Consider the example of Adams's photograph of the summary execution. The image itself enables the viewer to know at most that an individual was killed in a deliberate way by means of a pistol shot to the head. But such limited knowledge falls far short of what the viewer needs to know in order to ethically evaluate the act. For such evaluation further knowledge is required concerning such things as the events leading up to the killing and the mental states of the

persons involved. The viewer needs to know, for example, whether the executed man himself has in the past committed some deliberate act of killing, or whether the executioner believes that by carrying out the execution in summary fashion he will prevent acts of killing in the future. None of this knowledge can be acquired by means of a photograph. Words, by way of contrast, can easily provide such knowledge. They can, for example, inform the reader of heinous acts committed by the victim prior to the execution. Indeed, in the months after this image was widely circulated in the American press, Adams learned that the executed man had hours before murdered an entire family, a discovery that led Adams to lifelong remorse for the damage the image did to the reputation of the executioner. Such limitations in the kind of meanings photographs (and images generally) can convey lead Sontag to conclude that photojournalistic images can serve only to “goad conscience,” and that the effect such images can have will amount to no more than “some kind of sentimentalism.”

In her 2003 work, *Regarding the Pain of Others*, Sontag acknowledges some positive ethical dimensions of photojournalism. For one thing, such images can cause viewers to remember past atrocities, and remembering of this sort is for Sontag an intrinsically positive ethical act. As well, photojournalistic images can help keep the suffering of those who are geographically distant in the minds of viewers, and in this way make it more difficult for that suffering simply to be ignored. But Sontag remains steadfast in her lack of optimism with regard to the potential for photographs to foster comprehensive understanding.

A second and increasingly pressing ethical dimension associated with photojournalism arises from the advent of digital technology. Prior to the widespread use of such technology it was difficult to alter a photograph in an undetectable way. As a result, viewers of photojournalistic images developed an implicit trust that the beliefs they formed as a result of viewing such images were generally true, and that they had good reason for believing those beliefs to be true. As Barbara Savedoff notes in her book *Transforming Images: How Photography Complicates the Picture*, such trust has carried over into the digital era, and can be taken advantage of by those who avail themselves of digital techniques. A seamlessly altered image, presented to a trusting audience, can engender radically false beliefs, even while the viewers believe that they have good reason for thinking those beliefs to be true. Concern that such trust will be taken advantage of in this way has led newspapers to deal harshly with photojournal-

ists who succumb to the temptation. There is at least one instance of a photographer for the *Los Angeles Times* being fired for submitting a digitally altered photograph that was run on the front page.

Photojournalists themselves have been active and vocal regarding photojournalistic ethics. The founders and members of such professional groups at Magnum Photos codified many aspects of what is considered ethical practice in the late 1950s and 1960s. Earlier in the twentieth century, the use of photographic images in overtly propagandistic contexts, even those obviously highly manipulated, such as the montages and collages of John Heartfield or Hannah Höch in the 1920s and 1930s, provided a lexicon for use of images for social goals. The viewer was afforded the opportunity to be educated about the nature of the image itself as well as its purpose and thus be empowered to judge better the ethical issues that arose.

Portraiture

The portraiture context is one in which the photographer creates an image of her subject with the subject's willing participation. Commercial instances in which the subject hires the photographer to make an image that is pleasing to the subject—weddings, graduation photographs, department-store portraits—are ethically unproblematic, as in such situations it is understood that the photographer will use her technical expertise to render an image that is flattering in exchange for a certain sum.

Matters are more complicated, however, in contexts where the portraitist has not been hired by the subject, and is expected to make an image that is interpretive. Examples of this sort include images by a diverse range of photographers including Diane Arbus, Richard Avedon, Annie Leibovitz, Robert Mapplethorpe, and Alfred Stieglitz.

A sustained investigation of the ethical dimensions of such portraiture occurs in Arthur Danto's essay “The Naked Truth.” Danto's discussion begins with the observation that it is an important aspect of being human that we care about how we appear to others. Unlike non-human animals, with the onset of adolescence, human beings normally become highly conscious of the image they project to those they encounter. Given the centrality of such concern, Danto suggests that we ought to have a right to control over our appearance, a right that can be thought of as akin to our right to control over our bodies. In the same way that it is wrong to do violence to the body of another (including medical procedures absent informed consent) it is arguably wrong to do violence to the image of another.

And since the interpretive portraitist has the power to present via his photographs an image of the subject that is in conflict with the image that that subject desires to project, an ethically problematic situation arises.

Danto illustrates his claim by discussing two portraits of the Warhol-orbit transvestite Candy Darling, one made by Richard Avedon and the other by Peter Hujar. Candy Darling desired to project the image of a glamorous, female, Hollywood film star, notwithstanding her biological maleness. To do so she dressed in the attire, arranged her hair, and exhibited body language and patterns of speech evocative of Lana Turner or Kim Novak. However, when Avedon invited Warhol and members of the Factory to his studio for a group portrait he apparently asked Candy Darling (and several others) to disrobe, so that in the portrait Candy Darling is naked—her penis fully in view—thus presenting an image of her radically at odds with the one she desired to project. Hujar's portrait, by way of contrast, made in a hospital room in the period before Candy Darling's death, shows his subject fully in character, playing out the role of a participant in a glamorous death. Danto is highly critical of Avedon for his "morally bruising" treatment of Candy Darling's desired image, and praises Hujar for having "submerged his artistic will to that of the subject."

The plausibility of Danto's ethical judgment hinges on whether it is desirable to construe the role of the interpretive portraitist so that she is always constrained by a respect for the desired self-image of her subject. While in many instances we may laud a portraitist for submerging her artistic will in this way (certainly this is the case with Hujar's portrait of Candy Darling), there are at least as many instances imaginable in which we feel that the subject's desired self-image is problematic in some respect (inappropriate, vain, inflated, etc.), and that the portraitist is doing all parties involved a favor by violating it. An example might be the portrait made by Diane Arbus of Norman Mailer (*Author Norman Mailer in His Brooklyn Home*, 1963). At the time she made the portrait, Mailer's public image as the embodiment of virile manliness was at its peak, and yet Arbus produced an image that suggests Mailer is physically underendowed. It is arguable that such treatment, notwithstanding the "moral bruising" of Mailer's image it perhaps involved, was appropriate at that time. Given this possibility, in order to complete his examination of the moral structure of such images, Danto will need to provide some

guidance regarding when—and when not—it is appropriate for the portraitist to impose her artistic will.

A related debate arose with the publication of a series of photographs taken by Diane Arbus in the early 1970s of residents of homes for the mentally handicapped (Diane Arbus, *Untitled*, Aperture, 1995). In an article published in the *New York Observer*, the photography critic A.D. Coleman harshly condemned Arbus's daughter Doon for allowing such publication. His central claim was that such images constitute "a fundamental violation of human rights," presumably because they project images of subjects who could not have provided the kind of informed consent in the use of their images that Danto's position apparently requires.

In her essay "Aristocrats," Janet Malcolm takes a much more positive attitude towards the Arbus publication. She argues that the subjects are portrayed in a very positive light, reflecting Arbus's attitude that those born with their traumas are society's true aristocrats—they have (in Arbus's words) "already passed their test in life." As well, Malcolm suggests that the images can benefit current residents of homes for the mentally handicapped by presenting images that convey such nobility. These positive consequences, Malcolm seems to suggest, override any concerns we should have about violations of individual rights.

It is difficult—perhaps impossible—to resolve the debate between Coleman and Malcolm. They emphasize different axioms of ethical thinking, axioms that are inherently in conflict. Coleman places a premium on concerns about violations of human rights, concerns that are not lessened by observing that such violations can have positive consequences. Malcolm, by way of contrast, is apparently willing to forgo concerns about human rights if the benefits of doing so are great enough. The difference between the two positions is thus an instance of the traditional philosophical conflict between deontological and teleological approaches to ethics.

Street Photography

The street-photography context involves a photographer making non-photojournalistic images of human subjects in public locations typically without their permission and often without their knowledge. Classic examples of this sort include images by Bill Brandt, Manuel Álvarez Bravo, Henri Cartier-Bresson, Robert Frank, Helen Levitt, and Garry Winogrand.

The legal status of such activity is clear. The general rule is that in the United States photographers are free to publish images of any person who

was located in a public venue, whereas in Quebec and parts of Europe the subject's consent must be obtained before an image is circulated.

The ethical dimensions are less clear and have not been discussed in a systematic way. However, it is likely that many of the issues Danto raises in his discussion of portraiture apply in this context as well. If we assume that persons have a right to control over their appearance in the same way that they have a right to control over their bodies, then it follows that a subject's informed consent should be obtained before their image is published. Informed consent embodies two requirements: (i) the subject must be told how their image will be used and, (ii) the subject must understand the possible consequences of such use. However, placing the burden of obtaining such informed consent on a street photographer would render the activity practically impossible. For one thing, such photography often takes place in crowded and fast-moving public spaces, making the apprehension of individuals to sign consent forms impossible. And even if such consent could be obtained, it is unlikely that it would be obtained with the subject's full understanding of the possible consequences of the publication of the image (often even the photographer is unaware of these).

Thus if we take Danto's concerns seriously it may be that street photography is intrinsically unethical. Many will resist this conclusion, objecting that there must be something wrong with an argument that labels unethical many of the best photographic collections of the twentieth century, including Robert Frank's *The Americans*, and Henri Cartier-Bresson's *The Decisive Moment*. The matter remains unresolved and is ripe for sustained investigation.

Documentary Photography

Much like street photography, documentary photography captures images of individuals often, but not always, without their consent. Further, these images are presented as being objective, speaking to some higher "truth" that justifies the use of individuals' images, often rendering those portrayed as anonymous, as in Dorothea Lange's famous *Migrant Mother, Nipomo, California*, 1936. While photographing a person on the street presents little opportunity to identify that individual, Lange clearly was capable of identifying her subject and in fact the title contains the specifics of the place in which the photograph was made, raising the inevitable question of manipulation of the subject in an attempt to structure a more dramatic emotional reaction to the image. Likewise, August Sander's portraits of Ger-

man "types," which in order to create a social document purposefully avoided allowing individual identity, are often cited as ethically ill-conceived, while simultaneously admired as striking and important photographs.

The rapid rise of social documentary photography with the Works Progress Administration and Farm Security Administration and the illustrated magazines that promulgated these images, such as *Life* or *Look*, combined to produce questions about the ethical behavior of the photographers. A famous example was that of Arthur Rothstein, who was accused of faking his striking image of a skull baking in the wasteland of the Dust Bowl, and stage-directing a shot of a farmer walking through a dust storm with his young children. Rothstein admitted to moving the skull and framing pictures to delete or include points of reference in order to make a more dramatic shot, a common practice in documentary image-making, yet the controversy around this incident seemed to arise more from a clash of political ideologies rather than photographic ones, a not uncommon occurrence. Also of concern was the government's goal of obtaining images to promote social programs, leading some to denounce the entire WPA/FSA project as propaganda.

PHOTOGRAPHY IN EUROPE: AN OVERVIEW

As the birthplace of photography in 1939, Europe has had the medium's longest development and many of its most significant achievements. In the twentieth century, however, an overriding characteristic of photography was that it had become a true worldwide phenomenon. Yet in many spheres, European photography was innovative and continued to lead the world. The period between the two world wars was perhaps the most fertile in photographic history, in experimental fine arts photography, in the development of equipment and other technical advances, as well as in popular forms, particularly the use of propaganda and the development of the illustrated press. Yet during other eras, Europe lost ground. In the manufacture of equipment, the center in the postwar era shifted to Japan and the United States; in scientific advances the United States, though the Eastman Kodak and Polaroid Companies predominated.

The individual countries of Europe each have their unique histories, and regional histories can also be traced. Photography in Europe overall has become a true topic along with the development of contemporary art photography in the last three decades of the century. And even within the realms of contemporary photography, there are very various, different, and equal tendencies, and it would be extremely foolish for example, to reject *libre expression* photography in the name of documentary photography or vice versa.

The most important and erudite essay on photography in Europe was written in the first issue of the magazine *European Photography* (1980) by Jean-Claude Lemagny, curator of contemporary photography at the Bibliothèque nationale de France in Paris. He introduced a model of an aesthetic clock that served as a means for an original as well as conclusive analysis of photography. It was a proposal for the classification of the contemporary tendencies in the medium of photography with great attention to the survey of photography as a whole and thereby tried to explain the different, interrelated processes without neglecting their differences and correlations. In 1991, he did an update and took a second look at his clock.

In his first classification of creative photography in Europe, he started with 236 extremely varied pictures in slide form and laid them out in a circle. He let himself be guided solely by the visual relations that spontaneously developed among the pictures without assigning them a definite place a priori. He noticed that the main points of the circle could be characterized by a few fundamental approaches toward photography. At 12 o'clock stood the conceptual picture, the photo as pure idea; at 6 o'clock, the photo as material object, as chemical-physical matter; at 3 o'clock, the photo as relation to external reality, as reportage; and at 9 o'clock, the photo as relation to inner reality, as surrealism—including, of course, all the transitions between the hours.

If we use this model for the classification of photography in Europe at the end of the century, what would be seen?

What was most conspicuous to Lemagny was the significance of the 9 o'clock pole: photography as a picture of the internal world, as staging. It is undisputed today that photography simultaneously can be a medium for projecting an idea and a medium for recording reality, and the shock generated by this insight has sent a wave along the entire circle.

At the 12-o'clock pole, the significance of photography as an instrument of the conceptual artist has weakened: the mighty impulse from 9 o'clock has covered this pole and almost strives to unite itself with the photo as pure representation (3 o'clock). It is this powerful drive that unites the internal picture (9 o'clock) with photography as social criticism, together with theoretical reflection (Victor Burgin) and post-modern practice. It is currently in the process of overcoming the contradictions between the subjectivity of the artist as an intellectual on the one hand and his duty as an observer of social conditions and their inadequacies on the other.

At 6 o'clock the tendency toward an abstract, geometrizing photography has disappeared in favor of an intensive and multiform search for the substance of photography, for its means of expression: that which Lemagny called the "resurrection of the

flesh," in turn driven by the "return of the gods" coming from 9 o'clock and its "theatre of reality."

The pure reportage or photojournalism at 3 o'clock does not seem to have reawakened. Interest in it has further declined in favor of a reflection upon society that comes from the "north" and a formalistic (in a positive sense) attribute that comes from the "south" and is expressed in the pictures of Joseph Koudelka or in documentary commissions (François Hers's DATAR-projects in France).

Thus, according to the most recent state of affairs, the 9 o'clock pole has proven to be the shining victor. Its protagonists were Paul de Nooijer and the Dutch School and elsewhere (in France, Georges Rousse and Bernard Faucon) have become numerous. By way of the intermediate stages of social conception in photography (as the team of Magnum Photos) this pole tends almost to supersede traditional reportage. And by way of the exploration of the material possibilities of photographic production, the movement leads to the "direct" photograph. For no thinking photographer today forgets—regardless of how strongly he may reject any subsequent manipulation of the picture—that the print which he produces is nothing other than the sum of its tactile value.

All these movements first take form and make sense in the long view. We should always remember that contemporary art—in contrast to science—does not advance more quickly than the arts of the past. We notice that from 1930 to 1950 the central pole lay approximately at 3 o'clock (Brassaï, Henri Cartier-Bresson), while today it is located on the opposite side (at 9 o'clock). And that in the 1970s, the liveliest points were likewise opposite each other: 12 o'clock (conceptual artists, Christian Boltanski) and 6 o'clock (Pierre Cordier, Jean-Pierre Sudre). The 9 o'clock pole stood at the beginning of its ascent: Michael Szulc Krzyzanowski and others were still lonely exceptions. And a certain dynamic definitely emanated from the 3 o'clock pole: Gilles Caron, Gilles Peress, Carl De Keyzer, David Hurn, Martin Parr, and many others. The dynamic proceeded "south" (toward 6 o'clock) with William Klein, and "north" (toward 12 o'clock) with Robert Frank, who finally tipped the balance.

Studying the contemporary photography you can conclude that both—two major currents—the "southern" and the "northern" supremacies today.

Photographers such as Suzanne Lafont, Craigie Horsfield, Dirk Braeckman, Pentti Sammallahti, Sophie Calle, Thomas Struth, Andreas Gursky, Anselm Kiefer, David Hockney, Thomas Ruff, Joan Fontcuberta, Andreas Müller-Pohle,

Annette Messager, Peter Fischli and David Weiss, Wolfgang Tillmans, Bernard Faucon, Rineke Dijkstra, Pierre et Gilles are to be the truly great artists of our time, representing the United Kingdom, Germany, Belgium, the Netherlands, France, Spain, and Finland.

But more than in other art forms, the subversive and revolutionary strength of photography lies in the muteness of the forms, and the conceptual photography of the 1970s lost significance to the extent that it failed to pose the relevant questions and denied the material qualities of the work, because the true artist's only problems are technical problems.

As for the future, it appears that it lies at 6 o'clock, in a photography that is supported by the objective reality of its material forms, after having forgotten for a moment that in art there are only material forms. But the philosophical point of view (12 o'clock) is also lively. At first sight philosophy and photography appear to be closely linked, until one checks which philosophers have written an essay on the topic. Apart from the major exceptions of Roland Barthes and Walter Benjamin, hardly any have. This is quite astonishing, but then again it is not. It is not, because philosophy reflects; it is a re-view that looks back at what has occurred, and photography is too recent an event already to be part of the question of the essence of humankind. This is because photography displays a similar ambiguity to philosophy. Both show something and are therefore knowing, but also put a question and are therefore unknowing. In the Merleau-Ponty vein, philosophy is an unknowing knowing. And ambiguity is a central element of philosophy. This was formulated somewhat more emphatically by Samuel Ijsseling, when he sought to define philosophy in two opposing statements:

Philosophy is a body of well-founded affirmations and justifiable denials which altogether display a certain coherence; it is in other words a "science." Philosophy is a body of questions which again and again question what has already been stated (the entirety of affirmations and denials); this means it is an un-knowing.

Photography is equally ambiguous. It shows something, a fragment of reality framed by the camera or in the darkroom which, considering the objectivity of the process, can lay significant claim to factual knowledge. Each one also asks a question: what is the reality-value of an image? And how is the objective de-objectified by the subjectivity of the maker and the viewer, augmented by the contextual influences on both? This ambiguity has

been called the “paradox of photography.” Could it be more philosophical? It is Barthes in particular who opposes the “doxa.” The “doxa” is the view that derives its strength from power in the broadest sense of the word: public opinion, the view of the silent majority, the narrow-minded view, everything that is so-called “natural,” the violence of prejudice, that which one maintains *is* so because it *is* so. The metaphorical sense of the word “para” in Greek is “against.” *Para tein doxan* means “against expectations.” This last word at the same time makes the link with psychology, which assumes that our perception is determined by expectation. The paradox starts us thinking, in order to adjust our expectation to the actual situation. If not we are “dogmatic,” a word with the same stem as “doxa,” which refers to the unwillingness to change one’s opinion. Barthes argues for paradoxical thinking. Photography states this paradox most acutely. Every photo is a “doxa”: it is reality the way it is, in many cases even with demonstrative force.

However, every photo is a paradox: it is a picture of reality, or in other words, it is a way of seeing. And that should not be taken too simply, as no more than a relativization by accentuating the fact that it is a way of looking, coupled with the conviction that it actually is reality. Its “image-dom” implies that it is not reality, that it is a way of representation, that in our pan-photographic culture we have learnt that this reality as such cannot say anything with any certainty that we do not know from other sources of information, such as direct observation or verbal explanation.

A philosophy of European photography is part of cultural philosophy when photography is considered as a mass-culture phenomenon, and part of art philosophy when “art photography” is concerned. In my opinion it would at this point be wrong to make a major distinction, on the basis of either philosophy or photography. Art philosophy may be considered part of cultural philosophy. In the case of photography one might ask oneself whether the desire to be art is important. Perhaps photography should just be photography. In addition to this there is the postmodern phenomenon of the blurring boundaries between art and mass culture. The latter is becoming the object of or source of inspiration

for the former. And in its outdated modernism art is becoming kitsch.

This is why a philosophy of the history of photography comes down to asking the classic questions: “What are its characteristics? How can one interpret it? What is its value? How does it function and within which systems? How is meaning produced? All this makes a contribution to the fundamental philosophical question: what is photography?”

In Europe we see that the ambivalence between photography’s reference to reality and its openness for the imaginary is especially interesting for artists who are investigating how place and the perception of it can be represented. Contemporary photographers are mainly concerned with conceptual reflections on the seamless transition between the presentation and the representation of a place, the documentation of an active, artistic re-arrangement of a location or the construction of space, using diverse media and thus crossing the border of two-dimensional photography.

The field of hybrid rhetoric paradoxically unites the diverse European countries that continue to enjoy the differences of their collective experience. Leaving the 1990s, when “visualism” was at stake, the contemporary photographic practices of Nordic and Eastern countries draw closer to the South and Western aspiration to transgress medium-bound, traditional art photography and move toward critical reflections.

Perhaps we can end with a statement of the man who offers us the red thread in our overview, Jean-Claude Lemagny: “It is certainly clear that in the eternal struggle between reality and the idea of it that one constructs, reality must conquer the idea and only that which Zarathustra calls ‘the sense of the earth’ deserves to triumph.”

FREDERICK H. EVANS

British

Known for his extraordinary interior photographs of churches and portraiture, Frederick Henry Evans went against the prevailing winds of his era in photography to produce startling modern, historically important photographs at the turn of the nineteenth to the twentieth centuries. Despite his international renown in midlife, Evans's early years are largely unknown. Born in 1853, Evans was self-educated, and in the 1870s, he was a bank clerk. In his early 20s, because of poor health, he visited Boston and lived with his aunt for a year. Health was also the reason for visiting England's Lake District, where the scenery made a deep impression.

In keeping with the scientific era, Evans bought a microscope in the 1880s, and then took up photography to record the images. The Royal Photographic Society, in 1887, awarded him a medal for his photomicrographs of shells. In the 1880s, he left clerking and became a partner, and later, sole owner of a London bookstore. The book shop attracted a remarkable clientele, which included George Bernard Shaw whose writing on Ibsen Evans recommended to appropriate customers. In addition to a considerable literary background, Evans also acquired a connoisseur's appreciation of art, and he collected drawings, prints, and Japanese artifacts. Evans recognized the artistic talent of the 18-year-old Aubrey Beardsley, a frequent browser in the store, and it was Evans who recommended this young artist to the publisher J. M. Dent.

Evans's photography included portraiture, and Beardsley proved one of his best subjects in a photograph showing him in profile, his long hands supporting his chin. The pose of this young artist of the Decadence referred to a gargoyle on Notre Dame de Paris.

While running his unusual bookstore, Evans pursued photography in his spare time, and in 1894, he photographed York Minster, where he would return in 1902 to make *In Sure and Certain Hope*, whose title comes from The Book of Common Prayer.

Typically, Evans would visit a cathedral town for days so he could experience the sacred building under many different conditions. If necessary to achieve the

right effect, he would pressure church officials to remove furniture and even gas lighting fixtures.

He usually used a 4 × 5-inch camera and occasionally an 8 × 10 camera. Double-coated Cristoid films were used so that shadows and highlights would be recorded on fast and slow emulsions to assure maximum detail. A battery of lenses up to 19 inches in focal length was used to get the desired coverage and perspective. Typically, exposures ranged from several seconds to hours at f/32. The negatives were always printed on platinum paper, which yielded an especially subtle range of middle tones.

Health forced Evans to retire from book selling, and he moved to Epping in 1898, but this allowed him to pursue photography full time. In 1892, some photographers seceded from the London Photographic Society (after 1894, The Royal Photographic Society of Great Britain) and formed the Linked Ring, a select international group open to women and featuring the annual Photographic Salon. Evans was invited to join the Linked Ring in 1900, where he was a leading advocate for the Purist faction as opposed to the Pictorialists or Impressionists, who advocated using manipulative techniques.

As designer and installer of the Linked Ring's Photographic Salon exhibitions at the Dudley Gallery in London from 1902–1905, Evans showed skill and imagination in transforming a somber space and usual hanging methods into a well lit area with photographs arranged to emphasize visual statements. These ideas spread to the Little Galleries of the Photo-Secession. Evans corresponded extensively with Alfred Stieglitz, leader of the Photo-Secession in New York and publisher of *Camera Work*, where Evans's work and ideas were well represented.

Without training in traditional art media, Evans could not practice the manipulative techniques others used to emulate fine art. Consequently, he championed straight or pure photography and wrote frequently in journals such as *Amateur Photographer* and *Photography*, where he championed his beliefs about photographic art. While praising the gum bichromate works by Robert Demachy and other outstanding artists using manipulative tech-

niques, he did not wish to call such images photography. Evans believed photography could achieve the level of art through the medium's limitations rather than with hybrid imitations. While he sometimes resorted to retouching and other corrective measures, he staunchly maintained there should be no tampering with the negative or print.

Such perfectionism was not an end in itself, and Evans aimed for what he called "cathedral picture-making" in which the result would give the viewer an emotional experience equivalent to what might be felt at the actual site. He pursued this aesthetic in all aspects of his photography, including landscapes where trees were photographed for their architectural resemblances. This idea of art through a limited medium was extended to his other passion, the pianola, and though critics derided him, Shaw, another pianola enthusiast, defended him.

Evans was influenced by J. M. W. Turner's architectural watercolors, as well as by Odilon Redon's contemporary Symbolist prints, which he collected. In addition, he steeped himself in the theology of correspondences of the eighteenth century mystic Emanuel Swedenborg as interpreted in the writings of James John Garth Wilkinson. The metaphorical title, *A Sea of Steps* (1903), showing the stone, wave-like steps to the Wells Cathedral Chapter House, would seem to suggest Evans's interest in Swedenborgian thinking as well as in the Symbolist movement.

The purist approach also suggests influences from critic John Ruskin's emphasis on depicting facts and those Pre-Raphaelites who aimed for "photographic" detail. Evans was not a social activist like William Morris, though he shared the Arts and Crafts leader's views on work, and in 1896, he photographed Morris's Kelmscott Manor.

Evans reached a wider audience when *Country Life* published his work on English churches in 1904–1905. This magazine then offered him an open commission, so he chose to photograph mostly chateaux and small churches in France from 1906–1907. Around World War I, Evans concentrated on photographing works of art, which were then privately published in platinotype editions. Never one to compromise, he could not accept silver-based papers, which were replacing platinum paper. So, he stopped photographing.

When he died in London on 24 June 1943, few were familiar with his achievements. The Royal Photographic Society reawakened interest in his work through a memorial exhibition in 1944.

Biography

Born 26 June 1853. Little known of his early years, but in 1870s was a clerk in a London clearing house. Around 1873, went to Boston for a year because of health. Purchased camera in 1883, made photomicrographs. Bookstore operator in London in 1880s. Became friends with George Bernard Shaw, helped launch Aubrey Beardsley's career. Photographed cathedrals, landscapes, and portraits. Retired from bookstore in 1898, and moved to Epping. Elected to Linked Ring in 1900, from 1902–1905 in charge of London Photographic Salon. Featured in *Camera Work* 4 (October 1903). Photographed English parish churches for *Country Life*, 1905. In 1906–1907 photographed French chateaux and churches for *Country Life*. Joined London Secession, 1908. Landscapes reproduced in George Meredith Memorial Edition, 1909–1911. Membership in the London Salon Club, 1910. Interior photographs of Westminster Abbey for *Country Life*, 1911. From 1912–1919, privately published editions of platinum prints of artist's works. Made Honorary Fellow of The Royal Photographic Society, 1928. Died 24 June 1943.

WALKER EVANS

American

Walker Evans's photographs helped define, document, (and sometimes invent) both the cultural and physical landscape of America in the twentieth century. More than any other photographer before him, Evans relished the anonymity of his camera and its reflective, detached quality, and his subjects, from tenant farmers in Alabama to domestic exteriors throughout America, are simply allowed to exist as themselves, never sentimentalized or celebrated. Walker Evans was as exacting and meticulous as the images he documented, calling his photographs "reflective rather than tendentious and, in a certain way, disinterested" (Hill 1982, 151). Though he worked independently for magazines such as *Time* and *Fortune*, Evans is probably best known for his collaboration with fellow journalist (and poet/novelist) James Agee in a sprawling documentary of tenant farmers in Alabama, *Let Us Now Praise Famous Men*. Originally ignored in its initial publication in 1941, *Famous Men* was re-discovered in the early 1960s, and heralded as a masterpiece by many critics, and Evans's reputation as a documentary photographer enjoyed a rebirth and re-evaluation that continues to this day.

Though born in St. Louis in 1903, Evans spent much of his boyhood in Toledo, Ohio, Chicago, and New York City because of his father's relocations as an advertising director. Evans's family was fairly affluent, sending young Walker off to Phillips Academy in Andover, Massachusetts. After his graduation in 1922, he enrolled in Williams College, Williamstown, Massachusetts, and began studying literature. His love of writing and literature eventually sent him to Paris, where he studied briefly at the Sorbonne, hoping to become a writer himself.

It wasn't until around 1928 that Evans first began to experiment with photography, taking a few shots with a basic, handheld camera and sharing them with his friends. But it was his love of literature (especially European modernists like Pound, Joyce, and T.S. Eliot) that inspired Evans's early photographs and theories about art. His first published photographs of the Brooklyn Bridge (for Hart Crane's epic poem *The Bridge*) were mere shapes, close-ups of the latticework and structure in

heavy definition, like the disjointed, cubist canvases of Pablo Picasso.

Around this time, Evans became interested in documentary photography, spending his days on the streets of New York snapping pictures of its architecture and people. His own style began to emerge as a mixture of realism and objectivism, where the subjects or the images became the central focus of the work, non-dramatic, non-posed, and the author's presence was minimized. His friendship with Lincoln Kirstein, the son of a wealthy Boston socialite, allowed him the opportunity to create his first series of domestic exteriors of Victorian houses throughout New England, which would later become his first solo exhibition at the Museum of Modern Art in 1933, and two years earlier, his first group exhibition at the John Becker Gallery in New York put him in the company of up-and-coming photographers Ralph Steiner and Margaret Bourke-White.

Evans's trip to Havana (to provide pictures for Carleton Beals's book) brought the first of Evans's documentary photographs that would later define his style. Evans's photographs in *The Crime of Cuba* were studies of the people of Havana, of the poor families living on the streets, or the ubiquitous beggars fanning out across the town. But Evans stopped short of making any political statement with his camera, observing the ironies of Cuban life remotely. Unlike other documentary photographers, Evans hungered after the non-posed, non-dramatic, simple subjects. His photographs were observant, anonymous, and sequential studies that fit together rather than individual images that stood on their own, and the Cuba series, published in 1933 gave Evans the exposure that propelled him into his next two jobs, as a staff photographer at *Fortune* magazine, and, perhaps most importantly as a documentary photographer under Roy Stryker in the Resettlement Administration (later the Farm Security Administration [FSA]).

But Evans's best-known photographs were most likely taken during a break in his duties with the Resettlement Administration (RA) during a brief stay in Hale County, Alabama, with novelist and friend James Agee. Agee had initially been commissioned by *Fortune* magazine in 1936 to do an article

on the plight of the Southern tenant farmer and was assigned a staff photographer. He insisted that *Fortune* get him Evans, and the publishers negotiated a deal wherein Evans would be able to leave the RA, but his photographs would still be in the public domain. There may not have been a more unlikely partnership: Agee was a romantic, obsessed with the superficiality of documenting lives plainly with himself in-frame; Evans was clinically out-of-frame, an anonymous, bodiless eye, recording and observing. The resulting "article" was both too long and too confusing to be anything *Fortune* could publish, and eventually, Agee and Evans published it as a photo-text (along the lines of Caldwell and Bourke-White's *You Have Seen Their Faces*).

When *Let Us Now Praise Famous Men* was published in 1941, Walker Evans's 31 photographs were the preliminary "book" to Agee's. The photographs and words were co-equal representations and commentary on the lives of the farmers they lived with. The book was revolutionary, a massive indictment against documentary efforts to represent any life absolutely, and also a re-appropriation of the genre of photo-text itself. But America's period of intense introspection was passing, and Evans and Agee's angry book garnered little comment; it would not be until nearly 20 years later that *Let Us Now Praise Famous Men* would receive the proper attention it deserved. What makes Evans's photographs in *Famous Men* so powerful is their unflinching and clinical attachment to detail and subject. When pictures were framed wrong or focused incorrectly, Evans simply cut out the negatives, physically cropping and editing his pictures to a more faithful representation of what he observed and wished to convey.

Unlike many of the photographers working for the RA, Evans's pictures were lucid, candid; the opposite of the propaganda he was hired to produce. Though the RA was peppered with stellar photographers, some of whom would go on to have important careers, Evans's pictures are the most well-known and the most memorable. They quickly became icons of the period he was documenting and have remained epitomes of both 1930s' photography as well as of the powerfully influential notion that the photographer can be both vitally engaged yet removed and anonymous that results in a sort of transcendence of both subject matter and maker.

His style of anonymity allowed Evans the opportunity to photograph truly anonymous subjects, to observe and reproduce clear images without the burden of heavy commentary and superficial drama that he felt distracted the viewer from the actual topic. This is best demonstrated in Evans's next

project after being released from the RA, a portrait series of New York City subway riders. Evans concealed his camera under his coat to snap these pictures in an extreme example of his desire for anonymity, where Evans acted virtually as a voyeur to attempt more realistic, unrehearsed pictures. Indeed, these photographs have a random, detached quality, creating a connection between anonymous photographer and subject.

The simplicity of Evans's subjects and style belies a very complex and focused eye; he attempted to translate what he knew about literature, modern art, and popular culture into a visual reflection. If one is amazed by the clearness of Evans's eye, it must also be considered that such clarity only deepens the difficulty of interpretation. Above all else, Walker Evans did not want his photographs to tell stories, follow moods, and create drama: they resist simple assimilation and understanding. Recently, Evans's pictures of signs and advertisements have come into critical scrutiny, and through them, one can glean not only the documentation of America and its popular culture, but also a real and palpable borrowing of such modern art techniques as collage, found art, and *trompe l'oeil*. His vision and style, crystal clear, uncompromising, makes his photographs some of the most recognizable in the history of American twentieth century photography, and the arbiter and documenter of a peculiarly introspective American decade, the 1930s.

VALIE EXPORT

Austrian

Valie Export is a leading European figure in the experimental, restless mix of artistic media that characterized late twentieth-century contemporary art practice. She has done drawings, texts, films, video, and performances documented through photographs that explore feminist topics, especially the power relationships between men and women and female sexuality. Binding all of Export's work is a concern with puncturing or deconstructing media representations that shape the viewer's perceptions. Although Export came of age as an artist during the heyday of the *Wiener Aktionismus* (Vienna Actionism) group and Body Art, her status as a woman set her apart from the particular activities of these artists who used their bodies as an extended medium to create transgressive actions meant to question the status quo and shock the public. Arising from the societal upheavals caused by and following World War II, and dealing openly with sex, aggression, and destruction, the Actionists inspired Export to delve into these difficult subjects.

Early in her career Export, rebelling against traditional forms in cinema that she believed were mercenary, helped define the concept of "expanded cinema." Her concept re-examined the processes of shooting, film editing, and projecting film in works featuring numerous screens and installations with mirrors that allowed the illusion of duplication, as in *Abstract Film n° 1*, 1967, or *Split Screen Solipsismus* from 1968. The theory of expanded cinema also included interactive works that went beyond passive viewing. Export's *Tapp und Tast Kino* (*Tap and Touch Cinema*) is such a work. A film performance, the artist strolled through the streets of Vienna, her chest covered by a box fitted with curtains. Her frequent artistic partner Peter Wiebel invited passersby to reach through the curtain into the box and touch the artist's breasts, the artist remaining indifferent to men's touches. Export also realized more playful works like *Ping Pong, Ein Film Zum Spielen*. The viewer is invited to play a Ping Pong game in which the opponent is a television screen, emphasizing the split in the reality of contemporary life by presenting both a real and virtual ball and the power relationships between the media (artist-filmmaker) and the consumer (player).

Export's involvement in a wide variety of artistic media can perhaps be explained by her first artistic act in which she took the name by which she is known. Born Waltraud Lehner in Linz, Austria, in 1940, she attended a convent school and then studied at the *Textilfachschule* (Technical School for Textile Industry) in Vienna. She married, became a mother, divorced, and then completed her studies in 1964, with a specialization in textile design. In 1967, she created her pseudonym, Valie being the diminutive of Waltraud, and Export being an excerpt from the popular Austrian cigarette brand AustriaExport. In taking this pseudonym, Export created a reflection on consumerist ideology and grounded her artistic identity in photography and graphic design. Export prefers that her name be printed in capital letters, emphasizing it as a brand name. In 1970, she created the black-and-white photographic work *Valie Export Smart Export*, where her face is partially hidden by a pack of cigarettes where the AustriaExport logo is replaced with a close-up of her face encircled by the words "*Semper and Ubique, Immer und Uberall*,"—"always and everywhere." She aggressively thrusts the cigarette pack forward toward the viewer, her face frozen into a defiant mask with closed eyes and a lit cigarette between her lips. This appropriation of masculine codes remained at the center of her subsequent works.

Export's impact of photography has been significant in its manifestation as preserving a documentary trace of performances realized in public area. One of her best-known actions, the tattooing of a garter fastener on her thigh in 1970, is known chiefly by its photographic documentation. From her 1969 action *Aktionshose: Genitalpanik* (*Action Pants: Genital Panic*), for example, there are only a few pictures, posters, and text that remain. This action consisted of walking the aisles in an art movie house wearing pants in which the crotch area had been cut out, exposing her genitals, radically reversing the conventional relationship of the female sex to consumers of movies. During 1968, she created her three *Identitätstransfer* (*Identity transfer*) works, where she presented herself adorned with attributes associated with men, such as a chain bracelet or a chain hanging down an open shirt. The photograph commemorating one of these actions shows her hair

ruffled, wearing a leather jacket, tight jeans, and with a gun in one hand. Export plays with posture, spreading her legs so that her sex is obvious, revisiting the codified image of the rebel and proposing a feminist version of male chauvinism. The artist does not play with dressing-up, so cherished by artists like Marcel Duchamp, but presents herself as a woman who assimilates the criteria defining masculinity. In her male garments, masculine posture, and with the ultimate masculine fetish, the gun, as an accessory, she presents her female sex like a weapon in order to explode the cultural taboos about “unladylike” behavior of spreading the legs wide as well as to invoke Freudian theories about fetishism.

From 1972 to 1982, Export conceived perhaps her best-known photographic works, the series *Körperkonfigurationen (Body Configuration)* in which she considered the relationships between her body, architectural elements, and geometry. In these images, she lays herself in various configurations out in the urban landscape to both accentuate the architectural space and serve as a constraint to it. In *Aus dem Geometrischen Humanoiden Skizzenbuch der natur (From the Geometric Humanoid Sketchbook of Nature)* of 1974 she positions her hand to “hold” the landscape. In these pictures, the body is not always charged with a political message, but suggests its inability to submit to and thus adapt to the architecture, by extension, its inability to submit and adapt to the social and political architecture that shapes society. In 1989, she realized her first digital photographic works, and has continued experimentation with this medium.

EXPOSURE

Making an exposure is the first step in making an image permanent. Once an exposure is made, the film is developed, and the image is created. In the case of digital imaging, the exposure is recorded directly to the light-sensitive device. The amount of exposure is determined by how much light strikes the film or light-sensitive device. In negative films, for example, an increase in exposure results in an increase in density on film. Exposure controls include aperture (f/stop) and shutter speeds that are set based on recommendations of the in-camera light meter.

Getting the correct amount of exposure on film is important for capturing all of the detail in the original scene. For example, if the film does not receive enough exposure (underexposure), the shadow areas of the original scene will not record, and the midtones and highlights will seem dark. If a film is given too much exposure (overexposure), the highlight details will be lost.

The amount of exposure needed is based on varying factors. The amount of light in the scene, the film's speed (sensitivity), and the reflective characteristics of the subject are the contributing factors in determining the correct amount of exposure. Other aspects include lens focal length, the

distance from the lens elements to the film (bellows extension), and any filters or supplementary lenses that could be used.

Exposure Measurement

The amount of light needed to properly expose film is measured by a light meter. A light meter can either be internal or handheld, and makes its measurements in the context of a given scene. The light meter also needs to be set for the ISO of the film being used; this determines the actual amount of light needed for a "good" exposure based on the film's light sensitivity. The outcome of this measurement is usually in the form of aperture and shutter speed settings, though many meters can also determine the number of EVs (exposure values) for a given scene. All meters render the light or subject they are measuring to a middle grey value, also known as 18% grey. This value is based on the "average" scene, containing an equal amount of highlights, midtones, and shadows. Since not all scenes fall into this "average" standard, the meter can give inaccurate readings for particular scenes. For this reason, it is important to understand how to interpret and modify "sug-

gested" exposure readings so that the proper exposure for a given scene is recorded on film.

Exposure Settings

Aperture and shutter speeds are incremental in the amount of the exposure they give on film. The settings for aperture directly complement shutter speeds, and vice versa. Each step in both settings either doubles or halves the amount of light reaching the film. These settings, known as stops, allow the photographer to add more or less exposure in even, predictable terms. For example, a shutter speed of $\frac{1}{2}$ second delivers twice as much light as $\frac{1}{4}$ of a second, but $\frac{1}{2}$ second is half as much as 1 second, the next shutter speed up.

1 sec. 1/2 1/4 1/8 1/15 1/30 1/60 1/25 1/250 1/500 1/1000

Common shutter speed settings. Moving left, each number doubles the amount of light reaching the film. Moving right, each number halves the amount of light reaching the film.

Aperture settings, or f/stops, work in an identical fashion. Aperture works by closing metal blades in the lens to create larger or smaller openings. Each f/stop number is based on the diameter of the aperture blades in relation to the focal length of the lens. Therefore, an aperture setting of f/22 represents a very small opening, and an aperture of f/2.8 is considered to be "wide-open." For each increase in aperture size, twice the amount of light strikes the film. For each decrease, the amount of light is cut in half, just as with shutter speeds.

f/2.0 f/2.8 f/4 f/5.6 f/8 f/11 f/16 f/22 f/32 f/45 f/64

Common aperture settings. Moving left, each number doubles the amount of light reaching the film. Moving right, each number halves the amount of light reaching the film.

Each stop change, whether aperture or shutter speeds, represents either a halving or a doubling of the amount of light striking the film. For this reason, photographers may use any number of combinations of aperture and shutter speed to get the same amount of exposure on film. This is called the law of reciprocity. This law states that the amount of exposure is the same, regardless of the rate at which it is given. The classic analogy for this law is the bucket analogy. If a full bucket represents a

good exposure, it does not matter if you fill that bucket slowly, drop by drop, or quickly, with great volume. The analogy to the amount of time represents the shutter speed, and the amount of water allowed to leave the faucet represents the aperture.

Because of the law of reciprocity, a metered exposure is given an infinite number of possibilities. For example, a photographer can choose to use a smaller aperture, provided that they compensate the loss of light of the smaller opening with a greater amount of time in their shutter speed. By the same token, if the photographer wishes to use a longer shutter speed, they must close down their aperture an equal amount to compensate and still achieve proper exposure. This is called reciprocal exposure, or equivalent exposure.

f/22@2 sec.

f/16@1 sec.

f/11@1/2 sec.

Metered Exposure f/8@1/4th
f/5.6@1/8th
f/4@1/15th
f/2.8@1/30th
f/2.0@1/60th

Equivalent exposure. Each setting will give the exact same amount of exposure on film as the metered exposure.

Bracketing is the term used to refer to deliberately over- and underexposing the film, especially if the photographer is unsure of the meter's accuracy for a particular scene. A typical bracketing method is to overexpose by one stop (twice the amount of light), and underexpose by one stop (half the amount of light) from the meter's recommendation. Because of equivalent exposure, this can be accomplished either with change in aperture settings or by changing the shutter speed.

Minus one stop f/8@1/8th OR f/5.6@1/15th

Metered Exposure f/5.6@1/8th

Plus one stop f/4@1/8th OR f/5.6@1/4th

Bracketing. Subtracting one stop of light will have the amount of light striking the film, resulting in underexposure. Adding one stop will double the amount of light striking the film, resulting in overexposure.

The exception to the law of reciprocity on film is when the exposure is very long or very short.

EXPOSURE

The film experiences a loss of film speed in these cases, which in turn causes underexposure. Reciprocity law failure is typically encountered with exposures greater than 2 seconds, but varies from film to film.

Exposure and Its Effects on Film

Exposure is directly responsible for the amount of detail captured on film, ultimately determining the quality of the image on film. A film that is able to maintain a great amount of detail, despite some over- or underexposure, is thought to have wide exposure latitude. Black and white films are considered to have good exposure latitude, due to the fact that they are forgiving in the amount of exposure they need to produce a quality image. Color slide films are considered to have very narrow exposure latitude, meaning the exposure needs to be very exact to render detail.

The greater the amount of exposure, the greater the recorded density will be on negative film. Increased density on a negative corresponds to the highlights of a scene in a final print. Conversely, shadow areas correspond to areas of less exposure on a negative. For this reason, shadow detail tends to be the first thing lost when the image is underexposed. Because the amount of light in the shadows of a scene is so low, they are not given the amount of time needed to record on film in underexposure. The highlights in an underexposed image never achieve the proper amount of density to allow them to appear as light as they were in the original scene. Instead of appearing white, the highlights may instead appear grey. The result of an underexposed image is one with lowered con-

trast and little to no shadow detail. The result on positive (slide) film is identical, though it happens even more quickly given slide film's narrow exposure latitude.

Overexposure on film will cause details in the highlight region of a scene to disappear. Film is not able to handle an infinite amount of exposure. Once maximum density is reached, film characteristically begins to level off. If even more exposure is given, the already overexposed light-sensitive particles in film will begin to grow larger, causing an obliteration of highlight detail. This phenomenon is known as a "blocking up" of the highlight detail.

Film's response to both exposure and development can be graphed in the form of a characteristic curve. A characteristic curve plots exposure versus density in a chart that can be compared in terms of that film's contrast and exposure latitude.

F

FAMILY PHOTOGRAPHY

Twentieth-century family photography was a collage of technologies and practices, some dating to the advent of the medium, others incorporating social and scientific advances emblematic of the times. Studio portraiture, for instance, whether practiced by highly regarded artists, storefront entrepreneurs, or street or itinerant photographers, remained an essential source of family images. The street photographer was even mechanized in 1928 with the introduction of automatic photography booths (“photo-mats”). And, as in the nineteenth century, family photography could also be understood to include the constant stream of photojournalism, advertising, and other forms of commercial photography that flooded into the home.

Important as these practices were, what distinguished twentieth-century family photography was the preponderance of nonprofessionals producing personal images. The making of photographs became a consumer project with the photographic industry constantly expanding and retooling to meet the consumer’s needs. The century’s largest single photographic enterprise, Kodak, invented and sustained itself by providing the means for family imagery. Major innovations in photographic technology—if not originally conceived for the family market—came to be adapted for it. The facility and

growing sophistication of even the most basic cameras made personal images into the building blocks of lifelong visual narratives. As a result, the practices that constituted family were discussed as part of a larger understanding of change in twentieth-century culture, art, and history.

Technology

The technology of twentieth-century family photography was irrevocably shaped by George Eastman’s 1888 Kodak camera and its promise of “you take the picture and we do the rest.” Eastman took full advantage of advances such as dry plate photography, roll film, daylight loading cartridge, industrial-scale photo processing, and earlier roll cameras. By 1900, the success of the Kodak camera and industrial processing of its film had resulted in Eastman’s marketing of another eight models. These, like all Kodak products, were promoted by Kodak’s aggressive advertising campaigns as well as by the company’s pressure on merchants to sign exclusive marketing agreements. At the turn of the century, Kodak enjoyed a leadership role in the new home photography industry that included a half million dollars in annual camera sales.

FAMILY PHOTOGRAPHY

With the introduction of the first Brownie camera in 1900, the final ingredient in the marketing of mass photography fell into place: that is, photography's affordability to unprecedented numbers of middle and working class people. Priced at \$1.00 per camera plus \$0.15 for the six exposure roll, the Brownie sold some 100,000 units in the United States and Britain during its first year on the market.

While Kodak, from the 1890s to the end of the twentieth century, dominated family photography, it was not entirely free of competition. Its chief American rival was the long established Anthony & Scovill Company (AnSCO after 1907) that introduced its own roll film camera in 1905—for which it was promptly sued by Kodak for patent infringement. In Britain, Ilford Ltd., from the mid-1890s, the most successful manufacturer of gelatin dry plates outside the United States, turned to the production of cameras and, in 1912, roll film. The German corporation, Agfa (The Aniline Manufacturing Corporation), a commercial dye manufacturer, began producing film in 1908 and cameras in 1928. In Japan, the Cherry portable camera was first manufactured in 1903 by Knoishi Honten, the forerunner of the Konica Corporation.¹

These, like the majority of large photography companies in the twentieth century, would continue to follow Kodak's lead in developing point-and-shoot cameras as well as the film stocks and industrial processing facilities to support them. Kodak produced 125 models of the Brownie camera between 1900 and 1970. While some of these went so far as to offer bellows lens mounts, stereo exposures and, later in the century, flash attachments, Kodak never lost sight of the parameters of need and accessibility with which the original model was designed. Even as the company diversified, it was careful to maintain its dominance of the family photography market. In 1963, with the introduction of the Instamatic line, Kodak once again emphasized simplicity of use, selling more than 50 million units prior to 1970.

The Instamatic was typical of second generation point-and-shoot cameras in that it incorporated artificial illumination and was designed to use color film. Flashbulbs, first marketed in 1930, were commonplace in home photography in the post-World War II period with 400 million sold in 1951 alone. The Instamatic generation brought an even more practical means for low light photography through the integration of permanent flash units. Home use of color film had become practical, though expensive, with the Kodachrome and Agfacolor stocks introduced in 1936. It wasn't until after the Second World War with the coming of Kodacolor, Ansco-

color, Ektachrome, and Fuji-color that color film not only worked well in point-and-shoot cameras but could be processed at competitive prices. By the mid-1960s color had overtaken black and white as a standard for family photography, a trend that continued with the subsequent introduction of ever-faster color stocks.

Other innovations in second generation point-and-shoot cameras owed their origin to the redesign and popularization of 35 mm photography by a number of Japanese companies beginning in the mid-1950s. The Japanese researchers used 35 mm as the platform on which features such as the single lens reflex optics, automatic exposure control, automatic focusing, motorized zoom lenses, and motorized film advance were adapted for general use—including, by the 1960s, use in less expensive family formats.¹¹ By the 1980s, cartridge-loaded 35 mm cameras with these features were being sold to family photographers as slightly upscale versions of point-and-shoot cameras.

Other alternatives to the basic family camera proved less successful. The Polaroid Land camera, with its self-developing film, was introduced in 1947. The first Polaroids were relatively expensive, complicated, and produced prints that compared badly to those of conventional cameras. Polaroid improved its technology, introducing color with its Swinger camera in 1962. Its 1972 SX-70 system provided an integrated electronic flash, simplified focusing, and multi-exposure film packs. In the 1990s, Polaroid introduced smaller, less expensive cameras aimed at a youth market. It also emphasized the visual record keeping function of its technology. However, Polaroid's family photography division suffered from the spread of one-hour photo processing labs in the 1970s, disposable cameras in the 1980s, and digital photography in the last decade of the century.

Towards the end of the twentieth century, these last two innovations looked to both the past and the future in their contributions to the reinvention of family photography. Fuji's "utsurundesu" (film with lens), the single use (or disposable) camera, introduced in 1986, reiterated Kodak's 1888 idea of returning the camera to the processor along with its film. These small cardboard box cameras, only marginally more expensive than the roll of color film they contained, were soon available wherever film was sold. Fuji's sale of a million single use cameras in six months led to the rapid development of other manufacturers' models. Single use cameras were soon available with built in flash, panoramic lens, telephoto lenses, or with plastic shells that allowed them to be used under-

water. The cardboard box could be printed with custom designs and promotional messages or simply decorated for particular occasions. By 1996, a decade after their introduction, single use cameras were selling at a rate of 80 million annually in Japan alone.

It was not until the very end of the twentieth century that the cost of digital photography was lowered to the point where it became affordable for most families. However, the development of electronic family photography had begun much earlier in the form of home video. Sony's 1965 portable, black and white video camera wired to a separate reel-to-reel half-inch video recorder was a relatively crude and expensive downscaling of professional television cameras and video recorders. By the early 1980s, it had been replaced by color camcorders making use of half inch and, in the 1990s, 8 mm video cassettes. A third generation of home video, in the form of the digital video camcorder, was introduced by Sony in 1982. By the mid-1990s, digital video camcorders, often no larger than conventional still cameras, could be fed into home computers, their footage edited by increasingly sophisticated software. The potential of this domestic version of television-computer convergence, as well as the continually decreasing price of both analogue and digital home video made it, by century's end, the most widely used domestic alternative to silver-based photography.

Digital still photography, as a mass marketed consumer format, was introduced in tandem with the digital video cameras. While digital imaging on computers was first demonstrated in 1979 and marketed by Sony in 1982, the cameras were prohibitively expensive for home use. It was not until 1994 and 1995, respectively, that Kodak and Casio broke the US\$1,000 price barrier. The following year, 20 other models of relatively low-cost digital cameras were introduced by Japanese electronics companies and one million units were sold. By decade's end, sales of digital cameras had increased to approximately four million per year with prices of some models falling well below \$500.

Digital tools also contributed to changes in chemical-based family photography. After 1990, commercial photo developers could return digital prints of conventional film on Kodak's photo CD, a device that also allowed for in-store and home computer editing of those prints. In 1996, Kodak, with more than 40% of the world photography market, and Fuji, with an additional third of it, together introduced their Advanced Photography System. This hybrid technology was based on magnetically striped cartridge film imprinted by

the camera with information used subsequently to set the parameters of digital developers and editing equipment.

At the end of the twentieth century, it remained to be seen whether Kodak and Fuji succeeded in creating anything more than a transitional technology. The exponential growth in home computers, computer speed, and computer memory as well as the increased accessibility of peripherals associated with digital photography (photo editing software, ink jet printers, scanners) offered the family photographer more options for less cost. Digital images could be produced by scanning conventional images or shot directly with digital cameras. Home darkrooms, while greatly facilitated throughout the century by downscaled commercial equipment, and improvements in pre-mixed chemicals and prepared papers, could not match the options available in even the basic photography software distributed with printers and scanners. More advanced software, most notably Adobe Photoshop, offered professional photo finishing on home computers. Finished photographs could be viewed on screen or printed as hard copy on a variety of photo papers. Digital images could be stored in password-protected virtual albums, transmitted to any number of recipients anywhere in the world via e-mail or mounted for universal viewing on the World Wide Web.

Practice

From their first advertising campaigns, Kodak and its competitors went to some length to demonstrate that point-and-shoot cameras could be used by anyone, including women and children. The Kodak "girl" in her striped Edwardian dress was introduced in 1910 to become a mainstay of the company's promotional material until 1940. In North America and Europe, Kodak sponsored photography clubs in schools and youth organizations while publishing photo manuals and other camera literature aimed at children. In 1930, the company went so far as to give away a half million Brownies worldwide to children turning twelve that year.

One result of the proliferation of family photography was common loathing of the ubiquitous "camera fiend." By 1900, the dignified act of sitting for a photographic portrait in the privacy of a studio became far less common than daily encounters with ordinary people photographing each other in public. Bill Jay points out that the aggression associated with photojournalists was first reported with shock and dismay as early as the 1890s in relation to family photographers. In what Henisch and Henisch refer to as "the trivialization of tra-

FAMILY PHOTOGRAPHY

vel,” the great monuments and vistas of the world, previously photographed by professionals with great respect and artistry, now shared the frame with grinning spouses and line-ups of reluctantly posed children. Worse still, citizens feared being photographed against their will and did so to the extent that some pressed for, and occasionally obtained, legislation prohibiting the practice.

As the popularity of point-and-shoot photography continued to grow, the “camera fiend” became the more innocuous “shutterbug” and, finally, an entirely assimilated participant in public behavior. Conversely, the importance of public places and events were to some extent signified by the numbers of people taking pictures. Cameras and film were sold at historical sites and monuments, recreational areas, sports arenas, theme parks, zoos, and museums. From at least the 1963 Zapruder home movie of the Kennedy assassination, images, particularly videos taken by non-professionals, were integrated into professional photojournalism.

Throughout the century, families were inundated with these self-generated images. Photographs not consigned to shoeboxes, envelopes, or desk drawers were placed in redesigned family albums—albums differing significantly from their nineteenth-century predecessors. Earlier albums contained ornate pages with slots into which *cartes-de-visite* and cabinet cards were placed. These portraits of family members shared the album with images of illustrious persons or places with which the family wished to be associated. The overall effect was that of a record, often compared to the record keeping pages of the family bible.

Twentieth-century family albums were characteristically composed of blank pages onto which various sized photographs could be attached in an infinite variety of layouts and collages. With this physical change came a change in the tone and purpose of the albums. The illustrious persons and places were phased out as was the nineteenth-century practice of post-mortem photography. Family albums became less a pictorial record of family members than visual narratives of personal triumph: births, children’s parties, first days at school, graduations, weddings, anniversaries, other ceremonies and special events. The family displayed its possessions (homes, cars, pets) and, in its travel photos, its possession of the world’s most desirable locales. Unlike nineteenth-century portraiture, almost everyone looking at the camera—that is, looking at another member of the family or a friend photographing them—smiled.

Most family photographic albums were arranged in a roughly chronological order that continued in

volume after volume. However, as Langford demonstrates, albums could be arranged thematically or could focus on single events or experiences, some of which were not entirely pleasant. The family photographs could be augmented by postcard and studio photographs of family members. Entire albums of professional photographs—most notably the wedding album—were professionally photographed and arranged in a highly ritualized manner. It was also possible for the creation of the album itself to be a ritual, classmates giving each other photographs for graduation albums or, in the 1990s, Japanese school girls assembling “passports to heaven,” albums filled with photographs of their good deeds. Albums might even be reduced to a set of wallet-sized images bound together in plastic sleeves.

The visual narrative of the family album was usually accompanied by a verbal narrative, either through elaborate captions or the verbal accompaniment of a family member. Verbal narration also accompanied the presentation of family images as transparencies which, thanks to the electric slide projector, were second only to albums as a means of storing and presenting family images. Verbal narration was also a part of home movies. Kodak’s 16 mm home movie system, introduced in 1923, its 8 mm system put on the market in 1932 (re-introduced as the Brownie movie camera in 1946), and its super-8 mm film and equipment, introduced in 1965, produced silent movies over which the filmmaker or others were expected to speak.ⁱⁱⁱ When these formats gave way to the video recorder, images of family activities became “self-narrating,” long takes of synchronized sound activities very much in the manner of the “*cinema verite*” films released by documentary filmmakers. The more edited narration of family video, including music and voice over, came with the appearance of professionally produced wedding tapes and, at the end of the century, with home computer-based digital video editing.

These narrative practices of family photography (sometimes referred to as “vernacular” photography) had, by the latter part of the century, generated some academic commentary. The most frequently quoted work, Roland Barthes’ *Camera Lucida*, was a meditation on the manner by which a photograph of his mother functioned as means of focusing his memory. Barthes’ work is expanded upon in a more feminist ideological context in work such as Annette Kuhn’s *Family Secrets* and Marianne Hirsch’s *Family Frames*. Martha Langford’s *Suspended Conversations* pursues the idea of narrative in family albums while Linda Haverty

FAMILY PHOTOGRAPHY

Rugg's *Picturing Ourselves* is a study of the shaping of our perception of four historical figures by the informal photographs taken of them.

Family photography has also been of considerable interest to twentieth-century artistic photographers. The snapshot aesthetic—a rejection of formal aesthetics in favor of the spontaneity and naïveté of amateur photography—has been cited as a sensibility linking the work of fine art photographers from Walker Evans to Garry Winogrand. Home movie formats were essential to the practice of experimental filmmaking. From the 1970s, the art photographer most visibly concerned with family photography has been Jo Spence, particularly in her exhibition, *The Family Album, 1939–1979* (1979) and her 1986 book *Putting Myself in the Picture*. The family photograph has also been the basis for especially striking monumental sculpture. Perhaps the most noted example of this was Yaffa Eliach's *Tower of Faces* in the United States Holocaust Memorial Museum. A three story space whose walls and ceiling are covered with more than 1600 studio portraits and enlarged snapshots, the tower is a visual reincarnation of a single village's holocaust victims.

Eliach's *Tower* effectively summarizes the place of family photography in the twentieth century. It mirrors the expectation of visual identity—everyone, as it turned out, had their picture taken. And that they did so, mattered. For, in Barbie Zelizer's phrase, “the mechanics of visual history and historical record” have, in effect, helped dictate the monumental role of the quotidian.

- i Other Japanese camera companies can trace their origins to the first third of the twentieth century, though none would become major forces in the international market until at least the 1950s.
- ii In 1981, the sale of 35 mm cameras manufactured by Japanese companies peaked at more than seven and a half million units.
- iii After 1973, Super-8 was available with magnetic striped film that offered a limited sound on film potential. This was of less interest to family filmmaking than it was to low budget documentary.

ROTIMI FANI-KAYODE

Nigerian

As an African artist whose work engages issues of diaspora and projects multiple subject positions, Rotimi Fani-Kayode often described himself as an outsider in three distinct ways; within his African family, which navigated modern Britain with a traditional spiritual identity; as a gay man in an intolerant black community; and as a black artist in a racist society:

My identity has been constructed from my own sense of otherness, whether cultural, racial, or sexual. The three aspects are not separate within me. Photography is the tool by which I feel most confident in expressing myself. It is photography, therefore—Black, African, homosexual photography—which I must use not just as an instrument, but as a weapon if I am to resist attacks on my integrity and, indeed, my existence on my own terms.

Rotimi Fani-Kayode was born to a prominent Yoruba family in Lagos, Nigeria in 1955. His father, Chief Remi Fani-Kayode, was a respected high priest and notable politician. Indeed, the Kayode family was well regarded for their spiritual responsibilities in their hometown of Ife, a sacred city in southwestern Nigeria regarded as the spiritual center of Yoruba culture. But when a military coup and civil war threw Nigeria into turmoil in 1966, Fani-Kayode and his family moved to England and settled in the seaside resort town of Brighton. He continued his education there until the age of 21, when he traveled to the United States to further his academic career. While his desire was to study fine arts, he compromised with his parents' wishes for him and also studied economics. After receiving a B.A. from Georgetown University in Washington D.C. in 1980, Fani-Kayode moved to New York and completed an M.F.A. in fine art and photography at the Pratt Institute in 1983.

It was during his graduate studies that Fani-Kayode began making iconic and dramatic color portrait photographs of himself and other black men, nude or dressed in traditional Yoruba clothing. Such images laid the important formal and critical framework for his later photographic works, which explored issues of race, masculinity,

homoeroticism, and nationality, often involving a sophisticated and ambiguous mix of African and Western iconography. Upon his return to England after completing his graduate studies in 1983, Fani-Kayode met his partner photographer/filmmaker Alex Hirst, and began an important personal and collaborative relationship. The two moved to London, and Fani-Kayode continued his focus on part-autobiographical and mythical portraits; pursuing the theme of the male black body as a subject of desire.

Although his work is sometimes regarded as similar to the early 1980s work of American photographer Robert Mapplethorpe, in truth Fani-Kayode's work pushes beyond simple references to gay iconography. Indeed, many of his photographs say as much about postcolonial issues and racism in contemporary British society as they do about gay sexuality. In this regard, it is useful to remember that Fani-Kayode's career in the 1980s coincided with the years of political leadership by Prime Minister Margaret Thatcher, a conservative tenure that witnessed several race riots in Britain. In response to his personal experience and social environment, in 1987 Fani-Kayode co-founded the London-based organization Autograph, The Association of Black Photographers, a group that remains vibrant and active to this day.

In the same year, Fani-Kayode published his first book, *Black Male/White Male* (1987), a collection of photographs consisting of intimate portraits made in the early to the mid-1980s, including an image of American writer Essex Hemphill, and accompanied by text by Hirst. The photographs explored formal aesthetics of color photography in a dynamic manner and also challenged stereotypical views on race, interracial relationships, and sexuality. Photographs from this period also recognize the photographer's own spiritual background as an integral part of this investigation. In "Bronze Head" (1987), the bust of a Yoruba god, customarily seen as signifying an artist's spirit, is portrayed in an image of sodomy. In trying to reconcile the notion that the traditions of his Yoruba culture reject homosexuality, Fani-Kayode attempted to create images that rejected profanity and instead

provoked contemplation of sexual desire and the act of creation as positive, beautiful concepts.

Another example of Fani-Kayode's complex post-modern style can be acknowledged in the part-auto-biographical image "White Bouquet" (1987). Here, a standing white man presents a bouquet of white flowers to his black lover, who lies on a white chaise longue. Both men are nude and anonymous; their faces are unseen. The lighting is soft, setting a sensual tone within an ambiguous scene, which points to the powerful rhetoric of much of Fani-Kayode's work. He presents an intimate moment that can be interpreted several ways, as a homoerotic encounter or a subversive comment on the racial power relationship associated with colonialism. Additionally, in its conceptual reference to Edouard Manet's painting *Olympia* (1863), the image highlights the artist's sophisticated knowledge of European art history. Images from the *Communion* series (1989) display a similar sensitivity and theoretical subtlety in the treatment of the male nude, in what Kobena Mercer has characterized as an exploration of the relationship between erotic fantasy and ancestral death. *Communion* is a group of photographs that appear to have been a very personal and final collaboration between Fani-Kayode and Hirst, which were never exhibited while they were both alive. Fani-Kayode died from AIDS in 1989; Hirst died from HIV-related illness three years later.

Although his six-year professional career may be regarded as brief, Fani-Kayode's art-making was intensely personal and politically engaged. The significance of his work was consistently overlooked during his lifetime, probably due in part to the controversial nature of his chosen subject matter, but also because of debate about the authorship of several of his photographs, despite consideration of the genuine spirit of collaboration he and Alex Hirst shared. Discussion of Fani-Kayode's work in Hall and Sealy's *Different* (2001), and the inclusion of his photographs in exhibitions like the 50th Venice Biennale in 2003, point to recently renewed interest in the Nigerian's work by curators and historians who understand his significant role in having helped shaped various critical discourses in British photography of the late twentieth century.

FARM SECURITY ADMINISTRATION

The Farm Security Administration (FSA) was the eventual name given to a series of programs designed as a part of Franklin D. Roosevelt's "New Deal" that were meant to bring relief to struggling farmers during the years of the depression. Its existence is important to photography because of the founding of its Historical Section. This section advocated a photographic documenting of both the administration's work as well as the rural areas of America that the programs were supposed to aid. During its ten-year existence, the Farm Security Administration's Historical Section under Roy Stryker helped to both provide work to out-of-work photographers and solidify the careers of a number of the leading American photographers of the era, including Esther Bubley, John Collier, Jack Delano, Fred Driscoll, Walker Evans, Dorothea Lange, Russell Lee, Carl Mydans, Gordon Parks, Arthur Rothstein, John Vachon, Marion Post Wolcott, as well as muralist/photographer Ben Shahn.

The beginning years of the 1930s saw an increase in poverty affecting America's rural populations, including a rise in sharecropping. The economic devastation, known as The Great Depression called for decisive government action. Elected president in 1933, Roosevelt established a series of programs designed to boost America's sluggish economy and help those suffering in America's farmlands. Termed the New Deal, Roosevelt's programs offered jobs to those suffering from unemployment, as well as relief for farmers. The Agricultural Adjustment Administration (AAA) was Roosevelt's first attempt to bring aid to farmers, though it did little to help smaller farmers and sharecroppers. In 1935, Roosevelt created the broader Resettlement Administration (RA) headed by Rexford G. Tugwell, Columbia University economics professor and part of Roosevelt's "brain trust," whose mission, among others, was to document the agency's work through photography. Tugwell chose as the head of this Historical Section his former student, Roy Stryker.

FARM SECURITY ADMINISTRATION

Stryker's vision for the Historical Section was grand. He wanted to attempt to document not only the work of the RA but also the conditions in which rural Americans lived. Within the first year of its founding, the Historical Section of the Resettlement Administration had already employed close to fifteen American photographers. Although Stryker's vision was aligned with the government's goal of not only documenting conditions, but using the photographs as a kind of propaganda for Roosevelt's programs, to the point of writing "scripts" his photographers were to follow. With such independent photographers as Walker Evans in the RA's employ, however, the focus of the branch shifted from government work to pure documentation of rural America, or what Stryker would later call, "introducing America to Americans." One of the first photographers to be appointed to the Historical Section, Arthur Rothstein, an employee of Stryker's at Columbia, developed a preliminary series of principles to guide the work of photographers. In 1936, Stryker also went after a series of higher profile photographers whose work he admired. Carl Mydans, Walker Evans, and Dorothea Lange were all hired in the first year of the section's existence.

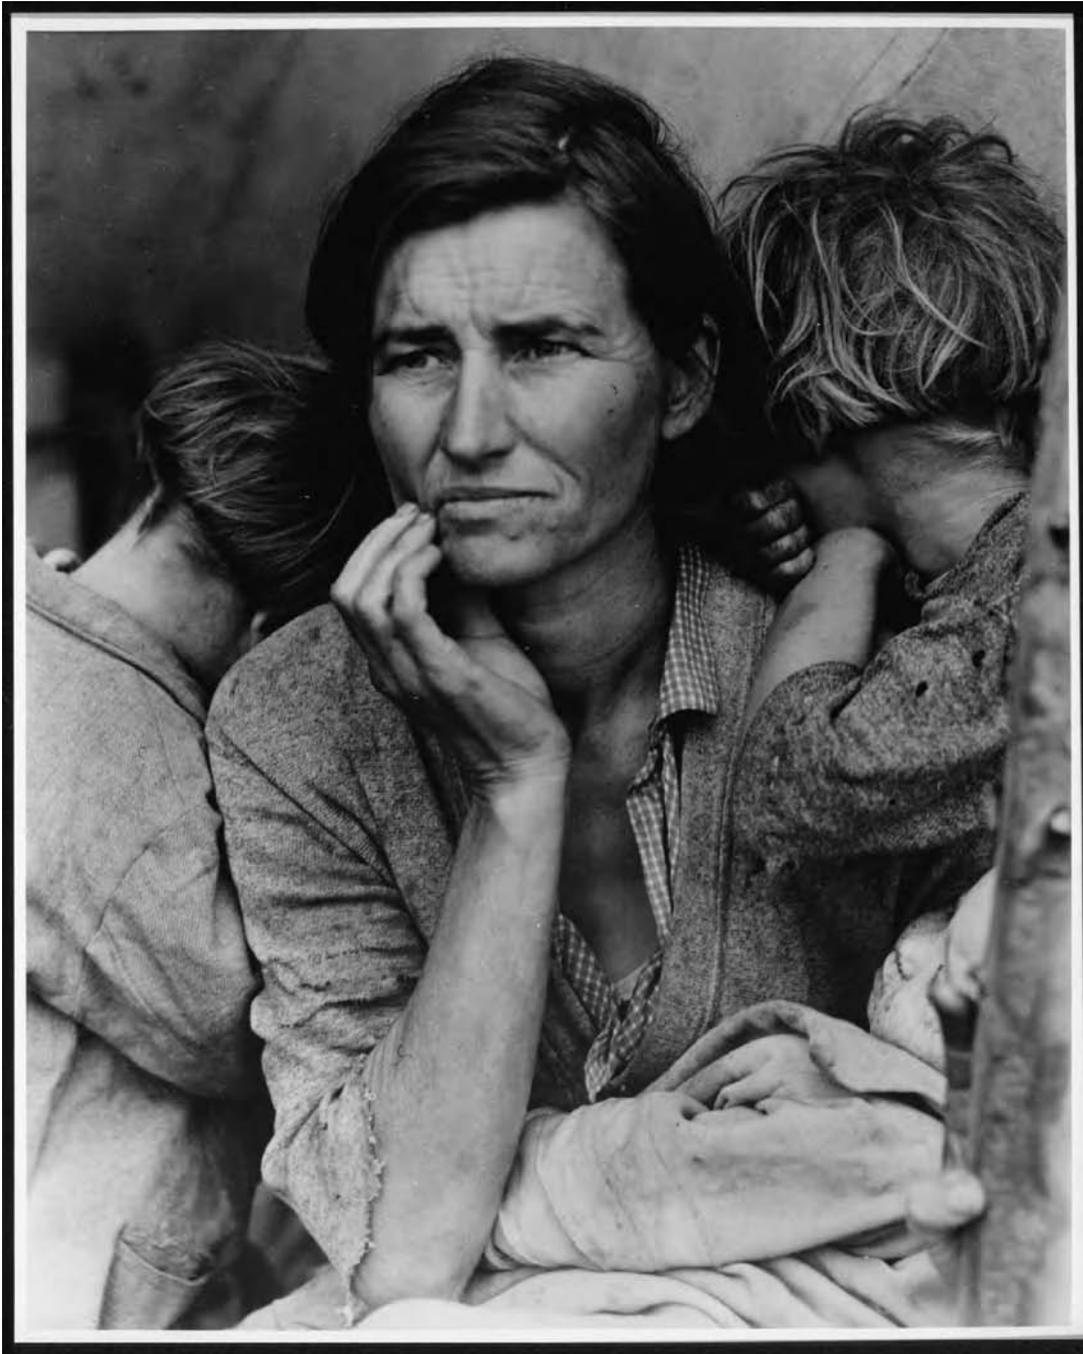

By 1937, a number of changes occurred to the Resettlement Administration. It had been swallowed by the larger Department of Agriculture, the head officer Tugwell had resigned, and the agency was renamed the Farm Security Administration by which it is best known. As FSA's photographers fanned out over the Midwest, South, and Southwest to document the conditions of the rural American poor, they created some of the most memorable and famous images of not only the 1930s, but of the twentieth century. As Arthur Rothstein's documentation of the Shenandoah National Park in Virginia, Carl Mydans's images of West Virginia coal miners, or Dorothea Lange's poignant photographs of California migrant workers, were published in various magazines and newspapers, Americans became fascinated with the plight of their rural neighbors.

Walker Evans, in 1936, on leave from the RA/FAS, traveled to Hale County, Alabama, where he and poet-novelist James Agee collaborated on what eventually was published, in 1941, as *Let Us Now Praise Famous Men*. Walker's negatives, though commissioned by *Fortune* magazine, were negotiated to remain in the public domain, as were the negatives of all the government-employed photographers, and this project is often thought of as the epitome of what FSA photographers were able to accomplish. Evans's detached and introspective

style contrasted sharply with other FSA photographers such as Dorothea Lange, whose pictures are dramatic events that often offer the structure of a story. Taken in early 1936, Lange's *Migrant Mother*, perhaps the most famous of her career, shows a woman and her two children in Nipomo, California. The mother is seated, eyes focused in the distance, while her two children stand in *contra posto*, each with their backs to the camera. The scene is striking and dramatic with its dark, charcoal blacks and brilliant whites, and the positioning of the figures conveys a clear emotional message. Evans's infrequent portrait photographs, such as those of the Burroughs family in Alabama, offer none of the straightforward emotion of Lange's. In Evans's works, the story of the subject rests just beyond the image, with meaning hinted at but never offered.

Stryker's bold and sometimes argumentative personality caused conflicts with many photographers, most of whom were interested in remaining on the project to produce authentic social documentation that also expressed their creativity and individual viewpoints, not mere propaganda. Internal instability notwithstanding, as the 1930s drew to a close, the FSA's documentation seemed less imperative. America's increasing national introspection was shattered by a European war that, after the attack on Pearl Harbor, turned increasingly threatening. By the time America entered the Second World War in December 1941, the urgent program of "introducing America to Americans" was curtailed, along with many of the various New Deal programs. Stryker's FSA was subsumed into the new Office of War Information, a centralized information agency established in June 1942 as part of the Office of Emergency Management and was dissolved a year later. Though accused of suppression and heavy editing, Stryker managed to protect the catalogue of nearly 270,000 negatives by placing them in the Library of Congress, Washington, D.C.

The FSA had not only documented the impact of government programs on rural America, but had also produced the very image of the Depression in a collective American memory. Their images, varying in style, form, and subject captured the essence of what the Depression meant for hundreds of thousands of America's poor. Lange's photographs of migrant workers helped to inspire John Steinbeck's novel *The Grapes of Wrath*, which proved to be an instrumental text that exposed the corrosion of American ideals in the face of crippling poverty. Evans's detached landscapes and portraits were the first book of the experimental and influential

Dorothea Lange, *Migrant Mother*, Nipoma, California, 1936/printed later, gelatin silver print, 22.1 × 17.7 cm, Gift of Robert Doherty.

FARM SECURITY ADMINISTRATION

Let Us Now Praise Famous Men, which argued for the humanity of sharecroppers and tenant farmers and rejected the use of their images for aesthetic purposes. Although there is disagreement as to how effective the FSA was at aiding the broader economic relief efforts of the Roosevelt administration, there is no doubt that it quickly became a program through which America embraced its art and artists. The FSA's legacy, which can be seen at both the Library of Congress or at the website <http://memory.loc.gov/ammem/fsowhome.html>, helped to emblaze the decade of the 1930s onto the American national memory that still reverberates. Numerous exhibitions have been mounted featuring the FSA photographers in anthologies and monographic presentations, including the influential Museum of Modern Art exhibition organized by Edward Steichen, *The Bitter Years 1935–1941: Rural America as Seen by the Photographers of the Farm Security Administration*.

FASHION PHOTOGRAPHY

Fashion photography occupies a unique position in the world of photography. It commands the attention of almost everyone. Fashion photography answers the need for what the current image of femininity is in our society. It appears to be easy to do; above all, ever so glamorous, yet fashion photography is amongst the most difficult to practice. As a result, fashion photographers rank at the top of the profession in terms of respect, name recognition, and income. Fashion photography historically has been considered within a nexus of commercial practice including so-called beauty photography and glamour photography. These distinctions are important in the overall field: beauty photography

is a commercial pursuit intended to sell cosmetics, hairstyles, physical fitness products, and increasingly, health and food products. Glamour photography historically has implied creating an overall effect accentuating the desirability of the sitter and has been most associated with the photographing of movie stars and other celebrities whose physical appearance is their stock-in-trade.

The photography of fashion began shortly after the invention of the medium in 1839. While it was difficult at first to make portraits due to the long exposures required, gradually film speeds increased and the making of portraits became possible. In many ways the first portraits can be thought of as

fashion statements since the sitters almost always wore their best and fanciest clothes. But these photographs were limited in distribution, generally only seen by the immediate family and friends, and were not created for advertising or other commercial purposes. The half-tone process, invented in the early 1890s, made the direct reproduction of a photograph possible. Prior to this advance the lithographic process was used to reproduce photographs, requiring the hand of an artist to transfer the image from photograph to the metal plate or wood block. The half-tone process reduced the continuous tone of a photo into a series of small and large dots on a printing plate. The realism of the photograph was thus brought to the mass circulation media, and everyone who could afford to buy a magazine could discover the latest fashion trends.

History

The first fashion photographer to achieve that distinction was Baron Adolph de Meyer (1868–1946). His first photographic work appeared in 1894 in various exhibitions in London, Paris, New York, and Brussels, where it was noted that he was a dedicated amateur. The term “amateur” was used at this time to denote someone of considerable artistic and intellectual abilities as opposed to commercial practice. He married Olga Caracciolo in 1896 or 1897 and the marriage provided him with entree to fashionable social circles as well as the title Baron. Practising the soft-focus Pictorialist style in ascendancy during the era, de Meyer became a member of the Linked Ring Brotherhood, the Royal Photographic Society, and the Photo-Secessionists in 1908. During these years de Meyer acquired a strong reputation as a portrait photographer particularly of high society and the artistic circles. His fashion career began in 1914 when he signed a contract with Condé Nast to be the first full-time photographer for *Vogue* and *Vanity Fair* magazines.

There were numerous instances where de Meyer provided not only the photography, but also contributed his skills as an accomplished writer and layout artist in the form of complete articles for these magazines. In 1921, he accepted an offer from William Randolph Hearst to work for *Harper's Bazaar* magazine, where he gained even greater editorial control. He continued working for *Harper's Bazaar* until 1929 when his contract was not renewed and the magazine officially changed its name to *Harper's Bazaar*. Following the death of his wife Olga in 1931 he traveled throughout Europe. He made a permanent move to Hollywood,

California, in 1939 under the threat of Hitler's advances in Europe. While he continued to make a few society portraits, his success was largely forgotten and he died in relative obscurity of coronary thrombosis in 1946 in Los Angeles.

Baron de Meyer was a technically and visually brilliant photographer. He often used back or side lighting of his subjects, a technique that is not often used today. His models were largely drawn from the ranks of high society or from the theatre world, a practice that has continued. Towards the end of his career as fashion photographer he was strongly influenced by Modernism in the arts, principally Dada and Surrealism, and he began to increasingly photograph his subjects in profile. The best examples of his work in these new directions were a series of advertisements he produced for the Elizabeth Arden Cosmetics Company in which his models became increasingly stylized and unnatural, a newly constructed style of femininity.

American born Man Ray (1890–1976) lived and worked in France during most of his adult life. His work as a fashion photographer was far reaching in terms of its visual impact and influence on other photographers, but has been overshadowed by his work as a painter, film maker, inventor, and sculptor. He arrived in Paris in 1921 and a year later his first rayographs were published in *Vanity Fair*. Man Ray's photographs were extensions of his artistic development and visions, and often highly experimental and like his peer Francis Bruguiere integrated Surrealist and Dada effects.

Another baron, Baron George Hoyningen-Huene, who was born in Russia, followed Baron de Meyer. He fled to Paris in 1921 and along with Man Ray, became the chief photographer in 1926 for *Vogue*. His style of work was quite similar to that of Baron de Meyer, using back and side lighting of his subjects. Visually his subjects became Greek sculptures, his lighting revealed texture and volume, and garments became the center point of all of his photographs.

Horst P. Horst was born in 1906 in Germany and was trained as an architect. At age 24 Le Corbusier accepted him as an apprentice in his Paris office. During his stay in Paris he met Baron George Hoyningen-Huene and traveled with him that winter to England to meet with Cecil Beaton, the British *Vogue* photographer, whose elaborate costuming and set design and decoration reflected his theatrical and briefly influential vision. Early in 1931 Horst was hired by *Vogue*, initially to do design and layout work, but late that year his first photographs were published in the magazine. His visual style was again similar to that of de Meyer and Huene using elements of Greek mythology as

the main symbolism in the photographs. But the design and architectural tendencies Horst expressed added unusual surprises to his pictures. He was able to strike the right balance between the model, the garment, and the architectural surroundings. Horst was able to direct and capture a pose that under other circumstances would have looked forced and unnatural, infused with an elegance of design to make his photographs memorable masterpieces.

Horst was also a master of studio lighting, sometimes working three days on a single set-up. He was not afraid to use numerous lights in his set-ups to create the dramatic effects that he felt his photographs needed. One of his most timeless photographs, *Mainbocher's Pink Satin Corset*, published in American *Vogue* in 1939, was also the subject of a video by Madonna, making it an enduring icon.

Louise Dahl-Wolfe was the first woman fashion photographer to reach prominence in the 1930s and is known for her long tenure with *Harper's Bazaar*. Dahl-Wolfe took fashion out into the open and used deserts, beaches, and various exotic locations as her backdrops. While other fashion photographers had sometimes photographed the out-of-doors, notably Heune's *Swimwear by Izod* (also known as *Divers*) of 1930, Louise Dahl-Wolfe raised it into a new art form, sweeping away the "Greek statue" genre of fashion photography. Another female practitioner, although working in a less distinctive style, was the Berlin-based Germaine Krull. American Lee Miller, whose notoriety as a model overshadowed her work behind the camera, was another fashion photographer based in Europe during this period.

Hungarian Martin Munkacsi, New York's leading fashion photographer during the 1930s and 1940s, left Germany and immigrated to the United States in 1934. That year, he signed an exclusive contract with *Harper's Bazaar*, which under Carmel Snow's editorship and Alexey Brodovitch's art direction established itself as the most sophisticated fashion magazine of the era. He too promoted the highly active style that showed models and clothes in motion, often out on the street, inspiring the upcoming generation of American photographers. Other important practitioners of fashion photography between the wars, working out of Paris and New York, are Brassai, Erwin Blumenfeld, Arnold Genthe, George Platt Lynes, John Rawlings, Edward Steichen, and Maurice Tabard.

Irving Penn and Richard Avedon emerged into prominence following World War II. Richard Avedon was born in 1923, graduated from Columbia University in 1941, and studied with Alexey Bro-

dovitch at the New School for Social Research from 1944 until 1950. He was hired at *Harper's Bazaar* as a staff photographer in 1945, and held that position for twenty years. He also photographed the French collections in Paris for both *Harper's Bazaar* and *Vogue* from 1947 until 1984. He photographed his subjects in sparse settings, stripping away all extraneous elements so that the viewer would concentrate only on the sitter. One of his many books, *In the American West*, published in 1985, exemplifies this principle. All of his subjects were photographed against a clean white background and the visual focus was completely on the sitter.

Irving Penn was born in 1917 in Plainfield, New Jersey, and following his education in public schools enrolled at the Philadelphia Museum School of Art at age 18. He studied advertising design with Alexey Brodovitch and his first job, working for Alexander Lieberman at *Vogue*, was to suggest covers for the magazine. His first photographic cover was published in the October 1943 issue of the magazine and he continues to contribute work. His photographic work covers not only fashion and portraiture, but also still lifes and nudes. His work shows a similar sparseness of backgrounds as Avedon's, but with some important departures. Early in Penn's career he started to use large moveable walls, which he placed at right angles to each other. Into this corner he placed his subjects, giving them and us, a sense of tight space. He discovered a different form of tight space when he rented a local photographer's studio in the Andes Mountains following a fashion assignment in 1948. The studio had a large north-light window as the sole source of illumination and a plain backdrop with a non-descript floor in which he photographed the villagers. During the next few years he constructed a tent with a similar lighting scheme that traveled with him on overseas trips. The book *Worlds in a Small Room* was the result of these travels.

The major shift in fashion photography that came with both of these photographers was the elimination of the sumptuous settings—glamorous drawing rooms, or theatre locations—and sense of aristocracy, which had been greatly eroded by the work of Munkacsi and by that of William Klein and Louis Faurer, who practiced grainy, blurred styles emphasizing personal expression during the waning years of World War II and in the immediate postwar era. Toni Frissell, who had apprenticed with Cecil Beaton, practiced a casual, straightforward style capturing active, vital women. German-born Herman Landshof also made youthful, active

women his signature, showing his photographs mainly in magazines such as *Mademoiselle* aimed at a younger audience. This shift also signaled the decline of Paris as the center of high couture and the development of New York, London, and Milan as fashion centers.

Exemplary of another new style, that of the highly eroticized fashion image, Helmut Newton was born in Berlin in 1920. He studied with the leading photographer Yva, left Germany before World War II, and enlisted in the Australian Army. In 1957, he moved to Paris, where he became a regular contributor to *Vogue*, *Elle*, *Playboy*, and *Marie Claire* magazines. Helmut Newton was the first photographer to overtly inject sexuality into fashion photographs. From the beginning, sensuality had been an undercurrent in fashion photographs. Almost every photographer working in the area also made nude photographs, and although occasionally a discreet nude was published in the mainstream magazine as a fashion illustration, most of this work was published as a fine arts effort. With Helmut Newton the models were absolutely certain of their sexuality and thrust it into the foreground. In his highly sexualized images, showing nude and partially nude women, Helmut Newton invited the viewer to be a voyeur and in doing so, he opened a window into a previously forbidden world.

Guy Bourdin, born as Guy Louis Babares in Paris (1928), learned the basics of photography during his service in the military from 1948–1949. He was employed at different times as a salesman for a Paris department store and a messenger for the U.S. Embassy. He started working for *Vogue* magazine in 1954, and his first editorial work was published in the magazine the following year. Twelve years later he started to photograph the advertising campaigns for the Jourdan Shoe Company, while continuing his work for various fashion magazines. Bourdin followed the trail blazed by Helmut Newton, but also carved his own niche in the fashion world. His photographs often have a sadomasochistic touch, sometimes humorous, and always provocative. While Newton almost always worked on location, Bourdin created his realities in the studio.

At the end of the century the field had expanded greatly, with numerous top fashion photographers making substantial contributions to the field, experimenting with color, lighting, extreme locations, computer manipulations, and other digital techniques. A substantial number of women have successfully entered the field, including Deborah Turbeville, whose murky, languid style of color work initially was considered unappealing. Ellen

Von Unwerth made the transition from model to photographer, as did the British Sarah Moon, who creates highly manipulated images that hark back to the elaborate style of Cecil Beaton and Baron de Meyer. American Sheila Metzner has photographed in some of the most extreme locales on earth, and the Dutch-born Inez Van Lamsweerde has moved between a career as a fashion photographer and a respected contemporary artist utilizing digital manipulation of her images. French-born Patrick Demarchellier, who works primarily in color; East-German born Peter Lindbergh, known for his black-and-white, retro-styled image of supermodels; Chicago-based Victor Skrebneski, known for his starkly light studio works featuring muscular models; Hiro, whose lush work in color signaled a shift from the predominance of black-and-white; Herb Ritts; Bruce Weber; and numerous others continue to make the photographs that exemplify style and luxurious living.

What Is Fashion Photography?

Fashion photography occupies a unique position in the medium; it is the one type of photography that captures, at one point or another, almost everyone's attention. Fashion photographers, particularly those at the top of the profession, most easily cross the line between fine art and commercial work. It is the one arena where art and commerce can exist in an easy and productive relationship. For some photographers, the line dividing art and commerce is indistinguishable; for others there is a sharp line separating the two. Sheila Metzner and Sarah Moon are two photographers who make no distinction, while Irving Penn and Richard Avedon keep their artistic projects apart from their commercial work. Yet, there is no denying that their artistic work informs the fashion pictures and gives their work a distinctive edge.

As the goal of fashion photography is to project an ideal world that is irresistible to the consumer, it demands an extreme amount of attention to detail, and thus is perhaps the least forgiving of all of photographic genres. The tiniest detail that is overlooked may become a major flaw in the finished photograph making it useless.

As is photography itself, fashion is an illusion. The clothes that we wear and the facades they can create are statements about our identity, both to ourselves and the larger world. In creating its illusion photography shows only two dimensions in place of the reality of three dimensions existing within time. Yet this reduction of reality into a two-dimensional image can create a compelling

whole; this is particularly true in fashion photography. Fashion photography does so by concentrating on the best and most perfect parts of both the “real world” and photographic practice. In photography, the choice of the right equipment, the correct angle of the shot, lighting, film, and even the studio or location environment creates a compelling image. In the arena of fashion there are additional requirements: it is the choice of the model, the make-up, hairstyling, the costume, and precisely what part of the garment is to appear in the final photo in addition to the inherent photographic requirements that determine a successful image. It is not enough for the photographer to be a masterful observer, he or she must also be a director of sorts, creating the image as it is captured.

The world of fashion is in a constant state of flux. A successful fashion photographer must learn to live with change (which ironically he or she may have introduced only to see it be abandoned as “last-year’s-style”) and adapt to it. Despite the achievements of towering figures in the field and the ideals they exemplify, there are no formulas to adopt. Constant reevaluation and searching for new ways to look at a familiar subject is required, thus experimentation is the constant companion of the fashion photographer. But experimentation can bring success as well as failure. Success will mean travel into new territories; failure will mean starting over again. For this reason many fashion photographers experiment through their fine art work, with successes translated back into their commercial work and failures left behind. The result is both artistic growth and exciting new images for consumption in the fashion industry.

The twentieth century has seen the shift in fashion photography from the selling of a specific product to the adaptation of a lifestyle. Baron de Meyer’s photographs depicted a garment and a setting that the reader of fashion magazines could aspire to, but seldom achieve. Few could afford the clothing the haute couture designers created. Following World War II, the direction of fashion changed in perceptible ways. Ready-to-wear was featured along with couture creations; movie stars and other celebrities continued to be used as models, but more “average” women were also featured in fashion layouts. Athletic models in motion, exemplified by Lisa Fonnsagrives became more popular. In the latter decades of the twentieth century, the feminist movement that demanded equality in rights and income, the mass marketing techniques of such companies as the Gap or Ralph Lauren, and the sudden rise of the Internet as an avenue of commerce and information, all contrib-

uted to the change in the point of view of the fashion photographer. Designer labels became available in discount department stores, and magazines regularly feature the side-by-side comparisons of the couture design and the affordable knock-off. The growth of new fashion magazines, art, music, and the increasing emphasis on youth culture were signaled by a new form of fashion photography. The new fashion photography delves deeply into narrative, telling stories that are not necessarily glamorous, including the anxieties and fears and realities of everyday life. In some ways the pictures of Juergen Teller with their “flash-on-camera” look, are closer to the average snapshot that the reader of the magazines have made themselves. Similarly, California-based Larry Sultan’s photographs for designer Kate Spade of fictitious families visiting various locales, including New York, have become the family snapshot album of this century. Philip-Lorca diCorcia also uses this technique, blurring the lines between fashion and documentary photography. These approaches infused new authenticity to fashion photography by mimicking vernacular styles and promoting lifestyle over a focus on items to be acquired.

The Business of Fashion Photography

There are two major segments to fashion and beauty photography. One is the advertising side, the other is often referred to as editorial work. The difference between the two can be stated in one word—control. In advertising photographs it is the client, the art director, or the agency that controls the final content of the photograph. The photographer is often chosen based on who can most closely interpret the style and content of the ad or the ad campaign. While the photographer can suggest, it is the client who decides.

In editorial work it is the collaborative work between the magazine editor and the photographer that produces the end result. In editorial photography, the selection of who will be the photographer often depends on who can best interpret the editorial viewpoint of the magazine, offering a certain amount of artistic freedom.

The business of headshots and model composites is another major element of fashion photography, and studios producing this kind photography can be found in almost every town in America. The typical headshot for fashion modeling is almost always done with large light sources such as umbrellas or soft boxes. This approach minimizes any skin blemishes and tends to flatten the perspective. The skillful application of make-up can open up the eyes

or emphasize or reduce the prominence of other facial features. Before any application of make-up starts, it must be determined whether the final photograph is going to be in color or black and white. Make-up for black and white should be somewhat stronger than that used for color photographs.

Most photographers will use either 35 mm or medium format camera equipment, and the choice of lenses is usually a medium telephoto lens in order to flatten the perspective. Headshots for other purposes such as theater or publicity stills often utilize somewhat stronger lighting in order to add a sense of drama.

Model composites are an essential part of what a model needs for her or his business success. The composite or “comp card” contains from three to six photographs as well as the physical statistics of the model and the agency with which she or he is associated. The photographs include a headshot, usually on the cover, followed by several partial or full-length photographs. The basic use of the comp is to allow an art or casting director to select the model type needed for a particular assignment. This is generally followed by a casting call or a “look-see” for a more detailed evaluation of the models. A model’s comp must be up to date since many decisions are made from the comp card. A change in hairstyle or color requires a new card.

The fashion model is of course an inextricable aspect of fashion photography. When Baron de Meyer started making fashion photographs, he used as his models the people he was acquainted with, namely the high society women in his and his wife’s social circles. Occasionally, he would employ an actress from the stage or a ballet dancer. But the reputation of this latter group of models was mostly unsavory. One indication of this was that he would credit the high society women in the title of the picture with their name, but not the actresses. This practice continued for several decades. As women became emancipated in the early part of the twentieth century, the social and moral strictures altered. In the late 1920s, John Robert Powers started the first modeling school and talent agency in New York and the professional model became a reality. Young women were trained in proper etiquette as well as what was expected of a fashion model. The first professional model to achieve celebrity was Lisa Fonssagrives. Born in Sweden, she moved to Paris in the 1930s to train as a ballet dancer. She was discovered by Horst and became famous for her grace and poise. She worked extensively in Europe in the 1930s and 1940s and married the photographer Irving Penn. Following her move to the United States she was in great demand in

New York until the late 1950s. Suzie Parker and her sister Dorian Leigh, and Dovima (who appeared in the classic Avedon image with chained elephants) joined Fonssagrives as top models of the 1950s. The 1970s saw the “super model” phenomenon epitomized by Cindy Crawford’s emergence in the 1980s as a major celebrity due to her work as a fashion model.

Hollywood Glamour Photography

In the world of photography there is one category that stands by itself, namely Hollywood glamour photography. It is neither the standard portrait photograph, nor is it the fashion photograph of that era, nor the production stills that were part of the making of a motion picture. It is a category by itself, and while there have been many practitioners of this type of image making, one name stands out above all, George Hurrell (1904–1992). He singularly invented the category and was part of the golden age of Hollywood glamour photography from 1925 to 1950.

From almost the very beginning of motion pictures, the still photograph of either the production highlights or the headshot of the stars, was an integral part of it. The portraits of the stars were mass-produced and were displayed in the theatre lobbies. The format of choice for these pictures was the 8×10-inch camera, because contact prints could be rapidly reproduced in quantities. Every studio in Hollywood employed a staff photographer to make these portraits. Clarence Sinclair Bull was one of the early photographers who defined the visual language of the genre, while Ruth Harriet Louise was the first female head of the MGM portrait studio from 1925 until 1930. Others included Virgil Apger, Eugene Robert Richee, and Ernest Bachrach. In Chicago, Maurice Seymour was the glamour photographer from the early 1930s through the 1960s.

George Edward Hurrell was born in Covington, Kentucky in 1904. He attended the Art Institute in Chicago as a painter, and was hired by Eugene Hutchinson, a prominent Chicago portrait photographer. Under Hutchinson’s tutelage, he learned darkroom work as well as retouching, airbrushing, and hand coloring. In 1925 he moved to Laguna Beach, California, with Edgar Payne, another painter. He quickly learned that the making of photographs was more profitable than the painting of the seascape oils he favored at that time. Most of the portraits he produced during the next two years were done outdoors, and he became exceptionally skilled at using sunlight to produce a pleasing portrait. In 1927, he moved to Los Angeles and opened

a photography studio in the Granada Building. The following year he received a visit from the legendary photographer, Edward Steichen, who needed a darkroom to process some of his film. Steichen disclosed that he was charging his client \$1500 for similar work for which Hurrell was charging \$50. Shortly after that the opportunity came for Hurrell to photograph the star Ramon Novarro and Hurrell made a series of portraits that not only pleased Novarro, but also stood out from the usual studio portraits. By then he had acquired two arc lights so that his portraits could be done indoors at any time of the day or night.

Norma Shearer, who was married to Irving Thalberg, head of MGM Studios, was put in touch with Hurrell by the same person who had introduced him to Novarro. Hurrell made a series of indoor portraits of her that were startlingly different from the standard studio portraits. The difference was in the lighting scheme.

The standard equipment of the studio portrait photographer was the 8 × 10-inch view camera. Most studios used a Kodak Portrait lens, which had purposely several chromatic defects. The visible effect of this was the halos that formed around the highlights when the lens was used at a wide open, f-4 aperture. It must also be remembered that using a lens at its widest aperture produces very shallow depth of field and the result is a picture that is sharp in only one plane, but out of focus in all other areas. This “soft focus” effect was actually sought after by the studios since it gave the portraits a dreamlike and romantic quality. But as important was the fact that this method produced fewer skin flaws and reduced the amount of retouching needed. The method of lighting the portrait followed the conventions of centuries of painting. A large light source was placed at eye level, a hair light was set behind the subject aimed in order to separate the subject from the background and finally, a light was aimed at the background to provide even greater separation. This lighting scheme and the use of the soft focus lens satisfied the portrait buying public. This scene was ready for a revolutionary change by a bored and restless George Hurrell.

When Hurrell did Novarro’s portrait, he started by placing his main light on a boom directly above his subject. This placement has a tendency to create strong shadows in the eye sockets as well as a deep shadow under the nose and chin. He opened these shadows with his second light set at face level. There were two other tools that Hurrell used. He owned a Wollensak Verito soft focus lens, but for the Novarro portrait he closed the lens down to an aperture of f-22, thus defeating the purpose of the

soft focus lens. The result was sharpness across the entire picture plane. Finally, Hurrell used orthochromatic film for his portraits. The effect on skin tones with this film was to give the sitter a tan, which translated into an exotic look. These three parts added up to a greater whole. It provided Hollywood with a new and glamorous way to portray its treasure of stars. It turned the stars into idealized icons.

With the success of the Norma Shearer’s portraits, he was hired as the chief photographer at the MGM Studios in 1930. But his interest was in operating his own studio and in 1932, he left MGM. He was quickly imitated, not only in Hollywood, but all over the country, and his style lives on in many studios.

BERNARD FAUCON

French

Discovered in the early 1980s, the work of Bernard Faucon is presently linked to “*mise en scène*” photography, staged or fabricated photographs. With colorful, elaborately constructed images that blend reality and fiction, he has created an original, poetic world.

Present in the world’s most important public and private collections, Bernard Faucon is one of the rare French contemporary photographers to have achieved international recognition. His fame in particular throughout Japan and in the United States is vast, reflecting a body of work at once modern and romantic, and anchored in universal issues.

Born in 1950, Bernard Faucon spent the first 20 years of his life in Apt, a small town in the south of France, where his parents set up a summer house. In 1967, his grandmother offered him his first camera, a Semflex, with which he photographed those closest to him as well as his first landscapes.

In 1971, Bernard Faucon settled in Paris, where he studied philosophy at the Sorbonne. There, he was deeply affected by the thinking of the eminent Thomist philosopher Jacques Maritain, with whom he became friendly, and who had a great influence on him. From 1965 on, he began to paint, making pictures in relief. But it was in 1976 that he purchased a Hasselblad camera and decided to dedicate himself to photography, then producing his first photographic “*mises en scène*.” Using mannequins he collected like ready-mades; he reconstructed powerful moments in an idealized childhood. His mannequins became veritable characters in fables that at times he mingled with real children. Among his various themes, he favored the natural elements: water, fire, snow; as well as the essential rituals of this young age, such as snack time, games, and parties.

The titles of his photographs: *L’enfant qui vole*, *La neige qui brûle*, *La comète*, *L’enterrement des jouets*, (the child who flies, the burning show, the comet, the toy burial) evoke a magical world halfway between dream and reality.

Discovered in 1979 in two exhibitions, the first in Paris (at the Agathe Gaillard gallery) and the sec-

ond in New York (at Castelli Graphics), he very quickly achieved international recognition.

He abandoned the use of mannequins in 1981, however, putting them aside to concentrate on landscapes and interiors containing the mere traces of a presence that has already vanished. A glass of water abandoned on a side table under the full moon; a lavender field where brilliantly colored pieces of laundry hang out to dry under a clothesline; a party in the shadowy half-darkness in which one can distinguish lights only from afar. He has also photographed fires that set nature ablaze. As in Giorgio de Chirico’s paintings, Bernard Faucon has created a strange, beautiful, metaphysical atmosphere in his work. Little by little, his work structured itself around several important series that evoke the passage of time, the fragility of the moment, and the fleeting quality of happiness.

Simultaneously a scenic designer, stylist, decorator, wardrobe artist, accessory specialist, and lighting designer, Bernard Faucon has produced rigorously composed images that require weeks of preparation.

I think of works in series...after a very abstract phase, I reconstruct the image from details, objects, situations.... Everything is lighted, brightened, even on the outside, but no effects are added on film. I don’t use filters. If I need something to be out of focus, I create a light smoke. I photograph what I want, and even if it lasts only for the moment of shooting the picture, I can believe I saw it.

(From an interview by Hervé Guibert, *Le Monde* 14/01/1981)

He produced only several dozen photographs per year, always in color, and using an ancient technique, that of the Fresson print, which produces a patina similar to that of painting. Following the series *Les Grandes Vacances* (1975–1977) and *Evolution probable du temps* (1981–1984), he invented *Les Chambres d’Amour* (1984–1987). In empty rooms, embers smolder, wild grasses overtake the ground, an expanse of cold milk seeps out like a lake. Ice, straw, dried flowers, an unmade bed make up his poetic furnishings, the last refuges of his intimacy, in which the artist’s romantic interrogations and concerns are reflected, as if in a mirror.

In 1987, Bernard Faucon discovered Asia and, thrilled by the golden light of gods and temples, created *Les Chambres d'Or* (1987–1989). Gold leaf applied to walls, landscapes, and bodies sublimates and transforms a reality in which material and spiritual, oriental and occidental, clash violently.

Then followed a more radical series, *Les idoles et les sacrifices* (1989–1991), which juxtaposes 12 portraits of adolescents transfixed in a golden light with a series of 12 landscapes crossed with a blood-red wound.

Bernard Faucon first showed his work at the Yvon Lambert gallery in Paris, at a moment when the Espace Photographique de Paris was also exhibiting a retrospective of his work. He published several books at that time, notably in Japan, and began to travel in Asia and the Middle East.

Les Ecritures (1991–1993), phrases inscribed in the landscape, marked a real turning point in his work. For the series, he wrote text by hand, enlarged it, produced the letters in plywood, covered the letters with reflective tape, then installed them in spaces he had chosen. Artificial lighting revealed the text. But Bernard Faucon created not installations, but photographs. Although his work could easily be categorized within the field of contemporary art installations, he remained faithful to Fresson prints, whose largest formats do not surpass 60 × 60 cm. After having inscribed the words in the landscape, he then started inscribing them onto bodies, even onto skin itself.

A last series, entitled *La fin de l'image* (1993–1995), marked the end of his photographic activity. Fifty-one small-format photographs framed in black unfold like a film. On each, one can read short phrases: “*tout pour un baiser et la vie avec,*” “*tu me caches le monde,*” “*j’étais aimé*” (all for a kiss and life with it; you hide the world from me; I was loved)... and on the last, simply the word “*fin*” (end) appeared.

In 1997, Bernard Faucon decided to suspend production of his photographic images. Conscious of having said everything he could with the medium, he thus turned toward writing. “Even the greatest do not know how to stop time,” he asserts. “Either I regenerate myself dramatically, or I go on to something else. One thing is certain, the history of the image is coming to an end (in an interview with Michel Guerrin, *Le Monde*, June 10, 1995).”

From 1997 to 2000, he developed a vast project in 20 countries, entitled *Le plus beau jour de ma jeunesse*. Aided by a young writer, Antonin Potoski, he invited 100 young people in each country, armed with instant cameras, to a party, and asked them to photograph those they loved and moments

of happiness. Selected by and then shown for the first time together at the Maison Européenne de la Photographie, Paris, in November 2000, these images toured the world, accompanied by a book about the project. In 1999, he published his first collection of texts without images, *La peur du voyage*.

LOUIS FAURER

American

Louis Faurer emerged in the 1940s as a talented photographer on the basis of both his personal and commercial work. He is best known for his artistic photography: gritty black-and-white emotionally charged photographs that capture the great bustling crowds of New York City streets and the isolated, haunted figures that roam them. His subject matter, raw style, disregard for the “rules” of photography, and his involvement with commercial magazine photography place him in what is now known as the New York School of Street Photography. Although Faurer was included in seminal group exhibitions at mid-century, only within the last few decades has his work regained significant recognition.

Born on August 28, 1916 to Polish immigrant parents in South Philadelphia, Faurer displayed an early predilection towards drawing; he attended Philadelphia's School of Commercial Art and Lettering, and worked as an advertising painter and commercial letterer before turning to photography in 1937. His early photographic education primarily consisted of pouring through Farm Security Administration publications. Faurer particularly admired Walker Evans's photographs, but his own work never had quite the same objective, social documentary style. Not long after picking up a camera, Faurer won the “Photo of the Week” award in a local paper and soon found his preferred subject matter—city streets that alternately teemed with crowds and featured lone figures. Work completed while he was in Philadelphia displays a strong inter-

est in street vendors and beggars. In *Market St., Philadelphia, PA*, 1937, the limbs, cane, sign, and pencil box of a blind man jut out into the picture frame in sharp focus amidst the blurry figures of rushed pedestrians.

In 1946, Faurer began commuting to New York in search of commercial photography work and found a position at Hearst publications' *Junior Bazaar*. He met Walker Evans in the offices of *Fortune* and Robert Frank at *Harper's*. Frank and Faurer became friends, and they admired and influenced each other's work. Frank offered Faurer the use of his studio; Faurer worked both there and in the studio of Sol Mednick (whom he knew from Philadelphia) until moving to New York in 1948. He also met *Harper's Bazaar's* legendary art director Alexey Brodovitch, and attended several classes at Brodovitch's Design Laboratory while he remained primarily self-taught. The utilization of motion, blur, and large grain in Faurer's fashion photography during this period, however, reflect Brodovitch's predilection for dynamism and novelty.

Between 1947 and 1951, Faurer worked prolifically, creating a distinct and haunting body of personal work possessing great emotional impact while maintaining his career as a commercial photographer. He acted as the great roaming eye of the city, wandering its streets and peering out of its windows. Everywhere in the photographs people are looking—at times looking back at the photographer, but most often looking at the surrounding sights of the city. His images capture the bustling energy of postwar America, as in *Broadway, New York, NY*, 1949–1950, which shows laughing young women in a convertible barreling down a street of lighted marquees. Most often, however, his work conveys a sense of underlying isolation and disillusionment. He is particularly drawn to the social outcasts and loners: the retarded man holding a flower in *Eddie, New York, NY*, 1948, the eerie twins in *5th Ave., New York, NY*, c. 1948, or the woman smoking a joint, oblivious to the men behind her in *Barnum & Bailey Circus Performers, Madison Square Garden*, 1950. Faurer, however, always approached these subjects with empathy, never criticism. With themes such as the individual versus metropolis, along with general mood and style, many of Faurer's works from this period display an affinity with cinema's *film noir*.

Faurer was particularly attracted to Times Square at night. His photographs capture the area at its post-war zenith, before it became a seedy center of vice. Graphically bold images of lighted signage, such as *New York, NY*, 1948, capture the dynamism of city life and attest to his continued

interest in commercial lettering. Working primarily at night provided technical challenges. Using a 35 mm camera (most often a Leica), the most sensitive films of the time, wide-aperture settings, and slow shutter speed, he primarily relied on intuition and experience, not light meters, to achieve proper film exposure. Many of Faurer's photographs possess a dreamlike quality, owing to his use of multiple exposure and spliced negatives or his seeking out of reflections [see *Multiple Exposures and Printing*]. In "Accident," 1949–52, Faurer capitalizes upon having accidentally exposed the film in his camera twice, creating a haunting print that eerily combines a wedding with a shivering boy at the scene of an accident.

At mid-century, the Museum of Modern Art included him in many important group exhibitions, including *In and Out of Focus*, 1948, and *The Family of Man*, 1955. In 1949, he became a staff photographer for the short-lived but extravagantly produced *Flair*, which in 1950 published his photo essay, *The Eight Million*. Faurer relocated to Europe in 1968 for reasons described variously as a desire to pursue commercial work, emotional distress, marriage problems, and trouble with the IRS. He returned to New York in 1974, just as photography was gaining greater recognition in the art world with more venues for its display. Faurer began to seek recognition for his artistic work, an endeavor helped after meeting William Eggleston and curator Walter Hopps. During the last decades of his life, he secured exhibitions, taught photography courses, and printed earlier negatives while continuing to photograph; however, his work lacked his former intensity. Faurer also supervised color printing of 35 mm transparencies dating to mid-century. He died in Manhattan on March 2, 2001.

Faurer is often noted as filling a gap in the history of American photography between Walker Evans and Robert Frank, both of whom he knew and admired. His work is far more emotionally wrought and offhanded than Evans's but without the extremely expressive potential and strong sense of composition of Frank's. Faurer's renewed reputation, however, rests less on historiographical convenience than on the intrinsic merits of his strong personal vision of America expressed in works from the forties and fifties.

ANDREAS FEININGER

American

A photographer for *Life* magazine for 20 years, Andreas Feininger created some of the most iconic images of modern America. His view of Coney Island on the July Fourth holiday (1949) congested with a sea of celebrants and a photograph of the car- and pedestrian-clogged Fifth Avenue in Manhattan (1950) conveyed the kinetic and chaotic life of city dwellers in the mid-twentieth century. The 1951 picture of photojournalist Dennis Stock holding a camera in front of his face has become a symbol of the unique marriage between camera and photographer. Building upon themes explored first at *Life*, Feininger focused his later work on nature, in particular on the geometric structures and patterns common among forms such as leaf veins, shell spirals, and forest growth.

Born in Paris in 1906 to American artist Lyonel Feininger, Andreas and his younger brother Theodore Lux Feininger (a painter and photographer) traced their early artistic influences to the Bauhaus in Germany, where Lyonel taught in the 1920s. At the avant-garde institution, Feininger studied cabinetmaking and took a photography class from Walter Peterhans, yet he recalled teaching himself how to experiment with form, technique, and subject matter, no doubt inspired by László Moholy-Nagy who lived in the same duplex as his family. By the late 1920s, Feininger published photographs through the Dephot photo agency, and he had several photos included in the landmark 1929 exhibition *Film und Foto* at the Deutsche Werkbund in Stuttgart, Germany.

After acquiring a degree in architecture from the Anhaltische Bauschule zu Zerbst in 1928, Feininger worked as an architect for firms in Dessau and Hamburg until 1932, when his American citizenship prohibited him from legal employment in Germany. He briefly worked for the architect Le Corbusier in Paris, then moved to Stockholm where he found employment as a photographer for architectural businesses. There he married Gertrud Wyse Hägg, with whom he had one son, Tomas, born in 1935. While in Sweden Feininger published a few photography books, including *Stockholm* (1936), which featured images of ships

and barges in the city's port, and *New Paths in Photography* (published in English, 1939), which presented some experimental work.

Increasingly challenged to find work, by 1939 Feininger moved his family to New York, where he quickly secured commission assignments from the Black Star photo agency and *Life* magazine. In 1942 the U.S. Office of War Information hired Feininger to shoot a series on the country's factories producing weapons and instruments for the war. The next year *Life* magazine hired Feininger as a staff photographer—a position he held until 1962. At *Life*, Feininger completed more than 340 assignments, many of which he initiated himself. With a straightforward, realistic style, Feininger captured the dynamism of New York, the abstract beauty of factories and manmade landscapes, and the fascinating world of insects. The Dennis Stock image was part of a photo essay on working people and their equipment, such as a welder with a protective helmet or a diver with a face mask.

In addition to his work for *Life*, Feininger wrote articles on technique and aesthetics for *Popular Photography* (1949–1950) and *Modern Photography* (1957–1969 and 1969–1972). He published several books and was included in a number of exhibitions, notably *The Family of Man* at the Museum of Modern Art (1955) as well as a one-person exhibition titled *The Anatomy of Nature* at the American Museum of Natural History (1957).

Feininger's nature subjects became his obsession. After quitting *Life* in 1962, Feininger devoted himself to creating photography books intended to inspire appreciation and environmental action on the part of the reader. Thus *Trees* (1968), *Shells* (1972), and *Leaves* (1984) promote the beauty and variety of species and *Forms of Nature and Life* (1966), *Nature Close Up* (1977), and *In a Grain of Sand* (1986) explore the interrelatedness of natural forms, from a snake's skeleton to mineral deposits in a rock specimen. He typically shot inanimate objects in his studio at home, with minimal background and usually in close-up. In the landscape, Feininger took non-sentimental photos of trees, tightly cropped images of bark, and gripping shots of insects devouring each other. Feininger worked with color photography as early as the 1950s, and he

published a few Cibachrome close-ups of butterfly scales and leaf veins in his last book *Nature in Miniature* (1989).

Regardless of subject matter (pine cones or freight ships, feathers or assembly lines), Feininger emphasized formal characteristics in his photographs that he also espoused in his articles. Such qualities included clarity, contrast, pattern, outline, texture, and detail. He credited this approach to his educational background:

As long as I can remember, I have been interested in the forms of rocks and plants and animals. I have studied them, not with the eye of an artist, but with the eye of the architect and engineer, who is primarily interested in structure, construction, and function.

(*Anatomy* 1956, 8)

Feininger's analytical style posits his photographs somewhere between the clinical work of *Neue Sachlichkeit* (New Objectivity) German artists such as Karl Blossfeldt and Albert Renger-Patzsch and the sensual imagery of American straight photographers Edward Weston and Imogen Cunningham (all of whom Feininger exhibited with at various points in his career). Compared to fellow *Life* photographer Margaret Bourke-White, Feininger lacked drama, both in terms of his photography and his public persona, yet he maintained a consistency in quality and aesthetics.

His imagery and dedication to the field were rewarded by numerous exhibitions and awards. The International Center of Photography organized a traveling retrospective in 1976, and his photographs have been collected by several major museums including the International Museum of Photography and Film, George Eastman House in Rochester, New York, and the Center for Creative Photography, University of Arizona, Tucson, which also houses his archives. He received a Gold Medal Award for Editorial Design from the Art Directors Club of Metropolitan Washington in 1965 and a Robert Leavitt Award from the American Society of Magazine Photographers in 1966. He died in New York at the age of 92.

T. LUX FEININGER

German

The youngest of three sons born to caricaturist and painter Lyonel Feininger and Julia Berg, Theodore Lucas Feininger was also one of the youngest students ever enrolled in Germany's Bauhaus Institute of Architecture and Design. Although he would later insist that he was a painter, not a photographer, during his brief photographic career Feininger produced playful candid snapshots and formal studies that described everyday life at the Bauhaus and the waning years of Germany's "golden" interregnum era.

T. Lux's father Lyonel was born in New York to German immigrant parents, and in 1871 he returned to Germany; he studied visual arts in Hamburg, Berlin, and Paris. After 14 years working as a caricaturist and draftsman, on the eve of World

War I, Lyonel was appointed a "master" at the Bauhaus in Dessau, where two of his sons were later enrolled. Despite the fact that the elder Feininger was directly opposed to the implementation of formal photographic study at the Bauhaus, all of the Feininger boys experimented with the medium and freelanced as professional photojournalists at one time or another. T. Lux's eldest brother, Andreas Feininger, trained as an architect but became well known as a photographer in the United States, publishing more than 350 photographic essays in *Life* magazine between 1943 and 1962. But it was T. Lux who first took an interest in photography when, as a teenager, he discovered his grandmother's Kodak box camera in the attic of the family's home in Weimar. Within a year, he had purchased a 9 × 12 inch plate camera and, with Andreas's assistance, set up a darkroom in their home in Dessau.

Despite six years of undergraduate and postgraduate study at the Dessau Bauhaus, Feininger nevertheless describes himself as a “self-taught” photographer. Though his formal education in aesthetics no doubt influenced his photographic style, it is also true that the experimental photography for which the Bauhaus is now so well known was not formally implemented into its curriculum until 1929. Though many Bauhäuslers dabbled with the modern *Neue Sehen* or “New Vision” aesthetic in the mid-twenties, photography was widely regarded as a peripheral pursuit by instructors more dedicated to functionalist architecture and design. Feininger himself noted that he did not study photographic literature or theory until well after his emigration to America in 1936. It is perhaps precisely this lack of formal critical thinking about photography that lent such a fresh, unmediated character to Feininger’s photographs.

Counting Russian film and German photographers Umbo and Walter Peterhans among his influences, Feininger has been careful to note the distinctions between their approaches and his own. Peterhans, he observed, was a still-life photographer, whereas Feininger preferred to capture movement and human subjects. Feininger’s body of work is characterized by two distinct styles—candid snapshots of Bauhaus student life and architecture exploiting the “New Vision” preference for extreme points of view; and an exploration of the spatial relationships between humans and architecture, and more carefully posed formal documents of Oskar Schlemmer’s Bauhaus theater workshops and performances. Photos like “Sport at the Bauhaus” (c. 1927) employ a stylistic spontaneity of pose, angle, and shutter speed that reiterates the creative spontaneity for which the school was so well known. In this photograph, two young Bauhaus athletes are suspended in a mid-air, back-to-back collision above a backdrop depicting the school’s architectural campus. Their central positioning in the composition over the five-story “Prellerhaus” student studio building coupled with the photographer’s worm’s-eye view creates a clever distortion of scale that earned the photo the alternative title “Jump over the Bauhaus.” This kind of dynamic point of view and playful humor are likewise evident in the mischievous smirks and clowning poses adopted by members of the Bauhaus jazz band, whose ranks Feininger photographed with equal enthusiasm. It is important to note, however, that Feininger’s satirical wit extended beyond youthful musing to include a more serious critique of the ideological conflicts at the school. Both students and “masters” were divided between the strict dialectical materialist approach of

architects like Walter Gropius and Hannes Meyer and what Feininger described as a more “intuitive” approach of the painter Paul Klee and theater master Oskar Schlemmer. Feininger’s critique of Gropius’ approach included pictures like *Das Flache Dach* (*The Flat Roof*), which called attention to the failure of “functional” architecture by documenting the tendency of the flat roofs to flood and leak.

Feininger’s more formal images of the masks, costumes, stage sets, and choreography of the theater workshop are no less dramatic than his candid snapshots, but their drama is conjured more by careful spatial arrangement and lighting than by extreme or oblique points of view. His 1928–1929 studies of masks, for example, are carefully composed still lifes that emphasize the plasticity of the subject through the photographer’s use of deep shadows punctuated by well-placed highlights. Taken together, Feininger’s body of work functions as much like a thoughtfully constructed family album as it does a documentary record of this famous school’s legendary aesthetic ideologies.

Contrary to his own professed lack of interest in professional photographic practice, in 1927 Feininger sent two portfolios of photographs to Alfred Barr, then chief curator of fine arts at New York’s Museum of Modern Art (MoMA). Barr, who had visited László Moholy-Nagy at the Bauhaus earlier that year, loaned 16 of these photographs to the Bauhaus Exhibition held at the Harvard Society of Contemporary Art in 1931, and two were officially purchased by MoMA that same year. In 1928, Feininger published his first photographs as a freelance photographer for the Dephot photographic agency, which placed his photographs in a broad range of publications like *Die Woche*, *Die Dame*, *Der Arbeiter Fotograf*, and *Das Illustrierte Blatt* over the next few years. And in 1929, he had seven photographs accepted into the internationally influential *Film und Foto* exhibition in Stuttgart.

Despite this early success, by the early 1930s Feininger turned his interests to painting, exhibiting two works at Berlin’s 1930 Kunstblatt Ausstellung under the name “Theodore Lux,” perhaps dropping his last name in an attempt to avoid comparison with his famous father. Just prior to the ascension of Hitler’s National Socialist regime, Feininger traveled to Paris, Sweden, and Switzerland before emigrating to New York City in 1936. Branded as a “degenerate artist” by Hitler’s cultural ministry due to his association with the Bauhaus and his wife’s Jewish heritage, Lyonel Feininger also emigrated to New York the following year. Having left the bulk of his negatives and most of his paintings behind, the youngest Feinin-

ger would not resume his photographic practice until 1946, after three years of service in World War II with the U.S. Army. Though he did not publish or exhibit his work during this period, Feininger describes the years between 1946 and 1952 as a time when he “worked the most intensely and consciously at the problems of photography” that led to “a fruitful interchange [between his] photography and painting” (Feininger, *T. Lux Feininger: Photographs of the Twenties and Thirties*, unpaginated preface).

In the years following 1952, Feininger once more left photography behind in order to pursue painting and to work as a teacher at Sarah Lawrence College, Harvard, and finally at the Boston Museum School of Fine Arts from 1962 to 1975. He has since enjoyed a successful career as a painter but will be forever regarded as an important practitioner of the modern New Vision style of photography popularized in Germany in the late 1920s.

HANS-PETER FELDMANN

German

Born in 1941, Hans-Peter Feldmann is one of the most enigmatic personalities of the art world to emerge after 1960. As much as his photographic images seem to center on the everyday, his pursuit of an artistic career is unconventional. By 1989, when the comprehensive catalogue *Hans-Peter Feldmann: Das Museum im Kopf* was published and a retrospective was established in Frankfurt and a year later in Düsseldorf, Feldmann had stopped his artistic activities, preferring to run a shop for accessories and crafts, later a mail-order operation for thimbles, and then a business for selling toys made of tin. After 1980, he destroyed all works in his possession and had a seemingly farewell exhibition at the Museum van Hedendaagse Kunst in Ghent, Belgium and then avoided the art world. His rediscovery in 1990 not only focused on the reception of his artistic works but also was guided by an important aspect of 1970s art: the confrontation with mass media and especially with the social, political, and aesthetic function of photography. This important function of the photograph was first described in "The Work of Art in the Age of Mechanical Reproduction," Walter Benjamin's highly influential 1931 essay, which Feldmann has consistently acknowledged.

Feldmann's oeuvre reflects the collective cosmos of images that condition perception and reality in the late twentieth-century, the millions upon millions of private, press, and advertising images that are often anonymous, banal, and seemingly worthless and yet form the most important archive of the twentieth century.

Just as East Germany-born painter Gerhard Richter, to whom Feldmann offers the highest praise, began to collect these images which surround us daily for his *Atlas* shortly after immigrating to the West in 1961, Feldmann collected illustrations, advertising photographs, postcards, placards, and photo albums that he obtained from their owners or from flea markets, and expanded the work of these found images with his own photographs. Though Richter also thought his collection worthy to exhibit, he mainly used it as the basis and point of departure for his paintings. Feldmann, on the other hand, never hesitated to exhibit his seemingly artless, mass-produced product, relying on the art context to transform it while retaining an aspect of originality.

Although he studied as a painter, he abandoned this medium in 1968. After 1968, Feldmann began to categorize (as Richter did in his own way) the daily flood of haphazard images with which he was inundated into small booklets arranged according to subjects, such as chairs, mountains, bicyclists,

swimmers, trees, and sailboats, and these serializations closely suggested the works of Bernd and Hilla Becher. He self-published these booklets as simple stapled brochures in various sizes as black-and-white offset publications with no annotation or commentary on what was being presented. The covers were gray cardboard, the title was stamped in blue, and they were not signed; the maximum print run was one thousand.

Feldman's first booklet was *12 Bilder* (12 Images; 1968). For these 12 images of airplanes in the sky, he took more than 100 photos and edited them down to a dozen. He had also published booklets that feature just one image. Most characteristically, however, Feldmann errs on the side of excess. For example, to ridicule normative aesthetics and the interchangeability of images, he collects his series of subjects from calendars, books, and postcards or from amateur and professional photographers, often choosing the most banal and hackneyed sorts of imagery and presenting often over 100 images. Feldmann preferred that the average number of objects and photographic representations mirror each other. The number of publications per year varied; in 1968 there were two, and in 1972 there were seven. In one instance, in *3 Bilder* (1976), he substitutes the images with descriptions, which made clear how close his work is to conceptual art. (In a reverse strategy, he once answered interview questions by providing photographic images.) The exhibitions of these booklets are as unpretentious as the booklets themselves; in museums and galleries they are tethered by cords from the ceiling or lie on tables that the visitors may handle them.

In 1977, Feldmann showed his *Bilderfundus* (Fund of Images), which he described as a "copy of the world," in the Folkwang-Museum in Essen, Germany. The museum exhibition of these materials as well as their display in booklets raised questions about the traditional concept of art and work: photos are trivial, and these are readymades and reproductions. In the age of mass media the artistic original has become, for Feldmann, a dubious category.

Before 1968, under the influence of Konrad Klappheck, who like Richter was a professor at the Kunstakademie Dusseldorf, Feldmann painted precise representations of simple objects, avoiding any of the individual style that would later emerge. According to an often-circulated anecdote, he created his large-format photographs that are difficult to transport to demonstrate to gallery workers how the reproduction replaces the original. The ensuing departure from painting and the general breakup of the concept of art have their origins in the political,

social, and cultural movements of the 1960s, in which the power of mass-media images was evident: when millions of people followed their television screens for the moon landing, the Vietnam War, the student protests, and the civil rights demonstrations and media theorist Marshall McLuhan became a cult figure. Reactions in art abounded: at the 1972 Documenta 5 in Kassel, Germany there was an exhibition of title pages of the German weekly news-magazine *Der Spiegel* from 1960 to 1972.

Although Feldmann has often been portrayed as an artistic maverick, his work joins that of many other American and European artists reacting to the disruptions of the 1960s. Feldman himself has pointed to an intellectual closeness of his work especially to Belgian conceptualist Marcel Broodthaers, Gilbert & George, and French conceptual painter Daniel Buren. His work has many affinities to that of Ed Ruscha, who also created booklets of collections of images. Like the French artist Christian Boltanski, Feldmann creates archives from the massive archive of vernacular photography, family snapshots, and other images that are often overlooked. Although his work was not as well known as these figures in the 1960s and 1970s, he later was recognized as having a seminal role in the development of conceptual photography in the 1980s, and has even been identified as an early example of appropriation as an artistic strategy.

Feldmann also created books, which were essentially collections of his brochures, where he displayed comprehensive photo series, interconnections of the media, and documentations of periods of time. Many remain unpublished; others accompanied exhibitions, such as *Eine Stadt: Essen* from 1977. Because it thematized German left-wing terrorism, very much like Gerhard Richter's cycle on the Red Army faction, *18 Oktober 1977*, Feldmann's self-published book *Die Toten [The Dead], 1967–1993* (1998) caused a sensation, with its 95 photographs of terrorists and their victims culled from the news media. Feldmann's contribution to the end of the century was *100 Jahre*, photographs of 101 people from his circle of family and friends, beginning with an eight-week-old baby and ending with a 100 year old woman.

As a logical consequence of his work, Feldmann also used the media itself as a platform. Without securing the cooperation of the publishers, he managed to have photos placed in feature and business sections of Cologne newspapers that had no relationship to the text and no caption. He smuggled them in many times, some having no comment or indication that they were Feldmann's artistic contributions. They confirm that we accept empty

formulaic images as documents and organize them in stereotypically defined categories. Another kind of action in newspapers occurred in 1975, when he placed colorations on one page of the feminist *Emma*. In his *Zeit-Serien* (Time Series) he took 36 photographs of a scene, the number of images on a standard roll of film, documenting various everyday situations or scenes, such as pictures of a car radio while music that he enjoyed was playing. In 1995 he founded the magazine *OHIO*.

Many of Feldmann's projects are postcard series and placard-like prints. For the yearly exhibition in Vienna called *Das Plakat*, he created toward the end of 1994 and the beginning of 1995, 3,000 public placard partitions, on which he arranged family photos of his own and of strangers in black and white on a blue background. In his subversive mimicry, Feldmann is active in all media he can copy.

FEMINIST PHOTOGRAPHY

Twentieth-century feminism has been a richly diverse, multifarious, and hotly contested terrain. Feminist artists, activists, and historians continue to negotiate the terms of the debate, often with widely different positions. There is no one definition of feminism, but a web of occasionally conflicting theories and practices emanating from changeable cultural conceptions of sexuality and gender. Attempting to categorize feminist photography is, therefore, an even more slippery task. Suffice it to say that in the wake of feminist political action in the 1960s and 1970s, a newfound interest in women's photography—both contemporary and historical—was spreading. Mirroring developments in the emerging fields of women's history and women's studies, those working in this first wave of feminist investment in photography began by re-situating and rescuing. Their assignment was to re-situate the work of women photographers within the history of photography and rescue those women photographers who had disappeared from the historical record. They also worked in photographic images, publications, and exhibitions, to present new ways of thinking about and looking at representations of women. On the heels of this initial interest in the idea of women and photography, a new generation of feminist artists and photographers began to emerge in the 1970s and early 1980s. Although evolving at the same historical moment as the first group of photographers, what set this group apart was an active engagement with feminist political and theoretical debates and the fact that their enterprise was immersed in the developing fields of postmodern and feminist theory. The work of this second generation of feminist photographers, particularly their keen examination of power, privilege, and the formation of identities in contemporary culture, set the tone for a growing number of women who entered the photography scene in the late 1980s and 1990s, women from backgrounds and orientations that had been previously under-represented. Composed primarily of women artists of color and lesbian artists, this third generation of feminist photographers often challenged the tenets of what they perceived to be the prevailing mainstream, White, middle-class, straight feminist orthodoxy.

The Women's Movement, 1970s

Two early traveling exhibitions in the United States demonstrate the emerging overlap between feminism and photography in the 1970s. On the West Coast in 1975, the San Francisco Museum of Modern Art launched the exhibition and catalogue organized by Margery Mann and Anne Noggle titled *Women of Photography: An Historical Survey*. This exhibition surveyed the work of 50 women photographers; the catalog remains a significant source on the work of women in photography. In New York in 1979, the International Center of Photography sponsored Margaretta Mitchell's traveling exhibition with accompanying catalog titled *Recollections: Ten Women of Photography*. Mitchell received a National Endowment for the Arts grant in 1978–1979 to develop the project, thus demonstrating the topical nature of such projects for the art community and the nation in the late 1970s.

As these exhibitions traveled across the country, a group of young women photographers including Bea Nettles, Wendy Snyder MacNeil, Judith Golden, Anne Noggle, and Judy Dater were gaining significant exposure for their own photographic work that consistently explored women's issues. Bea Nettles has created mixed-media photographic pieces dealing with domesticity and women's identity since 1970. Snyder MacNeil and Golden both started in the early 1970s by photographing themselves and their own personal relationships. These very subjects—domesticity, family, and issues of personal identity—were key areas of inquiry for those participating in the feminist movement in the 1970s (and after), yet women photographers of the time rarely used the term “feminist” in connection with their work. Dater and Noggle became known for their direct, psychologically evocative portraits, mostly of female sitters. The strong and self-assuredly sexy women typically photographed by Dater, such as her portrait of *Laura Mae* (1973), seemed to typify the newly defined liberated, young, American female. In contrast, Noggle, who came to photography as a return college student in her early 40s, turned her lens to less fashionable and not-so-

sexy middle-aged subjects, including a series of self-portraits from 1975 of the artist recovering from a face-lift. Like most women photographers of their generation, both Dater and Noggle not only used their female subjects as substitutes for themselves, they also produced self-portraits throughout their photographic careers. This interest in female subjects in photography established an exploration of female identity that would pervade feminist photography for the remainder of the twentieth century. As their imagery reveals, the impetus for their work was often rooted in their own personal history. Unlike later feminist photographers such as Cindy Sherman and Barbara Kruger, the photographic projects in this first generation of feminist photography were not yet specifically conceived of or discussed as political or cultural critique. In fact, Dater and other women photographers of the time were often quite ambivalent about politics and feminism in particular. These women worked at being considered photographers in their own right, not “women” photographers per se. Although their work focused on women’s identity, their public attitude was that gender itself was not the primary issue. In stark contrast, the next generation of feminist photographers would construct their work around the very issue of gender.

A somewhat similar early history can be traced in Great Britain, although from the start feminist photography in Britain was a clearly political, feminist enterprise. This was primarily due to its roots in the social documentary tradition, originating with the 1972 exhibition *Women on Women*, a collective documentary project initiated by the Half Moon Gallery in Whitechapel. The exhibition featured women photojournalists photographing women subjects and led to the formation of the socialist, feminist group the Hackney Flashers in 1974. One of the major forces behind the group was the photographer Jo Spence, who wrote and exhibited extensively before her death in 1992 and became a significant figure in the development of twentieth-century feminist photography in Europe and the United States. Rooted in a straight documentary photography tradition, Spence’s early work in the 1970s and 1980s consisted mostly of social documentary projects focusing on women, work, and the domestic sphere. Diagnosed with breast cancer in 1982, Spence, in collaboration with Rosy Martin, developed “photo therapy,” a healing technique, realized through a series of self-portraits. Spence has become a major inspiration for breast cancer survivors and a generation of British women photographers, including the Irish born Angela Kelly. Now living and working in the

United States, Kelly’s work, while focusing on the problems of growing up female in a male-dominated society, also reexamines the social documentary tradition itself, questioning the nature of realism and representation.

Gender Discourse, 1970s–1980s

Thoroughly immersed in the new wave of ideological investment in Freudian psychoanalytic, feminist film, and predominantly French critical theoretical models, the next generation of feminist photographers working in the 1970s and 1980s grappled with the nature of representation and issues of sexual difference in their photographic work. Often coming to photography from a conceptual art, fine art, film, video, or commercial art background, artists including Sarah Charlesworth, Martha Rosler, Mary Kelly, Barbara Kruger, and Cindy Sherman, examined the construction and perpetuation of cultural myths and stereotypes through visual images and the mass media. These artists used photography as one tool in their creative repertoire. Sarah Charlesworth, for example, came from a conceptual art background to investigate photography as a subject in itself. From her *Modern History* project in the late 1970s to her *Objects of Desire* and *Doubleworld* projects in the 1990s, Charlesworth explores how photography functions as a play of symbols in our culture—symbols that affect us individually and collectively. Straddling the first generation of feminist photography and the second, Martha Rosler has worked in video, photography, performance, and installation since the late 1960s, creating politically motivated works that challenge cultural and political biases. Rosler’s engagement with media images came directly out of her involvement in anti-war protests and the women’s liberation movement. Her *Bringing the War Home* series from 1967–1972, was a response to the artist’s frustrations with media portrayals of the U.S. military involvement in Vietnam. Rosler used photographs from mainstream American magazines to create photomontages that juxtaposed images from the war in Vietnam with scenes of American domestic interiors, creating a startling contrast. Rosler’s well-known photo/text project, *The Bowery in Two Inadequate Descriptive Systems* from the mid-1970s, used text and images in order to rethink the documentary photography tradition and demonstrate the limitations of both pictures and words as vehicles to reveal social realities. In her video and performance work of the time, such as her *Semiotics of the Kitchen*, 1975, Rosler commen-

ted more directly on women's issues. Mary Kelly inserted psychoanalysis and semiotics in art practice and agitated the London art scene when she first exhibited her now renowned *Post-Partum Document* (1973–1979) at the Institute of Contemporary Art in 1979. Commenting on psychoanalytic discourses of gender and motherhood, Kelly's complex multiple section, mixed media work used literary, scientific, psychoanalytic, linguistic, and archaeological modes of representation to document the artist's relationship to her son in his early stages of development. *Post-Partum Document* was radical not only because it took on the tabooed conjunction of motherhood and desire, but also because it presented an analysis of language and sexuality as socially determined. This kind of statement was novel at the end of the 1970s, although it would become the foundation of the emerging discourse on sexual difference in the next decades. Like many feminist artists of their generation and after, both Rosler and Kelly were quite articulate about their work and successfully negotiated the crossover from artist to critic and vice versa.

Inspired by this developing feminist critique of photography's role in the perpetuation of gender stereotypes, media-savvy artists such as Barbara Kruger and Cindy Sherman created imagery that worked against such stereotypes and undermined the authority of the male gaze. In reaction to the objectification of women in the art, advertising, and Hollywood film industries, both Kruger and Sherman adopted the very same strategies used in those industries in order to subvert their power and harness it for their own critique. After working for several years as an art director and photo editor for fashion magazines, Kruger began in the 1970s to create image and word pieces, culminating in what have become her signature style photo/text montages banded with red striped slogans. Her untitled series of images, including *Untitled (Your Body is a Battleground)*, 1989, appropriates the look of the mass media in order to comment on its pervasive power in our culture and its disembodied authorial voice. This piece, and others in the series, also implies a specific political agenda, as Kruger takes on the pro-choice/abortion debate with the slogan "Your body is a battleground." Kruger's work became more politically engaged over the next decades as she gained exposure through a variety of international public art projects and poster campaigns.

The significance of the female body as a site for political action and resistance, as seen in Kruger's work, was further developed in the work of Cindy Sherman and would ultimately become the back-

bone of feminist photography for the rest of the century. With her black and white *Untitled Film Stills* series from the late 1970s and early 1980s, Sherman expanded the gender discourse to focus on the instability of identity, the social constructions of gender, and the idea of femininity as masquerade. In these photographs, as in almost all of her work, Sherman posed herself as the model in a series of narratives that mimic classic Hollywood film stills, although these images do not directly reference any original film or story; they are completely made-up. Sherman's photographs emphasize the voyeurism of film, as the viewer often peers in at the woman through a doorway, or a window, or from below. By using herself to create a seemingly unlimited cast of female characters, Sherman not only forces us to confront our inability to fix or locate her own identity, they point to the precariousness and fluidity of female identity, and femininity, overall. In her later color work, Sherman moved away from typically glamorous representations of women and pursued darker more ambiguous images of femininity, images that involved violence, eating disorders, and the sex industry. For a series of images produced in the 1990s, Sherman used various sex toys, dolls, and other paraphernalia to create rather horrifying large-scale "still-life" photographs in intense color. Although harshly criticized for this work, with these images Sherman was portraying the other, overlooked side of the glamour and sex industries, the side that sustains violence against women and urges them to binge and purge in order to maintain an artificial standard of female beauty.

Sherman's employment of the body, specifically her own body, as a vehicle for social and cultural critique, can be linked to a group of feminist performance/body artists and their photographic production. Feminist artists including Americans Hannah Wilke, and Dorit Cypis and Cuban-born Ana Mendieta, for example, all used themselves as a subject in order to address issues of personal and public identity. Ranging from studio pieces, to earthworks, to mixed media installations, Wilke, Mendieta, and Cypis use their own bodies to create representations about the female body where they implicate the viewer as a participant in their potentially voyeuristic and narcissistic projects. In photographs made from the early 1970s until her death in 1993, Wilke, the most prominent of this group, played with notions of narcissism, masquerade, and female objectification. In her *S.O.S.—Stratification Object Series*, 1974–1979, Wilke photographed herself using various poses and props, her body covered with small rolled-up pieces of

chewing gum shaped like female genitalia. Through this performative piece, Wilke participated in, constructed, and controlled her own objectification, thereby invoking and destabilizing the power of the male gaze. Condemned by feminist critics as narcissistic and exploitative of her own beauty, Wilke's final series of photographs served as a chilling response to those critics. In her *Intra-Venus* series from 1992–1993, Wilke (with Donald Goddard) produced photographs of her body while undergoing treatment for cancer. These images, much like Cindy Sherman's later color works, force the viewer to confront their expectations of the female body and female beauty. In comparison, American photographer Jeanne Dunning has taken up the human body as subject, mingling notions of the body and the grotesque, in a series of photographs of bodies and food. Since the 1990s, Dunning has created vibrant large-scale color photographs of bodies covered in ambiguous puddings and liquids, with messy, oozing flesh. Although Dunning's work is about the actual body itself, not representations of the body per se, again like Sherman and Wilke she encourages the viewer to look at something that is considered taboo in our society. The following generation of feminist photographers will take up this concern, picturing bodies that have been consistently overlooked.

Other Voices, 1980s–1990s and After

In the late 1980s and 1990s, a plenitude of racially and sexually defined women artists gained recognition for their photographic work that looked to represent their identity in contrast to Western, White, heterosexual standards of femininity. It is, essentially, a bit misleading to isolate these women here as the third generation of feminist photographers, for much of their work overlaps with or fits into categories of feminist art production already discussed in this essay. However, for continuity and clarity, I have chosen to discuss these women as a group. An impressive list of feminist artists beginning with veterans Clarissa Sligh, Pat Ward Williams, Lorraine O'Grady, Carrie Mae Weems, Lorna Simpson, and Deborah Bright, carrying over to a younger generation of women including Catherine Opie, Laura Aguilar, Kaucyila Brooke, Jolene Rickard, Korean-born Young Soon-Min, the Australian Tracey Moffatt, and others, worked to identify their own discourses of identity and representation. Although richly diverse in ethnicity and ideology, much of the work of these women artists is rooted in notions of family and community, and stems from their own personal histories.

Clarissa Sligh and Carrie Mae Weems, for example, initially photographed, or used photographs, of their own families in their works. In her *Reading Dick and Jane with Me* book project from the 1980s, Sligh reconstructs the standard American public school reader published between 1935 and 1965, with images from her own family album. Within and among the images, Sligh interjects her commentary on the differences between the upper middle class happy White family depicted in the readers and her own experience as a poor black child growing up in the American south. Carrie Mae Weems began photographing her *Family Pictures and Stories* series, 1978–1984, where she uses text and images to tell her own family story, when she was a college student in California. In this series, Weems presents an intimate yet complex portrayal of her family where she, as the photographer, functions as an insider and an outsider. Weems returned to photograph her working-class family as an educated black woman. Although emerging out of their unique personal histories, Weems and Sligh create imagery that resonates with the African American community and has relevance to all members of families. In her *Untitled Kitchen Table Series* from the 1990s, Weems uses herself as the model in a series of domestic narratives that circulate around a kitchen table. Combined with poetic text, the images in this series, much like Cindy Sherman's *Untitled Film Stills*, are less about Weems's experiences and more engaged with constructions of femininity and domesticity in American culture. Even photographer Tracey Moffatt's fictional photo-narratives, where she also uses herself as the model, stem from her background growing up female and aboriginal in a predominantly White, working class Australian suburb.

In photographing the members of their communities, Catherine Opie and Laura Aguilar also use photography as a way of representing their own identities. Located in Los Angeles, Opie and Aguilar picture different lesbian communities. In her *Latina Lesbians* series, an ongoing photographic project begun in 1986, Aguilar combines black and white images of lesbian women set in mostly domestic interiors with handwritten descriptive captions written by the sitters themselves. In contrast, Opie's *Being and Having* and *Portraits* series from 1991 present large-scale vibrantly colored studio portraits of her friends within the local lesbian and S-M communities; communities that remain relatively unseen in our culture. In *Being and Having*, Opie photographs her lesbian friends in masculine drag, whereas *Portraits* sympathetically depicts transsex-

uals, cross-dressers, tattooed dominatrixes, drag kings, and other subjects. Aguilar started in the late 1990s to produce startling nude self-portraits, and Opie included herself in her *Portraits* series. Artists from Sligh and Weems, to Opie and Aguilar have returned at the end of the twentieth century to practice a feminist photography rooted in personal experience—much like Dater, Noggle, and the women of the first generation of feminist work in photography—thereby signaling once again that the personal is indeed the political. Moreover, through their work, the women in this third generation not only broadened the scope of the feminist debate, they also intensified and improved it, pointing to the limitations of traditional Western feminist orthodoxy in its refusal to confront questions of race and gender. Further, they truly opened up feminism, proving it to be a completely heterogeneous discourse at the end of the twentieth century.

FESTIVALS

Proliferating widely in the last quarter of the twentieth century, photography festivals are now an intrinsic part of both the exhibition of photography and the growth and development of the medium. The festivals serve as meeting places for a community of photographers, critics, collectors, and photographic enthusiasts. Festival curators, in selecting works and designing programs around specific themes, help to identify current and emerging issues as well as acknowledge new talent and previously unrecognized bodies of work. Speakers, forums, publications, and other educational activities further the work of photographic history, criticism, and theory. By publishing catalogues, archiving exhibitions, and providing both face-to-face and online access to these holdings, photography festivals contribute significantly to the study of the medium. Photography festivals also play a central role in the establishment of a global network linking photographers to academic, professional, and general audiences.

The history of photography festivals parallels that of arts festivals. While the arts have always been associated with religious celebrations and other recurrent public gatherings, the idea of events designed specifically to celebrate the arts is a product of nineteenth century arts societies and academies presenting annual salons and seasons. For photography, this took the form of events such as the annual print show initiated by the British Royal Photographic Society in 1858. As the academy shows sparked oppositional *salons des refuses*, public exhibitions became sites of contestation over the ownership of art and taste. At the same time, the arts, both official and oppositional, were featured in a series of international exhibitions that began in the latter half of the nineteenth century. Photography was on display at the first of the major events of this kind, the *Great Exhibition of 1851*.

In 1895, the launch of the *Venice Biennale* marked the beginning of the international arts festival as we know it. The *Biennale*, like the Olympics founded contemporaneously with it, invited national delegations to compete for prizes awarded according to commonly held standards of excellence. In the twentieth century, events such as Emile Jaques-Dalcroze's

Hellaru Festival (founded 1910) and Max Reinhardt's *Salzburg Festival* (founded 1921) helped redefine the nature of performing arts by acting as showcases for avant-garde work. In 1932, the *Venice Biennale* established an *Esposizione d'Arte Cinematografica*—what was to become the first of the large international film festivals. It was followed in 1946 by the *Cannes Film Festival*, an event that placed the international competition for artistic excellence within a commercial context.

Despite the success of international arts festivals focused on other art forms, the first such festival dedicated to photography was not founded until 1969. In that year, Lucien Clergue organized the *Recontres d'Arles* in Arles, France, a general arts festival with a significant photography component. *Recontres d'Arles* remained a relatively obscure event until 1974 when Clergue persuaded both Ansel Adams and Brassai to attend as featured speakers. Attracting major figures to the festival—in a manner similar to the way film festivals use the star system—gave the *Recontres de Arles* photography festival an international prominence. Photographers such as Yousef Karsh, André Kertész, and Aaron Siskind were featured by the festival in succeeding years. The festival continued to grow and, in 2004, the 35th *Recontres d'Arles* mounted 40 simultaneous exhibits, published a 300-page catalogue, and offered 21 workshops and two conferences as well as presenting five *Recontres d'Arles* Awards.

In his introduction to the 2002 *Recontres d'Arles* catalogue, Artistic Director François Hébel argues that the success of the festival and the many photography festivals that have succeeded it derives from a need on the part of photography's audience, like cinema's audience, to develop standards of taste in a medium where the difference between "master and clone" is often difficult to discern. Hébel suggests that the pursuit of this taste-building exercise has taken place at three different types of events: the city-based "month of photography" festival; the smaller, specialized festival; and events designed for professionals working in the medium.

The original and pre-eminent "month of photography" event—arguably photography's equiva-

lent of the *Cannes Film Festival*—has, since 1980, been the biennial Paris *Mois de la Photo*. It was Paris that developed the model for incorporating a large number of the city's exhibition spaces into a single event. These spaces include major museums (which in the 2004 Paris *Mois de la Photo* featured the Louvre, the Pompidou Centre, the Jeu de Paume, and the Musée d'Orsay) as well as smaller museums and commercial galleries. The Paris *Mois de la Photo* also incorporates exhibitions in foreign embassies and cultural agencies, once again evoking the idea of nation-based representation within a global event. In general, the individual exhibits can be divided into three categories: historical retrospectives; exhibits organized around contemporary genres, artists, and practices; and more idiosyncratic exhibits in which curators provide a subjective view of contemporary photography.

From the beginning, Paris established that the scheduling of the festival for an entire month is intended to do more than just allow the time to find and view shows mounted at dispersed venues. It is also a means of asserting photography's cultural eminence within the city's cultural calendar.

In the 25 years that followed the launch of *Mois de la Photo*, cities as diverse as Berlin, Bratislava, Cape Town, Krakow, Mexico City, Moscow, and Stockholm have declared their own "month of photography." Festivals such as Buenos Aires' *Encuentros Abiertos*, Madrid's *PPhotoEspaña*, Rome's *FotoGrafia*, and *Fotografie Biennale Rotterdam* while not using the "month of photography" phrase have borrowed from the French model. Houston's *FotoFest* was the first North American Biennial "month of photography" in 1986 and in the scope of its festival and inter-festival programs is now second only to the Paris event. In Canada, Montreal's *Mois de la Photo* and Toronto's rapidly growing *Contact* are building on the success of their cities' major film festivals. Brazil hosts *Foto Arte*, a major festival in Brasilia, as well as festivals in Sao Paulo and Rio de Janeiro. China has located its international photography festival in the ancient city of Pingyao while Denmark's major photography festival, the *Odense Foto Triennial*, takes place in galleries on the island of Fyn.

As the "month of photography" festivals mature, they incorporate a variety of functions including speakers, conferences, workshops, and portfolio reviews. Some offer adjunct mini-festivals of photography-based new media or festivals within festivals featuring films by and about photographers. Increasingly, these various activities have been organized around themes that curators cite as being especially pertinent to the medium today. Montreal's *Mois de la Photo*, having declared itself "a

cohesive, single themed festival," labeled its 2003 theme: "Now. Images of Present Time." In 2004, *PPhotoEspaña* organized its 170 presentations under the general theme of "new documentary languages" while in the same year the Paris *Mois de la Photo* highlighted a program entitled, "HiStories—from documentary to fiction."

Many of the festivals have also organized programs to take place between their main events. These include programs of speakers, conferences, and the publication of journals. Houston's *FotoFest* operates a classroom education program, "Literacy Through Photography," which utilizes photography to enhance writing skills, visual literacy, and cognitive learning in grade school students. But perhaps the most important function of the festivals between events is their archiving of the work they show. The Paris *Mois de la Photo* has amassed a collection of more than 15,000 works while *PPhotoEspaña* gets two million hits per year on its Internet archive.

Events comprising the second of François Hébel's categories, the festivals in smaller centers and specialized festivals, can be every bit as ambitious as the larger "months of photography." The *Noorderlicht Photofestival*, for instance, an annual collaboration between the Dutch cities of Groningen and Leeuwarden, constructed a website featuring all 950 photographers who participated in the event. In Germany, the festivals staged by *Das BildForum* in Herten and Mannheim function as eclectic gatherings of professional and amateur photographers with a wide range of exhibitions and workshops. *Encontro da Imagem*, a photography festival in the Northern Portuguese city of Braga, engaged visiting photographers in an ongoing visual documentation of the city.

Other festivals have earned reputations as high profile specialized events. Photojournalism is the sole focus of both *Visa pour l'image* in Perpignan, France, and *ClickArt*, a festival held in conjunction with the Singapore trade show, *Photo & Imaging Asia*. *Foto & Photo*, hosted by the Italian city of Cesano Maderno, is known for its exhibition of experimental photography. The French seaside resort of Biarritz hosts *Terre d'Images*, a festival of travel photography. Thousands of amateur photographers compete for awards offered by the *Togher International Festival of Amateur Photography* in Cork, Ireland.

Smaller festivals have also been used to enable the emergence of local photography. This is particularly true of festivals in two of the poorest nations on earth. In 2000, Bangladesh staged *Chobi Mela* which, in addition to its exhibition of foreign work, mounted a retrospective of photo-

FESTIVALS

graphs taken during the nation's 1974 war of independence. The Bamako (Mali) *African Encounter with Photography* combines international exhibitions with a unique perspective on the work of African photographers.

Hébel's third category of photography festival, events for professionals, encompasses both the production and collection of photographs. *Photolucida* in Portland, Oregon, and the *Rhubarb-Rhubarb Festival* in Birmingham, England, both display the work of internationally recognized photographers but are primarily designed for mid-career photographers wishing to enhance their professional abilities through portfolio reviews and workshops. *Fotonoviembre*, in the Canary Island capital of Tenerife (Spain), offers exhibitions and workshops for an audience of photography scholars, conservation experts, critics, and journalists.

An entirely different sort of festival is the photography fair organized for photography dealers and buyers. These range from small events organized by local collectors clubs to regional and national gatherings at which sellers display both photographs and photography equipment. Other events, such as the *Daguerreian Society Symposium and Trade Fair*, serve a more specialized group of dealers and buyers. On the international level, two events dominate the photography trade fair circuit: the Association of International Photography Art Dealers (AIPAD) *Photography Show* and *Paris Photo*. The Washington-based AIPAD, organized in 1979 to aid and regulate dealers in art photography, held the first of its annual *Photography Shows* the following year. The annual *Paris Photo*, founded in 1997, bills itself as "the global reference for the market in 19th century, modern, and contemporary photos" and, each year, highlights the work of photographers from a designated nation. In 2004, a third annual event, *photo-london*, was established as a meeting place for galleries and dealers of historic and contemporary photographs as well as film and video.

In the first years of the twenty-first century, photography festivals work towards increased cooperation and globalization. Increasingly, festivals coordinate the use of traveling exhibitions and events, often across international borders. *The San Antonio Photography Festival*, for instance, has mounted a cross border exhibition in conjunction with the *Fotoseptiembre* festival staged by Mexico's *Centro de la Imagen*. In 2005, Paris's *Mois de la Photo* went a step further by working with festivals in Vienna and Berlin to mount the first *European Month of Photography*. The idea will be expanded in future festivals to include other cities such as Rome,

Bratislava, and Moscow. In announcing that its Europeanization of the month of photography "draws its inspiration from the collective values and references that provide the foundations of today's Europe," the Paris *Mois de la Photo* harkens back to François Hébel's definition of the photography festival as an instrument for the pursuit of common taste.

Perhaps the most ambitious collaborative effort among photography festivals is the *Festival of Light*, a joint initiative by 22 photography festivals in 16 European, North American, and South American countries. From the mid-1990s, annual meetings have facilitated international exchanges of exhibits while the Festival's website is a useful portal to its members' events. In its mission statement, the *Festival of Light* reflects a growing sensibility among photography festivals when it proposes a permanent "pathway of photography around the world."

FILM

Photography literally means “drawing with light.” If light is the pen, then film is the canvas on which the artistry unfolds. Before film, events were “captured” over time and with an artist’s pen, subject to the bias of memory and drama of the artist. Events in history, faces of the famous and of loved ones, faraway places; all could be brought quite literally and realistically to the viewer’s doorstep. The invention of flexible roll film, allowing cameras to be lighter and more portable, meant that photographers could now capture events more dynamically, no longer restricted to the confines of a tripod.

Film is made up of a light-sensitive emulsion supported on a flexible base, and must remain in complete darkness until the image is to be made. Compounds in the film react as they are struck with photons of light, creating a microscopic chain reaction within the film’s emulsion. This reaction is then amplified by development, and made permanent with fixing. Without both of these steps, the image captured by exposure to light would be fleeting, destroyed by the light needed to view it. The concept of film as a sensitized material has remained remarkably unchanged since the origins of photography.

History

The *camera obscura* (“dark room” in Latin) was an early device dating back to ancient times that

allowed artists to literally draw from life via a darkened room and a well-placed hole in a shaded window or wall facing a scene. The artist could set his subject outside this room in front of the hole, hang a canvas or paper from the opposite wall, and sketch the upside-down image of the subject projected there. This device was later modernized and made portable with the help of lenses and mirrors. The camera obscura was a boon for artists struggling for the realism of proper perspective and proportion, but took some time to execute.

The Daguerreotype

In 1826, a Frenchman by the name of Joseph-Nicéphore Niépce was experimenting with a novel way of making the images projected with the camera obscura permanent without the help of an artist’s pen. Using the basis of a graphic process known as lithography, Niépce captured the first known photograph outside the window of his country home. Grainy and lacking in fine detail, this image required an exposure of eight hours in bright sunlight.

Louis-Jacques-Mandé Daguerre was also experimenting with light-sensitive materials when he heard of Niépce’s accomplishments. Daguerre contacted Niépce in 1829, and soon after, they became partners. Together, they found that by using silver iodide compounds that were known to react to

FILM

light by turning black in color, they could capture a transient image. Their process involved the sensitization of a copper plate. By exposing the plate to iodine vapor, a coating of the light-sensitive silver iodide would form on the plate. They then used this plate in place of the canvas or paper in the camera obscura, and would expose it for a period of time to the chosen scene. The difficult part, Daguerre found, was making that image permanent so that it could be viewed under the same light that created it. He discovered that he could develop the image by using heated mercury. The mercury vapors would cling to the areas that had been previously exposed. The greater the amount of exposure in a given area, the greater the concentration of mercury would be. The image was then made permanent or fixed in a solution of sodium thiosulfate, known historically as hyposulfite of soda, the derivation of the dark-room term “hypo.”

The resulting product, called a daguerreotype, was an image of stunning quality and detail. The silvered image was at once positive and negative, depending on how it caught the light. While more sensitive than Niépce’s original emulsion of bitumen of Judea and lavender oil, daguerreotype still required that the subject remain motionless for several minutes. In addition, the process was incredibly difficult and inherently hazardous. Despite these factors, the popularity of daguerreotypes grew to staggering proportions, particularly for portraiture.

The Calotype

At the same time, an Englishman by the name of William Henry Fox Talbot was working on his own technique. Instead of a metal plate, Fox Talbot sensitized paper by saturating it alternately with common salt (sodium chloride) and silver nitrate, producing silver chloride. This compound gained density in direct proportion with the amount of light striking it. The resulting negative images were also fixed in a hypo solution. Fox Talbot then took these paper negatives and placed them on top of another piece of sensitized paper, and exposed the negative sandwich to bright sunlight. The second paper was then developed and fixed, resulting in a positive image called a calotype. Unlike the daguerreotype, multiple identical images could be created from the same negative. However, the nature of the paper was such that the images lacked the clarity and detail of daguerreotypes.

Wet Collodion

The next advance in photographic materials was in 1851 with the wet collodion process. Fredrick Scott Archer, also of England, made use of collodion, a substance that suspended the light-sensitive particles within a sticky emulsion that could be poured over a glass plate. When dry, the emulsion became a tough transparent suspension for the latent exposed image, which was then developed in pyrogallic acid or iron sulfate. The plate was then fixed, washed, and dried. The resulting negative on a transparent base provided the ability to make multiple positives of the images, like Fox Talbot’s calotype. However, the image also had the clarity of the daguerreotype. Soon, the wet collodion process would replace both the calotype and the daguerreotype as the dominant photographic process.

The disadvantage of the wet collodion process was that the plate was only sensitive while the emulsion was still wet. That meant the photographer would need a veritable darkroom wherever he was going to take the picture. Despite this drawback, the process was used widely in some of the first examples of photojournalism during the American Civil War. War photographer Mathew Brady documented never-before-seen images of war with a traveling darkroom inside a horse-drawn wagon.

Color Films

Meanwhile, avenues for reproducing the colors of reality on film were being pursued. James Clerk Maxwell, a Scottish physicist, demonstrated that all colors could be represented through combinations of the three additive primaries (red, green, and blue). It was not until 1907, however, that practical commercial color photography was achieved by brothers Auguste and Louis Lumière. The duo were inventors of the autochrome process, which involved the integration of several layers of dyed starch grains (red, green, and blue) with a coating of photographic emulsion over a glass plate. The results were impressionistic, with pointillism-like dots of color.

Kodachrome was the product of two research scientists associated with the Eastman Kodak Company. Using a subtractive process, Leopold Mannes and Leopold Godowsky came up with a way to manufacture an emulsion containing layers sensitive to each primary color (red, green, and blue). The result was the first example of realistic color in photography when Kodachrome was introduced in 1935.

Film's Evolution

In 1871, R.L. Maddox, an English photographer, pioneered the dry plate process. This process made photography considerably more convenient, as the photographer was now free to photograph without a portable darkroom in tow. In addition, emulsions became more sensitive, allowing exposures in fractions of a second instead of minutes. The camera was now truly a portable device, and the snapshot was born.

The final steps in the evolution of film came with the invention of gelatin in the 1880s, a thin flexible material in which the emulsion could be suspended and coated onto virtually any surface. The ideal surface came a few years later with the use of a thin, flexible cellulose. By coating gelatin emulsion onto this new, flexible base, photographers were no longer restricted to large view cameras or the limitation of only shooting one image, then needing to reload the film. The new flexible film could be made into rolls, allowing images to be photographed quickly and in sequence. George Eastman of Eastman Kodak was at the forefront of this photographic revolution, manufacturing some of the first pre-loaded consumer-based cameras. Once the roll was exposed, the camera was sent back to the company for processing. Kodak's famous slogan, "You take the picture, we'll do the rest," outlined the new convenience roll film afforded the world of photography.

Modern Film

Modern film comes in many types, depending on what the photographer wants as a final outcome. Black and white films result in images made up of thousands of tones of gray. Color films are designed to reproduce the most realistic color possible in a given situation. There are special application color films as well, designed to render a pastel version or even a highly saturated version of the original scene.

Negative films, available in both color and black and white, most often are used if a photographic print is the intended final outcome. Slide film, (most often color) also called reversal film, produces positive transparencies of the image. Color slide film comes in different color balances, daylight balanced, and tungsten balanced. Each film most realistically represents color in the scene when photographed using those light sources.

Other considerations when choosing film include film size. Roll film, used in most consumer cameras, includes 35 mm, medium format film (120 mm

and 220 mm), APS (Advanced Photo System) and miniaturized formats, such as disc film and 110-cartridge film. Sheet film, typically used in view cameras, is most commonly found as 4 × 5-inch film, but can come in sheets as large as 8 × 10-inches.

Films for specialized applications include instant film, popularized by the Polaroid Company. This film contains the processing chemistry within its structure, allowing the film to be processed almost immediately after exposure. High contrast film, sometimes known as graphic arts or lithographic film, produces monochromatic images using only black and white, with no shades of gray in between.

Film Speed

Film sensitivity, or the amount of light needed to make a proper exposure, is determined by the film's speed. Film speed is denoted by its ISO (International Standards Organization), which is based on testing done by the manufacturer. ASA (American Standards Association) is an older notation that uses the same numerical system of determining a film's speed.

The film speed determines how sensitive that film is to light. The more sensitive the film is to light, the higher the film speed, and the "faster" the film. The less sensitive the film is (the more light it needs), the lower the film speed number; lower numbers are considered "slower" films. For example, a film with an (ISO) speed of 400 is very sensitive to light and is considered to be fast. Part of the reason for this terminology relates to how these films are used. Since an ISO 400 film needs very little light to make an exposure, this allows the photographer to shoot in low-light situations. It also allows for the freezing of motion, since the film allows for smaller and smaller fractions of seconds to be used. In contrast, a slower film, such as ISO 100, needs a greater amount of light to make a proper exposure.

ISO numbers correspond directly to the sensitivity of the film.

Film Speed	Amount of light needed
ISO 100	****
ISO 200	**
ISO 400	*

ISO 100 film needs twice the amount of light to make an exposure as ISO 200 film, which needs twice as much as ISO 400 film. Respectively, ISO 400 speed film requires half the amount of light to make an exposure as ISO 200. For every doubling of ISO numbers, the amount of light needed is cut in half.

FILM

Grain

As film speed increases, so does the grain of that film. The grain of a faster film needs to be physically larger to provide more light-gathering surface area. While the advantage is greater sensitivity, the larger grain is more visible in the final image, particularly as it is enlarged. Larger grain tends to interfere with overall sharpness and contrast in an image. Theoretically, one should use the slowest speed (lowest ISO) film that is permissible in a given situation. A slower film will produce a smoother, more uniform distribution of detail, resulting in a sharper, higher contrast image. However, extremely large grain, such as that found in 1000+ ISO films, can be used to achieve an intentional effect.

In recent years, manufacturers have worked to reduce grain by increasing the efficiency of the light-sensitive portions of the emulsion. The result is greater sensitivity with relatively smaller grain. An example of this technology is Kodak TMAX, which provides a smaller grain size than films of the same speed.

Developer/film combinations can also be used to try and reduce the size of the grain in the final image. Fine-grain developers are manufactured for this express purpose.

Storage and Handling

Film should be kept in a cool, dry place, out of direct light, when not in use. Even a short-term exposure to heat can affect the film adversely. Heat can “fog” the film; add exposure to the film that is non-image forming. The result can be streaks, total film density, or partial fog, which can cause resulting images to look dull and have low contrast. Heat can cause color films to shift color responses, resulting in unpredictable color reproduction.

For long-term storage, film should be kept in a refrigerator or freezer (instant film, such as Polaroid, should not be frozen). Before using, film that is stored in either a refrigerator or freezer should be allowed to reach room temperature before using. Failure to do so can result in condensation that can image on the film, as well as potentially damage the internal chamber of a camera.

Roll film should always be loaded out of direct sunlight. Sheet film is loaded into special holders in complete darkness.

Note the film’s expiration date, usually printed on the film box. If kept at room temperature, film quality decreases steadily after this date. If frozen or refrigerated, a film’s “life span” can be extended significantly.

X-rays, such as those used in airport security machines, can potentially affect and fog faster ISO films. Precautionary measures include specialty lead-lined film bags and request for hand inspections.

How an Image Is Recorded

Structure

Film is constructed of several layers on a polyester or acetate base. The top-most layer is the scratch-resistant coating. Directly beneath this layer is the emulsion, which holds all the light-sensitive and image-forming components of the film suspended in gelatin. Beneath the emulsion is an adhesive layer to provide extra support between the emulsion and the plastic base. Beneath the base is another layer of adhesive, which mounts the final layer, the anti-halation coating. This layer is used to reduce the amount of potential reflection of light coming back through the film off of the back of the camera, resulting in a higher contrast image with greater detail.

Response to Light

Within the film’s emulsion are compounds responsible for the film’s sensitivity to light. These compounds, known as silver halide crystals, are made up of silver and a halogen, such as bromine, iodine, or chlorine. If this combination resulted in a perfect structure, the crystal would not be sensitive to light. Because of flaws and irregularities in the crystal, free-floating silver ions are also present.

When light strikes the silver crystal, it results in the excitation of electrons within the matrix, which in turn attracts these free floating silver ions. The result is a small clump of silver ions, their size ultimately determined by the amount of exposure on the film. The exposure must achieve a minimum threshold to provide at least four atoms of silver to this clump to make it developable. At this point, the film has recorded a latent image, chemical in nature but not viewable on film.

The Formation of an Image

After film has been exposed, the resulting latent image needs to be developed to be visible. Development accomplishes several goals. The first is amplification of the latent image to silver metals to produce a physical image. The second is to neutralize the film’s light sensitivity so that viewing light does not destroy the intended image. Finally, the image needs to be “fixed” making it permanent.

The first step in processing any type of film is development of the latent image. This is usually

accomplished by providing a chemical reducer (developing agent) to the silver halide. The exposed silver halide compounds are converted to metallic silver, leaving the unexposed crystals unchanged. The developer also contains an alkali, often known as the accelerator, to provide the pH of 7 or higher needed for the developing agent to function. Other components of modern developer include agents that reduce the amount of development that could potentially take place in unexposed areas (known as chemical fog). Preservatives may also be added to reduce the reaction of developing agents to air, resulting in oxidation (rust).

Once the image is formed, the next step is to neutralize the non-exposed silver's sensitivity to light and make the image permanent. These two things are accomplished by fixing the film in a fixing bath. The fixer, usually a sodium thiosulfate, converts the unexposed remaining silver halides into a soluble compound that can be washed away. By getting rid of any silver that could react later to light (the developed image no longer has that capability), fixing accomplishes both goals. What is left behind is the developed image.

Chromogenic (most often color) films are slightly different in structure in that they contain dye couplers as well as silver halides. The same reaction takes place during exposure, but development of these films yields the formation of dye clusters as opposed to silver. The remaining silver is bleached out, leaving only the dye layers intact on the film.

Density and Exposure

The resulting density on film is directly proportional to the amount of exposure the film received. The more light that strikes the film, the more silver will form, and the resulting density will increase. In a negative process, this means that greater density will occur in areas of highlight, and lesser density will form in shadows. The response of film in this way can be diagrammed in the form of a characteristic curve.

If one plots increasing negative density on the x-axis, and increasing exposure on the y-axis, the result is a curve that outlines the film's response to light. The lower portion of the curve, the toe, is indicative of the shadow portions of the negative. The straight-line portion is representative of the film's midtones. The shoulder, or upper portion of the curve, where exposure and density are at their highest, represents the highlights recorded on film. This curve shows that density does not increase in direct proportion to the amount of

exposure the film receives. In the shoulder and toe portions, increase in exposure results in a smaller increase in density than does the straight-line portions. The straight-line portions show a proportionate increase in density as exposure increases. Therefore, the tonal separation of the midtones in the negative will most accurately represent the original tones in the scene.

Characteristic curves vary with the contrast of the film. The higher the contrast of the film, the more quickly it will record greater density. The result is a characteristic curve with a very steep slope, with very little straight-line portion. Since this type of film is generally lacking in midtones, this portion of the curve is very limited.

Exposure has a direct affect on the appearance of the film's characteristic curve, and therefore, the film's contrast. For example, if a film is underexposed, the tones move toward the toe of the curve. As a result, shadow areas are near to non-existent, and midtones lack the density they need to provide sufficient contrast. Highlights are recorded on the straight-line portion, and represent the only tones in the negative that will reproduce a sufficient amount of detail.

Overexposed film will result in a shift toward the shoulder portion of the curve. While shadows will be well represented, midtones and highlight areas of the negative will contain too much silver, resulting in a loss of detail.

Spectral Sensitivity

Films react differently to light than the human eye does. Human vision is sensitive only to the visible spectrum, which contains wavelengths from 400 (violet) to approximately 700 nm (red). The human eye peak sensitivity is at approximately 500 nm, which is green.

Panchromatic film, the most common type of black and white films, has a sensitivity that extends from outside the visible spectrum (300 nm) in the ultraviolet range to about 650 nm (red). The result is an increased sensitivity to blues and violets appearing in a scene. For this reason, a clear blue sky will appear lighter on the final black and white image than it did in the scene.

Orthochromatic film is more sensitive to blues and greens, but does not respond at all to reds. It is most often used in graphic arts applications. Because it does not record light falling inside the red wavelength, orthochromatic film can typically be handled under a safelight without fear of fogging.

FILM

Infrared films, usually created with the incorporation of dyes, are able to record wavelengths far outside the visible spectrum. The resulting image is capable of showing details invisible to the human eye.

FILM: HIGH-CONTRAST

High contrast films are marketed for various specialized application. Depending on the particular nature of the process, there are different requirements for the film in terms of contrast, maximum density, speed, spectral sensitivity, processing chemicals, and dimensional stability with their own specified processing chemistries. Because of stringent technical requirements for each application, there are subdivided categories of films. This article will describe high contrast films and their processing in general terms.

Line photography and halftone photography are two major parts of graphic arts process photography. Reproduction of line drawings begins with originals in solid black-and-white with no intermediate gray tones. Line films have high maximum density and high contrast (gradient of 5 to 10). However, line films must be dimensionally very stable, of high resolution and provide high fidelity of reproduction.

Several other high contrast films are often similar in photographic characteristics to line films.

These include document films, copy films, phototypesetting films, and image-setting films. Different applications have their own requirements in terms of film size, base material, packaging, and life expectancy.

Halftone photography is used to convert continuous tone originals (e.g., pictorial photographs) to halftone images, an optical illusion in which the tones are represented by solid dots of equal spacing and density but varying area. Very high contrast lith films are employed, and films are exposed twice, one with overall flashing, and another image-wise, detail exposure. Originals are photographed onto lith films with a contact screen, a crossline screen, or other means of screening, and processed in a special lith developer, which gives rise to lith effect and extremely high gradient (greater than 10) to render solid dots of sharp edges.

Line films and lith films differ in terms of developer solutions in which they are processed. Line films as well as other non-lith films are typically processed in rapid access developers that produce a

high contrast image of good resolution. This type of developer can be used in automated processing machines with replenishment.

Lith films are processed in lith developers (e.g., Kodak D-85), consisting of hydroquinone as the sole developing agent, a small amount of free sulfite, a bromide, and an alkaline agent. The free sulfite level is often maintained by a sodium formaldehyde bisulfite system. In lith developers, well exposed grains in the emulsion are developed first. Chemical reaction products of this development influence the subsequent development of nearby grains in two ways: the products enhance development of well exposed grains, and they suppress that of poorly exposed grains. This autocatalytic mechanism enhances the image contrast and contributes to the very sharply edged halftone dots, called hard dots. One peculiarity of lith development is that, unlike conventional development, the contrast peaks at certain development times and further development will lower contrast and degrade the dot quality. Also, lith development tends to render fine clear lines to be filled in, and for black lines to be broadened, distorting fine details of the originals, thereby making it unsuitable for line type applications.

One major shortcoming of the classic lith development is the instability and short life of the working developer solution. Development is manually performed in trays, and factors such as agitation can significantly alter the results. Therefore, newer generations of lith films were designed for new types of lith developers. They use nucleating agents and nucleating accelerators in films and developers so that extremely high contrasts and lith effects are obtained with more stable processing chemistry. In this type of system, interaction between neighboring grains are stronger than in classic lith development in the sense that the development products can render unexposed nearby grains developable, called infectious development.

Another kind of high contrast photography is used for scientific imaging such as microscope photography. Techniques vary widely among researchers, from high contrast technical films developed in medium contrast developers (e.g.,

Kodak Technical Pan processed in HC-110) to low contrast pictorial films developed in high contrast developers (e.g., Ilford HP5 Plus processed in D-19). Higher contrast is desired in these applications because the original specimens are often of low contrasts. The resulting images are of continuous tone nature with enhanced details.

Some photographers use high contrast technical or document films to record continuous tone pictorial images. Such films are developed in extremely low contrast developers (such as Kodak Technidol Liquid and POTA formula) to produce negatives of pictorial quality. These techniques offer higher resolution but often with inferior tonal rendition than those obtained with pictorial materials, especially with subjects of wide luminance ranges. As described above, there are many different products for high contrast imaging. Such a range of products attain desired contrasts and other photographic properties by a variety of techniques in formulation of emulsion and the processing chemicals. The photographic properties of these films vary greatly when processed in low contrast developers for pictorial applications.

FILM: INFRARED

In a rainbow we see the decomposition of sunlight in its visible components, however, there are parts of this light not detectable by human vision. Beyond violet rays are ultraviolet rays to which photographic film is also sensitive, below red rays there are infrared rays. Photographic films thus make it possible to “see” more of the electromagnetic spectrum, and infrared film makes it possible to photograph within wavelengths between 730 and 900 nanometers (nm—one-millionth of a millimeter). This film is used for various scientific applications as well as by fine arts photographers for its aesthetic appeal.

For the purposes of photography, the wavelengths of 730 to 900 nm are called the near infrared, and cannot normally be perceived in any way. Far infrared, which can be felt as heat, is 900 nm and beyond, some people define the end of this spectrum at 1200, others at 1400. “Normal” film is aimed towards reproducing, as close as possible, the spectrum of human vision, with the exception of early photographic emulsions, which were sensitive only to the ultraviolet and blue parts of the spectrum. Light sources other than the sun produce different spectrums. Tungsten light has a spectrum leaning more in the yellow and red part of the spectrum, and is high on infrared radiation. Discontinuous light sources, such as fluorescent, neon, and sodium vapor lamps produce little or no infrared light.

Infrared film was designed to photograph in the near infrared part of the spectrum; the expected uses were scientific and military. With this film it is possible to photograph scenes illuminated by infrared rays that would not be visible by the subject. Differences invisible to “the naked eye,” could be captured by infrared film “illuminated” with infrared radiation. Although designed to photograph in the infrared part of the spectrum, most infrared films are also sensitive to visible light. Each of the commercially manufactured black and white infrared films, however, has its own particular characteristics: Kodak Infrared High Speed film (Kodak HIE) is the more widely available; it also has the highest sensitivity in the infrared part of the spectrum. It produces the soft and

grainy images characteristic of pictorial infrared photography, is available in 35 mm and wider rolls for use in aerial photography. Sheet film formats are only available by special order. The Konica Infrared 750 has a name describing its sensitivity peak at 750 nm; its sensitivity falls sharply beyond that point. In the visible part of the spectrum it is sensitive to blue light. It is slower in speed, with higher contrast and finer grain than Kodak. It is available in 35 mm and in 120 formats. Ilford SFX 200 addresses itself to the pictorial uses of infrared. Its infrared sensitivity is not too wide and is promoted as a “special effects” film, not as an infrared one. The newest comer is Maco 820; the number 820 describes its sensitivity limit. Users report it to have characteristics close to the Konica Film; produced by a small German company it is not widely available.

The only available color slide infrared film is Ektachrome Professional Infrared, and it is sensitive to infrared in the 700 to 900 nm region, providing false colors, with infrared reflecting objects appearing with red or magenta tones. Like infrared black and white film, it requires filtering for best results.

All these films require special care while loading and unloading the camera. The Kodak films even require all handling operations to be made in complete darkness. Other special care should be taken when using infrared films: Some modern cameras have infrared devices for loading and frame counting; these devices will, in most cameras, fog a part of the film frame. Infrared light may focus at a different point than visible light, thus some lenses are marked with an infrared focusing mark, while some Konica Hexar models had their autofocus systems with two infrared focusing programs. For Kodak and Konica films, however, the easiest way of dealing with infrared focus shift is to use a wide angle lens with a small lens aperture to get more depth of field. Another difficulty related to the use of infrared film is the fact that exposure meters are not reliable on setting infrared exposure. Testing is the only way to set infrared exposures, and the best starting point is on film manufacturer’s tables.

As infrared films are also sensitive to visible parts of the spectrum they are used with filters to

block that visible light. The most common is the red #25, which still allows the passage of enough visible light to use the viewfinder of a SLR camera. Yellow and orange filters can also be used, even if with a slighter effect. A #29 dark red filter will give a stronger effect than the #25, however, there are filters like the #87 and the #89 that are opaque to visible light, giving the strongest effect. As only infrared light is recorded on film, these are not widely used in pictorial photography.

The typical look of an infrared photograph lies in the facts that the objects reflect infrared light in a different way than they do in visible light. Skies are rendered very dark with white clouds, foliage is much lighter than it appears to the eye. Fair skin tones and lips appear lighter, but eyes appear very dark in black and white infrared photography. With Kodak Infrared, highlights will appear with great halos or flares due to the lack of anti-halation backing on the film. There is a popular idea that some kinds of cloth will appear transparent to infrared radiation but a picture where a dressed person appears to be undressed has yet to be made.

Color infrared film is easily recognizable by its artificial colors. The use of yellow and orange filters is advised, and infrared reflecting objects will be rendered as red or magenta.

Some electronic image equipment seems to have no difficulties dealing with infrared, and some video cameras and digital still cameras are capable of producing images in the infrared part of the spectrum. They are now used as preview devices or to produce a final image. They are able to take away some of the unpredictability of infrared photography. However this unpredictability is part of the fun in photographing the invisible.

FILTERS

A filter is a transparent, often colored piece of glass or plastic that is placed over a camera lens to produce a particular effect. Filters function as a barrier in front of the film, changing the characteristics of the light passing through it.

Filters are used in photography for a wide variety of reasons, including contrast control and color correction, as well as special effects and applications. Larger filters are also used in other ways, such as to provide safelight illumination or to otherwise change the color and intensity of a light source. Filters are also used to produce special effects as well as enhance the effects of certain wavelengths on film.

The Behavior of Light

Light is composed of three colors: red, green and blue. These are known as the additive primaries. The combination of these primaries produces all the variations of color.

Light that strikes the surface of an object can be reflected, absorbed, or transmitted. Objects appear to be certain colors due to their transmission or reflection of different wavelengths of light, producing color. Black objects non-selectively absorb most of the light falling upon them, while light and white objects reflect the majority of the light falling on their surface.

Filters work by reflecting, absorbing, or removing part of the light entering the camera lens. Filters cannot add anything to the incident light; in order for a green filter to transmit green light, the green wavelength must be present in the light to start with.

Types of Filters

Filters can be classified by how they remove or reflect radiation. In the case of color filters, the wavelength is removed selectively. For example, a green filter absorbs red and blue, but transmits

FILTERS

the green wavelengths of light. This selective transmission is what causes the filter to appear green to the eye.

Other filters remove light non-selectively by wavelength. These filters, known as neutral density filters, remove an equal portion of all wavelengths, reducing the amount of light being transmitted through the filter in general.

Other filters, called polarizers, remove light according to its angle of polarization, or vibration. These filters are used to reduce reflections and capture patterns of refraction as color.

Another method of categorization of filters is through how transmission of light is accomplished. Transmission filters absorb other wavelengths, while generally transmitting a category of wavelength through the filter. These filters can be plastic or glass, and have the common distinction of being the color that they transmit. Transmission filters are the most common type of filters, since the wavelength transmitted can remain fairly general, i.e., green or ultraviolet radiation. They can be made of gelatin, plastic, or glass, and come in several sizes and shapes, from screw-mount filters designed to attach to the front of a camera lens to large acetate filters used to change the color of a light source.

Other filters reflect the wavelengths of light not transmitted. These filters, known as interference or barrier filters, can be made to be much more selective in terms of the final transmitted wavelength. For example, instead of transmitting all greens, an interference filter can be made to transmit only from 400–410 nm. This specificity makes these filters an ideal choice for scientific and medical applications where more precise narrow-band transmission is needed. Interference filters often are made of glass and have a mirrored appearance. The color of the wavelength band is only apparent on an interference filter if it is held to a light source.

Special application filters include soft-focus filters, which scatter light across the filter, creating a softened, pastel effect, and cross-screen filters, which produce a “starburst” effect around lights.

Uses of Filters

By absorbing (or reflecting) certain wavelengths, color filters can create contrast effects, particularly on black and white film. A color filter will lighten colors adjacent to its color on the color wheel, and darken colors opposite, also known as complementary colors. If a green filter is used on a scene of apples on a green background, for example, the

apple will appear darker in tone while the background will render lighter on black and white film. This is due to the filter’s absorption of red light, making the apples very dark, and the transmission of green, lightening that part of the subject.

This method of using filters to enhance or change contrast on black and white films can also be used to overcome film’s inherent blue sensitivity. Black and white films are more sensitive to colors in the blue and ultraviolet wavelengths than the human eye, and therefore, render these areas lighter on film than we see them. As a result, images that include sky often render as bright white, even if it’s a blue sky on a cloudless day. A popular technique to darken the sky on black and white film is to use one of blue’s complements (yellow, orange, or red).

Color correction filters, more subtly colored than contrast filters, are designed to correct film’s response under certain light sources. For example, a magenta-toned filter is used to correct for the green cast that accompanies photography under fluorescent illumination.

Neutral density filters, which remove light equally from all wavelengths, are used in a variety of applications. Most commonly, neutral density is used when it is important to reduce the amount of light striking the film without altering the color. For example, if photographing a busy city street at high noon, there may be too much light to use an appropriately slow shutter speed to blur the action of the fast-moving cars and pedestrians. A neutral density filter could be used to reduce the amount of light, thereby allowing the photographer to use an exposure of several minutes if desired.

Polarizing filters remove light according to the angle it enters the filter. The effect is one of reducing reflections, increasing contrast and saturation, and darkening skies. Since much of these factors involve the scattering of light, polarizing filters effectively remove the glare created.

Filters are used in infrared and ultraviolet photography to absorb all wavelengths except those intended to reach the film. Since these wavelengths are outside the human visible spectrum, the resulting images are often unusual. Often, infrared and ultraviolet photography is used in the sciences to record information not readily seen with the human eye.

Filter Factors

By their nature, filters reduce the amount of light striking the film. For the purposes of exposure compensation, many manufacturers publish filter factors for each filter, which determine how much

light is lost. Filter factors are measured in powers of two, corresponding to stops of light needed to compensate for the light loss (see figure). Filter factors can vary with the light source being used.

FINE ARTS PRESSES

Throughout the twentieth century, publishing houses and independent entrepreneurs established fine arts presses around the world, publishing art anthologies, art history books, artists' books, broadsides, catalogues raisonnés, editioned prints, exhibition catalogues, monographs, multiples, and photographic essays. In the production of such works, each press defined itself through the unique reproduction, printing, and distribution methods chosen for a project. The diversity and reach of these presses grew in tandem with the receptivity of the general readership to visual books and limited editions. Hundreds of commercial and private presses, along with museums, universities, foundations, and ateliers began creating book lists and imprints specifically for photographically illustrated works. The art publishing niche expanded as imported and exported books, predominantly between the United States and Europe, brought international exposure to artists and publishers.

New avenues of artistic and critical dialogues arose as photo-books proliferated, influencing art

photographers, collectors, curators, and historians. The book format offered both a portable viewing venue and a level of mass exposure for photographers that would presumably eclipse that of a single gallery or museum exhibition. A partnership between publisher and artist, leading to the creation of an art book, often represented both a united creative vision and the desire for either a wider or more exclusive audience. The resulting work alternately was considered a stand-alone art object, or as French art historian André Malraux famously wrote in his 1953 book *The Voices of Silence*, "a museum without walls."

The photo-book held special appeal for artists, art collectors, bibliophiles, curators, gallerists, and print-houses. Photographers now had an entirely new set of creative possibilities in architecting a book—from its physical structure, paper quality, and image sequencing to its text, typography, and graphic design. The images selected for a book could be read as iterations of the original works, with the associated differences in size, tonal quality,

texture, sequencing, and presentation. Alternatively, a book could serve as the original, sole manifestation of an artist's photography-based work. In the seminal essay *The Work of Art in the Age of Mechanical Reproduction* (1936), German critic Walter Benjamin explored the theoretical implications of image reproduction on art and society.

In 1900, when acclaimed French photographer and novelist Adrien Gaspard-Félix Tournachon, known as Nadar, published *Quand j'étais photographe (When I was a Photographer)* (Paris: Flammarion), there was already a well-established history of photographic images appearing in book form. In 1844, London publisher Longman, Brown, Green, and Longmans released the first volume of William Henry Fox Talbot's *The Pencil of Nature*. Bound with 24 original salted paper prints made from calotype negatives, it is widely considered the first commercially sold photographic book. British botanist and photographer Anna Atkins is credited as the first person to publish a book consisting only of photographic illustrations. Atkins self-published the scientific reference work *Photographs of British Algae: Cyanotype Impressions* in 1841.

The tradition of the fine art book became firmly established in the early part of the century, fueled by patrons specifically interested in handcrafted, limited editions. In the United States alone, the annual tally of fine arts editions tripled, from nearly 200 in 1900 to about 600 in 1919. Print houses generally produced each new book as an edition of 100, 250, 500, and sometimes 1000 copies. Whether a publisher limited the number of available copies or released a short-run first edition, the value of each book was greater than a mass-market version because of its high-quality printing and inherent scarcity. Limited edition art books also were usually signed by the artist or author, which created another layer of desirability around the work.

In America, Alfred Stieglitz began publishing his renowned periodical *Camera Work* in 1903, featuring the work of photographers from around the world as photogravure images. Though the last issue of *Camera Work* appeared in 1917, the journal was a forerunner for similar publications, which focused more on exposure to like-minded peers than profitability. In 1919, Weyhe Gallery in New York, headed by Carl Zigrosser, published *The Weyhe Portfolio: Twelve Prints by Contemporary Artists*. Considered a groundbreaking model of fine art publishing, the portfolio successfully promoted the artists it featured as well as the gallery's name. Edward Weyhe's press later went on to create the first Eugène Atget monograph, *Atget Photographe de Paris*

(1930), which was co-published in Paris and Leipzig by Henri Jonquières.

A flurry of inventions in commercial printing that made photomechanical reproduction possible had begun after Richard M. Hoe of New York patented the rotary press in 1847. Printers who acquired the machinery were able to produce larger editions in a more reliable, less labor-intensive way. In the early 1900s, art presses welcomed the mechanization of photogravure production, which became known as rotogravure. From its early stages, gravure printing for photographic reproductions was more popular in Europe than the United States. After esteemed Los Angeles photo-book publisher Twin Palms and Twelve Trees Press started business in 1980, gravure printing for its new titles was outsourced to Nissha Printing Company of Kyoto, Japan. Overall, the photogravure exhibited seamlessness in tonal range and compatibility with inks and papers that made it a favorite among art presses, until the less expensive letterpress halftone and photo-offset lithograph competed for attention in the years to follow.

Across the Atlantic, small private presses in western Europe also were experimenting with the photographic image in print. In London, a press known as The Studio published *Colour Photography and Other Recent Developments of the Art of the Camera* (1908), with simultaneous editions in Paris and New York. Editor Charles Holme compiled 98 monochrome and 18 color plates for the book, which was regarded as the first color anthology of major photographers. Contributors included Frances Allen, James Craig Annan, Alvin Langdon Coburn, and Baron Adolph de Meyer. Holme selected multi-colored plates for the work, which were reproductions of autochrome originals. The autochrome, a three-color print process patented by Auguste and Louis Lumière in 1904, gained popularity among photographers as soon as it entered the marketplace in 1907.

As photography began to saturate new magazines and newspapers in America, the cultural cachet of the fine art book became more publicly visible, especially in large metropolitan areas. A burgeoning interest in fine book buying sparked the establishment of organizations such as the Limited Edition Club in 1929. Exhibitions of books-as-art were held at the New York Public Library in 1919, The Grolier Club in 1921, and The Metropolitan Museum of Art in 1924. Contemporary art museums also began commissioning private presses to publish exhibition catalogues, monographs, and art history books.

Legendary photographer Edward Steichen, then director of the Museum of Modern Art's photogra-

phy department, curated *The Family of Man* in 1955. All 503 images from the exhibition—the most successful photography show of the twentieth century—were reproduced in the catalogue as black-and-white photogravures. Maco Publishing, a magazine printing company, produced MoMA's first edition, which went on to sell hundreds of thousands of copies worldwide. By 1961, ten editions later, MoMA had sold more than one million copies of the work, making it the single most successful photography publication in the twentieth century.

During the Great Depression of the 1930s and leading up to World War II, the market for fine editions shrank considerably, attracting only those who could afford what was generally considered a luxury item. The so-called paperback revolution of the 1930s and 1940s, exemplified by the stream of inexpensive books entering the marketplace, drew more readers into bookstores than ever before. While mass-market paperbacks gained popularity, the fine art book maintained its connotations of prestige, aesthetic value, and collectability.

Within the first half of the twentieth century, the comparatively labor-intensive techniques of the hand-made calotype, photogravure, and woodcut illustration gave way to the machine-made halftone, rotogravure, and photo-offset lithograph. Later in the century, as computers entered publishing and print houses, digital offset computer-to-plate technologies yielded further photo-reproduction options for art presses. In considering all art presses in existence at any given time, the range of printing methods used was as varied as the methods available at that time. As the variety of approaches to high-grade art printing grew, large commercial print houses tended to favor methods that would accommodate longer print runs and shorter production timelines.

The arrival of the new and improved halftone screen was viewed as a great leap forward in production efficiency, as printers could now place a photographic image next to lead type, then transfer both to the same printing plate. In the late 1800s and early 1900s, brothers Louis and Max Levy of Philadelphia developed and refined the press equipment used to create halftones. The "Levy screen" came into widespread commercial use, offering printers better control over the replication of photographic tonal range. Walker Evans's book *American Photographs* (1938), published by MoMA, was considered the highly successful result of a marriage between his black and white photographs and the letterpress halftone printing technique.

Alongside developments in the halftone process of photographic reproduction, many publishing houses began exploring the advantages of offset printing.

In 1903, American printer Ira Washington Rubel and German lithographer Caspar Hermann independently invented and unveiled offset presses to the commercial publishing industry. Through continuous improvements in the 1930s and 1940s, photo-offset lithography offered economy and speed that was comparable to and increasingly better than letterpress. As color film types and color print processing options multiplied in the 1950s and 1960s, photo-offset lithography became the process of choice for the high-quality tonal subtleties yielded by its four-color separations.

In the postwar arena of fine art publishing, the fluctuating dynamics of international production and distribution were widely attributed to the acquisitions and mergers that would dominate industry news through the end of the century. The path of Abrams Books is a prime example. Established in 1949 by Harry Abrams of New York, Harry N. Abrams, Inc., was considered the first company in the United States to focus entirely on art book publishing and distribution. Initially, most of the Abrams book list consisted of imports from European publishing houses. By the 1960s, Abrams had begun championing emerging American artists through its *Contemporary Artists* series and by exporting titles to Europe. In 1966, the Times-Mirror Company in Los Angeles acquired the company, which was later sold to La Martinière Groupe of France in 1997. Through such changes, Abrams retained its size, and after purchasing the Stewart, Tabori & Chang imprint in 2000, its catalog diversified to include such areas as cooking, fashion, and interior design.

Larger publishing houses, particularly subsidiaries of corporate conglomerates, assessed the profitability of a single new title or series against the production costs of long print runs. By using the sales channels already in place and extending print runs further, many large presses were able to lower the per-copy price of each book to meet an even broader audience. Publishers who owned world rights could distribute their books internationally and release co-editions elsewhere. In 1991, Callaway Editions published seven simultaneous co-editions of Irving Penn's *Passage*, which won the prestigious Prix Nadar. The award, given by the *Bibliothèque nationale de France*, honors the best photographic book published in France or in the French language each year.

Many print houses, such as independent press David R. Godine of Boston, relied on reprint programs to flesh out their offerings. With the necessary legal rights and permissions, a publisher could reprint or re-release a work using their own pro-

duction techniques and design approach, often with a new introduction by an author, critic, curator, or art historian. More than 25 years after Random House subsidiary Pantheon Books published the internationally successful trade edition of *Wisconsin Death Trip* (1973) by Michael Lesy, the University of New Mexico Press released its own version as a paperback reprint edition in 2000. Many other successful works, in contrast, did not extend their availability via a second edition. Henri Cartier-Bresson's *The Decisive Moment* (1952) was published simultaneously by Simon & Schuster, New York, and Éditions Verve, a Paris-based art press run by Stratis Eleftheriadis, known as Tériade. After its immense impact on twentieth century photography, the book sold out and did not reappear as a new edition.

Along with reprints and co-editions, the procession of rare art books perpetually re-entering the art market lengthened through each decade. *The North American Indian*, a 20-volume photographic and narrative series by Edward Sheriff Curtis, was published from 1907 to 1930 with financial backing from John Pierpont Morgan. John Andrew & Son and the Suffolk Engraving Company hand-pressed 2276 bound and portfolio photogravure prints for each of the nearly 300 editions produced. By the time The Plimpton Press of Norwood, Massachusetts, published the final volume in the set, the unprecedented publishing feat went largely unnoticed by book patrons in the 1930s. In the 1970s, collectors and auction houses began to express a surge of interest in Curtis's work, and by the turn of the century, each volume sold for prices ranging from \$7,500 to \$20,000.

As smaller art presses produced more short-run books of the highest production quality each year, many sought to enhance distribution opportunities and marketability to potential collectors. From its first year in 1952, New York-based Aperture was known for its influential photography magazine of the same name, led by Minor White. In 1965, when Michael Hoffman came on board as editor after White's departure, Aperture created a book publishing program. Released that same year, the Edward Weston monograph *The Flame of Recognition*, edited by Nancy Newhall, became one of the best-selling photography books of the century. In 1968, Hoffman partnered with publisher Jonathan Williams to establish The Book Organization, a cooperative endeavor designed to strengthen bookstore sales for a group of small art presses. As Aperture's publishing operations expanded under the Aperture Foundation umbrella, publications like the *Masters of Photography* series and the land-

mark monograph *Diane Arbus* (1972), published in association with MoMA, brought the press its greatest visibility and successes yet.

In 1979, photo-eye of Santa Fe, New Mexico, created *Booklist*, a quarterly international guide to photography book publishing. Photo-eye developed *Booklist*, deemed the only publication of its kind, alongside its own imprint, photo-eye Books. Within 20 years, photo-eye became the largest independent photography bookstore in the United States. When New York-based Distributed Art Publishers, known as DAP, was established in 1990, it soon became the largest international distributor of contemporary fine art books. The DAP catalog includes titles from independent presses such as Actar of Barcelona, Spain; Steidl of Göttingen, Germany; and Hatje Cantz Verlag of Ostfildern, Germany. Publications from museums such as the Solomon R. Guggenheim Museum, New York; the Art Institute of Chicago, the Walker Art Center, Minneapolis; the San Francisco Museum of Modern Art; and the Museum of Fine Arts, Boston; rounded out the catalogue.

From the 1970s onward, dozens of small presses specializing in photography books debuted, as demand for such works grew along with their affordability as mass-produced art objects. In New York, photographer Ralph Gibson started his own art press, Lustrum, in 1969. The following year, Gibson self-published the highly acclaimed book *The Somnambulist*, and in 1971, Larry Clark's groundbreaking *Tulsa*. Gibson later produced more than 30 monographs that established him as both a photographer and book artist.

In 1984, Benedikt Taschen began publishing photography under his Taschen Books imprint, based in Cologne, Germany. Over the next 15 years, the press established its reputation through the lush, high-quality printing of its photo-book line. Each title was produced in mass quantities and sold at relatively low prices in large bookshops. In 1999, Taschen published a 464-page photo-book by Helmut Newton called *Sumo*. Measuring 31 × 32 inches and weighing in at 66 pounds, it was the biggest and most expensive book published in the twentieth century. Taschen released a limited edition of 10,000 signed and numbered copies, with each one accompanied by its own display stand.

In 1991, Walter Keller and George Reinhart founded Scalo in Zurich, Switzerland, with an additional office and gallery in New York. The definitive Robert Frank book *The Americans*, first published by renowned French press Robert Delpeire in 1958, joined the Scalo edition list in 1998. Phaidon Press, founded in 1923 by Bela Horovitz

and Ludwig Goldscheider of Vienna, Austria, became of the most widely recognized imprints worldwide, opening offices in London, Paris, Berlin, and New York. In 1993, Phaidon published *Workers* by Sebastião Salgado, a book of black and white photographs that won best book of the year prizes from the *Rencontres Internationales de la photographie Arles* (Arles International Festival) and the International Center of Photography, New York. Five years later, Phaidon published *Cream: Contemporary Art in Culture* (1998), a successful book-as-exhibition showcasing the work of 100 emerging artists chosen by an international group of critics.

London-based Thames & Hudson is another art publisher that expanded internationally, opening offices in Paris and New York, as well as subsidiaries in Melbourne and Singapore. Since its inception in 1949, Thames & Hudson became one of the largest illustrated book publishers in the world, producing nearly 200 hardcover and paperback titles annually. In 2000, another large art publisher, Rizzoli International Publications, became even larger as its Milan-based parent company, RCS Libri, acquired French house Flammarion and its Italian counterpart Skira. Rizzoli maintained the art publishing operations of Rizzoli New York, along with the imprint's flagship bookstore.

Unlike the larger multinational houses with booklists spanning several art media, many of the new, smaller presses tended to build and streamline their catalogues solely around photo-books. PowerHouse Books in New York debuted in 1995 under the leadership of Daniel Power, a co-founder of DAP. Other prominent publishers such as Schirmer-Mosel Verlag of Munich, Germany; Schaden of Cologne, Germany; and Umbrage Editions of New York also focus primarily on photography book publishing. In 2000, Nazraeli Press in Tucson, Arizona, published the first of its well-received *One Picture Book* series of artist's photo-books, limiting each new edition to 500 signed and numbered copies. Each book contains an original print by the artist commissioned for each project in the series.

As the demand for art and photography books continued on into the next century, new and well-

established presses were dealing with many of the same questions as their predecessors, namely about project funding, production values, distribution goals, and printing innovations. While independently addressing such variables, each fine arts press aspired to a perfect result that would appear tangibly in print, and as each one defined it.

HANS FINSLER

German

Hans Finsler is a leading representative of the movement *Neue Sehen* (New Vision) or *Neue Fotografie* of the 1920s. He was an art historian, photographer, educator, and, for a while, a librarian. One of his greatest merits is to have driven commercial photography towards artistic representation in a decisive way. His photographic oeuvre consists almost exclusively of arranged objects which seem to come out of the picture like sculptures. Evident in his images is the influence of the extraordinary design of the *Neue Sachlichkeit* (New Objectivity): perspective of the camera, focus, concentration on details, and an emphasis on diagonals. The two groups in this movement stressed either the experimental, process-related focus, or focus on the object; Finsler belonged to the latter group. He dedicated himself to questions of design, light, and the arrangement of special structures in his pictures.

Born in 1891 in Heilbronn as the son of a Swiss merchant, Hans Finsler studied architecture in Munich and Stuttgart as well as art history with Heinrich Wölfflin and Paul Frankl at Munich University. In 1921, he moved to Halle (Saale) to complete his Ph.D. under the supervision of Paul Frankl. During this time, he earned his living by working as a librarian and teacher of art history at the school of commercial arts *Burg Giebichenstein*. Here, he started using photography as a means to collect demonstrative material for his courses and to document the works of the school and its artists. Soon this developed into the first course of photography at a German art school. In 1929, the magistrate sanctioned the establishment of a new department for modern artistic photography at the art school, with Hans Finsler as its head. Finsler led this photography course until 1932.

In addition to his teaching assignments, Finsler worked for municipal institutions and firms in and outside Germany, as, for example, a chocolate producer in Halle, the “United Factories” in Düsseldorf and Munich, the *Werkbund* and North German Lloyd, by supplying advertising photographs. In 1928, Finsler had his first solo exhibition in Halle; the year after, he participated with numer-

ous photographs in the *Fifo* (film and photography exhibition) at Stuttgart. The pictures taken during the decade in Halle—probably around 2000—are considered the most important part of his photographic oeuvre. Finsler’s work and the activities of his students found high acclaim in Halle and beyond. He published in various journals and took part in exhibitions in Berlin, Munich, Zurich, Stuttgart, Paris, and London. The city of Halle repeatedly hired him for advertising and documentary photography; Finsler studied the interplay of architecture and landscape in the industrial town, and the recording of the city’s appearance was one of his important concerns.

Thus, the years in Halle were a fulfilling time for him and led him to attain artistic maturity as a photographer. He soon found his photographic language, his “optical grammar.” The functional context of objects, their characteristic use, and productive qualities figured prominently in his pictures. Some of his most impressive shots are those of ocean steamers of the Lloyd, taken from an oblique bottom position. A striking feature of his experiments in creating an abstract image through photographing objects is Finsler’s predilection for geometrical structures that are achieved through calculated arrangements. Finsler was also a master of architectural photography, his photographs capturing the plasticity and materiality of buildings and cityscapes through his choice of perspective, composition, and play of light. As did other exponents of the *Neue Fotografie*, Finsler also favoured eggs as still life subjects: a series of these pictures, consisting of 22 pictures, was probably produced in the beginning of 1929.

In 1931, the city of Zurich offered Finsler a teaching position in photography at the commercial arts department of the school of commerce. Finsler accepted “for reasons of health and family” and remained there as head of the department until his retirement in 1958. Among his pupils were Werner Bischof, Amil Schulthess, Ernst Scheidegger, and René Burri. He was active publishing articles on photography for *Camera*, *Du*, and other journals. In Switzerland, Finsler also found a circle of clients highly appreciative of his work, among them the modern furnishing

house of Switzerland, *Wohnbedarf AG*. At the end of the 1930s, Finsler increasingly committed himself to his work for the *Schweizerischer Werkbund*, and he acted as its chairman from 1946 to 1955. In 1969, he showed a selection of his works of the 1920s, which he published two years later, with his own comments, under the title *Mein Weg zur Fotografie* (My Way to Photography). Finsler died in 1972 in Zurich.

FRANZISKA SCHMIDT

Biography

Swiss, Born in Zurich, 7 December 1891. Studied architecture at the *Technische Hochschule*, Munich, 1909–1914; studied art history in Munich by Heinrich Wölfflin and Paul Frankl, 1914–1918; married Lita Schmidt, a study colleague, 1921; Librarian and Professor in Art History at the *Kunstgewerbeschule Burg Giebichenstein*, Halle, Germany, 1922–1932. Autodidact in photography, from 1922; founded first class for “object photography” at the *Burg Giebichenstein*, 1927–1932; taught photography at the *Kunstgewerbeschule*, Zurich, 1932–1958. President, Swiss *Werkbund*, Zurich, 1932. Died in Zurich, 1972.

ARNO FISCHER

German

Arno Fischer and Evelyn Richter are the most prominent names of the older generation of the former German Democratic Republic (East Germany) photographers. Arno Fischer is today seen as the outstanding East German photographer personality and as “the most well-known of the unknown German photographers.” Even to the present, Fischer devotes himself to photography in two ways: as a photographer and teacher. In both fields he has been very influential on generations of younger photographers.

Born in 1927 in Berlin-Wedding, Arno Fischer soon had the idea of becoming a press photographer, but ultimately decided to undergo an apprenticeship in carpentry. His parents died early, and he was raised by relatives. His uncle, a dedicated amateur photographer, inspired him to make his first photographs in 1941. After his military service and imprisonment in England, he returned to Berlin in 1946 and started to study drawing and sculpture at the *Käthe-Kollwitz-Kunstschule* in West Berlin in 1947–1948. After the closing of that school, he continued his studies of sculpture at the *Hochschule für Angewandte Kunst* at Berlin-Charlottenburg; he broke off his studies in 1953 when he was denied a scholarship for having previously studied in the east. It was for solely financial reasons that he moved into the eastern part of the city with his wife and started working as a photolab technician. In 1956, he obtained an assignment at the picture archive of the *Hochschule für Bildende und Angewandte Kunst* in Berlin-Weißensee. There he became first assistant of the graphic artist Klaus Wittkugel and freelance photography teacher. Since 1962, he worked as a photographer for the fashion and culture magazine *Sibylle*. From the middle of the 1960s, he shot picture reports in other socialist countries and worked for various magazines and newspapers like *Freie Welt*, *Wochenpost*, *Sonntag*. In 1971, Fischer resigned from Weißensee and continued as a freelance photographer. He traveled to Africa on behalf of his clients and published several illustrated volumes on cities. In 1974, he took a two-year teaching fellowship at

the *Hochschule für Grafik und Buchkunst* (HGB) in Leipzig. In the 1970s and 1980s, he undertook several trips to the USSR, France, Great Britain, The Netherlands, and the United States.

Together with others, Fischer founded the work group *Fotografie* in the *Verband Bildender Künstler* of the GDR. In 1983, he obtained an assignment at the HGB in Leipzig as a professor of artistic photography. Besides this, he taught press journalism at the *Fachhochschule* in Dortmund, West Germany, from 1991 until 2000; in 1993, he had to leave the HGB.

Arno Fischer always looked for a direct confrontation with reality, and was a committed proponent of subjective social photography. He tried to convey a familiar feeling for life, and to express his political convictions in a symbolic way. From 1952 onwards, Fischer concentrated on photography as his medium. His experience as a student of sculpture made him stress the presentation of plastic bodies in his pictures. “One of my strong points in sculpture was relief, and that consists mainly of composition for me. That is, I see the world already as something composed when I look at it.” Nevertheless his style is narrative and does not depict a posed reality. Even if some pictures look as if they have been staged, they are never more than sometimes intensely awaited moments of real events—“the decisive moment.” His commercial photographs also were imbued with considerable artistry, seeking to rise above mere illustration and to raise important existential questions.

Fischer habitually worked with single images, although at times he later arranged many into a series. The most important among these series are photographs from divided Berlin of the 1950s. The pictures were meant to document what was happening in Berlin, the focal point of the German division that had taken on a distinct shape by then: the social, political, and economical polarisation of the city had become an unmistakable fact. Fischer’s doubts about the West and sympathy for the East are conspicuous. Fischer did not focus on the symbolic interpretation of ruins or the architectonic destruction of Berlin; his interest was rather to gain insight into social

structures and the encounters and gestures of human beings. The strong impact of his photographs was due to a photographic language that was uncommon and both aesthetically and formally well-calculated: it went counter to contemporary clichés. The publisher *Edition Leipzig* wanted to publish this series under the title *Situation Berlin*. The evaluation of his experiences of the West were more or less in conformity with GDR authorities, but not his aesthetics; and the building of the Wall in 1961 became a pretext for banning the book. The series reappeared 40 years later, following the wall's dismantling.

An often quoted, important experience for Fischer was his encounter with Robert Frank's works, and especially his book *The Americans* of 1958. Frank's passionate photographic language and his conception of street photography encouraged Fischer to continue in this vein. He felt supported in his approach to search for the symbolic aspects in the fleeting nature of everyday situations. A further inspiration for Fischer and some of his colleagues was René Burri's book *Die Deutschen*, published in 1962, which was conceptually similar to Frank's works.

It was by accident that Fischer joined the fashion and cultural magazine *Sibylle* in 1962. Until 1985, he published photographs in its pages which formally qualified as fashion photography, although he never saw himself as a fashion photographer. Partly due to his and Thea Melis's work, the appearance of the magazine changed radically in the 1960s. Through a new concept and altered imagery of fashion photography, it wanted to establish a more realistic self-representation of society, and traditional "puppet poses" were abolished. Elements of live photography were adapted to the presentation of fashion photography: moments of movement, background as authentic environment, withdrawn depiction of fashion. These features were nothing new internationally, but gave a completely different appearance to fashion photography in the GDR. For a long time, *Sibylle* remained a forum for the otherwise hardly conceivable publication of such photography in the GDR.

Arno Fischer, always conceiving of photography in social and cultural terms, also saw himself as a teacher and mediator of photography. Especially in this context, his charisma has fully revealed itself: during all these years he has constantly had a circle of pupils and admirers around him. His lectures on photography resemble conversations about this medium. It is one of his greatest talents to mobilise the energies and trigger the independent artistic

development of others. In this way, he has become an example to many photographers.

PETER FISCHLI AND DAVID WEISS

Swiss

Collaborating since the late 1970s, Swiss artists Peter Fischli and David Weiss work in various media, including sculpture, film, installation, text, photography, and video. In their aesthetic practices and public life, the two artists have taken great pains to circumnavigate their individual personas, forging instead a rigorously collaborative identity. As such, precious little is known about them beyond the most basic biographical data.

While the work of Fischli and Weiss reflects a definite relationship to pop art and conceptual art, their fixation on seemingly banal objects and images breaks with Warholian detachment, suggesting that the stuff of everyday life may carry potential philosophical and spiritual consequence. This longstanding preoccupation with the quotidian is a constant in their work, evident in their first collaboration, *Wurstserie* (Sausage Series), 1979. In the 10 color photographs, a variety of sausages and meat products are posed in scenes

with alternately generic and specific titles, including *In den Bergen* (In the Mountains) and *Titantic*. The most widely circulated image from the series is *Der Unfall* (The Accident), a two-car sausage-mobile collision against a backdrop of roughly carved cardboard high-rises, with cigarette butts, in lieu of human bodies, posed in the scene as both onlookers and casualties. The image bears a timbre common to all of the work of Fischli and Weiss: it is at once ludic, with a childlike sense of inventiveness, and bothered, with a trace of agitation.

For the five years following *Wurstserie*, Fischli and Weiss abandoned the camera in favor of the unfired clay of *Plötzlich diese Übersicht* (Suddenly this Overview), 1981; and the polyurethane, cloth, and paint of their three subsequent projects. While many of their collaborations do away with the camera altogether, it seems that the possibilities and practices associated with photographic technologies are always at work in the output of Fischli and Weiss. Like the sausage-animated images of their debut collaboration, their practices in other media of the same period show a commitment to the commonplace, and an exploration of the promise and thresholds of archival practices and the positivist systems of modernity—every image captured with a camera begs the viewing subject to wonder how many other images might have been missed. With their return to the camera in *Stiller Nachmittag* (Quiet Afternoon), 1984–1985, the pair produced a series of black-and-white and color photographs of contraptions devised out of food and kitchen gadgets. These still images of contrivances anticipate the best-known work of Fischli and Weiss, *Der Lauf der Dinge* (The Way Things Go) 1985–1987.

A half hour of color footage shot on 16 millimeter film, *Der Lauf der Dinge* follows a chain reaction, from a rotating trash bag which sets a tire in motion through a series of other events, to the ultimate overflow of a foamy substance and its subsequent ignition. En route, there are a number of spills, unravelings, eruptions, explosions, and rotations. Frequently characterized as a Rube Goldberg, the events shown in *Der Lauf der Dinge* are fundamentally different from the zany contraptions invented by Goldberg, who illustrated them to amuse his readers. A Rube Goldberg device entails, per definition, an obsessively elaborate design, ultimately yielding the completion of a very simple task, such as juicing an orange or shutting a window. Goldberg's inventions were a playful critique of Taylorist fantasies of efficiency, but nothing happens at the end of *Der Lauf der Dinge*; it is utterly

non-teleological. In spite of this apparent aimlessness, or perhaps because of it, the footage is absolutely compelling and uneasy. Arthur Danto has suggested that the uncanny quality of the piece may be attributed to its visual quality and the materials used in the contraption, suggestive of an interrogation space and various implements of torture. 2003 saw renewed interest in *Der Lauf der Dinge* when Fischli and Weiss publicly considered legal action against Honda in response to a car commercial which clearly references their work, giving rise to provocative debates around questions of intellectual property.

In the years devoted to the realization of *Der Lauf der Dinge*, Fischli and Weiss also produced a number of cast rubber works before returning to the photographic medium with *Airports* in 1988. The series of cibachrome images taken around the world show commercial jets of variously relevant global import on runways, surrounded by cargo, truckloads of luggage, and the occasional worker, shot against a range of landscapes, including mountain ranges, bleak industrial surroundings, and lush flora. The images are aggressively generic; one could easily imagine them on the pages of an in-flight children's activity book. The strategically artless photographs have an undercurrent of anxiety; even in a pre-9/11 world, airplanes and all of the trappings of air travel connote the threat of contamination from afar, and the dangers of hijackers, mechanical malfunctions, and crashes. If *Airports* evokes the nervousness of departure, then the next Fischli and Weiss project addresses the anticipation of arrivals. The 1991 *Bilder, Ansichten* (Pictures, Opinions) is a series of color photographs including the most clichéd images of Paris, Giza, Stonehenge, Sydney, and Rome, as well as snow-capped mountains, butterflies and flowers, goldfish, children, and a kitten. Without question, the artists maintain their attention to the seemingly banal in still photographs, and in their video work this inevitably stands in the foreground of issues of temporality and duration.

In the early nineties, Fischli and Weiss completed a number of color videotape projects, explicitly confronting questions of the archive and the limits of spectatorship. The most epic of these projects is the untitled video installation mounted at the Swiss Pavilion of the 1995 Venice Biennale, consisting of 30 color videotapes containing 80 hours of footage of the artists' journeys, from little local drives to intercontinental trips. The artists installed the video in Venice on 12 monitors, making it impossible to watch everything at once. Throughout the 1990s,

Fischli and Weiss maintained their commitment to everyday objects and the nature of contemplation in a range of media practices.

Their first major work of the new millennium distills many of the key concerns so characteristic to their oeuvre. *Món Visible* (Visible World), 2000, consists of 14 massive light box tables lined up end to end in a dark room, displaying 2,800 slides shot by Fischli and Weiss over the course of 13 years, including many images seen in their previous collaborations. The sheer volume of images places a particular set of demands on the viewer, and the subject matter and exhibition method suggest that Fischli and Weiss will continue to repeat the same set of concerns in their work: the pleasure of banality, the status of the artwork, and the limits of positivism.

ROBERT JOSEPH FLAHERTY

American

Robert J. Flaherty has been widely acknowledged as "the inventor of documentary film." Although primarily known as a film director and a cameraman (for the films *Nanook*, *Moana*, *Man of Aran*, *The Land*), he was also a still photographer, capable of lyrical images with an ethnographer's perspective. Born in Iron Mountain, in Michigan's Upper Peninsula, on February 16, 1884, he was the eldest of seven children of an Irish Protestant father and German Catholic mother; his paternal grandfather had lived in Quebec City, Canada. His father was a mining engineer and an iron ore explorer, and the young Flaherty was more often in the northern woods with his father, looking for iron ore, than in school.

In the employ of a railroad company exploring the eastern coast of the Hudson Bay, the great indent in the frozen north of Canada between 1910 and 1912, Flaherty made several expeditions to the Nastapoka Islands, Fort George, Great Whale Island, and across the Ungava Peninsula. He took many still photographs and became acquainted with the native Inuit. His striking body of photographs from these expeditions are held largely in the collection of the Thunder Bay Historical Museum Society. These photographs included images from Fort George, Baffin Island, the Ungava Peninsula, and Fort Chimo, and they depict the Natives of Northern Quebec, including

the Nasakapi of the Nastapoka Islands with their distinctive headgear and clothing, and the Inuit. He captured portraits of men, women, children, candid and posed; and images of their dogs, dwellings, and boats, as well as daily life in Port Arthur, today's Thunder Bay. On all of his trips, Flaherty had heard tales of the Belcher Islands, and he was determined to explore them; for a trip launched in August, 1913 with this goal in mind, Flaherty was carrying a hand-cranked Bell and Howell movie-camera. The weather, however, prevented his success, and he returned to the United States for his marriage in 1914 to Frances Hubbard, who was to become as well his collaborator on future projects. Flaherty gave to friends some of the photographs that he made; they found them fascinating in their depiction of a people and culture of which they had little knowledge. Further motivated, Flaherty returned to explore the Belchers from 1914 until 1916, shooting about 70,000 feet of film footage—mostly of the Inuit pursuing their prey, but also of the landscape and wild life. The title of this first effort was to be *Innuït* (*Eskimo*), roughly edited in 1917. But disaster struck when the highly flammable film stock in use at the time caught fire while Flaherty was working with the negative; the only copy seems to be lost.

Unsatisfied by his first experience with motion pictures (and badly burned by the fire of the nitrate celluloid), Flaherty returned to the Canadian North on exploration assignments, always accom-

panied by his movie camera. In 1919, with the financial help of the French fur company, Révillon Frères, Flaherty again shot the Inuit with the idea of telling a story instead of merely juxtaposing images and short scenes. This effort, *Nanook of the North* (1922), becomes his first real movie and the one that earned him enduring fame—a silent film made with an Inuit family living in Inukjuak (also known as Inukjuak, or Port Harrison), on the east coast of the Hudson Bay, in northern Québec. It showed the everyday life of an engaging Inuit named Nanook (“The Bear”), with scenes such as his hunting a walrus, participating in the building of an igloo, and a surprising scene of the whole family sleeping together side-by-side, naked. The enjoyment of modern, Western culture, such as listening to a record played on a gramophone, was also captured. *Nanook of the North* was later reedited with a soundtrack; thus, two versions of the film remain today. The film was a huge success worldwide, although some critics condemned Flaherty for showing an exotic side of the Inuit doing things that they had left behind, such as wearing traditional clothing (which was made especially for the film) or hunting using primitive harpoons. Later critics also point out that Nanook was more or less “hired” to be the lead in the film, as he served as Flaherty’s main assistant, coordinating transportation, taking care of the equipment, and even suggesting scenarios, thus creating a work of fiction more than that of a dispassionate ethnographic documentary. Flaherty’s technical innovations were considerable as well; shooting in the frigid conditions of the north provided endless challenges; the use of graphite as a lubricant was one important innovation.

Nevertheless, by contemporary accounts, the audience that most enjoyed the movie was the Inuit themselves. Tragically, as the film was entrancing audiences worldwide, the Inuits were facing exceedingly harsh conditions; Nanook died of starvation not long after filming was complete.

For his still photographs made in the Canadian north from 1910 onwards, Flaherty utilized a 5 × 4-inch Eastman plate (or view) camera and a 4 × 5-inch Graflex roll-film camera to take photographs of Inuit groups. Although the Inuit people were by no means entirely isolated, when Flaherty showed photographs to Nanook for the first time in his life, the Inuit did not understand what he saw and could not grasp what the images represented. As Flaherty explained later:

My task is to make Nanook understand what I intended to do. My first difficulty was that he didn’t even know

how to read a picture. The first pictures I showed him meant no more to him than so many curious marks. It was only when I showed him some photographs of himself which I had made as tests—I had him look at himself in the mirror, and then at the photographs—that I got him to understand what a picture meant.

(Flaherty [1934], quoted in Christopher, 1998: 187)

Although Flaherty is widely credited with coming up with the first film documentary and his device of shooting footage with the idea of constructing a narrative was pioneering and has proven to be enduring, according to filmmaker Dennis Doros Flaherty had in fact been influenced by previous films such as Edward S. Curtis’s film, *In the Land of the Head Hunters* (aka *In the Land of the War Canoes*, 1914), and Herbert Ponting’s *90 Degrees South: with Scott to the Antarctic*.

Flaherty went on to make a number of other films, including *Moana: A Story of the South Seas* (1926), about the Samoan people, with whom Flaherty and his wife lived for almost three years. *Moana* was innovative: Flaherty pioneered the use and development of panchromatic black-and-white film. When Flaherty’s friend, the British producer (and later founder of the National Film Board of Canada), John Grierson saw *Moana*, he coined a new term, namely “documentary,” to describe his innovative style, combining an ethnographic approach with poetic images. Although his documentaries were successful, Flaherty’s career as a filmmaker was difficult. Often at odds with those interested in the commercial exploitation of his films, or with his producers or collaborators, his only other great success was *Man of Aran* (1934). Invited by his old friend John Grierson to England to live in 1933, Flaherty shot for over a year off Ireland’s Galway coast, on the island of Aran, creating an epic without dialogue, which showed the rude life of fishermen, who re-enacted for the camera some fishing practices that were long abandoned.

After other setbacks, including work on a big-budget production in India of Rudyard Kipling’s *Elephant Boy*, Flaherty returned to the United States. There, he made *The Land* (1942) for the U.S. Department of Agriculture, and *Louisiana Story* (1948), funded by corporate support.

Robert J. Flaherty died of a thrombosis on July 23, 1951, in Dummerston, Vermont. The Annual Robert Flaherty Film Seminar, an international event, has been held every year since 1954, having been inaugurated by Flaherty’s widow. The Robert Flaherty Foundation was established in New York City in 1953; it moved to Brattleboro, Vermont, the following year. Canada also remembered Flah-

FLAHERTY, ROBERT JOSEPH

erty's presence as an explorer; today, one of the Belcher Islands in Hudson Bay is named after him. The Robert Flaherty Papers are housed at the Butler Library of Columbia University, New York.

YVES LABERGE

Biography

Born Robert Joseph Flaherty in Iron Mountain, Michigan, 16 February 1884. Studied in various primary schools in Michigan. Between 1896 and 1898; lived with his father, a mine manager, in Port Arthur (now Thunder Bay). From 1899–1890, sent to board at the Upper Canada College in Toronto; returned to US in 1900. From 1902 to 1903, studied for a short period at the Michigan College of Mines, in Houghton, but abandoned formal education after being expelled. Worked as a prospector north of Lake Huron, between 1907 and 1910. In August 1910, hired by Sir William Mackenzie, a builder of the first Canadian railroad, to explore the eastern coast of the Hudson Bay. Made three journeys on the Hudson Bay between 1910 and 1913. Studied motion picture photography and movie-camera technique for a month, in 1913 at the Eastman Company in Rochester, New York. Married Frances Hubbard (1883–1972), who studied with him at the Michigan College of Mines, on November 12, 1914, in New York City. Fourth expedition in the Canadian North 1915. Began to shoot the Inuit again in 1919. Released first film, *Nanook of the North*, as director, cameraman, and producer, 1922. Wrote his impressions about life in the

Canadian North, *My Eskimo Friends*, in 1922–1924. After living three years in the South Seas, released his film *Moana*, 1926. Lived in U.K. between 1931 and 1939. Received the “Best Film” Award at the 1934 Venice Film Festival. Returned to the U.S. in 1939, until his death. In 1948, his film *Louisiana Story* received a British Film Academy award. Honorary Ph. D. awarded by the University of Michigan, 1950. Died of a thrombosis on July 23, 1951, at his home, in Dummerston, Vermont.

VILÉM FLUSSER

Czech

Vilém Flusser, an important philosopher in the arena of the new communications media and their cultural function, was a representative of a Czech intellectual tradition that included writers like Franz Kafka and Franz Werfel and philosophers like Edmund Husserl. Flusser was also influenced by the language philosophy of Ludwig Wittgenstein and by many aspects of Walter Benjamin’s writings on art, technology, and history. While he

wrote on a number of topics related by the theme of globalization, including technology, emigration, and nationalism, his ideas about the nature of photography and the photograph have made him an important influence on image theory in the 1980s to the present day. In contrast to the analytical modernist thinking, focused on the depth of the signified and represented by theorists like Karl Marx or Sigmund Freud, Flusser directed his main interest to the “surfaces” of the signifier and their equivalence. He emphasized the creative possibili-

ties of communication, and especially of artificially created worlds.

Flusser was born in 1920 in Prague into a German Jewish family. He began studying philosophy at Charles University in Prague in 1939 but fled Nazi occupation to England in 1939. He continued on to Brazil in 1941. There, Flusser enrolled at the University of Sao Paulo. He managed an electronic transformer factory while establishing himself as a philosopher. In 1963, he was appointed a Professor of the philosophy of communication at the University of Sao Paulo. In 1976, he settled in France and taught in Aix-en-Provence and Arles, while giving lectures and serving as a visiting professor at various European and American universities. He died in 1991 in a car crash near the Czech-German border after delivering his first public lecture in Prague.

Flusser tried to conceptualize the semiotic, communicational, and aesthetic implications of the photographic medium by focusing on its technical specificity. Nevertheless, a photograph is not for him “a message without a code,” as Roland Barthes put it, nor a transparent image of an objective reality. Rather, it is defined as a way of transcoding, that is, re-writing, the scientific formulas which made possible technological progress and, therefore, photography itself.

According to Flusser, the transition from the prehistorical to the historical period was parallel to the substitution of magical thinking, dominated by images, by rational or linear thinking. Flusser believed that in the late twentieth century humans entered a transitional period between historical and post-historical thinking. Linear thinking—based on writing and essential to history—is about to be put aside by a new form of thinking that is much more complex: thinking which is multi-dimensional and visual, based on algorithms, and inspired by system and chaos theory.

In that sense, traditional images are pre-historical and technological images post-historical; the former signify visual phenomena, the latter the scientific concepts which made them possible. Photography, by transforming linear equations to images, re-injects magical thinking into modern societies, introducing the postmodern era. Flusser’s questioning of contemporary culture joins in that point the necessity, expressed by Walter Benjamin, of a dialectical form capable of linking together the modernist rationalization of the culture and the simultaneous revival of magical or mythical models of behavior.

Flusser was intensely interested in the potential of virtual reality to enable human beings to create and manipulate their environments. In the cultural

logic of post-modern societies, the technological potential available to humans brings about a rupture with the humanist traditions of the past and the forms of subjectivity associated with them. The autonomous subject has been decentred and transformed into a product of his own creation, a fairly consistent theme in postmodern thinking.

Flusser postulated that the invention of photography was the starting point of a technological and cultural process in which the mechanical structures introduced by industrial revolution give place to cybernetic ones, based on algorithms. In this context, the increasing dominance of electronic means of communication is the most distinctive feature of post-industrial societies. Photography is thus regarded as the last step before the complete dematerialization of the image and its transformation to pure information. What is important in a photograph is not the object itself but the information of which it is the vehicle. In Flusser’s perspective, there could be no such a thing as an “original photography.”

The extreme mobility and general equivalence of information make photographic images volatile, nomadic, and uncertain, easy to manipulate: their final meaning depends much more on their context than on the images themselves. For Flusser, visual images, unlike verbal information, are multidimensional symbolic structures open to interpretation. Through a feed-back effect, photographic reproductions of reality influence and transform reality itself, attempting to conform it to pre-programmed and standardized stereotypes. In that way, photography tends to generalize its own range of technical possibilities to the large scale of social exchange. As Flusser observes, the operating model of photographic vision is not one of causal but of functional thinking. The difference is that in the latter, the result is programmed in advance and not analytically deduced. In that way, Flusser considers the social implications of photography as an integral part of its meaning.

Electronic media of communication and their imagery absorb and recycle their objects, dissolving the historical dimension of reality in a series of redundant reproductions. As artist Alfredo Jaar puts it: “Images have an advanced religion. They bury history.” For Flusser, no meaningful distinction can be drawn between reality and representation, for they differ only in degree of probability, not in essence.

Like the French philosopher Jean Baudrillard, Flusser addressed media images as representations of a radically new kind, calling not for the traditional aesthetics of production but for a historically relevant aesthetics of reception. Such aesthetics

should be capable to understand the postmodern inversion of the supposedly stable relation between subject and object of representation, as well as its historical and cultural implications and perversions. Thus, photography, rather than being just a new entry in the lexicon of visual history, calls for the revision and re-consideration of traditional aesthetic categories.

During the course of his life, Flusser published numerous essays on a wide range of topics and many books, writing in German and Portuguese. Among them, *Für eine Philosophie der Fotografie* ("Towards a philosophy of photography"), 1983, explores the implications for human society of the transition from writing culture to image-culture. *Die Schrift* ("Writing"), 1989, asks what is lost if the alphanumeric code of writing is superseded. In 1992, Flusser's "philosophical autobiography" was published under the title *Bodenlos* ("Bottomless"). *Nachgeschichte* ("Post-History"), 1993, considers the different implications of "the end of history" in the post-industrial world.

FORMALISM

Formalism in the visual arts is a philosophy of aesthetics first formulated in its modern form in the early part of the twentieth century by such British Bloomsbury Group writers as Clive Bell and Roger Fry. Bell's and Fry's theories had arisen from the consideration of painting, but the basic notions of formalism could be applied to other two-

dimensional forms, and were soon being used to examine and understand photography.

The basis for the theories of Bell and Fry was simply that representation was irrelevant to paintings' value as an art form, that is, what the work depicted was not what made a work of art great. Applying his ideas to the whole of art history in his

1914 work, *Art*, Bell considers very few artists actually great. For Clive Bell the essential quality of any artwork was its ability to provoke an aesthetic emotion. Aesthetic emotion is obtainable only through the presence of what Bell termed “significant form.”

Bell does not deny that art can contain representational forms and still be considered art, but he asserts that artistic value can only be measured through significant form, which although it can be pointed out by a critic, an object is not art until it has independently provoked this response from the viewer. By Bell’s own admission all art experiences are thus entirely subjective. While representational imagery can be amusing or intellectually challenging, it is often not aesthetic. Its nature is often more documentary. Bell compares the history of art to the history of religion and finds a common motive for both. The aesthetic and the divine are both roads for people to exchange mundane reality for ecstasy. Aesthetic and religious rapture are very similar as described by Bell, and at their best both are completely independent of historic facts or contrived dogmas.

A contemporary of Bell, Roger Fry published his major writing on art in 1920, called *Vision and Design*. While Bell was dismissive of the relatively new tendency in painting, Impressionism, Fry cites the movement as the beginning of a new revolution in art. Impressionist artists removed art from the arena of strict representation and placed it firmly in the realm of structural design and harmony. More technical than Bell, Fry identified five emotional elements of design in all forms of art: rhythm or gesture, mass, space, light and shade, and color.

According to Fry, art stimulates emotion by using the emotional elements of design, and combined with sympathy within the viewer for the artist, and the purpose of the thing, thereby creates a feeling of unity and harmony in the viewer. These are what indicate a successful work of art. Following from Kant, Fry believed distinguishing art from natural beauty is the consciousness and the intent of the artist.

The contemporary painter-theorist in Poland, Stanislaw Ignacy Witkiewicz, deserves mention for his 1919 work *Nowe Formy w Malarstwie (New Forms in Painting)*. His Formalist theory was very similar to Bell’s argument. He identified that the essence of art lies in its form and that a successful artist strove to create a multi-structured unity of forms. He acknowledged that all art comes from an understanding of life, and because of this art may or even must contain referents to the real world, but that the evaluation of any work of art must be dependant on aesthetic qualities not related

to the real world referents on which that work may be based.

In 1904, American photographer Sadakichi Hartman wrote essays strongly objecting to painterliness in photography, a basic tenet of the overriding photographic style of the day, Pictorialism. He referred to over-manipulated negatives and allegorical sentimentality and the inferiority of these to pure photography relying on nothing more than an artistic eye and technical skill. The straight photography movements in the early part of the century included such American artists as Alfred Stieglitz, Paul Strand, and Edward Weston. In Russia the Constructivist photographers had many of the same aims as the straight photographers did, and was epitomized by the work of Alexander Rodchenko. These movements addressed the tension between the concepts of objectivity and subjectivity. The important matter for these artists was not the object being captured, but rather the mind that directs the capturing. Photography of the 1920s and 1930s made such a visual impact that its effects were seen in the works of painters around the world. Despite this, aesthetic theorists of the era, like Bell and Fry, largely ignored photography in favor of painting, sculpture, and architecture.

Perhaps art history’s best-known straight photographer was Alfred Stieglitz, who was very interested in Formalist composition. For Stieglitz, form was the main concern of the photographer, whatever narrative or moral or allegorical interpretations might come from the final image was irrelevant to the production of the image. Perhaps Stieglitz’s most famous photo, *The Steerage* (1907), is potentially a cold, documentary criticism of class divisions in a democratic society, but for the artist and for the Formalist it is a composition in form consisting of round and triangular shapes, diagonals, and light areas juxtaposed with dark masses. In order to reach his lofty formalistic goals without provoking confusion about potentially meaningful subject matter, Stieglitz and others in his group began photographing ordinary objects. The epitome of his efforts was the production of a series called the *Equivalents* and his *Dreaming Trees* series. The *Equivalents* began in 1923 with cropped studies of clouds. They were documentary, but also evocative and beautiful. These works have a connection to Bell’s theories as they use significant form without narrative or even pictorial context to invoke an aesthetic emotion. He moved the documentary out of mundane life and into the realm of high art. The images are still works of straight photography, but as documents, they have no function.

FORMALISM

Stieglitz had a direct effect on Edward Weston's work. Straight, simple, pure form was his hallmark. Weston's studies of a toilet, including *Excusado* (1925), are completely devoid of irony or cultural criticism and stand as a document of pure form divorced from reference to Duchamp's *Fountain* of 1917, an actual urinal displayed as a "ready-made" sculpture. The primary distinction between Formalist and documentary photography lies with Formalism's core reliance on the technical skill of the photographer, whereas documentary photography is interested in the subjective meanings of the people and things being depicted. Imogen Cunningham's 1923 nude study *Triangles* also exemplifies the Formalist approach, in which the highly loaded subject of female flesh is reduced to a series of volumes and shapes, sensual in its gradations of light and tone rather than in its representation of the nude female body.

Bell's and Fry's theory of Formalism contained logical flaws. Bell's terms, aesthetic emotion and significant form, are inseparably linked and he can offer no definition of one without implying the definition of the other. This, of course, leads to circular reasoning. Also, he can provide no adequate criterion for differentiation on what emotions are aesthetic and which are not. Another flaw in Bell's approach is his inability to completely dismiss the historic importance of subject matter as it is opposed to form. Bell's logic defines criteria for what an artwork is by first finding a common denominator for all art. Not all art is Expressive; many artists have strived to remove any emotive content from their works. Not all art is representational. But it seems all art has form, therefore a thing is not art unless it has form. Some would argue, however, that everything has form, so Bell qualifies himself, and says art is that which has significant form. This, critics maintain, does little to differentiate fine art from a mathematic theorem. In response, the formalist cites a theory of function. A mathematical theorem does not have the primary function of displaying its significant form. It may be more eloquent with form, but it is still a valid and accepted theorem without form. Art, to be art, must have the primary function of displaying its form. Yet this argument is also flawed because it ignores the very real possibility that art may have no primary function unique to itself. This point of criticism, with the mathematical comparison, is eloquently explained in *The Routledge Companion to Aesthetics* (2001).

An essential modern theorist whose Formalism radically changed painting after World War II was the American Clement Greenberg. Greenberg dif-

fers most radically from Fry and Bell in the Marxist bent of his writings. This is seen in his idea of dialectical conversion, which is a phenomenon that occurs when one pushes a concept to its extreme and finds oneself proceeding in the opposite direction. An example is the painting movement Cubism of the early years of the twentieth century. Cubism's pursuit of naturalism by depicting objects and figures in the world from multiple viewpoints and planes, ends in utterly flat abstraction. In this way, Greenberg, like Bell, considers abstract, non-representational art as continuous with representational forms; indeed they are a natural evolution of art towards unity.

Greenberg reduces art to formal elements but is much more extreme than his predecessors. An artist must exploit the characteristic methods of his media to embed the art in its area of expertise. Painting must therefore exhibit only the characteristics of paintings, not sculptures or photographs, and so on. In the 1950s and 1960s he championed pure painting as he contrasted it with the painterliness of Abstract Expressionism. He applauded the openness of artists such as Clifford Still, Barnett Newman, and Mark Rothko.

In Greenberg's thought art was in danger of becoming kitsch, entertainment. To avoid this art must purge itself of uncharacteristic elements and become literal and purely self-referent, but most of all, abstract. Essential to his abstraction is the complete absence of any illusionist space. Greenberg believed, as did Fry, in art-for-art's sake. Art was outside reality and morality; it stood as a refuge from the chaos of ordinary life.

Formalism as it developed in the latter half of the twentieth century is relatively easy to understand but difficult to apply with any consistency. Many critics acknowledge that there are two basic camps of Formalist thought. Hard or Extreme Formalism, which is absolute in its assertion that art is only that which evokes aesthetic emotion through significant form, meaning that all aesthetic properties are formal properties; and Soft or Moderate Formalism, which allows that the historic nature of subject matter may be considered in the value of some works. This mode of Formalism allows that many aesthetic properties of art are formal, while many are not formal.

Moderate Formalism addresses the critique of the theory that points out that much of what is currently and openly accepted as art does not have the primary function of displaying significant form. Some art, like Dadaist ready-mades, have not created aesthetic form at all. Such pieces are made to provoke intellectual consideration. For a Hard

Formalist a ready-made sculpture or even a public monument cannot be art, but a Moderate Formalist can still accept these items as art, conditionally. The condition allows that even though one may require considerable knowledge of history or of the formal properties of previous works to properly judge the aesthetic merits of a particular piece, it stipulates that the judgment or emotion provoked once arrived upon, given previous experience, is itself independent of that history or those previous works. The artist's intention in creating the work is not relevant to its value, neither are issues of originality. DuChamp's *Fountain* (1917) may be *best* understood in the context of its history and intent, but it does not necessarily follow that it can *only* be so understood. It can be formalistically appreciated outside of context, on its own merits.

Formalism as an aesthetic concept in photography has been linked to and at times confused with the medium's inherent strengths as a medium of document. Photography's immediate referent to reality and—representationalism has made it difficult for some artists and critics to define photographic images in purely aesthetic, Formalist terms. However, from the very beginning of the twentieth century, photographers have fought against the notion of narrative in their works and have pushed for an interpretation of Formal or straight photography.

One of the most powerful recent voices in Formalist photographic criticism was John Szarkowski who served as Director of the Department of Photography at the Museum of Modern Art from 1962 to 1991. Szarkowski championed straight photography and agreed in large part with the judgments of Clement Greenberg. He promoted that the meaning of a photo lies in the medium itself, that is: form follows function. In the 1960s, exhibitions at the Museum of Modern Art under Szarkowski promoted highly formalistic readings of artists such as Stieglitz. Szarkowski sought to remove any metaphoric interpretations from contemporary photography. He identified five formal properties of photography: the thing itself, the detail, the frame, the time, and the vantage point.

Postmodern theory stands in opposition to modern Formalist arguments. The postmodern stance often holds that photography has no inherent context and therefore no inherent historic unity. A photographic image, for these critics, has no meaning unto itself as an aesthetic object. A photo is inseparably tied to its use or function as an object in a context outside of itself.

From a radical and new way of appreciating and evaluating what art should be, to an interesting but

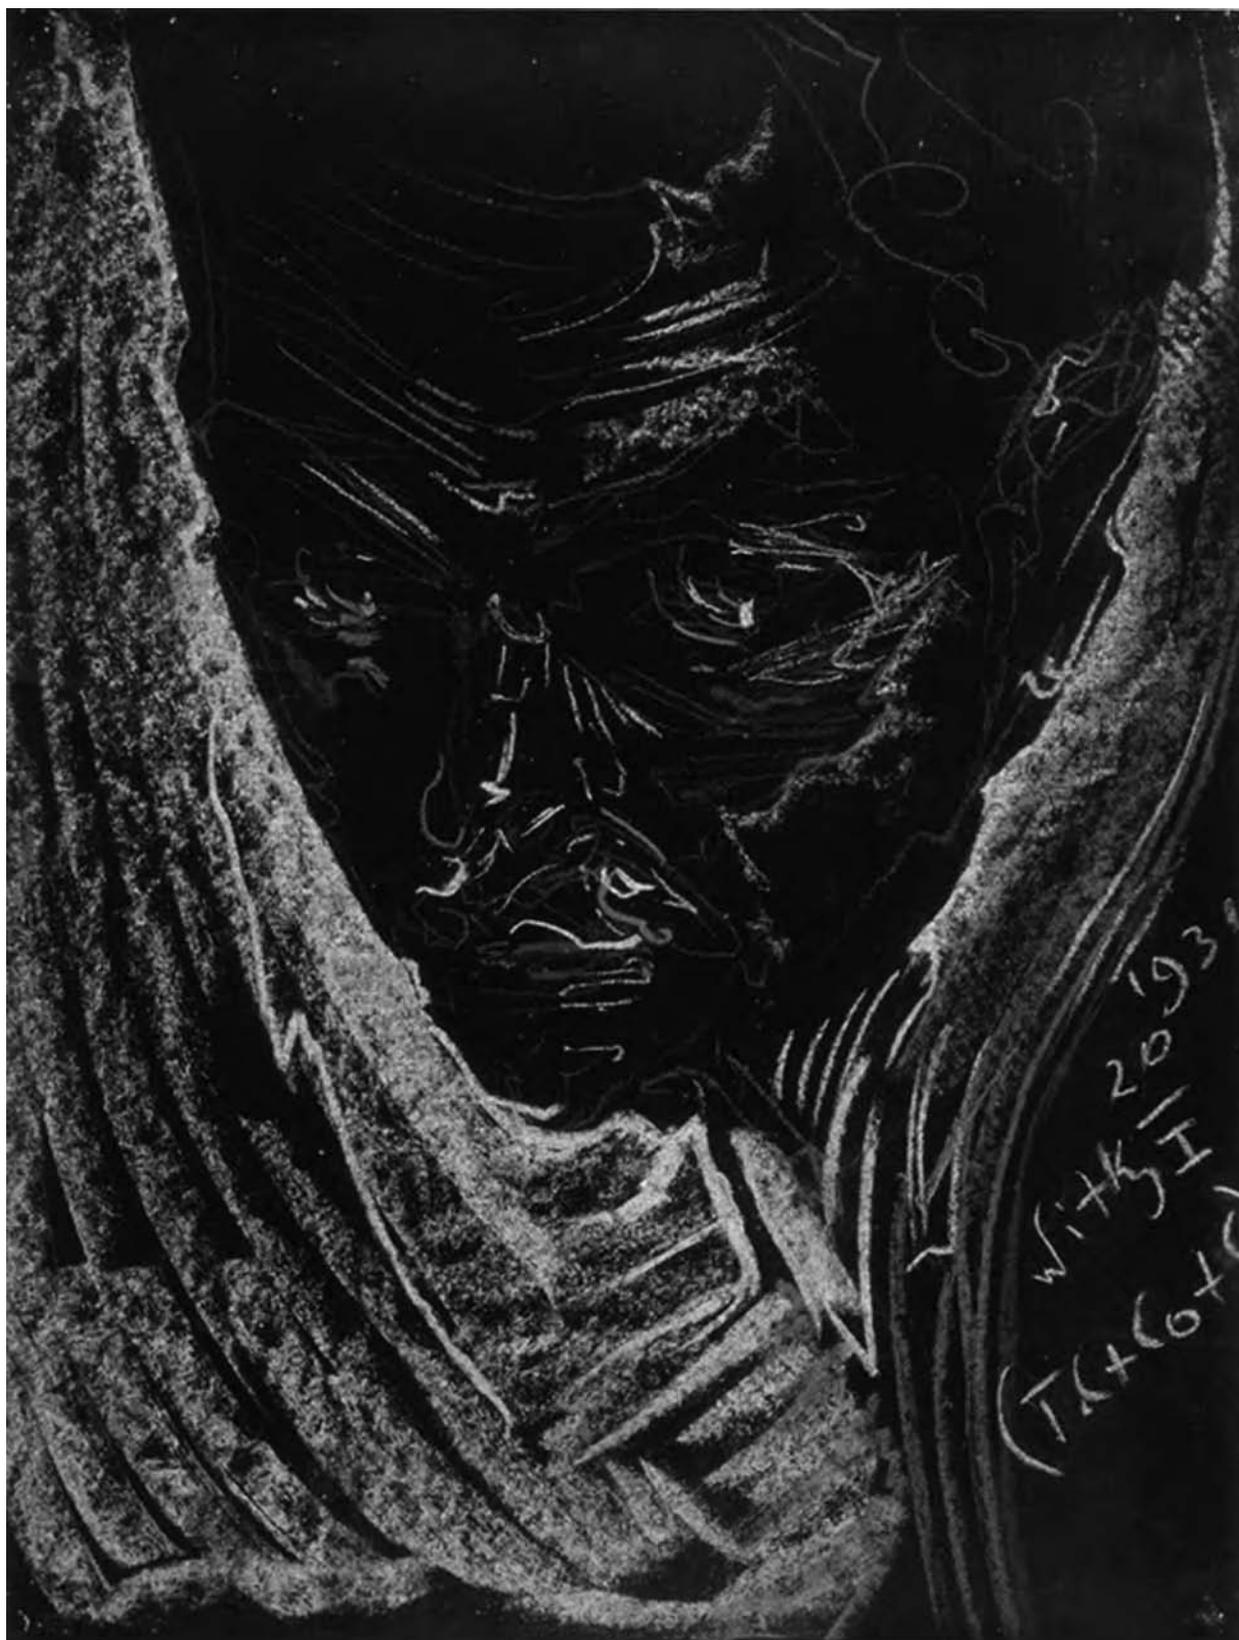

not as widely believed tenet of historical aesthetics, Formalism has developed throughout the twentieth century, and in its course has had a profound effect on all arts, particularly the visual and musical. Bell's Formalism contained a Romantic ideal of the artist-savior, who could move an individual to catharsis by the use of significant form in painting. Roger Fry was more pragmatic than Bell and preferred that form be an indication of aesthetic beauty and not necessarily moral obligation. In the latter part of the century theorists like Greenberg strove to remove subjectivism from the visual arts. His calling for a purely abstract and flat art that contained referents only to itself was an extension of Fry's theory with a markedly political bent. John Szarkowski, during his years at the Museum of Modern Art shaped the way contemporary photography was evaluated and interpreted showing that despite the obvious connection photography had to the real world, it too could be a Formalist medium. At the heart of any of these writers' works is the notion that a work of art need not be evaluated against the subjective, social-political structure in which it was created. For the Formalist, an artwork is the fullest expression of the characteristics of its medium so produced to create an aesthetic response that is unique to that one work and utterly devoid of meaning in a real world sense.

SAMUEL FOSSO

Nigerian/Cameroonian

The photographs of Samuel Fosso have often been exhibited with the work of his West African compatriots Malick Sidibé and Seydou Keïta, but Fosso's work is unparalleled in Africa. Although Fosso worked as a commercial studio photographer like Sidibé and Keïta, it is not his portraits of locals but his intriguing self-portraits that have excited great interest in Africa, Europe, and the United States. His self-portraits have incited frequent comparisons to the American photographer Cindy Sherman in their presentation of different identities through clothing and props that remain ambiguous in their intentionality. Although this comparison may be superficially apt, it must be noted that Fosso created his portraits in the 1970s in relative isolation, inspired by highlife music and American singer James Brown, and without knowing that his portraits would eventually be exhibited. Fosso's self-portraits must also be contextualized within Central African Republic's (CAR) history and politics. The ambiguous roles that Fosso's identities perform against the backdrop of political unrest in CAR accomplish a socio-political critique of conventional society's restrictions, while subtly pointing to the grotesque self-reinventions of CAR's dictator, "Emperor" Jean-Bedel Bokassa.

Born in Cameroon to a Nigerian mother and Cameroonian father, Samuel Fosso belongs to the Ibo tribe. According to his own story, he was paralyzed until age three, but was cured when a healer rolled him off of the roof of a house. Fos-

so's grandfather, who was also a healer and village chief, had arranged for this curing of his grandson. Fosso's recent color photographic series *le rêve de mon grand-père* (2003) refers to this event, showing Fosso painted as a healer and dressed as a chief. According to Fosso, "It's a staging of the way of life I experienced as a child, a way of life that has since often haunted my dreams....I did it to pay homage to my grandfather and to honour him" (Bonetti and Schlinkert 2004, 25). Fosso's mother died by the time he was five, near the time the Biafran civil war broke out in Nigeria, endangering the lives of many Ibos. Fosso's village fled to the forest to escape the fighting and survived there for several years. At age ten, Fosso went to live with his uncle in Bangui, the capital of the Central African Republic.

Two commercial photographers worked in Bangui when Fosso arrived, one from Cameroon and one from Nigeria. Disliking the long, hard hours of work in his uncle's shoe factory, Fosso asked his uncle if he could apprentice with the Nigerian photographer, and by the age of 13 he opened his own studio, which went through a series of name changes: Studio Photo Gentil, Studio Hoberau, Studio Convenance, and Studio Photo Nationale. Fosso's black-and-white studio practice followed the conventions of many West African commercial photographers. He was in the business of making people appear as their best and ideal selves; in effect, making people look as beautiful as possible. The slogan in his shop read, "With Studio Photo Nationale you will be beautiful,

chic, elegant and easy to recognize” (Bonetti and Schlinkert 2004, 97).

Fosso began making self-portraits after shop hours, originally to send to his grandmother in Nigeria to show he was doing well in his new life; but the impetus to take his own picture became a pleasure in itself. Fosso says: “It was fun...It was beautiful. I was liberated from the past, from the suffering” (Bonetti and Schlinkert 2004, 33). A teenager impressed by 1970s youth culture imported from the West, Fosso had a local tailor sew fashionable bell-bottoms and tight shirts from pictures on record covers like the ones by African rock star Prince Nico Mbarga. As Manthia Diawara has noted, such clothing was a sign of youthful rebellion against traditional society, a way of both dissolving ethnic friction and avoiding the strictures of elders. Fosso’s black-and-white self-portraits androgynously celebrate the young man’s handsome and sexy persona; he mimics rock stars and 1970s dandies. He kept these photographs to himself; public dissemination of certain photographs which border on the erotic, with Fosso posing gracefully in white underwear or wearing nothing but a tight, striped swimsuit and rubber kitchen gloves, could have gotten him into trouble.

Formally, many of Fosso’s early black-and-white self-portraits consistently include a checkerboard or diamond-patterned floor, a low, patterned stage running the length of the studio horizon line, and a backdrop, sometimes with patterned cloth curtains. Often the backs of studio lights appear at the sides of the photograph, glamorously framing the subject. Some photographs include Fosso with a friend dressed the same as he. In an appropriation of advertising or record cover aesthetics, Fosso also added text in the form of adhesive letters to some of his photographs, using proverbs that he copied from books such as “Life is liberty.”

Fosso began to gain international fame after his self-portraits were exhibited in the first photography biennale in Bamako in 1994, *Rencontres de la Photographie Africaine*. Two years later his works were included in the landmark African photography exhibition *In|sight: African Photographers, 1940 to the Present* at the Guggenheim Museum in New York. After Fosso entered the international art world, his style changed. Fosso was commissioned to shoot a series for the Parisian department store Magasins Tati, associated with Africa because it traditionally served the immigrant Algerian community. For this work, Fosso had access to different props and costumes, and worked with the help of assistants. The color photographs from this series continue Fosso’s investigation into different

identities, including a lifeguard, an African chief, a “liberated American woman,” and a golf player. The roles Fosso plays are more clearly designated than in his earlier self-portraits, although ambiguity remains in the strangeness of the identities Fosso chose. In a more serious vein, the recent black-and-white series, *Mémoire d’un ami* (2000), refers to the murder of a good friend by the police just outside of Fosso’s studio. Metaphorical memorials, these self-portraits depict uneasiness, anxiety, and vulnerability.

PHOTOGRAPHY IN FRANCE

France was a major locus of photographic activity until the mid-twentieth century. For the better part of the second half of the century, it was, however, characterized by a relative lag in institutional presence, which kept photography in its status as a minor art. The situation changed in the years 1980–2000 with a popular, scholarly, and artistic establishment of the medium. Yet, significantly, at the end of the century there no scholarly history of French photography available (Nori 1988 is an illustrated popular outline), and the only two French general histories of photography (Rouillé & Lemagny and Frizot) were written essentially from the perspective of American photography.

If French Pictorialism was indistinguishable from others, the early century should be remembered for the invention of the Autochrome, the photographs of Eugène Atget, and the images of Jacques Henri Lartigue.

The Autochrome, appearing in 1907, was the result of a long train of research to produce direct color images. As the first stable commercial color

emulsion, it was adopted by artists (such as Alfred Stieglitz) and reporters (such as the operators commissioned by financier Albert Khan). Although it remained mostly confined to France, it raised "crucial questions about the relationship between photography and painting." But it excluded at the same time "the possibility of manipulation of the final image" (Frizot in Frizot 423), thus pushing the medium further away from pictorialism and into a more autonomous form.

Eugène Atget (1857–1927) can be seen as a link between the nineteenth and twentieth centuries (Nesbit in Frizot 399). Beyond the documentary value of his pictures of Paris, he illustrates the "discovery" that later spectators, and especially other photographers and artists, can make of images, a symbol of the permanent recycling of photography. "Invented," as it were, by Berenice Abbott in the late twenties, Atget was also reinvented by much more contemporary photographers and critics as a "precursor of modernism" and a "mystery" in the history of photography.

Jacques Henri Lartigue (1894–1986), as scion of the upper class, started taking pictures in 1902 and did so throughout his life. Experimenting more or less consciously with forms, formats, and subjects, he kept a visual diary of a changing world at the same time as he explored the language of the medium. Celebrated towards the end of his life, he was one of the first French photographers to be canonized by the museums in the 1970s. His images should be placed alongside the growing reservoir of personnel documents on artists (see Elvire Perigo, “Intimate moments and secret gardens,” in Frizot) and their vision (Loti, Zola, Bonnard, etc.), and of family albums which have helped reassess the history of the medium since the 1980s.

Paris was undoubtedly one of the high places of avant-garde or modernist photography in the interwar years. A great many of the most interesting modernist experimental photographers, many of them central Europeans, met and worked there for a few years. Not always connecting formally with pictorial avant-gardes yet keeping a close contact with the “document” through their commercial activity, photographers such as Hungarian André Kertész, American expatriate Man Ray, Jacques-André Boiffart, Maurice Tabard, or Emmanuel Sougez expanded the field of photographic vision, questioning the power of the eye to invent the world. Women were numerous and particularly creative in both form and content of images (Germaine Krull, Florence Henri and the modern city, the strange and innovative Claude Cahun).

The other avant-garde was Surrealism. Although the work of another Hungarian immigrant, Brassai, can be connected to that influence, it is certainly best characterized by Man Ray, Dora Maar, Raoul Ubac, and Hans Bellmer. Maurice Tabard (1897–1984), who remained active for the better part of the century from the 1930s to the 1960s, is an interesting case in point, combining surrealist images with more formal work such as photograms *à la* Man Ray.

The interwar years also experienced the expansion of ethnographic photography, in keeping with a nineteenth-century tradition. The Mission Dakar-Djibouti (1931–1933), collecting artifacts and images for the Musée du Trocadéro, was a particularly remarkable instance which perfected Marcel Griaude’s investigative method based on a system of reconstitution (“staging”). Photography does not seem, however, to have caught with French ethnographers, in any case less than with their American colleagues, at least until the 1960s, when a new form of study and intervention appeared.

World War II brought an end to this most creative moment of the history of French photography. In Vichy France, while still seen as secondary to radio and cinema, photography was enlisted in propaganda, and all agencies were placed under direct control of the Ministry of Information and Propaganda. The Central Service of Photography (SCP), despite its modest size, became a tool for the massive dissemination of images participating in the cult of Marshal Petain. But the creative photographers of the prewar years either left the country or did not collaborate with the Vichy regime and the Nazis, and most of the propaganda remained relatively mediocre compared to what happened in other countries (Germany, Italy, and the Soviet Union, and for that matter, in a different context, the United States) (Denoyelle 11–17).

However, for humanistic photography, the major movement of French photography, the war was simply a parenthesis (de Thézy). Defined loosely as a type of approach centered on man and proposing an ode to human life, humanistic photography aims at revealing the hidden beauty of the world. Between art and reportage, it was less experimental than the extraordinary avant-garde that preceded it, but was nonetheless its inheritor, if only with the idea that photography was a mode of expression in its own right. After its disappearance in the 1960s, it would form the inspirational basis for “creative photography,” a practice that affirmed the inventiveness and autonomy of the photographic medium. Marked by a great classicism of composition and framing, always preferring the greatest clarity (with a medium format Rolleiflex), finding its inspiration most of the time in the streets of Paris and its suburbs (although other cities and the country were not forgotten), humanistic photography created a type of visual imagination that was to bloom in the culture of the immediate post war, in the cinema, and in literature in the form of “poetic realism.” Although they never formed a school per se, the common characteristics of humanistic photographers’ practices are strong enough to mark them as a movement: the street, the workshop or factory, the working class home, and of course the *bistrot* or the *guinguette* and night life. Among the best-known artists were Pierre Boucher, Marcel Bovis, Brassai, Yvonne Chevallier, Pierre Jahan, André Kertész, François Kolla, Willy Ronis, Emmanuel Sougez and, in the next generation, Jean-Philippe Charbonnier (1921–2004), and Edouard Boubat (1923–1999), whose subtle and efficient modernism makes him much more than simply a “humanistic photographer.”

Robert Doisneau seems the archetypal French humanistic photographer, and his public reputation has soared since the 1980s with massive publications of his images in albums, books, postcards, and calendars. His *Baiser de l'hôtel de ville* has become a popular icon, very comparable to the fame of American painter Edward Hopper's *Nighthawks*. Most of these photographers learned photography as a trade, and they kept practicing it, for a living, as craftsmen. With the complete absence of any photographic market for prints in France until the 1970s, their major medium and source of income was the printed page. They worked for the most part with the expanding illustrated press (*Miroir du monde*, *Marianne*, *Voilà*, *Détective*, *Paris-Match*, *Vu* and *Regards*) without forgetting the professional press (industry and medicine), and they published their images in the growing number of illustrated books—travel, arts, and even fashion, advertising and the cinema. A few important “livres d’auteur” were published, such as Brassai’s 1933 *Paris de nuit*; or Izis’s 1950 *Paris des rêves*; *Instantanés de Paris* by Doisneau of 1955, and Cartier-Bresson’s famous *Images à la sauvette* of 1952, which combined photographs and texts by famous writers, and sometimes illustrated literary works.

A particular place should be made for Henri Cartier-Bresson, not only the most famous and influential French photographer of the second half of the century, but also as the perfect representative of the French touch, or *qualité à la française*. Cartier-Bresson began as a modernist formalist (as evidenced in his pre-war images, see Galassi) and developed, after the war, a more humanistic philosophy of the person that he celebrated in his famous “geometrical eye,” placing on a same line the “subject” and the “heart of the photographer.” His exceptional body of work should be seen in the context of several others, in between such photographers as Robert Capa and Chim (David Seymour), Kertész and Willy Ronis, as well as his younger *alter ego*, Marc Riboud (1923–). Blending geometry and morals, a theory that he justified with references to both French seventeenth-century classicism and Eastern philosophy, Cartier-Bresson formulated photography as an ethic and an aesthetic based on “the decisive moment,” a manner of visual climax or epiphany only existing in framing, when the world suddenly *makes sense* and reveals itself.

Cartier-Bresson was also the co-founder of Magnum Photos, which had a great influence on the emergence of a practice of photo-reportage, both concerned with and highly conscious of form, which combined sensitivity to events with personal expression.

For a while indeed, Paris was the capital of photographic agencies (Gamma, Sigma, Sipa) created in the wake of the movement of May 1968 (Guy Le Querrec, Gilles Caron, Martine Frank, Hervé Gloaguen, Claude-Raymond Dityvon). Raymond Depardon, who is also a documentary filmmaker, is a case in point and a survivor in a world which has destroyed much of the “concerned photography,” combining assignment with personal expression, and an investigating and tender look at human situations with powerful and yet simple visual forms. Paradoxically, one could place in the same category Jean-Loup Sieff, Jean-François Bauret, and Guy Bourdin, whose pioneering work in fashion photography in the 1970s provides examples of freedom of creation within a highly constrained field; their imaginative iconography (Bourdin’s fantasies and Sieff’s ultra-wide-angle shots and black-and-white landscapes) has now become common place.

Despite the magnitude of Cartier-Bresson as an influence, most French photography between the 1950s and the 1980s was of a different kind, indirectly claiming an American lineage, and marking its dependence on American inspiration. The “naturalists” such as Denis Brihat, Lucien Clergue, Jean-Paul Gautrand, and Jean-Pierre Sudre (Nori 99) took natural forms as their source of poetic inspiration and treated photographs as objects like paintings in a manner not unlike Edward Weston’s. They were also active in fostering an institutional recognition of photography. The “subjective realists” could be seen as the heirs of the Swiss-born American Robert Frank, whose seminal book *The Americans* was first published in France, combining wandering and the practice of the narrative exploration of the series. Bernard Plossu is the paradigmatic example of this widely present trend, as well as Arnaud Claass, who teaches at the Ecole nationale de la Photographie in Arles. An important figure of the period is the critic and exhibition curator (and sometimes photographer) Gilles Mora (1945–). Typically combining a background in French literature (which he teaches) and a fascination for American culture of the 50s and 60s (literary and musical), Mora gathered many creative talents in photography in the late 70s and founded the *Cahiers de la photographie*. He also curated exhibitions and edited several books, among which is a reference monograph on Walker Evans. Common to many of these players is the concept of “photographic act,” which aimed at defining photography as index (as opposed to emblem or sign), rooting it, and its analysis, in the act which produces it.

In the 1990s, the demise of press photography definitely drew photography towards art. The most interesting pursued a direction inaugurated by Christian Boltanski, using photo albums, toys, and personal memories to construct a questioning of memory and figuration in complex installations; and by Denis Roche, poet and author, member of group *Tel Quel*, who writes aesthetic and metaphorical analyses of photography, while composing visual fictions about himself (self-portraits and reflexive images). Commissions by private and public sponsors has also led to new forms of documentary. Marc Pataut photographs the French poor while Jean-Luc Moulène, in a more formalist approach, reworks daily objects and places in the language of conceptual art to foster their reversibility and ambiguity (Poivert 184) changing the role and nature of the spectator. They may constitute a revival of the social documentary tradition, through the medium of contemporary art. More original—but no less ambiguous—is the work of the many photographers who in the wake of the huge commission by the national planning agency DATAR (1983–1989) studied the changing landscapes of France under the general title of *The Territories of the French*. Inspired by the photographic myth of the Farm Security Administration and the memory of the Mission Héliographique of 1851, the DATAR hired photographers to document—visually and aesthetically, but not sociologically—the changing environment of the country and to educate viewers to its perception. It chose to contract with artists and, once selected, to leave them a fairly free hand as to the way they handled the subject.

Although the project was conducted under the intellectual supervision of photographer François Hers and critic Jean-François Chevrier, whose able introduction to the published book tried to inscribe the survey in the history of art, it was little seen outside the photographic world, and its results varied greatly in quality and relevance (Doisneau's and Depardon's are among the miscast). The project inaugurated a spate of similar smaller ones, often conducted without much thought and evaluation given to it, and in a somewhat repetitive manner. The reason might have been that although much poetical thinking about photography was available in the 1980s and 1990s, there was a relative paucity of serious scholarly historical tradition in the field. Very different was a project conducted by three photographers commissioned by the Plan urbain to “accompany” the urban development of three towns in La Réunion, a French “département” in the Indian Ocean. Based on a long col-

laboration with the population (1989–1994) and a permanent evaluation of their work by outside sociologists, anthropologists, and critics, the BKL project is an original and pioneering example of the revival of a photographic practice combining the individual and the group, the photographer and the community, art and action, creation and testimony.

The interest in landscape photography has been relatively less marked in France than in the United States, despite the influence of the New Topographics group on a younger generation tired of human interest photography (Jean-Louis Garnell). Results have often mimicked some of the best American photography without really opening new vistas, except for Eric Dessert.

Despite its apparently varied practices, contemporary practice is marked by its autobiographic and often egoistic tendencies, and a particular attention to the phenomenon of memory (Poivert 64), paradoxically leading to its great homogeneity and repetitive nature.

With the democratization of the photographic process in the 1920s, photo-clubs, or photo societies, which had existed since the nineteenth century, took a great importance in the development of photographic practice among amateurs. Until the 1970s, in the absence of structured teaching and exhibiting of photography, they offered the only “photographic community,” especially in the Provinces (every city has a photo club affiliated to the French Federation of Photography). They were deeply influenced by the movement for popular education in working class environments, although most major French photographers of the second half of the century came to photography from an art background, and many were from a bourgeois milieu often with independent means, when their immediate predecessors (“The Humanists”) had gone through the trades.

Le Rectangle (created by Emmanuel Sougez in 1937) was a professional and overtly nationalistic—if not slightly xenophobic—reaction against what was perceived, with the increasing availability of equipment, as an amateuristic shift of the practice, and the dangerous competition of Germans and Central Europeans, who stifled French photographers (de Thiry 66). It defined itself as “an association of French advertising and illustration photographers...of faultless technician.” (de Thiry 66). It was followed by the *Groupe des XV* (1946–1957), an association based on much of the same principles as the former one but with a more experimental and intellectual turn.

Among the clubs, the *Photo-club des 30 × 40* (created in 1951 by Roger Deloy) was particularly innovative and welcoming to new trends in contemporary photography, as was the *Groupe Libre Expression* (founded in 1963 by Jean-Claude Gaubrand, Jean Dieuzaide, Pierre Riehl), which formed the avant-garde of a renaissance of creation. Of a somewhat hybrid kind, the *Gens d'Images* association, created by Albert Plécy in 1954, includes photographers, graphic designers, printers and journalists, and gives out two important awards: the Niépce Award to a young photographer wanting to become a professional, and the Nadar Award to the best photobook of the year. As for the *Société française de photographie*, created in 1851 and owning a rich collection of images, it spent most of the century as a slumbering belle, before being revived in the 1990s by a group of young scholars who now publish the respected *Etudes photographiques*, a French equivalent of *History of Photography*.

The real new start of French photography took place in the 1970s with the simultaneous expansion of exhibitions, teaching, collection, and writing about photography, while teaching remained modest until the 1980s, and, one could even argue, the 1990s. The American model was very important (see Kempf) in this change, as young Frenchmen and aspiring photographers discovered in the United States not only a photographic form but also a country where photography was taken seriously by powerful cultural and educational institutions. In a country that had introduced the cinema in the university and invented the nouvelle vogue, they longed for similar recognition. Museums created and expanded their collections of photography, thus forming a base for recognition and a market for prints. The *Rencontres Internationales de la Photographie* (RIP), founded in Arles in 1970, functioned as a series of American-style workshops for almost a decade before turning into a mini Cannes festival of photography. Festivals, with the biennale *Mois de la Photo* (Month of Photography) in Paris (begun in 1980), multiplied in the provinces as well, as did houses of photography and photography museums (including the Centre national de la photographie in 1982; Maison européenne de la photographie following Paris-Audiovisuel of 1977, created by Jean-Louis Monterosso; and the Centre photographique du Nord-Pas-de-Calais founded by Pierre Denain). Many public and semi-public institutions (DATAR, Fondation de France) commissioned or supported photographers and photographic projects, developed collections, produced exhibitions and books, stimulating

at least the market, and making it possible for a sizeable number of photographers to earn a living outside the press, whose market had shrunk considerably in the 90s. Contrejour, founded by Claude Nori (born in 1949) in 1975, as both a publishing house and a meeting place for contemporary photography until its folding in the 1990s, helped disseminate contemporary French photography through various short-lived but influential publications, exhibitions, and low-cost books. Interestingly, as photography finally achieved a broader status, almost all trace of an industry of photographic equipment and material had disappeared, with the acquisition of the Lumière company by Ciba and its successive merging with Ilford (1961–1976) and narrowing of activity, and that of the camera and lens makers SOM and OPL (and their famous Foca). Only Kodak remained in Paris.

Teaching has always remained the poor relation of photography. Because of a lack of means, universities have never managed to launch comprehensive Bachelor of Fine Arts/Master of Fine Arts programs in photography, so common in the post-war era in the United States. The notable exceptions of Paris 8 and Paris 1, and the existence of seminars and workshops in other universities and especially fine arts schools (where photography is now a fashionable and necessary part of the curriculum) should not hide the dearth of technical means, which often limits teaching to theory, a fact that the recent development of computer graphics and digital photography has managed to hide. Only two institutions actually tackled the problem of the specialized and comprehensive curriculum: the old lycée Lumière, whose orientation is the training of technicians in photography and the cinema; and the Ecole Nationale de la Photographie (ENP) in Arles (1982), which, under the able leadership of its first director, Alain Desvergnès, became a model school training “image people.”

This theoretical slant is mirrored in the written production on photography. With the exception of Pierre Bourdieu and his *Un art moyen*, a sociology of photographic practice, French photographic writing has been essentially of a theoretical or aesthetic nature, and in any case very limited. The paradigm has been—and to a great extent remains in contemporary studies—philosophical (more in fact than semiological, despite a few pieces by Roland Barthes and lesser-known scholars) and literary, often mixing the two in the Blanchot tradition (Denis Roche, Régis Durand, Jean-Marie Shaeffer). The archetypal work by Barthes, *Camera Lucida*, seems a case in point where theoretical concepts solidify in formulas as they coalesce

through a rambling autobiographical meditation and sensitive readings of images. Newspapers only began running columns on photography in the 1980s (mostly *Le Monde* with Serge Guibert).

The history of photography has long been an underdeveloped discipline, one essentially based on the nineteenth century. Although two histories of photography (Rouillé et Frizot) were published, their editors had to rely on many foreign scholars in the absence of specialized French historians. The field is now undergoing a revival after the pioneering work of nineteenth-century historian André Rouillé, with MA and PhD students doing original research under the guidance of a younger generation of scholars trained in many different disciplines, making the study of “the photographic image” an exciting transdisciplinary field (Brunet, Frizot, Gunthert, Poivert).

France was both early and late in institutionalizing photography. Just as the newly born photographic process was immediately taken within the field of the law through the patent—in that respect differing from what happened in Great Britain and the United States (Brunet, *L'histoire de l'idée de photographie*)—photography was included in official collections as early as the nineteenth century. Because of the *dépôt légal* law, requesting that all printed matter be registered at the Bibliothèque nationale de Paris (National Library), the Cabinet des estampes (Prints Division) received pictures as early as 1851, on the grounds that they were “paper editions.” It remained, however, an archival and haphazard process until the mid-40s and early 50s, when young librarians started an active policy of collecting images, not from the point of view of illustration and information (organized by subject matter) but from that of authorship (organization by author). In the 1970s, Jean-Claude Lemagny, the head librarian for photography at the Cabinet des estampes, furthered the process, making the Cabinet des estampes a central player in the field. However, in the early 1980s, creative photography of the first half of the twentieth century and especially of the interwar years was still virtually absent from public collections. A policy of acquisitions and gifts (against tax exemption) allowed such institutions as the Bibliothèque nationale, the Musée national d'art moderne, and the Ministry of Culture (since 1975) to acquire such archives as those of Lartigue (1979/1986), Ronis (1983), Kertész (1984), Kollar (1987), and René-Jacques (1990). Various museums in the Regions also developed their photographic collections, such as the Musée Nicéphore Niépce (Châlons-sur-Saône), the Réattu (Arles), and the Museums of Marseille. Almost independently, the

Municipal gallery of the Château d'eau in Toulouse, created by Jean Dieuzaide (1974), ran many important exhibitions. Eventually, the Fonds National d'Art Contemporain, which started to collect photography in 1980, and its regional branches, FRAC, especially FRAC-Aquitaine, began large collections of mostly contemporary photography and commissioned works as well.

MARTINE FRANCK

Belgian

One of only five women photographers to be full members of Magnum Photos, Martine Franck has placed her mark on photography through her compassion and commitment to the profession. Her consistent strength in image-making is evidenced through the visual telling of diverse stories in her images. Yet Franck has resisted any attempt by others to label her work with any specific gendered viewpoint, commenting that photography is a language through which reality is made understandable, regardless of gender.

Born on 2 April 1938 in Antwerp, Franck was educated in the United States, primarily in New York and Arizona, before finishing her childhood education at the Heathfield School in Ascot, England in 1954. From 1956–1957 she studied at the University of Madrid and then from 1958–1963 at the Ecole du Louvre in Paris. Saying the camera gave her a “function,” Franck’s early interest in photography came from her grandfather and her first forays into photography began with trips to China, Japan, and India in 1963. The following year she took a job as the photographic assistant to Eliot Elisofon and Gjon Mili at the Time-Life Photo Laboratories in Paris and in 1965 Franck began freelancing for *Life*, *Fortune*, *Sports Illustrated*, *New York Times*, and *Vogue*.

Since the 1960s, Franck has been photographing with a discipline and drive to create documentary images that become more than mere records. Therefore, her work ranges from being aesthetically forceful to socially relevant, depending upon the project she has chosen. Cool with a graphic vigor, *Le Luberon, Alpes-de-Haute, Provence, France, 1976*, the high contrast landscape pushes towards the viewer as if the land is an ocean of

undulating, metallic strips. In other images, subtle irony plays an underlying element in what seems to be straightforward documentary. In a photograph dated 1972, a well-dressed woman leans over to read the wall text accompanying a painting by Paul Delvaux, not noticing how her action plays into the Delvaux’s painted nude woman walking towards her. Other times, such as is the case with the Théâtre du Soleil work, the extended series seems like a labor of love threaded into the lens of her camera. Through her friend, Ariane Mnouchkine, in 1965, she began her association with the newly founded Théâtre du Soleil cooperative. In the years since then, Franck has shown how her work and the company have matured to a high level of professionalism and acclaim.

During the 1970s Franck began exploring the possibilities of film by being the director of *Music at Aspen* and *What has happened to the American Indian?* This interest continued with *Contre l'oubli: Lettre a Mamadou Mauritanie* (1991) and the production of filmed stills with Robert Delpire of *Ariane & Co. Théâtre du Soleil* (1995).

After becoming a member of the Vu photographers agency from 1970 to 1971, in 1972 she became one of the seven founders of the photography agency Agence Viva, an organization seeking more social goals beyond straight documentary image-making. After Viva closed in 1979, Franck became an associate member of the Magnum Photos cooperative agency the following year. In 1983 she became a full member of the agency. Throughout her career in photography, Franck’s interest in the human face has led her to create some of most remarkable and telling portraits. In her book and exhibit, *Le Temps de Viellier*, her subjects become portraits of old age, a reality in which oftentimes the physical shell houses a youthful mind. This is exem-

plified in the 1975 image, *Hospice at Ivry-sur-Seine, Val-de-Marne* where an elderly woman mimics Franck's act of photographing. The woman's face scrunches up and her eyes twinkle. Other portraits of the elderly convey their loneliness and dejected feelings as life closes in around them, even during the momentary joy of holidays shared with the Les Petits Frères des Pauvres. Capturing the private moments of well-known people in the arts is another important portion of Franck's portraits. Lili Brik, companion of the Soviet poet and playwright Vladimir Mayakovsky and sister of Elsa Triolet, reclines pensively in her sumptuous chair in a Paris hotel in 1976. Brik's dramatically made-up eyes avert away from the camera's perspective. Yet in another image dated 1993, a casually posed Curator-in-Chief Pierre Rosenberg smiles proudly in front of one of his favorite paintings by Rubens at the Musée du Louvre. In a portrait dated 1978, Michel Foucault's intense gaze, doubled by the light reflections on his glasses and the gesture of his finger held across his lips, makes us uncomfortable, much like his thought-provoking theories. Many of these portraits have become telling documents of a particular moment in time.

The same sensitive handling of the human face is expressed in Franck's images of children and the innocence of childhood, or in some cases lack of, found in the most unusual circumstances. The expressions and gestures of the three boys amidst the rusted junk cars in *Graveyard for stolen cars, Darndale (on the outskirts of Dublin), Ireland, 1993* are disturbing and serve as contrast to the anxious young faces of the ballerinas in *Petits rats (young dancers) of the Paris Opera in the foyer of the Opera Garnier, Paris, France, 1979*. The concrete sided staircase wraps around and carries the curious faces of little children up to the very top in the 1965 photo, *Children's library built by the Atelier de Montrouge, Clamart*.

Whenever the human element is the subject of Franck's camera, compassion links all. This compassion has caused her to form long-term associations with several organizations, such as Théâtre du Soleil and Les Petits Frères des Pauvres. Her work in the 1990s with this latter organization was part of a photo project on exclusion in Europe with Franck's most notable contribution being of Tory Island, off the Donegal coast of Ireland, from 1993 to 1997. A rugged, desolate place with a population of only 130 people, the Irish government sought to transplant the people from what is perceived as an impractical way of life. Without actively intervening in their lives, Franck managed to document the tight-knit community where all are subtly intertwined in a

timeless way apart from the fast moving global economy. The circle of life expressed in the joyful image, *The wedding of Tory Islander Pauline Doohan to Brian Gallagher, 1996*, corresponds to the portrait of *Francis McAteer, replacement parish priest of Tory Island, 1993*, who oversees the joys and sorrows of the village. Thirty-five of these images were part of the exhibit, *Magnum's Women Photographers*, at the National Galleries of Scotland in Edinburgh in 1999.

In the 1990s, Franck became interested in the cause of the displaced Tibetan Buddhist people living in Nepal and India. This project specifically addresses the life of the "Tulkus," the young reincarnations of great Tibetan lamas. Her images tell a story and yet also are making a difference by illustrating the continuation of traditions and rituals outside of their sacred homeland. Young boys are photographed being playful with their tutor or merely sleeping on their thrones surrounded by the tributes of the Tibetan New Year celebration. Her sharp eye seeking the socially marginalized, the devoted amidst desolation, and the displaced continues, becoming part of the diverse body of work Franck has created since 1963.

Married to Henri Cartier-Bresson since 1970, Franck was one of the few permitted to photograph the reticent photographer. She and their daughter, Melanie, worked together to create the Fondation Henri Cartier-Bresson in Paris.

ROBERT FRANK

Swiss-American

One of the most-cited figures in twentieth century photography, Frank's contribution to the postwar era lies with his revelatory book, *The Americans*, which was not only a seminal work of photography, but a prickly social document that called into question the rosy picture of American life widely accepted during the Eisenhower years. Although Frank's career has spanned more than 50 years, he has always worked, to some extent, in the long shadow cast by *The Americans*. Frank expressed his frustration with the legendary status of his early work thus: "I wished my photographs (the old ones) would move—or talk—to be a little more alive"; and much of his subsequent work has been more of this nature: varied, experimental, and multimedia, embracing film, video, text, poetry, and performance. A peer of Henri Cartier-Bresson, who occupies a similar legendary status with photographs that capture the mood of the street and the alienation of the individual in society, Frank's philosophy is in fact diametrically opposed to that of the French photographer. "There is no 'decisive' moment," Frank has famously said. "You have to create it. I have to do everything necessary for it to appear in my viewfinder" (*Conversations in Vermont* [film] quoted in *Bild für Bild Cinema*, Zurich, 1984). The bulk of his work, aside from *The Americans*, is in fact autobiographical, even confessional in nature.

Robert Frank was born on November 9, 1924 in Zurich, Switzerland to Hermann Frank and Rosa Zucker, a Jewish couple. He attended primary and secondary schools in Zurich, and upon his gradua-

tion, apprenticed with graphic designer and photographer Hermann Segesser between 1941 and 1942. Although Jews were being exterminated all across Europe, in the safety of neutral Switzerland, the Franks were able to go about their lives relatively undisturbed. As a German immigrant, however, in 1941, Hermann Frank, along with his sons Robert and Manfred, was forced to apply for Swiss citizenship. Robert Frank was finally granted official Swiss citizenship in 1945. During this unsettled period, he had continued his study of photography, working as a still photographer on a film, and at the film and photography studio of Michael Wolgensinger. Wolgensinger had studied with Hans Finsler, who had trained at the Bauhaus, and he taught Frank about large format cameras, instilling by example classical and experimental techniques. Frank briefly was assistant to a photographer in Geneva, and he was impressed by the work of the leading Swiss photographer of the day, Jakob Tuggener, who documented the street, architecture, and social life in Switzerland in a straightforward and unsentimental way.

After military training in 1945, Frank relocated to Basel to work at the Hermann Eidenbenz studio, a graphic design firm, at which time he produced his first book, a unique volume of original prints called *40 Fotos* (street photographs taken with 6 × 6 Rolleiflex), and he traveled with his family to Paris and Milan. Frank's desire, however, was to leave Switzerland and go to America, which he achieved in 1947, arriving in New York in February of that year. He found employment as a junior photographer at *Harper's Bazaar* magazine under the tutelage of legendary art director Alexey Bro-

dovitch. This association was short-lived, however, for by the fall he had quit to work as a freelance photographer, completing assignments, including fashion shoots, for a variety of publications, including magazines and newspapers, including the picture magazines *Life* and *Look*, and *The New York Times*. Purchasing a 35 mm rangefinder Leica, Frank began a series of travels, notably to Peru and Bolivia, he arranged these series, using original prints, in book form. He met his future wife, Mary Lockspeiser, in the late 1940s as well; they married in 1950. Mary Frank, from whom Robert separated in 1969, went on to become a well-known artist working primarily in ceramics. The year 1950 marked his introduction as an exhibiting photographer when he was included in the seminal group exhibition at the Museum of Modern Art (MoMA), New York, *51 American Photographers*.

Following the birth of their first child, Pablo, in 1951, the Frank family relocated to Paris. Frank traveled to the United Kingdom, where he photographed in London and later Wales (1953). In England, Frank came to know and admire the work of Bill Brandt, and somewhat under his aesthetic influence, made a series of pictures of coalminers. These early works from London and Wales were reissued in book form in 2003. Back in Paris in 1952, he met Edward Steichen, in Europe to research photographers for exhibitions at MoMA, including *The Family of Man*, which was mounted in 1955. Traveling extensively during this period of his life, Frank returned to New York in 1953, where he became friends with Walker Evans and with whom he later worked as an assistant. Evans's book, *American Photographs*, was also highly influential on Frank's rapidly developing ideas about the sequencing of photographs. His second child, Andrea, was born in 1954, and he met poet Allen Ginsberg, who was to become an important influence and collaborator. He also took his first photograph for what would become *The Americans* at a Fourth of July event in Upstate New York (*Fourth of July—Jay, New York*). Frank's restless desire to travel was facilitated in 1955 when he received a John Simon Guggenheim Memorial Foundation fellowship, the first European to receive such a grant. With this grant and its extension in 1956, he crisscrossed the United States, photographing in New Jersey, Chicago, Detroit, North and South Carolina, Hollywood, the western states of Montana, Idaho, Nevada, and Nebraska, the southwest in Arizona and New Mexico, especially along Route 66, at that time the main artery across the nation, along the Mississippi River in the deep south, and Texas. After photographing the inaugu-

ration of Dwight D. Eisenhower for his second term in 1957, Frank selected and printed the works for his envisioned book.

While attempting to find a publisher, he worked on his first film, a 16 mm short shot in Florida with beat writer Jack Kerouac, whom he'd asked to write an introduction for his book. Later, commentators note that Frank was reacting to the massive project which he had assisted on (and was included in, both with his own works and in a portrait of him and his wife by Louis Fauer), Steichen's *The Family of Man*. Kerouac's introduction is diametrically opposed to the humanistic, often romantically idealistic language of Carl Sandburg's introduction to *Family*. Frank shared with Kerouac, whom he'd met in New York, a more realistic image—some might even say it was cynical—of postwar America, and its social structures, including the rampant segregation, the vast divide between rich and poor, the dark fears aroused by the Cold War, and the constant threat of nuclear holocaust, the alienation of youth exemplified by the emerging “beatnik” culture that Kerouac so brilliantly chronicled. That he couldn't find an American publisher was not entirely unexpected, as frustrating as it was. This would change with a trip back to Paris, and the embracing of the project by visionary publisher Robert Delpire. The book, first published in 1958, has never been out of print.

Opening with a now-classic image of two figures standing at windows of an ordinary brick structure, the American flag streaming across the center top of the picture (*Parade—Hoboken, New Jersey*), 82 images follow, showing, in gritty, dense tonalities, a panoply of American life. Politicians in top hats contrast with African Americans attending a funeral in their fedoras and straw boaters (*Funeral—St. Helena, South Carolina*). A glamorous Hollywood starlet (*Movie Premiere—Hollywood*) contrasts a Hollywood counter waitress (*Ranch Market—Hollywood*). The works are exquisitely selected and presented, forming rhythms and meanings that interweave throughout the book. The “great themes” of *The Family of Man* are likewise presented, yet they speak quietly, without the stage-managing of emotions of that project. Death is juxtaposed poignantly with the joy of living through the sequencing of a picture of an exuberantly smiling African American woman sitting in a chair against the setting sun of a weedy field (*Beaufort, South Carolina*) and a funeral view on the next page that shows an elderly African American in his coffin, formally attired men passing respectfully by (*Funeral—St. Helena, South Carolina*). The “exotic” is found in a cowboy leaning against a waste can in

an urban setting (*Rodeo—New York City*), the personal in the book's final image of Frank's own car, within it his sleeping wife and child (*U.S. 90, en route to Del Rio, Texas*). Yet the individual images hold up as works of art: among the best known are of a Black nurse holding a baby so preternaturally White it seems to glow (*Charleston, South Carolina*) and a tuba player at a political rally, his face completely blocked by the giant circle of the tuba's horn (*Political Rally—Chicago*).

Although the process of shooting for the classic images that make up *The Americans* was a solitary, peripatetic activity, Frank's more common process is one of collaboration. His well-known 16mm film, *Pull My Daisy* (1959) was realized with New York painter Alfred Leslie and is a free interpretation of an act from Jack Kerouac's play *The Beat Generation*. Frank went on to make more than 20 films, including *Me and My Brother* (1965–1968), *Cocksucker Blues* (1972), featuring Mick Jagger and Keith Richard of the rock group The Rolling Stones, and *This Song for Jack* (1985), featuring Beat poets and writers Gregory Caruso, Allen Ginsberg, and William S. Burroughs, and dedicated to Jack Kerouac. Frank also produced the music videos *Run for New Order* (1989) and *Summer Cannibals* for Patti Smith (1996).

His works subsequent to *The American*, are filled with family, friends, and places that reflect the fabric of his life. In the 1960s, he concentrated primarily on making films, although he was beginning to have some success with his photographs: his first solo museum exhibition was held in 1961 at the Art Institute of Chicago, and the George Eastman House purchased 25 images from *The Americans* in 1965. Photographs that made up his next publication, *The Lines of My Hand*, began to be amassed. Published in 1972, this book looks inward, at Frank's own life and what it means to be an artist.

In 1970, Frank, his marriage to Mary over, had become involved with artist June Leaf, and together they purchased property in the desolate, often extreme climate of Mabou, Nova Scotia, where they built a studio and resided part of the year, and which was to be the setting for and subject of many photographs. The 1970s were full of personal difficulties for the photographer; his daughter Andrea, only 20, died in an airplane crash in Guatemala in 1974. His close friend and frequent collaborator on films, Daniel Seymour, disappeared and was presumed dead. His father died in 1976. His son, Pablo, who would eventually commit suicide, was becoming increasingly troubled by mental illness, and Frank unflinchingly confronted these

tragedies with his camera, often in montaged sequences of snapshot-like images that are difficult to read in that they are fractured, shot at extreme angles, and inscribed with texts, some written into the film's emulsion. Rather than the fluid narrative line achieved by *The Americans*, the works of *The Lines of My Hand* are disjointed and resist easy interpretation. Many are clearly expressions of grief and are often painful to become involved in, such as *Monument for my Daughter Andrea, April 21, 1954/December 28, 1974*, which consists of Polaroids presented on a photo album page, or *Sick of Goodby's*, 1978.

In 1990, on the occasion of a major retrospective mounted by the National Gallery of Art, America's most prestigious museum, the Robert Frank Collection was founded. Consisting of negatives, contact sheets, work, and exhibition prints, it is a fitting tribute for the Swiss-born artist who helped reveal America to itself. Yet Frank's work can be best summed up by the work *Hold Still—Keep Moving* of 1989, used as the title for his 2000 retrospective at the Museum Folkwang in Essen, Germany. A photograph is seized from a flow of life; it holds life still, yet all the photographer, or the viewer, for that matter, can do is to keep moving.

GISÈLE FREUND

French

Gisèle Freund's portrait of Virginia Woolf (1939), taken a few weeks before the novelist's suicide, captures the patient attention and poignant sincerity that characterizes her photographic eye. It is interesting, then, that Freund's decision to become a photographer arose out of economic necessity. Her portraits of some of modernism's most celebrated figures have become canonical images, despite the fact that Freund purposely downplayed her aesthetic role, having always considered herself a documenter rather than an artist. Because of her fascination with everyday human experience, Freund's oeuvre includes such wide-ranging work as travel reportage, documentation of poverty and political life, and even a study of mediums and palm readers. Arguably, the color portraits taken in the 1930s and 1940s are Freund's most striking work. Her experimentation with Kodachrome and 35 mm Agfacolor, combined with her uniquely candid portraiture style, would help distinguish her work from the era's other proficient photographers and guarantee her role as an invaluable witness to and recorder of a most creative and productive generation.

As a Jew and a Socialist, Freund was forced to flee Germany in 1933 as the Nazi violence she was documenting had become a threat to her personal safety. Freund arrived in Paris with an incomplete dissertation and the Leica her father had given her when she was 15. Befriending Adrienne Monnier, the proprietress of *La Maison des Amis des Livres* bookshop, was personally and professionally transformative for Freund, as Monnier would eventually publish the completed dissertation and introduce Freund to the artists and writers who would prove her most captivating subjects. Monnier would remain a lifelong mentor and companion.

While completing her doctorate in sociology at the Sorbonne, Freund was steadily establishing herself as an adept photographer. Her views from Notre Dame (1933) and the publication of a photo-essay in the first year of *Life* magazine (1936) were the beginning of a formidable career in documentary and portrait photography. Because no French magazine could process color, *Life*'s publication of

Freund's piece on poverty in northern England was a singular opportunity that would turn into a lifelong collaborative alliance. Her first official assignment, given to her by the director of the Bibliothèque nationale de France, was to photograph all the libraries in Paris for the 1937 World's Fair. *Vu* magazine featured this commission, whose affectionate analysis of the eccentric library patrons was just the beginning of Freund's characteristic scrutiny of her subjects' bodies, clothing, and posture.

Freund's unwillingness to retouch photographs led her to focus upon artists and writers, whom she assumed were less concerned with physical perfection. Though many were apparently quite disappointed with their portraits, Freund continued to photograph the era's most celebrated artists and writers, including Jean Cocteau, Marcel Duchamp, Henri Matisse, André Gide, Simone de Beauvoir, Samuel Beckett, Jean-Paul Sartre, Colette, and Walter Benjamin. Her photographs for the dust-jacket of André Malraux's *Man's Fate* (1939) and James Joyce's *Finnegan's Wake* (1939) were among her most prestigious commissions. Freund's precise composition and traditionally posed subjects offer an interesting counterpoint to the work's intense intimacy and technologically advanced use of color. The result of this implicit tension is a gallery of faces whose graphically featured skin tones and eye color create pictures quite distinct from the more widely reproduced black and white photographs of her contemporaries.

Freund fled France in 1941 and eventually traveled to Buenos Aires where she would remain for the duration of the war. In South America, Freund worked as an assistant film producer and a photo-journalist, completing assignments in Argentina, Chile, Ecuador, and Uruguay.

Returning to Europe for a brief time in 1946, Freund, like many other photographers, visited the post-liberation concentration camps. Once there, however, Freund felt that she could best serve the efforts by identifying the bodies of former acquaintances rather than by documenting Nazi atrocities.

In 1948, Freund joined Magnum Photos, Robert Capa's photographers' collaborative, for which she would become the Latin American contributor. It

was during her six years associated with Magnum that Freund produced her well-known *Life* spread on Eva Peron, wife of Argentinean dictator Juan Peron, then at the height of notoriety. Her portraits of Mexican muralist Diego Rivera and of his wife, painter Frida Kahlo with her dogs were also taken during this extraordinarily productive period. Because of her friendship with post-revolutionary writers and artists, Freund was denied entry into the United States and placed on the McCarthy blacklist. For this, Capa dismissed her from Magnum.

Throughout her career, Freund remained committed to the productive intersection of sociology and photography and to the social history of her medium. In numerous interviews and essays she explained her love of portraiture as arising directly out of a fascination with the human face's profoundly expressive quality. Freund's prodigious writings articulate her interest in photography's transformative capacity, particularly what she explained as its ability both to democratize and transform artistic production and representation. In this assessment, she also remained sharply critical of photography's availability to further an unethical agenda in which manipulation and persuasion often play upon a viewer's emotions. In her photographs and critical essays, Freund consistently demonstrates such sensitivity, insisting in one interview that love of humanity is essential to good photojournalism.

Even after she ceased photographing in the 1980s, Freund remained passionate about the various ingredients that constitute her craft. The bond between photographer and sitter, the complex nuances of the human face, and the relative merits of various photographic equipment were equally important components in Freund's approach to a subject. In *Photography and Society*, her well-known study of photography's social history, Freund expresses a modest pride in her influence upon fellow photographers, claiming that she legitimized the more versatile and modern Leica camera. Indeed, the dynamic quality of much of her work illustrates the Leica's revolutionary impact on photography.

Upon returning from Mexico in 1954, Freund established permanent residence in Paris, where she lived until her death in 2000. Though no longer a photographer, Freund continued her dedication to photography by giving lectures, exhibiting her work, and writing—a practice she at one point claimed was her real love. In 1977, Freund became president of the French Federation of Creative Photographers and was awarded a doctor *honoris* from the National Museum of Photography at Bradford University. Ironically, one of her most

widely reproduced images is seldom recognized as part of her body of work. Taken at the 1981 inauguration, Freund's picture of François Mitterand became his official presidential photograph, a staple image found in official buildings throughout France.

FRIENDS OF PHOTOGRAPHY

The Friends of Photography was a group of photographers, photo historians, and photo enthusiasts who were dedicated to the promotion of creative photography through exhibitions, publications, workshops, and community outreach programs in the greater San Francisco area. For nearly 34 years the group supported the medium of photography and its practitioners through active and varied community programs.

The Friends of Photography was officially established when a core group of 12 individuals met at the home of Virginia and Ansel Adams in Carmel, California, on January 1, 1967. The Founding Group included Arthur Connell, photographers Morely Baer, Wynn Bullock, Gerald Robinson, Gerry Shape, and Cole Weston, writer and photographer Liliane DeCock Morgan, architect Edgar Bissantz, musician Rosario Mazzeo, and photo historians Nancy and Beaumont Newhall. Ansel Adams was elected President and Brett Weston was named Vice President. The diverse makeup of this initial group, which included people engaged with photography on varied levels, established the group's unique perspective. Created at that time was the first Board of Trustees, consisting of 18 Trustees; the position of Honorary Trustee was established in 1985. An Advisory Committee was elected and those people were formally designated as Advisory Trustees in 1974.

For the first three years operations were handled by volunteer committees led by members of the Board of Trustees. In 1972, as The Friends became more established, a full-time, professional and paid staff was hired to operate the organization's growing program. Membership revenue was the largest single income source for The Friends, which was augmented by wholesale and retail sale of books as well as special offers of fine prints and books to members.

Exhibitions were a significant component of The Friends of Photography's program, offering a venue for audiences to explore and be inspired by all styles and generations of creative photography. The work of Adams, Wynn Bullock, Imogen Cunningham, Dorothea Lange, Brett Weston, Edward Weston, and Minor White comprised the first exhibition of The Friends of Photography, which was held in the historic Sunset Center in Carmel, California, from June 23 through July 30, 1967. Later in 1969, a second gallery was opened in the same complex allowing simultaneous exhibitions until 1976 when all exhibitions were on view in the Sunset Center's main gallery. That first year, The Friends held four additional exhibitions that included the work of Eugène Atget, Ruth-Marion Baruch, Bruce Davidson, Pirkle Jones, W. Eugene Smith, and Paul Strand.

The exhibition program continued through 2001, rotating monthly or bi-monthly, and included the work of Berenice Abbott, Manuel Álvarez Bravo, Paul Caponigro, Harry Callahan, Judy Dater, Emmett Gowin, Robert Heinecken, Anthony Hernandez, Lewis Hine, Harold Jones, Barbara Morgan, Marion Palfi, Robert Rauschenberg, Edmund Teske, Jerry N. Uelsmann, Todd Walker, and Adam Clark Vroman, to name only a sampling. Also mounted were thematic exhibitions such as *Ten Top European Photographers, East and West* (1971), *Classics of Documentary Photography* (1976), *The Photograph as Artifice* (1978), *Dyed Images: Recent Work in Dye Transfer* (1982), *Narrative Images/Post-Documentary Photography* (1987), *Proof: LA Art and The Photograph 1960–1980* (1993), and *Landscapes of War: The American Civil War in Photographs* (1997). Over the years, there were ten exhibitions that featured the work of the members

FRIENDS OF PHOTOGRAPHY

of The Friends of Photography. During the early years (1967–1972) exhibitions were organized by a committee headed by Wynn Bullock. With the formation of a paid staff, the position of curator was established and made responsible for organizing all exhibitions or inviting special guest curators.

As the organization grew, so did its breadth of publications. As an early form of communicating news to members, mimeographed newsletters were sent out to members (eight between 1970 and 1972). Beginning in January 1978 and running until December 1986 a monthly publication titled *The Newsletter of The Friends of Photography* was mailed to its members. From January 1987 through spring 2001, *Review, Newsletter of The Friends of Photography* was distributed to members monthly. In 1972, The Friends of Photography released its *Untitled* series; over the subsequent 22 years, 58 issues were published and beginning in the late 1970s, each issue focused on one artist or theme with a unique design to complement the content. Each member received a copy of *Untitled* and individual titles were also available for sale. Beginning in autumn 1994, and running until spring, 1996 The Friends published for their members *see: a journal of visual culture*, which included photography, creative writing, and criticism.

With the death of Ansel Adams in 1984, The Friends of Photography began a search for a new location in San Francisco. Named the Ansel Adams Center, this facility opened in 1989, and was first located on Pier 1 at Fort Mason before relocating to the Yerba Buena Center, where it had five exhibition spaces and an extensive photography bookstore. The final location was 655 Mission Street in San Francisco.

Conceived of as a living and growing educational force, education through, The Friends had a tremendous impact on the whole community from children to seniors. Beginning in 1969 The Friends held educational seminars and workshops focused on practical photography skills. Over the history of the group, educators involved included Adams, Morley Baer, photo historians and critics Peter Bunnell and Andy Grundberg, Linda Conner, Imogen Cunningham, Robert Dawson, Rod Dresser, Lee Friedlander, Emmet Gowin, Michael Kenna, Mark Klett, Annie Leibovitz, Ellen Manchester, Sally Mann, Richard Misrach, Lisette Model, Wright Morris, Olivia Parker, Meridel Rubenstein, John Sexton, Ruth Thorne-Thompson, Al Weber, and Jack Welpott.

Specific goals of the education and outreach program included the promotion of visual literacy

and the implementation of innovative programs that used photography to increase involvement with local communities. Some of the programs sponsored by The Friends included: The Look Again! program that promoted museum/school collaboration; Hands on History of Photography aimed at familiarizing high school students with the history of the medium; Workshops for Educators were one-day sessions aimed at primary and secondary teachers accompanied by Resources for Educators, which provided hands-on educational materials free of charge; designed for grades 4–8 was Ansel Adams' Curriculum Resource for Teachers focused on Adams' accomplishments in photography. In the late 1990s, The Friends offered free photography classes for children, youth, and adults through Community Partnerships with Bayview Opera House, Ruth Williams Memorial Theater, and Horace Mann Academic Middle School.

On October 31, 2001, due to rising rent costs in San Francisco and budgetary deficiencies, The Friends of Photography closed all operations and exhibitions. All of the group's assets were distributed among other organizations. The San Francisco Art Institute received the 3,000-volume library, the archives and records were given to the University of Arizona's Center for Creative Photography, and The Oakland Museum of California adopted the education program operating with funds from The Friends of Photography Education Endowment.

MASAHISA FUKASE

Japanese

Masahisa Fukase's career, which came to an abrupt halt in 1992 from a fall and subsequent brain damage, points to his obsessive need to confront and seek his changing self. Fukase's insistence on photographing his life events and his immediate surroundings often result in images that provoke unease, yet they also affirm his existence reciprocally. His works hold a unique place in postwar Japanese photography. In a culture where public displays of private emotion have often been found distasteful, Fukase's work has been provocative, while the photographer himself has developed a persona of mystery.

Born in 1934 into a family who owned a photographic studio in Bifuka-cho, Hokkaido, Fukase acquired skills of developing film and making prints as a child, assisting his father. Later in his life, Fukase commented that his enmity for photography probably emerged from the experience during youth when he washed prints continuously at his father's studio despite his wish to go and play with his friends.

His relationship to photography, based on "enmity" grew stronger and more complicated throughout his career. In a sense, his body of work testifies not only to his changing self, but also to the changing nature of his relationship to photography. He once noted that "I work and photograph while hoping to stop everything. In that sense, my work may be some kind of revenge drama about living now. And this is what I like the most." Photography, in Fukase's mind, serves both as the enmity against and as the necessary means with which to explore and express himself.

Fukase planned to take over his father's portrait studio after his graduation from university with a bachelor's degree in photography. However, because he began living with a woman immediately after his graduation in 1956, he remained in Tokyo and took a job as a photographer for an advertisement agency. The miscarriage by this woman in 1961 and her sudden disappearance in 1962 with a newborn baby left Fukase emotionally distraught. Although Fukase began photographing in slaugh-

terhouses in 1961 for a series called "*Kill the Pigs!*" his visit to the slaughterhouse in Shibaura became almost a ritual after her departure. He took the earliest train there and photographed all day, every day, for a year. He continued to visit the location after he met Kanibe Yôko, his future wife, juxtaposing the stale and cold conditions of the slaughterhouse with the unmistakable and expressive human existence of Yôko.

His life with Yôko played a central and decisive role in his career from 1963 on. Series such as *Yôko* (published in 1978) and *Ravens* (published in 1986) attest to their transformative and challenging relationship through intensely symbolic and emotional representations. Particularly after their separation in 1975, Fukase traveled to his hometown in Hokkaido more frequently, while photographing ravens in various places out of his train windows. The images included in the series *Ravens* are often printed with overtly visible grains, and the silvering eyes of the ravens as well as their shadowy existence create a weary mood of detachment and darkness. For Fukase, ravens became an appropriate projection of his own feelings and living conditions. As he noted at the third installment of the series, "I did not care a bit about ravens. I assumed a defiant attitude that I myself was a raven." Fukase exhibited the series *Ravens* in four installments in galleries, and for the last "chapter," he revisited the town housing project where he and Yôko spent their married life. On this occasion he stated, "I felt scary, something like a crime offender going back to the crime scene...The desire to photograph grew larger and larger, and various images of tombstones kept spreading in front of me." The result from the interaction among Fukase's effort to reconcile with the unrepeatable past, his completely changed life after Yôko, and his enmity toward photography construct a powerful personal journey that sustained Fukase and his relationship with photography for a decade.

During these trips home, Fukase continued to work on another series of photographs entitled *Family*, using a large-format view camera that his father used in his portrait studio. For about 20 years, Fukase photographed his family portrait in

similar compositions. Photography, for Fukase, is not merely an expressive medium of choice, but also an unbreakable tie back to his father and his family business. Quiet and composed postures and expressions of family portraits contrast dramatically with his *Ravens* series. In *Family*, his camera calmly captures his family members who continue to belong to his world. If *Ravens* is a meditation on the past he tries to forget and his struggle with forgetting, *Family* serves as a reminder of the past that is present and remains. This series came to an end when his father died in 1987, and Fukase used the photograph of his father at the funeral as the last image. In the same year, he selected and exhibited a series *Memories of my Father*, which was shown in Tokyo and Israel. His relationship with photography changed through this project, and Fukase began including his own body in photographs around this time.

In 1990, Fukase published and exhibited the first section of *Shikei* (private scenes) series, which include his travel shots from various places as well as self-portraits in a bath tub using an underwater camera. In these images, Fukase composes the image by including a part of his body, pictorially asserting his existence. In a number of images entitled “*bukubuku*,” which mimics the sound of air bubbles from underwater, Fukase stares directly at the camera, confronting his enmity of photography from childhood as if to enact his final revenge drama. The tension between Fukase’s reliance on and vengeance toward photography seems to be an unmediated confrontation for the first time in these images. Before he could further explore his new relationship to his photography, an unexpected fall prevented Fukase from continuing this dialogue.

MAKI FUKUOKA

Biography

Born in Bifuka-cho, Hokkaido, 25 February 1934. Attended Nihon University Department of Fine Art, 1952–1956. Worked as a photographer for advertisement and publishing companies 1956–1968; Freelance photographer 1968–1992. Ina Nobuo Award 1976. Ina Nobuo Special Award 1992; The 8th Higashikawa Special Prize 1992. Fell from stairs near his favorite bar, and stopped photographing 20 June 1992.

Individual Exhibitions

1960 *Seiyujo no Sora* (Sky over an Oil Refinery) Konishisoku Gallery; Tokyo, Japan
 1961 *Buta wo Korose!* (A Slaughterhouse); Ginza Gallery; Tokyo, Japan
 1976 *Tori*; Ginza Nikon Salon and traveled to Shinjuku Nikon Salon; Tokyo and Nikon Salon; Osaka, Japan

1978 *Yoko*; Nikon Salon; Tokyo, Japan
 1979 *Karasu 1979*; Ginza Nikon Salon; Tokyo and traveled to Shinjuku Nikon Salon; Tokyo and Nikon Salon, Osaka, Japan
 1981 *Karasu Tokyo hen*; Ginza Nikon Salon; Tokyo and traveled to Nikon Salon; Osaka, Japan
 1982 *Karasu Shūshō*; Ginza Nikon Salon; Tokyo, Japan
 1983 *Arukume 1* (Walking Eyes/Part 1); Ginza Nikon Salon; Tokyo, Japan
 Arukume 2 (Walking Eyes/Part2); Shinjuku Nikon Salon; Tokyo, Japan
 1985 *Irohanihoheto* (ABC...); Ginza Nikon Salon; Tokyo, Japan
 Karasu kei (Ravens Scene); Polaroid Gallery; Tokyo, Japan
 1987 *Ravens*; Zait Photo Salon; Tokyo, Japan
 Chichi no Kioku (Memories of Father); Ginza Nikon Salon; Tokyo, Japan
 1990 *Shikei Tabi no Tayori* (Private Scenes—Letters from Journeys); Ginza Nikon Salon; Tokyo, Japan
 1992 *Shikei '92* (Private Scenes); Ginza Nikon Salon, Tokyo, Japan

MIRAN FUKUDA

Japanese

Exemplary of the young generation of Japanese artists emerging at the end of the century, Miran Fukuda is known as a multi-media artist who often deals with issues of authorship, authenticity, and the coding of visual information, and the relationships among photography, painting, and consumer culture. While she does not create photographs in any traditional manner, in her art Fukuda often deals with her senses developed through photography, the history of art, and the digital culture, and she expands upon the experiments of the conceptual photographers of the 1970s and 1980s, including figures such as Gilbert & George, Robert Heinecken, and Richard Prince.

Fukuda was born into a family of artists; her maternal grandfather was an illustrator of children's books, and her father, Shigeo Fukuda, is perhaps Japan's best-known graphic designer of the post-World War II era. She grew up in a family home where prints by American Pop Artists Roy Lichtenstein and Andy Warhol were hung, and it was not surprising that Fukuda began considering an artistic career at age 15.

Upon completing a master's degree in oil painting at the prestigious Tokyo University of Fine Art and Music in 1987, Fukuda started receiving attention from Japan's art world and received numerous awards, including the 32nd (1989) Yasui Prize (created in honor of Sotaro Yasui, a Japanese modernist painter) for her still life painting *Wednesday* as the youngest recipient in the history of the award, which was given annually until 1996 to an artist of excellence younger than age 50 pursuing representational painting. Soon, she started showing internationally, including the traveling exhibition *Photography and Beyond* in Japan (1995), where she showed six photo-based works, including *Tablecloth* (1990), acrylic paint and commercially photo-printed plastic on panel; *Still Life: Apple, Pears, Cake Boxes and Pot* (1992), color photograph; and *The Princess Margarita as Seen by Doña Maria Augustina* (1992), acrylic on board) that demonstrated her unique conceptual interplay between photography and painting mediums.

To Fukuda, art is a means of expression through which she challenges viewers on conventional recognition and concepts of art, and through which she proposes new ways of looking and thinking. Further, Fukuda believes that her work, a realized manifestation of her thoughts and values, is effective only if it is transmitted to a viewer as a clear opinion, as if it were an excellent writing piece. Desiring her paintings not to be the paintings of the past, while acknowledging they are like paintings from the past, and desiring her work to be revolutionary, Fukuda has investigated and challenged the issue of "subjectivity" in the work of art, which, she believes, has been a core element of historical painting. Fukuda has attempted to construct art through "coded" visual information, using well-known existing images and icons such as master European and Japanese paintings and Disney characters to minimize subjectivity in her work, presenting it as ready made and reproducible. Her investigation of the photographic medium, particularly newspaper photography, is related to this interest. Perhaps her best-known works dealing with this issue are *Gilbert & George and I* (2001) and *Frank Stella and I* (2001), both painted with acrylic on panel. Both paintings are based on enlarged snapshots in which Fukuda posed with well-known artists. She investigates whether snapshots, which usually exist as recorded evidence (i.e., I was there with the artists) rather than as art works, thus perhaps lacking "subjectivity" as art, can be turned into works of art. With respect to "authenticity," since 1996, Fukuda has been making a series of works, composed simply of a newspaper page which shows reproduction of her work (e.g., an exhibition review), titling it with a name of the newspaper and the date of publication, and giving it an edition number based upon a number of the newspaper printed. In this series, Fukuda focuses on the commercial practice of and market for reproductions of paintings, whether by her or a historical master painter, which reduces them to mere commodities, suggesting that there may be no conceptual (and perhaps no production value) difference between such fine arts reproductions and a newspaper reproduction. This critical approach is evi-

dent in Fukuda's installation *Mainichi Shimbun Newspaper*, April 30, 2000 (2000). This work consists of a page from a newspaper showing an art review, including photographs of excited viewers at a Vermeer exhibition in Osaka, Japan, in which one photograph from the newspaper is enlarged to the extent that the Vermeer painting therein, *Girl with the Blue Turban*, is displayed in its original dimensions. Impressed with the high quality of reproduction available in newspaper printing and excited about the fact that the painting reproduced in the newspaper can be viewed as an original by dint of her re-contextualizing it, Fukuda placed a color reproduction of the painting over the photocopied painting in the enlarged newspaper photograph. Fukuda also used newspaper reproductions in earlier works, such as *Metrocard* (1995) by placing on one side of the Tokyo subway prepaid transit Metrocard well-known photo images from newspapers, covering the notorious 1995 Tokyo sarin attack by Aum cultists that killed and injured a number of subway passengers. Such images include casualties rescued on a subway station platform, heavily gas-masked and uniformed hazardous materials workers decontaminating the subway, and one of the attackers presenting an innocent demeanor while being interviewed. These images, have become signature images of the attack and thus coded into the public's memory.

JAROMÍR FUNKE

Czech

In the history of Czech photography Jaromír Funke (1896–1945) is considered both a pioneer of the modern view of photography in the 1920s and 1930s, as well as one of the most influential intellectuals and pedagogues. Next to Karel Teige, concerning his journalistic activities, and Josef Sudek, concerning his photographic work, he is without any doubt one of the most important personalities of the left cultural scene of those years.

Funke, from a wealthy family, photographed since his twelfth year. In his first self portrait he selected a photograph in the mirror, as if he wanted to point out that not only the photographed one is of importance, but also the way in which the photo was composed.

His study of medicine (which he had probably begun in 1915, in order to escape war service) he gave up in 1919 and then studied law at his father's request. His first painting and graphic attempts (which he sent for evaluation to Karel Teige) showed him that talent was lacking. Later he spoke of the fact that an internal need to express himself "in pictures" led him to choose photography.

In 1922, Funke discontinued his law studies without any exams. He decided to dedicate himself mainly to photography. His first photographic attempts, which he sent to the magazine "*Fotografický obzor*" (Photographic Review), and which are reminiscent of the work of Jacques Henri Lartigue, were not published. It was only in 1924 that the Swiss magazine *Camera* printed—along with his articles on photography—his photographs. This was Funke's breakthrough in the Czech photographic circles. Invitations to exhibitions Paris and Toronto followed.

Against the generally prevailing pictorialist trend, Funke regarded the brightness and the accuracy of the photograph as its most important characteristic: He called it "photoingenuity," which can only be achieved by the lens of the camera. He defined modern photography as precise, with sharpness, eschewing manipulation or re-touching of both the negative and positive. According to Funke, the photographer can achieve great

success within the documentary and artistic traditions, if he avoids the prevailing "impressionistic" style. With his articles Funke commented on his own development, which had begun with the arranged experimental series "*Still life*," done in 1923.

In his studio work, Funke photographed plates, glasses, phials, and transparent geometrical objects in elegant arrangements; these materials were supplemented (1924) by pasteboard or cardboard geometric forms. Style screen means were thereby the shade, which delineated the forms by exact light direction. Thus in the photograph "*Spirála*" (Spiral) shades of gray are embodied in the area of a triangle form as a result of the lighting. Funke began in 1925 to experiment with photographic abstraction using patterns of light and shade created by objects off-camera rather than the objects themselves. Funke saw therein a further confirmation of his thesis of "photoingenuity," by which it additionally wins more autonomy: Those "light-abstractions" confirm the "essence of the photography, which is developed by light and not by objects."

In one article in "*Fotografický obzor*" (Photographic Review, 1927) Funke dissociated himself from the Rayograms of Man Ray. For him a photograph is possible only as shot through the camera, and every photographic "product" that is created without it is not authentic:

Those photographic specialities are not any more photographs. It finds neither a release act (of an interaction between successful shot and successful development, which expresses in consequence perfectly the creative idea M.Ch.) nor a gesture of release and still less the solution itself of a taken over task.

This criticism, which Funke employed on the illustrations of the surrealist book of "*Les champs délicieux*" by Man Ray, he repeated again in a manifesto project, which he addressed together with František Drtikol to the artist union "*Umělecká beseda*" (Artist Federation) in Prague. Both photographers rejected pictorialism and suggested a new modern direction. Funke and Drtikol began to experiment at the same time with the conscious integration of light and shadow into the photographic

picture shot. For Drtikol this technique served to underscore the decorative quality of the picture, particularly in his nudes; Funke used it in order to create abstract forms.

Along with Funke's fine arts efforts, he produced a large number of commercial works, including architecture, advertising, landscape photography, and portraiture. At the end of the 1920s Funke was considered one of the most progressive photographers in Czechoslovakia, whose works received attention everywhere and whose critical contributions in different magazines were often discussed. Now, as before, most of his texts could be read as explanations or additions to his photographic intentions. Thus Funke extended for example his theses over the "photoingenuity" by terms of the integration and visualisation of the emotions, which he formulated (1929) on the occasion of the second member exhibition of the *Czech Photographic Society* (Česká fotografická společnost) in Prague 1929: "For us the photographic purism [that is, "photoingenuity"] is fundamental, to which two substantial components belong: Feeling and arrangement."

He shared these opinions with another well known Czech photographer, Josef Sudek, who also lived in Kolín and who was of the same age. The two took up the industrialization of the city—so that it is difficult sometimes to differentiate between the two. It was Sudek, who convinced Funke to participate further in international exhibitions although both were excluded from all Czech photographic circles either because of their criticism of the pictorialism, which was still in vogue. During their excursions they were joined by the photographer Eugen Wiškovský, who—contrary to Funke—was always interested in practical applications reflected theoretically upon the point of view of the "*Gestalt*"—psychology over the medium. Wiškovský propagated the *Neue Sachlichkeit* (New Objectivity) in the Czech Republic, particularly after the legendary *Film und Foto* exhibition of 1929 in Stuttgart. The cooperation at the magazine published by Karel Teige "*ReD*" (Revue Devětsilu) in 1929 began after his acquaintance with Anna Kellerová, later his wife. She was active in the communist movement and her father was one of the initial members of the Czech communist party. She probably arranged the contact with the poet František Halas, who drew Teige's attention to Funke. In "*Red III*," No. 1 some photographs of Funke appeared. He was also invited to supply his photographs for the magazine "*Index*," published in Moravian Brno. At the end of 1929 he contributed slides that reproduced abstract photographs to a new form of scenery in the Brno City Theatre.

At the beginning of the 1930s, the exhibition "*Nová fotografie*" (New photography) presented the Czech avant-garde photography in its breadth for the first time. Funke took part both organizationally and with his own work. In the summer of that same year he was in Brno, where he was to cooperate in an advertising film, but without success. Instead he took photographs of newer buildings of Czech avant-garde architects, among them from Bohuslav Fuchs. These works, which appeared in Fuchs' self-edition, have been lost.

Funke's interest in socially engaged photography continued to grow while he at the same time turned down an offer to teach at the Bauhaus in Dessau with Walter Peterhans because Peterhans's aesthetic contradicted his own. Instead he accepted the offer to teach at the Slovakian "*Učňovské Škole Fotografické*" (Slovakian Apprentice School on Photography, 1931–1934) and at the *Škole uměleckých řemesel* (School of Applied Arts, starting from school year 1931–1932 to 1934). A stay in Bratislava, which compared with Prague was a city pregnant with social differences, and his journeys through Slovakia and finally through that part of the Ukraine (Subcarpathian Ruthenia), which belonged to the Czechoslovakian Republic, shocked Funke in such a way that he reported photographically the poverty (cycle *Špatné bydlení*, Bad living, 1930–1931).

In the 1930s Funke created some of his most well-known works, including the series *Čas trvá* (Time Persists). He also published the folios *Nová architektura* (New Architecture, 1931), *Fotografie vidí povrch* (Photography Sees the Surface, 1935), and he was particularly busy with teaching. He sketched (1933) guidelines for photography instruction at higher commercial schools, which were immediately applied at the "*Státní grafická kola*" (State School of Graphic Arts) in Prague. At the end of 1934 Funke asked for a transfer from Bratislava to Prague, and on February 1, 1935 his request was approved.

His articles, lectures, and photographs witness the variety of his interests, making Funke one of the most demanded personalities of cultural life in Prague. In 1936, he became a member of the most important group of artists in Czechoslovakia at that time—*Mánes*. He prepared numerous publications (or worked on them), in which his photographs (and those of his colleagues) were featured. He also took part in organizing—and contributing to—the new photo section *Mánes* (February–April). Because teaching at the *Státní grafická Škola* in Prague took up five to eight hours daily, Funke's public engagements were reduced considerably in order to have the time for other work.

By the outbreak of World War II in 1939, travel possibilities were limited. Funke photographed nevertheless in the area of Louny (symbolically the origin of the Czech nation), photographed churches and monuments in Prague (the fear that they could be destroyed by the war was not groundless), and returned occasionally to Kolín to photograph there also.

In Kolín he survived an immense bombing of the city in August 1944 but fear accompanied him constantly. On March 22, 1945, Jaromír Funke died suddenly because an emergency operation, needed because of an intestine perforation, could not be carried out due to a four-hour air raid alarm.

Biography

Born in Skuteč (Bohemia) on 1 August 1896. Childhood in Kolín, there attending High School. 1914 admission at the "French Lyzeum" (Secondary School) in Grenoble. 1915 "Abitur" at the High School in Kolín. 1915 Funke studied medicine in Prague. 1919 changed to study law. Between 1919 and 1922 also attended lectures on philosophy and history of art at the Philosophical Faculty. 1920 began intensively to dedicate himself to photography. Met Josef Sudek in Kolín, with whom he maintained a lifelong friendship. Photography publications in the Swiss magazine *Camera*, first participation in exhibitions (Toronto, Paris). Member of the *Photo Club Prague* (March 1924). In January 1925 co-founded the *Czech Photographic Society*. In 1927 gave first public lectures on photography. 1929 exclusion of Funke (and Sudek) from the *Czech Photographic Society*. 1929 the beginning of his cooperation at the magazines *Red and Index*. In April 1930 participated in the legendary exhibition "New Photography" in the Mansarde of the Aventinum (Aventinská Mansarda). From September 1931 lectured at "Škola umeleckých remesiel" in Bratislava (School of Applied Arts in Bratislava) and the "Učňovské Škole Fotografické" (Apprentice School of Photography, in Bratislava). From March 1932 photographs for the monthly magazine "Nová Bratislava" (New Bratislava). At the beginning of 1933 prepared guidelines for photography instruction used in the school year 1933–1934 at *Státní Grafická Škola v Praze* (State School of Graphic Arts in Prague). In May 1933 external professor to this SSGA in Prague. 1.9. 1934 regular professor for photography in Bratislava. 1.2. 1935 appointment as regular professor for photography at SSGA in Prague. Apart from teaching, worked on several photographic cycles, notably on "Čas trvá" (Time Persists). Beside numerous portraits of well-known artists, Funke took photographs of Bohemian churches, monuments, and landscapes: After the outbreak of the war he intensified this personal "Mission héliographique" both in Prague as well as in the environment (Kolín, Karltejn, Louny, Poděbrady). During

the war cooperated at numerous photo publications, among them the Portfolio *Moderní česká fotografie* (Modern Czech Photography, Prague, 1943). Numerous lectures on photographic techniques and esthetic problems of the photography. Died March 22, 1945.

Individual Exhibitions

- 1931 *Kolín ve fotografi* (The city of Kolín in the photography), Kolín
- 1935 *Krásná jizba* (Nice Living), Prague (also shown in Bratislava 1936)

SEIICHI FURUYA

Japanese

During his early studies in architecture, Seiichi Furuya began photographing the everyday aspects of life in Tokyo. This relationship with his camera led to him giving up architecture and devoting himself entirely to the study and practice of photography. But it was not until he left Japan for Vienna, Austria that his professional life in photography began. From the mid-1970s through today, Furuya has developed work that ranges from the deeply personal, evolving images of his wife, family, and home, to the changing political and environmental landscapes that surrounded him in Eastern Europe. Furuya's work captures notions of living both geographically and emotionally on life's borders, and is punctuated by the moment the Berlin Wall fell. He continues to engage viewers with photographic insights about home, memory, and the ways of revisiting and interpreting the divisions of space and ethos.

Born in Japan, Furuya moved to Vienna after his photography studies in 1973. After two years in Vienna, he moved to Graz, Austria, where he met Christine Gössler, who immediately became the subject of many of his photographs. They wed in 1978, during Furuya's first return to Japan since his departure. Upon their return to Graz, Furuya became more involved with other artists and in seeking exhibition possibilities. In 1980, photographs of Gössler were published in the magazine *Camera Austria*. That same year, Furuya spent time in Amsterdam, where he documented the coexistence of families and strangers, often distressed or dis-

placed on the city's streets. Although a more distant view of the conflict between the simultaneous closeness and isolation involved in relationships, these photographs paralleled the resolution Furuya may have sought in his images of Gössler. Following Amsterdam, Furuya relocated to Vienna, where he and Gössler had a son, Komyo Klaus, in 1981.

While establishing himself in the Austrian and European worlds of photography, Furuya also remained committed to the work of other Japanese photographers, and encouraged their involvement in the European art world. He introduced such figures as Nobuyoshi Araki, Daido Moriyama, and Shomei Tomatsu to the exhibition and publishing practices in which he was flourishing. During this time, Furuya continued to photograph Gössler while carrying on with his own journey as a Japanese foreign national living and working in Cold War Eastern Europe. Mental and physical borders and boundaries appear in his 1981–1983 works entitled *National Frontier*. For this work, Furuya used the idea of himself as the traveling, displaced photographic eye to capture a story about the borders between Austria, Czechoslovakia, Hungary, and Yugoslavia. The story consists not only of the physical evidence of division and boundaries, but of the human response of inhabiting a space that is constantly divided, questioning whether an identifiable place exists at all. Furuya's own interactions with the fractured physical and mental spaces consist of his written responses to those images.

In 1984, Furuya accepted a job as a translator for a Japanese construction company, and he and his family moved to Dresden. Gössler's severe depres-

sion eventually led to hospitalization, and the family decided to move to East Berlin. Gössler, ill and less frequently photographed, nevertheless remained Furuya's consistent and beloved subject. In 1985, Gössler committed suicide by jumping to her death. Furuya photographed the traces of the tragedy: her neatly placed shoes left behind, her body lying on the ground, the police approaching the scene. These were his final images of Gössler, and even then the camera proved its power as a connecting force between the couple.

Furuya did not exhibit photographs of his wife until 1989, four years after her death. That year, Furuya developed the first of two *Mémoires* exhibitions, which consisted predominantly of images of Gössler, and centered around the themes of life and death. Revisiting a life through the memorial of the photograph was something that Furuya chose to do both privately and publicly, just as he had done in his earlier years while documenting Gössler. It was in preparation for exhibiting loss that Furuya publicly presented Gössler's images to the world. In the book accompanying this 1989 exhibition, Furuya did not arrange Gössler's images in a chronological replay of their life together. Instead, he pursued the ways in which his memories were shifting, altering, and reconciling a loss of love and life with an attempt to organize the photographs of a living memory.

In 1995, Furuya developed a second *Mémoires* series, again visiting the past and the need to resituate his photographic memories. For the 1995 series, Furuya included photographs of both Gössler and their son. This reinterpretation of his work led to critical success and a second accompanying publication. By rearranging his memories again in 1995, Furuya enacted both the role of photographer/author, the one who is in control of the arrangement, and also the viewer/spectator, who begins looking and remembering differently during this later phase of life and work. An exercise in dealing with death through visual representations and photographic communication, Furuya's work adheres to the varying roles of engaging with an image. Themes of loss and emptiness are also evident in the photographs without Gössler: the moment Furuya isolates an urban street scene or rural landscape, the image is often cut or bound by some event or person out of range.

The Model Wife exhibition in 2000 placed Furuya's work alongside several prominent photographers, including Baron Adolph de Meyer, Alfred Stieglitz, Edward Weston, Harry Callahan, Emmet Gowin, Lee Friedlander, Masahisa Fukasse, and Nicholas Nixon. The exhibition focused on the

enduring complex relationship between husband and wife when the two are photographer and subject. In 2004, Furuya's *alive* exhibition in Vienna marked a transitional moment in the artist's process of remembering with a collection of works from 1970 to 2002. These photographs remain untitled, but each offers a date and location, arranged according to Furuya's evolving memories.

HEATHER BLAHA

Biography

Born in Izu, Japan, 1950. Studied architecture in Numazu, 1966–1969. Studied photography at the Tokyo Polytechnic University, 1970–1972; co-founded photo magazine *Camera Austria*, 1980; published *AMS* by *Camera Austria*, 1980–1981; co-founded the Austrian Photo Archive, 1983; co-curated and co-edited exhibitions and catalogues for: *Daido Moriyama*, Graz, 1980, *Shomei Tomatsu: Japan 1952–1981*, Graz, 1984, *Araki. Akt Tokyo. 1971–1991*, Graz, 1984, and *Keep in Touch. Positions In Japanese Photography*, Graz, 2003. Received the Camera Austria Award for Contemporary Photography, Graz, 1993; Rupertinum Photography Award, Salzburg, 2000; Ina Nobuo Prize, Tokyo, 2002. Lives with his son, Komyo Klaus in Graz, 1987–present.

ADAM FUSS

British

In a time when sophisticated single-lens-reflex (SLR) cameras are being increasingly challenged by rapid advances in the resolution and color quality of digital cameras, Adam Fuss stands apart in his commitment to photographic images made without the use of a camera. Mechanically if not conceptually aligning himself with the earliest photographers William Henry Fox Talbot, Louis Jacques Mandé Daguerre, and Joseph Nicéphore Niépce, Fuss works almost exclusively with paper exposed directly to light. His images are made with pinhole cameras, large-format photograms, and silver-plated daguerreotypes. But

unlike his nineteenth-century predecessors, Fuss is less interested in the objective nature of such direct representations—the sheer fact of being able to capture the effect of light bouncing off objects in the world onto a sensitized medium—than he is in the metaphorical qualities that arise from direct exposures. Metaphorical associations abound quite naturally from the timeless, fundamental simplicity of his chosen subject matter: flora and fauna of the natural world as exemplified by sunflowers, swans, snakes, and eviscerated rabbits, and elemental icons of pure energy such as water, smoke, skulls, and newborn babies. While today we take the photomechanical nature of photography for granted, Fuss's anachro-

nistic rejection of the camera invites us to reexamine the kinds of imagery possible with the simplest of photographic means. When compounded by the open symbolism of his subject matter, the images create a profound sense of magic and loss, fluctuating between the wonder of life and the inevitable cessation of death.

As a child Fuss moved back and forth between the countryside of southeast England and southeast Australia, where his mother's family lived. Because of his father's illness and early death due to a stroke and the frequent relocations as a consequence, Fuss's childhood years were riddled with uncertainty. The only constant for the young artist seems to have been his connection to nature, a relationship that has obvious vestiges in his adult artistic preoccupations. Fuss became invested in photography while still a teenager, primarily interested in the gadgetry of the camera and photo processing. After boarding school in West Sussex, England, Fuss once again returned to Australia to work as an assistant in a photo studio where for the first time he was exposed to the history of photography and the concomitant theoretical issues. In 1982, Fuss moved to New York, working at the Metropolitan Museum, where roaming the sculpture halls at night he got the idea to take pinhole photographs of the classical figurative sculptures. Using a handmade pinhole camera affixed with an 8 × 10-inch photo back, Fuss created dramatic black-and-white images of the figures in space, the forms centralized in the photos by the encroaching circles of darkness and the focus fall-off so typical of pinhole photography. He devoted the next two years to shooting this first extended series of work, in part motivated in reaction against the consumerist, technological slant of commercial and art photography he saw elsewhere in the culture.

Fuss's focus on the photogram, for which he is perhaps best known, came about as the result of an accident. While shooting sculpture in a museum in Washington, D.C., he forgot to take the cover off the hole of his makeshift pinhole camera, but because light leaked within the box, when he developed the photograph he witnessed the image of dust floating within the interior of the camera recorded on the paper, essentially creating his first photogram. This revelation of what he could do without the camera led to an intense period of experimentation, during which Fuss happened upon many of the themes and sources that continue to today: large-headed sunflowers pressed en masse against photosensitive paper, seeming to grow and decay before our eyes; spirals of light created by swinging a suspended flashlight over Cibachrome paper; splashes and droplets of water caught in frozen motion, alternating chaotic

and cataclysmic or serenely geometric; snakes writhing through talcum powder and swimming through water; young babies blotting out their own shadow against hyperpigmented fields of yellow. The water pictures are made by submerging photographic paper in a shallow pan filled with water, in which a splash is made, a snake released, a child lain down, the movement caught in brief flashes of light. Despite the static nature of the still images they exude a palpable energy, an immediate aftershock of the material presence of the subjects to their own representation. The artist describes his move from sophisticated SLR cameras to low-tech pinhole photography to cameraless photograms as a process of internalization, both in terms of photographic methodology and in psychological, personal terms. As he has brought the source closer and closer to direct contact with the surface of his media he has turned further and further inside himself for motivation and meaning. Both choices wrestle the image from a space of darkness, the one literally, the other metaphorically.

Two major series exist in Fuss's oeuvre: *Details of Love* and *My Ghost*. In the hotly colored Cibachrome photograms of *Details of Love* rabbits pair off facing one another, the cute and cuddly silhouettes suggesting all the solace and communion of romantic love. But their iconic bodies are in sharp contrast to the mass of entrails spread out from mouth to anus linking them in a visceral tangle of real and symbolic connections. Intensifying the photomechanical, photochemical nature of the images, the acids of the internal organs in contact with the paper shift the resulting color chemistry. In comparison, the color palette of *My Ghost* is a subtle range of a daguerreotype's silver blues and the graphic blacks, whites, and smokey grays of silver gelatin photograms. True to the title, all the images are ghostly and ethereal: sheer, see-through structures of old-fashioned children's nightdresses, swirls of smoke bellowing up across the picture plane, frantic birds caught in mid flight, silvery embossed swans spreading out their wings, stark figures of women hunched over in despair. Collectively they evoke a story of sadness and mourning, potent images of a childhood rendered indecipherable and abstract with age and memories strangely recollected through the photographic, creative process. Fuss's ability to render the literal metaphorical is at the heart of his production.

FUTURISM

Futurism is a movement of the Italian avant-garde that emerged in the early years of the century and exerted a strong influence on all aspects of Italian art, architecture and design, and literature. While having the greatest impact on the cultural life of Italy, Futurism was one of many movements that swept the European continent advocating revolutionary change and issuing a call to arms to artists, writers, and musicians of all types to rise up against the status quo and adopt modern forms and modern technologies with the intent of improving society. In photography this movement produced highly experimental works by numerous figures from the 1910s to the 1940s.

On February 20, 1909, the Parisian newspaper *Le Figaro* published the first futurist manifesto by Filippo Tommaso Marinetti, who explained his conceptual innovations for poetry. Thereafter, the Italian painters Umberto Boccioni, Giacomo Balla, Gino Severini, Carlo Carrà, and Luigi Russolo, among others, gathered around Marinetti and drew up *Manifesto dei pittori futuristi* (Manifesto

for Futurist Painting), published in February 1910, and then *La pittura futurista: Manifesto tecnico* (Futurist Painting: Technical Manifesto), published in April of the same year. Later they created manifestos on other subjects, such as sculpture, music, architecture, clothes, and food.

The painters committed themselves, in the words of the French philosopher Henri Bergson, to the goal of representing the inner, subjective perception of a body's movement in flux and presenting its apparent transposition with other bodies and its dematerialization. At the same time in Rome, Anton Giulio Bragaglia and his brother Arturo were conducting their first experiments with motion photography, which they called photo dynamism. Following the futurists' manifestos, Anton Giulio Bragaglia came to appreciate the simultaneous perception of successive movements of a body and represented these in photography through a synthesis of long and multiple exposures; he captured the traces of movement and recorded in a single picture a body in motion overlapping multiple times. The

results of Bragaglia's work contrast with the series of analytic images from motion studies by nineteenth century figures such as those of photographic innovator Eadweard Muybridge and the time photography of physician and physiologist Étienne-Jules Marey. Marinetti endorsed Bragaglia's investigations and exhibited all of his photodynamic images. Bragaglia also commented on them in lectures and in his published essay *Fotodinamismo futurista* (Rome: Nalato, 1911). Afterward, an initiative by Boccioni in 1913 officially banned Bragaglia's photographic experiments from the futurist movement. Boccioni rejected photography as a potentially creative medium for the intuition of the artist and feared that futurist paintings would be seen as based in motion-study photography. Bragaglia dedicated himself from that time on to making film. In the futurist movement, photography was then used only to make portraits of individual members and of group gatherings. During the 1920s outside of Italy, countless experiments were conducted with multiple and long exposures, photo collages, and montages, as well as photograms. These were undertaken by such people as Ilse Bing, Anton Stankowski, László Moholy-Nagy, and Heinz Hajek-Halke in Germany, many of these figures associated with the Bauhaus; Maurice Tabard and Man Ray in France, who were associated with Surrealism; and Alexandr Rodchenko and El Lissitzky in the Soviet Union, associated with Constructivism. At this time Italian photographers and artists also began once again to experiment with photography. The photography of the European avant-garde was exhibited from May to July 1929 at the exhibition *Film und Foto* in Stuttgart.

The second generation of Italian futurism, as Enrico Crispolti first called it in 1958, is characterized by an intensive engagement with new technologies. This included a fascination with speed, the automobile, and the internal mechanisms of machines. In September 1929, Marinetti published his first theoretical writings about *aeropittura*, painting that represents the visions and emotions experienced while flying and thematizes the conquering of space—a notion developed by many futurist artists, such as Giacomo Balla, Benedetta Cappa, Tullio Crali, Enrico Prampolini, and Tato. In November of the same year, Vinicio Paladini published an essay on photomontage, which originated in Germany with László Moholy-Nagy and Hannah Höch. In 1930, Tato (pseudonym of Guglielmo Sansoni) and Marinetti published *Il manifesto della fotografia futurista* (Manifesto of Futurist Photography). In this work they called for the art of photography to explore many things:

the drama of the static and moving object; the effect of surprise; the transformation of objects; the inversion of the reality effect; the optical fusion of bodies and objects; the perspective from heights to depths and from depths to heights; and photographing characteristics of people or bodies with extreme close-ups or psychological and satirical combinations with other bodies that suggest an inner psychological state. In the sixteen points listed in his manifesto "The Art of Transforming Objects," Marinetti, whose creative work was influenced by a passion for war, includes, though it seems unconnected, the art of war camouflage, which aims to elude observation from the air.

Between 1930 and 1933 many amateur and professional photographers exhibited futurist photography in Turin, Milan, Rome, and Trieste. Filippo Masoero presented views of flight, *Aerofotografia*, that recorded distorted images of cities from the perspective of an airplane. In 1915, Fortunato Depero created staged self-portraits that Giovanni Lista describes as the first futurist photo performance. Like Ivo Pannaggi and Marcello Nizzoli, Paladini created collages, such as the series "Olympic Games" (1934), made from photographs, images printed with type, and colored paper, which were similar to Dadaist works. In the second and third decades of the twentieth century, Arturo Bragaglia created many-headed portraits and extended time exposures of everyday body movements, such as *The Smoker* (1913) and *The Slap* (1912). Tato, Ferruccio A. Demanini, and Wanda Wulz stand out with their sandwich-board portraits. These portraits represent how the overlapping of memory and the impressions of the present in an individual's consciousness affect perception. They were also intended to represent characterizations of people and their inner psychological state. In this way, artists play with symbols and with combinations of the ironic and serious, as in the self-portrait of Wanda Wulz *Ich + Katze* (1932) and in the portrait by Tato of the writer Mino Somenzi—whose piercing gaze is shown simultaneously from various directions, with a central symbol of futurism, the propeller, transposed over it. Tato combined different objects under extreme lighting to create new and strange figurations. He calls attention to these optical effects in his naming of the images, for example, in the ironic photographs titled the *Perfect Citizen* (1930) and *Shepherd with Little Ass* (1930). He constructs the scenes from paper figures and so deconstructs, very much like Giulio Parisio, the claim to reality that is generally imposed on photography, leading the viewer through the same medium but to a subjec-

FUTURISM

tive reality of fantasy and dream. Different from Tato, Gianni Croce, Mario Bellusi, and Giorgio Riccardo Carmelich compose from various everyday objects abstract still-life constructs that they pose in harshly contrasting light to bring out the drama between objects.

Around 1933, the artists Bruno Munari, Tullio D'Albissola (pseudonym of Tullio Spartaco Mazzotti), and Luigi Veronesi began creating photographs. In general, they directed the content of futurist photography to the themes of dance, sport, flying, psychological portraits, the still life, the city, and machines. Giovanni Lista collected, studied, and published many works of futurist photography that are now in various private and public photography collections, such as the George Eastman House in Rochester, New York; the Metropolitan Museum of Art in New York; the J. Paul Getty Museum in Los Angeles; Museo di Storia della Fotografia Fratelli Alinari in Florence, Italy; and Museo d'Arte Moderna e Contemporanea di Trento e Rovereto in Trento, Italy.

G

GALLERIES

Galleries are physical or virtual spaces where photographic works and the public cross paths. Galleries can have many structures, diverse objectives, and utilize a variety of resources to link photography and public. Examples of some gallery structures include cooperative galleries, commercial galleries, cultural spaces both public and private, web galleries, galleries at temporal events such as art fairs or symposiums, and vanity galleries. Galleries can showcase work by genre such as still life, portrait, landscape, or experimental, exhibiting only photography or various media, exhibiting work on general or specific themes or events, organized by individual authors, institutions, or groups. Each gallery structure will in some way bring photographic works and the viewing public together. Different structures will accomplish these links in different ways, varying their rapport either to photographers, to the public, or both.

In a cooperative gallery, artists become members to participate in gallery activities. There may be a membership fee and members may be asked to participate in gallery functions by helping to hang shows, gallery sitting, newsletter production, etc. Membership may also be open to the general public, who through their membership provide support, both financial and time, to the gallery. Some

events and activities at a cooperative gallery may be open to the general public, others to members only. Activities may be educational or promotional, such as juried shows.

Commercial galleries are places of business where gallery directors promote photography as a consumer good. Commercial galleries represent a limited number of artists and apply countless strategies to provoke the sale of a photograph. Some galleries build their reputation by carrying only the work of well-established artists. Other galleries claim to be presenting heretofore undiscovered talent. Some galleries will solicit submissions for group or solo shows, juried by the gallery director or a guest curator. There is a contract between artist and gallery, either implicit or in writing. The contract will determine the division of responsibilities, such as framing, insurance, regulation of exhibits, insurance, prices, fees, and method of payment.

Both public and private institutions can have gallery space for exhibitions. Public institutions such as the commercial attaché to embassies, municipal, state, or federal buildings, public libraries, community centers, or universities can host exhibitions in a gallery, generally open to the public-at-large. Private institutions also, such as private schools, non-profit organizations, theaters, coffee shops, and

GALLERIES

churches, may choose to have separate gallery space for exhibitions that incorporate the gallery activity with their otherwise daily business. Some individuals make use of their home to showcase photography as a special occasion.

Less than twenty years after the arrival of the home computer, telecommunications has mushroomed to impressive proportions and the resulting explosion of web galleries devoted to photography is phenomenal. In 0.26 seconds, a Google search for "Gallery Photography" produced 1,210,000 results. This volume of activity is difficult to monitor, measure, or analyze as the virtual, immaterial terrain of activity is everchanging with little to no lasting trace of content. Web galleries allow people to look at images, research photography, buy and sell photographs, advertise and promote photography, and give technical and aesthetic training and instruction.

Calendar events such as community or state fairs, festivals, symposiums, or conferences, can organize temporary galleries to exhibit photography. The exhibitions may have a geographic significance, showcase local authors or local imagery, or have a thematic significance, such as AIDS, dogs, or tornadoes.

Vanity galleries are galleries where the gallery owner exhibits the owner's work. These galleries may be part of the artist's studio or independent spaces. Another form of the vanity gallery exists as rented spaces, where the artist contracts for a specific time at a certain cost to utilize the gallery.

There are several historical antecedents that foreshadowed the evolution of photography galleries in the twentieth century. In the nineteenth century, science and technology fairs began to show arts and crafts, and photography was from its inception a part of such activities. Louis Daguerre made public his photographic process in 1839 and that same year a Daguerreotype was exhibited at the 12th annual Fair of the American Institute in New York City. Until early in the twentieth century, the American Institute remained almost the only institution to exhibit photography in New York City, exhibiting works by Mathew Brady, Napoleon Sarony, and Edward Bierstadt. Some of these fairs were annual events and eventually a need was identified for a permanent exhibition space.

Also in the nineteenth century, some photographers used part of their studio as a gallery space, sometimes becoming a local point of interest beyond the studio's clientele. This practice served both to attract customers and to establish the photographer's expertise. Some of these studio galleries were extravagantly decorated and advertised in grandiose words, such as Mathew Brady in 1853

advertising his studio as a "palace of art," or Charles D. Fredericks's studio description as a "Photographic Temple of Art." In New York and Washington, D.C., Mathew Brady's galleries were successful business endeavors, but the principle income came not from the exhibitions but from the studio photography work.

Interestingly enough, one of the first galleries to exhibit photography in the twentieth century also exhibited paintings and sculpture. This was Alfred Stieglitz's creation of the Little Galleries of the Photo-Secession, referred to as 291, the gallery street number on Fifth Avenue. The Photo-Secessionists included photographers such as Gertrude Käsebier, F. Holland Day, and Clarence White. 291 was from the beginning a gallery space devoted to the promotion of photography in relation to other arts. Urged on by painter and photographer Edward Steichen, Stieglitz and the Photo secession began publishing a newsletter called *Cameraworks* in 1903 and opened Gallery 291 in 1905. After a year of showing photographs, the gallery began exhibiting more European paintings and occasionally Stieglitz's own work until closing down in 1917 following a series of exhibitions including work by the photographer Paul Strand. In 1921, Stieglitz mounted a show of his own work in space borrowed from the Anderson Galleries on Park Avenue where he exhibited other art until 1929. He wanted the space to provide a sense of community for artists and structured it as a cooperative gallery, trying to distance himself from the commodity aspect of works of art. From 1929 until 1946, the year of his death, Steiglitz exhibited art at An American Place on Madison Avenue, mostly paintings and other prints as well as his own photographs and those of Paul Strand.

In 1931, Julien Levy opened the Levy gallery in New York City with a retrospective exhibition of American photography. The gallery had a difficult time finding a market for photography and quickly modified the gallery's agenda to include a broader range of artwork. Photographers who exhibited at the Levy gallery included Berenice Abbott, Eugène Atget, Man Ray, Paul Outerbridge, and Henri Cartier-Bresson. The Bay Area's Group f/64's cooperative gallery, which opened in 1933, was dubbed "683" after its street address in a clear reference and homage to Gallery 291.

In the 1940s and 1950s, more galleries dealing with photography appeared in the United States and in Europe but rarely did this cultural activity prove lucrative. Some galleries organized exhibitions around other activities that could generate revenue, such as bookstores, coffee houses, or

movie or theater lobbies. In the 1950s, the FNAC started in France. The FNAC is a department store devoted principally to music, books, and audio-visual equipment. From its beginning in 1954, the FNAC built retail stores with exhibition spaces devoted to photography. With over 50 stores in France and Europe, these galleries, where work is not for sale, are visited by thousands of people on a daily basis, an impressive volume of public passage that few other gallery structures can achieve. The success of these photography galleries has grown over the decades; the FNAC now hosts regular competitions for new talent and has a growing collection of photography.

In 1954, Helen Gee opened Limelight Gallery in New York City and showed over 60 photography exhibitions until 1961, the gallery income supported by an adjoining coffeehouse. The Limelight Gallery at that time was a major art institution in NYC and their decision to show photography was the beginning of a growth spurt in the art photography market that persisted through the end of the century.

By the late 1960s and through the end of the century, photography galleries found more financial success in the dynamics of the expanding art market in general. An increasing number of universities added photography to their curriculum, public and private grants to photographers peaked during these decades, and major auctions started to include photography. In New York City, the Witkin gallery opened in 1969; the Light Gallery in 1971. Galleries worked at promoting both the sale of photographs and the advancement of the photographer's reputation. In 1968, Harry Lunn opened his gallery in Washington, D.C. and specialized in the sale of limited edition photography portfolios, a format used through the end of the century. In the 1980s, legendary New York dealer Leo Castelli supported photography in his Castelli Graphics site, and Pace/Magill and Robert Miller galleries specialized in the medium, showing numerous contemporary American and European photographers. San Francisco's Fraenkel Gallery, established in 1979, is one of the leading west coast photographic galleries. More recent editions include Chicago's Stephen Daiter Gallery and New York's Janet Borden, Robert Mann, and Edwynn Houk.

In Canada, Jane Corkin founded an influential Toronto-based gallery in the late 1970s. In Paris, Galerie Michelle Chomette exhibited cutting-edge contemporary photography from the 1970s through the end of the century. Also in Paris, Jean-Pierre Lambert's tiny Galerie Lambert off the Place du Marché Ste. Catherine in the Marais exhibited contemporary photography from 1981 to 1998. One critic

described the photography exhibited at Galerie Lambert, a space sometimes compared to Stieglitz's 291, as "UFOs," unidentified photographic objects.

In Washington, D.C., the Kathleen Ewing Gallery has promoted fine art photography since 1976, exhibiting contemporary local artists and historical as well as internationally known artists. Ewing described photography as the one art medium that has not suffered a decline in activity since the growth spurt in the art market in the 1970s. Since 1979, Ewing has been Executive Director of the Association of Independent Photographic Art Dealers (AIPAD), an organization of 130 members. Robert Klein, director of the Robert Klein Gallery in Boston, is President of AIPAD. AIPAD is the only organization specifically for photography dealers. All members of AIPAD have significant, quality inventories of photography that the public can access either through exhibitions or by appointment. AIPAD has a regularly updated publication called *On Collecting Photographs*, which includes a photography timeline, common questions and answers, a glossary of terms, and a bibliography. They also publish a yearly catalogue to accompany their annual exhibition in New York. This catalogue and exhibition describe nearly 100 participants, each representing several photographers. These exhibitions began in 1980 and include a large group show as well as individual booths for each participating gallery. They also post alerts regarding stolen photographs.

In the late 1990s, Paris Photo in France established a yearly event at the Carrousel du Louvre called Paris Photo. Using the underground galleries created in recent renovations of the Louvre, every fall nearly 100 participants and over 30,000 visitors convene for several days to view, buy, and sell photographs. A catalogue accompanies this international event and participants are selected by committees of professionals in photography. Like the annual AIPAD exhibition in New York, Paris Photo usually defines a theme for each year's event.

ANDRÉ GELPKE

German

One of Europe's leading postwar photojournalists, André Gelpke creates in his photographs vibrant, arresting images by offering an abundance of information. Precisely composed and perfectly framed for the composition at hand, his rich black-and-white pictures freeze time into intense images which, because of the absence of time and movement, can seem overwhelming, even alienating. Whether it is capturing a playground frozen into a timeless frieze of human and architectural forms (*Bretagne*, 1983) or human subjects who are photographically transformed into virtual specters or automatons (such as the three swimmers presenting themselves for a mist-blurred lens in *Kanalschwimmer*, 1977 or the handshake and bow captured in *Kunstverein Köln*, 1979), Gelpke uses the unique technical language of photography to create evocative, emotional reflections of reality.

Like all of the generation of contemporary German photographers, Gelpke, born in 1947, grew up in a divided Germany that faced huge challenges of reconstruction after the war. He attended grammar schools in his hometown of Beienrode and in the industrial town of Rheydt, and secondary schools in Rheydt and Krefeld. After various trade jobs and service in the military, and after developing an interest in photography, in 1969 he entered the Folkwangschule, Essen, where Otto Steinert, the instigator of the "fotoform" group which practiced a highly abstract form of photography (more generally known as Subjective Photography), taught. It was under Steinert that Gelpke's style was formed, wherein vignettes of the world around him are excised and framed, so to speak. Within this style, Gelpke has produced rich and varied bodies of work. Series shown in exhibitions such as *Sea Pieces*, *Plastic People*,

Sankt Pauli and published in books such as *Sex-Theater*, *Fluchtgedanken*, and the famous *Der Schiefe Turm von Pisa* demonstrate Gelpke works in the best documentary tradition, adding a distinctive, intelligent visual rhetoric.

In 1975, after working as a photojournalist for about a year, Gelpke was a co-founder of the Visum Photo Agency in Hamburg, now a leading stock photo and photographic agency.

André Gelpke is a conservative in the pure sense of the word. Photography, however, is an immense store of forgotten and deeply hidden meanings. Because of its development throughout the entire culture, every photograph is full of symbol and meaning, which go unnoticed by most people in daily life. But the photographic work of André Gelpke is not merely a store of hidden emotional values; it also offers imaginative potential. This is why he at the same time is very much a progressive. He conserves and reminds us of not only the forgotten or overlooked, but also creates, through his role as "image designer," new worlds, some of them perhaps even utopias. The works in the series *Fluchtgedanken*, completed in 1983, for example, largely feature people shot, obviously posing, from behind, thus hiding their faces, or from angles where the hair obscures the face. Each image is mysterious, but taken together, the series evokes a palpable sense of otherness, despite the straightforward, recognizable imagery.

Gelpke's early photographs are also often uniquely erotic, not in the conventional sense of depicting nudes or other accepted sensual material, but in his humanistic vision, which creates dense and evocative worlds within each of his compositions. Each series, moreover, is built up like a dream, where black and white shades, nuances of color, and intriguing compositional forms merge together and where one image spontaneously evokes another. In this sense,

his work practice resembles that of the Old Masters, who were able to reproduce, in an enigmatic way, space, light, and depth in their paintings. Yet Gelpke's work is unmistakably contemporary and often refers to the modern photographic masters.

Gelpke has said about his work:

In this visual age, when our consciousness of reality is increasingly permeated by the actualities of television, photography, and advertising, my aim is to present the photographic-bureaucratic fact collector with a selection of my reality clipping from an only apparent "pseudo-reality" and thereby to bring about a new questioning of reality.

(*Contemporary Photographers*, St. James Press)

At the end of the century, his work became more overtly erotic, and he has experimented with shooting in color, as in the series *Fata Morgana*. The series *Amok* and *Familientag*, while showing many of Gelpke's characteristic composition and framing, have the additional formal attribute of often startling, oversaturated, but still realistic color.

For Gelpke, experiences are memories, signs, symbols, levels, and geometric forms. As such, he cannot "do" much with them; they are "nothing." Only after the experiences become solidified in a photographic composition can he begin to change and modify them into a usable code system. He uses codification—spontaneously and impulsively—to make the chaos of the world recognizable, converting chaos through his images into an elemental order.

The Spanish photographer and writer Joan Fontcuberta wrote:

André Gelpke tends to speak of two categories when referring to his work: the monologues (introspection) and the dialogues (relationships with the external). There is no opposition between them—they are complementary because they basically try to exercise two distinct types of vision upon the same reality: sensual vision and intellectual vision.

(*Contemporary Photographers*, St. James Press)

In 1990, Gelpke relocated to Zurich to teach; he has continued to collect his unique images into increasingly experimental series of works that feature still lifes, portraiture, and landscapes combined into suggestive and timeless narratives.

JOHAN SWINNEN

Biography

Born on 15 March 1947. Studied photography with Professor Otto Steinert at the Folkwangschule, Essen, 1969–1974. Photographer since 1974. Founding member of Visum Photo Agency, Essen-Hamburg, 1975–1978;

moved to Zürich, Switzerland in 1990; lecturer in photography at the Höheren Schule für Gestaltung in Zurich.

Solo Exhibitions

- 1977 *André Gelpke*; Stedelijk Museum; Amsterdam, Netherlands
- 1982 *André Gelpke*; Werkstatt für Fotografie; Berlin, Germany
- 1984 *André Gelpke*; Centre Georges Pompidou; Paris, France
- 1986 *André Gelpke*; Museum für Photographie, Braunschweig, Germany and traveling
- 1987 *André Gelpke*; Fotogalleriest; Oslo, Norway
- 1988 Fotofest; Texas Commerce Bank; Houston, Texas
Heim-Weh; Fotoforum; Hamburg, Germany
- 1989 Fotomuseum; Braunschweig, Germany
- 1990 *André Gelpke*; Museum Folkwang; Essen, Germany and traveling to Sprengel Museum, Hannover, Germany
Nostalgia; Goethe-Institut, Brussels, Belgium
- 1992 *Heim-Weh*; Goethe-Institut München, Munich, Germany and traveling

Group Exhibitions

- 1975 *Landesbildstelle*; Hamburg, Germany
- 1977 *Recontres Internationales de la Photographie*; Arles, France
Centre Georges Pompidou, Paris, France
Sander Gallery, Washington, D.C.
- 1979 *Fotografie nach 1945*; Kunstverein Kassel; Kassel, Germany
- 1980 *The Imaginary Photo Museum*; Kunsthalle, Cologne, Germany
- 1982 *Künstler verwenden Photographie – Heute*; Kunstverein Köln; Cologne, Germany
Place and Identity in European Photography; Rimini, Italy
- 1984 *Contemporary European Portraiture*; Northlight Gallery, Herberger College of Arts, Arizona State University; Tempe, Arizona
- 1988 *Twentieth-Century Photography*; Museum of Fine Arts; Houston, Texas
- 1990 *Otto Steinert und Schüler*; Museum Folkwang; Essen, Germany
- 1994 *8 Fotografen zum gleichen Thema*; Siemens Fotoprojekt; Städtische Galerie, Nordhorn, Germany
- 1996 *Die Klasse*; Museum für Gestaltung, Zürich, Switzerland
- 2002 *Schupmann Collection - Fotografie in Deutschland nach 1945*; Stadtmuseum Münster; Muenster, Germany

PHOTOGRAPHY IN GERMANY AND AUSTRIA

Germany and Austria are Central European countries with few natural borders, which has led to several dividing and unifying processes in their history. In the course of the twentieth century, Germany and Austria have changed their frontiers more than once; in the aftermath of World War II, Germany was divided into two parts for over 40 years, reunifying in 1989. The histories of German and Austrian photography therefore have been characterized more by individual contributions and various stylistic approaches than by distinctive national tendencies. On the other hand, the countries' geopolitical situations drew the attention of countless wanderers between East and West, which allowed German and Austrian art and culture to develop integrally within larger international movements.

German and Austrian photography in the twentieth century has been, for the most part, a mirror of the medium's history, but with a certain emphasis on singular developments. This ponderation is mainly due to the German language, which emphasizes precise formulation and descriptive qualities, often at the cost of elegance and dignity. German science and art have been described as conceptually strong and devoted to long-term developments, even if they come comparatively late. The stylistic histories of the visual arts and architecture in Germany and Austria demonstrate that these countries have rarely been the site of inventions or innovations but often that of the maturation of a particular technique or style. As German and Austrian photography encompasses virtually all

developments in photography, they reflect the general historical development of photography in the twentieth century.

The widespread fine art photography, or Pictorialist movement, brandished its waves on the German shore but left little impact on history as a whole. The Viennese Trifolium (Hugo Henneberg, Heinrich Kühn, Hans Watzek), founded in 1891 and dissolved by Watzek's death in 1896, was exhibited in Berlin, Dresden, Hamburg, and Munich, but only a few followed the American Alfred Stieglitz's clarion call for artists. The brothers Theodor and Oskar Hofmeister from Hamburg exhibited widely throughout the country, as well as the Krefeld sports teacher Otto Scharf, the Hamburg merchant Heinrich Wilhelm Müller, the painter Friedrich Matthies-Masuren, and the military officer Ludwig David from Berlin. Some of the fine art photographers specialized within the field, many in portraiture: Rudolf Dührkoop and his daughter Minya Diez-Dührkoop in Hamburg and Bremen, Hugo Erfurth in Dresden, Jacob Hilsdorff in Bingen and Munich, and Nicola Perscheid in Berlin. The Wiener Kamera Klub founded in Vienna spread Pictorialist ideas.

Two men were, on different levels, influential in spreading the idea of photography as a fine art among a larger public. One was the German-American and co-founder of the Photo-Secession Frank Eugene, who, having studied painting in Munich, stayed in town and effectively pursued both arts among the scene; his close collaboration with the

famous painter Franz von Stuck emphasized photography's impact on art. Having taught portrait photography at the Bavarian State School of Photography, he was named Professor of Fine Art Photography at the Academy of Graphics and Book Art in Leipzig in 1913—the first professorial seat in art photography in Germany. The other, Erwin Quedenfeldt in Dusseldorf, was not as lucky; he had wanted to integrate his private school of Fine Art Photography into the local School of Arts and Craft, then under the reign of the well-known designer Peter Behrens, but he had to give up these plans after Behrens' move to Berlin in 1908. Quedenfeldt, a chemist by profession, invented a printing process and was busy inventorying rural architecture in the Lower Rhine area. In Vienna, the Staatliche Graphische Lehr-und Versuchsanstalt (State Graphic Teaching and Research Faculty), founded in 1888, still concentrated on the technical side of the medium, expanding to art only after 1918, mostly under the influence of Rudolf Koppitz.

Both Eugene and Quedenfeldt, as well as the portraitist Hugo Erfurth, had prepared the road to modernism in photography by introducing high contrasts and plain white backgrounds into their work long before these practices were common. On the other hand, the work of two of the most important of the German modernists—August Sander and Albert Renger-Patzsch—is not explicable without noting their backgrounds in the Fine Art movement. While Sander had tried to establish himself as a professional Fine Art Photographer before World War I, Renger-Patzsch came from an amateur background, his father being a widely published author on technical aspects of photography, like gum-printing. In 1925, August Sander was encouraged by some friends from the Cologne art scene to reprint his old portraits on technical paper and to collect them under a sociological scheme. In less than four years, he had identified subjects that he thought represented Germany, his concept incorporating portraiture as well as architectural photography. When his first book appeared in 1929 under the title of *Antlitz der Zeit* (Face of Time), it was acclaimed with great applause as a mirror of German society. Albert Renger-Patzsch had appeared on the scene just one year before with his book *Die Welt ist schön* (The World is Beautiful), which received similar fame, although its title was rejected by nearly all critics.

Albert Renger-Patzsch had brought straight photography to Germany in the manner executed a decade earlier by Paul Strand: images of technical, natural, and artificial objects depicted from low distance under sharp light with overall deli-

cacy in showing surfaces and detail. Recognition for Renger-Patzsch came precisely at the time when avant-garde painters had switched to a style named *Neue Sachlichkeit* (New Objectivity), which applied notions about realistic representation to painting as obviously derived from photography. The climate of these developments was felt more strongly at several art schools and academies of the time in Germany and Austria, one of which has lent its name to a number of stylistic approaches: the Bauhaus. For the first nine of its 14 years of existence, photography was an integral part only of the basic (foundation) course at the Bauhaus. Masters like Georg Muche and László Moholy-Nagy introduced the medium to their students as a means of visual training, a practice that can be traced in the work of avant-garde luminaries like Umbo (Otto Umbehr) or Irene and the Austrian Herbert Bayer.

When Moholy-Nagy began teaching at the Dessau Bauhaus, his wife Lucia Moholy turned from her work in the promotion of literature and took up the documentation of her husband's paintings, the designs of students and other teachers, and with a long series of architectural photographs of the new Bauhaus buildings at Dessau. She also did Moholy-Nagy's darkroom work, reproducing his photograms, preparing his books for print, and advising him on technical details for his camera photographs. For several decades, her work languished in the shadow of her husband's huge and influential oeuvre but, according to the recollections of various Bauhaus students, Lucia Moholy was equally influential on their photographic practice.

When the Moholys left the Bauhaus in 1927, Joost Schmidt taught a class in advertising and photography, again as part of the foundation course. In 1929, Schmidt invited Walter Peterhans to start a class in photography, in fact the only photography course at the Bauhaus, which continued until it was closed by the Nazis in 1933. Peterhans's curriculum followed guidelines well known to photography students all over Germany: methods of developing film and prints; studies in densitometry, photograms, setting of light; and the main uses of the medium. The only truly modern curriculum in photography was taught just a few miles away from Dessau, at the arts-and-crafts school at Burg Giebichenstein in Halle. Following an aborted career as an art historian, Hans Finsler, initially the school's librarian, designed a modern curriculum based on photography's unique, intrinsic qualities. In Halle, Finsler was unable to fully explore his ideas, but with his departure for Zurich he was to become the most influential tea-

cher in Swiss photography of his era. Besides Hans Finsler, it was Max Burchartz at the Folkwang school in Essen who had, more or less by chance, introduced photography into his curriculum and practice, and two of his students at the end of the 1920s, Anton Stankowski and Klaus Wittkugel, were to gain fame in the 1950s as graphic designers using photography.

When Walter Peterhans was called for the Bauhaus, he left behind a small advertising studio to two of his private students, Grete Stern and Ellen Auerbach. Under their nicknames “ringl + pit,” Stern and Auerbach made this studio well known among advertising agencies and designers of the late 1920s. Although only in their mid-1920s, Stern and Auerbach attained immediate success with their application of modernist principles to advertising, fashion, and object (still life) photography. A number of their competitors at the time were also receiving recognition with their work: Ilse Bing in Frankfurt on the Main started a career in theater and dance photography while studying art history; Gisèle Freund used her camera to document political demonstrations in the same town where she was studying sociology; and Lotte Jacobi, who had taken over her father’s photographic workshop, created journalistic portraits of prominent and everyday people. She not only published her photographs in various illustrated newspapers but also accompanied the famous writer Egon Erwin Kisch throughout the Soviet Union and Central Asia.

Lotte Jacobi’s work was in the new field of photojournalism. She especially dealt with the political aspects of the field by cooperating with the large commercial papers as well as with communist party activists like the *photo-monteur* John Heartfield (Helmut Herzfelde), for whom she set the protagonists of his posters into the scene. The introduction of photographic journalism into Germany had been delayed, which proved an advantage when it arrived as a force in the late 1920s. The large printing companies not only introduced autotype printing of photographs in 1925 in German tabloids and magazines, but they also devoted considerable space to photographic reproductions, allowing a new generation of young illustrators and photographers to create innovative lay-out and design schemes. In the highly competitive market of German-illustrated newspapers of the 1920s and 1930s, editors welcomed such innovation and counted on the name recognition of the emerging “star” photographers to sell their publications. A star system had soon emerged.

The first “star” of photojournalism was, without doubt, Erich Salomon. After studies in jurispru-

dence, he served the Ullstein publishing house in legal affairs. During a court case, he took candid photographs. Although such activities were strictly forbidden, the resulting images were so respectful to both the court and the litigants that Salomon was thereafter greatly sought out to document the important events of the day. There was no important conference without Salomon present up to the mid-1930s, yet even his distinguished reputation did not prevent his being murdered by the Nazis at Auschwitz in 1944. Other photojournalists of the late 1920s, such as Felix H. Man, followed Erich Salomon’s precedent; others, such as the brothers George and N. Tim Gidal, found their themes in everyday life. Austrian press photographers like Lothar Ruebelt concentrated on sports very early, whereas Harald Lechenperg pursued a career as a traveling journalist with long trips to Central Asia and Africa. But most journalistic photographs were provided by press agencies, which gave a number of very young practitioners the chance to introduce themselves into the field. The left-leaning magazines had to rely on a well-organized amateur movement called *Arbeiterfotografie* for the majority of their images. Photographers like Walter Ballhause, Erich Rinka, John Graudenz, Ernst Thormann, Richard Peter senior, and Toni Tripp emerged out of this movement. Among the *Arbeiterfoto* correspondents who survived the Nazi persecution and received positions in the newly founded German Democratic Republic (GDR), Walter Ballhause is the most prominent.

Most journalists in the 1920s treated the Nazi party movement with a mixture of oppression and neglect, and subsequently they were among the first who feared for their lives after the National Socialist party came to power in January, 1933. Erich Salomon did not return from a conference in Den Haag; N. Tim Gidal used the occasion of another conference to flee to Switzerland; Felix H. Man followed his editor Stephan Lorant to the United Kingdom; Gisèle Freund had to emigrate to France in order to finish her doctoral thesis. Ilse Bing had moved to Paris just prior to these political developments, and Hans Finsler was appointed lecturer of photography at the Zurich school of arts and crafts in 1932. What was left to German photojournalism after this severe loss can be viewed as a level of mediocrity as well as a chance for very young amateurs, who seized the opportunity for careers. These photographers include: Wolfgang Weber, Hilmar Pabel, Bernd Lohse, Wolf Strache, Werner Cohnitz, Max Ehlert, and Erich Stempka, just to name a few. But even these men produced material of a higher quality than the photo-journalism

efforts of the Nazis—even propaganda minister Joseph Goebbels regularly bemoaned the miserable quality of the photographic material presented to him. What happened in Germany in 1933 was to be repeated in Austria in 1938: When the Nazis came into the country, a number of photographers like Wilhelm and Laszlo Willinger had to flee from their homes and businesses.

Photography, of course, was an integral part of the Nazi propaganda machine. As photography was seen as inherently modern in proposition and effect, there was no rejection of modern or even avant-garde styles in the first years of the regime. In 1929, the Stuttgart exhibition *Film und Foto* had set the framework for a common foundation of knowledge about modern German photography; historically, this exhibition must be seen as an important retrospective of the various experimental techniques and styles of German photography to date. When the exhibition traveled to a number of German cities, it was welcomed by critics and public alike, and graphic designers could no longer think of effectively advertising products without using photographs. As a result, modernism was well established at the time of the Nazi regime, and a number of modern designer-photographers continued working without change. Herbert Bayer worked for advertising agencies and curated large exhibitions featuring works that utilized photomontage, serial imagery, and avant-garde leaflets. Bayer's last show accompanied the Berlin Olympic Games and was an enormous success, while it also marked the tolerance of modernism by the Nazis. In early 1938, Bayer left for the United States, where he went on to become a leading designer and photographer.

The fate of another modernist was not as lucky: Else Simon-Neuländer, better known under her brand name Yva, was the most famous fashion photographer in Germany of the 1930s and published in all important magazines. In 1936, she was urged to sell her business to a friend; in 1938, she began work as an X-ray assistant in a Berlin hospital. In 1942, she was deported to the Majdanek concentration camp, where she is suspected to have been murdered. Her last apprentice, Helmut Newton (Neustaedter), however, survived by fleeing to Australia. Many other photographers, including Lotte Jacobi, left their businesses behind, sold them for cheap or gave them away for nothing, using all of their belongings to pay for their emigration. On the other hand, some of these cheaply acquired photostudios allowed other careers to flourish, a phenomenon which continued after World War II.

In many minds, Nazi photography is synonymous with the work of Heinrich Hoffmann. A well-trained

portrait photographer with stages abroad, including at the atelier of E. O. Hoppé in London, he opened a small studio in Munich shortly before World War I. In 1921, he met Adolf Hitler and became a personal friend; Hitler eventually transferred to Hoffmann the copyright of his image, resulting in the fact that no one was allowed to take or sell photographs of Hitler without Hoffmann's permission. To this monoculture of imagery came a racist ideology, as spread in photographic books by Erna Lendvai-Dircksen and Erich Retzlaff. The result was an average boredom of the public when looking at photographs, and this would only be overcome by propaganda strategies of individual authorship. As with the communist *Arbeiterfotografie* (Worker Photography) movement, the Nazi government tried to stimulate amateur photography by installing local groups, subsidizing amateur magazines, and combining sport or travel activities with photography. Leni Reifenstahl is also closely associated with the Nazi movement, especially her film and the photographs adapted from it of the Berlin Games.

The amateurs, however, needed stars to look up to, and by 1933, two were already available: Walter Hege and Paul Wolff. Both were moderately modern in their work; both were extremely productive and actively teaching at workshops and in academies, but their work focused in different directions. Walter Hege was an interpreter of ancient ruins, and Paul Wolff depicted the beauty of everyday life, especially for those few lucky and rich enough to afford driving around Germany in automobiles. In the late 1930s, he was followed by the Austrian Stefan Kruckenhauser with similar images on what was now called the Ostmark. Albert Renger-Patzsch still was recognized as the greatest photographer at the time but did not gain the status of a star during this era as did Hege and Wolff. The most important aim of these photographers and their role in state propaganda was not achieved, however: to inspire a large number of young women and men to become the next generation of propagandists. As a result, World War II began with the Nazis undertaking great efforts to install Propaganda companies (PK) and to enlist such well-known photographers as Hanns Hubmann, Fritz Kempe, Hilmar Pabel, and Lothar Ruebelt. But, despite their being masterfully photographed and printed, these military propaganda pictures had little lasting influence.

Those images that would have interested the German public in a totally different way were not published before 1945: photographs of acts of persecution against Jews, the Sinti and Roma people, political opponents, and all those not able or will-

ing to fit into the racist scheme of the Nazi regime. Most of the images that depict the Holocaust are derived from material seen, taken, and supplied by the perpetrators themselves, thus showing only one side of the truth. Crimes against humanity, as executed openly among the German people, were set into scenes in order to be photographed and recorded in a matter similar to documentary filming. Photographs of concentration camps are rare, and even rarer are images like those by Mendel Grossman of the Ghetto in Lodz, Poland, which had to be smuggled out shortly before he was transported to another camp, where he died. The rarity of these photographs quickly made them icons of the Holocaust, contrasting sharply with the masses of propaganda photographs taken by amateurs and professionals alike, as these few images show the actual horror of people willing to look away from what was done in their name.

After 1945, Germany lay in agony, and so did German photography. Only a few photographers documented the damage and destruction of the country's cities, as Robert Capa had done on his assignment in Berlin in August, 1945. Eva Kemlein worked in Berlin, Hermann Claasen in Cologne, Erna Wagner-Hehmke in Dusseldorf, Karl-Heinz Mai and Renate Roessing in Leipzig, Lala Aufsberg in Nuremberg, and Herbert List and Tom von Wichert in Munich. Many others did not wish to know anything about war and its results. The older photographers who had participated in propaganda and other war crimes now took their motifs from nature, so as to deny that they had helped to destroy a cultivated country. Younger photographers fled to abstraction as a manifestation of their amnesia. In 1949, a group of young photographers was formed which was to become the nucleus of 1950s modernism; its name was *fotoform*, and the more famous members were Peter Keetman, Otto Steinert, and Ludwig Windstosser. Keetman represented the purest form of *fotoform*; Steinert had incredible impact on the German photographic scene as teacher, and Windstosser presented German industry after its remarkable postwar recovery. The group offered membership to two older avant-gardists—Raoul Hausmann, the former *dadasoph*; and Heinz Hajek-Halke, who had played a minor but prolific role in the 1920s.

Hajek-Halke taught on a part-time contract at the Berlin Academy and helped a number of students to find their way, among them characters so diverse as Dieter Appelt and Michael Ruetz. Otto Steinert taught in Saarbrücken until 1959, where he helped important artists like Monika von Boch, Kilian Breier, and Detlef Orlopp start their careers,

but he switched to teaching straight photo-journalism upon moving to Essen. Among his more important students were Hans-Joerg Anders, Henning Christoph, Juergen Heinemann, Bernd Jansen, Dirk Reinartz, Heinrich Riebesehl, Guido Mangold, Rudi Meisel, Peter Thomann, Walter Vogel, Wolfgang Vollmer, and Wolfgang Volz. A few of Steinert's students in the 1960s moved to art photography (e.g., Arno Jansen, André Gelpke, and Timm Rautert).

The situation in Austria after 1945 was slightly different: U.S. propaganda magazines like *Heute* encouraged a number of very young photographers like Ernst Haas and Jewish immigrants like Erich Lessing to create a fresh scene of a life magazine journalism nearly unknown in any other European country. From the same ground, the career of Inge Morath emerged.

There were important exponents of 1960s photo-journalism in Germany besides Steinert's students. On one hand, men like Robert Lebeck and Thomas Hoepker pursued their own careers within classic journalism, whereas other photographers like F.C. Gundlach, Walter Lautenbacher, and Charlotte March laid out new goals for fashion photography; even Helmut Newton returned to the German-illustrated papers via France. Advertising and industry instigated a number of photographers to produce masterworks in this field, among them Robert Häusser, Franz Lazi, Will McBride, Karl-Hugo Schmölz, and Walde Huth, and, above them all, Reinhart Wolf. While there were many developments in politics and society during this era, art was not yet a real theme in photography until the mid-1970s. The only movement that quietly blossomed in the 1960s was called *Generative Fotografie*, which indicated a self-referential, extremely abstract form of autopoetically generated images in photographic techniques, including micrography, chemigraphy, and multiple pin-hole photography. This movement was led by Gottfried Jäger and embraced figures as diverse as Hein Gravenhorst, Karl-Martin Holzhaeuser, and Manfred Kage. This movement stimulated early experiments in computer graphics as well, as seen in the work of Herbert W. Franke, Manfred Mohr, and Frieder Nake.

Parallel to the renaissance of interest in classical photography as seen in the art market in the 1970s, there were two chains of development that represent German photography for the next 20 years. One received the name of *auteur* photography, after film theory's use of the term, with Andreas Müller-Pohle and Wilhelm Schuermann as its main protagonists, following in the footsteps of Steinert students Arno Jansen and Heinrich

Riebesehl, whom they identified as their artistic fathers. The other, more important development can be described as the integration of photography into all existing concepts of art, but used mainly as a means of documenting the artist's own body. Dieter Appelt had been the forgotten forerunner of this movement, but all of those who followed him, from Gerhard Richter to Jürgen Klauke, Katharina Sieverding, and Klaus Rinke with Monica Baumgartl to Anna and Bernhard Johanne Blume, owed a great deal to his efforts and emphasis. Painter Sigmar Polke, who integrated reproduction technologies and photochemistry into classical as well as Pop forms of painting, explored new territory that has proven to be extraordinarily influential. All of these artists became teachers at various German art academies but did not found stylistic schools of their own.

The *auteur* movement was equally strong in Austria, and some of its proponents like Manfred Willmann, Cora Pongraz, Michael Mauracher, and Margherita Spiluttini gained world fame. On the other hand, there was the Wiener Aktionismus (Vienna Actionism) of performance and body art, which initiated the use of photography in the visual arts on a definitely new level. Protagonists of this development were Peter Weibel, Rudolf Schwarzkogler, Heinz Cibulka, Guenther Brus, and others who did not record their actions themselves but with the help of press photographer Ludwig Hoffenreich. This movement forms the background against which more recent artists such as Valerie Export have emerged.

The work of Hilla and Bernd Becher presents an entirely different case. Starting with architectural documentation of vernacular industrial sculptures in—according to the language—a typical German manner, the Bechers' work around 1970 represented the best of Conceptual Art and craft tradition in photography. In 1976, Bernd Becher was appointed professor of photography at the Düsseldorf academy and immediately began to assemble a class in the traditional sense of the word. A number of exhibitions made discernable three generations of Becher students who themselves have gained fame throughout the world now. The first generation is best represented by Candida Höfer, Axel Hütte, and Thomas Struth; the second by Andreas Gursky, Thomas Ruff—now his successor on the Düsseldorf chair—Jörg Sasse, and Petra Wunderlich. The third generation does not yet carry the clear profile of the earlier group, but includes already well-known artists like Laurenz Berges, Johannes Bruns, Christine Erhard, Elger Esser, Claus Gedicke, Heiner Schilling, and Andrea Zeitler.

The success of Bernd Becher's class concept stimulated similar efforts at other academies. Angela Neuke, former student of Martha Hoepffner and Otto Steinert, was installed to a seat at Essen university in 1983 after a long career in photojournalism, and she pursued, until her untimely death in 1997, the set up of a large class of promising designers and photo journalists, among them well-known names like Joachim Brohm, Zóltan Jókay, Volker Heinze, Karin Apollonia Müller, and Markus Werres. On the other hand, since the late 1950s, the Leipzig *Hochschule für Grafik und Buchkunst* (Academy of Graphic and Book Art)—the oldest academy in Germany—had watched closely what happened in the classes of Otto Steinert, his colleagues, and his successors. Nearly every student at this school had to fix his identity against the Western advantages in photo-journalism, which was damned as propaganda in order to install the GDR's own vision. Whereas Gerhard Kiesling, Lotti Ortner-Röhr, Richard Peter junior, Wolfgang G. Schröter, Erich Schutt, and Horst Sturm can clearly be seen as the next generation of German propaganda photographers, others became dissidents of the system and subsequently were not shown again before the late 1980s. Ursula Arnold has to be named here in first place, whereas the roles of, among others, Ulrich Burchert, Arno Fischer, Evelyn Richter, Detlev and Uwe Steinberg remain a little iridescent.

Since 1978, after the installation of the art historian Peter Pachnicke as head of the photography class, interest shifted from straight-forward photojournalism to what was the official function of art in socialist countries: the view on mankind. Christian Borchert and Helfried Strauß broadened the classical fields; Jens Röttsch and Rudolf Schäfer introduced photographic design to the GDR; Sybille Bergemann and Ute Mahler did the same for fashion. During the 1980s, several GDR photographers earned international fame through magazines and books, among them Ulrich Wüst, who had come from town planning, and a number of performance artists using photography as a means of expression, for example, Kurt Buchwald, Klaus Elle, and Klaus Hähner-Springmühl. Shortly before and after the German re-unification of 1990, a number of Leipzig students formed another nucleus of architectural documentation, by no means minor to the Becher class: Max Baumann, Matthias Hoch, Frank-Heinrich Müller, Peter Oehlmann, Hans-Christian Schink, Erasmus Schröter, and Thomas Wolf were followed by Thilo Kühne, Annett Stuth, and a growing number of young photographers now studying in Leipzig under the new direction of Joachim Brohm, Astrid Klein, and Timm Rautert.

[*Photograph courtesy of George Eastman House*]

The 1990s saw in Germany the same integration of all fields formerly separated in art, design, and technology. Computer imagery and virtual reality, model building and exact documentation, still and moving images grew into each other and were exhibited as photography only under the conditions of being a two-dimensional, printed, or projected plane. Thomas Demand's work, for example, is shown as photography although he considers himself more a media artist and sculptor. On the other hand, Gudrun Kemska, trained as sculptor, is equally known as a video artist and as a photographer. Heidi Specker has had a training in photography, but her work can be traced in computer graphics as well. Susanne Brügger's *Map Work* coincides with the return of cartography into Conceptual Art, and Hardy Burmeier uses vernacular photographs of the nineteenth century as a base for his computer works.

Artists of this kind come from a variety of backgrounds which were less distinctive for their work than in former generations. Subsequently, a new type of institution arose, teaching an equal variety of subjects from drawing and painting over photography and philosophy to electronics and economy. Although several academies have taken the first steps of their own transformation in that direction (like the Viennese Academy of Applied Arts), only two new schools have to be named in this field—the *Kunsthochschule für Medien* (Academy of Media) in Cologne, and the *Staatliche Hochschule für Gestaltung* (State Academy of Design) in Karlsruhe, which is directly linked to and situated under the

same roof as the *Zentrum für Kunst- und Medientechnologie* (Centre of Art and Media Technology). It is too early to see results of these schools, but there still is going to be a small German notion in works that integrate photography and media technology, the Internet and virtual reality, English language and Chinese or Kanji characters. These artists will act globally and still have their feet on the ground of their home countries, Germany and Austria among them.

JOCHEN GERZ

German

Unlike conceptual artists who radically denied the validity of the image, Gerz uses photography in order to redefine the status of representation in contemporary art and culture. For him, photography and text, through their many forms, are two inadequate, but complementary descriptive systems. As he put it: "What's happening when I am in front of an Ad Reinhardt monochrome? I am

constructing a text. What's happening when I am reading? I am creating images as they were a part of my nature."

Jochen Gerz was born in Berlin in 1940. In 1966, he moved to Paris, where he has lived ever since.

While studying in Cologne, London, and Basel, Gerz became interested in poetry. As early as 1959, he was a writer and translator; gradually his texts became more and more visual, until by 1966, the year he settled in Paris, he joined the visual poetry

movement. In 1968, he co-founded, with Jean-François Bory, the alternative editorial group Agentzia. Gerz would henceforth explore several artistic paths at the same time, such as literature, painting, sculpture, drawing, and photography, always keenly critiquing the media and desiring to involve the spectator in the creative process. Since 1969, several of his photo/text works have played off the tension between photographs (most often black and white, but in color since 1987) and critical texts.

If Gerz forms columns of lines to supplement illustrations, suggesting a correspondence between text and image, the reader very soon arrives in a no man's land in which he tries to locate the meaning of the two only seemingly related information systems. Although the relation between image and verb is called into question, the meaning, or rather the multiple meanings emerge in the failure of communication and in the concomitant deception of representation. The linearity of verbal text gives Gerz's photographs a particular temporal dimension that re-inscribes them in the field of reality, *not despite but through* fiction. "Time does not allow myth to exist," as Gerz said. That is why memory, the act of recalling the past, plays such an important role in Gerz's work, as a fundamentally aesthetic field. Nevertheless, the object of souvenir ultimately seeps away; it can only be evoked and not seized through photography. What links Gerz's sculpture with his photographic work is this interest on monumentality, as something which is concerned with memory, rather than with power.

Texts and images are used to examine their own function and dysfunction, their mutual analogies as well as their internal dissemblance. His photo-texts resemble a riddle more than having the quality of directing messages for purposes of communication.

With his combinations of images and texts, Gerz departs from the tradition established by John Heartfield. Heartfield created collages presenting social contradictions and power structures; he staged dissonances and focused on contradiction. One doesn't find these kinds of alienation or enlightenment strategies in Gerz's works. His works of art don't present didactics in an aesthetic guise. The information content of Gerz's messages "keels" over, turning them into riddles when trying to understand them.

Following the French symbolist poet Mallarmé, who showed less interest in words than in the white spaces between them, Gerz said: "I'm interested in the non-visual intermediate zone developing from the operation, which is neither text nor image." This intermediate zone illustrates the shift from photographic reality to intellectual abstraction. In *De L'Art n° 1 (About Art n°1)*, 1982–1983, black-and-

white landscape photographs are associated with a text about art. A poetic dimension rises up between the metaphorical images on the concept of landscape and the theoretical essay on what art might be. *De L'Art n° 1* is the first of a series of eight works composed always in the same way: texts and photographs complete each other, but they could also be viewed separately. Such works ask questions on the interstice and/or link between the visual and the verbal, their interdependency and their conflicts.

In contrast to politically involved artists of the 60s and 70s who considered art as a weapon to be wielded in the everyday debates in the arena of social policy, Gerz pursues a more radical approach by continually calling communications systems into question, not as neutral instruments but as elements of an existing order. Rather than linking his interrogations with the "representation of politics," he oriented his work to the "politics of representation," that is, its internal structure and ideological forms. For Gerz, aesthetics are intimately related to the social field. As he showed with *Exposition de huit personnes habitant la rue Mouffetard, Paris (Exhibition of eight persons residing Mouffetard road in Paris)*, 1972, art is a space of a potential collective expression.

In 1976, Gerz represented Germany in the Venice Biennale and participated in Documenta 6 (1977) and 8 (1987) in Kassel. In the 1980s, the artist was commissioned to create several monuments in which he would subvert the idea of commemoration, turning spectators into actors: *Monument Against Fascism*, Harburg, 1986; *Bremen Questionnaire*, Bremen, 1990; *2,146 Stones Monument Against Racism*, Saarbrücken, 1990–93; *The Living Monument*, Biron, 1997. In parallel with his artistic work, Gerz has taught as a visiting professor in Germany, France, Canada, and the United States. He is a Senior Research Fellow at Coventry University in England and a Member of the Art Academy in Berlin, and he holds the Honorary Chair at the Braunschweig Art Academy.

MARIO GIACOMELLI

Italian

Mario Giacomelli is one of Italy's most prominent photographers, and among the best-known photographers of the twentieth century. His deeply humanistic photography focused, in the most part, on his native country, although he created notable series on the pilgrimage site of Lourdes, France, and he documented the 1974 famine in Ethiopia. In 1955, he was discovered in Italy by the Italian photographer Paolo Monti, and, beginning in 1963, he became renown in the United States through John Szarkowski of the Museum of Modern Art, New York, where Szarkowski presented a series called *Scanno*, and then later incorporated an image of the photographer in his famous book *Looking at Photographs* (1973).

Born in 1925 in the seaport town of Senigallia in the Marche region of central Italy, Giacomelli grew up in a modest family. When he was nine, his father died. From that time, he dedicated himself to poetry

and painting. At the age of 13, he started working for a printer. After 1953, Giacomelli was taking photographs around the area with a Comet Bencini, at the time a very popular camera. The following year, as a self-taught photographer, he joined the photography group Misa founded by Giuseppe Cavalli in Senigallia. Also in the group at its beginning were Vincenzo Balocchi, Ferruccio Ferroni, Pier Giorgio Branzi, Paolo Bocci, and Silvio Pellegrini. Although Cavalli was a formalist who preferred aesthetically composed photographs in gradients of light gray, Giacomelli, whose later work displayed similarly sharp contrasts, profited from his experience with Cavalli. Over the next few years, Cavalli readied the members of Misa to join the photography group La Bussola, which he had founded in 1947 with Ferruccio Leiss, Mario Finazzi, Federico Vender, and Luigi Veronesi. The formalist style during these years stood in contrast to the neo-realists, who, during the postwar period, were begin-

ning to shoot photographs of the country, especially the land and the people of southern Italy, without aestheticizing the image. In literature, representatives of neo-realism include Elio Vittorini and Cesare Zavattini; in film, Vittorio De Sica, Roberto Rossellini, and Luchino Visconti; and in photography, Nino Migliori, Franco Pinna, and Gianni Berengo Gardin. The photographic works were influenced by a reality that their authors had experienced and wanted others to experience, but also showed an influence of American precursors from, for example, the Farm Security Administration and Eugene W. Smith. At the same time (1953–1955), Paul Strand, with his objective viewpoint, was photographing his series *Un paese* in the Italian town Dorf Luzzara in the Po valley. Within this cultural and photographic context, Giacomelli developed an individual style that distinguished him decisively from the others. His photography did not serve as reportage or documentation, but it did help the author to overcome his innermost fears. He conceived the camera as a medium of expression, like the brush is for the painter and the pen for the poet.

In 1954, he bought a used 6 × 9-inch Kobal camera that he modified to produce a 6 × 8½-inch image. He was largely unconcerned about lighting conditions because he used an electronic flash. His mode of expression, whose composition and formal structure he learned while doing graphic work in the printing business, consists of many elements. These include the stark juxtaposition of black and white and a strong, coarse granularity made on photo paper sensitive to contrasts. He also used apparently accidental, formal elements created from consciously “bad” photographic techniques, such as moving the camera and shooting out of focus or resorting to double exposure and extreme development of the negatives. This makes many of his works appear to be a mixture of spiritual and material objects. Other works highlight the tensions created by strong graphic contrasts. The background is often washed out in an overexposed white while the black bodies seem to float. Movement in photography is very important for Giacomelli because it represents life and the passage of time. He developed his own visual language, as he also did in his poetry, and it enabled him to represent scenes that correspond to his vision and perception of the world. The titles of his photography series are usually borrowed from stories or poems by authors who inspired him, such as Cesare Pavese, Edgar Lee Masters, Emily Dickinson, Giacomo Leopardi, and Eugenio Montale. Giacomelli valued the series, which after years he often assembled anew by placing the images in a different sequence. His preferred subjects were poor

and simple people. His photography projects would last some three years because he entered into sympathetic contact with each situation by living with the people in order to eventually work among them. After 1986, he broadened the content of his images with symbolic, artificial elements, such as pigeons, cardboard masks, and dogs made of fur fabric. An example of this is the photography series *Il pittore Bastari* (1992–1993).

Among his most well-known series is *Verrà la morte e avrà i tuoi occhi*—a title inspired by a Pavese poem—which is composed of photographs from 1955–1956, 1966–1968, and 1983. Ruthless and blunt, Giacomelli presents the residents of a home for the elderly in up-close, intimate situations, with the camera flash creating contrasts with their wrinkled skin. In another work, he poses these elderly people, who are dying, against the young, suffering people from Lourdes (1957). Giacomelli took the images in the series *Scanno*—named after the small town in the Abruzzi region of Italy that he visited in 1957 and 1959, five years after Henri Cartier-Bresson—in only a few days. Although he photographed the residents in their daily routines, his eye and technique lend the images the expression of a mystical engagement with the unconscious. The formal oppositions in his photographs of black-clad women standing in front of white walls reflect the inner contrasts of youth and age, tradition and progress, masculinity and femininity. The series *Presi di coscienza sulla natura* is composed of images taken from 1954 to 2000. With an abstract effect, this series displays photographs of cultivated earth, oceans, and beach landscapes, which are photographed in part from an airplane. Giacomelli edited many negatives so that the print better matched his intentions. These kinds of representations show influences of the Italian artist Alberto Burri, whom Giacomelli met in 1968. Although the title of another series, *Io non ho mani che mi accarezzino il volto* (I have no Hands to Caress my Face, from a poem by David Maria Turollo) (1961–1963), sounds melancholy; these photographs of priests playing in and against a backdrop of snow have a spontaneous, happy, and vital effect. *Caroline Branson* (1971–1973), which was inspired by Edgar Lee Masters’s *Spoon River Anthology*, is a love story in suggestive images, whose dramatic content represents the loss of ecstasy and the circle of death and rebirth. Giacomelli especially used the surreal effect created by the double exposure of a negative, which suits the presentation of visions of the unseen and unconscious. In *Favola, verso possibili significati interiori* (1983–1984), Giacomelli presents largely abstract images of bent iron rails that encourage

the personal fantasy of the photographer and the viewer to roam free. In doing this, he subscribed to the notion that the message of the image first comes to life in the interpretation of the viewer. In *Ninna nanna*, a collection of photographs taken from 1955 to 1987, the author recalls the memory of childhood in his sadness about the transitoriness and vanity of human creations. His mother's death in 1986 was another trigger for the melancholy and remembrances that he worked into the series *L'infinito* (1986–1988) and *A Silvia* (1987–1990), inspired also by the poetry of Leopardi.

Giacomelli's later series, such as *Io sono nessuno!* (1992–1994), *Bando*, (1997–1999), and *Questo ricordo lo vorrei raccontare* (2000), contain graphic signs, the disappearance of figures, and their shadows. In these works, the author expresses an inner world: alienation and desperation of human individuality, loneliness, the traces of time, transitoriness, and death. Arturo Carlo Quintavalle called Giacomelli's works "informal photographs" and read this as the photographer's self-analysis. Having spent most of his life in his home region, Giacomelli died in his home town of Senigallia in 2000. Many photography collections contain works by Giacomelli. Among them are the Museum of Modern Art in New York; the International Museum of Photography and Film, in Rochester, New York; the Bibliothèque nationale in Paris; the Victoria and Albert Museum in London; the Pushkin Museum in Moscow; and the Centro Studi e Archivio della Comunicazione at the University of Parma.

RALPH GIBSON

American

Ralph Gibson has made significant contributions to photography in the second half of the twentieth century, particularly in the area of fine arts photographic publishing. As the founder of Lustrum Press in 1969, Gibson put his belief that photographers needed to publish their photographs in an appropriate format into action. He had worked in advertising and design in Los Angeles, where he developed an understanding and appreciation of the possibilities of the photographic book and, realized that, in addition to exhibitions, books could be an effective means of disseminating not only his own photographs, but those of others.

Gibson was born on January 16, 1939 in Los Angeles, California, and grew up in Hollywood. His father was assistant director to Alfred Hitchcock and often took Gibson with him to the sets during the 1940s. The lighting style of the period, which featured sharp contrasts, had a lasting impact on the impressionable young Gibson and would later become a major characteristic of his photographs. Film, which is the illusion of movement created by a series of still photographs, may also have planted the idea of sequence, another of Gibson's defining characteristics. As well, Gibson was influenced by Hitchcock, the master of mystery films, as can be seen in his often moody and mysterious photo-narratives. Later influences included the filmmakers Ingmar Bergman and Jean-Luc

Godard, as well as the writers of the *nouveau roman* or new novel, Alain Robbe-Grillet, Marguerite Duras, and Nathalie Saurraute. Gibson also acknowledges his indebtedness to painter Giorgio De Chirico and Surrealism.

After graduating from high school in 1956, Gibson enlisted in the United States Navy, where he received some training as a photographer. Following his discharge in 1960, he enrolled at the San Francisco Art Institute, where he came into contact with Dorothea Lange. He served as her assistant from 1961 to 1962. Returning to Los Angeles in 1963, Ralph Gibson's first serious projects in photography were documentary in nature and influenced by the work of Robert Frank, for whom he served as assistant and cameraman on his films *Me and My Brother* and *Conversations in Vermont*, as well as that of Henri Cartier-Bresson and William Klein, whose styles were in considerable contradiction. What these figures shared and what Gibson responded to was their interest in documenting contemporary urban life. But Gibson had not yet found his own vision. His early series *The Strip: A Graphic Portrait of Sunset Boulevard* (1966) explored the nightlife of youth on Los Angeles' famous boulevard but did not achieve much success.

Gibson's approach to photography changed radically in 1969, when he moved to New York City, established a studio, and founded Lustrum Press, which he directed. While he developed his

own photo books, he published Larry Clark's seminal *Tulsa*, in 1971, showing in harrowing images teenage amphetamine addiction; as well as *Passport*, 1974, which helped establish the reputation of photojournalist Mark Ellen Mark. Gibson's first book was *The Somnambulist*, published in 1970. In contrast to the documentary style in photography in which clarity of information is essential, Gibson described *The Somnambulist* as a "dream sequence." It is the first of three books that form the *Black Trilogy*. Gibson's conceptual approach was subtractive, with importance placed on what was not presented in the photograph; that is, the meaning was generated by what the viewer did not see—the formal qualities of the work, such as the patterns of highlights and shadows implying what Gibson called a "non-specific narrative." Alain Renais' mysterious, black-and-white film, *Last Year at Marienbad* (1961), with the screenplay by Alain Robbe-Grillet, had been especially significant for Gibson. *Deja-Vu*, published in 1973, and *Days at Sea*, 1974, complete the *Black Trilogy*. *Days at Sea* shows Gibson's often grainy images becoming increasingly abstract; there is also a heightened sense of the erotic that results from the mysterious tableaux and anonymous figures. *The Somnambulist* broke new ground in that it relied very little on text. The book was the ideal medium for Gibson, because he could control the juxtaposition and sequence of the images, leading the viewer to make comparisons and develop a narrative.

In the 1980s, Gibson continued his unique approach in *Syntax* (1983), *L'Anonyme* (1986), and *Tropism* (1987), the latter two books published by Aperture. Gibson has said, "Whatever the mode—from the snapshot to the decisive moment to multimedia montage—the intent and purpose of photography is to render in visual terms feelings and experiences that often elude the ability of words to describe." Gibson provides additional insight when he says, "[A] photographer's need to create becomes 'the event' itself and the photographer finds himself responding to feelings that can only be defined after he has made the photograph."

Preferring the 35-mm Leica M-3 with a 50-mm lens, Gibson has also used 28, 35, and 90-mm lenses. His use of high-speed Tri-X film in bright sunlight, which he also overexposes and underdevelops, results in dense negatives that allow him to achieve the grain and contrast he desires. Although primarily known for his books, Gibson also creates 11 × 14 and 16 × 20 prints for exhibitions.

In 1991, after having established a reputation as a black-and-white photographer, Gibson published

L'Histoire De France, his foray into color photography, and his fifteenth published monograph. It is an adventure in which he continued to fragment and isolate objects; his use of color is restrained and is carefully integrated into the total composition. As in many others of his books, *L'Histoire* features little text, only an introduction (by Marguerite Duras), chapter titles, and an afterward.

Gibson's series *Ex Libris* (2001), consisting of 109 duotone photographs, expresses his lifelong interest in books and language. For this project, he photographed signs, letter forms, icons, and images representing the history of mankind. Subjects include the Rosetta Stone, the Koran, the Gutenberg Bible, and a wide variety of objects selected from international museums. This series also showcased his first use of 30 × 40-inch Iris prints, and archival, digital inkjet technology.

While Gibson seems to maintain the essence of the medium of photography, he also expands the parameters of both image and technique. His suggestive glimpses of reality create visual riddles that appeal to the unconscious and imagination. By asking the viewer to participate in his act of creation by imagining the narrative, Gibson transports the viewer to a dreamlike world where everything seems pregnant with possibility.

N. TIM GIDAL

German

Photojournalist Tim Gidal entered the profession at a watershed moment in the history of the medium. Born Ignaz Nachum Gidalewitsch in Munich in 1909, twenty-year-old Gidal published his first photo essay the same year the Deutsche Werkbund launched its influential traveling exhibition of modern photography *Film und Foto* in 1929. The largest exhibition devoted solely to photography to date, "FiFo" (as it became known), celebrated the medium's stylistic diversity and international import at the end of the 1920s. Though Gidal entered the profession too late to be included in this groundbreaking show, he quickly earned a reputation as one of the innovators of the new "objective" style of photojournalism it promoted. The eyewitness objectivity, visual acuity, and passion for social justice for which Gidal became known were evident, even in his earliest photographic essay titled *Greetings, Comrades!*, published in the *Münchner Illustrierte Presse* in June, 1929.

By the end of World War I, photography's perceived objectivity had largely displaced the subjectivity

and emotional angst of Germany's wartime journalism and Expressionist painting. In the midst of the nation's mounting obsession with *Sachlichkeit*, or objectivity, photojournalists like Gidal offered the nearly five million purchasers of German-illustrated magazines compelling first-hand accounts of Europe's "golden twenties" and deepening political, social, and cultural strife.

Gidal's own life was deeply affected by the National Socialists' ascent to power in the early thirties. The fourth of five children born to liberal Orthodox Jewish Russian and Lithuanian immigrants, Gidal developed a deep appreciation for his Jewish and Zionist identity. As a young man, he studied history, art history, and economics at the Universities of Berlin and Munich, but he studied photography only informally with his photojournalist brother Georg, before Georg's untimely death in 1931. Gidal's early professional success placed him at the forefront of a growing league of freelance photographers working for the *Dephot* photo agency in the late 1920s, including Kurt Hulton, Felix Mann, Erich Salomon, and Umbo, among others. One of his most influential suppor-

ters during this time was a young picture editor for *Weekly Illustrated* named Stefan Lorant, who hired the neophyte photographer for assignments in Munich and London. In the early 1930s, Gidal traveled extensively in Germany, France, Holland, Poland, and Scandinavia before emigrating to Basel, Switzerland in 1933 to complete his doctoral dissertation “Pictorial Reporting and the Press.”

Tim Gidal’s role as a practitioner, scholar, and historian of photography set him apart from his contemporaries. A humanist in the truest sense of the word, his contributions to the medium’s modern history include the publication of more than 30 books, the organization of nearly two dozen major exhibitions, and the tutelage of several generations of students in the United States and Israel. Throughout a career that spanned the better part of the twentieth century, Gidal imparted his genuine compassion for his subject matter and his profound belief in the significance of the photographer’s role as an historical eyewitness. Whether documenting a mundane interaction between pedestrians on a street in Tel Aviv or photographing Gandhi’s address to the All-India Congress, Gidal maintained an unwavering faith in the dignity of his sometimes ordinary, sometimes extraordinary subjects. Though he professed a healthy respect for photographers who attempted to “express their inner self with the help of the photographic lens,” Gidal felt it best to “leave it to the object/subject to express itself with the assistance of [his] camera” (*My Way* preface by Nissan Perez). His images invariably evoke an emotional response, despite Gidal’s consistent and exacting professional distance. In Gidal’s view, only through the “subjective experiences of the objective facts,” could a “genuine” photo-reporter “become a witness to his own time.” Although he photographed sensational events, Gidal avoided sensationalism by refusing to photograph violent scenes and by emphasizing the ordinary in the extraordinary and vice versa.

In many early photographs, like “And Yet it Moves,” taken in 1929, it is clear that Gidal experimented with the extreme camera angles and subjective manipulations popular with the photographers trained under László Moholy-Nagy at the Bauhaus. Other pictures, such as his 1935 photograph of mannequins in a milliner’s shop window, resemble the proto-surrealist photographs of Eugène Atget, who captured the spirit of turn-of-the-century Paris by photographing the defining urban spaces of Parisian life rather than the inhabitants themselves. Still other photos, like an untitled 1930 image depicting a disheveled young couple exchan-

ging a passionate kiss, recall the voyeuristic nightclub photography of contemporaries like Brassai. There are tightly cropped crowd pictures resembling the work of Weegee and urban snowstorm photos à la Alfred Stieglitz or Edward Steichen. In the end, however, Gidal eschewed both subjective avant-garde techniques and the much-lauded “decisive moment” approach promoted by modern photojournalists like Henri Cartier-Bresson in favor of more objective, unmediated images that convey the expressive personality of his subjects as well as his own intimate understanding of those subjects.

Following the completion of his doctorate in 1935, Gidal produced and directed three short documentary films in Palestine under the title *Eretz Israel* which were screened throughout Germany, France, and Italy in 1936. After the publication of his book *Children in Eretz Israel* that year, Gidal permanently relocated to Eretz, working as a freelance foreign correspondent for Reuters-Photos and as a photographer for the Jewish National Fund and the Hebrew University Hadassah Medical Center. In 1938, he became the first photojournalist to publish a color photo-essay when *Marie-Claire* printed his series *Holy Land*. Gidal traveled to London for the launch of Lorant’s *Picture Post* then embarked for India and Ceylon where he produced some of his most famous *Life* magazine and *Picture Post* photo-essays *The All India Congress*, *Travels with Gandhi*, *Village in India*, and *Buddha Procession in Ceylon*. Upon his return to Palestine in 1940, Gidal provided photo-essays of campaigns in North Africa, Burma, and China for the Middle East Eighth Army magazine *Parade*. In 1943, Gidal was wounded on Samos Island in the Aegean Sea and was subsequently assigned to Southeastern Asia under the command of General Mountbatten.

Following his marriage to Sonia Epstein in 1944 and the birth of his son Peter two years later, the Gidal family joined leagues of Nazi-persecuted German Jewish intellectuals and artists when they embarked for New York City. In 1948, Gidal assumed a position on the editorial staff at *Life* magazine while teaching classes in the History of Visual Communication at the New School for Social Research. Over the next two decades, Gidal published more than two dozen books, including *This is Israel* (1948) and a series of 23 children’s books co-written by his wife Sonia that depicted children in different cities and villages around the world. Though he continued to photograph, his work as a curator, professor, and author took precedence from the mid-1950s on. His most influential text was a history of photojournalism published in Germany in 1958, translated as *Modern Photo-*

journalism: Origin and Evolution, 1910–1933 in 1972 and still widely cited as an invaluable first-hand account of the development of modern photojournalism. By the time of the book's U.S. release, Gidal had returned to Israel, where he met his second wife, Pia Lis. He spent the next two decades exhibiting and teaching in the Department of Communications at the Hebrew University of Jerusalem, where his scholarship focused almost exclusively on Jewish history in The Holy Land, the Near East, and, finally, in Germany. His textbook *Everyone Lives in Communities* appeared in 1972, and in 1980, Gidal was awarded the Israel Museum's Kavlin Prize for outstanding achievements as a pioneer of photojournalism and teacher/historian of photography. Three years later, he was honored with the Dr. Erich Solomon Prize for Germany in Cologne.

Throughout the 1980s, Gidal (who was by then known as Nachum T. Gidal) worked to compile an illustrated history of Jews in Germany with his second wife Pia, whom he married in 1984. An exhibition of selected works from the book traveled throughout Germany in the mid-eighties, and the book, titled *Jews in Germany from Roman Times to the Weimar Republic*, was released in 1988 and translated in English a decade later. The recipient of numerous awards and honors, Gidal was elected Fellow of the Royal Photographic Society, London and made an Honorary Fellow in 1992, the same year he was named Corresponding Member of the Deutsche Gesellschaft für Photographie. His work is held in the permanent collections of, among other distinguished institutions, New York's Museum of Modern Art, the Los Angeles County Museum of Art, London's Victoria and Albert Museum, the Berlinische Galerie, Paris' Bibliothèque Nationale, Paris; Fotomuseum, Munich and the Ludwig Museum in Cologne. After 87 years as a devoted practitioner, scholar, and humanist whose work was extraordinary in both its scope and significance, Nachum Tim Gidal died in Jerusalem on October 4, 1996. His archive of more than 14,000 prints and negatives was bequeathed to the Israel Museum in Jerusalem.

GILBERT & GEORGE

Italian/British

Gilbert Proesch and George Passmore met in 1967 at Saint Martin's School of Art in London where they both studied sculpture. As Gilbert & George they became one of the most important artistic duos of the second half of the twentieth century. Radical in

both message and medium, they tried to do away with the highbrow aspect of art. Photography was their prime method to bring art to the people: "We're in the Yellow Pages, under 'Artists.' We are making work, we imagine, for the viewer out there. Artists fall in love with art; we fell in love with the viewer of art. That's the difference." (Bracewell 2001, p. 5)

Proesh was born in the Italian Dolomites and was trained as a wood sculptor in his father's shop. He studied at the Wolkenstein School of Art in Italy, the Hallein School of Art in Austria, and the Munich Academy before moving to London. Passmore attended Darlington Hall College of Art and the Oxford School of Art prior to his London studies. He worked at the Selfridges Department Store and was a barman before he got into Saint Martin's.

According to tradition the two got together as George was the only one who could understand Gilbert's poor English. Presumably their common aversion to the elitist approach to art in general and sculpture in particular at Saint Martin's also played an important role in the decision to go their own way. They became one artist and were since then hardly ever seen separately, neither in real life nor in their art, in which they feature prominently.

At a time when the artistic community was wondering what options were left to explore, Gilbert and George made the radical, but at the same time the only possible choice: they turned life into art and became their own subject matter. They purchased a house, which they named "Art for All," in the working-class neighborhood of Spitalfields in East London and declared that they were "living sculptures." As living (and singing) sculptures they quickly made their name in the late 1960s and early 1970s. In these performances, which could sometimes last for hours, they took the stage dressed in matching business suits with their hands and faces bronzed. If they moved at all, it was in a mechanical and hollow manner.

They appeared interchangeable and stripped from any personality or imagination. In the best known renditions of these sculptures they got drunk or mimed to the music-hall song *Underneath the Arches*. These first performances, representing loss of creativity, had an annoying and unpleasant character. The photographic documentation of some of the "drunk" pieces mimic the off-balance stagger of a drunk; the black and white snapshot-like images are presented willy-nilly across a mounting board, as in *Smashed*, 1973.

Over the years Gilbert and George have expressed themselves through a number of mediums: bookmaking, mail art, drawing, video, painting, and photography, along with their trademark public persona, which always had performance-like qualities. Nevertheless Gilbert and George have consistently referred to their work as sculpture, stretching the traditional definition into a generic term now in wide use in contemporary art. By giving up their separate identities and becoming both artist and artwork, Gilbert and George realized a

notion in the avant-garde of the twentieth century that had long been an ideal, that of erasing the distinctions between life and art. Thus when artist, artwork, and everyday life form a unity, it becomes superfluous and even impossible to make a distinction between genres or mediums. Even so, their use of photography has clearly changed over the years.

At first it served as a way to record their performance sculptures and typically took the form of modest black-and-white documents. Very soon photography became their most important manner of expression, and their large-scale photomontages, bold in both color and subject matter, are a visual language uniquely their own. The artists themselves are the most important and only constant motif in that language. Dressed in their characteristic matching business suits, which they refer to as their "responsibility suits of our art," Gilbert and George conspicuously appear in their work. Other visual elements evolved and varied over the years, but symmetrical compositions, the artists' conservative look, references to art history and the organizing of individual works into series, gave their work a more classical appearance. They not only developed a striking visual language, but created their own conceptual world. Their fundamental ideas, which they codified in various manifestoes, have remained consistent over the decades. Gilbert and George never stopped making fun of the elitist nature of art. Their purpose was to break social and ethical taboos and dissolve the boundary between the private and the public sphere. In doing so, they proved not to be shy of tackling controversial topics such as alcoholism, sex, unemployment, violence, racial tension, homosexuality, and AIDS. Religion, social class difference, and other sacred cows were never safe from the artists.

Between 1970 and 1974 Gilbert and George made a series of charcoal-on-paper sculptures: charcoal drawings featuring natural motifs that covered entire walls. In a 1971 series of triptychs, *The Paintings (with Us in the Nature)*, Gilbert and George put themselves in the midst of an idyllic natural setting. Their photographs of the time were very different. As seen in *Gin and Tonic* (1973) they presented individually framed photos in large patterns. Until 1974 they almost exclusively made black-and-white photographs. Not surprisingly, given their increasingly transgressive subject matter, the first colors to appear in their pictures were strong reds and yellows evocative of blood and urine. Beginning in the 1980s and throughout the 1990s Gilbert and George produced numerous series of exuberant, large-scale montages of photographs. These works are characterized by extremely

GILBERT & GEORGE

bright colors and overlaying black grids, which echo the early patterned compositions. The artists very literally proclaimed themselves subject matter and appeared in almost every picture or included blown up images of their urine, sperm, and excrement, but often featuring natural elements like trees or clouds. These montages were far less realistic and much more humorous and ironic, and often cartoon-like, as exemplified by the 1983 work, *Coming*, which shows the artists looking toward the sky as enlarged and brightly-colored sperm passes by. They also experimented with huge photo-murals consisting of a single composition in framed panels spanning up to 30 feet.

Despite the often difficult subject matter, these montaged works were very well received by both the public and the critics, ensuring the artists an international reputation in the contemporary art world. Gilbert and George have had numerous exhibitions, referred to, fittingly, as one-man shows, all over the world. Their work was shown on three occasions at the international festival of contemporary art, Documenta in Kassel, Germany and was selected for the Venice Biennale. They were short listed for the Turner Prize in 1984 and won the prestigious award in 1986. With their work included in the collections of the most important photography museums and in those of world renowned art institutions, Gilbert and George occupy a unique place in the history of twentieth century photography.

LAURA GILPIN

American

Laura Gilpin biographer Martha Sandweiss described her as "a consummate landscape photographer," while Ansel Adams called her "one of the most important photographers of our time." Especially noted for her images of the Navajo people and portraits and panoramic landscapes that emphasize the quality of light, Gilpin was also a pioneering female photographer. As noted by her biographer, while Gilpin had a keen sense of design

and composition, her interest in the cultural significance of the landscape was equally as important, and it is this quality that has assured her work a lasting place in the history of photography.

Sandweiss argues that Gilpin's "interest in landscape distinguishes her from other women photographers and her approach distinguishes her from other male photographers." Whereas anthropologist and photographer John Collier Jr. described the "challenges" presented by the terrain, Gilpin sought an "accommodation" with the landscape.

Through her work, she became acutely aware of how the land was an environment that shaped human activity.

Gilpin was born in Colorado Springs and she began using a camera at age 12. Both her mother and family friend photographer Gertrude Käsebier supported her interest in photography. Educated in eastern boarding schools, Gilpin asserted her regional individuality by wearing a cowboy hat at school. In 1916, she enrolled in the Clarence White School in New York and mastered the Pictorialist style favored by the school's instructors.

A year later, she returned to Colorado and opened a studio specializing in portraits and architectural buildings, and she began photographing the landscapes around eastern Colorado. In 1924, she photographed the Mesa Verde cliffs and ruins and self-published the images as: *Mesa Verde National Park* (1927), and a companion booklet, *The Pikes Peak Region* (1926). Unlike many of her contemporaries who during the Great Depression found employment with government-sponsored programs such as the FSA [see WPA], Gilpin earned her living producing postcards, and a series of lantern slides of archaeological subjects. Her earnings were supplemented by a turkey farm that she ran with her lifelong companion Elizabeth Forster.

Shortly before World War II, her book on the Rio Grande pueblos, *The Pueblos: A Camera Chronicle* (1941), was published, after which she left her work in the Southwest to take a job as a photographer in the public relations department of the Boeing Aircraft Company in Kansas. After the war, she traveled to Yucatán in Mexico and expanded her interest in the architectural heritage of vanished indigenous peoples. The images of her next book, *Temples of Yucatán; A Camera Chronicle of Chichen Itza* (1948), are characterized by a visually powerful explosion of light from a sunburst framed by a sentinel-like portion of *El Castillo* (The Castle). Her next book, *Rio Grande: River of Destiny* (1949), was described as “a human geographical study.” In her final book on the Southwest, *The Enduring Navajo* (1968), Gilpin sought to record and convey how the Navaho were accommodating to change in the same way they had accommodated to their physical environment. She had begun photographing this tribe in the 1930s, when Elizabeth Forster worked as a nurse in a Navaho community. At the age of 81, Gilpin was awarded a Guggenheim Fellowship, and from then on until her death at 88, Gilpin worked on recording the ruins of Canyon de Chelly in New Mexico and Arizona. Her photo-

graphic archive is at the Amon Carter Museum in Fort Worth, Texas.

Gilpin's artistry has received much merited praise, and she is acknowledged as a premier landscape photographer, her work showing the deep commitment she had to the places she felt exemplified a feeling of spirituality and peace. In recent years, however, her work has come under scrutiny by scholars concerned with issues of cultural appropriation. Martha Sandweiss argues that Gilpin's work was motivated by her outsider status as a White person and that Gilpin was trying to get “close to people whose tradition and history seemed deeper than her own.” Like Gilpin, novelist and westerner Willa Cather was also drawn to a culture not her own, and to some of the same locations, in particular to Mesa Verde. In one of Cather's books, the main character asserts that “the relics of the Mesa Verde belong to all people. They belong to boys like you and me that have no other ancestors to inherit from.” Sandweiss noted that passages in Cather's *The Professor's House* could have served as text for some of Gilpin's images: “Far above me...I saw a little city of stone, asleep. It was still as a sculpture...it all hung together, seemed to have a kind of composition.” Gilpin did offer to illustrate Cather's book but received no reply.

While Gilpin did not agree with characterizations of her work as having unique qualities because of her gender, others have argued that Gilpin's fascination (along with that of Cather's) with the Southwest and its people was based on her outsider status, not only as White woman but as a lesbian. Jonathan Goldberg maintains that both the writer and the photographer shared an interest in “racialized others,” and negotiated their lesbian “difference” by immersing themselves in “exotic” cultures as a method of managing their outsider status. He notes, for example, that images of women predominate in both *The Pueblos* and *The Enduring Navaho*, and that this surfeit has had personal and cultural significance, one that is too often underplayed by art critics and biographers, thereby leaving us with a truncated understanding of both Gilpin and her work.

HERVÉ GLOAGUEN

French

Hervé Gloaguen belonged to the tradition of twentieth-century photo-reporters who defined themselves as socially aware photographers. As a founding member of the Agence Viva in France, he wanted to create a new way of reporting and photographing social events. Active in both color and black-and-white photography, he concentrated on the former without neglecting any genre: natural and urban landscapes, group or single portraits are common in his work.

Born in Rennes in 1937, Gloaguen grew up and was educated in Brittany. His talent for drawing and early interest in photography led him to enter the École des Beaux-Arts de Rennes in 1957. A year later, he was

admitted to the École technique de photographie et de cinématographie (ETPC), better known as the École de Vaugirard, in Paris. However, his results were unsatisfactory, and he dropped out of the school after six months.

Now settled in Paris, Gloaguen worked as an apprentice at Photo-Littré, where he learned basic photo laboratory skills. Between 1960 and 1962, he performed his compulsory military service in the Navy and joined its photo and cinema agency at the Fort d'Ivry, near Paris. At this same time, Gloaguen was an amateur jazz musician, which triggered his first Parisian photographs of concerts and theatre shows. He also used short leaves from the Navy to visit and take photographs in Portugal, Spain, and Belgium.

Having completed his military service, he was briefly employed as a photo-reporter and lab assistant by a small photo agency, the Atlantic Press. Through his acquaintance with actors at the Théâtre Mouffetard, he knew Chris Marker, who helped him meet Jacques Dumons, artistic director for the elite French magazine *Réalités*, whose staff photographers were Jean-Philippe Charbonnier and Edouard Boubat. In 1963–1964, on Dumons's recommendation, Gloaguen worked as an apprentice with Gilles Ehrmann, a regular freelance contributor to *Réalités*. Among his first published images in 1965 were eight color photographs presenting the Paris production of Edward Albee's play, *Who's Afraid of Virginia Woolf?*; these illustrate Gloaguen's early experience in color photography and his taste for stage photography.

Between 1965 and 1971, he gained further experience in photojournalism. He kept publishing in *Réalités*, but Électricité de France, the electricity company, also gave him some assignments through its "Création-Diffusion" department in order to illustrate *Contacts électriques*, its newsletter. During this period, he went four times to the United States, traveling to Boston, Dallas, and New Orleans, and exploring the contemporary art scene in New York. In 1966, he met Andy Warhol and Merce Cunningham, whom he photographed. Ugo Mulas had well documented the artistic life of New York in his *New York: Arte e persone* (1967). Gloaguen's idea was to do the same in Paris. Between 1969 and 1972, he photographed the Parisian art scene and published *L'Art actuel en France* (1973), with texts by Anne Tronche. He joined the short-lived Agence Vu in 1971 and, thanks to his new membership, Gloaguen had important encounters with Martine Franck, Richard Kalvar, and Claude Raymond-Dityvon.

In 1972, Alain Dagbert, Martine Franck, François Hers, Richard Kalvar, Guy Le Querrec, Claude Raymond-Dityvon, and Gloaguen created the Viva group. A predilection for collective action and rebellion had been in France since May 1968. In this context, the inception of Viva was a response to various phenomena. Gloaguen epitomized the emergence of photographers who wanted to include in their photographic work political and sociological content. Together this group shared a moral sense and a critical point of view on photography as a communication device: it was too elitist and manipulated; seldom-covered topics or groups should be thoroughly photographed to reach a wider audience. The photographer's moral intervention, Gloaguen pointed out, must come before the subject's choice, because he or she cannot really control the use of its image. This belief was a driving element for their group.

His *Famille d'Aix-en-Provence* (1972), included in the touring exhibition *Famille en France* (1973–1976), typically illustrates this. No member of the family notices him as he records simple daily actions, such as parents making their bed. In many of Gloaguen's images, protagonists seem unaware of him. He admitted using long focal length lenses rarely. Gloaguen developed in the 1970s his own style, in which the quest for accurate, useful images did not neglect formal qualities and personal involvement. Photographs of daily social life became choreographed records which echo his visual interest in theatre and music shows. In *Squatters à Islington* (ca. 1974), the movements and looks of immigrants animate stable compositions set in a derelict, working-class London district.

Viva unsuccessfully responded to market demands. In addition, personal conflicts within the group did not help it solve management failures. After 1978, Gloaguen gradually distanced himself from the group, although he was still part of it officially, and he further experimented in color photography in Lyons through the support of a grant.

In 1982, Gloaguen joined the Rapho photo agency. His knowledge of color photography helped him publish in both the French and German versions of *GEO* from 1983 to 1990. He benefited from his links with Air Solidarité, a humanitarian non-governmental organization (NGO), to travel to Africa during the 1980s. His numerous journeys gave him a standing position in the social documentation of this continent, as exemplified, in 1989, when the Rencontres internationales de la photographie in Arles, France welcomed his exhibition *Le miel et le bronze*. One of his greatest photographic and journalistic achievements in the 1980s was his reporting on the international blood market, published by *GEO* in 1987. The worldwide survey of this trade again underlined his interest in denouncing injustice. The United Nations High Commissioner for Refugees (UNHCR) sent him to Canada, Australia, Pakistan, Swaziland, Thailand, and the Central African Republic on assignment to document refugees' lives.

In the 1990s, his photographs were exhibited in Paris and throughout France. In 1995, Gloaguen finished a twenty-year photographic campaign—documenting Roman nightlife in color. His attempt to build an original photographic language in color is well illustrated by this series.

The scope of Hervé Gloaguen's work as a photojournalist is wide and mostly available in print (i.e., in color illustrated magazines or in his books of photographs). These show his attention to French landscape and urbanscape. His work illustrates his

GLOAGUEN, HERVÉ

personal interest in both the visual and performing arts, and it documents his concern with photographing multiple aspects of the human condition. In France, some of his photographs are included in the collections of Réattu Museum in Arles and in the Nicéphore Niépce Museum in Chalon-sur-Saône.

FRANK GOHLKE

American

Frank Gohlke approaches photography as a literary medium. “Photography,” he says, “compresses a multitude of histories into a single frame.” He relishes the textual possibilities of the scenes he captures. For him, the process of “unpacking” the potential meanings in an image, and the contemplation of these meanings, is the key project of photography. Light, texture, contrast, and other formal concerns enter into his work in subordinate roles, aids to the articulation of his thematic interests.

The environment, both natural and built, has remained the dominant theme of Gohlke’s work since he began in the late 1960s. Early in his career, he was drawn to the wide-open vistas of landscapes in the midwest and western United States. A native Texan, he returned often to photograph prairies, either as nearly “empty” expanses or as hosts to an incongruous variety of architecture. In the more expansive landscapes, we find evidence of the persistent, if subtle, presence of human endeavor—a distant telephone pole or a dirt track—despite the suggestion of infinite emptiness. In the others, he emphasized his concerns for the impact of built structures on the natural environment. Though banal in themselves, the houses and simple farm buildings in these images become catalysts for contemplation when they interrupt otherwise pristine vistas, forcing an understanding of the growing ubiquity of the built environment.

Gohlke strives to create images with deadpan objectivity. The subjects that he selects are dense enough as they stand; he finds no need to further dramatize the inherently compelling narrative of his scenes with provocative angles or radical lighting. This approach early earned him a place in the watershed exhibition, *New Topographics: Photographs of a Man-Altered Landscape*, held at the International Museum of Photography at the George Eastman House in 1975. Most of the photographers in this exhibition, also including Robert Adams, Lewis Baltz, Bernd and Hilla Becher, Joe Deal, Nicholas Nixon, John Schott, Stephen Shore, and Henry Wessel, Jr., shared a social concern for the environment that they expressed photographically in a style merging the goals of 1930s documentary mode projects with the ideals of straight photography—both of which Gohlke had become acquainted with directly from Walker Evans.

Gohlke had met Evans in Connecticut. Having finished his graduate work in English literature at Yale University, he had stayed on in the area to study photography with Paul Caponigro. During this time, he also got to know Evans, who strongly encouraged his decision to become a photographer. Gohlke then moved to Vermont for three years and there established a photography program at Middlebury College.

In 1971, Gohlke moved to Minnesota. Here he encountered the enormity and monumental sculptural presence of the grain elevators that dominated the area where he lived and began a decade-long engagement with the subject. The elevators were emblematic of the incredible productive capabilities of the Midwest, but were also relics of the past. Though they had once embodied the strength of the trade driving the local economy, many of these structures had fallen into various states of ruin by the 1970s. An elegiac tone permeates much of the work of this period, but the images are also laced with an enormous respect for the architectural grandeur of the hulking giants that lined Minneapolis’s midway district. For his book, *Measure of Emptiness: Grain Elevators in the American Landscape* (1992), Gohlke selected key photographs from this period and wrote an insightful essay on the significance he found in the subject.

Though closely associated with images of American landscapes, Gohlke has also created several significant bodies of work involving European subjects. In the mid-1980s, for example, he was asked to join an ambitious effort in France to document the country’s landscapes. This *Mission Photographique de la DATAR* organized a distinguished group of international photographers whose work was deeply engaged with the landscape. The project was openly based on its famous nineteenth-century predecessor, the *Missions héliographiques*, organized by the *Commission des Monuments historiques* (Commission on Historical Monuments) in 1851 to inventory France’s architecture photographically. Tellingly, the impetus for the first project was the realization that France’s aggressive modernization efforts under Napoleon III were threatening its architectural heritage. Likewise, the DATAR project responded to the growing awareness that the country’s landscapes had suffered gravely from a

century of rampant industrialization. The latter *Mission* published its final report in the form of a thick volume reproducing the photographs produced by the project.

Many of Gohlke's other projects over the following decade echoed his DATAR work in that he focused on a specific geographic area with the goal of establishing its essence at a given point in time. For example, having moved to Massachusetts in 1987, Gohlke began an ongoing project to document the Sudbury River 25 miles west of Boston. The river, once the muse of American Transcendentalist writers Nathaniel Hawthorne, Ralph Waldo Emerson, and Henry David Thoreau, was the subject of local activism to keep it protected—an effort that eventually (1999) led to its becoming part of the national parks system. In 1993, Gohlke had worked with a local art museum (the DeCordova Museum and Sculpture Park in Lincoln, Massachusetts) and the Sudbury Valley Trustees on a project to celebrate the untrammelled beauty of the river. Unlike so much of his work to date, this project focused on the potential for humans to have a light touch in their uses of natural resources—it is the chaotic order of nature that defines Gohlke's Sudbury River and its environs.

Much of Gohlke's work in the 1990s derived from commissions. He photographed Lake Erie for the Gund Foundation in 1997–1998 and participated in the National Millennium Survey in 1999–2000. As well, he was twice invited to work in Italy. First, in 1994 he was invited to photograph the *Parco del Gigante* by the Province of Reggio Emilia, a project that included both an exhibition and a catalogue. Then in 1998 he was asked to participate in a much larger project to photograph the industrial port of Marghera in Venice. The organizers of this second project selected an international roster of photographers whose approaches to the landscape differed considerably. Gohlke's contribution featured his signature black-and-white images of the industrial landscape, but also included views of non-descript interiors of factory control rooms and office areas. These images signal an expansion in Gohlke's interest; they spark contemplation of the impact of built environments on humans rather than on the landscape, and they provoke consideration of how the world we shape in turn shapes us.

This concern informs many of Gohlke's more recent projects as well—works that reflect an interest in the built environment itself. He has an ongoing series that focuses on funeral homes, for instance, in which he studies the exteriors of this specialized architectural form. He also has completed a project with Joel Sternfeld in Queens,

New York, that includes exteriors from several different neighborhoods displaying both the haphazard and carefully articulated patterns of urban life. In this later work, as in all of his previous endeavors, Gohlke's images require reading, unpacking as he describes it, to appreciate the vital complexity of his literate photographic output.

Biography

Born in Wichita Falls, Texas, 1922. Attended Davidson College, Davidson, North Carolina (1960–1963) and the University of Texas, Austin, where he earned his B.A. in English literature in 1964. Graduate work in English literature at Yale University, New Haven, Connecticut, where he received his M.A. in 1967. Studied photography with Paul Caponigro (1967–1968) while still living in Connecticut, where he met and was greatly influenced by Walker Evans. Taught at Middlebury College, Middlebury, Vermont 1968–1971, founding the photography program. From 1971 to 1987, Gohlke lived and worked in Minneapolis, where he taught variously at the Blake School (1973–1975), the University of Minnesota Extension, Minneapolis (1975–1979), Colorado College (1977–1981), and Carleton College (1980). He also taught at Yale University Graduate School (1981). In 1987, he moved to Massachusetts; began part-time teaching at the Massachusetts College of Art, where he is currently Visiting Professor of Photography. John Simon Guggenheim Memorial Foundation Fellowships, 1975–1976 and 1984–1985; National Endowment for the Arts Photographer's Fellowships, 1977–1978 and 1986–1987; Bush Foundation Artist's Fellowship, 1979–1980; McKnight Foundation/Film in the Cities Photography Fellowship, 1983. Lives and works in Massachusetts.

NAN GOLDIN

American

Nan Goldin's color portraits of her bohemian community in the 1970s turned the intimate family snapshot into an artistic genre and valid photographic art. Reappropriating the family medium of the slide show and the photo album, Goldin

creates a visual diary of the private lives of her chosen "family" of gays, lesbians, transgender people, and others outside of mainstream society whom she has photographed consistently over 30 years. Her work with familiar characters known affectionately as "the family of Nan" and her emotional intensity are evocative of cinematic narratives, large

scale, powerful, and intense, a claim which she herself makes. Unlike cinema, Goldin insists on the truthful unposed nature of her work, thus aligning herself with photography's fidelity to realism, openly introducing her authorial relationships to the subject, through titles that give her subject's name and the place where the photograph was taken. Goldin has encouraged this reading of her work as autobiographical, famously describing *The Ballad of Sexual Dependency* as "the diary I let people read." She challenges the notion that gender is biological and shows the constructed nature of gender roles, tracking what she calls "the third gender."

Born to an affluent Boston family, Goldin started photographing at age 15 after her elder sister committed suicide, which Goldin stated helped her deal with that tragedy. Goldin left home at an early age and lived with various foster families as a teenager. She attended art school, where she planned to do fashion photography and studied at New England School of Photography with Henry Horenstein, who influenced her snapshot aesthetic. She later attended the Boston School of Fine Arts, where her roommates, the subjects of her first show in 1975, were two drag queens whom she photographed at home and at gay bars. In 1978, she moved to New York City, where she became involved in a thriving art scene emerging around the East Village.

Goldin's work has been associated with the unposed photographs of Larry Clark and the banal "outtakes" of contemporary artist Jack Pierson. Goldin has also been associated with Cindy Sherman, who similarly documents the constructed nature of gendered identity, glamour, and self-presentation. Goldin acknowledges debts to Nobuyoshi Araki, painters Barnett Newman and Mark Rothko (in her use of empty spaces and her visual clarity), as well as to sixteenth-century painter Caravaggio's sensual portraits. Within the history of photography, she has been associated with the portraiture of August Sander and Diane Arbus; however, unlike these two photographers, Goldin is part of the group she documents and uses her images as a form of emotional connection, rather than distance. This claim to "insider documentary" also allows her to disavow criticisms of voyeurism and exoticism. As Goldin has stated, "I'm not crashing. This is my party. This is my family, my friends." She also takes self-portraits, further blurring her role as photographer vis-à-vis her subjects.

Goldin's work initially was presented as evolving slide shows for downtown audiences composed of those who participated in the fringe culture lifestyles she documented. Her *Ballad of Sexual Depen-*

dency series, made between 1978 and 1996, was her first large slide show and comprises over 700 images set to an eclectic soundtrack. It later was published as a book. Her photographing of her community of her friends enabled those who became familiar with her work to follow her subject, even allowing the viewer to follow the breakdown of relationships, death from AIDS or addiction, and addiction recovery, such as in the five-panel series *Gilles and Gotscho, 1992–1993*. Goldin was also unscathing in her self-portrayal, as her own drug and alcohol abuse landed her in the hospital in late 1988.

Goldin's break with the photographer's presumed neutral gaze is vividly evident in her book *The Other Side*. This series documents the intimate relationships and communities of transsexuals, depicting them at nightclubs and at events like Wigstock and other gay pride events. Like the *Ballad of Sexual Dependency*, Goldin presented these photographs as slide shows at weekly dinner parties.

Goldin challenged the traditional values of art and portrait photography with her 1996 Whitney Museum, New York, retrospective *I'll Be Your Mirror*. One of the few female photographers to have been featured in a solo exhibition at the Whitney, it represented a turning point in Goldin's career and her entry into the mainstream contemporary art world. The photographs shown in this exhibition, demonstrate her preferred settings: interior spaces in which private dramas are played out, particularly cluttered kitchens and bathrooms, rumpled beds, downtown bars, nightclubs, and other gathering places. These photographs are always acutely attuned to the intricate negotiations between people and their surroundings. Among Goldin's strengths is her use of color as a catalyst for amplifying the motional tenor of the moment. In one of her better known images, *Nan and Brian in Bed, NYC 1983*, the scene is illuminated with an orange glow that captures the mood of a painful and dying relationship as Goldin captures herself lying behind her lover on the bed, distant and alone. *Nan One Month after Being Battered, NYC 1984* is a startling portrait of painful self-confrontation, her lipstick garishly echoing the blood from her injured eye. Nan's images are acutely aware of the politics of looking and the power dynamics involved in the seer and the seen. By immersing the viewer in the lives of people not normally seen on the big screen, Nan humanizes them, telling their story and her own with vivid clarity and careful sympathy.

In *All By Myself-Beautiful at Forty, 1953–1995*, Goldin expands the theme of autobiography as a narrative form. A moving sequence of 83 self-port-

traits set to singer Eartha Kitt's "Devil's Playground," the series suggests a confrontation with maturity and aging and incorporates more exterior shots than featured in her earlier series, including cityscapes and landscapes empty of people.

Her photographs are snapshot-like but technically sophisticated in composition, using strong depth of field, mise-en-scène-like mirrors and glistening light fixtures. Consistent throughout her oeuvre is the power of setting to express emotionality, as she uses color to ascribe meaning to the shabbiest apartment, a mirrored nightclub, or in her more recent work, landscapes infused with trauma, such as "Red Sky Outside my Window, NYC, 2000" from her series *Elements*. Goldin uses photography as a means of recording an individual's psychological state, emphasizing the medium's ability to express more than the objective "truth." Now centered in Europe, she is still exploring relationships in her recent *Heart Beat, 2000–2001*, with 228 slides which track five couples in domestic scenes. In this series, the artist is more peripheral to the relationships and desire that she depicts than in her earlier work, where the boundaries between artist and subject were blurred.

EMMET GOWIN

American

Emmet Gowin can seem like two photographers. One captured images of his rural family life in the late 1960s and 1970s, images deeply rooted in an earthbound and intimate knowledge of place and person. The other captured images from his world travels in the 1980s and 1990s, images often uprooted in an airborne and detached comprehension of untainted and irreversibly tainted landscapes. If

there was no readily apparent evolution from one subject matter to the other, there is nevertheless subtle unity to this eminent photographer's body of work. Partly achieved through technical adventurousness, refined composition, and ethereal calm, this unity is animated by Gowin's faculty for the ineffable: "the fact that something is unsayable, that you are emotionally restricted from saying or even recognizing consciously what your own spirit is struggling with, energizes one's work" (Interview

with John Paul Caponigro, *Camera Arts*, Dec./Jan. 1998–1999).

Born in Danville, Virginia, in 1941, Emmet Gowin was raised by devout parents, his father a Methodist minister, his mother a Quaker. During his high school years, he was inspired by Ansel Adams's pictures and began to take photographs. In 1960, he attended the Danville Technical Institute as a business major. In 1961, he enrolled at the Richmond Professional Institute (now Virginia Commonwealth University) to study painting and photography, earning a B.A. in 1965. During these college years, in 1964, he married Edith Morris and formed a close tie with her family in Danville. Edith, along with their sons, Elijah and Isaac, and her extended family became a subject of his photographs in the late 1960s and 1970s.

Gowin attended the Rhode Island School of Design, receiving his M.F.A. in 1967, and these years, 1965–1967, proved crucial to his artistic development. While he experimented with 35-mm photography, influenced by the work of Henri Cartier-Bresson and Robert Frank, he also studied with Harry Callahan, who encouraged his use of larger picture formats, seen in images such as *Nancy, Danville, Virginia*, 1965. And, much as Callahan had, Gowin focused on his wife as a subject; his early portraits of her clearly demonstrate their intimate and deep bond, although some, such as *Edith, Danville, Virginia*, 1971, capturing Edith urinating while standing, were shocking to many when first exhibited. Much like Sally Mann's work of about a decade later, Gowin's depictions of childhood and intimate family life often reveal more about the viewers who find them disturbing than about the photographer or the subjects of the photos. During this period, in 1966, he visited Walker Evans in New York, and, with Callahan's assistance, he met, and later developed a friendship with Frederick Sommer, who influenced his technique and thinking.

From 1967–1971, Gowin taught photography at the Dayton Art Institute in Ohio, and in 1971 his photographs were reproduced in *Album* and *Aperture*. He became widely known for pictures of his rural domestic life, which combine unflinching innocence and snapshot spontaneity with inspired composition and technical experiment. Gowin reflects on images such as *Nancy and Twine Construction, Danville, Virginia*, 1971: "through the lives of new relatives, my more whole family, I returned to the mood that finds solemnity in daily life. As a child, one has the time for such pastimes as sunlight on water or the weave of the porch screen and the openings and closings of those doors. I wish

never to outgrow that leisure" (*Emmet Gowin: Photographs*, Philadelphia Museum of Art, 1990). Gowin augmented the mood of pictures of Edith and his family in Danville through experiments with circular lenses:

About the circular pictures: I had quite forgotten that it was the nature of the lens to form a circle and in 1967 my only lens was a short Angulon intended for a small camera. I'd been given an old Eastman View 8 × 10 and brought the two together out of impatience and curiosity. After a while, I recognized the wonderful exaggeration near the edge. I began to use the camera with this lens, but for several years I would trim these prints so that the circle was disguised. Eventually I realized that such a lens contributed to a particular description of space and that the circle itself was already a powerful form.

(*Emmet Gowin: Photographs*, Knopf, 1976, p. 101)

During the 1970s, Gowin began to travel extensively, particularly in Great Britain, Italy, and Jordan, and to photograph both cultivated and uncultivated landscapes. He became established in the academic and arts worlds, and in 1973, he accepted a teaching position at Princeton University. While residing with his wife and children in Newtown, Pennsylvania, he gave lectures and workshops at the Museum of Modern Art, New York, and Yale University, and over time, throughout the United States, Europe, and Japan. His workshops and writing often focused on the dark-room techniques, such as selective and over-all bleaching, combination developing, toning, and contour mapping that distinguish his images. He received prestigious honors, such as the John Simon Guggenheim Memorial Fellowship and the National Endowment for the Arts Fellowship. As his renown as a teacher and mentor grew, he brought Frederick Sommer to be a visiting Senior Fellow at Princeton.

In the 1980s, Gowin began to take aerial landscape photographs, both of natural geologic features and of altered landscapes. In 1980, a fellowship from the Seattle Arts Commission brought him to Washington, where he photographed the aftermath of the Mount St. Helens eruption, creating images such as *Spirit Lake, Mount St. Helens, Washington*, 1980. Over many years, he returned to Washington to photograph Mount St. Helens and, also in Washington, the Hanford Nuclear Reservation. He photographed from an airplane using a gyroscopically stabilized Hasselblad camera, originally developed by NASA to record space flights. In 1982, at the invitation of his former Princeton student, Queen Noor al Hussein, he visited Jordan and pho-

tographed the astonishing facades carved into rock at Petra.

Throughout the 1980s and 1990s, Gowin continued to employ aerial photography to record the impact of humanity upon the landscape. In images such as *Pivot Irrigation Near the One Hundred Circle Farm and the McNary Dam on the Columbia River, Washington*, 1991, he evokes the simplicity and majesty of human survival relying on the depletion of finite resources. Gowin observes, "The astonishing thing to me is that in spite of all we have done, the earth still offers back so much beauty, so much sustenance" (*Emmet Gowin: Changing The Earth*, Yale University Press, 2002, p. 158). He has photographed widely divergent landscapes with a similar sensibility, including military test sites, Kuwait after the Gulf War, and smokestack industries in the Czech Republic. While bearing witness to the degradation of the land, these are images of stunning photographic beauty created with the difficult and time-consuming split-tone process that brings subtle color to black-and-white prints. In 2002, the Yale University Art Gallery (in association with the Corcoran Gallery of Art) organized a nationally touring exhibit of his aerial photographs. The associated book, *Emmet Gowin: Changing The Earth*, was dedicated to his mentors Harry Callahan and Frederick Sommer.

DAN GRAHAM

American

Dan Graham has been a leader among late twentieth-century conceptual artists in the United States and Canada. His early photography was an important foundation for his later installation-based artwork about public and private space. He is also a critical theorist who contextualizes his work using complex theoretical and philosophical propositions in essay format.

Graham's first, most widely recognized photographic project consisted of a group of straightforward photographs of houses in Jersey City, New Jersey, accompanied by an essay. The work was titled *Homes for America* and was published in the December 1966–January 1967 edition of *Arts Magazine*. The photographs showed houses from various angles, the occupants of the houses, and the activities taking place within the homes.

The basic look of these early photographs by Graham is part of an anti-aesthetic movement among conceptual art photographers of the period. The straightforward, deadpan snapshot look compares to the work of Edward Ruscha, for example, who showed the west coast version of pre-fabricated housing in his book, *Some Los Angeles Apartments* (1965). Graham's alienated shots of the outside of the buildings also likens to the work of the German photographers who so influenced conceptual photography, Bernd and Hilla Becher, however at a much less refined formal level. For general purposes, Graham's photographs are technically simple, but in their

casual appearance, they effectively transmit the ordinariness of subjects they document.

The artist's interest in tract housing compares to other documentary photographers. Walker Evans was one of the first to make record of lower-income living conditions when he and others like him worked for the Farm Security Administration. Graham's intentions, however, are considerably less straightforward. Without the text, the photographs look like documentary work, but taken together with the article, they reek of criticism, their deadpan, drab appearance a commentary on the lives of those whose environments they represent. The article consisted of commentary on the tract housing units, comparing their size, color, and locations. The houses were analyzed and studied like scientific information but made to seem like a lifestyle limited by the products of mass production. Graham's somewhat intrusive images of the goings-on inside the strangers' homes are also somewhat sardonic. The ambiance of Jersey City becomes a field day for his flip, aesthetic review.

Graham was also cognizant of the presentation of his photographs. He placed his images instantly into a magazine, as opposed to offering prints for sale at a gallery. He allows the photographs to be reproduced in mass quantity and be made available to a wide audience for a low cost. The result is that he demonstrates the ease of reproduction of the photographic medium, even for an artist, who would be expected to be more concerned with the uniqueness or value of an original. He also places

the images in a strategic design within the article. The photographs and text are arranged in long rows, which mime the conditions of tract housing. At one of his earliest exhibitions, at the Finch College Museum of Art, New York, the photographs were featured as a slide projector presentation.

Following the *Homes for America* project, Dan Graham created a diverse oeuvre of artwork and theory. He began by using commonly available resources such as advertising, music, and television, to communicate a critical art perspective. One of his most notable examples of this type is a work titled, "Figurative." Here, Graham documented a strip of paper from a calculator or cash register. The paper has a series of unrelated numbers in a consecutive series. Graham printed the strip of paper next to text that read "Figurative by Dan Graham," and the work was displayed in an issue of *Bazaar* magazine by means of his purchasing space as an advertisement. Here, Graham played on the viewers' expectations for commercial imagery. The intention of the artist seems incomprehensible, save for that of provoking the viewer of the magazine into a re-consideration of the validity of mass-produced imagery.

The use of photography to accompany other art projects is very important to Graham. He has made many site-specific structures and installations. The site-specific works he makes are typically temporary. The photograph plays an important role in making a record of the event and work. This approach compares to the work of Robert Smithson, a contemporary to Graham in the 1960s and 1970s who created large site-specific conceptual works that were temporary and unavailable to most except through photographs. The photograph becomes the manner in which many people experience the work, and thus its simplicity is due to the fact that it is expected to serve as a factual, objective document that can communicate a more complex, frequently subjective work of art.

Graham has also used film and video since the 1970s for installations and performance works that actively engage the viewer. He frequently poses experiences of simultaneous subjectivity and objectivity, playing with notions of time, and of private and public space. His deconstruction of the experience of viewing art has involved closed-circuit video systems within architectural spaces. Using mirrors and surveillance, Graham suggests the experience of being viewed while one is also viewing. The transmission of an idea through the structure of information is frequently important to Graham. While he spends considerable time constructing his elaborate installations and video works, he also produces a great amount of theoretical writing, which accompanies the works and has equal if not greater importance. Issues of contemporary social

phenomena preoccupy Graham and his writing. He has produced conceptual theoretical essays on punk music, suburbia, and public architecture. His work is a product and also critique of a mass-mediated society. His photographs and artwork frequently function within mass media or in dialog with those systems.

PAUL GRAHAM

British

Few British photographers of the twentieth century have been as prolific as Paul Graham. Since 1979,

he has exhibited in group and in solo exhibitions on an almost annual basis throughout Britain, Europe, and North America, and he has been the recipient of some of photography's most presti-

rious awards. His work is also to be found in the collections of museums and galleries such as the Victoria and Albert Museum, London; the Museum of Modern Art, New York; and institutional and private collections across Europe, the United States, and Japan.

Born in Stratford, England in 1956, Graham attended Bristol University from 1974–1978. Graduating with a Bsc. in Microbiology, Graham had no formal education in photography but had his first solo exhibition at the Arnolfini, Bristol in 1979. His series *House Portraits* from this period was included in the group exhibition *Houses and Homes* in 1982. The austere color photographs of new housing developments display from an early stage the tension between Graham's photographic and political influences, a characteristic of much of his work. The composition and use of photographic objectivity, references the work of Walker Evans, and that of Lewis Baltz and those associated with the New Topographics group. However, the choice of subject, the sprawling suburban housing estates that formed what are commonly referred to as New Towns, stems not only from the economic phenomenon of the built environment but also the superficial construction of the communities that lived there.

In 1982, Graham took up a teaching position at Exeter College of Art, where he was Lecturer in Photography until 1984. In 1983, he received an Arts Council Publication Award, and in the same year he published *A1-The Great North Road*, which toured several galleries in England as an exhibition under the same title. The photographic series of garages, service-stations, and cafes dotted along the main arterial route from the north to south of England examined the alienation of traveling individuals from the built environment they passed through on their journeys.

In 1984, Graham left Exeter College of Art to become Lecturer in Photography at West Surrey College of Art and Design, where he taught from 1984–1987. In 1985, he received a Greater London Arts Association Award and in 1986 the second of his four Arts Council Publications Awards. During the same year, he published and toured a body of work under the title *Beyond Caring*. The series depicted the waiting rooms of London DHSS unemployment offices. While his previous work had concentrated on the alienation of the individual from the built environment around them, this series focused on the institutional spaces where individuals had to confront the mechanisms of state that affected their everyday lives. This series was a departure from his earlier work and was

very much in the vein of social documentary. Unlike much British documentary from this period, however, Graham used color photography, a format that brought criticism from photo journalists and documentary photographers who held on to the altruistic ideals of traditional black-and-white documentary photography.

Graham's work does not fall easily into the prescribed genres of photographic practice, an aspect that is evident in his body of work on Northern Ireland, *Troubled Land*. In this series, Graham photographed those spaces where Nationalist and Unionist communities of Northern Ireland laid claims to territory by using painted curb stones and political graffiti. The series made references to both the genres of landscape and conflict photography. Graham has been one of the few visiting photographers to take a critical approach to Northern Ireland, and his work is often cited as an influence on Irish photographers who have taken the dominant representations of Northern Ireland in the popular media as a departure point for their own work.

Troubled Land was published as a book in 1987 in what was to prove a busy and successful year for the photographer. Early in the year, he received the Young Photographers Award from the International Centre of Photography, New York; the Channel 4/Arts Council Video Bursary, London; and a commission from the Hayward Gallery, London. Throughout the year, he also participated in solo and group exhibitions in Europe, North America, and Japan.

In 1988, Graham was awarded the W. Eugene Smith Memorial Fellowship, USA, and the following year was made Fellow of Photography by the Museum of Photography, Film, and Television, Bradford, England. In 1990, he published and exhibited a second body of work on Northern Ireland under the title *In Umbra Res*. The series moved away from the broad compositional representation of territory in *Troubled Land*, to informal studies of people and objects, which were used metaphorically and metonymically to describe the conflict. The photographs were exhibited as diptyches and triptyches to form a narrative within the broader scope of the work, a strategy used in the series *New Europe*, exhibited the following year.

Throughout 1990–1995 Graham regularly photographed in Japan and continued to work on his *Television Portrait* series. In 1992 and 1995, he was again recipient of an Arts Council Publications Award. In 1995, a series of his work on Japan was published as a book, *Empty Heaven*. Again using a combination of portraits and ob-

GRAHAM, PAUL

jects, the work examined the fragile concealment of aspects of Japanese culture. During the same year, he was awarded the Charles Pratt Memorial Fellowship, USA.

Graham continued to photograph and exhibit regularly throughout the mid and late 1990's, and in 1996 his work up to that date was published by Phaidon as part of the publisher's Contemporary Artists Series. In 1999, a new body of work was published, *End of An Age*, and in 2000 a catalogue, *Paintings*, was also produced. In 2001, Graham represented Britain in the 49th Venice Biennale. Photographing in the United States, he is still based in London.

SID GROSSMAN

American

Sid Grossman stated that “the function of the photographer is to help people understand the world around them.” As a dedicated social documentary photographer, he created images with an uncompromising concern for the human condition. Even though he printed imaginative and expressive works expanding the medium’s limits during his career, since his death he has been shrouded in controversy and obscurity, a victim of the McCarthy era and changes in photographic tastes.

Grossman was a key personality in The Photo League, an influential organization for professional and amateur photographers in New York City. A founding member, Grossman was also a teacher and Director for the League’s school from 1938 to 1949. His legacy includes hundreds of inspired students (Dan Weiner, Walter Rosenblum, Arthur Leipzig, Lisette Model, Leon Levinstein, among many others) who passed through his progressive classes, both in New York and, later, at his Provincetown School of Photography. Grossman also mingled with other photographers at the League, including Paul Strand, Dorothea Lange, Berenice Abbott, Weegee, and Ansel Adams. Strongly influenced by the Depression-era Farm Security Administration photographers and the documentary hero Lewis Hine, Grossman believed photography should serve a social purpose. Most of his street scenes show working-class Americans and the disenfranchised enduring and surviving hard times.

Like many Photo League photographers, Grossman photographed the underprivileged America he knew from his own childhood. His parents were

Jewish immigrants living in the Lower East Side; after his father deserted the family, his mother supported four children as a cook. Grossman attended high school in the Bronx, took classes at the City College of New York, and joined the Film and Photo League. The following year, in 1936, he helped found the new splinter group, The Photo League. Largely self-taught, Grossman concentrated on freelance documentary work while also employed by the Works Progress Administration (WPA) as an outdoor manual laborer. Grossman’s first photographic project for the League began in 1938, when he collaborated with Sol Libsohn on the *Chelsea Document*. Many League members worked in activist groups, photographing economically disadvantaged neighborhoods throughout Manhattan in an effort to visualize and understand an area’s problems, solutions, and overall character. Grossman participated in many other projects, both in and out of the League; in 1939, he created *Negroes in New York*, a Federal Art Project/WPA assignment. As a freelance photographer over the years, he also infrequently earned commercial assignments from various magazines and businesses, such as *Fortune*, *Esquire*, *Made-moiselle*, and *Lord and Taylor*.

By the late 1940s, Grossman began experimenting boldly with smaller cameras and pushed beyond the clear, focused “realism” of traditional documentary by combining people-oriented content with the daring use of angles, surfaces, and light. He increasingly allowed his camera to blur truncated figures in dramatic motion and tilted planes. The grit and grain of these prints enhanced the images’ mood, blended his documentary philosophy with a more modernist snapshot aesthetic, and expanded definitions of doc-

umentary expression. Whether focusing on beach scenes at Coney Island, street festivals in Little Italy, or the cultural life of Harlem or Central America, Grossman sought vibrant images displaying a concern for humanity's struggles to survive and endure.

Grossman's life and work also perfectly exemplify the difficulties encountered by politically engaged documentary photographers from the Depression to the cold war years. During his travels to the midwest (Oklahoma, Missouri, and Arkansas) in 1940, Grossman photographed folksingers, farmers, and union activists, creating clear, unaffected, "straight" black-and-white images of the people he met. He also attracted the attention of the FBI, which apparently initiated surveillance of the League because of Grossman's associations with known Communists during this trip. By 1945, when Grossman worked in photo labs for the US Army Air Corps in Central America, he was investigated by the Army Intelligence Bureau because of alleged Communist activities.

Then, in December 1947, Photo League members were surprised to find the organization publicly blacklisted by the US Attorney General in a list of "totalitarian, fascist, communist and subversive organizations." Membership soared as photographers joined in support and defense of the League. But in 1949, during Angela Calomiris's testimony against Communist leaders at the Foley Square Trials, she suggested that The Photo League was a subversive organization and specifically named Grossman as the man who introduced her to the Communist Party. As an informant for the FBI, Calomiris worked at the League (and other groups), gathering incriminating information for the federal government. She also distrusted documentary photographers' penchant for images of social injustice; this propagandistic "Red slant," as she called it, reinforced anti-American ideals.

Ironically, as Grossman entered his most productive, successful, and experimental years (working concurrently on five series, *Folksingers*, *Coney Island*, *New York Recent*, *Mulberry Street*, and *Legion*, 1946–1948), he faced staggering difficulties. After the listing and naming, Grossman's career disintegrated; from 1949, when he quit the League, until his death in 1955, he earned (according to his widow Miriam Cohen) just one commercial assignment. Such accusations kept him, as well as others in the League, from being hired for freelance jobs. With membership dwindling in the wake of federal investigations, The Photo League folded in 1951.

As tastes changed and pressures mounted, many photographers turned away from social realism and sought more subjective, interior realms. While images visualizing the downtrodden may have been

celebrated during the Depression, in prosperous post-war America some viewed the same content and concern with suspicion. Grossman, too, started investigating new subjects and styles. During the last years of his life (1949–1955), Grossman photographed in Provincetown, Massachusetts, where he and his family spent their summers in retreat. He taught private classes, studied with Abstract Expressionist Hans Hofmann, and expanded his photographic vocabulary yet again. His work (as seen in *Journey to the Cape*, 1959) radically shifted, including more formally engaged abstractions and non-documentary subjects. They testify not only to Grossman's stylistic diversity but also to the effects of repressive cold war politics on art.

Biography

Born Sidney Grossman in New York City to Morris and Ethel Glickstein Grossman, 15 June, 1913. Attended City College of New York, ca. 1932–1935; studied painting with Hans Hofmann, Provincetown, ca. 1949–1953; art classes, New School for Social Research, 1949. Joined Film and Photo League, ca. 1934–1935; founding member, The Photo League, 1936; resigned, 1949. Teacher and Director, Photo League school, 1938–1949 (also taught classes at Henry Street Settlement, Harlem Art Center, his own Provincetown School of Photography, and his own New York apartment). Worked in Central American photo labs for Public Relations Section, US Army Air Corps, 1945–1946 (*Cantina*, *Black Christ*, *Ballet Russe* series). *Folk Singers*, *Coney Island*, *Foreign Legion*, *Recent New York*, *Mulberry Street* series, 1946–1948. *New York City Ballet* series, ca. 1951–1955. Married Marion Hille, 1941 (divorced ca. 1949); married Miriam Echelman, 1949; son Adam born 1954. Died of heart disease, 31 December, 1955.

GROUP F/64

Over a period of roughly four years in the early and mid-1930s a small group of photographers and arts enthusiasts met in an Oakland, California, studio to look at each other's work and share ideas about photography as an art form. They

named themselves "Group f/64" after a small camera lens aperture to symbolize their collective commitment to clear photographic seeing. Their identifying label and its attendant practices and ideals intentionally refuted the painterly works

produced by Pictorialist photographers who dominated artistic photography during the first quarter of the twentieth century. While Group f/64 was neither unprecedented nor unique at the time, this informal association, as much a social gathering as an avant-garde movement, nonetheless holds a significant and frequently reconsidered place in the evolution of photographic aesthetics.

Among the photographers involved in Group f/64 were Ansel Adams, Imogen Cunningham, Brett and Edward Weston, and Willard Van Dyke, the group's most vocal spokesperson. Others who participated and exhibited in the handful of Group f/64 exhibitions were Sonya Noskowiak, John Paul Edwards, Alma Lavenson, Consuelo Kanaga, Henry P. Swift, and Preston Holder. Late in the group's lifespan, Peter Stackpole, William Simpson, and Dorothea Lange were invited to take part in the group. (Although Lange, who received technical assistance from Adams for her work with the Farm Security Administration, never took up their offer, it is significant that her photographs and her social documentary style appealed to this group of modernists.)

Characteristics of Group f/64 Photographs

Group f/64's major contemporaneous exhibition was held at the M. H. de Young Memorial Museum in San Francisco in November and December of 1932. Museum director Lloyd La Page Rollins was an advocate of photography and had previously exhibited the work of several of the f/64 photographers. Later exhibitions of f/64 work (prior to the group's dissolution) took place at small galleries run by Ansel Adams and Willard Van Dyke in the Bay Area.

Writing in 1992, Therese Heyman characterized the Group f/64 work displayed at the de Young:

Seen together, the images established a varied but singular point of view. For the most part, objects were seen closely, framed by the sky or similarly neutral backgrounds. Nothing was moving, and there was great attention to the finely detailed surface textures of the subjects. There was little in the photographs to suggest either the modern industrial world or the troubles of the times....We find images of still life, bits of landscape, posts, bones, and sky, a few industrial buildings, portraits, and nudes or figure studies. The subjects were ordinary in the sense that they were encountered frequently, and yet most had a commanding presence when photographed.

(Heyman 1992, 23–25)

Typically the photographs were made using large-format cameras that produced 4 × 5 or 8 × 10-inch

negatives. With their clear-focusing lenses (as opposed to the blurring and softening optics often employed by Pictorialists seeking painterly images) closed down as far as possible (f/32, f/45, f/64, and f/90 being among the smallest apertures available), these cameras recorded a wealth of detail and tone on black-and-white sheet film negatives. Willard Van Dyke described the Northern California environment of the early 1930s in a way that makes the Group f/64 working habits seem organically engendered. At the time, Van Dyke wrote in *Camera Craft*, before the atmospheric smog characteristic of the latter part of the century settled in upon the Bay Area, there was “a marvelous California light—the skies were so blue and the air was so crisp and clean and there was a kind of hard brilliance that we accentuated by using very sharp lenses and very small apertures.” But historian Naomi Rosenblum cautions that although f/64 members sometimes referred to their work as uniquely American—specifically, western American—and revolutionary, the fact that “the beneficent California climate contributed a special flavor to this late-blooming branch should not obscure the international character of the modernist tree from which it issued” (Rosenblum 1992, 34)—a tree which had been growing since the turn of the century.

Precedents and Background for Group f/64

In the early decades of the twentieth century, and particularly in the years between the two World Wars, there was an international groundswell for change and evolution in photographic art. Then approaching the centennial of its announcement to the public, the medium and its practitioners were undergoing a retrospective self-consideration; the new photographers sought to ascertain, examine, and utilize what in the making of a picture was unique to photography. In 1923, a Czech cultural periodical called *Disk* published the following slogan, which summarizes the emerging attitude and clearly anticipates Group f/64: “Photograph: Objective truth and documentary clarity above all doubts” (quoted in Hambourg, Maria Morris, and Christopher Phillips, *The New Vision: Photography Between the Wars*, New York: Metropolitan Museum of Art, 1989, p. 78). In Europe, magazines were often the venue for the new photography. Hard-edged, crisply focused images were taking the editorial and advertising space formerly claimed by illustrators and painterly photographs. “Visual essays” and photo-reportage began to appear, taking advantage

of photography's unique visual language. The course of avant-garde discovery sometimes led down paths tending toward the unconventional and the abstract (see the disorienting views of Alexander Rodchenko and László Moholy-Nagy), but it also included the startlingly frontal formalism of Albert Renger-Patzsch and Karl Blossfeldt, whose work complimented that of the painters in the *Neue Sachlichkeit* (usually translated as "new objectivity") movement, and Man Ray, whose concentration on objects was surreal in its precision. August Sander made the transition from painterly portraiture to the objective "exact photography" he advertised in the late 1920s. The ruling principle of the new vision was that it was rooted in twentieth century technology.

Writing in a 1963 *Artforum* review, Margery Mann suggests that the emerging modernism of photographic exactitude may have had a revolutionary, social genesis. She describes the interest in clarity as "the completely honest penetration of reality," and asserts that the photographs and photographers emerging during the early 1930s "represent a break with the past; they see the world afresh because the country was in dire straits. Problems required solutions; traditional ways of thinking were not to be trusted." She was specifically addressing Group f/64 in California, but her ideas had parallels across the country and across the ocean. Among the artists exemplifying the new photography in the United States, anticipating f/64's emergence, were: Paul Strand, who made precisely detailed, close-up images of industrial objects, street people, and his wife Rebecca throughout the 1910s and 1920s; Ralph Steiner; and Paul Outerbridge, Jr., whose crisp images of clothing placed him among the leaders of a shift in advertising imagery towards the elegant simplicity and factual clarity of the Precisionist style and away from Pictorial sentimentality and soft-focus excess, as represented in publications by the photographs of Baron Adolf de Meyer and Edward Steichen's early commercial work.

The aesthetic credo of Group f/64 was directly anticipated in the United States in a 1930 exhibition organized by Lincoln Kirstein at the Harvard Society for Contemporary Art. About the work in his show Kirstein wrote "[it] attempts to prove that the mechanism of the photograph is worthy and capable of producing creative work entirely outside the limits of reproduction or imitation, equal in importance to original effort in painting and sculpture." (Hambourg 1989, 44-45) In his exhibition Kirstein presented work by artists who

had received support and endorsement from Alfred Stieglitz, including Strand and Charles Sheeler, and other photographs by Berenice Abbott, Walker Evans, Ralph Steiner, Eugène Atget, Tina Modotti, Edward Weston, László Moholy-Nagy, Man Ray, Edward Steichen, and Doris Ulmann, among others. Kirstein was influenced by and included examples of press photography, scientific and cartographic images, and medical X-rays. The democratic inclusion of photographs outside the usual definition and practice of "art," with a particular focus on images published in popular periodicals, was a defining feature of the important *Film und Foto* exhibition held in Stuttgart, Germany, in 1929 that Kirstein carried forward in his show. Many of the photographers Kirstein displayed at Harvard also appeared in the German exhibition.

Relationship to Pictorialism, Stieglitz

Much of Group f/64's activity took place at 683 Brockhurst Street, a studio in Oakland that, ironically, was formerly occupied by Anne Brigman, a leading Pictorialist photographer; Willard Van Dyke had been an assistant for Brigman, and rented her studio from her after she moved to Southern California. Following the de Young exhibit, and after the departure of Rollins from his museum post in April 1933 created a need for a new advocate of f/64-style photography, Van Dyke started running a gallery out of the Brockhurst Street location. He referred to the gallery as "683," very conscious of the presence and importance of "291," Alfred Stieglitz's New York gallery (founded in 1905) that fashioned itself as the world headquarters of modernist art and photography.

All precedents and parallels notwithstanding, the members of Group f/64 considered themselves and their aesthetic philosophy revolutionary. They rejected Pictorialism out of hand, and, in part because of their resolute attachment to the West Coast, also resisted the standards represented by Alfred Stieglitz in his eastern stronghold. The struggle with Pictorialism was carried out in public, largely in the pages of *Camera Craft* magazine in a series of written exchanges between 1933 and 1935 by Van Dyke, Adams, and William Mortensen. Prior to editor Sigismund Blumann's May 1933 review of Group f/64's exhibition at the de Young, the San Francisco-based *Camera Craft* had been a popular magazine dedicated to the reigning style of Pictorialism, largely voiced by Mortensen. But when Ansel Adams was invited

to write a series of articles that first appeared in the magazine in January 1934, *Camera Craft* acknowledged the emergence of a forceful new attitude in photography, and its pages hosted a new chapter in the debate over the true nature of photography. The program of Group f/64 simultaneously shifted from the studio and the gallery to the printed page; as the exhibition of f/64 work tapered off, its aesthetic doctrine was being formulated, transcribed, and disseminated for posterity.

Debates over what is authentically “photographic” did not originate with Group f/64 and Pictorialism. Even within the Stieglitz circle, arguments about what deserves to be called a photograph abounded. In 1904, Sadakichi Hartmann, one of the Photo Secession’s leading exponents, wrote an article titled “A Plea for Straight Photography.” Hartmann took a number of highly regarded Secessionists to task for excessive manipulation of their photographs. Unlike Mortensen, Stieglitz never positioned himself as the spokesperson or leader of a particular school of photography. During f/64’s lifetime, correspondence between Stieglitz, Adams, and Weston suggests a cautious, nuanced respect developing between the writers, though Stieglitz did not rush to exhibit and, thereby, publicly endorse the new, hard-edged work from the west. Ultimately, Adams was the only Group f/64 photographer to show with Stieglitz; his 1936 exhibition in New York was Stieglitz’s first show of photographs since a Strand show nineteen years earlier.

Straight Photography and the Great Depression

The Group f/64 photographers were not all born straight. Many began making photographs in the dominant Pictorialist style. In the early 1920s, both Imogen Cunningham and Edward Weston were making soft-focus photographs of nudes, set in groups or singly in natural scenes with the lighting and dramatic effects characteristic of a painterly attitude. But by the middle of the decade both had made sharply focused, full-range prints that were clearly committed to modernist goals. Ansel Adams took a bit longer to foreswear the Pictorialist label; his 1931 exhibition of atmospheric prints at the Smithsonian, *Pictorial Photographs of the Sierra Nevada Mountains*, marked the end of his soft-focus period.

While often rigidly applied as the signal criterion of straight photography, the term “purity” actually has varying interpretations in regards to Group f/64’s

approach to photography. While the group was philosophically opposed to extensive manipulation resulting in images resembling paintings more than photographs, they were not, individually or collectively, opposed to more subtle corrective measures within the photograph. Dodging, burning, cropping, and enlarging were permitted and practiced. Imperfections resulting from chemicals or particles on negatives could be retouched and removed from prints. Adams used filters in front of his lens, as well as underexposure and overdevelopment, to ensure negatives rich in detail and tonal range. Edward Weston regularly arranged vegetables and shells to create a pleasing still life arrangement for his photographs. In general, the goal was to remove traces of the photographic process that would interfere with direct communion with the objects and scenes pictured.

This principled commitment to clarity and to the information-bearing capacity of photographs linked them, technically at least, to the social reform mission of the Farm Security Administration and its massive documentary photography project. Though the economic hardships of the Depression were slow to reach California, by 1935 the severe conditions had taken hold in the west. Group f/64 photographers faced a dilemma, which, while related to realism, could not be resolved with debate or darkroom work. Only individual levels of social consciousness could resolve the question of photography’s role in the face of overwhelming social problems. Prior to this challenge, f/64’s images had revealed only passing interest in social issues. Consuelo Kanaga’s close-up portraits of young, beatific black faces were notable for their beauty as richly toned prints; Kanaga, however, was interested primarily “in the way black-and-white photography could make social statements, and only in passing did she consider photography as a fine art” (Heyman 1992, 29). This tension began to unravel the sense of purpose shared by the Group f/64 photographers.

After witnessing Willard Van Dyke’s evolving commitment to social activism, developing as a result of Van Dyke’s connections to Dorothea Lange, Ansel Adams wrote to Edward Weston that Van Dyke was becoming more “a sociologist than a photographer. His photography seems to be turning into a means to a social end, rather than something in itself.” Although Adams admired Lange’s emotional imagery and her ability to make evocative images that truly recorded the time (and would later collaborate with her on a project documenting the Japanese internment camp in Manzanar), he could not abide her unwill-

ingness to commit to fine printing techniques. While the tools and approaches were much the same, the ends diverged sharply. As Oren writes, “As the Depression wore on it became difficult to sustain Group f/64’s timeless, optimistic view of American materiality against the narrative pressure of a more stoic, social documentary view” (Oren 1991, 123). Van Dyke and Kanaga leaned in Lange’s direction, the pursuit of photography as a vehicle for truth and reform (Van Dyke eventually became a filmmaker, producing propaganda pieces for the Works Progress Administration reform effort). Adams, the Westons, and others of their f/64 colleagues maintained their focus on photography as art for art’s sake.

Dissolution and Legacy of Group f/64

In the wake of the division between the activist and the aesthetic ends of straight photography, and in the face of increasingly dire economic conditions for Bay Area art galleries, Group f/64 came to a quiet end in 1936. Its legacy endures; by its collective activity Group f/64 lent prominence to the concept of straight photography and helped define just what constitutes “purity” in photographic practice. Through debate and visual counterpoint with Mortensen and Pictorialism, f/64 staked out new territory for photographic art. These clear, sharp images were among those that ushered in new standards for art photography in the post-Stieglitz era. Although there was minimal social mission inherent in Group f/64’s practice, its commitment to unadorned reality validated and opened the door to artistic acceptance for the work of FSA photographers, and documentarians before and after. Michael Oren situates the group’s legacy in terms that ring of spiritual purity and humility.

Group f/64 may be seen as part of an essentialist movement whose traditionally American preoccupation with the hard edges of material details reaches back to the Transcendentalists, who saw in such details evidence of God’s immanence. Anecdotal qualities, whether of Mortensen’s or Lange’s type, would have vitiated such pretensions (Oren 1991, 123).

The 1932 de Young exhibition was revisited in major exhibitions in 1963, 1978, and 1992. Group f.64 member Henry Swift facilitated the first, at the San Francisco Museum of Art (later the San Francisco Museum of Modern Art). During his lifetime Swift used his income as a stockbroker to purchase prints from the other members; his widow added to the collection and donated it to the Museum of Art in 1962. Using the original checklist and the Swift

collection as guides, the curators of the later shows (Jean S. Tucker at the University of Missouri-St. Louis and Therese Thau Heyman at The Oakland Museum, respectively) recreated the 1932 exhibition as accurately as possible, given the limitations of a checklist that sometimes offered only a general description of a print’s subject, rather than a standard, accepted title. These periodic reassessments underscore Group f/64’s importance as a primer and a touchstone for straight photography.

While some of the technical particularities of f/64’s straight approach have been subsumed into camera club quality critique factors (e.g., sharp and proper focus, good highlights and shadow detail, strong, dramatic pictures that create immediate interest, sometimes using one strong element of interest), and the Group’s concentration on natural forms may have evolved into the work of countless nature photographers wielding macro-focus lenses fitted out with ring lights for full revelation of, as Edward Weston put it, “the thing itself,” the intrinsic fascination with photographic beauty that characterized Group f/64 has continued to inspire photographers to come to grips with whatever photography’s tools have to offer in terms of unique visual, aesthetic qualities.

ANDREAS GURSKY

German

During the 1990s, Andreas Gursky became one of the most prominent photographers in Germany. His large-format color photographs are distinguished by their precise composition, detailed depth of field, and overall structure that avoids any central vantage point. He is interested in how social and political culture structures people's lives at leisure or at work, in the world of fashion, sport, business, or finance.

Gursky was born in Leipzig, East Germany, in 1955 to a third-generation family of photographers. He grew up in West Germany, where his parents had moved the year he was born. As soon as he could walk, he came into contact with photographers, as well as photographic techniques and their application to the advertising industry. This may have encouraged his decision to pursue his studies at the famed Folkwangschule in Essen, which at the time was the most renowned school of photography in Germany. The school was directed and greatly influenced by the founder of subjective photography, Otto Steinert, who trained photographers in an applied aesthetic that corresponded to his own; and the students worked primarily in small-format photography, in prints rich in contrasting black and white. Although Gursky began his studies the year of Steinert's death in 1978, the aesthetic taught at the school was slow to move from the principles established by Steinert. During this time, Gursky dedicated himself to black-and-white photography reportage with a Leica 35 mm camera. Among the young instructors who had taken over teaching from Steinert, Gursky profited most from the sustained influence of Michael Schmidt, who familiarized him with his own opinions and with the latest developments in photography coming from America.

After four semesters at the Folkwangschule, Gursky followed the advice of his photographer friend Thomas Struth and applied to the Academy of Art in Düsseldorf. There he entered the photography class directed by Bernd Becher and his wife, Hilla. With this step, Gursky turned away from applied photography and to the study of photography as a free art form. In the class he met Candida Höfer, Tata Ronkholz, Thomas Ruff, and Petra

Wunderlich; Thomas Struth and Axel Hütte had just finished their studies. The Becheresque principles of style served as a model for this generation and even the following generation. The Bechers taught students to focus on only one theme, one point of view, and one perspective, as well as to decontextualize the subject by excluding as much as possible, any elements that defined time—all essential components of the Bechers' work. The Bechers also influenced Gursky's aesthetic, which in the 1980s focused on common clichés such as people strolling on a Sunday afternoon, playing soccer, or going on a packaged vacation. These themes allowed him, as observer, to maintain a constant distance, and thus his photographs preserved little of the reality of the scenes he shot, making them stand for the general state of things in the industrial world. The precise observation, the fixation on a singular idea of the image, and the patient execution belong not to a medium applied to the world for a functional purpose but to one that is an independent expression and an attitude toward life. Taking in the Bechers' understanding of photography, Gursky put aside the 35 mm camera, which made possible quick-reaction shots and the capture of fleeting moments; from then on he worked with large- and medium-format cameras, no longer in black and white, but exclusively in color. In technique and composition, his photographs from the 1980s demonstrate the influence of American color photographers such as Stephen Shore, William Eggleston, and, above all, Jeff Wall. A characteristic of his photography that crystallized over time is the distant, elevated position of the observer that faded out the defining condition of the frame and led to a floating perspective. Human beings formed by the structures of their world become unrecognizable and appear as part of a single mass that submits, whether in leisure or work, to the same occupation. Mountain climbers, swimmers, skiers, theater audiences, and party or rock-concert goers are as equally subservient as stockbrokers and industrial workers. "I observe human species under the open sky from the perspective of an extraterrestrial being. To make clear that my interest rests in the species and not the individual, I have abstracted people into tiny figurines" (*Gespräch mit B. Bürgi* Zurich, 1992, p. 10).

Though human actors still appear in earlier landscapes, which suggest a kind of narration—*Sonntagsspaziergänger, Ratingen*, 1984 (Walking on Sunday, Ratingen); *Neujahrsschwimmer*, 1988 (New Year's Swimmer); *Angler, Mühlheim*, 1989 (Fisherman, Mühlheim)—in the evolution of his work, human beings appear at ever greater distances or seem mediated by traces of modern civilization. Even the titles emphasize the factual—*Restaurant, St. Moritz*, 1991; *Börse, New York*, 1991—to the point of denying additional information. Furthermore, everyday objects remain the focus of his camera but are presented as optical phenomena. Surfaces and colors seem to be thoroughly structured elements of the photographs' composition that confuse or even completely destroy the spatial perspective, something that the floating viewpoint and the distance from that object serve to promote. It also seems to pull the floor from under the feet of the observer. Parallel to the development of his increasingly abstract style was the size of his prints, which from 1988 to 2000 went from .36 × .185 meters to the maximum size of a roll of photographic paper, 1.8 meters high and 5 meters long (*Tote Hosen*, 2000 [Nothing Doing]). In their presentation and reception, these unusual large formats are very similar to painting; as part of the everyday environment, they become the object of another image. This is not to say that Gursky's work conforms to painting in its pictorial manner; the photographs exploit painterly characteristics by transforming given factual objects into objects of monumental size, by cutting photography from any recognizable reference of the object photographed, and also by suggesting in its content a kind of color-field painting, as well as a color scheme that is negated on the flat shiny surface of the photographic paper.

In 1992, Gursky began to use digital technology to in part create his imagery. His first efforts consisted of minor retouching, but soon he was using the computer to construct the image, allowing a further confusion of perspective and vantage point. Yet Gursky holds to creating the final print photographically, using a photo-editing program to transform, assemble, and touch up scanned negatives. He then creates a new negative, which creates the final enlarged print.

Unlike many photographers, Gursky does not work in series. Although certain staging arrangements that create themes of images appeal to him, each photograph is based on a single, precise idea that elicits an individual image. The scenes in the photos depict the self-evident character of everyday life as well as oddities closely observed, both of which

Gursky turns into an abstract pattern. None of his images is temporary or spontaneous. Rather, his trained observing eye seeks out a theme that must form itself into a visual concept, something that often requires a long time to transform—in photographic terms—into a single manageable work and leads to the production of only a few images per year.

JOHN GUTMANN

American

John Gutmann had two advantages working as a photojournalist in America in the 1930s. As a German immigrant, he saw American life and culture through the eyes of an outsider. Also, his background in painting and familiarity with modernism merged and influenced his photographic visions. Although Gutmann photographed in America

from 1933 on, his photographs were virtually unknown until the 1970s, when the art world accepted photography as a serious art form.

John Guttman was born May 28, 1905 in Breslau, Germany (now Wroclaw, Poland) into a financially comfortable Jewish family, where he was exposed to the arts at an early age. He had a special affinity for the visual arts and entered the State Academy for Arts and Crafts in Breslau,

where he was a master pupil of Otto Müller, the Expressionist painter, who had been a member of die Brücke. Gutmann graduated with a B.A. in 1927, and also studied philosophy and the history of art at Silesian Friedrich Wilhelms University, Breslau. He then moved to Berlin and completed an M.A. in art from the State Institute for Higher Education and continued to study at the Alexander von Humboldt University and the Berlin Academy of Arts. As he was establishing a reputation as a painter, the oppressive power of Nazism dramatically increased. In 1932, he lost a teaching position because he was a Jew, then decided to emigrate.

Upon the advice of a friend, Gutmann decided he would settle in San Francisco. Thinking that it would be impossible to earn a living as a painter there, he bought a Rolleiflex camera and, with the aid of a manual, taught himself the bare essentials of photography. After convincing the Berlin news agency Presse-Foto that he was a professional photographer, he signed a contract. He then set sail on a Norwegian freighter and arrived in San Francisco on New Year's Day, 1933. For several years, Gutmann supported himself as a photo-journalist for Presse-Foto, and did not yet view himself as an artist.

The work of the California-based Group f/64 photographers and the federally-funded Farm Security Administration photographers prevailed during the 1930s, but Gutmann distinguished himself through particularly well-composed and enigmatic images. He was simultaneously taken aback and invigorated by American popular culture, and unlike his contemporaries, he approached his subjects not to reveal their social contexts or anthropological realities, but to satisfy his outsider's curiosity and delight himself.

His illustrations for magazines through which he supported himself were far more than documents. With his artistic training Gutmann approached his subjects thoughtfully and imbued his photographs with multiple levels of meaning. Although familiar to Americans, the subjects that fascinated him—the street, automobile culture, signs, ethnic minorities, women, graffiti, and the American people during the Great Depression—were viewed through the eyes of a newcomer. Yet his work has proven to be a valuable source of information for cultural anthropologists in that he documented that which no other captured—not the downtrodden struggling to survive, but the masses of Americans who were participating in life and enjoying themselves despite the hard times.

On a cross-country trip in 1936–1937 for Pix, Inc., a New York photo agency, Gutmann discovered a treasure trove of surrealist images at the New Orleans Mardi Gras. *The Game*, showing a stylish, riding-habit-clad threesome strolling down a littered street acknowledging the camera through their Mardi Gras masks, and *Jitterbug*, showing a dancing masked couple, are simultaneously real and unreal. He also captured what might seem to be ordinary sights, such as a vertical car park in Chicago, but photographed them at an angle and exposure that turns the scene into a Surrealistic wonderment. Gutmann was struck by the plethora of signs and graffiti which was nonexistent in Germany. This aspect of American culture so fascinated him throughout most of his life that he resumed this interest as late as 1987 in his series, *Signals*, where letters, numbers, and fragments of words were photographed against a black background.

In 1936, Gutmann began a position teaching painting, drawing, and art history at San Francisco State College (SFSC; now San Francisco State University), which he held until his retirement in 1973. World War II interrupted his teaching while he served with the Army Signal Corps and the Office of War Information in the China-Burma-India theatre as a still and motion picture cameraman. After the war, Gutmann resumed his teaching position, and in 1946 he founded the creative photography program at SFSC, one of the first of its kind in America. He designed the facilities and taught beginning and advanced photography. He also exposed Bay Area audiences to experimental films, documentaries, and classical short films through his film series, *Art Movies*, held at the college. He continued to work on assignments for Pix, Inc., and his photographs were published in *Time*, *Life*, *Look*, and numerous other national and international magazines.

During his decades of teaching, however, Gutmann's photographs were largely unknown to the faculty and students at SFSC. Yet Gutmann's legacy to photography on the West Coast is measured by more than just his extraordinary body of work from the 1930s. His contact with European Modernism had brought a sophistication to his various activities which has had lasting implications for the San Francisco artistic community. In 1959, Gutmann hired Jack Welpott to teach photography on a full-time basis at SFSC, and Welpott went on to expand the department into one of the few successful university-level photography programs in America in the 1960s and 1970s.

In 1972, the year before Gutmann retired from teaching, he began a review of his thousands of

negatives and reprinted many of the 1930s negatives. After amassing a portfolio of 100 images, he went to New York in 1974 at the age of 67 and secured an exhibition at Light Gallery; Gutmann's photographs were rediscovered. His exhibition, *The Face of the Orient*, had been mounted at the M.H. de Young Memorial Museum in San Francisco in 1947, and now 27 years later, the San Francisco Museum of Modern Art mounted a second major solo exhibition titled, *As I Saw It*. Thereafter and until his death in 1998, Gutmann's photographs were exhibited widely in both the United States and Europe and acknowledged for their unique and enduring qualities. *The Photography of John Gutmann: Culture Shock* organized by the Iris & B. Gerald Cantor Center for Visual Arts at Stanford University, Palo Alto in 2000 featured his classic images and traveled across the United States, cementing his reputation.

John Gutmann never considered himself a great photographer or a great artist. About his work, he said:

I believe a good picture is open to many individual and subjective associations. Ambiguity is an essential part of life. I believe that art is life, and in that sense I am not desperately trying to make art; rather, I am interested in recording the marvelous extravagance of life.

H

ERNST HAAS

Austrian

Ernst Haas is celebrated as one of the century's great innovators in color photography. His ability to transform mundane and everyday objects or occurrences into images of rare beauty with symbolic and poetic resonances has been much imitated over the years. Haas himself was unconcerned by these attempts to imitate his style, but would always encourage people to find their own vision and way of seeing the world through the medium of photography. Elliott Erwitt, a fellow member of Magnum Photos, who readily admits to having little interest in color photography commented:

He has been incredibly copied since the beginning....It was certainly new—nobody had done it before and nobody has stopped doing it since....The trouble is that most of Ernst's imitators over the years have been photographically vulgar and obvious, and in a way that's reduced his work retroactively, which is a shame. He just does it better than all of them.

(Elliott Erwitt, *American Photographer* Dec. 1983)

Ernst Haas was born in Vienna in 1921 to a middle-class family. His father was a government official and an amateur photographer, while his mother was always keen to nurture the creative

talent she saw in her son through drawing, painting, and music. Always keen to further his studies, Haas had to contend with the new order in Hitler's Austria where he often found himself obstructed and discouraged from pursuing further education due to his Jewish ancestry. This would not stop the young Ernst Haas, who having survived the war found part-time work in a photographic studio, as well as teaching a basic photography course at the American Red Cross center. It was here that he was introduced to the work of Edward Weston, whom he cites as an early influence, whose work sang to him in poetic style that he had never before experienced in photography.

Having exhibited his work at the Red Cross headquarters, and with the backing of Warren Trabant, editor of the German language magazine *Heute*, Haas began to receive regular magazine assignments. It was at this point that his widely acclaimed photoessay of the returning Austrian prisoners of war from Russia was published. This led to offers of employment from *Life* magazine and an invitation from Robert Capa to join the newly formed photographic agency Magnum in Paris.

True to his own lifelong beliefs in having the freedom to create his best work rather than to be driven by the powerful magazine editors of the time, Haas

declined *Life* magazine's offer and joined Magnum. This introduced him to other great photographers of the time such as Henri Cartier-Bresson, from whom he learnt about "the decisive moment" and how to use his discerning eye to build up, then break down the compositional elements in his photographs. Werner Bischoff, who became a great friend, also contributed to Haas's growing interest in humanistic work. In a letter to Wilson Hicks, the magazine's picture editor, Haas explains his decision not to join *Life*'s staff: "There are two kinds of photographers, the ones who take pictures for a magazine, and the ones who gain something by taking pictures they are interested in. I am the second kind."

This was an ethos that would remain prominent in Haas's work throughout his career. It would also be intrinsic to his best work including his visceral colour photography of New York, Paris, and Venice as well as his groundbreaking work in "motion" photography. His early New York photography was published on 24 pages over two issues of *Life*, an unprecedented use of colour photography. His "motion" work of bullfights in Spain in the 1950s was also highly acclaimed as a new way of seeing. Haas described his intentions in a statement prepared for his 1962 exhibition at the Museum of Modern Art, New York, the first solo exhibition of colour photographs in the museum's history:

To express dynamic motion through a static moment became for me limited and unsatisfactory. The basic idea was to liberate myself from this old concept and arrive at an image in which the spectator could feel the beauty of the fourth dimension which lies much more between moments than within a moment.

Haas visited the United States for the first time on photojournalism assignments for *Vogue*, *Life*, *Paris-Match*, and the *New York Times Magazine*, among others, in 1951. *Life* published the groundbreaking color photoessay "Images of a Magic City," that chronicled Haas's observations of New York City in 1953; Haas had been spending more and more time in the United States, traveling in the Southwest photographing his "Land of Enchantment" photoessay and serving as the American Vice-President of Magnum. He moved permanently to New York in 1965. His career continued to build on its already considerable success. Haas was in demand by large corporations and teaching organisations alike. In typically paradoxical manner he managed to maintain both areas to the highest levels of quality. He shot for corporations such as Ford, Volkswagen, Chrysler, Leica, and Mobil Oil in addition to being one of three photographers to photograph the "Marlboro Man"

advertising campaigns from the early 1970s–1980s. He became involved in Hollywood films, including "The Misfits" and "West Side Story." He also began to run workshops and seminars on photography. In the 1970s and throughout the 1980s, he increasingly used audio-visual equipment to display his work in new ways. Instead of using a single slide projector he would use two projectors dissolving images into each other to a background of music. Once again he delighted in the paradox he provoked from his audience—some spellbound and others unable to watch it all. Having been involved with a four-part PBS television series on photography in 1962, he became involved in directing workshops at the Maine Photographic Workshops in the early 1970s.

Ernst Haas's photographs were also published in book form, including *Creation*, which sold over 250,000 copies, a photographic representation of the creation of the world inspired by his involvement as second director on the film "The Bible." Other books included *In Germany*, *In America*, and *Himalayan Pilgrimage*, a highly spiritual and personal photographic account of the Himalayan region.

There are few places or subjects that Haas did not photograph in his lifetime, from America to Japan, from portraits to landscapes. He always photographed according to his own style and convictions, always experimenting, much imitated but never imitating others. He was among the first of his generation to stride down the path of colour photography, transforming what he saw to challenge his audience, a path since followed by countless others. Following Haas's death from a stroke in 1986, the American Society of Magazine Photographers established the annual Ernst Haas Award for Creative Photography and the Maine Photographic Workshops begins the Ernst Haas Photographic Grant, funded by Kodak. The Ernst Haas Memorial Collection was established at the Portland Museum of Art in Portland, Maine in 1999.

BETTY HAHN

American

Betty Hahn's work is characterized by her relentless experimentation with technical processes and subject matter, and the endearing sense of wit and humor so pervasive in her pictures. These same qualities keep her from being typecast as a "modernist" or "feminist" or some other category of photographer constrained to a particular ideology. Her work is recognizable in that it has no one "signature" appearance. Hahn has experimented with different cameras—plastic toy cameras, 35-mm cameras, the 20 × 24-inch Polaroid camera—and different photographic and non-photographic processes, including gum bichromate prints on paper and fabric, collotypes, cyanotypes, cibachromes, as well as gelatin silver prints, and woodcuts, serigraphy (silkscreening), lithography, trapunto (a stuffed quilting technique), and ceramics—to realize her aesthetic ideas. She was a pioneer in the 1960s and 1970s, along with such figures as Bea Nettles, Robert Heineken, and Thomas Barrow, in working with various non-silver methods at a time when straight black-and-white photography, much of it documentary, was the only kind of art photography taken seriously.

Hahn was born in Chicago in the fall of 1940 and attended Catholic schools during most of her youth. She showed artistic talent from an early age, and many of the recurring themes and motifs which form her aesthetic signature—horses, flowers, crime, and mystery—first surfaced when she was a young girl. A drawing of two horses Hahn rendered when she was 10 years old was published in *Children's Playmate Magazine*, and she received about 200 fan letters as a result. In 1954, she read Sir Arthur Conan Doyle's *The Complete Sherlock*

Holmes, beginning her interest in crime and mystery. And when she was 17, she received her first award, the Hallmark Honor Prize, for a small watercolor landscape. Unlike many adults, Hahn never narrowed her wide-ranging childhood interests, and she made her career out of experimenting with both subject and process.

Her formal art education took place at Indiana University in Bloomfield, Michigan, where she completed both her Bachelor of Arts and Master of Fine Arts degrees in 1963 and 1966, respectively, under the guidance of Henry Holmes Smith. Smith had worked with László Moholy-Nagy, whose work in the 1920s and 1930s had pushed many aesthetic and technical boundaries. Smith encouraged Hahn to do the same, and in 1965 she made her first gum bichromate prints. Without imitating Smith's work, or that of Andy Warhol or Robert Rauschenberg, two artists she admired and whose images influenced her, she developed her own unique style.

After graduate school, she taught design and photography at the National Institute for the Deaf at Rochester Institute of Technology, and later in 1970, transferred to RIT's School of Photographic Arts and Sciences, where she taught until 1975. In the winter of 1976, Betty Hahn was hired by Van Deren Coke to teach photography in the Department of Art and Art History at the University of New Mexico in Albuquerque. The department faculty then included Tom Barrow, Rod Lazork, and the already famous historian of photography, Beaumont Newhall. She retired in 1997.

Hahn has drawn and continues to draw upon her travel experiences, domestic situations, daily circumstances, and art history for her subjects. Though her techniques may change from project

to project, familiar themes appear and reappear. Since 1970, she has rendered flowers, gardens, and botanical studies in needlepoint and watercolor, and also as Polaroids, monotypes, silkscreens, and gum bichromate prints. She has also made color lithographs, embellishing many of these with whatever materials are at hand including spray paint, felt-tip markers, and instant coffee. In pursuing her interest in themes of crime and mystery, she has followed and documented a stranger throughout streets in London in *Observations of British Intelligence*, 1981; collected and photographed household items destroyed by her Borzoi puppy in *Crime in the Home* 1982; and constructed simulated crime scenes that she then recorded in *Scenes of Crime* 1979. Hahn has also given new life to images appropriated from other sources, masterfully illustrated in her long-running *Lone Ranger* series, which she began in 1974. Initially inspired by an image that she found in a stationery store—an 8 × 10-inch glossy black-and-white Hollywood still photograph—she has altered the iconic figures of the Lone Ranger and his companion Tonto using silkscreen, duo tones, Van Dyke prints, and photolithography. Many of the finished works are colorful and humorous. Silver stars and toy bullets, flocking, Sanka brand instant coffee, and pastels adorn various works in this series. Her titles for these images, *Who Was That Masked Man? I Wanted to Thank Him*, *Starry Night*, and *Phantom Stallion*, to name just a few, are as unique as her alterations, and they reflect her wry sense of humor.

David Haberstick, curator of photography at the National Museum of American History, Smithsonian Institution, and graduate student classmate at Indiana University, has summarized Betty Hahn's aesthetic sensibility and her career up to the present. Writing for the monograph that accompanied Hahn's 1995 retrospective, he stated that:

...there is a beauty and unity in Hahn's work that renders it a satisfying, multifaceted, intricately interconnected exposition of photography, its traditions, its role in our lives and its surprising affinities with other arts. More than any other artist, in my mind she summarizes, recapitulates, almost embodies, the history of photography.

(Steve Yates, David Haberstick, Dana Asbury, *Betty Hahn: Photography or Maybe Not*, Albuquerque: University of New Mexico Press 1995, 17)

Betty Hahn continues to live and to work in Albuquerque, New Mexico.

Biography

Born Betty Jean Okon in Chicago, Illinois on 11 October 1940. She received a Bachelor of Arts degree in 1963 and a Master of Fine Arts degree in 1966, both from Indiana University, where she studied under Henry Holmes Smith. In 1967, she moved to Rochester, New York and met Roger Merten, Bea Nettles, Tom Barrow, and Nathan Lyons. Hahn taught photography and design to deaf students at the National Institute for the Deaf, Rochester Institute of Technology in 1969. She was hired as a visiting artist by Van Deren Coke in January 1976 at the University of New Mexico, and in August that year accepted a full-time tenured position there to teach photography. She retired from the University in 1997. Her numerous awards include: a grant from the New York State Council on the Arts in 1975; National Endowment for the Arts fellowships in 1978 and 1983; Honored Educator award from the Society for Photographic Education in 1984 and 2000, a fellowship from the Visual Arts Research Institute at Arizona State University in 1987; a Polaroid fellowship in 1988. Betty Hahn lives and works in Albuquerque, New Mexico.

HEINZ HAJEK-HALKE

German

Best known for his production and promotion of abstract *Lichtgrafik* (light graphics), German photographer Heinz Hajek-Halke experimented with nearly every photographic style and technique developed in the twentieth century. Well regarded by his fellow practitioners, he remained a somewhat more obscure figure to the general public until the 1990s, when a renewed historical interest in the arts, politics, and culture of Germany's Weimar republic sparked a resurgent interest in his career. Though he enjoyed early success with his experimental montage, reportage, advertising, industrial, and botanical photographs, Hajek-Halke's major contribution to modern photography remains his development of a unique abstract pictorial idiom in the form of camera-less photographs produced after the Second World War.

Hajek-Halke aligned himself with experimental photographers like László Moholy-Nagy, Man Ray, and Herbert Bayer and was perhaps this group's most tireless promoter of the camera's unique aesthetic possibilities. He eschewed the straight or "objective" style of photography practiced by German contemporaries like August Sander and the Group f/64 school in the United States, in favor of highly mediated montages and abstract imagery produced via creative darkroom experimentation. More than a mere practitioner of this experimental style, Hajek-Halke was an equally passionate photographic educator whose popular books *Experimentelle Fotografie* (1955) and *Lichtgrafik* (1964) had an international influence in part due to text translations into three languages. Rather than conceal his innovative techniques, Hajek-Halke deliberately revealed his working methods in detailed captions noting his exacting darkroom procedures. For example, the caption for the photograph *Tanaquil* in his 1955 book reads:

Exposure mounting.—3 negatives: 1) picture of clouds, 2) agaric (top view), 3) picture of nude, glass negative, was sooted on the back and cleaned with dry brush only insofar as was needed, for the desired pictorial effect.—2 exposures, the enlarger being set differently for each.

(Hajek-Halke, *Experimentelle Fotografie* 1955, unpaginated)

Among Hajek-Halke's most important works were his experimental "light graphic" images made without a camera. More than mere photograms, these images evolved from the photographer's combination of various chemical and mechanical techniques. Hajek-Halke regularly combined non-traditional materials such as wire, glass, dirt, varnish, and fish bones with darkroom procedures like solarization, double exposure, montage, and even the occasional smoking or burning of a negative. Many of the resultant images, like *Friedhof der Fische*, of 1939, retain recognizable forms while an equal number are more fully abstract. In the former, one recognizes the influence of Bauhaus photographer Walter Peterhans's evocative subject matter and the abstract forms of Moholy-Nagy's photograms. In the latter, the weight of the medium's inherent objectivity strains against the subjectivity of the unidentifiable forms to create images that are at once assertive and immediate yet suspended in a kind of dreamy, timeless alchemy.

Born in Berlin in 1898, Hajek-Halke spent the majority of his childhood in Argentina before returning to Germany in 1910 at age 12. Although his father—an academic painter and caricaturist—discouraged him from pursuing a career in the visual arts, in 1915 Hajek-Halke enrolled as a painting student at Berlin's Königlichen Kunstschule. His initial career as a film poster designer was interrupted by his active service in the First World War. At the war's end, the young photographer resumed his studies at the Berlin Museum of Arts and Crafts under the Czech Vienna Secessionist graphic artist Emil Orlik before traveling to Hamburg where he produced publicity photos for a chemical-pharmaceutical firm. Hajek-Halke returned to Berlin in 1923 to work as a picture editor, printer, and draftsman at the Dammert publishing house, but it was not until his 1924 apprenticeship in the studio of famous Berlin photographer, Yva, that he began to seriously explore the expressive potential of the photographic medium through collage and montage. From the mid-1920s through the early 1930s, Hajek-Halke worked as a freelance photojournalist for Berlin's Presse-Photo agency while pursuing his own experimental fine art photography. During this time, he also collaborated with photojournalist Willi Ruge and Bruno Schulz, editor of the journal

Deutsche Lichtbild, who hired Hajek-Halke to create layouts and montages for his publication.

Hajek-Halke was enamored with the subject of the female nude throughout his career and this subject constituted the first of his published photos in the late 1920s. One of his most renowned, *Defamation* (1926–1927), features a bird's eye view of a nude model's torso, cropped, enlarged, and diagonally superimposed across a busy Berlin street. In the lower left, three top-hatted men engaged in discussion are balanced by three smaller figures just visible in the upper right. It is difficult to discern if the cryptic title refers to the modern defamation of the once "natural" landscape represented by the model's organic form, to the conversation of the top-hatted trio in the lower corner, or to the photographer's refusal to follow the rules of "straight" photography. In *Defamation*, the model's rounded curves are reiterated in the tires of the cars at the top of the scene and in the men's hats, yet her organic form seems otherwise out of place, writ large amidst an urban modernity that literally passes over and by her. Thus, if Hajek-Halke is to be viewed as ahead of his time for his atypical technical innovation, it is perhaps equally important to note that his frequent formal opposition of presumably "natural" female forms with all things cultural, modern, or intellectual marked him as a man entirely of his time.

Like so many artists who remained in Germany throughout the Third Reich, the degree of Hajek-Halke's complicity with, and resistance to, the Nazi regime is difficult to ascertain in historical retrospect. Although he joined the National Socialist Party in 1933, Hajek-Halke shortened his last name to "Halke" later that year and moved to Lake Constance in the Bodensee region in a move that some historians have viewed as a kind of transgressive "inner exile." Proclaiming his outrage at the fact that Hitler's Propaganda Ministry requested him to falsify documentary photographs, Hajek-Halke turned his attention to the less politically-charged field of zoological macro-photography. At the same time, however, he won a gold medal at the 1933 International Photography exhibition and continued to write how-to articles for amateur photographer periodicals in the field of small animal macro-photography. During his years at Lake Constance, Hajek-Halke developed a passion for natural science with a particular interest in herpetology. In the mid-1930s, he contributed photographs and essays to a Natural Science newspaper and traveled to Brazil to conduct research at the Butantan Snake Farm. Though he considered emigrating to Brazil, Hajek-Halke returned to Germany in 1938 and to more politically sensitive work

creating aerial photographs for the Dornier-Werken airplane manufacturing firm in Friedrichshafen. This work was interrupted by World War II and, ultimately, by the photographer's internment as a French prisoner of war in 1944–1945.

As was the case for many German photographers in the 1930s, Hajek-Halke lost all his equipment in the war and as a result, channeled his postwar energy into the founding of a snake-breeding farm that produced snake products and medical leeches for the pharmaceutical industry. He began renewed attempts at painting but was quickly drawn back into his lifelong interest in experimental photography. Hajek-Halke joined Otto Steinert's avant-garde *fotoforum* group in 1950 and in 1955, was appointed as a Lecturer in Graphic Design and Photography at West Berlin's Academy of Fine Arts, a post he held for more than a decade.

In his critically acclaimed 1955 book, Hajek-Halke noted that its purpose was to "stimulate the interested viewer and show him as concrete pictures those things which he can perceive at any time in his closest surroundings" (Hajek-Halke, *Experimentelle Fotografie* 1955, unpaginated preface). When considered in tandem with his expressed desire to resume the photographic experiments of the 1920s' Dessau Bauhaus, it is clear that Hajek-Halke's later work represents the successful synthesis of his early experimental imagery with his World War II era experience in aerial photography and scientific macro-photography. In the decades preceding his death in 1983, Hajek-Halke's continued aesthetic innovation and dedication as a teacher won him many awards, including the Cultural Prize for German Photography and the coveted David Octavius Hill Medal. His work has been acquired by New York's Museum of Modern Art, Germany's Folkwang Museum, Kestner Museum, Berlin Kunstbibliothek, and France's Pompidou Center, among others.

In 1964, art historian Franz Roh described the process of viewing Hajek-Halke's photographs as necessarily challenging. He noted in the introduction to *Lichtgrafik*,

One is disposed... not only to accept them in detail, since they contain both macro- and microscopic statements, as it were. Bold chiaroscuro configurations are impinged upon by smaller flourishes, by light of increasing and diminishing intensity. The most diverse linear particles of light and form are permeated by every conceivable nuance of shading. The eye is led by stages from the purest white, via light, cloudy opacities, to a wide range of medium greys and an abundance of blacks—a profusion which effectively avoids the purely decorative.

(Hajek-Halke, *Lichtgrafik*, 1964 unpaginated preface)

As a photographer who remained (and served) in Germany throughout both world wars and whose complicity with the Third Reich remains unclear, a summary of Hajek-Halke's personal biography requires a similarly nuanced attention focused upon the details of his life and his broader contributions to the medium.

PHILIPPE HALSMAN

American

Blending technical precision with “psychological portraiture,” Philippe Halsman made unique, rich photographs of mid-twentieth-century icons. His photographs of actors, politicians, artists, academics, and other luminaries adorned the pages of the big American picture magazines from 1941 to 1979. He had the unmatched number of 101 *Life* covers to his credit. During the height of his career his work was so widely admired that in a 1958 poll conducted by *Popular Photography*, Halsman was named one of the “Ten Greatest Photographers.” Beginning in 1941, Halsman explored surrealism in a decades-long collaboration with the Spanish surrealist artist Salvador Dalí. The collaboration led to startling photographs, perhaps the most recognized and elaborate of which is *Dalí Atomicus*. In this dream-like photograph, Dalí, a canvas, a chair, two cats, and a splash of water all appear to defy gravity by hanging suspended in midair.

Born in 1906 in Riga, Latvia, Halsman was raised by his father, a dentist, and his mother, a school principal. Young Philippe had an upper-middle-class, Jewish upbringing with education in the arts and in several languages. His first foray into photography was in 1921, when he began using his father’s old 9 × 12-cm view camera to photograph family and friends. He completed a Bachelor of Arts degree in 1924 and then from 1924 to 1928 studied electrical engineering at the Technische Hochschule in Dresden, Germany. While studying in Dresden, he began to work as a part-time freelance photographer. In 1928 while the family vacationed in the Austrian Alps, a hiking accident resulted in his father’s death. Anti-semitism in the area at that time contributed to the accusation, trial, and conviction of Philippe for the death of his father. In 1930, after serving two years in prison, Halsman was freed due to the efforts of important intellectuals, including Albert Einstein and Thomas Mann. Halsman rejoined his family in

Paris in 1931. He studied briefly at the Sorbonne in 1931, writing French poetry, before pursuing photography on his own. In 1932, he started his own portrait studio in the Montparnasse section of Paris.

From an early point in his development as a portrait photographer, Halsman’s approach was to reveal and capture something about the private inner person that was not normally seen by the public. This brought depth and life to his portraits. Later in his career, Halsman often wrote about “psychological portraiture”:

If the photograph of a human being does not show a deep psychological insight it is not a true portrait but an empty likeness. Therefore, my main goal in portraiture is neither composition, nor play of light, nor showing the subject in front of a meaningful background, nor creation of a new visual image. All these elements can make an empty picture a visually interesting image, but in order to be a portrait the photograph must capture the essence of its subject.

(Halsman 1972, 7)

Halsman’s technical approach evolved from his desire to render clear, precise images showing emotion. Careful lighting rendered images with dramatic highlights and shadows. From the start of his career, Halsman focused sharply, eschewing the more fashionable soft-focus technique. He needed large negatives for great detail. The classic 9 × 12-cm view camera that he began his career with was capable of all of this but was slow. The turning point came after a discouraging sitting with Andre Gide, a writer who Halsman “admired above any other.” Halsman decided he needed a camera capable of quickly capturing the emotion on his subject’s face before it disappeared. The Leica, Rolleiflex, and Hasselblad, which allowed simultaneous viewing and photographing, were all tools that Halsman used, but their negatives were still too small to satisfy him. Halsman’s compromise was to design a 9 × 12-cm twin-lens reflex (TLR) camera, built in 1936 by the grandson of the first camera maker. In 1946 he

refined his camera to the TLR 4 × 5-inch Fairchild-Halsman, built for him by the Fairchild Corporation.

Between 1932 and 1940, Halsman achieved recognition in Paris as one of the top portrait photographers. He shot extensively for magazines such as *Vogue* and *Vu*, in fashion and portraiture. At that time he sought out and photographed many notable figures of French art, literature, and theatre. But Halsman's life in Europe came to an end in 1940 with Hitler's march on Paris. His wife and children had visas and were able to leave for New York, but Halsman had to flee south from Paris as a refugee. He was only able to obtain an emergency visa to the United States due to the assistance of First Lady Eleanor Roosevelt, Thomas Mann, and Albert Einstein, among others.

In New York with his family, Halsman started anew. A portfolio that he shot for Connie Ford in 1941 gained recognition and got him a first assignment on hats with *Life*. The photography he then went on to make while working on freelance assignments for *Life* and other big American picture magazines of the time, such as *Look* and *The Saturday Evening Post*, gave his work the widespread exposure that assured him great lasting, popular success. His portraits, from the 1940s through the 1970s, ran the gamut of notables, from the Duke and Duchess of Windsor to actor Marlon Brando, from Albert Einstein to sex symbol Marilyn Monroe. In striving to capture the essence of his many famous subjects, Halsman succeeded in creating some of the most recognized and celebrated portraits ever taken of them.

Halsman and others have written on how he evoked a psychological response from his sitters. Halsman's pathos-filled portrait of Albert Einstein in 1947 came about during a conversation with the scholar that turned to Einstein's feelings about his role in creating the atomic bomb. In contrast, for his vulnerable yet seductively confident 1952 photo of Marilyn Monroe in a corner, Halsman used a very different approach. Positioning her in the corner, he and his assistants flirted with her to get Monroe's responses. A signature method for catching subjects off guard that Halsman asked of many of his sitters was to have them jump. His theory of "jumpology" and photos of notable people jumping appear in *Philippe Halsman's Jump Book*.

Besides his considerable achievements as a photographer, Halsman was one of a handful of people influential in the creation of the American Society of Magazine Photographers (ASMP), crucial in setting standards for the trade. He was elected president in 1945. In 1962, he formed the Famous Photographers School with Richard Avedon, Alfred Eisenstaedt, Irving Penn, and others and became one of its guiding faculty.

With the end of World War II, and the attainment of U.S. citizenship, Halsman was again able to travel. In 1951, he returned to Europe and photographed leading figures such as painters Marc Chagall and Henri Matisse. He was then asked to join Magnum Photos as a contributing member so that his work could be distributed by the agency outside of the United States. In 1960, he went to the Soviet Union to photograph the leading luminaries there. In 1966, he traveled to Switzerland to photograph writer Vladimir Nabokov.

In 1979, the last year of Halsman's life, his photographic achievements received widespread exposure in the form of a major retrospective exhibition at the International Center of Photography in New York City. The exhibition toured throughout the United States until 1986. In 1998, another major retrospective was launched, this time at the National Portrait Gallery by the Smithsonian Institution. *Halsman: A Retrospective* was published to coincide with the exhibition. The exhibition toured the United States, Britain, and France through 2002.

HIROSHI HAMAYA

Japanese

Hiroshi Hamaya is one of the great names of photojournalism in Japan, of a similar stature to Ken Domon and Ihee Kimura. His strongest contribution to twentieth century photography, however, is his series of aerial views of wild and dramatic landscapes, including pioneering shots of Mt. Everest. Born in Tokyo, Hamaya began his career in photography in 1931. In 1933, he worked in a photography department of an aviation laboratory, where it might be assumed that he acquired his taste for aerial photography. Self-taught, he became a freelance photographer in Tokyo in 1937, his pictures capturing both the changes of the city and the changes of the people during the inter-war years. After the defeat of Japan in World War II, Hamaya focused on the country's reconstruction with modern urban architecture. It was during this period the elements of Hamaya's mature style began to be codified, with two major publications attesting to this new aesthetic: *Yukiguni*

(*Snow Country*), 1956 and *Urah Nihon (Japan's Back Coast)*, 1957. Yet his photographic thinking and his original style only emerged some years later.

Yukiguni is a work of long gestation. In 1939, Hamaya was sent to Takada in the Niigata area in order to make a report about a military camp. During his first stay, he met an ethnologist, Keizo Shibusawa, who impressed Hamaya with his knowledge and rigorous sense of observation. Applying this knowledge, Hamaya visited this region over a ten-year period, centering his interest for the most part on a village called Kuwadoridani, near Takada. His choice of subject matter encompassed a broad sampling of photographic topics: candid studies of villagers, daily life, farm work, and scenic views of the area covered in snow. In this manner, he describes the life in the village during various commemorations and ceremonies, like the winter Festival of Fire, also showing the relation between the peasants and their divinities. The pictures reveal the deep respect that links the

villagers and farmers to their land in an area covered by snow four months of the year. Yet what this series truly revealed can only be understood in an immediate Japanese post-war context where it can be seen as a reply to the rapid modernization and the American occupation. Because the villagers of Kuwadoridani are isolated, they do not benefit from the technical progress, changes of mentality, or Americanization of the urban spaces. But neither are their time-honored traditions disturbed. Hamaya used an original technique of oscillating between larger, almost abstract, views that describe the life of the people and intimate, close-up shots of individuals such as *Woman Planting Rice*, 1955. This photograph depicts a woman passing through a rice field. A formal analysis of this picture can elicit the interpretation that farmers are being left by the wayside, but it can also be read as a quest for more traditional values, a quest for identity, and a specific form of awareness. This oscillating between the documentary and personal reflection are a unique character of early works by Hamaya.

Hamaya next passed many years taking pictures of villages along the West coast of Japan. Much like an ethnologist, he records work in the fields, rituals, the way of living, and the organization of rural society. These pictures were collected in *Urah Nihon (Japan's Back Coast)* of 1957. Hamaya further developed and deepened his themes, bringing to the fore the relations between the villagers and the historic and geographic frame of the places where they live, in lives punctuated by seasons and ceremonies. Hamaya's realism and his focus on agriculture, fishing, and traditional folklore provide a counterpoint to the migration of people to great urban centers in the massive modernization of Japan of the 1940s and 1950s.

With these two collections, Hamaya secured his reputation in Japanese photography circles. Further success arrived when works from these series were selected for the exhibition *The Family of Man* at the Museum of Modern Art, New York in 1955, which also toured Japan. Hamaya secured another milestone in Japanese photography with his entry to Magnum Photos in 1960, the first Japanese photographer to join this Paris-based agency. Although Hamaya traveled extensively on photojournalistic assignments, his strongest work remained that which was realized in his native land. In 1960, he published a series of pictures entitled *Okori to Kanashimi no Kiroku (Record of Anger and Sadness)*, through which he stands up against the Japanese government at the time of the Japan-U.S Security Treaty (ANPO).

During the 1960s, however, portraits of Japanese life gradually disappear from his work, although he

returned to the theme in 1976 with a series devoted to the life of Japanese women in the Showa era. He increasingly turned to what might be called natural architecture portraits, taking up aerial photography that results in a set of color, panoramic views of Japan as published in collections entitled *Nihon Rettō (The Japanese Archipelago)* and *Landscape of Japan*, 1960–1964. Through aerial photography Hamaya turns his gaze to the world landscape, shooting in America, Canada, Greenland, Australia, Algeria, Turkey, Western Europe, and most dramatically, in Nepal with his extraordinary series of black-and-white aerial views of the Himalayas. These photographs are featured in two publications: *Aspects of Nature* (1980) and *Aspect of Life* (1981), and are more than landscapes. They are better described as portraits of nature, wherein Hamaya, with his lens, sculpts mineral and vegetal components into a natural architectural order.

Although the aerial work on a formal level is strikingly different than Hamaya's earlier photographs, the consistent thread is the photographer's reliance on the notion of place. In the aerial works, Hamaya seeks out places seeming to become, or at the opposite end of the spectrum, are still wild. He expresses strength through images of mountains or, volcanoes in which nature is the sole law. More than straightforward panoramas, his photographs, as in those of icy landscapes or deserts, present an abundance of details that require the viewer to create order through observation and rational thought, much as humans create order through their actions on nature.

A modest man, Hamaya often downplayed his achievements, but was eloquent when he stated:

[I feel] photography is less creative than painting: sometimes I tell myself that I'm not a very creative person...but at the same time I know that photography is more a matter of finding than of creating. We wander round the world trying to find things and to decide they are important.

(Interview with Frank Horvat, November 1988, *Entre Vues*, Paris: Nathan, 1990)

Hamaya died in 1999 at his home in Kanagawa Prefecture.

HANS HAMMARSKIÖLD

Swedish

Hans Hammarskiöld, along with his contemporaries in the 1940s and 1950s, contributed to significant changes in Swedish photography, bringing it from styles that relied on conventions of the past to more contemporary photographic expressions. His

body of work includes a rich representation of nature as well as cityscapes, fashion, and industrial photographs that feature distinctive lighting with a rich contrasts of tones.

Born in 1925 in Stockholm, Hans Hammarskiöld is largely self-taught in photography. While studying at secondary school, Ostra Real, from

1936 to 1944 in Stockholm, he discovered photography and became fascinated with its possibilities. He spent a great deal of time taking pictures and developing prints in the darkroom. After high school, Hammarskiöld spent six months as an assistant to Sven Thermanius, a well-known cinematographer. In 1947, Hammarskiöld bought his first camera, a Rolleiflex, and, in 1948 became an apprentice photographer at portrait Studio Ugglå, where he studied under Rolf Winquist, an outstanding Swedish portraitist of the time.

Hammarskiöld's photographic career really began in Stockholm in 1949, at an exhibition titled *Unga fotografer* (Young Photographers), a show organized by a group of contemporary photographers. The photographers who made up this group wished to separate themselves from both the subject matter and style of the photographic establishment made up of the generation of pre-war photographers. These photographers celebrated what the younger generation saw as an outdated, romanticized view of the Swedish national identity.

One of Hammarskiöld's images from this time, *Barcelona 1949*, shows his digression from the portraiture style he had adapted from Winquist, the movement in this image differing considerably from the style he had been learning as an apprentice. It also displays the sharp contrast of tones with deep blacks and bright whites, a significant departure from the modulated grays prevalent in Swedish photography at the time. In *Frost, 1949*, Hammarskiöld also diverges from convention in focusing on one detail of nature, rather than shooting an over-all scene. This technique becomes a characteristic of his photography over the years, and this image of grains of grass with a leaf in the upper left-hand corner is the first of his many photographs of nature, and more specifically of the magical beauty of frost.

In 1950, Hammarskiöld focused on architecture and fashion and worked for a year at Sten Didrik Bellander's studio. At the time, Bellander's studio was a common meeting place where young photographers frequently congregated. Hammarskiöld had his first individual exhibition at Rotohallen in Stockholm in 1951, and he won the newspaper "Svenska Dagbladet" prize that same year.

During the early 1950s, Hammarskiöld traveled to the United States, which strongly influenced his developing photographic style. Hammarskiöld set off to discover what was happening abroad during this transitional time for postwar Europe and met leading photographers in New York such as Edward Steichen, W. Eugene Smith, and Irving Penn.

Edward Steichen, director of photography at the Museum of Modern Art (MoMA) in New York at

the time, became an important influence for Hammarskiöld as Anna Tellgren illustrates in *Tio Fotografer*, *Self-perception*, and *Pictorial Perception*. They formed a lasting friendship, and Steichen encouraged the young photographer. Hammarskiöld's work was included in two of Steichen's exhibitions at MoMA: *Postwar European Photography* (1953) and *The Family of Man* (1955). Hammarskiöld would later take several striking portraits of the great photographer, including *Edward Steichen 1968*.

In 1955–1956, Hammarskiöld joined Condé Nast in London, working for *Vogue* magazine. His contributions included fashion stories, portraits, advertising, food, and interior photography. In addition to this commercial work, Hammarskiöld wandered around London taking captivating images of the city. *Battersea Bridge, 1955* and *Chelsea Embankment, 1955* portray an enigmatic quality of London, with dramatic lighting and dark silhouettes structuring the images. These photographs were exhibited at the Institute of Contemporary Arts in London in 1957.

At this time, Hammarskiöld was also taking black-and-white, highly contrasted but intimate portraits of his family. In his finely composed photographs of his pregnant wife, *Caroline, 1955* and his daughter, *Suzanne, 1961*, Hammarskiöld used accentuated lighting and sharp contrasts. During this time Hammarskiöld took his remarkable portraits of the American poet of Swedish origin Carl Sandburg, resulting in *Sandburg, 1959*. The image features distinctive lighting, adding sharpness and clarity to this elegant portrait.

Returning from London in 1957 to work in Stockholm, Hammarskiöld became and remains a freelance photographer. In 1958, he was one of the 10 founding members of "Tio Fotografer" (Ten Photographers). The group included Hammarskiöld, Sten Didrik Bellander, Harry Dittmer, Sven Gillsätter, Rune Hassner, Tore Johnson, Hans Malmberg, Pal-Nils Nilsson, Georg Oddner, and Lennart Olson, many of whom were among the young photographers who exhibited their work together back in 1949. Ten years later, after many of them had been abroad as a result of their postwar isolation from the world of photography outside of Sweden, the group formed itself officially. Like Hammarskiöld, a few of the group had spent time in the United States while some traveled within Europe, notably to Paris. The reunited group established an agency called Tiofoto in 1959.

Between 1958 and 1968, Hammarskiöld produced picture stories, food photography, still-life, portraits, and industrial photography. He also prepared illustrations for many books.

HAMMARSKIÖLD, HANS

In 1967, on assignment for a Swedish company, Hammarskiöld started creating “Pictoramas.” These are color visual multimedia shows using up to 36 different projectors and often synchronized with music. Hammarskiöld also photographed artists and their work, such as American sculptor Claes Oldenburg and the great Russian dancer Rudolf Nureyev. He published a book of holographs with Swedish artist and poet Carl Fredrik Reuterswärd in 1969 titled *Laser*.

Throughout his career, Hammarskiöld has taken photographs of nature, frequently focusing on details that result in images which are fairly abstract. In *Gotlandsstrand*, 1973, a feather is lit up in the foreground with the shining sun in the background, separated by the ocean and unique rock formations. The line of the translucent feather adds a decorative quality to the image found in many other of his images such as “The Royal Palace, Stockholm, 1970.” The swan’s curved white neck frames part of the image, again presenting a graphic aspect of the image with intense black-and-white contrasts. Hammarskiöld’s many photographs of nature celebrate its beauty and complexity. In Jan Cederquist’s text, *Hans Hammarskiöld, Photographer* (1979), Hammarskiöld is quoted:

I’m very concerned about what we’re doing to nature today. As a photographer I could try influencing opinions by showing ugly deforestation areas, animals killed by pesticides and the like. But I prefer doing it the opposite way. To show the beauty and magic of nature. To try to make people see and feel what’s really at stake.

Hammerskiöld still illustrates books today, taking many pictures of nature, working mainly in color since 1984. He has illustrated 25 books, and his photographs have been published internationally. His work is also found in collections across the world, including MoMA, the Library of Congress, and the Bibliothèque nationale de France in Paris.

HAND COLORING AND HAND TONING

The practise of applying colour by hand onto monochromatic photographs was common from almost the very beginnings of photography until well into the mid-twentieth century, by which time commercially viable colour processes had been developed and replaced the need to add colours to a black and white print. To consider the use and need for hand colouring it is important to appreciate the expectancies of photographers in the early nineteenth century. It was soon after the advent of the Daguerreotype and Calotype that photographers questioned their art's inability to render natural colours. Despite several attempts by a succession of inventors throughout the 1800s, it would not be until 1907 that the Lumiere brothers were successful in creating and manufacturing their Autochrome process. Yet the cumbersome nature and expense of early color processes ensured that hand-coloring persisted.

The technique flourished especially as a service offered by the portrait photographer. By the end of the nineteenth century, many establishments offered not only delicate coloured additions to the portrait but sometimes would completely over-paint the photograph in oils, watercolour, or crayons to such an extent that the resulting hybrid generally presented the visual characteristics of both painting and photograph with the aesthetic qualities of neither. Often the best colourists had been miniature

portrait painters whose craft had been superseded by the advent of the photograph. These painters found their skills were in demand for applying colour to glass plates or prints and retouching—removing technical defects and improving the appearance of the subject. Many photographers who had higher aspirations than the family portrait found such practise derisory to the seriousness of their work.

Travel photographers aiming their work at the popular market often coloured their prints as well as the lantern slides used in their lectures. Burton Holmes, an American photographer active between the 1880s and 1950s, was a well-known producer of coloured glass slides to the popular market. In later years Holmes's slides were hand painted to such a high standard by a team he himself trained that the results compared favorably to slides produced by modern colour film (Colebeck, 14).

The humble picture postcard was initially coloured by hand in the late nineteenth century. Stencils were produced to allow block colours to be applied selectively by teams of workers in factories throughout the world. As the popularity of postcards grew, this labour-intensive method was mostly replaced by machinery by the late 1920s.

Whether by hand or machine, colouring had initially been used to replicate a natural rendition; it also eventually created its own aesthetic, one largely asso-

ciated with the glamour and film industries. By the 1930s, reproductions in popular magazines were often from hand-coloured photographs. Hollywood film stars were seen delicately coloured at a time when the movies in which they starred were shot in black and white. Even after the invention of Technicolour, the cinema industry in the 1940s and into the 1950s still employed hand colourists, primarily to work on movie stills and publicity shots. As films were often shot under controlled lighting in the studio, the still photographer with slower lenses than the film cameraman would produce their work in monochrome, with the publicity departments reproducing their prints from hand-coloured photographs.

It was common in the 1930s for portrait photographers to supply clients with hand-coloured prints. The methods of colouring varied depending on the intensity of colour required. Normally, a sepia-toned print was used as the warmth of the base provided a better rendering to the colours of the inks, dyes, and paints used, and also ensured none of the print would be seen as black and white. Many books offered both the professional and amateur photographer advice on the technique of hand colouring while simultaneously expressing a general mistrust of this practice, especially for the serious photographer.

Public taste for colour, even in its crudest form, had induced portrait photographers to offer to their customers coloured photographs which, sometimes, are far removed from works of art. However, specialists in such work may plead extenuating circumstances; for example, severe competition (Clerc, 463).

The mediums recommended by this and other volumes had different characteristics and results depending on the qualities of the print. Coloured dyes adhered best to glossy prints while smoother

matte papers responded better to water colours. Pastel crayons were suitable especially if the user had an understanding of sketching, though the complications suggested by the amount of formulae required to treat the print prior to working with oil paints would deter all but the most dedicated. The air brush was employed for its smoothness in applying colour, usually after areas of the print had been masked off, and brushes of various sizes used to highlight detail.

As colour films became cheaper and thus more widely used, the need for hand colouring receded. Designers still used selective hand colouring in advertisements and especially fashion magazines well into the 1950s, often using blocks of colours in a similar method to the picture postcards of the turn of the century. Though occasionally still used, and replicated now by computer retouching, it is the distinctive and recognisable look of the hand-coloured print that is its use and value long after colour photography has become the norm, employed occasionally, in most instances purely for its nostalgic appeal.

ERICH HARTMANN

American

Erich Hartmann's strongly composed vision of documentary photography not only led him to join Magnum Photos in 1952, but to successfully apply his vision to other realms with sensitivity and insight as a self-named working photographer. His concise style brought him commercial projects where he exercised

and experimented with the documentary genre. One of his most poignant projects was to document the deserted Nazi concentration camps decades after the war, challenging his ability to capture the essence of objects and place. This may appear as a counterpoint to much of the work he was known for in the technology field, yet he developed a specialty in bringing out the essence of seemingly inanimate objects, such

as computer components, revealing their power and expression. Hartmann who exhibited in Austria, Holland, Germany, Italy, and Japan, was firmly committed to the Magnum collective, serving on the board and as president, and is attributed to being the first to bring the techniques of photojournalism to corporate assignments.

The first child of a prosperous, middle-class Jewish couple, Hartmann was born in 1922 in Munich, and made his first photo in 1930. He fled Germany with his family to Albany, New York, when he was 16 years old. There, he worked in a textile mill and attended evening high school and night classes at Siena College. Hartmann served in the U.S. Army in England, took part in the invasion of Normandy, and after the war he served in Civil Affairs as an interpreter in Belgium and Germany. In 1946, he moved to New York City, married Ruth Bains, and began working for two years as an assistant portrait photographer before turning freelance. After meeting Robert Capa in 1951, he was invited to join Magnum Photos a year later and continued to develop his documentary focus. Although he never formally trained as a photographer, he was influenced by the work of photographer and prominent art director Alexey Brodovitch, Berenice Abbott, and Belgian photographer Charles Leirens at the New School for Social Research, and Werner Bischof and the Farm Security Administration photographers such as Ivan Massar and Clyde (“Red”) Hare.

As a freelance photographer based in New York City, Hartmann generated photo essays and reports for major magazines in the United States, France, Germany, Italy, and Japan. His photo essays were published in major magazines including mainstream news and business magazines such as *Fortune*, *Life*, *Time*, *Newsweek*, *Business Week*, *The New York Times Magazine*, *Paris-Match*, *Die Zeit*, *Stern*, travel and leisure publications such as *Venture*, *Vogue*, *Travel and Leisure*, *Connoisseur*, and science publications such as *GEO*, and included general interest and topics related to high technology, genetics, electronics, and scientific themes. Hartmann also developed corporate and advertising clients, including Litton Industries, Pillsbury, RCA, Ford Motor Company, IBM, Boeing, and Schlumberger. Hartmann took both color and black and white on assignment depending on the project. He also carried with him a 35 mm camera loaded with black and white film, and a couple of extra rolls that he shot to document his life on assignment and personal aspects of his life. Hartmann was an early colorist and for a period of time specialized in laser photographs that were exhibited in Europe and the United States. He mastered a

technique that allowed him to alter angles of the photograph without distorting the object.

In the fine-arts area, Hartmann had his first one-man show “Sunday Under the Bridge” at the Museum of the City of New York in 1956, and he continued exhibiting worldwide throughout his career, both independently and in Magnum Photos presentations.

Membership in Magnum Photos developed and influenced Hartmann’s style and working method but he developed a more personalized approach. While from 1955 to 1961 his main assignments were photo-essays for top magazines, he turned to corporate and institutional projects that showed a uniquely human face in science and industry. The documentation of satellite production done for the European Space Agency and many other “*high technology stories*” he has told reveal his “precision” of composition and concern for documentary authenticity. His fascination with how technology embodies also the beautiful led him to intimate portraits of precision-manufactured components. “It was a certain kind of view, that was no longer dependent on posing everything. And I came upon this from being interested in presenting objects in a way they hadn’t been looked at before.”

As a working photographer Hartmann explored varied themes in numerous countries, later exhibiting social aspects of what he found there. For example, his “Mannequin Factory” exhibition came from an assignment—some of the images evoking a metaphor for the dehumanizing horrors of our time. And his last major projects provide a glimpse of the photographer’s personal philosophy.

From 1969 onwards Hartmann lectured students at different institutions in the United States, including lectures at the University of Syracuse and New York University and in Europe. He had a deep commitment and sense of responsibility to help develop young photographers and always had an intern working with him. Hartmann’s longtime association with Magnum provided mutual support from colleagues such as Elliott Erwitt, Eve Arnold, and Inge Morath, who was a strong supporter of his later project, “In the Camps.”

While “In the Camps” deviates from his usual subject matter, it maintains Hartmann’s ability to allow the objects to speak for themselves. In the haunting images of Nazi concentration camps as they were in 1995, even devoid of people, the camps speak loudly of the horrors they contained. Hartmann photographed these places as an indebtedness to escaping them and “to fulfill a duty that I could not define and to pay a belated tribute with the tools of my profession.” With “In the Camps” the feeling from these penetrating images and the essence of its meaning evokes the human tragedy

that took place, and it is a powerful reminder. A second project that was completed after Hartmann's death, "Where I Was," offers an autobiographical look at his career and the photographs he took along the way. Reminders of his concise style and recurring fascination with laser light and reflected abstractions can be seen, displaying the depth in his accomplished journalistic and technical skills. The observations of the world around him and of people's relationship with their environments reveal a multifaceted, reflected view of the ordinary.

Hartmann the working photographer was surrounded by high technology and technical ways of looking at objects around us, while at the same time he was a self-proclaimed "commonplace" photographer who had a way of looking at the ordinary with unusual angles and perspectives. Following his death in 1999, he was recognized for his contribution to photography and young photographers that he nurtured and supported and with the naming of the Erich Hartmann Arts Centre at the United World College of the Adriatic in Duino, Italy, in February 2000.

JOHN HEARTFIELD

German

Helmut Herzfeld's Anglicization of his name to John Heartfield in the summer of 1916 was in protest to a nationalistic slogan being repeated around Germany, "May God Punish England" (*Gott Strafe England*). The decision to change his name as a form of protest is an example of a life and career that was devoted to, and motivated by, socially conscious action. Not a photographer himself, Heartfield spent his life using photography as a form of politically motivated art. The early part of his career was spent with the Berlin Dada group in which he and his close friend, the painter George Grosz, pioneered the technique of "photomontage." Strictly speaking, photomontage is a technique that creates a new artwork by appropriating and combining pieces from existing photographs. However, it is not uncommon to see a photomontage made with a combination of photographs and other materials, whether text, drawing, or found object. Heartfield and the other members of the Berlin Dada group used photomontage to create disruptive, often nonsensical artworks inspired by the brutality and senseless violence of World War I. In fact, Heartfield and his brother, Weiland Herzfelde (who added an "e" to his name, at the same time Helmut changed his name) were both drafted for service in the war. Heartfield served from 1914 to 1916 when he, by all accounts, staged a nervous breakdown in order to ensure his discharge from the military. Early photomontage was also meant to critique the forces of business and commerce as well as the Expressionist art movement. From Heartfield's Dada period onward, he diverged from his use of photomontage in his art.

Heartfield's work changed a great deal as he moved away from his earliest Dada-influenced pieces and toward photomontages more explicitly in reaction to current events. This shift was con-

nected to his increasing involvement with the German Communist Party. The 1924 photomontage entitled *Ten Years Later: Fathers and Sons*, inspired by the ten year anniversary of the beginning of World War I, was his first piece that made explicit reference to contemporary events. In it, a row of skeletons appears to be suspended above a group of very young boys dressed as soldiers marching to war. In the foreground looms a German general, positioned to lead the young soldiers. Both a remembrance of the dead and a warning against future wars, this piece provoked strong reactions when it was displayed, enlarged, and surrounded by various mementos of the war, in the front window of his and Weiland's bookstore and publishing house, Malik Verlag. At one point, it attracted such a crowd that the police had to be called in to restore the flow of traffic outside the storefront.

Heartfield continued to use photomontage as a means of political critique for the balance of his career. Like many politically motivated artists, he did not seek distribution through the traditional channels of museums or galleries—though it did eventually find him in some small degree—but rather in posters, postcards, and on book and magazine covers, mostly those published through Malik Verlag. His work as a book jacket designer was also his primary means of financial support. The majority of Heartfield's work appeared initially in the magazine *Arbeiter-Illustrierte-Zeitung*, or *A-I-Z* (The Workers' Illustrated Newspaper). The Communist-affiliated magazine, aimed primarily at German workers, was founded in Berlin in 1925 but, like Heartfield himself, was forced to relocate to Prague in 1933 when Hitler came to power. *A-I-Z* was remarkable for two reasons: (1) unlike other similarly-aimed periodicals of the time, it used photography in an innovative way, and (2) it is one of the few examples outside of the former Soviet Union of avant-garde art that success-

fully reached a mass audience. Though Heartfield contributed photomontages to *A-I-Z* as early as 1930, his contributions were more frequent and substantial after his flight from Germany. He became an editor of the magazine for a time, and was frequently provided space for commentary on current events. In 1938, shortly before Germany invaded Czechoslovakia, the magazine ceased production and Heartfield fled to England under threat of extradition back to Germany. He also published works in the magazine *VI—Volks Illustrierte* (People's Illustrated).

An apt example of Heartfield's work during this period is *Adolf—the Superman. Swallows gold and spouts junk* (1933) (*Adolf, der Übermensch: Schluckt Gold und redet Blech*). This photomontage, one of his better known works, appeared in *A-I-Z* and subsequently received a form of mass distribution via large reproductions posted throughout Berlin. The image is one of Hitler, mouth open as if to speak. His chest cavity appears to be an X-ray, so that his ribs are visible, as are the gold coins that form his spine and fill his stomach. Both the subject matter and formal features of this photomontage illustrate many of the important aspects of Heartfield's mature work. The majority of his pieces produced for *A-I-Z* were directed specifically against Hitler and the Nazis. The use of the title—which is as much a caption, and a part of the work itself, as it is a title—to explicate and reinforce the meaning of the images is a feature that becomes more prevalent during this period. Finally, the combination of images from conventional (often journalistic) photography with those that have been manipulated to create a visual disruption was a common technique in Heartfield's photomontages.

Once in England, although Heartfield continued to support himself as a commercial artist and a book jacket designer, he also continued his anti-Nazi work. His work was included in the group exhibition *Living Art in England*. A version of *Kaiser Adolf: The Man Against Europe* appeared on the front page of *Picture Post* in September 1939, but in 1940 Heartfield was interned as a person of German nationality. This not only restricted his artistic output, it also adversely affected his health. In 1950, he was able to repatriate to Germany and settled first in Leipzig, later in East Berlin. He there returned to his former work as a designer of stage sets, book jackets, and political posters. Once back in Germany, he received a number of honors and awards, such as his nomination by Bertolt Brecht to the German Academy of Arts in 1956. However, like Heartfield, Brecht was an outsider in the post-World War II German art and political scene. The milieu of the German art that remained was much different than it had been in the

interwar period. Avant-garde artistic techniques such as photomontage were held suspect in favor of social realism. Finding himself a committed artist without an organization to be committed to, Heartfield's later life provided an example of the conundrum of the Western artist who would attempt to make political art outside the gallery system.

Yet John Heartfield's work has endured and continues to inspire generations of politically motivated artists. His photomontage style has also had a deep impact on advertising photography, particularly in the juxtapositions of startling imagery with socio-political commentary. He particularly inspired Andy Warhol, who emerged from an advertising background to become one of the most influential artists of the twentieth century.

Biography

Born Helmut Herzfeld in Berlin-Schmargendorf, Germany, 19 June 1891. Studied at Royal Bavarian Arts and Crafts School, Munich, Germany, 1907–1910; Arts and Crafts School in Berlin-Charlottenberg, 1912–1914. Commercial artist for paper manufacturers Bauer Brothers, Mannheim, 1911–1912. Military service, 1914–1916. Founded periodical *Neue Jugend* and publishing house Malik Verlag with his brother, Wieland Herzefelde, 1916–1918. During same period, also directed scientific documentaries for UFA in Berlin and designed scenery for films. With his brother and George Grosz, edited satirical magazines *Jedermann sein eigener Fussball* and *Die Pleite*; with Grosz and Raoul Hausmann edited *dada 3*, 1919–1920. Scenic director of the Max Reinhardt Theatres in Berlin, 1921–1923. Editor of satirical magazine, *Der Knüppel*, 1923–1927. Designed photomontages for *Arbeiter Illustrierte Zeitung* (AIZ) and book covers for the Malik Verlag and other publishers, 1929–1933. Designed book covers and illustrations for the publisher Lindsay Drummond and Penguin Books, 1941–1950. Received offer of lectureship on satirical graphics at Humboldt University in East Germany, 1948. Designed scenery and posters for the Berliner Ensemble and Deutsches Theater in Berlin, 1950. Received full professorship at the Deutsche Akademie der Künste, 1960. Won first prize for a mural at Werkbund Exhibition in Mannheim, 1914. Nominated by Bertolt Brecht to the German Academy of Arts, GDR, 1956. German National Prize for Art and Literature, 1957. Medal for Fighter against Fascism, 1933–1945, 1958. Peace Prize of the GDR, 1961. Died in Berlin, 26 April 1968.

DAVID MARTIN HEATH

Canadian, born United States

David Martin Heath, photographer and teacher, began photographing in the early 1950s and in 1957 moved to New York City where he developed his own dark, lyrical style of “street photography” while working as a photo assistant to earn a living. His deep commitment to the art of photography propelled him to publish the seminal book, *A Dialogue with Solitude*, in 1965, which was the outcome of two successive Guggenheim fellowships in 1963 and 1964. His photographs explore the human psyche, delving deeply into the most intimate moments of his subjects, and communicate these emotions on both very personal and universal levels. His subjects include the wide array of emotions found in children, the relationships between men and women of all ages, and the character of solitude and fragility. Using a variety of media from 35 mm to Polaroid instant film, Heath’s studio is the street where he photographs human nature and the human condition. His influences came from not only photography and the arts, but from philosophy, religion, and childhood experiences. Fundamentally, his photographs are best viewed not as single images, but as sequences: series of emotions, thoughts, and responses to what he is seeing in his environment, presented in poetic relationships to each other to elicit an effective and affective sense of his vision.

What I have endeavored to convey in my work is not a sense of futility and despair, but an acceptance of life’s tragic aspects. For out of acceptance of this truth: that the pleasures and joys of life are fleeting and rare, that life contains a larger measure of hurt and misery, suffering and despair—must come not the bitter frustration and anger of self-pity, but love and concern for the human condition.

(Heath 2000, Preface)

Born in Philadelphia on 24 June 1931, Heath was abandoned by his parents at the age of four years old and grew up in foster homes and orphanages until quitting school at the age of 16 to pursue a job as a photo finisher. After his service at the end of the Korean War, he returned to the United States with an even keener interest in photography and pursued post-secondary education in the Philadelphia and

Chicago areas. Heath was influenced and inspired by the photo essays in the magazines of the 1940s and 1950s, and was particularly moved by Ralph Crane’s 1947 *Life* magazine essay “Bad Boy’s Story” concerning orphans and foster children, which addressed his personal experience.

In 1957, Heath left Chicago for New York City, where he attended a class with W. Eugene Smith at the New School for Social Research in 1959 and a workshop in Smith’s loft in 1961. Inspired by the photographs of his teacher, he realized the power that photography had as a means of artistic expression. Heath worked as an assistant to commercial photographers during the late 1950s and early 1960s and attempted to build a career around photojournalism. However, his desire was to be a creative photographer. His photographs were exhibited first in the 7 Arts Coffee Gallery in New York, and he was given his first major one-man show by the Image Gallery in 1961. In 1964, his photographs were published by *Contemporary Photographer* (Winter 1963/1964) published by Lee Lockwood, himself a photojournalist. During the 1960s, he exhibited with major museum and university art galleries, including the Museum of Modern Art, New York, the George Eastman House, Rochester, New York, and Yale University in New Haven, Connecticut.

His street photographs of the 1950s and 1960s were influenced more by the work of Robert Frank, which stressed the ambiguity possible in the single image and its relationship to other images in a sequence. His photographs—tragic, comic, and poetic—are imbued with a sense of solitude of the individual. “Disenchantment, strife and anxiety enshroud our times in stygian darkness” (Heath 2000).

Recognized as one of the seminal photography books of the 1960s, *A Dialogue with Solitude* remains the central body of work by which Heath is recognized. The 82 photographs, taken over a ten-year span from his service in Korea to his time in Philadelphia, Chicago, and New York City, achieve the unified and meaningful statement that he sought in his work. Arranged in 10 sections and designed to be viewed in sequence, the photographs investigate the human condition—from isolation, loneliness, despair, and destruction to laughter and love. John Szarkowski, Director of Photography at the Museum

of Modern Art, has said that Heath's photographs "combined the freedom and spontaneity of the small-camera approach with a rare formal intensity and precision. His pictures possess stability, simplicity and great emotional force." The book is a moving, eloquent statement of both hope and despair.

Through his teaching, Dave Heath has quietly influenced a wide range of photographers and is the direct antecedent of photographers who turn their cameras on subjects that have a deep personal connection to their lives, such as Larry Clark and Nan Goldin. Heath taught at the Dayton Art Institute, Ohio, and Moore College of Art in Philadelphia, Pennsylvania in the late 1960s before moving to Toronto to teach at the Ryerson Polytechnical Institute from 1970 to 1996. Having a deep affinity with the work of Diane Arbus, and having been greatly affected by her suicide in 1972, he continued to photograph, but redirected his investigation to new mediums—most particularly those of the instant Polaroid, slide sound projections, and journals, which he continues to work on today.

Dave Heath presently lives in Toronto, Canada, where he is represented by Michael Torosian (Lumiere Press) who recently re-issued *Dialogue with Solitude* (2000). Howard Greenberg Gallery in New York City also represents him. Heath's photographs can be found in numerous collections, including the Museum of Modern Art, New York; the Art Institute of Chicago; the International Museum of Photography, George Eastman House in Rochester, New York; and the National Gallery of Canada in Ottawa.

ROBERT HEINECKEN

American

Robert Heinecken is a pioneering figure in contemporary photography and somewhat of a paradox, as he is a photographer who has rarely taken a picture. Although not as well known as many of his contemporaries his influence has been significant, both for his creative work and his role as an educator. Putting forth some of the earliest ideas about “photo-sculpture”—three-dimensional structures upon which photographs were presented, exploring notions about mass media and popular culture, and exploring the form now known as artists’ books, Heinecken’s work was an integral part of the aesthetic pressure-cooker that was Southern California in the 1960s and 1970s. In the early 1960s he founded the photography program at the University of California at Los Angeles (UCLA), eventually mentoring dozens in the graduate program, many of whom have gone on to significant careers, including photographers David Bunn, Patrick Nagatani, Jo Ann Callis, John Divola, and Ellen Brooks, video artist Scott Rankin, and author and teacher James Hugunin.

Born in 1931 in Denver, Colorado, the only child of a Methodist minister, a missionary from a family of missionaries, Heinecken attended public schools in Colorado and as a boy took informal art lessons. The family relocated to Los Angeles and then Riverside, California, where Heinecken attended high school and a community college, continuing his interest in art. His early adulthood was rebellious; enrolling in UCLA, he was put on probation and dropped out after less than two years of study. To avoid the draft for the Korean War, he enlisted in the U.S. Navy as a Naval Aviation Cadet. Although barely meeting the minimum height requirement (years later admitting he stuffed his boots with newspaper), he found the discipline of the military helpful. Eventually he was commissioned as a Second Lieutenant in the U.S. Marine Corps as a jet fighter pilot, where he trained other pilots and achieved the rank of Captain.

After discharge Heinecken returned to UCLA where he met Edmund Teske, who was working as a figure model, and became associated with Linda Connor and Jack Welpott, who was the first MFA candidate in photography accepted into the graduate

program. He also met the influential artist Wallace Berman, also a poet and small-press publisher. His interest in American visual culture began early; he presented an audio-visual program at Aspen Design Conference in 1963 on the topic. It was in 1965 that he attended the meeting in Rochester, New York, that led to the formation of the Society for Photographic Education, where he met Nathan Lyons, Carl Chiarenza, Jerome Liebling, Van Deren Coke, Minor White, and Beaumont Newhall, all of whom were to become important friends as well as colleagues.

Although chiefly associated with California, in the mid-1980s Heinecken began living alternative years in Chicago, serving as a guest instructor at the School of the Art Institute. The motivation for this was his relationship with photographer Joyce Neimanas, whom he had met in mid-1976 when serving as a guest instructor at Columbia College. Heinecken quickly became an integral part of Chicago’s important photography community, which included SAIC colleague Kenneth Josephson. His seminal photo-installation *Waking Up In New America* was presented at the Art Institute of Chicago in 1987. Heinecken continued to teach at UCLA until his retirement in 1991 after which he was appointed Professor Emeritus; in 1996 he relocated to Chicago full-time.

Although Heinecken is thought of and identifies himself as a photographer, his only use of a camera was the Polaroid SX-70, with which he created the artists’ book and series *He:/She:* in the mid-1970s. His career is not without controversy; a continuing motif is pornography, and his work has been criticized as being misogynist, as typified by the 1973 mixed-media work *Lingerie for a Feminist Suntan #3*. This work challenges feminist teachings that the male gaze is harmful and exploitative in any and all of its forms with a prickly humor that most likely confirmed his detractors’ opinions. Consisting of a life-size photograph of a voluptuous nude woman, actual bra and panties are displayed on a hanger attached to the work. The areas usually covered by this clothing are hand-colored with a wash of brown; the rest of her body is pale.

Heinecken’s ideas about sculpture and photography helped initiate the seminal 1970 exhibition at the Museum of Modern Art, New York, *Photogra-*

phy into Sculpture in which his so-called “puzzle pieces” (images adhered to blocks of wood that could be refigured) were included. In 1969, his audacious act of screening grisly Vietnam war photographs over the existing images in the pages of a number of *Time* magazines, and placing them back on the newsstand where they were sold has become legendary and inspired a rich vein of investigation into the commercial print medium. Exemplifying this interest is one of Heinecken’s best-known series, the folio *Are You Rea* (1966–1968). To create these works, the artist used magazine pages as “negatives,” which produced prints that merge images from both sides of the original pages.

These often disturbing images fused text and image as well as image and image, indicating another of Heinecken’s interests, the relationship of image and text which culminated in *The S.S. Copyright Project “On Photography”* of 1978. Using a method that is now very familiar to us through the paintings of Chuck Close, this large-scale work features in one panel the image of writer Susan Sontag created through a montage of black-and-white snapshots of the artist, his friends, his California studio, his car, his everyday life, and what he has called “waste photos found in the UCLA lab” almost carelessly stapled onto a board. The other panel creates Sontag’s likeness through photographs of the text of her book, *On Photography*, variously exposed to achieve a range of dark and light. A text panel aggressively placed between these two images begins “An intense comparison of these two pictures intends to throw light on a few serious on-going dilemmas which have plagued photography since its inception in 1833 and its re-discovery in 1977.” a sarcastic reference to the publication date of Sontag’s volume. Everything photography is about and everything that it does to the eye and mind is somewhere in this work.

In the 1990s, Heinecken turned to more personal themes, including a cycle of photomontages using the image of the Hindu god Shiva. He had discovered later in life his maternal grandmother had been Indian, and the attributes of this god of destruction and creation allowed him to extend his investigations into the nature of photographic imagery and its uses in and impact on contemporary culture. He has exhibited widely and internationally and is in the collections of most major museums in the United States.

NANCY HELLEBRAND

American

Nancy Hellebrand is a photographer whose work has moved from the black-and-white social documentary photography of people that she began in the early 1960s to more abstract black-and-white studies of faces and bodies made in the early 1980s to her most abstract nature studies in color, begun in the late 1980s and continuing to the time of this writing. Although her photography, printing, and even subject matter have changed dramatically from the time of her earliest to her latest work, Hellebrand’s work as a whole seeks to reveal the truth or essence of her subjects as she sees them and as she wishes them to be seen.

Hellebrand began her college education as an art major. Her discovery of photography as the artistic medium she would follow occurred during her first year of college at USC in 1963 with a course being taught there by Bernie Kantor. As she pursued social documentary photography, her choice of black-and-white 35-mm seemed a somewhat natural choice. Another photography course Hellebrand

took in New York with Alexey Brodovitch in 1964 was crucial to Hellebrand’s development of a personal vision. Brodovitch influenced her by stressing that when photographing, one’s personal view should take precedence over known orientation to subject. Following one’s impulses was of more artistic merit than portraying the strictly familiar.

While pursuing her bachelor’s degree, from 1964–1965 Hellebrand apprenticed to David Attie, a commercial photographer. From 1966–1967 she was a studio manager for John Cochran, a fashion photographer. In 1967, Hellebrand opened a photography studio in New York, shooting commercial, editorial, and informal portraits in black-and-white 35-mm. She also taught photography at Parson’s School of Design, New York in 1970. In 1971, Hellebrand received her B.A. in English Literature from Columbia University. In that year, she closed her studio and moved to London to study photography privately under Bill Brandt until 1974. Bill Brandt influenced Hellebrand chiefly by the example of his life and art, showing Hellebrand that a lifestyle devoted to the pursuit of art was highly desirable and extremely worthwhile.

From 1971 through 1974, Hellebrand produced a series of medium format black-and-white photographs of Londoners in their homes. The portraits that she captured culminated in a solo exhibition for Hellebrand at London's National Portrait Gallery in 1974, and a book, *Londoners at Home*, published in the same year. Her portraits, representing a variety of Londoners of varying ages, sexes, occupations, and classes, all convey a common sense of the desperation of her subjects. For instance, the photograph shown on the cover and plate #7 in *Londoners at Home*, entitled "Young girl (13 years old)," portrays a seated female who is trying to appear to be a grown woman. Her extended hand with engagement/wedding band upon it, holding a burning cigarette, would seem to illustrate that she is indeed a woman. One could merely accept the image the young girl is projecting, except that her self-conscious expression and stance belie it. Coupled with that, the completely empty space Hellebrand has left around the girl further diminishes her façade of womanhood.

Many of Hellebrand's other photos from *Londoners at Home* show a hodgepodge of possessions in her subjects' homes that Hellebrand carefully included to reflect some truth about their owners. Photographing with a medium-format camera and wide-angle lens corrected for distortion, Hellebrand got very close to her subjects and took in just as much of their home's surroundings as she wanted to convey her ideas. In choosing challenging existing light in what were obviously poorly or unevenly lit and shadowy apartments, Hellebrand made an artistic decision to emphasize the real over the artificial. Despite the great degree of stillness that must have been required on the part of her subjects, they still appear to look real—natural in their surroundings.

In 1974, Hellebrand returned to Philadelphia and began exhibiting her work at Light Gallery in New York. She taught photography at Philadelphia College of Art in 1975 and at Bucks County Community College from 1975 to 1988. The early 1980s marked the beginning of a transitional period for Hellebrand's photography, moving away from the documentary approach toward people she'd pursued for roughly 20 years and toward an abstract approach. As her focus changed, so too did her medium. Using an 8 × 10-inch view camera, Hellebrand made extreme close-up portraits of faces and bodies. In carefully cropping within camera on certain parts of peoples faces and bodies, she made abstractions out of them. In the mid-1980s, Hellebrand photographed landscapes in 8 × 10, producing small platinum prints. A series of photographs of handwriting Hellebrand took in the late 1980s marked her turning point from documentation to

abstraction. This work, inspired by Hellebrand's interest in calligraphy, was taken from samples of handwriting, greatly enlarged, toned brown, and printed on matte paper.

Hellebrand's artistic path, her shift from people to nature and from more conventional documentary to more experimental abstract, runs concurrent with her spiritual belief of Sufism as it relates to developing one's higher perception of reality beyond mere appearances. Her images of nature are not so much an expression of their object as they are an expression of her vision of nature and her interpretation of the divine within it. Hellebrand began to photograph in color and print digitally in the early 1990s, beginning with landscapes. In the late 1990s, she shot tree branches moving in the wind. Her untitled *Water Series #754*, an image taken from running water, is representative of the work she has done from 2002 to 2004, digitally photographing water and clouds and then manipulating the results. She has changed the apparent forms of nature, enhancing their color, texture, and contrast until her large-scale giclee prints (a digital process) appear very much like pastel drawings.

Hellebrand's work has appeared in many group shows, including major shows at the International Center of Photography and the Museum of Modern Art, in New York. Besides Hellebrand's 1974 solo exhibition at the National Portrait Gallery in London, she has had two major solo exhibits in 1984 and 1989 at Pace/MacGill Gallery, New York. Her work can be seen in many public collections, notably in the Museum of Modern Art in New York, the National Portrait Gallery in London, and the Philadelphia Museum of Art. Hellebrand has been the recipient of fellowships from the John Simon Guggenheim Memorial Foundation and the National Endowment for the Arts.

NIGEL HENDERSON

British

Nigel Henderson was an innovative artist working with photography who said of his work "I've never thought of myself as a photographer" and "I use the camera to draw." He had little interest in documentary photography or the fine print, preferring to transform reality using collage and a range of experimental print techniques. His collages, which he hoped would "stick a little bit in peoples' craw," relied on ephemera, neglected fragments, splashes, and marks, chance and contradiction, to produce what he described as an "expressive document," which was frequently laden with personal symbolism.

As a young man growing up in London in the 1930s, Henderson met many of the foremost European artists, intellectuals, and writers of the period and his work was shaped by these contacts. Although he has been seen as both a pop artist and a member of the New Brutalist movement of the 1950s, and his work has parallels with the mark-making of Abstract Expressionism, he himself acknowledged that his strongest influences were Dadaism and European Surrealism.

Henderson was born in 1917 in St. Johns Wood, London. His parents came from very different social backgrounds and divorced when he was seven. It was through his mother's involvement in the art worlds of London and Paris that, as a teenager and young man, Henderson met members of the Bloomsbury Group, T.S. Eliot, Bertoldt Brecht, Marcel Duchamp, Max Ernst, and other prominent artists and writers. He initially studied biology at Chelsea Polytechnic but left without completing the course and worked as an assistant at the National Gallery in London from 1936–1939. At about this time, he started painting seriously and experimenting with collage and, through his mother's friendship with the American collector, Peggy Guggenheim, showed early work in her gallery, Guggenheim Jeune.

He was 22 when war broke out and he became a pilot in Coastal Command, an experience which both enchanted him and left him "very, very jumpy" after five years of war. Imagery from his years of flying and time in the biology lab were both to find their way into his later work. In 1943, he married Judith Stephens, an anthropologist and niece of Virginia Woolf, and after the war they moved to the East End of London where she was working on a research project. Henderson received an ex-serviceman's grant to study at the Slade School of Art where he met the sculptor Eduardo Paolozzi, who became a great friend and collaborator on a range of projects.

By the late 1940s, Henderson was recovering from his war experience by walking the streets around his home in Bethnal Green, a working class area of almost Dickensian poverty. Later he said that

I was consciously sometimes looking for chunks, bits of typification of Englishness—including the cliché 'British Oak' and all that and I still won't avoid it, it meant something to me. I think of these notions of the steadiness of the English character—and the war brought it out—and I found it very impressive, playing cricket in the street for instance was something I'd longed romantically to do.

In 1949, while a student at the Slade School of Fine Art, he took up photography initially in order to record the, to him, alien and fascinating world of Bethnal Green as source material for his work. In three years of photographing the area he created a remarkable visual record of a place and time. It was his only major documentary project and, like his collaged work, is redolent with a nostalgia for a culture about to disappear and a fascination with the ambiguity of reality.

When he began taking pictures Henderson enrolled on a technical course but found it unsympathetic and eventually taught himself photography. He also

started experimenting in his bathroom darkroom, making photograms, double exposures, distorted and folded paper prints, and drawing on glass negative plates. He sometimes hand coloured these complex images. As he saw it “if you encounter photography for yourself in a way you’re going to reinvent photography for a while.” These works were a starting point from which his later collages were to develop.

In the 1950s, he worked briefly for *Vogue* and the *Architectural Review* but gave up the idea of commercial photography when he was asked to teach photography at the Central School of Art and found teaching a “great stimulus” and a shared enthusiasm. After his move to Essex in 1954 he continued teaching, first at Colchester School of Art and later at Norwich School of Art, where he became Head of Photography in 1965. The Paolozzis had also moved to Essex and together the two couples set up Hammer Prints Ltd., a successful textile and ceramic design company.

In the 1950s, Henderson was part of the Independent Group based at the Institute of Contemporary Arts and was regarded as a key and influential figure of the period, in particular by his contemporaries. With his friends, Paolozzi and architects Alison and Peter Smithson, he was involved in two major and controversial exhibitions: *Parallel of Life and Art* at the Institute of Contemporary Arts in 1953 and *This Is Tomorrow* at the Whitechapel Art Gallery in 1956 for which the group made the installation *Patio and Pavilion*. A number of works by Henderson from this exhibition are now owned by the Tate.

However, although he was a prolific artist, Henderson professed a lack of interest in a career as an artist and was motivated by what he described in 1978 as a “very strong amateur passion. It’s a very rude word now for some reason and I’m sorry because I like the word. It means doing things for the love of it. I can’t see anything wrong with that.” After his move out of London he exhibited less and was almost unknown to a generation of art lovers. It was only after his death in 1985 that his work gradually began to be exhibited again and recognised as a significant and influential contribution to the development of British art in the 1950s.

FLORENCE HENRI

Swiss

Born in New York City on June 28, 1893, Florence Montague Henri was the eldest child of a French father, Jean Marie François Henri, and a German mother, Anne Marie Schindler. When her mother died two years later, Florence's father, a director of an oil company whose position required extensive travel, left the children in the care of relatives. Her sister René stayed with an aunt in London while Florence went to live with her mother's family in Silesia, then part of Germany, where she remained until the age of nine.

By 1902, Henri was living in Paris in a boarding school run by nuns, where she began taking piano lessons. In 1905, she moved to London and lived there with her aunt and in Sandown on the Isle of

Wight, at the time a thriving center and gathering place for musicians. In London, she studied at the Earl's Court Road Conservatory under Percy Grainger. When her father died in 1907, leaving her with a modest but comfortable inheritance, Henri moved to Rome to live with her father's other sister, Anny Gori. Through her family associations, Henri became acquainted with Filippo Marinetti and several other leading avant-garde figures of the Futurist artistic and literary movement. In Rome, she continued her music studies at the Conservatory of the Santa Cecilia Academy, where Henri met Ferruccio Busoni, who became her mentor.

In 1909, Henri returned to England, living for two years in a boarding school run by the Sisters of Mary in Richmond. She continued taking piano lessons

and by 1911 played pieces by Grieg, Liszt, and Franck at concerts in Bechstein Hall (later named Wigmore Hall). By 1912, Henri moved to Berlin to continue her music studies as the pupil of Egon Petri, and then Busoni. With the outbreak of war in 1914, Henri, unable to leave Berlin and to receive money from her inheritance in England, had to make a living playing the piano at the silent cinema. Perhaps due to this difficult situation and her own highly self-critical view of her ability to compete against the piano masters, Henri decided to abandon music and took up painting instead. In the beginning, she executed traditional drawings of figure studies and landscapes. Towards the end of the war, she met the writer and art historian Carl Einstein, who became a mentor and close companion for many years. Einstein was associated with the Cubist circle in Paris.

In Berlin, Henri studied in the atelier of Johannes Walter-Kurau, where she met Margarete Schall, a fellow painting student who became a close friend. Berlin was a rich source of modern art activity; the city's galleries exhibited the works of Fernand Léger, Robert Delaunay, Pablo Picasso, Vasily Kandinsky, Umberto Boccioni, Gino Severini, Kasimir Malevich, and László Moholy-Nagy. Quite probably, all of these impulses convinced Henri to move to Paris to further her study of art. By 1924, she had taken up residence in Paris, determined to learn more about modern art. Between 1925 and 1927, she enrolled at the Académie Moderne, where she studied with Léger, Amédée Ozenfant, and at the Académie Montparnasse with André Lhote. In the fall of 1925, her work was shown along with others from the Académie Moderne in the *Exposition Internationale L'Art Aujourd'hui*, the first international exhibition of avant-garde art in Paris since the war. Henri's paintings were shown side by side with works by proponents of Cubism, Futurism, Purism, Constructivism, Orphism, Synchronism, and Surrealism.

While living in Paris, Henri traveled frequently to Berlin and along the way visited her friend Margarete Schall in Essen. Through Schall, she met students and faculty members of the Bauhaus in Dessau. In 1927, Henri enrolled in a summer session as a non-matriculating student studying with Moholy-Nagy, Kandinsky, and Paul Klee. Although photography was not yet part of the Bauhaus curriculum, Moholy-Nagy and others used photography as part of their teaching method, finding the camera an ideal art-making device for the machine age. Through her experience with Moholy-Nagy, Henri learned all the current camera techniques: double and multiple exposures, montage, photograms, micro-photographs, and negative prints. Equally influential to Henri's training in photography was her friendship with László's wife,

the photographer Lucia Moholy, who made significant portraits of Henri.

Henri soon recognized the medium's capacity as a pictorial language and outlet for creative expression. Upon returning to France, Henri began to develop a large body of photographic work based upon her Bauhaus experience and an extension of the formal and structural aesthetics of Cubism, Purism, and Constructivism. These non-objective principles forged an alternative to the then-dominant French art movement Surrealism. Henri transcended the avant-garde of one art form to that of another.

Henri's greatest experimentation with geometric abstraction occurred during the period between 1929–1930, the years in which she was most closely involved with the artists and critics associated with *Cercle et Carré* founded by Belgium poet, writer and art critic Michael Seuphor. *Cercle et Carré* was an avant-garde group of international architects, painters, sculptors, writers, and intellectuals which published a review of abstract art under the same name. Henri was one of two photographers whose work appeared in the group's magazine. Another Paris-based organization equally devoted to geometric abstraction, *L'Art Contemporain*, featured her work in their publication—the only photographer in a review devoted to art, poetry, and theory.

In her photographic work, Florence Henri exploited the dialogue between realism and abstraction, but always maintained a recognizable subject. She was concerned with transparency and movement, and she explored spatial extension and fragmentation in her utter modern vocabulary.

Her still life and abstract compositions achieved by balancing abstraction with a pure and essential subject were created in the spirit of the machine age. She viewed space as if it were elastic, distorting figure and ground and altering planes through the use of mirrors and lenses. Henri chose mainly a few primary elements of essential form. One of the most frequently repeated forms in her imagery is that of the sphere—either as a perfectly round ball(s) or in such natural forms as an apple.

In her portrait work featuring mainly artists, Henri was primarily concerned with women. She helped to redefine and shape mainstream ideas of womanhood revealing forceful and independent types whose features appeared as abstract rhythmic patterns. Her compositional format—filling the picture plane with close-up shooting and tight cropping and immediacy of the subject—was influenced by Lucia Moholy and followed the formal strategy of New Vision (*Neue Sehen*) portraiture. Henri constructed an image of the new modern woman, evoking at times the serious introspective mood and even

the quiet painful melancholy that permeated some of her portraits of women as well as those of herself.

When her inheritance dwindled with the stock market crisis of 1929, Henri explored the field of commercial art and found that photography served a profitable means of livelihood. She began photographing the luxury goods optimally featured in fashion magazines. Among her clients were the perfumery Lanvin, Au Bon Marché department store, and Columbia Records. She applied her brand of modernism by placing emphasis on the articles versus a functional narrative. In an advertisement featuring Selcroix table salt, Henri applied photomontage setting the product against a seascape.

In her studio work for fashion advertising, Henri understood the link between fashion and modernity and the important role contemporary apparel played in shaping a new female identity. Shooting from above or at an angle, she contrasted bold geometric patterns against the model's form as part of the composition. Likewise, Henri's female nudes are thoroughly modern. Her figure and nude compositions evince a luxuriant sensuality set within a dream-like atmosphere.

Henri's street photographs reveal her continued search for form and composition. She sought out nature, but the human form set within her nature remained an abstract entity. She saw urban life in terms of complex formal relationships that emphasized texture, structure, and chiaroscuro. In her vision of urban scenes, such as life along the Seine, Henri remained always analytic versus descriptive, emphasizing the spatial ambiguity of figure and ground.

During World War II, Henri, like Picasso, Georges Braque, and Lhote among others, stayed in Paris. Her intellectual and professional life was severely disrupted by the dissolution of the artistic circles that had supported her creativity. Likewise, during the war her photographic production was curtailed because photography film and paper became scarce and expensive. After the Nazi Occupation of France, photography was forbidden altogether. After the war, Henri produced photographic portraits on occasion, but primarily returned to painting. She also found a new interest in quilting to which she could apply principles of modernism in color and design. Henri died in 1982 in France, at a time when her considerable achievements were being recognized by a new generation of photographic historians and collectors.

Biography

Born June 28, 1893, New York, New York; naturalized Swiss citizen. Moved between Silesia, London, Paris, and Rome from the ages of two to 14 to live with family members following the death of her mother (1895) and father (1907). Studied piano in London at the Earl's Court Road Conservatory under Percy Grainger (1905–1907). Studied piano at the Conservatory of the Santa Cecilia Academy in Rome under mentor Ferruccio Busoni. (1907–1909) Performed Grieg, Liszt, and Franck at concerts in Bechstein Hall in London (1911). Studied music in Berlin (1912) with Egon Petri and Ferruccio Busoni. Remained in Berlin during the war. Discontinued playing piano; took up painting. Attended Berlin Academy of Fine Arts and studied art in Munich (1918–1920); in Berlin, studied at the atelier of Johannes Walter-Kurau. Married briefly to Swiss Karl Anton Koster (1924). Enrolled in summer session at Bauhaus Dessau (1927). Studied with László Moholy-Nagy, Vasily Kandinsky, and Paul Klee. Learned photographic process and experimentation with Moholy-Nagy and his wife Lucia Moholy. Moved to Paris and began an intense period of photographic experimentation. (1927) Henri photographs, two ball-and-mirror compositions and a self-portrait, featured in Moholy-Nagy essay published in the Dutch journal *ilO* (December 1928). Photographs exhibited in *Fotografie de Gegenwart* (Contemporary Photography) in Museum Folkwang, Essen and *Film und Foto* in Stuttgart and traveling. Introduced to Michel Seuphor and became part of a small group of international avant-garde artists and writers known as Cercle et Carré. Opened commercial photographic studio and instructed students in photography, Gisèle Freund among them. Entered into world of commercial advertising illustration (1929). Died July 24, 1982, La Bérangerie, Laboissière-en-Thelle (Oise), France.

FRANÇOIS HERS

Belgian

François Hers was born in 1943 in Brussels. He is not a photographer per se but rather an artist who uses photographs to intervene in the field of art. His career can be summed up as a search for a new status for art in contemporary society defined as a new relationship between artists, their works, and society. His choice of photography as a medium and his (relatively limited) personal photographic practice are the direct product of this intellectual, philosophical, and political position. His ambition, after his art studies, was to reclaim the freedom and relevance for art that he felt the modernity of early twentieth century figure Marcel Duchamp had gained and lost afterwards, and go beyond the figure of the solitary and all-powerful artist as avant-garde hero. His search for a new relevance and legitimacy for art was inscribed in a great utopia of collective involvement of all—and not simply artists—in art as consumer society invaded 1960s Europe.

In 1966, one of Hers's first projects was to design a commissioned mural for a company by asking the workers to take pictures or to borrow prints from their family albums to tell their life stories. One

hundred of the most representative images chosen by the workers made up the final mural.

His later practice was that of a photographer using photographs for larger projects, often institutional ones, and much less that of an image maker. Indeed he often states that his participating in group exhibitions is merely for him a way to keep in touch with the world of art, but that his main concern is to modify its deep structure and modes of intervention. In 1972, he co-founded Viva, a cooperative of photographer-authors modeled after Magnum Photos. The second half of the 1970s saw him traveling widely and making various reportages leading in 1981 to a book and exhibition, *Intérieurs*, and in 1983 to *Récits*.

This was followed in 1983 by his initiating one of the major photographic realizations of the decade in France, the Mission photographique de la DATAR (Photographic Mission of the Direction for Territorial Planning). Hers, with the support of the director of the government agency for planning and development, Bernard Latarjet, set up an ambitious program of public commissions. The Mission, combining the documentary and accumulative spirit of the Farm Security Administration and the philosophy of Hers's concept of commission, contracted with

HERS, FRANÇOIS

photographers over a period of six years (1983–1989). The central idea was to represent the nature of the French territory today and the relationship inhabitants have with it. Every contract was negotiated with the photographer both technically and artistically so that the result would be an artistic statement as well as a source of meaning for the understanding and the appropriation of what had become the buzz words of the times: space and territory. Obviously not all works succeeded in fulfilling this mission; the choice of photographers and the rather literal influence of the American New Topographics style (as exemplified by Lewis Baltz or Frank Gohlke) limited the artistic impact it could have had. As a project, however, it was a milestone in the rediscovery of the complex aspect of commissioning and it was a seminal experiment for various other collective photo projects focusing on community.

In 1990, Hers tried to open up his concept of commission to any person or group—and not simply

classic public or private patrons—wishing to commission a work of art by securing funding from the Fondation de France. The Fondation de France, created in 1969, finances innovative projects on societal issues not otherwise funded. In a manifesto called “the Protocole,” Hers defined the role of the “mediator”: half producer, half architect. The mediator negotiates the project between artist and commissioner; she or he organizes, structures, and helps formalize the conception, realization, and eventual dissemination or exhibition of the work.

Hers sees himself as this mediator. His photographic practice is now wholly contained in this institutional role. He occupies an interesting, albeit very marginal, place on the French photography scene. Inheritor of the utopias of the 1960s and 1970s, deeply committed to a democratic ideal of access of all not to consumption but to co-production of art works without compromising the high requirement of art, his action tries to

François Hers, “Interiors,” first photo in the series, 1981, Photo: Philippe Migeat.
[CNAC/MNAM/Dist. Réunion des Musées Nationaux/Art Resource, New York]

maintain the vital link of creation at a time when, on the one hand, contemporary art is more esoteric than ever and, on the other, consumerism triumphs in mass culture.

JOHN HILLIARD

British

Conceptual artist John Hilliard first began to use photography as a student during the 1960s. Initially, the camera was a means to document his temporary site-specific installations, but Hilliard soon recognized that the metonymic power of the photographic image deserved more serious examination. In realizing that the camera was not simply a neutral device for recording fact, the artist began exploring the language and history of the medium of photography. He established a challenge to expose the myth of photographic truth, a form of rigorous visual and intellectual inquiry emblematic of Conceptual Art and Minimalism in the late 1960s. Hilliard started questioning the selective methods of image making and confronted the ways photographic meaning could be manipulated.

By the early 1970s, after time spent traveling in the United States and further guided by critical theory and semiotics, Hilliard began to work exclusively with photography. A representative work from these early years of inquiry, *Camera Recording Its Own Condition*, 1971, is a sequence of seventy black-and-white images presented in a grid-like quasi-

scientific fashion, showing the reflection of a camera at the moment the photograph is taken. Each image differs slightly, as Hilliard changed both the speed and aperture, thus creating a range of legibility from light to dark, depending on the over- or under-exposure of the image. At the center of the grid, an image suggests itself as the "correct" exposure. Such self-referential imagery indicates Hilliard's concern with the mechanics of photography, actions that paradoxically reveal the intervention of the photographer in the camera's supposedly objective realm.

Similarly, in *Causes of Death*, 1974, Hilliard scrutinized the photographer's subjective editing process through a series of four black-and-white images of what appears to be a sheet-covered dead body prone on a rocky landscape. While obviously depicting the same subject from the same angle, each photograph is cropped a little differently to create a new context of meaning for each image, suggesting a different cause of death. Other projects by Hilliard from this fertile period in the 1970s—concerning a consideration of focus, film speed, and technical darkroom decisions with regards to paper and developing—again exposed the fallibility of photography as an objective or evidentiary medium.

As Hilliard pursued this line of inquiry further, he began experimenting with color photography through the 1980s, which led to a repositioning of his critique from the investigation of classic representational practices in photography to a semiotic examination of imagery in popular culture. As a result, much of Hilliard's work from the last two decades presents a critical comment on the ubiquitous transmission of images through commercial advertising in newspapers, magazines, and cinema. Oftentimes, his visual statements on the effects of mass consumerism can be seen in very direct ways, as found in "East/West, 1986." In this large photowork, Hilliard presents a dynamic juxtaposition of a positive and negative version of a highly stylized profile portrait of what appears to be a sophisticated Asian woman. Here, the artist provokes consideration of issues of identity, mirroring, and cultural assimilation.

Hilliard developed a rich, colorful, saturated style during the 1990s, presenting tableaux images with erotic and sometimes violent narratives, and glossy surface effects which emulate or at least reference the seductive power of advertising. For the most part, these images remain vague, as the artist uses devices that obstruct the full view of the subject. In "Miss Tracy, 1994," a female nude lies prone on a bloodied sheet, but the majority view of the woman's body is abstracted by an opaque rectangle. Only the periphery or "frame" of the subject remains in focus. Hilliard continues his experiment in the construction of ambiguity and the manipulation of narrative means. Formally, his presentation draws attention to the surreal nature of photographic space—the relationship between the picture plane, and the spaces before and beyond—and to the traditional acceptance of the transparency of a photograph.

While he has continued to produce work with a formal vocabulary that disrupts a seamless gaze of the subject, in more recent years Hilliard's work has become larger in scale, almost to the point of mural form, through printing his photographs on canvas and vinyl. As well as the visual impact of a larger size, such images must also be understood as a direct formal critique of surface. A clear example of this strategy can be found in *Nocturne*, 1996, an image of an interior wall in an abandoned house, covered for the most part with wallpaper and graffiti. Yet the central focus of the image is blocked by a rectangle of an enlarged, close-up detail of the decorative wallpaper. The visual riddle of *Offence*, 1997, works in a similar fashion. Here, a couple in the front seat of a car peer through the windshield, but their view out (and consequently the audience's gaze in) is obstructed by a white rectangular police sign indicating the car has been clamped. The lighting, dress, and demeanor

of the couple suggest a distressing incident may have occurred, and the stern police warning "Stop! Do not attempt to move it!" further adds to the confused nature of the scene. Here again, the artist has successfully manipulated the narrative through elements of cropping, framing, and obstruction.

Speaking about his working practices in 1997, Hilliard explained that his usual procedures involve a progression through a series of rough drawings, diagrams, and writings, in an almost cinematic or storyboard fashion. From this collection of visual and textual language, Hilliard then affects a rigorous process of selection to arrive at a particular photographic composition. Such strategies of assiduous analysis have persisted throughout his career, and his professional success in teaching during the last 20 years must also be recognized alongside his credentials as an active artist with a strong exhibition record. Significant faculty positions in London, at the Camberwell School of Art, and currently at the Slade School of Art, further highlight his reputation. And while never automatically associated with a particular artistic or aesthetic group, Hilliard's distinct formal and intellectual examination of photography places him alongside the likes of the theorist and photographer Victor Burgin in the history of late twentieth-century British photography.

LEWIS HINE

American

One of the towering figures in twentieth century photography, Lewis Wickes Hine's photographs of immigrants, child labor, and industrial workers

are, along with Eugène Atget's photographs of Paris and August Sander's study of his fellow Germans, one of the major achievements of photography in the first third of the last century. Hine died impoverished and in relative obscurity, however,

on November 4, 1940 in Dobbs Ferry, New York, a few miles from his home in Hastings-on-Hudson. This was ten months after the death of Sara Ann (Rich) Hines, his wife of 35 years.

Born on 26 September 1874 in Oshkosh, Wisconsin, from necessity, Hine worked in various manual labor jobs in Oshkosh for seven years following his graduation from high school in 1892 and the death of his father in the same year. He managed to study sculpture and drawing during this period of his life and studied for a year at the University of Chicago, but it was his relocation to New York City in 1901 that set the course towards his important photographic career.

In 1903, Hine taught himself the basics of photography at the urging of Frank A. Manny, the director of the Ethical Culture (Fieldston) School in Riverside, New York, where Hine taught nature studies and geography. Hine's initial interest in photography was as another tool to be used in his job as a teacher, and it was at the urging of Manny that Hine began to photograph immigrants at Ellis Island in New York Harbor, the work beginning with school field trips meant to counter the racist and generally anti-immigrant stereotypes common among the middle class and upper classes. Following what must be regarded as one of the richest apprenticeships in the history of photography in completing this extraordinary study in 1909, Hine became a professional photographer. His approach to photography remained instrumental throughout his career, guided by his ideas about society and education, which were rooted—rather loosely—in the politics of the Progressive Movement and concretely in the ideas of John Dewey (with whom Hine may have taken a course while at the University of Chicago) and his training in the new discipline of sociology. In any case, it is clear from his degree in education from New York University, received in 1905, and from his studies in sociology at Columbia University in 1907, but above all from the evidence of his photographs, that the influence of Dewey's ideas outweighed any others.

In 1905, Hine met Arthur Kellogg, an important social reformer, to whom he sold some of his Ellis Island images. In 1907, he also photographed for the massive sociological study, *The Pittsburgh Survey*. Somehow he managed to photograph a series on Washington, D.C. slums for the reformist magazine, *The Survey*, that same year. This led to his freelancing for and eventual hiring by the National Child Labor Committee (NCLC) in 1908, which published *The Survey* and which assigned Hine to photograph and collect data on tenement homeworkers. As a full-time investigator and photographer for NCLC, Hine resigned his teaching position

at the Ethical Culture School, “changing [his] educational efforts from the classroom to the world.”

He continued his photography of labor, moving to concentrate on child labor, which he continued until 1917. During that period he traveled tens of thousands of miles mostly in the southern, eastern, and southeastern states photographing children working in mines, mills, sweatshops, and every sort of factory, which employed them for 10 to 14 hour days, six days a week of relentless, deadening, cheap labor. The photographs and the data were used in publications, lantern slide illustrated lectures, and to successfully lobby Congress, which enacted the first laws regulating child labor. Looking at these magazines and at photographs of the lobby boards, Hine also influenced notions of sequence, serial presentation, and the rudiments of photojournalism.

By training, education, and inclination, Hine was a cultured and witty man, far more sophisticated about contemporary and modern art than his contemporary Alfred Steiglitz was about the art inherent in the documentary traditions of photography. It is those traditions arising from the combination of social expectations (what are photographs for and how the viewer understands them) and the then new technology of photo-mechanical reproduction that reached a critical juncture in Hine's work.

Aspects of, among many others, the work of nineteenth century photographers Mathew Brady and Timothy O'Sullivan provide a context for measuring Hine's contribution. Preceding Hine by a generation, Jacob Riis's muckraking photographs seem to overlap some of Hine's concerns; however, among many differences the most important are that Riis hired professional photographers for much of the work credited to him, and unlike Hine, Riis photographed types. From his early work at Ellis Island to his last important project, photographing the construction of the Empire State Building, Hine's photographs are about the individual person or group of people seen individually, if in a social context. Following Hine, and more fruitfully linked to him is Paul Strand. Strand, a student at the Ethical Culture Fieldston School, and a member of the camera club Hine directed there, is rightfully recognized as an originator of Modernism in photography, but Strand's social concerns and socialist politics rooted in the Progressive politics of the School are given short shrift by photo writers following the anti-political lead of Steiglitz.

Hine named—and in some significant way created—what he called “Social Photography,” or what is now more commonly called documentary photography. It should be noted that this use of the term documentary was first applied to films and did

not come into common use until 20 years after Hine began to photograph. As the social and didactic content of Hine's photographs dim with the passage of time—while their value as historic documents grows—the elegance of the work remains. Contemporary viewers might care to use Walker Evans's formulation, “documentary style” for the best of Hine's photographs.

In 1918, Hine quit his position with the NCLC when they, feeling the struggle to regulate child labor was successful, reduced his salary. He took a job with the American Red Cross and photographed the aftermath of World War I in France, Greece, and the Balkans, returning to the United States in 1919 where he organized exhibitions for the American Red Cross Museum, which had been founded in Washington, D.C. that year. He also photographed Red Cross-sponsored rural health programs. After 1919, Hine was not associated with any organization, and he began to call himself an “interpretive photographer.” Until he was commissioned to photograph the construction of the Empire State Building in 1930, Hine's only income was from freelance work. He organized exhibitions of his work, including *Interpretation of Social and Industrial Conditions Here and Abroad*, which was shown at the National Arts Club and the Civic Club, both in New York City, in the fall of 1920. He continued to supply photographs to *The Survey* throughout the 1920s, but the Progressive movement continued a decline precipitated by WWI. During this time, Hine returned to Ellis Island for new work there as well as taking assignments from unions and advertising agencies, but his main project was the celebration of the industrial worker, including photographs taken while documenting the construction of the Empire State Building. This culminated in the only book of his work published in his lifetime, *Men at Work* in 1932; it garnered considerable acclaim. These photographs, like all of Hine's work, focused on the human individual within, this time, the literal framework of the steel. A portfolio of photographs of loom workers in textile mills was exhibited at the 1933 World's Fair in Chicago and published that year as *Through the Loom* as well as in *The Survey*. In the same year, an assignment photographing the Tennessee Valley Authority dam projects at Wilson and Muscle Shoals in Alabama ended when his photographs were published without crediting him. By 1938, he could no longer earn a living from his photography.

In his last years, Hine twice unsuccessfully applied to the Guggenheim Foundation for grants, but more shamefully, in retrospect, is Roy Stryker's refusal to hire Hine for any Farm Security Administration work,

considering him “past his prime.” As Hine slipped further and further into poverty, he was getting increasing recognition for his photographs beyond their utility from the critic Elizabeth McCausland, the young art historian, Beaumont Newhall, and above all from photographers, especially Berenice Abbott, and the young documentarians in New York's The Photo League. In 1939, a retrospective of Hine's work was successfully mounted at the Riverside Museum under the sponsorship of an umbrella group ranging from the New York City comptroller, his long-time supporter the sociologist and editor, Paul Kellogg, Berenice Abbott, and even Alfred Steiglitz, no doubt with the encouragement of Paul Strand.

After Hine's death in 1940, his son Corydon gives the Hine's archive to The Photo League. Upon its dissolution, Walter Rosenblum, acting on behalf of the League's membership, donated the archive to the George Eastman House in Rochester, New York.

HIRO

Yasuhiro Wakabayashi, known more commonly as Hiro, has not achieved widespread recognition in the art world, but is one of the most creative and sought-after commercial photographers in the late twentieth century. His work cannot be simplified as mere advertising, as his aim is always to create highly unique and provocative images. Whether shooting product still lifes, celebrity portraits, or fashion spreads, he succeeds in elevating his commercial photography to the aesthetic status of high art.

Due to political circumstances, Hiro's early life was characterized by instability and upheaval. He was born in Shanghai, China, in 1930 to Japanese parents. His father, a linguist, was working on a Chinese-Japanese dictionary. Hiro did not see his parents' homeland until the age of six, when they were forced to flee to Nagano during the Sino-Japanese war. The family was then shuffled between China and Japan multiple times as relations between the two nations grew increasingly antagonistic. The family almost immediately returned to China, how-

ever, this time settling in Peking. As a young teen, Hiro was drafted into the Japanese army of occupation and bore witness to torture and atrocities. In 1945, as the Chinese army entered to re-take the city, the Wakabayashis were forced into an internment camp. After a few months they were able to depart once again for Japan and re-settled in Tokyo, where Hiro finished high school.

Following World War II, Hiro came into contact with American soldiers in Japan and became increasingly fascinated with America. He was particularly attracted by the design of the products the soldiers brought with them, from military machinery to beverage cans. By tutoring American officers in Japanese he came into contact with Western magazines, and was motivated to experiment with photography himself. He began shooting around Tokyo with a Minoltaflex. The American magazines Hiro had discovered had such an impact on him that in 1954 he chose to depart for New York City with a very specific objective in mind: to

HIRO

become a photography assistant to either Richard Avedon or Irving Penn.

The young photographer had such talent and determination that he soon met his goal. Within two years of his arrival on American shores, Hiro succeeded in being hired as Avedon's assistant. When Avedon went off to Paris on assignment he asked Hiro to stay in New York and practice taking commercial still lifes. The two exchanged correspondence across the Atlantic, with Avedon alternately praising and sharply criticizing Hiro's work. Quick to recognize the immensity of his talent, in 1958 Avedon named Hiro an associate at the studio.

A second major influence on Hiro's photography was Alexey Brodovitch, renowned art director for *Harper's Bazaar*. In 1956, Hiro began studying photography at the New School for Social Research with Brodovitch, who provided him with aesthetic direction and career development. Impressed with Hiro's work, Brodovitch tested his readiness for publication with a deceptively simple assignment: he asked him to photograph a Dior shoe. Hiro labored for weeks before totally satisfying Brodovitch's expectations, at which point he was finally allowed to begin working on assignments for *Harper's Bazaar*.

Hiro developed his own aesthetic standards according to Brodovitch's dictum that one should click the shutter only when the camera reveals something that has never before been seen. This emphasis on originality and innovation has remained with Hiro throughout his career, and is manifested in the frequently startling nature of his compositions. He has a remarkable ability to generate surprise through his choices in composition and his evocative use of hyper-saturated color. By draping a ruby and diamond necklace over the hoof of a steer, or allowing a tarantula to creep up a model's foot, he uses unexpected juxtapositions that recall the strategies of surrealist art.

Though his images never shy from audaciousness, Hiro's technique is highly controlled and calculated. He is as known for his intensity, control, and patience as he is for his imagination. Approaching his medium with a scientific precision, he is a consummate perfectionist with a tendency to value preparation over spontaneity. In the studio he is also a great experimenter, particularly with lighting. He obsesses over the nature and quality of light, and has utilized strobes, colored gels, infrared film, and neon to generate various effects. His interest in cinematography led him to experiment with a movie camera, not out of a desire to be a filmmaker, but in order to apply the appearance of moving pictures to still photographs. In the studio, he developed complex techniques to convey a sense of motion. This filmic, shifting

focus can be observed in some of his portraits, which have an interior focus but blurred edges.

In many ways, Hiro's abilities and aesthetics are particularly appropriate to commercial photography. His love of innovation and novelty are perfectly suited to the aims of advertising and the capitalist sensibility that drives it. His ostentatious color, animated forms, and clarity of vision likewise make his images enormously appealing and seductive, signs of the pleasures of excess. Yet his depiction of products and commerce is not simplistically celebratory. He has also used the medium of advertising to make a critique about conspicuous consumption, as in 1972, when he created a cosmetics advertisement featuring a close-up of a woman's mouth as she gobbled pharmaceuticals.

Although he has never fully garnered a reputation as an art photographer, Hiro has a strong body of work that he created independently for non-commercial purposes. In 1962, on a return trip to Japan, he took black and white portraits of strangers cramped into subway cars, their bodies pressed uncomfortably against the glass windows of the train doors. The series succinctly conveys the claustrophobia and anxiety of urban existence. In 1990, he published the book *Fighting Birds/Fighting Fish*, featuring black-and-white photographs of illegal cock fights and vibrant color photographs of Siamese fighting fish. With these images, Hiro elegantly conveys the choreography of the animals' warlike gestures. More recently he turned his camera to human subjects, and created black-and-white images of babies. Rather than sentimentalizing the innocence of infancy, he instead radically frames the compositions around fragments of the infants' bodies to underscore their strange, almost alien quality.

HISTORY OF PHOTOGRAPHY: NINETEENTH-CENTURY FOUNDATIONS

To fully understand the twentieth-century history of photography, it is necessary to return to photography's beginnings, to the contextual environment of its "invention" in France and England and to important precedents. Although historians document through texts as early as the fifth century BC the phenomenon of light projected through a small opening (aperture), creating variable patterns on a surface, photography's "pre-history" really began in the Renaissance with two basic photographic concepts: the ideas of the "frame" and of the "box."

The "frame" is an important editing device allowing two-dimensional representation of three-dimensional space (a drawing, a painting, later a photograph) and depends largely on principles of linear perspective developed in 1435 by the Italian

painter Leone Alberti in *On Painting*. The "box" combines the light source, aperture, and surface into one entity, the "camera obscura." This Renaissance drawing device conceived by Leonardo da Vinci (about 1500) and described by Giovanni della Porta in *Natural Magic* (1553), is literally a "dark room" with one wall (opposite a tiny opening) becoming the vertical section of a cone of light: the frame (called "Alberti's window"). The camera obscura improved through time becoming smaller and more portable; optics were added (the idea attributed to Daniello Barbaro in 1568), and mirrors to "right the image."

Thus, a cumulative effort of many centuries of ideas and innovations allowed the inventors of photography, Joseph-Nicéphore Niépce, Louis

Daguerre, William Henry Fox Talbot, and Hippolyte Bayard to draw on this “pre-history,” to add to the mix through trial and error, the latest nineteenth-century chemistry and achieve what historians refer to as the “historical moment”—a permanent image taken by a camera (camera obscura). At least four such “moments” declared the invention of photography. The first photograph, amazingly still extant, was by Joseph-Nicéphore Niépce taken from a window on his estate at “Le Gras,” near Chalon-sur-Saone, in France, dated 1827. The emulsion (bitumen of Judea familiar to graphic artists) was coated onto a pewter plate and the camera exposure lasted about eight hours, as evident from the recorded shadows. It was a photograph (heliograph); but it was not a viable process. That would come later with the achievements of Niépce’s partner, Louis Daguerre, a commercial artist of some renown. Unfortunately, Niépce died before Daguerre discovered, probably by accident, the key to his positive process: mercury vapor as a developing agent. The historic announcement of the invention of the daguerreotype (a copper/silver plate) was made in January 1839, and was greatly facilitated by François Arago of the Chamber of Deputies who convinced the French government to purchase the patent and provide Daguerre a substantial annuity of 6,000 francs.

Daguerre’s announcement gave rise to another historical moment across the Channel from France, where the distinguished English scientist, William Henry Fox Talbot, hurriedly gathered his photographs, many exposed in tiny cameras, and his experimental evidence of a very different negative/positive paper process, the Talbotype, and announced before the Royal Society the invention of photography (“Photogenic Drawing”) in England, also in 1839.

While nationalistic politics fed the declarations of invention in France and England, still another inventor, an unsung hero, waited at the request of the French government to announce what was, in a strange way, a combination of both processes. Hippolyte Bayard invented a positive paper process of photography, more like Talbot’s than Daguerre’s, perhaps with more significance to art history, since he immediately exhibited some of the most aesthetically interesting images of the time. Along with architecture and genre subjects, Bayard’s enigmatic self-portraits, including *Self-Portrait as a Drowned Man (1840)*, an allusion to David’s *Death of Marat*, borrowed on satire to reproach the French government for his lack of recognition. These photographs helped establish France as a center of photographic art and

provided a home for Talbot’s English paper process, the Talbotype or calotype, for even Bayard switched to the more sophisticated calotype.

Prior to the dissemination of the daguerreotype process, with its greatest expansion in the United States (9,000 instruction manuals and considerable equipment sold in 1839), and the calotype process, with its greatest achievements in France, there was another development in Scotland, in the early body of photographs produced by Hill and Adamson. Although the French had declared the daguerreotype patent-free except in rival England, Talbot maintained his expensive patent on the calotype, delaying its expansion in his own country. He offered it patent-free, however, to his friend, Sir David Brewster, in Scotland, where eventually it was given to the artistic team of David Octavius Hill and Robert Adamson, a partnership that produced over 2,500 calotypes, mostly portraits, allegories, and tableaux beginning in 1843. This perhaps overshadowed Talbot’s own considerable contribution of photographs printed in his book *Pencil of Nature* (1844), calotypes of architecture and genre scenes, many taken at his estate at Lacock Abbey. Photography’s “historical moment” in England was best represented in about four-and-a-half short years by an extensive portfolio of photographic art in Scotland, a great start for the medium.

Despite this achievement, the calotype flourished better in France and has been characterized as a collective aesthetic occurring between 1845 and 1870 according to Andre Jammes and Eugenia Janis in *The Art of French Calotype* (1983). Unlike the daguerreotype, used primarily in the commercial portrait studio, the paper calotype lent itself to a long tradition of print-making and drawing, and was an efficient reproducible art (numerous prints from one negative). The “lack of aura” attributed to one-of-a-kind art, would later challenge photography’s legitimacy in the twentieth century according to Walter Benjamin in *The Work of Art in the Age of Mechanical Reproduction*. Furthermore, since the calotype looked like art (it was championed by Lady Eastlake, an early writer on photography), it was easy for critics and intellectuals to include the calotype with more established arts in a never-ending desire to have photography imitate painting and hold its own as “high art.” Hippolyte Bayard’s positive paper prints hung next to works by Titian and Rembrandt, in the Martinique benefit exhibition, in Paris, in 1839—possibly the very first photography exhibition.

The early French calotypists, Hippolyte Bayard, Louis Blanquard-Evrard, and Gustave Le Gray experimented with and improved the aesthetic potential and longevity of the medium, by improving the tonal range, the richness of blacks, the vari-

ety of papers, and waxing the negative. The waxing process developed to improve emulsion absorption was attributed to Le Gray, a photographer and teacher with his own art school. The production of lasting portfolios to preserve the delicate calotypes and facilitate their distribution was attributed mostly to Blanquard-Evrard. The photo critic, Francis Wey, stated, "Our albums are our salons."

The nationalistic fervor of the Second Empire prompted Napoleon III to modernize Paris, following the French Revolution (1789–1793), and to attempt to restore the glory of French architecture. For the first time, photographic documentation played a role in restoration, as did the influence of Romanticism on all literary and visual output. Romanticism influenced the use of the calotype over the daguerreotype to document the great medieval cathedrals across France, despite the detail, sharpness, and tonal range that could be achieved with the daguerreotype; ironically, it was considered of too small a scale and too impersonal ("cold tinge, shiny surface"). Government grants for photographic restoration, the "Missions Héliographiques" (1851) were provided to the early calotype artists: Hippolyte Bayard, Henri Le Secq, Edward Baldus, Gustave Le Gray, and O. Mestral. Charles Nègre, calotypist and student of Le Gray, later explained this romantic viewpoint:

Being a painter myself....whenever I could dispense with architectural precision, I indulged in the picturesque, in which case I sacrificed a few details when necessary, in favor of an imposing effect that would give a monument its real character and also preserve the poetic charm that surrounds it.

(Jammes 1983, 62)

If the project failed as architectural documentation—even the ongoing lithographic survey, "Voyages Pittoresques," provided more details than the calotype photographs—it gave these fine calotype photographers recognition and respectability, as Daguerre had had with government support.

The calotype was also used for documentation in Egypt, the Holy Land, and other locations. Maxime du Camp, accompanied by writer Gustave Flaubert, made calotypes as early as 1850 on an expedition to Egypt; Charles Marville documented Paris prior to Eugène Atget, and photographed in Germany in 1853; and Edward Baldus, using both the calotype and the wet-plate process, documented cathedrals, early railroads, and the devastating Rhône floods of 1856.

While members of the science community seized on the new wet-plate collodion attributed to Frederick Scott Archer, in 1851, advocates in the art commu-

nity fought furiously for the retention of the calotype. The art journals of this period, *La Lumière*, for the *Société Héliographique* and *The Bulletin for the Société Française* favored the calotype, while *Le Propagateur* and *Cosmos* came out in favor of the collodion. The new technology triumphed and in 1851 the collodion era emerged.

Collodion, initially developed for medical use, had the properties for even suspension of silver producing a superior glass negative especially when printed on albumen paper. Therefore, collodion/albumen became the standard used for over 30 years. Unfortunately the glass negatives had to be exposed and processed while moist, requiring a portable darkroom in the field. Although faster, the collodion process was still incapable of recording action.

Louis Daguerre's process had an immediate universal appeal, especially in the United States. In 1839, Samuel Morse, painter and inventor of the Morse code, purchased a daguerreotype system. Experimenting with John Draper, New York University chemistry professor, the two initiated a period in the United States that became the longest, most advanced, and lucrative commercial practice of daguerreotypy in the world. Other innovators, Henry Fitz and John Plumbe working in Boston, Robert Cornelius and the Langenheim brothers in Philadelphia, and others, offered services such as toning, coloring, size options, and elegant frames. They applied steam power and the new German system of labor (assembly line) to their mini-factories and competed to reduce prices. Two of the finest establishments to evolve out of this experimental period in the United States were Southworth and Hawes in Boston, who learned from Daguerre's representative in the U.S., François Gouraud, and Mathew Brady in New York City and later Washington, D.C., who studied under Morse and Draper.

Southworth and Hawes represent the highest quality of skill and variety of daguerreotypy ever produced, rivaled only by Mathew Brady in the United States and, possibly, by Antoine Claudet and Richard Beard in England, and Jean-Sabatier-Blot in France. Beard patented a coloring process that made daguerreotypes as precious as the hand-painted, ivory miniatures they replaced. Brady, prior to his reputation as American Civil War photographer, began by making jewelry cases, learned the daguerreotype, and opened his first of several studios on lower Broadway, New York City, in 1844, across from the famous P. T. Barnum American Museum. He realized that photographing the famous was a means to success. Brady's most important early daguerreotype edition, *The Gallery of Illustrious Americans*, featured prominent Americans

such as naturalist John James Audubon, politician Henry Clay, and others. This edition of daguerreotypes, one-of-a-kind positives, were reproduced as lithographs by the famous lithographer, François d'Avignon. And this shrewd venture helped build his reputation as "Brady of Broadway."

Brady also photographed renowned actress Jenny Lind, performing for P. T. Barnum and the celebrated wedding of another Barnum star attraction, the midget, Tom Thumb, held at New York's Grace Church. Brady established his last and most luxurious studio, the National Portrait Gallery, across from this church where he continued making celebrity portraits including Edward, Prince of Wales, and presidential candidate, Abraham Lincoln, who said: "Brady and the Cooper Institution [where he delivered a speech] made me president." Photographs taken by Brady personally are few due to eye problems. He had to rely on his brilliant operators, Alexander Gardner, who managed Brady's Washington, D.C. studio, Timothy O'Sullivan, George Barnard, and others whose work was produced under the Brady name, a practice that continued during the Civil War. Gardner and O'Sullivan finally broke with Brady to produce portfolios of the war under their own names: "Gardner's Photographic Sketchbook of the War," (which included work by O'Sullivan) and Barnard's "Photographic Views of Sherman's Campaigns."

War photography was introduced with the advent of the wet-plate process, subsequently replacing illustrators and sketch artists in the field with photographers and their portable dark rooms. Alexander Gardner, specializing in photographs of Lincoln, documented the "Hanging of the Lincoln Conspirators," shortly after the assassination. As one of the first "photojournalistic events" it was too ghastly for the public, and illustrations, but not the actual photographs, were published to record the event.

Known for the first photographs of war in the Crimea, in 1855, pre-dating Brady by some six years, Roger Fenton, the English photographer, holds a special place in the nineteenth century. His career spanned an important middle period connecting the invention of Talbot's calotype, the advent of collodion, the commercial "view" business, and finally war photography. In spite of his reluctance to regard photography as high art, Fenton preceded and laid the foundation for the return of art photography in England during first, the Pre-Raphaelite period, and second, the Pictorialist period.

Fenton had visited France in the 1840s. He was very impressed by salon life, befriended the calotype artists, and had studied painting with Paul Delarocche. In 1847, he joined the English Calotype Club,

which had only 12 members due to Talbot's restrictive patent. He founded the Photographic Society of London, in 1853, which later became the Royal Photographic Society and, even established a dark-room in Windsor Castle for Prince Albert. Both Queen Victoria and Prince Albert were strong advocates of photography.

The Crimean War forced Fenton to perfect his new collodion skills under horrible conditions. Sent to Balaklava Harbor at the request of Agnew's Publishing of Manchester, England, and Prince Albert, he recorded the chaos of war and the aftermath of battle, which prompted John Szarkowski, in *Photography Until Now*, to refer to photographs of the terrain as "bare, moon-like landscapes." Fenton photographed for only four months, producing 360 plates, mostly portraits of officers. In 1855, he contracted cholera and was replaced by James Robertson and Felice Beato.

In some ways, the Crimean and American Civil Wars marked the ends of two remarkable careers in photography. Mathew Brady's very nineteenth-century mission and destiny nearly destroyed him; first, when he was almost killed during the battle of Bull Run, and later, when his venture ended in bankruptcy. There was little interest in buying his photographs after the war although, eventually, some 7,000 plates were purchased at discount by the United States Library of Congress. Roger Fenton, having recovered from war and cholera worked for the British Museum and made camera "views," then with little explanation, abruptly ended his photographic career in 1862. Fenton's "views" were some of the best of the genre. His closest competition, Francis Frith and Company, lasted an amazing 111 years. The view business prospered during the wet-plate era with such companies as Francis Frith in England, George Washington Wilson in Scotland, the Alinari Brothers in Italy, Adolphe Braun in France, Bonfils of Beirut, and others, providing eclectic, romanticized, often trivialized documentation of people, places, and events that, nonetheless, are important to the historic photographic record.

The collodion process provided studios with other commercial offerings to augment the portrait and view business. The tintype (Ferrotype, 1856), a collodion positive image on metal, was a cheaper yet far inferior version of the gradually disappearing daguerreotype; the Ambrotype (1854), a collodion positive image on glass, attributed to the American James Ambrose Cutting; and the stereograph (1849) attributed to Sir David Brewster of Scotland, made with a stereoscopic camera such as the Dancer, the Quinet, and the Disderi offered, with the aid of a stereoscope, the phenomenon of three-dimensional

views. The “carte de visite” (1857) attributed to A.A. Disderi in France offered inexpensive multiple portraits, an idea quickly copied by all the large portrait studios, including Brady’s of New York. Such innovations greatly expanded photography’s commercial possibilities, and, except for the Ambrotype, were extremely popular, some into the twentieth century.

The best studios, such as Mathew Brady in the United States and A.A. Disderi and Etienne Carjat in France survived through fierce competition to prosper in the late nineteenth century. They produced some of the finest portrait work as well as a sensitive record of each country’s political and artistic leaders. Another Frenchman, Gaspard Félix Tournachon, or Nadar, was the first in France to photograph from a balloon and to photograph underground with artificial lights, but more importantly, to expand and transform his satirical political cartoons (the Panth, on Nadar) into a highly successful and unique portrait business. His singular style with simple lighting and an emphasis on character when applied to photographing celebrities, created a model for many portraitists and fashion photographers in the twentieth century.

Roger Fenton, who spent a lifetime as an advocate for photography left this pursuit at a time when art photography suddenly reemerged among the elite in English society. Various photographers aspiring to high art, during the 1850s and 1860s, aligned themselves with their English brethren, the Pre-Raphaelite painters, John Millais, Georges Watts, and Dante Gabriel Rossetti. They used the photographic medium to fabricate popular allegorical themes from literature and the Bible. Neither collage nor allegory was new to photography, but they had not been used to this extent. Oscar Rejlander was one of the earliest Pre-Raphaelite photographers, who made thirty separate negatives of models and through multiple printing created an amazing collage, measuring 16 × 31 inches, called *Two Ways of Life*, an allegory based on the famous Raphael painting *The School of Athens*. One of Rejlander’s ways of life in the allegory featured overt nudity, appropriate to the theme but not to a Victorian audience. He was criticized for this but only after winning first prize in the Art’s Treasure’s Exhibition in Manchester, in 1857, and having the work purchased by Queen Victoria.

Henry Peach Robinson, a painter, illustrator, and photographer also produced allegories using multiple printing techniques which were less ambitious than Rejlander’s. “Fading Away,” which featured a healthy fourteen-year-old girl facing the moment of her death, was criticized as too morbid, probably because the photographs made the scene look too real. However, some in Victorian society thought the photograph “an

exquisite sentiment” providing a glimpse into nineteenth-century Romantic sensibility. Robinson also published a famous “how-to” book, *The Pictorial Effect in Photography*, in 1869, complete with instructions and illustrations to produce photographs following methods used by the Pre-Raphaelite painters.

The collodion process lured two more in England to art photography, Lewis Carroll and Julia Margaret Cameron. Carroll, the writer of *Through the Looking Glass*, and *Alice in Wonderland*, was also a math lecturer at Oxford in England. He had a fascination, possibly obsession, with very young girls, especially Alice Lidell, the model for Alice in Wonderland, her sisters, and others, and decided to photograph them, often in allegorical costume and pose. Some of these photographs were nude studies, which again aroused Victorian criticism, which contributed to Carroll’s laying down his camera and stating that the negatives in question would be destroyed at his death. The photographs that have survived showed a strong sensitivity to the subject and an almost fastidious practice of craft typical of all of Carroll’s endeavors.

Julia Margaret Cameron was of the privileged class; she took up photography late in life as a hobby that became a consuming passion. Cameron was close to her mentor, and Pre-Raphaelite painter, George Watts, and attempted many allegories based on the Bible and on the King Arthur legends. Her portraits of Alfred Lord Tennyson, Charles Darwin, Henry Wadsworth Longfellow, and others, are exceptional and convey a unique style that is close-up and abstract, with harsh lighting. Although Cameron was a strong role model for women in photography, a medium dominated by men, it is perhaps misleading to characterize her as an early example of feminism by today’s definitions. In her autobiography, *Annals of My Glass House*, she stated: “When I have had such men before my camera my whole soul has endeavored to do its duty towards them in recording faithfully the greatness of the inner as well as the features of the outer man.” Cameron is best known for illustrating Tennyson’s “The Idylls of the King.” Somewhat less known are her sensitive portraits of women in which the poses, the titles, and the delicacy of these enigmatic pictures reveal another aspect of her complex oeuvre.

Allegorical photography aligning itself with Pre-Raphaelite painting resulted in some of the most ambitious and contrived art photography ever produced. And it had its critics. One of these, Peter Henry Emerson, was a physician with an English mother and an American father. He was a distant relative of Ralph Waldo Emerson, American essayist, who, shortly after learning the camera, stated

that he: “took several photographs that were destined to revolutionize photography and make my name in photographic circles.” This prophesy was not far off the mark. His famous textbook entitled *Naturalistic Photography for Students of the Arts* (1889), considered an antithesis to Robinson’s own book, *Pictorial Effect in Photography*, advocated the straight use of the camera without any manipulation of process or consideration of allegorical subject matter. “Naturalistic Photography” appears to be a revolutionary statement, yet within the context of art history, Emerson’s images although not in the style of the Pre-Raphaelites were in the style of the “Naturalists” of the “Rustic” New English Art Club and of the French artist, Jules Bastien-Lepage.

Emerson produced a series of portfolios taken in the East Anglia region of England. He began the series in 1886 with *Life and Landscape in the Northfolk Broads* and ended it in 1895 with *Marsh Leaves*, which is considered his best work. Although making claims to be working with photographic reality, he idealized the peasants he photographed, often posed them in highly stylized compositions, and insisted on “soft focus” for atmospherics.

By the time Emerson’s career declined, in 1891—he dramatically renounced his own thesis stating: “The Death of Naturalistic Photography”—he had already influenced, art photography’s next phase. Pictorialism, from 1888 to 1912, was a universal style of aesthetic photography meant to evoke feeling and to elicit beauty over fact.

By the 1880s, photography had become a less complicated process with the development of the dry-plate. Practitioners proliferated, especially art photographers. Naturalism continued to have its supporters, in the work of Frank Sutcliffe in the English coastal town of Whitby, but Impressionism, Post-Impressionism, Symbolism, and Tonalism also influenced the Pictorialist photographers toward the turn of the century.

To the members who formed the “Linked Ring,” a group trying to raise photography to high art in imitation of painting, in 1892, Pictorialism was a radical break with the photography that preceded it. The Ring started as an English gentlemen’s club, (women were not admitted until 1900), and some of its members were Herschel Hay Cameron (Julia Cameron’s son), Frank Sutcliffe, Frederick Evans (a distinguished architectural photographer), James Craig Annan, and others. They created their own exhibition spaces and “linked” their endeavors with Pictorialists in other countries. The *Linked Ring* advanced the camera club movement that still exists today. The Vienna Camera Club of 1891 with Pictorialist Henrich Kuehn, the Paris Photo Club of 1894 with Pictorialist Robert Demachy, and the

New York Photo-Secession of 1908 with Pictorialist Alfred Stieglitz, Edward Steichen, and others, were some of these “links.” Stieglitz, who may have had the greatest influence on the style, the direction of, and the institutionalization of art photography in the twentieth century, ironically received his first of 150 photographic awards from Peter Emerson.

Pictorialism featured some of the finest images in black and white and color (platinum, photogravure, gum bichromate, etc.) ever attempted by photographers. Of special note is the refinement of the gum bichromate process by Robert Demachy in France. This beautiful and complex photographic process formed a color bridge between the first hand-painted daguerreotype and the invention of the autochrome process by the Lumière brothers, in 1907.

Pictorialism also influenced documentary photography. Following the American Civil War, Brady photographers (now independent), Timothy O’Sullivan, Alexander Gardner, and others such as the U.S. Army photographer, A. J. Russell, took their wet-plate skills on the road. The U.S. government and private corporations such as the railroads, paid photographers to document the American West. The geological survey expeditions in the United States (also in Canada) were some of the most difficult assignments photographers undertook with their large wooden cameras and darkroom wagons. From 1867 to the early 1880s, these public and private surveys provided information on geology, settlement, indigenous people, and natural resources. These survey photographs remain some of the most magnificent images ever made of this vast and unspoiled territory.

The most important of the government surveys were: the Clarence King 40th Parallel Survey from California to the Great Salt Lake, with photographer Timothy O’Sullivan (who briefly joined the Darien Expedition to Panama in 1870); the Lt. Georges Wheeler Survey West of the 100th Meridian ascended the Colorado River, with O’Sullivan and William Bell in 1871; the Francis Hayden Survey from 1870–1878 to the Yellowstone region and south to New Mexico and Arizona, with William Henry Jackson; the John Wesley Powell Survey of 1871–1882 to the Grand Canyon, Virgin, and Zion regions and the Upper Rio Grande Valley, with E. O. Beaman, James Fennimore, and Jack Hillers; and the California State Josiah Whitney Surveys of the 1860s to Yosemite, with Carlton Watkins.

Timothy O’Sullivan’s photographs were some of the earliest and least romanticized images of the land. However, geologist King, looking for evidence of the theory of “Catastrophism” through God’s interaction with earth, may have influenced O’Sullivan’s choice of views. The Hayden surveys to Yel-

lowstone with William Henry Jackson included landscape painters Sanford Gifford and Thomas Moran. Together they planned their “picturesque” views. Some of Jackson’s views were also destined for sale through Anthony’s of New York. The aestheticization of the land, the expanding commercialism, and the easy access to the West following the “meeting of the rails” (the much photographed Promontory Point in Utah connecting East with West) brought closure to this period, but not before the portfolios of Jackson and Moran convinced the U.S. Congress to designate Yellowstone a national park.

Carlton Watkins of the Whitney surveys, had a forty-year career, starting as a studio photographer in San Jose, California. Although he is best known for his Yosemite photographs (1860s into the 1880s), his work took him from Mexico to Canada, and included documents of the early mining and lumber industries, legal land disputes, and California missions—tens of thousands of images many of which were exhibited in California and in New York. Of all the survey photographers, Watkins’s personal style and complexity of composition perhaps best situates him as a figure transitional to the twentieth century art genre, “Landscape Photography.” Watkins’s work also helped paved the way for the designation of Yosemite as a national park.

Not all survey work was of the land. The photographers O’Sullivan, Hillers, Jackson, and later Edward Curtis, Carl Moon, and Adam Vroman also photographed the rapidly disappearing tribes of Native American. A very large collection of portraits survives, made mostly by Curtis, who began publishing portfolios on Southern tribes, in 1908 and completed this work with Volume 20, on the Alaskan Inuit, in 1930. By his death in 1952, at the age of 84, Curtis had made over 40,000 negatives, 2,200 photogravures, thousands of pages of text, and also wax cylinders of tribal languages.

Most photographs of Native Americans were “captivity portraits,” those taken shortly after battle, “assimilation” photographs, showing Native Americans in government schools such as Carlisle, Hampton, etc., or “novelty” photographs, extreme poses of Indians often with implements of the dominant culture, such as automobiles, airplanes. These were just some of the ways that photographers represented the “other.” Most photographs, including those of Curtis, romanticized the Native Americans as “noble savages” living in a world created by James Fenimore Cooper. Curtis occasionally over-posed his subjects or was not careful with their dress or artifacts in his portraits, but he was sympathetic to their plight and consistent in his approach to photographing, which he referred to

as “The Twenty Five Cardinal Points.” If anything, Curtis is guilty of applying the Pictorialist style to his ethnographic photographs.

Eadweard Muybridge, an Englishman living in the United States, was another survey photographer who made landscape and panoramic views in California and elsewhere during this period, but his finest work was as a photographer and inventor. Accepting a private commission to photograph a galloping race horse called Occident, Muybridge succeeded in making the first “action” photograph and is credited with the invention of the camera shutter. With this device he produced a series of motion studies using people and animals then continued this work with funding from the University of Pennsylvania and the American painter, Thomas Eakins. These motion studies culminated in the book *Animal Locomotion* (1887). When these studies were shown in a zoopraxiscope, an early movie projector, Muybridge became the inventor of the motion picture.

Toward the end of the century, one of the largest waves of immigrants arrived in New York Harbor and other ports, creating unprecedented social problems. To address these there emerged a new social science and a new category of photography, “social documentary.” From 1882 to 1887, during one of the worst economic depressions in American history, half of the population of New York City, mostly immigrants, was unemployed and living in poverty. Among them, was Jacob Riis, an immigrant from Denmark, living in desperate conditions in police lodgings—the same lodgings he would later, as a journalist, expose through photographs and eliminate altogether with the help of Police Commissioner, Theodore Roosevelt. Riis used his camera as a “weapon,” as a tool for social reform by publishing, in the newspapers, his photographs of squalid living conditions. His first of many books of photographs, *How the Other Half Lives*, was published in 1890 using the new half-tone printing process and together with written exposés and lantern slide lectures was to make a large impact on improving the life of the poor and the exploited.

Jacob Riis’s successor, Lewis Hine, also reflected part of a larger new social science emerging during the Progressive Era beginning in 1890 that took a scientific approach to understanding poverty not as a “sin” but as an economic condition. Hine, was a photography teacher at the progressive Ethical Culture Center, in New York. He also worked as a photographer for the Pittsburgh Survey, a new sociological investigation, and the National Child Labor Committee (NCLC) and used his camera to expose the exploitation of children in their working environments. Lewis Hine’s social documentary

photography set the stage for another group of photographers, the Historic Section of the Farm Security Administration (FSA), who worked during the Great Depression of the 1930s.

Photography had always been a technological art, and now as the century was drawing to a close, the wet-plate had finally gone the way of the daguerreotype and calotype. From 1880, it was gradually replaced by the dry plate process, using not collodion but gelatin and not requiring an instant dark-room. It was only a matter of time before gelatin would allow the glass plate itself to disappear, for roll film to come into being, and the hand camera to achieve popular commercial success.

There were, however, a few holdovers still using the glass-plate cameras. Eugène Atget started photographing Paris late in life after a somewhat unfulfilled career as an actor. He saw the changes occurring in his beloved city as modernity laid its claim on the boulevards and buildings and, like Charles Marville before him, thought he could preserve through photography what was still ancient and sacred. Atget continued to use his large wooden plate camera well into the twentieth century, and long after the Kodak had made everyone a potential photographer. Atget's work (over 10,000 plates) collected by Man Ray's assistant, Berenice Abbott, although primarily done on commission and in subject categories for sales has, over the years, been championed by the modernists, especially the Surrealists who were inspired by the haunting, empty cityscape populated by dolls and hats in shop windows—human surrogates functioning in another reality.

Paul Martin was one of the first photographers to use the latest hand camera, Fallowfield's Facile Detective camera, a noisy wooden, movable dry plate camera. Prior to this, the most portable cameras were the stereos used by nearly all large format photographers. Martin, a working class Frenchman who lived in England, photographed and exhibited his work through camera clubs and magazines. Using his Fallowfield camera he made some of the most modern, candid, and often serendipitous street photographs and night shots of a genre that began with the French calotypist, Charles Nègre in the 1850s, continued with the London portfolio of John Thomson, the genre scenes of Frank Sutcliffe, and the turn-of-the-century work of Alice Austen in Lower Manhattan, New York City. Martin also made some sculpture pieces of fishmongers, very modern photo "cut-outs." Although offered a free Kodak, Martin, like Atget, continued to use his precious wooden camera.

In a shrewd, risky entrepreneurial venture, George Eastman of the Eastman Dry-Plate Company of Rochester, New York (1880) created an innovative

portable hand camera. The preferred name for these first hand held cameras was the "detective camera," taken from popular literature. The cameras were novelty items disguised in walking canes, waistcoats, hats, and guns—few worked very well. The functional, inexpensive Kodak camera was designed with a short focal length lens of f/9, a shutter operated by pulling a string, and a roll of paper negative film of one hundred round frames. It included with the camera purchase, factory processing and reloading. The advertising read, "You press the button, we do the rest." Not just the film but the entire camera was sent back to the company following exposure. Unique, modern, and instantly popular, even the name "Kodak," was a designed acronym. The twentieth century had arrived.

HISTORY OF PHOTOGRAPHY: TWENTIETH-CENTURY DEVELOPMENTS

By the end of the nineteenth century, a myriad of technical advances had placed cameras and photographs in the hands of millions. George Eastman had successfully mass-marketed Kodak cameras and ingeniously provided for efficient developing. The half-tone process had at last enabled photographs to be published along side of text. Artistically-minded photographers were challenging moribund photographic societies and gathering together to pursue the artistic side of the medium. In the United States, Alfred Stieglitz broke with the Camera Club of New York. Members of this "Photo-Secession," (founded in 1902) included, among others, Gertrude Käsebier, Clarence White, Alvin Langdon Coburn, George Seeley, and Stieglitz's ally, Edward Steichen. The fifty issues of the quarterly *Camera Work* magazine, published by Stieglitz between 1903 and 1917, multiple printing documented the pictures and convictions of the Photo-Secession. Considered among the most sumptuous art magazines ever produced, it contained superb reproductions of photographs. In addition to *Camera Work*, the Photo-Secessionists showed work at gallery 291, named from its street number on Fifth Avenue, New York City, also known as the Little Galleries of the Photo-Secession. Stieglitz showed not only photographs there but also, from 1906 on, avant-garde modern art, some of which was selected in Paris by Steichen.

Straight Photography

After 1900, the notion of style was contested among aesthetically minded photographers. The dominant style of much twentieth century photography was called "straight," to distinguish it from the blurred, vague look of Pictorialism, which had held sway in the last half of the nineteenth century. Stieglitz's own style of the 1890s—less vague and less ostensibly "artistic"—pointed the way to the "straight." The new photography was crisp and looked more purely a product of the camera. There was less darkroom manipulation to the negative, and many

photographers used an approach called "previsualization," where the finished picture is composed in the viewfinder. Some of those who had begun as Pictorialists converted to this new approach, most notably Edward Weston, whose trip to Ohio in 1923 and his encounter with the Armco Steel plant marked a decisive shift towards a sober, brittle style. Edward Steichen, too, one of the most romanticizing Pictorialists up to about 1920, made a soul-searching effort to learn and adapt to straighter approaches. In the early 1920s, Stieglitz made a series of cloud pictures entitled *Equivalents*, which, despite their everyday subject, were intended to convey the artist's deepest feelings.

Stieglitz championed straight photographers such as Paul Strand whose works were featured exclusively in the last two issues of *Camera Work* in 1916 and 1917. His candid pictures of street people taken with a modified camera and his close-ups of machinery and architecture demonstrated how the straight style could produce documents filled with ideas and feelings. Strand settled in France in 1950, thereafter traveling extensively—to the Hebrides, Italy, Ghana, and Egypt—and produced several books of photographs. Stieglitz continued to be a dynamic force for artistic photography in the 1920s and was the proprietor of the Intimate Gallery, and another gallery called An American Place—the title of which reiterated his faith in the expressive aspirations of a distinctly American creative spirit—until his death in 1946. Many aspiring photographers—several of whom would become famous—made the pilgrimage to visit Stieglitz and ask for his advice. After his death, his long-time partner, the painter Georgia O'Keeffe, saw to it that his collection and his own photographs entered important museum collections.

Group f/64, named for one of the aperture's smaller settings, which produced the maximum depth of field with the greatest overall sharpness, was founded in 1932 as an informal collection of like-minded straight photographers. These included Edward Weston, Imogen Cunningham, Sonya Noskowiak,

and Ansel Adams. Using a classic view camera and using natural light exclusively, they made 8 × 10-inch negatives, stopping their lenses down very far to achieve the greatest depth of field. Vivid detail was achieved by contact printing on glossy papers. Retouching or enlarging in any measure was considered taboo. This aesthetic extended to the exhibition of their prints as well. Eschewing decorative frames, they mounted their prints on simple white card stock sparsely spaced on gallery walls. This became standard for the exhibition of photographs throughout the twentieth century. Adams combined his convictions about the straight approach with his passion for the outdoors. After being made aware of photography after visiting the 1915 Panama-Pacific Exposition in San Francisco, Adams avidly hiked and photographed the mountains and spaces of California and the West. Closely linked to the environmental organization the Sierra Club and its concerns, his images of the Sierra Nevada range and of Yosemite produced classic pictures of twentieth century photography. His famous “Zone System,” a sophisticated procedure he advocated for determining precise lights and darks, might be seen as the technical expression of the straight photographers’ heightened concern for craft.

Straight photography appeared in Europe in a variety of manifestations, and for many reasons. In Germany, the “straight” approach was embodied in the *Neue Sachlichkeit* (New Objectivity) movement, also the name of a soberly realistic contemporary painting style. In photographs of everyday things, Albert Renger-Patzsch made important images in the early and mid-1920s. The title of his well-known book, *The World is Beautiful* (1928), signaled his interest in the straightforward depiction of everyday subjects. Similarly, Karl Blossfeldt’s detailed close-ups of plant forms achieved a monumentality of design. The Cologne-based professional portraitist August Sander made countless images of diverse sitters, emphasizing their ethnic, class, and social identities in the first half of the twentieth century. He imagined a vast catalogue of all different types of sitters that was to be called *People of the Twentieth Century. Face of Our Time* (1929) was the first manifestation of this project. The Nazis confiscated it for its liberality, but later observers have been suspicious of Sanders’s treatment of “types.”

The Influence of Avant-Garde Art

Avant-garde artists became interested in the expressive and design aspects of photography in the first decades of the twentieth century. This, in turn, led photographers to experiment freely with the med-

ium. There was renewed interest in camera-less photographs, made by placing objects on photographic paper and exposing the arrangement to light. Though they had been made long before—even during the dawn of the medium itself—these images were now of interest for their pictorial qualities. Several artists discovered them at the same time. The Dada artist Christian Schad made his “schadographs” beginning in 1919. Man Ray produced his proto-Surrealist “rayographs” in Paris, in 1921. The Hungarian Constructivist László Moholy-Nagy, inspired by Schad and with the assistance of his photographer wife, Lucia, made his own abstract “photograms.” Overall, photograms have become a staple of photographic education.

Another new medium was photomontage, which involved pasting objects on photographs or in cutting and assembling photographs into one picture. Again, this had its roots in earlier practices, such as the combining of watercolor and photographs in the Victorian period and in the combination printing of figures such as Oscar Gustav Rejlander and Henry Peach Robinson. The most important montagists hailed from Germany. Hannah Höch produced culturally aware montages made from ephemera—newspaper, advertising, and vernacular photography. Raoul Hausmann, like Höch, was associated with Dadaism, and also made jarring photomontages. This hybrid medium was also of great interest to the Surrealists, who admired the weird juxtapositions in those made by Max Ernst and others. They also utilized new treatments of photography, including solarization, multiple printing, and bas-relief (*paraglyphe*), a technique used by Raoul Ubac which produced a three-dimensional effect. Man Ray’s Surrealist photos often made strange transformations of the female body.

Constructivists like Moholy-Nagy and El Lissitzky were less interested in the preposterous meanings than in combining images in the interest of new spatial and light effects. The most prolific of all was the Soviet Alexander Rodchenko, who produced myriad prints, posters, books and other projects. Their daring designs made the Stalin regime keep careful watch. German-born John Heartfield (born Hertzfeld) used photomontage in biting political satires. Wittily combining photographs of politicians with bizarre elements in absurd situations, and given lacerating titles, Heartfield’s anti-fascist imagery appeared in illustrated workers’ magazines (such as the *Arbeiter Illustrierte Zeitung*) between 1929 and 1938 in Berlin and Prague.

The Bauhaus, a progressive German arts-and-crafts school was the first in which photography was taught as an integral part of a comprehensive

arts curriculum. Teachers such as Moholy-Nagy, Gyorgy Kepes, and Herbert Bayer used photography to expand their students' vision. They prized the negative as an end in itself, used the photogram as a teaching tool, and took pictures from unorthodox viewpoints. For Moholy-Nagy, the photograph was a necessary tool for the advancement of an enhanced appreciation of things. He delighted in all manner of technical imagery including X-rays, photomicrographs, and motion photography. In his influential book, *Painting, Photography, Film* (1925), Moholy extended his conviction that photography was an essential part of the modern sensibility. This was a motif in teaching and publications. After the Nazis threatened the Bauhaus, Moholy-Nagy fled first to England, then to Chicago, where he founded the New Bauhaus (later the School of Design and the Institute of Design) bringing his venerable Constructivist-inspired notions of photography's utility to a generation of artists, designers, and photographers.

Documentary Photography

Although photographs had been made to document all manner of things in the nineteenth century, it was not until the 1930s that they came to be admired for their aesthetic value alone. Additionally, technological advances such as miniature cameras as the 35 mm format was initially known, quick shutters, and faster film, changed both the process and the resulting documentary imagery.

In many ways, the photographs of Eugène Atget span both centuries. He made some 10,000 pictures in an attempt to document the entirety of picturesque Paris: its denizens, its alleys, parks, and old buildings. Atget sold them to architects, set designers, and artists and worked in relative obscurity until being "discovered" by Man Ray, and by his assistant, Berenice Abbott. She saved his entire body of work upon his death in 1927; today it is housed in the Museum of Modern Art, in New York. Similarly, a group of enigmatic photographs of New Orleans prostitutes by the amateur E. J. Bellocq (c. 1912) were discovered. They were later printed by Lee Friedlander. In the twentieth century, the appreciation for photography elevated the status of many previously unrecognized talents. Such was the case with James VanderZee, whose decade-long career in New York City as a professional photographer was recognized as producing a veritable documentary portrait of the Harlem Renaissance.

Most documentary photography in the twentieth century has been socially concerned. As a teacher at the progressive Ethical Culture School in New

York, and as a trained sociologist, Lewis Hine was genuinely interested in social justice, and used his pictures to affect change. Beginning in 1905, he began taking pictures of Ellis Island immigrants. To make his most important body of work, he traveled to mines and textile mills to document children at work. These images were then used to change child labor laws.

The economic crisis of the American Depression provided the impetus for a major documentary project. Under the direction of Roy Stryker, an economics professor, a group of photographers under the aegis of the Farm Security Administration (FSA) was sent to rural America to document the effects of poverty. Another part of its mission was to justify in pictures the successes of President Franklin D. Roosevelt's New Deal programs. Photographers such as Arthur Rothstein, Walker Evans, Dorothea Lange, Russell Lee, and Ben Shahn were sent to the hardest hit areas of the country, often to the Dust Bowl, where farmers were being driven from their land by the harsh weather and blighted economy. Stryker often briefed photographers before they went into the field. They sent their rolls of film back to Washington, D.C., for developing. Today, thousands of their photographs—which were used at the time in posters, advertising, and in all manner of public forums—are housed in the Library of Congress. Although each photographer had a certain style, overall, FSA photographs show a heightened sense of compassion and often a concern for pictorial values. Photography also played a large part in the collaborative projects associated with the time. These include Walker Evans's pictures for James Agee's book on Alabama sharecropper families, *Let Us Now Praise Famous Men* (1941), and Margaret Bourke-White and Erskine Caldwell's book on the South, *You Have Seen Their Faces* (1937).

The New York-based Photo League (1930–1951) was a group of liberal photographers and filmmakers committed to depicting the urban poor. They produced important projects such as the *Harlem Document*, but aroused suspicion during the McCarthy era for their left-wing politics. In England, at nearly the same time, a project called Mass-Observation also sought to understand national identity by accruing documentary information. Founded in 1936 by the journalist and poet Charles Madge, and including the participation of filmmakers and natural scientists, it sought to amass raw data about daily life and about Britain's status quo. Ordinary people took countless photographs of their lives and provided information about their

reactions to all sorts of events and conditions. Humphrey Spender made evocative images of industrial towns disguised as a worker.

Photojournalism

Photography and the press have always been intrinsically linked. Even before the technology existed to reproduce photographs in mass-produced publications—originally, actual photographs were bound into books—drawings made from photographs were printed. The halftone process, widely used after 1900, enabled photographs to be published along side of text. With the widespread use of miniature cameras such as the Ermanox (1924) and the Leica (1925), photojournalism came into its own. These new cameras made photographers highly mobile, and enabled them to inconspicuously move close to the action. They utilized natural light, had wide-aperture lenses, and fast exposure times. The development of the flash in the twentieth century represented a great advance over the cumbersome, explosive, and smoky flash powder previously utilized. The synchroflash coordinated the flash with the shutter of the camera. Later, multiple flashes allowed photographers to arrange a room with many light sources, creating a more natural effect, and simply wait for an appropriate moment to shoot. Flashbulbs and electronic flashes were other twentieth-century innovations.

A new style of photography evolved which emphasized informality and spontaneity. Images now conveyed news. Photographically illustrated publications became wildly popular in the 1920s and 1930s. Germany led this phenomenon with publications such as the *Müncher Illustrierte Presse* (1928), though France's *Vu* (1928) and, later, Henry Luce's *Life* and *Look* (begun in 1936 and 1937, respectively), in America, were also widely read. Margaret Bourke-White's industrial photographs first appeared in *Life*, as did those of Alfred Eisenstaedt. Pictures of politicians, events, and interesting sites held viewers in thrall and became important in shaping popular opinion. The photo-essay—sequenced pictures accompanying an informational text—was a form that was invented to suit these new picture magazines. Over time, every manner of human-interest story was expressed in this form. Innovative editors, such as Stefan Lorant, editor of the *Müncher Illustrierte Presse*, oversaw both image-making and stories. Photographers were part of a team that included an editor, researcher, and writer. Over time, effective formulae for photoessays were established. Pictures were sequenced on the page before the addition of text,

and opening paragraphs established a context for the imagery that followed. In 1934, Lorant fled the Nazis. In London he established important picture magazines such as *Picture Post* (1938) and *Weekly Illustrated* (1934). The spontaneous and natural look of the photographs he printed, many by émigré photographers, impacted photojournalism around the world. Certain photographers, such as Felix H. Man and W. Eugene Smith, became well known for their images that became part of memorable photo-essays. Picture magazines provided important experiences for photographers and editors in the twentieth century. Andreas Feininger, for example, who had worked for *Life*, later made several books of design-conscious imagery. The influential Alexey Brodovitch, art director of *Harper's Bazaar* from 1934–1958, helped shape the style of magazine layouts, and that of important photographers as well.

Photojournalists became adept at capturing significant and newsworthy moments. This led to an appreciation of the aesthetic of spontaneity in its own right. The Hungarian-born André Kertész made beautifully composed images notable both for their composition as well as their perceptiveness. Henri Cartier-Bresson, working in France, conceived of an entire approach based on capturing, as he said, the “decisive moment,” the name of an important book of his images (1952). He described the process of the patient readiness to snap preconceived shots as a “fencer making a lunge.” He was a founder of Magnum Photos in 1946 with David Seymour (“Chim”) and Robert Capa. This photographer's collaborative, which maintained a staff of roving cameramen taking pictures to sell to press agencies, was the result of a desire for greater control over their pictures.

Since photography's invention, war has provided the subject for countless pictures. The sites and soldiers of the Crimean War and the American Civil War were extensively photographed. Actual scenes of battle, however, could not be taken because of cumbersome equipment. But by 1930, smaller cameras, roll film, and the dictates of the press made the experience of war inherently photographic. Governments, too, used photography for aerial reconnaissance and to monitor troop movements, as well as for propaganda purposes. Combat photographers faced great technological challenges and life-risking situations. Robert Capa became a pioneering combat photographer. His blurry images of moments from the Spanish Civil War and from D-Day conveyed the franticness of battle. Joe Rosenthal's image of American soldiers raising a flag on the Iwo Jima battlefield (1945) became an icon of American patriotism. In Britain during

World War II, a host of talented press photographers made memorable images of Blitz damage, including George Rodger, one of Magnum's founders. Powerful pictures of the human cost of war were made by the Soviet photographer, Dmitri Baltermants. Lee Miller, a former assistant to and model for Man Ray, accompanied American forces and produced startling pictures of the liberation of the German concentration camps. David Douglas Duncan photographed the war in Korea. Don McCullin and Larry Burrows made graphic pictures of the wounded in Viet Nam in the 1960s. War photographs assumed the power to change public opinion. Thus, governments have exerted control over their publication.

Fashion Photography and Portraiture

Although nineteenth-century photographers made images of fashionably dressed sitters, fashion photography was not a distinct genre. Because photographs could now be published, because of sophisticated retail strategies, and because the motion picture industry used photographs to sustain interest in its stars, fashion photographers became important in the 1920s and 1930s. Designers, magazines, and department stores all depended on them. Baron Adolph de Meyer, a Pictorialist, made images of aristocratic beauties, as did George Hoyningen-Huene, while Edward Steichen made unforgettable images of Hollywood stars and cultural figures. Man Ray produced Surrealist-inflected fashion photographs in the 1930s. In England, Cecil Beaton came to represent the very ideal of the urbane fashion photographer.

Several portraitists became renowned for their perceived ability to capture the personalities of their sitters. In the first half of the century, Steichen, Beaton, Yousef Karsh, and Gisèle Freund documented important sitters. Phillip Halsman, Irving Penn, Richard Avedon, David Bailey, Herb Ritts, and Annie Leibovitz have done the same in later decades, their works straddling the border between rote documents and artworks. Pictures by these photographers were most often collected in books, which might be seen as a continuation of the nineteenth-century predilection for compiling images of famous sitters. Since the 1970s, the portrait tradition has been ironized by the witty photographs of William Wegman, who photographed his pet dog in situations formerly reserved for serious portraiture.

Science and Technology

Twentieth-century scientists and photographers were interested in capturing motion in ever-smaller increments. Eadweard Muybridge and Jules Larey had been pioneers in the previous century. With the development of super-quick shutters and film, scientists such as Harold Edgerton amazed viewers with images of bullets captured in mid-trajectory and the beautiful symmetries of water droplets. X-rays, aerial photography and astronomical photography, and infrared photography were also refined in this period, as was the ability to photograph images seen through electron microscopes. In general, as it had in the past, photography proved to be an indispensable tool of modern science. Concurrently, older forms of the medium, such as the tintype and the stereograph, disappeared.

As the twentieth century drew to a close, and with the dawning of the technological era, photographs were breaking free of the traditional camera and darkroom altogether. Digital photography, the transcription of the subject directly to disc or drive, was the result of a marriage with computers. By the 1980s, scanners and software had been developed to store and convincingly alter pictures, thereby calling into question the inherent veracity of the photograph. The abandonment of any traditional developing, the meaninglessness of a photographic "original," and the ease with which digital imagery is transmitted through Internet systems has irrevocably changed the fundamental nature of the medium.

Color

Color photography matured in the twentieth century. Previously, color in photographs—outside of the singular and isolated experiments of isolated inventors—was achieved by the actual application of colored pigments to the photograph's surface. The first practical color process was the Autochrome process, invented in 1907 by the French Lumière brothers (Auguste and Louis). It produced a positive color transparency, not a print on paper, by using a color screen, actually a glass plate covered in dyed starches, through which light registered colors on a layer of emulsion. Alfred Stieglitz, John Cimon Warburg (1867–1931), and Jacques Lartigue all made autochromes. However, the process was expensive, ephemeral, produced unique examples, and did not encourage experimentation.

Advances did not come until the 1930s when Leopold Mannes and Leopold Godowsky, Jr., working at Kodak Research Laboratories, invented Kodachrome film. The following year, the Agfa Company of Germany, arrived at the Agfacolor negative-positive process. Like the Kodachrome process, it made possible reversal film, which produced color transparencies suitable for projection (as slides) and for reproduction (as prints). In 1942, Kodak introduced Kodacolor film, which, after years of refinement, became the most popular color photography process of all.

Camera artists at mid-century cautiously made works in color, some courted by Kodak and other companies to demonstrate its practicality and expressiveness. Important early practitioners of color processes include Paul Outerbridge, Jr., Madame Yevonde, and Helen Levitt. The Austrian Ernst Haas, a Magnum photographer, made remarkable colored abstract and blurred motion works at mid-century. In 1958, the Belgian Pierre Cordier began making his abstract “chimigrammes,” color photographs made chemically on photosensitive paper. In America, in the 1960s and after, photographers such as William Eggleston and Nan Goldin explored color, especially the warm end of the tonal range. The nature photographer Eliot Porter captured the shimmering surfaces of the outdoors and produced books sponsored by the Sierra Club. The chromogenic print, or C-print, as it is known, is a further stage in the development of color processes and has been a choice of artistic photographers. Ektachrome is an example of this process, which relies, like much color photography, on layers of variously color-sensitized emulsions.

The instantaneous Polaroid process, invented by Edwin Land and marketed after 1948, is an example of a dye diffusion print that produces a unique positive print. The SX-70 process produced finished prints within the camera itself. It was eagerly taken up by amateurs. Photographers in the 1960s and 1970s, such as Maria Cosindas and Lucas Samaras, made works of startling originality sometimes by manipulating (rubbing and scratching) the emulsion process as the image develops. Still, many photographers resisted what they saw as the gaudy tones of color photography, which had long been associated with amateurs and used for advertising and reproduced in popular magazines. Until the last two decades of the century, the dominance of black-and-white photography for artistic expression was unchallenged. Additionally, the cost of reproducing color photographs in monographs and other publications has been, until recently, prohibitively expensive. By 1990, however, color

photography—in prints of monumental scale and bright tones—had become an important aspect of contemporary art, much of which includes photography. Sandy Skoglund made bright dye-destruction prints from shots taken of her elaborately staged painted sets. Indeed, many heralded contemporary artists, including the generation who emerged in Germany in the late 1980s, including Andreas Gursky and Thomas Struth, work exclusively in large color photography formats.

Post-War Photography

The readership of picture magazines declined in the 1950s and 1960s because of the popularity of television and the ease of travel. As amateur photography flourished, the need for professional photography—portraiture, architectural photography, journalistic imagery, and the like—began to wane. By this time, the public recognized a split between the pragmatic uses of the camera, and more expressive/aesthetic pursuits. Important museum exhibitions of photography became a regular occurrence in the twentieth century. They often gave legitimacy and names to various movements and groups. The *Film und Foto* exhibition in Stuttgart, Germany, in 1929, included about one thousand images, mostly “straight” and Constructivist, from photographers around the world.

By mid-century, the straight approach to photography was being transformed into highly subjective, even mystical statements. Minor White wished his symbol-laden imagery to convey profoundly personal, symbolic content. He was also instrumental in the institutionalization of fine art photography in the United States. He was a founder of *Aperture* magazine (1952), a publication devoted to superbly printed artistic photography, and also became an important teacher. Aaron Siskind explored the abstract imagery of paint-spattered walls, old billboards, and pavements. Harry Callahan’s work was less abstract but just as formal in its spare sense of line. Both became influential teachers, first at the Institute of Design (Chicago) and later at the Rhode Island School of Design.

Until the 1950s and 1960s, totally abstract photography was uncommon, although abstract photographs were made by the Constructivists and by the followers and students of Moholy-Nagy. In 1917, Alvin Langdon Coburn had made kaleidoscopic abstract photographs, “Vortographs,” with the aid of a mirrored box. Francis Bruguiere also made images filled with abstract light effects around the same time. In the 1940s, photographers such as Frederick Sommer made horizon-less images of the Ari-

zona landscape. Resembling contemporary abstract paintings, they were admired by the Surrealists.

After 1950, a number of photographers working in America became interested in societal conditions. They documented figures in their surroundings in a laconic, unsentimental way. After training as a photojournalist, the Swiss émigré Robert Frank traveled across the country taking informal photos of lonely spaces and isolated individuals. The resulting book, *The Americans* (France, 1958; America, 1959), with its foreword by the Beat writer Jack Kerouac, seemed to articulate the alienation many felt during the Cold War.

A movement in photography known as “Social Landscape,” dominated photography in the 1960s and 1970s. It was named for important exhibitions, one of which was *Toward a Social Landscape* (1966, George Eastman House), organized by the photographer-curator Nathan Lyons. Discontent with American popular culture in the post-war period, questioning the conventions of good picture making, and influenced by Frank’s *The Americans*, photographers such as Bruce Davidson and Garry Winogrand took random-seeming pictures of the often inscrutable behavior of individuals and groups. In England, Raymond Moore and Tony Ray-Jones worked from a similar outlook. Lee Friedlander’s imagery often included himself, and reflected the isolated individual on the street and in hotel rooms. Diane Arbus’s photographs, some of which appeared in *Esquire* magazine, portrayed society’s outcasts, the disabled, and the grotesque antics of public behavior. Her bizarre pictures are thought to express the outrage associated with contemporary societal pressures and with the celebration of a radical individuality in this period. Bruce Davidson’s series of ghettos and New York City gang teenagers, and Danny Lyon’s civil rights protestors, prisoners, and motorcyclists are seen as part of the “New Journalism” style of photography prevalent in the 1960s and 1970s. It was thought to be the pictorial equivalent of the hard-hitting reportage of contemporary journalists such as Norman Mailer, Tom Wolfe, and Hunter Thompson. In a similar vein, Mary Ellen Mark made moving but unsentimental photographs of homeless children.

European photography between the 1920s and 1960s was marked by imaginative uses of documentary photography. Although there were progressive photos published in the flourishing picture magazines, many photographers also published influential books of their works. Brassai (the pseudonym of Gyulas Halász) became well known for his book, *Paris de nuit* (*Paris at Night*) (1933), which documented the city’s picturesque and haunting night-

life. Another photographer working in Paris, Robert Doisneau made lighter, more satirical documents of Paris and its strollers. Much European photography reveals a social aspect. In Mexico, Manuel Alvarez Bravo made Surrealist-inspired documents of peasant life; Tina Modotti, Edward Weston’s one-time partner, photographed peasants with a revolutionary political outlook. In Germany, Otto Steinert was influential in reintroducing an experimental spirit to photography in the post-war period. He was a founder of a movement called “Subjective Photography” and led an important group called “fotoform” in the early fifties. The Swiss Werner Bischoff made socially conscious color imagery of poverty-stricken peoples. Josef Sudek of Czechoslovakia is renowned for his still lifes and images of Prague. From a younger generation, Jan Saudek makes innovative works that recall nineteenth-century pictures. Mario Giacomelli’s images of Italian village life are noteworthy. Japanese photographers have kept pace of western developments and have brought an original aesthetic to their pictures. Eikoh Hosoe’s imagery is more artistic than Takayuki Ogawa, who is known for socially realistic works.

Contemporary Photography

A different approach to the landscape was represented in a highly influential 1975 exhibition entitled “New Topographics: Photographs of a Man-altered Landscape” mounted by the International Museum of Photography and Film, George Eastman House. Among the images represented were those by Robert Adams, Lewis Baltz, and the German couple, Hilla and Bernd Becher, which soberly depicted features of the industrial landscape, or the banal spaces and housing projects of the American West. They seemed to be a reaction to the highly subjective documentary work that was made in the 1950s and 1960s. In a similar spirit of coolness, the handful of photographers spearheaded by Mark Klett who conducted the Rephotographic Survey Project (RSP) between 1977 and 1979 precisely documented 122 nineteenth-century western survey sites.

After 1970, photographers manipulated the print as an object in its own right. Recalling the nineteenth-century fondness for manipulating negatives, photographers now explored all manner of manipulations. Along these lines, Jerry Uelsmann made fantasy-filled combination prints in the 1960s. Robert Heinecken and Ray K. Metzker made ingenious series and collages from photographic fragments. Duane Michals explored the series in themes

that often hint at the otherworldly. The Starn twins (Doug and Mike) tore and reassembled photographs with tape. Artists such as David Hockney and Gilbert & George made large-scale, multi-image collages. Photographs are integral components of the paintings of Anselm Kiefer and Sigmar Polke where they often relate to recent German history.

Although the 1960s witnessed a taste for harsh documentary photographs, some images provoked scandals in the later part of the century. Les Krims's 1970 image of a legless man on a pedestal provoked a viewer to hold the son of the gallery director hostage until it was removed. An exhibition that included some of the graphically sexual images of Robert Mapplethorpe provoked conservative members of Congress to call for their censorship and for a rethinking of government funding for the arts in general. The homoeroticism of some of the works was linked to the AIDS epidemic, from which Mapplethorpe himself later died. Andre Serrano gained notoriety for an image of a crucifix immersed in urine (1987). Joel-Peter Witkins's photographs have shocked many viewers; his antique-looking images of bizarre tableaux often include amputees and severed heads. Jock Sturges was brought to trial for his images of nude girls; Sally Mann's pictures of her own nude children have sparked a less heated debate.

Feminist concerns and issues of identity were expressed by photographers working in the latter decades of the century. Cindy Sherman's self-portraits explore women's roles while Astrid Klein's collages, which use the conventions of advertising photography and language, challenge assumptions about gender. Similarly, in the 1990s, photo-artists such as Lorna Simpson and Carrie Mae Weems have critiqued cultural stereotypes about race and about the female body.

Institutionalizing Photography

Museums began establishing their own distinct photography departments as well, with one of the earliest departments at the Museum of Modern Art, in New York (1940). In 1955, the Museum of Modern Art (MoMA) mounted *The Family of Man*, a blockbuster exhibition arranged according to universal themes of love, work, and birth. Including 500 works by nearly 70 photographers shooting in countries throughout the world, it was the most visited photography exhibition ever; its catalogue became the best selling photography book of all time. It was arranged by Edward Steichen, then head of the photography department,

and was meant to reaffirm humane values in the post-war period.

In the twentieth century, photography became the subject of serious intellectual inquiry. Figures such as Walter Benjamin, Roland Barthes, Susan Sontag, and John Berger have written important philosophical and cultural examinations of the medium. Authors and poets have also integrated photography and its effects into their writing. The century also saw the advent of pioneering historians of photography such as Heinrich Schwartz, Helmut and Alison Gernsheim. Nancy and Beaumont Newhall encouraged artistic photography in their time and established departments of photography in museums and universities alike. Beaumont Newhall wrote an enduring history of photography, *The History of Photography: From 1839 to the Present* in 1937, based on a landmark exhibition of the same name at MoMA. Important curator-writers such as John Szarkowski, also at MoMA, curated significant shows and shaped opinion about the direction of contemporary photography for several decades. Organizations for amateurs and professionals proliferated in the twentieth century. Camera clubs, exhibiting societies, and workshops sprang up in cities around the world. A broad range of magazines and instructional books conveyed professional, aesthetic, and technical information. After World War II, galleries devoted exclusively to photography were established. The market for photography soared in the 1970s as historians and museums determined a canon for its history.

HISTORY OF PHOTOGRAPHY: TWENTIETH-CENTURY PIONEERS

Like traditional histories, the history of photography has, until recently, been “heroic.” That is, it has focused on the achievement of individuals. Even as photohistory has become wider in its scope and has become more interested in its social and cultural dimensions, it is still important to single out those pioneers whose work and interests embodied crucial changes in twentieth-century photography. Those discussed in this entry—mainly up to the 1980s—introduced a new style, subject, or technique. They may also have championed a new way of thinking about the medium. Their importance can be measured by their influence on others and through their exhibitions, publications, and awards.

Stylistic Pioneers

The most renowned photographers of the century introduced new styles and subjects. In the first few years of the twentieth century, Robert Demachy (1859–1936) was an expert of the gum bichromate and oil processes, important Pictorialist techniques. He advocated heavy manipulation of the negative, to make photos more artworthy, describing this aesthetic in books and magazines. Hugo Henneberg (1863–1918), Heinrich Kühn (1866–

1944), and Hans Watzek (1848–1903) were leaders of the Pictorialist movement in Austria and formed a group known as the Trifolium. They produced many pastoral, Impressionistic images. Clarence White (1871–1925) was a key member of Alfred Stieglitz’s Photo-Secession and an important teacher of Pictorialist principles. His elegant images of his turn-of-the-century family were influential. The school that White established (in 1916) trained many subsequent photographers.

Alfred Stieglitz (1864–1946) was a one-man propaganda machine for artistic photography, and was a leader in camera clubs and organizations in the years around the turn of the century. He was the nexus for a clique of artistic photographers, which he called the Photo-Secession. He championed a new style of photography in opposition to the prevailing Pictorialist aesthetic. Called “straight,” it was more crisp and eschewed any manipulation to the negative. He was also the publisher of a lavish photography magazine, *Camera Work*, which established a precedent for quality and aesthetics. He was proprietor of the first and most important gallery of artistic photography in America, the Little Galleries of the Photo-Secession (later, simply 291 for its address on Fifth Avenue, in New York). Finally, inasmuch as

291 and *Camera Work* eventually showed important modernist artworks of all kinds—paintings, drawings, sculptures—Stieglitz acted as a champion of modernism in general and thus linked the mission of photography with that of the fine arts. Stieglitz's *Equivalents*, sky photographs done in the early 1920s, were powerful examples for aesthetic-minded practitioners later in the century.

Edward Steichen (1879–1973) was a romantic-minded Pictorialist photographer and a tireless lieutenant for Stieglitz's Photo-Secession and *Camera Work* magazine. Besides taking some of the most memorable images of the era, he also made masterful portraits of famous figures. He became a well-known commercial photographer in the 1920s and 1930s and, as an officer in the Navy during World War II, was responsible for tactical aerial photography. His later career is marked by his organization (as director of the Department of Photography, Museum of Modern Art [MoMA], New York) of the 1955 *Family of Man* exhibition.

Women also made strong contributions to Pictorial photography. The pioneering woman photographer Gertrude Käsebier (1852–1934) was a founding member of Stieglitz's Photo-Secession and is renowned for her images of mother and child. Alice Boughton's (1865–1943) long career was devoted to portraiture cast, like Käsebier's, in a Pictorialist style. Another pioneering female photographer was Anne (Annie) W. Brigman (1869–1950), a Photo-Secessionist whose female nudes set in California mountain landscapes were unique.

Though his most important works were made in a Pictorialist mode, Alvin Langdon Coburn (1882–1966) is credited with making some of the first purely abstract photographs in the medium's history, sometime around 1916. Shooting through a kaleidoscopic mirror device on his camera, he called the resulting pictures "Vortographs," after the English abstract movement Vorticism. He also photographed the geometry of the New York City. Francis Bruguière (1879–1945) also conducted abstract and experimental effects in photography as seen in his 1920s images of cut paper shapes.

Alexandr Rodchenko (1891–1956) was dedicated to the social and aesthetic mission of Russian Constructivism. Besides taking important photographs, Rodchenko was an influential graphic designer, painter, and filmmaker. He was connected with many major culture figures of his time. He is remembered for his images of parades, construction sites, sports, and the circus often taken from unconventional points of view. Another Constructivist photographer and designer was El Lissitzky (1890–1940) who used photomontage and photographic exhibi-

tions to promote the principles of good design and utopian ideals.

Academically trained as an artist, and influenced by the natural philosophy of his day, Karl Blossfeldt (1865–1932) is known for his close-up photos of plant forms. These were published in the book *Urformen der Kunst (Archetypes of Art)* (1928), an important example of the 1930s art style known as *Neue Sachlichkeit (New Objectivity)*. The work of Albert Renger-Patzsch (1897–1966) is also linked to this style by virtue of his close-up images of machine parts, plants, shells, and other design-inherent subjects. His book, *The World is Beautiful* (1928) featured a hundred of his own images. The photographer/painter/filmmaker and designer, László Moholy-Nagy (1895–1946) was a leader in his philosophy of photography, in the advanced nature of his own pictures, and in his teaching. His book, *The New Vision: From Material to Architecture* (1930), was a key landmark in *Neue Sehen* or "New Vision" photography. An impassioned, intellectual teacher, from 1923 Moholy-Nagy taught light and color at the renowned design school, the Dessau Bauhaus. After emigrating to America, he founded the New Bauhaus (later the Institute of Design) in Chicago in 1937. Moholy-Nagy's own photography is comprised of abstract "photograms," photomontages, and daringly formal photographs. The geometric, semi-abstract photographs of Florence Henri (1895–1982) seem to embody Moholy-Nagy's principles.

Associated with the Dada and Surrealist groups of the 1920s and 1930s, Man Ray (1890–1976) used photography to make important avant-garde art, e.g., his "Rayographs," as he called his camera-less pictures. Lee Miller (1907–1997), Man Ray's model in the 1920s, became an important photographer in her own right and was witness and participant to many of Man Ray's innovations (e.g., solarization). In the 1920s and 1930s, Man Ray also produced innovative fashion photography. Man Ray's career spanned New York and Europe, photography and the fine arts, and the world of fashion and Hollywood.

Similarly, Bill Brandt (1904–1983) brought a lyrical surrealist vision to images of the English working class and, later, to distorted female nudes. Working in Man Ray's studio for three months, Brandt developed a taste for formal experimentation. His books, *The English at Home* (1936) and *A Night in London* (1938) were instrumental to subsequent generations of socially concerned photo-documentarians.

Hungarian émigré Brassai's (1899–1984) images of the nightlife of Paris have become so well known that many visitors' experience of that city has been shaped by them. He photographed the café deni-

zens, homeless, and participants in the sex trade. His *Paris de Nuit* (1933) was acclaimed as an instant classic. Trained as an artist, painter Pablo Picasso, sculptor Alberto Giacometti, and writer Jean-Paul Sartre were among his notable friends.

California-based Edward Weston (1886–1958) was among the most influential photographers of the century for his style and for his persona. Following Stieglitz's lead, Weston embraced the "straight" style of photography—his conversion while shooting an Ohio steel plant in 1922 has become legendary—in which the subject is shown in sharp detail. He also advocated "previsualization," that is, imagining the finished picture before the shutter is released. Around 1930, Weston was a founder of Group f/64, a loose, short-lived association of his friends and followers, in which many of his own principles were applied. In 1937, he was awarded the first John Simon Guggenheim Memorial Fellowship in photography. His relationships with other photographers, his circle of California writers and artists, and his three photographer sons (Brett, Neil, and Cole) make him a singular figure. His *Daybooks*, journals that he maintained from 1923 to 1943, describing his method and outlook, are unique resources in twentieth-century photohistory.

Ansel Adams (1902–1984) is regarded as the preeminent landscape photographer of the American West. He was a devoted member of Group f/64 and, through a series of influential books, came to be regarded as a technical expert. His intricate "Zone System" became an ideal for determining correct exposures. In advocating for the Sierra Club before Congress, he exemplified how a photographer could make a difference in terms of conserving the land he photographed. His politically-conscious images of the WWII internment camp for Japanese Americans at Manzanar, California, are now seen as important documents of the era. Adams was also a tireless organizer, helping to establish the department of photography at the Museum of Modern Art (1940), and the department in what is now the San Francisco Art Institute (1946). Imogen Cunningham (1883–1976) was also a progressive west coast photographer and a founding member of Group f/64. Her close-ups of plant forms and later nudes are well known. She won a Guggenheim award in 1970, and at age 92 she began her final project, *After Ninety*, a collection of portraits.

Paul Strand (1890–1976) is considered one of the most important photographers of the century, mainly for his socially compassionate and uncompromisingly "straight" images, yet has proven to have influenced countless photographers practicing

in various styles and genres. Stieglitz heavily promoted his formal images at gallery 291 and in the pages of *Camera Work* magazine. Strand also made landmark avant-garde films that were formally daring (e.g., *Manhattan*, with Charles Sheeler, 1920) and socially conscientious (e.g., *The Plow that Broke the Plains*, with Pare Lorentz, 1936). His book collaboration with photohistorian Nancy Newhall, *Time in New England* (1950), where historical literature is coupled with photographs taken on location, is considered a model of the genre. Images taken during his extensive travels, which occupied Strand for the rest of his life, appeared in influential books.

In his images of New Orleans, the Mississippi river, and the ruins of the antebellum South, Clarence John Laughlin (1905–1985) projected a haunting romance on regional subjects. Similarly, Wright Morris (1910–1998) produced photographically illustrated novels (e.g., *The Inhabitants*, 1946), most of them set in the Midwest, in which the pictures and text exist separately. Images of old farm structures or lonely landscapes are set beside texts describing characters and rural life.

Moving into the post-war era, Harry Callahan's (1912–1999) spare images of his wife, Chicago streets, and watery landscapes remain highly influential. In 1976, he was the subject of a major exhibition at the MoMA and became the first photographer to represent the United States at the 1978 Venice Biennale with a one-man exhibition of his work. He has influenced many photographers, first as a teacher at the Institute of Design, in Chicago (later the Illinois Institute of Technology) from 1946 to 1961, then at the Rhode Island School of Design, until 1977. He is often regarded as part of a teaching partnership with Aaron Siskind (1903–1991). Siskind was a socially conscious photographer in the 1930s, having been a member of New York's progressive Photo League. There he worked on projects such as *Harlem Document* and met like-minded photographers such as Walter Rosenblum (b. 1919). By the 1960s, Siskind had adopted the abstract imagery—graffiti, peeling paint, faded signs—for which he has become known.

Minor White's (1908–1976) formal, mystical images inaugurated a heightened subjectivism for photography in the 1950s and 1960s. Highly educated himself, he became an important teacher, and for some, a guru. He was a founder and editor of *Aperture* magazine, and from 1953 to 1957 curator of exhibitions at the George Eastman House (now the International Museum of Photography at George Eastman House). A dedicated teacher, he held posts at the Rochester Institute of Technology

and at the Massachusetts Institute of Technology. The exhibitions he organized (e.g., *Light*, 1968) were notable for their conceptualism.

Wynn Bullock's (1902–1975) finely printed images of landscapes and nudes-in-landscapes from the 1950s and 1960s had a philosophical bent to them. The poetic black-and-white imagery of Paul Caponigro (b. 1932) is similar. He has taught in many institutions and has been the subject of solo exhibitions at many major museums.

Beaumont Newhall (1908–1993) was, for all intents and purposes, the most important (particularly in the United States) photohistorian of the twentieth century. As a photographer, curator, and author he worked at many important institutions and with many important photographers. The many editions of the textbook that grew from the catalogue of a seminal 1937 exhibition at the Museum of Modern Art became the standard history of the subject until late in the twentieth century. His wife, Nancy Parker Newhall (1908–1974), was an invaluable assistant and published seminal documents and treatments of photohistory.

Pioneering Fashion and Portrait Photographers

The work of certain fashion and portrait photographers has been recognized as artworthy and influential. Cecil Beaton (1904–1980) was the prototype of the aristocratic society portraitist. Talented in many areas, his fashion imagery and celebrity photographs are widely known. He was also a prolific writer (particularly about his own career), a cartoonist, painter, and a film and theatrical designer. Besides his work for magazines such as *Harper's* and *Vogue*, he transformed himself into a war photographer in the 1940s and later became official photographer to the Royal family. Horst P. Horst (1906–1999) is remembered for the fashion and advertising images he made during his long tenure as a Condé Nast photographer.

The Canadian portraitist, Yousuf Karsh (1908–2002) photographed many important figures in the twentieth century. Images such as his famous *Winston Churchill* (1941) appeared in magazines and were later collected into picture books. Gisèle Freund (b. 1908) made definitive portraits of early and mid-twentieth-century writers and intellectuals, some in color. Arnold Newman (b. 1918) became well known for his pictures of, as he said, “people in their natural surroundings,” mostly artists, scientists and politicians.

Irving Penn (b. 1917) helped raise fashion photography to the status of art. A student of the influential editor/art director, Alexey Brodovitch (1898–1971), by the late 1940s, Penn was photographing for

Vogue. His work evolved from motion images set in outdoor locations, to isolated portraits with blank backgrounds. His sitters range from a broad mix of cultures, ethnicities, and classes. Richard Avedon (1923–2004) also studied under Brodovitch and became an important fashion photographer, particularly for *Harper's Bazaar*, in the post-war era. His work also came to use blank backgrounds. His protégé, Hiro (b. 1930) used color effectively and embraced a more collective kind of production than had been used by masters of photography before.

Herb Ritts (1952–2002) photographed celebrities and models in a way that looked back to classic Hollywood photos. Annie Liebovitz's (b. 1949) self-aware portraits of actors and musicians appeared in magazines and collected in books. Beginning in the 1970s, William Wegman (b. 1943) applied the conventions of celebrity and fashion portraiture to his pet (Weimaraner) dogs to produce witty, irreverent images that have become landmarks of late modern photography.

Defining the Documentary

Documentary photographers made inroads in terms of subject matter and in their relationship to their subjects. Their work ranges from “ethnic” subjects to images that reference provocative social issues. Arnold Genthe's (1869–1942) photographs of San Francisco's Chinatown are regarded as important documents of that community. Devoting himself to documenting the vanishing tribes and customs, between 1907 and 1930 Edward Sheriff Curtis (1868–1952) published his enormous multi-volume, *The North American Indian*, the century's most exhaustive ethnographic survey. Though the resulting images are now seen as heavily contrived, they are important as art and information.

Photographing his countrymen outside of Cologne in 1910, the German photographer August Sander (1876–1964) began work on “*Man of the Twentieth Century*,” which was to be a catalogue of the various types and classes that made up society. In 1929, his book, *Anlitz der Zeit (Face of Our Time)*, the first installment in the massive project, was published. It was suppressed by the Nazis for its wide range of “undesirable” types.

Lewis Hine's (1874–1940) series of immigrants in Ellis Island (1905) and the photographs he took while working as an investigator and reporter for the National Child Labor Committee (1908–1916) are pioneering works of social documentary. His resourcefulness in gaining access to factories and sweatshops is legendary. Hine's “photointerpretations” as he called them, were used on pamphlets,

posters, and in articles and exhibitions. They were also used as evidence in governmental hearings about child labor.

Berenice Abbott's (1898–1991) book, *Changing New York* (1939), is a landmark of artistic urban and architectural documentation. The images she made to illustrate scientific laws are also important. Abbott took great pains to see that the contents of Eugène Atget's (1857–1927) studio were preserved.

Not a photographer himself, Roy Stryker (1893–1976) was nevertheless the guiding sensibility behind the Farm Security Administration (FSA), which sponsored a massive documentary project during the Depression. An economics professor, he directed such photographers as Russell Lee (1903–1986), Dorothea Lange (1895–1965), Ben Shahn (1898–1969), Jack Delano (1914–1997), Arthur Rothstein (1915–1985), Walker Evans (1903–1975), and others. He gave them assignments and suggested shooting scenarios, research, and travel plans. Stryker was also responsible for disseminating and promoting their imagery as they related to Franklin D. Roosevelt's New Deal programs (of which the FSA itself was one). Stryker's insistence on capturing the deleterious effects of the Depression in human terms runs throughout the FSA body of pictures. The pioneering female documentarian, Marion Post Wolcott (1910–1990) portrayed rural areas in a sentimental vein in her work for the FSA. *Migrant Mother* (1936), by Dorothea Lange, an image of a worried mother surrounded by her children, has become an icon of the Great Depression in America. Lange's feeling for the speech of her subjects is seen in the captions of her book collaboration with Paul S. Taylor, *An American Exodus: A Record of Human Erosion* (1939).

Walker Evans is regarded as the most purely artistic of the Depression-era photographers. He may be said to have been a romantic documentarian; his works speak both to the living conditions of his sitters and to picture making itself. His appreciation for writers and literature can be seen in his book projects, which include *Let Us Now Praise Famous Men* (with James Agee, 1941). His solo exhibition at the MoMA, *American Photographs* (1938), was a landmark. In the same vein, the laconic, Cold War-era photographs of Robert Frank's (b. 1924) *The Americans* (France, 1958; U.S., 1959) influenced an entire generation of photographers. Another pioneering figure who had been mentored by art editor Alexey Brodovitch, Frank made images for pictorial magazines and documented his travels. The Guggenheim Fellowship he won in 1955, the first given to a European-born photographer, enabled him to make the images for *The Americans*.

In 1952, Roy DeCarava (b. 1919) became the first African-American artist to receive a Guggenheim Fellowship. He contributed the pictures for a collaboration with the writer Langston Hughes, *The Sweet Flypaper of Life* (1955), a unique book documenting everyday life in Harlem. DeCarava ran a gallery devoted to artistic photography, A Photographer's Gallery in New York City, one of the first artists' cooperatives and the first to have an African-American proprietor. In the early 1960s, DeCarava ran the Kamoinge Workshop for young black photographers, also the first of its kind. The African-American Gordon Parks (b. 1912) is a pioneering documentarian best remembered for his images of the Black experience. A late participant in the FSA, Parks made photographs for the Standard Oil Company before becoming a *Life* photographer in 1948. His images and essays devoted to urban African Americans are celebrated, and he has been the subject of many exhibitions.

Garry Winogrand (1928–1984) was a pioneer of the documentary style that came to be known as "Social Landscape." Influenced by Walker Evans's *American Photographs* and by Robert Frank's *The Americans*, Winogrand's most innovative work shows awkward societal relationships enacted in public spaces. Slightly later, Robert Adams (b. 1937) and Lewis Baltz (b. 1945) became exemplars of "New Topographics" photography. They made straightforward, ostensibly banal images of suburban sprawl in the west and/or images of man-made structures in an almost clinical manner. Other photographers sometimes linked to this style include Hilla (b. 1934) and Bernd Becher (b. 1934), and Joe Deal (b. 1947). Bill Owens (b. 1938) has also devoted his career to images of suburbia.

Also of significant influence to later generations of photographers in both their choice of subject matter (subcultures or neglected populations) and gritty, seemingly candid style were Americans Danny Lyon (b. 1942), Bruce Davison, and Larry Clark. Lyon made powerful series of society's outlaws—bikers, prisoners, and political radicals. Davidson (b. 1933) also produced personally inflected photo-essays about urban populations. His *East 100th Street* (1966–1968) is a representative example. Larry Clark (b. 1943) embodied the photographer who lived the life of his subjects. His *Tulsa* (1971) frankly documented the culture of violence and drugs of the city's underworld. Figures that followed in this documentary genre include Mary Ellen Mark (b. 1940), who became intimate with her subjects' lives and was sponsored by not-for-profit groups to publish her images of homeless children and prostitutes. Nan Goldin (b. 1953) applied the snapshot aesthetic to the colorful char-

acters of her life—her family, friends, drag queens, addicts, and lovers.

War Photographers

War photographers have risked their lives to document the many wars of the twentieth century. Over time, cameramen aimed to get closer to the action and make more graphic pictures. By the later part of the century, their works had the power to shape public opinion.

Robert Capa (1913–1954) was the preeminent war photographer of the twentieth century. His willingness to get close to combat—he was killed by a landmine in Indochina—established a precedent for subsequent war photographers. His battlefield imagery of the Spanish Civil War and the Allied landing on the beaches of Normandy is particularly well known. With Henri Cartier-Bresson and others, he founded the Magnum Photos cooperative agency, which became a symbol and model for photographers taking collective action to retain control of their own work.

A highly decorated Marine in the South Pacific during WWII, David Douglas Duncan (b. 1916) became known as the “Legendary Lensman” for his battle photographs. Duncan was the first photographer to be given a solo exhibition by the Whitney Museum of American Art, New York. Larry Burrows (1926–1971) exemplified the conscientious photojournalist willing to risk his life—he died in a helicopter crash—for his images, having spent nearly a decade in Vietnam photographing the effects of war. Don McCullin (b. 1935) has taken images of devastation and injury in Vietnam, Congo, Lebanon, Biafra, and Londonderry. His book *Hearts of Darkness* (1981) amounts to a document of violent conflict in the twentieth century.

Photojournalists

The imagery of photojournalists appears in newspaper and illustrated magazines. Pioneers are those whose works are recognized for their art and/or for those whose subjects are unique. Editors have played a prominent role in determining subjects and layout.

Frances Benjamin Johnston (1864–1952) has been called the first woman press photographer. Associated especially with the nineteenth century, she worked well into the twentieth, producing straightforward pictures for the popular press, for government assignments, and of American sites and architecture over a long, productive career.

Alfred Eisenstaedt (1898–1996) and Erich Salomon were pioneering photojournalists; their pictures and behavior defined the modern photojournalist.

Working with small-format cameras, they infiltrated newsworthy events shooting candid images of politicians, natives, and celebrities. In 1935, Eisenstaedt went to America where he became a staff photographer for *Life* magazine, a post he would hold for more than forty years. The imagery of Andreas Feininger (1906–1999), a long-time photographer for *Life* (1943–1962), is laced with experimental techniques. Felix Man (1893–1985) also made countless news photographs for pictorial magazines such as the *Müncher Illustrierte*, *Picture Post*, and *Life*. Werner Bischof (1916–1954) was widely known as a photojournalist of renown for compassionate travel images. He became a member of the influential collaborative, Magnum, in 1949, and was sent on assignment to cover famines as well as the Far East.

Margaret Bourke-White (1904–1971) was a pioneering female photojournalist between the late 1920s and the 1950s. Her images were widely seen in Henry Luce’s new picture magazines, *Fortune* and *Life*. She became something of a heroine, taking assignments in such places as the Soviet Union and India. The monumentally formal aspect of her work, such as the *Fort Peck Dam* (1936), which graced the first cover of *Life*, as well as her exotic travels, influenced later photojournalists.

Henri Cartier-Bresson (1908–2004) is famous both as a photojournalist and as an artist of the camera. His “decisive moment” aesthetic, watching for the perfectly composed incident, has been widely imitated. Cartier-Bresson photographed for several magazines, and came into contact with many important photographers and artists of his day (he had been trained by a painter). After being captured by the Nazis during the war, he escaped and became part of the Resistance. In 1947, he founded the Magnum agency with Robert Capa, David (“Chim”) Seymour (1911–1956), and others. Cartier-Bresson’s one-man exhibition at MoMA in 1946 launched his international career.

To Paris from his native Hungary in 1925, André Kertész (1894–1985) was a freelance photographer working for many European magazines and newspapers. His aesthetic journalistic style was very influential on later photographers. He was particularly adept at capturing humane situations with a heightened sense of composition. Inspired by Surrealism, his important series, *Distortions*, are images of female nudes seen in a distorting mirror.

W. Eugene Smith (1918–1978) is regarded as a master of the photo-essay form. After being wounded while a war correspondent for *Life*, Smith dedicated himself to illustrating dramatic stories of human drama (for example, *The Spanish Village*, April 9, 1951), in *Life* magazine.

John Heartfield (née Helmut Herzfeld, 1891–1968) subverted the notion of the candid photojournalist altogether. He made politically subversive photomontages, most of which were published in the magazine *AIZ* (*Arbeiter Illustrierte Zeitung*), that mercilessly lampooned the militarist German government. They are unique in the history of photohistory and in the history of art. Although Weegee (Arthur H. Fellig, 1899–1968) was not the first crime photographer, he was certainly the most archetypal. His picture book, *Naked City* (1945), comprised of lurid crime-scene images, became something of a bestseller and was the basis of a movie and a television series.

Pioneers of Motion and Color

Several photographers made inroads with new techniques, which allowed them to photograph their subjects in ways never before seen.

With their links to the Italian Futurist movement (*Futurismo*), and the notion of “futurist photodynamism,” brothers Arturo and Anton Giulio Bragaglia are famous for applying the principles to the medium of photography. In the 1930s, the electrical engineer Harold Edgerton’s (1903–1990) advances in rapid strobe lighting (sometimes to one millionth of a second) produced stop-action images that were as beautiful as they were scientific, popularizing both photography and scientific research. His pictures regularly appeared in *Life* magazine. They were also displayed at a 1937 MoMA exhibition. The Albanian-American Gjon Mili (1904–1984) trained as an electrical engineer at MIT where he knew Harold Edgerton. He later collaborated with him and made artistic motion images of his own. Barbara Morgan (1900–1992) is best remembered for her dance photographs, for which she is regarded as a master. Instead of taking pictures during performances, she worked with dancers—Martha Graham and Merce Cunningham among them—to capture dramatic moments in the dance.

Eliot Porter (1901–1990) is important for the aesthetic and scientific value of his color nature photographs. Trained as a biologist, his works were praised by Stieglitz. He became connected with the Sierra Club and throughout his long career has produced several books of his lavishly colored pictures. Helen Levitt (b. 1913) was originally influenced by Cartier-Bresson’s “decisive moment” aesthetic and took pictures of New York and Mexico City streets. She was awarded two Guggenheim awards (1959, 1960) to make color photographs, and these figure largely in her reputation. Although figures like Paul Outerbridge had used color processes as part of their

art, William Eggleston (b. 1939) is considered one of the first mature practitioners of color photography. The images he made in the late 1960s and 1970s of his native Tennessee are at once beautifully composed and evocative of social issues. Trained as a painter, and having worked with Robert Frank, the color photographer Joel Meyerowitz (b. 1938) became well known in the late 1970s for his pastel-hued Cape Cod landscapes, views of St. Louis, and Florida. Marie Cosindas (b. 1925) is a pioneering color photographer, and one of the most celebrated women photographers of the 1960s and 1970s. She also was an early experimenter with instant film, often heightening its color for more vivid effects. She was given solo exhibitions in 1966 at MoMA and at the Boston Museum of Fine Arts, the first for a living Boston photographer.

Pioneers of Home and Nation

Several photographers in the twentieth century produced bodies of work that have become recognized as singularly representative of their respective countries.

Martin Chambi (1891–1973) was Peru’s most renowned photographer. His pictorial images from the 1920s through the 1950s of landscapes, natives, workers, and professionals in their costumes comprise a unique and invaluable record of that society. The African portrait photographer Seydou Keita (1921–2001) made an invaluable record of Mali culture through the works he produced in his studio.

The photographer Manuel Álvarez Bravo (1902–2002) captured the street life and political strife of his native Mexico. He had been encouraged by photographer Tina Modotti (1896–1942) to show his pictures to her lover, Edward Weston. A young film actress, Modotti became Edward Weston’s lover and subject of his early images. In the 1920s and 1930s, she produced her own works, which utilized Weston’s crisp, straight approach but in the service of Mexican, anti-fascist subjects.

Ken Domon (1909–1990) was arguably the century’s most influential documentary photographer in Japan. In his images of ancient monuments and Japanese life (including Hiroshima victims), he advocated a new, crisp style in opposition to the then prevailing Pictorialist style. He was also an important organizer, the founder of the Shudan Photo group (1950), and was important for showing the works of western photographers in Japan. The Japanese Eikoh Hosoe (b. 1933) is important in his own country and abroad. His 1960 *Man and*

Woman series was groundbreaking both for its subject and for the gender implications it explored. This was further explored in his book, *Embrace* (1971). Hosoe has published books of dancers, has been an important advocate of artistic photography, and has taught internationally. Kikuji Kawada (b. 1933) was a freelance photographer in the 1950s and founded the Vivo group with Hosoe and others. His works relate to indigenous subjects—the Japanese flag, soldiers, the Hiroshima monument—and are compiled in books (e.g., *The Map*, 1965).

Roman Vishniac (1887–1990) is known for his atmospheric documentation of European Jews in the immediate pre-WWII era. Josef Sudek (1896–1976) was Czechoslovakia's most renowned photographer and made memorable images of urban landscapes and lyrical images of banal objects. Jaromir Funke (1896–1945), also relentless innovator and experimenter, and Sudek were founders of the Czech Photographic Society and are regarded as masters in that country.

Pioneers and Provocation

Some twentieth-century photographers are famous for the controversy their works provoked. This was mainly due to the then-disturbing nature of their subjects. Lisette Model (1906–1983), for instance, is famous for her quirky portraits of human imperfection. To New York in 1938 from a background in art, and encouraged by Alexey Brodovitch, Model utilized a snapshot aesthetic. Teaching at the New School for Social Research in New York around 1950, she influenced young photographers. One of these, Diane Arbus (1923–1971), photographed unique individuals in bluntly frontal fashion. Arbus sought out and photographed invalids, twins, pet owners, transvestites, and eccentrics of all types. Before committing suicide in 1971, she had been awarded Guggenheim Fellowships in 1963 and 1966. Arbus was the first major American photographer—and the first woman photographer—to be represented at the Venice Biennale. Ralph Eugene Meatyard's (1925–1972) haunting images of dilapidated architecture and masked figures of the late 1950s and 1960s share a brooding, gothic quality. Les Krims (b. 1942) is recognized for his bizarre portfolios of the 1970s (e.g., *The Incredible Case of the Stack O'Wheats Murders*) in which he stages comic scenarios in the style of police photographs. His work became notorious when, during an exhibition of his images in Tennessee, the son of the gallery director was kidnapped until his pictures were taken down.

The work of Robert Mapplethorpe (1946–1989) includes images of flowers, of bodybuilders, celebrities, and homosexual and sadomasochistic imagery. He was a major figure in what would come to be known as the “culture wars” of the late 1980s and early 1990s. Conservative politicians, regarding his work as indecent, called into question the entire system of government sponsorship of the arts. This led to greater restrictions being placed on the National Endowment for the Arts. Tragically, Mapplethorpe's work must also be seen as related to the first wave of consciousness of the AIDS epidemic since he himself died of the disease. Andres Serrano also shocked viewers in 1987 with an image of a crucifix seen through urine. Joel-Peter Witkin (b. 1939) is known for his bizarre subjects—amputees, corpses, and fetish images—arranged in macabre tableaux and printed in techniques reminiscent of early processes.

Sally Mann's (b. 1951) images of nude children, mainly members of her own family, provoked controversy apart from their nature as probing character studies. Jock Sturges's masterfully printed images of nude girls, usually shown in beach locations, were at times confiscated as pornography.

Late-Century Pioneers

Lee Friedlander (b. 1934) is known as a pioneering Social Landscape photographer, but with an interest in photographic vision and in the mechanics of picture making. His works often include pictures within pictures. In the 1970s and 1980s, he devoted himself to images of American historical sites and landscapes. Kenneth Josephson (b. 1932), too, explores the nature of the photograph itself and the presence of the photographer in even more conceptual ways. Emmet Gowin (b. 1941) photographed his wife, Edith (Morris), in the familiar spaces of their native Virginia. His works have a gentle pathos and are noted for their sense of time.

Duane Michals (b. 1932) is associated with the expressive use of the artistic photo-sequence in the late 1960s and 1970s. Often containing an element of fantasy, they have a narrative, almost filmic quality. Jerry Uelsmann (b. 1934) is regarded as a pioneer in multiple printing. Beginning in the 1960s, he produced fantastic, surreal images that defied logic and, considering their date, sought to expand consciousness. Uelsmann is also recognized as a teacher of note.

With his roots in performance art, Lucas Samaras (b. 1936) made a lasting impression with a series of self-portraits (*Autopolaroids*, 1971). Shortly after, he began experimenting with the instant Polaroid SX-70 process, manipulating images while they were still developing (*Photo-Transformations*, 1975). And while

technically her photographs are not innovative, Cindy Sherman is considered a major figure of late-century photography for redefining the artist's self-portrait and being largely responsible for the widespread acceptance of photography as contemporary art; her most important works, *Untitled Film Stills* (beginning in 1977), feature herself as a subject in sophisticated scenarios that evoke the feeling of remembered pictures. They draw on cultural history—films, literature, news imagery, popular culture. Sherman's imaginative self-representation raises issues of gender and identity.

HISTORY OF PHOTOGRAPHY: INTERWAR YEARS

Photography as it was practised in Europe, the United States, and Japan during the period from 1918 to 1941 closely parallels the hopes, doubts, and fears of Western societies confronted with the future of the great project of the Enlightenment and its democratic ethos. Seeds planted earlier fully bloomed for better or for worse in that ideologically intense period, which experienced the development of utopian totalitarianisms in Europe and the success and extraordinary failures of financial capitalism, thus questioning the theoretical models of the modern

State. In those years, the world was still a coherent and fairly simple place where old powers reigned, even though the catastrophe of the Great War, World War I, was already shifting the center of gravity towards the United States, but not yet towards the rest of the world, which still remained more or less under forms of imperial domination. Such a situation explains the violent oppositions in the culture of the period, as well as its surprising vitality: widely believed was the idea that only culture could save man from himself, and more pre-

cisely, or a new culture that would take into account the physical *tabula rasa* of the war. The society that emerged sealed the central presence of the machine in modern life, and photography would become the perfect instrument and expression of that mechanical modernity. It fully entered the visual art scene while expanding dramatically in the worlds of information, industry, and commerce. All the future developments and issues of photography date back to those interwar years, which produced some of the most interesting and complex works—a fact that latter-day authors tend to neglect.

Photography was by then practised the world over and by more and more segments of the population—in South America, Australia, Asia, and Africa—although much remains to be done to document those local practices. For all intents and purposes, however, the history of the medium was still almost exclusively written in Europe, North America, and Japan, if only because these were the centers of industrial power. Issues were, however, notably different in Europe and the United States, and despite comparable forms, the photographic expressions of the two continents diverged.

The first characteristic of interwar photography was its cross-fertilization, with the powerful internationalization that took place after the Great War and until the early 1930s with the rise of the Nazi State in Germany and its subsequent expansion in central Europe.

Circulation

The Europe of the aftermath of the war was one of the circulation of artists—and photographers in particular—and of the establishment of a few art capitals: Berlin, London, Paris, and Prague. In Paris, a particularly interesting concentration of emigrant photographers produced a rich creative ambiance, although it never took the form of “schools,” either formal or informal. The most active and influential photographer was certainly Man Ray (1890–1976), an American expatriate who came to Paris in 1921. Later on arrived André Kertész (1894–1985) and Brassai (1899–1984) from Hungary, Florence Henri (1893–1982), born in the United States, and Ilse Bing (1899–1998) from Germany, as well as Lisette Model (1906–1983) from Austria.

In Germany, the Bauhaus (1919–1933) encouraged the bridges between all forms of expression and disseminated its theories in Europe through its students. One of the most emblematic figures of these (trans)continental migrations was László Moholy-Nagy (1895–1946) who left Hungary for Austria, before becoming one of the theoreticians of the Bau-

haus and reconstructing it in Chicago in 1937 as the Institute of Design. His photographic and theoretical work as well as his teaching condensed all the formal and intellectual experiments of the period, compelling him to explore and invent the language of the future—with the camera—to paraphrase his often quoted statement that the new illiteracy would be visual (*Painting, Photography, Film*, 1925–1927).

But the most open center was Prague, which inherited both the French influence and that of the Bauhaus, as well as the American avant-garde. In Prague, the camera really became the instrument of modernity with Jaroslav Rössler (1902–1990) and his abstract compositions, Jaromir Funke (1896–1945) with his surrealist images and photographs of industrial objects, Josef Sudek (1896–1976), who mixed classicism and surrealist innovation—not unlike Eugène Atget and the early Walker Evans—and of course Frantisek Drtikol (1883–1961) who experimented in the 1920s and early 1930s with the nude, mixing genres and forms in a most original way.

The influence of European photographic developments was also felt in Japan. The *Film und Foto* exhibition (1929) in Stuttgart traveled to Tokyo and Osaka, and Japanese photographers acclimated European and especially German modernism, experimenting in framing and manipulation of the image, away from the more traditional practices—portraiture, genre scenes, and Pictorialism—at a time when Japan was undergoing a cultural revolution of unprecedented magnitude.

Photographers in the United States kept in close touch with European developments, and participated in considerable numbers in *Film und Foto*. Some figures such as Berenice Abbott, who made Atget known and was deeply influenced by the Bauhaus aesthetic, spent significant time in Europe and was friendly with many European artists. On the whole, however, the United States developed a different course, because of the divergent conceptions of the place of the artist in society and perhaps more importantly of the very nature of society and the place of the machine in it.

The Cultural Revolution in Europe

Photography between the wars cannot be reduced to avant-garde practices and to New Vision (*Neue Sehen*) or New Objectivity (*Neue Sachlichkeit*)—two loose but powerful terms covering experimental practices in Germany, France, Italy, and the Soviet Union. More classical, post-Pictorialist, or simply poetic and pastoral images were made, printed, exhibited, and appreciated (see Kurt Hielscher's *Deutschland*, 1924), and stimulated a growing body of serious amateurs. There was also a powerful continuation of portraiture, the best-known

practitioner being August Sander (1876–1964), as well as Hugo Erfurth (1874–1948) who made portraits of artists, politicians, and leaders of the time.

The movement was made possible by Dadaism and Futurism—which had started the upsetting of traditional values in art during World War I—and would in turn feed Surrealist image-making (Jacques-André Boiffard, Hans Bellmer, Raoul Ubac, and Man Ray). But it is to be seen in the context of German expressionism and Soviet Constructivism that gave it its real aim and ideology. The issue was clearly to change how people saw the world in order to prepare them for the new and better times to come, and in some cases—in the Soviet Union—to construct a modern industrial society out of a rural one. As the photographic image became omnipresent in the media, both in news and advertising, it turned into an instrument of learning and ultimately of active propaganda. Far from “pure art,” the European practice of the period was committed and in some sense “total” as the 1928 title of an article by Johannes Molzahn in *Das Kunstblatt* proclaimed: “Nicht mehr Lesen, Sehen” (Not mere reading, seeing!).

Formally, avant-garde practice of the time can be characterized by the change—and often break up—of point of view and the creation of a new experience of the commonplace and trivial: high- or low-angle shots, extreme close ups, and fragmentation of subjects often leading to total abstraction. This “vision” is intimately connected with industrial objects including buildings.

The object triumphed in the 1920s as it occupied all the aspects of daily life (Aleksandr Rodchenko, Albert Renger-Patzsch, Moholy-Nagy, Germaine Krull, Hans Finsler, Umbo). Renger-Patzsch’s programmatic book for the new vision, *Die Welt ist Schön*, (*The World is Beautiful*) of 1928 was in fact supposed to be called *Die Dinge* (*Things*). As for the human figure, it did not quite escape the effects of the mechanical eye in the distortions of André Kertész and Bill Brandt, and perhaps first and foremost in the renewal of the nude, transformed by a Drtikol and a Maurice Tabard, or Umbo’s mannequins and Bellmer’s disarticulated and uncanny dolls.

The other direction was that of the photomontage, multiple exposure, and the cameraless photography with the photogram. Photograms—shadows of objects on photographic paper—were extensions of X-ray photography and could very well have been reinvented in the twentieth century by Moholy-Nagy or Man Ray, both beginning to practice the form in 1921. This double “origin” is significant of its expressive as well as instrumental function. Passively objective traces of common objects, photograms construct at the same time a strange and mysterious world that begs interpretation or at least opens the image to wide

narrative associations. The superimposition and the creative use of “mistakes,” particularly that of amateur and vernacular practice, produced in the hands of El Lissitzky, T. Lux Feininger, Herbert Bayer, Man Ray, Rodchenko, Tabard, Moholy-Nagy, and others, images which were either akin to automatic writing or more conducive to meditation on a dream-like world, made up of improbable meetings or conjunctions, combining once again the reality of the objects and their surreal connections. All these techniques aimed at shifting the center of representation from simple being-ness—that is, the weight of the presence of the object itself—to one of association and structure producing meaning.

Photomontage, an extension of collage practised since the nineteenth century, took on a new vitality in the 1920s, boosted by Dadaism, Cubism, and the development of the poster, and more generally, graphic design as it came to be used as a visual message. In that respect, it can be seen as a manner of integration of the image into language, constructing statements as a mechanic constructs a machine. Mixed and hybrid in essence, the photomontage became an activity in itself, culminating with the *Fotomontage* exhibition of 1931. With authors such as Kurt Schwitters, Rodchenko, Moholy-Nagy, and numerous lesser-known or anonymous artists, it was one of the central practices of the New Vision although now it tends to be seen as a secondary practice. It formed the basis for the budding art of graphic design, which bloomed in central Europe and the Soviet Union. Poster design, political and commercial advertising, and magazine layout provided the best outlets for expressions of photomontage (*Die Neue Linie*, *Vu*, *Regard*). More polemic forms, such as John Heartfield’s, hinted at the political force of photography, its power on “the masses” and thus its potential revolutionary nature. This direction, however, was ambiguous and the power of the visual image made its use by totalitarian states, notably the Soviet Union of the mid-1920s, then Italy, and eventually Germany in the early 1930s, particularly easy.

USA: The Nature of Photography

American photographers had quite different concerns. They kept in close touch with European developments—and sometimes emulated them, especially the most obvious stylistic figures of Constructivism (Abbott, Evans) or New Objectivity (Paul Strand, Charles Sheeler, Margaret Bourke-White, Evans), but their position and issues were different, especially as regards the role of the photographer in society. This would explain the development of the medium in the United States in the post-World War II years, and its relative supremacy.

The Great War had obviously a much reduced impact on American society as it did not produce the *tabula rasa* effect—the Great Influenza epidemics of 1918 may have been in fact more traumatic—and periodization tends to be slightly different. The powerful efflorescence of a strongly material and industrial culture was, on the other hand, paramount. The involvement of artists in commercial work, their questioning of their place in society, and the “relevance” of their work, all combined to focus the debate on the nature of photography—and especially its autonomy in the field of visual arts, a major difference from European practice. Despite concerns with the growing materialism of the 1920s and the existence of a strong documentary tradition, the project for most American artistic photographers of the interwar years remained internal to the medium.

The mutation of American photography away from Pictorialism towards “pure” or “straight” photography began in the mid-teens, can be best followed by the debate among the group surrounding Alfred Stieglitz—its galleries, exhibitions, and publications (see the articles by Marius de Zayas “Photography,” *Camera Work* 41, January 1913, and “Photography and Artistic-Photography,” *Camera Work* 42–43, April–July 1913, in which this Mexican artist and friend of Stieglitz theorized the “truth function” of photography) and Clarence White who formed a school, organized shows, and published *Pictorial Photography in America* (1920–1929). The two groups were separated by strong egos and a different relation to commercial assignments and money—the financially independent Stieglitz advocated absolute detachment from the constraints of commissions or the market while predictably White, who had to earn a living, more pragmatically trained commercial photographers. But the work they inspired is in fact quite complementary, and it evidences the various reactions to and difficult integration in artistic discourse of mass culture.

After the late 1910s, Alfred Stieglitz kept his strong intellectual presence especially through his own production, in particular the O’Keeffe portraits, the “Equivalents” series and the views of New York. His own practice did not necessarily closely follow the strict “purist” aesthetics he advocated but displayed a deep and original understanding of the place of the eye in the modern sensibility.

The portraits of Georgia O’Keeffe began in 1918 and continued until the mid-1930s. Intimately linked to the history of the couple, open-ended and totalizing, they constitute a truly photographic project, playing on time, gaze, and alterity/difference. The “cloud” series, or *Songs of the Sky* and then *Equiva-*

lents as it came to be known (1922–1930) are images of clouds without reference to the surrounding landscape, essentially made with a 4 × 5-inch camera. It is a clear manifestation of symbolist theory, freeing the image from any “referential” value (except for the meteorologist...) and concentrating on the emotion produced by the transcendental and the infinite (Davis 121). The series of New York buildings Stieglitz made in the 1930s, mostly from his window, as well as the Lake George images, although more direct in its form, develop an idea of the intensely spiritual but essentially personal relationship with the world, neither intellectual nor simply sensual.

This approach marks a real distance with European photography of the times, which had moved towards high Modernism, and reinforces the connection with what Edward Weston was doing in California. Weston, who had practiced pictorial photography since 1911 in Los Angeles, turned to “pure” photography in the early 1920s after meeting the Stieglitz group. He subsequently went to Mexico (with Tina Modotti) before returning to California in 1926. His style and subject matter increasingly emphasized the forms of objects as rendered through a continually sharper use of the optical qualities of the camera and the print. His famous series of vegetables, nudes, and Western landscapes form a coherent stylistic body of work aiming at being essentially photographic and at recording the “quintessence of the object.” They are steeped in a philosophy borrowing largely from Transcendentalism and sustaining a mystical ideal of “depiction of timeless and universal life rhythms.” (Davis 134).

Weston is also important for his institutional activities. He was asked to prepare the West Coast selection of the 1929 *Film und Foto* exhibition in Stuttgart and received in 1937 and 1938 the first John Simon Guggenheim fellowships granted to a photographer. In 1932, he formed around him a group of photographers, among whom were Ansel Adams, Imogen Cunningham, and his son Brett, called Group f/64 and devoted to direct, pure photography extending from the lens to the print.

The print was to be Ansel Adams’s main field of expertise. Adams, who was training to become a pianist, turned to photography under the influence of Paul Strand and devoted his energy to making perfect negatives and prints, and creating a form of mystical realism that was to make him, in the World War II and post-war years, the master American landscape photographer.

The technical expertise that Adams refined in printing is an interesting characteristic of the interwar period in the United States as opposed to a freer, less “crafty” approach to the medium in Eur-

ope. Weston and Strand, as well as Stieglitz, paid great attention to the making and the selecting of their prints conceived as real and unique art objects. Its roots are no doubt numerous—in American machinism, maybe even in a certain conception of the work ethic—but can be easily ascribed to the autonomization of the medium.

The most direct exponent of Stieglitz's theory well into the century was probably Paul Strand (1890–1976), whose pictures were featured in the last issue of *Camera Work* in 1917, for many marking the break in America with the outmoded Pictorialist style. He developed Stieglitz's concept of straight photographic practice and was probably as adamant about it. He was also a fierce critic of Materialism and of an American society caught in the ideology of the machine and of science ("Photography and the New God," *Broom*, 1922). He wanted to substitute for it a society where contemplation and its main player, the artist, would bring a fully human dimension to life. In that respect, although his philosophy was very similar to that of Stieglitz or Weston, his photography, from the early modernist studies of fences (1917) or his famous *Blind* (1916) to the portraits of peasants and common people, and his numerous images of buildings in the United States and abroad, show a much greater human concern.

His friend and partner on a short film venture, *Manhatta* (1921), Charles Sheeler (1883–1965), had fewer qualms as regards industrial power and technology. His images of the Ford Plant at River Rouge (1927) or of the deck of an ocean liner (1929), of a steam locomotive (1939), or of a turbine (1939), that he treated both as a painter and as a photographer, are clear manifestations of a form of industrial sublime (Davis 153). The line is thin between the complex work of Sheeler and the multitude of images by lesser known although no less competent photographers who displayed a fascination for the machine age. Machines, cars, tools, industrial buildings, factories, and bridges, were the heroes of the age, and found their zealots beyond the walls of the gallery in photographer-star Margaret Bourke-White and in publications such as Henry Luce's *Fortune*.

Photographic life was active in the United States in that period—witness regular exhibitions (Davis 130–131) and the activities of camera clubs. Pictorialism was largely dead by the 1920s but would not completely disappear and in fact would merge quite easily with the "documentary" aesthetic of the 1940s ("humanistic photography" as it was sometimes called). Quite clearly, however, American

photography was, by then, developing its own *sui generis* form of New Objectivity.

Walker Evans best exemplified the invention of this American form of photographic realism. His first images, made on his return from Paris (1927) and in Cuba (1933), display an essential modernistic style that makes them comparable with those of contemporary German and central European photographers. Form, and the multitudes of surprises and "puns" allowed by the city environment, were essential in those early photographs. Evans, however, by the time he was hired by the photographic department (historical section) of the Resettlement Administration (later Farm Security Administration), had moved towards a more comprehensive vision. Subjects appear more clearly in their entirety and tended to draw the spectator towards their existence, more than towards the photographer's choice. Focusing on the vernacular architecture and folk art with a penchant for the old and dilapidated and photographed with a large view camera (up to 8 × 10-inch), Evans developed a melancholy—or at least interrogative—gaze on the American scene, leading to the publication of one of the most influential books of the decade, *American Photographs* (1938), which accompanied the first solo photographer exhibition at the Museum of Modern Art, New York. Because of his association with a government information agency and his work on contemporary subjects and scenes, Walker Evans has long been discussed in terms of the documentary nature and function of his images. The debate is particularly sterile in his case. Indeed, together with Sheeler and Strand, Evans may be seen as bridging in photography the gap between art and society: neither commenting upon the latter (whether positively as commercial photographers do, or more negatively as documentary or press photographers), nor evading it (as Stieglitz), Evans defined a place and a stance, the frontal gaze, at the same time committed with its bodily presence but also detached, neither participant, nor observer. This proposition was to characterize much of American photography in the years to come.

The Human Condition

The decades that saw the development of totalitarian regimes on the failures of exhausted monarchies and imperial systems, and that experienced a mere decade later, a massive, global, and apparently endless recession that undermined the very pillars of democracy, could not remain blind to the role and vision of the artist in society. Simultaneously, politicians became aware of the possibilities of the medium in furthering their agenda, be it liberal as

in the United States or totalitarian as in the Soviet Union, Italy, and Germany.

This concern took different forms. Photojournalism, for want of a better word, was one of them and went beyond the simple news photograph. Documentary photography tackled projects of a larger nature.

This started in Germany, with the *Berliner Illustrirte Zeitung* and the *Münchener Illustrierte Presse*, which developed “picture stories” and commissioned images from photographers such as Erich Salomon (1886–1944) or Felix H. Man (1893–1985) (a series on Italian dictator Mussolini’s daily life). Few were trained photographers but many had studied the humanities in university. The taking of power by the Nazi party in 1933 led to the disbanding of the creative groups around the magazines and the dissemination of operators and editors throughout Europe, thus giving birth to a wide variety of illustrated publications elsewhere. The form also reached the United States, with the creation of *Fortune* (1930), *Life* in 1936 by Henry Luce, and *Look* in 1937. France had its own, with *Match* (1926) and Lucien Vogel’s *Vu* (1928), a more politically committed publication. *Vu* hired photographers such as Kertész, Germaine Krull (1897–1985), Brassai, and Robert Capa (1913–1954). In his magazine work Kertész explored daily life in the city and in the country, with a general tone of criticism towards the dehumanizing trend of modern life, but mostly emphasizing the paradoxes and strange encounters in an ironic manner close to surrealism. Brassai, for his part, specialized in night life and the underworld, looking at the city as a large stage where characters pass. In England, Bill Brandt chronicled English life (*The English at Home*, 1936) as well as London by night (*A Night in London*, 1938).

More systematic, and less geared towards the press, larger documentary works are one of the distinctive marks of the period. Documentarians used the collection power of the photographic image, which had already been perceived in the great surveys of the nineteenth century, and coupled it with new increased means of dissemination.

In Germany, after the Great War, near Cologne, a professional photographer named August Sander began what he planned to be a survey of the German people of the period. The project was so vast and comprehensive that it took years to complete and was published in various installments. His aim was precisely to reflect the society of the twentieth century (one of the names of the series was “Men of the Twentieth Century”) thanks to the “purity” of the camera. He set up a simple protocol that he stuck to methodically, posing the sitter in his work environ-

ment, positioning the subject to face the photographer, and capturing the subject’s full body. The survey was organized according to the occupation of the sitter, the only identity provided by the caption.

But collective operations were the most important ones and the survey that had the deepest effect on the future of photography was undoubtedly that of the Farm Security Administration in the United States. More than its hiring of Walker Evans, Dorothea Lange (1895–1965), or Ben Shahn (1898–1969), and its training of several young men and women who were to become major players in the field of humanistic photography in the post war years, the FSA, under the direction of Roy Stryker (1893–1976), was significant in its structured and coherent attempt at constructing a full picture of American society of the era. This was accomplished not by using portraits of its people, but by showing them in their daily environment and, if necessary, expressing, by visual means the “essence” of the situation. Placing the responsibility on the shoulders of the photographer/reporter and his necessary honesty, and presenting the result in the form of an organized file of images and documents, the FSA inaugurated a new relationship between the photographer and the world. Stryker’s commitment was not one of his own opinion but one of his own conviction, that of the faith in the people and the fundamental need for a democracy to give a voice to their existence. Such a complex interplay makes the work of the FSA the great laboratory of the modern image, and the place where all the contradictions of representation in a mass culture are at play.

The Effect of Technique

Most of the developments already cited would not have been possible without radical evolutions in the technical capabilities of the camera, film, and printing processes. The creation of the small camera, Oscar Barnack’s Leica (c. 1925), using cinema film and made possible by the improvement in lenses and fine-grain developers, enlarged the field of the “photographable” with its maniability, its unobtrusiveness, and the possibility to create multiple exposures. As with all epistemological breaks, it took a while to percolate, and was first taken up—understandably—by non-professional photographers. Inevitably, alongside the technical perfection sought by some—especially American—photographers, a new type of image, grainier, rougher, with harsher contrasts, more stylized, and “wrenched from the world” as it were, became accepted. Practical and affordable color film also made its debut. Color photography remained for the most part limited to the world of advertising because of cost, but

demand for it was high and such popular magazines as *National Geographic* made a policy of publishing as much color as it could. By the mid-1930s, and despite the Depression, the first color transparency films were released by Agfa and Kodak (1936).

The 1920s and 1930s also experienced the birth of modern advertising, in the United States and to a more limited extent in Europe and Japan (Davis 555–580). Advertising made heavy use of the photographic image, absorbing much of the creative energies and ideas of the period. Most major photographers—with perhaps the exception of Stieglitz—worked at some point in their careers for commercial publications. The photograph invaded the entire public sphere, even book covers. More and more photography books, entirely or partially composed of photographs, were published. They formed one of the major sources of dissemination of the work of many practitioners and gave birth to a new form of art (Davis 172–173, Frizot 570). The 1920s and 1930s were indeed the decades of graphic art, poster, and book design. Serious photography criticism ensued (with the publications of articles in specialized magazines and histories of photography), and by the mid-1930s several important exhibitions had taken place in Europe and the United States, thus establishing the photograph as an art among others.

Such evolution spurred the development of an audience of trained viewers—more and more often practitioners themselves, albeit within the very limited sphere of the family snapshot. The public of all classes became more familiar with as well as more aware of the power and the potential of the photograph. This expansion of popular practice and of popular consumption of photography formed the intellectual, cultural, and economic base for the development of postwar photography.

HISTORY OF PHOTOGRAPHY: POSTWAR ERA

There is one thing the photograph must contain, the humanity of the moment. This kind of photography is realism. But realism is not enough—there has to be vision and the two together can make a good photograph. It is difficult to describe this thin line where matter ends and mind begins.

(Robert Frank 1962)

At the end of World War II, the world's vision of itself had been shattered, and it had to reconceptualize the idea of "humanity" in order to face new issues and concerns that were arising in the postwar era. Photography, which, in the interwar years, had been highly experimental, even in some of its practical and commercial applications, also changed to fit the new times. During WWII, photojournalism, with Europe as its primary arena, had captured the horrors and traumas of the war. In the postwar years (roughly 1945–1959), the recognition that photographers could use their cameras not just to record events, but to influence the way in which the public responded to these events, changed the way in which the art of photography was conceived. Insurrection in India, poverty in the United States, the war in Korea, and the new social elite in Europe were just a few of the subjects that would come to dominate the work of postwar photography. These new subjects, combined with the more critical support and sponsorship of photographers, led artists to realize that they could shape attitudes and history through their concerns and a commitment to the medium. The concept of the independent photographer as a lone individual with a personal vision, and not connected or obliged to anyone, took shape during these years in which the photographer began to explore the world and the self. These years are remembered as a time when photographers such as Robert Frank, William Klein, and Minor White among others, would carve out an important niche in the new world order, initiating a wide variety of developments.

There are three main shifts that occurred in the photographic world after 1945. The first was physical. Up to and during WWII, Europe, especially the capitals of France and Germany, had been the lively and energetic nexus of the photographic and artistic

world. It was known as *the* place artists went if they were serious and wanted to fully develop their talents. The onslaught of war only emphasized the importance of going overseas, and many Americans left their homeland in the late 1930s and early 1940s to go abroad and follow the events in Europe, Africa, and Asia. After the war, European photography continued to be important as we can see in the postwar work of such talented men as Henri Cartier-Bresson and Robert Doisneau, but the center of the photographic world had shifted its focus west to the United States as expatriates returned home and American photographers began to experiment with light and form. European photographers, aroused by this demographic shift, also left their homeland to search out new subject matter in America, which had happened only infrequently prior to WWII.

The second shift that occurred was stylistic, and grew out of the renewed interest in what is called "straight photography." It was originally conceived by art critic Sadakichi Hartmann who, although he highly praised the 1904 exhibition of the Photo-Secession at the Carnegie Institute, in Philadelphia, Pennsylvania, called for a return to a photography that was untouched and left as the eye had originally seen it. "To work straight" according to Hartmann was to "[r]ely on your camera, on your eye, on your good taste and your knowledge of composition..." In other words, the goal should be to produce "photographs that look like photographs" as opposed to the more abstract photography that was prevalent in the first half of the twentieth century. The postwar photographers answered Hartmann's call as is evidenced in many images of the time by artists such as Paul Strand, Ansel Adams, Robert Capa, and Ruth Orkin.

The third shift was social. The "humanist movement," as it is now called, was perhaps the greatest innovation in the postwar years and hit its apex in the photographic work of the 1950s. Up to the end of the 1940s, photographers had primarily worked for the sake of society, to inform it, if not to improve it, or to declare some sort of personal truth as we see, for example, in the work of Alfred

Stieglitz. Up to the 1950s, photographers, especially in the United States, attempted to promote some sort of social message. After the 1950s, photographers in the United States continued to focus on and question nature and society, but there was a turn toward a more personal viewpoint. Many famous names from the war, such as Margaret Bourke-White, continued to work, but they shifted from photojournalism to a more humanistic approach. Individualism was encouraged and the image of the solitary photographer traveling alone around the country became the stereotypical image of the artist/photographer.

Thus conceptions of subject, method, and style began to radically shift in the late 1940s. The mood of this moment is perhaps, surprisingly, encapsulated in the development of tabloid journalism from the 1930s to the 1940s in the work of the man who is perhaps the most famous of these photographers, Arthur Fellig, more commonly known as “Weegee.” The Austrian-born photographer is best remembered for his macabre images of New York City in the late 1930s and 1940s, which culminated in the publication of his book *Naked City* in 1945. The book includes photographs of murder victims as well as of the curious crowds that gathered on the streets of New York during and after the war years. Weegee’s obsession with the grotesque side of urban life led to his stark but memorable photographs of life in seedy bars and the alleys behind them, filled with prostitutes, famous gangsters, conspicuous dwarfs, freaks of all sorts, and their voyeuristic onlookers. Weegee had a fascination for photographing the other end of the spectrum as well. His images of the rich and famous—Frank Sinatra, Louis Armstrong, Jayne Mansfield—are also well-remembered. Perhaps the most distinctive characteristic for which Weegee is known is that he slept with a police radio next to his bed (and also had one in his car) and was often the first to arrive at a crime scene. This was the basis for the rumor about how he must have used a “Ouija” board to divine the future—hence, one theory for how he got his name.

Most important is Weegee’s style, which is fundamental to an understanding of how photography after 1945 materializes in the work of artists such as William Klein and Robert Frank. Weegee’s signature was a strong flash with a starkly contrasting black and white image. His style is often confrontational with a flash going off in the face of those he was in pursuit of. Given that most of his images are of night scenes in the city, this brash lighting only adds to the uncanny atmosphere of his portrayals of New York nightlife. Transvestites being taken into the police station, women crying outside

a burning building, automobile crashes, and dead bodies revealed a different side of America than was generally seen. Yet not all of Weegee’s photographs involve death and destitution. There are also images filled with joy, humor, and a touch of the burlesque, such as the memorable image of water-soaked children gathered in the sunny summer street watching warily as a policeman turns off the fire hydrant—perhaps their only form of amusement—in *Police End Kids’ Street Shower—Under Orders, August 18, 1944*. Weegee also celebrates the diversity and paradoxes of the United States in his vibrant images of church gatherings and jazz concerts in Harlem and intimate shots stolen of people sleeping or kissing in movie theaters. Thus, although he would never gain the artistic prominence of the photographers he inspired in the 1950s, Weegee’s artistry and influence is notably present in the next generation.

One of the artists that represents the bridge between the photojournalism of Weegee’s era and the more individualistic aspects of the late 1940s and early 1950s was William Klein. Although his work was starkly different than the brazen images of Weegee, Klein’s work is considered to border on the grotesque and to echo the black-and-white photos in *Naked City*. Although American, Klein was first a sculptor, and began his career in France, where he worked in the studio of Fernand Léger while also concentrating on other media such as painting and abstract photography. Returning to New York in the 1950s, Klein quickly gained a reputation for his “bad” photographs of city life. This was further emphasized when he was noticed by American *Vogue* and hired as a fashion photographer in 1954. Uncomfortable with the workings of a photo studio, Klein took his models out onto the streets of New York, where he developed a unique look and pioneered the creative use of the wide-angle lens.

In the pages of *Vogue* and in his own work, Klein violated all of the rules of photography by deliberately distorting and blurring his figures, and his subject matter was also extreme images of children with toy guns pointed at the camera. His “in your face” style became a trademark and would be something we would later observe in, for example, the efforts of Diane Arbus. Yet although his images seem random and hasty, one can find a certain symmetrical balance to them. Klein’s genius is summed up in his publication *New York, New York* (1956), which draws on all of his talents (and the influences of Weegee).

Another photographer who made the transition between WWII and the postwar era is Robert Capa. Known for his photography of the Spanish Civil

War and WWII in Europe, Hungarian born Capa's (born Endre Friedmann) career lasted up to the moment he was killed by a landmine in Indochina in 1954. Capa, who considered himself to be a journalist rather than an artist, was the quintessential mid-century photographer. He was both a straight photographer and a humanist and had an eye for amazing portraiture. Paradoxically, he first entered the world of photography for economic rather than artistic reasons as a darkroom assistant. Yet, influenced by his relationships with some of the great photographers of his time, such as Cartier-Bresson and André Kertész, Capa became one of the most sought-after photographers of the 1930s and 1940s. Technically speaking, Capa was never a master in the darkroom. His editors remarked that he seemed to have installed a device on his camera that intentionally scratched his film. Thus, although Capa never did quite master the technical side of his art, such as the use of his flash, his style and ability to capture the emotion of a moment are virtually unsurpassed in the photographers of his generation.

After WWII, Capa continued to photograph and make an impact on the world of photography both artistically and professionally. As a man of his era, Capa understood that "professionalism" was becoming more individualistic in late-1940s Europe, where the art world was still buzzing with energy. The photographers who were working and living in Paris banded together in 1947 to create Magnum Photos. Named for its dictionary definition as a "two-quart bottle of spirits," "Magnum" was an agency formed to support a commitment to "concerned" photography and to serve as an international forum for professional photographers and a training ground for young up-and-coming artists. Owned and operated by the artists themselves, the agency's founding members included Robert Capa (who was at the center of the activity) and Henri Cartier-Bresson. Their goal was to improve the lives of photographers and at the same time to allow full artistic license. It was meant to be a collective enterprise in which photographers could develop individually and be free to roam the world and choose their own subjects.

While he was still establishing Magnum, Capa continued to travel the world. He created a portfolio of images from the USSR in 1947, the building of the newly founded State of Israel in the late 1940s, the social elite of Europe in the 1950s, and haunting images of Japan and Indochina in 1954. Capa was also capable of capturing the essence of everyday life of the rich and famous: his photos of Picasso and his family at the Golfe-Juan in 1948 are best remembered in the photo of the artist holding an umbrella over Françoise Gilot while walking on

the beach, and another of him cradling his young son in his arms. We find the same atmosphere present in Capa's photos of Matisse at his studio in Nice and Alfred Hitchcock at work on a film set.

Although Capa was influenced by Cartier-Bresson's theory of "the decisive moment," the two had very diverse approaches to their subject matter. While Cartier-Bresson was noted for his "cool detachment" from his subjects, Capa became intimate with the people he photographed and immersed himself in the whole experience. This commitment to his subjects is tragically marked by the fact that while marching with the Vietnamese army near Thaibinh on a last-minute assignment for *Life* magazine in May of 1954, Capa was killed climbing a dike. His last images show the very spot where he lost his life moments later.

Women also made an impact on postwar photography and one of these was another photographer who had become famous during WWII—*Life* photojournalist Margaret Bourke-White. Though Bourke-White gained a reputation for such firsts as being the first female photographer to fly on a bombing mission during the war, and the first western photographer allowed to enter the Soviet Union, some of her most impressive and touching images were created after 1945. For example, she was sent to India and Pakistan to capture the turbulence of the era and from this produced one of the most striking photos ever taken of Gandhi, *Monhandras Gandhi at His Spinning Wheel* (1946). For that photo she was asked to first learn the art of the chakra, the spinning wheel, in order to better understand the man. She successfully spun some wool and was let in and allowed three photos. The first two failed technically and her only shot turned out to be *the* one. Whenever Gandhi later saw her he would joke, "There's the torturer again." She was also the last one to interview Gandhi before his assassination. In the early 1950s, she went on to photograph other important social issues such as South Korea and apartheid South Africa where she documented the life of poor blacks living behind barbed wire such as in *Shantytown Dweller* (1950) and *Gold Miners* in Johannesburg (1950).

The shift from the 1940s to the 1950s was not just noted in the work of individual photographers such as Bourke-White and Klein but was perhaps best illustrated in one of the most important artistic events of the 1950s. *The Family of Man* exhibition that took place at the Museum of Modern Art (MoMA) in 1955 influenced and defined the shape of the future of photography. Billed by its promoters as "the greatest photographic exhibition of all time" it was organized by Edward Steichen and was a compilation of

503 images by 273 photographers from 68 countries selected out of over 2 million photographs submitted from all over the world. The title was taken from a poem by Carl Sandburg who wrote in his introduction that “Everywhere is love and love-making, weddings and babies from generation to generation keeping the Family of Man alive and continuing... alike and ever alike we are....” Steichen wanted to explore photography’s universal themes such as love, childhood, family, work, play, suffering, and death. He aimed to convey the dynamism of photography and how it could help explain “man to man” and act as “a mirror of the universal elements and emotions in the everydayness of life—as a mirror of the essential oneness of mankind throughout the world.”

The exhibition was seen as an international and communal effort to heal the wounds still left over from WWII and it toured Europe (including Russia), Africa, and Asia. It was an attempt to disseminate the ideas of these commonalities and included photographs from the Farm Security Administration, the National Archives, and files from *Life* Magazine. Images included scenes from middle America, the Indian subcontinent, Java, Europe, Cuba, Pakistan, and the Belgian Congo. Well-known names such as Bill Brandt, Robert Capa, Robert Doisneau, Ruth Orkin, Irving Penn, Dorothea Lange, and Allan and Diane Arbus graced the pages of the exhibition catalogue, which is sprinkled with philosophical quotes from such diverse personalities as Montaigne, Thomas Jefferson, and a Sioux Native American.

The Family of Man exhibition said many things about mid-century photography but one of the most interesting was the discourse it prompted regarding the shift in the treatment of the African American as a subject from before and after WWII. The exhibition included images of African Americans by photographers such as Consuelo Kanaga, Helen Levitt, W. Eugene Smith, and Wayne Miller, in whose work we see portraits of intimacy between family members, children playing in the streets, and the American jazz scene.

One of these is often defined as one of the least-known American photographers, though Consuelo Kanaga’s (1894–1978) career spanned 50 years and she is now credited with having pushed the subject of the African American towards a less romanticized and more realistic viewpoint. A photographer during the Depression, by the 1940s, Kanaga focused her camera on the power of the individual subject most likely inspired by the photographs of the Appalachian residents made in the 1920s, and 1930s by Doris Ulmann. Equally indebted to the Photo-Secessionists (Stieglitz and Steichen) Kana-

ga’s work blended commercial photography and social documentary with a hint of abstraction. Her balance between aesthetics and social issues explores this interaction between the camera and the subject that was such a central theme in the postwar era. Perhaps Kanaga’s most significant contribution to postwar photography developed from her trips to Tennessee and Florida in the late 1940s and early 1950s. In the marshlands of Florida she took her most memorable image of an African American migrant worker protecting her two small children with her arms. The photograph “She is a Tree of Life to Them” was so named by Edward Steichen when he placed it in *The Family of Man* exhibition in 1955. Kanaga said that this striking image was influenced by Sargent Johnson, an African American sculptor from San Francisco.

Another group of photographers who rose to prominence after WWII were African-Americans, who played a significant role in the way that the world viewed them as both subject and artist in the postwar years. Along with other great names such as Richard Saunders and Gordon Parks, Roy DeCarava is now remembered as one of the most influential photographers of the mid-century whose collection of work spans three decades and gives us some of our most memorable images of DeCarava’s native Harlem. In a time when the art world was dominated by the White male, African-Americans were kept on the sidelines and had worked largely in journalism and commercial photography, the most well-known being James VanDerZee who was a studio and portrait photographer. Yet things rapidly changed after 1950 and this was partly due to DeCarava.

DeCarava began his career as a painter who worked early on as a commercial artist. In 1947, having exhausted the medium, he turned to photography as a mode of expression. He liked the directness of the camera. With help from Edward Steichen, DeCarava became the ninth photographer ever to be awarded a Guggenheim Fellowship and in 1955 co-authored his famous book *The Sweet Flypaper of Life* with poet Langston Hughes. The book won much critical acclaim and marked a turning point in African-American photography as an art form. With DeCarava we find sensitive portrayals of life in Harlem with images that are often mere shadows of form. His photos reflected the move away from the harsh political motifs of the 1930s and a general postwar shift towards a more personal, more abstract view of things. Perhaps his most notable contribution to African-American photography is DeCarava’s representation of the Black community, and of greats such as singer Billie Holiday and

musician John Coltrane, which communicated a newly found independence that has continued in postwar African-American photographic art.

Three other photographers who carried the photography of the 1940s into the 1950s and influenced photographers for many years to come were Harry Callahan, Aaron Siskind, and Minor White. Harry Callahan's career began in the mid-1940s. He was a self-taught photographer who was greatly influenced by Adams, Stieglitz, and László Moholy-Nagy (at Chicago's Institute of Design, where Callahan taught in the 1950s) but who forged his own identity and style that was much more personal than many of his peers. Having worked in the darkroom at General Motors Photography Department during the war, it was during a four-month period in New York in 1946 that he met Nancy and Beaumont Newhall who were impressed by his work and showed it in the 1946 exhibition *New Photographers*. His photographs followed in the tradition of modernist experimentation of the 1920s and 1930s but have a much more humanistic and personal quality. Callahan's talent shows in his incredibly fine images such as *Cattails against Sky* (1948) and *Weed against Sky, Detroit* (1948), but his most famous and profound photographs are of his favorite models, wife Eleanor and daughter Barbara. Very intimate works, some of the photographs show his wife nude in a domestic interior such as in *Eleanor, Chicago 1948*, others are of her emerging from still water, in shadow, or are "snapshots" of his family going about their daily lives.

New Yorker Aaron Siskind (1903–1991) is remembered as one of the most noteworthy mid-century photographers whose art is centered primarily on one subject: the picture plane, a subject that is also known as one of the most important aesthetic issues in modern art. Although he was actively engaged in the world of documentary photography in his early years of work, from the moment of his first exhibition in New York in the late 1940s his contribution to modern art only grew. Practicing in the tradition of the "straight" photographers he is associated with New York School Painting and his subject matter is reminiscent of the surfaces of a painting by Franz Kline or Clyfford Still. Rather than taking traditional subject matter as his central concern, Siskind often focused his camera on a wall and engaged with the picture plane. Geometrical forms and flat planes became his object of study. Although he produced well-known images such as *Terrors and Pleasure of Levitation* (1954) and facades of Chicago streets, Mexican pyramids, and abstract designs on walls in Rome, he is relatively unknown compared to other

photographers of his time. Yet his impact was great. A radical by nature, his work did for photography what abstract expressionists such as Kline and de Kooning did for their own medium. In addition he was a great teacher who was in residence at the Chicago Institute of Design alongside Harry Callahan in the 1950s–1970s and later went on to the Rhode Island School of Design.

Minor White was perhaps the most influential photographer of these three men and of the postwar era. Having worked for the Works Progress Administration (WPA) during the Great Depression, White is remembered for his haunting images of the natural world but also as one of the founding members of *Aperture* quarterly and as a great teacher who helped advance the careers of many burgeoning artists. White's meticulous "straight" photographic style was formed during his exchanges with such masters of the prewar era as Edward Weston, Alfred Stieglitz, and Ansel Adams. His conversations with Stieglitz, in particular, spurred his "meditations" about photography as a way to translate visual form into something he called the "suprasensual." For White, the photograph was a "mirage" and the camera was a "metamorphosing machine."

To get from the tangible to the intangible...a paradox of some kind has frequently been helpful. For the photographer to free himself of the tyranny of the visual facts upon which he is utterly dependent, a paradox is the only possible tool. And the talisman paradox for unique photography is to work "the mirror with a memory" as if it were a mirage, and the camera a metamorphosing machine, and the photograph as if it were a metaphor.... Once freed of the tyranny of surfaces and textures, substance and form can use the same to pursue poetic truth.

White developed the theory of the "accidental," and his essay *Found Photography* is a profound description not only of his approach, but of his spiritual process. While he saw photography as something sacred and spiritual, White was also a master technician which just added to the exquisiteness of his craft. Photographs such as *Pacific, Devils Slide, California, 1947* and the stunningly majestic *Barn and Clouds, In the Vicinity of Naples and Dansville, NY, 1955* are perhaps some of the most outstanding illustrations of his aesthetic theory in practice.

Apart from Minor White, Swiss-born photographer Robert Frank is probably the most influential of the postwar era. Unlike the abstract planes of Siskind or the intimate familial portraits of Callahan, Frank's work framed the mundane moments of loneliness, boredom, racial strife, and the banal, everyday life of America in the 1950s. On his arri-

val in New York in 1946 Frank found work with *Harper's* and *Junior Bazaar*. After *Harper's* closed its doors a year later he left New York and traveled through the Americas to Peru and Bolivia before returning to Europe in 1949. For the next five years he continued to travel between Europe and the United States and published his stunning yet somber collection of images in the book *Black and White Things*.

The postwar photographic era perhaps culminated in Robert Frank's landmark project—*The Americans* (1959). This is probably the most influential single photo book published between 1945 and 1959. Having begrudgingly returned to the United States in 1953, Frank spent the years 1955–1956 traveling across America on a Guggenheim Fellowship, capturing scenes that revealed an America driven by racial conflict, politics, loneliness, and boredom. Using a 35-mm manual Leica he shot 500 rolls of film, which unfold for us his version and vision of America in the 1950s. His images are of public space and public life—streets, post offices, Woolworth's, cafes, small hotels, bus stations, parks, hospitals, elevators, diners, and gambling casinos. His subject matter runs the gamut from 4th of July picnics to cowboys to interstate highways. Even the design of the text was somewhat revolutionary. Reflecting Walker Evans's book *American Photography*, Frank's book was sparse and the photographs were only printed on the right-hand side of the pages. The left-hand side was blank except for the page numbers. Thus, from Frank we get a vision of a foreigner's response to his adopted country that is a kind of “anguished visual poetry rather than graphic art.” Jack Kerouac, author of *On the Road*, wrote in the introduction to the book “he sucked a sad poem right out of America onto film, taking rank among the tragic poets of the world.” Frank is merely a “poetic” observer whose photographs revel in the voyeuristic rather than participatory pleasure of the image. It was not just his choice of subject but his unique style that included closely cropped scenes, that also draws the eye. In addition, Frank is known for frequently photographing directly into the glare of the light, and often framed his subjects off-center or on a tilted horizon. This skewed sense of balance along with his use of the small, handheld 35-mm camera greatly influenced the way that photographers worked from that time on. Thus, Frank deliberately breaks the rules of “good” photography. Yet in doing so he also closes off a great and productive era in postwar photography but, more importantly, looks ahead to the 1960s and 1970s in which photographers such as Richard Avedon, Diane Arbus, and

Garry Winogrand will carry on his tradition in their own vision.

In Europe, the important group *fotoform* became the nucleus of 1950s modernism; Peter Keetman, Otto Steinert, and others showed both the continuity and disruption with the previous photographic styles, especially in Germany. “*Subjektive Fotografie*,” a style that focused on abstraction, design, and close observation was emerging, codified in a series of three exhibitions in the early 1950s.

Around the world, in Japan, which had its own postwar era, but also in countries not directly affected by the World War, there was a general boom in photography as societies increasingly modernized and standards of living increased. Japan's postwar photographers, including Ken Domon, Hiroshi Hamaya, Kikuji Kawada (whose famous black and white picture of the Japanese flag, laying on the ground, soaked and wrinkled, is a symbol of an essential part of Japanese reconciliation with their war years), Shomei Tomatsu, and others reflected the introspection and independence that characterized western photographers. Photojournalism and social depiction predominated as Japan's postwar photographers dealt with the aftermath of their defeat and the devastating physical and psychological consequences of the atomic bombs dropped on Nagasaki and Hiroshima.

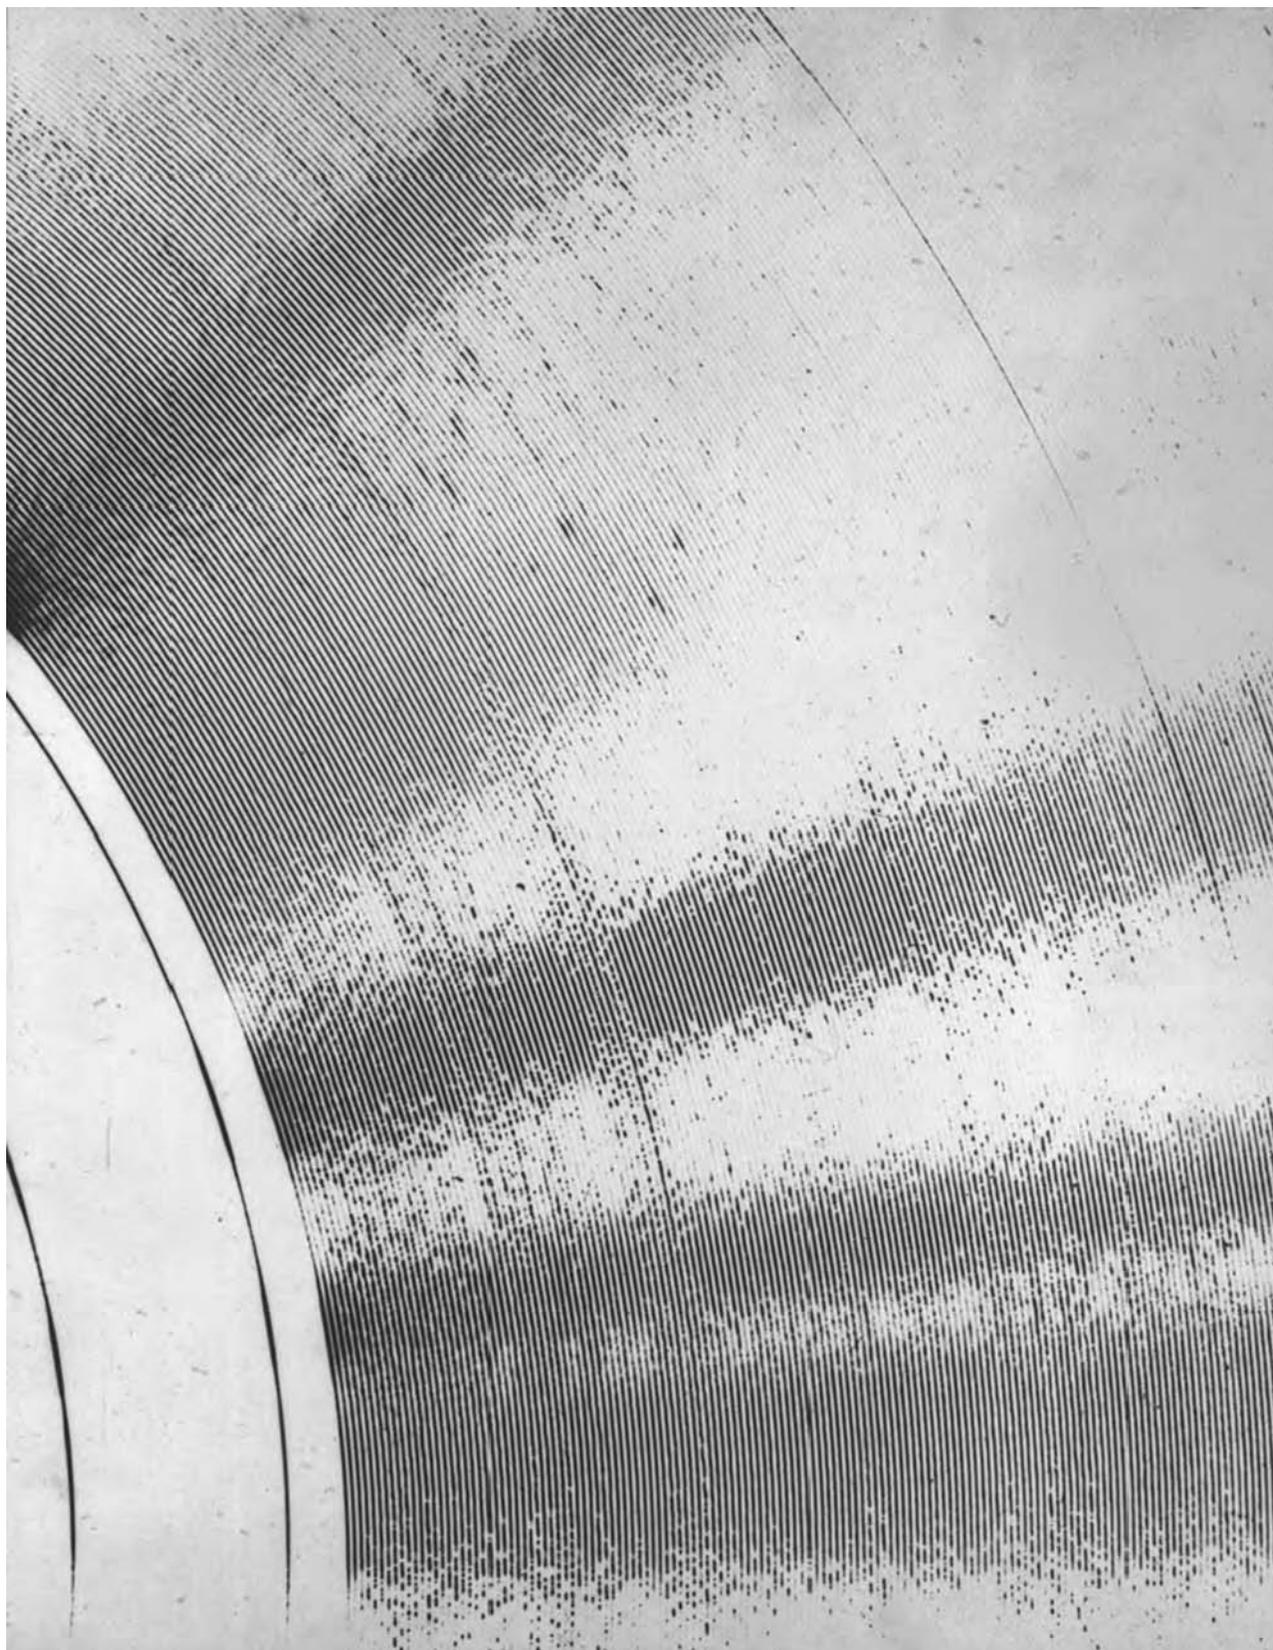

In the USSR and countries under communist rule, policies dictating “official” styles constrained photographic innovation even as they codified photographic genres such as Socialist Realism.

HISTORY OF PHOTOGRAPHY: THE 1980S

A medium linked with low art and popular culture, photography has historically been considered a secondary form of artistic expression. Despite the early efforts of the Pictorialists, photography continued to be associated with documentary, informational, and commercial contexts. Its status started to change in the late 1950s and during the 1960s, when the medium was progressively introduced into the international contemporary art scene and began to be more widely collected, both publicly and privately. This process culminated in the 1980s and photography acquired a double status: on the one hand, it became a luxury object, invested with considerable aesthetic and economic value; on the other, it continued to address broader public functions through its “popular” forms that came to dominate mass communication. And most interesting, these two seemingly opposing statuses were conflated by many of the most successful artists of the era. Other artists confronted photography as both an object of aesthetic delectation and a vehicle of more traditional social concern, expanding tendencies that had shaped photography in earlier decades.

By the middle of the 1980s, photography had accomplished “all that was first set out in its mid-nineteenth century agenda: general recognition as an art form, a place in the museum, a market (however erratic), a patrimonial lineage, an acknowledged canon.” (Solomon-Godeau, 85) More specifically, the considerable growth of the art market contributed to the fetishist dimension of photography, transforming it into saleable and often over-valued merchandise. Indeed, in the 1960s an increasingly active market had devel-

oped that coincided with Robert Rauschenberg’s and Andy Warhol’s introduction of photography into painting and as leading artists, into the mainstream of contemporary art practice. Moreover a mass of documentation—of conceptual art, land art, performance and body art, mail art—appeared in galleries in the late 1960s and 1970s and made their habitués accustomed to seeing photographs and eventually to buying them. Thus a new market developed, one whose prices were geared more toward high-priced painting than to traditional photography.

As the market grew in the 1980s, private collectors constituted its most influential force and dominated art-world consensus. Contemporary curator and critic Dan Cameron summed up the unique situation in 1986:

If the art world five years ago seemed to be dominated by the galleries—an adjustment that contrasted, for example, to the central role of critics during the 1960s—it now appears that patronage itself is becoming the all-important factor in determining the type of international impact an artist is going to have. Whereas until recently artists and dealers talked about the number of works sold from an exhibition, now the emphasis is clearly on who bought them.

(*Art and Its Double*, p. 30)

Beyond market peculiarities, the 1980s were characterized by a fervent polemic—an artistic as well as a theoretical one—around photography. The widespread use of technical and reproducible imagery in the fine arts is considered as one of the main distinguishing features of postmodernism, which em-

erged full-blown in the decade and distinguished it from modernism's formalist aesthetics that are embedded in the idea of the unique object. Historically, although there was "modernism" in photography, in the larger application of this term in the art world, photography was often seen as the proverbial second-class citizen because it was a highly reproducible medium. In this way, photography appeared to resist classification according to traditional aesthetic categories, and instead called for the revision and re-actualization of these categories. Hence the paradox: if there is some specificity in the photographic image, it consists in its elusiveness and its capacity to shift from one category to the other, that is, precisely, in its lack of specificity. In that sense, photography could be apprehended either as a record of some exterior reality, or as an interiorized vision revelatory of the photographer's own inner being. In most of cases, it was both at the same time.

For Rosalind Krauss, "the photographic...had come to affect all the arts." (Michelson, 1987, introduction) Photography was central not only to advanced art but to society as well. Photography critic Abigail Solomon-Godeau wrote:

As photography has historically come to mediate, if not wholly represent, the empirical world for most of the inhabitants of industrialized societies (indeed, the production and consumption of images serves as one of the distinguishing characteristics of advanced societies), it has become a principal agent and conduit of culture and ideology.

(Solomon-Godeau 1984, 76)

Although the decade is characterized by a wide diversity of styles and uses of the photographic medium, a primary distinction can be made between artists who used photography among other forms of expression (without being exclusively photographers) and those who came to be called "pure photographers."

Many artists of the first group, and especially those who combined photography with texts, had largely internalized art theory and assimilated into their own art making. Following a conceptualist and post-conceptualist realm, such photographers tried to demonstrate the distance that separates photography and its referent, despite their common identification.

Photography had been thus regarded as a particular semiotic system, the understanding of which, far from being obvious, depends on visual and cultural codes. Informed by French structuralism and semiotic theories (Roland Barthes, Jean Baudrillard, Jacques Derrida, and Michel Foucault), as well as by psychoanalysis (Jacques Lacan) and

phenomenology (Maurice Merleau-Ponty and Louis Althusser), artists renewed and expanded the conceptualist critique of representation. From that point of view, photographic images were texts to be deciphered rather than works of art to be admired. For Rosalind Krauss, the photograph is "a meaninglessness surround which can only be filled in by the addition of a text." ("Notes on the Index: Seventies Art in America," p. 66).

Two seminal essays by Roland Barthes, "*The Death of the Author*" and "*From Work to Text*," served as references for the artists. According to Barthes:

We know now that a text is not a line of words releasing a single 'theological' meaning (the 'message' of the Author-God) but a multi-dimensional space in which a variety of writings, none of them original, blend and clash. The text is a tissue of quotations drawn from the innumerable centers of culture....Succeeding the Author, the scribe no longer bears within him passions, humors, feelings, impressions, but rather this immense dictionary from which he draws a writing that can know no halt: life never does more than imitate the book, and the book itself is only a tissue of signs, an imitation that is lost, infinitely deferred.

(Barthes 1977, 146-147)

Not only did the captioned photograph incorporate verbal texts into visual art more than ever before, but captioning so linked the visual with the verbal that the visual was turned into a text. In "*Notes on the Index: Seventies Art in America*," Krauss characterized the photograph as an "index," an imprint of something tangible in the physical world. According to her, indexes are "marks or traces [of that] to which they refer, the object they signify. Into the category of the index, we would place physical traces (like footprints), medical symptoms...." Photography would belong to that same category of motivated signs.

Among the artists who investigated the textual dimension of photography, Victor Burgin is maybe the most representative. Burgin's work is a constant questioning of the photographic medium as a sign-producing device capable to influence social behavior. Photography is for Burgin an apparatus of power, an ideologically motivated representation that has to be deconstructed, as can be seen in *Office at Night*, 1985-1986. Burgin's work is informed by psychoanalytical theory, using it to investigate the mechanisms of visual representation as well as the return of the repressed in the cultural sphere. But for Burgin photography is, above all, a process of production. "Such a process, through the technical manipulation of materials, mediates reality and constitutes an ideological intervention in the world. This awareness corrects the ingenious

acceptance of the camera as an incorruptible instrument of truth.”

A whole generation of what became known as conceptual photographers (or “media artists”, as critic Irving Sandler calls them) emerged from the California Institute of the Arts (CalArts) in Los Angeles. An influential figure was John Baldessari, who first used the term “post-studio art” to designate those practices, very fashionable in the late 1970s, which exceeded straight painting or sculpture. Opening formalist aesthetics to the examination of art’s potential social and political engagement, Baldessari’s art and teaching were informed by production and presentation strategies culled from disciplines outside the traditional confines of fine art, such as commercial photography and mass media imagery. Baldessari, a generation older than many of his students who received early fame, was himself finally recognized as an important artist in the 1980s with works such as *The Little Red Cap*, 1982 and *Hanging Man with Sunglasses*, 1984.

Once the stability of traditional artistic categories was successfully challenged by photography in the late 1970s into the 1980s, attention was transferred to the politics of image making by photographic as well as by more traditional means. Indeed, postmodernism emerges as a dominant fine arts ideology at the same time as political and social dimensions appear widely in art-making as both methodology and subject matter. More important, photography and the critical thinking that accompanied it in the 1980s are so interwoven that the full impact of works often cannot be understood without reference to their theoretical contexts.

In the preface of *The Anti-Aesthetic: Essays on Postmodern Culture*, Hal Foster makes an important distinction between two kinds of postmodernism: a postmodernism of resistance and a postmodernism of reaction. According to Foster, the former “seeks to deconstruct modernism and resist the status quo,” while the latter repudiates modernist tradition in order to celebrate those normative structures that perpetuate cultural conservatism and its interests. (p. xii) If conceptual photographers and media artists were the tenants of the former type of postmodernism, the latter was associated with painting, dominated the art-world of the 1980s.

Photography was valued over painting by those who promoted deconstruction theory because of its perceived “relevance,” that is, its capacity to function as a critical agent capable of raising questions about contemporary society, its values, and its symbols. Painting, and more specifically neo-expressionist painting that emerged in the late 1970s and early 1980s and that was rooted in the heroic ges-

ture of the artist in search of transcendence, was considered by oppositional postmodernists as regressive and ahistoric, promoting a conception of the artwork as a luxury commodity, ready to be exchanged in the marketplace.

Perhaps as a result of this reaction against neo-expressionism, the 1980s in the United States saw the emergence of the tactics of appropriation or simulation. These strategies were also a reaction to the dominant ideology of the mass media. Artists like Sherrie Levine, Barbara Kruger, Richard Prince, or Martha Rosler sought to deconstruct myths of American culture as they shaped or were manifested in everyday life by willfully ‘rephotographing’ famous photographs and signing them as their own or through using found, anonymous imagery.

As an art director in the 1970s, Barbara Kruger worked for Condé Nast publications, whose legendary art directors had nurtured and shaped many of the premier photographers of the twentieth century. This experience provided her a sense of how magazines manipulate their readers through photography as well as graphic skills that she employed in her subsequent art work. As she noted, “It’s the magazine’s duty to make you their image of their own perfection.” Employing collage and photomontage, techniques used by avant-garde artists of the 1920s and 1930s including Hannah Höch and John Heartfield, Kruger re-inscribed these visual strategies in a contemporary context, focusing on representation as an instrument of power and a regulator of sexual difference. In works such as “Untitled” (*Your gaze hits the side of my face*), 1981 and “Untitled” (*Buy me I’ll change your life*), 1984, Kruger demonstrates how photography can serve as a means of addressing questions about language, sexuality, representation, commodities, and the relationships among them, expanding the perspectives and possibilities of feminist art. Pre-existing images, lifted from their original contexts and reproduced in black and white, are open to new interpretations. Thus Kruger demonstrates that the meaning of a photograph lies on its social use and context more than on what is inherent in the image.

As can be seen in Kruger’s work, much of the most important artistic production of the 1980s is directly concerned with photography’s capacity for creating and imposing social stereotypes. Many artists explored the visual potential offered by mass imagery and advertising, blurring the limits between high art and popular culture by use of photography. Another paradigmatic artist of the 1980s is Richard Prince. Prince also began his career working at a commercial photography concern, the clippings department of Time-Life publications. In the base-

ment archives of the publisher of the famous picture magazine, he had access to literally thousands of images. In 1977, he began re-photographing photographs from advertisements. By separating images from their media context—that is, from their intended significations—Prince enabled them to take on other meanings. Saturated blow-ups of everyday commercial imagery, his Ektacolor prints explored photography's capacity to transform reality into fiction and fiction into reality. Prince became particularly associated with fragmented representations of the Marlboro Man, as in *Untitled (Cowboy)* of 1989. Enlarged and cropped, these images became free-floating signifiers of the mythology of American masculinity, subtly displacing the visual and imaginary relationship between the viewer and the artwork.

Another important artist of this tendency is Cindy Sherman, who emerged in the 1980s not only as an acclaimed photographer but as one of the decade's top contemporary artists. Sherman's *Untitled Film Stills* (started in the late 1970s and continued during the 1980s) are a set of black-and-white photographs in which the artist has costumed herself to suggest the female types available in the Hollywood movies of her childhood. Associating femininity with masquerade, she addresses directly the way mass media inscribe women into stereotypical models of representation, distributing roles and creating characters. Thus, Sherman establishes a sort of dictionary of photographic poses, through which the veracity of the staged image, as well as the codes required for its reading, are seriously called into question.

While Sherman works exclusively within the photographic medium, she is not considered a photographer in the sense of traditional photographic practice. Within the realm of "pure photography," as exemplified by figures like Helmut Newton and Henri Cartier-Bresson who inherited the tradition of the straight photography of the 1920s and 1930s, the theoretical debates also raged. Pure photography focused on what made photography different from any of the other arts—its "truth" to appearances and its peculiar physical and formal qualities. The most eminent spokesman for this formalist conception of photography was John Szarkowski, the director of photography at the Museum of Modern Art, New York, who more than any other individual in America had established photography as a high art, defining its terms of discourse and creating its canon, until being challenged by *October* magazine and its deconstructionist aesthetics in the 1980s. As Irving Sandler writes, Szarkowski had been to photography what formalist champion Clement Greenberg had been to painting. Szarkowski's thesis was that photography

is a unique medium, which, as it evolved, progressed self-consciously toward its own essence. This essence was theorized in terms of inherent properties such as time, the frame, detail, and the vantage point. In seeking to identify photography's "values, traditions, masters and masterworks," as Solomon-Godeau put it, Szarkowski felt that photography was "purified of its worldly entanglements, distilled into a discrete ensemble of 'photographic pictures,'" in short, treated with reference to itself only. Reflecting on his contribution, Szarkowski commented: "I think I took the risk of allowing photography to be itself and show itself without being couched in the rubric of philosophical or moral positions." (Sandler 1996, 348) Szarkowski's formalism was challenged again and again through the forum of *October* particularly as it prompted him to dismiss the directions photography took in the 1980s.

October's contributors were not the only ones who called into question this purist, documentary conception of photography. Many photographers rejected this stance as well as Vilém Flusser's assertion that photography is the last step before the complete dematerialization of the image. These artists, often called impure photographers, focused on the particular materiality and tactility of photographic emulsions. In contrast to pure photographers, these artists minimized photography's traditional or "straight" role as a veristic window on the world. They loosened up and expanded technique, cultivating the grain in their images, utilizing blurred focus, cropping, wide-angle distortions, and exploring color. Some of these photographers also began, harking back to the aesthetics of the Pictorialists, to manipulate the surface, emulating the idiosyncratic "touch" of the painter and to enlarge the formats, so that their photographs could compete with wall-size canvases.

Artists like Joel-Peter Witkin and Giordano Bonora (*Untitled*, 1986) especially exemplify the furthering of the Pictorialist tradition of creating a unique, painting-like works with subject matter that evokes spectral or allegorical associations. Witkin, like Mike and Doug Starn, Paolo Gioli, and Italian artist Natale Zoppis, among others, used brushwork, stacked multiple images, and manually colored their prints, enhancing photography's visual presence.

An important part of postmodern art theory saw in photography a significant shift from production to reproduction, the seminal article of Walter Benjamin "The Work of Art in the Age of Mechanical Reproduction," the often-cited support for this viewpoint. In this view, inherent in the nature of a photograph, the modernist boundaries between "high" and "low" cultural forms are breached or

obscured. Although there is no critical consensus about postmodernism, as Solomon-Godeau points out, “the properties of photographic imagery which have made it a privileged medium in postmodern art are precisely those which for generations art photographers have been concerned to disavow”. (Solomon-Godeau 1984, 76) On the other hand, impure photographers rejected the identification of photography with mechanical reproduction (and the subsequent denial of the original), prizing unique prints or limited editions of their work. In such a way, they aspired to the “aura” of the traditional, one-of-a-kind, and handmade work of art, defending the tradition in which the uniqueness of the process as well as the originality of the idea makes each print unrepeatable.

Examining the aesthetic divisions of photography that emerged in the 1980s, writer Susan Weiley proposed that

the more accurate distinction lies between photographers whose work invites intimate viewing, as in a book, and those who intend the work for a wall.... Work has shifted from the intimacy of being held in the hand toward something that has to be seen on the wall, at a distance. It's a major difference.

(Weiley 1980, 149)

While this distinction is somewhat helpful in sorting out the influential currents of the decade, the personal and intimate was not restricted to book formats or traditional small-scale black-and-white photographs typical of 1950s icons Harry Callahan or Robert Frank, nor was the public and distanced to be found solely on gallery and museum walls. Artists like Christian Boltanski took an interest in the intimacy of the photograph as a personal souvenir, producing both intimate artists' books as well as huge installations. In Boltanski's work, photography allows the creation of a fictional past, demonstrating that our personal identities are more and more structured by photographs, which tend finally to take the place of our memories, as in *Monument*, 1987. The format in which these photographs appear matter not as much as the intimate manner in which the artist presents them, often in grotto-like settings with the illumination of bare light bulbs or even candles. Others, such as Jeff Wall, using photograph's fictive abilities to “create” cultural and societal memories, relied on presentations associated with public spheres, such as advertising light boxes, while also successfully presenting these large-scale, backlight transparencies in book form, demonstrating the continuing, inherent flexibility of the medium.

The photo-paintings that emerged at the beginning of the 1980s and quickly became a favorite, if not dominant form in contemporary art through the end of the century originated with such artists as Jeff Wall. Using references to the history of paintings as well as to media imagery, Wall plays off the historical presumptions about photographs capturing or presenting reality while paradoxically creating fictions and the thin lines that separate these presumptions. Early works, such as *The Thinker*, 1986, based on Auguste Rodin's famous bronze, refer directly to great works in the history of art. In later works Wall explored the literary and filmic aspects in his art. The majority of his pieces contain references to art history, the media, and socio-economic problems, typical of postmodernism, and putting forth the concept that recasting tradition into contemporary visual culture may be one of the true distinguishing features of the decade.

Robert Mapplethorpe's work is also iconic 1980s imagery and is emblematic of the fact that underground, alternative, marginal, and marginalized cultures were favored topics for photographers during the decade. Mapplethorpe's most notorious images create a photo-document of the New York gay scene. But like Cindy Sherman, he made a series of self-portraits in which he appears disguised: as a horned devil, drag queen, terrorist with a machine gun, gangster, and so on. Although extremely personal and often shocking, his work has the stylishness and finish of high-fashion photography, essentially dehumanizing his models. Through quotations of old master paintings and fine art photography of historic figures such as Man Ray or George Platt Lynes, he aestheticized often repellent subjects, creating highly charged, seductive images whose sheer beauty served as a foil for their unrestrained sexuality. As Hal Foster put it:

new social forces—women, blacks, other ‘minorities,’ gay movements, ecological groups, students...have made clear the unique importance of questions of gender and sexual difference, race and the Third World...in such a way that the concept of class, if it is to be retained as such, must be articulated in relation to these new terms.”

(1983, 17)

Nan Goldin's *The Ballad of Sexual Dependency*, which examined the social milieu of those considered outsiders, was one of the most influential photographic series of the 1980s. Often working within the loose narrative structure of series of related images, Goldin photographed intimate scenes of her closest friends. Expressing a highly personal viewpoint, Goldin also frequently featured a reli-

gious motif as seen in *Self-Portrait in Blue Bathroom*, 1980, where the bathtub suggests ritual cleansing, and the artist's image in the mirror is framed by the blue of St. Mary, another tendency that harkened back to an earlier time, especially the turn of the twentieth century. Andre Serrano's overt use of Christian iconography caused a firestorm of controversy in the late 1980s, sparking the so-called "cultural wars" in America.

Sexuality and its complex relations with the photographic act of seeing are also at the center of Nobuyoshi Araki's work. Araki presents the female body with an erotic intensity as in his *Tokyo Story* series, 1980–1988. Undressed, bound, and staged in domestic environments, it becomes the object of both exhibitionist and voyeuristic instincts. Playing with the conventions of documentary and fashion photography as well as pornography, Araki uses his photographs as a means to exorcise his phantasms, offering along the way an incisive portrait of contemporary Japanese urban culture, proving that in the 1980s, the human body, naked or dressed, does not necessarily only implicate sexuality. In the 1980s, sexuality becomes yet another area for discourse on social issues, politics, or aesthetic theory.

The use of the human body, while a central motif in 1980s photography, was not monolithic in the nature of its representations. In stark opposition to Mapplethorpe's cold vision of perfect physique, John Coplans focused on the deterioration and vulnerability of the flesh, using his own body. As Elizabeth Fraiberg wrote, Coplan's photography "is the stuff of Mapplethorpe's worst nightmares." (Fraiberg 1990, 28) Coplans use of large scale and fragmented images presented in series brought forth a number of earlier tendencies associated with art photography of the 1960s and 1970s.

It is Lucas Samaras, working since the 1960s, who has probably most fully explored the limits of the documentary form through his use of Polaroid photography in a number of series in which he presents the intimacies of his own everyday life. Using the ability of Polaroids to both instantly offer up their image as well as their ability to be physically manipulated, Samaras enriched an historically humble medium with a personal literature that challenges presumptions about its immediacy and "popular" character. The highly personal, humble use of photography exemplified by Goldin and Samaras or Francesca Woodman, among others, also saw its opposite in another hugely influential tendency of the 1980s, that of the cold, distanced, analytic social document.

The most characteristic example is the work of Bernd and Hilla Becher, which is principally an

objective recording of architectural relics of the industrial age. (*Industrial Facades #4*, 1978–1995) yet which in presenting "typologies" fit well within the postmodern theoretical structures advanced during the 1980s. Bechers' conception of photography influenced a great number of photographers, who had worked since the 1970s but burst forth on the international scene in the 1980s, among them Andreas Gursky, Thomas Ruff, and Thomas Struth. The Bechers, whose photographs had achieved prominence within the conceptual and minimal art movements, taught at the Staatliche Kunstakademie (State Art Academy) in Düsseldorf, where Gursky and others assimilated their rigorous method and its implications. Teasing an eccentric geometry out of each of his subjects, Gursky reorders the world according to his own visual logic, accumulating myriad details to offer a sense of harmonic coherence. His pictures typified by *Hong Kong Stock Exchange*, 1994, may be described as modern-day versions of classical history painting in that they reproduce the collective mythologies that fuel contemporary culture: travel and leisure (sporting events, clubs, airports, hotel interiors, art galleries), finance (stock exchanges, sites of commerce), material production (factories, production lines), and information (libraries, book pages, data).

Ruff and Struth also exploited and expanded the Becher's use of photography as a neutral medium in the service of an objective representation of reality. The mechanical and coldly descriptive appearance of their images is reminiscent of August Sander's sociological use of photography to record "types" in the 1920s and 1930s. Yet this generation of artists realized that photography's "neutrality" and "objectivity" are not a reality, rather a commonly-held belief. In their typically large-scale, color photographs, these artists present images that often seem more real than reality itself.

Another important photographer to emerge out of the historical traditions of photography in the 1980s is Martin Parr. A photojournalist in temperament and by training, Parr produced several startling color series that extended and redefined this tradition, including *The Last Resort*, 1986–1988, and *The Cost of Living*, 1988. In these photographs that unite a growing political awareness with a preoccupation with the domestic and mundane, Parr created dynamic, colorful images that, ranging in subject from crumbling British seaside towns to international hubs of consumer culture, offer witty, unblinking insights into contemporary life.

But aesthetic tendencies or even aesthetic fad and fashion aside, photography, unlike painting and other traditional media, is primarily a fruit of

science and its industrial applications. Its expressive potentialities, before being a matter of conscious choice and personal vision, depend on technology. In that sense, one of the reasons of photography's success in the 1980s is the fact that it became available to a growing number of people. The visual possibilities offered by the technological progress of photographic procedures gradually disengaged photography from its traditional subjugation to reality. Artists used various techniques, including large format Polaroid photography, advanced electronics, multimedia, and digital imaging, to create works that question issues of historical verity as well as the conflict between reality and imagination.

During the 1980s, a system called DX coding was introduced for 35-mm film. The cassettes in which the film is encased were imprinted with an auto-sensing code enabling certain cameras to automatically set the film speed; this information can also be used by processing laboratories to accurately develop the film. In 1980, Sony demonstrated the first consumer camcorder, and in 1984 Canon demonstrated the first electronic (digital) still camera. In 1985, Minolta marketed the world's first auto-focus SLR system (called "Maxxum" in the United States). In 1987, both Kodak and Fuji introduced inexpensive disposable cameras, the Kodak Fling and Fuji Quicksnap. Both were sold in foil wrappers ready-loaded with film, the complete camera being given to the film processor after exposure. Canon went on to introduce the RC-760 still video camera in 1987 and the Q-PIC floppy disc camera in 1988, which led to the introduction and widespread acceptance of digital cameras in the 1990s.

Such are the issues that preoccupied photographers in the 1980s: the technical particularities of the medium which, along with industrial evolution and the advent of digital technology, deeply transformed its aesthetic premises; the role and function of photography in the broader social and cultural context of post-industrial societies; the place of human subjectivity inside them, that of the body, its intimacy, disguises, mutations and mythologies; quotation and play with the typologies and historical conventions of the medium; coexistence of past and present and the shifting relations between fact and fiction. In this way photography is constantly taking effect between the private and the public sphere. Among the many exhibitions that seemed to showcase these tendencies, we can retain *Image Scavengers: Photography*, mounted in 1982 by the Institute of Contemporary Art at the University of Pennsylvania in Philadelphia; *Appropriation and Syntax: The Uses of Photography in Contemporary Art*, mounted in 1988 at the Brooklyn Museum of Art in New

York; *20th Century Photographs from the Museum of Modern Art*, photographs selected by John Szarkowski and Susan Kismaric, mounted in 1982 at The Museum of Modern Art in New York; and *New American Photographs*, mounted in 1987 at the Harvard University Art Museums.

The 1980s witnessed a particularly vital and inventive period when the reciprocal influences of artistic and commercial photography effected a clear change in the way that artists as well as the public apprehended photography. If the photographic experimentation in the field of fine arts opened the way to advertising and other mass media, permitting them to revise and renew their communicational strategies, the artistic recycling and appropriation of "low" forms of photography offered to artists an inexhaustible universe of new topics. From now on, not only commercial photography can be considered as a form of art, but, more importantly, artistic photography can be analyzed in terms of communication and visual marketing.

Be that as it may, it is clear that the photographic production of the 1980s cannot be apprehended through compartmentalized stylistic categories. Artists knowingly called into question such arbitrary divisions that confine and close off the art-discourse, showing that photography is much more complex and rich than it appears to be, a multidimensional and ambiguous object. Indeed, toward the end of the decade, the watchwords were hybridization and interbreeding, topics that would be further elaborated in the 1990s.

HANNAH HÖCH

German

Hannah Höch entered the art world as a creative force with the radical-leaning Berlin Dada circle, which formed shortly before the end of World War I. She was generally regarded as responsible for appropriating the photomontage technique from folk culture and making it an avant-garde art form in a way that perfectly fit the anarchic spirit of the Dada movement. Her works frequently contained distinctly personal iconography, but ultimately took part in the political discourses of the Weimar Republic, including those involving ideas of utopia, debates over technocracy in German society, and the construction of women's identities.

Born in 1889 in the Thuringia region of Germany, Höch was the daughter of an insurance company manager and an amateur painter and housewife. As the family's eldest child, she took care of her younger siblings and was largely kept from attending school. She was nearly 22 when she was finally able to enroll in the Kunstgewerbeschule in Berlin. There, she studied glass with Harold Bengen. The outbreak of World War I forced her brief return home, where she worked for the Red Cross. In 1915, she returned

to Berlin to study graphics with Emil Orlik at the Staatlichen Lehranstalt des Kunstgewerbemuseums. She met and became involved with the Austrian artist Raoul Hausmann in the same year. Their romantic liaison brought her into contact with many figures of the avant-garde, including the Futurists. Later, when the Berlin Dada circle unofficially formed in 1917, after the arrival of Richard Huelsenbeck from Switzerland, she also met the political dissidents George Grosz and John Heartfield, who published incendiary pamphlets under the name Malik Verlag.

Between 1916 and 1926, Höch worked three days a week for the Ullstein Verlag, which published the popular illustrated magazines *Die Dame*, *Berliner Illustrierte Zeitung*, and *Die praktische Berlinerin*. At Ullstein, Höch designed pattern books appearing in these journals, which targeted female audiences. Her work for Ullstein, taken in conjunction with the politicized intellectualism she took part in as a member of the Dada movement, eventually informed the ideological content of much of her art.

During a trip to Gribow on the Baltic Sea in 1918, Höch saw souvenir postcards depicting officer's uniforms onto which photographs of heads had been pasted. The medium used to create the images was photomontage, a technique existing since the nine-

teenth century. Höch was consequently stimulated to experiment on her own. As the illustrated magazine industry exploded during the Weimar years, Höch used portions of images collected from periodicals like those in which her own ornamental patterns appeared to create her photomontages. An inveterate collector, she kept scrapbooks and filled boxes with clippings, filed according to the object represented. Höch also frequently incorporated fragments of her own photographs and watercolors into her work.

Between 1918 and 1922, Höch remained closely affiliated with the Dadaists, from their explosive self-introduction into the art world through a radical performance at the usually decorous Berlin Secession of 1918 to the 1921 Dada evenings staged by Hausmann and Kurt Schwitters in Prague. In 1920, Höch participated in the First International Dada Convention held in Dr. Otto Burchard's gallery in Berlin, an event that marked the apex of Dada's artistic preeminence in Germany. Among several of her works exhibited was her renowned critique of the Weimar Republic, *Schnitt mit dem Küchenmesser*. Her 1922 work, *Meine Haussprüche*, is said to mark her break with Hausmann and the nihilism of Dada. The work manifests a sympathetic turn towards Constructivism in her compositional adherence to a vertical–horizontal axis.

Unlike John Heartfield, who extracted images from their sources with meticulous attention to outline and who subsequently rephotographed his montages so that each would appear as a seamless whole, Höch allowed the edges of her collaged images to be apparent. Because of the clipped-off contours, the juxtaposition of incongruous sizes, the visibility of picture seams, and the resulting grotesque appearance of her figures, Höch's works have been characterized by historians as violent. This brutality served her underlying messages, which frequently dealt with the continued subjugation of women in a culture undergoing seismic political shifts.

Always at issue for Höch was society's belief in the credibility of the photograph. Unknown to many readers, magazines and newspapers routinely manipulated the images that accompanied news articles in order to make them more dramatic. Höch's photomontages utilized similar methods of fabrication, yet allowed the evidence of the manipulation to be seen. With their cobbled appearance, her pictures constantly remind the viewer that they are artificial constructions. By emulating the level of control expended by fashion magazines to assemble ideal "realities," she both subverted and commented on the mechanisms of the media, revealing the didactic power of illustrated magazine content and the insidious implications this power had for women's self-perceptions and political situation.

Höch continued to create small format photomontages through the mid-1930s. She was immensely productive, exhibiting frequently, creating highly political series like *From an Ethnographic Museum*, and even publishing a book critiquing consumer culture entitled *Scheingehacktes* with her companion, the Dutch poet Til Brugman, in 1935. Through Brugman, she met the artists Piet Mondrain, Theo Van Doesburg, and Hans Arp, all with whom she became close friends. The National Socialist's Degenerate Art campaign of 1937, which successfully isolated artists and prevented their collaboration, halted Höch's exhibition possibilities and her productivity. In 1942, she moved to a small house on the outskirts of Berlin near Heiligensee, working and exhibiting intermittently until her death in 1978.

Biography

Born Johanne Höch in Gotha (Thuringia), 1 November 1889. Enrolled in the Berlin Kunstgewerbschule, 1912. Returned home to work with Red Cross, 1914. Studied at the Staatliche Lehranstalt des Kunstgewerbemuseums in Berlin, 1915. Became companion of Raoul Hausmann, 1915. Accepted part-time position at Ullstein Verlag, 1916. Experiments with photo collages after encountering medium during trip to Baltic Sea, 1918. Left Hausmann and broke with Dadaists, 1922. Began relationship with Dutch poet Til Brugman and settled in The Hague, 1926. Established contacts with Piet Mondrain and other de Stijl artists, 1926. Denounced as cultural Bolshevik by National Socialist, Wolfgang Willrich, 1937. Married pianist Kurt Matthies, 1938. Divorced Matthies, 1944. Lived in isolation on Heiligensee near Berlin, 1942. Died in Berlin on 31 May 1978.

HORST P. HORST

American

The formal portrait of designer Coco Chanel, Paris, 1937 and the famous 'Mainbocher Corset,' Paris, September 15, 1939, are among the twentieth

century's best known fashion photographs. Both were made within two years of each other by the photographer, Horst P. Horst. Displaying an intuitive understanding for form, grace, femininity, and elegance, the elegantly composed, dramatically lit

photographs exemplify Horst's style and capture the spirit of the 1930s. Horst himself conveyed the sophistication of the era: he was handsome, charming, and gregarious. He and photography were the perfect match for a "wonderful life," which gave him entrée to homes, gardens, and soirees. He said "I like taking photographs, because I like life. And I like photographing people best of all, because most of all I love humanity."

During a career spanning over half a century, Horst P. Horst gave us the definitive portraits of such diverse twentieth century figures such as fashion icons the Duchess of Windsor, Consuelo Balsan, The Baroness Pauline de Rothschild, and Elsa Schiaparelli; movie stars and singers Marlene Dietrich, Mistinguett, and Mary Martin; artists Salvador Dali, Jean Cocteau, and Cy Twombly; writer Gertrude Stein; and a host of others. Each of these portraits capture the personality and style of the sitter while at the same time conveying enduring qualities that has allowed it to become a classic. Horst said of Schiaparelli "she was daring and knew how to show it successfully," a phrase that accurately describes him as well.

Born in 1906 in Weissenfels-an-der-Saale in Germany, the son of a merchant, Horst originally came to Paris to study architecture with Le Corbusier. After meeting George Hoyningen-Huene, already established as the French capital's premier portrait and fashion photographer, he turned instead to photography. The 1930 Huene photograph *The Divers* of a young Horst, muscular and handsome in an Izod bathing suit, paired with a female model at the end of a diving board, is a watershed image, a signal of the androgyny and the drama that characterized the worlds of high society and art of the 1930s.

Horst's earliest photographic works echo Huene's cool classicism. But his dramatic lighting, circular backlighting, and use of the silhouette, were his own innovations and rapidly were established as his signature. Within a few years, Horst developed a more ornamental style. He may not have revolutionized fashion photography, but he certainly perfected it. He had a preference for a richly packed studio, a continued use of props, and complicated lighting effects. His *trompe l'oeil* (a photograph within a photograph) shots were among his most original. In 1936, Horst was at the height of his interest in placing his models in an elaborate studio "set," frequently designed by one of his friends, such as the interior decorators Jean-Michel Frank or Emilio Terry. Horst recalled that the Paris studio

was equipped with about 20 large floodlights and spotlights. He preferred to use the spotlights to emphasize the important points of a dress.

Horst flourished in the 1930s, and photographed prolifically in a style that embraced theatricality and classicism simultaneously. A favorite model was Lisa Fonnsagrives (later Lisa Penn), and it was his work with Lisa that demonstrated a gradual shift in approach. He eliminated props, relying on his mastery of studio lighting. Lisa was also the subject of some of his most successful nude studies, which convey the graphic inventiveness power of his compositions. This power can be seen in the classic *Vogue* cover of June 1, 1940. He posed the athletic and statuesque Lisa to create letters that spell out the magazine's title. These stylized gestures were based in part on his observations of dance; like a choreographer, Horst knew the graphic and emotional power of these gestures arrested at their peak.

Horst moved with the "fashionable set" in Paris in the 1930s. Amongst his closest friends were Coco Chanel, the eccentric and brilliant artist Christian Berard, the Vicomtesse de Noailles, Gertrude Stein, Luchino Visconti, and Janet Flanner. While he consistently photographed his friends, his photographs of Coco Chanel are particularly well known. Asked to photograph Chanel for *Vogue*, he found she hated the picture. Ready to pose several days later, she showed up with a bag of her jewelry, which was laid out on a table so that she could choose which piece to wear. She became absorbed in thinking about a love affair that was ending; this was the image Horst captured. It became her favorite image for years. He continued to have great success with his fashion work, which was formally inventive, ingeniously lit, often with a slight surrealistic edge. This sense of the strange and the dramatic is beautifully evoked in *Dali's costumes for the Ballet Russe de Monte Carlo production of Massine's Bacchanale, executed by Chanel*, which appeared in *Vogue* on October 15, 1939.

In 1962, when the ingenious Mrs. Diana Vreeland came to *Vogue* as editor-in-chief, she commissioned Horst to do a report on the Edwardian Consuelo Vanderbilt Marlborough Balsan and her collection of French works of art, beginning a new phase of Horst's career. Horst and his companion, the writer Valentine Lawford, set off around the globe, reporting on the lives of the "tres chic." In this work he pioneered the use of the small format camera and natural light for society portraiture and fashion photography, originating "lifestyle photography," an amalgam of formal portraiture, an unspoken narrative, and the capturing of the aura

that surrounds celebrity. Barbara Plumb in her introduction to the book *Interiors* wrote:

Whoever Horst photographed, he beguiled. It was magic to watch him at portrait sittings. When the rapport had jelled, he would ask for a Dubonnet or a Campari, depending on his mood, and then start clicking away with his Rolleiflex or Hasselblad. Even the stiffest and most fidgety of subjects overcame any natural shyness and fear of the camera in Horst's presence because he made each one feel appreciated and beautiful. The whole process was so much like a seduction that often other people in the room felt like intruders—or voyeurs.

One knows upon viewing these works that these were seamless collaborations between sitter and photographer, both of whom were enjoying their task at hand.

What ultimately characterizes Horst's photography is his conception of beauty. He studied classical poses, Greek sculpture, and classical painting. He devoted meticulous attention to details such as the positioning of hands, arms, and feet during the process of being photographed. The Detolle corset for Mainbocher featured in American *Vogue*, September 15, 1939, is an undisputed masterpiece of fashion photography. This haunting photograph marked Horst's farewell to Paris, soon to be occupied by Nazi Germany. Horst said

I left the studio at 4:00 A.M., went back to the house, picked up my bags, and caught the 7:00 A.M. train to Le Harve to board the Normandie....For me, this photograph is the essence of that moment. While I was taking it, I was thinking of all that I was leaving behind." Years later he said, "We all felt that war was coming....And you knew that whatever happened, life would be completely different after. I had found a family in Paris, and a way of life.

Horst immigrated to the United States in 1935 and became a naturalized citizen. He continued to photograph well into his 80s, and died Nov. 18, 1999, at his home in Florida.

Biography

Horst P. Horst was born Horst Bohrmann August 14, 1906, in Weissenfels-an-der-Saale in Germany. He was the son of a Garman hardware-store owner. After his education at the Schulpforta, followed by a short period in Switzerland and Capri, he was sent by his parents to work for a Hamburg export firm. He soon returned to study at Hamburg's Kunstgewerbeschule, a well-known school of applied arts under the direction of Walter Gropius from 1926–1928. While there he wrote to Le Corbusier

and was invited to be a student-apprentice at the architect's atelier in Paris in the late 1920s. In Paris he met George Hoyningen-Huene and became his photographic model and lifelong friend. He started his career at *Vogue* helping out with sets at the *Vogue* studio in Paris. He began taking pictures himself and continued working for Condé Nast Publications in Paris as staff photographer, 1932–1935. He took over as chief photographer in *Vogue*'s Paris studio when Huene left to join *Harper's Bazaar*. Horst spent part of each year in Paris and the remainder in New York. He made New York and Oyster Bay his permanent residence. He specialized in fashion, portraits, travel, and later with Valentine Lawford houses, gardens, and lifestyle photography. Immigrated to the United States in 1935 and was naturalized in 1942. He served in the U.S. Army from 1942–1945 as a technical Sergeant. He remained a fashion and still life photographer for Condé Nast Publications well into his 80s. Died November 18, 1999, Palm Beach Gardens, Florida.

EIKOH HOSOE

Japanese

Eikoh Hosoe is among the most important practitioners in the history of modern Japanese photography. Born Toshihiro Hosoe in 1933, the son of a Shinto priest, he was only 12 years old when Hiroshima and Nagasaki were bombed by the United States during World War II, leaving unprecedented physical and psychological destruction. Hosoe

acquired his first camera at the age of 18 and began to capture the transformations of a terror-ravaged Japan; he changed his name to Eikoh to mark the beginning of a new era. His easy mastery of English provided opportunities, especially later in his career.

Hosoe’s early interest was in documentary-style photography. His photograph “Poddie-Chan” (1951) of a young American child (taken at the

Grant Heights U.S. Army Base in Tyoko during the postwar occupation) won first prize in the student section of the Fuji Photo Contest of 1952. Inspired by the result, he enrolled at the Tokyo College of Photography but soon abandoned his interest in documentary ideals. While at the College, Hosoe was a key contributor to a new expressive style espoused by the *Demokrato* (Life) group that collaborated during the postwar era. Other members included Ay-O, On Kawara, Masuo Ikeda, Tatsuo Fukushima, and the spiritual leader Shuzo Takiguchi. Hosoe began to experiment and created photographs that were extremely dramatic and—a move which has continued throughout his adult life. His photographs around this time attempted to evoke the dark, post-nuclear face of Japan as a way of understanding changes and exploring personal expression. The strong contrasts made possible by black-and-white photography have also been a consistent interest for the artist, who has only ventured into color photography once.

Hosoe graduated in 1954 to become a freelance photographer. His book *35mm Photography*, a technical guide, was published a year later, and favorable sales allowed him to travel throughout Japan. During 1956, Hosoe mounted his first solo show at Konishi-roku Gallery, entitled *An American Girl in Tokyo*, a fictional photo essay with text that depicted a story of ill-fated love between an American girl and a Japanese man. While commercially unsuccessful, the story recounted in the exhibition was made into a radio drama, and the series was published in *Photo Salon* magazine.

The most profound moment of Hosoe's early career, however, occurred in 1959, when he saw a performance by the young dancer and founder of *Butoh* dance, Tatsumi Hijikata. Hijikata adapted Yukio Mishima's novel *Kinjiki* (*Forbidden Colors*, 1952–1953), creating a scandal through his exploration of the homoerotic themes of the book. At this time, Hosoe helped to found the commercially successful photo agency VIVO, an organization formed from a group called Eyes of Ten, and he also staged his second solo exhibition, *Otoko to onna* (*Man and woman*), which shocked Japanese audiences and earned him international attention. The exhibition included very large, fragmented nude portraits of Hijikata and the people in his dance troupe, which Hosoe refers to as “photographic theatre.” That same year, on a beach in Chiba, Hosoe and Hijikata made the experimental, anti-nuclear war film *Navel and Atomic Bomb*. Hosoe has also made several other films during his career, such as *Judo* (1964) and *Modern Pentathlon* (1964) for the Tokyo Olympic Games. Both artists

returned to Chiba the following year to develop a new series titled *Embrace*. By chance, however, Hosoe also discovered Bill Brandt's *Perspectives of Nudes* (1961) and abandoned the *Embrace* project for 10 years for fear of imitating the British master.

Also at this time, Hosoe won the “Most Promising Photographer Award” of the Japan Photo Critics' Association, and he began one of the most important and successful working relationships of his career with Mishima, who was impressed by Hosoe's work with Hijikata. One of their first collaborative projects was a series of photographs of Mishima, which Hosoe created for the writer's book of critical essays, *The Attack of Beauty* (1961–1963). Mishima was among the first modern Japanese writers to attract critical attention in the West; his novels often addressed the tension between Western and Japanese cultures. During this time, Hosoe took another series of portraits of Mishima, which were published as the book *Barakei* (1963), translated into English as *Killed by Roses*. Hosoe's photographs reveal the tension Mishima embodied between pre- and post-war Japan as well as the body and the mind. The series has been described by Hosoe as a “subjective documentary.” The artist's directorial role in the project is most evident in works such as *Ordeal by Roses #32* (1962) and *Ordeal by Roses #5* (1962) which depict Mishima with a rose in his mouth and tied up with a hose—symbolizing a masochistic balance of eroticism and menace. During this time, Hosoe married Misako Imai.

While highly regarded for this literary work, Mishima—Hosoe's most celebrated collaborator—was equally famous for his preoccupation with the human body, its beauty and degeneration. He longed for the patriotism of Imperial Japan and was explicit about the cultivation of the perfect physical form. His ultimate act of will was by committing *seppuku* (ritual suicide) in 1970.

Mishima's death coincided with the launch of the revised version of *Barakei*, which Hosoe postponed the release of until the following year. The English translation had also been changed to *Ordeal by Roses* at Mishima's request. The photographs in *Barakei* evidence the stylistic innovations of postwar Japanese photographers and reveal a level of photographic manipulation not seen until much later in other parts of the world. Many writers, such as frequent Hosoe commentator Mark Holburn, regard this publication as the artist's masterpiece.

Other well-known series, such as *Kamaitachi* (The weasel's sickle, 1965–1968), *Simmon: A Private Landscape* (1971–), and *Kimono* (1963), are private studies and metaphors for a changing Japanese society. The later works are cinematic and intensely dramatized,

playing on sexual discoveries, legends, and myths that relate to Hosoe in his personal life. During the 1970s, Hosoe began to show his work outside Japan, most often in America, as well as holding photography workshops at home and abroad. In 1972, Hosoe met Cole Weston, son of Edward Weston whose work he had admired since the early 1950s, and agreed to translate the *Daybooks of Edward Weston* into Japanese.

Throughout his career, Hosoe has used the human form, and the nude in particular, to explore issues of identity and the spiritual self, although there is no history of the nude in Japanese art photography until early in the twentieth century. Hosoe's photographs during the mid 1980s of the work of Spanish architect Gaudi reveal his belief that Gaudi's curvilinear flourishes have the sensuality of flesh. His book, *The Cosmos of Gaudi*, was published in 1984—although Hosoe had studied Gaudi's work since 1964—and included drawings and poems by Joan Miró. It was not until 1991 that Hosoe attained gallery representation through Howard Greenberg/Photofind Gallery, New York. Hosoe's most recent series include *Luna Rosa* (1990–1996) and *People Concerned with the Works*. Today, Hosoe remains an important figure in photography through his teaching and workshops (he has been Professor of Photography at the Tokyo Institute of Polytechnics since 1975). A retrospective of Hosoe's work, *Eikoh Hosoe: META* toured the United States throughout the 1990s.

GEORGE HOYNINGEN-HUENE

American

A leading fashion photographer between the World Wars, George Hoyningen-Huene brought an austere elegance to haute couture with sharp, polished images often bearing strong classical overtones. His work appeared in the principal fashion magazines of the time and had a significant impact, not only on contemporaries like Horst P. Horst and Cecil Beaton, but also on later photographers, including Irving Penn, Richard Avedon, and Herb Ritts.

Hoyningen-Huene was born to nobility in Saint Petersburg, Russia in 1900, and refinement and luxury were the mainstays of his childhood. His father was a baron, in charge of the czar's equestrian activities, and his mother was an American socialite. His early years were divided between the imperial court, a country estate in Estonia, and family tours of Europe. His appreciation for Renaissance and Classical art developed out of his European travels and was reinforced by frequent visits to the Hermitage. Despite a passion for history and archaeology, he was a mediocre student, excelling only in his drawing lessons.

With World War I and the Russian revolution, his family went into exile, first in Britain, then on the French Riviera. In 1918, Hoyningen-Huene joined a British expeditionary force fighting in Russia, where he witnessed famine and death firsthand. Upon his discharge, he moved to Paris to work as a film extra and perfect his drawing skills under the tutelage of cubist artist André Lhote before starting as an illustrator in his sister's fashion design studio, Yteb. His easy manner, exacting eye, and social pedigree assured him access to the highest echelons of the fashion world, and by 1925 his drawings were appearing in *Harper's Bazaar*. He signed an exclusive contract with Condé Nast a year later and designed photo backdrops for French *Vogue* before finding the opportunity to work behind the lens.

Too restless behind the drafting table, Hoyningen-Huene took quickly to the collaborative spirit of the photography studio, contributing photographs to *Vogue* and *Vanity Fair*. Edward Steichen, *Vogue's* head of photography and a major force in fashion at

the time, heavily influenced Hoyningen-Huene's early photographic style in stressing a modernist crispness with hard, modulated light that emphasized smooth lines, sculptural form, and fine detail. Hoyningen-Huene adeptly incorporated these traits into his work, as seen in *Lee Miller, Coiffure by Callon*, 1930, (Lee Miller was later to become a well-known photographer herself), where a plain backdrop and reflected light center attention on the nuances of the model's hairstyle and dress.

Despite his debt to Steichen, Hoyningen-Huene worked beyond these technical basics to develop his own style, adding a classical flavor derived from his extensive knowledge of art history. In costuming and form, the languid *Lisa Fonssagrives, Evening Dress by Vionnet*, 1938, pays homage to the neoclassicism paintings of Jacques Louis David, while the smooth male torso in *Beach Fashion*, c. 1930, suggests a fragment of Greek sculpture much like that found in Hoyningen-Huene's later *Fallen Statue, Isle of Delos*, c.1943.

An equally significant component of Hoyningen-Huene's Condé Nast work was his taste for gender indeterminacy, especially in his swimwear shoots, where he often depicted androgyny and role reversal. This aspect of his style derived in part from his close ties to the Surrealists—he was friends with Man Ray and Jean Cocteau, among others—but also likely drew on his own experiences as a homosexual in 1920s Paris. In *Bettina Jones, Beachwear by Schiaparelli*, 1928, a woman leans beside a seated man, coolly peering down at him over her cigarette smoke as though she has cornered her next conquest. Hoyningen-Huene's most famous image, *Swimwear by Izod (also known as Divers)*, 1930, addresses sexual ambiguity through simplified formal composition. With remarkably similar bodies, hairstyles, and swimsuits, a man and woman turn their backs to the camera, and, as her legs perfectly overlap his, their symmetry suggests they are merely two sides of a single being.

In addition to his fashion layouts, Hoyningen-Huene gained a reputation as a celebrity portraitist, making images of people as diverse as the movies' Tarzan, Johnny Weissmuller, and fashion designer Coco Chanel. He had a special talent for movie

stars, however, as he was able to convey anything from charming affability—as in *Cary Grant*, 1934—to iconic inaccessibility, which he captured in his portrait of the expatriot American dancer and performer, *Josephine Baker*, 1929.

Hoyningen-Huene's personal life overlapped with his work in his relationship with Horst P. Horst, who was his apprentice, model (as in *Beach Fashion* and *Swimwear by Izod*), and lover. One of the most fruitful relationships in the history of fashion photography, the two men worked and traveled together in the early 1930s, even building a house together in Tunisia. Horst's own photography would be deeply marked by what he learned from Hoyningen-Huene—occasionally to the point of virtual indistinguishability—and so it appeared only natural that, when Hoyningen-Huene left Paris in 1935 to join *Harper's Bazaar* in New York, it was Horst who succeeded him at French *Vogue*.

Working for *Harper's Bazaar* brought significant changes to Hoyningen-Huene's style as he strove to meet a different editorial style. Not only did he work in color more frequently, but he often left the studio to shoot outdoor assignments and even agreed to participate in advertising campaigns. While these changes demonstrated his considerable adaptability, they also revealed the fragility of his carefully controlled aesthetic. The photographs from this period sometimes seem cluttered and even tentative, losing the concise elegance of his Paris work as they deviate more toward the pretty than the powerful.

With growing discontent over the demands and limitations of magazine work, Hoyningen-Huene sought new subjects for his camera, taking extended trips to Africa in 1936 and Greece in 1937. Beginning with the book *African Mirage*, from 1938 to 1946 he published several works based on his travels, combining photography with literary texts and essays. Despite some stunning portraits, like the enshrouded young man in *Tunisia*, 1936, these projects evinced a preference for landscapes and architecture, and Hoyningen-Huene adjusted his methods accordingly. Seeking basic geometrical patterns and the play of planes, he produced monumental views with strong lines and cutting shadows, as in *Valley Temple of Khaf-Re, Egypt*, 1943.

Given these changing interests, at the end of World War II, Hoyningen-Huene decided to leave the fashion world entirely, moving to Hollywood in 1946. Always attracted to the cinema, he had produced and directed several short movies over the years, and with the encouragement of his friend and lover, film director George Cukor, he found work with the studios as a "color coordinator." The position was particularly nebulous in the still-

nascent color motion picture industry, and it suited Hoyningen-Huene's appetite for new creative and collaborative challenges, allowing him to combine his interests as he worked in production design, costume design, and even cinematography to develop the overall aesthetic of productions like *A Star is Born* (1954), *Let's Make Love* (1960), and *A New Kind of Love* (1963). He supplemented this film work with occasional publicity portraits of Hollywood stars and taught photography at the Art Center School. Never returning to full-time photography, he died of a heart attack in Los Angeles in 1968.

GEORGE HURRELL

American

The name George Hurrell is synonymous with the exacting art of Hollywood glamour portrait photography. His technique involved precise lighting and careful retouching of his negatives to produce the flawless beauty, drama, and sensual allure characteristic of his highly influential style. It was Hurrell who was instrumental in creating “the look” of many legendary stars of Hollywood’s Golden Age, often bolstering their careers and the success of their films with his sophisticated, mesmerizing photographs.

Raised in Cincinnati, Ohio, young George Hurrell had developed an interest in drawing and painting and later discovered photography as a way to reproduce his paintings. At the age of 16, he moved to Chicago to study painting, first at the Art Institute of Chicago and then at the Academy of Fine Arts, but he left the program in 1922. In the same year, he found a job hand coloring photographs for a commercial studio and moved from studio to studio until the portrait photographer Eugene Hutchinson hired him in 1924. While working for Hutchinson, Hurrell learned the techniques of lighting, negative retouching, airbrushing, and darkroom work.

Growing impatient with work at the Hutchinson studio and wanting to escape the cold Chicago winters, Hurrell drove west and settled in an artists’ colony at Laguna Beach, California, in 1925. Although he still harbored a desire to paint, he found a lucrative business photographing artists, their paintings, and the circle of rich and famous who frequented the bohemian set in Laguna Beach. Establishing a reputation for fine portraiture among the crowd, he eventually moved to Los Angeles in 1927. There, he got his first opportunity to photograph an actor when the socialite and aviatrix Poncho Barnes recommended the young photographer to her friend, the actor Ramon Novarro.

Impressed with Hurrell’s photographs of Barnes, Novarro commissioned a series of portraits. Thrilled with the results and unimpressed with lackluster studio photographers he had worked with in the past, Novarro showed his new stills to other actors at Metro-Goldwyn-Mayer (MGM) film studios. The photographs caught the eye of actress Norma Shearer. Shearer wanted the leading role in *The Divorcée* but was unable to convince her husband, MGM production chief Irving Thalberg, that she had enough sex appeal for the part. She hired Hurrell to create a new image for her. Hurrell trans-

formed the actress into a sultry siren and created the photographs that would land her the role. Thalberg and Shearer were so impressed with Hurrell's work that MGM studio's publicity department hired the photographer in 1930. For the next two years, Hurrell photographed every star at MGM, including Joan Crawford and Jean Harlow, his work setting a new standard for portraiture in Hollywood.

Hurrell's success was attributed to a photographic expertise that developed from the perfection of several techniques he had learned over the years. His formula for portrait lighting included attaching a spotlight to a boom arm, which could be carefully positioned to cast highlights on the subject's hair. He then added a softer key light placed slightly above and in front of the subject's face emulating natural light, and he illuminated the background with a floor lamp. Hurrell carefully adjusted the lighting to add dimension and drama to his photographs. In addition, he developed a retouching process, with the help of an assistant, that was so refined his subjects were asked not wear makeup during their sessions. Powdered graphite was applied to the negatives with a blending stump to accentuate the skin's highlights. This technique, in addition to the careful printing of his negatives, would yield a smooth, flawlessly luminous, yet lifelike quality to his subject's skin tone. Remarking about Hurrell's style, actress Loretta Young commented, "[your skin] looked like you could touch it."

From 1930 through the 1950s, Hurrell's career as a photographer flourished, but guided by a restless spirit; he worked at various studios as well as running an independent freelance business. By 1932, life at MGM for him was troublesome; after a disagreement with the head of publicity Howard Strickling, he left to set up his own studio on Sunset Boulevard. Hurrell's business prospered as stars flocked to his studio for portraits. After six years, the photographer moved to Warner Brothers, helping establish the careers of stars Bette Davis, Humphrey Bogart, Errol Flynn, and James Cagney. His talents for portraiture were needed during World War II, and Hurrell found service with the First Motion Picture Unit of the U.S. Army Air Force, where he shot training films and photographed generals at the Pentagon. He returned to Hollywood after the war, but soon found that the old style of glamour photography was out of fashion. Hurrell worked on the east and west coasts shooting advertising and fashion layouts through the 1950s, and he started a television production company with his wife, Phyllis, in 1952. He settled in Southern California permanently in 1956 returning to the film industry as a unit still man.

Recognition for his life's photographic work came in the 1960s and continues to the present day. Hurrell's first exhibition, *Glamour Poses*, opened at the Museum of Modern Art, New York, in 1965. Throughout the 1970s, he published numerous commemorative books and special-edition prints of his work. His reputation for creating glamour associated with the golden years of Hollywood was acknowledged by later generations of actors and actresses, and he continued to photograph stars including Liza Minelli, Paul Newman, and Robert Redford in his characteristic style. After his retirement in 1976, Hurrell continued to shoot portraits, adding to his portfolio the faces of Hollywood stars such as Sharon Stone, Brooke Shields, and John Travolta. Among his last assignments during the early 1990s were portraits of Warren Beatty and Annette Bening for the movie *Bugsy*, and singer Natalie Cole for the cover of her album *Unforgettable*. In the last years of his life, Hurrell worked with producer J. Grier Clarke and producer-director Carl Colby on *Legends in Light*, the first television documentary of his life and work. George Hurrell died of cancer in 1992.

AXEL HÜTTE

German

Axel Hütte, with Thomas Struth, Andreas Gursky, Thomas Ruff, and Candida Höfer, is a prominent representative of the so-called “New German Photography,” the “Düsseldorf School,” or the “Becherschüler”—labels that refer to a group of German photographers who came into prominence during the 1980s and who all studied with Bernd Becher at the Düsseldorf Academy of Art. Influenced by both the detached documentary style of German prewar *Neue Sachlichkeit* or New Objectivity and the self-reflexive attitude of conceptual art, these photographers depict the late twentieth century environment by means of prints—often large—that are characterized by compositional simplicity and the clarity and sharp details typical of the large-view camera.

Apart from an impressive series of black-and-white portraits in the late 1980s and early 1990s, Hütte aimed his camera chiefly at architecture, cities, and landscapes. His early 1980s black-and-white series of inner courtyards, entrance halls, and stairwells of London public housing projects of the early and mid-twentieth century testifies to this. Hütte presents these spaces as anonymous and deserted monofunctional zones, revealing both the weaknesses of the urban social reform programs that created them and the ruthless spatial politics of the Thatcher-era that neglected them. These photographs of worn-out architecture contribute to an artistic tradition that reaches back to nineteenth-century realism, which featured wastelands, back streets, and backyards prominently. At the same time, however, Hütte combines this unspectacular, everyday generic architecture with unmistakably classical overtones by referring both to the renaissance image of the *città ideale* and nineteenth-century topographical or architectural photography. This effect is achieved by milky white skies, a geometrical clarity, and an emphasis on the perspectival recession of the architectural space, which shows some similarities with Struth’s street series. Yet Hütte makes the viewer more aware of the picture frame. The photographic perspective consciously takes up a position *vis-à-vis* the urban scenography.

This sophisticated framing and fragmentation of (urban) space is equally prominent in his 1990s color photographs of bridges and subway exits.

In his pictures of steel bridges, the grid of cross-beams and girders demarcates and traverses the image. As a result, the surrounding landscape becomes a two-dimensional icon and is translated into a collage-like abstract image. In the photos of Berlin subway stations, this interest in industrial architecture is combined with a fascination for the rhythmical play of glass surfaces and their varying degrees of transparency.

Hütte, however, is mostly known for his landscapes. One of the highlights of his career to date is his series of pictures of the Italian countryside made in the early 1990s. Hütte shows that the Italian landscape is a long-standing cultural construction that developed in relation to an age-old imagery of *vedute* and *capricci* of scenery with architectural fragments and ruins. Although unmistakably depicting a contemporary landscape by means of a modern medium, he refers to this wealthy tradition. His landscape perception is colored by stereotypes and pictorial conventions such as the division of the picture into fields of color and the use of *repoussoir* elements, stressing the spatial tension between foreground and background. This is achieved by partially blocking the view with an architectural construction, which can be ancient crumbling walls as well as recently built suburban areas. In other cases, Hütte uses the familiar frame motif in order to contain the landscape within the structure of a classical loggia or a simple, utilitarian concrete or steel shelter.

The low horizons, the subtle hues, and the attention to the fragility of the structural elements of the landscape also turn up in his late 1990s impressive natural landscapes photographed on diverse continents. In contrast with his Italian series or other Mediterranean views, in his later work Hütte depicts spectacular mountain tops, glaciers, deserts or dense jungles. With these images of the virgin nature of extreme landscapes, Hütte, unmistakably, refers to the romantic notion of the sublime. Nevertheless, he does not create nostalgic images of a natural world, which, in contemporary society, is first and foremost an exotic product of tourism—a phenomenon that always has been closely connected with (photographical) image production. Hütte knows that the viewer is aware that his images are artificial con-

Axel Hütte, Furka, Suisse, 1995, Photo: Jean-Claude Planchet.
[CNAC/MNAM/Dist. Réunion des Musées Nationaux/Art Resource, New York]

structions made by means of a technical apparatus and the endless patience of the artist. Sometimes, he reminds us of that fact by stressing the act of framing—especially in his diptychs, in which the same landscape is framed differently. Hütte succeeds in lending a certain modern quality to these seemingly innocent images by focussing on the vulnerability of the landscape. Atmospheric conditions are stressed. Often, the landscape is presented as an almost imperceptible realm. The view in his Italian *vedute* is blocked by an architectural structure; his mountain tops are equally obfuscated in fog, and his jungles are completely grown thick. With their almost monochrome surfaces, geometrical simplicity, and their suggestion of boundless extensions, these landscapes answer to the modernist space of abstract art and modern architecture favouring infinity, transparency, and dematerialization—qualities evoked in the deep blue monochromes of Hütte's recent nocturnal cityscapes as well.

IMAGE CONSTRUCTION: PERSPECTIVE

Strictly speaking, perspective refers to the illusion of three dimensional space created in a two dimensional image by lines converging toward a single point, and the apparent decrease in the size of objects that occupy space further from the camera. In classical perspective, the size of an object is in a more or less standard hierarchy of depiction, from those in the foreground to those meant to be in the midground and background of a painting; in other words, in a traditional painted or drawn scene the viewer can perceive those things that are “closer” by the size relationships presented among all objects in a scene. In a photograph, however, the size of objects in the foreground and background of a photograph can change greatly with variances in distance between camera and subject. As the camera moves in close, the subject appears larger in the image while the objects in the background remain about the same size. As the camera is drawn away, the subject appears smaller or the same size as the objects in the background.

In photographs, there is not only the illusion of depth, but there are also different kinds of depth established by the type of lens on the camera and the distortions created by the lens and camera angle. Changing a lens without changing the camera-to-subject distance will not affect single point

perspective, because the sizes of all objects in the image will change by the same amount. But the lens will change the perspective on how much space there seems to be between the objects from foreground to background. A long focal length or telephoto lens compresses the space in perspective and makes objects in front of, or behind each other, seem closer together. A classic example is when shot from behind through a telephoto lens, the pitcher in a baseball game appears reduced in size relative to the distance the viewer “knows” separates him from the batter and catcher and which normally would cause the pitcher to loom larger than those at home plate, even as the distance between the pitcher and home plate appears greatly truncated.

A wide-angle lens has the opposite effect of making objects seem farther apart than they really are. This effect should be familiar by the warning placed on the slightly convex mirrors used as rear-view mirrors in automobiles: “Caution: objects are closer than they appear.” A wide-angle lens will also distort the shape of objects by making them seem to stretch out away from the center of the image. Vertical elements may lean to the side, or spherical shapes may appear to be elliptical, especially near the corners of the frame. This dis-

tortion is increased if the camera is aimed down or away from the center of the image. It is also increased as the camera moves closer to the subject, and decreased as the camera moves back from its subject to a greater distance. The human form, especially the face, becomes especially distorted by this effect in wide-angle lenses, particularly when the camera is close to its subject. For this reason, photographers often choose a longer focal length lens for portraiture, figure studies, and fashion photography, unless this distortion is part of the photographer's intent. The portraits and nudes of British photographer Bill Brandt during the 1950s created groundbreaking images of the human figure using the distortion of wide-angle lenses to make his subjects appear emotionally intense, mannered, and painterly.

Perspective, as it applies to the way horizontal lines in an image recede and move closer together as they move into the background, will be exaggerated with a wide angle lens, and increased as the camera moves in closer. This same effect that occurs with vertical lines of building is often seen as undesirable, because it is a frequent problem in the photography of architecture, where good perspective is important. Swings and tilts of a large format view camera back and lens are frequently used to correct this kind of perspective distortion. Digital tools may also be used to make corrections, but will change the shape of the rectangular image and require cropping the image to a smaller size.

The width and breadth of the space in a photograph may be extended with a panorama perspective to include more space, from left to right, than is actually possible in a single photograph. In extremely wide panoramas, there may even be more than one set of converging lines, creating multiple perspectives in a single image. This can be achieved with a special panorama camera designed for this purpose. Panorama images can also be made with digital image stitching tools in leading photographic software packages.

When the camera is located beyond the common positions of the human body, oblique, radical perspectives are possible. The "bird's eye view" may be accomplished from a high vantage point looking down. This perspective may sweep out high across a landscape with a smooth, gradual transition between foreground, middle ground, and background; or, it may be more extreme, with the camera pointed directly down on its subject in a smaller space.

The "worm's eye view" occurs when the camera is located near the ground and pointed upward at an extreme angle. Widely attributed to Russian

Constructivist Alexander Rodchenko, this perspective was inspired by the Russian Revolution to invent new ways of looking at the world. Rodchenko felt this new change in political and social conscience deserved equally new visual perspectives to alter the viewer's perception of what is possible, visually and conceptually, in an image. Designers experimenting with cameras at the Bauhaus, such as the Hungarian architect László Moholy-Nagy, also worked with new forms of perspective, inventing camera angles and framing strategies that varied from conventional expectations of what a photograph could be.

This experimental spirit in perspective came early in the twentieth century with the exciting new cultural changes brought about by early twentieth century modernism, but it was also a response to the freedom offered by newly designed hand cameras. Until 1888, all photographs were made from extremely large glass plate cameras limited to the perspectives offered from the static location of a tripod, and limited in use to the expertise of skilled photographers. The hand camera made it possible for laymen and practitioners of other disciplines to experiment with photographic perspective as a means of exploring ideas of their own, and it freed them from the physical limitations of large view cameras. The results of these early experiments in perspective are now integrated into both commercial and artistic photographic practice.

Contemporary photographers continue to experiment with perspective. Photographer John Pfahl has done an extensive series of "altered landscapes" in which he has used string and other strips of material in the photograph to "draw" in the photograph. In the final print these interventions in the landscape appear both as three-dimensional and two-dimensional figures, because they play on the illusions offered by tricks of scale and dimension in a three dimensional space compressed into a two dimensional medium.

While the photograph is a medium that has always been known for its accuracy in representing reality, the relationships of objects or forms in a photograph from a given point of view, or a given lens, can vary within a very broad range of possibilities. The singular point of view, however, remains constant. Today, some theorists would argue that this central, singular viewpoint suggests the individualism of entrepreneurial capitalism, and thus constitutes a set of pictorial conventions that affirm a political ideology. Some artists might argue to the contrary, that this condition is what makes photography capable of expressing a succinct humanitarian and emotional point of view.

Either way, perspective is important to how the camera makes "reality" an interpretive process.

Perspective can alter the perception and the viewers' experience of what is possible within the terms of photographic space and vision. In response to social, cultural, and political points of view, it can alter the intellectual interpretation of the image. Understanding perspective is critical to understanding how to master the expressive control of photographic technique and the communication of ideas through photography.

IMAGE THEORY: IDEOLOGY

Since its establishment as both a practical and fine-arts application, an ideology about photography's nature has been developed that contains varying sets of dictums describing what should be considered legitimate or even ideal in photography, as an art and as a craft. This set of assumptions has alternately bound and freed photographers to create images for societal consumption. The consumption of the images is itself within another set of assumptions, with political considerations looming large, as a medium so widespread and having such a clear impact on society cannot fail to have deep political implications.

The phrase that served as the title of William Henry Fox Talbot's pioneering 1844 book *The Pencil of Nature* remains at the center of all ideological discussions about photography. From the idea of photography being a means by which the existing world is faithfully depicted two main questions arise. The first question asks if photography is an objective medium; the second question deals with photography's status as a means of artistic expression. These questions both arise, however, from the chemical, optical, mechanical nature of photography which seems, in a commonsense view of things, to endow the medium with a "natural" or "automatic" (objective) manner of reproduction.

Photography's early success owes much to the needs of nineteenth century society of such a pro-

cess. Even if the "natural" and "automatic" part of photography worked against its successful recognition as an art form, photography was able to produce the kind of images western artists, using devices such as the camera obscura, had been searching for since the fourteenth century. The scientific or natural part of the photographic process was seen as a way to escape human subjectivity, a very desirable idea in the nineteenth century as astonishing strides in the sciences were made.

As the camera was developed and refined in the late nineteenth century, especially with lenses modeled on the human eye, the camera and the eye were seen as functioning very much in the same way. The resulting ideology was that photography was perceived as tantamount to human vision, that is, human vision "frozen" in time and neutral in its capturing of the image. In this sense photography could be considered a universal language, an idea that can be found in many nineteenth and early twentieth century texts on the subject.

Yet defining photography as at base neutral and "scientific" did not resolve whether or not it could be considered art; in fact, paradoxically, its very "objective" nature allowed some artists to theorize that by hand-manipulating these optical, chemical, mechanical processes, true artistry could arise, a viewpoint at the base of the Pictorialist movement of the late nineteenth and early twentieth centuries.

Anyone could capture an image; few could successfully manipulate that captured image to be on a par with painting or printmaking as a unique, soulful expression of a creative individual.

Yet as early as the 1920s, many artists and theorists began to question this ideology, especially in light of the revolutionary political events of the day, including World War I and the communist revolutions. In the great disruptions of society in Europe and elsewhere, it quickly became apparent that photographs were malleable. The context in which the image was seen was recognized to be how the photograph's meaning was determined. The rise of the illustrated press in Germany and later America, the use of photographs in advertising, and the burgeoning of the cinema, universally described as but an illusion of light, quickly spread the idea of photography as a subjective medium that showed no more "truth" than any other. In fact, its ability to mimic what seemed to be the "real world" yet be unreliable as fact gave rise to an entire new image theory: that of photographic images as paradoxical. Many were content to let photography do what it did well—more or less effortlessly capture images from the everyday world (as evidenced by the huge commercial success of products for the amateur market)—and give photography its due as a supporting player in the drama of fine arts production.

"Photographic vision," the notion that the human "eye" was now being influenced by that of the camera lense was first expressed with the rise of Modernism and the *Neue Sehen* (New Vision) movement in the 1920s. This notion arose out of the interplay between the practical applications of photography and the aspirations of some of its practitioners that it be recognized as an art medium equal to all others, but on its own terms. What photography was able to depict that the human eye could not capture undeniably influenced various modern art movements, from Impressionism to Cubism. Yet photography's expressive qualities remained in doubt even as its subjectivity became increasingly apparent, especially to its practitioners and theorists.

As a major component of advertising and propaganda, photography's subjectivity became harder and harder to deny, yet popular audiences for the medium remained vulnerable to photography's claim to objectivity. Its optical-mechanical qualities were still recognized as scientific; what changed was a recognition that all human activity was inescapably subject to human manipulation and interpretation, a legacy of such post-World War II philosophies as Structuralism and Deconstruction. Considering each photograph as a cultural

artifact, that is, a product of a particular society and culture with its own particular set of codes, directly opposed the earlier notion of photography as a universal language. This a more politically driven critique than it might seem; as with photography their target is, from a Marxist point of view, what could be called the ideological superstructure of society.

The question of photography's objectivity did not arise once and then become settled. The issue has been rethought and revisited in various ways during various eras. The shift from artisan activities to the commercial press in early twentieth century paralleled but did not define the reaction against Pictorialism that unfolded in the fine-arts photography realm as early as the first decades of the century. The "objectivity," which would become the distinctive mark of mid-twentieth century photography, had its roots in the *Neue Sachlichkeit* (New Objectivity) movement of the 1930s, a product of post-World War I society. The images that resulted from the ideology of this movement were paradoxical; many were so experimental or abstract that the average viewer may not see them as objective in any sense. Yet the philosophy held that in producing images that could be made only via photographic means (whether with a camera or through non-camera means such as photograms), true objectivity could be achieved, as the process was freed from the subjectivity of the human eye and experience.

The quest for objectivity took a much different path among American art photographers of the 1930s, exemplified by Ansel Adams and Edward Weston. These photographers believed that through the use of view cameras, small apertures and the care in exposing, developing, and printing that led to the zone system, objectivity was achieved through sheer technical skill. These decisions, which produced photographs that were considered at the same time objective and beautiful, in fact restricted photographic practice to a small part of what photography was capable of achieving. The belief that crystal sharp, black-and-white images that displayed the full range of tones from black to white were in fact the best, most factual representations of the real world showed the power of ideology. These images in many ways could not be further from "real," as they deleted color, assumed that human vision is clear, sharp, and able to focus simultaneously on foregrounds and backgrounds, and presented images with degrees of perspective often beyond human vision. Yet Weston's and Adams's ideology shaped the perception of what is an objective image in virtually all types

of photography, especially architectural, advertising, and industrial photography, and set the standard for what was acceptable as a fine-arts photograph for decades.

The tension between the subjective nature of photography and those who believed the medium had authentic applications toward objectivity reemerged in Europe around World War II with photographers like those who would found Magnum Photos (including Henri Cartier-Bresson and Robert Capa) or *Life* magazine photographer W. Eugene Smith. These photographers, enamored of the possibilities of small format cameras, which could use available light and come close to the subject without the subject's being aware of the photographer, dictated an entire school of photographic endeavor. This movement had many rules that claimed to be signals of whether a photograph could be "trusted" as straightforward, unmanipulated, and solely reliant on a combination of the medium's optical-mechanical characteristics, shaped only by an alert guide. These rules included that the image should not be cropped, leading to the famous black border Cartier-Bresson included in his photographs to prevent publishers from cropping them, as these photographers had great conflicts with publishers arising from the way photographs would appear in the printed page. Yet this idealism had its practical limitations: W. Eugene Smith worked extensively on his prints, bleaching, dodging, and burning until he got the desired effect. The ability of the photographic negative to be manipulated to compensate for less-than-ideal conditions at the point of its exposure by no means is antithetical to the idea that photographs are objective. Yet as these very techniques are most often employed to smooth over the differences between the way photography can capture images and the way the human eye and brain process visual information, would indicate that photographs in fact are not, and perhaps cannot be, objective. A further confusion about authenticity and objectivity happens with montage, which presents disparate images as one. Now easy to achieve with digital techniques, this technological advance will create new ethical problems for photographers.

In the late twentieth century, ideological concerns about the photograph as an objective record resided mostly in the area of photojournalism, as postmodernism codified the position that all images are subjective given that they are human creations consumed in various cultural contexts. An example is that in the late 1990s the considerable success of Brazilian photographer Sebastião Salgado, also a Magnum photographer, led some

to criticize him for posing or otherwise interacting with his subjects against the traditions of photojournalism in which the photographer should be an observer, not a participant. Yet Salgado also follows the ideology of the social documentarians of the early twentieth century, such as Jacob Riis or Lewis Hine, whose social and political agendas superseded the ideologies of fine-arts image making. Yet the debate that Salgado engendered demonstrates the continuing synergy between these two areas—the developing and perpetuating of image ideologies useful to photographer-artists interested in aesthetic expression and those useful to larger societal goals.

Today's photography is a very broad field with applications in almost every aspect of modern life whether using chemical or digital means. The often subtle or even arcane arguments within photography as a fine-art activity continue to have an impact on its larger practice. And the practice of photography in other realms continues to inform the fine-arts ideologies. The development in the last decades of the twentieth century of a fine-arts aesthetic based on vernacular forms such as the snapshot or the photo album shows these ideologies continued to be defined by those that arose at photography's inception.

IMPRESSIONISM

Impressionism in photography is inextricably intertwined with naturalistic photography and Pictorialism, or art photography. In 1889, Dr. Peter Henry Emerson published a book entitled *Naturalistic Photography for Students of Art* in which he argued for the establishment of photography as a legitimate art reliant on the specific techniques of the discipline. In part, Emerson's text was a reaction to Henry Peach Robinson's *Pictorial Effect in Photography* (1869), a highly influential publication that advocated a beautiful, artistic photography based on the emulation of painting. Such pictorial effects were often achieved through the careful staging of subject matter and unrestrained manipulation of the photograph itself. Emerson vigorously objected to such contrived photography and its overt concern with the aesthetic of the finished product. Rather, Emerson argued for naturalism, which he defined as "the true and natural expression of the impression of nature by an art." Emerson reasoned that beauty already exists in nature; thus, "all suggestions for the work [must be] taken from and studied from nature" (Emerson 1889, 23).

In addition to opposing the aesthetic aims of Pictorialism as practiced by Robinson, Emerson objected to the seemingly opposite scientific mentality that sought to render all aspects of the photographic subject in focus. For Emerson, the goal of naturalist photography had nothing to do with the exact recording of nature. Rather, Emerson argued, the photographer should use the camera to convey the image perceived by the human eye. Relying on physiological studies of the human eye and scientific explanations of human sight, Emerson claimed that the eye does not perceive the entire field of vision with perfect clarity; only the central object appears sharp and in focus, while the foreground and background of the image appear slightly blurred. Thus, the goal of the naturalist was to remain true to human perception, to capture the essence of the scene as viewed by the human eye. To achieve this end, Emerson suggested that the photographer shoot only naturally occurring (not manufactured) scenes and make all but the central object of the photograph slightly out of focus.

Emerson's call for pure, naturalistic photography—an honest photography using simple equip-

ment and non-staged compositions to imitate human perception—proved quite influential, providing a middle-ground between the aesthetic sentimentality of Robinson's Pictorialism and the supposed objectivity of scientific photography. Yet, Emerson's proposal of intentional blurring in the photograph opened the way for a less precise type of photography that, ironically, and to Emerson's dismay, fostered another form of photographic Pictorialism—impressionism.

With respect to painting, the term "impressionism" derived from a Claude Monet painting entitled, *Impression: Sunrise*, of 1872. Monet's hazy image of the port of Le Havre offered a representation of the momentary experience arising from a transient impression rather than the precise detail of the scene. From then on, the word impressionism has been used to describe this artistic movement, understood as both an extension of and a departure from preceding realist painting. Thus, an understanding of impressionism requires an awareness of the inherent qualities of realism.

The development of realism is most often traced to the art and literature of nineteenth century France. The hallmarks of realism commonly included a broadened notion of history, an expanded range of experience, and a concentrated field of vision in temporal and emotional terms. For realist artists, historical, royal, and/or religious subjects were replaced by common and contemporary subjects available for immediate observation. The acceptability of this new subject matter corresponded to more general trends involving the post-enlightenment rise of scientific activity and the preceding romantic era. The aim of realism was to give truthful, objective, impartial representations of the real world, based on the rigorous contemplation of contemporary life. This ambition stemmed from the desire of artists in the late eighteenth and early nineteenth century to rid themselves of emotional subjectivity arising from preconceived and formulaic methods of artistic production. The realists' chosen tool was that of the developing basis of science and empirical research: "objective" study and observation. Realists, such as the painter Gustav Courbet or the positivist Auguste Comte, intended to present objects and events without prejudice, not in accordance with subjective or insti-

tutional notions. The French author Hippolyte Taine challenged people to look—really *look*—at their surroundings:

Give up the theory of constitutions and their mechanism, of religions and their system, and try to see men in their workshops, in their offices, in their fields, with their sky, their earth, their houses, their dress, tillage, meals, as you do when landing in England or Italy, you remark faces and gestures, roads and inns, a citizen taking his walk, a workman drinking

(Linda Nochlin, *Realism: Style and Civilization* 1971, 23)

Thus, fidelity to reality, despite the problematic nature of what exactly constitutes a truthful perception of reality, became a primary aspect of the realist endeavor.

Similar to realist painters, impressionist artists were also guided by the notion of fidelity to reality. As did their predecessors, impressionists dedicated themselves to the representation of scenes as immediately perceived. This insistence on contemporary subject matter observed first hand functioned for both realist and impressionist artists as an objection to established and institutional artistic conventions. Yet, the impressionists significantly differed from the realists in their understanding of fidelity to reality and the artistic techniques employed to render that reality. Rather than abide by the realist tendency to create seemingly objective and detailed reproductions of a scene, impressionists focused on representing an actual experience derived from the fleeting moment of observation. Furthermore, as was Emerson a few years later, impressionists were likewise influenced by scientific discussions of human vision and perception. They too recognized that the human eye does not see colors and objects as distinct entities, but rather perceives them with respect to the colors and objects with which they are juxtaposed. In addition, ever-changing atmospheric qualities of light and air, not to mention the motion of the subject, affect the overall image of any given scene. With these issues in mind, impressionists focused on capturing the play of light and color that activated an image, not reproducing an exact likeness of the objects in that image. The resulting aesthetic involved the hazy and somewhat imprecise representation of the scene as the painter had experienced it during his act of creation. Thus, more so than crisp delineation of detail, impressionist painters attempted to accurately convey the subjectively perceived essence of a precise moment.

The impressionists' emphasis on the perceived essence of a scene was somewhat similar to Emerson's prescriptions for naturalist photography. It is not surprising, then, that impressionism also had its

photographic adherents. George Davison (1854–1930), a young devotee of the concepts of naturalism, took Emerson's suggestions for “differential focusing” to another level. Emerson never intended for a photograph to be completely out of focus; yet, Davison recognized the aesthetic potential inherent in the unfocused image. In 1890, Davison delivered a lecture entitled “*Impressionism in Photography*” in which he argued that the degree of focus of a photograph should be determined by the photographer's intent. If the goal of the photographer was to objectively record his subject, then clarity of detail necessitated total focus. If the photographer had more artistic intentions, he was then free to render his subject at will in order to achieve an aesthetically pleasing outcome. As an example of an artistic image, Davison offered his own award-winning photograph, *The Onion Field* (1890), a blurred and imprecise representation of an old farmstead captured with pinhole photography.

Such out-of-focus photography, often in replication of impressionist painting, quickly became popular, due in part to its ability to convey a romantic and ephemeral atmosphere. To achieve impressionistic representations of their subjects, generally natural landscapes, ambitious photographers adopted a variety of techniques. In pinhole (essentially lense-less) photography, the camera lens was replaced by a small hole through which light could shine on light-sensitive material, resulting in a more diffused and less precise image. Another technique involved the use of a soft-focus lens; blurring resulted from the exploitation of imperfections in the camera lens itself, providing a “softer” representation of the subject or scene. To achieve impressionistic images, other photographers printed their images on rough-surfaced paper or even fabric, and employed diffusion filters during the printing process. In addition, the introduction of the gum bichromate process in 1894 allowed photographers to physically manipulate their images, using a variety of methods to both erode and/or layer upon a light sensitive gum arabic mixture that coated the photographic paper. All of these techniques, used alone or in combination, aided photographers in the creation of impressionist photographs, pictures that were often consciously modeled on the works of impressionist painters.

Not all were thrilled by the pictorial effects of impressionist photography; Emerson, for example, lambasted Davison as an untrained amateur and accused him of misappropriating the original concepts of naturalism for the development of a “fuzzy school” of photography. Yet, the denouncements of critics did little to stop the spread of impressionist

IMPRESSIONISM

photography and various pro-impressionist groups emerged, beginning in 1892 with the Linked Ring Brotherhood. Earlier that year, H.P. Robinson, along with Davison, resigned from England's premiere photographic institution, the Royal Photographic Society. As advocates of photography as a fine art, Robinson and Davison sought to distance their work from the scientific photography promoted by the Photographic Society. Robinson then founded the Linked Ring and invited a number of photographers, including Alfred Stieglitz and Frederick H. Evans, to become members of this exclusive, new London-based organization dedicated to the propagation of photography as a fine art. Ten years later, building upon the model of the Linked Ring, Stieglitz initiated the Photo-Secession in the United States. While not all members of the Linked Ring and Photo-Secession produced impressionist images, they were dedicated to the establishment of photography as a fine art and, with this in mind, adopted a mentality that embraced the sentiment of

impressionist photography to convey an accurate, albeit subjective, momentary perception of reality. In the ever-present struggle to establish photography as a legitimate art, the attitude and techniques fostered by impressionism allowed the work of serious photographers to stand apart from that of both scientists and the increasing numbers of amateurs infiltrating the field. Impressionism offered photographers the freedom to work in accordance with individual artistic aspirations and to present a personal and emotionally charged representation of the world.

Impressionism in photography was a relatively short-lived movement. By 1910, a clear preference emerged for a photography governed by its own conventions, not modeled on the aesthetics of painting. With the increasing acceptance of photography as a fine art in its own right, a number of photographers turned to purely photographic techniques to create their works, leaving behind the conscious emulation of impressionist painting.

Today, the diffused aesthetic of impressionist photography frequently appears in the work of commercial and nature photographers. In these genres, a hazy or imprecise representation can prove helpful in a number of ways. For example, the calculated blurring of an image can infuse the image with atmospheric emotion ranging from glowing optimism to misty gloom, while simultaneously de-emphasizing less enticing details of a model or product. In addition, the photographer can convey activity by panning the camera in tandem with a moving subject. In conjunction with a relatively low shutter speed, this technique will render the subject in focus and the remainder of the scene out of focus. The use of special lenses can create impressionist images, as well. A long lens (useful for photographing subjects at a distance) and/or shallow depth of field will also allow selective focus, as will certain combinations of aperture and shutter speed settings. A soft-focus lens can be used to soften details, such as facial wrinkles of models, resulting in a smoother and more idealistic image. Alternatively, once the photography is taken, the final image may be altered during the developing process in any number of ways, from the layering of diffusion filters to computer-based digital manipulation. In short, contemporary photographers have recourse to a countless array of techniques to achieve impressionist effects, and can rely on impressionist effects to evoke an infinite range of emotions.

INDUSTRIAL PHOTOGRAPHY

Twentieth-century industrial photography is a subset of documentary photography, focused on production and abundant supply. Its own subsets include environments of productivity, or industrial zones; tools and machinery for industrial production, or capital goods; workers, work teams, and foremen; and the interrelationship of these components under the aegis of entrepreneurial, corporate, or governmental control. An enormous storehouse of images, escalating in quantity and complexity of interpretation from ca. 1900 through the 1950s, it is primarily an American phenomenon with its roots

in the transportation revolution that replaced canals, packet boats, and steamers with railways, large cargo ships, and ore boats; in the power revolution which replaced steam with electricity; and in the engineering revolution which replaced shop-based, rule-of-thumb engineering with laboratory-based, university trained planning, drafting, and theory. Industrial photography may be said to reflect an American system of manufactures, wherein any image pertaining to a specific archive is interchangeable with another, and that the archive itself only makes sense when considered to be an

INDUSTRIAL PHOTOGRAPHY

index of the production process that transforms raw materials into industrial products, then distributes them to outlets for sales or back into production for further stages of fabrication.

American industrial imagery, particularly engineered tall structures such as cranes, derricks, and skyscrapers, became of supreme interest to industrializing European countries during the interwar years of the 1920s and 1930s, engineering an international Machine Style and a European variant photography known as *Neue Sachlichkeit* (New Objectivity). New Objectivity photography was, however, contained within the architectural, crafts, and fine arts disciplines as taught in the Weimar Bauhaus, an experiment in utopian living and production that did not survive the massive military preparations and suppressions on the eve of World War II. It was not industrial photography per se.

As codified in the postwar industrial zones and factories in the 1950s and 1960s on both sides of the Atlantic, industrial photography has factual/historical and metaphorical relationships to progress. The factual/historical relationship entails records or inventories of processes and machinery that relate to the monitoring, managing, and improving of production. The metaphorical relationship is more obtuse and entails “pictorial stories” of industry that relate to the instilling of an aura of productivity. A late-1960s German text defines this metaphor as marketing of the “prestige variety”:

The new photographic style does justice to this development by trying to bring out the spirit of our age, to interpret...the rhythm of modern industry, the precision, the many interlocking functions on the mechanical, electrical, chemical, and biological level as an integrated whole....The technical characteristics of such plants attract the photographer with a flair for pictorialism as much as they provide the technologist with the information he needs....

(Giebelhausen 1967, 36)

The following chronological summary exposes the factual and metaphorical components of industrial photography as dynamic fields of operation and representation. It considers the evolving industrial landscape. In order to explain these dynamics, large projects rather than individual pictures or photographers are foregrounded, although their trajectories may intersect individual careers and styles. Pictures are viewed as industrial artifacts in production and as archives in distribution.

Archival projects manifest a compulsive desire for completeness, a faith in an ultimate coherence...an empiri-

cist model of truth prevails. Pictures are atomized, isolated in one way and homogenized in another.

(Sekula 1987, 118)

The summary concludes around 1950. Succeeding decades are most accurately represented as post-industrial, with industrial imagery and zones skewed to more personal and ironic approaches defined and maintained within academic forums and the art world. As Kim Sichel has explained

The cultural power of the machine as a beacon of the future has been radically changed. In recent decades, photography's relationship with the machine world has also changed, evolving from a tool for preaching to a more tentative, ironic, and historicizing record...a more self-referential stance.

(Sichel 1995, 1, 9)

1900–1920: Industrial Zones

Industrial photography became a defined field at the turn of the century. Before this time numerous photographs were taken of individual proprietorships, shops, and dense industrial areas. These cannot be defined as industrial zones or “works” because they lack coherence and comprehensiveness; in their jumbled heterogeneity they float free of coordinates or connecting links, save those of the proprietors or engineers, prominently posed in the pictures, who were responsible for their construction or operation. Coordinates were provided through burgeoning transcontinental railroad systems and the concomitant expansion of factory districts and building types along the rights of way. By 1900 major railroad lines crisscrossed and even overlapped the country, converging in parallel grids or huge arcs at urban gateways and urban freight yards—the new “metropolitan corridors.” These grids and arcs, followed by the overhead lines of electrified trolleys and locomotives, are both the “text” and organizing elements of photographs taken along the New York/New England seaboard; at the Brooklyn Bridge; and in Chicago, Cleveland, St. Louis, and other expanding corridors. Alfred Stieglitz's *Hand of Man* and *In the New York Central Yards* (1902 and 1893, respectively), feature these grids and convergences.

At the same time, the “control of communication” and the establishment of managerial hierarchies in large railroad companies were also reflected in the photographic codification of industrial building types. Besides monumental bridges,

photographs of industrial installations include monumental terminals; trackside maintenance structures; power stations; suburban depots; any number of factories, iron and steel works, and petroleum installations; as well as loading and unloading devices along wharves and docks. Whether or not they appertain to the new oligopolies and monopolies being formed in these years, each structure appears as a singular artifact *and* as a component of a coherent engineered order. Its own components (roof lines, smokestacks, trusses, suspension cables, cranes, towers) read clearly so as to be easily identified and cross-referenced. Trains, ore boats, and other ships also loom large, yet do not disorient the viewer as they are pictured head-on, horizontally, or zeroing diagonally into deep space.

Just as “system,” “efficiency,” and “survey” were the buzzwords of the new engineering theory, “consolidation” characterizes these dynamic industrial images. The Detroit Photographic Company, which marketed prints and postcards, consolidated the practices and inventories of William Henry Jackson and numerous other independent photographers. Along with the stereo views of the Keystone View Company, Underwood & Underwood, and other national distributors, Detroit Photographic’s images marketed a visual archive of urbanism as industrialized order to an industrializing public (metropolitan workers and shoppers). They show residues of “grand style”—clear compositional boundaries between the genteel observer and the industrial zone. However, their equally grand exploitation of the long, panoramic format, for example, the four-part panorama of Bethlehem Iron Company (1891), indicates linear expansion and implies boundless diversification.

The drama of these new zones—their smoke, steam, and thrusts—is also forcefully presented in photography. It is indebted to paintings, prints, illustrated stories extolling industrial escapism, and Pictorialist photography. Stieglitz’s snapshots of the New York Central yards, Alvin Langdon Coburn’s smoky, artfully smoke-stacked views of Pittsburgh steel installations, and Clarence White’s studies of mid-western canal and eastern ship-building zones show the visceral impact of the spreading “hand of man.” Pictorialism was instrumental in creating a symbolic language of process, material transformation, looming form, and cavernous space that Margaret Bourke-White and others would infiltrate into the next generation. Where industrial photography and industrial Pictorialism substantially differ is in the notion of the archive itself, which implies a huge quantity, a

need for storage, mass distribution, and the submersion of the artist into the arterial tracks of engineered and romantic commerce. Pictorialism vaunted the single print by the singular artist.

Archival and industrial strategies and images come together in the photographic document of 1904–1914, the construction of the Panama Canal. Ernest Hallen, the official photographer of the U.S. government’s Isthmian Canal Commission, made over 10,000 negatives covering every aspect of the project. His most advanced work positions the observer right in front of huge concrete structures or within the canal cut. Ulrich Keller notes that these intersections produced not only an “awesome body of information,” but also “the systematic documentation of a given industrial production process by a specially appointed photographer who remains on the job for months, if not years.” (Keller 1983, viii) The “awesome information” strategy extended into the corporate 1920s; studied, systematic communication would define federally controlled projects of the 1930s.

1920–1930: Incorporated Structures

By the 1920s and in the fully developed industrial corporation, the production and distribution of images were fully professionalized by executive managers and engineers. A departmentalized hierarchy of communication strategies replaced the multiple founts of image-making of previous decades, and photography came into its own to represent them. Members of the higher executive strata utilized this imagery to communicate with one another horizontally, reinforcing their hard-won status of policy-makers and gatekeepers.

Decontextualization was the mode of address, and it was accomplished via a variety of image types: aerial views of industrial installations as well as urban industrial districts; perspectives of factory interiors; close-ups of machines; and close-up portraits of executives. These were perfected by photographers whose prominence was keyed to their ability to adapt their techniques and styles to various industrial jobs and clients. Success was also keyed to exposure in the key archival publications of the day. Corporate stockholder magazines, portfolios, and advertisements were the basis of this exposure as publicity managers generated the commissions. Re-publication in business culture magazines (*Fortune* and *Vanity Fair*), in university textbooks (*American Economic Life*), and in multi-volume pictorial histories (*The Pageant of America*) further standardized and ensured the life of these image types.

Margaret Bourke-White's photographs of Cleveland's iron and steel district and its major industry, Otis Steel (1927–1929), followed by their re-publication in *American Economic Life* and in *Fortune's* "Hard Coal" (February 1931); "Iron Ore" (April 1931); "Raw Materials in Costly Motion" (July 1931); and "Mill on the Lake" (September 1931), among other portfolios, effectively decontextualized and systematized romantic Pictorialism. Structures and workers were enshrouded in clouds, fog, or smoke, or captured as silhouetted apparitions piercing the darkened sky. Far from being considered pollutants, smoke and steam enhanced the illusions snatched from nature, contributing to the symbolization of power as it was magnified in the corporate nexus. As practiced by Herb Rittase, Ewing Galloway, and the many anonymous corporate photographers whose work appeared in *Fortune*, this type of imagery exponentially increased the body of formats and styles derived from early twentieth-century romantic and engineering-based prototypes. Thus choreographed buildings, vehicles, and machines were re-visualized as mysterious, ineffable presences—metaphors for the controlling executive presences who, ensconced in their financial district offices, had literally decontextualized themselves from the scene.

Top executives saw themselves and their territories as abstractions: auratically bathed in light, shadow, and/or atmosphere; decontextualized via tight cropping and the close-up; and further abstracted in indeterminate space. The photographic programs of leading-edge image disseminators General Electric and Ford companies show these strategies clearly. Examples in the General Electric's archives include power stations, dynamos, and transformers photographed either with or without workers as scale figures. General Electric reproduced these as cut-outs or montages on a blank field, with captions such as "\$4600 buys this 1667, kv-a. Transformer, 99% efficient, 13 feet high." (Ripley, 1929) Ford's image program included the photographs of Charles Sheeler, who covered the new River Rouge plant. Sheeler's photographs update the industrial grid with the planar complexities of Cubist painting, transmitted through Stieglitz's gallery 291 and its journal *Camera Work*. *Criss-Crossed Conveyors* (1927) was reproduced in *Vanity Fair* with the caption, "By Their Works Ye Shall Know Them." In Ford's company magazine *Ford News*, Sheeler's *Ladle Hooks* (1927) was elevated to the level of a religious icon; it received the publicists' appellation "the Cathedral of Industry." According to Terry Smith, "[This is a]n industry without produ-

cers, process, or product...an industry of image, look, an abstract domain, a suitably clear background for the pure act of consumption of the sign to be sold." (Smith 1993, 115–16.) This was the ultimate abstraction of the industrial zone.

1930–1940: Governmental Power

During the Depression years of the 1930s, industrial photography followed major building projects and these were located in the federal sector. The key federal projects involving industrial photography were power stations, in particular hydroelectric dams constructed in the Far West. "The huge scale of the new power stations and their potential for transforming society made them more imposing than anything that had preceded them." (Nye, 1994, 133)

Photographers were retained by the U.S. government to document these projects from inception to completion. As public money was involved, the intent of these photograph campaigns was rhetorical and propagandistic: to prove fiscal responsibility, to survey managerial control and worker safety, to put a closure to the satisfactory surmounting of engineering challenges, and to supply the burgeoning image agencies (for example, the Newspaper Enterprise Association and *Life* magazine) with grandiose publicity scaled to emphasize social as well as economic value. The industrial photographers of the 1930s were expected to know not only image-making strategies, but also the various technical processes involved with construction. As differentiated from the photographers of the contemporaneous Farm Security Administration photographic project, industrial photographers on federal construction sites were permitted to "draft" their own shooting programs so long as they adequately covered the project to which they had been assigned. Image types were codified in line with their rhetorical and engineering-oriented functions: overall views, taken over time; details showing the technical intricacies of construction components; routines of work; equipment and machinery; construction milestones, often embellished or re-staged for dramatic effect; and "fine art" views.

Ben Glaha, an engineering draftsman hired to document the Hoover Dam project, exemplifies 1930s industrial photography. His views of the dam site along the Colorado River have the grandiosity and abstraction of Bourke-White's *Mountains of Ore* (1927–1929), but heroic titles (reflecting heroic corporate identities) have been replaced with engineering data: "The Downstream Face of

the Dam and a Portion of the Power Plant as Seen from the Low-Level Catwalk. Top Forms on Dam at Elevation 1,055. October 2, 1934.” His structural and mechanical engineering details have the decontextualization, planar gridding, and complexity of Sheeler’s River Rouge conveyors, but heroic slogans (reflecting corporate advertising campaigns) have been replaced by information: “Detail of Roof Slab and Beam Reinforcement in Canyon Wall Valve-House Structure. June 1, 1935.” And in his fine-art views, taken as engineering documents and then printed for display and framing in federal offices in Washington, the controlling eye of the executive manager has visually been replaced by that of the machine. This is exemplified in the monumental claw-like shapes and shadows climbing up and arching over “Portion of 287.5 Kv. Transformers, Roof Take-off Structures for Units N-1 to N-4 Inclusive, from Ramp at Elevation 673.0. April 12, 1938.” Glaha commented that “drawings of this type are often beautiful....It is the beauty of precision, the beauty that becomes evident when nonessentials are stripped away—in other words, the beauty of pure function.” (Ben Glaha, quoted in Vilander, 1999, 55) This was the ultimate streamlining of the industrial project.

After 1940: Industrial Re-Mapping

The didactic functions and messages of industrial photography were an established lexicon by the 1940s. What became apparent during and after World War II was that the focus of American progress had shifted: from the industrial metropolis to the industrial district with its factories; thence to the power plants being constructed in remote, rural locations; and finally to the vehicles and highways that transported materials, products, goods, and people to all of these sites of production. One aspect of post-World War II industrial photography is its linkage to an emergent highway culture, a culture of space bisected by highways, criss-crossed by junctions, bounded by billboards, and anchored by tourist villages that rapidly merged with nearby towns. The “strip,” the ubiquitous jumble of establishments just outside so many city limits that photography from the 1950s through the 1980s would scrutinize, was not far behind.

The major industrial photography project of this eminently modern era was the archive amassed by Standard Oil of New Jersey (SONJ) under the direction of Roy Stryker. Intended to bolster the huge petroleum company’s image through the production and dissemination of thousands of pictures (SONJ was under fire because of accusations

of possible wartime collusion with the Germans), the project amassed 85,000 photographs, thousands of which were kept in circulation. Some made their way into newspapers and magazines, including SONJ’s *The Lamp* and *Photo Memo* and the popular periodicals *Life*, *Look*, and *Saturday Evening Post*. Others were enlarged into the relatively new form of the photo mural and sent to cultural and educational organizations. Still others formed the visual texts of fine art exhibitions, including *In and Out of Focus* at the Museum of Modern Art, New York.

What is important about this culminating industrial archive is not its image styles, image types, or even its short-lived success as propaganda, but rather the overall scale and reach of the program and its thorough professionalization. Whether the subject of a pictorial sequence is an oil installation and its high-technology machinery, such as the series devoted to the fluid catalytic cracker in Linden, New Jersey, or a SONJ-dominated locale, such as the series on St. Martinville, Louisiana, or three SONJ towns in Texas, the content is the restructuring of the continental map as nodes of industrial activity separated by huge spatial voids. These nodes extend the notion of industry from the workplace to the town and finally to the family home itself. Photography makes this extended industrial landscape “real.”

Esther Bubley, Russell Lee, Harold Corsini, Edwin and Louise Roskam, Gordon Parks, Todd Webb, John Vachon, John Collier, Jr., Berenice Abbott, Charlotte Brooks, and Elliott Erwitt were the SONJ photographers. They worked as freelancers. Some were veterans of 1930s documentary projects and others made their first mark here. In that they were working with a by-then fully professionalized photographic language, they can be considered the first “industrial photographers.” From this point on, industrial photography would be mainstreamed “to help sell products, to influence public opinion, and to educate and entertain employees.” (Zielke and Beezley 1948, v) It comes as no surprise that the aforementioned text, dividing industrial photography into “pictorial,” “human,” “news,” and “how-to” interests, came out in the apex years of SONJ-distributed imagery. Thereafter, the how-to books proliferated, and the field plateaued.

INFRARED PHOTOGRAPHY

Pioneering astronomer Sir William Herschel made the discovery of infrared light in 1800. Interested in viewing the sun through a large telescope and recognizing that this cannot be done by direct means, he began a search for filters that would accomplish this. Herschel discovered certain colored filters passed little light, yet produced a great deal of heat. Other filters passed lots of light, but little heat. He speculated that different

rays had different heating capacities and that the rays from the infrared, literally meaning "below the red" were responsible for the maximum heating effect. In an elegant experiment he proved his theory. Many refinements of this discovery followed, principally by Ritter and Ampere. From the 1870s on a great deal of scientific experimentation with sensitizers took place, including those chemicals that extended the sensitivity into the infrared

INFRARED PHOTOGRAPHY

range. Modern photographic infrared films were perfected by the early 1930s, and initially the applications of the films were for scientific and military purposes. Gradually these films gained popularity with artists and photographers, and they are readily available in most camera stores.

Infrared Film

Infrared films are made by adding certain sensitizers to the film emulsion during the coating process. This “allows” the film to “see” the infrared spectrum. The question is “exactly what does this film see?” The answer is that it depends on what filter is used with the film. Without any filter the film works as a coarse grain, green sensitive (orthochromatic) emulsion, and it is sensitive to the entire visible light spectrum. By adding filters, starting with yellow (#12) and going to orange and red (#25) or the infrared only filter (#87) the film can “see” deeper and deeper into the infrared range. The filters actually subtract or block the visible light depending on the color of the filter and therefore reveal more of the remaining infrared light. The question is often asked if the infrared films can record heat and the answer is that they cannot “see” heat. The reason is that the infrared films record the infrared portion of the light spectrum *reflected* from the subject being photographed, not the thermal energy that the subject contains.

Light Spectrum

There are different theories that describe the light spectrum. The one that makes the most sense for photographers is the wave theory. This theory holds that light is a wave and that you can measure the length between the tops of the waves, similar to waves in the ocean. The distance here is very short, shorter than of one millionth of a meter. We call these nanometers and the visible light spectrum sits between 300 and 700 nanometers. Ultra violet is about 300 nm, while red is 700 nm. Beyond 730 nm is the infrared range, and its length is generally defined as being between 730 to 1400 nm. The commercially available films range in sensitivity from 750 nm to 900 nm. Thus it becomes important to select the right film for a given purpose or infrared effect. Kodak films are generally sensitive up to the 900 nm range. Ilford SX-200 has a range up 750 nm, while Konica films reach into the low 800 nm range. Since nanometers are analogous to horsepower in an engine, the higher the number the more infrared the film is potentially capable of recording. The difference in the results then becomes the filter that you apply in taking the photograph. The

stronger the filter, the more of the infrared information that you will record on your film.

Exposure

Infrared films do not have standard exposure sensitivity such as an ASA or ISO. The reason is that the film is sensitive to the amount of infrared radiation that is reflected from the subject that you are photographing. So where does infrared radiation come from? The sun is a massive source of infrared, but as we all know, the amount of sunlight present can vary depending on many factors, including weather conditions, pollution in the air, time of day, and season of the year. Other good sources of infrared light are tungsten bulbs and strobe lights.

Some light meters and camera meters can read infrared very well, others do not do so well, and unfortunately none have an explanation or warn-

Konica 750 in the 2¼" film size	ASA 32 without the filter
Kodak Infrared High Speed HIE – 35mm	ASA 125 without the filter
Ilford SX200	ASA 200 without the filter

ing in the directions that come with the meter. Fortunately, the amount of infrared light that is present is proportional to the amount of light from the above sources.

The following are some recommended settings for camera light meters that have proven valuable and should serve as a starting point.

The method of taking an infrared photograph is to take a meter reading without the filter on the camera, set the proper exposure, and then put the filter on the lens.

Infrared Light and Lenses

There is another element to consider with infrared and that is the wavelength itself. The lenses on almost all cameras are made to focus the visible light spectrum. Optically the lens must bend the different rays (read different wavelengths) so that only one image is formed on the film inside the camera. This is quite an optical feat and some older lenses could not do this. With infrared we find that the wavelengths are even longer than the visible light waves and that the normal rules no longer apply. These waves in effect form an image behind the camera when the camera is focused on the visible wavelengths. In order to make an infrared image that is in sharp focus, we must actually

“un-focus” the camera. Most 35 mm cameras have a small mark or dot on the lens barrel that indicates where the infrared focus point is, thus making our job a little easier. But there is another way to help solve the focus problem. It is called depth-of-field. By using an f-stop of f/8 or smaller aperture the focus problem of infrared films is almost eliminated. As a practical matter you can expose at f/8 or f/11 and let the meter determine the shutter speed. This will work well for about 90% of the situations involving 35 mm cameras. Focusing with sheet film and a view camera is somewhat different. The recommendation here is a normal focus through the ground glass and then extending the bellows about 1/4". Again, using depth-of-field or smaller apertures will help to eliminate the focus difference.

Processing and Handling

This is something else that is different from normal black-and-white films. The Konica and Ilford films can be handled in subdued light, but the Kodak film must be loaded and unloaded in total darkness. That means in a darkroom or with a changing bag. Processing the film requires some care as well. Infrared films tend to react strongly in the highlight areas and can easily be overdeveloped.

Why Use Infrared Films?

Philosophically speaking, the film literally records light waves that cannot be seen. Extending this, we are recording objects or people that are not there. That is not quite true, but then a photograph is an illusion anyway. It does put the viewer on notice that something different is going on. It is an approach of isolating the image and subject in a special way, and it declares the artist/photogra-

pher's intentions. An infrared photograph almost always conveys a strong sense of drama. One of the distinguishing features of infrared photographs is that all vegetation in bright light turns “white” in the finished print. Skin tones take on an alabaster look. Infrared film can open up a whole new world of seeing for the photographer.

Since the 1930s infrared film has been used among fine art photographers in addition to its scientific applications. While widely explored by amateur photographers, its use by professionals remains limited. Weegee, for example, used infrared film and infrared flash to photograph movie audiences. Edward Steichen used it to make some of his World War II photographs. Minor White completed a series of infrared landscapes in the mid-1950s using large format infrared film, including the image *Barn and Clouds in the Vicinity of Naples and Dansville, New York*, 1955. The lesser-known photographer António José Martins employed infrared film in his Arctic landscapes. Since the time of these pioneers, infrared film has played a role for its aesthetics in the history of the medium.

INSTANT PHOTOGRAPHY

Instant photography has many possible origins. The idea of a photographic process that would produce a positive image in a short amount of time had antecedents in the nineteenth century

with direct positive print processes like the daguerreotype, the ambrotype, and the speedily produced tintype (or ferrotype), and with combined photographic processing systems like the collo-

INSTANT PHOTOGRAPHY

dion-plate Dubroni camera system, where the plate was both exposed and developed in the watertight interior chamber of the camera. In the twentieth century, technologies like the photobooth (patented in 1925) and the more recent digital camera allow the photographer or subject to view the photograph shortly or immediately after it is taken, but since these processes rely on a separate printing process (albeit in the case of the photobooth, one contained within the mechanism) they resist classification as “instant photography.” True instant photography, then, originated with the innovations of scientist and Polaroid founder Edwin H. Land, and its basic principles are best articulated in his own words. In his 1947 article “A New One-step Photographic Process,” Land described the goal of instant photography as essentially:

...a camera and a photographic process that would produce a finished positive print, directly from the camera, immediately after exposure. From the point of view of the user, the camera was to look essentially like an ordinary camera, the process was to be dry, the film was to be loaded in one of the usual ways, the positive print was to look essentially like a conventional paper print, and the print was to be completed within a minute or two after the picture was taken

(Land 1947, 61)

Land’s first instant camera, the Model 95 Polaroid Land Camera, went on sale in 1948 and was technologically revolutionary on a number of levels. The collapsible camera was at once sturdy, relatively compact, and large enough to accommodate $3\frac{1}{4} \times 4\frac{1}{4}$ films. The camera was designed to house two rolls—one of photosensitive film and the other of positive paper—which were pressed together as the film was extracted from the mechanism protecting the developing and printing emulsions. But the real innovation of Land’s “one-step photography” system was the film’s entirely contained self-processing system. As the exposed Land film was pulled from the camera, it was pressed between a pair of steel rollers. The rollers ruptured a “reagent pod” of developing chemicals and spread them between the negative and positive layers. The viscous chemical mixture initiated a diffusion transfer process (developing both negative and positive images simultaneously) and stabilized the image. In less than one minute the negative layer could be peeled away and discarded leaving a richly detailed finished positive print.

Despite some minor alterations in its early years (a shift from sepia to more professional looking black and white films and improvements in the print stabilization process) the Land Camera was

an unmitigated success with professionals and amateurs alike. Given the ability to view the finished photograph and the photographic subject side by side, Land saw his one-step system as not only an entertaining approach to snapshooting but also a way to take better photographs, putting the power of aesthetic production in the hands of the everyday consumer. Thus while Land was ever focused on making his instant cameras as mechanically streamlined and operationally foolproof as possible, he was also consistently concerned with instant photography as an artistic medium. Just one year after the Model 95 was introduced to the public Land met landscape photographer Ansel Adams and promptly hired him to work for Polaroid as a consultant. Adams was instrumental in the development and marketing of Land films, specifically with professional photographers in mind. In his lifelong collaboration with Polaroid, Adams used his Land Camera and the larger format 4×5 Polapan Land films he helped to inspire to create masterfully detailed and composed black and white landscapes of the American southwest, and penned the *Polaroid Land Photography Manual* (1963). In the foreword to this text, however, Adams diverges somewhat from Land’s democratic vision of the citizen-artist by stressing the distinction between the Land Camera’s popularity as a gadget for everyday photographers and its sophistication in the hands of the skilled professional to whom the book was addressed. In the mid-to-late century, however, professional photographers’ main use of the instant process was as a proofing method to determine proper exposure of studio set-ups.

A restless innovator, Land continued to tinker with the one-step process, making the film speed and the development process faster and the films more stable. In 1963, Polaroid introduced Polacolor instant color films, and in 1972, Land achieved another major breakthrough with what he termed “absolute one-step photography” embodied in the revolutionary Polaroid SX-70 camera. Designed specifically with everyday snapshot photographers in mind, Land saw the SX-70 as a solution to all of the “problems” of the Land Camera and thus reinvented virtually every aspect of extant instant photographic technology. Far more compact than earlier models, the SX-70, when collapsed, was designed to fit snugly into a man’s coat pocket. The camera was also fully automatic, motorized (no pulling to extract the film was required), and employed a radical new “garbage free” film technology for which no timing, peeling, or coating of the film was required. The negative and positive layers of each frame of film were contained in a

plastic card with a clear window in front. As the image developed and stabilized, opacifiers protecting the image became slowly transparent until the finished print was revealed. The particular intrigue of the SX-70—one which landed the SX-70 and its inventor on the cover of *Life* magazine—was taking a picture and watching the image appear before your very eyes. And because of this particularly novel feature, the SX-70 also laid claim to a new kind of photographic practice: the photograph that was taken so that the photographer, and often the subject as well, could watch it develop. In contrast to the sophistication and control offered to the user of the Land Camera, the SX-70 offered remarkable ease of use, mechanical simplicity, and a certain “magical” quality. Of course, the ingenious design of the SX-70 had its drawbacks as well. Land’s democratic desire to create a camera for anyone and everyone marked as problems many of the design features that might have given more aesthetically minded photographers more creative control. And while some art photographers have found aesthetic uses for the SX-70 (see below), for the most part, the technology defined and reflected a distinctly vernacular usership.

While the Land Camera and the SX-70 stand out as particular milestones, the technological history of instant photography includes a broad range of products and applications. Since the introduction of the SX-70, Polaroid has emphasized the shift in the instant photography demographic from the professional photographer to the amateur snapshotter by producing a variety of inexpensive cameras featuring plastic lenses and novel features, like the stripped down Pronto! (introduced in 1976), the brightly colored Cool Cam (1988), and the I-Zone, still being manufactured at the turn of the twenty-first century, which produces postage-stamp-sized color photos with a sticker backing. But Land also found ways to employ his instant photographic process to develop a variety of other technologies, from instant slide films and instant overhead transparency films to the ground-breaking but ill-fated Polavision, an instant, color, motion picture system. And Polaroid was by no means the only company to produce technology for instant photography, although most have relied heavily on the SX-70 design. Minolta, Konica, Keystone, and Fuji all designed instant cameras to be compatible with Polaroid films. The Polaroid Corporation put its proprietary relationship to instant camera and film technology to the test in 1976 when it filed suit against Eastman Kodak Company in a landmark patent case and won. After ten long years of litigation, Kodak, who had managed to corner over a quarter of the U.S. market on instant photo-

graphic technology in the early 1970s with its Kodak Instant system, was found to have infringed upon seven of ten Polaroid patents covered in the suit and ordered to stop manufacturing and selling their instant cameras.

Since the 1980s, the Polaroid Corporation has been in decline and the popularity of instant photography is currently much challenged by the growing sophistication of digital image technology. However, instant photography may yet maintain a foothold in the photographic technology market for its broad range of practical and aesthetic uses. Because of its immediacy and the control it offers the photographer over the image, the instant photograph has played a role in a variety of professional contexts including medical imaging, document copying, identification, insurance, and professional photography. In addition, and in keeping with Land’s goal of bridging the gap between art and vernacular photography through instant technology, Polaroid has actively and effectively encouraged instant photography’s role in the realm of art production and maintains a large archive of artwork produced with their cameras. The success of this enterprise reflects an aesthetic engagement with the particular formal and technical character of the medium. The quality of images produced with Land film, for example, is superb, as the instant negative is necessarily the same size as the positive print and therefore equivalent to standard medium and large format films. While Ansel Adams pioneered the use of Polaroid instant film for his highly detailed landscapes, contemporary artists like Chuck Close have maintained this practice, using 20 × 24-inch Polaroid prints as maquettes for his large photorealist portrait paintings. William Wegman has also created a number of striking 20 × 24-inch images of his famous Weimaraner dogs.

Other artists have been drawn to the particular visual effects of the amateur-oriented SX-70 films. Andy Warhol liked to use the contrasty photos produced by his Polaroid Big Shot to create his commissioned silkscreen portraits of the 1970s and 1980s, and Walker Evans, a lifelong detractor of color photography, became enamored with the vivid, jewel-toned masterpieces he created with the SX-70 in the last years of his life. The unique design of instant film also offers a wealth of technical possibilities for aesthetic experimentation to those willing to scratch, peel, and manipulate their instant images. Instant photography manuals offer guidelines for Polaroid photo transfers, negative separation, peeling away the white titanium oxide backing to alter the colors, and pressing into the developing emulsion to distort the image. Using this latter technique,

INSTANT PHOTOGRAPHY

multi-media artist Lucas Samaras is well known for his abstractly expressionistic “autopolaroids” and “photo-transformations.” The SX-70 has also been productively used by Robert Heinecken, especially in his “He:/She:” series of the 1970s that combine trenchant texts with snapshot-like images. Various Polaroid processes have been explored by Marie Cosindas, who creates jewel-like color compositions using the instant process, and Rosamond Purcell, who began experimenting with PIn the late years of the twentieth century, David Levinthal and American photographers Joyce Tenneson and Ellen Carey have explored the process; Levinthal creating quirky set-ups with toys, Tenneson affecting portraits, and Carey striking layered images and abstractions.

Despite this variety of aesthetic and practical applications, instant photography is, even today, best known for its social function as a medium for personal or snapshot photography. Land’s goal of “absolute one-step photography” was always a democratic one and the SX-70 and its descendants have had a unique role in the realm of vernacular photographic practice. The instant camera produces a photograph unlike any other, and one that accentuates the core facets of the snapshot image. Instant photography embodies an air of playfulness and mystery but also an inherently incidental quality. The instant photograph, particularly in the vernacular mode, feels at once precious, because it is unique and not easily reproduced, and yet disposable, not worth reproducing. It trades on its immediacy, not its posterity. The novelty of the photographic process, where one takes a picture just to see it develop, calls attention to the role of amateur photography as not only a means of documentation but also a leisure activity in its own right in many contemporary cultures. But the photograph’s instantaneousness is perhaps most significant because of the way that it

condenses the meaning of a variety of snapshot practices into a single moment. The instant photograph not only documents a moment to be reviewed and remembered later but also becomes present in that moment. Gratification is instant and intimate as the Polaroid is inevitably passed around to be viewed and discussed. If the photograph is an unflattering one, the subject may immediately discard it. If it is a good snapshot, it can be injected into the social narrative right away, uniting its viewers as the network through which the photograph circulates. And as incidental as the instant snapshot may be, it holds the nostalgic charge of both a photographic record and a physical memento, an affective potency that digital photography may never quite achieve.

INSTITUTE OF DESIGN

The Institute of Design (New Bauhaus) began as an outpost of experimental Bauhaus education in Chicago and became one of the most important schools of photography in twentieth-century America. It was the home to such photographic luminaries as László Moholy-Nagy, Harry Callahan, and Aaron Siskind, and the inspiration to students who would become some of the best fine-art photographers in the country. The Institute of Design (or ID) also educated generations of photographers who would in turn become teachers, thus ensuring a lasting legacy of ID principles and pedagogy. The pictures that have emerged from the teachers and students there set new standards for photographic exploration, using photography's own means to expand its possibilities.

The New Bauhaus and School of Design, 1937–1946: Moholy's Experiment

The school began when a group of Chicago industrialists, the Association of Arts and Industries, decided to found a school that would be based on Bauhaus principles. In 1937, they contacted Walter Gropius, the former head of the German Bauhaus and then teaching at Harvard University, to ask him to be the new school's first director. He declined, but suggested his good friend and colleague László Moholy-Nagy, who had also taught at the Bauhaus. Moholy-Nagy living in London at the time, agreed, and boarded a ship to the United States to head up what would be called the New Bauhaus.

In 1937, Moholy-Nagy was already one of the most versatile artists of the twentieth century. A painter, sculptor, photographer, filmmaker, typographer, and set designer, he also had extensively published his theories on photography and film. His greatest artistic goals were to harness light as a medium in and of itself, and to this end he made photograms, films, plexiglas light sculptures, and what he called the Light-Space Modulator—a moving machine whose shimmering and perforated surfaces reflected and refracted light in constantly changing ways. His experience at the Bauhaus had been to teach its Foundation Course, a workshop in which students explored the properties of various materials through innovative and experimental pro-

blems. The Bauhaus was radical in its hands-on approach, which—in direct contrast to traditional academic art education, whose pedagogy was based on imitation of the masters—put students in direct contact with materials and techniques. More than an art school, the Bauhaus positioned itself as integral to the fabric of daily life; it aimed to combine art and technology to the service of society. Moholy-Nagy brought these ideas and methods with him when he came to Chicago to start his new school.

In October 1937, the New Bauhaus was opened to great expectations in the art and industrial communities of Chicago. Housed in the former Marshall Field mansion on Chicago's historic Prairie Avenue, the school had been modernized in keeping with its mission of educating the whole person and providing the tools for a new vision appropriate to a new age. The school offered both day and evening classes, and in the first year, over 60 students attended either full- or part-time (among these were Nathan Lerner, and in the second semester, Arthur Siegel). The classes were structured as a series of workshops in which all students took the foundation, or Basic Workshop, in the first year, which exposed them to numerous fields, and over the next three years pursued a more specialized course of study in such workshops as Color, Sculpture, Architecture, or Light. It was in the Light Workshop that photography was taught; also included in this category was film, typesetting, advertising, and light studies. György Kepes, a photographer and painter who had known Moholy-Nagy since their days together in Berlin, was hired to lead the Light Workshop. When he was delayed in getting to the States, however, the class was begun by his assistant Henry Holmes Smith, who had been an active commercial photographer and would go on to teach photography for decades.

Although photography was not taught as a separate discipline, all students there came into contact with photographic processes and exercises, just as all students participated in the various other workshops. In the Basic Workshop, exercises approached materials and visual problems from the position of experimentation; Moholy-Nagy and his faculty urged students to try new ideas and welcomed unforeseen results. Students began by making tactile charts of

various textures, wooden hand-sculptures intended to feel good in the palm rather than look exciting on a pedestal, and innovative designs in wood and paper that transformed materials from two dimensions into three. The point of all these exercises was to experience the world afresh, as a child would. Similarly, the Light Workshop approached photography as a step-by-step process in which students would come to understand intimately the principles of photography and especially of light.

Light workshop exercises began with the photogram, a cameraless picture made by placing an object or casting shadows directly onto a piece of photographic paper while exposing it to light. Moholy-Nagy and Kepes believed it was the key to all photography, because it revealed the photographic paper's infinite range of tones and its essential sensitivity to light. From a practical point of view, the photogram required no cameras or equipment (no small help in a time of limited funds) and got students into the darkroom right away for processing skills. Students then progressed to light modulators, in which they manipulated white pieces of paper to reveal the play of light and tonal gradations over the paper's varied surfaces; students were encouraged to see the world itself as a light modulator and understand photographic subject matter in terms of gradations of black, white, and gray. Eventually, they would work with multiple exposures and superimposed images; negative prints and solarization; prisms and mirrors to explore reflection, refraction, and distortion; and "virtual volume," in which an object such as a string or wire produced the appearance of a three-dimensional volume when spun around during a lengthy exposure. Nathan Lerner pioneered the "light box," a controlled environment in which the effect of light on various objects could be studied, and other students began working with this technique as well. Most of the photographs of this early period are characterized by the intense exploration of the properties of photography in careful studio set-ups, and by the application of these discoveries to portraiture and still-lives.

The New Bauhaus lasted only one year. Because of financial difficulties and apparent philosophical conflicts, the Association of Arts and Industries elected not to re-open the school in the fall of 1938. This did not deter Moholy-Nagy and his faculty and students, however, and a new school, The School of Design in Chicago, opened in February 1939 at 247 East Ontario Street, in an abandoned bakery below the old "Chez Paree" nightclub. Moholy-Nagy convinced the faculty initially to teach for free, subsidizing the school with his own earnings and with the support of the enlightened arts patron Walter

Paepcke, president of the Container Corporation of America and later founder of the Aspen Institute. Many of the students from the New Bauhaus enrolled. Henry Holmes Smith had left the program when the school did not re-open, but Kepes continued to lead the Light Workshop, now assisted by student Nathan Lerner as well as technicians Leonard Nederkorn and Frank Levstik. Other photographers who would teach at the School of Design on a full- or part-time basis included James Hamilton Brown, William Keck, Edward Rinker, and Frank Sokolik.

The curriculum that had been innovated in the New Bauhaus was carried over to the School of Design, and while students did not specialize in photography, all students came into contact with it. (Some, like Homer Page and Milton Halberstadt, who enrolled in fall 1940, would go on to careers as photographers.) Photography still began with the basics of photograms and light modulators and progressed through various forms of experimentation. As more practicing and commercial photographers taught classes, however, photography also began to move slowly out of doors, and students conducted exercises in such formal qualities as texture and repeating forms. During this time Moholy-Nagy and Kepes also publicized their special photographic pedagogy in articles in *Popular Photography* such as "Making Photographs without a Camera" (Moholy 1939) and "Modern Design! With Light and Camera" (Kepes 1942); Kepes and Lerner also collaborated on an entry on "The Creative Use of Light" in the *Encyclopedia of the Arts*. In the summer of 1940, the school held a special summer session at Mills College in Oakland, California, in which most of the faculty participated and which attracted numerous new students to the school. In 1941, a traveling exhibit of photographs by students and faculty of the school called *How to Make a Photogram*, designed by Moholy-Nagy, Kepes, and Lerner and circulated by the Museum of Modern Art, New York, began a six-year tour of schools and museums and gave the school's photographic program further publicity.

In 1944, the school changed its name once again, to the Institute of Design, and gained college accreditation. With the waning of World War II and the introduction of the G.I. Bill, more and more students attended the school, and increasingly, they were interested in photography. Moholy-Nagy began offering special photography courses to veterans, and by the spring of 1945, 20 students were enrolled in night photography classes and eight in the specialized course. That fall, the school moved to 1009 N. State Street, and enrollment swelled to nearly 500.

(The school moved once again in the fall of 1946, to 632 N. Dearborn, where it remained for nine years.) Needing more faculty, and realizing the potential of the photography program, Moholy-Nagy hired Arthur Siegel in 1946 to begin a four-year photography course (Kepes had left the school in 1943). To inaugurate the new program, Siegel organized a six-week seminar in photography in the summer of 1946. “The New Vision in Photography” featured the country’s top photographers and curators, including Berenice Abbott, Erwin Blumenfeld, Gordon Coster, Beaumont Newhall, Ed Rosskam, Frank Scherschel, Paul Strand, Roy Stryker, and Weegee. With workshops, slide presentations, lectures, and films, the symposium revealed the state of the field and helped put the Institute of Design on the cultural map. Where photography had once been an integral part of the design curriculum, now it was being recognized as having its own history and practices.

Sadly, Moholy-Nagy would not remain to shepherd the school through this major change; the previous year, he had been diagnosed with leukemia, and he died on November 24, 1946. But the school he founded would live on to have an enormous impact on photography in the United States. Already, the Institute of Design had revolutionized the way photography was taught and practiced in very important ways: photography was acknowledged as an essential component of modern vision; it was part of an education that involved all the arts and strove to shape the whole person; it was understood as part of a study of light and its properties; and it was taught experimentally, with a hands-on, Bauhaus workshop approach. Furthermore, the school introduced the European avant-garde to Chicago, effectively changing the geography of photography in America; photography previously had been dominated by artists in New York and the San Francisco Bay Area, but henceforth Chicago would also be recognized as one of the important American centers of photography.

The Institute of Design, 1946–1961: Callahan, Siskind, and the Shift Toward Individual Expression

The year 1946 marked a significant shift for photography at the Institute of Design, as it separated thoroughly from the design program and began its own specialized course of instruction, one that would eventually be marked by an individual subjectivity and a sense of personal expression. Not only had Moholy-Nagy, the school’s founder and link to the European Bauhaus, died, but the nascent program veered away from the study of photo-

graphy as pure experimentalism. The new head of photography, Arthur Siegel, had attended the New Bauhaus in its first year, but had gained most of his photographic experience working for government organizations; he would later freelance for the premiere American picture magazines and do commercial work. His contacts were more professional than avant-garde, and his outlook more practical than theoretical. Well read and acerbic, Siegel was a charismatic teacher with very strong opinions. Perhaps his most lasting contribution to the school was his teaching of the history of photography; his introduction of the class helped ensure that photography there became understood as a separate discipline with its own unique past.

Siegel immediately hired his friend Harry Callahan, whom he had met in Detroit. An avid, largely self-taught photographer, Callahan had only been making pictures for a few years and had no teaching experience, but he proved to be the perfect fit for the new direction the Institute of Design was taking. Callahan was the model of a working photographer, making pictures every day regardless of mood or inspiration. His try-anything approach to formalism encompassed multiple-exposure, extreme contrast, and “light drawing” with lengthy exposure, as well as straight-on architectural photography, portraiture, and still-lives of weeds and grasses. During his time at the school, Callahan worked on some of his most well-known series, such as 8 × 10 “snapshot” portraits of his wife Eleanor and daughter Barbara, pictures of women on the street lost in thought, weeds against the snow, and Chicago facades. Callahan’s combination of experimentalism and humanism had impressed Moholy-Nagy, who had approved his hiring in the summer of 1946, and it would later be the primary influence upon numerous students.

Callahan embraced the existing photographic exercises he was handed as part of the photography curriculum, and added several of his own. Still beginning with photograms and light modulators, he moved on to documentary problems, such as having students photograph people on the street after talking to them, and the “evidence of man” assignment (photographing humanness without actually showing people); technical issues, such as the 90% sky problem, which taught students how to get a clean negative, and “near and far,” a focus problem; and formal issues, such as sequences or street numbers or the alphabet as found out in the world. As curious as any student, he would often go out and try the problem himself as soon as he had assigned it. In contrast to Siegel, Callahan was taciturn and sometimes inarticulate as a teacher;

his method was to teach by example, and with very few, well-chosen words.

As some of the original faculty, like Frank Levstik and Frank Sokolik, departed in the late 1940s, Callahan and Siegel filled their posts with a variety of part-time teachers. Gordon Coster, Ferenc Berko, and Wayne Miller all taught at the school during this period, and were especially valued for their documentary experience and classes. Students increasingly were taking their cameras out into the city, away from the studio and its controlled experimentation, and found Chicago rich in subject matter; student pictures from this period often focus on children, local architecture, and street scenes. One of the first four-year photography students in 1946 was Art Sinsabaugh, who graduated from the program in 1949; upon graduation, he was hired by Callahan to teach, and eventually ran the evening photography program through 1959. His early reticulated and solarized pictures, then still typical of ID student work, could not have predicted his later long, narrow prairie landscapes made with a banquet camera. Another student of Callahan's was Yasuhiro Ishimoto, who attended from 1948 to 1952. Although Callahan did not show his own photographs to students at that point, his influence was profound, and can still be felt in Ishimoto's compassionate portraits of children on Maxwell Street or pictures of cars in snow.

In 1949, two important changes occurred: Siegel resigned from the faculty at the Institute of Design, leaving Callahan to become the head of the photography department, and the ID, ever short of funds and needing greater support, merged with the Illinois Institute of Technology. In merging with IIT, the ID gained institutional backing but lost some of its independence. Although Siegel would return to teach sporadically throughout the 1950s, his absence was felt, and Callahan knew he needed another strong personality to help him direct the photography program. He made an inspired choice, one that would mark the beginning of a teaching team so complementary and influential as to be legendary in photographic education: in 1951, he hired Aaron Siskind.

At the time, Siskind was living in New York, where he had gained a significant reputation in art circles as a photographer. Originally a teacher—he taught English for 21 years in New York's public schools—he had only recently taken up photography full-time, and was trying to find a way to support himself and continue his photographic career. He was also a close associate of the Abstract Expressionists, and often exhibited with them; his photographs of painted and graf-

fitti-covered walls shared a similar two-dimensional formalism. The wall pictures were something of a departure for Siskind, however, whose initial interest in photography had been directed toward his political activism. Throughout the 1930s, he had been a member of the leftist Film and Photo League, where he oversaw group documentary projects such as "Portrait of a Tenement" and "Harlem Document." In Chicago, he continued his work on painted and graffiti-covered walls, and documented Chicago's architecture and urban facades as well as leading students in more socially-oriented projects. One of his most memorable series from the period is "Pleasures and Terrors of Levitation," an extensive series of divers at the Oak Street Beach, their figures silhouetted against the white sky like a new alphabet.

Siskind was in many ways Callahan's opposite: where Callahan was shy and found teaching at times agonizing, Siskind was a natural teacher, his years in the city schools having accustomed him to speaking in front of a group. Callahan remained devoted to his wife, Eleanor, throughout his life, whereas Siskind married several times and was a notorious womanizer. Callahan was quiet but centered, Siskind gregarious and outspoken. Somehow, though, the two formed an extremely compatible and effective team, and students recall them as almost a single entity. (Although there were other photography teachers sporadically at the ID in the 1950s—among them, Lyle Mayer, Keld Helmer-Peterson, Arthur Siegel, and, when Callahan was on leave in France during the 1957–1958 academic year, Frederick Sommer—Callahan and Siskind were the leaders of the program.) Callahan gravitated toward the beginning students, teaching them the foundation problems, and Siskind gradually took on the more advanced students, guiding their individual projects. When the graduate program began, both men met with the students to advise them on their master's theses.

Together Callahan and Siskind shaped the new undergraduate curriculum. Callahan increasingly emphasized working in series, so students could follow an idea in a sustained manner; this would eventually lead to the master's thesis. Siskind developed some new assignments to add to the evolving batch from the school's early days. The "copy problem," in which students attempted to duplicate exactly the tones of another print, taught technical skills, while his "significant form" problem sent students to Chicago's conservatories to photograph plants in distilled form. But it was Siskind's experience on group documentary projects that would have some of the most impact in the 1950s.

He began leading collaborative student projects to photograph local public housing developments, the elderly, and an extended record of the buildings of Louis Sullivan. “The Sullivan Project,” as the latter came to be known, began in the fall of 1952, and involved students such as Len Gittleman and Richard Nickel. The students documented Sullivan buildings throughout Chicago and the Midwest, exhibited the photographs, and planned to publish a book; although the book never happened, Nickel made the project the subject of his 1957 master’s thesis and worked to preserve the buildings. In 1956, Callahan and Siskind outlined the undergraduate curriculum in an article in *Aperture* called “Learning Photography at the Institute of Design.” They described the course of study over four years, from undertaking the foundation course, then clarifying technique, then experiencing the photographic disciplines or traditions (such as portraiture, journalism, architecture, and so on), and finally engaging in a planned project. Their goal, as they stated it, was “from within the framework of a broad professional education to open an individual way.” This was the beginning of a marked departure for photography at the Institute of Design; it became at once more vocational and more personally expressive.

In the spring of 1950, a few students had approached Callahan asking to continue on in a graduate capacity, but the school offered no further study in photography. Callahan convinced IIT to allow a graduate degree, and, later with Siskind, guided the students in producing a concentrated series, or body of work. In 1952, the first Master’s of Science degrees in photography were granted to Marvin Newman, Jordan Bernstein, and Floyd Dunphey; Newman’s thesis was an exploration of the series form itself. The thesis project became the model for future graduate study at the ID, and indeed for advanced photographic inquiry throughout the country. Many students would go on to conduct sustained photographic projects and received master’s degrees at the Institute of Design, and many of these would institute similar programs in schools across the United States.

Some key events in the late 1950s shaped the way the ID’s photographic program evolved. In 1955, the school selected a new director, Jay Doblin; that same year, it moved from Dearborn Avenue on the north side to Crown Hall, on IIT’s south-side campus. Doblin, a commercial designer whose appointment was protested by most of the faculty and students because of his business orientation, had little interest in artistic photography. At the same time, however, he allowed the small program to

continue without much interference from the administration, and this relative isolation provided Callahan and Siskind with a great deal of freedom. The move to Crown Hall physically integrated the ID with IIT but removed the school from the city’s center of activity. The photography program also began to gain some a national reputation through the stature of Callahan and Siskind as well as such publications as their *Aperture* essay; *The Student Independent*, a 1957 student-produced portfolio in an edition of nearly 500; and the ID’s first book, *The Multiple Image: Photographs by Harry Callahan*, published in 1961.

In 1961, *Aperture* also published an issue devoted to the graduate photography program at the ID, with an introduction by Arthur Siegel and featuring the thesis photographs of Joseph Jachna, Kenneth Josephson, Ray K. Metzker, Joseph Sterling, and Charles Swedlund. Among the top students in the program, all five would go on to successful photographic and teaching careers. Jachna explored water in his thesis, while Josephson studied the multiple image in different forms, Metzker documented Chicago’s Loop, Sterling focused in on the American teenager, and Swedlund presented an experimental approach to the nude. Although quite different in subject matter and approach, all shared a certain ID style—contrasty black and white and based in a graphic sensibility—and a goal of personal expression through sustained inquiry. In a shift away from Moholy’s original idea of photography as part of an integrated curriculum, it had now become a separate discipline, and experimentation was now put to the service of picture-making. The most important change at—and contribution of—the ID in this period was the emphasis on individuality and subjectivity in photography, and the development of the series and body of work. More change would occur in the 1960s, with the departure of Harry Callahan and a changing academic and political climate.

The Institute of Design, 1961–1978: The Siskind and Siegel Years

In 1961, Callahan left the Institute of Design to join the faculty at the Rhode Island School of Design, and Siskind became the head of the Photography Department. During the 1960s and into the 1970s, there were many important changes at the school. An increasingly large number of students joined the graduate program and earned master’s degrees in this period, and the photography program, under Siskind’s leadership and eventually that of Arthur

Siegel, grew more and more independent from ID and IIT. Both the artistic and political climate changed dramatically during these years, and had their effect on photographic practice at the school. And it was during this period that students were trained in large numbers to become photography teachers, directing photographic programs at new and established institutions across the country and propagating an ID philosophy and pedagogy to new generations of students.

Siskind was the primary draw for students who came to study at the ID in the 1960s. Although he was assisted by former student Joseph Jachna, who taught from 1961 to 1969, and various other teachers for much shorter periods—Reginald Heron, Frederick Sommer, Wynn Bullock, Joseph Sterling, Charles Swedlund, and Ken Biasco—he more or less embodied the program. Classes consisted of seminars and critiques in which students presented their thesis work to Siskind, and additional meetings were as likely to be at a student-faculty party as in a classroom. The ID and IIT administration allowed the program a great deal of independence, and photography became increasingly isolated from the other departments at the school. But although the focus was now on the graduate thesis project, students still began with the foundation as initiated by Moholy-Nagy and modified by Callahan and Siskind.

The 1960s witnessed the rise of environmentalism, free love, hallucinogenic drugs, and the anti-war and civil rights movements. The times were manifested photographically in a renewed interest in photographic landscapes, nudes, psychedelic experimentation, and politically grounded documentary photographs. ID students were affected by the times in varying degrees, but it is clear that photography there, as around the country, began to look different from that of the preceding generation. At the ID, students began to move beyond the solitary frame, using such techniques as collage or inserting photographs in their photographs, printing entire strips of film as a single image, and uniting two or more frames or negatives into a joined picture. The nude (both male and female) became a subject of intense exploration, a screen upon which different experimental techniques were projected. Students increasingly inserted themselves into the photograph, bypassing a detached abstraction or documentation in favor of a more self-conscious approach to photography. A select list of the almost 50 photographers receiving master's degrees in the 1960s includes Barbara Crane, Reginald Heron, and Thomas Poret (1966); Thomas Barrow, Kurt Heyl, Thomas Knudtson, William Larson, Art Sin-

sabaugh, and Judith Steinhauser (1967); Rosalyn Banish, Barbara Blondeau, Keith Smith, and Geoffrey Winningham (1968); and Kenneth Biasco and Linda Connor (1969). Their thesis projects followed, in reach and scope, the standard laid out in the 1950s: sustained investigations of a particular topic or technique, they originated from the foundation course assignments and expanded upon them with individual vision.

Siskind was retired by the school in 1970, and returned to teach classes in 1971 before joining Callahan at the Rhode Island School of Design. Four years before his departure, however, he had rehired Arthur Siegel to help teach the graduates, and Siegel once again became head of the photography program in 1971, where he remained until his death in 1978. With his training as a student at the New Bauhaus in 1938, experience founding the photography department in 1946, and commitment to teaching there sporadically throughout the 1950s, Siegel was the last remaining link to Moholy-Nagy's program. As irascible and brilliant as ever, he was also the last in a line of charismatic photography teachers. Other faculty and visiting lecturers taught photography for short periods at the school in the 1970s, and included Patricia Carroll, Alan Cohen, Jonas Dovydenas, John Grimes, Arthur Lazar, David Phillips, David Plowden, David Rathbun, Alex Sweetman, and Garry Winogrand (whose small-format, edgy street photography would have a lasting effect on student work).

The 1970s witnessed a massive rise in graduate enrollment, with over 80 master's degrees awarded. A necessarily incomplete list would include Barry Burlison, Eileen Cowin, Antonio Fernandez, Elaine O'Neil, Judith Ross, and Robert Stiegler (1970); Calvin Kowal, Esther Parada, Lynn Sloan, and Warren Wheeler (1971); Douglas Baz, Patricia Carroll, Alan Cohen, Francois Deschamps, and Charles Traub (1972); Andrew Eskin and James Newberry (1973); David Avison, John Grimes, and Lewis Kostiner (1974); and many others in the second half of the decade. A notable change was the rise of cinematography and animation, both of which were attracting students in schools across the country. Cinema, long a favorite medium of Moholy-Nagy, had been an active part of the photography program since as early as 1942, and many students and teachers had made films independently or as part of a class during the 1950s and 1960s. In the late 1960s, students began to earn degrees with thesis projects in cinematography, and after 1971, cinema became separate from still photography. Under teachers such as Larry Janiak, students produced short, experimental, and

documentary films that emerged from their solid foundation in photography.

One of the most striking phenomena during this period was the impact the Institute of Design had on graduate photographic education nationwide. As the country began to devote more funds and efforts toward higher education in the 1960s and 1970s, new colleges began to sprout up and old ones expanded their art departments. The ID, at this time, was one of the few institutions to train photography teachers, and an extraordinary number of its graduates went on to head or found photographic programs. In the process, the ID's graduates exported its unique pedagogy: problem-based learning, with emphasis on a significant body of work, rooted in the European avant-garde and tempered by American individual subjectivity.

After Siegel died in 1978, the school's last link to the New Bauhaus was gone. By then, the ID was already heading in some different directions, away from the kind of photography that had been practiced for its first four decades. Film and animation were eventually cut from the curriculum, and, under the direction of John Grimes, the school began early on to investigate digital technologies. Grimes hired such teachers as David Plowden, Patty Carroll, and Jay Wolke to continue the instruction of photography, and after 1985, the two possible areas for specialization became computer imaging and documentary photography. The graduate program continued through the early 1990s, but the undergraduate program in photography was eliminated in 1994, and the concomitant loss of faculty eventually shrank the master's program as well; the last strictly photographic theses were completed in 2001. Photography has now been absorbed, as a tool of visual communications, into the graduate design program as a whole—in a way, returning the school and the program to Moholy-Nagy's original goals of a more integrated education.

THE INTERNET AND PHOTOGRAPHY

In the last years of the twentieth century, the proliferation of digital photographic technologies converged with rapidly expanding access to the global networking of computers. The result, for both professional and amateur photographers, is a transformed medium whose online component has encompassed, merged, expanded, and altered previous practices. Sending photographs at electronic speed has become commonplace. Photography's past as well as its present output has been scanned into the system, producing an unprecedented number of images for scholarly, personal, and commercial use. Museums, galleries, and photography festivals now display their collections to global audiences. Photojournalism in online newspapers and magazines has the currency of broadcast news while offering a range of display options impossible to achieve in print. Camera stores, film-processing labs, and photo pornographers have set up shop in the virtual world. Thousands of websites provide both professional and amateur commentary on the descriptive, historical, interpretive, and technical aspects of the medium.

Online photography is the product of a second stage in the development of computer connectivity. The first stage, the founding of the internet, began with a proposal made by the Rand Corporation in 1962 to find a means of linking military computers. It was only in 1969 that four computers were able to "talk" to each other. What we now call the internet is a product of the Transmission Control Protocol/Internet Protocol (TCP/IP) established in 1983. The Protocol allowed for the connection of an infinite number of computers in a global network, each identified by its Internet Protocol (IP) number. While creators of the internet saw it as having limited academic, business, or military applications, its origins coincided with the advent of desktop computing. As a result, the 1,000 computers linked to the internet by the end of 1984 grew to an estimated 1 million interconnected machines in 1992.

The second stage of computer connectivity was marked by the invention of the World Wide Web by Timothy Berners-Lee in 1991. The web operates within the internet to link informational "sites" rather than physical computers. It was made far more useful in 1993, when a University of Illinois student, Marc Andreessen, released Mosaic, the first

web browser. Mosaic, which would later become Netscape, allowed users to find websites on the basis of the information within them, sparking a second growth spurt in computer connectivity. The number of sites grew from 600 in 1993 to 1 million in 1997. At the end of 2004, it was estimated that there were more than 20 million sites on the web accessible to more than 900 million people.

While the internet in its first decade was used largely for the transmission of text (e.g., email), both the worldwide web and the browsers designed for it could accommodate images. At first, these images were provided by industrial scanning equipment and could only be housed within relatively large servers. Access to images, given the computer and modem speeds of the day, was frustratingly slow. But the exponential increases in computer speed and memory and the introduction of broadband connections during the 1990s provided an incentive for an increasing number of images on the web. Conversely, the growing availability of images inspired consumers to buy ever faster computers with ever larger memories and to connect them to ever faster online services.

The startling improvements in computer speed, capacity, and connectivity were complemented by the advent of the digital camera. Digital imaging techniques had been developed by NASA and a number of independent laboratories (e.g., the Image Processing Institute at the University of Southern California) as early as the 1960s. But it wasn't until 1990 that Kodak proposed the current set of standards for digital photography. The following year, Kodak sold the first digital camera to be manufactured according to those standards, a Nikon F-3 equipped with a 1.3 megapixel sensor. From 1994–1996, consumer digital cameras, designed for interface with a home computer, were marketed by Apple, Kodak, Casio, and Sony. Like computers, the capacity of digital cameras increased rapidly, while their price fell, and by the end of the 1990s, peripherals such as scanners and photo printers also became available to home consumers.

Half a decade after the convergence of digital photography and online technologies, photography itself is the subject of websites dedicated to a wide variety of activities pertaining to the medium. Local

photographers and photo supply shops have their own websites while many of the major photographic companies maintain elaborate sites dedicated to their products and their history. Personal websites offer family photographs, amateur art photography, and self-styled commentary on the technology and aesthetics of the medium. Chatrooms and newsgroups, maintained by internet service providers, offer discussions of the medium and its specialized components. Students of photography may find a variety of photography courses, ranging from collections of tips from self-styled experts to university-based curricula. Established photography journals such as *The British Journal of Photography*, the American *Popular Photography*, and the French *ReVue Photography* offer online editions. Entirely online “zines,” like *Online Photography*, and *Digital Photography and Imaging International* offer news and how-to articles, as well as links to the work of lesser-known photographers.

As photography-oriented websites grew in number and diverged wildly in quality, photography enthusiasts began posting lists of what they had found to be the most worthy links. One of the first of these “portal” sites, *Bengt's Photo Page*, was created in Sweden by Bengt Hallinger in 1996. As of this writing, it continues to offer a vast number of links to online photo exhibitions, digests, how-to articles, magazines, user groups, and a set of links to digital photography news groups. Charles Daney's *Photography Pages* provides a slightly different though no less extensive selection of links. *Still Journal* provides articles and reviews and a “portal to the art, technique, history and culture of photography.”

Amateur photography websites proliferate, especially those of local camera and photography clubs. Vernacular uses take many forms, including the “Are You Hot” website, wherein an individual can post a photo, presumably his or her own, and be evaluated by others. Professional organizations, such as the Society for Photographic Education, feature extensive and informative websites to communicate with their members.

Photojournalists, who were among the pioneers in the use of digital cameras, have continually expanded the uses to which internet photography has been put. Digital images are instantly transmitted worldwide to editors who have an unprecedented range of options in editing and presenting them. Newspaper and magazine websites offer photo essays, often with voice-over commentary as well as photo galleries that contain collections of images not shown in the print edition or held over well beyond its run. One of the first uses of

these galleries came with the death of Princess Diana in 1997—though by the turn of the century, this practice had become a standard item on the websites of most major publications. The events of September 11, 2001, depicted in extensive archival sites in journals worldwide, created photographic coverage of a single event unprecedented in terms of the number of posted images and their accessibility.

Traditional photo agencies, such as Magnum Photos or Alinari, moved quickly into the digital age, developing detailed sites for interested individuals, professional researchers, and commercial visitors.

The internet and world wide web also facilitated sales of archival photographs, providing an impetus for the creation of ever larger and more accessible photo archives. Among the largest of these commercial archives is TimePix (with archival images from *Time*, *Life*, *People*, *Fortune*, and *Sports Illustrated* as well as the million-image Mansell collection). Other online suppliers of archival images include WireImage, PhotoDisc, and Microsoft's digital photography company, Corbis which, in 1995, purchased the Bettmann Archive's 17 million images to achieve a collection of some 70 million photographs. Many of the larger circulation newspapers and magazine have online “stores” marketing their own photo archives.

With the spread of the internet as an educational tool, other photography collections make samples of their holdings and their exhibitions available online for research and teaching purposes. George Eastman House and the Library of Congress have been leaders in this practice, the Library currently offering over 300,000 of its 5 million images accessible online. Other institutions, such as the International Museum of Photography, the New York Public Library, the University of California at Riverdale Museum of Photography, and Musée de l'Élysée Lausanne Museum provide a diverse selection of historical photographs and current exhibitions. Local and regional archives also make use of the internet, either individually or collectively, as exemplified by sites such as *British Columbia Historical Photographs Online*. The internet has also spawned its own, entirely online photography museums. One of the earliest and most extensive is the *American Museum of Photography*, founded by William B. Becker in 1996 based on his personal 5,000-image collection of historical photographs.

In addition to these general collections, the history of photography is well served by a number of additional online resources. Among these are Robert Leggat's *History of Photography* site, founded in 1997 as an overview of the subject and, of course, *PhotoHistorians*, a site maintained by Professor

William Allen at Arkansas State University with hypertext links to hundreds of individuals interested in the history of the medium. Professor Andrew Davidhazy at the Rochester Institute of Technology posts a site with links to the many areas of photography history in which he has an interest. The *Midley History of Photography* site is a collection of articles and unpublished materials by R.D. Wood on the history of early photography. Early photography is also well documented, including sites maintained by *Maison Nicéphore Niépce*, *The First Photograph* site posted by the Harry Ransom Research Centre of the University of Texas, Austin, and the *Daguerreian Society*. Mike Ware's *Alternative Photography Pages* contains an encyclopedia of historical processes while a single process is covered in exemplary detail on *Stanford University's Albumen* site. Examples of other specialized histories include the late Peter Palmquist's *Women in Photography* site, the extensive *History of Photography in Japan*, and the detailed corporate timeline published by Kodak on its website. Organizations such as The Royal Photographic Society, The Photographic Historical Society of Rochester, New York, and la Société française de photographie provide useful portals, not only to their own members but also to other photography organizations.

Specialized interests in photography are also well served by the internet. Virtually any genre in photography can be quickly accessed through formal or informal groups' postings on the web. Sites for architectural photography, aerial and panoramic photography, glamour and fashion photography, and industrial photography are particularly prominent.

As it has evolved into a marketing tool, the internet has also become a primary means for the buying, selling, and trading of antique cameras, both in the large auction sites such as eBay and in more specialized sites. The German site, *Classic Cameras*, provides an introduction to the development of the camera along with worldwide links to individuals buying, selling, and trading old cameras. Two other sites also offer this latter function as well as links to other classic camera sites: *The Classic Camera Website* and Don Colucci's *Antique and Classic Camera Website*. A singularly non-commercial escape from the online antique camera world is the virtual tour of *Canon's Camera Museum* in Japan.

In less than a decade, online photography has evolved its own unique forms of photographic exhibition. Fritz Nordengren's site, *Behind the Viewfinder—A Year in the Life of Photojournalism*, is an exchange of work and ideas by ten diverse photojournalists who, along with Nordengren, engaged in a very public communication beginning in January

of 1998. Sites like *Photo.net* and *Qiang Li's Photo Critique Forum*, in addition to offering familiar commercial portal links, offer a forum whereby individuals critique one another's photographs.

Finding photographic images on the internet became increasingly easy, as most search engines, notably Google, created special image-only searches. Searches turn up both fine arts photographs and any number of amateur postings, creating unique "virtual galleries" with every search.

The sum total of the services made possible by the convergence between photography and the internet has yielded a profound change in how the visual world is accessed by that one sixth of the world's people with access to the internet. It's clear that online photography has contributed to the so-called digital divide, the growing difference in informational access between that one sixth of the population and the five sixths without computer access. The computer has become a kind of gatekeeper for social inclusion, and it will likely be the work of the twenty-first century to first determine and then moderate the computer's shaping of the visible world.

INTERPRETATION

To interpret a photograph is to make sense of it for oneself and to learn what it means to others. For many viewers, photographs seem to be transparent, obvious, like looking at actual persons, things, and events in the world, and in little need of interpretation as images. Because photographs are made from light reflecting off of people, places, and objects in the world, they have attributes of what C. S. Peirce called “indexical” qualities. The photographic sign is caused by what it signifies, or in Roland Barthes’s definition, a photograph is “that which has been.” Thus, given this causal connection to reality and an inherited Renaissance style of realistic depiction, people often view snapshots, news photographs, advertising images, and art photographs as transcriptions of reality rather than as opinionated and

influential constructs bearing situated knowledge and invested expressions. Photographs are factual, fictional, and metaphorical, and need to be interpreted. The interpretation of art, for Arthur Danto, entails seeing the work as being about something, projecting a point of view by rhetorical means, requiring interpretation within a cultural context.

In Ernst Gombrich’s and Nelson Goodman’s view, there is no innocent eye, and by implication, no innocent camera, or viewer. According to Goodman,

the eye functions not as an instrument self-powered and alone, but as a dutiful member of a complex and capricious organism. Not only how but what it sees is regulated by need and prejudice. It selects, rejects, organizes, discriminates, associates, classifies, analyzes,

INTERPRETATION

constructs. It does not so much mirror as take and make; and what it takes and makes it sees not bare, as items without attributes, but as things, as food, as people, as enemies, as stars, as weapons.

(Goodman 1976)

An interpretation of a photograph is a thoughtful response in language to its subject matter, medium, form, and the context in which it was made and in which it is seen. Interpretations, like photographs, are constructs. When we interpret we do not merely report meaning, we build it and then report it; interpretation is a process of discovery and invention.

To interpret is to make meaningful connections between what we see and experience in a photograph and what else we have seen and experienced. Richard Rorty says that “reading texts is a matter of reading them in the light of other texts, people, obsessions, bits of information, or what have you, and then seeing what happens.” Jonathan Culler prods interpreters to

ask about what the text does and how: how it relates to other texts and to other practices; what it conceals or represses; what it advances or is complicitous with. Many of the most interesting forms of modern criticism ask not what the work has in mind but what it forgets, not what it says but what it takes for granted.

To interpret a photograph is to ask and answer such questions as: What is this that I see? How was it made? What is it about? What does it represent or express? What did it mean to its maker? What did it mean to its intended viewer? What is it a part of? What are its references? What is it responding to? Why did it come to be? How was it made? Within what tradition does it belong? Interpretations are built by individuals and shared. Eventually cumulative answers to interpretive questions, offered publicly by informed interpreters, most often art historians, critics, curator, and photographers themselves, are received as conventional understandings that are generally shared in scholarly venues by a community of like-minded interpreters and then passed on as what are essentially canonical understandings, in short, the accepted view by which subsequent interpretations are made. Such conventional interpretations of photographs are recorded in history of photography courses, encyclopedias, exhibition catalogues, and especially in historical texts.

Socially minded interpretations broaden conventional interpretations by examining the social implications and consequences of images. Allan Sekula, for example, advocates that we “regard art as a mode of human communication, as a discourse anchored in concrete social relations, rather

than as a mystified, vaporous, and ahistorical realm of purely affective expression and experience.” Socially interpretive questions include answers to these kinds of questions: What ends did the image serve its maker? What purposes, pleasures, or satisfactions did it afford its maker and its owner? Whom does the image address? Whom does it ignore? How is it gendered? What problems does it solve, allay, or cause? What needs does it activate or relieve?

To interpret an image is also to make personal sense of it by asking and answering such questions as: What does this image mean to me? Does it affect my life? Does it change my view of the world? A requirement for an interpretation by some scholars is that it changes one’s life. Rorty, in the Pragmatist tradition, argues that there should be no difference between interpreting a work and using it to better one’s life: A meaningful interpretation is one that causes one to rearrange one’s priorities and to change one’s life. In the phenomenological tradition, for Hans Gadamer and Paul Ricoeur, the purpose of interpretation is to make the artwork one’s own. Ricoeur asserts that interpretation involves appropriation by which the interpreter makes what is interpreted one’s own through the endeavor to make sense of it in the light of his or her personal experience. Because an artwork has an existence of its own, Ricoeur adds the requirement that the work interpreted must be understood as well as appropriated.

Feelings guide interpretations. As Goodman argues, “The work of art is apprehended through the feelings as well as through the senses. Emotional numbness disables here as definitely if not as completely as blindness and deafness.” Israel Scheffler negates the false dichotomy between thinking and feeling: “Reading our feelings and reading the work are, in general, virtually inseparable processes...Emotion without cognition is blind, cognition without emotion is vacuous.”

Conventional, social, and personal interpretations are not mutually exclusive and ought to correctively enhance one another. A conventional interpretation that ignores social implications of what it interprets is lacking in complexity and relevance. A social interpretation, however, that ignores conventional knowledge of what it interprets risks lack of correspondence to relevant facts of origin. A personal interpretation that is uninformed by conventional knowledge and social insights is most likely too personal to be relevant to what is being interpreted.

As Umberto Eco asserts, texts have rights: All images set limits as to how they can be interpreted. The rights of an image are established in part by

the internal textual coherence of the image that sets itself firmly against any uncontrollable urges of the interpreter for social betterment or personal meaning. Nevertheless, “photographs’ rights” are often and seamlessly overridden by the printed words that accompany them, or by the contexts in which they are shown: a Lennart Nilsson photograph made for scientific meaning of an intra-uterine fetus can readily be supplanted by placing it on placards in demonstration for or against abortion rights. In practice, photographs mean through use. Responsible interpretative endeavors can rectify misuses of images.

If one wants a plausible interpretation of a photograph, one cannot just fix on one or two elements of the photograph and forget about the rest of the elements in the image and in its causal environment. There is a range of interpretations any work will allow that is socially constituted by consensual agreement of pertinent practitioners. As Eco asserts, certain readings prove themselves over time to be satisfactory to the relevant community of interpreters. For Eco, “certain interpretations can be recognized as unsuccessful because they are like a mule, that is, they are unable to produce new interpretations or cannot be confronted with the traditions of the previous interpretations.”

It is not the goal of interpretation to arrive at a right interpretation, but rather interpretations that are reasonable, informative, convincing, enlightening, satisfying, and that allow interpreters to continue on their own. Contrarily, weak interpretations might simply be inane, far-fetched, unresponsive, unpersuasive, irrelevant, boring, or trivial. Nor is it the goal of interpretation to arrive at a single, cumulative, and comprehensive singular interpretation. Images are not the kinds of things that reduce to singular meanings, and informed interpreters of images are not the kind of responding individuals who are looking for simple, single meanings. There are many different interpretive answers to the different questions interpreters ask. Multiple interpretations are valuable in that they direct a viewer’s attention to an aspect of an image that the viewer might not otherwise see and ponder. Good interpretations inspire other interpretations and engender further discourse.

Some interpretations are better than others. Interpretations can be evaluated by criteria of coherence, correspondence, and completeness. Coherence is an external and independent criterion asking that the interpretation make sense in itself, as a text. The criterion of correspondence asks that the interpretive text match what is seen in and known about the image being interpreted. Interpre-

tations ought also to account for all that is included in the image and what contextual knowledge is available about its origins.

Interpretations of an image ought not to rely exclusively on or be limited to what the maker of the image meant the image to mean. As Israel Scheffler argues,

human creation is always contingent, always experimental, always capable of yielding surprises—not only for others, but for the human creator himself. The product humanly made is never a pure function of creative purpose and foreseeable consequences of the maker’s actions. The human maker does not fully own his own product.

Intentionalists, however, believe that an image does have a meaning and the meaning is determined by the maker of the image. A significant limitation of Intentionalism is that it commits one to the view that there is a singular meaning of a work, and a single correct interpretation of it, namely, the maker’s meaning.

In opposition to Intentionalists, Conventionalists maintain that meanings that can be reasonably attributed to an image are based on the linguistic, cultural, and artistic conventions at work when the image was made. Nor does it make sense to limit what a photograph might mean based on what its maker says it means. To rely on the artist’s intent for an interpretation of an artwork is to put oneself in a passive role as a viewer. Reliance on the artist’s intent unwisely removes the responsibility of interpretation from the viewer; it also robs the viewer of the joy of interpretive thinking and the rewards of new insights into images and the world. Thus the maker’s intent might play a part in interpretation, but ought not determine a work’s meaning.

Interpretations can discourage further interpretations. Karen-Edis Barzman refers to these as “master readings” that have “a dependence on so much erudition that the reader is disarmed and even daunted at the moment of reception, a moment in which asymmetrical power relations between writer and reader are at least implicitly affirmed.” Such interpretations position the viewer asymmetrically as a passive recipient of fixed meaning (the interpreter’s), harmfully deny the plurality of interpreters, and suffocate thought.

They presume to read authoritatively for their audiences, universalizing their own situated perceptions, fixing meaning with the stamp of finality, and thus rhetorically denying their readers the possibility of intervening interpretations themselves.

YASUHIRO ISHIMOTO

American, Japanese

Yasuhiro Ishimoto's work embodies a unique mixture of Japanese, American, and European influences. Born to Japanese parents in San Francisco in 1921, he has worked as a Japanese citizen since 1961, using a number of traditional Japanese themes. As further proof of his impeccable Japanese credentials, he was included in the canonical *Photography and The National Museum of Modern Art, Tokyo 1953–1995* exhibition curated by Masuda Rei at the National Museum of Modern Art, and he was named a Man of Cultural Distinction by the Japanese government in 1997. This belated identification of his work as a part of the modern Japanese photographic tradition has overshadowed the pivotal influence of the Bauhaus in his photographic education and obscured the importance of the formative years that he spent in the United States.

Although born in the United States, Ishimoto returned to Japan at age three with his parents to begin his schooling. Being born in the United States granted him automatic citizenship, and in 1939, when he graduated from high school, he returned to the United States to go to college. He began studies in agriculture at the University of California, but in 1942 his plans were interrupted by the outbreak of World War II. Despite being a citizen, he was interned in Armach, Colorado with

other Japanese Americans. Although this forcible confinement could have been traumatic, he claims that, as a young man, he was easily able to endure the fieldwork, and the enforced break in his college studies gave him time for contemplation that he would otherwise have lacked.

At the end of the war, Ishimoto began studies in architecture at Northwestern University, Evanston, Illinois. Soon, however, after reading László Moholy-Nagy's *Vision in Motion*, he transferred to the celebrated photography program at Chicago's Institute of Design. This program had been founded in 1937 by Moholy-Nagy as The New Bauhaus, and, by his death in 1946, it had incorporated many of the same tenets of design faith that the original Bauhaus in Dessau had espoused. Although he was under the tutorship of the inspirational Harry Callahan and supervised by Aaron Siskind, Ishimoto soon developed his own method of working and won the Moholy-Nagy Prize in 1951 and then again in 1952.

After graduating from the Institute of Design in 1952, Ishimoto returned to Japan. His big break came shortly thereafter, when one of his photographs was selected to be part of the monumental 1955 *The Family of Man* exhibition being put together by Edward Steichen at the Museum of Modern Art in New York. The picture, of a young girl loosely tied to a tree in a game of hide-and-peek,

captures an exhilarating childhood moment in which the adult gaze of the audience gets caught between constraint and play, sexuality and innocence. The world tour of *Family of Man* brought his work to a global audience and provided him with the opportunity to publish a 1958 collection of his work in Japan as *Aru Hi Aru Tokoro (Someday Somewhere)*.

Shortly after the *Family of Man* exhibition, in 1956, Ishimoto married Shigeru, to whom he remains married. The couple returned to Chicago in 1958, living there until 1961 when they moved to Japan, where Ishimoto applied for and received citizenship. While in Chicago, however, Ishimoto had put together two series of pictures that illustrate the three major influences on his work: the city life of Chicago, traditional Japanese art, and the principles of the New Bauhaus.

In the years after his book *Aru Hi Aru Tokoro* won the 1958 New Talent Prize of the Japanese Photography Critics' Association, he compiled two other books: *Chicago, Chicago*, a lyrical portrayal of life in Chicago at the end of the 1950s, and *Katsura*, an architectural anatomy of the seventeenth-century Imperial detached palace (or "Villa") at Katsura. Although the subjects of *Chicago, Chicago* and *Katsura* are quite different from one another, depicting different eras in different countries, Ishimoto drew on the Bauhaus aesthetic in capturing them. On the one hand, Ishimoto presents life in Chicago according to the principles of Moholy-Nagy's *Vision in Motion*, observing and structuring the inner life of his fellow humans through their interactions with the new technology. On the other hand, he presents the Imperial design of the Villa at Katsura as if it were a result of Bauhaus geometrical design theories *avant la lettre*.

Along with Moholy-Nagy, Ishimoto can count Hiroshige, the nineteenth-century painter, and Bashō, the Japanese Haiku poet of the seventeenth century, as major influences. Each of them, in their respective disciplines, was a master of the genre representing each of the customary stations along the Tokkaido—the major road linking the capital at Edo (modern-day Tokyo) to the Emperor in Kyoto. From Hiroshige, he took elegance and an ability to catch a moment in time; and from Bashō, a contemplative delight in tiny details. Rather than coach stops at guest houses along a road, Ishimoto's stations of the Tokkaido are the 29 "JR" station stops between Tokyo and Kyoto on the publicly-owned *Yamanote-sen* of the national Japanese Railway. The poignant pictures in *Yamanote-sen 29* are a further illustration of his ability to grasp a historical design in the context of modern technology.

The same elegance and contemplative regard found in *Yamanote-sen 29* are also found in the sequences of clouds, footprints, and crushed leaves that comprise an increasing proportion of his work in the 1990s. Ishimoto had addressed these subjects earlier in his career, but he has dwelt on them—pushing them to abstraction—even as the patient clarity of his earlier work was helping him become accepted as one of the main talents in twentieth-century Japanese photography. His influence on the younger generation of Japanese photographers and especially on members of the VIVO (Esperanto for "life") group has so far come from this earlier phase. Most notable among the members of that group who were affected by the intimate moments he found in the city were Ikko Narahara, Eikoh Hosoe, and Kukuji Kawada.

Ishimoto continues to take and print photographs. Since before his studies at the Institute of Design he has printed his own pictures, a practice that explains why his gelatin silver prints are never larger than 11 × 14 inches—the largest size he can print in his darkroom. Along with re-envisioning his classic series in his 1983 color pictures of the Katsura palace, or his collection *Chicago, Chicago 2* of the same year, Ishimoto re-investigates his old negatives, allowing him to rediscover his former triumphs and fashion new insights from them.

Biography

Born in San Francisco, 14 June 1921 to Japanese parents; moved to Japan in 1924. Graduated from Kochi Prefectural Agricultural High School, 1939; traveled to United States, 1939. Studied agriculture at the University of California, Los Angeles; interned in Japanese-American camp, 1942–1944. Enrolled in architecture program at Northwestern University, Evanston, Illinois, 1946. Studied with Harry Callahan and Aaron Siskind 1948–1952 at Institute of Design (ID), Chicago. Won prize in young photographers' contest sponsored by *Life* magazine; ID's Moholy-Nagy Prize 1951, 1952. Returned to Japan, 1953. Married Shigeru, 1956. Won New Talent Prize of the Japanese Photography Critics' Association for his book *Aru Hi Aru Tokoro (Someday, Somewhere)* in 1958. Lived and photographed in Chicago, 1958–1961. Returned to Japan and won Camera Art Award for "Face of Chicago" in 1962. Obtained Japanese citizenship, 1969. Mainichi Art Award for his book *Chicago, Chicago*, 1969. Received the Annual Award of the Japan Photography Association and the Ministry of Education's Art Encouragement through the Selection

ISHIMOTO, YASUHIRO

of Excellence Award, 1978. Japanese government awarded him Medal of Honor with Purple Ribbon in 1983, Order of Cultural Merit in 1993, and Man of Cultural Distinction in 1997. Lives in Tokyo, Japan.

GRACIELA ITURBIDE

Mexican

Now aligned with the most notable names in Mexican art, Graciela Iturbide's photographs are political, emotional, and often surprising. Though only in mid career, her place in the history of photography has been firmly established as the foremost Mexican photographer after her mentor, Manuel Álvarez Bravo. Her work emphasizes that photography more than captures the main events of the twentieth century; it looks closely at the everyday and the unusual of the contemporary world. Iturbide has more than 20 years of experience, ranging from her first project, a study of the Seri Indians in Northern Mexico (1981), to a retrospective of her work at the Philadelphia Museum of Art (1997–98). Her photography is memorable and striking because she is not limited by artificial borders. Rather, her art emphasizes that there are no minor subjects and that each moment and each act are integral to understanding the fast-paced contemporary world and the relations between the old and the new, the indigenous and the foreign, the traditional and the technological.

Born in Mexico City in 1942 as the oldest of 13 children, she remembers how she made her first contact with photography by looking through family photo albums. She married in 1962 and gave birth to three children, but after the 1970 death of her six-year-old daughter, she decided to take her life in a different direction, and she studied photography at Mexico City's National Autonomous University from 1969–72 in the Department of Cinema. It was during this time that she spent a year as assistant to Mexican photographer Manuel Álvarez Bravo, who also became her greatest inspiration. The importance of this relationship is reflected in the light, shadow, and subject matter of her work. Like her mentor, she is not concerned so much with creating distinctions between social hierarchies, but instead her photographs often concentrate on the forgotten, the impoverished, and the heterogeneous nature of modern life.

After a trip to Europe where she met Henri Cartier-Bresson, she returned to Mexico and became very active in the Mexican art world, and in 1978 she was a founding member of the Mexican

Council of Photography. Her opportunity to make an important contribution to the history of photography came in 1979, when renowned Mexican artist Francisco Toledo asked her to do a series of photographs of his hometown, Juchitán, Oaxaca, in southern Mexico. Juchitán is known throughout Mexico for its matriarchal society and for women of such strength and loveliness that they are often referred to as having bewitching powers. Iturbide photographed this indigenous Zapotec community and documented the powerful and multi-faceted role of these women as healers, community leaders, and merchants. In this series, she captured some of the most powerful images of the Mexican indigenous and was awarded the first prize at France's prestigious people "Mois de la photo" in 1988.

Iturbide is passionately interested in the role of women in the community, and the overwhelming physical presence of her subject matter from the "Juchitán" series is felt in photographs such as *Our Lady of the Iguanas* (Nuestra Señora de las iguanas) 1980 depicting a Juchitán merchant wearing a headdress of live iguanas, a common sight in the Isthmus of Tehuantepec. In these photographs, she transforms the everyday into the mystical, the surreal, the enchanting. It is clear to see how, like her predecessors such as Rufino Tamayo and Frida Kahlo, Iturbide's work directly addresses the relation between history and the present, between the indigenous and the modern world. Her photographs often reveal the mixture of the pre-Hispanic, the Catholic, and the modern. Each image is a conscious dissection of the impact that technology and contemporary society have made on traditional cultures in Mexico and other regions of the world and the ways these cultures are surviving the New World Order. In photographs such as *Angel Woman* (Mujer Angel) 1979, which portrays a Seri Indian walking into the Sonoran desert with a boom box, and *The Store* (La tienda) 1982, which highlights the on-going impact of the Spanish Conquest on the local culture in Ecuador, she portrays the realities of contemporary Latin America. In addition, her photographs from the Juchitán such as *Chickens* (Pollos) 1979 demonstrate that she does not turn away from stark scenes that transgress sexuality, gender roles, and the harsh reality

ITURBIDE, GRACIELA

of everyday life in Mexico's indigenous regions but celebrates their importance.

Iturbide's work exudes the rich influences that have swept into her variegated subject matter, and the reflections of master photographers such as Edward Weston, Alfred Stieglitz, Paul Strand, and Margaret Bourke-White are evident throughout her images. At the same time, her portraits of Oaxacans reflect the influence of the dramatic and surreal style of Joel-Peter Witkin, but with the subtlety and sensitivity to their subjects of Diane Arbus's work and the confrontational nature of Robert Mapplethorpe. The influence of one of her greatest inspirations—the Italian-born photographer Tina Modotti—is also evident. Modotti was a socially committed photographer who lived in Mexico for a large part of her life and concentrated on photographing workers and political movements between World War I and World War II. Like much of Modotti's photography, Iturbide's heterogeneous photographic subjects reflect her social commitment to using photography for making a difference in the way the world sees. She integrates herself into the community and photographs as she sees, and in that way finds the beauty or the horror of her subject matter and passes this on to the viewer. She is intimate with her subject matter and, rather than forming a critical opinion, she lets it speak for itself.

Iturbide has an international following and has traveled and photographed communities in Cuba, Peru, Panama, Russia, and Madagascar in the same provocative style found in her work from Mexico. She has undertaken photographic journeys to the southern United States and to India, and she has been invited to speak throughout the world, including Puerto Rico, South Korea, and the esteemed Beaux Arts School in Paris, France. She currently resides in Mexico City.

IZIS (ISRAEL BIDERMANAS)

French, born in Lithuania

Izis Bidermanas is one of the most important French photographers, who unfortunately has been greatly underestimated. His career started at the end of World War II, when he portrayed his resistance comrades in Limoges. By the time he was included in the popular 1955 exhibition, *The Family of Man*, at the Museum of Modern Art, New York (MoMA), he had joined the staff of *Paris-Match*, specializing in photographs of painters, artists, and writers. He published several photography art books collaborating with artists and poets from Paris and its poorer quarters, discovering astonishing formal relations between objects and people. After leaving *Paris-Match* in 1969, he worked as a freelance photographer until his death in 1980.

He was born in Marijampole in Lithuania on January 17, 1911. Although Bidermanas had shown interest in painting at an early age, he left school at age 13 to be an apprentice to a portrait photographer in that city. After living the life of a gypsy, wandering the countryside to photograph, he ended up, penniless and speaking no French, in Paris in 1930 at age 19. As apprentice to a portrait

photographer, Bidermanas had learned techniques of soft focus and retouching, both of which he later rebelled against, calling them untruthful. In Paris, he worked first in a laboratory, retouching photographs and printing. He was employed by the photographer Arnal and later directed a small photography shop in the 13th arrondissement in Paris, before opening his own studio in 1934 and producing portraits.

During World War II he became a member of the resistance movement, photographing his comrades and working as a photo researcher. After the war he became a French citizen (1946) and worked as a freelance photographer before joining the staff of *Paris-Match*. Remaining with the magazine for over 20 years, he focused on photographs of painters, poets, and writers. He was known to stroll the city of Paris as a dreamer, searching for moments, which “aroused his curiosity, moved him or made him reflect.”

Following the German invasion of France in 1940 Bidermanas, as a Jew, was forced to flee and hide; he supported himself retouching photos. It was during this time he took on his pseudonym, Izis. He ended up in the Limoges in 1944, fighting as a soldier during the liberation of the town and where he

made portraits of the French underground resistance fighters. It was this intense experience that caused him to radically alter his style. He asked if he could photograph his comrades of the Resistance; they showed up nicely washed and dressed. As this completely changed the image he desired, he asked them to don their filthy, war-stained clothing that he might capture the heroes of Limoges.

These photographs caused a stir when they were exhibited in Limoges under the title “Ceux de Grammont,” and they caused him to be noticed upon his return to Paris, where he met with Laure Albin-Guillot, known as the “muse of portraiture” and one of the leaders of the École de Paris, the photographer Brassai, and Emmanuel Sougez, founder of the photo service *L'Illustration* and an important promoter of young photographers. He met and photographed Dora Maar at this time, producing a notable portrait of her smoking a cigarette in a masculine manner. Izis mounted his first exhibition in 1946, but quickly realized he could not support himself without returning to studio work, and opened another studio at 66, rue de Vouille in 1947, which he maintained until 1954.

When he became associated with *Paris-Match* in 1949, he had the occasion to photograph Paris's leading artistic and literary figures. He met the painter Marc Chagall, well-known for his joyful, mystical Jewish subjects and became friends. Chagall later allowed him as the only photographer to document his work on the ceiling of the opera in Paris, photographs he later published in a book.

In 1951 he met poet and screenwriter Jacques Prévert, with whom Bidermanas jointly created several beautiful art books, including *Charmes of Londres* (1951) following a three-week stay in London, with handwritten texts by writer and playwright Jacques Audubert to poet and writer André Virel. One of his best-known photographs, shot in the East End slums, shows a man blowing bubbles. In 1951, Izis provided 59 more photos for the publication *Grand bal du printemps*; these books are now highly sought-after for both Izis's poetic images and the texts they contain.

In 1955, Izis participated in the international exhibition *The Family of Man*, a worldwide success that featured the type of humanistic photography that was so characteristic of that era in France. His work became internationally known at this time, although he rarely left Paris. He did complete memorable images during sojourns in Israel as well London in the early 1950s. In 1965 his childhood interest in circuses and friendship with Marc Chagall resulted in the publication *Le Cirque d'Izis*, with lithographs by the painter and circus photographs by Izis.

Izis was dismissive of methods and devices, such as light meters or flashguns, which he thought would destroy the atmosphere he searched to capture and recreate in his prints. He was not very prolific, often waiting a considerable time to capture the right image, and employing his trusty old Rolleiflex in all his photography.

Throughout his career, Izis was interested in individuals rather than showing people as part of an event. He photographed what made him curious, moved him, or made him think. Prévert compared him to one who goes out strolling in dreams.

As the meaning of his photographs is often rather more suggestive than explicit, his documentary photography belongs to the so-called metaphorical documentation. His motifs often resemble a riddle and require poetic understanding. His books, especially “*Paris des poètes*” (1977) demonstrate the artist's sometimes surrealist working methods. In 1978, he became an honorary member of the Rencontres d'Arles. He died on May 16, 1980.

The Hotel de Sully honored Izis with a retrospective in 1988. While his archive belongs to his widow, his photographs have been exhibited internationally and are included in the collections of several photography museums and photography departments within general museums such as the Bibliothèque Historique de la Ville de Paris, Bibliothèque nationale de Paris, Musée Reattu, Arles, France, Musée du Limoges, France, Museum of Modern Art, New York, and the Art Institute of Chicago.

J

J. PAUL GETTY MUSEUM

Located on the heights of Los Angeles's hills of Santa Monica, the Getty houses two renowned photography collections at the J. Paul Getty Museum and at the Getty Research Institute. Oil tycoon J. Paul Getty (1892–1976) first established the museum in 1953 as an educational establishment dedicated to his collection of European painting, decorative arts, and classical antiquities. In 1976, his substantial bequest funded one of the most expansive acquisition strategies of the 1980s, enlarging the museum and establishing the research institute. The two collections at these institutions represent two different discourses in photography—its establishment as an art form and reconciliation with its nineteenth-century functions. Both establishments have purchased a number of American and European private collections, providing historical reflections on photography's varied developments, beginning from 1839 through the modernist era.

J. Paul Getty's substantial bequest, reportedly nearing \$2.3 billion, reached the Getty Trust in 1982 and decisions were made to create new departments for the museum (illuminated manuscripts, prints and drawings, sculpture, and photography) and to create additional organizations that underscored existing programs in education, con-

servation, and scholarship. With this expansion the J. Paul Getty Museum was joined by the Getty Research Institute for the History of Art and the Humanities, the Getty Conservation Institute, the Getty Information Institute, the Getty Education Institute for the Arts, and the Getty Leadership Institute for Museum Management. These organizations now form "the Getty," located in a contemporized design of a classically inspired structure built by leading architect Richard Meier. Initially located in Malibu, the Getty opened at its spectacular new site in Santa Monica in 1997 and received widespread, international exposure.

Since its inception, photography competed for artistic authority and acceptance into museums. Although major institutions such as the Metropolitan Museum of Art and the Museum of Modern Art in New York, and the George Eastman House (now International Museum of Photography and Film) in Rochester, New York, began collecting as early as 1928, photography was still relegated to a second class status within most art museums. Following the Museum of Modern Art's landmark exhibition *The Family of Man* in 1955, photography permeated a public audience. Even so, the Getty was a late-comer to the collecting of photography. This was ameliorated considerably by the Getty trust, which

J. PAUL GETTY MUSEUM

allowed the museum a huge advantage in the art market during the 1980s at the time it was being affected by contemporary art developments around performance art and conceptual and color photography. Individuals who had amassed photography collections from 1839 through the 1950s became the Getty's source for rare and valuable objects.

In the photography department's formative years, Weston Naef, Chief Curator of Department of Photographs, stated his intentions: "I want to work slowly and systematically toward forming the most comprehensive collection of photographs of all schools, all periods, up until and through the 1930s." (Schreiber, 1984, 93, 95) Yet the collection seemingly was established overnight. This occurred when in 1984, the art dealer Daniel Wolf was introduced to Naef and John Walsh, the director of the J. Paul Getty Museum. Daniel Wolf had first approached Naef with the collections of legendary Detroit and New York-based curator and collector Samuel Wagstaff and Chicago-based Arnold Crane. Wagstaff's collection included 18,000 objects and represented many important nineteenth century figures. Arnold Crane's collection represented early French and British materials and important twentieth-century modernist photographers such as Man Ray, László Moholy-Nagy, and Walker Evans. After securing these two collections, additional purchases were made including early European photography (Bruno Bischofberger of Zurich), portions of the Albert Renger-Patsch archive (Jürgen and Ann Wilde of Cologne), and 1920s and 1930s Czech photographs (William Schurmann of Aachen).

While unusual at the time, the acquisition of these materials under the auspices of a private dealer that were in fact for a public museum caused a seismic shift in attention from the East to the West coast. By the official announcement of the department's creation in September 1984, the museum had acquired some 30,000 objects, reportedly costing \$20 million.

Acquisition strategies at the J. Paul Getty Museum are qualified by thematic divisions: How We Live, Mythology, Natural World, People and Occupations, Religion, Science and Industry, and Where We Live. These divisions shape public reception, relying mostly on the ideas of cultural developments. In the Department of Photographs, the diversity of photographic systems and objects, including stereographs, graphic illustrations of photography's influence, original negatives, prints by various techniques, card photographs, and cased objects such as daguerreotypes and ambrotypes, highlights the international phenomenon of photographic processes that shaped artistic developments. Wagstaff's collection provided the substance for the department's first

exhibition, *Hanging Out: Stereographic Prints from the Collection of Samuel Wagstaff, Jr. at the J. Paul Getty Museum* (1985). *Experimental Photography: Discovery and Invention* (1989) was a later exhibition and symposium that brought together photography's major figures who first attempted to connect photography's scientific endeavors of the nineteenth-century with the fathers of modernist photography, such as Alfred Stieglitz, Beaumont Newhall, Larry Schaaf, Nancy Keeler, Eugenia Parry-Janis, and John Szarkowski were among the symposium's participants, whose presentations constituted a related publication. Other exhibitions have ranged from examinations of nineteenth-century permutations, such as *Palette of Light: Handcrafted Photographs, 1898–1919* (1994), to monographic exhibitions of the masters of photography: Eugène Atget, Gertrude Käsebier, Albert Renger-Patsch, Walker Evans, Doris Ulmann, Edward Weston, Dorothea Lange, Manuel Álvarez Bravo, and Frederick Sommer.

The exhibitions reflect a dedication to scholarship and dissemination of communal knowledge that is culturally biographic. The depth and diversity of their collection allows for exploration of acknowledged masters that increases understandings of their timely contributions. Walker Evans, widely acclaimed for his photographs from the 1930s and 1940s of America's rural communities, exemplifies the museum's conscientious research. The exhibitions, *Walker Evans: The Getty Collection* (1995), *Walker Evans: Signs* (1998), and *Walker Evans, Cuba* (2001) revealed his ability to not only document America but to intuitively identify the structures that subtly characterize the growth of industry. *The American Tradition and Walker Evans: Photographs from the Getty Collection* (2001) actively demonstrated this strength of the collection. Work chosen from 1850 to 1940 exhibited Evans with predecessors and contemporaries to discuss the insight photographers gave to changes in advertising and immigration that transformed rural towns and urban cities. This smaller exhibition of rare photographs complemented a larger exhibition that the museum hosted, *Walker Evans & Company: Works from the Museum of Modern Art*. The J. Paul Getty Museum also holds the work of nineteenth century English pictorialist photographer Julia Margaret Cameron, and has exhibited and published this work extensively.

The educative role of the J. Paul Getty Museum is realized through symposiums and colloquiums around important ideas that bring together eminent authorities to engage in discussions and debates on contemporary topics involving the collection and the artists. An important component of

the Getty's educational program is their publication *In Focus*, an alternative form of catalogue for many of their monographic exhibitions. The standard format is pocket-sized with over 100 pages and consists of 50 images, artist's chronology, and transcriptions of round-table discussions that include important figures in photography. Among the titles in this series are *André Kertész* (1994), *Alfred Stieglitz* (1995), *Eugène Atget* (2000), *August Sander* (2000), and *Dorothea Lange* (2002).

In contrast to the museum, the Getty Research Institute (GRI) for the History of Art and the Humanities offers a collection that critically engages the function and employment of photography. Photography acquisitions in the Special Collections and Visual Resources department are also purchased from individual collectors, but the agenda is shifted from a modernist approach to interests in the vernacular. The collection is divided into seven areas: Ritual, Performance, and Spectacle; Cross-Cultural Exchange; Processes of Conception and Production; Visual Communication and the Culture of Images; Art and Science; History of Collecting and Display; and Cultural and Social Debates. Headed by Curator of Special Collections, Frances Terpak, the divisions examine the complexities of the nineteenth-century and photography's participation by examining the materials of the period, which includes archival photographs, rare books and albums, and mechanical devices.

The approach at GRI is interdisciplinary and expansive. *Framing the Asian Shore: Nineteenth-Century Photographs of the Ottoman Empire* (1998) was composed from a purchase of 6,000 photographs from French collector Pierre de Gigord. The exhibition contextualized the photographs in postcolonialist terms, examining the Western image of the Orient. Other materials that described Eurocentric interests were included as well, such as maps, early prints, ceramic tiles, and Romantic literature. Exchanges between scientific technology and visual perception are growing aspects of the collection as well. *Devices of Wonder: From the World in a Box to Images on a Screen* (2001) connected visual entertainment devices from the seventeenth-century through to the twentieth-century and displayed many of photography's precursors such as a physionotrace, crank magic lanterns, and a portable camera obscura. In addition to Western devices, the department has increased holdings in Latin American photography. Purchases have resulted in a two-part exhibition that traced Mexico's revolutionary history through to its modernist era, *Mexico: From Empire to Revolution* (2000). The exhibition featured the work of Augustin Victor Casasola,

Manuel Ramos, and a series of documentary photographs that captured the historic shooting of Emperor Maximilian, photographs that served as Édouard Manet's inspiration for his realist painting *The Execution of Emperor Maximilian of Mexico* (1867). The collection of Mexican photography complements the J. Paul Getty Museum in its large holding of photographs by Manuel Álvarez Bravo, whose work is often connected to both Mexico's documentary tradition, which stems from the Revolution and to modernist and surrealist movements.

Since 1984, the museum has extended its collection to include practices since the 1930s and 1950s, moving into the areas of Pop Art and color photography. *The Hidden Witness: African Americans in Early Photography* (1995) was an important exhibition in this respect. The objects drew from a recent acquisition of Jackie Napoleon Wilson's collection of African American photography composed of daguerreotypes, albumen prints, and *carte-de-visites* from the Civil War era. Although the exhibition featured nineteenth-century work, contemporary artist Carrie Mae Weems was commissioned to create a photographic installation that spiritually responded to *The Hidden Witness*. The collaboration received wide acclaim and laid the groundwork for later comparative exhibitions such as *Nadar/Warhol: Paris/New York* (1999) and *William Eggleston and the Color Tradition* (1999).

The Getty makes a difference by weaving together the presentation, enjoyment, study, and conservation of the visual arts in order to increase the public's knowledge and sensitivity, expand its awareness and creativity, sharpen its understanding and caring—all with the conviction that cultural enlightenment and community involvement in the arts can help leap to a more civil society.

These last lines of the Getty's mission statement are a summation of institutional aims of the photography collections at the Getty. Overall, the keys to their collections are informational. At both institutions, the departments offer study rooms, which are available by appointment, to view the collections and foster research. A grant program exists explicitly for this purpose. On another level, photography is used in a conventional sense on the internet through the Getty Center's Photo Study Collection Database, which represents a physical department at GRI. Containing over 250,000 object entries, the photographs document works in the collection (Antiquities, Medieval, Decorative Arts, Sculpture, Painting, and Prints) as well as donated and acquired images by photographers of archaeological sites and other humanities interests. Their website, www.getty.edu underscores their collections—a

J. PAUL GETTY MUSEUM

conglomerate of works dedicated to accessing examples of the human endeavor.

LOTTE JACOBI

American

Lotte Jacobi created some of the most striking and enduring original photographic portraits of the twentieth century. Although many of her subjects were celebrities, including actors and dancers, her works were not mere glamour shots. Jacobi captured not only the sitter, but the essence of his or her creativity through her direct approach and bold compositions, leaving a legacy that has shaped our perception of the artistic circles that emerged during the years between World War I and World War II in Berlin.

Born in Thorn, West Prussia, Germany (now Toruń, Poland) in 1896, Johanna Alexandra Jacobi (Lotte was a nickname that caught on at home) was the fourth generation of her family to take up photography. Her great-grandfather, Samuel Jacobi, a glazier, began making daguerreotypes in the 1840s, having purchased equipment, a license to practice, and instructions from Daguerre while visiting in Paris. Growing up in Posen, Germany, the oldest of three children, Jacobi studied art history and literature at the Academy of Posen (1912–1916). At the age of 18, she aspired to become an actress,

the theater being one of her many interests, but she kept returning to her roots in photography. She made her first pictures using a pinhole camera made by her father, Sigismund Jacobi.

In 1916, Jacobi married Fritz Honig, and the couple had a son, John Frank, the following year. The marriage only lasted four months; after a long separation, their divorce became final in 1924, and Jacobi retained custody of her son. The following year, she enrolled her son in school in Bavaria, and Jacobi attended the Bavarian State Academy of Photography in Munich, where she learned film and photography, and the University of Munich (1925–1927), where she studied art history.

After completing her formal training, Jacobi moved to Berlin, where her family had operated a photographic business since 1921. Following an apprenticeship with her father, Lotte became the director of Jacobi Studio of Photography from 1927–1935, photographing some of the most prominent German citizens, including Bertolt Brecht, Albert Einstein, Käthe Kollwitz, and Kurt Weill. The Jacobi Studio made photographs for print media; John Heartfield was a customer from 1929–

1932. Jacobi made photographs for Heartfield, some for his montages and some for book covers.

During the 1930s, the theater and the arts became her primary subjects; she extended her interest to include dance and eventually film. Film and dance were important components of her early studies and influenced her photography stylistically. Liquid forms and fluid motion became a hallmark of her works associated with dancers and actors. To accomplish her indoor work without a flash, she began to use a 9 × 12-cm Ermanox, one of only nine such cameras made during 1928–1929. During this period, she reluctantly switched from the use of glass plate negatives to celluloid film.

Pursuant to her love for the theater, Jacobi began a series of theater portraits, appearing during and after dress rehearsals when it was permissible to photograph the actors. Portraits of stage actors Peter Lorre, Franz Lederer, and Lotte Lenya, which have become her iconic photographs, are some of the most original and modern images, even by today's standards. Jacobi's portrait style, characterized by experimentation with abstraction—unusual perspectives, cropped-heads, and high or low-angle shots—places her work firmly among the German school of photography known as the *Neue Sachlichkeit* (New Objectivity) and the experimental works of Russian photographer and graphic artist Alexandr Rodchenko.

Jacobi's works, like those by the New Objectivity practitioners, are beautiful formalist images that appear intended for press advertising and today help define the visual style of the Weimar Republic. In 1930, her work appeared in a modernist exhibit in Munich, *Das Lichtbild*, organized by Max Burchartz, and mounted the following year in Essen. Although she worked closely with avant-garde photography methods, Jacobi always privileged the expressive content of her images over formal aesthetics.

While still in Europe, a client in Berlin arranged for Jacobi to travel to the Soviet Union from the fall of 1932 to January, 1933. Her work from this four-month sojourn reflects her response to the diversity of people, places, and geography. Much of her early work prior to her coming to the United States has been lost.

Of Jewish heritage on both sides and upon the death of her father in 1935, Jacobi with her son John fled the inhospitable climate of Nazi Germany, and they settled in the United States; she became a naturalized citizen in 1940. Once in New York, she opened a portrait studio with her sister Ruth at the corner of Sixth Avenue and 57th Street in October, 1935. She eventually flourished in a succession of studios on her own in New York City from 1935–1955 and maintained a gallery during 1952–1955. In

1938, she was the first woman to photograph on the floor of the New York Stock Exchange during trading hours. She held an instant celebrity status as a refugee witness of German culture before the rise of the Nazi Party. Her photographs appeared in the *Sunday Herald Tribune* shortly after her arrival.

Jacobi's portraits made in America are equally captivating as those from her German period, possessing the immediacy of the moment and the presence of the person portrayed. The images reveal the photographer's willingness to observe her subject rather than direct the proceedings; the sitters appear to have been caught slightly unaware. Photographing luminaries Albert Einstein, First Lady Eleanor Roosevelt, actor Paul Robson, and painter Marc Chagall among others, Jacobi achieved naturalism in her portraiture work by instilling a relaxed atmosphere. She explained her approach to portraiture:

My style is the style of the people I photograph. In making portraits, I refuse to photograph *myself*, as do so many photographers.

(Wise 1978, p.8)

While photographing her subjects, often in the sitter's own surroundings, Jacobi converses casually, uses existing light, and waits for her subjects to come into their own. Jacobi penetrates her subject's self-conscious, translating the sitter's personality to the permanent image. In 1939, when *Life* magazine did an essay on Einstein, he insisted that Jacobi be one of the photographers.

Shortly after arriving in America, she met German publisher and fellow émigré Erich Reiss, and the couple married in 1940. Reiss took over the accounting and management of Jacobi's studio in New York. Reiss died in 1951.

In America, Jacobi's oeuvre took on many shifts in style, moving from objectivity to photogenic drawings called "light abstractions." In 1946, when her husband Erich Reiss became ill, and as a form of therapy, she suggested they both began a course in photograms taught by Leo Katz at the Atelier 17, an artistic center in New York City. Jacobi's unique vision of an already explored process translated to her capturing fragile abstract patterns on light-sensitive paper created by moving objects and lights. Katz called her camera-less work made in the 1950s "photogenics." To achieve the abstracted patterned effect, she used candles, flashlights, glass, cellophane, and paper cut in odd shapes.

A collection of photographs Jacobi made in the 1930s and 40s, a documentary of New York City, remained an important personal project but one that was never exhibited.

In 1955, Jacobi moved to rural Deering, New Hampshire with her son John and his wife Beatrice; she continued photographing, exhibiting, and teaching. In the later part of her life, she found time to explore untapped interests in beekeeping, gardening, and politics. The University of New Hampshire at Durham awarded her an Honorary Degree in 1973, and the University holds The Lotte Jacobi Archive comprised of 47,000 negatives, several hundred study and exhibition prints, three portfolios, as well as letters, catalogues, documents, and other printed material. She died in Concord, New Hampshire, in 1990.

SUNIL JANAH

Indian

Photojournalist Sunil Janah was born in 1918 in Dibrugarh in the northeast Indian state of Assam, and educated at St. Xavier’s and Presidency colleges in Calcutta. A gift of a camera from his grandmother at age 11 and inspiration from a family friend engaged in the profession of photography launched his career as one of the most prolific photographers of pre- and post-independence India. Janah captured, through his lens, images of some of India’s most tumultuous and calamitous times. In the 1940s alone, his photographs recorded the Bengal famine of 1943; the South India famine of 1945 (with Margaret Bourke-White); India’s peasant, labor, and

independence movements; and the communal violence and mass dislocations that accompanied the Partition of India.

Janah’s photographic interests started with the pictorial, photography being a hobby secondary to his interest in literature. Eventually, he combined the two interests to launch a lifelong career in photojournalism.

Janah joined the Communist Party of India in 1943 and briefly served as the photo editor on the party’s newspaper *The People’s War*. He probably envisioned the deliverance of India from British imperialism in a socialist system of governance. It was through his involvement in the Communist Party, substantiated by his photographic represen-

tation of ordinary working people—factory workers, miners, fisher folk, men tilling fields, and women transplanting rice or picking tea leaves, that he participated in the anti-colonial and anti-imperialist struggle and rallied for a socialist state in post-independence India.

In 1943, the diversion of Indian food grains to the British army on the Eastern Front of World War II, the British seizure and destruction of barges that prevented the transport of grains to outlying regions of Bengal, and the involvement of manipulative grain brokers all combined to precipitate the worst human calamity in India's economic history. Janah's potent images of the Bengal Famine of 1943, followed by the images of the 1945 famine affecting South India, in particular Rayalseema and Mysore, permanently encapsulated an historical portrayal of a man-made disaster in an exploited nation reeling under imperialist dominance. Janah photographed emaciated people waiting in line for food, groups of skeletons and hungry dogs gnawing at dead bodies, reminding viewers of similar images by Felice Beato in the aftermath of the Mutiny of 1857.

Janah also accompanied American photographer Margaret Bourke-White (1904–1971) as an interpreter and reporter during her travels in India, providing insider reports. Together, they captured the 1945 Famine as well as some of the most vivid terror-filled images of the violence that marred India's progress to freedom. Bourke-White's images were published in *Life* magazine and in her book *Halfway to Freedom* (1949).

Political events and personalities formed a core subject of Janah's photographs. In addition to portraits of Mahatma Gandhi and Jawaharlal Nehru, Janah also photographed historic moments between Gandhi and Mohammad Ali Jinnah during their talks on the future of India, Gandhi in Calcutta trying to pacify warring Muslims and Hindus during the partition riots of 1946–1947, uprisings against British rule and their brutal suppression, and the communal violence itself, that was unleashed in Calcutta on the eve of India's independence. Particularly horrifying are his images of the bodies of political demonstrators piled in a heap after being shot by police in Bombay in the aftermath of the Naval (R.I.N.) Mutiny, and of bloated bodies on the streets following the Calcutta riots. The Partition itself has been poignantly captured in his depiction of a barbed wire fence implying the creation of separate Hindu and Muslim nations.

During 1947–1967, Janah worked as a freelance photographer in Calcutta, serving also, from 1958 to 1964, as the Head of the Department of Photography at the School of Printing Technology, Calcutta.

Between 1967 and 1979, Janah worked from Delhi. His work during this entire period, from 1947–1979, included assignments from commercial firms as well as from the Government of India and associated agencies, such as the Damodar Valley Corporation and the India Tourism Development Corporation.

In 1957, Janah documented the United Nations' aid in the Southeast Asian nations of Burma, Malaysia, and Thailand, where he photographed rice and rubber plantations and tin mines. He also fulfilled assignments for the U.N. Organization in Geneva and Paris.

In the post-independence era, in the 1950s and 1960s, India executed a series of five-year economic plans based on industrial projects involving the construction of dams and steel plants. Janah maintained a detailed photographic inventory of the changes that represented India's modernity. Notable in this regard are photographs such as those of boatmen rowing a loaded country boat on the Hooghly River, against the background of a Calcutta skyline dominated by modern buildings, and of tribal women workers carrying loads below the giant upright steel pylons of a power plant under construction. Almost as if to counteract the rapid forces of industrialization that threatened India's natural life and beauty, Janah traveled extensively to photograph the people of India—its workers, its peasants, and its tribal people residing in remote areas. Some of his photographs vividly portray their shrunken bodies during natural disasters, while others express their intrinsic grace.

Particularly as regards tribes, Janah felt amazed at the ease with which they appeared before a camera, a gadget unknown to most of them. In eastern and central India, he photographed the Santals, Oraons, Bhumias, Hos and Hajangs of Bengal and Bihar, the Gadabas, Saoras and Juangs of Orissa, the Chakmas of Tripura, and the Murias and Bisonhorn Marias of Bastar. In the west and south, he photographed the Bhils of Rajasthan, the Warlis of the Western Ghats and the Todas of the Nilgiris. In the northeast, Janah photographed the Kukis of Manipur, the Nagas of Nagaland, the Abors, Daflas and Mishmis of Arunachal Pradesh, the Miris of the Brahmaputra valley, and the Kacharis, Khasis, Garos and Mikirs of Assam and Meghalaya. Janah's photo-documentation of these tribes preserved pristine images of lives that are constantly changing under the threat of economic and industrial development. Through Janah's camera, the traditional and the modern, the rural and the urban converged to produce a holistic image of an emergent modern nation.

Subsequently, Janah spent more of his time photographing India's monuments and archaeological remains, its dance forms, and its natural beauty. His photographs are a record of India's evolution from political subjugation to independence, from famine to economic recovery and industrialization, from tradition to modernity. Poised between images of the past and present, of the Taj Mahal and Bombay's Victoria Terminus railway station, the temples and sculpture of Khajuraho and Orissa and the modern office blocks of Delhi, Janah's photographs present a priceless visual continuum of India's past and present.

Janah did much of his early photography using a Rolleiflex that had to be held at waist level in order to view the image projected on the ground-glass screen on top of the camera. This positioning may have enhanced the dramatic effect of his composition. He mostly took his photographs in natural light, often under difficult physical conditions. With age, his vision has declined. Although he continued, until very recently to be active in his darkroom, he now spends much of his time working on writing his reminiscences to accompany a retrospective publication of his photographs. Janah, now 86, lived with his wife Sobha in London from 1980 to 2003, and now resides in Berkeley, California.

Janah was awarded the Padma Shri in 1972 by the Government of India in recognition of his outstanding achievement in his field.

Janah's works have been exhibited extensively in India and abroad, including Calcutta, Delhi, Mumbai, Havana, Berlin, London, Prague, Bucharest, Sofia, New York, Philadelphia, and San Francisco.

Janah published three books: *Tribals of India* (2nd ed; OUP, 2003), *Dances of the Golden Hall* with Ashoke Chatterjee (Indian Council of Cultural Relations, 1979), and *The Second Creature* (Signet Press, 1948). His photographs have illustrated several others, including most of the illustrations in books such as *Mahatma Gandhi* by Jawaharlal Nehru, *India Brandt* by Arthur Lundkvist, *Kama Kala* by Mulk Raj Anand, and *Indian Temple Sculpture* by A. Goswami. The BBC and ITV in the United Kingdom and Doordarshan in India have produced short documentaries on the life and works of Sunil Janah.

Biography

Born in Assam, India in 1918. Photographer and journalist for the Communist Party of India, 1943–1947, working as

the photo editor of the CPI paper *People's War/People's Age*, 1943–1946. Recorded (a) the Bengal-Orissa famine of 1943–1944; (b) the South India famine of 1945 (with Margaret Bourke White); (c) India's peasant, labor and independence movements; and (d) India's partition. Freelance photojournalist, Calcutta, 1947–1967, and in Delhi, 1967–1979. Work included assignments from the Government of India and associated agencies, such as the Damodar Valley Corporation and the India Tourism Development Corporation, India's agricultural, mining and metal industries, and development projects. Continued photographing and recording: India's urban, rural and tribal life; political and cultural luminaries; classical dance; temple architecture and sculpture. Worked for the United Nations organization in Burma, Malaya and Thailand in 1957, and in Geneva and Paris in 1958–1959. Head of the Department of Photography at the School of Printing Technology, Calcutta, from 1958 to 1965. In 1972, awarded the Padma Shri by the Govt. of India, for outstanding achievement in his field. In 1980, moved to London. Continued writing and darkroom printing work on exhibitions and books. Also continued taking photographs in the United Kingdom, Europe, and North America into this century, until rendered unable by increasing loss of vision.

Individual Exhibitions

- 1965 Calcutta, 1952 and 1953, and New Delhi
- 1972 Berlin, Rostok and London
- 1975–76 Prague, Bucharest and Sofia
- 1984 London at the South Bank and at the Barbican; and Oxford, at the Oxford Museum of Modern Art (along with the paintings of the poet Rabindranath Tagore, on the 125th anniversary of the poet's birth)
- 1985 New York Overseas Press Club
- 1987 Oxford, Wolverhampton and several other cities in the Midlands, United Kingdom
- 1991–92 New Delhi, Calcutta and Bombay, (Retrospectives)
- 1992 Havana Bienelle at Havana, Cuba
- 1994 Merida, Mexico
- 1996 New Delhi—by the Indira Gandhi National Centre for the Arts (IGNCA).
- 1997 Preston at the Harris Gallery, and London at the Nehru Centre
- 1998 Gallery At 678, New York
- 2000 Kalart Gallery, San Francisco

Group Exhibitions

- 1982 *Festival of India*, at The Photographers Gallery, London
- 1990 *Fotofest 1990*, Houston, Texas
- 1997–98 *India—a Celebration of Independence*, an exhibition organized by the Philadelphia Museum of Art and Aperture Foundation at Philadelphia, London, Milan, Virginia, New Delhi, Mumbai (Bombay) and Chennai (Madras)

PHOTOGRAPHY IN JAPAN

The history of Japanese photography is necessarily understood in relation to Western developments, yet it is important to avoid being overwhelmed by the seemingly endless stream of images that flow from Japan. As well, it is important to decode long-standing Western fantasies about Japanese representation. Yet the preeminence of Japanese photography in areas such as equipment manufacturing during the second half of the twentieth century and the Japanese love of the photographic medium stand as unique features in world photographic history.

Photography was brought to Japan by Dutch travelers between 1839 and 1840; in other words, photography was introduced to Japan virtually from the beginning. In 1848, at the beginning of the Tokugawa period (1848–1868), photographic equipment is mentioned in a document written by a Nagasaki merchant named Toshionjo Ueno. At that time, Nagasaki was the only city where Dutch and Chinese ships were allowed. Soon after, Japan was shaken by violent political and military conflicts, rendering photographic experimentation difficult. The first recorded Daguerreotype was realized by Eliphalet Brown, Jr. in 1854 at the time of the second expedition of Admiral Perry, who had been sent by the United States government to force commercial exchange between Japan and the United States. Brown had been mandated to create an illustrated report, but unfortunately most of these photographs disappeared in a fire in the United States two years later.

The Meiji Restoration of 1968 saw the nation's capital moved to Tokyo (renamed from "Edo"), and for the first time, Western ideas and products were freely allowed into Japan. Thus, for this per-

iod of Japanese photography, it is not surprising that the most renowned photographers are Westerners. Felice Beato, who had been the first European to work in China, exploited the growing market for Japanese art in the West and created many delicately hand-colored works published in two albums: *Views of Japan with Historical and Descriptive Notes* and *Native Types*. Baron Raimund von Stillfried-Ratenicz, originally an Austrian painter and direct competitor to the Italian Beato, set up a studio with a number of Japanese assistants, ultimately buying out Beato's studio. The native pioneers of Japanese photography, Hikoma Ueno in Nagasaki, Renjo Shimooka (1823–1914) in Yokohama, and Kimbei Kusakabe (1841–1934) are less well known. Hikoma Ueno is credited with setting up the first native-run studio. Kimbei Kusakabe had trained with both Beato and Stillfried, and he founded his own studio in 1877. It is Renjo Shimooka who is often dubbed the "father of Japanese photography." Although their studios catered to a great extent to Western tourists, they allowed the diffusion of photography in the Japanese society. Landscapes proved popular subjects aside from the portraits that were their main trade, and they largely combined Western conventions while enhancing some details with color. Because most of these productions were intended for the Western market, they fulfilled Western expectations of the Land of the Rising Sun as a place of pastoral beauty and elegant, exotic people. The misty mountainscape, gentle geisha, or the fierce Samuri were popular images.

At the turn of the nineteenth century, there were well over a hundred photography studios operating

in Japan, but the expansion of the field had been limited by the fact that all photographic equipment had to be imported at great cost, as there were no native manufacturers. This situation changed in the early years of the century, with the Cherry Portable camera debuting in 1903. A forerunner of Konica, this modest dry-plate camera marked the beginning of the Japanese camera industry, which was soon to become a dominant force. The Fujii Lens Seizo-sho factory was founded in 1908, equipped with modern manufacturing equipment imported from Germany, and consolidated in 1917 into Nippon Kogaku Kogyo K.K., a forerunner of Nikon, considered one of the finest lines of cameras in the twentieth century. For the amateur market, an affordable pocket-sized camera called the Minimum Idea was introduced in 1911. Its huge popularity can be surmised from the founding, two years later, of the Minimum Photo Club.

During the Meiji era, photography had been linked to the aristocracy and the upper class, both as patrons and subject matter. At the turn of the century, however, newspapers begin to publish photographs; the first Japanese photojournalists covered the Boxer Rebellion in China in 1900 and the Russian-Japanese war in 1904–1905. Important pioneering photographers of this period were Reiji Ezaki and Kenzo Tamoto, who studied with Hikoma Ueno and created the well-known work, *Ainu woman harvesting seaweed* (ca. 1900), and paved the way for a more realistic photographic style.

Great expansion in the field took place during the Taisho era (1912–1926). With Emperor Taisho's succession to Emperor Meiji, Japan was finally fully emerging on the international scene. Despite the boom of the Minimum Idea camera, photography was still largely an artistic medium, remaining under the influence of painting in the dominant Western style known as Pictorialism. Japanese Pictorialists include: Teiko Shiotani, Hakuyo Fukumori, Ori Umesaka, and Yasuzo Nojima, who, like their western counterparts Robert Demachy, Julia Margaret Cameron, and Gertrude Käsebier, concentrated on techniques to enhance texture, create half tones, and soften outlines. In Japan, painting and photo are so closely linked that the term which is used is *shashin-ga*, which could be translated as "photographic painting."

Until 1920, the division of style common in painting was applied to photography: on one hand, the *Nihonga* style or Japanese painting and on the other hand, the *Yoga* style, which means Western painting. The Fukuhara brothers, Shinzo and Roso, who were a major force in the early days of modern photography in Japan, and Kiyoshi

Nishiyama are key figures of this period. They were the first to breach this stylistic partition, associating the spare but atmospheric characteristics of the *Nihonga* tradition with a clearer pictorial vision, as exemplified by the emerging Modernists in the West such as Paul Strand or Edward Weston. In 1921, Shinzo Fukuhara, who had traveled and photographed extensively in the West, formed *Shashin-Geijyutsu-sha* along with his brother Roso and Isao Kakefuda and Motoo Ootaguro, and founded the magazine *Shashin Geijyutsu* (Art Photography). Shinzo also served as first chairman of the Japan Photographic Society. These photographers did not free themselves entirely from Pictorialism, as can be seen in Shinzo's *Paris et la Seine*, 1922. Roso Fukuhara, however, achieved a more Modernist vision in his works.

A number of illustrated news and popular magazines appeared during the 1920s, providing venues for photography, including *Kokusai Shashin Joho*, *Kokusai Jiji Gappo* (later named *Sekai Jiji Gappo*), and *Kokusai Gappo*. Photography magazines included *Geijyutsu Shashin Kenkyu*, *Photo Times*, and *Amateur*. The first major photography curriculum at the college level, the Konishiroku Shashin Senmon Gakko photo school, was established in Tokyo. Renamed Tokyo Shashin Senmon Gakko in 1926, the school currently exists as the Tokyo Institute of Polytechnics. This program joined the already existing photography department, founded in 1915, of Tokyo Bijutsu Gakko (Tokyo Art School).

During the Taisho period, the history of Japanese photography also saw a major milestone with the introduction and subsequent widespread use of the small format, roll-film camera. A leading example was the Kodak Vest Pocket, introduced by Eastman Kodak in 1912, and available in Japan around 1915. This camera spawned the *Vesu-tan* group, who experimented with lens effects and printing techniques that were relatively simple and did not require a professional studio to achieve. In 1925, the Konishiroku Honten Company introduced the highly popular Pearlette camera as an imitation of the Vest Pocket. The consequence was a major expansion of amateur photography associated with Japanese practice. The 1920s also saw the founding and expansion of numerous photographic clubs and associations. Along with Shinzo Fukuhara's *Nihon Shashin-kai* (Japan Photographic Society), founded 1924, the *Zen-Nihon Shashin Renmei* (All-Japan Association of Photographic Societies) formed from the consolidation of numerous smaller clubs. This organization published the influential *Asahi Camera* magazine.

Advances in equipment manufacturing continued. Asahi Kogaku Goshi Kaisha, the forerunner of Asahi Optical Company, Ltd., the maker of Pentax cameras, had been established in Tokyo in 1919 as a manufacturer of ophthalmic lenses. By 1934, it had become a major supplier of camera lenses for manufacturers such as Konishiroku and Minolta. The forerunner of Olympus Optical Co., Ltd., Takachiho Seisaku-sho, had also been established in 1919, as a microscope manufacturer. It made its first photographic lens in 1936. Photographic papers were being widely manufactured by this era as well. In 1928, the forerunner of Minolta Camera Company was founded. Along with several other lens manufacturers producing innovative products, Nippon Kogaku Kogyo K. K. manufactured its first Nikkor lens, which in 1936 was first mounted on the Hansa Canon camera. The forerunner of Canon, Inc. was established in 1933 as Seiki Kogaku Kenkyusho (Precision Optical Instruments Laboratory), introducing the Hansa Canon in 1935. In 1934, the Fuji Photo Film Company was established. That same year, the “Super Olympic,” the first 35mm camera made in Japan, was produced.

In the first half of the 1930s, at the beginning of the Showa period (1926–1989), Japanese photography saw the impressive burgeoning of the medium also characteristic of the interwar years in Europe. Along with the influence of European avant-gardes, there was the development of press photography or photojournalism, and the advent of modernist design and advertising. Building on the expansion of artistic thought and practice of the 1920s, institutions that could form the basis for an academic movement, a counter-culture, and an avant-garde were in place. Photography followed the race for development of Japanese society in general, and reflected the changing conditions and the new sensibilities of individuals. During this period, marked by two major disasters—the 1923 Tokyo earthquake and the devastation of the atomic bombing of Hiroshima and Nagasaki in 1945—the medium entered into a stage wherein there was the uneasy coexistence of opposing expressions: the traditional Pictorial-influenced realism, and experimental practices.

In the 1930s, photography bloomed in the illustrated press, which in part was inspired by the picture stories of *Life* magazine, which began publication in 1936. Yonosuke Natori was the first Japanese photographer to be published in *Life*, with his images of Japanese soldiers. The photojournalists, however, were opposed to *shinko shashin* (new or modern photography), whose adherents

mixed Pictorialism with aspects of the European avant-garde. Modernism represented a decisive rupture, a rejection of a pictorialist aesthetic that many Japanese photographers were reluctant to make. Fueled by technical advances, however, the modern movement included significant experimentation, which led artists to discover new possibilities.

Those who practiced *shinko shashin*, or the new photography, included Kiyoshi Koishi, Nakaji Yasui, Iwata Nakayama, Yasuzo Nojima, and Ihee Kimura; they were particularly influenced by the German movement *Neue Sachlichkeit* (New Objectivity), and the teachings emanating from the Bauhaus schools in Dessau and Berlin. They were able to experience firsthand the European avant-gardes via the *Film und Foto* exhibition, organized in 1929 at Stuttgart, Germany and presented in 1931 in Tokyo and Osaka. This exhibition showed the works of László Moholy-Nagy, Albert Renger-Patzsch, and many others. The *Photo-Times* magazine, founded in 1924, had also begun to publish new trends in foreign photography in the 1930s.

Innovations proposed by the *shinko shashin* philosophy were spread via three important clubs, each reflecting the personality of their founders: Kiyoshi Koishi with the Naniwa Shashin Club of Osaka, Nakaji Yasui with the Tanpei Shashin Club, and Iwata Nakayama with the Ashiya Camera Club. Another group, Zen 'ei Shashin Kyokai (photographic avant-garde), was in part inspired by Surrealism. In parallel, the Realist Movement appeared with, among others, Ihee Kimura, Shoji Ueda, Yonosuke Natori, and Hiroshi Hamaya.

An important magazine that supported the expression of the modern photography movement, *Koga*, published 18 issues between May, 1932 and December, 1933. Graphic design and typography as innovative as the photographs that appeared were published by the magazine's principals, Yasuzo Nojima, Iwata Nakayama, Nakaji Yasui, and Ihee Kimura. The first issue consisted of a manifesto that urged photographers “to smash into pieces the concepts of traditional art.” Works by *Koga's* three founders are characteristic of the *shinko shashin* movement. Nojima, the head of the magazine and the oldest of the three, had practiced a Pictorialist style for more than 20 years, as exemplified by the 1910 photograph *Troubled Waters*. Around 1930, he made a radical move to experimental forms, as seen in *Untitled, Model F* of 1931. While he specialized in nudes and portraits, Nojima consistently tried to go beyond the rules of these genres. Kimura was the first to use a 35-mm Leica to produce snapshot-like photographs of the daily life of the working classes of Tokyo. His photo-

graphic style is characterized by a floating space, an emphasis on texture that suggests a zen spirit in the conception of his photographs, as can be seen in *Portraits of Literary Artists* of 1933. Nakayama had worked in portrait studios in New York and Paris, where he came into contact with what was called "Pure Photography," as exemplified by Paul Strand or Albert Renger-Patzsch. When he returned to Japan, he worked on photograms and multiple exposures.

During the short life of *Koga*, several essays on theoretical and experimental topics were published, further disseminating these ideas among Japanese photographers. Publication ceased in 1933 for financial reasons and because Ihee Kimura decided to pursue photojournalism. The modern or new photography movement revealed the fluid situation of Japanese photography in the 1930s. The most important club, the Naniwa Shashin Club, which had been a leader of Pictorialist style for 20 years, moved, for a short period, to the promotion of experimental works.

Several smaller groups in the Kansai area (Osaka and Hyogo) were dedicated to experimentation. The Tanpei Shashin Club, created by Bizan Ueda and Nakaji Yasui in February 1930, attracted Osamu Shiihara and Tershichi Hirai, who practiced styles very strongly influenced by the German New Objectivity. Shoji Ueda, a mainstay of the Naniwa Club, was particularly inspired by Moholy-Nagy's *Malerei, Fotografie und film*, and was one of the first Japanese photographers to develop a highly personal aesthetic, photographing his family as models in his ongoing *Dunes* series. Sutezo Otono and Ei-Q (Sugita Hideo) were the first photographers to explore the possibilities of photogram, a technique pioneered by Moholy-Nagy and Man Ray. Ei-Q worked on a plastic approach to photography, combining painting and photography.

Also, Surrealism had been important in Japan because it gave birth to a new photographic style in the late 30s. Gingo Hanawa, Yoshio Tarui, and Terushichi Hirai created the avant-garde group *Zoei Shudan*. They used techniques such as photograms and multiple exposures and printing to describe imaginary worlds. The photomontage work of Gingo Hanawa that explored themes of dream and illusion and which he dubbed "Complex Pictures," is created with a collage technique, allowing a broader definition of photography. With his *Hansekai* series, Kiyoshi Koishi proved that he had integrated and digested avant-garde techniques, employing them as tools to elaborate his own photographic universe.

However, Pictorialism continued to exert attraction on young photographers after 1930, carrying this style much beyond its general practice in the West. Sakae Tamura and Giro Takao, two young photographers of this period who had been published in *Photo Times*, created pictorialist pictures, modeled on Impressionist painting and infused with subjectivity, that were considered as works that forecast Surrealism.

Established figures such as Ihee Kimura, Shoji Ueda, and Yonosuke Natori, with their adaptations of Social Realism, a style practiced in Europe and America especially during the Great Depression, took up the visual vocabulary and the themes of the German illustrated press. But in the mid-1930s, the Japanese government, marching inexorably toward militarization, took over these themes to make fearsome weapons of propaganda in magazines such as *Front* or *Nippon*. Propaganda, along with a film shortage and government crack-down on the manufacture or importation of photographic equipment as World War II began, cut significantly into photographic production. Censorship was also practiced. Ken Domon's protest against censorship published in *Nihon Hyoron* in 1943 resulted in the banning of the magazine, and the last months of World War II saw the destruction of thousand of so-called "compromising negatives." The war era also saw the consolidation or cessation of publication of many photography magazines as part of the general contraction in the field.

As with every aspect of Japanese life, the dropping of the two atomic bombs by the United States in the waning months of the War are an inescapable reality and watershed for Japanese photography. The tragedy of Nagasaki and Hiroshima is immortalized by the photographic accounts in the hours and the days that followed the bombings by Yoshito Matsushige and Mitsugi Kishida in Hiroshima and Army photographer Yosuke Yamahata in Nagasaki, along with some pictures by a young student, Toshio Fukuda, Seizo Yamada, and Eiichi Matsumoto. From these rare documents ensued many reflections about destruction and what history cannot erase. Initially, there was a ban on publishing any photographs of the atomic bomb destruction by the U.S. occupation; this ban was lifted in 1952. But as late as 1965, Kikuji Kawada published a collection called *Bijutsu Shuppansha (Maps)* in which he mixed close-up shots of stains, bumps, and cracks on walls of the Atomic Dome of Hiroshima with pictures of dead soldiers. Through the combination of these disparate elements, close-up shots of objects and numerous signs, Kawada evoked the defeat of Japan during

World War II. His famous black-and-white picture from this series of the Japanese flag, lying on the ground, seeming soaked and wrinkled, is a symbol of an essential part of Japanese history.

The general devastation caused by World War II as well as the economic reality of a bankrupt country also devastated the Japanese photographic equipment industry. Many manufacturers, having had their resources diverted to the war effort, found it difficult to rebuild in the bleak postwar years. The Nikkor lenses, however, after having been introduced to eminent war photographer David Duncan Douglas, who was then in Japan, became the lenses of choice for international war correspondents and photojournalists, one step towards the preeminence of Japanese photo equipment in the postwar era.

Photographers tried to report the terrible events of the war while looking to the reconstruction of the mental and physical landscape of the country. Ken Domon, who with Shigeru Tamura and Hiroshi Hamaya had formed *Seinen Hodo Shashin Kenkyukai* (Young Documentary Photo Research Club) in 1938 to practice a socially aware documentary style, published his powerful series *Hiroshima* in 1958. A work about memory and the inability to completely bury the past, this series was unique in post-war Japanese photography as the country modernized and looked to a future shaped by science and technology. This accession to modernity is evident in two events: the 1964 Tokyo Olympic Games and the 1970 Osaka World's Fair. As part of reflection about modernization, Japan discovered, in the 1950s and 1960s, such Western photographers, as Henri Cartier-Bresson, Robert Doisneau, Brassai, Robert Frank, and W. Eugene Smith, who realized one of the most heartrending photographs of Japan, *Tomoko Kamimura in Her Bath*, 1971 from a photo-series that chronicled the disastrous mercury poisoning caused by a manufacturing plant in the fishing village of Minamata.

In 1950, Ken Domon founded the *Shudan* group, which exhibited such leading international photojournalists as Margaret Bourke-White, W. Eugene Smith, Henri Cartier-Bresson, and Bill Brandt. Following the tenets of the German movement "Subjektive Fotografie," the first signs of a revival of photographic subjectivity appear while the popularity of the practical applications of photography greatly increases. Post-war Japanese photographers generally were unconcerned by technical issues; American-born Yasuhiro Ishimoto, trained by Harry Callahan and Aaron Siskind at the Chicago Institute of Design, visited Japan in 1953 for a five-year stay and brought with him the lessons of the

New Bauhaus, greatly influencing the emerging post-war generation. He permanently relocated to Japan in 1961 and became a Japanese citizen. Ishimoto was the only Japanese to be included in the massive *The Family of Man* exhibition organized in 1955 by the Museum of Modern Art in New York and which circulated in Japan in 1956 to an audience of over a million people.

Post-war Japanese photography largely developed around three axes: documentary photography, personal photography, and commercial photography. Ken Domon led the movement for documentary forms with an influential essay in which he defined "realism" photography, published as instructions for potential entrants to the monthly contests held by the international magazine *Camera*, for which he served as a juror. Another important practitioner was Shomei Tomatsu, who with his series *Nagasaki, 11:02* (the time the atomic bomb was dropped) pays tribute to the survivors of Nagasaki. Ihee Kimura and Hiroshi Hamaya, professional photographers before the war, increasingly considered photography as a medium to discover, capture, and transmit a social reality. Hamaya documented folklore, traditions, and rituals that were threatened with being swept away in the rush to modernization. Hamaya developed his photographic thinking through two major publications: *Yukiguni (Snow Country)* of 1956 and *Urah Nihon (Japan's Back Coast)*, 1957. Ihee Kimura, inspired by Cartier-Bresson's philosophy of "the decisive moment," continued his snapshot aesthetic in documenting the average Japanese citizen in the street, at work, or engaging in other aspects of everyday life. Kimura's importance to Japanese postwar photographic history is reflected by the naming of a prestigious prize awarded annually by *Asahi Camera* magazine.

Relationships to history, the history of a place, religious experience, and the construction of bonds which unite people and their divinities are also found in the photography of Yoshio Watanabe. A leading architectural photographer, in 1953 he was authorized to take pictures of the ritual of razing and rebuilding the Ise Jingu Shrine, an ancient Shinto temple in the Mie Prefecture made of wood, which takes place every 20 years. The documenting of this reconstruction was a milestone both for Watanabe and Japanese photography.

Personal photography is based on the I-Novel, and based on the idea that photography can become an individual expression, a notion that came late to Japan. These photographers were younger, emerging as professionals after the War. The most representative artists in this arena are Daido Moriyama, who was influenced by William Klein; Nobuyoshi Araki,

who was the first to use and popularize the term “I-photography”; and Masahisa Fukase, who completed series about solitude and madness, such as the *Yoko* series, 1964–1975. Other postwar figures, such as Eikoh Hosoe and Ikko Narahara (known also as simply “Ikko”), explored other personal paths.

In his 1956 series *Man and His Land*, Ikko draws a parallel between two communities, the small village of Kurogami on the island of Kyushu, destroyed by an erupting volcano; and the artificial island of Hajima, which was built around a coal mine. The photographs presented a pessimistic view wherein man is subject to both nature’s hostility and social oppression. Ikko continued working with the photoessay form but expanded his practice to other experimental art mediums in the 1970s and 1980s. Eikoh Hosoe dramatized a relationship between himself and a young American girl he met in a base as he was looking to improve his English in a photo narration *An American Girl in Tokyo* (1956), using a photojournalistic technique to create a work of fiction. Hosoe was hardly the only Japanese photographer to dwell on implications of the U.S. occupation of Japan, which officially ended in 1952 but saw U.S. troops stationed on Japanese soil to the end of the century. Shomei Tomatsu, who has established himself as one of Japan’s leading postwar figures with his 1958 series *Chewing Gum and Chocolate*, documented the pre-occupation of Japanese people wishing to save their traditions and culture from Americanization.

From 1957 to 1959, critic Tatsuo Fukushima organized seminal exhibitions called *Jūnin no me*, which means “The Eyes of Ten People.” The 10 exhibitors were Eikoh Hosoe, Yashuhiro Ishimoto, Kikuji Kawada, Shun Kawahara, Ikko Narahara, Masaya Nakamura, Akiro Sato, Akira Tanno, Shomei Tomatsu, and Toyoko Tokiwa. Six of these colleagues, Hosoe, Kawada, Narahara, Sato, Tanno, and Tomatsu, created the important agency VIVO to support and distribute their style of photojournalism while pursuing their personal work.

Significant advances in photographic technology continued as Japanese manufacturers innovated and improved their products. By 1962, Japan had displaced West Germany as the world’s top producer of cameras. In the early 1960s, the Nikonos camera, the first underwater camera not requiring a bulky housing, was introduced. The Pentax SP was introduced in 1964 as the first single-lens-reflex camera featuring a through-the-lens exposure system, which was soon to become standard in SLR cameras. The next year, the first Japanese cameras incorporating electronic shutters were introduced, and Canon created the world’s first

camera with a quick-loading feature for 35-mm film, also to become a standard feature.

In the second half of the 1960s, a new generation of artists, including Daido Moriyama, Hiromi Tsuchida, Yutaka Takanashi, Masahisa Fukase, and Issei Suda questioned the conception of modern art based on the creation of an original world inspired by the personality and the aesthetic sense of the artist. In November of 1968, Yutaka Takanashi, Takuma Nakahira, Koji Taki, and Takahiho Okada published the magazine *Provoke*. The pictures of these photographers are characterized by a fragmentation without any aesthetic order and by violently contrasted images. Although very short-lived, publishing only three issues, with runs never exceeding 1,000 copies, *Provoke* became a seminal opus of post-war Japanese photography. Indeed, *Provoke* carried radical photographic theory and unpolished images described as *are-bure-boke* (rough, blurred, out-of-focus) as described by photohistorian Anne Wilkes Tucker.

Nobuyoshi Araki first emerged as a major force in Japanese photography when he was awarded the first ever and now prestigious Taiyo-sho Award in 1961. A photo essay called *Satchin* that followed children out on the street in Tokyo was the first in an almost continuous documentation of everything that comes before Araki’s lens, including subject matter many consider goes beyond the erotic to pornographic, making him a prototypical figure of Japanese photography in the West.

During most of the postwar period, the nude in photographs was considered objectionable, and the government banned the depiction of pubic hair, to the point that officials impounded nude photographs of Edward Weston scheduled for a 1976 exhibition. Kishin Shinoyama was one of the few Japanese to explore this genre fully, with his 1969 series *Death Valley*, *Twin*, and *Brown Lily*. The *Death Valley* nudes are striking abstractions of the body arranged against the dramatic landscape of the famous California desert. Shinoyama also made his mark with a collection of photographs of Yukio Mishima. In September 1970, before his suicide by *hara-kiri*, which became an international event, the novelist posed for Shinoyama, acting out for the camera his ideas for his own death. Two pictures in particular became very famous: the first one shows the transformation of Mishima into a Saint Sebastian motif, his wrists tied to the branch of a tree while arrows pierce his side and armpit. In the second one, Mishima is lying on the ground, a short saber stuck in his abdomen, while the photographer stands behind him, brandishing a longer saber, waiting for a signal to behead Mishima.

Mishima claimed to be protesting against the loss of values in Japanese society to the advances of technology and capitalism. Those pictures, like those from the 1963 collection *Barakei (Killed by Roses)* of Eikoh Hosoe, once more questioned the modern history of Japan and its relationship with Western art history.

With the beginning of the Heisei period in 1989 with the death of Emperor Hirohito and the succession of Emperor Akihito, while domestically Japan experienced a severe recession which caused the closing of several magazines and photo galleries, a new breed of Japanese photographer had emerged, dealing with international artistic issues and achieving international recognition while staying true to the deep traditions of Japanese photography. Yasumasa Morimura became known internationally with work that explored this set of themes. In large-format color images, Morimura used himself, costumed and made-up, to imitate the major paintings of Western art history, such as *Daughter of Art History: Princess A*, of 1990, which is inspired by Velasquez's portrait of l'Infante Margarita of 1656. Morimura also realized a self-portrait, *Doublonnage (Marcel)*, in 1988, in which he represents himself as a new Rose Sélavy, the portrait of French avant-garde artist Marcel Duchamp in the guise of his female alter-ego that was immortalized by Man Ray in 1920–21. Although working within postmodern precepts at the end of the twentieth century, Morimura's method creates a continuity between painting and photography, a salient issue at the turn of the nineteenth century.

Hiroshi Sugimoto, another internationally renowned figure, has meditated on time and space since 1978. Made with a wooden cabinet 8 × 10-inch Durdorf and Sons view camera and long time exposures modulated by filters to create a film speed comparable to nineteenth century films, Sugimoto pictures contain a disturbing poetry initially more collected by those in the West than in Japan. Photographing in ongoing series the elaborate U.S. movie palaces of the 1920s and 1930s, drive-in theaters, natural history museums, wax museums, and seas and oceans, the Zen spirit that infuses Sugimoto's work seems uniquely Japanese.

Toshio Shabata is another prototypical Japanese photographer who has established a wide reputation in the West with his extraordinary, large-scale landscape studies, often showing the earth contained or otherwise interrupted by man's engineering feats. His 1999 exhibition *Quintessence of Japan* established his reputation as one of Japan's leading contemporary photographers.

Japanese photographers historically had been almost entirely male; in the 1980s and 1990s, young Japanese women finally began to emerge as creative forces, chief among these figures is Mariko Mori. Like her colleague Yasumasa Morimura, identity is one of Mori's favorite themes. She also integrates into her photographic compositions elements from Shintoist Buddhism: (*Mirror of the Water*, 1996; *Pure Land, Entropy of Love* and *Burning Desire*, 1998). She often represents herself as a sort of hybrid creature of human and machine, a character who has perhaps stepped out of the *manga*, and *anime* forms so popular in Japan during these years. Mori is also a technical innovator, working with holographic imagery and three-dimensional video. Since 1995, Mariko Mori has worked on a project, *Beginning of the End*, that combines space and time. At each stop during her extensive travels, the artist takes photographs using a 360° camera, the artist herself present in the middle of the image, held within transparent capsule. Made up of 13 panoramic images, *Beginning of the End*, is divided into three groups that depict the past (Angkor, Teotihuacán, La Paz, Bolivia, Gizeh), the present (Times Square in New York, Shibuya in Tokyo, Piccadilly Circus in London, and Hong Kong), and the future (represented by ambitious development projects La Défense in Paris, the city of Shanghai, the Docklands in London, Odaiba in Tokyo, and the construction boom of post-Cold War Berlin).

The high school student Hiromix (Toshikawa Hiromi) became a phenomenon in Japan with her Nobuyoshi Araki-inspired photo diary style as young women became a greater and greater influence on the creation and consumption of photographs. A 1998 exhibition *An Incomplete History*, attempting to capture the history of female photographers during the 130-year history of the medium, began a two-year tour of the United States. It featured nine photographers, most of whom had been largely overlooked, including Eiko Yamazawa, Osaka's first woman photographer who ran her own studio from the 1930s to the 1950s; Tsuneko Sasamoto, known as Japan's first female documentary photographer; Miyako Ishiuchi, who did a pioneering series of male nudes; and Michiko Kon, a younger artist known for her still lifes.

In the 1990s, Japanese photography saw greater institutionalization, with the opening of the permanent quarters of the Toyko Metropolitan Museum of Photography, the founding of the Kiyosato Museum of Photographic Arts and the Shoji Ueda Museum of Photography, and numerous other photography programs. The widespread use of dis-

posable cameras and other easy-to-use equipment, such as the auto-focusing camera developed in Japan, further cemented the longstanding fascination with the medium. Photography entered the digital age with the manufacture of products that further expanded amateur use, such as camera phones, automatic vending machines dispensing photo stickers that created the Print Club (Purinto Kurabu) craze, and other devices, with the Internet allowing almost instantaneous circulation of images.

HAROLD JONES

American

Harold Jones's career in photography has spanned more than 40 years. He has been involved with the industry in its many facets—as a museum curator, gallery director, director of a photographic archive, a teacher of studio photography at the college level, and as a professional photographer. As an undergraduate student at the Maryland Institute of Art in Baltimore in the early 1960s, Jones studied both painting and photography. When applying to graduate programs, he produced a portfolio of black-and-white photographic self-portraits that were painted over half their surface. At the time, he did not know of anyone else working in this manner, and did not know how to refer to this collection of hybrid images. Fortunately for him, his prospective graduate advisor, Van Deren Coke, liked the work and took Jones on as a student at the University of New Mexico in Albuquerque.

Following his graduate work, Jones spent several years as an assistant curator at the George Eastman House in Rochester, New York, but left in 1971 to become the first director of the Light Gallery in Manhattan. Tennyson Schad, owner of the Light Gallery, hired Jones to operate what was then only the second major gallery devoted to the sale of art photography in New York City. The Witkin Gallery had opened in 1969 and sold nineteenth-and twentieth-century photographs, but the Light Gal-

lery focused on the work of contemporary photographers, including Harry Callahan, Aaron Siskind, Frederick Sommer, and, later, Robert Mapplethorpe. The gallery's success was attributed to Tennyson Schad's willingness to show young, unknown photographers and to trust his staff and directors in their artistic decisions. While Jones left in 1975 to become the first director at the Center for Creative Photography, Light Gallery continued to impact the contemporary photography scene until it closed in 1987.

The Center for Creative Photography at the University of Arizona in Tucson was established in May of 1975 to house the purchased archives of Ansel Adams, Wynn Bullock, Harry Callahan, Aaron Siskind, and Frederick Sommer. As the center's first Director, Jones oversaw the earliest programs at the center, which included publication of a journal, in-house and touring exhibitions, and continued collections acquisition. In 1977, Jones left the center, but he stayed in Tucson, to start a program of photography instruction at the University of Arizona. The photography of Harold Jones is difficult to categorize, and there are no generalizations that satisfactorily describe his varied body of work. His original dual training in painting and photography led to a practice that Jones referred to as “photodrawings”—gelatin silver prints that are worked with a variety of hand-colored surfaces. Over the years, Jones used ink, food coloring, and oil paints as well as a

variety of chemical toners, often in combinations that were thought to be incompatible. The resulting images are unique and cannot be duplicated. Jones' hand-colored effects range from subtle to direct and are the result of continuing experimentation. Initially, he felt ambivalence about altering the surfaces of his prints, feeling that it was an impure practice, but ultimately he concluded that the making of the photograph was the first phase of drawing, and surface treatments and coloring constituted the second phase.

In addition to experimenting with hand-coloring, Jones's approach is varied even within his unaltered prints. Jones has worked with both multiple and long-duration exposures to capture people in motion, or to suggest apparitions. Rather than creating intimate or psychologically probing studies, Jones uses as his subjects everyday objects arranged in compositions that require viewing and re-viewing. Jones has described his delight in the process in which a person moves beyond a superficial reading of a photograph to a closer inspection. His images reinforce the idea that a world continues beyond the picture plane, that one is seeing a fragment of a larger whole. While he often photographs everyday objects, such as the supports of a water tower, or laundry hanging on a folding rack, they are often taken from an unusual vantage point or cropped in unexpected ways. These varied approaches can produce a range of effects from humor to mystery. Sometimes Jones creates formal compositions that submerge the meaning of the objects shown. When the objects displayed can be discerned, however, they appear neither mundane nor banal. Jones' compositions and juxtapositions provoke questions whose answers are often not found within the edges of the photograph.

In addition to his work as a photographer, since 1977 Jones has been instructing students at the University of Arizona on the art of photography. As a professor, Jones teaches introductory and photo-techniques courses and also provides instruction in documentary photography and self-portraiture. The University of Arizona photography department includes several studio photography instructors. The department promotes a philosophy of creating photographs that communicate significant personal substance by building on a broad background in the visual arts at large and through a specific knowledge of the cultural, historical and visual aspects of photography.

PIRKLE JONES

American

Pirkle Jones was an integral part of the California photographic community, chronicling its people, politics, and landscape. Jones, however, was not a native

of California; he was born in 1917 in Shreveport, Louisiana. In 1946, after serving in World War II, Jones entered the first class in photography at the California School of Fine Arts (now the San Francisco Art Institute) in order to study with Ansel

Adams. Adams had founded the program and taught many classes there. Jones worked as Adams' assistant from 1947 until 1953 and the two photographers forged a lifelong friendship. Jones has spent much of his 60-year career as a teacher of photography, primarily at the San Francisco Art Institute; he joined the school's faculty in 1952, and remained there until his retirement in 1997. Jones has also drawn inspiration from his associations with some of the other luminary American photographers of the twentieth century—Edward Weston, Minor White, Imogen Cunningham, and Dorothea Lange. Jones is perhaps best known for two collaborative documentary projects: *Death of a Valley*, with Lange; and *A Photographic Essay on the Black Panthers*, co-created with his wife—writer, photographer, and poet, Ruth-Marion Baruch.

Jones is noted for the breadth of his work, which includes landscapes, architectural photographs, portraiture, cultural impressions, and politically charged social documentary photographic essays. While his career was shaped by his proximity to a community of great artists, Jones developed his own idiosyncratic photographic vision. Though the body of his work is difficult to characterize, nature is certainly one of the dominant themes. Jones's technically masterful images of waterfalls, trees, marshes, and rocks are not solely intended as photographic illustrations of the environment, but rather as impressions of his own relationship to nature, which in its untouched state has sacred overtones. This idealization of the land, which issues from the Adams tradition of landscape photography, is used to instill nostalgia. For it is through this more arcane and Edenic "before" that Jones suggests the negative impact of human development upon landscapes and customary ways of life. In his social documentary photography, Jones similarly plays the dual roles of artist and witness. One senses Jones's personal commitment to and passion for his subject matter, his images often expressing his point of interest and his point of view. His sensitive and acute observations of human behavior are emotionally charged and visually poetic.

Jones's first major project motivated by social consciousness was conceived in 1956 when Dorothea Lange approached him to collaborate on a photographic essay commissioned by *Life* magazine. This piece documented the final year of Berryessa Valley in California, which was about to be flooded after the completion of the Monticello Dam. While the assignment was never published by *Life*, it was later reproduced as a single issue of *Aperture* magazine in 1960 under the name *Death of a Valley*. Lange and Jones chronicled the community's last year before their forced relocation. The pictures look with a vivid sense of nostalgia

and empathy at a small town, small farm way of life. Images of the orchards in bloom; pears, grapes, and grain being harvested; pastoral sun-bathed countryside; quaint homes; and well-seasoned locals are contrasted with melancholic scenes of profound loss, dispossession, destruction and dislocation: severed power lines, burning structures, and tractors scarring the once-fertile earth. The essay and the subsequent exhibition remain powerful testaments to the price of progress. The series received popular and critical acclaim, and it figures among the highlights of Jones's career. Two years after the *Death of a Valley* project, Jones collaborated with Ansel Adams to document the construction of the Paul Masson Winery in Saratoga, California. Completed in 1963, as both a publication and a touring exhibition, *The Story of a Winery* illustrated the growth of a new industry, telling the story of winemaking from the early bud-break on the vine to the final product in the glass.

Jones's most enduring creative partnership was with Ruth-Marion Baruch. Over the course of their marriage, Jones and Baruch produced a number of photographic milestones, the first occurring in 1961 when the pair was drawn to a small, forgotten town located on the banks of the Sacramento River. *Walnut Grove: Portrait of a Town* documents a small, racially diverse community in transition. While the town's fertile soil and location made it a thriving business gateway and agricultural hub, the introduction of a freeway which bypassed Walnut Grove led to the town's decline. The location gave Jones another opportunity to visually explore the manner in which development has changed a town's habitation and landscape.

Perhaps Jones's greatest photographic legacy is the landmark series *A Photographic Essay on the Black Panthers*. Eventually gaining the trust of the party leaders, Jones and Baruch were granted unprecedented access to the group's inner circle. Portraits of Panther leaders Kathleen and Eldridge Cleaver, Huey Newton, Bobby Seale, and Stokely Carmichael appear alongside other photos of participants at Panther rallies and demonstrations in Oakland and San Francisco during 1968. Jones and Baruch also captured more intimate moments—images of members' family gatherings and the young recipients of the Panther's Breakfast for Children Program. Jones's and Baruch's photographs clearly humanize their subjects, connecting the activists' struggles with universal themes of family and hope for a better future. The project intended to create a better understanding of the organization; images projecting dignity, pride, and sincerity were used to temper the violent reputation

for which the group became infamous. Kathleen Cleaver, commenting on the series 35 years after its first public appearance, wrote:

The photographs Ruth-Marion Baruch and Pirkle Jones took amidst such tumultuous events show the sensitive humanity that animated the young revolutionaries in the Black Panther Party. Although we typically were portrayed in the mass media as thugs, menacing criminals, or subversives, their work radically contrasted the propaganda of the time.

(Cleaver 2002)

A Photographic Essay on the Black Panthers became a politically controversial and widely exhibited series of photographs, drawing 100,000 visitors to its inaugural venue at the de Young Museum in San Francisco, and appearing as *The Vanguard: A Photographic Essay on the Black Panthers* when the images with accompanying text were published by Beacon Press in 1970.

One year after embarking on the Panthers series, Jones was drawn to a California houseboat community known for its artistic and free-spirited residents. In *Gate 5, Sausalito*, Jones connects to the essential humanity of those alternative lifestyle seekers, celebrating their iconoclastic natures through captured moments of personal observation. Jones's work since the mid 1970s displays a Weston-like penchant for finding order among the seemingly chaotic. In Jones's *Flea Market* photos, symmetry is present amongst disorder, beauty amongst the bric-a-brac. The *Rock, Salt Marsh* and *Mount Tamalpais* series signal Jones's return to more nature-oriented and landscape-dominated imagery. Finding a middle path between verisimilitude and abstraction, the natural environments pictured by Jones issue from his introspective creative process and promote similar contemplative moments in viewers.

The Santa Barbara Museum of Art held the first retrospective of Jones's work in 2001. *Pirkle Jones: Sixty Years in Photography* showcased 120 of his photographs. In 2003, six years after the passing of Ruth-Marion Baruch, Jones donated 160 vintage prints from the original exhibitions of *A Photo Essay on the Black Panthers* (1968) and *Walnut Grove: Portrait of a Town* (1961) to U.C. Santa Cruz. The photographs, along with Jones's and Baruch's complete archive, will be housed in the Special Collections of the university library.

CARLA ROSE SHAPIRO

See also: Adams, Ansel; Documentary Photography; Lange, Dorothea; Weston, Edward; White, Minor

Biography

Born in Shreveport, Louisiana, 2 January 1914. From 1936 to 1940, participated in pictorial photography salons organized by the Camera Pictorialists. Served in the U.S. Army in 1941, stationed in the South Pacific. After World War II, he was accepted into the first photography class offered at the California School of Fine Arts in San Francisco (now the San Francisco Art Institute [SFAI]), where he studied with Ansel Adams. Married poet and photographer Ruth-Marion Baruch in 1949. Professional assistant to Ansel Adams in San Francisco from 1949–1953. Instructor at the California School of Fine Arts from 1952–1958. Formed, with several other artists, the Bay Area Photographers in 1955. In 1960, *Aperture* published *Death of a Valley*, a collaboration between Jones and Dorothea Lange which documented the Berryessa Valley in California. With Ansel Adams, completed the project, *The Story of a Winery* in 1963. Collaborated with Ruth-Marion Baruch in 1968 on *A Photographic Essay on the Black Panthers*. Returned to teaching at the SFAI in 1970 until his retirement in 2001. In 1997, established the Pirkle Jones and Ruth-Marion Baruch Endowment in support of their Photography Archives Endowment at Special Collections, University Library, U.C. Santa Cruz. Currently lives and works in Mill Valley, California. Other awards: Photographic excellence award, National Urban League, New York, 1961; Fellowship Grant in Photography by the National Endowment for the Arts, 1977; Award of Honor at the San Francisco Arts Festival, 1983.

KENNETH JOSEPHSON

American

When the journal *Aperture* published Kenneth Josephson's thesis pictures in 1961 in a special issue devoted to five graduating students, it was a sign that he was a photographer to watch, a photographer with the courage to experiment. Josephson's thesis subject was the "Exploration of the Multiple Image," and though his subsequent body of work does not exclusively focus on the "multiple image," his career, so to speak, does. While his finished photographs largely take the form of silver prints, his career has included work as a street photographer, filmmaker, conceptual photographer/artist, and professor of photography. Since the early sixties, his diverse, prolific output has contributed to changes in the perceptions of photography that

occurred simultaneously with photography's acceptance by the art market and most museums.

Josephson was born in Detroit, Michigan in 1932. He took his first photographs around the age of 12 and soon was processing his own film and prints independently. After high school, he studied at the Rochester Institute of Technology (RIT) from 1951–1953 and was trained in the technical aspects of photo-chemistry and commercial photography until he was drafted into the Army. He served for two years in West Germany, printing photographs for the U.S. Army. Upon his return to civilian life, Josephson resumed his studies at RIT, where he was a student of Minor White and Beaumont Newhall, eventually graduating with a B.F.A. in 1957. Upon his return to Detroit, he married and took a position as a photographer for the Chrysler Corporation.

After the death of his wife Carol in 1958, Josephson relocated to Chicago and began graduate studies at the Institute of Design (ID) of Illinois Institute of Technology, where Harry Callahan and Aaron Siskind were teaching. ID had been started by László Moholy-Nagy in 1937 as the “New Bauhaus,” and it educated students in modernist aesthetics that stressed a formalist methodology and encouraged experimentation. Whether it was because of his talented instructors, the innovative curriculum, or such fellow students as Joseph Jachna, Ray Metzker, Joseph Sterling, and Charles Swedlund, his career took off as his talents in photography became noticed. In 1960, he received his M.S. from ID and was offered a position as the first photography instructor at The School of the Art Institute of Chicago (SAIC). In 1962, he was one of the founding members of the Society for Photographic Education (SPE). In 1964, Josephson was included in *The Photographer’s Eye* at the Museum of Modern Art, New York, which traveled around the world, and by 1966 he had his first solo exhibition in Stockholm at the Konstfackskolan.

Josephson easily adopted the “straight” style taught by Callahan and Siskind, now known as “Chicago School” and identified by crisp details, dramatic lighting, and abstract design. He was trained in multiple printing, montage, collage, and about the photograph as fine art and as a physical object, but since 1960 has basically followed the same practice, summed up in the following:

The heart of the method is this: A clue from one photograph would develop into an idea for another. At times the subject matter suggested a method of working and vice versa. Sometimes I would seek out some specific subject matter with a planned picture in mind, but as I became involved with the subject a very different picture would result.... The best procedure for me to follow is to involve myself completely with a number of problems, then move from one to another, and return to each for the purpose of re-evaluation. This time lapse period was the most important factor of this procedure.

(White, Minor, ed., “Five Photography Students from the Institute of Design, Illinois Institute of Technology,” *Aperture* 9, 2 (1961), n. pag. III.)

Polapans 1973, a black-and-white print of a light bulb with four polaroids taped below, is a fitting example of his method, first because his subject *is* photography, second because each Polaroid glows brighter and nearer, and third because of the witty image of the bulb representing the idea.

His *Multiple Image* method allowed him to alternate between conceptual, nude, still-life, and “street” photography. Part of the time, he concen-

trated on high contrast photographs of pedestrians in the shadows of Chicago’s elevated trains dabbled with bright light. At other times, he crossed over between series combining a nude image as part of a larger image, such as *Sally*, 1976. Since 1964, he has been placing “Images within Images” and photographing “Marks and Evidence,” names given by Josephson to two of his series. Since 1967, he has been intervening in his photographs by placing such things as his arm, shadow, or reflection in the frame before shooting. Repeatedly questioning the assumed givens of photography and reality became his preferred subject, requiring the viewer to figure out his pictures.

Josephson was one of the early pioneers of Conceptual art. For example, before the English artist Richard Long photographed a trace left by his walking on grass and called it art, Josephson photographed a similar trace he found by chance see *Wisconsin*, 1964. Since 1968, he has collaged postcards, black-and-white and color photographs often fragmenting space, such as *Illinois*, 1970, pre-dating the multi-perspective collage work of David Hockney. The technique of collage was only a step away from assemblage, and after 1970 Josephson made three-dimensional objects which included photographs, such as *Anissa’s Dress*, 1970.

Without a doubt, Josephson’s photography deals with intellectual issues; however, a significant yet subtle aspect of his work is its humorous, sometimes surreal, content, which deals with the paradoxes of everyday life, with the gap between the second and third dimensions, and with the medium of photography itself. For example, his “History of Photography” series (begun 1970) takes a look at signature works by renowned photographers from an often humorous point of view, such as *Chicago*, 1978, a version of Edward Steichen’s 1926 portrait of Gloria Swanson, which shows, instead of the movie siren’s veiled face, bare buttocks beneath a lacy veil. Other examples are found in conceptual works such as *The Bread Book*, 1973, an artists’ book composed of shots of the fronts and backs of each of the slices in a loaf of bread, bound in the order in which the loaf was cut. And last, but not least, his transformational, still-life photographs of paper bags and books from the early 1960s and 1988.

In 1972, he received a Guggenheim Fellowship, and in 1975 and 1979 National Endowment for the Arts fellowships that gave him the opportunity to travel. In the late 1970s he traveled in India, expanding his “street” series to include another culture and acknowledging his continuing interest in the intuitive work of Garry Winogrand and Henri Cartier-Bresson. After 1984, Josephson became interested in

landscape and traveled to England, France, and Italy adding more images to his landscape series, demonstrating the influence of Eugène Atget and Edward Weston.

In 1997, Josephson retired from The School of the Art Institute of Chicago, where he taught for 37 years and influenced generations of photographers. He has exhibited widely in the United States and abroad, and his work is included in collections throughout the United States, Canada, Sweden, and France.

K

YOUSUF KARSH

Canadian

Yousuf Karsh rose to international renown in 1941 as the photographer of the defiant World War II British Prime Minister Winston Churchill. Already famous as a studio portraitist in Canada where he had lived since leaving his native Armenia, he quickly became the portrait photographer of choice for political leaders, celebrities, and artists. By the end of his long career, Karsh had achieved a rare stature: His portraits had become the images by which many public figures are best remembered—Churchill’s pugilistic stare; writer Ernest Hemmingway in a rugged knit sweater; painter Georgia O’Keeffe in raking light beneath a rack of antlers. His pursuit of the inspirational in his sitters reflects the tradition of public portraiture that conveys authority and eminence, a style not associated with the fine-arts aspirations of many twentieth century photographers. This traditional style, however, supported Karsh’s humanist belief that the good in mankind can be captured in a photograph. In his portraits, he reflected his conviction that,

There is a brief moment when all that there is in a man’s mind and soul and spirit may be reflected through his eyes, his hands, his attitude. This is the moment to record. This is the elusive ‘moment of truth.’

(Karsh 1963, 95)

Yousuf Karsh was born in Mardin, Armenia, in 1908 and with his family fled Turkish persecution to Syria in 1922. The teenaged Karsh continued on alone to Canada in 1924, sponsored by his uncle George Nakash, a studio portrait photographer in Sherbrooke, Quebec. After barely six months of high school he began working full-time with his uncle, providing income which allowed him to help support his family in Syria. In his uncle’s studio he learned the language and repartee between photographer and client, and found this human dimension to photography deeply appealing.

In 1928, Karsh’s uncle sent the young man to Boston to apprentice with master society portrait photographer John H. Garo. There, he was exposed to Garo’s prominent circle of visitors and learned the importance of light, shadow, and form. He stayed on in Boston after completing the apprenticeship, then returning to Canada, and relocating to the capital Ottawa in 1932 to be at the crossroads of visiting dignitaries. While in Boston, Karsh had studied the reproductions of great classical portraitist painters at the Boston Public Library and had been immersed in late pictorialism as he explored the realm of celebrity portrait photography. The soft focus and atmospheric effects in *Turban*, 1936, displays the romantic idealism present in his early photographs. Karsh began mastery

of the black-and-white printing process in Garo's studio and continued perfecting the process to support the subtle range of texture and light in his photographs. During this period Karsh was associated with the Ottawa Little Theatre where he met actress Solange Gauthier, whom he married in 1939. There he was also exposed to new potential in lighting and directing subjects that brought a more dramatic and chiseled sculpting of images, such as *Romeo and Juliet*, 1933, which suited newspaper and magazine reproduction. By the mid-1930s, Karsh had developed a style that demonstrated his talent in shaping light, producing a stylish, more-angular composition than was fashionable in the conservative post-colonial era Ottawa where he had settled. His association with the Little Theatre also led to a commission from the theatre's patrons, Lord and Lady Bessborough, representatives of the King of England in Canada.

During these early years, as he became known across Canada as *Karsh of Ottawa*, he experimented with photography and entered international salon exhibitions. Karsh also built his reputation through society sittings and photographing personalities visiting Ottawa, such as character actress Ruth Draper, singer and activist Paul Robeson, and British royalty Lord Louis Mountbatten. Through Canada's leader, William Lyon Mackenzie King, he was appointed to photograph Winston Churchill and captured the image by which the world remembers this pugnacious, fearless leader.

Karsh traveled again to London in 1943 where he photographed dozens of personalities that were first published in English popular illustrated magazines and the book *Faces of Destiny*, 1946, beginning his portfolio of international celebrities. In 1944, he undertook the first of many *Life* magazine assignments, portraying some 70 Washington, D.C. personalities. In the following year, he photographed the participants of the pre-United Nations San Francisco Conference, adding to his collection of what he called "people of consequence." Karsh also received his first advertising assignments during this period, in which he promoted Kodak film and made portraits of distinguished musicians for RCA Victor. Karsh continued to photograph celebrities and travel around the world adding royalty, heads of state, Nobel Prize laureates, and spiritual leaders, and amassed an evocative volume of portraits. Karsh's images were widely published in magazines and he produced a series of books that in addition to the pictures, recounted his experience with each sitter creating an impression about his subjects that was larger than the words or pictures alone. Some of his best-known portraits were made in the 1950s, including *Georgia O'Keefe*, 1956, and *Ernest Hem-*

mingway, 1957. Karsh constantly traveled, accompanied by his second wife, Estrellita Nachbar, whom he married in 1962, preferring to photograph his subjects in their own environments even though his initial success had been as a studio artist.

Although primarily known as a celebrity photographer, Karsh undertook two key assignments to portray everyday people for industrial commissions and the Canadian news magazine *Maclean's*. The industrial profiles bestowed a heroic, dignified status on front-line workers, presenting strong, inspirational portraits, such as *Rear Window (Gow Crapper)*, 1951, for Ford of Canada and equally compelling portraits for Canada's Atlas Steel. The factory setting presented compositional and lighting challenges that Karsh met through combining negatives from various exposures. A profile of Canada's cities assigned by *Maclean's* required Karsh to personify the country, swelling with post-war prosperity. The series sketched the regions and captured the public's conception of its identity, not surprisingly often using portraits of people to illustrate the geography of the country, such as *Farmer by His House*, ca. 1952.

The majority of Karsh's photography was in black and white and developed by inspection with his own formula for gold-toned prints that are especially archival. The color photographs he produced, mainly in the 1940s and 1990s, were dye transfers realized through a printer in New York. The unique and impressive style that Karsh developed in this period influenced countless photography students, and he also touched many students while serving as a visiting professor at numerous universities in North America.

Over his 60-year career Karsh photographed more than half of the International Who's Who Millennium list of the "100 most influential figures of the twentieth century" and was also the only photographer included in the list. Karsh's images have been widely disseminated in publications and have appeared on stamps around the world. He received the Companion of the Order of Canada and countless honors, including degrees from more than 13 universities. In 1987, the National Archives of Canada purchased Karsh's archives of negatives, color transparencies, and over 50,000 original prints. Karsh's images are in collections around the world and have been exhibited internationally, including in Japan, Australia, Argentina, Canada, and the United States, and a definitive retrospective in Berlin in 2000. Karsh died in Boston, Massachusetts, July 13, 2002 at 94-years-old.

GERTRUDE KÄSEBIER

American

Gertrude Stanton Käsebier was one of the leading photographers of the early years of the twentieth century, a fact made more remarkable by her gender. At a time when women were often held back from artistic aspirations, Käsebier was remarkably successful, although her goal of being an artist aside was initially put aside to marry and raise a family. One indication of the high esteem in which her work was held was its being featured in the inaugural issue of the Photo-Secession journal, *Camera Work*, in January 1903, by the renowned photographer Alfred Stieglitz. Even before this, Stieglitz wrote in his journal, *Camera Notes*, that Käsebier was “the leading portrait photographer in this country [United States].” She is particularly known for her portraits, including those of mothers and children as featured on a U.S. postal stamp in the “Masters of Photography” series in 2002.

Gertrude Stanton was born 18 May 1852, to a Quaker family in Fort Des Moines, Iowa. Her parents, like thousands of Americans in the mid-nineteenth century, crossed the plains in a covered wagon. After an eight-year stay in Iowa, John Stanton, seeing opportunity in the Gold Rush, established a saw mill in Eureka Gulch, Colorado Territory, but his death in 1864 left his wife Muncy, Gertrude, and son Charles to fend for themselves. The family moved back to New York City where Muncy Stanton later operated a boarding house, and Gertrude was to meet her future husband, Eduard Käsebier.

As a child, Käsebier showed artistic inclinations, but they were never encouraged, and she had no formal training. She credited her grandmother as having been an inspiration to her with her artistry in patchwork quilts, and said her first primer with its colorful pictures caused her to want to be a painter. Gertrude attended the Moravian Seminary for Women in Bethlehem, Pennsylvania, living with her maternal grandmother, but left to marry Eduard Käsebier in 1874 on her 22nd birthday. Shortly after her marriage, Käsebier had applied to Cooper Union, an art school in New York City, but was turned down. When she attended the Pratt Institute in Brooklyn after her children were grown in the late 1880s photography was not then consid-

ered art, and Käsebier thus received no academic training in the medium.

Her first success with photography was through a competition sponsored by *The Monthly Illustrator* in 1892. She won a \$50.00 prize, but gave the money away because, according to William Innes Homer, “her teachers chastised her for taking the photographic medium seriously, and, in deference to their views, she came to believe she had done something wrong....”

In 1893, she was the chaperone of an art class (as she was likely the oldest student) that went to study *en plein air* at an art colony in Crdcié-en-Brie, a provincial village in France. On a rainy day when she could not paint from nature, she turned to her camera to do indoor portraiture. Thereafter Käsebier focused intently on photography, studying with a chemist in Germany, who helped her with the technical aspects. Eventually returning to Brooklyn, Käsebier apprenticed herself to photographer Samuel Lifshy where she learned the business aspects of photography.

Käsebier made a concerted effort to borrow poses and techniques from antique portraits, and consciously set out to elevate photographic portraiture to the status of fine art. In his 1903 essay in *Camera Work*, “Mrs Käsebier’s work—An Appreciation,” noted art historian and critic Charles H. Caffin extolled the virtues of her work, profuse in regard to the merits of her artistic portraits, which he believed were especially sensitive in regard to the character of the sitter. Although Käsebier claimed to have psychic powers, in fact she worked extremely hard to achieve this quality, spending several hours with each sitter until she felt she knew him or her well enough for the likeness to be a biography. As her friend, the writer Mary Fanton Roberts [Giles Edgerton] explained, “Her real work is done with the sitter—not in the dark room.” She was against retouching because she believed it detracted from the character of the sitter, and she only did it when pressure was applied by her client. Käsebier claimed retouching made “people look like peeled onions.”

She established her first portrait studio at 273 Fifth Avenue in New York in 1897, and in 1898 opened a summer studio at a house known as Long

Meadow in Newport, Rhode Island. There Käsebier mingled freely with the wealthy and socially connected, and she established some important professional relationships. The photographer Baron de Meyer admired her work and spent time with her; the prominent Boston photographer F. Holland Day went to visit, accompanied by Frances Lee, who became one of Käsebier's favorite models, appearing in some of her most best-known pictures.

Käsebier also made a number of portraits of Native Americans. The experiences she had had, especially with the Sioux, as a youngster in Eureka Gulch prepared her for this later photographic work. When she undertook this work in the East, Native Americans were not accessible to her so she wrote to William Frederick Cody (Buffalo Bill) requesting that he allow some of the "braves" from his Wild West Show to be photographed by her. It is said that one of the sitters was so frightened he covered himself with his blanket and Käsebier practically had to trick him into a relaxed attitude. The resulting portrait is *The Red Man*, circa 1898.

This work was included among the five photographs featured in *Camera Work's* first issue, along with complimentary articles by Caffin and Frances Benjamin Johnson. Käsebier had been part of the group dedicated to promoting photography to the status of fine art that in 1902 formed the Photo-Secession. However, the formal elements displayed by Käsebier were characteristic of the painting movement of the late nineteenth century known as Symbolism: flatness of imagery, decorative patterning in the manner of Japanese prints (well illustrated in her sensitive portrait of the celebrated Sioux activist and musician, *Zitkala-Sa*, 1898), simplicity of composition, and overall harmony of design.

Käsebier worked primarily with platinum prints, although she did begin using a gum bichromate process in 1901. Her photographic debut had taken place in 1898 at the first Philadelphia Photographic Salon where she exhibited ten works: portraits, studies related to the mother-and-child theme, and one nude. The next year she was appointed to the jury. It was in this salon that she exhibited a Madonna and child, which she called *The Manger*; it sold for \$100.00, setting a record for the highest price paid for an art photograph at that time. Her work in a similar spirit, *Blessed Art Thou Among Women*, the image that subsequently appeared a postage stamp, is perhaps her best-known. One of the most prestigious exhibition spaces in which her work was shown was the Little Galleries of the Photo-Secession, popularly referred to as 291 (Fifth Avenue address), owned and operated by Alfred Stieglitz, with whom she had a close but tempestuous relationship. Käsebier was elected to membership in both the

prestigious Camera Club (1900) in New York and The Linked Ring (1900) in London. Also in 1900, photographer Clarence H. White recognized her as "the foremost professional photographer in America." She had won numerous awards and had exhibited throughout the United States, Europe, and South America. By 1910, the year of her husband's death, the most fruitful period of Käsebier's photography had passed, as taste shifted away from Pictorialism. She moved from her home in Oceanside, Long Island, to 342 West Seventy-first Street in Manhattan where she also maintained her studio. Also in 1910, Käsebier became President of the Women's Federation of the Professional Photographers Association of America. In 1912, she resigned from the Photo-Secession, and early in this decade she gave up photography. In 1916, Käsebier helped found the Pictorial Photographers of America. She continued to exhibit and kept her studio open until 1927, but by then her daughter Hermine was doing most of the work. When Käsebier died in 1934, Pictorialism was definitely out of favor, and Käsebier's work was considered out-of-date.

KIKUJI KAWADA

Japanese

Kikuji Kawada was born in 1933 in Ibaraki Prefecture and studied economics at the Rikkyo University of Tokyo between 1948 and 1955. Kawada then took up photography, working for the publishing house Shinchosha until 1959; a self-taught photographer, he never stopped learning new techniques of shooting and printing. His first solo exhibition, titled *Sea*, took place at the Fuji Photo Salon in Tokyo in 1959. With *Sea*, Kawada explored one of his favorite topics: The history and the stories of Hiroshima through its ruins and landscapes of desolation. Yet Kawada is not limited to landscape documentation, and two series, *Bijutsu Shuppansha (Maps)* of 1965 and *The Last Cosmology* of 1979–1997 brought him to international attention. The former series also examines the effects of World War II on the Japanese landscape, the latter documents eclipses of the moon and the sun. Focusing on luminous marks, *The Last Cosmology* offers to viewers an almost abstract picture where changes in atmosphere are detected as pure visual sensations the viewer must perceive.

In Japan, Kawada belonged to a group, with Ikko Narahara, Shomei Tomastu, and Eikoh Hosoe, that allowed the emergence of a new photographic style that countered the photographic realism that had held sway among Japan's photographers since the 1930s. This new style allowed the photographs to elaborate their own visual form rather than following strict conventions. Between 1957 and 1959, Kawada participated, with Yashihiri Ishimoto, Shun Kawahara, Akiro Sato, Akira Tanno, Shomei Tomatsu, Toyoko Tokiwa, Masaya Nakamura, Ikkō Narahara, and Eikoh Hosoe in many exhibitions called "Jūnin no me," which means "the eyes of ten persons." Within this group, six members (Kawada, Satō, Tanno, Tōmatsu, Narahara, and Hosoe) created an organization they called VIVO, which in the universal language Esperanto means "life." These photographers shared the desire to be free of the canons of the photojournalism aesthetic by creating original, creative images. While exemplifying this goal, VIVO functioned more as an organization that offered members exhibition and publishing opportunities than a polemical group. After the dis-

solution of VIVO in 1962, an important exhibition of their work was mounted, which marked the new direction in the history of photography in Japan that VIVO members achieved.

In 1960 and 1961, Kawada traveled extensively around Japan and became a teacher at the Tama Art University. His 1961 exhibition, *Maps*, at the Fuji Photo Salon established him as a major figure. These pictures are witnesses to the pain and suffering the Japanese people endured in World War II and in the devastation of the atomic bomb attacks on Hiroshima and Nagasaki, and their will to remember the past. In 1965, Kawada published a collection taken from this exhibition, called *Bijutsu Shuppansha (Maps)*, where he mixed close-up shots of stains, bumps, and cracks on walls of the 'atomic dome' of Hiroshima with pictures of dead soldiers. Through these close-up shots of many signs and objects, Kawada evokes the defeat of Japan during World War II. His famous black-and-white photograph of the Japanese flag, crumpled, spoiled, worn, and folded is particularly symbolic of the war era and its aftermath. The flag was an essential emblem used by the military government in the 1930s and 1940s to assist in imposing a nationalist policy. As shown by Kawada's picture, it also signifies the defeat of Japan. Yet, this image also evoked the will of Japan's reconstruction so that the national emblem would proudly fly again.

Kawada pictures give specific testimony, as do Ken Domon's publications (*Hiroshima, Kenbunsha*, in 1958) and those of Shomei Tomatsu (*11:02 Nagasaki Shashin Dojinsha*, in 1966). This publication is a key for understanding Kawada's works. Indeed, Kawada does not focus on an object for its own sake, he chooses it as a vector. With a subtle interaction of framing and light, Kawada confers to the object a symbolic power to make it travel through stratum of interpretation.

In his pictures, Kawada combines many levels of meaning to create different approaches to reality. This tendency was accentuated in the series *Seinaru Sekai (Damned Atavism)* in 1971 and *Ludwig II no Shiro (Castle of Ludwig II)* in 1979. The first series is based on and meant as a commentary on a Tatsu-hiko Shibusawa essay entitled "Essays about Baroque Art," and the two series together portray a

fantasy world full of chimeras and frightening creatures inspired by medieval Western churches, gardens, or New York City's Wax Museum. In a similar vein, Kawada has also photographed the fantastical architecture and objects in the Sacred Grove of Bomarzo outside Rome, the Tiger Balm Garden in Hong Kong, and the Boboli Gardens in Florence. With these series, Kawada established his style and his photographic vision by accentuating contrasts that play with various levels of symbolism. He also evokes a perverted world where the sacred becomes grotesque, the grotesque allowing Kawada to evoke a parallel between Japan and the Occident and to set up an inquiry about the relationships between the cultures in the history of these forms.

This theme was explored, but in a more deeply psychological manner, in his series *Los Caprichos* of 1986 in which Kawada explored and extracted the dementia and madness hidden in the boredom and the banality of daily life. In 1996, Kawada received two major awards for his entire work, the annual award from the Photographic Society of Japan and an award from the International Photographic Festival of Higashikawa.

Beginning in 1999, Kawada employed digital means to compose photo-montages as well as exploring digital photography and new printing techniques. These manipulated pictures portray different objects related to consumer society, like cars (*Car Maniac*, 1998) or the urban environment. With his collection *Eureka*, he devised an imaginary city using elements such as monuments or highways extracted from other cities, continuing his interest in the incoherence, the instability, and loss of landmarks of modern life. His images are also meditations on the hidden face of society in which he establishes a parallel between the city and the behavior of city dwellers. According to Kawada, the city, its plan, and the restraints of urbanism are the best reflection of our consciences.

THOMAS CYRIL

See also: **Digital Photography; Domon, Ken; Hosoe, Eikoh; Photography in Japan**

Biography

He was born in 1933 in Ibaragi Prefecture. He graduated from the Department of Economics, Rikkyo University, 1955. He was a staff photographer at the Shinchosha Publishing Company, 1955–1959. He turned freelance in 1959. After leaving Shinchosha, he organized and co-founded the VIVO photographers agency with E. Hosoe, S. Tomatsu, I. Narahara, and others, 1959. He has since worked as a freelance photographer. In 1966, he made a tour of Europe and visited both Europe and Southeast Asia. He received the Annual Award, The Photographic

Society of Japan in 1996, the Domestic Artist Prize, and Higashikawa Award at the Higashikawa International Photography Festival in 1996.

PETER KEETMAN

German

The terms “*fotoform*” and “subjective photography” are well-known synonyms for West German photography of the 1950s. Among the most enigmatic representatives of this photographic style is Peter Keetman, who influenced subsequent generations of photographers with his formally composed, purist images.

Keetman was born on April 27, 1916, in Wuppertal-Elberfeld. His father, an enthusiastic amateur photographer, gave the eight-year-old Keetman a camera. In 1935, the father also sent him to study at the Bavarian State Instructional Institute of Photography, which today is the State Academy of Photographic Design in Munich.

In 1937, Keetman finished his studies with the apprentice exam in commercial photography. He worked in the studio of Gertrud Hesse in Duisburg, Germany, then in 1939 he moved to Aachen and joined the industrial photographer Carl-Heinz Schmeck, who worked mainly for firms in heavy industry. In 1940, Keetman was drafted for military service and was severely wounded.

In 1947, he resumed his master’s studies with Hanna Seewald in Munich at the State Instruc-

tional Institute of Photography. After completing his master’s in 1948, with fellow student Wolfgang Reisewitz, he audited a course taught by the photographer and artist Adolf Lazi, who had just established a private instructional institute of photography in Stuttgart. In the context of an exhibit called *Die Photographie 1948* (Photography 1948)—one of the very first photo exhibitions in postwar Germany—Lazi also showed works from Peter Keetman.

Repelled by the propagandistic use of photography in the period of National Socialism, young photographers, among them Keetman and Reisewitz, as well as Siegfried Lauterwasser, Toni Schneiders, Ludwig Windstosser, and their mentor Otto Steinert, formed the group *fotoform*; they created a community of shared interests, planned group exhibits, and participated together in other exhibits. The collective goal of the group’s members was not to make photography that served the represented object—in the sense of an objective reflection of reality—but to reorient photography toward the creative possibilities of the medium and toward the creation of an inherently valued art product.

The following year the young group presented works at the first Photo-Kino exhibition in Co-

logne (called Photokina after 1951). One review described the explosive force of the fotoform exhibition as an “atomic bomb in the manure pile of German photography.”

In 1950, under the overall control of Otto Steinert, a worldwide photography movement developed from fotoform called “subjective photography” that existed until the fall of 1991. In his many exhibits of subjective photography, Steinert borrowed from the organizational impulse of fotoform, and, in internationalizing and popularizing the group, he altered it. The other members gradually withdrew from the stage and worked as commercial, industrial, portrait, and theater photographers.

Keetman received enormous publicity from the success of his shows. He participated in nearly every important exhibition of the 1950s and 1960s, and his works appeared in almost every photography journal.

After the 1950s, Keetman made a living on commissioned works, industrial reports, and photography for illustrated volumes of art textbooks. He also dedicated himself to illustrating books on urban and rural landscapes, such as *Munich* (1955) and *Bavarian Lake Country* (1958), which were very successful. These commissions also stimulated his free photographic work. One of his best-known series was published in the book *Volkswagen: A Week at the Factory*, which collected a series of photographs made within the Wolfsburg VW assembly line in 1953.

He always took time to systematically investigate the photographic potential of objects. He would examine the representability of an object in a long series of trials. The image always aimed to capture the essential structure of the object. He also made countless landscape prints, mainly in the upper Bavarian area of Chiemgau, that are distinguished by their concentration on line and on graphic qualities. Keetman’s technical experiments with movement studies in the 1950s were also commercially valued. His *Lichtpendelm-Schwingungsbilder* (Light Pendulum—Images in Oscillation), in which a moving light source traces curves over the photo paper, was used in advertising.

Keetman’s artistic work is concerned with interpreting the energies that give objects shape and drawing out the essential forms, themes, and subjects. To accomplish this, he uses all the possibilities for representing an object that the technology of photography offers. His perception of things suggests the natural world, in whose structural composition he sees a model for comprehending all things in life.

Keetman’s photography avoids any narrative impulse and has no formal foregrounding construc-

tion. It concentrates on the energy of the things themselves. In this sense, his works more closely belong to the “informal”—the most radical answer to the new freedom of the postwar period. The concept of the informal was first raised by Michel Tapié in 1951 and is not bound solely to a rejection of any figuration or content, but also suggests the greater meaningfulness of matter in relation to form, and thus the self-shaping powers inherent in all matter. This is the last radical essay into traditional art and onto the plane of metaphysical experience. The artistic rendering of this experience that flows directly from the artist in the process of painting or drawing sets a natural limit for the camera. Nevertheless, it is amazing that attempts are made in photography to reach a similar experience by eliminating the fact of the camera—so that one attempts to retrace self-shaping powers to the photographic materials.

As Keetman wrote in 1950, the eye for detail leads to a new natural order and form: nature is the master instructor of simplicity and truth; these two are symbols for photography.

SEYDOU KEÏTA

Malian

Seydou Keïta is Mali's best known photographer. He operated a highly successful portrait photography studio in the capital city of Bamako, during the decades surrounding Mali's independence from France in 1960. However, his international recognition and place in the world history of photography did not arrive until the 1990s.

Born in Bamako, Keïta spent the early years of his life as an apprentice carpenter to his father. When he was 14 years old, his uncle returned from a trip to Senegal with a Kodak Brownie, which he gave to Keïta. He started by taking photographs of his family and friends. Although he continued to work as a cabinet maker, and had no official training in photography, Keïta began photographing professionally in 1939. He learned to develop and print from a local studio operator and photo shop owner, Frenchman Pierre Garnier, as well as photographer Mountaga Demblélé, who also loaned him use of his darkroom. In 1948, Keïta opened his own studio in a lively part of the city. Around the same time he bought a 13 cm × 18 cm box camera, which produced sharp contact prints without the need of an enlarger.

As a commercial portrait photographer, Keïta has said repeatedly that his only concern was to satisfy his customers by presenting them clearly and in their best possible light. Working in black and white, using both natural and artificial light, Keïta's portraits reflect this obligation to flatter his sitters—sometimes resulting in characteristically unusual compositions, such as bust-length portraits shot at three-quarters or other angles. His output is also a reflection of the social and political changes in Bamako at this time. The city enjoyed rapid urbanisation and development at the end of the Second World War, with workers streaming in from surrounding regions. Keïta's photographs catered to a burgeoning middle class in the bustling new urban centre (at that time a city of about 100,000 people), including office clerks, shopkeepers, politicians, and employees of the colonial government (such as schoolteachers and soldiers). As a photographer, Seydou Keïta's role was to make his subjects look like they belonged to the middle class of Bamako, to make them feel modern and *Bamakois*.

Following World War II, people in Bamako, especially young men, began to wear European clothes, which were viewed as stylish and fashionable. To meet this demand, Keïta had several European suits available in his studio, including a beret, as well as accessories (watches, fountain pens, watch-chains, plastic flowers, a radio, a scooter, a bicycle, and an alarm clock). Some young sitters consciously imitated characters they identified with from American B-grade films. Keïta understood the importance of picturing external signs of wealth and beauty in his women sitters; he would show off their large earrings and ornate hairstyles as well as their long, slender fingers that were a sign of high social standing. Although largely taken on the bare ground in his courtyard, Keïta also used cloth backdrops with decorative patterning. Sometimes the backdrop matched the clothes, but Keïta claimed this was mere coincidence. Between 1949 and 1952 he used his own fringed bedspread, but later changed the backdrop every two to three years. Today, these various fabrics are used as a reference to date his work.

Keïta soon became well known for his portraits and was never short of work. His studio was well located in the centre of the city. During slow periods, two former apprentices from his days as a carpenter took samples of his work to the train station to invite business. In interviews, Keïta spoke of the lines of people who used to wait in front of his studio, especially on Saturday evenings and Muslim holidays. As Keïta noted, "To have your photo taken was an important event."

Following Mali's independence from the French, Keïta became the country's official photographer for the new socialist government in 1962. The government job offered prestige and, presented to him as his patriotic duty, he reluctantly closed his studio. He covered the main events of Mali's first 15 years of independence—presided over by President Moubido Keïta and then ruled by the National Liberation Military Committee—such as official visits and meetings with heads of state. However, Keïta's pictures from this period are in government archives and thus far, inaccessible.

Keïta retired in 1977, but to his surprise was 'rediscovered' and then celebrated by the Western world in the 1990s (together with the younger

Bamako photographer Malick Sidibé). Although there are several stories related to the discovery of Keïta, a 1991 exhibition *Africa Explores: Twentieth Century African Art* at the Museum of African Art in New York proved crucial in bringing his work to the attention of the international art world. French curator of contemporary African art André Magnin relates the story of seeing Keïta's portraits in that exhibition. Although Keïta was uncredited, in 1993 Magnin tracked him down in Bamako with the help of photographer Françoise Huguier, and gained access to tens of thousands of negatives covering the period from 1948 to 1962, which now form the only available source of Keïta's work (negatives from 1935 to 1947 have been lost).

In 1994, the Fondation Cartier pour l'art contemporain (Cartier Foundation for Contemporary Art) in Paris organised a one-man exhibition as part of the 'Mois de la Photo' in Paris, which brought Keïta's work to the attention of both specialists and the general public. Since this time, his work has been shown all over the world. André Magnin's monograph *Seydou Keita* (Scalo, 1997) further popularised his work, and Keïta even came out of retirement to photograph fashion for magazines such as *Harper's Bazaar* in 1998.

Keïta's photographs have been displayed in the West as large exhibition prints to meet the formal demands of the art gallery. This dramatic recasting of their original form and function has given the images a new life. However, it is important to remember their original postcard size, as intimate documents at the threshold between private and public life, shared between friends, lovers, and family. For contemporary Western viewers, the formal beauty of the black-and-white studio portraiture and Keïta's lack of exposure to Western publications gives them a freshness of vision. More strikingly, the images attract because of the dignified poses of the sitters, and their clear desire to cast themselves in the manner in which they wished to be defined. Although the names and professions of many of the sitters have been lost, their aspirations are communicated in a way that makes them emotionally and visually compelling. In contrast to photographs produced by Western observers, Keïta's portraits are the result of an African photographer controlling the camera to create images of African subjects for an African audience. Thus, in Keïta's photographs, Bamako is imagined as the city at the birth of modernity in West Africa.

ANDRÉ KERTÉSZ

American, born in Hungary

Though he developed his photographic style in post-war Paris amidst a flurry of avant-garde activity, André Kertész never aligned himself with any particular artistic movement. While somewhat influenced by the Constructivist and Surrealist tendencies of his period, he always remained true to his own sensibilities, which valued humanity, emotion, and the value of observation. Brassai, Henri Cartier-Bresson, and W. Eugene Smith would all name him as a major influence of their work.

André Kertész's life followed a westward trajectory from old world to new world, during which he was always guided by his ambition for photography. Born Kertész Andor in 1894 in Budapest, he grew up in a middle class family that was Jewish, but not strictly religious. At the age of 14 Kertész lost his father to tuberculosis. He and his two brothers were subsequently raised by their mother and taken under the wing of their uncle, who they followed to the Budapest stock exchange for

employment. Kertész became inspired by the images he discovered in Hungarian magazines as a youth, and was the only member of his family to develop an active interest in art. Upon the completion of his schooling in 1912, he eagerly launched his career as a photographer with the purchase of his first camera.

Kertész found his early subject matter in the streets of Budapest and its rural surroundings. He was particularly drawn to the more marginalized members of society, like the gypsies and peasants who existed on the fringes of Hungarian society. While such subjects were shared by the Hungarian pictorialist photographers, Kertész's aesthetic sensibilities significantly diverged from those predecessors. The Pictorialists tended to wrap their compositions in a layer of haze and romanticize their lower-class subjects. Kertész's approach was more akin to a realist tradition, more interested in observation and reportage than in perpetuating a nostalgic mythology. This straightforward portrayal of the underclasses also hints at social critique, though he was never overtly political. The fun-

damental loyalty to documentary photography that Kertész developed early on would remain with him throughout his career.

In 1914, Kertész was recruited by the Austro-Hungarian army to fight in the First World War, and his camera accompanied him on the front lines. Two years later, while recovering from wounds in an army hospital, he took some of his first “distortion” photographs of soldiers swimming in the hospital pool. Unfortunately, most of the negatives from the war were later destroyed during the Hungarian Revolution.

Following his tenure as a soldier, Kertész returned to Budapest and resumed his job at the stock exchange, but photography came to occupy more of his time. In 1917, his photographs began to be published in such Budapest publications as *Erdekes Ujság* (*Interesting News*) and the satirical magazine *Borszem Jankó*. It was around this time that he met Elizabeth Saly, a coworker at the stock exchange, who began appearing in his pictures in 1919. A student of art and dance, she would eventually become his lifelong partner.

Kertész can be characterized by a certain stubbornness in his working method, which led to certain difficulties in his career. He was denied a silver medal in a 1924 exhibition sponsored by the Hungarian Amateur Photographers' Association. He was punished for refusing to conform to salon conventions, insisting on submitting silver prints rather than the traditional bromoil prints. Shortly thereafter his efforts were validated when *Erdekes Ujság* published one of his war-era night photographs on the cover—his first cover photograph.

While Kertész accumulated photographic successes, the political circumstances in Budapest became distinctively uninviting under Admiral Horthy's anti-Western, anti-Semitic nationalist policies. Such a repressive climate, compounded with Kertész's artistic goals, provided plenty of impetus for a decisive move to Paris in 1925, whereupon Andor became André for good.

Kertész's immigration was aided by a press card, and he immediately launched his career as a freelance photojournalist, taking pictures for a variety of French, German, British, and Italian publications. He lived in Montparnasse, a thriving locale for artists and bohemians, and established himself amongst the community of Hungarian expatriate artists whose social headquarters was the Café du Dôme. He became casually acquainted with the few other eminent photographers in Paris, Germaine Krull, Berenice Abbott, and Man Ray. He also befriended such luminaries as poet Michel Seuphor, painter Piet Mondrian, and his fellow countryman

Brassaï, who was then working as a journalist and would credit Kertész for inspiring his own interest in photography. Kertész paid a momentous visit to Mondrian's studio in 1926, during which he took portraits of the artist and still lifes of various items in the apartment. A photograph from this visit depicts Mondrian's glasses and pipe on a table and plays on the abstract geometry for which their owner was so renowned.

Kertész brought something of his Hungarian aesthetic to his Paris photographs—a lighthearted, sometimes satirical approach to capturing moments in the daily lives of Parisians. Though he occasionally experimented with cropping, he did not frequently manipulate his negatives otherwise. He found the city to be a rich enough subject matter to warrant straight observation. However, his occasionally disorienting framing and interest in abstract forms hinted at his association with the avant-garde. He generally favored oblique angles over frontal views and often utilized high viewpoints, creating images at times suggestive of László Moholy-Nagy's highly experimental “new vision” photography or Alexandr Rodchenko's Constructivism.

The Sacre du Printemps Gallery hosted Kertész's first solo exhibition in March 1927. The exhibition connected Kertész's work to “*l'esprit nouveau*,” the term coined by Guillaume Apollinaire nine years earlier in his call for a postwar formalistic “return to order,” and later adopted by Le Corbusier and Amédée Ozenfant's Purism movement. Michel Seuphor and the poet Paul Dermée were responsible for reviving the term, and chose Kertész as their principal photographer when they published a magazine called *Documents internationaux de l'esprit nouveau* in April 1927, a platform for their interest in abstraction and the International Style. Kertész's contributions to the *Premier Salon Indépendant de la Photographie* in 1928 revealed his penchant for aestheticizing everyday objects and his interest in abstract formalism. Such tendencies are demonstrated by his picture of a fork resting against the curve of a plate, a composition distinguished by its play of line and shadow. Yet his work never reduces its subjects to total abstraction. There is a certain sensitivity to his approach, as well as a loyalty to his subjects and their connotations.

An artistic breakthrough of sorts occurred in 1928 when Kertész purchased his first Leica camera. The ease of portability of the recently developed instrument suited Kertész's aesthetic and fostered spontaneity and experimentation in his work. His interest in capturing chance encounters—or “the decisive moment” that would become the trademark of Henri Cartier-Bresson—is demon-

nstrated in a 1928 photograph taken in Meudon, in which a man carrying a large wrapped package approaches the camera as a locomotive rumbles across a bridge at the top of the composition.

Aside from being frequently published in the literary journals of avant-garde circles, Kertész's photography also reached a more mainstream audience through pictorial magazines specializing in human interest stories. He was one of the most important contributors to the new magazines *Vu* and *Art et Médecine*, and became a pioneer of the photo essay.

Kertész had a brief marriage from 1928–1930 to Rosza Klein, a Hungarian woman who later became a photographer herself, under the pseudonym Rogie André. In 1930, he visited Budapest for the first time since his departure, and rekindled his relationship with Elizabeth Saly. She went to Paris to live with Kertész the following year, and they were married in 1933. She resumed her role as his frequent model, appearing in photographs amongst palm-reading gypsies, in Parisian cafés, and posing with André himself.

It was around this time that Kertész began exploring one of his most renowned themes, the *Distortions*. These experiments began as assignments for *Vu*; in 1929 he took photographs of a fortune teller in the transmuting sphere of her crystal ball, and a year later took portraits of his friend Carlo Rim in a circus mirror. He developed this technique further with a series of distorted nudes commissioned by the mass magazine *Le Sourire*. In these *Distortions*, women's bodies are morphed into grotesque creatures with nebulous shapes—bodies that refuse to be contained or easily defined.

These compositions hint at an affinity with Surrealism, and Kertész did occasionally publish in journals associated with the movement, including André Breton's *Minotaure*. However, Kertész never pledged allegiance to Surrealism or any other movement, and maintained his loyalty to what he called "naturalism." Despite his experimentation with distorted images and unusual juxtapositions, Kertész was never interested in manipulating the photographic process itself, which distinguishes him from the techniques employed by his contemporary, Man Ray. When elements of Surrealism appear in Kertész's work, they most often derive not from the artist's hand, but from the simple observation of daily life. This impulse appears in the 1937 photograph of a repairman's arm reaching between the blades of a ventilator. Though the image displays the kind of jarring juxtaposition typical of Surrealism, and closely resembles a montage, it is in fact an unmanipulated snapshot of the real world.

At this point Kertész turned more attention to the publication of books, and his first, a collection of portraits of children entitled *Enfants*, was published in 1933. He would go on to publish several more books of his photographs, including *Nos Amies les Bêtes* in 1936, *Day of Paris* in 1945, and *On Reading* in 1971.

In October 1936, André and Elizabeth Kertész sailed for New York City for what was intended to be a two-year experiment with America. He opted to leave Paris for essentially the same reasons he fled Budapest 11 years earlier: an increasingly repressive political environment and the promise of making a better living as a photographer. Through a Hungarian relative, Kertész was offered a one-year contract with Keystone Studios, a motion picture agency with a New York office. Upon arriving he was disappointed to find a paucity of reportage assignments, and had to settle for working in the studio on commercial photography.

By early 1937, Kertész had already dissolved his contract with Keystone and decided to try his luck with American magazines. He began working for Alexey Brodovitch, an acquaintance from Paris who was now the art director at *Harper's Bazaar*, a Hearst publication. He also took society portraits for Hearst's *Town and Country* and freelanced for two Condé Nast publications, *House and Garden* and *Vogue*.

In 1938, he attempted to break into *Life* magazine with an assignment focusing on the New York waterfront. Kertész took a number of successful compositions, from bird's-eye views of the harbor to more intimate shots of workers on tugboats, but none of the photographs were ever published, for reasons still uncertain. Despite this setback, Kertész continued to submit work to other magazines such as *Coronet*, which was more inclined to respect photography as a valid, autonomous art form rather than as mere illustration for text. However, since *Coronet* did not hire staff photographers, but bought pictures from various artists through agencies, Kertész was unable to make a living from this publication alone. One of Kertész's main obstacles in acquiring magazine work was his manner of working. American editors preferred photographers who took multiple roles of film and offered a large pool of images from which to select. Kertész, by contrast, was much more economical, opting to submit a small number of very fine images, and thereby assuming the role of editor for himself.

Amidst his career struggles, Kertész maintained a certain degree of visibility as an artist, continuing to exhibit works and publish books of his photographs. In December 1937, Kertész had his first solo exhibi-

tion in America in the gallery of *PM* magazine, a trade publication geared toward the advertising industry. Nine months previously he was included in a major exhibition at the Museum of Modern Art, New York, entitled *Photography 1839–1937*, and in 1941 the Museum acquired his photograph of a schoolhouse in Armonk, New York, when it was included in their exhibition *Image of Freedom*.

Perhaps the greatest blow of Kertész's career occurred in 1939, when wartime circumstances resulted in him and Elizabeth being declared enemy aliens by the U.S. government. Residents holding "enemy" passports were discouraged from photographing outdoors out of fear that photography might be used to undermine national security. Since Kertész was essentially forbidden from street photography, which had always been his primary means of expression, he withdrew from publishing work altogether.

This reclusion lasted until 1944, when André and Elizabeth became naturalized American citizens. Photographic assignments began to pick up, and Kertész soon began doing projects for *Fortune*, including a series of photographs of factory workers in various industrial cities. Also in 1944, he respectfully declined an offer from Moholy-Nagy to teach photography at the New Bauhaus (Institute of Design) in Chicago, ever preferring the role of the amateur to that of the intellectual. Five years later he secured an exclusive contract with *House and Garden*, which supplied him with a stable income and opportunities for travel in America and Europe.

After 13 years with Condé Nast, he broke his contract with the company and retired from magazine photography. He would continue to take pictures throughout his later years, frequently dedicating his images to the memory of Elizabeth, who died of cancer in 1977. As he aged, his camera retreated from the street and retired indoors to his apartment, but often with a gaze toward the outside world. Many of his last photographs were taken through the window of his apartment overlooking Washington Square, and he did a great number of still life compositions by setting up little household objects and sentimental souvenirs on windowsills.

Biography

Born in Budapest, Hungary, 2 July 1894. Received baccalaureate from the Academy of Commerce, Budapest in 1912, but self-educated in photography. Worked at Budapest Stock Exchange 1912–1914 and 1918–1925; Served in Austro-Hungarian Army, 1914–1918; Published in various Budapest magazines as a freelance photographer, beginning 1917; Freelance photographic reportage for multiple European magazines following move to Paris, 1925; Studio work for Keystone Studios, 1936; Freelance photographic work for American magazines published by Condé Nast, Hearst, and Luce, 1937–1949; Exclusive contract with Condé Nast, 1949–1962. Received silver medal at Exposition Coloniale in Paris, 1930; Gold medal at IV Mostra Biennale Internazionale della Fotografia, Venice, 1963; made honorary member of American Society of Magazine Photographers, 1965; guest of honor at the Miami Conference on Communication Arts, University of Miami, Coral Gables, Florida, 1965; John Simon Guggenheim Memorial Fellowship, 1974; guest of honor at VI Rencontres Internationales de la Photographie, Arles, 1975; appointed Commander of the Order of Arts and Letters by the French government, 1976; recipient of Mayor's Award of Honor for Arts and Culture, New York, 1977 and 1981; Medal of the City of Paris, 1980; First Annual Award of the Association of International Photography Art Dealers, 1980; Honorary Doctorate of Fine Arts from Bard College, Annandale-on-Hudson, New York, 1981. Died in New York, New York, 28 September 1985.

Individual Exhibitions

- 1927 Galerie Au Sacre du Printemps; Paris, France
- 1937 *André Kertész, an Exhibition of 60 Photographs*; PM Gallery; New York, New York
- 1946 Art Institute of Chicago; Chicago, Illinois
- 1962 Long Island University; New York, New York
- 1963 *André Kertész, Photographies*; Bibliothèque nationale de France; Paris
- IV Mostra Biennale Internazionale della Fotografia; Venice
- 1964 *André Kertész, Photographer*; Museum of Modern Art; New York, New York
- 1971 Moderna Museet; Stockholm, Sweden
- 1972 The Photographers' Gallery; London, England
- 1975 VI Rencontres Internationales de la Photographie; Arles, France
- 1978 Musée National d'Art Moderne; Centre Georges Pompidou; Paris, France
- 1980 University of Salford; Salford, England
- Photographs of a Lifetime*; Israel Museum; Jerusalem, Israel
- 1981 Cornell Fine Arts Center, Rollins College; Winter Park, Florida
- 1982 *André Kertész: Master of Photography*; The Chrysler Museum; Norfolk, Virginia
- 1985 *André Kertész of Paris and New York*; Art Institute of Chicago, Chicago, Illinois and traveling

WILLY KESSELS

Belgian

The varied output and wide-ranging career of Willy Kessels reflected many of the twentieth century photography's significant aesthetic developments. Like many of his contemporaries, Kessels had a career in the visual arts before he became a photographer. An architectural draftsman, furniture designer, and sculptor, Kessels was one of the protagonists of Belgian

avant-garde art and modern architecture during the 1920s. Architecture and the urban environment play an important role in his photographic oeuvre, which developed from 1929 onwards. In fact, Kessels' architectural photography is an indispensable visual archive of Belgian modernism. In Brussels he photographed many of the buildings by leading architects such as Henry Van de Velde, whose portrait he also made. The generally moderate nature of Belgian architectural

modernism, which hesitates between functionalism, neoplasticism, and Art Deco, is perfectly matched by Kessels's photography, which is characterized by what might be called a subdued constructivist aesthetic. Although often employing bird's eye views, diagonal compositions, and oblique framings, his images never feature the radical fragmented structures and spatial disorientations of Russian and German avant-garde photography. Kessels presented modern buildings as pristine but stable objects, where the sculptural mass is stressed by a subtle balance of light and shade.

His middle-of-the-road modernism is reflected in his urban motifs as well. His bird's eye view of the *Square du Petit Sablon* (1930) stresses the gentle curves of a park and demonstrates an affinity to Alvin Langdon Coburn's famous *The Octopus* (1912), a bird's-eye view of a snow-covered park rather than to László Moholy-Nagy's more abstract and dynamic depictions of the urban landscape. His picture of Brussels' *Grand'Place* (1930), taken from the tower of the town hall, contains two obligatory constructivist characteristics: the bird's eye view and a predilection for pronounced shapes that bisect and structure the image, providing it with contrasting patterns of light and dark. In this case, however, the graphic elements are gothic tracery instead of modern iron or steel work, and the vertical view shows a village square rather than a hectic metropolis. The disjointed rhythms of scale and the kaleidoscopic effects, so characteristic of avant-garde depictions of the metropolis, are absent even in his urban montages. *Habitations individuelles* (1932), the photomontage of modernist dwellings he made for the book *Bruxelles-Atmosphère*, shows a relatively coherent structure and a compositional stability not seen in the work of his peers.

In the early 1930s, Kessels participated in two important photo exhibitions organized by the surrealist E.L.T. Mesens: *Internationale de la photographie* and *Deuxième exposition internationale de la photographie*. Both exhibitions were held at the Brussels Palais des Beaux-Arts and featured works of the leading photographers and international avant-garde artists of the day. Kessels was represented with a characteristic selection, which, along with his architectural and urban photography, included nudes and various commercial commissions. His nudes, although often betraying classical aesthetic conventions and pictorialist influences, contain unconventional viewpoints and framings and traces of darkroom experimentation, such as solarization. His advertising photography for, among other clients, hotels, furniture manufacturers, construction firms, and pharmaceutical firms, was a significant contribution to the rapid prolifera-

tion of the illustrated press during the 1930s—in Belgium represented by magazines such as *Le Soir illustré*, *Les Beaux-Arts*, *Reflets*, and *Variétés*. Kessels' advertising photographs, which he regularly combined with his own graphic design, are often pretexts for his experiments with composition and various lighting techniques. Some of these commercial commissions are among his best works, especially those that combine a kind of *Neue Sachlichkeit* (New Objectivity) sobriety with avant-garde techniques. In his still-life compositions made for advertising purposes, Kessels often imbues everyday objects with magical qualities, resulting in almost surrealist effects such as *Saint-Nicolas chez Barbebleu* (1937), his reportage of a doll factory published in the magazine *Reflets*.

Another highlight of his career is the still life photographs he took for *Misère au Borinage* (1933), the documentary film made by Joris Ivens and Henri Storck that deals with the notorious poverty, misery, and social injustice in the coal mining region of the Belgian Borinage. The pictures from this series that were made with a large-format camera are sharply focused and replete with detail, as can be seen in portraits of miners and their families. These photographs are reminiscent of the work of predecessors Jacob Riis, Lewis Hine, and peers such as the American Farm Security Administration photographers of the 1930s. Others, made with a small format camera, are characterized by a slight blur, evoking a pictorialist interest in atmospheric effects. This can be seen in the pictures of unemployed labourers scrambling for bits of coal on the slopes of slag-heaps.

With this important contribution to the aesthetics of realism, Kessels presents himself as a politically engaged photographer. In the mid-1930s, however, Kessels exchanged the unmistakably leftist overtones of the Borinage pictures for ultra-right-wing leanings. Some of the Borinage pictures took on entirely different meanings when they appeared in a pamphlet distributed by *Rex*, one of Belgium's fascist movements—a fact which illustrates the highly complex and ambivalent relationships between modern art, photography, ideology, and politics during the 1930s. Kessels sympathized with the Flemish nationalist and ultra-right-wing movement *Verdinaso*, for which he shot a propaganda film. He also made a portrait photograph of its leader Joris Van Severen and during the Second World War, after the collapse of the Verdinaso movement, he photographed several leaders of the Belgian collaboration.

After the war, Kessels turned his camera to the scenery and inhabitants of the valley of the river Scheldt, which he had discovered during the early 1940s. His deeply humanistic portraits of local

farmers and fishermen, the pictures of Emile Verhaeren's tomb on the river's bank, and the many tranquil riverscapes and landscapes are vaguely reminiscent of pictorialism, and constitute a parochial, even sentimental view of his native region. In addition, Kessels undertook a broad range of dark-room experiments, such as photograms, solarizations, double exposures, and scratching on the negative, resulting in abstract organic forms and demonstrating an affinity with the contemporary movement *Subjektive Photographie*.

These two bodies of work seem completely disconnected from Kessels's turbulent personal life. Shortly after the war, Kessels was convicted of collaboration with the Nazi occupiers of Belgium and imprisoned. Even as late as 1996, these events still stirred controversy: a retrospective exhibition in Charleroi was censored and never opened to the public. Undoubtedly, Kessels' war past has been in large part a cause of his relative obscurity.

Biography

Born in Dendermonde, Belgium, 26 January 1898. Briefly studied architecture in the Saint-Lucas School and the Royal Academy of Fine Arts, both in Ghent. After working as an architectural draftsman, furniture designer, and sculptor, he became a self-educated photographer in 1929. Wins the *Prix de publicité Pétrole Hahn* on the occasion of the *Deuxième exposition internationale de la photographie* in Brussels. Member of the jury of the *Festival international du Film* at the occasion of the 1935 Universal Exhibition in Brussels. In 1947, sentenced to four years imprisonment as a result of collaboration during World War II. Died in Brussels, 10 February 1974.

EDMUND KESTING

German

Edmund Kesting was a painter, photographer, and art educator. He founded two private art schools and an artists' group, and was intimately involved in the avant-garde movement of the 1920s. The sentence "A painter looks through the lens," was taken from an article in the late 1930s, and the title of a book edited by Kesting in 1958, aptly demonstrates how he conceived of himself as a mediator between painting and photography. He propagated the close connection between these two art forms and saw himself literally as a "light painter," an artist drawing with light.

Born in 1882 in Dresden, Kesting very early showed his artistic and musical talents. After his intermediary exams, he attended a school of commercial arts and joined the *Dresdner Kunstakademie* in 1915. In 1919, still a student himself, he founded with painter Carl Piepho the private school of design *Der Weg* (The Path) and taught there. In 1926, he established a branch of this school in Berlin. Both schools had to be closed down in 1933 with the advent of the Hitler regime, and, classified as an "entarteter" (degenerate) artist by the Nazis, Kesting was banned from painting and exhibiting.

In the 1920s, Kesting mainly worked as a painter, inspired by expressionism as well as dadaism and constructivism. Due to his encounter and ensuing friendship in the beginning of that decade with poet, musician, and essayist Herwarth Walden, who founded the artists' group and art gallery the *Der Sturm* (The Storm), Kesting came into close contact with a number of avant-garde figures. From 1923 onwards he participated in all major exhibitions of that circle. Under that influence, Kesting produced a number of paper collages he called "*Schnittgraphiken*" (cut graphics). Deeply impressed by the works of the Russian Constructivists Alexandr Rodchenko, El Lissitzky, and Wassily Kandinsky, Kesting increasingly incorporated elements of constructivism into his paintings.

Kesting first came into touch with photography during his experimental works with photograms in 1923. Artists like László Moholy-Nagy and El Lissitzky, who themselves were experimenting with the medium, enhanced his interest in photography. He

saw himself as one of these innovators when he self-consciously stated that "a small circle of photographing painters decided the fate of photography, and I am one of them, too." In contrast to other constructivist photographers, however, Kesting saw photography not so much as a creative medium in the sense of the artists associated with the movement *Neue Sachlichkeit* (The New Objectivity), but rather as an artistic form with which he expected to master the classic repertoire of expression and design in a modern way. Thus, photography was simultaneously creative and apparatusive to him.

Kesting started experimenting with the technique of multiple exposure around 1926–1927. The first samples are portraits of his wife Gerda Müller-Kesting and of sculptures of the *Dresdner Zwinger*. It was by accident that he came upon the idea of consciously using this technique in his work. Although Kesting is sometimes seen as the founder of this "sandwich technique," this credit actually goes to the Swedish painter Oscar Gustav Rejlander, who preceded him in creating doubled images and constructed scenes by means of multiply exposed negatives.

Kesting used to see portrait photography as a great challenge, and he worked on it mainly until 1937 and during the last decade of his work period. His models were initially his family—wife and child—and later increasingly friends, relatives, pupils of the *Weg* school as well as artists, writers, and other VIPs. He persistently used multiple exposure and thereby tried to visualise the mental and lively aspects of the portrayed personalities. The literal "multi-layeredness" of his pictures and the concentration on shades of light, the modelling of light and shadow, were his means to convey and transfer meaning. Kesting almost exclusively used this technique inside the studio; outdoor multiple exposures are rare.

His portraits can be classified into dominant categories: one type is the montage of profile and half figure photographs, another the combination of (half) profile and silhouette pictures. A third group consists of photographs of women in mirrors or with veils.

From 1930 to around 1936, Kesting also did dance photography, emphasising the movement and rhythm of the bodies. He enlarged his reper-

toire of forms by including combinations of whole bodies with facial silhouettes, inspired especially by Mary Wigmann's pupil Gret Palucca.

In the middle of the 1930s, mainly for financial reasons, Kesting turned towards architectural and advertising photography. In this course, he photographed the entire Green Vault of the *Dresdner Kunstsammlungen*. His object and advertising photography, while sometimes being reminiscent of the cool and emotionless style of *Neue Sachlichkeit*, do betray that Kesting was not at home in this field: they lack the necessary technical perfection. Kesting worked mainly for the firms Minos (photography) and Auto-Union (cars).

Kesting's most impressive series, a photomontage of the devastated centre of his native city of Dresden in 1945, shortly before the end of the war, is "*Der Totentanz von Dresden*" (Dance of the Dead in Dresden), in which dancing skeletons are set into the ruins of the city. In his use of this traditional painterly motif, *Der Totentanz* has a unique place in post-war German photography of the devastation of World War II.

Kesting's activities as a painter saw a new upswing after the war, when he founded the artists' group "*der ruf*" (The Call). In 1946, he led the workshop "*Photographie und Film*" at the *Staatliche Hochschule für Werkkunst* at the *Hochschule für Angewandte Kunst* in Berlin-Weißensee. As a result of his position on formalism and socialist realism in the German Democratic Republic, Kesting was forced to leave his teaching position in 1953. The department of photography was dissolved. Kesting was employed at the *Deutsche Hochschule für Film und Fernsehen* three years later. During these years he experimented with photochemical painting. Furthermore, he again took up portraiture, photographing artist friends from West Berlin as well as the cultural and political establishment of East Germany.

Kesting's works are scattered all over the world. Numerous early plates are lost, and many of Kesting's prints from these are not extant either, and are known only in reproductions. Many of his photographs have posthumously been dated and registered by his wife, since Kesting himself did not care much about systematic registering of his work. He saw photography as a "forward-looking work."

YEVGENY KHALDEI

Ukranian

Yevgeny Khaldei was a photojournalist who is best known for his photographs of World War II. His photographs are humanistic images that document the war from the Russian perspective. As an employee of a Soviet news agency, Khaldei ensured that his photographs were acceptable to the Communist regime. Khaldei was often not credited as the author of his photographs and never given royalties for their use in publications.

Khaldei began his career as a contributor to his factory newsletter with images representing laborers in the Soviet Realist style. This was followed by contributions to various city and regional publications. In 1935, he sent photographs to Fotokhronika of Soyuzfoto, a precursor of TASS, and was invited to Moscow to take a course in photography where he studied with Semyon Fridlyand, Arkady Shaikhet, and Max Alpert and learned a humanistic approach to photojournalism. He began working for TASS in 1936.

From 1941–1945, Khaldei followed the Red Army as a war photographer for TASS. He used a Leica camera throughout the war. He photographed soldiers preparing for battle as in *Murmansk*, 1942; soldiers in the midst of liberating a country in *Vienna*, April 1945; and at leisure such as the light-hearted photograph *Sailor's Leisure*, *Murmansk*, 1941. In these works and others, Khaldei used formal qualities such as well-balanced compositions and dramatic lighting to make the event appear monumental. Khaldei is also noted for his images of women such as female snipers as in *Liza the Sniper*, *Novorossiisk*; Soviet women pilots represented in *Women Pilots* (called “night witches” by the Germans because they fought at night); crossing guards as in *Road to Berlin*, May 1, 1945; and many images of innocent bystanders. He also photo-

graphed the victims of war such as the *Murdered Jews in a Synagogue*, *Budapest*, and a *Jewish Couple*, *Budapest*, 1945, whose yellow stars he removed from their coats. Khaldei contributed to the drama of some of his photographs such as *Outskirts of Vienna*, 1945, an image of soldiers walking over a Nazi flag in front of a burning home, by setting fire to the home which belonged to a concentration camp commandant. Other photographs like *Life Again*, *Sevastopol*, May 1944, depicting young sunbathers against the ruins of the city, were considered too frivolous to publish at the time.

As the end of the war approached, Khaldei had seen the famous photograph of Americans raising the flag at Iwo Jima by Joseph Rosenthal and set out to create his own flag-raising images. He hired his family friend, Israil Solomonovich Kishitser, to make three flags for him which he made from red tablecloths. Khaldei photographed the first flag being raised at the airport, and the second flag being raised at the Brandenburg gate. The third flag was raised over the Reichstag on May 2, 1945. At the request of TASS, Khaldei removed the watches on the soldier holding up the flag bearer. They were concerned that it would be perceived as a sign of looting or consumerism.

Khaldei also captured the atrocities of war such as the realistic image, *Executed Russian POWs in Rostov Prison*. His images involving war criminals are equally dramatic such as *Suicide of a Nazi Family*, *Vienna*, 1945, which records a Nazi officer who killed himself and his family. He recorded the final defeat of the Germans in his many photographs of the victory parade in Red Square, Moscow, on June 24, 1945.

After the war, Khaldei photographed the conference at Potsdam and trials at Nuremberg. Khaldei photographed numerous images of Joseph Stalin,

Winston Churchill, and Harry S. Truman at the peace conference. He seems to have captured the character of Stalin in works such as *Truman and Stalin, Potsdam, July 1945*, and *Potsdam, July 1945*. In the latter image, Khaldei placed Stalin in the center of a picture so that he is the focus of attention. He also stands out in his white suit. At Nuremberg, Khaldei photographed the war criminal and, especially, Hermann Goering at the trials, who was extremely angry that the soldiers allowed a Russian to photograph him.

In 1947, Robert Capa was visiting Russia, but was not able to leave the country with his undeveloped film. Khaldei processed the film for him. Capa, stunned by his lack of equipment, gave Khaldei a Speed Graphic camera.

In 1948, Khaldei was dismissed and given no reason by TASS. According to the Nakhimovskys, his employment may have ended due to anti-Semit-

ism or time he spent alone photographing Josip Broz Tito, who recently broke with Stalin, in his office.

After his dismissal from TASS, Khaldei continued to work as a photographer producing works such as portraits of composer Dimitry Shostakovich and cellist Mstislav Rostropovich in 1951. In 1959, he was hired by the Russian newspaper *Pravda* and photographed Russian life. He was forced out for being Jewish in 1976.

Khaldei only began to be recognized towards the end of his life through awards, exhibitions, and publications. In 1995, he was awarded a medal from the French Ministry of Culture. Colgate University Professor Nakhimovsky can be credited with bringing attention to the photojournalist in the United States through organizing the exhibition *The Lens of the Beholder: Photographs of the Soviet Empire* (Picker Art Gallery from October 29–December 15, 1995) and writing *Witness to*

Yevgeny Khaldei (Jewgeni Chaldej), Ruinen im Zentrum Berlins.

History: The Photographs of Yevgeny Khaldei in 1997. This was followed by the exhibitions *A Witness to History: Yevgeny Khaldei, Soviet Photojournalist* at the Jewish Museum, New York from January to April 13, 1997, and *Russia in Black and White: The Photojournalism of Yevgeny Khaldei*, Jewish Museum, San Francisco from February 24 to July 17, 1997.

JENNIFER OLSON-RUDENKO

Biography

Yevgeny Khaldei was born on March 10, 1917, in Yuzovka (later Stalino, later Donetsk), Ukraine. In 1918, Khaldei's mother was killed in a pogrom against the Jewish community, and the family took up residency with his grandparents. After completing four grades, Khaldei went to work cleaning the insides of steam engines in order to help support himself. In 1936, Khaldei began working for TASS news agency. In 1937, he was drafted and served as a guard on the Finnish border. He continued to work for TASS serving as a war correspondent from 1941–1945. In 1941, his family, along with the other Stalino Jews, was killed by the Nazis. On October 31, 1945, he married Svetlana and she bore him a daughter, Anna. In 1948, he was dismissed by TASS. In 1959, Khaldei was hired by the Russian newspaper *Pravda*. In 1976, he was dismissed for being Jewish. He died on October 6, 1997 in Moscow.

CHRIS KILLIP

British

In the television series of the book *Another Way of Telling*, the artist and writer John Berger begins the second episode of the series with a discussion of a photograph of a young skinhead sitting on a brick wall crying. Berger remarks that it is no accident that the young man is framed by the bricks in the photograph; indeed, he states that there is something in common with what is happening to the youth and the bricks that surround him. Berger's comments point not only to the metaphorical role of the objects in the photograph but also to the role of the photograph in telling the story of the individual and the place he is in. The photograph *Boy Sitting on Wall, Jarrow 1976*, is from Chris Killip's series *In Flagrate*, one of the most significant

bodies of photographic work on the north-east of England, an area of Britain that has periodically been photographed since the 1920s with the rise in popularity of the photo-essay through magazines such as *Picture Post*.

Born in Douglas on the Isle of Man in 1946, Killip who is largely self-taught in photography, began his career as an assistant to the advertising photographer Adrian Flowers in Chelsea, London, between 1963 and 1965. After several years working as a freelance photographer's assistant in London, Killip returned briefly to his hometown on the Isle of Man between 1969 and 1971 before once more returning to the British mainland in 1972, this time to the North of England whose landscape and people became the subject of his most widely celebrated work.

It was during the intervening years back on the Isle of Man that Killip's work was to take a direction that would have a significant effect on his subsequent work on the North of England throughout the 1970s and 1980s. Having encountered the work of photographers such as Paul Strand, Walker Evans, and August Sander at the Museum of Modern Art while on assignment in New York in 1969, Killip gave up commercial photography to return home and photograph the Island as he experienced it. The result was not of a body of work that expressed his own personal story of life on the island but rather a narrative that told the story of the changing social relations between the islanders and their environment as he experienced it during social upheavals brought about by changing population demographics and the influx of wealthy financial services workers onto the island. Although his photographs of the island and its inhabitants appeared in a number of photo-essays between 1969 and 1973, the complete body of work was not published as the book *Isle of Man* until 1980.

In the years between photographing and publishing his work on the Isle of Man, Killip began to photograph in the north-east of England. In 1972, he received a commission from the Arts Council of Great Britain for the touring exhibition *Two Views—Two Cities* and during the same year, he also exhibited in the Photographers' Gallery in London in the group show *Four Photographers*. Killip's work on the North-East during these early years was also supported by a number of major awards throughout the early and mid-1970s. He received an Arts Council of Great Britain Photography Award for the year 1973–1974 and between 1975–1976 he was the recipient of the Northern Arts Photography Fellowship. In 1977, Killip was also awarded an Arts Council of Great Britain Major Bursary Award.

It would be wrong to portray Killip during this period as journeyman photographer, traveling throughout and photographing north-east England. Killip was also very much to the fore of a fledgling photographic culture during this period, making a significant contribution to bringing photography to a wider public audience. Between 1976 and 1980, he served as a member of the Photography Committee of Northern Arts in Newcastle-Upon-Tyne, making awards to other young photographers. During this time, 1977–1979, he was also a member of the Photography Committee of the Arts Council of Great Britain.

Killip's role in supporting photography was not just confined to an administrative role sitting on Arts Council committees. In 1976, he was a founding member of the influential Side Gallery in Newcastle-

Upon-Tyne. Between 1976 and 1984, Killip played an active role as an exhibition curator and advisor before serving as Director of the Side Gallery between 1977–1979. During his eight-year association with the Side Gallery, Killip curated and co-curated a number of exhibitions that brought past and contemporary documentary photography to the attention of the arts community of the north-east. Amongst those from the past were exhibitions of work by Lewis Hine, August Sander, Weegee, and nineteenth century figures Thomas Annan and E.J. Belloq. Exhibitions of contemporary documentary photographers included the work of familiar names such as Martine Frank, Robert Doisneau, Don McCullin, and Gilles Peress as well as young British photographers Chris Steel-Perkins and Trish Murtha.

After two years as Photographic Consultant to the *London Review of Books* between 1979 and 1981, Killip spent the next decade concentrating on his photographic work while at the same time participating in exhibitions throughout Europe, North America, and the Southern Hemisphere. The many years spent photographing the North of England culminated in the publication in 1988 of *In Flagrante*, recognised as one of the most significant and influential bodies of British documentary of the twentieth century. If his photographic influences are predominantly North American, the direction and subject matter of this work was very much shaped by the political and ideological effects on the society of that period. Margaret Thatcher's Conservative laissez-faire economic policies brought about rapid de-industrialisation throughout North England, the results of which were etched on its landscape and the faces of those who remained there. Killip's work is not the campaigning social documentary that is the norm for such subject matter: indeed, he was to acknowledge in the brief introductory text that the images said more about his experiences than those photographed. As Berger was to remark on the standard photographs of such subject matter:

In Flagrante does not belong to this tradition. Chris Killip is admittedly aware that a better future for the photographed is unlikely. The debris visible in his photos, the debris which surrounds protagonists, is already part of a future which has been chosen—and chosen, according to the laws of our particular political system, democratically.

(Berger 1988)

Having received the Henri Cartier-Bresson Award in 1989, Killip was awarded an honorary Master of Arts by Harvard University, Cambridge, Massachusetts in 1994. Between 1994 and 1998, Killip had held the Chair of the Department of Visual and Environmental Studies and had been Director of

KILLIP, CHRIS

the Carpenter Center for the Visual Arts at Harvard University, where he is currently a Professor of Visual and Environmental Studies.

AART KLEIN

Dutch

Without any formal education Aart Klein became one of the most important Dutch photographers of his generation. He is best known for his graphic approach to photography.

My photography is called black-and-white photography, but in fact it's the other way around: white on black. That is because if you don't do anything, you get a black image. Things only happen when you open the shutter: then you make a drawing in white.

(Marsman 1996)

This statement, by far his most famous, reveals his distinct vision and underlines how much he valued the technical aspect of photography.

Aart Klein was born in 1909 in Amsterdam. At the age of 21, he took a job as an office clerk at the Polygoon photo press agency. In the nine years that followed, he moved up from administrative assistant to one of the agency's most important photo-

graphers. Negatives of this period, his learning years, are lost, however. During the World War II years he held various jobs, including press photographer and an official photographer for the city of Amsterdam taking wedding photos. In 1943, he was forced to work in Germany by the Nazi occupiers taking portraits. On a leave back in Amsterdam he went underground. With the Donia Group, a resistance cell, he took pictures that were sent to the Allied forces in England. Later, he registered his country's liberation with a group of photographers called Particam, or Partisan Cameras.

In 1946, Aart Klein and Sem Presser, on assignment for the Dutch Ministry of Information, captured the state of post-war Germany in the book *Zoo leeft Duitsland. Op de puinhopen van het Derde Rijk* (How Germany Lives. On the Ruins of the Third Reich).

After the war, Klein, with his colleagues Maria Austria, Henk Jonker, and Wim Zilver Rupe from Particam, founded a photo agency using their lib-

eration name. This name, at Klein's initiative, was later changed to Particam Pictures. The Particam crew showed a distinctive style due to Klein's technical skills. They were able to avoid the use of flash by slightly heating the developer, which produced a much more sensitive film. Being able to photograph in darkened theaters or situations allowed the Particam photographers to corner the market in all kinds of stage photography, and the group had a virtual monopoly for theatre, opera, ballet, cabaret, and circus photography. Klein began showing his works in photographic exhibitions around this time, including in "Foto '48" at the Stedelijk Museum, Amsterdam.

In 1953, the Netherlands was confronted with the worst natural disaster in its history, known as the Big or Great Flood. During an extremely strong storm in the Atlantic, dikes were breached and the North Sea flooded the southern part of the country. One-thousand, eight-hundred and thirty-five people were killed, 47,000 houses were destroyed, and 139 kilometers of dikes were damaged. Together with Ed van der Elsen and photojournalist Dolf Kruger, among others, Klein's work showed his country and the world the tragedy that had especially affected agricultural areas. His pictures of the flooding were published in the newspaper *De Spiegel*.

Because of his formal approach to composition, Klein was included in the landmark *Subjektive Fotografie II* exhibition in 1954, but the Dutchman never really let go of reality to move toward the abstraction demonstrated by many of the other photographer who showed on that occasion. His work always retained recognizable elements and was never fully abstract. Even so, Klein's work was never as popular as that of many of his photojournalist or fine-arts contemporaries, making him somewhat of an outsider.

A subject that Klein especially mastered was birds in flight; he had the remarkable ability to position the birds seemingly exactly where he wanted them to capture the most dramatic images. This talent provoked one of his assistants to remark that Klein always carried a few birds in his pocket. Klein, however, was merely very patient and would wait for what Henri Cartier-Bresson called "the decisive moment," that is, until the composition matched what he had in mind. But unlike the French master, for Klein the work was not finished with the snap of the shutter. He worked hard in the darkroom to achieve his desired contrast so that they achieved their distinctive graphic appearance. Works such as *Zebra*, 1957, showing a zebra from the rear, exemplify this practice. The zebra's stripes are sharply etched across the picture plane, creating a pattern that almost obscures the organic shape of the animal.

The work conducted by Klein in the darkroom can be fruitfully compared to the efforts of his countryman, painter Piet Mondriaan, when he developed his trademark abstract style. In a famous 1912 series of paintings that documents his move to abstraction, Mondriaan purged the naturalistic image of an apple tree until he was left with a set of geometrical shapes. In the same way, Klein repeatedly adjusted the level of contrast until his pictures were pure and clean, emphasizing the straight lines and planes he looked for when he was shooting.

In 1956, Klein left Particam Pictures and set up his own studio. It was in this period, Klein combined his preferences for landscape and industrial photography and made, at his own initiative, his most famous works on the Delta engineering project, published in two books: *Delta. Poort van Europa* (Delta. Gateway to Europe) and *Delta. Stroomland in beweging* (Delta. Land of Streams in Motion). This project, which allowed Klein to continue the theme of the struggle against water, which so shapes the Dutch psyche that he explored in the aftermath of the Big Flood, was aimed to prevent flooding. It consisted of the creation of major infrastructure in the splendid natural setting of the southern part of the Netherlands. Klein once again looked for the vast planes of the landscape and the rhythmic qualities of the dikes and bridges. With a great deal of patience, vision, and technical skill, he created a distinct look at the massive interventions in the landscape meant to prevent a disaster like the one he witnessed a decade earlier. Although Klein always looked for subjects that matched his style, it is wrong to look at his pictures as mere graphic tricks. His work displays his belief in progress and offers a very personal and optimistic view.

In the years that followed the completion of the Delta photographs, Klein worked for the newspaper *Algemeen Handelsblad* and for Dutch companies such as Shell and Philips. Not surprisingly, these and other companies welcomed the optimistic spirit of his photography. Besides, his style fitted the modern industrial architecture and the visual taste of the 1960s and 1970s. Later on, he frequently went abroad, with travel grants and on assignment for different government agencies.

While Klein was not active as a photographer at the end of his life, it was at that time his influence and importance were recognized and appreciated. In 1982, he received the Capi-Lux Alblas Prize. In 1986, a major retrospective exhibition was mounted in Breda, the Netherlands. In 1996, Aart Klein received Fund for the Visual Arts, Design and Architecture's oeuvre prize. When Aart Klein died in 2001 at the age of 92 his pictures of the 1953 flooding and the

subsequent Delta works were a part of his country's collective memory.

ASTRID KLEIN

German

The German photo artist Astrid Klein became well known in the 1980s with her large scale black-and-white photo works—she uses this term to distinguish her intentions from traditional photography. In almost all her works Klein uses existing text and graphic material, altering it greatly through various manipulations including greatly enlarging it, overlaying grids or other markings, including masking and stencilling, and using positive and negative images. By unhinging pictures and words from their original context, these materials lose their relationship to reality. The concept of a photograph as a reproduction of reality, that is, the ability to map a real item onto a picture, is given up and transferred into fiction through distancing. She is also a sculptor and writer.

Born in Cologne in 1951, Klein studied at the Academy of Art and Design in Cologne. At the beginning of her artistic career she created small-sized gouaches on backgrounds. It was in the late 1970s that she dedicated herself to photography, and along with German photo artist Rudolf Bonvie, embarked on a project to work out the specifics of the medium as a pictorial application independent of traditional photographic usages. Later, her interest was directed toward an analysis of the journalistic use of pictures, as reflected in her use of photo material from mass media. Klein can therefore be seen as connecting to a generation of artists, which, in the 1960s and 1970s, dealt with the unpleasant realism of the mass-media-based photography. Among these artists, were Jürgen Klauke, who was teaching at the Fachhochschule Köln in the mid-

1970s, and the Czech-born Katharina Sieverding, who creates politically-charged, large-scale self-portraits, by whom Klein was greatly influenced. Klein's first solo exhibition took place in 1980 at the Künstlerhaus Hamburg; further exhibitions quickly followed in Cologne, Berlin, and Düsseldorf.

At the beginning of the 1980s, she created the work *Marche ou crève* (March or Die) (1981). It is a five-panel photo work, showing Black women of the Third World who hung themselves to escape (according to the press reports from which Klein obtained her image) the changes of the modern world. The viewer's reception of the work is directed by the interplay of text and picture—a technique that the artist gradually downplays in her later work. In the course of the 1980s, Klein departed increasingly from straightforward, easily intelligible texts. Her works become more complex and abstract, particularly through her use of a multiplicity of experimental photographic methods. She presented images in both negative and positive, worked with double exposure, the overlay of negatives, photo or light drawing, etching into the emulsion, and inserting paper cut-outs into the photographic print. Thus she picks up the technique of the photogram (or Rayogram), which was used in the 1920s by such experimental artists as Man Ray.

In silhouette, seven dogs are arrayed across the picture plane of a large photo panel that was part of the installation *Endzeitgefühle* (End Time Feelings) (1982) in an abandoned Hamburg factory. Their black forms were inscribed on a photo of a factory wall with a boarded-up door not unlike the wall upon which it was fixed, and acted like projected shades, racing wildly, perhaps from a horrifying past, into an unknown apocalyptic future. A version of this work was also placed in a subway station in Hamburg in 1986. The setting underlines the threat, darkness, and end-time mood of the central theme of this work. In *Endzeitgefühle*, Klein takes up the political discourse of the 1980s, but her terminology serves as a more timeless statement. This work is in contrast to earlier works combining picture and text excerpted from the contemporary press, and marks a turning point in Klein's career.

She began managing the transformation of the images she selects and the uncoupling of the material from its original context, through greatly enlarging the found elements. Thus, raster, the pattern of lines created by a signal coming through the cathode ray tube of the television, common in mass-media illustrations, appear. This becomes apparent in works as *eingeebnet*, *eingordnet*, *begradigt* (Levelled, Arranged, Straightened) and *Gedanken abgetrieben* (Thought Aborted) both of 1984.

By 1986, Klein had become a visiting professor at the Hochschule für Bildende Künste in Hamburg. Invitations to exhibit in London, Toronto, and many other cities in Europe and overseas followed. She received a number of German grants and scholarships, including the Förderpreis der Stadt Köln (1984), the Karl Schmidt-Rottluff Stipendium (1987), and the Kaethe-Kollwitz-Preis of the Akademie der Künste (1997), as well as the Kunstköln-Preis (2001). The awards are evidence of the importance and appreciation of Astrid Klein's work. Since 1993 she has been professor of fine arts at the Hochschule für Grafik und Buchkunst, Academy of Visual Arts Leipzig. In 1998, she became a member of the Akademie der Künste in Berlin.

In 1994, the work *Auswege* (Ways Out) arose, consisting of a wall installation that shows the motif of women in light-coloured dresses who walk along a narrow way repeated 11 times. Referring back to a work of the same title from 1983, the piece relies on the device presenting a spatial dimension into the picture that alters the architecture of the space to create the narrative of the piece. The path that is taken by the women in the photographs serves as a connecting element.

fremd (Foreign) (1994), a collaboration with Rudolf Bonvie, consists of seven individual components presented within the exhibition space. The viewer is also included in the pictures by mirrors that carry the writing *fremd* in different languages. Here, as in Klein's early works, picture and text are combined, but by the foreign languages the legibility is made more difficult and the information is not referred compellingly to a contemporary problem. The political aspect, however, is not to be ignored.

Klein's interest in the context of the exhibition space shows up also in the installation which she created in 2001 for the Bundestag in Berlin. The installations of fluorescent tubes, following the course of steps in the Jakob-Kaiser-Haus, bear quotations from Thomas Hobbes' *Leviathan* (1651), who postulated the necessity for contractual arrangements in his political philosophy as basic condition for the existence of a society.

Running through Astrid's Klein work is the examination of the relationship of text to picture, wrenching this almost ubiquitous manifestation of photography out of its everyday realms and placing it into images in which these relationships can be reconsidered. This is not only a device that allows her to analyze society's relation to art, but to muse on the political implications of art and photography.

WILLIAM KLEIN

American

William Klein is an eclectic artist, initially a painter and graphic designer, and a renowned photographer and filmmaker. Appreciated since the 1950s for the striking novelty of his images in Europe and Japan that followed the publication of his now legendary book about New York, *Life Is Good and Good for You in New York* (1956), his importance to contemporary photography was late in being established in the United States. Today, however, he is recognized as one of the most important practitioners of twentieth-century photography, who helped establish the genre known as snapshot photography or street photography. The use of the wide-angle lenses to distort the image, fast film, extreme contrast, grainy printing, and blurry and streaked imagery is Klein's photographic language.

William Klein was born in New York in 1928. He studied sociology at City College of New York, and in 1946, enlisted in the United States Army, where he worked as an army newspaper cartoonist. When he was discharged in 1948, he found himself in Paris and decided to stay, living there until 1954. These were the years of his artistic formation. After attending the Sorbonne, he briefly studied painting with Fernand Léger. Abstraction was the prevailing aesthetic in Europe at that time, but it was the teaching of Léger that had its greatest impact on how Klein learned to relate to the art world: there should be no barriers between the various artistic mediums and styles. Léger provided the example: while best known as a painter, he also did set design, costume design, mur-

als, and films. This attitude had its origins in the avant-garde movements of Russian Constructivism, the Dutch movement De Stijl (The Style), and Dada, as well as from the teachings of the German Bauhaus.

In 1952, an Italian architect, Mangiarotti, after viewing Klein's exhibition of abstract paintings at the Galleria del Milione in Milan, asked him to realize a mural made with sliding and revolving panels. Klein painted the panels with abstract shapes and then photographed the panels in motion. This led to his first experiments in the darkroom with a kind of rayograph or photogram, where he placed geometrical shapes on photographic paper and exposed them to light.

In 1954, Alexander Liberman, art director of *Vogue*, was in Paris. He saw an exhibition of Klein's abstract photographs and offered him a job at *Vogue* as a fashion photographer. Back in New York, Klein began his personal project: a photographic diary of his return to his native city. The photographs he took in the streets of New York did not convince prospective American publishers. They seemed too raw and violent; Klein's aesthetic was in direct contradiction with the rules of what was then considered good photography. The canons that had been imposed by Henri Cartier-Bresson were those of a clean and balanced image, built on the average tones. The persons were taken at a distance or secretly. Klein meant to contradict explicitly every rule dictated by Cartier-Bresson: to the average tones he opposed a strong black-and-white contrast, to a clean and defined printing contraposed a grainy one obtained through the blowup processes. Klein chose a popular model

KLEIN, WILLIAM

for his photographs, the images published in the daily newspaper, *New York Daily News*. In fact, grainy printing nearly succeeded in obtaining a typographical effect. Also, the way he went catching photographs in the crowd was the same as a paparazzo in search of a scoop, stealing smiles or tears in a hurry, nearly in motion. His images seem to have a cinematic soul, most of them look like photographs selected from a movie, as we can see in *Dance in Brooklyn*.

The first publication of the series exited in Paris in 1956 with the Dada-like title: *Life Is Good for You in New York. William Klein Trance Witness Revels*. William Klein took care of every aspect of this book and of the following ones: design, typography, covers, and texts. The book was meant to be a photographic story with chapters.

In New York he could not find a publisher for his books, but he found a very well-paid job and, for ten years (1955 to 1965), worked as a fashion photographer at *Vogue*. Klein's pictures brought new revolutionary ideas in the fashion world as well. In contradiction with the sharpness and clearness of Irving Penn's and Richard Avedon's photographs, he shot images with his Rolleiflex to re-frame and manipulate in the darkroom. Instead of a telescopic lens, he introduced the wide-angle lens, and the streets, instead of the studio, were his favorite settings.

While Klein photographed fashion in New York, Europe and Asia looked to him for his stronger and subversive images, those shot in the streets of New York. *Rome* (1958), *Moscow* (1959–1961), and *Tokyo* (1961) were his following publications.

William Klein, *Gun 2*, near the Bowery, New York, 1955/print 1985, gelatin silver print, 23.4 × 34.6 cm, Museum Purchase: Lila Acheson Wallace Fund.

[*Photograph courtesy of George Eastman House, © William Klein. Courtesy Howard Greenberg Gallery, New York City*]

In 1965, Klein left *Vogue* and professional photography and took up filmmaking. His most famous works are *Who are you Polly Magoo?*, *Cassius the Great*, *Loin du Vietnam*, and, released in 2000, *The Messiah*.

At the beginning of his photographic career in 1956, William Klein won the Prix Nadar for the book *New York*. At Photokina 1963, he was voted one of the greatest artists in the history of photography. In 1978, he was honored at the International Festival of Arles. In 1980–1981, the Museum of Modern Art organized an exhibition of his early works, which redefined the role of the photographer inside the New York School of Photography.

William Klein lives and works in Paris as a filmmaker and, part-time, as a still photographer.

MARK KLETT

American

Mark Klett is among the most accomplished landscape photographers in the ranks of twentieth century American photography. His unique photographs incorporate elements of a nineteenth century tradition, while critically examining many of the twentieth century's most poignant environmental concerns. Throughout his work, Mark Klett focuses on the experience of contemporary travelers in the American West, while demonstrating how that experience differs from the mythologized histories of this same land. Klett is an educator, artist, and historian who has influenced a generation of photographers and inspired a new sensibility for those interested in landscape and culture.

Klett's introduction to photography began with an early interest in science. In 1974, he received a B.S. in geology from St. Lawrence University in Canton, New York. After graduating he studied photography with Nathan Lyons at the Visual Studies Workshop in Rochester, New York, receiving his M.F.A. in 1977. During graduate school Klett spent summers working for the United States Geological Survey (USGS) in Wyoming and Montana. This combination of experiences would prove to be a seminal period that would define his mature work as an artist.

Upon completing graduate school, Klett helped to organize the Rephotographic Survey Project (RSP), a project in which a series of nineteenth century photographs of the American West were rephotographed by a team of artists. Supported by an National Endowment for the Arts (NEA) grant, he

worked with Gordon Bushaw, Rick Dingus, JoAnn Verburg, and the art historian Ellen Manchester to document over 100 sites that were previously photographed by photographers such as Timothy O'Sullivan and William Henry Jackson, who traveled with nineteenth-century explorers and surveyors. The work of the RSP photographers was published as *Second View: The Rephotographic Survey Project* (1982). This project had a significant impact on Klett's work as an emerging artist, teaching him to carefully consider the boundaries between science and art, past and present, and to successfully integrate these concerns into his photographs.

When Klett's work with the RSP was nearly complete, he took a position with the Sun Valley Center for the Arts and Humanities in Sun Valley, Idaho. This position meant that Mark Klett would now settle in an area where he was most at home, making the move to Idaho in 1978. His work began to look at a personal experience with the western landscape, allowing the beauty and austerity of nineteenth century photography to inform his new photographs. His photographs from this period are diaristic in their style and mark the beginning of hand-written text on the face of each print. Since 1979, Klett has used a Polaroid material to produce his photographs. This material, Type 55 P/N film, was crucial to the exacting work of the RSP photographers for its ability to produce both a positive and a negative without the use of traditional developing agents. It became an integral part of Klett's work, acting as both a practical and stylistic element to his photographs.

In 1981, he received a Ferguson Award from the Friends of Photography. Klett used the award money to travel and work in Nepal. In 1986, he worked with the artist Linda Connor to publish a portfolio entitled *Nepal*. Klett's gelatin silver prints, most measuring 16 × 20 inches, were printed to show the development marks left by the Polaroid film—a reference to the wet-plate negatives made during the nineteenth century, and a conscious nod to the photographers whose work he studied so intently. After returning from Nepal, Klett accepted a position with the Photography Collaborative Facility at Arizona State University (ASU) in Tempe, Arizona. It was in the desert southwest that he began to explore the land as a resident. This deeper identification with the desert helped solidify his understanding of the desert's ecosystem, seasons, light, and cultures. This is clearly seen in photographs where he captures the drought of cacti, the sprawl of humanity, or the blinding light of midday. In images such as *Checking the Road Map, Crossing into Arizona, Monument Valley, 6/22/82*, we see the momentary pause of new residents who seem less concerned with their present location than they are with their ultimate destination. This kind of experience is exactly what Klett focuses on regarding life in the twentieth-century West. Klett writes: “The longer I work, the more important it is to me to make photographs that tell my story as a participant, and not just an observer of the land.”

Within the history of landscape photography, Mark Klett's photographs are often noted for the many ways in which they challenge a long-standing artistic tradition. His unconventional practices within the field of photography include the choice to print on matte surface paper, the inclusion of an irregular border from the Polaroid negative, and his addition of text in the finished photograph. Further, he has defied the landscape tradition of utilizing a full tonal range by photographing during the brilliant light of midday, yielding a palette of middle grays seldom seen in the work of his contemporaries. Klett's photographs question the assumption that a landscape must contain drama to achieve aesthetic success. His titles, often witty or descriptive, are written directly on the face of each print in his signature silver ink, making his work instantly recognizable and emphasizing the photograph's presence as an object and his role in its creation. Klett consistently includes the date on which the photograph was taken as an integral component of his title. This serves to remind the viewer that a photograph exists within the larger context of human history, and that it too has a history unto

itself. Titles such as *Fallen Cactus, New Golf Course, Pinnacle Peak, Arizona, 3/4/84* suggest a moment in time when the “permanence” of a golf course was first given life, ironically, through the death of an iconic desert plant. Klett's first monograph *Traces of Eden: Travels in the Desert Southwest* (1986) appears as an early example of his working style and demonstrates his fluidity between the disparate media of black and white and color.

In the 1990s, Klett completed a series of rephotographic projects, albeit smaller than the original RSP. In 1990, he created a 13 panel panorama of San Francisco that was originally photographed in 1878 by Edward Muybridge. The two works were published back to back as a nine-foot-long accordion book *One City/Two Visions: San Francisco Panoramas, 1878 and 1890* (1990). Working with a similar project in 1991, Klett made a series of photographs documenting the changes in and around Oklahoma City since 1889. This work, published as *Photographing Oklahoma: 1889–1991* (1991), contains archival photographs made during the nineteenth century that are then juxtaposed with his own work. In 1992, he began a new body of rephotographic work in Washington, D.C. The project resulted in the publication of *Capitol View, A New Panorama of Washington, D.C.* (1994).

Throughout Mark Klett's career he has used both color and black-and-white film. Much of his color work from the 1980s and early 1990s was printed with the dye transfer process, creating a print known for its rich, saturated palette, and archival longevity. After the disappearance of dye transfer materials in 1994, Klett began to explore the emergence of computer technology to produce both color and black-and-white work. Working with digital cameras as well as digital output to explore this technology, his work has remained on the leading edge of current technology. In 1997, he launched a website containing the work of a long term project entitled *Third View*. In the Third View project he has utilized the assistance of graduate students to document many of the sites that were the subject of the original RSP photographers. Field diaries, video, and sound are used to create a dynamic addition to the photographs in this new series. The website is found at www.thirdview.org/.

Throughout his career, he has made use of images for commercial purposes as well as aesthetic ones. Mark Klett's photographs can be found in publications such as *Condé Nast Traveler*, *Westways*, *Harpers*, and *Outside* magazine among others. Commercial work has helped to maintain his status in the photographic community in the United States and abroad. His photographs are

KLETT, MARK

held internationally in over 50 museum collections and have been exhibited in nearly 70 individual and 200 group exhibitions worldwide.

PHOTOGRAPHY IN KOREA

The word “photography” is translated as *sa-jin* in Korean, a name given by a group of Chosun dynasty diplomats who visited Beijing in the 1860s and took pictures at one Russian photographer’s studio. Each syllable has a distinct meaning and the two combine to define the term. The first part, *sa* means precise representation, while the second one, *jin* means essence or true quality of an object. The meaning of *sa-jin* thus differs from that of the English term “photography,” which emphasizes the exact reproduction of the surface of the object being photographed. Instead, the word *sa-jin* underscores the understanding of Korean people on photography, through which, they believe, not only the outer surface, but also the inner quality of an object can be transmitted.

Modern photography was introduced in Korea during the 1880s, 40 years after its invention by Daguerre. This delay was a result of the foreign policy of the Chosun dynasty, which banned all forms of contact with Western culture before 1876. During the 1880s, some people including Kim Yong-won, Ji Un-young, and Hwang Chol learned the technique of photography and opened their studios in Korea. However, even with their activities, photography was far from being accepted by the general public due to expensive equipment and the shamanic taboo circulated in the society.

The Act of Hair-Cut (*danbal-lyong*) executed in 1895 played a key role in the distribution of photography among the public. Faced with the mandate of cutting their long hair, the symbol of filial piety, Korean literati and other Koreans wanted to leave the visual record of their long-haired appearance.

Photography provided an easy and detailed medium, which satisfied their demand, and from this period onward, commercial photography has been a successful venture in Korea. Competition among photography studios contributed to the development of photographic techniques and lowered the price of pictures. Furthermore, some even wanted to learn the practice of photography as a leisure activity. In order to meet the demand, the YMCA opened a course for amateur photographers, while a few private institutions offered short-term night classes.

After Korea was colonized by Japan in 1910, the photography industry in Korea was mostly dominated by Japanese photographers. With the help of improved techniques and equipment along with the support from the Japanese Government General in Korea, Japanese photographers had a virtual monopoly on photography production. In response to this situation, a group of Korean photographers organized Kyong-sung (currently Seoul) Photographers’ Association in 1926. Instead of maintaining the traditional focus on studio portraiture, they expanded their field of subjects with various techniques and new materials.

Amateur photographers began to appear in significant numbers during the 1930s; the introduction of the portable, inexpensive, and less complicated camera equipment then available attracting a wider public to the medium. By 1937, there were 70 amateur photography clubs with up to 1,000 members in Korea. However, their activities were soon the target of suppression from the Japanese government. During the Second World War, on the

grounds of national security, the Japanese government restricted the activities of Korean photographers. They were not allowed to take pictures from buildings higher than 50 meters, and film could not be purchased without official permission.

When Korea regained its autonomy at the end of World War II in 1945, photographers in Korea organized groups and conducted various activities. In 1945, a group of amateur photographers founded Chosun Photo Art Study Group (Choson Sajin Yesul Yonguhui). Their members arranged the first salon exhibition of art photography, which was the first nationwide photography competition in Korea. During this period, the public was primarily interested in photography as 'art,' yet the term 'art photography' was not clearly defined. Instead, the tendency was to refer to photography by amateurs as art photography.

During the Korean War in the early 1950s, many war correspondents, both foreign and Korean, actively recorded the vivid situation of the war, which ultimately introduced the concept of 'realism' to Korean photography. Also beginning from the early 1950s, photographers began to participate in international photography competitions. Although few were successful in these during the 1950s, by the late 1960s, photographic works submitted for international competitions by Korean photographers earned more than 4,000 awards in about 50 competitions. Due to their participation at these international competitions, Korean photographers had ample chances of contact with the latest Western photographic trends. In the meantime, photography became available to a wider public. For example, *The Family of Man* exhibition organized by the Museum of Modern Art, New York, when shown at the Kyongbok-gung Museum in Seoul in April 1957, attracted more than 300,000 visitors.

In the 1960s, media photography played an important role during the democratic movement in Korea. During the April 19th Student Uprising, when people protested against the autocracy and corruption of the government, photographers risked their lives to record the brutal forces used by the government to suppress the protests. These pictures were published in various newspapers, which eventually brought

about the fall of the corrupt government. So-called media photography found its function and responsibility during this political upheaval. Along with art photography, journalistic or realistic media photography now constituted one of two major trends of photography in Korea.

Photography began to be adopted in commercial advertising relatively late in Korea, beginning only in the late 1960s. The primary concern of the new government during the 1960s and 1970s was 'modernization.' The economy was changing from a traditional, agriculture-based system to an industrial one. Advertising photography was the outcome of the period when mass-production engaged mass-consumption. In addition, the introduction of color film and auto-focus cameras after the 1960s made photography more accessible to a wider population. Due to the successful economic development after the late 1970s, photography became a popular leisure activity among the general public. The digital revolution came as a boon to amateur Korean photographers in the 1990s, aiding the exchange of ideas and images, and numerous amateur photographers post their works on their personal websites.

Postwar and contemporary Korean photographers who have made reputations both in Korea and outside include Choi Min-shik, who most commonly focuses on human subjects; Lim Young-kyun, who takes landscapes that capture the rhythms of ordinary life; Jeong-Hee Park, also a landscape photographer; Kim Ga-jung, who takes nudes; Kim Woo-young, a nature photographer who photographed the Himalayas; photojournalist Siwoo Lee, known for his photographs of landmine victims; and Jungjin Lee, a female photographer who served as an assistant to Robert Frank during her studies in New York. Suh Jai-Sik published the popular books, *The Beauty of Korea* and *The Beauty of Seoul*, featuring his expansive color photographs. The arrest and subsequent jailing of photojournalist Seok Jae-hyun in China for allegedly taking photographs of North Koreans attempting to escape that country, made international headlines at the close of the century.

JOSEF KOUDELKA

Czechoslovakian

A documentary and landscape photographer, Josef Koudelka first came to international prominence as the anonymous Czech photographer who chronicled the 1968 Soviet invasion of Czechoslovakia. Koudelka, already earning a reputation as a photographer of Gypsies and theatrical life at the time of the Russian military intervention, subsequently became a political exile. As a wanderer who cherishes solitary independence, he has become a specialist in desolate photographs of outcasts like himself. Much of his work depicts vanishing lifestyles and such sore points of contemporary life as environmental destruction.

Koudelka was born in the tiny village of Boskovic, in the province of Moravia in Czechoslovakia in 1938. Introduced to photography as a teenager by a friend of his father's, Koudelka began photographing his family and surroundings with a 6 × 6-inch Bakelite (plastic) camera. In 1961, he earned a degree in aeronautical engineering from Technical University in Prague and also acquired an old Rolleiflex. Koudelka then embarked on a career as an engineer in Prague and Bratislava at the same time that he began developing his photographic career.

Koudelka credits the Czech photographer and critic Jiri Jeníček with encouraging him to put together his first exhibition, in 1961. At this show, Koudelka encountered Czech photography critic and curator Anna Fárová, who became a friend and collaborator. While completing his military service in Bratislava, Koudelka met the Roma poet Desider Banga and began photographing the Roma people using one of the first wide angle lenses that came to Czechoslovakia. This East German lens with a focal length of 25 mm enabled Koudelka

to work in small spaces and achieve a full depth of field even with bad light. In the 1960s, the Roma were undergoing forced attempts to assimilate them within the Czech state. Although Koudelka found taking these photographs to be difficult, he found inspiration in the music played in their settlements and in the support of the Roma themselves.

By chance, Koudelka also became involved with Czech theater. He began to take freelance photographs of performances for the magazine *Divadlo (Theater)* in 1961. The first performance that he photographed was Bertold Brecht's *Mother Courage* and he continued to work for *Divadlo* until leaving Czechoslovakia. He later explained why he stopped doing theatrical work:

By [photographing theater] the same way I photograph real life, I learned to see the world as theater. To photograph the theater of the world interests me more....With the gypsies, it was theater, too. The difference was that the play had not been written and there was no director—there were only actors....It was the theater of life.... All I had to know was how to react.

(Koudelka 2002, 122)

In 1968, Alexander Dubcek, the new leader of Czechoslovakia, initiated a reform program to create "Communism with a human face." The resulting freedom of speech and press, freedom to travel abroad, and relaxation of secret police activities led to a period of euphoria known as the Prague Spring. Encouraged by Dubcek's actions, many Czechs called for far-reaching reforms including neutrality and withdrawal from the Soviet bloc. To forestall the spread of reforms, the Soviet army invaded Czechoslovakia in August 1968. Koudelka recorded this invasion. His pictures were smuggled out of the country with the help of Fárová and

published with the initials P.P. (Prague photographer) to spare his family any possible reprisal. The highly dramatic pictures showing Russian tanks rolling into Prague and the Czech resistance became international symbols and won “anonymous Czech photographer” the Overseas Press Club’s prestigious Robert Capa Gold Medal. The photographs would not be published under Koudelka’s name until 1984, following his father’s death.

Koudelka left Czechoslovakia on a three-month exit visa in 1970 to photograph gypsies in the West. He did not return after the expiration of the visa and became stateless. England granted him political asylum that same year. Introduced to the photographer’s cooperative Magnum Photos by Elliot Erwitt, Koudelka became an associate in 1971 and a full member in 1974. Despite numerous offers of work, Koudelka refused most assignments. In constant movement, he preferred to wander around Europe in search of pictures of a world that he felt was rapidly disappearing.

In 1986, Koudelka began working with a Linhof panoramic camera. The wide format for portraying the city and countryside had long interested him. Even his early work includes attempts to achieve a panoramic view, with either horizontal or vertical cropping from originally square negatives. Koudelka used panorama to photograph the changes wrought by the construction of the Channel Tunnel in France in 1988, the fall of the Berlin Wall in 1988–1991, and the war in Beirut, Lebanon in 1991.

This new camera also enabled Koudelka to make a series of apocalyptic photographs about the catastrophic state of the countryside. After becoming a French citizen in 1987, he was able to go back to the current Czech Republic for the first time in 1990. The visit led to *Black Triangle*, a study of his native country’s landscape wasted by industrialization and environmental catastrophes. Monumental, painterly compositions of superbly balanced and expressively provocative panoramic shots show how oversized technological instruments have transformed the land into a ravaged and unkempt stage devoid of human presence.

Koudelka has been the recipient of major awards such as a grant from the British Arts Council to document the disappearing Roma life in England (1976). He also received an official invitation from the French Ministry to document urban and rural landscapes in France (1986). The grants sustained him through long-term projects in black and white that led to the publication of several books including *Gypsies* (1978) and *Exiles* (1988), which was shot at the edges of Europe in Ireland, Spain, Por-

tugal, and Greece. His most recent publication is *Lime Stone* (2001), which continues Koudelka’s emphasis on landscapes devastated by people.

MAX KOZLOFF

American

Critic, photographer, curator, Max Kozloff is a leading figure in the field of photography and photographic criticism. Born in Chicago, Illinois on June 21, 1933, Max Kozloff began his training as an art historian. In 1953, he attended the University of Chicago, where he received his Bachelor of Arts degree and then his Master of Arts degree in Art History in 1958. Kozloff also studied at the Institute of Fine Arts of New York University from 1960–1964. In 1967, he married the artist Joyce Kozloff. They have a son, Nikolas. Kozloff was an art critic for *The Nation* from 1961–1969, the New York editor of *Art International* from 1961–1964, and served as Executive Editor of *Artforum* from 1974–1976. In 1976, as both a personal and political choice, Kozloff expanded his interest from the field of art criticism to writing on and practicing photography.

Kozloff's work as a critic has gone well beyond the medium of photography and is influential on artists, art historians, and the art world. He has written critically on a diverse range of artists including photographers Peter Hujar, Duane Michaels, and Weegee and the nineteenth century painter Jean-Baptiste-Siméon Chardin and contemporary painter Jasper Johns. His many collections of essays focus on photography, museums, and modern art,

and include *Lone Visions*, *Crowded Frames*, *Cultivated Impasses*, *Social Graces*, *The Privileged Eye*, *Renderings: Critical Essays on a Century of Modern Art*, and *Photography and Fascination*. Besides street photography and Jewish photographers, his area of expertise in writing about photography includes portraiture and photojournalism.

Kozloff taught at the California Institute of Arts, Valencia, from 1970–1971 and at Yale University in 1974 as well as the School for the Visual Arts, New York. It is his career as a lecturer, however, that has allowed his ideas to be widely disseminated; his 2000 lecture series at The School of Visual Arts in New York was on his book of collected writings, *Cultivated Impasses: the Waning of the Avant-Garde, 1960–1980*, which examines the complex debates that animated the art world of the 1960s and 1970s. In this volume, Kozloff re-examines the traditions of twentieth century modernism from the viewpoint as a 1970s art critic covering every type of art from the period, from conceptual art to body art to multi-media installations.

While focusing on avant-garde movements in much of his writing, as a photographer Kozloff has commented that he sees himself working in the tradition of Eugène Atget, his subject matter often store windows and the streets. Kozloff has written on “fortuitous encounters” as the premise of street

photographer, and in a 2000 interview with Vicki Goldberg, Kozloff remarked on his evolution:

What's guided me all along has been the hope of achieving a kind of intelligible obscurity. I first noticed it when I started photographing store windows, around 1976. These windows are particularly compromised surfaces, since they simultaneously let us see into their contents while interrupting them with reflections, at some illusory remove of the world around us. The model was Atget. There was something innately pictorial about this experience, which evaporated in the round, and left only my flat transcription of it. The spectacle provided by store windows was, in pictorial terms, of double exposure, of disintegration, of seeing and not seeing. Confusing and frustrating as this situation was, it taught me about the larger equivocations of the visible world. The photograph became a kind of dream.

While a regular exhibitor on the New York scene, Kozloff's 1998 joint exhibition with his wife Joyce Kozloff, *Crossed Purposes*, at the List Gallery, Swarthmore College, Pennsylvania, toured the United States. Featuring Joyce Kozloff's map paintings alongside a survey of Max Kozloff's color street photography, *Crossed Purposes* focused on Kozloff's celebration of the rich diversity of urban life, especially festivals and street fairs. Much of Kozloff's work centers on the notion, in his words, of "chance intimacies," and these photographs capture not only the aesthetics of the setting, but also demonstrate Kozloff's intellectual and emotional commitment to social change and activism. At the same time, his photographs often have a tender poignancy, provoking discussion about evidence, perception, and subjectivity in photography.

Additionally, Kozloff has curated many critically praised exhibitions, including the 2002 *New York: Capital of Photography* at The Jewish Museum, which examined how street photographers have come to define urban perception as the characteristic visual experience of modernity. Corresponding with his own interests in street photography, this exhibition presented a survey of over 100 images of the genre spanning the twentieth century. As well, the exhibition sought to examine the photographer's response to the city in the context of a Jewish sensibility, beginning with the work of Alfred Stieglitz and his circle up to works by contemporary photographers. Kozloff's most recent book, also examining work, *New Yorkers: As Seen by Magnum Photographers*, was published by Powerhouse Books in 2003.

In a 1997 reflection, Kozloff concisely encapsulates his view on photography and criticism and the

ways in which they interact and crossover, both in his own work and in life:

An educated eye, a sociopolitical critique, a self-affirming consciousness: these are strong assets of any criticism. Only let them be combined with and worked through each other, so that they may be mutually informed yet moderate by their competing interests. Let them reach toward, rather than shun the photographic image. Let it be realized that the pictures themselves may have an unexpected impact, but won't bite. The age of the image needs a reaffirmation of photographic criticism as a separate field concerned with filtrates of memory, rich in portents of art, yet based in the material witness of life.

Kozloff is the recipient of many awards, including a Pulitzer Award for Criticism and a Fulbright Fellowship in 1962; the Frank Jewett Mather Prize for Art Criticism and the Ingram-Merrill Foundation Award in 1965; a Guggenheim Fellowship in 1969 and the NEA Fellowship for Art Criticism in 1972. In 1984, Kozloff received a national Endowment for the Arts Criticism Fellowship. In 1990, he was awarded the International Center of Photography's Writing Award. Kozloff continues to practice photography and criticism in New York today.

ROSALIND KRAUSS

American

Rosalind Krauss is a leading contemporary art historian and critic of the late twentieth century. She is Meyer Shapiro Professor of Modern Art and Theory at Columbia University, with which she has been associated since 1992. She received her Bachelor of Art's degree from Wellesley College in 1962. She developed her knowledge of modern painting and sculpture with the aid of the influential art historians Clement Greenberg and Michael Fried and began writing criticism in the 1960s. She received her Ph.D. from Harvard University in 1969 with a dissertation on the sculptures of David Smith. She explains in the preface of her first book, *Terminal Iron Works: the Sculpture of David Smith* (MIT Press, 1971): "It was during this period of intense study of modernist works of art that my own conviction about the quality of American sculpture was strengthened."

Even though her critical work was originally firmly anchored in American art, her interests and her approach found an attentive audience in France. Formed in the tradition of American formalism and convinced that the history of modern art could not be pursued apart from its criticism, Rosalind Krauss joined the editorial board of *Artforum* magazine in the 1960s. She distanced herself from the heritage of American formalism without ever

renouncing it and left *Artforum* to start *October* magazine in 1976. This journal quickly became an important tool for a transatlantic critical dialogue.

Initially specialized in the history and criticism of the plastic arts, Rosalind Krauss became more and more interested in photography. As she herself has explained, this interest follows the logical direction taken by modern art itself in its ever-expanding use of the real as material instead of simply subject matter. Her questioning of the photographic concept comes from the development of her personal critical experience about art. As she often does in her critical approach, she starts a dialogue between seemingly heterogeneous concepts, like photography and impressionist painting, and reconceptualizes a whole field making one the condition of the other. There would not have been, in this case, an impressionist movement without the capability of thinking in photographic terms: "photography teaches the distance between perception and reality." Even though she applies photographic concepts to the intellection of the development of modern art, Rosalind Krauss suggests that photography and the history of photography should not be approached through the discourse of art history as photography belongs to the sphere of the archives and not the sphere of the museum. She settles, for example, the questions about the unity of the body of work of Eugène Atget by seeing it as an archival

collection rather than an "oeuvre." This way, she eliminates the need for spurious artistic justifications for the many repetitions of a same subject in different photographs. As an archival practice, photography is automatically justified in its cataloging of a subject matter through time.

The growing importance of photography in the critical evaluation of her field is self evident in her fourth book, *The Originality of the Avant-Garde and Other Modernist Myths* (1985). In 1990, the Macula Editions in Paris compiled twelve previously published articles with a new introduction under the title, *Le Photographique, pour une théorie des écarts*.

In the line of Roland Barthes and Walter Benjamin, Krauss establishes photography, or more precisely, the photographic, as a theoretical tool with which she can re-examine a variety of artistic productions. She poses as essential for the re-evaluation of our apprehension of art objects the indexical quality of photography. As a sign which has a relationship with its referent based on a physical association, photography functions in the same mode as impressions, symptoms, traces, or clues. As such, photography differs completely from other modes of reproduction that could be qualified as iconic, where resemblance establishes the relationship with the referent. This semiological specificity of photography is used by Krauss as a theoretical tool to look at other works of art in the way they function as signs. She interprets the importance that the work of Marcel Duchamp took in the 1960s as the exemplary modernist practice through the recognition of a pivotal point in the conception of painting and sculpture. The work of Duchamp develops pictorial and sculptural practices that function as indexes rather than icons, providing a new interpretation of what constitutes an aesthetic image. It is precisely this substitution of modes, the indexical for the iconic, in the work of Duchamp that led Rosalind Krauss to talk about photography and to understand through photography how Duchamp influenced the American artists of her generation.

Besides her work as a critic and theoretician, Rosalind Krauss has curated exhibitions, many of them on contemporary sculpture. In the area of photography, she originated the exhibition *L'Amour Fou: Surrealism and Photography*, at the Corcoran Art Gallery,

Washington, DC, in 1985. She authored a book on Cindy Sherman in 1994, and her 2000 book *Bachelors* examines female artists including photographers Claude Cahun, Sherman, and Francesca Woodman.

BARBARA KRUGER

American

Barbara Kruger's 1993 reflection—"I had to figure out how to bring the world into my work"—succinctly captures the socially engaged language and ethical-political dimensions that have characterized her art works from their beginnings in the early 1970s. She also alludes to the fact that her works commonly appear in sites other than art galleries and museums and thus is able to reach a broader audience: billboards and other public placements, newspaper pages, magazine and book covers, t-shirts, and matchbooks, among them. Her emergence coincided with that of other artists influenced by post-structuralist theory and semiotics, as well as the contemporary art movements Conceptualism and Feminism. Her peer group included Dara Birnbaum, Mary Kelly, Cindy Sherman, and Victor Burgin. These artists shared a common interest in photography from popular culture and media; others of this generation like Kruger, became known for their practice of "appropriation" or scavenging of pre-existing images, including Richard Prince, Sherrie Levine, and Ross Bleckner. These engagements, or interrogations of photography, challenged prevailing fine art and documentary photography traditions. These artists' works critically engaged how forms of power were related to visual images, and how media culture was exerting increased social and public influence. Kruger's overriding theme is to play with contemporary stereotypes and clichés, using the iconic power of selected images as a point of departure.

Kruger's experience as a graphic designer was critical to her artistic development both in the forms her work takes and her desire to address the popular audience. Kruger was born in Newark, New Jersey, in 1945. After graduating from Weequahic High School, she attended Syracuse University, New York, majoring in art, from 1964–1965; and then went on to Parsons School of Design, New York, from 1965–1966, where she studied photography with Diane Arbus, and the graphic designer, painter, and former art director of *Harper's Bazaar*, Marvin Israel. In 1966, Kruger began working as a designer at *Mademoiselle* magazine, where she became senior designer until 1970; she continued

for many years to be a freelance picture editor with *House and Garden* and *Aperture*.

Kruger's earliest works were fiber-based hangings with mixed media such as paint, glitter, and ribbons. These pieces were exhibited in New York at the Whitney Museum of American Art 1973 Biennial, and at Artists Space in 1974. In 1979, Kruger began using photography, and self-published *Picture/Readings*, which along with other series, *Hospital*, *Public Sector/Private Space*, and *Remainders*. These works took the form of photo/texts; initially she took her own black-and-white and color photos and authored her own, sometimes extensive, texts. The rephotographing of found images collaged with concise texts began in 1978 with *Untitled (Business)*, and subsequent *Untitled (Perfect)*, 1980, and *Untitled (Deluded)*, 1980, which initiated the pared down plays and contrasts between word and image that are so distinctive to her work. With *Untitled (Your comfort is my silence)*, 1981, and *Untitled (Your gaze hits the side of my face)*, 1981, Kruger began framing her works in vibrant red lacquer, as well as employing Futura bold italic fonts, in texts that had a directness of address that have become her signature style. Her participation in Documenta VII, Kassel, Germany, and the Venice Biennial, both in 1982, and the 1983 Whitney Biennial, coincided with her entry into the commercial gallery system, with Larry Gagosian Gallery in Los Angeles in 1982, Annina Nosei Gallery in New York from 1983–1986, and then as the first woman artist with the Mary Boone Gallery beginning in 1986.

During this period she was active in placing works on billboards and buses, and realized public projects in Providence, Rhode Island; Minneapolis, Minnesota; and Atlanta, Georgia. In the late 1980s, she mounted billboard projects in Australia, and was active with the group Art Against Aids and lent her talents to other public health issues. In addition, Kruger has, since the 1970s, been active as a teacher, curator, and writer/critic. She began writing her column on television and popular culture, "Remote Control," as well as other commentaries and reviews for *Artforum* in 1979; *Remote Control* was assembled as a book in 1993. The multiple sites of exhibition and formats of display for her art works, her various contributions as a

designer, critic, editor, and curator, combined with her feminist and other social engagements, led critic David Deitcher to describe her as a “cross-over artist,” whose varied artistic and social commitments made it impossible to separate these usually separate realms of activity and knowledge.

The photographic images which Kruger crops and overlays with type are selected from as wide a variety of sources as photography itself encompasses, including commercial photographs from manuals, photo magazines, and archives. Critic Carol Squiers has described Kruger’s choice of images as being “peripheral images, the workhorse photographs of advertising and magazine illustration.” The directness of address in Kruger’s texts invites the viewer to reflect on the process of how images produce meaning. For example, in *Untitled (Buy me I’ll change your life)*, 1984, and *Untitled (I shop therefore I am)*, 1987, Kruger employs the language of consumer culture, and highlights the blatant ways that advertising functions as an interface between consumer and commodity. Squiers also underlines how Kruger’s work complicates the boundaries between commercial, editorial, and artistic photographs:

She manipulates, modulates, and recodes the address of obscure and sometimes hilarious images, playing received wisdom, treacly clichés, and militant critique against visuals whose original function is often puzzling at best.

In the 1990s, Kruger began incorporating video and sculpture into her work, and has explored the genre of installation. However, her signature strategy of found images combined with terse text continues to be Kruger’s primary way of working. Seventy-one works spanning 1978 to 1999, as well as documentation of Kruger’s public projects and billboards, were included in her 1999 retrospective at the Museum of Contemporary Art, Los Angeles, which constitutes her most comprehensive exhibition and catalogue to date. The startling simplicity of Kruger’s photo montages is testimony to the powerful capacity of images to draw on deep and already circulating social meanings. Combined with concise and deliberate texts, Kruger’s photo-based works self-reflect on the powerful role of the image in popular culture and society.

GERMAINE KRULL

Dutch, born in Germany

Although she had a long career and worked in numerous genres, it was Germaine Krull's experimental photography from the 1930s that secured her reputation. Krull is counted among the most influential photographers of the classical avant-garde. Her choice of subjects was uncompromising, and her style of representation was completely new for the time—a style both independent and

schooled. Krull's contacts in Germany, Holland, and France made her a key figure in the artistic exchange between some of the most active centers of artistic renewal, and her closeness to artists and intellectuals such as Walter Benjamin, Jean Cocteau, Florent Fels, and André Malraux also contributed to her success and fame. With the recommendation of her friend, the artist Robert Delaunay, she was the only female photographer represented at the 1926 Salon d'Automne in Paris, a

show that substantially influenced modern photography in France. Its impact can be seen in the works of Ilse Bing, Pierre Boucher, Brassai, Henri Cartier-Bresson, René Jacques, Pierre Jahan, François Kollar, Roger Parry, Roger Schall, Maurice Tabard, and René Zuber. Krull is no less important than Alexandr Rodchenko from the USSR or Albert Renger-Patzsch from Germany.

Born in 1897, Germaine Krull came to know much of Europe because her parents moved the family so many times during her childhood. Her independent-minded father schooled her at home until her parents divorced in 1912. In 1915, she applied to enter university but was unsuccessful because she lacked a high school diploma. She then applied to a school of commercial photography in Munich that was still heavily influenced by German-American Pictorialist Frank Eugene, who had taught there until 1913. After completing her studies, she worked as a portrait photographer from her own studio. In her nudes and in photographs that she published in 1918 along with photographs by Josef Pécsi and Wanda von Debschitz-Kunowski, she followed pictorial conventions.

In the intellectual circles of Munich, Krull had close contact with liberal and left-wing thinkers. By 1919, she had become attracted to revolutionary communism in the Soviet Republic, and in 1921, she participated in the Third World Congress of the Communist International in Moscow, though she did not photograph any of the political events. In 1923, she opened a studio in Berlin with Kurt Hübschmann (alias Kurt Hutton), who matched her photographic ambitions and met her demanding standards. The two created a number of nude series over the next few years. In a sequence of lascivious photographs of nude couples from 1924 titled "Les Amies," Krull tended toward an unencumbered improvisation (although the subjects were posed) that created a distance from Pictorialism that distinguishes her later work. At this time she also began shooting street photography, though few of these photographs made their way into the press.

In 1923, she met the Dutch filmmaker Joris Ivens. In 1925, she moved with him to Amsterdam, and there she came into contact with the Dutch avant-garde movement that arose around the journal *i 10*. Together with Ivens, who at the time was very much under the influence of Soviet filmmaker Sergei Eisenstein, Krull tried stylistic innovations in film and photography. In 1925, this resulted in urban landscape portraits of Antwerp, Rotterdam, and Amsterdam from both a bird's-eye and a worm's-eye view. Her photographs of the docks were pioneering and one of the high points of her work.

Krull found one of her most important subjects in industrial complexes, where she photographed smokestacks, cranes, ship masts, and iron bridges. The industrial structures in these photographs often melt into confusing geometric patterns. Her photography never indulged in compositional finesse; on the contrary, her photographs seem to capture the momentary and the careless. Krull emphasizes falling lines and creates confusion by foreshortening perspective, layering the depth of certain image surfaces, focusing on obscuring details, and altering the horizon line. She captures the speed of the perpetually moving eye, similar to the way László Moholy-Nagy did at the time, but without his tendency toward constructivist abstraction. She was not interested in his theories about photography, but, like him, she sought to capture the new theme of the city in a subjective form of perception.

In 1928, she published her masterpiece, *Métal*. It contains photographs taken after 1923 of machines and industrial structures from various locations. In 1926, Krull moved to Paris, where she quickly made contact with progressive artists, most notably Eli Lotar in 1927, for whom she left Ivens. Critical to her increasing fame was Robert Delaunay, who exhibited her work along with his own at the Salon d'Automne in 1927. If Krull's description corresponds to actual facts (something not yet confirmed), then this was the very first avant-garde photography exhibit in France. A photo series of the Eiffel Tower that she made in 1927 was enormously successful; the images reappeared years later in illustrated books and photography anthologies. They were also integrated into *Métal*.

This paean of a book foregrounds the details of machinery to the point where their function as technology is unrecognizable, with double exposures obscuring them even further; she makes them appear like animated creatures. Krull's photographs are more expressive and more disturbing, and at the same time more casual, than what the *Neue Sachlichkeit* or "New Objectivity" of the time had to offer. Similar garish effects were prominent in Krull's works from her time in Amsterdam and Paris. Her aim was an alienation effect that was half expressionistic, half surreal, and played with light and shadow to have an impact of the fantastic on the objects photographed. In visualizing the world of machines, she put into play these effects, and out of the denaturalized world of industrial wonders there arose images filled with pathos. When she took photographs of everyday subjects, the same effects gave the objects a poetic meta-existence. Around 1930, with the same style, she photographed Parisian boulevards, arcades, and market

halls. A number of these photographs recall the work of Eugène Atget, something noted by Walter Benjamin (see his famous “Kleine Geschichte der Photographie” from 1931).

At this time Krull also worked as a successful commercial photographer. After 1926, she ran her own studio, and it supplied German magazines with dramatically illuminated fashion photography. She worked as a journalist for French newspapers, doing this without losing her interest in experimental photography, especially collages, multiple exposures, and photo montages. The portraits from her time in Paris have a vividness that results from her use of deep shadows. After 1929, street photography grew in reputation, and she toned down her style. A nude photo from 1930 emphasizes a simplicity that was more reminiscent of Edward Weston and Imogen Cunningham than of the art photography of Paris. During the 1930s, she made photo illustrations for crime novels and travel books in addition to planning a photographic novel.

After 1928, Krull’s works were shown at the famous Salon de l’Escalier, where modern photography first made its breakthrough in France, and at all the important photo exhibits in the following years. One of the introductory volumes in a series about contemporary photography was dedicated to her work, and in 1931, Edward Burra wrote to a female friend that he did photography “by the Germaine Krull method” (Mellor 1978, 123–125). She already had an international reputation as a pioneer of modern photography, but war and emigration hurt her leadership role. Her ability to change styles, her aversion to theoretical reflection, and her part-time occupation with commercial photography may have contributed to her being forgotten for so long.

In any case, Germaine Krull soon gave up photography. During World War II, she was certified by the Allies as a war correspondent and she photographed in Italy, Germany, and France, publishing works in *Libération*, and *Rafale*. She also photographed as a war correspondent in Indochina, and moved to Bangkok after the war, where she opened a hotel. Living and traveling in the East from 1947 to the early 1960s, she continued to make photographs but without any special stylistic character. Her later photography from Asia goes through the same evolution as photography in both Western Europe and the United States. It shows a turn away from formalism and toward the “humanist” values of mirroring the outside world. In the early 1960s, André Malraux commissioned her to document the art memorials of Thailand and Indochina.

Late in life, before returning to Germany in 1983, she lived in northern India among Tibetan refugees, including the Dalai Lama, with whom she became close. However, she never again entered the popular consciousness with her photography. It was at Documenta 6 in Kassel, Germany, that her prewar avant-garde works were rediscovered, but a retrospective of semiabstract photographs that appeared the same year in Bonn did not have the intensity of her earlier works.

Biography

Born to German parents in Wilda-Poznań, Poland, November 29, 1897. Childhood in East Prussia, Italy, France, Switzerland, and Austria. Moved to Bavaria, Germany, 1912. Studied at Bayerische Staatslehranstalt für Lichtbildwesen (the Instructional and Research Institute for Photography) in Munich, 1915. Completed exams for Master’s of Photography, 1917. Opened studio in Munich, ca. 1918. In the same year her first photography publication. Traveled to Berlin, Hungary, and the USSR and was arrested numerous times for her political activities for Communist groups, 1919–1922. Opened a studio in Berlin, 1923. Contact with the Dutch avant-garde, travel, and residence in Amsterdam, 1924–1925. Moved to Paris, 1926. Worked for magazines and participated in several international photo exhibits. Moved to Monte Carlo and opened a studio, 1935. Travel to Brazil, 1941. Until 1944 organized for the French liberation the photo agency of the Services d’Information de la France Combattante (Radio Brazzaville). Moved to Algeria to the Office Française d’Information Cinématographique. Participated in the invasion of southern Italy started at Naples. Continued work as a war correspondent in Ceylon, 1944. Settled in Bangkok, 1946. Became part owner and manager of the Hotel Oriental, 1947. After a short stay in Paris, moved to India, 1967. Returned to Germany, 1983. Died in Wetzlar, Germany, July 31, 1985.

Individual Exhibitions

- 1943 Centre de l’Information de la France Combattante, Algiers, Algeria
- 1967 *Germaine Krull, 1927–1967*, Musée du Cinéma, Paris, France

DOROTHEA LANGE

American

One of the twentieth century's best-known photographers, Dorothea Lange was devoted to illustrating the human condition, creating one of the most widely-reproduced and studied images in photography, *Migrant Mother* of 1936. Although best-known for her work with the Depression-era Farm Security Administration, Lange's passion for her photography and her subject matter lasted throughout her career.

Born Dorothea Nutzhorn in 1895 in Hoboken, New Jersey (she later took her mother's maiden name), young Dorothea knew she wanted to be a photographer. At age seven she contracted polio, leaving her with a lifelong limp, which she felt marked her life—enabling her to understand what it was like to be an outsider. During her teenage years, Lange attended a public school in New York City and spent much of her time observing the everyday life around her. After high school, while studying to be a teacher, Lange announced that she wanted to become a photographer and embarked on a self-apprenticeship.

She eventually worked as an assistant in several portrait studios, notably that of Arnold Genthe, and befriended many photographers who helped her to learn the technical aspects of photography. In 1917, she studied with Clarence White, the well

known Photo-Secessionist, at Columbia University. A year later, after travels and with few resources, Lange found herself in San Francisco. Here she met artist Roi Partridge and his wife, photographer Imogen Cunningham, who would remain lifelong friends (and whose son Rondal Partridge would later become her apprentice). Shortly thereafter she opened a portrait studio (1919) and was soon established as a prominent portrait photographer, her aesthetic sense having been influenced both by Genthe and White. Lange married painter Maynard Dixon in 1920 (whom she would divorce in 1935).

Lange remained a portraitist for the first 15 years of her career; her clients were mainly from the industrial and commercial worlds. Her pictures were often done with a soft focus and were frequently side profiles or taken at untraditional angles with natural lighting such as in *Harry St John Dixon, 1922* or *Dorothy Wetmore Gerrity, 1920*.

Although she was a sought after portraitist, Lange changed her photographic subjects after the stock market crash in 1929 and the ensuing Great Depression. Lange was compelled by the social crisis to document what was going on, and she took to the streets to photograph the people around her and their reactions to the economic decline. This change of direction was significant and she, from this point on, dedicated herself to photographing the trou-

bling conditions of the dispossessed. One of Lange's first images of this unrest is a photograph of a breadline near her studio, which became one of her most famous images, *White Angel Breadline*, 1933. The unshaven man with his hands clenched in front of him, leaning against a wooden railing, his back to the crowd waiting for his ration of food, creates an overwhelming sense of isolation, a feeling that will be omnipresent in Lange's images to come. Lange's images begin to shift from her portraiture technique, in which the individual is taken out of their context, to a style that focuses on the relationship between the subject and their environment such as *Dust Bowl Refugees Arrive in California*, 1936.

Lange continued to photograph the social turmoil of the Great Depression in the streets near her portrait studio while she received her first exhibition in 1934 at Willard Van Dyke's Brockhurst Gallery in Oakland, California. Lange had made portraits of Van Dyke and his colleagues Ansel Adams and Edward Weston all of whom were associated with the Group f/64, a group of West Coast photographers. Although Lange did not join the group, she was in contact with several members.

At this first showing of her work, Lange's photographs were noticed by Paul Schuster Taylor, an economics professor at Berkeley. He asked her to take photographs for his articles dealing with social research and reform. Lange and Taylor collaborated and together began their mission to publicize the plight of thousands of Americans for the California Emergency Relief Administration. Their initial work resulted in field reports made up of Taylor's interviews with workers, Lange's photo essays and Taylor's analysis depicting the frightening reality of the migrant agricultural workers in California. Taylor's sociological approach to their subjects would have an important influence on Lange's developing style of photography as well as the thinking of Roy Stryker at the FSA.

After photographing the conditions of migrant workers in the Imperial Valley, Lange wrote to Stryker,

...what goes on in the Imperial is beyond belief. The Imperial Valley has a social structure all its own and partly because of its isolation in the state those in control get away with it. But this year's freeze practically wiped out the crop and what it didn't kill is delayed—in the meanwhile, because of the warm, no rain climate and possibilities for work the region is swamped with homeless moving families.

Taylor and Lange were married in 1935 and continued their professional partnership until Lange's death in 1965.

In 1935, Lange was hired by Roy Stryker of the Resettlement Administration's Photographic Division, which would become the Farm Securities Administration (FSA) in 1937. Part of Roosevelt's New Deal, this governmental operation developed programs intended to help impoverished farmers. The FSA hired photographers to document rural America and Lange, along with Walker Evans, Ben Shahn, Carl Mydans, Russell Lee, and others, became part of this project to show America at work and document the deteriorating social situation. Today, these photographs hold an important place in the history of documentary photography representing a pervasive public state of misery. The FSA images carry on a documentary tradition begun by Jacob Riis and Lewis Hine around the turn of the twentieth century, but add a new dimension to documentary photography in the intimacy of the portraits, which is most notable in the work of Lange.

Lange threw herself into her work with the FSA, as she did with all her endeavors, and began traveling and surveying the countryside to document rural poverty. Lange also became a social observer of the migrating farmer population. She interviewed her subjects and took extensive notes, as Taylor had done on their projects together, creating a context for her images. Lange continued to work for the FSA on and off until 1940, despite her sometimes difficult relationship with Stryker and the budgetary problems within the administration. Conflict with Stryker was frequently linked to the fact that she did not have any control over her images once the negatives were sent to Washington.

Many of the images from Lange's FSA period have become icons of the Great Depression and the state of despair of the American people at the time. Her compassionate portraits of poverty stricken people such as *Migrant Worker in San Joaquin Valley, California*, 1936, *Migrant Workers in Rural California*, 1938, and *Migrant Cotton Picker, Eloy, Arizona 1940* convey the desolation of rural America. Her intimate and powerful portraits of women alone or with children have become symbols in American pictorial history: *Mother and Child, Yakima Valley, Washington*, 1939, *Woman in High Plains, Texas Panhandle*, 1938, *Mother and Children on the Road, Tulelake, Siskiyou County, California*, 1939 and of course, the most famous *Migrant Mother*, 1936. Lange's great skill was her ability to engage her subjects; this engagement along with her frequent use of close ups evoke compassion from the viewer.

In her photograph, *Hoe Culture, Alabama*, 1936, Lange focuses on the hands and torso of her subject,

reminiscent of the modernist technique of using a part to represent the whole. In *Heading Towards Los Angeles, California, 1937*, Lange photographs two men walking on a desolate road. Lange shows the injustices of society by framing her image with these men to the left of the picture and a billboard advertisement to the right that shows an image of a man reclined in a chair accompanied by, “Next Time, Try the Train, RELAX, Southern Pacific.” This ironic juxtaposition using figures and text powerfully depicts the misfortune of the people she saw around her.

Lange and Taylor eventually published many of these images in 1939 in a book titled, *An American Exodus: A Record of Human Erosion*. This project was intended by Lange and Taylor to be a document—a photographic and textual representation—conveying the underlying causes of the rural poverty. According to Henry Mayer in *The Making of a Documentary Book*

While public opinion sought causes of this shift in the misfortunes of nature—drought and dust storms—the authors of *An American Exodus* passionately insisted that deeper causes lay in a moral callousness about the social effects of mechanization and in political indifference to the poor and the voiceless.

(p. i)

After working for the FSA, Lange, who believed in the social and political importance of her photographs, began working for the Bureau of Agricultural Economics. Shortly thereafter, in 1941, Lange was the first woman to be awarded a John Simon Guggenheim fellowship.

The following year, Lange worked for the War Relocation Authority, the government agency responsible for forcing 110,000 Japanese Americans into internment camps after the bombing of Pearl Harbor. She and Ansel Adams both took many pictures of the internment camp in Manzanar, California. Lange’s sensitive representations of the people at the camps confirm her conviction against this government program; her powerful images of displaced children such as *Japanese American Children, Hayward, California, 1942* and *Pledge of Allegiance, San Francisco, California, 1942* communicate her disapproval of the project.

Lange later photographed for the Office of War Information and was assigned to report on the minority groups on the West Coast. She again collaborated with Ansel Adams on recording the wartime expansion of the “boom-town” of Richmond, California, as military vessel construction filled their shipyards.

During the postwar period, Lange suffered from health problems that kept her from photographing

on a regular basis for several years. When she was able to work again, she did a photo essay with Adams on the Mormons for *Life* magazine, and *Life* then sent her to Ireland to do a story titled, *Irish Country People*.

In 1953 and 1954, Lange participated actively in the preparation of the *The Family of Man* exhibition, held at the Museum of Modern Art (MoMA) in 1955 and which subsequently traveled extensively around the world. During this time, she advised and exchanged ideas about the exhibition with Edward Steichen, with whom she had a long lasting and close friendship. Ultimately, eight of Lange’s images were included in this seminal exhibition.

At this time Lange also worked on a story for *Life* magazine on the daily life of a public defender in Oakland. Lange focused on the faces, expressions, and gestures of the public defender as well as all those in the courthouse such as in *The Witness, Public Defender, Oakland, California, 1955–1957*. *Life* did not end up publishing the story but it was published by newspaper supplement *This Week* in 1960.

In the 1950s Lange began to take more and more photographs of her own family. She also accompanied Taylor, who had become an economic consultant for rural questions in developing countries, on various assignments. They traveled to Asia, South America, and Egypt where Lange continued to photograph, emphasizing the features and gestures of her subjects. Lange’s close up portraits are direct and honest, a style that dates back to her FSA days, such as the portrait, *Palestinian, 1958*.

In 1962, many of Lange’s FSA images were shown in Steichen’s exhibition at the MoMA, *The Bitter Years*. In 1965, one of her last projects was a book of many of her images of women titled, *The American Country Woman*, a book intended to show the courage and purpose of many of her subjects.

In 1964 and 1965, Lange was involved in selecting works from her entire career, without limiting the photographs to her well known Depression-era images for the retrospective at MoMA, which appeared in 1966. Lange died of cancer on October 11, 1965, weeks after choosing the last images for her retrospective. Her images have been exhibited and published worldwide and her archives, including negatives, prints, books, letters, contact sheets, and notes are held at the Oakland Museum of Art in California.

JACQUES HENRI LARTIGUE

French

In 1963, after almost 60 years of taking photographs daily and pasting the images into albums, Jacques Lartigue publicly exhibited his personal photographs in New York at the Museum of Modern Art (MoMA). At the same time, he changed his name to Jacques Henri Lartigue. A meeting in 1962 with John Szarkowski, the Director of the Department of Photography at the MoMA, meant that Lartigue was to become one of the most well-

known and admired amateur photographers in the later twentieth century. Lartigue was born in Courbevoie into one of France's wealthiest families in 1894. He began photographing at age six using his father's camera, and received his own in 1902. Lartigue recorded the world around him in great detail, both in photographs and in corresponding diaries. The wealth and connections of his family meant that from a young age Lartigue was granted access to some of the most important people and events of the time, and his photographs have become valued

as the representation of the end of France's *belle époque*. Lartigue's photographs, while taken to preserve his memories, now function as documents that record an era rather than simply a life.

Most of Lartigue's early photographs record events and people at his home. Lartigue's first photograph is a fairly typical family portrait that he took on a 13 × 18-cm plate camera in 1902. His aunt, uncle, and cousin stand at the left of the group, and his parents along with his brother Maurice (Zissou) and another child named Marcelle, who holds a kitten, stand at the right of the group. His aunt leans forward to steady his cousin who sits on a tricycle. The photograph was taken outdoors and the windows of the family home are visible behind the people. Although he was to take many photographs of the people close to him, this is one of the few straight portraits that Lartigue took. Many of his pictures of people capture them in less typical poses, often in movement.

Lartigue's father continued to give his son new cameras and by 1904 he was able to take snapshots with his Gaumont Block Notes camera. The faster shutter speed of this camera allowed Lartigue to capture movement. Movement seemed to appear everywhere in the Lartigue household. He photographed his nanny, Dudu, throwing a ball into the air, and Zizi, his cat, leaping into the air for a toy. In another photograph, a family member hurls a cushion out of a second-story window. Siblings, cousins, and even adults appear engaged in playful action. These action photographs are significant, for they demonstrate a young boy's extraordinary ability to anticipate and capture a moment. In one particularly remarkable photograph, *My Cousin Bichonnade, Paris, 1905*, Lartigue captured his cousin running down an outdoor staircase. She makes her hands into fists and raises them to chest level. Her left knee juts forward and both her feet, which have left the ground, are almost hidden by her long skirt. It appears as if Bichonnade is flying. The notation in the album below the photograph reads "Photo taken with Spido-Gaumont 6 × 13" (Lartigue, Album 1905, folio 44 recto, reproduced in Centre Pompidou, *Jacques Henri Lartigue, L'Album d'une vie/A Life's Diary*, n.p.).

Flight was one of Lartigue's obsessions. In 1906 he wrote in his diary: "There's one thing all of us want to do...it's an idea we all dream and talk about...to get up into the air! In my sleep I can fly...I fly all the time. I can't get enough of it. But once awake, I'm a little boy again" (Diary, Rouzat, 1906; quoted in *Diary of a Century*). Lartigue spent much time recording some of the first flights and flight-related experiments in France. There are

photographs of the family constructing his brother's glider, as well as balloon races in the Tuileries gardens, and an image of a small Zissou, dwarfed by the huge "Colonel Renard" dirigible. Lartigue watched and photographed many of the early airplane experiments that were conducted at the Issy-les-Moulineaux airfield. The names of significant figures in the history of French aviation appear in his diary and in the captions below his photographs: Gabriel Voisin, Amérigo, Léon Delagrangé. Not only do these photographs record some of the first airplanes, they are also beautiful compositions that express a young man's fascination with flight at a time when it still seemed unreal. *Mathieu in a Farman, Issy-les-Moulineaux, January 1911* shows a flat, almost empty airfield. At the very top of the frame a plane floats, sideways, its silhouette like an eagle. It hangs there as if by magic. In the lower half of the frame we see a couple walking their baby in a pram, and all three turn their heads to watch a biplane leave the ground. In *Audemars in a Blériot aeroplane, Vichy, September 1912*, a sea of hats tilts upwards to watch a small, primitive-looking plane that swoops in from just above the tops of the trees. By taking the photograph from within the crowd, Lartigue captured the sense of wonder and excitement that must have come with these early flights.

The young Lartigue was also captivated by another invention of the era—the automobile. In addition to the many family photographs depicting his father's cars, or family members dressed in riding outfits, Lartigue also photographed automobile races. As with the photographs of family members playing around his home, Lartigue focused on capturing movement. Here, at the races, the challenge was to capture speed. Lartigue did this remarkably well in his most well-known photograph *Delage Automobile, A.C.F. Grand Prix, Dieppe Circuit, June 26, 1912*. A car races so fast out of the picture frame that its wheels become distorted ovals. The onlookers appear to lean in the other direction, expressing tension between the speed of the car and the immobility of the people. Everything in the image is blurred except the body of the car and its driver and passenger. While many of Lartigue's other images capture the excitement of the races by showing the track, the crowd, and groups of cars, none captures speed so perfectly.

In addition to depicting the inventions of the early twentieth century, Lartigue also photographed the fashion of that period. In a series of photographs taken in 1911 and 1912 on the fashionable, bourgeois streets of Paris—Avenue de Bois de Boulogne and the Avenue des Acacias—Lartigue caught the image of society's *élégantes*. The women are dressed

in remarkably elaborate clothing: a long fur jacket with silk tassels; hats shaped like dirigibles, festooned with feathers; piles of ermine wrapped around shoulders and hands, trailing down over a velvet embroidered and fur-trimmed skirt; lace collars, sleeves, and bodices. While some of the women look at the camera, many turn their heads trying to avoid the camera's gaze. Indeed several of the women appear unaware that Lartigue photographs them. Some are photographed from behind, lending the images a voyeuristic quality. When the women do realize they are being photographed, the expressions on their faces range from suspicion and dismay to coy haughtiness. In 1910, the 16-year-old Lartigue wrote in his diary about taking photographs of Paris's fashionable women:

She: the well-dressed, fashionable, eccentric, elegant, ridiculous, or beautiful woman I'm waiting for. You can spot her from far away, in the midst of all the other people, just as you can immediately spot a golden pheasant when it's surrounded by chickens...My camera makes such a noise that the lady jumps...almost as much as I do. That doesn't matter, except when she is in the company of a big man who is furious and starts to scold me as if I were a naughty child. That really makes me very angry, but I try to smile. The pleasure of having taken another photograph makes up for everything! The gentleman I will forget. The picture I will keep.

(Diary, Paris, 29 May 1911, quoted in *Diary of a Century*)

The hunting references are clear. For Lartigue, photographing was a kind of sport that enabled him to capture a moment or a person and preserve it for himself.

Photographing women was something Lartigue continued to do for the rest of his life. In 1919, he married Madeleine (Bibi) Messager, the daughter of composer and Opéra director André Messager. On their honeymoon, Lartigue made some of his most intimate images. In one photograph, *Honeymoon at the Hôtel des Alpes, Bibi and Me in the Mirror's Reflection, Chamonix, January 1920*, the camera looks through an open door at Bibi sitting in the tub. To the left of the door, Lartigue's image is reflected in a mirror above an armoire. At the right of the frame the couple's clothes hang on a clothes stand and newspapers are scattered across a table. It is a domestic scene that is both happy and poignant, for Lartigue is only present in his reflection. This is a telling photograph of a man who described himself as distant and self-absorbed. Lartigue photographed all three of his wives as well as actresses, friends, models, and lovers.

Despite his passion for photography, Lartigue earned his living as painter. By 1922, he was exhibit-

ing his paintings at the Galerie Georges Petit in Paris, and by the mid-1930s he was well known as an artist. He also worked as a consultant on several films and as an interior decorator. Lartigue's profile in the art world along with his privileged status as a member of a bourgeois family meant that he was able to photograph several famous artists and performers. In the 1920s he made a series of photographs of women, including performers Josephine Baker and Gaby Basset, entitled *Portraits with Cigarettes*. He was friends with the artist Van Dongen and photographed him many times over the years. He photographed Picasso in his studio in 1955. These images, however, are not typical portraits. One photograph of Picasso, for example, shows the artist from behind, dressed only in a pair of shorts, closing the door to his studio in Cannes. It is not a heroic portrait. Two pages from one of Lartigue's albums from 1955 show the hands of both Picasso and of Jean Cocteau. Picasso wears the same shorts as in the picture of his studio, but here we see only the top of his leg, the bottom of his shorts and one hand resting prone against his leg. By contrast, the photograph of Cocteau shows the torso of a man in a suit, his hand animated, gesturing, while another hand in movement, belonging perhaps to the photographer, obscures most of his face.

After Szarkowski "discovered" Lartigue, he became known as a photographer. That same year his photographs were featured in an issue of *Life* magazine and eight years later, in 1970, Richard Avedon edited a book entitled *Diary of a Century* that presented many of Lartigue's photographs along with corresponding diary entries. It was only at this late stage in his life, after photographing daily from the age of six, that Lartigue worked as a photographer. He worked on several magazine commissions and, in 1974, Valéry Giscard d'Estaing, president of France, asked Lartigue to take his official photograph. When Lartigue replied that he was not an official photographer, d'Estaing stated that was why he wanted Lartigue to take his portrait.

When Lartigue was in his 80s, he donated his photographic collection—his 130 albums, all his negatives, cameras, and diaries—to the nation of France. Since then, the Donation Jacques Henri Lartigue has mounted many traveling exhibitions, which have made his photographs even more popular. While the popularity is due in part to the subject matter and the photographs' status as records of early twentieth century life, it also reflects Lartigue's uncanny ability to capture an image at the best possible moment and to seemingly preserve it forever.

PHOTOGRAPHY IN LATIN AMERICA: AN OVERVIEW

The history of photography in Latin America is rich and diverse. The work of Latin American photographers often reflects the key historical, social, political, and aesthetic forces at work in the region. A variety of people and groups brought the photographic medium to Latin America in the nineteenth century: foreign invaders, such as the French forces seeking to place Maximilian on the throne in Mexico; amateur artists looking for inspiration, such as Adela Breton; settlers searching for a way to earn a

living, such as the German Guillermo Kahlo, the father of the renowned artist Frida Kahlo; and numerous foreign companies seeking profits and needing to illustrate their operations to investors.

During the nineteenth century, Latin American photography more closely followed artistic and journalistic trends from outside the region. European institutions, audiences, and aesthetics played significant roles in this early Latin American photography. However, by the early twentieth century,

Latin American photography became more complex and syncretic. It often portrayed the many problems and contradictions of societies that combined indigenous, colonial, and modern industrial elements.

In the early twentieth century, documentary photography grew in importance in Latin America. Already by the late nineteenth century, Latin Americans had become increasingly interested in visual records of contemporary events, as was seen, for example, in the many combat photographers who recorded the region's conflicts. Documentary photography became more widespread as travel became easier with construction of roads and rail lines. Also, the appearance of illustrated periodicals such as *Caras y Caretas* in Argentina and *El Cojo Ilustrado* in Venezuela created more demand for photographs.

The beginnings of documentary photography can perhaps best be seen in Mexico and Brazil during the late nineteenth century. In Mexico, documentary photography prospered under the dictatorship of Porfirio Díaz. This photographic style suited the needs of the dictatorship, showing off public works, parades, and orderly citizens, all in line with the positivism of the era. In Brazil, Marc Ferrez, the best-known nineteenth-century Latin American photographer, recorded economic development and modernization starting in the 1860s and continuing into the early twentieth century.

It was during the period of the Mexican Revolution that began in 1910 when documentary photography matured in Mexico. The best example of an early Mexican photojournalist is Agustín Víctor Casasola, who left an archive of more than 600,000 plates. He photographed some of the key revolutionary leaders such as Emiliano Zapata and Pancho Villa. Casasola, who sometimes traveled with troops, showed the human side of the conflict and focused on the life of ordinary soldiers. He often photographed women, both soldiers and those accompanying the men. Casasola's photographs also demonstrated the horrors of war, as seen in his images of executions. His work shows how photography can be used to aid in the construction of political history and national identity.

The early twentieth-century also saw the flourishing of portraiture in Latin America, a trend that began in the late-nineteenth century and was part of a world-wide phenomenon. These early portraits often depicted members of a new urban society that was growing in size, power, and wealth. This trend can be seen in the work of photographers such as Melitón Rodríguez and Benjamín de la Calle in Colombia, Alejandro Witcomb in Argentina, Romualdo García in Mexico, and Eugene Courret in Peru.

As might be expected in a region in which Catholicism predominates, many early Latin American photographers used their medium to examine the place of the Catholic Church. Among the most notable early examples is the work of Juan José de Jesús Yas, who was born in Japan, moved to Guatemala in 1877, and converted to Catholicism. Starting in the 1880s and continuing until the second decade of the twentieth century, he frequently photographed the clergy, churches, and ritual objects. Missionaries in the remote parts of Latin America also used photography to document and legitimate a European presence among indigenous populations. Missionaries used their cameras to record the lives, rituals, and cultures of native inhabitants and the transformations that took place with the arrival of so-called "civilization."

In the post-World War I period, there were limited options for photographers in Latin America. Relatively few photographers were able to both earn a living and maintain any sense of artistic vision. There was no counterpart to the photographic experimentation that took place in Europe and the United States, as seen in the work of photographers such as Alfred Stieglitz. Furthermore, the nihilism and pessimism of the European avant-garde was not present in Latin America, as the region did not experience the same death and destruction. Rather, themes such as pan-Americanism and *Indigenismo* permeated Latin American photography.

Despite the limited opportunities for photographers in general in the post-WWI period, the 1920s did see the emergence of the so-called Cuzco School. Centered in Cuzco, the photographers associated with this school—Native Americans from the highlands of Peru—produced images that were modern and ethnographic. These men used old equipment and earned a living as traditional village studio photographers, working under difficult economic situations. Furthermore, each of them came from the same social and ethnic groups as many of their subjects. None of them became rich nor famous in their lifetime. It was only later in the twentieth century that these men were recognized as important photographers.

The most well-known of the Cuzco School photographers is Martín Chambi. Chambi, the son of peasants from the village of Coaza, began working during the 1920s. He began his career as an apprentice for a photographer working for a British mining company. He later moved to Cuzco, where he made a modest living as a studio photographer. Chambi also traveled widely and produced thousands of documentary photographs. His body of work was influenced by the *indigenismo* ideology prevalent at

the time in Peru. He was also associated with the nationalist APRA political party. Chambi's work brings his subjects to life, even in ordinary scenes and without defying the conventions of conservative Peruvian society. He meticulously posed his photographs, so much so that they satisfied his upper-class clients who were unaware that he was satirizing their status and class power. Unfortunately, Chambi died virtually unknown in 1973.

In addition to Chambi, the other Latin American master who emerged from the first half of the twentieth century was the Mexican Manuel Álvarez Bravo. Álvarez Bravo began taking photographs in the mid-1920s. Originally more interested in painting, music, and literature, in 1922, Álvarez Bravo met the photographer Hugo Brehme and decided that he, too, would become a photographer. Then in 1927, Álvarez Bravo met Tina Modotti, who led him to find a personal tone for his images. Edward Weston came to admire Álvarez Bravo's work, which opened the doors to the international photographic community. Álvarez soon became internationally famous, exhibiting in Paris in the 1930s along with Henri Cartier-Bresson. His work possesses a great poetic quality. Furthermore his images offer a wide range of interpretations, as there is often more than meets the eye in what seem like ordinary photographs. Like the Mexican muralists of the time, Álvarez Bravo incorporated Mexico's indigenous past into his images.

There were relatively few women involved in photography in the early twentieth century. The first to make a significant contribution was the Italian-born Tina Modotti, who first went to Mexico in 1923, where she lived off and on until she died there in 1942. Modotti was a student of Edward Weston. She is known for her photographs of Mexican street and village life, exploring everyday problems of the people. For example, she produced images of workers' demonstrations. Modotti emphasized what she called "photographic quality," which meant taking "sincere photographs" without manipulation. Modotti had an important influence on other Mexican photographers such as Manuel Álvarez Bravo and Lola Álvarez Bravo.

Lola Álvarez Bravo was another important female photographer in Mexico in the first half of the century. Many of her images reflect the surrealist movement. She also produced portraits, especially of painters and writers involved in the vibrant art scene of Mexico City in the 1930s and 1940s. Among her subjects was the artist Frida Kahlo. Álvarez Bravo was able to capture Frida's free spirit in a way that no male photographer had been able to do.

A third female photographer of note in Mexico was the Hungarian-born Kati Horna, who came to

Mexico in 1939 seeking political asylum. Horna settled in Mexico City for the rest of her life. Like Álvarez Bravo, she was part of the surrealist movement. Horna also earned a living as a newspaper photographer.

In Buenos Aires, Argentina, a number of female photographers also made significant contributions. In particular, the German-born Annemarie Heinrich and Greta Stern rose to prominence. Both women arrived in Buenos Aires in the 1930s and both became known for their artistic portraits, a distinctive characteristic of the Buenos Aires photography scene. Their clients were often well-known artists from theater, dance, and cinema. No artist who visited the Colon Theater in the Argentine capital failed to visit their studios. These glamorous photographs of the famous performing artists developed in Buenos Aires to a greater extent than anywhere else in the region.

The role of Latin American photography changed with the Cuban Revolution of the 1950s. From the early days of the revolution, Cuban photographers recorded the events of the guerrilla war against the dictator Fulgencio Batista. Not only did photographers document events, they also portrayed the leaders of the revolution. Iconography played an important role in Latin American photography of the period. Fidel Castro's image became known worldwide and could be seen in publications such as *Life*. Che Guevara became a popular icon in large part due to Alberto Korda's photograph of the revolutionary leader with a black beret with a revolutionary star on it.

In many ways, the photographs of the Cuban Revolution followed the tradition of epic photography begun during the Mexican Revolution with the works of photographers such as Casasola. In the post-Cuban Revolution period, Latin American photography was given a sort of revolutionary imperative. That this was the case can be seen in Fidel Castro's unannounced visit in 1984 to the Third Colloquium of Latin American Photography being held in Havana. The Cuban leader reminisced about the role of photography and images during the revolution. Furthermore, with the creation of the Cuban news agency Prensa Latina, a Third World alternative to international news organizations, a new space was opened for Latin American photojournalists.

One of the results of the Cuban Revolution was that it forced photographers—as well as those in almost any other occupation—to choose sides. Either one was committed to the ideals of social revolution or one was labeled as a frivolous and decadent artist who simply produced art for art's sake.

LATIN AMERICA: AN OVERVIEW, PHOTOGRAPHY IN

The Cuban Revolution was not the last time that photography was used for political purposes. Rebels in El Salvador during the 1980s continued the tradition. However, the Salvadorans also added a new twist to traditional documentary photography. They made the genre more pragmatic and media-savvy. The 1980s was a decade of media events, and in places like El Salvador, where conflict was rampant, a good photograph could be just as important as a military victory.

In 1978, Latin American photographers staged the First Colloquium of Latin American Photography in Mexico City. Subsequent meetings would be held in Mexico City in 1981 and Havana in 1984. The events brought a new prominence to Latin American photography. In the wake of the Cuban Revolution and influenced by more recent events such as the Sandanista Revolution in Nicaragua, leftist political rhetoric dominated the meetings. The Colloquium was accompanied by an exhibition called *Hecho en Latinoamerica (Made in Latin*

America). The exhibition clearly had a point of view, as photography was seen as an anti-imperialist tool. Some used the term “liberation photography,” in reference to Liberation Theology, which was so prevalent at the time. One critic described the exhibit as “documentary and humanistic with an occasional tinge of exoticism and leftist politics.” While some Latin American photographers did produce alternative styles of images, they were largely unrepresented at the Colloquium.

The Colloquium was also important in that it helped to internationalize Latin American photography. It led to a series of international exhibitions that helped to bring Latin American photography to a global audience for the first time. Also important is the fact that for the first time, some of these exhibitions were based on extensive curatorial surveys. Generally, Latin American curators had lacked the funds to conduct such a survey.

While the Colloquium had emphasized the political and social nature of Latin American photo-

graphy, by the end of the twentieth century, the medium had taken many forms. While traditional themes of social justice and magical realism continued, many other forms of experimental photography prospered. Among them was the avant-garde work of Luis González Palma and Mario Cravo Neto. Others such as Pedro Meyer, Graciela Iturbide, and Flor Garduño produced documentary fine art. Overall, by the end of the century, the Latin American photography scene was as diverse and vibrant as anywhere in the world.

CLARENCE JOHN LAUGHLIN

American

For most of his career as an active photographer (1930–1967), Clarence John Laughlin remained outside the mainstream of American photographic practice. Laughlin's first love was writing, and his interest in photography began with the notion that the images could add another layer of understanding to his words. Although the bulk of his work is straightforward black and white photography made with a 4 × 5-inch view camera, it is the relatively small number of pictures involving staged tableaux, collage, multiple printing, and other techniques that often put him at odds with those who practiced and championed straight photography in the United States. It was his insistence that the captions written to accompany the pictures were integral elements of the photographs, and needed to be displayed with them that in part created a reputation that he was a cantankerous individual. It was not until the late 1960s, when Laughlin had ceased to photograph consistently, that his work began to be seriously considered as a unique and important voice in the photographic history of the twentieth century.

Laughlin's pact with the written word was hardly superficial. His father encouraged him to read at an

early age, but when the elder Laughlin died in 1918, Clarence left school to help support his mother and crippled sister. He continued to read, especially American fiction and the writings of the French Symbolist poets. At his death in 1985, his personal library numbered some 30,000 volumes. He was likewise self-taught as a photographer.

Laughlin's work is organized around a series of 23 themes or groups, the core of which was established early in his career. By the time of his first museum exhibition in 1936 at the Delgado Museum of Art (now the New Orleans Museum of Art) the group structure was firmly in place. The groups serve not only as a road map for the progression of his work, but as a key for understanding the philosophical organization of it. The groups addressed some prosaic themes, such as *The Louisiana Plantations* and *American Victorian Architecture*, but also ventured into areas that were less easily defined, such as *Poems of the Interior World* and *The Mystery of Space*.

The photographs of his American contemporaries (including Ansel Adams, Edward Steichen, Alfred Stieglitz, Paul Strand, and Edward Weston) were known to Laughlin, but he found little in theirs that reflected his own concerns of photography. He

saw much more correspondence with his own vision in the photographic work of the Europeans Hans Bellmer, and Eugène Atget, the expatriate Man Ray; the paintings of Russian refugee Eugene Berman; and the constructions of the eccentric American artist Joseph Cornell. Laughlin's active collecting of books and other literature of the Surrealist movement, along with his 1940 exhibition at the New York gallery of Julien Levy has often caused him to be considered part of that movement, but he was never officially associated with them. Bolstering a Surrealist affinity is a unique group of pictures called *The Color Experiments*. These were created between 1943 and 1946 using the materials of the dye-transfer process, at times in combination with gelatin silver camera images or photograms, and sometimes employing elements of drawing, collage, and frottage.

Laughlin initially used the subject matter of his native Louisiana to forge his approach to what he called "the third world of photography, the world beyond documentation and purism." His earliest books, *New Orleans and Its Living Past* (1941) and *Ghosts Along the Mississippi* (1948), respectively, synthesize urban and rural milieus, suffusing the characteristic architecture of each place with both symbolism and nostalgia. His fascination with the lessons that could be learned from the architecture of the past were set in sharp contrast against what he felt was the mechanized pace of modern life, and the soulless architecture that often accompanied it. With the outbreak of World War II, Laughlin began an even more symbolically charged set of pictures (*Poems of the Interior World*) that he hoped would expose the folly and madness of global war. Work on the series of over 300 prints and accompanying captions continued throughout the 1940s, and must be regarded as among his most ambitious projects.

From the late 1940s until he ceased photographing in 1967, Laughlin worked more outside of Louisiana than within his native state. He traversed the western part of the United States, usually on commissions to photograph new architecture or to deliver lectures, and began to record the vanishing inventory of Victorian-era architecture in major cities. Chicago is perhaps best represented in the over 5,000 negatives that form this project, but extensive work was carried out in Milwaukee and Lake Geneva, Wisconsin, Galveston and San Antonio, Texas, and Los Angeles and San Francisco, California. For this project, in some ways an extension of his earlier architectural work in Louisiana, Laughlin seemed anxious to record every detail of the buildings and abandoned the overt symbolism he had favored in the 1930s and 1940s. These

photographs present the buildings as a catalogue of relics, a precious heritage doomed by the misguided policies of urban renewal.

Failing health and other obligations curtailed Laughlin's career as an active photographer after 1967. Though he had long looked to Europe (especially France) as a source of inspiration, Laughlin didn't travel abroad until 1965. On that trip he photographed briefly in England and France, forming the last of his categories, *Fantasy in Europe*.

For the last 20 years of his life Laughlin re-evaluated his accomplishments in photography. This process included creating a master index of his negatives and refining the arrangement of the groups. He also worked on writing projects, organized exhibitions of his work, and actively sought a home for his archive. In 1968, the University of Louisville Photographic Archives purchased his negatives and a set of prints. In 1973, the Philadelphia Museum of Art produced the retrospective exhibition, *The Personal Eye*, accompanied by a book of the same name published by *Aperture*. In 1981, his voluminous archive of correspondence, master prints, and manuscripts were acquired by the Historic New Orleans Collection. And in 1983, the portion of the work at the University of Louisville was combined with the archive in New Orleans. Less than two years later Laughlin died in New Orleans after a series of debilitating ailments. His ashes were interred in Père-Lachaise Cemetery in Paris.

Biography

Born near Lake Charles, Louisiana, 14 August 1905. Moved with family to New Orleans in 1910, where he was educated in local schools until the ninth grade. Continued his education with selected night courses during the 1920s. Self-educated in photography beginning in 1930. From 1936–1941 was a photographer with the U.S. Army Corps of Engineers. Had a trial period of employment at *Vogue* magazine, 1941. Appointed Assistant Photographer in the National Archives in Washington, D.C., 1942. Military service in World War II was as a photographer with the U.S. Signal Corps (New York) and Office of Strategic Services (Washington, D.C.), 1943–1946. From 1946–1965 earned his principal living by photographing contemporary architecture, writing magazine articles about photography, circulating exhibits of his own work, lecturing throughout the United States on his photographic theories. Received a Carnegie Corporation grant through

the Library of Congress in 1952 to continue photographing antebellum southern architecture. Named an Associate of Research at the University of Louisville, Louisville, Kentucky, 1968. Awarded an honorary doctor of humane letters by Tulane University, New Orleans, Louisiana, 1976. Died in New Orleans, Louisiana, 2 January 1985.

ROBERT LEBECK

German

Robert Lebeck stands among the great German photojournalists. In more than a half century of work—20 years of which he spent with the German magazine *Stern*—he has produced photographs of significance and authenticity, consistently managing to capture people and powerful situations in photographs.

Lebeck was born in Berlin in 1929. He grew up with his grandparents in the town Jamlitz near Berlin, and in 1943 at the height of World War II he became a soldier. He was subsequently captured and became a prisoner-of-war. When the war ended, he was released from an American prison camp and went on to earn a high-school diploma in Donaueschingen, Germany. Then, in Zurich and later at Columbia University in New York, he studied ethnology. He traveled throughout the United States, working as an usher, as kitchen help, and with the railroad. The skills he acquired in the United States were to serve him well as a photojournalist. In the United States he chanced upon U.S. magazines such as *Life* and *Look* and was fascinated by their variety and quality:

I only later learned that the magazines in Germany before the Hitler period were as world renowned as the American magazines of the 1950s. From their reputation I came to understand what qualified as a good photo essay and what it meant to respect photojournalism. And I did all of this without realizing that I would choose this career.

(Steinorth 1993, 6)

In 1952, he returned to Germany and received a job with the U.S. Army in Heidelberg. The next year, his wife gave him his first camera. The leading German photojournalist and fashion photographer Herbert Tobias (1924–1982), who was returning to Heidelberg from Paris, taught Lebeck how to develop film and make enlargements. His first photo, of Chancellor Konrad Adenauer in Baden-Baden, was published in July 1952 in the *Rhein-Neckar-Zeitung*, a newspaper in Heidelberg. The following year Lebeck worked for various newspapers in Heidelberg.

When Winston Churchill received the Karlspreis award from the city of Aachen in 1956, no journalists were permitted to attend the closed dinner

festivities. Lebeck disguised himself among the kitchen workers and photographed the great leader at the banquet; Scotland Yard confiscated the film. The next day Lebeck was again prepared and hid behind a curtain as members left the reception. When Adenauer suddenly asked for a photographer, Lebeck was ready.

By the middle of the 1950s, new magazines had begun to make up a significant portion of the press. Among them was *Kristall*, out of Hamburg, where Lebeck had his breakthrough in 1960, traveling for three months across Africa. It was the year that the European powers bestowed independence on their last colonies. There, as the state of Zaire (now Congo) declared its independence and the Belgium King Baudouin and President Joseph Kasavubu drove along the boulevard in an open car, Joseph Kasavubu took the king's sword from the car's backseat. Lebeck was the only photographer who recorded the scene.

In 1966, Lebeck went to Hamburg to work for *Stern*, which had become the biggest weekly magazine in West Germany. He was always there at the focal point of events. In 1963, he was at the coronation of Pope Paul VI. Lebeck photographed Cardinal Ottaviani laughing as he kissed the pope's hand; he would have so much preferred being named pope. This image has become an icon of photojournalism. "It shows what it means to be there when the event takes place," Lebeck said.

He made a gripping photograph at American politician Robert Kennedy's funeral as the coffin was carried from the ceremony into the night. When Ayatollah Khomeini, the Iranian revolutionary leader, returned to Tehran from Paris after 15 years of exile, Lebeck sat with him in the plane. His photographs of Khomeini's arrival in Tehran suggested the coming of war, which the Islamic revolution would begin only a few months later in the name of Allah.

These photographs reveal the photographer's special skill at recording situations in the second that history and a decisive historical moment melt together. Also important is that Lebeck ignored all the prevailing rules of photography, which makes clear that such photographs require the total sensory perception of a watchful and decisive eye. Although Lebeck's photography exhibits a light-

ning-quick determination of subject, detail, light, and perspective, it also demonstrates a perfect staging of the scene that lends the momentary situations a meaning far beyond the event.

Despite competition from television and the changes brought about by digital photography, Lebeck does not view the future of photojournalism with pessimism:

The most important thing, and the reason I believe in the future of still photography, is that still photos remain longer in one's memory. Georg Stefan Troller once formulated this observation in a vivid way and gave a series of very illuminating examples. It is curious that when one thinks of photographic images, one thinks of still photographs. Troller knew what he was talking about, because he had made many provocative films for television. No one seems to remember precisely, but Troller once explained that the photo appears to capture time, to vanquish time, to subdue the duration of time, and photography is an act that challenges transitoriness and because of this exhorts our passionate participation. In my opinion, one cannot better phrase the reasons to speak of a future for photojournalism.

(Steinorth 1993, 11)

Lebeck is internationally known not only as a photographer but also as a collector. At the end of the 1960s, he began collecting nineteenth-century photographs. According to Lebeck, he purchased his first daguerreotype in the United States in 1967 and started collecting postcards of photographic journalism. Soon his interests widened from the pioneers of photography to the amateurs with artistic ambitions. At important auctions in the 1970s, a collector with little money but an eye for quality could procure striking examples of the history of photography. He had a special interest in new discoveries, tracking down unknown and forgotten photographic works and undervalued treasures. With an unconventional way of proceeding and an eye for quality photographs, Lebeck has made a substantial international contribution to the history of photography. In 1993 the city of Cologne purchased his complete collection of more than 11,000 photographs.

RUSSELL LEE

American

Russell Lee is an American photographer best known for his documentary work on the Great Depression and the Dust Bowl, which was undertaken for the Farm Security Administration (FSA) between 1936 and 1942. Because of his detailed photographic observations of American social realities of the late 1930s, Lee was described by Roy Stryker, the FSA director, as “a taxonomist with a camera.”

The son of Burton and Adeline Lee, Russell was born in Ottawa, Illinois in 1903. His childhood was marred by his parents’ divorce and his mother’s premature death. Lee was entrusted to the care of several legal guardians, including his grandparents and his great uncle. He attended Culver Military Academy in Indiana, where he graduated in 1921, and then enrolled at Leigh University in Pennsylvania, earning a degree in chemical engineering in 1925. In spite of this scientific education and a promising career making composition roofing with the Certainteed Products Company, based in Marseilles, Illinois, Lee’s marriage to painter Doris Emrick in 1927 introduced him to the world of art. Dissatisfied with his job, Lee resigned from the Certainteed Products Company in 1929 and moved first to San Francisco, where he started painting, and subsequently to the Woodstock Art Colony, New York. From 1931 to 1936, Lee painted portraits and landscapes in Woodstock and his first 35 mm camera was bought as a drawing aid. Yet Lee soon found out that his talent was with photography rather than painting. He started documenting the lives of the people in the Woodstock surround-

ings during the Depression and later focused on New York, detailing the effects of the economic crisis on the urban context. His scientific knowledge allowed Lee to experiment with the photographic medium and its technical aspects. In particular, the use of flash became a distinctive feature of his photographs, enabling Lee to capture detailed shots of interiors.

In 1936, Roy Stryker invited Lee to join the photographic team of the Resettlement Administration (RA), which was later renamed Farm Security Administration (FSA). Part of the New Deal programs to help farmers during the Depression years, the RA and the FSA used their photographic section to gain support for their projects. The aim of the photographic staff, which in addition to Lee included Ben Shahn, Dorothea Lange, Arthur Rothstein, Jack Delano, and Walker Evans, was to show to the nation the predicament of agricultural workers in the 1930s. During his six years with the FSA, Lee traveled extensively throughout the United States, recording the rural and the urban social realities of the Depression. His most famous work consisted of two series of photographs of San Augustine, Texas, taken in 1939, and Pie Town, New Mexico, 1940. Lee’s photographs, like those of his FSA colleagues, were widely disseminated through national newspapers, magazines, and even books, such as Richard Wright’s *12 Million Black Voices* (1941). This successful photo-documentary volume on African American history featured both Lee’s rural images and his grim depiction of black Chicago slums. Lee’s FSA photographs have been praised as social documents. Yet, like other FSA photographers,

Lee has also been subjected to criticism. Maren Stange, for example, has argued that the FSA documentary style, which Lee fundamentally contributed to codify, ultimately suppressed the radical potential of the photographed subjects, testifying “both to the existence of painful social facts and to the reformers’ special expertise in ameliorating them, thus reassuring a liberal middle class that social oversight was both its duty and its right.” During his tenure with the FSA, Lee divorced from his first wife and in 1939 married Dallas journalist Jean Smith. The couple soon started to work together and Jean Lee often followed her husband in his travels, writing captions and short essays for his photographs.

During the Second World War, Lee, who had left the FSA in 1942, worked for the Overseas Technical Unit of the Air Transport Command (ATC). The new unit’s task was to photograph the routes and the airfields flown by the ATC, thus providing American pilots with images of the often unknown airspace in which they would fly. In 1944, Lee was promoted to major and the following year he received the Air Medal for his contribution to the unit.

At the end of the war, Lee returned to his life-long project of illustrating American social realities. In 1946, the Department of the Interior commissioned Lee to document the health, housing, and safety conditions of coal miners throughout the United States. Lee’s photographs, which amounted to more than 4,000, were part of a survey promoted by the Department of the Interior and the United Mine Workers. They portrayed the lives of coal miners showing their daily activities, the interiors and exteriors of the mines, and their accommodations. Many of these photographs were published in 1947 in the final report of the survey, *A Medical Survey of the Bituminous Coal Industry*, which contributed to important changes in the work and health regulations of the mining industry. That same year, Lee, together with many of his former FSA colleagues, was again under the direction of Roy Stryker working for Standard Oil New Jersey (SONJ) in an effort to improve the corporation’s public image. After SONJ, Lee continued to work in the field of industrial photography throughout the 1950s and was hired by several important companies such as Arabian-American Oil Company (Aramco) and Jones and Laughlin Steel. Parallel to this body of industrial photographs, Lee collaborated with Texan political and cultural institutions to record post-war Texas life and its different social conditions. Lee’s subjects were extremely varied and ranged from the living conditions of Spanish-speaking population to state mental institutions, from portraits of Texan politi-

cians to those of literary authors. Though Lee’s reputation is closely connected to the American soil, in 1960, he was in Italy for two and a half months taking over 4,000 photographs for a special issue of *Texas Quarterly* on that country. Throughout the 1950s and 1960s, Lee’s work appeared in *Fortune*, *The New York Times Magazine*, *Magnum*, and *The Texas Observer*.

After a retrospective exhibition organized by the University of Texas at Austin in 1965, Lee accepted a position as the first photography instructor at the University of Texas. Teaching became the focus of Lee’s career until his retirement in 1973. He died in Austin on August 28, 1985.

ANNIE LEIBOVITZ

American

Simultaneously an artist, a photojournalist, and a commercial photographer, Annie Leibovitz has played a seminal role in the business of image making in the late twentieth century. Her works, which have appeared in American and European magazines including *Time*, *Stern*, *Paris-Match*, *Rolling Stone*, *Vanity Fair*, and *Vogue* among others, document society's preoccupation with celebrity and appearance. The methods by which she has been able to articulate the essence of star personae have revealed her to be a keen interpreter of popular culture. An unwitting pioneer of the women's movement, Leibovitz blazed her own trail to success in a largely male-dominated industry, and she has continued to help redirect perceptions of female identity.

The daughter of an air force officer and a professional dancer, Leibovitz was born in 1949 in Westport, Connecticut. She enrolled in the San Francisco Art Institute in 1967 and began to study painting during a period when Minimalism and Post-Painterly Abstraction were considered the only viable expressive means. Feeling a greater affinity for realism, Leibovitz began to investigate other modes of artistic expression. Her study of painting, however, provided her with a strong sense of composition that has informed her photographic work.

During the summer of 1968, Leibovitz joined her parents on Clark Air Force Base in the Philippines, where her father was stationed. Her mother had the opportunity to go to Japan and took Leibovitz with her. On the trip, Leibovitz bought her first professional camera, a Minolta SRT101, and began taking amateur shots, which she developed herself in the base's hobby shop. Upon her return to the Art Institute, she began taking night courses in photography.

While in school, Leibovitz studied with Ralph Gibson, who introduced her to the works of Henri Cartier-Bresson, Dorothea Lange, and Robert Frank. Initially, she was drawn less to portraiture than to studies of locations and environments. This was an interest sparked by *Life* magazine's early photo essays, entire articles expressed principally through pictures captured by a single roving journalist such as *Life*'s long-time photo editor Walker Evans.

In 1970, Leibovitz approached the two-year old San Francisco-based youth and rock magazine *Rolling Stone* with a picture she had taken of beat poet Allen Ginsberg. Art director Robert Kingsbury bought the portrait and introduced Leibovitz to founding editor Jann Wenner. In 1971, Leibovitz received a bachelor of fine arts degree from the San Francisco Art Institute. After a short independent assignment in Europe, which she took specifically to hone her skills, Leibovitz returned to *Rolling Stone* seeking a position and was subsequently hired on a \$47.00 weekly retainer.

Leibovitz became chief photographer of *Rolling Stone* in 1973 and by 1974, had photographed most of the era's foremost rock artists and many of its major political figures. She often collaborated with writer Tim Cahill, taking photographs as he gathered story material. Her initial work consisted of candid shots taken while following subjects engaged in specific activities. An example of this portraiture type can be found in a body of work created in 1975, when Leibovitz served as the official concert photographer for the Rolling Stones. She traveled with the band, capturing many facets of their tour, both onstage and off. Her best-known image from this period, however, is that of the nude John Lennon embracing the fully clothed Yoko Ono, taken on the day of Lennon's murder.

Since the mid-1980s, Leibovitz's portraits have become elaborately staged productions, highlighting a sitter's celebrity persona or referencing an object or deed that has made the sitter famous. Rejecting the conventional close-up view, Leibovitz has preferred the 35-mm lens, which allows for the inclusion of contextual and conceptual details, like props. Before photographing her subjects, she has admittedly studied them from various perspectives, considering them in political, psychological, and sociological terms before determining her conceptual and compositional approach. This stylistic change, emphasizing the contrived over the candid, reflects her 1983 move to New York-based Condé Nast Publications, which produces the glossy fashion magazines *Vanity Fair* and *Vogue*.

Leibovitz's mid-career work also saw a brief return to her early role as photojournalist. In 1985, she became the official photographer for the World Cup Games in Mexico and in 1994, she documented the aftermath of the sieges of Sarajevo, Bosnia. Atlanta's Olympic Games Committee commissioned Leibovitz to make portraits of participating athletes in 1996. This assignment yielded both a book and a traveling exhibition.

In 1991, Leibovitz became the second living and only female photographer to have a retrospective exhibition at the National Portrait Gallery in Washington, D.C. In the same year, she brought suit against Paramount Pictures in a closely watched artist's rights case for their irreverent appropriation of her nude portrait of the pregnant actress Demi Moore for an advertising campaign promoting *Naked Gun 33½: The Final Insult*. The image at issue contained a model's similarly posed pregnant body, topped with actor Leslie Nielsen's head. Paramount was acquitted of copyright infringement charges based on the doctrine of Fair Use.

In 1999, Leibovitz published a collaborative work entitled *Women* with critic and essayist Susan Sontag. The book contains over 70 photographs of women, ranging from the world renowned to the unknown and cutting across ethnic and socio-economic boundaries. An exhibition of the same name, containing over 50 of the book's images, each made of four separate Iris prints constituting portraits of enormous size, has traveled to various venues nationally. The brainchild of Susan Sontag, the book was intended to redefine conventional conceptions of femininity and has affirmed Leibovitz's trademark interest in the mutable concepts of identity and image.

SAVANNAH SCHROLL

See also: **Cartier-Bresson, Henri; Evans, Walker; Frank, Robert; Gibson, Ralph; Lange, Dorothea; Life Magazine; Portraiture; Sontag, Susan**

Biography

Born in Westport, Connecticut, 2 October 1949. Traveled to Japan and bought first camera, 1968. Lived on kibbutz in Israel and took part in archeological dig of King Solomon's temple, 1969. Received bachelor of fine arts degree from San Francisco Art Institute, 1971. Appointed chief photographer for *Rolling Stone* magazine, 1973. Official concert tour photographer for Rolling Stones, 1975. Contributing photographer for *Vanity Fair* magazine, 1983. American Society of Magazine Photographers Photographer of the Year Award, 1987. Clio Award and the Campaign of the Decade Award from *Advertising* magazine for her American Express "portraits" campaign, 1987. Founded Annie Leibovitz Studio in New York City, 1990. Infinity Award from International Center for Photography, 1990. Currently lives and works in New York City.

Selected Individual Exhibitions

- 1991 *Annie Leibovitz: Photographs*; National Portrait Gallery, Smithsonian Institution, Washington, D.C., and traveling
- 1998 *Annie Leibovitz Retrospective*; Center for Modern and Contemporary Art, Veletrzni Palace National Gallery, Prague, Czech Republic, and traveling through Eastern and Central Europe
 - Olympic Portraits*; Olympic Museum, Lausanne, Switzerland, and traveling
- 1999 *Women*; Corcoran Gallery of Art, Washington, D.C., and traveling
- 2000 *Nudes: Mark Morris Dance Group*; Edwynn Houk Gallery, New York, New York, and traveling

Selected Group Exhibitions

- 1989 *150 Years of Photography: Leibovitz, Mapplethorpe, Newman, Slavin, Weber, Beaufrand, De la Ville, Scannone, Sigala, Vogeler*; Museo de Arte Contemporáneo de Caracas, Caracas, Venezuela
- 1990 *5 × 5: Leibovitz, Ritts, Newman, Weber, Mapplethorpe, De la Ville, Sigala, Scannone, Vogeler, Beaufrand, Díaz, Giovanni, Ospina, Galvis, Gómez-Pulido*; Fundación Museo de Arte Acarigua-Araure, Bogotá, Colombia
- 2000 *Picturing the Modern Amazon*; New Museum of Contemporary Art, New York, New York
- 2000 *Picturing Women*; Steven Scott Gallery, Baltimore, Maryland

Selected Works

- American Soldiers and the Queen of the Negritos, Clark Air Force Base, the Philippines*, 1968
- Mick Jagger, Buffalo, New York*, 1975
- Patti Smith, New Orleans, Louisiana*, 1978

LEIBOVITZ, ANNIE

John Lennon and Yoko Ono, New York City, 1980
Whoopi Goldberg, Berkeley, California, 1984
Demi Moore, 1991
Jennifer Miller, New York City, 1996
Eileen Collins, Johnson Space Center, Houston, Texas, 1999

JEAN-CLAUDE LEMAGNY

France

Jean-Claude Lemagny has played multiple roles in the world of fine-art photography. His extensive academic achievements include a License in History and Geography, a Certificate in French Literature, a Certificate in Art of the Middle Ages, a Superior Studies Diploma in the History of Art, and an Aggregation in History, which is a prestigious professional qualification as a teacher. In 1963, he was named Chief Curator for the Department of Prints and Photographs at the Bibliothèque nationale de France (BNF). His first responsibilities at the BNF included cataloguing art books and eighteenth century French engravings. In 1968, he became responsible for the contemporary photography collection. He was also a professor at L'École du Louvre, teaching classes in eighteenth century engraving. In 1998, Lemagny retired as official curator of photography and was named an Honorary General Curator of the BNF.

An articulate and prolific writer, Lemagny produced hundreds of articles and several major books on exhibitions, individual photographers, movements, or themes in photography. He both organized and participated in numerous conferences and colloquiums on photography in France and around the world, attending untold numbers of openings and receptions for photography. By invitation from other institutions, he often guest curated

exhibitions or wrote accompanying text for catalogues. He participated in the first meetings with Lucien Clergue to organize the Rencontre Internationale d'Arles, an international photography event that began in 1970. This annual event brought thousands of participants each summer to the south of France to participate in a variety of both structured and spontaneous photo activities, including exhibitions, public and private critiques, workshops, and lectures. The streets could be filled for days with people looking at or showing photographs. Though Lemagny was sometimes invited to give an official presentation at Rencontre d'Arles, his presence was more often at his personal initiative. Summer after summer, Lemagny could be found seated at a table, often at the Hotel Arlatan, reviewing photographers' portfolios on a first-come-first-served basis, the line of hopeful artists sometimes stretching for blocks. He would take a break at noon to eat a sandwich and otherwise spent the day looking at and talking about hundreds of photographs.

In his role as Curator of Photography at the BNF, Lemagny considered himself a public servant and wanted to serve. He handled administrative activities of the department, met regularly with contemporary artists, organized monthly exhibitions with texts for the Galerie Colbert, the photography exhibition space for the BNF, and every week was available for consultation to researchers in the Prints and Photographs reading room. He

worked extensive hours to handle such responsibilities, sometimes meeting with artists on Saturdays. The depth and intensity of his involvement in photography made him a valuable source of information about contemporary photographers, photography institutions and activities, and diverse personalities in the art world such as gallery directors, editors, curators, and critics. Because of the demands on his time at the BNF, he once said, "If I truly need to finish some work, I need to stay home." His dynamic, incessant presence in the world of photography in Paris was so strong that he was nicknamed, "The Master."

One of his principle responsibilities at the BNF was to acquire new works for the collection. Meeting regularly with artists, he confronted the problem of limited financial resources and the continuous discovery of new work. Purchasing works directly from the artist or through a gallery or agent, he opted as a matter of policy to disperse available funds to a diversity of potential artist instead of concentrating funds for major purchases of the more established and more expensive works. Over the years he served as photography curator the BNF acquired over 70,000 new photographs. His curatorial efforts establish the collection of the BNF as one of the most important photography collections in the world.

Lemagny was also responsible for the organization of exhibitions from the library's collection. On a monthly basis, BNF photography exhibitions filled the library's Galerie Colbert. The Galerie Colbert was an experiment to create and maintain an exhibition space that coherently reflected the contemporary aspect to works exhibited there. Lemagny organized nearly 100 exhibitions in the Galerie Colbert. Some of these exhibitions were in other sites in Paris and around the world. *Eloge de L'Ombre*, an exhibition and catalogue organized by Lemagny, was presented to the public in 2000–2001 at the Kawasaki Municipal Museum and the Yamaguchi regional Fine-Art Museum in Japan.

The publication in 1992 of *L'ombre et le temps* is a look at this curator's thoughts and visions on photography. Working with other contributors responding to his propositions, this book strives to merge both enthusiastic support and provocative criticism into fertile material for reflection on the state and nature of photography.

In 1994, shortly before retiring as curator of photography, he organized an exhibition and book called *La Matière, l'Ombre et la Fiction*, (*Matter, Shadow and Fiction*). Both the exhibit and the book

drew from the BNF's collection of contemporary photographs, organizing works by panels based not on author, date, content, theme, or genre but by the photographs' visual compatibility. Lemagny once wrote that any two photographs have more in common one with the other than any photograph could ever have with something seen in it. The presentation provoked both strong support as well as criticism. In 1996, Jean-Francois Chevrier criticized Jean-Claude Lemagny for devoting himself to creative photography while neglecting documentary and informational considerations. The same year, Philippe Arbaizar wrote of Lemagny's tremendous work and contribution to the world of art photography.

In 1989, Lemagny wrote: "In photography, as in all art, what is of fundamental importance is not finding an idea but exploring matter manifest in forms. It is about sustaining a certain thickness, from within which creativity can circulate."

LENS

The photographic camera is a product of convergent evolution, a process where similar forces give rise to analogous though unrelated structures. What is striking about the camera is the way it resembles the eye. Some inventions intentionally mimic nature. In the case of the camera, the mechanism functions like a biological structure, but for several centuries it was developed without a working knowledge of the physiology of vision.

Cameras contain two essential components: a light-tight chamber and an aperture. In a properly constructed camera, the aperture projects the scene in front of it as a visible image within the chamber. Modern cameras use light-sensitive substances to capture, process, and transmit that image. Our visual apparatus functions in a similar manner, as retinas process visual information projected by the pinhole aperture seen within the iris.

Cameras can operate without a lens. These devices are called pinhole cameras because the aperture must be narrow enough to allow only one coherent image into the chamber. Pinholes function by allowing only one ray of light from each point of a visible surface to reach the back of the camera chamber.

Pinhole cameras have the advantage of simplicity and infinite depth of field—every point within the image is in focus—but the size of the aperture sorely limits the intensity of the image. Consequently photosensitive materials require several minutes of exposure. In evolutionary terms, pinhole cameras correspond to the most primitive eyes in nature, for instance those of a nautilus, which also consist of a pinhole and simple retina.

The lens improves the efficiency of cameras by gathering more light. Unlike a pinhole, which approaches the spatial limit of zero, lens apertures can be of finite size, creating a bright image within the apparatus that reduces exposure time. The lens retains the qualities of a pinhole by focusing light from many different directions into a single coherent image. A correspondingly large aperture—in other words, a hole—projects light incoherently, forming a circular beam of illumination, not a visible image.

The lens functions through refraction, or the fact that light bends when it passes through media of different densities. Both the eye and the camera exploit the structural capacity of a lens, one crys-

talline and the other organic, to focus light and form a coherent, transmittable image within a darkened chamber.

Though some ancient cultures may have discovered some of the properties of lenses, such inquiries, if they happened, lie outside the stream of development that led to the camera. The first reports of lenses in our historic continuum appear in thirteenth century Europe, where lenses were used to correct impaired vision. A Venetian law book from 1300 refers to *roidi da ogli*, “little disks for the eyes,” and in 1306 sermon Friar Giordana of Pisa reported that the art of making eyeglasses was scarcely 20 years old.

In the sixteenth century, the lens became married to the camera in its current use of amplifying the intensity of projected images. It was first mentioned in mid-century by the Milanese polymath Girolamo Cardano, who described how the visual effects of the pinhole camera can be enhanced by the insertion of a biconvex lens in the aperture:

If you want to see the things which go on in the street, at a time when the sun shines brightly, place in the window shutter a biconvex lens. If you then close the window you will see images projected through the aperture on the opposite wall....ⁱⁱ

Daniele Barbaro subsequently explained how to focus by altering focal length and depth of field in *La Practica della prospettiva*.ⁱⁱⁱ But Giambattista della Porta was the first person to widely promote the lens. In *Magia Naturalis* he recommends using a biconvex lens to improve images within the *camera obscura*, and his widely circulated text popularized the camera as a tool for painters.

Lensmaking steadily improved after the Renaissance. Optical standards were established during the eighteenth century, and the invention of photography in the nineteenth century created a mass market for lenses. Virtually every camera incorporates a lens. While pinhole cameras are functional, they are impractical for most uses. And, while the biconvex lens used in early photographic cameras sufficed to brighten images, compound lenses were required for the many advances of photography since the nineteenth century.

Lens manufacturing advanced considerably during the twentieth century. The main innovations lay

in three areas: coatings, aspheric geometry, and the creation of compound assemblies. These advances increased the power and utility of photographic lenses, leading to a diverse range of uses that has continued expanding into the twenty-first century.

Coatings minimize flare and other disruptions caused by reflections within the lens assembly. The basic lens is spherical and easily mass produced because calibrating grinding equipment to a circular form is relatively simple. Aspherical lenses often offer superior performance to spherical lenses, but they require sophisticated design and manufacturing resources. Finally, photographic cameras require compound lenses to serve the range of demands placed by modern users. The item we commonly denote as a “lens” is, in fact, an assemblage of convex and concave lenses, bonded with cement and mechanically calibrated to act in concert.

Modern lenses are highly specialized. Photography services a range of disciplines: snapshots, journalism, advertising, prepress production, cinema, television, photomicroscopy, astronomy, and aerial surveillance from street level to satellite. Each of these disciplines and their many subdisciplines requires a specialized lens apparatus.

The spread of digital computers in the 1970s had a major impact on lens production. For seven centuries only a handful of organizations had the capability to produce superior products. Computers allowed more entrants into the industry, and they also supported complex manufacturing processes that were previously difficult or impossible. Combined with advances in materials science, specifically the development of inexpensive and durable optical-

grade polymers, digital computers have contributed to the spread of cameras in virtually every context.

Relentless progress has pushed the lens to the point of invisibility while making its cost negligible. In such a situation it is impossible to predict which innovations will take hold, for instance the now standard practice of including cameras in mobile phones. While progress will continue in the established photographic disciplines, the advent of cheap, ubiquitous cameras, and their inclusion in a broadening array of devices, will be the most dynamic area of development in the coming century.

HELMAR LERSKI

Swiss-Polish

Helmar Lerski was among the most original representatives of the avant-garde active between World War I and World War II. He was a very important link between Pictorialism and what was called “*Neue Sehen*” or New Vision on the one hand, and between photography and film, on the other. Born to Polish immigrants in Strasbourg, then part of Germany, he came to photography only indirectly.

After receiving an education as a bank clerk in Zurich, he immigrated to the United States, and working part-time to make ends meet, eventually established himself as an actor in German-speaking theaters. In 1905, he published a book of aphorisms about free love, a fashionable theme amid the contemporary criticisms of bourgeois institutions. This was his only literary work. He learned photography with the help of his first wife, Emilie Bertha Rossbach, who came from a family of photographers.

Nevertheless, measured by the expectations of pictorial photography of that time, his technical skills were slight. In 1909 he gave up acting, and in 1910 he opened his own studio with his wife. His first published photography dates from the following year, appearing in Milwaukee, Wisconsin-based German-language newspapers. After 1911, at the latest, Lerski took part in one of the Photographers' Association of America conventions. It is uncertain whether he took a teaching position in photography in Austin, Texas, that the university offered him in 1914. In any case, he already had a reputation among the faculty. The influential critic of the time, Sadakichi Hartmann, emphasized the singular artificiality of Lerski's photographs that seemed to reveal a face "masked by mimicry."

In the early American years of his work, the term "Lerski pictures" gained currency. These photographs already show the stylistic characteristics that were to become typical of Lerski's output. In their overall qualities they conformed to the current standards of artistic photography, dominated by the soft-focus, expressive ideals of Pictorialism. But through the manner in which the subject is portrayed, Lerski created a distinct style, one achieved by chiaroscuro light effects and posed gestures, by use of a low vantage point to indicate pathos, making his works comparable to those of nineteenth century master Julia Margaret Cameron. Lerski paid particular attention to lighting, using a clever mixture of side and frontal illumination that he aimed with mirrors.

In 1915, Lerski returned to Germany. In the same year he had a one-man show, which was well received, at a Berlin publishing house, with one critic suggesting that Lerski might be a figure able to liberate photography from its increasingly hide-bound traditions. Even at this time it was apparent that he avoided traditional ways of printing and that the theatrical staging of his photographs was something not previously seen. Although he exhibited his photographs again the next year, Lerski then suddenly gave up still photography. In 1916, he found a position as director and cameraman of the photography and technical department of the newly founded WW Film Society of Berlin. The aesthetic of German expressionism, with its reliance on graphic effects, hard contrasts of light and shadow, and dramatic portrayals, suited him well. A press release from the first year that he worked with the film society praised the photographic treatment of the actors' faces as "uniquely specialized...with the entire treasure of his means and form of expression," which was brought out by Lerski's unusual lighting technique. Trade publications cited the

quality of his light staging, which Lerski continued to use after the WW Film Society broke up. Over the next few years he worked with screenwriter and poet Béla Balázs and director Berthold Viertel; a 1925 article in *Die Filmwoche* described him as artist, poet, and visionary of the camera.

After another four years of more or less successful film projects (most of which were directed toward a narrow group of intellectuals), Lerski returned to still photography. After 1929 his pictures of personalities from the Berlin art scene began appearing in *Vogue*, *Die Dame*, *Die neue Linie*, *Scherl's Magazin*, *Sport im Bild*, and *Die weite Welt*. Essays praising his earliest work also started to appear. Yet Lerski first secured his great fame as a portrait photographer for a project he worked on privately in his studio. Hiring off the street and from employment agencies, he photographed anonymous models, a practice which excited much attention after these pictures were published. Lerski was represented with these studies in 1929 at the world-famous Film und Foto exhibition. This was followed by a major exhibition of these works, *Everyday Heads*, in 1930, and a book of reproductions was published. Two museums had already purchased some of his prints.

Lerski's photographs presented a completely new project. He did not concern himself with conventional beauty, and photographed physiognomies because of their expressive intensity. The models' faces are photographed up close, tightly cropped, and often from below. Complicated lighting transformed the faces into vivid landscapes against a neutral backdrop. In the dramatically lit atmospheres, and quietly expressive expressions Lerski captured with the intent to produce an introspective, but noble, if not heroic, expression without any particularized psychological revelation; one can trace the influence of German films. Lerski represented not single individuals, but representatives of the collective. His method, however, was completely different from that of his contemporary August Sander, who photographed typical citizens he felt exemplified their professions or positions in society. Lerski portrayed people without any overt symbols or even intimations of their social positions. Only the "true" humanist potential was to come forth in his portraits. If ever the term "expressionistic" applied to photography, it applied to Helmar Lerski.

In his following project, Lerski further pursued his unique vision. In 1931, he worked in Palestine on *Document of the Jewish Race*, a photography series for which he had already secured a French publisher; he planned to have Albert Einstein write

the foreword. The work was supposed to show the “original Jewish type and its many branches” and included photographs of their “milieu,” although Lerski’s urban and landscape photography never achieved anything like the intensity of his portraiture. Of these, however, only a few ever made it to print; the book project was never completed. In 1932 Lerski immigrated with his second wife to Tel Aviv, where he continued his photography and also took portraits of Arabs. He also turned once again to film but without much success. In 1936, he began to work on a new photo project, *Metamorphosis Through Light*. Within three months he took 175 pictures of a single Jewish worker in the glaring sun, always with the aid of mirrors. By 1930 he had already conceived the idea for this work, which he would later consider his masterpiece. This project pushed to the limit the style that can be found in his earliest photographs and that he perfected in *Everyday Heads*: the transformation of the face into sculpture; the suppression of all physiognomic expression in the interest of pathos; and the attempt to convey mysterious meanings and character that reveal the sublime depths of the human soul. In 1937, Lerski showed a number of photographs in London, presenting them in a succession of projections from transparencies for five weeks—a very unusual form of presentation at the time. In Lerski’s exhibitions, the conceptually organized presentation of his works prevailed, more than with other photographers of classical modernism. In this respect, the projects *Everyday Heads* and *Metamorphosis Through Light* pointed to the future.

When World War II made working conditions difficult, Lerski reached back to older materials. In Jerusalem in 1941 he showed *Images of the Human Face*, which was based on his portraits of Jews and Arabs. From the negatives he enlarged individual details that produce a continuous concentration on the speaking aspects of the face. He had already set the stage for this project in an edition of the magazine *Die neue Linie*. In addition, he created portraits of workers and soldiers for the propaganda exhibition Fight and Work for the Jewish support fund Keren Hajesod. He also worked again in film. A number of his remaining photographic works share the same preoccupation with the representation of humanity; for example, he photographed a series of hands that he worked on in 1944 and a series of portraits of wooden puppets illuminated in expressionist lighting. After his return to Zurich in 1948, Lerski again gave up photography. Always an artistic loner, characteristic of the great independence of his style is that he was heralded as an artistic precursor in the exhibition *Subjektive Foto-*

grafie 2 of 1955 by Otto Steinert, and at the same time enjoyed a reputation as a socially critical “humanist” in the then German Democratic Republic in East Germany, one of the few Western avant-garde artists to receive such high recognition. Lerski died in Zurich in 1956.

WOLFGANG BRUECKLE

Biography

Born to Polish parents (birth name: Israel Schmuklerski) in Strasbourg, France, then part of Germany, February 18, 1871. Raised in Zurich, Switzerland, after 1876. Received Swiss citizenship, 1887. Moved to the United States, 1893. Worked as an actor in German-language theaters in Chicago, New York, and Milwaukee. Began learning photography from his wife Emilie Bertha Rossbach and established with her a studio, 1910. Photographs appeared at the yearly meetings of the Photographers’ Association of America, 1912–1914. Reputedly taught photography and German at the University of Texas, 1914–1915. Returned to Europe, 1915. Cameraman in many Berlin film studios, 1915–1929. Technical director of Schüfftan-Photography, Deutsche Spiegeltechnik GmbH (Ufa), 1925–1927. Managed a photography studio, 1928–1931. Photo and film work in Europe and the Near East, 1931–1932. Moved to Palestine; worked there as a cameraman and photographer, 1931. Occasional European travels, 1937–1939. Return to Zurich, 1948. Honorary member of the Palestine Professional Photographers’ Association, 1939. Died in Zurich, November 29, 1956.

Individual Exhibitions

- 1915 *Portraits*; Galerie der Grafik-Verlag, Berlin, Germany
- 1930 *Köpfe des Alltags*; Kunstbibliothek, Berlin, Germany
- 1934 *Jewish Heads*; Massik Art Shop, Tel Aviv, Palestine
- 1936 *Dynamic Photography*; Divan Bookshop, Jerusalem, Palestine
- 1938 *Metamorphosis Through Light*; Academy Cinema, London, England
- 1941 *Thirty Years of Photographic Works*; Bezalel Jewish National Museum, Jerusalem, Palestine
- 1942 *Images of the Human Face*; Bezalel Jewish National Museum, Jerusalem, Palestine
- 1943 *Fight and Work*; Tel Aviv Museum, Tel Aviv, Palestine, and traveled through Palestine, to New York, Johannesburg, South Africa, and London
- 1945 *Human Hands*; Tel Aviv Museum, Tel Aviv, Palestine
- 1946 *75th Birthday Exhibition*; Mikra Studio, Jerusalem, Palestine
- 1948 *Verwandlungen durch Licht*; Kunstgewerbemuseum, Zurich, Switzerland
- 1951 *Helmar Lerski Photographien*; Schauspielhaus, Zurich, Switzerland
- 1955 *Photographies de Helmar Lerski*; Musée de l’Etat, Luxembourg
- 1958 *Bruder Mensch*; Staatliche Landesbildstelle, Hamburg, Germany

- 1961 *Der Mensch mein Bruder*; Paulskirche, Frankfurt am Main, Germany, and traveling
 1982 *Helmar Lerski, Lichtbildner: Fotografien und Filme, 1910–1947*; Museum Folkwang, Essen, Germany, and traveled to Munich, Germany, and San Francisco, California
