice that duty may require.

Thank you for listening.

Good night and God bless all of you.

do in his secondary position. People in Washington even said he might not be on the ticket in 1964. Then came the assassination of Kennedy in Dallas, and Johnson was suddenly the president under traumatic circumstances. In the national crisis, Johnson showed his strengths as a leader by reassuring a shocked nation and promising continuity with the programs of his fallen predecessor. During the next eighteen months, Johnson was at his best in the White House.

EFFECTIVE NATIONAL LEADERSHIP

Johnson's command of Congress and his sense of domestic priorities enabled him to push through a measure to cut taxes, to launch the War on Poverty and, most important, to achieve enactment of the Civil Rights Act of 1964. Beating back a filibuster by southern senators, Johnson insisted on a tough law that produced a real change in how African-Americans stood with the law in regard to public accommodations. Even at the risk of losing states in the South in the 1964 presidential election, Johnson persevered to write into law the goals of a more equal nation.

In the presidential election, Johnson forged a powerful majority to defeat the Republican candidate, Barry Goldwater of Arizona. Part of Johnson's appeal lay in the idea that he would be a more cautious and careful president, particularly in respect to the crisis in southeast Asia over the struggle between North and South Vietnam. Johnson conveyed the strong impression to voters that he would not escalate the war, which had already grown in violence. Once elected with a huge majority, Johnson found that the military situation in Vietnam was deteriorating. As a result, he escalated the war in 1965, first by bombing North Vietnam and then by committing thousands more U.S. ground troops. For the next three years of his presidency, Johnson used his leadership to involve the United States more deeply in the war in an effort to coerce North Vietnam into a negotiated settlement.

THE VIETNAM DILEMMA

Johnson also pursued his Great Society program at home with a large agenda of legislation in 1965–1966.

He achieved a voting rights law for African-Americans, created the Medicare system of health insurance for the elderly, and obtained laws to protect the environment. However, by 1966 his command of Congress faltered, and resistance grew within the country to the expansion of federal power. Democratic losses in the 1966 congressional elections weakened Johnson's mastery of Congress. Racial tensions in the nation further eroded Johnson's political base and support for his liberal nationalism in the White House.

The war in Vietnam, which seemed stalemated by 1967, was the major drag on Johnson's political standing. Unable to articulate his reasons for pursuing the war to the U.S. people, Johnson became a president whose ability to travel around the country was restricted. On television he seemed overbearing and loud, and his popularity sagged. The lengthening casualty lists and the prospect of an endless involvement in Vietnam made the war less acceptable to many U.S. citizens, even when they sympathized with Johnson's anti-Communist goals.

By this time, Johnson's ability to lead the nation had been seriously compromised. On both the right and the left, faith in his honesty had receded. Within the Democratic party, first Senator Eugene McCarthy of Minnesota and then Senator Robert F. Kennedy of New York became challengers for the nomination in 1968. The Tet offensive in South Vietnam, launched by the North Vietnamese in early 1968, showed that U.S. claims of victory in the war were premature. Even though the enemy suffered heavy losses, its capacity to launch a strike against the United States convinced many of Johnson's constituents that the war could not be won at an acceptable cost.

WITHDRAWAL FROM LEADERSHIP

With his political base eroding and his renomination in doubt, Johnson took a dramatic step to renounce national leadership. Convinced that he would not survive another term because of his uncertain health, Johnson made a nationally televised address on 31 March 1968, in which he said he would not accept another presidential nomination from his party. The

address briefly revived his popularity, but he spent the remainder of his term in a vain search for a way to start negotiations with the North Vietnamese. In January 1969, he left office perceived as a failed president who had started well and then lost the confidence of the U.S. people because of his deceptions and failures in foreign policy.

Lyndon Johnson had great potential and impressive talents as a national leader, and for a time he achieved important results in domestic policy. In dealing with the Vietnam War, however, he practiced escalation on the sly and never leveled with the U.S. people about the real costs and dangers of the nation's involvement in southeast Asia. When the war went badly, his deceptions and poor judgment opened up a credibility gap with the people whom he had been elected to lead. Lyndon Johnson's tragic career is an object lesson in how not to conduct the affairs of a democracy to achieve effective leadership.

JONESTOWN MASS SUICIDE

In 1978, the world was shocked to learn of the mass suicide of virtually all of the members of a small, obscure church called the “People’s Temple.” More than nine hundred people took their lives in the church’s compound in Guyana, South America, drinking cyanide-laced Kool-Aid at the order of the church’s founder and leader, the Rev. Jim Jones.

The phenomenon of mass suicide is extremely rare in human history, probably because the self-preservation instinct is the most basic of all human motives, and overcoming it for a large group of people at the same time is extraordinarily difficult. In 72 C.E., the Jewish defenders of the fortress called “Masada” chose to die rather than be taken prisoner by the Romans. In Waco, Texas, in 1993 the followers of evangelist David Koresh apparently elected to die after a long siege by U.S. law enforcement (although considerable evidence suggests that many tried to flee but were murdered by Koresh’s armed guards). The next year, in an unrelated case, fifty-eight members of an obscure church called the “Solar Temple” killed themselves in Switzerland. In 1997 eighteen men belonging to a group called the “Heaven’s Gate Church” took their own lives. There are a few other known cases, but such occurrences are extremely uncommon. Those that do occur therefore deserve close examination.

Jim Jones had grown up a quiet, unsociable boy who might have become one of life’s losers had he not discovered that he possessed the gift of preaching. The power to move others with his words gave Jones a sense of satisfaction and pleasure that he had never known. He founded the People’s Temple in Indiana, and from the beginning the church stressed social activism and a commitment to racial equality. Blacks and whites were equally welcome in the People’s Temple—a phenomenon not often found in the U.S. heartland during the early 1960s.

In 1965, Jones relocated the church to San Francisco. Some of his Indiana congregation made the journey with him, and many more people joined in California. While Jones continued the church’s work of helping the downtrodden, he also became more demanding of his followers and more extreme in his

view that he and the People's Temple were surrounded by enemies who would stop at nothing to destroy them. In 1977, Jones decided to relocate the church to a compound he had purchased in the jungles of Guyana. Almost one thousand of his followers went with him.

In the isolated church compound, Jones became more strident and controlling. He required church members to submit to him in all matters—religious, financial, personal, even sexual. Shortly thereafter, Congressman Leo Ryan, who represented the area of San Francisco where Jones's church had been headquartered, began to receive anxious calls and letters from family members of those people who had gone with Jones to Guyana. These constituents of Ryan were concerned that their relatives had been incomunicado since arriving in Guyana, and they feared that some might be held there against their will. In November 1978, Ryan and a small entourage traveled to Jonestown to inspect conditions there firsthand.

Ryan apparently found Jonestown to be a productive, peaceful community whose members had nothing but praise for the Rev. Jones. However, a few people told Ryan they wanted to leave, and he agreed to take them back on his plane with him. However, as Ryan and his party were boarding their plane to leave, they were ambushed by a group of gunmen sent by Jones. Ryan and four others were killed.

Back at the church compound Jones called together members of the church community. He informed them of Ryan's death but did not mention his own responsibility in the matter. Jones then told the church members that the Guyanese government was going to use the murders as an excuse to destroy the People's Temple. Elements of the Guyanese army, he said, were already on the move, and when they arrived at Jonestown all the church members would be arrested, tortured, and then executed. Jones's followers had no way of knowing that this account was a complete fabrication.

Jones then told members of the People's Temple that it was time to die. Their final deed, he said, would be a defiant act of "revolutionary suicide." Vats of poisoned Kool-Aid were prepared, and the church members lined up to drink. Those who expressed reluctance were coerced by Jones's rifle-

wielding guards. In all, more than nine hundred people died—including Jones himself, whose body was found with a fatal gunshot wound. A few church members pretended to drink the poison and feigned death, thus surviving to provide witness to Jonestown's last horrifying hours.

SUICIDE AS ESCAPE

In order to induce the willingness to commit suicide in the mind of someone who is not severely depressed or suffering from some other severe mental disorder, a person must present death as an escape—either *from* something or *to* something. The defenders of Masada, a fortress on the edge of the Judean Desert and the Dead Sea Valley, killed themselves the night before the Romans were expected to storm the walls of the fortress. Because rebels against Rome who were taken alive invariably suffered slow, agonizing deaths, the Jews at Masada apparently decided to spare themselves such a fate while also making one last defiant gesture toward their oppressors. During the Indian Wars that accompanied the settling of the U.S. frontier, many whites feared being captured by their "savage" enemies in the belief that death by torture was sure to follow. White tales of Native American torture practices were sometimes accurate (as in the case of the Apaches), often exaggerated, and sometimes com-

Selection from *The Letter Killeth* by Jim Jones

In this 24-page pamphlet, found at Jonestown, Jim Jones sought both to criticize the shortcomings of the Bible and also establish the Biblical foundation of the Peoples Temple.

Message from the Apostle

I have come to make God real in the lives of people. My only desire is to establish the great work of Jesus Christ on our troubled globe. I have taken the true scriptures to heart, where it declares in Phillipians 2 for us to "let this mind be in you, which was also in Christ Jesus: Who being in the form of God, thought it not robbery to be equal with God" (and we are all created in His image and likeness-form). I am crucified with Christ; nevertheless I live; yet not I (my personal ambitions), but Christ liveth in me."

It is written and proven that as a man thinketh in his heart so is he. Thus I have decided to be fully and completely the temple of the Holy Ghost, which scripture instructs us all to be. It was *declared* by the savior-teacher, Jesus, in Nazareth consciousness, that there are 30 fold, 60 fold and 100 fold. Or to interpret accurately, one can be 30 percent yielded to God or 100 percent. I have settled for nothing less than His fullness dwelling in me.

God and Jesus are as reincarnatable as a child's smile. Matthew 25 says when you feed a hungry person or clothe a naked child you have been doing it directly to Jesus Himself. Let me bring to your remembrance that after Jesus left the Body in the Sonship degree, not even those who had lived and worked with him for four years recognized the very same Jesus when he appeared in a

different likeness on the road as His followers departed from the tomb. Imagine! they thought they had been speaking with a gardener. Can you not see the mystery? God never appears the same way twice.

God is Love, therefore whoever reincarnates love more fully should be followed: As Paul the apostle related in yesterday, "follow me as I follow Christ." I am causing untold thousands to believe in the Jesus of ancient history by the great miracles of healings, prophecies and discernments I perform in His name! Many have believed God to be dead until I showed them that He is as tangible as the food they eat and the air they breathe. Oh what a privilege it is to live in this recognition and be able to personify the Mind and Works of God in Christ, therefore enabling the pure in heart to see God, and know Him aright, which is life eternal.

Jesus asked when they would stone him, For what good works do you stone me? If you cannot receive me for my name sake, receive me for my work sake. I am fulfilling His words that we are gods and sons of the Most High, and that these things that He did and greater will ye do because He has gone back to the Father. What I am doing so must ye do, that is become living epistles, read and known of all men, (the only Bible or epistle people really read and believe in nowadays).

I am letting concerned humanity see my good works that they might glorify God, the Father.

pletely fabricated. However, the conventional wisdom along the frontier was, "When fighting Indians, save the last bullet for yourself."

Other individuals and groups have chosen suicide as a perceived instant path to paradise. The men of the Heaven's Gate church who took their lives did so in the belief that their souls would be immediately transported to a spaceship after passage of the Hale-Bopp comet—a spaceship that would transport them to heaven. More recently, some Islamic extremists have been willing to become suicide bombers in the belief that this form of martyrdom guarantees their souls an instant passage to eternal bliss.

Jim Jones's appeals to his followers in the final hours at Jonestown combined both of these ele-

ments. He told the church members that the Guyanese army was already en route to the church compound and that its soldiers would destroy the church community and subject its members to torture and death (whether this was a fabrication on Jones's part or a delusion will never be known). Thus, suicide was framed as an escape from painful death. Further, Jones said that the mass self-destruction he was urging would constitute an act of sacred rebellion against the power structures that had oppressed the church members all their lives. Soon, he assured them, all of them would be reunited with Jones in heaven.

Of course, for such an appeal to be successful, the church members had to have absolute faith in Jones

and his pronouncements. Most of them did—and Jones had worked hard to achieve that faith.

JONES AS CHARISMATIC LEADER

The German sociologist Max Weber described charisma as the attribution to a leader of a special quality that sets him apart from all other men. Other scholars have built on Weber's concept, but all would probably agree that the charismatic leader was embodied in the Rev. Jim Jones. Jones was an emotional speaker—both in public venues and in private conversations. He knew how to evoke strong emotions from others, as well. He was adept at portraying himself as a man specially selected by God. Jones would conduct “healing ceremonies” in which he would appear to rip cancerous tumors from the bodies of afflicted church members. Of course, this was one of the oldest conjuring tricks in existence; the “tumors” were rotting chicken gizzards, and their “removal” from the patient's body was no more than sleight of hand. Con artists masquerading as “psychic surgeons” or “faith healers” have used the same device for centuries. Another trick, this one performed by “mentalists,” involves the performer revealing knowledge about an audience member that could not possibly be known by the performer. Of course, mentalists usually have skills gathering intelligence from the audience before the show, and Jones had trusted associates who covertly went through the personal belongings of church members, read their letters and diaries, and passed on the most personal tidbits to Jones. He could thus appear to have read the innermost thoughts and feelings of church members, inspiring the belief that he had near-divine powers.

These and similar techniques allowed Jones to achieve what Ann Ruth Wilner defines as the essence as charismatic leadership: the ability to impose a view of reality upon followers. According to Wilner, a leader's relationship is one of charisma if the followers accept all the leader's statements as fact. The leader is thus permitted by the followers to define reality, and there may be no more profound power that a leader can have. Thus, when Jones told his congregation that the Guyanese army was on the

move toward Jonestown, intent on torture and murder, the church members accepted his words without questioning how Jones, isolated in the jungle, could possibly have knowledge of the army's movements or intentions. Thus, when Jones informed them that a long, painful death was coming, the church members saw the poisoned Kool-Aid as the lesser of two evils, and few paused to question whether the first evil was actually a bona fide threat.

JONESTOWN AS TOTALITARIAN STATE

Charismatic leaders are often seen as the heads of totalitarian political units, and that is exactly what Jim Jones turned the Guyana encampment into: his own private dictatorship. Most of the attributes characteristic of totalitarian states were present, and they allowed Jones to rule over almost one thousand people without competition or challenge.

Like many totalitarian political entities, Jonestown was isolated from its neighbors. Jones controlled who could enter and who could leave. The isolation of the jungle setting made unauthorized departures all but impossible, even if any people were inclined to make such an attempt. All contact with the outside world was conducted by Jones and his most trusted cohorts. All mail sent by church members was vetted by Jones first, and such communication was discouraged in any event.

Totalitarian states favor centralized communication, and in Jonestown all news and information came from one source: the Rev. Jones. Jones provided not only information, but also interpretations. As has already been shown, his view was accepted unquestioningly by people who had been conditioned to call him “Father” and to view him as nearly divine.

Like other dictators such as the Russian leader Vladimir Lenin and the German Nazi leader Adolf Hitler, Jones saw the value of coercive persuasion. His most trusted followers were the only people in Jonestown permitted to carry guns, and those guns were used to enforce Jones's will. However, punishment could be more insidious. Jones sometimes invited those who had questioned him to appear before the assembled church members to confess

their sin. Confession was always followed by punishment. In order to cement his control, Jones often had beatings administered by the sinner's spouse—in front of the whole assembly. Such practices actually served to bind people more strongly to Jones, through the induction of cognitive dissonance (psychological conflict resulting from incongruous beliefs and attitudes). The person who had just punished a spouse would be left to think, “I *must* revere this man above all others—I just beat my wife in public because he told me to.” To reject Jones would mean that one had just committed such an atrocity for no justifiable reason.

Jim Jones was a lonely man who started out looking for love, learned to crave adoration, and ultimately was satisfied with nothing less than absolute control over a community of people who saw him as their savior. He led them all too effectively—to San Francisco, to Guyana, and ultimately to hell on Earth.

JUSTICE

Leaders shape the course of events in just about every group context imaginable, from corporations to social organizations to religious congregations. In accomplishing their work, leaders coordinate

with other people to articulate goals, create plans, and implement strategies. Leaders thus have to create a positive work environment for others who occupy subordinate positions. To create that work environment, leaders have to ensure that all people involved are satisfied with their work environment, including the decisions made and actions taken by the leaders.

Evaluations of fairness play an important role in people's satisfaction with their circumstances. People's judgments of justice also have important implications for how they respond to situations and interactions. In order for leaders to achieve their goals, they must understand the impact of justice concerns on people's reactions to their circumstances.

BELIEF IN A JUST WORLD

People almost always work with assumptions of justice, even when they do not explicitly articulate justice principles in a particular context. The social psychologist Melvin Lerner (1980) proposes that people experience a “justice motive,” which he describes as a need or desire for justice, the concern with “deserving” and justice, and the distress associated with inequity or injustice.

Lerner argues that people believe that the world is fair or just and apply this belief to their perceptions of interactions and situations. People have this “belief in a just world” (BJW) in order to satisfy their need for orderliness and controllability.

Perceiving acts of injustice or victims of injustice violates people's sense that the world is a fair place. People will condemn victims as a defensive maneuver to protect their belief in justice. Victims are perceived as being unattractive, deserving of suffering, conforming to authority, and controlling the situation. Lerner's research has shown that even martyrs, typically held in high esteem by society, are derogated. Presumably this derogation occurs because the suffering of an innocent or nobly motivated victim would threaten one's belief in a just world.

How do people know that the derogation of victims is an indication of a need to preserve the illusion of justice and not just an indication of general misanthropy? The answer is that derogation has been

observed in research studies only when participants have no way to compensate an innocent victim. If participants are given an opportunity to help compensate a victim, they generally take the opportunity and do not derogate the victim.

Further evidence supporting Lerner's assertion that people have a need to believe in a just world has recently been produced by Canadian researcher, Carolyn Hafer. Hafer has demonstrated that participants who hear a news story about an unpunished crime are more emotionally upset than participants who hear a news story about a crime situation in which the criminal is caught and punished. Unpunished crimes violate people's sense of justice, and when people's sense of justice is violated, they experience distress.

Whereas social psychologists such as Lerner have examined the justice motive, others have considered how people arrive at judgments of justice or injustice. On what basis do people perceive injustice? Social psychologists have considered three types of principles that may be used to make judgments of fairness. These principles are distributive justice (which addresses outcomes), procedural justice (which addresses process or procedure), and retributive justice (which addresses punishing perpetrators for their wrongdoing).

DISTRIBUTIVE JUSTICE

When people use distributive justice norms, they interpret fairness in terms of distributions or outcomes. The most influential theory of distributive justice is equity theory. Originally proposed by J. Stacey Adams, equity theory was further developed by Elaine (Hatfield) Walster, Ellen Berscheid, and G. William Walster. Equity theory posits that people feel most comfortable in equitable or fair situations or interactions. Generally, a situation is considered equitable when people receive rewards or goods in proportion to the level of their contribution. In an equitable exchange or interaction, one person's outcomes to relative inputs are equal to the other person's outcomes to relative inputs. A person's inputs are his or her contributions to the exchange, and a person's outputs are his or her "receipts" from the

exchange. An equitable relationship is one in which profits are proportionate to inputs.

Expressed as an algebraic formula, the central proposition of equity theory is that justice is obtained when:

$$\frac{\text{Outcomes of person A}}{\text{Inputs of person A}} = \frac{\text{Outcomes of person B}}{\text{Inputs of person B}}$$

When the proportions are not equal, inequity occurs. If, for example, the ratio of outcomes to inputs is greater for A than for B, A is overbenefited, and B is underbenefited.

Equity theory proposes that inequitable relationships arouse tension or distress, which in turn produce emotional responses, both in those who overbenefit (exploiters) and those who underbenefit (the exploited). Emotional responses such as guilt, shame, and fear are felt by the overbenefited. The underbenefited experience emotional responses such as anger, frustration, and dissatisfaction. According to Walster, Berscheid, and Walster, emotional reactions to inequity are more likely to occur among underbenefited people than among overbenefited people. Of course, different people may have different assessments of who is overbenefited or underbenefited depending on what they count as legitimate inputs and valued outcomes.

To reduce their distress over an inequitable situation, people are motivated to eliminate the inequity, either in actuality or in their perceptions. Inequity may be reduced in a number of ways. First, people can increase or decrease their own inputs or outcomes. For example, the worker who feels that he is working harder than the woman next to him may slow down the pace of his work in order to restore equity. Second, people can attempt to increase or decrease the other person's inputs or outcomes. The dissatisfied worker might steal money from the woman whom he sees as too highly compensated, or he may throw obstacles in her way as she goes about her job. Third, people can cognitively distort their inputs and outcomes. The worker might convince himself that he is not working very hard or is not very talented, or he might convince himself that he is gaining a lot of non-material benefits (e.g., great experience). Fourth,

people can cognitively distort the inputs or outputs of the comparison person. Finally, people can “leave the field.” The worker who feels inequitably treated might quit his or her job.

Although equity theory has been extremely influential in social psychology, it has not escaped criticism. One serious problem, according to Morton Deutsch, is the implication that all interactions among people are exchanges characterized in terms of inputs and outcomes. Deutsch points out that equity applies mostly to business or impersonal relationships. Other norms of distributive justice, such as equality or need, seem to be used in relationships outside the contexts of business. Some evidence from surveys and experiments indicates that equity may not be the central consideration when people make justice judgments about close interpersonal relationships.

PROCEDURAL JUSTICE

Starting with the 1975 publication of John Thibaut and Laurens Walker’s landmark book *Procedural Justice: A Psychological Analysis*, social psychologists have recognized that individuals care not only about distribution or outcomes, but also about the procedures by which outcomes are derived. Procedural justice theories hypothesize that people will find a negative or undesirable outcome acceptable if it is achieved through fair procedures and that people will find an objectively positive outcome unacceptable if it is achieved through unfair procedures. One aspect of what constitutes fair procedures is the opportunity to express one’s point of view.

Initial research on procedural justice developed out of Thibaut and Walker’s (1975) examination of third-party decisions in conflict situations. Subsequent work has found judgments of procedural fairness to be important in a variety of contexts, such as the law, politics, education, and business. Judgments of procedural justice have important implications for people’s reactions to situations or interactions. For example, people’s judgments of procedural fairness in legal procedures affect their willingness to accept decisions more than does the actual outcome of the legal procedures. Research reveals that people’s perceptions of group authorities, institutions, and rules

are influenced by procedural justice judgments. Judgments of procedural justice have also been found to (1) enhance feelings of loyalty to organizations, (2) enhance willingness to help organizations, (3) enhance one’s commitment to one’s organization, and (4) affect reactions to overall organizational rules. In business contexts people adhere to agreements over time if they feel that the initial decision is procedurally fair.

One important question to be addressed is why people care about procedures. Thibaut and Walker argue that procedures matter because they permit people to feel that they can help mold outcomes. In this view people care about procedures because, in the long run, procedures affect outcomes.

Another possibility is that people care about procedures for expressive or noninstrumental reasons. Working in concert with a number of other collaborators, Tom Tyler has developed a relational model of procedural justice. Tyler’s relational model posits that people want to feel that they are valued members of respected groups. Being well treated by authorities communicates respect.

Consistent with the relational model of procedural justice is the finding that the opportunity to express one’s opinion makes people feel that procedures are fair even when the opportunity for expression comes *after* a decision has been made. If procedural fairness mattered only for instrumental reasons, such a finding would not have been obtained. More support for the group value model of procedural justice comes from the finding that explanations help people cope with disappointing events. In one study Jerald Greenberg recorded the amount of sabotage and resignations that occurred in industrial plants that faced pay decreases. In the plant where management respectfully explained the reasons for the decreases and apologized for them, sabotage and resignations were much less pronounced than in the plant where management gave a curt announcement.

Although procedural justice concerns matter in many situations, in some situations people’s justice judgments do not depend on whether or not they assess procedures as being fair. For some issues, some people have what Linda Skitka calls “moral

mandates” by which they feel strongly about the issues regardless of the situation. Consider a person who has a moral mandate stating that abortion is wrong. For such a person, learning that the Supreme Court had followed all the proper procedures in determining that abortion is a woman’s right does nothing to change the person’s condemnation of the court’s decision.

RETRIBUTIVE JUSTICE

Although retribution, revenge, and compensation are basic and pervasive justice reactions evident in even the most ancient civilizations, until recently social scientists have paid less attention to the dynamics of corrective justice than to distributive or procedural justice. Much of the research in the area of social justice borrows from the civil and criminal justice literature in the United States. Although justice researchers recognize that jurisprudence is culturally determined, they also assume the existence of some general moral imperatives.

When a wrong occurs, society sometimes reacts by focusing on the victim and sometimes reacts by focusing on the perpetrator. In the former situation the overarching concern is to make the victim whole in the sense of restoring or compensating for what has been lost. Based on the extent of “damages” suffered and “pain and suffering,” the compensation due to the victim varies. New legal conventions, such as the “victim impact statement,” aim to restore dignity and value to the victim by giving the victim voice, an important element of procedural justice.

Sometimes the overarching concern after a wrong is to punish the perpetrator. The impulse to punish is a manifestation of moral condemnation. When one does not adhere to societal rules, others feel contempt, disgust, and (most commonly) anger—which lead to moral outrage and a concern for retribution. Retribution is a “passionate reaction” to the violation of a societal rules, norms, or laws.

Punishment of the rule violator serves several purposes. Some punishment is aimed at incapacitating the perpetrator so that he or she cannot commit future harmful acts. In most cases punishment also serves to vindicate societal rules, to legitimate group norms,

and to restore homeostasis (reducing negative emotion and cognitions). Oftentimes perpetrators are demonized. Such demonization helps members of society convince themselves that the perpetrators lie outside the scope of their own moral community and thereby bolsters any threatened beliefs in the just world.

Many factors affect the extent to which perpetrators are punished for violating societal rules. The seriousness of the crime (i.e., nature of the offense) is associated with applicable punishment. The state of mind of the perpetrator and mitigating circumstances also affect the extent to which punishment is prescribed. Perpetrators tend to be punished more if the act was seen as reckless rather than negligent, if the act was seen as foreseeable and intentional rather than unforeseeable, and if there was evidence of a desired outcome and knowledge that the outcome was morally wrong. Perpetrators are punished less if they express remorse and offer confessions and apologies for their actions.

CONCLUSIONS FROM JUSTICE RESEARCH

Social psychological research has demonstrated that people care about justice and wish to believe that the world is a just or fair place. People can use three types of principles—distributive, procedural, and retributive—to determine whether a situation or interaction is just. Ample support exists for each of these principles to be used in judgments of justice, and the particular context may determine which principle(s) people use. For instance, when people wish to gain a certain outcome, they are likely to use the principle of distributive justice to evaluate the situation or interaction. If people’s relationship to a decision maker is most salient, however, they will probably use the principle of procedural justice to determine whether the situation is fair. Finally, if the context includes the perpetrator of an illegitimate harm, people will probably use the principle of retributive justice to evaluate the interaction.

IMPLICATIONS FOR LEADERS

The social psychological literature on social justice has at least two significant implications for leaders.

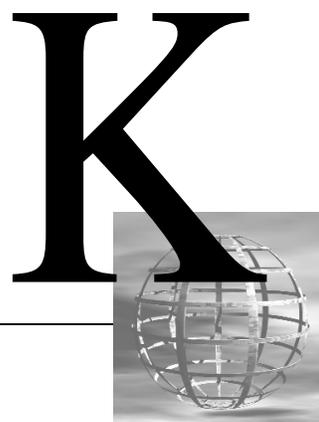

First, leaders must recognize that justice is an important concept in people's everyday lives. The fact that people would like to view the world as a just place suggests that leaders must ensure that the environments they set up for others should be (perceived as) fair. For instance, the policies and practices that govern the particular organization or workplace should be seen as legitimate, and the leader's actions and decisions should also be viewed as fair.

Second, leaders must be aware that different principles may be used to determine whether a situation or interaction is fair. They need to use the principles of distributive and procedural justice in making a situation or decision fair. Leaders should not only ensure that they apply the rules of equity in determining rewards and punishments, but also establish good relationships with everyone they work with. Only when their interactions are characterized by trust, respect, and neutrality will others perceive the leaders' decisions and actions as procedurally just.

 **KENNEDY, JOHN F.**
(1917–1963)

President of the United States

Forty years after his assassination in Dallas on November 22, 1963, John F. Kennedy is still one of the most admired of all presidents of the United States. His popularity among the public is higher than his rating among historians. Kennedy is generally rated as an above average president, but is not among the greats or near greats. Who was John F. Kennedy, why is he so admired by so many people, and why is he regarded less highly by historians than by the public? Kennedy's charm, eloquence, wit, and handsome, youthful appearance combined to create an unusual charisma. But the specific, tangible accomplishments of his administration did not meet the promise and expectations that he created.

John F. Kennedy (JFK) was born outside Boston, Massachusetts, on May 29, 1917. His parents came from prominent Irish Catholic Boston families. His father, Joseph Patrick Kennedy, was the son of a successful saloon keeper and one-time state senator, Patrick Kennedy. Joe Kennedy showed unusual aptitude for business and banking, graduated from Harvard in 1912, and made a large fortune in shipping, liquor, and stock trading in the years before the Great Depression, which began in 1929. His business acumen made him a powerful figure in film making and

in politics. He was appointed first chairman of the Securities and Exchange Commission (SEC) in 1934 by President Franklin Roosevelt and ambassador to Great Britain before the outbreak of World War II. JFK's mother, Rose Fitzgerald Kennedy, came from a more established Boston Irish family, and a highly political one. Rose's father was John F. "Honey Fitz" Fitzgerald, a mayor of Boston and U.S. congressman, and one time political rival of Patrick Kennedy. Honey Fitz was not happy when his daughter Rose fell in love with Joe Kennedy, but he did not stand in the way of her marrying Joe.

John Fitzgerald Kennedy, called Jack by his family and friends, was Rose and Joe's second child. An older brother, Joseph P. Kennedy Jr., was born in 1915. Joe and Jack were followed by seven other Kennedy children, five sisters and two brothers. Joe was robust, popular, and successful. Jack was less robust than Joe, and he had numerous illnesses as a child and throughout his life. Jack followed Joe to Choate, a private school, and then to Harvard, but was constantly overshadowed by his older brother. Joe was the more conventional, authority-oriented brother. Jack was casual in the way he approached almost everything. But Jack got serious during his last year at Harvard and wrote an honors thesis that was soon published as a best-selling book. Called *Why England Slept*, it analyzed the reasons that the British ignored the growing threat of Adolf Hitler

and failed to take action to stop him before he catapulted Europe into World War II in 1939. Jack Kennedy showed intelligence and talent when he chose to work hard. Still, Joe was clearly the favorite son and was being groomed by his father to run for president of the United States. Meanwhile, Jack considered a career in journalism.

KENNEDY ENTERS POLITICS

World War II changed things. In 1943, Jack served in the Navy in the Pacific, commanding at a small patrol boat, PT 109. On a risky night mission, his boat was cut in two by a Japanese destroyer. Two men were killed, but Kennedy rescued most of the crew and led them to a small island, swimming with a seriously wounded man for more than five hours, using his teeth to hold on to the wounded man's life jacket. Jack was also wounded and returned to America as a war hero. For the first time, Jack drew more attention than Joe. Perhaps to equal or best his brother, Joe undertook risky flying missions in Europe and was killed when his plane exploded over the English Channel in 1944. That left Jack as the brother to enter politics.

At his father's urging, Jack jumped into a race for Congress in 1946. He was easily elected at the age of twenty-nine. He was a shy, thin, and unhealthy young veteran, but his smile, charm, and optimism—and his family wealth and connections—propelled him into office. Kennedy entered Congress with a large class of new representatives, including another Navy man, Richard M. Nixon of California. Kennedy was an indifferent congressman, regarded by many as a lightweight playboy. But Kennedy did take a special interest in legislation protecting or extending the programs of Franklin Roosevelt's New Deal, particularly that which advanced the interests of labor and the poor.

After three terms in the House of Representatives, Kennedy took a large political risk. He challenged the incumbent, Henry Cabot Lodge, for one of the two Senate seats from Massachusetts. Lodge was campaign manager for Republican presidential candidate Dwight D. Eisenhower and took JFK lightly. Even with Lodge distracted, few gave Kennedy

much chance of winning. But Kennedy made good use of two resources: his family and the new medium of television. Kennedy's mother, three of his sisters (Eunice, Pat, and Jean), and his two brothers (Robert, or Bobby, and Edward, or Ted) campaigned around the state. Coffees arranged for female voters seemed to be particularly effective in promoting the handsome congressman. In addition, Kennedy did some campaigning on television. His father had been active in Hollywood in the 1930s and understood the potential power of visual images. Kennedy upset Lodge and won a narrow victory.

During his first year in the Senate, Kennedy married Jacqueline Bouvier. They had four children, but only two, Caroline and John Jr., lived past infancy. In 1954, Kennedy's back problems, exacerbated by his war heroics, required that he undergo surgery twice. It was not clear that Kennedy would survive the ordeal. At one point he was given the last rites of the Catholic Church. However, he put his convalescence to good use and, with the collaboration of his speechwriter and close adviser, Theodore Sorenson, he wrote the Pulitzer Prize-winning book *Profiles in Courage*. Kennedy's intelligence and attractiveness made him a serious contender for the vice presidential nomination with Adlai Stevenson in 1956. Although he lost that contest, his appeal immediately made him a potential presidential candidate for 1960.

After winning an overwhelming reelection to the Senate in 1958, Kennedy began campaigning for president in earnest. His opponents for the Democratic presidential nomination included two other extremely formidable senators, Hubert Humphrey of Minnesota and Lyndon Johnson of Texas. Kennedy won two critical primaries against Humphrey and went on to win nomination for president, just barely, on the first ballot of the Democratic convention. He made an entirely unexpected choice for his running mate, Senator Lyndon Johnson. Johnson's campaigning in the South, especially Texas, was crucial to Kennedy's narrow victory over the Republican candidate, incumbent Vice President Richard Nixon.

Kennedy believed that the key to victory was television. He told his press secretary after the election, "We wouldn't have had a prayer without that

gadget” (Gergen 2000, 213). Most important were four televised debates between Nixon and Kennedy. Nixon was far better known than Kennedy and was ahead in polls before the debates started. The first debate gave Kennedy the opportunity he needed to show that he was intellectually capable of handling the presidency. But it was his appearance that won the day for him. Studies of the debates indicate that Kennedy did better among television viewers than Nixon, who did better among radio listeners. People liked what they saw when Kennedy appeared on television (McLuhan 1964).

THE NEW FRONTIER

The Kennedy Administration, dubbed the “New Frontier,” lasted less than three years. The world, the country, and Kennedy changed during that short period. Kennedy had an intimidating foreign adversary in Premier Nikita Khrushchev of the Soviet Union. When they met in Vienna in June 1961, in the wake of the Bay of Pigs fiasco of April 1961, Khrushchev successfully bullied Kennedy, who seemed unprepared to enter into tough negotiations with Khrushchev. Khrushchev came away from their summit meeting with an unfavorable impression of the “weak” American president. In August 1961, the Soviets built the Berlin Wall between the eastern and western parts of that already divided city. Believing that he could further change the dynamics of the Cold War in his favor, he authorized the placement of offensive nuclear missiles in Cuba. When the secretly placed missiles were discovered in October 1962, Kennedy demanded their removal and instituted a naval blockade of Soviet ships heading toward Cuba. The world narrowly avoided nuclear war thanks to the good sense and restraint that both Kennedy and Khrushchev showed in resolving the crisis. While Kennedy’s handling of the Cuban missile crisis is often cited as exemplary foreign affairs leadership, recent scholarship shows that luck played a large part in avoiding war. Nevertheless, the successful resolution of the crisis led both Kennedy and Khrushchev to greater mutual respect and an easing of tensions, culminating in a nuclear test ban treaty in 1963. In this domain, Kennedy’s leadership in foreign affairs was

Leadership and learning are indispensable to each other.

—John F. Kennedy

successful. At the same time, the United States was getting more deeply involved in Vietnam. One of the unanswered questions about Kennedy’s presidency is whether he would have avoided the war into which his successor, Lyndon Johnson, led the nation during his own term as president.

On the domestic front, Kennedy’s economic policies are generally regarded as successes. However, two of Kennedy’s main legislative initiatives, a strong civil rights bill and a tax cut, were stalled in Congress. After Kennedy’s death, President Johnson managed to pass both, to the benefit of the country. Perhaps Kennedy’s most important domestic accomplishments were symbolic rather than substantive. His charismatic style was inspirational to a whole generation of young people who responded to his charm and wit. His inaugural address, drafted by Theodore Sorenson, contains the oft-quoted challenge “Ask not what your country can do for you; ask what you can do for your country.” Kennedy also spoke of the challenge of defending freedom: “The energy, the faith, the devotion which we bring to this endeavor will light our country and all who serve it—and the glow from that fire can truly light the world.” One of the initiatives at the start of Kennedy’s administration was the Peace Corps, a program through which young people, and older people, could volunteer to work in a foreign country, in areas like health care, farming, and education, helping the host country build more stable institutions.

Kennedy’s style and charisma were felt beyond the borders of the United States. In 1963, memorable visits to Ireland and then to Berlin demonstrated the willingness of people in many countries to join Kennedy and the United States in trying to improve the world. As Kennedy said in his well-known American University speech in 1963, “For in the final analysis we all inhabit this small planet. We all breathe the same air. We all cherish our children’s future. And we are all mortal.”

John F. Kennedy was assassinated in Dallas, Texas, on November 22, 1963. A lone gunman, Lee Harvey Oswald, was implicated in the shooting and was himself murdered while in police custody. (In 1979, a House committee released a report, saying that Kennedy was probably killed by Oswald in a “conspiracy” with others.)

THE KENNEDY LEGACY

It is impossible to know how he might be rated by historians had he lived and perhaps served a second term. Why is Kennedy not rated as highly by historians as he is by the public? Among the reasons are early foreign policy mistakes, initial timidity in dealing with civil rights, and an inability to get his legislative agenda through Congress. But his ability to mobilize people toward unselfish goals and active engagement continue to inspire those who experienced his leadership. As with other presidents, including those as distant as the first three, George Washington, John Adams, and Thomas Jefferson, new scholarship raises and lowers historical reputations. A 2003 biography by Robert Dallek raised Kennedy’s to some degree. Dallek underlines the courage that Kennedy demonstrated in performing the duties of his office while fighting illness and intense pain. In contrast to historical evaluations, the appraisal of the public seems quite stable. Millions admired Kennedy and they know why. At present students of leadership can read, remember, if they are of the Kennedy “generation,” and form their own judgments.

KENYATTA, JOMO (1891?–1978)

*First prime minister and president
of the Republic of Kenya*

Jomo Kenyatta was an integral part of Kenya’s long struggle to break free of colonization. A member of Kenya’s largest tribe, the Kikuyu, he was born in the last decade of the nineteenth century into a country devastated not only by the introduction of British colonialism, but also by a series of natural disasters, including disease, famine, and swarms of locusts. He rose to prominence as part of a group of young, educated Africans who sought the return of tribal lands from British settler groups. Kenyatta appealed to the British Colonial Office in 1928 for land reform in Kenya and spent the following fifteen years in Europe fighting for the independence of Kenya and other African nations and advancing his education. Upon his return to Kenya in 1946, he was accepted as a national leader. A few years later he was arrested and imprisoned by the British, who met the militant anti-colonialist uprisings throughout Kenya by declaring a state of emergency. Following his release in 1961, Kenyatta worked to craft a new constitution for an independent Kenya. He became prime minister in 1963 and president in 1964. He remained in office until his death in 1978, devoting his energies to the development of his country’s social and economic stability.

In many respects, Kenyatta’s leadership resembled that of Mohandas Gandhi, Kwame Nkrumah, and Frantz Fanon, men who inspired loyal followers and sought to break the grip of colonialism and exploitation in their countries. He worked to reconcile African cultural traditions with Western advances in agriculture and commerce and to transform his country from an environment of colonial rule to that of a self-determined independent nation.

PREPARING FOR PROMINENCE

In 1909, Kenyatta became ill, and his mother brought him for treatment to the Church of Scotland mission school at Thogoto, where he learned basic academics and was trained in carpentry. In 1914, the year after he received his Kikuyu initiation rites, he took his Christian baptism as Johnstone Kamau. However, in spite of the colonial education he received in Thogoto, which according to scholars “[destroyed] self-confidence and creativity in Africans by placing Europe in the center of its instructional objectives” (Aseka 1992, 8), his connection to his tribal heritage remained important to him throughout his lifetime.

After five years at the mission school, he left for Nairobi, the place where young, educated Kenyan Africans went to make their mark. It was here that he first exhibited two important attributes of his leadership—adherence to his principles and a powerful personality. He steadfastly refused to shift his focus from scholarship and carpentry to masonry (considered a lesser trade) when directed to do so by school administrators. He took a job as a store clerk and renamed himself, changing his name from Kamau, his birth name, to Kenyatta (Kikuyu for a type of beaded belt). Later he would change his Christian name, Johnstone, to Jomo (Kikuyu for burning spear). His political ascent began in 1924 when he joined the Kikuyu Central Association (KCA), part of a protest movement organized against the increasingly restrictive legislative acts imposed by the colonial government. The British had achieved control of Kenya through a series of legal maneuverings. Kenya’s traditional governance had been mostly by councils of elders, age groups sets (a system of lifetime education that defines age groups and the specific responsibilities to society that apply to each), and tribal chiefs from its more than forty tribal and seventy ethnic groups. However, in 1888 the Imperial British East Africa Company was given a charter that authorized a monopoly of trade, in 1895 the British East African Protectorate was formed, and by 1920, the protectorate had been redefined as the Kenya Colony and Protectorate. These measures severely limited economic opportunity for Africans

while enhancing the resources of the white settlers. They enabled white settlers to exercise control over commerce, law-making, and governmental affairs and to push native Africans into concentrated areas of land.

A PAN-AFRICANIST IN EUROPE

His political ascent began when he joined the Kikuyu Central Association (KCA). In four years, Kenyatta had emerged as a leader, founded the first Kikuyu language newspaper, *Muigwithania* (Kikuyu for reconciler or conciliator), and was elected to the full-time post of general secretary of KCA. In these roles, he advanced tribal unity and self-advancement. In 1928, he traveled to London to advance the KCA’s objectives: the return of land lost to European settlers, political representation, and government-financed education. Although he was unsuccessful in getting an audience with the colonial secretary, in part because KCA was not recognized as the official voice of the Kikuyu, he established many valuable friendships with liberals, left-wing radicals, and Pan-Africanists who shared his anti-colonialist convictions, and he wrote forcefully for various journals of the liberal press, as well as communist journals, about the injustices that he and other native Africans encountered back home.

After a brief visit to Kenya in 1930, he returned to London, and for the next fifteen years, he traveled, studied, and worked unceasingly to get Kenya’s problems a better hearing in Europe. Although he struggled intermittently with poverty and illness, he studied at Woodbridge College, a Quaker school in Birmingham (1931–32); Moscow University (1932–33); and the London School of Economics (1934–37), where he studied under the noted British anthropologist Bronislaw Malinowski. He wrote and lectured extensively on the negative impact of British colonialism, and in 1938 he published *Facing Mount Kenya*, the first serious study of African culture and society in Kenya. He helped organize the fifth Pan-African Congress, “Africa for Africans,” held in Manchester, Great Britain, in 1945, which was attended by many important leaders including Harold Arundel (League of Colored People), W. E. B. Du Bois

Jomo Kenyatta at a victory celebration on 28 May 1963 in Nairobi after his Kenya African National Union party takes 62 of 112 seats in the parliamentary elections.

(National Association for the Advancement of Colored People), George Padmore (West Indies), and Kwame Nkrumah (Ghana). In the 1960s, young black power advocates in the United States would be inspired by these remarkable leaders.

RETURN TO KENYA

By the time he returned to Kenya in September 1946, Jomo Kenyatta was a formidable voice for a unified Kenya. Between 1946 and 1947, he led the Independent Teachers College at Githunguri and in 1947 he was elected president of the Kenya Africa Union, an intertribal party that had been organized in 1944.

But the Kenya to which Kenyatta returned had degenerated: Economic conditions had deteriorated during and after World War II, the forms of colonial control had worsened, and more militant groups had arisen. Kenyatta and other elders found themselves losing control over these younger, more militant factions. The older moderates pushed for constitutional ways to regain their sovereignty while the young militants felt that violence was the only vehicle that could restore both their land and their manhood. In this they were supported by Frantz Fanon, a black psychiatrist and revolutionary born in the French Antilles, who argued in his powerful writings that

colonization was violence and that therefore violence was necessary to free the native from his learned inferiority and subjugation.

One of the more militant groups was the Mau Mau, a secret group of primarily Kikuyu bound by oath to force the expulsion of white settlers and of the African chiefs the Mau Mau viewed as collaborators. The Mau Mau were responsible for murders, attacks on European farms and churches, and the assassination of a senior Kikuyu chief in broad daylight. On October 20, 1952, Sir Evelyn Baring, the new governor, declared a state of emergency and signed orders for the arrest of 183 Africans, including Kenyatta and five other KAU leaders. These six men were charged with “managing Mau Mau.” Their trial began in November 1952, and on April 8, 1953, they were found guilty. The maximum sentences were imposed, concurrent sentences of seven years and three years of hard labor with indefinite restriction in a remote area to follow imprisonment. Kenyatta remarked at their trial, “We know pretty well that the reason for our arrest was not Mau Mau, but because we were going ahead uniting our people to demand our rights.” (Kenyatta 1968, 57). During the state of emergency, 13,000 Kikuyu were killed and 80,000 imprisoned while only an estimated 32 Europeans were killed. British authorities destroyed Kikuyu crops, confiscated cattle, burned property, and relocated Africans en masse.

Kenyatta was confined to Lokitaung prison on the northern frontier, but because of his age and declining health, he was spared hard labor and allowed to continue his study of Buddhism, Confucianism, and the Hindu ideal of nonviolence. During his imprisonment his stature continued to rise, and he became a symbol for an independent Kenya; he was especially encouraged by Ghana’s independence in 1957. His imprisonment ended in April 1959 with his transfer to Lodwar under indefinite restrictions. The following year he was elected president in absentia by the newly formed Kenya African National Union (KANU), which would become the strongest party in the Kenya Legislative Council.

By 1961, considerable pressure had been mounted in London and across Africa for Kenyatta’s release. Nationwide elections were scheduled for Kenya, and

both major parties made it clear that there could be no stability without Kenyatta. In his first press conference following his imprisonment, he addressed many issues, including his status as a restricted person, political freedom for Kenya's Africans, and the continued importance of land reform. His comments on leadership were very instructive: "It is not for him to decide whether he would be Chief Minister or anything else when he was free. It was for his people to decide what they wanted him to be" (Kenyatta 1968, 124). In August 1961, Kenyatta was released without further restrictions.

POST-COLONIAL KENYA

As KANU's president, Kenyatta's goal was to establish himself as acceptable to all Kenyans and to set aside their fears of colonial officials and European settlers. He helped to write Kenya's new constitution, and in May 1963, as a result of Kenya's first fully franchised elections, he became prime minister. The country attained its independence on December 12, 1963, and a year later it became a republic of the British Commonwealth. Kenyatta was elected its first president.

Guiding an independent Kenya toward economic and social stability was a huge undertaking. Kenya and other post-colonial nations found themselves adrift in confusion and despair. Tribal and ethnic differences magnified the lack of an educated electorate, the lack of political institutions, and the lack of the operating systems necessary to run a free nation. As president, Kenyatta recognized that his country's progress must be a shared responsibility. Just as Gandhi appealed to colonizers and subjects as human beings, Kenyatta set forth the Swahili cry "Harambee" (all pull together) as his unifying theme. He steered his nation's people—Africans, Indians and Europeans—toward hard work, patience, and planning. He aimed to revolutionize Kenya's approach to agriculture and to help the country grow an industrial base by building infrastructure and attracting foreign investment. He oversaw the creation of over five thousand self-help groups (local and regional groups of Kenyans, guided by principles of self-determination, who took part in the

rebuilding of Kenya) who built roads, schools, and hospitals.

Following an upsurge of tribal violence and the assassination of a cabinet minister, Kenyatta exercised his presidential powers to rule Kenya as a one-party state in order to preserve stability. Affectionately known to Kenyans as "Mzee" (a Swahili title of honor meaning old man), he was reelected, unopposed, in 1969 and 1974. But even during these difficult times, he never failed to find strength in his African roots: "My works and my beliefs have always been in service to the people . . . understanding the tempo and the tribulations of their lives. . . . They know me best as I have always been: as one of them"(Kenyatta 1968, x).

Kenyatta's life is so interwoven with Kenya's struggle for independence that to speak of one is to speak of the other. At the time of his death in 1978, he is said to have asked his wife, "Is there anything I have not done?" (Aseka 1992) An innovative leader who encouraged his followers to struggle against colonialism to reassert basic rights for their people, his life and his work inspired Africans, not only in Kenya, but across the whole of Africa and the African Diaspora. His funeral was attended by dignitaries from all over the world.

🌐 **KING, BILLIE JEAN** (b. 1943)
*U.S. tennis champion and leader
 in the women's sport movement*

Billie Jean Moffitt King has led by example as she has pioneered women's tennis and the women's sport movement into the twentieth century. She leads with energy and a sense of urgency to fulfill a destiny to work for gender equity and for social change.

Born Billie Jean Moffitt, King began her tennis career at age eleven in the public parks of Long Beach, California, telling her mother, "I am going to be number one in the world." To help pay for tennis equipment and excursions to tournaments, her mother went to work, and her father (a firefighter) took a second job. From this beginning in the tennis world, Billie Jean King resented the old-fashioned image of tennis as a pastime of the rich. In 1967, she

In an event of great symbolic importance to the women's sports movement, Billie Jean King shakes hands with Bobby Riggs after defeating him in the so-called Battle of the Sexes in Houston on 20 September 1973.

Source: Bettmann/Corbis; used with permission.

spoke out against the United States Lawn Tennis Association's (USLTA) practice of "shamateurism"—paying top amateur players under the table so that they could afford the expenses of participating in USLTA-sponsored amateur tournaments. King felt that the practice was corrupt and held tennis back by preventing the professionalization of the game. She led tennis into a more honest era in 1968 when promoters agreed to allow professionals and amateurs to compete against each other in tournaments.

KING'S LEADERSHIP MILESTONES

Throughout her career, King has been a strong and, some would say, natural leader—pressing the margins for social justice in sports.

The "Battle of the Sexes"

Billie Jean King was celebrated by women everywhere when she won the "battle of the sexes" match against Bobby Riggs in 1973. Riggs, a tennis champion in the late 1930s and 1940s, had been critical of the quality of women tennis players. He had tried many times to get King to compete against him, and she had turned him down, saying that she was devoting all of her time and energy to promoting the new Virginia Slims Tour. Much to King's surprise, Margaret Court, the top-ranked women's player in the world, agreed to play Bobby Riggs in May 1973, and Riggs beat Court with ease. King then took Riggs up on his challenge to play a match, which turned out to be an event that created significant social change. The pre-match publicity was intensive, with Riggs sporting a "chauvinist pig" T-shirt in practice sessions and announcing, "If I am to be a chauvinist pig, I want to be the number one pig" On 20 September 1973, the match was held in the Houston Astrodome. King, then twenty-nine years old, ran the fifty-five-year-old Bobby Riggs ragged, winning the match, 6–4, 6–3, 6–3. The *London Sunday Times* called the match "the drop shot and volley heard around the world." the match itself and King's victory over Bobby Riggs came to symbolize women's struggle for equality in the 1970s

Creating Greater Opportunities for Women in Tennis

After decades of male domination in tennis, King decided to put her energy and creativity into the founding of a women's tennis tour. She led the boycott of tournaments where the ratio of prize money was 12:1, men to women, and in 1970 the Virginia Slims Women's Tennis tour was launched. In April 1973, the International Lawn Tennis Association (counterpart of the Men's Association of Tennis Professionals) declared that the women players must either submit to their national association or be banned from the Grand Slam tournaments (e.g., Wimbledon, the U.S. Open) forever. The furor over this mandate forced the groups to compromise and merge under the USLTA. King was not satisfied with the merger and recognized a need for the women of professional tennis to form a group that would improve the conditions of their profession, speak out in the players' interest, and continue to carry the torch for women's tennis rights. In June of 1973, the Women's Tennis Association (WTA) was formed. Sixty-four of the top ranked female players in the world voted for Billie Jean King as WTA president.

Expanding Opportunities for Coed Tennis

In 1974, King founded World Team Tennis with husband Larry King. World Team Tennis (WTT) has been an innovative coed tennis league designed to show young people that men and women can play together, cooperate on the court, and work together to win. King was the first woman to coach a coed team, the Philadelphia Freedoms. The popular 1975 Elton John song "Philadelphia Freedom" was inspired by the pop star's friendship with King, and the song has become the theme for that WTT franchise. Always creating new ways to promote tennis, King successfully led the negotiations to start a cable tennis channel that began in 2003.

Civil and Gay Rights Activism

In 1981, Billie Jean King's ten-year-long affair with hairdresser Marilyn Barnett came to light in a pal-

A lot of women weren't raised with the idea that competing was something they should do. Along came Billie Jean, just at the moment when a lot of the rhetoric of the women's movement was really meeting reality.

—Hillary Clinton

imony suit brought by Barnett. During the highly publicized case, King became the first American athlete to acknowledge a homosexual relationship. Although Marilyn Barnett lost the suit, King estimated the episode cost her and her husband (they were later divorced) millions in endorsements. King went on to champion civil and gay rights causes in Chicago where she lives, and in 1998, she established the Billie Jean King Foundation to fund projects that reflect or promote equal opportunity for all, with a special emphasis on ensuring the rights of gay and lesbian youth.

KING'S CONTINUING LEADERSHIP AND LEGACY

During and after her career as a player (King retired from competitive tennis in 1984), Billie Jean King has been an author, commentator, promoter, coach, and activist. In 1974, she founded *WomenSports* magazine and started the Women's Sports Foundation, an organization dedicated to promoting and enhancing athletic opportunities for girls and women. King coached and captained the U.S. Federation Cup in the late 1990s, and she coached the U.S. Olympic Gold-medal-winning tennis teams in 1999 in Atlanta and in 2000 in Sydney.

Billie Jean King has been celebrated by *Life* magazine as one of the 100 most important Americans of the twentieth century. She won twenty Wimbledon titles and seventy-one singles titles, and she was the first woman athlete to win more than \$100,000 in a single season in any sport. She is one of a very select few to have won a singles title in each of the four Grand Slam Tournaments.

King has also won many awards through the years for her leadership in sports and human rights causes, including the International Olympic Com-

mittee Women and Sport Trophy in 2002 for her work as “an advocate for women’s rights, within and outside sport.”

With her energetic and flamboyant style on and off the court and tireless efforts on behalf of women in the sports world and in society, Billie Jean King has been a highly significant leader in the cause of women’s tennis and in the fight for equality and social justice.

KING, MARTIN LUTHER, JR. (1929–1968)

U.S. civil rights leader

In presenting Martin Luther King Jr. with the Nobel Peace Prize in 1964, Gunnar Jahn, chairman of the Nobel Committee, stated, “He is the first person in the Western world to have shown us that a struggle can be waged without violence. He is the first to

make the message of brotherly love a reality in the course of his struggle, and he has brought this message to all men, to all nations and races” (Nobel Peace Prize 1964, para. 59). King’s leadership during the civil rights movement of the 1950s and 1960s was crucial to passage of the 1964 Civil Rights Act and the 1965 Voting Rights Act, and he remains the figure most identified with the struggles and achievements of the civil rights movement.

FAMILY BACKGROUND

As far back as Martin Luther King Jr.’s family memory extended, it recalled a history of Afro-Baptist leadership. His maternal great-grandfather, Willie Williams, was a slave exhorter (a preacher who tried to sustain slaves with Biblical exhortations) on a plantation in Greene County, Georgia. Claiming a birthright to freedom, his son, Adam, celebrated the day of his emancipation, 1 January 1863, as his birthday. Adam Daniel Williams had only a few months of formal education when he left the plantations of east Georgia in 1887 for Atlanta. There, he became the pastor of a small congregation, Ebenezer Baptist Church, earned a ministerial certificate from Morehouse College, and married an alumna of Spelman College. Williams nurtured a growing congregation through Atlanta’s race riot of 1906 and the great fire of 1917, served as president of the city’s branch of the National Association for the Advancement of Colored People (NAACP), and built a significant church building on Auburn Avenue. At his death, Williams was succeeded as pastor of Ebenezer Baptist Church by his son-in-law, Martin Luther King Sr.

Leadership was not inherited, however, in Martin Luther King Sr.’s own family line. He came from a family as broken by slavery’s cruel legacy as any. His abusive, alcoholic father was probably the child of a white male and a woman of color. His mother was born to one of several women claimed by her rough-hewn father. Martin Luther King Sr. resolved to be more than his father and grandfathers had been, to leave a different legacy for his children. He did so by marrying Williams’s only daughter, getting an education, and inheriting his father-in-law’s pulpit. In the bottom of the Great Depression, Ebenezer

Baptist Church faced the possibility of a bank's foreclosing on the mortgage. King Sr. nurtured a congregation of respectable working-class people, many of whom were women who worked six and a half days a week in the homes of Atlanta's white folk.

Born on 16 January 1929, Martin Luther King Jr. was the second of three children born to the Reverend Martin Luther King, Sr. and Alberta Williams King. While Martin Luther King Jr. was a child, his father paid off the church's mortgage, encouraged his people to look to each other for goods and services, and became a leader in black Atlanta's religious and civic affairs. Thus, young King knew his father as a leader in efforts to increase black voter registration and win pay equity for black public school teachers in Atlanta.

EDUCATION

The earliest sign of Martin Luther King Jr.'s own potential for leadership was winning a local oratorical contest in which he spoke on "The Negro and the Constitution." At the same time, however, his parents' ambition for young King may have inhibited his early experience of leadership. Through grade school and high school, he was advanced three times beyond his age peers, so that he entered Atlanta's Morehouse College at fifteen. Commuting across town from home, King earned mediocre grades. He was only nineteen when he graduated in 1948, with a class that included both early admissions students like himself and veterans whose education had been interrupted by World War II. Already ordained in the Baptist ministry, he had begun years of listening and learning—from his father, from Morehouse president Benjamin Mays, and many others—how to preach, what worked and what did not work in a pulpit.

In 1948, King left Atlanta for six years in northern, predominantly white schools. His three years at Crozer Theological Seminary in Chester, Pennsylvania, and three years at Boston University's Graduate School of Theology produced the first real signs of King's leadership among his fellow students. At Crozer, a predominantly white student body chose him as its president in his senior year. At Boston University, King organized black graduate students into

the Dialectical Society, which met periodically to hone their skills in theological discussion. Moreover, King's professors were increasingly charmed by the bright young student's capacity to repeat back to them what he knew they already believed, and his grades improved commensurately. Academically, it was a skill that shaded off into plagiarism, but rhetorically it hewed resonance with an audience's deepest beliefs to a brilliant degree.

In Boston King met Coretta Scott, from Alabama. They married in 1953 and were to have four children.

THE MONTGOMERY BUS BOYCOTT

Nearing the completion of his doctoral studies, Martin Luther King Jr. could have become a college professor or administrator. He believed his vocation was to preach, however, and in the spring of 1954 he accepted a call to become the pastor of Dexter Avenue Baptist Church in Montgomery, Alabama. The choice of pulpit hardly anticipated leadership of mass movements, however, for Dexter Avenue was a small congregation of Montgomery's well-educated African-American elite. King spent his first eighteen months there finishing his dissertation and establishing his authority with the congregation. When the city's experienced civil rights leaders decided to launch a boycott of the city's buses in December 1955 because of a long series of abuses that culminated with Rosa Parks's refusal to give up her seat to a white passenger, he was an inexperienced but unanimous choice to become its spokesperson. Even at the boycott's beginning, King proved to be an eloquent public speaker. As a leader, he believed that its success depended on a militant nonviolence that would become a hallmark of his career.

As the boycott extended from days to weeks, local accommodation of the boycott's modest demands became increasingly unlikely. So King reached out to his networks of contacts—the National Baptist Convention, Alpha Phi Alpha fraternity, the National Association for the Advancement of Colored People, and centers of northern liberal sentiment—for advice and support. By March 1956, the Montgomery bus boycott won national attention and King spent increasing amounts of time away from the city to

Selection from Martin Luther King's "Letter from a Birmingham Jail"

April 16, 1963

My dear fellow clergymen:

While confined here in the Birmingham city jail, I came across your recent statement calling my present activities "unwise and untimely." Seldom do I pause to answer criticism of my work and ideas. If I sought to answer all the criticisms that cross my desk, my secretaries would have little time for anything other than such correspondence in the course of the day, and I would have no time for constructive work. But since I feel that you are men of genuine good will and that your criticisms are sincerely set forth, I want to try to answer your statements in what I hope will be patient and reasonable terms.

I think I should indicate why I am here in Birmingham, since you have been influenced by the view which argues against "outsiders coming in." I have the honor of serving as president of the Southern Christian Leadership Conference, an organization operating in every southern state, with headquarters in Atlanta, Georgia. We have some eighty-five affiliated organizations across the South, and one of them is the Alabama Christian Movement for Human Rights. Frequently we share staff, educational and financial resources with our affiliates. Several months ago the affiliate here in Birmingham asked us to be on call to engage in a nonviolent direct-action program if such were deemed necessary. We readily consented, and when the hour came we lived up to our promise. So I, along with several members of my staff, am here because I was invited here I am here because I have organizational ties here.

But more basically, I am in Birmingham because injustice is here. Just as the prophets of the eighth century B.C. left their villages and carried their "thus saith the Lord" far beyond the boundaries of their home towns, and just as the Apostle Paul left his village of Tarsus and carried the gospel of Jesus Christ to the far corners of the Greco-Roman world, so am I compelled to carry the gospel of

freedom beyond my own home town. Like Paul, I must constantly respond to the Macedonian call for aid.

Moreover, I am cognizant of the interrelatedness of all communities and states. I cannot sit idly by in Atlanta and not be concerned about what happens in Birmingham. Injustice anywhere is a threat to justice everywhere. We are caught in an inescapable network of mutuality, tied in a single garment of destiny. Whatever affects one directly, affects all indirectly. Never again can we afford to live with the narrow, provincial "outside agitator" idea. Anyone who lives inside the United States can never be considered an outsider anywhere within its bounds.

You deplore the demonstrations taking place in Birmingham. But your statement, I am sorry to say, fails to express a similar concern for the conditions that brought about the demonstrations. I am sure that none of you would want to rest content with the superficial kind of social analysis that deals merely with effects and does not grapple with underlying causes. It is unfortunate that demonstrations are taking place in Birmingham, but it is even more unfortunate that the city's white power structure left the Negro community with no alternative.

In any nonviolent campaign there are four basic steps: collection of the facts to determine whether injustices exist; negotiation; self-purification; and direct action. We have gone through [all] these steps in Birmingham. There can be no gainsaying the fact that racial injustice engulfs this community. Birmingham is probably the most thoroughly segregated city in the United States. Its ugly record of brutality is widely known. Negroes have experienced grossly unjust treatment in the courts. There have been more unsolved bombings of Negro homes and churches in Birmingham than in any other city in the nation. These are the hard, brutal facts of the case. On the basis of these conditions, Negro leaders sought to negotiate with the city fathers. But the latter consistently refused to engage in good-faith negotiation.

raise moral and financial support for the local struggle. By then, he had shown a talent for leadership by gathering around him strong local leaders who could defer to his leadership in a common cause. The boycott stretched into the summer, demanding greater determination and resources to sustain it than anyone at its outset could foresee. Through a yearlong boycott, King faced only one threat to his local leader-

ship, and it quickly collapsed. In December 1956, federal courts ordered the desegregation of Montgomery's city buses.

Winning the bus boycott confirmed King's leadership on three levels. First, he had proven himself to be a powerful advocate for his cause. Better than perhaps any other spokesperson for the civil rights movement, King articulated local grievances in con-

vincing terms of national and religious values. Second, he was able to draw talented organizers of movement activity around him. However contentious their disagreements might be, they deferred to his leadership. Finally, despite threats to himself and his family, arrest, and emotional exhaustion, King dramatically embodied his message of “militant nonviolence” (a concept developed by Mohandas Gandhi, whose work King studied and embraced, especially after a 1959 visit to India). A further task of leadership remained: organizing and maintaining a regional agency to coordinate and lead the civil rights movement throughout the South

THE SOUTHERN CHRISTIAN LEADERSHIP CONFERENCE

In January 1957, Martin Luther King Jr. and others met in Atlanta to organize the Southern Christian Leadership Conference (SCLC). Yet it remained largely an organization on paper, with no significant accomplishment, for the next three years. Headquartered in Atlanta, understaffed and underfunded, it announced initiatives only. In 1960, King moved to Atlanta to become co-pastor with his father of Ebenezer Baptist Church and hired Wyatt Tee Walker as executive director of the SCLC. Walker brought discipline, energy, experience, and talent to an organization in need of those qualities. It was a propitious time in the civil rights movement. Black college students launched the sit-in movement, as King settled in Atlanta. The Congress of Racial Equality (CORE) initiated the Freedom Rides a year later. SCLC played a supportive but marginal role in both movements. It could not yet claim any major initiative as its own.

Between 1961 and 1965, however, King and Walker, and later Andrew Young, positioned the SCLC at the center of a broad coalition of organizations at the heart of the civil rights movement. To its right, the older National Association for the Advancement of Colored People (NAACP) and the Urban League were firmly based in the black middle class and pursued their goals largely through litigation and lobbying. To its left, CORE and the Student Nonviolent Coordinating Committee (SNCC),

organized by young leaders of the sit-in movement, were more volatile. Initially firmly committed to nonviolence, they would eventually burn themselves out in its cause. Led by King, Walker, and Young, the SCLC launched a series of local campaigns—to which King brought the spotlight of national attention—that became much of the framework for our understanding of the movement: in Albany, Georgia; Birmingham, Alabama, Danville, Virginia; St. Augustine, Florida; Selma, Alabama; Chicago, Illinois; and Memphis, Tennessee.

It is a matter of conjecture whether King’s and the SCLC’s strategy of identifying with and bringing attention to critical local campaigns was borrowed in part from Billy Graham’s contemporary evangelistic crusades, was a function of its organization by local affiliates, or was largely accidental. Yet, clearly, King and the SCLC were drawn into the first of the local campaigns, at Albany, Georgia, without sufficient preparation. Aiming at broad-gauge targets, they were met by a wily police chief who minimized violent confrontations with demonstrators. Albany produced little dramatic footage for national press photographers and television cameras. King came away from a draining year of demonstrations in Albany with little to show for his trouble. The lessons learned in Albany were applied to Birmingham. Birmingham’s police chief was the embodiment of violent southern law enforcement. In the mighty citadel of racial segregation, leaders of the movement narrowly targeted specific goals and directly challenged Birmingham police authorities. The confrontation produced some of the most striking pictures of the civil rights era and one of its most eloquent statements, King’s “Letter from a Birmingham Jail.”

“I HAVE A DREAM”

Later in the summer of 1963, Martin Luther King Jr. gave his best-known public address, “I Have a Dream,” at the March on Washington. Here, perhaps most effectively, his leadership as orator was manifest. He invoked biblical and national values and embodied the civil rights movement—a movement for and to which he spoke—in the first-person “I” of

The ultimate measure of a man is not where he stands in moments of comfort, but where he stands at times of challenge and controversy.

—Martin Luther King Jr.

his speech. He appealed to, and sought, the best of America. More than that, his speech was a ringing declaration of hope for all humanity. These noble aspirations were cruelly thwarted just three weeks later in Birmingham, when a bomb exploded on a Sunday morning in a church, killing four little girls. King was there to preach for their funerals. Martin Luther King Jr. knew that his vocation was to preach. He was, occasionally, awkward when cast in other roles. In 1964, the civil rights movement reached another crisis moment when it challenged the seating of Mississippi's all-white delegation to the Democratic National Convention in Chicago. Cast in a highly political role, his advice failed to hold together the center of the alliance between movement leaders and the administration of President Lyndon Johnson. Yet King felt increasingly obliged to political action, even as the movement he led began to fray. The Danville and St. Augustine campaigns were frustrating skirmishes, but Selma put the major political issue—voting rights—squarely on the table.

THE FINAL YEARS

Because it was cast in the classic mold of civil rights marchers confronting brutal legal authorities, the Selma to Montgomery march was successful and eventually led to passage of the 1965 Voting Rights Act. Yet, in Chicago, a highly political and alien context for King, his leadership of the movement had been little more successful than it had been in Albany years earlier. His critics accused King of diffusing his influence to the urban North, to economic issues, and to protesting the war in Vietnam in his final years. It was as if, they thought, the lessons of Albany had never been learned. King died, the victim of an assassin's bullet, on 4 April 1968 in Memphis, Tennessee.

KING'S LEGACY

In proclaiming a national holiday in honor of Martin Luther King Jr. on 14 January 1994, President Bill Clinton stated that Dr. King had “dedicated his life to ending the injustice of racism, gracing the world with his vision of a land guided by love instead of hatred and by acceptance instead of intolerance” (The White House 1994, para. 1).

Martin Luther King Jr. was the greatest preacher in twentieth-century America. More than anyone else, he demonstrated the power of the proclaimed word and moved a nation to confront racial issues that it had mishandled or avoided for a century before his death.

—Ralph E. Luker

KROC, RAY (1902–1984)

Founder of McDonald's Corporation

Born in Chicago, Raymond Albert Kroc spent so much time thinking up wild schemes and business ideas during his adolescent and teenage years that family and friends considered him a bona fide day-dreamer. No one in Ray's family ever believed or conceived he would eventually become a legendary entrepreneur and business genius. Although Ray ran a very successful lemonade stand and was a hardworking drug store helper as a child, his first attempt (during his sophomore year at high school) at establishing a serious business endeavor, a music store specializing in sheet music and novelty instruments, failed.

The United States entered World War I during the spring of Ray's sophomore year; shortly thereafter, Ray managed to convince his parents to let him join the Red Cross as an ambulance driver, though it meant lying about his age to gain entry. The armistice ending the war was signed before he deployed to France, so he did not see overseas action.

Ray soon realized his penchant for action and dislike of academics. He tried returning to school at his parents' request, but only lasted a semester. For the next thirty-five years, Ray honed his business knowl-

Ray Kroc stands in front of one of his franchises holding a hamburger and a drink.

edge and his ability to find opportunity in places others overlooked. He was very successful during his career as a paper cup salesman, but not as successful as he would become in the hamburger business at the age of fifty-two. Later in life, Ray Kroc liked to remind people that his seemingly overnight success with McDonald's was in fact the product of more than four decades of experience as an entrepreneur and a very hard worker.

THE McDONALD'S METHOD

The story of how Ray traveled to California from Illinois in 1954 to observe the McDonald brothers' hamburger operation and how he eventually led it to become the international leader in the fast-food industry is well known and often repeated among business leaders. In fact, many university courses include the McDonald's business model as a successful case study in business administration, opera-

The quality of a leader is reflected in the standards they set for themselves.

—Ray Kroc

tions, logistics, and human-resource allocation. It is uncommon, though, for university students to study the leadership traits, characteristics, and principles that Ray Kroc lived by and that made him and McDonald's Corporation a success. Five of the principles with which Ray Kroc founded McDonald's and made it successful are his commitment to the public through "Q, S, C, & V" (quality, service, cleanliness, and value), his attention to detail, his adherence to the notion that one should lead, not manage, decentralization of authority, and education.

Q, S, C, and V

Ray Kroc continually demanded quality, service, cleanliness, and value from every restaurant franchisee and from all McDonald's corporate-owned restaurants. This mantra is an unshakable principle by which the organization's restaurants are operated. Ray took any degradation of these quality markers by any restaurant owner, manager, or employee as a personal affront on his leadership. These four words can be found inscribed on a brass marker in nearly every McDonald's restaurant as a reminder to employees and customers of the company's commitment to those principles and its desire to lead through that commitment.

Attention to Detail

Ray Kroc realized that customers returned to McDonald's for a reason, and that reason was the consistency and quality of the product. Food from McDonald's is prepared in exactly the same manner in Paris, Texas, as it is in Paris, France, and in the rest of the thousands of restaurants around the world. Ray was once accused of being in the french fry business because of the effort and detail he demanded in its preparation. Every detail—the potato harvest, the drying technique, the size and shape of the container in which the customer

receives the end product—was scientifically studied. McDonald's guarantees the same level of quality in all their products in all their restaurants.

Leadership, Not Management

Above all, Ray Kroc was a true leader and not a manager. He repeatedly hired experts and taxed their knowledge, but gave them the freedom to work effectively. In his own words, Ray said "I believe that if you hire a man to do a job, you ought to get out of the way and let him do it" (Kroc and Anderson 1977, 83). He lived and ran McDonald's by this belief. During McDonald's startup, Ray hired Harry Sonneborn to manage financial and legal matters. Ray often depended on Harry's knowledge and intuition to guide and develop his decisions as a leader. This led to successful strategic property acquisitions, necessary corporate restructuring improvements, and the company's initial public offering in 1965. Harry Sonneborn's freedom to explore and ply his trade made Ray Kroc and several other people at McDonald's instant millionaires.

Decentralization of Authority

As McDonald's grew, Ray realized that he could not be omnipresent in McDonald's operations. To ensure success at every level, Ray believed in decentralizing authority. He believed that day-to-day operations decisions should be made at the lowest levels possible and set up various regions and district units within the organization. He refused to punish honest mistakes, even when they were costly. Immediate dismissal occurred, however, when dishonesty was responsible for the mistake. In this manner, McDonald's employees learned that they were valued for more than their assigned responsibilities. This leadership belief resulted in the permanent adoption of several items developed by franchisees, including the Filet-o-Fish (1963) and Big Mac (1968) sandwiches.

Education

Although Ray was unsuccessful in his personal academic achievements, he realized the value of educa-

tion for his employees. Training and education in McDonald's operations is held at the local McDonald's restaurants as well as at Hamburger University in Oak Grove, Illinois. There McDonald's offers courses in management and operations to domestic and international students. McDonald's also operates training centers in England, Japan, Germany, and Australia.

McDonald's remains the world leader in the fast-food business niche. In its 2002 annual report summary, McDonald's reported serving more than 46 million customers daily at 31,108 restaurants located in 119 countries. This ongoing success can only be attributed to Mr. Kroc's vision and unrelenting demand of adherence to his leadership principles and philosophy.

—Jaime L. Benavides

KUROSAWA, AKIRA (1910–1988) *Japanese film director*

Akira Kurosawa is credited with single-handedly bringing Japanese film to the notice of the world at large through such films as *Rashomon* (1950) and *Seven Samurai* (1954). Kurosawa's leadership in the field of filmmaking has made his work the benchmark against which all subsequent Japanese directors have been measured and a major source of inspi-

ration for a generation of American filmmakers. Kurosawa's career, however, is ultimately axiomatic of the rise and decline of the film industry in which he worked.

BEFORE WORLD WAR II

Kurosawa's filmmaking career began in the early 1940s, when he became an understudy to a more established director, Kajiro Yamamoto, at P.C.L. (Photo Chemical Laboratories, which would later become the powerful Toho Studio). During this early part of his career, Kurosawa trained in many aspects of the filmmaking process, from camera techniques to editing and scriptwriting. Something of Kurosawa's mature style was evident to critics even as early as his first feature film *Sanshiro Sugata*, which he directed and adapted from Tsuneo Tomita's novel in 1943. The film contains some of the camera work, like lateral tracking shots that follow the movement of characters across the screen and the intercutting of shots which acted to create a sense of movement and a layering of perspectives within a scene, which would become common techniques in Kurosawa's filmmaking. *Sanshiro Sugata* reflects therefore maturity beyond the fledgling director's years or experience, and indicates the strong artistic presence that Kurosawa would engender in almost all his subsequent filmmaking. Kurosawa's subsequent films, the World War II propaganda films *The Most Beautiful* (1944) and *Sanshiro Sugata: Part II* (1945), were more stylistically muted, as the director balanced between artistic sensibility and the requirements of those who allowed him to continue working.

THE OCCUPATION YEARS (1945–1952)

Thereafter Kurosawa began making films during the Occupation period and under Japan's studio system proper. He worked for Toho intermittently, though their relationship was sometimes strained. Kurosawa was involved with the widespread strike action that plagued the studio in the 1940s, particularly as a member of the Artist Group (Hirano, 1992: 205–240). Several of the films from this period, including *Stray Dog* (1949) and *Scandal* (1950) dealt with

Japan's postwar social conditions and psyche. In *Stray Dog*, for example, the central character, Murakami (a policeman) dresses up as a soldier and goes in search of his stolen gun. The search takes the audience through postwar Tokyo and explores the sense of confusion to be found within that cityscape. That Kurosawa's work in the intrawar years was less visually impressive than that which followed illustrates how important independence was to Kurosawa's filmmaking style. When allowed the freedom to experiment, as he does in *Stray Dog* and *Scandal* among others, Kurosawa creates strong links between his subject matter and his camera techniques, leading the way for many of the Japanese and international filmmakers who were to follow him.

It was in this postwar period that Kurosawa was first thrust into the international limelight with *Rashomon* in 1951. Recommended by Italiafilm's Japanese representative Giuliana Stramigioli to the Venice Film Festival organizers, *Rashomon* went on to win the 1951 Grand Prix and later the Oscar for Best Foreign Film. This film has been immensely influential in international cinema; such recent films as Quentin Tarantino's *Pulp Fiction* (1994) can be related back to *Rashomon*'s fractured, unreliable narrative. While it was this kind of international recognition that kick-started Kurosawa's "golden age" career, this international acknowledgment has also led to his problematic relationship with later Japanese directors.

GOLDEN AGE

During the 1950s and 1960s, Kurosawa experienced the height of his filmmaking powers, just as Toho Studio wielded extensive production powers. This enabled the studio to bankroll films like Kurosawa's *Seven Samurai*, which, costing ¥210 million, was the most expensive film ever made in Japan at that time. Kurosawa, during this period was known not only for his authoritative style of filmmaking, which earned him the press nickname "*Tenno*" or emperor, but also for his innovation in stylistic techniques such as multicamera filming, wipes (where the end of one scene is replaced by that following it by a lat-

eral, vertical or even diagonal sweep across the screen, a technique that frequently appears in the *Star Wars* films directed by George Lucas), pans and slow motion photography. Furthermore, Kurosawa has been deservedly praised for his adoption and experimentation with wide-angle, anamorphic lenses and CinemaScope widescreen aesthetics, which he first used in 1958 in *The Hidden Fortress*.

Kurosawa's significance as a filmmaker goes beyond the borders of visual experimentation. Perhaps the most significant narrative innovation Kurosawa made can be found in his presentation of his heroic characters. Many of the heroes found in his films are loners, and seem to have been intended as role models for his audiences. Several times, though, Kurosawa departed from the heroic norms of Japanese cinema, providing some of the most interesting cinematic examples of the antihero available in either Japanese or American film. *Yojimbo* (1961) and *Sanjuro* (1962) provide particularly good examples of Kurosawa's blending of the hero with the antihero. They center on a *ronin*, a masterless samurai who become warriors for hire. In *Yojimbo* and *Sanjuro* Kurosawa's heroic antiheroes attempt to right social injustices, though for morally ambivalent reasons. These heroes were largely responsible for the reenvisioning of the *jidai-geki* (period film) genre in Japan. The films they appear in marked the end of the Toei Studio's dominance in the genre, and their heroes were the central reason for Toei's failure because the rival studio's films had nothing to compete with Kurosawa's ambiguous *ronin*. These ambiguous heroes lived on as a heroic model in American and Italian filmmaking as in Sergio Leone's "Man with No Name" films starring Clint Eastwood from the mid-1960s. Thus, Kurosawa reworked an entire genre of Japanese filmmaking, while also providing a heroic template that has resonated deeply within and beyond the Western film genre.

Kurosawa, however, should not be viewed as the lone creative force behind the films he made. Others, including his long-term scriptwriting partners (Shinobu Hashimoto or Ryuzo Kikushima), composers (Masaru Sato), cinematographers (Kazuo Miyagawa) and particularly actor Toshiro Mifune,

all enabled the director to realize his visually striking films. Nevertheless, the central justification for considering Kurosawa as a significant leader in film studies can be mapped at the level of his filmmaking management. He co-wrote almost all of his films, and even edited them as well as determining the overall production style they exhibit. It is significant, however, that when Kurosawa lost the support of the studio system in the 1970s, his films declined in popularity both critically and at the box office.

After *Red Beard* in 1965 and *Dodeskaden* in 1970, Kurosawa became unable to obtain Japanese financing for his films for an extended period. Following a suicide attempt in 1971, Kurosawa left Japan for the Soviet Union to make *Dersu Uzala* (1974) for Mosfilm, collecting another Oscar for Best Foreign Film. This was followed by two other significant films made in Japan, but with American filmmakers as producers: Francis Ford Coppola and George Lucas (*Kagemusha*, 1980) and Steven Spielberg (*Dreams*, 1990)—further evidence of Kurosawa's international links. Although these films received a mixed reception from audiences and critics in Japan and abroad, they indicate just how significant Kurosawa's international success had become to the continuation of his career in later years.

INFLUENCE ON AMERICAN AND EUROPEAN FILMS

Beyond the significance of Kurosawa's films to Japanese cinematic history, the director's presence in the Japanese film industry has had impact on academic appreciation of Japanese film worldwide. Kurosawa's recognition by many European and American theorists, critics, and filmmakers as an *auteur*; a director with definable stylistic traits and a personal vision, has deeply influenced much of Japanese film theory since the 1970s as reflected in the current predominance of director-oriented studies in Japanese film scholarship. This influence has cemented and further legitimated Kurosawa's importance and leadership within the field of film, but it has also fostered a narrow view of the Japanese film industry on the part of critics and film historians.

Auteur studies of Kurosawa and other Japanese directors have provided a good understanding of Japanese film as an art, but relatively little information about the Japanese film industry has been documented outside or even within Japan.

Kurosawa's continuing influence in film is probably best viewed not in the films of Japan, but rather in contemporary American cinema. The rise of television and collapse of the studio system made Kurosawa's expensive brand of filmmaking virtually impossible within his domestic milieu. Consequently, according to Stephen Prince in *The Warrior's Camera* (1991), many of the directors who followed him, including Nagisa Oshima and Shuji Terayama, worked to devalue Kurosawa's directorial style in order to promote their own. Since the 1990s, however, there has been a move among Japanese filmmakers toward recognizing Kurosawa's legacy in Japanese cinema. Animator Hayao Miyazaki provides one example of this trend, with his record-breaking *Princess Mononoke* (1997) based in part on Kurosawa's samurai films. Although Japanese cinema is now attempting to recover and honor Kurosawa's work, American filmmakers have led the way by wholeheartedly embracing the director's filmmaking style, beginning in the 1960s. Some of the most famous examples of Kurosawa's influence include John Sturges's remake of *Seven Samurai* as *The Magnificent Seven* (1960) and George Lucas's borrowing from *The Hidden Fortress* to make *Star Wars* (1977). For it is in his impact on directors worldwide that the logical conclusions and reinterpretations of much of Kurosawa's art can be viewed, and it is in this context that Kurosawa has earned his reputation as a leader among filmmakers.

LABELING THEORY

Labeling theory was presented by the sociologist Howard Becker in his book *Outsiders: Studies in the Sociology of Deviance* (1963) as a unique way to understand deviance. Many perspectives on deviance, such as consensus theory and structural functionalism, assume that deviants are inherently different from conforming individuals. In contrast, labeling theory asserts that deviance develops from social processes that start with the creation of rules. Individuals who fail to conform to these rules are therefore labeled as deviant. It is social agreement about rules, rather than particular rules or internal characteristics of an individual, that produces deviance.

The arbitrary nature of deviance is illustrated by the fact that what is considered deviant can change over time. The modern feminist movement that started in 1963 with the publication of Betty Friedan's book *The Feminine Mystique*, illustrates the fluid nature of deviance. In the early 1960s, a woman who wanted a demanding career or did not want children was seen as deviant. Modern feminist leaders, such as Gloria Steinem, were considered deviant for arguing that women should pursue atypical family or career goals. But in contrast to the early 1960s, recent statistics indicate that girls in secondary school now dominate in extracurricular activities, such as student government, academic clubs, and the

performing arts. The education gap between men and women is narrowing, with more and more women earning Ph.D.s, M.D.s, and J.D.s. In a complete reversal, women today who express the desire to stay home and raise children may be viewed as deviant. Thus, what defines deviant feminine identity has completely changed in less than fifty years, a phenomenon completely in character with the assertions of labeling theory.

From the point of view of labeling theory, public awareness is required to categorize an act as deviant. In the absence of attention from others, individuals can engage in deviant behavior but avoid the deviant label, becoming what Becker called "secret deviants." In contrast once individuals receive the "deviant" label, they are "tagged" as deviants, and this socially constructed identity can influence how they are perceived and treated by others. Once labeled, a stigmatized identity can encourage them to take on a nonconformist role that further alienates them from mainstream society. Through the operation of self-fulfilling prophecies, the tendencies of others to treat them differently because of their deviant status may actually promote deviant thoughts and behaviors in marginalized individuals.

The historical root of labeling theory is found in the symbolic interactionism of George Herbert Mead and Charles Cooley. In his book *Human Nature and the Social Order* (1902), Charles Cooley developed

the concept of the “looking-glass self.” From Cooley’s perspective the self-concept develops as people imagine how they appear to others. Both an individual’s “true” nature and what others actually think of him or her are less relevant than what the individual believes others think about him or her. In a similar fashion George Herbert Mead, in his book *Mind, Self, and Society* (1934), argued that the self emerges from the mind’s understanding of social interactions and symbols. Labeling theory can be viewed as a variant of symbolic interactionism because, according to labeling theory, deviance emerges from how people define deviance in terms of the violation of socially constructed rules. In other words deviance is socially constructed rather than an objective phenomenon.

LEADERSHIP PROCESSES INVOLVED IN LABELING THEORY

Leaders and leadership play key roles in creating deviance as described by labeling theory. An important step in the social construction of deviance is the establishment of rules that, if violated, become the basis for designating an individual as deviant. Typically, leaders make important contributions toward the creation of rules. One clear example of how leaders create rules is the efforts of elected officials to create laws. The members of the Senate and the House of Representatives exist in a delicate balance with the president in the creation of rules. Although the president can veto bills created in Congress, with a sufficient majority, the House and the Senate can override the desires of the president. In the case of laws, rule violation leads to an extreme form of deviance known as “criminality.”

The actions of elected or appointed representatives of the government represent one method of rule creation. Other types of rule creation can occur with leaders with less formal power. In 1954 a psychiatrist named Frederic Wertham published a book called *The Seduction of the Innocent* that blamed comic books for deviance in the form of juvenile delinquency and ultimately led to the creation of the Comics Code Authority, which tightly regulated the contents of comic books. Although Wertham lacked the formal

authority of an elected official, his expertise as a mental health professional provided him and his book with sufficient credibility to significantly alter how comic books were written and published. Individuals who define themselves as rule creators are termed “moral entrepreneurs” by labeling theory. Retail outlets were unwilling to stock comic books without the approval of the Comics Code because such books, and their publishers, were seen as deviant.

For a rule to influence the creation of deviance, rule breaking must be identified and the rule must be enforced. Leaders and leadership processes play an important role in the detection and punishment of deviance. Enforcement requires that a system exist for the purpose of detecting rule violations. Labeling theory recognizes that rule violation systems vary in their degree of formality. At one end, formal systems, such as the police or military, maintain the status quo and by doing so identify and punish or otherwise constrain rule breakers. In a formal system, leaders play a key role in creating and maintaining an ordered system. Less formal groups, such as coworkers or classroom peers, can target deviants and apply pressure to them to conform to existing rule systems. In less formal systems, leadership roles may be established in terms of seniority, expertise, or popularity.

The importance of detection in the process of deviance creation is illustrated by the ongoing debates, often initiated by leaders such as government officials, about instituting surveillance cameras in public places. Although intended to curtail criminal activity, the prevalence of security cameras makes it more likely that noncriminal forms of deviance will also be detected. As such, the detection of deviance must be balanced by a concern for individuals’ rights, such as the right to privacy.

LEADERSHIP PROCESSES IN THE RESPONSE OF THE DEVIANT

Deviant individuals may insulate themselves from larger society. Although in rare instances a deviant becomes entirely isolated, more often the deviant seeks out others who are similarly deviant. Interactions with similar others can produce new social

structures and processes. The emergence of leaders from a pool of deviants may be included among these social processes.

Leaders of deviant groups develop goals geared toward trying to improve the group's deviant status. By the process of "neutralization," for example, deviant acts are reinterpreted as justified. Deviance may be justified in a number of ways. Deviants can deny responsibility for their actions. A deviant might argue that the way he or she was treated by society is the source of his or her deviant actions. Ironically, Frederic Wertham's condemnation of comic books provided juvenile delinquents with an external explanation for their behavior. Their crimes, it could be reasoned, should be excused because their criminal behavior should be taken as an unintended consequence of their well-intentioned reading of comic books. Another form of neutralization denies the victim's claims of injury. For example, a vandal might try to argue that the wealthy have a disproportionate share of the wealth and therefore "deserve" to have their property damaged. A third type of neutralization focuses on appeals to higher authorities. The civil rights movement was premised on beliefs about social justice and fairness. Leaders such as Martin Luther King, Jr., emphasized the importance of providing equal rights for disadvantaged minorities.

IMPLICATIONS OF LABELING THEORY FOR SOCIETY AND SOCIAL POLICY

Because labeling theory examines how society creates deviance through the process of establishing rules, labeling theory suggests that some social problems may exist more as a result of the way society has defined rules about them than because of any inherent destructiveness they possess. To the extent that society deals with forms of deviance that reflect the rule creation of moral entrepreneurs rather than the results of serious social problems, societal resources may be used less than optimally. An example of this process is the concept of "victimless crime," such as prostitution. In the typical act of prostitution, a man exchanges money for sexual favors. Each party walks away satisfied. From such a social exchange point of view, prostitution represents

a perfect example of capitalism, with each party happier after the exchange. Despite this "fair exchange" perspective on prostitution, most elements of society label prostitutes and the men who patronize them as deviants. The arbitrary nature of prostitution as a form of deviance is evident in the significant number of respectable men who at least on occasion have paid for the services of prostitutes. In addition, although generally seen as a criminal act, in parts of Nevada prostitution has been legalized, though carefully regulated.

Because prostitution is labeled as deviant, as well as criminal, a significant amount of tax dollars go toward fighting it. These efforts typically yield unsatisfactory results because it is costly to try to prevent prostitution, yet the parties involved both desire to maintain the system of economic exchange. The money spent trying to catch and punish parties involved in prostitution could be better spent on preventing more destructive forms of criminality, such as assault, murder, rape, arson, and theft.

One leadership process that has emerged in the debate regarding the legality of prostitution is the formation of advocacy groups for prostitutes and other sex workers. One influential group is known as COYOTE (Call Off Your Old Tired Ethics). Founded in 1973 by Margo St. James, the goal of COYOTE is to help all kinds of sex workers fight for their rights. The goal of this group is to neutralize deviance associated with prostitution and create more favorable environments for sex workers and their customers in the process. In other words groups such as COYOTE work to reinterpret deviant acts (those associated with prostitution) in terms of mainstream society.

LIMITATIONS OF LABELING THEORY

Like many theories developed in the social sciences, there is a great deal of debate about whether sufficient empirical evidence in support of labeling theory exists. Although some researchers have obtained findings consistent with the predictions of labeling theory, other investigators have failed to demonstrate support for the theory. Some critics have argued that labeling theory lacks sufficient rigor to be refuted, a clear requirement for a scientific theory.

One important practical limitation of labeling theory is its implications for the ways in which society deals with deviants. By identifying the cause of deviance as the interaction between the individual and society, rather than a problem within the individual, labeling theory can be used to argue that criminals should be rehabilitated rather than punished for their crimes. As such, labeling theory is inconsistent with a focus on the individual's accountability to society for his or her own behavior.

RESEARCH DIRECTIONS FOR LABELING THEORY

Because it was derived from symbolic interactionism, labeling theory can be applied more broadly than just to deviance. Researchers have examined other areas of social behavior that may be understood in terms of labeling theory. Interviews with members of Debtors Anonymous identify the importance of shame as part of the labeling process. Even something as seemingly minor as hair color can be a source of a deviant label. Children and adults with red hair report that this physical attribute can lead to their being labeled by others (e.g., as hot-tempered). Labeling theory also has shown to be useful in understanding how the elderly behave as consumers.

The development of leadership and the nature of leadership processes, from a labeling theory perspective, warrant further research. It would be interesting to compare the emergence of leaders in dominant groups with parallel processes in deviant or minority groups. Do leaders in both arenas operate in similar manners? Are the bases of power for leaders in both domains similar or distinct?

Another aspect of deviance that should be further explored concerns stigmatized but not necessarily negative behaviors or physical or psychological states. For example, a physical disability, such as blindness, creates a deviant, that is, minority, status, but is most often viewed in a sympathetic manner by society.

Much of the effort of labeling theory has focused on the experiences of the deviant, especially in the context of criminal behavior, where deviant behavior is often equated with criminal offender status. An

important, but largely ignored, issue is how the principles of labeling theory can be applied to the victims, rather than perpetrators, of crimes.

Although labeling theory takes the point of view that acts are only deviant because they are labeled as such, labeling theory cannot explain what factors cause someone to be willing to commit deviant acts, even if the deviant categorization of those acts is arbitrary and socially constructed. Further work should be directed toward a better understanding of what motivates an individual to accept and even seek out a deviant status.

LABOR MOVEMENT

The evolution of modern industrial capitalism brought closely associated new organizational forms, such as corporations, the welfare state, and labor organizations, but these forms had marked contrasts in trajectory, structure, and success. In the United States, nineteenth-century craft unions emerged to provide mutual aid and to promote standards and regulations but also to oppose unskilled and foreign labor. Union leaders were committed to economic objectives for their members but avoided

mobilization of a mass political movement based on workers' common interests. Union leaders opposed industrial unions that developed along with mass production, urbanization, and waves of immigration, such as the International Workers of the World (IWW), which mobilized unskilled and immigrant workers and promoted mass politics.

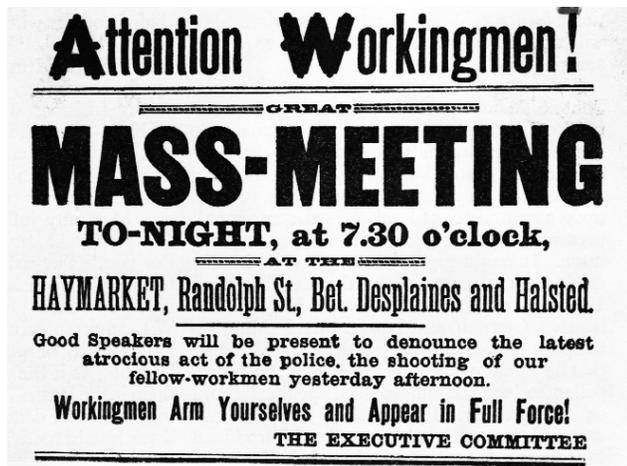

U.S. labor leaders focused on organizing and collective bargaining but not on occupying government office. In part this choice responded to Pope Leo XIII's encyclical, *Rerum Novarum* (1891), which supported worker rights but only if unions would focus on workplace economic gains, not societal transformation that challenged private property rights. U.S. labor leaders succeeded in organizing substantial majorities in major economic sectors—mining, transportation, capital goods, and durable goods manufacture—but pursued limited political goals within a two-party system. Business unionism taught leaders that union prosperity depends on internal control and discipline but also that aggressive demands can undermine union security in an increasingly global postwar economy by pushing employers overseas or undermining their competitive strength.

In contrast, European and Third World nations produced industrial unions whose leaders more often were political leaders. Thus, unions' leaders engaged in party politics, and unions became identified with social legislation defending and promoting working-class interests. Expressing this alternative vision of unions' political and social leadership, in 2002 the former Brazilian metalworker union president, Luiz Inacio Lula da Silva, achieved the ultimate potential for transforming union leadership into national leadership as Brazilians elected him president. Elsewhere, the Labour Party's Tony Blair serves as the United Kingdom's prime minister, and Sweden's Social Democrats have dominated national politics for most of the past century.

Labor leaders, both in unions and in associations of unions, such as the AFL-CIO, represent a complex set of actors in a diverse population of organizational contexts and social relations. At one extreme, the local level, leadership encompasses the pragmatic duties of shop-floor stewards and union local presi-

dents. At the other extreme, reflecting unions' structural evolution into national associations, union leadership may also participate in elite power structures. For example, some U.S. labor leaders have become part of a national policy elite; AFL founder Samuel Gompers and George Meany prominently represented labor in mainstream political institutions. Others, such as Eugene V. Debs and A. Philip Randolph, founded unions and emerged as influential leaders of social movements. U.S. labor leaders have not, however, followed the path of their counterparts in Europe, where labor parties participated in electoral politics and sometimes controlled national governments. As a result of these different leadership models and political strategies, U.S. labor laws contrast with those of other nations; labor standards and collective bargaining rights lack state support found elsewhere.

During periods of organizing or union reform movements, leaders typically rise from within the ranks of workers at a workplace or from a social movement struggling for economic, social, and political gains (Gouldner 1950; Nyden 1985). Mobilization and activism embed leader identity with rank-and-file worker concerns and life circumstances. Direct unmediated communication between leaders and union members sustains democracy and leadership legitimacy (Webb and Webb 1902; Cornfield 1993). However, a substantial amount of research literature documents the existence of alternative models of union organization and leadership (MacDonald 1959). On the one hand, unions may develop into large, complex, centralized bureaucratic organizations. In such "business model" unions, consistent with Robert Michels's "iron law of oligarchy" thesis, leadership may develop an entrenched conservative elite, focused on controlling members, monopolizing communication, building a professional staff, and formalizing internal authority structures and relations with employers (MacDonald 1959; Marcus 1966). Historically low leadership turnover rates and lack of democratic structures for opposition elements provide evidence that such nondemocratic qualities exist in many unions (Kahn, Lang, and Kadav 1986). These unions may be characterized by nepotism and leadership social networks based on race, ethnicity,

A poster announcing a mass-meeting of workers to be held on the evening of 5 May 1886, the day after the Haymarket Square incident in Chicago.

Source: Corbis; used by permission.

religion, and other group identities. Finally, business unionism becomes reified (regarded as material) in policies that emphasize a contract between leaders and rank-and-file members. In the business union model, members' dues purchase services from an insulated cadre of professional union leaders who define union objectives and policies and conduct negotiations with employers. Weak accountability, low transparency, and extreme status differences mark relations between leaders and rank-and-file.

In contrast, democratic union organization sustains rank-and-file member activism and participation wherein leadership is continually revitalized by an ongoing culture of social mobilization that targets not only workplace gains, but also societal goals such as labor standards, social welfare, civil rights, democracy, and environmental protection. Democratic union leadership turnover rates and diversity, organizational protections for opposition interests, and frequent elections confirm the potential for democratic leadership structure. Democratic union leaders typically serve limited terms without opportunity to succeed themselves. Leader compensation, union-supported expense accounts, and leadership subsidies remain far lower than in business union models. Historical assessments of U.S. unions find multiple patterns of authority relations, with social movement (democratic) unionism and rank-and-file

voicing opportunities evident in numerous union contexts, from locals to central labor councils to national union leadership.

SOCIAL ORIGINS

LaPorte (1999) notes that the business (service contract) union model produces a bias toward better educated, verbally adept, and technically skilled leaders; more staff are college educated and professionals (attorneys) who equate potential for leadership as consistent with their own traits. Promotion from the rank-and-file is rare with a premium on communication skills; few resources are expended on identifying or developing leadership from rank-and-file members. Even in Mills's (Mills and Atkinson 1945) early survey, labor leaders' educational attainment was high for the time, with 22 percent college graduates, 41 percent high school graduates, and 36 percent with less than a high school degree (Mills and Atkinson 1945).

Mills found that approximately 50 percent of union leaders "are Protestants, 35% are Catholics, 10% state no religious affiliation and slightly more than 4% are Jews" (Mills and Atkinson 1945, 168). In contrast, Ganz and associates' (2003) study of California union leaders found 50 percent Catholic, 25 percent Protestant, 20 percent Jewish, and only 5 percent without religious affiliation. Moreover, only 21 percent were women, and only 11 percent were Hispanic—well below their rates in California's union membership and overall demographic profile. Fink's (1984) survey of labor leaders charts their decline from 36 percent foreign born in 1900 to 4 percent in 1976. Form (1985) observes that the southern shift of U.S. industry and unionization led to one-third of labor leaders being from the South by 1976. Thus, leadership social origins roughly tracked some U.S. labor force demographic and manufacturing trends, but minority and gender leadership representation counters these trends.

MINORITY LEADERS

In 1994, women and people of color represented 50.3 percent of union members and 53 percent of the

U.S. employed population (Roby, 1995). Nevertheless, overall ethnic and minority leadership remains disproportionately low, and striking long-term disparities continue in some unions where women and minorities constitute majorities (Greer, 1953; Gaspasin, 1998; Roby, 1995). Union leadership surveys consistently document low minority and women's representation (U.S. Department of Labor 1970; U.S. Commission on Civil Rights 1982; Coalition of Labor Union Women 1980) despite long-term post-World War II growth in minority union membership, especially in service and white-collar unions. The degree of minority leadership often reflects such factors as its strategic significance during union organizing, minority organizational activities within unions, and whether an official gained his or her position by appointment or by election (Cornfield 1989; Greer 1953; Lamm 1975). Cobble (1993) identified four common leadership paths: founders, inheritance, individuals with technical expertise, and promotion or election from rank-and-file status. In many established unions only the latter path is normally available to most minority leaders. Cobble (1993), Wertheimer and Nelson (1975), and Roby (1995) stress the importance of entry level leadership activities such as attendance at union meetings and election to the office of shop steward. High-profile minority leaders, such as A. Philip Randolph (Railway Porters Union) and César Chávez (United Farm Workers), did emerge in labor market niches and not only founded unions, but also led campaigns for civil rights and worker rights. Public sector unions contrast with this profile, reflecting both higher minority labor force participation in this sector and less influence from entrenched conservative social interests.

Minority union leaders have faced important barriers in bureaucratic union settings, such as their dual representation role, discrimination, and lack of mentorship or training (Greer 1953; Gaspasin 1998; Roby 1995; Lamm 1975; Kornhauser 1952; Melcher, Eichstedt, Eriksen, and Clawson 1992; Cook, Lorwin, and Daniels 1992; Cobble 1993). African-Americans, Hispanics, women, and other minority leaders must balance the roles of union officer and minority representative. Dual roles increase the pressures felt by minority leaders and may result

in minority leadership being defined as symbolic or liaison by upper union leadership (Kornhauser 1952) and of limited power. Cornfield (1993) notes that minority leadership increases during periods of intensive conflict and mobilization as the groups the leadership represents become important for success. Since 1995, AFL-CIO organizing initiatives targeting service, public, and white-collar workforces, coupled with affirmative action campaigns, have led to increased minority leadership in individual unions and in state and national labor associations. In skilled craft unions, lack of affirmative minority recruitment into apprentice programs and the absence of affirmative action and mentoring programs produced disproportionately low levels of minority participation at the rank-and-file and leadership levels.

LEADERSHIP EDUCATION, TRAINING, DEVELOPMENT

LaPorte (1999) found that business union leadership development is selective, skill directed, and biased in favor of better-educated, verbally skilled, politically adept, and technically oriented members. Increasingly, consistent with Mills (Mills and Atkinson 1945), whereas election campaigns stress leaders' union-based experience and rank-and-file origins, staff leadership increasingly stresses college-educated and professional people with no shop-floor experience in local unions. Although union leaders may be considered labor movement professionals (Nesbit 2001), union culture continues to honor shop-floor experience; leadership credibility deriving from the school of hard knocks has weighed more than formal academic training (Nesbit 2001).

When people pursue formal educational credentials, such education typically occurs after candidates achieve office. Richard Dwyer (1977) identifies labor education as three distinct stages in the twentieth-century U.S. union leadership education: (1) from 1910 to the mid-1930s, stressing social reform; (2) from 1930 to the mid-1960s, stressing "bread and butter" knowledge of organizing, collective bargaining, and grievance procedures; and (3) from 1960 to the present, stressing social science and management skills training. These stages

*The leader has to be practical and a realist,
yet must talk the language of the visionary
and the idealist.*

—Eric Hoffer

parallel changes in corporate management as growing organizational size and complexity, market expansion and integration, and increasingly complex regulatory environments changed the demands involved in union responsibility and leadership (Nesbit 2001; Clark and associates 1996). In the most recent era, labor studies programs, universities, and union-based educational centers increasingly provide formal education.

The labor movement and academia have had a long-standing but tenuous relationship (Nesbit 2001). Pragmatic union leaders often view intellectuals as outsiders and impractical. Harvard University's Trade Union Program, which provides one of the oldest examples of the relationship (Nesbit 2001), offers union officials and staff intensive training constructed around a core of strategic planning, labor history, union governance, economic analysis, and dispute resolution and arbitration. Many institutes of higher education have followed the example of the University of Wisconsin-Madison, where John R. Commons founded the first Industrial Relations Institute and initiated labor relations curriculums. An updated listing of such programs and the many state-sponsored programs may be found at the American Federation of State, County and Municipal Employees website at www.afscme.org. Unions also have increased their efforts at formal leadership training, and almost every union has an educational program, although resources dedicated to these programs vary greatly. The George Meany Center's National Labor College has created a year-round curriculum of short courses and has developed a bachelor of arts program for union leaders and staffers (Nesbit 2001). Providing academic credit for time involved in union leadership recognizes union emphasis on experience and performance.

With the advent of globalization, new government regulations, and varied economic concerns,

union leaders must be properly trained to respond and best represent worker concerns (LaPorte 1999). Despite their resistance to "book learning," modern unions encourage formally trained leadership. Recent patterns of leadership recruitment document the increased presence of leaders who enter leadership ranks as professionals (frequently as attorneys) but lack rank-and-file experience.

CAREER PATHS

LaPorte (1999) notes that leadership paths are dominated by political loyalties, not by broadly defined potential for leadership and selection by the rank-and-file. Those people to be appointed are mentored and groomed with a premium on loyalty to higher officials and a conformity with leadership social norms that mirrors managerial culture (Jackall 1988). Cronyism, patronage, and nepotism dominate along lines of race, gender, and language barriers. LaPorte (1999) asserts that in business model unions, when leaders don't trust members, essential functions are filled by hired staff members, many from outside the union, who have no natural base for developing their own power in the union—no threat to the leaders.

The factors motivating local union leaders' original activism typically are immediate and practical (mistreatment by management; dissatisfaction with wages and working conditions; desire for personal power, recognition, or financial gain; absence of other leaders; and prounion sympathy) (Seidman 1950). At that point, however, Mills (Mills and Atkinson 1945) notes two distinct career paths: one where labor leaders originated in rank-and-file jobs and a second where 20 percent of labor leaders originated in white-collar professional careers and then became union officials. Typically, labor leaders begin in local unions and then move to head either a state association or an international association. Either path constitutes substantial upward social mobility. Mills's survey in the 1940s concluded that labor leaders are best understood as a class of self-made men who rose through the ranks to become national leaders by virtue of personal qualities.

More recently, Ganz and associates' (2003) survey identified four motivations influencing labor leaders' career choices. Whereas some leaders saw union leadership as a means to achieve social reform objectives, others had well established community leadership goals prior to joining a union. For a third set of leaders, union leadership was a career option rooted in personal ambitions for upward mobility, status, and power. Finally, some leaders found motivation in their own experience as union members who perceived the importance of unions for their own lives and the lives of others. In contrast with conventional assumptions, Ganz and associates (2003) document a substantial exit from the labor movement between 1984 and 2002. Nearly one-third of labor leaders left during those years, one-half after losing political fights and one-half after they perceived that the union context did not best serve their social reform or personal goals.

SOCIAL AND POLITICAL LEADERSHIP

LaPorte (1999) notes that leadership develops around a set of core values. These values define what the union should look like or become and what the workplace should be and legitimate a larger conception of social and political goals. A transformational, participatory, or social movement form of union, however, seeks to build union member power by encouraging personal involvement and action. Cold War anticommunism and business unionism expressed moral conservatism originating with nineteenth-century craft unions. Evaluating U.S. unions between 1938 and 1955, Stephan-Norris and Zeitlin (1995) identified strongly divergent strains of political consciousness within union leadership. Radical and Communist-

The Global Compact

First proposed by U.N. Secretary-General Kofi Annan in 1999, the Global Compact aims to build corporate citizenship through support of nine principles that deal with human rights, labor, and the environment. As of 2003, more than 1,200 corporations around the world had signed the compact.

Human Rights

Principle 1: Businesses should support and respect the protection of internationally proclaimed human rights within their sphere of influence; and

Principle 2: make sure that they are not complicit in human rights abuses.

Labor Standards

Principle 3: Businesses should uphold the freedom of association and the effective recognition of the right to collective bargaining;

Principle 4: the elimination of all forms of forced and compulsory labor;

Principle 5: the effective abolition of child labor; and

Principle 6: eliminate discrimination in respect of employment and occupation.

Environment

Principle 7: Businesses should support a precautionary approach to environmental challenges;

Principle 8: undertake initiatives to promote greater environmental responsibility; and

Principle 9: encourage the development and diffusion of environmentally friendly technologies.

led unions were much more likely to negotiate contracts that recognized a range of prolabor provisions when compared with stridently anticommunist and authoritarian-led unions.

Labor leaders' roles in influencing national social and political development reflect unions' relative labor market strength, their capacity to establish formal political representation, and the degree to which labor interests have been institutionalized in labor law and government agencies. In the United States prior to the New Deal, labor leaders failed to influence social policy generally and played only a marginal role in the passage of the 1935 Social Security Act (Cornfield 1991; Domhoff 1986–1987). Labor leaders have been more influential, however, when high levels of mobilization and union density were com-

bined with Democratic Party incumbency to provide a basis for resisting campaigns to pass anti-union security legislation (right-to-work) and passing public sector collective bargaining laws.

Labor leaders have been found to play a central role in promoting democracy and welfare state growth and improved working conditions in the United States and Europe. Barton's (1974) interviews with five hundred leaders, including those of seventy-six unions with over fifty thousand members, found distinct economic and foreign policy camps. Labor leaders' values and attitudes were found to be similar to minority group leaders and leaders from ideologically liberal organizations all held similar positions on economic issues, but business union model labor leaders typically supported business community positions on foreign policy. Labor leaders stood virtually alone in their strong support for federal government control of social programs—with many Democratic leaders differing on this issue. Labor leaders, however, often supported business associations' anticommunist, antidemocratic, and prodictatorship positions on foreign policy.

The typical labor leader's work life is dominated by a heavy, bureaucratically structured workload that concentrates on communicating with members, servicing their concerns, and representing their interests to management, government, and the larger community. As heads of democratic organizations, union leaders are also politicians whose lives revolve around the reality of elections by rank-and-file members but who often work within a leadership culture focused on limiting the opportunity for opposition. Working within a highly institutionalized environment of government regulations and contractual obligations, leaders face a contradictory set of cross-cutting demands. As movement leaders, directing mobilization and membership campaigns to recruit members, some union leaders must display charismatic qualities. As heads of complex bureaucracies, union leaders must master the skills of political negotiation, procedural calculation, and technical analysis.

These day-to-day challenges become mediated and structured by societal changes, such as immigration, technological advances, and the evolution of markets. During the past 150 years, as unions have

become core institutions of pluralist democratic societies, leadership objectives have oscillated between mobilization militancy and conservative defense of workplace gains. Current trends in globalization of trade, investment, and labor will present union leaders with an additional set of challenges in the twenty-first century. Labor leaders' ability to respond to these challenges and establish organizational structures that cross national boundaries and establish international labor standards will determine the future of union revitalization or decline.

LAISSEZ-FAIRE LEADERSHIP

Laissez-faire leadership may be the best or the worst of leadership styles. If the leader follows the normally understood definition and standard practice of noninterference and "hands-off" when supposedly leading his or her followers, the worst form of leadership is

manifested. However, when the twenty-first century properly prepares his or her followers, laissez-faire leadership emerges as the ultimate form of leading.

The two words *laissez-faire* and *leadership* are absolute direct opposites. The French term *laissez-faire* was originally used relative to mercantilism, and is defined in economics and politics as an economic system that functions best when there is no interference by government, and is considered a "natural" economic order that procures the maximum well-being for the individual and extends to the community. Leadership is defined as an interactive process that provides needed guidance and direction. Leadership involves three interacting dynamic elements: a leader, a follower(s) and a situation. The leader's role is to influence and provide direction to his/her followers and provide them needed support for theirs and the organization's success.

World, political, religious, and military leaders such as Mahatma Gandhi, Mao Tse Tung, Winston Churchill, Martin Luther King Jr., and George Patton have led multitudes, and even countries, to victory against seemingly insurmountable odds. Early-twenty-first-century leaders must develop a future vision, obtain commitment for such a vision, and inspire, motivate, and empower others to attain the highest level of accomplishment.

The noted author James MacGregor Burns (2003) presents two types of leadership: transactional and transformational. Aspects of transactional leadership are almost overlays of positive and proactive management where both attempt to influence employees to improve performance toward accomplishing organizational goals and individual personal and professional growth. They negotiate mutually satisfying goals, and enabling the leaders/manager's role to become one of encouraging and guiding the employee toward satisfying these goals.

In the management-by-exception passive mode, the manager/leader establishes job expectations and standards and dictates them in a one-way, top-down fashion. He/she emphasizes the punishments associated with not meeting the standards. The role is one of indifference, non-involvement or "leave alone"; hence, this mode could be called "laissez-faire leadership" or abdication of responsibility.

The transformational leader is identified with change. He or she influences others to improve themselves and/or the company beyond what would normally be accomplished without such leadership. Transformational leaders champion the change process and continually communicates the vision to all those involved. The managers continue their functions of planning, organizing, staffing, directing, controlling, communicating, problem solving, and decision making to maintain productivity output and quality while managing the change process.

AUTOCRATIC LEADERSHIP

The autocratic leadership style thrives in highly structured, hierarchical chain-of-command environments such as the military or very bureaucratic organizations. This type of leader exercises almost absolute power and commands strict compliance and conformity. The autocratic leader generally has a well-defined and controlled disciplinary process with an emphasis on punishments for noncompliance. This leader determines prescribed policies, procedures, rules, and goals. He or she is the decision maker and such self-directed decisions are final. In this environment, little interaction or communication is expected among associates. Out-flowing information is highly restricted while in-flowing communication is well filtered and defensive.

Autocratic leaders are usually rigid in their thinking and perceptions. They believe that employees have minimal abilities and capabilities and need close supervision and direction, and that controls are needed to assure their compliant behavior. The autocratic leaders believe their style is highly efficient. Unfortunately, this style of leadership results in minimal or no innovation, and virtually no personal or organizational change, growth and development. Cooperation, commitment and achievement are stifled.

Most individuals are familiar with the autocratic leader because such leaders are prevalent even today. It is generally not considered one of the best methods of leadership; however, the autocratic leader definitely is the preferred style in the military, police, and other organizations where individuals may be in dangerous situations.

DEMOCRATIC LEADERSHIP

Democratic leadership is sometimes referred to as enlightened leadership. An individual manifesting this type of leadership recognizes each person's self-worth and esteem. The leader's actions are based upon trust, integrity, honesty, equality, openness and mutual respect. Democratic leaders show consideration and concern for others by empathetic listening and understanding. They foster open communication among all employees at all levels. Reasons and circumstances pertaining to decisions that affect the employees, department, or organization are shared in a timely fashion. Under such leadership, a highly positive, motivation-oriented environment is established to help satisfy the higher-level self-esteem and self-actualization needs as defined by Abraham Maslow (1998) in his hierarchy of needs. Ultimately, the democratic, enlightened leader strives to empower all employees to their maximum capability and desire. At the same time, the democratic leader places a strong emphasis on teamwork, while functioning as a facilitator to develop a natural synergy among the group.

The democratic or enlightened leader practices employee involvement in considering important issues and exercises influence in reaching consensual decisions. The ultimate goal is to democratically attain commitment to and ownership of decisions. He/she has high performance and quality expectations and recognizes that the only way to attain them is through a committed workforce. Employees participate in establishing goals—both common goals for the good of the organization and goals for their own personal self-growth, learning and development. The role of the leader/manager is to guarantee each employee's success in accomplishing these goals. A feedback system is instituted whereby each employee has the responsibility of informing the leader/manager of any obstacle that prevents successful achievement of the goals, and the leader/manager subsequently removes the hindrances.

The democratic leader places a high emphasis upon rewards rather than punishment. When discipline or correction is needed, it is administered justly. This leader recognizes that mistakes will happen and

considers them learning opportunities. In this way, everyone benefits and the mistakes may not reoccur.

LAISSEZ-FAIRE LEADERSHIP

The laissez-faire leader is one who believes in freedom of choice for the employees, leaving them alone so they can do as they want. The basis for this style of leadership is twofold. First, there is a strong belief that the employees know their jobs best so leave them alone to do their jobs. Second, the leader may be in a political, election-based position and may not want to exert power and control for fear of not being reelected.

Such a leader provides basic but minimal information and resources. There is virtually no participation, involvement, or communication within the workforce. Understanding of job requirements, policies, and procedures are generally exchanged from employee to employee. Because of this, many processes are out of control. No direction is given and the laissez-faire leader functions in a crisis or reaction mode. If there are goals and objectives, employee agreement or commitment is just assumed. Even if goals and objectives are shared, rarely is there a defined plan to accomplish them.

Laissez-faire management or leadership can only lead to anarchy, chaos, and inefficiency and can be dismissed out of hand as useless. Basically, the overall effect of laissez-faire leadership seems to be negative. But there may be an aspect of such a style of leadership that is very positive. Hersey, Blanchard, and Johnson (2000) propose that leaders do not have just one style of leadership, but rather have many varying styles depending upon the situation. In one situation, the employees are essentially incompetent, and lack job knowledge and skills. Here, the leader must be the key person in charge. Being an autocratic leader seems appropriate since the followers do not know enough to make any of their own decisions. Safety may also be a key factor. It is the leader's objective to train the employees as rapidly as possible to get them to a predetermined level of competence so they can begin contributing to the department and organization. Once they have successfully reached the prescribed level, the employees pass onto the next level.

In another situation, the leader continues to function in the autocratic style; however, as each employee matures and gains competence, his/her style evolves into the democratic leadership mode. The employees continue to gain knowledge about the job requirements, to become technically skilled and gain an understanding of the job and related tasks. This is accomplished through much interaction with the autocratic/democratic leader. The goal here is to make all employees job-competent so they do not need direct supervision.

At the point that democratic leaders emerge, they leave the autocrat behind. Through mutual discussion and decision making, the leader conducts a transaction with each employee. The leader offers an opportunity for each employee to move on to a third stage in which he or she takes on additional responsibilities. Employees are expected to continue working at their given jobs, but they begin functioning as pseudo-managers in a participatory manner. The leader will guide, counsel, direct, instruct, and share pertinent departmental and organizational job information to train and develop each employee to the maximum capability. Each employee will be expected to investigate and make process improvement and quality recommendations to the democratic leader. The recommendations must be fully documented and justified to prove to the leader that the employee has sound decision-making judgment. The goal in this situation is to allow each employee to learn and to prove he/she can make good, sound decisions.

Finally, those employees who have proven their decision-making acumen are fully empowered to make independent decisions within an agreed boundaries. Once each employee is comfortable in this last mode, the leader becomes a leader by exception or a laissez-faire leader. He/she knows minimal leadership or management is needed for these individuals.

LEADER CATEGORIZATION THEORY

Theories of leadership traditionally have focused on the leader. For example, the goal of preliminary leadership research was to identify the characteristics that enable someone to be a great leader. In addition, researchers, in an attempt to understand leader-follower processes, have examined leader behavior, power, and contingency theories that specify the interaction between leaders and their situation. More recently researchers have placed greater emphasis on followers and their perceptions of leadership. This emphasis argues that ultimately leader-

ship exists in the eye of the beholder (i.e., the follower) and stresses the process of being labeled (categorized) a “leader” by one’s followers. The catalyst for research involving leader categorization was the work on categories in the social and cognitive psychology literatures.

CATEGORIES

A category is a mental representation of non-identical objects and events, including people and their characteristics, that are perceived as belonging together. (Note that several terms are used interchangeably with the word *category*, such as *schema*, *concept*, and *knowledge structure*.) Specifically, objects, events, and people are categorized based on their similarity to either category exemplars or prototypes. Exemplars are explicit examples of category members (e.g., Wayne Gretzky for “hockey player”), whereas prototypes are abstractions of features common to the focal category (such as the characteristics of hockey players). In general, as a person’s experience with a particular category increases, categorization moves from exemplar-based to prototype-based processing. Research has shown that the activation of particular characteristics of a category, prototype, or exemplar will elicit activation of other characteristics that belong to that category.

In addition to varying by content (i.e., prototypes versus exemplars), categories can vary by hierarchical structure. Specifically, in the context of cognitive psychology, people have argued that categories exist at three alternative levels: the superordinate, basic, and subordinate levels. The superordinate level involves making general group membership judgments (e.g., deciding whether the animal in question is a mammal). At the basic level, categorization is based on an overall gestalt (a structure, configuration, or pattern of physical, biological, or psychological phenomena integrated to constitute a unit) perception, and this level is the fastest and most common level for identifying category members (e.g., recognizing the mammal as being a dog). Finally, categorization is most specific at the subordinate level (e.g., the dog is a German shepherd).

However, the ease of categorization is highest and is usually done automatically at the basic level.

The use of categorization processes is prevalent in social interactions because it helps guide information processing, especially when one's mental capacity is reduced (due to, for example, high stress or distraction), relationships are familiar, or accurate retrieval of social information is not a chief goal. In fact, scholars have argued that categorization is an automatic process that serves as the default mode in social perceptions, helping perceivers assimilate large volumes of information. Categorization also lays the groundwork for people's subsequent interactions with individuals because they guide people's social expectations. In addition, first impressions are uniquely influential, and, after an individual is assigned to a particular category, later recategorization of that individual is unlikely. Indeed, after a person is categorized, much of the subsequently encountered information relevant to that person is processed in terms of the relevant category.

Mental categories serve several purposes. For example, reliance on mental categories helps people make sense of non-identical individual members via their knowledge of the categories to which the members belong while preserving as much information as possible. In social contexts, mental categories serve as a lens through which people shape their own reality and interpret the behaviors of others. In fact, the meaning that people extract from events is determined in part by the categories they assign to those events. Similarly, categorical knowledge facilitates making inferences about members' attributes and forming expectations about the future, even though people may have limited experience with members. For example, one might infer that an individual can ice skate from one's knowledge that she or he is a hockey player, although one has never witnessed the person on ice before. Categories with shared meanings can also facilitate effective communication with others because they express a large quantity of information. Lastly, the meaning that people derive from events via categorization goes beyond influencing only their social inputs; it also influences people's social outputs (such as attitudes and behaviors). For example, an innocent joke delivered by someone cat-

egorized as offensive might be interpreted as a verbal insult directed at oneself, resulting in retaliatory action directed toward that individual. However, the same joke delivered by someone categorized as being kind would be interpreted more positively and would not provoke aggressive actions.

Views of the structure of mental categories have undergone several modifications. Three predominant views were the driving force behind categorization research for many years: the classical, probabilistic, and theory-based views.

The classical view is the most stringent of the three because it insists that categories are defined by a set of necessary and sufficient attributes. That is, for the target individual or object to be classified as belonging to a specific category, the individual or object must satisfy all the criteria of that category (i.e., group membership is based on an all-or-none decision). However, several problems exist with this view. First, one can question whether defining attributes of categories exist and are shared by all members. For example, the Austrian philosopher Ludwig Wittgenstein concluded that no attribute is common to all members of most categories. Second, some category members are better examples of their respective categories than others. For example, blue jays are rated as more typical of the category "bird" and are classified as birds more quickly than are ostriches or penguins. Third, people have difficulty categorizing unclear cases. Due to these problems, the probabilistic view of categories was proposed.

The probabilistic view of the structure of mental categories employed Wittgenstein's idea of family resemblance to determine category membership. *Family resemblance* refers to a set of attributes that can potentially belong to any member of the category in question but that is not necessary or defining. As such, category boundaries are "fuzzy" (i.e., categories are graded), which addresses the problems of defining features and typicality that beset the classical view. Eleanor Rosch, an influential cognitive psychologist, maintained that clarity in fuzzy categories is attained through a comparison of the to-be-categorized stimulus to a category prototype, which is an abstraction of features common to most category members. However, two questions remain

unanswered by the probabilistic view. First, on what are judgments of family resemblance or prototypicality based? Although it was clear that group membership is determined by perceived similarity to prototypes, it was less clear why specific attributes are chosen and others were excluded. Second, the family resemblance of perceivers goes beyond discrete attributes, often considering the causal relations between category attributes and the situations in which attributes are manifested when making categorization decisions.

The theory-based view of the structure of mental categories holds that people use both family resemblance and causal knowledge for categorization, although scholars contest the relative importance of causal knowledge. Less extreme is the view that causal knowledge can aid categorization, although scholars have also argued that people's judgments of group membership require specific causal relations in order to categorize an object, event, or person in question. In sum, although some issues remain, scholars generally accept that causal knowledge, in addition to family resemblance or prototypicality judgments, is essential for categorization. This view of mental categories had a substantial impact on theories of leadership perception.

LEADERSHIP AND CATEGORIZATION

Categorization theory has been applied to a number of topics in leadership literature: (1) follower categorizations of leaders, (2) leader categorizations of followers, (3) leader categorizations of organizations, (4) recurrent network models of leader prototypes, and (5) group identities.

Examining follower categorizations of leaders is the most common application of categorization theory to leadership. In fact, scholars suggest that judgments of leadership effectiveness or leadership perception owe as much to followers' categorizations as they do to actual leader behaviors. The central idea in explaining leadership perception is that a person's characteristics and behaviors are compared to a category prototype, and if a match is sufficiently close, the person is classified as a leader. When there is sufficient person-prototype match, the leadership cate-

gory is then activated along with its associated features (e.g., charisma, intelligence, and decisiveness) that are all believed to characterize the person in question. One methodological consequence of this process is that leader behavior ratings tend to reflect categorization processes as well as actual behavior. This follower-centered recognition process, based on person-prototype comparisons, is fundamental to Robert Lord and colleagues' theory of leadership perceptions and Implicit Leadership Theory (ILT).

In addition to categorizing leaders by prototype matching (i.e., recognition processes), leaders can be categorized by inferential processes. Inferential processes involve inferring leadership from outcomes (i.e., knowledge of successful task or organizational performance) rather than from specific characteristics of the person in question. An example of this type of processing is the performance cue effect: In experiments, experimentally manipulated, bogus performance information significantly affected leadership categorization and ratings of observed leadership behavior even though subjects in all experimental conditions saw exactly the same behavioral stimuli. Considerable research shows that, in general, cues pertaining to success enhance perceptions of leadership, whereas failure cues inhibit leadership perceptions.

Related to ILT are implicit performance theories (IPTs), which refer to leaders' categorizations of followers. In IPTs, what constitutes a successful follower is determined by leaders' mental representations or prototypes of effective subordinate behaviors or characteristics. For example, citizenship behaviors belong to the "successful subordinate" category of some leaders. One consequence of using IPTs is that judgments of subordinates' performance will vary across leaders with different IPTs, even though the same performances are being evaluated. Moreover, when subordinates are perceived as being successful (e.g., based on their performance of citizenship behaviors), leaders will attribute to subordinates other qualities that also belong to the leaders' category of successful subordinates (e.g., intelligent, punctual, or hardworking).

In addition to organizing and interpreting follower-related information, mental categories guide

behavior and mediate the relationships of environmental inputs and feedback to subsequent leader behaviors. For example, Wofford and Goodwin propose that the manifestation of transformational versus transactional leadership behaviors is due to differences in leaders' mental categorization of followers. Transformational leaders motivate subordinates to transcend their self-interests and perform better than what is thought possible, whereas transactional leaders emphasize the quid pro quo nature of exchange relationships. Leaders who categorize their followers as self-reliant, innovative, and having initiative will exhibit more transformational leadership behaviors (e.g., charisma and intellectual stimulation), whereas leaders who categorize their followers as more goal- and outcome-focused will exhibit more transactional leadership behaviors (e.g., role clarification and contingent rewarding). Likewise, Wofford and Goodwin argue that leaders whose categorization of performance includes organizational goals and visions will display more transformational leadership behaviors as compared to those leader who emphasize broad or specific performance outcomes. Finally, leaders' behavioral responses also are influenced by self-categorization processes. Specifically, leaders who see themselves as possessing transformational characteristics are more likely to exhibit transformational leadership behaviors. In sum, the categorizations made by leaders impact the perceptions and behaviors of both leaders and followers.

In addition to categorizing followers, Porac and his colleagues have provided evidence that leaders form hierarchical mental representations of both their own and competing organizations. Because organizations possess a wealth of information, a complete assessment of one's own or competing organizations is not possible for perceivers, who have limited information-processing capacities. Mental categorizations offer a simplified means of processing and monitoring organizations' strengths and weaknesses, allowing perceivers to understand their immediate competitive environment in spite of their processing limitations. Specifically, leaders form categories of organizations based on their similarity to other category members or prototypes. A

leader will view organizations perceived as belonging to different categories than his or her own organization as weaker competitors or irrelevant and thus will pay less attention to them. Judgments of category typicality are also important because a leader will consider competitor organizations that are deemed more prototypical of the category to which his or her organization belongs to be stronger rivals.

MALLEABLE PROTOTYPES

Researchers recently have found that rather than being fixed, long-term memory schemata, leadership prototypes are malleable and are influenced by situational constraints in the context in which categories are used. For example, group characteristics, leaders' level within the organizational hierarchy, and leader (or follower) emotions, norms, and goals all can change the prototype guiding leadership perceptions. Because leadership prototypes are sensitive to all these influences, they are currently conceptualized as flexible cognitive structures that are regenerated on the fly to meet contextual demands. Recurrent connectionist networks provide a promising model of category structure consistent with this more flexible view of mental categories.

Connectionist networks have been used to model how information is stored and processed in the brain. They are systems of neuron-like processing units that continuously receive and integrate information from input sources and then pass on the resulting activation or inhibition to output units. For example, seeing an ice skate (an environmental input) may activate the unit or concept of "hockey" in one's mind, which, in turn, activates related units, such as "Stanley Cup" or "goalie." Activation is able to spread in this manner because the units are interconnected. The connections between units are either positive (excitatory) or negative (inhibitory) and are quantified by weights which represent the strength of association or relatedness between two units. For example, the connection between "ice rink" and "hockey" has a larger weight than that between "ice rink" and "baseball." Spreading activation is faster and more widespread among units that share connections with large weights. Furthermore, the perceived meaning of acti-

vation can be drawn from either an individual unit in a network (e.g., a unit could represent the trait of dominance) or entire patterns of activation and inhibition among units in a network. In the case of leader categories, meaning is thought to exist at the level of entire networks (i.e., it is distributed), and units within the networks are able to influence each other (i.e., relations are recurrent). Leadership categories are flexible because, in addition to leader behaviors or characteristics, situational constraints are another source that supplies inputs to the network. Thus, categorization uses the parallel processing of connectionist networks to integrate both past experiences (i.e., recollections of leader behaviors) and current situational constraints (e.g., norms and goals) to form leadership categories.

An implication of this model is that leadership prototypes are continually reconstructed on the fly. Consequently, expectations for leaders grouped in the same category (e.g., middle-level business leader) but at different times may vary depending on momentary constraints such as the existence of a crisis or the momentarily active goals and values of perceivers.

A chief advantage of recurrent connectionist networks is that different categories are represented by different patterns of activation or inhibition over the same units spread throughout a single network. This representation is more economical than traditional categorization representations, in which different categories are likened to separate “storage bins,” each of which contains its respective prototypes (many of which are redundant across various categories or subcategories). Another advantage of recurrent connectionist networks is that people do not have to learn leadership categories separately for each specific situation. Experience with leadership behaviors will eventually lead to a stable pattern of connection (via the weights associated with the connections among category units) that constitutes the leadership prototype or schema, but the emerging prototype that is associated with “leadership” can still vary as constraints and inputs vary from situation to situation. Although different situations involve unique constraints that lead to different “leadership” categories being manifested, the initial

learned pattern of connections serves as a basic template in each situation.

The final topic relevant to categorization involves the belief that membership in a group impacts members’ social perception processes (e.g., social identity theory), which Hogg and van Knippenberg have applied to followers’ perceptions of leadership. Hogg and van Knippenberg maintain that when group members have strong social or collective identities, they develop a group prototype. Members will then place greater emphasis on the group prototype when making leadership determination judgments, rather than their own idiosyncratic ILTs or leadership categories. Social identities will be especially salient when group membership (1) is chronically accessible, (2) is contextually cued, (3) makes sense of the differences and similarities among people, and (4) explains others’ behaviors.

People are more likely to perceive as leaders group members whom they perceive as being more typical of the group prototype than are less-prototypical members, and these group members will exert greater influence over other members. Similar to other leader categorization theories, social identity theory maintains that people’s judgments of leader effectiveness or leadership perception depend on a leader’s similarity to the group prototype. The difference lies in people’s emphasis on a group prototype rather than on a more individual or culturally specified prototype. This apparent point of conflict between social identity theory and categorization theories of leadership perceptions can be resolved by recognizing that group identities are a powerful type of constraint on the networks used to define leadership prototypes. Thus, social identity theory can be viewed as a special case of the more general recurrent network model that explains how prototypes can be adjusted to fit better with many situations.

LEADER-FOLLOWER RELATIONSHIPS

The study of leadership has often been synonymous with the study of leaders. Although their existence was acknowledged, the role that followers play in the dynamics of leadership has historically been understudied and often even ignored. In the United States and elsewhere, leadership has tended to be glorified while the word *follower* conjures up images of sheep and serfs. Yet the success of leadership undeniably depends on the actions of followers, who can choose either to support or to sabotage, and who can influence the actions of leaders for better or worse.

Recent work has emphasized the importance of positive leader-follower relationships in successful leadership; it has also noted a trend toward expanding follower roles into what was once seen as the exclusive domain of leadership. Indeed, the leader-follower distinction is itself often arbitrary: Most senior organizational leaders are also followers, though presumably engaged in a kind of proactive followership with their bosses that makes use of their own leadership skills.

EARLY TRENDS IN THE STUDY OF LEADERS AND FOLLOWERS

Early work on leadership tended to focus on the attributes, behavior, and influence styles of leaders. It considered a leader's followers to be a homogeneous group whom the leader treated uniformly and who, it was assumed, reacted to this treatment similarly. The so-called "Great Man" (or "Great Woman") approach popular in the early and mid 20th century sought to find attributes that would distinguish lead-

ers and followers, as if the two were different species that could be clearly and consistently identified. Yet while this early research was able to identify traits associated with leadership, it did not support the idea that a person needed to possess a certain trait or set of traits to become a leader regardless of the situation. Attributes associated with leaders in one context were not necessarily associated with leaders in other contexts.

Studies focusing on behaviors associated with leaders had similar successes and difficulties. Most early work assumed that leaders behaved in a fairly uniform manner regardless of the followers with whom they were interacting. Rarely was it acknowledged that a leader might behave differently or have different styles of interaction with different followers, or that the quality and nature of a leader's relationship with one group of followers might be markedly different from the quality and nature of the relationship with another group. These studies also focused on how a leader's behavior influenced followers' behavior, hoping to identify those leader behaviors that would spur followers to increased motivation and productivity.

THE EVIDENCE FOR MUTUAL INFLUENCE

Despite the initial emphasis on leader attributes and behavior, work began surfacing that indicated that followers and the relationship between leader and follower needed to be given more serious attention. Laboratory studies started to show that followers could indeed influence leader behavior. For example, a study by Crowe, Bochner, and Clark showed that followers who responded only to autocratic leader behavior could make their more democratically oriented leaders start behaving autocratically. This makes obvious sense: If a leader wants a successful outcome and one type of behavior does not produce it, the leader is likely to try other behaviors. When this happens, it means that the followers have effectively changed the leader's behavior.

Further, leaders were shown to behave differently with different followers, for example, granting more freedom and autonomy to capable staff members than they did to their less competent followers. This

and other work showed clearly that leaders were differentiating among followers and establishing different relationships with them, at least partly in response to the followers' behavior.

The idiosyncrasy credit model put forward by the psychologist Edwin Hollander in 1958 suggested that followers give leaders the legitimacy to influence them, based on the leader's ability to exchange valued resources with followers. According to this model, leaders can earn psychological credit and raise their status in the eyes of followers by demonstrating task competence and by conforming to the norms and standards of the group. Leaders need a certain amount of credit in the eyes of followers to be able to influence them; leaders must earn the right to influence followers. When followers have the opportunity to choose their leaders (such as by election), they will choose leaders who have earned the most psychological credit. Whether elected or appointed, leaders can offer followers a sense of progress in an organizational system (through promotions, raises, and acknowledgment of contributions) and fair treatment in exchange for the followers' loyalty and productivity. As long as the exchange is balanced, credit will be given and satisfaction and productivity will result. If unbalanced, credit diminishes. Elected leaders stand to lose the support of their followers and ultimately their position; appointed leaders will lose followers' commitment and willingness to perform.

THE LMX APPROACH

Organizational psychologist George Graen further developed the interactional approach by examining the different relations leaders establish with different followers. In 1975, Graen formulated the Vertical Dyad Linkage approach, examining the relationship between a leader and individual followers as dyadic links between members of two different levels within an organization, one of whom has direct authority over the other. This approach matured in the last quarter of the twentieth century into what is now called LMX (Leader-Member Exchange) theory.

Substantial research on LMX has documented that leaders can and do establish different relation-

Loyalty to One's Followers

The following ethnographic account of the actions of a Pawnee war party and its leader point to the important role a sense of responsibility for one's followers can play in motivating leaders to develop unique solutions to difficult situations.

[The Pawnee] were surprised by a party of Sioux. There were many of them, and they drove the Skidi [Pawnee] back, and at length these were obliged to climb the steep side of Court House Rock. The Sioux dared not follow them up on to the rock, but guarded the only place where it was possible to come down, and camped all around the rock below to starve the Skidi out. The Skidi had nothing to eat nor to drink, and suffered terribly from hunger and still more from thirst. The leader of the party suffered most of any, for he thought that he would surely lose all his men. He felt that this was the worst of all. He must not only die, but must also be disgraced, because under his leadership the young men of his party had been lost. He used to go off at night, apart from the others, and pray to Ti-ra'-wa for help; for some way to save his party.

One night while he was praying, something spoke to him, and said, "Look hard for a place where you may get down from this rock, and so save both your men and yourself." He kept on praying that night, and when day came, he looked all along the edge of the rock for a place where it might be possible to get down. At last he found near the edge of the

cliff a point of the soft clay rock sticking up above the level of the rest. The side of the rock below it was straight up and down, and smooth. At night he took his knife, and began to cut about the base of this point of rock, and night after night he kept at this until he had cut away the base of the point, so that it was no larger around than a man's body. Then he secretly took all the lariats that the party had, and tied them together, and let them down, and found that his rope was long enough to reach the ground. He put the rope around the point, and made a loop in it for his feet, and slowly let himself down to the ground. He got there safely, and then climbed back again. The next night he called his men about him, and told them how it was, and that they might all be saved. Then he ordered the youngest and least important man of the party to let himself down, and after him the next youngest, and so on, up to the more important men, and last of all the leader's turn came. He let himself down, and they all crept through the Sioux camp and escaped.

They never knew how long the Sioux stayed there watching the rock. Probably until they thought that the Skidi had all starved to death.

ships with different followers, and that these different relationships affect a wide variety of outcomes for leaders, followers, and their organizations. Specifically, better-quality leader-follower relationships are characterized by mutual support and respect, loyalty, affection, and often are associated with followers having greater autonomy and freedom to make decisions. When LMX is favorable, leaders are more supportive of followers and may monitor them less and mentor them more. Favorable LMX between leaders and followers has also been associated with better overall performance, satisfaction, and satisfaction with supervision on the part of followers, as well as less role conflict, more role clarity, and greater organizational commitment.

Because of these and other favorable individual and organizational outcomes, theorists suggest that leaders try to develop positive exchange relationships with all followers to the extent possible. Obvi-

ously, this does not always occur. With some leaders, there are perceived in-groups that enjoy positive LMX relationships with their leaders, while others do not enjoy good relationships. Leaders have lower expectations for followers in low-quality relationships, with follower compliance exchanged for salary and benefits. This may be acceptable to some employees, who seek only a paycheck and little autonomy or challenge, but it is likely to be dissatisfying for many others. In contrast, followers in high-quality LMX relationships get more from their leaders in terms of influence, benefits, and job prospects, but they also work under the leader's higher expectations in terms of commitment and effort.

TRANSFORMING LEADERSHIP

Exchanges appeal to followers at least in part because they satisfy followers' self-interest. Based on his sem-

inal analysis of political leadership, however, James MacGregor Burns proposed that leadership could be transformational as well as transactional. According to Burns, leaders can mobilize the energies of followers by appealing to followers' moral values, raising followers' awareness of ethical issues, and encouraging followers to rise above self-interest for the sake of a greater good. Current theories of transformational and visionary leadership, such as Bernard Bass's well-known model of transformational leadership, have built on this tradition, emphasizing the importance of influencing and empowering followers to accomplish shared objectives. Again, the importance of trust and respect are evident, as followers are believed to follow and to be motivated to do more than they might have previously thought possible, because they admire and trust the leader. Leaders who are transformers articulate a compelling vision based on shared values, inspire followers to act, and empower followers to move the vision into reality.

Though theories of transformational leadership tend to focus more on the leader than on the relationship, followers of transformational leaders do report higher satisfaction with their leaders, suggesting that the relationship is a positive one. One major contribution of these theories has been to highlight the importance of emotional processes as well as rational ones, as leaders and followers are seen to relate on an emotional level, even to the point of allowing followers to put aside what is in their own rational best interests in service of the organization. Another contribution is the emphasis on empowering followers, a process of power sharing that can allow followers to develop leadership skills of their own. Empowerment changes the nature of the leader-follower relationship by potentially putting the two on more equal footing and encouraging self-determination and choice for followers within prescribed boundaries.

DEVELOPING POSITIVE LEADER-FOLLOWER RELATIONSHIPS

Positive leader-follower relations do not develop without reasonable efforts on both sides to nurture them. For both leaders and followers, LMX improves as the other member of the dyad puts forth effort in

When the effective leader is finished with his work, the people say it happened naturally.

—Lao-Tze

developing the relationship. Dissatisfaction has been found when either member perceives the other to be contributing less to the relationship than he or she is. Followers in lower-quality relationships report less intention to invest in their relationships with their leaders, suggesting that if leaders wish to improve low-quality relationships with staff, they will likely need to make the first move. If the follower reciprocates, the relationship can begin to improve.

The likelihood of a positive leader-follower interaction also may depend on followers' needs, values, and preferences. Although work in this area is just beginning, there is evidence that followers differ in their leader preferences. One follower's perfect leader may be anything but perfect for another. Specific follower characteristics that appear to correlate with preferences for particular types of leaders include achievement orientation, self-esteem, need for structure, and specific work values. Consistent with the findings of transactional or exchange approaches, followers seem to be drawn to leaders who offer them something they value, whether it is rewards, job stability, or some other desired outcome. This suggests that leaders who wish to establish positive relations with a range of different followers may need to get to know the needs and values of the followers and be willing to expend more effort with some than with others.

Aspects of the work context also can affect the quality of leader-member interactions. Although larger units and heavy workloads appear to work against the development of better relationships, positive relations with the leader can increase followers' satisfaction even in these difficult situations. There is evidence that a better-quality relationship between the leader and follower is more likely to occur when the leader perceives the follower to be competent as well as similar in attitudes and values. To the extent that the leader's perception is based on demographic similarity or dissimilarity, problems of prejudice and discrimination may emerge.

THE NEEDS OF A DIVERSE FOLLOWERSHIP

One aspect of leader-follower relations that needs further examination is the impact that differences between leaders and followers have on the quality and success of their relationships. Twenty-first-century workplaces are populated with a much more heterogeneous group of workers than were the workplaces of earlier times, and research has shown that demographic differences between leaders and followers can make a difference in both satisfaction and performance. For example, several studies have indicated that the quality of the relationship between a leader and follower is lower when the two are of different genders. It is likely that relationship quality will be affected by other demographic factors as well. Both in the United States and elsewhere, demographic differences between supervisors and subordinates have been related to leaders' giving followers lower ratings for effectiveness, to leaders' being less attracted to dissimilar followers, and to lower levels of follower satisfaction.

Leaders may need to make greater efforts to work effectively with diverse staff members, particularly if leaders have tendencies to establish higher-quality relationships with demographically similar followers. Research suggests that it is worth the effort: It appears that outstanding leaders differ from less effective ones in their greater consideration of and sensitivity to the needs of followers. Work with international executives has suggested a variety of behaviors that can help leaders establish more positive relationships with culturally dissimilar followers, including being sensitive to cultural differences, being able to bring out the best in people, flexibility, and being open to criticism and feedback from others. Developing these skills as well as paying attention to the different relational needs of different followers may become even more important as organizations become more internationally diverse.

THE IMPORTANCE OF ACTIVE FOLLOWERSHIP

Many current authors have emphasized the importance of harnessing the creativity and talents of fol-

lowers as active participants. Obedience is no longer enough: Obedient followers are ill prepared to take initiative, generate ideas, and collaborate in creating and sustaining successful modern organizations. Followers are not powerless, and they can play a key role in improving leadership by supporting their leaders when appropriate and being willing to challenge them when warranted. Followers must find their own voice in their relationship with their leaders, and have the courage to use it. The courageous or exemplary follower is responsible, proactive, willing to resist improper influence, and even willing to coach the leader if necessary. The follower with skills complementary to the leader's own may provide balance and be able to act as a sounding board, potentially preventing mistakes that might have negative repercussions for the leader, follower, and organization alike.

Such proactive followership is likely to develop only within a leader-follower relationship characterized by mutual respect and trust. There can be risk, particularly for the follower, in challenging leaders. By establishing positive leader-follower relations, leaders can create the conditions necessary for the development of effective followership, including a safe environment in which followers feel comfortable bringing the best of their knowledge and abilities to the tasks at hand. And effective followership supports effective leadership. Good leaders and good followers enhance each other, to the betterment of both.

LEADERLESS GROUPS

Leaderless groups are those groups that exhibit the absence of formal leadership roles. At least initially, in leaderless groups no individual has responsibility for making sure that the group is progressing toward the achievement of certain goals or actions. Scholars have used the term *leaderless group* to describe a variety of situations in social groups, therapy groups, community groups, and management groups. In terms of leadership theory and practice, the idea of leaderless groups has played two key roles. First, structured leaderless group situations have been used in conjunction with the assessment of emerging leaders. Second, the idea of leaderless groups is related to the functioning of groups who may be viewed as more egalitarian, such as self-directed work groups or self-managed work groups. However, people could debate whether these types of work groups are actually leaderless groups or rather groups with shared leadership.

DEVELOPMENT OF LEADERLESS GROUPS

Research about the functioning of leaderless groups is not abundant. As Eleanor Counselman noted, we have a striking absence of knowledge about how leaderless groups actually function (Counselman, 1991). Leaderless group movements emerged most prominently in the 1950s and 1960s in conjunction with both the humanistic movement and the development of more formal theories of leadership behavior. Comprehensive reviews for this time period focused both on the psychotherapeutic field and the organizational behavior field. These reviews are exemplified by the literature reviews of Seligman and Desmond in psychology and Bernard Bass, a leadership theorist, in organizational behavior (Seligman and Desmond, 1974; Bass, 1954). Primarily, leaderless groups have been used either as a therapeutic tool or as a leadership assessment mechanism.

We likely have less information on the ongoing function of leaderless groups because the use of the idea itself has been directed to drawing out leadership behaviors. When this drawing-out occurs, the leaderless group no longer is leaderless. The question of whether leaderless groups can be viable on a long-term basis is important but beyond the scope of the discussion here.

As Seligman and Desmond note in their historical review, leaderless groups have been used in psychiatric settings to reduce the effects of institutionalization on patients. Leaderless groups have also been used in conjunction with peer self-help groups in communities (Seligman and Desmond, 1974). In these settings experts hypothesize that individuals would develop greater capacities for self-functioning if they had to take some personal actions and initiatives to organize activities, initiate structure, and generally interact in this leaderless environment. However, as Counselman asks, are these really leaderless groups or rather periodic leaderless sessions that are still under the control of a leader (Counselman, 1991)? This type of approach may also be seen in the organizational behavior field, for example, in such cases as T-groups (therapy groups) and sensitivity training practices (Porter, 1979). These practices begin to serve as a bridge into the organizational behavior and leadership fields.

The leaderless discussion group has been widely used as a method to study the emergence of leaders and leadership patterns. Bass has reviewed the literature in this regard (Bass, 1954). Leaderless group discussions have been widely used as part of management assessment techniques. Individuals are placed in unstructured situations, and trained observers watch either as a participant-observer or as an individual observing from behind a one-way mirror. The purpose of these exercises is to identify leadership behaviors and practices in an artificial situation that will be predictive of future managerial success. Scholars have conducted numerous studies of how leaders emerge in these situations and what variables determine the emergence of leadership. For example, the effect of gender on the emergence of leaders in leaderless groups has been the subject of much research (Eagly and Karau, 1991; Moss and

Kent, 1996). The effect of physical appearance has been studied (Campbell, Simpson, Stewart, and Manning, 2002). Again, the focus of the research has been more on how leadership emerges rather than on the phenomenon of “leaderlessness” itself.

EVOLUTION OF THE CONCEPT

The concept of leaderless groups as an assessment method is still used today. The concept of leaderless groups may have evolved during the years into the related concepts of self-leadership, self-directed work groups, and self-managed teams. These concepts may be typified by the work of Manz on self-managing groups (Manz, 1995). The concept of leaderless groups has had an impact on the development of current leadership trends. The ideas of increasing empowerment, allowing employees to be owners, and creating greater employee participation in the workforce are likely related to the concept of leaderless groups, but little formal research directly outlines this conceptual migration.

The concept of leaderless groups has been important in the development of theories about personal leadership traits and group leadership patterns. A review of how leaderless groups have functioned in practice indicates that the primary value of the concept may be more as the setting for researchers to discover how leaders emerge in groups and what individual behaviors, attributes, and characteristics are correlated with the recognition of leadership than it has been in helping us understand the dynamics of how leaderless groups actually function. This may be because in the absence of clear leadership roles or in a leadership vacuum, participants will invariably insert leadership behaviors. Additionally, though, we can make a case that in some way, the concept of leaderless groups has influenced the development of popular concepts such as self-directed and self-managed teams. Whether these types of teams are actually leaderless groups or some type of shared leadership groups remains for future researchers to determine.

LEADER-MEMBER EXCHANGE (LMX) THEORY

Many theories of leadership focus on the nature of the interactions that occur between the leader and his or her subordinates. They attribute effective leadership to a situation in which subordinates give the leader the legitimacy and power to lead effectively in return for various valued resources provided by the leader (trust, respect, status, money, privileges). One of the best known of these transactional theories of leadership is Leader-Member Exchange (LMX) theory, which evolved from the earlier Vertical Dyad Linkage (VDL) model.

TRANSACTIONAL THEORIES OF LEADERSHIP

Transactional theories of leadership recognize that leadership is not a property of an individual, but is a relationship in which one person leads and others follow. The key question about leadership, therefore, is what kind of relationship must exist between leader and followers for the leader to be able to be innovative and to have followers comply with his or her requests, ideas, suggestions, and behavioral

leads. That is, what kind of relationship allows a leader to be an effective leader? To answer this question, transactional theorists focus on the “transactions” between leaders and followers.

Transactional theories draw on equity theory in social psychology, which argues that interactions between people are governed by the principle that each interactant should give as best as he or she can to match whatever resources are provided by the other interactant—resources can include praise, information, help, support, and punishment. Transactions lie at the core of relationships and interpersonal interactions, and people are motivated to reduce inequity in these transactions. Where a transaction takes place between leader and followers, there is great potential for inequity because the leader has a range of skills, experience, and expertise that followers cannot easily match. Thus, a state of inequity exists. To redress the transactional imbalance, group members reward the individual with social approval, praise, prestige, status and power; in other words, with the trappings of leadership and the ability to lead effectively.

One of the best-known early transactional theories of leadership was proposed by Edwin Hollander in the mid-1950s. Hollander argued that for a leader to be effective he or she needed to be allowed by the group to be innovative, to be able to experiment with new ideas and new directions; that is, to be idiosyncratic. Drawing on the equity argument, Hollander wondered what circumstances of leadership would create a transactional relationship between leader and followers in which the followers would provide the leader with the resources to be able to be idiosyncratic. Hollander famously argued that leaders who had behaved in a highly conformist manner as they climbed the organizational ladder accumulated credits, called “idiosyncrasy credits,” from the group. When they arrived at the top of the organization, followers would effectively hand over these credits (as a resource) to the leader, who could then spend them by behaving idiosyncratically, innovatively, and creatively. In one study, for example, older children, who had previously shown leadership potential, were introduced into small groups of younger children in a Hungarian nursery. The most successful leaders

were those who initially complied with existing group practices and who only gradually and later introduced minor variations.

More recent research since the early 1990s, by Tom Tyler and his associates on processes of trust among people in a group with which they identify strongly, would argue that conformist, or group-serving, behavior builds trust among members. When one member rises to a leadership position, or occupies a leadership position, the basis of trust persists and creates an environment in which the group allows the leader to be innovative, nonconformist, and idiosyncratic because the group trusts the leader to do the right thing for the group.

LMX THEORY

Vertical-Dyad Linkage (VDL) Model

LMX theory is a transactional theory of leadership. Originally called the Vertical Dyad Linkage (VDL) model, it arose in the early 1970s in reaction to the dominant behavioral and contingency models of leadership. These traditional models implicitly assumed that leaders adopt the same leadership style with all group members (the so-called average leadership style approach).

In contrast, VDL researchers believed that leaders adopt different leadership styles with different subordinates. More precisely, leaders develop different dyadic exchange relationships with different specific subordinates. These relationships can either be ones that treat the subordinate as a close and valued “ingroup” member with the leader, or ones that treat the subordinate in a more remote manner as an “outgroup” member who is separate from the leader. As the VDL model has evolved into LMX theory, this dichotomous treatment of leader-member exchange relationships—the ingroup versus outgroup distinction—has disappeared and has been replaced by a continuum of quality of exchange relationships.

LMX Theory

LMX theory focuses on the quality of dyadic leader-member exchange relationships. These rela-

tionships can range on a continuum from ones that are based on mutual trust, respect, and obligation (high-quality LMX relationships), to ones that are simply based on the terms of the formal employment contract between leader and subordinate (low-quality LMX relationships).

High-quality LMX relationships are ones where subordinates are favored by the leader and thus receive many valued resources, which can include both material benefits (e.g., money, privileges) and psychological benefits (e.g., trust, confidences). Leader-member exchanges go beyond the formal employment contract, with managers showing influence and support, and giving the subordinate greater autonomy and responsibility. High-quality relationships should motivate subordinates to internalize the group’s and the leader’s goals. In contrast, low-quality LMX relationships are ones in which subordinates are not favored by the leader and thus receive fewer valued resources. Leader-member exchanges simply adhere to the terms of the employment contract, with little attempt by the leader to develop or motivate the subordinate. Subordinates will simply comply with the leader’s goals, without necessarily internalizing them as their own.

LMX RESEARCH

LMX theory predicts that effective leadership requires leaders to develop high-quality LMX relationships with their subordinates, because these relationships should enhance subordinates’ well-being and work performance. Such relationships might also bind the subordinate to the group more tightly through loyalty, gratitude, and a sense of inclusion.

LMX relationships develop over time within groups. The motivation for developing differentiated LMX relationships is that in most groups, the leader has to relate to a large number of subordinates. In order to be effective, it is simply more efficient to select some subordinates in whom to invest a great deal of interpersonal energy and to treat the rest in a less intensive and personalized manner. The process through which this selection occurs involves the leader discovering what sort of a role the subordinate can or does have in the group. First, there is a role-

taking stage in which the leader has expectations about a subordinate's performance-motivation and capacity, and tests this out by giving the subordinate a set of tasks and assignments. Compliance with the leader's expectations regarding these tasks and assignments leads into the role-making phase in which the LMX relationship is defined. There is mutual and equitable exchange of resources within the leader-member dyad; for example, information, influence, support, attention, desired tasks, and latitude of acceptable behavior. Task performance, commitment, and citizenship are expected from the subordinate. The final stage is role-routinization in which the leader-member relationship has become stable, smooth-running, and relatively automatic.

Differentiated Leader-Member Dyads

Research on LMX theory has shown that in organizations, managers tend to differentiate among their subordinates, and establish better LMX relationships with some subordinates than with others. According to one study, over 90 percent of managers vary greatly in the quality of the relationship they have with their subordinates. There is probably a practical reason for this. Managers have limited resources, with many demands upon their time. Therefore, they direct resources to a smaller number of their subordinates who take primary responsibility for helping with work-related issues. Differentiation in quality of relationships may be a functional strategy adopted by managers to achieve optimal performance when resources are limited or when there are many demands placed upon them (e.g., work complexity, managing many individuals).

Antecedents and Consequences of LMX Relationships

Research has identified four main antecedents of different LMX relationships: member characteristics (e.g., performance, personality and upward influence behavior), leader characteristics (e.g., leader ability), interactional variables (e.g., demographic compatibility and similarity), and contextual variables (e.g., leader workload, pressure on time). For example, high-quality LMX relationships are more likely to develop when the leader and the subordinate have

similar attitudes, like one another, and belong to the same socio-demographic groups (same sex, same ethnicity, same religion). Likewise, more able leaders and better performing subordinates are more likely to develop high-quality LMX relationships.

LMX relationships have a number of important consequences. Subordinates' ratings of their LMX relationships are positively related to supervisor ratings of job performance, objective job performance, job satisfaction, well-being, organizational commitment, organizational citizenship behavior, and member career outcomes. High-quality LMX relationships are also associated with lower employee turnover, and with fewer retaliation behaviors on the part of subordinates. There is also longitudinal research that suggests that if leaders develop a partnership, rather than just an exchange relationship, with specific followers, there can be significant performance gains. Overall, then, high-quality LMX relationships may produce (though most studies are correlational, not causal) better performing and more satisfied workers who are more committed to the organization and less likely to leave.

Dyadic Partnership Building

The process of LMX relationship development (role-taking and role-making to role routinization) has reasonably good support from direct longitudinal studies. This process, however, is also quite consistent with broader theories, and associated evidence, in social psychology of group development. For example, small groups tend to go through five developmental stages to establish people's roles, and the types of role and interpersonal relationships people have with one another within the group. The first four stages are particularly relevant to the development of LMX relationships:

- **Forming:** an orientation and familiarization stage
- **Storming:** a conflict stage where members know each other well enough to start working through disagreements about goals and practices
- **Norming:** Having survived the storming stage, members achieve consensus, cohesion, and a sense of common identity and purpose

- Performing: a period in which the group works smoothly as a unit that has shared norms and goals, and good morale and atmosphere

LIMITATIONS OF LMX THEORY

The principal limitation of LMX theory is that it focuses primarily on dyadic leader-member relationships and fails to consider that these relationships occur in the context of the group as a whole. The leader-member dyads are treated as though they develop, and have their effects, in isolation from other leader-member dyads, from other dyadic relationships, or from the group as a whole. The majority of research on LMX is, quite explicitly, located at the dyadic level, with very little theorizing or empirical work examining LMX at the group or social-network level. Research and theory focus on the leader-subordinate relationship without acknowledging that each dyadic relationship occurs within a web of other relationships.

Dyadic Relations

LMX theory has been criticized for failing to conceptualize the social context. What is missed is that a specific leader-member relationship is located within the context of other leader-member relationships, and indeed the entire network of member-member relationships within the group. These other relationships will affect the members' perceptions of how other leader-member relations are structured and conducted. From social psychology, we know that people make social comparisons to evaluate the nature of their own perceptions and relationships. In a group, these comparisons will be made overwhelmingly with fellow group members' leader-member relationships—the group provides the parameters for valid social comparisons.

One consequence of the dyadic approach is that the quality of a specific LMX relationship is treated as though it is absolute. LMX theory assumes that people simply evaluate their own LMX relationship in an absolute sense. In the light of social psychological research on social exchange processes and social comparison processes, this may be rather

oversimplified. It is more likely that subordinates evaluate the quality of their LMX relationship not only in the absolute sense (low vs. high) but also with reference to their perception of other subordinates' LMX relationship. Since leader-member relations are important, subordinates will be highly motivated to compare their relationship with other members' leader-member relationships. More broadly, evaluation of LMX relationships will be influenced by concerns about what is considered to be "fair" within the context of the organization. Notions of equity, prior LMX history, comparison with other LMX relationships and procedural justice, are all likely to play an important part in determining LMX quality.

One of very few LMX studies that did focus on LMX quality as a comparative judgment (absolute LMX in relation to the average of other LMX relations in the group) showed that the higher the relative value, the lower the employee turnover eighteen months later.

Subgroup Relations

We can take the social context argument one stage further by noting that the social organization of many groups is not structured around isolated individuals but around a number of distinct subgroups, such as departments, divisions, or work teams in an organization. Social comparisons are therefore more likely to be intergroup than interpersonal comparisons. How does the leader relate to "my" subgroup in comparison with other subgroups? Intergroup comparisons—"us" versus "them"—have a quite different logic to interpersonal comparisons. Specifically, they have the familiar characteristics of intergroup behavior—ingroup favoritism, ethnocentrism, and outgroup denigration. This will have far-reaching consequences for subordinates' relations to their leader and reaction to their work, a possibility that has not been explored by LMX research.

Social Identity

The limitations of LMX theory hinge on the same overarching issue. Leadership and the nature of

leader-subordinate relationships need to be understood in the context of a deeper and more textured analysis of group processes, intergroup behavior, and the nature of group membership. Leaders lead groups that furnish group members with a sense of identity, and these groups and associated identities exist within a wider intergroup comparative context. Furthermore, differentiated leader-subordinate cliques within the group may establish powerful intergroup relations within the group. If perceived leader-member relations affect leadership effectiveness, then an understanding of such relations needs to recognize that the leader-member relationship does not exist in isolation from other interpersonal, inter-subgroup, and intergroup relationships.

In addition, the notion of “member” needs to address the member’s self-concept. Is the member conceiving of self as an isolated individual, as an individual in relation to the leader, as a member of a subgroup, or as a member of the group as a whole? From a social identity perspective, it could be argued that leader-member relations will be differently structured as a function of how strongly members identify with the group. Where people identify strongly with a group their relationships are depersonalized; they are based upon common group membership and shared group normative expectations. This contrasts with more personalized relationships, which are personal and idiosyncratic, among people who do not identify strongly with a group. The natural and preferred relationship among people, including between leaders and subordinates, varies as a function of identification with the group.

To be effective, leaders would need to cater their relationship to levels of identification. In some cases this would require depersonalized relations with high identifiers and personalized relations with low identifiers. In many cases, however, groups frame relations one way or the other: low-salience groups are characterized by personalized relations and high-salience groups by depersonalized relations. An inappropriate match between relationship style and strength and form of self-conception would violate people’s expectations and would hinder effective leadership. For example, although personalized dyadic relations catered to each individual will be

associated with effective leadership in low-salience groups, depersonalized relations that treat all members alike as important group members might be more effective in high-salience groups.

Social identity leadership researchers provide some evidence that although personalized leader-member relationships may promote effective leadership in low-salience groups, they are not so effective in high-salience groups. In high-salience groups, depersonalized leader-member relations in which followers are treated as prototypical group members are more strongly associated with effective leadership.

THE FUTURE OF LMX THEORY

LMX theory is a particularly valuable perspective on leadership because it views leadership as a relationship between leaders and followers. Furthermore, it considers the nature of the relationship to be important. The limitation of the approach is that it focuses too narrowly on the leader-member dyad, and does not consider the self-conceptual dimension of groups. The future for LMX theory is promising, but for the promise to be fulfilled LMX theory needs to widen its conceptual reach to consider social identity and self-conception processes, and to locate the dynamic of leader-member dyads in wider group and intergroup processes and structures.

LEADERSHIP, SITUATIONAL AND CONTINGENCY APPROACHES

See Leadership Development; Situational and Contingency Approaches to Leadership

LEADERSHIP DEVELOPMENT

The concept of leadership development can be unclear or even confusing because it is made up of two terms—*leadership* and *development*—that are each ambiguous and multifaceted. There is no single,

universally accepted definition of leadership. Some researchers have gone so far as to say that it is impossible to define leadership in words, but people know it when they see it. Leadership can mean different things to different people depending on their experience, background, and developmental level. The best we can apparently do is to describe leadership as a process (not a position) that involves leaders, followers, and situations. The social-influence aspect of the proposed definition is limiting. There are potentially other forms of leadership such as relational dialogue that transcend influence processes. Also, research has shown that people hold implicit leadership theories that vary based on their experience and background. The distinction between leaders and followers is a somewhat arbitrary one. Everyone is a leader at some time or another, and everyone is also a follower at times. The roles change in a dynamic, fluid, and ongoing fashion. In a given situation, an individual may adopt both a leader and a follower role depending on whether he or she is influencing others or being influenced, setting direction or following direction, or providing support or receiving support at a particular moment.

Another aspect of leadership worth noting is that it is inherently a multilevel phenomenon. Leadership involves individuals, groups, and organizations. On an individual level, people adopt leader and follower roles. In groups and organizations, leadership emerges in the context of social structures and processes. Without a context in which to interact, there can be no leadership. Therefore, leadership is not something that is *added to* individuals, groups, or organizations; rather, it is *drawn from* those various entities.

Development, for its part, implies a change in state. It is growth from a less complex to a more complex way of thinking or acting. By this definition, aging is not necessarily development, because getting older without a corresponding change in cognitive or behavioral complexity does not constitute development. In most people, however, aging and development tend to go hand in hand. Research on adult development and in gerontology suggests that development often occurs throughout the lifespan, even into old age.

Human development has been discussed as an ongoing cycle of differentiation (acquiring new knowledge, skills, and abilities) and integration (organizing knowledge, skills, and abilities into more complex forms), moving toward increasing levels of complexity. But the change from a relatively simple state to a complex one is not always straightforward, and development is not perfectly predictable. Two individuals participating in an identical development program are likely to change in very different ways. What and how someone learns is of critical importance to development. Enhancing the ability to learn from experience is a key concern in development in general and in leadership development in particular.

DEFINING LEADERSHIP DEVELOPMENT

Leadership development is the act of expanding the capacities of individuals, groups, and organizations to participate effectively in leadership roles and processes. In a comprehensive approach to leadership development, it is assumed that everyone (and not just top-level leaders) can learn and grow in ways that will make them more effective in the various leadership roles they take on and in the leadership processes that they contribute to. Therefore, development is appropriate at all levels—individual, group, and organization. Organizations are increasingly faced with what can be termed adaptive challenges, rather than technical problems. Adaptive challenges are situations that the organization has not experienced before and therefore is initially unprepared to handle. There are no known solutions to such problems, and it may not even be obvious how to identify or construct the problem. No single leader, no matter how talented or charismatic, can single-handedly solve these kinds of novel, hard-to-frame, and open problems. For this reason (and others), organizations need people at all levels who are prepared to share in more complex forms of leadership.

As mentioned, leadership is a dynamic process that involves leaders, followers, and situations. The first step in developing leadership is to develop individuals at all organizational levels so that they can participate effectively in this dynamic process. Sometimes the most effective way to participate is by

taking charge and setting direction or initiating structure. Other times participation may mean being considerate or supportive. Effective participation sometimes involves active listening or demonstrating commitment to the ideas or suggestions of another. Leadership is not a single role that is enacted by a single individual. Instead, it is a process that emerges as various roles are enacted, and those roles—and the people filling them—can change as the challenges change. Although leadership development begins with developing individuals, that is not where it should end. To help clarify this proposition, a distinction is needed between leadership development and leader development.

LEADER DEVELOPMENT

There is a longstanding confusion in the academic literature as well as in organizational practice between *leader* development and *leadership* development. What most researchers, theorists, and practitioners call leadership development focuses on developing individual leaders, and therefore might more accurately be called leader development. Most development programs and practices ignore the social context (including the roles that others play in the leadership process) in which leadership occurs. Instead, the focus of most programs is typically on helping individual leaders acquire or enhance knowledge, skills, and abilities in ways that are expected to improve their overall ability to lead. The focus is on developing human capital in organizations. The development of human capital is a necessary task, but alone it does not ensure more effective leadership. Leadership emerges through social interaction, and therefore it depends on the pattern and quality of networked relationships in an organization—what has been termed the social capital of an organization.

Effective leadership requires attention to both types of capital. Developing human capital without attention to social capital ignores the fact that leadership is based on interactions among leaders, followers, and the social environment. By the same token, attempting to develop the social capital aspects of leadership without preparing individuals with the necessary skills to communicate, influence, inspire, and otherwise

effectively participate in leadership is also ill advised. The key to developing effective leadership is to devote attention to both human and social capital—to link leader development with leadership development.

DEVELOPMENT PRACTICES

There are any number of practices that can be used to promote leader and leadership development. Although the most common approach is still the formal classroom program, there is a trend to embed development in the context of ongoing work. This trend can be traced back to interview research with managers in the 1980s regarding their most potent developmental experiences. Those interviews strongly indicated that managers believed experiences gained while on the job—and not classroom programs—most helped them develop leadership ability. The specific experiences were not always the same—they could be hardships or even failures, international assignments, mentoring, or receiving peer feedback (among others)—but it was the fact that the development occurred in a work-related context that made it so effective. Although people may learn worthwhile things from a classroom program, it is difficult to transfer the results back to the job and the organization. The difficulties in transferring classroom training further underscore the fact that developing individuals while ignoring the context in which they work is likely to have only limited impact.

Organizations make use of various development practices; several are briefly reviewed below. The practices are arranged below from least embedded to most embedded in the context of ongoing work.

Formal Classroom Programs

Most leadership development approaches still rely primarily on the formal classroom program. It is estimated that at least 85 percent of companies that engage in leadership development efforts use formal programs. Such programs usually offer a classroom seminar covering basic theories and principles of leadership in addition to activities designed to enhance self-awareness and self-understanding. These programs typically last several days to per-

haps a week or more and usually are held in an off-site location. Because of the considerable expense associated with program development customized for the organization, many organizations choose to send their managers to open-enrollment programs offered by private organizations or to university-based executive education programs.

Outdoor Challenges

Also known as wilderness training, this is becoming a popular method for developing teamwork and team-based leadership skills. Outdoor challenges also encourage participants to overcome risk-taking fears. Activities can include rope climbing, whitewater rafting, rappelling, and even mock boot camps followed with paintball games. Although such adventures are interesting and exciting for participants, there is no conclusive evidence that they lead to enhanced leadership or development back on the job. Obvious differences between wilderness and organizational contexts likely contribute to transfer-of-training difficulties.

360-Degree Feedback

This practice is also called multi-rater or multi-source feedback. It is a method of systematically collecting perceptions of an individual's performance and the effect he or she has on others from various perspectives (for example, peers, subordinates, supervisors). A basic assumption with 360-degree feedback is that others' perceptions of an individual vary depending on the nature of their relationship to that person. The practice can therefore help build a more complete and accurate picture of an individual's leadership ability. It is also useful for developing human capital in the form of enhanced understanding of one's impact on others. The method is especially useful if used in conjunction with other efforts that are directed at helping someone change in ways suggested by the feedback.

Executive Coaching

Coaching is a form of goal-focused, personal, one-on-one learning. It can be used to improve individual

performance, enhance a career, or work through organizational issues such as change initiatives. Coaching tends to be a relatively short-term intervention aimed at improving specific leadership competencies or addressing specific challenges. Many executive coaching assignments are linked to 360-degree feedback efforts, with the goal of helping the recipient make sense of the feedback and creating a plan for change.

Mentoring

Developmental relationships in organizations can be of a formal or informal nature. Formal mentoring programs are run by the organization, whereas informal mentoring, while typically encouraged by the organization, is not initiated or administered through formal channels. One strength of mentoring as a developmental tool is that it provides opportunities to observe and interact with people who have greater experience, such as members of senior management. These opportunities give the recipient a more sophisticated and nuanced understanding of the organization and the challenges it faces. Research indicates that both formal and informal mentoring can be effective for development, but that informal mentoring tends to have more benefits than formal mentoring.

Job Assignments

Development through job assignments provides managers with diverse experiences that help them master team building, strategic thinking, and to develop persuasion and influence skills. In order for a job assignment to be developmental, it must challenge an individual to use leadership approaches that he or she has not used before. The assignment must be made with development in mind and attention paid to its development aspect, otherwise the focus tends to be merely on how well the assignee performs, with little regard for his or her learning or development.

Action Learning

Action learning assumes that people learn most effectively when dealing with work-related issues in

Look at a man the way that he is, he only becomes worse. But look at him as if he were what he could be, and then he becomes what he should be.

—Goethe

real time. It is best described as a structured, continuous process of learning and reflection with a corresponding emphasis on addressing a problem of strategic importance to an organization. The idea behind action learning is relatively straightforward, but effective implementation is difficult. Similar to job assignments, the emphasis tends to be on performing well, with little attention devoted to learning. Without the learning component, development will be limited. One well-known action learning initiative was General Electric's "Work Out" program initiated in the 1980s by CEO Jack Welch. The action-learning process in this case involved working out problems in ways that enhanced General Electric's core values of empowerment and "boundary-less" behavior. It is notable for its efforts at making everyone responsible for leadership. Although action learning could be done using simulations, that is not typical. Also, leadership simulations are not very common. The most difficult issue with action learning is not transfer of training; rather, it is keeping the importance of learning on par with the emphasis on performance.

EVALUATING LEADERSHIP DEVELOPMENT

Relatively few evaluative studies have empirically estimated a link between a particular leadership development program and actual leader development. Instead, evaluation efforts tend to focus on leader or group performance—that is, on how well a particular task was performed or problem solved. An implicit assumption is that if task performance was good, then development must have occurred and the initiative must have been successful. Although these are interesting and testable hypotheses, the approach does little to advance a better understanding of development. Performance could be improved with

little or no individual or group development having occurred. It is also possible that development occurs with no subsequent improvement in task performance (at least immediately). To appropriately test these hypotheses, a much better understanding of the criteria for leadership development is needed. Issues to be addressed in developing appropriate criteria include a comprehensive approach to conceptualizing and operationalizing the construct of development.

It is important to recognize that development is a relatively long-term investment in the human and social capital of an organization. There are few shortcuts to leadership development, but the potential payoffs can be instrumental in bringing about better overall organizational adaptation and effectiveness.

—David V. Day

LEADERSHIP EFFECTIVENESS

Adelphia Communications, John Rigas, CEO; AOL Time Warner, Robert Pittman, CEO; Arthur Andersen, Joseph Berardino, CEO; Bristol Myers, Fred Schiff, CEO; Citigroup, Sanford Weill, CEO; Enron, Ken Lay, CEO; Merrill Lynch & Co., David Komansky, CEO; Qwest Communications, Joseph Nacchio, CEO; Sunbeam, Al Dunlap, CEO; Tyco International, Dennis Kozlowski, CEO, and the list goes on—companies that were icons of success have now become icons of dramatic failure, unethical practice, or simply bad judgment. One day these companies and their leaders were lauded as the embodiments of leadership effectiveness and the next day as embodiments of what is wrong with the system.

The concept of leadership effectiveness is difficult to define because it is a complex concept that attempts to capture myriad components: multiple organizational contingencies and various personal and interpersonal behaviors. Here we shall attempt a normative definition and explain how its many components help us grasp a complex subject.

DEFINITION

People define the concept of leadership effectiveness in many ways. Indeed, Stogdill (1974), Bass (1981), and Bass and Stogdill (1990) catalogued and interpreted almost five thousand studies of the concept and found great variance in its definition. Burns (1978) captured the problem most vividly in a statement still widely quoted today: “Leadership,” he said “is one of the most observed and least understood phenomena on earth” (Burns 1978, 2). People seem to accept a default position that leadership is simply what leaders do and that leaders are simply people in positions of power over others. An alternative to this position will be offered later. Still, we must have a starting point for our understanding of leadership effectiveness—even if it means that almost immediately we will create controversy.

One inclusive definition of *leadership effectiveness* is “the successful exercise of personal influence by one or more people that results in accomplishing shared objectives in a way that is personally satisfy-

ing to those involved.” This definition arouses controversy when examined from perspectives based on behavior in different contexts. Although this definition most comfortably applies to the interpersonal, small-group, and network levels found within typical work environments, in almost all political arenas and in some huge organizations, leadership effectiveness will be defined differently.

For organizations in which members or employees are significantly affected by decisions and actions that take place at a distance with only representative participation at best, leadership effectiveness is the successful exercise of personal influence attempts by one or more people that results in accomplishing organizational objectives congruent with a mission while earning the general approval of their constituencies (in the case of political leadership) or stakeholders (in the case of business and civil society organizations). Stakeholders are people who have an interest in an outcome.

In both cases, the definition’s several conceptual components require further explanation because each has inspired a literature of its own to help clarify its meaning and to help us understand how to use it appropriately.

“SUCCESSFUL EXERCISE OF PERSONAL INFLUENCE BY ONE OR MORE PEOPLE”

A limited view of leadership sees it as a set of behaviors and functions specifically tied to one role or formal position. Holding this view, one would expect that only the CEO could be the leader. A somewhat wider view would recognize that leadership of a division, a committee, a department, or an office is equally important for the accomplishment of organizational goals because each person’s work contributes to achieving the overall purpose of the organization. The broadest view of leadership recognizes that everyone who exercises his or her personal influence, whether selecting office supplies, choosing a site for the company picnic, or deciding the location of a new plant, could be engaging in leadership.

Furthermore, the interaction among people before a consensus is reached or simply during the process of working together results in incremental, often sub-

tle influences that occur so quickly that the combined result of the collective exercise of influence is leadership by the group itself rather than by any one individual. Consider the performance of a planning committee. Even when it has a formal leader or convener, inevitably the input of each member, as influenced by others through discussion and decision making along the way, results in the group as a whole creating a plan no one could have managed alone. Thus, the planning committee effectively leads the larger organization when its work is done.

“THAT RESULTS IN ACCOMPLISHING SHARED OBJECTIVES”

Using influence unilaterally because one has the legitimate organizational right to do so is more illustrative of the use of intimidation than interpersonal influence freely accepted by others. The distinction is important because accomplishing shared objectives requires the participation of relevant people in the decision-making process or their tacit, if not explicit, acceptance of decisions made on their behalf. Organizations have a huge number of objectives distributed to every person and unit. To meet this criterion and to build the trust of each employee or member in the management of the organization, the organization should have a clearly articulated vision and mission. In that way, each person will know whether any particular decision or objective will help achieve the overall organizational purpose. Thus, each person, even if not directly involved in making every decision or in creating every objective, can still feel that objectives are shared when they sensibly fit the vision and mission.

“IN A WAY THAT IS PERSONALLY SATISFYING TO THOSE INVOLVED”

Although effective leadership requires the accomplishment of the organization’s objectives that serve its vision and mission in a way that is personally satisfying to those involved, both the degree to which objectives are accomplished and the satisfaction of those involved are quite subjective. Indeed, often inherent contradictions and conflicts make it virtu-

ally impossible to please everyone all the time. An organization that is meeting its financial targets but at the same time laying off people creates such a contradiction. A company that is registering many new high-tech inventions while its stock price drops precipitously is experiencing a conflicted state perceived by some as success (therefore indicative of effective leadership) and by others as failure (therefore indicative of ineffective leadership).

STAKEHOLDER VIEW OF LEADERSHIP EFFECTIVENESS

About the only statement that can be made about leadership effectiveness with any certainty is that, more often than not, it is in the eye of the beholder. In large organizations, the various objectives being served reflect the importance of serving diverse stakeholders. What appears obvious at first—that the objective of business is to increase the bottom line, or that the objective of a political party is to elect candidates—becomes rather complex and muddled when seen in the midst of either surviving in the marketplace or campaigning for office.

In the case of political parties, we can readily understand the various constituencies and interests that must be convinced. In the business world, stakeholder interests that once included only the investment community and the board of directors now include employees, customers, suppliers, regulators, local communities, civil society organizations, and even competitors in some cases when joint ventures or the development of industry standards is considered. Leadership effectiveness at the top of an organization is no longer seen as simply increasing the bottom line or satisfying any one priority because there are equally important, if competing, interests to be served.

Similarly, at other levels in the organization, leadership effectiveness is subject to a diversity of objectives. Work flow and interdepartmental decision-making processes, the pursuit of mutual efficiency targets and the development of external relationships with key stakeholders (e.g., customers and suppliers) are different objectives from those that are created within a work team or that serve the interests of one's own department and staff. All of this suggests

that leadership effectiveness includes a dimension associated not only with just one's followers but also with one's colleagues.

FORMS OF INFLUENCE IN ADDITION TO LEADERSHIP

If we see influence style as the personal product of one's power and values disposition as a continuum of possibilities, we can then distinguish several forms of influence. In other words, a value important to a person is translated into a belief system that causes one's behavior, in this case one's form of influence. Nirenberg (2002) identified six forms of personal influence in organizations. (See Table 1.) He classified only one of these forms as leadership.

These distinctions result in various behavioral styles used by an individual or a "position holder" within a group—be it at the level of the organization, division, department, bureau, shop, and so forth. With this understanding, however, not all forms of influence should be defined as "leadership" as we discuss that behavior here. Identifying various forms of influence helps us make a clear distinction between the conventional wisdom of leadership as "positionship" (regardless of the form of influence) and leadership as just one process of interpersonal interaction.

Although this perspective is new, it helps us more accurately frame the discussion by being more precise about what we mean when we talk about leadership effectiveness—especially within the context of employee-based organizations in a democratic, free-market society. With this perspective, we clearly reject German Nazi leader Adolf Hitler, Soviet leader Joseph Stalin, and Cambodian leader Pol Pot as leaders, although surely they were tyrants and dictators. Influential? Yes. However, their influence was largely based on threat, coercion, intimidation, and mass murder. We must also reject Albert Dunlap (CEO, Sunbeam) and Joseph Nacchio (CEO, Qwest) as failed, if not criminal, CEOs for maintaining their position of power through the economic equivalents of mass murder (layoffs) and rape (asset stripping). They are not considered to be leaders in the sense of that term as it is used here, even though, of course,

Table 1. Forms of Personal Influence in Organizations

<i>Forms of Influence</i>	<i>Unimpeded Personal Will/Force</i>	<i>Based on Property Rights</i>	<i>Formal, Legalistic, Bureaucratic</i>	<i>Managerial</i>	<i>Leadership</i>	<i>Consensus Building</i>
Position Reference	Dictator	Owner/boss	Supervisor, administrator	Manager (transactional)	Leader (transformational)	Partner
Description	Imposes will on organization; abuses others; sees human resources as instrumental to his or her own ends	Exudes a sense of ownership and the prerogatives that accompany it	Administrative savvy; narrow vision	Trades favors for results; seeks stability and maintains status quo; rewards and punishments emphasized	Seeks to change status quo and mobilize effort through an inspired vision of what could be	Engages others in a shared vision for mutual benefit; each person a peer or team member
Example (Business)	Al Dunlap, Scott Paper and Sunbeam	Henry Ford, Ford Motor Company	Robert Stempel, General Motors	Michael Eisner, Disney	Herb Kelleher, Southwest Airlines	Jack Stack, Springfield, Remanufacturing
Example (Public Figure)	Mao Zedong, premier of the People's Republic of China	Lee Kuan Yew, prime minister, Singapore	Herbert Hoover, U.S. president	John Major, prime minister, United Kingdom	F. D. Roosevelt, U.S. president	Nelson Mandela, president, South Africa
Values Orientation	Completely egocentric, narcissistic	Organization as self	Organization as a machine	Bureaucrat entrusted with the organization	Problem solving, communicative, open	Community builder
Power Usage	Coercive, totalitarian	Coercive, authoritarian, legitimate	Legitimate, coercive, reward	Legitimate, reward, coercive	Expertise, vision	Relationship expertise, identification
Outcomes	Obedience	Obedience, compliance	Reluctant compliance	Willing compliance	Enthusiastic consent of followers	Shared ownership of process and results
Enrichment	Dictator and cronies	Owner/boss	Company	Company, manager, some followers	Company leader and some followers	Everyone
Preferred or Most Compatible Employee	Fearful, feelings of hopelessness or sociopathic nature	Feelings of powerlessness and unworthiness	Duty, obligation, or work for economic necessity, conventional	Careerists	Creative, achievers	Responsible, integrated peer behavior
Effectiveness	Possibly in short term	Possibly in stable environment	Likely only in stable environment	Most likely in stable environment	Likely in most knowledge-based environments	Highly likely in most environments

Source: Nirenberg (2002, 14).

Note: Although oversimplified, this table attempts to indicate the nature and variety of influence styles and their outcomes. Of course, the individuals mentioned here are chosen as representative of a dominant impression of them drawn in the news and popular culture media. It is not the intention to say that every influence attempt in their lives can be fairly described by this categorization or that these individuals haven't used other influence styles in a significant way.

Leadership Effectiveness as Viewed by James Fenimore Cooper

This extract from The Pathfinder (1840) by James Fenimore Cooper indicates that leadership effectiveness often has to do with how a leader or potential leader is perceived by others.

Notwithstanding his humble rank, there was something in the mien and character of Sergeant Dunham that commanded respect. Of a tall, imposing figure, grave and saturnine disposition, and accurate and precise in his acts and manner of thinking, even Cap, dogmatical and supercilious as he usually was with landsmen, did not presume to take the same liberties with the old soldier as he did with his other friends. It was often remarked that Sergeant Dunham received more true respect from Duncan of Lundie, the Scotch laird who commanded the post, than most of the subalterns; for experience and tried services were of quite as much value in the eyes of a veteran major as birth and money. While the sergeant never even hoped to rise any higher, he so far respected himself and his present station as always to act in a way to command attention; and the habit of mixing so much with inferiors, whose passions and dispositions he felt it necessary to restrain by distance and dignity, had so far colored his whole deportment that few were altogether free from its influence. While the captains treated him kindly and as an old comrade, the lieutenants seldom ventured to dissent from his military opinions; and the ensigns, it was remarked, actually manifested a species of respect that amounted to something very like deference. It is no wonder then that the announcement of Mabel put a sudden termination to the singular dialogue we have just related, though it had been often observed that the Pathfinder was the only man on that frontier, beneath the condition of a gentleman, who presumed to treat the sergeant at all as an equal, or even with the cordial familiarity of a friend.

“Good morrow, brother Cap,” said the sergeant, giving the military salute, as he walked in a grave, stately manner on the bastion. “My morning duty has made me seem forgetful of you and Mabel, but we have now an hour or two to spare and to get acquainted. Do you not perceive, brother, a strong likeliness in the girl to her we have so long lost?”

“Mabel is the image of her mother, Sergeant, as I have always said, with a little of your firmer figure; though for that matter the Caps were never wanting in spring and activity.”

role is to facilitate the creation of a vision and a mission plus a strategy to achieve them. People naturally turn to the CEO for “leadership of an organization.” That CEO in exercising leadership—as the successful exercise of personal influence by one or more people that results in accomplishing shared objectives in a way that is personally satisfying to those involved—engages in a direct or representational process of mutual interaction. However, the act of leadership will also be a functional part of the job of everyone who works with other people within an organization. Thus, it is important for leadership skills to be dispersed throughout the organization in order to craft the ability of a diverse workforce to live the vision and achieve the mission of the organization. Leadership is most effective when it results in an organization (unit, department, school, etc.) implementing its strategy and reaching its goals while the experience of work in the organization is satisfying to its employees. In this situation the individual seeks to change the status quo and mobilize effort through an inspired vision of what could be that grabs the imagination of people whom he or she is attempting to influence.

BEST PRACTICES IN LEADERSHIP EFFECTIVENESS

they had followers—a necessary but not sufficient requirement to be a leader.

In the case of business organizations, for example, the CEO represents a point of contact to the external world of investors, regulators, and the local (perhaps even international) community. His or her

In order to identify best leadership effectiveness practices, people need to decide which intended outcomes will be sought in utilizing the leadership form of influence. Remember that the use of leadership as a form of influence doesn’t preclude the use of other influence styles such as boss, manager, partner, or

supervisor. The distinction keeps our discussion focused when using these concepts. When we are being a boss, or a manager, or a dictator, or a partner, we should recognize it as such and not simply claim that whatever behavior a person with power exercises is “leadership.”

A “leadership” influence style focuses on the mobilization of colleagues in a consensual, collective effort to achieve the organization’s vision. This mobilization may also involve some real managerial constraints. For example, organizations must be not only effective in implementing their strategy, but also efficient. A profit must also accompany management’s mobilization of resources, and the organization must be adaptable to both external demands for change and internal processes to meet customer and employee needs.

Leadership effectiveness is fundamentally the practice of the following principles:

1. Build a collective vision, mission, and set of values that help people focus on their contributions and bring out their best.
2. Establish a fearless communication environment that encourages accurate and honest feedback and self-disclosure.
3. Make information readily available.
4. Establish trust, respect, and peer-based behavior as the norm.
5. Be inclusive and patient, show concern for each person.
6. Demonstrate resourcefulness and the willingness to learn.
7. Create an environment that stimulates extraordinary performance.

An example of leadership effectiveness using these principles was described by journalist Fara Warner in *Fast Company* magazine. In 1998, Hyundai Motor America was in disarray, and its cars were common targets of ridicule. Only ninety thousand cars were sold that year. Finbarr O’Neill, the company’s general counsel, was acting CEO and meeting with Hyundai dealers at their annual retreat. According to Warner, O’Neill got up and asked the dealers where they thought the company should be

going. “They started throwing out suggestions, yelling out advice. Fin called time-out, left the room, came back with an easel with lots of paper on it, and started writing a bunch of things down” (Warner 2002, 84).

“By the meeting’s end, O’Neill had recorded 100 suggestions—and was facing a decidedly less angry mob of dealers. Fin said, ‘I can’t work on all of these at once, so let’s pick the top 10, and that’s where I’ll start’” (Warner 2002, 84). The dealers remember that as Hyundai’s defining moment. “It was the day that somebody took charge. It’s when we got leadership” (Warner 2002, 84). Apparently O’Neill’s influence in stimulating the group’s development of a set of shared objectives and helping it move toward those objectives got immediate results. His action provided momentum for desired change in a consultative fashion involving all the dealers wanting to participate.

As O’Neill began to organize the company to solve the issues raised at that meeting, the turnaround began, and the disarray ended. The board, seeing progress being made and still not having chosen a new CEO, appointed O’Neill to the position—a person who is self-described as “not a car guy.” However, he knew what was needed and exercised effective leadership as defined here.

EVALUATING LEADERSHIP EFFECTIVENESS (PERSONAL)

If being effective is important, it should be measured. How do we know we are effective leaders? We have many ways to ascertain performance. We cannot always easily know that our followers are satisfied and that objectives are being met. Regular, observable feedback is more likely at the small-group level than at the institutional level. Where it is not observable, feedback from colleagues, subordinates (followers), and other stakeholders can be obtained through 360-degree feedback instruments. The concept of 360-degree feedback is to offer individuals the opportunity to solicit meaningful performance feedback from those whom they attempt to influence and those who are related to their achieving organizational goals at all levels.

One of the ironies of determining leadership

effectiveness in this way is that it points out one of the differences between organizationally based leadership and leadership achieved, say, through the political process in the case of public office or through direct competition for other official or informal positions of power. The use of a 360-degree instrument is most useful in focusing on an individual's style, facility with leadership skills, achievements, and relationships with stakeholders (or the lack thereof). The individual, until removed by superiors, retains his or her powers conferred by the organization. Because of the concepts of chain of command and unity of command, the position holder's actions, especially when they are a problem to his or her subordinates, are less likely to be known by the person who must act to improve them. Thus, one of the major contradictions of organizational leadership (at least in a business context) is that leaders are not accountable to followers. Rather, they are appointed by their superiors to lead their subordinates as followers. If they please their superiors, no matter how ineffective they are as leaders in their subordinates' eyes, they remain in power.

In the political world, after Election Day constituents—through correspondence, lobbyists, issue-oriented campaigns, and the media—let public officials know where they stand. Polls undertaken by an officeholder enable the officeholder to gather performance feedback similar to using 360-degree instruments in the business world.

LEADERSHIP SKILLS

Leadership effectiveness requires paying attention to a four-dimensional field of behavior. In addition to paying attention to direct reports, according to Bowers and Seashore (1966), a leader needs to pay attention to three other dimensions: (1) maintaining managerial goal emphasis and clarity; (2) having the ability to provide the necessary support for individuals to do their work and achieve their objectives; and (3) facilitating followers' (subordinates') interaction with one another to create efficiencies, good feelings, and teamwork. These dimensions are recognized as part of the leadership section of the Baldrige Criteria, 2003 award, which is a national

business award given to the organizations that best exemplify quality business performance.

To succeed in addressing these four dimensions, individuals must have the following skills and attributes:

Personal

- Identifying and living up to one's and one's organization's values
- Developing self-confidence/esteem
- Being committed to keeping agreements
- Being authentic
- Communicating truthfully
- Being able to use creative, holistic (and interdisciplinary) thinking
- Giving and receiving feedback (positive and negative)
- Being able to be self-disclosing
- Being able to actively listen/empathize
- Having a capacity for self-reflection about behavior in interpersonal contexts
- Honoring and knowing how to stimulate inquiry and dialogue
- Keeping everyone informed
- Reducing stress, anxiety, and fear

Interpersonal

- Meeting facilitation
- Being resourceful, creative, adaptable
- Offering dispute resolution through mediation
- Offering peer supervision and coaching
- Maintaining process observation
- Using role clarification and self-assessment
- Suspending judgments
- Using team building (including the use of survey feedback and action research techniques)
- Maintaining creative problem identification and problem solving
- Using consensus-building methods
- Mastering half-day or full-day retreats

GLOBALIZATION, DIVERSITY, AND LEADERSHIP EFFECTIVENESS

Increasingly, successful organizations create the demand for leadership, and the successful act of leadership requires people to become more open to their whole experience of interpersonal interaction in the workplace. In effect, each person will need to see more, hear more, and understand more—in order to help the organization to see and meet the changing needs of customers and employees, and to focus the collective productive intent of their part of the organization on achieving effective results. Leadership is about intelligence—about pushing back personal limitations and being open to new possibilities for creating a better, more enjoyable, more successful organization. As Lee Kun-Hee, chairman of Samsung Electronics, South Korea, said, “To effectuate change within groups, we must initiate change within ourselves. You need to know yourself well, your habits, strengths and shortcomings. Questioning yourself thoroughly is the beginning of change” (Rosen 2000, 46–48). With the emergence of a global economy and a diverse workforce, this questioning is essential.

Most of all, perhaps, the act of leadership is about building strong positive relationships. The result of leadership effectiveness is ultimately the creation of a seamless partnership between customer, employee, and organizational purpose in order to succeed in the market.

THE LEADERSHIP-VERSUS-MANAGEMENT CONTROVERSY

People have an all-pervasive assumption in most of the business leadership literature that just because you are a boss (supervisor, manager, department head, etc.), you are also the leader—or should be. This assumption gives rise to the question, “How does leadership differ from management?” A host of other questions soon follow. Which is more important to an effective organization: leadership or management? If an organization accomplishes its goals, isn’t that good enough, wouldn’t its members or employees be satisfied? Stephen Covey best summarizes the differences and what is at stake. “Manage-

ment is a bottom line focus: How can I best accomplish certain things? Leadership deals with the top line: What are the things I want to accomplish? In the words of both Peter Drucker and Warren Bennis, ‘Management is doing things right; leadership is doing the right things.’ Management is efficiency in climbing the ladder of success; leadership determines whether the ladder is leaning against the right wall” (Covey 1989, 101). At this point in the evolution of the leadership literature—especially as it pertains to the business world and all non-elective offices—what is important is not either leadership or management but rather when to exercise each. However, as a strategy to achieve effectiveness at the personal and organizational levels, what may be most important for building effectiveness is the day-to-day climate in which people work.

THE ORGANIZATIONAL ENVIRONMENT OF LEADERSHIP EFFECTIVENESS

The purpose of leadership effectiveness is organizational effectiveness. However, at times the organization, when focusing on the leader, becomes dependent rather than more able to achieve its goals. Coca-Cola has been struggling ever since its highly effective and charismatic CEO Roberto C. Goizueta died in 1997. Similarly, after Edwin Land died in 1991, Polaroid, the company he founded, entered a period of decline resulting in its bankruptcy in 2001 (from which it has since emerged with a successful new product). To avoid the consequence of becoming overly dependent on a heroic leader, some companies are striving to institutionalize leadership. According to Pasternack and associates, at Sony, Fuji Xerox, Corning, and Continental Airlines, “Key leadership tasks are institutionalized in organizational systems, practices and cultures. . . . People at all levels take initiative to solve problems, and even to start new businesses” (Pasternack, Williams, and Anderson 2001, 71). The idea of creating organizations of leaders or a culture of leadership shifts the responsibility of effectiveness to more and more people. The culture of leadership is required to move companies to a level of effectiveness not even possible under a single “great man” or charismatic leader.

Each year, *Fortune* magazine, in partnership with the Great Place to Work Institute, surveys U.S. businesses and determines the best places to work as described by their employees (among other factors). One typical comment found on the Great Place to Work Institute website regarding a winning culture was, “Everyone’s contribution is important. Accomplishments are shared across the board. No one stands alone. Our tasks are accomplished as a result of a genuine collective effort” (www.greatplacetowork.com/great/index.php). In effect, then, the culture itself acts as what Kerr and Jermier (1978) first identified as a substitute for leadership.

Managing culture has received much attention since Peters and Waterman published *In Search of Excellence* in 1982. Since then many researchers have identified culture as a key factor in organizational longevity (De Geus, 2002), economic performance, and employee satisfaction, productivity, and commitment. Likert (1961) is considered to be the father of the concept of culture, and Collins (2001) is the latest to demonstrate that culture is the single most powerful means to creating great organizations. Culture is the collective interpersonal feel of the organization as determined by its values, norms, policies, and structure.

For a positive culture to be sustained year after year, leadership is required—emanating not from an individual but rather from everyone in the organization. To that end Noel Tichy and Eli Cohen said organizations “need to become teaching organizations . . . everyone pass[ing] their learning on to others.” In winning organizations, “leaders exist at all levels and leaders actively develop the next generation of leaders. Once this ‘engine’ gets running, it is hard for competitors to stop” (Tichy and Cohen 1997).

EVALUATING LEADERSHIP EFFECTIVENESS (ORGANIZATIONAL)

How well organizations create the right environment can be determined by surveys as well as by structured action research techniques that involve all employees in developing and assessing the criteria for the culture they will find most satisfying and productive. For Fred Fiedler (1967), a leading

researcher in the field of leadership effectiveness, key goals are high employee satisfaction and low stress accompanied by high performance.

FUTURE DIRECTIONS

As we have seen, leadership effectiveness is the successful exercise of personal influence by one or more people that results in accomplishing shared objectives in a way that is personally satisfying to those involved. Because of the changing nature of organizations the definition of leadership effectiveness will also change. Organizations are becoming more dependent on creativity, innovation, and knowledge acquisition and development. This dependence requires an intelligent, professional workforce capable of independent judgment. As individuals increase their responsibilities and work in a knowledge-based environment, they are less in need of an effective leader than an effective organizational environment. To that end, organizations would leverage their human resources by creating productive norms, building structures that support learning and the expression of leadership qualities by each employee or member. Thus, the definition of leadership effectiveness will move from a focus on the individual influencer to a widespread acceptance of responsibility to ensure organizational effectiveness by each person.

is, individual people who have aspirations, skills, and characteristics are called to leadership by a communal problem, need, or potential. These public problems are often complex, affecting diverse groups of people and raising fundamental questions of what the common good might be. Take, for example, the AIDS crisis that began in the early 1980s and today is a global scourge. People who have become leaders in the fight against AIDS have come from a multitude of backgrounds; they are physicians, public health officials, gay activists, social service managers, UN staff, people with AIDS and their relatives, scientists, philanthropists, clergy, economic development experts, journalists, and many more. Each has taken on leadership responsibility in the AIDS crisis out of a particular commitment to reduce human suffering and each brings a unique set of skills and characteristics to this leadership work. This is true whether the leader is a relatively obscure bureaucrat in a public health agency or Bill Clinton or Nelson Mandela. These leaders have had to help diverse constituents develop a shared sense of what the common good might be in the fight against AIDS.

The central challenge of leadership studies today is to understand how individuals can draw on their unique (but culturally conditioned) set of aspirations, skills, and characteristics to enable a host of other unique individuals to work together on shared concerns in a world where—as Harlan Cleveland (2002) has put it—no one is in charge.

Increasingly, leadership scholars are shifting from a “in-charge” leadership model in which a CEO or president or general discerns the best direction for an organization or community and then issues the proper directions and incentives to obtain desired results. (See, for example, Heifetz 1994; Lipman-Blumen 1996; Heenan and Bennis 1999; Wheatley 1999; Huxham and Vangen 2000; Quinn 2000; and Drath 2001.) These scholars recognize that no one person, group, or even organization can be wholly in charge when it comes to addressing a significant public issue in today’s complex, interdependent world. This is true for the businesswoman attempting to develop and market a new product (for example, an AIDS vaccine) as well as for the public health

LEADERSHIP FOR THE COMMON GOOD

Leadership for the common good arises at the intersection of personal passions and public need. That

official trying to change individual behavior (for example, convincing teenagers in Kenya or the United States to practice safe sex).

The Leadership for the Common Good framework (Bryson and Crosby 1992; Crosby 1999) offers guidance for leaders and constituents working together to accomplish change in such a world. The framework consists of four elements: the nature of the shared-power world, the shared-power settings in which followers and constituents tackle public problems, and key leadership capabilities that will be needed over the course of a policy change cycle. It is based on the definition of leadership as “the inspiration and mobilization of others to undertake collective action in pursuit of the common good.”

DYNAMICS OF A SHARED-POWER WORLD

Anyone who has passion and a good idea for combating a problem like AIDS will soon find that he or she must attend to the varying desires, values, needs, and power bases of numerous individuals, groups, and organizations that have a stake in the proposed change. Each stakeholder has some power to facilitate this change, but cannot do so alone. (Of course, each stakeholder also has some power to block the change.) Many of the stakeholders, moreover, are linked to each other in formal and informal networks. These networks enable them to share information, coordinate activities, or engage in joint projects. In such a complex world, change advocates cannot simply construct logical arguments or make demands and expect the system to comply.

These change advocates will have to engage in political, issue-oriented, and therefore, messy, planning and decision making (Innes 1996; Huxham in press). They will have to create new networks and alter existing ones as they strive to establish a regime of mutual gain (i.e., a set of principles, and decision-making procedures that achieve lasting benefit at reasonable cost and that serve people’s deepest desires for a better world). They will need to astutely design and use forums, arenas, and courts, the key shared-power settings in which leaders and constituents tackle public problems.

SHARED-POWER SETTINGS

Traditional views of power (and, indeed, of leadership) have often focused on the social practice of decision making and implementation, which occurs in formal and informal arenas. A holistic view of power, however, recognizes the equal importance of two additional social practices: the creation and communication of shared meaning in formal and informal forums and the adjudication of disputes and sanctioning of conduct in formal and informal courts (Giddens 1984; Bryson and Crosby 1992). Moreover, analysis of change efforts indicates that the creation and communication of shared meaning may be even more crucial than making and implementing decisions, since how a change effort is interpreted has tremendous impact on what decisions are even considered (Bryson and Crosby 1992; Crosby, 1999). For example, as long as AIDS in the United States was defined mainly as a disease affecting gay men, top officials in the Reagan Administration did not feel the need to make funding for AIDS research and education a priority. Only after it was clear that many other groups were affected and that celebrities were dying of the disease were these officials ready to view AIDS as an urgent public health issue.

In a shared-power world, leaders have their greatest impact through astute design and use of the settings—forums, arenas, and courts—in which the three social practices occur. Forums include task forces, discussion groups, public hearings, formal debates, newspapers, television and radio broadcasts, and professional journals. In these settings, speakers and audiences communicate shared meaning through discussion. Arenas include legislatures, parliaments, city councils, boards of directors, cabinets, cartels, and executive committees. In these settings, leaders help constituents influence the implementation of legislative, executive, and administrative decisions. Courts include the “court of public opinion” (probably the most powerful court), formal courts or tribunals, and professional licensing bodies. In courts, decisions and conduct are judged or evaluated and sanctions imposed.

LEADERSHIP CAPABILITIES

In order to effectively design and use forums, arenas, and courts to achieve beneficial social change, leaders draw on eight capabilities.

- Leadership in context: understanding the social, political, economic, and technological “givens”
- Personal leadership: understanding self and others
- Team leadership: building effective work groups
- Organizational leadership: nurturing humane and effective organizations
- Visionary leadership: creating and communicating shared meaning in forums
- Political leadership: making and implementing decisions in legislative, executive, and administrative arenas
- Ethical leadership: adjudicating disputes and sanctioning conduct in courts
- Policy entrepreneurship: coordinating leadership tasks over the course of policy change cycles

Leadership in Context

Leaders must consider how sociological, political, economic, and technological forces enable and constrain desired change. With regard to the global anti-AIDS campaign: leaders have had to pay attention to social conditions such as cultural taboos against sex education; they have had to understand different political systems in order to obtain government assistance; they have had to understand how market forces affect drug research and treatment; they have been able to use advanced technology to develop tests for the virus, even as improved transportation technology (such as commercial airlines) made transmission of the disease more widespread. An especially important sociological context for leadership is cultural views about leadership and change; for example, who is expected to be a leader and how much reverence is accorded to tradition.

Personal Leadership

Numerous leadership scholars and advisers agree that leaders need grounding in human psychology—

that is, they need to understand themselves and others. People aspiring to leadership can begin this work by considering what is most important to them and how this personal “passion” calls them to leadership. They can then assess the strengths and weaknesses that they bring to the leadership work. Among vital leadership strengths are integrity and a sense of humor, awareness of one’s preferred or habitual ways of learning and interacting with people, a sense of self-efficacy and courage, cognitive and emotional complexity, commitment to continual learning, authority and other resources, supportive personal networks, balance, and awareness of how leadership is strengthened and weakened by one’s location in major social hierarchies. Leaders also need to understand what they have in common with others involved in the leadership work and how to bridge the differences.

Team Leadership

Those seeking to accomplish major change sooner or later will need to assemble and sustain productive work groups—that is, they will need to practice team leadership. The essentials of team leadership are wise recruitment, communication, empowerment, and leadership development of team members. Team leaders try to ensure that team members are diverse enough to contribute an array of needed perspectives, skills, and connections to the work, yet sufficiently unified around the team’s purpose. Team leaders use communication methods that align and coordinate members’ actions, build mutual understanding and trust, and foster creative problem solving and commitment. They help team members claim and develop their power in service of the group’s mission through, for example, helping the group develop a shared understanding of its mission, strategies, decision-making procedures, rules, work plan, and evaluation methods. In teams with a designated leader, a more directive leadership style may be most effective in the team’s early stages; however, in time, directive leaders should become more participatory and seek to develop leadership capacity in everyone. Leaders also help their teams celebrate accomplishments and weather adversity.

Organizational Leadership

To cope with public problems, leaders must ensure that effective and humane organizations are created, maintained, or restructured as needed. Leaders of the fight against AIDS have created new medical research foundations and new advocacy and voluntary organizations, as well as restructured public health agencies. The main tasks of organizational leadership are attending to organizational purpose and design, helping the organization adapt to internal and external change, and building inclusive community inside and outside the organization. Attention to organizational design includes creation of meaningful mission and philosophy statements, development of goals and strategies, construction of inspiring visions of success, and creation of flexible governance, administrative, and communication systems. Leaders also help establish a culture of integrity, inclusion, learning, and productivity, especially by being role models. Adapting to internal and external change requires constant monitoring of internal and external environments, experimentation, oversight of management routines and details, collaboration and team building, and planning for change. To build inclusive communities, leaders foster systems that care for organizational members, facilitate shared problem solving, and provide resources for the shared work.

Visionary Leadership

Visionary leaders interpret current reality, and shape collective visions of the future. They are adept in the design and use of formal and informal fora, the settings in which various stakeholders can present and debate interpretations of the present, past, and future, and where they can develop shared meanings and mission. Take, for example, global conferences on AIDS where officials from governmental and non-profit health organizations, scientists, public figures, experts on epidemiology, advocates of the poor, donors, and journalists come together to argue about causes and consequences of the epidemic and debate strategies for prevention and treatment of the disease—especially as it affects people in poor countries.

Certainly a critical aspect of developing shared meaning is obtaining agreement that a communal problem, need, or potential exists and that it is urgent and important enough to merit sustained attention and action. Visionary leaders will need to marshal evidence to demonstrate that the problem affects or has the potential to affect many members of the community and that failure to act will result in widespread harm or loss of opportunity. Thus, in their speeches at the International AIDS Conference in Barcelona, Spain, in July 2002, Bill Clinton and Nelson Mandela, as co-chairs of the International AIDS Trust, presented statistics and human stories to emphasize the “reality” of what is now a pandemic.

Also important is developing a problem definition, or frame, that can prompt a diverse array of stakeholders to see how solutions that flow from the definition can help them accomplish their goals. The frame, of necessity, will be multifaceted and comprehensive, combining several narrower frames. For example, the spread of HIV/AIDS can be framed as a medical problem, it can be framed as an economic problem, it can be framed as a drug abusers’ problem, or a gay problem, or an attack on families, a sexual irresponsibility problem, or a conflict between affluent and poor people. At the Barcelona conference, Clinton and Mandela spoke of an interdependent world that brings “universal vulnerability” and shared responsibility for dealing with global problems.

Finally, visionary leaders emphasize the kind of future they seek and offer specific steps that provide credible hope that the problem can be remedied. In Barcelona, Nelson Mandela suggested very specific actions for decreasing stigma and discrimination against HIV/AIDS sufferers. He emphasized the link between AIDS and poverty, and thus highlighted the importance of solutions that fight poverty, not just illness.

Political Leadership

Political leaders are adept at the design and use of formal and informal arenas, the settings in which legislative, executive, and administrative decisions

are implemented. Especially important is organizing key stakeholders into sustainable coalitions that can convince decision makers to adopt proposed changes and that can monitor implementation of the resulting new policies, programs, or projects. For example, in Brazil, a coalition of gay activists, nongovernmental organizations, and top political leaders persuaded Brazilian lawmakers in the late 1990s to pass legislation mandating “state of the art” treatment for all AIDS patients. As a result, government labs began producing generic AIDS drugs, and Brazil now offers a compelling model of how a country with a very large poor population can combine a system of well-run clinics and cheap drugs to reduce AIDS deaths and the rate of AIDS transmission.

Ethical Leadership

Ethical leaders are adept at the design and use of formal and informal courts to adjudicate disputes and sanction conduct. Ethical leaders educate others about ethical principles, laws, and norms and how they apply to particular cases. Ethical leaders help adjudicate disputes that arise when principles, laws, and norms conflict with each other. For example, they may help constituents see that one principle is more important than another, or they may find ways to balance conflicting laws or norms, or they may be able to reframe a conflict so that common ground can be found. For example, advocates for poor people with AIDS in countries like Brazil and South Africa have argued that these patients should receive generic anti-AIDS drugs free or at very reduced rates. Representatives of giant pharmaceutical companies, meanwhile, have argued that such action violates patent laws that protect their rights to market the brand-name versions of the drug and prohibit other manufacturers from selling cheap copies. The World Trade Organization provided ethical leadership when it declared in 2001 that poor countries that faced a national health emergency could buy or make generic versions of patented drugs. Perhaps the most important court is an informal one—the “court of public opinion.” Ethical leaders who continually emphasize the responsibility of drug companies that benefit from government-funded research to reduce

the prices of AIDS drugs for poor people are appealing to the court of public opinion.

Policy Entrepreneurship

Policy entrepreneurs coordinate leadership tasks over the course of policy change cycles, which consist of seven phases: initial agreement, problem formulation, search for solutions, proposal development, proposal review and adoption, implementation and evaluation, and continuation, modification, or termination. Leadership in context and personal leadership are vital at the outset of a policy change effort; visionary leadership is also very important in the early phases (initial agreement, problem formulation, and search for solutions); political and ethical leadership become more important in the subsequent phases; team, organizational, and intraorganizational leadership are likely to be needed throughout the change cycle. The success of any major policy change effort depends on the ability of numerous policy entrepreneurs to inspire and mobilize enough key stakeholders to adopt policy changes and protect them during implementation.

—Barbara C. Crosby and John M. Bryson

LEADERSHIP IN THE DIGITAL AGE

Different epochs produce different kinds of leadership—with different patterns of hierarchical authority, different skill sets and attitudes, and different institutional incentives. Societies today are experiencing transitions potentially as far-reaching as the transition from agricultural to industrial societies. Today's epoch is in the early stages of a transition from an industrial-based society to a postindustrial digital society, and leadership patterns are beginning to reflect that transition.

The new society—variously called “information society,” “knowledge society,” or “networked society”—is marked by four key structural changes reshaping leadership: rapid and far-reaching technological changes, especially the digitalization of information and communications technology

(ICTs); accelerated globalization; a shift toward knowledge as the central factor of production (i.e., from brawn to brains); and more distributed, less hierarchical organizational forms with greatly accelerated movement within and across organizations and sectors. In this highly dynamic environment, leadership innovation and adaptability are critical, especially the leader's capacity to channel the right knowledge to the right people at the right time in the right place.

As a result, a postindustrial, digital-age style of leadership is emerging. It is characterized by stronger horizontal linkages among elites across different sectors and even different countries, especially among government leaders, private entrepreneurs and executives, and researchers and civil society leaders.

Of course, there are caveats regarding the spread of digital leadership. First, timeless and universal characteristics of leadership remain important today. These characteristics include passionate commitment, focus and discipline, charisma, and other characteristics identified by observers of leadership through the ages. These characteristics have not been supplanted, but they coexist in a different mix with other factors. Second, the new leadership will vary somewhat from country to country, culture to culture, and sector to sector and will be most visible in economically advanced societies and in the information and communication technology sectors.

New societal conditions are eliciting new forms of leadership necessary to launch and sustain the transitions toward more knowledge-intensive societies. Leadership in the digital age needs new attitudes, new skills, and new knowledge gained through unique professional experiences responsive to the societal features identified earlier.

We must distinguish between two related but different leadership categories. The most inclusive category is “leadership in the digital age,” which refers to leadership in any institution or sector embedded in the broader transitions toward a more knowledge-intensive society. All leaders, whether leaders in health, the arts, or manufacturing, must be aware of the new constraints and opportunities that ICTs provide and use them effectively. The second category, “digital leadership,” refers to leadership in the core

sectors of the knowledge society—the three C’s of computing, communications, and content (broadcasting and print and now multimedia). The two categories of leadership are closely related, and many leadership innovations, such as the use of website portals to link customers and suppliers, originated in the core ICT sectors and diffused from there.

Digital leaders can be defined functionally by their contributions to the transition toward a knowledge society. These contributions include awareness building, resource mobilization, operational leadership, and structural leadership. Awareness-building leaders convince sections of the population to attend to the new ICTs as resources that can help them achieve their goals. Resource-mobilizing leaders convince social actors to obtain and deploy valuable resources, whether money or high-level political support, to spread ICTs more widely. Indeed, mobilizing an effective pro-diffusion political coalition is an essential element of digital leadership and in leadership in the digital age more broadly. Pro-diffusion coalitions are societal groups that support legal, regulatory, legislative, organizational, and other changes necessary for the new technologies to diffuse, changes such as greater research and development budgets, ending monopolies in favor of greater competition, lower prices, private entrepreneurship, and so forth. Leadership is also expressed through operational activities, whereby leaders, often in government or private companies, actually provide and manage the hard infrastructures like telecoms networks as well as the soft infrastructures like education and research at the core of the knowledge society. When notable people are able to convince audiences that the information revolution is not only about using ICT tools but also about shifting toward a new kind of distributed, digital society, they are engaging in structural leadership.

Digital leadership innovation is not static but rather changes through time. Because technology innovation is so highly dynamic, the mix of leadership skills required also changes. For example, the Internet industry has passed through pre-commercial, commercial, competitive, and consolidation phases. In the precommercial phase the Internet was created, managed, and used for noncommercial purposes,

mostly by leading researchers and academics. The appearance of the first fully open, nondiscriminatory Internet Service Provider (ISP) marked the “commercial” phase. The third period began when several commercial ISPs were active, typically driving down prices and raising quality through competition. After this phase, consolidation occurred in the ISP market (during the period of 2000–2001). Each phase had a slightly different mix of leaders interacting across the public, private, research, and civil society sectors. First driven by campus and think tank-based leaders in the research and development community, later in the commercial and competitive phases leadership initiative shifted to entrepreneurs. In each phase, the technological, political, and resource challenges were rather different and demanded different mixes of leaders. In the early period of the transition, awareness-building and resource-mobilizing skills were useful. In later periods, operational skills were especially valued. In Silicon Valley, the development, manufacture, commercialization, and marketing of silicon chips and the personal computer were driven in part by such highly visible leaders as William Hewlett (Hewlett-Packard), Andy Grove (Intel), and Steve Jobs (Apple Computer).

INFORMATION CHAMPIONS, INFORMATION REVOLUTIONARIES, AND INFORMATION CONSERVATIVES

In the early days of the information revolution in developing countries such as Brazil and China, “information champions” shared certain personal and professional features. In the Internet sector, many came from families in the professional middle class, the children of doctors, engineers, and teachers, neither very rich nor very poor. Many in the first wave studied abroad and returned home imbued with the distributed, bottom-up, and democratizing spirit of the Internet. Leaders such as Nii Quaynor in Ghana and Edward Tien of China championed more open, liberal access to knowledge, doing battle against government information conservatives who fought to retain their own top-down, centralized visions.

Digital leaders are distinguished from non-leaders

by their different combinations of skills, attitudes, knowledge, and their professional and personal experiences. Leadership must be driven by unique attitudes appropriate for the digital age. Digital leaders must be flexible and adaptable and possess wide intellectual curiosity and a hunger for knowledge. They must be willing to see value in sharply different perspectives and be comfortable with uncertainty. Like all leaders at all times, they must possess true passion for what they do. They look globally for solutions and challenges and insist on constant learning from their collaborators and followers. They maintain a more egalitarian and results-oriented approach than earlier leaders.

A list of necessary leadership skills would include the capacities to build coalitions and forge communities of interest, to multitask, and to remain focused on one's own priorities, even while seeking common ground with leaders in other sectors. Substantive knowledge, including knowledge of how the new technologies function, is especially important in the knowledge society. Leaders must also know what they do not know, and know how to get that missing knowledge by mobilizing their own social networks. These new combinations of skills, attitudes, and knowledge require new patterns of experience, especially personal movement across different sectors in jobs where the emergent leader is forced to engage with people from different professional and demographic backgrounds. Through all these cross-border shifts, successful leaders are able to develop and sustain a moral compass to guide their behavior.

Skills, attitudes, knowledge, experiences, and ethics fit together in a mutually reinforcing "package" for successful digital leaders.

THEORIES OF LEADERSHIP IN THE DIGITAL AGE

Literature on leadership in the digital age has been only partly successful in capturing these complex, distributed, cross-sectoral dynamics. Most works on what is called "e-leadership" are written about business leadership. Business school faculty produce action-oriented analyses with actionable recommendations designed to promote a new kind of relation-

ship in firms and markets (Annunzio 2001, Mills 2001). A much smaller number of works trace the early leadership contributions of scientists and engineers, typically through histories of scientific innovation and breakthroughs (Abbate 2000). With some exceptions, mainstream "leadership studies" have not yet covered the complex interactions among the many non-business and business stakeholders in the transitions to the knowledge society (Cleveland 1997). Some scholars, such as Wayne Baker (2000), offer frameworks based on networks of social capital wherein one's social networks constitute a valuable resource like investment capital. Yet, the leading theories of the knowledge society still remain too static, too macro, too apolitical, and conceptually underdeveloped. Needed is a new framework that demonstrates both the transitory and contingent natures of these changes in the substance and style of ICT digital leadership, as well as its emerging continuities and underlying patterns.

THE QUAD: A CONCEPTUAL FRAMEWORK FOR DIGITAL LEADERSHIP

One way to advance contemporary leadership studies is in the context of the four-sided interactions that occur across the institutions and sectors most directly involved in the technical and sociological innovations of the information revolution. These four-sided interactions, or "quads," encompass government officials, private entrepreneurs, civil society leaders, and senior researchers. In the shift toward a knowledge society, countries and communities where four-sided "quad" relationships are more robust, predictable, balanced, and interactive are more successful in effecting a sustainable transition; those countries and communities with weak quads have weak transitions (Wilson 2002). The cross-sectoral quad leadership model overcomes the limits of other models because it links microbehaviors like leadership to middle or mesolevel small-group interactions out of which new digital leadership patterns emerge. The quad model also draws attention to the ways individuals and groups employ the new distributed, interactive technologies to mobilize the necessary skills, knowledge, and attitudes required

to create and sustain the more distributed, interactive social leadership networks for the digital age.

OTHER THEMES AND ISSUES IN DIGITAL LEADERSHIP

The newness of the networked knowledge society and digital leadership means that much remains to be explored in study and practice. Leadership and institutionalization are critical areas of investigation. The German sociologist Max Weber speculated about the relationships between charismatic authority, with its sharp personal appeal to those followers who experience it most immediately, and the development of lasting institutions that can preserve the original sense of purpose. How does the first generation of digital leaders preserve its vision through institutions that persist over many generations? This is especially a challenge in developing countries, where institutions typically are weak. Generational dimensions of digital leadership are also important issues involving possible differences in leadership styles, substance, and perhaps capabilities as well (Bennis and Thomas 2003). Cross-national and cross-cultural differences in digital leadership are also critical subjects in a globalizing world (Wilson 2004).

LEADERSHIP SUCCESSION

Every organization must confront issues of leadership succession if it is to survive beyond its founding period. Leadership transitions are crucial in an organization's history, and yet leadership scholars are strangely silent on the issue of succession. Scholars and researchers write about becoming a leader, being a leader, and being a good leader, but rarely about leaving leadership to others.

This is puzzling, as nothing is as inevitable in organizational life as leadership transition. Like death and taxes, transitions of power are wholly foreseeable. Despite this, the issue of succession is fraught with individual and institutional anxiety. CEOs and executive directors apparently put off succession planning for the same reason most people avoid writing their wills. Founders of private businesses and nonprofit organizations identify feelings of immortality, lack of a suitable successor, and fear of retirement as some of the many factors that inhibit their own succession planning.

Although leadership scholars are silent on the topic, one might expect business gurus to devote considerable attention to the leadership issues inherent in the succession process, but this is not the case. In fact, the business literature focuses on the succession process primarily from the standpoint of shareholder value, earnings, stock prices, and organizational fluidity. Yet the business journal *Business Horizons* has suggested that numerous studies point to a crisis in succession planning and executive development. The American Society of Training and Development, a U.S.-based professional association of organizational consultants, reported in its fall 1998 membership

Joshua Succeeds Moses—Joshua I (King James Version)

- 1: Now after the death of Moses the servant of the LORD it came to pass, that the LORD spake unto Joshua the son of Nun, Moses' minister, saying,
- 2: Moses my servant is dead; now therefore arise, go over this Jordan, thou, and all this people, unto the land which I do give to them, even to the children of Israel.
- 3: Every place that the sole of your foot shall tread upon, that have I given unto you, as I said unto Moses.
- 4: From the wilderness and this Lebanon even unto the great river, the river Euphrates, all the land of the Hittites, and unto the great sea toward the going down of the sun, shall be your coast.
- 5: There shall not any man be able to stand before thee all the days of thy life: as I was with Moses, so I will be with thee: I will not fail thee, nor forsake thee.
- 6: Be strong and of a good courage: for unto this people shalt thou divide for an inheritance the land, which I swear unto their fathers to give them.
- 7: Only be thou strong and very courageous, that thou mayest observe to do according to all the law, which Moses my servant commanded thee: turn not from it to the right hand or to the left, that thou mayest prosper whithersoever thou goest.
- 8: This book of the law shall not depart out of thy mouth; but thou shalt meditate therein day and night, that thou mayest observe to do according to all that is written therein: for then thou shalt make thy way prosperous, and then thou shalt have good success.
- 9: Have not I commanded thee? Be strong and of a good courage; be not afraid, neither be thou dismayed: for the LORD thy God is with thee whithersoever thou goest.
- 10: Then Joshua commanded the officers of the people, saying,
- 11: Pass through the host, and command the people, saying, Prepare you victuals; for within three days ye shall pass over this Jordan, to go in to possess the land, which the LORD your God giveth you to possess it.
- 12: And to the Reubenites, and to the Gadites, and to half the tribe of Manasseh, spake Joshua, saying,
- 13: Remember the word which Moses the servant of the LORD commanded you, saying, The LORD your God hath given you rest, and hath given you this land.
- 14: Your wives, your little ones, and your cattle, shall remain in the land which Moses gave you on this side Jordan; but ye shall pass before your brethren armed, all the mighty men of valour, and help them;
- 15: Until the LORD have given your brethren rest, as he hath given you, and they also have possessed the land which the LORD your God giveth them: then ye shall return unto the land of your possession, and enjoy it, which Moses the LORD's servant gave you on this side Jordan toward the sunrising.
- 16: And they answered Joshua, saying, All that thou commandest us we will do, and whithersoever thou sendest us, we will go.
- 17: According as we hearkened unto Moses in all things, so will we hearken unto thee: only the LORD thy God be with thee, as he was with Moses.
- 18: Whosoever he be that doth rebel against thy commandment, and will not hearken unto thy words in all that thou commandest him, he shall be put to death: only be strong and of a good courage.

report that of all the organizational issues confronting CEOs today, the leadership succession process is the least understood and most in need of further study.

Succession planning is more crucial now than ever before, given the worldwide leadership exodus predicted for the first decades of the twenty-first century. The retirement of baby boomers, as they are called in the United States, is in fact a worldwide occurrence. The U.S. Census Bureau reports that declining fertility and increasing life expectancies are leading

to greater growth in older populations than in overall populations in most of the world's countries. The workforce exodus represented by people retiring and the shrinking numbers of people replacing the retirees makes for an unsettling equation.

The departure of boomer generation leaders will have an enormous impact on the private and non-profit sectors. Maria Schafer, writing for *Software Magazine* in 2001, reported that in the private sector, for example, 20 percent of the largest U.S. companies will lose 40 percent or more of their top execu-

tives by 2005. In the late 1990s and early 2000s alone, close to two-thirds of major U.S. companies replaced their CEOs. Even in the best of times, family-owned businesses survive a generational transition only 30 percent of the time, and only 10 percent endure to the third generation. Now we expect fewer family successors overall with a constant number of family businesses and the same failure rates.

FOUNDER'S SYNDROME, SUCCESSOR'S SYNDROME

Recent attention has focused on “founder’s syndrome,” a subject introduced in an online discussion group in September 2000. This syndrome arises when a founder refuses to step down from the formal leadership of an organization he or she founded, presumably to the detriment of the organization. Although no print literature on the topic exists to date, the notion of founder’s syndrome has gained a certain currency, at least among ambitious underlings. It is rare for a founder to choose to step down from a robust organization. In fact, many U.S. boomer founders such as Marian Wright Edelman and Brian Lamb continue to enhance the institutions they founded. “I have more work to do, and this is the place to do it,” Lamb said recently when asked about his succession plans for CSPAN. Certainly there needs to be more research on the relationship between the longevity of the founder as CEO and the long-term health of an institution.

Successors suffer a syndrome too. A successor is always a Janus-like figure, looking forward and backward simultaneously. Smart successors look to the future and new horizons as well as to the past for history, wisdom, and experience. A successor is the new leader of an organization, but like it or not, he or she is also following in a founder’s footsteps. A successor is both a leader and a follower, by definition, and must come to terms with the founder’s ghost. Too often, however, the ghost of the founder threatens the successor, and the successor’s own envy, jealousy, fear, and paranoia hinder his or her best efforts. Successor’s syndrome can become utterly disabling for the individual and for the institution.

Succession is a much more nuanced process than the notions of founder’s syndrome or successor’s syndrome suggest. The use of archetypes juxtaposed against organizational condition and founder exit conditions provides a more subtle understanding of the complexity of the interactions.

THE USE OF ARCHETYPES IN SUCCESSION SCENARIOS

The psychologist Carl Jung first introduced the concept of archetypes as inherited ideas present in the collective unconscious of the human race as well as in each person’s unconscious. In an early lecture on the subject in 1936, Jung said:

The concept of the archetype, which is an indispensable correlate to the idea of the collective unconscious, indicates the existence of definite forms in the psyche that seem to be present always and everywhere. (p. 87)

In his later work, Jung saw archetypes as shaping both matter and mind, universal and yet having individual variation. Certain figures are archetypes (the mother, the hero, the trickster), but forces of nature, animals, and even situations and events also can be archetypes. The archetypes presented in Table 1 were identified through a review of business journals and news and nonprofit literature, as well as through interviews with nonprofit founders and successors, from 1999 to 2002. The identified archetypes were placed in a matrix that incorporated exit conditions of the founder, types of successors, and a descriptive rating of the overall health of the organization at the time of transition, subjectively derived from media reports.

Founder Exit Conditions

As boomer founders leave their organizations, nine exit conditions have been identified that affect the organizational environment a successor will enter: illness, death, voluntary retirement, coerced retirement, coerced departure, firing, term limitation, acceptance of another role within the organization, and voluntary departure to take a new job. A tenth possibility, not discussed here, is that of merger or

The man whose authority is recent is always stern.

—Aeschylus

acquisition—certainly one of the most common scenarios in the private sector—whereby merged organizations become, in effect, a new organization, and the resulting analysis takes on greater complexity.

Types of Successors

The above nine exit conditions interact with the two types of successors, the inside successor and the outside successor. Inside successors are most often selected when the organization is in good health and someone is needed to continue the work of the founder. In a healthy organization, the inside successor will typically continue to champion the founder's vision, in addition to honing his or her own vision for the organization. Outside successors are brought in times of crisis or decline; they represent the organization's desire to forge a new direction or to save the organization from possible demise. In the private sector, the financial district often drives the push for outside successors.

The ways in which successors enter their new role is in fact a crucial factor in their ability to lead. A recent study discussed in the *Harvard Business Review* in 1997 used a statistical model of CEO performance and found that what a CEO does in the first three years is not as important for the company's performance measures as how the CEO got there. Thus the exit conditions of leaders and the entrance conditions of successors are highly relevant.

Organizational Condition

Affecting these two successor entry conditions (inside and outside) is the variable of the health of the organization (positive or negative)—fiscal health and employee morale—as the founder exits and the successor enters. So, for example, an outside successor following a term-limited founder in a fiscally healthy corporation with high employee morale will

face a very different scenario than will an outside successor following a term-limited founder in a corporation experiencing financial difficulties and employee dissatisfaction.

Viewing succession as a product of three conditions (founder exit, organizational health, and successor type) allows a myriad of archetypes to emerge, as shown in Table 1. These images abound in the media and in the research about transitions. Some of the more common ones are the following:

- *The innocent.* An inside successor from a sick organization who succeeds a founder who steps down because of term limits is portrayed as an innocent—with the power and burden of purity.
- *The savior.* An outside successor in a sick organization who succeeds a founder who is fired is seen as a savior or messiah.
- *The assassin.* An inside successor from a healthy organization who succeeds a founder who is thrown out can be seen as an assassin or terrorist.
- *The disloyal lieutenant.* An inside successor from a healthy organization who succeeds a founder who is coerced into retirement will be seen as the architect of that coup.

ARCHETYPE SCENARIOS

By way of example, consider the three scenarios briefly described below, all of which use the archetype matrix.

Scenario 1

If a founder dies during a time of organizational prosperity, organization members perceive the inside successor as the resurrection or reincarnation of the founder. Indeed, the successor often takes on the projections of others, and some organization members report that they feel like the founder has risen from the dead. The environment may become oppressive, imbued with the sense that an omnipresent Holy Ghost is always looking over things. Conversely, a Holy Ghost may confer a sense of comfort, reassurance, and organizational stability by upholding the founder's values and enduring legacy. A recently departed Disney executive reported that even in the

Table 1. Archetypes Derived from Succession Variables

Organization Health	Successor type	Founder Exit Conditions							Term limitation	Acceptance of another role within company	Voluntary departure for new job
		Illness	Death	Voluntary retirement	Coerced retirement	Coerced departure	Firing				
Positive	Inside	Virus or clone	Holy Ghost	Inheritor or favorite child	Disloyal lieutenant	Assassin	Traitor	Pretender or functionary	Eunuch or puppet	Inheritor or abandoned child	
Negative	Inside	Martyr	Murderer or phoenix	“Neutron” or dreamer	Flawed or disloyal hero	Samurai	Flawed hero	Innocent	Diplomat or disloyal lieutenant	“Iron man” rebuilder or abandoned child	
Positive	Outside	Doctor, healer	Interloper	Pretender to the throne	Intruder	Terrorist or innocent	Saint	Usurper	Innocent or pretender or collaborator	Good step-parent	
Negative	Outside	Caretaker	Undertaker	Rebuilder or fool	Fool	Accomplice	Savior	Fool or dreamer	Prisoner or diplomat	Fixer or slash and burn	

early 2000s, some sixty years after Walt Disney’s death, employees (or rather, “associates”) of the Disney Company are still known to say in staff meetings, “That’s not the way Walt would have done it.” Companies or organizations named after their founders, such as the Walt Disney Company or the W. K. Kellogg Company, have a tendency toward the Holy Ghost archetype.

Scenario 2

The pretender archetype occurs when an inside successor assumes the leadership role after a successful founder or leader in a healthy organization steps down due to term limitation.

First, pretenders need to confront the issue of founder transference (that is, the tendency of employees to transfer the founder’s attributes and leadership style—good and bad—to the successor) directly. Second, pretenders should define a new agenda that communicates successes in new arenas while maintaining the legacy of the organization.

There have been notable examples of pretenders marshalling the support of their predecessor. If the pretender can marshal any of the favorite child/inheritor archetype, the successor can make use of the founder in a way that serves her/his own agenda. Some pretenders and favorite child/inheritors have successfully used founders as sounding boards, fund raisers, and advocates for the organization and its new leadership. John Gardner, the founder of Common Cause, is one example of a founder who continued to play an important and strong role in promoting the work of the organization long after he had left.

Scenario 3

Jack Welch was the quintessential inheritor/favorite child when he took on the presidency of General Electric. Welch succeeded Reginald Jones, whom Welch described in his recent autobiography as the United States’ most admired businessperson. Under Jones’s leadership, General Electric flourished, with sales more than doubling from \$10 billion to \$22 billion and

Hereditary Succession

Probably the most common form of leadership succession throughout history has been hereditary succession where leadership is passed from one kin to another, usually father to son. The following excerpt from Inscription of Darius on the Rock of Behistun, a Persian text dating to the sixth century BCE, traces the pattern of hereditary succession in his kin group.

Column I

I am Darius, the great king, the king of kings, the king of Persia, the king of the provinces, the son of Hystaspes, the grandson of Arsames, the Achaemenian.

(Thus) saith Darius, the king: My father is Hystaspes; the father of Hystaspes was Arsames; the father of Arsames was Ariyarnnes; the father of Ariyarnnes was [Teispes]: the father of Teispes was Achaemenes.

(Thus) saith Darius, the king: On that account are we called Achaemenians; from antiquity are we descended; from antiquity hath our race been kings.

(Thus) saith Darius, the king: Eight of my race were kings before (me); I am the ninth. In two lines have we been kings.

(Thus) saith Darius, the King: By the grace of Auramazda am I king; Auramazda hath granted me the kingdom.

(Thus) saith Darius, the king: These are the provinces which are subject unto me, and by the grace of Auramazda became I king of them: Persia, Susiana, Babylonia, Assyria, Arabia, Egypt, the (Islands) of the Sea, Sparda, Ionia, [Media], Armenia, Cappadocia, Parthia, Drangiana, Aria, Chorasmia, Bactria, Sogdiana, Gandara, Scythia, Sattagydia, Arachosia and Maka; twenty-three lands in all.

(Thus) saith Darius, the King: These are the provinces

which are subject unto me; by the grace of Auramazda they became subject unto me; they brought tribute unto me. Whatsoever commands have been laid on them by me, by night or by day, have been performed by them.

(Thus) saith Darius, the king: Within these lands, whosoever was a [friend], him have I surely protected; whosoever was hostile, him have I utterly destroyed. By the grace of Auramazda these lands have conformed to my decrees; even as it was commanded unto them by me, so was it done.

(Thus) saith Darius, the king: Auramazda hath granted unto me this empire. Auramazda brought me help, until I gained this empire; by the grace of Auramazda do I hold this empire.

(Thus) saith Darius, the king: This is what was done by me after I became king. He who was named Cambyses, the son of Cyrus, one of our race, was king here before me. That Cambyses had a brother, Smerdis by name, of the same mother and the same father as Cambyses. Afterwards Cambyses slew this Smerdis. When Cambyses slew Smerdis, it was not known unto the people that Smerdis was slain. Thereupon Cambyses went into Egypt. When Cambyses had departed into Egypt, the people became hostile, and the lie multiplied in the land, even in Persia, as in Media, and in the other provinces.

Source: King, Leonard William, & Thompson, R. Campbell. (1907). *The Sculptures and Inscription of Behistun*. London: British Museum. Reprinted in McNeill, William H., and Sedlar, Jean W. (Eds.). (1968). *The Ancient Near East*. New York: Oxford University Press, pp. 119–121.

earnings growing even faster, from \$572 million to \$1.4 billion. Welch started his career at GE in 1959 as a twenty-four-year-old chemical engineer, and in April 1981 he became chairman and CEO. The inheritor transformed quickly into a neutron/dreamer (“Neutron Jack”) as he dramatically downsized GE, but by focusing on the legacy of GE and Jones, he

managed to bring the organization back into alignment and went on to be recognized (at least by business school professors) as one of the United States’ top CEOs.

FUTURE

The work on leadership succession has only just begun to interest leadership scholars. The fact that such research must take into account leader exit conditions, health of organizations at the time of transition, successor conditions, follower factors, and myriad inside and outside variables makes the task complex indeed. Jungian archetypes provide a road

I have lived some thirty years on this planet, and I have yet to hear the first syllable of valuable or even earnest advice from my seniors.

—Henry David Thoreau

map to guide preliminary explorations of these interrelating variables. The worldwide turnover of current executives in the first two decades of the twenty-first century and the complexity of the issue gives this research area urgency, utility, and intellectual challenge not found in many other research arenas.

LEADERSHIP THEORIES: OVERVIEW

Human beings have always been keenly interested in leadership; from earliest times, philosophers and thinkers have constructed leadership theories and frameworks. In sixth- and fifth-century BCE China, Confucius sought laws of order between leaders and subordinates and wrote about them in the *Analects*. Plato, the Greek philosopher of the late fifth to mid-fourth century BCE, described an ideal republic with philosopher-kings providing wise and judicious leadership. Notable works in the sixteenth century by Niccolò Machiavelli and in the seventeenth century by Thomas Hobbes were followed by works by Mary Parker Follett (1863–1933), Bertrand Russell (1872–1970), and Harold Lasswell (1902–1978), which analyzed power and leadership in modern life.

These efforts and other philosophical approaches constitute a rich and ongoing normative approach to understanding leadership and seek to provide ethical and constructive views of good leadership. Normative approaches to leadership attempt to understand and suggest ideal concepts of leadership, and emphasize how leaders and followers “ought” to behave. A normative approach asks, What is right in this situation and what ought to be done?

In contrast to the normative approach, the descriptive approach looks at leadership behavior in a more value-neutral way. It investigates not what we would like leaders to do or what we think they should do, but what they actually do. In contrast to the normative views, most descriptive work on leadership uses the tools of social science. This approach has arisen primarily in the United States and almost exclusively since the turn of the twentieth century. It has used principally empirical methods from the fields of political science, psychology, and sociology in the service of theory building.

It is important to state from the outset that these theories are not discrete or linear, but make their appearances in varying degrees throughout the his-

tory of leadership studies. Understanding leadership as a set of desirable traits (the “trait theory” approach), for example, was popular at the beginning of the twentieth century, resurgent in the 1980s, and continues to be a factor in some modern leadership theories. However, it is also true that many theories are part of the ongoing history of leadership studies in the past half-century but are no longer considered very useful. In the selection of theories that follows, we outline briefly both early attempts and more current ones, that, while incomplete, have offered important perspectives on understanding leadership.

FREUD'S PSYCHOANALYTIC THEORY

Although seldom cited in modern treatments of leadership, Sigmund Freud's book *Group Psychology and the Analysis of the Ego* (1921) touched on many elements of leadership that are represented in today's descriptive theories. Freud was highly influenced by the French writer Gustave LeBon's 1895 analysis of crowds. Both Freud and LeBon emphasized the extremely strong hold that leaders and their ideas can have on groups. Quoting LeBon, Freud wrote that people in groups “place themselves instinctively under the authority of a chief” (Freud 1955, 81). A person who asserts his or her authority is quickly accepted as the leader, as long as he or she represents the ideal qualities of the group and also has great force. Such a leader is both loved and feared. As a result of these emotions both the leader and the leader's ideas are highly influential.

Under Freud's taxonomy, the leader's influence is primarily based on emotion rather than on rationality. Ideas are important, but their forceful and colorful presentation is more important than their logic. As long as the leader continues to be successful in helping the group reach its goals, he or she will continue to have prestige and influence. Freud also emphasized the importance of the leader creating the illusion that he or she loves all the members of the group equally. This is as true in highly organized groups such as a church or the military as it is in crowds. People are willing to submit to the leader if they feel that they all have the same standing in relation to the leader.

Freud's theory helps us understand retrospectively George Washington's success as a military leader during the American Revolution. Washington was an imposing figure who was clearly loved by his troops, but he was also feared. Richard Brookhiser, senior editor of the *National Review*, writes that Washington had “physical authority in its simplest form” (Brookhiser 1996, 56). He could charm both men and women, but he would at times also display a barely controlled temper. Thus he elicited fear as well as affection.

The importance of Freud's theory is that it highlights the strong emotional attachments between leaders and followers and the idea that it is the emotional impact of the leader and the leader's ideas that are important in leadership. Both of these concepts remained important as leadership emerged as an organized area of study.

TRAIT, BEHAVIOR, AND SITUATIONAL OR CONTINGENCY APPROACHES

It is fair to say that from World War II until 1975, three research schools dominated the leadership research agenda, particularly in the United States: trait theory, the behavioral approach, and situational or contingent approaches. Later, power and influence theories, group relations, and constructionists' approaches predominated.

Trait Theory

Early work on leadership focused on leaders themselves; these early theories have come to be called “great man” theories. The psychologist Edwin P. Hollander describes this period as essentially dominated by the search for the traits of good leaders. Early observational studies of U.S. industrial pioneers provided scholars an opportunity to identify the traits or abilities that appeared to set these leaders apart. Bernard Bass (1997) notes that in the early twentieth century leaders were considered to be superior individuals different from most other people because of skills and capabilities that came to them through inherited money or social standing. Later research considered hereditary properties such as

intelligence, height, and self-confidence to be distinguishing characteristics of great leaders. Hundreds of studies in the early 1930s and 1940s looked for significant correlations between leader attributes and leadership outcomes, without discerning the intervening variables that influenced those outcomes. Researchers who compiled and found statistical significance in a set of desirable leader traits found that these factors did not translate so easily from situation to situation. A leader who was decisive, fearless, and objective might produce a victory on the battlefield, but fail utterly on a school board or in a classroom.

In the end, this avenue of research failed to produce a set of generic traits that leaders must possess to be effective in any situation. The wish for a list of traits still persists, however, as evidenced by popular books such as Stephen Covey's *Seven Habits of Effective People* that answer the popular yearning for a set of attributes, traits, or goals that indicate a leader.

Behavioral Approach

The study of leadership was swept into the U.S. behaviorist movement of the early and middle decades of the twentieth century. As the notion of inherited or inherent leadership was dispelled, behavioral scientists turned their attention to the measurable behaviors of leaders. They wanted to look at what leaders actually do on the job. Their operating hypothesis was that the behaviors of effective leaders differed from those of ineffective leaders. During this period, particular attention was paid to the relationship between leaders and followers and to the implications that relationship had for the workplace. Psychologists at Ohio State and the University of Michigan in particular contributed seminal research in the behavioral understanding of leadership.

Research of that era demonstrated consistently, however, that effective task leaders were bifurcated in their leadership approach: Consideration for followers (in the workplace, employees) was crucial and statistically significant, as was a strong task orientation. Effective managers showed high concern for people *and* for production; that much appeared to be true.

This research stream yielded the questions that the next iteration of research helped to clarify: Why is it that people who are leaders in one situation are not leaders in another situation? Why did Churchill, for example, lose support in peacetime when his wartime leadership was so crucial to England and the world? Questions like these made it clear that even the behavioral approach was missing crucial ingredients.

Situational or Contingency Approach

The early situationalists felt that the context or the environment in which leadership emerges was a crucial unrecognized factor in leadership outcomes. Clearly, they claimed, leadership varies from situation to situation. As John Gardner, the founder of Common Cause, has noted, the leadership needed for a social movement is often quite different from the leadership needed for military action. Contextual variables, called moderator variables (such as the type of work environment, followership characteristics, or group task), were found to influence the leader's effectiveness.

The mid-1960s ushered in a contingency theory of leadership that focused on the impact of the situation in explaining a leader's effectiveness. The scholar Fred Fiedler's work established that certain types of leadership behaviors are more effective under certain predictable conditions. For example, when a group is engaged in a task that is boring, tedious, or dangerous, then supportive and engaged leadership helps to lower group anxiety, increase self-confidence among the members, and minimize the unpleasant aspects of the work. When the task is unstructured and complex and the subordinates are highly educated, Fiedler found that a consultative style of leadership produced stronger outcomes than directive or authoritarian styles.

THEORIES OF TRANSFORMATIONAL LEADERSHIP

One of the most influential leadership developments of the past few decades has been the historian James MacGregor Burns's concept, first articulated in 1978, of transformational, or transforming, leader-

ship. Burns made a fundamental (and often debated) distinction between transactional and transformational leadership. Transactional leadership “occurs when one person takes the initiative in making contact with others for the purpose of an exchange of valued things” (Burns 1978, 19). The valued things may be of an economic, political, or psychological nature. The leader may secure economic benefits for followers who in turn grant authority and legitimacy to the leader. In this kind of leadership, Burns argues, the “bargainers have no enduring purpose that holds them together” (20). Their relationship is a kind of business arrangement.

Some leadership theorists contend that this kind of exchange describes all leadership. However Burns argues that transactional leadership should be distinguished at a very fundamental level from transforming or transformational leadership. Transformational leadership “occurs when one or more persons *engage* with others in such a way that leaders and followers raise one another to higher levels of motivation and morality” (20, italics in original). Burns cites India’s Mohandas Gandhi as a transformational leader who raised the aspirations of millions of Indians and in the process was transformed and elevated himself. Indians’ beliefs about what was possible for them politically and economically were fundamentally reoriented by Gandhi’s vision. He also completely redefined how such goals could be achieved, namely, through nonviolence. Clearly, leaders have the potential to radically alter the motives and morals that govern a group. And, in Burns’s view, not only are the motives and morals of the group altered, the leader embraces the transformation as well. Leader and followers share a common cause.

Burns and the scholar Georgia Sorenson were critical of former president Bill Clinton for failing to fight for real change after the failure of Hillary Clinton’s health plan; for Burns and Sorenson, Clinton failed the test of transformational leadership, although he was an exemplary transactional leader. Another former U.S. president, James Polk (1795–1849), is another example of an effective transactional leader, one of the most effective presidents in this regard. He was able to get support for certain ideas, such as annexing Texas, and he deliv-

ered on his promises. Yet he is not remembered for any transforming principles or policy changes. Abraham Lincoln, in contrast, is remembered for completely eradicating slavery in the United States. That constituted transformational leadership. Burns and Sorenson argue that transformational leaders display courage, commitment, conviction, and competence, all channeled toward creating change.

Work by Bernard Bass and Ben Avolio and by Robert House and Boas Shamir develops similar themes. They all distinguish behaviors from effects. As House and Shamir state, charismatic leadership produces transformational effects. Bass characterizes the behavior of transformational leaders as having four significant attributes. First, they have charisma, or idealized influence. They have conviction and values, and they “emphasize the importance of purpose, commitment, and ethical components of decisions” (Bass 1997, 133). Second, they use inspirational motivation, meaning that they “articulate an appealing vision of the future, challenge followers with high standards, talk optimistically with enthusiasm, and provide encouragement and meaning for what needs to be done” (133). Third, such leaders provide intellectual stimulation, pushing followers to consider new points of view, to question old assumptions, and to articulate their own views. Finally, they demonstrate individualized consideration, meaning that they take into account the needs, capacities, and aspirations of each individual follower in the effort to treat followers equitably. One of the empirical questions that Bass has addressed is whether these four factors are independent enough to be differentiated. The last three are all correlated with charisma, suggesting that charisma is the more general factor. However, the dimensions are conceptually distinct. The most useful view may be that the latter three qualities often go along with charisma and give it a fuller definition.

House and Shamir add to our understanding of the characteristics of charismatic behavior. They propose, first, that charismatic leaders articulate an ideological goal, a vision of a better future for followers. Often that vision incorporates fundamental values such as freedom, beauty, or dignity. Second, they add that charismatic leaders build a positive

image that appeals to followers. Third, charismatic leaders take risks and sacrifice themselves for their goals, thus demonstrating the courage and conviction noted by Burns and Sorenson. Fourth, like Bass and Avolio, House and Shamir note the importance of “empowering behaviors.” These include having high expectations for followers and conveying the belief that the group can attain its lofty goals. Leaders who behave in these ways have the ability to influence a group toward a wide range of behaviors. In the best instances, the behaviors will promote universal values.

In an exchange between Burns and Bass under the auspices of Kellogg Leadership Studies Project, the question of whether or not Hitler was a transformational leader was debated and discussed extensively. Some argued that Hitler transformed the German nation and the Reich party, while others held that only moral or good leaders should be considered transformative leaders. The clash between the normative and descriptive concepts of leadership was clearly apparent. In the end, Bass, who was one of the parties in the debate, concluded that Hitler’s leadership should be classified as “pseudo-transformational.” Nevertheless, the question of why people follow evil leaders remains. Issues of power, authority, and compliance seem to intrude into otherwise benign situations.

TRANSACTIONAL MODELS AND IDIOSYNCRASY CREDIT

In the last decades of the twentieth century, chiefly through the work of the scholar Edwin Hollander, we have come to acknowledge how important the role of the follower is for understanding leadership. Hollander has emphasized that leadership is a process that involves followership. Followers are crucial because they either give leaders their support or withhold it. Hollander believed that charisma, too, was a quality that followers either bestow upon leaders or take away from leaders. Whether followers accord or withdraw support or charisma depends on what they get in return. Leadership involves an exchange. Generally, the leader helps the group define reality and reach its goals. Thus leaders can be considered to be,

among other things, meaning makers. The leader helps the group toward its various goals, and in return, the group accords the leader status, recognition, esteem, and legitimacy. Legitimacy, like charisma, is given or taken away by followers. The leader must continue to deliver.

There is a particular kind of commodity that followers sometimes give leaders. When leaders have conformed to group norms and demonstrated competence in helping the group reach its goals, followers may grant them idiosyncrasy credit, also called the credit to deviate. In exchange for benefits leaders deliver to the group, they are allowed to deviate from group norms, which frees them up to innovate and produce even more rewards for the group. Deviation and innovation can spend the leader’s credits, but if those expenditures bring further benefits to the group, the leader acquires more credit.

If leaders do not have sufficient idiosyncrasy credit, idiosyncrasy or deviation may cause them to lose the group’s support. One interesting example of the use of idiosyncrasy credit is President Richard Nixon’s overtures toward the People’s Republic of China and the Soviet Union in 1972. A Democratic president would not have had enough credit built up with conservatives to take that step without generating severe criticism. Nixon, however, with his past as a vocal opponent of Communism, had enough credit to proceed without being challenged by conservatives. Once Nixon’s policies appeared to be accomplishing important goals for the United States, he built up even more credit with his Republican followers. Leaders must assess whether they have sufficient credit to deviate from group norms and steer the group in novel directions and toward unconventional goals.

As the work on followers became more salient with the subsequent work of Robert Kelly, Lynn Offinger and others, leadership scholars began to construct a more nuanced view of leadership. In a seminal paper titled “Empowerment for Change: A Conceptual Working Paper,” produced under the auspices of the Kellogg Leadership Studies Project, James MacGregor Burns challenged researchers to abandon the “power over” model and to take up the study of leadership aimed at “realizing goals mutu-

ally held by both leaders and followers.” To do so, he suggests, involves greater attention to the role of followers as well as to the motivations of potential opponents and to competition from other actors.

PROCEDURAL JUSTICE AND COMPLIANCE WITH AUTHORITY

Tom Tyler and E. Allan Lind’s relational theory (1992) focused on the ways persons in authority make decisions and the effects different kinds of decisions have on compliance. They argued that procedural justice is more important than distributive justice. That is, people’s willingness to comply with the decisions of authorities is more influenced by whether those decisions are based on fair procedures than by whether those decisions give them favorable outcomes. Tyler and Lind suggested that it is easier to judge the procedural fairness of a decision than to judge whether its resulting distributions are fair, and that people believe that they will do well in the long term if procedures are fair. Authorities who show concern for one’s needs, who consider one’s views, who are polite and treat one with dignity, and who are honest and unbiased are perceived as procedurally fair and just. When one is treated fairly by an authority, that fair treatment signals that one has value in the group. The authority powerfully represents the group, such that good treatment by the authority predicts positive treatment by the group as a whole. Under these circumstances, the individual accords the authority legitimacy and voluntarily complies with the authority’s decisions. Interestingly, Tyler and Lind described a perception similar to Freud’s idea of the illusion that the leader loves all group members with an equal love, namely, an “illusion of personal justice” (Tyler and Lind 1992, 155). People have the general expectation that they have been and will be fairly treated by legal and political authorities.

COGNITIVE AND CONSTRUCTIVIST THEORIES OF LEADERSHIP

Some of the newest work on leadership involves a cognitive or constructionist view or schema. Soren-

son writes about cognitive structures, and Sonia Ospina and her team at New York University have been looking at the leadership stories of grassroots leaders. Howard Gardner stresses the importance of a leader’s words, woven into stories. Gardner holds that the central element in leading is relating and embodying stories, typically about identity. Leaders lead “through the stories and acts they address to an audience” (Gardner 1995, 13). The most powerful stories are about identity. Effective leaders tell stories “about themselves and their groups, about where they were coming from and where they were headed, about what [is] to be feared, struggled against, and dreamed about” (14). Such stories are dynamic. They unfold over time, and the leader and followers are the “principal characters or heroes” (14).

Gardner also adds the important concept that the leader’s actions, or his or her embodiment of the story, is as influential as the actual words of the story. One of Gardner’s most interesting examples is Pope John XXIII. The architect of the Second Vatican Council, John XXIII expressed in words a story of humility, openness, and inclusion. This story ran into the counterstories of the entrenched Catholic leadership, stories that emphasized hierarchy, obedience, and formality. John’s behavior reinforced his words: His story was effective, and it appealed broadly to non-Catholics as well as Catholics, because it was so firmly grounded in the words and deeds of Jesus. A story that resonated so closely with the story of Jesus himself was difficult for the church elders to counter effectively.

LEADER SCHEMATA

The image people have of leaders has been explored by a number of psychologists studying what are known as leader schemata or implicit leadership theories. Robert Lord and his colleagues found that leaders are thought of as competent, caring, honest, understanding, outgoing, verbally skilled, determined, aggressive, decisive, dedicated, educated, kind, and well dressed. Robert Kenney and his colleagues found sixteen categories of expectations that could be grouped into four prototypes that described people’s implicit theories about new leaders’ behav-

ior: They assume new leaders learn the group's goals, take charge, are nice people, and are initially nervous. In his book *Why Presidents Succeed* (1987), Dean Keith Simonton proposed that leaders are expected to be strong, active, and good. All work on leadership schemata follows some of Freud's original conceptions that a person who asserts their authority in a group does so with the implicit approval of the followers.

These approaches characterize people's beliefs about leaders at different levels of specificity. What is common to all of them is the idea that people do have a schema about leadership and that this schema forms a standard for judging leaders. The social psychologist Michael Hogg argues that once followers have decided that a person qualifies as a leader there is a tendency for them to attribute the leader's behavior to "intrinsic leadership ability, or charisma," and to "construct a charismatic leadership personality for that person" (Hogg 2001, 190). Thus leadership schemata are used to evaluate leaders or potential leaders, and they can have a profound effect on what personal qualities are attributed to someone who has been judged to meet the leader standard.

THE FUTURE

As the study of leadership has matured, scholars have ventured across disciplinary boundaries seeking new ideas from other areas of inquiry. We have moved from a unidisciplinary approach to a more multidisciplinary approach, evident particularly from 1977 onwards. But the challenge continues to be to move from merely borrowing ideas to fully integrating them. We have many ideas about leadership but we still do not have a clear understanding of its complexities. Ralph Stogdill's 1974 *Handbook of Leadership* (Stogdill was joined by Bernard Bass for the 1981 edition) listed 4,725 studies of leadership and 189 pages of references. Stogdill eventually concluded that "the endless accumulation of empirical data has not produced an integrated understanding of leadership" (Stogdill 1974, vii). The management theorist Jerry Hunt lamented, "What is missing, in addition to quantity of theoretical for-

mulations or models is a 'grand' or generalized theory of leader-subordinate relationships—if indeed, such a theoretical development is desirable or possible" (Hunt and Larson 1977). This is still as true today as it was then.

The quest for integration across theories of leadership has led a group of scholars (the General Theory of Leadership Group) to meet over the last few years to begin to address these questions. The conceptual strengths and weakness of various approaches, the post hoc nature of inductive theory, the tensions between the normative, analytic, and descriptive approaches, the discipline-specific language and terminology, the political nature of research funding, and the U.S.- and individual-centric models of leadership have contributed to the challenge of their efforts. Yet there are universals, too, they agree, in the sense that leadership and its challenges have been at the core of the human condition and human progress.

We are far from a complete understanding of leadership. It may be ambitious to think that the study of leadership or a theory of leadership can supply all answers. Yet there is little question that informed theories of leadership and followership can and do contribute to resolving some of the most complex issues facing the new millennium. Poverty, terrorism, failing schools, racism, and global environmental degradation are problems of the human heart and the human mind, and they cry out for human leadership.

LEADING AT A DISTANCE

Today, leadership in organizations is generally perceived as a relationship or interaction between a leader and his or her immediate followers. Most people have personal experience of this kind of leadership. Indeed, a large part of our knowledge of leadership and followership is gained from this dyadic relation. Our experiences tend to be of leadership in groups because nearly every leadership relation is embedded in a group context. Leadership scholars have written at length about this basic constellation and have developed appropriate theories.

In contrast, our knowledge and understanding of leadership in conjunction with the concept of distance is apparently limited. In 2002, the scholars John Antonakis and Leanne Atwater still had to conclude that “with few exceptions, leadership scholars have not expressly defined nor discussed leader distance, how distance is implicated in the legitimization of a leader, and how distance affects leader outcomes” (Antonakis and Atwater 2002, 673). This might be a surprise for those who remember how scientific research on leadership started. Leadership research was inspired by myths and legends about great leaders, mostly perceived as heroes. All that was known about these people came from historians, books and newspapers, or questionable sources. Sometimes people received second-hand information, but hardly anyone made up their minds about the character of a leader or whether to follow a leader based on direct evidence and independent assessment. What people had, therefore, was an image of leaders, and that image influenced their perceptions and the actions. Distance—geographical (physical) distance—is an essential component of this leadership relation. For different reasons, leadership research has not continued to focus on this phenomenon intensively. With the exception of some psychoanalytical ideas about the effects of mass psy-

chology on leading people, mainstream research turned to methodologically isolated people or face-to-face interactions to obtain information about the traits or behaviors of leaders and their effects in concrete settings. The result has been that a very natural type of influence over people—something every one of us is confronted with regularly—has been almost ignored for quite a long time.

CONCEPTIONS OF DISTANCE IN LEADERSHIP RESEARCH

Examination of the substance and the effects of distance in leadership relations seem necessary for two reasons. First, (organizational) life is characterized by different forms of leader distance; so we should come nearer to leadership reality. Second, our leadership knowledge is still limited and focused on the dyadic level of analysis. There is hope that research on this topic can enrich the whole discipline. However, we have to bear in mind right at the beginning that “no theory currently exists that integrates the various types of distance in organizations” (Napier and Ferris 1993, 321) and that “leadership at a distance in the organizational domain,” which is our topic here, “has yet to generate much empirical work” (Antonakis and Atwater 2002, 674).

It would be a good idea to start our consideration of distance in leadership with reflections about the term and how it is used in the leadership context. The assumption is that distance between people produces a difference in the relationship and that the difference may make it difficult to lead others or may produce unintended effects in leading others. Although leadership cannot be conceptualized without positing some kind of difference between the leader and the led, some differences, resulting from various types of distance, are worth mentioning. This entry concentrates on distance in organizations.

Geographical Distance

Leaders and followers do not work at the same place, in the same building, or in the same region. In organizations, one finds this constellation quite often in the sales division. It is also common in large organiza-

tions with many subdivisions and in organizations with an international orientation.

Hierarchical Distance

Leaders and immediate followers are influenced by other leaders at higher echelons. Researchers are increasingly interested in top-echelon leaders and their effects on people down the organization. Research in this direction has relied on anecdotal evidence about the influence of CEOs, with the analysis often concentrating on the effects that are provoked by people who are assumed to be transformational or charismatic leaders. The scholar Gary Yukl warns that merely considering the influence of the top leader does not provide a complete perspective. Instead, organizations should be characterized as multidimensional influence networks. In that regard, the effects of the immediate superior of the leader (sometimes called “the boss”; herein the person in this position is called the beta leader) on the leader-follower relationship are of particular interest. The scholars Fred Fiedler and Joseph Garcia stress this point by saying that the “importance of the leader’s superior has been almost ignored by laboratory researchers. . . [but] the boss is a very important factor in understanding the leader’s behavior and the group’s performance” (Fiedler and Garcia 1987, 4). This supports the psychologist Dean Frost’s contention that “functional dependence on the immediate superior makes the ‘boss’ the most important resource in many leader environments” (Frost 1983, 124).

Social Distance

Differences of age, race, gender, or specific networks result in differences in beliefs, values, attitudes, and decisions. Some of these differences are not related to the work environment; others might be. The legitimation of people who are perceived to be different is critical when their differences are not tolerated or appreciated by others. This is conspicuous when culturally divergent groups with strong value differences interact. For instance, the researchers Shalom Schwartz and Galit Sagie have demonstrated that

value priorities are related to other differences in meaningful ways. Other researchers—for example Robert House and his colleagues at the GLOBE (Global Leadership and Organizational Behavior Effectiveness) research project—have shown that value differences generate different conceptions of what leadership in organizations should entail. So, social distance leads to practical consequences. The psychologist Terence Mitchell shows, for example, how specific social characteristics of followers may have an influence on how the leader assesses the performance of the follower: the greater the social distance, the greater the probability of harsh judgment in the case of a bad performance.

Psychological Distance

While geographical, hierarchical, and social distance are objective in nature, psychological distance is subjective. Some researchers do not separate psychological and social distance; they reason that the effects of social distance are psychological in the end. But this is generally true because hardly any effect of social importance provokes behavior independently from information processing. The most familiar psychological distance in leadership research is the measured difference in intelligence between leaders and followers. Here it is assumed that the distance between the intelligence of the leader and the follower should not be too high; otherwise communication problems arise. It is quite easy to think about other factors, such as emotions or motivations. For example, an extrovert leader might generate greater distance between him- or herself and an introverted subordinate than would be the case with extroverted subordinates; similarly, an extrovert leader and an introverted subordinate might have different values and expectations, leading to differences in evaluating future events.

We do not have detailed knowledge about the effects of distance and closeness on the leader-follower relationship, or even about the interplay of the four types of distance. Leadership research, traditionally near to psychology in approach and outlook, ought to be able to adapt findings from psychology on social and psychological distance to the

concept of leadership relations. But this does not address the core concept of distance in leadership, because social and psychological distance from others is constitutive for any relationship, not merely leader-follower relationships; without distance, one's sense of self-identity cannot emerge. Currently, the idea of distance in leadership research in organizations is inevitably associated with hierarchical distance. In the future, geographical distance will possibly receive comparable attention. For the time being, however, the terms *leading at a distance* and *leadership at a distance* should be reserved for the hierarchical type of distance. Social and psychological distance may have additional effects, but those effects are not important for the special kind of leadership discussed here, as they are equally relevant or irrelevant in nonhierarchical distance relationships. In organizations, hierarchy is ubiquitous and dominates the organizational experience of all organizational members—hence the focus here on hierarchical distance.

DISTANCE LEADERSHIP BY TOP LEADERS AND BETA LEADERS

Typically, studies of leadership distance in organizations have focused on world-class leaders or on CEOs of famous or important corporations. Many people are interested in knowing why some companies outperform others, and many reason that the person at the top may be responsible for the performance differences. So, Pierre Bellon, current president and director general of the French Sodexo Alliance, a world-class food and management services company, was asked in an interview, published in the *Academy of Management Executive* in 2003, if he used “any special strategies or approaches to keep everyone focused on the organization's goals and mission” (Ford 2003, 43). Anders Dahlig, the CEO of the Sweden furniture company IKEA, was asked to comment on the question “What characterizes the leadership of IKEA?” (Kling and Goteman 2003, 36). This interest in top leaders is due to the fact that these managers in particular are responsible for the choice of goal priorities and the manner in which strategy is implemented. Additionally, they symbol-

Table 1. Important Empirical Studies Describing the Importance of the Beta Leader

<i>Authors</i>	<i>Focus</i>	<i>Main Statement</i>
Pelz (1952) Wager (1965) House, Filley, and Gujarati (1971)	Strength of influence of alpha leader with respect to beta leader	There is a positive relationship between the strength of the alpha leader's influence with the beta leader and followers' satisfaction with the alpha leader.
Anderson et al. (1990a) Anderson and Tolson (1991)	Strength of influence of alpha leader with respect to beta leader	There is a positive relationship between the strength of the alpha leader's influence with the beta leader and followers' perception of control.
Meindl (1990)	Followers' attribution of responsibility to the alpha leader when he or she fails	If the beta leader shares responsibility for a negative outcome provoked by the alpha leader, followers reduce the portion of the blame that falls on the alpha leader.
Cashman et al. (1976) Graen et al. (1977)	Relationship between the alpha leader and the beta leader	The quality of the relationship is a moderating variable for different variables that are used by followers to evaluate and judge their alpha leader.
Pfeffer and Salancik (1975)	Expectations of the beta leader and the leadership behavior of the alpha leader	Expectations of the beta leader influence the work-related behavior of the alpha leader.
Bass et al. (1987)	Transmission of the leadership style of the beta leader to the alpha leader	There is a positive relationship between the transformational and transactional leadership style of the beta leader and the alpha leader.
Fiedler and Garcia (1987)	Beta leader as a stress factor for alpha leaders	Stress provoked by the beta leader reduces the utility of the intellectual abilities of alpha leaders and reduces group productivity.

ize actual power and hope for the future. The leadership scholar James Meindl and his colleagues have pointed out that ordinary organizational members attribute not only corporate performance but also favorable (or unfavorable) turns of events to organizational leaders.

The question remains how these executives are able to influence others. A standard answer is given by David Waldman and Francis Yammarino when they refer to organizational culture, and indeed, the shaping of culture has frequently been mentioned since the 1982 publication of *In Search of Excellence: Lessons from America's Best-Run Companies*, by Tom Peters and Robert Waterman. Additionally, the leadership literature notes that CEOs establish the organization's orientation and spread trust and energy through it through symbolic action, commu-

nication, and occasional personal contacts. The forming of a team of followers, sometimes called disciples when the leader in question is known for his charismatic or transformative qualities, seems to be a necessary condition if the leader is to achieve a cascading influence on as many organizational members as possible.

Although some empirical studies try to conceptualize the effects of top executive leadership on performance measures, results are mixed and confounded with methodological measures. For example, David Day and Robert Lord state that after analyzing some executive succession studies, they determined that "leadership can explain as much as 45% of an organization's performance" (Day and Lord 1988, 453), but they nevertheless conclude their article with the remark that a theory of executive

leadership “needs a much broader conceptual and methodological foundation” (459). In sum, plausible arguments, anecdotes, and mere guesswork dominate this field. Some researchers see the current interest in CEOs as representing a resurgence in heroic leadership approaches, but no one can deny that possible courses of action are chosen at the top, and people generally agree that top executives can function as outstanding role models.

But we do not have to climb so far up the hierarchy to think about leadership at a distance. With the exception of the top leaders themselves, every leader in an organization has a superior. It would be very unlikely that this fact had no influence on leadership relations. In the first of two general models of leadership at a distance (sometimes called “indirect leadership”), both proposed originally by Francis Yammarino in 1994, a beta leader affects people further down in the organizational hierarchy by acting through his or her immediate subordinate, the alpha leader (who then influences those below); this is called the cascading model. This sort of influence happens regularly in organizations. Imagine that the beta leader motivates the alpha leader to attain certain goals, and that the alpha leader is therefore energized to inspire his or her own followers.

In the second model, called the bypass model, the beta leader influences those further down not through his or her influence on the intervening alpha leader, but directly. In other words, the beta leader bypasses the chain of command. This might happen, for example, when the beta leader wants to convey technical information or instructions without losing time or when he or she wants to avoid the danger of information selection by others. It also applies when the beta leader wants to give a personal word of encouragement or praise to an indirect follower. A brief survey of leadership literature reveals that some scholars have noted these paths of influence. (See Table 1.)

Although this overview shows that the influence network of the beta leader, the alpha leader, and the alpha leader’s subordinates is acknowledged in research, it also makes clear that no compact theoretical framework exists yet. However, there are isolated results that indicate a direction of influence and

give us a guide for further research. Jürgen Weibler has tried to describe the form of the beta leader’s influence in more detail. For this he modeled a triadic influence relationship (leadership triad) and asked more than two hundred managers to depict how they influence indirect followers and how they are influenced by the beta leader. A body of evidence supported the selection of three (and not more) consecutive hierarchical levels. Weibler considered not only paths of interaction between the beta leader and the alpha leader and between the beta leader and the indirect followers, but also how the beta leader was able to shape the context in which leadership takes place.

Weibler demonstrated that there is an influence network between the three consecutive levels in the hierarchy. In an extension of conventional theory, he showed that the influence of the beta leader can be exercised both in face-to-face situations or through shaping (or co-shaping) policy, organizational structure, or organizational culture. Both directly and indirectly exercised influence has remarkable consequences for the relationship with the alpha leader and thereby for the whole leadership system. Furthermore, influence is not unidirectional; influence can also move from the lower levels upward.

The beta leader is able to influence indirect followers through the alpha-leader and directly, for example, through setting or changing goals, by the working conditions and infrastructure that are established, through qualification guidelines, and through policy decisions on (for example) salary, career planning, and promotion. In addition, the beta leader influences indirect followers by establishing rewards and punishments for follower behavior in his or her unit. When followers rated their perception of the general influence of the beta leader on a 5-point scale, with 5 being high and 1 being low, beta leaders received an average rating of around 3.5, with higher peaks in certain areas. There was no evidence that the basic structure has to be modified substantially under certain conditions. The most prominent surprise might be the insight that the actors in the leadership triad are aware of this influence network.

Weibler’s findings also indicated an overlap between the tasks and responsibilities of the alpha and beta leaders, with the beta leader’s influence

tending to be more general, normative, and strategic. In the long run, the beta leader's influence on the follower increases and may even be higher than the influence of the alpha leader. In any case, the beta leader is perceived as a counterbalancing power with respect to the alpha leader.

THE STATE OF RESEARCH TODAY

Leadership at a distance is understudied in leadership theory. Although research has revealed an influence network that can be conceptualized as a leadership triad, leadership in three or more echelons has not been examined (with the exception of top leadership). There is, however, a fair amount of anecdotal information, which is useful because it says something both about real life in organizations and about implicit leadership theories. This perspective has made us aware that the often presupposed freedom of the leader to act must be revised; leadership in practice must be seen as a more complex relationship. However, we are still arguing on a very narrow database, and any findings should be treated as explorative. Research directions yet to be explored include how strong advances in technology will affect leadership relations (e-leadership). If the communication platform changes, expectations and possibilities with regard to supporting, monitoring, and stimulating followers may change too. The result may be new leader prototypes, at least in some (virtual) situations, no doubt with consequences for working and leadership structure and processes within the leadership triad and more.

LEADING FROM WITHIN

Leadership is a process that emanates from the essence of us and requires an understanding of who we are and why we are who we are. The process of leadership is a reflection of our thoughts and beliefs. These thoughts and beliefs, in addition to a passion to make a difference, result in actions.

An understanding of their inner identity, purpose, and vision is critical for persons in leadership positions. Without the ability to identify core values, to achieve balance, one cannot authentically cope with the demands of leadership in the ever-changing fast pace of the world today. Persons contemplating leadership in any arena must take time out to reflect, to seriously consider three basic questions: (1) Who am I? (2) What is my primary purpose or passion? (3) What do I value? We lead by virtue of who we are. Understanding what makes us tick, our true nature, is unfamiliar territory to many of us. Yet, this core, our inner self, is an important factor in deter-

mining the manner in which we lead or, for that matter, follow.

Leadership development programs have proliferated greatly. Yet, chronic social and economic problems persist, schools are struggling, business organizations are downsizing, and the marketplace is in chaos. Perhaps the development of new leadership by focusing on programs that change external behaviors through the use of skill building will place us on a successful trajectory. However, do the programs ask the correct questions about the kind of leadership? Several ideals appear to be prevalent. First is the thought that youthful leadership with tremendous energy and ambition to succeed will create the new successful environment. Second is the image of the “hero” leader of old, the champion with extraordinary vision, stature, public presence, and great risk-taking abilities. Third is the idea of the leader who is a skilled strategist, analyst, and organizational expert with the ability to generate tremendous enthusiasm around a team effort. All three of these ideals are good, but they miss the essence of leadership. They emphasize the skills and personalities of leaders but neglect the deeper and more essential elements of inner spirit, values, authenticity, and hope.

Leadership development programs historically emphasize external development. They focus on leadership styles, visioning, public speaking skills, strategic planning for shared visioning, team building, conflict resolution, and so forth. Few programs, if any, take the time to help people understand that their actions are a reflection of their inner being, their beliefs, values, and passions. The leader and the inner person are not separable. Leadership development and personal development enjoy what might be termed a “symbiotic” (mutually beneficial) relationship. The words of Paul Walsh, chairman and CEO of Pillsbury, reflect this philosophy. He said that the missing link in leadership development programs is first growing the person in order to then grow the leader. The way people lead is a conscious presentation of their inner being, an authentic self-expression that proclaims their true values. Restructuring leadership development programs from a series of exercises focused on external behaviors to an integrated, personal development, as well as content-driven

In simplest terms, a leader is one who knows where he wants to go, and gets up, and goes.

—John Erksine

seminars and lectures, greatly strengthens the learners and the organizations.

Studies have shown that those people who consistently excel in leadership activities have a sense of purpose, a deep commitment, and a feeling that what they do has meaning and contributes to a worthwhile cause. Their actions are deeply rooted in values and spirituality. Leading with the power of a deep understanding of who we are and why we do what we do can be termed *leading with soul* or *leading from within*.

Many leaders appear to get results, at least temporarily. Fewer leaders create lasting value that strengthens themselves and their organization or community. Getting immediate satisfaction or short-term results is not true leadership. One can get results but destroy the long-range environment. Unfortunately many individuals are willing to sacrifice health, values, relationships, lifestyle, and eventually the success of the organization by focusing on external events that exhibit power and self-aggrandizement. To be an authentic leader, one must strengthen an understanding of core values, spirituality, ethics, and respect for the common good.

If books and other publications are an indication of interest and trends, then the focus on personal development, an understanding of core values and spirituality, is on the rise. This focus is captured well by Katherine Tyler Scott, who says that we are living in a “time between times,” a time in which traditional thinking and practices appear to be unaligned. Therefore, we are being challenged to reexamine our perspectives. The way we will teach leadership will include a focus on both competence and character. The commitment to this deeper level of educating leaders will achieve a positive transformation of individuals, organizations, and society.

LEARNING ORGANIZATION

According to the management scholar Peter Senge, who popularized the concept of the learning organization, learning organizations are places “where people continually expand their capacity to create the results they truly desire, where new and expansive patterns of thinking are nurtured, where collective aspiration is set free, and where people are continually learning to see the whole together” (Senge 1990, 7). Accordingly, at the heart of the idea of a learning organization is the insight that there is enormous human potential that can unfold and act in effective and fulfilling ways within social institutions such as businesses, government departments, schools, and charities. Leaders and the relationship between leaders and followers can help unlock this underdeveloped and underemployed potential and hence contribute to developing organizational learning practices.

Antecedents of the concept of the learning organization were discussed as far back as the 1920s, but the learning organization’s recent relevance as a topic for consideration did not emerge until the late 1980s, when a combinations of ideas, theories, and practices were gathered under the name “learning organization.” Learning in organizations has become increasingly vital in today’s complex, uncertain, and dynamic business environment. The increasing competitive challenges imposed by the global economy and by technological changes in

It is always easier to dismiss a man than it is to train him. No great leader ever built a reputation on firing people. Many have built a reputation on developing them.

—Unknown

products and services force corporations and their members to learn in order to increase knowledge sharing and communication, which in turn leads to increased flexibility, innovativeness, and effectiveness. Accordingly, the notion of organizational learning has gained academic and practice-oriented currency since the 1980s as a preferred model for development and to manage change. It can be seen as a cornerstone of successful economies and societies in the twenty-first century.

UNDERSTANDING LEARNING AND VARIOUS APPROACHES TO THE LEARNING ORGANIZATION

Discussions of organizational learning and learning organizations are characterized by heterogeneity and multilayeredness as well as by the absence of a uniform, generally accepted theory. How one defines organizational learning depends on one's underlying understanding of learning itself. Learning needs to be seen as a multifaceted and dynamic process. Basically, learning is the acquisition of competencies that make it possible to modify patterns of thinking and acting that help the learner to develop goal-oriented behavior for dealing with changes or new orientations. According to Peter Vail (1996), ultimately learning represents a way of being, a holistic attitude that takes all experiences as a learning opportunity or learning process.

There are different orientations for approaching learning. A behaviorist orientation uses experimental procedures to study behavior in adaptive relation to the environment, while a cognitive orientation examines the individual's mental information processes and changes in cognitions (that is, changes in preferences, assumptions, knowledge, and judgments). According to a constructionist perspective, learning results from

self-productive, autopoietic (self-forming) processes, by which meaning and reality are created. According to social constructionism, learning emerges not based on single individuals, but as a social process that occurs in community: As members create reality by sharing and coordinating certain values, thinking traditions, and interpretation practices, learning occurs. Generally, learning takes place when new facts and knowledge are acquired and transferred, opinions and beliefs are modified, or new paradigms are developed.

The scholar Gregory Bateson (1904–1980) developed a multidimensional view of learning that recognized different types and levels of learning. The researchers Chris Argyris and Donald Schön (1978) adapted this view to an organizational context by differentiating single-loop learning, double-loop learning, and deuterio-learning. According to them, an organization learns through the agency of its individual members, who are changing their theories of use. In single-loop learning, errors are detected and corrected in an adaptive process of continuous improvement. In double-loop learning, the organization's success formulas and the values, assumptions, and action strategies that it has taken for granted are questioned and challenged, leading to a deeper level of collective understanding of those values and assumptions. Deuterio-learning, the "learning of learning," occurs when organizations learn how to carry out single-loop and double-loop learning. Deuterio-learning means that organizations reflect on and inquire into previous episodes of organizational learning and modify the learning system, which may enhance the learning process and culture itself.

In addition to the cultural approach of Argyris and Schön, there are other models of the learning organization. According to the adaptive approach, learning takes place as an experience-related adaptation to the environment, while the functional-interpretative approach sees learning based on information processing as the development of organizational knowledge. According to an integrative-systemic approach, learning represents the incorporation and practice of specific learning disciplines, including personal mastery, systems thinking, mental models, team-orientation, and shared vision. Others have stressed the necessity

for “unlearning” or for considering informal learning. Meanwhile, typologies have been developed to systemize the different approaches.

AIMS AND CHARACTERISTICS OF ORGANIZATIONAL LEARNING

Essentially the aim of organizational learning is to produce “useful outcomes” (Dodgson 1993, 378). Organizations strive to increase their capacity to innovate—and therefore their ability to survive and change. Learning within and about an organization serves for a critical analysis of preexisting rules, practices, structures, and processes, which leads to the development of possible alternative approaches, strategies, and solutions. Learning helps increase an organization’s problem-solving capacity and can lead to behavior changes that bring about improved performance at the individual, team, and organizational levels. These efforts are intended to strengthen the organization’s ability to adapt in the face of radically changing internal and external environments and as a precaution against the uncertainties of the future.

However, there exists a peculiar ambivalence concerning organizational learning’s purpose and goals. Learning can be a core competence of the organization, a source of renewal, energy, and revitalization, and the employees’ tool against layoffs, cutbacks, and reengineering. But there is also a shadow side to the learning organization: Learning can be just one more way to get more out of the work force for less, or learning can be subverted or at least perceived to be subverted by management in order to aid or justify downsizing, restructuring, and invasion of privacy. It can become a “prescription to help managers retain control under dramatically changed external circumstances” (Coopey 1995, 202). Furthermore, there is tension between the goals and time perspectives involved: On the one hand, the learning organization’s primary goal of developing its ability to learn from experience requires a long-term perspective. Yet this often conflicts with the short-term bottom line of productivity, accountability, results, efficiency, and profitability. Holding learners both to the long-term vision of learning and simultaneously to short-term performance requirements creates not only time conflicts for

employees but also false expectations that set the learning organization and its learners up for failure.

CHARACTERISTICS OF A LEARNING ORGANIZATION

There are many ways to characterize a learning organization. For example, in learning organizations employees have access to knowledge, resources, networks, and learning strategies; there are multiple reward systems; and there is participative policy enabling implementation, development, and evaluation of learning processes. Importantly, a learning organization offers its members self-development opportunities, as well as support, guidance, and mutual feedback. These and other characteristics are at the same time conditions for the effectiveness of learning processes in and from organizations. In a learning organization, there will generally be both individual and transpersonal—that is, group and organization-wide—levels of learning. To avoid the problem of how to bridge the gap between individual and collective levels of learning, learning needs to be seen as an ongoing and integrative process of creating multiple realities dependent on multiple coordinations. That is, learning takes place individually by different people, while the sum of their individual knowledge is collective. For example, when an employee acquires a specific competency like a technical or language skill, this knowledge will alter not only his reality, but also that of an organization. Consequently, both realities and further plural realities involved need to be coordinated.

ORGANIZATIONAL LEARNING RELATED TO LEADERSHIP

What is the role of the leader within learning organizations? What are the specific actions that a leader can take to help his or her organization become a learning organization? What can leaders do to support a learning organization? Learning organizations require a new view of leadership and the leader-follower relationship. If, as Senge (1990) has suggested, in a learning organization leaders are designers, stewards, and teachers, it will be necessary to overcome the conventional, hero-

like conception of the leader and unidirectional monological practices of leadership in favor of shared or distributed leadership with a more dialogical orientation.

Leaders as Learners: Leaderly Learning

First of all, leaders themselves must value learning and become expert at learning in the context of the organization. That means they must develop what Argyris (1993) calls the competence of leading-learning: They must role-model continuous learning for others. Leaders with a learning orientation should have the kinds of traits that David Kolb, a scholar of organizational behavior, suggests good experiential learners exhibit: openness, lack of bias, and the ability to reflect on experiences from many perspectives and to draw those various perspectives into an integrated course of action. A leader who has the ability to learn how to learn—that is, to develop skills to handle new assumptions, new processes, and new ideas on a daily basis—is an important presupposition and condition for any learning organization. The organizational psychologist Edgar Schein defines the learning leader as one who is willing to acknowledge his or her lack of knowledge and the given uncertainty in order to advocate the importance of learning and to promote learning throughout the organization. A leader's willingness to articulate and challenge his or her assumptions encourages a culture of inquiry and innovation. It is also important that leaders learn about themselves in the process of developing as leaders. For this, they should have the capacity to reflect on their intentions, emotions, and experiences and on their effects on others and on the organization. With this, they should have the ability to make adjustments for themselves and in their interpersonal relationships. Organizations that support the process of leaderly learning have a head start in developing into learning organizations successfully.

Vision and Empowerment, Mentoring, Coaching, and Facilitation

The creation of a collective vision of the future with other members of the organization appears to be an

essential task for leaders of learning organizations, and communicating this common vision to the organization seems to be of collateral importance. To share in the creation of the organization's vision, and to enable self-organized learning processes, employees must be empowered. Empowerment can be defined as "interactive, mutual decision making about work challenges in which power for work outcomes is truly shared" (Marsick 1994, 19). Mentoring, coaching, and facilitation, as forms of hands-on support, are three additional tools for developing effective learning in the workplace. Mentoring can foster workplace learning by relating career development to personal development; it also builds self-esteem and self-confidence.

With coaching, leaders stimulate, encourage, and accompany employees' learning processes; leader coaches promote inquiry, experimentation, and dialogue. As part of this coaching, leaders help those they are coaching overcome barriers, defensive routines, and inhibiting loops that hinder the development of a learning organization. On occasion, leader coaches must gently confront themselves and their staff with the need for reality testing, which can help expose hidden assumptions in everyone's mental models of reality and can help staff to deal with anxiety.

For developing an imbedded acceptance of learning and personnel with the necessary learning abilities, collective and organizational-level factors that facilitate learning need to be identified, including emotional factors. Other facilitating factors include task variety and internal exchanges as well as continuous learning opportunities and feedback.

Because leadership plays an important role in supporting the transformation of shared mental models and in linking the individual, team, and organizational levels of learning, leadership must occur at all those levels if the organization is truly to become a learning organization. This implies that to some extent leaders must be willing to devolve authority in support of self-learning and self-management processes: Decision making and responsibility become more decentralized, hierarchical structures are flattened out, and lateral networking is favored over hierarchical control.

COMMUNITIES OF LEARNING PRACTICE

One particular way in which leaders can support learning processes is to accept and foster what are known as communities of practice. These communities are groups of people who come together to share and to learn from one another both face-to-face and virtually. They are held together by a common interest in a body of knowledge and are driven by a desire and need to share problems, experiences, insights, tips, templates, tools, and best practices. Community members deepen their knowledge by interacting on an ongoing basis and over time develop a set of shared practices in a mutual engagement, joined enterprise and shared repertoire (e.g., communal resources such as routines, sensibilities, artifacts, vocabulary, and styles). Members of these communities may discuss innovative ideas and cooperate on solving problems or develop collaborative inquiries. Unlike temporary teams, or business units, they are organized around what matters to their members, offering them chances to develop a sense of identity (Wenger 1998, 145) and situated learning.

Communities of practice form constellations of interconnected practice and networks for the negotiation of meaning, and they fulfill a number of functions with respect to the creation, diffusion, and transformation of knowledge and learning in organizations. As an embodied and emotional context for learning, they can retain knowledge in “living” ways, and make learning a vibrant process also across organizational boundaries. Even when they routinize certain tasks and processes, they can do so in ways that are responsive to specific circumstances. Learning in such communities helps build emotional and social competencies in addition to the more standard business competencies. One of the advantages of communities of practice is that they preserve the tacit and emotional aspects of knowledge and learning that formal systems cannot capture. With their interpretive sense making, they contribute to organizational community building and innovation. With regard to leadership, it is essential that these communities become what Senge (1997) referred to as “communities of leaders and learners.”

LIMITATIONS, IMPLICATIONS, AND PERSPECTIVES

As we have seen, there are tremendous complexities entailed in developing a learning organization. First among the limitations one needs to consider is what the scholars Daniel Levinthal and James March called a “myopia of learning,” that is, ignoring a long-term perspective or the larger system in which learning is carried out. Additionally, learning traps can emerge when the focus is too strongly on the past (learn-restrictive holding to the status quo) or only on future-arranged discovery of innovations. Even more likely is that harmful patterns of behavior may be learned. There is also the question of whether or not the learning activity and its progress will be linked to return on investment, and more generally, how the success of the learning activity will be assessed and measured. An organization is unlikely to be able to make the transformation to a learning organization if it is too hampered by internal and external constraints or insufficient resources. Because learning does not happen only on a cognitive level but also takes place at emotional and even spiritual levels, we need a more comprehensive and integrative approach. Integrative learning must overcome reductionism and bring together thinking and feeling, individual and collective, and inner and outer realms (Beck and Cowan 1996; Wilber 1995, 2000), while also considering questions of power, politics, and ideology (Coopey 1995; Vince 2001). Only with such an integrative approach can the demand to get behind the rhetoric that “people are our greatest asset” (Sisson 1994, 7) be realized.

Future research on the connection between the learning organization and leadership needs to extend our understanding of the relationship between (learning) leaders and followers and should develop concepts and practices related to learning “leader-follower-ship.” Understanding the leader-follower relationship as an ongoing social and emotional process opens up the possibility of nonhierarchical ways of interacting and fostering trusting, authentic shared leadership or even partnership-oriented stewardship.

The concept of the learning organization is not a ready-made solution that can be introduced and

employed without specific adjustment to each company. Rather, each corporation must find its own way of learning and changing, based on its operating history, existing culture, and external environment. In a learning organization, today's performance is a product of yesterday's learning, and tomorrow's performance is a product of today's learning. The test of the utility of the approach for business is the extent to which the adoption of integrated learning leads to improvements in business performance, while for individuals it is a question of employability and quality of working life. Once this synergetic link between the learning organization and leadership is attained, an integrative development and change of both the corporation and its members in society as a whole are sure to follow.

LEE, ANN (1736–1784)

Founder of American Shaker movement

One theory of leadership holds that “when society is in a state of flux, the conscious need of leadership is much more urgent than in a tranquil state. . . . [People] desire leadership, ask for it expressly, and are more open to guidance by others” (Wieman and Wieman 1935, Ch. 24). During times of relative stability, religious institutions become dulled and stagnant, training leaders who “are able to do certain stunts well,” (Wieman and Wieman 1935, 2) but cannot enter into a reciprocal relationship of shared experiences, fears, and hopes. But in times of instability and momentous change, leaders emerge, be they women or men, who experience that instability and claim it as their own. An American proponent of this theory, Henry Nelson Wieman, lists a sampling of leaders in history, both religious and secular, men and women, who enter into this reciprocal relationship of felt need and mutually beneficial response, giving women and men equal due. For religious cultures, such foment may include the leader’s claim to divine inspiration or even divine right. Wieman’s criterion for reciprocity among religious leaders and their followers during periods of rapid change is echoed by a nineteenth-century American Shaker apologist, F. W. Evans: “But let the following proposition be first considered: namely, that at a given part, point, and time of every cycle human affairs, in all ages, nations, and tribes, there have invariably arisen an order and people analogous (in some measure) to the American Shakers” (Evans 1849, 5). Evans reaches back to Greece and Rome, and, in characterizing these orders, includes inspiration, asceticism, often celibacy, and the leadership of women and men.

Mother Ann Lee, founder of the Shaker movement, exemplifies this type of leadership. She emerged as a religious leader in Manchester, England, at the dawn of the industrial revolution to become the cornerstone of what has been called the

longest lived communal religious order in U.S. history. The spark for that movement had been struck nearly a century before her birth in 1736.

Between 1650 and 1750, the English countryside experienced a relentless shift from an agricultural economy to an industrial one. Cottage industries were giving way to mills and factories. Women who had once worked all day in the fields, or sheared their own sheep and brought the wool to market, began to seek employment at mills springing up seemingly overnight. The English northwest, which included the region of Lancashire and the town of Manchester, where Ann Lee was born, became a bustling center for the textile industry. In 1650, Manchester already had been known for producing varieties of woolen goods. By 1690, France had imported calico printing into Manchester, increasing its importance as a manufacturing center, and in 1761, canals opened up for importing coal into town. By the first quarter of the nineteenth century, Manchester had become the cotton capital of England. And while progress seemed inevitable and praiseworthy, everyday life was anything but decent. Friedrich Engels, whose German father owned a factory in Manchester where Friedrich served as his agent, described the working-class district, old Manchester, as a hellhole:

Such is the Old Town of Manchester, and on re-reading my description, I am forced to admit that instead of being exaggerated, it is far from black enough to convey a true impression of the filth, ruin, and uninhabitableness, the defiance of all considerations of cleanliness, ventilation, and health which characterize the construction of this single district, containing at least twenty to thirty thousand inhabitants. And such a district exists in the heart of the second city of England, the first manufacturing city of the world. . . . Everything which here arouses horror and indignation is of recent origin, belongs to the industrial epoch. (Engels 1892, 45, 48–52)

In that same span of one hundred–odd years, religious movements, known collectively as “Non-Conformist” for their separation from the established Church of England, began to appear in England and in the American colonies. Influenced by English

mystics and French Protestant sects from southern France, most of whom were fleeing persecution, these communities preached an inward, individualistic piety, egalitarianism, anticlericalism, and communal ownership of property, as well as each member’s capacity to hear and respond directly to the will and word of God. Seeing visions and hearing God’s voice were to be expected. Believers roamed from town to town, calling for conversion in public squares. On both continents they were jeered, imprisoned, beaten, or flogged, and sometime executed. Children were enlisted in proselytizing and experienced persecution along with the adults. George Fox, founder of the Quaker movement in 1651, wandered over the English northwest preaching a faith of “the inner light, light of light,” a pure Johannine gospel returning to the heart of spirituality. Fox and his community finally settled in the region of Lancashire, which became the center of the Quaker movement in England.

One characteristic of these Non-Conformist movements was the ascent of women into positions of religious leadership. Jane Lead, an English mystic and leader of an early-seventeenth-century movement, the Philadelphians, heard voices when she was fifteen, which were affirmed by her community. Some of Jane’s prophetic writings found their way into Shaker communities. Margaret Fell, a disciple of George Fox, opened up Quaker schools in 1653. In that same year, another Quaker, Mary Fisher, attempted to convert the sultan of Turkey. Many women in these communities were poor and illiterate. Ann Lee, one of eight children, never attended school, nor did her siblings. They worked. Ann went to work as a child in a factory as a cutter of hatter’s fur. She was said to have been born in the very depths of poverty. Others, like Mary Fisher, had both the means and the education to approach a potentate and try to bring him into the light.

ANN LEE’S EARLY LIFE AND HER EPIPHANY

In 1736, Ann Lee was born on Toad Lane in the town of Manchester into a family of eight children. Her father, John Lee, was a blacksmith. At sixteen, she married Abraham Stanley, also a blacksmith, who

Testimonies of Mother Ann Lee and the Elders

The excerpts below—from the Shaker document *Testimonies of Mother Ann Lee and the Elders* (originally published in 1816)—offer glimpses into the leadership style of Ann Lee.

Chapter XXIV

1. Mother Ann and the Elders abounded in visions, prophecies and revelations; these, and many other gifts were administered in abundance through them, to those who embraced their testimony; they were given to strengthen, confirm, and establish the faith which the people had received; and were also preparatory to, and evidences of the real substance which was to follow.

6. Again, after Mother Ann returned from Poughkeepsie jail, Mehetabel was at Watervliet, and a number of Believers being present, Mother addressed them as follows, "You are called in relation to all the rest of mankind, and through your faith and obedience they must receive the gospel. Pain and sufferings will never cease in the Church until all souls have heard the gospel of salvation. This gospel will be freely offered to all souls; and will be a savor of life unto life, or of death unto death." She also said, "The increase of the gospel in the first opening, will be small; after that, souls will embrace it by hundreds and by thousands; for this testimony will overcome all nations; it will increase till the covering is taken off; then mankind will see the rottenness of Antichrist's foundation; then souls who are bound in their sins will call to the rocks and to the mountains to cover them. But the Saints will never be overcome again by the beastly power of Antichrist."

16. At Ashfield, Mother Ann, being under great sufferings,

said, "It will not be my lot, nor the lot of any who came with me from England, to gather and build up the Church; but, it will be the lot of Joseph Meacham, and others, to gather and build up the Church." She also said, "It will not be my nation, nor any of those that came with me from England who will lead this people, but the lead will be given to Joseph Meacham." *Sarah Bennett.*

Chapter XXV

12. While Mother Ann was at Enfield there came a woman to see her by the name of Tryphena Perkins, who made a great profession of Christianity. But, in the hearing of a number of people, Mother Ann reproved her for her wickedness, and said, "You are a filthy whore." This greatly offended her, and she went away and complained that she had been abused, which furnished Mother's enemies, as they supposed, with sufficient cause to prosecute her. They now began to flatter themselves that they were able to prove Mother a false prophetess, and determined to prosecute her for defamation. They said they could prove to a certainty, that Tryphena's organization was such that she could not, possibly, be guilty of the charge of whoredom; she was called a great Christian, and, of necessity, a pure virgin. But, behold, she was soon found to be with child, by a married man! This was well known throughout the town of Enfield, and Mother's enemies were greatly abashed and confounded.

Source: *Testimonies of the Life, Character, Revelations and Doctrines of Mother Ann Lee and the Elders With Her, Collected from Living Witnesses in Union with the Church.* (1888). (Originally published 1816) Retrieved October 7, 2003, from <http://www.passtheword.org/SHAKER-MANUSCRIPTS/Testimonies/tstmonys.htm>

came to live with Ann's family. Ann kept her own last name. Over the next six years, she had four children, all of whom died in infancy or early childhood. She would later interpret her grief and pain as a judgment upon her concupiscence. Ann's religious education at home taught her pietism, Protestant mysticism, and female leadership.

In 1758, twenty-two-year-old Ann began attending a Quaker religious society led by Jane and James Wardley, who had broken off from the mainline Quaker movement. The Wardleys had been influenced by French millennialists from the Cevenole in

southern France. Known as *les trembleurs*, these prophets preached the doctrine of the imminent second coming of Christ and the advent of his millennial kingdom, as well as a distinct form of worship that involved shaking. In Manchester, the Wardleys' group became known as the "Shaking Quakers," which was soon shortened to simply the "Shakers."

In the tradition of Non-Conformist movements, Ann and members of her society began traveling from town to town, preaching the second imminent coming of Christ, practicing their ecstatic form of worship in public, and experiencing persecution. In

1770, the testimony of salvation and life was fully revealed to Ann Lee and acknowledged by her society, so that afterwards, she was known as “Mother Ann”:

I saw in vision the Lord Jesus in his kingdom and glory. He revealed to me the depth of man’s loss, what it was, and the way to redemption therefrom. Then I was able to bear an open testimony against the sin that is the root of all evil; and I felt the power of God flow into my soul like a fountain of living water. From that day I have been able to take up a full cross against all the doleful works of the flesh. (Evans 1859, 9)

That sin at the root of all evil was sexual relations. It may have been in this vision that she saw the judgment of grief and pain which accompanied her marriage and motherhood.

Two years later, imprisoned for a brief time for “profaning the Sabbath” by her dancing and shaking, Ann had another vision, which clarified her understanding of the evil driving sexual relations and the final disclosure of God synthesizing male and female in Deity itself. According to Shaker testimonies, two of her revelations struck at the heart of the social order of church and state:

One was the duality of Deity, God both Father and Mother; one in essence, one God, not two . . . but God who possesses the two natures, the masculine, the feminine, each distinct in function yet one in being, Co-equals in Deity. The second was that the secret of man’s sin . . . his loss of purity, lay in the premature and self-indulgent use of sexual union. (Society of Shakers 1998, 14–27)

The sexual act was intended by God to have begun an ascent from a physical to a spiritual plane of existence, where all flesh and its works would be left behind. By performing the act before God gave permission, Adam and Eve regarded sexual pleasure as its own end, which became, “for all humanity, a constant curse, the source of crimes, all degrees of hideousness, of wars and sufferings untold. Women, under its sway, became in all lands and among all races, the abject slave, burdened not only with the weight of her lord’s cruelties and passions, but with her own vile passions as well” (Society of Shakers

1998, 14–27). According to Ann, it was the Wardleys who first introduced her to a life of celibacy, the couple having lived together for years without physical intimacy.

Having heard Ann’s testimony after her release from prison, the society went one step farther and proclaimed Ann Lee as the “anointed daughter.” For them, she was the second coming of Christ, the Word, completing the full revelation of God as male and female and inaugurating that millennial community of believers whose lives witnessed to the fulfillment of human community. Their beliefs did not endear them to the authorities. Persecutions only increased. Then, in 1774, Ann is said to have had another revelation, “directing her to repair to America; also that the second Christian Church would be established in America; that the Colonies would gain their independence; and that liberty of conscience would be secured to all people, whereby they would be able to worship God without hindrance or molestation” (Evans 1859, 9).

ANN LEE ARRIVES IN AMERICA

Ann and her companions embarked for New York on 19 May 1774. Those who accompanied her were Abraham Stanley, her husband; William Lee, her brother; James Whittaker; John Hocknell and his son Richard; James Shepherd; Mary Partington; and Nancy Lee (a niece of Mother Ann). Conspicuously absent were the Wardleys.

The group arrived in Manhattan on 6 August, where they took up various forms of work. Abraham Stanley, Ann’s husband, divorced her to marry another when Ann refused to cohabit with him. In 1776, Mother Ann and the rest of her group secured land outside of Albany at Watervliet. For the most part, they were left alone and at peace, receiving continued reassurances, signs, and visions from Mother Ann heralding a new humanity coming in waves to join with them. These prophecies were not entirely from out of the blue. Fifty thousand Quakers had already sailed to the shores of the Colonies, and if the “waves” of humanity, strictly speaking, would not arrive from over the sea, there was a great movement of peoples within the Colonies and later, in the

newly established United States, seeking religious freedom and the true church.

In 1780, Ann's prophecies seemed to have come true. Near Watervliet, New Lebanon was the seat of a revival movement that fizzled out as quickly as it had been ignited. Several local leaders and Joseph Meacham, a prominent Baptist pastor who lived in the area and would later lead the movement after Ann's death, had heard of her and the Shaker movement and journeyed to Watervliet. Meacham was said to be the first American convert to the movement. According to Shaker legend, General Lafayette visited the group while alive and again after his death several years later in France. The millennial community, unimpeded by the wall between life on earth and the life hereafter, communicated regularly with those considered dead or "gone." Souls were eternal. Heaven and hell were states of the soul in which it could remain on probation until that moment it turned to God and received eternal life.

Now visible and audible, the group endured persecution once again. Mother Ann was imprisoned, this time on charges of being a British spy. Soon released through the help of her supporters, Mother Ann along with a group of elders from the community set off on a preaching mission throughout New England. For two years the Shakers doggedly carried out their mission throughout the Northeast. Reminiscent of their trials in the region around Lancashire, they once again were beaten, flogged, and run out of one New England town after another. They preached the necessity of confessing sin, celibacy, renunciation of the flesh, and ecstatic dancing as the means of entering into the millennial church. They did not preach that their particular community was the last to appear upon earth. Rather, were the community in that time of the second coming, the millennial age, the duration of which was given by the prophecy that when there were fewer than five Shakers left on earth, the final spirit of Christ would pour out on world, and all would become Shakers.

At least on one occasion, however, converts did think that theirs was the last community on earth. At the opening of a Shaker community in Enfield, New Hampshire, the believers, "having more zeal than wisdom and understanding," felt that they didn't need

to provide for themselves or one another. Mother Ann reproved them: "She bade them go home and set out apple trees, and raise calves, and make provisions as though they were to live a thousand years, and gather something to do good with" (*Testimonies of Mother Ann Lee and the Elders* 1888, 207–210).

As odd, bizarre, or threatening to the established orders as their tenets seemed, the Shakers were heard. Women divorced their husbands, girls broke off their engagements. In that era, freedom for women meant freedom from marriage and its attending burdens and suffering. Testimonies abounded as to Mother Ann's tenderness, compassion, and gentle persuasion. But she had another side as well, and some remembered her as awe-inspiring, one who demonstrated her devotion through harsh punishments. Overall, she was portrayed as a formidable and charismatic woman:

Mother Ann Lee . . . was a woman rather below the common stature of women; thick set, but straight and otherwise well proportioned and regular in form and features. Her complexion was light and fair, and her eyes were blue, but keen and penetrating. . . . Her manners were plain, simple and easy; yet she possessed a certain dignity of appearance that inspired confidence and commanded respect. By many of the world, who saw her without prejudice, she was called beautiful; and to her faithful children, she appeared to possess a degree of dignified beauty and heavenly love, which they had never before discovered among mortals. (Green and Wells 1848)

In 1784, Mother Ann died shortly after returning home from a missionary journey. James Whittaker took over from Mother Ann, and then in 1787, leadership passed to Joseph Meacham. It was Meacham who actually organized the community for the "gatherings" or "orders" of the Shaker movement. New "gatherings" sprang up from New Lebanon in Massachusetts, Connecticut, and Maine. Lucy Wright, another American convert, succeeded Meacham in 1811. Under her leadership, the movement spread westward to Ohio, Pennsylvania, Kentucky, and Indiana. At the height of the movement around the time of the Civil War, the Shakers numbered about 6,000. Afterward they declined in number until today

less than a dozen remain in the Sabbathday Lake Community in Maine.

CONCLUSION

Born during a time of social and economic upheaval launched by the industrial revolution, Mother Ann Lee addressed the needs of her community in a way that promised personal salvation, economic autonomy through frugality and thrift, and spiritual autonomy through direct communion with God. The extreme ascetic life of celibacy made it possible for women to ascend to positions of leadership. Yet while women leaders were a regular feature of new religious movements, the second generation invariably saw men take the helm and hold on to it. The Shaker movement was unique in that women continued to function as the highest religious authorities in their communities. The final revelation of God as male and female completed a Christian anthropology in which the labor and capacities of women were, for the first time in history, equal to men in power, authority, and continuity of leadership. One result was Shaker inventiveness that drew upon women's private, unheralded labor to become the public and valued labor of the community. The circular saw joined the two technologies of the spinning wheel to the saw blade. Shakers also invented the clothespin, the cut nail, the push broom, and over 7,000 other items registered in the United States Patent Office. The Shakers' work ethic exemplified the American virtues of self-reliance, industry, and thrift; their spirituality contributed to cycles of revivalism characteristic of American religiosity. Ann Lee's admonition, "Go home and put your hands to work, and your hearts to God," (*Testimonies of Mother Ann Lee and the Elders* 1888, 207–210) is as compelling today as it was more than two hundred years ago.

LEE, ROBERT E. (1807–1870)

Military leader

Robert E. Lee is best known for his military leadership of the Confederate States of America during the U. S. Civil War. As the commanding general of the Army of Northern Virginia, Lee was widely respected as a brilliant, bold, and daring military strategist who upheld a personal code of honor, integrity, and self-discipline. His genius was respected on both sides of the Mason-Dixon line, and before he enlisted in the Confederate States Army, he was reportedly offered command of the Union Army, but declined. In addition to his intelligence and moral character, Lee's ability to selflessly inspire his officers and troops and willingly delegate vital tasks made him one of the most influential leaders of the Civil War.

Robert Edward Lee was born in Stratford, Virginia, on 19 January 1807 and was raised from the age of three in Alexandria, Virginia. His father, "Light Horse Harry" Henry Lee, was a confidant of George Washington, delegate to the Continental

Congress, and former Governor of Virginia. Following distinguished service in the Revolutionary War, his father faced financial collapse after a series of controversial and financially ruinous business speculations, and left Virginia for Barbados in 1813, leaving his family behind. His mother, Ann Carter Lee, instilled in Robert the virtues of honor, integrity, self-control, and financial responsibility.

Lee graduated from the U.S. Military Academy (West Point) in 1829. Shortly after graduation, he married Mary Custis, whose father was the adopted son of George Washington. They had seven children. Lee spent the next thirty-two years in the U.S. army. His opportunity for leadership came in 1846 during the Mexican-American War when his bravery, leadership, and strategic tactics earned the respect of General Winfield Scott, who thereafter became Lee's mentor. Lee also experienced a profound spiritual awakening while in the army, and his religious convictions played a vital role in his life.

By early 1861, the deep divisions in the nation over issues such as slavery, states' rights, and economic policies had reached a breaking point. The growing threat of secession by the Southern states caused Lee conflict and distress. He opposed slavery and felt loyalty to the nation he had long served. At the same time, he strongly disagreed with what he considered to be the infringement on states' rights by the federal government. Above all, Lee was a Virginian first and, given his family's extensive ties to the state, could not see taking a stand against it. In his view, a stand against Virginia was a stand against his family. During this time, Lee was offered command of the Union army, but on 19 April 1861, Virginia seceded,

Surrender at Appomattox

The U. S. Civil War was effectively ended with the surrender of the Army of North Virginia at Appomattox Court-House, Virginia, on 9 April 1865. The surrender was preceded by negotiations through an exchange of letters between the Union Commander, Lieutenant-General Ulysses S. Grant, and the Army of Northern Virginia Commander, General Robert E. Lee. The most important were the last two letters, from Grant to Lee and then Lee's response. To his credit, Lee demonstrated his loyalty to his troops by negotiating for them parole and the right to return to their homes.

In accordance with the substance of my letter to you of the 8th instant, I propose to receive the surrender of the army of Northern Virginia on the following terms, to wit: Rolls of all the officers and men to be made in duplicate, one copy to be given to an officer to be designated by me, the other to be retained by such officer or officers as you may designate. The officers to give their individual paroles not to take up arms against the government of the United States until properly exchanged; and each company or regimental commander to sign a like parole for the men of their commands. The arms, artillery, and public property to be parked and stacked, and turned over to the officers appointed by me to receive them. This will not embrace the side-arms of the officers nor their private horses or baggage. This done, each officer and man will be allowed to return to his home, not to be disturbed by United States authority so long as they observe their paroles and the laws in force where they may reside.

—U.S. Grant, Lieutenant-General

Head-Quarters, Army of Northern Virginia April 9, 1865.

General: I received your letter of this date containing the terms of the surrender of the army of Northern Virginia, as proposed by you. As they are substantially the same as those expressed in your letter of the 8th instant, they are accepted. I will proceed to designate the proper officers to carry the stipulations into effect.

—R. E. Lee, General.

and Lee resigned the next day. He returned to Virginia to live as a civilian, except to defend his native state. Soon thereafter, he accepted command of the military forces of Virginia, and in early June 1862 was appointed commanding general of the Army of Northern Virginia.

As a leader, Lee viewed the development of plans and strategies as his primary responsibility. He exhibited a great talent for choosing exceptional people as his military commanders, and giving them the

autonomy to execute his plans as they saw best. Lee also placed significant emphasis on coordination and communication among his military units, recognizing that bold, coordinated efforts by a smaller, better-led and better-motivated force could defeat much larger armies.

Throughout 1862 and into the first half of 1863, Lee's leadership and his "offensive–defense" strategy produced astounding victories against much larger and better-equipped foes. Lee recognized at this time that a decisive Confederate victory on Union soil could end the war. In June 1863, Lee turned his depleted but confident army north to Gettysburg, Pennsylvania. While it was an army of invasion, Lee would not tolerate an army of conquest. Civilians in the North were treated with respect. Acquired food and other materials were not confiscated but paid for—albeit with claims on Confederate currency.

The battle of Gettysburg in early July 1863 was Lee's biggest failure as a leader. His communications broke down. His generals' boldness and aggressiveness was, at critical moments, replaced by caution. The rapid and coordinated deployment of troops was at vital times lost to piecemeal actions. The end result was a courageous but devastating Confederate defeat. Lee's army retreated back to Virginia.

Over the next two years, Lee still sought the elusive, decisive victory that he believed would secure the Confederacy's independence. He led efforts to reorganize his army's logistics, to better equip his soldiers, and to diminish the growing suffering of civilian Virginians. Lee's officers and troops were committed to continuing the war, but Lee showed perhaps his greatest example of leadership by unilaterally deciding to end four years of horrific bloodshed. He surrendered his army at Appomattox Courthouse, Virginia on 11 April 1865, after securing parole for all of his soldiers. The Civil War was effectively over.

After surrendering, Lee returned to Richmond, Virginia, where his family had lived during the war. He received a hero's welcome, but pledged to focus on the reconciliation, reconstruction, and the reintroduction of Virginia to the Union. He showed no malice toward the Union armies and no bitterness for the

failed cause, but instead a steadfast determination to help rebuild his native state.

After the war, Lee declined several offers to considerably enrich himself and his family by leading business organizations, and instead accepted an offer to become the president of Washington College in Lexington, Virginia. The war had seriously disrupted the college, and Lee led efforts to increase the size of the student body, recruit new faculty, expand the campus, repair war-torn buildings, and raise money to secure the college's future. His leadership style in all of these endeavors was similar to that which he had used as a military commander. He established bold plans and strategies, and then depended upon those with whom he worked to successfully implement them. Speaking little at meetings, he listened intently to the reports of those charged with various tasks and ensured that results were achieved.

At the age of sixty-three, Robert E. Lee died in Lexington, Virginia, in October 1870. His courage in the face of devastating loss served as an inspiration to all.

LEGACY

A leader's legacy lies in the patterns of behavior within his or her organization that reflect his or her contributions and impact on the organization. It may reflect the leader's vision, values, personality, achievements, general leadership qualities, or any combination of these. Legacies can be positive or negative, powerful or insubstantial, enduring or short-lived. Leaders who are mindful of their legacies can affect the direction and well-being of an

organization and its policy long after their association with the organization has come to an end. Organizations that are mindful of the motivating influence of positive legacies can mine their organizational history for rich illustrations to inspire their members.

RESEARCH ON LEGACIES

There is surprisingly little theory and research on leadership legacy. Most research on leadership has tended to focus on strategies and techniques for enhancing leaders' performance, with scant attention paid to the mechanisms underlying the development of a powerful, positive, and enduring legacy. Some researchers have addressed leaders' impression management strategies—that is, the ways in which leaders can manipulate the image that others have of them in the present. The concept of legacy, however, focuses on the future and the past. It is future oriented in that the construction of a legacy often requires leaders to visualize what future they desire for their organization after they have left it. This is necessarily a much broader and longer-term vision than one typically sees in organizational strategic plans. Legacies are past oriented in that they offer in the present something from the past: Organizations can resurrect the values and achievements of past leaders, using them to affirm organizational values, motivate members, and encourage the accomplishment of current objectives.

It is very common for organizations to build on the legacy of their founder. To motivate and inspire employees, organizations may perpetuate stories and anecdotes describing the founding leader's vision, sacrifices, successes, and ability to overcome obstacles. Current leaders at Walt Disney Company, for example, emphasize the devotion of founder Walt Disney (1901–1966) to children and to wholesome family entertainment. The goal is not only to communicate a value but also to give company members a sense of pride and identity. Research suggests that stories about seminal individuals and pivotal historical events abound in successful organizations, and these myths and legends serve an important purpose. They tend to foster group cohesiveness, feelings of

The final test of a leader is that he leaves behind in others the conviction and will to carry on.

—Walter Lippman

identification, inspiration, commitment, and continuity in an organization.

THE ROLE OF DEATH IN PROMOTING LEGACY

Some research that suggests that a leader's legacy is cemented at the time of his or her death. Death appears to trigger considerable thought and reflection about the legacy of the deceased. Research in this area suggests that people's impressions of the dead are less likely to change than their impressions of the living. "One does not know more facts about a man because his is dead," observed the British author John Berger, "but what one already knows, hardens, and becomes more definite" (Berger 1967, 160). In other words, once people die our sense of their legacy becomes heightened and sealed. Leaders who are highly visible public figures often know that their deaths will draw attention to their life achievements and raise the question of how they performed as leaders, and how they will be remembered. A leader's death signals that his or her contributions are open to final assessment and evaluation.

Researchers have also found that people tend to view dead leaders more favorably than living leaders. Philosophers, authors, and poets have long been aware of the great respect and devotion people have for dead heroes and leaders, as well as the strength people draw from these individuals. Homer's *Iliad* and *Odyssey* (c. eighth or ninth century BCE) celebrates legendary Greek heroes, and Virgil's *Aeneid* (unfinished at Virgil's death in 19 BCE) commemorates the legendary Aeneas, the Trojan whose descendants, the Romans believed, were the first rulers of Rome. More contemporary ways of exalting dead leaders have included the practice of posthumously naming universities, buildings, and awards after them.

This phenomenon is called the death positivity

bias. The bias emerges in judgments of nonleaders as well as leaders, in impressions of both males and females, in judgments of those who die young as well as old; and regardless of the cause of death. In most cases, death causes a person's legacy to be assessed more favorably than it would be if the leader were still living. The death of a leader also enhances people's impression of the organization to which he or she belonged. This connection between a leader's behavior and people's impressions of the organization is a very strong one. Surprisingly, people show a death positivity bias even in impressions of leaders who were rather ineffective.

MORAL BEHAVIOR AND LEGACY DEVELOPMENT

It is important to note that the death positivity bias does not guarantee a favorable legacy for a deceased leader who committed moral transgressions. It appears that on the dimension of morality, people show an extremization bias: Dead moral leaders are judged significantly more favorably than living ones, whereas dead immoral leaders are rated significantly *less* favorably than living ones. Compared with living immoral leaders, dead immoral leaders are viewed as weaker, as less inspirational, as less motivational, as worthy of less respect, and as engendering less pride on the part of others in the organization. Also, whereas a dead moral leader's organization is rated more favorably than a living moral leader's organization, a dead immoral leader's organization is judged as less successful than a living immoral leader's organization.

Other findings offer clues regarding the difference between current impressions of living leaders and retrospective legacy judgments of past leaders. It seems that people's current impressions of a living leader tend to be influenced by moral or immoral behavior performed early in the leader's career. A dead leader's legacy, in contrast, is most influenced by moral or immoral actions performed in the final stages of his or her career. Even leaders who were immoral early in their careers will be highly revered upon their deaths if they performed numerous moral actions toward the end of their careers. Researchers

have called this phenomenon the St. Augustine effect, named after Augustine of Hippo (354–430), a Catholic philosopher and theologian who underwent a transformation from sinner to saint during the course of his life.

The public's reactions to the terrorist attacks on New York City and Washington, D.C., on September 11, 2001, support the idea that people reserve their greatest reverence for individuals whose final act is one of self-sacrifice. Hundreds of firefighters, emergency rescue workers, and law enforcement personnel sacrificed their lives to save others from New York's World Trade Center. Although almost three thousand people perished, a disproportionate amount of media attention and national mourning focused on the loss of these emergency personnel. Their courageous and heroic actions at the time of their deaths earned them a permanent positive legacy.

MAINTENANCE AND REPAIR OF LEGACIES

The results of several studies conducted in the United States in 2003 suggest that a leader ensures a positive legacy by engaging in proactive moral leadership, particularly as his or her career advances toward its final stages. The leader's death triggers an assessment of legacy, with the leader's moral or immoral behavior—with more emphasis placed on recent behavior—as the foundation on which the legacy is built. Leaders may benefit their current reputations by ensuring that moral actions taken early in their careers are widely known, but leaders who are conscious of their future legacies are wise to increase the level and visibility of their philanthropic activity toward the end of their lives.

Although many leaders aspire to exert a positive and enduring impact on an organization after they are gone, they often face obstacles. In the political arena, the U.S. presidents Richard Nixon (1913–1994; served as president 1969–1974) and Bill Clinton (b. 1946; served as president 1993–2001) both left office with moral stains on their reputations, although for very different reasons and to a very different degree. Nixon made numerous efforts to repair his criminal image by serving as an elder statesman, writer, consultant, and informal ambassa-

dor to subsequent administrations. Upon his death, criticism of his presidency and of his personal character were softened out of respect for the dead, but his post-presidential activities did not feature the type of moral emphasis needed to overcome his past unethical behavior. Clinton's legacy is still unclear. To improve history's final judgment of him, Clinton would be wise in his remaining years to emulate the postpresidential life of Jimmy Carter (b. 1924; served as president 1977–1981), whose philanthropic activity has endeared him to the public and overshadowed a presidency that many had criticized as ineffective.

The legacy of John F. Kennedy (1917–1963; served as president 1961–1963) is a fascinating example, inasmuch as the public's idealization of Kennedy's administration as the perfect Camelot was no doubt due to a heightened death positivity bias resulting from his premature death. Admired as a president, Kennedy and his reputation have withstood posthumous revelations of numerous marital infidelities and calculating behaviors. Had he lived to run for a second term, the realities of his lechery and dealings with underworld figures would most likely have gravely damaged the presidency, debilitated his administration, disillusioned his supporters, and clouded his legacy. Similarly, the positive image of Thomas Jefferson (1743–1826; served as president 1801–1809) has endured despite recent DNA evidence supporting the claim that he fathered several children with his slave, Sally Hemings. Kennedy's and Jefferson's positive legacies remain intact due to people's reluctance to alter their impressions of the dead, particularly if such alterations violate norms prohibiting criticism of the dead. The extremization bias leads people to judge dead immoral leaders more harshly than living ones, but only if their immoral behavior was known before they died. People who are well thought of when they die continue to be well thought of when negative information surfaces posthumously, a phenomenon known as the frozen-in-time effect. The results of several studies conducted in the U.S. suggest that, in general, impressions of the dead are more resistant to change than impressions of the living.

In the business world, legacy management is pervasive. The so-called robber barons of the late nine-

teenth century left remarkable philanthropic legacies in the arts and education. Steel magnate Andrew Carnegie (1835–1919) built libraries and museums, established the Carnegie Endowment for International Peace, and contributed vast sums of money to social causes. As a result, he became known as St. Andrew. The Rockefeller family, the industrialist Henry Clay Frick (1849–1919), and the railroad magnate Amasa Leland Stanford (1824–1893) were other late-nineteenth-century men and women of wealth and power who left sizable philanthropic legacies, perhaps spurred into giving by the pejorative label robber baron.
