DAVID LEVINTHAL

American

Since 1972, David Levinthal has photographed his collection of toy figures, models, and historical figurines, and this unique work has defined him as one of the leading postmodern artists in America. Levinthal uses Polaroid's instant SX-70 and mammoth 20 × 24-inch cameras to photograph his tabletop tableaux. The resulting images expose and critique cultural myths and stereotypes, particularly American cultural stereotypes around racism and sex, as well as historical events around which myth and stereotypes have grown, such as Nazism or the Holocaust. Like his contemporaries, Cindy Sherman, Barbara Kruger, and Laurie Simmons, Levinthal draws much of his inspiration and imagery from the myths and icons that appear in film noir, pulp novels, romance books, pin-up magazines, advertising, and television.

Levinthal exploits the veracity of the photographic medium to create images that question the nature of representation. His photographs of staged tableaux are a groundbreaking example of what many postmodern artists were doing in the late 1970s and 1980s—constructing and staging scenes for the camera. Critic A. D. Coleman referred to this working method as "the directorial mode," underscoring the idea the photographer controls every detail of the scene to be photographed. During these decades, many other artists including Sherrie Levine, Cindy Sherman, Sandy Skoglund, and Joel-Peter Witkin made images of elaborately staged subjects that evoke the feel of reality, because they are photographed in a straight documentary style, but are in fact photographic fictions of artificial moments.

Born in San Francisco on March 8, 1949, Levinthal grew up in a wealthy Jewish family. In 1966, he took a basic photography class his freshman year at Stanford's Free University in Palo Alto. He practiced the West Coast aesthetic of masters Edward Weston and Ansel Adams; he even studied the nude with Adams's contemporary Ruth Bernhard. Levinthal's early work of pinball players and storefronts in Santa Cruz and railway cars in Palo Alto reflect the street photography style popularized by Lee Friedlander and others in the 1960s. After graduating from Stanford with a degree in studio art in 1970, from 1971–1973, he pursued a master of fine art's degree in photography at Yale University, New Haven, Connecticut, where he explored his fascination with American popular culture. Initially, he made close-up photographs of M&M's and Chuckles candies and donuts, which garnered the attention of his instructor Walker Evans. By the winter of 1972, Levinthal had begun photographing toy soldiers engaged in battle on his linoleum floor.

What began as part of Levinthal's MFA thesis developed into a three-and-a-half year collaboration with his friend and fellow classmate Garry Trudeau, who went on to create the cartoon strip *Doonsbury*. This collaboration resulted in Levinthal's first photographic series and the publication of *Hitler Moves East: A Graphic Chronicle, 1941–1943* of 1977, with a text by Trudeau. Inspired by the war photographs of Robert Capa, Levinthal arranged toy soldiers in elaborate artificial settings—using potting soil, flour for snow, even fire—to recreate the Eastern Front and Hitler's invasion of Russia. He photographed with a Rolle SL-66 camera and sepia toned the grainy black-and-

white Kodalith paper to convey the gritty feel of war. To underscore the artificiality of his simulated tableaux, Levinthal employed what would become his hallmark techniques of ambiguous space, dramatic lighting, exaggerated blur, and selective focus to obscure the boundaries between reality and artifice. *Hitler Moves East* is considered a classic and an early example of a postmodern photography book, which influenced others such as Sherrie Levine, who also photographed with toy figures, and Cindy Sherman to stage tableaux and fabricated fictions in their own work.

After graduating from Yale, Levinthal taught at a succession of colleges including the University of Nevada, Las Vegas, 1975–1976. Despite the critical acclaim of *Hitler Moves East*, he felt uncertain about his artistic career and returned to school in 1981 to earn a Management Science degree from the Massachusetts Institute of Technology, Cambridge, Massachusetts. In 1982, he co-founded New Venture, a public relations firm in Menlo Park, California. In 1983, having established financial security, he sold his business, moved to New York City, and was immediately included, along with postmodern photographers James Casebere, Sarah Charlesworth, Laurie Simmons, and others, in his first group exhibition, *In Plato's Cave*, at the prominent Marlborough Gallery.

Inspired by the paintings of Edward Hopper and film noir, between 1984–1986 he produced *Modern Romance*. Working in the tradition of Lucas Samaras, Levinthal used the instant SX-70 Polaroid camera for the first time and created voyeuristic photographs of figures in bedrooms, diners, and on street corners. He also transmitted the scenes to television via video and made photographs of the scenes on the TV screen. During 1987–1989, Levinthal used the mammoth 20 × 24-inch Polaroid instant camera for the first time to photograph *The Wild West*. Inspired by the Western movies and television shows he grew up with, this series depicts tiny plastic cowboys and Indians in saloons and on horses to address stereotypes and frontier myths. Resembling film stills, his new photographic format monumentalized the tiny toy figures, promoted shallow depth of field, and created ambiguous scale.

Seduction and sex pervade Levinthal's subsequent bodies of work. For *American Beauties* (1989–1990), he posed voluptuous plastic pin-up girls in bikinis on a beach of white sand but lends an ominous twist to these 1950s glamour girls as they pose against a menacing black sky. Levinthal goes to sexual extremes in *Desire* (1990–1991) to critique the stereotyping of women as submissive

sex objects. His use of heavy blur obscures explicit detail, but the plastic Caucasian sex dolls from a Japanese mail order catalog wear black leather, red stilettos, and are blindfolded and bound for S&M. The title of his *XXX* series (2000–2001) signals the adult nature of his photographs of scantily clad and nude women posing like porn stars and strippers. Photographed with the 20 × 24-inch Polaroid camera, the 12-inch plastic dolls look almost life-like in their pornographic presentation, but they are representations of male fantasies and comment on sexual stereotypes.

During the 1990s, Levinthal created his most controversial work by examining the Holocaust and racism. For *Mein Kampf* (1993–1994) he composed figures of SS officers, Hitler, and nude concentration camp victims in chilling scenarios that retell the brutality and horror of the Holocaust. Even more controversial was his series *Blackface* (1995–1996). Levinthal photographed his extensive collection of black memorabilia, household objects such as mammy cookie jars, lawn jockeys, and Little Black Sambo figurines that stereotype African Americans. For *Blackface*, he avoided blur and used the clarity of the 20 × 24-inch Polaroid camera to photograph these small racial objects in extreme close-up. *Blackface* was to be exhibited at the Institute of Contemporary Art in Philadelphia in 1996, but the institution cancelled the exhibition. Critics of the day questioned whether Levinthal was being complicit or critiquing stereotypes in his *Blackface* series. His other series include: *Die Nibelungen* (1993), *Barbie* (1998–1999, 20 × 24-inch Polaroid), *Netsuke* (2002, SX-70 camera); and *Baseball* (2003, 20-by-24-inch Polaroid).

Levinthal exhibits in museums and galleries internationally, and his work is in the collections of leading museums around the world. Levinthal also produces commercial photographs for Exposure NY's clients such as Absolut Vodka, IBM, *The New York Times Magazine*, *Men's Journal*, *GQ*, *Entertainment Weekly*, *Playboy*, and *Wired* magazines.

CLAUDE LÉVI-STRAUSS

French

Claude Lévi-Strauss was born in Belgium and educated in France. By the mid-1930s, he was beginning to develop a whole new approach to the study of what were then termed primitive cultures. Based on his studies of these cultures, many of which enjoyed very little contact with the modern world, he was also advancing interesting theories regarding kinship configurations. Lévi-Strauss would eventually become known as the father of “structural anthropology,” and would join the elite European and American intellectual circles. He held a distinguished post at the University of Paris, counting Roland Barthes, philosopher Michel Foucault, and influential psychoanalyst Jacques Lacan

among his colleagues. For Lévi-Strauss structural analysis was a methodology to discern universal human truths that transcended historical time, and he published numerous anthropological tracts that put forth his influential views: *Tristes Tropiques*; *The Savage Mind* and *The Raw and the Cooked: Mythologies*. As a hobby, and also as a way of documenting his work, Lévi-Strauss began photographing the various tribes with whom he interacted. To illustrate certain points, Lévi-Strauss included some of these photographs in his publications. However, it was not until 1994, with the publication of his photographic memoir, *Saudades Do Brasil* (nostalgia for Brazil), that Lévi-Strauss made his most significant contribution to the field of photography.

Lévi-Strauss rarely discussed the role of photography in his observation of indigenous cultures. In *The View From Afar*, Lévi-Strauss does discuss the power of photography as an artistic expression, particularly as it relates to the art of painting. In a lengthy passage, Lévi-Strauss elucidates the limitations of photography:

The primary role of art is to sift and arrange the profuse information that the outer world is constantly sending out to assail the sensory organs. By omitting some data, by amplifying or reducing other data...the painter introduces into the multitude of information a coherence... Can it be said that photographers do the same thing? To do so would be to overlook the fact that the physical and mechanical constraints of the camera, the chemical constraints of the sensitive film, the subjects possible, the angle of view, and the lighting, allow the photographer only a very restricted freedom compared with the artist's practically unlimited freedom of eye and hand.

(Lévi-Strauss 248–249)

The limitations of photography do not presuppose the uselessness of the medium, however. Even though the ability to manipulate film is not as great, Lévi-Strauss identified the ability of photography to “capture reality,” perhaps more than any other art form. As he later concludes, photography is more objective than other art forms.

Lévi-Strauss felt that photography had a use above and beyond art, however; he believed that the medium provided a valuable supplement to field observation. During his long career, Lévi-Strauss observed many cultures on five different continents. In an attempt to augment his writing, to make the culture “come alive” for the reader, he would sometimes include photographs when describing a tribe. However, Lévi-Strauss recognized that this form of documentation was, in one sense, reliant upon time and place. As he states in his introduction to *Saudades Do Brasil*:

My negatives are not a miraculously preserved, tangible part of experiences that once engaged all my senses...they are merely their indices—indices of people, of landscapes, and of events that I am still aware of having seen and known, but after such a long time I no longer always remember where or when. These photographic documents prove to me that they did exist, but they do not evoke them for me or bring them materially back to life.

(Lévi-Strauss 1995)

Photographs are no substitute for actual observation, and their inclusion in anthropology must therefore be supplemental, a powerful representation of reality, but a representation nonetheless.

The 180 photographs included in *Saudades Do Brasil* date from the mid- to late-1930s, when the anthropologist made several expeditions to various tribes in the Mato Grosso region of the Amazon. Even though they date from different expeditions and involve different tribes, the set-up of the collection suggests a single expedition starting in Sao Paulo and moving into some of the most remote locations in Amazonia. The Sao Paulo photographs suggest a modern, frenetic city, with cars crowding wide boulevards and people hustling down busy streets. Famous for his studies of “primitive” peoples, in this section Lévi-Strauss turns his eye on the development of mechanization and commercialism in a previously agrarian society. The compilation quickly moves on to more outlying territories; however, even as the horse begins to replace the car in these photographs, there is still evidence of rapid change in these formerly inaccessible locations. The roads in these photographs are all dirt, but they are well-maintained and broad enough for vehicular traffic. The towns have a more primitive look, but in one photograph electrical lines can be seen running to one of the buildings. At this point the compilation enters a third section, as Lévi-Strauss chronicles his visits to the remote Caduveo, Bororo, and Nambikwara tribes. Some of these photographs may be recognized from his other works, but nowhere else had he published such an impressive collection. Lévi-Strauss paints a vivid portrait of traditional and relatively unspoiled tribal life in the Amazon. His camera focuses on all areas of cultural practice, including photographs of subjects fishing, dancing, cooking, eating, grooming, and engaging in strength rituals. He also includes photographs involving native dress, face decoration, and traditional weapons.

Immediately apparent in *Saudades Do Brasil* is the lack of posed subjects. True, there are quite a few close-ups in the collection; however, all of these illustrate some aspect of ornamentation, such as a nasal feather labret or a facial tattoo. Other than these, the other photographs in the collection appear spontaneous, with the subjects going about their daily routines of work, rest, and play. This approach to photography manifests the anthropologist's goal of non-interference. But this compilation is more than just a memoir of peoples from the past, it also represents a new argument by Lévi-Strauss, one which he broaches in his introduction, but really advances through his use of visual images. Lévi-Strauss laments the disappearance of these cultures, and identifies as the culprit the institution of European economic models and the sub-

sequent population explosion. *Saudades Do Brasil* thus acts as a warning, a retrospective on several cultures nearing extinction.

Lévi-Strauss's contributions as an anthropologist and philosopher, however, have had a greater impact on contemporary art and photography than his use of the medium. His ideas have informed Structuralism, which became an essential ingredient in the development of photographic theory in the 1960s and 1970s. Various observations he made, such as "the decision that everything must be taken into account facilitates the creation of an image bank," have been starting points for numerous contemporary artists, including the seminal sculptor and theorist Robert Smithson.

HELEN LEVITT

American

Perhaps best known for her photographs of children at play on the street corners of New York City, Helen Levitt also made a career out of documenting the social conditions of urban America. Her photographs are striking, dramatic events that tell stories through their captured moments, weaving context into her subjects deftly and subtly. Her collaboration with author James Agee produced some of the mid-century's most striking documentary films, and one book, *A Way of Seeing*. Agee himself admired Levitt's photos very much, describing them as almost a work of literature:

At least a dozen of Helen Levitt's photographs seem to me as beautiful, perceptive, satisfying, and enduring as any lyrical work that I know. In their general quality and coherence, moreover, the photographs as a whole body, as a book, seem to me to combine into a unified view of the world, an uninsistent but irrefutable manifesto of a way of seeing, and in a gentle and wholly unpretentious way, a major poetic work.

Levitt was born in 1918 in the city that she would later document so passionately. After leaving an unsatisfactory stint at school, Levitt began to work for a commercial photographer and teach herself the basic photographic techniques. But, in 1935, Levitt became so impressed by the images of Henri Cartier-Bresson at the exhibition *Documentary and Anti-Graphic* (which also included work by Walker Evans and Manuel Álvarez Bravo) that she bought the same Leica camera that Cartier-Bresson photographed with. Soon after, Helen Levitt met Cartier-Bresson and began to do simple pictures with the basic, 35-mm camera. Levitt's subjects were mostly poor children in New York City, and through techniques she learned from Cartier-Bresson, she captured them unobtrusively. With her right-angle viewfinder, Levitt remained as much on the periphery of her scenes as possible. Those early pictures, which would have been considered in the same tradition of "street photographs" by Walker Evans and Ben Shahn, were instrumental in creating Helen Levitt's style. Evans was, in particular, a huge influ-

ence on Levitt's own photographs. Like Evans, Helen Levitt wanted to remain a bodiless eye, on the edge of her subject's periphery, so that her photographs had an authentic and unrehearsed style.

It was, in fact, her meeting with Walker Evans that fueled the majority of Levitt's career. As her mentor, Evans introduced the young Levitt to his then-collaborator, James Agee, who later would become both her collaborator and strongest admirer. Through her study under Evans, Levitt honed her craft, and created a distinct style that borrowed her mentor's own detached indifference. This style is most clearly evident in her first major photographic collection of her trip to Mexico City with Alma and Joel Agee, James Agee's wife and infant son. Her photographs in Mexico recall Walker Evans's own photographs in *The Crime of Cuba*; though Levitt frequently chose children as her subjects, the photographs of Mexico City are darker and more bleak than any she had taken in New York City. Many of them focused on the rural poor and their stifling living conditions and inadequate surroundings. Many of her Mexico City portraits contain a cinematic movement, captured through several photographs taken in rapid succession. And like Evans's photographs of Cuba, Levitt stopped short of making any absolute political statement, deciding instead to nestle her commentary in ambiguous vessels.

The subtle detail and clarity of her subjects won Levitt her first solo exhibition at the Museum of Modern Art in 1943, a following photography fellowship, and a great reputation in the growing photographic community. Her photographs began to appear with regularity in popular magazines and photo journals of the time alongside her mentors and colleagues, Walker Evans, Ben Shahn, and Margaret Bourke-White. After her return from Mexico City, Agee and Levitt began a lengthy and productive collaboration together. Both artists believed in the power of the ordinary, in the poetry hidden within the mundane world, and their association reflected it. Together, they produced a short book, *A Way of Seeing*, as well as two critically acclaimed documentary films, *The Quiet One* and *In The Streets*. In the academy-award nominated *The Quiet One*, Agee performed the narration for Levitt's film about an emotionally disturbed African American student at a reform school, while the *In The Streets* documented the urban life in the streets of East Harlem in the 1940s.

Her focus on film kept her away from photography for the majority of the next decade, though she briefly studied at the Art Students League in New York, and became interested in the method and production of color photography. She returned to

the streets of New York and began, again, to document them through the new color medium she had studied. She was awarded a Guggenheim Fellowship for her efforts and produced a show at the Museum of Modern Art. Unfortunately, the master slides from Levitt's show were stolen from the museum and have yet to be recovered.

Levitt still works and lives in the city she helped to document. A retrospective of her photographs of New York from 1937–1945 was displayed at the Laurence Miller Gallery, and countless people have recently re-discovered the beauty and lyrical simplicity of Helen Levitt. Within the group of 1930s documentary photographers, Helen Levitt stands as a chronicler of the quiet, undiscovered subjects, the overlooked beauty of the mundane. Her photographs of children translate their play into a visceral, shared language. Unlike many of the photographs of the century, Levitt's work makes no overt political statement; her subjects are captured just as they are, without commentary or dialogue with their audience. In fact, through her photographs, an audience loses its identity, becomes the transparent eye of the camera lens and discovers her shared way of seeing.

JULIEN LEVY

American

Julien Levy opened his first art gallery in the depths of the Great Depression in the autumn of 1931. As a student at Harvard University, Levy had been among a talented group of young men including Alfred Barr and Arthur Everett “Chick” Austin, who were to become pioneering curators of modern art, who had studied art history with Paul Sachs, and who would go on to be among the most important catalysts for introducing modern art to the United States. Levy met the artist Marcel Duchamp when his father purchased a Brancusi sculpture and the two sailed for Paris together in 1927. Soon after his arrival he met the poet Mina Loy and her daughter Joella, and during his time in Paris, Levy socialized within an art world that included patron of the arts and collector Peggy Guggenheim, photographers Man Ray, Berenice Abbott, and Eugène Atget, and writer Gertrude Stein. Levy imagined the possibility of capturing this energy and aesthetic talent for New York—he married Joella Loy and after the young couple returned to Manhattan, Mina Loy would remain Levy’s artistic mentor and professional link to the Paris art scene.

After working for a few years at the Weyhe Gallery, under the direction of print collector Carl Zigrosser, Levy opened the Julien Levy Gallery at 602 Madison Avenue at 57th Street, on 2 November 1931. His first exhibition was meant as a tribute to a man he considered one of his spiritual godfathers, Alfred Stieglitz. During the 1930s, Stieglitz ran his own gallery called An American Place. Levy sought a loan of photographs from Stieglitz for his opening show, but the elder photographer declined, suggesting instead that Levy mount and frame a selection of photogravures from issues of *Camera Work* magazine. Levy’s retrospective of American photography featured the best of Pictorialist and early Straight photography with work by Stieglitz, Edward Steichen, Paul Strand, Gertrude Käsebier, Clarence White, Anne W. Brigman, and Charles Sheeler, as well as nineteenth-century images by Civil War photographer and portraitist Mathew Brady. Stieglitz’s response to Levy’s initial overtures of collaboration suggests his initially skeptical

attitude to the younger dealer’s efforts to promote photography. However, the two men remained in contact over the next decade, with Levy often visiting Stieglitz at An American Place to share meals, discuss art, and look at photographs together.

One of Levy’s most lasting contributions to the history of photography developed from his friendship with Man Ray and Berenice Abbott in Paris. Abbott had befriended the elderly photographer Eugène Atget, and took Levy to his studio where Levy bought a large number of Atget’s prints. When Atget died in 1927, Abbott rescued the vast number of negatives and prints in his studio and with the financial help of Levy, sought to promote Atget’s remarkable archive of material. Back in New York, Levy mounted an exhibition of Atget’s work at the Weyhe Gallery, and then included Atget in several exhibitions at the Julien Levy Gallery. Levy promoted Atget’s work to his friend Alfred Barr at the new Museum of Modern Art, but the museum was not yet ready to accept photographs into the collection. Levy’s patience with the project to support Atget’s archive grew thin, but Abbott’s tireless efforts over the next several decades eventually resulted in the purchase of the Atget Archive by the Museum of Modern Art in 1969, and Levy reaped the financial proceeds of half the sale.

The Julien Levy Gallery is best known in art history as the space where a U.S. audience first encountered Surrealism, and although Levy’s keen eye and willingness to take aesthetic risks made artists such as Dorothea Tanning, Salvador Dali, Max Ernst, and Joseph Cornell standard fare in his exhibition seasons, Levy never abandoned his deep commitment to promoting photography as a fine art. During the two decades that Levy ran his gallery, he presented a wide range of solo and group photography exhibitions, exploring themes such as the tradition of portrait photography, and drawing important connections between European and American photographers. Henri Cartier-Bresson had his first solo exhibition at the Gallery in 1933, and Lee Miller had her only solo show during her lifetime at the Gallery the same year. Man Ray had his first solo show in New York in April 1932. Walker Evans, known now as a quintessentially

Julien Levy, Frida Kahlo (With Fingers on Cheek Smoking).

Collection, 2001]

“American” photographer, was included in several exhibitions at the Levy Gallery during the 1930s, suggesting an association with European and surrealist tendencies relatively unexpected in his career. Other photographers shown at the Julien Levy Gallery included George Platt Lynes, Manuel Álvarez Bravo, André Kertész, László Moholy-Nagy, Brett Weston, David Hare, and nineteenth-century masters Nadar and Julia Margaret Cameron. Perhaps taking a cue from his mentor Stieglitz, Levy often presented photography with other media, which enriched and complicated viewers’ understanding of the representational mode of photography.

The Julien Levy Gallery closed at its final location at 42 East Fifty-Seventh Street in April 1949. Unfortunately, there is no permanent archive of Levy’s collection or his work as gallery owner, dealer, and promoter of Surrealism. However, his large collection of photographs was purchased by the Art Institute of Chicago in the 1970s and was featured in an exhibition at that museum in 1976. The Julien Levy Collection at the Art Institute of Chicago continues to be an essential

resource for understanding the growth of American and European photography in the mid-twentieth century.

ALEXANDER LIBERMAN

American

“Photography is not art”—these are the words of photographer, publishing executive, writer, painter, and sculptor Alexander Liberman. Art or no, from the time he received a vest-pocket Kodak as a gift from his father at the age of eight, photography would have a decisive influence on his life. Liberman had an immense sense of documentary purpose and fervently recorded his family, social circle, and travels. Later, his appreciation for a photograph’s straightforwardness and spontaneity would reinvent fashion photography.

Alexander Liberman was born in Kiev, Russia, in 1912 to an upper-class family. In 1917, he moved to Moscow where his father, a timber merchant and economist, advised Vladimir Lenin and his mother founded the first state children’s theatre, which became a showcase for Constructivist costume and set design. Liberman’s mother had always hoped he would become a painter and encouraged him to use

his artistic talent to design sets for the theatre. Unfortunately, it was closed after she refused to adapt *Treasure Island* to the ideologies of the new Soviet republic.

In 1921, Liberman was sent to live with friends in England. Three years later, he joined his parents in Paris, France, where he attended the exclusive Ecole des Roches and received a degree in Philosophy and Mathematics from the Sorbonne in 1930. While in Paris, he became acquainted with many artists—especially Russian émigrés such as Marc Chagall. In 1931, he began to study painting with André Lhote and architecture with Auguste Perret at the Ecole Spéciale. He then transferred to the architecture program at the Ecole des Beaux-Arts and accepted a part-time job with noted artist and designer Cassandre.

After he withdrew from his studies, the progressive editor Lucien Vogel asked him to join the staff of *Vu*, one of the first photographically illustrated magazines, where he worked as art director and

later managing editor. At *Vu*, he became known for his innovative photomontage covers that recalled Russian Constructivism, and he also met photographers Henri Cartier-Bresson, Brassai, and André Kertész. In 1936, Liberman left the publication to devote himself to painting.

Shortly after Germany invaded France, Liberman escaped to New York where his parents and several acquaintances had already settled. The year was 1941, and Lucien Vogel was already working for Condé Nast and convinced him to hire Liberman at *Vogue*. Although the art director initially dismissed him, Liberman was rehired by Nast himself who was impressed with his gold medal for magazine design from the 1937 International Exposition in Paris. Liberman began designing covers for *Vogue* and was promoted to art director in 1943. He would go on to become editorial director of Condé Nast Publications in 1962, a post he would hold for over 30 years.

In the early 1940s, Liberman stopped painting as he settled into his new life in the United States. His mother reacquainted him with many artists in exile whom they had known in France such as Fernand Léger and Marc Chagall, and he began commissioning illustrations for *Vogue* from artists he admired, including Salvador Dalí, Joseph Cornell, and Marcel Duchamp.

Liberman's acknowledgement of the shift in social attitudes during World War II would have a profound influence on *Vogue* and all of fashion photography. He felt that the new era deserved less whimsical images of women and more candid, original fashion reportage. Liberman highly respected the work of Edward Steichen and his ability to capture the true essence of his subjects. He sought to set a new standard—just as Steichen had revolutionized photography at Condé Nast Publications years earlier. For that reason, he recruited photographers with gritty documentary and experimental sensibilities—Allan and Diane Arbus, Erwin Blumenfeld, Irving Penn, Gordon Parks, William Klein, John Rawlings, and Helmut Newton—and he would later enlist the talent of Richard Avedon and Patrick Demarchelier.

In 1948, Liberman sent Penn, who began as his assistant in 1943, on assignment to Lima, Peru, where he would take the legendary photograph of model Jean Patchett sitting in a café with her elbow on the table, holding her pearls to her lips and staring past the gentleman seated with her. Liberman described Penn's almost accidental image as "a woman caught in an everyday moment—the imperfection of actual life." He regarded the aus-

tere clarity of Penn's photography as characteristically modern, and Penn would later credit Liberman with teaching him to "capture the gesture of a real person."

Actual life to Liberman was about art, and *Vogue* would become a forum for contemporary art. In 1947, Liberman began to make annual visits to France where he photographed the painters and sculptors of the School of Paris such as Picasso, Braque, and Matisse. Several of these artists, like Léger and Chagall, he had known for years. What began as a series of photo essays for *Vogue* became his most acclaimed exhibition at the Museum of Modern Art, New York in 1959 and a successful book entitled *The Artist in His Studio* published in 1960. James Thrall Soby described Liberman's unaffected portraits of these artists in their studios and homes as having an "extraordinary visual sensitivity" and a "rare capacity for psychological insight." He also photographed his contemporaries from the New York School such as Jasper Johns, Robert Rauschenberg, and Helen Frankenthaler. Many of these portraits were to be collected in a book titled *Nine Americans*, which remains unpublished. Liberman's portraits of artists comprise a timeless record and key understanding of the artistic process that he felt critical accounts could not achieve alone. Selections of these portraits were included in the exhibition *Portraits of Artists by Alexander Liberman* at the Getty Research Institute in 2003.

Liberman was a man of astonishing versatility, and he was also a prolific painter and sculptor who exhibited regularly since 1954. His sculpture and paintings are in the collections of major museums, such as the Museum of Modern Art, the Corcoran, the Solomon R. Guggenheim Museum, and the Tate Gallery in London. His public sculpture can be seen around the world, including the Storm King Art Center and the Smithsonian's Hirshhorn Museum and Sculpture Garden.

In the 1990s, Liberman published three more volumes of photographs: a tribute to his close friend Marlene Dietrich, his photographs of the Capitoline Hill in Rome, and a collection of images from the course of his life. Alexander Liberman died in Miami in 1999.

LIBRARY OF CONGRESS

The Library of Congress is a unique, multi-faceted institution. Among its many functions, it houses an important collection of historic photographs, along with other visual materials, in the Prints and Photographs Division. To understand the scope of the Library's photographic collections, it is useful to consider the larger context of the Library's diverse collections, services, and programs. It serves as the legislative library and research branch of the U.S. Congress, for example, as well as the copyright agency for the United States; a center for scholarship with research materials in diverse media, representing a comprehensive, international range of subjects in more than 450 languages; a public institution with many general and specialized reading rooms; a government library; a major provider of bibliographic data, products, and services; a sponsor of exhibitions and musical, literary, and cultural programs; a conservation research center; and the largest repository of maps and atlases, printed and recorded music, motion pictures, and television programs in the world.

The Library of Congress was established when the U.S. Congress was preparing to move to its new capital of Washington D.C. On April 24, 1800, President John Adams approved legislation to appropriate \$5,000 to purchase "such books as may be necessary for the use of Congress," and on January 26, 1802, President Thomas Jefferson signed the law defining the functions of the Library, creating the position of Librarian of Congress, and giving Congress authority to establish the Library's budget and regulations.

Jefferson believed that the American legislature needed access to information on "all subjects" in many languages in order to govern a democracy, so a comprehensive mandate for the Library's collections was implicit. He argued that there was "no subject to which a Member of Congress may not have occasion to refer." This Jeffersonian concept is the rationale for the broad collecting policies of the Library of Congress, which were most fully realized in the twentieth century. Jefferson's belief in the power of knowledge and its importance to democ-

racy also encouraged the Library to share its collections and services extensively with other institutions.

During the early 1850s, as the Library began to expand in size and function, it had to stave off competition from the Smithsonian Institution to serve as the national library. The Smithsonian's librarian, Charles Coffin Jewett, tried to establish a national bibliographical center at the Smithsonian, but his plan was blocked by Smithsonian Secretary Joseph Henry, who preferred that the Smithsonian concentrate on its programs of scientific research and publication. Henry favored the development of a "national" library at the Library of Congress, and in 1854 he dismissed Jewett, agreeing 12 years later to transfer the entire 40,000 volume library of the Smithsonian Institution to the Library of Congress.

The person most responsible for shaping the Library of Congress into an institution of national significance in the Jeffersonian spirit was Ainsworth Rand Spofford, Librarian of Congress from 1865 to 1897. Spofford achieved this goal by linking the legislative and national functions of the Library through the 1897 reorganization of the Library.

In 1876, the U.S. Bureau of Education listed the rapidly growing Library of Congress as one of the two largest libraries in the United States, with its approximately 300,000 volumes. By 1897, when the Library moved from the Capitol into its spacious new building, its collections ranked first among American libraries in size and scope. Over 40% of its 840,000 volumes and 90% of the map, music, and graphic arts collections had been acquired through copyright deposit. Important items deposited with copyright registrations included Civil War photographs by Mathew Brady's studio and some of the earliest motion pictures.

Copyright deposits greatly influenced the development of the Library's collections. When the Library moved into its new building, separate custodial units were established for the special collections formed primarily through copyright deposit—maps, music, and graphic arts. Spofford's successors as Librarian of Congress hired subject special-

ists to develop these and other collections and persuaded Congress to appropriate substantial funds to purchase research materials for all collections. Copyright deposit remained one of the Library's major acquisitions sources throughout the twentieth century, but between 1865 and 1897 it was fundamental in making the Library of Congress a national institution.

Shared acquisitions and cataloging necessitated international bibliographic standards, and the Library met the challenge through the creation in the mid-1960s of the MARC (Machine Readable Cataloging) format for communicating bibliographic data in machine-readable form. This new capability for converting, maintaining, and distributing bibliographic information soon became the standard format for sharing data about books and other research materials. The possibility of worldwide application was immediately recognized, and the MARC structure became an official national standard in 1971 and an international standard in 1973. Although this format was clearly library-oriented, it found favor with the archival community, where it has been extensively used to catalog photographic collections and individual photographs in a variety of institutional settings, including libraries, archives, and historical societies (art museums are notable exceptions to this trend).

The Library of Congress has greatly expanded beyond its initial function as a library devoted to books, so its collections span the traditions of libraries, archives, and museums, including not only conventional printed books but rare and unique books and incunabula, maps, printed ephemera, photographs, motion pictures, and even musical instruments. Although widely acknowledged as the "national" library, it still does not serve as an official national library in the same sense that such institutions exist in other countries.

Photographs in the Library of Congress in Washington are held in the Library's Prints and Photographs Division, along with other works on paper, from printed posters to fine-art prints. The Adams Building of the Library, opened in 1939, contained the Prints and Photographs Division until the massive Madison Building was completed in 1980. The Prints and Photographs Division in this modern facility is easily accessible to researchers. Although the aims of the Library in collecting photographs have tended toward the documentary, they also encompass fine-art photographs, especially since curator Jerald C. Maddox, who served as curator of photography in the pivotal period

from 1966–1987, consciously began forming a collection informally identified as "master" photographs in the 1970s. George J. Hobart became curator of documentary photography in 1968. Other noted photographic professionals who have helped shape the collections and practices of the Prints and Photographs Division throughout its history include:

Hirst D. Milhollen (1906–1970), a specialist in photography for over 40 years, helped obtain the Brady collection, and was appointed curator of negatives in 1950. Noted photographer and legendary archivist Paul Vanderbilt was chief of the Prints and Photographs Division from 1947–1950, and consultant in iconography, 1950–1954. He developed the basic scheme of picture retrieval. Alan Fern, on the staff of the Library for 21 years, was chief of the Prints and Photographs Division, then director for special collections since 1978, until serving as director of the Smithsonian Institution's National Portrait Gallery, 1982–2000. Stephen E. Ostrow succeeded Fern as chief of the Division. Recent photography staff include Beverly Brannan, curator for large documentary collections since 1974, and Verna Curtis, who became Jerald Maddox's successor.

When Merry Foresta began collecting art photographs for the Smithsonian Institution's National Museum of American Art (later called the Smithsonian American Art Museum) in the early 1980s, this initiative represented competition, which led the Library to return to its concentration on the documentary tradition and to de-emphasize its commitment to new acquisitions of "fine-art" photography.

The functions of the Division are separated into three areas: curatorial, cataloging, and reference. The specialized and skilled members of the cataloging staff have been highly influential in their field for many years. Typically developing descriptive and technical standards that encompass photographs and non-photographic prints alike, their publications and professional networking, both formal and informal, have promoted professionalism and the standardization of rules, procedures, and nomenclature for prints and photographs throughout the archival, library, and museum communities.

Collections

An overview of some of the Library's photographic holdings provides some impression of their diversity, size, scope, and significance. The more than 725 daguerreotypes in the Prints and Photographs Division include primarily portraits, but fine architec-

tural views and outdoor scenes are found also. In 1926, the Library acquired its first “master” fine-art photographs: two important groups of works from the estate of influential pictorialist Clarence H. White and from his fellow Photo-Secessionist, Gertrude Käsebier. Although the Library had by this time amassed substantial holdings of documentary photographs, these acquisitions marked its recognition of the artistic value of the medium and its intention to develop collections of aesthetic significance in tandem with those of documentary importance.

In the 1930s, photographs by F. Holland Day and Clarence H. White were received from the Alfred Stieglitz estate. For many years the Stieglitz photographs were kept in the rare book room, but eventually curator Jerald Maddox consolidated the photographs into the Prints and Photographs Division.

In the 1930s, the Carnegie Corporation provided funds to establish and support at the Library a national repository for photographic negatives of early American architecture, now called the Pictorial Archives of Early American Architecture. This development had been encouraged by the deposit at the Library in 1929 of several thousand photographic negatives of gardens and architectural subjects by an important architectural photographer (among her other specialties), Frances Benjamin Johnston. This deposit was followed by many others in later years. Supported by grants from the Carnegie Corporation, Johnston was commissioned by the Library to create an archive of her fine photographic records of the rapidly disappearing Southern antebellum architecture, with special devotion to its humbler buildings. Johnston’s donation of a body of work set an important precedent for donations of architectural photographs by photographers and their families and sponsors, among them Gertrude Wittemann, Theodor Horydczak, Carol M. Highsmith, and Joseph E. Seagram and Sons.

In 1943, Librarian of Congress Archibald MacLeish announced the purchase of the photographic prints and glass negatives by Arnold Genthe (1869–1942) remaining in his studio at the time of his death. This collection of approximately 10,000 negatives, 8,700 contact prints and enlargements, plus transparencies and color work, is the largest assemblage of Genthe’s work anywhere. At about the same time MacLeish established a committee “to insure the proper development” of the Library’s photographic archive.

Genthe was an internationally recognized photographer working in the soft-focus pictorialist style. The Library’s “electronic collection” contains ap-

proximately 16,000 of Genthe’s black-and-white negatives, transparencies, lantern slides, and color Autochromes. Its production was part of an initiative by Congress to help the Library to preserve fragile negative collections. Most of Genthe’s prints were unprocessed by the end of the century, however, and access to them requires written permission from the Chief, Prints and Photographs Division.

The Library’s Prints and Photographs Division has long been almost synonymous with documentary photographs from the era of the Great Depression. In 1940, the Library of Congress Works Projects Administration (WPA) Project began collecting materials produced by the federal art, music, theater, and writers’ projects and the Historical Records Survey. In collecting materials from these government-initiated projects, the line between the missions of the Library and the National Archives was blurred, since the National Archives would normally (and more logically) collect original materials produced or commissioned by the federal government.

In 1944, the Library took custody of the Office of War Information collection of nearly 300,000 photographs, including the “photo-documentation of America” file organized by Roy E. Stryker in the Farm Security Administration from 1936 to 1942. The combined photographic archives of two landmark photographic documentation projects carried out successively within two federal agencies, the Farm Security Administration (FSA) and the Office of War Information (OWI), were placed by executive order under the administration of the Library. The FSA-OWI archive was the most comprehensive photographic survey of the lives of ordinary people ever assembled. To the Library’s already extensive pictorial coverage of American buildings, cities, and news events it added an unequalled record of a broad spectrum of Americans living and coping with the difficult period of 1935–1943. The famed photographers, who worked on the basis of field assignments from Stryker, included Walker Evans, Dorothea Lange, Russell Lee, Arthur Rothstein, Ben Shahn, Jack Delano, Esther Bubley, Gordon Parks, Marion Post Wolcott, Carl Mydans, and John Vachon. As the scope of the project broadened, the photographers began documenting both rural and urban areas, then turned to Americans’ mobilization for war. The total collection, including photographs from outside sources—military, industrial, and news bureaus, contains about 164,000 black-and-white film negatives and transparencies, 1,610 color transparencies, and 107,000 black-and-white photographic prints.

In 1943, Ansel Adams (1902–1984) documented the Manzanar War Relocation Center in California and the Japanese Americans interned there during World War II. In *“Suffering under a Great Injustice”*: *Ansel Adams’s Photographs of Japanese-American Internment at Manzanar*, the Prints and Photographs Division at the Library of Congress presented on the World Wide Web side-by-side digital scans of both Adams’s 242 original negatives and his 209 photographic prints, allowing viewers to observe his darkroom technique and cropping decisions. Although most of the photographs are portraits, the images also include daily life, agriculture, and sports and leisure activities. Adams donated these prints and original negatives to the Library between 1965 and 1968. In the World Wide Web version, the entire collection appears online for the first time. The online collection also includes digital images of the first edition of *Born Free and Equal*, the book Adams based on his work at Manzanar.

The Panoramic Photograph Collection contains approximately 4,000 images featuring American cityscapes, landscapes, and group portraits. These panoramas offer an overview of the nation, especially for the early twentieth century when the panoramic format was at the height of its popularity. Subjects include: agricultural life; beauty contests; disasters; engineering works such as bridges, canals and dams; fairs and expositions; military and naval activities, especially during World War I; the oil industry; schools and college campuses; sports; and transportation. The images, 1851–1991, cover all the states and the District of Columbia, plus some foreign countries and U.S. territories. The Library’s large collection of panoramas was formed largely during the late nineteenth and early twentieth centuries, again in consequence of the copyright privilege. More than 400 photographers are represented in the collection. Postcards and magazines reproduced panoramas as advertisements for real estate and the promotion of the tourist industry. Panoramic photographs were also popular as group portrait souvenirs for people attending conventions, conferences, and company events, when panoramic photographers actively solicited orders from the large number of participants in such wide-format group portraits.

The Theodor Horydczak Collection (mid-1920s–1950s) documents both the architecture and people of the Washington metropolitan area in the 1920s–1940s, including streets and neighborhoods and exteriors and interiors of commercial, residential, and government buildings and interiors. Washing-

ton events and activities of national import, such as the 1932 Bonus Army encampment, the 1933 World Series, and World War II preparedness campaigns, are also depicted.

One of the important benefactors of the Prints and Photographs Division was Angelo A. Rizzuto (1906–1967), whose gift of his own photographs was accompanied by a financial gift. Rizzuto had conducted a major photographic survey of Manhattan and planned a publication. In 1969, through Rizzuto’s bequest, the Library received the working files for his unfinished book. The 60,000 black-and-white negatives and photoprints offer a detailed record of Manhattan from about 1952 to 1966. The emphasis in Rizzuto’s work is on the vast scale of the Manhattan cityscape and the complex interrelationships between people and their environment. Although he supplied minimal caption information, the photographer carefully organized his images chronologically. The collection has not been cataloged and is not available for use except by special petition. Division chief Alan Fern decided to purchase photographs for the collection with Rizzuto’s fund, and Jerald Maddox used it judiciously to acquire art photographers’ portfolios. The Rizzuto fund also facilitated the acquisition of photographs by Roger Fenton.

The *Look* Collection includes 3.9 million photographs, negatives, and color transparencies (represented by about 10,060 catalog records), ca. 1951–1971. This material is rich in the documentation of American and international events and the lifestyles of celebrities, as well as the “human interest” stories of the less than famous, in which the now defunct *Look* magazine specialized.

The Carl Van Vechten Photographs Collection includes 1,395 photographs, taken from 1932–1964 by this American photographer (1880–1964). The collection is noted for portraits of celebrities, especially figures from the Harlem Renaissance. While the Van Vechten material represents only a portion of the artist’s total output, the Library also contains some photographers’ complete archives, such as the Toni Frissell collection, which is notable for both her significant World War II contribution and her fashion photography.

Other photographic collections include: the American Red Cross Collection of 50,000 photographs and negatives; the 303 glass-plate negatives among the papers of Orville and Wilbur Wright, which record their work with flying machines, donated in 1949; the Abdul-Hamid II Collection, which portrays the Ottoman Empire during the reign of one of its last sultans, Abdul-Hamid II,

with 1,819 photographs in 51 large-format albums, ca. 1880–1893; and photographs produced and gathered by George Grantham Bain, ca. 1900–1931, for his news photo service, including portraits, worldwide news events, and New York City (about 1,200 photographs may be seen online, selected from the larger collection, with records being added frequently).

Access

The Prints and Photographs Reading Room provides public access to the collections and services of the Prints and Photographs Division and is open to patrons conducting research in the Division's collections. The Prints and Photographs collections of over 13.6 million images, including photographs, fine and popular prints and drawings, posters, and architectural and engineering drawings, is international in scope; however, the collections are naturally rich in images documenting the history of the United States and the activities of citizens.

There is no comprehensive published catalog describing the enormous collection of the Prints and Photographs Division, and intellectual access is complicated. Many materials are cataloged in groups, with no itemized listing, and others are not listed in a catalog, but rather are made available through "browsing" files in the Reading Room. A portion of the holdings is available on the Internet. Of special interest are the over 650,000 items (as of 2001) from several of the Division's collections that are represented by catalog records and accompanying digital images in the Prints and Photographs Online Catalog; new records and digital images are added continuously. Access to the online catalog, as well as to illustrated guides, reference aids, and other information about the Division's collections and services is available through the reading room's home page on the World Wide Web at <http://www.loc.gov/rr/print/>.

The Division has prepared guides, reference aids, and finding aids for particular collections and popularly requested topics, which often list images not yet accessible through the online catalog. There are specialized reference aids, for instance, on "Women's Activities During the Civil War," "Timber Frame Houses," and on the National Child Labor Committee photographs by Lewis Hine. Some of these documents are accompanied by digitized images.

Access to the FSA-OWI negatives is now done electronically via the Library's Web site, and users are often fascinated by the "killed" images which were not printed during the life of the project,

whereas access to the prints is through a vertical file in the Prints and Photographs Reading Room and on microfilm surrogates. Many of the prints were sorted into "lots" or groups arranged by assignment or geographic location. Most of the lots were microfilmed in order, after which they were disassembled and refiled according to a decimal classification scheme, involving numbered subject categories, developed by Paul Vanderbilt, who had had prior experience with the collection as an archivist for the OWI. His arrangement of "lots" and the FSA-OWI Reading Room File for the agency was already implemented when the Library received the collection with Vanderbilt as its curator. Vanderbilt apparently intended to interfile images from non-FSA-OWI sources into the large browsing file he had created, but such an expansion was never implemented; in retrospect, most researchers are probably relieved that this very special collection is not encumbered or confused by photographs from other sources. Even picture researchers who are normally more interested in the subject content of pictures than in their provenance or creators realize the historical and practical value of keeping this illustrious FSA-OWI archive separate from other pictures of similar subjects.

Access to the lots by photographer, location, and subject headings is provided by records in a card catalog. The microfilm of approximately 1,800 lots (400 lots were not microfilmed) preserves this initial arrangement by assignment. A published set of 1,637 microfiches reproduces the FSA-OWI Reading Room File: *America 1935–1946: The Photographs of the U.S. Department of Agriculture, Farm Security Administration, and the U.S. Office of War Information, Arranged by Region and by Subject*.

The popular Web-based American Memory Project was established in 1990 to begin sharing portions of the Library's Americana collections in electronic form. Since the Prints and Photographs Online Catalog generally includes only cataloging implemented since the mid-1980s, images organized and described in prior decades are available only by searching manual files in the Prints and Photographs Reading Room. Some images are described at the group level rather than the item level, so many published images credited to the Prints and Photographs Division may not yet be available via the online catalog.

Full use of the collections in the Prints and Photographs Reading Room requires the help of staff familiar with the Division's varied systems of cataloging and finding aids and who supervise the safe, appropriate use of disparate materials. Special

arrangements must be made when patrons wish to view more than 15 original items from the Division's collections (not including documentary photographs, which constitute the bulk of the Division's holdings); unprocessed and/or fragile material requiring supervised handling or special preparation for visits by classes or groups; or when the number of images requested exceeds average use. Researchers sometimes have been frustrated by limitations on access to descriptive information about photographic collections, largely attributable to the Library's chronic backlog of processing and cataloging (which in turn has been criticized as the result of bureaucratic mismanagement and delay), but the Division's willingness to negotiate physical access to unprocessed materials has been exemplary and much admired. Many repositories will not allow research access until collection materials until processing has been completed. The policy of the Prints and Photographs Division, whether official or unofficial, has been flexibility in working around these limitations with researchers.

The Library does not grant or deny permission for the reproduction of images from its collections. While some may be unrestricted, e.g., when their copyrights have expired and they have entered the public domain, many others in the Prints and Photographs Division clearly are covered by current copyright restrictions; indeed, the very presence of many photographs in the Library was occasioned by their submission with copyright registrations. Patrons are advised to be aware of the kinds of rights and restrictions that might apply, such as copyright, licensing agreements, trademark, donor restrictions, privacy rights, and publicity rights. Since the Library houses the U.S. Copyright Office, its passive attitude toward copyright restrictions and reluctance to vigorously enforce copyright might seem odd, since other repositories frequently refuse to provide copies of materials known to be copyrighted. The Library's attitude, however, is that the burden of adherence to copyright and other restrictions is the responsibility of the user, not the repository, and is consistent with its generally very open policies.

JEROME LIEBLING

American

Jerome Liebling's photographs are the visual manifestations of his fascination and concerns for people, their places in the world, and their abiding passions. Despite a career of over 50 years of image making, his photographic identity is elusive; it is as difficult to summarize Liebling in a phrase as it is to represent the nuanced range of his photographs in a single example. Neither journalist nor portraitist, Liebling's niche can be provisionally labeled as "documentary humanist." As Sarah Boxer wrote, "Liebling's photographs go beyond the humane—the standard tone of documentary—and reach the human." Though he claims that "My life in photography has been lived as a skeptic," and a note of moral indignation pervades his work, his photographs are neither nihilistic nor cynical. Instead, they seem transcendent, as if the visible, material world is transmuting into something ethereal. Exterior shells, costumes, and carapaces mingle with living forms in his photographs; they instill a keen appreciation of our own corporeal and spiritual existence.

New York City was Liebling's birthplace and first major subject; his earliest important works record children engaged in imaginative games and explorations on the city streets, along with neighborhood and family rituals. He studied photography prior to and following his army enlistment in World War II. His association with Walter Rosenblum at Brooklyn College inspired his participation in the Photo League from 1946 to 1948; the socially conscious activities of the League photographers matched his own sense of the need for photography to address issues of morality and justice. Besides Rosenblum, Paul Strand's photographs and films were important influences, along with others engaged with the progressive humanism of the League. Ad Reinhardt was one of Liebling's design teachers, and his Bauhaus-inspired curriculum left an important mark on Liebling's work. Addressing the pain and suffering he witnessed in wartime Europe became another formative, lasting goal of his photography.

In 1949, he left New York City and began teaching photography in Minneapolis at the University of Minnesota. It was there that his career as a

photographer, filmmaker, and teacher was firmly established. Liebling was among the earliest to teach photography in a university setting (and was one of the founders of the Society for Photographic Education in 1962). His legacy at the university and in Minnesota is still strongly felt among a generation of photographers. *Light of Our Past*, a 1983 exhibition in St. Paul, included Liebling and the work of 30 other photographers who came to maturity during Liebling's two decades in Minnesota and who, in most cases, were either formally or informally guided by Liebling. The influence is more intangible than specific, more about a personal, open-ended, and inquiring attitude towards one's subject than a specific way of applying one's tools. Passionate engagement is valued highly, as is a sense of justice and respect.

While his subject matter has been extremely diverse, Liebling's formal approach has been consistent over time, reflecting a purity of vision instilled in him by his exposure to Bauhaus design imperatives. As Naomi Rosenblum explains, "Liebling has made the economy of means that is at the heart of Bauhaus aesthetic doctrine reverberate with emotional intensity" (*Contemporary Photographers* 1982, 455). His photographs are made with a hand-held, medium format camera, allowing both descriptive richness and a mobile, responsive point-of-view. Like August Sander's, Liebling's portrait subjects are usually well described by contextual details like clothing and equipment. Overriding all physical evidence, however, is a gentle yet intense regard that characterizes Liebling's work. In speaking of his portraits he refers to an exchange between photographer and subject, a giving to each other that is critical to the image. The results can feel very intimate. His choices of subjects tend to favor those whose lives are filled by labor. "My sympathies remained more with the folk who had to struggle to stay even, whose voices were often excluded from the general discourse," Liebling wrote in 1997.

He has worked in both black-and-white and color, taking up the latter, with tremendous facility, in the late 1970s. Many of his subjects listed below have been realized in both media. The extended series, often covering many years, is important to Liebling, though more as accumulation of distinct,

time-inflected views than as conventional narrative. Among the subjects Liebling has recorded are: handball players; cadavers; mannequins; agricultural workers; politicians in various guises; slaughterhouse workers in South St. Paul; informal street portraiture in Miami, New York's Brighton Beach, and Minneapolis' Gateway District; street scenes in Spain and London; ruined buildings in the South Bronx; clients of social service agencies; Native American and Shaker communities; mining and manufacturing areas of the Midwest; and the farming landscape of Massachusetts's Pioneer Valley and the physical traces of Emily Dickinson in Amherst. Regional concerns have informed Liebling throughout his career; he has, purposefully and incidentally, made telling portraits of his three long-term homes—New York City, Minnesota, and Massachusetts, where he moved in 1970.

Liebling's motion picture work reflects the importance of serial imagery. He studied film at the New School for Social Research, concurrent with his engagement in the Photo League. He taught photography and film simultaneously while at the University of Minnesota and Hampshire College, Amherst, Massachusetts. His academic colleague in Minnesota, Allen Downs, was a frequent collaborator; their films include *The Tree is Dead* (1955), *Pow-Wow* (1960), and *The Old Men* (1965). Group projects at the university, echoing similar efforts in the Photo League, included documenting the demolition of the Metropolitan Building, a landmark building razed in 1961 as part of a Minneapolis urban renewal campaign. Filmmaker Ken Burns has noted his influence on a generation of Hampshire students.

Alan Trachtenberg, a frequent commentator on Liebling's work, offers a fitting summary:

Liebling's pictures are often difficult to look at, not easy to take. His work embraces great extremes and demands much in return....Liebling speaks what is on his mind as well as what is in his eyes, and speaks directly to common civic concerns. There is no mistaking that his camera is an instrument of communication.

(Trachtenberg 1982, n.p.)

LIFE MAGAZINE

Life magazine began publication with the 23 November 1936 issue. It was the third in a string of successful magazines developed by publisher Henry Robinson Luce (b. 3 April 1898–d. 28 February 1967), whose first two magazines *Time* and *Fortune* began publication in 1923 and 1930, respectively. Luce predicated his decision to start

a picture magazine on his growing belief that photography could communicate the news, tell stories, and elaborate on editorial points of view. He recognized the rhetorical possibilities of photography, noting that he wanted to, "edit pictures into a coherent story—to make an effective mosaic out of the fragmentary documents which pictures,

past and present, are....” For most of the remainder of the twentieth century, *Life* played a major role in expanding the role of photography in U.S. culture. Photography has altered U.S. visual culture profoundly over the last century and *Life*’s refinement of, and consistent use of, the photo-essay has contributed to these changes. Their best-known picture editor, Wilson Hicks, famously noted that pictures, if carefully organized and accompanied by captions, “lend themselves to something of the same manipulation as words.” It is hard to overestimate the significance of *Life*’s contribution to the history of photography or to correctly gauge the effects of the magazine’s editorializing on American social history. Much of our understanding of the rhetoric of images comes from exposure to the use of photography that *Life* pioneered and some part of what generations of Americans have understood of the world came to them via the magazine.

While the success of *Life* was unprecedented, selling over a million copies each week within four months of its initial publication, the magazine itself did have key models on which to build. Foremost among these, Luce’s premier publication, *Fortune*, had for years been using photographs in increasingly essayistic forms. This magazine dedicated to business and culture had also utilized the services of Leica photographers such as Dr. Erich Salomon, whose suites of candid photographs ignited a shift in what *Fortune* was after in its photography. By 1935 the magazine was consistently favoring the use of the lightweight 35 mm cameras for use by its photographers, especially when focusing on people. Their star photographer, Margaret Bourke-White, struggled through the transition to a more humanistic approach to photography that year before signing on to work at *Life*. Her famous cover *Fort Peck Dam* and the accompanying photographs for *Life*’s first issue demonstrated that by 1936 she had mastered the art of candid photography without losing her touch for creating monumentalizing images of industry.

The other major source that Luce relied on for the early development of *Life* was the example of the German illustrated press. For much of the 1920s, first in Germany and then in France and England, European illustrated magazines had demonstrated a great agility in the use of photography as journalism. The *Münchener Illustrierte Presse* and the *Berliner Illustrierte Zeitung*, among others, had long and successful track records when Luce sent Daniel Longwell, the editor in charge of planning *Life*, to Germany to study their illustrated publications. Luce also hired Kurt Korff, the celebrated editor of the *Berliner Illustrierte Zeitung*, who had by then fled Nazi Germany

for New York, to come work with Longwell in the role of advisor. At Korff’s recommendation, Alfred Eisenstaedt was hired as one of the main staff photographers at the magazine. Eisenstaedt and Bourke-White’s photographic contributions to the early issues of *Life* represent the twin models on which the magazine was predicated: the German illustrated press and Luce’s own publication, *Fortune*.

In the summer before he published the first issue, Luce released a prospectus for his new magazine in which he discussed his plans:

To see life; to see the world; to eyewitness great events; to watch the faces of the poor and the gestures of the proud; to see strange things—machines, armies, multitudes, shadows in the jungle and on the moon; to see man’s work—his paintings, towers, and discoveries...to see and take pleasure in seeing; to see and be amazed; to see and be instructed.

During the first two years of *Life*’s publication the editors pursued a program of experimentation with formats. Some of their signature layout features, such as the two-page bleed where one image extends to all four borders of a two-page spread, were developed at this time. As well, they early discovered the sales value of a little sex. Seldom did an issue of *Life* miss the opportunity to include partially clad women, sometimes under cover of a story on Hollywood or thinly veiled as a fashion piece on the season’s swimwear. Though this practice opened the magazine to criticism from some fronts, its impact on sales was undeniable.

Life soon realized that they needed more photographers on their staff. In addition to Bourke-White and Eisenstaedt, they began publication with only two other experienced photographers—Peter Stackpole and Thomas D. McAvoy. The editors planned to supplement their staff photographers’ photo-essays with news service pictures. They also wished to find people familiar with the growing practice of documentary photography. To this end, as the magazine hired new photographers they sought out people such as Carl Mydans who had trained under Roy Stryker in the Historical Section of the Farm Security Administration (FSA). Stryker taught FSA photographers to work from a script to ensure that they brought home images that supported a particular argument. Documentary became a mode of photographic persuasion that used the rhetoric of realism to gain an authoritative voice on a given subject. Stories were planned in advance and the photographers given lists of desired images to go create. Along with the captions and the context of the magazine’s story, the photographs carried

the weight of authenticity that came to characterize this practice. *Life* deserves credit for participating in the development of this form of visual rhetoric, even as its editorial points of view must be clearly understood.

Under Luce's watch, for example, the magazine took an editorial stance in favor of intervention in the European conflicts of the late 1930s. To enlist the support of their readers, they published stories that focused on France's and Britain's need for help. In the wake of Germany's annexation of Austria they ran a 16-page spread in their 28 March 1938 issue on the rise of the Nazi party. The accompanying text opined that Austria was just the first step in Germany's plans for European domination; it further decried the treatment of Jews under the Nazis. With this article, and others like it, the editors of *Life* attempted to shake the magazine's readers out of their lingering isolationist slumber and prepare them for war. Over the next three years, the magazine would steadily endorse the need for American involvement in the European conflict and stress the implausibility that the French Army or the British navy would be able to forestall a German advance westward.

The culmination of the magazine's World War II editorializing came with Luce's famous essay "The American Century," which appeared in the 17 February 1941 issue. Luce used *Life*'s editorial page to argue that Americans must "accept wholeheartedly our duty and our opportunity as the most powerful and vital nation in the world and in consequence to exert upon the world the full import of our influence, for such purposes as we see fit and by such means as we see fit." He looked beyond the war as well to a time when the country would assume its role as de facto leaders of the world. In this light, the international coverage in the magazine took on the quality of surveying an empire, one that Luce argued belonged rightfully to all Americans willing to step up and accept their destiny.

Once the United States entered the war, *Life* endeavored to reinforce the decision and to defend their role in shaping public opinion. In the 15 December 1941 issue, the magazine editorialized that

Life's new-age journalism makes information about *all* the forces that move and shape our lives easy to understand and absorb—and infinitely exciting. In doing this, *Life* helps great masses of people come to grips with the world as it really is—helps them make more intelligent decisions.

Life covered World War II aggressively, sending its best photographers around the world to capture in great detail every battle they could—it even set

up a training camp for new war photographers as many of its veterans were already in the field. Bourke-White photographed Red Square in Moscow the night the Germans bombed the Kremlin; Robert Capa was on the beach with the GIs during the invasion of Normandy on D-Day; William Vandivert endured the Blitz of London; and W. Eugene Smith sent back unsparing images of the rigors of the Pacific conflict. Their efforts brought impressive returns. By some estimates, 15% of all American adults read *Life* magazine by the time the conflicts in Europe began.

Life was not without controversy during its rise, both from outside and inside the magazine. From the start, many scholars criticized the magazine's oversimplification of complex subjects (such as Friedrich Nietzsche's philosophy). Others found it culturally philistine. Despite *Life's* constant commitment to reproducing art—they reproduced over 72 paintings in the first six months of 1950—many modern artists criticized their less-than-adventurous selections. The conservatism of the first decade changed incrementally as evidenced by lavishly illustrated articles on Abstract Expressionism as early as 11 October 1948 and continuing for the following decade. Internally, the problems tended to involve rifts between the editors and the photographers or writers. W. Eugene Smith, who had over 50 photo-essays in *Life* between 1946 and 1952, eventually quit at the height of his success because he had no control over the final layout of his pictures or the content of the captions. He objected strenuously and over a long period, but the editors were unwilling to give up control of the key stage in creating the magazine. Smith resigned in 1954.

Throughout the 1950s and into the 1960s, *Life* maintained a dominant position in the magazine world. One 1950 survey estimated that half of the American population now read at least one copy of *Life* in a three-month period. By 1953, almost 5 million copies were sold each week—which implied that over 26 million actually read the magazine once the "pass-around" factor was considered. Some of the magazine's most memorable stories date to those years, including W. Eugene Smith's "A Spanish Village" (9 April 1951). Despite the advances in television technology, and a growing audience for the programs it carried, *Life* continued to offer one of the most popular formats for the communication of news and events. Television did not have the capability to air news footage in ways compelling enough to steal *Life's* audience—yet.

With the exponential growth of television—both in terms of people who owned TVs and with what was being offered by the networks—the 1960s

offered the magazine its first declines since its inception. The advances of network news from small, under-financed departments, to large-scale international operations, along with the generous airtime now given to the nightly news, greatly increased their audience. For example, despite having top photojournalists covering the Vietnam War, *Life's* coverage was dominated by that on television. In turn, advertising revenues started to taper off at the magazine as television offered cheaper advertising when considered in terms of dollars per viewer reached.

Part of *Life's* success had always been serendipitous; the reasons for its decline would be likewise partially out of its hands. In the 1930s, Luce and his editors were able to capitalize on advances in technology to bring a new type of magazine to the public. In the 1960s it was the broadcast networks' turn at wild popularity. As good as war had always been for the magazine, and the Vietnam war was no exception, even more people turned to nightly news to bring images of the conflict into their homes. In the wake of television's monumental success, and with ever increasing publication costs unmet by dwindling advertising revenue, *Life* ceased publishing as a weekly with the 29 December 1972 issue. Hedley Donovan, then Editor-in-Chief, explained that the magazine had been losing money for four years before deciding to close down. He also held out the promise of a possible return by noting that they had not sold the name. The magazine did produce occasional "Special Event" issues over the next six years and the moderate success of those led the company to try once again to publish *Life*, only now as a monthly.

The new *Life* began with the October 1978 issue and carried on, at times even thriving, until its May 2000 issue. Pictorially, the new *Life* had much in common with its forebear—perhaps too much. Often the magazine seemed dedicated to nostalgia. It did have its high points, though. During the 1980s, *Life* ran emotionally charged stories, such as Donna Ferrato's 1985 piece on domestic violence, which often placed the magazine at the forefront of photojournalism again. And in 1991 the magazine returned to the weekly format as a response to the increased interest generated by the Gulf War. Though short-lived, the experiment was based on the editors' past experiences with increased circulation during wartime. Later in the decade, after returning to the monthly format, *Life* began enjoying profitable years again. The period of economic health lasted

until the late 1990s. At that point, the magazine's new editor dismissed approximately a third of the staff, reverted to *Life's* earlier signature style, and reemphasized photojournalism. These efforts appeared to be working when the announcement of *Life's* second closing was announced. Despite rising revenues, the costs of printing, paper, and distribution proved overwhelming even for a magazine with the backing that *Life* had. Once again, the publishers dangled the possibility of future special issues.

Tellingly, in 2000 *Life* became available in a limited format as an online journal—www.lifemag.com. This digital incarnation of *Life* may prove to be more prophetic than we now realize. The world of photography on paper is losing increasing ground to digital imaging. Perhaps *Life* is once again on the leading edge of how citizens of the world will get their information—the company does continue to control a vast pixilated domain of the world's visual culture.

LIGHT METERS

Light meters (also known as exposure meters) are used to determine the amount of light needed for a given photographic exposure. In many cameras, light meters are often built into the body, and can be made to automatically set the exposure. Handheld light meters are used with cameras without built-in meters, as well as for special metering applications.

The amount of exposure needed on film is determined by the film speed or sensitivity. The light meter is set to this speed to determine the aperture and shutter speed combination that will result in the appropriate amount of density on film. The light meter measures the light intensity of the scene, and then calculates the needed exposure based on the film speed. This exposure is most often given in terms of aperture and shutter speed settings, but can also be rendered in exposure values (EV).

Exposure is a combination of the intensity of the light that reaches the film, and the length of time that light strikes the film. Exposure can be increased and decreased by controlling these two factors. These are controlled by changing the aperture, which controls the brightness, and by changing the shutter speed, which controls the time.

Light meters measure the brightness value of a scene based on the assumption the scene has an average distribution of highlights, midtones, and shadows. The average of these tones is a medium gray, also known as 18% gray. All light meters, regardless of function, rely on 18% as the standard.

Types of Light Meters

The most common form of light meter is the reflected light meter. These meters are most commonly built into camera bodies, but all handheld meters also have reflected metering capability. Reflected meters measure the amount of light being reflected off of the subject and the scene. To take a reflected meter reading, the meter (or the camera) is pointed at the subject or scene to be metered. The meter will then provide readings that will render that scene to the 18% gray standard.

A variation of reflected light meters is the spot meter, which takes a meter reading in a highly spe-

cific area, usually about $.5-3^\circ$ of the total scene (as opposed to the $30-50^\circ$ reading of a standard reflected light meter). Spot meters can be built into a camera system or into handheld meters.

Handheld light meters often have the additional capability of taking incident meter readings. Incident meters evaluate the amount of light falling on the subject. In this manner, the subject's original reflectance values are irrelevant. To take an incident meter reading, the meter is brought to the position of the subject (so that the light falling on the meter is identical to that falling on the subject) and the meter is pointed back toward the lens of the camera. Incident meters use a white dome for a reading, which results in a very wide angle of view (180°). The metered value is calibrated to the 18% gray standard, but it is the light falling on the subject that is placed at this value.

Flash meters are designed to take a light meter reading in the brief burst of light caused by a flash discharge. Flash meters are most often of the handheld variety, and are often capable of both reflected and incident flash meter readings.

Color temperature meters are designed to measure the color temperature of a given light source. Color temperature results in a particular color cast on film that is often not easily detected by the human eye. For example, fluorescent light sources look white to our eye, but render with a greenish cast on film. As every light source has a different color temperature, color temperature meters provide a measurement of that value so that it can be corrected by use of filters while shooting.

Middle Gray

A light meter, regardless of type, assumes that every light source and subject is middle gray, or 18% gray. The 18% gray value is the average of all the possible tones in an image. The assumption that the scene is "average" works fairly well the majority of the time. However, in instances where the scene is not "average," as in an example of a white horse in a field of snow, the meter will render the scene improperly when it places it to 18% gray. The result is a muddy, gray horse and field instead of the white with detail of the original scene. The

solution would be to add two to three stops of exposure to the original meter reading, resulting in greater density on film, which in turn would result in a more appropriate rendition of the original scene.

Other instances when a meter can be “fooled” occurs with scenes that feature high contrast. For example, a scene with a backlit subject will often produce a silhouette of the subject in the photographic print, since the meter will try to average the very light background with the very dark subject. The result is a lack of detail in both areas. The solution would be to get closer to the subject in which the detail is desired, re-meter, and use that setting as the final exposure. The background will still be bright and without detail, but the subject will now be rendered with the desired amount of detail.

Different Meters for Different Scenes

There is no one metering choice for every situation and every scene. Reflected meters are designed to place any subject they are pointing at to 18% gray. The white horse scene mentioned above would render incorrectly if the meter is followed in its exact recommendation. However, knowing the exact tone the meter is to measure can provide an advantage with placement exposure, i.e., placing the tones of the subject based on the middle reading of 18% gray. The white horse scene is the perfect example; knowing the scene would be rendered incorrectly if the meter reading is followed should prompt the photographer to slightly overexpose the scene so that the whites would be white. Reflected meters also have the advantage over incident meters in that they only need to be pointed at the subject. Landscapes and subjects that are very far away are only able to be metered with a reflected meter, because of the impossibility of taking an incident meter reading at such subjects. Reflected meter readings and placement exposure are the building blocks of the Zone System, an exposure and development system developed by Ansel Adams to render the tones of the scene according to the previsualization of the photographer.

Incident meters are used in cases where reflected meters could potentially fail, such as the white horse in a snowy field scene. Since incident meters measure only the light falling on the subject, the subject’s original tones are rendered accurately. Incident meters are a poor choice in scenes with

complex lighting or ones in which the subject is out of easy reach of the camera.

Metering Systems

Built-in light meters often come with a series of metering features in modern cameras. Most modern SLR cameras come with many metering capabilities. The most common metering features are automatic (in that the exposure is automatically set), and aperture and shutter priority. Aperture and shutter priority can be considered semi-automatic, since they each allow you to choose either an aperture that you want (in aperture priority) or the shutter you prefer (in shutter priority). The camera will then set the corresponding shutter speed or aperture needed to obtain proper exposure.

SLR cameras also often come with features designed to make the metering process more accurate. Most in-camera meters “see” the entire scene inside the viewfinder and calculate the exposure accordingly. However, many modern SLRs can be set so that the meter “looks” to the center (center-weighted) for the exposure, or even more specifically, can be set to look at only a few degrees of a scene at a time (spot metering).

Multi-segmented metering systems, also known as matrix metering systems, divide the scene into a series of segments that are each evaluated independent of one another. The overall pattern is then compared to a series of common patterns inside the camera’s memory to give a more accurate exposure. An example of a common pattern would be a darker foreground against a light sky.

LIGHTING AND LIGHTING EQUIPMENT

A photograph can be created only through the action of light on a sensitized emulsion; thus light is the most basic tool the photographer has to apply and the primary skill the photographer has to master. The application of light to a photographic setting can be one of the more perplexing problems a photographer faces, for as any amateur photographer quickly learns, what is seen with the human eye—which has a remarkable range of perception under all sorts of lighting conditions—is not what will be translated onto a photographic image. When photographing out-of-doors, the basic rule is that the photographer should always have the sun behind him/her, yet the range of conditions out-of-doors is vast and no single rule can be applied. In the absence of sunlight; at night or indoors, the most widely used lighting source is the flash on the camera, either built in as on modern point-and-shoot cameras, or a flash attachment. When using flash, the results often are not what the photographer had in mind; harsh shadows and a flattened perspective are just two of the problems with this kind of lighting. Learning how light behaves can have an enormous pay-off in satisfaction and a major improvement in the resulting picture for amateurs. For professionals, lighting is a stock in trade.

Size of the Light Source

The sun is the most frequently used source in the making of pictures. It is a very steady and reliable source and even on a cloudy day there is usually enough light available to make good photographs. It is during the evenings and nights or indoors that some form of supplemental lighting needs to be used. In the case of professional studio photographers their lighting equipment and the predictability that these lights provide is an essential part of their practice.

When the photographer needs to apply light to a subject or scene, it is essential to consider the relative size of the light source and the relative size of the subject to be photographed. The sun is physi-

cally much larger than the earth (by a factor of almost 40 times), but from our vantage point on earth it is a relatively small light source. Although it is brilliant and intense, compared to many structures or objects on earth, it is a relatively small light source. When the light source is relatively small and the subject/object relatively large the following can be expected to happen: the shadows will be strong and deep, the contrast in the photograph will be very high, and every bit of textural detail will be revealed. This can easily be verified on a bright sunny day. The shadows are very strong and can often be captured displaying an almost perfect outline of the objects that cast them.

Under partly cloudy conditions, a new lighting situation arises. The sun now illuminates the cloud, which in turn illuminates the earth, thus the size of the light source has changed. While the sun is still the origin of the light, it is now the cloud that retransmits the light, and its size determines what happens to the shadows and contrast and textural detail. When the relative size of the light source is larger than the relative size of the subject/object to be photographed the following things can be expected to occur: the shadows will be weak or almost non-existent, the contrast in the photograph will be normal or low, and textural detail will not be prominent.

These same lighting situations can be duplicated with almost any form of man-made light. From household light bulbs to extensive strobe systems, all of these can be adapted to what occurs in naturally available light. A simple light modifier can be a white card, where the bulb illuminates the card and the card in turn illuminates the subject. Professional photographers often use white, silver, or gold umbrellas on their strobe equipment to make the light source larger. Sometimes a softbox is used to change the size of the light source. The number of variations is almost endless, and it is what can give a photograph that special “signature” that is often referred to as the style of a certain photographer. Fashion and commercial photographers, such as Horst P. Horst or Annie Liebovitz, often have a

signature style of lighting. Others characteristically utilize flash to create a distinctive lighting environment, Weegee being a famous example.

There are some basic rules that the professionals follow in portrait or people photography. With the emphasis that is placed on youthfulness in our society, most portrait and beauty photographers use very large light sources for their pictures. The reason is that the larger the light source the less prominent any textural detail will be. Textural detail in this instance means wrinkles or slight perceived skin defects and the lighting approach can minimize these defects.

The Key Method of Lighting

One method of thinking about lighting is what is often referred to as the “Key” method. The Key method becomes a necessity when there are two or more light sources used in the picture. The Key method asks a simple question, namely: “What is the character or mood of the picture going to be?” Once the character of the picture has been determined the light source that creates this mood will become the Key light. The Key light will determine the basic exposure and all of the other lights will be balanced to the key light.

Direction of the Light

Where the light comes from is as important as the size of the light source. The character or mood of a photograph is often determined by the angle of the light that illuminates the subject. Top lighting will result in the major portion of the face being cast in deep shadow. A portrait where the light source is small and placed lower than the face will have a disturbing ghoulish effect. A light placed at a 45 degree angle will produce one side of the face that is pleasingly open, but the other side in deep shadow. A light placed behind a person will produce a “halo” effect. All these effects can be modified by use of fill-in lighting or flash, resulting in an almost infinite number of variations of how and where to position the lighting equipment.

A standard method of lighting a portrait is to use a large light source as the main or Key light and a smaller concentrated light coming from the rear towards the camera, but not visible in the picture. The Key light is often slightly above the sitter’s

head, particularly when the sitter is wearing glasses. This reduces the flare that is often seen in the glasses.

Light Modifiers

There are a variety of ways a light source can be changed or modified. A very common modifier is an umbrella, which is used to create more diffuse light that flattens and evens out the tones that are captured photographically. Umbrellas can be sized from 24 inches to well over 6 feet in diameter. The lining of the umbrella is as important as its size in creating diffused lighting; some feature silver reflective material on the inside, others are lined with white or gold foils. The purpose of these linings is to enlarge the light source. Since the basic shape is circular, the light will be cast on the subject in a circular manner.

A soft box is a square or rectangular box made of fabric and a lightweight frame that also enlarges the light source. A soft box provides a very even source of light over the entire surface of the box, but the quantity of light drops off very rapidly outside of the perimeter of the box.

Grids and snoots are tools used to concentrate light and are often used in portraits on the hair portion of the picture. Barn doors are another method of concentrating light onto the subject.

One of the least expensive modifiers can be a piece of plain white cardboard, often called a fill card, which can be mounted onto the camera, a stand, or simply held in the hand while photographing. The purpose of the card is to reduce a shadow by reflecting light from a strobe or bulb.

Flash can be utilized as fill-in to create a more diffused lighting situation when photographing out of doors, even on bright, sunny days. Strong shadows can be minimized by a flash set to two stops more than the speed of the film being used.

Photographers in the twentieth century have endlessly experimented with lighting environments and techniques, from László Moholy-Nagy’s famous “light modulator” experiments at the New Bauhaus (Institute of Design) in Chicago to Man Ray’s experiments with photograms.

O. WINSTON LINK

American

O. Winston Link is known primarily for his extraordinary documentation of the final years of the steam railroad engine and of America's vanishing rural landscape during a five-year period between 1955 and 1960. His lifelong fascination with railroading, combined with the knowledge that the era of the steam engine was indeed passing, had prompted this documentation. When his bold black and white, night-time photographs of trains were first exhibited several decades later in 1983, he was linked evermore with his subject.

Named after two maternal ancestors who served in the United States Congress in the nineteenth century, Ogle Winston Link was born December 16, 1914 in Brooklyn, New York to Earnest Albert Link and Ann Winston Jones Link. Link's father, Al, was an elementary school carpentry teacher and Ann a homemaker. Introduced to various technical activities by his father, Link's career trajectory in the manual arts is attributed to his father's influence. As early as four years of age, Link was enthused by trains when he glimpsed a toy train set in a department store window. On day trips with his father, Link shot New York harbor and other landmarks. Trains were also frequent subjects of his adolescent photography as he haunted rail yards and railroad hubs in New Jersey. A self-taught skilled amateur photographer, Link developed his film at home and printed the photographs with an enlarger that he built.

While attending Manual Training High School in Brooklyn, Link served as the photographer for the yearbook. But from an early age, his father had convinced Link to become a civil engineer, and Link won a scholarship to attend Polytechnic Institute of Brooklyn (now Polytechnic University). His interest in photography was sustained, however, as he served as the photo editor for the yearbook and photographer for the class newspaper. Link supplemented his income by shooting weddings on the weekends.

After earning his degree in 1937, Link was offered a position as publicity director for the public relations firm Carl Byior and Associates; he accepted thinking it would do until he landed a job in his field

of engineering. Link applied his technical skills, refined aesthetic, and sense of humor to each assignment he received, mastering the ability to stage a photograph yet make it seem spontaneous and natural, the necessary components of public relations photography. One of his photos for a new type of heat-resistant glass was described by *Life* magazine as a classic publicity picture.

In 1942, he left Carl Byior to work on a research initiative at Columbia University, New York, that advanced the war effort. Deafness in one ear had prevented him from serving in the military; however, he used both his civil engineering knowledge and technical skills in photography on several projects. Link helped develop a device that detected enemy submarines from low-flying planes. He worked on capturing the speed of bullets on film, and documented the commercial research company, Airborne Instruments Laboratory in Deer Park, Long Island. Ignoring the wartime ban on railroad photography, he shot steam engines on the Long Island Rail Road, whose tracks lay adjacent to the laboratory, thus renewing his interest in a favorite subject.

His desire to capture the drama of trains at night inspired him to work with other engineers to develop radio signals that would activate a series of flashes that would illuminate his subject. The project failed because the metal bulk of the trains interfered with the radio signals, which could not activate all of the lights. As well as depicting the afterburner effect of jet airplanes taking off, Link solved other scientific and photographic problems during his years at the laboratory. Although the strobe photography of Harold Edgerton is better known, Link also used strobe lights and adapted them for synchronized flashes, which became a valuable technique that he would brilliantly apply to his most celebrated work.

After the war, Link went into business for himself as a commercial photographer specializing in industrial subjects. First working out of his parents' house, he eventually rented space in Manhattan in 1949. Link's clients included top advertising agents and companies like B.F. Goodrich, Alcoa Aluminum, and Texaco, though he accepted occasional assignments from the *New York Times* and various fashion houses.

While on assignment to take photographs of air conditioning systems for Westinghouse in Staunton, Virginia in 1955, Link drove a dozen miles to Waynesboro to watch a Norfolk & Western train that was passing through. After a rail worker's invitation, Link toured the train yard, repair shop, and refueling facilities, where his enthusiasm mounted until he spotted a steam engine at work. At that time in the mid-1950s, the major railroads had traded their steam engines for diesel-powered engines, but the Norfolk & Western still powered their locomotives by steam.

After returning to New York and excited by the potential of photographing the railway at night, Link submitted a proposal and several prints that he had taken to the head of Norfolk & Western, asking permission to document the trains, people, and property along the railway's route. Link advanced his cause by pointing out the absence of night photographs of trains, though his preference for night shooting stemmed from his desire to control lighting that could not be accomplished in daylight. Given access to the line, Link, along with his assistant (and later biographer) Thomas Garver, filled the time between his commercial assignments by covering the line's route, which wound through Virginia, North Carolina, West Virginia, Kentucky, and Ohio. During the five years that he spent on this venture, financing it completely with his own funds, Link employed a specially designed and coordinated series of flashes at night to depict his subject. Relying upon his scientific training, Link intricately placed lighting in the areas that he wished to film, sometimes taking days to set up for a complex shot in which he simultaneously used three 4 × 5-inch view cameras. Such dramatic images as *NW1/Train No. 2 Arriving at Waynesboro, Virginia*, 1955; *NW 723, Cow 13, Norvel Ryan and his Son Bringing in the Cows, Train No. 3 in the Background, Shawsville, Virginia*, 1955; and *NW 821 Luray Crossing with Y-6 Locomotive and Freight, Luray, Virginia*, 1956, resulted.

Link's charming personality won him friends among the rail workers who rallied when Link requested that engineers back trains up for another shot or create white steam on demand to synchronize with his shots. Understanding the interdependence between people and technology, Link integrated rail workers, as well as people who lived in the surrounding communities, within his images, thus illustrating how the engines affected daily life and how the railroad's active, loud, churlish personality was a member of the community.

Following the running of the last steam engine in May of 1960, Link sought publishers who would be

interested in a book-length treatment of the Norfolk & Western photographs. His failure to secure a publishing contract forced him to lock away his negatives and try to market sound recordings that he made of the steam engines. Few of his images were published in national magazines and it was not until 1976 when the Museum of Modern Art, New York, acquired six of his photographs for the permanent collection that any professional interest was expressed in his images. After Alan Ripp's 1982 article in *American Photographer*, solo exhibitions of Link's Norfolk & Western photos were launched in London and in the United States the next year, thus broadening the audience for Link's work. Retiring in 1983 to Mount Kisco, New York, Link was recognized as the only photographer shooting at night during the period from 1940 to 1970. Link's other significant project was documenting the erection of the Verranzo Bridge linking Brooklyn to Staten Island in 1960.

Remarkable for his planning, his ability to set up the shot and envision the outcome, coupled with his commitment to perfection, resulted in Link's depiction of the relationship between industry and humanity. His techniques lent an otherwise innocuous scene the ability to evoke a second and third look from his audience. Most importantly, Link recorded a time and place in America that otherwise would have remained hidden from view. The History Museum and Historical Society of Western Virginia has set up an O. Winston Link Museum in Roanoke, Virginia, to preserve and disseminate Link's remarkable historical and cultural legacy.

Biography

Born in Brooklyn, New York, 16 December 1914. Attended Polytechnic Institute of Brooklyn, Brooklyn, New York, B.A., 1937. Tau Beta Phi, 1936. Public Relations Director, Carl Byior and Associates, 1937–1942; research engineer and photographer for the Airborne Instruments Laboratory, Office of Scientific Research and Development, Columbia University, 1942–1945; self-employed industrial and commercial photographer, 1942–1987. Died 30 January 2001 in Katonah, New York.

Individual Exhibitions

1983 *Night Trick*; The Photographers' Gallery, London, England, and traveling
 1983 Akron Art Museum; Akron, Ohio
 1983 International Center of Photography; New York, New York
 1983 Chrysler Museum; Norfolk, Virginia

LINK, O. WINSTON

- 1983 Museum of Science and Industry; Chicago, Illinois
1983 Houston Center for Photography; Houston, Texas
1983 Museum of Contemporary Photography; Columbia College, Chicago, Illinois
1983 The Madison Art Center; Madison, Wisconsin
1996 *B & W and Color Photographs*; John McEnroe Gallery, New York, New York
1998 *Trains that Passed in the Night: The Railroad Photographs of O. Winston Link*; Sheldon Memorial Art Gallery and Sculpture Garden, Lincoln, Nebraska, and traveling
1998 *Vintage Contact Prints from the Early Years 1937–1952*; Robert Mann Gallery, New York, New York
2003 *Steam Power Railroad Photographs of O. Winston Link*; University of Virginia Art Museum, Charlottesville, Virginia
2004 *Arrested Motion: 1950s Railroad Photographs by O. Winston Link*; Fenimore Art Museum, Cooperstown, New York

Group Exhibitions

- 1998 *UTZ: A Collected Exhibition*; Lennon, Weinburg, Inc., New York, New York
1998 *Flashback: The Fifties*; Bonni Benrubi Gallery, New York, New York
2000 *O. Winston Link, George Tice*; Robert Klein Gallery, Boston, Massachusetts
2000 *The Steam Locomotives of 20th Century—Naotaka Hirota and O. Winston Link*; Kiyosato Museum of Photographic Arts, Yamanashi, Japan
2002 *Photographs We Know, Iconic Images*; Fahey/Klein Gallery, Los Angeles, California
2003 *Enchanted Evening*; Yancey Richardson Gallery, Chelsea, New York

- 2003 *Only Skin Deep: Changing Visions of the American Self*; International Center of Photography, New York, New York, and traveling

Selected Works

LINKED RING

The Linked Ring, also known as the Linked Ring Brotherhood and officially the Brotherhood of the Linked Ring, was a group formed in London in May of 1892. It was composed of photographers interested in furthering their ambition to elevate the practice of photography to that of the other fine arts mediums such as painting or the graphic arts. Though not synonymous with the Pictorialism movement, many of the aims of that movement were the aims of the Linked Ring, especially in establishing high standards of technical quality that was greatly expressive, differentiating themselves from the burgeoning numbers

of amateur photographers, and quickly developing commercial applications. Unlike Pictorialism, the associates of the Linked Ring generally aspired to creating photographs that successfully exploited the unique qualities inherent in the medium and not necessarily in subservience to the forms and conventions of painting. The aesthetic aims of the Linked Ring, however, tend to be blurred with those of Pictorialism due to the fact many Pictorialists were involved in this group along with other, later secessionist groups, particularly the American Photo-Secession (founded in 1902).

Chief among the founders were leading nineteenth century photographers Henry Peach Robinson (1830–1901), George Davison (1854/6–1930), and Alfred Maskell (active 1890s), author of the influential publication *Photo-Aquatint, or the Gun-Bichromate Process*, whose increasingly acrimonious relations with the Photographic Society of London (renamed Royal Photographic Society [RSP] in 1894) and resignation from the Society in 1891 led to the idea of the Linked Ring. Through this organization they could not only better further their ideas, but express their dissatisfaction with the RPS. This venerable institution did not distinguish among the various types of photographic practice, considering all photographs equal. This notion was especially inflammatory in the area of “scientific” versus “artistic” applications. As well, RPS often hired individuals with no experience in the medium, such as sculptors or painters, to jury their prestigious annual exhibitions, and prizes were awarded, despite many feeling it unfair to judge one photograph as “better” than another. The organization was a loose federation of like-minded individuals, and featured no board of directors or officers, and to which members were elected based solely on the existing members’ judgment of the artistic value of their work.

Other well-known founders of the Brotherhood were Frank M. Sutcliffe (1853–1941), who captured lush Yorkshire landscapes; Paul Martin (1864–1944), known for his engagingly natural, candid portraits; Alfred Horsley Hinton (1863–1908), a leading landscape photographer who was also a popular judge for photographic exhibitions as well as the editor of the influential and popular magazine *Amateur Photographer*; and Frederick Hollyer (1837–1933) known for his beautiful Platinotype portraits of late-nineteenth century literary and artistic figures.

Chief among the Brotherhood’s activities was the establishment of an exhibition that would serve as an alternative to the RPS exhibitions and those of other groups. Called the Photographic Salon, to associate it with the annual painting salons organized in many European capitals, it first appeared in 1893. The eminent Scottish photogravurist J. Craig Annan (1864–1946; elected to the group in 1894) and Frederick H. Evans (elected in 1900) served as the exhibition’s first directors. In keeping with Linked Ring ideals, no medals or prizes were awarded. The Photographic Salon was extremely successful and became an important annual event in the world of fine arts photography, later being known as the London Salon.

As well, the Brotherhood published an annual titled *Photograms of the Year*, which like the Photo Club of New York’s publication *Camera Notes* and the Photo-Secession’s later *Camera Work*, served to spread the image of advanced photographic practice around the world.

Leading American Pictorialist and photographic champion Alfred Stieglitz, who had been elected to membership in 1894 took notice, founding his own group with essentially the same ideals, the Photo-Secession. Leading Pictorialist photographer Gertrude Käsebier, who worked out of a well-respected professional studio in New York, was the first woman to be elected to the Linked Ring in 1900. Another early female member was Canadian Minna Keene (1861–1943); in 1908 Keene was also the first woman elected as a fellow to the Royal Photographic Society.

Though but a loose organization, the Linked Ring exhibited characteristics typical of many groups; internal dissent and rivalries began emerging, especially after 1905. By this time, many of the members of the Photo-Secession had also become members of the Linked Ring, raising concerns among the originators of the group at the British group being dominated by Americans. At the 1908 Photographic Salon, it was determined a majority of displays were by Americans. Reactions included a “Salon des Refusés” of photographs not admitted to the Salon mounted at the offices of *Amateur Photographer*. Still in the majority, the British members changed the rules for the following year’s Salon, leading to the resignation of several influential Americans including Stieglitz and Clarence White. The success of the Salon des Refusés and continuing discord within the Brotherhood led to the Linked Ring being dissolved in 1910. The London Salon of Photography, which mounts an annual exhibition with a continuous history to the present day, has roots in the Linked Ring. In a historical irony, many of photographs by and archives of the founders of the Linked Ring can be found at the Royal Photographic Society.

HERBERT LIST

German

Herbert List figures as one of the most important German avant-garde photographers of the 1930s and 1940s. Although List was rightly named one of the most important German photographers in the post-war years, he was nearly forgotten in the 1960s and 1970s. One reason he was again recognized in the 1970s was that his art recommended itself to the concerns of the last years of the twentieth century: formal innovation, the exploration of the self, and he did not fit without contradiction into either *Neue Sachlichkeit* (New Objectivity) or Surrealism—the trends dominating Germany during his formative years.

Central to this new reception of List's works were his surrealist still lifes created in the 1930s. Already at that time the critic Egon Vietta had emphasized the metaphysical aspects of List's works and connected them to the works of Giorgio de Chirico, Carlo Carrà, and the painting of the *Pittura Metafisica*. In the unique aura of his puzzling still lifes List positioned objects so that the light endowed them with surreal qualities and metaphysical elements. List himself speaks of a "mysterious marriage" that the objects celebrate with one another, and that he intended "to reveal the magical substance within them."

André Breton and the Paris Surrealists influenced List's early works. List seized on such artistic techniques as double exposure, and he combined objects in a way that recalled the works of poet Comte de Lautréamont. In these works, List does not combine objects that are essentially foreign to

each other; he tears objects from a shared context and then they establish a wonderful correspondence with each other. Borrowing from Surrealism, List developed his own formal language using elements of neo-classicism that dominated advertising art and fashion in the 1920s.

List's works from the 1930s show the influence of themes from Greek antiquity. Two themes that move through his entire oeuvre are images of Greece and photographs of young men. List's interest in Greece was nurtured by a humanist education as well as the high esteem Greeks placed on the love of boys; this was the image of ancient Greece promoted by the poet Stefan Georgh that Friedrich Gundolf then conveyed to List, whom he met during List's short stay as a student at the University of Heidelberg.

In 1937, List embarked on a trip to Greece that lasted a number of months. There he photographed temples and sculptures of classical Greece as well as the landscape, architecture, and residents of the islands. He composed these photographs so the ruins of antique temples would have a monumental appearance.

His photographs also included everyday objects, such as clothing mannequins he photographed along the streets of Athens, fishing nets, and beach-front bars. He staged these in photographs that can only be described as magic realism. The works were exhibited in the Galerie du Chasseur d'images in Paris and were the first to earn List recognition. He then published photographs in *Harper's Bazaar*, *Verve*, *Photographie*, and *Life*. The publication of the book *Licht über Hellas*

(Light over Greece), which was to be printed in 1939 by the Paris publishing house Arts et Métiers Graphiques, did not happen. In 1945, the plates were destroyed in a printing press in Magdeburg during a bombing campaign. The book finally appeared in 1953.

The male body and its representation is a central theme that can be traced throughout List's entire work. His first photographs were taken on the beaches of the Baltic Sea, and List's photographs often invoke nature as a snapshot of an ideal, timeless, utopian vision of masculinity that celebrate the cult of eternal youth and the beauty of beautiful men. Most of List's photographs of young men were never published when they were taken. In the 1930s and 1940s, photographs of male nudes could have put List in acute danger because his pictures of young male bodies could not be reconciled with the image of the body held by the National Socialists. This is true even though List's perspective and monumentalization adopted the reigning aesthetic of the 1930s and suggests the political climate of the time. In using the ancient Greek image of the body, ancient models of the ideal physique became central to his work. They are recorded in the aesthetic ideal of ancient Greek sculpture and the athletic figures they represent. The play of light and shadow became a decisive element in his compositions. These echoed back to the invigorating effect created in his photographs of store window mannequins and to his series of Viennese wax figure works titled *Präuschers Panoptikum*, which seemed to bring the artificial human figure back to life.

After the war ended, List began work photographing ruins of the destroyed city of Munich, focusing on the baroque and classical structures of a city so renowned for its architecture that it was called "Isar-Athens," or Athens along the Bavarian river Isar. These photographs, made in glistening light, created an aesthetic experience that linked his images of Greece with the ruins of Germany. In the immediate post-war period, this representation of destruction—one wholly deprived of moralizing—met with no interest and no possibility for publication.

Beginning in the 1950s, List turned away from the symbolic arrangements of still lifes and architecture and concentrated on the representation of people. List substituted individual images with the photographic essay. He took photographs showing daily life in places like the Trastevere quarter of Rome or the city of Naples, and these works became his greatest contributions to *Life* magazine. The form of the book also became more important

to his photography. Between 1945 and 1947 List self-published many of his most important photography projects with private publishers. Books he readied for publication include, *Zeitlupe Null* with metaphysical still-lives, *Augenblicke* with photographs of encounters with people, *Ver Sacrum* with photographs of young men, and the volume of photographs *Panoptikum* with photographs from a wax figure works. However, up to the *Panoptikum*, List's projects were collections of individual photographs. However, in his books *Rome* (1955), *Caribia* (1958), about the island world of the Caribbean, and *Napoli* (1962), the concept of series became the defining element. In the 1950s, List produced reportage projects with emotional themes that displayed his interest in people and the shift in his works to human interest photography. From that point forward List's works conveyed a sensitivity toward humanity and his attention often focused on the lives of simple people. These included the Indians on coffee plantations in Mexico and the black population on the Caribbean islands, their customs and religious rituals. His first experiments with color photography appeared in 1960 in the magazine *Du*.

RICHARD LONG

British

Richard Long's exhibited and published work is most frequently seen and, arguably, most consistently brought to mind through the medium of photography. Beginning his career in the late 1960s with anonymous, impermanent works that combined walking and different forms of recording

and mediating the experience of natural landscape, Long set upon a course of development that he found allowed numerous variables, including the use of photography. His poetic, meditative work was increasingly recognized in Europe and the United States during the following decade. By the mid-1970s he was established as an artist of international standing. In a manner that is characteristically

understated and pertinent, Richard Long has described his work as: “Art made by walking in landscapes. Photographs of sculptures made along the way. Walks made into textworks” (<http://www.richardlong.org/>).

Born in Bristol, England, in 1945, Long attended Bristol School of Art, gaining a Diploma in Art and Design in 1966. He went on to study fine art although not specifically photography at St. Martins School of Art during 1966–1968. He made his first works of art by means of walking in landscape in 1967 including the piece *A Line Made By Walking*. Emerging as part of a new generation of British artists who were to achieve international importance, including Victor Burgin and Gilbert & George, his first major exhibition was staged in the Galerie Konrad Fischer, Dusseldorf, in 1968. He began to make works specifically for gallery installations including *Three Circles of Stones* for *The New Art*, held at London’s Hayward Gallery in 1972. Richard Long’s work has also been frequently shown in group exhibitions, which showcase different approaches to topography and temporality (for example *Time, Place, Space: Richard Long, On Kawara, Lawrence Weiner* at the Galerie Ghislaine Hussenot, Paris in 1990) or which seek to align him to the Earth Art movement, such as *Magiciens de la Terre*, held at the Centre Georges Pompidou, Paris, in 1988.

Establishing a clear line of influence upon Richard Long’s art or attaching him to art movements is a task that yields inconclusive results. This is partly explained by the artist’s reticence to say much on the subjects but also because movements such as Earth Art (making art in, and of, the landscape—a movement alternatively know as Land Art) or art practices associated with the production of series or with the combination of image and text, offer only partial insights into a working method that *de facto* is the work, and which is pursued alone and independently. Long, however, is on record for admiring, at an early stage in his career, avant-garde composer and artist John Cage’s use of pace, time, and rhythm in works such as *Indeterminacy*. More recently, he has expressed a liking for the work of some of his contemporaries, including American conceptualist Lawrence Weiner. Long also links himself to a long cultural history of walking that includes practices of religious pilgrims and wandering Japanese poets. Because he uses potent and universal symbolic forms in his work such as straight lines, spirals, and circles, Long has frequently been viewed as part of the ancient tradition of constructing ritual earthworks, as well as being seen to be conceptually attuned to the mysticism of both Zen

Buddhism and Shinto. He has incorporated “musical whispers” drawn from the popular music (for example, Bob Dylan’s *You Ain’t Goin’ Nowhere*) in the titling of some of his pieces and in some textworks. His own admirers range widely across the creative arts and include musician and producer Bill Drummond of KLF, as well as numerous visual artists such as fellow British conceptualist Hamish Fulton, an occasional walking companion for Long.

As it has developed, single or serial photographs with descriptive titles attached to the photographic works as texts, have become a key element within Richard Long’s art. The majority of these photographs are monochrome prints, but color is used where it is deemed to add meaning to the work, as is the case with the 30 different delicate color modulations that form the series *No Where: A Walk of 131 Miles Within An Imaginary Circle In The Monadhliath Mountains* of 1993. Camera technology is kept simple and straightforward with a preference for the Nikkormat camera.

Photography is important to Long because the speed of execution inherent in the medium allows transient impressions to be registered and also because photography offers the artist yet another form of physical engagement with the world. This latter consideration is an important factor for an artist for whom the idea of touch has been used literally and metaphorically in the form of walking, as well as in the making of landscape artworks, which combine natural materials and the elements.

In the process of making work, these mediations with nature take many different forms in works, which are sometimes created near to home but frequently in far distant, sometimes geographically remote, locations. They include the surface indentations made into the earth by walking, which were photographed for *A 2½ Mile Walk Sculpture* of 1969; the stones thrown in a circle photographed for *Throwing Stones Into A Circle* of 1979; and the artist’s body impression, which was photographed for *Sleeping Place Mark* of 1990. Such photographs of works made on site are viewed by the artist to be “the appropriate way for that place to become art in the public knowledge” and therefore to reach an audience (Giezen 1985, 3).

Photographs appear in Long’s gallery exhibitions and publications as a means of bringing the work to an audience but, at the same time, they are also intended to function in their own right and are not mere “copies” of what might be experienced when apprehending the artist’s sculptures *in situ*. This distancing from the simplistic idea that what is shown in a gallery replicates what would be

encountered on site is carried through to the frequent use of quarry stones obtained from sources near to exhibition locations rather than the use of materials removed from the landscape sites of the sculptures. Far from being “copies” of experiences of apprehending the sculptures (which may or may not still exist) the photographs of the sculptures are now considered by many as the crucial production of meaning in his work. Following on from this, it has been argued that the artist’s photographs cannot be easily pulled apart from the creative act itself and are therefore an integral part of it.

Richard Long invariably involves himself in all aspects of the presentation of his work in gallery exhibitions and in publications, many of which are in fact artists’ books, a medium that was instrumental in Long’s early success. A case in point is *Walking in Circles* shown at London’s Hayward Gallery in 1991. Here he worked closely with the exhibition organizer in the selection and installation of the works, and he collaborated with the graphic designer in the production of the book that accompanied the exhibition. Such attention to detail can variously be seen in the *Walking in Circles* publication in the recreation of one of the exhibits as a blind embossed design on the binding, in the titling of the different sections of the book, and in the choice and ordering of the photographs.

Examples of work are in important private collections such as the John Haldane Collection and in numerous art museums and photographic collections of the first rank such as the Museum of Modern Art, New York.

Biography

Born in Bristol, England, on 2 June 1945; continues to make this location his home. Attended Bristol School of Art from 1962, gaining a Diploma in Art and Design in 1966. Fine arts study at St. Martins School of Art (now part of the London Institute) 1966–1968; no formal photography training. Begins association with Galerie Konrad Fischer, Dusseldorf, Germany, and Galerie Yvonne Lambert, Paris, France, late 1960s. Becomes associated with Anthony D’Offay Gallery, London, late 1970s. Awarded Kunstpreis Aachen, 1988, and the Turner Prize of the Tate Gallery, London, 1989; Chevalier de l’Ordre des Arts et Lettres, by the French Ministry of Culture, 1990.

Individual Exhibitions

1968 *Richard J. Long: Sculpture*; Galerie Konrad Fischer, Dusseldorf, Germany

- 1969 *Richard Long*; John Gibson Gallery, New York, New York
Richard Long—Sculpture; Galerie Yvonne Lambert, Paris, France
- 1970 *Richard Long*; Dwan Gallery, New York, New York
- 1971 *Richard Long*; Gian Enzo Sperone, Turin, Italy
Richard Long; Art & Project, Amsterdam, Holland
Richard Long; Whitechapel Gallery, London, England
Richard Long; Museum of Modern Art, Oxford, England
- 1972 “*Projects*” *Richard Long*; Museum of Modern Art, New York, New York
- 1973 *Richard Long*; Stedelijk Museum, Amsterdam, Netherlands
- 1974 *Richard Long*; John Weber Gallery, New York, New York
Richard Long; Scottish National Gallery of Modern Art, Edinburgh, Scotland
- 1975 *Richard Long: River Avon Driftwood; Crossing Two Rivers/Minnesota/Wiltshire*; Art & Project, Amsterdam, Holland
- 1976 *Richard Long*; Gian Enzo Sperone, Rome, Italy
Richard Long: River Avon Driftwood; Arnolfini, Bristol, England
Richard Long; Art Agency, Tokyo, Japan
- 1977 *Richard Long*; Whitechapel Gallery, London, England
Richard Long; Gallery Akumalatory, Poznan, Poland
Richard Long; Kunsthalle, Berne, Switzerland
Richard Long; National Gallery of Victoria, Melbourne, Australia
Richard Long; Gallery of New South Wales, Sydney, Australia
- 1978 *Richard Long*; Halle für internationale neue Kunst, Ink Gallery, Zurich, Switzerland
Richard Long; Ausstellungsraum Ulrich Ruckreim, Hamburg, Germany
- 1979 *Richard Long: The River Avon*; Anthony D’Offay Gallery, London, England
Richard Long: Sculpturen en Fotowerken; Van Abbe-museum, Eindhoven, Netherlands
- 1980 *Richard Long*; Fogg Art Museum, Cambridge, Massachusetts
- 1981 *Richard Long*; Graeme Murray Gallery, Edinburgh, Scotland
Richard Long; David Bellman Gallery, Toronto, Canada
Richard Long; Centre d’Artes Plastiques Contemporains de Bordeaux, Bordeaux, France
- 1982 *Richard Long*; National Gallery of Canada, Ottawa, Canada
- 1983 *Richard Long Exhibition*; Century Cultural Centre, Tokyo, Japan
- 1984 *Concentrations 9: Richard Long*; Dallas Museum of Art, Dallas, Texas
- 1985 *Richard Long*; Malmo Konsthall, Malmo, Sweden
Il Luogo Buono: Richard Long; Padiglione d’Arte Contemporanea di Milano, Milan, Italy
- 1986 *Piedras: Richard Long*; Palacio de Cristal, Madrid, Spain
Richard Long; Solomon R. Guggenheim Museum, New York, New York
Richard Long; Porin Taidmuseo, Porin, Finland
- 1987 *Richard Long*; Musee Rath, Geneva, Switzerland
Richard Long; Centre Nationale d’Art Contemporain, Grenoble, France

LOOK

First published in 1937, *Look* magazine was a bi-weekly general interest magazine, one of the first and longest-running pictorial magazines in American publishing history. Gardner Cowles, Jr., son of an Iowa publishing family responsible for several key media acquisitions in the Des Moines area, launched

Look as a competitor to Time's *Life* magazine (whose publication lifespan mirrors *Look*'s). Because the Cowles media group continued to acquire new publications, *Look* was subsequently published under various company names: Look, Inc. (1937–1945); Cowles Magazines (1946–1965); and Cowles

LOOK

Communications, Inc. (1965–1971). In its early years (prior to World War II), *Look*'s content consisted primarily of sensational tabloid spreads about celebrities, fashion, sports figures, strange “news” items, and other popular trends. After WWII, the magazine assumed a more family-oriented focus, with regular features, such as fashion, food, sports, and popular entertainment, as well as special features on current health issues, developments in medicine and technology, social issues of the day, and political affairs. When *Look* ceased publication of the magazine in 1971, Gardner Cowles, Jr. gave the entire archive of negatives to the Library of Congress in Washington, D.C.

When *Look* came into the market, in an economy still struggling back to its feet from the Depression of the previous decade, many people were either out of work or underemployed; this was no less true for photographers. *Look* therefore enjoyed a ready pool of potential staff, and employed a substantial number of photographers full-time. In a given year, *Look* maintained a roster of 10 to 12 full-time photographers, in addition to at least as many freelance photographers. Several of the regular staff photographers at *Look* had experience with documentary photography, such as Stanley Tretick and Tony Vaccaro, both of whom served as photographers for the military. Many others had worked for the federal government's Farm Security Administration (FSA) project or the Office of War Information (OWI) projects prior to their tenure at *Look*, among them Russell Lee, Arthur Rothstein, and John Vachon. The success and timing of the FSA project, in particular, may have played a significant role in paving the way for photojournalism publications such as *Look* and *Life*. In America's pre-television era, before the overwhelming ubiquity of visual culture, pictures were still fresh and new. The public response to the images in the FSA collection was tremendous, not only because of the innovation and artistic achievement they represented, but because they communicated in a new way the hardships, character, and personal effort of working people across the country—entirely in pictures. At a time when the country was preparing itself for international combat, it is no wonder that Americans were especially receptive to images that consolidated and magnified the cultural and political climate of that era. The FSA images, in many ways and almost instantaneously, distilled public sentiment by creating a visual lexicon of American culture and character. Whether fortuitously or by design, *Look* was well-positioned to capture this public yearning for symbols, to harness that mixture of escapism and glamour, grit and gumption,

nationalism, and local pride that so characterized mainstream American culture around WWII.

Look's “golden years” (1954–1964), corresponded to a surge in readership across the industry, due largely to economic recovery following the war, as well as the thicket of political issues arising from a new period of social change. *Look* remained competitive by covering the “serious” issues. One of its more notable efforts is the January 1956 issue, whose feature article, titled “The Shocking Story of Approved Killing in Mississippi,” carried an exclusive interview with Roy Bryant and J.W. Milam, two men accused (but not convicted) of the murder of Emmett Till just three months prior. During the interview, Roy Bryant and J.W. Milam actually confess to the murder. While *Look*'s reporting drew some criticism (Roy Wilkins, Executive Secretary of the NAACP at the time the story went to print, questioned the veracity of Bryant and Milam's account of Till's activities prior to the murder, while other readers, sharing their comments in letters to the editor, objected to coverage they considered overly-prescriptive and condemning), there is no doubt that, in the minds of mainstream America, this was a bold editorial decision that augmented *Look*'s image as a serious journal of record.

The two- to three-month production cycle at *Look* meant that feature stories were sometimes less than timely or relevant. *Look* endured an embarrassing flap when it published the results of an opinion poll related to the 1964 presidential election just a few weeks after the assassination of John F. Kennedy. *Look*'s desire to inform and stimulate without adversely provoking or challenging its readers imposed another limitation on its effort at hard-hitting news coverage. As a counterbalance, the magazine padded its political coverage with lifestyle and food sections, celebrity profiles and product surveys aimed at a thriving—and increasingly competitive—consumer market: women. *Look*'s increased pitch to the female consumer found its home in regular features such as “For Women Only,” which highlighted unconventional and often frivolous “trends” in fashion and leisure, from Vivienne Colle patchwork dresses to jeweled hosiery and two-person ponchos.

Look's shift in content and design to a more family-oriented, consumer-friendly format is widely attributed to the editorial influence of Fleur Cowles, Gardner Cowles' wife and associate editor at *Look* from 1947 on. Fleur (née Fenton) worked for a short time with the Truman Administration before marrying Gardner Cowles and, shortly thereafter, assuming her role on the magazine's staff; it is often noted that her influence began informally—with suggestions in the

form of notes tucked into Gardner Cowles' papers—and was a primer for subsequent positions with *Quick*, another Cowles publication, and her own brainchild, *Flair* magazine, a short-lived but influential art, culture, and lifestyle magazine, featuring innovative design and formatting, sophisticated layouts, and a more fluid organizational structure attributable to Fleur's interest in Surrealism.

Appeals to female readers and the presence of Fleur in a prominent position did not necessarily bridge the gender gap of the era. In an interview with the American Society of Media Photographers (ASMP), Charlotte Brooks, a veteran *Look* photographer, described the mixed blessing of being the only woman photographer on staff for the duration of her 20-year tenure at *Look*. Brooks described a definitively discriminatory work environment, where she was paid less than her male counterparts and assigned to a restricted slate of stories deemed appropriate for women. At the same time, Brooks enjoyed tremendous professional opportunities. As she explained:

I think it had to do in part with the nature of the assignments. Although I enjoyed everything, the other people used to hate "All-American Cities" and "What is a Teacher?" But I had a marvelous time; I loved all of it. The people involved were interesting people, and it was always so wonderful to be able to go out as Miss Look. I think I got a little bit of a head about that. You were not yourself at all, nobody would know your name, but you represented a powerful organization and it had some meaning.

(American Society of Media Photographers, Charlotte Brooks interview, October 4, 2004)

In general, *Look* photographers, many of whom remained at the magazine until its final days in 1971, enjoyed a considerable degree of creative freedom as the result of *Look*'s production methods. Images were processed as "jobs" rather than "assignments," which

meant that photographs that were not selected for a specific story might still be used at a later date. This procedure, in addition to *Look*'s photographic format, afforded its photographers considerable license and authorship in their work, as most were collaborations between photojournalist and writer. *Look* provided steady employment for many professional photographers, offered unprecedented opportunity for young artists, and launched the careers of several notable photographers, among them Stanley Tretick, made famous for his photographs of John F. Kennedy, and fashion photographer Douglas Kirkland, whose portraits included such luminaries as Marilyn Monroe, Marlene Dietrich, and Elizabeth Taylor.

URS LÜTHI

Swiss

Born in 1947, Urs Lüthi belongs to the generation of European artists whose aesthetic programs were decidedly influenced by the challenge to traditional

thinking about artistic production and distribution that came to a head in the events and aftermath of 1968. In particular, the artistic practices of this generation were fueled by Harold Szeeman's influential 1969 exhibition at the Kunsthalle Bern, *When*

Attitude Becomes Form, which famously brought a number of American post-minimalist artists and European conceptualists together to present a model of art as an idea manifest in an action.

A Swiss national who spent some time working as a graphic artist, Lüthi's long and prolific career culminated in the prestigious invitation to represent Switzerland at the 2001 Venice Biennial. His work, which largely centers around self-representations in a number of media, has been described as both body art and conceptual, and although Lüthi was undoubtedly influenced by movements like Fluxus and Conceptual Art, his work resists strict categorization, and he did not align himself with any particular group or charter. Given to experimentation in a variety of media and presentation, including photography, performance, painting, video, installation, and even graphic design, Lüthi's work has been varied and not always conceived of as coherent, especially in the United States where he has received significantly less attention than in Europe. However, it is indisputable that Lüthi's photographic work—especially his self-portraits—have had an important, if not seminal, role in redefining the use of photography as an autonomous art form in the latter half of the twentieth century. Of crucial concern to his oeuvre are recurrent questions regarding the relationship between truth and representation, or as he suggested in a 1974 statement, the tenuous line between subjectivity and objectivity. For Lüthi, “perhaps the most significant and creative aspect of my work is ambivalence as such...Objectivity is not important to me; all is objective just as all could be subjective” (Lüthi 2001, 9).

It therefore makes sense that Lüthi's earliest artistic investigations led him to an investigation of photography and to the self-portrait in particular, since, in the days before Roland Barthes's seminal reflections on the photographic medium, for example, photography itself was still largely conceived of as a vehicle of truth. On the other hand, the self-portrait had long been historically understood as the artist's means to evidence an interior truth, to make public a very private self. Lüthi's earliest self-portraits, however, were largely in “disguise,” as if to suggest the impossibility of a communicable stable subject. In particular, the most famous of his self-portraits pictured him in various poses as a woman, such as the sultry *Self-Portrait* (1971), which suggests comparison to Man Ray's photograph of *Marcel Duchamp as Rose Sélavy* (1920–1921), or the tellingly titled *I'll Be Your Mirror* (1972), and the famous *Lüthi Also Cries For You* (1970). Not only did these images question traditional gender norms,

they also positioned photography as an art form in its own right. They were printed on canvas, de-emphasized the role of the artist as implicated in self-revelation, and instead constructed a model wherein the artist would serve as a vessel for an externally imposed quest. As he did in a 1970 exhibition in Lucerne entitled *Visualized Thought Processes* (1970), in which he displayed all of his possessions in glass cases alongside postcard displays of his sketches and self-portraits, Lüthi uses these photographs to blur the categories of art and motif, thereby also blurring the function of the artist.

In 1974, Lüthi participated in the seminal *Trans-former: Aspect of Travesty* exhibition, curated by Jean-Cristophe Amman, in which he displayed a 20-photograph series of black and white large-scale photographs of his own naked body, clutching a smaller black and white self-portrait. Entitled *The Numbergirl* (1973), this series exceeded the exhibition's intended focus on transsexuality and launched Lüthi's international star. The narrative aspect of the photographic series was something he had also explored in an earlier collaboration with David Weiss and Willy Spiller. *Sketches* (1970), the photographic series that ensued from this collaboration, represents Lüthi and Weiss at play, in various staged poses and configurations.

Throughout the 1980s, Lüthi returned to painting and produced a number of abstract and landscape paintings, many of which he also entitled *self-portrait*, illustrating his continued concern with simultaneously confirming and dispelling the view of art as a perceived repository for personal identity and experience. When he returned to photography, it would be to incorporate photographic images in large-scale installations and series. Turning in the 1990s to enhanced technologies and digital reprocessing, Lüthi began to embrace the methods and means of contemporary advertising, fusing a seemingly kitsch aesthetic into his pursuits of everyday life. First came the exhibition at Galerie Blancpain-Stepczynski in 1993 of *The Complete Life and Work, Seen Through the Pink Glasses of Desire* in which Lüthi exhibited 180 photographs, all printed in a uniform size and shape and in pink, from his life and artwork, further blending the boundaries between art and life and making the image serve as an equivalent sign for each.

In the series *Placebos and Surrogates* (1996–ongoing) and two of its constituent parts, *Run for your Life* (2000) and *Art for A Better Life* (2001), Lüthi contrasts the excesses of a culture that continually promotes wellness propaganda and health as means to achieve happiness with the mundane images of his own life and aging body, continuing to question the relationship between truth and

beauty in an imagerial culture. In this series, large-format photographs of beaches and other traditional places of leisure are mounted on a wall, the frames angled inward so as to appear as if invisible. The images are surrounded by a pink glow, a literal photographic “aura,” which reflects off the walls from the edges of the red frames. Around these are hung, for instance, plaques admonishing the viewer to “discover your essence” or “change your life,” platitudes from a cultural machine that attempts to brand and market happiness like any commodity. The important aspect of Lüthi’s work is that he recognizes that art too may play a role in this commodification—that it too may function as a surrogate for truth. He displays all of his works emblazoned with a photographic representation of his own head, cast in profile like a Greek statue, as both trademark and discursive authority. Likewise, for his 2001 Venice Biennale exhibition, he reissued his famous self-portraits from the 1970s, re-titling them with their original name and the new title: *Trademarks* (1970s/2001). In his long pursuit of thinking about the role of the artist, Lüthi recognizes that these canonical portraits, which have vastly influenced a generation of artists, have become as entrenched as the very assumptions of photographic truth that he started out contesting.

GEORGE PLATT LYNES

American

George Platt Lynes was an accomplished fashion photographer during his lifetime, most sought after for his technically virtuosic commercial work for *Harper's Bazaar*, *Vogue*, and other popular magazines. He was sought after as well as for his engaging portraits of some of the most influential literary figures of his day, including dance critic and ballet impresario Lincoln Kerstein, and poets W.H. Auden and Marianne Moore. The images for which he today commands a great deal of attention, however, are his Surrealist-inspired homoerotic nudes (*Male Nude on Faux Skin Rug*, 1953) and mythological studies (*Birth of Dionysus*, 1936–1939). Lynes was formed, for the most part, by the expatriate era of the 1920s and 1930s and the artistic luminaries he encountered in his frequent trips to Europe. More specifically, the intellectual and emotional attachment he sustained throughout his lifetime with Monroe Wheeler, the head of New York's Museum of Modern Art (MoMA) Exhibitions and Publications departments during this time, and with Gertrude Stein, were the most important influences that would steer him towards his achievement and as one of the most significant, yet almost forgotten, photographers of the twentieth century.

George Platt Lynes was born in 1907 in East Orange, New Jersey, the son of a clergyman. Educated at private schools and briefly at Yale University, Lynes made his first trip to France in 1925 where he met artists Jean Cocteau and Pavel Tchelichev and writers Andre Gide and Gertrude Stein, with whom he corresponded for the next ten years, and all of whom he later photographed. He returned stateside that same year and published a series of literary pamphlets including Stein's *Description of Literature* and Ernest Hemingway's first play, *Today is Friday*, with cover designs by Cocteau and Pavel Tchelichev. Lynes began photographing in 1927, under the mentoring of a local professional photographer in Englewood, New Jersey, and opened The Park Place Book Shop in 1928. Accompanied by Monroe Wheeler and writer Glenway Wescott, he made his second trip to France in 1928, during which he was probably introduced to the work of expatriate photographers Man Ray,

George Hoyningen-Huene, Germaine Krull, Paul Outerbridge, Jr., and Berenice Abbott. Lynes began experimenting with "double exposures and other controlled accidents in the surrealist manner, however, there is little to suggest that Lynes subscribed fully to the tenets of surrealism." (Crump 1993, 140).

In 1931, Lynes met and was encouraged by Julien Levy, with whom he collaborated on a series of Surrealist-influenced still-lives. Levy included work by Lynes in the *Surrealism* exhibition at the Wadsworth Athenaeum, Hartford, Connecticut, and in the seminal *Surréalisme* exhibition at the Julien Levy Gallery in New York in 1932. Lynes had his first solo exhibition at the Leggett Gallery, New York in 1932. Levy also exhibited his work in conjunction with Walker Evans later that year, as well as in the influential exhibition, *International Photographers*, at the Brooklyn Museum of Art. Lynes opened a portrait studio in New York City in 1932 and quickly became known for his portraits and fashion photographs. The same year, Levy and Lincoln Kirstein, Lynes's friend since prep school, included his work in *Murals by American Painters and Photographers* at MoMA, its first exhibition to include photography. In 1934, he had his second solo exhibition at the Julien Levy Gallery and in 1936, he was included in the controversial *Fantastic Art, Dada, and Surrealism* show at MoMA (see *The Sleepwalker*, 1935). Over 200 of Lynes's portraits and photographs were shown at the Pierre Matisse Gallery in New York City in 1941.

Alexey Brodovitch, who as art director for *Harper's Bazaar*, began giving Lynes fashion assignments because of his ability to solve difficult artistic problems that studio lighting offered. Lynes acted as official photographer to Lincoln Kirstein's American Ballet Company (later the New York City Ballet) documenting George Balanchine's productions until the early 1940s in the tradition of Baron Adolph de Meyer and Hoyningen-Huene. Lynes also photographed choreographer and dancer Frederick Ashton and the principal dancers in the operetta *Four Saints in Three Acts*, 1934 (Crump 1993, 141).

Lynes's mythological series, completed between 1937 and 1940, legitimized the male nude in the

surrealist tradition. The images, representing the myths of Dionysus, Pan, Orpheus, and Eros, and others, were eroticized male nudes. These, along with his more straightforward male nudes, make up the bulk of the work he did between the late 1930s and early 1950s. Lynes utilized the same manipulation of light and composition as in his fashion and portrait studies. In many cases, the figures are posed in scenes that suggest narratives. In others, the concentration is on the gesture and the pose, and in still others, the emphasis shifts to the model's direct engagement with the viewer. There exists little differentiation in the way Lynes photographed both the male and female nude. In both, the emphasis on the musculature of the figure and the eroticism of the form, has been suggested as a direct result of his communication with sex researcher Alfred C. Kinsey, the most noted collector at the time of Lynes' erotic images. Lynes pursued his relationship with the Kinsey Institute as a repository for what he considered his most important work (Miller 1994).

Lynes moved to California in 1945 to become director of *Vogue's* Hollywood studios. He made many portraits of film stars at this time but found this work debilitating. He returned to New York after three years and spent the remainder of his life doing fashion photography and continuing his personal work, although he never regained the notoriety that he had before his move to the West Coast. Lynes was unable to exhibit most of his creative work during his lifetime for fear that its homoerotic qualities would endanger his career. He destroyed a large portion of these photographs, and few of the remainder were made public until Lynes was the subject of a major retrospective at the Art Institute of Chicago in 1960 and *George Platt Lynes: Photographs from the Kinsey Institute* in 1993. Various monographs followed including, *George Platt Lynes: Photographs 1931–1955*, Twelvetrees Press, 1981; *George Platt Lynes: Ballet*, Twelvetrees Press, 1985; and *George Platt Lynes, Photographs from the Kinsey Institute*, 1993. Lynes died nearly impoverished in 1955.

Biography

Born in East Orange, New Jersey, 15 April 1907. Privately educated. Enters Yale University, 1925. Makes first trip to Europe, meets lifetime companions Glenway Wescott

and Monroe Wheeler, 1925. Publishes the *As Stable Pamphlets*, Englewood, New Jersey, 1925. Opens Park Place Book Shop, Englewood, New Jersey, 1926. Exhibits his celebrity portraits at Park Place Book Shop, continues traveling to Europe, teaching himself photography, 1928. Julien Levy arranges to include Lynes in *Surréalism* exhibition, Wadsworth Athenaeum, Hartford, Connecticut, 1931. First important exhibition Julien Levy Gallery in tandem with Walker Evans, 1932. Opens first New York City studio, 1933. Begins publishing fashion and portrait work in *Town and Country*, *Harper's Bazaar*, and *Vogue*, 1934. Documents American Ballet (now New York City Ballet), 1935. Surrealistic composition *The Sleepwalker* included in *Fantastic Art, Dada and Surrealism*, 1936. Photographs mythology series, 1937–1940. Disillusioned with New York and his private life, Lynes closes his studio and leaves for Los Angeles to head *Vogue* magazine's Hollywood studio, 1945. Return to New York, 1948. Meets sex researcher Alfred Kinsey who purchases photographs for Kinsey Institute, Bloomington, Indiana Institute, 1950. Publishes his male nudes in homoerotic magazine *Der Kries* using the pseudonyms Roberto Rolf and Robert Orville, 1951–1954. Declares bankruptcy, 1954. Diagnosed terminally ill with cancer; last portrait with Monroe Wheeler, May, 1955. Died in New York, New York, 6 December 1955.

DANNY LYON

American

A self-taught photographer, Danny Lyon began taking photographs at the age of 17. Raised in Forrest Hills, New York, a middle class neighborhood just outside Manhattan, Lyon went on to the University of Chicago where he majored in history. By the time he received his Bachelor of Art degree in 1963 Lyon had already begun work on one of the most important series of his career, that on the civil rights movement. In 1962, he had joined the Student Non-violent Coordinating Committee (SNCC) as a photographer documenting the U.S. civil rights movement. This association began a career as a photojournalist and a filmmaker that has spanned five decades.

Coming of age during the socially conscious 1960s, Lyon's documentary photography and film work grew from a deep commitment to social issues. An innovator in the immersive and social approach to documenting marginalized communities, Lyon's belief in photography's accessibility and its potential for social change coupled with his working method have made him one of the most original photographers of the late twentieth century. From the beginning of his career, Lyon has maintained that documentary images should not be isolated from the context of their making. He has said that "Photography works best when it does what it is uniquely qualified to do as a medium: reproduce the real world." Along with his peers Bruce Davidson, Leonard Freed, Roland L. Free-

man, and Mark Ellen Mark, he sought through his photography to raise awareness of issues of tolerance and social justice.

Lyon's documentary projects investigate social groups and their surroundings by his joining the group and photographing it from within. He has produced moving accounts of groups as diverse as bikers, prison inmates, Native Americans, and Mexican immigrants. Lyon's own Jewish, east coast background never stopped him from immersing himself in communities different from his own. As the first staff photographer for the Atlanta based, predominantly African American organization, SNCC, Lyon worked with this group from 1962 to 1964. During that time Lyon's ideas regarding the usefulness of photography for social good were perfectly in line with the organization's needs for documentation of the student-led movement within the civil rights movement. His images of lunch counter sit-ins and demonstrations were striking and often showed the violence and risk involved in the struggle. His photographs were reproduced in the press, as well as in SNCC fundraising brochures, and were compiled in his own book called *The Movement* (1964). A later edition entitled *Memories of the Southern Civil Rights Movement* (1992) included additional text by Lyon and others that put the student contributions to the civil rights movement in context.

Lyon's most celebrated book of the period, *The Bikeriders*, was produced just after his time in the south. Published in 1968, *Bikeriders* probed the dan-

gerous and exciting life of motorcycle riders from the perspective of the Chicago Outlaw Motorcycle Club. Lyon became a proud member of the Outlaws, traveling with them, sharing their lifestyle, and photographing them from 1963 to 1967. His next book, *Conversations with the Dead* was published in 1971. Over a period of 14 months Lyon was allowed access to the Texas prison system. His photographs explored the lives of those incarcerated in six Texas prisons. The publication included texts taken from prison records and convicts' writings, particularly the letters of Billy McCune, a convicted rapist whose death sentence was commuted to life in prison. While many of Lyon's books have had a great influence on the social documentary tradition, *The Bikeriders* and *Conversations with The Dead* became seminal examples of the new style of modern photojournalism.

Lyon's subsequent books are distinctive in their inter-weaving of photographs, text, interviews, and sometimes fiction. As published works, each project combined Lyon's searing photographic images with his and his subject's first person observations, giving the reader a fuller picture of the complex world Lyon often spent years investigating. This format contrasted sharply with the more traditional photo book model of the time, where image and text occupied distinct areas of a publication. Lyon, however, has maintained this practice throughout his career, even though he believed that it made many museums reluctant to show his work.

In the late 1960s, Lyon embarked on a major series documenting the destruction of an area of lower Manhattan through urban renewal. Photographing buildings over a 12-block area, Lyon captured the end of an architectural era and also made portraits of some of its inhabitants. Dozens of Manhattan's nineteenth century buildings were soon to be demolished to make way for renovations to the Brooklyn Bridge and the construction of the World Trade Center. After this series was published as *The Destruction of Lower Manhattan*, Lyon worked sporadically for the federal government as a photographer. From 1972 through 1974 he completed a number of assignments for the Environmental Protection Agency's DOCUMENTERICA project. During this time he photographed extensively in Texas including the Rio Grande Valley and the Chicano barrios of South El Paso and Houston. In 1974, he photographed the Bedford-Stuyvesant section of Brooklyn, New York. Like his earlier documentary studies of marginalized groups, Lyon's images from these assignments mirror his concerns of community. They depict ethnic neighborhoods struggling under the pressure of outside forces, including federally driven policies such as urban renewal. Lyon's

humanistic approach is revealed in sequences of images that not only record ethnic communities before they are destroyed, but also express an intimacy and respect for the individuals he has come to know through the process of documenting them.

While not nearly as well known as his still photography, Lyon has pursued documentary filmmaking since the late 1960s. Over the years he has gained recognition as a skilled and thoughtful filmmaker. His films include *Soc. Sci. 127* (1969), *Little Boy* (1977), *Los Ninos Abandonados (The Abandoned Children, 1975)*, *Born to Film* (1982), and *Media Man* (1994). Working simultaneously in film and still photography, Lyon has recorded many of the same Latino and Native American communities in both mediums. In 1979, a decade after being awarded a Guggenheim Foundation Fellowship in photography, he was awarded another in film.

During the 1980s, Lyon became increasingly interested in mixing autobiographical themes into his work. As a result, old family photographs, his own images of his wife and children, as well as autobiographical texts became familiar elements in works such as the 1982 film *Born to Film*, and the books *I Like to Eat Right on The Dirt* (1989), and the autobiographical monograph *Knave of Hearts* (1999). In 1990, a major traveling retrospective of his work entitled *Danny Lyon: Photo Film. 1959-1990* was mounted by the Folkwang Museum in Essen, Germany, and the Center for Creative Photography in Tucson, Arizona.

While his work has been included in countless group and solo exhibitions through out North America and Europe, Lyon's philosophy about the power and responsibility of documentary image-making are best expressed in his book projects. The importance of photography's accessibility and its potential for social and political change have been the driving force that has lead him to work extensively in the American South, the Southwest, Mexico, Haiti, and Cuba. In keeping with his interest in democratizing the photographic image, Lyon has created a website (www.BleakBeauty.com) which not only displays his work for a broad audience but also provides a discussion forum and an outlet for his political views:

When activist photography appeared on the scene in the early 1960s we assumed that a revolution was at hand... The marriage of the B&W photograph with the offset printing press was a marriage made in heaven; for the realistic picture could be reproduced and available to thousands for a reasonable amount of cash. This happy marriage should have spawned dozens of picture-magazines helping to radicalize America and putting the

LYON, DANNY

power of the press into thousands of individual hands. This did not happen. Instead the explosion of interest in photography spurred few magazines, but hundreds of art galleries instead.

Lyon's personal involvement as a witness to the struggles he records has made him a unique figure in American photography. He has been an unapologetic subjective reporter, pursuing a type of advocacy in documentary practice and expressing his views on the failures of society and the endurance of disenfranchised communities. He has also been a champion of the photographic book as a distinct and democratic form of expression where text and image have equal importance in illuminating the photographer's vision.

NATHAN LYONS

American

Since the mid-1950s, Nathan Lyons has contributed significantly to the discipline of photography. As a photographer, curator, director, teacher, writer, editor, and lecturer, his influence has been felt in the field for nearly five decades. Leroy F. Searle writing for *Afterimage* in the Jan/Feb 2004 issue recalls:

When I first met Nathan Lyons, I anticipated something midway between a legend and a rumor—entirely appropriate for someone who...had created a full-fledged graduate program in photography affiliated then with SUNY-Buffalo...he moved the program from the George Eastman House to an old woodworking factory, enlisting every new class of graduate students into remodeling... and turning the Visual Studies Workshop into one of the most remarkable institutions in the contemporary history of American art and culture, whose graduates, faculty, and friends are, without much exaggeration, the Who's Who of American Photography.

Born January 10, 1930 in Jamaica, New York, Lyons, a self-taught photographer, became interested in the medium in 1945 at the age of 15. After having graduated from Haaren High School, New

York in 1947, he enrolled for two years in the Manhattan Technical Institute where he studied architectural drafting, and then went on to major in Business Administration at Alfred University, New York from 1948–1950. In 1950, Lyons enlisted in the U.S. Air Force as a photographer, was involved in the Photo Intelligence Unit in Korea from 1951–1953, and then remained for a year as a staff news writer and public relations photographer. He returned to Alfred University in 1954 and majored in English literature, graduating in 1957 with a Bachelor of Arts. That same year he was hired by the George Eastman House in Rochester, New York, a museum of photography and cinematography founded in 1947, to be the Director of Information and Assistant Editor of the magazine *Image*. His first curatorial project was in 1959 when Lyons organized the traveling exhibition, *Seven Contemporary Photographers*. He has since gone on to immerse himself completely in photography. He founded *Afterimage*, a nonprofit, bimonthly journal of photography, independent film, video, and alternative publishing, and was editor of the magazine from its start in March

1972 through to 1977. In 1983, he organized Oracle, now an international organization of directors and curators of photographic institutions that meets annually to discuss a variety of issues and topics related to photography.

Lyons's various accomplishments are all based on his identity as a scholar. As the author and editor of numerous books and exhibition catalogues, his writings have sought to define the capabilities of the image-making process specific to photographic practice. In doing so, he has encouraged the development of a history of photography as well as stimulated a "discussion of photography as an expressive medium," as Lyons wrote in the catalogue essay to his 1967 exhibition for Eastman House, *Photography in the Twentieth Century*, 1967. The exhibition consisted of photographs from the George Eastman House's collection, including work by Diane Arbus, Bill Brandt, Harry Callahan, Robert Capa, Mario Giacomelli, Eikoh Hosoe, Ray K. Metzker, Lisette Model, Duane Michels, Frederick Sommer, Edward Steichen, and Jerry Uelsmann, to name just a few who were included and who demonstrate the range of possibilities in and approaches to photography. This exhibition was one of many he organized during his time as Associate Director and Curator of Photography at the George Eastman House until 1969, when he left to become the founding Director of the Photographic Studies Workshop (now Visual Studies Workshop), a media arts center and one of the first alternative organizations of its kind in the country.

Considering his own personal, photographic projects, Lyons carefully organizes his photographs by presenting them as diptychs, juxtaposing image next to image in sequences, thereby revealing how meaning is constructed and how interpretation is structured by sets of juxtapositions. Since 1956, he has been engaged in creating sequences of images with words appearing in the frame and playing an important role in the formation of meaning.

In 1962, Lyons set aside his view camera for a 35 mm camera, and has thought of the work produced after this year as eventually forming a trilogy starting with *Notations in Passing*, published in 1974, his first attempt at creating photographic sequences that set the pace for his approach and provided an introduction to his visual vocabulary. For several years he was involved in recording the urban and suburban landscapes as well as documenting the man-made in the rural environment. Meditative in its presentation, *Notations* possesses a rhythm that captures the poetics of human intervention in the landscape. There are no essays or texts accompanying the images, except for one word, "Introduction,"

printed at the start of the book. In retrospect, this serves as an apt beginning for what was to come in subsequent years in his career as a photographer.

His second photographic project in the "trilogy" is *Riding 1st Class on the Titanic!*, which took 13 years to complete and reflects many of the same concerns as Robert Frank's *The Americans*. From 1974 to 1987 Lyons photographed storefront windows, graffiti, bumper stickers, and billboards, among others urban displays. The title of the book is taken from an inscription that appears in one of the photographs, which captures a graffiti-sprayed wall.

Lyons's most recent publication, *After 9/11*, published by Yale University Art Gallery, is a visual record of the varied responses and reactions by Americans to the devastating tragedy of the terrorist attack that led to the collapse of the World Trade Center. Lyons engaged in recording the collective response in cities and towns across the United States, including New York. Over the course of 13 months he photographed man-made compositions he discovered in the landscape that mimicked the American flag. The flag is present in a number of these photographs, but when not included, Lyons frames the scene and presents it in a horizontal format so as to construct an image that represents and takes the form of the American flag.

Lyons's photographs have been included in a number of exhibitions and are in the permanent collections of the Addison Gallery of American Art, Andover, Massachusetts; Amon Carter Museum, Fort Worth, Texas; Center for Creative Photography, Tucson, Arizona; International Center of Photography, New York; Museum of Fine Arts, Houston, Texas; Museum of Modern Art, New York; and the San Francisco Museum of Modern Art, California, to name just a few. He has lectured extensively on photography and photographic education, and continues to teach workshops at the Visual Studies Workshop, such as *Image, Sequence, Series*, which examines narrative and non-narrative structures employed as a strategy in photographic practices. In 2001, he left his position as Director of the Visual Studies Workshop, but continues his involvement as Director Emeritus at the Workshop and as a member of the Board of Directors. He is also Distinguished Professor Emeritus at SUNY Brockport, New York. Whether he is photographing, writing, curating, lecturing, or editing Lyons's perceptive, intuitive, and full engagement with the world around him, and therefore the world of images, results in an honest response to his environment and a body of photographic work that as Adam D. Weinberg wrote "provide[s] a contin-

uous line of thinking, a guidebook to a life, a 'guidebook' that has influenced the thinking of a generation of photographers."

M

DORA MAAR

French

Acknowledged primarily for her role as Pablo Picasso's muse and mistress, Dora Maar is now being recognized for the merits of her long artistic career. She was established as an artist before Picasso entered the Parisian art scene, having studied painting with André Lhote and photography with Henri Cartier-Bresson. It was Cartier-Bresson who suggested to Maar that she become a photo-journalist, which she did in the early 1930s, traveling to Britain and Spain. These photographs of street life are in direct contrast to her earlier elegant fashion photography, but she is perhaps best known for her paradoxical Surrealist images.

In the early thirties, the French set designer Pierre Kéfer invited Maar to share his studio in Neuilly, and they collaborated on portraits and advertising as well as fashion photography. Her first professional job was photographing Mont Saint-Michel for a book the art critic Germain Bazin was producing. Through a mutual friend, Maar was introduced to the Hungarian-born photographer Brassai, who at that time was well-established as a photographer. She was also influenced by Louis-Victor Emmanuel Sougez, whom she considered a mentor. He was a founder of the New Photography movement (in

Germany, *Neue Sachlichkeit* or New Objectivity). When Maar was gravitating between painting and photography, Sougez urged her to pursue photography. The Kéfer-Maar studio closed in 1934 when Maar's father provided her with a studio and dark-room of her own near the church of Saint-Augustine in the eighth arrondissement of Paris. This address, 29 rue d'Astorg, became the title of one of her most famous Surrealist photomontages.

Paul Eluard's Surrealist poem "Identités" was dedicated to Maar and points to her ambiguities. She read and signed numerous Surrealist manifestoes and participated in several Surrealist exhibitions. Her subject matter is rooted in Surrealist thought and writing; Maar's flower pictures are thought to have been stimulated by Georges Bataille's 1929 essay, "The Language of Flowers." Her work seems also to have been inspired by the concept of the minotaur, half beast and half man, expounded upon in the Surrealist publication, *Le Minotaure*. This is best expressed in *Portrait of Péré Ube*, 1936, the name of the protagonist in Alfred Jarry's trilogy of plays first produced in 1896. Using a close-up of a baby axoloti (or armadillo though it has not been confirmed) as her model for Ube, Maar may have inspired Picasso's *Dream and Lie of Franco* (1937). Maar achieved many of her

images through photomontage and photocollage, a method of cutting, pasting, and rephotographing.

Maar also became involved in leftist anti-Fascist political groups such as *Masses* and *contre-Attaque*, through which she met Surrealist poet André Breton and photographer Man Ray. Maar photographed many of the Surrealist artists, and she and Man Ray worked together to illustrate the poet Paul Eluard's *Le Temps Déborde*. It was Eluard who, late in 1935, introduced Maar and Picasso on the set of *Le Crime de Monsieur Lange*, the socialist-inspired film written by Jean Renoir and Jacques Prévert. Although Maar remembered this brief meeting, Picasso did not; and Eluard's friend Jean-Paul Crespelle's account of the meeting in the *Café de Deux Magots* in Saint Germain, a famed Left Bank meeting place for artists, writers, and intellectuals, has become the accepted meeting place. Maar was engaged in a dangerous game—flinging a knife between her fingers. At times she missed and, according to Crespelle, “a drop of blood appeared between the roses embroidered on her black gloves.” Fascinated by Maar, Picasso sought her expertise in printing photographic proofs from glass plates (*cliché-verre*).

Mary Ann Caws has pointed out in *Picasso's Weeping Woman: The Life and Art of Dora Maar* that the two main themes in Maar's work—fashion and the avant-garde, and the street life of the impoverished—reflect the “constant pull between the two sides of her character, between her exuberance and her self-constraint.” Her political activism also emerged in her work, especially her set photography for *Le Crime de Monsieur Lange*.

Dora Maar's paradoxical impulses can also be identified through the early work she did for erotic magazines and the extreme Catholicism she turned to in later life. Again quoting Caws, Maar “turned from Picasso to God.” Another of her themes was the isolation of humanity. Maar photographed lone figures in the streets of London, Paris, and Barcelona. These images are considered metaphors for her own situation by some scholars because, after her breakup with Picasso, she eventually became a recluse.

Picasso's and Maar's tumultuous relationship took place between 1936–1944. After the defenseless Spanish town of Guernica was bombed by the German Condor Squadron on Sunday, 26 April, 1937, Picasso began painting his monumental mural of the same title. He had been commissioned to create the mural for the Spanish Pavilion in the Paris Universal Exposition that would open May 1937, but had previously been uninspired. *Guernica* has become what many scholars believe is his masterpiece. His inspiration came from the expressions he read on Maar's face as she learned about the attack, inspiring the

“Weeping Woman” image in *Guernica* as well as other paintings. Maar was the only person Picasso permitted in the studio during the five-week gestation of the painting; he even allowed her to paint a few strokes. Brassai had previously served as Picasso's official photographer, but now Maar chronicled the master and the development of the masterpiece with her camera, yet she abandoned photography thereafter because of Picasso's consistent belittling of her talent. Maar was also the subject of a number of Picasso portraits. In *Dora Maar Seated* (1937), the youthful Maar appears confident and optimistic.

As the war in Europe intensified and France became occupied by Germany, the Maar/Picasso relationship deteriorated. Maar had been devoted to Picasso, taking a back seat to him personally and professionally. When he left her for Françoise Gilot, she suffered a nervous breakdown. Eventually receiving psychiatric treatment from the psychoanalyst Jacques Lacan, Maar became more self-confident and composed. She resumed her friendship with Brassai, made new friends, and continued painting. In the 1980s, in her seventies, Maar returned to photography.

Picasso never left her totally, and Maar was never able to recover fully from his rejection; she maintained that she was not his mistress, but he was her master. Although he had tormented her, she was the one woman in his life whose intellectual capacity was equal to his. She turned to religion for solace and kept mementoes of their seven years together throughout her long life.

Illustrating Bazin's book was Maar's first professional work, and illustrating André and du Bouchet's poem, *Earth of the Mountain*, was her last (1961). Maar exhibited her work extensively during the forties. Collector/critic Heinz Berggruen has established a new museum in the Western Stoler Building, part of the Charlottenburg Palace Complex, in Berlin, where the work of Dora Maar is featured in one room.

Biography

Born Henrietta Théodora Markovitch 22 November 1907 in Paris to an immigrant Yugoslav architect and a French Catholic housewife. Childhood spent in Buenos Aires where her father was involved in numerous construction projects. Fluent in French and Spanish, which later endeared her to Picasso. At 19, returned to Paris to study painting and photography in Paris at the Académie Julian and the École de Photographie. Her painting lessons in André Lhote's atelier brought her in contact with Cartier-Bresson, and it was during this period that

MADAME D'ORA

Austrian

Dora Kallmus began her photographic career in the early twentieth century documenting Vienna's cultural and court figures. She was born in Vienna on February 20, 1881, to a distinguished Jewish family; her father, Dr. Phillip Kallmus, was a court lawyer. When she was just a young girl, her mother died, leaving Kallmus and her sister Anna to be raised by a grandmother and a governess.

Originally Kallmus had designs on a career as an actress. Dissuaded by her family she subsequently

considered becoming a milliner or dressmaker, but turned to photography instead. In 1906, she expressed the desire to become a photographer and open her own studio. Through her uncle's mediation, Kallmus received formal training in photography. Early in 1907, she began a five-month apprenticeship in a prominent studio in Berlin where photographic techniques were considered more progressive than in Austria.

Leading society photographer Nicola Perscheid, who operated studios in Berlin and Leipzig, was persuaded by a hefty sum paid by Kallmus' father

to become her mentor but because of her sex, she was still denied the full spectrum of technical training. While Kallmus learned the basic principles of portraiture, how to photograph, copy, retouch, and deal with clients, she never fully learned all the basic camera operations.

Undaunted by this shortcoming, however, Kallmus opened her own studio in Vienna during the fall of 1907 simply called "d'Ora" perhaps to disguise her Jewish origins. She enlisted the help of Perscheid's former first assistant Arthur Benda to act as studio manager and to handle the technical equipment, leaving Kallmus free to cultivate her clientele. Their partnership endured until 1926.

From 1908 on, Kallmus began to call herself Madame d'Ora. Many of her first patrons were referred through personal and family relations. A list of her earliest sitters reads like a who's who of Vienna's elite society sprinkled with the names of illustrious literary and artistic types such as Alma Mahler-Werfel.

Following the model of Perscheid, the collaborative work by Benda and Kallmus reflected the photographers' attention to artistic lighting and treatment. Besides printing in silver and gum, they were interested in a straight color printing process known as Pinatype, a forerunner of dye-transfer printing invented in France in 1903.

Considered at the onset of her career to be but a 'professional amateur,' within a few years of her studio's opening, Kallmus had established herself as an art photographer, known for her elaborate light management and ability to create artistic photographs that corresponded to her sitter's personality. Although Kallmus hardly ever had a camera in hand, reserving her talents for stylistic compositions while Benda took care of the technical end of things, her creative photography and personal and family connections helped attract rich and famous patrons predisposing a successful following.

In her photographic portraiture Madame d'Ora introduced a compelling mixture of drama and sophistication that earned her the patronage of Europe's most celebrated names. Her early interest in theater, film, and fashion never diminished as is evident in the costuming and posing of her photographed subjects. In an advertisement for a 1913 seasonal appearance in Berlin, the studio suggested that ladies arrive with soft materials, furs, mugs, evening coats, shawls, and hats, with which Madame d'Ora might create artistic photographs. The practice of assembling her subjects in imaginative costume and dramatic poses draws a comparison to the posturing and composition used by Vienna Secession painter Gustav Klimt.

Beginning in 1915, theatrical photographs taken in her studio preoccupied d'Ora. Photographs of actors were in demand and actors became patrons of studios whose photographs were well received by the print media. The initiative for a portrait would often come from Kallmus. It was in this capacity that she formed a friendship with the celebrated dancer Anna Pavlova whom she invited to her Berlin studio in 1913. She became enthralled with photographing the new modern dance movement that had recently become popular in Europe.

Coupling her knowledge of the theater for expressive posing with her keen fashion sense in costuming her subjects, Kallmus synthesized her model's outward appearance with their inner values. Additionally, her photographs exuded a precision and vitality reflective of the photographer's concern with form—the contour of the model does not blend with the surroundings but projects forth from a dark or very light background. These effects were accomplished in the studio where artificial lighting was managed by Kallmus' elaborate staging techniques.

When Emperor Karl became King of Hungary in 1916/17, d'Ora gained access to wives of Hungarian magnates during the coronation festivities. In 1917, her studio obtained permission to photograph the Emperor Karl and his family. After spending the first quarter of the century photographing Austrian-Hungarian aristocracy, Kallmus moved to Paris where her works captured the vitality of the 1920s fashion and entertainment milieu.

While still in Vienna around 1910, Kallmus, sensing the trend toward more photographic representation in advertising media, had photographed several times the hats of the Viennese designer Rudolf Krieser; these were some of her particularly imaginative creations. Arriving in Paris initially in the early 1920s when the demand for fashion photographs in magazines was on the rise, Madame d'Ora found fashion photography to be an important and lucrative genre.

Soon Kallmus preferred to photograph fashion over portraits because the process represented constant change and stimulating challenge, one in which she varied the disposition of her images to correspond with the fashion items that were being photographed. Her fashion photographs represented the top design houses including Patou, Rochas, Chanel, Lanvin, and Worth.

Much of Kallmus's success was due to her keen sense for business. In the summers from 1921 to 1926, Kallmus and Benda followed the 'international' set to the elegant health resort Karlsbad, Czechoslovakia, where they ran a studio in the

MADAME D'ORA

Olympic Palace Hotel. It was this exposure to an intercontinental clientele that had given her the idea to open the Paris studio. To increase their photography opportunities there Kallmus worked hard to establish solid relationships with editors of magazines in German- and French-speaking countries. Kallmus adjusted to the new city but the move caused a rift in the relationship with Benda. He eventually returned to Vienna.

In Paris during the twenties, d'Ora's clientele drew from similar demographics as it had done in Vienna: artists, entertainers, and women of the highest social ranks were among her sitters. The designer Coco Chanel, the actor Maurice Chevalier, and the singer Mistinguett were among those who sought her expressive and glamorous photographic style and with whom she became friends. Sittings with the American actress Anna May Wong, American dancer Josephine Baker, and the painter Tamara de Lempicka likewise produced some of her most memorable photographs. Her cool, calculated fashion and entertainment photos and portraits were sometimes described as *style moderne*—the French version of the German *Neue Sachlichkeit* or New Objectivity.

With the Nazi occupation of France in 1940, Kallmus spent the remaining war years hiding in the small remote town of Lalouvesc, France. During that time, she lost her sister and an assistant to the extermination camps. After the war, she returned to Paris and lived a quiet existence. She resumed making portraits with the assistance of a young Dutch photographer Jan de Vries. These portraits express a reflexivity not seen before in her earlier works.

Other post-World War II subjects dealt with changing circumstances related to war trauma. She did a series of photographs in a refugee camp close to Vienna and work originating in an asylum for refugee women. Her themes include a series documenting daily activities in Parisian abattoirs or animal slaughterhouses. As a late body of work these images augment symbolic indictments of war and the Holocaust. Kallmus was killed in a motorcycle accident, October 30, 1963, in Steiermark, Austria.

MAGNUM PHOTOS

Magnum is a cooperative photographic agency devoted to the artistic and editorial independence of all its members. Founded in 1947 by Robert Capa, Henri Cartier-Bresson, George Rodger, and David Seymour (“Chim”), Magnum became the world’s preeminent international photo agency, representing photographers from all over the world and every point on the photojournalistic spectrum.

Many of Magnum’s early members had built their reputations on war photography. They shared a common bond of leftist political views that informed the cooperative organization of the agency. Rather than proposing common political agendas, aesthetic sensibilities, or personal goals, Magnum strives for idealism in its members, who share an unmatched dedication to the power of photography and the independence of the individual photographer.

Magnum was the brainchild of Robert Capa (born Endre Friedmann), a Hungarian exile who moved to Paris from Germany in 1933. He became known as the world’s greatest war photographer while documenting the Spanish Civil War. In Paris he befriended several other photographers, artists, and political activists, many of whom were also recent émigrés. During this time, the Popular Front was gaining tremendous strength, and its supporters began to harness the propagandistic power of the photograph to rally additional support for their cause. Meanwhile, the surging popularity of newspapers and illustrated magazines in Europe and the United States created endless demand for photographs documenting current events.

As photojournalism became an increasingly popular career, particularly among leftist political activists in Europe, new issues arose concerning the governance and ownership of their photos. Most magazines and newspapers hired photojournalists to work on individual assignments. The original photographs, negatives, and copyrights for all the material produced through the course of that assignment usually then belonged to the magazine or newspaper that commissioned the work. This system allowed photographers little control over how their works were used: cropping their images or isolating them from their original contexts could significantly alter the photograph’s meaning or original composition, and the pho-

tographer was powerless to stop it. Furthermore, photographers could only receive income from each photograph once, regardless of how frequently the image was reproduced. Photographers had little choice but to continue to work under this system because of the high costs associated with traveling to remote locations. Because photojournalists relied on news agencies to cover the initial financial costs of each project, working on projects without editorial support was exceedingly difficult.

During the 1940s, many photographers began to advocate for greater control over their work. By 1943, Robert Capa had conceived of a photographers’ cooperative that would strengthen the rights of its individual members through unification. Although Capa discussed his vision with several photographer friends, gaining support from George Rodger and David Seymour, among others, it would be several years before his plans came to fruition. In the meantime, Capa joined the American Society of Magazine Photographers, where he advocated for the rights of photojournalists to have more control over their assignments, negatives, photographs, and copyrights.

In the spring of 1947, Capa finally organized a meeting of interested people, including Bill Vandivert, a photographer for *Life*, his wife, Rita, and Maria Eisner, who had founded and run Alliance Photos in Paris in the 1930s. Over lunch at the Museum of Modern Art in New York, they established Magnum Photos, Inc. Henri Cartier-Bresson, David “Chim” Seymour, and George Rodger were not present (and in fact, had no idea such a meeting was taking place), but were nevertheless made vice-presidents of the organization. This group of seven members became the original shareholders of Magnum. They planned for offices in New York and Paris, to be run respectively by their new president, Rita Vandivert, and Maria Eisner, now secretary and treasurer. The group assigned each photographer a region of specialty: Bill Vandivert would cover the United States, “Chim,” Europe; Cartier-Bresson, Asia; and Rodger, the Middle East and Africa; Capa would float across all regions as needed. Although office staff managed the agency’s day-to-day operations, including promoting Magnum, attracting and coordinating assignments, and mana-

ging copyrights, the photographers themselves would make all decisions about the cooperative. Magnum's services were paid through a percentage of each photographer's earnings: Magnum would receive 40% of fees paid for assignments received through the agency, 30% for assignments made directly through the photographer, and 50% of each photographer's reprints. Any profits would be divided amongst the shareholders to offset the year's fees.

After the first year, Bill and Rita Vandivert left Magnum, with Bill believing he would fare better with his existing magazine relationships. Maria Eisner took over as president, but with now only four photographers, the group needed additional members. Capa, Chim, Cartier-Bresson, and Rodger agreed that members should not only be first-rate photographers, but should also fit in with the group's ideals. Werner Bischof, the first Magnum invitee, had recently made a name for himself by photographing the devastation in Europe following World War II. He joined in 1949. Bischof explained what convinced him to join this new venture: Magnum's photographers were "the best in the world—Capa, Cartier-Bresson, Chim, and Rodger. What is important to me is that they are all sound people and socialist-inspired...They are free people, too independent to tie themselves to one magazine" (Miller, 1997, 74). Ernst Haas, Magnum's next inductee, received simultaneous invitations to join Magnum and *Life*. In a letter turning down *Life*'s offer, he explained, "What I want is to stay free, so that I can carry out my ideas... I don't think there are many editors who could give me the assignments I give myself" (Miller 1997, 75).

Magnum continued to hand-select new members they saw as a good fit, such as Dennis Stock, the winner of a *Life* contest for young photographers. It also admitted eager new photographers with enough gumption (or luck) to bring in a portfolio, such as Eve Arnold and Erich Hartmann. Many of Magnum's early members joined after meeting and receiving encouragement from a current member. In the early years, Magnum was more of a friendly club than an elite agency. Through this spirit of camaraderie, many of the more experienced photographers, including Capa and Cartier-Bresson, advised young members on editing or traveling in unfamiliar territory. Occasionally new recruits worked with senior members as assistants and researchers, which functioned much like an apprenticeship, although no such formal arrangement existed. Many young Magnum members note the excellent education they received by studying the agency's archives, which included vast numbers of contact sheets from some of the world's best pho-

tographers. These junior members started with small projects and gradually moved up to more important assignments.

After asking Maria Eisner to leave when she became pregnant, Capa took over as president of Magnum in 1951. He found the position tedious and passed the responsibility on to Rodger after less than a year. Rodger, too, disliked the position. At Magnum's inception, Rodger had suggested hiring two businessmen as directors of the agency, to leave the photographers free to take pictures. His idea then was dismissed, as the other members did not want to relinquish control to non-photographers. As president, Rodger again suggested establishing a board of directors to oversee the agency's administration. This time, the members agreed that Capa would return to the position of president, but to reduce his responsibilities, they would form a board of directors comprised of the original Magnum founders and hire an editorial manager to handle the business administration. They hired John Morris, then picture editor at *Ladies' Home Journal*, who was one of Magnum's best customers. Almost immediately, Morris and Capa began arguing about whether to expand the agency. Morris did not see financial viability without growth, and Capa did not believe the cooperative could support more than a dozen or so photographers.

Magnum's reliance on its photographer-members for governance was intended to help ensure the artistic integrity of the organization and, to some extent, support it against pressure to submit unwillingly to commercial demands. The downfall of being run by its members was that, as photographers, they had only a secondary interest in the business of running the company. This lack of business development has caused tremendous difficulties for the organization, which—despite its success—has seemed on the verge of financial collapse since its inception.

Magnum's precarious finances have caused much conflict within the organization. The focus on each photographer's artistic or journalistic freedom over his or her financial responsibility to the organization has left some members feeling that they carry the bulk of the agency's financial burden. Commercial assignments are usually the most lucrative assignments, even for the best photographers. The photographers willing to work on such projects are Magnum's lifeblood—it could not survive on photographers' personal projects alone. On the other hand, many members feel that working on commercial projects compromises the artistic integrity of their agency. Tension between those photographers who consider themselves artists

and those who identify themselves as journalists has existed since the beginning of Magnum. Magnum bridges this hazy line by supporting each photographer in his or her own personal goals.

In its policies and philosophy, Magnum prizes the photographer's independence above everything. A former Magnum bureau head once said, "Magnum isn't a democracy—it's anarchy in the truest sense because the guiding principle is not the greatest good for the greatest number, but the rights of the individual to do whatever they like" (quoted in Miller). Because it embraces individual independence, Magnum photographers do not fit any single profile; there is no "Magnum aesthetic." Nevertheless, certain trends prevail, such as the use of black-and-white rather than color film; a strong editorial component even in documentary photographs; a consistent ability to capture the essence of human emotions. The one common tie amongst all Magnum members is complete devotion to photography and the independence of the photographer. Magnum described this devotion in a 1961 brochure as a dedication "to continuing photojournalism in the tradition established by the three Magnum photographers who have died on photographic assignments of their own choice" (Miller, 1997, 195).

Capa was in Indo-China in 1954, photographing his fifth war, when he was killed by a landmine. The same day, Magnum members learned of his death, they also received news that Werner Bischof had died in an accident in Peru. At Capa's death, Chim stepped forward to take his turn as president. He would be killed two years later during fighting near the Suez Canal.

Amidst uncertainty over the future of the organization that seemed built around Capa, his brother, Cornell Capa, resigned from his position at *Life* to join Magnum. Cornell's involvement boosted morale tremendously. He became a leader in the organization and would assume the presidency after Chim's death.

The founding members felt that reorganization would be necessary for Magnum to survive without Capa. At the next annual meeting, they established a system for admitting new members, after which time membership in Magnum became extremely selective. To be considered, a photographer must submit a large portfolio of work to be judged by the current members. If it is approved by a majority of members, the applicant is offered membership as a nominee. Nominees may claim association with Magnum, but they have no voting rights in the organization. After two years as a nominee, the photographer may submit a more extensive portfolio

for review. Following majority approval, the nominee becomes an associate member of Magnum, but still does not enjoy voting privileges. With full membership, granted only after a third portfolio review, the photographer receives full voting rights and becomes a part-owner of the agency.

By 1960, moving images of current events were available almost immediately via television. Film required time to be processed even before it could be printed and distributed. Many illustrated journals of the 1930s and 1940s redirected their focus from news of current events to social and lifestyle topics. As part of a brief attempt to carve a niche in this new field, Magnum created the short-lived Magnum Films in 1964. It had closed by 1970. In 1972, *Life* magazine, one of the largest clients for many photojournalists, closed (it would reopen in a monthly format in 1978).

Despite a reduced demand for photojournalism, Magnum has continued to grow to become an organization with membership limited to 50. In 1987, Magnum opened its third office, in London. Its immediate success inspired the opening of a Tokyo Magnum office in 1990.

By asserting the rights of individual photographers to control their own work, Magnum increased the artistic integrity of photojournalism. Magnum has thrived in the territory where art and photojournalism intersect. But in the process of elevating photojournalism to art, Magnum photographers were faced with a new issue, voiced by London art critic Marina Vaizey in response to Magnum's 1989 exhibition *In Our Time*:

Have these starving people, these slum dwellers, these prostitutes and the insane, given their consent for their plight to be shown not just as the news, but in an art gallery? It is a curious thing that somehow, in these hundreds of photographs, almost all of which are concerned with the human condition, the terrible is so gorgeously memorable.

(quoted in Miller 1997, 278)

At the start of the twenty-first century, as it continues to struggle with many of the issues haunting it since the start, Magnum's strength lies in the devotion of its international stable of photographers and the depth, breadth, and quality of their work.

Members of Magnum

1947 (*founding members*)

Robert Capa (b. 1913, Hungary, d. 1954, Indochina)

Henri Cartier-Bresson (1908–2004, France)

George Rodger (1908–1995, England)
 David Seymour (“Chim”) (b. 1911, Poland, d.
 1956, Suez)
 William Vandivert (b. 1912, U.S., resigned 1948)

1949

Werner Bischof (b. 1916, Switzerland, d. 1954,
 Peru)

1950

Ernst Haas (b. 1921, Austria)
 Erich Lessing (b. 1923, Austria)

1952

Erich Hartmann (b. 1922, Germany, d. 1999, U.S.)

1954

Cornell Capa (b. 1918, Hungary)
 Elliott Erwitt (b. 1928, U.S.)
 Burt Glinn (b. 1925, U.S.)
 Kryn Taconis (b. 1918, Holland, resigned 1960)

1955

Inge Morath (b. 1923, Austria)
 Marc Riboud (b. 1923, France)

1957

Eve Arnold (b. Philadelphia)
 Brian Brake (1927–1988, New Zealand, resigned
 1967)
 W. Eugene Smith (1918–1978, U.S.)
 Dennis Stock (b. 1928, U.S.)

1958

Wayne Miller (b. 1918, U.S.)

1959

René Burri (b. 1933, Switzerland)
 Bruce Davidson (b. 1933, U.S.)
 Sergio Larrain (b. 1931, Chile)
 Nicolas Tikhomiroff (b. 1927, France)

1961

Hiroshi Hamaya (1915–1999, Japan)

1964

Charles Harbutt (b. 1935, U.S., resigned 1981)

1965

David Hurn (b. 1934, England)
 Constantine Manos (b. 1934, U.S.)

1967

Ian Berry (b. 1934, England)
 Marilyn Silverstone (b. 1929, U.S.)
 Burk Uzzle (b. 1938, U.S., resigned 1982)

1968

Bruno Barbey (b. 1941)

1970

Hiroji Kubota (b. 1939, Japan)

1971

Philip Jones Griffiths (b. 1936, Wales)
 Josef Koudelka (b. 1938, Czechoslovakia)

1972

Leonard Freed (b. 1929, U.S.)

1974

Paul Fusco (b. 1930, U.S.)
 Gilles Peress (b. 1946, France)

1975

Richard Kalvar (b. 1944, U.S.)

1976

Micha Bar-am (b. 1930, Berlin)
 Miguel Rio Branco (b. 1946, Canary Islands)
 Guy le Querrec (b. 1941, France)

1977

Mary Ellen Mark (b. 1940, U.S., resigned 1981)
 Raghu Rai (1942, India)

1979

Raymond Depardon (b. 1942, France)
 Alex Webb (b. 1952, U.S.)

1980

Susan Meiselas (b. 1948, U.S.)

MAGNUM PHOTOS

1982

Eugene Richards (b. 1944, U.S.)

1983

Martine Franck (b. 1938, Belgium)
Chris Steele-Perkins (b. 1947, Burma)

1985

Abbas (b. 1944, Iran)

1986

Jean Gaumy (b. 1948, France)
Harry Gruyaert (b. 1941, Belgium)
Peter Marlow (b. 1952, England)

1988

Michael Nichols (b. 1952, U.S.)
Eli Reed (b. 1946, U.S.)

1989

Thomas Höpker (b. 1936, Germany)
James Nachtwey (b. 1948, U.S.)
Ferdinando Scianna (b. 1943, Italy)

1990

Stuart Franklin (b. 1956, England)
Carl De Keyzer (b. 1958, Belgium)
Patrick Zachmann (b. 1955, France)

1993

Steve McCurry (b. 1950, U.S.)
Larry Towell (b. 1953, Canada)

1994

Nikos Economopoulos (b. 1923, Greece)
Mao (b. 1962, Beijing)
Martin Parr (b. 1952, England)
Gueorgui Pinkhassov (b. 1952, Russia)

1995

Chien-Chi Chang (b. 1961, Taiwan)

1996

Alex Majoli (b. 1971, Italy)

1997

David Alan Harvey (b. 1944, U.S.)
Lise Sarfati (b. 1958, Algeria)
John Vink (b. 1948, Belgium)
Donovan Wylie (b. 1971, Northern Ireland)

1998

Luc Delahaye (b. 1962, France)
Kent Klich (b. 1952, Sweden)

2002

Mark Power (b. Britain)

2003

Paolo Pellegrin (b. 1964, Italy)
Bruce Gilden (b. 1946, U.S.)

MAISON EUROPÉENNE DE LA PHOTOGRAPHIE

The Maison Européenne de la Photographie, situated in the historic heart of Paris, is a major centre for contemporary photographic art. Opened in 1996 and created and directed by Jean-Luc Monterosso, the M.E.P. represents a completely new kind of cultural establishment. It houses an exhibition centre, a large library, a video viewing facility with a wide selection of films by or about photographers, and an auditorium. It is designed to make the three fundamental photographic media—exhibition prints, the printed page, and film—easily accessible to all.

The mansion which houses the M.E.P., situated at no. 82, rue François Miron, was built in 1706 for Hénault de Cantobre, the royal tax collector. It has belonged to the City of Paris since 1914, and was chosen as the site for the M.E.P. in 1990. The city authorities asked the Yves Lion firm of architects to undertake the restoration of the original building, as well as the addition of a new wing on the rue de Fourcy. The façade overlooking the street, the period ironwork, and the central staircase are all fine examples of classical architecture, and as such all are listed features.

The M.E.P. has some 15,000 square feet of exhibition space on several floors. New selections of works from the permanent collections are shown regularly in addition to the temporary exhibitions.

The Collection

Established in the early 1980s, the collection consists of over 15,000 works and is representative of international photography from the end of the 1950s to the present day. The acquisition of several complete series of photographs (including Robert Frank's "Les Américains," Josef Koudelka's "Prague 1968,"

and Raymond Depardon's "Correspondance new-yorkaise") has made it possible to organize coherent monographic exhibitions. Major donations have also augmented the collection, for example from Dai Nippon Printing (Tokyo) and the Reader's Digest Foundation. The Polaroid Company of Boston has placed 1,500 original Polaroid prints in trust of the Centre, and an entire gallery is devoted to Irving Penn, one of the greatest photographers of the second half of the twentieth century.

The permanent collection reflects the art of photography in all its various forms, from photojournalism to fashion photography to works that stand halfway between photography and the plastic arts.

The inaugural exhibition at the M.E.P. in spring 1996 was entitled *Une Aventure Contemporaine: la Photographie* and looked at the most important developments in photography over the last forty years. Since then a series of large retrospectives and themed exhibitions have offered opportunities to discover—or rediscover—the work of some of the most important figures of recent photographic history, such as an exhibition of Pierre et Gilles, the Paris of William Klein, or "Errances" (wanderings) by Raymond Depardon.

The Roméo Martinez Library

The library's catalogue is built around the collection of the historian Roméo Martinez, for 20 years editor-in-chief of *Camera* magazine. It now has some 18,000 titles, including a large number of first editions, spanning the last 50 years of the history of photography. It provides both researchers and members of the photography-loving public with an exceptionally extensive overview of photographic publishing the world over. There are, for

example, 1,000 Japanese books available for consultation. Library staff is on hand to provide visitors with help and advice, and the catalogue can be consulted via self-service computer terminals. And the library also has a selection of CD-ROMS. Finally, a selection of the most important photography magazines is available for consultation.

Films and Videos

The *Vidéotheque* in the Roméo Martinez Library provides access to videos via independent viewing terminals. It has over 1,000 titles, including film portraits of photographers, interviews, and series on historical and aesthetic developments in photography. There are also films made by famous photographer/filmmakers, including Robert Frank, William Klein, Alain Fleischer, and Raymond Depardon.

The 100-seat Bernard-Pierre Wolff Auditorium screens videos and films linked to current exhibitions. Public discussions, conferences, and lectures

on the various ways the photographic image is used also take place here.

Other Activities

The ARCP conservation and restoration workshop is directed by Anne Cartier-Bresson; the workshop's essential aim is to restore and preserve the extensive photographic collections of the various museums, libraries, and archives belonging to the City of Paris. It works hand in hand with a number of research and teaching establishments in France and abroad.

A bookshop, a café, and a website (<http://www.mep-fr.org>) complete the services offered to the public. Since the opening approximately 150 exhibitions have been organised and 50 catalogues published.

MAN RAY

American

A leading experimental artist of the avant-garde of Paris during the 1920s, Man Ray was one of the most formidable Surrealist photographers and was known, along with László Moholy-Nagy, as the creator of camera-less photography in the modern era. By the time his work was recognized in the Museum of Modern Art's 1936 exhibition *Fantastic Art, Dada, Surrealism* it had already been widely published. His wide-ranging experimental process, moreover, had already attained significant stature within Modernist artistic discourse since it had continued and reinvigorated the debate between painting and photography begun around the turn of the twentieth century. As a photographer he created a number of the iconic images of the century, including *Tears* of 1932 and the portraits of Marcel Duchamp as his female alter-ego Rrose Selavy of 1920–1921.

Born on August 27, 1890, as Emmanuel Radnitsky to a Jewish family in Philadelphia, Pennsylvania, the artist spent most of his youth in Brooklyn,

New York, after his parents moved there in 1897. Having entered high school in 1904, the young Radnitsky learned freehand and industrial draughtsmanship. Four years later he was offered a grant to study architecture only to turn it down, claiming that the construction of buildings was not as interesting as creating an interior's ambience. Soon after, Rudnitsky began taking courses in drawing and water color at the Ferrer Center. Named after a Spanish anarchist, this educational institution was devoted to the practice of libertarian principles.

In 1911, the aspiring artist moved to Manhattan after meeting Alfred Stieglitz at the 291 Gallery. However during the spring of the following year, Rudnitsky moved again to Ridgefield, New Jersey, where he began work as an advertising draughtsman. Upon visiting the now-legendary Armory Show held in New York in 1913, he discovered the European avant-garde. Although he continued working as a draughtsman for a publisher of maps and atlases, he partnered with the poet Alfred

Kreymborg and sought to create an artist's community in Ridgefield. In 1914, Rudnitsky married poet Adon Lacroix (Donna Lecoœur), with whom he had been living for quite some time and officially changed his name to Man Ray.

During the fall of that year, Man Ray met French avant-garde artist Marcel Duchamp, who was at that time living in New York and had his first solo exhibition at the Daniel Gallery, which featured a collection of sketches and 30 paintings. Arthur J. Eddy, a prominent attorney involved in developing policies for modern trade, purchased six paintings, which led Man Ray to move back to Manhattan. In 1915, he purchased his first camera for the purpose of documenting his own art work, but was soon using it to explore new avenues of creativity. His interest in nuance, for example, appeared in his articulation of pictorial shadows and was reflected in a painting from 1916 titled *The Rope Dancer Accompanies Herself With Shadows*. While attending a number of soirees at the home of Walter Arensberg Man Ray associated with many notable artists such as Americans Charles Demuth, George Bellows, and the French painter Francis Picabia. He also became an active member in the nascent New York Dada movement.

Prior to his second solo show at the Daniel Gallery during the winter of 1916, Man Ray experimented relentlessly, designing a rotating collage titled *Revolving Doors*. In 1917, he painted his first "aerograph," which is a depiction made by airbrush that emulates photographic effects, titled *Suicide*. At this time, he also made the first of his "Eggbeater" sculptures, which transformed the notion of mundane utility into a latent sexual metaphor. Man Ray's work was beginning to be collected in 1918 by Ferdinand Howell and inspired him to reproduce *The Rope Dancer* into an aerograph.

The rapid development and use of technology, despite the benefit of new industries that developed in Western society, to create fearsome instruments of war during the First World War caused those who were involved in the Dada and Surrealist movements to decry the use of the machine. To intellectuals of the post-World War I era, the notion of freedom was believed to exist in anarchy. Seeking intellectual and material autonomy, Man Ray published a single issue of an anarchist magazine titled *TNT* after the newly-developed explosive in March 1919. At this time, he also separated from his wife and began a correspondence with leading European Dada figure Tristan Tzara.

The following year he began collaborating with Marcel Duchamp and attempted to make an anaglyphic movie with two cameras. On April 29, he signed the constitution of "Société Anonyme Inc." along with Duchamp and Katherine Dreier, a collector of Modern art and founding director of the Society of Independent Artists. During the summer, Man Ray followed Duchamp to Paris where he was introduced to the Dadaists. During November of that year, Man Ray created his first rayograph, also known as a photogram, which depicted a silhouette upon paper without the use of either a negative or a camera.

At the opening of his third solo show at the Galerie des Six, he met composer Erik Satie with whom he worked to create *The Gift*, an iron whose face bristled with nails, one of his many Dadaist objects that transform everyday items into sculptures rife with mystery or paradox, including the now legendary *Object to be Destroyed*, of 1923–1932, a metronome affixed with a photographic cut-out of an eye. He also made the acquaintance of the famous French model, Kiki de Montparnasse, of whom he made striking portraits, along with other denizens of the Parisian avant-garde, including Gertrude Stein and Jean Cocteau. By 1923, Man Ray was an established photographer undertaking portrait and fashion assignments, and hired Berenice Abbott as his assistant. His famous image of Kiki shot nude from the back and embellished with the "F"-holes of a violin, *Le Violon d'Ingres*, appeared in a 1924 issue of *Littérature*. *Vogue* also published some of his fashion photography in May of that year.

From the mid-1920s to the late 1930s, Man Ray worked on avant-garde films with a number of artists, including Marcel Duchamp and his "Anemic Cinema," and published his work in both monographs and books of poetry. By 1929, Lee Miller became his assistant. Man Ray later returned to New York, in the summer of 1940, and stayed there until 1951. After returning to Paris, however, he spent less time with photography and focused more of his time on painting. His photographic work, however, brought him great acclaim: In 1961, he received the gold medal for photography at the Venice Biennale and in 1967, he received worldwide recognition in a show titled, *Salute to Man Ray* that was held at the American Center in Paris. By the time of his death on November 18, 1976 in Paris, Man Ray was a legend for his work that propelled Surrealism into a lively, historic art

MAN RAY

movement. Man Ray's Parisian studio was kept intact after his death by his widow, Julia, but was destroyed in a fire in 1989. The Man Ray Trust has been established to preserve what remains of his archive and disseminate his artistic legacy.

Biography

Born in Philadelphia, Pennsylvania, on 27 August 1890, as Emmanuel Rudnitsky. Family moved to Brooklyn, New York in 1897. Attended high school and studied draughtsmanship in 1904. Studied drawing and watercolor at the Ferrer Center in 1910. Moved to Manhattan in 1911. Moved to Ridgefield, New Jersey in 1912. Married Adon Lacroix, legally changed name to Man Ray and had his first solo show at the Daniel Gallery in 1914. Purchased first camera for documentation purposes in 1915. Published anarchist magazine titled *TNT* and separated from Adon Lacroix in 1919. Began collaborating with Marcel Duchamp, signed Société Anonyme Inc. manifesto, moved to Paris and created first rayograph in 1920. Hired Berenice Abbott as his studio assistant in 1923. *Le Violon d'Ingres* published by *Litterature* in 1924. Hired Lee Miller as his studio assistant in 1929. Recognized in *Fantastic Art, Dada, Surrealism* organized by the Museum of Modern Art, New York in 1936. Returned to New York in the summer of 1940. Returned to Paris in 1951. Received a gold medal for photography in Venice in 1961. Recognized by the American Center in Paris with *Salute to Man Ray* in 1967. Died in Paris, France on 18 November 1976.

Individual Exhibitions

1915, 1916, 1919 Daniel Gallery; New Jersey
1923 "Coeur à Barbe"; Theatre Michel, Paris
1967 "Salute to Man Ray"; The American Center, Paris

1971 Two Retrospectives; Boymans van Beuningen Museum, Rotterdam and Galleria Schwarz, Milan

Group Exhibitions

1920 *Exhibition of Painting by American Modernists*; Museum of History, Science and Art, Los Angeles
1926 *Société Anonyme*; Brooklyn Museum, New York
1936 *Fantastic Art, Dada, and Surrealism*; Museum of Modern Art, New York
1985 *L'Amour fou: Photography and Surrealism*; Corcoran Gallery of Art, Washington, D.C., and traveling
1996 *Rose Is a Rose Is a Rose: Gender Performance in Photography*, Solomon R. Guggenheim Museum, New York, New York

Selected Works

Cliché Verre, 1917
Dust Breeding (on Duchamp's Large Glass), 1920
Portrait of Jean Cocteau, 1922
Rayogram, 1923
Object to be Destroyed, 1923–1932
Le Violon d'Ingres, 1924
Kiki de Montparnasse as Odalisque, ca. 1925
Noire et Blanche (Black and White), 1926
Place de la Concorde, ca. 1926
Mrs. Henry Rowell, 1929
Primacy of Matter over Thought, 1929
Sleeping Woman, 1929
La Tête, 1931
Les Larmes (Tears), 1932
The Lovers (My Dream), 1933

FELIX H. MAN

German

Like Erich Salomon, Wolfgang Weber and a few other photographers, Felix H. Man appeared as a leading exponent of the modern photojournalism that made his breakthrough in the weekly press of Germany toward the end of the 1920s. He was a member of the famous German photo agency *Dephot* (Deutscher Photodienst) and soon became a leading figure in the development of the British illustrated press. His significance to the history of photography lies as well in the area of color photography and also in the advancement of art historical scholarship. From the 1950s on, he was more interested in art history, which he had studied before 1920. He wrote books about graphic art, and from 1961–1975 he was editor of *Europäische Graphik*, a series of portfolios of original artworks.

Felix H. Man was born as Hans Felix Sigismund Baumann on November 30, 1893 in Freiburg/Breisgau in Germany. His family came from Riga, which was at that time part of Imperial Russia. When he was 10, his father gave him his first camera. He soon was taking pictures of anything he saw, and he started to develop and print the pictures himself in a cellar darkroom. In 1912, he matriculated and studied art and art history, and his camera became less important to him. During his service in the German army between 1914 and 1918 in World War I, he took up photography again. Almost all the pictures of this period, mainly taken in the trenches and behind the lines, were lost during the bombing of World War II.

In 1926, Man moved to Berlin and worked for the publishing house Ullstein Verlag as an illustrator. He was drawing at that time, but soon he began to find that the growing market for his photographs was pushing his drawing aside. By the end of the 1920s, he became production chief of the photojournalism department of *Dephot*, founded by Simon Guttman and Alfred Marx and serving various daily papers. Joining him there were Walter Bossard and Kurt Hübschmann, later known as Kurt Hutton of *Picture Post*.

Around 1930, Man was working for the *Münchner Illustrierte Presse* (MIP) and the *Berliner Illustrierte Zeitung* (BIZ), both rapidly growing and in keen com-

petition. His main subjects were on one hand, portraits of statesmen, artists, musicians in action, imposing theatrical productions; and, on the other hand, the simple life of villages and their inhabitants or the streets of Munich, Berlin, or London to which he traveled on assignments. Unlike Wolfgang Weber, Harald Lechenperg, or Walter Bossard, who were traveling worldwide as photojournalists, Man was largely confined to work on the continent and in England, although he later traveled to North and South America and India. From 1930 to 1931, he went to Italy and made his famous reportage *A Day with Mussolini*, printed on five pages in the *MIP* and widely reprinted.

Between 1929 and 1931, the *MIP* published over 80 reports by Man. At this time, he worked very close with Stephan Lorant, chief editor of the *MIP* and an important figure of the new photojournalism of the 1920s and 1930s. When the Nazis took over Ullstein Verlag in 1934, Man emigrated to England, where he again met Stephan Lorant working for the magazine *Weekly Illustrated* in London. After six months, Man left the paper and over the next three years had a difficult time. Unable to obtain a work permit, he was forced to leave England every three months. (In 1948 he finally became a British citizen.) He shot photographs for the *Daily Mirror*, film companies, fashion magazines, and for the pocket magazine *Lilliput*, which Lorant had started in London.

In October 1938, Stephan Lorant founded *Picture Post*, and Felix Man and Kurt Hutton joined him as photographers. From the beginning, *Picture Post* was a great success, and Man sometimes had more than three substantial reportages. Although Lorant left Europe for the United States in 1940, Man continued to work for *Picture Post*, leaving for a short time to try to start a new magazine and to study the problems and possibilities of color photography. He returned to *Picture Post* in 1948, principally to produce color picture stories.

At the beginning of the 1950s, Man again left *Picture Post* and completed some color assignments for U.S.-based *Life* and *Sports Illustrated* magazines. He also began concentrating on art subjects, and he made studies of a number of famous artists at work in their studios, among them painters Pablo Picasso and Georges Braque, architect Le Corbu-

sier, and sculptor Henry Moore. These pictures were published as a book in 1954 under the title *Eight European Artists*, which was edited by Man. He also started a collection with original graphics (which he built up to one of the largest private collections of lithographs) and did research on graphic art, studying its history and techniques. He wrote several books and articles on lithography, painting, and cultural affairs as well as continuing to photograph until his death in 1985.

In most of his reportages, the pictures were put together in a way that they were able to tell the story, making a text almost unnecessary. In this context, Man often made use of the portrait, putting it in sequences, in particular, and in this way relating the content intensively to reality. Unlike many photojournalists who shoot multiple rolls of film to find the right pictures in the solitude of the studio, Man was able to seize the precise significant moments from the passing scene, capturing the essence of the occasion in sequences of 20 or 30 pictures. The pictures themselves were documentary and simple, showing artless realism and only using natural light, keeping the truth of the atmosphere.

Biography

Born as Hans Felix Siegismund Baumann in Freiburg/Breisgau, Germany, 30 November 1893. Started making photographs, 1903. Studied art and art history in Munich and Berlin, 1912–1914; service in the German army, 1914–1918; continued his studies at the Kunstgewerbeschule in Munich, 1918–1921; illustrator and photographer for Ullstein Verlag, Berlin, 1926–1933; production chief for photojournalism for *Dephot*, 1928; photoreporter for *Münchener Illustrierte Presse*, 1929–1932; immigrated to England, 1934; co-founder of *Weekly Illustrated*, 1934; photographer for *Daily Mirror*, *Liliput* (since 1937) and *Picture Post* (since 1938); photojournalist for *Life*, 1950–1951. Moved to Lugano, Switzerland, 1961 and Rome, 1972. Recipient of the “Kulturpreis” of the DGPh (German Photographic Society), 1965. Died in London, 1985.

MANIPULATION

Photographic manipulation is any change or adjustment made to the photographic image through altering the exposure, development, printing processes, or final image. Manipulation in the camera is achieved through multiple exposures, using specific types of lenses that distort perception, filters attached to the lens, and special films. Multiple exposures are images taken on the same piece of photographic film, and can be of two completely different photographic scenes or of the same subject captured in more than one way. Wide angle, telephoto, and photomicrography (extreme image magnifications) alter the perception of the image from what the human eye is capable of viewing without such optical tools. Filters can alter how light is projected onto the film in the camera. Manipulation through the use of films sensitive to other energies outside of the visible spectrum, such as infrared film, create images based on heat and can be combined with filters for further effects. High-contrast film produces images that have extreme texture and graininess, which further manipulates the photographic image.

The photographer, through framing, cropping, and the use of specific vantage points to define the photographic image, also controls manipulation in the camera. Cropping, which defines the edges of a photographic print, can alter how an image is perceived by changing basic spatial clues within the pictorial space. Framing alters how an image is perceived as well. Using a low or high viewpoint will flatten an image and change how depth is shown in the pictorial space. The same manipulations that occur in a camera and with lenses can also be created in the darkroom. Changing the lens and the lens housing in the enlarger creates effects such as vignetting and distortions in perspective.

Darkroom manipulations occur through deliberate changes in the film developing process to controls such as time and temperature and with the introduction of specific types of chemicals. Reticulation is achieved through extreme temperature fluctuations during film development. This can range from small cracks in the film emulsion to warping of the entire image surface of the film. Intensification and reduction, techniques used on previously processed negatives, allow for areas of

the negative to be re-altered chemically. Intensification increases the density of shadow areas on a negative, and reducing agents can be applied to specific parts of the emulsion to remove silver from the image. The Sabattier effect, often incorrectly called solarization, exposes the film or the photographic print to light midway through the development process and creates a reversal of tones in the image and a Mackie line (a thin black line) between the dark and light areas in the image. Cross-processing of color films (processing negative film in E-6 chemistry and positive film in C-41 chemistry) will skew the color, tonal, and contrast range of the film. Retouching with chemicals such as Red Cocaine or spotting dye can further alter film, and the emulsion can be scratched or etched from the film's surface with a variety of tools.

The darkroom process allows manipulations to occur during printing such as burning (adding time or intensity to a specific area to increase density), dodging (removing time or intensity from a specific area to decrease density), flashing (applying an intense burst of light to the image), diffusing the light projected through the enlarger with filters or other materials, and masking areas of the print with various types of filters or acetate. Contrast filters, placed in the enlarger and used with variable contrast black-and-white printing paper, can manipulate the contrast range. High-contrast printing is done through a process known as posterization, which reduces the continuous-tone image to a range of only a few tones. Multiple negatives may be produced for each tone, and printed together on the same sheet of paper. Specific films and graded paper will also produce effects that manipulate the normal tonal range of an image. Manipulation of the negative in the enlarger, such as sandwiching more than one image, will combine all involved negatives into one composite image. This can also be done through multiple printing, which projects individual negatives onto one sheet of paper. Photograms eliminate the negative altogether, and are created by placing objects on top of a sheet of photographic paper much like a contact print. Negative prints use the paper print of an image as the negative and produce a reversal of the tones. The digital darkroom of programs such as Adobe Photoshop allows

traditional darkroom manipulations on the computer screen and further increases the ease of compositing multiple images and changing color and tonal variations, and may mimic special darkroom effects such as reticulation and posterization.

Toning and non-silver processes alter the basic chemical and color of a printed image. Toning can add a specific colorcast or alter the intensification of the tonal range. Non-silver processes such as platinum, palladium, gum bichromate, cyanotype, and hybrids of the photographic and silkscreen mediums further manipulate the photographic image. Spotting (retouching the print to eliminate dust and scratches), bleaching (lightening or eliminating part of a photographic print), and hand-coloring photographs are manipulative techniques that occur after the darkroom process.

The uses of manipulation in photography occur for aesthetic and commercial purposes. Fine-art prints created from many negatives mimicked the traditional narrative paintings of neoclassical artists, and manipulation in the darkroom was a characteristic of photographers such as Man Ray and László Moholy-Nagy, who used photograms and the Sabattier effect extensively in their work. Multiple exposures in the camera were a staple of Harry Callahan's images during his time in Chicago in the 1950s and 1960s, and Jerry Uelsmann's multiple printing techniques incorporate up to 20 enlargers and image fragments into one composite work. Digital manipulations are also utilized in contemporary fine art pieces. Commercial photography, such as fashion and product advertisements, utilizes high-contrast images, cross-processing of color films,

and retouching through computerized and traditional darkroom techniques to produce a flawless final image. Photojournalism is one area of photography where manipulation is rare because of ethical reasons, and journalistic integrity forbids modifications of images published as factual documents.

ROBERT MAPPLETHORPE

American

While he did not begin his artistic career with a camera, Robert Mapplethorpe's photographs earned him a reputation that transcended the boundaries of the art world and permeated popular culture. This notoriety was due partly to the inherent strength of his images but also a result of heated

controversies over the transgressive nature of his subject matter. Mapplethorpe's body of work—largely comprised of nudes, flowers, and portraits—is characterized by a remarkable clarity of vision that emphasizes a sensual formalism. His thematic scope is exceptionally consistent, as the themes that occupied him as a young student remained with him throughout his relatively brief artistic career.

Mapplethorpe was born to a middle-class, Catholic family in Floral Park (Queens), New York in 1946, and in 1963 he enrolled in art school at the Pratt Institute in Brooklyn. One of his most formative relationships was with the singer and poet Patti Smith, whom he met in the late sixties. The two became involved with the underground New York punk scene centered at the club Max's Kansas City, and moved into a room at the Chelsea Hotel, a landmark of bohemian New York. Smith and Mapplethorpe had a short-lived romantic relationship but remained lifelong friends and confidantes, and she would serve as one of his most frequent models.

While in art school, he was not immediately drawn to photography, but instead focused on the more traditional mediums of drawing, painting, and sculpture. He began to create mixed-media collages and assemblage pieces, often including images he lifted from the gay pornographic magazines sold around Times Square. As Mapplethorpe came to desire more control over the raw materials for these assemblages, he began taking his own photographs.

His interest in the medium was particularly spurred on in 1971 when he met John McKendry, curator of photographs and prints at the Metropolitan Museum of Art. McKendry supplied Mapplethorpe with a Polaroid camera, showed him the photography archives at the Museum, and brought him to Europe to meet art collectors. The following year, Mapplethorpe met another influential figure, curator Sam Wagstaff, with whom he developed a non-exclusive but long-term intimate relationship. Wagstaff supported Mapplethorpe in his photographic endeavors, providing him with studio space in Manhattan and in 1976 giving him a Hasselblad camera. He and Wagstaff avidly collected photographs, and Mapplethorpe was especially drawn to turn-of-the-century artists, including Baron von Gloeden, Julia Margaret Cameron, and F. Holland Day and Nadar.

Mapplethorpe's early pieces often played with religious and sexual imagery, yet he was not so much interested in blaspheming religious authority as he was in sanctifying carnal acts. He made several multi-panel works resembling altarpieces, including some triptychs that employed mirrors to implicate the viewer in their sexual imagery. His earlier interest in more tactile, non-photographic mediums led him to view his photographs not merely as images, but as unique art objects. This tendency is demonstrated by his utilization of unconventional frames and mixed media, as well as his experimentation with various printing processes, from his early photo-transfers of magazine images onto cloth and canvas, to the platinum prints on linen he created in 1987.

Mapplethorpe exercised a great amount of directorial control over his compositions. He was not interested in documenting chance encounters, and most of his photography was done within the confines of his studio. He frequently placed drop cloths or backdrop paper behind his subjects, as if to emphasize the nature of his pictures as "set-ups."

The images that cemented his notoriety were his pictures of the sado-masochistic homosexual underground, a subculture with which he was directly involved. His explicit photographs of erect penises, men in bondage gear, and various sexual acts not usually seen by mainstream society had a volatile impact and led to a number of controversies. A 1983 solo exhibition at the Palazzo Fortuny in Venice was closed to minors due to the content of the artwork. The greatest disputes over his work, however, occurred shortly after his death in 1989, and made him a key figure in the so-called "culture wars" of the 1980s and 1990s. In June 1989, the Corcoran Gallery in Washington, D.C., fearing potential public outcry, canceled their plans to exhibit the Mapplethorpe solo show *The Perfect Moment* just two weeks before it was set to open. The following year, when the exhibition traveled to the Contemporary Arts Center in Cincinnati, the gallery and its director were indicted for (and subsequently acquitted of) obscenity and child pornography. The latter charges were a result of Mapplethorpe's few nude photographs of children, which were essentially innocent on their own terms but became questionable due to his reputation as a documenter of sexual deviance.

The great dynamic in Mapplethorpe's work is the tension between his subject matter, which is powerfully transgressive and sometimes shocking, and his manner of composition, which is highly traditional and classicist. His interest in beauty and symmetry is present even in his most jarring compositions featuring sado-masochistic acts. He was particularly interested in photographing black men, posing their chiseled bodies in ways that clearly enunciate the formal language of classical sculpture. Toward the end of his career, these references became even more straightforward when he began photographing gleaming white Greek sculptures. He treated inanimate objects and human subjects with an equal amount of formalist enthusiasm; his *Eggplant* of 1985 seems a blatant reference to Edward Weston's iconic *Pepper* of 1930, particularly with its sensual overtones and keen attention to texture and shadow.

Although Mapplethorpe was interested in photographing nudes for both their formal possibilities and their capacity to arouse, he never objec-

tified his models into simple flesh. He preferred to emphasize the humanity of sexuality, which is underlined by the fact that he always titled his figure studies with the names of his models (unless they specified a preference to remain anonymous). This naming emphasizes the personhood of his subjects as well as their complicity in his works.

His photography is also notable for its problematization of dualisms of gender and sexuality. In some 1980 self-portraits, he plays with androgynous imagery by fashioning himself as a woman in make-up and fur, not unlike Marcel Duchamp's alter-ego, Rrose Selavy. His 1983 book of photographs of body-building champion Lisa Lyon features her in a number of poses that humorously undermine stereotypes of femininity.

Mapplethorpe did not hesitate to utilize his art for commercial projects, and often did fashion shoots and celebrity portraits for various magazines, including *Interview*, *Vanity Fair*, and *Harper's*. His early involvement in the New York music scene also led him to create photographs for a number of album covers for Patti Smith, Television, Laurie Anderson, and others.

Mapplethorpe died in 1989, three years after he was diagnosed with AIDS. The Robert Mapplethorpe Foundation, launched by the artist the year before his death, continues to promote photography and fund AIDS research.

MARY ELLEN MARK

American

For three decades, Mary Ellen Mark has photographed members of subcultures around the world, including heroin addicts in England, runaway adolescents on the streets of Seattle, women confined to a locked psychiatric ward of Oregon State Hospital, circus performers in India, prostitutes in Bombay, and children with cancer at a camp in California. Her constant subject is people within a social context, and she generally aims for an empathetic but unsentimental expression of humanistic values. One of the most widely respected documentary photographers working today, Mark moves seamlessly between journalistic and fine arts contexts: she has completed many editorial assignments for magazines, photographed advertising campaigns, and published books of her personal projects; her work has been shown in numerous gallery and museum exhibitions worldwide; and her photographs are included in significant museum and private collections.

Born in Philadelphia in 1940 to a middle-class family, Mark received her undergraduate training

in the fine arts, receiving a BFA in art history and painting from the University of Pennsylvania in 1962. She embraced photography while continuing at the University of Pennsylvania as a graduate student in the Annenberg School for Communication, receiving an MA in photojournalism in 1964. After graduation, she went to Turkey to photograph on a Fulbright Scholarship, then traveled throughout Europe. In 1966, she moved to New York City, where she still lives, and began to work as a freelance photojournalist. In 1968, she traveled for the first time to India, a country that has inspired some of her most significant work. In her career, she has photographed throughout the United States, and in many other parts of the world, among them England, Spain, India, Vietnam, and Mexico. Mark's work has appeared in magazines such as *Life*, *Time*, *Paris-Match*, *Ms.*, *New York Times Magazine*, *Vanity Fair*, *Vogue*, and *The New Yorker*, as well as virtually all the leading photography magazines and journals. She has published 14 books of her photographs; and her images have been published in many anthologies and exhibition catalogues.

Early on, Mark also achieved success as a photographer for the film industry, a lucrative career direction that helped subsidize her social documentary projects. She shot production stills for dozens of films, including *Alice's Restaurant*, *The Day of the Locust*, *Apocalypse Now*, *Ragtime*, *One Flew Over the Cuckoo's Nest*, and *Silkwood*. The film stills brought her notice and assignments from magazines, including a 1969 commission from *Look* to create a photo-essay on Federico Fellini directing the film *Fellini Satyricon*, which Mark considers her breakthrough story in photojournalism.

Constantly curious about the vagaries of human experience, Mark specializes in social documentation and portraiture, working mainly in black and white. While some of her editorial work has involved portraits of celebrities, including film stars and directors, writers, artists, and musicians, more often Mark has photographed those she calls the "unfamous," meaning people outside the mainstream whose lives are not conventionally newsworthy. She is drawn particularly to outcasts whose lives play out within a troubled situation that isolates them, such as poverty, illness, or addiction; and to people who live in social groups that function like a substitute family, such as performers in an itinerant circus or the inhabitants of a brothel. The diversity of her topics reflects both the assignments offered to her and her personal interest in certain topics; she manages to fund personal projects through a variety of means, including grants, financial support from non-profit organizations, and selling her ideas to magazines and other commercial outlets.

Mark's preferred method is to proceed with a project by immersing herself over an extended period in the world of her subjects, developing a relationship with her subjects and learning to see nuances in the conditions of their environment. To cite several examples: Mark and the writer Karen Folger Jacobs lived for 36 days in a women's maximum security unit in a mental institution in Oregon, resulting in the book *Ward 81* (1979); Mark spent several months on two separate trips to India in 1980 and 1981 photographing Mother Teresa and her Missions of Charity in Calcutta for a *Life* magazine assignment and subsequent book; and she traveled with 16 different circuses during two three-month trips to India to produce the book *Indian Circus* (1993). Sometimes Mark will stay in touch with people long after a project is finished. For example, she has returned to Seattle repeatedly to photograph Erin Blackwell, or "Tiny," who was 14 when Mark first photographed her in 1983 for a photo-essay for *Life*, including the often reproduced image, "Tiny" in *Her Halloween Costume*,

Seattle, Washington, USA. The latter assignment led to the Academy Award nominated film *Streetwise* (1985), directed and photographed by Mark's husband, the filmmaker Martin Bell, and to Mark's 1988 book of the same title.

In her photo-essays, Mark is more interested in revealing individual personalities set within their sociological context than in telling a conventional narrative with a beginning, middle, and end. Precedents for her work include the work of photo-journalists Margaret Bourke-White, Dorothea Lange, and W. Eugene Smith. Mark is interested in exploring the emotional and psychological tenor of small societies, and makes no pretense to objectivity. About *Ward 81*, Mark observed, "I just wanted to do photographs that I believed in without having any rhyme or reason or theory, or having to spell out a sort of storytelling. I wanted to show their personalities—that was the thing that drew me to them" (Fulton, 11–12). More generally about her intentions for her work, Mark stated, "I think each photographer has a point of view and a way of looking at the world...that has to do with your subject matter and how you choose to present it. What's interesting is letting people tell you about themselves in the picture" (Fulton, 27).

Mark wants each of her images, including those that are part of a photo-essay, to be able to stand alone as a single image, to sum up and provide insight into the personality and life of a particular subject. A hallmark of Mark's style is that her subjects are aware of the camera and make eye contact, projecting themselves into the lens. This intimacy reflects Mark's capacity to engage her subjects on a personal level; the approach also involves viewers, since the subjects appear to be gazing directly at them. Mark favors black-and-white over color photography, but occasionally shoots in color, including the images made for her book *Falkland Road: Prostitutes of Bombay* (1981), which show prostitutes in Bombay situated in the colorfully patterned interior rooms of brothels. Although Mark demands high technical quality in her prints, she does not undertake her own darkroom work. She mostly uses small, handheld 35 mm cameras, and likes to work close to her subjects with short lenses. She also has shot with medium-format and 4 × 5-inch view cameras. She used the large 20 × 24 inch Polaroid camera for her study of twins, shot over several years at the annual Twins Days Festival in Twinsburg, Ohio, and published in the book *Twins* (2003).

Biography

Born in Philadelphia, 1940. BFA in painting and art history, University of Pennsylvania, Philadelphia, 1962; MA in photojournalism, Annenberg School of Communication, University of Pennsylvania, 1965. Fulbright Scholarship to photograph in Turkey, 1965–1966. Freelance photojournalist living in New York from 1966. Contributing photographer to *The New Yorker*; has published photo essays and portraits in many publications, including *Life*, *Time*, *Paris-Match*, *Ms.*, *New York Times Magazine*, *Vanity Fair*, and *Vogue*. Published 14 books of her photographs. Photography workshops taught in Mexico and throughout the United States since 1974. Elected to Magnum Photos, 1977; left Magnum to work independently, 1982. Numerous honors and awards, including:

three grants from the National Endowment for the Arts, 1977, 1979, and 1990; Leica Medal of Excellence, 1982; Robert F. Kennedy Journalism Award, 1984; Photographer of the Year Award from The Friends of Photography, 1987; World Press Award for Outstanding Body of Work Throughout the Years, 1988; George W. Polk Award for Photojournalism, 1988; John Simon Guggenheim Fellowship, 1994; Hasselblad Foundation Grant, 1997; the Cornell Capa Infinity Award from the International Center of Photography, 2001; World Press Photo Award, 2004; and five honorary doctorate degrees.

MASKING

Masking in photography is a process by which an object, or mask, blocks out an unwanted portion of the image. Masking may take place before, during, or after the picture is made, in the form of mechanical manipulations that alter the reality captured.

The term masking may also be applied more theoretically to describe the visual complexity of the medium of photography. The three categories of literal, technical, and metaphorical masking frequently co-exist. For example, a photograph of a

mask, whether it has been manipulated during processing or taken without excessive alteration, typically relates to a deeper meaning, to things that lie physically and conceptually outside the frame.

Early in the twentieth century, European artists appreciated African, Oceanic, and pre-Columbian masks primarily because they were unusual, unfamiliar, and more “honest” in their proximity to nature rather than civilization. The Expressionists, Cubists, and Surrealists were inspired by artifacts to explore approaches that were not limited by intellectual or empirical thinking including exaggeration, abstraction, and imagination. Similarly, masking in photography allows an artist to expand beyond documentation into the realm of creative experimentation. Like the masking traditions revered by modernist artists, masking in photography emphasizes the processes of making and interpreting images while, at the same time, it calls attention to and even questions the act of representation.

Walker Evans’s 1935 photographs of the Metropolitan Museum of Art’s African art collection not only depict masks but also illustrate one of the most basic types of masking. Almost unnoticeably, the edges around the backdrop of a work print show the hardwood floor and white wall and reveal the “real” environment for this image: the museum. While looking at this picture, it is easy to focus on the central image of the mask and ignore the margins. Having to deal with such distractions is unusual because in studio photography, the periphery has usually been eliminated by the photographer’s selective eye and the ability to crop with the viewfinder or in the darkroom. The process of elimination that has not yet taken place here is typically concealed during the photographic process and transformed into the final pristine image.

Technical masking encompasses more radical alterations that intentionally create a very different image from the one presented to the camera. For example, mask cut-outs or masking tape is used to cover areas that should not be exposed in combination printing and double exposure. Silver tape is frequently used to mask extraneous borders from 35 mm slides, and filters are used during exposure and development to enhance or downplay certain colors or tones. Masks are often used to achieve color correction for color separations and offset lithography (See Jaffe et al., *Color Separation Photography* 1965, pp. 75–99). Color correction masks utilize the subtractive method of color production based on the primary colors of light and the four-color printing process. For example, a blue-filter separation negative subtracts all the blue light to print yellow, a green filter prints ma-

genta, a red filter prints cyan, and white light produces black. Digital imaging masks regulate contrast, allow multiple images to be layered seamlessly, and sharpen blurred edges (London, et al., *Photography* (2002), pp. 240 and 243). Because crucial details may be lost during digital recording, Adobe Photoshop’s Unsharp Mask (USM), like its film predecessor, combines two blurred versions of an image to actually sharpen the image. The areas of overlap in the blurred versions distinguish an edge and allow contrast to be enhanced on either side of the edge. The reversals and complementary mixes so integral to film photography and four-color printing are present but often less obvious in the processing and refinement of digital images.

Virtually undetectable with digital technology, technical masking can be traced to the experiments of nineteenth-century photographers, including Gustave Le Gray, Oscar Gustav Rejlander, and Henry Peach Robinson. It is also found in the work of such twentieth-century photographers as Anton Braggia, Claude Cahun, Alvin Langdon Coburn, Hannah Höch, Man Ray, and Wanda Wulz. Jerry Uelsmann began using what would become a common method of building images in digital processes before digital technology was available by combining separate black-and-white film negatives in which the manipulation, though often discernable, is made as seamless as possible. Uelsmann’s *Untitled (Cloud Room)* (1975) creates a dreamlike image of a dining room with a cloud-filled sky as the ceiling. Images like *Untitled (Cloud Room)* function most successfully when their manipulation is detectable in an intriguing way so that the fictional and factual aspects truly enhance one another.

Metaphorical masking relates to the underlying meaning in a photographic image: what is not readily visible, such as an ambiguity in meaning or the creation of a persona. This kind of complexity occurs in all types of imagery, but the convergence of objective facts and subjective interpretation is unique in photography because these aspects necessarily rely on one another for full impact.

Clarence John Laughlin uses a combination of literal, technical, and metaphorical masking in *The Masks Grow to Us* (1947). A woman wearing a veil over her head and a pearl necklace is shown with a second face, perhaps a mask or mannequin whose features closely resemble hers, superimposed on top of the left side her face. The bottom of the composition looks kaleidoscopic and the woman’s face is slightly blurred. Laughlin’s caption reads:

In our society, most of us wear protective masks (psychological ones) of various kinds and for various rea-

MASKING

sons. Very often the end result is that the masks grow to us, displacing our original characters with our *assumed* characters. This process is indicated in visual, and symbolic, terms here by several exposures on one negative—the disturbing factor being that the mask is like the girl *herself*, grown harder, and more superficial.

(Laughlin 1973, 120)

The Masks Grow To Us includes literal masking in the depiction of a mask, technical masking by using multiple exposures, and metaphorical masking through the reference to the assumptions of psychological masks, which are virtually unrepresentable.

In the second half of the twentieth century, such photographers as Diane Arbus, Ralph Eugene Meatyard, Yasumasa Morimura, Cindy Sherman, Lorna Simpson, and Joel-Peter Witkin use masks or costumes to signal a self-conscious representation of the struggle between meaning and surface appearance. Masking encompasses and embraces oppositions consistently encountered in the photographic process. The tension between black and white, negative and positive, tangible and elusive, reality and creativity are consistently negotiated in such a way that they compliment and inform one another.

ANGUS McBEAN

Welsh

Angus McBean, a noted theatrical and portrait photographer, was a master of stagecraft who developed a sharply focused style employing dramatic lighting with lustrous highlights and deep shadows. His portraits of theatrical celebrities and other notables, glamorous and often in extreme close-up, seemed revolutionary in their time. A subset of his style, with which he is most often identified, was heavily influenced by Surrealism and its now familiar vocabulary of devices and clichés; these pictures achieved bizarre effects through elaborately constructed sets, photomontage, multiple

exposure, the use of scissors, and other photographic "trickery" and manipulation.

McBean always seemed to be indulging a childish quest for fun, and he wrote that he had "used the new romantic idea merely for its fun value—merely as a relaxation from a busy life of portraiture and stage photography—and have produced many amusing and some good compositions." He was dedicated to the production of illusions, for which the theater is an obvious metaphor, and he sought to produce more or less convincing illusions through photographic means.

As a teenager, he bought a 2½ × 3½-inch Autographic Kodak camera and photographed Welsh

architecture. Pressured by family, the young man planned to become an architect. He briefly attended the local technical college but was an indifferent student, distracted by movies and other extracurricular pursuits. He turned to banking, but a lackluster performance in a series of jobs convinced him (and others) that his talents lay elsewhere. Having once been fascinated by the theatrical masks he had seen in performances in Newport, he began making masks, beginning with one of his own face. His father died in 1924, after which McBean, his mother, and sister moved to London. Beginning in 1925, he worked for seven years as a trainee at Liberty's, restoring and selling antiques.

He had built a darkroom and studio in his mother's house at Acton and was determined to earn a living in the world of theater. He devoted his time to photography and mask-making, initially without income. At an exhibition of his masks and photographs he had organized for a West End tea-shop, McBean met the renowned society portrait photographer, Hugh Cecil. Although McBean was eager to learn craftsmanship and technique from Cecil, he privately disdained the formulaic soft-focus portraits for which the older photographer was acclaimed. After a year in his employ, McBean left Cecil to open his own studio in Belgrave Road, Victoria, where he could practice his distinctive style of portraiture.

From 1935 to 1955, McBean became one of Britain's most well-known photographers, building upon his talent for theatrical mask making and set design. In 1932, he received his first stage commission, to make masks for Ivor Novello's play, *The Happy Hypocrite*. Novello was pleased with the masks and, after finding that McBean was also a photographer, invited him to photograph the show. McBean soon became known as the "court photographer" of the theatrical world. His pictures were published in magazines such as *The Sketch*, *Theatre World*, and *Playgoer* as well as used by the theater companies as publicity stills.

Intrigued by the strange juxtapositions and dream imagery of Surrealism which he saw in an exhibition of paintings by William Acton in 1937, as well as fashion pictures by photographers such as Horst P. Horst, McBean developed a style of humorously fantastic portraiture. His interest in Surrealism was not profound; he was mainly attracted to the world of fantasy associated with the movement. His photographic output stands as one of the best, if not the most obvious, examples of stagecraft and the directorial mode in photography,

involving elaborate preparation and manipulation of the subject and setting, as well as photographic manipulation or trickery after the exposure. He photographed noted British stage and film actors Vivien Leigh, Laurence Olivier, John Gielgud, Paul Scofield, and others.

While his surrealistic portraits enjoyed considerable popularity, they were also sometimes controversial. In 1940, his picture of Diana Churchill's apparently disembodied head aroused so much dismay that, in a bizarre twist of fate, he was imprisoned for two and a half years, although he returned to his work after his release, and his theatrical photography again flourished. McBean's activities in this field diminished in the 1950s, due to changing customs and economic circumstances in the theater (including the elimination of the traditional two-hour "photo call" at rehearsals upon which he had relied) and a lack of picture magazines as outlets for his work.

In the 1960s, however, McBean began to be in demand to produce record album covers. Although his style was not a natural fit with the new popular culture of the 1960s, in 1963 he made a famous, atypical photograph of the Beatles looking down a stairwell, a straightforward portrait deriving from a Bauhaus aesthetic. The appreciative Beatles asked him to repeat the pose for their updated look in 1970.

After the 1960s, McBean stopped taking photographs and devoted himself to the production of collages from fiberglass and metal, designing wallpaper, and renovating his medieval house in Suffolk, Flemings Hall. McBean's collection of negatives and other archival material was purchased in the early 1970s by the Theatre Library at Harvard University, but he destroyed the remainder of his glass plates. In his last photographic phase, he came out of retirement to do color fashion photography for *L'Officiel* in 1983, then worked for the French *Vogue*. He died in 1990.

Although much of McBean's imagery may seem overwrought and even silly to later critics, his work in the genre had considerable impact on fashion and advertising photography of the late twentieth century. His theatrical photographs—whether in his naturalistic but glamorous, dramatic style or in his whimsical, fanciful mode—constitute a valuable document of the heyday of mid-century British theater.

Biography

Born in Newbridge near Newport, Monmouthshire, South Wales, June 1904. Attended technical college, Newport, briefly, followed by an unsuccessful series of bank jobs. Father died 1924; family moved to Acton, London, 1925. Trainee in antiques department, Liberty's, 1925–1932. Worked for photographer Hugh Cecil for about a year, then opened his own portrait studio in Belgrave Road, Victoria. Theatrical commissions (masks, set designs, and photographs) from 1933, including reproductions in many periodicals. Began Surrealist experiments, 1937. Closed Belgrave Road studio, 1940. Incarcerated 1940–1942. Theatrical work suffered during World War II because theaters were closed. Opened new studio in Endell Street, Covent Garden, 1945. Redesigned interior of the Academy Cinema, Oxford Street, 1952. Obtained contracts for LP record album covers, 1950s–1960s. Featured in a BBC television documentary, 1982. Retired from photography; designed wallpapers for friends and explored other craft projects. Color fashion photography for *L'Officiel*, 1983, then French *Vogue*. Died June 9, 1990.

RALPH EUGENE MEATYARD

American

At first glance, Ralph Eugene Meatyard's black-and-white photographs from the 1950s and 1960s seem like informal, playful snapshots of his family and friends, suburban backyards, and peaceful countryside. On closer inspection, his remarkable photographs reveal a multitude of mysterious and disconcerting elements. Lawns are scattered with broken bits of discarded dolls; enigmatic ghost-like figures emerge from the shadows; children's faces are frequently obscured by grotesque Halloween masks in decrepit rooms, enacting inscrutable dramas or charades. In every image, there is something askew. Meatyard employed his knowledge as an optician; his interest in Zen philosophy, photographic language, and metaphorical representation; and ideas taken from contemporary painting, literature, and art theory to compile a rich variety of photographic experimentation representing the "scientific nature of camera vision and the spiritual essence behind the visual world" (Tannenbaum 1991).

Meatyard, born in Normal, Illinois in 1925, graduated from high school in 1943 and entered the Navy. He attended Williams College in Williamstown, Massachusetts in 1943–1944 under the Navy's V-12 program, where he became interested in the works of poets and writers Ezra Pound, Gertrude Stein, and William Carlos Williams. He was an avid reader, which later translated into an interest in having his photographs accompanied by text and collaborating on various projects with writers and thinkers such as Roger Martin, Wendell Berry, Guy Davenport, Jonathan Greene, and James Baker Hall, who were his contemporaries and formed his intellectual and aesthetic circle. After the war, Meatyard married Madelyn McKinney in 1946, and he apprenticed as an optician in Chicago. He received his license in 1949 and began working in Bloomington, Illinois. In 1950, he left to study philosophy at Illinois Wesleyan University, Bloomington, and after one semester he accepted a job as an optician with Tinder-Kraus-Tinder in Lexington, Kentucky where he worked until he opened up his own shop in 1967.

Meatyard purchased his first camera in 1950 to photograph his newborn son, and he quickly became intrigued by the different ways he was

able to express himself and make visible hidden worlds with a camera. In 1954, he studied with art historian and photographer Van Deren Coke. In the same year, he joined the Lexington Camera Club (led by Coke) and the Photographic Society of America, a national organization of amateur photographers with a thrust towards photojournalism. He participated in the PSA's competitions, salons, and national shows during the years 1954 and 1955, exhibiting his photographs which contained the seeds of his later abstractions, blurred images, and fabricated scenes.

It was his involvement with the Lexington Camera Club that nurtured his interest in non-conventional photography by emphasizing personal expression and encouraging its members to photograph figuratively and literally in their own backyards. In 1956, Van Deren Coke included his photographs in an exhibition, *Creative Photography*, at the University of Kentucky, along with those of Ansel Adams, Aaron Siskind, Harry Callahan, and other modern masters. His first joint project (1955–1956), a collaboration with Coke, was a documentation of Georgetown Street, a popular thoroughfare in Lexington. It was a methodical photographic survey reminiscent of projects carried out by the Farm Security Administration and the Photo League in the 1930 and 1940s. This was first time Meatyard utilized the series, a practice that he continued throughout his photographic career.

In the summer of 1956, Meatyard attended a workshop at Indiana University, Bloomington, Indiana, with Henry Holmes Smith, Minor White, and Aaron Siskind, where the concepts of abstract photography, technical experimentation, and the expressive power of the photograph solidified his work. Influenced by the Abstract Expressionists, he embarked on a project where he painted images for the express purpose of photographing them. He also began a series of images of sunlight reflected on the surface of water, which he continued for the rest of his life. Other projects of this period included the "No-Focus," pictures which were abstracted forms of pure light against darkness; and the Zen Twigs and Motion-Sound series, both of which utilized "the fluid boundaries between objects and the

spiritual and natural energy inherent in them” (Tannenbaum, 1991).

In 1957, Meatyard shared an exhibition with Coke at A Photographer’s Gallery in New York City. His first one-man show was held at Tulane University in New Orleans in 1959, the year in which Coke published a Meatyard portfolio in *Aperture* with an accompanying text. Meatyard was included by Beaumont Newhall in the New Talent in the Photography U.S.A. section of *Art in America* in 1961. During 1967–1970, he collaborated with the writer Wendell Berry on work which resulted in the book *The Unforeseen Wilderness* (1971), to convey the essence of the Red River Gorge, a wilderness area in Kentucky.

“Produced throughout his career, Meatyard’s figurative works are romances as Ambrose Bierce defined the genre: stories that need never actually have taken place to ring true” (Tannenbaum 1991). In these photographs, he was creating the illusion of childhood, free of care and full of curiosity, as in *Untitled (Child with Hubcap)*, c. 1959. The images are staged realities drawing upon juxtapositions, dreams, alienation, and in many cases, conflict. By posing family members with strange props and masks and bringing together symbols of death and decay with children, he explored a deeper layer of meaning and truths behind relationships, the transition from childhood to adulthood, consciousness, and existence.

In 1970, Meatyard discovered he had cancer. He continued to photograph what would become his most enigmatic series, *The Family Album of Lucybelle Crater*, which he had begun just before his diagnosis. A name adapted from a character in a Flannery O’Connor short story, it was based on the concept of informal but staged poses of a family album and Gertrude Stein’s essay, “Portraits and Repetitions” (1935). Meatyard employed his wife, Madelyn, as the central constant masked figure photographed alongside a myriad of masked family members and friends including himself.

Meatyard died on 7 May 1972. His powerful and unique work, which aligned fabricated figurative imagery with deep psychological introspection, set the stage in contemporary art practice for figures such as Cindy Sherman, Richard Prince, and Jeff Wall, although his impulse to record the mysterious and ultimately inexplicable nature of everyday human existence is far removed from the postmodern strategies explored by these artist-photographers. His photographs continued to be seen following his death in a number of exhibitions and publications, most notably a major traveling retrospective, *Ralph Eugene Meatyard: An American Visionary*, organized by the Akron Art

Museum in 1991; *Ralph Eugene Meatyard (Aperture 18)*; and *The Family Album of Lucybelle Crater*, both in 1974. His photographs are included in numerous major collections, including the George Eastman House, the Metropolitan Museum of Art, the Museum of Modern Art, New York, and the Smithsonian Institution, Washington, D.C.

SUSAN MEISELAS

American

One of the leading women photojournalists of the late twentieth century, Susan Meiselas is known for her uncompromising, often disturbing, but sympathetic documentations of subcultures considered tawdry and people suffering the atrocities of war. Her work has been hailed as offering a new type of photojournalism, where the subject speaks for himself or herself through the inclusion of his or her voice in interviews or extended titles.

Born in Maryland in 1948, Susan Meiselas graduated with a degree in Anthropology from Sarah Lawrence College, Bronxville, New York in 1970, before completing a Master's Degree in Visual Education at Harvard University in New Haven, Connecticut. While at Harvard, she took her first photography class. She also worked as an assistant editor to renowned documentary filmmaker, Frederick Wiseman. Between 1972–1974, Meiselas used photography as an educational tool, organizing workshops for teachers and young children from the South Bronx, New York. During this same period, Meiselas spent her summers documenting striptease acts at carnivals in New England, Pennsylvania, and South Carolina. Interested in what motivated the women performers, most of whom hailed from small towns in America, Meiselas photographed them behind the scenes, and recorded their stories. By virtue of her sex, she was automatically excluded from attending the male-only shows. To photograph the women on stage, she disguised herself as a man. As carnival strip shows have now largely vanished, the resulting body of photographs forms a valuable sociology document.

When *Carnival Strippers* was first exhibited in 1975 it was accompanied by a sound track derived from the recordings that Meiselas had made. When it was published in book form in 1976, 75 black-and-white photographs were reproduced and juxtaposed with transcribed extracts from those recordings. Significantly, the selected quotations were not intended as captions, but as parallel or complementary narratives to the photographs. In 2003, a revised edition of *Carnival Strippers*, including an audio CD, was published.

Carnival Strippers was considered an important body of work not only for its sympathetic portrayal

of women considered part of the underbelly of society, but also because it marked Meiselas's entry into Magnum Photos and signaled the start of her career as a freelance photographer. She was nominated to join the agency in 1976; she became a Magnum Associate in 1977 and a Full Member in 1980. The project is also crucial to understanding the way in which Meiselas works. Characteristic of Meiselas's documentary method is the manner in which she encourages people to speak for, and about, themselves—a skill that derives, perhaps, from her training in anthropology and her work in education. Her experimental use of image and text differs from the convention of photograph-plus-caption, which she explored to great effect in subsequent projects, such as *Nicaragua: From June 1978–July 1979* (1981), *Kurdistan: In the Shadow of History* (1997), and *Encounters with the Dani: Stories from the Baliem Valley* (2003). Her purpose is to expand the experience of the photographs, and so engage more fully with the viewer and the people whose lives she documents.

Meiselas's book, *Nicaragua*, is now regarded as a watershed in photojournalism. She traveled independently to Nicaragua in the late 1970s, before the popular insurrection was launched. When political upheavals reached a crisis point and the media began to take notice, Meiselas's pictures were published internationally. Interested in producing a longer-term, more reflective response to the situation, she continued to make photographs in the area. As the book title makes explicit, the images in *Nicaragua* date from June 1978 and July 1979. They chronicle the overthrow of General Anastasio Somoza Garcia by the Sandinistas. As examples of war photography or photojournalism, these images are unusual, both in terms of format, and in the way in which they are organized as a publication. One way this project differs from other examples of the genre is that Meiselas shot in color. Although not the first time images of war were made in color, the saturated, seductive hues sit edgily with the often tightly framed images of conflict, fear, and death. But more significant is the manner in which the book is organized. Divided into two sections, the first part sequences photographs with no captions, obliging the reader to experience the chaos and confusion of the insurrection and its origins

without any anchoring words. In the second section, the photographs are reproduced as black-and-white thumbnails with lengthy explanatory titles. There are also a number of texts, including a chronology of events leading up to the revolution and various interviews, among them official quotes from Somoza as well as testimony from a housewife named Rosa Atilia. The ambiguity of the first section is thus contextualized by the voices of those whose history is being documented in the second. While it becomes apparent that Meiselas's sympathies are with the Sandinistas, she again explores a type of reportage that encompasses competing perspectives and not reducing the complexity of her subject to a single, or simplistic point of view. Most important, her device of using disparate texts derived from interviews and conversations moves towards challenging the criticism most often leveled at a documentary impulse: the silencing or disempowering of those who are photographed.

Meiselas's subsequent projects, also resulting in books, *Kurdistan* and *Encounters with the Dani*, both use the juxtaposition of image and text, drawn from a variety of sources, as a rhetorical device. In each case, Meiselas takes on the role of editor more than author. The intention of the two books is to collect together and negotiate the competing representations and implications derived from encounters between different peoples. In addition to the book *Kurdistan*, Meiselas has initiated a website project, www.akaKurdistan.com, which aims to establish a virtual archive of visual artifacts and reminiscences.

Encounters with the Dani evolved out of Meiselas's collaboration with the filmmaker Robert Gardner, whom she had met at Harvard, and who in the early 1960s had lived with and filmed the Dani of Baliem Valley, West Papua, a Stone Age society. It is a kind of dossier; historical and geographical documents are brought together with personal testimonies in a way that is overwhelming. Meaning is not presented as a *fait accompli* through the use of a single, captioned image. Rather, it is endlessly generated and moderated out of an array of interpretations.

Meiselas was active in Chile, El Salvador, and Nicaragua, and she has received various awards for her work in Central America. They include the Robert Capa Gold Medal for outstanding courage and reporting (1979), the Leica Medal for Excellence (1982), a MacArthur Fellowship (1992), and the Hasselblad Foundation Prize (1994). Meiselas has co-produced two films in collaboration with Richard Rogers and Alfred Guzzetti: *Living at Risk: The Story of a Nicaraguan Family* (1985) and *Pictures from a Revolution* (1991). Her photographs have been published widely, for example, in *Time*, the

New York Times, *Paris-Match*, and *Life*. She continues to undertake projects that combine education, oral history, and photography, including a program titled *A Photographic Genealogy*, which she developed as a consultant to the Polaroid Corporation.

ANNETTE MESSAGER

French

Annette Messenger escapes easy categorization as both a photographer and a contemporary artist. Her works, which first appeared in the early 1970s, are as ambiguous as the titles she gives them—*Collectionneuse* (The Collector), *Artiste* (The Artist), *Femme pratique* (Practical Woman), *Truqueuse* (The Special Effects Artist), *Colporteuse* (The Pedlar), *Paradeuse* (The Exhibitionist), and *Gardeus* (The Herder), just to name the most important ones. Her works vary from simple illustrated books to large, complex installations made with soft toy animals and knitted objects, with body parts made of colorful fabric, and with shells, plastic bags, mirrors, and stuffed animals. Within this rich array of materials and techniques, photography and as well as “found” photographs play a decisive role.

Annette Messenger was born in 1943 in the small town of Berck in northern France. After winning a photography competition sponsored by Kodak and the prize of traveling through Asia, she began studying art at the Ecole des Arts Décoratifs in Paris—a conscious decision against the option of the conservative Académie des Beaux-Arts. She traveled in a circle of like-minded young artists; among them were Christian Boltanski (with whom she has shared a long relationship), Jean Le Gac, and Paul-Armand Gette. In the atmosphere of revolt in May of 1968, she rejected “high art” and sought to connect art with life as practiced at the time by the Fluxus group and its French members Ben Vautier and Robert Filliou, by the Italian Arte Povera group, and by Joseph Beuys, the Belgian conceptual artist Marcel Broodthaers, Gilbert & George, and many others. Media considered unartistic strongly appealed to her; her seemingly banal themes—informed by post-structuralist philosophy that assigned virtually as much importance to context as to object—loaded such media with significant cultural meaning.

Messenger viewed her turn to the everyday, to the low in quality, and to the second class—including photography, which in the 1960s was still not recognized as an art form on the same level as painting or sculpture—as analogous to her marginal position as a woman in the world of art and in society-at-large; she pursued subversion through affirmation.

In the 1970s, she created dozens of what have been termed album collections, into which went hand-crafts and palaver about beauty and universal dreams of love and happiness. To examine the roll of mass media in defining models, Messenger used a great many images of women, including professional models, from newspapers, magazines, and especially from women’s magazines. She cut out these photographs and glued them into inexpensive paper booklets, manipulating them through placement and drawing upon them to create an ostensive revolt against female norms, including crossing out the eyes of babies.

In her role as Frau Everywoman, Annette Messenger incorporates the taboo, the cruel, and the uncanny into her work. Based in content and aesthetic form on the thrillers of Alfred Hitchcock, the series *Les feuilletons* (1978) is a large format work made of cut-outs of color photographs with charcoal sketches. Her sexual fantasies, especially underlying desires for women in glossy magazines, run free in *Les effroyables aventures d’Annette Messenger truqueuse* (1975)—a work in which the photographs are based on sketches. This work represents a second variant of her artistic practice utilizing photography, one that plays with the idea of the medium’s truthful representation of reality. A third variation is found in her drawings based on photographs. *Le bonheur illustré* (1975/76), a series of 180 color pencil drawings, was created from travel industry brochures; like the German painter Gerhard Richter, she used photos as “models”; and like Sigmar Polke, another leading German painter, she was fascinated by popular culture.

With her photo albums bringing together an inventory of everyday, domestic artifacts, Messenger widened her survey of visual clichés and collective fictions and connected photography with an increasingly wide range of media. Inspired by European and non-European folk art, popular forms including advertising, Surrealism, and the contemporary trend of mixing genres, Messenger developed a hybrid form symbolic of what she perceived as the patchwork culture of the late twentieth century and appropriate to the multiple modes of female existence. Central to her photography, which was always black and white, was the human body or parts of the body.

Messenger, in fact, often makes reference to nineteenth- and early twentieth-century medical and criminal photography, especially Jean-Martin Charcot's photographs of women diagnosed as hysterics in the Salpêtrière hospital in Paris.

In the early 1980s, Messenger began covering walls with the fantastic world of *Chimères*. She constructed witches, spiders, grotesque trees, bats, and giant moles made from torn photographs painted in shrill colors that depict eyes, noses, mouths, tongues, and sexual organs. This technique of ripping a fragmentary image from a whole creates a forceful representation that blends the aesthetic of the street fair with Surrealism, showing the influence of Hans Bellmer's grotesque artworks assembled from doll body parts. With *Mes petites effigies* (1987), she began using stuffed animals as voodoo dolls, which she wrapped in black-and-white photographs of human limbs and with the accompanying texts evokes a cultish aura. Her playful imitation of stuffed animals presents the recurring parallel in her works between photography and taxidermy—both freezing life and transforming the subject into a fetish.

She further emphasizes the fetishistic character of photography in works such as *Les Lignes de la main* (1987–1988) and *Mes Trophées* (1986–1988). In these works, large format photographs of the soles of feet, the palms of hands, posteriors, and elbow joints create idyllic landscapes that yield all kinds of mythical creatures, heavenly bodies, and ornamentation. Precursors to this art are the gallant Cartes du Tendre of the Rococo period, tattoos, instruction manuals for chiromancy, and the clichéd figure of the hysterical woman. In general, Messenger's works—her repertoire of forms and motifs—come from a variety of sources, combining art history and folklore.

Her voyeuristic representation of body parts is in part inspired by Catholic votive imagery, which fascinated Messenger as a child. *Mes Voeux* (1988/89) is indebted to the dense presentation of these images in chapels and churches. It features an ensemble of black-and-white framed photographs that are hung from strings, showing nostrils, lips, outstretched tongues, a single finger, toes, navels, armpits. These parts stand in for various people but do not form the sum of a single body. Sexual zones are also not overlooked; she includes nipples, male genitalia, and pubic hair. By isolating and amassing these images, Messenger ridicules the voyeurism of porno magazines and at the same time plays with the voyeurism of the viewer, which she impedes by the sheer quantity of accumulated, overlaid, and detailed sectioning of her photographs. Messenger prizes photography precisely as a technology of reproduction.

Dépendanceindépendance from 1995, an installation in the form of a heart, consisting of 500 elements taken from works created in the previous 20 years, creates once again the ambivalent magic and ironic mesmerizing power of photography lost in other works such *Les restes* (1998/99) and *Les Répliquantes* (1999/2000). In the 1990s, important museums such as the Museum of Modern Art in New York and Reina Sofia in Madrid acknowledged Messenger's artistic originality with solo exhibitions.

RAY K. METZKER

American

Using black-and-white photography from his student work through his latest landscapes, Ray K. Metzker has proven himself a master of this medium in the late twentieth century—his experimentation with and challenging of long-held tenets of photography have been hallmarks of his career.

Best known for his multiple-image compositions, Metzker enriches each of his works through intensive darkroom efforts and investigation of material expressions.

Born in Milwaukee, Wisconsin in 1931, Metzker started photographing at age 13, continued his photographic studies at Beloit College, briefly worked as a commercial photographer, and taught photogra-

phy in the U.S. Army for two years while stationed in Korea. The education that was to inform his distinctive visuals and photographic experimentation, however, came from Chicago's Institute of Design (ID), where Metzker worked with Aaron Siskind and was the protégé of Harry Callahan.

His Masters thesis and first professional series, *My Camera and I in the Loop* (1957–1958), comprised distanced observations of Chicago denizens in the cityscape and was immediately recognized by an exhibition at the Art Institute of Chicago. Such “humanist” observations of people and their surroundings would inform several series, including *Europe* (1960–1961), *Philadelphia* (1963), many of his famous *Composites* (1964–1984) and *City Whispers* (1981–1983). Many of these works convey the psychological isolation of city dwellers, especially as they are dominated by their architectural surroundings.

Hired as a professor at the Philadelphia College of Art in 1962 where he has been an important force in photographic education ever since, Metzker moved to the city that he would feature in many of his works and which still calls home.

Taking cues from his Bauhaus-inspired experimentation at ID, in the early sixties Metzker started to explore multiple images in his works. In the *Double Frame* series (1964–1966), he printed two frames that were contiguous on a roll, often one vertically and one horizontally oriented, to create an overall picture. Metzker incorporated into the composition the black line between frames and often blended it with peripheral dark shapes. This use of black areas and high-contrast whites and grays was to characterize Metzker's work through the sixties and seventies.

In 1964, Metzker began to expand his exploration of multiple images, thus starting his best-known works, *Composites*, which are collages of many prints arranged in grids to create unified compositions. Taking photographic repetition to its logical conclusion, Metzker made works such as *Torso I* and *Torso II* (1965) that are composed of multiple but identical prints mounted on a board. Though these and other early *Composites* maintain an intimate scale, in 1965, Metzker started making large *Composites* of Philadelphia streetscapes with narrow strips of multiple-exposed paper prints. These works did not have identical images, but similar patterns of lights, buildings, or pedestrians. Metzker produced a dynamic visual rhythm by juxtaposing varying images that had some similar and some disparate elements. In *Sailing on 9th* (1966), one sees an urban street with repeated buildings and point of view. Trucks, individuals, and an image-obliterating white reflection change from scene to

scene. Metzker does not offer a linear narrative; rather, he gives us a formal arrangement of values that defies one's expectations of cinematic vision. In *Sailing on 9th*, he repeats the central building motif four times across a single narrow print. Metzker avoids deadpan composition by laterally shifting the repeated elements and introducing the optical lacunae of stark black or white shapes. The syncopation evident in these works marks Metzker's love of twentieth-century music including jazz and composers such as Francis Poulenc and Erik Satie. Along with the *Composites'* distinctive formal qualities, Metzker conveyed the cacophony and visual disjunction of urban life. Metzker often juxtaposed and mounted several prints to make larger works that measured up to six feet. This scale, which gave the works the gallery presence of a canvas, anticipated the assembled photographic documents of the conceptualists and the large photographic works that characterize photography of the eighties and nineties.

Through the late sixties and early seventies, Metzker made sojourns to New Jersey beaches to escape Philadelphia's summer heat. On the sands of Atlantic City and Cape May, Metzker photographed unaware individuals and couples asleep in the sun on beach blankets and chairs. The resulting *Sand Creatures* photographs show people in a vulnerable, yet relaxed, state. *Sand Creatures: Cape May* (1973) reveals Metzker's long shadow superimposed atop a sleeping, comely woman. This juxtaposition suggests Metzker's self-aware imposition, even as he recalled of this series, “I took what they presented—delicate moments—unadorned and unglamorous, yet tender and exquisite.”

Predominately an urban photographer through the sixties, in 1970, Metzker turned his attention to the desert landscape while a Visiting Professor at the University of New Mexico in Albuquerque. This study marked a new direction for his work—one that would dominate his output through the eighties and nineties.

Sensing that his landscapes were unoriginal, in 1976, Metzker started to investigate formal possibilities for the photographic depth of field. In his *Pictus Interruptus* works, the photographer disrupted his scenes with objects that he would place in front of a corner of the lens. The resulting break in illusionistic depth forces viewers to focus on the images' overall formal qualities, even as they try to identify the blurry, occluding object.

Since the late seventies, Metzker's landscapes have often included out-of-focus foreground elements that create visual tension or harmony with the rest of the photographic field. His *Castagneto, Italy* works from

the *Feste di Foglie* series (1985) and his *Door County, Wisconsin* photographs that make up the *Door Suite* (1988) are examples of this rich, formal investigation of landscapes. This extended meditation on the natural world continues to the present and also includes his *Earthly Delights* (1987–1988) *Bernheim*, (1989) *Nature's Realm*, (1990–1994), *Moab I* (1994–1996) and *Moab II* (1997–1998) series. While these landscape works seem to be straight photography, Metzker often achieves their remarkable compositional balance and tonality in the darkroom through careful cropping, dodging, and burning. The results are often high-contrast images with “luminescent” foliage, or lush, “painterly” passages evocative of Impressionism. These unabashedly gorgeous images of trees, grasses, rocks, water, and sky call to mind the spirituality, beauty, and sense of the sublime advocated by the Romantics and Transcendentalists.

Biography

Born in Milwaukee, Wisconsin 1931. The artist lives and works in Philadelphia, Pennsylvania; Moab, Utah and other locations. B.A., Beloit College, Beloit, Wisconsin, 1953; active service, United States Army, Korea, 1954–1956; M.S. Institute of Design, Illinois Institute of Technology, Chicago, Illinois, 1958. Moved to Philadelphia, Pennsylvania, 1962. Professor of Photography, Philadelphia College of Art (now Philadelphia University of the Arts), 1962–1980; Professor, University of New Mexico, Albuquerque, 1970–1972; Professor, Columbia College, Chicago, 1980–1983; Distinguished Professor, George Washington University, Washington, D.C., 1987–1988. John Simon Guggenheim Memorial Foundation Fellowship, 1966, 1979; National Endowment for the Arts Grant 1974, 1988; La Napoule Foundation Residency, 1989; Bernheim Arts Fellowship, 1989; Mayor's Art and Culture Award, Philadelphia, 1991.

Individual Exhibitions

1959 *My Camera and I in the Loop*; Art Institute of Chicago; Chicago, Illinois
 1967 *Ray K. Metzker*; Museum of Modern Art; New York, New York
 1974 *New Mexico*; Dayton College of Art; Dayton, Ohio and The Print Club of Philadelphia; Philadelphia, Pennsylvania
 1978 *Ray K. Metzker: Multiple Concerns*; International Center for Photography; New York, New York
 1979 *Pictus Interruptus*; Light Gallery; New York, New York
 1985 *Unknown Territory: Ray K. Metzker Photographs 1956–83*; Museum of Fine Arts, Houston, Texas; San Francisco Museum of Modern Art, San Francisco, California; Art Institute of Chicago, Chicago, Illinois; the Philadelphia Museum of Art, Philadelphia, Pennsylvania; the High Museum of Art, Atlanta, Georgia; International Museum of Photography and Film, The George Eastman House, Rochester, New York; National Museum of American Art, Washington DC
 1991 *A New Leaf: Photographs by Ray Metzker*; Art Institute of Chicago; Chicago, Illinois
 1997 *Ray K. Metzker: When Darkness Reigns*; Laurence Miller Gallery; New York, New York
 2000 *Voyage of Discovery: The Landscape Photographs of Ray. K. Metzker*; Cleveland Museum of Art, Cleveland Ohio; and Philadelphia Museum of Art, Philadelphia, Pennsylvania.

Group Exhibitions

1958 *Photographs from the Museum Collection*; Museum of Modern Art; New York, New York
 1963 *Photography 63/An International Exhibition*; The New York State Exposition; Syracuse, New York and George Eastman House; Rochester, New York
 1968 *Photography and the City*; Smithsonian Institution; Washington, D.C.
 1970 *Bennett, Steichen, Metzker: The Wisconsin Heritage in Photography*; Milwaukee Art Center; Milwaukee, Wisconsin
 1976 *Philadelphia, Three Centuries of American Art*; Philadelphia Museum of Art; Philadelphia, Pennsylvania
 1978 *Mirrors and Windows: American Photography Since 1960*; Museum of Modern Art; New York, New York and traveling
 1981 *Erweiterte Fotografie/Extended Photography*; Association of Visual Artists, Vienna Secession; Vienna, Austria
 1983 *Harry Callahan and His Students: A Study in Influence*; Georgia State University Art Gallery; Atlanta, Georgia
 1989 *On the Art of Fixing a Shadow: One Hundred and Fifty Years of Photography*; National Gallery of Art, Washington, D.C., Art Institute of Chicago, Chicago, Illinois, Los Angeles County Museum of Art, Los Angeles, California and traveling
 1990 *Photography Until Now*; Museum of Modern Art; New York, New York
 1992 *Special Collections: The Photographic Order from Pop to Now*; International Center of Photography; New York, New York
 2002 *Taken By Design: Photographs from the Institute of Design, 1937–1971*; Art Institute of Chicago; Chicago, Illinois (traveled to San Francisco Museum of Modern Art, San Francisco, California and Philadelphia Museum of Art, Philadelphia, Pennsylvania)

PHOTOGRAPHY IN MEXICO

Photography arrived in Mexico during 1839, a few months after its invention in Europe. During the nineteenth century, it was largely the province of portraits, which were usually of society's poles. On the one hand, the wealthy had represented themselves so as to appear modern and successful; on the other, the lower classes were portrayed as "popular types": Indians or similarly exotic people engaged in picturesque occupations, often hawkers of strange merchandise. There was little of the landscape and cityscape photography seen in Europe, but the different governments in power soon found the medium useful for making visual records of prisoners and prostitutes. In what would later be called photojournalism, daguerrotypes were made of the U.S. troops occupying Saltillo during 1847, the first photographs ever taken in a war zone.

Portraiture reached new heights in the late nineteenth and early twentieth centuries, with the work of Romualdo García and Natalia Baquedano, the latter a pioneer woman photographer in Mexico. Commercial-documentary photography was largely the domain of foreigners such as Americans William Henry Jackson and Charles B. Waite, and the French-born Abel Briquet, who were contracted by railroad and steamship lines to document the country's modernization under Porfirio Díaz (1876–1910), and thus further stimulate foreign investment. Guillermo Kahlo (father of the painter, Frida) was employed by the Porfirian government to document the colonial buildings, and he traveled the country for four years, producing exquisite large-format images which constitute the biggest and most systematic inventory of the cultural patrimony under Spanish rule. However, the real milestone of this period was the photojournalist debut of the Casasola brothers, Agustín Víctor and Miguel, who took their first press pictures in 1902.

The Casasola Archive contains the best-known photographs in Mexico, for they have been disseminated repeatedly in illustrated histories which have played a role in state building and party dictatorship. Images of Porfirian progress and its antithesis, the Mexican Revolution (1910–1917), are indelibly imprinted in Mexican minds, thanks to the collection Agustín Víctor began to form when he founded the first Mexican photojournalist

agency in 1912, spurred by the sudden arrival of photographers and filmmakers who flooded the country to cover the first great social conflagration of the twentieth century. Agustín Víctor was an entrepreneur, as well as a photographer, and the pictures of more than 480 individuals can be found in the Casasola Archive, making it difficult to isolate and analyze the work of the different image makers, something further complicated by the fact that little research has been done on the publications in which photographs from the Casasola Archive appear.

During the Porfiriato, it appears that Casasola photographs in *El Mundo Ilustrado* (weekly supplement of the newspaper, *El Imparcial*) represented the social classes of that society in radically different, though complimentary, ways. "Political news" was dedicated to the order and progress wrought under President Porfirio Díaz, focusing on his ceremonies, state appointments, and diplomatic receptions, as well as his official visits and "informal" trips. However, the activities of dissenting groups, strikes, and the resistance of Indian communities were considered antisocial conduct; they were portrayed as a military, not a political problem. The populace was divided along the same lines. Society people appeared in the social chronicles, while the lower strata were represented as picturesque types or criminals, if they were unfortunate enough to end up in the police columns.

There is no evidence in the Casasola Archive of the photography that denounces social and political inequalities as can be seen in the pictures of Jacob Riis or Lewis Hine in the United States, and it appears that no such imagery developed in the rest of Latin America. The reform movements to which Riis and Hine were related had no counterparts in Mexico, but the Casasolas did take photographs during the Porfiriato with some implicit criticism of social conditions, and they documented the protest movement against Díaz's reelection in 1910. Further, it appears that the Casasolas developed a distinctly modern style of graphic journalism, capturing Díaz in unposed photos, as well as working with a view to creating photo-essays.

The Revolution presented photojournalists, for the first time, with the visual manifestations of con-

stant social ferment: lines of people awaiting the distribution of foodstuffs in the midst of famine, protests with banners that clamor for “WATER, WATER, WATER,” and women demanding “Work for all.” However, photography (as glimpsed through the Casasola Archive) continued largely to corroborate the political interpretations of whatever regime held power in Mexico City, and to whom the advertising of opposition gains in the countryside was anathema. There are interesting images: for example, those made in 1913 of Francisco Madero’s overthrow during the “Tragic Ten Days” could be among the first combat photographs of the twentieth century and the touching farewells between women and soldiers in the train station are still evocative. But, in general, the images of the revolution that most dominate are of the different leaders who passed through Mexico City.

After the armed struggle ended, the Casasolas maintained the agency, and among their assignments was the work Agustín Víctor did for the Mexican government during the 1920s and 1930s as the photographic coordinator of various state offices. Thus, it comes as no surprise that in his archive there are few images of post-Revolutionary Mexico that focus on the continuing social inequalities. However, though his prison photography was made for the yellow sheets of tabloid journalism, some images carry at least an implicit criticism of class injustice: sad-eyed teenage prostitutes stare back at the camera; men in bare feet and ragged clothing stand in front of well-clad lawyers to be judged; street urchins, their faces smeared with filth, are corralled by police who seem to take little joy in their task; officers taunt transvestites who appeal to the camera with their eyes.

Edward Weston and Tina Modotti came to Mexico City in 1923, and their presence was to have an important influence on Mexican photography. Integrating themselves into the cultural effervescence, they entered into the world of the muralists and other artists. Weston was already famous when he arrived in Mexico, but it was here that he effected the break with Pictorialism that would define twentieth-century photography throughout the world. Eschewing the soft-focus that attempted to imitate painting, he insisted that he was uninterested in the question of whether photography was art or not; his concern was whether a given image was a good photograph. He was wary of the intrinsic picturesqueness of Mexico and battled to avoid it. One result of his search to define the new medium can be seen in his 1925 images of a toilet, which served to demonstrate photography’s power for reproducing the beauty of the mundane.

Tina Modotti was known as his apprentice, and she followed his example of hard-focus photography that revealed things in themselves. However, her commitment to social justice led her to fill Weston’s form with a radically different content, perhaps inaugurating critical photography in Latin America. What are probably the first examples of published photographs which questioned the new Mexican order can be found in a handful of her images that appeared during the 1920s in the newspaper of the Mexican Communist party, *El Machete*. There, depictions of social inequities were accompanied by cutlines pointing out the contradictions between the promises of the Revolutionary regime and the reality of most people’s lives. For example, one image of a little girl carrying water was ironically titled “The Protection of Children,” and the cutline stated: “There are millions of girls like this in Mexico. They labor strenuously for 12 to 15 hours a day, almost always just for food...and what food! Nevertheless, the Constitution....”

Modotti’s photos were an appropriate counterpart to the lithographs that were placed on *El Machete*’s pages by its founders, the muralists José Clemente Orozco, David Alfaro Siqueiros, and Diego Rivera, and they were a welcome change from the fuzzy images of Soviet leaders that had been the paper’s photographic staple. Accustomed to carefully planning her images, she did not feel comfortable photographing in the street. She had no qualms, however, about creating a photomontage such as *Those on top and those on the bottom* (1928) to make her point. In the lower half of this photo, a poor man in rags sits on the curb of a city street forlornly holding his head in his hand. In the upper half, a billboard looms with an advertisement from a fashionable men’s store: a painting of a monocled, light-skinned man in a tuxedo is helped into his overcoat by his mestizo butler, and the pitch for Estrada Brothers clothiers claims that they “Have everything a gentleman needs to dress elegantly from head to toe.”

The real battle between those who wanted to represent Mexico through picturesque modes and those who resisted the appeal of the exotic began in the 1920s as part of the search for national identity provoked by the Mexican Revolution. Ironically, the controversy is most easily embodied—at least initially—in the positions adopted by foreigners: on one side, that of Weston and Modotti, who rejected such stereotyping; on the other, that of Hugo Brehme. A German who arrived in Mexico in 1908 (he died there in 1954), Brehme was the leading light of the magazine *Helios*, published by the Association of Mexican Photographers, and his

position in the controversy is encapsulated in the title of the book he edited in Spanish, German, and English: *Picturesque Mexico*. Photographers such as Rafael Carrillo and Luis Márquez joined Brehme in believing that their idyllic and bucolic perspective was the proper way to represent Mexico. Though they used *Helios* as a platform to attack the direct, realist vision of Weston, Modotti, and Manuel Álvarez Bravo as being “an imitation of foreign exoticisms,” their photography was nonetheless oriented toward giving readers outside Mexico what they expected. Thus, when asked if there was a Mexican School of Photography, Luis Márquez responded:

Mexico is an absolutely photogenic country: its archeological ruins, its colonial monuments and its peculiar landscape are the foundation of the photography that has developed there. Showing its diversity, the monumental and the typical, has made Mexico known in foreign lands.

The greatest of Mexico’s photographers, Manuel Álvarez Bravo, was no doubt stimulated by the presence of Weston and Modotti. He, in turn, was a definitive influence on the most aesthetically experimental Mexican photojournalists of the period between 1950 and 1970, Nacho López and Héctor García, and through them on the New Photojournalism of Mexico. Lola Álvarez Bravo was the first wife of Manuel Álvarez Bravo, and she used his name from the time they were married in 1925 until her death in 1993. Lola’s best photography manifests the sort of understated irony for which Manuel is famous, a modest esthetic in which the photographer’s presence is rarely noted. In one or another image, she expressed with particular poignancy her situation as a woman: for example, the powerful photo of a woman who—covered by a grid of shadows which take on the form of bars—slumps in her window and gazes into space, *In Her Own Prison* (ca. 1950). For many years, Lola lived in the shadow of Manuel (though they separated in 1934). In 1965, a major exhibit of Lola’s work was held in the Palace of Fine Arts, but it was only with her “discovery” in 1979 by the French critic Olivier Debrouse that her imagery began really to be seen in exhibitions and books. This is not unexpected, for Lola worked for many years as a photojournalist for minor magazines that were seen by a very limited audience.

Photojournalism has been the cradle of photography in Mexico, but visual representations of politicians were almost uniformly laudatory of those in power, prior to the founding of a genuinely critical press in the 1970s. As in much of the world,

illustrated magazines were a paramount form of visual culture and the primary venue for photographs, from the mid-1930s to the mid-1950s. In Mexico, José Pagés Llergo was the founder of the most important pictorial gazettes, and his productions—*Rotofoto* (1938), *Hoy* (1937), *Mañana* (1942), and *Siempre!* (1953)—were the *Life* and *Look* of Mexico. The constraints within which these publications functioned can be appreciated in his guiding dictum: he asserted that his journalists had no restraints, “as long as they don’t touch the President of the Republic or the Virgin of Guadalupe.” In fact, *Hoy* and *Mañana* were far more restrictive than Pagés’s relatively pluralistic code in their reverence for the powerful. However, *Rotofoto* offered images that went against the grain. Because of that, the magazine lasted only 11 issues, from 22 May to 31 July, 1938, before it was destroyed by goons from the official labor union. Still, though short-lived, it was an agile, provocative, and fundamentally graphic attempt to vindicate the place of photojournalists in Mexican publications. In the 1950s, *Siempre!* became the first really pluralistic periodical in Mexico.

Despite governmental control of the press during the party dictatorship which lasted until 2000, some photojournalists challenged the status quo. Among the first to do so were the Hermanos Mayo, who arrived in Mexico during 1939, fleeing from their defeat as members of the Republican forces in the Spanish Civil War. Composed of five “brothers”—Francisco (Paco), Faustino, Julio, Cándido, and Pablo—this photojournalist collective had taken on the “nom de guerre” of Mayo in honor of May Day. In Mexico, their commitment to working-class democracy was largely co-opted by the mass media, but they revolutionized Mexican photojournalism by introducing the 35-mm Leica camera and using it with such skill as to overcome the objections to its “tiny negatives.” A direct result of that technological innovation were dynamic photographs taken in the very center of action. The Hermanos Mayo played somewhat the same role that other refugees from Europe, such as Robert Capa and Alfred Eisenstadt, did in U.S. publications. Since their arrival, they have provided images for more than 40 newspapers and magazines, and their archive of some five million negatives is the largest in Latin America.

Notwithstanding their technical contributions, perhaps the most important asset of the Mayo was their development of a photographic discourse which insists that identity is formed in the process of people making something out of what their situation is making of them. Social struggles of

the 1950s and 1960s offered the Mayo many opportunities for constructing their visual dialectic. Their images may be the best taken of the 1958–1959 strikes, where teachers, telegraphers, and railroad and oil workers clashed with government forces during one of the most important movements in Mexico since the revolution of 1910–1917. There, they captured the outrage evident on a telegrapher's face as he glared from the background in the occupied offices at a bayonet-bearing soldier who dominates the photo's foreground. The Hermanos Mayo also covered the student movement of 1968, preserving for perpetuity the dialectic of oppression and resistance in images of students captured and forced to lie on the ground during the army's invasion of the university: even under the reflected glare of the bayonets that threaten them, they persist in their pursuit of free expression by flashing the sign of "Victory."

Nacho López is a pivotal figure in Mexican photography. He enjoyed the most autonomy within mass-circulation magazines, usually selecting his own themes and, in some cases, being given the power of decision over image choice and lay-out. His focus on the daily life of the downtrodden was an attempt to rescue the importance of the seemingly insignificant, the dignity of the poor, and the significance of the apparently commonplace. He represents a sharp break with prior Mexican photojournalism, both in terms of his social commitment as well as in the aesthetic explorations which mark him a true author of images and the foremost practitioner of the photoessay form in Mexico.

López was clearly the chosen photojournalist of *Siempre!*, the most respected periodical, for his essays appear in the first six issues. There, in 1954, López published the single most critical photoessay to appear in the illustrated magazines, "Only the humble go to hell." For López, Hell was the police stations where only the poor were at the mercy of "insolent, insulting, and ill-humoured police who are indifferent to the pain they cause the helpless"; the rich paid off the police in the street in order to spare themselves such ignominy. Corrupt and with impunity, the Mexican police were as deserving of a critique in 1954 as they are today, but López's indictment was one of very few that can be found in the entire history of the Mexican press.

Although his career as a photojournalist lasted only from 1950 to 1957 (he then went on to work in the cinema), López's concern for the downtrodden, his aesthetic search, and his insistence on carrying out authorial intent were a crucial example to later generations of Mexican photojournalists. His reflections on his craft were important guidelines

for his colleagues and students: "My profession is the most appropriate to understand dialectically the world of contradictions, to exhibit the struggle of classes, and to comprehend man as an individual." He left an important legacy in his classes at the National University (UNAM); Elsa Medina, one of the outstanding New Photojournalists, said: "He taught me to see."

Héctor García is another important Mexican photojournalist who began his career in the 1950s. His pictures of the 1958–1959 strikes were so damning of government intervention that the newspaper *Excelsior* refused to publish them. Forming the magazine *Ojo, una revista que ve*, García was able to print images of striking railroad and oil workers, as well as of the brutal beating of a male nurse who attempted to aid a woman overcome by tear gas. García embodies contradictions characteristic of the "perfect dictatorship" within which Mexicans lived under the rule of the official party: he produced many flattering images while working for President Luis Echeverría during the 1970s, but was one of the first photojournalists to explicitly critique the country's powerful. In a 1947 photograph, he poked fun at the wealthy, showing their foibles in an image where a tuxedo-suited man raises the toes of his shoes to free the long train of the woman's fancy dress on which he has trod. García also produced one of the few photos in which the sharp class distinctions characteristic of Mexico are made manifest: it is September 15th, and people are strolling near the central plaza (Zócalo) where the yearly "Cry of Independence" will soon take place. In the foreground is a poor peasant couple, loaded down with bundles of goods they hope to sell in order to eke out their precarious existence. Behind them come a very different two-some, dressed in evening clothes. The title García placed on the image speaks eloquently about the unfair distribution of wealth (and the muted protest against it): *Each With Their Own Cry* (1965).

In a photo taken in 1955, García directly confronted the cultural mechanisms utilized by the governing party to legitimize its rule. A young sugar cane cutter, covered with the filth of his grueling task, stands in front of a typical post-Revolutionary mural of a colonial scene in which an overseer whips peasants as they work in a cane field. Wall paintings such as this emphasize the Spanish exploitation of the Mexican people and, by extension, sanction the Revolutionary regime by inferring that such oppression is now a thing of the past. By placing the cane cutter against the mural, and submerging him into it through lowering the contrast, García creates a confrontation between

history and myth, and exposes the lies of such officialist renditions of yesterday and today.

Weekly magazines had provided photographers a place to publish during the first "Golden Age" of Mexican graphic reportage from the end of the 1930s to the mid-1950s, but during the 1970s, a second flowering occurred, as that role was taken over by daily newspapers. In 1977, Manuel Becerra Acosta led a movement to create a cooperative newspaper, and, to this day, *Uno más uno* describes itself as "The pioneer of graphic journalism in Mexico." In that daily, young photographers were given great latitude, and visual experimentation took precedence over the usually monotonous task of "covering" events. The respect given photojournalism was even more pronounced in *La Jornada*, the newspaper founded in 1984 by dissidents who left *Uno más uno*. From its very inception, *La Jornada* was conceived as a graphic medium: the artist Vicente Rojo designed the daily's format to include an image on every page, whether a photograph or a cartoon.

The new generation of photojournalists have published their work and earned their daily bread in *Uno más uno* and *La Jornada*: Pedro Valtierra, Elsa Medina, Marco Antonio Cruz, Francisco Mata Rosas, Fabrizio León, Andrés Garay, Raúl Ortega, Guillermo Castrejón, Eniac Martínez, Frida Hartz, Jorge Acevedo, Rubén Pax, Luis Humberto González, Angeles Torrejón, Christa Cowrie, José Antonio López, Aaron Sánchez, and Daniel Mendoza, to mention only some. Far from believing in the objectivity which prior graphic reporters such as Agustín Casasola or Enrique Díaz employed as a smoke-screen to dissimulate the services they provided to the state apparatus, and fundamentally opposed to the use of photographs as either filler or simple illustration, some members of the New Photojournalism summed up their position in a statement that accompanied a 1988 exhibit of their work:

A new generation of image creators now exists that recognizes the ideological, cultural, and symbolic character of their work; who obviously maintain the premise of their duty to inform, but without pretending to be a "faithful" register of reality....They are conscious that what they transmit is their point of view, opinions, and the position they assume in front of the events they see day after day.

The New Photojournalists have treated representatives of the State in ways to which they are little accustomed. For example, Marco Antonio Cruz ironically recast props of official symbolism in the photograph he made of President Miguel de la Madrid against a painted backdrop during a 1984 political meeting. In what must surely be the first

critical image of a president in office, De la Madrid appears at the very bottom of the photo, with a huge black cloud over his head on which is written "UNEMPLOYMENT," and from which a lightning bolt comes that is aimed directly at him. In another image characteristic of the New Photojournalists, Andrés Garay photographed in 1984 the then all-powerful leader of the oil workers, Joaquín Hernández Galicia, seated at a table behind bottles of rum and brandy, which dominate the foreground. Though the image nearly cost Garay a beating, and it required great finesse to secretly carry the film from the banquet, the photo is a faithful representation of the new generation's work. Fabrizio León produced an acidic commentary on the Mexican electoral process in 1988 when he pilloried Miguel Bartlett, then President of the Federal Election Commission and architect of the fraud that gave the presidency to Carlos Salinas, by photographing his haughtiness through the smoke of his cigarette. The Chiapas Rebellion of 1994 provided the New Photojournalists with much fodder, and the 1998 photo by Pedro Valtierra of the combat between Indian women and soldiers is the most famous picture to come out of that struggle. In Valtierra's image, the Indians rise up against the impositions to which they have been subject in reality and, as well, in the systems of representation with which the State has legitimized itself. They push back, and seem to be winning the age-old struggle to define their culture in ways that differ sharply from the picturesque terms in which they have too often been depicted.

Political critique is innovative in the Mexican context, but the most unique element of the New Photojournalism is the development of a documentary form within a newspaper format. This has resulted from the newspapers' emphasis on picturing daily life activities, which allows photographers to publish images that have no relation whatsoever to "news." Thus, photojournalists can follow their own personal interests, confident that they will have a space to publish if their pictures are esthetically interesting. This freedom has also allowed the New Photojournalists to explore alternative venues for their images, such as books, magazines, exhibits, and posters, with the result that many—including Francisco Mata Rosas, Guillermo Castrejón, Eniac Martínez, and Marco Antonio Cruz—have undertaken extended documentary projects. Finally, the incorporation of women has been an important force in transforming a guild and a photographic genre, usually dominated by men.

Documentary photography that is not photojournalism has had a long history in Mexico, and

it has often focused on Indians. Some photographers, working for the National Indigenist Institute, have demonstrated great sensitivity toward their subjects. Individuals such as Julio de la Fuente and Alfonso Fabila established a respectful esthetic for photographing Indians in the 1940s. They were followed in this by photographers such as Gertrude DUBY Blom, who began in the 1950s, and in later years by Nacho López and Alfonso Muñoz. Mexico's natural exoticism, however, makes it an easy mark for photographers who prefer the attractions of "Orientalism." Bernice Kolko produced images in the picturesque vein during the 1950s. In one image, an old peasant woman with a lined face is portrayed as the essence of motherly abnegation, sitting in front of a thatched roof that provides textured reference to idyllic tropicalism, and posed with her hands folded together as if she were praying (perhaps for her release from such romantic nonsense). More recently, Flor Garduño is the Mexican photographer who is probably most given to the stereotypical representation of her culture, often staging images by dressing Indians in exotic clothing and placing them in picturesque surroundings. The Chiapas Rebellion of 1994 brought a different sort of attention to the Indians, and the most interesting result has been the project to teach Indian women to photograph, one of whose results has been the book, *Camaristas: Mayan Photographers* (1998).

Graciela Iturbide's work also falls into photographs which tempt with their picturesque qualities, though hers is a complex and sophisticated photography which has the greatest audience outside of Mexico. Iturbide and the renowned Mexican writer, Elena Poniatowska, collaborated on a documentary project about the city of Juchitán, Oaxaca, which resulted in the book, *Juchitán of the Women* (1989), a paean to a mythical matriarchal society embodied in images such as Juchiteca women dancing together. Iturbide later ratcheted this idealization of rural Mexico up another level in her work, *In the Name of the Father* (1993). Here, Iturbide presents the "grotesque-picturesque" in photos of the traditional, though ghastly, slaughter of goats in Oaxaca brought down from the highlands by Mixtec shepherds at the end of the rainy season; Iturbide's images of dead goats piled up on textured *petates* or whose bloated corpses lie next to sleeping babies provide a macabre spectacle. Iturbide creates especially moving pictures when she photographs her own culture, as in the image of a woman sitting alone in a bar under a mural painting (1972) or the cultural blending so typical of the late twentieth century

in her iconic work *Mujer Angel (Angel Woman)*, Sonora, 1979 which shows an Indian woman in traditional raiment striding into the countryside carrying a portable radio.

Outside the pale of photojournalism, several Mexican photographers of the late decades of the twentieth century merit serious attention. David Maawad and Alicia Ahumada have produced superb documentary studies of Hidalgo and other areas outside of Mexico City; theirs are among the few photographs free of the taint of the picturesque which so haunts Mexican imagery. Mariana Yampolsky has also made some wonderful photographs of the countryside, its inhabitants and architecture. Within the sphere of art photography, Gerardo Suter has created constructed images that are provocative, and the work of Humberto Chavez combines an intense intellectualism with an overwhelming sensuality. Pedro Meyer is among the pioneers of digital imagery in the world, and he has argued for years that the computer revolution will erase the frontier between fiction and documentary, as well as liberate photographers from "reality."

Notwithstanding the explorations of many individual image makers, the history of Mexican photography has largely been written in photojournalist and documentary images. One reason for this is that the country has demonstrated a concern with conserving its photographic heritage which is unique in Latin America. The Fototeca of the INAH (National Institute of Anthropology and History) was constructed in Pachuca, a cold and dry location to the north of Mexico City, furnished with up-to-date equipment, and technicians trained in advanced conservation procedures; it contains the Casasola Archive, as well as those of Tina Modotti and Nacho López. The National Archive (AGN) also has large holdings, including the five million negatives of the Hermanos Mayo. This heritage has been disseminated through a vast number of publications, perhaps the most significant of which is *Río de luz* (River of Light), a series that includes many of the most important Mexican and Latin American photographers. The series has functioned largely under the editorship of Pablo Ortiz Monasterio, himself an important contemporary photographer.

The prominence of photography in Mexico was both recognized and stimulated by the 1994 founding of the Centro de la Imagen (Center of the Image). Under the directorship of Patricia Mendoza, the Center has created an extraordinary space for photography, including constantly changing exhibits, workshops taught by photographers and historians from all over the world, and a

library worthy of note. The Center also coordinates the activities of *Fotoseptiembre* (PhotoSeptember), the biennials of photography and photojournalism, and the publication of the magazine, *Luna Córnea*. The health of Mexican photography can be gauged in the feverish effervescence of the many activities undertaken in the Centro de la Imagen.

JOEL MEYEROWITZ

American

Originally a street photographer, Joel Meyerowitz came to prominence as an advocate and pioneer of color photography in the 1970s. His early style was characterized by black-and-white urban scenes in the 1960s. Over a decade later, he created color photographs of seascape, landscape, and cityscape with a quiet, emotive sensibility. In his introduction to the Meyerowitz publication *Bay/Sky*, novelist Norman Mailer once asked, “Is there one of his prints that does not express his ongoing quest for the instant when nature can reveal itself through mood, light, mist, seaweed, wind, or the endless vortices of water in its dialogue with sand?”

Meyerowitz was born and raised in New York City in 1938. After high school, he enrolled at Ohio State University, Columbus, where he studied painting and medical drawing from 1956–1959. After graduation from college, he worked as an art director in New York City. While on location supervising a shoot with photographer Robert Frank, Meyerow-

witz became inspired by Frank’s quick but focused working method. He eventually quit his job and devoted his time to photographing in 1962. Influenced by the tradition of street photography that he knew from the work of Frank and French photographer Henri Cartier-Bresson and through a close working relationship with Garry Winogrand, he began shooting black-and-white images with a 35-mm Leica camera. For the subject of his photographs, he chose urban life in New York City during the 1960s, and he captured the irony and strangeness he found in the streets.

By the 1970s, Meyerowitz began to shoot color, and as an early practitioner of the medium, he was instrumental in changing prevailing attitudes in the art world toward color photography. Serious fine art photographers had, for the most part, disregarded color film and the resulting prints, finding that the color produced was often exaggerated or unrealistic. Meyerowitz found that color was critical to the accurate representation of the visual world and that color illuminated his own memory of that experi-

ence. In color work, he was able to discard narrative subject matter and emphasize the formal qualities of the photograph in regard to light and its emotive qualities. These characteristics were essential to the aesthetic development of color photography as it emerged in the late 1970s and early 1980s.

In the mid-1970s, Meyerowitz received acclaim for his earliest color series taken during summers spent in Provincetown, Massachusetts, when he began photographing the seascape of Cape Cod. Instead of shooting with a 35-mm camera for this series, he used an antique 8 × 10-inch Deardorff view camera, which enabled him to create large negatives that yielded nearly grainless images with clarity and detail. Meyerowitz expressed a sensitivity to the mood of a scene by capturing various atmospheric conditions, light effects, and the changing quality of color throughout various times of the day and into dusk. The most notable images from this period include a series of photographs taken on the porch of his summer home. As in the work *Porch, Provincetown*, 1978, Meyerowitz carefully observed the light as it fell upon the architectural elements that framed an open expanse of sea in the distance. The photographs were included in the book *Cape Light*, a publication that eventually became a classic work of color photography.

Works from the Cape Cod series led to subsequent color work and publications. He produced photographs of St. Louis in 1977 for a project commissioned by the Saint Louis Art Museum. While on four extended trips to the city during different seasons of the year, Meyerowitz made over 400 negatives. The St. Louis Arch became a significant, recurring element throughout this series in terms of its scale, its role in relation to the city, and its constancy throughout a variety of weather conditions and changes of season. Briefly, Meyerowitz turned his attention away from the land to the individual and embarked on a new series of portraits of redheads while vacationing at his summer home in Cape Cod; they appeared in his 1990 book *Redheads*.

In the last two decades of the century, Meyerowitz photographed the Manhattan skyline. After spending his summers in Cape Cod, he would return each fall to the city, and, beginning in 1981, he regularly shot from his twelfth-floor studio on West 19th Street. With 50 feet of windows and a clear view looking south, he observed the play of light as storms and weather systems passed over lower Manhattan. He became captivated by the skyline of New York City—he noted:

I thought I was being called by the scale of the city seen against the sky, but, of course, what really excited me

was the towers of the World Trade Center on the horizon. The towers were by turns hard-edged and glinting, like the Manhattan schist they stood on, or papery, or brooding and wet, smothered in tropical cloud banks carried up by the sea. Some days they were pewter, or gilded, or incandescent...

This body of work, which he amassed without exhibiting, was originally conceived as an urban landscape series. He made what turned out to be a final photograph just days before the Twin Towers of the World Trade Center were destroyed by Islamic terrorists on September 11, 2001, and the entire series of images immediately took on new significance.

Meyerowitz was away from New York during the attacks. Returning to find that photography of the site, which quickly came to be called Ground Zero, was prohibited, he was determined to gain access to record history and create an archive for the city of New York. He stated, “My task is to make a photographic record of the aftermath: the awesome spectacle of destruction; the reverence for the dead; the steadfast, painstaking effort of recovery; the life of those whose act of salvation has embedded itself deeply into the consciousness of all of us in America and around the world.” He was granted access through his alliance with the Museum of the City of New York (the only photographer allowed complete access to the site), and the museum selected photographs from this series for inclusion in *After September 11: Images from Ground Zero*, a special exhibition that has traveled worldwide since 2002.

Meyerowitz is the author of numerous books, including the well-regarded history *Bystander, The History of Street Photography*, co-authored with Colin Westerbeck. He has had one-man exhibitions at the Museum of Modern Art, Art Institute of Chicago, San Francisco Museum of Modern Art, and Boston Museum of Fine Art, and has work in museums and private collections in the United States and abroad. He has recently produced and directed his first film, *POP*, an intimate diary of a three-week trip he made with his son Sasha and his father Hy, who has Alzheimer’s Disease.

DUANE MICHALS

American

Self-taught in photography, Duane Michals has redefined photography by traveling a path unrestricted by the rules of the medium in order to explore its possibilities, always seeking expression and imagination rather than an adherence to specific, traditional forms. Michals is particularly known for his narrative sequences, in which he plays upon the cinematic aspect of photography. He has written, "I believe in the imagination. What I cannot see is infinitely more important than what I can see..." (*Real Dreams*, Addison House, 1976). Like graphic riddles, his "photostories" symbolize intangible realities. His career as a photographer has been unusual, with equal success in the commercial field and in the fine arts.

Raised in McKeesport, Pennsylvania where he was born in 1932 to a working-class family, Michals spent a great deal of time with his Slovakian grandmother, who lived with his family. He credits her with his later development of an alter ego, Stefan Mihal,

whose life Michals might have led, complete with the suburban home, factory job, and middle-class family. During high school, he became interested in art and on weekends started taking watercolor painting classes at the Carnegie Institute in Pittsburgh and then at the Carnegie-Mellon University. Enabled by a scholarship, Michals went on to study at the University of Denver, where he earned a B.A. in Art in 1953. Drafted into the United States Army shortly after graduation, he served as a second lieutenant in Germany during the Korean War. In 1956, after his army stint was over, Michals decided to study graphic design at the Parsons School of Design. After one year, he left to begin working as a graphic designer/assistant art director at *Dance* magazine.

Within a year, in 1958, he accepted a keyline/paste-up and design position with the publicity department at Time, Inc. That same year, it was on a three-week trip to Russia that Michals first became interested in photography when, with a borrowed camera, he took candid shots and portraits of Russian people. Upon

his return to the United States, he saw the greater potential of his Russian portraits and began to move into the commercial photography field, finding steady success. His first group exhibition, which also featured the work of Garry Winogrand, was in 1959 at the Image Gallery in New York. Starting with his initial commercial commission doing the publicity stills for the Broadway musical revue, *The Fantasticks*, Michals soon found steady work doing freelance photography for such varied magazines such as *Esquire*, *Mademoiselle*, *Show*, *Vogue*, *The New York Times*, *Horizon*, and *Scientific American*.

Then, in 1964, Michals began a personal project photographing the empty, unpeopled spaces within the city, seeing their stage-like implications. By 1966, frustrated with the weaknesses of the camera and the rules about what photography was supposed to be, he began doing photographic sequences of 5 to 15 images. Like all of his "photo-stories," each preconceived and staged sequence in natural light is simple and logical yet seemingly illusory. These narrative tableaux anticipate the fictive strategies popular to the postmodernist artists of the 1980s.

Derived from his belief "what I cannot see is infinitely more important than what I can see," Michals' early sequences, such as *The Spirit Leaves the Body* (1968), *Fallen Angel* (1968), and *Chance Meeting* (1969), build a story while simultaneously increasing the psychological tenor. Each three and a quarter by five inch image is masterfully emotionally psychological, sexually provocative, and elusive in its realistic representation. Influenced by the fusion of reality/unreality in the Surrealist paintings of Rene Magritte and the haunting *pittura metafisica* of Giorgio de Chirico's paintings, as well as the documentary tradition in photography, Michals has developed a style of telling unresolved graphic riddles in tableau form. Fuzzy focus, double exposure, the blur, and other imperfections of the photographic process enhance the immediacy of each scene. Thematically, the photographs of Duane Michals dwell upon his obsession with love and death. The place of dreams, unconscious, and spiritual wishes become the subject for his camera as the intangible materializes. The strength of Michals' vision lies in his acknowledgment of our spiritual yearnings and desires.

An early interest in verse and the works of Walt Whitman led Michals to begin writing poetry in 1972. In 1974, Michals began to write on his photographs, thereby subverting the viewer's literal expectations. The touch of the hand is apparent. Mistakes are included, leaving an impression of chance and authenticity. One of his best-known images, "A Letter from My Father," is a photograph taken in 1960 but reprinted in 1975, the year his father died, with

Michals' handwritten thoughts. Poignant and private, the poetic handwritten text tells about an unfulfilled promise, adding a dimension that is markedly different than that of the visual.

Michals continued to push the boundaries placed upon photography. In 1975, Michals eliminated photography altogether in *Failed Attempt to Photograph Reality* by writing on a piece of paper, including the words "...To photograph reality is to photograph nothing." Then, anticipating the hybrid conceptualism of the postmodernists, Michals began painting on his own photographs in 1978. In *Ceci n'est pas une photo d'une Pipe* (1978), a reference to Magritte, Michals sought to show the inevitable limitations of the single photograph. In the late 1970s, Michals began to include more overt references to his homosexuality. In his books, *Homage to Cavafy* (1978) and *The Nature of Desire* (1986), his ideas on normality as being culturally defined, the beauty within both sexes, and the legitimacy of affection between sexes comes through the eloquent openness of his words and images.

Working simultaneously in both the commercial and fine art photography fields, Michals has managed to bridge the historical friction between them, seeing the mutual possibilities and exchange of ideas long before the 1990s acceptance of fashion photography as art. He sees no division and does his commercial work alongside his art photography. Preferring real, naturally lit locations, yet disdaining both the studio and the darkroom, all of his work contains a lyrical element, as exemplified in his album cover, *Synchronicity*, for the musical group The Police. His commercial success has granted him the financial ability to pursue his personal fine art work.

Since 1964, Michals has been represented in major solo exhibitions throughout the world, and his photographs are found in both museum and private collections internationally. Beginning with *Sequences* in 1970, over 20 books of his images have been published. *The Essential Duane Michals* (1997), a compilation of his ongoing photographic career, includes both his commercial and fine art photography. Michals lives in New York City.

BORIS MIKHAILOV

Ukrainian

Boris Mikhailov has come to be considered one of the key post-Soviet artists within both the Western and Eastern canons of contemporary photography. He was born in Kharkov in the former USSR, and his career has spanned the Soviet control of his country through the declaration of Ukrainian independence. Incorporating diverse photographic strategies, aesthetics, and subject matter, he has created a challenging and wide-ranging body of work noted for its critique of Soviet life, contemplation of social changes after the fall of communism, and its broader ongoing examination of the role of both the photographer and the photograph within diverse political, geographic, and social contexts.

From the start, Mikhailov's work challenged the rules that defined what was acceptable as art under the Soviet regime. It was at the age of 27 that Mikhailov took his first photograph—a portrait of a "sensual and Western-looking woman smoking a cigarette" (Williams 2001). Despite attempts to have it publicly exhibited, the photo was repeatedly denied because its subject matter was deemed inappropriate. A few years later, when officials discovered nude photos of his wife among his private documents at work, he was fired from the state-owned camera factory where he had been employed as a technical engineer. Yet in spite of this, he resolved to devote himself exclusively to the medium around 1967, beginning a career as a black-market commercial photographer and privately pursuing his own artistic projects.

Choosing to bypass the heavily censored state-sponsored channels for making and showing photographs—namely camera clubs, magazines, and public exhibitions—Mikhailov gravitated towards a more radical and underground culture for circulating his work. He participated in clandestine exhibitions ar-

ranged in private homes known as "kitchen shows." Here, he slowly began to gain recognition for his work and for the first time found himself in the company of like-minded artists critical of Soviet life. It was at one of these exhibitions that Mikhailov met the Russian artist Ilya Kabokov, who went on to notably influence the development of his work and introduce him to the wider Moscow scene of dissident artists and intellectuals.

Mikhailov's photographic projects have almost always taken the form of extended series, often completed over the course of several years, and widely varying from one another in terms of their formal aspects, conceptual strategies, and subject matter. Key to understanding many of Mikhailov's pieces is appreciating the extent to which he was directly and indirectly reacting to controls and restrictions placed upon photographic practice in the USSR. Any photo that questioned Soviet power or way of life, any portrayal of the naked body, and the very act of photographing without permission in most public spaces were strictly forbidden. Meanwhile, official images of the idealized Soviet citizen were everywhere in the culture, portraying something Mikhailov and many others felt was entirely distant from their own reality.

In the thick of these conditions, Mikhailov set out to make his early works, *Red Series* (1968–1975), *Luriki* (1971–1985), and *Sots Art* (1975–1986), each experimenting with aesthetic devices, such as a snapshot style of shooting, the hand-coloring of pictures, and re-appropriation of found photos, to pointedly articulate his discontent with the Soviet status quo. The *Red Series* contrasts drearily prosaic moments in communist life against the crowning visual symbol of Soviet power and control—the color red. Both *Luriki* and *Sots Art* play sarcastically with the Russian tradition of hand coloring photographs, thereby transforming this popularized aesthetic into a means

to critique idealization and representation. Of all his projects, these three have been the most closely associated with the work of the Moscow Conceptualists, a group of artists including Ilya Kabakov, Eric Bulatov, and Oleg Vassiliev, who radically and ironically sought to comment on the legacy of the Russian avant-garde and Social Realism in order to address the failures and hypocrisy in their society.

The next important phase in Mikhailov's work, which includes the projects *Unfinished Dissertation* (1985) and *Salt Lake* (1986), explored ways to question the stability and objectivity of more traditional photojournalistic-looking images. Combining black-and-white photos with sloppy hand-written text in no discernable relationship to one another, *Unfinished Dissertation* epitomizes the futility of subjectivity inside an environment in which it is not allowed to exist. Displayed on the backside of a lengthy and incomplete academic dissertation that Mikhailov happened upon in the garbage, the work irreverently reveals authority, meaning, and truth as little more than facade. *Salt Lake* takes as its subject the bathers on the shores of a lake near Slavjansk. What might at first be mistaken for idyllic images of a summer outing, at closer inspection reveal another fissure in the myth of the Soviet utopia—as the viewer slowly realizes that the lake is surrounded by a dirty and inhospitable industrial landscape.

As dramatic historical changes occurred around him—the fall of communism and the declaration of Ukrainian independence—Mikhailov's photographic work kept close stride. His most acclaimed post-Soviet bodies of work, *By the Ground* (1991) and *Case History* (1997–1998), document the uneasy transition from a socialist to capitalist model of society. *By the Ground* consists of street scenes in Kharkov and Moscow shot from a camera held at waist level, pointed down. The melodramatic formal qualities of the panoramic, sepia-toned pictures, in contrast with the banality of the scenes portrayed, cleverly parallel the tension felt between the promise of freedom and the slow and complicated moment towards tangible social and political change. *Case History*, undoubtedly Mikhailov's most well-known and controversial work to date, unflinchingly records the plight of the newly created homeless population known as the *bomzhes*. Diseased bodies, depraved sexuality, lawless children, feral animals, and gruesomely desperate living conditions are the subject matter of this body of almost 500 color documentary-style photographs. When asked about the reaction of his subjects to being photographed, Mikhailov explains:

Most often they were more interested in contact and conversation and in the help they could receive, but

sometimes they wanted the situation in which they found themselves to be known, so that someone would take and interest in it.

(“A Discussion Between Boris Mikhailov and Jan Kaila”)

Critics were quick to point out the fine ethical line that this work straddles—as Mikhailov paid his subjects to pose and often directed their performances in front of the camera. Some voiced outrage over the sensationally voyeuristic portrayal of tragic circumstances for a Western audience, while others defended the work as an important socio-historical record and desperate call for help.

Mikhailov's career has spanned more than 35 years, and he continues to exhibit and publish widely in the East and West. He has been the recipient of many prestigious international awards, including: the Coutts Contemporary Art Award, the Hasselblad Award, and the Citibank Photography Prize. He continues to photograph and currently splits his time between his native Kharkov and Berlin, Germany.

LEE MILLER

American

Lee Miller was a noted Surrealist, studio and fashion photographer, and war correspondent whose work for *Vogue* magazine during World War II is often considered to be her most important contribution to the history of photography. Although she changed careers a number of times, Miller’s enduring legacy can be found in her images, as photography became the one passion that sustained her for much of her adult life.

Born in Poughkeepsie, New York in 1907, Elizabeth (known as Lee) Miller was raised in a household where photography was a prevalent influence. Miller’s father Theodore was both a successful businessman and avid amateur photographer. Characterized as a privileged yet rebellious adolescent, Miller was expelled from numerous private schools before being sent to Paris with a governess in 1925. Beginning her formal artistic education while in France, she studied at L’École Medgyes pour la Technique du Théâtre, and upon her return to the United States in 1926, Miller enrolled in the Art Students League of New York. A beautiful and highly photogenic young woman, Miller’s studies were sidetracked by her brief but highly successful career as a model for *Vogue* magazine, where the leading fashion photographers of the day, including Horst P. Horst, Edward Steichen, Arnold Genthe, and George Hoyningen-Huene, photographed her.

In 1929, Miller returned to Paris and inserted herself into the atelier of Surrealist Man Ray. Although familiar with photography since her childhood, it was in Man Ray’s studio that Miller

learned about photographic technique. While Miller modeled for Ray, she also produced her own photographs and assisted Ray in his darkroom. It was here that Miller claimed to have contributed to the rediscovery of the Sabattier effect, a nineteenth-century process that had been all but forgotten. Also called solarization, it is a darkroom technique in which film is purposely exposed to light during the development process, encouraging a partial reversal of printed black-and-white tones. Man Ray is typically credited with the revival of the technique, but Miller recalled the moment of discovery in Ray’s darkroom differently. She claimed that it was her accidental action of exposing unfixed film to light that encouraged the development of a technique that later became a signature of both Miller’s and Man Ray’s work.

In Paris, Miller also starred (as an armless statue) in Jean Cocteau’s avant-garde film, *Le Sang d’un poète* (Blood of the Poet), and she had her first exhibition of her photographs. She also ended her affair with Man Ray after meeting Egyptian businessman Aziz Eloui Bey, whom she married in 1934 following the suicide of Bey’s wife.

Miller left France in October of 1932, but not before building an independent and successful photography studio in Paris. She repeated this success upon her return to New York City, opening a studio at 8 East 48th Street with her younger brother Erik. Miller’s work was well received almost immediately in the United States, and she was featured in a one-woman show at the Julien Levy Gallery in December of 1932, just two months after returning to her home country. She photographed a number of

luminaries in the arts, including composer Virgil Thompson, artist Joseph Cornell, and actress Gertrude Lawrence. She closed her New York studio in 1934, however, to relocate to Cairo with her husband, and she drastically curtailed her professional photographic practice. During a trip to Paris in 1937, Miller met British artist and Surrealist patron Arthur Penrose, with whom she traveled in Europe, leading to the dissolution of her marriage and her relocation to England in June of 1939.

Once again in a more central location and creative milieu, Miller's photographic career revived. In January of 1940, she began working for British *Vogue*. In her capacity as a studio photographer, she produced countless images of various celebrities and wartime fashions. Independently of the magazine, Miller documented the hardships encountered in England during the blitz, and in 1941 a number of her photographs were published in the book *Grim Glory: Pictures of Britain under Fire*. Edited by Ernestine Carter and with a preface by Edward R. Murrow, the book described the blitz through image and text, and was marketed in the United States, allowing the American public a glimpse into the wartime conditions in England.

Encouraged by *Life* magazine photographer David E. Scherman (of whom she made a famous portrait posing with his photo equipment and wearing a gas mask), Miller was accredited as a U.S. forces war correspondent in 1942, although women were not allowed to photograph combat. Although the photographic assignments received from *Vogue* remained relatively benign immediately after her accreditation, including portrait assignments of *Life* magazine photographer Margaret Bourke-White and members of the Women's Royal Naval Service, the designation eventually allowed her the latitude to travel outside of the *Vogue* studios and to report on a number of dangerous wartime situations. In 1944, Miller traveled to Normandy, France six weeks after D-Day and photographed a U.S. Army evacuation hospital. These images were published in the September 1944 issue of *Vogue* alongside her written transcript outlining the subject. After publication of the story, Miller regularly served as both photographer and reporter for *Vogue*, as she followed the U.S. Army eastward during the waning months of the war.

Arriving in Paris shortly after the city's liberation from German occupation, Miller produced numerous fashion photographs, the most notable of which *Vogue* Magazine published in its October and November 1944 issues. After Paris, Miller continued into hostile territory with the U.S. Army, focusing exclusively on the destruction left in the

wake of World War II. Her most powerful photographs from this time period were taken in the German concentration camps of Dachau and Buchenwald. Although highly disturbing and graphic, Miller's images of prisoners and defeated SS guards were reproduced in the June 1945 edition of American *Vogue*, giving readers an unprecedented glimpse into the horrors that befell the citizens of Europe.

Miller continued to work for *Vogue* after the close of World War II, covering stories in Denmark, Austria, and Hungary. In February of 1946, she returned to London, where she married Roland Penrose one year later. After the birth of her only child, Antony, in September 1947, Miller worked for *Vogue* sporadically. Although she largely abandoned photography, she did continue to photograph the many notable visitors to the Penrose farm in Chiddingfold, East Sussex, including artists Max Ernst and Pablo Picasso. Her later years were spent dedicated to her new passion for cooking and traveling with Penrose until her death in 1977. Although recognized for her work as a photographer during the early stages of her career, Miller had become remembered primarily for her work as a model and muse to Man Ray until her son Antony published her biography, *The Lives of Lee Miller*, in 1985. He later edited the book *Lee Miller's War: Photographer and Correspondent with the Allies in Europe*, a 1989 publication that concentrated on her experiences with the U.S. Army during World War II. Antony Miller also established and directs the Lee Miller Archive in East Sussex, England, which conserves and publishes the Lee Miller photographic heritage.

RICHARD MISRACH

American

Richard Misrach is popularly recognized as one of the foremost American landscape photographers working at the end of the twentieth century. The greater part of his oeuvre forms a comprehensive collection of images centered on an investigation of and response to the American desert; dynamic, large-format color photographs that capture the splendor and formal essence of a unique terrain, yet simultaneously highlight social and political concerns. Misrach views the desert as metaphor, where serene beauty exists alongside the conflict and violence of pollution and other aspects of environmental damage wrought of human agency.

Misrach's love of photography was kindled in the late 1960s when he was a psychology student at the University of California at Berkeley. In 1973, he received a National Endowment for the Arts Visual Artist's Fellowship, which enabled him to complete and publish his first book, a black-and-white portrait documentary series entitled *Telegraph 3 A.M.: The Street People of Telegraph Avenue, Berkeley, California* (1974). These nighttime images were taken in an effort to raise money for a food bank, but resulted in somewhat of a personal crisis for Misrach. He considered the production of a coffee-table book of people in poverty as problematic and questioned the role of the legitimacy of the photographer as political activist.

These concerns continued to percolate as Misrach began to engage the landscape of the American West as his subject in the latter part of the 1970s. At this time, his formal influences included Minor White and Edward Weston, and he later rediscovered the work of nineteenth-century expeditionary photographers Timothy O'Sullivan and William Henry Jackson. Yet the traditions in landscape photography formed by the legacy of such image-makers dictated that the American wilderness often served as mere scenery to human existence. Misrach veered from this approach and instead chose to highlight the effects of human encroachment on the environment. In addition, unlike his photographic predecessors, he began to use color. Working with an 8 × 10-inch Deardorff camera, Misrach found that he was able to capture a myriad of details in his subject, and the importance of light, and subsequently color, began to play a major role

in his working method. In anticipating the moment he wanted to arrest, Misrach learned to wait and watch all day for the perfect light.

The reward for Misrach's patience and his political desire to articulate the fragile balance between humans and nature can clearly be seen in numerous stunningly beautiful, minimalist landscape images from his epic *Desert Cantos* project and in his 1996 exhibition, *Crimes and Splendors: The Desert Cantos of Richard Misrach*. Now spanning decades in production, Misrach's *Cantos*—the titled is inspired by the long poems of Dante Alighieri and Ezra Pound—are a group of works that exist as individual photographic series with unique landscape subjects, but which are connected by aesthetic and metaphorical concerns.

Misrach's first four cantos (*The Terrain, The Event I, The Flood, The Fires*), produced from 1979 to 1985, focus on basic elements of the desert that he encountered where the landscape appears to be reclaiming or asserting itself, and also reveal evidence of past and continuing human activity. In these initial series, Misrach introduced significant themes, such as ecology, militarism, and tourism, which recur and overlap in later works. As curator Anne Wilkes Tucker has observed, Misrach successfully threads cultural and environmental violence through several cantos produced in the late 1980s (Tucker 1996). Silent scarred bombing range landscapes comprise *Canto V: The War (Bravo 20)*, where abandoned military installations and the rusty equipment of war litter the desert; these images formed the basis for Misrach's book *Bravo 20: The Bombing of the American West* (1990). By contrast, *Canto VI: The Pit*, focuses on mass burial piles of animal corpses. Here, the surreal detritus, while organic, ultimately bespeaks human intrusion, suggesting problems of disease, pollution, or possible nuclear toxicity. Similar metaphoric implications of destruction and violence can be understood from the defaced porn images of *Canto XI: The Playboys*, in which Misrach photographed bullet-hole riddled pages of two *Playboy* magazines he found at a Nevada test site.

Later cantos, such as *XVII: The Skies* and *XXI: Heavenly Bodies*, might, upon first glance, suggest less political impetus. Misrach focuses our attention

upwards, presenting distilled views of desert skies that are quietly beautiful in a way that potentially references traditions in abstract painting. The overwhelming sense of scale suggests the greater power of natural forces as opposed to human agency. Yet in *The Skies*, the individual titles of the photographs noting their location, such as “Mecca, California” or “Jerusalem Mountain, Arizona,” must surely be understood as topographical signifiers. Similarly, in the night sky images of *Heavenly Bodies*, where Misrach’s camera records the movement of stars, planet, and aircraft, location plays an important part in the formation of meaning. Arousal of the issue of cultural ownership comes when the viewer realizes these are skies over Native American desert lands. Even at his most subtle, Misrach maintains a connection to his political motivations.

Equally, when working in new landscapes outside of the western states, the photographer sustains a keen interest in the juxtaposition between humans and nature. In 1998, Misrach received a “Picturing the South” commission from the High Museum of Art, Atlanta. For this project, he photographed an area along the Mississippi River between Baton Rouge and New Orleans, popularly but distressingly known as Cancer Alley. While recognized as a seat of great antebellum cultural history, the natural resources of this area have also been ravaged by decades of pollution from the petro-chemical industry. Here again, in *Pictures from the South* (1998–2000), in images of vibrant green polluted swamps, Misrach’s seductive rich color photographs challenge the viewer to consider the often sickening results of human agency in the environment.

Works from Misrach’s recent series *On the Beach* (2003) are similarly unnerving. Inspired by Nevil Shute’s 1950s post-apocalyptic novel set in a world slowly dying from the effects of an atomic war, Misrach captures figures within a vast expanse of a beach or water. Often the view is unsettling and anonymous. Human subjects are dwarfed by their empty but exquisite surroundings. It is through such minimal and serene beauty that Richard Misrach’s social concerns are consistently and perhaps most cleverly revealed. And while he may not have been the first to bring politics into the discourse of landscape photography, he is certainly one of the most successful contemporary artists to use a strategy of juxtaposition between aesthetics and an informed ecocritical polemic.

LISETTE MODEL

American

Lisette Model was born Elise Amelie Felicie Stern (the family name was later changed to Seybert) to a wealthy and cultured Jewish Viennese family. She enjoyed a privileged private education and early associations with Vienna's artistic and intellectual community. Model studied piano and later became a student of avant-garde composer Arnold Schönberg, a fellow iconoclast. Through their friendship, Model initially pursued a music career, beginning singing lessons in Paris in the early 1920s. From her initial days in Paris, Model associated with the artistic and intellectual community including the Surrealists and other free-spirited successful women in their circle. In 1926, her family left Vienna and moved to the south of France, following the death of Model's father.

During the early 1930s, Model abandoned music and singing altogether to study drawing and painting. She subsequently turned to photography, influenced in her career choice by her younger sister Olga, a photographer in her own right, from whom Model learned rudimentary darkroom procedures, camera application, and materials. Shortly, after being introduced to photography, she received a demonstration on the use of the Rolleiflex from Rogi André, André Kertész's first wife. The two women spent time together walking the streets of Paris while André pointed out photographic opportunities. Model's first photographs were of family and friends, including photographer Florence Henri and her future husband Evsa Model.

The photographer Ergy Landau, in whose studio Olga worked, played an equally important part in advancing Model's career. Through her association with Landau, Model met Charles Rado of the Rapho Agency, a photo distribution firm founded in 1933 by Landau in collaboration with Brassai and Rado. Charles Rado, who was in charge of photo distribution, acted as an agent to promote Model's work.

Model's French period (1926–1938) is largely shrouded in mystery. One of her first photography projects was done in the summer of 1934 while she was visiting her mother at their family home in Nice. On the Promenade des Anglais, Model found potential subjects for her scrutinizing gaze, an assortment of rich character types—wealthy French, American,

and Russian tourists. In February 1935, her photographic work of the materialist culture of the Côte d'Azur graced the cover of *Regards* magazine, an AIZ-like publication supported by the Communist Party. In addition to her *Promenade* series, Model's French work constitutes a poignant social documentary of marginal personages—street vendors and the homeless in Paris and Nice, old Nice, a few Parisian street scenes, and the zoo in Vincennes.

On September 6, 1937, she married painter Evsa Model; the couple immigrated to the United States the following fall. Once established in America, in 1940 Model began working as a laboratory technician for a Long Island weekly magazine, *PM*. The magazine's picture editor Ralph Steiner recognized the quality of Model's work and in January 1941, he published seven of her photographs, including some from the *Promenade* series in *PM's Weekly*, under the heading, "Why France Fell." Model worked for Steiner from 1940–1941.

Through her association with Steiner, Model met many of New York's creative forces—Sid Grossman, co-founder of the Photo League, and Alexey Brodovitch, art director of *Harper's Bazaar*; she enjoyed an intimate association with both of them. In 1941, Model began a 12-year freelance relationship with *Harper's*; her first assignment, to document people at leisure on Coney Island, became one of her iconic series. Model was an active contributor to *Harper's* during the 1940s and 1950s, preferring to work on a non-assignment basis creating her photographic narratives on speculation. In addition to her work at *Harper's*, Model took on freelance assignments between 1941–1953, working for popular magazine publications, *Look* and *Ladies Home Journal* among others. Model worked as an independent photographer in New York from 1953 until her death in 1983.

A regular member of the New York Photo League, whose leftist politics of the 1930s coincided with her own, Model participated in the group's exhibitions, newsletter, lectures, and symposia. Due to the conservative climate of America following World War II, Model was reticent to discuss her French period, in particular her association with the *Regards* publication. Even so, in 1947, the Photo League was investigated, and its members fell under the scrutiny of the McCarthy era and were black-

listed. Model was interrogated by the F.B.I. in 1954, as were many of her friends, employers, and neighbors. Additionally, she continued to be cautious about any current political affiliations that might be perceived as subversive and thus connecting her to far-leftist organizations. Perhaps as a result of this scrutiny during this period, Lisette and her husband experienced reduced employment opportunities; the couple was supported during the more difficult financial times through the generosity of friends Berenice Abbott, Ansel Adams, Edward Steichen, and Edward Weston.

Following closely the style she practiced in Europe, Model's American photographs—a sometimes ruthless indexing of human topology—received quick recognition with exposure in museums, galleries, and fashion magazines, and through the Photo League. Model's inspiration was drawn from American glamour, window displays, jazz clubs, and circus performers. Her subjects ranged from the sublime to the non-idealized even grotesque chosen from New York's leisure world of entertainment and shopping, including the Lower East Side and Coney Island, where she caught one of her most famous images—a rotund, exuberant bather standing in a sumo-wrestler pose (*Coney Island Bather*, New York, 1937–1941). Her lens focused on people in every station of life, and her photographs capture an eerie beauty with their intuitive and uncompromising honesty.

Model's portrait style features exaggerated "types" characterized by their high contrast, deep shadows, often drastic cropping, and unusual perspectives. In her *Running Legs* series of shoppers on New York's Fifth Avenue, Model objectifies and fragments the figure as she allows only legs and feet within the camera frame. In another series titled *Reflections*, Model photographed refractive images of New York store windows, a body of images that draws comparison to works by Eugène Atget. Other subjects capturing her attention included the blind realized in a 1944 series *Lighthouse*, *Blind Workshop* published by *Harper's*, and jazz musicians, although her intention to publish a book on jazz performers was never realized.

Much of Model's lasting contribution to the field of photography came in the form of her mentorship as an instructor. When her husband took a teaching assignment in Northern California in the late 1940s, Model likewise found an opportunity to teach photography at the San Francisco Institute of Fine Arts in 1947. During this time, Model met Ansel Adams, and the two photographed in Yosemite National Park together. In 1951, Model began teaching at the New York

School of Social Research, where she remained on staff for 30 years (1951–1982). Beginning in 1954, her teaching methods evolved into a more informal approach, but her notebooks outlining her principles point to her firm, if eccentric, opinions. Among her many students were Robert Frank and Diane Arbus. Model's influence on Arbus was especially strong in demonstrating how what might at first glance seem grotesque can be rendered beautifully and sympathetically. Model once described to her students the battle she waged against complacency and ambition for its own sake:

The thing that shocks me and which I really try to change is the lukewarmness, the indifference, the kind of taking pictures that really doesn't matter....This kind of looking for a good photograph or the *trying* to self-express oneself—you see self-expression but the motivation is not something irresistibly important. It is something [which is done] in order to make a career, to be proud of one's photographs, to become a great photographer, to become famous....The so-called great photographers or great artists...they don't think so much about themselves. It is what they have to say that is important.

(Thomas 1990)

MODERN PHOTOGRAPHY

Modern Photography began life as *Minicam* in September 1937, a magazine devoted towards the “miniature camera” of the day. The first issue hit the newsstands a few months after the launching of *Popular Photography* magazine, and the two magazines would stay rivals and competitors for over 50 years. The initial focus of *Minicam* was on the new 35-mm and twin-reflex cameras, as opposed to the medium- and large-format cameras that were the norm of the day (though the magazine featured articles on all

cameras, regardless of format). *Minicam* was published by Automobile Digest Publishing Company, Cincinnati, Ohio, and was printed in “digest” size (6½ × 9½ inches). Change was inevitable since the small format of the magazine made it a challenge to attract advertisers. Twelve years later, in August 1949, *Minicam* was purchased by the Photographic Publishing Company, New York. Not only did the publication now establish itself as an east coast publication, but beginning with the September 1949 issue,

the magazine became full-sized and its name was changed to *Modern Photography*, the name that would grace the front of the magazine until publication ceased in July 1989.

The competition between *Popular Photography* and *Modern Photography* was as much about circulation and ad space as it was about editorial coverage. Both magazines had rival technical staffs and equipment testing laboratories; if one magazine had an innovative piece of equipment to test cameras or lenses, the other was bound to try to get it. The rivalry extended into the publishing of annual issues as well. Both magazines tried to corner the market on annual specialty photographic magazines focused on specific equipment or picture-taking techniques; *Modern* publishing their Photo Buying Guide, Photo Information Almanac, How to Photograph Nudes, and Rock Photo (guide to photographing rock concerts), among others.

Thousands of readers turned to *Modern* each month for the latest advice about improving their picture-taking techniques or to view portfolios of talented photographers, (one highlight from the 1970s was a 32-page essay and portfolio on Leni Riefenstahl). Probably the most important aspect of the magazine for its loyal readers was its equipment testing (each month different equipment would be tested in “Modern Tests”) and technical features. It was vital for the editorial staff of *Modern* to be considered the authority in camera and lens testing, and to ensure that the magazine maintained a state-of-the-art laboratory, and strove to make the technical results as reader-accessible as possible. *Modern* also employed experts from the highly regarded Japan Camera Inspection Institute (JCII) as editorial correspondents to help make “Modern Tests” as technically accurate as possible. Other popular departments were “Hard Knocks,” in which editors would praise and/or pan reader photos; The Camera Collector; Keppler’s SLR

Notebook, a monthly column by the editorial director/publisher; and “Too Hot to Handle,” where the staff would answer readers’ probing questions.

Reader satisfaction was crucial to the success of *Modern Photography*. Equipment that passed “Modern Tests” would be given a *Modern Photography* “Seal of Approval” that guaranteed to readers that the equipment purchased by the consumer would perform as tested by the magazine, or it would be repaired or replaced until it did. *Modern* also had an extensive section of mail order advertisers in the back of the magazine, and to ensure customer satisfaction devoted a page in each magazine to explaining the vagaries of mail order practices.

The publishing imprint of *Modern* saw many changes over the years. In 1963, 14 years after Photographic Publishing brought it to New York, the magazine was sold to Billboard Publications, and four years later it was sold again to ABC Leisure Magazines, Inc., a division of ABC, which became ABC Consumer Magazines. In 1986, *Modern Photography* was purchased by Diamondis Communications, Inc., a subsidiary of Hachette Publications, Inc. After the publication of *Modern*’s July 1989 issue, it merged with its archrival of many years, *Popular Photography*. At the time of the merge, *Modern Photography* had a monthly circulation base of 500,000.

Though *Modern Photography* exists in name no more, in many ways the current *Popular Photography*, with the publisher, editor-in-chief, and managing editor all hailing from *Modern*, is a successful melding of the two giant American consumer photographic publications of the twentieth century.

MODERNA MUSEET

The Fotografiska Museet, now incorporated into the Moderna Museet, began in 1964 when photography enthusiasts founded the *Fotografiska Museets Vänner* (Friends of the Photography Museum). Earlier, interest in Swedish photography first appeared when the

National Museum introduced *Modern svensk fotokonst* (Modern Swedish Photography) in 1944 and *Svensk fotografi av idag-svartvitt* (Swedish Photography today—black and white) in 1954. Meanwhile, Otte Skold, Director of the National Museum, suc-

cessfully persuaded the Swedish government to create a museum specifically dedicated to twentieth century art. At that time, an Association of Friends of Moderna Museet was formed. Its collection of 150 art works was transferred in 1958 from the National Museum to this new Museum of Modern Art (Moderna Museet), which was to be located in an empty naval drill hall on the island of Skeppsholmen in Stockholm. After Skold's death later that year, Pontus Hulten was appointed director and along with cutting-edge exhibitions of contemporary and kinetic art, he was responsible for an important photography exhibition in 1962, *Svenskarna sedda av 11 fotografer* (The Swedes as seen by 11 Photographers).

The decade of the 1960s brought great success to the new museum as concerts, poetry readings, and films drew large audiences. In 1964, a major exhibition introduced the Swedish public to American Pop Art followed in 1965 by the exhibition, "Helmut Gernsheim's Duplicate Collection Classic Camera." This internationally-recognized collection, along with Professor Helmer Bäckström's historical photographic collection acquired in 1964, became the foundation of the Fotografiska Museet, which was formally established in 1971 when the Fotografiska Museet's Friends Association gifted their collection of photographs to the National Museum. During the following years, numerous organizations, notably The Swedish Photographers Association, The Swedish Tourist Organization, The Photographic Society, Stockholm, The Swedish Tourist Traffic Association, the National Association of Swedish Photography, The Press Photographer's Club, *TIO Fotografer* (Studio Ten Photographers) as well as private individuals donated photographs, thus, establishing photography as a permanent fixture on Sweden's artistic scene.

Later in 1971, the entire collection of photographs and photographic literature was consolidated and transferred to the Modern Museum. As part of the reorganization of the National Museum's collections in 1973, the Fotografiska Museet became a department within the Modern Museum in 1976 and in December of that year, its activities moved into the Museum's west gallery. In 1978, curators Åke Sidwall and Leif Wigh contributed to the growing international debate on photography with *Tusen och en Bild* (Thousand and One Images), a wide-encompassing survey on the rise and development of photography. The Fotografiska Museet continued to organize exhibitions on a wide-encompassing diversity of subjects, including *Genom Svenska Ogon* (Through Swedish Eyes), 1978–1979; *Bäckströms Bilder!* (Backstroms Pictures), 1980; *Se dig om I glädje* (Look back in Joy), 1981; and *Bländande Bilder* (Dazzling Pic-

tures) 1981–1982. In 1983, a large retrospective of the photographs of Henri Cartier-Bresson took place. In 1984 *Fotografier från Bosporen och Konstantinopel* (Photographs from the Bosphoros and Constantinople) and in 1985, the first retrospective of Irving Penn expanded the Museum's exhibition activities on international photographic subjects.

Meanwhile, Moderna Museet was challenging the Swedish public with discussions of Postmodernism by highlighting such artists as painters Andy Warhol, Marcel Duchamp, Francis Picabia, the group of American and European sculptors known as the Minimalists, and photographer Cindy Sherman. Along with its collection of world-renowned photographers, including nineteenth-century master Julia Magaret Cameron and major twentieth-century figures August Sander, Diane Arbus, Bill Brandt, and Lotte Jacobi, there are significant Swedish photographers, such as Sune Jonsson (b. 1930) whose love and respect for Nordic nature is found in people and places in the sparsely populated regions of the countryside, and Christer Strömholm (b. 1918), founder of the Kursverksamheten's School of Photography, whose deeply moving works display the vulnerabilities of life. Other Swedish photographers are Lennart af Petersens, Karl Sandels, Walter Hirsch, Lennart Olson, Harald Lönnqvist, Annika von Hauswolff, Emma Schenson, and Monica Englund-Johansson.

In 1990–1991, with the need for more space and better conditions, an architectural competition was held for the construction of a new building for the Moderna Museet. Over 211 proposals were received with Rafael Moneo of Spain, winner of the 1996 Pritzker Architecture Prize, proclaimed the winner. In 1993, the old drill hall held its last exhibitions, a retrospective of the work of Gerhard Richter and the photographs of Chilean contemporary artist Alfredo Jaar, and closed after 35 years.

While Moneo's three-storey modernist building was rising, temporary premises in a former tram depot in the city center housed installations, including an exhibition of a gift of 100 Irving Penn photographs. The new Modern Museum opened in February 1998, the year in which Stockholm became the European Cultural Capital and with the new premises, the status of the photography collection with some 300,000 objects changed. In his introduction to the Moderna Museet's catalogue, then director David Elliott outlined what he recognized as the task of the modern museum and stating that "the art of the whole world must be considered," as he set a global outlook for the institution. The Fotografiska Museet lost both its name and its independent department status and is today housed in the Department of Exhibitions and Collections of the

Modern Museum. There is no permanent installation; however, temporary exhibitions take place on a regular basis. Recent interest in Nordic photography throughout Scandinavia has led to the founding of the Nordic Network for the History and Aesthetics of Photography in 2003 whose aim is to make Nordic history of photography more visible and to serve as a platform for discussions on international theoretic developments and literature.

The Library

The Photography Library together with a Study Room for eight researchers provides a unique environment for the public to conduct photographic research. The Library began with several important book collections, namely that of Helmut Gernsheim and Professor Helmer Bäckström as

well as the collection of *Fotografiska Föreningen* (the Photographic Society, Stockholm). All give the collection its distinguishing strength in the historical development of Swedish photography and its relationship to the world photographic scene. Today the Moderna Museet houses the largest photographic library in northern Europe and contains literature on individual photographers, books on world photographic history, and exhibition catalogues as well as a pioneering collection of artists' films and videos. Its periodicals' section is unparalleled in Sweden, comprising press clippings from a selection of Swedish newspapers, some 200 magazines from around the world, and an extensive historical archive, including documents in 11,000 vertical files on Swedish and foreign photographers and photographic issues.

MODERNISM

The term “modernism” loosely describes a vast and dynamic field of cultural and aesthetic innovation that emerged in the first decades of the twentieth century. A response to the industrialization and mechanization that shaped Western culture in the eighteenth and nineteenth centuries, modernism first announced its innovations through painting and literature. James Joyce’s *Portrait of the Artist as a Young Man* (1916) slices the novel into distinct literary styles, experiments with the fluidity of language, and suspends narrative time to represent the vicissitudes of subjective experience and perception. Marcel Duchamp’s *Nude Descending a Staircase No. 2* (1912) (the Armory show’s *succès de scandale*) triumphantly culminates the fragmentation, analysis, and multiplication of perspectives variously explored by impressionist, post-impressionist, and Cubist painters.

Although photography was associated with modernity’s technological inventions and had become the defining feature of mass visual culture, it had a somewhat late and an unsettled place in modernism. And yet even though photography came late to the scene as a medium in which modernism was expressed, it had informed literature and painting’s innovations. Modern artists working in every medium were compelled by the camera’s capacity to represent what Walter Benjamin later described in “A Short History of Photography” (1931), as the “optical unconscious”—that which the physical eye cannot see. Duchamp’s *Nude Descending a Staircase No. 2*, which arrests and depicts motion’s minute fragments in painterly shards, could not have

appeared in a culture bereft of photography’s deepening and expanding of vision’s capacities.

While photographic vision informed Futurism, Surrealism, and Dada’s dismantling of aesthetic hierarchies, it was these fine arts movements that helped to break open photography’s experimental paths. It is particularly the Dadaist use of montage, which cuts photographs from their original contexts and then juxtaposes them with text and typography, that calls attention to the image as sign, and therefore undermines the assumption that the photograph renders a positivistic truth. The deconstruction of the photographic image is in tension with, but not wholly unrelated to, another impulse in modernist photography: exploring the photograph’s unique capacity to represent traces of the material real, what Rosalind Krauss describes as the photograph’s indexical relation to that which it depicts. Many modern photographs, particularly those that veer toward abstraction, are explorations of and meditations on the limits and possibilities of the photographic medium. Man Ray’s “rayographs” and László Moholy-Nagy’s “photograms,” cameraless images produced from placing and exposing objects on light-sensitive paper, as well as Alfred Langdon Coburn’s Vortographs, kaleidoscopic compositions of mirrored light and shadow, are just a few of modernist photographers’ attempts to discover the fundamental qualities of the photograph.

Reflecting on the unique capacities of the photograph and defamiliarizing perspectival form became two interrelated tropes for exploring photography’s visual language. Looking at her own image in a

vertical mirror that is held up against a bare wall by two mirrored balls, Florence Henri's austere and sexually suggestive *Self Portrait* (1928) stages photography's geometries of reiteration. In many of his photographs of young Parisian bohemians such as *Groupe joyeux au bal musette* (1932) Brassai depicted those in proximity to cafe mirrors, therefore presenting images of the photographed subjects as well as their reflections. Writing about Brassai's visual commentary on the photograph's capacity for "self reflection," Craig Owens argues in "*Photography en abyme*" (1978) that the mirror's doubling of the subjects "functions as a reduced, internal image of the photograph." Even more compelling for reading photography's interpretative play are the images of people only visible in the photograph through their mirrored reflection.

In 1936, when Walter Benjamin published "*The Work of Art in the Age of Mechanical Reproduction*," he theorized and contextualized many European and Russian photographers' enthusiasms about photography's revolutionary potential. In the 1920s and 1930s, photographers such as Alexandr Rodchenko and László Moholy-Nagy theorized and created a photographic practice called New Vision, and attempted to enliven viewers experiencing modern life through stagnant perceptual and aesthetic traditions. Using smaller format cameras and unencumbered by the need for tripods, Moholy-Nagy and Rodchenko explored the perspectives offered by the modern city—its high-rises and dramatic scales, its geometries of contrast, its industrial patterns and textures—and experimented with what Christopher Phillips describes as "the purposefully disorienting vantage point" (1989). Moholy-Nagy's *Berlin Radio Tower* (1928) is shot from far above ground such that the spaces, shadows, and objects below intersect into a dense and abstract pattern, implicitly celebrating the technological and industrial shaping of modern life. Rodchenko's *Sawmill, Piles of Wood* (1931) depicts, from far below, one moment in the process of carrying and stacking plywood. Dynamically askew, Rodchenko's photographs defamiliarized the habitual human-centered perspectives, "shooting from the belly button." Defending his work against critics who claimed his photographs indulged in distortion, in "*The Paths of Modern Photography*" (1928) Rodchenko declares: "Photography—the new, rapid, concrete reflector of the world—should surely undertake to show the world from all vantage points, and to develop people's capacity to see from all sides."

Modernism in photography can be rightly said to have emerged in Europe in the avant-garde circles of Berlin, Munich, Vienna, Paris, and Prague. In the United States, paradoxically, Alfred Stieglitz essen-

tially kept photography in the past to establish its "modern" value as a fine-arts medium. Distressed by the proliferation of photographs in mass culture and the rise of the Kodak amateur, Stieglitz worked to convince the world that photography's aesthetic stature could be raised to that of painting and drawing largely by mimicking the accepted aesthetic qualities of these mediums. Encouraged by an early correspondence with the late nineteenth-century naturalist photographer Peter Henry Emerson, and armed with a wealth of new technical knowledge, Stieglitz produced and promoted Pictorialist photographs—soft focus images of pastoral scenes thematically and compositionally derived from nineteenth century paintings. Between 1902 and 1907, Stieglitz became American photography's most influential figure and established America's first institutions for art photography. With the Munich and Vienna Secessions as its rebellious predecessors, Stieglitz founded the Photo-Secession in 1902 to mark modern American photography's break with its more conservative past, personified by the Camera Club of New York. His Gallery 291 displayed Pictorialist photographs, and came to be the first American venue to feature the drawings, paintings, and sculpture of European modernism. The journals *Camera Notes* (1897–1902), and then *Camera Work* (1902–1917) focused on the photograph's potential for artistry and established standards of eloquence in photographic reproduction. The work of Edward Steichen, Gertrude Käsebier, Clarence White, and Frank Eugene were regularly featured in these Stieglitz forums. These artists manipulated their photographs to Pictorialist perfection through attentive printing, cropping, and retouching. Their elegantly crafted platinum and gum bichromate prints dovetailed with the gauzy, soft, and reflective photographic effects and symbolist themes.

Around 1910, however, Stieglitz's photographic practice shifted from Pictorialist to so-called "straight" photography—images taken in the open air with a rapid exposure and presented with a minimum of cropping and other manipulation. Many of Stieglitz's straight photographs seem to formally and thematically embody the liminal space between the nineteenth and twentieth centuries. Photographs such as *From the Back Window* (1915) have the textured effects of weather and atmosphere—giving them hazy chiaroscuro nostalgia—but are also detached and compositionally abstract.

The abstract logic of Stieglitz's straight photography was developed in the late 1920s into the 1930s to pristine extremes by Edward Weston's sharp, incisive, close-up photographs of gleaming organic forms and Paul Strand's austere and attentive photo-

MODERNISM

graphs of urban, mechanical, architectural geometries. Weston's style of modernism, however, relied on the large-format camera, but with the negatives precisely exposed so that the need for darkroom manipulation was limited and quickly became a sort of classicism of freezing beautiful, awe-inspiring images in lush blacks and whites, mimicked by a large contingency of west-coast based photographers including Ruth Bernhard and Ansel Adams.

But as much as Stieglitz secured photography's place in modernism, he limited its meaning and scope, particularly in terms of its political engagement. In *Reading American Photographs* (1989) Alan Trachtenberg argues that Stieglitz's definitions of modern photography occluded and narrowly defined Lewis Hine's "radically reformative achievement"—his portrayals of the workers, immigrants, and children forced to the impoverished edge of New York's industrial economy around the turn of the twentieth century. However, the two poles that Stieglitz's and Hine's work represents—portraying the aesthetics of repetition, perception, and abstraction and critiquing capitalism's effects—were unpredictably debated and synthesized in postmodern photographic practice.

TINA MODOTTI

Italian

Italian-born Tina Modotti worked predominantly in Mexico from 1923 until 1930, and produced a body of work that initiated a Modernist photographic aesthetic in that country. She was one among a number of artists and intellectual expatriates who traveled to Mexico between the wars, and who contributed to the flowering of the Mexican Renaissance. Modotti's signature style integrated precise formal clarity with incisive social content, and her work may be seen in the context of other modernists of the period who worked in what is known as the New Vision style. In contrast to European photographers situated in post-war metropolises, however, Modotti tailored her vision to the conditions she found in Mexico: a country—in flux following 10 years of unrest—attempting to transform its agrarian economy to reflect the modernization that had been accomplished abroad. The subject of her photographs often depicted the back-breaking labor necessary to achieve the mechanized changes sought by the post-Revolutionary government. Her legendary life and love affairs, early death, and a photographic career that was initially in the shadow of the great master Edward Weston made Modotti for many years an underrecognized figure in twentieth-century photography.

Modotti arrived in Mexico City from California in August, 1923 with Weston; together, they established an important photography studio that flourished until Modotti left in 1930 (Weston returned to the United States in 1926). Modotti had immigrated to America from her birthplace of Udine, Italy in 1913, joining her father and a sister who had settled in San Francisco. There she worked in the textile industry and began acting in the amateur theatre of the vibrant Italian Colony. In 1918, she moved to Los Angeles with Roubaix de l'Abrie Richey (known as Robo), and they lived together as a married couple. He was a poet, writer, and artist who had refashioned himself from a Oregon farm boy into a sophisticated California bohemian. A great beauty, Modotti quickly found work in Hollywood's burgeoning film industry, starring in the 1920 production *A Tiger's Coat*, and finding roles in two other movies.

In addition to acting, Modotti earned a living modeling for a number of artists, including photographers Jane Reece, Arnold Schröder, Wallace Frederick Seely, Johan Hagemeyer, and, most importantly, Weston. Some of Weston's most sensual nudes are of Modotti, and they began a liaison sometime around 1921.

In 1922, after the death of Robo and of her father, Modotti decided to become a photographer. Although she acknowledged that Weston had been crucial to that decision, a number of factors may have contributed. Her uncle, Pietro Modotti, operated a successful photography studio in Udine, turning out portraiture, still lifes, and landscape photographs, and running an influential school of photography in the north of Italy. In addition, when her father first arrived in San Francisco, he opened a short-lived photography studio. Most significantly, however, Modotti's experience as an actor and model came into play: working on the "other" side of the camera gave her insight to the mechanics of picture making and the aesthetic issues such as composition. In short, becoming a photographer allowed her to "seize control of the gaze."

In Mexico, Modotti managed their studio, and in exchange, Weston instructed her about the techniques of photography. Both artists used a large-format camera, which required careful composition on the ground glass. Her first camera was a 4 × 5-inch Corona, a stationary view camera that required a tripod, but she later bought a hand-held 3¼ × 4¼-inch Graflex. She used the Corona for formal portraiture and to document the murals created by the artists of the Mexican Renaissance (Diego Rivera, Clemente Orozco, David Alfaro Siqueiros), supporting herself by both activities. She used the Graflex for more spontaneous images that she made on the streets of Mexico. Like Weston, Modotti subscribed to precise composition on the ground glass, and both used the contact method of printing by placing their negative directly on sensitized paper and exposing it in the sun.

Modotti's oeuvre can be divided into two periods: 1923–1924 and 1925–1930. Her earliest subjects were still-lives, a genre she used to study formal issues such as light, pattern, composition, and tone. But unlike her teacher, Modotti usually

sought to imbue her subject with symbolic content. *Roses* (1924), for example, is a tightly constructed near abstraction of four white roses that also functions as a *momento mori*, suggesting the transitory nature of life. Modotti's architectural studies from this period are marked for their complicated spatial configurations and delicate tonal gradations. In 1925, Modotti began to photograph outdoors, and her *Telephone Wires* (1925) marks a change in her work, in which now distinctive modernist elements are evident. In keeping with New Vision aesthetic, she often approached her subjects from novel, extreme vantage points and photographed machine-age subject matter, the result being an abstracting of space and form. And like many political artists of the day, Modotti consciously brought a social element to her work.

In 1927, Modotti officially joined the Communist Party, already populated by many of her Mexican friends and colleagues, among them, Frida Kahlo, Rivera, Orozco, and Siqueiros, who contributed their artistic skills in the service of the cause, believing that art could be the catalyst for social and political change. Modotti's strongest images from this period include *campesinos* (peasant farmers) and *obreros* (workers) engaged in protest or in manual labor, as in *Workers Parade* (1926) and *Tank No. 1* (1927). For her, images of workers expressed both the humanity of the people and the heart of the Communist movement. She also returned to still life in 1927, and she made a series of "revolutionary icons," careful arrangements of a guitar, a bandolier, a dried ear of corn, and a sickle, for example, *Bandolier, Guitar, Sickle* (1927).

The receptivity to public art fostered in post-Revolutionary Mexico in the early 1920s began to diminish toward the end of the decade as government policies turned more conservative. Modotti's subject matter was seen as provocative, if not inflammatory. *Workers Reading El Machete* (1927), for example, was a potent reminder that the Revolution's promise of universal literacy for the lower and working classes, many of whom were of Indian descent, was as yet unfulfilled. In this tightly composed image of two young *obreros* reading the Communist organ, Modotti adroitly illustrates the strategy of activist participation in changing the conditions of the underprivileged.

But while Modotti herself was conscious of photographing with a "class eye," she was equally concerned about making photographs that met the criteria she learned from Weston. She made two series in 1929 that demonstrate this point: *Woman from Tehuantepec*, (1929) and *Hands of the Puppeteer*, (1929). Her heroic heads of the women of

Tehuantepec, who control the political life of the region, are emblematic without being ethnographic. And when she made images of a puppeteer's hands, the tight cropping and straight-on frontality contribute to the powerful metaphor: those in power control and manipulate those without.

In December 1929, Modotti's work was exhibited in a solo exhibition that was well received. Her love affair with Julio Antonio Mella, founder of Cuban Communist Party who was gunned down in her company, and her involvement with radical politics (she was accused of plotting the assassination of President Pascual Ortiz Rubio) caused her to be deported from Mexico as an undesirable alien in 1930. Her photography career ended, and over the next 12 years she traveled to Moscow, Paris, and Spain in the service of the International Red Aid. Modotti returned to Mexico in 1939 and died at the age of 45 three years later.

Biography

Born Assunta Adelaide Luigia Modotti Mondini in Udine, Italy 16 August 1896. Minimal formal education as a child; emigrated to San Francisco, California to join her father in 1913. Moved to Los Angeles with common-law husband, artist Roubaix (Robo) de l'Abrie Richey, in 1918; he died in 1922. Moved to Mexico City with Edward Weston, who taught her photography, 1923. Exhibited with Weston in Mexico until his departure, 1926. Produced hundreds of copy prints of the Mexican Mural movement; published photographs in dozens of international journals, magazines, and periodicals. Joined the Mexican Communist Party, 1927. Romantically involved with Julio Antonio Mella, founder of Cuban Communist Party, 1928. Accused of his murder and acquitted, 1929; expelled from Mexico as an undesirable alien, 1930. Moved to Germany, 1930 and then Moscow, 1931. Gave up photography and worked for the International Red Aid in Russia 1931–1934, in France, and in Spain during the Spanish Civil War, 1935–1939. Returned to Mexico with Italian Communist Vittorio Vidali, 1939. Died Mexico City, 6 January 1942.

LÁSZLÓ MOHOLY-NAGY

Hungarian-American

László Moholy-Nagy's reputation as one of the most influential figures in twentieth-century photography has withstood the vagaries of fashion and the advance of thought about the medium of the post-war era, a dialogue that his ideas were instrumental in nourishing. A painter, sculptor, designer, film maker, theorist, and teacher, as well as a pioneering experimental photographer, Moholy-Nagy seemed the embodiment of a twentieth-century Renaissance man, equally at home in the classroom, studio, experimental laboratory, and the realm of ideas.

László Moholy-Nagy was born in 1895 into a farming family in the village of Bácsborsod in an agricultural area of southern Hungary, where he grew up and attended elementary school. For his secondary education, he attended the gymnasium in Szeged, where he studied law. In Szeged, he first came into contact with the intellectual elite that was to shape modern Europe. Poet Gyula Juhász was a mentor, as Moholy-Nagy also nurtured ambitions to be a writer. Drafted into service in 1914 during World War I, he served on the Russian front in the artillery. Wounded and hospitalized twice during the war, Moholy spent his recovery drawing, a childhood interest. Upon his discharge after suffering a hand wound, he returned to the study of law after the war in Budapest, but around the time of the bloodless bourgeois revolution in 1918 and the

subsequent rise of Communism with the proletarian takeover, Moholy-Nagy abandoned further study to return to Szeged and take up the life of an artist. Although active in the intelligentsia, Moholy was not essentially political; he moved first to Vienna, then to Berlin in 1920, where he met the Czech-born Lucia Schultz, his future wife and collaborator. Moholy-Nagy became a member of the organization of vanguard Marxist Hungarian artists then actively shaping the new regime; they issued a manifesto in 1922 titled "Constructivism and the Proletariat," published in their periodical *MA (Today)*. Early artistic efforts included coediting and designing the *Buch neuer Künstler (Book of New Artists)* with Lajos Kassák, a leader of the Hungarian artistic and political avant-garde.

A turning point in his life, however, came in 1923 when the architect Walter Gropius, who had been impressed by an exhibition he had seen, invited Moholy-Nagy to teach at the Bauhaus, founded in Weimer four years earlier. Asked to teach the foundation course, replacing the painter Johann Itten, Moholy remained at the school for five years, first in Weimar and then when the school moved to Dessau. The Bauhaus was a radical new idea in pedagogy. Unlike traditional arts training, which was based on mastering accepted forms, often through copying masterworks, the Bauhaus had a hands-on approach combined with the philosophy that art was integral to the fabric of daily life; it aimed to train the

whole human being and to combine art and technology in the service of society. Photography, however, did not yet play a role of any significance at the Bauhaus. Although Lucia was a trained photographer, Moholy-Nagy was self-taught, yet it was his concern with the medium that brought it to the fore in the Bauhaus curriculum, with such figures as Erich Consemüller, the brothers Andreas Feininger and T. Lux Feininger, and Walter Peterhans making significant contributions.

Moholy-Nagy's vision of art was idealistic, yet practical. Concerning the function of the artist, he wrote:

Art is the senses' grindstone, sharpening the eyes, the mind and the feelings. Art has an educational and formative ideological function, since not only the conscious but also the subconscious mind absorbs the social atmosphere which can be translated into art... What art contains is not basically different from the content of our other utterances, but art attains its effect mainly by subconscious organization of its own means. If that were not so, all problems could be solved successfully through intellectual or verbal discourse alone.

(*Moholy-Nagy*, Passuth, 363–364)

Photography was, in Moholy-Nagy's mind, the ideal creative medium for the times, able to construct a "New Vision" (*Neue Sehen*), which in 1927 became the title of his highly influential book. In the new world, transformed so fundamentally by the modern technology emerging in Europe, he sought new possibilities for perceiving and interpreting modern life, and found them in what he termed the "pure design of light." Together with Lucia Moholy, he developed the camera-less technique of the photogram, which had been independently developed by others, including Man Ray. He delighted in all manner of technical imagery, including X-rays, photomicrographs, and motion photography. Exploring Constructivist ideas, he shot from radical angles, including the bird's-eye and worm's-eye views advocated by Alexandr Rodchenko and El Lissitzky, whom he had met in 1921 during a sojourn in Dusseldorf. A notable example is *Bauhaus Balconies* of 1926 (also known as *Dessau*, 1926). Part of his duties at Bauhaus was to plan, edit, and design publications, and he produced 14 *Bauhausbücher* including his influential text, *Malerei, Fotografie, Film* (*Painting, Photography, Film*; 1925) as Number 8 in the series. Through his teaching and writing, Moholy extended his conviction that photography was an essential part of the modern sensibility.

Political pressures at the Bauhaus effected Moholy-Nagy's (as well as Walter Gropius's) departure

and return to Berlin in 1928. His marriage to Lucia ended in 1929, and he remarried in 1931 to Sybil Pietzsch. In Berlin, Moholy worked as a designer, including stage set designs for *Tales of Hoffman* and *Madame Butterfly*, and he painted and experimented relentlessly with the new materials of modernity, such as plastics. He was particularly fascinated by the play of light on and through these materials, and soon had fashioned what he called "Light-Space Modulators" to demonstrate the interaction of light as a dynamic element in sculpture. With his abstract light-pictures or photograms, manipulated images, including multiple exposures, and montage and collage techniques, Moholy-Nagy was a pioneer of experimental photography. His graphic design was similarly experimental and advanced, combining photography, text, and formal "fine arts" elements, and he was one of the first to recognize the value of photography as an instrument for commercial art and advertising. The "Typofoto," a combination of image and text, played a central role in his own publications, and then was taken up and continued by Herbert Bayer. He also made films.

Along with dozens of other modern artists, Moholy-Nagy was forced to flee before the increasing tyranny of the Nazi regime as it took hold of Germany in the mid-1930s. He first made his way to Amsterdam and then to London in 1935, where he continued to actively photograph, completing commercial assignments including photographic illustrations for the book *The Street Markets of London* and a book on Eton College. He also continued to experiment, particularly with sandwiching multiple negatives, which he called "superimpositions," and with forays into the use of color.

For his fellow Hungarian refugee and director Alexander Korda, he created special effects for Korda's adaptation of H.G. Wells's *The Shape of Things to Come* in 1936, although they were not used in the final film. He also worked on a documentary film about the London Zoo with writer and social theorist Julian Huxley. In 1937, there was another turning point—he was invited to America to set up a new school of industrial arts training.

In Chicago, a center of industry and mercantilism, an effort to find a director for a proposed school for industrial art had resulted in an offer to the architect Walter Gropius. Gropius, however, had only recently accepted the offer of a professorship at Harvard, and he recommended his close friend for the position. In May of 1937, Moholy-Nagy traveled to Chicago and agreed to head the New Bauhaus—American School of Design, as it was initially known, to be housed in the mercantile baron Marshall Field's former mansion. The prospectus he

prepared to demonstrate his curriculum was in the form of a chart fashioned of concentric circles. It outlined a five-year program of study, with general first-year courses on the outermost layer. "Light, Photography, Film, and Publicity" are grouped together in one block in the third year of study, after students have completed its prerequisite, "Science." In short order, Moholy appointed a faculty, drawing on his former Bauhaus associates, including Hin Bredendieck, who had been one of his students, and Gyorgy Kepes, who was to teach the Light Workshop, as the photography department was initially known. Early students in the Light Workshop, including Nathan Lerner and Arthur Siegel, eventually became photography instructors at the New Bauhaus as well.

Moholy's teaching method, so admired by his students and associates, largely bewildered the industrialists funding the school. They complained of seeing strange and inexplicable models and objects (surely Light-Space Modulators) lying about the school's classrooms and were distressed by the collegial nature of the instruction, which promoted collaboration and interaction between instructor and student and the students themselves. After only a year, the school's governing board, the Association of Arts and Industries, attempted to fire Moholy on the grounds he lacked "teaching experience," among other flaws. When faced with overwhelming support for Moholy from his students and faculty, the AAI board, claiming financial difficulties as a continuing effect of the Great Depression, closed the school, in spite of Moholy's five-year contract. It was this contract which in fact brought into being the School of Design. Moholy successfully sued the AAI and immediately set up a new school in an abandoned bakery on Chicago's near north side. Classes at the School of Design commenced in February of 1939. Moholy had taken a position as a designer for the Parker Pen Company as well as for Spiegel's mail order department store, and he plowed some of his earnings back into the school. He had also found an enlightened patron, Walter C. Paepcke, the executive who ran the progressive Container Corporation. Under Paepcke's patronage, Moholy was finally able to realize the school he had envisioned. He appointed a Board of Advisors that included New York curator Alfred Barr of the Museum of Modern Art, educator John Dewey of the University of Chicago, and his friends Walter Gropius, and Julian Huxley, among others. In 1944, the name of the school was changed to the Institute of Design.

In his own work, during the Chicago years, Moholy-Nagy worked extensively with a Leica

camera, including experimenting with color slide photography. At the Institute of Design, he worked with students to help with the war effort, including designing camouflage.

Diagnosed with leukemia in 1945, Moholy returned to his first love, painting, creating among other works, a series of abstract canvases titled *Leuk* after the disease that would kill him in the fall of 1946. His widow, Sybil Moholy-Nagy, pulled together his many various writings into a posthumously published book, *Vision in Motion*. Moholy-Nagy's legacy lived on, however, at the Institute of Design, which thrived, attracting such teachers as Harry Callahan (whom Moholy hired just a few months before his death) and Aaron Siskind, and graduating such talents as Kenneth Josephson, Art Sinsabaugh, and Barbara Crane. The International Museum of Photography and Film, George Eastman House, Rochester, New York has an in-depth collection of Moholy's photographic works, from the private collection of his widow. Moholy-Nagy's daughter, Hattula, has continued to promote Moholy-Nagy's work. Materials are archived primarily in the Archives of the Illinois Institute of Technology (which subsumed ID in 1949), which hold original manuscripts documenting the early years of the Institute of Design and at the Bauhaus-Archiv in Berlin.

Biography

Born, Borsód (present-day Bácsborsód), Mohol Puszt, Hungary, 20 July 1895. Drafted into Austro-Hungarian Army and sent to Russian front, 1914. Wounded and recuperated in Odessa, Russia, military hospital, 1914, Galicia, Italy, 1917; discharged and returned to study of law, at the Royal University in Budapest. Co-founder MA group of avant-garde artists, 1917. Left university and Hungary, 1918. Briefly stayed in Vienna, then Dusseldorf, then resided in Berlin, 1920. Married to Lucia Schulz, 1921. Invited by Walter Gropius to head up Metal Workshop and Foundation Course at Weimar Bauhaus, 1923; published *Malerei, Fotografie, Film*, 1925. Moved to Dessau when Bauhaus relocated, 1925. Left Bauhaus in 1928. Experimented with camera-less photography, Constructivist principles. Moved to Berlin, worked as stage and set designer, and operated commercial design studio, 1928–1934. Built first "Light-Space Modulator," 1930. Married Sybil Pietzsch, 1931. Fled Nazi Germany, 1934 to Amsterdam, then London, 1935. Documentary photography and films, commercial work, 1935–1937. Invited

to head new school of industrial design in Chicago, 1937, established “New Bauhaus–American School of Design.” Reorganized and renamed School of Design, February of 1939 (later Institute of Design). Succumbed to leukemia, in Chicago, 24 November 1946.

Selected Works

Jealousy, 1925
Leda und der Schwan, 1925
Self-Portrait, Berlin (also known as *Mondegesicht*; photograph), 1926
Two nudes, ca. 1925
Sailing, 1926
Massenpsychose, 1927
Pont Transbordeur in the Rain, Marseille, ca. 1929
Fotogramm III, ca. 1929
Light Space Modulator (gelatin silver print), 1930
Superimposition, ca. 1935
Study with Pins and Ribbons, 1937–1938
Laboratory, 1938
Plexiglas mobile sculpture in repose and in motion (gelatin silver print), 1943
Sculpture, Plexiglas (gelatin silver print), 1945

Individual Exhibitions

1922 Galerie der Sturm; Berlin, Germany

MONTAGE

Montage refers to a variety of related artistic techniques developed during the early part of the twentieth century in photography, film, literature, and the plastic arts, whereby parts of separate works are appropriated and juxtaposed to make a new artwork. Usually, the heterogeneity of the components is foregrounded by leaving visible the seams where the pieces were put together; often too, a break in visual, temporal, or narrative continuity foregrounds the technique. The terms collage, assemblage, and photomontage have at times been used interchangeably with montage, but they may be used with slightly different valences as well. Collage is often favored as a term to describe still, non-photographic images that have been "cut and pasted" together; assemblage often refers to three-dimensional, sculptural works that are created from other pre-existing objects. Since the term "montage" was made famous by Sergei Eisenstein in conjunction with his film, *Battleship Potemkin* (1925), this term is more often associated with film than with other media, while photomontage is the term often used to describe a montage made from still photographs.

The origins of montage techniques (as a form of artistic practice) is generally acknowledged to be in 1912 with Cubism, when Pablo Picasso and Georges Braque began integrating materials such as newspaper scraps or waxed paper into their paintings. Though similar techniques had been used in advertising for some time previous, it was not done with

any apparent theory or organized practice. It is with Cubism that montage techniques enter the artistic vocabulary. Photomontage began as an avant-garde practice with the Berlin Dada group. Two sets of artists have claimed to be its originators: Raoul Hausmann and Hannah Höch on the one hand; John Heartfield (Helmut Herzfeld) and George Grosz on the other. Whomever the innovators may have been, photomontage seems to have been fully assimilated as an aesthetic practice by 1919. The impetus was to create a sense of shock and distance in the viewer. This often was accomplished by using images that were familiar (or of a familiar type), but combining, cutting, or manipulating them in a way that placed them in an entirely new context. In Höch's *Cut with a Kitchen Knife* (1919), for example, images taken from mass media periodicals are combined to make a statement, however elliptical, about the position of the recently enfranchised "New Woman" of Weimar Germany. Images of the establishment are juxtaposed with those of a female form who seems to "cut" through what stands in her way. This is typical of Dada photomontage: images are taken from one context (magazines or newspapers), manipulated, and given a new context in order to impart a new message, often counter to the originally intended one.

The Surrealists, working in the period between World Wars I and II, used similar ideas in a different way. Rather than revealing their manipulation

MONTAGE

of the images, the Surrealist artists hid them. Instead of cutting and pasting images, they manipulated their photographs in the darkroom before printing them, or they used tricks of light and shadow to present fantasy as reality. Both André Kertész, in his *Distortion* series (1933), and Man Ray, in his numerous photographs of the nude female torso, used the photograph to transform the nude female form into something else. Man Ray's famous *Untitled* (1927) endows his model with tiger stripes by way of the shadows cast by a gauze curtain. Their artworks present a manipulated world as if it were a real one. The intention here is similar to that of Dada photomontage, to induce an estrangement in the viewer regarding his own world and his certainty about it. However, the Surrealists' interest in the interior life, in dreams and nightmares, and in psychoanalysis led them to favor these techniques over the more direct ones that had been used by the Berlin Dadaists.

Both of these avant-garde groups used montage techniques in their art to produce a sense of shock and estrangement in their viewers in an attempt to make art into a form of social praxis—that is, to fuse art with everyday life. Yet when works from the two groups are compared, there is little chance that they will be confused. Montage techniques remained an enduring feature of art for nearly a century precisely because of their great flexibility. They allow the artist to create an artwork that has a clear and effective message and to do so in a highly individual way. Montage has often, for these reasons and others, been used by those who make political or social statements with their art. Montage was used by the avant-gardes of the left. Many in both the Dada and Surrealist groups had ties—though often tenuous ones—to the Communist party. However, montage is by no means the exclusive province of those on the left. It has also been used quite effectively by avant-gardists of the right, such as the Italian Futurists, whose interest in collage and montage strategies following Cubism stemmed from their advocacy of speed and technology.

Soon after its acceptance by the avant-gardes as a legitimate artistic practice, montage's flexibility and power was redirected with new vigor toward non-artistic purposes, particularly in advertising and propaganda. In the United States, montage has been used in these arenas in a much more overt way than it has been in art or literature. The appeal is nearly identical: montage provides a way for a message—whether commercial or ideological—to be presented in a way that makes a strong impression while giving the appearance that the viewer is making independent connections between

disparate images rather than having a viewpoint or opinion forced upon her. When discussing propaganda, it is often difficult to separate it from works that would be considered “art,” since many montages that were designed as works of art have also had a propagandistic impulse behind them.

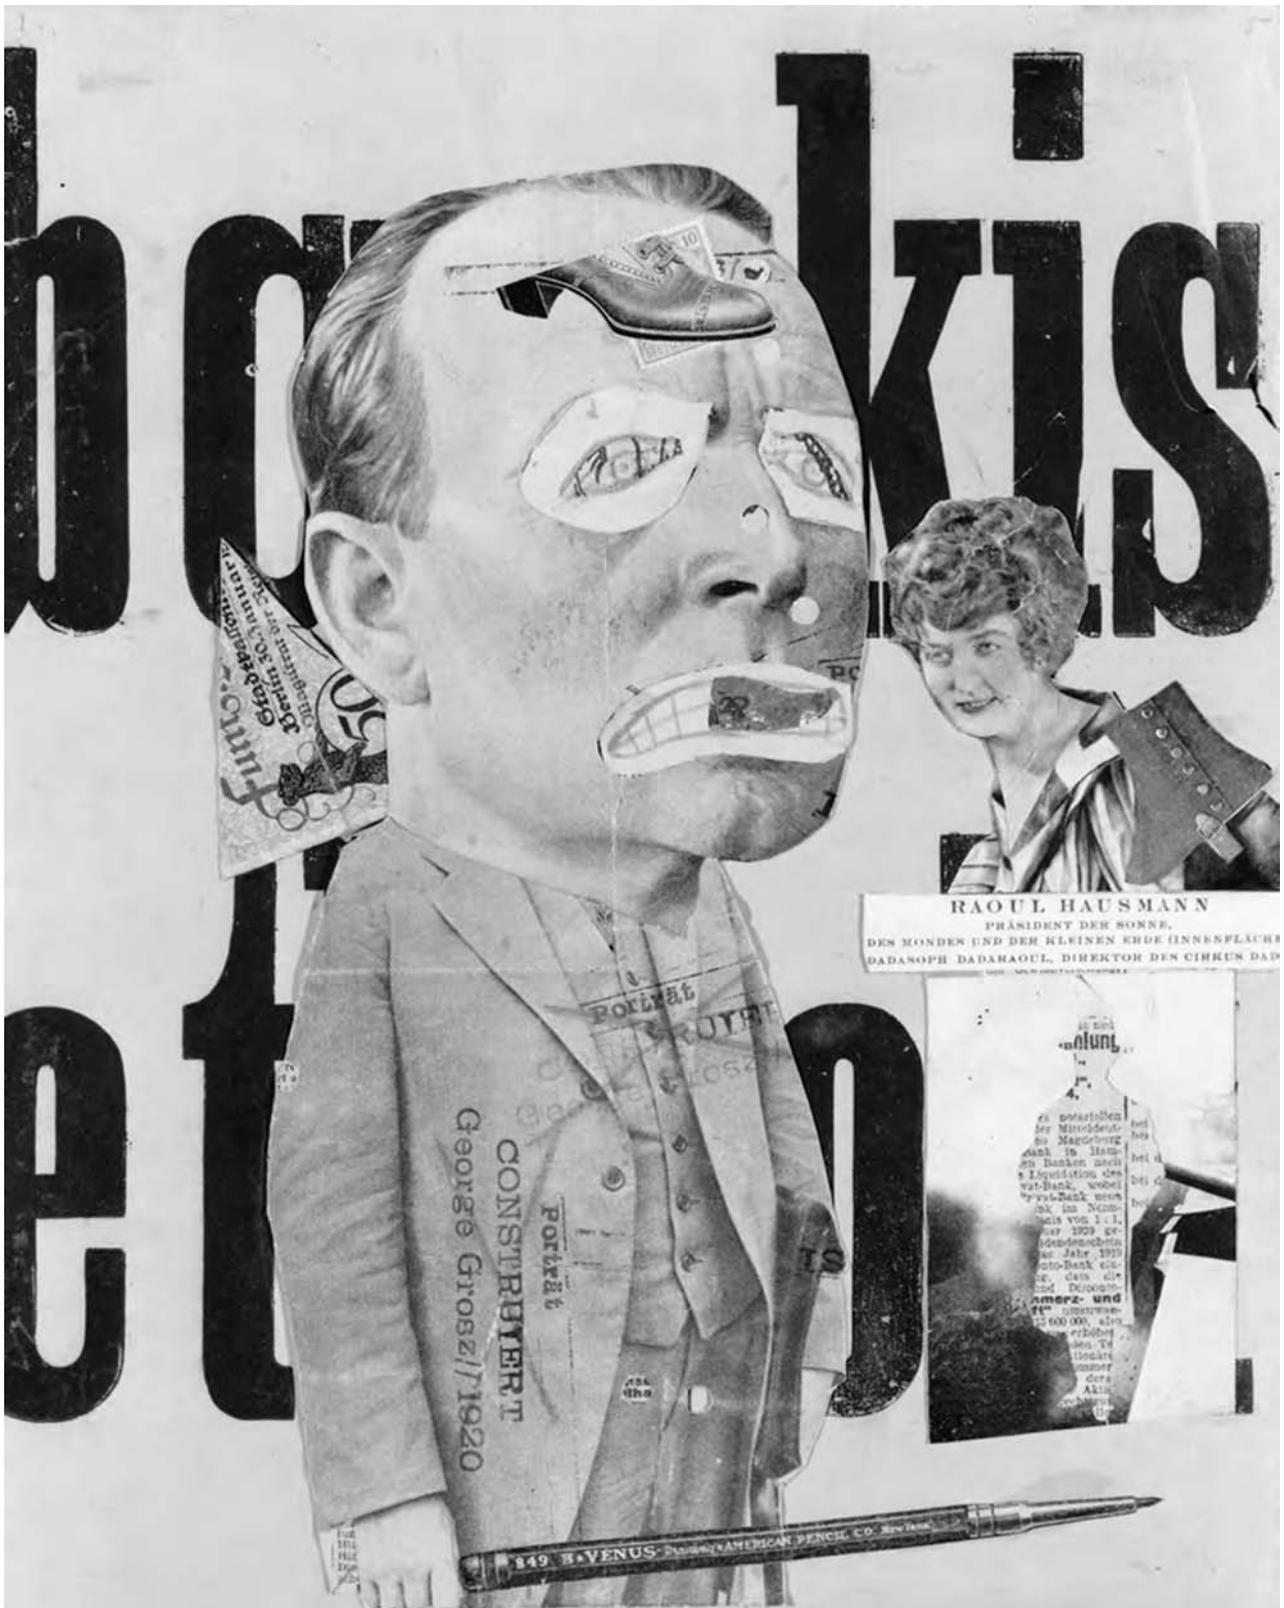

A significant part of the appeal of montage throughout its history has been the ease with which artists are able to use it to combine avant-garde and mass cultures. It breaks down the barriers between high and low art, as well as those between art and commerce and/or propaganda. There was a rich tradition of this kind of artwork in the former Soviet Union, where many artists affiliated with the Communist party used montage to political effect. For instance, in the poster by El Lissitzky, *The Current is Switched On* (1932), photomontage is used to convey the industrial power of the Soviet Union as it provides literal (electric) power to its citizens. At the same time, scope and scale are manipulated to attribute a mythological largeness to the figure of Stalin, whose head and shoulders loom large in the right half of the image. The left upper quadrant of the poster shows an enormous hand switching on electric power. Both of these unnaturally large human figures are juxtaposed against a background of a nighttime cityscape, lit with an abundance of lights, including spotlights. The effect is not a romanticized one, but rather one of practical force. This is a city for workers.

In the United States, similarly, montage has been used as a form of propaganda. One well-known example is the large photomontage that was a part of the *Road to Victory* exhibition, organized for the Museum of Modern Art from 21 May to 4 October, 1942. This exhibit featured one large wall of photomontage, where an enlarged photograph of soldiers marching to battle is juxtaposed with photographs of “typical” American couples, young and old, in the city and the country. The message seems fairly clear: the thousands of anonymous soldiers marching into battle during World War II are ensuring America's victory, and thus the continuation of the American way of life. Subtlety is not a common feature of montage.

The interaction between advertising and montage has also been an enduring and fruitful one. Many of photomontages of the historical avant-gardes—Dada, Futurism, and Surrealism—were born from this exchange. Not only did artists like Höch use materials from mass culture, but many of them, such as Heartfield worked as commercial artists and turned their montages into posters or post cards rather than exhibiting them in traditional

John Heartfield, Hitler erzählt Märchen II (Hitler tells fairy tales II), from "AIZ, Das Illustrierte Volksblatt," March 5, 1936, p. 160, rotogravure print, rephotographed montage with typography, 37.5 × 26.5 cm, Museum Purchase, ex-collection Barbara Morgan. [Tate Gallery, London/Art Resource, New York]

means. More recent artists have tended to follow a similar pattern. The German artist Klaus Staeck, for instance, produced a book of photomontages that used famous images and slogans from advertising but manipulated the images to give them new meaning. Barbara Kruger, an American artist, takes images from magazines (many from the post-World War II period) and gives them new captions. *You Are Not Yourself* (1984) shows a woman's crying face reflected in a shattered mirror. The words of the caption appear to be pasted on the image, as if in a ransom note. Kruger's technique is quite similar to Heartfield's, particularly in the use of the caption. Here, the image and caption reflect on the reification of the image of the woman in American advertising. Tibor Kalman, a Hungarian-born American graphic designer, used montage techniques in advertising, but also in advertising-like works that held political and social messages. Kalman's design firm was responsible for a highly controversial series of advertisements for the Italian clothing company, Bennetton, which contained images such as a priest and a nun kissing, or a Black woman nursing a White baby. Kalman was also the editor of the magazine, *Colors*, which utilized remarkably similar images and graphics in articles on social issues such as racism and homophobia. Kalman, unlike many montage artists, was fully immersed in the advertising world. His graphic design firm, M&Co. was extremely successful financially, designing corporate annual reports, commercial packaging, and mainstream advertising campaigns; yet the political message behind much of his work and his statements are not easily reconciled with the corporate work. As media technology has advanced and sped up over the past 50 years, it has increasingly borrowed and assimilated both the techniques and the visual arsenal of the montage artist. Whether or not there is sufficient visual power in montage to continue as an artistic technique and a political weapon remains to be seen.

INGE MORATH

German

Inge Morath's life and work revolve around two poles: literature and photography. She began as a writer, photographed numerous authors, married the playwright Arthur Miller, and for 25 years, she has been a popular lecturer on her own achievements in photography. She considers herself a photo journalist in the widest sense of the word, and she clearly describes why photography is settled in the vicinity of literature as her own personal contribution to the world: "The power of photography resides no doubt partly in the tenacity with which it pushes whoever gets seriously involved with it to contribute in an immeasurable number of forms his own vision to enrich the sensibility and perception of the world around him" (Kunsthalle Wien 1999).

Inge Morath was born in Graz, Austria in 1923 and grew up in Germany. She belongs to the so-called *Lost Generation* who were robbed of their youth, future, and perspectives by the national-socialist regime. As a twenty-year-old, she started to study interpreting under war-time conditions, looking for the only legal way to develop her early-discovered linguistic ability. In her autobiography, she gives an impressive description of meeting foreigners immediately after the end of the war, receiving help from them, and her surprise at how trustworthy they were after everything that she had learned to the contrary through propaganda.

Inge Morath's road to the renowned press bureau Magnum Photos was shorter than her road to photography. She accompanied Ernst Haas, with whom she had worked in Vienna on his assignments, but she was independent enough to take on her own jobs, quickly advancing from translator to critic, from interpreter to author. As picture editor of the magazine *Heute*, she was able to provide Ernst Haas with commissions and ideas for series for over half a year. In 1947, she accompanied him on further assignments at distinguished photo-journalist Robert Capa's invitation but soon relocated to London.

According to her own account, Inge Morath learned photography like writing in a foreign language. In London, she was an unpaid assistant of Simon Guttman, who had pioneered the idea of

photo agencies in the 1920s, and she learned the basics of daily shooting and work in the darkroom under difficult conditions. When she returned to Paris in 1953, Robert Capa gave her the status of an associate with Magnum. Henri Cartier-Bresson provided her with expert advice on her early work and tips on how to improve it. It is his transition to irony and measured distance that impressed Inge Morath in him above all others. In this way, he handed her the key to emancipate herself from the social roles of woman and the professional role of caption-writer by using abstract picture compositions. The principle of this technique can be seen in her early photographs.

In a 1955 image, Mercedes Formica stands on a narrow balcony, looking past observers and photographer into the vague distance, while behind her several Madrid streets are stacked up on top of each other. The photograph is upright and, due to the positioning of the woman on the extreme left-hand edge, seems so narrow that it is only the car in the lower third of the picture that stops one thinking it is an anamorphic projection. A technique of photographic abstraction becomes an iconological sign; the distortion characterizes a member of bygone classes just as the emphasis on the vertical characterizes the slightly nervous tension of feminine self-determination in Spain's masculine society.

Inge Morath's operational base moved to the United States. With increasing distance from the Magnum offices, her working methods changed: the lonely journeys and series as direct commission from the agency became rarer. Inge Morath became more and more like a simultaneous translator of actual events. The most important expression of this new, original development is a series of staged single and group portraits which Inge Morath began in New York; she shows the artist Saul Steinberg and his personal circle of friends, all of whose faces are hidden behind paper masks. Another series of this type was taken at the shooting of the film *The Misfits*, showing Marilyn Monroe as an "ecstatic" but unpretentious dancer.

Morath's career was interrupted, however, by her marriage to Arthur Miller and the birth of her daughter Rebecca Miller. She took up projects again in the late 1960s. As her projects became bigger and more complex and could no longer be

squeezed into the confines of a magazine, she undertook books. Many of these projects were closely connected to Arthur Miller's literary and political activities. During this period, Morath also proved herself to be an adept portraitist. Her method was to talk to people, alone and in groups, get close to them, then distance herself again to bring her camera into the situation, camouflaging it with talk and other distractions. Only then would she begin to shoot, studying the first results, rejecting them, starting the process a second, a third, countless times—and often returning in the end to the very first shot.

The difference between her photographic process and the resulting photographs is significant, and it corresponds to the difference between talking and writing: photographing is the performative act; photos are written, corrected, and edited products of lengthy preparation. Inge Morath's mastery developed fully when she employed her communicative competence to this process, and she achieved this at the side of that gifted communicator Arthur Miller. She accompanied him on trips to Russia, China, Latin America, Asia, and Europe. One of her most important photographs of this period is of

Joseph Brodsky whom she persuaded to take a walk on the roof of the Peter and Paul Fortress in Leningrad in 1967. On one hand, the shock of the bright light is clearly felt as they step out onto the roof after climbing up through the protective darkness; on the other hand, she cleverly adapts the perspective of the spy from the Soviet government who was certainly present to monitor their actions.

Inge Morath's pictures demonstrate how linguistic competence and artistic activity can be combined. And they also show qualities that photography as a medium and genre still has in the age of motion and electronic media. Inge Morath has added her photographic skill to her linguistic competence, and that has enabled her to achieve extraordinary things—not only in the act of talking and photographing, but more in the resulting pictures and texts.

ROLF SACHSSE

Biography

Born in Graz, Austria, 27 May 1923. Studied in literature and Romance languages, Berlin and Bucharest, 1942–1945. Translator for the *United States Information Services* and

Inge Morath, Joseph Brodsky takes a walk in Leningrad, Leningrad, Russia, 1967.
[© Inge Morath/Magnum Photos]

contributor to *Heute* magazine in Vienna, 1946–1949. Cooperation with the photographer Ernst Haas and freelance author in Vienna and Paris, 1949–1950. Freelance author, began own photography and internship with Simon Guttmann in London, 1951–1953. Associate Membership with Magnum Photos and first assignments in photography, Paris, 1953. Assistant to Henri Cartier-Bresson, Paris and Spain, 1953–1954. Magnum commission by Robert Capa for portraying women in Spain, 1954–1955. Full membership with Magnum since 1955. Journeyed to Iran, 1956. Has lived in U. S. since 1959. Married to Arthur Miller, 1962; one daughter, Rebecca. Journeyed to the USSR, 1965, to China, 1978. Grand Austrian State Award for Photography, 1991. Honory Gold Medal of the Federal Capital Vienna, 1999. Lives in Roxbury, CT.

YASUMASA MORIMURA

Japanese

Born in the port city of Osaka in 1951, Morimura grew up in the unfashionable heartland of Japan. The economic hub of the Kansai region of Japan, Osaka lacks the illustrious history of nearby Kyoto or the cosmopolitanism of neighboring Kobe. Despite this starting point, Morimura became one of the most provocative and cosmopolitan photographers of the late twentieth century. He is best

known for taking photographs which copy icons of western culture but include his own face or body in the place of the central character. This is especially disconcerting for the viewing audience, as the characters he replaces are often women such as Madonna, Marilyn Monroe, and the Mona Lisa.

Brought to prominence by having his pictures displayed at the 1988 Venice Biennale and by the inclusion of his work in several touring shows of Japanese photographers in the late 1980s, he sealed

his arrival with his 1990 *Daughter of Art History* exhibition in Tokyo. Morimura's photographs are large, glamorous, and playful, but they also have a serious intent. Whereas modernist art is often iconoclastic, Morimura's postmodernism can best be described as *iconoplastic*. He manipulates some of the most celebrated images from the history of western painting, twentieth-century poster art, and contemporary culture to make accepted images provocative once again. He achieves this primarily by using the crafts and techniques associated with movie-making: building sets, creating costumes and makeup, carefully controlling the lighting, and using himself as model. He works primarily in sequences such as *Marilyn*, *Mona Lisa*, or *Judith* (after Cranach the Elder's *Judith with the Head of Holofernes*) in which the settings of the pictures, the relationships of the elements of the picture, and its tone are changed from one photograph to the next, tracing a narrative of the image's deconstruction.

Morimura is often compared to the American Cindy Sherman because of their shared penchant for tongue-in-cheek tableaux and sexually subversive self-portraits. Morimura acknowledges her influence in his photograph "To My Little Sister: for Cindy Sherman" (1998)—which reprises Sherman's "Untitled #96" (1981)—with himself as the subject. Sherman's main influence comes through her *Untitled Film Stills* (1977–1980) and *History Portraits* (1989–1990) in which her self-portraits are at their most iconic and most disruptive of gender stereotypes.

Three crucial differences exist, however, in Morimura's work that set him apart from Sherman. First, whereas Sherman is a woman dressing as a woman for her pictures, Morimura often, but not exclusively, cross-dresses as a woman, changing the nature of the challenge to essentialist views of art and gender in the photographs. Second, Morimura is Japanese and thus ethnically different from the western celebrities whose images he emulates, his work alluding to such aspects of contemporary life as cultural colonialism and racial stereotyping. Finally, Morimura uses specific images rather than generic ones, dealing with cultural icons as a genre rather than exploring the genres that an iconic image might represent. For example, he made a number of Marilyn Monroe pictures based on several of the most famous images of the actress, whereas Sherman's *Untitled Film Stills* are original, anonymous pictures based on the genre that the Monroe pictures embody.

By inscribing himself into pictures where the central character often is neither male, Japanese, nor an artist, Morimura destabilizes assumptions

about gender, nationality, or race, and the function of the artist. Morimura's best-known and difficult images are those in which he appears in the place of an alluring icon of femininity, often making little attempt to disguise that he is male and very unlike the original subject. By doing so, Morimura deflects the prurient heterosexual male gaze which he feels determined the "originals," and he can be understood as a cross-dressing male artist in the western tradition or as an *onnagata*, (men who play women characters) in the Japanese *kabuki* tradition. Whether understood within one or both of these traditions, he reminds us that the object of desire is always determined by convention. This is best exemplified by his *Self-Portrait (Actress)/Black Marilyn* (1996), in which he reprises Marilyn Monroe's famous skirt-blown-up pose, except that in this picture Morimura, rather than Marilyn, has let the black skirt blow up to reveal a large, fake semi-erect phallus complete with bushy black pubic hair. The photograph trumps the coy concealment of conventional desire through three "revelations": Morimura is pretending to be Marilyn Monroe "revealing" the epitome of male desire as male; Marilyn's famous holding down of the skirt is "revealed" as an attempt to hide a prosthetic penis; the black pubic hair (of *Black Marilyn*) "reveals" that this most famous of blonde models is a bottle blonde.

In the late twentieth century, the flow of transnational capital was marked in the public consciousness by the more visible flow of images across national borders. With a picture like *Self-Portrait (Actress)/After Catherine Deneuve 3* (1996), Morimura highlights the orientalist bias of the original picture. In the original poster, the exotic Japanese setting sells the star to the western audience for her films after whom eastern audiences are encouraged to model themselves. By replacing Deneuve with a Japanese face, the image that had first arrived in Japan as a western image selling the Japanese an orientalized western view of themselves is re-appropriated as an ironic Japanese view of orientalism.

Morimura provokes a similar reappraisal of Manet's *Olympia*, redone as *Portrait* (Futago) (1988–1990). By making *Olympia* a Japanese model, Morimura highlights the racially motivated demotion of the Black figure who stands behind her, a character neglected not only by Manet but also by the feminist critics that had argued on behalf of *Olympia* in the 1980s.

Morimura was trained as a painter at the Kyoto City University of Arts, and in his early work, he often used his skills in this area to create his images. At the end of the century, he moved more towards

digital means to create his tableaux. He also used digital technology to create such works as *Yen Mountain*, in which he substituted the portraits on Yen notes with his own face, or to design on his self-promotional website modelled after that of a department store.

WRIGHT MORRIS

American

In 1933, Wright Morris left college for a year of travel in Europe and bought his first camera, a Zeiss Kolibri, in Vienna. Although he returned to California in 1934 hoping to become a writer, Morris remained intrigued by photography. In 1935, he began with cloud studies captured on his Rolleiflex; he then turned to photographing alleys, structures, and artifacts. By 1936, Morris began writing short prose paragraphs that anticipate the style of his 1946 publication *The Inhabitants*.

Moving east to Middlebury, Connecticut, Wright traveled to Cape Cod and other parts of New England, where he worked with his first view camera, a 3¼ × 4¼-inch Graphic. It was in 1938 that he first encountered photographs by Walker Evans, who became one of Morris's most important photographic influences. By 1939, he had conceived of a photo-text project; it was approved for publication by James Laughlin at New Directions. Morris also interviewed with Roy Stryker of the Farm Security Administration photography project, although Stryker was confused by and ultimately not impressed with the lack of people in Morris's photographs, and thus he was not hired by this now-legendary government make-work program.

The 1940s represent Morris's most important period. He sold two photographs submitted in a photography contest to the Museum of Modern Art in 1940 and published his first photo-text essay. His photographic mission had crystallized: he sought to capture icons of the American landscape in order to preserve the past as well as to celebrate the beauty conveyed by utilitarian structures that had often fallen into disrepair. A large proportion of photographs from the 1940s depict barns, houses (interiors and exteriors), barbershops, churches, and grain elevators. Morris believed that the absence of people in

these photographs paradoxically "enhanced" their presence: the structures and objects, he argued, strongly suggested the "appropriate inhabitant."

Wright's working method was the photographic expedition, which culminated in his first and defining experiments in photo-texts—*The Inhabitants*, published in 1946, and *The Home Place*, published in 1948. His first photographic tour lasted nine months: in 1940 and 1941 he traveled through the south, midwest, and southwest to California then back to New York. His first Guggenheim Fellowship allowed Morris to travel to the West Coast again in 1942, returning to New York via Nebraska, his birth state.

In 1943, he undertook yet another photo-safari that began in California and culminated with his relocation in Bryn Mawr, Pennsylvania, but included travel through Colorado and Nebraska. His second Guggenheim Fellowship permitted Morris to embark on a photographic trip to Nebraska in May and June of 1947, by which time he was using a 4 × 5-inch view camera.

In *The Inhabitants*, Morris juxtaposes a photograph on the right with text on the left in each spread. Images of buildings predominate; not one person appears. Instead of short, descriptive, or factual captions that were by then traditional in the photographic series, the text combines what seems to be part of a running narrative by the author with self-contained paragraphs that employ varying personae. The former reads like an essay or non-fiction; the latter like an excerpt from a short story or novel. Conceptually, this was a daring experiment on Morris's part, for instead of recording the inhabitants of these buildings and locales through his camera, he provides for their existence through his imagination in the form of words.

These texts, however, do not function as prose poems that describe the photographic content or offer a symbolic equivalent. Rather, they are echoes

that hover within the visual traces that the camera has set down. Part of what makes Morris's method unique is that the photographs and texts do not create a sequential narrative. He utilized a boldface headline to establish a linear, progressive unfolding over the course of the book. At times the headlines interact with or refer to the text that follows, especially in those which give voice to people Morris had met and sometimes knew well, such as family members. *The Inhabitants*, as unique as it is, however, might be considered the raw material or draft for what is arguably a more radical experiment in photo-text—*The Home Place*, published two years later in 1948.

The text of *The Home Place* is a novel, a consciously crafted narrative with characters, plot, and setting. Interwoven with the text are photographs without captions. These images are paired on each spread of the book with the ongoing text. The first photograph and first sentence of the novel give a false impression that the pairs of images and texts will directly connect throughout the work. Subsequent spreads, however, diverge from a direct connection. For many spreads, there is no mention in the text of what is displayed in the facing photograph; sometimes there is not even any concrete reference to an image within the entire novel. *The Home Place* was unprecedented in its design and concept and might be said to anticipate artists' books that emerged in the 1960s.

Because Morris had published two novels, his theory and execution of the photo-text, particularly in *The Home Place*, were confusing to reviewers (who considered him a novelist first) as well as to his readers. In an interview from the 1970s, Morris indicates that although *The Home Place* was well received, it pointed out a dilemma: he was losing readers and picking up lookers. By the 1950s, Morris abandoned his photo-text experiments and concentrated on a career exclusively in words. His publisher declined to include photographs in Morris's 1949 novel, *The World in the Attic*, and although he intended his third Guggenheim Fellowship in 1954—a trip to Mexico—to include photography, he abandoned his photographic ambitions as he became deeply immersed in the novel that he was writing.

By 1967, Morris had returned to photography and photo-texts. Over the next 20 years, he produced two new photo-texts, *God's Country and My People* and *Love Affair—A Venetian Journal*, and provided the words to a third, *Picture America*. He also published several essays and books on photography, including *Photographs & Words* and *Time Pieces: Photographs, Writing, and Memory*. Before his death in 1998, Morris lived to see a renewed interest in his photographs and his photo-texts; a major retrospective exhibition was held at the San

Francisco Museum of Modern Art in 1992. His legacy relates not just to the photographs that he took but even more significantly to his ideas on and experimentation with the creative (as opposed to documentary) use of photography and text.

STEFAN MOSES

German

Born in 1928 in the Silesian town of Liegnitz, Stefan Moses is one of the most important German photographers of the second half of the twentieth century. In addition to his photographic features for magazines, including *Neue Zeitung*, *Das Schönste*, *Revue*, *magnum*, and starting in 1960, also for *Stern*, his success was particularly due to his independent projects, in which he brought together concept and candid photography and created an innovative visual language with a unique personal character. Starting in the 1960s, he compiled books of portraits and photo series, which had a broad influence, including *Manuel* (1967), *Transsibirische Eisenbahn* (Trans Siberian Railroad, 1979), *Deutsche* (Germans, 1980), *Abschied und Anfang—Ostdeutsche Porträts* (A Farwell and a Beginning—East German Portraits 1991), *Jeder Mensch ist eine kleine Gesellschaft* (Each Person is a Small Society, 1998) and *DDR—ende mit wende* (GDR—back from the turning point, 1999).

Through today, he has remained true to the portrait as both a photographic genre and manifold psychological portrait of German society. "Germany and the Germans" has been at the core of his lifelong work. His extensive series reflect the social and cultural development of the Bundesrepublik. The project, *East German Portraits* from 1989 and 1990 could be considered the most important photographic work about the process of German reunification. His oeuvre, a "synonym for photography in Germany," as one critic described, constitutes a significant contribution to the discussion surrounding the issue of German identity.

For over five decades, Moses has been creating portraits of the Germans in the stylistic tradition of the "roving photographer." His images—of old and young, artists and intellectuals, poor and rich, their homes and celebrations, organizations and schools—have garnered him the role of the chronicler and portrait photographer of German post-war society. His approach is understandably simple. Ordinary and prominent citizens in Cologne, Berlin, or Munich are depicted in front of a gray felt cloth that he carries with him. The neutral background functions like a stage, and the poses take on an emblematic quality. The individual is removed from a familiar environment, and this relativizes his or her social standing. These typological portraits are individualized studies of universal relevance—"the shortest of all operas ever written," according to the German art historian, Wolfgang Kemp.

Moses approaches his countrymen from both East and West with analytical intuition and affectionate warmth. His photographs demonstrate a sensitive, curious, and inquisitive view of his contemporaries. With a profound understanding of human nature, he studies the people he encounters with great psychological sensibility, and he penetrates physiognomies in a way that builds on a dialogue with the earlier systematic photo series of August Sander and Irving Penn.

The list of people Moses has photographed reads like a *who's who* of the German-speaking intellectual and cultural elite: Theodor W. Adorno, Ingeborg Bachmann, Ernst Bloch, Heinrich Böll, Willy Brandt, Hans Magnus Enzensberger, Max Frisch, Günter Grass, Walter Jens, Erich Kästner, Thomas Mann, Ludwig Meidner, Bernhard Minetti, Alex-

ander Mitscherlich, Carl Orff, Botho Strauß, Martin Walser and Peter Zadek—major figures of twentieth-century Germany.

The contemporary events he documented and the German cultural personalities he photographed are of unparalleled breadth. His colleagues at the magazine *Stern*, for example, Robert Lebeck, Thomas Höpker, and Max Scheler, primarily worked in foreign photographic journalism—particularly in the 1960s. In contrast, Moses preferred to travel in Germany, which he describes as “the most interesting country in the world”.

Following in the footsteps of his father, a passionate hobby photographer who died at a young age, Moses took his first photographs in 1936 with a large-format Steinheil camera that had belonged to his father. From then on, photography “had taken hold of him.” At 15, while forced to work for a Breslau photo company, he began his professional training with Grete Bodlée, a photographer of children. Stefan Moses learned how to use the small-format Leica and how to compose a photographic portrait. Due to his Jewish ancestry, he was sent to the Ostlinde work camp, from which he managed to escape in 1945. Late that same year, he continued his training in Erfurt. After completing his apprenticeship, he was engaged as a theater photographer for the Weimar Nationaltheater in 1947. This was the initial source of his great enthusiasm for the theater, which remains with him today.

In 1950, shortly after the founding of the GDR, he moved to the Schwabing section of Munich—renowned as a bohemian neighborhood since the turn of the century. His colleagues and friends, Jo von Kalckreuth and Herbert List, lived next door. Moses worked as a photojournalist for newspapers and magazines. Today, he still sees no difference between journalistic and artistic photography.

A few of his series are particularly outstanding. *Manuel*, the first publication as photo series in post-war Germany, soon became a cult book of the 1960s generation of parents. Here, Moses depicts his son Manuel’s first year of childhood as a poetic story told in images. For his series *Die großen Alten* (The Great Elders), Stefan Moses chose the German forest as his backdrop. Since the 1960s, he has created his unmistakable portraits of German politicians, authors, and artists in this mythical and magical setting.

For over four decades, the photographer has asked painters, sculptors, and even some colleagues to create a mask out of materials from their immediate surroundings. This series, *Künstler machen Masken* (Artists Make Masks), which is still being continued today, was initiated in 1964 with portraits of the sculptor Gerhard Marck and the painter Ernst Wilhelm Nay.

Moses has German philosophers and thinkers photograph themselves in a standing mirror that he provides, so that the photographer appears in the background of this conceptual series, called *Spiegelbilder* (Mirror Images), as the inspirational director of the scene.

Since the 1970s, Moses has consistently compiled and published photo essays. In 1979, this approach took the form of the trend-setting publication, *Transsibirische Eisenbahn* (Trans Siberian Railroad), with 26 photo narratives, evocative and metaphoric images of human encounters.

Since 1953, he has been hot on the heels of photographic subjects from throughout the world and has researched his reports through different trips to regions of North and South America and Asia, but largely in numerous European countries, Israel, Italy, Austria and also Hungary, where he documented the Hungarian Revolution of 1956. With its numerous awards, exhibitions, and publications, this consistent and continuously expanding body of work has also been internationally recognized as one of the most outstanding German contributions to photography in the second half of the twentieth century. In 1990, Moses was awarded the David-Octavius-Hill Medal of the Gesellschaft Deutscher Lichtbildner (GDL), and the following year he received the “Honors Award of the City of Munich,” awarded to a photographer for the first time. In 1994, Moses was the first photographer to be named a proper member of the Academy of the Fine Arts in Munich. The photographer’s archive (negatives, slides, original prints, records) is in the collection of the Photography Museum within the Munich City Museum, which featured the first international retrospective of his work in 2002. An accompanying monograph has been published in order to do justice to the exhaustive scope of this photographer’s work.

MATTHIAS HARDER

Biography

Born in 1928 in Liegnitz in Lower Silesia. 1936, first photographs with his father’s large-format Steinheil camera. 1943, beginning of his professional training as an assistant to the children’s photographer, Grete Bodlée. Training continued after the end of the war as an apprentice in Erfurt. 1944–1945, interned in the Ostlinde labor camp 1947–1950, first employment as a theater photographer in the Nationaltheater in Weimar. 1950, moved to Munich, where he worked as a photojournalist for magazines, such as the *Neue Zeitung*, *Revue*, *Das Schönste*, and *magnum*. Traveled to New York, South America, Israel, and Asia in the 1950s and 1960s. 1960–1968, features for the magazine *Stern*; began his long-term photographic projects about

Germany and the Germans, which ultimately became his central themes. Independent projects, including books like *Manuel* (1967), *Transsibirische Eisenbahn* (1979), *Deutsche* (1980), *München* (1980) and *FlicFlac* (1981) 1989–1990, Photo series *Abschied und Anfang—Ostdeutsche Porträts* commissioned by the Deutsches Historisches Museum in Berlin. 1990, awarded the David-Octavius-Hill Medal of the photographic society, Gesellschaft Deutscher Lichtbildner (GDL) 1991, honored with the cultural recognition award of the city of Munich. 1994, named a proper member of the Akademie der schönen Künste in Munich. 1995, the Photography Museum of the Munich Stadtmuseum purchased the photographer's archives. 2001, Honorary Award of the Stankowski Foundation, Stuttgart.

Individual Exhibitions

- 1988 *Transsibirische Eisenbahn*; Holbeinhaus, Kunstverein; Augsburg, Germany
 1990 *Stefan Moses*; Städtische Galerie Filderhalle; Leinfelden-Echterdingen, Germany
 1991 *Abschied und Anfang. Ostdeutsche Porträts*; Deutsches Historisches Museum; Berlin, Germany, traveling through Germany and abroad

- 1998 *Selbst im Spiegel—Jeder Mensch ist eine kleine Gesellschaft*; Bayerische Akademie der Schönen Künste; München, Germany
 1999/2000 *ende mit wende—DDR*; Schillermuseum; Weimar, Germany (traveling through Germany: Galerie der Stadt Stuttgart, and Stadtmuseum Hofheim)
 2000 *Manuel*; Argus Fotokunst; Berlin, Germany
 2001 Ernst Bloch-Zentrum; Tübingen, Germany
 2002/3 *Deutsche Vita—Retrospektive*; Fotomuseum im Münchner Stadtmuseum, traveling through Germany and abroad

Group Exhibitions

- 1965/66 *Ost und West—Fotoreportagen* (Thomas Höpker, Stefan Moses, Max Scheler, Eberhard Seeliger); Museum für Kunst und Gewerbe; Hamburg, Germany (traveling through Germany: Stadtmuseum München, Kunstverein Bremerhaven, Bezirksamt Berlin-Reinickendorf)
 1979 *Fotografie 1919–1979 Made in Germany—Die GDL-Fotografen*; Fotomuseum im Münchner Stadtmuseum; München, Germany
Deutsche Fotografie nach 1945; Kasseler Kunstverein; Kassel, Germany

UGO MULAS

Italian

Ugo Mulas is an Italian photographer perhaps best known for documenting the art and artists participating in the prestigious international art exhibition, the *Venice Biennale*. As such, his photographic work captured a panorama of artists, painters, and sculptors of American and European avant-garde of the 1950s and 1960s. Working in black-and-white and Polaroid formats, his work is not limited to the production of documents about artists. During his career, Mulas has elaborated a unique sensibility that explores and questions the photographic act.

Born in Hugo Mulas in Pozzolengo, Italy in 1928, as a young man he studied law and took evening classes at the Academy of Fine Arts in Brera in 1951–1952. Mulas was largely self-taught, and for him the camera became an instrument used to relate his experiences on the streets of Milan and in its periphery. Some of his earliest work offers night views seemingly void of human beings. He also photographed at the Giamaica Bar, a gathering place for Milanese intelligentsia, where Mulas began doing photographic portraits and formed friendships with many artists, sculptors, theater artists, novelists, and journalists.

Through the efforts of a journalist friend, Mulas became, from 1954 to 1968, the official photographer of the *Venice Biennale*. As such, he was able to document meetings between artists, art dealers, curators, exhibition designers, and he captured the “behind the scenes” story while the huge exhibition was being set up in numerous different halls and buildings. But these pictures oscillate between two poles: the documenting of events considered fashionable, such as parties, gatherings in bars (as in the photograph of the French sculptor César in discussion with a Japanese couple) and capturing events related to the artistic life of the *Biennale* (i.e., the 1962 work showing Alberto Giacometti receiving the Biennale’s Grand Prize in which Mulas focused on the emotion on the face of the Italian sculptor as he attempts to hide his sentiment with his hands, or the 1964 pictures of Robert Rauschenberg in a gondola on the Grand Canal).

In 1962, Mulas went to the Italian city of Spoleto, which hosts a yearly municipal arts festival, to photograph an outdoor sculpture exhibition that had been mounted that year. In these works, Spoleto is transformed into a night space where urban architecture and contemporary sculptures are intermingled. In the early 1960s, with his pictures of the American abstract sculptor David Smith in the foundry where he forged his monumental sculptures, Ugo Mulas conceived a dialogue between the artworks and their environment, capturing another behind-the-scenes artistic activity that had to that point rarely been seen in photographs. This dialogue and play between artists and their works appear as well in the memorable pictures Mulas captured of Alexander Calder, renowned for his mobiles, in Saché, France, in 1961, and in Calder’s studio in Roxbury, Massachusetts. Mulas’s work in this area became a model for other pictures featuring sculptors with their works in the studio or situated in specific places.

From 1964 to 1969, Ugo Mulas, with the help of gallery owner Leo Castelli and writer Alan Solomon, undertook several stays in New York, where he embarked on an important series of pictures of leading American artists of the era. Most show the artists in various environments, and they include sculptors John Chamberlain, Claes Oldenburg, George Segal, Marcel Duchamp (of whom Mulas took a photograph studying the famous picture showing him playing chess with a nude woman); and painters Jim Dine, Jasper Johns, Roy Lichtenstein, Barnett Newman, Larry Poons, Robert Rauschenberg, James Rosenquist, Frank Stella, Andy Warhol, and Tom Wesselmann. These photographic series were

collected for the publication *New York, Arte e persone*, in 1967, published in English as *New York: The New Art Scene*. In that same year, Ugo Mulas had his first solo exhibition at the Galleria Il Diaframma in Milan.

The avant-garde Italian painter Lucio Fontana has been one of Mulas’s primary artist subjects. Fontana, known for violently slashing the canvases of his paintings to create a clear space where everything—action, time, and light—converge in a point of violent paroxysm, is featured in a 1964 photographic series which is indicative of a transition in Mulas’s career. These photos describe moments, suspended in time, before Fontana employed a knife to make cuts in the canvas. Mulas amplifies the artist’s action by emphasizing contrasts and by focusing on the artist’s body movements.

After this series, Mulas’s work becomes more poetic as well as becoming illustrations for poetry. He began to photograph Monterosso in Liguria, where his sea scapes might be said to have become part of a four-hand opus *Allegria di Ungarelli* on which Mulas and the poet Eugenio Montale collaborated in 1969.

In the late 1960s, as Mulas began rethinking his photographic aims, he worked on a number of theatrical productions, particularly with the director Virginio Puecher in *Wozzeck*, an Alban Berg opera, in 1969–1970, and Benjamin Britten’s opera *The Turn of the Screw*, in 1969. Mulas had previously worked as a theatrical photographer with Giorgio Strehler for Carlo Bertolazzi’s *El nost Milan* in 1955–1956, for Bertold Brecht’s *Threepenny Opera*, in 1955–1956, and for Bertold Brecht’s *Life of Galileo*. But the works of the late sixties first brought together projections of architecture images and landscapes brought to the edge of abstraction through use of solarization.

During the last two years of his life, Mulas conceived a final work, which can be seen as a theoretical and photographic legacy. This series entitled *La Verifiches* (The Verifications) of 1971–1972, condenses, in some ten pictures that are accompanied by texts relating his reflections upon photography, his lifetime of photographic experience. The titles evoke the various aspects of photographic practice and include: *Tribute to Niépce; Photographic operation; self-portrait for Lee Friedlander; Time in photography, to J. Kounellis; The blow-up, the sky for Nini; The laboratory, one hand developed, the other one fixed, to Sir John Frederick William Herschel; Lenses, to Davide Mosconi, photographer; Sunlight, diaphragm, exposure time; Optics and space, to A. Pomodoro; The legend, to Man Ray.*

MULAS, UGO

Ugo Mulas wrote about the late series: "I have given this name to this series of photographs because my intention is to understand the sense of the activities I have never ceased to accomplish, at times up to 100 times a day for years, without ever questioning them in themselves apart from their utilitarian function."

MULTIPLE EXPOSURES AND PRINTING

Multiple images in photographic prints are created through a number of methods: multiple exposures with or without a flash in the camera, sandwiching negatives in the darkroom, printing from multiple negatives and enlargers in the darkroom, and digital manipulation. These techniques have been used through most of photography's history for creative and technical control over images.

Multiple exposures consist of exposing one piece of film more than once in the camera. This is achieved through a variety of techniques, depending on the film format and camera specifications. Medium and large format film (as used in view cameras) can be easily exposed multiple times by not changing or forwarding the film inside the camera. Some point-and-shoot and 35-mm cam-

MULTIPLE EXPOSURES AND PRINTING

eras are more difficult tools for multiple exposures because of the mechanism that forwards the film within the camera; an interlock between the shutter release and film advance may only allow one exposure per frame. This function may be manually overridden by rewinding the film either fully or partially, or by triggering the film release button on the camera body to rewind the film. The bulb (B or T setting) shutter mode may also be used and a dark slide placed over the lens, allowing the photographer to control the shutter and exposure of each individual light imprint on the film by using the time-exposure function.

Multiple images on one frame of film may take the form of two (or more) different scenes, or the same scene shot more than once, or of a partial image. This latter technique may be achieved by using a black piece of cardboard or dark slide to block out part of the image area in each multiple exposure. Also, one scene shot and recorded in exactly the same manner will allow for effects that cannot be achieved in a single exposure, such as a large amount of depth of field, to be created in the composite shot. Using an electronic flash or a strobe light in a darkened room can also result in the same effect as manually exposing a frame of film more than once in the camera under more conventional conditions. While the shutter is kept open, the flash or strobe light is used to create a quick burst of illumination, and may be repeated numerous times to fully illuminate an image or portray motion.

Exposing the film multiple times will create overlapping images and have an impact on the exposure time, and thus overall density of the film. To ensure an intelligible exposure, each individual exposure or shot must be metered and the combined exposure time should approximately equal that shown by the light meter reading in the camera for a single exposure. For example, if an image is created by two exposures, each shot must be half of the total exposure that would be required for a proper exposure of one image of the scene. Dividing the meter reading given by the shutter speed and aperture setting by the number of images taken is generally accurate for most multiple exposures, but excessive multiple images placed on one sheet of film may produce what is known as reciprocity failure. Reciprocity failure occurs because film's sensitivity to light as it is exposed may be altered during the process of exposing multiple times, and unpredictable overexposure, underexposure, or color shifts may result.

Darkroom techniques for multiple exposures include sandwiching negatives and multiple printing. Sandwiching negatives places two or more

images on top of each other in the enlarger's negative holder with the composite image created by exposing the negatives during printing on photographic paper. Placing more than one negative in the enlarger increases the overall image density and this must be compensated with increased intensity of the enlarger's light source or with a longer exposure, or a combination of the two. Increased density may also alter the image contrast and necessitate additional burning and dodging in selected areas.

Multiple printing is a darkroom technique that exposes individual negatives onto one sheet of photographic paper to form a composite image. This technique can be achieved in one of two ways: by using multiple enlargers to print individual negatives, or using the same enlarger to print multiple negatives that are changed with each image exposure. The unexposed areas of photographic paper for composite printing must be covered as each individual image element is printed, and multiple test strips for exposure, contrast, and color balance (if printing color) must be utilized to master this technique. Areas where individual negative areas overlap may also be problematic, and advanced burning and dodging of these areas will provide a more finessed transition from one negative element to another. During multiple printing, registration of the print in the easel or registration of the negative carrier in the enlarger is necessary to form matching edges in the print and exact overlapping of the individual negative exposures. Advanced darkroom manipulation techniques such as flashing, masking, and split filtration printing may also be integrated into the multiple printing processes.

Digital darkroom programs such as Adobe Photoshop have widened the range of tools and processes available for photographers. Scanning of traditional film images and importing of digital documents creates a compositing tool in the computer, and each image element can be added to a complex composition. The tools used in this process are different from the traditional darkroom and film exposure methods, but achieve similar creative results. Cutting and pasting of individual image elements allow a composite to be created on layers in the imaging program, and blending of these elements is achieved through digital effects such as feathering the edges, changing opacity, and masking of image elements. The digital tools can also be integrated back into the traditional darkroom process, and an inter-negative or transparency can be printed from the composite created in Adobe Photoshop on most conventional inkjet printers. This document can in turn be utilized in

the traditional darkroom for singular and multiple printing techniques.

Multiple exposures and printing are techniques that have been used by fine art photographers since the invention of the medium. Nineteenth-century master Henry Peach Robinson incorporated many individual negatives into his fine art montage pieces, and multiple exposure was a hallmark of the photographic avant-garde in Paris, Vienna, Munich, and Berlin between the world wars. Edmund Kesting and Bauhaus master László Moholy-Nagy were notable practitioners of multiple exposure and printing techniques. More recently, in the 1950s multiple exposures in the camera were practiced by Harry Callahan and encouraged in his many students at Chicago's Institute of Design as well as Louis Fauer in his nighttime photographs of New York City. Jerry Uelsmann and John Paul Caponigro are two late-twentieth century masters of multiple printing, Uelsmann utilizing up to 20 enlargers in his traditional darkroom and Caponigro a master of digital compositing with tools such as Adobe Photoshop.

VIK MUNIZ

Brazilian

The career of Vik Muniz echoes what nineteenth-century critic Charles Baudelaire called the photographer during his own era: "operator." Muniz's artistic strategies connect him with this description in that he uses photography as a means to an end that is not strictly photographic. The pictures for which Muniz is known in fact consist of images made from chocolate, sugar, dust, ink, wire, cotton, urban detritus, and other materials that are then photographed.

This *modus operandi* places Muniz's photography within a lineage of early twentieth-century photographers and artists such as Man Ray and his photographs of dust, and Salvador Dalí's and Brassai's pictures of found objects that they called involuntary sculptures. Muniz is also linked to conceptual artists

who used photography as documentation of an event, performance, and as supplement to an idea. Yet Muniz's work is as emphatically about photography's ability to mimetically reproduce the world as it is about its power of illusion. This dichotomy is one of the impulses that drive Muniz's art, though to construe it as being solely about perception is to undermine its formal and conceptual rigor. Muniz has emphasized that his work is more than visual sleight of hand: "I like illusions that say something about reality or, at least, our ability to cope with it" (Muniz, *Seeing is Believing* 1998).

Beginning his artistic career as a sculptor, Muniz's focus was on creating objects. As his sculptures became more like visual puns imbued with double meanings, Muniz progressively reconfigured sculpture from its three-dimensional format into a two-

dimensional one. The paradox was that these early three-dimensional works incorporating photography began to increasingly privilege the picture and its capacity for illusion rather than sculpture's material presence. This was slowly arrived at by combining photography with found objects that enabled the art work to both literally and figuratively address the world outside of it. Exemplary of this early work are *Tug of War* and *Two Nails* of 1989. In *Tug of War*, a real "rope" is the link between two photographs of individuals each tugging the end of a rope. In "Two Nails," Muniz exploits the historical illusory device of *tromp l'oeil* through the interplay of a photograph of a piece of paper nailed to a wall that, in turn, is itself nailed onto the wall by a real nail. This work demonstrates what would remain a leitmotif in Muniz's later work: photography's slippage between its indexical quality, that is, its ability to record the world, and its antithesis when it is embodied as a real, tangible object. These early works also explore the image as it shifts from perception to identification within the viewer.

The Best of Life (1988–1990) is a group of pictures of news events taken from the magazine that gives the series its name. Muniz drew famous photographs that recorded events such as the lone Chinese man stopping tanks in Tiananmen Square and Neil Armstrong walking on the moon from memory and then photographed these drawings. By reconfiguring these images through his personal recollection, Muniz explores the relationship between our collective understanding of history via images provided to us by the news media, and our individual engagement with these images. *The Best of Life* series marks Muniz's practice of conceptual photography in which the idea that structures the work and resonates from it takes precedent over the work's formal qualities. However, by presenting his pictures as gelatin silver prints that imbue them with the aesthetic of a traditional photographic medium, Muniz becomes concerned with the convergence of forms and images that produce multi-layered narratives.

The Sugar Children (1996) further conveys Muniz's coupling of materials and meaning. *The Sugar Children* features images of the sons and daughters of impoverished sugar mill workers; these images are rendered by Muniz with sugar on black paper and then photographed. Although it is a sweetener, within the context of *The Sugar Children*, sugar becomes a bitter pill to swallow, producing a scathing social commentary. This could also be said of Muniz's *Pictures of Chocolate* (1997–1998), most notably his photograph of Freud titled *Sigmund*.

This photograph and others in the series—such as (*Milan*) *Last Supper*—produce a visually poetic work that powerfully evinces the marriage of form and image. In (*Milan*) *Last Supper*, chocolate is an analogue of the food pictured as being served during Jesus Christ's last supper that pushes the limits of the visual experience of art through indexical associations. That is, in the same way that a photograph is traditionally a recording of an event in the real world, in (*Milan*) *Last Supper*, it serves as an index of something not usually the experiential province of art: the sense of taste. Taste is also an element with *Sigmund*, albeit couched in Freud's own ideas about psychosexual development. For chocolate now alludes to both Freudian oral gratification or the oral stage, and to the anal stage by way of the picture's viscosity alluding to excrement.

Muniz has also looked at photography's own history, producing the series *Equivalents*, a reference to Alfred Stieglitz's famous series of skies and clouds, as well as works in which he drew with dust photographic documentations of installations by famous Minimalist sculptors such as Donald Judd.

Muniz exploits the conceptual coupling of materiality with narrative, or meaning and its vehicle of articulation—be it drawing or photography or pictures made with sugar, chocolate, thread, wire, or dust—like no other contemporary photographer. Muniz's practice continues to engage formal and conceptual arenas that push the boundaries of photography in myriad directions, and his interest in emerging technology and image-producing media will surely secure his importance not only for twentieth-century photography, but for twenty-first as well.

MARTIN MUNKACSI

Hungarian

Martin Munkacsi, New York's leading fashion photographer during the 1930s and 1940s, was born on May 18, 1896 in Koloszsvar, Hungary, near the town of Munkasc (now Cluj Napoca, Romania), the historic capital of Transylvania. The fourth of seven children in a working-class Jewish family his original surname—either Mermelstein or Marmorstein—was changed, by the family to Munkacsi upon moving to Disco-Szent-Marton, Hungary (now Tirnavani, Romania); the new name, invented during this era of pogroms, was distinctly Hungarian and not identifiably Jewish.

At 16, Munkacsi left home and settled, on his own, in cosmopolitan Budapest. Bright and energetic, he started his professional life as a writer, contributing reports on soccer matches and automobile races to *Az Est*, a sports daily. By 1921, as a self-taught photographer working with a home-made camera, Munkacsi was regularly providing sports photographs for *Az Est* and documenting performances for *Theatre Life*, a weekly review. Munkacsi's natural métier was as a sports photographer; he displayed a virtuosic talent for capturing, in a still image, the pure exhilaration of movement.

Munkacsi relocated to Berlin in 1927 and signed a three-year contract with Ullstein Verlag, the city's major publishing house. His first credited story appeared in the October 14th issue of *Berliner Illustrierte Zeitung*, Ullstein's weekly picture magazine. With a circulation of two million, *Berliner Illustrierte Zeitung* was the most widely read magazine of its kind in the world and, in the United States, is best remembered as the template for *Life* magazine.

Munkacsi's work appeared in other Ullstein publications: *Die Dame*, the German equivalent of *Vogue*; *Uhu*, an "arty" monthly featuring essays and photographs of nudes; and *Knipsen*, a book for amateur photographers. Occasionally, he worked for Ullstein's competitors, *Die Woche* and *The Studio*.

Throughout this period (1930–1934), Munkacsi claimed—with characteristic bravado and somewhat questionable credibility—that he was the highest-paid photographer in Berlin. He did, undeniably, enjoy great success and traveled extensively on assignment throughout Europe, Africa, and the Americas. As Henri Cartier-Bresson later recalled: "In 1932, I saw a photograph by Martin Munkacsi of three black children running in to the sea ["Liberia, c. 1930," published in *Das Deutsche Lichtbild*, 1932], and I must say that it is that very photograph which was for me the spark that set fire to the fireworks... and made me realize that photography could reach eternity through the moment. There is in that image such intensity, spontaneity, such joy of life, such a prodigy, that I am still dazzled by it even today."

During a brief 1933 visit to New York, Munkacsi was hired by *Harper Bazaar*'s legendary editor Carmel Snow to shoot his first fashion layout. Snow had been introduced to Munkacsi's photojournalism by Frederic Varady, a Hungarian artist, and Edward Steichen, then employed as the chief photographer for Condé Nast. In her memoir, Snow wrote about that initial shoot, the revolutionary turning point in fashion photography when Munkacsi took the model out of the confines of the studio:

The resulting picture of a typical American girl in action, with her cape billowing out behind her, made fashion history. Munkacsi's was the first action photograph

made for fashion, and it started the trend that climaxed in the work of Avedon today.

As life in Germany grew increasingly untenable, the Berlin-based publishers Ullstein Verlag capitulated to anti-Semitic pressure by firing Jewish employees and hiring Nazi editors. When Munkacsi turned in a rather straightforward assignment, photographing fruit for one of Ullstein's women's magazines, five of his prints were rejected by one of the new editors. "These are bananas," was the explanation. "Bananas are not an Aryan fruit!" Munkacsi left Germany and emigrated to the United States, arriving in New York in May, 1934. That year, he signed an exclusive contract with *Harper's Bazaar*. Munkacsi's photographs (and occasional writing) appeared regularly in the magazine; under Carmel Snow's editorship and Alexey Brodovitch's art direction, *Harper's Bazaar* established itself as the most sophisticated fashion magazine of the time.

In 1934, working with Kurt Safranski, the former managing editor of Ullstein, Munkacsi helped develop a dummy for a new picture magazine. Their project, rejected by the Hearst Publishing Corporation, was eventually sold to Henry Luce and was eventually realized as *Life* magazine—with Safranski as managing editor and Munkacsi contributing photographs.

In 1940, Munkacsi received a \$4,000 per month contract from *Ladies' Home Journal* to photograph their popular feature "How America Lives." He was said to be earning more than \$100,000 a year and liked to quip, "A photograph isn't worth a thousand words, it's worth a thousand bucks!" Munkacsi's contract with *Ladies' Home Journal*, however, ended in 1946, when the magazine pages were taken over almost entirely by color photography. Unable to make the transition from black-and-white to color photography, Munkacsi received fewer major magazine assignments and worked as a freelance photographer for the Reynolds Company, King Features, and the Ford Motor Company. He also worked as a lighting director and cameraman on the stop-action animation puppet feature of *Hansel and Gretel*.

Although Munkacsi continued to take photographs and write (his autobiographical novel, *Fool's Apprentice*, was published in 1945), his once radical vision had moved firmly into the mainstream, and he found himself out of touch with the changing times. In 1963, while attending a Hungarian team's soccer game at Randall's Island, New York, Munkacsi suffered a fatal heart attack.

In a memorial to Munkacsi published in *Harper's Bazaar* (June, 1964), Richard Avedon wrote:

He wanted his world a certain way, and what a way! He saw what was free in it, happy in it, and however much he suffered, and he did suffer, his pain never destroyed his dream. Without illusions there would be no art and possibly no life in the world. The art of Munkacsi lay in what he wanted life to be, and he wanted it to be splendid. And it was.

MUSEUM FOLKWANG

The photography collection in the Museum Folkwang, Essen, Germany, is a division of the Museum of Modern Art, and considered one of Germany's most important collections of photographs. Although the collecting of photography has been ongoing, in 1978 the photography collection of the city of Essen was integrated into the museum, greatly expanding the number and scope of the holdings.

At the end of the century, the collection held roughly 50,000 photographs, most of which are vintage prints. Though it has a rich collection of nineteenth century photographs, the main focus is on the twentieth century. Areas of special empha-

sis include the photography of 1920s, photojournalism of the 1950s and 1960s, the Subjective Photography of Otto Steinert and his circle, and international contemporary photography from the 1980s to the end of the century. The museum also has strong thematic holdings in portraiture and architectural photography. With its comprehensive program of exhibitions and its collecting initiatives, the museum is unique in that it combines an interest in historical archiving with the promotion of the most up-to-date developments in contemporary photography. Two areas are important to consider. One is the history of the holdings

assembled by Otto Steinert, which comprise the cornerstone of the museum's collection, and the other is the long tradition of photography archiving and mounting exhibitions in the Museum Folkwang in general.

When Otto Steinert was made a professor of photography at the *Folkwangschule für Gestaltung* in 1959, he began to build the collection as a photo-historical archive for the school. It was a teacher's collection that would allow one to use original prints in the classroom. From the very beginning Steinert united teaching, collecting, and exhibiting, and in recognition of this historical usage, since 1959 the museum has sponsored a yearly exhibition on the history of photography.

The first exhibition of photographs mounted by the museum, however, was the presentation of another collector's holdings, the famous historian of photography Helmut Gernsheim, whose collection provided an overview of over 100 years of photography, from its beginnings to the 1930s. (This collection, however, was purchased by Harry Hunt Ransom and became the centerpiece of the Harry Ransom Humanities Research Center at the University of Texas, Austin.) Following this exhibition, the school purchased the omnibus volume of photographs made by the portrait photographer Hugo Erfurth and the *Neue Sachlichkeit* (New Objectivity) photographs of Albert Renger-Patzsch. But in the early years, the collection grew sporadically rather than systematically. In 1961, at the first European photography auction, Steinert acquired another cadre of photographs, among them a portfolio of 144 images from the pioneers of photography David Octavius Hill and Robert Adamson. In the 1960s, Steinert was interested in the work of Heinrich Kühn, a turn of the century art photographer, and in photographs from the 1920s, which shaped acquisitions. In the mid-1960s, as interest in photojournalism increased, Steinert began collecting works of Felix H. Man, Erich Salomon, and Robert Lebeck. By 1978, the collection contained around 3,800 photographs.

The integration of the photography collection into a museum of modern art was an important recognition of photography as art within a museum context in West Germany. This path-breaking move can be traced back to the 1920s and the Museum Folkwang's long-standing relationship with the medium of photography. Under the influence of the then curator Kurt-Wilhelm Kästner and the photographer and Folkwang instructor Max Buchartz there arose in Essen in the late 1920s and 1930s a forum for photography. In 1929, even before *Film und Foto*, the well attended and influential photography exhibition in Stuttgart, Kästner

created the exhibition *Fotografie der Gegenwart*. Following this, he presented *Das Lichtbild* (1931), an exhibition from Munich that he and Max Buchartz enlarged with works from students in Essen. The first individual exhibition of photographs by Florence Henri (1933) was the last exhibition Kästner curated before the Nazis removed him from his position. After the war, Steinert reconnected to what Kästner had begun by establishing a yearly exhibition series "*Beiträge zur Geschichte der Fotografie*," held from 1959 to 1978.

In 1979, Ute Eskildsen, a student of Otto Steinert, took over the photography division and continues to guide it into the twenty-first century, continuing the interweaving of the historical and the contemporary. The museum expanded its holdings in the areas that Steinert had focused on in his collecting, architectural photography and human representation. It has also filled gaps in its special collection of photography from the 1920s so that the holdings range from the experimental Bauhaus photography to New Objectivity, and include the estates of Helmar Lerski, Germaine Krull, and numerous collections from German-Jewish emigrants, such as Lotte Erell and ringel+pit, the studio of Ellen Auerbach and Grete Stern. There is also a reprint of August Sander's epic work, *Menschen des 20. Jahrhunderts*, which Steinert himself never could procure for his collection. Another area of considerable attention is the 1950s, with holdings from the members of the photography group "fotoform" and from the exhibition series *Subjektive Fotografie* organized by Otto Steinert, an area enlarged by the purchase of Steinert's private collection.

A strong interest in contemporary photography also motivates the museum's purchases. Among them are collections by the Americans William Klein and William Eggleston, and Michael Schmidt. In addition the museum secured the estates and archives of Helmuth Kurth, Walter Peterhans, Fee Schlapper, Wolfgang Weber, and the archives of Peter Keetman.

When they transferred the school's collection to the public museum, staff took inventory of the holdings over the following years. Now the public can access the collection with a filing system ordered by author and a slide library ordered by keyword. Once a week anyone can view original prints. Unknown works are conserved and restored to public attention by means of the numerous exhibitions and their accompanying catalogues that are grouped around the central areas of the collection. Robert Knodt has been responsible for the scientific handling and conservation of the collection since 1985.

As a further resource the museum offers pedagogical guides to its exhibitions, as well as courses on the key areas of the collections and on the themes of the exhibitions using original prints from the museum's holdings.

The exhibition program features six to eight projects per year. Exhibitions with historical themes are interchanged with exhibitions of contemporary photography. Among historical exhibitions, the focus has been on the photography of the *Neues Sehens* movement. In 1979, to honor its 50th anniversary, the museum reconstructed the *Film und Foto* exhibition, one of the most important for experimental photography of the 1920s. In 1982, the museum presented the works of the photographer Helmar Lerski. In the following years there were important individual exhibitions and catalogues for photographers of the 1920s, such as Anne Biermann, Sasha Stone, and Walter Peterhans. In 1994–1995, a large group exhibit took place of female photographers from the interwar period, “*Fotografieren hieß teilnehmen—Fotografinnen der Weimarer Republik.*” In 1999, the collection featured a retrospective of the works of the photographer Germaine Krull. Since the 1980s a great number of young photographers have had their first museum exhibition within the photography collections—Michael Schmidt is an example. Internationally renowned photographers such as Lee Friedlander, William Klein, and Robert Frank have had individual exhibitions at the Museum Folkwang.

In 1982, when artistic photography was still rarely in high demand, the museum began sponsoring a scholarship for contemporary German photography in collaboration with the Alfred Krupp von Bohlen und Halbach-Stiftung. In 2000, the Krupp Stiftung also began sponsoring a program

for young curators. In addition, with support from the Dietrich Oppenberg Stiftung, the museum initiated the Albert Renger-Patzsch Prize to support European photography book production.

THE MUSEUM OF MODERN ART OF NEW YORK

The Museum of Modern Art of New York (MoMA) did more than any other institution to shape the art of photography in the twentieth century. Over the course of the century it played a crucial role in enhancing the aesthetic and financial importance of photography as well as helping

to define the scope of photography as an art form. The museum achieved this through the exhibitions it organized, through its collecting policies, and through the activities of its now-legendary curators of photography: their choices, catalogue notes, and books.

Since its foundation in 1929 MoMA has consistently led the way in the display and collection of photographs. Initially these photographs were included in traveling exhibitions or exhibitions of other art forms—most notably architecture. With the formal creation of a Department of Photography, in 1940, the Museum consolidated its presence as the leading champion of photography as a form of art rather than as primarily a scientific, marketing, or educational tool. Since then the Museum has expanded the art of photography to incorporate those other, more functional, aspects of the form.

The following account of the Museum's involvement with photography is in two sections. The first section provides a historical overview of photography at MoMA. This includes a brief account of the relationship to photography of the founders and early officers of the Museum, as well as a description of MoMA before there was an official Department of Photography, followed by an account of the trends and key exhibitions under each of the four heads of the Department. The second, shorter section will deal with the effect that photography had on MoMA and the influence that MoMA exerted upon photography during the course of the twentieth century.

Before MoMA

The history of photography at MoMA does not start *ex nihilo* with the foundation of the Museum but rather, as with the other departments of that now august institution, it begins with a scattered interest that predated the Museum and which existed independently of the Museum in its early years. The most important forum for photography was the Photo Secession group (1902–1917) which included, among others, the work and participation of Edward Steichen and Alfred Stieglitz. In the United States early aesthetic guidelines for the newly-possible art of photography grew up around a number of galleries in New York that displayed and sold photographs and around the Photo-Secession group which, along with its journal—*Camera Work*, promoted the idea of photography as art and inspired a generation of photographers and photography collectors.

MoMA before the Department of Photography

From its inception the MoMA was open to new ideas. One of the major reasons that its wealthy founders brought it into being was to supersede the stuffiness and institutional inertia of the existing galleries and museums. Likewise, the reason that they brought Alfred H. Barr to direct it was his fearless exuberance about the “new.” Barr was the

Director and guiding light for the first few decades of MoMA. Originally recommended to the founders by Paul J. Sachs of the Fogg Museum at Harvard, Barr—an art history professor at Wellesley—came to MoMA as a young man and was largely responsible for museum staff appointments and artistic direction.

Shortly before he arrived at the Museum, in 1929, Barr had been to Europe and the new art he had seen during his travels was the European avant-garde—a movement which had many photographer practitioners (most notably expatriate American Man Ray). In his course on modern art at Wellesley, Barr included not only photography but architecture and machine-made products, which provided an indication of his views on the possibilities of art and of the direction he intended for MoMA. Indeed, in a comment in the Museum's inaugural *Bulletin* celebrating the Museum's opening in 1929 Barr noted that the Museum would probably expand in time to include departments such as film and photography.

Barr drew, and periodically updated, a genealogical flow chart of modern art, placing a version on the cover of his 1936 book *Cubism and Abstract Art* from the exhibition of the same name. This highly influential chart gave ample scope for entirely new genres or, in the case of photography, for the collation of a series of existing practices into a single genre. Despite, or because of, this openness the Museum's first acquisition of a photograph—*Lehmbruck: Head of a Man* by Walker Evans (given by Lincoln Kirstein in 1930)—was not a deliberate departure from previous types of museum acquisition but a pragmatic move to accept a donation. It was only the 23rd work of art that MoMA had acquired. In 1931, with the death of Lillie P. Bliss (one of the Museum's founders), the fledgling Museum acquired a substantial art collection including several photographs. Although it was not until the founding of the Department that it was actively enlarged, the photograph collection had now properly begun.

The Museum began in rented space in the Heckscher Building (on Fifth Avenue and 57th Street) but quickly moved around the corner to bigger premises on 53rd street owned (and later donated) by the Rockefellers. The first two exhibitions at the new location of the Museum on 53rd Street relied upon photography. The first—*Modern Architecture: International Exhibition* in 1932—coined the name of the pre-eminent architectural style of the next 30 years and relied for its argument on 75 or more large photographs illustrating the new building and design practices coming out of

Europe. The second exhibition on 53rd Street was the first to include photography explicitly. The Advisory Committee wanted to show domestic artwork alongside the new art that was coming in from Europe, and Barr wanted a chance to display photography as an independent art. *Murals By American Painters and Photographers* (1932) gave exactly that opportunity and he turned to Lincoln Kirstein for help.

Kirstein, a friend of architect and MoMA Architecture Curator Philip Johnson and one of the founding members of the Harvard Society for Contemporary Art, went on to serve on the Junior Advisory Committee of MoMA. Kirstein turned to his friend and New York gallery owner Julien Levy for help, and between them they procured the photographs that were displayed. Kirstein was also the director of the 1933 exhibition of Walker Evans prints (which he later donated) of nineteenth century homes—the first one-man photography show at MoMA. Kirstein was one of three especially generous donors who gave time, money, and photographs to the Museum and later to the Department. Over an extended period of time the second of the three donors, James Thrall Soby, gave over 100 Man Ray prints, served as trustee, curator, administrator, collector, organizer of exhibitions, and author of publications that accompanied them. The third, David McAlpin (an investment banker and amateur photographer), was related to the Rockefellers who were so instrumental in creating the Museum. He was friendly with painter Georgia O’Keeffe, Alfred Stieglitz’s wife, and secured gifts of her husband’s prints; he acquired a handful of Edward Weston and Man Ray photographs, and, among other things, provided \$1,000 to fund the first (and only) Photographer’s Fellowship in 1946.

Before there was a Department of Photography, there existed a department that dealt specifically with a photomechanical art. Although with hindsight it appears obvious that there should be separate departments for “Film” and “Photography” there is no intrinsic rationale for separating the art of these two photographic processes. It was little more than chance that Iris Barry, a former film critic, should move (via the MoMA library) from London’s *Daily Mail*, to set up the Film Library in 1935 (re-named the “Department of Film” in 1966). A film library was anything but a foregone conclusion since, although it realized the “filmotek” of the original plans, it only came about after two years of committee work had been spent exploring the possibility. Indeed, “Photography” and “Film” might easily have been two parts of a larger “Department

of Machine Art” suggested by Philip Johnson’s 1934 *Machine Art* exhibition, on display during the committee’s deliberations.

When Iris Barry moved from the library to take charge of the Film Library she was replaced as librarian by the photographer and historian Beaumont Newhall. This placed him in an ideal position to advance the cause of photography within the institution. In 1936, he was invited to curate the exhibition that would become the 1937 exhibition *Photography 1839–1937*. Sam Hunter quotes the then President of MoMA, A. Conger Goodyear, describing it as “one of the most complete and satisfying exhibitions in the Museum’s history.” It was the first comprehensive photography exhibition ever attempted in the United States: In it, Newhall introduced photography as a museum art, presented the museum as an educational institution, and paved the way for a Department of Photography with himself at its helm.

The Department of Photography under Beaumont Newhall, 1940–1946

Funded by a \$5,000 grant from David McAlpin, Beaumont Newhall’s researches for the 1937 exhibition had been extensive, and they culminated in his publication of the catalogue for the 1937 exhibition as *Photography: A Short Critical History* (1938). This was subsequently expanded into the standard history book of photography. With frequent revisions through the decades *A History of Photography from 1839 to the Present Day* remains one of the most important English language books on photography.

The opening at the new building on 53rd Street in May 1939, meant that there was more space, among other things, to display photographs. With celebration and its own special issue of the Museum’s *Bulletin*, the Department of Photography at the Museum of Modern Art was formally established in 1940. Although the Brooklyn Museum had a Department of Photography (the only one in the country), MoMA boasted the first curatorial department in any museum to be devoted exclusively to photography. In the bulletin, Newhall announced his intention for the Department to

function as a focal center where the aesthetic problems of photography can be evaluated, where the artist who has chosen the camera as his medium can find guidance by example and encouragement and where the [public can study] the classics and the most recent and significant developments in photography.

Its opening exhibition was *Sixty Photographs*—curated by Newhall along with the prominent photographer Ansel Adams who had been lured away from California by McAlpin. Although small compared to the century-spanning 1839–1937 exhibition, *Sixty Photographs* sent a clear message that the new department would not limit itself stylistically but, as it said in the bulletin, would rather be guided by the principle that quality in photography works best through the evocation of “an epoch by preserving a moment in the passage of time.”

Newhall put on an Edward Weston retrospective in 1946 and a Henri Cartier-Bresson exhibition in 1947 with the help of Levy and Kirstein but there was little he could do that would have surpassed the founding of the Department or his seminal 1937 exhibition. His job was made more difficult by the entry of the United States into World War II and his subsequent call up. While he was on active duty his wife Nancy kept the Department going, continuing to raise funds and to put on exhibitions. Towards the end of the war there was an attempt to change the focus of photography at MoMA by setting up a Center of Photography. This was based in a Quonset hut in the Museum garden and Willard Morgan, a close friend of the Newhalls, was brought in as Director. Overly ambitious, the Center achieved little apart from an unsuccessful national snapshot competition sponsored by Kodak. Morgan soon departed, leaving Newhall in charge again.

Under Newhall MoMA’s library had been carefully systematized. He brought the same care to the newly-formed Department, which he established as an independent entity within the Museum. It acquired holdings and published them, it developed an unrivalled institutional presence in world photography and, for better or for worse, it turned photography into a museum art. The 229 prints that the Department began with had already multiplied almost ten-fold to over 2,000 by the time Newhall left. Some of these were gifts from donors such as Soby, Kirstein, and McAlpin, and the rest had come through thoughtful accumulation. A careful curator and expositor, Newhall set consistently high standards over more than 30 exhibitions. A victim of internal politics, he presided over the Department for a shorter time than any other person of the twentieth century.

The Department of Photography Under Edward Steichen, 1947–1962

In 1942, the flamboyant photographer, patriot, and showman, Edward Steichen, had been asked to

guest-curate an exhibition that became the 1942 *Road to War* exhibition. It was a collection of photographs from many sources explaining the entry of the United States into the War, with texts by Steichen’s brother-in-law, the poet Carl Sandburg. It was a resounding success for the middle-aged U.S. Lieutenant Commander. After the death of Alfred Stieglitz in 1946, Steichen was the most eminent photographer in the nation and one with a flair for marketing. With the failure of Willard Morgan and his Center for Photography, Steichen was linked with another ambitious plan. Without the Committee on Photography or Newhall having been consulted, Steichen was asked to take over as director of photography at MoMA. It was assumed that Newhall would stay on as a glorified archivist and historian but instead he immediately stepped down. Steichen was not able to take up his post for more than a year, and when he eventually arrived at MoMA, the activities of the Photography Department had sputtered to a halt.

During his 15 year tenure Steichen swept the Department up in his undimmed enthusiasm for the changing face of photography. The exhibitions moved from the “classical-historical” tendencies of Newhall to a broader, more populist vision influenced by the burgeoning field of photojournalism. He presided over the first important bequest of a collection of photographs to the Department—51 Stieglitz photos donated in 1950 by Georgia O’Keeffe—as well as devising and curating the most popular photography exhibition in history—*The Family of Man* (1955).

In the aftermath of the war Steichen put together a series of international portraits to show the diversity and beauty in what he called, in the catalogue, the “essential oneness of mankind through the world.” He sifted through 2 million photographs before making the final selection of 503 prints that demonstrated a shared humanity scattered through numerous genres and locales. In the end the prints came from 68 countries and from 273 different photographers. The exhibition itself was seen by over 7 million people worldwide and the catalogue sold well into the millions. Along with Newhall’s *History of Photography* it was still selling well at the century’s close.

Steichen had been a founding member of Photo-Secession and identified with its refined aesthetic but before he took over the Department of Photography he had been Chief Photographer at Condé Nast as well as having worked for the Navy and the Army during the World Wars. His changed sensibility and relative breadth of interest was reflected in the 1951 exhibition *Forgotten Photographers*, which reflected

the less self-conscious tradition of photography carried out daily in the practical, commercial, and amateur spheres. As well as an ideological action, the exhibition further helped Steichen broaden the still narrow audience of people who would come to see photographs in a museum. Although radically different, *The Family of Man* and *Forgotten Photographers* shared the photojournalistic notion of prioritizing the message of the exhibition over that of any individual's photographs.

Although a photographer of note, Steichen did not display his work at MoMA until he had already announced his retirement. His own retrospective—*Steichen the Photographer*—in 1961 provided a lively insight into his work and was no exception to his self-professed aim to promote the “aliveness of the melting pot of American photography.” MoMA had long since reneged on its plan to divest itself of earlier work as time passed, meaning that expanding and shaping the collection was of paramount importance. Despite his belief in the domestic product Steichen also made important acquisitions from Europe and Latin America, giving the collection an international breadth in keeping with the world view of the curator of *The Family of Man*.

While his successor, John Szarkowski, would achieve the reputation as a nurturer of young talent, Steichen was responsible for inspiring and recognizing the generation coming up in the 1950s. Steichen enjoyed capturing the tone of the moment rather than delving into the past: There were few historical exhibitions and only two books published by the Department during his tenure (*The Family of Man*, and *Steichen the Photographer*). He worked with Robert Frank before his groundbreaking series *The Americans* was published; he exhibited Harry Callahan and Aaron Siskind early in their careers; and he bought two Rauschenberg prints in 1952—before any other work by Rauschenberg had entered any other Museum collection.

The Department of Photography Under John Szarkowski, 1962–1992

John Szarkowski, who was picked by Steichen to succeed him in 1962, went on to have such an impact on photography that *US News and World Report* could claim with little exaggeration in 1990 that “Szarkowski's thinking, whether Americans know it or not, has become our thinking about photography.” During his directorship photography went from being barely accepted in the art world to being an established, respected, and highly sought after museum art. This change went hand-

in-hand with the rocketing market value of photographic prints of the 1970s and 1980s. The sudden appreciation in value of photographic prints meant that the Museum's collection, as well as growing in size to over 20,000 prints by Szarkowski's departure, had also grown exponentially in value.

At pains to distinguish himself from Steichen, Szarkowski's first show, *Five Unrelated Photographers* (1963), moved away from Steichen's category-based exhibitions and displayed five photographers (Garry Winogrand, Ken Heyman, George Krause, Jerome Liebling, and Minor White) who were distinctly different from one another. Steichen had steered clear of one-person shows; in an eight year span Szarkowski exhibited André Kertész (1964), Dorothea Lange (1966), Henri Cartier-Bresson (1968), Brassai (1968), Bill Brandt (1969), Eugène Atget (1969), Walker Evans (1971), and Clarence H. White in major one-person exhibitions. Berenice Abbott, Bruce Davidson, Duane Michals, and August Sander were among many others who received smaller, yet important, treatments.

Szarkowski also successfully mounted thematic exhibitions, curating *The Photographer and the American Landscape* (1963), before moving to the first of his two important theoretical exhibitions. His directorship was bookended by these epic theoretical exhibitions: *The Photographer's Eye*, at the beginning of 1964, brought Szarkowski's vision of photography to the forefront of public attention; *Photography Until Now* at the end of his tenure (1989) established his view of the approved history of photography.

The Photographer's Eye revolutionized the field of photography by displaying works of acknowledged masters side by side with magazine spreads and anonymous documentary photographs. Diverging markedly from his predecessors he brought together a wide array of photography including anthropological collections, industrial prints, and photographs by artists of their own paintings or sculptures to celebrate the newly enlarged display space available to the Department. Between his two epics Szarkowski put together other “study” exhibitions to investigate issues in photography, such as narrative in *The Photo Essay* (1965) and the expanding scope of the camera's eye in *Once Invisible* (1967) but his swansong was the ambitious *Photography Until Now*, which still lives on in the eponymous book. In that show Szarkowski cemented his position as the eclectic champion of the photographic art in its vitality no matter where it is found.

Between the two huge Museum building projects that took place in 1964 and 1984, Szarkowski built up

the Department with a number of acquisitions and exhibitions. The *New Documents* show in 1967 ushered in a new generation of American artists (Lee Friedlander, Winogrand, and Diane Arbus among others) many of whose prints MoMA bought. His energy for publication seemed limitless as the Department published a vast number of its own catalogues espousing quality work by such photographers as Harry Callahan (*Callahan*, 1976), Lee Friedlander (in *New Documents*, 1967), Garry Winogrand (*Public Relations*, 1977), and Diane Arbus (in *New Documents*, 1967, and her retrospective in 1972) as well as managing the influential survey of American photography since 1960, *Mirrors and Windows* (1978).

While Szarkowski concentrated on emerging and contemporary photographers who were quickly recognized as modern masters, the Department also occasionally looked back to earlier photographers. In 1971, an important Walker Evans retrospective was mounted that harked back not only to the first photograph acquired by the Museum in 1930, but to the first photography book that Szarkowski himself bought, as he recalled fondly in an interview in the art and literary magazine *Grand Street*. In 1975, Szarkowski organized MoMA's second major retrospective of Edward Weston, (the first had been in 1946) confirming him as a major influence on twentieth century photography.

Ironically, for a forward-looking director, one of the most important undertakings of the Department under Szarkowski was a historical project. In 1968, the Museum finally acquired the funds to buy a vast collection of work by Eugène Atget (1856–1927) from Julien Levy and Berenice Abbott. The cataloguing, preservation, and display of over 5,000 prints, duplicates, and negatives from the collection took over a decade, led to four exhibitions and to four volumes of *The Work of Atget*. As well as having documentary value about historical Paris and technical value in showing what equipment was available around the turn of the century, Atget's work is simply beautiful.

The selling of the Museum's air rights and subsequent redevelopment project in the early 1980s expanded the Museum's exhibition space. Szarkowski used his seniority and stature to obtain increased storage and display space for the Photography Department. Szarkowski hired Susan Kismaric as an assistant curator during this period, and she brought the new space into play with shows such as *British Photography from the Thatcher Years* (1990) and Barbara Kruger's 1988 *Picturing Greatness*.

Szarkowski's achievements at MoMA were manifold. They included rethinking exhibitions to

allow for heterogeneity and re-shaping the boundaries of the art of photography to include industrial, scientific, journalistic, or advertising prints, with more traditional "art" photography. In taking this broader view of photography he was steering away from the narrower artistic and aesthetic qualities of the Photo-Secession tradition or of Steichen's later years. Szarkowski's move towards a more Catholic understanding of photography was in no way intended to dilute the seriousness of the field, but rather to include previously overlooked genres and fields of photography in the gaze of the collector and the purview of the scholar.

The Department of Photography Under Peter Galassi, 1992–Present Day

In 1992, John Szarkowski stepped down after 30 years of service. In his place he appointed Peter Galassi, a curator in the Department since 1974 who had been responsible for the influential 1981 exhibition *Before Photography*. In this exhibition Galassi suggested that photography was not the product of an arbitrary confluence of cultural and technological developments but rather a legitimate inheritor of a particular, albeit minor, pictorial tradition that predated photography and was evident in certain late eighteenth century paintings. As director Galassi has continued to view photography as part of an interwoven, organic continuum of artistic production. As part of "MoMA2000"—the Museum's millennial review of itself and its subjects—he organized, along with the Director of the Museum and the other departmental directors, several interdisciplinary exhibitions and wrote about their content and conceptualization.

Galassi wasted no time in stamping his imprimatur on the Department. He used the occasion of the exhibition *American Photography 1890–1965* (1997) to write his own history of both U.S. photography and photography at MoMA. As well as providing an invaluable overview to both of these subjects it explains the tradition that Galassi saw himself following. In 2000, Galassi continued this engagement with tradition in *Walker Evans and Company*, an exhibition that was not simply a Walker Evans retrospective like Szarkowski's 1971 show, nor a nostalgic review of the photographer whose print was the first to be acquired by MoMA (although it was symbolically tied to both of those things) but also a way of showing how views on Evans' photography and its context had changed over the years.

Concentrating on the interconnectedness of art forms has not deterred Galassi from holding impor-

tant exhibitions devoted exclusively to photography. In his first year as Director of the Department he curated Philip-Lorca diCorcia's show *Strangers* (1993) an exhibition that defamiliarized the types of photography that Szarkowski had brought into the Museum, opening or re-opening them for enjoyment and analysis. In the catalogue that accompanied the exhibition Galassi quotes with approval diCorcia's observation that "photography is a foreign language that everyone thinks they speak." The last major show before the Museum again closed down—for its second set of major renovations and expansions in 20 years—was the first, and eagerly awaited, show of Andreas Gursky in the United States (*Andreas Gursky* (2001)). The show was a major critical and popular success and Galassi's fluent and scholarly catalogue was in the best of MoMA's educational traditions.

Influence of Photography on MoMA

Written into the mission statement of MoMA is the central principle of education. As well being a legal requirement for the Museum's foundation in the city of New York, Barr, Goodyear, and the founders had a burning desire to spread the message of modern art. Photography enabled the spread of this message: bringing the inaccessible to the public in three separate ways. First, the Museum used photography as a marketing device to attract visitors. Second, it allowed the Museum to arrange exhibitions where the original work could not be viewed. The Museum often displayed architecture—an inconceivable undertaking without the ability to photograph and collate pictures of buildings in one gallery. Likewise the site installations of the conceptual art movements would have been substantially different had photography not existed or had museums such as MoMA not taken photographs seriously as a mode of display. Third, photography allowed exhibitions to extend beyond the Museum. Starting in 1933, Elodie Courter was taking "Circulating Exhibitions" around the city and the country for those who could not get to MoMA itself. The success of these touring exhibitions depended on their use of photographs to illustrate the art that could be seen at the Museum. Both the architectural displays and the Circulating Exhibitions pre-dated the Department of Photography, but were, each in their own way, crucial to the development of MoMA as an aesthetically broad-based, artistic, and educational facility.

Over the course of the century the Museum became increasingly concerned with market for-

ces and the commodification of the building and collection. This explains the Board of Trustees abandonment of Barr's original plan to divest non-contemporary art—the artworks had simply become too valuable to discard—and decision to sell the building's air space in the face of widespread public condemnation. Photography played an important part in this self-conscious movement of the Museum towards treating its own art as a commodity. The building on 53rd Street set a new standard for museums in providing a street view that looked more like a shop than a museum and for providing, in its entry-level lobby space, a large shop from which it was possible to buy cheap prints of works from the permanent collection and some from the temporary exhibitions. More than any other museum MoMA gave its shop a position of prominence and sold photographs to its visitors by the million—in the form of catalogues, books, postcards, and posters.

As well as its building, its subject, and its collection, MoMA has managed to successfully package and sell the scholarship of its curators. MoMA has justly become famous for the quality of its publications. However, not only the Department of Photography, but the Departments of Film, Painting, Sculpture, and Architecture all relied on photography to make their books compelling, and in many cases, even possible.

Influence of MoMA on Photography

In addition to being so highly influenced by photography in the spheres of education and marketing as to be unthinkable without it, MoMA had a profound effect on photography in the aesthetic and commercial spheres. Although the acceptance of photography into exhibition space was part of a larger social movement towards the democratization of art, MoMA was the institution that wielded most influence to secure photography its own place in the museum. By treating photography as a recognizable and distinct genre, and one whose aesthetic had to be treated seriously, MoMA gave the discipline a sense of identity and *gravitas*.

Initially this sense only extended as far as the museums that took their lead from MoMA but, by the late 1970s and 1980s, this soon spread to commercial auction houses, raising the prices of photographic prints. This was partly due to the assumption that art, in general, was a good investment and partly due to increased demand from collectors whose appetite had been whetted by MoMA's ceaseless proselytizing. Photography would not have been

considered an acceptable form of art investment had MoMA not constantly presented it as the equal of painting and sculpture in exhibition after exhibition and, by forming a Department in 1940, given it institutional parity with them.

The nature of the unit of photographic art was also largely determined by MoMA. Walter Benjamin's famous essay "The Work of Art in the Age of Mechanical Reproduction," which demystified the "aura" of art, was published in 1936, the same year as Beaumont Newhall put together his exhibition on the history of photography. This latter could easily have been influenced by the same arguments that swayed Benjamin against fetishizing the object of art itself. Photographers work with a combination of cameras, film, and paper to make photographs. Depending on the exact process, rendering prints from a stored image is usually, at least theoretically, reproducible. As such it would make sense for the negative, or the copyright of the image to be the accepted unit of exchange for photographic art. However, the Museum's insistence on buying, collecting, and exhibiting photographic prints—in exactly the same way as paintings or sculptures were bought, collected, and exhibited—meant that the print had become the accepted commodity in photographic art by the end of the twentieth century.

Despite these numerous and far-reaching interventions in the history of photography, perhaps the most enduring impact that MoMA has had on photography has been on the scope of the art form. By forming a Department of Photography the Museum made it clear that it thought of photography as more than simply a technique (there is no Department of Pointillism, for example). Photography nowadays is used in marketing, education, science, industry, and history; its products are found on any imaginable surface constituting, *inter alia*, artworks, documents, and evidence; it is used for business, pleasure, sport, and religion. Over the twentieth century, and especially under the stewardship of John Szarkowski, MoMA has opened the possibility that any print produced by anyone, for any reason, might have enough aesthetic significance to merit its treatment as art.

MUSEUMS

The Two Families of Museums

There are well-known institutions that have, apart from paintings or other art forms, or those dedicated to history, culture, or science, some generous, unique collections of photographs, negatives, plates, or cameras; while other museums and galleries exclusively dedicate themselves to photography. What sets museums apart from the many other institutions that have extraordinary collections of photographs—public archives, national libraries, private foundations, newspapers and press agencies, various governmental agencies and departments—is that museums have a mission to collect, conserve, exhibit, and educate. Famous institutions such as the Centre national de la photographie in Paris or the Royal Photographic Society in London are not museums *per se*, but are nonetheless very dynamic because of their conferences, publications, and learning programs.

In the first category are respected institutions like the Metropolitan Museum, or the Museum of Modern Art in New York City (MoMA), the Musée d'Orsay in Paris, the Victoria and Albert in London, and the McCord Museum in Montréal, which are multidisciplinary, or “general museums,” some featuring incomparable collections dedicated to photography.

On the other side, the International Museum of Photography and Film at the George Eastman House, Rochester, New York, the Musée Nicéphore Niépce in Chalon-sur-Saône, France, the Alinari Museum in Florence, Italy, the Musée Suisse de l'appareil photographique (The Swiss Camera Museum), Vevey, Switzerland, could be ranked in the second category of specialty museums of photography.

Although there are notable exceptions, specialty museums often tend to focus on “artistic” photography and the avant-garde, while most art and science museums that exhibit photographs have a broader conception, sometimes with a more historical, ethnological, and technical approach.

The Role of the Museum in the Acceptance of Photography

During the nineteenth century, photographs were acquired by only a handful of institutions. In Eng-

land, as early as 1857, the South Kensington Museum, which became the Victoria and Albert, had collected the new medium. Thus in the early years of the twentieth century, the presence of photographs in art museum collections, along with the opening of galleries and specialized museums in photography, are seen as eloquent proofs that finally acknowledged the recognition of photography as an art form.

The collecting of photographs by museums closely followed the passion for the medium by some of its leading practitioners. Since 1905, Alfred Stieglitz had run the Little Galleries of the Photo Secession, on 291 Fifth Avenue, in New York City. In 1910, Stieglitz organized an exhibition of Pictorialist photographs at the Albright Art Gallery, which was well attended and widely written about, beginning that institution's early interest in the medium. Stieglitz played a major role in the acceptance of photographs by the Museum of Modern Art, the Art Institute of Chicago, and the Museum of Fine Arts (MFA) in Boston.

According to its website, the MFA “was one of the earliest museums in the country to collect photography.” This initiative began in 1924, when Stieglitz made a donation of some 27 of his photographs, now held in the MFA Department of Prints, Drawings, & Photographs, a typical departmental structure for many general art museums. Again reflecting how photography was truly valued, while donations were accepted, the MFA's first purchase of photographs (a group by Edward Weston) was not until the late 1960s.

Founded in 1929, the Museum of Modern Art (MoMA), freed from traditional notions about what constituted fine arts by the very definition of its founding, innovated by establishing a special department for photography under art historian Beaumont Newhall in 1940. When photographer Edward Steichen, well known in the fine-arts community for his sequence of leading French sculptor Auguste Rodin's *Balzac*, was appointed as director for the photography section in 1947, it was another confirmation that the profession was recognized as a dynamic part of contemporary art.

If most museums dedicated to photography concentrate on the visual result of the medium, others

depict the technical dimensions. Dedicated to one of photography's founders, the Musée Nicéphore Niépce opened in 1972 in the city where the scientist was born, Chalon-sur-Saône, in central France. Although Niépce's collections and cameras were reunited as soon as 1861, they were not accessible to the general public for almost a century. This collection now has over two million photographs, plus thousands of optical objects, and early apparatus as old as Niépce's prototypes from 1816. The Niépce Museum also organizes demonstrations of camera obscura. The technical advances in the field continue to form the core of public collections: Mixing art, science and optics, a unique museum dedicated to holography was created in Paris on 25 March 1980 as the Musée de l'Holographie.

Photography as Narrative

Many museums and similar institutions that are not related to the fine arts but to humanities (or historical, ethnographic, social issues), such as the Red-Cross Museum (Musée international de la Croix-Rouge) in Geneva use among other artifacts all kinds of photographs to represent their duties, mission, and history. Under the influence of new museology, recent museums tend to conceive the exhibition of any kind as a storytelling medium, rather than a place to see separated elements that only have beauty and rarity in common.

Since many people tend to believe that photographs tell the truth about reality, museums depicting photographs play a central role in the social representation of oneself and others, contributing to the nation-building and the construction of a national identity, past and present. As any media, museums must be seen as places of interpretative processes and vehicles of ideologies.

Catalogues and Art Books

The role of all museums in supporting photography and its practitioners has been greatly expanded by the widespread commitment of institutions to publishing, often with very little or no profit. Considered an essential part of scholarship, exhibition catalogues have burgeoned in the last several decades of the twentieth century, with many museums publishing both art books that reproduce via photography, paintings and other artworks from their permanent collections and temporary exhibitions. Some professional photographers such as Alfred Stieglitz or Patrick Altman (b. 1950) even specialize in the photographic reproductions of art works into books, postcards, and posters. Once relatively rare among the

publication of monographs, books focusing on photographers are routinely published by museums to accompany temporary exhibitions. Less common at the end of the century are publications documenting museums' photography collections. Keeping abreast of developments in the museum field, among others, UNESCO publishes a journal in four editions (English, French, Spanish, Russian), *Museum International*, about issues related to museology.

A Wave of New Museums

Perhaps coincidental to the celebrations of the 150th anniversary of the birth of photography in 1989, the 1980s were an incredible period of growth for museums exclusively dedicated to photography, with numerous openings of new facilities, most the first ever in their respective countries. While Ireland had its Gallery of Photography in Dublin since 1978, Iceland's Reykjavík Museum of Photography (Ljósmyndasafn Reykjavíkur) was created in 1981. In Bradford, West Yorkshire, England, a National Museum of Photography & Television opened in 1983 to tremendous attendance. In 1984, Denmark opened in Herning its Danish Museum of Photography (Danmarks Fotomuseum), followed in 1987 by the Museet for Fotokunst (Museum of Photographic Art) in Odense, and later in 1999, a National Museum of Photography (Det Nationale Fotomuseum) was launched in Copenhagen.

The Canadian Museum of Contemporary Photography (CMCP) was created in 1985 from the photographic division of the archives owned by the National Film Board of Canada and the National Gallery of Canada. Uncharacteristic of most museums, the CMCP began its activities by presenting rotating exhibitions in various locations, and opened its own building only in 1992, in Ottawa.

Although its name does not give a clue, the Musée de l'Elysée in Lausanne, Switzerland, is a museum solely dedicated to photography. It opened in 1985, the same year as the Fratelli Alinari Museum of the History of Photography was inaugurated in Florence, Italy. In Charleroi, Belgium, the Musée de la Photographie was created in 1987. In 1990, the Tokyo Metropolitan Museum of Photography was Japan's first comprehensive art museum especially devoted to photography and optical imagery, soon followed by the Nara City Museum of Photography in 1992.

A first Hungarian Museum of Photography was opened in Kecskemét in 1991. The following year, in the United States, the Griffin Museum of Photography was created in Winchester, Massachusetts. The Latvian Museum of Photography was established in

MUSEUMS

1993 in Riga (Latvia, a former part of USSR). In 1994, the Norway government purchased the private Preus Fotomuseum (Preus Museum of Photography), which had opened in 1976; since 2001, it is known as the Norsk Museum for Fotografi-Preus fotomuseum, in the city of Horten. Launched in 1998, the Thessaloniki Museum of Photography was the first and only photography museum in Greece. In February 2000, the Finnish Museum of Photography opened at the Cable Factory in Helsinki. In about two decades, the number of museums related to photography in the world has more than quadrupled.

New Technologies and Their Impact on Museums

Along with their traditional missions of collecting, conserving, and exhibiting, museums at the end of the century moved toward the massive task of digitizing their collections. Although rife with problems, including obtainment of copyright and the expense of equipment and staffing, this area will inevitably become more and more central to most museums' missions. New technologies have also allowed for so-called virtual museums to offer countless photographs through the World Wide Web. The American Museum of Photography is a virtual museum that can only be visited on the Internet, at (<http://www.photography-museum.com/>). However, museums as we have always known them remain vital institutions for conserving, protecting, and selecting photographs, and educating the public in various ways.

MUSEUMS: CANADA

In terms of Western civilization, Canada is a very young country, with the birth of the Confederation as recent as 1867. Photography as a young medium parallels Canada's youth as a country and the enthusiasm with which the medium has been ac-

cepted and collected is evident from the holdings in various Canadian museums.

National identity in Canada is very much dependent on its cultural institutions and their ability to provide a cohesive force across great variances in

demographics, climate, topography, and economics. Since Confederation, cultural institutions such as the Canadian Broadcasting Corporation and the National Film Board have held the country together and created a cohesive force across the vast land mass. From these public institutions with audiences of “middle Canadians” has evolved an interest in the medium of photography that is now embedded in collections in museums across Canada. Photography as a democratic art form and leveler of variances suits Canada’s national personality in its accessibility, documentary nature, transportability, and ease of communication as a medium.

Many of Canada’s finest museums across the country boast excellent photographic collections that in many cases rival those of major world institutions. Only a selection of the better known of these museums are highlighted, with other photographic treasures to be found in this vast country.

Art Gallery of Greater Victoria

The fine art collection of the Art Gallery of Greater Victoria began in the early 1940s, and became open to the public in 1947. The Gallery, now with over 17,000 works of art, is one of Canada’s finest museums. The focus of the Art Gallery is to engage the public in nuances of the art world, while striving to be the leader in visual arts in British Columbia and Canada. Housed in an historic nineteenth century mansion, the collection includes Asian, historic Canadian and European and contemporary art with an emphasis on Canadian and Japanese art. The contemporary art consists of mainly works from artists in western Canada, and includes photography.

Although only about five years in the making, the photography collection now holds almost 200 works. The works are by Canadian photographers, and include many pieces by the photographer Claude Benoit. The Gallery has recently begun to exhibit new media. One notable exhibition in July of 2004 was *Farheen Haq, Breathing Space*, a photography and video installation.

www.aggv.bc.ca

Art Gallery of Hamilton

With its first acquisition of 29 paintings by William Blair Bruce in 1914, the Art Gallery of Hamilton (AGH) has been continually expanding, and is now Ontario’s third largest public art gallery. The strength of the AGH lies in its 8,500-plus works permanent collection, emphasizing nineteenth century

European, historical Canadian, and contemporary Canadian art. Particular attention has been placed on women artists, as well as twentieth century Canadian artists. All works in the AGH collection can be recognized as significant achievements in bringing an understanding of visual arts for the people of Hamilton, and abroad.

Within the permanent collection are over 320 photographs by many significant Canadian and international artists. As the entire collection grows, the photography collection is expected to grow as well. Many of the artists are contemporary, including Suzy Lake, Evergon, Geneviève Cadieux, Angela Grauerholz, and Robin Collyer. An important photographic exhibition hosted by the AGH currently on tour of the region is *The Eye of Edward Steichen*, featuring Steichen’s work from the 1920s and 1930s. Currently, the AGH is under construction, but will reopen in the Spring of 2005 with two major exhibitions; *Lasting Impressions: Celebrated Works from the Art Gallery of Hamilton*, and *Heaven and Earth Unveiled: European Treasures from the Tanenbaum Collection*.

www.artgalleryofhamilton.on.ca

Art Gallery of Newfoundland and Labrador

The permanent collection of the Art Gallery of Newfoundland and Labrador (AGNL) is a culmination of the Memorial University of Newfoundland collection, begun in 1961, the J.K. Pratt Memorial collection, begun in 1986, and the AGNL collection begun in 1994. The entire permanent collection now held at the AGNL comprises over 5,500 works of art. The AGNL holds examples of painting, printmaking, drawing, sculpture, indigenous crafts, experimental media, and photography. The first priority of the AGNL is to collect works of art by contemporary and historical artists in the Newfoundland and Labrador area. The collection also includes works about the area, as well as many works by other contemporary Canadian artists. The AGNL has accepted a mandate to provide for the public visual works of art that hold the ideas and aesthetics of the artist in their communities.

Modest in comparison to the entire collection, the AGNL holds a collection of contemporary photography. Of the approximately 100 works, Canadian artists represented include Marlene Creates and Steven Livick. The AGNL generally presents about 20 exhibitions per year. Two significant exhibits including photography were *Manfred Buchheit, A Retrospective*, in 1996 and *Light Proof* in 2000.

Art Gallery of Nova Scotia

In 1908, the Nova Scotia Museum of Fine Arts was founded, and in 1910, the permanent collection was begun. The museum then became the Art Gallery of Nova Scotia (AGNS) in 1975, and today boasts a collection of over 10,000 works of art. The beautiful Victorian architecture of the Dominion Building is the AGNS's home for historic and contemporary Nova Scotian, Canadian, international, and folk art. The permanent collection includes paintings, drawings, sculptures, photography, video, and decorative arts dating back to the eighteenth century. The AGNS also houses many major loans from the Nova Scotia College of Art and Design, as well as other institutions from the province of Nova Scotia. The focus of the Gallery is to bring visual arts and the public together, as well as the exploration and enjoyment of the works.

The AGNS has over 600 photographs in its permanent collection. With both historical and contemporary works, the photography collection is a fine example of mainly Canadian artists. Historical works include the photography of George Nass, Sid Kerner, and Ronald Caplan. Contemporary works include those from Canadian artists Susan McEachern, Steven Livick, and Thaddeus Holownia. International works are also collected, such as those by Gary Wilson and Franco Fontana. In 2003, an important retrospective of the Canadian photographer Tim Zuck was exhibited, titled *Tim Zuck: Learning to talk*.

www.agns.gov.ns.ca

Art Gallery of Ontario

The permanent collection of the Art Gallery of Ontario (AGO), originally the Art Gallery of Toronto, was begun in 1900. Over a hundred years later, the collection now holds over 36,000 works, representing a thousand years of art making. The collection includes European Old Masters, Group of Seven, and Canadian and international contemporary works. In the spring of 2005, AGO will be unveiling its "Transformation." With the help of many donations, the Transformation will include new art, a new building, and new ideas.

The photography collection within the contemporary collection of AGO is a mixture of Canadian and international artists, including Jeff Wall, Steven Livick, Edward Steichen, Cindy Sherman, and Martha Rosler to name a few. The AGO also

has a significant collection of the photographer Captain Linneaus Tripe. One of the strengths of the photography holdings is the unique collection of portraits. Some of these portraits were exhibited recently in the show *In Situ*, showcasing the photographs of other artists in their studios. Edward Steichen's photograph of Brancusi in 1927 is a great example of art of the subject of making art.

www.ago.net

Canadian Centre for Architecture

In 1979, the Canadian Centre for Architecture (CCA) was founded with the purpose of building public awareness of the role of architecture in society. With the help of Phyllis Lambert, the founding director of the institution, the CCA began collecting works dating from the seventeenth century to the present documenting the architecture of the world. The collection consists of drawings, paintings, sculpture, and photography.

The photography collection within the CCA showcases the history of photography relating to architecture. With over 55,000 photographic items dating back to the beginning of the medium, the collection studies the role of photography in representing the created environments of the time. The collection holds over 72 daguerreotypes, some dating back to 1840 and being among the most important extant daguerreotypes today. In addition, the collection holds many works from nineteenth century photographers from the United Kingdom, such as William Henry Fox Talbot; from France, such as Edouard Baldus, including major albums done for the railways; Georg Bridges from Greece; Robert Macpherson of Italy with some of the finest work in existence today; and Charles Clifford from Spain, to name just a few. Photographs from the early twentieth century include works on civil engineering projects and construction sites. The collection also has many works by twentieth century photographers involved in the interpretation of modern architecture, such as Alfred Stieglitz, Charles Sheeler, Paul Strand, and Walker Evans, all represented by a number of iconic images.

The CCA often holds exhibitions dedicated to their photography collection. A recent important exhibition in 2004 was *West 27th Street, Manhattan*, showcasing photographs by John Veltri of the city of New York in 1966, before its redevelopment.

www.cca.qc.ca

Canadian Museum of Contemporary Photography/Musée canadien de la photographie contemporaine

The Canadian Museum of Contemporary Photography/Musée canadien de la photographie contemporaine (CMCP/MCPC) was founded in affiliation with the National Gallery of Canada in 1985. The history of its collection, however, dates back to the 1960s, as the Still Photography division of the National Film Board of Canada. A good portion of the works dating from 1962 to 1985 is from the collection of the National Film Board. Opening its doors to the public in 1992, the CMCP/MCPC currently holds over 160,000 photographic works, spanning over 40 years. The collection comprises works by Canadian-born or Canadian-resident artists. As one of only a few national museums devoted specifically to photography, the CMCP/MCPC has successfully held up its mandate of collecting the best of documentary and fine art photography produced by Canadian contemporary artists. The incredibly large body of work that it holds represents an internal view of Canada's recent history, society, and culture. In addition to photographs, the collection includes negatives, books, filmstrips, assemblages, installations, and video art.

Contemporary Canadian artists represented include Jeff Wall, Kelly Wood, Lynne Cohen, Michael Snow, Damian Moppett, and Jocelyne Allouche, among others. The CMCP holds many exhibitions each year. A significant past exhibition was in 2003, titled *Confluence: Contemporary Canadian Photography*, showcasing the best of Canadian photography from the last decade. Additionally, a significant recent exhibition in September 2004, titled *Phil Bergerson: Shards of America*, showcased the Toronto-based photographer's work about literal and figurative signs that people leave behind. In 2002, CMCP/MCPC was the only North American venue for a major retrospective of the Robert Frank exhibition, *Moving Out*.

www.cmcp.gallery.ca

Edmonton Art Gallery

In 1924, the Edmonton Museum of the Arts held its first exhibition with only 24 paintings borrowed from the National Gallery of Canada. By 1929, it had its first permanent location and the beginning of its permanent collection. After several facility changes, and an ever-growing collection, in 1974, the collection moved to its present location, and is now known as the Edmonton Art Gallery. With

over 5,000 works in the permanent collection, the Gallery includes Canadian and international art, both historical and contemporary. Media collected includes paintings, sculptures, installations, and photography. The primary mandate of the gallery is to preserve the artistic heritage of Canada. This includes a program called "*Adopt a Painting*", through which the public can help to restore some of the artwork that is deteriorating.

The photography collection within the Gallery holds over 1,200 works, and continues to grow. The photographs held are a mixture of historical and contemporary, Canadian and international, as well as traditional and experimental. The Canadian artists include Vicky Alexander, Raphael Goldchain, and Lauren Greenberg. Major international artists include Ansel Adams and Walker Evans. An important exhibition in recent years was *Technicolor*, in 2003, including the works of Canadian photographers Chris Cran, Clay Ellis, Geoffrey Hunter, Angela Leach, Chris Rogers, and Arlene Stamp, and included photographs relating to the visual language of today's newest technologies.

www.edmontonartgallery.com

Glenbow Museum

As Western Canada's largest museum, the Glenbow Museum consists of an art collection, a library, and an archives section. The museum boasts a collection of over a million objects. As a multidisciplinary institution, the collection includes cultural history, ethnology, mineralogy, and military history. The focus of the museum is therefore multifaceted. The art collection within the Museum contains over 28,000 works, including contemporary, historic, Western Canadian, and Inuit art. The main focus of the art collection is to represent Canadian artists, with a large portion of Western Canadians. Within the contemporary art collection is the photography collection with works by such Canadian photographers as Alan Dunning, Craig Richards, Iain Baxter, Douglas Curran, and George Webber to name a few.

Within the Glenbow archives, there are approximately 79,000 photographs for research purposes. Although most of these works are by non-artists, the collection is a significantly large one including many documentary works. The exhibitions held by the museum are usually multimedia, and many include photography. One particular show coming in 2005 is *Our River: Journey of the Bow*, featuring works about Alberta's famous Bow River.

www.glenbow.org

Library and Archives Canada/Bibliothèque et Archives Canada

In 1872, as a branch of the Department of Agriculture, the archives began collecting documents of national significance. Today, the archives hold millions of films, documentaries, architectural drawings, works of art, music, and the most substantial holding of Canadian photography in the country. Collected since the 1870s, with images dating back to the 1850s, the photography department now holds over 21.3 million photographic images. Similar to museums, the archives is an institution providing knowledge to the public through their collections and services. The majority of photographs were acquired from Canadian studios, newspapers, and government agencies. All of the works deal with Canadian life, Inuit peoples, government, and history.

<http://collectionscanada.ca>

MacKenzie Art Gallery

One of the earliest art collectors in western Canada, Norman MacKenzie, directed in his will that the majority of his collection be given to the University of Saskatchewan in the hopes that an art gallery would be built to house it. In September of 1953, the Norman MacKenzie Art Gallery officially opened. With a range of historical to contemporary art, including works by over 5,000 different artists worldwide, the collection represents art from Western Canada, as well as national and international, and an emphasis on Saskatchewan art. Within the collection are examples of fiber arts, painting, sculpture, drawing, collage, and most recently, photography.

The photography collection, although small in comparison to the rest of the collection, is a fantastic representation of Canadian artists. Some of the artists include Shelagh Alexander, Lynne Cohen, Evergon, and Frances Robson. Of the 175 and increasing number of photographs in the collection, the emphasis is on mid-career and established contemporary Canadian photographers. The MacKenzie Art Gallery has held many significant exhibitions, the most recent ones including photography. In October of 2004, the gallery held an exhibition titled *The Body*. This exhibition showcased works from the permanent collection, including photography, painting, and drawing depicting the human figure, from Renaissance nudes to modern abstractions.

www.mackenzieartgallery.sk.ca

McCord Museum of Canadian History

Founded in 1921 by David Ross McCord, the McCord Museum holds more than 1.2 million objects. As a public research and teaching museum, it is dedicated to the preservation and reflection of the social history of Canada. With exhibitions, cultural activities, tours, and publications the museum seeks to present an interactive experience for the public.

In 1956, the museum acquired the archives of Montreal photographer William Notman, a veritable visual history of Canada. The 450,000-plus photographic collection encompasses the famous Notman & Sons studio photographs spanning over 78 years. The photographs cover the period of time from 1840–1935, and include landscapes, portraits, events, and other historical photographs. The photography collection also includes about 600,000 images by other photographers, including Alexander Henderson and John Taylor. This archive inspired the exhibition *After Notman: Photographic Views of Montreal, A Century Apart*, which paired photographs taken by the Notman studio of views of Montreal a hundred years ago with the photographic views of Montreal today by the photographer Andrzej Maciejewski.

www.mccord-museum.qc.ca

Montreal Museum of Fine Arts/Musée des beaux-arts de Montréal

Bishop Francis Fulford founded the Art Association of Montreal in 1860 to establish an art library that was lacking in Montreal at the time. In 1879, the Art Association became the Musée des beaux-arts de Montréal/Montreal Museum of Fine Art, and was the first institution in Canada specifically designed for an art collection. Today, after almost a century-and-a-half of collecting, the museum holds a collection of over 30,000 works including sculpture, paintings, drawings, works on paper, and photographs dating from antiquity to contemporary. The main focus of the museum is the promotion of works by Canadian and international artists to provide the public with a breadth of artistic heritage. The museum's permanent collection is divided in sections, Ancient Cultures, European Art, Canadian Art, Inuit and Native American Art, and Contemporary Art.

Within the contemporary collection is a significant collection of photography. With over 600 works, the collection holds examples of Canadian and international photographers. Important Cana-

dian artists represented include Louise Abbott, Raymonde April, and Michel Campeau. In addition to Canadian photographers, the collection includes works by Brassai, Dorothea Lange, Eadweard Muybridge, and Germaine Krull. The museum has held many exhibitions dedicated to the medium of photography, including *Herbert List, Romantic Wanderer*.

www.mbam.qc.ca

National Gallery of Canada/Musée des beaux-arts de Canada

Beginning in 1880, the National Gallery of Canada (NGC) has collected over 50,000 works including Canadian, European, American, Contemporary, Modern, Inuit, and photographic art. The main focus of the NGC is to develop, maintain, and make known throughout Canada a collection of international art, both historic and contemporary, with a special reference to Canadian art.

The photography collection, although the youngest of NGC's collections, is the largest with over 20,000 photographs. Established in 1967 by James Borcoman, it comprises one of the top major international photographic collections covering the entire history of the medium, from 1839 to the present. Many different types of photographs are represented in the collection, such as daguerreotypes, ambrotypes, gelatin silver, and platinum prints, and many examples of color as well as new modern photographic techniques. Rather than just single important images, the collection represents several in-depth bodies of work to give the viewer a greater understanding of the artist's work. Many famous and socially significant artists are represented in the collection, including Julia Margaret Cameron, Eugène Atget, Walker Evans, August Sander, Diane Arbus, and Edward Weston, to name a few. In addition to the historic artists, the collection also represents many contemporary photographers, such as Roger Merten, David Heath, Lynne Cohen, and Gary Schneider. Many important exhibitions are organized from the NGC's photographic permanent collection, including the 2004 exhibition *Faces, Places, Traces*, showcasing 97 photographs, newly acquired by the NGC. The most notable images of the newest acquisition were several vintage prints by Paul Strand.

www.national.gallery.ca

Vancouver Art Gallery

Founded in 1931, at the end of the twentieth century the Vancouver Art Gallery's permanent collec-

tion boasted over 8,000 works of art including paintings, sculpture, mixed media, and photography. With an emphasis on British Columbia artists, the Vancouver Art Gallery also holds the largest public group of paintings by the renowned modernist Emily Carr and represents a comprehensive resource for visual arts in the region.

Since the 1980s, the gallery has been building a strong collection of photo-based art, which now includes almost 800 works. Vancouver is renowned for its contemporary photography, specifically the "Vancouver School," a group of photographers working in photoconceptualism. The Vancouver Art Gallery's permanent collection includes many of these "Vancouver School" works, such as those by Stan Douglas, Rodney Graham, Jeff Wall, and Ken Lum, among others. The Vancouver Art Gallery is also home to the archive of renowned Pictorialist John Vanderpant. In addition to Vancouver-based artists, the permanent collection holds the works of such important photographers as Andreas Gursky, Cindy Sherman, Thomas Struth, and many others. The main focus of the photography collection is to build a dialogue on photography and the conceptual and material possibilities that surround the medium. In 2003, the Vancouver Art Gallery held an exhibition titled *The Big Picture: Recent Acquisitions from the Collection of Alison & Alan Schwartz* showcasing the gallery's \$3.5 million acquisition of photographic works from 20 different artists, including Matthew Barney, Thomas Ruff, and many other European, British, and North American artists.

www.vanartgallery.bc.ca

Winnipeg Art Gallery

Since its founding in 1912, the Winnipeg Art Gallery (WAG) has held up its mandate to develop and maintain the visual arts in Manitoba and Canada, and to involve the public in the arts. Since its inception, the WAG has collected over 22,500 works, ranging from the fifth century to the present. The collection encompasses historical, decorative, Inuit, contemporary, and photographic arts, with an emphasis on Canadian artists, specifically those from Manitoba.

The photography collection within the WAG concentrates on the twentieth century, with a strong emphasis on Canadian photographers. Consisting of over 1,100 photographs, the genres represented range from social and documentary, landscape and portraiture, as well as contemporary photo-based works.

MUSEUMS: CANADA

Many successful Canadian photographers are represented in the collection, such as Sam Tata, David McMillan, Barbara Astman, and Sorel Cohen. The collection also includes works by important international photographers, including Diane Arbus, Brassai, Henri Cartier-Bresson, and Lotte Jacobi. In 1985, the collection was given an important gift of 200 photographs, representing a 70-year span of André Kertész's work.

Exhibitions are frequently mounted from the photography collection such as that of American artist, Mark Ruwedel, *Written on the Land*, showcasing his photography of humankind's impact on the land.

MUSEUMS: EUROPE

European museums are the repositories for many of the premier collections of photography in the world, and are especially rich in nineteenth-century material. Many general museums with comprehensive collections have some photography holdings, but the major collections require special mention. As well, there are a number of museums devoted solely to the medium.

Austria

Albertina Fotosammlung, Vienna

Founded in 1999, the photography department of the Albertina is a collection of Austrian and international historical and contemporary photography. Holdings include the archives of the Höhere Graphischen Bundes-Lehr-und Versuchsanstalt (Vienna Training and Research Institute of Graphic Art directed by Josef Maria Eder) of Austrian and international photographs, photoliterature, and cameras from the beginnings of

photography, including holdings of the Technische Universität and collections of the Photographische Gesellschaft Wien (founded 1861) of predominantly nineteenth century materials, with a large number of Austrian and French Calotypes, and results of different kinds of physical and optical experiments ; the Langewiesche Archiv (on loan from the Austrian Ludwig Foundation, Vienna) of the famous publisher of *Die Blauen Bücher* and *Der Eiserne Hammer* consisting of approximately 10,000 images printed between 1907 and 1960 with works of Gutschow, Albert Renger-Patzsch, Rudolf Koppitz, Lucia Moholy, and others, and Convoluts of the former Kaiserliche Bibliothek with early examples of photography in Austria, predominantly donations from the Kaiser Franz Josef. In 2003, the Albertina began a series of exhibitions concentrating on photography in Austria in galleries of approximately 800 square meters.

www.albertina.at

Rupertinum, Museum Moderner Kunst, Österreichische Fotogalerie (Austrian Photo-Gallery), Salzburg

Founded in 1983, the Photo-Gallery is the only museum in Austria dedicated to collecting contemporary Austrian photography and features approximately 15,000 prints. Although the collection includes works from the early part of the century, including Pictorialism and works by photographers Inge Morath, Ernst Haas, and Franz Hubmann, the majority of the collecting is since the end of the Second World War, including Austrian Aktionismus (Otto Mühl, Hermann Nitsch, Rudolf Schwarzkogler, Günter Brus), and workgroups of Arnulf Rainer and the generation that emerged in the 1980s, including Valie Export to contemporary digital photography. Three to four temporary exhibitions are mounted per year. An extended photo-library is part of the museum's library. A biannual competition has been mounted since 1983, and a purchase prize, the Rupertinum Fotopreis is offered.

www.fotonet.at/rupertinum

www.rupertinum.at

Belgium

Museum voor Fotografie, Antwerpen

In 1984, the Province of Antwerp purchased the Huis Vlaanderen (Flanders Warehouse) for the purpose of turning it into the Museum of Photography that opened 1986. The major collections were formed from an exhibition at the Sterdoxhof Museum tracing the art and science of photography that was mounted in 1965. Thus in dealing with the history of photography, equal emphasis is placed on the images and equipment in the museum's permanent exhibition. The museum features five galleries with approximately 1,200 square meters. An average of 18 temporary exhibitions each year accompany the permanent installation. The museum also features a library of approximately 20,000 volumes focusing on Belgian and international photography as well as photo magazines.

www.provant.be

Musée de la Photographie de la Communauté française à Charleroi—Centre d'art contemporain, Charleroi

In the heart of French-speaking Belgium, at Charleroi, a converted neo-gothic Carmelite nunnery houses the Musée de la Photographie. Although the museum opened in 1987, the photo-collection was founded in 1978 and contains over 80,000 images, more than 1 million negatives (most of them black and white), and 2,500 cameras. Collec-

tions focus on documentary and social photographs (Archives de Wallonie); and Belgian photographers, with significant holdings of Léonard Misonne, Gustave Marissiaux, Willy Kessels, Charles Leirens, Julia Pirotte, Serge Vandercam, etc. 2,000 square meters are devoted to the history of photography and exhibitions by contemporary artists with 10 to 12 exhibitions are mounted each year. The museum also features a discovery area; a library with more than 6,000 books and around 100 magazines; a documentation center; a bookshop; and publishes its own magazine, *Photographie Ouverte* (founded in 1978 with four issues per year).

www.musee.photo.infonie.be

Croatia

Muzej suvremene umjetnosti (Museum of Contemporary Art), Collection of Photography, Film and Video, Zagreb

Founded in 1954, the Zagreb Museum of Contemporary Art integrates several galleries, collections, and a library. The beginnings of the center date back to 1973 when a department for new media was established. The largest part of the museum's collection consists of post-1950 works by both Croatian and foreign artists. The 1950s and 1960s are represented by photojournalist Mladen Grcevic for Magnum Photos, a large collection of reportage and art photos by Milan Pavic and Ante and Zvonimir Brkan, and structuralist films by Tomislav Gotovac from the mid-1960s. Important modernist Croatian photographs of the 1920s and 1930s are also featured, including works by Ivana (Koka) Tomljenovic Meller, who studied at the Bauhaus Dessau.

www.mdc.hr/msu

Czech Republic

Uměleckoprůmyslové museum (Museum of Decorative Arts, Department of Graphic Arts and Photography), Prague

The museum was founded in 1900, the photo-collection in 1902. The extended photo-collection holds highlights of twentieth century Czech photography, especially of the modernists of the 1910s to the 1930s: ca. 60,000 prints and 30,000 negatives. Main holdings are of leading international Czech figures Josef Sudek (ca. 21,000 prints, 27,000 negatives), Frantisek Drtikol (ca. 5,000 prints, 300 negatives) as well as Josef Koudelka, Jan Svoboda, and photographers of Magnum agency. One gallery of 240 square meters is devoted to one to two exhibitions per year in the main building of the

MUSEUMS: EUROPE

museum; an average of three exhibitions are held in the Josef Sudek Gallery, and the museum organizes and sponsors other projects in the Czech Republic and abroad. The Library of the Museum of Decorative Arts is the largest Czech public library specializing in art and related fields, including photography books and magazines.

www.knihovna.upm.cz

Moravská galerie v Brně (Moravian Gallery in Brno), Brno

The photography department of this extensive general museum, one of the most important in the Czech Republic, was founded in 1962. Highlights are photographs of the 1920s and 1930s with numerous examples of Czech modernists including Josef Sudek, Jaromír Funke, František Drtikol, Karel Kašpařík, and others. The Cloister at the former Governor's Palace (one of the museum's three buildings) is devoted to photography; every year about seven exhibitions, most of them monographic exhibition, of both Czech and foreign photographers are featured.

www.moravska-galerie.cz

Denmark

Danmarks Fotomuseum, Herning

This museum devoted entirely to photography was established by former photo dealer Sigfred Løvstad with his comprehensive collection of photographic equipment, especially historic cameras. The museum was established in 1983 with the collections enlarged in 1984 when the National Museum in Copenhagen deposited most of their historical photo collection. Permanent exhibitions cover photography from its beginnings to the present day with an emphasis on the history of the camera. Other special features of the collection include photographs by Hans Christian Andersen and a display of holograms and their associated technology. The museum consists of eight galleries of 535 square meters, and features approximately eight temporary exhibitions per year of both Danish and foreign photographers.

www.fotomuseum.dk

Museet for Fotokunst, Brandts Klaedefabrik, Odense

Founded in 1987, the museum features approximately 7,500 items, including significant holdings of Danish photographers Keld Helmer-Petersen, Viggo Rivad, Gregers Nielsen, Per Bak Jensen, Jytte Rex, Igor Savchenko (Belarus), Herman Försterling (Germany), William Eggleston (USA), and Pentti Sam-

mallahtu (Finland). The major goals of the museum include the preservation of Danish photo history and promotion of the art of photography to the Danish public. Approximately 12 temporary exhibitions are mounted each year, four that feature experimental work by younger artists in a series called "The Platform" and one that features works from the collection. The museum houses a library with almost 4,000 items on photography, and publishes a bilingual journal: *KATALOG*. The museum also hosts the Odense Foto Triennale festival.

www.brandts.dk/foto

Finland

Suomen valokuvataiteen museo, Finlands fotografiska museum, Helsinki

Founded in 1969 in a former cable factory, the Finnish Museum of Photography specializes in historical and contemporary Finnish photography. As such the museum sponsored the national project "Memory of the Photograph" to rescue Finnish photographs with the aim of helping photographic archivist in Finland to catalogue and manage their collections. Research and data networks are key features of the museum which features 900 square meters of exhibition space including galleries for permanent and temporary exhibitions, including a gallery devoted to exhibitions by emerging photographers. The Museum houses a modern conservation laboratory, a central photographic archive, and a library.

www.fmp.fi

France

Bibliothèque nationale de France, Estampes et photographie (Prints and Photography Department), Paris

The premier collection of photographic material in France, the photo collection of this ancient institution, represents more than 4 million photographs covering the entire history of photography. Areas of particular significance for twentieth century photography are works by Eugène Atget, and over 100,000 works of contemporary photographers. The Bibliothèque nationale maintains one of the largest photo-libraries in France and awards two major photography prizes, Prix Nadar and Prix Niépce, for young photographers living in France. Works from the collection are exhibited on a regular basis in the Galerie Colbert as an experimental exhibition venue for contemporary photography. Complete online services are available for research and viewing of photographs, including virtual exhibitions.

www.bnf.fr

Centre Méditerranéen de la Photographie, Bastia Cedex

This Center was founded in 1990 as a foundation falling under the cultural plan for Corsica established early in the twentieth century. The Center highlights not only Corsican photographers and international photographers working in Corsica but also photography of the Mediterranean area. The collection holds more than 500 works by approximately 80 photographers plus the archive of the Corsican photographer Ange Tomasi, featuring works from 1900 to 1950. Exhibition space consists of three galleries of 350 square meters wherein approximately 10 exhibitions are presented each year. CMP also collaborates to mount exhibitions at other cultural institutions in Corsica. The Center is also responsible for two photo biennials, the Biennale Photographique de Bastia and the Biennale Photographique Bonifacio, and it publishes *Le bulletin de Centre Méditerranéen de la Photographie*.

www.cmp-corsica.com

Maison Européenne de la Photographie, Paris

The museum opened in 1996 in the heart of Paris in the historic Hôtel Hénault de Cantobre with its rapidly-growing collection concentrating on international contemporary photography from the 1950s to the present day. The museum's Library Roméo Martinez is built around the collection of the famous editor of *Camera* magazine, and holds more than 12,000 books covering the history of photography from the end of the World War II to the present, including a number of first editions as well as magazines and essential research materials on the history of photography. The Video Library features more than 700 tapes showing the work of contemporary photographers. The museum also features an auditorium and the Atelier de Restauration et de Conservation des Photographies de la Ville de Paris (ARCP), founded in 1983 to help preserve the various photographic collections and archives of the City of Paris.

www.mep-fr.org

Centre National d'Art Moderne, Centre Georges Pompidou, Paris

In 1975, the Musée national was transferred under the authority of Centre Georges Pompidou, the photography collections included. Today the Centre National d'Art et de Culture houses more than 13,000 prints (and many more negatives) of the twentieth century with extraordinary examples of famous photographers, especially early twentieth

century Man Ray, Dora Maar, Brassai, Florence Henri, Germaine Krull, Lucien Lorelle, Roger Parry, Maurice Tabard, Hans Bellmer, André Kertész, László Moholy-Nagy, and others, plus thousands of photographs that document other artists and their work including Constantin Brancusi, Hans Arp, Pablo Picasso, and others. The museum features a large photo-library.

<http://www.cnac-gp.fr>

Musée Français de la Photographie, Bièvres

The museum was founded in 1960 by the collectors Jean and André Fage and opened in 1964. In 1974, the museum was reinstalled at its current site in Bièvres, which was renovated in 1998. The collection holds numerous historical cameras, and other diverse photographic and technical equipment shown in a permanent exhibition about the history of photography from its invention to the present day. The museum's photo collection is mainly focused on the nineteenth century, but twentieth century photography and contemporary works are also represented in the archive and shown in three to four temporary exhibitions each year.

www.photographie.essonne.fr

Musée Réattu, Arles

The museum was founded in 1868 with the photo-collection begun in 1962 through the efforts of Lucien Clergue and Jean-Maurice Rouquette. The MR now holds more than 4,000 works of the highest quality, many of them coming as donations from the photographers themselves. Highlights include works by masters of the 1920s and 1930s such as Edward Weston, Germaine Krull, François Kollar, Dora Maar, and Man Ray. The festival Rencontres Internationales de la Photographie in Arles encouraged other photographers and collectors to donate, expanding the collection to include works by Ansel Adams, Robert Doisneau, Lucien Clergue, Izis, William Klein, Jerry Uelsmann, Arthur Tress, Yousuf Karsh, Cucchi White, Eva Rubinstein, and Keiji Tahara. From 1985 on the collection of "photographie changerienne" and photography as part of conceptual art was extended. Photo-objects of Pascal Kern, Jochen Gerz, Mimmo Jodice, Alain Fleischer, Jacqueline Salmon, and others came into the collection. The acquisition strategy now shows more about the dialogue between photography and other arts. The collection also features photographs of the city of Arles. The museum keeps a changing permanent photo exhibition and mounts two to four temporary exhibitions each year.

Germany

Berlinische Galerie, Landesmuseum für moderne Kunst, Photographie und Architektur, Berlin

Founded in 1975 to collect and exhibit works by Berlin-born or based artists, beginning with the Berlin Secession. It features a comprehensive collection, including photography. Of particular relevance are the archives and estates of Heinrich Zille, Erich Salomon, Marta Astfalck-Vietz, and Herbert Tobias; a collection of photography of the former German Democratic Republic (East Germany); and a collection of contemporary photographers including Dieter Appelt, Thomas Florschuetz, Elfi Fröhlich, and Michael Schmid.

www.berlinischegalerie.de

Kunstabibliothek, Staatliche Museen Preussischer Kulturbesitz, Berlin

Founded in 1867, as one of the first libraries specializing in art, the Kunstabibliothek has grown and expanded over the years to include, besides library collections, approximately 100,000 examples of architectural, fashion, commercial, industrial and fine-arts photography, including a large collection of German and international photography of the nineteenth and twentieth centuries. Particular artists include Ernst Juhl, Fritz Matthies-Masuren, László Moholy-Nagy, Max Burchartz, Albert Renger-Patzsch, Helmar Lerski, Thomas Florschuetz, and Dieter Appelt. The museum also features the archives of Fritz Matthies Masuren (acquired 1915) and Ernst Juhl (acquired 1916). In 1994, the Library relocated to its own building that features an exhibition space of 285 square meters that mounts one or two exhibitions per year.

www.smb.spk-berlin.de

Fotografische Sammlung im Museum Folkwang, Essen

The Department of Photography was founded in 1979 within this comprehensive museum. The collection consists of international photography of over 50,000 works of the twentieth century with an emphasis on portraiture, architectural photography, photojournalism, and postwar developments including works of the group *fotoform* and those associated with *Subjektive Fotografie*. The collection holds the estates of Helmar Lerski, Germaine Krull, Wolfgang Weber, Walter Peterhans, and Otto Steinert and the archives of Peter Keetman and the *ringl+pit Studio*. Other early twentieth century figures featured include Heinrich Kühn, Hugo Erfurth, László Moholy-Nagy,

Albert Renger-Patzsch, August Sander, and Edward Steichen. Exhibition space consists of two galleries that feature four to six exhibitions each year.

www.museum-folkwang.de

Museum für Kunst und Gewerbe, Fotosammlung, Hamburg

The photography collection of one of Germany's most important general museums was founded in 1900 and since 1987 has existed as an independent space of the museum. One of the oldest and most important collections in Europe, it covers the history of photography from its beginnings to the present day. Highlights are the early years of photography (with about 1,300 items), a collection of historical cameras and photo-equipment, art photography of around the turn of the twentieth century (2,700 items of the Collection Ernst-Wilhelm Juhl), photographers of the *Neue Sehen* (New Vision) movement of the 1920s, Japanese photography, and the *Subjektive Fotografie* of postwar Germany, photojournalism, and contemporary trends. In recent years a particular collecting focus has been fashion photography, with the museum acquiring works by Irvin Penn and others. The photo department holds also the complete personal library and the archive of Fritz Kempe, the Collection Willem Grütter, the estate of Wilhelm Bandelow, the Foundation Mode Welten of F.C. Gundlach, and the foundation Gerhard Kerff. A supplementary photo-library with more than 10,000 volumes is part of the museum library. Since 1991 the Reinhart Wolf-Prize, given by the Reinhart Wolf Foundation for young talent exemplifying new tendencies in photography has been administered by the museum. Forum Fotografie, founded in 1994, is an exhibition space for contemporary experimental photography.

www.mkg-hamburg.de

Staatliche Galerie Moritzburg, Halle/Saale

The Staatliche is the leading museum of the Sachsen-Anhalt region, housed in a former castle. Photography was collected since the very beginnings of the museum in 1885 and the collection stands at more than 50,000 items. Of particular interest are the estates of the Swiss photographer Hans Finsler, director of the photo-class at the Hallesche Kunstschule at Burg Giebichenstein, Halle, 1927–1932, donated in 1986, and Finsler's assistant, Gerda Leo. Other important areas of collecting are Vanguard Photography of the 1920s and 1930s (*Neue Sehen*), East German

photography after 1945 with the archive of the former Fotokinoverlag Leipzig, and the photo-collection of the former society of photography of the Kulturbund of the GDR, photography from Eastern Europe after 1945, and international contemporary photography. The photo library houses more than 8,000 books.

www.moritzburg.halle.de

Sprengel Museum, Hannover

Founded in 1979, the Sprengel is one of Europe's leading contemporary art museums. The formal department of photography and new media was begun in 1993 although regular exhibitions of photography have been held during the museum's history. Collecting is focused on international photography since the 1970s, especially American social documentarians. Special collections include, on permanent loan since 1992, the Ann and Jürgen Wilde Collection of over 1,500 vintage photographs of Albert Renger-Patzsch, Karl Blossfeldt, and others, and since 1993, the Siemens Kulturprogramm Collection with 600 prints of contemporary photography and since 2001, the Heinrich Riebesehl archive with more than 3,000 vintage prints and approximately 15,000 negatives. The Sprengel also administers the Spectrum Prize for international photography. Exhibition spaces include two galleries of 1,275 square meters that present six to seven exhibitions each year.

www.sprengel-museum.de

Museum Ludwig and Agfa Foto-Historama, Cologne

The Agfa Foto-Historama is located within Museum Ludwig, founded in 1976 and devoted to contemporary art. The Photo-Historama is one of Europe's most important collections devoted to the cultural history of photography. In 1986, after having been housed in temporary quarters for many years, the collection found a new home in the Ludwig, and was placed on permanent loan to the city of Cologne. At the core of the collection is the private collection amassed by Erich Stenger. Acquired in 1955, this collection covers all aspects of the history of photography. Additional holdings are 300 portraits by Hugo Erfurth and the archives of the Agfa Kamerawerk in Munich, featuring approximately 20,000 photographic and reproduction devices from all fields of the twentieth century photographic industry. The Photo-Historama mounts exhibitions in three galleries of 220 square meters.

www.museenkoeln.de/ludwig

Fotomuseum im Münchner Stadtmuseum, München

In 1888, the Historische Museum of the city of Munich was founded, and although photography was incorporated into its collection from its beginnings, it wasn't until 1961 that the photo museum as part of the city museum was founded, forming one of the most important photo collections in Germany. The collection features extensive nineteenth century holdings. Twentieth century holdings include the archives and estates of Franz Grainer, Frank Eugene, Fritz Witzel, Victor Knollmüller, Theodor Hilsdorf, Filip Kester (12,000 prints), Barbara Lüdecke (3,000 prints), Thomas Höpker (5,000 prints), Hubs Flöter (5,000 prints), Rudolf Carl Huber, Hermann Rüdigsühli, Richard Seewald, Karl Hubbuch, Waldemar Bonsels, Franz Hanfstaengl, Theodor Hilsdorf, Alois Löcherer, Stefan Moses (20,000 prints), Herbert List, Regina Relang (20,000 prints), Erich Retzlaff, Renata Riederer, Jo von Kalkreuth, Norbert Przybilla, Walter Hege (1,000 prints), and others; the archive of the journal *Quick* 1946–1990 (ca. 100,000 prints), the photo archive of the *Deutscher Kunstverlag* with photographs of the *Preussische Messbildanstalt* (5,000 prints), an archive Berlin of fashion photography 1930–1945 (4,000 prints), an archive of amateur snapshots 1890–1990 (ca. 180,000 prints), and the collection Uwe Scheid that also includes rare photo-literature and phototechnical equipment. Important photographs by Willi Moegle, Josef Breitenbach, Hanna Seewald, the group fotoform, Fritz Henle, Joseph Albert, Hilmar Pabel, Will McBride, Heinrich Hoffmann, August Sander, Alfred Eisenstaedt, Felix H. Man, Lotte Jacobi, André Kertész, Hans Namuth, Erich Salomon, and J. Heydecker are also featured. Since the 1980s efforts have focused on collecting international contemporary photography, and a major renovation of galleries was made at the turn of the twenty-first century. The Fotomuseum also houses an extensive photo library with more than 10,000 books and magazines and a department for photo conservation. It also mounts numerous symposiums, workshops, and lectures.

www.stadtmuseum-online.de

Great Britain

National Museum of Photography, Film & Television, Bradford

Founded in 1983 as a part of the National Museum of Science and Industry. The museum has become one of the most-visited museums in Britain with its collection including more than 3.5 million items of historical, social, and cultural value. These include the world's first negative, the earliest television footage, and early examples of moving pictures.

MUSEUMS: EUROPE

The photo collection is one of the largest and most important in Great Britain and traces the technical and aesthetic developments of photography from the earliest experiments in the 1830s to examples of contemporary practice across many genres and applications of the medium. The collection also features concentration in documentary advertising, and amateur photography. Highlights include important works by international twentieth century masters, including Lewis Hine, Edward Steichen, Alfred Stieglitz, Man Ray, László Moholy-Nagy, Bill Brandt, Ansel Adams, Brassai, Margaret Bourke-White, Robert Capa, Henri Cartier-Bresson, Giselle Freund, Yousuf Karsh, and Weegee. Works of the postwar generation, many emerging in the 1980s, include Richard Billingham, Chris Killip, Chris Steele Perkins, Martin Parr, Cornelia Parker, and Jo Spence. Other important holdings are the Zoltán Glass archive (10,000 negatives) and the archive of *The Daily Herald*. This archive, which represents a remarkable picture of British social life from 1912 to the 1960s, consists of over 2,500,000 prints and 100,000 negatives and contains many photographs from agencies such as Associated Press, Planet News, U.P.I., and the Press Association. A 1999 renovation updated the museum facilities to provide one of the most technologically sophisticated exhibition spaces in Europe, offering interactive displays, learning laboratories, and a wealth of on-line materials as well as permanent and changing exhibitions, workshops, and lectures.

www.nmpft.org.uk

National Portrait Gallery (NPG), London

The museum was founded in 1856 to provide a repository of historical portraits in all mediums regardless of the artistic quality of the portrait. Collecting was sporadic in the area of photography with the National Photographic Record (NPR), which began in 1917 the most significant means of acquisition. In the 1970s, under the directorship of Roy Strong, photography became a more integral part of NPG's activities with the founding of a department of photography and film. Attendance to a 1968 exhibition of Cecil Beaton was significant, and served to spur collecting of more contemporary materials. Holdings include approximately 160,000 photographs, with approximately 9,000 prints from the NPR (1917–1970); the Benjamin Stone collection of Members of Parliament and visitors to the House of Commons between 1897–1906; the Howard Coster Collection; the Elliott and Fry Studio collection of 20,000 negatives and prints; the Ida Kar Collection of writers and artists; the Cecil Beaton

Collection of over 1,200 prints; the Dorothy Wilding Collection of 710 prints of celebrities and royals; and the Angus McBean Collection of 113 prints. Generally one large photographic exhibition is held each year with changing permanent displays. Extensive education and research facilities, conservation laboratories, and on-line services are also offered.

www.npg.org.uk

The Royal Photographic Society, Bath

Formed in 1853 with Queen Victoria and Prince Albert as patrons, it was granted the use of the title "Royal" by decree in 1894. The Society's mission today, as in 1853, is "to promote the Art and Science of Photography." Membership is open to everyone with an interest in photography. The Society is currently located at The Octagon, Bath, which houses the Society's offices and its internationally important collection. The Society's famous collection is part of Britain's national heritage. It includes over 150,000 photographs, books, items of equipment, and other unique material from 1827 to the present day. The collection covers the whole evolution of photography and the variety of photographic processes. There are also modern classics by Edward Weston, Ansel Adams, and Yousuf Karsh and a steadily growing emphasis on the work of contemporary photographers. Material by the Secessionist photographers, including Alvin Langdon Coburn, Edward Steichen, and Alfred Stieglitz is strong, as is the history of early colour photography. RPS mounts an extensive series of workshops, master classes, lectures, courses, conferences, meetings, field trips, seminars, public darkroom, and photo competitions.

www.rps.org

Imperial War Museum, Photograph Archive, London

Containing over 6 million images, the Photograph Archive is a rich source of material on the two world wars with photographs by Bill Brandt, Bert Hardy, and Cecil Beaton among others. Its coverage spans the entire twentieth century and is international in scope. The impact of war on civilians and the contribution of Commonwealth countries are documented in depth; other nations are also included. More recent material shows the British Army's international contribution to NATO and humanitarian relief efforts.

www.iwm.org.uk

The Tate, London

Photographs as part of contemporary art have been acquired since 1972. The several hundred

photographs in the collection are not part of a separate section but exceptional examples of the contemporary art scene. They are mostly conceptual works of outstanding British and international artists. Photography is exhibited as part of the changing exhibitions. The Tate also houses extensive photographic materials in the Tate Archives concerning mostly British art and artists.

www.tate.org.uk

The Victoria and Albert Museum, Department of Prints, Drawings, Paintings and Photographs, Photography Collection, London

V&A holds the national collection of the art of photography, and is one of the largest and most significant photography collections in the world, international in scope and ranging from 1839 to the present. The museum holds approximately 300,000 prints in the primary collection plus thousands of photographs of works in the various other collections, known as the Picture Library. The V&A's Theatre Museum, and the Indian and South East Asian department also hold photographic archives. Important twentieth century photographers represented include Henri Cartier-Bresson, Bill Brandt, Don McCullin, and many others, with an index available in the Print Room. Since 1977 the National Art Library has made substantial acquisitions of photography publications, including key journals, monographs, early texts, exhibition catalogues, and experimental publications. These are supplemented by 'Information Files' on photographers and institutions, containing such materials as press cuttings, exhibition announcements, and sometimes correspondence. A changing selection of nineteenth and twentieth century and contemporary photographs, drawn from the collection, forms special exhibitions and illustrates a history of photography in the Canon Photography Gallery. Exhibitions of photography are mounted each year, and extensive educational resources include "Education Boxes" of photographs in the Print Room that contain selections of work ordered into three themes: The History of Photography, Photographic Processes, and Techniques and Contemporary Photography.

www.vam.ac.uk

Hungary

Magyar Nemzeti Múzeum (Hungarian National Museum), Történeti Fényképtár (Historical Photo Gallery), Budapest

Hungary's largest photo archive preserves about one million photographs of which half a million are

individually registered, the remainder arranged by subject in chronological order. The collection dates back to 1874 when the first daguerrotype was registered in the Hungarian National Museum. The archive's goal is to collect and systematize photo material covering all aspects of the Hungarian history and maintain its important collection of the history and technological history of photography, reflecting that the two predecessors of the present archive were the Historical Gallery established within the Hungarian National Museum in 1884 and the Museum for Contemporary History founded in 1957. Since 1995 the Historical Photoarchive has been an independent department of the Hungarian National Museum with five galleries of 1,500 square meters, mounting one photography exhibition per year.

www.origo.hnm.hu

Magyar Fotográfiai Múzeum (Hungarian Museum of Photography), Kecskemét

In 1991, in an historic building that was once a synagogue, the collection of over 75,000 items amassed by the Association of Hungarian Art Photographers since 1958 for the purpose of establishing a museum was finally opened. MFM is the only museum solely devoted to photography in Hungary. Now consisting of more than 500,000 photographs and 80,000 negatives from the 1840s to the present, the collection's main focus is on Hungarian photographers including André Kertész, Brassai, Cornell Capa, Robert Capa, László Moholy-Nagy, György Kepes, Paul Almásy, Rudolf Balogh, Alajos Martsa, Muky and Martin Munkácsi, Baron Lorand Eötvös, Károly Divald, Angeló, Olga Máté, Balázs Orbán, Ferenc Hopp, Imre Kinszinski, Károly Escher, Tibor Honti, Jindrich Štreit, Stefan Lorant, Gergely Palatin, János Reisman, Antal Simonyi, József Pécsi, Pál Rosti, Iván Vydareny, as well as contemporary photographers Tanás Féner, Péter Korniss, Gábor Kerekes and almost five hundred additional Hungarian and foreign photographers. A special collection, Fotohungarika, containing Hungarian-related works of foreign photographers who have worked in Hungary such as Erich Lessing, Mario de Biasi, Ferdinando Scianna, Chim, and Henri Cartier-Bresson is being developed. Collections also feature cameras, archival documents, books, booklets, and audio and video recordings. The museum also features a conservation laboratory, a database information center, and extensive online resources. Approximately eight to ten exhibitions are mounted at the museum and others are sponsored abroad, supported by a series of monographs titled "A magyar

Ireland

National Library of Ireland, National Photographic Archive, Dublin

The photographic collections, almost 300,000 items, of the National Library of Ireland are now housed in the National Photographic Archive. While most of the collections are historical there are also some contemporary collections, the majority of the material, however, focusing on Irish society, landscape, and history. Collection focuses include landscape photography, studio portraits, photojournalism, and early tourist photographs. Significant twentieth century collections include the Cardall Collection of approximately 5,000 negatives for postcards from the 1950s and 1960s, the Clonbrock Collection of over 2,000 glass plates spanning the years 1860–1930, the Eason Collection of 4,000 negatives for postcards dating 1900–1940, the Keogh Collection of political events and studio portraits from 1915–1930, the Morgan Collection consisting of aerial views of Ireland 1957–1958, the O’Dea Collection of 5,300 prints covering all aspects of railway transport in Ireland between 1937–1966, a collection of Panoramic Albums containing views of coastal scenes, and the Poole Collection of 60,000 glass plates images of the South East of Ireland dating 1884–1954. The archive building incorporates modern storage, a conservation area, dark-rooms, and a reading room in addition to its exhibition gallery. Many database resources are accessible through the reading room, and online cataloguing information is also available.

Italy

Museo di Storia della Fotografia Fratelli Alinari (The Museum of History of Photography Fratelli Alinari), Florence

Opened in 1985 as a museum by the Fratelli Alinari company, one of the world’s oldest firms in the field of photography, the Alinari houses 800,000 prints showing the development of photography as an art as well as photographic equipment from 1839 to the present day. The first museum in Italy devoted solely to photography, the collection is particularly rich in Italian photographers. Also located in the Palazzo Alinari, is the Alinari archives with 400,000 glass-plates and 750,000 negatives on film

that preserve the photographic record of the art, economy, and way of life of Italian and European society from photography’s beginnings to the present day. Alinari technicians work actively to make prints from these original negatives for both exhibitions and commercial purposes. An integral part of the Alinari Museum is the Library of History of Photography, from the origins to the present day. A Conservation Workshop was founded in 1996 in collaboration with the Opificio delle Pietre Dure. The museum and the Alinari firm organize traveling photo exhibitions in Italy and worldwide and host important exhibitions developed elsewhere. Educational resources include an on-line digital catalogue, edu.alinari.it, that includes 85,000 pictures, both historical and modern.

Books, periodicals, poster books, and multimedia are published by the Fratelli Alinari Publishing House.

Latvia

Latvijas fotoarhīva muzejs (Latvian Museum of Photography), Riga

Founded in 1991 and opened to the public in 1993, the museum collects, preserves, and exhibits the photographic heritage of Latvia. The collection is one of the most significant in Latvia and includes approximately 10,500 items plus documents and photographic and darkroom equipment. Research is conducted into the history of Latvian photography as an inseparable and unique component of Latvian culture as well as into its role in the overall evolution of world photography. Collections include negatives by Karlis Lakse (1920–1945), works by an unknown photographer in Ventspils (port in Latvia; 1944–1945), photographs by war reporter Janis Talavs (1943–1945), negatives and slides by Roberts Kalnins (1930–1970), and negatives and prints by Andris Stanguts (1970–1980). The exhibition space consists of four galleries of 207 square meters for the permanent collection covering the development of photography in Latvia (1839–1941) and two galleries with 90 square meters that feature 12 to 15 temporary exhibitions per year focusing on international contemporary photography, contemporary Latvian figures, and works by Latvian nationals living elsewhere. The museum has a specialized photo library with 2,400 books and 3,600 magazines and offers online resources on contemporary Latvian photographers.

The Netherlands

Nederlands Fotomuseum, Rotterdam

Founded in 1992 the Fotomuseum's collection holds the negatives, transparencies, and prints from 70 Dutch photographers of the nineteenth and twentieth century who worked for press agencies, theatre companies, film companies, fashion houses, industry, the government, and publishers. A unique feature of the museum is that it holds agreements by which its holdings can be sold to the public for various commercial or private uses.

Ten to fifteen exhibitions each year are mounted in the museum's three galleries of 600 square meters, focusing mainly on the contemporary photography of the Netherlands. Bilingual (Dutch/English) publications are produced. The museum features a comprehensive Restoration Department offering conservation and restoration services to the public. The museum library emphasis is on photography theory, the history of photography, and Dutch photograph since 1945 and contains not only books but extensive digital materials and an online catalogue.

www.nfi.nl

Stedelijk Museum, Amsterdam

The photographic collection of this general museum (founded in 1885) began in 1958 with gifts of two collectors. Currently the collection contains 9,000 photographs of international as well as Dutch artists, many of these a permanent loan of the Dutch government. Of particular interest are works by László Moholy-Nagy, Gertrude Käsebier, Paul Strand, Eugène Atget, Cecil Beaton, Robert Capa, André Kertész, Johan van der Keuken, Diane Arbus, Nan Goldin, and Rineke Dijkstra and concentrations of works by Eva Besnyö (78), Erwin Blumenfeld (42) and Ed van der Elsken (240). The library features over 2,500 photo-books and periodicals as part of the general art library of the museum. Photography exhibitions are mounted as part of the general program.

Norway

Norsk Museum for Fotografi, Preus Fotomuseum, Horten

Based on the collection of the Preus fotomuseum from Preus Foto corporation, the Norsk Museum was founded in 1994 when this collection was acquired by the state for the purpose of establishing

a national museum for photography in Norway. Located on the fourth floor of the Karljohansvern, owned by the Ministry of Defense in a space called Storehouse No. 1, its charter is for the preservation, collection, and dissemination of photographs in Norway, with a particular focus on art photographs. The collections and exhibitions contain Norwegian and international photographs, cameras, and other objects that illustrates the development of photography. The museum also features an international library with 20,000 volumes on the prehistory and history of photography, photographic techniques, history of the camera, photography as a form of art and documentation, and all types of photographic activity and related topics. The periodicals collection comprises around 1,000 titles, 100 of which are current. The library incorporates a number of Norwegian and international archives, foremost among them the Narath Archive.

www.foto.museum.no

Poland

Muzeum Narodowe Wroclaw (National Museum of Warsaw, Photography Department), Warsaw

The photo collection was founded in 1963. Holdings include ca. 10,500 photographs. The collection concentrates on creative photography, especially Polish art photography since the beginning to the present. Particular artists include Hermann Krone, Józef Czechowicz, Jan Bułhak, Witold Romer, Zbigniew Dłubak, Franciszek Groer, Aleksander Krzywobłocki, ZdzisłBeksinski, Natalia NN, and Edward Hartwig. Photo-literature is included in the museum library.

Galleries for temporary exhibitions comprise 6 rooms and 250 square meters, and two or three photo exhibitions per year.

Museum Sztuki (Museum of Fine Arts), Lodz

Founded in 1930, the museum is one of the oldest museums of modern art in Europe. In 1977, the Department of Photography was founded featuring about 3,000 photographs, as well as artists' videos. The department houses a unique international collection of avant-garde art, covering the period from the 1920s to the 1930s, and collecting is concentrated on contemporary photography, especially of Poland and Central Europe. Featured photographers are Florence Henri, Anton Stankowski, Stanisław Ignacy Witkacy, Werner Bischof, František Vobecký, Vilem Reichmann, Christian Boltanski, Annette Messager,

MUSEUMS: EUROPE

Derek Boshier, John Hilliard, and Barbara Kasten. Special archives include photography and photographic albums of Poland (1912–1939) by Jan Bułhak and in the Department of Graphics and Modern Drawing, an archive of Polish avant-garde photomontages of Kazimierz Posadcki, Janusz Maria Brzeski, Mieczysław Berman, and photograms of Karol Hiller from the 1920s and 1930s. Postwar reportage and sociological photography (Zofia Rydet, Bohdan Dziworski, Tomasz Tomaszewski, Adam Bujak and Anna Bohdziewicz) and photography related to avant-garde movements (Zbigniew Dłubak, Andrzej Pawłowski, and Marek Piasecki) are featured. A selection of Socialist Realism from the 1950s is another area of concentration, as well as a large number of works by artists of the Toruń-based group Zero 61. Books and catalogues, mainly Polish-language, and magazines on photography are collected by the museum library. Two to three temporary exhibitions are mounted each year.

www.muzeumsztuki.lodz.pl

Muzeum Historii Fotografii (Museum of the History of Photography), Cracow

Founded in 1986 and located in a historic villa, MHF is the only museum in Poland that exclusively collects and shows photography. The collection, made up in part of that amassed by the Cracow Photographic Society, comprises some 55,000 photographs, cameras, and other photographic equipment. The collections focus on Polish history, including cultural, political, and military photography, and especially photography of the region and of the city of Cracow. Highlights include works by Jan Bułhak, the first coloured slides (autochromes) by Tadeusz Rząca, and complete documentation of the works of Władysław Marynowicz—the Polish photographer active in Britain. Recently, the museum has started a collection of fine arts photography, featuring the works of Erich Lessing, Edward Hartwig, and Fortunata Obrąpalska. The technical aspects of photography are another area of interest in the museum, with the permanent display consisting of photographic equipment. The library holds approximately 5,500 volumes. Approximately 10 temporary exhibitions are held each year in nine galleries within the museum's 230 square meter building.

www.mhf.krakow.pl

Portugal

Centro Português de Fotografia, Porto

The museum was founded in 1997 to be the national center for collecting photography in Por-

tugal. Collection focuses on both Portuguese and international photography from its beginnings to the present day. The CPF also maintains an archive that holds negatives and prints of Portuguese photographers and studios. This archive is divided into two parts, one located in Porto holding the collections belonging to the northern part of the country and the other in Lisbon holding the collections of southern Portugal. These archives hold over 2.5 million works. Highlights of the collection include Bernard Plossu, Paulo Nozolino, Duarte Belo, Emílio Biel, Nicholas Nixon, Neal Slavin, and Bruce Gilden. The most important and representative collections in the Archives are those of Domingos Alvão (1869–1946), Aurélio da Paz dos Reis (1862–1931), Joshua Benoliel (1878–1932), portraits of the prisoners in Cadeia da Relação (1880s–1905), and the newspaper *Século*. CPF's library holds approximately 1,600 books and 200 magazines, as well as a database information service. CPF features many educational programs, including workshops, seminars, and book publishing. The permanent display is an overview of the history of Portuguese photography and historical cameras. Eight temporary exhibitions are mounted each year of both Portuguese and international developments in photography.

www.cpf.pt

Spain

Universidad de Navarra, (University of Navarra), Pamplona

The photo collection was founded in 1990. Owners of the growing photo collection are: Legado Ortiz Echagüe, Fundación Universitaria de Navarra, and Universidad de Navarra.

Special collections include the José Ortiz Echagüe Collection with ca. 1,700 photographs, cameras, and other technical equipment; a nineteenth century Spanish Collection with ca. 4,600 photographs; and the Juan Dolcet Collection with ca. 750 photographs. The whole collection aims to form a Spanish photo collection that covers photography in Spain from its beginnings until today. The photo library holds ca. 1,200 books and magazines. Approximately four to five temporary exhibitions are held per year. Publications, courses, congresses, symposiums, conferences are also produced.

www.unav.es

Museu Nacional d'Art de Catalunya, Barcelona

A museum devoted to the history of Catalan art, including photography, displaying works from the

eleventh century until 1950. The result of the consolidation of two collections of early and modern art in 1990, the photography department was begun in 1996. While the collecting of international art has begun, the strength of the museum is photography by Catalonians. The collection holds approximately 1,200 photographs with concentrations by Joaquim Pla Janini, Josep Lladó, Josep Masana, Emili Godes, Otho Lloyd, Oriol Maspons, Francesc Català-Roca, Toni Catany, Joan Fontcuberta, Pere Formiguera, and Humberto Rivas. Two to three photography exhibitions are mounted each year.

www.mnac.es

Instituto Valenciano de Arte Moderno, Valencia

A museum devoted solely to modern and contemporary art, IVAM was founded in 1989. The IVAM holds more than 2,000 photographs in two areas of concentration: the master photographers of the twentieth century such as Robert Frank, Walker Evans, Bernard Plossú, Eugène Atget, André Kertész, Robert Capa, Weegee, and Gabriel Cualladó and photography since the 1970s including Cindy Sherman and Richard Prince. IVAM mounts temporary exhibitions of photographers from the collection and contemporary developments.

www.ivam.es

Museo Nacional Centro de Arte Reina Sofía, Madrid

A museum devoted to modern and contemporary art under the ministry of culture of Spain, MNCARS features a growing photography collection of approximately 1,000 examples of twentieth century photography. Highlights of the collection are the photographs taken by Dora Maar of the process of the painting of *Guernica* by Pablo Picasso on permanent display. The focus is on contemporary Spanish and international photography including Jean Marc Bustamante, Günther Förg, Andreas Gursky, Axel Hütte, Thomas Ruff, and Thomas Struth.

www.museoreinasofia.mcu.es

Sweden

Moderna Museet, Fotografiska Museet, Stockholm

The Moderna Museet was founded in 1958 (new building 1998), the photo museum as a department in 1973. The result of the integration of several holdings, including those brought together by the Fotografiska Museets Vänner (Friends of the Museum of Photography; founded 1964) and the Helmut Gernsheim Collection and the Helmer Bäckström historical col-

lection, the collection includes works from the 1840s to the present day. Particularly rich in works by Swedish Pictorialists, including John Hertzberg, Henry B. Goodwin, Ferdinand Flodin, and Ture Sellman. Altogether it comprises some 300,000 objects of international and Swedish photography. Important Swedish photographers represented include Sten Didrik Bellander, Kerstin Bernhard, Hans Hammarskiöld, Hans Malmberg, Anders Petersen, and Christer Strömholm. Other holdings include collections of Svenska Fotografernas Förbund (Swedish Photographer's Association), Svenska Turistföreningen (Swedish Tourist Club), Svenska Turisttrafikförbundet (Swedish Touristtraffic Association), Fotografiska föreningen (The Photographic Society), Riksförbundet Svensk Fotografi (National Association of Swedish Photography), and the collection of Pressfotografernas Klubb (Pressphotographer's Club). The museum also features a library of approximately 20,000 volumes, a history archive with 12,000 items catalogued by Swedish and foreign photographers, institutions, museums, galleries, exhibitions and exhibition activities, and a conservation workshop. Approximately five to ten exhibitions are mounted each year.

www.modernamuseet.se

Hasselblad Center, Göteborg

The Erna and Victor Hasselblad Photography Center, known as the Hasselblad Center, was established in 1989 to promote scholarly research and education in photography. The Center operates research projects, organizes seminars and lectures, has a library and archives for students and researchers, and awards a prestigious annual prize, The Hasselblad Foundation International Award in Photography. The exhibition hall of the Hasselblad Center is situated in the Göteborg Museum of Art where an average of six exhibitions are mounted annually, with the work of the Hasselblad Award winner shown in November and December. The Center is also assembling a collection that concentrates on the work of Nordic photographers including Sune Jonsson, Christer Strömholm; Stig T. Karlsson; Adriana Lestido; Pål-Nils Nilsson and of Hasselblad Award winners Ernst Haas, Edouard Boubat, Manuel Alvarez Bravo, Robert Häusser, Henri Cartier-Bresson, Hiroshi Hamaya, William Klein, Sebastião Salgado, Susan Meiselas, and Boris Mikhailov. The Library contains approximately 5,000 books, catalogues, and exhibition catalogues. It also holds a number of annual volumes of different photographic magazines and a clippings archive. In 1998, the Center acquired the photography library of Rune Hassner. It is now

Stefan Moses, Metallarbeiter, Essen 1963.
[© Fotomuseum im Münchner Stadtmuseum]

being coordinated within the Hasselblad Center library. The Center also publishes the magazine *HASSELBLADCENTER*.

www.hasselbladcenter.se

www.hasselbladfoundation.org

Switzerland

Musée de l'Élysée, Lausanne

Known as “a museum for photography,” the museum was founded in 1985. Housed in an eighteenth century villa, the museum exhibits and collects photography from its beginnings to the present day and in all its aspects including journalism, advertising, fashion, social documentary, and scientific and fine art photography, and houses approximately 27,000 items, including the International Polaroid Collection with over 4,600 prints and the Association for Contemporary Photography Collection with approximately 450 prints. Highlights include works by Adolphe Braun, Gianni Berengo Gardin, Robert Capa, Gilles Caron, Adrien Constant de Rebecque, Jean-Gabriel Eynard, Francis Frith, Mario Giacomelli, Gabriel Lippmann, Lucia Moholy, John Phillips, Sebastião Salgado, André Schmid, and Christine Spengler. The museum houses a great number of historical archives including the Association for Contemporary Photography Archive. The

library contains thousands of books, numerous photo journals, and a reading room. The museum mounts 15 to 20 photo exhibitions each year in six galleries on four floors with approximately 1,200 square meters. The program is international.

www.elysee.ch

Fotomuseum Winterthur, Winterthur

Founded in 1993, the Fotomuseum collects both art photography and applied photography in the areas of architecture, fashion, and industry. The collection consists primarily of contemporary photography, starting with an in-depth representation of work by Swiss-born Robert Frank. The 1960s and 1970s are represented by Lewis Baltz, Larry Clark, William Eggleston, Valie Export, Hans-Peter Feldmann, Peter Hujar, and Urs Lüthi, and recent international developments bring the collection up to the present day. The Fotomuseum Winterthur seeks to acquire groups of works rather than single examples. The applied photography archive is especially rich in industrial photography from the Van Roll firm. Five to seven exhibitions are mounted in five galleries of 550 square meters.

www.fotomuseum.ch

FRANZ-XAVER SCHLEGAL

MUSEUMS: UNITED STATES

The history of twentieth-century photography in the United States has certainly been inextricable from, if not entirely symbiotic with, the history of its institutions. These institutions have ranged from small galleries to grand museums, from alternative exhibitions spaces to subject-driven archives. Considering, for example, the aspirations and activities of Alfred Stieglitz, it would be easy enough to argue for his place as a forefather of later twentieth-century photography curators. His galleries displayed photography with the instructive aim of securing the medium a place within the long-established hierarchies of art. Such public displays were supplemented in print by his journals *Camera Work* and *Camera Notes*, to say nothing of his enthusiastic collecting practices.

Indeed, some of the most important museum photography collections have been graced by gifts from Stieglitz's vast holdings of American photography. However familiar such practices may have become to the operation of museums later in the century, the fact remains that Stieglitz ran a gallery with the intent to sell—albeit intermittently—the works of art he exhibited by the artists he supported. This example of Stieglitz is intended to acknowledge at the outset of this discussion the complicated and sometimes contradictory points of intersection between institutional categories that are considered distinct more often than may be warranted. Like the galleries run by Stieglitz during his lifetime, a variety of institutions have impacted the developments of photogra-

phy in the last century. Nevertheless, public museums have often generated discussions about the nature, dissemination, and explication of photographs through their exhibition, acquisition, and preservation practices. Representing the breadth of form and function of the medium, these practices show some signs not of disappearing, but of pliability and innovation, at the outset of the twenty-first century.

The Library of Congress was the first public institution in the United States to add a photograph to its permanent collection (1845). This act is particularly noteworthy in the history of photographic institutions since it predates such notable early collections as the *Société Héliographique* founded in Paris in 1851 and the Royal Photographic Society established in London in 1853. Photographs entering the Library of Congress for most of the nineteenth century were meant as supporting visual documents to such major historical events as the Civil War or as records of development of cities, towns, and even individual buildings. This approach to photography fueled certain photographers' fights at the turn of the century to claim photography as one of the fine arts. This fight for artistic legitimacy, most often linked to the Photo-Secessionist group in New York, longed for photography to be collected and displayed in the same fashion as painting. This directive inspired Stieglitz's seminal *International Exhibition of Pictorial Photography* which, in 1910, filled the Albright Art Gallery in Buffalo, New York, and broke all that museum's previous attendance records. Eventually, Stieglitz and his cohorts hoped to find similar institutional success in the country's leading art museums.

While there were some other early photography exhibitions (in 1900 at the Art Institute of Chicago, for example), a single institution and its librarian remain responsible for the first comprehensive effort to present photography's history in the context of an art museum exhibition. Nearly a century after the Library of Congress's first photography acquisition, the Museum of Modern Art, New York, (MoMA) became one of the only museums in the United States to regularly exhibit photography. In a 1932 exhibition of murals by leading American artists Lincoln Kirstein—with the help of Julien Levy—invited photographers Berenice Abbott and Edward Steichen to participate. The following year, Kirstein displayed Walker Evans's photographs of American Victorian architecture. But it was not until Beaumont Newhall was hired as the museum's new librarian that photography was given its most constant institutional advocate.

Newhall immediately set about organizing an exhibition that would become a touchstone in all

subsequent histories of photography, to say nothing of its impact on exhibitions of photography. *Photography 1839–1937* incorporated more than 800 works, grouped according to their technical processes (e.g., daguerreotype, calotype) and cultural application (e.g., journalism, science, artistic expression). The exhibition aimed to trace and locate developments that were medium-specific, even technique-specific as in Newhall's proposal that certain photographic methods yielded images notable for their significant details while others were distinguished by their array of tonal masses. In choosing to include astronomical photographs, X-ray images, sports photography, film stills, and aerial photography, Newhall seems to have been more interested in how to look at—and subsequently comprehend—wide-ranging photographic practices. This outlook remains remarkable, especially given that a more restricted view of the medium would certainly have better championed photography's artistic merit, a position that continued to appeal to many museums' interests and acquisitions as photography gradually came into its own.

In 1940, Newhall was appointed the museum's curator of photography, the first such post in any museum. Over the next seven years, Newhall continued to consider the specificity of photography in nearly 30 separate exhibitions ranging from historical French photography to emerging artists such as Helen Levitt. Increasingly, he became more interested in the medium as a means of personal expression, a view that seems to have been helped by his close working relationship with Ansel Adams. Despite Newhall's efficacy, MoMA's trustees chose to appoint Edward Steichen as director of the department in 1947 and Newhall resigned. Christopher Phillips has interpreted this sudden changing of the guard: "Simply put, it seems clear that Newhall's exhibition program failed equally to retrieve photography from its marginal status among the fine arts and to attract what the museum could consider a substantial popular following" (Phillips, 23). If this was the case, MoMA had chosen wisely. For in Edward Steichen they found someone whose primary interest in photography by that time was not its artistic aims, but its illustrative and persuasive capabilities.

Elsewhere in the United States during these years, photography began to enter the collections of other museums. Alfred Stieglitz made gifts of his photographs to the Metropolitan Museum of Art in 1928 and 1933. Upon his death in 1946, the Metropolitan received a bequest that expanded the collection to over 600 works. The Art Institute was another beneficiary of Stieglitz's bequests, receiving

a substantial portion of his collection in 1949, which marked the beginnings of their photography collection. Shortly after MoMA acquired its first photographs, the institution that was to become the San Francisco Museum of Modern Art (SFMOMA) was founded in 1935. From its inception, SFMOMA advocated strongly for photography's place in modern art as well as in the institution's programming. Without a doubt, this decision owed much to the active group of San Francisco photographers, the f/64 Group, whose members included Ansel Adams, Imogen Cunningham, and Edward Weston. Advocating a sharp and unaffected style of photography, the group coalesced at a major exhibition of their work at the M. H. de Young Memorial Museum, also in San Francisco. The work of these photographers was among the first to enter SFMOMA's permanent collection, prompting regular exhibitions and an expanding collection, as when Ansel Adams encouraged Georgia O'Keeffe, Stieglitz's widow, to donate dozens of his photographs to the museum in 1952.

In 1949, the International Museum of Photography (as it is currently known) opened at the George Eastman House in Rochester. George Eastman had founded Eastman Kodak Company, which was almost single-handedly responsible for the popularizing of photography at the end of the nineteenth century. Their famous slogan, "You push the button, we do the rest," lured many to begin making photographs as a personal hobby or family chronicle. Eastman himself had been an avid photographer in addition to collector. Fifteen years after his death in 1932, the first museum in the United States dedicated solely to photography and moving pictures was chartered. Beaumont Newhall was appointed curator of the collections and, from 1958 to 1971, he served as the director of Eastman House. Newhall's exhibitions and friendships with leading photographers of the day not only greatly affected the Eastman House programs, but the development and education of photography students at the nearby Rochester Institute of Technology. Under Newhall's tenure, the museum's holdings expanded exponentially, creating one of the greatest photography collections in the world.

After an extremely successful career in fashion and portrait photography and while heading up U.S. naval combat photography during World War II, the ever-versatile Edward Steichen mounted two highly patriotic exhibitions at MoMA. *Road to Victory* (1942) and *Power in the Pacific* (1945) were unabashed explorations of American military might that utilized photographs in strikingly new ways through placement, size, and juxtaposition. It was

as if Steichen had taken the photo-essays from picture magazines established in the decade before in the pages of *Life* and made them three-dimensional. Using photographs to illustrate a particular narrative, Steichen's efforts provide two early examples of an exhibition-driven blurring of boundaries between the documentary and propagandistic uses of photographic images. Such story-telling exhibition practices not only propelled him into the director's seat of the MoMA Photography Department, but they would reach a global zenith in his next major project.

In January 1955, Steichen inaugurated what, by many accounts, still reigns today as the most widely attended photography exhibition ever, *The Family of Man*. Both the exhibition installation and the book based on it relied on a series of juxtapositions of photographs made around the world. It took Steichen three years to sort through the 2 million photographs and eventually select some 503 images by 273 photographers, grouped according to theme. Reprinted to unify tones, to heighten dramatic contrasts, and to resize according to visual impact (from 5 × 7 inches to wall-sized), each photograph was presented as a tightly cropped image, without border or frame, mounted on board. Once harmonized in this fashion, the photographs were arranged on columns, hung from wires and rods, suspended in the air, and mounted on panels. The work's original captioning or title—along with most other deference toward the artist—was eliminated in favor of the thematic for a particular section that was complemented by quotations, proverbs, and tales from a host of cultures.

Through sequential thematic groupings such as Birth, Family, Work, Love, and Death, *The Family of Man* intended to replicate a universal course of human life as sequences of moments that were highly photographic and photographable. Steichen's universal aims also prompted an extended tour of the exhibition in U.S. venues and, beginning in 1959, worldwide venues from Moscow to Paris to Japan. In total, more than 10 million visitors experienced a version of *The Family of Man*. Marked by such a strong humanist impulse, the exhibition managed to pull at the heartstrings of a public caught between the shadows of World War II and the Cold War, while also inciting strong criticism, perhaps most famously from the cultural critic and theorist Roland Barthes. Yet whatever its faults as a tribute to the photographers who took the photographs or as an honest pictorial investigation of the experience of life in various parts of the globe, it must be said that Steichen succeeded in collapsing categories that photo history and photography institutions—MoMA included—had long struggled to establish.

The slippage promoted by *The Family of Man* between photojournalism, artistic expression, scientific and technical data, and amateur snapshot today appears as a perhaps unintentional articulation of postmodernism *avant la lettre*.

By the 1960s, the tide had most certainly changed in photography's favor. There now existed multiple departments in museums devoted to the collection and display of photographs. The wildly successful touring tenure of *The Family of Man* had proven that public interest in photography was as fervent as it was far-reaching. As Beaumont Newhall retrospectively characterized it:

...the scheduling of major photographic exhibitions by leading art museums in Europe and America; the growing interest in photography on the part of individuals as well as institutions; the inclusion of courses in the photographic arts by universities and art schools are all steps toward the ultimate unquestioned acceptance of the potentials of the camera.

(Newhall 294)

Photography, in other words, had come into its own.

At MoMA, John Szarkowski succeeded Steichen and moved the department quickly away from the more encompassing social conception of photography to one that would emphasize the medium's aesthetic character. Szarkowski worked to codify photographic practice during his tenure at MoMA, hoping to establish and define the peculiarities of the medium. In exhibitions such as *The Photographer's Eye* (1964) and *Looking at Photographs* (1973), he intended to discern a style and tradition that was firmly grounded in the formal and technical characteristics. As he famously explained in his introduction to the former of the two exhibition catalogues, "This book is an investigation of what photographs look like, and why they look that way" (John Szarkowski, *The Photographer's Eye*, New York: Museum of Modern Art, 1966, p. 1). Szarkowski's efforts to discern and distill the essence of photography would quickly meet with harsh criticism as those in a younger generation, their everyday lives steeped in photographs of all stripes, found fault with formalism.

It was Szarkowski's 1967 exhibition *New Documents*, however, which perhaps most indelibly marked the history of late twentieth century photography. Intending to identify the most recent developments of the previous decade, Szarkowski focused on the work of Diane Arbus, Lee Friedlander, and Garry Winogrand, all of whom he considered to have inherited and created anew the documentary photography tradition of the 1930s. In fact, Diane

Arbus's retrospective exhibition in 1971 drew crowds to MoMA larger than those for *The Family of Man*, suggesting a new level of public excitement about photography. *New Topographies: Photographs of a Man-Altered Landscape* at the George Eastman House also identified an emerging trend in the broadly-construed field of landscape photography, notably the emphasis on the altered landscape as a subject of contemporary photography. Works by Robert Adams, Bernd and Hilla Becher, Joe Deal, Nicholas Nixon, Stephen Shore, and Henry Wessel, Jr., among others, considered the effect of the developed landscape in urban centers, tranquil suburbia, and forsaken buildings. The exhibition mounted by the Metropolitan Museum of Art, which had not theretofore particularly dealt with photography, *Harlem on My Mind*—often labeled the first of modern-day museum blockbusters and one of the great controversies in museum history—secured its place in twentieth century photo history. A thematic exhibition not confined by media, *Harlem on My Mind* was single-handedly responsible for the historical recovery of James VanDerZee as one of the leading photographic portraitists of his day.

By the outset of the 1970s, photography's popularity with art museums and publics alike was increasingly undisputed. Between 1973 and 1990, the number of photography collections in the United States more than quadrupled and the number of photographers in those same collections skyrocketed from well over 1,000 to over 32,000. The market for photography ballooned similarly; prices for photographs between 1975 and 1990 escalated by approximately 650 percent (Alexander, 698). These figures undoubtedly reflect the activities of those photography institutions or departments established at the time. For example, the years 1974 to 1976 saw the founding of the International Center of Photography in New York, the Center for Creative Photography in Arizona, and Museum of Contemporary Photography in Chicago collections.

The formation of the Photographs Collection at the J. Paul Getty Museum is perhaps among the most astounding examples of this buying curve. In 1984, the art world was stunned to learn of the Getty's acquisition of the complete holdings of three private collections and portions of several others. Amounting to more than 25,000 photographs, these acquisitions demonstrated the relative ease and affordability of amassing a collection of significant breadth and depth. The same amount of funds that might be directed to a single Old Master painting could, in the early years of this market, yield an entire department's worth of photographs. Photography was quickly becoming an institution

itself. That is to say, photography's establishment in these decades—the “photo boom” as it is sometimes called—had relied widely on standardization, historicization, and definition. As Douglas Nickel has commented:

A latecomer to institutional attention and intellectual respectability, the field suddenly found itself in the 1980s in the uncomfortable position of being the arriviste of academic subjects, both newly sanctioned by officialdom and an occasion for heated controversy....[I]t also encountered a growing body of critical writing that took exception to the methods of photography's formal canonization, one that argued against the mapping of traditional art historical approaches and values onto photographic subjects and, ultimately for the nonidentity of photography and photographic history itself.

(Nickel 548)

Indeed, many of these critical objections were provoked by museums' sanctioning of photography as art, worthy of collection, displaying, and preserving in its own right.

Douglas Crimp, among others, provided a salient example of this trend when he outlined the removal of photographic books and albums from the shelves of the New York Public Library. These objects were then reassembled as the Library's Photographic Collections, a physical move that embodied the separation of photography from its subject, a triumphal dislocation that allowed photography to be understood *only* in the context of art.

Whereas we formerly have looked at Cartier-Bresson's photographs for the information they conveyed about the revolution in China or the Civil War in Spain, we will now look at them for that they tell us about the artist's style of expression. This consolidation of photography's formerly multiple practices, this formation of a new epistemological construct in order that we may now *see* photography, is only part of a much more complex redistribution of knowledge taking place throughout our culture.

(Crimp 1989, 8)

Crimp was not alone in theorizing the institutional structures—and strictures—newly placed on photography. Other critics began illuminating the classificatory, exploitative, regulatory, and racist uses of photography. Victor Burgin, Rosalind Krauss, Christopher Phillips, Allan Sekula, Abigail Solomon-Godeau, Sally Stein, and John Tagg were chief among those who attempted to reveal and contextualize the power and politics of photography vis-à-vis their institutions.

Not coincidentally, certain artists had begun using photography to convey and problematize some of these same perceptions of the medium. Artists with

practices as diverse as those of Vito Acconci, John Baldessari, Dan Graham, Louise Lawler, Sherrie Levine, and Robert Smithson began to use photography in new and provocative ways that raised questions crucial to museums: how is such work to be classified, exhibited, and interpreted? For example, Cindy Sherman famously declared in the press release accompanying her book *Untitled Film Stills* that she was *not* a photographer. Instead, she classified herself as a performance artist utilizing photography. Thus, the 1990 *Index to American Photographic Collections* could make note of the fact that Sherman's work could be found not in the Art Institute of Chicago's photography collections, but in those of the contemporary department. While this is no longer the situation (both departments now hold Sherman's work), such a classification is more than mere syntax; it had a direct impact on determining the context in which Sherman's work would be exhibited and thus viewed. Such a classification originally determined that it was institutionally more productive and appropriate for Sherman's images to be surrounded by works contemporary to hers regardless of medium rather than by other examples of, say, photographic self-portraiture.

The questioning of the boundaries of media specificity made so explicit in the work of someone like Sherman continue to haunt broadly the conception of photo history and, more specifically, to define exhibition and acquisition practices in today's museums. Once a sign of photography's arrival and success, departments dedicated exclusively to photography must now work to explain that exclusivity. Some choose a kind of forced historicism, wanting to attract only those photographers' work that explicitly refers to either the medium's history or its technology, particularly as it was shaped and understood by museums in the twentieth century. Some have sought out artists who do just the opposite, intending to push or even break down the boundaries of the medium. Some have chosen to collaborate across media boundaries—meaning, institutionally, between departments—in order to breed a different kind of interpretive exhibition, one that perhaps in the end dwells on photography's ubiquity as in MoMA's *Open Ends*. And still others have coyly extended arguments of medium specificity by mixing together photography and film and video. This outlook has yielded such recent major exhibitions as the International Center of Photography, New York's, *Strangers: The First ICP Triennial of Photography and Video*, which inaugurated a series of exhibits devoted to the collective consideration of shared themes between the two media and the Solomon R. Gug-

genheim Museum's *Moving Pictures*, which surveyed video, film, and photography of the past four decades. While *Strangers* remained largely focused on the over-arching theme of the Other as encountered in what they termed photographic media, the Guggenheim proposed specific affinities between the media in the exhibit: all are essentially photo-based, reproducible, and omnipresent in mass culture forms such as television, advertising, cinema, and journalism.

The continued consideration of the boundaries of photography has also prompted new attention on those photographs that had increasingly been marginalized in mainstream museum collection and exhibition practices. While this trend has now been reversed to a certain extent with recent acquisitions by the Met and others of vernacular photographs, alternative collections that have developed outside museums provide some clues about what museums had previously disavowed, overlooked, or omitted from their purview. Two serviceable examples of such alternative collections are the Burns Collection and the Kinsey Institute's collection. Burns Collection is home to more than 700,000 photographs including some 60,000 examples of early medical photography ranging from the 1860s to 1920. Additionally, the collection is home to images of what might be considered the darker side of life and, therefore, of photography's subjects—crime, death, disaster, disease, murder, racism, riots, and war. The Kinsey Institute for Research in Sex, Gender, and Reproduction was established in 1947 by Dr. Alfred C. Kinsey, the pioneer in the research of human sexual behavior and author of the infamous "Kinsey Reports." His photographic collection was an intricate part of his data collection on the topic, begun in 1938. Arranged categorically by position or act, these nearly 96,000 photographs from the United States, Europe, and Asia include work by such photographers as Judy Dater, George Platt Lynes (the second largest holding of his work worldwide), Irving Penn, and Joel-Peter Witkin.

Increasingly, museums must operate as businesses in order to make ends meet. In the case of acquisition and exhibition policies, this outlook has led to corporate underwriting as attested to by the many exhibition catalogue forewords that are penned by company CEOs and Chairs of the Board. Such funding opportunities have no doubt assisted museums in a time of ever-diminishing government support, but they have also called into question the viability of curatorial freedom. Of course, curators have long relied on the fostering and maintaining of relationships with collectors (be they individual or corporate), dealers, and artists, making it possible to wonder if there ever

was complete curatorial independence. Nevertheless, following the so-called culture wars of the 1990s, some have argued that museums are no longer willing to absorb the risks implicit in mounting exhibitions of photographers or subject matter that could be taken—or mistaken—as questionable. As the examples of Sally Mann, Robert Mapplethorpe, and Andres Serrano, one person's support of provocative artwork was another person's source of indignation.

Despite and perhaps in spite of such institutional setbacks, public interest in photography remains seemingly insatiable. Any doubt about this was rent asunder by the role photography played—both outside of and within museums—in the wake of September 11, 2001. In two small storefronts in Soho, New York, and just over a mile from the site of the atrocity, thousands of photographs hung from floor to ceiling. Bystanders, residents of New York, and those with a photographic reaction to the events they wanted to share—many of them amateurs without any particular aesthetic or photographic training—in addition to professional photographers contributed their photographs of the events of that day and its aftermath to the display. *here is new york: a democracy of photographs*, as the exhibition was titled, was as remarkable for the overwhelming number of submissions and attendant sales of the images to raise money for victims' children as it was for the astounding numbers who visited this unofficial quasi-museum (more than 100,000 within the first two months). This photographic catharsis of sorts might seem singular or location-specific, yet the museological reaction to September 11 confirmed just the opposite. Across the country, but especially in New York of course, museums installed exhibitions within months of the tragedy. From MoMA's collection-generated *Life of the City* (which included a small-scale installation of *here is new york*) to the New York Historical Society's presentation *New York September 11 by Magnum Photographers*, from the Met's display of historical photographs of the city, entitled *New York, New York*, to the nationally touring *September 11: Bearing Witness to History* from the Smithsonian, museums emerged as spaces for the contemplation and comprehension of the events, a role confirmed by public attendance. Notably, the overwhelming majority of such exhibitions were comprised entirely of photographs. This unity of institutional response suggests that in a time of ever-changing media technologies, photography's lure remains as potent as ever.

Museums and their Collections

Below is a list of selected U.S. museums and a summary account of their history, the size of their

photography holdings, and, when possible, the notable concentrations in the work of either specific periods or individual photographers. This is intended as a sketch, not an exhaustive account, of some of the most significant photographic collections in the United States. For additional information, please refer to the “Further Reading” section below as well as separate entries on individual museums located elsewhere in the *Encyclopedia*.

Art Institute of Chicago

Although its first photography exhibition occurred in 1900, the AIC did not begin a permanent collection until 1949, prompted by Georgia O’Keeffe’s gift of a substantial portion of the Alfred Stieglitz Collection. The AIC would distinguish itself with the purchase of the entire Julien Levy Collection, making it a stronghold of early twentieth-century American and European photography, as well as a gift from Edward Weston of more than 200 photographs. Among its nearly 17,000 photographs, works by Paul Strand, Eugène Atget, and André Kertész are represented in depth.

www.artic.edu

Center for Creative Photography

Located at the University of Arizona, in Tucson, the CCP functions as a museum and archive, claiming more archives and individual works by North American photographers of the twentieth century than any other museum. Such photographers as Ansel Adams, Lola Álvarez Bravo, Richard Avedon, Louise Dahl-Wolfe, W. Eugene Smith, and Edward Weston number among the 180-plus archives housed there. Supporting the archives is an art collection of vintage prints by those listed above as well as Wynn Bullock, Harry Callahan, Andreas Feininger, Aaron Siskind, Frederick Sommer, Edward Steichen, and Paul Strand.

www.library.arizona.edu/branches/ccp/home

J. Paul Getty Museum

The Department of Photographs was initiated in 1984 after one of the largest acquisitions in photo-history. Acquiring the complete collections of Bruno Bischoffberger of Zurich, Samuel Wagstaff of New York, and Volker Kahmen/Georg Heusch located near Bonn, Germany. In addition, the Getty purchased large portions of the American and European collections of Arnold Crane and the early French photographs collected by André and

Marie-Thérèse Jammes as well as a number of more specialized private collections. All told, more than 25,000 photographs, hundreds of daguerreotypes, and albums holding thousands of mounted photographic prints amounted to one of the finest collections ever assembled. Ranging from some of the earliest photographic experiments to the late 1960s, the collection has particular depth in the work of the following photographers who practiced their art in the twentieth century: Eugène Atget, Manuel Álvarez Bravo, Bernd and Hilla Becher, Hans Bellmer, Brassäi, Harry Callahan, Henri Cartier-Bresson, Imogen Cunningham, Walker Evans, T. Lux Feininger, Lewis Hine, Gertrude Käsebier, André Kertész, Yasuo Kuniyoshi, Man Ray, Lisette Model, László Moholy-Nagy, Sigmar Polke, Albert Renger-Patzsch, Alexandr Rodchenko, August Sander, Aaron Siskind, W. Eugene Smith, Edward Steichen, Alfred Stieglitz, Paul Strand, Doris Ulmann, Weegee, Edward Weston, and Garry Winogrand.

www.getty.edu/museum

International Center of Photography

The ICP was founded in 1974 in New York by Cornell Capa, brother of Robert Capa who was known for his intense and proximate views of the Spanish Civil War and the World War II invasion on the beaches of Normandy. Founded to support the legacy of “concerned photography” and serving as both a museum and a school, the ICP’s permanent collection totals more than 60,000 photographs that span the medium’s history. Documentary and human-interest photography dominate the collection in the work of such photographers as Berenice Abbott, Harry Callahan, Capa, Henri Cartier-Bresson, Aaron Siskind, and Weegee. Also of note is the 1990 gift of the Daniel Cowin Collection of African American History and the purchase of the AIDS Graphics collection in 2000. The ICP has also committed itself to emerging electronic imaging media as evidenced by the first triennial of photography and video in 2003.

www.icp.org

International Museum of Photography and Film at George Eastman House

Founded in 1949 with the arrival of Beaumont Newhall. Holds major collections of work by Lewis Hine, Alvin Langdon Coburn, Edward Steichen, and others, including over 400,000 photographs and negatives covering the landmark processes from the technical evolution of the medium. Representing over 8,000 photographers, including most of

MUSEUMS: UNITED STATES

the major figures in photo-history, the collection also boasts one of the largest daguerreotype collections in the world, a large number of early British and French photography, nearly 500 vintage prints by Eugène Atget, and 20,000 prints and negatives bequeathed by the pictorialist photographer Alvin Langdon Coburn. Both Alfred Stieglitz and Edward Steichen donated large bodies of work, the latter numbering nearly 4,300 vintage prints. The Eastman House holdings of Lewis Hine's photography are considered definitive. The collection also encompasses more vernacular and popular forms of photography such as personal albums, stereocards, travel albums, astrological images, lantern slides, and press and war photographs.

www.eastmanhouse.org

Library of Congress

Both the nation's oldest federal institution devoted to culture and the world's largest library, the Library of Congress in Washington, D.C., has collected photographs since 1845. Since then its holdings have grown to include over 13 million photographs, which include negatives, transparencies, and several thousand related books and periodicals. Its particular mission is to amass pictorial documents of the people, achievements, environments, and history of the United States. The Library claims an unsurpassed collection of photographs of the following: the American Civil War, Lewis Hine's work for the National Child Labor Committee, American architecture, Pictorialism, the Farm Security Administration, American news agencies, and photojournalism (e.g., the archives of such periodicals as *Look* and *U.S. News and World Report*).

www.loc.gov

Metropolitan Museum of Art

The Metropolitan Museum of Art, New York, (MMA) acquired photographs as early as 1928 when Alfred Stieglitz made the first of a series of gifts to the institution in the form of 22 of his own photographs. Over the years, curators of the (then) Prints Department added to the collection. In 1992 a separate Department of Photographs was established. Today the collection of more than 20,000 is grounded by four collections acquired over the years. Stieglitz, the museum's first photographic patron proved to be one of its most generous and bequeathed to the museum over 600 photographs from his personal collection. These photographs encompass icons of the Photo-Secession and Pictori-

alism, including three of Edward Steichen's painterly and differently toned prints of *The Flatiron*. In 1987, the Ford Motor Company donated their collection of European and American avant-garde photography. Strongest in the period between the two world wars, works by Berenice Abbott, Brassai, Walker Evans, André Kertész, Man Ray, and László Moholy-Nagy form this collection's core. More recently, the Walker Evans Archive of negatives, personal papers, and collected ephemera joined the department's holdings in 1994 and the Rubel Collection of early British photography was acquired in 1997. Works by such artists as Adam Fuss, Felix Gonzalez-Torres, and Hiroshi Sugimoto represent the MMA's commitment to contemporary photography.

www.metmuseum.org

Museum of Contemporary Photography

Established at Columbia College in Chicago in 1976, it represents a concentrated collection of post-war photography made in the United States. Among its 6,000-plus photographs are the works of such major figures as Harry Callahan, Barbara Crane, Dorothea Lange, David Plowden, Jerry Uselmann, and Louise Dahl-Wolfe. The MCP is deeply devoted to the work of photographers from the Midwest. Since 1982, its "Midwest Photographers Project" has regularly highlighted the work of both established and emerging regional photographers.

www.mocp.org

Museum of Modern Art

The first and frequently considered to be the most influential of all photography departments, MoMA, New York's first photography acquisition occurred in 1930. The department was formed 10 years later. The collection has grown to encompass over 25,000 works from the dawn of photography to the present, many by the recognized masters of the photographic canon.

www.moma.org

Museum of Photographic Arts

Founded in 1983 and located in San Diego, California, the Museum of Photographic Arts (MoPA) is yet another museum devoted exclusively to photography. MoPA in fact collects, as it calls it, "the entire spectrum of the photographic medium." In its collecting, the Museum attempts to trace the entire history of photography and also focuses on the materials and documents related to the history and process of

photography. The collection is strong in early twentieth century masters, Latin-American artists including Mario Cravo Neto, Graciela Iturbide, and Sebastião Salgado, photojournalism, post-World War II American photography, and social documentary and Soviet Russian photography, including works by Russian Constructivist Alexandr Rodchenko.

www.mopa.org

San Francisco Museum of Modern Art (SFMoMA)

Distinguished as one of the oldest photography collections in the United States, SFMoMA began acquiring photographs in 1935 from local contemporary photographers who would quickly come to prominence across the nation as the f/64 Group. Works by Ansel Adams and Imogen Cunningham numbered among its earliest acquisitions. In the 1950s and 1960s, photographs by Jack Delano, Walker Evans, Dorothea Lange, Russell Lee, Arthur Rothstein, Alfred Stieglitz, Edward Weston, and Marion Post Wolcott were acquired. Today, SFMoMA holds one of the nation's foremost collections of photography.

www.sfmoma.org

Whitney Museum of American Art

Although photography featured in early exhibitions overseen by Gertrude Vanderbilt Whitney as far back as 1917 and has appeared in Whitney Biennials since 1977, the Whitney Museum's Photography Collection was not formally established until 1992 with the first full-time curator appointed seven years later. The exclusively American collection now numbers well over 2,000 photographs.

N

HANS NAMUTH

German

Hans Namuth, best known for his portraits of artists, began his career as a photojournalist and enjoyed commercial success as an advertising photographer. Namuth's status in twentieth century photography, however, rests on his sensitive portraits of artists and other creative people. His reputation as a portraitist was established by his photos of the preeminent Abstract Expressionist painter, Jackson Pollock. Unlike his predecessors, Pollock worked with unprimed, unstretched canvases placed directly on the floor of his studio, fostering a dynamic technique with his media: he moved energetically around his canvas, stepped directly onto it, and attacked the surface with unprecedented vigor. Documenting Pollock's movement, in both still photography and film, Namuth emphasized the performative aspect of this artist's technique. Indeed, Namuth's recording of Pollock's energy is so closely aligned with the artist's "classic" phase that the canvases are rarely considered without reference to Namuth's photographs of their creation.

Namuth's career as a photographer consists of two distinct phases interrupted by the tragic effects of Nazi Germany and World War II. Born in Essen, Germany in 1915, Namuth was arrested by Nazis in

his hometown in 1933 for distributing anti-Hitler leaflets. His father, a member of the Nazi party, secured his release and supplied him with an exit visa enabling Namuth to flee to Paris. A fellow German acquaintance in Paris, Georg Reisner, introduced Namuth to commercial photography. Learning the trade from Reisner, Namuth sold his work to Alliance Photo and Three Lions who placed his work in publications such as *Paris-Match*. In 1936, Namuth and Reisner were assigned by *Vu* to cover the Workers' Olympiad in Barcelona. Coincidentally, they arrived to cover the event the day before the Spanish Civil War began. They photographed the war for *Vu* and other European publications, eventually leaving Spain to work as freelance photojournalists in France for the remainder of the decade.

In 1939, when France declared war on Germany, Namuth was interned and eventually joined the French foreign legion. He was discharged a year later (1940), fleeing to Marseilles and eventually securing passage to New York in 1941. In an effort to secure Reisner's freedom, Namuth sold his camera, but his friend committed suicide in late December before leaving France. Initially, Namuth worked in menial positions at various commercial photography studios in New York City. In January

1943, he joined the U.S. Army and left for Europe in December of that year. Namuth was discharged in October 1945, returned to the United States, and pursued photography as a hobby. However, in 1946, when the company he worked for, Tesumat, Inc., went bankrupt he returned to photography as a profession.

In 1946, Namuth traveled to Guatemala and photographed the natives of Todos Santos in collaboration with anthropologist Maud Oakes. These works were exhibited the following year at the Museum of Natural History in New York. During this period, Namuth took a few classes with Josef Breitenbach, an acquaintance from his days in Paris, at the New School for Social Research. Thereafter, he studied with Alexey Brodovitch, his most important influence, in an informal class taught at Richard Avedon's studio. Brodovitch, the art director of *Harper's Bazaar*, provided Namuth with numerous opportunities in fashion and advertising photography, and from 1949 through the mid-1950s, Namuth routinely published photographs in this magazine. Simultaneously, he worked on advertising campaigns for clients like Ford Motor Company and Shell Oil for some of New York's most prestigious advertising agencies, such as Pix Corporation and Doyle, Dane and Bernbach. Frequently, Namuth incorporated children into his assignments, taking pride in his avoidance of traditional poses by shooting his subjects as they played once they were no longer conscious of the camera's presence. This technique became a hallmark feature of his subsequent portraits of artists, architects, writers, and composers.

During this period of commercial success, Namuth sought ways to satisfy his ambitions as a creative artist. At an opening for Long Island artists, Namuth introduced himself to Jackson Pollock and asked if he could take pictures of him at his studio. Pollock had previously been photographed by Martha Holmes and Rudolph Burckhardt but was inclined to avoid photographers. Nevertheless, Pollock invited Namuth to his studio in late July 1950, and over the next four months, Namuth shot countless photographs and directed two short films of Pollock and his work. While neither Holmes nor Burckhardt had secured Pollock's confidence to such a degree that he was willing to paint in front of them—their photographs are staged with the artist posed as if painting—Namuth gained Pollock's trust and was allowed to shoot the artist as he worked.

Due to flaws in the lens of his camera, Namuth used prolonged exposure times, which emphasized the artist's movement; the scale of the canvases

is reiterated by the blurred movement of the artist darting in and around the surface. This frozen-in-time movement has been cited as the source of Harold Rosenberg's formulation of the concept of "Action" painting in his landmark essay, "The American Action Painters." However, this supposed influence is based on flawed conclusions; not only did Rosenberg deny this influence, but he developed his concept of "Action" before he saw Namuth's photographs. Nonetheless, Namuth's photographs and films, Pollock's canvases, and Rosenberg's essay were vital resources for the following generation of American artists who found in the work of all three men a new approach to art-making that encouraged such postmodern developments as conceptual art, installation art, and performance art.

Aware that Pollock's physical encounter with his canvases was a quality that his camera could merely suggest, Namuth convinced Pollock that filming him would be even more compelling. Initially filming in black-and-white from afar, Namuth disliked the results. He struck upon the idea of Pollock painting on glass with the camera directly beneath the surface. Namuth convinced the artist of this project and, shooting in color, he finished filming on Thanksgiving Day, 1950.

Namuth's career as a portraitist took off after the photographs of Pollock were published in *Art News* and *Portfolio* in 1951. Gaining the trust of his subjects, Namuth photographed countless artists in their studios, often while they were working. One of his most compelling portraits was of painter Barnett Newman in 1951. The opposite of the performance-based photographs of Pollock, this portrait nonetheless typifies many of Namuth's compositional conceits. He preferred to show artists *mise-en-scène*, surrounded by his or her work. In the case of Newman, the artist contemplates a few paintings propped against a wall in his studio; light from the windows bathes the scene with a somber mood that parallels Newman's interest in the sublime.

Namuth published his portraits of artists, writers, architects, and composers in many of the most recognized magazines of the 1950s and 1960s, such as *Harper's Bazaar*, *Holiday*, *Cosmopolitan*, *Vogue*, and *Fortune*. He published many cover portraits for *Art News* from the early 1970s until 1983. In the 1980s, Namuth also worked closely with *Architectural Digest* and *Connaissance des Artes*, publishing numerous portraits for both magazines. One of his most significant collaborations was with Brian O'Doherty on the book *American Masters*, which was published in 1973. Namuth worked

on this project for 10 years, and it resulted in his most successful exhibition, *American Artists*. During this period, Namuth directed and produced many films of such luminaries as painters Willem de Kooning and Josef Albers, architect Louis Kahn, and sculptor Alexander Calder.

Namuth's skill at disarming his often formidable subjects and capturing them in unstaged situations that revealed the intimacy of the act of creation left him without an easily identifiable "signature" style, unlike many other well-known portraitists. He died in New York in 1990, however, leaving a visual legacy that not only documented the American art world of the latter half of the twentieth century, but considerably enriches its understanding.

Biography

Born in Essen, Germany, 17 March 1915. Opened photography studio with Georg Reisner in Puerto da Pollensa, Majorca, 1935. Photojournalist for *Vu* during Spanish Civil War, 1936. Joined French Foreign Legion, 1939. Demobilized from French Foreign Legion, 1940. Arrived in New York City, 1941. Began military service in U.S. Army, 1943. Discharged from U.S. Army, 1945. Traveled to Guatemala and photographed natives at Todos Santos, 1946. Studied photography with Josef Breitenbach and Alexey Brodovitch, 1949. Photographed and filmed Jackson Pollock at work, 1950. Published photographs of Pollock in *Portfolio* and *Art News*, 1951. Began photographing for *American Masters*, 1963. Filmed *Willem de Kooning: The Painter*, 1964. Produced numerous commissioned portraits for the cover of *Art News*, 1971–1983. Portrait commissions, *Architectural Digest*, 1983. Published more than 100 portraits of artists in *Connaissance des Arts*, 1983–1990. Received special recognition at Recontres Internationales de la Photographie d'Arles, 1988. Died in East Hampton, New York, 13 October 1990.

Individual Exhibitions

1948 *Guatemala: The Land the People*; Museum of Natural History, New York, New York, and traveling
 1959 *17 American Painters*; Stable Gallery, New York, New York
 1973 *American Artists*; Castelli Gallery, New York, New York
 1974 *American Artists*; Corcoran Gallery of Art, Washington, D.C.
 1975 *Early American Tool*; Castelli Gallery, New York, New York, and traveling
 1977 *The Spanish Civil War*; Castelli Graphics, New York, New York
 1977 *Living Together*; Benson Gallery, Bridgehampton, New York

1978 *Small Retrospective*; Himmelfarb Gallery, Water Mill, New York
 1979 *Todos Santos*; Castelli Graphics, New York, New York, and traveling
 1979 *Jackson Pollock*; Museum of Modern Art, Oxford, England, and traveling
 1980 *Pictures from the War in Spain, 1936–1937*; Galerie Fiolet, Amsterdam, The Netherlands
 1981 *Artists 1950–1981: A Personal View*; Pace Gallery, New York, New York
 1982 *Hans Namuth*; Castelli Gallery, New York, New York, and traveling
 1988 *Hans Namuth*; Recontres Internationales de la Photographie d'Arles, Arles, France
 1990 *Portraits of Artists*; Parrish Art Museum, Southampton, New York
 1999 *Hans Namuth, Portraits*; National Portrait Gallery, Washington, D.C.

Group Exhibitions

1975 *The Photographer and the Artist*; Sidney Janis Gallery, New York, New York
 1977 *Hommage à Pollock et à Kline*; Galerie Zabriskie, Paris, France
 1979 *Self-Portrait*; Center for Creative Photography, Tucson, Arizona
 1982 *Counterparts: Form and Emotion in Photographs*; Metropolitan Museum of Art, New York, New York
 1983 *Portraits of Artists*; San Francisco Museum of Modern Art, San Francisco, California

NATIONAL GEOGRAPHIC

It was common practice in the 1880s in the American capital for scientific associations and other societies to form, duplicating similar men's clubs and other associations so widespread in Great Britain. *National Geographic* magazine was started by the National Geographic Society in January 1888 by 33 individuals in downtown Washington, D.C. The organization elected Boston attorney and philanthropist Gardiner Greene Hubbard as its first president. The invitation dated 10 January 1888 to that 13 January organizational meeting at the Cosmos Club's Assembly Hall stated clearly that it was "for the purpose of considering the advisability of organizing a society for the increase and diffusion of geographical knowledge."

The *Washington Evening Star* coverage of the founding of the society consisted of one paragraph on the front page of its four-page edition. The article listed its officers and its objectives.

To publish and disperse the lectures delivered by members, the inaugural issue of a thin *National Geographic* magazine appeared in October 1888. Directed by a committee of mostly academicians, the publication would be considered dry and dull by any standards. Likewise, the plain-looking, terracotta-colored cover would not win any design contests. That initial press run with a cover price of 50 cents was sent to 200 charter members of the society who undoubtedly would enjoy reading such articles as "Geographic Methods in Geologic Investigation" or "The Classification of Geographic Forms by Genesis." Even nonscientific readers, if there had been any at that time, might enjoy "Fighting for Life Against the Storm" in that inaugural issue. Written by Everett Hayden, the article scientifically depicted the blizzard of 11 to 14 March 1888 in the northeastern United States and emotionally described the harrowing adventures of New York pilot boat No. 3.

It would take seven months for the second issue of *National Geographic* to be produced. The volunteer staff waited until there were enough dissertations or academic lectures to fill another volume. The April 1889 main feature was "Africa, Its Past and Future."

Despite their individual price of 50 cents, *National Geographic* subscriptions were given free

as an incentive bonus for members who paid their yearly dues of \$5. Lifetime memberships were available for \$50. Even with low prices, membership in the society only reached 1,178 by 31 May 1895.

Future issues would be published more regularly, and by January 1896, the magazine became a monthly with a lowered sales stand price of 25 cents. The terra-cotta cover was replaced with a buff color. The contents, staff, authors, and the legend "An Illustrated Monthly" appeared on the cover.

The September 1896 issue contained an article and photo spread titled, "The Recent Earthquake Wave on the Coast of Japan," that occurred on 15 June of that year. Produced by Eliza Ruhamah Scidmore, an associate editor and the only woman serving on the board at that time, the striking photographs showed floating corpses, beached ships, and splintered homes.

Even more surprising to readers was the November 1896 issue, which featured the first of what were to be many photographs of topless female natives to grace the pages of *National Geographic* magazine. Titled "Zulu Bride and Bridegroom," the picture is a wedding portrait in which the two are looking into the camera while shaking hands, perhaps a sealing of their recently exchanged wedding vows.

Notwithstanding its modest redesign, the provocative photographs, the occasional nontechnical article, and the claim to being "An Illustrated Monthly," *National Geographic* continued to be produced by a volunteer committee of those who desired a more academic approach to the subject of geography within its pages.

Hubbard died in 1897 with the society in debt for \$2,000. He was succeeded reluctantly in January 1898 by his 51-year-old son-in-law, Alexander Graham Bell, who continued to devote considerable time working on his inventions of a flying machine and a method to record sound. Bell was not a geographer nor interested in what he deemed to be primarily a local social club. Other than paying his dues, Bell had not participated actively in the organization. His eventual acceptance of the offer was based more on family loyalty to the dream of his father-in-law than geographic aspirations. After a few months of minimal growth in membership or

circulation, however, Bell announced his intention of turning *National Geographic* into a higher quality publication. He proposed increasing circulation by relying less on newsstand sales and more on membership expansion. His thoughts were that people would be interested in geography only if it were presented in an entertaining way. The phrase “to sugarcoat the pill” was mentioned frequently after Bell took over the reins of the organization. Bell also expressed a desire to use photographs that went along with the articles, rather than the occasional pictures or maps that were independent of any text.

Bell made another decision that would have an impact on *National Geographic* for decades. He hired a full-time editor with writing and editing skills. His idea to hire an editor may have met more resistance from the volunteer editorial staff until they learned Bell would pay the individual out of his personal funds. Gilbert Hovey Grosvenor had helped with proofs and layout of his historian father’s two-volume *Constantinople* in 1895, considered by many to be the first scholarly book to use abundant photographs. Asked if he could turn *National Geographic* into a magazine as popular as others of the day—*Harper’s Weekly*, *Munsey’s*, *The Century*, *McClure’s*—the 23-year-old schoolteacher and graduate student told Bell that he could, but that it would take time.

Grosvenor turned down Bell’s offer of substantial monetary assistance accepting a monthly salary of \$100, which was considerably less than what he was earning as a teacher of languages, chemistry, and algebra at the New Jersey Englewood Academy for Boys.

On 1 April 1899, Grosvenor began his tenure at the publication. Bell showed him the society’s small rented office, half of which had to be shared with the American Forestry Association. Noticing the lack of a desk, Bell told the young hire he would send his own desk to the society’s headquarters for his use. That afternoon a walnut rolltop was delivered. Crammed into the small space were six large boxes full of *National Geographic* magazines that were returned unsold from newsstands. Despite Bell’s original offer, the job was not that of managing editor, but only as assistant editor and only for a three-month trial period.

With what can now be seen as an early example of direct marketing, Grosvenor was successful in recruiting additional members for the society by sending an impressive personal letter on quality stationery to prospective nominees. His efforts were not overlooked by the editorial committee. Bell tore up the three-month contract before the

end of April and confirmed Grosvenor’s appointment as assistant editor for one full year. The June issue listed the new assistant editor. It appeared below that of John Hyde, editor, and all 12 associate editors. The editorial committee was so appreciative of Grosvenor’s recruiting drive, however, that it voted to give him wide powers, including continuing solicitations.

Grosvenor, like Bell, realized that offering the magazine as a bonus for membership would be successful only if the publication proved interesting reading. Geography would have to be transformed from a dull, academic subject to a popular, entertaining topic. Grosvenor told Bell that the Greek root word for geography means a description of the world. Therefore, such universal topics as people, plants, animals, birds, and fish would be suitable topics for the pages of the magazine. Bell offered his support, agreeing that illustrations and maps would make *National Geographic* more readable for laypersons.

Grosvenor received a stamp of approval from the board of managers in September of 1900 when it named him managing editor and raised his annual salary to \$2,000. He continued to improve the publication by printing shorter articles of more general interest. He thought that readers in the United States would be interested in stories and photographs of their newly acquired possessions—Cuba, Puerto Rico, and the Philippines. He was able to obtain inexpensive photographs from national government agencies and used the new photoengraving method to reproduce them for *National Geographic* magazine. In December 1904, while he was facing a deadline with 11 pages that were still empty, a Russian explorer’s unsolicited package of 50 photographs arrived on his desk. He went out on a limb when he decided to use several pictures of the mysterious “forbidden city” of Lhasa in Tibet for those 11 pages in the January 1905 issue. The photographer’s only requested payment was a credit line. Rather than being dismissed for such action, as he expected, Grosvenor was congratulated and thanked by members. He was voted onto the ruling board and the executive and finance committees. A French ambassador complimented Grosvenor with the Legion of Honor for his efforts to “vulgarize geography.”

A short time later there was a repeat of the previous success. William Howard Taft, former governor-general of the Philippines and now secretary of war, offered his second cousin, Grosvenor, photographs of the island nation. The April 1905 magazine printed 138 photos on 32 pages. That issue was so popular in building membership that

an extra press run was required to meet demand. The year started with 3,400 members for the society, but by December 1905 there were 11,000. Grosvenor would provide direction for the National Geographic Society for the next 66 years.

Those multiple-page spreads and the introduction of color photography by 1910 transformed *National Geographic* magazine into the top tier of photojournalism. Noted journalism historian Frank Luther Mott said that the use of color transformed the magazine into its own class of publication. Grosvenor had experimented with color in 1906, using it with maps in the August and September issues. That same year saw another first in the pages of *National Geographic*, several flashlight photographs of animals at night. Taken by George Shiras III, these included deer, fish, and porcupines. In the November 1910 issue, the publication ran the biggest collection of color pictures to appear in a single magazine up to that time. Covering 24 pages, the hand-tinted spread was titled "Scenes in Korea and China." Another common sight today, the foldout photograph, started in 1911. A large panoramic shot of the Canadian Rocky Mountains unfolded into a seven-inch by eight-foot keepsake.

The society's first of many monetary grants, now that it was on solid financial footing, was awarded in 1906 to Commander Robert E. Peary in the amount of \$1,000 to help fund his exploration of the North Pole region. (Peary, in fact, had been featured in an article in the first *National Geographic* back in October 1888. It described the young civil engineer's explorations in search of a proposed ship canal through Nicaragua.) That first grant was followed by one less publicized for \$25,000 to pay for his 1909 North Pole discovery. Over the next few years, National Geographic Society became embroiled in a prolonged controversy as to whether Peary or Dr. Frederick A. Cook was the first to actually discover the North Pole. With the *National Geographic* backing, both financially and in print, Peary became unofficial winner. The controversy paid off for the magazine, whose circulation figures jumped to 107,000 by 1912.

Earlier expeditions had been sponsored by the society, however, including its first in 1890 and 1891 for mapping Mount St. Elias along the uncharted border between Alaska and Canada. During that outing, the explorers discovered Mount Logan, Canada's highest peak at 19,524 feet. Since the society did not have funds at that time, Hubbard provided the money for that northern trip. The organization's fortune was secure enough by 1911 that Grosvenor declared that it would provide 15 percent of its dues revenues to support expeditions and

research proposals every year. He also realized that explorers needed to take cameras along to record their discoveries. One rule to photographers was to avoid getting Westerners in the shot, thus contaminating the picture. Society-sponsored expeditions from 1912 to 1915 led to restoration of Machu Picchu, the ancient city of the Incas, in the Peruvian Andes. A \$10,000 grant in 1912 allowed its discoverer, charismatic Yale professor Hiram Bingham III, to fill an issue of *National Geographic* with "In the Wonderland of Peru." The coverage included maps, drawings, a now-common foldout panorama, and 234 photographs taken by Bingham with a magazine-supplied camera.

More flashlight photos ran in 1913, but this time Shiras had the animals trip a wire to take their own pictures. The series was another step of aligning the magazine with a growing conservation movement by shooting with cameras, not guns.

While vacationing in Europe in 1913, Grosvenor saw signs of war. Arriving back at the office, he had 300,000 maps of Europe produced for insertion into *National Geographic* ready for when the battles began the following year, beginning the long tradition of map inserts. Similarly, in 1918 the magazine printed a map showing troops along the Western Front. Americans wanted to know where their soldiers were fighting and the map became required reading for that purpose. Circulation continued to skyrocket, even during the war when many other publications saw declines. In 1914, the number was 285,000. At war's end, four years later, it had jumped to 650,000. Two years later, with the former-isolationist United States a world power, circulation leaped beyond three-quarters of a million.

From 1916 to 1921, with the help of its members bestowing individual gifts along with the society donations, the organization was instrumental in purchasing land to protect the West Coast's giant sequoias and redwoods. The next popularization project was massive, stemming from a January 1924 article on Carlsbad Caverns in southwest New Mexico. More photographs appeared in a September 1925 follow-up story.

Advancements in aviation enabled Grosvenor to publish aerial photographs. *National Geographic* readers in 1922 were entertained with "Fighting Insects with Airplanes: An Account of the Successful Use of the Flying-Machines in Dusting Tall Trees Infested with Leaf-Eating Caterpillars." Other aerial subjects included the Alps, the Amazon, the Andes, the Arctic, Canada, Mount Everest, and Palestine.

Another society-sponsored trip to the North Pole was successful on 9 May 1926. This one was by

airplane with Navy pilots Robert E. Byrd Jr. and Floyd Bennett. *National Geographic* took advantage of the publicity and the popular Byrd received the society's highest award, the Hubbard Gold Medal, the following month. Grosvenor would continue supporting Byrd, and the young pilot would continue promoting *National Geographic* as well as supplying it with aerial and traditional photographs. The society provided a \$75,000 grant for Byrd's flights over the South Pole and surface explorations of Antarctica during all of 1929.

After providing aerial photographs, *National Geographic* decided to take cameras underwater for its readers. In January 1927, an expedition produced color photos below the Gulf of Mexico near the Dry Tortugas, small islands west of the Florida Keys. The camera was sealed in a brass box with a glass window for the lens. Shots taken below 15 feet of the surface needed auxiliary light, provided by the flash of one pound of magnesium powder. The dangers of this assignment were evident when one ounce exploded early, severely burning W.H. Longley, a zoologist.

Borrowing photographic plates from Europe, chief lab technician Charles Martin was able to use them for color photographs taken from dirigibles. The September 1930 magazine carried what was claimed to be the first-ever color photo taken from the skies. The plate was directed at the U.S. Capitol from the Goodyear airship *Mayflower*. Its motors had been turned off to eliminate vibrations. Other scenes captured Washington, D.C. and New York. They were taken by Grosvenor's son, Melville Bell Grosvenor, newly appointed assistant editor of *National Geographic* and a graduate of the Naval Academy.

The magazine was the first to print aerial photos proving the earth's curvature. In November 1932 it published the moon's shadow on earth during a solar eclipse. In 1936, it produced the first color shot of the sun's corona during a total eclipse. Thanks to George Eastman that same year, Kodachrome film became available in rolls, eliminating the clumsy, heavy, and often fragile glass plates that previously had to be used.

The rush to deadline in 1905 that caused that first photo spread was no longer a problem at National Geographic. In fact, by the mid-1940s, the magazine had a supply of 350,000 unused photos in its files, along with several thousand unpublished articles.

Grosvenor retired in 1954, and three years later his son took control of the magazine. He beefed up the international staff, hiring 50 full-time writers and 15 full-time photographers. The now common photo cover was started in 1959.

It did not take long for *National Geographic* to rise to the top of a photographer's dream assignment. Not only was there excellent color reproduction of their creative work on thick, quality paper, but the contracts paid top dollar. Also reimbursed were the complete expenses of photographers on location, typically to exotic locations for extended periods of time. One calculation put the number of 36-exposure rolls of color film shot in a typical assignment at 250 to 350. The average appearing in the magazine's main feature is 30 to 40 prints.

Veteran photographers who have enjoyed a long association with *National Geographic* include Sam Abell, William Albert Allard, James P. Blair, Jonathan Blair, Sisse Brimberg, Jodi Cobb, Reza Deghati, David Doubilet, David Alan Harvey, Chris Johns, Ed Kashi, Karen Kasmauski, Emory Kristof, Joe McNally, Joel Sartore, James Stanfield, and Alex Webb.

Today *National Geographic* with its familiar yellow border boasts a paid circulation of about 9 million and a monthly readership of 40 million. The average subscriber is 56 years old with a median household income of \$81,700. Several foreign-language editions have been launched over the past decade. There are now 25 editions in 23 languages other than English. Its interactive website, started in July 1996, was redesigned in September 2000. Its online store offers books, guides, posters, prints, cameras, and equipment.

Spin-off magazines—such as the 1 million copies of *National Geographic World*, introduced for junior members in 1975 and renamed *National Geographic Kids* in 2002, and the 1.2 million circulation of *National Geographic Adventure*, launched in 2001 and aimed at the 18- to 34-year-old market—and hundreds of books have provided additional outlets for photographers over the years. Its first feature film, "K-19: The Widowmaker," was released in July 2002.

PHOTOGRAPHY IN THE NETHERLANDS

Photography is seen and practiced as a flexible medium by most photographers in the Netherlands. Long a center of innovative design, architecture, and art education, photography's various usages in the Netherlands have created a heterogeneous field, wherein little importance on aesthetic purism is placed. During the 1970s, throughout most of Europe, only occasionally would interesting exhibitions of photography be presented to the general public that would arouse and sustain interest in the medium as reflective of the spirit of our time and that illustrated photography's unique value.

In the Netherlands, only the Prentenkabinet of the University of Leiden had a relatively good collection of Dutch photography and a small number of important photographs from abroad. Besides this, few art connoisseurs and a very small percentage of the Dutch population knew about photography and photographers of their own countries and of other countries. Galleries seldom held photography exhibitions, and museums had only a few important shows. Of the prewar era, only Paul Citroen, Paul Schuitema, Piet Zwart, Jan Kamman, and Ed van der Elsken were internationally known.

In the early 1970s, there was an infusion of new energy into photography. The situation rapidly changed with the opening of two photo galleries in Amsterdam in 1974: first the Canon Photo Gallery and one month later, Gallery Fiolet. As a consequence, the Stedelijk Museum and the Rijksmuseum in Amsterdam became more interested and started to collect photographs and regularly organize photo exhibitions. All these activities, together

with the interest of the press, helped to bring a new awareness of photography to the public.

Another important aspect is that, today, photographic equipment (analogue and digital) lies within everyone's reach and the step to a start in photography has become much smaller. Young people can try more easily to photograph and are more likely to present the results to qualified people who might give them the chance to exhibit what they are doing, how they are doing it, and to outline the dimensions of their exploration.

The photographers with a humanistic vision in the 1950s were Ed van der Elsken, Dolf Toussant, Dolf Kruger, and Violette Cornelius. They stimulated a group of "people photographers" as Sem Presser, Kryn Taconis, Cas Oorthuys, Eva Besnyö, Maria Austria, Aart Klein, Emmy Andriessse, Carel Blazer, Charles Breijer, and Ad Windig. In the 1960s, photographers such as Sanne Sannes and Gerard Fieret started a new concept with the dynamic use of the camera to create strong black-and-white pictures.

In the present situation of photography in world culture, more and more individual and organized activities are taking place. With an increase in books, catalogues, magazines, and printed matter, the Dutch museums of contemporary art have demonstrated great interest in this medium, giving to it a place of primary importance by holding several important one man shows and historical exhibitions, thus closing a gap of several years of almost complete inertia. They started several new initiatives in the 1990s: Nederlands Fotoarchief (1989), het Nederlands Fotogenootschap (1991), het Neder-

lands Foto Instituut (1994), het Nederlands Fotorestauratie Atelier (1994), Huis Marseille in Amsterdam (1999), het Fotomuseum Amsterdam (2001).

The Hague Museum of Photography opened at the end of 2002 with the successful exhibition *Photographers in the Netherlands 1852–2002*. Each year, the museum presents at least four interesting up-to-the-minute exhibitions, focusing sometimes on established names and sometimes on new talent. The museum works with the University of Leiden Print Room, which possesses one of the largest and most important collections of historical photographs in Europe. The museum shares premises with the GEM, a new museum of contemporary art which aims constantly to juxtapose work from The Hague, The Netherlands, and the wider world. Its exhibitions encompass a wide range of disciplines: video and other installations, painting and sculpture, multimedia, performance art, film, photography, drawing, digital art, and design. Apart from exhibitions, the GEM is a venue for a range of other activities such as lectures, discussions, performances, concerts, film shows, and book presentations.

The Maria Austria Instituut in Amsterdam is famous for archiving. Within its collection are the complete works of Eva Besnyö, Louis van Beurden, Carel Blazer, Hein de Bouter, Fred Brommet, Hans Buter, Hans Dukkers, Paul Huf, Frits Gerritsen, Henk Jonker, Wubbo de Jong, Wim van der Linden, Frits Lemaire, Philip Mechanicus, Wim Meischke, Boudevijn Neuteboom, Ad Petersen, Jaap Pieper, Arjé Plas, Sem Presser, Kees Scherer, Robert Schlingemann, Nico van der Stam, Waldo van Suchtelen, Ed Suister, Jan Versnel, Johan Vigeveno, Ad Windig, Bram Wisman, Eli van Zachten, Wim Zilver Rupe, Maria Austria, and the KLM Archive.

Examining photographers today it is clear that their pictures are refreshingly new pictures with a motivated statement in which feeling and experiences are the basis of a new visual dialogue. Several Dutch photographers share a Dutch way of composing the image, the use of space and light, and the timing is similar in many photographers as is the constant research into mystery, the creation of patterns of light, shadows, abstractionism, and a certain “surreal esprit.” Their work has roots that go back in history to where the enigma of space, light, and the depth of luminous tones were the ingredients in the works by great masters. The proper use of light can make the ordinary seem unusual, it can reveal the unfamiliar, evoke moods and emotions, and together with the use of space and the timing it can exert a grip on the spectator.

Seen from the point of view of semiotics or sign theory, photography possesses above all an essential

indexical character, because as an imprint of light the photographic image is directly and physically connected to its referent. Every photograph thus is a unique trace of the real. This results in the “unavoidable feeling of reality that you can’t get rid of, even though you know all the codes that are in the game and which are fulfilled in the production.” If the viewer sees the photograph as an index, then the mimetic and the symbolical play a subordinate role. The work of Paul Huf and Eddy Postuma de Boer provide examples of this tendency.

On the other hand, the photograph is only pure index for a brief moment, because as soon as it is viewed, it has been separated from reality. The principle of photographic space-time distance is a counterpoint to the indexical principle of physical proximity. The photograph is the memento of the definite lost, and herein lies its fictional potential: it is open for any narrative the viewer can (re)construct. The works of Jan Dibbets and Ger van Elk are representative.

The photographers from the Netherlands use various aspects of growth and decay. Contemporary photographers doing so are Frans Lanting, Anton Corbijn, Rineke Dijkstra, and Inez van Lamsweerde.

Contemporary photography in the Netherlands can be considered as an autonomous discipline, and it would be more useful to analyze its applications in other fields. In the first place, contemporary photography is characterized by an approach to photography that actually does depart from reality, yet renders this reality from a very specific angle/perspective as a result of the photographic technique and design it employs. In particular, the processes that are typical of the medium of photography, for instance, repetition, paradox, and the gap between actual reality and its representation, are often recurred to. This contemporary, emphatically visually oriented photography is characterized by a certain degree of alienation from reality as the latter can be perceived and often stands out by its markedly illusory character.

Photography is able to create a duplicate world/reality that is of a more dramatic nature than the natural world. By imaging this reality in a fragmented manner, the photographer suggests that there is a need for another, a second reality, which ought to be conquered by the photographer.

In the second place, one needs to point out that contemporary photography is quite ambiguous. It consists of showing a parcel of reality, framed by the camera or in the darkroom, and—considering the objective nature of this procedure—is entitled to lay serious claims to thorough epistemological validity or genuine knowledge of reality. In addi-

tion to this, it is at the same time a calling into question of the reality value of a given image and of the manner in which the objective is being “dis-objectified” by the subjectivity of both the creator and of the spectator, which, in turn, is enhanced by contextual influences on and conditioning of both of these. This very ambiguity has been called the paradox of photography. The art of photography presents this paradox in its most acute and incisive manner. Each and every photograph constitutes a *doxa*: it is reality as it is, quite often with conclusive argumentative evidence.

The argument departs from the assumption that photographs are taking over the place of reality, because of the simplified and at the same time credible image that they produce of it. As such, Sontag’s theory hardly pertains to the pictures by Jo Brunenberg, who makes the phallic nature of flowers and the flower-like aspects of the penis merge, and does so via the intimacy of partial images, which are kept almost pictogrammically small.

The American essayist Susan Sontag goes so far as to label the discoveries of the 1980s as “marginal,” and adopts a polemic stance with regard to the inclination of both photographs and critics to cluster in schools. According to her line of reasoning, and as opposed to the art of painting, there is only one type of photography and, as a whole, it is of an overall eclectic and global nature, operates by annexation, and is closely connected with reality.

Theo Derksen is another photographer who brings together visual images that form a moving portrait of human existence. The photographs by

Theo Derksen reveal the movement and rhythms of life, the volatile mysteries, and the loneliness. His photographic imagery shows a sharp-minded but passionate vision of every life. They give voice to the silent spirit of every man, every woman, and every child who struggles to survive in a conflict-prone world. By photographing out of focus, Theo Derksen denationalizes well-known geographical locations, which after they have been mixed up form a new, admittedly non-existent country. And that is perhaps the thread in this overview: the ambivalence between photography’s reference to reality and its openness for the imaginary is especially interesting for artists who are investigating how place and the perception of it can be represented.

BEAUMONT NEWHALL

American

Beaumont Newhall, a gracious and learned New England patrician, was a pioneering historian, a consummate scholar, an enthusiastic teacher, and a photographer. His unprecedented seven-decade career as curator, museum director, art historian, teacher, scholar, author, librarian, and photographer established photography’s vital role in art history. Working in partnership with his wife, Nancy, also a native

of Lynn whom he married in 1936, Newhall created a basic framework for the discipline of modern photographic history. He felt his involvement with the history of photography, which he understood to be fluid and always changing as more understanding is achieved, was his greatest accomplishment, not his achievements at any single institution. *The History of Photography from 1839 to the Present Day*, is a founding document for the field. Understandable to the general public and valuable to scholars as well,

the book has gone through five editions. His message was clear: that photography is a fine art on par with all other arts, painting, sculpture, prints, architecture, and film.

Newhall was instrumental in the creation and development of the department of photography at the Museum of Modern Art (MoMA). He continued on to a distinguished and innovative career as curator and director of the George Eastman House in Rochester, New York, and later as teacher at the University of New Mexico creating a foundation that set standards for photographic scholarship. He enthusiastically shared his knowledge and insight with students, scholars, colleagues, and people around the world, setting an inspirational example. He encouraged many of his students to pursue careers in photography and then generously helped launch those careers. Many became historians and curators who have ensured photography's remarkable stature and popularity.

Newhall's philosophy is best summed up in his own words

History is research, and history is interpretation, and history is presentation—in that order. Research is the easiest to learn and the most fun. The interpretation becomes difficult and the presentation requires a real stage-setting and careful structuring—even the shortest piece I do is structured.

Beaumont Newhall was born in Lynn, Massachusetts in 1908. When he was 15, he taught himself film processing in his mother's darkroom, where she made portraits of family and friends. He dreamed of going to Hollywood and becoming a film director but attended Harvard University to study art history, graduating in 1930. A year later he obtained a master's degree, having participated in Paul Sachs's famous museum studies course, which appealed to Beaumont for its "hands on" approach.

In 1936, Newhall was offered a job as librarian at the new MoMA by director Alfred Barr, also a product of Sachs's Harvard class. Shortly thereafter, Newhall was allowed \$5,000 to mount the first exhibition of the history of photography. The result was one of the most ambitious and wide ranging photography exhibitions ever assembled. Opening spring 1937, Newhall's landmark survey *Photography 1839–1937* presented 841 items, including cameras, apparatus, and negatives alongside photographs that summarized the medium's first 100 years. Beaumont's keen understanding of the technical specifications, not only of each camera but each photographic process, allowed a richer understanding of the photographer's intentions as well as the image itself, bridging the science and art of photography. This exhibition was

also the genesis of Newhall's history; the show's handsome, fully documented catalogue was to far outstrip the show in significance and influence. Lewis Mumford in his review in *The New Yorker*, noted that Newhall "did an admirable job in ransacking the important collection for historic examples; his catalogue, too, is a very comprehensive and able piece of exposition—one of the best critical histories I know in any language."

The show circulated to 10 American museums from coast to coast. Among the contemporary photographers represented—today's twentieth century masters—were Ansel Adams, Paul Strand, Edward Weston, and Margaret Bourke-White. An expanded version of Newhall's catalogue essay was published in book form by the museum the following year as *Photography: A Short Critical History*. It was widely translated and regarded as the classic history of photography.

The Museum of Modern Art was effectively the only museum in America that regularly exhibited photography in the 1930's. As a result of his position, Newhall became friendly with many of the most important photographers of his time, including Edward Weston, Ansel Adams, and Henri Cartier-Bresson. Cartier-Bresson's emotionally-charged work especially appealed to Newhall as he was a fan of the small-format camera and its ability to capture the spontaneous.

Newhall was named MoMA's first curator of the newly established Department of Photography in 1940 and eventually became its first director. Like his MoMA colleague, architect Philip Johnson, Newhall was a strong advocate of Modernism and helped to define the movement as it emerged in the United States and Europe. He had the gift of a great collector-curator, which is to buy decisively and with total assurance in his acquisitions. In order to purchase works, Newhall had received the modest sum of \$1,000 from arts' patron David H. McAlpin. Newhall wrote in his memoir *Focus* that he

Spent half the money in the next few days. I went down the street to the Delphic Studio galleries and bought the entire one-person exhibition of some fifty photographs by László Moholy-Nagy for five hundred dollars. These were, for the most part, made in the mid-1920s, while he was teaching at the Bauhaus...That collection, plus the work I later acquired for the George Eastman House, constitutes the greatest collection of Moholy-Nagy in this country.

In 1942, when Newhall served in the Army Air Force during World War II, Nancy Newhall became acting curator of MoMA's photography department and eventually organized over a dozen exhibitions including the first major retrospective of Paul Strand.

Under her curatorship, then little-known photographers Helen Levitt, Eliot Porter, W. Eugene Smith, Aaron Siskind, Harry Callahan, and Weegee received their first serious attention and scholarship.

In 1947, Newhall was awarded a Guggenheim Foundation fellowship to rework his book, and the new version was published in 1949 by MoMA under the title *The History of Photography, 1839 to the Present*. He continued to revise and expand his study over the next 35 years, with the last revision in 1982.

In 1948, Newhall was appointed the first curator of the newly established George Eastman House in Rochester, New York, where he served for 10 years before becoming the museum's director until his retirement in 1971. At Eastman House, Nancy Newhall worked on exhibitions, and with her husband, advised the collection of Exchange National

Bank of Chicago, the first collection of photographs assembled for an American corporation. Together they were founding members of the influential San Francisco-based organization Friends of Photography for the promotion of photographic education. After his retirement from Eastman House, Newhall became a visiting professor of art at the University of New Mexico, where he helped to establish the first doctoral program in the history of photography at an American university.

Few have had a greater impact on interpreting the history of fine art photography, but also on the culture of photography than Beaumont Newhall. Newhall died in 1993; Nancy had died in 1974, struck by a tree while white-water rafting. The Beaumont and Nancy Newhall papers are archived at the Getty Research Institute, Los Angeles, California, and are available at the Online Archive of

Beaumont Newhall, Charis Weston's Typewriter.

Biography

Born in Lynn, Massachusetts, 1908. Attended Harvard University and earned a B.A. *cum laude* in 1930 and also from Harvard an M.A. in 1931. Studied at the Institut d'art et d'Archeologie, University of Paris, Courtauld Institute of Art, and the University of London. Lecturer at the Philadelphia Art Museum in 1931. An assistant in the Department of Decorative Arts at the Metropolitan Museum of Art, New York. Librarian at the Museum of Modern Art, New York in 1935. In 1940, became its first curator of photography and served as curator from 1940 to 1942 and from 1945 to 1946. During World War II, Newhall was a major in the Air Force and served as photographic interpreter in Egypt, North Africa, and Italy. He then served as curator and director of the Eastman House from 1948 to 1971. Throughout his career, Newhall taught the history of photography and photographic arts at such institutions as the University of Rochester, Rochester Institute of Technology, State University of New York at Buffalo, as well as at the Salzburg Seminar in American Studies, Austria. He lectured all around the world. He became a professor at the University of New Mexico in 1972 and was named

Professor Emeritus in 1984. He served as an honorary trustee of the Eastman House until his death. Died Santa Fe, New Mexico, February 26, 1993.

ARNOLD NEWMAN

American

With a professional career that has spanned more than 66 years, Arnold Newman, called the “father of the environmental portrait,” is known for memorable portraits of artists, statesmen, writers, and musicians that render an unparalleled assemblage of twentieth-century genius. During his prolific career, Newman also photographed still lifes, experimented

with collages, and produced documentary studies of rural African-Americans. His portraits of ordinary people are less known; however, they display Newman's trademark connection between photographer and subject, the *sine qua non* of humanity that exists without regard to financial or social station. Breaking with long-standing portrait conventions, Newman incorporated a person's living or working spaces into the portraits, whether by object, symbol,

or space. In this way, the subject's surroundings are not mere background but include elements indicating interactions between society and his subjects, setting up a dialogue that establishes one creative unit. Newman, nevertheless, eschews any attempt at establishing a formula.

My idea of photography came from the snapshot. As a boy I remember seeing photographs of Teddy Roosevelt. In the official portrait, he looked like an embalmed, overstuffed walrus. But in another, a snapshot, he was photographed with his foot on top of an animal he'd shot and was grinning like mad and one could sense from a photograph like this what the man really looked like, how he stood, even what he was like as a human being. I began to develop an idea that combined the reality of the snapshot with a creative graphic approach. I wanted to show where a person lived and worked, a kind of reality combined with a carefully worked out composition. I didn't set out to do something different so much as to do something that interested me.

Born in New York City, the second of three sons of Isidor and Freda Newman, Arnold moved at the age of two to Atlantic City where his father pursued a dry goods business. When that faltered, he managed small hotels in Atlantic City and in Miami. In 1936, Newman graduated from high school and with his parents' blessing studied art, earning a scholarship to the University of Miami in Coral Gables, Florida. Plans of becoming a painter ended two years later when family financial difficulties caused his departure from academia. A chance encounter on the Atlantic City boardwalk soon changed his life when Leon Perskie, a professional photographer and family friend, encouraged Newman to work in Philadelphia where Perskie's son owned a chain of inexpensive portrait studios in the Lit Brothers department stores. Soon Newman was living in Philadelphia with his childhood friend, Ben Rose, who graduated from the School of Industrial Arts in photography under the tutelage of Alexey Brodovitch, art director at *Harper's Bazaar*. Newman planned to work by day and study art at night but, after watching his friends photographing, he soon borrowed a camera and began to develop his own photographic vision.

Work, meanwhile, meant churning out 40–60 portraits daily. Stifled by the humdrum, Newman started photographing people on his own, experimenting with techniques promulgated by modernism and abstraction. He was influenced by the works of painters Pablo Picasso and Piet Mondrian, and the Farm Security Administration photographs, especially those of Walker Evans, whose catalogue for the 1938 exhibition, *American Photographs* at the Museum of Modern Art (MoMA) had opened Newman's eyes to a new way of seeing.

He then returned to Florida where he accepted more lucrative employment as manager of the Tooley-Myron chain portrait studio in West Palm Beach. By 1941, Newman couldn't wait to start working independently and began photographing people in their everyday surroundings—on the porch or on the street—away from the artificiality of the studio. On the advice of friends, Newman traveled to New York City to see Beaumont Newhall, MoMA's Curator of Photography. Impressed by Newman's portfolio although not by his printing skills, Newhall recommended that he see Alfred Stieglitz. Discovery by Newhall and Stieglitz, two illustrious names in the history of American photography, propelled Newman to leave Florida and move to New York City. Finally able to practice his own unique style of portraiture, Newman set out to find interesting people, such as painters, sculptors, and other creative people who worked well with his environmental concept. Raphael Soyer became the first of what Newman calls his "experimental subjects." A joint exhibition with Ben Rose at the A.D. Gallery followed in 1941. Attended by New York's advertising and cultural elite as well as by Ansel Adams and Newhall, who purchased a print for MoMA's permanent collection, this event launched Newman's professional career.

U.S. Army orders obliged Newman to return to Miami in 1942, but after receiving a deferment, he stayed on to open Newman's Portrait Studio in Miami Beach. Its success did not keep him from returning to New York City again and again to photograph such artists as Piet Mondrian, Marc Chagall, Charles Burchfield, John Sloan, and Max Ernst. Throughout his career, Newman has followed his maxim that "a good portrait must first be a good photograph." From early on, he was interested in abstraction and in shapes; he found strength in geometric design and being able to interconnect geometric shapes in new and unusual ways. "For me photography is intellectual excitement," he says, "a joy and the occasional experience of rich satisfaction in creating an image that pleases me as well as others. Is it a portrait? Is it art? That is up to others to debate. I am pleased just to make a good photograph."

In December 1945, the Philadelphia Museum of Art organized *Artists Look Like This*. Critical acclaim convinced Newman to move to New York City permanently, and he received his first assignment for *Life*, a portrait of playwright Eugene O'Neill. Among the first photographs he did for *Harper's Bazaar* was composer Igor Stravinsky seated at a grand piano, an image rejected

by the editor but one that has since become Newman's most widely-recognized. Numerous commissions for magazines such as *Fortune*, *Holiday*, *Vanity Fair*, and *Look* followed.

Newman's innovative approach to portraiture influenced media and advertising through key publications in the United States and abroad. Exhibitions and purchases of his work by major museums, including the Metropolitan Museum of Art, New York; Victoria and Albert Museum, London; and the Stedelijk Museum, Amsterdam have led to global recognition.

Newman's place in the history of photography as a portrait photographer with an artist's sense of composition and observation and a field researcher's rapport with his subject was set more than 50 years ago. Newman credits this "gift" to his early hotel experiences as catalyst for a lifelong fascination with people. "I think people are the most exciting things we have," he recounted in an interview, "not interesting faces, but interesting people. They don't have to be famous. I just love people and what they do with their lives."

HELMUT NEWTON

German

Born Helmut Neustaedter in Berlin in 1920, to Jewish parents, he grew up in privileged circumstances in the home of his wealthy button-manufacturer father and American mother. Newton's father sent him to attend the city's American School, but he was a bad student and was expelled when his fascination with photography, sparked by an Agfa box camera bought when he was 12, along with his interest in girls, overshadowed his interest in learning. After leaving school in 1936, the young Newton apprenticed to top photographer Elsie Simon, known as Yva, until he was forced to flee after the start of Hitler's vicious pogroms against German Jews two years later. Upon flirting with death by consorting with Aryan girls, his parents managed to secure him passage on a ship to China, but he stopped off in Singapore, where he got a job as a photojournalist at the *Straits Times* newspaper, a job he held for just two weeks, after which he was fired for incompetence.

There he met a glamorous older Belgian woman, and, powered by an epic sex drive, became her lover; he caroused around the British colony until moving to Australia in 1940, just ahead of the Japanese invasion. After briefly being interned as a German citizen, he later joined the Australian army, serving five years, and, in 1948, married actress June Brunell, a fellow photographer who later would both photograph Newton and work with him on his books. She sometimes published under the name Alice Springs, a legendary sheep station in the Australian outback. She would remain his partner for more than 55 years until his death. It was during this time he changed his name to Newton, opened a small photo studio in Melbourne, and soon began contributing fashion photos to *French Vogue* in 1961, a magazine that he stamped with his trademark images for a quarter century. Throughout the years, Newton shot extensive campaigns for the major fashion houses, began shooting celebrities and royalty, and contributed to magazines such as *Playboy*, *Queen*, *Nova*, *Marie-Claire*, *Elle*, and the American, Italian, and German editions of *Vogue*.

His stark and provocative style set a new industry standard. He began to photograph overtly sexual images after a major heart attack in 1971 and with the encouragement of his wife. His nudes became his

signature and the self-reflexive, often isolated poses of the models frequently caused controversy in the art world. With the publication of his erotic photo book *White Women* in the 1970s, he won the sobriquets "The Prince of Porn" and "The King of Kink" (nicknames that he disdained). His sado-masochistic stamp was so visually arresting he was constantly turning down offers to direct feature films. His work began fetching upwards of \$100,000 each at auction. One of his most well known publications is the oversized *Big Nudes*, which distributed his work to a wider audience, where he has been celebrated by novelists, such as J. G. Ballard and semioticians, such as Marshall Blonsky, and criticized by the Moral Majority and feminists. In 1998, Scalo publishers released *Pages from the Glossies*, a collection of not just his most important fashion shots, but of the entire magazine pages, giving context to their original reception—a rare opportunity in photo publishing.

One of the most ambitious projects surrounding Newton was one of his last. In 2000, he had a mammoth retrospective at the International Center of Photography in New York (the first show in its new mid-town gallery). Also that year, art publishers Taschen released *Sumo*, a collection so big it came with its own table. The book, which weighs some 65 pounds, had a limited print run of 10,000 copies and carried a price tag of \$5,000—making it the most expensive book ever published. But somehow this would seem fitting for the man who came to weave so fluidly into the worlds of super-celebrity, super-power, and super-wealth. No matter how exclusive or infamous his subjects might be, they were all props in Newton's world, playthings for an imaginative boy who grew up in the heady world of the Weimar Republic.

An Australian citizen, Newton lived in Monte Carlo in the summer and at Hollywood's famed Chateau Marmont hotel in the winter. He defied convention with his paradoxical images—in his most controversial and iconic images one finds, for example, icy coldness coupled with heated passion and painful emotional distance mixed with an unnerving intimacy. In Newton's realm the viewer is, for all intents and purposes, a voyeur. Subjects of his photographs seem to hand themselves over to him, in body and soul, all the while representing Newton himself first and foremost. No matter what

celebrity or movie star is pictured, it will always be identified first as “a Newton.” A good example of this autobiographical tendency is that through his controversial career, he evoked his close scrape with the Nazis (his mentor Yva died at Auschwitz). He shot, for instance, a series of portraits of the most surprising subjects for a Jew who had spent his life wandering the world, including former United Nations chief Kurt Waldheim, who was linked to the Nazis, and far right-wing French political leader Jean-Marie Le Pen. According to his 2003 autobiography, when he photographed Leni Riefenstahl, Hitler’s official documentarian, she made him promise not to “call her an old Nazi.” But the ever-exuberant Newton never dwelled on his past—or his seemingly unbelievable luck. He was always pushing forward the boundaries of acceptable imagery, and pushing himself ever further in his art. Productive and highly sought after until the end of his life, Newton died of injuries from a car accident at the Chateau Marmont in Hollywood, California in 2004. Shortly before his death, he had established the Helmut Newton Foundation in a former Prussian Officers’ club adjacent to the railway station in Berlin where he had fled Nazi persecution and donated approximately 1,000 works to his native city.

Biography

Born in Berlin, Germany, 31 October 1920. Attended the Werner von Trotschke Gymnasium and the American School in Berlin, but expelled from both. Apprenticed under the German photographer Else Simon, known as Yva. Worked as freelance photographer, journalist, and later fashion and celebrity photographer for numerous publications (including *Playboy*, *Vanity Fair*, *Harper’s Bazaar*, *Vogue*, etc.). Became associated with Marlborough Gallery, New York, and G. Ray Hawkins Gallery, Los Angeles, early 1980s. Awarded Tokyo Art Directors’ Club Prize, 1976; American Institute of Graphic Arts Award for *White Women*, 1977–1978; named Chevalier des arts et des lettres by the French Minister of Culture, 1989; Awarded the Grosses Bundesverdienstkreuz by the Federal Republic of Germany, and named Chevalier des Arts, Lettres et Science by S.A.S. Princess Caroline of Monaco, 1992; *Life* Legend Award for lifetime achievement in magazine photography; 1999. Died in Hollywood, California, 23 January 2004.

NICHOLAS NIXON

American

Nicholas Nixon achieved national attention in the early stages of his career, when his subjects were primarily industrial landscapes and aerial city scenes. Having established his approach to the American landscape, Nixon applied the same methodology to human subjects, which have comprised the vast majority of his career. Working in series, Nixon seeks to document human relationships, experience, and identity as physical, nearly-quantifiable forces, things ruled by time and transformation, perpetually in process, and evidenced in abundant display on the surfaces of human faces and bodies. What is distinctive and unusual about Nixon's work with people is the interplay of the personal and the impersonal: his interest in cataloguing the human experience via classical, historically clinical photographic procedures favored by Edward Weston and Walker Evans. Nixon shoots exclusively with black-and-white film and large-format view cameras, ranging in size from 8 × 10-inch to a 14 × 17-inch camera

built especially for him. For Nixon, the challenge has been to marry traditional technology with instantaneous imagery, to render the careful rigor of the view camera responsive to the energy and nuance of human character and interaction. He writes "Maybe part of my artistic ambition is to keep the lively part of snapshots and get rid of the dull, studied part of portraits, but maintain the best juice of both. And mix the two together (Nixon 1991)."

Born in Detroit in 1947, Nixon's early professional life was structured around his interest in public service. After receiving his bachelor's degree in English Literature from the University of Michigan in 1969, Nixon volunteered with the VISTA (Volunteers In Service to America) program in St. Louis (1969–1970) and soon thereafter became a high school teacher in Minneapolis (1970–1971) before enrolling in an M.F.A. program at the University of New Mexico. In 1974, he received his master's degree in photography and accepted a teaching position at the Massachusetts College of Art in Boston. He began photographing large cityscapes of the Boston area

using an 8 × 10-view camera, chronicling the density and complexity of urban development from high vantage points—work that positioned Nixon squarely inside of a rising movement of young photographers documenting the “social landscape.”

In 1975, curator Bill Jenkins assembled ten artists, Nixon among them, whose work exemplified this new movement in documentary photography, in a George Eastman House group exhibition titled *New Topographics: Photographs of a Man-Altered Landscape*. Other photographers included in the exhibition were Robert Adams, Lewis Baltz, Bernd and Hilla Becher, Joe Deal, Frank Gohlke, John Schott, Stephen Shore, and Henry Wessel, Jr. While it was not the first major exhibition for all of these artists (both Robert Adams’s *The New West* and Lewis Baltz’s *New Industrial Parks* preceded the *New Topographics* exhibition), it was the first time the working methods and collective identity of the New Topographics, as the group came to be known, were declared in a formal, public way. The exhibition was seminal in that it placed a startling new approach within the traditions of documentary and landscape photography while at the same time clearly outlining a radical departure from those traditions. While artists such as Ansel Adams were producing epic portraits of an untouched and idealized “nature,” the New Topographics were documenting the profound reconfiguration of the American environment in areas of concentrated human activity: industrial parks, chemical plants, expressway loops, housing tracts, and shopping centers. As a generation of artists who had never experienced the natural landscape without also experiencing its counterforce—industrialism—the New Topographics assumed the task of re-claiming the terrain of landscape photography by focusing on the prosaic and profoundly “man-altered landscape.” They aimed to render their subjects without ceremony or sentimentality, adopting an overtly ascetic approach to their images (taking as their model real estate and survey photographs). In framing the landscape, they actively rejected the “subjective” themes of beauty and idealism and chose, instead, the “objective” study of place—geographical, cultural, and political. The New Topographics artists worked to minimize the role of style, and instead strove to see the environment clearly and wholly as it truly appears. Many of them worked in series as a way of equalizing the value of individual images and democratizing a system of visual meaning that can subordinate its subjects to authorial control and isolate subjects from cultural context.

By the time of the *New Topographics* exhibition, Nixon had already begun to apply this ideology to

photographs of human subjects. Nixon’s work with human subjects (e.g., *School*, *The Brown Sisters*, *Pictures of People*) melds the technical precision and scrutiny of the large format view camera with the emotional and cultural specificity of the snapshot, a technique that has become his trademark. Speaking about his role in the continuum of great view camera photographers, Nixon has said:

I’m honored to be using the same methods as Atget, as Walker Evans. I want to honor what is possible. I’d like to go deeper, get closer, know more, be more intense and more intimate. I’ll fail, but I’m honored to be in the ring trying. I’d like to go deeper than Stieglitz did about his marriage. It’s arrogant, but I’d like to try.

(Ollman 1999)

To subjects at close range, this format is, if not unkind, certainly unromantic in its relentless attention to discrete variations in human surfaces: pores and wrinkles and hairs achieve stunning prominence in Nixon’s photographs, almost as if he believes it possible to uncover the physical substance of what is ineffable and elusive in human identity and relationships. In 1975, Nixon produced the first image of his ongoing series *The Brown Sisters*, which chronicles his wife, filmmaker and journalist Bebe Nixon, and her three sisters in a series of annual portraits, one selected for each year. Included in its nascence in the 1978 exhibition *Mirrors and Windows* at the Museum of Modern Art, New York, *The Brown Sisters* is one of Nixon’s most recognized achievements. The fact that the images are produced as a series, always composed in the same way—the camera always at eye level, the four women arranged in the same order—connects each image to the others and plots them along a temporal trajectory, prompting the viewer to examine the four women, not as figures suspended in a single “decisive moment,” but as the collective site of an ongoing and changing narrative; across the series, uniformity gives rise to variation, and the relationships and identities of the four sisters are evidenced by the slow, steady transformation of this human landscape.

Throughout the 1980s, Nixon’s attention encompassed a wide variety of human subjects, his photographs striving to penetrate the broadest possible spectrum of societal issues. His images of “porch life” in Kentucky (from the series *Pictures of People*, 1988) document the starkness and lyricism of quotidian family life in an economically-depressed swath of rural America. Notable in this series is the 1982 image *Covington, Kentucky*, which shows a young boy on a porch basking in a patch of sunlight, his arms outstretched and his head thrown

back as, with eyes closed, he appears to stand in time suspended, soaking the sun's rays in a gesture that is as deep in its expression of physical experience as it is ordinary. By contrast, Nixon's *Family Pictures* series (1985–1991) examines the artist's own immediate, familial relationships—those with his wife, Bebe, and their two children, Clementine and Sam—in some cases, offering a glimpse of the artist breaching the frame in order to demonstrate the full scope of these relationships.

In his *School* series, published in 1998, a collaboration with Pulitzer Prize-winning child psychiatrist Robert Coles, Nixon spent two years among the children of three Boston-area schools: an elementary school in Cambridge, the Perkins School for the Blind, and the prestigious Boston Latin school. Working alongside Coles, Nixon chronicled the habits and routines of children ranging from the very gifted to the severely impaired, gathering with clinical precision the subtle, fleeting gestures that play on the surface and provide physical clues to the unknowable, ineffable experience of an interior self. *Gary Moulton, Perkins* is one such image—remarkable in its delicacy and allusion to this interior, notable as proof of Nixon's success as an acquisitive documentarian working in abstract, emotional terrain.

Nixon's desire to "go deeper, get closer"—his continued efforts to achieve clarity of representation by effacing himself as an author—has led him, over the course of his career, to increasingly complex and culturally potent subjects. His series *People with AIDS (PWA)*, a collaboration with his wife, Bebe Nixon, attempted to document people living with HIV/AIDS, the effect the disease has on their lives, their families, and their identities. The series aroused fierce condemnation and outrage from the HIV/AIDS-activist community at its debut in 1988 at the Museum of Modern Art (MoMA). The published series is a combination of image and text—text that, by and large, features the words of 15 HIV-positive people talking about what is happening to their bodies as they confront the realities of their illness. The MoMA exhibition, however, consisted of selected images only, a decision responsible for much of the furor surrounding the exhibition, led primarily by members of the activist organization AIDS Coalition to Unleash Power (ACT UP), who believed the *PWA* series, in its unabashed survey of the physical deterioration and anguish attendant to advanced stages of AIDS, perpetuated dangerous myths about people suffering from the disease, myths that would ultimately encourage discriminatory policies that harm people living with HIV/

AIDS. ACT UP demonstrators staged public protests outside of the museum, distributing manifestoes and leaflets that demanded images of HIV-positive people "who are vibrant, angry, loving, sexy, acting up and fighting back," as well as "no pictures without context." Robert Atkins, a journalist and art historian who wrote extensively about the *People with AIDS* controversy, describes the special burden of proof Nixon's *People with AIDS* series faced:

Nixon's pictures are, in fact, often grim accounts of the virus' murderous capability, but they are also a welcome record of its effect on a diverse, not-always-gay population of heterosexual women-of-color and hemophiliacs. As the first body of work exhibited on an extremely public stage, they also suffered from impossible expectations...Nixon's pictures were somehow expected to appeal to everybody: to simultaneously win over bigoted or uncommitted museum goers [sic]; and to foment activism and buck up the spirits of people with AIDS. No single body of work could possibly work such magic.

(Atkins 1999)

In many ways, the controversy surrounding the *People with AIDS* exhibition is similar to that surrounding the *New Topographics* exhibition: where the *New Topographics* exhibition challenged the public's expectation of what constitutes a photographic landscape, Nixon's *People with AIDS* series challenged presiding notions of what constitutes a fair and honest portrait—inevitably raising the question of artistic responsibility: to one's subject, as well as one's audience. For the *People with AIDS* series, the question rested, specifically, on how one documents illness responsibly—particularly one so stigmatized in American culture. Our intuitive belief that the intimacies and details of our most personal experiences are entitled to a certain degree of privacy is well-supported by much of traditional portraiture, which holds such mysteries at bay, well-protected within the fog of romanticism and mystery. These notions are directly challenged by portraits such as Nixon's, which neither covet nor protect, but aim instead to disable such mysteries and expose the realities they would otherwise obscure. The question of artistic responsibility is especially acute when the subject's control over their own image is limited, as is the case with the *People with AIDS* series, as well as Nixon's work with the *Perkins School for the Blind*. When the subject cannot return the viewer's gaze (*Perkins School for the Blind*), or cannot control the physical manifestations of a debilitating illness (*People with AIDS*), the viewer is confronted with an identity whose ownership remains ambiguous: who controls this physical identity, if not the subject? The degree to which Nixon's images seem to privilege the

viewer in this relationship is potentially discomfiting at the same time that it is potentially irresistible.

Nixon continues to work in the domestic and public realm. Throughout the early years of the twenty-first century, Nixon has produced images of delicate intimacy and bald sensuality as part of his *Couples* series, in which lovers of all ages and sexes are catalogued in their most tender and passionate moments. In another collaboration with Bebe, the Nixon's produced a series titled *Room 306: A Year in Public School*, which examines their son Sam's sixth-grade class as a microcosm for the ongoing, often intractable issues facing the American public school system. His more recent *Boston Public Garden* series interestingly combines elements of both his landscape work and his photographs of people, focusing on the interaction between couples in public parks; human relationships suspended, hinged, and nested among the architecture of the public terrain.

NON-SILVER PROCESSES

For the past hundred years, when we speak of a photographic print, we speak of a silver halide emulsion on paper. Silver salts suspended in gelatin have been the mainstay of the photo industry since mass production began in 1886. Yet although the earliest experiment to capture light in the late eighteenth century and early years of the nineteenth century did involve the use of silver, in the 1840s when photography was finally established, the list of newly discovered light-sensitive emulsions reads like a cookbook of photochemistry. Most processes were short-lived. The few that survived were employed at various times during the twentieth century as important alternatives to the silver process in fine arts photography and printmaking.

Tintype, daguerreotype, cyanotype, kallitype, carbon prints, bromoil, Van Dyke brown, platinum prints (platinotypes), palladium prints, and gum bichromate were among the most popular early processes that are still used today. They are labor-intensive, difficult, sometimes dangerous processes that often produce images that cannot be duplicated in a subversion of photography's modern definition as a process by which multiple, identical copies can be produced. Inherent in all these processes, however, is a pictorial style that alters and transforms the photographic image through surface, texture, color, and tonalities that are unique to the process.

All of these processes reflect the struggle of early photographers to make photographic images that would not fade. Many of these processes used silver in some step of the process yet came to be called "non-silver" to differentiate them from the silver gelatin print, which solely relies on silver. As early as 1822, Joseph Nicéphore Niépce, a printmaker with poor drafting skills, made the first successful

photographic plate after coating a glass plate with bitumen of Judea thinned with oil of lavender. The bitumen was exposed to sunlight through an engraving, oiled to make it transparent. After several hours, the exposed areas of the bitumen coating became insoluble. The still soluble bitumen, protected by the lines of the engraving, washed away in turpentine and oil of lavender. Further experiments with pewter plates instead of glass led to the first permanent photograph from nature. In 1826, using a camera aimed from his third floor window in Gras, France, Niépce recorded the view. It was an eight-hour exposure.

In 1829, he formed a partnership with Louis-Jacques-Mandé Daguerre. Legend has it that Daguerre, aware of Niépce's experiments with silver-plated copper and vapors of iodine, began experiments with iodized silver. By chance, he placed an iodized silver plate in a cupboard used for storing chemicals. Upon opening the cupboard a few days later, he was surprised to find an image on the plate. Through the process of elimination, he discovered that mercury vapors from a broken thermometer had revealed the latent image. The Daguerreotype was born a few years later in 1837, when Daguerre discovered that treating the plate in a salt solution after exposure would stabilize the action of the mercury on iodized silver.

Meanwhile, just across the English Channel, another struggling draftsman, William Henry Fox Talbot, unhappy with his efforts to capture the view from Lake Como using his pencil and a projection device called a camera lucida, switched to a portable version of the camera obscura and began his own experiments with the photographic print. Talbot began his research with silver salts, patent-

NON-SILVER PROCESSES

ing the calotype process in 1841. In this “salted paper” process, the paper is first coated with a solution of silver chloride or ammonium chloride combined with a sizing agent such as arrowroot, starch, or gelatin. The paper was then sensitized with a coat of silver nitrate and allowed to dry. After exposure through a negative to sunlight, the print was washed in water to remove the unexposed silver nitrate. The image was gold-toned then fixed in sodium thiosulfate and washed again to remove the excess fixer. The final prints ranged in color from reddish brown or, if gold-toned, anywhere from reddish to purplish brown. The color depended on the sizing, trace materials found in the paper, and length of time in the toning bath. The calotype process is similar to the Van Dyke brown and kallitype processes.

The inexpensive alternative to a daguerreotype followed on the heels of Frederick Scott Archer’s published results on the use of collodion to make glass plate negatives in 1851. The tintype, a direct descendant of the collodion process, was invented by an American, Hannibal L. Smith in 1856. It was simply a thin metal plate, lacquered black then coated with the collodion and potassium iodide emulsion and sensitized with silver nitrate. The image was developed in pyrogallol acid and fixed in sodium thiosulfate.

While silver was making headway into the mainstream of photographic processes, other light-sensitive materials were also being explored, including ferric (iron) salts, a process to become known as cyanotype. In 1842, Sir John Herschel, renowned British astronomer and the first to note the importance of sodium thiosulfate as a fixer, discovered that ferric ammonium citrate or ferrous chloride combined with potassium ferricyanide and coated on a sheet of paper, placed under a negative and exposed to sunlight, then washed out in water, produced a blue positive image. The process was easy to combine with other non-silver processes and the relative simplicity of the cyanotype (or blueprint) process ensured its popularity for generations to come. Engineers and draftsmen continue to use it for copying line drawings. Herschel also noted that ferrous salts could reduce silver to its metallic state, leaving the door open for the development of the kallitype in 1899, an iron printing process that allows the development of an image similar to platinotypes, but which is much less expensive and can be used on fabrics.

The cyanotype process may have been an important and true alternative to silver, and far less susceptible to the problems of impermanence in the silver-based processes, but it remained relent-

lessly blue. The discovery of the pigmented processes in the 1850s seemed like the answer.

These pigmented processes were the result of the research of three men: Monge Ponton, who discovered the light sensitivity of bichromates; William Henry Fox Talbot, who noted that soluble colloids such as gum arabic and gelatin mixed with bichromate lose their solubility; and Alphonse Louis Poitevin, who added pigment to the colloid.

The carbon process, in which carbon black is suspended in potassium dichromate and a colloid such as gelatin, albumen, or gum arabic, and brushed on the paper, dried, and exposed to sunlight through a negative, proved to be the most popular process of its day. Later fine-tuned as the carbon transfer process, it involved exposing the negative to the colloidal film mounted on thin tissue, stripping the tissue away, and transferring the final image to a paper backing. The dry transfer process, developed in 1935 as a means to make permanent color prints, grew out of the carbon transfer process.

Gum bichromate came along a few years later, in the 1860s. Watercolor pigments were added to the gum arabic and ammonium dichromate solution and exposed to sunlight through a negative. (Alternately, starch and gelatin could be used as an emulsion, and potassium or sodium bichromate could be used to fix the light.) Gum bichromate became a popular process among the Pictorialists in the 1890s and has continued to attract photographers and printmakers with its versatility of palette and its ability to combine well with other processes. Another version of the gum bichromate process is the casein bichromate process. In this process casein—milk solids dissolved in ammonia—is used instead of gum arabic.

Bromoil, developed in 1907 by C. Welbourne Piper and E.J. Wall, is another of the bichromate pigment processes. In this case, the gelatin-bromide print is treated with a bichromate solution, thus bleaching the dark silver image and chemically altering the gelatin. An oil pigment could thus be absorbed into the print in proportion to the original silver image. In an earlier version of this, the bichromated gelatin is hardened through exposure to sunlight through a negative. The print is soaked in water and oil-based pigments are brushed or rolled on, penetrating the print more or less, depending on the amount of water the emulsion has absorbed. It was a frequent choice among the Pictorialists. The Fresson Process, a patented secret process developed by Theodore-Henri Fresson, is a version of the bromoil process still in use today.

Platinum prints and the less expensive but similar palladium prints are still widely used today and are by far the most popular of all the non-silver processes. Sir John Herschel was the first to realize the potential for platinum as a light-sensitive material, but it was William Willis who perfected their use and patented the process in 1873. In platinum printing, ferric oxalate and potassium chloroplatinite coat the paper, which is exposed to sunlight through a negative. The ferric salts become ferrous in proportion to the exposure. The print is developed in potassium oxalate, which dissolves the ferrous salts and reduces the platinum to its metallic state. The unexposed ferric salts remaining on the paper are removed by a dilute solution of hydrochloric acid. The final image is in pure platinum, a highly stable metal that is rarely affected by the environment. The tonal range is extraordinary, making platinum prints the connoisseur's choice in photographic prints.

With the exception of the platinum and palladium processes, most of these alternatives to silver would have disappeared entirely after the introduction of commercially manufactured silver-based papers in the mid-1880s if photographers had been content to remain outside the arenas of fine art. With the invention of roll film and easy-to-operate box cameras, photography was considered no more than a photomechanical process easily employed to record the visible world. An artist, however, did no such thing: an artist interpreted the world through personal sensibilities. Photography, to be recognized as an art medium, had to reflect its abilities through modulation of tonalities and details, to respond to the artist's interpretation of a subject. Informed by the academic standards applied to the painting and graphic arts of their day, the Pictorialists began their quest to secure photography's position as an art form.

Alternatives to the silver print were thus reconsidered, this time for their ease of manipulation and their ability to reflect the photographer's individual interpretation of the image on the negative. Experimentation with these earlier processes led to new and more flexible formulas for non-silver imagery.

Gum bichromate was an immediate success among photographers with higher artistic aspirations when the French photographer Robert Demachy rediscovered the process and introduced it to the European community at the 1894 London Salon. The French and Austrian Pictorialists quickly seized upon it because of its great range of manipulation and in America, Alfred Stieglitz, Edward Steichen, and Gertrude Käsebier were among the many who championed its potential.

Stieglitz was an active proponent of photography as a fine art. As the founding editor in 1903 of the vastly influential magazine *Camera Work*, Stieglitz was a pivotal figure on the American front of the Pictorialist movement. He was the instigator of the Photo-Secession and organized the seminal exhibition of art photography at the National Arts Club in New York City in 1902, *Pictorial Photography, Arranged by The Photo-Secession*. The Photo-Secession consolidated the already influential Pictorialist movement in America, bringing together like-minded photographers in both Europe and America for active dialogues, technical information, and exhibitions, spreading the word about not only the gum bichromate process, but the photogravure and platinum print, or platinotype, as it was more commonly called during this era.

Photogravure, an intaglio printmaking process using potassium dichromate and gelatin as a photo-resist on copper plate (another of Talbot's discoveries), was also popularized by Steiglitz in America. The etching process yielded a richness in detail and tonality consistent with fine intaglio prints. The plates were hand-rubbed with different colors of ink and hand-pulled on art papers. Multiples could be made, but like any hand-worked craft, the effort was labor-intensive and reflected the printer's sensibilities.

Platinum printing continued as a popular medium among the Pictorialists, especially when it was combined with other processes such as gum bichromate, carbon, and cyanotype. British and American photographers took the lead in experimenting with gum and platinum printing. The leading American-born Pictorialist, Alvin Langdon Coburn, a frequent exhibitor of the combined processes, is often credited with the invention of this technique. The French and the Austrians were best known for their work in gum bichromate, although Robert Demachy, an early champion of the gum process, became the leading proponent of the oil transfer process. Bromoil, its less complicated cousin, gradually replaced it as a first choice among amateurs well into the 1940s. By 1910, Pictorialism had reached its peak. In America, the fabled 1910 exhibition of Photo-Secessionists at the Albright Gallery, in Buffalo, New York, beat all attendance records for the gallery. Six hundred or so photographs were on display to 16,000 viewers. In 1917, the last issue of *Camera Work* was published featuring the work of Paul Strand. The era of "straight photography" and its almost exclusive reliance on the gelatin silver print had begun.

NON-SILVER PROCESSES

Gertrude Käsebier, *The Heritage of Motherhood*, ca. 1904/print 1916, gum bichromate print, 27 × 24.9 cm, Gift of Hermime Turner.
[*Photograph courtesy of George Eastman House*]

Non-silver processes were relegated to the pages of photo history books until the new wave of “alternative processes” suddenly appeared along with the growth of photography departments in American art schools in the late 1960s. Art students, influenced again by the painters of the day who used photo images extensively in their work—notably Andy Warhol and Robert Rauschenberg—began to rediscover the non-silver processes. Teacher-photographers Robert Heineken, Betty Hahn, and Bea Nettles, a professor at the University of Illinois Champaign-Urbana, were among the pioneers of this renewed interest in non-silver processes. Nettles introduced Kwik Print, a proofing method for commercial platemakers, as an easier alternative to the gum process for photographers. Her guide to Kwik Print and other non-silver processes, *Breaking the Rules: A Photo Media Cookbook*, has been in print since first appearing in 1977.

The Alternative Processes movement employed photo-printmaking techniques such as photo-silkscreen, intaglio, and litho as well as the earlier non-silver processes. It was largely seen as a reaction to the aesthetic of the straight black-and-white print that continued to exemplify fine art photography. The goal was to expand the definition of photography and photographic materials. The movement reached its peak in the important traveling exhibition, *The Alternative Image* organized by the John Michael Kohler Arts Center in Sheboygan, Wisconsin in 1983.

As the twentieth century turned and new technologies in photographic imaging make quality photo manipulation and reproduction even more accessible, particularly digital printing in the form

of the laser print or ink-jet print, a new movement in “Historical Processes” is unfolding. Once more, the early, non-silver processes, including daguerreotype and tintype, are being re-examined. Once more, the craft of the hand, the one-of-a-kind search for the artist’s sensibility is the goal.

LORIE NOVAK

American

Lorie Novak has been conjuring memories for nearly two decades, reflecting images of herself, then others onto landscapes and through empty rooms that resonate with a real or imagined personal history. They are snapshots and fragments, bits of visual memory and oral history from her own family archives as well as others, projected over and

over again until they become streams of archetypes, familiar enough to be borrowed freely amongst participants and viewers alike.

Through family snapshots in projected installations, Novak mines deep cultural memories, encouraging viewers to recollect their own family histories. The startling merge between cultural history and private moments of family life that Novak achieves in her work captures the spirit of the gen-

erations of Americans born and raised after World War II much as the legendary 1955 *The Family of Man* exhibition did for previous generations.

In 1954, just as color film became readily available to the amateur photographer, Novak was born in Los Angeles. As the first child and grandchild in her family she was frequently photographed. Her grandparents had emigrated from Central Europe at the time of the pogroms, and she was the beginning of the second generation in America.

At the University of California in Los Angeles, she studied photography with Robert Heineken, and decided to pursue a career as an artist. She transferred to Stanford University, where she received her B.A. in Art and Psychology in 1975.

While wandering through Europe the summer after college, she accidentally ran a roll of film through her camera twice. The combined images were a breakthrough that began her exploration of melding of time and places. Following her M.F.A. from the School of the Art Institute of Chicago, Novak began exhibiting photographs of interiors (living rooms, bedrooms, kitchens) altered by colored lights and slide projections of shadows, light patterns, and landscapes, layering time and spaces through projected images.

One day, while experimenting with the slide projectors, she put in a slide from her childhood: "There I was in this room with this ghostly projection of myself as a child, and that's what got me started examining family photos. A lot of it is a search for truth, what photographs mean. That ghostly vision of myself as a child was a turning point in my work."

Throughout the 1980s, Novak created color photographic prints from montaged slides projected onto the bare walls of empty rooms. Working with snapshots gleaned from her family's archives, she chose images for their emotional evocation of familial relationships and childhood. Eventually, she added images from the news media, creating a chronological and cultural context for her collected family memories. In 1987, while in residence at the MacDowell Colony in New Hampshire, she began a series of landscape works where she projected slides directly into the landscape at night. The ground, trees, and sky became a stage: a dark backdrop that resonated with feelings of fear, longing, and decay.

Critical Distance, 1987-88 was her first installation designed to be experienced in its projected form. In early 1991, Novak installed *Traces* at the University Art Museum at California State University, Long Beach. *Traces* was followed by *Playback* in 1992, a five projector installation commissioned by The Southeast Museum of Photography in Day-

tona Beach, Florida, for the traveling exhibition *Betrayal of Means/Means of Betrayal*.

In *Playback*, the 15 minute sequence included live radio with preprogrammed stations offering the sound equivalents of the media images. *Playback*, however, was more autobiographical than earlier works: the material was more chronological, and images, both public and private, were now updated with each exhibition.

Novak began to enlarge the family snapshot pool in *Collected Visions I* commissioned by the Houston Center of Photography in 1993 with funds from the National Endowment for the Arts. In this installation, music composed by Elizabeth Brown and slides of women and girls examine the representation of girlhood and the experience of coming of age. Novak collected family snapshots from friends, students, and colleagues, as well as women from the Houston community, who provided her with a wide range of images from varied generational, ethnic, and social backgrounds.

The similarity as well as the differences among the photographs led Novak to collect more photographs of both sexes and inspired the creation of *Collected Visions on the Web*, www.cvisions.cat.nyu.edu. With a project grant from the Center for Advanced Technology at New York University, Novak teamed with sound designer Cilly Castiglia, web designer Betsey Kershaw, and programmer Kerry O'Neill and launched the *Collected Visions* website in 1996 at a conference on family photographs at Dartmouth College, Hanover, New Hampshire. The site, complete with a searchable database and opportunity to write and include personal stories, is an interactive archive of family snaps and narratives donated from people all over the country. By 2001, the site had over 2,500 photographs submitted by over 350 people.

In 2000, Novak completed the third part of the *Collected Visions* project, a computer-based installation that draws on the website's extensive archive of snapshots. *Collected Visions 2000* debuted at the International Center of Photography's midtown New York gallery. The computer-driven installation used high-resolution digital projectors and a high-quality streaming media system created specifically for the project by Jonathan Meyer. Music composed by Elizabeth Brown for viola, flute, shakuhachi, piano, and toy accordions was mixed with people's voices commenting on their family photographs. As the images streamed forward, words and music, cultural and personal memories intersected, morphing time and place, familial relationships and cultural identities into American archetypes.

In a search that began with her own family's images, Novak sought to examine the question of how photographs shape our memories. In *Collected Visions 2000*, her innovative exploration of personal and cultural memory (through the often casual and fragmented family snapshot) culminates in a collection of memories, family photographs, and photo essays that examine and reinforce our sense of common history. Her photographs and installations have been exhibited at institutions such as the International Center of Photography, The Center for Creative Photography at the University of Arizona, Tucson, and the Museum of Contemporary Art in Chicago, and in many group exhibitions, including the Museum of Modern Art, New York, and the Art Institute of Chicago. As of this writing, she is the Chair and Associate Professor of the Photography and Imaging Department at Tisch School of the Arts at New York University.

NUDE PHOTOGRAPHY

The first photographs of the nude appeared roughly simultaneously with the first cameras. It is a truism that every new communication medium is rapidly turned to the production of pornography, and it is this very problem that has plagued photographers who wished to depict the nude human figure. Distinctions between the nude as art, the nude as erotica, and the nude as pornography/obscenity can be imprecise, subjective, and culturally dependent.

The earliest manifestations of the photographic nude in the twentieth century involved the production of the infamous "French postcards," which were for sale in the streets of Paris from about 1905 to 1925. The development of the picture postcard meant that images could be mass produced cheaply instead of being printed from a negative one at a time. The trade flourished in Paris because of the city's notoriously relaxed attitude toward sexuality, as well as the availability of a large pool of talent on both ends of the camera—many artists resided in the City of Light, along with a substantial number of women of easy virtue, who were willing to commit the (then) scandalous act of posing nude for photographs.

It is perhaps not coincidental that professionally-taken nude photos in the United States began in a similar milieu. Around 1912, E. J. Bellocq, about whom little is known, took a series of photographs featuring the prostitutes of New Orleans famed "Storyville" district. Although not all of Bellocq's photos involve nudes (some are quite touching in their innocent domesticity), many of them do.

In the early years of the twentieth century, those who wished to take and/or publish photographs of the nude figure had to contend with the fundamental assumption on the part of many that photography is not really art, since it involves both mechanical and chemical processes in its creation. More traditional forms, it was argued, such as painting and sculpture, depended entirely on the artist's skill and vision and thus represented "pure" art. In contrast, photography seemed more technical than artistic. This prejudice plagued all early photographers, regardless of their subjects, but it was felt particularly acutely by those photographing the nude. For if the nude figure was not considered art, then it would, by default, be con-

NUDE PHOTOGRAPHY

strued as pornography (or at best, eroticism) and subject to social and legal sanction.

For years, photographers sought to gain respectability for their nascent art form by having their product imitate classical art forms, especially painting. This effort was clearly manifest in nude photography produced in the late nineteenth and early twentieth century. Nudes are portrayed reclining on beds or sofas, gazing dreamily off into the middle distance, surrounded with luxurious fabrics and unlikely props.

This approach gradually gave way to the work of the Photo-Secessionists, led by Alfred Stieglitz, who wanted photography to be accepted in its own right as an art form, and sought to achieve this goal by using the techniques that were unique to photography—such as special printing techniques, retouching of negatives, and the use of soft focus and filters, in an attempt to duplicate the look of the traditional fine arts mediums of painting and prints. But it was Stieglitz himself who realized that this approach was limiting, and he eventually sought to develop a uniquely photographic style, especially as it involved the nude. Nude photography as we know it today has its origins with Stieglitz's later work, especially the studies of his wife, Georgia O'Keeffe, as well as in the works of Edward Weston, known for their combination of artistic sensibility, passion, and a sense of the power of the camera as a recorder of reality. Weston's nude studies from the 1920s and 1930s of his various mistresses and wives, including Tina Modotti, set the standard for fine arts black-and-white nude photography; his famous studies of vegetables and shells also defined the artistic nude in demonstrating how black-and-white photography can capture the surface of things to create a sensuous, provocative image.

Others who helped bring nude photography into the modern era include European photographers of the 1920s and 1930s, including Maurice Tabard, Erwin Blumenfeld, and Brassai, influenced by Surrealism and the theories of the subconscious promulgated by Sigmund Freud. Man Ray used the nude in his photograms to create sensuous and new representations of the female body; André Kertész and André Steiner experimented with distortion techniques to create startling images of human flesh. In the United States, two pioneering women photographers made modernist nude studies. Imogen Cunningham photographed both the male and female nude. Ruth Bernhard highlighted the curves of the female body by contrasting it with the hard edges of geometric figures. Paul Outerbridge Jr. was an innovator in the use of color photography, creating a series of nudes as early as the 1930s.

The choice of subject has always been an issue for those concerned with photography, and nowhere is this more true than when the subject involves nudes. One important issue involves gender. The vast majority of work featuring the nude focuses on female subjects. Set aside the last two decades of the twentieth century, and the female figure probably occupies 95% or more of all nude studies published. Many have raised the legitimate question of why this should be so.

One answer involves simple demographics. Traditionally, photography has been both a business and a hobby carried out by men (although this has been changing in recent decades). A heterosexual man interested in photographing nudes will probably be drawn to the female form, given the inherent beauty that most men find in the female body, as well as the sexual stimulation which female nudes usually provide. Sexually, men tend to be much more responsive to visual stimuli than women, which probably explains why "skin magazines" appealing to men proliferate while those aimed at women are rare.

However, another explanation has been offered by some feminist critics, who argue that the predominance of nude female images represent men's continuing power over women. Thus, as one "takes" a photograph, one simultaneously "possesses" the subject of the photo. In this view, a man photographing a nude woman is both objectifying and possessing her—and, if the photo is later sold, exploiting her as well.

The relative paucity of male nudes until recently may also be explained in part by longstanding Western homophobia. Homosexuality was (and in some ways, continues to be) a stigma, and a man who sought out nude male models ran the risk of being perceived as homosexual. If the male nudes were published, the risk increased geometrically. Likewise, a man viewing male nudes, even if his interest was purely aesthetic, faced the suspicion that he found the images sexually attractive, with all the attendant cultural condemnation that involved.

Another issue of subject choice involves children. It is well recognized that children have sometimes been victims of sexual exploitation, some of which has taken the form of photographs. Child pornography (also called "kiddie porn"), which refers to pictorial materials (whether still or in motion) of sexual acts involving children is rightly condemned by many societies and considered a serious criminal offense. But beginning in the 1970s, some countries extended the definition of child pornography to include photographic depictions that did not involve acts commonly consid-

ered obscene. Great Britain passed the Protection of Children Act in 1978, which made illegal indecent photographic representations of children. However, the act does not define the term “indecent,” which has led to such actions as the prosecution of BBC news anchor Julia Somerville for sending to a photo lab nude, non-sexual pictures of her preadolescent daughter.

In the United States, relevant federal law includes the Child Protection Act (1984), which denies child pornography protection under the First Amendment, and the Child Pornography Prevention Act (1996), which makes it a federal crime to possess or distribute images that sexually exploit or appear to sexually exploit minors. In addition, each state has its own laws on the subject. The inherent difficulty in defining terms such as “indecent” and “exploit” has led to unsuccessful action against American photographer Jock Sturges, active in the 1970s through the end of the century, for his work depicting adolescent nudists, and threats of legal action against photographer Sally Mann, who has published two books that included photos of her young children nude or partially clothed. The ambiguity of some state laws has resulted in prosecution (or threats thereof) of parents in California, Maryland, Missouri, and Ohio. In each case their offense involved bringing to a photo lab negatives depicting their children naked. Even Edward Weston’s 1920s-era nude photographs of his son Neil, considered of the highest artistic merit, have become increasingly difficult to present. Weston was not alone in photographing children nude; around the turn of the century, nude studies of children were a common artistic photography subject, and women, notably Bay Area Photo-Secessionist Anne W. Brigman, were especially active in this genre.

In terms of genre, nude photography may be divided into the categories of art, anthropology, erotica, advertising/fashion, photojournalism, and body culture. Each of these, along with their most prominent practitioners, will be discussed below.

The list of important nude photographers is long and distinguished. In addition to those already named, it includes the turn-of-the-century American innovator Charles Schenk, who in 1902 published the first book of nude photos in the twentieth century, *Draperies in Action*, a series of collotypes that explored motion and form. In the early decades of the century, Arnold Genthe photographed dancers, nude or nearly nude, including the legendary Isadora Duncan and others following her free-spirited, naturalistic style of dancing. Harry Callahan’s models (often his wife Eleanor) always

seem remote—mentally removed from their surroundings and their very nudity. Paris-based Emmanuel Sougez used the nude to portray the apotheosis of femininity with strong, naturally posed models in front of drapery in seminal works from the 1930s. Hungarian-born Ferenc Berko, who spent much of his career in Aspen, Colorado, often ignored the face entirely in his classic nudes of the 1930s through 1950s, as did the prolific French artist Lucien Clergue, whose nudes are often portrayed in or near the sea (such as the famous *Sea Nude, Carmargue*, 1958) or in controlled environments in which the body is a canvas upon which light and dark creates striking patterns. The distinguished photography teacher and instructional author Charles Swedlund was interested in advancing technique, and his nudes are often the products of his experiments with shutter speed, focus, and film stock. Bill Brandt, in contrast, used the wide-angle lenses and the archaic technology of a pinhole camera to photograph the nude figure, creating highly distorted images that downplayed sexuality.

At the end of the century, numerous artists presented nudes in photography, as opposed to nude photography. This is an important distinction: in much contemporary photography, nudity is presented as any other element, with no particular formal or stylistic emphasis on the depiction and which is most often part of a larger aesthetic project. Gilbert & George, for example, often present nudes in an overall scheme of social and political commentary. A deliberately informal, snapshot style of depicting the nude began to emerge in the 1980s. This important tendency is typified by such figures as Nan Goldin, who presents a diary of all aspects of the lives of her circle of friends; Wolfgang Tillmans, who shows his subjects naked for seemingly no particular reason, or Boris Mikhailov, who while favoring a social realist style, convinced Russian derelicts to take off their clothes when having their pictures made.

Anthropology, in this context, refers to photographic studies of foreign cultures. In some of those cultures (especially those in tropical climates), nudity or semi-nudity may be the norm, so photographic representations will necessarily include the nude.

In the United States, the most accessible source for this kind of photography was, for many years, the magazine *National Geographic*. But the magazine’s approach to the subject raises some interesting racial issues. *National Geographic* regularly published photos of women with bare breasts; in addition, it sometimes included photos clearly showing the naked genitals of men—but these displays of flesh only occurred if the subjects were non-white. Between the 1950s and the

NUDE PHOTOGRAPHY

1990s (the magazine has since changed its policies, and no longer publishes nudes of any race), *National Geographic* presented nude or semi-nude photos of members of several African tribes (Nuba, Zulu, Dyak, and Masai, among others), several tribes of South American Indians (including the Jivaro and Urueu-Wau Wau), residents of Yap Island, New Guinea, and the Adama Islands, and even African-American entertainer Josephine Baker. But not one person of Caucasian ancestry was similarly displayed.

Erotica is, of course, designed to prompt sexual desire. As such, erotic nudes are often confused with pornography by consumers, critics, and courts. The essential difference is one of artistic intent and skillful execution. American law defines pornography as that which lacks redeeming social value. Erotica, therefore, is that which possesses such value. In America, pubic hair in a photograph was long considered a mark of pornography and was thus shunned by respectable photographers—although this distinction fell by the wayside in the 1970s. This distinction has been similar in Japan, where censorship of nudes was rigorous into the 1980s, and so-called “hair nudes” freely published and shown only in the closing years of the century. As late as 1986 leading photographic magazines publishing artistic nudes have been prosecuted for obscenity. Nudes by Araki Nobuyoshi helped break down these long-standing taboos, and books featuring “fully” nude photographs of television and movie actresses were runaway best sellers in the late 1990s.

Important photographers in the erotica genre include Bunny Yeager, a former “figure model” herself who achieved fame in the 1950s photographing model Betty Page; Helmut Newton, whose often fetishistic nudes disturbed as often as they stimulated, and Robert Mapplethorpe, whose explicit homoerotic photographs caused considerable controversy in the last two decades of the century. A subcategory of erotica includes historical male nude photography by fashion or glamour photographers such as George Platt Lynes.

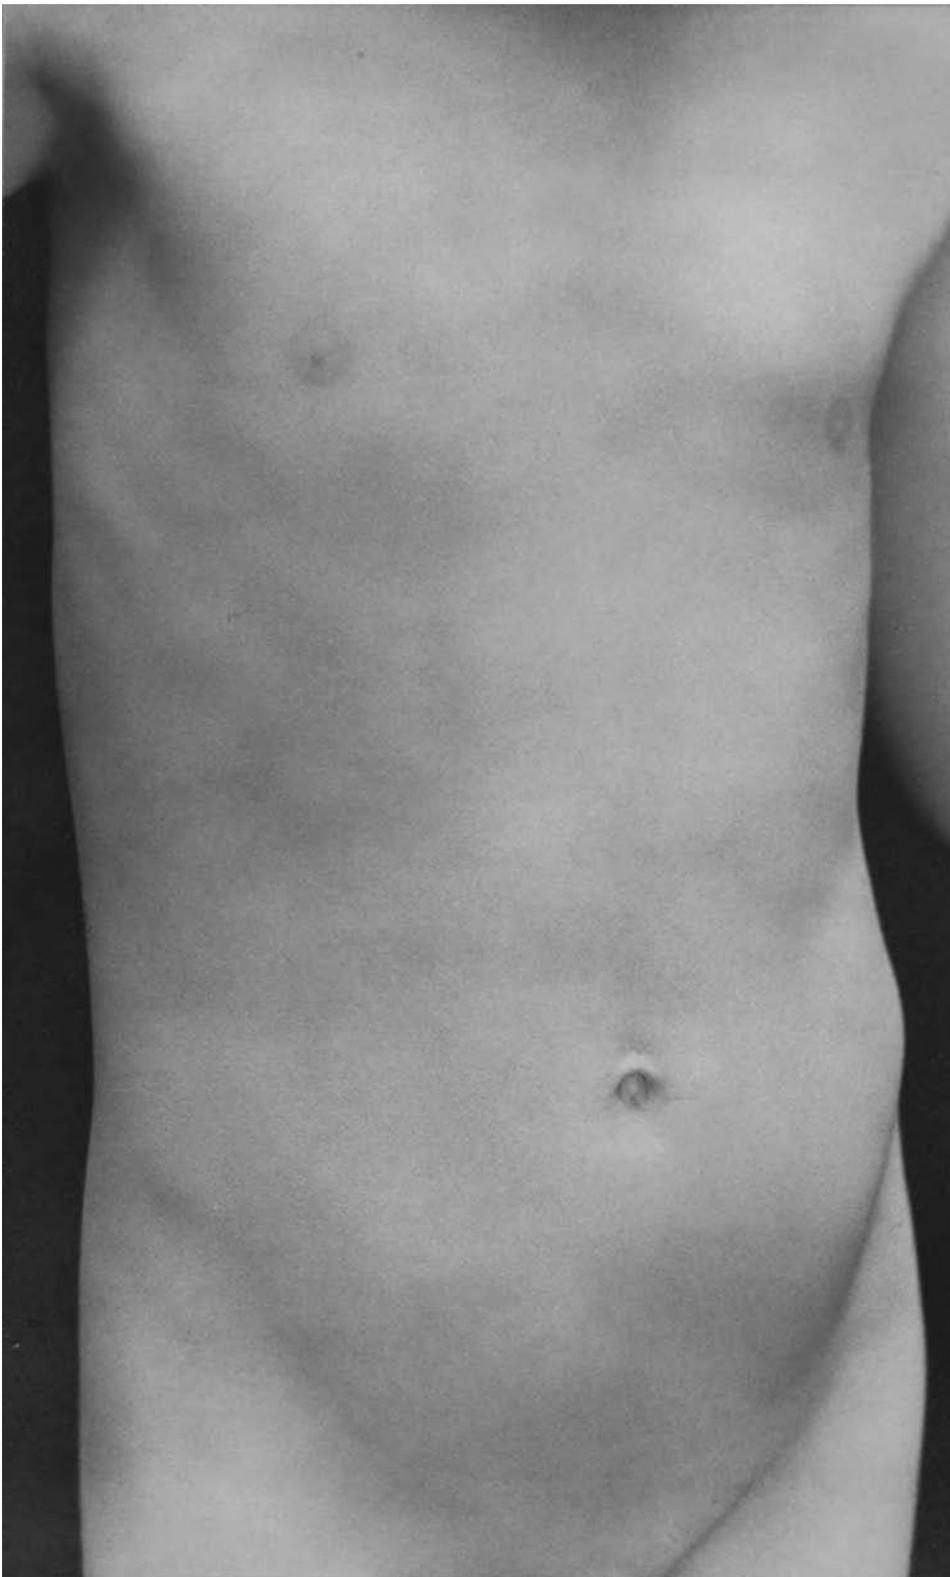

Advertising in America (although not in Europe) has tended to shy away from nudity, unless it is portrayed very discreetly. J. Frederick Smith, well known as a pin-up illustrator, was also a master at creating beautiful but culturally acceptable nudes for magazine advertising. Fashion magazines, whose editorial content is itself a form of advertising, have been less restrained. Beginning in the 1960s, publications like *Vogue* and *Harper's Bazaar* often featured elegantly photographed nudes or semi-nudes by such masters of the form as Richard Avedon, Hiro, and Irving Penn.

Body culture, a term originating in Germany's Weimar Republic in the 1920s, includes athletics, body building, and nudism. Nudity and athletes have a long association, since the competitors in the original, Greek Olympics are said to have competed in the nude. In acknowledgement of this tradition, the official poster for the 1912 Stockholm Olympics featured several nude athletes, their genitals carefully hidden. Posters for the Olympics of 1920 (Antwerp), 1924 (Paris), and 1952 (Helsinki) also featured artistic photos of nude male competitors. Discreetly posed photos of Olympic athletes constituted the cover story of the July 1996 issue of *Life* magazine.

Body builders, by definition, desire their muscular forms to be displayed, and such exhibitions have usually involved minimal clothing so as to maximize the aesthetic experience for the viewer. Some body builders have dispensed with clothing entirely, posing for photos in the nude. Photographers specializing in unclothed male bodybuilders include David Leddick, Reed Massengill, and Don Whitman. Bill Dobbins and Paul Goode have been among those best known for focusing on female competitors.

Nudism is a philosophy that contends that the human body is inherently beautiful, and maintains that nudity is not necessarily sexual. Nudist organizations have been publishing magazines portraying this lifestyle for decades, the first of which was the German magazine *Gymnos*. The first American nudist publication was *The Nudist*, founded in 1929. Nudist photography typically features subjects of both genders, all ages, and a wide variety of body types. Lighting is generally natural, artificial poses are discouraged, and anything smacking of erotica is shunned.

Photojournalism is characterized by three elements: timeliness (it is part of the record of contemporary events); objectivity (the image accurately depicts the event that took place); and narrative (combines with verbal elements to give a coherent account). Probably the best known example of the nude in photojournalism is Nick Ut's 1972 Pulitzer Prize winning photo of a nude, preadolescent Vietnamese girl fleeing her napalmed village. Many photojournalists had difficulty finding a market for nudes, since few mainstream publications would publish “full frontal nudes,” and only a limited number would consider more modest depictions, such as those involving a rear or side view of the subject. These policies were relaxed somewhat beginning in the 1980s, and it became possible to find discreetly portrayed nudes (i.e., no genitalia on view) in publications such as *Time*, *Newsweek*, and *People*.

Edward Weston, *Torso of Neil*, 1925, Platinum/palladium print, $9\frac{1}{8} \times 5\frac{1}{2}$ "', Purchase.

NUDE PHOTOGRAPHY

The development of the Internet has made photography of all sorts easily available to consumers, including nudes. Although many of the nude photos available on the World Wide Web involve hard-core pornography, the work of some of the best photographic artists can also be located, making them available to a far larger audience than ever before.

OFFICE OF WAR INFORMATION

The Office of War Information (OWI) is often considered significant because it ended a fertile period of New Deal-sponsored documentary photography in the United States. Indeed, the important Farm Security Administration (FSA) division of photographers lasted for less than one year after being absorbed by the OWI. But the OWI's support for photography is more accurately seen as a transitional stage in government support for the arts more generally. The direct employment of photographers documenting rural and ethnic communities during the Great Depression gave way to controlled propaganda during the Second World War and later to covert support for private institutions during the first two decades of the Cold War. In another stage, between 1965 and 1995, the National Endowment for the Arts actively funded visual artists in the United States.

The OWI was established as a branch of the Office for Emergency Management by an executive order on June 13, 1942, six months after the United States entered the Second World War. Like the British Ministry of Information and the Canadian Wartime Information Board, the OWI was a centralized information agency. The Domestic Operations Branch of the OWI oversaw and funded the production of all forms of U.S. media. The Over-

seas Operations Branch sought to control the international circulation of both domestic and foreign media. Only Latin America, which was the terrain of Nelson Rockefeller's Office of the Coordinator of Inter-American Affairs, fell outside of the OWI's reach.

OWI officials were culled from the top ranks of journalists, writers, and artists. Liberal radio commentator Elmer Davis directed the OWI and his associate directors included playwright Robert Sherwood and writer Archibald MacLeish, who served simultaneously as Librarian of Congress. The journalists at the OWI felt uncomfortable censoring reportage, and an internal debate quickly arose over whether the OWI should ensure the factual representation of the War or engage in selective dissemination of information. As we shall see, the OWI's use and later abandonment of photography fell at the center of this debate.

In October 1942, the OWI took over the photographic unit of the FSA. Economist Roy Stryker had originally founded the unit for the Resettlement Administration in July 1935, and in 1937 it moved to the Historical Section of the FSA's Information Division. Throughout the second half of the 1930s, FSA photographers including Walker Evans, Ben Shahn, Dorothea Lange, and filmmaker Pare

OFFICE OF WAR INFORMATION

Lorentz documented the effects of federal agricultural policy on farming communities. The FSA's purview quickly grew to include industrial workers and minority communities as well. When Congress cut the FSA budget in the summer of 1942, however, Stryker, who was intensely protective of his project, began to arrange for his photographers to do contract work for the Office of the Coordinator of Information and later its successor, the OWI. As preparation for war began, the FSA photographers recorded the effects of these preparations on the same communities it had already been photographing. One important new assignment, for instance, was the documenting of the internment of Japanese Americans, particularly the FSA's arrangements for the maintenance of properties owned by interned farmers.

Because Stryker was never able to secure civil service status for the FSA photographers and thus exempt them from the military draft, some were either drafted or voluntarily joined the military. Russell Lee, for example, became a photographer for the Air Transport Command, and Arthur Rothstein joined the Signal Corps. Other photographers moved to the OWI with Stryker and accepted new assignments that extended their earlier documentary work. Charged with collecting images of hard working, thriving, minority communities, John Collier Jr. was sent to Rhode Island to record Portuguese fisherman. On a subsequent assignment, Collier studied FSA projects in Taos, New Mexico, where, on the side, he photographed the local Pueblo Indians. Dorothea Lange was sent to San Francisco to capture the everyday lives of Italian Americans and Hispanics during the War. Collaborating with non-OWI-affiliated Ansel Adams, Lange sought to expose the discrimination against women and minorities entering the newly expanded workforce. Another OWI photographer, Gordon Parks, was sent to cover the African American pilots of the 332nd Fighter Squadron. Other photographers who moved from the FSA to the OWI include Marjory Collins, Jack Delano, Esther Bubley, and John Vachon.

The documentary photography work that the OWI initially commissioned quickly stirred ideologically-charged scrutiny. Many photographers complained of restricted freedom in the field, time-consuming paperwork, and the misuse of their material in government publications. Gordon Parks's celebration of African American fighter pilots and several other OWI projects had alerted Congress to the power of the OWI to influence public opinion. On the whole, the increasing tendency of the OWI to release only positive images of the War and wartime America worried opponents of Franklin

Roosevelt's administration. As a result, during the 1943 budget hearings, the House of Representatives voted to dismantle the Domestic Operations Branch of the OWI. Although the Senate returned some financial support and limited opportunities remained for photographers in the Overseas Operations Branch, Stryker decided to leave the OWI and permanently preserve the file of photographs he had worked so hard to build.

Going over the heads of his direct superiors, who wanted the collection broken up and redistributed, Stryker arranged with Archibald MacLeish for the photographs to be stored at the Library of Congress after the War. The collection was merged with the OWI's News Bureau and remained at the disposal of the OWI for the rest of the War. But Stryker also arranged for the OWI to continue employing art historian/archivist Paul Vanderbilt, who Stryker had hired in 1942 to undertake the daunting task of re-organizing the file by subject. Vanderbilt protected the integrity of the file and eventually moved with the collection to the Library of Congress. There he continued to oversee the FSA-OWI collection as head of the Library's Prints and Photographs Division.

After Congress enervated the OWI's Domestic Operations Branch, the OWI assumed a less direct role in the production of art and entertainment. The OWI's Bureau of Motion Pictures, for instance, curtailed its active and far-reaching control over the production of films, limiting itself to evaluating pre-production scripts for Hollywood. U.S. intelligence agencies (continued after the War by the Central Intelligence Agency) and the State Department eventually gave up the direct production of propaganda in favor of funding the display and circulation of American art by private institutions. The Museum of Modern Art in New York (MoMA)—where the administration contained many ex-intelligence officers including Nelson Rockefeller—assumed the most prominent role. During the War, MoMA had fulfilled 38 contracts for the Library of Congress, the Office of the Coordinator of Inter-American Affairs, and the OWI. After the War, MoMA collaborated with the CIA to circulate Abstract Expressionist painting as a symbol of American creative and individual freedom. Under the new direction of former head of the U.S. Navy's photographic division, Edward Steichen, MoMA's Department of Photography assumed a slightly more overt political role and staged liberal, anti-communist shows like *Korea: The Impact of War in Photographs* (1951) and the blockbuster *Family of Man* (1955). Yet the FSA-OWI photographers were only occasionally included in MoMA shows.

Today the FSA-OWI collection consists of approximately 165,000 negatives and transparencies and many more prints. The collection also includes work produced by other government agencies and by private companies during the Second World War. In a massive project of digitization, the Library of Congress has made over 112,000 black-and-white and 1600 color photographs from the collection available on-line as part of its American Memory project.

LENNART OLSON

Swedish

Best known as a photographer of bridges, Lennart Olson has also carved out an unmistakable style. Lennart Olson started working as a freelance photographer in 1954 and quickly became one of the leading photographers in Sweden; among many other achievements he was a founding member of the Swedish photographic association "Tio Fotografier." He has produced several books and his images have been shown at many exhibitions in Sweden and abroad, including the Museum of Modern Art (MoMA) in New York. In the 1960s, Olson worked for some years as a filmmaker, producing more than 50 documentary films for Swedish television.

As a photographer and an artist, Olson has developed gradually, taking time to seek his dream and fashion a language of imagery all his own. The camera is his instrument and in the darkroom he strengthens that which he wishes to express. The son of a professional photographer in Fritsla, a town outside Boras, Olson had the opportunity to learn about the medium at an early age, and he started to photograph in 1931 at the age of six. Young Lennart studied printmaking at the Royal Swedish Academy in Stockholm, his expertise as a photographer being largely self-taught. He worked in professional photo studios until he entered the Swedish Air Force in 1945. After his discharge

Olson married and started a family, supporting himself as a commercial and studio photographer specializing in architectural assignments. His works were widely published in such European magazines as *Industria* and *Arkitektur*.

In 1951, Olson traveled to Paris and became one of the first photographers to embrace the new, international currents shaping postwar photographic practice. Postwar photographers were exploring new spheres, conceiving their works in terms of concretism and abstraction, wherein photography was its own reality, not one that merely represented the larger reality. Photographers were particularly attuned to space and how photography could create "new spaces"—concerned with the medium's inherent ability to express the line and the surface play of imagery, allowing one to find abstract form. Edward Steichen said in a 1952 interview:

Look at Lennart Olson...he is one of the most interesting of the younger generation of photographers, not for the graphical elegance of the pictures, but for their significance, content, their visual interpretation of space, deep, boundlessness...His line patterns reach far out into the universe, whirl round his visionary ionosphere.

An international career was developing. In 1953, Steichen presented Olson at MoMA as a prominent figure of the postwar generation of photographers. When the museum's permanent photography department opened, Olson was the main attraction

with his monumental suite of bridges, including soaring images of the oft-depicted Brooklyn Bridge.

It was in 1952 that he photographed his first bridge, *Skanstullsbron*, a reinforced concrete arch bridge in Sweden. It was a decisive experience that led Olson to explore the universe of bridges: their shapes, motions, and relations in the landscape. Each bridge has its own particular character, its own exertion, its own abutments and combining points. The poetical language of form is strengthened in the photographs by forward elevation of the leading lines in the composition and by reduction of details. Many of his photographs get very near the geometrical abstraction, well demonstrated in the 1966 work *Tjörnbridge IV*. Photographed by positioning himself under a flat-bed bridge spanning a waterway, the image shows what appears to be a black monolith against a white void reaching up from a small hillock. The landscape is printed in dusty, manipulated grays; a rudimentary reflection indicates the mostly white space of the bottom third of the work is indeed water. The bridge has been transformed into an almost abstract composition of great graphic power.

Discussing whether his work is abstract or documentary photography, Olson has always answered "both...and." There lies the focal point in his language of form, writes his old friend and colleague, Kristian Romare:

He carries his image out, toward the extreme edge of abstraction. Then he lets a recognizable detail, a head sticking out over a parapet, maybe just a few rivets on a surface of steel, reveal that we stand before a photographic image.

(Olson and Romare 1989)

Olson's experience as a commercial photographer and his distinctive fine arts work found common cause with his fellow Swedish photographers seeking to advance themselves. With Hans Hammarskiöld and others, he founded the collective Tio Fotografer in 1958. This experience also led him to filmmaking, and he worked as a freelance cameraman for Swedish television for nearly 20 years between 1960 and the 1980s. He often fulfilled overseas assignments, and on these assignments took the opportunity to photograph such notable artists Jean Tinguely, Niki de Saint Phalle, Tristian Tzara, Man Ray, and Fernand Leger. Examining both his still and moving pictures, one can collate his approach and methods of working to discern that the main theme running Olson's work is clarity, not only in overall composition, but in detail and depth of imagery.

In the 1970s, Olson's interest turned to photolithography, which suited his already highly graphic

style. In the 1980s, with the return in interest to more traditional photographic techniques of that era, he made his first photo gravures and began to explore the gum bichromate process, mediums that seem antithetical to his prior hard-edged style. His works also became more sensual in subject matter; phallic forms emerged, as in *Postbridge, Dartmoor, England*, 1991, which shows a weathered handmade stone bridge seemingly glowing with moisture in dim light; a stone bridge and its reflection in still waters evokes a vaginal image in *Grange-in-Borrowdale I. River Derwent, England*, 1991, proving Olson to be a restless creative spirit always interested in further exploration.

In summary of his quest, Olson stated:

In documentary filmmaking I'm looking for straightforwardness, in my stills I'm looking for ambiguity. One usually sees a film only once; if one hasn't understood it by then, it's too bad. One ought to be able to come back to a picture many times, and it should stimulate one's own fantasy for different interpretations.

Biography

Born Gustaf Lennart Eugen Olson, 21 December 1925, Göteborg, Sweden. Childhood and adolescence in Fritsla, where his father was a photographer. From 1940 until 1948 employed by various photographic enterprises. 1945–1946 served in the Swedish Air Force. 1948, employed by Foto Henried, picture agency in Stockholm. Travels to Paris, 1950. In 1952 he starts working at Förbergfilm in Stockholm, where he produces films based on still photographs. In 1955, freelance photographer working mainly with assignments in the field of architecture, art, industrial, and commercial photography, also with picture stories, published in magazines, such as *Vi*, *Form*, *Industria*, and *Konstrevy*. In the period 1955–1960, several journeys in Europe and Asia on assignments for, among others, *Nordiska Uppslagböcker*, *Arkitektur*, *Form*, *Konstrevy*, and *Vi*. Founding member Tio Fotografer group, 1959; photo agency Tiofoto, 1959. In 1960 he produces his first television films during a reportage around the Black Sea in collaboration with Kristian Romare. Freelance cameraman for Sveriges Television, Sweden, 1960–1980. In 1984 he leaves Stockholm to settle at the seaside in southern Sweden.

OPTICS

Optics defines light and vision, two fields of knowledge of profound importance to photography. Like any modern science, optics is comprised of numerous specialties, but the one most pertinent to the development of photography is classical optics. Also known as geometric optics, the discipline arose between the sixth and third centuries BCE in Greece, when painters, philosophers, and mathematicians began investigating the mechanics of vision. Aristotle presents one of the earliest discussions of optics, followed by Euclid and Claudius Ptolemy, each of whom devoted multiple treatises to the subject. While optics achieved prominence as a science, it is likely that the impulse for research into the principles of vision began with Classical painters who developed naturalism as the dominant aesthetic of Greek art.

Greek theorists held that art should present the appearance of reality. In one famous example, the artist Apelles painted grapes so realistically that they fooled the birds that had flocked to eat them. However, Greek naturalism went beyond the pro-

per modeling of form. Painting was conceived as a window onto an imaginary world that fooled the eyes. To achieve the effect of depth on a two-dimensional surface, painters developed linear perspective, a technique for representing the appearance of objects in three dimensions. Investigations into linear perspective led to the discovery of principles that explain how the visual field is constituted from physical space.

In his fourth century treatise, *Physics*, Aristotle described optics as a subaltern science that is derived from geometry. The contrast between the *Optics* and *Geometry* of Euclid clearly delineate the subaltern status of visual knowledge. *Geometry* is a fat tome containing an extensive exposition of its subject. *Optics* is a slender companion volume that presents a modified form of geometric reasoning. Optics shares postulates with geometry, but Euclid uses them to describe appearances of things rather than the construction of objects. It is through this geometric pedigree that optics, and by corollary photography, is related to a much earlier representational

practice—surveying. Just as optics developed from attempts to reproduce visual space, geometry was discovered through efforts to model physical space in survey documents. Representation of space has been a critical element of urban civilization since it first emerged, and archaic documents show that Sumerian surveyors first applied the principles of geometry over 6,000 years ago.

The distinction between geometric and optical science might best be described as the contrast between the vertical (or aerial) and horizontal perspective. When a viewing station is situated directly above a field, that is, when the viewpoint is parallel to the field, objects present a geometrically accurate appearance. Their size, shape, and distance from one another appear in the mathematically correct ratio. When objects are viewed horizontally, that is at a 90-degree angle to the viewing field, then perspectival effects occur. Near objects appear relatively larger than distant objects, elements of objects are foreshortened, and distances are distorted. The philosopher Plato used these effects to criticize empirical knowledge, but he did not realize that perspectival effects could be defined mathematically. Only a few generations later, Euclid was able to systematize optics, creating one of the early successes of rational science.

Thanks to optics we can produce rigorous descriptions of visual space that can be translated into geometric terms. In other words, we can mathematically account for the apparent distortions of vision, and we can even work backwards to the geometrically correct description of an object. Our brains do this automatically, for instance when we perceive an irregular hexagon as a cube or realize that a nearby house is smaller than a distant mountain. Optical algorithms can be embedded into machinery, which is precisely what happens in photography. When stated as an algorithm, focusing a camera is an act of measurement, which is why the focus ring of a manual camera states the distance between the film plane and the subject of the shot.

Classical optics has long been superseded by modern sciences of light and vision, but its influence remains in the ubiquitous technologies of photography, cinema, and video. And it is even apparent in the new technologies of virtual reality, since its principles play a strong role in generating realistic spaces for games, flight training, and other simulated environments. It is almost redundant to say that the primary expression of optics lies within the camera, which is by definition an optical device. Photographic cameras evolved from the camera obscura, a device that originated in medieval laboratories. Scientists in the Middle Ages revived Classical learn-

ing, but they contributed an empiricism that was previously absent. The development of the camera is a consequence of an empirical approach where observation and instrumentation complemented theoretic speculation on visual phenomena.

In its simplest form the camera obscura is a shuttered room with a narrow aperture that admits light. The first recorded use of the camera obscura is in an optical treatise written by the ninth century scientist al-Kindi, who constructed a special room to investigate the nature of light. At this point the image-forming abilities of the camera were of little interest. Al-Kindi and his tenth century successor Abu Ali al-Hasan Ibn al-Haytham built camera obscuras to investigate the propagation of light. Euclid had assumed that light propagated in a rectilinear fashion, and the camera obscura was used to provide physical evidence for that statement. Optical texts by al-Kindi and Ibn al-Haytham became standard university fare, and through them knowledge of the camera spread to centers of learning in the Islamic world and Europe.

The camera obscura remained rudimentary and relatively unknown until the Italian Renaissance, when interest in naturalist representation accompanied a revival of Classical culture. Naturalism was expressed in the painting and reliefs of the Renaissance, prime examples of which were drawn in perspective. The term perspective comes from the Latin word for optics, and so-called Renaissance painting is simply painting done within the framework of optics. While the exact origins of Renaissance perspective were not documented, it is likely that perspectival method arose from a combination of trial and error, notably in the work of Giotto, combined with medieval optics and the discovery of the *Geography* of Claudius Ptolemy by Florentine scholars. The latter work contains the only definitive record of classical perspective, adapted for the representation of the Earth's surface, and it could have inspired the inventors of Renaissance perspective, Bruno Brunelleschi and Leon Battiste Alberti, to develop the technique.

The training and tools of perspectival painters were in keeping with the geometric origins of optics. In the introduction to *On Painting*, the first known handbook on artistic perspective, Alberti calls on painters to learn geometry and become mathematicians. Perspectival method adapted surveying tools like compasses, rulers, and measuring cords to the canvas, which is not surprising since many Renaissance artists were also accomplished engineers, architects, and urban designers.

Once again the conditions for progress in optics were in place, this time within a culture that was

far more technically inclined than ancient Greece. Realist paintings became the artistic standard of the fifteenth century, but classical perspective was difficult to achieve with manual tools. By the end of the sixteenth century, Italian inventors had combined the primitive camera obscura used by scientists with the lens, which had been invented in the thirteenth century. Inserting a lens into the aperture of a camera created a device that was useful to painters, draughtsmen, and documentarians. Demand for the device was high, stimulating a succession of innovation in cameras and image-making that continues unabated to this day. Acting through the camera, optics has become a primary mode of communication in late industrial civilization.

The relationship between photography and optics accounts for the multiple understandings we attach to photographs. There is no question that photographs are physical artifacts formed by natural, that is, technological, processes. As mentioned previously, a manual tradition of mathematical representation has supported the activities of urban civilizations for millennia. The tools of surveying, cartography, and perspectival painting generated images that contain roughly the same information as a photograph. Renaissance artisans introduced new technologies to simplify the intense calculation and drafting skills required by these manual technologies, and the camera obscura was the most notable of these devices. Over a period of 400 years, improvements in lenses and advances in chemistry allowed the introduction of photography, a technology that automated the production of optical representations.

As a society we invest heavy symbolic value into the optical mode of production. Unlike manual forms of representation, which bear the foibles of their creators, photographs are a form of truth, the products of surrogate eyes, and they possess industrial qualities that seem quintessentially modern. But making photography an emblem of modernity belies the Classical, even archaic, origins of optics. While photography is a modern invention, it lies at the end of a chain of development in mathematical imagery that began with the earliest civilizations. Mathematically accurate representation is a vital component of any hierarchical urban society, and the emergence of photography in modern civilization is symptomatic of a continuum of development, not a break with the past. It is then more accurate to say that photography was a quintessentially nineteenth century invention: it automated a process that had traditionally been performed by skilled labor. Like locomotives, cotton gins, and mills, photography is a product of the Industrial Revolution, but it is based on processes

that were introduced at a much earlier stage of human development.

The optical qualities of photography give the medium a magical feel. Cameras form images without intervention, and photographic images recreate our environment with tremendous accuracy. Such qualities seem without precedent in earlier technologies, but the background for such a device is actually quite intimate: it lies within our eyes, and it is explained by the unusual status of Classical optics.

Classical optics is a physical science, grounded in mathematics, and it is closely related to geometry, cartography, and astronomy. But, unlike its sister disciplines, it has a phenomenological component because it describes how things appear to our perceptual faculties. It translates between subjective and objective fields of representation, and it provides a basis for creating technologies of perception, that is, automated systems of representation like photography. Euclid and his successors described the appearance of things through a set of theorems that could be embedded in practices like perspectival drawing. With the discovery of the pinhole effect, the phenomenon that forms images in cameras, followed by lenses, it was possible to largely automate the process of picture-making.

Much like how tools enhance human strength, cameras amplify vision. Optics is thus equal parts physics, physiology, and psychology. The discipline describes the behavior of light, but it does so in the context of perception, since nature has evolved an optical device—the eye—for animals to access their environment. Eyes and cameras are a prime example of convergent evolution, which explains why photographs look real. Like levers and pulleys, they use physical principles—the amplification and documentation of light—to extend our powers of perception. Our awareness of the visible world is based on optics, and photographs, like experiences they resemble, are a form of perception.

The optical paradigms developed by Euclid dominated the study of light and vision until the modern era. They were essentially a phenomenology. While they described the behavior of light in the eye with some accuracy, they neither offered a general theory of light, nor did they explain image formation in the eye and its transmission to the brain. Classical theory reached its peak in the work of Johannes Kepler, the first thinker to rigorously explain how eyes exploit the pinhole effect to form images. Kepler did not proceed to make the obvious comparison between eyes and cameras because he realized that a considerable amount of work needed to be done in the physiology of vision. After Kepler's breakthroughs, scientists like Rene

Descartes made great advances in the physics of light with tools like prisms. It was not until the nineteenth and twentieth centuries that the physiology of vision has been put on a solid grounding, mostly through the work of neurologists, experimental psychologists, and cognitive scientists. Though science has yet to produce a complete understanding of vision, Euclidean optics and Classical representation has, through the medium of photography, permeated the vast majority of human societies.

PAUL OUTERBRIDGE JR.

American

A master of color photography known for his carefully composed still-lives and the psychologically complex eroticism of his nudes studies, Paul Outerbridge Jr. was a relentless perfectionist attracted to the sensuous qualities of the photographic object. His career began in the formalist abstraction of the 1920s avant-garde, while his later work turned to questions of sexuality and the construction of narrative. Although he staunchly asserted photography's independence as an art form, his preparatory sketches and attention to materials and processing—not to mention the formal and thematic references found in his images—often bore close affinities to painting and printmaking.

Born into a wealthy New York City family, Outerbridge led a privileged early life, attending private schools and studying drawing and aesthetics at the Art Students League. As a young man he was an enthusiastic contributor to the city's art and theater scenes, finding work as a poster illustrator and set designer. During World War I, he served briefly in the Royal Flying Corps in Canada and began taking photographs in 1917 as documentation of military installations while serving in the U.S. Army in Oregon. After travels to Hollywood and Bermuda, Outerbridge decided to devote himself to photography, returning to New York in 1921 to marry Paula Smith and enroll in the Clarence H. White School of Photography. Clarence White's Pictorialist background fed Outerbridge's interest in the physical

aspects of the photograph and the importance of darkroom craft. Even as a student, Outerbridge printed in platinum, rather than silver, for better tonal range.

Although he tried pictorialist techniques and the street photography idiom popular among his schoolmates, Outerbridge was drawn to the work of Paul Strand, Edward Steichen, and others who sought modernist abstraction and dynamic visual impact in photographing common objects. His tightly-framed early still-lives, often composed from household articles, combine formal complexity with technical precision. In *Telephone*, 1922, a high angle and severe, off-kilter cropping compresses this everyday appliance into a dark, imposing mass of overlapping circles and crescents. His studies with the cubist sculptor Alexander Archipenko are reflected in *Saltine Box*, 1922, where manipulating frame, angle, and light source transforms an upturned tin into the destabilizing nucleus of a cubist field of fragmented planes of negative and positive space.

Outerbridge had landed regular advertising assignments with *Vanity Fair* and *Harper's Bazaar* by 1924, and his commercial photography recast products as novel, almost protean objects of formal beauty, fetishized by consumer desire. His well-known *Ide Collar*, 1922, renders a starched shirt collar as pure form stripped of utilitarian pretense. Placed on a checkerboard surface, the collar becomes a floating arabesque at odds with the rigidly patterned background, strongly suggestive of the surrealism of Man Ray as well as a precursor to Brassai's *Involuntary Sculpture* series.

Outerbridge joined the Paris avant-garde scene in 1925, initially working at Paris *Vogue* in collaboration with Steichen, though his chronic difficulty with authority led to his resignation after only three months. The break with the influential Steichen cost him an important ally in curatorial circles years later, but Outerbridge flourished as a freelance photographer while in Paris, building a lavish, automated studio in 1927 in partnership with mannequin manufacturer Mason Siegal. Freed from the conservatism of his American roots, Outerbridge enjoyed an extravagant, high-profile lifestyle in France. *Self-portrait*, c. 1927, neatly encapsulates the contradictions of his unabashed eccentricity and self-absorption of the time. Decked out in top hat and tuxedo, his harshly lit face is shielded by a balaclava and goggles. The artist-dandy is disfigured but dapper, at once worldly and enigmatic in his spotlight as he paradoxically commands attention and retreats into secrecy.

Outerbridge befriended sculptors and painters Constantin Brancusi, Pablo Picasso, Salvador Dali,

Francis Picabia, and fashion photographer George Hoyningen-Huene during this time, but his closest relationships were with Man Ray and Marcel Duchamp, both of whom would have an impact on his work. An early admirer of *Ide Collar*, Duchamp explored fetishism in a way that resonated with Outerbridge's later obsession with sexuality and the object. Man Ray's versatility and innovative approach to photographic processes likely served as sources of encouragement for Outerbridge's incipient experimentation with color photography.

His studio bankrupt and his marriage over, Outerbridge worked briefly in the film industry in Berlin and London in 1928 before returning to New York the following year, professionally and emotionally exhausted. Escaping to his family's country house in Monsey, New York, he absorbed himself in learning the relatively new carbro color process, whose infamous complexity and renowned high quality suited Outerbridge's penchant for meticulous, solitary work that produced rich results. Although his photographs up to this time could be easily inscribed within avant-garde trends, the three-color carbro process was fundamentally different from nearly all photography produced at that time and led Outerbridge to the individual, even idiosyncratic, aesthetic he sought. His technical virtuosity and elaborately staged still-lives brought him well-paid commissions throughout the 1930s for magazines like *Mademoiselle*, *House Beautiful*, and *U.S. Camera*, and he published a successful manual on color photography in 1940.

Although Outerbridge had made nude studies of his wife a decade earlier, he took advantage of the vibrant and sensuous properties of the carbro process to embark on a series combining satiny elegance with raw energy and brash artifice, all hinging on the frank depiction of sexual fetishism. Mirrors, masks, and selected clothing articles like gloves and stockings abound in these works as Outerbridge drew not only on his experience of surrealism's sexual ambiguity and psychoanalytic foundations, but on the breadth of art history itself. These works of the late 1930s lie somewhere in the provocative and precarious territory between cheesecake pin-ups and the Renaissance art tradition. In *Woman with Snake*, c. 1938, a scaly black serpent coils against the model's porcelain skin under an artificial tree, yet any evocation of Eve in Eden is deflected by the woman's bright, drugstore-counter lipstick and penciled eyebrows. *Dutch Girl*, also c. 1938, faithfully recreates the austere setting and solemn pose common to Old Master portraiture, while the model's forthright nudity is heightened by the primness of her dainty lace cap. The most troubling image, however, may be

Nude Woman Wearing Meat-Packer's Gloves, 1937, with its implications of masochistic self-mutilation as a woman digs at her cropped, nude torso with sharp, metal-tipped gloves.

Perhaps surprisingly—given their vastly divergent subject matter and purposes—Outerbridge's artistic and commercial work from this period share his careful choice and arrangement of objects, as well as an attentive and sometimes shocking juxtaposition of textures and colors. Even in so banal a commission as *Toilet Paper Advertisement*, c. 1938, the roll of tissue unwinds like a fine, wispy fabric floating on a sea of heavy, fleshy flowers, transforming basic hygiene into a matter of sensuous refinement.

In 1943, as the demand for color printing collapsed with World War II and his nude work failed to impress gallery owners, Outerbridge sold his house and headed to Hollywood. Too independent for the collaborative exigencies of the film industry, he finally settled in the coastal town of Laguna Beach, where he briefly opened a portrait studio and started a fashion design company—"Lois-Paul Originals"—with his second wife, Lois Weir. Though he traveled as far as South America and Europe on occasional magazine photo assignments, by the early 1950s he had essentially retired from serious photography, writing a technical column for *U.S. Camera* magazine and struggling to sell his prints at local art fairs. He died in 1958, leaving behind an uncertain artistic reputation, and it was not until the early 1980s—as new questions of gender and sexuality entered art historical discourse—that serious interest in his work would be renewed. The importance of his legacy has since emerged in its relevance to the work of photographers who emerged at the end of the century as varied as Robert Mapplethorpe, Cindy Sherman, and Pierre et Gilles.

BILL OWENS

American

Bill Owens's photographs consist largely of portraiture of middle class Americans living on the west coast during the late twentieth century. He spotlights anonymous individuals in casual, real-life activities through the use of formally advanced, largely black-and-white, photographs. His work is a significant contribution to portrait, documentary, and lifestyle photography of the late twentieth century.

Owens was born in California and raised in a rural area in the northern region of the state. He was interested in photography at an early age, but did not react well to formal training; as a result, he is largely self-taught. Following college, where he had explored poetry, he married and left California with his wife to serve in the Peace Corps in Jamaica. Upon returning to California three years later, he studied photography briefly at San Francisco State University and worked as a photographer for a local newspaper, the *Livermore Independent*.

Owens's newspaper work satisfied his interest in reality as a subject matter. His documentary photographs recorded diverse subjects and locations, taking particular note of the increase in suburban areas and the accompanying rise in the suburban lifestyle. Not only were natural, undeveloped spaces being taken over by planned building projects, but materialism and the pursuit of the American dream was dominating the lifestyle of the mainstream.

Owens's most accomplished work, *Suburbia* (1972), best known in its book form, was begun with a grant to photograph citizens of his community in and around Livermore. The project began in the late 1960s with Owens creating a shooting script for a series of events that he felt characterized suburban life: Tupperware parties, parades, and forms of casual recreation. He also documented many of his neighbors posing with what they deemed their most valued possessions, such as cars, motor homes, or furniture.

The result was an informal anthropological–sociological collection of beautifully shot and printed images of individuals displaying sincere pride in their families, homes, possessions, and community rituals.

The *Suburbia* photographs are formally refined, precisely focused, and generally display over-all, blanket lighting. Many were shot in black and white and feature balanced, straightforward compositions, especially shots of centrally positioned, smiling individuals. Occasionally Owens shot from odd angles and distances that added an unsettling perspective on seemingly ordinary suburban life. For example, a close-up on a pantry that overflows with preserved and canned food seems to be using the formal properties of the photograph to suggest the shocking confrontational view one obtains when opening a cabinet, which becomes intensified by excessive contents. Owens also employs color for certain images. His images of a kitchen and party are intensified by the use of color, as is one of a child in a costume.

Walker Evans was an important predecessor to Owens. Like Evans, Owens captures the domestic and social life of America. Another important precursor is Robert Frank, whose "road" photographs captured individuals in surroundings that indicated their backgrounds and social standing while simultaneously making them iconic Americans. Within the genre of portrait photography, Owens has numerous contemporaries such as Bruce Davidson, Danny Lyon, and Garry Winogrand. Winogrand's images of middle class Texans have particular resonance. Owens can be considered with Davidson, Lyons, and Winogrand as part of a movement of social realist photography that had particularly currency in the 1960s and 1970s in America.

What sets Owens' work apart, however, is that he interviewed his sitters and combined his images with his subjects' own words, creating layers of meaning not commonly available in documentary photography. Many of these captions reveal quotidian truths

and a general contentment with the status quo. One individual describes "The best way to have fun...is to come out on a Saturday morning and pull weeds in a median strip," implying that fun is a priority and that pleasure is derived by maintaining the local community. A picture of a young girl in a bedroom strewn with clothing features the caption, "I wanted Christina to learn some responsibility for cleaning her room, but it didn't work." An Asian family pictured around their dinner table is paired with the caption, "Because we live in the suburbs, we don't eat too much Chinese food. It's not available in the supermarkets so on Saturdays we eat hot dogs." Other comments indicative of the suburban mind frame include, "we're not doing too badly," and a couple who comments on the joy of being able to sit in front of their home and "watch the traffic go by."

Owens has noted that a quote he particularly admires, by an unnamed individual states, "The main thing in life is to live it your way." Indeed, Owens's photographs document the ways people lived their lives and spent their time and money during the late twentieth century. By documenting people, places, and their possessions, he shows the relationship between a way of life and income, represented by the diverse ways of spending (i.e., boats, cars, motor homes, parties). Owens's project also paralleled the growth of feminism in America, and his photographs document women influenced by "women's liberation." Yet in the final analysis, the images that make up *Suburbia* were created out of Owens's sense of responsibility to the community he documented. Owens even included his own family as one of the closing shots of the book. His sense of responsibility to his family prompted the decision to leave photography in the early 1980s when he founded a brewery.

Owens also published *Our Kind of People* in 1974, which featured photographs of fraternal and social organizations such as the Elks, Cub Scouts, and church groups, and *Working: I Do it for the Money*, 1977, about occupations, completed his examination of suburban life.

Biography

Bill Owens was born in San Jose, California, September 25, 1938. He received a B.A. in Industrial Arts from California State University, Chico, California in 1963. Following college, Owens traveled extensively through Central America, Europe, and the Middle East. He served in the Peace Corps from 1964–1966 in Jamaica, West Indies. He entered

San Francisco State College in 1966 to study photography. Worked as a photographer for the *Livermore Independent*, California from 1968–1978. In 1971, Owens obtained a \$2000 grant from Alfred Heller, publisher of *Cry California* magazine to begin work on photographs of suburban life. A Guggenheim Memorial Fellowship and two NEA grants followed. From 1972 to 1979, he published three collections of his photographs in the form of books. From 1978 to 1982, he worked as a freelance photographer. In 1982, Owens founded Buffalo Bill's Brewery in Hayward, California, where he presently resides and publishes two magazines: *American Brewer* and *Beer*. His photographs are included in the collections of Museum of Modern Art, New York, San Francisco Museum of Modern Art, Los Angeles County Art Museum, Museum of Modern Art, Stockholm, and Harvard University, among many other private and public collections.

P

PANORAMIC PHOTOGRAPHY

The panoramic image can trace its origins to Irish-born artist Robert Barker (1739–1806) who not only coined the term panorama but also patented his method of “circular” painting. Barker’s unique 360 degree view of Scotland’s capital city Edinburgh and a precursor of today’s IMAX theatres, proved to be a popular format with many of the early pioneers of photography, not least a young Frenchman by the name of Louis-Jacques Mande Daguerre. Daguerre, originally a landscape painter, invented a form of panorama in 1822 using paintings of Napoleonic battles. The Diorama, as Daguerre named his invention, was a hugely popular audio-visual show that made Daguerre a wealthy man and thus enabled him to devote all his time to the emerging science of photography. Taking up where his fellow Frenchman, Joseph Nicéphore Niépce, had left off, Daguerre spent the next 15 years experimenting and in 1839 he unveiled the Daguerreotype to the public; in essence, the first commercially available photographic process, which was to revolutionise the way we viewed the world.

The earliest panoramas were simply two or more Daguerreotypes placed or hung side by side, but as the science of photography quickly developed, so did the technical process of producing panoramas. The

original photographic definition of the term *panorama* was deemed as being an image whose width exceeded 100°—the first cameras designed specifically to capture a panoramic image emerged in 1846. One of the defining early images was a view of San Francisco shot in 1851 that used five separate daguerreotypes to create a panorama of the city and harbour, though it was believed that up to 11 panels were originally taken, producing a much wider vista. Panoramic images were produced throughout the last half of the nineteenth century, including George Barnard’s Civil War scenes.

Even up to the age of digital photography, the cameras used to produce panoramas were generally of two types—the swing lens; where the lens rotated while the film remained static, and the 360-degree rotation version where both film and camera rotated in unison. Though a somewhat specialist field due to the nature of equipment involved, early protagonists of the art were generally the domain of the professional and included Girault de Prangey (1804–1892), George Barnard (1819–1902), George R. Lawrence (1869–1938), Frederick W. Brehem (1871–1950), Felice Beato (c. 1830–c.1908), and Miles F. Weaver (1879–1932) amongst others. Panoramas of this era were still capable of generating much excitement when

PANORAMIC PHOTOGRAPHY

exhibited, reflecting a continuing interest in the form that had proven to be one of the most popular entertainments of the nineteenth century. Landscapes and aerial views dominated, although large group shots were also popular, even in the early years of the century; George Lawrence, known for his extraordinary aerial panorama of the aftermath of the Great San Francisco Earthquake in 1906, captured several notable indoor and outdoor crowd shots, such as *Great American Handicap*, c. 1907. Miles Weaver's panoramas of beauty contests, such as *Venice Bathing Beauty Pageant*, 1926, show the technical advances that allowed more refined group portraits two decades later.

However, with the introduction of Kodak's mass-produced Panoram camera in 1899, which captured a 142° field of view, the medium was at once within reach of the amateur enthusiast. For a time, panoramic photography was extremely popular with non-professionals since the Panoram did not need a complex tripod and also had the advantage of using roll film. British-born Alfred Hind Robinson (1864–1950) regarded panoramic photography as strictly a hobby but produced thousands of exceptional images between 1903 and 1930 using his trusty clockwork Kodak Panoram No. 4 camera, which used 12 × 4-inch nitrate film and produced a 180° sweep. Another master of the Kodak Panoram was Czech-born Josef Sudek (1896–1976) whose views of Prague are renowned. Like Robinson, Sudek preferred to produce his photographs as contact prints as opposed to enlargements, thus retaining detail and tonal range. What marks Robinson's and Sudek's work is not only their excellent compositions but the high technical quality—the relatively cheap, mass-produced cameras like the Panoram tended toward distortion—and it is a testament to these photographers' skill that they were able to produce such excellent results with such basic equipment.

Other cameras popular around the turn of the twentieth century included the Conley Panoramic Camera, the Al-Vista, and the Kodak Cirkut camera, patented in 1904. Frederick W. Brehm, a photography instructor and technician employed by Eastman Kodak, is generally credited with developing the prototypes and early versions of what became the Cirkut, which he used to make historic panoramas of the U.S. capital, including a 20 foot long, 360 degree panorama. Unlike the Panoram, the Cirkut used large format film ranging from 5 to 16 inches and capable of producing prints up to 20 feet long. The Cirkut also came with its own special tripod, which housed the negative film. This camera was largely the preserve of the commercial photographic market to produce cityscapes and large group por-

traits As the Cirkut traveled in an arc on its tripod, to produce a group that seemed to be normally arranged, either in a line or a block, the photographer had to carefully arrange his subjects in a corresponding arc to correct for distortion.

As the twentieth century progressed, the appeal of panoramic photography declined—the invention of the 35 mm format Leica camera in the late 1920s and the resultant rise of photojournalism certainly hastened the demise of the panoramic, which was seen increasingly as a novelty in a world where reportage capturing the immediate was all the rage. The wane in popularity of the panoramic was relatively short-lived, however, and the post World War II period witnessed a resurgence of interest. This interest continued to grow as large format landscape and art photography became more and more an integral part of the photographic spectra. The panoramic view also became increasingly popular among nature photographers in the late decades of the century. Fine arts photographers who created panoramic photographs include Art Sinsabaugh (1924–1983), who trained at Chicago's Institute of Design and specialized in views of the flat Midwestern landscape made with a 12 × 20-inch banquet camera, Charles Traub, a student of Sinsabaugh's, Josef Koudelka, and Mark Klett.

In addition, there was still demand for panoramic photography from the commercial market—particularly where large group shots were needed. Indeed, those who remember having their school photograph taken may also recall the prospect of a student appearing twice in the same photograph. As the panoramic camera swept from one end of the group to the other, a student would stand at one end, then run to the other before the camera completed its sweep, thus appearing as his or her identical twin in the shot—often referred to as the “pizza-run” in the business.

The continued popularity and interest in the medium may be attributed to the fact that a panorama captures the way we actually view the world where the human field of vision is wider than it is high. However, up until recently the mechanics of panoramic photography meant it was still difficult—and expensive—for the amateur to compete with the professional, thus keeping the art within the realms of an elite few. Film cameras such as the Widelux and Horizont as well as the Hulcher and Globus were all capable of producing excellent results but finding a photo-laboratory that could produce prints from 35-mm negatives or positives longer than 8 inches was another matter. The advent of the digital age, given that most digital cameras are now equipped with a panoramic setting as standard, has revolutionised and invigorated the genre. The relative ease of

producing panoramas using a digital process called stitching means that anyone with an eye for a scenic vista—even with a basic digital camera—can produce a panoramic image with relative ease. Gone are the days of using special cameras, tripods, and large format negatives or creating complex montages that required the services of an artist to air-brush the seams. Gone too are the days where the process of capturing and then reproducing a panorama took many hours—the process now is almost instantaneous and available to all though, like any other form of photography, the art of composition is still the key to producing a memorable image.

MARTIN PARR

British

Martin Parr came to prominence in the early 1980s documenting and reflecting the diversity of British society. He has been fortunate to see his career incorporate various disciplines and practices within photography. As a member of Magnum Photos, he is classified as a photojournalist though his work has been exhibited widely throughout the world and published as photo essays in numerous books. As his influence has grown, his subject matter has broadened to include the idiosyncrasies seen worldwide within society and culture.

Born in 1952 in Surrey, the heart of suburban, southern England, Parr's photographic education took place in the northern, industrialized town of Manchester in the early 1970s. Differences in class and the definitions and substance of "Englishness" would become an early and important theme within his work. Influenced by the documentary tradition, he

also placed the importance of humor firmly within his earliest work. For his graduation show in 1973, *Home Sweet Home*, he created a stylized idea of an English sitting room, his photographs displayed in picture frames normally used for family snaps. Staying in the North, Parr worked on several projects, documenting aspects of working class life, supplementing his income by teaching. *Bad Weather* published in 1982 was his first work to reach a wider audience. Shot over seven years, mostly with an underwater camera, the book of black and white photographs portrays a cold, wet, windswept Britain. Subject matter and humor combine visually through Parr's diligent editing.

The Last Resort in 1986 was the book that truly launched his career and reputation. A reportage on a working class, seaside town long after its glory days of the late nineteenth century, Parr by now had switched to color using medium format cameras, heightening the clarity and detail of his photography. The work is severe in its outlook showing dirt and

debris amongst the sunbathers and a sense of acceptance of the down worldly conditions occupied within the holiday resort. The technical change in style coluding with the forthright critical depiction of the subject was to become Parr's recognizable trademark.

His photography has a tendency to sharply divide his critics. For some his brutal honesty is a welcome breath of realism, humor, and observation, while his detractors claim his work to be mean, cynical, exploitative, and voyeuristic, accentuating only the negative and the contemptible. Following the success of *The Last Resort*, Parr continued with a series of books and exhibitions. His prodigious output includes *The Cost of Living* (1989) portraying the new affluence within the English middle classes during the 1980s, and *Small World* (1995) concerning the homogeneity within worldwide tourism. As well as these major projects, Parr has always continued to work as a photojournalist (the content of his books often deriving from this work) and to publish and exhibit further series and collections focusing on smaller themes. *Bored Couples* (1993) and *English Food* (1995) portray exactly what their titles suggest while *Japonais Endormis* (1998) is a series of close-up head shots of sleeping Japanese commuters. In producing these smaller books and exhibition catalogues, it has given Parr the chance to pinpoint his subject matter and to experiment with technological changes in his style of photography.

Parr's usage of technology is important, not only to the visual style associated with his projects but is sometimes an influence on what he shoots and how he exhibits. In *Bad Weather*, Parr commented, "Because I am a great disciple of discipline within photography I needed to narrow down my subject matter." The underwater camera and flashgun utilized in this work unified the subjects despite the diversity of locations. The change to color in the 1980s was seen at the time as a bold move. Monochrome was traditionally the medium of the photojournalist but color offered more realism, honesty, and purity to Parr. When he started to use ring flash, the technology demanded he only photograph close-up, bringing a new attention to ugly detail within his work as seen in *English Food* and later, *Common Sense* (1999), a work which allowed him to experiment with conventions in presentation. Using cheap, color laser prints, Parr exhibited this work simultaneously in 43 locations. The saturated colors unify the similarities seen worldwide on the banal and ordinary details current in everyday life at the end of the twentieth century.

In 1994, he had become a member of the photo agency Magnum after much debate within the group on his suitability. Many photographers within the cooperative perceived their role was to celebrate and

reflect humanity positively, and not as they reckoned Parr did, to criticize and ridicule. On this dichotomy, Parr was forthright in Russell Miller's history of the agency:

Of course I am biased, of course I am voyeuristic, of course I exploit, but I believe this applies to all photography and I am only unusual insofar as most photographers always deny these things, whereas I am happy to acknowledge that we are all voyeuristic and exploitative.

(Miller 1997, 298)

These differences recognized, if not accepted by all members, Parr would become one of Magnum's leading and busiest photographers. As well as actively involving himself within the running of the agency, he has diversified to pursue other areas of photography including fashion and advertising. He has continued to teach, has made several television documentaries, and compiled and edited books on subjects sympathetic to his own work. *Boring Postcards* (2000) celebrated the banalities of his collection of picture postcards and *Autoportrait* (2000) collected together portraits of Parr taken by local photographers around the world. While being an amusing series of snapshots and mementos of various tourist attractions, the theme of the book reflects ideas seen in his earlier work such as *Small World* and *Common Sense*. Although both equally praised and criticized for his photography, Parr has pursued his career from a forthright, coherent, and individual viewpoint. The directness seen in his photojournalism, exhibitions, books, and films has left him at the close of the twentieth century as one of Britain's most important and original photographers who has also become an important figure in the contemporary art world as well.

IRVING PENN

American

One of the most recognizable photographers of the twentieth century, Irving Penn has created a wide ranging but cohesive body of work, with his gift for transforming everything from trash on the street to food to haute couture into aesthetic statements that are elegant but straightforward, honest, and direct. His ability to use light, shadow, and space to pro-

duce still-lives and portraits that are both evocative and provocative is masterful.

Born on June 16, 1917 in Plainfield, New Jersey, Penn's design sense was fostered by study with Alexey Brodovitch at the Philadelphia Museum School of Industrial Art from 1934 to 1938. Penn's strong graphic sensibilities, which he began to develop as a young student, were to serve him throughout his career. Brodovitch recognized Penn's talents and invited him to

work with him at *Harper's Bazaar* on some design projects during school vacations. At *Harper's Bazaar*, Penn became exposed to the world of fashion and to the work of artists such as surrealist painter Salvador Dalí, American sculptor Isamu Noguchi, and the French artist and filmmaker Jean Cocteau. The now-legendary fashion arbiter Diana Vreeland was one of the young editors at the magazine.

From 1938 to 1940 Penn worked as a freelance designer in New York. Earning enough money to buy his first camera, he purchased a Rolleiflex, and wandered the streets of New York on weekends taking photographs. A few of those early images were printed as illustrations in *Harper's Bazaar*. From 1940 to 1941 he worked as an advertising designer for the Saks Fifth Avenue department store.

The young Penn, though, wished to explore the world, and in 1941 traveled to Mexico by train, in short trips across the southern United States. In Mexico, Penn painted for a year in a studio in Coyocacán, a suburb of Mexico City, and took photographs. Dissatisfied with his paintings, though, he destroyed many of them and returned to New York.

In 1943 he was hired by Alexander Liberman, art director of *Vogue*, as his assistant. Liberman recognized Penn's photographic talent, and urged him to pursue his photography. Penn's first cover, an elegant still-life, appeared on October 1, 1943; he eventually would photograph 165 *Vogue* covers.

Serving as ambulance driver and photographer in the American Field Service with the British Army in India and Italy in 1944 and 1945, his photographs of war activities show his early ability to capture an essential core of a particular scene or culture. In 1948, following a photographic assignment for *Vogue* in Peru, he stayed behind to spend Christmas in the historic city of Cuzco. Discovering a daylight studio in the center of town, in several days he won the trust of a people whose native Quechuan language he didn't know. There he photographed the indigenous peoples, such as *Egg Seller with his Son*, creating works that are simultaneously still-lives and portraits, as he carefully arranged a flowered curtain backdrop, eggs, and carpet with his subjects. Their beautifully woven striped garments became strong graphic components in the large angular shape created by father and son. His striking work *Cuzco Children*, showing two children leaning against an ornately carved table, is also from this series.

Even though at this relatively early point in his career he was still experimenting—during the years 1949 to 1950 between *Vogue* assignments he photographed the female nude and created prints using a complex bleaching technique—his work had an unmistakable mark. In portraiture, fashion, and

still life works, in black and white or color, his honing in on the essentials while creating works of great formal tension and beauty quickly made him one of America's most recognizable photographers.

In 1950 Penn married the beautiful fashion model Lisa Fonssagrives. His photographs of her frequently present her slim elegance, centrally placed with few background props. One sees Lisa, for example, in his *Woman with Roses* (Lisa Fonssagrives-Penn), Lafaurie Press, Paris, 1951, in partial profile, her black dress creating a dark sculptural silhouette in contrast to the white roses on her upper arm. Her sharp, elegant, symmetrical features with high cheekbones reflect contemporary style as well as classic sculpture.

Inspired by Alexander Liberman, Penn also worked on a series of "small trades" people—*Petits Metiers*—in Paris, New York, and London. He photographed generally unrecognized trades people such as a balloon seller, a cucumber seller, young butchers, pastry cooks, a coal man, or telegraph messenger posing formally in their work clothes and holding the implements of their trade or occupation. It was this series that saw the genesis of what was to become characteristic of his portrait style: subjects posed against a plain background and lighted from the side. He also at this time placed his subjects in corners, which became another trademark of his style.

Continuing to experiment, in 1952 he was introduced to the stroboscopic light by colleague Leslie Gill. Between 1950 and 1961, Penn was particularly intrigued by the seductive effects possible with infrared film, which brought forth sharp, black pupils, pale lips, and alabaster-like skin tones. Beginning in 1964, he discovered the platinum process, which was popular at the turn of the century for its softly modeled tones and density and luminosity.

In 1961, in Paris, Penn learned of a young Russian dancer named Nureyev, who had just defected, and invited him to pose. Penn's portrait, *Rudolph Nureyev's Legs*, Paris 1961, is a magnificent study in strength and in simple composition. The muscles, veins, and shape of these legs, one foot "on point," reveal both artistry and disciplined work. The gentle lines of the negative space between the legs add to the sculptural dimension of the piece.

In the late 1960s Penn built a traveling studio for a series of ethnographic essays for *Vogue*. From 1967 to 1971, he traveled to Dahomey, Nepal, Cameroon, New Guinea, and Morocco. The clarity and strength of his fashion photographs is carried to these ethnographic images. *Scarified Girl*, Dahomey, 1967, is a torso study of a young woman, nude from the waist up except for a simple chain necklace and neckpiece that bisect her body. The scars that embellish her skin

become a luminescent, textured garment through Penn's photographic lens.

Penn's ability to transform objects from the realm of the everyday to the realm of art was particularly seen in an exhibition *Street Material*, mounted by the Metropolitan Museum of Art in 1977. Showing photographs primarily taken in 1975 and 1976, Penn printed the images of old gloves, twisted paper, a paper cup, or cigarette butts using platinum paper with its gorgeous sheen and sensual appeal. Although taken decades earlier, the series *Earthy Bodies* caused a sensation when it was exhibited in 1980, showing nude studies of overweight models who celebrated their fleshiness.

Throughout his career Penn has photographed a long list of celebrities, statesmen, and artists, including Duke Ellington (1946), Alexander Calder (1946), Alfred Hitchcock (1947), Edward Steichen (1947), Georgia O'Keeffe (1948), Duchess of Windsor (1948), Edward Murrow (1951), Tennessee Williams (1951), Senator Hubert Humphrey (1951), Grace Kelly (1954), Pablo Picasso (1957), Henry Kissinger (1958), Sophia Loren (1959), Yo-Yo Ma (1964), Gore Vidal (1970), Arnold Schwarzenegger (1977), Merce Cunningham (1978), Yves St. Laurent (1983), Fernando Botero (1985), Mikhail Baryshnikov (1989), and Louis Malle (1990).

Penn's career is indeed multi-dimensional, embracing many aspects of the world around us. As his long-time friend and colleague, Alexander Liberman wrote

I am struck by the diversity and by the incredible attempt of this man to embrace all creation. The range of experience seems to me like the roving focus of a unique, implacable, all-seeing eye, disturbing and moving us in its passionate roving over life's meaning, shaking our preset expected experience of existence.

(Penn 1991, 9)

Biography

Born in Plainfield, New Jersey 16 June 1917. Studies design with Alexey Brodovitch at the Philadelphia Museum School, 1934–1938. Works as graphic artist in New York, 1938–1941. Spends year painting in Mexico, in Coyocacán, suburb of Mexico City, 1942. Hired by Alexander Liberman, Art Director of *Vogue*, 1943, to work as his assistant; becomes a photographer at Liberman's suggestion, October 1 first cover of *Vogue*. Serves as ambulance driver and documentary photographer in the American Field Service, with the British Army in Italy and India, 1944–1945. Series of dance photographs for *Vogue* and

various dance companies, 1946–1948. Photographer working with Alexander Liberman for Condé Nast publications, 1946 onward. Marries the fashion model Lisa Fonnagrives, 1950. Freelance advertising photographer living and working in New York City, 1952 onward. Associated with Pace/MacGill Gallery, New York City. Received Hasselblad Award, 1985. Major donation to the Art Institute of Chicago of prints and archival material, 1997. Lives and works in New York City.

Individual Exhibitions

- 1961 *Photographs by Irving Penn*; Museum of Modern Art, New York, New York, and traveling
- 1963 Smithsonian Institution, Washington, D.C.
- 1975 *I Platini de Irving Penn: 25 Anni di Fotografia*; Galleria Civica d'Arte Moderna, Turin, Italy
- Recent Works*; Museum of Modern Art, New York, New York
- 1977 *Street Material*; Metropolitan Museum of Art, New York, New York
- Photographs in Platinum Metals—Images 1947–1975*; Marlborough Gallery, New York, New York
- 1980 *Earthy Bodies*; Marlborough Gallery, New York, New York
- 1981 *60 Photos*; Marlborough Fine Art, London, England
- 1983 *Recent Still Life*; Marlborough Gallery, New York, New York
- 1984 *Irving Penn*; Museum of Modern Art, New York, New York, and traveling
- 1988 *Irving Penn: Cranium Architecture*; Pace/MacGill Gallery, New York, New York
- 1990 *Irving Penn: Other Ways of Being*; Pace/MacGill Gallery, New York, New York
- Vintage Prints from the Earthly Bodies Series 1949–1950*; Pace/MacGill Gallery, New York, New York
- 1991 *48 Portraits from 1948*; Pace/MacGill Gallery, New York, New York
- 1994 *Irving Penn: New York*; Pace/MacGill Gallery, New York, New York
- 1997 *Irving Penn: A Career in Photography*; Art Institute of Chicago, Chicago, Illinois, and traveling
- 2002 *Irving Penn: Still Life in Color, 1947–2001*; Pace/MacGill Gallery, New York, New York
- Earthy Bodies: Irving Penn's Nudes 1949–1950*; Metropolitan Museum of Art, New York, New York
- Amazing Grace, Alexandra Beller*; Whitney Museum of American Art, New York, New York
- 2004 *Present Concerns*; Pace/MacGill Gallery, New York, New York

Selected Group Exhibitions

- 1955 *The Family of Man*; Museum of Modern Art, New York, New York, and world tour
- 1967 *Photography in the 20th Century*; National Gallery of Canada, Ottawa, Canada, and traveling
- 1975 *Photography Within the Humanities*; Jewett Arts Center, Wellesley College, Wellesley, Massachusetts
- 1976 *Masters of the Camera*; American Federation of the Arts traveling exhibition
- 1977 *Fashion Photography*; International Museum of Photography, George Eastman House, Rochester, New York, and traveled to the Brooklyn Museum, Brooklyn, New

York; San Francisco Museum of Modern Art, San Francisco, California; Cincinnati Art Institute, Cincinnati, Ohio; and Museum of Fine Arts, St. Petersburg, Florida
 1978 *Tusen och En Bild/1001 Pictures*; Moderna Museet, Stockholm, Sweden
 1979 *Photographic als Kunst 1879–1979/Kunst als Photographie 1949–1979*; Tiroler Landesmuseum, Innsbruck, Austria, and traveled to the Neue Galerie am Wolfgang Gurlitt Museum, Linz, Austria; Neue Galerie am Landesmuseum Joanneum, Graz, Austria; and Museum des 20. Jahrhunderts, Vienna, Austria

1981 *Photographer as Printmaker*; Ferens Art Gallery, Hull, Yorkshire, England, and traveled to the Museum and Art Gallery, Leicester, England; Cooper Gallery, Barnsley, England; Castle Museum, Nottingham, England; Photographers' Gallery, London, England
 1983 *Selected Images: Abbot/Brandt/Brassai/Penn*; Marlborough Gallery, New York, New York
 1985 *Shots of Style*; Victoria and Albert Museum, London, England, toured Britain
 2004 *Fashioning Fiction in Photography since 1990*; Museum of Modern Art, New York

Irving Penn, *Large Sleeve (Sunny Harnett)*, New York, 1951, $13\frac{3}{16} \times 13\frac{3}{16}$ (34.5 × 34.4 cm), gift of the photographer.

GILLES PERESS

French

Gilles Peress's enduring interest in documenting the disturbing consequences of hatred led him to photograph some of the most violent conflicts of the latter half of the twentieth century: Northern Ireland, Lebanon, Bosnia, and Rwanda. His photographs of the Islamic Revolution in Iran gave him the opportunity to assert himself not only as a leading Magnum photojournalist, but also as a careful editor of his own books. As his work demonstrates, Peress defined and pursued his own creed.

I work much more like a forensic photographer in a certain way, collecting evidence. I've started to take more still lifes, like a police photographer, collecting evidence as a witness. I've started to borrow a different strategy than that of the classic photojournalist. The work is much more factual and much less about good photography. I don't care anymore about "good photography." I'm gathering evidence for history, so that we remember.

(*US News and World Report*, 1997, 67)

Born in Neuilly-sur-Seine in 1946, Peress spent his formative years in Paris. At the age of 20, he studied for two years at the Institut d'études poli-

tiques in Paris, a school with a reputation for interdisciplinary teaching in the social sciences. From 1969 until 1971, he studied at the Université de Vincennes, which was well known for the activism of its far left student groups.

In 1970, Peress took up photography as a way of carrying out his political activism. He first traveled to the region of Aveyron, France, to photograph a mining town, Decazeville, which had experienced social discontent since the closure of its coalmine some years before. He covered events of national interest such as President Charles De Gaulle's funeral in 1970 by focusing on the people's reaction to it. One of these untitled black-and-white street snapshots, published in *Paris/Magnum 1935–1981*, reveals the shock of citizens as they learn of the event from a newsagent's billboard. The social and economic difficulties experienced by Turkish immigrants in France and Belgium were also the focus of his photographs. Enlarging the scope of his interest outside continental Europe, he went to Northern Ireland in 1970 to photograph the conflict between two religious communities. These photographs contributed to Peress's selection as an associate member at Magnum Photos in 1972.

The struggle of immigrant workers to survive in unfriendly foreign countries continued to interest him. He documented the miserable social conditions of Portuguese and Algerian immigrant workers in France and Belgium. In 1974, he traveled to Germany to photograph Turkish immigrants who also shared the status of an uprooted labor force.

After settling in New York in 1975, Peress began to gain professional recognition in the United States. He received his first New York Art Directors' Club Award in 1977 for his reportage of French peasants in Burgundy. He then turned his documentary eye on subjects and events located in the United States, focusing on the social misery of joblessness, New York street life, and the U.S. presidential election in 1976. Peress traveled to Canada to record the first visit of Pope John Paul II and then to Central America, including Guatemala and Colombia. His photographs were regularly published in the *Sunday Times Magazine* and the *New York Times Magazine*.

With the aid of a National Endowment for the Arts Fellowship, Peress traveled to Iran in December 1979 and January 1980. His moving photographs of the Islamic revolution in Tehran received much critical attention and appreciation even before he published the book *Telex Iran* (1983). In one of these images, he captures the fierce eye of a veiled young woman as she walks towards the camera. This picture testifies to Peress's capacity to engage the viewer's emotions in the subject matter: faces partly cut off by the frame are so near that the beholder feels a part of the scene. The selection of a striking detail, such as this eye, allows the viewer to relate to the unfamiliar scene.

In the 1980s, Peress ended his black-and-white record of "a society locked in a circle of retribution": Northern Ireland. These photographic views of daily tension and civil violence, gathered over almost 20 years, were first publicized in the exhibition, *Power in the Blood*, which traveled throughout Europe and the United States. His documentation of armed political struggle was furthered by his assignment for *National Geographic* in the early 1990s to record the legacy of Simón Bolívar in Venezuela. Peress's wanderings through Colombia, Venezuela, Ecuador, Bolivia, and Peru allowed him to expand his knowledge of Central and Latin America and to return with troubling and intriguing color images. One such image is *Cajamarca, Peru, 1991*, taken during carnival, which records the symbolic burning of a baby with a mixture of vivid colorfulness and magical confusion.

His books *Farewell to Bosnia* (1994) and *The Graves* (1998) are sad testaments of the massacres in Bosnia-Herzegovina and in Kosovo. They exem-

plify Peress's ability to edit and gather material for history in a self-conscious way, as he declared. His own family history may also be at stake. Peress acknowledged in his 1994 book that his interest in Bosnia had been partly motivated by a cathartic desire to confront his father's troubling accounts of World War II. Photographs, such as the black-and-white image *The remains of victims from the graves at Pilice Collective Farm* (1996), record the traces of human insanity. This photograph belongs to the large number of Peress's images that have a highly disturbing appeal. He is sometimes criticized for composing pictures whose aesthetic appeal leads one to forget the subject matter.

Peress arrived in Rwanda to record the ethnic cleansing of the Tutsi by the Hutus shortly after the mass killing had begun in 1994. Finding evidence of the massacres was painfully easy as places where the Tutsi had been killed were numerous—one of these scenes is his *Church at Nyarubuye* (1994). He confessed in *magnum*° that this experience inspired him to question commonly held assumptions about the fairness of mankind. His book, *The Silence* (1998), presents his images of this tragedy.

On 25 September 2001, Peress, Michael Schulan, and two other friends initiated a project entitled the *Democracy of Photographs*. In a storefront not far from Ground Zero, they invited the public to hang their personal photographs of New York during and after the events of September 11. Visitors as well as submissions were numerous. This initiative illustrates Peress's belief in the need for collective participation in the act of remembrance.

PERIODICALS: HISTORICAL

Shortly after William Henry Fox Talbot patented his "talbotype" or calotype process, which enabled multiple prints to be produced from a single negative, photographs appeared in print media. Eager to demonstrate his process and the potential of published photographs, Talbot printed the first installment of the innovatory fascicle *The Pencil of Nature* between 1844 and 1846 for a group of several hundred subscribers. Just two years later, photography made its debut in an established periodical when he sold 7,000 calotypes to be hand-mounted in the June 1, 1846, issue of *The Art-Union*.

As photography advanced, a windfall of periodicals dedicated to the medium emerged around the world. The first, *The Daguerrian Journal* devoted to the Daguerrian and Photogenic Art, appeared in November 1850. Published in New York and edited by S.D. Humphrey, it continued as *Humphrey's Journal of the Daguerreotype and Photographic Art* until it ceased publication in 1870. *The Photographic Art Journal* published its inaugural issue in January 1851 publicizing itself as a monthly dedicated to the interests of the Daguerreotypist and the development of photography as an art form. In February 1851, *La Lumière* debuted in Paris. Publication was irregular, and after several changes in ownership

and editorship, publication ceased in December 1866. One of *La Lumière's* editors, Ernest Lacan, went on to found his own paper, *La Moniteur de la Photographie*, which remained in print from 1861 to 1914. The first German periodical dedicated to photography appeared in January 1854 with the publication of *Photographisches Journal, Magazin für Photographen Maler, Zeichner, und Freunde dieser Kunst* edited by Wilhelm Horn. The world's longest-running periodical devoted to photography, *RPS Journal*, began in London on March 3, 1853, published by the Royal Photographic Society as *The Photographic Journal* and is still in print today. Periodicals such as *Anthony's Photographic Bulletin*, which ambitiously commenced in 1870 with a circulation of 5,000 copies, invented itself as a resource for photographers by providing its readers with articles on techniques and processes as well as ample advertisements for photographic products and services. *Anthony's Photographic Bulletin* merged with *Photographic Times*, which ceased publication in 1915. Founded in 1890, the first picture weekly designed for photographs was *The Illustrated American*. This claim proved to be overly ambitious, and text began to edge out images. *The Illustrated American* issued its last number in 1899.

Camera Clubs and Photographic Societies

The mass popularization of photography led to the widespread formation of photographic societies or “camera clubs” whose members sought to investigate the artistic possibilities of photography and distinguish their work from snapshot hobbyists. Camera clubs thrived in urban areas, and New York City had more than any other metropolis. Two of the most prominent clubs—The Society of Amateur Photographers of New York and the New York Camera Club—would combine to form the Camera Club of New York in 1896 and printed a bimonthly newsletter, *The Journal of the Camera Club*, which detailed club proceedings and events. It only lasted four issues before it was expanded and revised by Alfred Stieglitz, one of the club’s most recognized members and former co-editor of *The American Amateur Photographer*. Stieglitz’s *Camera Notes* appeared in July 1897 and quickly established itself as a prestigious quarterly as well as a vehicle for the American Pictorialists to promote photography as a fine art. In 1909, *Camera Notes* was absorbed by *American Photography*, formed in 1907 by the union of *American Amateur Photographer* and *Photo-beacon*.

Stieglitz abandoned the Camera Club and *Camera Notes* in 1902 to establish the Photo-Secessionist group and a new quarterly, *Camera Work*, which began in January 1903 and was the first photographic journal to focus on images. The front pages featured photogravures of the highest quality, layouts for text were based on the designs of William Morris, and advertisements in the back of the journal were artistically designed and presented, often by Stieglitz himself. Lauded by the Royal Photographic Society as a pinnacle of dignity, taste, and artistic value, *Camera Work* became a respected journal upon publication. It almost exclusively featured the work of the Photo-Secessionists, and single issues were dedicated to several prominent photographers—Clarence White, Edward Steichen, James Craig Annan, and the Baron Adolph de Meyer.

In 1906, *Camera Work* announced the opening of Stieglitz’s Photo-Secessionist gallery “291” and began to reflect its activity. As time passed, Stieglitz’s interests shifted to French modernist art, which would become a mainstay of the gallery and consequently of *Camera Work*. The works of artists such as Henri Matisse and Pablo Picasso began to feature prominently—in fact, the August 1912 *Special Number* did not include photography at all. After a decline in subscriptions and other obstacles brought about by World War I, *Camera Work* ceased publication in 1917 with two final issues dedicated to the work of photographer Paul Strand.

In California, San Francisco-based *Camera Craft* began publication in 1900 and would become “The official organ of the Photographers’ Association of California” in the 1920s. In the 1930s, it became a debating ground between the Purists led by Ansel Adams and the Pictorialists whose spokesperson was William Mortensen. *Camera Craft* published the photographs and writings of influential photographers such as Ansel Adams, Imogen Cunningham, John Paul Edwards, Willard Van Dyke, and Edward Weston. It was later absorbed by *American Photography* in 1942.

Illustrated Newsmagazines

Illustrated weekly publications, such as *The Illustrated London News*, *L’Illustration*, and *Die Illustrierte Zeitung* came into existence alongside photography in 1842 and 1843 respectively; yet, they primarily made use of photography as copy for engravings. It was not until the invention of halftone printing in the 1880s that photographs began appearing alongside text in magazines. As a result, page layouts received more attention, photographs became more thoughtfully arranged, and articles consisting solely of photographs and captions soon appeared. One of the first picture stories to appear in a weekly periodical was a series of eight photographs by Ottomar Anschütz in the July 14, 1886 issue of Leipzig’s *Illustrierte Zeitung* depicting the “Greek Festival from Pergamon’s Times” at the *Jubiläumus-Kunstaussstellung*. That same year, *Le Journal Illustré* featured Felix Nadar’s famous animated interview with centenarian chemist and color theorist Eugène Chevreul in a series of 13 photogravures entitled “The Art of Living 100 Years.” The Nadar interview—a photographic sequence that forms a narrative—is considered a pioneering act in the history of photojournalism.

As halftone printing technologies improved, news journals began to present stories in picture sequences, and, as expected, subjects of national concern such as disasters and wars featured prominently. The 1899 cover of *Leslie’s Weekly*, formerly *Frank Leslie’s Illustrated Newspaper*, placed a photograph of dead Philippine soldiers killed in the war with America on the cover with the disclaimer: “This Issue Contains a Large Number of Remarkable Photographs of the Recent Bloody Engagements Around Manila.” Photographic coverage of the Spanish-American War and the Russo-Japanese War boosted *Collier’s* revenues. Arnold Genthe’s personal photographs documenting the San Francisco earthquake and resulting fire,

published first in the *San Francisco Examiner*, circulated widely. Immigration, labor issues, and slums were of particular concern to the American press and images regularly appeared in the pages of *Leslie's Weekly* and *Harper's Weekly*. Lewis Hine's images of tenements and poor working conditions were published extensively. Hine was also a staff photographer at the socially conscious magazine *Charities and Commons*, which continued as *The Survey*, a publication of the National Child Labor Committee. By the time the Titanic sank in 1912, halftones had almost completely replaced engravings in the press.

Illustrated news magazines such as *L'Illustration*, *The Daily Graphic*, *Collier's*, *The Illustrated London News*, and *Berliner Illustrierte Zeitung* avidly chronicled World War I. The critical moment that would trigger the war was captured in a photograph on the cover of the July 9, 1914 issue of *Die Hamburger Woche* showing the arrest of Serbian nationalist Gavrilo Princip after he had shot the Archduke Ferdinand, heir to the Austro-Hungarian throne. *The New York Times* dedicated extensive coverage to the war and began printing the *Mid-Week Pictorial War Extra*. Although war images were the main focus of photo reportage in the weekly press throughout the United States and Europe, civilian photographers found it difficult to access the front lines because of strict military controls. War authorities also determined which images would be released to the press. As the war progressed, allied forces realized that the publication of compelling war pictures could be an effective propaganda device, and civilians, appointed as official photographers, were given access to the front lines. Nevertheless, images were subject to censorship before publication. Despite these setbacks, editors made great efforts to assemble images in captivating layouts although they often lacked a coherent narrative.

The Modern Weekly

The introduction of smaller, faster, and lightweight equipment by the German camera industry, namely the dry-plate Ermanox in 1924 and the 35 mm roll-film Leica in 1925, would transform illustrated magazines. A multitude of new illustrated weeklies would surface in Germany after 1918, and the first to exhibit the effects of these technological advances was the *Münchener Illustrierte Presse (MIP)* under the direction of Stefan Lorant. A Hungarian native and former filmmaker, Lorant came to the paper in 1928 and capitalized on the opportunity to produce action photographs with the new faster cameras. Addition-

ally, he enhanced the effectiveness of photographic narratives in print by producing persuasive sequences of dynamic images in contrasting shapes, sizes, and temperament with careful consideration given to selection, spacing, and arrangement on two facing pages, which had become the design standard for photojournalism. At *MIP*, he published the early photographs of Felix H. Man, André Kertész, Alfred Eisenstaedt, Dr. Erich Salomon, and Robert Capa.

After the 1933 invasion of Bavaria, Lorant's political commentaries infuriated Adolf Hitler and he was imprisoned. Freed thanks to the efforts of the Hungarian government, Lorant went to England where he helped establish the *Weekly Illustrated* in 1934. Two of Lorant's most memorable layouts for the *Weekly Illustrated* were "Mussolini: What Is He Planning?" photographed by Felix H. Man showing the Italian dictator in his private study in Palazzo Venezia and "Midnight in Paris" where an overall black background frames images of Paris nightlife captured by the Hungarian-born photographer Brassai. Lorant would later leave the *Weekly Illustrated* to set up his own publishing company and journal, *Lilliput*, which touted itself to be "the Pocket Magazine for Everyone." *Lilliput* was acquired in October 1938 by Edward Hulton, owner of the Hulton Press, who offered Lorant the chance to start what was to be one of the most influential British news magazines, *Picture Post*. Less than six months after its founding in 1938, *Picture Post* had a circulation of over one million copies. *Picture Post* boldly documented Hitler's atrocities all over Europe, and Lorant solicited images from notable photographic talent such as Kurt Hutton, Tim Gidal, Felix H. Man, Bert Hardy, and Leonard McCombe. *Picture Post* discontinued publication in 1957.

The Communist periodical *Sichel und Hammer* became the left-wing *Arbeiter Illustrierte Zeitung (AIZ)* in 1925 under the direction of editor Willi Münzenberg and was exceptional because in addition to photo reportage, it regularly featured the sophisticated photomontages of John Heartfield on its covers. By combining leftist ideologies with Russian Constructivist and Dadaist sensibilities, Heartfield created witty political satires and penetrating social commentary using photomontage. Heartfield's photomontages were constructed from newspapers, magazines, and photographs that were created for his purposes. Sharply critical of the Weimar Republic and Nazi Germany, Heartfield left Germany for Czechoslovakia in 1933 after Hitler's regime began to take control of the country.

In Paris, Lucien Vogel, who began his publishing ventures in fashion, founded *Vu*, a weekly journal

dedicated to politics, cultural reporting, and fashion in 1928. Though its content was at times a mixed bag, *Vu* was highly stylish and extremely committed to Vogel's leftist principles. Special numbers followed the rise of fascist regimes in Italy and Germany as well as radical right-wing French extremist groups. *Vu* also dedicated annual issues to fashion and travel. In addition to photographs purchased from agencies, *Vu* commissioned pictures from André Kertész, Brassai, Henri Cartier-Bresson, Maurice Tabard, Robert Capa, and Dr. Erich Solomon. Often, *Vu* published pictures whose visual content and sophistication required little or no written text and the publication made extensive use of these pictures after Alexander Liberman became associate art director in 1933. Liberman's innovative use of photomontage distinguished *Vu*'s covers and many feature articles.

All of the ideas and practices that had been tested in the periodicals mentioned above were put into practice and refined, at what would become the pinnacle of modern photojournalism—*Life* magazine. Many of the photographers mentioned above would leave Europe during the Second World War and publish their work in *Life*. Consequently, a photojournalistic style inspired by the German illustrated press and stylishness of *Vu* resulted. Established in 1936 by Henry Luce of Time Incorporated, *Life* quickly became one of the most significant picture weeklies in publication. The inaugural issue featured a monumental industrial image of Fort Peck Dam in Montana by Margaret Bourke-White on the cover and included her photographic essay of the dam's surrounding shantytown settlements. *Life* demonstrated that through careful selection, arrangement, and captioning photographs could narrate a story as effectively as words. Within the first three years of publication, *Life*'s readership soared to over 3 million, and it was quickly imitated by new publications such as *Look*, *Picture Post*, *Paris-Match*, and *Der Spiegel*. *Life*'s focus swiftly shifted to war reportage, and Margaret Bourke-White, Ralph Morse, Carl Mydans, George Rodger, George Silk, and W. Eugene Smith were dispatched to the front as Allied photojournalists. In addition to publishing many of the twentieth century's most iconic images, *Life*'s photo essays about everyday lives would become leading examples of photojournalism such as Leonard McCombe's 1945 article "Career Girl: The Private Life of Gwyned Filling," which chronicled a day in the life of a young woman in New York City, W. Eugene Smith's 1951 essay "Spanish Village" that documented the peasant village Deleitosa in Spain, or Bill Eppridge's 1965 two-part documentary of a young couple addicted to heroin. Although no longer

a weekly publication, *Life* was re-launched in 2001 by Time Inc. after a temporary suspension.

Fashion Magazines

Fashion magazines were among the first publications to make persistent use of photographs. In 1909, U.S. publisher Condé Nast bought *Vogue*, a society magazine founded in 1892, and transformed it into one of the world's leading fashion publications published in three separate editions based in London, New York, and Paris. In 1913, *Vogue* began featuring the incandescent photographs of the Pictorialist Baron Adolph de Meyer that conveyed soft-focus opulence and the sensation of textures. When Edward Steichen joined the staff as chief photographer at Condé Nast Publications in 1923, he reinvented fashion photography and set a new standard for celebrity portraits. Steichen, already considered a master photographer, brought a sense of straightforwardness to fashion photography. He photographed models in sharp focus using actual surroundings and, if outdoors, natural light. Steichen's flair for arranging and composing his subjects, firm sense of design, careful use of artificial lighting, and innate timing would create radiant and compelling imagery of actors, intellectuals, statesmen, and models. During the 1920s and 1930s, the work of major photographers—Cecil Beaton, Seeberger Frères, Horst P. Horst, Nikolas Muray, Man Ray, and Charles Sheeler—appeared in all editions of *Vogue*. After 13 years at Condé Nast Publications, Steichen left in 1938.

Fashion photography and fashion magazines underwent further transformation in the 1930s. *Vogue* editor Carmel Snow shocked Condé Nast Publications when she left in 1932 to work for *Harper's Bazaar*. In 1934, Snow would recruit Russian-born designer Alexey Brodovitch as art director, and their dynamic collaboration began a revolution in modern magazine design. Brodovitch's advanced layouts made use of photomontage, full-bleed paging, and tactical sequencing of photographs, which would provide a new framework for fashion picture stories or fashion reportage. Hungarian-born photographer Martin Munkacsy, whose work had previously appeared in German illustrated weeklies such as the *Berliner Illustrierte Zeitung*, would be the first to employ candid techniques in fashion photography in his images of a bathing suit model running on the beach for the December 1934 issue of *Harper's Bazaar*.

Vogue made a comeback in the 1940s under the direction of Alexander Liberman, who was previously the art director at *Vu*. Responsive to a society

transformed by World War II, Liberman sought a less elitist approach to fashion photography and wished to forge it with more documentary and surreal sensibilities. As a result, Liberman published the fashion photography of Diane Arbus, Erwin Blumenfeld, Irving Penn, and William Klein. The documentary style would remain a mainstay of fashion magazines after the war although the readership revived its appetite for fantasy images once again affording photographers ample possibilities for continuous experimentation.

Photographers' Periodicals

In 1935, T.J. Maloney published the first edition of the annual publication *U.S. Camera*. The preface, written by Dr. Mehmed Fehmy Agha, art director at *Vogue*, claimed that books of photographs really need no prefaces and the photographs were made by "Americans in America and abroad and by foreigners in America for Americans." The spiral-bound issue featured high-quality photogravures in color and black and white on coated paper. Subdivided into categories such as "Illustration," "Portraiture," and "Scientific-Aerial-News," it featured hundreds of images by leading photographers selected by Edward Steichen—Berenice Abbott, Cecil Beaton, Margaret Bourke-White, Henri Cartier-Bresson, Arnold Genthe, Toni Frissell, Martin Munkacsi, and D.J. Ruzicka. *U.S. Camera* published memorable images of World War II as monographs, and many were the work of Edward Steichen taken during active duty with the United States Naval Reserves. One such monograph, *U.S. Navy War Photographs, Pearl Harbor to Tokyo Harbor: A Collection of Official U.S. Navy, Marine Corps and Coast Guard Photographs by Captain Edward Steichen* sold over 6 million copies in 1945.

In 1952, Minor White and a group of photographers and critics that included Dorothea Lange, Nancy and Beaumont Newhall, Ansel Adams, Barbara Morgan, Ernst Louie, Melton Ferris, and Dody Warren founded the influential photographic quarterly, *Aperture*. During its first year of publication, those who were generous enough to subscribe at the sustaining level of \$25.00 received a print by Ansel Adams. The first issue featured a photograph by Dorothea Lange on the outside cover, and on the inside cover was a quote from Ansel Adams that read "We have nothing to lose but our photography." *Aperture's* statement of intent declared it "a mature journal where photographers could talk straight to each other." In addition to publishing photographs by important photographers, it included insightful

critical essays and reviews of publications. *Aperture* courageously published controversial and charged images ranging from Manuel Álvarez Bravo's images of Mexico in the 1950s to photographs by Robert Mapplethorpe in the 1980s. In 1958, *Aperture* dedicated an entire issue to Edward Weston shortly after his death in which a selection of his masterworks were accompanied by excerpts from his *Daybooks* edited by Nancy Newhall. This issue, later published as a monograph entitled *The Flame of Recognition*, would become one of the most popular photography books of all time. Michael E. Hoffman assumed editorship of *Aperture* in 1965 and endeavored to make it the one of highest-quality photographic publications. *Aperture* celebrated its 50th anniversary in 2002 in a special two-part issue.

Reprint Series

Original copies of early photographic periodicals and monographs are rare, and series are often incomplete at the majority of research institutions. Thankfully, many have been reprinted. The most comprehensive is *The History of Photography*, a microfilmed reprint series of over 2,000 early monographs and 100 periodicals from the United States and Europe dating back to the seventeenth century. Another series, *The Literature of Photography*, edited by Peter Bunnell and Robert A. Sobieszek and published in 1973 by New York's Arno Press, reproduces 62 early monographs and treatises on photography. Additionally, all 50 numbers of *Camera Work* were issued as a reprint in 1969.

PERIODICALS: PROFESSIONAL

Most of the hundreds of professional photography newsletters, journals, and magazines founded in the twentieth century began circulation in the United States, the United Kingdom, France, Germany, and Japan. Across the board, these publications focused on addressing the educational and career-advancing needs of professionals, as well as aspiring professionals. As the market for commercial and fine art photography quickly became self-perpetuating, many magazines reflected an ever-changing industry on both sides of the lens, from technological advances in equipment to new ideas for portfolio presentation.

These periodicals set themselves apart by creating a unique framework of editorial and visual content that would appeal to a clearly defined readership, existing within what is now known as the niche publishing market. Publishers established and drew from what eventually became standard elements of photography magazines, such as photo industry news and trends; camera tests and reviews; buying guides; classified advertising; photographic and lighting techniques; art and commercial photography portfolios; interviews with artists, critics, publishing professionals, curators, gallery owners, artist representatives, and lawyers; legal advice; contests; events; exhibition listings; freelancing advice; and profiles of professional photographers.

Special-interest magazines for photography professionals existed as far back as 1854, when The Royal Photographic Society began publishing the weekly *British Journal of Photography* in London. Later known as the *RPS Journal*, the now-monthly publication includes portfolios and news articles, and it reached a paid circulation of 8,000 by its

150-year anniversary. The magazine publishing industry began to bloom internationally in the early 1900s, primarily in the United States and Europe. In 1897 Alfred Stieglitz founded *Camera Notes*, a popular quarterly that was distributed to members of the Camera Club of New York throughout its six-year lifespan. Other publications that drew the attention of serious photographers included the Philadelphia and Baltimore-based *Camera* (1897–1953), *Photo-Era* (1898–1932) in Boston, and *Camera Craft* (1900–1942) in San Francisco.

The growing commercialization of products in the American media of the 1920s and 1930s gave way to a flourishing market for advertising photography. In a 1929 book called *Illustrative Photography in Advertising*, Leonard Williams described methods for approaching “pictorial publicity photography.” In 1934, editor Charles Abel renamed *Abel's Photographic Weekly*, which his father Juan started publishing in 1907, to *The Professional Photographer*. The revamped publication also became a bimonthly, official magazine of the Photographers' Association of America (PAA), an organization that billed itself as the largest non-profit group for professional photographers in the world. Abel eventually combined his monthly magazine *Commercial Photographer* (1925–1950) with the journal known simply as *Professional Photographer*. The expanded publication balanced technical guidance for studio photographers with editorials about the artistic and economic aspects of the photography business. PAA, which changed its name to Professional Photographers of America in 1958, launched *Photo-Electronic Imaging (PEI)*.

Professional societies and camera clubs for advanced photographers multiplied significantly in the 1930s and 1940s, along with their associated periodicals. The first issue of the *Journal of the Photographic Society of America* appeared in 1935, later known as the *PSA Journal*. Philippe Halsman and W. Eugene Smith founded the American Society of Media Photographers (ASMP) in 1944 and began publishing the monthly *ASMP Bulletin*. The National Press Photographers Association, established in 1946, began issuing the monthly *News Photographer*. These membership-driven publications provided lively forums for photographers to share knowledge, experiences, and resources in the professional realm, well into the next several decades. En Foco, a non-profit organization founded in the Bronx, New York, in 1974, began showcasing the work of minority American photographers through its tri-annual *Nueva Luz Photographic Journal* (1984–). In an atypical case where a publication formed an organization for photographers, the Los Angeles magazine *Rangefinder*, founded in 1952, created the Wedding Photographers of America organization in 1973. The organization is now called Wedding and Portrait Photographers International.

In Canada, the National Association for Photographic Art in Scarborough, Ontario, founded *Camera Canada* magazine in 1969 and *Fotoflash* in 1981. The bimonthly *Photo Life*, founded in Toronto in 1976, is considered the largest circulation photography periodical in Canada. Its content encompasses photo industry news, equipment reviews, portfolios, and shooting techniques. *Photo Sélection* magazine, the French-Canadian counterpart of *Photo Life*, was founded in 1981. Another magazine founded in Toronto, *Photo Communiqué*, was developed in 1980 with an eye toward art photography.

During the second half of the twentieth century, an increasing number of regional and national photography periodicals competed for longevity, by capturing the interest of emerging artists and established professionals. In South America, many publications that were launched in the 1960s successfully lasted through at least the turn of the century, such as *Fotomundo* (1966–) in Buenos Aires, Argentina, and *Fotomundo* (1969–) in Mexico City, Mexico. Likewise in Asia, *Chinese Photography* (1957–) has been billed as the first professional photography magazine in China, and *Asahi Camera* (1926–) is one of the oldest professional periodicals in Japan. The Tokyo-based magazines *Commercial Photo* (1980–), *CAPA* (1981–), and *Deja-Vu* (1992–) have also continued past the year 2000.

After *Better Photography* (1997–) was launched in Bombay, India, the magazine became available to consumers in the Middle East, Nepal, Singapore,

and Sri Lanka. In Ankara, Turkey, the Association of Fine Art Photographers of Ankara created *Fotograf* magazine in 1967, to publish news briefs, technical information, and photographer profiles. The bimonthly *Capture* began in Australia in 1962, focusing specifically on commercial photography, studio practices, and business issues. In Johannesburg, South Africa, the *Professional Photographers of Southern Africa* founded *Profoto* magazine in 1964 for its membership. Forty years later, its subscriber base grew to more than 3,000 members.

In Europe, nearly every country launched its own series of professional periodicals, including Austria, Czechoslovakia, Denmark, Finland, Greece, Hungary, Ireland, Luxembourg, Norway, Poland, Portugal, Scotland, Spain, Sweden, and the Netherlands. In the former Soviet Union, *Proletarskoe Foto* [*Proletarian Photo*], published from 1931 to 1933, and *Sovetskoe Foto* [*Soviet Photo*] were the two dominant magazines for amateur and professional photographers. As the twenty-first century approached, new periodicals such as *Fotomagazin* (1995–) and *Foto & Video* (1997–) debuted and accumulated more subscribers than any Russian photography magazines. A biannual magazine called *IMAGO*, founded in Bratislava, Slovakia, began publishing the work of contemporary photographers from Central and Eastern Europe in 1996.

Of the European countries, England, France, and Germany introduced the most photography magazines for professionals throughout the twentieth century. The London-based, bimonthly periodical *Creative Camera*, founded in 1967 and previously titled *Creative Camera Owner*, was later absorbed by *DPICT* (2000–2001). The new iteration of the publication ended in 2002, after 25 years of news, exhibition reviews, and portfolios. The British edition of *Popular Photography* became *Practical Photography* in 1959 and onward. Other notable titles include the monthly *Professional Photographer* (1961), quarterly *Ten.8: Photographic Journal* (1979), and biannual *What Camera* (1977).

In France, Hachette Filipacchi launched *Photo* as a monthly in 1960, with the same basic format as *American Photo*. Similarly, *Zoom* magazine, founded in Paris in the late 1970s, launched editions in Milan and New York in 1980. *Zoom* primarily covered fashion and art photography. Paris-based *Camera International* debuted in 1984, and in 1994, the French Society of Photography relaunched its monthly periodical, *Bulletin de la Societe Francaise de Photographie*. *European Photography* was launched in 1980 in Göttingen, Germany, as a biannual, international periodical for contemporary photography and new media. *Fotomagazin*, a monthly based in Hamburg,

Germany, started publication in 1947 and later incorporated *Camera* (1922–1981). The bimonthly *Profifoto*, formerly *Fachkontakt*, began in 1969 in Duesseldorf as a magazine covering professional photography and digital imaging.

Photographers found inspirational images and methods, along with opportunities for publication and exhibition, within the pages of new professional periodicals. In Langhorne, Pennsylvania, *The Photo Review* began publishing quarterly in 1976, featuring an annual contest juried by a series of prominent museum curators. Fine art, commercial, and documentary photography all found a venue in *American Photographer*, which started in 1978 with an emphasis on profiles and interviews with high-profile professionals. The magazine, published by Hachette-Filipacchi Media, became *American Photo* in 1990. *Photo District News*, later known as *PDN*, began in 1980 and became one of the top periodicals for professional photographers. *PDN* features a wide range of departments in each issue, including portfolio sections, contests in self-promotion and marketing, in-depth industry news, technical articles, and classifieds. Similarly, the quarterly *Photographer's Forum*, founded in 1981, has interviews, features, portfolios, and reviews of photographic books.

Many new professional publications in the United States exhibited a more technical and equipment-oriented perspective on photography. The first issue of consumer magazine *Shutterbug* hit newsstands in 1971, previewing and reviewing the latest photographic equipment. The Primedia Group publishes the magazine, which has editorial offices in Titusville, Florida, and a circulation of more than 100,000. In 1979, Preston Publications in Niles, Illinois, began publishing the bimonthly *Darkroom and Creative Camera Techniques*, which became *Darkroom Techniques* and then *Photo Techniques* in 1996. In 1985, Werner Publishing Corporation in Los Angeles, California, unveiled *Outdoor Photographer*, specializing in landscape, sports, travel, and wildlife photography. *Nature Photography*, a bimonthly magazine from Quincy, Massachusetts, entered the publishing arena in 1990.

From the late 1980s through the 1990s, the American periodicals market saw more new titles showcased professional art photography. *View Camera* and *Camera Arts*, founded in Sacramento, California, in 1988 and 1997, respectively, feature portfolios and interviews with master photographers. New York-based *Blind Spot* magazine, which began publication in 1993, utilizes the format of an artist's monograph. *Double Take* magazine, founded in 1995 at Duke University and later based in Somerville, Massachusetts, featured documentary photo-

graphy alongside fiction, poetry, and essays. The bimonthly periodical *LensWork* (1993–), based in Anacortes, Washington, presents portfolios and in-depth interviews with leading photographers.

As digital imaging and photographic equipment gained significant press coverage in the 1990s, magazines devoted to the professional implications of the pixel surfaced on an international level, primarily in the United States and England. American company Cygnus Business Media, which launched the monthly *Studio Photography & Design* in 1998, purchased and relaunched *Digital Imaging* three years later. The well-known magazine *Popular Photography* began in 1937 with product reviews and how-to features, and then became *Popular Photography & Imaging* in 2003. The Rangefinder Publishing Company founded *Photo Lab Management* in 1979, which became *Focus on Imaging* in 2001. Other digital photography and imaging magazines in the United States included *Digital Output* (1995–), *PCPhoto* (1996–), *Digital Camera* (1998–), *Photoshop User* (1998–), and *DigitalFOTO* (2000–). In the United Kingdom, *Digital Photo Art* (1997–), *Digital Photo User* (1999–), and *Digital Photo* (2002–) also tapped into the tidal shift toward digital equipment, unique shooting techniques, and pixel-editing possibilities.

Alongside the wave of periodicals dealing with the implications of digital photography, innumerable publications on the Internet sprouted up throughout the 1990s. Entrepreneurs, Web site publishers, and advertisers experienced the immediacy of providing content to a potentially global audience within a relatively short timeframe, when compared to print media publishing. Online magazines such as *Zone-Zero: From Analog to Digital* (1993–), *ReVue Photography* (1996–), *The Digital Journalist* (1997–), and *Musarium* (previously titled *Story Line* and *Journal E*, 1997–) yielded opportunities for professional photographers to freely gather information from international sources, promote their latest work, and initiate direct communication with others in the field. These new avenues and methods continue to influence the creation and distribution of photography publications around the world, whether they are produced by an individual, a professional society, or a publishing conglomerate.

PERSPECTIVE

Aside from its generalized metaphorical use in our everyday speech, the term “perspective” denotes a specific—though varied and complex—application within the history of art. Put simply, the practice of perspective attempts to render objects in three dimensional space on a two dimensional picture plane. Centuries after rudimentary beginnings in Roman wall paintings, competing approaches to a comprehensive perspectival system developed during the Renaissance as means to depict objects with the greatest possible realism—a realism believed to be rooted in geometrical truths and mathematically determined proportions. While different perspectival methods evolved in painting during and after the fifteenth century, each claimed to reproduce the essential faculties of sight. With the invention of the photograph in the 1830s, the efficiency of painted perspective in recreating vision was undermined. But the question of how—or whether—perspective inheres in the photographic image remains the subject of great debate and diverse scholarship. Rather than confirming the accuracy, or even existence, of a universal perspectival system, photography has only complicated the notion of a mode of depiction that reproduces natural vision.

As the invisible yet underlying predicate of depth, space, and proportion in an image, perspective seems inextricably bound up with—or even the necessary condition of—the photographic image. That is, the notions of realism and perspective seem perfectly reconciled in the photograph. To be sure, perspective and depth of field have not been championed as the only emblems of “realism” in twentieth century photography—the blurriness of Robert Capa’s documentary images, for example, posit a different standard of photographic precision. But at the time of its invention in the 1830s, the photograph appeared to attain

precisely the representation of reality that painters had strived to capture since Leon Battista Alberti’s 1435 treatise on linear perspective, *Della Pittura* (often referred to as *De Pictura*, due to an early Latin translation). Alberti’s inaugurating text conceived of linear perspective (often called “scientific” or “artificial” perspective) as treating the picture plane like a transparent window, through which the viewer apprehends the objects depicted. (And indeed, this concept possesses an etymological basis, since the Latin word *perspectiva* derives from *perspicere*, meaning “to see clearly, to look through.”) Despite numerous challenges and alternative accounts, his notion has remained a popular explanation for how perspective works. In his famous 1924–1925 essay *Perspective as Symbolic Form*, the art historian Erwin Panofsky wrote,

We shall speak of a fully “perspectival” view of space not when mere isolated objects, such as houses or pieces of furniture are represented in “foreshortening,” but rather only when the entire picture has been transformed—to cite another Renaissance theoretician—into a “window,” and when we are meant to believe we are looking through this window into a space. The material surface upon which the individual figures or objects are drawn or painted or carved is thus negated, and instead reinterpreted as a mere “picture plane.” Upon this plane is projected the spatial continuum which is seen through it and which is understood to contain all the various individual objects.

(Panofsky 1991, 27)

Artists had attempted the transcription of three dimensions onto the two dimensions of the picture plane by means of drawing, mirroring, and proto-photographic exercises. Beginning in the Renaissance, Italian and Dutch artists used various optical devices, lenses, and other contrivances in enhancing linear perspective. In particular, since the 1500s the

camera obscura had served to project and neatly circumscribe a slice of the visible world onto a flat surface, which could then be traced and developed into a painting. It was not until the photograph, however, that the vectors of perspective could be invoked independently of the human hand.

Especially considering the role of proto-photographic apparatuses in the development of perspective, photography's detached viewpoint seemed to constitute an extension and refinement of perspectival painting. If the "window" had served as the paradigm of perspectival vision, then the camera lens would seem to literalize such a concept in practice. Some contemporary art historians, however, have argued that photographs seem to reproduce normal vision only because cameras have been designed in accordance with the conventions of linear perspective developed since the fifteenth century. Scott McQuire writes,

If the camera seemed miraculous in the nineteenth century, if its images were so quickly able to saturate consciousness and common sense as an unrivalled means of manufacturing lifelike resemblances, this acclaim was crucially underpinned by the dominance that geometric perspective had already achieved in visual representation.

(McQuire 1998, 18)

Indeed, the camera seemed to mechanize precisely the objective, rationalized, and scientific reproduction of reality to which perspectival systems had aspired. Yet the idea of absolute commensurability between photographic representation and actual vision is quite fraught. First, despite their vast influence on conceptions of realism throughout the centuries, Alberti's claims for a correspondence between perspectival and optical perception have been criticized for various reasons—not least in the sense that no system, however scientifically grounded, can isolate, "objectify," or reproduce the physiological act of seeing. Second, the photographic camera differs from the eye in important ways. The human retina is designed differently from the lens; we see with two eyes rather than one; and rarely does an individual view a scene without moving, however slightly or slowly. Third, despite claims for an "ontological" relationship between photography and the visible world, the photographic image is always and only a picture: an indexical record of an arbitrary viewpoint.

The relationships between perspective and seeing, and between vision and "rationalized" depiction, have proved some of the most polemical topics not only in the history of painting and photography, but also in the disciplines of philosophy and history. Throughout the development of the modern world after the Renaissance, perspec-

tive systems came to be seen not merely as drawing techniques, but as microcosms of the Enlightenment world view. The concepts of a transcendental "point of view" or an idealized viewing subject, for example, became linked to philosophical questions about the nature of perception and truth. In a marriage of perspectival order and rationalist thought, the human being came to be seen as the center of knowledge and perception. As the tenets of Enlightenment philosophy have come under attack in recent Postmodern discourse, so too has the associated concept of perspective. Yet challenges to an absolute perspective are not simply a phenomenon of Postmodern philosophy. Rather, they have definitive roots within early twentieth-century painting and photography.

The invention of photography did not, as is generally assumed, immediately displace the vocation of "realistic" painting. Rather, several nineteenth-century artists—Eugene Delacroix and Jean-Auguste-Dominique Ingres among them—proclaimed the potential value of photographs for providing a pre-existing model for the depiction of space. Nonetheless, in the wake of photography's popularization, the longstanding relationship between painting and realism never recovered its original, undisputed reciprocity. Paul Cézanne's subversion of a unified perspective in painting, subsequently adopted and radicalized by the Cubists, definitively breached the idea of the canvas as a transparent "window." Unhinged from any pretense to reflect reality, modernist painting could leave the task of mimesis to photography. Consequently, avant-garde photographers felt that if their medium was to prove itself a plastic art, it would have to shrug off its aura of unified space and time. Traditional perspective, then, became the very thing to be avoided in photographic art.

In particular, photo-collage served as an eminent pictorial trope adapted from Cubism, capable of tearing snippets of imagery from their normal contexts, generating an air of fantastic credibility. The incongruous scales, proportions, and subjects assembled in Dada and Russian avant-garde collages, for example, stridently laid claim to photography as a potentially "transrational" or "irrational" medium. In defiance of photography's prevailing reputation as the bearer of visual fact, collage could conjure up the idiom of fantasy—and the prerequisite for such an idiom was the rejection of the known dimensions of the material world. Alternatively, Futurist "Photodynamists" aspired to capture both movement and time through distortions of light; Surrealist photographers presented subjects as if passed through the strata of the unconscious. Eventually, the displacements and

superimpositions of montage endowed photography with effects of fragmentation and simultaneity that superceded even those of painting. At once violent and seamless, montage culminated the photographic transcendence of traditional perspective by shattering the continuum of pictorial space and time—realism and illusion could be grafted onto the same plane.

Again and again, the evasion or warping of perspective served as the touchstone for different twentieth-century photographic practices. In his innovative writings and pictures from the 1920s, the Russian avant-gardist Alexandr Rodchenko inveighed precisely against the photograph shot “from the belly button,” calling for alternative perspectival axes in photographic practice. The “worm’s-eye” view, in particular, became a staple not only of Rodchenko’s images (as in his 1927 *On the Fire Escape*), but also for contemporary Russian filmmakers seeking alternatives to conventional photographic space. Rodchenko inverted and distorted perspective, framing objects in normally unseen dimensions and drawing out an alternative “realism” through unusual angles.

In a vein similar to his Russian Constructivist contemporaries, the artist and theorist László Moholy-Nagy argued for photography as an innovator of new conceptions of space and time in modern society. Experimenting with painting, photomontage, and photograms, Moholy-Nagy believed that photography could supplement and even enhance perception. For example, using photomontages (like his *Leda and the Swan* [1925]) or X-ray-like photograms, the photographer-creator could invent fantastic spaces and structures, which might be realized in some utopic future. Like his Russian peer El Lissitzky, Moholy-Nagy considered the rote mechanics of perspective as fossilized relics of a different era, made obsolete by the technological advances of modernity. For these artists and theoreticians, experimental photography could help to bridge the gap between imagined space and lived space, the gap between art and life. No longer shackled to one rigid perspective, photography’s “plasticity” served as both a metaphor and crucible for revolutionary conceptions of space, architecture, and urbanism.

In later twentieth-century practice, composite or “piecemeal” montages (such as those of David

Hockney) propose alternative renderings of perceived space, including multiple perspectives, panoramic distensions, and mobile viewpoints. If photography can approximate human vision, these images suggest, it is only by incorporating into the image the inconsistencies of ocular perception. “Perspective,” in such photographic endeavors becomes not a prototype to be imitated, but rather a *process* that stages its own eccentricities.

WALTER PETERHANS

American, born in Germany

The reputation of Walter Peterhans, a former Bauhaus instructor, has long been secondary to that of what are considered the main representatives of modern photography, those who practiced during the medium's formative growth in Europe during the 1920s. This is due, in part, to the fragmentary way his photographic works were made known to the public, and in part because he dedicated himself more to his teaching than to his own art. Because of his profound influence as a teacher on students in Germany and in the United States, Peterhans is remembered more for his promotion of the medium as an independent form of expression than as a practicing photographer.

Peterhans' first experiments with photography began early with the encouragement of his father, the director of Zeiss-Ikon AG Dresden. His education included scientific training that later would come to good use as an instructor. In 1918 he began studying in the mechanical engineering department of the Technical University of Saxony in Dresden, then until 1924 he studied construction, mathematics, and philosophy in Munich and Göttingen. In 1925 and 1926, Peterhans learned photographic reproduction and print processing at the Academy of Graphic and Book Arts in Leipzig. He then went to Berlin where he began working as a freelance industrial and portrait photographer. In 1928, he participated in his first group exhibition, and with this he came into contact with the path-breaking photographers of the avant-garde. In the same year he joined the Society of German Photographers. In Berlin he also began to teach. Among his pupils were the photographers Grete Stern and Ellen Auerbach, who together took over his photography salon, when, in 1929, Hannes Meyer promoted him to director of photography studies at the Dessau Bauhaus. It was here that he showed his first and, in his lifetime, only individual exhibition. He approved the new direction Meyer was moving the Bauhaus—toward a scientific foundation, which Peterhans implemented in the course work of the photography department. For the first time the medium was institutionalized with introductory instruction on optics and photochemistry.

With the close of the Dessau school, Peterhans then worked at the Berlin Bauhaus until 1933, directing the course work for advertising photography. Upon the dissolution of the Bauhaus by the Nationalist Socialists (Nazis) as they ascended to power in Germany, he continued to teach at Werner Graeff's photography school in Berlin, then from 1935 to 1937 at the Reimann-Häring-Schule (after 1936 under the name Kunst-und-Werk-Schule). On the side he was also active as a journalist and freelance photographer. His work was already noticed overseas. An article from 1934 in the progressive *Cahiers d'Art*, which regularly reviewed Pablo Picasso's artistic development, refers to his work and that of his students Auerbach and Stern (who had formed a studio known as "foto ringl + pit").

When Peterhans emigrated to the United States in 1938 he found a position, at the request of Mies van der Rohe, at the Armour Institute in Chicago where he worked in various departments at the school. It was at this time that Peterhans abandoned photography because he could not adapt it effectively into his programs in visual training. Visual training was also added to the introductory course work at László Moholy-Nagy's "New Bauhaus" (later Institute of Design) and conceived as an experiment in cultivating students' aesthetic skills that demanded intellectual discipline and critical judgment. From 1945 to 1947 Peterhans was active as an instructor for the Committee on Social Thought at the University of Chicago, where philosophy served as the binding element between closely integrated departments. In 1953 he became a guest lecturer at the Hochschule für Gestaltung in Ulm, Germany, and directed the introductory course. From 1959 to 1960 he taught at the Hochschule für Bildende Künste in Hamburg. Unfortunately, a great deal of his photographic work from the 1920s seemed to have been lost.

Peterhans' teaching at the Bauhaus left a mark on the practice of photography at the institution, a pedagogical approach that Hannes Meyer introduced to other areas of study. Peterhans demanded a practical orientation and a scientific rigor applied to creative experimentation; under his guidance the medium was professionalized and avant-garde experiments receded to the background. In Moholy-Nagy's

engagement with photography, Peterhans saw only problems of illusion. In contrast to Moholy-Nagy, Peterhans was interested in promoting photography practice and pushed photography toward typography, advertising, and building construction.

Of greater significance than his own photographic work, which encompassed the photography of architecture, landscapes, still-lives, and portraits, was his work as an instructor. He promoted the development of applied art and sought to fight back the new “academicism, fed on the dilettantism” of the avant-garde (Peterhans 1930, 140). His concept of education consciously worked against the improvisational application of photography as a means of self-expression and self-staging. He saw his work more in line with the objectivity of Albert Renger-Patzsch, Paul Outerbridge, Jr., and Edward Weston than with the Bauhaus modernism of Moholy-Nagy’s circle (noted in a letter from 1952 written by Otto Steinert). In the first American appreciation of Peterhans that appeared in 1931, Harry Alan Potamkin compared Peterhans with his fellow German photographer Renger-Patzsch. His photographs, like those of Renger-Patzsch, display a striving for technical perfection, working to make clear the finest subtleties of an object’s material characteristics and the effects created by lighting. Peterhans thought the special expressive qualities of photography were a process of precisely detailing objects with halftones. In a similar vein, he categorically condemned the use of stark black and white contrasts. Instead he sought to represent the surface attraction of the most varied materials by means of nuanced tonal subtleties. Even in his portrait photography he aims to probe the texture of hair, skin, and textiles.

But his works also possess abstract–surreal themes and ironic subtleties. His still-lives, which represent the most unique aspect of his work, display this in the greatest measure. The arrangement in his still-lives of objects that seem randomly collected introduces a playful behavior with the surface reality of the photographic world of images. The titles of such photo assemblages stimulate the free play of form associations and infuse them with iconographic significance. Such poetic echoes extend far beyond the reach of the simple realism of *Neue Sachlichkeit* (New Objectivity); indeed, the work of his colleague, Paul Klee, even served to motivate him. In any case, these forays were always incidental to him. In his programmatic essay from 1930 he focuses on formal and technical problems and never discusses any conceptual questions of the medium. Peterhans began his theoretical masterpiece in the United States in relationship to his

teaching, but he never completed it. In the tradition of neo-Kantianism, he wanted to root aesthetic criteria in objective criteria that were scientifically valid and thus make pedagogical instruction more accessible. The methods that he developed as an instructor in Chicago became very influential in the years that followed, and had a profound influence especially on American postwar photographic practice.

Biography

Born in Frankfurt am Main, Germany, 12 June 1897. Graduated High School in Dresden, Germany, 1916. Afterwards military service. Prisoner of war, 1918. Studies at the mechanical engineering departments of the Technical University of Saxony in Dresden, Germany, 1918; studied in machine construction and philosophy in Munich, Germany, as well as a course of study in philosophy and mathematics in Göttingen, Germany, until 1924. Training in photography reproduction and printing processes at the Academy of Graphic and Book Arts in Leipzig, Germany, 1925–1926. Worked as a freelance industrial and portrait photographer in Berlin in 1927. Director of the photography course work at the Dessau and Berlin Bauhaus, 1929–1933. 1933 instructor at Werner Graeff’s photography school in Berlin and then at the Reimann-Häring Schule, Berlin, Germany, 1935–1937. Emigrated to the United States and adopted U.S. citizenship, 1938. Thereafter instructor of theory in the architecture department of the Armour Institute in Chicago. Additional instruction in the Committee on Social Thought at the University of Chicago, 1945–1947. In 1953 guest instructor at the Hochschule für Gestaltung in Ulm, Germany, 1953. Instructor at the Hochschule für Bildende Künste in Hamburg, Germany, 1959–1960. Member of the Gesellschaft deutscher Lichtbildner, 1928. Died in Stetten near Stuttgart, Germany, 12 April 1960.

JOHN PFAHL

American

The title of John Pfahl's 1997 exhibition at the Robert B. Menschel Photography Gallery at Syracuse University, New York—*Permutations on the Picturesque*—offers a viable summation of his overall project. In the decades since finishing his undergraduate and graduate work at Syracuse, exploring photography first in a fine arts program and subsequently as a newly organized facet of the university's School of Communication, Pfahl has sought various approaches to understanding and conveying his observations about what constitutes a picture, what makes a scene worth seeing and transporting into a photograph. His answers, posited in nearly a dozen distinct series, offer engaging conceptual strategies carried out in classically beautiful, formal print statements. As Estelle Jussim writes in the catalogue accompanying his 1990 Albright-Knox retrospective exhibition, "Pfahl's style is an idea. So is his content. In the broadest sense, John Pfahl is a conceptual artist to whom the 'idea' is a tension between the observable and the implicit." His weaving of intellect and aesthetic creates images that function as elegant diagrams, self-referential tools for critiquing and appreciating photographic truth.

In the early 1960s, when materials became available to produce color photographs outside of a commercial lab, Pfahl set up a darkroom to print his own images. With only a few exceptions he has made color coupler prints from large-format color negatives throughout his career, though in a 2004 interview with Robert Hirsch published in *The Photo Review* Pfahl states that *Extreme Horticulture* (work from the series was published in a 2003 monograph with that title) may be "the last project I do where the end result is a chemical print," implying that he will utilize inkjet printing to produce his subsequent work. Pfahl is notable as being, in 1978, the first photographer invited to use the mammoth Polaroid camera, which produced 20 × 24-inch "instant" prints (with the help of an assistant).

He completed his first sustained body of work during a 1965 trip to Oaxaca, Mexico. This followed two years in the Army, his marriage to Bonnie Gordon, a fellow Syracuse undergraduate, and preceded his entry into the first year of a new

graduate program in photography at Syracuse's School of Communications founded by Fred Demarest, who had been one of Pfahl's undergraduate professors in the School of Fine Arts. The courses Pfahl took in this program are considered to be the first curriculum dedicated to color photography at the graduate level. Pfahl has been a long-term member of the Society for Photographic Education and a dedicated instructor of photography in the academic setting.

Altered Landscapes was Pfahl's first series to achieve significant notice, and it continues to be a set of photographs that challenge basic assumptions and experience of photography. Pfahl made rough drawings on his camera's ground glass view finder, then with the help of assistants, inserted materials including tape, string, tin foil, and other objects into the scene to match the flat graphics on the picture's vertical plane. The appearance, in what we know to be a landscape of significant depth, of a two-dimensional geometric figure, underscores both the manipulation intrinsic to photographic seeing and the unique nature of the vision; the only place this illusion of flatness within three dimensions is complete is where the film records the lens-projected image (i.e., in the camera, on the ground glass). *Altered Landscapes* included images that were puns on places that captured the popular imagination, such as *Triangle, Bermuda* (1975) showing string on a beach marking out a triangle to a rock in the ocean, as well as several images created as respectful parodies of well-known photographs by Ansel Adams, including *Moonrise over Pie Pan* (1977) after Ansel's iconic *Moonrise, Hernandez* in which a tin pie pan placed in the landscape mimicks the moon in the sky, and *Wave, Lave, Lace* (1978), which shows lace laid across beachfront vegetation, mimicking the frothy waves as they break on the shore. The entire series shares visual and conceptual strategies parallel to work done contemporaneously by photographers Kenneth Josephson and Robert Cumming.

Pfahl's interest in the formal, aesthetic concept of landscape, the scene within what is seen, continues throughout all of his series. As time progressed he moved from direct intervention in the landscape to deeper consideration of the picturesque phenomenon within the finished image itself. Many of his

subsequent interests are articulated in straightforward color coupler prints. *Picture Windows* (completed in the period from 1978 to 1981), *Power Places* (1981–1984), *Arcadia Revisited* (1985–1987), *Waterfalls* (mid-1980s to mid-1990s), *Smoke* (largely 1988–1990), *Compost* (early 1990s), *Piles* (mid-1990s), and *Extreme Horticulture* (late 1990s and early 2000s) all reflect a commitment to the nuanced complexity of photographic truth. Many of these series are simple enough in content that the title is quite sufficient as description. Pfahl has photographed falling water, smoke issuing from industrial stacks, views framed by large windows, piled accumulations of various natural and man-made materials (in *Compost* as well as *Piles*), and natural landscapes inflected by the presence of nuclear or conventional power plants with a passionate, typological consistency that calls to mind the work of Roger Mertin, a colleague of Pfahl's who taught at the University of Rochester in New York. *Arcadia Revisited*, which fondly and painstakingly considers the Niagara River and Niagara Falls as an often depicted, deeply romanticized setting, and his most recent work recording remarkable horticultural landscapes suggest his interest in both cultural and natural history.

Since the idea of landscape is a combination of nature and art, it is fitting that Pfahl has also continued to consider the presence of the artist's hand within the final photographic piece. In *Video Landscapes* (1981) he directly photographed televised views of landscapes, and printed the results in platinum/palladium, giving remarkable pictorial weight and beauty to backdrops for such shows as *Fantasy Island* and *Masterpiece Theater*. *Permutations on the Picturesque* is a historical exploration of photographic form and content; scenes similar to those William Henry Fox Talbot and other nineteenth century artists captured by hand with the camera lucida drawing aid appear in Pfahl's hands as "digitally enhanced" inkjet prints, in which the hand of the computer is made visible in select areas either through obvious pixellation or other manipulation. *Submerged Petroglyphs* from 1984 show a New Mexican reservoir that has covered over a set of ancient rock drawings. Pfahl has placed an alpha-numeric code on the water's surface marking where each submerged image could be found, finishing what he describes as a "memorial pilgrimage" to "drowned" art-making sites. (These pieces were included in a 1988 publication, *Marks in Place*.) *Missile/Glyphs* (1984–1985) arose from the *Submerged* series; Pfahl created Cibachrome diptychs that combine images of still-visible rock drawings with close-up views of weapons in the National Atomic Museum in Albuquerque, New Mexico.

As Cheryl Brutvan wrote in her note on *Missile/Glyphs* in *A Distanced Land*, "Perhaps it is not so surprising after all to find the combination of ancient drawings and obsolete weapons compatible: they are both inadequate means of communication in the contemporary world." Pfahl's ongoing quest as an artist, historian, and humanist has been to articulate in photographic images the relationships between lived and viewed experience.

PHOTO AGENCIES

Photo and press agencies or bureaus first emerged as a force in photography during the 1920s. The convergence of technical advances, especially the introduction of small, lightweight cameras and photoreproduction processes that allowed the growth of the illustrated press, social causes—particularly war and its disruptions—and the ideology that through photography social changes might be enacted, caused committed journalists and photographers to band together. The result was the photo agency or press bureau, a means by which photographs could be placed in the public realm, most often through reproduction in newspapers and magazines, and the photographer could earn a living in a practice that had yet to become professionalized beyond the individual working out of a studio.

Photo agencies also arose out of the needs of governments to provide propaganda, notably the revolutionary Communist regime of the Soviet Union. In

the spirit of agitprop, which propounded the notion that the modern technology of photography was the appropriate medium with which to communicate with the masses, in the immediate post-Revolution years, the Bureau-Cliché was set up to supply regional presses with photos. This agency eventually merged with the Telegraph Agency of the Soviet Union to form TASS. The All Union Society for Cultural Relations with Foreign Countries (VOKS) established the RussFoto agency around the same time to serve public relations concerns abroad. In 1931 the massive SoyuzFoto organization was created, incorporating VOKS and TASS. SoyuzFoto organized branches around the U.S.S.R. and sent photographers to document events around the Soviet empire and sent out hundreds of copies selected photographs to domestic newspapers as well as the foreign press.

The Communist-inspired worker photography movement that was active in Germany from 1926

to 1932 was another important milestone. In this atmosphere of socially concerned photography, the German publisher Willi Münzenberg founded an agency in part to expedite illustrations to promote his Communist ideology for his magazine *Arbeiter-Illustrierte-Zeitung* (Worker Illustrated Magazine, *AIZ*, 1924–1938) and in part because the existing agencies, such as Mauritius-photo, ufa-photo, and Ecce-photo had threatened to boycott Münzenberg's magazine. The example of *AIZ*, influenced as well by the model of TASS and the Soviet Information Office's Novosti Press Agency, led to the rise of the illustrated newsmagazine in the United States, including *Forbes*, *Life*, and *Look*, which while employing their own staff, often published photos provided by agencies. Another influential agency was Dephot, founded in 1927 and brought to international prominence under Simon Guttman, represented a number of important photo-journalists and photographers including Andreas Feininger, N. Tim Gidal, Kurt Hulton, Felix Mann, Erich Salomon, and Umbo.

Photo agencies had been established in the United States in the 1920s as well, including Keystone and Worldwide. Pacific and Atlantic Photos, which established an office in Berlin in 1928, merged with the Associated Press (AP) in the 1930s. The AP, which began as a cooperative news agency in 1848, proved also to be one of the leading news bureaus of the twentieth century, covering general international news and providing photographs sent by wire to newspapers and magazines worldwide until this technology was superseded in the later decades of the century. Its still picture division, initially dubbed Wireworks, transmitted its first wire photo—of a plane crash in the Adirondack Mountains, New York—on January 1, 1935. Its reputation for providing news photography was sealed during the World War II years by its many courageous war correspondents who risked life and limb, some, such as Joe Rosenthal, who took the famous shot of the flag raising on Iwo Jima, dying in action. Eddie Adams, who took memorable war photographs, including a Viet Cong being executed by a Vietnamese general, also took memorable photographs of movie star Marilyn Monroe, typical of the range of subject matter handled by AP correspondents. Many of the most famous news pictures of the twentieth century were taken by AP photographers, including the series showing the explosion and crash of the Hindenburg blimp (Murray Becker); the screaming, bloodied Chinese child in the midst of bomb debris from the 1937 attack by the Japanese on Shanghai (H.S. Wong); President

Harry S. Truman holding up the *Chicago Daily News* erroneously announcing his defeat to Thomas Dewey in the 1948 elections (Byron Rollins); or the naked Vietnamese girl fleeing, with other children, from a napalm attack (Nick Ut). Many have received Pulitzer Prizes, including Horst Faas, Yasushi Nagao, Steve Starr, and Paul Vathis. Other large international news bureaus employing photographers include the British concern Reuters and Agence France Presse of France.

The 1930s saw the spread of photo agencies throughout Europe, localized in various countries but usually able to provide photographs to concerns outside their immediate locales. Notable in Germany was Berlin's Presse-Photo. Group Polygoon was the premier photo press agency in the Netherlands. In Madrid, the news agency EFE, founded in 1939, in its early years worked mostly as a propaganda arm for the Franco regime. In France, Alliance Photos and Three Lions were active in Paris. Perhaps the most important of the French agencies, however, is Rapho, founded in 1933 by the Hungarian immigrant Charles Rado. Rapho employed such figures as Lisette Model. Rapho is also one of the few European agencies from this era that survived; in 1977, Rapho merged with the Top Agency and in 2000, the agency joined Hachette Filipacchi Photos.

Photographers worked on assignment (commission) as well as submitted photographs for consideration for both news publications as well as fashion and lifestyle magazines. The rise of Adolph Hitler and the Nazis, who set up their own propaganda agency, Deutscher Verlag, brought this phenomenon to a halt, and shifted attention to the United States, where many photographers, journalists, and newspaper men had fled. Thus one of the best known American agencies, Black Star, can be said to have its origins in Europe. Founded in New York City in early 1936, its principals, including Ernest Mayer, who had directed the Mauritius Publishing Company, which included Mauritius-photo, a leading agency of the time, were all Germans fleeing Nazism. Photo agencies also began to be established in other parts of the world. In Japan, Nihon Kobo was founded in 1935.

After the focus on war photography during World War II, a new landscape emerged for the photo-journalist and the agency photographer. In part inspired by underground or resistance news and photo bureaus operating during the war, such as the Dutch Particam and the Photo Division of French Resistance (Services d'Information de la France Combattante), many photographers wished to continue the struggle to bring photographs of importance to the public. Out of their war experiences

PHOTO AGENCIES

in 1947, Robert Capa, a veteran of the Spanish Civil War, and Henri Cartier-Bresson, active in the French underground, founded Magnum Photos, perhaps the most famous photographer's cooperative. Unlike conventional news bureaus, Magnum was photographer-run, with a board of directors made up of practicing photographers. With magnum, the traditional arrangement of photographers receiving at most 50% of the amount charged for the photograph, minimal, if any, royalties, and paying for their own expenses and equipment began to be challenged.

In the Netherlands, Aart Klein, a veteran of Particam, established a photo agency of the same name. While relatively few agencies were established in the 1950s, such as the Swedish group Tiofoto was founded by Lennart Olson and in Japan, the important cooperative agency VIVO, co-founded by Kikuji Kawada and Eikoh Hosoe, was established in 1959. These agencies were perhaps more successful in influencing the aesthetic development of photography in their respective countries than as commercial concerns. Their model, however, was a potent one, and many agencies of the 1960s and 1970s, some short-lived, were founded by professional photographers practicing both reportage and fine arts photography, who were frustrated with the status quo. The Vu photographers agency was established in France. The Viva Photographers Agency, which sought social goals beyond straight documentary image-making was founded in 1972, numbering Martine Franck, later a Magnum photographer, and François Hers among its members.

But perhaps the most significant impact photo agencies had on the social fabric was in Africa. In countries struggling for independence and those dealing with post-colonial problems, photo agencies were instrumental in educating the populous, publicizing injustice, and developing national unity. One of the most important was the South African activist photographic collective Afrapix, founded in 1982. But it was modeled on earlier examples, including Kenya's Camerapix agency, founded in Nairobi in 1969 by Mohammed Amin. These agencies were counterbalanced, so to speak, by official press agencies like Syli-Photo in Guinea, Congo-press in the Democratic Republic of Congo, and ANIM in Mali, which existed in large part to craft the public personae of strongmen and dictators who ran these countries.

In the more traditional model of the photo agency, Gamma was set up in 1967 by Raymond Depardon; the Sygma Photo News Agency was begun in 1973, eventually becoming one of the

world's largest, and Sipa-Press, all in Paris. These agencies worked to codify an equitable method of payment, more often working on assignment from the commissioning source, whether a magazine, industrial concern, or advertising agency, than doing freelance work that was attempted to be sold as is to a client. Reproduction fees were generally negotiated, and photographers kept all copyright to their own work.

At the end of the century, there were consolidations and buyouts in the field, especially by the Microsoft Corporation and Getty Images that saw the demise of one of the major photo agencies, Sygma, and legal battles about the use of photographs in archives and photographers' rights. The business practices of Microsoft Corporation's archive and licensing company Corbis, which acquired Sygma in 2000, were called into question. A number of the agency's photographers, led by long-time president Allen Tannenbaum, left the firm. Many who remained were fired after staging a strike that closed down the Paris headquarters. Henri Cartier-Bresson, at age 93 the senior member of the French photo-journalistic establishment, wrote that he was

scandalized by the casualness and the cruelty of the massive firing....The compilation of an image bank, as well stocked as it might be, will never match the work of an author. On one side is a machine; on the other is a living and sensitive being. Corbis offers no choice.

(*Columbia Journalism Review*, July/August 2002)

The Corbis-Sygma situation brought into focus the changing business of photojournalism, the historical backbone of photo agencies. The future of photo agencies, along with stock companies and photojournalism in general, is likely to be bound to that of the internet, which has revolutionized the delivery of visual imagery.

PHOTO LEAGUE

The New York City photographers who banded together as the Photo League were dedicated to promoting social photography. In essence, they joined together the concept of social documentation with the practice of street photography. Purposeful social documentation, which had emerged as a distinct genre in the United States towards the end of the nineteenth century, usually was meant to inform the public about economic or social inequities in the hope of eliciting action. Street photography, which had become widespread only in the mid-1920s after hand-held cameras and easier processing methods were made accessible, was a way of capturing casual aspects of ordinary life as it devolved in urban settings. Over time, the blending of these two genres became the defining characteristic of the camera work done by Photo League members.

Emerging in 1936 during one of the more hopeful years of the Great Depression, the Photo League offered an alternative to the precepts of Pictorialism, an earlier photographic movement that had mostly attracted well-to-do amateurs. With its emphasis on artistic themes and soft, indistinct treatments, this approach to photographic art had already begun to seem old-fashioned in the highly mechanized culture of the 1920s; by the 1930s it seemed quite irrelevant. A different aesthetic approach, which mandated sharp, clear imagery and emphasis on what was termed “the thing itself,” claimed the attention of serious expressive photographers, among them Berenice Abbott, Ansel Adams, Paul Strand, and Edward Weston; all of whom would be associated to one degree or another with the Photo League. Also changing were the sharp divisions between the various genres of photography. As camera expression became recognized as the most up-to-date means of visual illustration, images of all kinds appeared in advertisements, periodicals, and on gallery walls, thereby expanding what was thought of as photographic art.

The Photo League was initially organized in the early 1930s as The Film and Photo League, under the sponsorship of Workers International Relief—a European organization with a social orientation. This body had established such groups in Chicago and New York as well as in major European cities in order to supply the radical left press with visual

images of working-class life taken from the point of view of those involved. In 1936, the still photographers in the New York group separated from the filmmakers (some of whom became Nykino and later Frontier Films), and changed the organization name to the Photo League. (The Chicago group appears to have become defunct by this time.) Their approach to documentation became less rigidly dedicated to portraying only the class struggle and more open to capturing other aspects of working class life. As a consequence, nearly all members photographed at one time or another in the streets of New York.

The League established an advisory board, which included Abbott and Strand and a rostrum of officers; for many years Walter Rosenblum was president. Over time, it rented a series of spaces in downtown Manhattan locations where members constructed darkrooms, meeting rooms, and galleries. Work by outside established photographers as well as by members was shown, with first-time exhibitions in the United States given by, for example, German montagist John Heartfield and French photographers Edouard Boubat and Robert Doisneau. Other than the Museum of Modern Art, the Photo League gallery was the only venue in the United States where one might see work by Eugène Atget, László Moholy-Nagy, and Henri Cartier-Bresson.

The League held semi-monthly meetings and presented lectures on a variety of topics. Among them was a symposium on Photographic Books, an unusual theme in an era when comparatively few such books were being produced. Suggestive of the wide range of themes of interest to League members were talks by Ralph Steiner on “Art and Documentary Photography,” by Ruth Bernhard on her personal work, and by editor Tom J. Maloney on *U.S. Camera Annual*. League members engaged members of Pictorial Photographers of America in an on-going discussion about the value of social photography as opposed to Pictorialism.

Starting in 1937 and largely under the directorship of Sid Grossman, the League ran a school for which tuition was a nominal \$15 a session. Classes in basic and advanced technique, documentary photography, and history of photography (taught by Grossman and Sol Libsohn among others) were

PHOTO LEAGUE

offered as well as workshops, in which students pursued individual projects; one such workshop was taught by Strand.

PhotoNotes, the League publication, edited on and off by Rosalie Gwathmey and produced at first by mimeograph, later by multigraph, and for its final issue by letterpress, not only kept members informed of day-to-day events, but also carried serious writing on critical issues in photography. Edward Weston was quoted as regarding it "the best photo magazine in America today." *PhotoNotes* continued to appear, if sporadically, throughout the war years despite the inroads made in 1941 by the draft, which depleted the number of men involved in League activities. Following the demise of the League, this valuable periodical was completely forgotten until reproduced in 1977 in book format by the Visual Studies Workshop, Rochester, New York.

Initially, to achieve its working-class focus, the League had set up Feature Groups (sometimes referred to as Documentary Groups). This approach owed something to the example of Lewis Hine, the pioneer social photographer who had documented American working people and, late in life, had been introduced to the League by Abbott and her associate, art historian and writer Elizabeth McCausland. After his death in 1940, his work was given to the League and a committee under the leadership of Marynn Older (Ausubel) was set up to conserve and reprint it. (Eventually, after the League ceased to function, this collection was given to George Eastman House in Rochester, New York).

The Feature Groups consisted of individuals, working in concert and alone, who returned over a period of time to specified working-class neighborhoods to create in-depth portrayals of the way people lived. One such endeavor, "Neighborhoods of New York," was under the leadership of Consuelo Kanaga, a West Coast photographer who had come east to work as a photojournalist. For another, "The Harlem Document," a contingent consisting of Lucy Asjean, Harold Corsini, Morris Engel, Beatrice Kosofsky, Jack Manning, and Aaron Siskind returned time and again to Harlem, working in the streets and gaining access to private apartments. Despite the fact that there were almost no black photographers in the League during its entire period, both projects reflected efforts by members to counter then prevalent racist attitudes toward black people. "The Chelsea Document," the work of Grossman and Sol Libsohn, depicted a west side working-class neighborhood that was home to longshoremen. Rosenblum portrayed Pitt Street, the immigrant neighborhood of his youth, and

Dan Weiner concentrated on Yorkville. At the time the tenement apartments in these neighborhoods were so cramped that much adult social intercourse and most children's games took place in the streets, greatly facilitating the photographers' access to their subjects.

Besides the inspiration deriving from Hine's example, League members were acutely aware of the documentary photography projects being funded in the mid-1930s by federal agencies, notably the Farm Security Administration (FSA) and the Works Progress Administration (WPA). *Changing New York*, a project initiated by Abbott for the WPA, undoubtedly directed members' attention to the social role that organized photographic documentation might play. The FSA's visual record of depressed conditions in the agricultural sectors of the United States, examples of which appeared in news media and weekly periodicals as well as in several large scale exhibitions, also was shown more than once in the League gallery.

Despite the rhetoric about structured social documentation, the League's methods of working always were somewhat flexible and became even more so at the end of the Second World War. By the late 1940s when Strand gave a Special Projects class, organized endeavors as such had disappeared, with participants engaged more by individual instances of pain and/or tenderness than by a need to catalog social inequities. Serendipitous street documentation by Arthur Leipzig and Sandra Weiner (each of whom studied with Strand) often revealed random but ambiguous moments of grace, thereby transforming social documentation into a more broadly humanist mode of expressive street photography. The end of the War undoubtedly brought with it a more accepting attitude toward human experience in general, with the result that the photographers frequently sought out exhilarating rather than distressing moments. With greater flexibility about theme and a more open attitude toward aesthetic matters in the post-war years, the League attracted both young photographers such as Jerome Liebling and those with established reputations, among them Barbara Morgan, Nancy and Beaumont Newhall, and W. Eugene Smith.

Ironically, this expansion in activities and membership, which inspired a move to new and larger quarters in the Hotel Albert on East 10th Street, took place during a period of increasing anti-left sentiment in the United States. Although the League considered itself a non-political entity, open to photographers of any belief, in 1947 it became one of several hundred organizations listed as subversive by a special board approved by the President

of the United States. Known as the Attorney General's List, this document adduced no evidence for its listings and no recourse was allowed, despite efforts by the president, W. Eugene Smith, to ascertain the basis for the listing. Merely as a result of being branded subversive, League members were in danger of losing or being denied jobs or they might have their passports withheld, making professional travel impossible. By 1951, membership had dropped so precipitously that the League, unable to pay its bills, suspended operations.

The Photo League should be seen as an institution that reflected the broadly based idealism of the New Deal during the Depression years. Begun as an attempt to find a path to social justice through the visual arts, its members eventually found the means to interact with each other and with the urban scene around them to give social photography an ardent and compassionate life of its own. Although its work was obscured for many years, it is now recognized as having established a serious culture of photography well before this approach became widespread among galleries and museums.

PHOTO-SECESSION

An organization of pictorialist photographers in the United States, the Photo-Secession was founded in 1902 by Alfred Stieglitz of New York for the purpose of advancing the cause of photography by achieving its recognition as a fine art. Among its most prominent members were Stieglitz, Edward Steichen, Gertrude Käsebier, Clarence H. White, Joseph T. Keiley, Alvin Langdon Coburn, Frank Eugene, and Annie W. Brigman. The group campaigned to achieve its goals through the exhibition of its members' work in invitational salons, in its own gallery space, and through the publication of its journal *Camera Work*. This essay will examine the Photo-Secession's origins, its principles and

goals, its exhibition activities, and the publication of *Camera Work*.

Origins of the Photo-Secession

The Photo-Secession was but one of a number of photographic societies that may have shared the same goal, but for Stieglitz and its other members the Photo-Secession was a public protest, an act of rebellion and separation from the other existing organizations within the amateur photographic community. The Photo-Secession was at once a statement of beliefs, the pronouncement of a goal, and perhaps an unspoken claim for preeminence

within that community. Its name was meant to suggest the radical nature of the group as the most progressive society of pictorialist photographers at work in the United States, and to evoke an association with the secessionist avant-garde art movements of Europe. The Photo-Secession was an opportunity for re-presenting and re-defining to a larger community what pictorial photography could be.

Stieglitz and the members of the Photo-Secession severed their allegiances to other organizations within the larger photographic community during a period of deep division between several schools of thought about the nature of artistic photography and the roles that amateur organizations should take in its promotion. In the nineteenth century, organizations such as the Camera Club of New York and the Photographic Society of Philadelphia had served a number of purposes, providing dark-room facilities, exhibition space, and training to photographers during an era when the practice of photography was technically demanding. But with the commercial availability of greatly simplified photographic materials, such as the gelatin dry plate in the late 1870s and with the introduction of the Kodak camera and a photo-finishing industry in the late 1880s, the practice of photography became accessible to a much larger community and the interests of camera club members became more varied.

The very popularity of the medium and the ease with which the new technologies made photography accessible contributed to the rise of a pictorialist movement to counter a perception of photography as a purely mechanical medium practiced without skill. It was the goal of this progressive, or New School, movement to demonstrate the artistic possibilities of photography. Influenced by a number of other movements within the traditional arts, such as Impressionism and Symbolism, photographers in Europe and the United States arrived at a pictorialist aesthetic often characterized by soft focus, a massing of highlights and shadows, and highly manipulated printing techniques meant to demonstrate control by the photographer over his or her work and at times to mimic the appearance of traditional artistic media of painting and print-making.

Acceptance of the advances made by members of the New School was not universal, particularly within those organizations with a strong following among the conservative or Old School photographers. This Old School objected to the pictorialist aesthetic as bad photography, objected to the domination of their societies by photographers of the New School with such views, and felt a loss of

opportunities to show their own work in club exhibitions. In the United States this was the case when conservative members of the Photographic Society of Philadelphia regained control of the organization after several years of domination by members with New School points of view. That Society's Philadelphia Photographic Salon, led by the New School, had been a leading venue for exhibiting the newer pictorial photography. In turn Stieglitz and other members of the New School boycotted the more conservative salon held after this retrenchment. Out of these divisions, and a similar situation within the Camera Club of New York where Alfred Stieglitz was a member, the Photo-Secession was born.

“American Pictorial Photography Arranged by the ‘Photo-Secession’”

When Stieglitz announced the Photo-Secession in March 1902 he had for several years been considering how to create such a group to serve the needs of pictorial photographers inclined to the aesthetics of the New School. Disagreements within the Camera Club of New York led Stieglitz to resign his position as vice-president. Objections to the emphasis on pictorialist topics in that Club's quarterly journal *Camera Notes* led him to resign as editor of the publication, which he had also founded. Stieglitz chose the opportunity of the March 1902 exhibition of pictorialist photography that he had organized for the National Arts Club in New York to announce the formation of the Photo-Secession. But when that exhibition, “American Pictorial Photography Arranged by the ‘Photo-Secession’,” an exhibition of more than 160 photographs by 32 prominent photographers, was announced the only members of the Photo-Secession were Stieglitz and perhaps those members of the *Camera Notes* editorial staff who had resigned with Stieglitz—Joseph T. Keiley, Dallet Fuguet, and John Francis Strauss.

Photo-Secession Principles, Organization, and Goals

In the early months of its existence the Photo-Secession was an organization in name only. When pressed by the photographic community to explain the purposes of the group, Stieglitz responded by simply stating that the objectives of the Photo-Secession were to serve the cause of pictorial photography, to unite American photographers and those interested in pictorial photography, and to hold exhibitions of work by its members and others. Soon other photographers exhibited at the National Arts Club joined with Stieglitz.

Though the Photo-Secession was only loosely organized, without a constitution or by-laws, it did have several categories of membership; the Council, which provided leadership to the group; Fellows, selected by the Council for the quality of their photography; and Associate members, who may not have been photographers but who had demonstrated a sympathy with the goals of the Photo-Secession. From its beginning the Council included among its members Stieglitz, Steichen, Käsebier, Keiley, Eugene, Fuguet, Strauss, John G. Bullock, Robert S. Redfield, Eva Watson-Schütze, Edmund Stirling, and William B. Dyer, all leading New School pictorialist photographers.

What set the Photo-Secession apart from other organizations that might claim to serve the same purposes was Stieglitz's determination to see pictorialism accepted as a fine art. Toward that end Stieglitz saw that controlling the conditions in which Photo-Secession photographs were seen was key. He first demanded of exhibition authorities that Photo-Secession work be accepted and exhibited as a group and not be submitted to a jury. Later, with the founding of *Camera Work*, he was able to present Photo-Secession photographs in well-crafted reproductions, and to publish analysis and commentary on pictorial photography in keeping with his views. And with the founding of the Little Galleries of the Photo-Secession he was able to present photographs under gallery conditions that he also controlled and that befitted their status as art.

Camera Work

Just as *Camera Notes* had served Stieglitz as an invaluable means of presenting New School pictorialism to a far a larger audience than simply the members of the Camera Club of New York, so would a printed journal be of vital importance to the Photo-Secession in presenting its work. With the same editorial staff with whom he had published the earlier journal, Stieglitz founded *Camera Work* in 1903. In *Camera Work* Stieglitz reproduced photographs by members of the Photo-Secession and other pictorialists, reproductions of non-photographic art, notes about Photo-Secession exhibitions and organizational news, and essays by artists, writers, and critics such as Max Weber, Gertrude Stein, Sadakichi Hartmann, and Charles Caffin. *Camera Work* served as a laboratory for translating original photographic prints—often painstakingly hand-crafted prints—into photomechanical reproductions, using a variety of such processes, including photogravure, four-color halftones, and collotypes, to yield reproductions with a greater sense of fidelity

to the originals than was common in the photographic press.

Little Galleries of the Photo-Secession (291)

The Photo-Secession was in essence an exhibition society, providing opportunities for its members to exhibit as a group under conditions subject to their control, and promoting their work through the photographic press, in *Camera Work*, or through articles placed in other publications. But until 1905 the Photo-Secession had no exhibition space of its own. When photographs by the Secession were shown it was in invitational exhibitions sent abroad to Europe, or held in the United States at such venues as the Corcoran Art Galleries in Washington, D.C., and at the Pittsburgh Art Galleries of the Carnegie Institute in Pittsburgh, Pennsylvania. In late 1905, at the suggestion of Edward Steichen, Stieglitz rented rooms on the top floor of the building at 291 Fifth Avenue in New York. These few small rooms became the Little Galleries of the Photo-Secession and were later known simply as 291 from the building's address. They would be the Photo-Secession's home until 1917.

At 291 Stieglitz staged individual and group exhibitions of photography by members of the Photo-Secession and prominent pictorialist photographers in sympathy with the organization's goals. It was operated as a commercial gallery and for the most part works displayed there were offered for sale, though the commercial aspects of the gallery and Stieglitz's handling of them became a source of discord among members of the Photo-Secession. Photographs were not the only art works exhibited at 291. From 1908 on Stieglitz began to show paintings, drawings, and sculpture in exhibitions arranged in part by Edward Steichen, who lived in France at the time and was a vital connection for Stieglitz to the art centers of Europe. Steichen made it possible for Stieglitz to show work by the painters Paul Cezanne, Henri Matisse, Pablo Picasso, and the sculptor Auguste Rodin, among others. Visitors to 291 also saw exhibitions of African sculpture and children's art. Works by the American modernists John Marin, Georgia O'Keeffe, Marsden Hartley, and Arthur Dove, whom Stieglitz supported for the remainder of his career, were also shown at 291.

Demise of the Organization

From 1908 Stieglitz's interest in pictorial photography seemed to wane, as he grew tired of the struggle to attain his goals and as the achievements of pic-

torial photography paled in light of what he was learning about European modernist art under the tutelage of Steichen and Max Weber. Stieglitz began to think in terms of summing up the history and achievements of pictorialism. Toward that end Stieglitz and the Photo-Secession organized a large exhibition, the "International Exhibition of Pictorial Photography," at the Albright Art Gallery in Buffalo, New York, in late 1910. In addition to photographs by members of the Photo-Secession, Stieglitz exhibited prints made by Alvin Langdon Coburn from the negatives of early Scottish photographers David Octavius Hill and Robert Adamson, prints by Julia Margaret Cameron, and by leading European photographers such as Robert Demachy and Heinrich Kühn. In a concession to other pictorial photographers who were not members of the Photo-Secession, a jury-selected Open Section was also included.

The Albright Gallery exhibition was the last large-scale exhibition of Photo-Secession photographs organized by Stieglitz. In it he presented a summary view of pictorial photography, establishing a history of its practice and legitimizing the work done by Photo-Secessionists. With the acceptance of photography by the Albright Art Gallery the Photo-Secession could claim that its goal of achieving the recognition of photography as a fine art had been attained.

Conclusion

The formation of the Photo-Secession in 1902 suggested a separation of that group's members from the community of pictorial photographers. Yet Stieglitz and the other Photo-Secessionists could no more separate themselves from the community than they could give up photography. They were inextricably a part of the photographic community, and their stance makes sense only within the context of that community. Rather than a separation, the Photo-Secession was instead a declaration that its members would no longer allow others to make

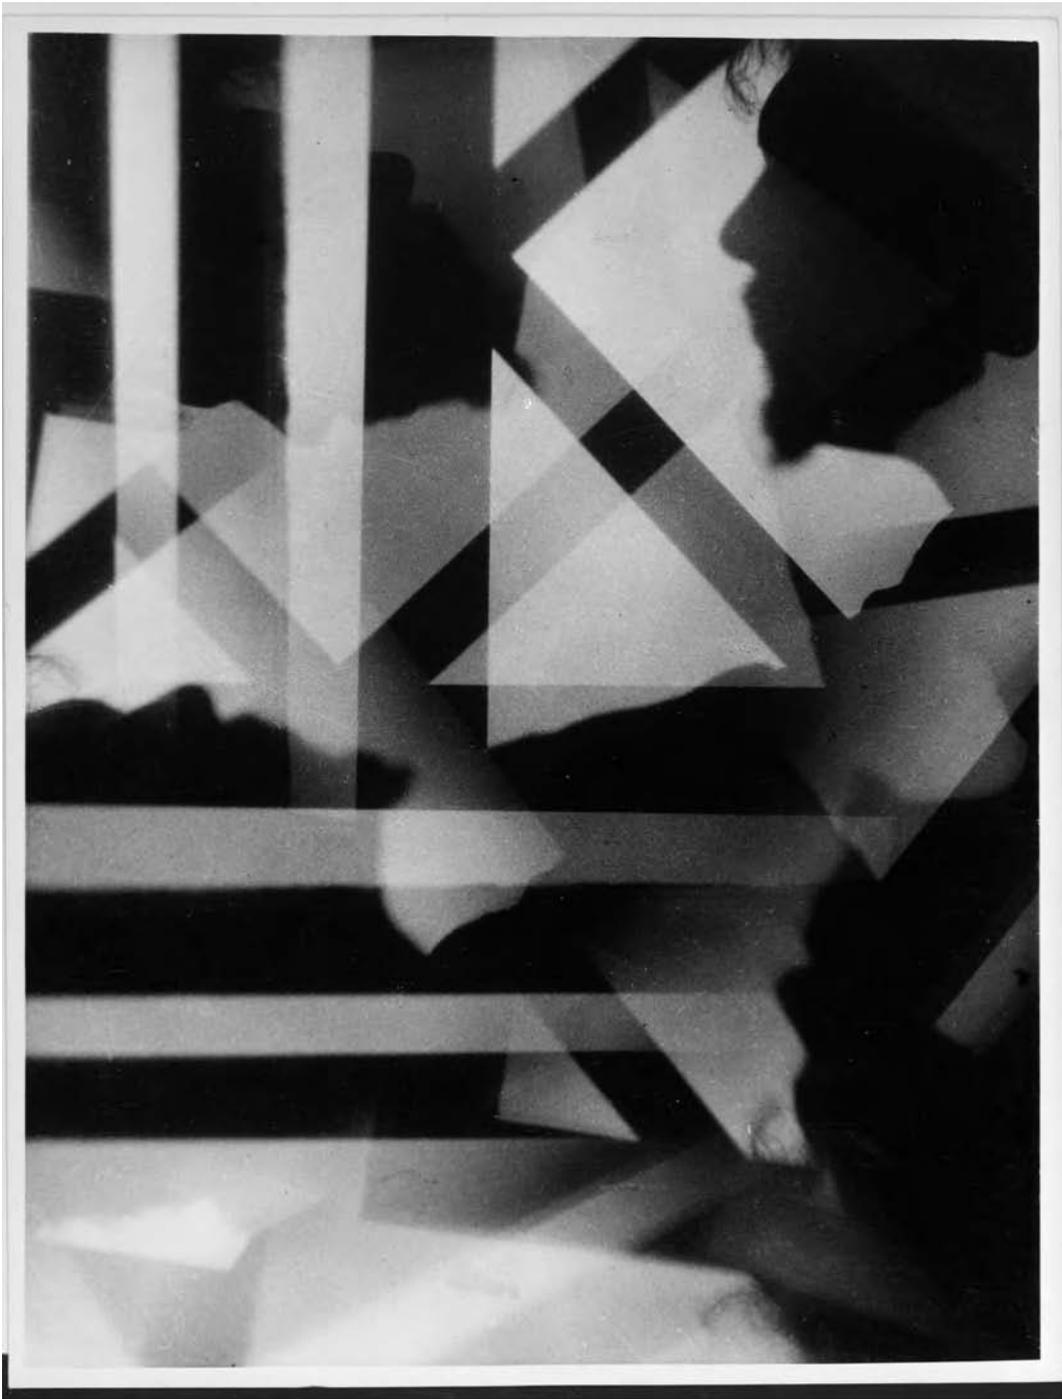

decisions about how their work should be seen, either in the material context of an exhibition, on the printed page, or in relationship to other arts. While the organization gave its members credibility within the larger arts community, the Photo-Secession also gave Stieglitz and its members the freedom to promote a view of photography that ultimately emplaced the medium within the institutions of fine art.

PHOTO-SECESSIONISTS

Around 1900 a group of photographers in Europe and the United States was beginning to rebel against traditional photography and nineteenth century photographic associations. These photographers wished to make photographs that would be valued not only for their subject matter but also for the manner in which they were made, that is, photographs realized with consummate mastery of the medium's unique technical and formal qualities and expressed with artistry. These ideals came to be associated most closely with and expressed by the Photo-Secession group, organized in 1902 by Alfred Stieglitz who at that time was already known internationally, along with 12 other photographers.

The Photo-Secession was a major turning point in photography. While the term refers to a specific organization of like-minded photographers, it also marked a significant conceptual and aesthetic advance in photography's status within society. The main goal of the group was to gain recognition for photography as a legitimate fine-arts medium. Photographers had been attempting this recognition since the early days of the medium, however, this need was made greater by the new class of amateurs bearing Kodaks, who had little or no technical knowledge in photography, that emerged after the introduction of inexpensive, easy-to-use cameras around the turn of the century.

The Photo-Secession was founded on February 17, 1902, in New York by John G. Bullock, Robert S. Redfield, and Edmund Stirling of Pennsylvania; William B. Dyer and Eva Watson-Schütze of Illinois; Frank Eugene, Dallett Fuguet, Gertrude Käsebier, Joseph T. Keiley, Edward Steichen, Alfred Stieglitz, and John Francis Strauss of New York; and Clarence H. White of Ohio.

As printed in an early brochure, the objectives of the Photo-Secession were threefold:

to advance photography as applied to pictorial expression; draw together those Americans practicing or otherwise interested in the art; and to hold from time to time, at varying places, exhibitions not necessarily limited to the productions of the Photo-Secessionists or to American work.

The Secession's governing structure was as follows:

A Council, composed of a Director and twelve others, to whom is absolutely committed the management of the

affairs of the organization. The Council until 1905 shall consist of the Founders of the organization. Thereafter the Council shall consist of the Founders and five additional Fellows elected biennially by the Fellows; Fellows, chosen by the Council and Associates

whose role was not clearly defined but who could submit work to the juried exhibitions.

The membership quickly grew, eventually reaching to up to a hundred. Many of the members of the Photo-Secession were also members of the Camera Club of New York, (Stieglitz served as its Vice-President) but there was no official relationship between the two organizations.

Alfred Stieglitz was the major figure of this group and a leading influence in photography since the first decade of the twentieth century. He founded the Photo-Secession with the idea of linking photographers with a common ideal about what art photography should be, following the ideals of the Linked Ring Brotherhood that had been formed in London in 1892. As well, the name of the group was taken from the various European Secessionist painters who had rebelled against academic painting, primarily the Vienna Secession founded in Austria in 1897. The Vienna Secession's model of an exhibition space and journal to disseminate the group's ideals was successfully adopted by Stieglitz. Another influence was that of the Symbolist painting movement, which sought to infuse art with larger philosophical ideals, removing it from the realm of the natural and sentimental into the spheres of mythology and psychology.

The Photo-Secession was the first school in the sense of a group with shared goals, ideas, and some commonality in style, in photography's history. The magazine *Camera Work*, directed by Stieglitz, was the major instrument promoting Photo-Secessionists' ideas and work. The Photo-Secession's ideals had a significant influence in many European countries, especially in France, Austria, and Great Britain. Various groups and associations were active in promoting this new photographic idea and style, often referred to as Pictorialism, which had adapted the look of paintings and graphics to align photography with its fellow-fine arts mediums. Along with the Linked Ring in Britain, the Wiener Kamera Klub, Austria (founded 1891) and the Photo-Club

de Paris (1894) were important groups that shared the American Secessionists' ideals.

One key way of promoting the work of these photographers was through exhibitions, starting with the participation of Secessionists in those promoted by the traditional camera clubs, evolving to the Secessionist group's own exhibitions and to a permanent gallery with a quarterly exhibit of largely Photo-Secessionist work in New York City. A pamphlet printed by the group in December of 1902 stated:

In order that the Photo-Secession may exercise a potent influence upon the welfare of pictorial photography, each member will be duly advised by the Council of the attitude which the Photo-Secession will assume toward any important exhibition and whether it is deemed desirable that the members of the Photo-Secession shall exhibit as a body, or individually.

However, only a month after the Photo-Secession's founding, Stieglitz had organized "Pictorial Photography, Arranged by The Photo-Secession," for the National Arts Club in New York. This show included works by founding members and well-known Pictorialists Käsebier, White, and Steichen, as well as Alvin Langdon Coburn. Portraiture, landscape (including urban), and the nude were the main themes for these photographers and the techniques were characteristics of Pictorialism. Techniques such as carbo printing, gum printing, platinotype, or later bromoil were used not only for their "artistic" effect (in that they mimicked the look of painting and graphic arts), but also because they would differentiate the photographers using these demanding techniques from the commercial studio photographer using albumin and gelatin silver processes, or the amateur with a Kodak.

Even as the Photo-Secessionists were seen as promoting pictorial photography, there were different understandings of the term among members of the group. Some would work in a more "documentary" way than others. These differences would lead to the end of this group just before World War I; ironically the magazine *Camera Work*, which had functioned to widely disseminate and promote pictorial photography, also helped lead the way to that style's demise. In 1916 *Camera Work* published the "straight photography" as seen by Paul Strand, and "abstract photography" by former Secessionist Alvin Langdon Coburn, leaving such figures as Gertrude Käsebier to continue to carry the torch for what was increasingly seen, with the rise of Modernism, as an outmoded style.

Those generally referred to as Photo-Secessionists indicate the 13 founding members as well as those

invited to join, but also those who aligned themselves with the group, which as stated in its organizing papers required only that the photographer believe in the ideals as stated by the organization.

Alfred Stieglitz (1864–1946), as instigator of the group, is the best-known Secessionist, although his subsequent eschewal of the fuzzy, Pictorialist look so common in the work of the Secession and alignment with the Modernism of Paul Strand and others later overshadowed his primary role in this history. Before launching *Camera Work* in 1903 Stieglitz had a wide experience publishing photography magazines. He was the editor of *American Amateur Photographer* and later of the Camera Club of New York magazine, *Camera Notes*. He was responsible for devoting *Camera Work* and his exhibition space, the Little Galleries of the Photo-Secession (also known as "291") not only to photography, but also to modern painting. Even during the years of Photo-Secession activities, Stieglitz began to turn to photography with a great concern with "truth." Best known of his post-Secessionist works are his "equivalents" (photographs of clouds) and the portraits of his wife, painter Georgia O'Keeffe.

Edward Steichen, born in Luxembourg in 1879, studied photography and painting in the 1890s in the United States. He was only 21 when his work was presented to the European public in the 1900 exhibition "New School of American Photography," held at the Royal Photographic Society in London and later in Paris. In Paris he met Robert Demachy, who, like Steichen was a practitioner of gum printing. In 1902 he held a one-man show at "La Maison des Artistes" in Paris, including not only photographs, but also paintings. On his return to the United States he was a co-founder of the Photo-Secession, and 10 of his photographs were published in the second issue of *Camera Work*. He can be seen as the Secessionist whose work has greater roots in painting, particularly Symbolist painting. Steichen went on to an eminent, wide-ranging career after the demise of the Secessionist group, including organizing the seminal exhibition *The Family of Man* in 1955. When he died in 1973, he could be considered one of the most important and popular photographers of the twentieth century.

Like Steichen, Gertrude Käsebier (1852–1934), studied painting during the 1890s. She was unique in this group in that she was a highly successful, established professional studio photographer. She also had exhibited widely, receiving her first solo exhibition at the Camera Club of New York in 1899. Along with Photo-Secession co-founder Eva Watson-Schütze, she was the rare woman associated with the group; she was also the first

PHOTO-SECESSIONISTS

woman to be elected to the Linked Ring. Some of her Secessionist colleagues considered her not to be sufficiently interested in the rules of composition, and her Christian motives were not sometimes well accepted by her peers, however, she was very popular among the public in general.

Alvin Langdon Coburn (1882–1966) was not a founding member of the Secession, but he was admitted in 1903 when he was only in his early twenties (as well as to the Linked Ring that same year). Born in Boston, he was a distant cousin to that city's most famous photographer, F. Holland Day, whom he met in 1898. He received his first camera very early in life and some of his photographs were exhibited in his hometown as early as 1897. Later, in 1900, nine of his photographs were shown at a Royal Photographic Society exhibition in London, and he had regular exhibitions of his work in New York and Great Britain where he relocated in 1912. Like Gertrude Käsebier he also had a professional studio in New York, which he had opened on New York's Fifth Avenue in 1902. His best known photographs are portraits, particularly of writers and painters. He is also regarded for his urban landscapes. His famous 1912 photograph *The Octopus*, prefigures his turn into abstractionism, for after photographing Vorticist painters Wyndham Lewis and Edward Wadsworth, he began in the late 1910s experimenting with Vorticism (which featured many of the same ideas as Cubism) applied to photography, which he dubbed "vortographs." Coburn was also a collector of photography's early masters.

If his own work was not important enough, Clarence H. White (1871–1925) might be known only by teaching some of the most important photographers of the next generation (including Dorothea Lange, Margaret Bourke-White, and Paul Outerbridge, Jr.) in his school at Columbia University in New York. Like others of the Secessionist group he discovered photography by means of modern painting. Until 1904, before embracing photography as a profession, he had been a bookkeeper in Newark, Ohio. His best known photograph, *Ring Toss* (1899), is an example of the use of light and of spontaneity. He was also a member of the Linked Ring, elected in 1900.

The German-American Frank Eugene (1865–1936), a Secession co-founder, had studied painting under Wilhelm von Diez at the Munich Academy of Art as well as in New York and Paris. Around the turn of the century he had created a number of nudes in which the photograph clearly showed the brushwork by which the photo-emulsion had been laid on, an effect that called attention to unique photographic

qualities (the emulsion) and referred to painting as well. He became known as a "painter-photographer" and first came to the attention of a wider public as a photographer in 1899 on the occasion of a solo exhibition in the Camera Club of New York. He was elected to the Linked Ring in 1900. From 1913 he taught in Leipzig at the Academy of Graphic Arts and Book Design and at the School of Photography in Munich, where he disseminated his unique technique to a large number of student photographers.

Eva Watson-Schütze, who along with Gertrude Käsebier, represented the significant female contingency of photographers at the turn of the century, was originally from New Jersey, but after having briefly opened a professional studio in Atlantic City and in Philadelphia, lived in the Chicago area with her husband after their marriage in 1901. She had exhibited in most of the major Pictorialist exhibitions of the era, including Day's "The New School of American Photography" of 1900 and had been elected to the Linked Ring the following year. Although she appeared in the first photographic exhibition held at the Little Galleries of the Photo-Secession, residing in Chicago she felt isolated from the movement and did not appear in subsequent exhibitions. She is especially associated with the Arts and Crafts colony in Woodstock, New York, where she painted; her best-known photographic work is perhaps *Woman with Lily*, 1905.

John G. Bullock (1854–1939), a pharmacy graduate, was another of the founding members of the Secessionist group. He started photographing in the 1880s. He participated in the Photo-Secessionist group activities until 1910, when his differences with Alfred Stieglitz caused him to leave the group.

Founding Secession member Robert S. Redfield (1849–1923) had served as President of the Photographic Society of Philadelphia, and was known for his bucolic, richly realized landscapes.

William B. Dyer had been a professional photographer since 1897, publishing the book *Love-Lyrics with Life Pictures by William B. Dyer* in 1899. He was elected a member of the Linked Ring, and championed by Clarence White to Alfred Stieglitz was one of the group's founders. His work was published in *Camera Notes* and *Camera Work*.

The American George H. Seeley (1880–1955) started exhibiting in 1904, and between 1906 and 1910 a number of his pictures were published in *Camera Work*. He specialized in nudes and studies with symbolistic overtones and his works displayed a remarkable use of light and shadow. He is best known, however, as a publicist.

Joseph Turner Keily (1869–1914) was a New York lawyer involved in photography since the

late 1990s. He joined the Camera Club of New York in 1899 where he was an associate editor for *Camera Notes*, and after co-founding the Secession, for that group's publication, *Camera Work*, where his pictures, mostly landscapes, were published. He was one of the Americans elected to the Linked Ring.

Little is known about the remaining three founders, Edmund Stirling, Dallett Fuguet, and John Francis Strauss, aside from their appearances in the pages of *Camera Work*.

Alice Broughton (1885–1943) had studied painting in Europe around the turn of the century and later was an assistant in Gertrude Käsebier's studio where she was introduced to the Photo-Secession and its ideals, becoming associated with the group in 1904 and elected a fellow in 1906. She specialized in portraits and pictures of children, and experimented with photographing nudes. She showed in the first photographic exhibition held at the Little Galleries of the Photo-Secession in 1905.

Annie W. Brigman (1869–1950) was born and educated in Hawaii but her marriage to a sea captain caused her relocation to California around the turn of the century. She participated in the San Francisco Salons of 1902 and 1903 and became known to Alfred Stieglitz, with whom she later became friendly. She continued successfully exhibiting her nudes and allegorical studies, and was included in various Photo-Secession exhibitions including the first held at the Little Galleries in 1905, which resulted in her being elected a fellow in 1906. Brigman was elected to the Linked Ring in 1909.

Harry Rubincam (1871–1940) was one of the Secessionists who very early on leaned in the direction of "straight photography" well before the term was coined, *In the Circus*, published in *Camera Work* in 1907, shows not only the speed of a running horse, but the whole ambience of the circus.

William Boyd Post (1857–1925) was a New York financier who joined Photo-Secession in 1902. After moving to Maine in 1901, he photographed snow landscapes, one of them published in *Camera Work*.

Robert Demachy (1859–1937) was a Parisian banker of independent means who had wide-ranging cultural interests. His wife was American, and related to Franklin Delano Roosevelt, later the U.S. president. In the field of photography, Demachy was both practitioner and theoretician, and was especially known for his work with the gum bichromate and oil printing processes, the latter of which he pioneered and developed with Alfred Maskell. In 1894 he helped to found the Photo Club de Paris and was a member of the Linked Ring, and later, the Photo-Secession.

There are also other photographers more or less associated with the Secessionist movement, including a number who were published in *Camera Work*. One of the best known was British photographer Frederick H. Evans (1853–1943). His best known photographs may seem, at first impression, as more documentary than pictorial. His images of churches and cathedrals show a rendition of the stone works with full detail. However, this retired bookseller seemed to see his photographs rather as a means to show geometry and the symbolism of the cathedral than as a documentary task.

Pierre Dubreuil (1872–1944) was born into a wealthy mercantile family in Lille, France. He began his career as a pictorial photographer and joined the Photo-Club de Paris in 1896. In 1903 he was elected to membership in the Linked Ring. His work was well-known to Alfred Stieglitz, who included it in an major Pictorialist exhibition for the Albright Art Gallery, Buffalo, New York in 1910. His work evolved from spontaneous naturalist photographs to gum-portraits and later to Symbolist studies, and he was an important innovator of the various printing processes favored by the Pictorialists, including the bromoil process and especially oil-printing processes. He moved to Brussels in 1918, where he became president of the Belgian Association of Photography and turned thereafter to a more modernist approach to photography.

Heinrich Kühn (1866–1944) was a member of the Wiener Kamera Klub and was instrumental in perfecting and introducing gum printing.

Along with Robert Demachy, Constant Puyo (1857–1933) is among the best known French pictorial photographers. His work appeared in *Camera Work*, as well as in many European photographic magazines.

Adolph de Meyer (1886–1946), a baron by marriage, is famous for his 1920s fashion work for *Vogue*. He was also published in *Camera Work*.

Frederick Holland Day (1864–1933), although never a member of the Photo-Secession is associated with the movement in that he was an early member (1895) of the Linked Ring and a leader of the American Pictorialists, second only to Alfred Stieglitz. In 1891 he was instrumental in the loose association of artists, writers, and poets known as the Boston Bohemians who had traveled and lived in Europe and were interested in introducing the Decadent movement philosophy of "art for art's sake" to the United States. This philosophy was an important component of Pictorialism that also informed the Photo-Secession's ideals. He was the organizer and main exhibitor of the important exhibition "The New School of American Photography," which

PHOTO-SECESSIONISTS

caused a stir when presented in London in 1900 and Paris in 1901, and served to spread Pictorialist ideas. It was around this time that his relationship with Stieglitz became estranged and as the ambitious photographers of the day were drawn towards the Photo-Secessionist group, Day remained apart, losing influence and interest, and is largely associated with nineteenth century photography.

Other photographers, some major figures associated with the nineteenth century and many now obscure, who were published in *Camera Work* and thus associated with the Photo Secession include: C. Yarnall Abbott, Prescott Adamson, J. Craig Annan, Francis Bruguiere, Julia Margaret Cameron, George Davison, Paul B. Haviland, F. Benedict Herzog, David Octavius Hill, Robert Adamson, Karl F. Struss, Hans Watzek, and William E. Wilmerding.

PHOTOGRAM

Photograms are photographic images made without a camera or lens. Objects are placed on a photosensitive surface and exposed to light, producing a negative, or value-reversed, imprint of the shadows cast by those objects. Technically, organic effects such as the tanned areas of skin or the dark, unfaded marks in the creases of an old sofa cushion are photograms, but pictorially speaking, when we refer to photograms we mean a photographic process that produces a unique image on chemically prepared and developed paper, and does so directly, without a mediating negative.

This direct contact between the material object and the surface of representation is the defining feature of photograms, setting them apart from other cameraless photographic techniques such as *brûlage* (melting the emulsion); luminograms (photographically recorded light effects); chemi-

grams (chemical distortion of the emulsion); and even the *cliché verre* (a print made from a drawing scratched onto blackened glass), which approaches the process by which photographs are produced with negatives—essentially copies of copies.

Because of their physical intimacy with the objects they represent, photograms have been grasped theoretically as an origin-point of photography: they have been regarded as images produced by nature itself, prior to the technologies we normally associate with photographic reproduction, and bear an indexical relation to the original object that is more material than in any other means of photographic representation. Appropriately, then, if the history of photography is written out of the desire to fix images, rather than as just another development in the march of technological innovation that began with the camera obscura, the

photogram, as the medium in which those experiments were carried out by the nineteenth century photographic innovators William Henry Fox Talbot, Hippolyte Bayard, Nicéphore Niépce, and Sir John Herschel, is not only present at photography's inception but fundamental to it. Nevertheless, it is important to keep in mind that this aspect of photograms has been variously foregrounded and obscured, depending on the diverse cultural contexts in which photograms were made and received; significantly, the term "photogram" itself, while in wide use now, did not even appear until the 1920s, and the term "shadowgram" was used interchangeably with it as late as the 1940s.

Historical Beginnings

The first pictorial photograms were produced as byproducts of testing emulsions. While both Bayard and Talbot had professed a desire to record images projected by a camera obscura, for the sake of experimentation it was simpler to place graphically distinct objects, often leaves and lace, directly onto sensitized surfaces to measure chemical accuracy and permanence. Both men called these brown-scale images "photogenic drawings," but it was Talbot who would give photograms originary status as "the pencil of nature," the process by which "nature draws herself" without human interference. The attribution would soon be seized by Talbot's tremendously popular calotype method—an ironic development, since it was in the stubbornly negative photogram images that Talbot had first recognized the potential for infinite reproduction that would become virtually synonymous with photographic practice. But Talbot had been making photogenically drawn images of leaves as early as 1826, and in spite of the speedy rise of the camera-based system, photograms remained a valuable resource for botanists, as the negative images were the exact size of the original specimen and were more precise than the positive prints made from them.

Anna Atkins is distinctive among these botanists for the albums she assembled; the initial series, *British Algae: Cyanotype Impressions, 1843–53* (1853), are the first published photographic books. The cyanotype technique, perfected by Herschel in 1839, produced a vivid Prussian blue photogram, and is the same procedure used to make architectural blueprints today. For Atkins, the idea that her botanographs were "sun drawings" in which natural light helped the plant to accurately reproduce itself on the treated paper was of the greatest impor-

tance. The photogram in this context was understood as a deeply organic kind of drawing, and while the cyanotype was unable to represent volumes, surface details, color, or even an ideal specimen combining features scattered over several samples into a single paradigm, photogenic drawing was valued for its materiality—for the sense that, far from being an illusion, it was the unmediated trace of the object, and therefore a graphic, archivally permanent, scientific presentation (as opposed to representation) of nature itself.

Avant-Garde Experiments

Atkins's process was quickly rendered obsolete even in amateur scientific circles by the sheer pace of technological developments within the field. As visual correlates, photograms were extremely limited: they could not show natural color or internal structure. Nor were they well suited to publishing purposes: they could not include cross-sections or explanatory text and could not scale the object up or down. By the end of the century, photograms had been relegated to the sphere of parlor tricks and children's amusements. It was perhaps this marginality, combined with the lingering sense of the photogram as an origin-point at once primitive, material, and fundamental, that made it attractive to European avant-garde artists of the interwar period looking for alternative modes of representation. Artists aligned with the Dada, Surrealist, and Bauhaus movements as well as the Soviet avant-garde recognized that photograms circumvented the conventions of Cartesian perspective imposed by the camera's lens. Because they rejected pictorial traditions, photograms were an ideal medium for the critique of those models of perception that gave the human subject authority over objects in the visual field. With this revision of contemporary representation in mind, we can begin to limn the fascination of the avant-garde with the photogram at a formal-political level, as a medium aligned more with montage and collage than with camera photography.

Like their nineteenth century predecessors (of whom the avant-gardes claimed ignorance) photograms of the interwar period are monochromatic negative images, but unlike high-contrast photogenic drawings, they tend to show a fuller range of tonal values, delivering a degree of spatial depth and volume missing from botanographs. Rather than confining themselves to flat specimens that delivered a recognizable, naturalistic image, avant-garde artists experimented with a variety of light sources and dimensional objects of varying trans-

PHOTOGRAM

parency, intent on pursuing the least recognizable, most unnatural images that the process could yield. Successive exposures, layering with flat glass, manipulating the paper, moving and combining light sources and refraction effects greatly increased the possibility of an unforeseeable outcome, a goal that was very different from that of the early photogram operators. Rather than making the photogram transparent to vision, a vehicle for the presentation of a reality reassuringly commensurate with the perceived world, these artists drew attention to those aspects of the photogram that made reality strange. Over the existing rhetoric of the photogram as origin, the avant-gardes layered a second discourse, of the photogram as absolutely incommensurate with normative vision.

The first photograms specifically intended to revise art practice are, ironically, the least well known. Working in the anti-bourgeois, anti-academic milieu of Zurich Dada, Christian Schad produced approximately 25 photograms in a single year, 1919. The images are at once extremely casual and clearly manipulated: while the detritus scattered across their surfaces is strikingly a-compositional, many of the pictures have been cut into irregular shapes after developing and rearranged as haphazard collages. Of all the photograms of the interwar period they most clearly convey the aleatory aesthetic that characterized Dada and early Surrealism. But in their stubborn non-referentiality, they also speak of the photogram as a form of “anti-photography,” working against photography’s claim to enhanced vision. Schadographs, as they came to be called, initiated a form of photography without a “point of view”—both literally and figuratively, in the sense that the viewer as well as the ideal single viewer it implied were missing; it was an absurdist’s medium.

Schad published only one photogram, in the Paris journal *Dadaphone* (1920), just before he broke with the Dada movement. He would return to the medium long after, in 1960, but in a much less abstract form, inspired by the Romantic prose poetry of Aloysius Bertrand. Meanwhile, without Schad’s knowledge, his photograms would be named and shown by the Dada impresario Tristan Tzara, who saw that they were placed alongside Man Ray’s and László Moholy-Nagy’s photograms in the 1936 show *Dada, Surrealism and Fantastic Art* at the Museum of Modern Art in New York.

It was Tzara who showed Schad’s work to the expatriate American Man Ray in 1922, and who subsequently gave Man Ray’s photograms the name “Rayographs.” Working first as a Dada and then from within the French Surrealist move-

ment, Man Ray produced hundreds of photograms (and in 1923 one photogram film, *Return to Reason*) that range from the straightforwardly representational (flowers, articulated mannequins) to the utterly unreadable. Many of the images combine these two poles into a formal tension that summarizes the paradox of the photogram as both a material trace and an abstract representation of reality. Unlike the tiny Schadographs, which had been printed in sunlight and have the flat scrappy look of a Schwitters collage, Rayographs open onto a lush, nuanced space created in the darkroom with a variety of lights exposing three-dimensional objects. The reference is much more to the plasticity of Dada and Surrealist assemblage than to collage properly speaking, with many of the images combining startlingly figurative planes that dwindle into a deep visual void. Possibly Man Ray’s airbrush painting technique, explored in the years just before he moved to Paris, prepared him for the use of dimensional objects and the mechanically assisted deskilling necessary to, in his words, “paint with light,” but his experiments undoubtedly drew on his friend Marcel Duchamp’s exploration of non-retinal art. By giving up the camera (the photographic correlate to the retina), Man Ray arguably opened the photogram onto a critique of vision commensurate with Duchamp’s—as if to corroborate this, the first Rayograph to be published, in the *Little Review* (1922), bore the name of Duchamp’s alter-ego, Rose Selavy, in mirror writing. But ultimately, the attraction that photograms held for those European Dadaists who would eventually become surrealists also lay in their apparently immediate and “automatic” quality. That aspect that Talbot had called “nature drawing herself” would be identified with the psychic and technological automatism that fascinated these two movements and seemed to guarantee for them an unforeseeable result, as against composition and authorial intent.

From the start, the Rayographs were actively promoted as central to Paris Dada and later, French Surrealism, appearing regularly in the publications of both of those movements. The first gallery show of the images was accompanied by a catalogue entitled *Champs Delicieux* (1922) to evoke the first automatic text, André Breton and Phillippe Soupault’s *Les Champs Magnetiques* (1919). In the catalogue’s introductory essay, Tristan Tzara calls the Rayographs “photography, inside-out.” His attention to the inversions and negations effected by the technique—its value reversals, its excoriation of painting, its mirroring of unrecognizable images—is coupled to an emphasis

on the technological elements of the process, to the point where he calls the artist himself a mechanical apparatus. Likewise, in the Surrealist context, André Breton would equate Rayograph production with the automatic utterances of the unconscious, as examples of the uncoded self-representation that is only possible to achieve through a neutralized, inanimate conduit. Man Ray himself, however, remained undecided, vacillating between the artistic validation that the phrase “painting with light” implies, his ongoing engagement with chance processes that seemed to refute those claims to authorship, and his habit of turning his photographic innovations toward commercial, rather than artistic gain. His 1931 book of photograms, a promotional vehicle for the Paris Electric Company entitled *Electricité*, is cynically prescient of the uses that advertising would make of Surrealist motifs.

The third interwar figure to theorize and disseminate photography without an apparatus was also the artist who, in his 1925 book *Painting, Photography, Film*, named the images “photograms.” László Moholy-Nagy was a Constructivist and Bauhaus artist whose interest in the medium was sparked through his contacts with the Dadaists, but who eventually made photograms central to his exploration of the essential formal elements of photography, a project radically different from Dada critique. Moholy-Nagy called his photograms “light compositions,” comparing the medium-specific role of light in photography to the role of color in painting and sound in music, and thus positioning photograms (and by extension, photography) within established artistic discourse, rather than isolating the ways the medium worked against those traditions. His early photograms, published in *Broom* (1923), were distinctly flatter than Man Ray’s, perhaps in an effort to distinguish his work from the Dada anti-aesthetic, but later he would make use of the full range of tonal and spatial possibilities of the medium, manipulating transparency and opacity to produce a non-referential, yet apparently dimensional mode of photographic abstraction governed, as he put it “by optical laws peculiar to itself.” Yet Moholy-Nagy’s project was much more complex than a set of exercises in formal composition: to the extent that his photograms “dematerialized” objects, making reality strange through photography, they can be linked to Constructivist imperatives to reconcile art and design and to investigate, in his words, “a new instrument of vision.”

Moholy-Nagy’s characterization of photograms as primal would seem to preclude any validation on his part of the mechanical aspect of photography;

he understood photograms as a liberating form in that they were freed from the camera as well as from referential representation. Yet he was oddly attracted to the mechanical-as-automatic aspect of the medium, and his long engagement with photograms can be traced to the same impulse to deskilling that had led him, in 1922 (the same year he made his first photogram) to make his so-called telephone paintings—works produced remotely, by dictating instructions to a signmaker over the phone. His experiments with light as the visual manifestation of energy in motion continued after his move to the Chicago Bauhaus, where a number of artists, among them photographer and educator Arthur Siegel, Gyorgy Kepes, Henry Holmes Smith, and sculptor Theodore Roszak emerged from his light laboratory committed to photogram production.

In spite of Moholy-Nagy’s early links to materialism, at least one member of the Soviet avant-garde, Constructivist El Lissitzky, disparaged Moholy’s photograms as tepid derivatives of Man Ray’s pictorial innovations. Lissitzky himself made a number of straightforward photograms in the late 1920s (among them several cyanotypes), but in keeping with the Constructivist dictum that insisted on factuality against aestheticism, he would stop short of pure abstraction. Nevertheless, elimination of the camera’s validation of classical perspective resonates with the general critique of the Cartesian model effected by Lissitzky’s axonometric Prouns; like the Dadas, Lissitzky was interested in images without a fixed point of view, and it is likely that the photogram’s attraction for him lay in its construction of imaginary space.

In fact, Lissitzky’s photographic experiments began during what could be called a Dada interlude in Berlin, where from 1922–1925 he was in steady contact with members of the avant-garde such as Kurt Schwitters, Jean Arp, and Raoul Hausmann, and where he managed to acquire five Rayographs. His 1929 essay on photography grounds the medium in the photographic material itself—light, strategically cast shadow, and sensitized surface—rather than in the camera, and focuses particularly on the photogram’s capacity to make photography over as art, a transformative process he called “*fotopis*’.” Consistent with his materialist views, Lissitzky would not directly call attention to the photogram as the essence of photography, but unlike Moholy and the Dadaists, his attitude by 1929 does seem to reflect a degree of disenchantment with technological rationalism, and a nostalgia for an ethos of unmotivated artistic creation.

Lissitzky’s first photograms, one of which, *4 i Lamp (Heliokonstruktion 125 Volt)* was published

in Schwitters's journal *Merz* (1923), were made in collaboration with de Stijl artist Vilmos Huszar and signed "El Huszar and Vilmos Lissitzky." The photograms, printed in both positive and negative versions, are distinctive in that the objects used were mostly transparent, some of them printed with commercial text. The resulting images recall the flattened field of Schad's collage-like prints, but with a much greater degree of control (Lissitzky used printing-out paper, which allows the operator to see the images before they are fully developed) and with the added peculiarity of spatial illusions juxtaposed with flattened silhouettes and non-objective type. It is this combination of the contact-printed photogram with readymade photographic images and typeface that is distinctive of Lissitzky's complex photomontages. Accordingly, among his contributions to the international exposition *Film und Foto* of 1929 was a combination print of an articulated mannequin juxtaposed with a photographic negative of the Eiffel Tower. Most memorably, he would use the technique in combination with photomontage in richly textured portraits of Kurt Schwitters (1924) and himself, notably *The Constructor* (1924) and *Self Portrait with Wrapped Head* (1924). Lissitzky's series of photogram-based advertisements for Pelikan ink and carbon paper (1924), with their witty interchange of light, shadow, and various means of representation stand in marked contrast to Man Ray's literal interpretation of his commercial subject in *Electricité*.

Although it has received comparatively little attention from art historians, the photogram technique circulated alongside photomontage and collage in the interwar period as a privileged mode of resistance against artistic norms and visual conventions. Man Ray's work in particular was almost immediately internationally published; Moholy-Nagy's *Painting, Photography, Film* (1925) was translated into Russian in 1927; and photograms by Man Ray, Lissitzky, Moholy-Nagy, and Schwitters (of which only one survives) figured prominently in the highly influential *Film und Foto* show held in Stuttgart in 1929 and which traveled internationally. Within the next decades, a number of artists would experiment with photograms, among them Herbert Bayer, Umbo, Oskar Nerlinger, Alexandr Rodchenko, Raoul Hausmann, Maurice Tabard, Roger Parry, Dora Maar, and rather surprisingly, the painter Pablo Picasso. The practice was particularly prominent among the Czech modernists, notably Miroslav Háek, Jaroslav Rössler, Hugo Táboršky, and Jaromír Funke.

Contemporary Photograms

Although Moholy-Nagy would introduce the photogram process in the United States in the 1930s, the work of American and European artists exploring new critical practices in the postwar context are more aligned with Dada's indexical records and Lissitzky's heterogeneous approaches than Moholy-Nagy's pure abstractions. By the late twentieth century, photograms, like photographs, appeared in the pictorial frame intermixed with a host of other media. The photogram technique, along with photography itself, surrendered its claim as a natural process and was folded into the postmodern acknowledgement that all images were culturally mediated. Robert Rauschenberg and Susan Weil's body blueprints of the 1950s, and West Coast artist Bruce Conner's body-sized photograms of the 1970s explored the disjunction between vision and phenomenal experience, while Robert Heinecken, German painter Sigmar Polke, and American photographer Thomas Barrow used photograms in the 1980s to draw readymade scraps of mass culture into the frame of artistic practice. Even the more lyrical abstractions of Adam Fuss and German photographer and photo-historian Floris Neusüss partake of a tension between pattern and reference that revises avant-garde photograms for a contemporary audience comfortable with the breakdown between art and commercial design. Other contemporary photographer-artists who use the technique as one among many include the Spanish Joan Fontcuberta, the Germans Willy Kessels and Andreas Müller-Pohle, and the Americans Susan Rankaitis and James Welling.

Only very recently, with the advent of digital photography, has the photogram become relevant once again as an avatar of materiality in an increasingly virtual world. In this newly expanded field of photographic possibilities, photograms testify to the physical presence of the objects they represent in a way that digital photography cannot approach without risking accusations of fraudulence and deceit. If contemporary photogram processes no longer bear the full revolutionary valence of their avant-garde prototypes, they at least seem to have regained their status as evidence, however distanced that evidence is from everyday vision. Whether their inherent visual paradoxes can now be deployed as resistant to the status-quo is another matter.

PHOTOGRAPHIC THEORY

The development of twentieth-century photographic theory can be divided into two periods, the first finding its roots in the nineteenth century and stretching through to the late 1960s, and the second dating from the 1960s, through to the present time. Prior to the 1960s thought about photography had been largely carried out by those who earned their living outside of universities, typically hobbyists, curators, critics, and professional photographers themselves. As a result, academic research that took place during this time had little impact on photographic theory. During the 1960s, however, there was a dramatic broadening of university curriculums, especially in North America, with the result that a new generation of journalists, art historians, and artists emerged that was marked by awareness of theoretical issues in academic disciplines such as philosophy, sociology, and political theory. This new theoretical awareness influenced photographic theory quickly and dramatically. These two periods can be labeled simply the pre-academic and academic, respectively, and roughly coincide with the Modern and Postmodern eras in visual arts as a whole.

Pre-Academic Period

Photographic Objectivity

The pre-academic period is dominated by the idea that photography is an essentially objective process. When a photograph is made, features of the scene in front of the camera are mapped onto the shapes and tones of the photograph according to optical and chemical laws, thus arguably leaving no room for the photographer's subjective understanding of the scene to have a bearing on the arrangement. Such presumed objectivity informed much pre-academic discourse in that it led many to deny that photography could be an art form, and others to conclude that photography could be especially helpful in the quest for progressive social reform and for the purposes of scientific, anthropological research.

Photography as an Art Form, Eastlake's Challenge, and the Pictorialist Response

The conflict between the objectivity of photography and the potential of photography as an art form

has its roots in the nineteenth-century early-modernist idea that art has as its essence subjective self-expression. In this view it is the proper function of the visual artist to depict, not the world as it is objectively, but rather the world as he or she subjectively takes it to be. This subjectivist understanding of art poses a problem for photographers with artistic aspirations, as it is not apparent how the allegedly objective photographic process can allow for the required subjective depiction. Lady Eastlake, writing in the 1850s, was perhaps the first to write clearly on this tension between the presumed objectivity of photography and the prevailing views on art. Eastlake essentially presented art-photographers with a challenge: either show how the objective process of photography can have enough subjectivity added to it allow for the possibility that it produce art, or surrender the idea that photography can be an art at all. Much of the ensuing one hundred years of photographic theory can be understood as a variety of responses to this challenge.

In England in the late nineteenth century, members of the Linked Ring Society explored different ways of responding to Eastlake's challenge. Henry Peach Robinson, for example, argued that the requisite subjectivity could be added by using photography to depict fictional scenes, something he achieved by cutting and pasting together elements from several photographs in a way that supported an imagined narrative. Such photographs, he argued, could not be accused of objectivity, as objectivity is a relation between a scene and its image, and so cannot be present when the scene itself is non-existent. A different approach was taken by Peter Henry Emerson, who felt that by abandoning actual subject matter Robinson was straying too far from the proper function of photography. Emerson instead chose to depict actual scenes, and added subjectivity by using the photographic process in a way that mimicked the optical limitations of the human eye. In the United States in the early twentieth century Alfred Stieglitz initiated the Photo-Secessionist movement, which took the attitude that photographs could be subjective insofar as they became more like paintings in terms of methods of formation and appearance. Collectively the Linked Ring and Photo-Secessionist

photographers were known as the Pictorialists. Notwithstanding their individual disagreements, from a theoretical perspective the Pictorialists were united in their belief that subjectivity could be added to photography only by invoking techniques foreign to what can be regarded as the essential nature of photography. This Pictorialist theoretical approach would, however, turn out not to be the dominant approach in the twentieth century, and would quickly be replaced by one antithetical in spirit.

Eastlake's Challenge, Straight Photography, and Strand's Solution

By the beginning of the twentieth century the modernist movement in art had expanded to require not only subjective self-expression, but self-expression in a way that utilized qualities unique to the chosen medium. In the case of photography this meant that sharpness, infinite tonal gradation, the inclusion of incidental detail, weddedness to actual subject matter, and, above all, objectivity—all the qualities that set photography apart from painting—had to be emphasized, not suppressed. This new aspect of modernism led to the movement known as straight photography, which dominated photographic theory and practice for at least the next 50 years.

Eastlake's challenge presented itself to the straight photographers in a particularly virulent form. In order for photography to be a potential art form it needed to be shown not only that the process could allow for subjectivity, but also that it could do so on its own objective terms, an apparent contradiction.

It was the photographer Paul Strand who pointed to a way around the problem. Strand acknowledged that in straight photography the mapping of aspects of the scene before the camera into shapes and tones on the photographic image is largely, if not wholly objective, but pointed out that there are other features of a photograph that are well within the control of a photographer wishing to engage in subjective self-expression, most notably composition. Prior to Strand, photographers had been aware of the importance of composition to their images, but the kind of composition relied upon was that familiar from traditional painting. A look at photographs by late nineteenth-century luminaries such as Talbot, Cameron, Robinson, Emerson, and Stieglitz reveals subjects that are clearly defined and centered in the image, and edges that are treated largely as nuisances away from which the viewer's attention is best drawn. With the photographs of Strand, however, it becomes less immediately apparent what the photographs are

centrally about, and edges become jarring as they bisect buildings and people in ways that express a highly personal understanding of the world.

Strand's idea was enormously influential. Stieglitz devoted the final issue of his important serial publication *Camera Work* to Strand's images, and Strand's influence can be seen in the photographs made by Stieglitz himself after about 1918. Edward Weston's work from the 1920s and later uses composition as an aid in self-expression, although in Weston's case as often as not the unique compositions are the product of arranging prosaic objects (shells, vegetables, etc) in relation to the camera, rather than the camera in relation to the objects.

Over the course of the next several decades photographers adopted a variety of approaches to adding subjective elements to their otherwise objective photographs, ways that went beyond Strand's use of composition and Weston's arrangement of subject matter. By the 1950s, for example, the "snapshot aesthetic" emerged, most notably in the work of Robert Frank and then later in the work of Diane Arbus. These photographers worked within the Strand tradition insofar as they maintained the objective relation between the scene and the image, but added subjectivity by incorporating the "mistakes" common to amateur photography. Frank's images of middle America are often underexposed, grainy, and involve tilted horizon lines—a litany of amateur mistakes—but in doing so succeeded in reflecting his bleak assessment of postwar American life. Arbus placed an electronic flash directly on the lens axis of her camera—a technical *faux pas* for most professional photographers—and in doing so illuminated her subjects in a way that revealed the fundamental vulnerability she saw in her subjects and, by extension, in all people, herself included.

Variations on Strand's Solution: Photographing the Immaterial

The optical-chemical process of photography is by nature wedded to the material, a fact that leaves the photographer who wants to depict immaterial subjects such as the mental or the spiritual in a difficult position. This is especially so for a photographer working in the tradition of straight photography, as the very characteristics that are unique to the medium are ones that tend to wed the depictive content of photographs to what was before the lens at the time of exposure. The only apparent solution involves the use of metaphor. While the photographer must in the first instance photograph a material object, he or she can use a variety of

formal techniques to do so in a way that suggests metaphorical treatment and that thereby deflects attention away from that literal, material object and toward the less-tangible subject matter that is of ultimate interest. Stieglitz, for example, photographed trees and clouds in ways he felt enabled them to stand as “equivalents” for his emotions, and in later years Minor White used infrared film and abstract compositions to photograph ordinary scenes and objects in ways intended to draw the audience’s attention toward the spiritual.

Freudian theory in general and the Surrealist movement in particular presented photography with related problems. Not only did the work of the Surrealists deal with subject matter of a highly intangible, depth-psychological sort, but the very conscious control that Strand saw as necessary for the incorporation of subjectivity in photography was anathema to their attempts to liberate the superego-censored subconscious. The ways in which surrealist photographers worked around these problems defy neat categorization, but it can at least be said that their methods often involved free experimentation with unusual techniques and materials. Man Ray, for example, discovered the method for creating his Rayographs after “mechanically” placing some darkroom implements on a sheet of photographic paper lying in a tray of developer and then briefly exposing the arrangement to light. The fact that the discovery was the result of a “mechanical” movement—Ray’s term for actions performed without conscious intention—is crucial since he thought of such movement as releases of energy from the temporarily uncensored subconscious. Rayograph images, being *caused* by subconscious energy, can be regarded as *representative* of such energy as well.

Social-Documentary Photography

So far we have focused exclusively on theoretical debates surrounding photography in relation to the development of modernism in the fine arts. Developing in parallel to but in isolation from this, however, was a movement that was unconcerned with whether or not photographs could be artworks, a movement that was instead concerned with using the alleged objectivity of the photographic process to further progressive social ends. From a theoretical point of view the idea behind the social-documentary movement is straightforward. The fundamental assumption is that humans are essentially caring individuals, and that if an unjust social order is currently being tolerated this is due to ignorance rather than malice. The remedy is therefore the alleviation of ignorance, and this is where photography can help. Straightfor-

ward photographs of individuals living in impoverished conditions or laboring under the circumstances of exploitation could be used to document such conditions objectively (and thus in a manner beyond dispute) and, if disseminated widely, would awaken the conscience of the majority and bring about changes for the better.

Such a theoretical framework is exemplified in the work of photographers such as Jacob Riis and Lewis Hine. Riis, working in New York just before the turn of the century, was shocked by the squalid conditions in which New York immigrants were living, and published books of photographs taken in Manhattan’s Lower East Side, which revealed in full detail the grim nature of their existence. Hine was concerned not only about the plight of immigrants but as well about child-labor practices in factories in other regions of the United States. Traveling widely, Hine gained access to factories where such practices were in effect, documented them photographically, and then disseminated the images widely.

In a similar spirit in the 1930s photographers working on behalf of the United States Farm Security Administration traveled the country photographing the living conditions of those who had been the most adversely affected by the Depression. Later, during the Cold War period in America, the danger of nuclear annihilation became of more concern to many than economic injustice or exploitation, a fact reflected in the shift to the kind of social-documentary photography associated with the 1955 *The Family of Man* exhibition at the Museum of Modern Art. *The Family of Man* consisted of over 500 photographs of people from a variety of cultures engaged in activities common to all human beings: work and play, friendship and love, birth and death. The theory behind the exhibition had much in common with traditional social-documentary photography insofar as both assumed that photographs were objective (and therefore convincing) records of what was before the camera, but added the assumption that photographs constituted a universal language that could be understood by people of all races and cultures. The faith was that people from all over the world would understand and be convinced by the exhibition’s message of common humanity, and thus unite in peaceful ways.

Visual Anthropology

The connection Eastlake saw between science and photography provides the theoretical underpinnings for a photographic activity known as visual anthropology.

PHOTOGRAPHIC THEORY

Three ideas lie at the heart of the traditional scientific method: (i) that scientific theories are presentations of the extra-theoretical world, (ii) that such theories have empirical content insofar as they can be used to explain and predict aspects of the observable world and, (iii) that these theories can be tested for accuracy of representation on the basis of their empirical content. This third idea requires that the predictions regarding what will occur made on the basis of the theory be compared with what actually occurs; mismatch in this regard mandates that the theory be discarded or at least revised, whereas coincidence suggests that the theory is accurate. Such comparison, in turn, requires observation, and here lies the point of contact between scientific theory and photographic theory. It is important to the integrity of the traditional scientific method that the observations of phenomena with which the predictions of the theory are compared be “theory neutral,” that is, that they not be influenced by the theory being tested. This is to say that such observations must be wholly objective, and, as Eastlake argued, objectivity is the essence of the photographic process. In short, if a scientist is worried that the theory being tested is influencing what she observes, then by incorporating photography in her activities she can expunge such subjective bias and be assured she is testing her theory in a rigorous way.

This traditional scientific method was first applied in the natural sciences such as physics and astronomy, but it wasn't long before others applied it to social sciences such as psychology and anthropology as well.

An anthropologist, for example, might have a theory about the nature of social organization in some culture, a theory with empirical content taking the form of predictions regarding observables such as manner of dress, contents of domiciles, etc. In order to test such a theory observations would need to be made regarding the actual arrangements in this regard, and such observations would have to be appropriately objective. Photography presumably would be ideal for this purpose as photographs of the relevant aspects of the culture being studied would display all relevant features, omitting none that conflicted with predictions of the theory and including none that were actually absent but which would serve to confirm the theory. Such is the basis for the practice known as visual anthropology.

August Sander's *People of the 20th Century* can be understood in such terms. Sander, while not a social scientist himself, felt there was value in a comprehensive photographic record of members of a parti-

cular culture, and chose his own, between-the-wars German culture, as his object of study. His project involved photographing German citizens from all classes and professions dressed in the clothes and situated in the contexts that were characteristic of their day-to-day lives. Each subject was photographed in plain frontal pose, from head to foot, in good light, and by means of a large-format camera that rendered highly detailed images.

More formally, the American anthropologists John and Malcolm Collier both photographed extensively in aid of their research, and published an influential book, *Visual Anthropology*, in which they codified their theory and methodology.

From the theoretical point of view, the social-documentarians and the visual anthropologists were similar insofar as they both believed in the objectivity of their images. They differed, however, with regard to the role of normativity in their respective projects. The social-documentarians had a strongly normative agenda insofar as they took the moral wrongness of the social arrangements they objectively documented as obvious, and had as their overall goal the alleviation of such conditions. The visual anthropologists, by way of contrast, did not consider it their business to pass moral judgment on the cultures objectively documented in their images, and instead took mere development of understanding to be their goal.

Walter Benjamin

We have seen that the fine-art tradition in photography dating back to Eastlake has subjective self-expression at its core. By and large, this core requirement served to keep the enterprise of fine-art photography and that of documentary photography (in both its social and anthropological forms) almost entirely discrete. However, in the 1930s a Marxist-inspired movement emerged that embodied a construal of art diametrically opposed to that accepted by Eastlake and those who followed in her tradition. The Marxist journalist and critic Walter Benjamin, writing in the 1930s, argued that artworks, properly understood, should function, not as precious, unique, aesthetic objects created as expressive acts of inspired individuals and exchanged for their commodity value within a capitalist framework, but instead as catalysts for revolutionary social change. Armed with this new construal of art, Benjamin argued that photography, rather than being a newcomer on the fine-art block having to establish itself by meeting Eastlake's challenge, was instead already paradigmatic of art insofar as a photograph's easy reproducibil-

ity both took away its “aura” of preciousness (and, hence, its value as a commodity) and allowed for the kind of wide dissemination thought necessary for the formation of class consciousness and other preconditions for revolutionary change. In its time Benjamin’s work had little influence on the actual practice of photography, but Benjamin’s ideas, with their emphasis on removing the commodity value of artworks and replacing it with value as vehicles for social critique and improvement, would be embraced by those writing on photographic theory in the later academic period.

The Academic Period

In the 1960s photography and journalism became subjects studied in the university context, and art history departments came to regard photography as a legitimate area of research. Cross-pollination occurred, as students took ideas they encountered in philosophy, sociology, psychology, and political theory and applied them to the practice and theory of photography. The result was that photographic theory began to question two fundamental ideas that had been taken for granted in the previous decades: (i) the objectivity of the photographic process, and (ii) the idea that photographic images have their meanings exhausted by what they literally depict.

The Demise of Photographic Objectivity

We have seen how the fine-art photographers, the social-documentary photographers, and the visual anthropologists all assumed that the photographic process has objectivity at its core. There were differences between these three groups in that the fine-art photographers tried to overcome objectivity while the latter two groups relied on it, but none of them questioned that it was present. Developments in psychology and sociology, however, soon put pressure on this traditional assumption.

In psychology the “new look” movement undermined traditional assumptions about the objectivity of human perception. Jerome Bruner and Neil Postman ran experiments in which subjects were briefly shown non-standard playing cards (e.g., cards with black diamonds, red clubs, etc.) and found that the cards were perceived as standard cards. Human perception thus came to be understood as being as much a product of memory and expectation as it is of what is actually presented to the eye—in short, human perception came to be seen as a largely subjective process. Photographic theorists such as Sigfried Kracauer argued that the

photographic process is in fact similarly subjective, or that, if the process itself is not, then our perceptions of photographs are. If this is correct then the images produced by visual anthropologists, for example, are not theory-neutral documents, but rather subjective interpretations cloaked in a false air of objectivity.

We have seen how photographers such as Riis and Hine hoped that the objectivity of their photographs would render them persuasive documents of injustices and thereby bring about progressive social change. Photographic images and their presumed objectivity were regarded by these photographers as powerful tools for use in the struggle with the inequities produced by unchecked capitalism. But with the tremendous proliferation of mass-media images in the late twentieth century came the suspicion that photographs are more of a mixed blessing than this traditional view would have it. Sociologically oriented theorists such as Benjamin H. D. Buchloh emphasized the ways in which governments and corporations can use the presumed objectivity of mass-media photography to erase or reshape cultural memory, or to convince mass audiences of the desirability of certain consumption-based lifestyles. A mass audience, trained to believe that photographs objectively record the facts, and then continually presented with photographic depictions of the past or advertising images in which consumer items are shown as integral components of desirable lives, soon come to accept the depicted histories or lifestyles as the norm, and modify their collective memory or spending habits accordingly. Photography and its presumed objectivity in this way came to be seen, not as an instrument of social betterment, but rather as a means of maintaining the status quo.

Feminist photographic theory is similarly concerned with the extent to which photographic advertising imagery and its presumed objectivity shape the audience’s understanding of social norms. However, in the work of theorists such as Abigail Solomon-Godeau, less emphasis is placed on concerns regarding the consumerist aspects of such corporate control, and more on the extent to which mass imagery shapes a woman’s sense of self. Such concerns are well illustrated in Cindy Sherman’s *Untitled Film Stills* series, in which she presents the audience with a series of self-portraits in which she plays out roles for women depicted in the mass media of the 1950s and 1960s. This series can be read as an extended imagistic analysis of Sherman’s own sense of self, or at least of one being forced upon her as a result of continual media exposure during her formative years.

Such emphasis on the malleability of the human individual reinforces the “death of the author” understanding of text and image interpretation championed by Roland Barthes. We have seen how the traditional, modernist understanding of art assumes the existence of a fixed author or artist whose function it is to encode their determinate ideas or emotions in the artworks they create. This same model implicitly assumes that it is the function of the audience and the critic to decode the artworks, and thereby come to understand their determinate, embodied meanings. Barthes, however, denies both of these traditional assumptions, replacing them with an understanding according to which the audience or critic imposes a plurality of ever-shifting meanings on artworks, unconstrained by the assumption of a stable author with determinate communicative intentions. In the extreme these lines of thought lead theorists such as Andy Grundberg and Jean Baudrillard to entertain the idea that social reality itself is merely the sum total of the mass-media imagery with which members of society are continually confronted. In this extreme photographic images are seen, not as representations of an image-independent world lying beyond them, but rather as constitutive of social reality itself. Images are regarded as “simulacra,” that is, as “copies” that lack originals, a view which precipitates in ontology what Grundberg calls a “crisis of the real.”

Questions About Photographic Meaning

Prior to the 1960s the meaningfulness of social-documentary photographs was regarded as a simple matter of what was before the camera at the moment of exposure. A photograph of a child laboring in a factory, for example, simply documented a certain occurrence at a certain place and time. Such straightforward meaning could be used for larger purposes—as a means, say, toward the abolition of child-labor practices—but the meaning itself remained simple and literal. With the onset of the academic period, however, structuralism in linguistics began to influence the understanding of image meaning, altering it dramatically.

Structuralism is a theory about the nature of word meaning, a theory which is in many respects at odds with common sense. On the commonsense understanding, words have as their meanings the things to which they refer. “Paris,” for example, has its meaning exhausted by the fact that it is used by English speakers to refer to the place, Paris. According to structuralist theorists such as the late nineteenth-century linguist Ferdinand de Saussure, however, the word meanings have less to do

with the extra-linguistic objects to which the words are conventionally used to refer, and more to do with the roles words have in relation to other words in the language of which they are a part. In the same way that a chess piece derives its meaning, not from anything it refers to, but rather from its role in relation to the other pieces on the board, on the Saussurian understanding of language a word such as “Paris” derives its meaning, not so much from the fact that it refers to the place Paris, but rather more from its use in relation to other words in the language being spoken. For structuralists, word meaning has more to do with the roles words play in a game of language than with how they function to refer to items in an extra-linguistic reality.

The connection between structuralism in linguistics and image-meaning in photographic theory comes when it is assumed that photographic images are like words. Once this assumption is made, it is open to a theorist with structuralist inclinations to view photographic meaning as being less a product of what was before the camera at the moment of exposure, and more a product of the relation of the photographic image to all other photographic images in the “visual language” of the media.

Such an understanding is well illustrated in the work of the “appropriationist” photographer Sherrie Levine. In the late 1970s Levine made a series of simple photographic copies of modernist classics such as Walker Evans’s images of sharecropper families, and then displayed them on gallery walls under her own name. Whereas the meanings of the original Evans images involve reference to sharecropper families, the meanings of the nearly indiscernible Levine prints have little if anything to do with the with what the images literally depict, and instead much to do with questions of originality, ownership, and “aura” (see the above discussion of Benjamin) that arise out of the fact that the Levine print is a copy of the Evans print. In this way the meanings of the Levine prints derive from their relations to other prints, and not from their relations to any extra-imagistic world.

This structuralist understanding of image meaning can be pushed to the “post-structuralist” limits where image-meaning becomes never a simple matter of what was in front of the camera at the moment of exposure, and instead always a product of the place of the image in the web of other images that are its historical antecedents. Such a post-structuralist view mixes well with the extreme ontological view mentioned above insofar as there is little point in analyzing image-meaning in terms of reference to an extra-imagistic world if one denies the existence of such a world. It is for such

reasons that theorists such as Baudrillard have strong post-structuralist sympathies.

Recent Developments

While current photographic theory remains wedded to the academic context, recent trends move away from an understanding of image-meaning in terms of theories about language-meaning. Kendall Walton and Patrick Maynard, for example, regard photographs as props that function to cause viewers to imagine seeing the objects represented in them. For Maynard, photographs are potent amplifiers of our powers of imaginary seeing, a fact which helps account for their widespread use in journalism, advertising, pornography, etc. Such an approach differs from language-based approaches insofar as there is no need for the viewer to learn conventions regarding reference relations or roles in language games in order to understand at least the literal meaning of images. Additionally, such theorists embrace the traditional view that photographs, unlike handmade images, maintain an objective relationship with their subject matter. Investigation into the interplay between these two roles—that of occasioning imagination and that of objectively recording—suggests future theoretical developments that are more in line with the Eastlake-Strand discourse discussed above than with the non-objective, language-based discourse that has hitherto been the mainstay of the academic period.

PHOTOGRAPHIC “TRUTH”

“The camera cannot lie”: this old cliché asserts photography’s *prima facie* claim to “truth.” Like most clichés it has a point. According to one standard analytic view, the “correspondence theory of truth,” a proposition is true if its content corresponds to an actual state of affairs, and such a correspondence is

easy to establish in many cases of photographic representation. Photographs can have propositional content: they can be “read” as informing us about the world, and in the absence of manipulation, either of the things or events photographed or of the resulting image, they are often rightly taken as veridical.

Two things put photographs, among all other forms of representation, in a class by themselves: first, once the apparatus is in place, there is a straightforward causal connection between object and image, not requiring the intervention of manual dexterity, interpretation, or judgment; second, the photograph can capture *everything* about the object (suitably illuminated and within reach), even details not noticed at the time of the picture's making. This power of fixing the states of affairs as they are at a given moment accounts for the immense importance of photography in contexts where truth practically matters: scientific data, forensic evidence, personal identification, and so on. But the proviso "in the absence of manipulation" is of primary importance in these contexts. "The camera cannot lie" cliché assumes that the proviso is satisfied, and practically speaking, most of the time, this has been a reasonable assumption. It has rested on more basic assumptions about the accuracy of optics, the adequacy of lighting, the quality of the light-sensitive emulsion and of the chemicals used to develop it, and the competence of the professionals involved; but by now the technology has been brought to a high degree of reliability and these things can for the most part be safely left below the level of awareness.

This comfortable state of affairs obviously requires qualification. "While photographs may not lie," said Lewis Hine, "liars may photograph" (Mitchell 1992, 30). Deception with the camera (or in the darkroom) has always been possible, yet its relative difficulty in years past has led to the situation where most viewers of photographs believed in their veracity. Since the advent of digital photography and the wide availability of programs like Photoshop there has been a shift in popular perception of the truthfulness of photography, and implicit in looking at late-twentieth century images is the idea that they may have been totally artificially created, never mind merely manipulated. This consensus, incidentally, arises more from the popular audience's experience with digital filmmaking and virtual reality games than through photography per se. This may seem an overnight revolution in the popular perception of photographic truth. But granted that the manipulation of images is now easier and more seamless than before, this perception of truth still remains a matter of degree. For it is also true that the suppression of photographic evidence, by manipulating either the negative or the final photograph through retouching or overpainting of the kind practiced, for example, in group shots of the Soviet leadership during the 1940s

and 1950s, has been familiar for a long time. It goes back to the retouching that was done in studio portraiture almost from the beginning of photography, and the techniques involved had been perfected in the multiple-negative works of photographers like Oscar Gustav Rejlander and Henry Peach Robinson as early as the mid-nineteenth century.

The question of truth did not pose much of a problem in the cultural context of that era, given that the photographic image emulated the painted image and the representational tropes were easily decipherable: the difference between the artful and the truthful is not too difficult to detect in sentimental representations of domestic life or tragic death. Yet as photography developed its own formal language specific to its intrinsic nature, the apprehension of truth became more complex. An essential truth about photographs is that they are almost impossible to be seen except within a context—of other photographs, of texts, of supporting images and documentation, and of specific display environments, and the context will affect the expectation of truth. The same portrait of a baby in its baptismal finery on the mantle of a bourgeois home says one thing; attached to a gravestone it says quite another.

The correspondence theory of truth works best when the object can be directly compared with its representation. "Snow is white" is true," said Alfred Tarski, formulating his principle of the "material adequacy" of truth, "if and only if snow is white." We can validate the truth of photographs of Paris when we go to Paris. It is normal for the represented object (or person) to be absent when we have the photographic representation at hand, but a few cases of direct comparison to establish an analogy, and some information about the provenance of the representation (it is by a known photographer, in a reputable travel magazine) reassures the viewer that the image is veridical, within obvious limits of perspective, lighting, detail, and so on.

Confidence in the basic reliability of photographic representation, however, means that photography has been implicitly trusted in cases where explicit comparison has never been possible, even when the evidence has run counter to entrenched beliefs. The paradigm for this phenomenon is the photographs made by nineteenth-century innovator Eadweard Muybridge. An ages-old puzzle about the galloping of horses—whether and if so when all four feet are off the ground—was solved photographically in 1878. In the words of Beaumont Newhall:

Though the photographs were hardly more than silhouettes, they clearly showed that the feet of the horse were

all off the ground at one phase of the gallop—but, to the surprise of the world, only when the feet were bunched together under the belly. None of the horses photographed showed the “hobbyhorse attitude”—front legs stretched forward and hind legs backward—so traditional in painting. The photographs looked absurd

(Newhall 1982, 119)

But absurd or not, the photographs were accepted as giving a definitive answer; though they were amazed, people seem not to have accused Muybridge of doctoring the evidence.

What has so far been said can obviously be generalized to many other cases. Photography brings us the truth of the microscopically small, the cosmically distant, and increasingly, with the passage of time and the accumulation of images, the more or less remote past. Correspondence, however, is not the only test of truth. Philosophers recognize that the acceptance of propositions as true cannot always fall back on matching word with object, image with reality. Sometimes all we have for the vindication of a proposition is another proposition, or a network of propositions: if the proposition under test fits in with others already known or taken to be true we may be confident—up to a point—in accepting it without empirical confirmation. The test of truth here is *coherence* rather than correspondence.

Coherence is a logical relation and invites the exploitation of logical properties. A strategy made famous by Karl Popper hinges on the fact that if confirmation cannot be achieved, falsification may be.

If we cannot find grounds to conclude that a given image *is* a true record of a real scene or event, we can take the opposite tack and attempt to demonstrate that it could *not* be a true record....The more information there is in an image, the harder it is to alter without introducing detectable inconsistencies....Furthermore, the difficulty of convincing alteration grows exponentially with the variety of types of visual evidence present....A photographic manipulator, like a dissembler who weaves a tangled web of lies and eventually trips himself up, is likely to be caught by some subtle, overlooked inconsistency

(Mitchell 1992, 31)

Between correspondence and coherence, then, and given the social context in which photography operates—editors, critics, dealers, publishers, and archivists, as well as photographers themselves and the academic and professional institutions they sustain—it looks as if truth in photography is, if not definitively established, at least robustly enough understood to prevent wholesale deception, in spite of the recent dominance of the digital camera. With suitable provisos about manipulation and

fraud, photography plays a trustworthy role in the economy of information. It may inspire anxiety as well as trust: when truth itself is subject to distortion and suppression, the truth-telling powers of photography can be a threat to those who are doing the distorting and suppressing. People with things to hide have reason to fear the truth of photography, as witness the countless plots that hinge on the existence of photographic evidence of adultery or crime.

All this said, photography can make no absolute claim of fidelity to the real. Radical skepticism is always possible; at best we can arrive at a close approximation to the truth about objects, we cannot grasp it fully or finally. From the notion of the truth *about* objects we might move, then, to a consideration of the other side of the coin, the truth *for* subjects. The individual, after all is the one who will have to decide, in the end, whether he or she can trust a given photographic representation, or whether or not to be suspicious of it. If the individual is compulsive he or she will worry about degrees of approximation that a more relaxed person would comfortably let go. If the individual is existentially engaged he or she may find the whole question of degrees of approximation irrelevant to involvement with the content or style of the representation.

Søren Kierkegaard, in his *Concluding Unscientific Postscript* (written in 1846), works out the opposition between objective and subjective truth in characteristically existentialist fashion. He is not so impressed with objective truth, even in photography (a daguerreotype studio opened in Copenhagen in 1842, but Kierkegaard pointedly declined the opportunity to have his portrait made). His target in the *Postscript* is theological and aesthetic truth, but what he says is of more general import.

In objective truth, says Kierkegaard, the emphasis is on the “object to which the knower is related,” but in subjective truth the emphasis is on “the nature of the individual’s relationship.” “The objective accent falls on what is said, the subjective accent on how it is said.” He stresses the futility of a progressive approximation to the truth, and reverses the usual priorities: instead of trying to arrive at something given, he starts with something taken; instead of approximating, he appropriates. Here is his central formulation: “An objective uncertainty held fast in an appropriation-process of the most passionate inwardness is the truth, the highest truth attainable for an existing individual” (Kierkegaard, 1941). Just such a reversal of priorities is to be found at the heart of the debate about photographic truth in the twentieth century.

PHOTOGRAPHIC “TRUTH”

Approximation aims for an impossible exactitude, but this may not be such a bad thing—we cannot reach the ideal, but we may come ever closer. This was the guiding notion of the group formed in the 1930s and known as *f/64*, from the smallest aperture of the standard camera, yielding maximum depth of field and sharpness of image. The members of this group—notably Ansel Adams, Imogen Cunningham, and Edward Weston—formulated almost ascetic standards for the practice of photography, according to which every image had to be a contact print on glossy black-and-white paper, showing no trace of handwork or avoidance of reality in choice of subject, on pain of being considered “impure.” But at about the same time other photographers, like Alfred Stieglitz and Walker Evans, were developing the flip side of Kierkegaard’s opposition.

“Exactitude is not truth”—this was the epigraph of a book Evans was to publish later; what truth was for him at the time is to be gathered, according to Jerry L. Thompson, from something he says about Eugène Atget—namely that it is a “projection of [the photographer’s] person.” “He projects himself by selecting and seizing a view,” continues Thompson; “...for Evans, the truth was his take, what he made of what he saw.” Similarly, for Stieglitz, “the larger truth...is the picture’s fidelity, its correspondence, to [his] experience of life as it was felt at the moment of the picture’s making.” “The truth for Stieglitz was his emotional state, his response, how he felt” (Thompson, 35, 38). These are two varieties of subjective experience: grasping, feeling, or in Kierkegaard’s terms appropriating, both standing in contrast to the drive to objectivity that approximates a truth given from without.

Even taking the contribution of the subject into account there may remain something about the object not grasped by the notion of correspondence. One complication arises from the fact that while most photographs are photographs of something (or someone) in the world, the photograph is also in its own right “a thing in the world.” Jean-Paul Sartre, in his book *The Psychology of Imagination* (in homage to which work Roland Barthes wrote his essay on photography, *Camera Lucida*), remarks on the physical presence of the photographic image itself: “As a perception, the photograph is but a paper rectangle of a special quality and color....” If it is a photograph of a man on a pedestal, I contribute an intentionality to it; if of my friend Peter, another level of intentionality is added.

We can imagine three successive stages of apprehension: photo, photo of a man standing on a pedestal, photo of Peter. But it may also happen that the three

stages occur so close to each other as to make but one; it can happen that the photo does not function as an object but presents itself immediately as an image

(Sartre 1948, 24)

This last condition is quite usual: the viewer (who is spared the work of developing, printing, mounting, and framing) hardly ever dwells on the photograph as physical object—it is nearly always seen directly as image.

But the image may have unexpected power—it can evoke, or provoke, or move to tears. This power is not something that is true of it in the simple sense of correspondence to a real state of affairs, it is something that is manifested in the encounter between the viewer who sees (or looks) and the person or object seen. Thompson finds an exemplary case of this in Walker Evans’s well-known portrait of Allie Mae Burroughs in *Let Us Now Praise Famous Men*: “The picture’s exceptional, amazing feature is that, instead of a subject looking at and understanding an object, it presents to us one subject looking at a second subject, who for her part looks back” (Thompson 2003, 43).

Barthes’s book, already referred to, is an extended meditation on this kind of encounter. He distinguishes between the general field of a photograph that directs our interest to it in the first place—its *studium*—and just this “looking back” that skewers our attention, as it were, which he calls its *punctum*. In the very moving second part of the book he describes his discovery of an early photograph of his recently deceased mother in which he found “the truth of the face I had loved”—a face he had never seen, since his mother was five when the photograph was taken, but which captured for him what he had failed to find in all the other “ordinary” photographs among which he had been searching.

What Barthes calls the “second *punctum*” is precisely the photograph’s necessary fixation of past time, its evocation of death. With great poignancy (a word etymologically related to “*punctum*”) he describes the feelings old photographs arouse in him when he realizes that the people represented are now dead—a feeling we can share when we look at his own picture on the back of his book (his last, and one which reads, in hindsight, like a farewell message; after the death of his mother, he says, he had only to wait for his own death, which followed quickly). “The Photograph then becomes... a new form of hallucination: false on the level of perception, true on the level of time” (Barthes 1981, 115): false because the thing represented is not there, true because it has been there.

Photographic “truth” has historically had a peculiar and sometimes controversial standing in relation to one of its very common uses, that is, towards political ends, and especially war photography. During the Civil War Mathew Brady was said in *The New York Times* to have brought home to its readers “the terrible reality and earnestness of war.” “If he has not brought bodies and laid them in our door-yards and along our streets, he has done something very like it” (Newhall 1982, 91). The difficulty, as John Berger has pointed out, is that since that time, and especially in recent years, we have become inured to such images. They trouble us briefly but then they become commonplace: “the picture becomes evidence of the general human condition. It accuses nobody and everybody.” There was a time, says Berger, when “the great witnessing masters of the medium like Paul Strand and Walker Evans” liberated photography from “the limitations of fine art” and put it at the service of democracy—but “the very ‘truthfulness’ of the new medium encouraged its deliberate use [by the Nazis, for example] as a means of propaganda” (Berger 48).

Inscribing Evans, with his subjective passion, as a “great witnessing master” underlines the danger of simple oppositions between subjective and objective. Ansel Adams was an objectivist of the f/64 school, but in the end, as Susan Sontag reminds us, a great photograph was for him a “full expression of what one feels about what is being photographed in the deepest sense and is, thereby, a true expression of what one feels about life in its entirety” (Sontag 1977, 118). Photography so conceived would not seem to lend itself readily to propagandistic use. And we may not wish to be drawn into the political arena—we may not feel that fine art represented a limitation from which photography needed to be freed, even for Berger’s

“brief moment” before propaganda took over. “It is still to this historical moment,” says Berger, “that Photography owes its ethical reputation as Truth” (Berger 1980, 54). We might ask in closing, what about its aesthetic reputation? The question opens up a whole new domain of inquiry. But if aesthetic truth is passed over in this summary discussion, that is because its problems are for the most part not specific to photography.

PHOTOGRAPHY AND PAINTING

A dialogue between photography and painting has been ongoing since the invention of photography. Sometimes the relationship has been conflicted: French painter Paul Delaroche purportedly exclaimed after the invention of the daguerreotype

was announced in 1839, “From today, painting is dead!” Anxiety about whether photography would usurp functions of painting was warranted in some instances, as the declining ranks of portrait painters could attest. Others in the fine arts saw potential

PHOTOGRAPHY AND PAINTING

utilitarian benefits in photographs—as a source of visual references from which to paint, for instance, and as a means to make reproductions of works of art widely available to the public—but did not accept that photography itself could function as a plastic, expressive medium within the umbrella of the fine arts. Indeed, most people in the nineteenth-century who took up photography thought they were using a machine that could record reality in accurate detail, and saw their photographs as documentary records. Nevertheless, artistic interactions between photography and painting have been widespread, significant, and symbiotic, even if not always recognized or acknowledged.

The subset of nineteenth-century photographers who saw artistic potential in photography (many of this group had trained as artists) concentrated on the aesthetic qualities of their images, and typically chose iconography, compositions, and approaches to light, shadow, and space that emulated various kinds of painting, including traditions that preceded their own era as well as evolving styles of modern painting. For instance, a landscape photographer such as Camille Silvy, who had absorbed the classical landscape painting paradigm, would compose a scene within a horizontal rectangle twice as wide as tall, frame the idealized vista with foreground trees or other elements, and organize space to emulate linear perspective; a portrait photographer such as André Disdéri, who had studied the pictorial conventions of academic painters, would copy their poses, props, and lighting. At the same time and paradoxically, various innovative nineteenth-century painters appear to have borrowed from photographic effects that ran counter to academic traditions in order to produce novel effects in their paintings, ranging from Edouard Manet's use of exaggerated *chiaroscuro* to Georges Seurat's interest in halation (an effect of glowing light seen in a photograph around a bright object against a dark background), to the casual poses, tilted perspectives, and cropped compositions that Edgar Degas borrowed from amateur photography. Certainly the instantaneous photography that became possible with faster exposure times influenced Impressionist painters to adopt approaches such as effects of blurring and flickering light that suggest a sense of the present moment.

At the turn of the twentieth century, the reigning direction in art photography in Europe and the United States was Pictorialism, an international movement that lasted from the late 1880s until the 1920s. As the name suggests, Pictorialists (a small group of art photographers outside the worlds of both commercial photography and amateur snap-

shot photography) claimed to be producing aesthetic “pictures” that resembled the scenes of traditional painting. They formed their own clubs, including the Linked Ring Brotherhood in London and the Photo-Club in Paris. The Pictorialists were particularly influenced by Barbizon School painters, as well as painters involved in Impressionism, Tonalism, and Symbolism. The adherents of Pictorialism, among them Gertrude Käsebier, Heinrich Kühn, Clarence H. White, Robert Demachy, and Anne W. Brigman, photographed poetic genre themes, romantic landscapes, and nudes, and experimented with various kinds of manual processes, including gum bichromate and bromoil, to further their claims to be working in an expressive, plastic manner similar to painting. The Pictorialists were partial to soft-focus effects achieved with special lenses and to printing with processes such as platinum printing that enhanced tonal effects.

After World War I the dreamy subject matter and impressionistic effects of the Pictorialists seemed old-fashioned and irrelevant to the modern world. For a while, it seemed instead as if painting and photography had parted company. The influential American photographer and gallery dealer Alfred Stieglitz advocated the independence of photography from other visual arts, particularly painting. Proponents of “straight” photography, sometimes called Purism, believed that photography had certain intrinsic qualities that should be emphasized in order to maintain its purity, including sharp focus, clarity in recording details of visual reality, and a smooth texture on the surface of the print. Although the connection was downplayed at the time, straight photography between the world wars related closely to Purism in painting, and Purist photography and painting both connected to the machine aesthetic of the era. American photographers closely associated with straight photography included Paul Strand, Imogen Cunningham, Edward Weston, and Ansel Adams. The straight-photography aesthetic greatly influenced documentary photography in Europe and the United States between the wars, which was assumed to produce objective records. Realism was seen as the special province of photography. Writers, who vigorously supported straight photography and its independence from other mediums, included Beaumont Newhall beginning in the 1930s and John Szarkowski since the 1960s.

In fact, photography has never been a completely autonomous medium. Not only has photography always interacted with other visual media, but photographers, painters, and other artists of a given time and place respond to similar cultural influences;

work in different media may show an affinity even if no direct interactions occur. Of course, often the relationship is direct: twentieth-century photographers responded openly and reflectively to modern art movements that are closely identified with painting, among them Cubism, Surrealism, Abstract Expressionism, and Pop Art. Influences also carried from photography to painting: for instance, the chronophotography of Etienne-Jules Marey, who used the camera to study sequences of movements, influenced attempts by Futurist painters to depict sensations of speed. Moreover there has never been a single relationship between photography and painting; instead many different kinds of exchanges take place at any historical moment. Even during the heyday of straight photography, many photographers sought out expressive themes and symbolic imagery that rejected any claims to objectivity. Stieglitz himself maintained that photographers have the right to produce images that are personal expressions rather than objective records, a point he demonstrated in his series of evocative cloud photographs, called *Equivalents*, intended to communicate emotional states.

Many photographers in the twentieth century embraced techniques such as collage and montage that contradicted the alleged purity of the medium, building on the experiments in working with unconventional materials and mixing media undertaken by avant-garde artists involved in Cubism, Constructivism, Dada, and Surrealism. Montage had precedents in the nineteenth century, notably in the allegorical compositions of Oscar Gustav Rejlander and Henry Peach Robinson, who combined separate photographs to produce composite tableaux. Typically, twentieth-century montages created during the years between World Wars I and II differed from these precedents because they are not seamless final images adhering to the unified space of linear perspective but instead are fractured images in which cut-up and reassembled fragments contrast with each other and retain their fragmentary character. Collages and montages by such artists as the German Dadaists Hannah Höch and Raoul Hausmann and Surrealist Max Ernst are not easily categorized within either painting or photography, but rather are a hybrid of both. The found photographic images incorporated in collages and montages widened the definition of fine-art materials and challenged the traditional supremacy of paint. Yet these figures were more readily accepted as artists and their work discussed as equal to the efforts by their contemporaries who painted or sculpted, while “straight” photographers continued to fight for artistic recognition.

Photography and Surrealism had a particularly fruitful relationship among avant-garde art movements. Surrealist photographers produced disorientating, psychologically charged imagery by recording peculiar objects or odd juxtapositions encountered by accident in the real world, as well as through the strange pairings of montage and other photographic manipulations that enabled the creation of psychologically charged images. Certain processes lend themselves to the Surrealist production of images that transpose the familiar into something strange in dreamlike fashion, including double exposure, solarization, and tone reversal through printing negatives. Surrealism continued in photography long after its momentum died down in painting, for example, in the enigmatic montages of Jerry Uelsmann from the 1960s on and the staged tableaux of Joel-Peter Witkin beginning in the 1980s.

Despite the popular view that photography is essentially a realistic medium, various twentieth-century photographers, like their counterparts in painting, explored abstraction. When Cubism emerged in France before World War I, photographers immediately began to experiment with new ways of treating forms and volumes as reductive geometric shapes. The interest in geometric abstraction transcended a painting-photography dialect and also involved sculpture, architecture, and modern design. Artists involved in Russian Constructivism, including Alexandr Rodchenko, and in the German Bauhaus, notably László Moholy-Nagy, embraced photography as a truly modern art that enabled new means of visual perception, and that lent itself to a geometric style. Such artists used techniques that promoted abstract effects such as extreme close-ups, which make it difficult to identify subject matter, and new angles of vision such as views angled sharply up or down, which suppress the horizon line, flatten space, and turn the elements of a scene into a flat pattern. In the United States, the landscapes of Laura Gilpin and the advertising images of Edward Steichen and Paul Outerbridge Jr. are a few of the many photographs that used design concepts derived from avant-garde movements associated with geometric abstraction.

In the 1940s and 1950s, some art photographers experimented with an intuitive, introspective approach to abstraction that tended to be biomorphic rather than geometric in character, and that paralleled Abstract Expressionism in painting. Minor White’s mystical landscapes realized with infrared film and Aaron Siskind’s close-ups of graffiti and peeling paint on walls, although different in character, can be seen as efforts to free photographic

images from their traditional representational function by reducing emphasis on recognizable subject matter. Like Abstract Expressionist painters (Siskind in fact was a friend of painter Franz Kline), White and Siskind wanted to express their inner psychological states and saw the purpose of their work as self-expression and aesthetic exploration.

Outside the hermetic world of abstraction in art photography, everyday photography proliferated, a development with enormous implications for all the arts. In his prescient 1936 essay, "The Work of Art in the Age of Mechanical Reproduction," Walter Benjamin argued that mechanical reproduction through photography would devalue handmade images because they could be copied and widely distributed, and that photography was creating a new kind of cultural object—a portable image divorced from a permanent context that gave it a fixed meaning. Twenty years later, Robert Rauschenberg, like earlier montagists but on a larger scale, recycled found photographs into his "combine paintings" in the 1950s and his silkscreen paintings beginning in 1962, allowing visual information ripped from its everyday context to infiltrate an art context. Also in the early 1960s, pop artist Andy Warhol began mixing painting and photography when he adopted the photo-silkscreen technique to reproduce onto canvases found photographs appropriated from newspapers, magazines, and other mass media sources. Rauschenberg's and Warhol's use of photographs as starting points not finished works and their adoption of alternative processes became strategies taken up by many artists from the 1960s on. Conceptually, their work connected with Benjamin's ideas, raising issues about artistic originality and the meaning, definition, and purposes of art in a visual culture that consumes an enormous quantity of images reproduced on a mass scale. They also presaged a general move to re-engage art in the everyday world, a move that the use of mass media photographs helped facilitate. The later 1960s also saw the development of Photorealism, a style of painting in which an artist attempts to recreate a photograph in paint, preserving all the photographic qualities of the model, such as spatial flattening, smooth texture, and selective focus. Chuck Close and Audrey Flack in the United States and Malcolm Morley in England were Photorealists in this era; more recently, Gerhard Richter and Sylvia Plimack Mangold have used a photorealist strategy for other ends.

By the 1970s still photographs of all kinds as well as the moving images of film and television saturated visual culture so thoroughly that art photographers, painters, and other artists had to take notice. By this time, photography instruction had entered the curri-

culum of fine arts education in colleges and universities, spurring exchanges with painting and other mediums, including the consideration of photographs in light of theories important to the visual arts in general. Photography moved to the center of art-world consciousness and was in a productive dialogue with many artistic forms beyond painting, including sculpture, installation, performance, film, and theater. Artists engaged in temporal or ephemeral forms such as performance or site-specific installations used photographs to preserve traces of temporary works. Some artists in this era turned to photography in part as a means to *oppose* painting, which they saw as a moribund discipline. Photography flourished as painting appeared to decline. Conceptual artists put photographs at the forefront of their practice, viewing photographs not as pictures, like traditional paintings, but as signs that communicate ideas, like a kind of symbolic language. They used photographs to comment on the nature of art, and on the meaning and use of images in mass culture. Feminist artists, Marxists, and others with an activist cultural agenda also approached photography semiotically, in their case questioning the social functions of photography, including how photographs represent and condition beliefs and values about race, gender, class, nationality, and so on. A general shift to "postmodernism" in the 1970s and 1980s corresponded to recognition that the images of mass media were not based on visual fact but on the manipulations of the entertainment industry and consumer capitalism.

Several trends connected photography in the late twentieth and early twenty-first century back to painting. Color became more common than black and white in art photography. And where photographs used to be small (the size of the negative if contact-printed), contemporary photographs displayed as art tended to be large-scale, holding the wall in the same manner as paintings, seen, for example, in the works of the German photographers who emerged in the 1980s, especially Andreas Gursky and Thomas Struth. Meanwhile, painting became reinvigorated with a return to figurative and narrative modes, and postmodern photographs likewise often depicted staged or fabricated situations that expressed significant themes. Photographers as varied as the Americans Cindy Sherman and Andres Serrano, Canadian Jeff Wall, New Zealander Boyd Webb, and the Japanese video and performance artist Mariko Mori constructed elaborate artificial tableaux, drawing variously from art history, film, fashion, and advertising. Some of these photographers and others began using computer montage to construct complex illusions,

bringing their practice even closer to the synthetic fabrication strategies of painters.

In general, recent photography and painting are both diverse, and no single relationship between photography and painting exists. For many artists, distinctions among media have become irrelevant or at least highly blurred. Certainly photographic ideas have fully entered the vocabulary available to other visual media, and vice versa. Developments in photography cannot be understood without considering parallel developments in painting; likewise painting must be seen against the backdrop of a world that is increasingly filtered through lens-based representations. And both painting and photography are engaged in a dialogue with new digital image technologies as the twenty-first century unfolds.

PHOTOGRAPHY AND SCULPTURE

Perhaps the most unlikely relationship between two media is that of sculpture and photography, the negotiation of form within a space seemingly at odds with the faithful reproduction of the outside world on a two-dimensional surface. However, sculpture and photography have shared a rich history during the twentieth century resulting in works that challenged the boundaries of expression in both media. Given its inherent ability to record events and situations, photography lent itself immediately to the documentation of sculptural projects in the first half of the century. For example, much of the work of the Russian constructivists is known not by the actual objects but through photographic representation. This function of photography has become the strongest link between the two media,

and one that has been explored increasingly by numerous younger artists at the end of the century.

In the 1930s, László Moholy-Nagy's famous example of his "Light-Modulators"—sculptures made to create specific lighting effects when photographed—inspired many students of photography both in Europe and at the Institute of Design (New Bauhaus), Chicago, to explore two and three-dimensional forms and formats. In the 1930s as well the Surrealists explored the idea of *sculptures involontaires* or common materials presented as "accidental sculpture." The French photographer Brassai created a series featuring ephemeral substances such as toothpaste and soap known as "involuntary sculptures" in an early example of what would become a common practice among process and performance artists.

In the early to middle years of the twentieth century, a number of highly regarded sculptors, including Constantin Brancusi, British sculptor Beverly Pepper, and the American David Smith used photography to extend their sculptural investigations, and in intervening years have become celebrated for their photographic *oeuvres* as well as for their three-dimensional output. The most intensive period of interaction between sculpture and photography, however, began in the 1960s when in the context of conceptual art, the photograph was used to record performances or present visual materials to address and examine ideas pertaining to society, politics, and art itself. This reinterpretation of photography's "place" emphasized its documentary properties, making it ideal as a method to record increasingly ephemeral sculptural practices. Concurrent with (and partly resulting from) conceptual art's dematerialization of the art object (facilitated by photography), expanded notions of sculpture began to emerge that placed greater emphasis on an aesthetic experience associated with the process rather than that of the resulting sculpture. These sculptural manifestations often consisted of performance, architectural constructions, and interventions with the natural environment, and drew art further from the gallery space and into what art historian Rosalind Krauss defined as the "expanded field." Thus the only surviving record of much of this work exists in photographs, films, and videos, which have assumed a greater importance due to the critical stature that these works have achieved in art history in the postwar era.

One of the first artists to incorporate photography within a sculptural work was Robert Smithson, whose work brought elements of the natural world into the gallery space and, conversely, made sculptural use of the environment to realize large-scale projects. Works that create a dialogue between the aesthetic space of the gallery and the world outside include *Nonsite (Franklin, New Jersey)*, 1968, in which stones from the site named in the title are arranged in a geometric series of containers, the shape of which is represented in the accompanying aerial photograph of the site. The photograph thus becomes an integral part of the overall sculptural installation, pictorially describing the "site" (Franklin, New Jersey) within the "non-site" of the work (the position of which varies with each successive presentation in a different gallery, domestic, or museum space). Smithson's larger and more ambitious projects, such as *Partially Buried Woodshed*, 1970, and *Spiral Jetty*, 1973, made direct interactions with architectural structures and natural formations, and existed only as long as the course of nature would allow. Photographing these

ephemeral works thus became crucial in recording their very existence and in conveying some sense of the experience of the particular work.

Other artists used photography to represent a different kind of interaction with nature, one that emphasized not so much the structure that resulted but the artist's experience in the world outside. Artists such as Christo, Hamish Fulton, Richard Long, and Ana Mendieta in particular used photography to document their forays and excursions into nature to do performances, erect sculptural structures, or recover materials that were later incorporated into sculptural works in the gallery. Mendieta's *Siluetas* series of 1973–1980 is perhaps the most striking example of the photographic documentation; the artist uses her body to create imprints, traces, or other interactions with natural materials in natural settings. The photographs thus work together with the sculptures to recreate the process of the works' creation. This emphasis on process also characterized the work of artists such as Eva Hesse, Robert Morris, and Richard Serra, who used photography as a documentary record of ephemeral works created in the studio in the late 1960s and early 1970s.

Gordon Matta-Clark's work similarly documented sculptural manifestations in the outside world, specifically, his interventions with architectural structures in the 1970s and early 1980s. These works featured strategic evisceration and destruction of a building to create a particular aesthetic effect. In his 1978 work, *Circus or The Caribbean Orange*, for example, a townhouse soon to be adjoined to the existing Museum of Contemporary Art in Chicago, was sliced through from floor to floor with large, circular cuts. The large cibachrome works document this installation from numerous, unconventional angles and are pieced together in a manner that mimics the sculptural sense of displacement within the installation itself. Matta-Clark's work is thus an important transition between the work of the 1960s and 1970s, in which photography was used primarily as a documentary tool and not as part of the sculptural object.

Artists working in the 1980s availed themselves of technological advances that allowed them to incorporate images into three-dimensional structures. This formal shift was accompanied by an increasing tendency of artists to mimic the appearances of the mass media as a critique of its pervasive effect on shaping culture. Dennis Adams often created architectural structures that featured appropriations of photographic images from history. In *Bus Shelter II*, 1984–1986, for example, he outfitted a bus shelter with a lightbox image of Julius and Ethyl Rosenberg,

tried, convicted, and executed in the early 1950s for treason as a result of Cold War paranoia in the United States after World War II. The placement of an iconic image of historically contentious figures where one would expect an advertisement jars the viewer from the idle distraction that one usually experiences in this public structure. Other artists from the 1980s, such as the Americans Annette Lemieux and Barbara Kruger, similarly combined appropriated imagery and sculptural constructs to provoke reflections on the latent meanings of images in the mass media.

Chilean artist Alfredo Jaar's politically charged work combined aspects of the work of the 1960s and 1970s in its use of photography to document the artist's experiences in a particular site or location and the adoption in the 1980s of the visual techniques of presentation in the mass media. Recording his interactions with communities in poverty-stricken and war-torn third world countries, Jaar combined sculptural elements that referred to a particular situation of his subjects, with images of them, often placed in lightboxes. In *Geography = War*, 1989, for example, images of African people affected by chemical waste poisoning are placed within lightboxes, which themselves are suspended above an array of large steel barrels filled with water that reflect the images. Jaar's use of the barrels and the water (a direct reference to the leakage of chemicals from similar barrels into the peoples' water supply) to "re-present" the images demonstrates a unique synthesis between sculptural elements and photography.

Artists in the early 1990s continued to use the combination of photography and sculpture to articulate political concerns. Robert Gober, for example, incorporated an image of himself as a model in a wedding dress advertisement in fabricated *New York Times* newspaper stacks. The newspaper headlines had been deliberately "placed" to emphasize issues relating to deaths from AIDS, combining with the image of Gober-as-bride to reflect on notions of gay identity. The bundle of newspapers—a fixture on the streets of New York City—not only presenting an oddly familiar and decontextualized structure within the gallery space, but also made a quietly provocative statement about the status of AIDS treatment and those who suffered from the disease in the United States and elsewhere. Matthew Barney's production stills of his surrealistic video and film epics on the crises of masculinity at the end of the millennium were placed within sculptural frames that were similar to the props and spaces depicted in the videos, films, and photographs. Other artists in the 1990s and into the 2000s have tended to eschew themes

overtly dealing with political issues of identity, returning to the more conceptual practice that characterized the interactions between photography and sculpture in the 1960s and 1970s. Los Angeles-based Charles Ray's 1992 work, *No*, presents a self-portrait of the artist, who is represented as a lifelike mannequin. A related photographic installation, *Yes*, 1990, depicts Ray experiencing LSD in an image that is bent almost imperceptibly and hung on a slightly convex wall. Italian artist Giuseppe Gabellone's photographs of the elaborately constructed sculptures that he fabricates become the sole record of that sculpture's existence as an important part of the process is the subsequent destruction of the sculpture upon completion of the photograph. Further advances in (and increased availability of) digital image creating processes have created greater possibilities for younger and emerging artists to fuse the photograph and three-dimensional structures in the years to come.

PICTORIALISM

In March 1902, Alfred Stieglitz organized an exhibition for the National Arts Club in New York titled “Pictorial Photography, Arranged by The Photo-Secession,” announcing both that Pictorialism was the highest form of “modern” photography and that his group, the newly-established Photo-Secession would ensure the promulgation of this important movement. The Photo-Secession was modeled on London’s Linked Ring, which was founded in 1892 (disbanded in 1909) and had had a major role in the development and dissemination of Pictorialism, which had begun to emerge during the last decades of the nineteenth century in Great Britain and on the continent.

Pictorialism was a widespread and influential movement of the early years of the twentieth century. It sought to elevate photography to fine-art status through the use of uniquely photographic means to create images that mimicked the formal qualities of the established fine arts media, notably painting. It is recognizable for its soft-focus look and limited range of tones, often evoking suggestive, atmospheric qualities.

The term itself had roots in the leading figure in British photography of the mid-nineteenth century, Henry Peach Robinson’s influential book *Pictorial Effect in Photography* (1869), which encouraged photographers to reflect traditional, painterly principles of composition and depiction. It came into

wide usage in the last decade of the nineteenth century, generally meaning any sort of photography that showed fine-arts aspiration by its subject matter—often nature or genre scenes, but including allegorical studies, portraits, especially those of women and children, and the nude—or specific technical attributes, most often the use of the more “artistic” gum bichromate and bromoil processes. Pictorialism was also associated with the naturalistic style promulgated by nineteenth century photographer and theoretician Peter Henry Emerson, who encouraged the capturing the “truth” as only the “scientific” medium of photography was able to do, yet presenting that truth in a soft-focus, more painterly style.

Stieglitz was one of the most important spokesmen and sponsors of Pictorialism in the twentieth century as it later became more narrowly associated with his Photo-Secession group, which included Gertrude Käsebier, Clarence H. White, Edward Steichen, Frank Eugene and Alvin Langdon Coburn, George H. Seeley, and Anne W. Brigman. His interdisciplinary art magazine, *Camera Work*, founded in 1903 and exhibitions mounted at the 291 gallery, also known as the Little Galleries of the Photo-Secession, opened in 1902 had great influence in spreading the international influence of the movement as well as upon the introduction of modern art to America.

The international movement of Pictorialism (in Germany, also called “*Kunstfotografie*” or “*Bildhafte Fotografie*”) as it predated the Photo Secession, however, began with presentations at the Vienna Trifolium in 1891 and the Linked Ring in London in 1892. Through publications and portfolio exchanges and numerous international salons, especially those in the United States in which photographers from Europe and later Japan were represented, they contributed significantly to the promulgation of Pictorialism and to its establishment as a standard for ambitious photographers. The exhibition *The New School of American Photography* organized by leading Pictorialist F. Holland Day of Boston, which appeared in London in 1900 and Paris in 1901, was of seminal importance.

A major impetus for the development of Pictorialism, however, was the drastically increasing number of snapshots by amateurs and the widespread use of photography in commercial and industrial applications. Pictorialism—especially in its use of the more challenging print processes—was a means of differentiating those with higher aspirations in the field, and was cultivated equally by professional photographers as well as by committed amateurs, including a surprisingly large number of women. By aligning themselves with the aspirations of contemporary movements in painting, the Pictorialists were able to make the point that they were practicing a fine art in photography. Early influences from painting included the Barbizon School, which idealized the simple life of the countryside and villages, Japanese art, with its atmospheric effects and flattening of the image, and Impressionism, which looked for subtle effects of color and light, and later Symbolism and the Nabi painters, and specifically in the United States, the work of James McNeill Whistler and the Tonalists. Somewhat paradoxically, in producing photographs that looked more like paintings and etchings or drawings, the Pictorialists indicated that photography could be a fine art only if it mimicked the accepted fine-arts mediums rather than by expanding the notion of what art could be as later happened with Modernism. Even so, rigidly confined stylistic approaches that mimicked old masters such as Rembrandt (e.g., by cabro prints) were controversial even within Pictorialism.

By 1905 Pictorialism was the dominant style and had begun to be influenced by the newly emerging abstraction in painting and the graphic arts. Demachy’s gum bichromate prints suggest red chalk paintings and the hatching methods of applying the photographic emulsion of Frank Eugene suggest the dissolving of figure and ground so typical of the

avant-garde painting styles of the day. The increasing sophistication of techniques to manipulate prints in laboratories allowed increased “artistic” effects to be produced. The soft-focus determined the graphic interpretation of lines, light, and shade, shaped by the emotionally-laden motive of the photographer. Landscapes, (later even city-landscapes), portraits, and genre-representations continued to be preferred themes. Photographs that simply “reproduced” were loathed. As well, each print was handled as if it were an original, subverting the natural ability of the medium to create many identical copies and prefiguring the much later Postmodern predilection. Above all, the Pictorialists valued the material beauty of their pictures, which increased the incentive to make their “photo object” into a work of art. The artistic value of a photograph was often measured by the quality of the craftsmanship, which guaranteed the finished picture had not only beauty but permanency. The family of pigment processes that were developed from the 1850s onward, in which the final image is rendered in pigments, was particularly popular among the Pictorialists because of their resemblance to traditional artistic media and the different ways they could be altered by handwork on their surfaces. This means made possible an unrestricted range of coloration and a wide scale of tone values. Favored techniques included Autochrome (a colored transparent image on glass, similar to a slide, patented in 1903), bromoil prints and oil pigment prints (related to the gum bichromate process, used from 1907 into the 1930s), and gum bichromate prints (introduced in 1894 and popular into the late 1920s).

Another important aspect of Pictorialism was the development of an art market for photography, although this occurred primarily in America. This was achieved by stressing the artistic significance of the works and creating a demand for them by means of the vigorous debate that swirled around the questions of artistic truth as well as by highlighting each work’s individuality and thus collectibility as a unique object. Stieglitz led the way, declaring that photography was an art medium that primarily stood to serve the spirit and the intellect. In the final analysis, the meaning could neither be found in the camera, nor in a specific technique, nor in a laboratory process, rather in the purpose—the intention—of the photographer; he may use every available resource and method to accomplish his objective. For the time being, Stieglitz continued to defend the mimicking of painterly styles.

However it was also Stieglitz who, from 1910 on, increasingly attempted to free photography from its obsession with paintings. He wanted a return of the

PICTORIALISM

lost individuality, independence, and identity of photography. In the face of the increasingly technically dominated world, acknowledging the breakthrough of photographically illustrated mass media, and against the background of the spectacular appearance of the new European art at the Armory Show of 1913 in New York, Stieglitz evolved into a strong critic of Pictorialism. Pictorialism had become incompatible with his idea of how the medium should be approached in that it did not sufficiently address the photographic qualities of photography. Additionally, Stieglitz began to realize Pictorialism's reliance on the qualities of other, established artistic mediums was counterproductive to the goal of the equality of photography as fine-arts medium. Gaining support from art critic Sadakichi Hartmann's publications from as early as in 1904, Stieglitz began to set Pictorialism at the opposite pole of his developing notion of "straight photography," beginning a debate about photographic aesthetics that continues today. After the important 1910 exhibition of Pictorialist photography at the Albright Art Gallery in Buffalo, New York, Stieglitz dissolved the Photo-Secession and distanced himself from his previous companions. In order to preserve Pictorialism, Stieglitz's former close associate, Clarence H. White, initiated a number of Pictorialist exhibitions beginning in 1911. In 1913 he founded various magazines and in 1915 the influential club, "The Pictorial Photographers of America" (PPA). Gertrude Käsebier also continued working in her established Pictorial style. In the United States after 1910 a new generation of Pictorialists in fact came onto the scene, who attempted to achieve expressive presentations without the manipulation of negatives and special object arrangements.

Internationally Pictorialism dominated until the end of the 1920s, in some countries until around 1930. This reestablishment of Pictorialism in the United States and elsewhere was achieved through photographic organizations whose memberships increased rapidly at the beginning of the 1930s despite the onset of the Great Depression. In America, Pictorialism endured the longest on the west coast, promulgated primarily by American photographers of Japanese descent who emerged in the late 1920s. They won international acclaim for their Japanese-oriented adaptations of the *Neuen Sehen* (New Vision) photographic movement emerging in Germany and central Europe, which stressed expressiveness. In Europe, Pictorialism lingered the longest in Great Britain.

Nevertheless, the end of Pictorialism was already foreseeable in the 1920s and had largely disappeared by the 1930s. Photography was no longer considered

an inferior form of illustrated presentation, even despite its increasing presence in news publications and commercial applications, especially advertising. The diversity and expressive flexibility of Pictorialism had played an important role in bringing the recognition of photography as a fine arts medium.

PICTURE POST

Launched in the late 1930s, against the backdrop of the Munich crisis and World War II looming, *Picture Post* was, for nearly 20 years, a clarion of social and political conscience, the barometer of British life and encapsulated all that was quintessentially "English." But more than this the magazine, home to some of the greatest photographic talent of the first half of the twentieth century, was to influence and shape British photojournalism for the next 50 years.

Financed by barrister-cum-publisher Edward Hulton, the editorial genius behind *Picture Post* was that of Hungarian Stefan Lorant. A former cameraman and film director Lorant had, by 1930, risen to become the chief editor of *Münchener Illustrierte Presse*, one of several pioneering picture-led magazines that emerged in Europe, and Germany in particular, during the 1920s. These evolved, taking advantage of advances in printing processes, to introduce a newly literate mass audience to the candid style of photography arising from modern small-format cameras such as the Ermanox and Leica. Lorant was a master in the new style of layout, the picture essay format, a narrative arrangement of images suggestive of the feel of cinema.

Following a period in "protective custody" in 1933 Lorant, like many artists, writers, and photo-

graphers, escaped Nazi Germany. He arrived in London in 1934, with his manuscript *I Was Hitler's Prisoner*, which was published in 1935, and by 1937 had launched his innovative pocket journal *Lilliput*. Hulton bought the magazine and employed Lorant to produce a new picture-led publication based on Lorant's earlier groundbreaking format *Weekly Illustrated* for Odhams Press.

On 1 October 1938, Hulton's national weekly—*Picture Post*—was born. The magazine addressed the issues of the day in terms the man in the street could understand. The first issue focused not on the politicians behind closed doors of 10 Downing Street but the people waiting anxiously outside for news that could plunge the country into war. The magazine also exhibited clear political convictions. In the third issue Lorant published a photo-montage by John Heartfield called "The Happy Elephants," a biting satirical comment on Prime Minister Neville Chamberlain's pledge of "Peace in our time." It was this strong use of imagery to put across complex social and political messages, coupled with Lorant's remarkable gift for layout, that set the tone. From the very first issue the British public wholeheartedly embraced the magazine. It outstripped its initial print run of 750,000 to peak in the summer of 1939 at a circulation of 1.7 million though read by half the population.

Photographers Kurt Hutton (Kurt Hübschmann) and Felix H. Man (Hans Bauman) whom Lorant had worked with in Germany, dominated the early years. Lorant also introduced the work of other Europeans, such as Erich Salomon, Brassai, Umbo, and Martin Munkacsı. These in turn influenced a new generation of British photographers, including Haywood Magee, Leonard McCombe, and Bert Hardy whose name became synonymous with *Picture Post*. Hardy's picture essays of life in the Gorbals, Glasgow, and Elephant and Castle, London, have become classics and his reportage of the London Blitz amongst the finest ever taken, so much so he was the first photographer to be credited in the magazine.

In 1940, with invasion seemingly imminent, Lorant booked passage for America. His assistant editor Tom Hopkinson took control continuing Lorant's strong editorial lead. Under Hopkinson's guidance photographers and writers developed a close working relationship. Macdonald Hastings, James Cameron, Kenneth Allsop, Fyfe Robertson, Robert Kee, and other talented journalists all worked under the unique direction to "put the picture first." The magazine continued to champion the issues of the day, covering the war at home and abroad, with essays such as *Life on a Destroyer* by Humphrey Spender and *Road to Victory* by Leonard McCombe, but also looking to a brighter future with plans for a better Britain, addressing issues of education, housing and the Welfare State discussed by such luminaries as J. B. Priestley and Julian Huxley. Always lighthearted, good humor pervaded the pages with stories like Bill Brandt's famous photoessay *A Day in the Life of a Barmaid*. No subject was too grand or too commonplace and Lorant's dictate to "appeal to the common man, the worker and the intelligentsia" remained intact.

In 1950 Bert Hardy and journalist James Cameron covered the conflict in Korea. Hardy's pictures of the Inchon landings won him the Encyclopaedia Britannica Award in 1951. However twice Hopkinson was prevented from publishing their shocking story of ill treatment of South Korean political prisoners: the piece would be highly damaging to the United Nations and Hulton was on the verge of receiving a knighthood. It was one of several behind the scenes confrontations with Hulton whose Conservative stance was increasingly at odds with *Picture Post*'s more liberal conscience and Hopkinson was sacked in October of 1950.

Initially there was no appreciable difference in the magazine. It continued to attract talented writers and photographers such as John Chillingworth, noted for his moving series of picture

essays of children in post-war Korea and Japan, and Carl Sutton, inventor of the action-sequence camera. Both worked their way up through the darkrooms under the direction of the renowned and fearsome Edith Kay. Thurston Hopkins covered a rich variety of subjects but always strove for and succeeded in showing the human condition. Rare for the period were the women staffers including Elizabeth Chat, Merlyn Severn, and Grace Robertson, whose essay *Mother's Day Off* exemplified her sensitive and thoughtful portrayal of people and events.

However a succession of editors slowly eroded the social voice and conscience of the magazine. There had always been space for cheesecake but it increased to the detriment of more serious articles, and a tide of advertising also began to swamp the pages. Slowly the once loyal public faded away and on 1 June 1957 the magazine finally folded.

On *Picture Post*'s youthful demise Hopkinson observed, "I think it just lost its sense of direction and wandered off into the fog..." Lorant was more blunt, "Picture Post died because it became dull and boring. It offered no new ideas." However its influence on British photojournalism is undoubted and was soon felt in other areas. Photographers Frank Pocklington and Charles "Slim" Hewitt and journalists Trevor Philpot and Fyfe Robertson were among those who went on to work in the new medium of television and helped transform the style of current affairs broadcasting in the way *Picture Post* had transformed magazine publishing.

PIERRE ET GILLES

French

A *fin de siècle* retrospective of Pierre et Gilles's work, appearing in Manhattan at the New Museum of Contemporary Art from September 2000 to January 2001, constituted the first major exhibition in the United States devoted to the French duo's work. This show brought to the attention of the American public the work of the French team of artists who have tirelessly exhibited their images in galleries and museums worldwide since the beginning of their collaboration in the mid-1970s. Pierre et Gilles are widely considered among the most famous and influential artists living in France today. Their images in reproduction have also appeared in magazines and music videos, as well as on movie posters, album covers, and postcards. It is primarily through magazine and advertising work that the artists have achieved international notoriety and admiration.

In 1976, Pierre and Gilles met at a party thrown by the fashion designer Kenzo, and from that point on their lives and work have been irrevocably intertwined. At the time of their meeting, Pierre was working as a fashion photographer whereas Gilles was a teacher and painter. Born in La Roche-sur-Yon, Pierre had studied in Geneva before arriving in Paris in 1973, where he entered the photographic world through his work for music and fashion magazines. Born at Le Havre, Gilles enrolled in the Academy of Art at the age of fifteen and graduated with distinction. He also moved to Paris in 1973, where he embarked on an artistic career creating collages, paintings, and illustrations destined for magazines and advertising. In 1977, Pierre and Gilles began to collaborate artistically under the name Pierre et Gilles. In the years to follow, their work appeared in magazines such as *Façade*,

Gay Pied, *Marie Claire*, and *Playboy*. They also designed several album covers, including those for Boy George, Marc Almond, Lio, and Etienne Daho. Throughout their years together, Pierre et Gilles have ventured as far as Morocco, India, Sri Lanka, Laos, and the Maldivé Islands, producing numerous works during their travels. In 1993, they received the Great Prize of Photography of the City of Paris. They currently live and work in Le Pré Saint-Gervais, on the outskirts of Paris.

The French artists' images are created through an elaborate process that achieves incomparable and sophisticated effects by the successful marriage of photography and painting. In an age marked by the dominance of the digital media, Pierre et Gilles's images are conspicuous insofar that they are the product of time-consuming and meticulous traditional craftsmanship—this in contrast to what their appearance might suggest to the viewer. These creations are best described as hand-painted photographs, with Pierre taking the picture and Gilles painting over it. It is important to note that neither medium takes precedence in their work. In fact, the frontiers between photographic and painted effects are so elegantly obscured that it is at times difficult to distinguish between what was captured by Pierre's camera and what added by Gilles's brush.

Pierre et Gilles begin by sketching a work based on a concept or idea that they mutually find fascinating or intriguing. With a model in mind, they construct an elaborate set using props and accessories carefully collected over the years and often brought back from their travels. Lighting is then used to enhance and magnify the subject through an interplay of angles and filters. What follows is the selection of costumes, make-up, and hair styles, which sometimes requires the help of specialists. Pierre then shoots about 50 to 80 frames

per set. Using paintbrushes, Gilles retouches a chosen enlarged print with successive layers of paint and glaze, in order to idealize the model, to attenuate or accentuate certain features, or to add interesting details to the whole image. The final product is thus unique and irreplaceable. The choice of frame is the final task, seeing that the artists consider this accessory to be an essential component of the image. They spend an average of 12 days on one work.

Pierre et Gilles use friends, celebrities, or simply unknowns as models. Their work consists almost exclusively of portraits. In the foreground of their images, male models pose as sailors, gigolos, street toughs, boxers, gods, princes, saints and sinners, martyrs, and historical villains. The female models often portray the traditional *femme fatale* (embodied for example in the figure of Eve, Medusa, or Salomé), women at the cross, fairies, goddesses and saints, bewitching sirens luring seamen to their deaths, or evil enchantresses. The theatrical posing, the presence of blood and tears, the physical perfection of the models are all characteristic of their pictures. The same model is often seen playing contrasting, sometimes contradictory roles. Except for the photographs taken in foreign locations during their travels, the portraits are set in Utopic worlds. Fields of technicolor flowers, vast blue skies with puffy clouds, and glittering stars compose the lavishly decorated backgrounds of their work.

It is the model, however, not the decor, who remains the focal point of the picture. The setting merely serves as an extension to what Pierre et Gilles perceive to be hidden aspects of the model's persona, or as a glorifying and idealizing background to the portrait. Among their best-known images are fashion designer Jean-Paul Gaultier in a striped sailor shirt surrounded by daisies, renowned French actress Catherine Deneuve as a fairy princess with a painted on tiara floating in a cloudy blue sky, and the German rock star Nina Hagen as a rubber-clad housewife tied to a kitchen chair. Their art often receives mixed reviews, as in the case of the poster designed for the 1995 Australian Gay and Lesbian Mardi Gras Festival, which was criticized by some for reinforcing traditional gender stereotyping.

The subjects and symbols of Pierre et Gilles's images originate from sources as diverse as American urban myths, Oriental stereotypes, classical and biblical tales, Eastern religions, and Parisian chic. Dominant elements of French identity often punctuate their work. Their painted photographs represent a world of beauty, desire, and pleasure, often steeped in religious allegory. Death, glamour,

glory, perverse innocence, and romance are among their preferred themes.

Over the years, they have created a number of series. Among them are: *La Création du monde* (1981) and *Le Paradis* (1981), staging a pure and idealized world that makes no mention of sin and redemption; *Les Saints* (1988–), ascribing to models saintly perfection in order to create a world in which beauty and emotion become tangible realities; *Les Plaisirs de la forêt* (1996), which portrays a phantasmagoric realm with mysterious and erotic overtones; and the black-and-white series “*La Rose et le Couteau*” (1998), inspired by photographic stereotypes of the 1940s. In the 1990s, their work has grown progressively more sombre and more complex.

Pierre et Gilles's work embodies the postmodern fracture of the boundaries between art and popular culture. By allowing fashion, queer sensibility, prevailing trends, erotica, sentimentalism, mass-produced imagery, popular television shows, street culture, fairy tales, and religion to penetrate deeply their hybrid creations, the French duo challenge established conventions and hierarchies of art and realism. They were initially dismissed by critics as kitsch, but are now gaining recognition through their redefinition of the traditional iconographic repertory. Refusing to represent in their art any particular social ethic, Pierre et Gilles strive to capture seemingly fleeting moments of idealized beauty and emotional intensity. Their images have gradually become one of the reference points in the art world, while their strong roots deeply embedded in popular culture and multiculturalism have caused repercussions in the worlds of advertising, fashion, music video, and publishing.

PIN-UP PHOTOGRAPHY

Pin-up photography may be considered a branch of glamour photography, which itself is related to fashion photography. The pinup (or pin-up) photograph is implicitly suitable to be hung on a wall like a poster (although failure to actually display a photograph does not disqualify it as a "pinup"). Beyond that functional definition, the pinup photograph connotes a particular style of glamour photograph. The traditional pinup portrays attractive girls and women, although certainly the pinup also encompasses male imagery, even if it constitutes a distinct minority. While any photograph, print, or magazine reproduction, regardless of subject matter, technically can become a "pinup" by wall display, the term is generally reserved to identify a broad style category of glamorous figure pictures, as well as glamour portraits that do not include the entire figure. A glamorous portrait of a beautiful woman may be torn from a magazine and tacked to a wall or bulletin board, but it does not necessarily fit the expectations associated with the term pinup unless it includes a sexual or sensual component. In a bow to a well-established tradition, we restrict the term to

a particular style or mode of figure representation, and its intention to provide measured sexual titillation. The "pinup" encompasses painting and drawing as well as photography, and the "Gibson girl" drawings of Charles Dana Gibson in the early 1900s and the *Esquire* magazine illustrations by Vargas in the 1940s are closely linked to the growth of pinup photography. Although much soft-core and hard-core pornography has been produced for "pinup" purposes, the name primarily evokes the notion of a scantily clad or nude full-figure image that adheres more closely to the "glamour" aesthetic than to the pornographic or prurient. In the majority of "pinup" poses, the model gazes directly at the viewer, engaging him (*usually* him) with a saucy, humorous, conspiratorial gaze. In the traditional "figure study," made ostensibly for aesthetic satisfaction, the nude or nearly nude model usually does not interact with the viewer; her eyes are turned away, or the face may even be hidden or cropped out in order to depersonalize the model and emphasize the body as an aesthetic object. If the centerfold images of magazines such as *Playboy* and *Penthouse* (ostensibly

intended for removal and display) became increasingly explicitly sexual since the 1960s, they generally remained within the pinup aesthetic. The pinup is usually characterized by its light-hearted, zesty, fresh, sometimes romantic approach, so a heavy, dark, gritty approach to sexuality, even if not specifically pornographic, seldom fits the pinup profile.

For a working definition, it is also important to consider medium as well as subject and style. What most people call a pinup is an ink reproduction created for a mass market, although lithographic posters often may be considered "original" works ("multiples") rather than reproductions. A pinup photograph is usually a photomechanical reproduction of a photograph, not the original print. Photographic pinups have been reproduced as posters, calendars, postcards, and reproductions in magazines, suitable for removal and display, especially multi-page centerfolds. Certainly any printed image from a book or magazine can be removed and pinned up for display, even if the subject is a building or a machine, but to call any image other than a reproduction of a "glamour," "cheesecake," or "beefcake" picture a "pinup" is to invite confusion, so thoroughly ingrained in popular culture is the notion of a pinup as a depiction of the human form with sexual overtones.

The "pinup" connotes a wide but defined range of styles within a complex history. Glamour, cheesecake, beefcake, and erotica constitute the primary modes of the pinup. Erotica is defined as an explicit appeal to sexuality, either by the representation of genitalia and/or specifically sexual poses, gestures, or themes. Again, distinctions should be made between figure photography *per se* and photographs that seek to amuse or titillate in an overtly sexual manner. Although it has been argued that all representations of the nude human figure inherently include an element of sexuality, most photographs that depict the figure as studies in form or that include the figure as an element in a broader or more complex composition are not normally classified as pinups. The pinup may be sexual or erotic, situated within a wide spectrum ranging from the mild to the highly charged, but it seeks to amuse and titillate rather than arouse.

"Glamour" photographs rely upon careful posing, makeup, costume, stagecraft, and dramatic lighting to render the face and/or figure attractive and alluring; they may not employ a specific sexual element, but will appeal sexually to the viewer by their beauty and the implied attainability in the code of the direct gaze. Glamour portraits of celebrities, female and male, fit this category. "Cheesecake" and "beefcake" photographs, which may also be "glamour" photographs, specifically include the figure or a portion thereof. Traditional cheesecake empha-

sizes the female legs and/or bust. The cheesecake pinup typically has been a clothed model prominently displaying bare legs, whereas beefcake implies a bare-torso male. One of the most famous cheesecake pinup photographs depicted actress Betty Grable in a swimsuit from the back (1942), emphasizing her legs in a simple pose; it fitted the pinup tradition because of her smiling, over-the-shoulder gaze at the viewer. Part of the appeal of the photograph was that the subject was a recognizable, popular film celebrity. Wildly popular, this pinup was sold to American G.I.s at the rate of 20,000 per week, and serves as a cultural icon, not only of the pinup tradition, but of World War II.

If the Grable photograph is one of the main icons of pinup photography, the other two most famous images both depict another movie actress, Marilyn Monroe. The first is the nude calendar photograph, created by Tom Kelley in 1951 before she became famous, and which gained even greater notoriety and rediscovery after it had helped her attain celebrity status. The second is the "still" from the film *The Seven Year Itch* (1955), dramatically exposing the fully clothed Monroe's legs with her skirt blown high by a strategic blast of air. Perhaps the most characteristic form of pinup that consistently warrants actual wall display is the calendar. "Girlie" calendars in a wide range of style and quality were available throughout the twentieth century, culminating in the sophisticated and often innovative Pirelli (a tire manufacturer) calendar, with pictures provided by famous photographers.

In the late twentieth century, two of the most widely circulated platforms for pinup photography were the annual *Sports Illustrated* magazine swimsuit issue and catalogs for women's lingerie and swimwear, such as Victoria's Secret. The *Sports Illustrated* annual swimsuit issue is clearly directed toward male customers in a blatant attempt to boost sales through its tenuous identification of cheesecake with sport. The light-hearted approach of the entire project is in the quintessential pinup tradition. The function of lingerie fashion catalogs is more complex, although the salient goal is to sell the company's products. The catalogs are directed toward female customers, unlike the male target audience that most female pinup pictures cultivate, yet many men eagerly peruse the catalogs after their wives or girlfriends discard them. It would be interesting to know how many Victoria's Secret tear sheets actually find their way to male bulletin boards and workshop walls. The appeal of such catalogs for women presumably is that they can identify with the models and imagine themselves wearing the alluring products in order to entice

their men, whose interest in the catalogs cannot escape notice. The purveyors of intimate and sexy apparel try to legitimize and validate what is essentially pinup photography by associating it with consumer products. Despite the ingenuity and variety that both *Sports Illustrated* and lingerie catalogs introduce in pose and setting (*Sports Illustrated* famously launches a global search for exotic settings for its celebrity models), the rules of these ventures are formulaic: nipples and genitalia can never be exposed, although their erotic but hidden presence is exploited. The old striptease rule that anticipation is more erotic than total nudity is invoked. Models are frequently topless, yet nipples remain strategically covered. In such modern manifestations the enduring pinup style remains a potent and lively form of photography, adroitly linking two types of desire: sexuality and consumerism.

The more sexually explicit pictures of women seen in men's magazines, from *Playboy* to *Hustler*, from the 1970s to the end of the century, might be included in the pinup category. Such pictures tend to fit the accepted definition of soft-core pornography when they include prominently exposed vulvas, apparent masturbation, and breast and nipple play. They do not represent the "classic" type of mild, comparatively "innocent" pinup, but since there is ample historic precedent for such mild pornography in the pinup genre, in calendars, "naughty" postcards, and other forms, it would seem arbitrary to exclude them. But they may not be "your grandfather's pinup." Hard-core pornography involving graphic sexual activity between two (or more) persons is beyond the scope of pinup photography, demonstrably different in spirit.

Well-known photographers who supplied the men's market with pinups during the 1940s–1960s included Peter Gowland, Andre de Diennes, Howell Conant, Bunny Yeager (who famously photograph-

ed herself), and a host of others. They were celebrated in the pages of popular photographic magazines such as *U.S. Camera*, *Modern Photography*, *Popular Photography*, and their annuals. Writer-photographers like Glen Fishback Jr. wrote about pinup and glamour photography in such photographic hobby magazines, dispensing practical advice about posing, lighting, and even locating and persuading potential models. As a photographer who used cheesecake to illustrate photographic product advertising, Fishback epitomized the combination of girls and gadgetry that the photographic magazines of the time promoted in order to reach a wide male audience. The era was clearly marked by a more "innocent" or "wholesome" style, which celebrated beautiful bodies, the pert and perky gaze of the models toward the viewer, and a "tasteful," mostly inoffensive approach to sexuality.

BERNARD PLOSSU

French

Bernard Plossu is emblematic of a generation of French—and more generally European—photogra-

phers born in the immediate aftermath of World War II and for whom both the discovery of the United States and traveling the world were seminal factors in the development of a photographic vision.

His photographs combine a deep sense of composition with an aesthetic of the flux that is often compared with Robert Frank. Widely represented in many museum collections, he is a prolific author who has never ceased producing exhibitions and books, combining personal projects and assignments for many institutions in France and Europe, often in collaboration with a writer.

Plossu was born in 1945 in Dalat (Vietnam, then French Indochina). He discovered photography with his father when traveling with him to the Sahara in 1958, an experience which defined his life-long relationship between photography and space, more particularly the desert. In 1965, after three years of studies in Paris, he took a trip to Mexico to visit relatives. There he traveled widely, even up to California. Meeting a British ethnographic expedition to Mexico's Chiapas region he became their photographer, creating such images as *Puerto Angel*, 1965.

For 10 years (1967–1977), based in Paris, Plossu traveled extensively to French regions and Europe; to the United States in 1966–1967; India in 1970; in Africa, Niger, and Morocco in 1975, and Senegal and Egypt in 1977, and published reportages in both photography magazines (*Photo, Camera*) and glossy magazines (*Réalités, Partir, Atlas*). Simultaneously he developed his own projects, such as the *Suburbanalist* series. In 1977 he settled in Taos, New Mexico, with his American wife, Kathy Yount. The next eight years (until 1985) will be his American—more specifically New Mexican—and “desert” years, as well as the beginning of his series on his own children (his son Shane was born in 1982). He then worked almost exclusively in black-and-white and with a 50 mm lens, abandoning the wide angle lens of his earlier years to the point he destroyed his wide-angle negatives made in the 1970s. During the late 1970s and early 1980s, he met countryman Gilles Mora. With photographer and publisher Claude Nori, they formed a dynamic group, deeply steeped both in French classical culture and American photography and pop cultures. Together they launched several projects, particularly *Les Cahiers de la photographie* based on the model of *Les Cahiers du cinéma*, the first—and to date only—critical publication in French on contemporary photography. The collaborations and works of these individuals represented an important step in the coming of age of French photography.

Plossu's separation from his wife and subsequent deportment from the United States in 1985 was a traumatic event in his life that caused him to reconsider a certain “American model” that may have characterized his earlier practice. It certainly reinforced his artistic creed and sensitivity. In 1988, a major 25-year retrospective at the Musée d'Art

moderne, Centre Georges Pompidou consecrated his place in French photography. He was subsequently awarded the Grand Prix national de la photographie, received the prestigious Villa-Medici-hors-les-murs fellowship to photograph India, Turkey, and Mali. From 1989 to 1992, he lived in Andalousia (Almeria) with his second wife, Françoise Nuñez, and their two children. Since 1992, he has been living in La Ciotat. The Spanish and Mediterranean years were extremely productive. In the 20 years since his return to France, Plossu produced a great many exhibitions, from new subjects to revisiting his archive of images, and many books. Most of these have been the result of commissions. Although he now travels less, and almost exclusively in near Europe, and works on some local long term projects (as the restoration of the Villa de Noailles in Hyères, published in 2003), Plossu still practices photography as a way of sharing the emotion of space and discovery.

Plossu's work is marked by a great continuity in the construction of a personal world and an extreme sensitivity to people and places translating in images of great softness and sensuality. His now 40-year career is characterized by his many solid friendships with other artists and photographers, and his loves, particularly of his children. It is also defined by his continuing study of the history of painting as well as love of literature (Plossu exorts, “one must always read!”) particularly such authors as Balzac, Céline, Malcom Lowry, Albert Cossery, Michel Butor, Amin Maalouf, and the writers of the Mediterranean.

Plossu's main influence, however, is to be found in the cinema (he was once called a “Nouvelle vague photographer”) that he discovered as a teenager through the movies of such international directors as Kenji Mizoguchi, Igmarm Bergman, Theodore Dreyer, Sergei Eisenstein, Nicholas Ray, and Luis Buñuel. Movies shaped his understanding of the image well before he learned about the history of photography—a rather standard phenomenon for a French photographer of this time. This influence is present in his blurred images, in his many pictures made from moving vehicles, but also in his choice of point of view and subjects. It marks his deep interest in the question of time, as a sensitive and photographic issue.

Although influenced by film, in his photographs Plossu never tells a story. Most of his images are in fact best described as contrapuntal. Choosing banal places and “non decisive moments” as he himself calls them (and as opposed to the ideal presented by Henri Cartier-Bresson of capturing “the decisive moment”) Plossu focuses on the surprise of the

world in a playful, lively, and thoughtful way. He walks—whether in the deserts of the world or in cities—and his roving eye experiences the sheer pleasure of being alive. This combination of design and spontaneous exhilaration makes him an heir of much French humanistic photography—although their aesthetics are in fact quite different.

Despite a fairly stable visual style over the course of his career, Plossu experiments continually with cameras and formats, but always within the range of amateur camera. He never owned a Leica and uses an old Nikkormat. At the end of the century he took up toy cameras and disposable cameras, which allow him to achieve a poetical grain and grayed-down tone—even with color film—and a fastness and ease of use which allows “the image to take you faster than you take it.” At the other end of the spectrum, Plossu uses the Fresson process—a slow and painstaking method of color printing—invented at the turn of the century by Theodore-Henri Fresson that mimics pointillism—as a way of expanding the poetical potential of the images. Printing formats are also very important for him. Although he delegates the actual printing of his images, he is careful about the choice of the size of the image, often trying miniature, and super-miniature prints (7.8 × 11.5 cm), especially of “large” topics such as landscapes, and panoramas and reinterpreting, through format change, his own pictures, from their first publication or exhibition.

DAVID LOWDEN

American

David Plowden's work documents the ordinary and often overlooked in America, the commonplace and the taken-for-granted. He is often compared to other documentary photographers, from Walker Evans to Eugene Atget in that his work displays the qualities associated with the classic, black-and-white images created by these masters, yet the fact that he photographed in the late decades of the twentieth century imbue his images with an atavistic quality.

Born in Boston, Plowden was educated at an assortment of mostly private schools, none of which he remembered with much fondness. He ran away from one, Choate, yet managed to do well, eventually overcoming his adolescent antipathy to the state of Connecticut to matriculate at Yale University in New Haven where he majored in economics.

He had learned the rudiments of photography and black and white printing as a teenager at the Putney School in Vermont, but his first job out of college was as an assistant trainmaster for the Great Northern Railroad. He was assigned to a two-man depot in Willmar, Minnesota, a small city about 100 miles west of Minneapolis/St. Paul. After a year he moved to New York City, where he worked briefly as a travel advisor and clerk, first for the American Express Company and later for Nametra, Inc. It was not until 1958, three years after his graduation from college that he decided to pursue photography. In 1959 he worked as an assistant to O. Winston Link, who achieved a measure of fame as a photographer of American railroads. A year later Plowden spent five months studying with the master of the "straight" photograph, Minor White, followed by a longer stint in New York City with George Meluso, who specialized in fashion and commercial photography. Walker Evans was an important early mentor, and Nathan Lyons encouraged him to "photograph the unphotographable," sound advice he never forgot.

During this formative period the principle focus of his photography became apparent when in 1959 and again in 1960 he traveled to eastern Canada and Maine to photograph the last active steam locomotives in North America.

"It began to dawn on me," Plowden writes in *Imprints. A Retrospective*, "that I hadn't simply been documenting steam locomotives in their final hour. I was witnessing something of far greater consequence: the transformation of a culture." Therein lies the meaning and significance of Plowden's work. His images describe an America that is still hand-made, ruggedly individualistic, and beautiful, an America that becomes harder and harder to find. His stunning black-and-white images of great engines of commerce and the built environment describe a slow but seemingly inexorable drift into senescence and disuse. His subjects include steam-driven ships and locomotives, embattled family farms, villages and small towns across rural America, the once vibrant steel industry, and most recently the American barn. It would be a mistake, however, to conclude that Plowden is only a compulsive collector of quaint and antique Americana. His principle subject is American culture, with special emphasis on its extraordinary evolution since the end of the Second World War. In many of his meticulous images of the built landscape, Plowden presents things and places that have lost their ability to compete in a new global marketplace. By so doing he forces us to examine and then re-examine our headlong rush to jettison the forms and structures of the past, discarding without thought or feeling what is no longer sufficiently useful or efficient. Plowden's photographs celebrate the non-global America, a place of productive farms and somnolent small towns, of grain elevators and bridges gracefully spanning great rivers.

It is as if 40 years after the heyday of the legendary Farm Security Administration (FSA) photographers Plowden decided to continue their work. Roy Stryker, who organized and directed the Historical Section of the FSA, wished to create a vast visual encyclopedia of America during the years 1935–1943. Plowden is similarly motivated. Driving from place to place, preferring two-lane "blue" highways to the interchangeable, characterless interstate system, Plowden searched out the unique, timeless, and visually powerful. If the light is not acceptable he waits or returns another day; he does not add light of his own. He uses a Hasselblad

PLOWDEN, DAVID

camera on a tripod, the Zone System for determining exposure and development, and makes his own prints.

In 1995, the Bienecke Rare Book and Manuscript Library at Yale University agreed to acquire Plowden's complete archive, his prints and negatives, published work, his notes, correspondence, journals,

and tapes. It is fitting testimony to his central importance as a photographer of American culture.

Biography

Born in Boston, Massachusetts, October 9, 1932. Attended Yale University where he majored in economics, graduating in 1955. Worked for the Great Northern Railroad as assistant trainmaster in Willmar, Minnesota. Began his photographic career in 1959 working as an assistant to O. Winston Link. During the 1960s he worked extensively for various magazines, including *American Heritage*, *Horizon*, *Vermont Life*, and *Fortune*. In 1968 he was awarded a John Simon Guggenheim Memorial grant to work on a book on American bridges. At the 1975 Wilson Hicks Conference on Visual Communication at the University of Miami, Plowden received an award for outstanding contributions to documentary photography. In 1978 he accepted an appointment as Visiting Associate Professor at the Institute of Design of the Illinois Institute of Technology in Chicago; in 1982 he was awarded tenure there. In 1984 he accepted a post as lecturer in the School of Communications at the University of Iowa, and two years later was appointed Artist-in-Residence and Senior Fellow at the University of Baltimore's Institute for Publications Design. His entire archive was acquired by the Beinecke Rare Book and Manuscript Library at Yale University in 1995.

POLAROID CORPORATION

The 27 October 1972 cover of *Life* magazine advertised the revolutionary Polaroid SX-70 system—the first fully automatic, motorized folding single lens reflex camera that ejects self-developing, self-timing color prints—with an image of Dr. Edwin Land using his “magic camera.” Land’s Polaroid Corporation had been a thriving U.S. company for almost 35 years by the early 1970s, cornering the market on one-step instant imaging. Land and his kind of magic photography were well known worldwide by this time as the company had been producing an extensive array of Land cameras and Polaroid films for personal and professional use since 1947 when Land first announced his one-step instant photographic process. Yet for most late-twentieth-century photography consumers, “Polaroid” signifies the hand-held instant color snapshot originated in 1972: the kind of image that pops right out of the camera and develops before one’s eyes. Although realized approximately 100 years after the first experiments in photography, Polaroid instant imaging expanded the possibilities of photography in ways that had not

been previously imagined. Even as we embrace the digital revolution, the spontaneous thrill of that instant image still delights us, for the idea and application of instant imaging are paramount in our desire to represent and interpret the visual world. Land, the “genius” as *Life* called him, had perfected a means to combine the desire to fix one’s image with the satisfaction of immediate recognition.

Seventeen-year-old Edwin H. Land left Harvard University in 1926 after his freshman year to pursue his own work on light polarization. He first established the Land-Wheelwright Laboratories in Boston in 1932 with Harvard physics professor George Wheelwright, III, where they continued to research and produce synthetic polarizers. In 1937, the Polaroid Corporation was formed. Beginning in 1939, Polaroid produced glasses, ski goggles, stereoscopic motion picture viewers, fog-free and dark-adaptor goggles for the Army and Navy, and the company received a contract to develop heat-seeking missiles equipped with miniature computers. Focusing its research and development on

wartime efforts during the early 1940s, the direction of the company would dramatically change when in 1944 Land first conceived of the one-step photographic system while vacationing with his family in New Mexico. On 26 November 1948, the first Land camera—the Model 95—was sold in Boston at the Jordan Marsh department store for \$89.50. This model was the prototype for all Polaroid Land cameras produced for the next 15 years.

Photographic sales of the Land Model 95 camera exceeded \$5 million in the first year. In 1949, Land hired photographer Ansel Adams as a film consultant, initiating a long tradition of working with and supporting photographic artists. Polaroid sales exceed \$23 million in the early 1950s, and over 4,000 dealers in the United States alone sold Polaroid cameras, films, and accessories. During the mid-1950s, the company invested its advertising budget on network television programs, as Polaroid products were now distributed in over 45 countries worldwide.

For the next several decades, Polaroid would continue to create and produce revolutionary photographic products for broad personal and professional uses, penetrating virtually every aspect of the photographic market. Always a technology-driven company at heart, Polaroid's research and development ventures aimed to offer the best imaging technology available in both consumer and commercial markets. Commercial products accounted for the bulk of the company's sales, as Polaroid developed products for application in business, medicine, science, industry, and the military. In 1961, for example, Polaroid introduced its Positive/Negative 4 × 5-inch film Type 55. Designed for professional photographers, it was the first black and white film to produce both a positive print and a negative in 20 seconds. Polaroid developed Polacolor in 1963, as instant color film was invented. In 1965, Polaroid sales surged with the manufacture of the inexpensive Swinger camera, a \$20 camera that took wallet-sized black and white photographs. And in 1972 the Polaroid SX-70 Land Camera, the first automatic, motorized, folding, single-lens reflex camera that makes self-developing instant color prints, was introduced. Classic film star Sir Lawrence Olivier served as an advertising spokesman for the camera, and *Life* magazine featured the camera and Land on its cover.

The far-reaching uses of the SX-70 system for personal photography have been well established, but professional photographers were also excited by the magic of instant imaging. For artists caught up in a wave of experimentation in the 1970s, particularly driven by a keen interest in the possibilities of color photography, Polaroid became

synonymous with cutting-edge photographic technology. The simplicity as well as the thrill of instantaneous photographic results captivated both artists and novice photographers alike. From the beginning Polaroid Corporation had encouraged artists to experiment with their medium, as Edwin Land fostered a relationship between artists and scientists, believing that the artists' point of view offered a valuable alternative to that of the company's technical staff. Land put Ansel Adams on staff as a film consultant in 1948, and grew the artist/consultant staff over the years. In the late 1960s the company developed an outreach program that provided photographers with small film and equipment grants in exchange for images presented to the permanent collection. As a result, a unique corporate collection began to emerge, and Polaroid generated an impressive collection of photographic artwork—artwork that now comprises the over 23,000-item Polaroid Collection. Some of the more prominent names represented include David Bailey, Dawoud Bey, Chuck Close, Timothy Greenfield-Sanders, David Hockney, Sarah Moon, Helmut Newton, Josef Sudek, and Rosamond Purcell. Beginning in the 1970s, exhibitions were occasionally organized using the collection as a basis. And as an adjunct to their collecting, the corporation set up a photography prize in 2000.

The diversity of photographs housed in the Polaroid Collection illustrates how artists and photographers have embraced Land's version of photographic magic. It also represents the range of films and formats developed by the company over the decades. Polaroid amplified its technological scope in the mid-1970s, with the development of the 20 × 24-inch and 40 × 80-inch instant cameras designed to produce high quality art reproductions for museums. These cameras incorporate already existing Polaroid films. Land was awarded his 500th patent in 1977. That same year, the One-Step Land camera was introduced and advertised in a series of successful television and print ads featuring popular actors Mariette Hartley and James Garner. This inexpensive fixed-focus camera became the best-selling camera in the United States, instant or conventional. In the late 1970s, Polaroid released Time Zero, a faster-developing film, to replace its popular SX-70 film. The company released Polaroid Sun 600 System cameras and Type 600 color film in the early 1980s. After leading the company for over four decades, Edwin H. Land retired as CEO of Polaroid Corporation in 1980, becoming Consulting Director of Basic Research in Land Photography.

After Land's departure, Polaroid Corporation continued to flourish in the early 1980s. By 1983, the company had reached over 13,000 employees, \$1.3 billion in sales, and more than 1,000 patents. A decade long legal battle with competitor Eastman Kodak was resolved in Polaroid's favor in 1986 when a Federal appeals court upheld its decision that Eastman Kodak violated Polaroid patent rights in the manufacture of its instant cameras and film. That same year, the Spectra System camera was introduced at Jordan Marsh department store in Boston, 38 years after the first instant Land camera was announced. Polaroid Corporation celebrated its 50th anniversary in 1987 and Edwin H. Land died in 1991, at the age of 82.

As technology manufacturing seriously declined in the United States in the early 1990s, and with the new challenge of digital photography, Polaroid Corporation has also suffered financial setbacks. Although digital camera sales made Polaroid the number one digital camera seller in the United States in the late 1990s and introduction of the I-zone, JoyCam, and PopShots cameras and films

was successful, Polaroid Corporation filed for Chapter 11 bankruptcy restructuring in October 2001. On 31 July 2002 One Equity Partners purchased Polaroid Corporation, creating a new company that now operates under the Polaroid Corporation name, thereby launching a new era for Polaroid and the legacy of instant imaging.

POPULAR PHOTOGRAPHY

Popular Photography (or Pop Photo, as the magazine is casually referred to) has long been considered the most widely circulated photographic publication in the world; its circulation hit a peak of 865,000 in 1979, and in 1999 its circulation stood at 453,000. By circulation alone, the magazine can justify its proclamation on the cover as the "world's largest imaging magazine." The magazine began publishing in May 1937, at a time when the popularity of the new 35 mm cameras was growing and two years following the introduction of Kodachrome color film by the Eastman Kodak Company. Since its inception, each monthly issue of Pop Photo has featured articles and tests on the latest photographic equipment and portfolios of important photographers.

Popular Photography had been published by the Ziff-Davis Publishing Company until 1985 when the magazine was sold, first to CBS Magazines, a division of CBS, Inc., and then to Diamondis Communications, Inc., a subsidiary of Hachette Publications, Inc. Pop Photo is currently published by Hachette Filipacchi Magazines, Inc., which also publishes American Photo. Pop Photo's publishing rival of many years, *Modern Photography*, was acquired by Diamondis Communications, Inc. in 1986 and merged into *Popular Photography* in 1989. Today, the Publisher, Editor-in-Chief, and Managing Editor of *Popular Photography* are former *Modern* staffers.

In his foreword to *The Best of Popular Photography*, published in 1979, celebrating the first 40 years of the magazine, then Editorial Director Arthur Goldsmith stated that *Popular Photography* "has been an informal teaching institution, a paperback university for anybody interested in the craft of photography" (xi). From its onset, *Popular Photography* reported on innovative photographers and technical advances in the field. And from its onset, the world of photography that Pop Photo focused on was fraught with change. The

magazine reported on the rise of what would later be labeled photojournalism, and many articles/photo essays in its first years of publication dealt World War II and images of wartime America (though with the rise of television, the interest in print photojournalism waned). After the war, the impact of photography on advertising was a major editorial trend in the magazine. As the country entered the prosperous 1950s, photography was becoming more than a hobby for many, and *Popular Photography* (along with *Modern Photography* and *U.S. Camera*) was an important showcase for new photographic talent. Through the mid-1960s, and up to the current issue, countless articles on equipment and picture-taking techniques have been helping educate readers on selecting cameras and accessories and taking better photos, with the mission to cover sports, culture, nature, portraiture, performance photography, and family photography as well as highlight the achievements of the master photographers.

Publishing highlights from *Popular Photography's* past include articles/portfolios on Alfred Eisenstaedt (1937); W. Eugene Smith (1943); Alfred Steiglitz (1946); David Douglas Duncan (1951); A memorial tribute to Robert Capa by John Steinbeck (1954); Henri Cartier-Bresson (1967); Paul Strand (1972); André Kertész (1974). And to further stimulate the readers' interest in the aesthetics of photographs, *Popular Photography*, through 1986, published a yearly *Photography Annual*, which featured portfolios of rising and major talents in the photography-world.

The current generation of Pop Photo readers would claim, as previous generations have, that the success of *Popular Photography* is in its equipment reviews and how-to photographic advice. But the magazine appeals to all areas that might be of interest to the picture-taking public. Each year the magazine devotes its December issue to in-depth reports on the year's top cameras and lenses, and

its January issue presents the Annual International Picture Contest, where the editors select and publish 50–75 images from the tens of thousands that readers have submitted to the magazine. The editors of *Popular Photography* write articles that help their readers take better photographs and to successfully navigate through the ever-changing world of film and digital photography: Recent articles include *How To Shoot Pro Portraits*, *Nine Pros Show Why and How to Use Autofocus*, *Online Photo-processing: Wonders or Blunders*. Monthly Departments featured in *Popular Photography* include, *Your Best Shot*, an ongoing photo contest/column where each month the best of readers' submitted images are published; *Point & Shoot*; *Just Out*; *What's On*; *Sint's View*, a column where technical advice and analysis for professional/advanced photographers is given; *Nature*, a column where detailed information about taking successful nature/landscape shots is given; *The Camera Collector*, classic cameras from eras-gone-by are discussed and pined for; *Digital Hands On*, which features reporting and testing of new digital equipment; and *Web Watch*, a discussion of the best photo-related sites on the internet. Also, of much interest to its readers is the fact that many mail-order firms specializing in photography advertise in *Popular Photography*, offering great variety and some hard-to-beat prices.

Popular Photography is looking toward the photographic future with articles and special semi-annual issues on digital technological breakthroughs that will be influencing and changing the art of picture taking and image making. Along with

technical reports of the latest film-based cameras and lenses, *Popular Photography* is reporting on the latest crop of digital cameras, scanners, printers, and software. But as much as *Popular Photography* looks forward, the magazine is always mindful of where it came from; each month *Popular Photography* features a department *Time Exposure*, bringing the readers back in time by reporting on what was featured in magazine 25 and 50 years ago. In 2001, *Popular Photography*, renamed *Popular Photography & Imaging*, is at the forefront of a rapidly changing photographic medium and industry. And after 65 years of successful publication history, neither *Popular Photography*, nor the popularity of—nor fascination with—picture taking, shows any signs of fading away.

ELIOT PORTER

American

Eliot Porter, known for his color photographs of nature, is credited as being the twentieth century's first serious practitioner of color landscape and nature photography. In some ways his career was very straightforward and in others it was filled with tension. Among the obstacles that Porter faced was the stigma of being a color photographer in the mid-twentieth century when black-and-white was

the accepted medium of serious artists. Yet Porter's commitment to color allowed him to amass a significant body of work that balances a love of science and nature with a desire for precision and creative expression. His photographs simultaneously pique curiosity about the many splendors of the natural world and make the potentially ordinary gleam as extraordinary.

Eliot Furness Porter was born on 6 December 1906 to an upper-middle class family living in the

suburbs of Chicago. He was the second of the five children of James Foster Porter, an architect and biologist, and Ruth Wadsworth Furness Porter, a social activist. Porter's love of nature was fostered at an early age by family trips and summers spent on their island in Maine, Great Spruce Head. His father's interest in probing aspects of the natural world in addition to an influential high school teacher led Porter to pursue a bachelor's degree in chemical engineering and an M.D. from Harvard Medical School. Porter explained that, "about this time I developed a capacity for observation that has lasted all my life" (Porter 1987, 22–23). From 1929 to 1939, Porter researched and taught bacteriology and biophysics at Harvard and then at age 33 abandoned his scientific career to follow his passion for photography.

Porter had begun photographing around age 10 and received his first camera, a Brownie, as a Christmas gift from his parents. He soon advanced to a Kodak with a faster shutter speed and eventually to a Graflex single-lens reflex. He and a boyhood friend photographed all kinds of birds on Great Spruce Head Island assisted by a canvas blind that Porter's mother helped them construct. He was in his late 20s when a colleague introduced him to the expanded capabilities of the 35 mm Leica camera with a shutter speed of 1/1000 second, and he promptly purchased a Leica for himself. The next significant acquisition was a view camera after seeing Ansel Adams's *Frozen Lake and Cliffs, The Sierra Nevada, Sequoia National Park, California* (1932). He met Adams at a dinner party and proudly showed his work. Porter relates, "That was a traumatic and embarrassing experience; I saw immediately how vastly superior his photographs were to mine, and how little I know about photography technically, or what its potential was for creative expression (Porter 1987, 27).

At Adams's suggestion, Porter purchased a larger format 9 × 12-cm Linhof. This was a life-changing experience, although not as significant as his 1938 meeting with Alfred Stieglitz.

Porter had shown his photographs to Stieglitz on a number of occasions, originally at the suggestion of his younger brother Fairfield Porter, a well-known realist painter living in New York. Stieglitz consistently commented that he must work harder. Finally, on his fourth visit, Stieglitz announced that he wanted to show Porter's pictures of Switzerland, Austria, and Maine in his already legendary gallery, An American Place. In addition to the great honor of being only the third photographer he showed in the gallery (after Adams and Paul Strand), Stieglitz paid Porter a very high compli-

ment: "Some of your photographs are the first I have ever seen which make me feel: 'There is my own spirit.' Quite an unbelievable experience for one like myself" (Letter dated January 21, 1939). The following year, due to his frustration with research and the realization of his artistic potential, Porter became a photographer full time.

His ongoing passion for photographing birds led Porter to break new ground in color photography in the 1940s. His first advancement with bird photography was to independently develop a system that synchronized the flash and the shutter to achieve higher quality photographs. When he approached Paul Brooks, editor-in-chief at Houghton Mifflin, about the possibility of publishing a book of these photos, Brooks stated that the images would need to be in color. Such a project presented significant technical challenges: the slower speed of color film, the more complicated printing process, and almost prohibitive cost of color publishing. Although he did not publish a book on birds until 1953, this continuing project sparked his zeal for color photography.

Porter in fact had a hand in the development of the popular film Kodachrome, which featured highly saturated, bright colors and became extremely popular with amateur photographers after its introduction by Kodak in 1936. He worked with the inventors to shoot test materials; he later also worked with Kodak scientists to test and perfect, and in 1946, developed the Ektachrome emulsion. A transparency or positive film, Ektachrome was highly compatible with the dye transfer process. The introduction of Kodachrome sheet film in 1938 expanded the opportunities for working photographers. Early on, many artistic photographers seemed excited about the possibilities of color, but later their reactions ranged from tepid to scathing; Kodachrome's highly saturated colors and tilt toward accentuated reds was felt to be too commercial, or appropriate only to the amateur. Stieglitz, for one, decided not to give Porter a second show because he felt his color bird photographs did not fulfill his artistic potential.

Ansel Adams also voiced considerable disapproval with the medium. Adams' opinion as regards to color might have been related to the limited success he was able to achieve compared to his black-and-white work or to the rivalry caused by the increasing popularity of Porter's work in color (Rohrbach 2001, 99 and 102). Even so, the schism between the mediums became significant, with color often seen as less expressive and artistic and black-and-white as noble and eternal.

Meticulous in his process, Porter always strove to capture the natural color of the scene in his final

prints, countering Adams's comments that color was too close to nature by pointing out the great degree of control the dye-transfer process afforded, a process Porter practiced at a particularly high level. Now largely obsolete, dye transfer allowed meticulous adjustment of color through the use of three separations or negatives for each color (cyan to print red, magenta to print green, and yellow to print blue). As one of the first photographers to work almost exclusively in color, Porter was able to produce ravishing and archival color prints through this process. And unlike many of his contemporaries who saw the natural splendors of the landscape as something to excerpt and freeze in almost abstract qualities of black-and-white, Porter approached his natural subjects as a means signifying the larger interconnectness of life.

Porter's photography became his license to see the world. Throughout the 1950s and 1960s he explored the terrain of the Americas including Mexico and Baja California; Glen Canyon, Utah, and the Grand Canyon; Adirondack Park, New York; the Great Smoky Mountains National Park, and Red River Gorge, Kentucky. From 1965 to 1980 he traveled to some of the most exotic and remote places in the world to take photographs: Galápagos Islands; Greece and Turkey; Africa; Iceland; Egypt; Antarctica; China and Macao. The subjects he investigated while on these trips significantly expanded his repertoire beyond birds and landscapes and included vistas, animals, architectural monuments, and people. Perseverance paid off and he was able to turn his photographs of most of these excursions into books. His first immensely successful publication, *In Wildness is the Preservation of the World* (1962), set the standard for a new style of books with high-quality reproductions combined with texts in a non-linear way. One of the first popular photographic "coffee table books," this lavish volume was also the first art book published by the environmental group, Sierra Club. It was through this project that Porter became associated with the Sierra Club; he joined Ansel Adams on their Board of Directors in 1965. Although Porter is associated with environmentalism and conservation, his ultimate success flowed from his independent vision. In 1986, after retiring from photography, he said, "You have to take the best pictures you can, what moves you most" (Hester 1986).

Another of Porter's influential volumes was *The Tree Where Man Was Born and the African Experience* with author Peter Matthiessen. Published in 1972, this was one of the first color nature books that conveyed the interrelatedness of man, the natural world, and animals, and showed a full range of

the daily life of African herdsmen, anthropologists and other scientists at work, animal behavior (including dramatic photos of a cheetah kill), and landscapes of Tanzania.

Eliot Porter's archives are held by the Amon Carter Museum in Fort Worth, Texas. The archive includes photographic material from 1939–1990, papers from 1866–1993, and an 1100-volume personal library. A detailed account of the archive's holdings can be accessed online <http://www.cartermuseum.org/collections/porter/index.php>. Porter died in Santa Fe, New Mexico, 2 November 1990.

Biography

Born in Winnetka, Illinois, 6 December 1901. Attended New Trier High School, Kenilworth, Illinois, 1918–1920; Morristown School, New Jersey, 1918–1920; Harvard University, School of Engineering, Cambridge, Massachusetts, 1920–1924, B. S. 1924; Harvard Medical School, 1924–1929, M. D., 1929; advanced study of biochemistry, University of Cambridge, England, 1926; self-taught in photography. Instructor and researcher in Biochemistry and Bacteriology, Harvard University and Radcliffe College, Cambridge, 1929–1939. Married Marian Brown, 1926 (divorced 1934). Married Aline Kilham, in 1936. Freelance photographer, Cambridge, 1939–1942; war work on radar development, Radiation Laboratory, Massachusetts Institute of Technology, Cambridge, 1942–1944; Member, Board of Directors, Sierra Club, San Francisco, 1965–1971. Recipient: Guggenheim Fellowship, 1941, 1946; Silver Plaque: Wildlife Photography Award, *Country Life International Exhibition*, London, 1950; Conservation Service Award, United States Department of the Interior, 1967; Distinguished Son of Maine Award, 1969; Associate Fellow, Morse College, Yale University, New Haven, Connecticut, 1967; Fellow, American Academy of Arts and Sciences, 1971. Honorary Degrees: D.F.A., Colby College, Waterville, Maine, 1969; LL.D., University of Albuquerque, New Mexico, 1974; D.Sc., Dickinson College, Carlisle, Pennsylvania, 1979. Died in Santa Fe, New Mexico, 2 November 1990.

Individual Exhibitions

- 1936 *Exhibition of Photographs by Eliot Porter*; Delphic Studios, New York, New York
- 1939 *Eliot Porter—Exhibition of Photographs*; An American Place, New York, New York
- 1940 *Exhibition of Photographs by Eliot Porter*; Museum of New Mexico, Santa Fe, New Mexico
- 1942 *Photographs by Eliot Porter*; Katherine Kuh Gallery, Chicago, Illinois
- 1943 *Birds in Color: Flashlight Photographs by Eliot Porter*; Museum of Modern Art, New York, New York, and traveled to Museum of Natural History, Chicago, Illinois; Orchestral Hall, Boston, Massachusetts

PORTER, ELIOT

- 1944 *Photographs by Eliot Porter*; National Audubon Society, New York, New York
- 1946 *Leaders in Photography: Eliot Porter*; University of Virginia, Charlottesville, Virginia, and traveling
- 1953 *Birds in Color: Photographs of Eliot Porter*; American Museum of Natural History, New York, New York, and traveling
- 1960 *The Seasons: Color Photographs by Eliot Porter Accompanied by Quotes from Henry David Thoreau*; George Eastman House, Rochester, New York, and traveling
- 1971 *Photographs by Eliot Porter*; Princeton University Art Museum, Princeton, New Jersey
- 1973 *Eliot Porter Retrospective*; University of New Mexico Art Museum, Albuquerque, New Mexico, and traveling
- 1980 *Intimate Landscapes*; Metropolitan Museum of Art, New York, New York
- 1987 *Eliot Porter*; Amon Carter Museum, Fort Worth, Texas, and traveled to Bowdoin College Museum of Art, Brunswick, Maine; Huntsville Museum of Art, Huntsville, Alabama
- 1998 *A Passion for Birds: Eliot Porter's Photography*; Amon Carter Museum, Fort Worth, Texas
- 2003 *Eliot Porter: The Color of Wildness*; Amon Carter Museum, Fort Worth, Texas

Group Exhibitions

- 1938 *Fifth International Salon of Photography*; Pictorial Photographers of America, American Museum of Natural History, New York, New York
- 1939 *Sixth International Salon of Photography. Centennial Exhibition of Photography 1839–1939*; Pictorial Photographers of America, American Museum of Natural History, New York, New York
- 1940 *Sixty Photographs*; Museum of Modern Art, New York, New York
- 1940 *Seventh International Salon of Photography*; Pictorial Photographers of America, American Museum of Natural History, New York, New York
- 1946 *The Camera's Eye*; Museum of Fine Arts, Museum of New Mexico, Santa Fe, New Mexico
- 1950 *The Second Country Life International Exhibition of Wildlife Photography*; Central Hall, Westminster, London, England
- 1955 *This Is the American Earth*; LeConte Lodge, Yosemite Valley, California
- 1957 *Madonnas and Marketplaces: Mexico in Color*; Lime-light Gallery, New York, New York
- American Spirit*; Kongresshalle, West Berlin, Germany, and traveled to Amerika Haus, Essem, West Germany; and Amerika-Haus, Munich, West Germany
- 1960 *Photography at Mid-Century*; George Eastman House, Rochester, New York
- 1962 *An Exhibition of Photographs: Laura Gilpin, Eliot Porter, Todd Webb*; Museum of Fine Arts, Museum of New Mexico, Santa Fe, New Mexico
- 1963 *Spectrum*; George Walter Vincent Smith Art Museum, Springfield, Massachusetts, and traveled to Kansas State Teachers College, Emporia, Kansas; University of Oregon, Eugene, Oregon; Atlanta Public Library, Atlanta, Georgia; Paterson State College, Wayne, New Jersey; Krannert Art Museum, University of Illinois, Urbana, Illinois; Hill School, Pottstown, Pennsylvania; Art Museum, Carnegie Institute, Pittsburgh, Pennsylvania

- 1963 *The Photographer and the American Landscape*; Museum of Modern Art, New York, New York
- 1965 *Selections from Photography in the Fine Arts Collection*; World's Fair, Eastman Kodak Pavilion, New York, New York
- 1975 *The Eye of the Beholder*; International Center of Photography, New York, New York
- Photography in America*; Whitney Museum of American Art, New York, New York
- 1976 *The Land: Twentieth Century Landscape Photographs*; Victoria and Albert Museum, London, England, and traveled to National Gallery of Modern Art, Edinburgh, Scotland; Ulster Museum, Belfast, Northern Ireland; National Museum of Wales, Cardiff, Wales
- Antarctica*; 59th Street Gallery, St. Louis, Missouri
- 1977 *The Great West: Real/Ideal*; Fine Arts Department, University of Colorado, Boulder, Colorado
- 1978 *Alfred Stieglitz and "An American Place,"* Zabriskie Gallery, New York, New York
- The Art of Seeing: Photographs from the Alfred Stieglitz Collection*; Museum of Modern Art, New York, New York
- Mirrors and Windows: American Photography Since 1960*; Museum of Modern Art, New York, New York, and traveling
- 1980 *Color Photographs by Marie Cosindas and Eliot Porter*; Art Institute of Chicago, Chicago, Illinois
- Color as Form*; Corcoran Gallery of Art, Washington, D.C. and traveled
- 1986 *Retrospective: Eliot Porter and Beaumont Newhall*; Photo Gallery International, Tokyo, Japan

PORTRAITURE

No genre flourished in the medium of photography quite like the portrait. Both photography's questioned status as an art form and the portrait's low place on academic painting's hierarchical scale allowed the portrait photograph to garner tremendous popular appeal. And despite all the innovations that have developed since its inception, photography has continued to be associated with representing people. In "*A Short History of Photography*" (1931) Walter Benjamin writes, "the renunciation of the human image is the most difficult of all things for photography." Given this affinity for portraying people, it perhaps is not a coincidence that photography became associated with democratic ideals. It has become a truism in the history of photography that its invention was coincident with and a part of the lower and middle classes' rise to cultural and political visibility. Photography aroused and satisfied the desire for portraits that were relatively inexpensive and quickly produced, but still could evoke aristocratic prestige.

Portrait photographs are so central to and embedded in contemporary visual culture they often go unnoticed. Portrait photographs provide the visual structure upon which the narrative of identity is constructed. Yearbook photos, identity cards, and wedding pictures—these are just a few of the images that frame the individual in the portrait's frame of recognition.

The portrait had a long history as a painted representation before the advent of photography.

Forms of portraiture existed in antiquity, but the image many would recognize as a portrait—a life-like depiction of a person frontally posed to display the individual's distinct facial features and distinct expression—is an inheritance from the European Renaissance, which celebrated the exemplary individual and perfected the depiction of three-dimensional perspective. Portraiture was assumed to be a mimetic art form based on physical resemblance, but this did not impede it from becoming a crucial part of the symbolism that announced and legitimized the European aristocracy. Though the portrait photograph clearly borrowed from the painted portrait's image repertoire, it also developed its own visual discourses as photographers experimented with and discovered the particular qualities of the photographic medium and rapid technological improvements made it an accessible and then unquestioned part of daily life.

Historians and theorists of photography in the late twentieth century have questioned the assumption that the portrait photograph offered unqualified access to a democratic public sphere. In his essay "The Body and the Archive" (1986), Allan Sekula acknowledges that photography expanded the portrait's "ceremonial presentation of the bourgeois self" but he also reads the portrait photograph dialectically, arguing that it operated both "honorifically and repressively." While portrait photography constructed a social archive that reinforced the importance of possessing and presenting an

“honorable” self, it defined itself against a shadow archive, which included “the poor, the diseased, the insane, the criminal, the nonwhite, the female, and all embodiments of the unworthy.” In his study *The Burden of Representation*, historian John Tagg aligns photography with institutions developed for observing, disciplining, and producing the modern subject: schools and factories, hospitals and prisons. Both Tagg and Sekula rightly argue that one cannot fully understand the phenomenon of the portrait photograph as it developed in the nineteenth century without considering its close ties to physiognomy and phrenology, which deduced moral character from physical features.

Mathew Brady and Nadar, two nineteenth century figures who pioneered portrait photography in America and France, respectively, created bodies of work that suggest that portrait photography lends itself to the creation of cultural archives, thus performing a documentary purpose not envisioned by the photographer while making his pictures. This tendency is exemplified by the work of German photographer August Sander. A professional portrait photographer, for Sander photographic portraiture became a tool for seeing, studying, and documenting how the individual is shaped by and placed within culture and history. In his portrait archives *Anlitz der Zeit* (*The Feature of Time*, 1929) and *Menschen des 20. Jahrhunderts* (*People of the Twentieth Century*)—which was not completed due to the rise of Hitler’s Third Reich—Sander sought to delineate the visual outline of Weimar Germany’s social order. If Tagg’s claim that “[t]he portrait is a sign whose purpose is both the description of the individual and the inscription of social identity” is true, we would have to say that Sander’s austere portraits depict individuals, but their individuality is secondary to Sander’s attention to social identity and type. Withholding his portrait subjects’ names, Sander instead titled his photographs according to the social type or occupation the subjects represent. *Young Woman, Revolutionaries, Working Student, The Painter, Communist, Young Mother, Middle Class*. Each portrait is distinct, but Sander’s archives work by the logic of comparison, as the mechanisms of social hierarchies become evident in the differences and similarities between the images, especially in the clothing, posture, and placement of the subjects. Graham Clarke compares *People of the Twentieth Century* to a “social map” for identifying “a hierarchy of social position and status within the dominant culture.” Confiscated by the Nazis and commended by Benjamin as a training manual for understanding imminent social codes, it is tempting to read subversion within Sander’s stoic, incisively detailed por-

traits. However, it is more accurate to claim that this work substantiates Sekula’s contention that the portrait photograph operates both “honorifically and repressively” as Sander’s portraits rely on a latent physiognomic logic and fix individuals into social types—tenets of Nazi racism—while they also delineate the actuality to class structure and oppression and place the working classes in the frame of cultural visibility.

Modernist visual art’s splitting of the sign from its referent challenged the mimetic premise of the portrait photograph, which relies on securing the relationship between physical and actual “appearance” of the individual and the portrait’s visual representation. In “Residual Resemblance: Three Notes on the Ends of Portraiture” (1994), Buchloch explains that “[i]n portraiture, a seemingly natural and guaranteed nexus between object and representation had appeared particularly evident: in fact, mimetic resemblance had been one of the category’s founding conditions.” It is the painting movement Cubism that dismantles the portrait’s mimetic foundation, as Pablo Picasso’s Cubist “portraits”—and particularly the depictions of his dealers from 1910—only include representations of their facial features to suggest their vanishing significance. The portrait photograph, however, remained a frequent, if not dominant part of modernist projects. For self-consciously modern and avant-garde artists, portraiture was a way to imagine and simulate familial relations among peers and document the intersubjective dimensions of collaborations. In Alfred Stieglitz’s circles, photographers made portraits of each other to build an image of collective pursuit and affinity. The twilight grays and crafted tones of Pictorialist portraits were well suited to the artistry Stieglitz and Edward Steichen hoped to bring to the photograph. Even figures associated with highly experimental forms in the 1920s and 1930s such as Man Ray, Florence Henri, Maurice Tabard, and Jaromir Funke made numerous portraits. Man Ray photographed key figures in the European avant-garde as though seeking to test the portrait’s expressive range. A statement written by André Breton encapsulates Ray’s approach: “The portrait of a loved one should not be only an image at which one smiles but also an oracle one questions.” The most famous of Man Ray’s portraits are those of Marcel Duchamp performing as his feminine alter ego Rrose Sélavy (1923–1924). In these portraits, Duchamp looks like a fashion model; (s)he wears a hat decorated with a black-and-white geometric pattern, and his graceful hands and ringed fingers are elegantly poised around a fur collar to draw attention to his made-up lips and

eyes. Similar in spirit to the self-portraits of the surrealist Claude Cahun, Ray's portraits of Duchamp reveal the self to be a malleable surface receptive to performance, resistant to a fixed gender identity, and capable of continual change, an arena that was to be thoroughly explored in the late decades of the twentieth century.

Twentieth century American portrait photography was less explicitly experimental, more likely to be rooted at least in the idea of depicting actualities. Jacob Riis, who began as a police beat photographer, depicted immigrants living in New York tenements with the express aim of changing conditions and enacting more progressive social policies. A generation later, Lewis Hine began his work as a social photographer when he photographed immigrants arriving at Ellis Island. In 1908, Hine went to work for the National Labor Committee and documented children working in dangerous, exploitative conditions. Both Riis and Hine created photographs of people that reveal their place within social, historical, and economic circumstances, and ideas of both human singularity and shared collectivity—embedded in the history and concept of the portrait—informed their work. As would Sander in Europe, Riis and Hine expanded the literal and figurative frame of the portrait to include the subject's surroundings, often with the idea of soliciting the public's sympathetic gaze.

Influenced by Hine's social conscience and Stieglitz's romantic modernism, the work of Paul Strand is best known as a fulfillment of "straight photography," with its austere attention to abstract forms. But Strand created some of the century's most compelling and well-known portraits, *Blind* (1916), featuring a blind beggar woman, and *Portrait, Washington Square Park* (1916), depicting a wizened, introspective, well-dressed woman. Strand's clear, scrutinizing focus and narrow framing seem to detach these portrayals from the world of human interaction.

Because there was in the early years of the century (which continues today) the need to depict the actuality of human suffering, portraiture was an important but implicit part of the documentary projects commissioned by the Farm Security Administration in the 1930s. In *Let Us Now Praise Famous Men* (1936), Walker Evans managed to create images of the farmer families that are revealing but not exploitative. In another of the century's most famous portraits, *Annie Mae Burroughs, Hale County, Alabama, 1936*, Evans created a subtle but compelling design as the shapes and lines of her eyes, mouth, hair, collarbones, and clothing seem to reverberate from the pattern of wood she is posed against. These design elements are second-

ary, however, to the photograph's focus on the complexity of Burrough's expression, which is fragile and stoic at the same time.

Evans had a talent for creating photographs that comment upon the portrait's place within cultural imaginaries and narratives. *Faces, Pennsylvania Town, 1936* places the profiles and inquiring looks of two young rural men in contradistinction to a barely focused crowd behind them. His iconic image *Penny Picture Display, Savannah, 1936*, packed with small head-and-shoulder studio portraits, reveals how standardized and commodified the twentieth-century self had become and comments upon the portrait's role in standardizing the visual form in which that commodification appears.

Though not often identified as such, portrait photography is a prevalent aspect of contemporary art photography, particularly when the politics of racial, sexual, and class identities are under scrutiny. In the 1980s, artists placed the portrait in a cultural and psychic field bordered by two intentions: highlighting the various social forces that impinge upon identity construction and enacting the subversive possibilities of performance. Nan Goldin's *Ballad of Sexual Dependency* (1986) is an extended group portrait of the lower East Side's sexual underground, and the self portrayed in the photographs' thick velvet colors is masked, bruised, and tragically posed in the search for emotional and sexual fulfillment. In the late 1980s and early 1990s, Cindy Sherman continued her investigation of self-portraiture by photographing herself within the poses and garish costumes of Old Masters' paintings. With prosthetic noses and breasts, wigs, and thick, obvious makeup, Sherman does not disappear within these images but excavates and highlights the gendered physicality repressed by their "old master" status.

Many contemporary photographers draw on the portrait to confront the predictability of viewers' perceptions. The early work of Lorna Simpson refutes the portrait's expected focus on the face by photographing African-American women with their backs turned or their faces covered with words and phrases of uncertain meaning. These "anti-portraits" suggests that the perceptual apparatus for seeing and naming African-American women is perpetually inadequate. Nikki S. Lee and Tomoko Sawada reproduce the self's ability to stage itself within the theatres and factories of identity, implicitly critiquing both the assumed malleability and invisibility of Asian-American women. At another pole of intention, the German photographer Thomas Ruff creates bare and grand, larger-than-life portrait photographs, hyper-real with detail that seem to reduce place, history, and culture to the particularities

Imogen Cunningham, Subway, New York, 1956, gelatin silver print, 22.6 × 19.5 cm, Museum Purchase.

of the individual face. But whether or not contemporary artists self-consciously critique the portrait and the discourses, institutions, and histories it participates reinforces, the continued—and surprising—appearance of this conservative genre in contemporary art expresses anxiety about the loss of a generalized frame in which the particular, self-determining individual can be recognized.

POSTERIZATION

Following disclosure of the technique in 1932 by Witold Romer in Poland, posterization emerged as a creative printing technique. As photographic materials improved, the method increased in popularity and was often described as tone separation. Instead

of relying on a full range of graduated tones, the camera negative was modified to ensure the posterized print only used a limited number of tones. The boldness of presentation and the graphic representation of the original justified the description of

posterization, creating something with the strong graphic qualities and visual impact of a poster.

When Romer first drew attention to the possibilities of manipulating the negative, he described his results as "*Izohelia*"—a Polish term derived from the Greek, implying equal areas of light. Romer and his colleagues published improvements to the process until the outbreak of World War II, by which time Romer was working in England on applying his *izohelia* process to map making.

Shortly after the war, Ralph Aubrey of Manchester, England, re-examined the process to recommend improvements. His examples demonstrated that tone separation had a valid place in contemporary pictorial photography, and by publishing in *Amateur Photography*, Aubrey ensured a wide distribution for his ideas and many photographers began to present posterized images in various important exhibitions.

The post-war renaissance of posterization techniques was acknowledged in Poland, where the Union of Polish Photographic Artists organized an international salon in November 1957 to commemorate 25 years of posterization. Six European countries exhibited 81 entries, but not all the submissions were especially good examples, many subjects not being well-suited to the technique. Those who mastered the intricate method soon became skilled in selecting subjects that were suitable for the bold treatment of creating a photograph composed of no more than black, white, and two tones of grey, however, and by the second salon in 1962, the contributions displayed an improved understanding of the process, with formal portraits responding particularly well to the treatment. Five years later, the third international salon attracted 128 works from 10 countries. To commemorate the 40th anniversary of the process, the Association of Polish Art Photographers staged "*40 Lat Izohelii*" in memory of Romer, who had died in 1967. For the first time, the exhibition included examples in full color.

Romer once referred to posterization as "this rather absorbing technique" and asserted "its difficulty makes it rare, and therefore attractive." To prepare a conventional negative for posterization called for four distinct phases before the final picture could be contemplated. In stage one, five prints were made on a hard grade of bromide paper at different exposure times, so that all the negative detail was transferred to the positive form, albeit spread over different prints. Scrutiny of these prints allowed unwanted elements of the composite picture to be discarded.

By using the contact printing method with a hard grade of bromide paper, the selection of positive

prints was converted into negative prints of very high contrast, and the "negatives" intended to create the highlights (white), and the shadows (black) in which the posterization could be identified. Any other of the negative prints could be eliminated. (Note that if three negatives were used, the final photograph appeared in four tones; that is, black, white, and two shades of grey. Similarly, two negatives provided three tones of white, grey, and black.)

The negative prints were again printed by contact onto bromide paper, creating a new set of positives with enhanced contrast and maximum density. In the last step, the final negatives were made on lith-type process film, which retained the detail of the original paper prints, but distributed over separate film negatives. The final printing stage demanded craftsmanship, patience, and darkroom skill as each of the prepared negatives was exposed, one after the other, onto a single sheet of photographic paper.

In this process, the highlighted areas received no exposure and remained white, whereas the small areas that provided the shadows had to achieve sufficient exposure to produce full black. Any intermediate negative, intended to produce two grey tones, relied on receiving the minimum printing exposure consistent with a good balance of densities, that is, the separation of tones that produced the effect of posterization.

Prior to printing, it was customary to enlarge the individual negatives to the size of the photographic paper, and to sketch outlines on a piece of drawing paper as an aid to subsequent registration. Of course, after exposing the first negative, the photographic paper had to be removed for safekeeping during the changeover for the re-alignment of the second and subsequent negatives. In using this technique, the final work is unique as a result of the demands of preparation and the intricacies of printing multiple negatives in register. Because the various exposures had a cumulative effect in those parts where there were overlaps in the negatives, note-taking was advisable.

In 1964, R. M. Callender used the process to assess the effectiveness of street lighting. His results provided graphic representations of the illumination distributed on the road surfaces, and in time, he calibrated the brightnesses to evaluate features of the installation. To produce prints in quantity, he evolved a method that achieved the effect of posterization at a single printing exposure.

In making the final negatives, Callender processed to a predetermined low density and assembled his pack of films, usually no more than four, to create a composite negative. When it was necessary to remove one of the low-density negatives, an adjustment

POSTERIZATION

to the grade of printing paper was introduced as compensation. Occasionally the technique of posterization was used, advantageously, on indoor subjects.

By the 1970s, Wladyslaw Marynowicz, (who came from Poland but worked in England as a photographic instructor), had conducted experiments at Ealing Technical College, Middlesex, England, and was producing posterized prints in full colour. Because of his mastery of photographic printing, he was able to select subject matter, such as animals and simple portraits, which responded to his techniques.

Nowadays, posterization can be achieved at the press of a button on computers, which will just as readily provide the results in two, three, four, or more levels of posterization...and in full colour. As a photographic process, with justification, it remains rooted in the twentieth century.

POSTMODERNISM

It is important to distinguish between a postmodern style and the postmodern age. Even after distinguishing between these two ways the term can be used, it remains an elusive concept, as the tenets that characterize postmodern are still evolving. The use of this term *vis-à-vis* photography does not so much distinguish a style, such as Pictorialism or the f/64 group, but an aesthetic environment in which images are produced, presented, and consumed.

A Sociohistorical Age

As Richard Appignanesi and Chris Garratt point out, the Latin origins of "post" and "modern" translate "postmodern" into "after just now." As a historical period, many consider the postmodern age to have origins alternately in the 1950s or 1970s, though some place it even earlier. Postmodernism has numerous other designations, including describing consumer society, image society, information society, society of the spectacle (Guy Debord), postindustrial society (Daniel Bell), and what Fredric Jameson calls multinational, or late, capitalism. In all cases, however, what is described is a change

in the way we think about society and our place in it. Jean-Francois Lyotard describes a cognitive paradigm shift from the age of "metanarratives" (grand theories or stories upon which the West has predicated itself) to an age in which these narratives, which privilege the western, white, male subject, have been decentred, or deconstructed (see Jacques Derrida for his concept of trace, or *différance*; Judith Butler on gender theory; and Gayatri Chakravorty Spivak on postcoloniality). Generally, this means that today many people in the West believe there is no absolute authority or system of values or beliefs that retains validity across all cultures and nations. The legitimization of one subjectivity and subsequent subordination of others is spurned; the validity of traditional approaches is radically challenged and subverted. So-called objective truths are shown to be couched in elaborate ideological constructions that invest power in the order of history, hierarchy, and episteme. Another way of thinking about postmodernism is to draw shapes with a stencil, and then remove the stencil: the resulting figures seem to be floating in space, disconnected from markers that would invest them with a sense of original or comparative

value. Jameson refers to this change as well when he refers to modernism as being characterized by production, and to postmodernism as being characterized by “the consumption of sheer commodification as a process.” What we are driven to consume is no longer the product, as much as the assembly line; that is, the desire to desire goods and services.

A Characteristic Style

As products are mass-produced, the value, and status, of what was once considered the “original” becomes redundant or irrelevant. For photography, as well as in other disciplines, postmodern themes manifest themselves stylistically in a variety of ways: a mixing of high and low cultures, including pastiche, bricolage, chance, ambiguity, parody, and irony; a subverting of classical narratives leading to focuses on multiplicity, fragmentation, schizophrenia, marginalia, minutia, and peripheries; and a stretching of or playing with traditional forms or codes, such as that which accompanies self-reflexive, metafictional, and intertextual modes. These techniques can result in a sense of “lived experience” which, postmodernists claim, is more representative of reality than are the styles of realism that give accounts of the mechanics of everyday life. There is a sense of empowerment, as well as joy, that comes from the reconstitution of historical or canonized texts, such as, in literature, Joyce Carol Oates’s rewriting of Henry James’s *Turn of the Screw*, and Kathy Acker’s rewriting of Charles Dickens’s *Great Expectations*. In most cases, postmodern style exhibits a “new kind of flatness or depthlessness, a new kind of superficiality in the most literal sense” (Jameson 1991, 9), a “waning of affect” that pervades commodity culture. This can be seen in, for example, Andy Warhol’s paintings and Laurie Anderson’s performance pieces, which thwart viewers’ expectations. It can be said that postmodern style grew from revolutionary thinking in architecture; indeed, Frank Gehry’s ideas of creating an architectural subject that cannot be adequately represented by a single photographic angle suggest the postmodern problematizing of perspectival frames. In her self-portraits, Cindy Sherman uses the techniques of defamiliarization to subvert classical and patriarchal codes.

Postmodernism and Photography

The photograph itself can be seen as a defining emblem of a postmodern aesthetic and age:

So it is that in our architectural histories and journals, we consume so many photographic images of the classical or

modern buildings, coming at length to believe that these are somehow the things themselves....All the more so is this true with color photography, where a new set of libidinal forces comes into play so that it is no longer even the building that is now consumed, having itself become a mere pretext for the intensities of the color stock and the gloss of the stiff paper. ‘The image,’ said Debord in a famous theoretical move, ‘is the final form of commodity reification’; but he should have added, ‘the material image,’ the photographic reproduction.

(Jameson 1991, 125)

The technology of photography, as well as the reproduction itself, naturally addresses issues of representation: the original and the copy, the authentic and the fake. But it also problematizes the issue of dominating discourse, power, and point of view. Postmodern photographers, such as David Hockney and Barbara Kruger, highlight these issues using irony, parody, and doublecoding. The technology of photography, of representation, is itself acknowledged and often addressed, making visible

Cindy Sherman, *Untitled*, 1982. Original in color. [Tate Gallery, London, Great Britain, Courtesy of the artist and Metro Pictures]

POSTMODERNISM

the traditional assumption that the medium is an empty conveyer of pure, unaltered reality. In fact, because of the photographer's lack of absolute control and domination over the final product—what develops into the photograph often produces unintended effects, in subject and in interpretation—photography is extremely important to gaining an understanding of postmodern elements, including discourses of domination, ownership, authorship, representation, and chance (Jameson 1991, 214).

RICHARD PRINCE

American

Richard Prince's photographs are documentations of the widely available, shared subject matter of mass-circulated, printed images. He is an important figure among both appropriation and conceptual photography movements of the mid- to late-1970s in the United States. His re-presentations of popular, frequently recognizable photographs have provoked a re-consideration of authorship and photography.

Prince has pinpointed his interest in art as beginning with the famous *Life* magazine spread of Hans Namuth's photographs of Abstract Expressionist painter Jackson Pollock. It was more the lifestyle of the artist, with its emphasis on individuality and freedom that appealed to him than the idea of working in any specific medium. He began his career using photography in the early 1970s. After college in Maine, he moved to New York and was employed in the clipping ser-

vice or "tear sheet" department of Time-Life publications. The job gave him access to thousands of printed images, which he re-photographed in a makeshift studio he surreptitiously had set up in the basement of the Time-Life building, and presented as new artwork. He slightly altered the cropping, lighting, and angle of the originals, escaping accusations of illegal reproduction and hinting at the seduction and stereotypes of mass media. As a result, he created works that are copies and yet that can simultaneously exist independently as unique photographs.

During the 1970s, Prince used found images to create collages, which as an art form relies primarily on the device of juxtaposition. In an early foray into what would become his signature style, Prince took four pictures of commercial photographs of living rooms from *The New York Times Magazine* and presented them in a uniform line. The re-presentation, (*Untitled*) *Living Rooms*, 1977, prompts the

viewer to acknowledge the monotonous, frequently serialized repetition of mass media. The work also refers to the reproduction potential inherent to the medium of photography, an important area of philosophical investigation during the last decades of the twentieth century. Prince presents duplicate photographs of what appear to be duplicate living rooms, implying that the elements of modernity are mass-produced, even its works of art. Prince's strategy had an immediate impact on his contemporaries—often dubbed The Picture Generation—especially Sherrie Levine, who became notorious for re-photographing a classic image by Walker Evans, and has been a significant influence on contemporary artists who emerged in the 1990s, the so-called “YBAs” or Young British Artists.

Other early appropriation work by Prince includes his series of photographs of Marlboro advertisements, *Cowboys* (1980–1984), for which he cropped out the text and logo of the popular and highly successful campaign. The resulting set of photographs alludes to the consumer's memory of the cigarette advertisements and makes an appeal to the collective American memory of the iconic western cowboy. The fragmentary, almost elusive nature of the works might be said to position Prince as the lone hero cowboy of the photographic world as he exposes the way in which advertisers appropriate visual ideals to romanticize a product. As Prince had not attended art school and had no training in photography, this early work was accomplished with rudimentary means; Prince used cheap commercial blow-ups of his source material, resulting in grainy, poorly color-balanced reproductions.

In 1983, Prince re-photographed an image of celebrity Brooke Shields as a young child, nude with an oiled body, standing in a bathroom, gazing at the viewer. Photographer Garry Gross, with the permission of the actress's agent and mother, had originally taken the image privately but it had become available to the public through a legal debate. Prince presented his “re-photograph” in a gallery space in Manhattan he had constructed specifically for the project, which he titled *Spiritual America*. Positioning the photograph in the front of the gallery, Prince hired an attendant who was told nothing about the work or its origin. *Spiritual America* generated renewed interest in the scandal over the original photograph that had been denounced as exploitative and child pornography and also generated a great deal of interest in the contemporary art world in Prince's re-photography project.

The photographs that Prince selected for much of his work in the early 1980s are of figures of rebellion, traditional masculine types, and of seductive femi-

ninity. He also appropriated the images of bikers and their women, punk rockers, French actress Catherine Deneuve, alternative youths, Superman, and criminals, figures that suit the delinquent gesture of appropriation. The subjects embody the fierce and the bold, the fearless, and the utterly romantic, all of the qualities that Prince himself exhibits by selecting printed imagery and stealing it for his own much more glamorous (and financially lucrative) representations. Prince has been sued several times by the photographers who took the original images, but he routinely settles these lawsuits.

There often seems to be no common ground between the subjects Prince juxtaposes, as in *Super Heavy Santa*, 1986, which features images of Superman, heavy metal musicians, and Santa Claus. The coy title presents no real clue; a close examination discloses that they share a use of costumes. In *Criminals and Celebrities*, 1986, he puts together images of outlaws and famous people. The juxtaposition highlights the fact that both criminals and celebrities often hide their faces from the cameras—criminals from shame and celebrities for privacy. The combinations in these works also reference the inconsistent jumbling of mass media, which places all images on the same plane. Prince's arbitrary juxtapositioning however, is made in clean and uniform grid-like patterns that imply the overarching order of the printed world. He is careful to arrange his individual images in lines, boxes, or rows. His system mimics the shape of columns in magazines. He applies the mindset of a graphic designer or layout artist. An example is *Velvet Beach*, 1984–1985. In this work, Prince presents 12 square images of waves. Each image shows the wave with white water in the action of breaking, at a tumultuous climactic and chaotic moment. The images are arranged, however, to form a uniform rectangle with consistent white space between them. The look is like a magazine layout.

At the close of the twentieth century, Prince produced a prolific amount of his own writing. He also began to create paintings of text and images. He pairs a joke, which is an appropriated textual social property, with cartoon-like iconography and abstract gestural painting. The jokes are sometimes incomplete or at their climactic moment. They are often crass or culturally outdated. The works, though aesthetically different from his early photography, share a common intention to evoke familiarity and shock. Like looking at the familiar photograph, a viewer reads a familiar joke, but yet is prompted to re-consider it in a new, more provocative manner.

Biography

Born in the Panama Canal Zone in 1949, Prince spent his formative years in Florida. He moved to New York in the early 1970s to work as a painter and was employed by Time-Life publications, where he re-photographed printed images to create new artwork. He has exhibited at Documenta, the Sydney Biennial, the Whitney Biennial, the Venice Biennale, the Museum of Modern Art, the Museum of Contemporary Art, Los Angeles, and the New Museum, among other venues. His work can be found in both major public and private collections. The artist has also enjoyed an accomplished career as an interviewer and writer for art magazines and journals. He has also published a series of artists' books. He lives and works in New York.

PRINT PROCESSES

The turn of the nineteenth to twentieth century oversaw the transition from the era of the artisan-photographer to the emergence of the photographic industry, as a consequence of inventions that separated the roles of chemist and photographer common at photography's beginnings. Richard Maddox's experiments (1871) with gelatin as dry emulsion guaranteed its sensitivity through long periods, making it unnecessary to produce emulsions immediately before their exposure to light, which would make obsolete the major nineteenth century processes, wet collodion (negatives) and albumen (prints). Additionally, the increasing availability of electric light made printing easier and more consistent, eliminating the dependence on the sun, and thus stimulating the industry in a spiral of inventions that continued to make photography easier.

Monochromatic Silver Processes

Starting with silver based monochromatic (black and white) processes, two ways of printing exist: by direct exposure to light (Printing Out Paper or POP) and by developing following the exposure (Developing Out Paper or DOP). In POP papers, the emulsion of the negative is placed in direct contact with that of the print material, exposing it to light till the image is formed. As the image is only formed by the action of light, this type of silver is

usually referred as photolithic silver. In DOP papers, the print emulsion is exposed briefly, in contact with the negative or more commonly by projecting it through an enlarger, forming a non-visible or latent image, that will become visible through the action of the developing agent. Studying both types under an electronic microscope one can observe that in POP papers the image is formed by small, highly separated spherical grains; while in DOP, the silver appears with the shape of long filaments, thus it is sometimes referred to as filamentary silver. These microscopic differences have macroscopic effects, as POP papers tend to show warmer colors and DOP more neutral ones. The POP papers can accept negatives with greater contrasts because the silver, which is reduced to become part of the image, acts as a partial mask to avoid an excess of exposure that would darken these areas. In DOP the contrast is usually controlled through different types or grades of paper, manufactured to obtain more or less contrast through the emulsion.

In the first decades of the twentieth century use of the classical print process of the nineteenth, the albumen print, persisted. Evidently many studios and professional photographers had a long experience with albumen printing, and they did not abandon it precipitously, despite the obvious advantages of the new emulsions based on gelatin and collodion. The first gelatin printing papers were POP, derived from

the Maddox gelatin emulsion on glass of 1871, and although its decline was precipitous after the 1930s, it still can be found in some commercial products used mainly in artistic photography.

Distinguishing a gelatin based paper from an albumen paper is easy due to the fact that gelatin papers are usually thicker and have a baryta (a compound of the element barium) layer, thus the common name “baryta papers” applied to them. This layer, placed between the paper base and the emulsion, gives the paper an extra brilliance and does not allow the paper fibers to be seen under low magnification (20–40×). Also they do not show the general yellow-ochre color visible in the non-image areas of albumen prints, nor the micro-cracks that appear because of the scarce elasticity of albumen to changes in humidity and temperature.

Collodion was used as a print emulsion from 1890 approximately until 1920. The technology was very similar to gelatin papers, also incorporating a baryta layer. In the 1910s and 1920s a variation called matte collodion became very popular. The extremely matte surface of these papers made them an economic alternative to platinum prints (platinotypes), and if toned with platinum, they achieved the platinum print’s characteristic gray-olive tone. Differentiating collodion prints from gelatin prints is difficult, due to their similar warm-gray tones; although with low magnification, collodion papers commonly show small abrasion marks that are less common in gelatin due to the self-healing properties of the latter. This is counterbalanced by collodion’s greater hardness that acts as a barrier against oxidants, keeping them in better condition than contemporary gelatin prints. Another method of differentiating the two is to place, in a non-essential margin area of the print, a small drop of water and let it stand. Collodion is highly waterproof so the drop is not absorbed, as will happen relatively quickly with gelatin.

Silver gelatin POP papers were followed by DOP papers that were much better adapted for use in artificial light. In fact, the first DOP papers were called “gaslight” papers because they were designed to be exposed briefly under a gas lamp at maximum illumination, cleverly, later in the development process the photographer reduced the gas supply, the light turned more orange and as such could be used as a safelight, which did not affect the paper. These papers were based on a mixture of silver chloride and bromide and offered slightly warmer tones than the more neutral tones of later DOP papers based on silver bromide, although through chemical toning it was possible to obtain other colors, one of the most widely used being sepia, derived from sulfur toning, that rose to great popularity in the 1920s.

Thanks to the industrial manufacturing of silver gelatin papers, a wide variety of choices was initially made available to the photographer: from glossy surfaces (obtained by drum dryers) to semi-matte and matte surfaces (obtained by adding fine silica powder to the emulsion), textures were also applied to the baryta layer in order to imitate cotton, silk, and other materials, plus a whole variety of colored paper bases were also used. Catalogues of the 1930s show a wide range of available papers, that over the course of the century, have been reduced to perhaps two or three types (grades) of paper produced by each company, chiefly Kodak, Agfa, and Ilford. As a consequence, many artistic photographers returned to artisan processes that allow them wider possibilities to control the texture and color of their images.

Throughout much of the twentieth century, gelatin silver papers were generally produced in grades that were differentiated by the length of exposure required to achieve a full range of tones. So called “soft” papers, papers that required longer exposures, achieve best results when printing from a high contrast negative. Well-exposed negatives are best printed on normal papers, and when dealing with an underexposed or “soft” negative, a “hard” paper gives the greatest range of tones. Papers were also graded by contrast, usually zero to five, from least to most pronounced degree of contrast. Papers that featured various surface textures (most commonly matte, velvet, glossy, and high-gloss) and yielded varying tones, from blue-black to warm browns, were commonly available, as were papers in varying thicknesses (most often single or double weight). At the end of the century, very few specialized papers for monochromatic printing were available; for example, Kodak’s professional grade black-and-white papers were multipurpose, and are capable of developing as color prints with the application of the proper chemicals.

Resin-coated (RC) papers were introduced in the 1970s to accelerate processing. Both sides of the paper are coated with a plastic material to avoid the absorbance of processing chemicals into the paper base and facilitate the removal of fixer salts in a much shorter time. Polyethylene and polyester are among some of the common plastic materials used. The conservation of some of the earliest RC papers have been questioned after colored spots appeared in some of them. Later papers seem to perform more adequately, although it is recommended to trim the margin areas to eliminate any residual fixer that might have penetrated the paper base through the side of the polyethylene-paper-polyethylene sandwich. Most museums and collections

still consider non-RC papers, now commonly called “FB” or fiber-based papers, to be more archival.

In general the archival quality of modern gelatin silver papers is good if the processing removes all signs of sulfur (from the fixer), which can accelerate the transformation of silver into silver sulfur during the aging process. One way to avoid sulfuring is to tone the print, substituting the silver for another more stable metal (platinum, gold) or by creating a silver compound (silver sulfur) that forms a chemical shield to prevent oxidation. Considering the attraction of silver to sulfur, sulfur toning acts as a controlled accelerated sulfuring to affect the whole print, instead of only certain areas as usually happens over time. DOP prints are much more stable to light fading and oxidizing agents (ozone, industrial gases, car pollution, etc.), in comparison with POP prints because of their bigger filamentary silver conglomerates.

Monochromatic Iron Processes

Some of these processes are known from the early days of photography, such as the cyanotype, invented by Sir William Herschel in 1835, which is based on the sensitivity to light of iron salts, and offers the rich deep blue tones that account for its name. Early in the twentieth century it obtained a certain popularity among amateur photographers, due to its simplicity that allowed them to make contact prints with great ease and very few materials. Sometimes professionals also used it to obtain fast test proofs, becoming in some way the equivalent to the professional use of Polaroid or digital cameras in modern studios. Since the 1950s, it enjoys a certain use among artists and photographers, who can use it to print on cloth and other materials instead of a paper base. It proves simple to identify thanks to its characteristic color, matte surface, and lack of emulsion that leaves the paper fibers easily visible, because the light sensitive solution is directly absorbed.

The platinotype is another process based on the light sensitivity of iron salts. Invented by William Willis and commercialized in 1878 through his own company, it obtained great acceptance by studio portraitists, although its high price never allowed it to equal the sales of gelatin silver papers. In order to identify it often the economic circumstances of the sitter provide valuable contextual data, because false platinotypes were made using matte collodion toned in platinum for less wealthy sitters (see above). After World War I, platinum prices increased significantly, and it was generally replaced by palladium that of-

fers similar results. Both have always been greatly appreciated in artistic photography, due to their wide tonal range, deep blacks with shadow details, and excellent conservation. They can be identified by their matte surfaces with neutral tones (when not toned), and clearly visible paper fibers as they also have no emulsion.

Monochromatic Pigment Processes

These processes are derived from Louis Poitevin’s search to find a way of printing more permanent photographs through the use of the light sensitive bichromated gelatin. He patented several methods in 1855. In them, a negative is exposed in contact with an emulsion of bichromated gelatin, that hardens proportionally to the light received, and later is “developed” by pouring water over the gelatin to dissolve and remove the non-hardened areas. Among the most widely used in the early twentieth century were carbon, bromoil, carbro, and gum bichromate, which were used by photographers pursuing a more pictorial effect in portrait and artistic photography. In the last decades of the twentieth century, gum bichromate has experienced a revival by some graphic artists who want to create photographic images with limited tones and textural effects. The Fresson process, derived from carbon, was patented by the Fresson family who still produce limited series for art galleries and photographers from all over the world. The high resistance to light fading of the pigments, used in all these processes, guarantees the excellent conservation of these prints, even those from the nineteenth century.

The carbon process began in the 1860s and takes its name from the pigments (amongst them carbon black) introduced in the bichromated gelatin to obtain the final color of the image. Although their colors can vary greatly, the most common ones are similar to those of traditional silver papers (neutral, warm, or purplish blacks). They are identified by their dense dark tones, and a certain relief in contours between high contrast areas is visible in raking light.

A further modification of the carbon process is the bromoil process developed in England in the 1900s and widely used by Pictorialist photographers till the end of the 1930s. Its own name describes the process, in which a silver bromide gelatin print is used as a matrix to print with the traditional oily inks of lithography. This is achieved by immersing the bromide print in a solution that hardens the emulsion in direct proportion to the density of silver in each area. Later the print is introduced in water, so the less hardened areas (lighter tones) absorb more water, and then

PRINT PROCESSES

drained. Finally, oil-based inks are spread over it, standing proportionally in the areas with less water (shadow areas) because of the repulsion of oil and water. The print can be left like this, direct bromoil, or used as a matrix against white paper to produce several bromoil transfers.

In the carbro process, the photographer starts with a wet gelatin silver print that is put in contact with a "carbro tissue" (thin paper sensitized with bichromated gelatin and pigments). Introducing both in a bleaching bath, the gelatin tissue hardens proportionally to the amount of silver in each area of the print. After separating them, the tissue is applied to good drawing paper so the gelatin sticks to it and the image is transferred. The silver print can be redeveloped and used a few more times. Due to its complexity, this process was developed and used mostly by pictorialists around the 1920s and has fallen almost completely out of use.

Subtractive Color Processes

Curiously the pigment processes were among the first to be used in order to obtain full color images. The first two decades of the century were dominated commercially by the Autochrome, the additive process invented by the Lumiere brothers. Autochromes were positives on glass and could not be printed. Nevertheless, the remarkable advances in color cameras, able to obtain three separation negatives of the three primary colors simultaneously, promoted research into printing methods that involved the overlapping of three layers, each one exposed to a primary color negative.

One of the first commercially available color printing process was based on carbro, requiring three silver prints made from three separation negatives and using a carbro tissue of each primary color to obtain three colored gelatins that must be perfectly aligned and pressed together over the paper to form the full color image. The dye-transfer process also uses three gelatin tissues hardened proportionally to the light received, after eliminating the non-hardened areas with water, each gelatin is immersed in a dye bath (yellow, magenta, and cyan) and the three colored gelatins are carefully aligned to obtain the full color image. Although its origins can be traced as far back as the 1870s, its peak use was in the period after World War II. It still is highly appreciated by photographers selling to museums and collections; they value its excellent color reproduction, high light stability, and the possibility of using different paper surfaces. To improve the light stability even more some recent innovations on carbon derived processes, such as EverColor have

appeared in the 1990s, combining digital color separation films and more permanent pigments.

In the 1910s and 1920s, the search continued for an integrated process with three overlapping layers that would not require separate treatment for each. The process that succeeded commercially, and became the most widely used, is the Chromogenic or Color Coupler, commonly termed C-Print, in which each of the three layers is sensitized to a primary color (blue, red, and green) with complex molecules that contain light sensitive silver and part of a dye molecule. After exposure, a latent silver image is formed. The developing process causes each light-activated molecule to join with the dye molecule, thus forming a color dye. The silver is removed in the fixer, leaving a final image completely formed by organic dyes.

It is very difficult to find dye molecules that fulfill all the complex requirements of this process: first, to behave according to the needs of the process (i.e., to be able to split in two separate molecules that will result in a primary color when joined in the color developer); second, to show in the print a good primary color; and third, to be stable to light, humidity, and other conservation hazards. In this search, manufacturers have not always chosen the most balanced solution, but sometimes compromise the durability due to the higher costs of choosing other molecules or processes. Most of the commercial color prints made before 1970 have very low color stability and their conservation conditions are very poor. Among the few early commercial products with a good dark color stability are Kodachrome prints, based on the same process used for transparencies. Since 1970, most of the companies have improved significantly in both the dark and light stability of their chromogenic prints.

A color process frequently used in art photography is usually referred by its commercial name, Cibachrome (presently Ilfochrome). It is a dye bleach or dye destruction process, based on the experiments of Arthur Traube (1910s). It uses a paper covered with three layers containing the colors that are later destroyed in a bleaching bath proportionally to the amount of light received, so it gives a direct positive from a color transparency. It is not hard to identify due to its characteristic thick polyester base, black margins, high color saturation, and high contrast. Dye bleach papers are commercially available in several surfaces and also in transparent sheets for backlighting. Due to their relatively good stability in dark storage (accelerated aging tests confirm a durability of more than 50 years without appreciable loss of color), dye bleach has been a process of choice for fine arts

photography since the 1960s. Even so, prints made through this process do fade relatively rapidly when exposed to light.

Polaroid is one of the most fascinating printing processes. Invented by Dr. Edwin Land and marketed since 1948, it can produce almost instant prints directly from the camera, first only for black and white and later in 1963 in color. An extremely sophisticated multilayer emulsion, it is based on the diffusion of silver or colorants through the layers, this shift being stopped proportionally to the quantity of light received in each area, thus providing a direct positive. Although its main use has been in amateur and scientific photography, several artists have chosen it as their favorite photographic media, notably Lucas Samaras and Rosamund Purcell. The identification of these prints is easy in their small format (up to 8×10 inches), as they have white margins (three being the same size and a larger one that contained the chemicals used in the development). The larger formats are recognizable through the chemical streaks that appear in the margins from the development process. The dark storage stability of Polaroid color is adequate but they can develop overall yellow stains and cracks in the emulsion.

Polaroid emulsion can be transferred to drawing paper or other surfaces. Polacolor ER films can be transferred directly by pressing the negative on the desired surface, while it is still developing, or from the fully developed positive, by peeling off the emulsion submerging it in hot water, and then placing it over another support, allowing creative manipulations by stretching and sculpting it. The SX-70 Polaroid also has had wide artistic acceptance because the image can be manipulated, while developing, by pressing or rubbing with spatulas or other tools.

In the 1990s, new ways of digitally producing photographic quality prints have been introduced at a rapid rate, however, they can be grouped into four major groups of printer devices: inkjet, dye-sublimation, laser prints, and photographic paper printers. The latter is basically a computer controlled professional enlarging system, only that instead of exposing all the paper at once, the exposition is done sequentially creating line after line of dots with a laser beam, and all kinds of color or monochromatic photographic papers can be used.

Inkjet printers deliver extremely fine drops of ink on the paper, allowing the use of a great variety of surfaces and materials. The colors in the print are formed by adjacent drops of ink, that show a pixelated structure when seen with magnification. The

number of inks used varies but usually include black and three to five colors. The first inks had poor stability, only two to five years. Since then the quality of the inks have improved, and some have been tested to provide more than 100 years of dark stability. Obviously, another important factor to consider is the quality of the paper itself. Introduced in the early 1990s it is probably the most popular way of printing digital images, as the printers are very affordable for the quality they render and among artists the professional Iris printers offer a wide range of choices.

Dye-sublimation printers are based on wax-based primary color inks that are sent as a liquid to the paper, where they mix to form the full spectrum of colors. They provide a continuous tone under magnification. Laser color printers are based on same principles as monochromatic ones, and can give excellent results but as with dye-sublimation the choice of papers is limited and the costs higher.

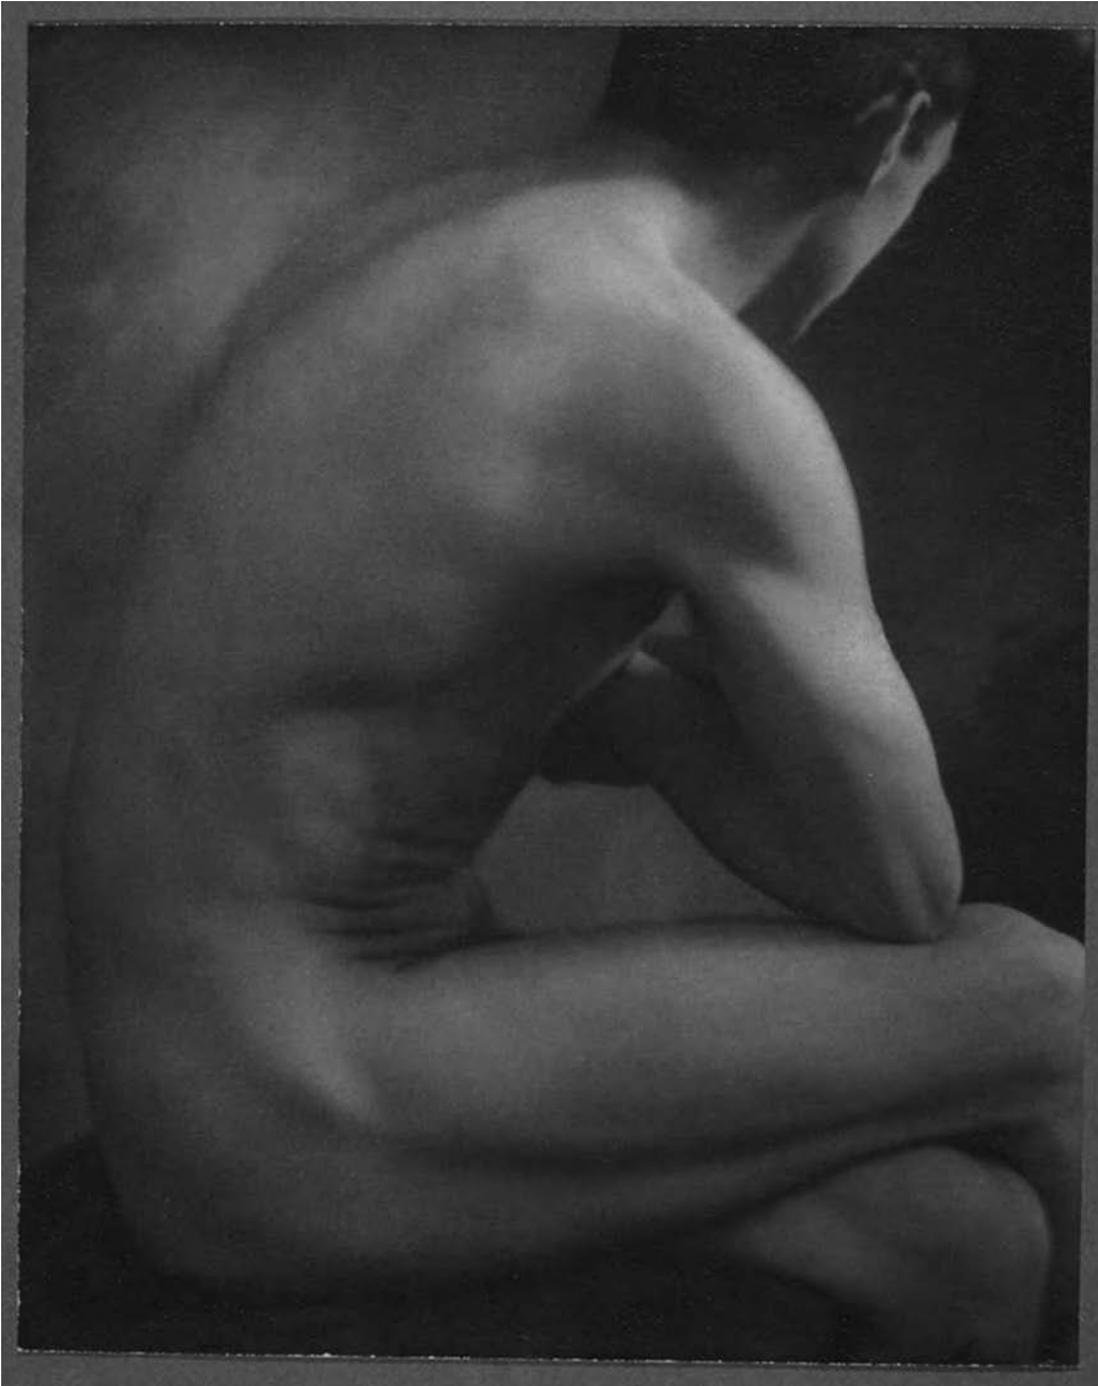

The digital revolution has made it possible to practice photography without a darkroom. Some people mourn the loss of the magical moment when the image appears in the developing tray, but others consider it a liberation from the inconvenience of working in darkness and hazards of the chemicals involved. The turn of the twentieth to the twenty-first century presents an uncannily similar situation to that which occurred at the previous turn of the century, when both artisan and industrial processes enriched the possibilities of photographic printing. Now we face a world where chemical and digital photography again offer photographers a wide spectrum of possibilities as to how a photograph is printed.

PRIVATE COLLECTIONS

Collecting photographs derives from multifarious impulses: the desire for investment, the challenge of connoisseurship, and even the excitement of the pursuit, but for many it evolves as a result of a passion for the medium. Photography's innate capacity to possess reality and to be possessed is what makes it such a desired collectible.

The first collections of photography were limited to the artists, scientists and wealthy upperclass amateurs who formed the ranks of the *Société Française de Photographie* in Paris and the Royal Photographic Society of London in the early 1850s. From an early date, the collecting of photographs was also seen as the responsibility of historical societies, libraries, and government archives. The private collector and private collection is sometimes a little-known entity until the collection is acquired by a larger, more visible institution.

During the first decade of the twentieth century, photographer, art connoisseur and magazine editor Alfred Stieglitz began collecting photographs, in part as a result of 291, the Photo-Secession gallery he operated in New York until 1917. Ranging from views of Victorian life to icons of the modern world and the extraordinary portraits and nudes he made of his wife, Georgia O'Keeffe, the initial Stieglitz Collection was donated to the Metropolitan Museum of Art, New York, and The Museum of Fine Arts, Boston, in 1922 and 1924, respectively. In 1949, another portion of the Stieglitz collection, 150 photographs and photogravures by Stieglitz as well as 50 photographs by his contemporaries were given to the Art Institute of Chicago as a gift from Georgia O'Keeffe.

The Julien Levy Collection, also housed at the Art Institute of Chicago, originated in the late 1920s when Julien Levy traveled to Paris with Marcel Duchamp and Man Ray in hopes of making a film with the two avant-garde artists. While in Paris, Levy purchased his first photographs from Eugène Atget in 1927, the last year of the photographer's life. Returning to New York, Levy continued to collect photographs and by 1931 opened a gallery. At that time, there was little interest in art photography and Levy turned to the sale of paintings instead, but maintained his intense interest in collecting photography. The strength of the collection lies

in works by Atget, Henri Cartier-Bresson, André Kertész, Man Ray, and László Moholy-Nagy.

Between the end of World War II and the early 1950s two encyclopedic collections of the history of photography were begun in Europe by Helmut Gernsheim, an architectural photographer based in Germany, and André Jammes, a rare book dealer, with his wife Marie-Thérèse Jammes, of France. By nature of the act of collecting, Gernsheim and Jammes became photo-historians—establishing the aesthetic framework that future collectors would emulate. A self-taught specialist, Gernsheim assumed the Bernard Berenson model of discernment and taste,

Once bitten by the collector's bug, you can't leave off. Having been an inveterate collector in other art fields, I applied the same criteria to photography. I only bought what appealed to me, yet with the connoisseur's eye for quality.

(Hill & Cooper 1979)

In 1963 the Photography Collection of the Harry Ransom Humanities Research Center at the University of Texas Austin was established when Harry Hunt Ransom acquired at the time the largest privately owned photography historical archive amassed by Helmut and Alison Gernsheim.

The Jammes collection, comprised of some of the finest Second Empire French calotypes and mid-nineteenth-century British works, became one of the cornerstones of the J. Paul Getty Museum's Department of Photographs when it was established in 1984. It was joined by several other important collections including those of Samuel Wagstaff, a curator and art historian associated with Detroit, Arnold Crane, a Chicago attorney, Bruno Bischofberger of Zurich, Jürgen and Ann Wilde of Cologne, and William Schurmann of Aachen, Germany.

Starting in the 1950s, photojournalistic as well as aesthetic photographs began to appear more frequently on gallery and museum walls and in private and corporate art collections. For many the idea of collecting photography came in the late 1970s and 1980s, an era of intense activity in an international art market in which photography was a more "reasonably priced" investment compared to its painting counterpart.

PRIVATE COLLECTIONS

The profile of the photography collector during the last decades of the twentieth century thus tends to be the non-historian amateur without great means who simply became enamored of the field, and discovering its relative inexpensiveness, began collecting. The Peter Eric Palmquist Photography Collection, assembled between 1971 and 2002, reflects the “accidental” collector, although Palmquist was himself a photographer. According to Palmquist, “My obsession with collecting photographs began unceremoniously in the spring of 1971 when, by chance, I found myself in an antique shop in McKinleyville, California, only a few miles north of my Arcata home.” The handful of images the shop owner convinced him to buy had multiplied over 30 years into a collection numbering approximately 250,000 photographs, including rare images from the earliest days of western American photography.

Palmquist also was especially drawn to the work of women photographers in California. By the mid-1980s, the emphasis included the collecting of data on women in photography globally, and by 1994 the Women in Photography International Archive was formally established. By the late 1990s, it featured more than 17,000 biographical files on female photographers past and present; 1,800 books and 4,000 articles “by and about” women photographers; and approximately 8,000 vintage photographs taken by women—many of them produced during the nineteenth century. Palmquist’s holdings have been acquired by the Beinecke Rare Book and Manuscript Library at Yale University.

Many smaller regional museums, such as the Milwaukee Art Museum, Wisconsin, have established photography collections through the acquisition (often by donation) of such avid collectors. Featuring modern and contemporary photographers, particularly those with ties to Milwaukee, collected by Floyd and Josephine Segel, the museum was able to leverage this 1986 gift into a more comprehensive photography collection, a typical strategy of institutions with limited acquisition funds. A collection put together by Joseph and Elaine Monsen, professors at the University of Washington, Seattle, forms the basis of the Henry Art Gallery, the UW’s art museum, contemporary art collection. Widely acknowledged as the most important collection of photography on the west coast, the collection was begun in 1960 when photography was little more than a curiosity to most serious art collectors and was acquired through purchase and donation in 1997.

The Henry Buhl Collection exemplifies a narrow view of acquiring—this collection, amassed in the 1990s, specializes in photographs of hands and was sparked by Stieglitz’s famous photograph of Georgia

O’Keeffe’s hands with a thimble. At the end of the century, Buhl’s collection spanned 160 years of photography beginning with a work by William Henry Fox Talbot dated to about 1840 and continuing through the present day. Vintage works of the early twentieth-century masters ranging from artists like Ansel Adams, Alfred Eisenstadt, Walker Evans, Dora Maar, Man Ray, Edward Steichen, Weegee, and Edward Weston; to modernists Diane Arbus, Richard Avedon, Lee Friedlander, Louise Lawler, and Garry Winogrand are featured as well as selected works by contemporary figures ranging from conceptual artist John Baldassari, Adam Fuss, Nan Goldin, and Sally Mann; and, to the lesser known Jed Devine and Thomas Roma. Photography particularly lends itself to such “subject collections.” Bill Hunt has amassed a collection notable for work that feature subjects with their eyes closed or obscured. Another collector of photographs of hands is Dr. Leo Keoshian and his wife Marlys.

More commonly private collections are amassed around a region or genre, such as the Judy and Sidney Zuber Collection, which focuses on Latin American photography, or the Helen Kornblum Collection of twentieth century women photographers now housed at the Saint Louis Art Museum in Missouri.

It is common that private photography collections gain their stature and maturity as part of a larger whole once contextualized by their placement as part of the greater collection of a major institution. A typical case is four collections, some private, some corporate, that form the cornerstones of the photographic collection of the Metropolitan Museum of Art in New York, an institution that did not aggressively collect the medium early on, but now houses a fine, comprehensive collection.

The gifts of Alfred Stieglitz to the Metropolitan—in 1928, 1933, and in a bequest following his death in 1946—ultimately numbered more than 600 works. In addition to superb examples of his own photography, his legacy comprises the best collection anywhere of works by artists of the Photo-Secession, the circle of Pictorialist photographers shown at his influential gallery 291 (also known as the Little Galleries of the Photo-Secession), and published in *Camera Work*. The Stieglitz Collection is especially rich in large master prints by Edward Steichen. The Ford Motor Company Collection, assembled by John C. Waddell and donated to the Museum in 1987 as a gift of the Ford Motor Company and Mr. Waddell, added 500 works of avant-garde European and American photography made between the two World Wars. This collection was joined by that of the Gilman Paper Company Collection, widely considered to be

the finest privately held corporate collection of photography from the medium's first hundred years. Formed over the course of two decades by the late Howard Gilman and his curator Pierre Apraxine, the collection comprises 4,000 works that the Gilman Paper Company began to assemble in 1975. Finally, acquired by the Metropolitan Museum of Art in New York in 1997, the Rubel Collection, assembled during the 1970s by a young collector from California through bequests from his relatives and judicious acquisitions, William Rubel, added important nineteenth century examples to their holdings. The collection of vernacular photography amassed by New York-based collector Thomas Walther, a top collector of nineteenth century and twentieth century modern photography, adds a unique dimension to the Met's collection.

Many European museum photography collections were formed by acquiring important private collections. The Sprengel Museum, Fotografische Sammlung, Hannover features the permanent loan of the Ann and Jürgen Wilde Collection of over 1,500 vintage photographs of Albert Renger-Patzsch, Karl Blossfeldt, and others. Much like the Metropolitan, various eminent private collections partially form the National Portrait Gallery photography collections in London, England (Howard Coster, Ida Kar, and Benjamin Stone) and the Maison Européenne de la Photographie, (Roger Théron, the legendary editor of *Paris-Match* magazine).

At the end of the century, private collections in fact became greatly sought after, such as the collection of Richard and Ellen Sandor of Chicago, named by the editors of *Art & Antiques* magazine as one of "America's Top 100 Private Collectors." Robert Drapkin, an oncologist based in Tampa Bay, Florida, has a distinguished general photography collection, as does Miami-based Martin Margulies, within a general contemporary collection. Susie Tompkins, founder of the Esprit Clothing company based in San Francisco, is an avid collector of photography, concentrating on works by female artists. William Lane, a businessman who is based in Boston, has put together a notable collection of American modernist photography. New York attorney Joel S. Ehrenkrantz and his wife Anne are typical of contemporary art and contemporary photography collectors in their involvement in a museum, in this case the Whitney Museum of American Art.

In Europe, Baron and Baroness Philippe and Marion Lambert of Geneva, Switzerland, are acknowledged as top contemporary art collectors who focus primarily on photography. Their collecting of the medium began with the purchase of a work by the

Swiss-born Robert Frank; it now features most of the top contemporary artists who use photography, such as Cindy Sherman or Jeff Wall. As in the past, many contemporary photography collectors become associated with institutions; in the case of the Lamberts, they are involved in the Metropolitan Museum of Art, New York, as well as supporters of the Centre d'Art Contemporain in their home town. At the end of the century other top contemporary photography collectors include Manfred Heitung, a businessman with interests in New York and Amsterdam, Paris-based industrial designer Christian Duc, and German industrialists Rainer and Ursula Blicke, who have also established a foundation for contemporary art and photography.

Top private collections, however, are often sold at auction and thus dispersed, as was the distinguished collection of Dutch-born attorney Bert Hartkamp, sold at Sotheby's, or the works of László Moholy-Nagy, acquired by artist and educator William Larson through personal relationships to form the single largest holding by the seminal photographer in private hands.

Another phenomenon of late twentieth century private collecting is the celebrity collection. London-based pop musician Sir Elton John has amassed a major photography collection in the last years of the century of over 2,500 works. The collection has been shown at the High Museum in Atlanta, where he maintains a home. Graham Nash, of the rock group Crosby Stills and Nash, parlayed his amateur interest in photography into a major collection and established Nash Editions, a fine art publisher specializing in digital production.

PROFESSIONAL ORGANIZATIONS

Professional organizations in photography have existed almost from the medium's beginnings, and have served a wide variety of purposes within the general desire to advance one's professional status within the field. The most common purpose is educational, but some organizations evolve into for-profit bureaus, or establish awards, publishing programs, or exhibition spaces that overshadow other activities. Unlike amateur photo clubs, which are largely open to any one interested in joining (although there may be dues or other fees), most professional societies admit those with credentials only, and often are by recommendation or nomination, the most famous also being one of oldest, the Royal Photographic Society (RPS) of Great Britain, based in London. What a 'professional photographer' is enjoys a wide range of interpretation, from those who are primarily teachers, to those who earn their living from their studio or photojournalistic practice, to those in such specialized fields as evidence photography or optical engineering.

Of historical importance, the Photo-Secession was the pioneering American professional organization, arising out of the camera club movement, which was largely made up of like-minded amateurs of means. Structured much like the RPS with a board of trustees and membership by invitation, though short-lived (1902–c. 1910), this society had an extraordinary impact on American and international photography.

The Photographic Society of America (PSA), based in Philadelphia, is the modern face of a long tradition of photographic societies in the United States that combined the interests of amateur and professional photographers. In the early years of the twentieth century, such organizations, including the Pictorial Photographers of America founded by Clarence White in 1915, were the chief organs for the exhibition of photography in their annual salons, held in New York and Philadelphia for the most part.

At the end of the century, PSA was an international organization with differing membership levels for the amateur or professional. It promotes photography through fostering local camera clubs for the amateur with competitions and prizes, as well as an annual conference, monthly magazine,

and educational services including on-line study groups. Their website is www.psa-photo.org.

The Photo League was a seminal organization that promoted the specific agenda of promoting socially aware photography. Formed in 1936 in New York in opposition to the professional organizations that largely promoted Pictorialism, such figures as Berenice Abbott, W. Eugene Smith, Paul Strand, and Walter Rosenblum were associated with the group over the years until it was black-listed as being sympathetic to Communism and ultimately disbanded in 1951. Many photographers showed in The Photo League's gallery; they established a low-cost school, funded individual projects, and published the magazine *PhotoNotes*.

The Friends of Photography based in Carmel, California, was another pioneering professional organization and an example of a support group founded by photographers that became known primarily for its exhibitions and publications. This venerable professional organization ceased operations in 2001 after a distinguished history of supporting photographic activity, especially on the West Coast, but with a nation-wide and international influence. Established in 1967 after an initial meeting held in the home of Ansel Adams and his wife Virginia, the organization's purpose was to promote creative photography. Ansel Adams served as the group's first president with Brett Weston as vice president. Exhibitions were promptly mounted at a former school known as the Sunset Center, beginning a long series of important photographic exhibitions. Friends of Photography also ran the influential Monterey Workshops, photographic master classes taught by the leading figures of the day, including Adams, Ruth Bernhard, Imogen Cunningham, Lee Friedlander, Emmet Gowin, Mark Klett, and photo historians such as Beaumont Newhall and Andy Grundberg. After Ansel Adams's death the organization relocated to San Francisco in 1984 where it continued its active program of publishing (notably its long-running "Untitled" series) and fellowships and scholarships including the Ferguson Grant for emerging photographers and the Ruttenberg Fellowship for excellence in portraiture.

One of the best known American professional organizations is the Society for Photographic Educa-

tion (SPE). Perhaps the leading not-for-profit membership organization for photography in the United States, it has regional chapters across the United States. It was established after a meeting of like-minded photographers in 1962 who had gathered for a conference at Rochester, New York, home of the George Eastman House. Although it “provides a forum for the discussion of photography-related media as a means of creative expression and cultural insight,” according to its mission statement, it is an interdisciplinary organization that seeks to promote a broader understanding of the medium in all its forms. Of particular importance to the SPE are the areas of teaching, scholarship, and criticism.

Prior to the 1960s, if taught at all at the university level, photography was a subject in departments of journalism. Recognizing the quickly spreading practice of establishing photography programs in university fine arts departments as a result of the general boon in postwar education, Nathan Lyons, then associate director at the George Eastman House, organized a conference titled the “Invitational Teaching Conference” in November 1962 in Rochester to address the concerns of these educators. Beaumont Newhall, Walter Rosenblum, the photojournalist so instrumental to New York’s Photo League, Arthur Sinsabaugh, Aaron Siskind, Henry Holmes Smith, John Szarkowski, Jerry Uelsmann, and Clarence White were among the 30 attendees. Representing the intersection of fine art practice, education, and history, these early participants aimed to formulate the goals, future, and improvement of photographic education. The first annual national conference was held in Chicago in 1963 and the articles of incorporation were signed in May 1964. Since its establishment, many noted artists, curators, and critics in the field of photography have been involved with SPE or its programs. Although the majority of its 1,800 members are fine art photographers and educators, curators, critics, historians, and artists are also members. The national headquarters are located at Miami University in Oxford, Ohio, and the archives are at the Center for Creative Photography in Tucson, Arizona.

SPE coordinates an annual national conference in the spring and regional conferences in the spring. Institutional memberships are accepted, and career opportunities are posted on their in depth website. Their website is www.spenational.org.

In the arena of working photographers, the American Society of Media Photographers (ASMP) is perhaps the leading professional organization. Founded in 1944 in New York, as the Society of Magazine Photographers by a handful of the world’s leading photojournalists and photographers, the purpose of

the organization was to work for professional rights and better working conditions, including the right to qualify for workman’s compensation if injured on the job, as well as fair compensation for the use of photographs when reproduced. Its mission states that “ASMP is the premier resource for community, culture, commerce and publications relating to publication photography.” The founding president was Philippe Halsman, and within a year, such major figures as Margaret Bourke-White, Robert Capa, Louise Dahl-Wolfe, André Kertész, Andreas Feininger, Dimitri Kessel, and Weegee had joined. An annual award was developed and became a prestigious prize. At the end of the century, ASMP had grown to over 5,000 members in 40 chapters nationwide and in many foreign countries, and maintains a legal defense fund and is active in promoting copyright law. Their website is www.asmp.org.

Advertising Photographers of America is a related organization specifically concerned with the business practices of advertising and standards to improve the field of advertising photography.

In Canada, the Canadian Association for Photographic Art/L’Association canadienne d’art photographique (CAPA) is the overarching professional organization, Canada’s largest. CAPA was formed in 1998 when two associations, the Colour Photographic Association of Canada (founded in 1947 in Toronto) and the National Association for Photographic Art (NAPA) founded in 1967 by photographers interested in advancing the practice of black-and-white photography merged. NAPA published the magazines *Camera Canada* and *Fotoflash*.

Emerging from the long tradition in Canada of amateur photo clubs, The Photographic Guild of Nova Scotia, founded 1947, developed into an organization geared toward the professional and commercial photographers, offering conferences, competitions, and other professional services while also offering activities and competitions for the amateur.

In Europe, the *Deutsche Gesellschaft für Photographie (DGPh)*, based in Cologne, Germany, is a leading organization, in the words of their mission statement, “whose activities predominantly concern the cultural interests of photography and related imaging media.” *DGPh* deals with all manner of photography from the fine arts to its scientific, commercial, and industrial applications. Its organizational structure reflects this pan-photographic orientation, with divisions such as “Imagery,” “Education and Advanced Training,” “Medical and Scientific Photography,” and so on. The Association arranges exhibitions, technical talks, and conferences, and develops initiatives in cultural, scientific, and political areas and awards

PROFESSIONAL ORGANIZATIONS

prestigious prizes and awards, including their Cultural Award for distinguished contributions to artistic, scientific, or journalistic photography, and the “Dr. Erich Salomon Award” for media and photographers for outstanding photography in journalism. *DGPh* was founded in 1951 at the instigation of Prof. L. Fritz Gruber, an eminent photohistorian, with the cooperation of the city of Cologne and the Association of the German Photographic Industry. While functioning as an umbrella organization for various other photographic associations and services, *DGPh* also has an elected membership. At the end of the century, its membership of over 900 included fine arts photographers, photojournalists, teachers, curators, scientists, inventors, doctors, and other disciplines. Their website is www.dgph.de.

Genre-specific organizations are by far the most prolific professional organizations: Altitude is for

aerial photographers only and features international aerial photographers on its website. The International Association of Panoramic Photographers, founded in the 1980s, is the leading professional organization for panoramic photographers located throughout the world. Wedding and Portrait Photographers International supports studio and wedding photographers through a magazine, website, and other professional services, including an annual competition with prizes and a scholarship fund. Numerous others can be located through web searches or local telephone directories.

PROPAGANDA

Propaganda is “the technique of influencing human action by the manipulation of representations” (H. D. Lasswell). Propaganda photography (propaganda) therefore refers to photographs consciously made to manipulate visual reality in order to provoke a certain reaction in the viewer. In most cases, propaganda is utilized for political purposes, but it can have other connotations and be used to sway people socially and aesthetically in advertising or other commercial applications. Making photographs to be used as propaganda is strictly forbidden in any system of journalistic ethics in photography, although most photographers are inclined not to believe that their work is or can be part of any sort of propaganda, even in blatant circumstances (the career of Leni Riefenstahl is instructive). In the twentieth century, the propagandistic use of photographs is more commonly found in the distribution of images than to the act of photographing itself. And, even under conditions of Fascist or Socialist governments well-known for their attempts to produce propaganda, effectiveness of propaganda photography can be easily over-estimated.

Propagare is a Latin word that meant grafting a tree but had been used metaphorically for proposing ideas in writing. A papal congregation in 1622 coined today’s use of the word propaganda by setting up a commission under this title in order to spread Roman Catholicism more effectively around the world. Propaganda gained its political meaning in the French revolution of 1792. In the early years of the twentieth century, little or no distinction was made between propaganda and advertising. After the events of the Soviet and Nazi regimes, however, propaganda has been most commonly understood as high-tech, mass-media governmental advertisement with a strong ideological meaning.

Propaganda imagery existed well before the invention of photography; it is as ancient as drawing on a wall. In 1525, German peasants and the Catholic church fought a civil war by spreading illustrated leaflets with pamphlets, and the same image could be used for or against its target. Mass circulation newspapers that emerged in the early nineteenth century saw articles illustrated with engraved drawings and later in the century, with

photographs that may have been made weeks, even months before or that had no direct relation to the news story it accompanied. On the other hand, governments, the British crown being an especially obvious example, pioneered the use of combat photographers who were attached to military units and under their command. Otherwise dispassionate photographers, such as Roger Fenton during the Crimean War, provided imagery that the government used for its own propagandist purposes by contextualizing it with information that furthered the British government's policies. Propaganda photography was well entrenched by the end of the nineteenth century, and as early as 1900 some began to question whether any printed photograph could be entirely trusted as "the truth."

The continuing development and increasing sophistication of the mass printed media in the early years of the twentieth century brought propaganda photography to its height of influence. World War I can be defined as a world war partly because of the world-wide dissemination of information about the war, including propaganda. Nations and their peoples were exhorted to participate in this war by means posters, films, rallies, and by extra issues of daily or weekly papers heavily illustrated with photographs. Again, it was the context into which these photographs were placed that served the propagandistic purpose. It was the captions that would make claims and "identify" what the reader was to focus on or believe: were the destroyed wagons or dead bodies results of enemy action? The reliability and trustworthiness of photographs were thus at the mercy of those that published them, whether they be private companies or government organs. All nations participating in World War I installed propaganda ministries and called up the best of their photographers and cameramen. A number of new technologies were introduced within these administrations, among them high quality aerial photography, which in turn stimulated photographers to explore new forms.

A number of revolutions followed the end of World War I, and all of them had used photography as a means of propaganda among their followers and sympathizers. Within the German revolutions of 1918 most of the propaganda was distributed by picture postcards as printed papers were too expensive for the general public. The Soviet revolution, on the other hand, made extensive use of large posters that were printed in small issues on photographic mural paper. Although photography did not play an important role in the propaganda strategies designed by Lenin, it was omnipresent at the October Revolution and in the

following years. By the early 1920s a number of young Russian artists had concentrated on what they called Agitprop, and propaganda was an integral part. Agitprop meant the inclusion of all forms of avant-garde art into everyday life, especially into communist ideology and thus into propaganda.

A number of artists began their careers in Agitprop programs, some of them becoming world-renowned. Chief among these is Alexandr Rodchenko who in 1924 had his first photographic posters published on the occasion of a film program named "Cinema Eye." From here it was a short step towards the use of propaganda within nearly any public appearance, and when the Soviet Union started to participate in international fairs and exhibitions, its stands were covered with large format photographs in the most unusual designs of the time. El Lissitzky was the chief designer of Soviet manifestations in the world, and he made extensive use of all sorts of propaganda: journalistic approaches to country and citizens, architectural photography of new structures erected, and portraits of important politicians. His compositions were marked by strong graphic and typographical elements with the result that this propaganda strongly resembled advertising. Soviet propaganda, however, was carried out on a grand scale, and along with the painting style Socialist Realism, formed the visual face of the Soviet empire. Yet by the 1930s, propaganda was shaping politics everywhere: No election was held without campaigns in magazines and newspapers, press releases, and posters, all illustrated with photographs—the medium that would attest to the "truthfulness" of that which propaganda could very well be manipulating or subverting.

Fascist and Nazi propaganda in Italy and Germany marked the next phase in systematic and overwhelmingly effective use of propaganda that resulted in the destruction of democracy. Up to 1936 German propaganda followed strictly the modernist rules of Italian Fascist propaganda, featuring the styles and methods promulgated by Agitprop and avant-garde art: photomontage and diagonal composition, use of (typo)graphic effects and telling short stories in small sequences, eye-catching images marked by bright whites and deep shadows. The last manifestation of this modernist propaganda style came in the exhibition *Germany* and its catalogue that accompanied the Berlin Olympic Games of 1936 designed by the former Bauhaus student and teacher Herbert Bayer. Yet Hitler effectively stamped out modernist art in Germany, labeling it "degenerate," closing down the Bauhaus and causing many artists to flee. Bayer himself emigrated to the United States in 1938 after realizing that his vision of modern design could no longer be pursued.

PROPAGANDA

By that time, propaganda had advanced to different goals: chief among which was stirring up the racist and anti-Semitic fervor. As well, propaganda was effectively used to prepare the German population for “total war,” and suppress any opposition by creating a climate of pervasive fear (*angst*). Nazi propaganda did not particularly attend to pictorial inventiveness, for example, there were no photomontages in Nazi propaganda, unlike their common use with Stalin’s regime in the late 1930s. Nazi propaganda’s most common quality was a fairly conventional and straightforward depiction of idealized German citizens as “types.” It was this tendency that caused the photographs of August Sander to become associated with German propaganda. Thus the selection of appropriate models was of more concern than the artistry by which they were photographed and presented. As is characteristic of propaganda, if necessary, a photograph was produced as a fake—many shots of children interacting with Hitler were staged with the daughters and sons of Nazi officials and not the spontaneous displays of affection and loyalty by strangers that they were clearly intended to depict.

There were two common forms of Nazi photographic propaganda: idyllic photographs of a beautiful country with happy people (often dressed in various regional costumes) intended to strengthen and stabilize the identification of the Germans with the regime, and photographs showing brutal acts against those deemed political opponents, the members of Jewish communities, Roma, and Sinti, and others not considered as belonging to the German mainstream. Most of these images mimicked scenes from movie features: narrow spaces with uncertain foregrounds, the protagonist Nazis mostly shown from the back or looming in the background, their victims depicted from above or angles that made them seem small and worthy only of hatred.

Japanese nationalist propaganda of the same era mimicked the Nazi standard by showing beautiful girls in traditional garb to represent the country’s “pure” history and bolster self-esteem but did not neglect the dreadful reality of Japanese war crimes in China.

With the outbreak of World War II came a world wide propaganda machine. Militaries from all countries produced leaflets, posters, radio programs, and illustrated papers in attempts to bolster patriotism and demoralize the enemy. Specific methods to achieve these goals varied little. Seen at a distance, it is clear many of the most celebrated images that resulted from the war at the time served as propaganda. Robert Capa’s photographs of the Allies landing at Normandy to Margaret Bourke-White’s

images from Naples, W. Eugene Smith’s and Edward Steichen’s series of brutal action in the Pacific Theater to Alfred Eisenstaedt’s V-Day kiss may seem obvious, but at the same time Cecil Beaton’s *Africa* or Arcadij Schaichet’s *Road to Berlin*, or Pierre Jahan’s work for the Resistance in Paris or *De Ondergedoken Camera* in Amsterdam also clearly served propagandistic purpose. After WWII, with the superpowers settling into the Cold War, even more propaganda was stimulated. As well, some photographers practiced a sort of “anti-propaganda,” such as W. Eugene Smith’s series “The Spanish Village,” which generates much of its power and meaning contrasted with Spanish dictator Franco’s bright marble monuments.

Within the framework of the Cold War, propaganda became a delicate business. The world tour of Edward Steichen’s exhibition *The Family of Man*, partly financed by the U.S. Information Service and the Coca-Cola Company, has often been denounced as having been mere propaganda rather than fulfilling its humanistic stated aims, but at the same time the common practice of Stalin’s regime simply to retouch photographs, deleting those no longer in favor from even previously published, historical photographs forms the other end of the propaganda continuum. The historical reality, however, is always different from the intentions of the propagandists. Neither could the propagation of peace and understanding through such efforts as *The Family of Man* prevent people from harmful action, nor were the careers of those “erased” by Soviet censors really stopped.

In 1989, however, nearly the whole communist system imploded. History proved right what communication researchers like Hovland and Lazarsfeld had ascertained in the 1950s at the height of the Cold War: propaganda as a whole, and photography within it, could not change people’s minds but simply strengthened existing tendencies. For the field of propaganda, this knowledge had two results.

First, propaganda became mostly local or national in scope. Be it the portraits of national leaders, of revolutionary martyrs, of war heroes, or of ordinary people presented in images that are ideologically sound, these photographs are widely used to fulfill societal needs, e.g., in the propagation of economic welfare, birth control, or other sorts of campaigns. Some of these images have become part of the larger world culture, such as the iconic portrait of the father of Chinese communism, Mao Zedong, or revolutionary martyr Che Guevara.

Second, propaganda is used as part of everyday journalism giving neither photographers nor readers a chance for recognizing the truth. But this only

functions in areas with closed borders, and these are diminishing.

On the other hand, propaganda has become a part of the worldwide media business, which has changed basic assumptions of ideology substantially. The launch of stars within media, be it movie stars or members of royal families, is not possible without a mixture of news material and propaganda. Its quality now lies in the preparation of mediated images meant to change people's ideas about consumption, or aggression, or their own roles in processes of globalization. By the manipulation of preferences in taste and interest, people can be brought to consume certain products or follow a certain lifestyle without concern for larger community and social welfare. Or to say it the other way round in the late twentieth century, propaganda is no longer a means of governmental action but of economic interests. The ease of creating seductive images through inexpensive and widely-available modern editing software designed to manipulate all aspects of a photograph has caused the public to suspect that almost all publicly distributed photographs have been altered in some fashion.

At the same time, propaganda gains a new role in shaping global politics as spy satellites, night vision technologies, and super-miniaturized camera equipment with instantaneous dispersal of images over the internet feed what has been called the Information War. The erosion of the credibility of images is an important part in bilateral propaganda fights as the aerial photographs of bombed buildings, bridges, and trains in the Gulf and Bal-

kan conflicts of the 1990s have shown. Thus, the new photographic propaganda might be created by automatic cameras in real time, look like scientific images, and pretend a truth not conceivable.

PUBLIC ART PHOTOGRAPHY

Photography and photographic processes have been utilized in the arena of public art beginning with early twentieth century documentation projects and continuing today as an effective means of public self-expression. Public art photography encompasses many facets ranging from conceptual and political art, to documentation, to unique works for exhibition, to architectural and place enhancement.

Public art may be defined as art that is created for permanent or temporary installation or exhibition in public locations freely accessible to the com-

munity as they go about their daily lives. This is in contrast to artwork exhibited for an audience who specifically seeks out viewing opportunities at locations such as museums and galleries. Public art is generally commissioned with public funds and is typically located in public spaces such as governmental buildings, plazas, parks, and city streets, but corporations, arts institutions, and individuals may also place art on public view to create de facto public works. The artwork itself may be installed permanently in, on or near a

PUBLIC ART PHOTOGRAPHY

building or public space, such as a sculpture. Or, the work can be part of a “portable” collection of work, such as photographs and paintings that can be moved among public buildings. Artwork may also be physically integrated into the location, becoming an essential element to the structure, such as an artist-designed floor, wall, or landscape. Temporary or ephemeral public artworks may include performances, photographic projections, or temporary displays.

From its invention up until the period of major growth of public art programs in the mid to late twentieth century, photography has been primarily utilized within public art as collectable portable artworks or as a medium for documentation. In the 1920s, Soviet artists seized upon the documentary nature of photography to create Agitprop, or works meant to sway the masses to a particular political viewpoint. Several significant documentary projects came about in the United States during the Great Depression in the 1930s, under the Federal Government’s Works Progress Administration (WPA) program, the Federal Arts Program (FAP), and the Farm Security Administration (FSA). Photographers, along with others in the arts such as painters and writers, were employed by the U.S. Federal Government and given the opportunity to create or teach art for reasonable pay.

The government hired the photographers to document the current condition of life in America, including documenting governmental relief and construction programs. Historically, these photographers built upon the distinguished social documentary work of independent photographers throughout the world in the earlier part of the twentieth century. Photographer Lewis Hine, with his groundbreaking images of the abysmal working conditions in industrial America, and the subsequent reform that these images helped bring about, is an excellent example of this earlier socially-conscious work.

The FSA program employed the photographers to document the life and hardship of rural America during the drought and Great Depression. The program produced a remarkable 270,000 images and included such notable photographers as Dorothea Lange and Walker Evans. The iconic twentieth century image, *Migrant Mother, Nipomo, California* (1936) by Lange was a product of the program. Photographer Berenice Abbott completed another significant project but hers was focused on the urban experience. Funded through the FAP and sponsored by the Museum of the City of New York, Abbott was employed to document New York City in a period of sweeping change during the 1930s. This

work culminated in the important portfolio, *Changing New York* (1939), a collection of 305 images.

Contemporary public art can be defined as beginning in the post-World War II era when artwork began to be incorporated into new post-war modern buildings and cities throughout the world. In particular, the 1960s and 1970s saw a significant growth of local governmental public art programs and interest in public art in general. Much of this funding was spurred by the newly created National Endowment for the Arts, one of President Lyndon Johnson’s “Great Society” programs. So-called “Percent for the Arts” programs were set up in a number of American cities that by statute called for the setting aside of a percent of the overall budget for the construction of a public building for the purchase and placement of art works. The federal General Services Administration in particular was a pioneer in percent-for-the-arts placements.

In this time period, photography as a public art medium was generally still utilized for documentation purposes and collecting of discrete prints. However, the evolution of technology and artists’ ingenuity changed this pattern in the 1980s, 1990s, and today. Photography is currently being integrated into public art on many different levels from large commercially-produced digital murals; to source imagery for etched reproductions in glass, metal, stone, or tile; to use in traditional commercial and advertising venues; to temporary projects including installations and projections.

Photography and the photographic process have become more feasible in public art largely through technological advances that have allowed for greater scale opportunities and the utilization of new materials and reproduction techniques that lead to a more permanent image and product. For example, Puerto Rican born artist Pepón Osorio’s community-based artwork entitled *I Have a Story To Tell You...* (2003) features glass panels incorporating transferred photographic images from the Latino community in Philadelphia. The panels became the walls and roof of a casita (small house) Osorio built in a community health center courtyard as a gathering place. Deborah Wian Whitehouse creates large-scale photographic works using commercial digital printing on vinyl sheets. Her work *Spirit of Atlanta* (2000), installed at the Atlanta International Airport, highlights diversity and urban life, and measures a remarkable 20 × 70 feet. Artist Ellen Driscoll’s large work, *As Above, So Below* (1993–1999), in New York City’s Grand Central Terminal is a mosaic mural she created with source photographic imagery.

Advancements in digital photography, through the accessibility of the process, ease of use and relative low cost of image-taking and distribution, has also encouraged the use of photography in public art. For example, over the past decade in China, digital photography has helped lead to a major photographic movement and interest in photography in general as a means of public expression—ultimately resulting in public exhibits and installations all over the world. An engaging example of recent work from China is artist Chen Shun-Chu's *Family Parade* (1995–1996). In the work, Shun-Chu created a large installation by covering an abandoned house with hundreds of framed images of his family.

Contemporary photographers and artists have also utilized, and some would say exploited, elements that have been traditionally available to the advertising and promotions industry, including billboards, photo light boxes, bus shelters, and bus and taxi placards. Many of these artists are specifically critiquing the prevalent advertising medium and how information, and photography, are disseminated in popular culture. Chilean artist Alfredo Jaar frequently utilizes photography in installations including large-scale prints and light boxes. His work, often political, focuses on the exploitation of the Third World by the industrial world. In *Rushes* (1986), Jaar installed 80 large photographs of Brazilian Indians mining gold in dehumanizing conditions beside the world market price of gold in a New York City Wall Street District subway station. In contrast, Taiwanese artists Pu and Yang Tsong utilized photo light boxes to exhibit tranquil images of nature in their work *Musical Skies* (1998) at the Memorial Hall Station in Taipei, Taiwan.

Artist Krzysztof Wodiczko combines photographic images and the photographic process of slide projection in his ephemeral work. Wodiczko, who was born in Poland and now lives in the United States, has produced his projection installations throughout the world since 1981. Wodiczko's work addresses social and political issues including homelessness, corporate power and the experience of the disenfranchised. The artist chooses the images and the buildings, such as monuments, museums, and corporate headquarters, to both engage the viewer and challenge the viewer's own perception and prejudice. His projections may include images of eyes or hands juxtaposed with images of guns, nuclear missiles, and money. For a project in 1985 at the Grand Army Plaza in Brooklyn, New York, Wodiczko projected a U.S. nuclear missile and a Soviet nuclear missile chained and locked together. These temporary works are also recorded for history and further reproduction through photographic documentation.

Others have successfully worked with projection including American artist Shimon Attie, whose striking work concentrates on the Holocaust and German Jewish history.

The intent and use of the photograph varies from artist to artist, from original work created by the artist to the inclusion of appropriated or historical images. The photograph, image, or projection can be the final complete artwork or it can be integrated into an overall, larger work. Photography, and evolving and innovative photographic processes, will continue to be a source for artists as they create works to enliven our public buildings, cities, spaces, and communities.

R

ARNULF RAINER

Austrian

Arnulf Rainer is one of the leading artists in Austria. His work alternates between photography and painting. His photographic work should be considered performative photography, similar to that by Valie Export, Ulay, Ana Mendieta, Bruce Nauman, and Vito Acconci. He became internationally famous in the fifties for his “over-painting” of already existing paintings and later for his over-painting and over-drawing of photographs. He uses self-portraits and other photographs as the base for his *Bildübermalungen* (*Over-paintings*). Expressive, spontaneous, and gestural, his work is important because its cross-disciplinary nature and focus on the body opened the doors to the innovations by many later artists.

Arnulf Rainer was born on December 8, 1929 in Baden (near Vienna), Austria. In 1948, he discovered Surrealism and until 1951 worked with Fantastic Realism style producing Surrealist-figurative work. Except for attending two Viennese art schools for very brief periods in 1949, he was basically self-taught. Since the early fifties, along with painting, photography has played an important role in Rainer’s work, starting with the pub-

lication of the photography portfolio *Perspektiven der Vernichtung* (*Perspectives of Destruction*) in 1951. Rainer’s interest in religion has made it a frequent theme for his art since 1953 when he began painting plywood crosses in his *Die Kreuzen* series. In this same year, he also began reading mystical texts and made his first photographic self-portraits. Between 1953 and 1959, Rainer executed his most well-known group of works, *Die Übermalungen* (*Overpaintings*), utilizing a method that was to become a constant in his work. With gloomy colors and a violent technique, Rainer painted over his own paintings, the paintings of other artists, and photographs of Old Masters.

Between 1962 and 1968, Rainer was involved with the Wiener Aktionismus (Vienna Actionism), whose activities sought to challenge accepted beliefs and traditions through performances that were erotic body rituals centered on sacrifice and suffering and could only be documented photographically. A period of preoccupation with the human body and body language followed his involvement with this group, the results of which began in 1968 with the first *Grimace* photographs made using an automatic photograph booth. Since 1969, Rainer has produced numerous series of painted-over and drawn-

over photographs such as *Face Farces*, a series that he continues today.

During the seventies, Rainer increasingly explored aspects of facial expression and body language. In the *Face Farces* and *Body Poses* series, Rainer posed for himself, grimacing, kneeling, lying and seated, nude and clothed. "Pilot," 1972 and "Black Bride" (Face Coloration), 1969/1970 are two works of these series, respectively. Rainer's fierce technique of over-painting reflects his anger with the silence of the image described by Rudi Fuchs in the 1986 *Arnulf Rainer: Self-Portraits* exhibition catalogue as "The photograph is hit and lashed or tortured to give away its secret, an expression not yet known as part of the culture." The American art critic Donald Kuspit, in an article titled "Arnulf Rainer: Self-Exposures," has said, "Rainer wants *both* the manifest content communicable by the matter-of-fact photograph, and the latent content communicable by the libidinous painterly process. And he wants them simultaneously—all at once." In works such as "Angst (Portrait of the Artist)," 1971 and "The Birth of an Artist," 1972, Rainer remains himself and does not try to assume a false identity in contrast to photographers of the 1990s such as Yasumasa Morimura, Cindy Sherman, or turn-of-the-nineteenth century artist F. Holland Day.

In 1973, he began a series of paintings, gestural *Handmalerei* (Hand Paintings) and *Fingermalerei* (Finger Paintings), again painted over a black-and-white photographic background, but done directly with his hands, fingers, and feet, thereby linking his work to Body Art. Arnulf continued his experiments on the body in the cycle *Frauenposen* (*Women Poses*), an example of which is *Die Rothaarige Reiterin*, 1977. In the mid-seventies, Rainer produced over-paintings of photographs of works by a wide variety of artists including nineteenth-century illustrator Gustave Doré, old masters Leonardo da Vinci, Rembrandt van Rijn, and Francisco de Goya, and post-impressionist Vincent van Gogh, known as *Kunst auf Kunst* (*Art on Art*); see *Vincent van Gogh als Blümmer*, 1979. Since 1977, he has had a preoccupation with themes of death leading to several series of drawings on photographs: *Totenmasken* (Death Masks), *Leichengesichter* (Corpse Faces), and *Mumien* (Mummies). After discovering the eighteenth-century Austrian sculptor Xavier Messerschmidt, Rainer began using many different techniques to alter images of the sculptor's work. An example from the *Messerschmidt* series is "Der von Fliegen Gequaelte (Messerschmidt-Ueberzeichnung)," 1975/1976. In the eighties, Rainer's interest in spirituality re-

awakened as he returned to a series from the late sixties *Die Kreuzen*, a number of which included drawings on photographs of crucifixions. In 1982, he produced the *Hiroshima* series, drawings on 72 photographs of the destroyed city.

Rainer's work is characterized by a constant search for new art forms and means of expression, as he questions the well known and established. Rainer paints and draws feverishly on his photographs so that sometimes the originals become nearly undetectable. In 1994, over two dozen of Rainer's paintings were destroyed when someone broke into his studio in Vienna. This persuaded him to resign his teaching position the following year. However, the equally anarchic and provocative Rainer continues to paint over photographs such as "Giottouebermalung," 1998. In this new series, *Schleierbilder* (Veil pictures), the paint layers are semi-transparent, allowing the photograph below to shimmer through as the surfaces below and above merge.

Rainer taught in Vienna from 1981 to 1995, and in Stockholm and Berlin after 1981. He has participated in many solo and group exhibitions in public and private venues around the world. In 1971, he was invited to represent Austria in the São Paulo Biennial. The following year, he participated in Documenta V in Kassel, West Germany and then participated in Documentas 6 and 7, 1972–1983 (after having participated in Documenta II in 1959). In 1978, he took part in the 38th Venice Biennial. Among his most recent exhibitions were his one-man shows in 1989 at the Solomon R. Guggenheim in New York as well as the 23rd São Paulo Biennial in 1996. In the year 2000, his work was the subject of a major exhibition in Amsterdam and Vienna celebrating his seventieth birthday.

ROBERT RAUSCHENBERG

American

Robert Rauschenberg has often been quoted as saying that his paintings act in the gap between art and life. The same can be said for photography, which snatches small bits of life and represents them as works of art. Rauschenberg's use of photographs in his paintings, then, redefines the two polarities in a way that suggests that the differences between art and life are not so great, the gap not too wide to cross, certainly not in one imaginative leap.

Among the first to use photographs in painting, Rauschenberg began incorporating a variety of elements into his work in the early 1950s, around the same time that he began experimenting with blueprints and photograms. As he moved from paintings that embedded photographs into the picture plane under a blanket of translucent paint, he continued to use objects to represent that space between art and life, even as the objects became bigger and more three dimensional. A chair or a pillow that is painted on but hangs outside the frame is not an image from life, as Magritte's famous pipe, but is the object itself. Experience is no longer one step removed through the act of art, but becomes the work itself.

The paintings he called his Combines evolved from canvases primed by newsprint to found-object assemblages that dissolved the boundaries of painting. Rauschenberg's 1955 Combine painting *Satellite* features a stuffed pheasant standing atop the frame-like perch; in his 1959 piece *Canyon*, a stuffed raven emerges from a box balanced on a narrow board, from which a hanging pillow almost reaches the floor. He created an international stir in 1955 when he drew and painted on bedding and a pillow, mounted it on a wall, and called it *Bed*. Perhaps his most famous piece is *Monogram* (1955–1959)—a stuffed Angora goat encircled by an automobile tire that stands on a painted collage pasture.

The invention of photography altered the trajectory of painting, freeing it from the servitude of merely recording appearances and giving it the liberty of abstracting expression. So also did opening painting to include found objects redefine the role of art. Including a five-by-even photograph on a five-foot painting—as Rauschenberg did in *Le-*

vee—demands that we, as viewers, change our focus. We are forced to pay closer attention as our focus shifts to a level of intuitive rather than literal understanding. Rauschenberg's work was at the center of a movement away from the aesthetics of painting to the ethics of art. Like contemporaries Jackson Pollack, Jasper Johns, and Willem de Kooning, Rauschenberg applied a nonliteral logic to move beyond the familiar.

He had met Jasper Johns in New York in 1954 and John Cage when studying photography and painting at Black Mountain College in North Carolina in 1948. Cage characterized their meeting as “understanding at first sight” and has said that he composed his seminal work *4'33"* after viewing Rauschenberg's series of all-white paintings. Speaking of Johns, Rauschenberg has said, “It would be difficult to imagine my work at that time without his encouragement.” De Kooning was also a friend whose work Rauschenberg admired. Rauschenberg took some of the first steps in American conceptual art when he erased a de Kooning drawing, framed it, and exhibited it as his own work in 1953, titled *Erased de Kooning Drawing*. He worried that the piece might be misconstrued as “anti-painting,” although de Kooning had given Rauschenberg the drawing with full knowledge of his intentions, bestowing a collaborative air to the work. Critic Leo Steinberg, who knew both artists, said that de Kooning chose a particularly dark crayon and pencil drawing to give to Rauschenberg, saying, “We might as well make it harder for you.”

With one gesture, Rauschenberg made it clear that the fruit of an artist's work need not be an object, while at the same time clearing the way for all artists whose talents lay outside of drawing. He began collaborating in the 1960s with Cage and choreographer Merce Cunningham to produce dance pieces; he designed one piece, called *Dark Horse*, that featured 23 turtles with lights on their backs to produce what he called “organic lighting.” Helen Molesworth, Baltimore Museum of Art curator of contemporary art, has said, “One could argue that it was Rauschenberg who made installation art itself possible.”

In the 1960s, Rauschenberg also began experimenting with overlays of silk-screened photo-

RAUSCHENBERG, ROBERT

graphs, a technique also being explored by Andy Warhol. Some of the silk screens were made from photographs he took himself; some were images not of people or objects but historical events, allowing Rauschenberg to compress fragments of documentary into his work. At age 37, Rauschenberg became the first American to be awarded the grand prize in painting at the Venice Biennale in June of 1964. The triumph was of the incongruous over the representational, the contradictory over the descriptive. Rauschenberg's work not only defies literal translation, but to attempt a merely meaningful interpretation is to become ensnared in its paradox. As described by *Time* art critic Robert Hughes, his work is the art of free association, as open ended and complex as the mind itself. It demands that the mind of the viewer be the same.

He founded an organization called Experiments in Art and Technology (E.A.T.) in 1966 whose purpose, he has said, was "to function as a catalyst for the inevitable fusing of specializations creating a responsible man working in the present." His painting became uneven in the 70s as he continued to broaden his scope. But as his earlier work championed disassociation—the disconnection of neighbors, made inherent by virtue of their creator-designated proximity—and his later work flaunts incompatibility and alienation. In the 1980s, as he hired more assistants to help achieve his goals, his work takes on an unintended irony, especially when compared with early work prized for its individuality. Quoted in an early interview, Rauschenberg spoke for all artists when he said, "I can't afford to lose touch with myself, because that's really all I've got."

Rauschenberg has also exhibited photographs as such, which surprised many with their straightforwardness. He first exhibited photographs in a 1980 small exhibition on Sanibel Island, Florida, near his home on Captiva Island; the next year a survey of his photographs was mounted at the Pompidou Center, Paris.

TONY RAY-JONES

British

Tony Ray-Jones was one of the most important English photographers of his generation through the visual quality of his work and the influence it had on young photographers, including his fellow Brit Martin Parr. Ray-Jones first emerged as a photographer in London when little was known about the medium's past, aside from some key images from the nineteenth century. There were no galleries showing photographs and very few books. In 1960, when he began to take pictures, Ray-Jones had no sense that he was unwittingly following a very British tradition of Social Documentary. In the 1930s, Humphrey Spender (1910–) had worked as a photographer for a project called *Worktown* for Mass Observation, which was studying the lives of ordinary people in Bolton, a Northern city. In 1936, Bill Brandt (1904–1983) had published *The English at Home*, a book which documented the social divisions of British society. Later, in the 1940s and 1950s, Brandt was to work for *Picture Post* magazine, the chief outlet for photographers who favored a popular audience. He also proved to be a strong influence on Ray-Jones, possibly because Brandt's brother taught at what then was called the London School (now College) of Printing, where Ray-Jones went in 1957 to study Graphic Design. Other photographers he came to admire were Henri Cartier-Bresson (1908–), Brassai (1899–1984), and Robert Frank (1924–)—all Europeans who managed to infuse

their images with whimsy and a sometimes sad but frequently engaging honesty. Ray-Jones wanted to be like one of his literary role models, George Orwell (1903–1950), and bring poetry to documentary or authenticity to the dignity and strangeness of 1960s street life. Having the attitude "take one for the man and one for myself," Ray-Jones was a working photographer who wanted absolute control over how his pictures would be seen. That attitude created problems in the 1960s. As a commercial magazine photographer, he could provide a convincing portfolio of published work and short stories, and he also took portraits for major magazines. Yet Ray-Jones wanted something else—to show his own vision of the world as a place of possibility where, with a camera, he could transform the mundane into the meaningful.

A seminal influence on Ray-Jones's development was Alexey Brodovitch (1898–1971), little known as a photographer but famous as a magazine Art Director and designer. Brodovitch, a White Russian emigré to Paris in 1920 and then to the United States in 1930, was Art Director of *Harper's Bazaar* and ran the Design Laboratory, an open-ended teaching situation that attracted the best and brightest. At the time Ray-Jones first met Brodovitch, classes were held in the Richard Avedon (1923–) studio in Manhattan. Brodovitch was admired greatly by designers and photographers and was mentor to many. He liked Ray-Jones's work, which was then a fusion of photography's old (European) world and the radical new of the

RAY-JONES, TONY

United States. Ray-Jones admired him for being clever and wise, and for being a visionary.

The United States was important for Ray-Jones and remains so for his partner, Anna Ray-Jones, an artist from Bradford, England, who lives in New York City. He went to North America first as a 19-year-old to take up a scholarship in design at Yale University. It was while there that he decided to concentrate on photography and spend a year in New York City, impressed by its possibilities and vitality. The experience honed his skills in working and seeing, but he returned to London in 1965 and devised a plan that was going to become his finest body of work—the English at leisure. It was at once an essay in folklore, eccentricity, and the quality of life. The pictures showed admiration for the photographers Ray-Jones thought worthwhile. The images were direct if sometimes enigmatic, ironic, lyrical, and often surreal. His images were the products of rigors in seeing and thinking, action, and reaction. Ray-Jones used *The Americans*, Robert Frank's 1959 book, as a model. This slightly surreal and often uncomfortable examination of England's urban life, coastal resorts and holiday camps, and society events was not published until two years after his death as the monograph *A Day Off: An English Journal*. His passing in 1972 was mourned publicly by Paul Strand, who wrote: "The tragic death of Tony Ray-Jones who was working in the great tradition...is a real loss to the art of photography in Great Britain and to people everywhere."

ALBERT RENGER-PATZSCH

German

Albert Renger-Patzsch is one of the most important promoters of modern photography in Germany, and his famous book *Die Welt ist schön* (The World is Beautiful; 1928) is considered a bible of the German modernist movements called *Neue Sachlichkeit* (New Objectivity) and *Neue Sehen* (New Vision). With this publication, Renger-Patzsch became famous overnight, seemingly almost against his will, considering his reluctance to collect his own writings on avant-garde photography. *Die Welt ist schön* is without a doubt one of the most important books on twentieth-century photography and was received with almost rapturous praise, though the author was angry that the book was understood philosophically and instead held it up as his declared belief in optimism (in a letter to Franz Roh from 1930, see Albert Renger-Patzsch, *Ruhrgebiet Landschaften* [Ruhr Area Landscapes], 1927–1935, edited by Ann Wilde and Jürgen Wilde, Cologne: Du Mont, 1982, p. 73). He had little interest in media and questions of art history and paid no attention to the later styles of photography. In the next decades, he did nothing to follow on the surprise success of his famous book. He preferred publishing his works himself, and he was faithful to the stylistic principles he defined for each book.

As a schoolboy, Renger-Patzsch began learning photography under the tutelage of his father. After ending his chemistry studies in Dresden, he began working in 1921 at the Folkwang publishers in Hagen, where he was director of their photography archive. Together with the photographers Fred Koch, Lotte Jacobi, and others, he built up a photography collection. To serve his abiding interest in the sciences, he also took photographs of plants and flowers, and in texts he wrote at the time, he emphasized the “new perspective” that was created by viewing the world “with the eye of an insect.” His own photographs, which were appearing anonymously in botany books published by Folkwang, demonstrated the strong forms and interest in unusually structured images that would mark his later works. These early images also explored the aesthetic potential of close-ups and enlarging details. The scientific uses for precise photographic docu-

mentation and for recording the characteristic qualities of objects greatly impressed Renger-Patzsch. To the end of his life, he claimed that photography was not an art but a means of documenting, and that it should not compete with the extreme effects produced by graphic arts because this would cause photography to lose its own treasure of nuance and detail. He rejected any attempts to push photography toward total abstraction.

In his earliest works, Renger-Patzsch was already leading the retreat from Pictorialism or so-called art photography. He was one of the first in Germany to reject technical or manual manipulations to improve the image, and he sought an unadulterated objective quality of photography. In this way, his works are comparable to those of Paul Strand in the United States; he was also called “the German Edward Weston” for the same reason. By the mid-1920s, Renger-Patzsch was publishing photography collections in rapid succession. His preferred subjects were architectural and landscape photography, and he often placed them in powerful sequences to create city portraits. In addition, he made impressive photographs of heavy industry. As one of the first photographers with great ambitions, he recorded the detailed construction of machines. Already in his early works one can see how the experience of the modern world influenced his art. Renger-Patzsch saw that the possibility of recording “the rigid linear structures of modern technology, the airy gridwork of cranes and bridges, the dynamic of 1,000 horse-powered machines” was better in photography than in any other medium. His credo demanded that he stand in service of the object and present the material objectively—a rigid will to form is noticeable in both his early and later publications. His photographs demonstrate an almost classical severity in the tension created by formal details on the image surface. Rows of metal scaffolding thicken into constructed rhythms; seams along the shore banks divide the image into shifting planes; stacks of identical products create detailed serial patterns—with these effects, he attempts to liberate spatial detail from all contingent elements and produce a new surface organism. In this way, Renger-Patzsch takes his photographs to the border of abstraction even as he always

claims that his works bring out the essence of the objects photographed.

This ambivalence is typical of the artistic viewpoint during the Weimar Republic. As soon as Renger-Patzsch published *Die Welt ist schön* in 1922 with photographs from the period (he wanted to call the book simply "The Things"), he became known as the main representative of the *Neue Sachlichkeit* movement in photography. But he had already had enthusiastic reviews by some prominent authors. Contributing to his rise in fame was the foreword to his book, written by the art historian Carl Georg Heise, which situated the photographs in the ontological discourse of contemporary theories of art, with their tendency to describe the symbolic quality and expressive essence of objects. The novelist Thomas Mann praised the images for this tendency, as did the writer Kurt Tucholsky. Walter Benjamin later criticized them for aesthetically stylizing the world into pure surfaces, an apparent overvaluation of the book's title. In reality, Renger-Patzsch's aesthetic sprang more from an interest, driven by science, in the composition of the visual structures of the outside world than from a desire for harmonic design. He sought to discover ordering principles that would show the relationship between art and nature, and technology and nature. Thus, basic tectonic patterns dominate the various objects in his work, and there are correspondingly few portrait photographs, prominently among which are those of workers at the Grünthal coppersmith. Where he does make occasional portraits, they are more conventional than his work with objects, and they often have traces of tastes from the turn of the century, especially the influence of Hugo Erfurth. In all of his other works, he executes his intentions without compromise in a style uncoupled from the painterly tradition, and he does this even in the many commissioned works for industry, which embraced the new language of objective still-life photography. The still life he created in 1925 for Kaffee Hag would become famous. Many progressive architects ordered series of photographs of their new buildings from him.

In photographic work not directly commissioned, Renger-Patzsch restricts his subjects to the inanimate world. People rarely appear in his photographs. He makes industrialization's influence on the landscape his main focus. The juxtaposition of modern technology and nature gives his photographs of the Ruhr area in western Germany, which was rarely ever photographed, a special appeal. He often represents a city's outer limits, where streets and fallow land intersect. These still-

life photographs of such scenes are comparable to the paintings of his contemporary Franz Radziwill. It made no difference in his work whether his subjects were things from the natural world or architecture, industrial products, or machines. His eye would monumentalize all objects, even the smallest. The division of his photographs into planes, lines, and zones of light and shadow remained especially constant, independent of the object photographed. To subordinate them to a leveling perspective, he forced his cool stylistic intention and principles of representation onto all subjects, de facto founding a popular style or school of photography. Photographers of the 1930s and 1940s, such as Hugo Schmölz, Adolf Lazi, Walter Peterhans, Wilhelm Castelli, Werner Mannsfeldt, the young Andreas Feininger, Arvid Gutschow, and Alfred Ehrhardt, followed his lead; later, in the 1960s Bernd and Hilla Becher promulgated a similar style to their students, including Thomas Struth, in the 1980s.

After he gave up the position Max Buchartz had secured for him in 1934 as an instructor of photography at the Folkwangschule in Essen, Renger-Patzsch worked without permanent employment until his death. In his later works, he avoided even more than before all dramatic intensification of effects, eliminating the confusing lines that still characterize "Fabrikschornstein" from 1925 and the famous photograph "Herrenwyk Blast Furnac" from 1928. The choice of themes became more restricted, the subjects more idyllic, apparently unrelated to the less restrictive atmosphere of post-World War II Germany. Renger-Patzsch retreated into himself more and more. He produced privately published, expensive collections of uncompromising artistry after repeated demands by Ernst Boehringer. Although his style remained faithful to his prewar works, especially in his reduction of visual intensity, his subjects were less monumental; the graphic qualities of fine linear forms and gradations of gray became more dominant, and in general there is a decrease in the mischievousness with which he chose detail and perspective.

At the end of his life, Renger-Patzsch made it known that photography no longer actually interested him, "but the object all the more." His books on trees and rocks, in which photographs are paired with accompanying scientific texts that give precise information about the characteristics of the represented objects, suggest the same systematic intentions as his early work. He thus reinforced the delicate interrelationship between the particular and the general that he has sought in his strictly photographic works. Later, he would emphasize

that it was always his dream to make photograph and text equal, confirming again his notion of photography as a form of communicating existing conditions and documenting natural facts.

Biography

Born in Würzburg, Germany, June 22, 1897. Schooled in the cities of Essen and Dresden, Germany. Military service, 1916–1918. Studied of chemistry in Dresden, broke off studies in 1921. Later director of the photography department of the publisher Folkwang in Hagen. Various positions in Berlin, Germany, and Kronstadt, Siebenbürgen, at the time in Germany, as photographer, bookkeeper, and salesman. Moved to Bad Harzburg, Germany, 1925, and Essen, Germany, 1929. There he was director of the department of illustrative photography at the Folkwang-Schule, 1933. After two semesters he resigned his post in protest against the school directorship that conformed to the new Nazi guidelines. In World War II, a war correspondent. Destruction of his archives in a bombing raid on Essen, 1944. In the same year, he moved to the town of Wamel near Soest, Germany. Awarded the David Octavius Hill Medal from the Association of German Photographers, 1957. Awarded the culture prize of the German Society of Photography, 1960. Gold medal award from the Photography Society of Vienna, 1961. Member of the Society of German Photographers, 1964. State prize for Artistic Crafts from Nordrhein-Westfalen, 1965. Died in Wamel, September 27, 1966.

REPRESENTATION

Each and every representation is above all else presentation, an act of showing and an act of bringing out an item by means of a sign.

One could not conceive a mental, intellectual, or social stage prior to the one of representation since mankind is *animal parolans*. The representation is inevitable, and more or less mimetic according to its linguistic or artistic representation. If the phenomena are fully given without delay, only the communication of the experience may be achieved thanks to the representation.

Yet, as and when the *technè* of our societies becomes complex, as well as its languages (artistic, data processing, etc.), a gap is created between the world and its representation: the present evolution reveals an increase in the distance between the item and the token never equaled. Moreover the artist mediator has constantly been disparaged as yielding a sacrilegious imitation of reality, without giving access to this wished presence. Finally, the mimetic pleasure it conveys is traditionally condemned by the philosopher, if not by the religious man. Today, with the democratization of culture, the classical values crumble giving priority to reason, to loss of transcendence, and to technological development enabling the creation of synthetic images, representation suffers a violent crisis, a "semiotic cut" (Bougnoux).

Nonetheless, despite the rejection of the *mimesis*, literature and art still keep on representing. To represent is to go from the tokens to the items; however, it is also to create an imitation. In the end, to represent comes back to the act of creation.

From the Tokens to the Trueness of Items

Paradoxically, if the philosopher and the religious man may condemn the image to mislead mankind

in his search for truth, the proselyte image enables mankind to render sensitive what goes beyond the understanding, assuring Man of a divine presence. As a result, its necessity relies on mankind's anxiety facing the temporary; religion and art have for a long time found some common ground by establishing values alleged as perpetual against the rapidity of existence. Likewise, the image enables a work of bereavement and relief. Did not the Egyptians do the same thing with the pictures of Fayoum?

Freud did not neglect stigmatizing the complex of emptiness, out from the apologue of *fort-da*. A child is able to sublimate the mother's absence by playing with a reel that he throws in the distance and that he pulls back toward him. Similarly, the image works as a tranquilizer and a painful spur by the creation of an autonomous world in which the principal of pleasure is entitled to quote. It is, according to Derrida, *pharmakon*, both remedy and poison.

To Plato, philosophy should leave the realm of shadows and throw light on the intoxicating appearances; he draws the original separation between reality and his representation. This desire for enlightenment and truth, inner wisdom among the Ancients, eschatology among the Christians, is found again by the photographer attempting to capture light in an animist sacrifice: the world's luminous vibration pervades human beings and things, toward human beings and things, fascinates him, whom works in the order of imminence.

To Imitate

In the antiquity, the will to represent has been attributed to a propitiatory ritual ("the premises").

Traditionally, the need to represent comes from this will; to outbreak the double of the one. The re-presentation is thus an iterative structure that moves the “one” into a different spatiotemporal fact, future or past, making it in this way acceptable, because divided in two.

If in drama the *mimesis* is in itself the representation, Plato, in his *Republic*, defines the impersonator as the image creator as opposed to the creator of reality. However Aristotle re-establishes the dignity of sensitive items and the sensitive could not be identified with error or evil. The increasing ambition to represent reality reaches its peak with Emile Zola and the Naturalists. In the nineteenth century, the possibility to imitate reality gains a proportion never equaled due to the analogical particularity of the photographic image: this medium only knew how to respond to what André Bazin considers a fundamental need to humanity, the desire of analogy.

To Nelson Goodman, one knows not how to imitate reality for the simple reason that one knows not what reality is. However Man uses all sorts of referential techniques, of which one is analogy. In what way then can an image be considered as reality? The reality image being the one who should relieve the most relevant information, realism appears as a norm between representation and the current esthetic and social system. Ernst Gombrich shades the meaning of Goodman’s extreme thesis as reality can be represented thanks to a mirror. Analogy always has a double aspect, the mirror-aspect and the map-aspect: an image redoubles reality and is a sign of reality, which means that it is the “code” to make the comprehension possible.

To Create

Photography, as opposed to painting, in its virtual simultaneity that short-circuits *a priori* the artist, has been from the start strongly criticized. “A forgery falsifies art history; an imitator of photography falsifies reality,” writes Susan Sontag. Yet firmly rooted in the reality from which it proceeds, photography deceives doubly: the camera is used to enhance the value of appearances, explains Sontag. Seen as a tool or a social means to liberate the people, in contradiction it turns against itself, burying itself in a “realism” of comfort, of making truth. More than any other means, photography is capable of expressing the desires and the needs of the dominant social stratum, because photography has what might be termed an artificial objectivity. Paradoxically, photographic representation, according to

Sontag, is “made anesthetic from a moral viewpoint in as much as it is stimulating from a sensory viewpoint.” By the confusion it entails, photography gathers all human stakes and ideologies to present them back to the viewer as being of similar value.

Photographic representation is thus deceiving: it only shows one fragment of the world, only one moment of temporality, given nevertheless as absolute. Its interpretation is that of detail, of exception or, on the contrary, of redundancy. Moreover, in all arts, including photography, the principles of which the *mimesis* relies on evolves therefore continuously. As a result from it, an underlying revolution takes place in our philosophical perception or interpretation of the world, facing an image, argentic or digital, which appears little by little to be auto-referenced because each steady reference is progressively removed.

REPRESENTATION AND GENDER

The visual manifestations of gender became increasingly complicated during the course of the twentieth century, and the late decades of the century saw numerous photographers, female and male, exploring gender in their works. A touchstone image might be one made in 1968, Diane Arbus's *Naked Man Being a Woman, New York City*. This seemingly straightforward, black-and-white photograph broaches aspects such as anatomical equipment and appearance versus reality that have subsequently become prominent in many photographic examinations of gender, demonstrating that gender plays an important role in both the exploration of identity and the presentation of self. Whether gender is considered in terms of the makers or as subject matter, the resulting imagery blurs the boundary between public and private issues that was once firmly in place and considered ideal.

In most of the major artistic movements since the Renaissance, roles for men and women were very separate and conventional, for the most part consisting of an active male creator and a passive female subject. Early twentieth century art was generally characterized by experimentation in the service of ideas, and the "new" medium of photography especially offered the promise of release from concerns and constraints of gender roles and distinctions. Yet the possibilities of exploding these conventions were not immediately seized upon. Pictorialism, the dominant style around the turn of the century, emulated painting and conventional gender roles were in fact adopted in most depictions. While female photographers were active in this movement in significant numbers, they chose domestic scenes or touching mother-and-child portraits as subject matters. Pioneering female photographer Gertrude Käsebier was especially well-known for these depictions and has been criticized for perpetuating stereotypes, but she also made striking portraits of Indian activist Zitkala-Sa that flew in the face of convention, gender and otherwise.

Both male and female artists took advantage of the ideal of the nude dancing freely in space as an expression of modernity, but these nudes were generally female, young, and sylph-like. West Coast Pictorialist Anne W. Brigman made many such studies; however, it can be argued that these images

connate freedom from convention and joy in the female body for how it can act, rather than merely providing a focus for the gaze, prefiguring developments arising out of feminist photography late in the century.

Many male photographers, such as those involved in the f/64 group and notably Edward Weston, tended to reinforce and magnify conventional gender stereotypes. While Weston did make some male nudes, they had the feel of classical figure studies; his female nudes, many of his various wives and mistresses, portrayed the female body as seeming on display for the gratification of the male gaze. Weston's paradigm of the perfectly exposed and printed black-and-white photograph of often faceless women in unusual or highly cropped poses informed so-called fine-arts nude photography throughout the entire century, and provided a model against which many, in later decades, worked.

Nudes by André Kertész in the 1930s and Bill Brandt of the 1940s through 1960s employed distortion to disorient and simultaneously distance and highlight the experience of voyeurism inherent in the notion of the conventionalized male gaze. The nudes of Robert Heinecken of the 1960s and 1970s, such as his *Cliché Vary* works and of the fashion photographer Helmut Newton of the 1970s and 1980s activate the border between celebratory relish and pornographic objectification of the female form. Were they not made by men, these images might be interpreted as liberated or probing expressions as being prototypes of the sexy self portrayals put forth by pop icon Madonna in the 1980s and 1990s or performances of nude models orchestrated by contemporary artist Vanessa Beecroft at the end of the century.

It was in the 1920s and 1930s that the practice of photography and the position of women both changed significantly. Photography and photographic realism were especially effective for the Dada and Surrealist assault on rational thought because the images were assumed to be truthful and any manipulations would incite questions about the truthfulness of reality. In the arena of the European avant-garde in general and Surrealism in specific, however, followed the well-trod traditions;

women commonly took on the roles of muse, alter ego, and victim for male artists. Many of these artists have been condemned as misogynistic, though, because the images they created of women were often pictorially mutilated—headless torsos being especially common—or powerless—props for elaborate costumes or for various experimental effects. Man Ray's shadowplays across the female torso combine both tendencies.

Despite these realities, because Surrealism positioned itself as critical (or contemptuous) of mainstream thought, this movement did provide a forum for female expression heretofore not available to women artists. Whitney Chadwick suggests that as artists, women were able to assert their uniqueness by way of irony, humor, and confrontation (Chadwick, 10). Painters Dorothea Tanning and Frida Kahlo, and photographer Claude Cahun, for example, were able to problematize their positions in relation to Surrealism and beyond into the larger artworld and society in general. Chadwick suggests that the relationship between the artist's "self" and the depicted "other" became especially complex when these women made self-portraits because "no matter how relentlessly pursued in the images reflected back to it, [the female self] can neither be fully captured by its representations nor escape them" (Chadwick, 12).

In 1929, Joan Riviere described the malleability of identity and range of possibilities available to woman in "Womanliness as a Masquerade." Examples of disguise and masquerade were prevalent for all Surrealist artists as the binaries of reality/fantasy, male/female, and self/other were collapsed. Such questioning of the establishment resurfaced in the late 1960s, both socially and artistically. Yet it remains that the most famous Surrealist representation of gender is Man Ray's portrait of avant-garde artist Marcel Duchamp as his female alter ego Rose Sélavy, not Claude Cahun's (born Lucy Schwob) androgynous self-portraits.

Various manifestations of the feminist movement throughout the century have sought to open up ideas beyond male Eurocentric viewpoint. The first wave was concerned with securing the right to vote, beginning with the first women's rights convention in 1848 and concluding with the ratification of the 19th Amendment to the U.S. Constitution in 1920. During World War II, Rosie the Riveter symbolized women stepping in to fill vacancies in the workforce. After the war, "traditional" roles were assumed: women were the homemakers, men the breadwinners. Several seminal feminist texts were published around this time, Simone de Beauvoir's *Second Sex* (1952) and Betty Friedan's

The Feminine Mystique (1963), leading to a revived interest in equal opportunities for both women and minorities in education and employment as well as equal treatment in the workplace and in the eyes of the law. Legal victories were achieved in 1964 with the Civil Rights Act prohibiting segregation and discrimination, and in 1972 with the U.S. Supreme Court decision supporting safe and legal abortions.

With the introduction of such alternatives came the artistic probing of "normal" or conventional approaches and lifestyles. Discussions of gender in the 1970s were centered on the feminist critique against modernist art practices of "male-dominated values of beauty and humanism" (Rosenblum, 263) as well as a moving away from exclusionary and hierarchical "high art" approaches. Feminism had the effect of opening up forms of expression not only for women, but also for multicultural social and cultural viewpoints that had also been underrepresented.

Attention to gender as informative to the construction and reception of artworks has been going on for the past 30 years. Linda Nochlin's seminal article, "Why Have There Been No Great Women Artists?" (1971) examined the gendered notion of artistic genius, a "golden nugget" exclusive to men. She pointed out that adequate training was not provided to women: barring them from life drawing also censured them from serious commissions. Historically women who had become successful artists, such as painters Artemisia Gentileschi, Rosa Bonheur, and Berthe Morisot had prominent male artists in their families. Though Nochlin's study did not consider photography, Laura Mulvey examined gendered dynamics of viewing with regards to film in her important essay, "Visual Pleasure and Narrative Cinema" (1975). She discusses the conditions that created and fostered conventional models of gendered viewing and being viewed that had previously been overlooked. These essays served as an important foundation for feminist scholarship, which has continued to investigate the objectification of women's bodies and the marginalization of women artists, and has expanded to include broader issues of gender.

Women began to be more active and successful in the field of photography in the 1930s, particularly in the United States, through the Farm Security Administration (FSA) and the emerging fields of photojournalism. Naomi Rosenblum explains that

Women have been actively involved with photography ever since the medium was first introduced in 1839.... The barriers to their participation in photography were lower, and recognition often came faster than in the other arts.

(Rosenblum, 7)

Their works, however were often indistinguishable from that of their male counterparts, which suggests that female photographers adapted male conventions rather than achieving their particular aims; indeed some women photojournalists, such as Margaret Bourke-White, may be said to have outdone men at their own game in her extreme risk-taking to get views never before captured, such as from parapets of skyscrapers. As well, the statistics about the presentation of women's photographs in major monographs and the representation of work by women in major collections at the time (1994) averaged about 10% compared to their male colleagues. Despite their advances, Rosenblum points out, "the fact that women's work remains 'underfunded, under-exhibited, under-studied, under-represented' suggests that efforts at parity still have a way to go" (Rosenblum, 9).

After a brief flowering of images showing a more liberated or fluid notion of gender representation in the interwar years, it was not until the mid-1960s that both female and male photographers took up the topic of the loosening of mores that accompanied the Sexual Revolution. While male artists tended to exploit the larger range of imagery now deemed acceptable, including representations of overt sexuality and pornography, female photographers turned their attention to self-representation as well as representation of men from their viewpoint. Marie Costinas's depictions of sailors in pastel-tinted Polaroids (*Sailors, Key West*, 1966) are noteworthy.

The inequality in the treatment of men and women, and not exclusively in the realm of the arts, was especially a concern to artists during the 1980s who incorporated political statements into their work. Artists such as Barbara Kruger, Jenny Holzer, Cindy Sherman, and Sherrie Levine used photography in confrontational ways to challenge the constraints and conventions of female representations as well as professional roles in advertising, language, film, and art. According to H.S. Mirza, "whereas 1970s and 1980s feminism centered on the 'right to be equal,' the postmodern feminism of the 1990s turned to the celebration of the 'right to be different'" (Mirza, 12–13). By mixing humor with cold hard facts these artists have tried to pique curiosity at the same time that they raise the public's consciousness. Cindy Sherman's adaptation of stereotypical tropes for the representation of women to create her various persona, particularly in her Film Stills of the 1970s initially seemed retrograde. Yet these images, in being pried away from the domain of the male photographer and claimed by a young female, proved seminal and inspira-

tional to others in the 1970s, 1980s, and 1990s. Francesca Woodman, conceptual artist Ana Mendieta, and younger figures Cynthia Wiggins and Katy Grannan, and many others created images that evoked the conventions of the male gaze but telegraphed female autonomy to behave and create depictions as necessary to the artistic project of the individual.

Pushing boundaries has been a consistent modus operandi in the late twentieth century. This often took the form of making the private public to the point that there seemed no boundaries between the two. In representations of gender, depictions have ranged from the conventionalized, as in Larry Clark's exposé of the sexualized heroin sub-culture he was part of in his *Tulsa* portfolio (1972), which depicts rather straightforward, albeit graphic, heterosexual behaviors, to Nan Goldin's diaristic *The Ballad of Sexual Dependency* (1987), which in focusing on New York's demi-monde presents a wide range of gender behaviors, including that of transvestites, gays, and other so-called alternative lifestyles. In the 1980s and 1990s, gender representation widened noticeably to include numerous depictions of gays and lesbians often by openly gay photographers. Robert Mapplethorpe was certainly a pioneer in this area, adapting a classical model of representation to depict persons and acts many viewers found disturbing or even shocking. Los Angeles-based Catherine Opie undertook a series of large-format color portraits of gays and lesbians who posed unabashed and undisguised in their presentation of self as gay individuals. Opie's representations in particular are resonant precisely because they often operate on paradoxical signals, with homosexual females adapting costumes and poses typically associated with heterosexual males, and homosexual men showing extreme manipulation of their bodies with tattoos and garments also associated with macho heterosexual subcultures such as bikers to signal their orientation.

An obvious endpoint to the discussion of gender in the twentieth century is the ostensibly fluid nature of gender boundaries. Yet sexual ambiguity, transvestitism, and hermaphroditism have intrigued numerous photographers throughout the century, including Brassäi (*The Prostitute Bijou at the Bar de la Lune in Montmartre, Paris*, 1933), Diane Arbus (*Young Man in Curlers*, 1966, *Naked Man Being a Woman, Hermaphrodite and Dog in Carnival Trailer*, 1970, and so on), Joel-Peter Witkin (*Madame-X, San Francisco*, 1981), and Nan Goldin (*Misty and Joey at Hornstrasse*, 1992). Both Claude Cahun's self-portraits (1920s–1930s) and Catherine Opie's portraits (1990s) explore lesbian sexual iden-

tity and the malleability of appearance through photography. In their work, personas take on the quality of masks and costumes recalling Riviere's notion "femininity could be shown to be a 'masquerade,' something that had to be endlessly performed and reinvented" (Evans, 109). Jürgen Klauke's films and photographic sequences, like *Self-Performance* (1972–1973) and *ProSecuritas* (1987) similarly explore issues of sexuality, the psyche, and self-presentation. Lorna Simpson uses text and imagery to question the empirical meaning in both means of expression. Photographs like *She* (1992) intentionally reveal and conceal aspects of the subject's identity so the viewer is left wondering about the gender due to the androgenous clothes, nondescript stance, and cropped-out face. Contemporary artist Renée Green uses photography to explore race and gender, including stereotypes about Black culture and male and female roles in that culture. Black male photographers have also pushed the boundaries of representation in exploring what it means to be a Black man in contemporary society. Anthony Barboza creates striking images that tread on both gender and racial stereotypes. Finally, questions of gendered representation are piquant in Japanese artist Yasumasa Morimura's impersonations of famous works of art like Manet's *Olympia* (*Portrait (Futago)*, 1988) and western icons of popular culture like Audrey Hepburn and Bridget Bardot. The work of these artists suggests that the transcendence of gender can take place fictively, cognitively, and actually.

REPRESENTATION AND RACE

The intersection of representation and race, more specifically, photographic representation and race, suggests numerous complex discussions. These involve defining race and racialization as concepts

and social practices; and then considering the ways in which photography is implicated in interpretations and constructions of race. Early photography was considered to be a realist instrument

that simply documented “reality.” From such a perspective, one might consider photography to have served as merely a recording device that documented the social existence and realities of race. However, the role of photography in actively constructing knowledge about identity and the human body, including racialized identities and bodies, has been significant to more recent critical approaches to photography. Such critical approaches explore the power of the photographic image as construction, and further engage the relations of power that are at work in the very acts of photographing. This essay will provide a brief overview of some conceptual approaches and photographs through which the intersection of race and photography might be understood.

It is now largely understood that race is a social construction. This contrasts with mid-nineteenth century conceptions of race as a given biological fact, a concept that persisted well into the mid-twentieth century, and some argue, still exists today. This biological notion of race posits difference between individuals based primarily on physical markers, specifically, skin color. A hierarchy of social characteristics was then attributed to individuals based on these presumed differences, and posited some races as superior and others as inferior. There was a confluence of the concept of race across a wide range of disciplines, predominantly as a category for scientific inquiry, but also in philosophy, literature, and art. This logic of race culminated in eugenics, whose practice in Nazi Germany resulted in the genocidal atrocities of the Holocaust, and led to the later rejection of biological racial hierarchies by scientists worldwide. Many scholars now study the relation between race and social practices, including how visual culture contributed to the production of race. They also examine the extensive ways in which concepts of race and their practice justified racism, and legitimated forms of abuses that were sanctioned by legal, political, and social structures. Early photography and racial imagery contributed in a central manner to both the construction and reinforcement of social race relations.

Racial difference was at the heart of colonialism and imperialism, whereby European colonial powers considered themselves superior to the nations and peoples they would dominate in Asia, Africa, and the Americas from the fifteenth through twentieth centuries. Travel and expeditionary photography not only documented landscapes for militaristic and governmental purposes, but also popularized forms of visual tourism for general publics and familiarized them with imperial ima-

gery. Anthropology as an academic discipline undertaking the study of “man,” developed alongside the nineteenth century rise of colonialism and imperialism that reached its peak between 1890 and 1920. Some argue that anthropology is colonialism’s by-product, a discipline that documents the traditions of other cultures as they are being destroyed by colonialism. Photography was extensively used as a documentary research tool in anthropology, and its sub-fields of biological anthropology, archeology, and ethnography. One starkly sees in biological anthropological photography the subjugation of colonial human subjects in the drive to create racial classifications and taxonomies of human beings; subjects were objectified, frequently unclothed, and photographed from several angles. It is here that contemporary questions about the very act of photographing can be easily understood: Who is photographing whom? How are they represented in the photograph, and towards what ends? If early anthropological photography was driven by a desire to capture the scientific “reality” of their subjects and visualize their racial difference, the revisiting of photographic archives by contemporary artists and curators now makes apparent the original photographers’ social contexts of creation, their preconceptions and desires. Alloula discusses how French photographers frequently manipulated their Algerian female subjects against a backdrop of the harem in order to conform to already existing colonial imagery and fantasies. Curators Melissa Banta and Curtis M. Hinsley closely outline the transition from travel photography and histories of exploration to the exact categories and uses of anthropological photography. These photographic archives have also been the subject of re-examination by contemporary artists. Carrie Mae Weems’s reworking of historical images of slaves and freedmen from the 1840s to 1860s (notably with the incorporation of text), in *From Here I Saw What Happened And I Cried* (1995–1996) attempts to provoke dialogue between the photographic subject and spectator; *The Hampton Project* (2000), similarly converses with historical photographs by Francis Benjamin Johnson from *The Hampton Album* (1900).

The major 2003 exhibition *Only Skin Deep: Changing Visions of the American Self*, brought together over 350 photographs and explored the complexity of race through its broad range of images from 1845 to 2003. The exhibition upholds that racial categories and the maintenance of populations into these categories is a constituent element of American identity. Photography served to produce and maintain these racial categories. Some of

the earliest photographs were of an anthropological and documentary genre, including daguerreotypes and *cartes de visite* (including one by the abolitionist, Sojourner Truth), some of which constituted more overt forms of exoticization and objectification of people of color, Aboriginal people, and non-Western subjects. In other instances, White photographic subjects are engaging in “dressing-up” as Native Americans or African Americans, reducing race and ethnicity to a set of identifiable codes—of aboriginality, or of Blackness—that can be easily inhabited and mimicked. The exhibition effectively pointed to the complexity of considering the imbrication of race and photography, embracing its many paradoxes and manifestations. In their own revisiting of the history of photography, curators Coco Fusco and Brian Wallis effectively identified lesser known photographs of racialized subjects by famous White photographers, such as Ansel Adams, Richard Avedon, Lee Friedlander, Dorothea Lange, and Edward Steichen; as well as contemporary artists such as Cindy Sherman, whose *Untitled (Bus Riders)* (1976) (predating her better known *Untitled (Film Stills)* [1977–1980]) have her performing in Blackface. It also incorporated the photographs of lesser-known photographers, such as Toyo Miyatake (and his substantive record of the Japanese American Manzanar internment camp, where he resided during World War II), and photojournalist Gordon Parks’s documentation of African-American social history, especially the Civil Rights movement of the 1950s and 1960s. Arranged neither by genre nor in chronological order, and inclusive of a large number of contemporary artists working with photography, *Only Skin Deep* effectively emphasized how racialized visual subjects and strategies appeared and resurfaced at various historical moments, and moved across different photographic styles.

The exploration of racial photographic imagery and its codes constitutes one manner of approaching this intersection of race and photography, by focusing on the subject of images. Another approach is to highlight the identities of the photographers, whereby, for instance, historical portraiture by photographers from racialized communities might be foregrounded. Deborah Willis’s numerous exhibitions and books have methodically compiled images by African-American photographers; as Faith Moosang’s recovery of C. B. Hoy’s negatives from his photographic studio of 1909–1920 reveal the rich interracial and intercultural communities of the Pacific Northwest. The complex and contentious historical photography of Aboriginal communities is examined in exhibitions such as the Smithsonian’s *Spirit Capture*; and projects such as *Partial Recall* in

which writers and artists such as Jimmie Durham and Jaune Quick-To-See-Smith were asked to reflect on historical archival photographs of Native Americans. Jeffrey Thomas’s ironic photographs of non-Natives photographing performing Native dancers, captures the matrix of viewing relations that underlie Native communities in representation.

Contemporary photographers have investigated race and difference in their artistic work with a variety of approaches. These move across genres, subjects, and racial imageries, making any easy generalizations somewhat reductive. Representations of idealized Whiteness, for instance, should be considered: Richard Prince’s *Untitled (Cowboy)* (1991–1992) embodies the apogee of American White masculinity, and usefully represents Dyer’s argument about the status of Whiteness as the pinnacle of race hierarchies. Nikki S. Lee’s uneasy self-portraits foreground her Asian physical characteristics as they dramatically contrast with the social markers of other group identities, whose communities she immerses herself into. Some artists work with photographic images and may use either a juxtaposition of multiple images, digital rendering, or physical manipulation to complicate the truth value still attributed so powerfully to the photographic image. Glenn Ligon’s *Self-Portrait Exaggerating My Black Features/Self-Portrait Exaggerating My White Features* (1998) (itself harkening back to a similar work by Adrian Piper) uses text to challenge the veracity of fixed racial evidence in two identical self-portraits. Lorna Simpson’s serial images have been described as “anti-portraits” that refuse the plenitude of the complete subject. And Dinh Q. Lê’s photographic tapestries physically weave snapshots and historical photographs from the Vietnam War, with war images culled from popular culture such as photojournalism and Hollywood films.

Photographic representation and race involves a consideration of how photography has contributed to constructing and maintaining certain types of knowledge about race. Issues to address might include the subjects of images and how they are portrayed, the social contexts within which photographs are taken and exhibited, the relations between photographer and their subjects, as well as the identity of the photographer.

MARC RIBOUD

French

A leading photojournalist of the second half of the twentieth century, Marc Riboud embodies the socially engaged photographer who foregoes the spectacle of high-profile news events to uncover the flashes of human drama in the undercurrents of everyday life. He has spent five decades—about half that time as a member of the Magnum photo agency—documenting the social, political, and economic conditions in dozens of countries on several continents, but much of his reputation rests on his work in Asia. From Turkey to Japan, he has revealed the changing face of that continent, most particularly in China, where he has returned again and again since 1957 to compile an exceptional visual record of China, from the Great Leap Forward through the Cultural Revolution to the Tiananmen Square protests and the turn toward capitalism.

Riboud was born in Lyon, France, in 1923 and took his first photographs as a child. In photographing the Exposition Universelle in Paris in 1937—with his father’s Kodak Vest Pocket camera Riboud made an early association between the medium and his interaction with other cultures. After fighting with the French resistance in

World War II, he studied engineering and worked for three years in a Lyon factory before turning to professional photography. In 1952, he met Henri Cartier-Bresson and Robert Capa, two of Magnum Photos’ founders, and joined the agency the following year. Cartier-Bresson would have a strong influence on Riboud’s style and working methods, though at the outset Riboud’s photographs tended toward the insouciant style of fellow Parisian Robert Doisneau and the weekly leisure magazines. *Paris, 1953 [painter of the Eiffel Tower]*, an image from Riboud’s first paid assignment for *Life* magazine, reflects this in its light-hearted treatment of a quintessentially Parisian subject. The painter floats over the city with comical grace, at one with the monument he clings to, like a music hall acrobat nostalgically transported from a belle epoque revue.

Cartier-Bresson advocated a less sentimental, more complex narrative style based on capturing the “decisive moment” that crystallizes a scene at a pivotal instant often capable of multiple interpretations. *France, 1953 [pilgrimage to Chartres]* is an early example of Riboud’s turn in that direction. Taken during a religious retreat at Chartres, it reveals his enduring interest in the individual as

inscribed—yet distanced—from society and its principal institutions of power. In the foreground, a young woman confesses to a priest at a makeshift confessional, while a crowd of church followers gathers in the field behind her. Despite the bucolic setting, the composition has a palpable tension as the collective power of the Catholic church seen on either side of the woman contrasts sharply with her deeply personal reflection.

Riboud embarked on international assignments in 1955 and made his first visit to China in 1957 at a time when the country generally was closed to Westerners. While he only occasionally has worked in France since, China has remained an inexhaustible source of interest. His earlier China photographs, like *Beijing, 1965 [antiques dealer]*, capture a country still caught between communism and the remnants of dynastic tradition. Here, storefront windows divide the street life outside into a neat triptych of past, present, and future: three elderly jade merchants lounge on the stoop of their shop at center, while two women with children converse at left, and a teenage girl in a Mao-style school jacket turns warily to the camera from the right. *Beijing, 1965 [divorce proceeding]* has a similar symmetry, although here it is a government tribunal coming between a private couple to pass public judgment under the gaze of Mao's official portrait. Much of Riboud's work in the last decades of the century in China captures the awkward balance between communism and emerging capitalism, contrasting coal miners and heavy industry with consumer culture and advertising. In an uncanny turn in *Shanghai, 1993 [shopping street]*, Mao's official portrait appears yet again, but this time in a busy shopping street where he shares wall space with a glamour shot of American icon Elvis Presley, each being the airbrushed icon of aging cults.

Through much of the 1960s and '70s, Riboud covered armed conflict and social revolt, from the wars in Algeria and Vietnam to the student uprisings in Paris and the Islamic revolution in Iran. Avoiding sensationalist depictions of violence, his work from the period often focuses on the resistance and actions of the general population as a consequence of such events. In that vein, *Washington, 1967 [girl with flower]* became an emblematic image of the American peace movement, depicting a young woman at an anti-war demonstration as she lifts a white daisy to the thrust bayonets of a line of soldiers. The diffuse light and long focal length imbue the event with a tender, romantic feeling that belies its action. His relationship with China earned Riboud a coveted press visa to North Vietnam in 1968, and his subsequent photographs of Ho Chi

Minh circulated worldwide as proof the Vietnamese leader was still alive.

While Riboud's work often has an immediate, almost snapshot quality that lends it a sense of transparent testimony, he also has made images of a more abstract and timeless quality. The silhouettes of two boys playing at dusk in *Ghana, 1961 [the beach in Accra]*, for example, merge into a choreographed figure against a setting that offers little indication of place or date. Since he left Magnum for freelance work in 1979, Riboud has expanded his range to include work of a more picturesque and spiritual tone, including a series on the Angkor temples of Cambodia and another on the Huang Shan mountains of China. Published in *Capital of Heaven*, his Huang Shan photographs use color instead of his customary black and white to produce misty blue-gray images of rounded peaks that recall the ghostly landscapes of classical Chinese scroll paintings.

In addition to his photography, Riboud played a central role in Magnum's management and development in the 1960s and 1970s, spending 14 years as its vice president for Europe beginning in 1959, and serving as president of the agency in 1975. Overseeing the agency's growth while mediating disputes among its independent-minded members, Riboud would become an important link between those who founded the agency in 1947 and the next generation of members who would see Magnum into the twenty-first century. He also helped expand the appeal of photojournalism beyond the confines of the news media by being among the first photographers to integrate reporting assignments with gallery and museum exhibitions and, since 1959, regularly publishing collections of his work. This practice has promoted the news photograph as an image of aesthetic consequence potentially transcending the circumstances of its genesis, though it also has raised the precarious question of the role of subjectivity in journalistic practice.

LELAND RICE

American

Leland Rice, a photographer largely associated with California, is among a generation of Americans who first received and benefited from a graduate education in photography which included a heightened awareness of the medium's history. As is typical of many of this generation, Rice is an educator as well as a photographer; he has lectured, organized exhibitions, written about photography, and collected photographs since the late 1960s.

Leland Rice was born on April 9, 1940 in Los Angeles, California, where he grew up and attended public schools. He attended Arizona State University at Tempe, where he played football. Although a business major, he enrolled in a photography class taught by Van Deren Coke and found his life's passion. After he was graduated from Arizona State, Rice returned to Los Angeles and attended Chouinard Art Institute for a year.

In the 1960s, there were limited opportunities for a graduate education in photography, but Rice was fortunate in that he moved north to enroll at San Francisco State College, now University, where he was able to study with Jack Welpott and Don Worth, known for his technical skills and beautiful horticultural photographs. Rice also studied with Bay Area legends Ruth Bernhard, Paul Caponigro, and Oliver Gagliani, known for his highly ab-

stracted landscapes, who formed a living bridge to the area's photographic history through figures such as Ansel Adams and Edward Weston. During graduate school, Rice and fellow graduate students including Judy Dater, John Spence Weir, Harvey Himelfarb, and others founded the Visual Dialogue Foundation. Rice was graduated with an M.A. degree in 1968, the same year VDF opened; Rice served as its first president. The VDF evolved into an informal group of Bay Area photographers who promoted their photography through exhibitions, the creation of a portfolio, and the expansion of the parameters of photography beyond the canon of Group f/64, which in the 1960s was still a dominant force in the Bay Area. The Visual Dialogue Foundation continued through 1972 when several of the members left the area.

Even as he was finding his way as a photographer, Rice began his career as a highly respected teacher. He first taught at the California College of Arts and Crafts, Oakland, from 1969–1972, where he established the photography program. During the 1970s and 1980s, he taught at: the University of California at Los Angeles, California; U.C.L.A.'s Extension, Pomona; the Institute of the Arts, Valencia, 1973; Pomona College, Claremont; Tyler School of Art, Philadelphia; and the University of Hartford, Connecticut. In addition, from 1973–1979 he served as curator of the Photography Gal-

lery at Pomona College. Rice has curated a number of significant exhibitions in the field, including the first major American exhibition of László Moholy-Nagy's photographs and photograms, and exhibitions of Herbert Bayer, Frederick Sommer, and Frances Benjamin Johnston.

Although well versed in the ideas and techniques of such masters as Alfred Stieglitz and Edward Weston, early in his career Rice preferred to raise questions and push the boundaries of the medium. In general, his photographs are heavily flavored by Surrealism and can be grouped into works realized before 1973; the Wall Site series done both in black and white and color between 1977–1983; and his Berlin Wall photographs of 1983–1989, all of which proceed in a logical progression of exploration, realization, and recapitulation of what has been discovered.

During the 1960s, Rice lived and photographed in the Haight-Asbury District of San Francisco where he was an observer of the hippie era. In his early, more traditional photographs, for example, *Untitled* (1968), in which fellow photographer Michael Bishop peers out the rear window of a Volkswagen, or *Untitled* (1969), in which a forlorn young woman sits on a couch resulting in an erotically charged image symbolic of the freedom of the 1960s, there is a sense of mystery that often borders on the sinister. These dark, moody photographs where the figures interact (or fail to interact) with the surrounding environment seem like stills from an Ingmar Bergman film. Rice also fragmented his photographs and created pictures within pictures resulting in strange and mysterious juxtapositions.

By 1972, Rice, now using a wide-angle lens, moved from depicting figures in his photographs to photographing objects and empty spaces which are suggestive of their former occupants, resulting in a heightened awareness of both objects and space. He photographed extremely common objects—a tripod and a lamp, a white chair, a chair and a plank, or a black plank leaning against the wall within an adjacent empty space. The viewer is struck by both the absence of human figures and the presence of objects and their spaces. They are both suggestive and mesmerizing.

With *White Door* (1973), a key photograph, Rice began the Wall Site series. It is a minimal, stark image where he captures the interplay of the dark textured wall, light, and form. To the extreme right, a white door is ajar. Its origins seem to lie in the world of painting rather than photography, as familiar subject matter seems to vanish to be replaced by

new dimensions of “the thing itself.” Light, darkness, and a sense of the spiritual dominate.

After returning to Southern California in the 1970s to teach at Pomona College, Rice became acquainted with the paintings of Richard Diebenkorn, and later in 1976 he became familiar with the color field paintings of Morris Louis and Mark Rothko. Beginning in 1977, in the color Wall Site works, now using a large format camera, he realized that color, light, and scale are elements employed by both painters and photographers alike. Rice documented the interiors of artists' studios and was especially interested in the casual placement of objects and the paint splatterings and waste left by the artists. The result was an engaging and compellingly spiritual series of documents; the images challenge the imagination as the viewer easily gets lost in color, form, light, and spatial relationships.

On a trip to Berlin in 1983, Rice discovered new material when he confronted *die Maurer* (the Wall—the Cold War's universal symbol of oppression. Concentrating on the area of the Wall in and near Potsdammerplatz where it had been a tempting “canvas” for both the professional and amateur alike, he focused his camera lens on the Wall's rich coating of graffiti. Moving almost microscopically close, he selected portions that appealed to his artistic sensibility, in a process not unlike that which resulted in the earlier Wall Site series shot in artists' studios. Rice selected from a continually changing palette of often expressionistic imagery, at times combined with pithy texts as in “Hunger Herr Pastor” of 1986. He has described himself as a “visual archaeologist,” but he is also a lyricist. Since the dismantling of the Wall in 1989, Rice's photographs have become even more valuable as historical, albeit poetic, documents.

Rice was the recipient of a National Endowment for the Arts grant in 1978 followed by a Guggenheim Photography Fellowship in 1979–1980. He received the James D. Phelan Art Award in Photography in 1986. He has intermittently been a trustee of the Friends of Photography since 1973. Rice has participated in numerous individual and group exhibitions, including during the 1980s at his Los Angeles gallery, Rosamund Felson. His photographs are included in numerous collections in the United States and Europe.

LENI RIEFENSTAHL

German

Leni Riefenstahl's status as an ex-Nazi and confidant to Hitler makes her one of the century's most

controversial artists. She is praised and pilloried in equal quantities, yet nobody disputes the quality of her artistic vision; the argument lies in her choice of subject matter. Riefenstahl is most renowned for

Triumph of the Will, the Nazi film which would sweep pre-World War II Germany and become the most famous, and infamous, propaganda film of all time.

Born to wealthy and supportive parents in Berlin in 1902, Riefenstahl spent much of her youth learning the art of dance. By her early 20s, Riefenstahl was a renowned dancer, touring throughout Germany. A knee injury halted her career, and she became involved in film, first as an actor; her aristocratic beauty made her an immediate sensation in a mountaineering film developed especially for her by director Arnold Franck. She starred in her first directorial effort, *Das blaue Licht* (1932, *The Blue Light*), and by the age of 35, Riefenstahl had become the most famous and successful woman filmmaker of her time. In addition to *Triumph of the Will*, she also directed the highly acclaimed *Olympia*. During this time, Riefenstahl also cultivated an interest in photography, and she took numerous pictures of German troops and members of the high command, including Hitler himself. Riefenstahl discontinued her position as “unofficial” photographer for the Nazi party when she witnessed German soldiers massacring unarmed Polish peasants, although she stayed in touch with Hitler and did not denounce him.

After the war, with her reputation ruined and with no friends inside or outside of Germany, Riefenstahl found it impossible to get the funding needed for film projects—her first love—and eventually turned solely to photography.

Following the war, Riefenstahl had faced Allied charges that she was a Nazi or a Nazi sympathizer. She was imprisoned and escaped to her mother’s house in Austria, where she was reunited with her husband and arrested again. Interrogated by the Seventh American Army, the Americans officially “denazified” Germany’s most notorious film director and released her “without prejudice” on June 3, 1945. Yet Riefenstahl was detained once again by the French. She and her husband lived under house arrest in Breisach, Germany and later in Königsfeld in the Black Forest, and she was interned in an insane asylum in Freiburg for three months. Released in August 1947, she was officially denazified by a French tribunal in July of 1949. Even so, in the same year, the Baden State Commissariat classified Riefenstahl *in absentia* as a “fellow traveler.”

In the late 1960s, she took on small, miscellaneous assignments, such as a photo essay of rock musician Mick Jagger and his wife Bianca. But it was in 1973 that she re-emerged when she created a book of still photographs from her 1936 documentary, *Olympia*. The film had been commissioned by the Nazi government in order to record German

dominance at the Olympic games in Berlin. It was a huge project, and she oversaw crew of over 170, including 60 cinematographers, who used three different types of black-and-white film stock deemed appropriate to the type of imagery being filmed: Agfa for architectural shots; Kodak for portraits; and Perutz for fields and shots of grass. Over 1.3 million feet (over 248 miles) of film were exposed. Despite the film’s origins, *Olympia* was a surprisingly balanced documentary. Many athletes were featured (including the African-American sprinter Jesse Owens), and the film sought to examine athlete as artist, focusing on the stylistic dimensions of body movement. Riefenstahl made many innovative breakthroughs filming *Olympia*, including utilizing cranes or high towers for panoramic aerial shots, mounting the camera on electric cars on rails for tracking shots of races, using slow motion to reveal the beauty and effort of the athletes, and underwater diving shots.

Thus, nearly 40 years after a film that took over two years to make and edit, Riefenstahl’s efforts yielded further fruit, as she chose certain frames of the film *Olympia* to be included in the book of photographic stills. Whereas the film had examined the beauty of bodies in motion, the book sought to explore the beauty of the body captured in time and place. Starting with a foggy, dark image of the Parthenon in Athens that suggests mythic distance, and continuing with images of the flame being brought into Berlin, Riefenstahl succinctly connected the antiquity of the games with the modern era. The book did not shrink from the controversial nature of the 1936 games; photographs of Adolf Hitler and Jesse Owens bring the politics of the event to the fore; and the use of photographic juxtaposition makes the 1973 version just as powerful as the original film version.

A year after *Olympia* was published, Riefenstahl began to organize a compilation of photographs taken on several of her earlier visits to the Kordofan province of Sudan. Since the 1950s, Riefenstahl had been attempting to make a film about a tribe in this region of Africa. However, a series of accidents (including an automobile accident in which she almost died), delays, and personal tragedies undermined this project, and in the mid-70s she gave up on the film and decided to organize her many photographs, releasing *Last of the Nuba* in 1974 and *People of the Kau* in 1976 as books. Both of these collections contain striking photographs of a culture which, at the time of her visits, had remained largely true to ancient traditions. The Nuba and their cousins the Kau wore no clothing,

and both tribes still practiced ceremonial face tattooing and blood rituals.

Although many of Riefenstahl's photographs focused on the patterns of face tattooing and the elaborate and beautiful forms of jewelry worn by the Nuba, it was the blood wrestling that most fascinated her. During this ceremony, men of a certain age grappled with each other while wearing sharp metal bands around their wrists. The results were often bloody, as documented by Riefenstahl's photographs. Not all of her photographs involved such rituals, however; as many portray the Nuba going about their daily activities, hunting, fishing, walking, and laughing. Unlike *Olympia*, the photographs in these compilations seem more natural and less posed. However, these photographs continued to display Riefenstahl's genius for capturing the artistry of the human body.

Probably due more to her controversial past than her actual photography, critics largely attacked these two volumes. In her article "Fascinating Fascism," Susan Sontag denounced Riefenstahl and her work:

Although the Nuba are black, not Aryan, Riefenstahl's portrait of them is consistent with some of the larger themes of Nazi ideology: the contrast between the clean and the impure, the incorruptible and the defiled, the physical and the mental, the joyful and the critical.

Other critics say these collections helped Riefenstahl, albeit inadvertently, destroy the Nuba culture by bringing them to the attention of Europe and America. They point to the fact that today the Nuba wear western-style clothing and conduct the blood fights more for tourist benefit than for ancient tradition. Despite these attacks, Riefenstahl won many accolades for her work in Africa. Some critics, such as Tomas Elsaesser, have identified her unparalleled ability to express the innate beauty of the human body. According to Elsaesser, "a consistent line runs through her life which seems to focus on the body as total, expressive fact."

In addition to her photographs of sports and African natives, Riefenstahl was also involved in sustained photographic projects involving mountains and marine life. In 1987, Leni Riefenstahl published her memoirs, an international bestseller that attested to the continuing interest in her extraordinary life as much as her success as a photographer. The documentary film *Die Macht der Bilder* (The Power of Images) by Ray Müller was released in 1992; under the title *The Wonderful, Horrible Life of Leni Riefenstahl*. It received an Emmy Award in the United States as well as the Japanese film critics special award. In this film, Müller tried

to provoke Riefenstahl into admitting guilt for her past. Her response:

What do you mean by that? Where is my guilt? I can regret. I can regret that I made the party film, *Triumph of the Will*, in 1934. But I cannot regret that I lived in that time. No anti-Semitic word has ever crossed my lips. I was never anti-Semitic. I did not join the party. So where then is my guilt?

Later, in an interview with *The New York Times*, she said: "I didn't do any harm to anyone. What have I ever done? I never intended any harm to anyone."

JACOB RIIS

American

Jacob A. Riis started the social documentary movement in photography in the late nineteenth and early twentieth centuries by utilizing photography in his calls for reform of Manhattan’s Lower East Side slums. A newspaper reporter by trade, Riis never considered himself a photographer and, in fact, knew relatively little about photography. Yet he realized the power of photographs, and he became one of the most effective social reformers of the Progressive era by employing his camera to shock people into helping change the living conditions of the poor. Riis was also perhaps the first to produce a mass-market book that contained a number of photographic illustrations.

Born in Ribe, Denmark in 1849, Riis immigrated to the United States as a young adult. After experiencing a number of hardships and struggling to find work as a carpenter, Riis got a job with the New York News Association in 1873 gathering general news. He then became editor of the *South Brooklyn News* in 1874 before joining the *New York Tribune* as a police reporter in 1878. All police reporters

worked from an office on Mulberry Street in the Lower East Side, and Riis soon became familiar with all of the problems in the tenements. He came to believe that the slums were producing a generation of lost Americans, and he determined to remedy the situation.

Possessing no skill at drawing, Riis wondered how he might bring his experience of the slums to people who would never dare to venture into them. He saw an ad for a German method of taking pictures by a method of flash termed “flashlight.” Realizing that the darkest reaches of the slums could perhaps be documented through photography, Riis hired photographers, but when this arrangement failed, he took up the camera himself. In 1888, now working for the *New York Sun*, Riis bought a kit that included a 4 × 5 wooden box camera, plateholders, a tripod, a safety lantern, developing trays, and a printing frame. To gain experience, he made a couple of exposures at Potter’s Field on Hart’s Island then ventured out into the night. The flashlight that Riis used consisted of a pistol lamp that fired magnesium cartridges and often terrorized the slum residents. The flash also

filled the room with such dense smoke that a second photograph was generally not possible. When Riis learned of a new method that did not involve a pistol, he quickly adopted it. He now used a frying pan to ignite magnesium powder blown through an alcohol frame, but this technique also had significant drawbacks, namely a tendency to set buildings on fire. In his autobiography, *The Making of an American*, Riis relates that he once barely managed to put out a fire that he started in a dwelling filled with blind beggars.

As Riis had hoped, photographs had enormous influence through documenting how slums were unfit for human habitation. Riis focused on the most egregious examples of overcrowding and exploitation. His photos include a cellar occupied by a Jew who is celebrating the Sabbath while another man shovels coal, children huddling in doorways to sleep, a gang of boys demonstrating their pickpocket technique, and a small boy who labors at pulling threads while men hover around him. Riis's frames typically involve so many people and objects that the images almost overwhelm the viewer. He would often allow the framing edge to violate closure, for example showing a hand on a shovel and cutting off the rest of the body. Often the subjects would stare directly at the camera, although Riis did occasionally ask them to look away to diffuse the confrontation with the audience. His depth of field is usually great with the harsh light that he employed illuminating every bit of grease and dirt.

The brutal living conditions in the slums existed because of a laissez-faire attitude, and Riis sought to replace this inattention with concerted action by private groups and the government. He demanded reform of the health and labor laws, changes in the housing codes, and the enforcement of existing statutes along with uplifting moral aid programs. To promote his goals, Riis determined to get his pictures into print. His first article, "How the Other Half Lives," appeared in *Scribner's* Christmas 1889 edition, but it did not include his photographs. Printing pictures directly from photographs was impractical for newspapers and magazines in the nineteenth century, and Riis's work was always turned into woodcarvings, with much of the detail and impact often lost in the translation. In subsequent years, Riis would use his photographs for newspaper and magazine articles, lantern lecture shows (early versions of slide shows), and books. His most famous work, *How the Other Half Lives* (1890) was an instant success with its combination of terse, angry prose and vivid illustrations "chiefly from photographs taken by the author," as the book's title page proclaimed. With 15 halftone re-

productions, some of them virtually redrawn, it was the first mass-market book to contain more than just a few photographs. In all, Riis published 15 books, and his 1902 work *The Battle With the Slum* is representative with its focus on slum life, the inadequacies of schools and playgrounds, the exploitation of small children who worked at home, and the brutal labor system in the sweatshops.

In *Children of the Poor*, Riis wrote of his experiences:

Yet even from Hell's Kitchen had I not long before been driven forth with my camera by a band of angry women, who pelted me with brickbats and stones on my retreat, shouting at me never to come back.... The children know generally what they want and they go for it by the shortest cut. I found that out, whether I had flowers to give or pictures to take... Their determination to be "took" the moment the camera hove into sight, in the most striking pose they could hastily devise, was always the most formidable bar to success I met.

Emphatically not a professional, Riis only made photographs for 10 years, probably stopping in 1898, confident that he had set reform photography on its feet and that others would continue his work. After retiring as a police reporter in 1901, Riis made a living as lecturer and brought his two-hour illustrated talk about New York slum life to every part of the country. He became involved with the small parks movement, and many of the buildings featured in his photographs were demolished in favor of small patches of green. When Riis died in 1914, his photographs were forgotten in a box hidden in the attic of his Long Island home. Through the efforts of Alexander Alland, 412 4 × 5 glass-plate negatives taken by Riis and other men (250 were probably taken by Riis alone) were found in 1945 just before the house was demolished, and this collection is now housed at the Museum of the City of New York (MCNY). The remaining Riis negatives probably vanished into the archives of the long-extinct newspaper that employed him.

Works printed from the original glass-plate negatives reveal a photographic eye very different than the often indistinct and blurry reproductions in *How the Other Half Lives*. An exhibition was mounted by MCNY in 1948 which revealed Riis was not just a social reformer, but a photographer of importance. The photographs do not shirk from the squalid scenes they depict, and their directness effectively fuses formal qualities with subject matter. Most of Riis's books have been republished either as facsimile editions or with plates reprinted from the original negatives.

Biography

Born in Ribe, Denmark, 3 May 1849. Apprenticed as a carpenter, but unable to find enough work; emigrated to the United States 4 June 1870; made attempt to survive in New York City then wandered through Pennsylvania and upstate New York working as a woodcutter, carpenter, farmer, furniture salesman, and miner; returned to New York in 1873; attempted to sell books, then took a job with the New York News Association; on 20 May 1874, went to work as editor of the *South Brooklyn News*; bought the paper then sold it to political factions for large profit; 1878 became police reporter for the *New York Tribune*; hired photographers in 1887; bought first camera in January 1888; converted photographs into lantern slides and formed lecture business; moved from *Tribune* to the *New York Sun* in November 1890; apparently stopped making photographs 1898; resigned as reporter to become writer and lecturer in 1901; left New York for Massachusetts 1913. Died on 26 May 1914 in Barre, Massachusetts.

HERB RITTS

American

Herb Ritts was born in Los Angeles in 1952, the son of a successful furniture storeowner, and he seemed destined to follow into the family business. He graduated in 1975 from Bard College in upstate New York, with a degree in economics, and returned to Los Angeles. There he worked in the family business, selling rattan furniture and other props to movie studios. It was during this time period, however, that he began to photograph his friends, and he received his first professional assignment in 1979 shooting stills for the movie *Champ*. Just a few years later, Ritts was considered by many to be one of the leading photographers and commercial/music video directors of the late twentieth century.

Ritts began taking pictures professionally in 1980 and quickly earned a world-renowned reputation as one of the major forces in contemporary fashion, celebrity, and fine arts photography. Ritts himself attributed his first success to shots of then-unknown actor Richard Gere taken on a desert excursion that ended with a flat tire. It was the tender machismo captured in the photographs of the young Gere that launched Ritts’s career as a commercial photographer and Gere’s career in films such as *American Gigolo* (1980). While shooting for Andy Warhol’s *Interview* magazine in 1985, Ritts exhibited his photographs in a gallery setting for the first time in a three-person show titled *Working in L.A.*; since then, his work has been showcased consistently in galleries around the world. From

that point, his career escalated, moving from fashion photography for the top national and international magazines such as *Harper's Bazaar*, *Vogue*, *Elle*, *Vanity Fair*, and *Rolling Stone*, among others, to album covers and music videos for singers such as Madonna, Cher, and Elton John. His black-and-white 1987 portrait of Madonna showing the pop singer in profile throwing her head back has in fact become one of his signature images. In 1991, two of his music videos won MTV awards for best female video (Janet Jackson) and best male video (Chris Isaak). His portrait series for the Gap clothing corporation received the Infinity Award for Applied Photography from the International Center of Photography in New York.

While Ritts received no professional training, his influences can be found in artists such as Man Ray and the great fashion photographers of the second half of the twentieth century, including Richard Avedon, Helmut Newton, Bruce Weber, and Patrick Demarchelier, who often posed their models against uncluttered, even stark backgrounds. Ritts's style, however, was his own, one which uniquely captured the glamour associated with Hollywood and Southern California. Working in both color and black and white, although primarily in the latter, Ritts's images are bold and dynamic, with the sitters often strongly emoting for the camera. Yet Ritts also photographed a number of celebrity subjects with painted faces that hide or disguise emotion, such as the 1988 series of actor Jack Nicholson as The Joker. Another work clearly influenced by Surrealism is a portrait of actor Dustin Hoffman as surrealist painter Salvador Dali (*Dustin Hoffman, Los Angeles*, 1996). The hiding of one's identity, no matter how well known the subject may be, is a consistent theme in Ritts's work.

The breadth of Ritts's accomplishment is considerable. Luminous images of celebrities contrast with haunting representations of Africa and its peoples. From seductive commercial layouts to pure studies of the naked human form, Herb Ritts's trademark is formal simplicity combined with eye-catching graphic qualities, such as stark black-and-white, or distinct, massive forms, such as in *Female Nude with Tumbleweed, Paradise Cove*, 1986. His oeuvre, however, can be divided into four areas: celebrities, fashion, nude or form studies, and his photographs of east Africa. His celebrity photographs were often optimistic and playful shots capturing the subject in terms of his or her trademark feature. His fashion work, even though his clientele included virtually every top magazine and designers such as Donna Karan, Calvin Klein, The Gap, Giorgio Armani, and Versace, often challenged

conventional notions of gender or race, and rendered the most mundane product mythical in its haunting intimacy. His studies in the natural beauty of form celebrate the human body as strong and sensuous, and take clear pleasure in evoking the tactile appeal of surface textures—the body flecked with grains of sand, veiled in sheer fabric, caked with dried mud, or exposed to flowing water. His stunning images of east Africa, collected on a 1993 trip, record the Maasai people, animals, and the landscape they inhabit as a timeless world of vast spaces and ancient ways, deliberately disconnected from the worlds of fashion and fame. His work can be found in the following published collections: *Herb Ritts*, *Herb Ritts: Pictures*, *Body Art*, *Men/Women*, *Duo: Herb Ritts Photographs Bob Paris & Rod Jackson*, *Notorious*, *Africa*, and *Work*. He died in December 2002 from AIDS-related pneumonia complications.

FRANZ ROH

German

Franz Roh was born in Apolda, Thuringia, Germany in 1890, and he died in Munich on 30 December 1965. Those two facts and a few others consisting mainly of exhibition and publication dates and book titles constitute the entire evidential autobiographical literature about Roh. We know, for example, that his doctoral thesis and subsequent book were titled *Dutch Painting of the 17th Century*. We do not know about the life he lived from birth through the World War I years to the award of his doctoral dissertation in 1918. Between 1919 and 1925, he published one book—*Nachexpressionismus—Magischer Realismus...*[After Expressionism— Magic Realism...], and he authored art criticism for the journals *Cicerone* and *Das Kunstblatt*. But it is Roh's work from the six-year period, 1927 to 1933, which defines him as a figure important to the history of twentieth-century photography; as a photographer, curator, publisher, critic, and author, his major contribution was his role in organizing the seminal 1929 *Film und Foto* exhibition. The paucity of personal information about Roh, however, has made it nearly impossible to use his life experiences to assess his art ideas, which has obscured and perhaps marginalized Roh's considerable achievement in shaping photographic practice and culture as it evolved in the 1920s.

European artists of the twenties were in rebellion against antiquated Victorian dogmas and the draconian and calloused thinking of The Great War leadership that so devastated Roh's generation. Artists reproached the absurdity of the reigning authority through the proclamations of new ideals, realized passions, and secular rationalizations. The actions and art of the young divided one generation from the other and one century from the other. Roh's was not a generation that honored silence about personal life choices because to be silent was to be complicit. Yet the record is blank about Roh's military service in World War I, surely a formative period that may have had an impact upon his mature beliefs and later work in photography. The record is so gaunt that the first words of Juliane Roh's essay in the monographic *Retro-spektive Fotografie: Franz Roh* begin this way:

Über Franz Roh als Fotografen kann ich aus persönlicher Erfahrung wenig berichten. [About Franz Roh as a Photographer I can relate very little from personal experience].

Roh's linked roles of publisher, critic, and curator were an outgrowth of the literary studies Roh undertook first in Weimar and then in Basel, Switzerland, Berlin, Leipzig, and Munich. These studies culminated in a 1918 assistantship with the art historian Heinrich Wölfflin. His introduction to photography is unknown, but in 1929, Roh pub-

lished and co-edited, with the legendary graphic designer Jan Tschichold, the decade-defining catalogue *Foto-Auge* [Photo Eye] and co-curated the seminal exhibition *Film und Foto*. This summary exhibition of the new modernist imagery was massive and a resounding success. After appearing in Stuttgart, the exhibition traveled to six venues worldwide: Zurich, Vienna, Danzig (now Gdansk, Poland), Agram (now Zagreb, Croatia), and Tokyo and Osaka in Japan. The curators and the regional advisors included László Moholy-Nagy (Germany), Piet Zwart (Holland), El Lissitzky (Soviet Union), Fritz Gruber (Switzerland), Edward Weston (USA), and others, and Hans Richter was the judge for cinema. They assumed that the exhibition and catalogue of the 1200 photographs by 187 photographers would define for the generations to follow 1920s experimental photography. Roh wrote an essay for the catalogue that defined an historical context for his own innovative photographs which were included in the exhibition and the New Vision imagery of, among others, Herbert Bayer, Andreas Feininger, Hannah Höch, El Lissitzky, László Moholy-Nagy, Walter Peterhans, Man Ray, and Maurice Tabard. He wrote:

Our book does not only mean to say “the world is beautiful,” but also: the world is exciting, cruel and weird....there are five kinds of applied photography: the reality-photo, the photogram, photomontage, photo with etching or painting, and photos in connection with typography.

In references to Pictorialism, the international style that *Film und Foto* was mounted in opposition to, Roh wrote:

...to a new world of objects we find the old seen anew.... for a long time we had photographers who clad everything in twilight (imitators of Rembrandt in velvet cap...). today everything is brought out clearly. ...[seen anew by] “wrong” focalizing...the use of the same plate over again....the audacious sight from and above and below endorsing the imagery.

Roh addressed his own personal camera work—the negative print—this way:

...a further variety of... reality-photo...[is] the negative print. The principle of inversion is known in arrangement of abstract forms, as applied in weaving and....in music too....why should not the same principle be applied to exterior realities...? Besides the inversion of direction, an inversion of light—and-dark is well possible. This, for the present, specifically photographic charm cannot be experienced elsewhere, for the distinction between a day and night view of the same reality is quite a different thing. we might perhaps speak of a world in the major

and the minor key, to indicate at least the completely changed expression of tone values.

From 1927 to 1933, when he actively photographed, Roh explored two invented visions: surreal collages/montages of figure and landscape, and the negative print. But it was the negative print and its polarized tonalities reminiscent of the photogram that allowed Roh to redefine photographic reality by compressing perspective, transposing highlights and shadows, de-eroticizing the sedentary model, and stripping from places, objects, individuals, and landscapes all references to other art forms and even photographic classicism. His technical mastery of the process solidified Roh’s place in the pantheon of Europe’s experimental photographic elite, as his photographs fused the visions, perspectives, and processes that categorized European photographic modernism.

Roh said that he began his photographic career in 1927 and worked until his arrest and three-month internment, in 1933, in the Nazi concentration camp in Dachau. Roh wrote that his first wife’s intervention on his behalf directly to Heinrich Himmler, then Police Commissioner of Munich and later the official most responsible for the Final Solution, resulted in Roh’s release. Roh apparently never photographed again.

Though his photographic career was brief, Roh’s images were an essential part of the 1920s modernist effort that uprooted, reengineered, and recalibrated the relationship between what we see and what we see through camera vision. Light and shadow became, in his work, bulky massed tones. By compressing highlights and shadows into a chalky gray mid-range hue that obscured more than it revealed, Roh gerrymandered photography’s normal tonal palette of black to white. Roh presented uneventful public acts—individuals crossing bridges on foot or in automobiles, workers and vendors in the street, or pedestrian groups converging on spacious unpopulated plazas or intersections—and simple private observances such as reading and bathing in a manner free of narrative entanglement, divorced from history and thus congruent with early modernist thinking.

MARTHA ROSLER

American

Martha Rosler is a photographer, writer, and video and performance artist. She is an important figure for feminist and conceptual photography. Her work explores gender, class, territory, ownership, and politics, among many other controversial and highly debated issues of the late twentieth century. As a leading contemporary artist, Rosler has also generated an important body of photographic work. Through this work, she has provoked considerable dialogue regarding social interaction and the way in which photography documents individuals, experiences, and ideas.

Born in Brooklyn, New York in 1944, Rosler’s early interest in art was as a painter. She took an undergraduate degree from the Brooklyn College and went on to the University of California, San Diego to attend a graduate program in fine arts in 1975. The graduate program included faculty members and critical thinkers Herbert Marcuse and Fredric Jameson, as well as many internationally recognized university lecturers. As a result, Rosler became more interested in conceptual art production, focusing on a reconsideration of conventional methods of representation, display, and distribution.

But even before attending the University of California, Rosler’s earliest photographic works show

her interest in challenging conventional representations. Her series, *Body Beautiful, or Beauty Knows No Pain* (1966–1972), features collage images of women from advertising, fashion layouts, pornography, and other found sources. These images are arranged into provocative arrangements that call into question the intentions of both advertisers and artists. Using glamorous views of women in seductive, conventional poses, she calls into question the way in which women are objectified in advertisements and the fact that they can be used as tools for part of a larger patriarchal social system. In describing her working method, Rosler states:

The subject is the commonplace—I am trying ...to question the mythical explanations of everyday life. We accept the clash of public and private as natural, yet their separation is historical. The antagonism of the two spheres, which have in fact developed in tandem, is an ideological fiction—a potent one. I want to explore the relationships between individual consciousness, family life, and culture under capitalism.

(interview, Video Data Bank, The School of The Art Institute of Chicago)

At the time she was working on the *Body Beautiful* series, Rosler was involved in the women's and civil rights movements, and in response to the highly political atmosphere of the era, she created a series of politically charged works. In *Bringing the War Back Home* (1967–1972), Rosler combined images of American daily life as represented in *Life* magazine with images of the war in Vietnam. Her arrangements provoked viewers to reconsider the consistency and luxury of American life at home, far from the war where young Americans battled and died daily.

Rosler moved from a collage technique to professional photography production in the mid- to late 1970's. Her most widely acclaimed photographic series is *The Bowery in Two Inadequate Descriptive Systems*, (1974–1975). For this project, Martha took photographs of the New York's Bowery, a place frequented by the homeless and drug and alcohol addicts which was beginning to be populated by artists' studios in the 1970s. The documentary style of this work is similar to the efforts of Walker Evans and others commissioned by the Farm Security Administration in the 1930s, who laid bare the poverty and dysfunction in America caused by the Great Depression. Like much of Evans's work, Rosler presents empty locations. By using vacant spots of the Bowery, Rosler could communicate the world of an underground subculture without exploiting its individuals. Her presentation of the empty spaces in broad daylight

also put a spotlight onto locations typically frequented at night. Beside each photograph, Rosler posted a card of printed words, featuring words and phrases used by the Bowery's denizens, such as "screwed up," or "groggy." The photographs and texts together became a documentation that communicated the subtleties of a subculture that is either outright unknown or misunderstood.

Rosler's photographs of the Bowery were also suggestive of the alienation inherent in modern life in urban environments. And while Rosler turned increasingly to video production in the 1980s, between 1983 and 1994, she worked on a series of photographic images titled *In the Place of the Public: observations of a frequent flyer*. These photographs include shots of the TWA terminal tunnel at New York's Kennedy Airport, empty seats from anonymous mid-western airports, jet airliners, motion walkways, and many other components of airport environments. The images capture the sterile atmosphere of these facilities where strangers walk in constant passage to other destinations, and where aluminum gilded bars and panels dominate the architecture. She manipulated her camera to blur, highlight, and darken, creating images suggesting a seductive, yet largely cold environment. When compared with Stephen Gill's photographs of deserted airport spaces and bleak buildings and Frits Rotgans's photographs of airplane hangars, Rosler's series, because of the saturated colors and provocative angles, seems an almost romanticized take on airplane travel.

Between 1995 and 1998, Rosler created a series of photographs of driving, included in the book and exhibition *Rights of Passage*. These photographs show the view through the windshield and document the backs of vehicles, signage, and the asphalt atmosphere of the American highway. In her essay which accompanied the photographs, Rosler explained that she considered roadways to be a critical component of the modern American landscape and that she was captivated by them as places of elusive liberation. Her documentation of the roadways is contemporary to many other late twentieth-century photographers such as Edward Ruscha, who also photographed the sprawl of manufactured spaces.

A general issue suggested in the photography of Martha Rosler is that of surveillance. Throughout her work, she takes the role of outside observer. Like photographer Sophie Calle, she is a witness to those who rarely take note of themselves. The inhabitants of the Bowery, busy travelers, and passing drivers rarely consider themselves subjects for artists. Her interest in political ideologies exposes

the dual and oppositional threats of alienation and unwarranted personal exposure and implies that alienation provides privacy. She captures the ambiguous nature of late twentieth-century society, complicated by the densely populated urban sprawl that highlights personal issues such as gender, dislocation, and homelessness.

Rosler's work poses questions of identity and experience to the viewer and audience, making her project more conceptual than formally orientated. The work is relevant to photographic history, art history, sociology, women's studies, urban studies, and cultural studies. She has also produced a series of writings, and film and video works that have expanded her influence.

Biography

Martha Rosler was born in Brooklyn, New York in 1944. She received a B.A. from Brooklyn College, New York in 1965 and her M.F.A. from University of California, San Diego, California in 1974. Visiting Artist, Simon Fraser University, Vancouver, Canada, 1979; Visiting Artist residency in video and photography, The School of The Art Institute, Chicago, Illinois, 1985 and others. Began publishing critical writings in *Artforum* and other magazines, 1975. Member of the Association of Independent Film and Video, College Art Association, Media Alliance and the Society for Photographic Education. Teaches at the Mason Gross School of the Arts of Rutgers University, New Brunswick, New Jersey, and lives in Brooklyn, New York.

Individual Exhibitions

- 1975 *The Kitchen*; New York, New York (with Allan Sekula)
- 1977 *Foul Play in the Chicken House*; Long Beach Museum of Art; Long Beach, California
- 1978 *Against the Mythology of Everyday Life*; and/or Gallery; Seattle, Washington
- 1979 Orange Coast College Photography Gallery; Costa Mesa, California
University Art Museum, University of California; Berkeley, California
- 1986 Los Angeles Center for Photographic Studies and ezty; Los Angeles, California
- 1987 *Focus: Martha Rosler*; Institute of Contemporary Art; Boston, Massachusetts
- 1988 *Martha Rosler: Four Works*; Viewpoints on Video Cable Series organized by the Long Beach Museum of Art; Broadcast throughout California
- 1991 *Focus on Southern Africa: Nancy Buchanan, Mzwakhe Mbuli, Martha Rosler*; Otis/Parsons Art Institute Gallery; New York, New York
Bringing the War Home; Photomontages from the Vietnam War Era; Simon Watson Gallery; New York, New York

- 1992 *Seattle: Hidden Histories*; Public art project in the series *In Public*; Sponsored by the Seattle Arts Commission
An Empty Space in Ottensen: Contaminated by History, Capital, and Asbestos. In the project *Stadtfahrt—City Tour*); Hamburg, Germany
In the Place of the Public; Jay Gorney Modern Art, New York, New York
- 1994 Palais des Beaux Arts; Brussels, Belgium Künstlerhaus; Stuttgart, Germany
In the Place of the Public; Contemporary Arts Center; Cincinnati, Ohio
- 1998 *In the Place of the Public*; Frankfurt Airport, sponsored by the airport and Museum für Moderne Kunst; Frankfurt, Germany
- 1999 *Martha Rosler: Positions in the Life World*; IKON Gallery; Birmingham, England and traveling to Institution d'art contemporain, Villeurbanne, France and Museu d'Art Contemporani de Barcelona, Barcelona, Spain

Group Exhibitions

- 1974 *Impact Art—Video Art '74*; Musée des Arts Décoratifs; Lausanne, Switzerland
Images by Women; University of California; San Diego, California
- 1975 *Information*; San Francisco Art Institute; San Francisco, California
- 1976 *Last Correspondence Show*; California State University at Sacramento; California
Social Criticism and Art Practice; San Francisco Art Institute; San Francisco, California
- 1977 *American Narrative/Story Art, 1967–1977*; Contemporary Arts Museum; Houston, Texas and traveling to Winnipeg Art Gallery, Winnipeg, Ottawa, Canada and University Art Museum, Berkeley, California
- 1978 *Whitney Biennial*; Whitney Museum of American Art; New York, New York
Public Disclosure: Secrets from the Street; San Francisco Museum of Modern Art and City Hall; San Francisco, California
- 1980 *Art of Conscience*; Wright State University; Dayton, Ohio. Traveling under the sponsorship of the Ohio Foundation for the Arts
- 1981 *Erweiterte Fotografie (Extended Photography)*; Vienna Secession; Vienna, Austria
- 1981 *Books by Artists*; Winnipeg Art Gallery; Ottawa, Canada; and traveling
- 1982 *A Decade of Women's Performance Art*; Art Gallery, University of California; San Diego, California
Documenta 7; Kassel, Germany
Seventy-Fourth American Exhibition; Art Institute of Chicago; Chicago, Illinois
- 1983 *Political Photography*; Stockton State College; Pomona, New Jersey
Whitney Biennial; Whitney Museum of American Art; New York, New York
Roles, Relationships, Sexuality; Long Beach Museum of Art; Long Beach, California
Mediated Narratives; Institute of Contemporary Art; Boston, Massachusetts
Video Art: A History, Part II; Museum of Modern Art; New York, New York and traveling
Content: A Contemporary Focus, 1974–1984; Hirshhorn Museum and Sculpture Garden, Smithsonian Institution; Washington, D.C.

ROSLER, MARTHA

Difference: On Representation and Sexuality; New Museum; New York, New York and traveled to Renaissance Society at the University of Chicago, Chicago, Illinois and Institute of Contemporary Arts, London, England

Brennpunkt: Kunst mit Eigen-Sinn; Museum Moderner Kunst; Vienna, Austria

In the Tradition of...Photography; Light Gallery; New York, New York
1986 *Whitney Biennial*; Whitney Museum of American Art; New York, New York

1987 *Sexual Difference: Both Sides of the Camera*; C.E.P.A. Gallery, Buffalo and traveling

1988 *Signs*; Art Gallery of Ontario; Toronto and traveling
1989 *Whitney Biennial*; Whitney Museum of American Art; New York, New York

Mediated Issues: Women, Myth, & Sexuality; Institute of Contemporary Art; Boston, Massachusetts

1992 *Imágenes de Guerra*; Centro Cultural/Arte Contemporáneo; Mexico City

Mistaken Identities; University Art Museum, University of California; Santa Barbara; Museum Folkwang, Essen; Forum Stadtpark, Graz; Neues Museum Weserburg/Forum Langenstraße, Bremen; Louisiana Museum, Humlebaek, Denmark; University of Western Washington, Bellingham, Washington

1994 *Corpus Loquendi: The Body for Speaking*; Dalhousie Art Gallery; Halifax, Canada, and traveling

War Works: Women, Photography, and War; Nederlands Foto Instituut, Rotterdam, Netherlands and Victoria and Albert Museum; London and traveling

Avant l'Histoire; Centre Georges Pompidou; Paris, France

Defining Eye: Women Photographers of the Twentieth Century, from the Collection of Helen Kornblum; The Saint Louis Art Museum; St. Louis, Missouri

1997 *Airport*; The Photographers' Gallery; London and Nederlands Foto Instituut, Rotterdam, Netherlands

ARTHUR ROTHSTEIN

American

By the time Arthur Rothstein formed a Camera Club at Columbia University in New York in 1935, photography had long been an interest. A darkroom in the basement of his childhood home allowed Rothstein to practice various photographic techniques and exhibit locally during high school. At Columbia, Rothstein organized exhibitions and events for the Camera Club, once inviting Edward Steichen to speak. He also began to understand the public demand for photographs at this time, offering to make photographs for fellow

students' theses as a way to offset the cost of tuition during the first years of what would come to be known as the Great Depression.

Rothstein met Roy Stryker, a professor of economics at Columbia, during his senior year. Stryker and fellow Columbia University professor Rexford G. Tugwell were shaping a New Deal project to document the state of American agriculture, the Federal Resettlement Administration. Stryker had quickly decided that one of the best ways to record both the destitution of agricultural life in the United States and the efforts of the New Deal government to alleviate such hardships would be visually, and

so he set about creating a team of photographers. Rothstein was the first to be offered a position with a group of photographers that, to a great degree, would come to define an era in U.S. history. In a short time, photographers Walker Evans, Russell Lee, Dorothea Lange, Ben Shahn, and John Vachon were also working for Stryker and the Resettlement Administration, later known as the Farm Security Administration (FSA).

Rothstein enjoyed the freedom and mobility that came with his FSA assignments, having little experience of the United States beyond New York City. During his very first assignment in the Blue Ridge Mountains of Virginia in 1935, Rothstein had the chance to acquaint himself with the locals, gradually gaining their trust and permission to photograph them as unobtrusively as possible. Rothstein's photographic vision was influenced not only by the directives about subject matter or feeling given by Roy Stryker but also by the more experienced talent of Walker Evans and Ben Shahn. Of their influence, Rothstein said during an extensive interview for the Smithsonian Archives of American Art:

[T]hey had very definite approaches; and it was not just a question of making a picture, but making a picture that had meaning. They made me very much aware of the elements that go into photography—that go beyond just the content of the picture—the elements of style, of individual approach, of being able to see clearly, being able to visualize ideas.

(Richard Doud, "Interview with Arthur Rothstein," 20)

Gee's Bend, Alabama [Artelia Bendolph] (1937) remains among Rothstein's most famous and lasting photographs of the Great Depression. Juxtaposition could be said to be one of the primary tropes of FSA photography. Commonly, printed billboards, advertisements, and promises of prosperity served as a backdrop to bread lines or, as with "Gee's Bend," functioned as insulation in the rural homes and shacks of those hardest hit by the depression. Rothstein photographed the moment when a girl, Artelia Bendolph, leans out beyond the frame of a cabin window, bathing her face in sun in the direction of a smattering of food advertisements, images which add weight to the sense of economic desolation to the formal isolation of the picture. Photographs like *Gee's Bend* and *Dust Storm, Cimarron County, Oklahoma* were published repeatedly throughout the late 1930s in such magazines as *Look*. Rothstein has said of the latter image of a father and his sons enveloped by swirling dust:

[I]t made people realize that here was as tragedy that was affecting people—it wasn't just affecting crops....

This photograph had a great deal of influence on people in the East, for example, who had no contact and no sense of identity with this poor farmer walking across the dusty soil on his farm in Oklahoma—it gave him a sense of identity.

(Richard Doud, online transcription of "Interview with Arthur Rothstein," <http://artarchives.si.edu/oralhist/rothst64.htm>)

Rothstein's *Skull, Bad Lands, South Dakota* also attained certain notoriety during his time with the FSA, for it was this photograph that sparked political accusations of fraud and fakery among New Deal policies of the Democratic administration. Rothstein's own account of the photograph stressed his formal and compositional experimentation; intrigued by the bleached skull, he spent the better part of a day placing the skull against various backdrops such as cracked earth, near cacti, and grass. After filing these pictures with the FSA in Washington where they were available free of charge to any interested publication, one Associated Press picture editor printed and captioned the photograph of the skull on dry, parched earth as an example of drought in the Western United States. Editors and Republican politicians alike soon claimed that the photograph represented an abuse of information by the government, intending to suggest conditions far worse than reality. The other studies of the skull that were then discovered in the files of the FSA only fueled the controversy, since they seemed to prove Rothstein's willing distortion of the facts. Long after attacks on New Deal policies and officials had subsided, the story of this photograph remains a telling example of the tenuous boundary between document and propaganda when photographs serve as mere illustrations for any number of contexts.

When speaking of the impact of his time with the FSA, Rothstein frequently cited the ways in which the FSA photographs were part of new techniques of visually based communication. The context of a photograph could, as in the case of "Skull," be equally important as the image itself in determining meaning. Rothstein understood the combined potential of words and pictures, a phrase that provided the title to one of his major catalogues. Working at *Look* from 1946 until the end of its run in 1971, Rothstein perfected this conviction, taking photographs he hoped would have the power of social commentary for a large audience. Throughout his tenures at *Look* and *Parade* magazine (1972–1985), Rothstein's belief in the communicative ability of photographs inspired and informed his teaching career at a number of universities. It also prompted

ROTHSTEIN, ARTHUR

him to publish a key text on photojournalism and color photography manuals before his death in 1985. Today, photographs by Rothstein can be found in over 90 institutions, most comprehensively in the International Museum of Photography and Film at George Eastman House, the Museum of Modern Art in New York, the Rothstein Collection in the Library of Congress, London's Royal Photographic Society, and the Smithsonian Institution.

Biography

Born in New York, New York, July 17, 1915. Attended Columbia University, majored in Physics and Chemistry, founded the University Camera Club; B.A., 1935. Became the first photographer of the Resettlement Administration; worked for the FSA 1935–1940; joined *Look* magazine as a staff photographer, 1940; photographed for Office of War Information in New York, 1941–1943; photo officer with U.S. Army Corps in China, Burma, and India, 1943–1946; Director of Photography at *Look*, 1946–1971; founding member, American Society of Magazine Photographers and editor of ASMP's *Infinity* magazine, 1971–1972; joined *Parade* magazine as Associate Editor, 1972; Director of Photography at *Parade*, 1978–1981; Associate Editor at *Parade*, 1981–1985. Member of faculty, Graduate School of Journalism at Columbia University; Spencer Chair Professor, S. I. Newhouse School of Public Communication, Syracuse University; member of faculty, Mercy College, Dobb's Ferry, New York; member of faculty, Parsons School of Design, New York, New York. Recipient of the National Press Photographers Association Award, 1963. Named a Fellow of the Royal Photographic Society of Great Britain, 1968, and a Fellow of the Photographic Historical Society of New York, 1979. Received over 50 awards in photojournalism and served on Pulitzer Prize Jury. Died in New Rochelle, New York, November 11, 1985.

THE ROYAL PHOTOGRAPHIC SOCIETY

The Photographic Society was formed on 20 January 1853. In August 1894, it became The Royal Photographic Society (RPS). The Society's primary objective was embodied in its introductory address, published in the first issue of its mouthpiece, the *Journal of the Photographic Society* (later, the *Photographic Journal*). It was to promote "the Art and Science of Photography, by the interchange of thought and experience amongst Photographers." The Society carried its ambitions into the twentieth century, organising meetings, lectures, conferences, and exhibitions. The *Journal* continues to provide a forum for the dissemination of medium-related information.

Established as a learned society, the RPS now offers three levels of distinction in photography: Fellowship (FRPS) introduced in 1895, Associate-ship (ARPS) introduced in 1924, and Licentiate-ship (LRPS) introduced in 1972. The elected RPS Council will award an Honorary Fellowship, at its discretion, in recognition of outstanding service to photography.

An Annual International Print Exhibition has been staged almost every year since the Society's inception, and the Society has variously used its premises to exhibit pictures from its collection, or to showcase touring exhibitions. For instance, in 1900, an exhibition organised by the photographer F. Holland Day, and entitled *The New School of American Photography*, was hung in the RPS Rooms at 66 Russell Square, London. During the 1970s, when the Society occupied premises at 14 South Audley Street, London, a number of one-

man shows (including Roger Fenton, Alvin Langdon Coburn, and Robert Demachy), in addition to themed, pictorial exhibitions, were staged in the John Dudley Johnston Gallery.

In 1980, the Society established its headquarters at The Octagon in Bath. The move ensured that the Society's photography-related activities could be expanded, and a full exhibitions programme put into place. *Photogenic* (October 2000–January 2001), an exhibition that drew exclusively from the RPS archives, comprised 130 original prints spanning 160 years of photography. It was the last RPS exhibition held at that venue.

In 2001, the RPS Council agreed to seek new partners to enable further access to its collection. Subsequent negotiations resulted in the collection being transferred from private ownership of the Society, to the nation, under the care of the National Museum of Photography, Film & Television, Bradford. It was made accessible to the public in November 2003. The RPS president who facilitated this decision was John Page Hon FRPS.

The origins, and changing fate of the RPS, are mirrored to a large extent in its collection. Despite the frequently-stated intention in the nineteenth century to create a permanent, national collection, it was not until the 1920s that collecting began properly.

The Society's first (honorary) curator was John Dudley Johnston. Twice RPS President (1923–1925 and 1929–1931), Johnston was a prominent and important Society member. In 1907, however, he had been elected a member of the secessionist group, the Linked Ring Brotherhood (1892–1910),

which broke from the RPS because it was too “purely scientific” and “practical” in its approach to photography. It is not surprising, then, that the core collection secured by Johnston has a pictorial bias.

According to Johnston’s 1930 Presidential Address, the collection comprised no more than 100 framed prints when he began acting as curator in 1924. By 1930, however, he had acquired notable works by Henry Peach Robinson, whom he considered the “Father of Pictorialism.” Johnston also secured the significant private collections of Alvin Langdon Coburn and Harold Holcroft. In the 1940s, Johnston was clearly collecting work that were representative of a particular period, rather than merely accumulating the “finest examples of photography.” Most of the acquisitions were donated, rather than purchased.

After Johnston’s death in 1955, the role of Honorary Curator went to his wife, Florence. Subsequently, the collection was cared for by a succession of curators, some paid, some unpaid. These include Gail Buckland, Carolyn Bloore, Arthur Gill, Valerie Lloyd, Brian Coe, Margaret Harker, and Pam Roberts.

The RPS Collection has long been recognised for its international importance. Its vast holdings incorporate daguerreotypes, photogenic drawings, waxed-paper negatives, albumen prints, *cartes-de-visite*, platinotypes, bromoil transfers, and gelatin silver prints. In addition, it demonstrates fine examples of little-known and experimental processes. It has images and albums by seminal nineteenth century photographers such as William Henry Fox Talbot, David Octavius Hill and Robert Adamson, Oscar Gustave Rejlander, and Julia Margaret Cameron, and boasts the world’s largest collection of prints by Fenton. A notable collection of correspondence between photographers and curators provides a vital context for many aspects of the visual material. The extensive library includes rare books and international periodicals, while the equipment collection spans the entire history of photography, often relating directly to material in the library and the photographic collection.

The diverse collection depends not only on the informed choices of previous curators, but also on the structure of the RPS. There are 18 regional groups and 15 special interest groups. Significantly, the Society’s specialist groups have ensured

that the former’s original interest in promoting photography in all its applications is reflected in the collection. For example, there exists a unique record of medical photography, documenting diseases and operations, and acquired from the RPS Medical Group during the 1980s. A fund set up by the American, Stephen Tyng, and administered by the RPS Pictorial Group since 1927, has enabled the purchase of over 150 photographs, including those by Arthur Kales, Asahachi Kono, and Rudolf Koppitz. The establishing of a Colour Group in 1927, ensured that the RPS acted as a forerunner in photographic experimentation. Two founder members, Agnes B. Warburg and Violet Blaiklock, are very well represented in the RPS collection. Their work contributes to our understanding of early twentieth-century colour processes, and helps to demonstrate women’s participation in advancing the art and science of photography. The Historical Society, formed in 1972, produces a quarterly publication, *The PhotoHistorian*, often with supplements that provide invaluable documentation relating to the history of photography.

The RPS is a living collection, and pertinent acquisitions are still made in order to augment and complement the existing holdings.

EVA RUBINSTEIN

American

Born August 18, 1933 in Buenos Aires, Argentina to Polish parents—ballet dancer Aniela Mlynarska and renowned pianist Arthur Rubenstein—Eva Rubinstein traveled constantly throughout her childhood, often living in Paris, where she continues to reside today. Following the outbreak of World War II, Rubinstein's family emigrated to the United States where they settled in New York City. Here, Rubinstein's early years of ballet and theater training with acclaimed teacher Mathilde Kszesinska were put to good use, as she eventually came to earn a living as a ballet dancer and actress, most notably starring in *The Diary of Anne Frank* on Broadway. In 1956, Rubenstein married William Sloane Coffin, Jr., with whom she had three children: Amy, Alexander, and David. After their 1968 divorce, and following brief studies with Lisette Model, Diane Arbus, and photojournalist and anthropological photographer Ken Heyman, Rubinstein began her career as a freelance photographer.

Photographing exclusively in black and white, Rubinstein's initial images were photojournalistic or documentary in nature, as she worked as a photojournalist with works published in *Life*, *Look*, and *The New York Times*. But her images soon became far more personal, depicting nudes, especially the male nude, and interiors, and describing an emotional and evocative style that soon became the artist's signature. Often referred to as "more emotional than cerebral," Rubinstein's work reflects the artist's long-held philosophy that a photographer's personal work is—consciously or not—always an expression of her mind.

Rubinstein is well known for viewing photography as interpretation—the means by which we make things our own, the way each of us puts our "stamp" on our personalized way of seeing. In fact, all of Rubinstein's work could be characterized as being intensely personal, which is due to the fact that the artist admittedly relied quite heavily on the participation of her human subjects and on the interaction between her subject and herself. The photographer's connection with many of her subjects was so complete that she remarked that she sometimes "became the other," often viewing the camera as an obstacle

and wishing that it would disappear, leaving her to take photographs with her body. Perceiving the camera's viewfinder as a "glass wall"—a site of disconnection standing between the photographer and reality—Rubenstein had a tendency to put the feelings of her subject before her own need to capture the moment.

This extremely romantic approach, in which Rubinstein attempted to eliminate any disconnection between her subjects and herself, lies in stark contrast to many of her contemporaries (such as Frank Horvat or Diane Arbus) who encouraged a more classical approach in their own work. Rubinstein's vehement disagreement with the artistic philosophy of Diane Arbus in particular was apparent when she stated, succinctly, "People are not for catching!" As evidence of the fact that she did not believe in using the camera as a tool of power or aggression, Rubinstein states that she would often avoid taking a photograph of unsuspecting subjects if she felt that a particular moment would be destroyed by her camera's intrusion, feeling the "opportunity" was akin to stealing.

Rubinstein's intensely emotional approach to photography has been appreciated by many major museums which have collected her work, including the Metropolitan Museum of Art and the International Center of Photography (both in New York), and she achieved critical acclaim early in her career primarily due to photographs taken in Ireland between 1969 and 1972 and also for her portraits of celebrities. Perhaps the artist's most fulfilling moment—personally and professionally—was her visit to Lodz in the early 1980s, just after marshal law had lifted in Poland. Rubinstein fell immediately in love with Lodz, the birthplace of her father, and worked closely with the Lodz City Historical Museum to document this dramatic period in Poland's history in photographs. Following a career which featured 92 solo exhibitions and 95 group exhibitions internationally, Rubinstein lives in Paris and teaches photography workshops throughout the United States and Europe.

Biography

Born in Buenos Aires, Argentina, 18 August 1933. Primarily self-taught in photography, but studied with Lisette Model and Diane Arbus, among others. Freelance photographer, 1968–present. Instructor at the School of Visual Arts, New York, 1972; Ansel Adams Workshop, Yosemite Valley, California, 1974; Manhattanville College, Purchase, New York, 1974–1975. Visiting Artist at Dayton Art Institute, Dayton, Ohio, 1973; Rhode Island School of Design, Providence, Rhode Island, 1974. Works collected by The Metropolitan Museum of Art, New York, the International Center of Photography, New York; The Israel Museum, Jerusalem; Fotografiska Museet, Stockholm; and the Art Museum, Lodz, Poland. Lives in Paris, France.

Individual Exhibitions

1972 Underground Gallery; New York, New York
 1975 Rencontres Internationales de la photographie; Arles, France
 1975 Canon Photo Gallery; Amsterdam, Netherlands
 1977 Galerie Trockenpresse; Berlin, Germany
 1983 The Photographers' Gallery; London, England
 1984 Image Gallery; Madrid, Spain
 1984 Muzeum Sztuki; Lodz, Poland
 1989 Encontros da Imagem; Braga, Portugal
 1989 Bibliothèque nationale de Paris; France
 1995 Galerie Augustus; Berlin, Germany
 1996 Galeria Sztuki "Zacheta"; Warsaw, Poland
 1997 Magyar Fotográfiai Múzeum; Budapest, Hungary
 1998 Muzeum Regionalne; Września, Poland
 2002 Filharmonia Narodowa; Warsaw, Poland

Group Exhibitions

THOMAS RUFF

German

Thomas Ruff's presence in contemporary photography came about in the mid-1980s. His rather dry, even seemingly sterile, photographs were in line with the aesthetic dominant in Germany during this time as promulgated by Bernd and Hilla Becher and their tenure at the Kunstakademie, Düsseldorf. While his subjects are often simple—

giant, deadpan portrait heads or modernist buildings—his ideas extend beyond the obvious. His goal is not to create any emotional connections for viewers; rather, his images are about “seeing” and helping viewers discover a new aesthetic so that they may find the space between reality and the photograph, a place where Ruff often finds himself.

Thomas Ruff, one of six children, was born in 1958 in Zell am Hamersbach, West Germany. His

first experiences in photography came about during his teenage years. In 1974, Ruff received his first camera, a small format Nikon, and he eventually took night classes in photography. In 1977, he entered the renowned Kunstakademie in Düsseldorf for an apprenticeship under Bernd Becher. It was during these years that Thomas Ruff first began the work that would later evolve into a style of photography that predominated among contemporary German photographers, most notably Bernd and Hilla Becher, and their students Andreas Gursky, Candida Höfer, and Thomas Struth. Often these photographs, or typologies, were considered cold and distant, lacking in any emotional content. Ruff's first series of photographs, *Interiors*, completed while still in school, depicted the inner spaces of buildings in and around his hometown. These photographs came about, in part, from his experiences working with a commercial photographer producing brochures for the building industry. What were of particular interest to Ruff were not the spaces themselves, but the sculptural objects he found within them, such as a chair or dresser. It was also during this time at the Kunstakademie that he began his series entitled *Portraits*. In the early 1980's, Ruff began photographing other students at the school and friends. The students tended to be of the same race, class, and age, providing a very homogenous, narrow view, which Ruff enjoyed, for the object was to make simple compositions in large collections. The photographs were straightforward portraits not unlike ID photos or mug shots. The sitters were asked to wear their own clothing and allowed to select from a number of brightly colored backgrounds. The sitters' faces are devoid of any expression, the portraits revealing nothing. Occasionally, a subject would be shown in profile or three-quarters view, but the majority were full-face shots. The photographs were printed out either as three times smaller or three times larger in scale than reality.

By the late 1980s, Thomas Ruff refined his portraits even further by eliminating the colored backdrops, removing emotional connotations to any particular color. As well, Ruff felt the color in his subjects faces was sufficient. The pose became standardized, with all models facing forward, gazing deadpan into the camera. The print size also changed to roughly six feet tall, equivalent to or taller than the height of most of its viewers as Ruff strove to achieve his ideal of a truly objective photograph which represented surfaces, not stories.

Meanwhile, Thomas Ruff was earning praise and a number of honors for his work. In 1982, he won the Kunstakademie's Paris stipend and in 1985 the

Jürgen Ponto Foundation Prize. It was also during this time that Ruff shared a studio with fellow former Kunstakademie students Andreas Gursky and Axel Hütte. In 1987, Ruff began employing digital technology to retouch his photographs, further enforcing his idea of the photograph as a paradigm against the authenticity of an image. At first, Thomas Ruff would simply use this technology to create the image he envisioned in his head. In his *Portraits* series, for example, he gave all his sitters blue eyes to further dissolve any differences between them. In his next series, *Houses*, Ruff digitally removed trees or other objects that interfered with the architecture or composition.

While Ruff is most closely associated with portraits, he has made attempts at "objective photography" through other subjects. His series *Stars* consisted of large photographs printed from negatives borrowed from the European Southern Observatory. In these photographs, white specks of varying sizes and configurations float in a deep black space like a visual road map. The *Night* series was another investigation of an objective aesthetic position that required his researching the capabilities of equipment new to him—night vision devices used by the military. Ruff did not digitally retouch these photographs, as he wanted the sickly green colorcast characteristic of night vision technology to indicate the process. Ruff's *Newspaper Photos* series consisted of enlargements of various images he had collected for years from local newspapers. For Ruff, the appeal was not the story behind the image, but rather the composition and the process. These photographs, once taken from their original context, became a manipulation by Ruff of the original.

After nearly a decade, Thomas Ruff returned to his work with portraiture in his mid-1990's series *Other Portraits*. Instead of using original images, he recycled old negatives from early portraits. Inspired by a police system used in Munich to create the likeness of suspects, Ruff fused two portraits together to create a new photograph and a likeness of a new person.

In 1998, Ruff was invited to photograph villas designed by German architect Ludwig Mies van der Rohe between 1927 and 1930. In these photographs, the buildings were treated similarly to his early portraits: simple, clean, and neutral. The photographs were commissioned for the first exhibition held after the restoration of Haus Lange and Haus Esters, gallery space for contemporary art in Krefeld, Germany, originally designed by Mies van der Rohe.

While Thomas Ruff's subject matter may have shifted over the past two decades, his intent has

not. His contention has been that all photographs are manipulations and that there is no authentic image; photographic reality is an illusion, whether manipulated by a computer or the photographer's choice of lenses. Therefore, the only truths in photography are the surfaces represented. In 2000, Ruff was offered a professorship at his Alma mater, the Kunstakademie. He currently lives and works in Düsseldorf, where he continues his visual quest for the ordinary.

PHOTOGRAPHY IN RUSSIA AND EASTERN EUROPE

The map of late twentieth-century Eastern Europe included Albania, Belarus, Bulgaria, Czech Republic, Croatia, Estonia, Hungary, Latvia, Lithuania, Macedonia, Romania, Russia, Serbia, Slovak Republic, Slovenia, and the Ukraine. This article primarily discusses the development of photography in the former Czechoslovakia (now Czech Republic), Hungary, Poland, and the countries that used to be the part of Soviet Union. The main distinction in the development of photography in the Eastern Bloc countries from other European countries is the presence of the Communist totalitarian regimes that to a lesser or

greater extent impeded the development of experimental movements and encouraged the exploration of topics related to the life of workers and peasants. Another influential aspect was the inability of artists to communicate with their colleagues around the world and to travel outside Eastern Europe.

Within Eastern Europe, there were two major models of development. The first occurred in countries of the former Soviet Union that fell under Communist rule relatively early in the 1920s and 1930s, and whose photo histories were homogenized by the Soviet system. These countries, for example Ukraine

and Belarus, only recently gained independence in the last two decades, and have been attempting to create opportunities for formal photographic art education and support of those artists who explore either specific or general existential themes through the medium of photography. The second model occurred in countries such as Poland and Czechoslovakia, which became part of the Socialist Bloc after World War II. In these countries, the Iron Curtain was not so rigid, allowing artists to be aware of the recent photographic developments in the rest of the world. Therefore, the history of photography in these countries correlates more closely to the history of photographic movements in the West.

In the early 1900s, Eastern European photographers learned about the ideas of Pictorialism from their fellow artists in Western Europe. In 1895, the Art Photography Club [Klub Milosnikow Sztuki Fotograficznej], founded in 1891 in Lwow, began to publish *Przegląd Fotograficzny* [Photography Review], the first monthly dedicated to photography in the Polish territories. By the early twentieth century, photography in Eastern Europe played an important part as both an artistic and a documentary medium. In 1901, the Warsaw Photographic Society was founded. In Russia, M.N. Dmitriev (1858–1948) is considered the founder of the genre of documentary photographic essay. He documented peasant famine in the area of Nizhnii Novgorod at the end of the nineteenth century and created photo portraits of the writer A.M. Gorky and the opera singer F. I. Shalyapin. Russian N.A. Petrov (1876–1940) is considered one of the main protagonists of Pictorialism in photography. For many years, he was the president of the Society of Photographers Amateurs “Daguerre” in Kiev. In this capacity, he also organized many international exhibitions in Kiev, introducing Ukrainian photographers to innovations and developments in other European countries. S.A. Lubovnikov (1870–1941) was known for his depictions of peasants. For his work, he received an award at the Paris World Fair in 1900, and he was given the title of honorary member of the Royal Photographic Society, London in 1910.

Jan Bulhak (1876–1950), whose influence continued until after World War II, became, in 1908, the first Polish photographer to turn to Pictorialism. His books include *Fotografica* (Photography), *Estetyka Swiatla* (The Aesthetics of Light), and *Fotografia Ojczyzna* (Photography of the Homeland). A portraitist, he also recorded important national landmarks, combining his interest in art photography with nationalist ideas. Bulhak first worked in Wilno (1912–1919), and then in the 1920s and 1930s

throughout Poland. He also was a member of the Polish Photo Club, founded in 1930, and a lecturer on art photography department in the Department of Fine Arts at Stefan Batory University in Wilno between 1919 and 1939. Tadeusz Rzaca, a pioneer in Polish color photography with pictorial aesthetics, was active in Krakow from approximately 1910.

Lwow, Poland was one of the main centres of the pictorialist school. Pictorialists found their inspiration in the works of masters active in Austria, including Hans Watzek and Hugo Henneberg, and had institutional support from Lwow Polytechnic and the University of Lwow. The Lwow Photographic Society united such important figures as Henryk Mikolasch, Jozef Switkowski, and chemist Witold Romer, who in 1936 invented “isohelia,” a technique that sharpens contrast and defines three-dimensional images.

Constructivism in the 1920s was an innovative, influential photographic movement. Originally conceived by Russian artist Vladimir Tatlin and taken up by brothers Antoine Pevsner and Naum Gabo, it was preoccupied with abstract painting and sculpture. It was Alexandr Rodchenko (1891–1956) who combined the ideas of the abstract art of Suprematist painter Kazimir Malevich and Tatlin with the idealism of the post-revolutionary Russia and translated the movement into graphic design and photography. The language of Constructivism, with its unusual perspectives, geometric compositions, and precise arrangements of the object coincided well with the desires of the new regime to create a new, reformed egalitarian society. While Tatlin attempted to create a monument to these new ideas in his sculpture, *Monument to the Third International*, using non-traditional materials such as glass and steel, Rodchenko claimed that contemporary men who believed in revolutionary ideas should reject the old-fashioned medium of painting because of its romantic, bourgeois connotations and accept photography as a new medium of representation. “Photograph and be photographed,” he proclaimed in 1928 (Hughes 1991). Indeed, Rodchenko attempted to create pictures that presented objects from previously unknown and unseen angles. He was notorious in choosing unusual perspectives and shortenings for his works so that architectural elements such as stairs or balconies resembled geometrical figures, and his photographs were similar to abstractions (“Stairs,” 1930).

Rodchenko was also interested in the medium of photomontage, which he used for illustrations and book covers. For example, he illustrated the Soviet Revolution’s leading poet Vladimir Mayakovsky’s

work, “Pro Eto” (About This), and the art magazine *LEF* (Left Front of the Art), which was enormously influential in the field of visual arts in the 1920s and 1930s. It was only after 1924, when Rodchenko’s ready-made supply of photographs for photomontages was depleted, that he turned to the camera to create the “straight” representations himself. In the 1930s, Rodchenko, among others, founded the photography section of the “October” group, the most influential group of cinematic and photographic artists at that time.

In Poland, among those who created Constructivist, leftist-oriented photo montages, heralding a modern, optimistic civilization, were Mieczysław Szczuka and Teresa Zarnowerowna of the *Blok* group and Mieczysław Berman, who in the 1930s found inspiration in works by John Heartfield. The painter, Karol Hiller (1891–1939), experimented with numerous photographic and design styles. He belonged to the Łódź group, *A.R.*, and developed his own technique, *heliographics*, in 1928. This method involves creating abstract compositions using tempera paints and gouaches on glass plates or celluloid to create handmade negatives, and then printing the results on photographic paper. Hiller based his works on small drawings reminiscent of a filmstrip in several other conventions ranging from organic abstraction to the constructivist influences of the German Bauhaus, which in the late 1930s became transformed into biological and cosmic forms. Stefan and Franciszka Themerson, in addition to their literary interests, made surrealist photo montages and abstract photograms for seven experimental films, including *Europa* (1932), which has not survived. Themerson was also the editor of the journal, *f.a.* (Film artystyczny, [Artistic Film]).

In Hungary, László Moholy-Nagy (1895–1946) was the most influential Constructivist photographer. Born in Hungary, he moved with his Czech wife, Lucia Moholy, to Vienna in 1919, where they collaborated on the periodical, *Horizont* [Horizon], and later to Berlin (in 1920), where Moholy-Nagy was a master at the Bauhaus. They began making photograms, cameraless images made by placing objects between a light source and light-sensitive paper. In the early 1920s, Moholy and Moholy-Nagy met Russian Constructivists such as El Lissitzky and Gabo, and they continued to formulate and then practice this movement’s ideology. In the second part of the decade, László Moholy-Nagy emigrated to the United States and founded the “New Bauhaus” (later Institute of Design) in Chicago in 1938.

In the Czech Republic, Jan Lauschmann (1901–1991) was one of the first not only to accept Con-

structivist interest in unusual lighting and perspective (*Castle Staircase*, 1927), but also to proclaim that photography should be seen as an independent art. He pioneered straight photoprinting instead of the highly manipulated gum printing techniques still prevailing in Eastern Europe.

In the Soviet Union, in addition to the works of Rodchenko and other Constructivist photographers, experimental art photography was developed by the Russian Photographic Society, which in 1921 became part of the State Academy of Visual Arts. The culmination of the Society’s work was the exhibition *Soviet Photography of the Last Ten Years*, held in 1928. This exhibition included 7,000 displays; the opening night alone attracted 2,000 visitors. The exhibition was reviewed in many photographic journals including *Photograph*, *Soviet Photo*, as well as the major Soviet newspapers. However, in 1929, an article in the *Soviet Photo Almanac* condemned the “right sways” in the works presented at this exhibit. These condemnations signified the change of political views on the arts; the “right sways” referred to art that was preoccupied with subjective themes reflecting the individual rather than the collective. From the early 1930s, photography in Russia served ideological purposes, and, consequently, the emphasis was on documentary rather than art photography.

In Poland, the Atlas Book Dealers (1925–1939) continued to disseminate ideas of art photography by publishing photographic postcards by well-known Polish art photographers. In that period, Polish photographers participated in international photographic salons. Moreover, in 1927, the *First International Photography Salon* took place in Warsaw.

In the 1930s, as Communist and socialist ideas became more prevalent in Poland, pictorialists turned to street scenes, often depicting the lives of workers. Even pictorialist propagandists such as Bulhak took up modernist themes in the 1930s, as did Romer. Therefore, Polish Pictorialism slowly adopted some ideas that typified the New Vision photography then in full bloom in Western Europe.

For Witkacy (Stanisław Ignacy Witkiewicz) (1885–1939), outstanding art theorist, playwright, and painter, photography was a tool that helped to explore the existential themes of one’s identity. He turned away from landscape and pictorial photography for deeply psychological expressionist portraits and self-portraits, and he staged Para-Dadaist scenes. His most unusual *w tzw. ciasnym kadrze*/close-ups photographs were taken from 1912 to 1919.

Rodchenko’s approach to photography also influenced the photojournalism of his time. For

instance, photographers such as Russian Boris Ignatovich (1899–1976), who with his sister was a student of Rodchenko, used contrasting tones and unexpected perspectives to convey the atmosphere of reconstruction and rebuilding after the revolution. While Ignatovich worked in a more formalistic manner, other Soviet photographers adopted a more humanistic approach. The photo records of large construction projects were published in the leading Soviet newspapers such as *USSR na stroike* [U.S.S.R. in Construction] and *Pravda* [Truth], to name just a few. The images taken by Arkady Shaikhet, considered the father of Soviet photojournalism, Max Alpert, Georgy Zelma, and others reflected the megalomania of the Soviet construction enterprise as well as the atmosphere of brotherhood between classes and genders that was commended by the ruling ideology. Along with the depiction of grand-scale projects, photographers showcased the individual sacrifices and suffering of workers.

Not long after the Communists came to power, they realized the enormous power of photography as a propaganda. Photography, like no other medium, allowed for flexibility; posters and documentary photos could be retouched or changed to express ideology. For instance, during Stalin's times, prosecuted politicians were wiped out of the photographs, their images destroyed. Those who photographed these images often followed the destiny of their work: they were either killed, imprisoned, or exiled.

The decades of the 1930s to 1950s, with the exception of the period from 1941 to 1945 when Soviet Union participated in the World War II, allowed for very little artistic photography. Preoccupation with personal visions was seen as betraying Communist values and was prosecuted. The very small amount of photographs that demonstrated personal vision rather than serving the dissemination of ideas of "common good" was buried in the archives of the artists. Only in recent decades have these images started to surface in museum exhibitions.

In Poland, documentary photography did not assume the same popularity as in Germany, Czechoslovakia, or to some extent, the Soviet Union. Polish documentary photographs assumed two forms. First were the images taken for mass circulation publications, which presented political events in their social context. The second form was photography not intended for mass audiences, but existed only as part of a photographer's *oeuvre*. These were mostly photographic essays made to illuminate a particular theme. Often, these photo cycles were

commissioned with the purpose of documenting a vanishing group or phenomenon. For instance, Roman Vishniac took pictures of Jews living in ghettos during the Nazi occupation. The most important Polish war photographers were J. Rys and H. Smiagacz, who recorded the September 1939 campaign in the capital. Tadeusz Bukowski, Sylwester Braun, and Eugeniusz Lokajski documented the Warsaw Uprising of 1944.

In the Soviet Union during World War II, Dmitri Baltermants (1912–1990) and Yevgeny Khaldey (1917–1997), among others, documented the atrocities of the war, especially the Soviet Union's participation in the fight with Nazi Germany. Khaldey earned his fame as the best war photojournalist in the Soviet Union by documenting such events as the liberation of the Jewish ghetto in Budapest and the fall of Nazi Berlin. His image of the Soviet flag hoisted over the bombed-out German Reichstag was published in numerous newspapers around the world. Khaldey was also sent to the summits of Potsdam and Yalta and to Nuremberg to record the trials of the Nazi supporters. In the 1950s, Khaldey fell victim to Stalin's persecution of Jews; he could not work for larger newspapers, and he had to earn his living by developing other people's images and by taking group portraits.

Baltermants is known for recording such important events as the defeat of the Germans in the Battle of Moscow, the Battle of Leningrad, and the battle of Kerch in the Crimea where over 176,000 soldiers were killed. After the war, he became the official photographer of Soviet leaders such as Nikita Khrushchev and Leonid Brezhnev. He also worked as photographer and later editor of *Ogonyok* [Light], a popular Soviet weekly magazine. American social photojournalist Arthur Rothstein's description of Baltermants' work effectively summarizes the work of the best photojournalists under the conditions of post-war censorship: "He managed to produce news photos with aesthetic appeal." (Mulligan and Wooters 1999).

During the decades between the two world wars, Czech photographer Josef Sudek (1896–1976) created individualistic compositions that both continued the tradition of pictorialism and employed elements from the German-based movement *Neue Sachlichkeit* (New Objectivity) and Surrealism. Trained as a bookbinder, he lost one of his arms while fighting in World War I, which caused him to turn to photography. Sudek's primary concern was the expression of his state of mind through light and shadow. He worked on many series for years, allowing him to capture precisely the desired level of light as well as to photograph his subjects from

unusual perspectives. What made Sudek's photography distinctive from other photography of the time was his preoccupation with subjective themes. Even when the occupation of the Nazis brought Czech cultural life to a halt, he continued to work in his studio, using its window as either background or foreground for his works.

In Poland after World War II, as the Soviet Union extended its influence over that country, it was the hope in artistic circles that artists would be able to practice and develop without the constraints of authoritarian rule. In 1946, the National Museum in Warsaw held an exhibition of Bulhak's photographs titled *Ruiny Warszawy* (The Ruins of Warsaw). In 1947, Bulhak and Leonard Sempolinski founded the Polish Union of Art Photographers (Polski Związek Artystów Fotografów). At first, the union continued the experimentations with techniques and subject matter in the tradition of the Polish photo clubs, but soon it was forced to adopt the political directives of Communist Poland.

Within Socialist Realism, there were three main trends—classical, pictorial, and documentary photography. In Poland, some of the most interesting documentary images, based on the experiences of the Magnum Photos group and influenced by French photography of the period, were created for an illustrated weekly *Swiat* (World), published from 1951 to 1969, which focused on humanistic photo reporting. Another important publication was the monthly *Polska* (Poland), the first to publish color photographs. The photographers associated with these publications, and also with *Razem* (Together) and *Perspektywy* (Perspectives), were critical of “propaganda of success.” Polish documentary photography was comprehensively showcased in 1980, in Bielsko-Biala at an event consisting of eight separate exhibitions under one heading: *Polish Sociological Photography Review*.

Experimental photography continued throughout the decades that Poland was under Communist rule. For example, in the late 1950s, Zdzislaw Bek-sinski (who was also an abstract painter), Jerzy Lewczynski, and Bronislaw Schlabs (also a fabric painter) worked in a style that alluded to the work of the interwar avant-garde. The most important show featuring works by those in this informal group was an underground exhibition titled *Anty-fotografia* (Anti-Photography). In the late 1950s and 1960s, Edward Hartwig (1909–2003) developed a graphics-like style that blended pictorial and modernist traditions. His work influenced many other Polish photographers, particularly in the field of landscape photography. In the 1960s, photographic Modernism was less popular as pho-

tojournalism developed. This trend was influenced by the success of Edward Steichen's exhibition organized in New York for the Museum of Modern Art, *The Family of Man*, which appeared in Warsaw in 1959.

The thaw that took place in the Soviet Union during the Khrushchev years (1958–1964) meant more freedom for the arts, especially for photographers. Fairly widely available by that time, mechanical cameras were used by both amateurs and professionals to explore the once-forbidden subjects of nudes, landscapes, and character studies. Most art photography was created by amateurs, who often met in clubs that allowed for the exchange of ideas and for the trading of costly, hard-to-obtain equipment.

The 1960s brought dramatic change of political climate to Czechoslovakia as well. Josef Koudelka (1938–) was working as a theatre photographer and was documenting the life of gypsies in Slovakia in the mid-1960s when in 1968 Russian tanks invaded Prague. His images of the first days of the occupation, photographs that he managed to smuggle from the country, became well known internationally. In the 1970s, Koudelka was awarded asylum in England. Since then, he has worked as a photographer in numerous countries. Koudelka could renew his work in his homeland only after the change of political climate in the late 1980s.

The two collective exhibitions *Fotografia Subiektywna* (Subjective Photography) in 1968 and *Photographers Exploring* in 1971 signified a breakthrough in Polish photography when many artists moved to experimental film, installations, photo sequences, and video art. The photomedia group *Permafo* (1970–1980) included Zbigniew Dłubak, Natalia LL (Lachowicz), and Andrzej Lachowicz and explored the role and significance through the medium of photography. Natalia LL also created feminist art in the 1970s. In the 1980s, her work became influenced by Existentialism and included religious subtexts. This highly experimental, multimedia work was encouraged by the important Polish critic, curator, and theorist Jerzy Olek.

The martial law declared on December 13, 1981 brought about the closing of many galleries and exhibition venues, and many photographers and other artists who used photographic techniques in their work emigrated at this time. The imposition of this law brought an end to Polish photomedia-ism, whose last significant show titled, *Construction in Process*, took place in Łódź in 1981.

After the initial shock, Polish culture went underground. From 1984 on, however, cultural life gradually revived. The first art group to take up the

struggle against martial law was *przy Kosciiele* (at the Church's side), ironically called "art in the vestibule." It organized exhibitions in the churches of major cities throughout Poland. Photographers including Mariusz (Andrzej) Wiczorkowski (one of Poland's most intriguing photographers still little known to Western audiences), Pawel Kwiek, Zofia Rydet, Erazm Ciolek, and Anna B. Bohdziewicz played an important role in these exhibitions. To commemorate these events of the 1980s, Bohdziewicz kept a *Fotodziennik* (Photojournal)—a record of events private and public that has been shown at many exhibitions both in Poland and abroad. Photo documentary series by Zofia Rydet (1911–1997) that she began in the 1960s after viewing *The Family of Man* exhibition introduced the concept of "sociological photography." By the time of her death, Rydet had collected thousands images of Polish citizens taken mostly against of the background of their homes.

Conceptual photography became an important practice in the Soviet Union during the 1970s and 1980s. F. Infantov attempted to document human actions, and by doing so "constructed" the images. Igor Makarevich created images that recall close-ups from a movie, using his self-portrait as a central motif. Finally, S. Borisov exercised full control of the images by acting as a film director of his theatrically inspired subject matter.

After Gorbachev's opening of the Iron Curtain, Olga Sviblova curated a number of exhibitions in Russia and abroad. Her goal was to acquaint Russian audiences with avant-garde photography and to show new trends. Outside Russia, she exhibited those artists who continued to experiment even during Communism. She became a founding director of the *Moskovskii Dom Fotografii* (Moscow House of Photography) in 1996, one of the most active cultural institutions in Russia. Being both a collecting and exhibiting institution, MDF has a collection of about 70,000 original prints from 1850 until the present day, including those of both Russian and international photographers. In recent years, Russian photographers have turned to such topics as the mythologizing of the artists' personality, questioning and reinterpreting previously established themes, and blending photography with theatre and video installations. For instance, A. Schul'gin challenged the notion of documentary photography by creating artistic depictions of heavy industrial machinery. From the 1960s to the present, Boris Mikhailov (1938–) has blended documentary and staged elements in the same image, creating mocking political commentary on life in his native Soviet Ukraine. In the 1997–1998 ser-

ies, *Case History*, for instance, he showcased the dreary, unhappy life of homeless people in his native city of Kharkov. His recent and best known series, *If I were a German*, deals with the themes of Eros, victory, power, and domination, and it references what arguably remains the most important event in twentieth century Ukrainian history: World War II. Photo and media artist Victoria Begalskaya criticizes the gloomy reality of post-Soviet Ukraine. In one of her recent projects, she uses the metaphor of garbage to suggest the quality of life of those living in poverty. Moscow artist Tatiana Liberman employs staged and straight photography to create avant-garde-inspired compositions that emphasize the metaphysical characteristics of objects.

In 1989, the Polish government lifted censorship of the arts. Drastic economic changes initially decreased artistic activity, however. In 1990, *Fotografia and Foto* (Photography and Photo), the only magazine in Poland dedicated to photography, ceased publication. By the end of the 1990s, as Poland's economic situation improved, two institutions still continue to be influential: *Związek Polskich Artystów Fotografików* (ZPAF) (Association of Polish Photographic Artists) founded in 1947 to unite those photographers who practiced professionally; and *Fotoklub Rzeczypospolitej Polskiej* (Photoclub of the Polish Republic), the central club for amateur organizations throughout the country. The practices of the 1990s and 2000s vary from photo and light installations, performance, and video art to the "elementary photography" movement, which uses early twentieth-century photographic techniques to challenge dependence on digital media. Thanks to Stefan Wojnecki (1929–), who promoted photography by teaching at the Academy of Fine Arts at Poznan, the city has recently emerged as an important photographic center. Two photo biennials were organized in Poznan, in 1998 and 2000.

Some of the young nations of Eastern Europe are now attempting to create formal programs for teaching photography and cultivating young talent. For instance, in 1991, in the Slovak Republic, which recently emerged from its union with the Czech Republic, the Department of Visual Media at the Academy of Fine Arts and Design (VŠVU) was initiated. Slovak photographic style has been characterized as "commenting and adapting" by art critic Lucia Lendelova (Lendelova, 2003). As of 2003, most Slovak photographers were educated outside of the Slovak Republic. Among the best images of the recent two decades are Robo Kočan's series of human faces portrayed as a set of inter-

Es [Sophie Küppers] and El Lissitzky, "Soviet Constitution. Article 1: The Union of Soviet Socialist Republics Is a Socialist State of Workers and Peasants," *USSR im Bau*, nos. 9–12 (September–December, 1937).

[*Research Library, Getty Research Institute, Los Angeles*]

changeable elements. Such conceptualist influences can also be seen in the works of Lucia Nimcová, who creates diaries of unfocused color images with playful adjustments. Other Slovak artists have turned to the political commentary; for example, Tibor Takáts takes photographs of the voters of Slovak political movement, HZDS, and enlarges them. These enlarged images disclose features turning the faces of specific individuals into highly aestheticized art objects.

S

SAFELIGHT

Safelights allow darkroom workers to handle photosensitive materials under limited illumination. A safelight consists of a light source, such as combusting gas or other fuel, incandescent light-bulbs, fluorescent light tubes or sodium vapor discharge lamps, and a filter to limit the range of wavelengths that are used for illumination. Various manufacturers have their own designations for spectral transmission characteristics of safelight filters. A Kodak Wratten filter number is often used to indicate the type of the safelight filter. In order to use maximum illumination while securing safe handling, the safelight should be suitably chosen for the type of photosensitive material.

Photographic materials such as plates, films, and papers are sensitive to light of certain wavelength ranges but insensitive to other wavelengths. Darkroom operations may be safely performed under illumination of some visible wavelengths to which particular photographic material is relatively insensitive. For example, conventional black-and-white enlarging papers are sensitive to ultraviolet and blue light, and they are far less sensitive to yellow and red light. Therefore, we customarily handle these materials under red or orange safelights in the darkroom. On the other hand, panchromatic plates and films are sensitized to all visible colors,

and therefore cannot be safely illuminated by visible light. When necessary, dim green safelight may be used, but only briefly. Thus there are considerable differences between materials and suitable safelights depending on the factors such as spectral sensitivity and photographic speed of the material.

Some silver chloride contact printing papers are only sensitive to the ultraviolet and deep blue region, and the sensitivity is also very low. These papers were sometimes called "gaslight papers" since the materials could be handled in a room lit by gaslight. Many classical processes predating silver gelatin process were also slow and insensitive to most, if not all, visible light, and they could be handled under dim room light without special filtration. Graded enlarging papers are also sensitive to ultraviolet and blue light only, so greenish-yellow safelight filters such as a Wratten OA filter can be used. Some fast enlarging papers and variable contrast papers are sensitive to blue and green, so amber safelight is used, with a Wratten OC or similar filter. Sodium vapor discharge lamps with amber filters are used for products of these categories in large darkrooms.

Orthochromatic materials are made sensitive to blue and green colors. Depending on the wavelength of sensitivity limit and the speed of the

SAFELIGHT

material, red safelights are used. Wratten No. 1, 1A, or 2 may be suitable. Some old photographic plates were used without spectral sensitization, called “color blind” plates. These materials are sensitive to the blue and blue-green region; therefore, amber and red safelights can be used.

Most modern black-and-white pictorial films are panchromatic, sensitive to all colors. Color materials, whether negative or positive, film or paper, are necessarily sensitive to all visible wavelengths to render natural colors. There is also a class of panchromatic black-and-white enlarging papers (e.g., Kodak Panalure) used to produce black-and-white prints from color negative films with natural tonal rendition across colors. All of these materials cannot be safely illuminated by visible light for the duration of darkroom handling, and they are often handled under complete darkness; slow materials may be briefly visualized under very dim green safelight (Wratten No. 3 filter). Some fast materials may be deliberately impaired of their light sensitivity by treating in desensitizing dye solution before brief visual inspection. The peak wavelength of 510 nm (dark green color) is chosen for the safelight because human eyes are most sensitive to this region, and panchromatic materials are often least sensitive in this region. To avoid the risk of fogging, dim green safelight can be used for only a brief moment with such materials. An alternative is to use infrared illumination and a vision scope.

Some infrared films, particularly those for graphic arts applications, are not very sensitive to green light, and may be used with dim green safelight. However, the safelight filter must eliminate infrared radiation from the light source. The Wratten No. 7 filter is made for this purpose. (The dark green Wratten No. 3 filter passes some red radiation and this is unsuitable for infrared material.)

Development of films and plates under safelight is called “development by inspection” and this was customarily performed before panchromatic materials became widely used. Orthochromatic plates were insensitive to red light, making it possible to develop them by visual inspection under red safelight. Panchromatic plates and films must be handled in total darkness, with brief use of dim green safelight at most. Despite this limitation, panchromatic materi-

als became widely used when darkroom workers started to precisely control negative contrasts by development time and temperature. Introduction of daylight processing tanks, accurate exposure meters, and improved quality control in film production also contributed to popularize panchromatic materials.

When selecting a suitable safelight, consult the film or paper manufacturer’s recommendation for the particular product, and choose type and number of safelights based on the darkroom size and configuration. Multiple products can be usually handled in one safelight as long as the light is safe to the most sensitive material in terms of spectrum and photographic speed. For typical black-and-white printing with graded or variable contrast enlarging papers, safelights with a Wratten OC (dark amber) filter are safe up to a few minutes at the recommended distance. With safelight exposure longer than the safe limit, the image contrast may become lower, or fog may develop in the area where imagewise exposure was not given. When working in a darkroom, it should be noted that eyes require a long time to adapt to large differences in the illumination level. One often perceives the first several minutes in darkroom safelight as too dim and finds difficulty in working. It is necessary to wait for up to 20 minutes before the eyes become fully adapted for the safelight illumination. Safelights based on discharge lamps may also require several minutes of operation before the luminance and spectrum are stabilized to avoid adverse effects.

SEBASTIÃO SALGADO

Brazilian

Sebastião Salgado is noted as the photographer of modern human labor. Thus, he focuses on muddied laborers dredging from the depths of the earth iron ore that is shipped halfway around the world where foundry men transform it into steel that then moves on to another point of the globe where it is molded into bicycles. His vision is macroeconomic; his photographs, microeconomic. He embodies the modern maxim, “Think globally, act locally,” which for the modern photographer might be better expressed as “Focus wide, shoot close.”

His native background, professional education, and artistic insight have combined to provide him with this unique and encompassing perspective. He grew up on a farm where his father raised cattle, in the municipality of Aimorés in the state of Minas Gerais, a landlocked state in central Brazil with great historical and cultural significance. In the eighteenth century, Minas Gerais was the economic center of the Portuguese empire. It provided the major part of the world’s gold along with vast quantities of diamonds and other precious and semi-precious stones. The colony’s extraordinary wealth made it a center of exceptional cultural activity. It developed as a major yet remote center of Baroque architecture, painting, sculpture, and music in the New World. After the colonial period, however, the state declined, left with haunting remnants of its Baroque past and imbued with a tenacious sense of pride in its past glory.

Salgado grew up during a period of great modernist cultural ferment in Brazil. Significant developments in photography occurred with the appearance of the first leading photo magazines, *Cruzeiro* and *Manchete*, modeled on *Life*, *Look*, and *Paris-Match*. They were the primary vehicles for the emergence of photojournalism in Brazil. Photography as an art form also emerged, producing the first generations of its most noted practitioners in Brazil, José Oiticica Filho (1906–1964) and Mario Cravo Neto (1947–).

Completing his secondary education locally, in the early 1960s he became a university student in Vitória, the capital of Espírito Santo, during one of the most politically charged periods in modern

Brazilian history. A military coup occurred in 1964, establishing a regime that became progressively more repressive, especially of university leftists and dissidents. Many of these were imprisoned and tortured; others went into exile, as did Salgado, especially to Paris, where they often studied the social sciences. After doing graduate work in economics at the University of São Paulo and Vanderbilt University, Salgado began his professional career as an economist with the Brazilian finance ministry in 1968. At the same time, the reactionary fury of the military regime was reaching its height.

Leaving Brazil again in 1969, Salgado studied economics in Paris at the Sorbonne. It was at this time that he became interested in photography. His wife’s study of architecture required her to photograph residences and interiors. This art so fascinated him that he began to pursue it intensely as a hobby, taking numerous portraits of his wife and later of his children.

In 1973, he joined an agency of key importance to the Brazilian economy, the International Coffee Organization, in London. On assignment in Africa, he began photographing scenes of the devastation of drought in Ethiopia. He increasingly perceived that as a photographer he could much more effectively express his concern about the economic conditions and role of people in the underdeveloped world. More importantly, he felt he could convey not only a sense of these people’s distress but of their dignity and resilience and of their vital engagement with life.

His aesthetic development as a photographer was strongly influenced by Henri Cartier-Bresson, who maintained that a photographic image must catch the balance of elements of a scene. The photographer must know the “decisive moment” to capture this balance. The substance, however, of Salgado’s photography was based on commitment to humanist engagement as reflected in the work of W. Eugene Smith and Walker Evans. The form of this engagement was narrative photojournalism. In the mid-1970s, he was associated with the Sygma agency; he went on to Gamma and Magnum Photos, and in 1994 he founded his own Paris-based agency, Amazonas Images.

From 1977 to 1984, he photographed in Mexico, Peru, Ecuador, and Brazil. From 1984–1985, he

witnessed the drought in the Sahel, in Western Africa. In 1986, he began a monumental project to photograph the activities of manual labor in places as varied around the globe as Brazil, Cuba, France, India, Bangladesh, the Soviet Union, and the United States. The fruit of this work came forth from the mid-1980s to the early 1990s in a series of major exhibits and publications.

His key series include: *Sahel: L'Homme en Détresse* (1986), *Other Americas* (1986), *An Uncertain Grace* (1990), *Workers: An Archaeology of the Industrial Age* (1993), and *The Children: Refugees and Migrants* and its companion volume, *Migrations* (2000). *An Uncertain Grace* is a powerful anthology of the force of Salgado's images. Here there are the mesmerizing photographs of laborers in the mammoth gold mines of Serra Pelada, Brazil, wending their muddied way up and down this vast cavity in the earth like legions of humanoid ants. There are the wrenching scenes of skeletal poverty in the Sahel. There is the resolute trekking of bowler-hatted Indian women and their children across mountain-bordered meadows.

The Children chronicles the plight of refugee children from across the world, in portraits that show the ravages inflicted by ethnic cleansing, political instability, war, and extreme poverty. An exhibition sponsored by the United Nations traveled around the United States.

Salgado has been the recipient of numerous awards from around the world. Nonetheless, critics have maintained that he overdramatizes the lives of the unfortunate. He has responded thus to this criticism:

Sometimes we from the South hemisphere wonder why you in the North think you have the monopoly of beauty, of dignity, of riches. Ethiopia is a country in crisis, where the people are suffering so acutely, yet Ethiopians are probably among the most beautiful, most noble people in the world. There is really no point in going there to deny this reality.... I believe this: that the people of the world are not those who lack basic material good. At any given moment in their history, the presently rich nations have been poor and vice versa.... There is no monopoly either of wealth or beauty in the world. I believe we must not destroy recognition of human dignity and beauty.... After all we [of the South] see ourselves as the agents of our own lives, not simply at the "victims" of external agencies.

In terms of equipment, Salgado works with relatively sparse resources. He photographs mostly outdoors and only in black and white. He does not use flash or tripods. He carries three cameras with 28-, 35-, and 60-millimeter lenses, occasionally using a zoom lens. He takes much time to get to know his subjects and will not photograph them in

any way that is demeaning, having a highly developed sense for respecting and conveying the dignity of his subjects.

In 1992 in Mexico City, Salgado's work was exhibited with that of the Peruvian master, Martín Chambi; and Salgado was presented as one of the two greatest Latin American photographers. For someone who had only begun photographing less than two decades before and who promises to offer so much more, Sebastião Salgado has achieved an exceptional position in modern international photography.

Biography

Sebastião Ribeiro Salgado, Jr, born in Aimorés, Minas Gerais, Brazil, 8 February 1944. Received undergraduate degree in economics, Federal University of Espírito Santo, Vitória; married Léia Denuz Wanick, Vitória, 1967. Received masters in economics from University of São Paulo, with additional study at Vanderbilt University, 1968. Worked for Brazilian Ministry of Finance, 1968–1969. Studied economics in Paris, doing course work for doctorate at University of Paris, 1969–1971. Worked for International Coffee Organization, London, 1971–1973. Photoreporter for drought in Sahel, 1973. Photographer for Sygma, Paris; first son born, 1974; with Gamma agency, 1975–1979; joined Magnum Photos, second son born, 1979. Received grant from French Ministry of Culture to support his photographic work, 1982, and worked with Doctors without Borders in Sahel, 1984–1985. Received Kodak/City of Paris award for first photographic book (*Autres Amériques*), 1984; Oskar Barnack Prize, 1985; New York International Center of Photography Photojournalist of the Year Award, 1986, 1988; Photographer of the Year, American Society of Magazine Photographers, Olivier Rebbot Award of New York Overseas Press Club, 1987; King of Spain Award, 1988; Hasselblad Award, 1989; Grande Prix de la Ville de Paris, 1991; Honorary Member of American Academy of Arts and Sciences, 1992; Publication Award (for *Workers*) of International Center of Photography, 1994. Founded own agency, Amazonas Images, in Paris, for distribution of his work, managed by wife, 1994.

Selected Individual Exhibitions

1986 *Sahel, Man in Distress*; Palais de Tokyo, Paris, Arles and Lausanne, France; São Paulo, and Beijing
 1986 *Other Americas*; Museo de Arte Contemporáneo; Madrid, and traveling to Paris, Lausanne, Oulou, Finland, Rotterdam, Rio de Janeiro, and Shanghai

1989 *Retrospective*; Hasselblad Center; Göteborg, Sweden and traveling
 1990 *An Uncertain Grace*; San Francisco Museum of Modern Art; San Francisco, and traveled to Los Angeles, New York, Washington DC, and Cambridge, Massachusetts
 1993 *Workers*; Philadelphia Museum of Art; and traveled to Paris, Lisbon, Madrid, and Bratislava, Slovakia
 2000 *The Children: Refugees and Migrants*; United Nations; New York and traveled

ERICH SALOMON

German

Erich Salomon is among a handful of German photographers and editors credited with establishing modern photojournalism. Perhaps the greatest mark of Salomon's achievement is the number of monikers his contemporaries attached to him: "Houdini of Photography," "Diogenes with a Camera," or as one French diplomat chided, "the king of the indiscreet." For a decade after 1928, Salomon excited German and foreign periodical readers with unposed portraits of politicians and celebrities captured by his inconspicuous lens. An editor at *The Graphic* in London coined the phrase "candid camera" to describe Salomon's innovative style.

Like most of his colleagues in the new German photojournalism of the 1920s, Salomon came to photography by chance and financial necessity. Born in 1886 into a well-established Berlin banking family, Salomon pursued a professional course of studies in zoology, civil engineering, and finally, with the urging of parents, a doctorate in law. While a conscript in World War I, he was captured at the battle of the Marne and spent the next three and a half years in French POW camps. In Germany's postwar depression economy, Salomon

earned a living with brief stints in banking and the stock exchange, work at a piano factory, and by running his own taxi service. By the mid-1920s he found promotions work at the country's largest periodical publisher, *Ullstein Verlag*. It was there that his interest in photography was sparked, and in 1927 Salomon first used a camera. His break came in 1928 when he snuck his small glass plate Ermanox camera into several high-profile criminal trials, and the pictures were published internationally.

Salomon completely transformed the character of interior photographic reporting by shooting in natural light, a development made possible by new hand-held cameras with fast shutter speeds. His unobtrusive cameras—the Ermanox until 1932, and 35-mm Leicas thereafter—enabled Salomon to catch people in "unguarded moments." Much of his work was quietly collected in the conference rooms of dignitaries, in closed sessions of Parliament, or at the dinner tables of celebrities. Such spontaneous photography became his hallmark, giving rise not only to Salomon's reputation as a charming spy, but also to a "snapshot" style that became internationally acclaimed. While based in Germany, he traveled throughout Europe and the United States, securing jobs from the world's best

illustrated magazines. In his first four years as a professional, he counted several dozen features to his credit, most of them published in the *Berliner Illustrierte Zeitung*, *Münchener Illustrierte Presse*, *The Graphic*, *L'Illustration*, and *Vu* in Paris, and *Fortune* magazine in New York. In all, the German press gave Salomon about 250 features and the foreign press another 80.

Salomon's most famous images were those of politicians and diplomats at work during crucial meetings of the League of Nations, and later reparations and disarmament conferences in The Hague, as well as social gatherings and official banquets for heads of state. He typically waited for a gesture, like a yawn or the lighting of a cigarette, before using a cable release to trigger his camera's shutter. The method enabled him to capture something wholly human in Europe's elite. In the absence of the old imperial spectacles typical of pre-war periodicals, the middle classes found Salomon's candid camera a comforting substitute. His were the images of a liberal Europe struggling and ultimately failing to emerge after years of devastating war. At times, the images seemed to present an old regime fatigued and ineffectual, but Salomon's ability to capture those moments in between the formal proceedings of the historical record, like a preoccupied British Foreign Minister Chamberlain balancing a long ash atop his cigar or the Reichstag Deputy Eisenberg exhausted and asleep in a lobby chair, were also testimonials to the sincere effort being made by flawed people. Several diplomats recognized the service Salomon provided with his sometime embarrassing photographs. No summit could be organized without Dr. Salomon, they quipped, for "people may then believe that this is a conference of no importance."

Salomon specialized in hard-to-get photographs. He was expert at evading security, and he snuck his camera into numerous social and political functions using hats, diplomatic pouches, even an arm sling to disguise his gear. He photographed Britain's High Court illegally and triggered his Ermanox within an attaché case to take potentially the only photograph of the U. S. Supreme Court in session. Salomon's rare photographs also included many European artists and intellectuals. His technical inventiveness helped him secure unique images of Pablo Casals, Igor Stravinsky, and Arturo Toscanini during performances by sitting in the orchestra with noiseless cameras rigged on a modified tripod. Despite the fast shutter speeds, Salomon's images inevitably carry streaks of motion that make them dynamic and tangibly immediate.

In 1933, Salomon fled Germany and eventually settled with his family in an apartment in The Hague. He continued to work from there, mainly

for Dutch publications and London's *Daily Telegraph*, though his pictures continued to be published worldwide. In 1940, he was trapped by the Nazi occupation and three years later was forced to go underground, his apartment sealed by the Nazis. When he returned in 1944, he was betrayed and ultimately he, his wife, and younger son Dirk, were sent to Auschwitz, where they were killed months before the camp's liberation. His elder son, Peter, who had been sent to England before the war, later managed to reassemble his father's disparate archive. Salomon had been wise enough to hide plates and negatives in various locations, including under a friend's chicken coop and in the archives of the Dutch Parliament. Several shows in the 1950s rekindled interest in Salomon's work and revealed lost material. The effort culminated in the publication of Salomon's best work in *Portrait of an Age*.

Biography

Born in Berlin, 28 April 1886. University of Munich, Doctorate of Law, 1913. Drafted into German Army; in French POW camps, 1914 to 1918. Various jobs before c. 1925 when hired at Ullstein Verlag, Berlin in sales. Sold first "candid" Ermanox pictures to *Berliner Illustrierte Zeitung*, 1928. International travel (England, France, United States, Netherlands) and publication in various illustrated magazines while based in Berlin, 1928–1932. Escaped Nazi Germany, 1933; established family and photography lab in his apartment in The Hague, 1935; Nuremberg Laws forced Salomon underground in Netherlands, 1943; captured by Nazis, 1944. Died in Auschwitz, Poland, 7 July 1944.

AUGUST SANDER

German

August Sander is best known for his straightforward portraits, specifically of Germans from a wide variety of social and economic backgrounds. He was part of a coterie of photographers who established the photographic book as an aesthetically and commercially viable art form in the 1920s. Though Sander had published one such book in 1924, *Unsere Heimat, Hannover*, it was the 1929 publication of *Antlitz der Zeit* (The Face of Our Time) that propelled him into enduring fame. This latter book incorporated portraits that Sander had created over the previous decades and that he organized to reflect sociological beliefs that, though loosely conceived, resonated strongly with his contemporaries. He also became an outspoken advocate for straight photography in the late 1920s, a time when the manipulated images characteristic of *Neues Sehen* (New Vision) or *Neue Fotografie* dominated most exhibi-

tions of creative photography. Though he had long enjoyed success in his portrait business, he also worked as a landscape and architectural photographer—work that would dominate his published output during the period of Nazi-controlled Germany. His landscape architectural photographs have received less attention over the years, and his reputation continues to rest primarily on his portraits.

Sander began his photographic career in 1892 while he was still in his teens. While working at a local mine, he was assigned to assist a visiting photographer. Sander made friends with this visitor, who in turn sent his young assistant a guide to making photographs. With the aid of a local physician who understood the chemistry involved, Sander learned most of photography's technical rudiments from that book. When, at age 20, he was called up to perform his compulsory military service in the garrison town of Trier, he managed to find time for an apprenticeship with a local photographer. He later

sought further apprenticeships and studied painting at the Academy of Art in Dresden, both considered prerequisites for a successful portrait photographer at the time. In 1901, he found a position as the director of a portrait studio in Linz, Austria. A year later, he married Anna Seitenmacher.

In Linz Sander had a traditional portrait practice. He employed all the popular trappings of the pictorialist studio. His early approach to portraiture involved trying to make photographs appear as salon-style paintings, replete with architectural props, painted backdrops, special lighting, and ample retouching. It was a successful combination in the first decade of the twentieth century, and the Sanders lived well in Linz for many years. In 1909, the family decided to abandon the city to avoid further exposure to the polio epidemic then ravaging the city—his eldest son, Erich, had already been stricken. They moved to Cologne, where Sander had an offer to join a large portrait business. Within a year, though, he had gone out on his own, establishing a new studio in nearby Lindenthal.

At his new studio, he attempted to try a complete change in style for his portraits. He was no longer satisfied with the artificiality of his earlier work. In a 1910 advertising brochure, he described his new style as “simple, natural portraits that show the subjects in an environment corresponding to their own individuality.” He intended to create a new business by procuring the equipment necessary to create studio-quality portraits in the sitter’s home. In an attempt to bolster this business, in 1910 he began riding through the towns surrounding Cologne seeking out potential clients. He would often make trips on Sundays in the hope of catching people on their way to or from church and hence already dressed nicely enough for a portrait.

By World War I, Sander had built a solid portrait business, including once again a lively trade in urban studio portraits. Before the war, he tended to use the “artistic” style for urban portraits and the more “natural” approach for his rural clients. During his service in the war—Sander was still in the reserves—he decided that he was unsatisfied with this split approach. Afterwards, sometime in 1920, he began experimenting with the use of glossy paper for all of his prints. He normally used the labor-intensive gum printing technique for his portraits, regardless of sitter or pose. The glossy paper was typically saved for architectural and industrial work. With his new technique, his portraits became documents, and the subjects lost their individuality as well as their names to become types. Though he continued his portrait business, his sitters’ images often ended up as part of Sander’s epic new project.

Sander had long been interested in ideas with considerable currency in the late nineteenth century and early years of the twentieth century that claimed moral character was evident in facial structure and habitual expressions. He also brought to his photographic practice the notion that through straightforward, thus “truthful” representation of nature, universal knowledge could be accessed. Thus, Sander began reorganizing his portrait archive. The photographs were no longer filed according to the names of the individuals, but rather by the type they would come to represent in a book he was planning. He imagined a large-scale, encyclopedic publication of his portraits titled *Menschen des 20. Jahrhunderts* (People of the Twentieth Century). Though the completed work was never published, the portion of it that was released as *Antlitz der Zeit* proved an ample demonstration of his ideas. He said he divided the work into “seven groups corresponding to the existing social order.” These groups reflected a social bell curve of Sander’s own perception. It began on one side with farmers and, as he put it, “proceed[ed] from the earthbound man to the highest peak of civilization, and downward according to the most subtle classification to the idiot.” The Farmer, The Skilled Tradesman, The Woman, Classes and Professions, The Artists, The City, and The Last People were his seven groupings. Consisting of 45 portfolios, each with 12 photographs, the finished project would have been immense.

The use of the book as an organizing principle was extremely important for Sander, and its use remains one of his enduring contributions to the period. He noted that “a successful photo is only a preliminary step toward the intelligent use of photography... Photography is like a mosaic that becomes a synthesis only when it is presented en masse.” Sander subjugated the individual image’s significance under that of its role in his grander scheme. Sander was always eager to control the context in which his photographs were viewed in order to more clearly articulate a point of view, but he despised the idea of manipulating the images themselves.

By the late 1920s, Sander advocated for a strictly straight approach to photography. In a 1931 radio broadcast, he announced:

The essence of all photography is of a documentary nature...in documentary photography, the meaning of what is being represented is more important than the fulfilling of aesthetic rules of external form and composition.

In this statement, Sander knowingly set his enterprise apart from the expressionist tradition in German art and associated himself with the growing number of adherents, such as Albert Renger-

Patzsch, to *Neue Sachlichkeit* (New Objectivity). Sander was opposed to the use of darkroom techniques to alter photographic images; he believed instead in dealing with the visible world in a direct and forthright manner.

When the Nazi party came into control of Germany in 1933, the printing plates for *Antlitz der Zeit* were confiscated, and he was forbidden to publish—all without explanation. Most likely, Sander's view of German society as widely variegated, exemplified by the many different types of people he presented in his range of typical Germans, contrasted too dramatically with the image of a pure race that the Party was trying to promulgate. Through the 1930s, Sander's work focused on new themes that proved less provocative. He published a series of five books called *Deutsche Lande, Deutsche Menschen* (German Lands, German People), that each focused on a different part of the country and its local inhabitants. (The word *Volk* was used instead of *Menschen* for the last three books in the series—a possible concession to Nazi taste.) Sander tried to live a low-profile life under the Nazis, but the arrest of his son (who would die in prison) as a communist activist combined with his own refusal to ostracize local Jews kept Sander in constant trouble with the Party. The harassment continued even when he moved to the small village of Kuchhausen at the beginning of World War II.

Sander and his wife remained in Kuchhausen for the duration of the war. Sadly, their new house was too small to allow him to move many of his negatives from the city. All of the material he had left behind was destroyed—ironically, not by the bombing of the city during the war, but by a fire caused by post-war looters. For this reason, his dream of completing the full version of *Menschen des 20. Jahrhunderts* was never realized. In spite of his age—he was in his late sixties by the end of the war—he continued to work vigorously to meet the new demand for his work for exhibitions during the 1950s and early 1960s. Sander died of a stroke at the age of 88 in Cologne.

Sander's work has influenced generations of photographers, including that of his contemporary, Walker Evans; the Americans Robert Frank and Diane Arbus, who emerged in the 1950s to put their mark on portraiture; the influential German photographers and teachers Hilla and Bernd Becher, who in turn influenced many of the major figures in photography in the last decades of the twentieth century; and many emerging figures of the late twentieth century, including those practicing Conceptual Photography, and portraitists such as the Dutch photographer Rineke Dijkstra and Ameri-

can Catherine Opie. In 1992, Sander's archive was acquired by the SK Cultural Foundation, Cologne, and it forms the core of this foundation's photographic archive. The archive has published facsimile editions of Sander's classic books.

SANDWICHED NEGATIVES

Before manipulative capabilities were transformed by computerization and digitization of the photographic image, artists used manual approaches to expand their images beyond a direct rendering of what lay before the camera. Collage, photomontage, combination printing, and sandwiched negatives were all methods photographers used to transform the image from a direct rendering of reality to something that utilized photographic components to a different end. Sandwiched negatives refers to a darkroom technique in which two separate negatives are placed on top of one another in the enlarger's negative carrier. Light passes through the negatives simultaneously to render a positive that includes the details of both negatives. In particular, the details of one appear through the light areas of the other. This is difficult with particularly dense negatives, and some practitioners underexpose the negatives knowing light will pass through them more easily when they are combined, or "sandwiched." Depending on which way the images relate best, the negatives can either be placed emulsion to emulsion or front to back.

In some instances, rather than placing the negatives in direct contact, they may be stacked with a piece of glass between them in the negative carrier. In this way, the focus may be adjusted so that one image is sharp, while the other image is soft and without detail. This process is not limited to negatives combined within the enlarger and can also be used to make a combination contact print with large format negatives that are 4 × 5, 8 × 10, or

even 11 × 14 inches in size. In this way the negatives are stacked and placed under a piece of glass to flatten them and hold their position on the light-sensitive paper. Practitioners may also use this strategy to combine pairs of color slides for exposure on positive/positive paper.

As photography was struggling to be considered an artistic medium in the late nineteenth century, photographers masterminded ingenious ways to make photographs that either looked like paintings or shared conceptual ideas with painting. British photographers Oscar Gustave Rejlander and Henry Peach Robinson made complicated genre scenes and detailed allegories by using multiple negatives, multiple exposures, and combination printing. In Robinson's 1869 treatise *Pictorial Effect in Photography: Being Hints on Composition and Chiaro-oscuro for Photographers, to which is Added a Chapter on Combination Printing*, he outlined ways in which photographers could manipulate their negatives to gain greater control over the image. By mitigating the mechanical nature of the process, photography was more likely to be accepted as a creative form.

In the early part of the twentieth century, the Berlin Dadaists utilized a variety of methods to combine disparate pieces of found imagery, materials, and text. In the late 1920s, interest in the hand-made quality of collage was supplanted by photomontage's seamless images made in the darkroom on light-sensitive paper. Sandwiching negatives was one of the many complicated darkroom

SANDWICHED NEGATIVES

techniques used by German photographer John Heartfield to create intricate photomontages with a political end. Tiger heads sitting atop political figures and babies gnawing on axes are just some of Heartfield's masterful combinations used to illustrate his anti-fascist message.

Interested in the play on reality offered by photomontage, Russian Constructivist El Lissitzky used the technique to create his well-known self-portrait of 1924 titled *The Constructor*. Together with direct exposure and sandwiched negatives, Lissitzky pictured his eye and hand as one inseparable unit suggesting a mutual reliance between his mind and his creative output. The range of details within this one image illustrates his complex identity. In a similar investigation of individuality, the photograph by German artist Alice Lex Nerlinger titled *Seamstress* (1930), pictures a young woman operating a sewing machine. A closely cropped image of the woman's face, with lips slightly parted in speech, is imposed over the scene. By creating one image from two views, the photograph speaks to the woman's multi-faceted character.

In 1967 Edith Gérin, a French photographer particularly interested in surrealism, created *L'Arbre Fantastique* by sandwiching two negatives of extremely different origins. One pictured a conventional landscape with a majestic tree at the center of the composition. To add texture and intrigue to the landscape, Gérin combined that negative with a negative she made of crystallized liquid on glass. In the photograph, the crystals emerge through the woody image and create a layered and ominous scene.

Beginning in the early 1960s, American photographer Jerry N. Uelsmann began investigating the surreal by combining strange and unusual details to create scenes that are other-worldly.

Through a variety of manual manipulations, including sandwiched negatives, Uelsmann tricks the eye by overlaying objects upon suspended nudes or conflating cloudy skies with hovering cubes. In these images staged environments are created and manipulated to reveal daunting and humorous fictions. In a 1989 photograph that pictures a flaming desk with a breathtaking mountain range in the background, Uelsmann sandwiched one of his in-studio fires with a bulky executive desk. Combined with an image of Yosemite, the photograph is a dazzling narrative of unlikely natural occurrences that yield a psychological tenor.

Uelsmann describes his process as being one of "post-visualization" whereby the darkroom is the setting for the investigation of numerous negative combinations. With multiple enlargers, multiple negatives, and sandwiching of two or even three negatives at a time, Uelsmann's photographs are intricate composites of the human figure, nature, interiors, and exterior environments. His methods bring together images that do not naturally exist in tandem; they exist only in his creative photographs.

SCANNING

When a photograph is viewed with a loupe, the magnified field of vision shows a collection of dots abutting one another, which creates the picture. Put simply, up close a photographic image is a dot matrix and learning how to control the dots is

the issue when printing out the image digitally. Before printing though, a photograph needs to be converted from a hard copy into digital information via a scan. This turns the dots into digital bits of information. Scanned images hold potentiality

for preservation and manipulation that prints and chemicals only could hint at. Yet despite these advantages, each generation of reproduction diminishes the quality of the original photograph.

The contemporary desktop method of a digital workflow includes the computer, scanner, and laser writer. Industry-wide software programs and cross-platform programs like QuarkXPress, Adobe Illustrator, and Adobe Photoshop allow the user to scan, import, manipulate, save, layout, and print images from a single desktop computer. Digitizing and electronically archiving old photographs extends their longevity and freezes them in time, while the original may continue to deteriorate.

The scanner, of which there are several types, merely takes a picture of an image. Flatbed and drum scanners dominate the marketplace. Most consumers use a flatbed scanner, and professionals use a drum scanner. Operating a flatbed scanner is a simple matter: the lid is opened, and the flat photograph is placed face down on the glass platen. The scanner reads and turns the photograph into digital information, thereby sending it through a USB cable from scanner to computer program. The software program used to scan and import the scan is often referred to as TWAIN—the industry standard language that talks between scanner and computer. The drum scanner, more expensive than flatbed scanners, also captures more detail, which is why they are more commonly found in professional applications, such as fine art presses.

Resolution

Resolution is the measurement of an image's output quality quantified by dots, lines per inch, or pixels. Printers measure resolution in dots per inch (DPI); computer monitors measure in pixels per inch (PPI); halftones measure in lines per inch (LPI); and scanners measure in samples per inch (SPI). (In comparison, the normal human eye can read at about 133 LPI.) Yet DPI and PPI are not synonymous because it takes more dots to fill a single pixel. Therefore, the ratio is not 1:1. Printers are only capable of reproducing a small spectrum of colors compared to the millions of colors found in reality. Even given modern equipment's advancements, photographers still cannot capture all the colors of the world. Higher-quality printers, however, offer better color reproduction given the higher resolution of the image.

Images fall into either high resolution (high-res) or low-resolution (low-res). For example, an image with 300 DPI or higher is considered a high-res file type suitable for various printing and publishing

applications. High-res scans are much less likely to produce an image, whether viewed digitally or printed out, that is grainy than a low-res file. Low-res scans are used primarily for convenience in sending files via the Internet or for insuring that the image is not publication quality to discourage unauthorized reproduction.

As discussed above, dots create an image; therefore, the quality of the scanner determines how much information it will pick up. Scanner resolution fits into two categories: optical resolution and interpolated (or digital resolution). Optical resolution measures what is actually evident, and interpolation artificially adds pixels to increase the resolution. Not all scanners have interpolation options. Usually this is an additional feature.

A scanner reads an image in samples per inch or SPI. The more samples, the larger the file size. The larger file size allows the user to make larger reproductions. The general rule for the best resolution when scanning an image is to scan the image at two times the lines per screen than the image's intended printing. Thus generally a photograph should be scanned at 300 dots per inch or DPI. A 300 DPI photograph prints the same as a 600 DPI. This can be applied only for scanning images though, where knowing the substrate determines the lines per inch. Images for posting on the Web, for example, need at maximum a resolution of 72 DPI.

Dot Control

There are three ways to control dots in reproducing a photograph: screen frequency, screen angle, and dot shape. A halftone is only one color (as is often the case with line art), and continuous tone art is a photograph that contains gradations of tone in black, gray, and white. Halftones have no gradient of color. The screen frequency is measured in LPI. The more lines per inch, the less noticeable the white space and the dots become. When discussing screen frequency, there are the general guidelines for a given substrate: 0 to 25 LPI for billboard, 25 to 55 LPI for silkscreen, 75 to 100 LPI for newsprint, 85 to 120 LPI for quick printers, 133 and up LPI for commercial printers, and 150 to 175 LPI for glossy magazines and fine art books.

Dot shapes are often circles, ovals, and squares, particularly in photographs. Changing the shape of the dot to a square, for example, changes and increases the contrast in the image. Photo manipulation software allows the user to change the shape of the dot for desired effect.

The screen angle defines how the dots line up. The angle ranges from 0 to 90°. At 45° the human eye

does not notice the pattern of the screen. A moiré occurs in a print when the screen angles collide. Often times this happens when the designer scans a reproduction rather than an original photograph.

Guidelines for Scanning Halftone and Continuous Tone Art

When scanning halftone and continuous tone art, several things must be kept in mind. Halftone art should be scanned at 800 SPI or higher. When the art appears in the scanning software interface, such as Photoshop, the image should be changed from grayscale to bitmap, which considerably reduces the file size and changes the pixels to black and white. The final step is to save the file as the desired file type, typically a TIFF. Once these steps are complete, the scanned file is ready to be imported into a page layout program.

There is no need to scan a photograph at higher than 300 DPI, unless its intended enlargement is greater than its original size. As a rule, scan the image twice the LPI of its final reproduction. Gen-

erally, the resolution is one-and-a-half times larger than the LPI. Repeat the saving and layout options as outlined in halftone scanning guidelines.

JÜRGEN SCHADEBERG

South African

Jürgen Schadeberg was chief photographer, photo editor, and art director at South Africa's *Drum* magazine during the 1950s, where he also nurtured the careers of the first generation of black photographers. Schadeberg immigrated to South Africa in 1950, at the age of 19, hoping to escape the specters of Nazism and racism in his native Germany. South Africa's Nationalist government, which had come to power in 1948 and many of whose leaders were longtime Nazi supporters, was then establishing the legislative, institutionalized racism of its Apartheid policy, which forcibly segregated the races. The Group Areas Act (1950) forced people to live in racially exclusive areas and was designed to keep South Africa's cities "white." Blacks had to carry IDs, called passes, that proved they had permits to work in a city and live in a black township on the outskirts. To

prevent blacks from migrating to the cities, they were restricted to tribal reserves, called "homelands," and the government emphasized ethnic differences to justify this tribalistic view of the black population, which was implicitly regarded as racially inferior. Failure to carry a pass was punished with jail. Sexual relations across the color bar were also illegal. Ironically for Schadeberg, Apartheid became an international symbol for racism in the second half of the twentieth century in much the same way as Nazi Germany symbolizes racism in the first half.

In 1951, Schadeberg accepted a job at *The African Drum*, a white-owned magazine that was geared toward black readers but focused on African traditionalism rather than urbanity. Within a year, the magazine was taken over, renamed *Drum*, and reoriented toward urban issues and readers. *Drum* first consisted of its owner, Jim Bailey, Schadeberg as photographer, Henry Nxu-

malo as journalist, Anthony Sampson as editor, and a secretary.

Drum exposed exploitative labor conditions, racism, and deteriorating social conditions. It tracked political resistance to Apartheid and the emergence of new leaders, including Nelson Mandela. It lionized black artistic expression, featuring musicians, writers, and actors. It put black beauties on its covers, proclaiming that “black was beautiful” despite the social denigration that blacks suffered under Apartheid. It covered black sport and leisure, including the pulsating nightlife of the dance halls and shebeens—speakeasies in the black townships where liquor was served to multiracial gatherings in contravention of the law. *Drum* pictured and described black urban life in a unique way, both popular and incisive, that turned it into a runaway success.

Schadeberg’s work for *Drum* crosses photographic categories, including social documentary, glamour and fashion, portraiture, and genre images of everyday life that are themselves historic documents. Schadeberg’s training in photography is evident in his technical proficiency and attention to formal issues of composition and lighting, but it is his sensitivity to the expressive power of images—their gestalt impact—that shines through his subject matter. Furthermore, the context of his images testifies to his humanism in a society becoming increasingly dehumanized. Schadeberg was arrested frequently, as were other *Drum* staff members.

By late 1953, *Drum* had spawned spin-offs, editions for Nigeria (1953), Ghana (1954), East Africa (1957), Central Africa (1966), and even for North America and the West Indies, making *Drum* a vital organ for the representation of black life and expression within twentieth-century photography. *Drum* chronicled the era during which most African countries gained their freedom, and Africans and people of African descent demanded their rights and asserted their cultures. Meanwhile, South Africa was moving in the opposite direction, toward ever-greater repression rather than freedom and equality for blacks. Racial conflict in the United States during the 1950s and 1960s invited mutual comparisons with South Africa. African-American experience and culture inspired many black South Africans, not only in resistance but also in culture. American jazz influenced local musicians, and vice versa. Among the new South African stars who established international careers were Miriam Makeba and Hugh Masekela, whom Jürgen Schadeberg photographed as he received a trumpet sent by Louis Armstrong. American fashions and lifestyles were echoed in clothing and big cars. A powerful township gang even called

itself the “Americans,” and gangsters adopted such monikers as “Boston” and “Homicide Hank.”

As *Drum* blossomed, Schadeberg became embroiled in picture editing, teaching photography, and enlarging *Drum*’s photographic department. He trained Nxumalo’s nephew, Bob Gosani, who became an outstanding *Drum* photographer. In 1955, Peter Magubane joined *Drum* as a driver and messenger, but soon became a photographer. Among the other black photographers who worked at *Drum* were Alf Kumalo, Victor Xashimba, Gopal Naranasamy, and Ernest Cole, who was later exiled to the United States and is the subject of a documentary film made by Schadeberg and his wife, Claudia. The British-born photographer Ian Berry, later a member of Magnum Photos, also worked with *Drum*.

Schadeberg left South Africa in 1964, shortly before *Drum* was banned. By this time, Apartheid repression had bitten deep, and Schadeberg had recorded the demolition of the black township of Sophiatown, the funeral for the victims of the Sharpeville Massacre during which police shot dead 67 demonstrators, the treason trial of Nelson Mandela and other leaders, and other harrowing events.

Schadeberg became editor of *Creative Camera* in London and shot assignments for *Time*, *The Sunday Times*, and *Die Zeit* (Hamburg). During the 1970s and 1980s, he taught photography in New York, London, and Hamburg; continued his documentary photography; studied painting; and curated photographic exhibitions, including a project for the opening of the New National Theatre in London, *The Quality of Life*.

Schadeberg returned to live in South Africa in 1985, when Apartheid repression was at a peak. Schadeberg, steeped in the humanist spirit of the 1950s, was disillusioned by the trends in documentary photography toward hard news and graphic violence. Instead, he focused on capturing everyday life and social changes, and produced numerous films with Claudia Schadeberg. In photography, he began to work in color and make digital prints, creating works of rich color and painterly sensibility, and produced a body of portraits.

One of the momentous changes that Schadeberg recorded was the elevation of Nelson Mandela as president of South Africa after 27 years of imprisonment. In 1994, Schadeberg photographed Mandela gazing through the bars of his former prison cell. Forty-two years separated this photograph from a historic image that Schadeberg shot of Mandela as an emerging leader. This gives some measure of Schadeberg’s extraordinary career, spanning more than 50 years.

Biography

Born in Berlin, Germany, March 18, 1931. Attended School for Optic and Phototechnic. Apprentice photographer for the German Press Agency, Hamburg. Immigrated to South Africa in 1950. Employed as sole photographer for *The African Drum* (later renamed *Drum* magazine, based in Johannesburg, South Africa)

in 1951; as *Drum* expanded became chief photographer, picture editor, and headed photographic department; trained several *Drum* photojournalists; freelanced for Black Star agency (New York), *Time Life*, and The German Press Agency. Relocated to London in 1964 as editor of *Creative Camera* magazine; shot on assignment for *The Sunday Times* (U.K.) *The Observer* (U.K.), *Time* (U.S.), *Die Zeit* (Hamburg); taught photography at Central School of Art & Design (London), 1972–1979; The New School (New York), 1979; and Hoch Kunst Schule, Hamburg, 1980–1981. Studied painting in Spain. Returned to South Africa in 1985. Currently lives in Johannesburg.

MICHAEL SCHMIDT

German

Michael Schmidt was born in Berlin in 1945, five months after the German surrender that ended World War II in Europe. His work throughout his career has been concerned with postwar German identity. He lived for a time in East Berlin, but his family crossed into West Berlin before the building of the Berlin Wall, and his formative years were in

the west. After training as a policeman, Schmidt first began making photographs in 1965. Berlin itself, and Schmidt's relationship to its social and physical landscape, has constituted the primary subject of his work ever since. Concerned with questions of photographic objectivity, personal subjectivity, politics, architecture, history, and memory, Schmidt's photographs have evolved over time but always engage the world in complex ways.

Schmidt arrived at a strategy of disseminating his work early on. He photographs large quantities of images without a specific project in mind. These images are then organized into groups with socially evocative titles, such as *Ausländische Mitbürger* (*Foreign Co-citizens*, 1973) or *Berlin, Stadtbilder* (*Berlin, Images of the City*, 1976–80). He exhibits the work in clusters or groupings intended to draw relationships among the images, often in a public context, and then, circumstances permitting, publishes a book of the images. Unlike many artist monographs, Schmidt's books are not intended to catalogue discrete images but rather to interconnect images dependent on those associations, mirroring his process of hanging photographs on the wall. The books tend to be light on text—often having none other than the title—and are truly more artists' books than monograph, despite mass production by major publishers.

The project that garnered Schmidt his first accolades was *Berlin-Krueberg* (1973), funded and published by the Mayor of Krueberg as a variation on the annual report. He photographed this project in his early career signature style, combining documentary instinct, humanitarian impulse, and political critique. In 1976, he co-founded the Werkstatt für Photographie in the Volkshochschule Kreuzberg, overlooking Checkpoint Charlie, a crossing gate in the Berlin Wall. The school greatly influenced photography in Berlin, serving as a primary place of exchange between a generation of Berlin photographers and their European and American contemporaries. Schmidt served as director of the Werkstatt from 1976 to 1978, and he continued to teach and participate in various academic settings. Famous pupils include Andreas Gursky, whom he taught at the Gesamthochschule in Essen. Schmidt was pivotal in bringing many American photographers working in the documentary tradition to Germany, such as Robert Adams, Lewis Baltz, and William Eggleston. His friendship with Baltz remained so strong that Baltz reproduced a letter from Schmidt to him in Baltz's 1990 book *Rule Without Exception*.

Schmidt gained new attention in the international photography community with his project *Waffenruhe* (*Ceasefire*). This project brought Schmidt his first exhibition at the Museum of Modern Art (MoMA), New York, in 1988, and it continued to be shown internationally through the late 1980s and early 1990s. *Waffenruhe* marked a new style for Schmidt, with closer cropping and other more evidently subjective aesthetic decisions. For the first time, he included photographs of the actual Berlin Wall, a metaphorical subject alluded to in many of

his earlier photographs of the city's neighborhoods. After *Waffenruhe*, Schmidt began to experiment more freely with different styles of photographing. Subsequent projects include *Selbst* (*Self*, 1985–1989), a relentless series of self-portraits that feature Schmidt's fragmented body parts. Throughout the 1980s and 1990s, he continued to manifest the experimental spirit evident in his early attempts to use conventional photographic materials in new ways—black-and-white film, silver gelatin prints, photographic books—by subtly reinventing his work in each subsequent project.

Schmidt continued to explore a landscape and a city fraught with history in his pivotal work *Ein-heit* (*U-ni-ty*, 1991–1994), shown at MoMA in 1996 and published in the same year. The importance of fragmentation as an interpretive trope is reinforced by Schmidt's dividing with hyphens a word meaning wholeness, diametric forces embodied in the very title of the project. Conventional aesthetics of black-and-white photography were abandoned in favor of intentionally inconsistent prints, often with compressed, almost monochromatic tonal ranges, large grain, and poor detail, all of which served to reinforce his subjects. The book presents a startling record of Schmidt's fascinations with the weight of history upon the German citizen, the cultural lineage behind his project, the interrelatedness of past and present, and the impossibility of truly knowing, especially through photography. A project of epic scope, Schmidt included portrait and landscape photographs that he made in Berlin, photographs of objects of significance to the German populace, and re-photographed images resonant in collective German memory. By combining portraiture of ordinary citizens with landscapes changed through history and historical material, Schmidt points to the effects of the latter two on the subjects in the portraits. Examples of re-photographed materials include stills from Leni Riefenstahl's 1934 Nazi propaganda film *Triumph of the Will*, photographs of soldiers of the German Democratic Republic passing a review, and a tablet inscribed with the third stanza of the German national anthem, the lyrics of which were used under the Weimar Republic and the Federal Republic. Images are doubled on facing pages, cropped tightly to fragment the scene, printed backwards, and otherwise freely manipulated.

Dense with precise historical references but also elusively vague at points, and lacking a declarative personal style, Schmidt's work has not achieved the international market success of many of his better-known German contemporaries. Nonetheless, Schmidt continues to live and work in Berlin, weaving

his own layers into the variegated strata of German culture and history. His legacy is already enormous.

TONI SCHNEIDERS

German

Toni Schneiders, one of the most widely published German photographers, emerged in the 1950s with a group of young photographers who made an impact "like an atom bomb of contemporary photography," as one contemporary critic wrote. This now-legendary group, fotoform, was founded in 1949 and included Peter Keetman, Siegfried Lauterwasser, Wolfgang Reisewitz, Otto Steinert, and Ludwig Windstosser. All members of the group later participated in the *Subjektive Fotografie* (subjective photography) exhibitions organized

by Otto Steinert. *Subjektive Fotografie* became an international movement of considerable influence, for which fotoform served as the germinating seed.

Toni Schneiders was born in 1920 in Koblenz in western Germany. Directly after completing his apprenticeship as a master photographer there, Schneider was drafted into military service in 1940 at the age of 20, and he served in the photography unit of the German air force. As a young war reporter in 1944, he participated in the liberation of Benito Mussolini from Gran Sasso by German paratroopers and documented the surprise attack on film. Like many of his colleagues, Schnei-

der was forced to experience how photography was used as a means of propaganda in Nazi Germany—and compelled to deliver acceptable images. At the end of the war, Schneider was fortunate to be able to hold onto his Luftwaffe-issue Leica and other equipment, which facilitated his career as a professional photographer. After a brief period of captivity as prisoner of war, he worked as a freelance photographer, first in Koblenz and then in Meersburg on Lake Constance beginning in 1947, where he maintained close contact with his colleagues Heinz Hajek-Halke and Peter Keetman.

Today it is difficult to comprehend the contemporary excitement about the apparently radical visual language of the young German photographers around 1950. An anonymous newspaper cartoon from the period shows people twisting and turning their bodies in strange contortions in front of the pictures in a photo exhibition in order to understand the unusual content of the images. Some exhibition visitors are overtaken by laughter; others require medical attention. This humorous critique referred to exhibitions that included Schneiders's photographs of surface structures or light reflections, as in *Spiegelnden Scheiben* (Reflecting Glass Panes) of 1952. In the early 1950s, there was an obvious lack of acceptance for artistic works that did not correspond to traditional concepts of representation, both in the socialist realism of Hitler's propaganda and the earlier conventions typical of Pictorialism with its emphasis on flattering portraits and sentimental genre scenes.

Comparing Schneiders's photographs from the late 1940s and those of other *fotoform* members with other post-war photographers in terms of their motifs, a radical renunciation of the images of destruction is apparent. This motif had been so widespread up to that point that an embrace of abstracted nature and light studies seemed inappropriate given the very real circumstances in Germany and Europe in general. Subjective photography and *fotoform* were quickly criticized for their pure formalism and aestheticism, which was in such sharp contrast to the socially engaged photography typical of the era. Yet Schneiders and his *fotoform* colleagues had not turned a blind eye to the social realities. According to the art historian and contemporary, J.A. Schmoll Eisenwerth, the works reflected "a broader outlook, in that the scenes had a particularly lonely atmosphere, which conveyed a sense of coldness and loss."

The photographs of the *fotoform* group have their origins in the photographic experiments of the *Neues Sehen* (New Vision) movement of the 1920s, both in terms of style and content, and they bear similarity to some of the painting of the 1950s, in particular to

American Abstract Expressionism and its French counterpart, *Informel*. Significant similarities between the content of abstract painting and photography are less common in this period than often assumed, if one can even compare the two media at all. Schneiders demonstrated a persistent interest in the fundamental forms of nature that are shaped by chance, such as air bubbles beneath the icy surface of a lake ("Luftblasen in spiegel eis," 1953) or delicate branches of snow-covered trees. Nature was a constant source of inspiration. With an attentive and curious eye, he discovered his symbolically laden subject matter on his long walks in the fall and winter, usually in the area near Lake Constance. The photographs were taken after a period of close observation, which often included waiting outside for hours.

Detailed views of natural structures, reflections, and shadows are characteristic of his pictorial language. In his images, Schneiders emphasizes the cropped view of what is actually seen; linear patterns extend beyond the edge of the photograph—and bear similarity to the all-over approach of Abstract Expressionism. Schneiders uses related compositional techniques in his images with a technical or cultural subject matter—for example, the railroad tracks in front of the engine hall from the year 1950 ("Bahnhof früh morgens") or a Doric legal inscription carved on a stone block on Crete from 1958. The pattern-like quality of the depiction makes the photographs seem to typify what they represent.

In addition to textures and objects that fill the image, Schneiders's work is also distinguished by a small recognizable object—perhaps a white boot on a dark lake or a lonely figure out for a walk on the bright pavement. Images convey a solitary existence, melancholy, and isolation. In some of his images, he sensitively dramatizes the trauma of the war and post-war period. This is particularly apparent in the photograph of a woman sitting in a train compartment sunk deep in thought—a photograph taken unobserved from a railroad platform somewhere in Germany in 1951. Her empty expression behind the glass symbolizes the suffering, dashed hopes, and melancholy of the postwar era. At the same time, the shift from abstract photographic studies to intense genre scenes in Schneiders's work represents the "human interest" zeitgeist in the international photography of the 1950s and 1960s.

Schneiders's interest in ordinary scenes, immediate human encounters, and their photographic image was heightened by his photojournalistic work outside of Germany starting in the mid-1950s. In his travel photography from the 1950s and 1960s in Europe, Africa, and Asia, he generally avoided stylization, the close-ups of nature, or light studies, which char-

acterized his *fotoform* period. Instead, he traced the ordinary life of the inhabitants along with the beauty of the country's nature and art by taking on the unassuming role of an artistic interpreter.

Both his personal and photographic approach demonstrate a careful and reserved perspective on surroundings. The resulting portraits are genre scenes with a subtle sensibility, which sometimes include a small joke in the background. Despite his works showing considerable abstract qualities, Schneiders has consistently remained rooted in the representational image. In his pictures, he unites the dual perspectives of the micro and the macro, of abstraction and representation, of transformation and clarity. Familiar objects, such as telephone poles, train tracks, the rings of a felled tree, or bamboo poles, become mysterious patterns filling the surface of the image, surreal signs. With their symbolic content, many of the images seem to convey a meaning.

Toni Schneiders has published his photographs in yearbooks, such as *Das Deutsche Lichtbild*, *Foto Annuario Italiano*, and *Photography Year Book*, in the "terra magica" photo albums, in the magazines *Atlantis* and *Merian*, and in numerous international journals. The broad scope of his oeuvre, ranging over five decades, includes portraits and genre scenes, still life, landscapes, and photographic experiments including solarization and multiple exposures.

His later commissioned work, largely in color, represented a contrast to the timeless, static black-and-white images from the period around 1950. "fotoform," the modern and artistic reaction to the experiences of war, remains the most creative phase in Schneiders' work.

Biography

1920, born in Koblenz. 1936–1939, apprenticeship and graduation to Master Photographer in Koblenz. 1940, soldier in the Luftwaffe. 1942–1945, war correspondent in France and Italy, brief captivity as a prisoner of war, then a freelance photographer in Koblenz. 1948, established a photo studio in Meersburg on Lake Constance, close

contact to the German photographers Heinz Hajek-Halke and Peter Keetman along with the French painter, Julius Bissier. 1949, member of the *fotoform* group; moved to Lindau on Lake Constance. 1950, worked as a photojournalist, architecture, and advertising photographer for newspapers and magazines. 1956, extended trips in Ethiopia, Europe, and North Africa. 1961, stayed in Japan, later in South east Asia. 1970, assembled a comprehensive image archive of European cultural history. 1999, Culture Prize of the Deutsche Gesellschaft für Photographie (DGPh). Member of the Gesellschaft für Deutsche Lichtbildner (GDL), the Deutsche Gesellschaft für Photographie (DGPh), and the Bund Freischaffender Fotografen (BFF). He lives in Lindau.

ALLAN SEKULA

American

Allan Sekula's photographic practice is inseparable from his work as a theorist and socioeconomic historian of photography. With other influential figures, such as Victor Burgin and Martha Rosler, he works within the Hegelian-Marxist tradition, drawing on notions of the interpenetration of art and society taken from philosophers and theorists Walter Benjamin, Jürgen Habermas, Roland Barthes, and others. In identifying photography as social practice, Sekula has had significant impact, especially in North America and Europe.

Sekula was born in 1951 in Erie, Pennsylvania. He attended the University of California, San Diego, where as an undergraduate he took classes simultaneously from the social philosopher Herbert Marcuse and the conceptual artist John Baldessari. From the former, he learned one of the central tenets of the Frankfurt School, which tirelessly sought to elucidate the complicity of the educational system in general and of high science in particular with what Eisenhower had identified as "the military-industrial complex" on which the economy of southern California, and Sekula's own family, largely depended. From Baldessari, he learned to re-think art photography as prescribed by modernism, and to see it rather as contingent on the ideas of photographer and viewer. The dual influence of Marcuse and Baldessari committed Sekula to a dialectical approach in realizing his socialist principles through his work, and provided an escape from "the two chattering ghosts of bourgeois science and bourgeois art which have haunted photography from its inception."

Since the early 1970s, Sekula has reached a growing audience through work—characteristically a sequence of prints or slides intercut by text—that widely exhibited in solo and international group exhibitions, adapted for publication in *Artforum* and *October* among others, re-printed in important anthologies debating the politics of representation, and published in books such as *Photography Against the Grain* (1984), *Fish Story* (1995), and *Dismal Science* (1999). Some of his images quickly acquired iconic status, especially those comprising *War Without Bodies* (1991/96) which demonstrate

that the fascination with weapons invokes a physical response. This series, with its trenchant text, was Sekula's critique of the fascination with automated weapons of war that made, for the Americans, the 1991 Gulf War a "war without bodies."

Sekula's work, in fact, is a sustained argument for documentary photography, perhaps better termed critical realism, which he advanced in the widely circulated essay *Dismantling Modernism, Reinventing Documentary: Notes on the Politics of Representation* (1976/78). It exposes both the myth that the camera cannot lie and the more recent myth that neither can it tell the truth. Although he asserts an affinity between documentary practices and democracy, he challenges the view that documentary photography is inherently "universal" as it depicts "real humans" in situations or expressing emotions that can be understood by all peoples. The seminal 1955 exhibition *The Family of Man* is a prime example of an objectivity that Sekula argued is but a delusion. He also argued against photography as an autonomous art form following the traditional fine arts model of providing a transcendent, genius-derived, and essentially private experience as well as against the more recent claim that photography has re-attained the status of art through self-reflexive staging.

Sekula instead claims a more modest, subservient status for photography, enabling a "radical consciousness from below," a lens, so to speak, for close scrutiny of economic life in line with his socialist ideology. *Aerospace Folktales* (1973) was an early exercise in the deconstruction of a sequence of images by means of a text that directs, if it does not initiate, the decoding of the images. In this work, he explored themes that have persisted to the present: the political economy of "ordinary" lives—in this case of his mother and father, an out-of-work aerospace engineer—and his commitment to history, in this case the history of his own formation, that implies a critique of the alleged neutrality of images and the ubiquitous historical amnesia he observed in American culture.

Sekula's parents are also the protagonists in *Meditations on a Triptych* (1973). Using family snapshots, he brings to what Benjamin called "the afterlife of the work" the kind of close reading of

photographic codes that was advocated by Barthes. Sekula aims not merely to pay close attention to the relationship between the signifier and the signified but to make it problematic.

Problematizing is the collective aim of work assembled in his first book *Photography against the Grain* (1984), which also takes its cue from Walter Benjamin: the notion that mechanically reproduced and therefore mass-circulated images are a form of currency. As currency they are so commonplace that their role in the reinforcement of capitalism that sustains monopolies in education, politics, and other realms, is overlooked. Although it is not possible to photograph ideology, Sekula argues that any photograph can be decoded to reveal an encoded ideology. Sekula cites Martha Rosler, Philip Steinmetz, Fred Lonidier, and Chauncey Hare as photographers and artists he admires for their ideologically self-conscious handling of image and text.

Anticipating the labelling of such work as joyless, he rails against the “fun police,” for there is work to be done, and there is pleasure to be had from it. It is a matter for debate whether this stance acquires piquancy or loses credibility by virtue of being presented in the display modes of the art world—exhibitions, catalogues, art books. That world, as Sekula argues, is a construct of modernity, and stems, like modernity itself, from a divide between “mental” and “manual” labor, the fundamental socialist political-economic analysis to which Sekula remains committed.

Sketch for a Geography Lesson (1983), *Geography Lesson: Canadian Notes* (1986), and *Fish Story* (1995) constitute a trilogy in which texts and images consider actual and imaginary geographies in a world where both have been determined by advanced capitalism. Sekula aims to make his reader *see* the truth of this assertion. His pictures make correspondences between nickel mining in Sudbury, the architecture of the Bank of Canada, derelict shipyards from California to Clydeside, and international container shipping. These things all play a role in the global undermining or perversion of relationships among natural resources, manufactured goods, labor, and profit. Sekula’s anthology *Dismal Science: Photo Works 1972–1996* (1999) reconfigured earlier projects with the more recent ones, all characterized by the same stern eye, critical acumen, wit, and empathy for the oppressed and under-represented. These themes are continued in *Deep Six/Passer au bleu* (2001): the global movement of commodities fostering the illusion of production without labor, the traces of capitalism’s advance left on ordinary lives and places.

SEMIOTICS

Semiotics, or semiology, is the systematic study of signs and the processes of communication and signification as they occur in various sign systems. The term "semiotics" is derived from the Greek word *semeion*, meaning sign. Although the nature and function of signs intrigued thinkers from early Greek thought onward, contributions to sign theory before the work of Ferdinand de Saussure (1857–1913) and Charles Sanders Peirce (1839–1914) cannot be considered semiotics in today's sense of the term.

The modern pursuit of semiotics has evolved into an interdisciplinary field of studies that focuses on the origins, manifestations, and uses of signs by individuals, and in discourses and cultures. Concerned with the production and interpretation of signs in all their forms and contexts, it aims at identifying the systematic regularities from which meaning is construed. Semiotics is too heterogeneous in its aims and goals as well as in its approaches and procedures to be considered a unified discipline. Instead, it is best understood as an interdisciplinary

SEMIOTICS

field open to individual approaches to and philosophical definitions of a particular object of study. The object of semiotic inquiry comprises anything (for example, architecture, fashion, a film, a kinship structure, a literary text, a musical score, a photograph) that can be studied as a system of signs dependent on cultural codes and conventions for the constitution of sense and meaning.

Semiotics and Photography

From the semiotic point of view, photography is considered to be a specific means of communication that carries information from a sender (the photographer) to a receiver (the viewer). In this view, photography is never a simple reflection of the real. Rather, it is entangled in a complex web of encoding and decoding, construction and interpretation.

A semiotics of photography aims to exhaustively describe the processes of signification and meaning informing the photographic image. Approaching the photographic image as a construction, it seeks to understand the manner in which it functions. A semiotics of photography asks *how* the photographic image means rather than *what* it means. Central to the semiotic analysis of the photographic image are questions regarding the specificity of photography's codes and semiotic rules, the structures and functions of the photographic message, and the precise nature of photographic information.

The starting point for a semiotic analysis of photography is an attempt to determine the rules and means of construction used by the photographer in order to create a photographic image whose meaning is as unequivocal as possible—unequivocal insofar as meaning is the same for both the sender and the receiver. Many semioticians have singled out the importance of framing, shooting angle, lighting selection, field depth, alteration of prints, and the use of captions when trying to determine how the photographer constructs an image, making its signification and, consequently, directing its interpretation. Semioticians agree that the photographic image is the result of a construction that tries to anchor or constrain its meaning. They also agree that the meaning of the photographic image is subject to the interpretative operations of both the photographer and the viewer.

History of the Semiotics of Photography

Although photography has been considered a legitimate object of semiotic inquiry since Peirce's categorical definitions of the sign and its relationship to

its Dynamic Object, it was not until the 1960s that semiotic investigations began to radically change the theory of photography.

At times, Peirce identified the photographic image as an indexical sign (a sign that is existentially, physically tied to its object). And, at other times, he acknowledged that there are strong grounds for supposing that the photograph belongs to the category of icons (signs who relate to their object by similarity). Today, it is generally argued that the photographic image is a semiotic hybrid: it represents iconically (by virtue of picturing the world) and it represents indexically (by virtue of pointing back to the world that caused it to appear as it does). To consider the photographic image a semiotic hybrid is to emphasize the coincidence—and not the mixing together—of iconic and indexical features. It is to posit the photographic image as iconically indexical, as a sign that points by picturing.

French literary critic and semiotician Roland Barthes was one of the leading exponents of the semiotic study of the photographic image. He studied photography from a semiotic point of view throughout his life. Barthes's principal concern was with exploring just how the photographic image is coded or, more specifically, what aspects of the photographic image are coded. He sustained that the photographic image may be metaphorically called a language, but that it is not a code in the strict sense of the term. Distinguishing between codes of analogy, codes of connotation, and rhetorical codes, Barthes concluded that the photographic image signifies on the basis of a heterogeneous complex of codes and not a single signifying system. Investigations into the photographic image as a polysemic message led Barthes to explore and expand upon important semiotic concepts and speculative instruments such as denotation and connotation, literal and symbolic meaning, anchorage, the analogy between natural language (speech and writing) and visual language, paradigmatic and syntagmatic relationships, motivated and unmotivated signs.

Unlike Barthes, René Lindekens believed in the autonomy of photographic language, defining it as an iconic language. A great part of his semiotic study of photography was directed toward isolating what he called the minimal units in photographic communication, on the plane of content and expression. Lindekens worked toward building a systematic theory of photographic meaning and defining a sort of pragmatics of photographic communication.

Contemporary encounters between semiotics and photography consider not only the structures that operate in the photograph's production of meaning, but also the social and psychic formations of the

photographer and the viewer that are intimately implicated in the photograph's meaning. Today, a semiotics of photography is often a social semiotics that combines textual analysis with attempts to take into account the ideological implications as well as the biographical and cultural experiences that are inscribed within the performance of the photographic utterance. In exploring the processes whereby meaning is negotiated, the semiotics of photography focus more and more on questions of context and reception; the problematics of authorship and interpretation; the interrelation of photographic image, experience, and comprehension; and the role of cultural codes of recognition, representation, and iconography in the creation and understanding of photographic meaning.

ANDRES SERRANO

American

Andres Serrano uses photography to address basic human issues such as life, death, religion, race, violence, corporeality, and sexuality. His work has provoked controversy and has elicited charges of obscenity and blasphemy. Despite the controversy (or perhaps due to it), Serrano has become one of America's most important photographic artists, exhibiting his large-format color photographs all over the world.

Serrano was born in New York City in 1950 to an Afro-Cuban mother and a Honduran father. He entered the Brooklyn Museum Art School in 1967, but left in 1969, battling drug dependency. In the 1980s, after a hiatus of several years, Serrano began showing his art in New York City. As a lapsed Catholic, religion plays a significant role in his

work. For the past 25 years, Serrano has explored what he calls his "obsessions" with Catholic imagery. Serrano is also interested in the figure of the outcast because, he claims, as a non-white American he identifies with the underdog.

While biography has influenced Serrano's work, he is also deeply engaged with the history of art. Serrano's early work was influenced by Surrealism, which he took up again in a later series, *The Interpretation of Dreams*, 2000. Other images, such as those in *The Morgue Series*, recall seventeenth-century painter Caravaggio's work, or the many Baroque and Renaissance paintings of the dead Christ. Serrano presents his viewers with an aesthetic that is at once beautiful and horrible, troubling and seductive. He has also done striking abstract photographs of unbroken expanses of milk, or blood, evoking Color Field paintings of the 1960s and 1970s.

Serrano usually works in series in which he explores a subject by developing an aesthetic. Two early series, *Bodily Fluids* and *Immersion*s, begun in 1985 and finished in 1990, utilize bodily fluids in previously unexplored ways. Serrano constructed Plexiglas containers out of simple shapes (a circle or a cross) to hold urine, blood, or milk, which he then photographed. He also began to combine the fluids in larger tanks to see how they would mix. Eventually, Serrano began to work with another bodily fluid, semen, and, using a camera with a motor drive, created photographs such as *Untitled VII (Ejaculate in Trajectory)*, 1989. In addition, Serrano began to immerse objects—small statues—in the vats of bodily fluids. For example, in *Female Bust*, 1988, he immersed a small plaster bust of Venus in a vat of his urine, and, after lighting it from all sides, photographed it. The result is a beautiful classical image bathed in a warm glow of light. In the late 1980s and early 1990s, many critics read these series in light of the AIDS crisis, and saw the images as political representations of bodily fluids that had become taboo and dangerous.

In 1988, Serrano was awarded a \$15,000 grant through the Awards in the Visual Arts program of the Southeastern Center for Contemporary Art (SECCA), Winston-Salem, North Carolina, a program partially funded by the National Endowment for the Arts (NEA). The award included participation in a traveling exhibition, included in which was the now infamous *Piss Christ*, 1987. When the American Family Association, who viewed the image as offensive to Christians, complained to the members of Congress, North Carolina Senator Jesse Helms and New York Senator Alfonse D'Amato launched an attack at the NEA for using taxpayer monies to support offensive art. The controversy was extensively covered in the press, and joined controversies over other contemporary artists who had received NEA grants, resulting in the “culture wars” of the late 1980s and early 1990s that raised questions about freedom of expression, federal funding for the arts in the United States, freedom of religion, and censorship.

After the *Piss Christ* controversy made Serrano one of America's most well-known photographers, he gradually ceased to use bodily fluids in his work and began to make portraits. In 1990, he started two new photographic series: *Nomads*, which made heroic portraits of New York's homeless; and *Klansmen*, which pictured members of the Ku Klux Klan in their hooded dress. Serrano has stated that “being who I am, racially and culturally, it was a challenge for me to work with the Klan, as much for me as for them, that's why I did it” (Serrano, *Talking Art*,

1993). Serrano points out that he was inspired by photographer Edward Curtis's photographs of Native Americans for the *Nomads* series. Unfazed by recent criticism of Curtis as romanticizing indigenous people, Serrano wanted to create heroic portraits that “monumentalized” his subjects, a word that he uses often in interviews. Indeed, Serrano continued this tradition in the 1996 series *Native Americans*, which pictures traditionally dressed native people in brilliantly colored, large-format portraits.

Functioning as another kind of portrait and referring to the Victorian practice of photographing the deceased, Serrano made a series of images in an Italian morgue. These photographs from his *Morgue* series tend to focus on details, rather than the whole body. *The Morgue (Knifed to Death I)*, 1992, for example, pictures an outstretched hand against a black backdrop, the fingertips blackened in the process of identification. At the left of the image, a streak of blood has oozed from a vertical wound just above the wrist. The photographs in this series are both horrific, producing a visceral reaction, as well as quiet and strangely beautiful.

Serrano has claimed that rather than attacking icons, he creates them. This is evident in all his portrait series. For *The History of Sex*, a project undertaken for the Groninger Museum in Amsterdam in 1996, Serrano created images that act as types for various sexualities, sexual acts, or sexual fantasies. Serrano's latest series, *America*, begun in 2002, suggests August Sander's portraits of Germans in that it presents American “types” including a heroin addict, Hollywood stars, an escort, and a Native American woman. In *America (Boy Scout John Schneider, Troop 422)*, 2002, Serrano puts a young, blond-haired blue-eyed boy in a three-quarter pose, in front of a glowing reddish-orange backdrop. This boy becomes as much of an icon as the musician portrayed in *America (Snoop Dogg)*, 2002.

Despite his provocative subject matter, Serrano's imagery is strongly traditional. Compared to other twentieth-century artists, Serrano draws much more on art historical models and established aesthetics. It is this combination of tradition and provocation that makes his photographs so appealing to a wide public.

DAVID "CHIM" SEYMOUR

American, born in Poland

Born Didek Szymin in Warsaw, Poland, then annexed as part of Czarist Russia, to a middle-class family on 20 November 1911, photographer David Seymour invented his nickname "Chim" in 1933, while living in Paris, from the first syllable of his family name as it should be pronounced in the Polish language. The elder Szymin owned an important publishing house of Hebrew and Yiddish books in Warsaw. During World War I, the Szymin family found refuge in Odessa and returned to Warsaw in 1919. The young Didek Szymin grew up in a Jewish household and went to a Jewish school, the Gymnasium Ascolah in Warsaw, graduating in 1929. As he subsequently lived and worked in many countries, Chim was fluent in Polish, Yiddish, Russian, and later in German, French, and English.

Didek Szymin first worked toward a career in the tradition of his father's profession, learning new techniques about how to produce art books with color plates at an innovative graphic-arts school in Germany. While in Leipzig (1929–1932), Szymin studied

color printing techniques for the reproduction of paintings, graduating from the Leipzig Akademie der Graphischen und Buchkunst in 1931. As the Nationalist Socialist regime gathered power, Szymin left Germany for Paris and in September 1932 became a university student in chemistry at the Sorbonne. In 1933, he began to take pictures as an extra job for a family friend, David Rappaport, who owned a photo agency in Paris, named "Rap." Through this contact, at 22, Didek Szymin became friends with photographer Henri Cartier-Bresson and the same year met André Friedmann, who would later become famous under the name Robert Capa.

Szymin's first professional publication as a freelance photoreporter was for a leftist French illustrated magazine, *Regards*, in its fifth weekly issue of March 2, 1934, publishing under the signature of "CHIM" (in capitals), a pseudonym that he would use throughout his career. His first photographs appeared in the newspaper *Paris Soir* and in the French illustrated magazine *Voilà*. His first subjects were urban and modern, often related to social and political change: street scenes, night workers, strik-

ers, political demonstrations, congresses, and meetings of writers in Paris. Almost from the beginning, Chim was one of the few photographers in France who used a small-format Leica 35-mm camera, which had recently been introduced. Chim was self-taught as a photographer; his main influences at that time were Brassai and his friends Capa and Cartier-Bresson.

Between 1936 and 1937, Chim became a special correspondent in Spain. His photographs of the Spanish Civil War that were published in many magazines made Chim a famous and respected photojournalist. There were at that time some 25 exclusive stories related to the Spanish Civil War that were published by Chim.

Back in Paris in 1937, Chim covered other political events and strikes in France, and occasionally elsewhere in Europe as well as in North Africa. The same year, he photographed Pablo Picasso working on his massive painting, *Guernica*, inspired by one of the atrocities of the Spanish Civil War, which he was creating for the Paris World Exhibition of 1937; this photograph became one of his signature images. Beginning in the mid-1930s, Chim shot cover photographs for various international magazines such as *Regards*, *Schweizer Illustrierte Zeitung*, *Life*, *Jours de France*, *Paris-Match*, and others.

On assignment in Mexico in 1939 to photograph the hundreds of exiled Spanish resistance fighters, Chim was in the United States when war was declared in Europe. Staying on in New York City, Chim assisted his friend Leo Cohn, who opened a darkroom ("LECO") on 42nd Street.

In 1942, Didek Szymin became a U.S. citizen and became David Robert Seymour. The same year, as were many Jews living in Poland, his parents were killed in the Holocaust. Drafted in the U.S. Army in October 1942 as a photographic instructor and aerial photointerpreter, he decided rather than taking photographs he wished to be more active in the war effort. Soon promoted to sergeant, Seymour was sent to England as a specialist in aerial photo-interpretation in order to prepare for the D-Day invasion on Normandy's beaches.

On Liberation Day, Seymour was in Paris, and after many years of separation, he celebrated victory with his friends Henri Cartier-Bresson and Robert Capa. After a promotion to lieutenant (in May 1945), Seymour returned to civilian status in the United States during the fall of 1945, and returned to his job at LECO.

A few months after the end of World War II, Seymour returned to a desolate Europe to work again as a photojournalist for *This Week* magazine. He photographed post-war Germany: Berlin,

Munich, war cemeteries, the Dachau Concentration Camp.

With Robert Capa, his French friend Henri-Cartier Bresson, British photographer George Rodger, and William Vandivert as co-founders, Seymour became one of the founders and the first vice-president of the Magnum Photos cooperative, in April 1947, in New York City. Working for Magnum gave Chim many assignments for many magazines like *Saturday Evening Post*; he traveled to Germany, Hungary, Czechoslovakia, and Poland.

In 1948, the UNICEF commissioned Seymour for a project on childhood after the war that became a posthumous exhibition, *CHIM's Children*, in 1957 at the Art Institute of Chicago. During three months in 1948, Chim photographed children in many countries, including Germany, Austria, Italy, Hungary, Greece, and his native Poland, including the portrait of the disturbed child Tereska (who had grown up in a concentration camp) as she was drawing a picture. These moving pictures of orphans and injured children appeared in several magazines worldwide, including *Life*. He also made numerous trips to Palestine and the newborn state of Israel, almost every year from 1948, to take pictures of the landscape and its people. Although Chim experimented with color in the early 1950s, most of his photographs were in black and white.

After the death of his friend Robert Capa in Indochina, Seymour became the president of Magnum Photo in 1954; he held this position until his death in 1956.

An art lover, Seymour photographed famous personalities such as the art historian Bernard Berenson, musician Arturo Toscanini, and author Carlo Levi. During the 1950s, Chim made beautiful portraits of legendary actresses Sophia Loren, Gina Lollobrigida, Kim Novak, Audrey Hepburn, Ingrid Bergman, and Marilyn Monroe. Seymour never married and had no children.

As a photojournalist or a member of the 12th Army Corps, Seymour visited many battlefields in just 20 years. During his coverage of the armistice following the Suez War in Egypt, Seymour was killed by a bullet from an Egyptian partisan, four days after the cease fire, in El Quantara, near Suez, on November 10, 1956. Chim had not yet reached 45. French photographer Jean Roy, who was traveling with him, was killed simultaneously.

In memory of the two great war photographers and photojournalists who were also friends and colleagues, The Robert Capa-David Seymour Photographic Foundation was created by sister Eileen Shneiderman along with Robert Capa's mother and brother Cornell in 1958 in Israel. Eight years

SEYMOUR, DAVID “CHIM”

later, in 1966, the Werner Bischof-Robert Capa-David Seymour Photographic Memorial Fund was established, later renamed the International Fund for Concerned Photography, Inc., which evolved into the International Center of Photography (ICP) in New York. The ICP maintains an extensive website on Chim, and holds many of his vintage prints. In 1996, Inge Bondi published the definitive book on David Seymour, titled *CHIM: The Photographs of David Seymour*.

During his short career, David Seymour worked as a craftsman dedicated to telling stories with images and not as an artist aiming to exhibit; thus, most exhibitions, books, and tributes were posthumous.

BEN SHAHN

American

Ben Shahn, primarily a painter, devoted only six years to photography, documenting American life during the Great Depression as a photographer for President Franklin Delano Roosevelt's Farm Security Administration (FSA). Capturing both urban and rural life, Shahn portrayed his subjects with sympathy and compassion, and, considering them people very similar to himself, often developed a close relationship with them. His photographs express human strengths and values, rather than evoking pity or shock for the inequalities of the working class.

Born in Lithuania in 1898, Ben Shahn immigrated to New York with his family in 1906. In 1913, he apprenticed as a lithographer, and by the early 1930s he had gained a sizable reputation as a painter concerned with social injustice. Although Shahn had yet to take up the camera, his early gouaches owed much to photography. In preparing his early series of paintings—*The Dreyfus Case* (1931), *The Passion of Sacco and Vanzetti* (1932), and *Tom Mooney* (1933)—Shahn relied heavily on photographs of the protagonists. His interest in photography was furthered by his friendship with Walker Evans. The two met in 1929, and they subsequently shared a studio. Although Shahn would later claim that Evans's only advice was, "f/9 on the sunny side of the street. f/45 on the shady side of the street. For 1/20th of a second hold your camera steady" (Morse 1972), Shahn's exposure to Evans's working practices was formative. Evans also introduced Shahn to the work of his contemporaries

Henri Cartier-Bresson and Eugène Atget, as well as that of pioneering social justice photographer Lewis Hine and famed Civil War photographer Mathew Brady.
