SAMPLE
Matrix: solutions
Sample preparation: Inject a 20 μL aliquot of a 10-20 μg/mL solution.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Ultracarb 5 ODS (Phenomenex)
Mobile phase: MeCN:MeOH:50 mM pH 5.2 ammonium acetate 4:35:61
Flow rate: 0.8
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 17

OTHER SUBSTANCES
Simultaneous: cinchonidine, cinchonine, dihydroquinidine, dihydroquinine, quinine

REFERENCE
Theodoridis,G.; Papadoyannis,I.; Hermans-Lokkerbol,A.; Verpoorte,R. A study of the behaviour of some new column materials in the chromatographic analysis of Cinchona alkaloids, *Chromatographia*, **1995**, *41*, 153–160.

SAMPLE
Matrix: solutions
Sample preparation: Inject a 20 μL aliquot of a 100-500 μg/mL solution in mobile phase.

HPLC VARIABLES
Column: 100 × 4.6 5 μm Hypersil C8 MOS 100A coated with phosphatidylcholine (95% pure soybean lecithin, Epikuron, Lucas Meyer & Co.) (Coat column by recycling a 1 mM solution of phosphatidylcholine in MeOH:water 80:20 for 24 h.)

Mobile phase: MeCN:35 mM pH 7.4 sodium phosphate buffer 40:60
Flow rate: 0.5–2
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: k' 3.89

OTHER SUBSTANCES
Also analyzed: amoxicillin, antipyrine, carbamazepine, chlorpheniramine, chlorpromazine, clonidine, codeine, desipramine, diphenhydramine, dipyridamole, ephedrine, flufenamic acid, haloperidol, hydroxyzine, imipramine, indomethacin, lidocaine, megestrol acetate, metoprolol, nabumetone, nadolol, phenobarbital, phenol, promazine, propranolol, pyrilamine, ropinirole, testosterone, thioridazine, tolfenamic acid, verapamil
Noninterfering: acetaminophen, aspirin, azathioprine, caffeine, carprofen, chlorambucil, cimetidine, fenoterol, flurbiprofen, ibuprofen, ketoprofen, ranitidine, salicylic acid, sulfamethoxazole, theophylline, thioguanine, tiaprofenic acid, trimethoprim, valproic acid

KEY WORDS
comparison with capillary electrophoresis

SAMPLE
Matrix: blood
Sample preparation: 200 μL Serum + 50 μL 40 μg/mL quinine hemisulfate in water, vortex 30 s, add 400 μL MeCN, vortex 1 min, centrifuge at 4000 rpm for 10 min. Remove organic layer and evaporate to 200 μL under a stream of dry nitrogen at 45°. Inject 10-20 μL aliquot.

HPLC VARIABLES
Column: 10 μm μBondapak C18
Mobile phase: MeCN:100 mM NaH_2PO_4 adjusted to pH 3.9 with phosphoric acid 20:80
Flow rate: 2.5
Injection volume: 10-20
Detector: F ex 280 em 455

CHROMATOGRAM
Retention time: 5.2
Internal standard: quinine
Limit of detection: 25 ng/mL

OTHER SUBSTANCES
Simultaneous: ciprofloxacin, ofloxacin, pefloxacin, norfloxacin, lomefloxacin, acebutolol
Noninterfering: nadolol, atenolol, thiamine, verapamil, digoxin, metoclopramide, prednisolone, hyoscine, midodrine, deoxyprenaline, metronidazole, ranitidine, gentamicin, netilmicin.

KEY WORDS
serum; quinine is IS

SAMPLE
Matrix: blood
Sample preparation: Let 100 μL whole blood dry on filter paper, cut into small pieces. Add dried blood sample or 500 μL plasma, serum, or red blood cells to 150 μL 2 M NaOH, add 6 mL ethylene dichloride, shake for 20 min on an orbital mixer, centrifuge at 1000 g for 10 min. Remove the organic layer and evaporate it to dryness on a vortex evaporator at 60°, reconstitute the residue in 100 μL mobile phase, inject a 25 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Zorbax-Sil
Mobile phase: Dichloromethane:MeOH:1 M perchloric acid 100:9:0.4
Flow rate: 0.8
Injection volume: 25
Detector: UV 254 or F ex 350 em 418 (cut-off filter)

CHROMATOGRAM
Retention time: 11
Limit of detection: 100 ng/mL

OTHER SUBSTANCES
Simultaneous: amodiaquine, chloroquine, dapsone, desethylchloroquine, dihydroquinidine, dihydroquinine, mefloquine, primaquine, proguanil, pyrimethamine, quinidine, sulfadoxine, sulfalene, sulfamethoxazole

KEY WORDS

SAMPLE
Matrix: blood
Sample preparation: Serum. 50 μL Serum + 50 μL 10 μg/mL IS in water + 50 μL 4 M NaOH + 200 μL MTBE, vortex for 30 s, centrifuge at 9950 g for 2 min, inject 100 μL of the organic layer. Whole blood. 50 μL Whole blood + 500 μL water + 50 μL 10 μg/mL IS in water + 50 μL 4 M NaOH + 200 μL MTBE, vortex for 30 s, centrifuge at 9950 g for 2 min, inject 100 μL of the organic layer. Dried blood. Spread 100 μL whole blood on a 70 × 30 mm piece of filter paper, allow to dry, cut paper into 10 × 5 mm strips, add 50 μL 10 μg/mL IS in water, add 1.5 mL 0.5 M NaOH, vortex for 30 s, let stand for 30 min at room temperature, add 300 μL MTBE, vortex for 30 s, centrifuge at 2000 g for 5 min, inject a 100 μL aliquot of the organic layer.

HPLC VARIABLES
Column: 150 × 5 5 μm Spherisorb S5SCX sulfophenylpropyl-modified silica
Mobile phase: MeOH:water 98.5:1.5 containing 9.41 g/L ammonium perchlorate, adjust apparent pH to 8.0 with 220 mL/L 50 mM NaOH in MeOH
Flow rate: 1.5
Injection volume: 100
Detector: F ex 215 em no filter

CHROMATOGRAM
Retention time: 3.5
Internal standard: hydroxychloroquine (8)
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES
Extracted: chloroquine, metabolites
Simultaneous: acebutolol, N-acetylprocainamide, atenolol, butriptyline, chlorpromazine, desipramine, flecainide, fluoxetine, imipramine, labetalol, maprotiline, mepacrine, metoprolol, mexiletine, norbutriptyline, normaprotiline, procainamide, propranolol, sotalol
Noninterfering: amitriptyline, amodiaquin, carbamazepine, clomipramine, dapsone, diazepam, dothiepin, doxepin, fluvoxamine, lorazepam, mefloquine, nitrazepam, norclomipramine, nordiazepam, nordothiepin, nordoxepin, nortriptyline, primaquine, proguanil, pyrimethamine

SAMPLE
Matrix: blood
Sample preparation: 50 μL Plasma + 200 μL 500 mM pH 8.0 phosphate buffer, mix, add 2 mL MTBE, shake on a reciprocating shaker for 10 min, centrifuge at 4000 rpm for 5 min. Remove 1.8 mL of the organic phase and add it to 100 μL 100 mM HCl, centrifuge at 4000 rpm for 5 min, remove 80 μL of the aqueous phase, vortex, inject a 40 μL aliquot.

HPLC VARIABLES
Column: 250 × 4 5 μm LiChrospher RP 18
Mobile phase: MeCN:buffer 16:84 (Buffer was 0.1% triethylamine in water adjusted to pH 2.5 with 85% phosphoric acid.)
Flow rate: 1.5

Injection volume: 40
Detector: UV 250

CHROMATOGRAM
Retention time: 4.91
Internal standard: quinine

OTHER SUBSTANCES
Extracted: quinidine

KEY WORDS
plasma; quinine is IS

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 233

CHROMATOGRAM
Retention time: 4.28
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, CSF, gastric contents, urine

Sample preparation: 200 μL Serum, urine, CSF, or gastric fluid + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, backflush the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine HCl and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES

Column: A 40 μm preparative grade C18 (Analytichem); B 75 × 2.1 pellicular C18 (Whatman) + 250 × 4.6 5 μm C8 end-capped (Whatman)

Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 20 min.

Column temperature: 50

Flow rate: 1.5

Detector: UV 220

CHROMATOGRAM

Retention time: 9.8

Internal standard: heptanophenone (19)

OTHER SUBSTANCES

Extracted: acetaminophen, allobarbital, azinphos, barbital, brallobarbitone, bromazepam, butethal, caffeine, carbamazepine, carbaryl, cephaloridine, chloramphenicol, chlordiazepoxide, chlorothiazide, chlorvinphos, clothiapine, cocaine, coomassie blue, desipramine, diazepam, diphenhydramine, dipipanone, ethylbromphos, flufenamic acid, formothion, griseofulvin, indomethacin, lidocaine, lorazepam, malathion, medazepam, midazolam, oxazepam, paraoxon, penicillin G, pentobarbital, prazepam, propoxyphene, prothiophos, salicylic acid, secobarbital, strychnine, sulfamethoxazole, theophylline, thiopental, thioridazine, trimethoprim

SAMPLE

Matrix: blood, microsomal incubations, urine

Sample preparation: Plasma. Mix 100 μL plasma with 200 μL cold MeOH, vortex for 10 s, centrifuge at 1500 g for 10 min, inject a 30 μL aliquot. Urine. Dilute 100 μL urine with 900 μL water. Mix 100 μL diluted urine with 200 μL cold MeOH, vortex for 10 s, centrifuge at 1500 g for 10 min, inject a 30 μL aliquot. Microsomal incubation. Mix 500 μL microsomal incubation with 1 mL cold MeOH, vortex for 10 s, centrifuge at 1500 g for 10 min, dilute the supernatant 1 in 4 with water, inject a 30 μL aliquot.

HPLC VARIABLES

Column: 100 × 2 5 μm Hypersil ODS

Mobile phase: MeCN:buffer 40:60 (Buffer was 10 mM Na_2HPO_4 containing 10 mM sodium dodecyl sulfate and 0.1 mM tetrabutylammonium bromide, adjusted to pH 2.1 with orthophosphoric acid.)

Flow rate: 0.5

Injection volume: 30

Detector: F ex 350 em 450

CHROMATOGRAM

Retention time: 47.7

Limit of detection: 160 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

Simultaneous: piroxicam

Noninterfering: arteether, artemether, chloroquine, cycloguanil, debrisoquinine, 4-hydroxy debrisoquinine, ethambutol, isoniazid, mefloquine, primaquine, proguanil, propranolol, pyrazinamide, rifampicin, streptomycin

Interfering: cinchocaine, cinchonine

KEY WORDS

plasma; liver; microbore

SAMPLE

Matrix: blood, saliva, urine

Sample preparation: Dilute 1 mL urine to 10 mL with water. 1 mL Plasma, saliva, or diluted urine + 20 μL 100 μg/mL primaquine in 100 mM HCl + 200 μL perchloric acid, mix for 5 s, add 1 mL 5 M NaOH, add 4 mL diethyl ether, mix for 1 min, centrifuge at 3000 g for 10 min. Remove the organic layer and add it to 100 μL 100 mM HCl, mix for 1 min, centrifuge for 5 min, inject a 10 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18

Mobile phase: MeCN:MeOH:20 mM KH_2PO_4 10:15:75 containing 74 mM perchloric acid, pH 2.8

Flow rate: 1.2

Injection volume: 10

Detector: UV 254

CHROMATOGRAM

Retention time: 7.8

Internal standard: primaquine (10.8)

Limit of detection: 10 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Noninterfering: acetaminophen, amodiaquine, chloroquine, chlorpheniramine, proguanil, promethazine, pyrimethamine

KEY WORDS
plasma

SAMPLE
Matrix: blood, tissue
Sample preparation: Blood or serum. 1 mL Blood or serum + 1 μg cianopramine + 1 mL water, vortex, add 1 mL 200 mM sodium carbonate, vortex, add 6 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 100 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer. Liver homogenate. 0.5 mL Liver homogenate + 10 μg cianopramine + 500 μL 2% sodium tetraborate + 8 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 400 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES
Guard column: 15 × 3.2 7 μm RP-18 Newguard (Applied Biosystems)
Column: 100 × 4.6 5 μm Brownlee Spheri-5 RP-18
Mobile phase: MeCN:100 mM NaH_2PO_4:diethylamine 40:57.5:2.5
Flow rate: 2
Injection volume: 30
Detector: UV 220

CHROMATOGRAM
Retention time: 3.53
Internal standard: cianopramine (8.93)

OTHER SUBSTANCES
Simultaneous: amitriptyline, amoxapine, benztropine, brompheniramine, chlorpheniramine, chlorpromazine, clomipramine, cyproheptadine, desipramine, diphenhydramine, dothiepin, doxepin, fluoxetine, haloperidol, imipramine, loxapine, maprotiline, meperidine, mesoridazine, methadone, metoclopramide, mianserin, moclobemide, norpropoxyphene, northiaden, nortriptyline, pentobarbital, pheniramine, promethazine, propoxyphene, propranolol, protriptyline, sulforidazine, thioridazine, thiothixene, tranylcypromine, trihexyphenidyl, trimipramine, triprolidine
Noninterfering: dextromethorphan, norphetidine, phenoxybenzamine, prochlorperazine, trifluoperazine
Interfering: nomifensine, trazodone, quinidine, nordoxepin, norfluoxetine

KEY WORDS
serum; whole blood; liver

Mirghani,R.A.; Ericsson,.; Gustafsson,L.L. High-performance liquid chromatographic method for the determination of the major quinine metabolite, 3-hydroxyquinine, in plasma and urine, *J.Chromatogr.B*, **1998**, *708*, 209–216.

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 208

CHROMATOGRAM
Retention time: 11.253

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 µm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 200.5

CHROMATOGRAM
Retention time: 15.168

SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. 500 μL Plasma + 100 μL 100 mM NaOH, mix, add 3 mL dichloromethane, shake for 10 min, centrifuge at 2000 g for 10 min, repeat the extraction. Combine the organic layers and evaporate them to dryness under a stream of argon, reconstitute with 500 μL mobile phase, inject a 100 μL aliquot. Urine. Dilute 1 mL urine with 25 mL water, filter (0.2 μm), inject a 100 μL aliquot.

HPLC VARIABLES

Guard column: 5 μm Spherisorb ODS-2

Column: 150 × 4 5 μm Spherisorb ODS-2

Mobile phase: Gradient. MeCN:7.5 mM pH 6 phosphate buffer 7:93 for 8 min, to 25:75 over 1 min, maintain at 25:75 for 6 min, return to initial conditions over 1 min, re-equilibrate for 10 min. (At the end of each day wash column with MeCN then water then re-equilibrate with mobile phase.)

Flow rate: 1

Injection volume: 100

Detector: F ex 350 em 450 following post-column reaction. The column effluent mixed with 5 mM sodium hypochlorite in 50 mM pH 4.5 sodium acetate buffer pumped at 1 mL/min and this mixture flowed through a 0.8 m × 0.5 mm ID PTFE coil at 25°. The effluent from this coil mixed with 20 mM o-phthalaldehyde in EtOH:500 mM pH 10.5 borate buffer 2:98 pumped at 1 mL/min and 100 mM 2-mercaptoethanol in 500 mM pH 10.5 borate buffer pumped at 1 mL/min and this mixture flowed through a 2.5 m × 0.5 mm ID PTFE coil at 25° to the detector.

(The hypochlorite oxidizes the secondary to a primary amine which then reacts with the o-phthalaldehyde and 2-mercaptoethanol.)

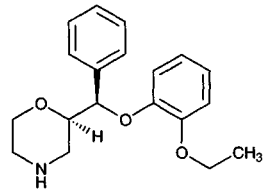
Reboxetine



Molecular formula: $C_{19}H_{23}NO_3$
Molecular weight: 313.40
CAS Registry No.: 98769-81-4

SAMPLE

Matrix: blood

Sample preparation: 1 mL Plasma + 1 mL Tris buffer + 7 mL diethyl ether, vortex for 1 min, centrifuge at 1200 g for 5 min. Remove the organic phase and add it to 200 μL 10 mM phosphoric acid, vortex for 1 min, centrifuge at 1200 g for 5 min. Remove the aqueous phase and add it to 200 μL borate buffer and 200 μL reagent, shake, let stand at room temperature for 5 min, add 100 μL 100 mM L-proline in water, add 3 mL n-hexane, vortex for 1 min. Remove

the organic layer and add it to 1 mL MeCN, extract, discard the upper n-hexane layer, wash the MeCN layer with 1 mL n-hexane. Evaporate the MeCN layer to dryness under a stream of nitrogen, reconstitute the residue in 500 μL mobile phase, inject a 200 μL aliquot. (Tris buffer was 25 mL 200 mM Tris solution and 5 mL 100 mM HCl made up to 100 mL with water, pH 9.1. Borate buffer was 61.8 g boric acid in 900 mL water, adjust pH to 8.0 with 20% NaOH, make up to 1 L with water. Prepare reagent by diluting 1 mL 18 mM (+)-1-(9-fluorenyl)ethyl chloroformate in acetone to 50 mL with MeCN.)

HPLC VARIABLES
Guard column: 30-38 μm Survival pellicular ODS (Whatman)
Column: 250 × 4.6 4 μm Supersphere 60 RP-8 (end-capped) (Merck)
Mobile phase: THF:buffer 46.5:53.5 (Prepare buffer by dissolving 13.2 g $(NH_4)_2HPO_4$ in 900 mL water, adjust pH to 7.5 with 85% phosphoric acid, make up to 1 L with water.)
Flow rate: 0.5
Injection volume: 200
Detector: F ex 260 em 315

CHROMATOGRAM
Retention time: 57 (-), 59 (+)
Limit of quantitation: 1 ng/mL

KEY WORDS
plasma; chiral; pharmacokinetics; derivatization

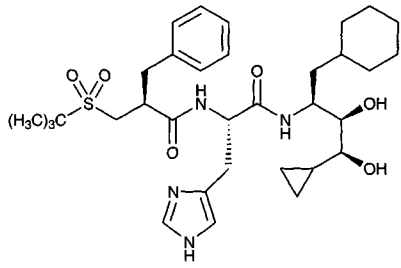
Remikiren



Molecular formula: $C_{33}H_{50}N_4O_6S$
Molecular weight: 630.85
CAS Registry No.: 126222-34-2

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 5 μL 2 μg/mL IS in MeOH + 1 mL butyl acetate, extract for 2 min, centrifuge at 2000 g for 20 min. Remove the organic layer and evaporate it to dryness under a stream of helium at 60°, reconstitute the residue in 40 μL MeCN and 25 μL 1 M pH 6.3 borate buffer, vortex for 2 min, add 10 μL 25.85 mg/mL 9-fluorenylmethyl chloroformate in MeCN, vortex for 1 min, let stand for 1 h, add 20 μL 225 mM L-proline in water, inject an aliquot.

HPLC VARIABLES
Column: 125 × 4 3 μm Nucleosil C18
Mobile phase: A:B 92:8, after 15 min wash with MeCN for 5 min, re-equilibrate at initial conditions for 10 min. A was MeCN containing 350 μg/mL N-hexylmethylamine and 15 mM trifluoroacetic acid, adjusted to pH 3.0. B was 5 mM trifluoroacetic acid in water.
Flow rate: 0.75
Detector: F ex 261 em 308

CHROMATOGRAM
Retention time: 8.6
Internal standard: (S)-α-[(S)-α-[(tertbutylsulfonyl)methyl]hydrocinnamido]-N-[1S,2R,3S-1-(cyclohexylmethyl)-2,3-dihydroxy-4-methylpentyl]imidazole-4-propionamide (Ro 42-4661) (10.8)
Limit of quantitation: 2 ng/mL

KEY WORDS
derivatization; plasma; rat; dog; monkey; pharmacokinetics

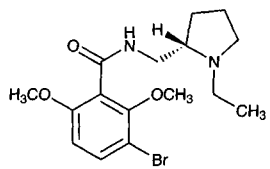
Remoxipride



Molecular formula: $C_{16}H_{23}BrN_2O_3$
Molecular weight: 371.27
CAS Registry No.: 80125-14-0, 82935-42-0 (HCl)
Merck Index: 8301
Lednicer No.: 4 42

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 100 μL MeCN, mix for 5 s, add 1 mL saturated sodium carbonate, mix for 5 s, add 7 mL pentane:dichloromethane 75:25, shake gently for 10 min, centrifuge at 18° at 1735 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 140 μL MeCN, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Ultrasphere cyano
Mobile phase: MeCN:MeOH:40 mM pH 6.8 ammonium acetate 82:8:10
Column temperature: 40
Flow rate: 1.5
Injection volume: 150
Detector: E, ESA Coulochem model 5100A, model 5011 analytical cell, screening electrode 0.6 V, detection electrode 0.92 V, model 5020 guard cell 1 V

CHROMATOGRAM

Retention time: 17
Internal standard: remoxipride
Limit of detection: <2.5 ng/mL

OTHER SUBSTANCES

Extracted: risperidone
Simultaneous: pseudoephedrine
Noninterfering: acetaminophen, benztropine, clonazepam, clozapine, fluphenazine, haloperidol, ibuprofen, lorazepam, trihexyphenidyl

KEY WORDS

plasma; remoxipride is IS

SAMPLE

Matrix: blood, urine
Sample preparation: Plasma. 1 mL Plasma + IS in 50 mM pH 2 NaH_2PO_4 + 500 μL 1 M NaOH + 4 mL diethyl ether:n-heptane 30:70, rotate for 10 min (if necessary break emulsion by freezing at -20° for 1 h), centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 300 μL pH 2 phosphate buffer, add 750 μL diethyl ether:n-heptane 30:70, vortex for 10 s, inject a 200 μL aliquot of the aqueous phase. Urine. 500 μL Urine + IS in 50 mM pH 2 NaH_2PO_4 + 500 μL 0.2 M NaOH + 4 mL diethyl ether:n-heptane 80:20, rotate for 10 min (if necessary break emulsion by freezing at -20° for 1 h), centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 0.5-3 mL pH 2 phosphate buffer, add 750 μL diethyl ether:n-heptane 30:70, vortex for 10 s, inject a 75 μL aliquot of the aqueous phase.

HPLC VARIABLES

Column: 100 × 4.6 3 μm Nucleosil 120-3C18
Mobile phase: MeCN:pH 2 phosphate buffer 30:70 containing 0.4 mM N,N-dimethyloctylamine and 0.5 mM decyl sulfate (plasma) or MeCN:pH 2 phosphate buffer 25:75 containing 0.2 mM N,N-dimethyloctylamine (urine)
Flow rate: 1.3
Injection volume: 75-200
Detector: UV 206

CHROMATOGRAM

Retention time: 2.2 (urine), 3 (plasma)
Internal standard: 3-bromo-N-[(1-propyl-2-pyrrolidinyl)methyl]-2,6-dimethoxybenzamide (3.5 (urine), 5 (plasma))
Limit of quantitation: 2 nM

OTHER SUBSTANCES

Noninterfering: metabolites

KEY WORDS

plasma

SAMPLE
Matrix: blood, urine
Sample preparation: 500 μL Plasma or 50 μL urine + 50 μL 5 μg/mL IS in 100 mM phosphoric acid + 50 μL 100 mM phosphoric acid + 200 μL 1 M NaOH + 5 mL hexane:MTBE 20:80, vortex for 2 min, let stand until the phases separate, freeze in dry ice/acetone. Remove the organic layer and it wash twice with 250 μL portions of 1 M NaOH. Add 500 μL 100 mM phosphoric acid to the organic layer, vortex, let stand for 5 min, discard the organic layer, evaporate any residual organic solvent with a stream of nitrogen, inject a 50 μL aliquot of the aqueous layer.

HPLC VARIABLES
Column: 50 × 4.6 3 μm Sepralyte C18 (Analytichem)
Mobile phase: MeCN:buffer 25:75 (plasma) or 31:69 (urine) (Buffer was 200 mM sodium perchlorate containing 100 mM phosphoric acid, pH 1.7.)
Column temperature: 40
Flow rate: 1.3
Injection volume: 50
Detector: UV 214

CHROMATOGRAM
Retention time: 1.8 (urine), 2.8 (plasma)
Internal standard: 3-bromo-N-[(1-propyl-2-pyrrolidinyl)methyl]-2,6-dimethoxybenzamide (2.6 (urine), 4.5 (plasma))
Limit of quantitation: 50 ng/mL (urine), 12.5 ng/mL (plasma)

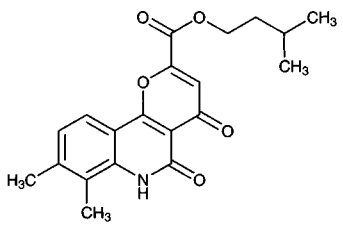
Repirinast

Molecular formula: $C_{20}H_{21}NO_5$
Molecular weight: 355.39
CAS Registry No.: 73080-51-0
Merck Index: 8305
Lednicer No.: 5 175



SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. Adjust pH of 1 mL plasma to 3-4 with 100 µL 1 M HCl, add 1 mL 1 M HCl, add 50 µL 10 µg/mL IS in water, add 5 mL ethyl acetate, shake for 10 min, centrifuge, repeat the extraction. Combine the organic phases and add them to 2 mL 100 mM pH 7.5 phosphate buffer, extract. Remove the aqueous layer and add it to 100 µL PIC A low

UV reagent (tetrabutylammonium bromide, Waters), add the mixture to a Bond Elut C8 SPE cartridge, elute with 7 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 50°, reconstitute the residue in 500 μL mobile phase, inject an aliquot. Urine. Dilute 100 μL urine to 10 mL with pH 2 citrate/HCl buffer, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4 5 μm Hypersil ODS
Mobile phase: MeCN:MeOH:buffer 5:30:65 to 5:45:50 (Buffer was 5 mM pH 3 tetrabutylammonium bromide.)
Column temperature: 65
Flow rate: 1.2
Detector: UV 345

CHROMATOGRAM
Retention time: 9.3 (as the active metabolite, the free acid, BAY w 8199)
Internal standard: BAY × 1453 (10.1)
Limit of quantitation: 10 ng/mL

KEY WORDS
plasma; pharmacokinetics; SPE

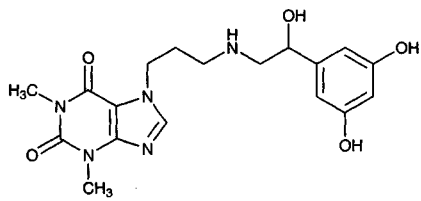
Reproterol



Molecular formula: $C_{18}H_{23}N_5O_5$
Molecular weight: 389.41
CAS Registry No.: 54063-54-6, 13055-82-8 (HCl)
Merck Index: 8307

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL C18 Bond Elut SPE cartridge with 1mL MeCN and 1 mL 100 mM pH 6.5 ammonium acetate buffer. Mix 250 μL plasma with 10 ng IS, 100 μL 10 mM HCl, and 500 μL 100 mM pH 6.5 ammonium acetate buffer. Make up to 1 mL with 100 mM pH 6.5 ammonium acetate buffer, vortex briefly. Add the mixture to the SPE cartridge. Wash with 400 μL MeCN:2.5 mM pH 6.5 ammonium acetate buffer 20:80, elute with 400 μL mobile phase (also defined as MeCN:2.5 mM pH 6.5 ammonium acetate buffer 80:20). Use the automatic sample processor (ASPEC XL, Gilson, France) to transfer a 100 μL aliquot into autosampler vial. Inject a 100 μL aliquot.

HPLC VARIABLES
Column: 30 × 4.6 5 μm. Guard column ODS (30) Phenomenex-Ultracarb (Phenomenex, USA)
Mobile phase: MeCN:2.5 mM pH 6.5 aqueous ammonium acetate 20:80
Flow rate: 1.0
Injection volume: 100
Detector: MS, Finnigan MAT TSQ 7000 triple-stage-quadrupole, positive mode, collision gas xenon, 133.32 Pa, 20 eV, heated vaporiser temperature 475°, sheath gas nitrogen 344.74 KPa, auxiliary gas nitrogen, exact flow rate not measured, 5 μA, heated capillary temperature 180°., m/z 390

CHROMATOGRAM
Retention time: 0.3-0.5
Internal standard: D-4908 (7-{3-[2-(2,5-dihydroxyphenyl)-2-hydroxyethylamino]-(1-methylpropyl)}theophylline; ASTA Medica, Germany; m/z 404) (0.3-0.5)

Limit of quantitation: 400 pg/mL

KEY WORDS
plasma; SPE; pharmacokinetics

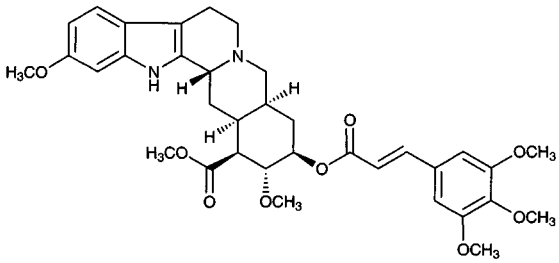
Rescinnamine



Molecular formula: $C_{35}H_{42}N_2O_9$
Molecular weight: 634.73
CAS Registry No.: 24815-24-5
Merck Index: 8311
Lednicer No.: 1 319

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 125 × 4.9 Spherisorb S5W silica
Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7
Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM
Retention time: 1.4

OTHER SUBSTANCES
Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzphetamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, buclizine, bufotenine, bupivacaine, buprenorphine, butacaine, butethamate, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorpromazine, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene, dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, lofepramine, loxapine, maprotiline, mecamylamine, meclophenoxate, meclozine, medazepam, mephentermine, mepivacaine, meptazinol, mepyramine, mesoridazine, metaraminol, methadone, methamphetamine, methapyrilene, methdilazene, methotrimeprazine, methoxamine, methoxyphenamine, methoxypromazine, methylephedrine, methylergonovine, methysergide, metoclopramide, metopimazine, metoprolol, mianserin, morazone, nadolol, nalorphine, naloxone, naphazoline, nicotine, nifedipine, nomifensine, nortriptyline, noscapine, orphenadrine, oxeladin, oxprenolol, oxymetazolin, papaver-

ine, pargyline, pecazine, penbutolol, pentazocine, penthienate, pericyazine, perphenazine, phenadoxone, phenampromide, phenazocine, phenbutrazate, phendimetrazine, phenelzine, phenglutarimide, phenindamine, pheniramine, phenmetrazine, phenomorphan, phenoperidine, phenothiazine, phenoxybenzamine, phentolamine, phenylephrine, phenyltoloxamine, physostigmine, piminodine, pimozide, pindolol, pipamazine, pipazethate, piperacetazine, piperidolate, pipradol, pirenzepine, piritramide, pizotifen, practolol, pramoxine, prazosin, prenylamine, prilocaine, primaquine, proadifen, procainamide, procaine, prochlorperazine, procyclidine, proheptazine, prolintane, promazine, promethazine, pronethalol, properidine, propiomazine, propranolol, prothipendyl, protriptyline, proxymetacaine, pseudoephedrine, pyrimethamine, quinidine, quinine, ranitidine, sotalol, tacrine, terazosin, terbutaline, terfenadine, thenyldiamine, theophylline, thiethylperazine, thiopropazate, thioproperazine, thioridazine, thiothixene, thonzylamine, timolol, tocainide, tolpropamine, tolycaine, tranylcypromine, trazodone, trifluoperazine, trifluperidol, trimeperidine, trimeprazine, trimethobenzamide, trimethoprim, trimipramine, tripelennamine, triprolidine, tryptamine, verapamil, xylometazoline

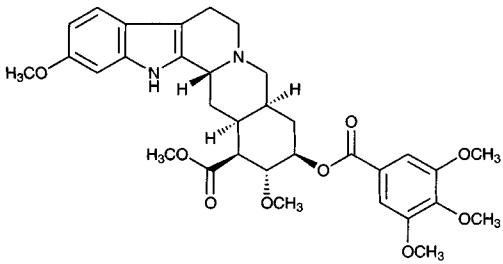
Reserpine

Molecular formula: $C_{33}H_{40}N_2O_9$
Molecular weight: 608.69
CAS Registry No.: 50-55-5
Merck Index: 8314



SAMPLE
Matrix: blood
Sample preparation: 2 mL Plasma + 2 mL saturated sodium borate in water + 3 mL benzene (Caution! Benzene is a carcinogen!), rotate at slow speed for 5 min, centrifuge for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 30 µL reagent, mix well, let stand for at least 10 min, inject a 20 µL aliquot. (Prepare reagent by adding 1 mL saturated vanadium pentoxide in concentrated phosphoric acid to 9 mL MeOH.)

HPLC VARIABLES
Column: 300 × 4 µBondapak C18
Mobile phase: MeOH:10 mM sodium heptanesulfonate 65:35
Flow rate: 2.5
Injection volume: 20
Detector: F ex 390 em 470 (cut-off filter)

CHROMATOGRAM
Retention time: 6
Limit of detection: 100 pg/mL

OTHER SUBSTANCES
Interfering: rescinnamine

KEY WORDS
plasma; horse; comparison with TLC method

REFERENCE
Sams,R. Determination of reserpine in plasma using high-performance liquid chromatography with fluorescence detection, *Anal.Lett.*, **1978**, *B11*, 697–707.

SAMPLE
Matrix: blood
Sample preparation: 3 mL Plasma + 45 μL 100 ng/mL IS in 10 mM HCl + 1 mL 600 mM pH 9.5 carbonate buffer + 10 mL n-heptane:isoamyl alcohol 98.5:1.5, shake for 10 min, centrifuge for 10 min. remove the organic layer and add it to 1.2 mL 100 mM HCl, shake for 10 min, centrifuge for 10 min. Remove the aqueous layer and add it to 500 μL 600 mM pH 9.5 carbonate buffer, add 500 μL MTBE, mix, centrifuge for 5 min. Remove the organic layer and evaporate it to dryness under reduced pressure, add 40 μL reagent, let stand for at least 10 min, inject the whole amount. (Reagent was a 1 in 10 mixture of a saturated solution of vanadium pentoxide in MeOH.)

HPLC VARIABLES
Column: 250 × 4.6 5 μm LC-1 trimethylsilyl (Supelco)
Mobile phase: MeCN:100 mM pH 4.2 acetate buffer containing 5 mM heptanesulfonate and 10 mM triethylamine
Flow rate: 1.6
Injection volume: 40
Detector: F ex 390 em 480

CHROMATOGRAM
Retention time: 5.2
Internal standard: methyl-18-triethoxybenzoylreserpate (7.8)
Limit of detection: 0.1 ng/mL
Limit of quantitation: 0.3 ng/mL

OTHER SUBSTANCES
Noninterfering: metabolites

KEY WORDS
derivatization; plasma; pharmacokinetics

SAMPLE
Matrix: blood
Sample preparation: 3 mL Plasma + 3 mL saturated sodium borate in water + 4.5 mL n-hexane:dichloromethane 50:50, mix for 20 min on a rotating tumbler, centrifuge at 2000 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 50 μL reagent, let stand for 25 min, inject a 20 μL aliquot. (Reagent was 1 mL of a saturated solution of vanadium pentoxide in concentrated phosphoric acid and 9 mL MeOH.)

HPLC VARIABLES
Column: 300 × 3.9 μBondapak C18
Mobile phase: MeOH:10 mM sodium heptanesulfonate in water 65:35
Flow rate: 2
Injection volume: 20
Detector: F ex 390 em 470

CHROMATOGRAM
Retention time: 6.5
Limit of detection: 70 pg/mL

SAMPLE

Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 µm NovaPack C18

Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)

Column temperature: 30

Flow rate: 0.8

Injection volume: 50

Detector: UV 268

CHROMATOGRAM

Retention time: 5.94

Limit of detection: <120 ng/mL

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 218.1

CHROMATOGRAM
Retention time: 16.433

KEY WORDS
whole blood

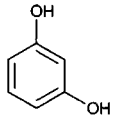
Resorcinol



Molecular formula: $C_6H_6O_2$

Molecular weight: 110.11

CAS Registry No.: 108-46-3

Merck Index: 8323

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200

CHROMATOGRAM
Retention time: 8.027

KEY WORDS
whole blood

SAMPLE
Matrix: solutions
Sample preparation: Aqueous food simulants. Pipette 1.0 mL 200 mg/L IS in MeOH into a 25 mL volumetric flask and dilute to the mark with the food simulant obtained from migration experiment, shake. Repeat the procedure to obtain a duplicate sample, filter a portion through a 0.2 μm membrane filter, inject a 20 μL aliquot. Olive oil simulants. Weigh 25 g olive oil food simulant obtained from migration experiment into a beaker, pour oil into a separating funnel, allow beaker to drain for 30 s. Rinse it with 25 mL hexane and add washes to separating funnel. Add 1.0 mL 200 mg/L IS in MeOH into funnel and mix. Add 10 mL water, shake vigorously by hand for 30 s, allow to stand for 5 min. Collect aqueous phase and reextract oil with a 10 mL water. Combine aqueous extracts, make up to25 mL with water, filter the extracts through a small cotton plug to remove any entrained oil. Repeat the procedure to obtain a duplicate sample. Inject a 20 μL aliquot. (Aqueous food simulants were: distilled water, 3% acetic acid in water; EtOH:water 15:85.)

HPLC VARIABLES
Column: 250 × 4.6 5 μm Hypersil ODS
Mobile phase: MeCN:buffer 15:85 (Prepare mobile phase as follows. Dissolve 7.5 g sodium dihydrogen orthophosphate in 800 mL water, add 150 mL MeCN and adjust to pH 3.6 with glacial acetic acid. Make up to 1000 mL with water.)
Flow rate: 1
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Retention time: 6.5
Internal standard: 2-methyl-1,3-dihydroxybenzene (7.4)
Limit of detection: 100 ng/g

OTHER SUBSTANCES
Extracted: hydroquinone, pyrocatechol

KEY WORDS
aqueous food simulants; olive oil simulants

SAMPLE
Matrix: blood
Sample preparation: Mix 100 μL serum with 200 μL MeCN and 10 μL 20 mM ascorbic acid, centrifuge at 16000 g for 5 min. Mix the supernatant with 200 μL water, inject a 2 μL aliquot. (Protect all solutions from light.)

HPLC VARIABLES
Column: 50 × 0.18 3 μm ODS-AQ (YMC, Wilmington, NC) (The separation capillary column was formed from fused-silica capillaries (Polymicro Technologies, Phoenix) by inserting a small 50 μm I.D. capillary ca. 15 mm into a larger 180 μm I.D. capillary and fixed by applying epoxy (No. 353ND, Epoxy Technology, Billerica MA). A glass filter paper frit (Whatman GF/A) was inserted into the larger capillary and forced against the smaller capillary with a stream of isopropanol. The stationary phase was suspended in 3 mL isopropanol and pumped into the larger capillary until a 50 mm bed was formed. The larger and smaller diameter capillaries extended no more than 100 and 16 mm from the frit, respectively.)
Mobile phase: MeCN:MeOH:water 65:2.5:32.5 containing 1% tetrabutylammonium perchlorate, adjusted to pH 5.0 with acetic acid and 174 mM sodium acetate
Flow rate: 0.004
Injection volume: 2
Detector: E, carbon-fiber working electrode +900 mV, Ag/AgCl reference electrode (details of preparation in paper)

CHROMATOGRAM
Retention time: 9.0 (isotretinoin), 9.5 (tretinoin)
Limit of detection: 410 pg/mL (isotretinoin), 64 pg/mL (tretinoin)
Limit of quantitation: 49.6 fmol (isotretinoin), 87.6 fmol (tretinoin)

OTHER SUBSTANCES
Extracted: retinaldehyde, retinol

KEY WORDS
cow; serum; capillary HPLC

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 750 μL 100 ng/mL acitretin in MeCN:9 mM NaOH 20:80, centrifuge at 1500 g for 3 min, inject a 500 μL aliquot onto column A with mobile phase A and elute for 7 min, elute column A in backflush mode with mobile phase A for 3 min, backflush contents of column A onto column B with mobile phase B and start the gradient for mobile phase B. At the end of the process flush the lines with component B of mobile phase B, re-equilibrate columns for 4 min. (Keep sample at 10° in the autosampler.)

HPLC VARIABLES
Column: A 14 × 4.6 37-50 μm Bondapak C18 Corasil (column fitted with 3 μm sieves not glass fiber filters); B 30 × 4 5 μm Spherisorb ODS 1 + 125 × 4 5 μm Spherisorb ODS 1 + 125 × 4 5 μm Spherisorb ODS 1
Mobile phase: A MeCN:1% ammonium acetate 10:90; B Gradient. A was MeCN:water:10% ammonium acetate:acetic acid 600:400:4:30. B was MeCN:water:10% ammonium acetate:acetic acid 850:146:4:10. A:B 100:0 to 70:30 over 6 min, then to 0:100 over 5 min, stay at 0:100 for 11 min.
Flow rate: A 1.5; B 1
Injection volume: 500
Detector: UV 360

CHROMATOGRAM
Retention time: 25 (isotretinoin), 27 (tretinoin)
Internal standard: acitretin (23)
Limit of detection: 0.5-1 ng/mL
Limit of quantitation: 2 ng/mL

OTHER SUBSTANCES
Simultaneous: tretinoin, 4-oxoisotretinoin, 4-oxotretinoin, metabolites

SAMPLE
Matrix: culture media
Sample preparation: 100 μL Culture media + 200 μL ice-cold EtOH, mix thoroughly, let stand for 15 min, centrifuge at 12000 g for 15 min, inject an aliquot of the supernatant.

HPLC VARIABLES
Guard column: Whatman CO:PELL ODS guard column
Column: 100 × 8 5 μm Nova-Pak C18 (radial-packed)
Mobile phase: MeOH:100 mM pH 7.0 ammonium acetate 90:10
Flow rate: 1
Detector: UV 340

CHROMATOGRAM
Retention time: 9.44 (tretinoin)

OTHER SUBSTANCES
Extracted: isotretin, motretinid, acitretin, Vitamin A (retinol), retinal, etretinate

REFERENCE
Kochhar,D.M.; Penner,J.D.; Minutella,L.M. Biotransformation of etretinate and developmental toxicity of etretin and other aromatic retinoids in teratogenesis bioassays, *Drug Metab.Dispos.*, **1989**, *17*, 618–624.

SAMPLE
Matrix: formulations
Sample preparation: Weigh out 1.25 g 0.1% isotretinoin cream or 0.05% isotretinoin gel, make up to 10 mL with MeOH, vortex for 15 min. Cut open two 10 mg isotretinoin capsules, add about 40 mL MeOH, sonicate for 10 min, filter, make up to 100 mL with MeOH. Grind 10% isotretinoin beadlets to powder, weigh out a 1.25 mg aliquot. Add 100 μL cream, gel, or capsule solution to 0.5 mL stainless steel extraction cartridge partially filled with Celite, complete filling with Celite, load the cartridge into the extraction chamber. Alternatively, directly add 1.25 mg beadlets powder to the extraction chamber (Supercritical Fluid Extractor, Isco, model SFX 2-10). Extract using the following conditions: chamber and restrictor temperature 45°, pressure 325 atm, static extraction time 2.5 min, dynamic extraction time 5 min, mobile phase MeOH:CO_2 5:95, solvent trap 17 mL MeOH. After extraction cool the MeOH extract to room temperature for 10 min, make up to 25 mL with MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Spherisorb ODS-2
Mobile phase: MeCN:MeOH:0.05% glacial acid 42.5:32.5:25
Flow rate: 1.2
Injection volume: 20
Detector: UV 360

CHROMATOGRAM
Retention time: 25.0 (isotretinoin), 30.3 (alitretinoin (9-cis)), 33.2 (tretinoin)

OTHER SUBSTANCES
Extracted: 11,13-di-*cis* retinoic acid, 9,13-di-*cis* retinoic acid, 9-*cis* retinoic acid, tretinoin

KEY WORDS
beadlets; capsule; cream; gel; SFE

SAMPLE
Matrix: milk
Sample preparation: Mix 50 mL milk with 30 mL ethanolic KOH (10:30). Saponify the mixture at 80° for 20 min. Extract twice with 10 mL n-hexane. Evaporate the extracts to dryness, reconstitute the residue with 1 mL mobile phase, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5μm C18 (Alltech)
Mobile phase: MeOH:EtOH 80:20
Flow rate: 1
Injection volume: 5
Detector: UV 250

CHROMATOGRAM
Retention time: 2.97 (isotretinoin), 3.38 (tretinoin)

OTHER SUBSTANCES
Extracted: retinal, vitamin A, vitamin D2, vitamin D3, vitamin E, vitamin K1, vitamin K2

REFERENCE
Gong,B.Y.; Ho,J.W. Simultaneous separation and detection of ten common fat-soluble vitamins in milk, *J.Liq.Chromatogr.Rel.Technol.*, **1997**, *20*, 2389–2397.

SAMPLE
Matrix: silicone oils
Sample preparation: Condition a 1 g Si Bond-Elut SPE cartridge with 5 mL n-hexane. Mix 1 g silicone oil with 2 mL dichloromethane, vortex for 2 min, centrifuge at 3000 g. Withdrawn the supernatant, repeat this procedure twice, filter (0.45 μm), heat the filtrate at 50°, expose to a stream of helium for 30 min. Add 2.5 μg retinol acetate, 2.5 μg α-tocopherol acetate, and 25 μg BHT. Add the mixture to the SPE cartridge, elute with 500 μL MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Zorbax C8
Mobile phase: Gradient. A was MeCN:200 mM ammonium acetate 72:25. B was MeOH:water 95:5. A:B 100:0 for 10 min, to 0:100 over 1 min, maintain at 0:100 for 14 min
Flow rate: 2 for 10 min then 1.5
Injection volume: 20
Detector: UV 350

CHROMATOGRAM
Retention time: 2
Internal standard: retinol acetate (9.5)
Limit of detection: 79.2 ng/mL
Limit of quantitation: 264.1 ng/mL

OTHER SUBSTANCES
Extracted: cholesterol (UV 210), retinal (UV 350), α-tocopherol acetate (UV 210), vitamin A (UV 350), vitamin E (UV 210)

KEY WORDS
ophthalmic silicone oils; SPE

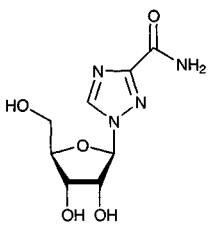
Ribavirin

Molecular formula: $C_8H_{12}N_4O_5$
Molecular weight: 244.21
CAS Registry No.: 36791-04-5
Merck Index: 8365



SAMPLE
Matrix: blood, CSF
Sample preparation: Prepare a boronate affinity gel SPE column by packing 100 mg Affi-Gel 601 (Bio-Rad) into a 65 × 6 1.5 mL polypropylene column, condition with 10 mL buffer, store at 4°, immediately before use condition further with two 1 mL aliquots of buffer. 500 μL Serum, plasma, or CSF + 500 μL buffer + 25 μL 100 μg/mL 3-methylcytidine methosulfate in water, mix, add to the SPE column, wash with five 1 mL portions of buffer, elute with two 1 mL portions of 100 mM formic acid. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 100 μL mobile phase, inject the whole amount. Buffer was 250 mM pH 8.8 ammonium acetate.)

HPLC VARIABLES
Column: two 300 × 4 μBondapak C18 columns in series
Mobile phase: 10 mM Ammonium phosphate adjusted to pH 2.5 with 85% phosphoric acid
Flow rate: 1.5
Injection volume: 100
Detector: UV 235

CHROMATOGRAM
Retention time: 8.0
Internal standard: 3-methylcytidine methosulfate (11.0)
Limit of detection: 100 nM

OTHER SUBSTANCES
Noninterfering: acetaminophen, N-acetylprocainamide, acyclovir, amikacin, 5-aminoimidazole-4-carboxamide-1-β-D-ribofuranoside, amitriptyline, azidothymidine, caffeine, carbamazepine, chloramphenicol, cyclosporin A , cytidine, desipramine, diazepam, digoxin, disopyramide, ethosuximide, gentamicin, imipramine, kanamycin, lidocaine, lithium, methotrexate, 1-methyladenosine, 5-methylcytidine, 7-methylguanosine, 7-methylinosine, netilmicin, nortriptyline, phenobarbital, phenytoin, primidone, procainamide, quinidine, salicylic acid, theophylline, 2-thiocytidine, tobramycin, uridine, valproic acid, vancomycin, zalcitabine

SAMPLE
Matrix: blood, tissue, tracheal aspirate
Sample preparation: Dilute tracheal aspirates 10-100 fold with 250 mM pH 8.8 ammonium acetate buffer. Homogenize (glass/PTFE homogenizer) mouse lung with 1 mL water, centrifuge at 13000 g. Filter (Amicon CF25) 1 mL plasma, serum, diluted tracheal aspirate, or lung homogenate while centrifuging at 500 relative centrifugal force (RCF) for 30 min, dilute ultrafiltrate with a volume of 2.5 M pH 8.8 ammonium acetate buffer equal to 10% of the volume of ultrafiltrate, add the mixture to the SPE cartridge, wash with 7 mL 250 mM pH 8.8 ammonium acetate buffer, elute with 6 mL 100 mM formic acid. Lyophilize the eluate, reconstitute with a volume of mobile phase equal to the original volume of ultrafiltrate, inject a 50 μL aliquot. (Soak the CF25 filters in water for 1 h before use. Prepare SPE cartridges by slurrying Matrex PBA-60 gel (88.87 μmole boron per mL, Amicon) in 250 mM pH 8.8 ammonium acetate and packing it into a 40 × 7 column to a bed volume of 1 mL, pass 50 mL 250 mM pH 8.8 ammonium acetate through the column.)

HPLC VARIABLES
Guard column: Guard Pak C18 (Waters)
Column: 250 × 4.6 5 μm Microsorb C18
Mobile phase: MeOH:buffer 1:99 adjusted to pH 5.10 with 10% ammonium hydroxide or 8% phosphoric acid (Buffer was 20 mM ammonium phosphate. Following each analysis flush column with a gradient of MeCN:water from 0:100 to 80:20.)
Flow rate: 1
Injection volume: 50
Detector: UV 207

CHROMATOGRAM
Retention time: 5.3
Limit of detection: 100 ng/mL

SAMPLE
Matrix: blood, urine
Sample preparation: Serum. 1 mL Serum + 5 μg uridine, vortex, add 1 mL water, vortex, filter (Centricon 30 membrane, 30 000 exclusion limit) while centrifuging at 2750 g for 2 h, wash the filtrate with 1.5 mL dichloromethane, pass the aqueous layer through a 10 mm i.d. column containing 2.3 mL wet 50-100 mesh Dowex 1X4-100 (chloride form) (Sigma) on top of 0.8 mL wet 60-150 mesh Lewatit S-1080 (hydrogen form) (Merck), elute with 3 mL water. Collect all the eluate and evaporate it to dryness under vacuum at 30°. reconstitute in 600 μL water, inject a 20-100 μL aliquot. Urine. 200 μL Urine + 5 μg uridine, vortex for a few s, add the urine mixture dropwise with stirring to 3 mL MeOH, centrifuge at 10° at 10000 g for 20 min. Remove the supernatant and add it to 2 mL n-hexane, mix, discard the hexane layer. Evaporate the MeOH layer to dryness under a nitrogen and vacuum, reconstitute the residue in 3 mL water, inject a 100 μL aliquot (J. Chromatogr. 1978, 160 169).

HPLC VARIABLES
Guard column: Guard Pak RP-18 (Waters)
Column: 250 × 5 7 μm LiChrosorb C18
Mobile phase: Water
Flow rate: 1
Injection volume: 20-100
Detector: UV 207

CHROMATOGRAM
Retention time: 6.9
Internal standard: uridine (13)
Limit of detection: 100 ng/mL

SAMPLE
Matrix: formulations
Sample preparation: Dilute injections with water, inject a 50 μL aliquot. Dissolve tablets or capsule contents in water (warm if necessary), filter (0.5 μm PTFE), inject a 50 μL aliquot of the filtrate. (Dissolve tablets or other formulations containing proteinaceous material in water at 60°, add 5% trichloroacetic acid (to pH 4.4), filter, inject a 50 μL aliquot.)

HPLC VARIABLES
Guard column: pellicular Corasil

Column: 10 μm μBondapak C18
Mobile phase: Gradient. A was prepared by dissolving 1 g sodium dioctylsulfosuccinate in 170 mL MeOH, add 10 mL concentrated formic acid, make up to 800 mL with water, adjust pH to 2.5 with 1 M KOH, make up to 1 L. B was prepared by dissolving 1 g sodium dioctylsulfosuccinate in 450 mL MeOH, add 10 mL concentrated formic acid, make up to 800 mL with water, adjust pH to 4.6, make up to 1 L. A:B 100:0 for 19 min then 0:100 (step gradient) or A:B from 100:0 to 0:100 over 25 min (concave curve 9), maintain at 0:100 for 3 min, return to initial conditions over 2 min.
Flow rate: 1.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 4 (step gradient), 8 (curve gradient), 2 (or riboflavin-5'-phosphate (either system))

OTHER SUBSTANCES
Simultaneous: folic acid (UV 280), niacin, niacinamide, pyridoxamine (UV 280), thiamine, pyridoxine (UV 280), ascorbic acid (UV 280)

KEY WORDS
injections; capsules; tablets

Woollard,D.C. New ion-pair reagent for the high-performance liquid chromatographic separation of B-group vitamins in pharmaceuticals, *J.Chromatogr.*, **1984**, *301*, 470–476.

SAMPLE
Matrix: formulations
Sample preparation: Weigh out 500 mg ground tablets, extract with water, make up to 50 or 100 mL with water, filter, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Nucleosil 10 C18
Mobile phase: MeOH:1% acetic acid 25:75
Flow rate: 1
Injection volume: 20
Detector: UV 270

CHROMATOGRAM
Retention time: 20

OTHER SUBSTANCES
Simultaneous: menadione hydrogen sulfite, niacinamide, pyridoxine, thiamine, ascorbic acid

KEY WORDS
tablets; multi-vitamin

REFERENCE
Sadlej-Sosnowska,N.; Blitek,D.; Wilczynska-Wojtulewicz,I. Determination of menadione sodium hydrogen sulphite and nicotinamide in multivitamin formulations by high-performance liquid chromatography, *J.Chromatogr.*, **1986**, *357*, 227–232.

SAMPLE
Matrix: formulations

HPLC VARIABLES
Column: 100 × 4 3 μm Hypersil BDS-C18
Mobile phase: Gradient. MeCN:water adjusted to pH 2.1 from 0.3:99.7 to 25:75 over 11 min
Flow rate: 0.5

Detector: UV 220

CHROMATOGRAM
Retention time: 10

OTHER SUBSTANCES
Simultaneous: biotin, caffeine, citric acid, folic acid, niacinamide, niacin, pantothenic acid, saccharin, thiamine, pyridoxine, vitamin B12, ascorbic acid

KEY WORDS
tablets

REFERENCE
Hewlett Packard Leaflet 12-5091-7351 EUS, **1993**.

SAMPLE
Matrix: formulations
Sample preparation: Dilute liquid multivitamin formulations, filter (0.45 μm), inject an aliquot.

HPLC VARIABLES
Column: 100 × 2.1 3 μm Spherisorb ODS-2
Mobile phase: MeOH:buffer 20:80 containing 0.1% triethylamine (Buffer was 10 mM KH_2PO_4 containing 5 mM sodium hexanesulfonate adjusted to pH 2.8 with phosphoric acid.)
Flow rate: 0.2 for 5 min, to 0.3 over 0.5 min, 0.3 for 12.5 min
Injection volume: 5
Detector: UV 254

CHROMATOGRAM
Retention time: 16
Limit of detection: 1.80 ng

OTHER SUBSTANCES
Simultaneous: folic acid (UV 280), pyridoxine (UV 280), niacin, niacinamide, thiamine

KEY WORDS
liquid multivitamins; degas solutions with helium; protect from light; narrow bore

REFERENCE

SAMPLE
Matrix: formulations
Sample preparation: Dilute liquid multivitamin formulations, filter (0.45 μm), inject an aliquot.

HPLC VARIABLES
Column: 250 × 4 5 μm Lichrosorb RP-8
Mobile phase: Gradient. A was 10 mM KH_2PO_4 containing 5 mM sodium hexanesulfonate adjusted to pH 2.8 with phosphoric acid. B was MeOH. A:B from 90:10 to 71.8:28.2 over 4 min, maintain at 71.8:28.2 for 1.5 min, to 50:50 over 6.5 min, maintain at 50:50 for 5 min, return to initial conditions over 5 min
Flow rate: 1
Injection volume: 5
Detector: UV 272

CHROMATOGRAM
Retention time: 11.12
Internal standard: theobromine (8)
Limit of detection: 0.465 ng

OTHER SUBSTANCES
Simultaneous: folic acid, niacin, niacinamide, thiamine, pyridoxine (UV 290)

KEY WORDS
liquid multivitamins; degas solutions with helium; protect from light

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 5 μm Accubond Amino (J & W)
Mobile phase: MeCN:buffer 10 :90 (Buffer was 20 mM phosphoric acid adjusted to pH 3.0 with 20 mM NaOH.)
Flow rate: 1
Detector: UV 254

CHROMATOGRAM
Retention time: 2.3

OTHER SUBSTANCES
Simultaneous: p-aminobenzoic acid, niacinamide, pyridoxal, pyridoxamine, thiamine, pyridoxine, vitamin B12

REFERENCE
J & W Catalog, 1992-3, p. 277.

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 33 × 4.6 3 μm Supelcosil LC-8-DB
Mobile phase: MeOH:buffer 15:85 (Buffer was 4.3 mM sodium hexanesulfonate containing 0.1% triethylamine, adjusted to pH 2.8 with phosphoric acid.)
Column temperature: 35
Flow rate: 1
Detector: UV 200

CHROMATOGRAM
Retention time: 3.7

OTHER SUBSTANCES
Simultaneous: niacin, pantothenic acid, pyridoxine, thiamine, niacinamide, ascorbic acid

REFERENCE
Rainin Catalog, C1-94, **1994**, p. 780.

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 100 × 4.6 Spheri-5 RP-8
Mobile phase: Gradient. A was 100 mM pH 4.7 acetate buffer. B was MeCN:100 mM pH 4.7 acetate buffer 25:75.
Column temperature: 26
Flow rate: 4

Detector: UV 254

CHROMATOGRAM
Retention time: 4.2

OTHER SUBSTANCES
Simultaneous: niacin, pyridoxine, thiamine, niacinamide, ascorbic acid

REFERENCE
Rainin Catalog, C1-94, **1994,** p. 7.21.

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 150 × 4.6 5 μm Inertsil ODS-2
Mobile phase: MeCN:50 mM KH_2PO_4 90:10
Flow rate: 1
Detector: UV 210

CHROMATOGRAM
Retention time: 10.5

OTHER SUBSTANCES
Simultaneous: biotin, folic acid, niacin, pantothenic acid, niacinamide

REFERENCE
MetaChem Catalog, **1995,** p. 21.

SAMPLE
Matrix: tissue
Sample preparation: Condition a 500 mg Nucleosil C18 SPE cartridge with 2 mL MeOH, 2 mL MeOH containing 5 mM sodium heptanesulfonate, and two 2 mL portions of water. Suspend 5 g homogenized tissue with 35 mL 10 mM HCl, autoclave at 121° for 30 min, add 2 mL 25 mg/mL taka-distase (Fluka) in 2.5 M sodium acetate, add 2 mL 10 (muscle) or 20 (liver) mg/mL clara-distase (Fluka) in water, add 2 mL 50 mg/mL papain (Merck) in water, adjust pH to 4.5, heat at 37° for 16-18 h, filter (paper), adjust pH to 6.5, filter again, make up to 50 mL with water, add 4 mL to the SPE cartridge, wash with 2 mL MeOH:water 20:80 containing 5 mM sodium heptanesulfonate, elute with 2 mL MeOH:water 50:50 containing 5 mM sodium heptanesulfonate, inject a 50 μL aliquot.

HPLC VARIABLES
Guard column: 20 × 4.6 10 μm Nucleosil C18
Column: 150 × 4.6 3 μm Nucleosil C18
Mobile phase: MeCN:10 mM pH 3.0 KH_2PO_4 16:84 (muscle) or 15:85 (liver) containing 5 mM sodium heptane sulfonate (Wash with MeCN:water 20:80 at the end of the day, store column in MeCN.)
Column temperature: 45
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 4.5 (muscle), 5 (liver)
Limit of detection: 160 ng/g

OTHER SUBSTANCES
Extracted: thiamine

KEY WORDS
pig; muscle; liver; protect from light; SPE

SAMPLE

Matrix: urine
Sample preparation: Centrifuge urine at 1400 g for 10 min, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 70 × 2.1 Co:Pell ODS
Column: 300 × 4 10 μm μBondapak C18
Mobile phase: MeOH:buffer 35:65 (Buffer was 10 mM KH_2PO_4 adjusted to pH 5.0 with 1 M NaOH.)
Flow rate: 2
Injection volume: 50
Detector: F ex 320-400 em 400-700 (filter)

CHROMATOGRAM

Retention time: 4.5 (riboflavin), 3 (riboflavin-5-phosphate)
Limit of detection: 50 ng/mL

KEY WORDS

protect from light

REFERENCE

Smith,M.D. Rapid method for determination of riboflavin in urine by high-performance liquid chromatography, *J.Chromatogr.*, **1980**, *182*, 285–291.

SAMPLE

Matrix: urine
Sample preparation: Preserve urine with oxalic acid, centrifuge at 2000 g for 10 min, inject a 25-100 μL aliquot of the supernatant.

HPLC VARIABLES

Guard column: Bondapak C18/Corasil
Column: 300 × 3.9 μBondapak C18
Mobile phase: MeOH:water 34:66
Flow rate: 1
Injection volume: 25-100
Detector: F ex 450 em 530 (long-pass filter)

CHROMATOGRAM

Retention time: 6.5
Limit of detection: 10 ng/mL

OTHER SUBSTANCES

Simultaneous: lumichrome, lumiflavin
Noninterfering: acriflavine, apresoline, corticosterone, dipyridamole, estradiol, estriol, estrone, ethylenediamine, hydrocortisone, prednisolone, succinic acid, tetrahydrocortisone, testosterone, urobilin

KEY WORDS

protect from light

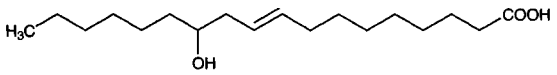
Ricinoleic acid



Molecular formula: $C_{18}H_{34}O_3$
Molecular weight: 298.47
CAS Registry No.: 141-22-0
Merck Index: 8378

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 0.17-1.7 mg/mL solution in MeOH, inject a 30 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: Gradient. A was MeOH containing 0.05% acetic acid. B was water containing 0.05% acetic acid. A:B 85:15 to 100:0 over 40 min, maintain at 100:0.
Flow rate: 1
Injection volume: 30
Detector: evaporative light scattering (ELSD, MK VIII, Varex), drift tube 75°, nitrogen flow 1 L/min, nitrogen pressure 22 psi or UV 205

CHROMATOGRAM
Retention time: 8.95

OTHER SUBSTANCES
Simultaneous: linoleic acid, fatty acids

REFERENCE

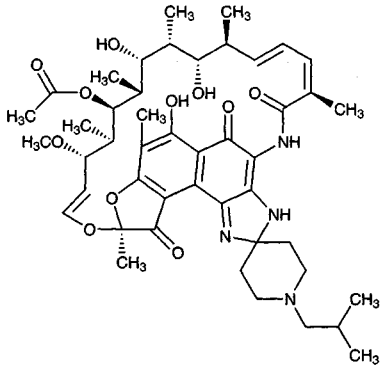
Rifabutin



Molecular formula: $C_{46}H_{62}N_4O_{11}$
Molecular weight: 847.02
CAS Registry No.: 72559-06-9
Merck Index: 8380

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL Bond Elut C8 SPE cartridge with 1 mL MeOH and 1 mL water. 1 mL Plasma + 25 μL 2 μg/mL sulindac in water, vortex briefly, centrifuge at 630 rpm for 5 min, add to the SPE cartridge, wash with 1 mL water, elute with 1 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 250 μL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES
Guard column: 15 × 3.2 RP-8 (Brownlee, ABI)

Column: 250 × 4.6 5 μm Zorbax RX C8
Mobile phase: MeCN:buffer 47:53 (Buffer was 50 mM KH_2PO_4 containing 50 mM sodium acetate, pH adjusted to 4.0 with acetic acid.)
Flow rate: 1
Injection volume: 100
Detector: UV 275

CHROMATOGRAM
Retention time: 10.8
Internal standard: sulindac (6.9)
Limit of quantitation: 5 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: atevirdine, delavirdine, U-89,255, U-96,183

KEY WORDS
plasma; protect from light; pharmacokinetics; rugged; SPE

REFERENCE

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 1 mL Plasma + 500 μL 50 mM pH 7.4 KH_2PO_4, mix, add 2 mL dichloromethane:isooctane 40:60, vortex for 10 min, centrifuge at 1200 g for 10 min, repeat extraction. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 300 μL mobile phase, add 1 mL n-hexane, wash, centrifuge at 1200 g for 5 min, discard hexane layer, repeat wash, inject a 200 μL aliquot of the aqueous phase. Urine. Inject an aliquot directly.

HPLC VARIABLES
Guard column: 30-38 μm CO:PELL ODS
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:50 mM KH_2PO_4 40:60
Flow rate: 1
Injection volume: 200
Detector: UV 275

CHROMATOGRAM
Retention time: 24.0
Limit of detection: 15 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 1 mL Plasma + 20 μL 5 μg/mL medazepam in MeOH + 1 mL buffer + 7 mL hexane:ethyl acetate 80:20, vortex for 10 s, centrifuge at 1200 rpm for 10 min, repeat extraction. Combine the organic layers and evaporate them to dryness under reduced pressure at 40°, reconstitute with 250 μL hexane:ethyl acetate 80:20, add 200 μL 50 mM phosphoric acid, vortex for 10 s, centrifuge at 1200 rpm for 1-2 min, freeze in dry ice/isopro-

panol, discard the organic layer, wash the frozen aqueous layer with 1 mL hexane, thaw, place under reduced pressure at room temperature for 10 min, add 100 μL 250 mM ammonium acetate in MeOH, mix, inject a 100 μL aliquot. Urine. 1 mL Urine + 20 μL 50 μg/mL medazepam in MeOH + 50 μL 3.6 M aqueous sulfuric acid, mix. Remove a 200 μL aliquot and add it to 800 μL 100 mM ammonium acetate in MeOH:water 40:60, mix, inject a 100 μL aliquot. (Buffer was 250 mM KH_2PO_4 containing 50 mM sodium 1-heptanesulfonate adjusted to pH 7.4.)

HPLC VARIABLES
Guard column: 15 × 3.2 NewGuard RP-18 (Brownlee)
Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeCN:buffer 38:62 (Buffer was 50 mM KH_2PO_4:triethylamine 61.5:0.5 adjusted to pH 4.2 with phosphoric acid.)
Column temperature: 40
Flow rate: 1
Injection volume: 100
Detector: UV 275

CHROMATOGRAM
Retention time: 22
Internal standard: medazepam (19)
Limit of quantitation: 100 ng/mL (urine), 5 ng/mL (plasma)

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: clofazimine
Noninterfering: amikacin, isoniazid, streptomycin, zidovudine

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 208.7

Guard column: 50 × 4.6 30 μm C8
Column: 250 × 4.6 5 μm Spherisorb C8
Mobile phase: Gradient. MeCN:5 mM pH 3.5 phosphate buffer from 6:94 to 90:10 over 5 min, maintain at 90:10 for 12 min.
Flow rate: 2
Injection volume: 20
Detector: UV 248

CHROMATOGRAM
Retention time: 11.9
Internal standard: N-butarylaminophenol (4.22)
Limit of detection: 200 ng/mL

OTHER SUBSTANCES
Extracted: pyrazinamide

KEY WORDS
plasma

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: Condition a 3 mL 15 mg SPEC.C8 SPE disc (ANSYS) or a Bond-Elut C8 SPE cartridge with two 1 mL portions of MeCN and two 1 mL portions of 100 mM HCl. 500 μL Serum + 200 μL 5% ascorbic acid in 100 mM HCl + 100 μL 50 μg/mL papaverine hydrochloride in water, mix well, add to the SPE disc or cartridge, apply a vacuum for 20 min, elute with five 100 μL portions of MeCN:MeOH 60:40. Evaporate the eluate to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 300 μL 100 mM HCl:water 67:33, inject a 50 μL aliquot. (Disc gave higher recoveries than cartridge.)

HPLC VARIABLES
Guard column: ODS
Column: 250 × 4.6 Spherisorb ODS-1
Mobile phase: MeCN:100 mM pH 4.7 KH_2PO_4 35:65
Column temperature: 40
Flow rate: 1.2
Injection volume: 50
Detector: UV 340

CHROMATOGRAM
Retention time: 11.5
Internal standard: papaverine (14.9)

OTHER SUBSTANCES
Extracted: metabolites

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL Bond Elut C2 SPE cartridge with 1 mL MeOH and 1 mL water. 500 µL Plasma + 25 µL 2 µg/mL sulindac in water + 100 µL 100 mM HCl, vortex briefly, centrifuge at 630 rpm for 5 min, add to the SPE cartridge, wash with 1 mL water, elute with 1 mL MeOH, add the eluate to 500 µL 3 mg/mL ascorbic acid, inject a 150 µL aliquot.

HPLC VARIABLES
Guard column: 15 × 3.2 7 µm RP-8 (Brownlee, ABI)
Column: 250 × 4.6 5 µm Zorbax RX C8
Mobile phase: MeCN:50 mM KH_2PO_4 45:55
Flow rate: 1
Injection volume: 150
Detector: UV 340

CHROMATOGRAM
Retention time: 4.4
Internal standard: sulindac (7.8)
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES
Simultaneous: atevirdine, delavirdine, U-89,255, U-96,183

SAMPLE
Matrix: blood, CSF
Sample preparation: 200 µL CSF or plasma + dimethylaminobenzoic acid + 200 µL MeOH, mix, add 1 mL buffer, add 7 mL dichloromethane:diethyl ether 40:60, shake for 15 min, centrifuge at 2500 g for 10 min. Remove the organic layer and evaporate it to dryness AT 45°, reconstitute the residue in 50 µl MeOH, vortex for 10 s, inject a 25 µL aliquot. (Buffer was 1 M KH_2PO_4 containing 0.2% ascorbic acid, pH adjusted to 4.2 with 1 M HCl.)

HPLC VARIABLES
Guard column: 50 × 4.6 30 µm C8
Column: 250 × 4.6 5 µm Lichrosorb RP-8
Mobile phase: MeCN:10 mM pH 3.5 phosphate buffer 48:52
Flow rate: 1.5
Injection volume: 25
Detector: UV 215

CHROMATOGRAM
Retention time: 5.8
Internal standard: dimethylaminobenzoic acid (3.8)
Limit of detection: 500 ng/mL

OTHER SUBSTANCES
Noninterfering: p-aminosalicylic acid, pyrazinamide, isoniazid

KEY WORDS
plasma; rabbit

REFERENCE
Chan,K. Rifampicin concentrations in cerebrospinal fluid and plasma of the rabbit by high performance liquid chromatography, *Methods Find.Exp.Clin.Pharmacol.*, **1986**, *8*, 721–726.

SAMPLE
Matrix: blood, CSF
Sample preparation: 200 μL Serum, plasma, or CSF + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, elute the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine hydrochloride and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES
Column: A 30 × 2.1 40 μm preparative grade C18 (Analytichem); B 250 × 4.6 10 μm Partisil C8
Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 15 min, maintain at 30:70 for 4 min.
Column temperature: 50
Flow rate: 1.5
Detector: UV 280 for 5 min then UV 254

CHROMATOGRAM
Retention time: 12.93, 16.28, 17.16 (compound undergoes decomposition)
Internal standard: heptanophenone (19.2)

OTHER SUBSTANCES
Extracted: acetazolamide, ampicillin, bromazepam, caffeine, carbamazepine, chloramphenicol, chlorothiazide, diazepam, droperidol, ethionamide, furosemide, isoniazid, methadone, penicillin G, phenobarbital, phenytoin, prazepam, propoxyphene, pyrazinamide, trimeprazine, trimethoprim

Merck Index: 8388

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 9.8

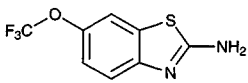
Riluzole



Molecular formula: $C_8H_5F_3N_2OS$
Molecular weight: 234.20
CAS Registry No.: 1744-22-5
Merck Index: 8389

SAMPLE

Matrix: blood
Sample preparation: Add 100-200 ng IS to 1 mL plasma adjusted to pH 6.0. Vortex, centrifuge at 2000 g for 5 min. Add to a 1 mL C2 Bond Elut SPE cartridge or CBA Bond Elut ion exchange SPE cartridge. Wash with 1 mL 10 mM dipotassium hydrogen phosphate, 500 µL water, and MeOH:water 10:90. Elute with 500 µL mobile phase, dry under a stream of nitrogen. Inject a 300 µL aliquot.

HPLC VARIABLES
Guard column: 39 × 4.6 μBondapak C18
Column: 300 × 4.6 μBondapak C18
Mobile phase: MeCN:MeOH:acetic acid:dipotassium hydrogen phosphate 10:55:1:35
Flow rate: 1
Injection volume: 300
Detector: UV 265

CHROMATOGRAM
Retention time: 9.2
Internal standard: RP 61307 (riluzole N-methyl derivative) (12.4)
Limit of detection: 5 ng/mL

KEY WORDS
plasma; pharmacokinetics; SPE

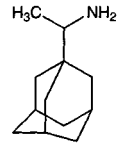
Rimantadine



Molecular formula: $C_{12}H_{21}N$
Molecular weight: 179.31
CAS Registry No.: 13392-28-4, 1501-84-4 (HCl)
Merck Index: 8390
Lednicer No.: 2 19

SAMPLE
Matrix: solutions

Sample preparation: 50 μL 5 mg/mL Rimantadine in 100 mM HCl + 50 μL buffer + 100 μL reagent, swirl for 1 min, place on ice for 5 min, add 2 mL mobile phase, inject a 5 μL aliquot. (Buffer was 100 mM sodium borate adjusted to pH 9.50 with 2 M NaOH. Reagent was 13.40 g o-phthaldialdehyde and 36.4 mg 2,3,4,6-tetra-O-acetyl-1-thio-β-D-glucopyranoside in 1 mL MeOH, protect from light, keep on ice.)

HPLC VARIABLES

Column: 150 × 3.9 4 μm Nova-Pak C18
Mobile phase: MeOH:buffer 85:15 (Buffer was 3 mL/L glacial acetic acid in water, pH adjusted to 7.20 with 2 M NaOH.)
Flow rate: 1
Injection volume: 5
Detector: F ex 338 em 420 or UV 254

CHROMATOGRAM

Retention time: 5.88, 7.11 (enantiomers)
Limit of detection: 6 ng (UV)

KEY WORDS

derivatization; protect from light; chiral

SAMPLE

Matrix: urine
Sample preparation: Adjust pH of 8 mL urine to 5.5 with 2 M HCl, add 80 μL Glusulase (DuPont), heat at 37° for 18 h. Remove a 2 mL aliquot and add it to 500 μL 5 M NaOH, add 8 mL cyclohexane saturated with triethanolamine:chloroform 2:1, add 100 μL 2% pentafluorobenzoyl chloride in cyclohexane, shake at 30 strokes/min for 20 min, centrifuge at 1500 g. Remove 7.5 mL of the upper organic layer and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 160 μL heptane:isopropanol 95:5, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4.6 Zorbax silica
Mobile phase: Gradient. Hexane:isopropanol 95:5 for 10 min, to 90:10 over 20 min, re-equilibrate for 5 min.
Flow rate: 1.5
Detector: radioactivity

CHROMATOGRAM

Retention time: 6.4

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

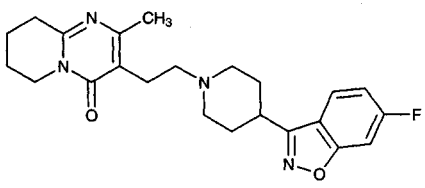
Risperidone



Molecular formula: $C_{23}H_{27}FN_4O_2$
Molecular weight: 410.49
CAS Registry No.: 106266-06-2
Merck Index: 8397
Lednicer No.: 5 150

SAMPLE

Matrix: blood
Sample preparation: 1 mL Serum + 500 μL 600 mM pH 10 sodium carbonate/bicarbonate buffer + 50 μL 3.76 mg/mL IS in MeOH + 8 mL heptane:isoamyl alcohol 98:2, shake at 250 cycles/min for 5 min, centrifuge at 1500 g for 10 min. Freeze the aqueous layer, evaporate the heptane layer to dryness under a gentle stream of nitrogen at 60°. Dissolve the residue in 75 μL mobile phase, inject a 65 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 LiChroCart
Mobile phase: MeOH:40 mM pH 7.0 ammonium acetate buffer 90:10
Flow rate: 1
Injection volume: 65
Detector: UV 280

CHROMATOGRAM

Retention time: 4.42
Internal standard: haloperidol (5.10)
Limit of quantitation: 1.2 ng/mL

OTHER SUBSTANCES

Extracted: metabolites IN clozapine, diltiazem, fluphenazine, hydroxyzine, mianserine, perphenazine, zuclopenthixol
Simultaneous: amitriptyline, citalopram, chlorprothixene, clomipramine, desipramine, desmethylcitalopram, desmethylclomipramine, desmethylsertraline, fluoxetine, 10-hydroxyamitriptyline, 8-hydroxyclomipramine, 8-hydroxydesmethylclomipramine, 10-hydroxynortriptyline, imipramine, methotrimeprazine sulfoxide, norfluoxetine, nortriptyline, paroxetine, sertraline
Noninterfering: carbamazepine, clonazepam, flunitrazepam, nitrazepam, oxazepam, oxcarbazepine

KEY WORDS

serum

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 100 μL 25 ng/mL remoxipride in MeCN, mix for 5 s, add 1 mL saturated sodium carbonate, mix for 5 s, add 7 mL pentane:dichloromethane 75:25, shake gently for 10 min, centrifuge at 18° at 1735 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 140 μL MeCN, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Ultrasphere cyano
Mobile phase: MeCN:MeOH:40 mM pH 6.8 ammonium acetate 82:8:10
Column temperature: 40
Flow rate: 1.5

Injection volume: 150
Detector: E, ESA Coulochem model 5100A, model 5011 analytical cell, screening electrode 0.6 V, detection electrode 0.92 V, model 5020 guard cell 1 V

CHROMATOGRAM
Retention time: 14
Internal standard: remoxipride (17)
Limit of detection: 0.1 ng/mL

OTHER SUBSTANCES
Simultaneous: pseudoephedrine
Noninterfering: metabolites, acetaminophen, benztropine, clonazepam, clozapine, fluphenazine, haloperidol, ibuprofen, lorazepam, trihexyphenidyl

KEY WORDS
plasma

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 100 μL 200 ng/mL IS in MeOH + 1 mL 50 mM pH 10 borate buffer, vortex briefly, add to an Extrelut 3 SPE cartridge, let stand for 5 min, elute with 15 mL hexane:dichloromethane 50:50. Add the eluate to 3 mL 50 mM sulfuric acid, mix for 10 min, centrifuge at 3000 g for 10 min. Remove the aqueous layer and add it to 6 mL hexane: dichloromethane 50:50, wash for 5 min, centrifuge. Make the aqueous layer basic with 150 μL 28% ammonia, extract twice with 3 mL hexane:dichloromethane 50:50. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 60°, reconstitute the residue in 100 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 30 × 4.6 5 μm Spherisorb cyano
Column: 250 × 4.6 5 μm Ultrasphere cyano
Mobile phase: MeCN:buffer 60:40 (Buffer was 50 mM KH_2PO_4 adjusted to pH 6.5 with 28% ammonia.)
Flow rate: 1
Injection volume: 20
Detector: E, 5100 A Coulochem, 5020 guard cell 1.00 V, 5011 analytical cell, detector 1 0.55 V, detector 2 0.80 V, output of detector 2 is monitored

CHROMATOGRAM
Retention time: 7.8
Internal standard: methylrisperidone (R68808) (14.3)
Limit of quantitation: 2 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, chlorpromazine, clomipramine, cyamemazine, desipramine, droperidol, flunitrazepam, haloperidol, imipramine, trihexyphenidyl
Noninterfering: alprazolam, bromazepam, carbamazepine, chlorazepate, diazepam, diphenylhydantoin, estazolam, ethylbenzatropine, oxazepam, phenobarbital, triazolam, valproic acid
Interfering: pipamperone

KEY WORDS
plasma; SPE

SAMPLE
Matrix: blood, feces, urine
Sample preparation: Urine. Inject up to 1.95 mL urine directly. Feces. Homogenize (Ultra-Turrax TP-25) feces with MeOH, centrifuge, repeat extraction twice more. Evaporate a 10 mL aliquot of the extracts to dryness under a stream of nitrogen, reconstitute in DMSO, inject a 200 μL aliquot. Plasma. Add an equal volume of MeCN to plasma, centrifuge. Remove the supernatant and reduce the volume under a stream of nitrogen at 40°, inject a 2 mL aliquot.

HPLC VARIABLES
Column: 300 × 4.6 5 μm Hypersil C18
Mobile phase: Gradient. A was 100 mM ammonium acetate containing 0.2% diethylamine, pH 6.0. B was MeCN:MeOH:1 M ammonium acetate containing 2% diethylamine, pH 6.0 80:10:10. A:B 100:0 to 50:50 over 1 h, maintain at 50:50 for 5 min, to 0:100 over 5 min.
Injection volume: 200-2000
Detector: UV 280 or radioactivity

CHROMATOGRAM
Retention time: 49

OTHER SUBSTANCES
Extracted: metabolites

SAMPLE
Matrix: blood, tissue, urine
Sample preparation: Plasma, urine. 1 mL Plasma or urine + 200 μL MeOH + 100 μL 2 μg/mL IS in MeOH + 1 mL 50 mM sodium borate, add 4 mL ethyl acetate, rotate at 10 rpm for 10 min, centrifuge at 1000 g for 10 min, repeat extraction. Combine the organic layers and add them to 3 mL 50 mM sulfuric acid, extract. Add the aqueous layer to 150 μL concentrated ammonia, extract twice with 2.5 mL portions of heptane:isoamyl alcohol 90:10. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 60°, reconstitute the residue in 80 μL mobile phase, inject a 30 μL aliquot. Tissue. Grind (Waring blender) tissue, homogenize (Ultra-Turrax) with 4 volumes of water. 1 mL Homogenate + 100 μL 2 μg/mL IS in MeOH + 1 mL 100 mM sodium borate, add 4 mL ethyl acetate, rotate at 10 rpm for 10 min, centrifuge at 1000 g for 10 min, repeat extraction. Combine the organic layers and add them to 3 mL 50 mM sulfuric acid, extract. Add the aqueous layer to 150 μL concentrated ammonia, extract twice with 2.5 mL portions of heptane:isoamyl alcohol 90:10. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 60°, reconstitute the residue in 80 μL mobile phase, inject a 30 μL aliquot.

HPLC VARIABLES
Column: 150 × 2.1 5 μm ODS-Hypersil
Mobile phase: MeCN:water:diethylamine 35:65:0.02
Flow rate: 0.8
Injection volume: 30
Detector: UV 280

CHROMATOGRAM
Retention time: 2.9
Internal standard: 3-[2-[4-([6-fluoro-1,2-benzisoxazol-3-yl]methyl)-1-piperidinyl]ethyl]-2,7-dimethyl-4H-pyrido[1,2-a]pyrimidin-4-one (Janssen R 68808) (5.4)
Limit of quantitation: 10 ng/g (tissue), 2 ng/mL (plasma, tissue)

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: diazepam, oxazepam
Interfering: desmethyldiazepam

KEY WORDS
plasma; dog; human; muscle; pharmacokinetics

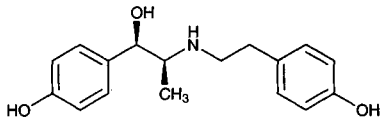
Ritodrine



Molecular formula: $C_{17}H_{21}NO_3$
Molecular weight: 287.36
CAS Registry No.: 26652-09-5, 23239-51-2 (HCl)
Merck Index: 8401
Lednicer No.: 2 39

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 1 mL water + 1 mL 600 mM potassium carbonate + 8 mL ethyl acetate, shake mechanically for 5 min, centrifuge at 2000 rpm for 15 min. Remove the organic layer and add it to 1.2 mL 100 mM HCl, shake for 5 min, centrifuge at 2000 rpm for 10 min. Remove the aqueous layer and add it to 500 μL 600 mM potassium carbonate and 1 mL ethyl acetate, shake for 5 min, centrifuge at 2000 rpm for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 300 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 5 μm Biophase ODS
Mobile phase: MeCN:buffer:water 20:10:70 containing 3 mM sodium 1-heptanesulfonate, pH 3.7 (Buffer was 2.1 M acetic acid containing 400 mM ammonium acetate.)
Flow rate: 1
Injection volume: 50
Detector: E, Bioanalytical Systems Model 4B, glassy carbon electrode 0.95 V, Ag/AgCl reference electrode

CHROMATOGRAM
Retention time: 9.33
Internal standard: nalbuphine (13.58)
Limit of detection: 0.6 ng/mL

SAMPLE
Matrix: blood
Sample preparation: Dilute blood with an equal volume of water. 1 mL Plasma or 900 μL diluted blood + 50 μL 1.6 μg/mL isoxsuprine hydrochloride + 0.9-1 mL buffer + 5 mL freshly distilled ethyl acetate, vortex for 1 min, centrifuge at 1750 g for 7 min. Remove the organic layer and evaporate it almost to dryness under a stream of nitrogen at 57°, evaporate the final 500 μL at room temperature, reconstitute the residue in 100 μL MeCN, vortex for 15 s, inject the whole amount. (Buffer was 26.5 g sodium carbonate and 21 g sodium bicarbonate in 500 mL water, pH 9.48.)

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak phenyl (plasma) or 200 × 4.6 5 μm Spheri-5 RP-18 (blood)
Mobile phase: MeCN:0.05% orthophosphoric acid 17:83 (plasma) or 63:37 (blood)
Flow rate: 2
Injection volume: 100
Detector: F ex 200 no emission filter or UV 254

CHROMATOGRAM
Retention time: 3.7 (plasma), 9.3 (blood)
Internal standard: isoxsuprine hydrochloride (15.1 (plasma), 16.3 (blood))
Limit of detection: 1 ng/mL (F)

OTHER SUBSTANCES
Simultaneous: fenoterol
Noninterfering: acetaminophen, albuterol, betamethasone, bupivacaine, caffeine, chloral hydrate, dexamethasone, diazepam, lignocaine, meperidine, metoclopramide, morphine, nitrazepam, terbutaline

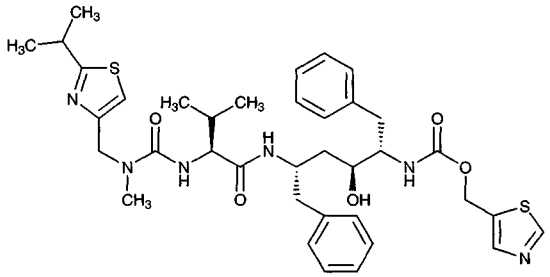
Ritonavir

Molecular formula: $C_{37}H_{48}N_6O_5S_2$
Molecular weight: 720.96
CAS Registry No.: 155213-67-5
Merck Index: 8402



SAMPLE
Matrix: bile, blood, feces, urine

Sample preparation: Rat, dog plasma. Add 3 volumes MeCN to plasma, vortex, centrifuge, evaporate the supernatant to dryness under a stream of nitrogen, reconstitute the residue in mobile phase, filter (0.45 μm) while centrifuging, inject an aliquot. Human plasma. Add 3 volumes MeCN to plasma, vortex, centrifuge, rinse the protein pellet with MeCN and MeOH. Evaporate the combined supernatants to dryness under a stream of nitrogen, reconstitute the residue with 200 μL MeCN:MeOH:25 mM ammonium acetate 15:15:70 adjusted to pH 4.8 with trifluoroacetic acid, inject an aliquot. Feces. Centrifuge fecal homogenate, rinse the pellet twice with EtOH, filter the supernatants (0.45 μm), inject an aliquot. Bile. Filter bile and inject an aliquot. Urine. Concentrate urine under a stream of nitrogen or via lyophilization, reconstitute in mobile phase, filter while centrifuging, inject an aliquot.

HPLC VARIABLES
Guard column: 5 μm Nucleosil C18
Column: 250 × 4.6 5 μm Beckman Ultrasphere C18
Mobile phase: Gradient. A was 0.1% trifluoroacetic acid adjusted to pH 4.8 with ammonium acetate. B was MeCN. A:B from 75:25 to 40:60 over 50 min
Flow rate: 1
Detector: A UV 220; B Radioactivity, Flo-One/Beta Model A-500 radioactivity with 0.5 mL flow cell

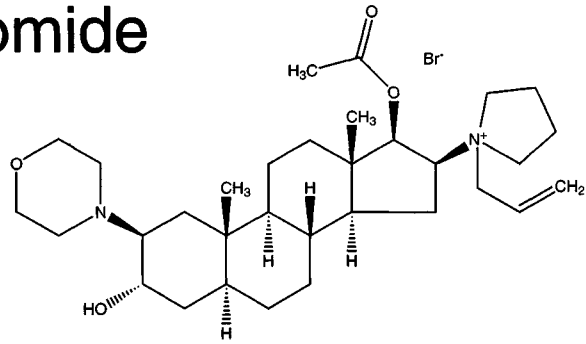
Rocuronium bromide

Molecular formula: $C_{32}H_{53}BrN_2O_4$
Molecular weight: 609.69
CAS Registry No.: 119302-91-9
Merck Index: 8407



SAMPLE
Matrix: bile, blood, stoma fluid, tissue, urine
Sample preparation: Homogenize (Ultra-Turrax) 1 g tissue with 9 mL 1 M NaH_2PO_4 for 10 min. Acidify 1 mL plasma, urine, or bile with 200 µL 1 M NaH_2PO_4. Homogenize 1 mL stoma fluid with 200 µL 1 M NaH_2PO_4. Make up 50-1000 µL plasma, 200-1000 µL urine, 5-200 µL bile, 1000 µL stoma fluid, or 100-1000 µL tissue homogenate to 2 mL with water, add 1 mL buffer, add 150 ng IS, add 7 mL dichloromethane, vortex for 15 s, centrifuge at 740 g for 5 min. Remove the lower organic layer and evaporate it to dryness under a stream of air at 37°, reconstitute the residue in 200 µL mobile phase, inject a 100 µL aliquot (or less). (Buffer was prepared by mixing 6 mL of an aqueous solution containing 7.505 mg/mL glycine and 5.85 mg/mL NaCl, 4 mL 100 mM NaOH and 6.2 g KI.)

HPLC VARIABLES
Guard column: 4 × 6 µBondapak C18
Column: 150 × 3.9 5 µm Lichrospher 100-RP18
Mobile phase: Dioxane:buffer 16:84 (Caution! Dioxane is a carcinogen!) (Buffer was 100 mM NaH_2PO_4 containing 0.11 mM 9,10-dimethoxyanthracene-2-sulfonate and 0.11 mM 1-heptanesulfonic acid, pH adjusted to 3.0 with orthophosphoric acid. After each series of analyses flush column with 15 mL water and 75 mL MeOH.)
Flow rate: 1
Injection volume: 100
Detector: F ex 385 em 452 following post-column extraction. The column effluent mixed with dichloroethane pumped at 1 mL/min and the mixture flowed through a 1 m × 0.25 mm i.d. stainless steel coil to a phase separator (Organon International) then the organic phase flowed through the detector (J. Chromatogr. 1987, 421, 327; Anal. Chim. Acta 1987, 192, 267).

CHROMATOGRAM
Retention time: 9
Internal standard: 1-(3α,17β-dihydroxy-2β-morpholino-5α-androstan-16β-yl)-1-methylpiperidinium bromide (Org 7402, Organon) (21)
Limit of detection: 5 ng tissue, 4 ng (urine, bile), 3 ng (plasma)
Limit of quantitation: 20 ng/mL (stoma fluid), 100 ng/mL (bile), 25 ng/mL (urine), 10 ng/mL (plasma)

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: cefotaxime, ceftazidime, ceftriaxone, cefuroxime, cephamandole, cephradine, dixyrazine, meperidine, metocurine, metoprolol, sulfamethoxazole, trimethoprim
Noninterfering: alfentanil, aprotinin, atropine, bupivacaine, chlorpromazine, daltaparin, dexamethasone, diazepam, dopamine, droperidol, etomidate, fentanyl, furosemide, gallamine, haloperidol, midazolam, morphine, neostigmine, nitroglycerin, nitroprusside, oxytocin, pancuron-

ium, pentobarbital, phenylephrine, phenytoin, pipecuronium, piperacillin, promethazine, propofol, ranitidine, succinylcholine, sufentanil, terbutaline, thiopental, vecuronium, verapamil
Interfering: alizapride, atracurium, ketamine, ketogan, lidocaine, metoclopramide, nimodipine, prochlorperazine, tubocurarine

KEY WORDS
human; dog; plasma; liver; lung

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL Bond-Elut C18 SPE cartridge with 1 mL MeOH:MeCN 2:1 and 1 mL water. Acidify 1 mL plasma with 200 μL 1 M NaH_2PO_4. Add 20-200 ng IS to 1 mL acidified plasma, add to the SPE cartridge, wash with 1 mL water, wash with 1 mL 100 mM pH 3 NaH_2PO_4, elute with 400 μL mobile phase, discard first 100 μL eluate, inject a 200 μL aliquot of the remaining eluate (from J. Chromatogr. 1987, 421, 327; modifications may be necessary).

HPLC VARIABLES
Column: 150 × 3.9 4 μm Nova-Pak C18
Mobile phase: Dioxane:water 20:80 containing 100 mM NaH_2PO_4 and 0.44 mM 9,10-dimethoxyanthracene-2-sulfonate, pH adjusted to 3 with phosphoric acid. (Caution! Dioxane is a carcinogen!) (After each series of analyses flush column with 200 mL MeOH then re-equilibrate with 120 mL mobile phase.)
Flow rate: 1
Injection volume: 200
Detector: F ex 380 em 452 following post-column extraction. The column effluent mixed with dichloroethane pumped at 1.6 mL/min and the mixture flowed through a 1 m × 0.25 mm i.d. stainless steel coil to a phase separator (Anal. Chim. Acta 1987, 192, 267) then the organic phase flowed through the detector.

CHROMATOGRAM

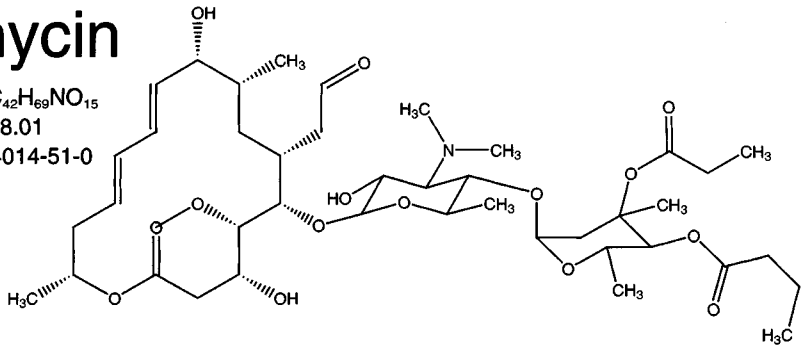
Rokitamycin

Molecular formula: $C_{42}H_{69}NO_{15}$
Molecular weight: 828.01
CAS Registry No.: 74014-51-0
Merck Index: 8408



SAMPLE

Matrix: blood

Sample preparation: Collect blood in tubes containing neostigmine methyl sulfate, final concentration 0.2 mM. 1 mL Plasma + 100 μL 2 μg/mL josamycin in MeOH, add 50 μL 100 mM pH 4.65 acetate buffer + 100 μL saturated NaCl + 100 μL 10 mM sodium lauryl sulfate + 5 mL hexane:isoamyl alcohol 90:10, shake for 15 min, centrifuge at 1000 g for 10 min, repeat extraction. Combine the organic layers and evaporate them to dryness under a stream of nitrogen with mild heating, reconstitute the residue in 200 μL 0.002% dansylhydrazine in toluene:MeOH:acetic acid 90:10:1.13 (freshly prepared), heat at 60° for 20 min, evaporate to dryness under a stream of nitrogen at 40°, reconstitute with 20 μL ethyl acetate, add 60 μL 100 mM HCl, inject a 20 μL aliquot of the lower aqueous phase. (Silanize glassware with 1% trimethylchlorosilane in toluene for 1 h at 70°, wash twice with MeOH.)

HPLC VARIABLES

Column: 150 × 4.6 3 μm Nucleosil C18
Mobile phase: MeCN:50 mM ammonium acetate 72:28
Column temperature: 32.5
Flow rate: 0.8
Injection volume: 20
Detector: F ex 352 em 537

CHROMATOGRAM

Retention time: 11.5

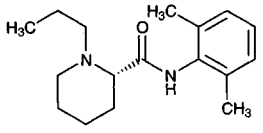
Ropivacaine



Molecular formula: $C_{17}H_{26}N_2O$
Molecular weight: 274.41
CAS Registry No.: 84057-95-4, 98717-15-8 (HCl), 132112-35-7 (HCl monohydrate)
Merck Index: 8417

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a Bond Elut SCX SPE cartridge. Hydrolyze 1 mL urine with 6 M HCl in a water-bath at 95° for 1 hr, dilute with water 1:5. Acidify plasma with phosphoric acid. Add the sample to the SPE cartridge, wash with 200 mM pH 4.5 acetate buffer, wash with MeOH:buffer 50:50, elute with MeOH:2 M ammonia 80:20, evaporate to dryness, reconstitute with 200 μL mobile phase, inject an aliquot.

HPLC VARIABLES
Column: 125 × 2 Superspher RP-Select B (plasma) or 125 × 4 Superspher RP-Select B (urine)
Mobile phase: MeCN:pH 2 phosphate buffer 15-25:85-75 containing 5-15 mM octanesulfonic acid
Detector: UV 210

CHROMATOGRAM
Limit of quantitation: 10 ng/mL (plasma), 300 nM (urine)

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
SPE; plasma; pharmacokinetics

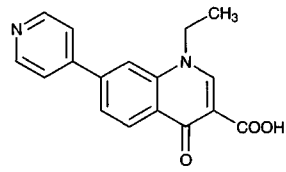
Rosoxacin



Molecular formula: $C_{17}H_{14}N_2O_3$
Molecular weight: 294.31
CAS Registry No.: 40034-42-2
Merck Index: 8426
Lednicer No.: 3 185

SAMPLE
Matrix: blood
Sample preparation: Filter 1 mL plasma using a micropartition system (MPS-1, Amicon, MA) while centrifuging at 2000 g for 20 min at 10°, inject an aliquot of the ultrafiltrate.

HPLC VARIABLES
Column: 250 × 4.6 Spherisorb ODS-2 endcapped
Mobile phase: MeCN:buffer 20:80 containing 5 mM tetrabutylammonium sulfate, adjusted to pH 2.5 with 1 M NaOH (Buffer was 100 mM citric acid containing 200 mM ammonium perchlorate.)
Column temperature: 37
Flow rate: 1
Detector: UV 280

CHROMATOGRAM
Retention time: 5.13
Internal standard: sparfloxacin (8.3)

KEY WORDS
plasma; ultrafiltrate

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 271.2

CHROMATOGRAM
Retention time: 13.467

KEY WORDS
whole blood

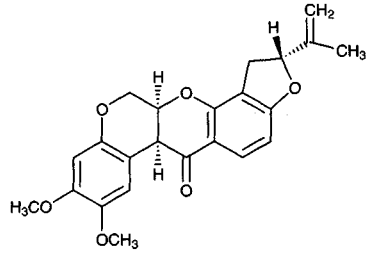
Rotenone

Molecular formula: $C_{23}H_{22}O_6$
Molecular weight: 394.42
CAS Registry No.: 83-79-4
Merck Index: 8427



SAMPLE
Matrix: feed
Sample preparation: 10 g Ground feed + 100 mL MeCN:glacial acetic acid 99:1, shake for 1 h, centrifuge, filter (0.45 μm) an aliquot of the supernatant, inject a 20 μL aliquot of the filtrate.

HPLC VARIABLES
Column: 300 × 3.9 μBondapak C18
Mobile phase: MeCN:water 60:40
Flow rate: 1
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Retention time: 8.2

OTHER SUBSTANCES
Simultaneous: rotenonone

SAMPLE
Matrix: sediment, tissue
Sample preparation: Fish, crayfish, mussels. Homogenize (Waring blender) with dry ice, place in freezer overnight. 10 g Sample + 60 (fish), 70 (fish offal, crayfish) or 100 (mussels) g anhydrous sodium sulfate, mix (Sorval Omni-mixer), place sample on top of 50 mm anhydrous sodium sulfate in a 22 mm diameter glass column, place a 50 mM layer of anhydrous sodium sulfate on top of the column, pass 100 mL diethyl ether through the column at 1.5 mL/min. Evaporate the eluate to dryness under reduced pressure at 30°, reconstitute the residue in 10 mL dichloromethane:cyclohexane 50:50, add a 5 mL aliquot to a 400 × 28 column packed with SX-3 BioBeads (Analytical BioChemistry Labs) in dichloromethane:cyclohexane 50:50, elute with dichloromethane:cyclohexane 50:50 at 4 mL/min, discard the first 112 mL of eluate, collect the second 112 mL and evaporate it to dryness under reduced pressure at 30°. Reconstitute with 5 mL benzene (Caution! Benzene is a carcinogen!) and add to the silica column, rinse flask with five 5 mL portions of benzene, add rinses to the column (do not allow column to go dry), elute with 70 mL benzene:acetone 97:3. Evaporate the eluate to dryness under reduced pressure at 30°, reconstitute in 5 mL MeOH, inject a 100 μL aliquot. Sediment. 10 g Sediment + 20 mL MeOH, mix (Sorval Omni-mixer), centrifuge at 1000 g for 5 min, repeat extraction 3 more times with 10 mL MeOH. Filter (Gelman type A/E glass fiber) the combined supernatants, evaporate the filtrate under reduced pressure at 30° to about 25 mL. Add the residue to 500 mL 100 mM HCl, extract three times with 20 mL hexane. Combine the hexane extracts and evaporate them to dryness under reduced pressure at 30°, reconstitute with 5 mL benzene (Caution! Benzene is a carcinogen!) and add to the silica column, rinse flask with five 5 mL portions of benzene, add rinses to the column (do not allow column to go dry), elute with 70 mL benzene:acetone 97:3. Evaporate the eluate to dryness under reduced pressure at 30°, reconstitute in 5 mL MeOH, inject a 100 μL aliquot. (Column was 5 g anhydrous sodium sulfate, 5 g 3% deactivated silica gel, and 5 g anhydrous sodium sulfate, all slurry packed in benzene. Silica gel was 40-140 mesh from J.T. Baker activated at 130° for 24 h.)

HPLC VARIABLES
Column: 150 × 3.9 4 μm Nova-Pak C18
Mobile phase: MeOH:water 70:30 (60:40 for fish offal)
Flow rate: 1
Injection volume: 100
Detector: UV 295

CHROMATOGRAM
Retention time: 5 , 17 (for fish offal)
Limit of detection: 5 ng/g (tissue), 25 ng/g (sediment)

KEY WORDS
fish; crayfish; mussels; shellfish; sediment

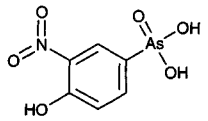
Roxarsone



Molecular formula: $C_6H_6AsNO_6$
Molecular weight: 263.04
CAS Registry No.: 121-19-7
Merck Index: 8430

SAMPLE
Matrix: feed
Sample preparation: Grind feed to pass through No. 20 sieve. 15 g Ground feed + 50 mL 20 g/L K_2HPO_4, shake for 5 min, centrifuge at 2385 rpm for 10 min. REmove a 30 mL aliquot of the supernatant and add it to 1 mL 2.5 M HCl, let stand for 15 min, centrifuge for 10 min. Remove a 25 mL aliquot and add it to 1 mL 6 M NaOH, add 2 g activated charcoal (Darco G-60 or equivalent), swirl, let stand for 30 min with periodic swirling, filter (0.45 μm) an aliquot, add the filtrate to an activated carbon SPE cartridge (Analtech No. 01-97), discard the first 2 mL, inject a 15 μL aliquot of the next 500 μL of eluate.

HPLC VARIABLES
Guard column: Bondapak C18
Column: 8NVC18 Radial Pak radial compression (Waters)
Mobile phase: MeOH:water 25:75 containing 3% PIC-A (tetrabutylammonium sulfate)
Flow rate: 1.2
Injection volume: 15
Detector: UV 243

CHROMATOGRAM
Retention time: 8
Limit of detection: <0.3 ng

OTHER SUBSTANCES
Noninterfering: bacitracin, bambemycins, BHA, BHT, chlortetracycline, erythromycin, ethoxyquin, furazolidone, hygromycin B, monensin, niacin, nicarbazin, ormetoprim, oxytetracycline, riboflavin, sulfadimethoxine, tetracycline, thiamine, vitamin D3, vitamin E, pyridoxine, vitamin A

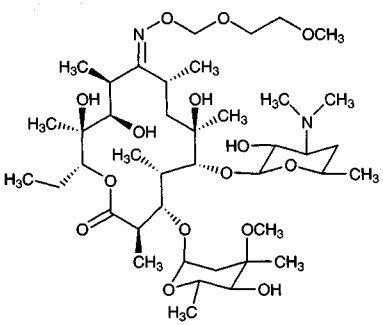
Roxithromycin



Molecular formula: $C_{41}H_{76}N_2O_{15}$
Molecular weight: 837.06
CAS Registry No.: 80214-83-1
Merck Index: 8433

SAMPLE

Matrix: blood
Sample preparation: 500 µL Serum + 50 µL 20 µg/mL IS in MeOH + 2.5 mL hexane:isoamyl alcohol 95:5, vortex for 20 s, centrifuge at 1500 g for 5 min. Remove 2 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 200 µL mobile phase, vortex for 20 s, sonicate for 1 min, centrifuge at 1500 g for 5 min, inject a 50 µL aliquot of the supernatant.

HPLC VARIABLES

Guard column: 20 mm long Supelguard C18 (Supelco)
Column: 50 × 4.6 5 µm Supelcosil C18
Mobile phase: MeCN:MeOH:water 50:20:30 containing 4 g/L (?) ammonium acetate
Flow rate: 1
Injection volume: 50
Detector: E, ESA Coulochem 5100A, 5010 analytical cell, +0.89 V

CHROMATOGRAM

Retention time: 3.5
Internal standard: RU 29767 (7.5)
Limit of detection: 50 ng/mL

KEY WORDS

serum; pharmacokinetics

SAMPLE
Matrix: blood, gastric juice, gastric mucosa, saliva, vitreous humor
Sample preparation: Homogenize 5-20 mg gastric mucosa in 300 μL 10 mM pH 7.4 sodium phosphate buffer with sonication. Add 500 ng clarithromycin in MeOH:water 50:50 to 500 μL plasma, serum, saliva, gastric juice, leucocytes lysate, vitreous humor or 300 μL gastric mucosa homogenate, vortex, add 200 μL 100 mM sodium carbonate and 3 mL MTBE, shake thoroughly (5 × 2 s in an SMI Multi-tube vortexer), centrifuge at 1000 g for 5 min, freeze the aqueous layer in liquid nitrogen or in a freezer at -70° for 15 min. Evaporate the upper organic layer to dryness in a centrifugal vacuum evaporator (Jouan RC 10.22), reconstitute the residue in 250 μL MeOH:water 50:50, inject a 20-50 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Zorbax SB CN
Mobile phase: MeCN:MeOH:50 mM Na_2HPO_4 and NaH_2PO_4 buffer 53:41:6 (pH 7.0) (The mobile phase was a mixture of 350 mL MeCN, 50 mL MeOH and 450 mL 50 mM Na_2HPO_4 and NaH_2PO_4 buffer.)
Column temperature: 30
Flow rate: 1
Injection volume: 20-50
Detector: E, ESA Coulochem II, guard cell +1.0 V, screening cell E1 +0.50 V, analytical cell E2 +0.80 V

CHROMATOGRAM
Retention time: 11.5
Internal standard: clarithromycin (10)

Limit of detection: 10 ng/mL (F)
Limit of quantitation: 50 μg/mL (F)

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
plasma; pharmacokinetics; protect from light

REFERENCE
Lombardi,F.; Ardemagni,R.; Colzani,V.; Visconti,M. High-performance liquid chromatographic determination of rufloxacin and its main active metabolite in biological fluids, *J.Chromatogr.*, **1992**, *576*, 129–134.

SAMPLE
Matrix: blood
Sample preparation: Mix 1 mL plasma with 20 μL 100 μg/mL IS in 20 mM NaOH. Add 500 μL 50 mM pH 7.0 phosphate buffer, vortex for 1 min, add 2 mL dichloromethane, vortex for 1 min, shake for 5 min. Centrifuge at 100 g for 10 min, separate the organic layer, repeat the extraction procedure twice, evaporate the combined organic lowers to dryness under reduced pressure. Reconstitute with 200 μL 20 mM NaOH, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 20 × 4.6 10 μm Vydac AXGU
Column: 250 × 4.6 5 μm Supelcosil LC-SAX
Mobile phase: MeCN:50 mM pH 7.0 phosphate buffer 10:90
Flow rate: 1.5
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Retention time: 7.3
Internal standard: fenbufen (3.5)
Limit of detection: 50 ng/mL

OTHER SUBSTANCES
Extracted: furprofen

KEY WORDS
SPE; plasma

REFERENCE
Carlucci,G.; Mazzeo,P. Simultaneous determination of furprofen and rufloxacin in human plasma by high-performance liquid chromatography, *J.Chromatogr.Sci.*, **1996**, *34*, 182–184.

SAMPLE
Matrix: blood
Sample preparation: Filter 1 mL plasma using a micropartition system (MPS-1, Amicon, MA) while centrifuging at 2000 g for 20 min at 10°, inject an aliquot of the ultrafiltrate..

HPLC VARIABLES
Column: 250 × 4.6 Spherisorb ODS-2 endcapped
Mobile phase: MeCN:buffer 19:81 containing 5 mM tetrabutylammonium sulfate, adjusted to pH 2.5 with 1 M NaOH (Buffer was 100 mM citric acid containing 200 mM ammonium perchlorate.)
Column temperature: 37
Flow rate: 1
Detector: UV 248

CHROMATOGRAM
Retention time: 4.68
Internal standard: enrofloxacin (7.53)

KEY WORDS
plasma; ultrafiltrate

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 10 μL 2 mg/mL IS in MeOH, mix, add 2 mL dichloromethane:diethyl ether 80:20, vortex for 15 s, centrifuge at 1500 g for 5 min, remove a 1.7 mL aliquot of the organic phase, repeat the extraction twice more with 2 mL portions of dichloromethane:diethyl ether 80:20. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 200 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 20 × 4.6 40 μm Pelliguard C18 (Supelco)
Column: 250 × 4.6 5 μm Viosfer C18 (Violet, Rome)
Mobile phase: MeCN:buffer 15:85 (Buffer was 100 mM phosphate buffer containing 5 mM tetrabutylammonium hydrogen sulfate, adjusted to pH 3 with orthophosphoric acid.)
Flow rate: 1.3
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Retention time: 6.2
Internal standard: 2-[4-(2'-furoyl)phenyl]propionic acid (7.3)
Limit of detection: 30 ng/mL

OTHER SUBSTANCES
Extracted: theophylline

KEY WORDS
plasma

SAMPLE
Matrix: blood, urine
Sample preparation: 1 mL Serum + 1 mL 100 mM pH 7 phosphate buffer + 100 (serum) or 150 (urine) μL 5 μg/mL ofloxacin in 500 mM NaOH, mix, add 2.5 mL dichloromethane, shake for 10 min, centrifuge at 1500 g for 10 min, repeat the extraction twice. Combine the organic layers and evaporate them to dryness with nitrogen under vacuum, reconstitute the residue in 200 μL mobile phase, vortex, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 20 × 4.6 10 μm AXGU anion-exchange (Rainin)
Column: 250 × 4.6 10 μm anion-exchange (Vydac)
Mobile phase: MeCN:50 mM pH 7 phosphate buffer 20:80
Flow rate: 1.8
Injection volume: 20
Detector: UV 296

CHROMATOGRAM
Retention time: 7.5
Internal standard: ofloxacin (5.6)
Limit of detection: 50 ng/mL (urine), 100 ng/mL (serum)

KEY WORDS
serum; pharmacokinetics

REFERENCE
Carlucci,G.; Palumbo,G. Analytical procedure for the determination of rufloxacin, a new pyridobenzothiazine, in human serum and urine by high-performance liquid chromatography, *J.Chromatogr.*, **1991**, *564*, 346–351.

SAMPLE
Matrix: urine
Sample preparation: Dilute ten times with water, inject a 20 μL aliquot. Deconjugate by heating 100 μL urine, 100 μL 50000 U/mL β-glucuronidase (Type II from limpets Patella vulgata, Sigma), and 800 μL pH 3.8 KH_2PO_4 buffer at 37° for 16 h.

HPLC VARIABLES
Guard column: 75 × 2.1 10 μm pellicular reversed phase (Chrompack)
Column: 250 × 4.6 5 μm CP Spher 5-ODS (Chrompack)
Mobile phase: Gradient. MeCN:buffer from 4:96 to 26:74 over 37 min, return to initial conditions over 5 min. (Buffer was 6.75 mL orthophosphoric acid and 2 mL diethylamine in 1 L water, pH 3.1.)
Flow rate: 1.5
Injection volume: 20
Detector: UV 246

CHROMATOGRAM
Retention time: 22
Limit of detection: 500 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
monkey; pharmacokinetics

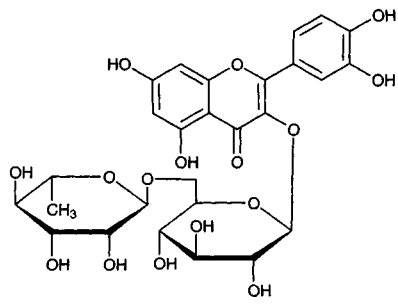
Rutin

Molecular formula: $C_{27}H_{30}O_{16}$
Molecular weight: 610.53
CAS Registry No.: 153-18-4
Merck Index: 8456



SAMPLE
Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 204

CHROMATOGRAM
Retention time: 10.1

SAMPLE
Matrix: blood, feces, feed, milk, urine

Sample preparation: Condition a 3 mL quaternary amine SPE cartridge (J.T. Baker) with 3 mL MeOH, 3 mL concentrated ammonium hydroxide, and 3 mL 200 mM HCl. Feed, feces. Air dry feces at 50° for 17 h. 350 mg Feed or dried feces + 350 μL 100 mM NaOH, mix, add 2.5 mL 100 mM NaOH, mix, centrifuge at 500 g for 10 min, repeat extraction twice with 2.5 mL aliquots and once with a 2 mL aliquot of 100 mM NaOH. Combine the supernatants and make up to 10 mL with water. Remove a 500 μL aliquot and add it to the SPE cartridge, wash with two 1 mL aliquots of MeOH, wash with 2 mL water (add 3 μL 2-octanol to top of water as an anti-foaming agent), elute with two 2 mL aliquots of 200 mM pH 8.8 K_2HPO_4, add 80 μL phosphoric acid to the eluate, make up to 5 mL with water, inject an aliquot. Urine. 1 mL Urine + 8.5 mL 100 mM NaOH, make up to 10 mL with water. Remove a 500 μL aliquot and add it to the SPE cartridge, wash with two 1 mL aliquots of MeOH, wash with 2 mL water (add 3 μL 2-octanol to top of water as an anti-foaming agent), elute with two 2 mL aliquots of 200 mM pH 8.8 K_2HPO_4, add 80 μL phosphoric acid to the eluate, make up to 5 mL with water, inject an aliquot. Serum. 500 μL Serum + 4.25 mL 100 mM NaOH, make up to 5 mL with water. Remove a 500 μL aliquot and add it to the SPE cartridge, wash with two 1 mL aliquots of MeOH, wash with 2 mL water (add 3 μL 2-octanol to top of water as an anti-foaming agent), elute with two 2 mL aliquots of 200 mM pH 8.8 K_2HPO_4, add 80 μL phosphoric acid to the eluate, make up to 5 mL with water, inject an aliquot. Milk. Add 200 μL milk to the SPE cartridge, wash with two 1 mL aliquots of MeOH, wash with 2 mL water (add 3 μL 2-octanol to top of water as an anti-foaming agent), elute with two 2 mL aliquots of 200 mM pH 8.8 K_2HPO_4, add 80 μL phosphoric acid to the eluate, make up to 5 mL with water, inject an aliquot.

SAMPLE

Matrix: yogurt

Sample preparation: 500 mg Homogenized yogurt + 7 mL buffer, sonicate for 2 min, shake mechanically for 20 min, centrifuge at 2000 rpm for 10 min, repeat extraction twice more. Combine the supernatants and make up to 25 mL with buffer. Remove a 5 mL extract and add it to 5 mL 10 mM tri-n-octylamine in chloroform, shake for 20 min, centrifuge at 2000 rpm for 10 min. Remove 2.5 mL of the organic phase and add it to 2.5 mL 100 mM sodium perchlorate in water, extract, centrifuge, inject an aliquot of the aqueous phase. (Buffer was 24.650 g $NaH_2PO_4.H_2O$ and 1.260 g $Na_2HPO_4.2H_2O$ made up to 2 L with water, pH 5.5.)

HPLC VARIABLES

Column: 250 × 4 10 μm RP-18 (Merck)

Mobile phase: MeOH:buffer 40:60 (Buffer was 900 μL 1 M phosphoric acid and 27.598 g $NaH_2PO_4.H_2O$ made up to 2 L with water, pH 4.5.)

Injection volume: 100

Detector: UV 270 for 4 min then UV 240

CHROMATOGRAM

Retention time: 2

Limit of detection: 20 μg/g

OTHER SUBSTANCES

Simultaneous: benzoic acid, sorbic acid

REFERENCE

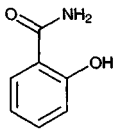
Salicylamide



Molecular formula: $C_7H_7NO_2$
Molecular weight: 137.14
CAS Registry No.: 65-45-2
Merck Index: 8480
Lednicer No.: 1 109

SAMPLE

Matrix: bile, blood, urine
Sample preparation: Plasma. 200 μL Plasma + 100 μL 1 M perchloric acid, mix, centrifuge at 12000 g for 3 min, inject a 100 μL aliquot of the supernatant. Bile. Dilute bile 1:10 with water, inject a 20 μL aliquot. Urine. Filter (0.45 μm) urine, dilute with water 1:4, inject a 30 μL aliquot.

HPLC VARIABLES

Guard column: 40 μm μBondapak C18
Column: 250 × 4.6 10 μm μBondapak C18
Mobile phase: 85 mM KH_2PO_4, pH adjusted to 3.35 with glacial acetic acid
Flow rate: 0.8 for 34 min, to 1.8 over 5 min, maintain at 1.8 for 11 min
Injection volume: 20-100
Detector: UV 313

CHROMATOGRAM

Retention time: 48
Limit of detection: 1.09 nmole

OTHER SUBSTANCES

Extracted: metabolites, conjugates

KEY WORDS

rat; plasma; whole blood

REFERENCE

Xu,X.; Pang,K.S. High-performance liquid chromatographic method for the quantitation of salicylamide and its metabolites in biological fluids, *J.Chromatogr.*, **1987**, *420*, 313–327.

SAMPLE

Matrix: blood
Sample preparation: 3 mL Whole blood + 6 mL ethyl acetate + 100 μL 10 μg/mL p-nitrophenol, shake, centrifuge at 3000 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 100 μL MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 40 μm μBondapak C18
Column: 250 × 4.6 10 μm μBondapak C18
Mobile phase: MeOH:0.5% acetic acid 40:60
Flow rate: 0.6
Injection volume: 20
Detector: UV 313

CHROMATOGRAM

Internal standard: p-nitrophenol
Limit of detection: 83 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS
rat; whole blood

REFERENCE

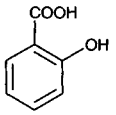
Salicylic acid



Molecular formula: $C_7H_6O_3$
Molecular weight: 138.12
CAS Registry No.: 69-72-7, 54-21-7 (Na salt)
Merck Index: 8484

SAMPLE

Matrix: blood
Sample preparation: Mix 100 μL plasma with 100 μL 2.5 μM IS, add 200 μL EtOH, vortex for 2 min, centrifuge at 1600 g for 15 min, dilute 50 μL of the supernatant with 950 μL mobile phase, filter (0.45 μm), inject a 50 μL aliquot of the filtrate.

HPLC VARIABLES

Guard column: 30 × 4.6 10 μm Spheri-10 RP18 (Alltech)
Column: 150 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeOH:buffer 15:85 (Buffer was 30 mM sodium citrate and 30 mM sodium acetate, pH 5.45.)
Flow rate: 1
Injection volume: 50
Detector: UV 295

CHROMATOGRAM

Retention time: 7.2
Internal standard: 2.6-dihydroxybenzoic acid (11.4)
Limit of detection: 3.89 μM

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

plasma

REFERENCE

Coudray,C.; Mangournet,C.; Bouhadjeb,S.; Faure,H.; Favier,A. Rapid high-performance liquid chromatographic assay for salicylic acid in plasma without solvent extraction, *J.Chromatogr.Sci.*, **1996**, *34*, 166–173.

SAMPLE

Matrix: blood
Sample preparation: Add 250 μL 200 mM orthophosphoric acid to 250 μL chilled plasma within 10 min of centrifuging (if fresh plasma) or within 10 min of thawing (if frozen plasma), vortex for 20 s, centrifuge at 5800 g for 3 min. Inject a 200 μL aliquot onto column A and elute to waste with mobile phase A, after 2 min backflush the contents of column A onto column B with mobile phase B, elute with mobile phase B, monitor the effluent from column B.

HPLC VARIABLES

Column: A 10 × 4.3 30 μm Hypersil C18 PEEK cartridge (Shandon, England); B 10 × 4 30 μm Hypersil C8 + 250 × 4.6 5 μm Nucleosil C8
Mobile phase: A Water:orthophosphoric acid 1000:1, pH 2.5; B MeCN:MeOH:water:orthophosphoric acid 150:200:650:1 (pH 2.6)
Flow rate: 1
Injection volume: 200
Detector: UV 225

CHROMATOGRAM

Retention time: 60
Limit of detection: 40 ng/mL
Limit of quantitation: 100 ng/mL

OTHER SUBSTANCES
Extracted: aspirin
Noninterfering: barbital, butobarbital, caffeine, 8-chlorotheophylline, clonazepam, cocaine, diazepam, flurazepam, furosemide, hydralazine, imipramine, nitrazepam, phenytoin, pindolol, propranolol, quinidine, theophylline
Interfering: xylazine, prazosin

SAMPLE
Matrix: blood
Sample preparation: Plasma. 1-2 mL Plasma + 600-1000 mg potassium carbonate plasma + 1 mL MeOH, shake for 1 min, centrifuge. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 500 μL mobile phase, inject a 25-50 μL aliquot.

HPLC VARIABLES
Column: 610 × 2 25-50 μm Bondapak AX/Corasil anion exchange
Mobile phase: MeOH:pH 5.6 phosphate buffer 15:85
Flow rate: 0.5
Injection volume: 10-50
Detector: UV 254, 280

CHROMATOGRAM
Retention time: 11.2 (at UV 280)
Internal standard: sodium salicylate

OTHER SUBSTANCES
Extracted: dipyrone (at UV 254)

KEY WORDS
plasma; sodium salicylate is IS

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: 500 μL Whole blood + 1 mL 1 M HCl + 200 μL 1 mg/mL β-hydroxyethyltheophylline in MeOH + 10 mL dichloromethane, rotate for 10 min, centrifuge for 5 min. Remove the organic layer and evaporate it to dryness, reconstitute the residue in 200 μL MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm ODS (Altex)
Mobile phase: MeOH:water:glacial acetic acid 40:66:1
Flow rate: 1.5
Injection volume: 20
Detector: UV 250

CHROMATOGRAM
Retention time: 6.4
Internal standard: β-hydroxyethyltheophylline (2)
Limit of quantitation: 10 μg/mL

OTHER SUBSTANCES
Simultaneous: methyl salicylate, theophylline
Noninterfering: acetaminophen, amobarbital, butalbital, caffeine, carbamazepine, glutethimide, ibuprofen, indomethacin, meprobamate, methaqualone, pentobarbital, phenobarbital, phenylbutazone, phenytoin, primidone, secobarbital

KEY WORDS
whole blood

Levine,B.; Caplan,Y.H. Liquid chromatographic determination of salicylate and methyl salicylate in blood and application to a postmortem case, *J.Anal.Toxicol.*, **1984**, *8*, 239–241.

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 0.2 mL 1 M HCl + 10 mL diethyl ether, gently mix for 10 min, centrifuge at 1500 rpm for 4 min. Remove the organic phase, evaporate it to dryness at 0° under a stream of nitrogen, add 200 μL mobile phase, vortex 90 s, inject a 5-100 μL aliquot.

HPLC VARIABLES
Guard column: 23 × 3.9 μBondapak C18/Porasil B

Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeOH:water:1-butanol:orthophosphoric acid 270:720:10:0.13
Column temperature: 47
Flow rate: 1.8
Injection volume: 5-100
Detector: UV 234

CHROMATOGRAM
Retention time: 8.0
Internal standard: m-anisic acid (9.6)
Limit of quantitation: 500 ng/mL

OTHER SUBSTANCES
Simultaneous: aspirin
Noninterfering: acetaminophen, albuterol, aminophylline, amitriptyline, atenolol, beclomethasone, bromazepam, caffeine, carbamazepine, chloral hydrate, chlordiazepoxide, cimetidine, clonazepam, codeine, desipramine, dexamethasone, dextropropoxyphene, diazepam, dicyclomine, digoxin, disopyramide, doxycycline, ergotamine, ethosuximide, furosemide, gentisic acid, haloperidol, hydrocortisone, imipramine, indomethacin, levodopa, lignocaine, lithium carbonate, meperidine, methdilazine, methylphenobarbitone, methylprednisolone, methysergide, metoclopramide, metoprolol, mexiletine, midazolam, naphthoxyacetic acid, nitrazepam, nitroglycerin, nortripyline, oxazepam, oxpranolol, pentobarbitone, pethidine, phenytoin, prednisolone, prednisone, primidone, procainamide, prochlorperazine, propranolol, quinidine, salicyluric acid, spironolactone, sulfamethoxazole, theophylline, trimethoprim, valproic acid, verapamil, warfarin
Interfering: methyclothiazide

KEY WORDS
plasma; pharmacokinetics

SAMPLE
Matrix: blood
Sample preparation: Activate a 1 mL Bond-Elut C8 SPE cartridge with 2 mL MeOH then 1 mL 10 mM HCl, do not allow it to dry completely. Sonicate 1 mL whole blood for 20-30 min then apply to cartridge. Wash with 100 μL water, elute with three 500 μL portions of MeOH:MeCN:1% aqueous ammonium hydroxide 50:20:30, combine eluents and evaporate to dryness under a stream of nitrogen at 40°. Redissolve in 1 mL MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.5 5 μm Spherisorb ODS
Mobile phase: MeCN:MeOH:buffer 35:13:52 (Buffer was water adjusted to pH 3.2 with orthophosphoric acid
Flow rate: 1
Injection volume: 20
Detector: UV 250

CHROMATOGRAM
Retention time: 3.5

OTHER SUBSTANCES
Simultaneous: ketoprofen, acetaminophen, naproxen, fenoprofen, ibuprofen, indomethacin

KEY WORDS
whole blood; SPE

SAMPLE
Matrix: blood
Sample preparation: 1 mL Blood + 1 mL water + 50 μL 76 mg/L allobarbital in EtOH:water 10:90 + 5 mL ethyl acetate, shake by hand, add 2 mL of 0.1 M HCl. Mix by inversion with a mechanical shaker for 5 min. Centrifuge at 2700 rpm for 5-10 min. Remove ethyl acetate and evaporate to dryness under a stream of nitrogen at room temperature. Take up in 200 μL MeOH, filter (0.45 μm), inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: Guard-Pak precolumn insert
Column: 200 × 4.6 5 μm Hypersil octadecylsilane
Mobile phase: Gradient. MeCN:1 mM pH 3.2 phosphate buffer from 20:80 to 40:60 over 10 min, stay at 40:60 for 6 min, to 20:80 over 4 min
Column temperature: 60
Flow rate: 3
Injection volume: 20
Detector: UV 202

CHROMATOGRAM
Retention time: 3.6
Internal standard: allobarbital (2.9)
Limit of quantitation: 10000 ng/mL pharmacokinetics

OTHER SUBSTANCES
Extracted: butalbital
Simultaneous: caffeine, aspirin

REFERENCE
Drost,M.L.; Walter,L. Blood and plasma concentrations of butalbital following single oral doses in man, *J.Anal.Toxicol.*, **1988**, *12*, 322–324.

SAMPLE
Matrix: blood
Sample preparation: 200 μL Serum + 400 μL 100 μg/mL 8-chlorotheophylline in MeCN, vortex for 10 s, centrifuge at 15000 rpm for 3 min, inject a 20 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeCN:water:glacial acetic acid 4:84:12 containing 4.84 g/L Trizma, pH 2.3
Flow rate: 2
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 8.26
Internal standard: 8-chlorotheophylline (5.29)
Limit of quantitation: 8 μg/mL

OTHER SUBSTANCES
Extracted: acetaminophen, theophylline
Simultaneous: caffeine, cefazolin, cimetidine, ergotamine, glutethimide, heparin, methamphetamine, propranolol, sulfamethoxazole, theobromine, tobutamide, trimethoprim
Noninterfering: amitriptyline, amobarbital, ampicillin, butabarbital, butalbital, celbenine, chlordiazepoxide, chlorpromazine, clorazepate, desipramine, diazepam, doxepin, ethchlorvynol, fluphenazine, hydroxyzine, ibuprofen, imipramine, isoniazid, lidocaine, mephobarbital, mesoridazine, methaqualone, methyluric acid, naprotyline, nordiazepam, nortriptyline, oxazepam, pentobarbital, perphenazine, phenelzine, phenmetrazine, phenobarbital, phenylbutazone, phenytoin, prednisolone, prednisone, procainamide, prochlorperazine, promazine, promethazine, propoxyphene, protriptyline, pyrilamine, secobarbital, thioridazine, thiothixene, timolol, trazodone, triazolam, trifluoperazine

SAMPLE
Matrix: blood
Sample preparation: Plasma. 200 μL Plasma + 200 μL 5 μg/mL IS in 200 mM HCL:200 mM orthophosphoric acid 50:50, vortex for 1-2 s, add 400 μL MeCN, vortex, let stand at 4° for 15 min, centrifuge at 10500 g for 1 min. Remove the supernatant and add it to 100-120 mg NaCl, vortex briefly, let stand at 4° for 10 min, vortex, centrifuge at 10500 g for 1 min, inject a 10 μL aliquot of the upper organic layer. Whole blood. 200 μL Lysed whole blood + 400 μL 5 μg/mL IS in 200 mM HCL:200 mM orthophosphoric acid 50:50, vortex for 1-2 s, add 600 μL MeCN, vortex, let stand at 4° for 15 min, centrifuge at 10500 g for 1 min. Remove the supernatant and add it to 200 mg NaCl, vortex briefly, let stand at 4° for 10 min, vortex, centrifuge at 10500 g for 1 min, inject a 10 μL aliquot of the upper organic layer.

HPLC VARIABLES

Column: 150 × 3.9 4 μm Novapak C18
Mobile phase: MeCN:water:85% orthophosphoric acid 18:74:0.09 (Before use prime column by recycling 200 mL mobile phase + 400 μL di-n-butylamine overnight at 0.3 mL/min.)
Column temperature: 30
Flow rate: 1
Injection volume: 10
Detector: UV 237

CHROMATOGRAM

Retention time: 6.8
Internal standard: 2-methylbenzoic acid (8.9)
Limit of quantitation: 100 ng/mL

OTHER SUBSTANCES

Extracted: metabolites, aspirin, gentisic acid, salicyluric acid

KEY WORDS

plasma; whole blood; pharmacokinetics

SAMPLE

Matrix: blood, CSF, gastric contents, urine
Sample preparation: 200 μL Serum, urine, CSF, or gastric fluid + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, backflush the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine HCl and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES

Column: A 40 μm preparative grade C18 (Analytichem); B 75 × 2.1 pellicular C18 (Whatman) + 250 × 4.6 5 μm C8 end-capped (Whatman)
Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 20 min.
Column temperature: 50
Flow rate: 1.5
Detector: UV 220

CHROMATOGRAM

Retention time: 5.2
Internal standard: heptanophenone (19)

OTHER SUBSTANCES

Extracted: acetaminophen, allobarbital, azinphos, barbital, brallobarbitone, bromazepam, butethal, caffeine, carbamazepine, carbaryl, cephaloridine, chloramphenicol, chlordiazepoxide, chlorothiazide, chlorvinphos, clothiapine, cocaine, coomassie blue, desipramine, diazepam, diphenhydramine, dipipanone, ethylbromphos, flufenamic acid, formothion, griseofulvin, indomethacin, lidocaine, lorazepam, malathion, medazepam, midazolam, oxazepam, paraoxon, penicillin G, pentobarbital, prazepam, propoxyphene, prothiophos, quinine, secobarbital, strychnine, sulfamethoxazole, theophylline, thiopental, thioridazine, trimethoprim

SAMPLE
Matrix: bulk, formulations
Sample preparation: Bulk. Prepare a 20 mg/mL solution of bulk aspirin in dichloromethane, inject a 10 μL aliquot as soon as dissolution is complete. Tablets. Prepare a 20 mg/mL solution of ground aspirin tablets in dichloromethane, filter (0.45 μm) immediately, immediately inject a 10 μL aliquot of the filtrate.

HPLC VARIABLES
Column: 150 × 4.6 6 μm Zorbax SIL
Mobile phase: Hexane:chloroform:acetic acid 80:19:3 (Before first use pump 10 column volumes of dichloromethane:acetic acid:2,3-dimethoxypropane 96:2:2 through column at 3 mL/min.)
Flow rate: 3
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 1.6
Limit of detection: 14 ppm

OTHER SUBSTANCES
Simultaneous: aspirin, salsalate

KEY WORDS
normal phase; tablets

SAMPLE
Matrix: formulations
Sample preparation: Grind tablets to a fine powder and add about 250 mg aspirin to 100 mL chloroform saturated with citric acid containing 500 μL formic acid, add 500 mg solid citric acid, sonicate for 2 min, centrifuge or filter, inject an aliquot. (If buffers or antacid are present add ground tablets equivalent to about 500 mg aspirin to 3 g acid-washed siliceous earth, mix, add 2 mL 6 M HCl, mix, add to a 200 × 25 column, dry wash container with siliceous earth, add to column, elute column with chloroform saturated with citric acid at 10 mL/min. Collect 150 mL eluent, add 1 mL formic acid, make up to 200 mL with chloroform saturated with citric acid, add 500 mg citric acid, shake, inject an aliquot.)

HPLC VARIABLES
Column: 250 × 4.6 5μm Zorbax-Sil
Mobile phase: Chloroform:methylene chloride:acetonitrile:formic acid 700:300:30:4 (At the end of the day wash the column with 200 mL MeOH.)
Flow rate: 2
Injection volume: 20
Detector: UV 300

CHROMATOGRAM
Retention time: 4.5

SAMPLE
Matrix: solutions
Sample preparation: Add 500 μL of a solution in MeCN to 100 mg finely powdered potassium carbonate, add 250 μL 3.8 mM 18-crown-6 in MeCN, add 250 μL 0.8 mM reagent in MeCN, heat at 80° in the dark for 20 min, cool, inject a 5 μL aliquot. (Synthesize the reagent, 3-bromomethyl-6,7-dimethoxy-1-methyl-2(1H)-quinoxalinone, as follows. Stir 483 g veratrole in 1.45 L acetic acid at 15° for 1 h, add 683 g concentrated nitric acid (d 1.05) over 1 h (maintain the temperature below 40° by cooling and regulating the rate of addition of the nitric acid). Continue stirring and add 2.127 L fuming nitric acid (d 1.50) over 1 h while maintaining the temperature below 30°, let stand for 2 h, pour into a large volume of cold water, filter, wash the solid with water until the washings are neutral, recrystallize from EtOH to give 4,5-dinitroveratrole (mp 129.5-130.5°) (J. Am. Chem. Soc. 1946, 68, 1536). Reflux 5 g 4,5-dinitroveratrole in 200 mL benzene (Caution! Benzene is a carcinogen!), add 100 g 60 mesh iron powder and 20 mL concentrated HCl in small portions over 1 h, reflux for 4 h, add 10 mL water, reflux for 2 h, cool, make alkaline with 2.5 M NaOH, extract several times with 200 mL portions of benzene. Combine the organic layers and evaporate them to dryness, add 10 mL concentrated HCl, recrystallize from EtOH to give 1,2-diamino-4,5-dimethoxybenzene monohydrochloride as very slightly pink needles (mp 240°) (Anal. Chim. Acta 1982, 134, 39). Heat 2.5 mmoles 1,2-diamino-4,5-dimethoxybenzene hydrochloride and 2.4 mmoles pyruvic acid in 30 mL 500 mM HCl on a boiling water bath for 2 h, cool with ice-water, filter. Wash the precipitate with water and dry it under vacuum, recrystallize from MeOH:water 90:10 to give 6,7-dimethoxy-3-methyl-2(1H)-quinoxalinone as yellow needles (mp 255°) (Chem. Pharm. Bull. 1985, 33, 3493). Treat 1 g 6,7-dimethoxy-3-methyl-2(1H)-quinoxalinone dissolved in 50 mL anhydrous MeOH with a solution of diazomethane in ether, evaporate to dryness under reduced pressure, dissolve the residue in 5 mL ethyl acetate, chromatograph on a 250 × 35 column filled with 130 g 70-230 mesh silica gel 60 (Merck) using n-hexane:ethyl acetate 25:75 to give 6,7-dimethoxy-1,3-dimethyl-2(1H)-quinoxalinone as yellow needles (mp 170-171°). Dissolve 350 mg 6,7-dimethoxy-1,3-dimethyl-2(1H)-quinoxalinone in 3 mL acetic acid, add 350 mg anhydrous sodium acetate, add 2 mL 1.5 M bromine in acetic acid, heat at 100° for 15 min, cool, add 10 mL ether, filter, wash the solid 2 or 3 times with small portions of ether. Combine the filtrate and washings and evaporate them to dryness, dissolve the residue in 5 mL ethyl acetate, chromatograph on a 250 × 35 column filled with 130 g 70-230 mesh silica gel 60 (Merck) using ether, evaporate the main fraction to dryness, recrystallize the residue from n-hexane:ethyl acetate 50:50 to give 3-bromomethyl-6,7-dimethoxy-1-methyl-2(1H)-quinoxalinone as yellow needles (mp 161-163°).)

HPLC VARIABLES
Column: 100 × 4 10 μm Radial-Pak C18 (Waters)
Mobile phase: Gradient. MeOH:water from 57:43 to 100:0 over 20 min, maintain at 100:0 for 12 min

SAMPLE
Matrix: solutions
Sample preparation: React the carboxylic acid, triethylamine, and 1-(2,5-dihydroxyphenyl)-2-bromoethanone in a 1:2:4 molar ratio in MeCN at 45° for 2 h, inject a 10 μL aliquot. (Preparation of 1-(2,5-dihydroxyphenyl)-2-bromoethanone is as follows. Stir 27.6 g 1,4-dimethoxybenzene and 28 mL bromoacetyl bromide at 0°, add 53.4 g aluminum bromide over 10 min (an exothermic reactions ensues), let stand at room temperature for 12 h, add 100 mL 48% HBr, add 100 g ice, stir for 1 h, extract twice with 200 mL portions of diethyl ether. Combine the extracts and wash them 3 times with 200 mL portions of water, dry over 40 g anhydrous magnesium sulfate, evaporate to dryness, recrystallize the product 3 times from EtOH to yield 1-(2,5-dihydroxyphenyl)-2-bromoethanone monobromoacetate (mp 105-107°). Dissolve 11 g 1-(2,5-dihydroxyphenyl)-2-bromoethanone monobromoacetate in 200 mL warm dry MeOH satu-

rated with HBr, stir for 18 h, add 200 mL water, cool to -10°. Collect the yellow solid and dry it under vacuum at 50° for 48 h, recrystallize from toluene:heptane 50:50 then toluene to obtain 1-(2,5-dihydroxyphenyl)-2-bromoethanone as yellow needles (mp 117-119°).)

HPLC VARIABLES
Column: 250 × 4 7 μm RP-18 LiChrocart (Merck)
Mobile phase: MeOH:100 mM pH 6.5 sodium acetate 58:42

SAMPLE
Matrix: solutions
Sample preparation: Inject a 50 μL aliquot of a solution in mobile phase.

HPLC VARIABLES
Column: 100 × 4.6 5 μm Spheri-5 RP-8
Mobile phase: MeOH:buffer 30:70 (Prepare buffer by mixing 4 mM Na_2HPO_4 and 7 mM KH_2PO_4 to achieve pH 7.)
Flow rate: 1
Injection volume: 50
Detector: F ex 355 em 460 (408 nm cutoff filter) following post-column extraction. The column effluent mixed with 50 μg/mL reagent in mobile phase pumped at 0.5 mL/min and then with chloroform pumped at 1 mL/min and the mixture flowed through a 1.8 m × 0.3 mm ID knitted PTFE coil to a 50 μL membrane phase separator using a polyethylene-backed 0.5 μm Fluoropore membrane filter (design in paper). The organic phase flowed to the detector. (Synthesize the reagent, α-(3,4-dimethoxyphenyl)-4'-trimethylammoniummethylcinnamonitrile methosulfate, as follows. Stir 20 mmoles 3,4-dimethoxyphenylacetonitrile and 20 mmoles p-toluamide in 50 mL EtOH at 50°, add 5 mL 50% aqueous KOH slowly, stir at 50° for 5 min, cool to room temperature, filter, dry the precipitate of α-(3,4-dimethoxyphenyl)-4'- methylcinnamonitrile. Dissolve 20 mmoles α-(3,4-dimethoxyphenyl)-4'-methylcinnamonitrile, 20 mmoles N-bromosuccinimide, and 20 mg benzoyl peroxide in 100 mL carbon tetrachloride (Caution! Carbon tetrachloride is a carcinogen!), reflux with stirring for 1.5 h , cool, filter, evaporate to dryness under reduced pressure, recrystallize from MeOH to give α-(3,4-dimethoxyphenyl)-4'-bromomethylcinnamonitrile. Vigorously stir 30 mmoles anhydrous dimethylamine in 100 mL dry benzene (Caution! Benzene is a carcinogen!) at 0°, very slowly add 10 mmoles α-(3,4-dime-

thoxyphenyl)-4'-bromomethylcinnamonitrile while stirring at 0°, stir at room temperature overnight, add 150 mL water, remove the organic phase, extract the aqueous phase twice with 100 mL portions of diethyl ether, wash the organic layers with saturated NaCl solution, dry over anhydrous magnesium sulfate, evaporate under reduced pressure to give α-(3,4-dimethoxyphenyl)-4'-dimethylaminomethylcinnamonitrile (J.Chem.Eng.Data 1987, 32, 387). Reflux 10 mmoles α-(3,4-dimethoxyphenyl)-4'-dimethylaminomethylcinnamonitrile, 20 mmoles dimethyl sulfate (Caution! Dimethyl sulfate is a carcinogen and acutely toxic!), and 5 g potassium carbonate in 50 mL acetone for 1 h, cool to room temperature, filter, dry the precipitate under vacuum at room temperature overnight, recrystallize from chloroform containing 2-3 drops of 95% EtOH to give α-(3,4-dimethoxyphenyl)-4'-trimethylammoniummethylcinnamonitrile methosulfate (mp 212-215°). Protect solutions from light.)

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.
Column temperature: 30
Flow rate: 2
Detector: UV 210

OTHER SUBSTANCES
Also analyzed: acepromazine, acetaminophen, acetophenazine, albuterol, aminophylline, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, aprobarbital, aspirin, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, benzotropine, benzphetamine, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, danazol, danthron, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine, eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isocarbostyril, isocarboxazid, isoniazid, isoproterenol, isoxsuprine, ivermectin, ketamine, ketoprofen, kynurenic acid, levorphanol, lidocaine, lorazepam, lormetazepam, loxapine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin,

mephobarbital, mepivacaine, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, methyltestosterone, methyprylon, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine, phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, pyrilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfanilamide, sulfapyridine, sulfasoxizole, sulindac, tamoxifen, temazepam, testosterone, tetracaine, tetracycline, tetramisole, thebaine, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tolmetin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, trimethoprim, tripelennamine, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

SAMPLE

Matrix: solutions
Sample preparation: 50 μL Solution + 50 μL pH 7.4 PBS + 100 μL MeOH, centrifuge at 12000 g for 10 min, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 Cosmosil 5C18-P (Nacalai Tesque)
Mobile phase: MeOH:50 mM NaH_2PO_4 20:80
Flow rate: 1
Injection volume: 50
Detector: UV 220

CHROMATOGRAM

Internal standard: salicylic acid

OTHER SUBSTANCES
Simultaneous: atenolol

KEY WORDS
buffer; Earle's balanced salt solution; salicylic acid is IS

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 5 μm Supelcosil LC-DP (A) or 250 × 4 5 μm LiChrospher 100 RP-8 (B)
Mobile phase: MeCN:0.025% phosphoric acid:buffer 25:10:5 (A) or 60:25:15 (B) (Buffer was 9 mL concentrated phosphoric acid and 10 mL triethylamine in 900 mL water, adjust pH to 3.4 with dilute phosphoric acid, make up to 1 L.)
Flow rate: 0.6
Injection volume: 25
Detector: UV 229

CHROMATOGRAM
Retention time: 5.20 (A), 4.35 (B)

OTHER SUBSTANCES
Also analyzed: acebutolol, acepromazine, acetaminophen, acetazolamide, acetophenazine, albuterol, alprazolam, amitriptyline, amobarbital, amoxapine, antipyrine, atenolol, atropine, azatadine, baclofen, benzocaine, bromocriptine, brompheniramine, brotizolam, bupivacaine, buspirone, butabarbital, butalbital, caffeine, carbamazepine, cetirizine, chlorcyclizine, chlordiazepoxide, chlormezanone, chloroquine, chlorpheniramine, chlorpromazine, chlorpropamide, chlorprothixene, chlorthalidone, chlorzoxazone, cimetidine, cisapride, clomipramine, clonazepam, clonidine, clozapine, cocaine, codeine, colchicine, cyclizine, cyclobenzaprine, dantrolene, desipramine, diazepam, diclofenac, diflunisal, diltiazem, diphenhydramine, diphenidol, diphenoxylate, dipyridamole, disopyramide, dobutamine, doxapram, doxepin, droperidol, encainide, ethidium bromide, ethopropazine, fenoprofen, fentanyl, flavoxate, fluoxetine, fluphenazine, flurazepam, flurbiprofen, fluvoxamine, furosemide, glutethimide, glyburide, guaifenesin, haloperidol, homatropine, hydralazine, hydrochlorothiazide, hydrocodone, hydromorphone, hydroxychloroquine, hydroxyzine, ibuprofen, imipramine, indomethacin, ketoconazole, ketoprofen, ketorolac, labetalol, levorphanol, lidocaine, loratadine, lorazepam, lovastatin, loxapine, mazindol, mefenamic acid, meperidine, mephenytoin, mepivacaine, mesoridazine, metaproterenol, metformin, methadone, methdilazine, methocarbamol, methotrexate, methotrimeprazine, methoxamine, methyldopa, methylphenidate, metoclopramide, metolazone, metoprolol, metronidazole, midazolam, moclobemide, morphine, nadolol, nalbuphine, naloxone, naphazoline, naproxen, nifedipine, nizatidine, norepinephrine, nortriptyline, oxazepam, oxycodone, oxymetazoline, paroxetine, pemoline, pentazocine, pentobarbital, pentoxifylline, perphenazine, pheniramine, phenobarbital, phenol, phenolphthalein, phentolamine, phenylbutazone, phenyltoloxamine, phenytoin, pimozide, pindolol, piroxicam, pramoxine, prazepam, prazosin, probenecid, procainamide, procaine, prochlorperazine, procyclidine, promazine, promethazine, propafenone, propantheline, propiomazine, propofol, propranolol, protriptyline, quazepam, quinidine, quinine, racemethorphan, ranitidine, remoxipride, risperidone, scopolamine, secobarbital, sertraline, sotalol, spironolactone, sulfinpyrazone, sulindac, temazepam, terbutaline, terfenadine, tetracaine, theophylline, thiethylperazine, thiopental, thioridazine, thiothixene, timolol, tocainide, tolbutamide, tolmetin, trazodone, triamterene, triazolam, trifluoperazine, triflupromazine, trimeprazine, trimethoprim, trimipramine, verapamil, warfarin, xylometazoline, yohimbine, zopiclone

SAMPLE
Matrix: wine
Sample preparation: Adjust pH of wine to 7-8 with potassium bicarbonate. Remove a 1 mL aliquot and add it to 1 mL 170 mM phenacyl bromide in acetone, add 1 mL 17 mM 18-crown-6 in acetone, add 1 mL acetone, heat in a boiling water bath for 75 min, cool, inject a 10 μL aliquot. (Recrystallize phenacyl bromide from n-heptane.)

HPLC VARIABLES
Guard column: 37-50 μm Bondapak C18/Corasil
Column: 250 × 4 7 μm RP-18 (Merck)
Mobile phase: Gradient. MeOH:water from 35:65 to 85:15 over 20 min.
Flow rate: 2
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 11.7

OTHER SUBSTANCES

Extracted: acetic acid, anisic acid, benzilic acid, benzoic acid, butyric acid, caprylic acid, cinnamic acid, citramalic acid, citric acid, enanthic acid, fumaric acid, galacturonic acid, gallic acid, glutaric acid, glycolic acid, glyoxylic acid, p-hydroxybenzoic acid, isocitric acid, α-ketoglutaric acid, lactic acid, malic acid, mandelic acid, phenylacetic acid, propionic acid, protocatechuic acid, pyruvic acid, sorbic acid, succinic acid, tartaric acid, valeric acid, vanillic acid, ascorbic acid

KEY WORDS

derivatization

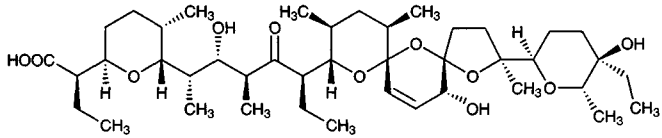
Salinomycin



Molecular formula: $C_{42}H_{70}O_{11}$
Molecular weight: 751.01
CAS Registry No.: 53003-10-4, 55721-31-8 (sodium salt)
Merck Index: 8488

SAMPLE

Matrix: albumen, eggs, feed, premix, tissue
Sample preparation: Eggs, feed, premix, tissue. 1 g Sample + 15 mL acetone, vortex for 5 min, centrifuge, decant the acetone layer. Re-extract residue (2x), evaporate the combined acetone layers to dryness. Partition the residue between 25 mL aqueous EtOH (water:EtOH 80:20) and 25 mL petroleum ether (50-110°). Evaporate EtOH fraction to dryness, dissolve residue in MeOH, adjust volume to 500 μL. Inject a 50 or 100 μL aliquot. Albumen. 1 g Sample + 15 mL MeOH, extract for 15 min, centrifuge at 1290 × g at -5°. Evaporate to dryness, dissolve residue in MeOH, adjust to a final volume of 500 μL. Inject a 50 or 100 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 4.6 5 μm Inertsil ODS-2 (Mandel Scientific)
Column: 250 × 3.2 5 μm CSC-Inertsil 150A/ODS-2 (Mandel Scientific)
Mobile phase: MeOH:water:acetic acid 95:5:0.1
Flow rate: 0.5
Injection volume: 50-100
Detector: UV 520 nm following post-column reaction. The column effluent mixed with vanillin reagent pumped at 1 mL/min. The mixture flowed through a Teflon knitted reactor coil (10 m × 0.5 mm i.d., total volume 2 mL) at 95° to the detctor. (Prepare the vanillin reagent as follows. Slowly and carefully add 20 mL concentrated sulphuric acid (95-98%) to 950 mL chilled MeOH, mix well, allow to cool to room temperature. Add 30 g vanillin with constant stirring. Filter solution, degas using vacuum, and store in amber-colored bottle.)

CHROMATOGRAM

Retention time: <10
Limit of detection: 5 ng/g
Limit of quantitation: 10 ng/g

SAMPLE
Matrix: feed
Sample preparation: 20 g Ground Feed + 200 mL hexane:ethyl acetate 90:10, stir at high speed for 2 h, let stand. Remove an aliquot equivalent to 1 g feed and evaporate it to dryness under reduced pressure at 40°, reconstitute with 2 mL MeOH, filter (0.45 μm), inject an aliquot of the filtrate.

HPLC VARIABLES
Column: 60 × 4.6 3 μm C18 (Hewlett-Packard)
Mobile phase: MeOH:5% acetic acid 90:10
Flow rate: 0.5
Injection volume: 20-25
Detector: UV 520 following post-column reaction. The column effluent mixed with the reagent pumped at 1 mL/min and the mixture flowed through a 1.5 mL reaction coil (Kratos Model 510) at 95° to the detector. (Reagent was 40 g/L vanillin in MeOH:sulfuric acid 100:2. Keep in an ice bath and prepare fresh daily.)

CHROMATOGRAM
Retention time: 6.7
Limit of detection: 1 ppm

SAMPLE
Matrix: bulk, formulations
Sample preparation: Bulk. Prepare a 20 mg/mL solution of bulk aspirin in dichloromethane, inject a 10 μL aliquot as soon as dissolution is complete. Tablets. Prepare a 20 mg/mL solution of ground aspirin tablets in dichloromethane, filter (0.45 μm) immediately, immediately inject a 10 μL aliquot of the filtrate.

HPLC VARIABLES
Column: 150 × 4.6 6 μm Zorbax SIL
Mobile phase: Hexane:chloroform:acetic acid 80:19:3 (Before first use pump 10 column volumes of dichloromethane:acetic acid:2,3-dimethoxypropane 96:2:2 through column at 3 mL/min.)
Flow rate: 3
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 2.2
Limit of detection: 5 ppm

OTHER SUBSTANCES
Simultaneous: aspirin, salicylic acid

KEY WORDS
normal phase; tablets

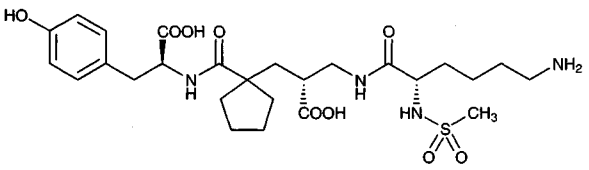
Sampatrilat



Molecular formula: $C_{26}H_{40}N_4O_9S$
Molecular weight: 584.69
CAS Registry No.: 129981-36-8

SAMPLE
Matrix: blood
Sample preparation: Condition a Bond-Elut Certify II SPE cartridge with 1 mL MeOH and 1 mL pH 7 phosphate buffer and a Bond-Elut C18 SPE cartridge with 1 mL MeOH and 1 mL water. Add 20 μL 1 μg/mL IS in water and 1 mL pH 7 phosphate buffer to 1 mL plasma, vortex. Add the mixture to the Bond-Elut Certify II cartridge. Wash with 1 mL pH 7 phosphate buffer, 1 mL MeOH:water:trifluoroacetic acid 15:85:0.1, dry under vacuum, elute with 1 mL MeOH: water:trifluoroacetic acid 80:20:0.1. Centrifuge briefly and evaporate to dryness under a stream of nitrogen at 37°. Reconstitute the residue with 1 mL 12% boron trifluoride in MeOH, incubate at 65° for 30 min. Add 2 mL water, evaporate to approximately 1 mL under a stream of nitrogen at 65°, add to the Bond-Elut C18 cartridge. Rinse the tube with 1 mL water, add the rinse to the SPE cartridge, wash with three 1 mL portions of water, elute into MTBE-rinsed polypro-

pylene tapered tubes with two 1 mL portions of MeOH. Centrifuge briefly, evaporate to dryness under a stream of nitrogen at 37°. Reconstitute in HPLC injection solution, vortex, centrifuge at 10000 rpm for 5 min. Inject an 80 μL aliquot. (HPLC injection solution was MeOH:water 50:50 containing 20 mM ammonium acetate and 5 mM triethylamine.)

HPLC VARIABLES
Column: 250 × 4.6 Spherisorb S5C6 (A), 30 × 4.6 3 μm (3 × 3CR C18) Perkin-Elmer (B)
Mobile phase: MeCN:20 mM pH 2.25 sodium phosphate buffer containing 2.5 mM octanesulfonic acid 35:65 (A); MeOH:water 80:20 containing 20 mM ammonium acetate and 5 mM triethylamine (B)
Flow rate: 1
Injection volume: 80
Detector: E, ESA Coulochem, analytical electrode 700 mV (A); MS, Perkin-Elmer Sciex API III-plus triple quadrupole, heated nebulizer, positive ion APCI mode, nebulizer 500°, collision gas argon, dwell time 100 ms, Q1 at m/z 613.1 and m/z 597.1, Q3 at m/z 211.4 (B)

CHROMATOGRAM
Internal standard: UK-79.942 (N-(1-(2-carboxy-3-(N2-acetyllysylamino)propyl)-1-cyclopentylcarbonyl)tyrosine, Pfizer Central Research, UK)
Limit of detection: 100 pg
Limit of quantitation: 500 pg/mL

KEY WORDS
plasma; derivatization; SPE

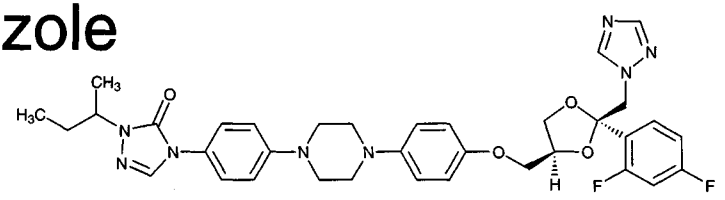
Saperconazole



Molecular formula: $C_{35}H_{38}F_2N_8O_4$
Molecular weight: 672.74
CAS Registry No.: 110588-57-3
Merck Index: 8510

SAMPLE
Matrix: blood
Sample preparation: 250 μL serum + 50 μL 0.3 N barium hydroxide + 50 μL 0.4 N zinc sulfate + 1 mL MeCN, vortex, centrifuge at 3521 g for 15 min, evaporate the supernatant to dryness under a stream of nitrogen, reconstitute with 250 μL mobile phase, inject an aliquot.

HPLC VARIABLES
Guard column: 7.5 × 4.6 5 μm Alltech Alltima C18
Column: 250 × 4.6 5 μm Alltech Alltima C18
Mobile phase: MeCN:MeOH:50 mM pH 6.7 phosphate buffer 47:8:45
Column temperature: 37
Flow rate: 1
Detector: UV 263

CHROMATOGRAM
Internal standard: saperconazole

OTHER SUBSTANCES
Extracted: itraconazole

KEY WORDS
serum; saperconazole is IS

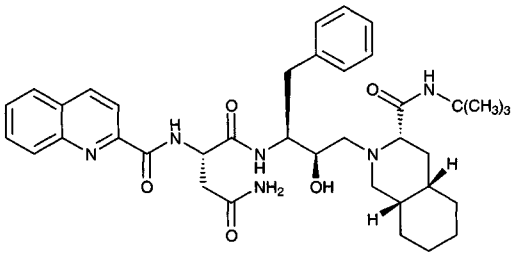
Saquinavir



Molecular formula: $C_{38}H_{50}N_6O_5$, $C_{38}H_{50}N_6O_5.CH_4O_3S$ (mesylate)
Molecular weight: 670.85
CAS Registry No.: 127779-20-8, 149845-06-7 (mesylate)
Merck Index: 8516

SAMPLE
Matrix: blood, CSF, saliva
Sample preparation: CSF, plasma. Condition a 1 mL 200 mg C2 SPE cartridge with 1 mL MeCN and 1 mL 100 mM ammonium acetate at 1 mL/min. 600 μL CSF or plasma + 600 μL 100 mm ammonium acetate solution, vortex for 10 s, centrifuge at 10500 g for 3 min. Add 1 mL of the diluted sample to the SPE cartridge using vacuum. Wash with 1 mL MeCN:100 mM ammonium acetate 30:70, suck dry using vacuum for 1 min. Elute with 400 μL MeCN:2.5 mM ammonium acetate 80:20, evaporate the eluate to dryness under a gentle stream of nitrogen at 40°. Reconstitute the residue in 150 μL mobile phase, vortex for 60 s, centrifuge at 10500 g for 3 min, inject an aliquot. Saliva. Condition a 1 mL 200 mg C2 SPE cartridge with 1 mL MeCN and 1 mL 100 mM ammonium acetate at 1 mL/min. 600 μL Saliva + 600 μL blank plasma + 1.2 mL 100 mm ammonium acetate, mix, centrifuge at 10500 g for 3 min. Add 2 mL diluted sample to the SPE cartridge using a vacuum. Wash with 1 mL MeCN:100 mM ammonium acetate 30:70, suck dry using a vacuum for 1 min. Elute with 400 μL MeCN:2.5 mM ammonium acetate 80:20, evaporate the eluate to dryness under a gentle stream of nitrogen at 40°. Reconstitute the residue in 150 μL mobile phase, vortex for 60 s, centrifuge at 10500 g for 3 min, inject an aliquot.

HPLC VARIABLES
Guard column: 10 × 3 Chromguard C18 (Chrompack Netherlands)
Column: 75 × 4.6 3.5 μm Zorbax SB-C18
Mobile phase: MeCN:buffer 40.5:59.5 (Buffer was water containing 25 mM sodium acetate and 25 mM hexane-1-sulfonic acid, adjusted to pH 4.0 with 37% HCl)
Flow rate: 1
Injection volume: 100
Detector: UV 239

CHROMATOGRAM
Retention time: 7.5

Limit of detection: 1.0 ng/mL
Limit of quantitation: 2.5 ng/mL

KEY WORDS
plasma; SPE; pharmacokinetics

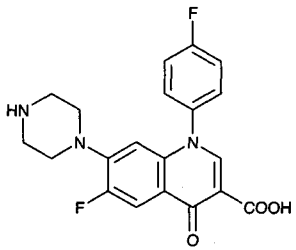
Sarafloxacin

Molecular formula: $C_{20}H_{17}F_2N_3O_3$
Molecular weight: 385.37
CAS Registry No.: 98105-99-8, 91296-87-6 (HCl)
Merck Index: 8517



SAMPLE
Matrix: milk
Sample preparation: Condition a 500 mg Bond Elut LRC PRS SPE cartridge with 5 mL MeOH and 5 mL extracting solution 65:35. Add 25 mL extracting solution to 5 mL milk, shake for 15 s, add 4 g anhydrous sodium sulfate, shake for 15 s, centrifuge at 3000 rpm at 5° for 5 min. Remove the supernatant and repeat the extraction with 25 mL extracting solution as before except do not add any more sodium sulfate, mix mechanically, centrifuge, combine the supernatants, add 25 mL 1% acetic acid, shake for 10-15 s. Freeze for 30 min to facilitate precipitation, centrifuge at 2500 rpm at 5° for 10 min. Add 75 mL to the SPE cartridge, pass the entire sample through the cartridge, then add 2 mL MeOH, wash with 5 mL water, wash with 2 mL MeOH. Elute with 2.5 mL 25% ammonium hydroxide-MeOH. Evaporate to dryness under nitrogen at 55°, dissolve the residue in 2 mL 1% acetic acid, sonicate for 1 min, vortex for 20 s, filter (0.45 μm), inject an aliquot. (Extracting solution was 1% aqueous acetic acid:EtOH 1:99.)

HPLC VARIABLES
Column: 150 × 4.6 5 μm Inertsil
Mobile phase: MeCN:2% acetic acid 15:85
Column temperature: 40
Flow rate: 1
Injection volume: 50
Detector: F ex 278 em 450, with a 418 nm cut-off filter

CHROMATOGRAM
Retention time: 5.6
Limit of detection: 1.2 ppb
Limit of quantitation: 5 ppb

OTHER SUBSTANCES
Extracted: ciprofloxacin, difloxacin, enrofloxacin

KEY WORDS
SPE

REFERENCE

SAMPLE
Matrix: tissue
Sample preparation: Condition a 10 mL 500 mg Bond Elut LRC PRS SPE cartridge with 2 mL MeOH and 2 mL equilibrating solution. 2 g Catfish muscle + 18 mL extracting solution, homogenize for 20 s, centrifuge at 3000 rpm for 5 min, decant the supernatant. Add another 18 mL extracting solution to the pellet and homogenize again, centrifuge at 3000 rpm for 5 min, combine the supernatants. Add 20 mL 1% glacial acetic acid, freeze for 30 min, centrifuge at 2500 rpm at 4° for 10 min. Add the extracts to the SPE cartridge, wash with 2 mL MeOH, 5 mL water, and 2 mL MeOH. Let the SPE cartridge dry for 30 s. Elute with 2 mL MeOH:30% ammonium hydroxide 80:20, dry the eluate under nitrogen at 50°. Reconstitute the residue in 500 μL mobile phase, filter (0.45 μm), inject an aliquot. (The extracting solution was EtOH:water:glacial acetic acid 98:1:1. The equilibrating solution was extracting solution:1% glacial acetic acid 35:20.)

HPLC VARIABLES
Column: 150 × 2 5 μm Inertsil Phenyl
Mobile phase: MeCN:2% formic acid 14:86
Column temperature: 40
Flow rate: 0.35
Injection volume: 50
Detector: MS, Hewlett-Packard 5989, Model 59987A electrospray, nitrogen drying gas 40 mL/min, 260°, nebulizing gas nitrogen, 80 psi, m/z 342

CHROMATOGRAM
Retention time: 7.33-7.75
Limit of detection: 10 ppb
Limit of quantitation: 20 ppb

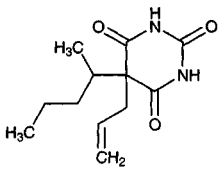
Secobarbital



Molecular formula: $C_{12}H_{18}N_2O_3$
Molecular weight: 238.29
CAS Registry No.: 76-73-3, 309-43-3 (Na salt)
Merck Index: 8563
Lednicer No.: 1 269

SAMPLE

Matrix: blood
Sample preparation: 200 µL Serum + 200 µL 50 µg/mL hexobarbital in MeCN + 25 µL glacial acetic acid, vortex for 10 s, centrifuge for 1 min, inject a 30-100 µL aliquot of the supernatant.

HPLC VARIABLES

Column: µBondapak C18
Mobile phase: Gradient. MeCN:7.5 g/L NaH_2PO_4 adjusted to pH 3.2 with phosphoric acid 5:95 to 22:78 over 24 min, to 45:55 over 10 min, maintain at 45:55 for 5 min. Re-equilibrate with 5:95 for 5 min.
Column temperature: 50
Flow rate: 3
Injection volume: 30-100
Detector: UV 210

CHROMATOGRAM

Retention time: 25.8
Internal standard: hexobarbital (20.6)
Limit of detection: 200-2000 ng/mL

OTHER SUBSTANCES

Extracted: acetaminophen, amobarbital, butabarbital, butalbital, chlordiazepoxide, diazepam, ethchlorvynol, flurazepam, glutethimide, methaqualone, methyprylon, nitrazepam, pentobarbital, phenobarbital, phenytoin, primidone, salicylic acid, theophylline
Simultaneous: amitriptyline, caffeine, clomipramine, codeine, desipramine, ethotoin, imipramine, lidocaine, mesantoin, methsuximide, nirvanol, nortriptyline, oxazepam, procainamide, phenylpropanolamine, propranolol, quinidine

KEY WORDS

serum

REFERENCE

Kabra,P.M.; Stafford,B.E.; Marton,L.J. Rapid method for screening toxic drugs in serum with liquid chromatography, *J.Anal.Toxicol.*, **1981**, *5*, 177–182.

SAMPLE

Matrix: blood
Sample preparation: 500 µL Serum + 50 µL 7 µg/mL IS in water + 1 mL buffer, vortex for 10 s, add 5 mL n-hexane:ether:n-propanol 49:49:2, shake gently for 20 min, centrifuge at 1000 g for 5 min, repeat the extraction. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 50°, reconstitute the residue in 300 µL mobile phase, inject a 50-100 µL aliquot. (Buffer was 10 mM sodium acetate:10 mM acetic acid 88.5:11.5, pH 5.5.)

HPLC VARIABLES

Column: 250 × 4.6 5 µm Partisil 5 ODS-3
Mobile phase: MeCN:buffer 28:72 (Buffer was 300 µL 1 M KH_2PO_4 and 50 µL 900 mM phosphoric acid in 1.8 L water, pH 4.4.)
Column temperature: 50
Flow rate: 2.8
Injection volume: 50-100
Detector: UV 195

CHROMATOGRAM
Retention time: 8.5
Internal standard: 5-(4-methylphenyl)-5-phenylhydantoin (11.5)
Limit of detection: 20 ng/mL

OTHER SUBSTANCES
Extracted: carbamazepine, ethosuximide, phenytoin
Simultaneous: mephobarbital, paramethadione, phenobarbital, primidone
Noninterfering: chlorazepate, clonazepam, diazepam, thioridazine, valproic acid

KEY WORDS
serum; pharmacokinetics

SAMPLE
Matrix: blood
Sample preparation: Condition a 100 mg Bond-Elut C8 SPE cartridge with 2 volumes of MeOH, 2 volumes of water, and 1 volume of 100 mM pH 5.59 Sörensen's phosphate buffer. Add 500 μL plasma to the SPE cartridge, wash with 2 volumes of 100 mM pH 5.59 Sörensen's phosphate buffer, wash with 1 volume of water, elute with 500 μL MeOH. Evaporate the eluate to dryness under vacuum, reconstitute in 50 μL MeOH, inject an aliquot.

HPLC VARIABLES
Guard column: 10 μm Guard-Pak C18 (Waters)
Column: 100 × 8 10 μm Radial-Pak C8 (Waters)
Mobile phase: MeOH:THF:100 mM pH 7.72 Sörensen's phosphate buffer 28:16:52
Flow rate: 2.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 6.39
Internal standard: secobarbital

OTHER SUBSTANCES
Extracted: methohexital, pentobarbital, thiopental
Noninterfering: ketamine

KEY WORDS
plasma; dog; secobarbital is IS; SPE

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: 100 μL Serum + 100 μL buffer + 1.5 mL IS in 5% isopropanol in chloroform, vortex for 30 s, centrifuge. Remove the organic layer and evaporate it to dryness under a stream of air at room temperature, reconstitute the residue in 100 μL mobile phase, inject a 6-10 μL aliquot. (Buffer was 13.6 g KH_2PO_4 in 90 mL water, pH adjusted to 6.8 with about 3 mL 10 M NaOH, made up to 100 mL.)

HPLC VARIABLES
Guard column: 20 × 4.6 Supelguard LC-1 (Supelco)
Column: 250 × 4.6 5 μm Supelcosil LC-1 (Supelco)

Mobile phase: MeOH:MeCN:buffer 17.5:17.5:65 (Buffer was 2.72 g KH_2PO_4 in 1.9 L water, pH adjusted to 6.3 with about 2 mL 1 M NaOH, made up to 2 L.)
Flow rate: 2
Injection volume: 6-10
Detector: UV 204

CHROMATOGRAM
Retention time: 7.31
Internal standard: 5-ethyl-5-p-tolybarbituric acid (tolybarb) (4.80)

OTHER SUBSTANCES
Extracted: acetaminophen, amobarbital, barbital, caffeine, carbamazepine, chloramphenicol, ethosuximide, mephobarbital, methsuximide, pentobarbital, phenobarbital, phenytoin, primidone, theophylline, thiopental
Also analyzed: acetanilide, N-acetylcysteine, N-acetylprocainamide, ampicillin, aspirin, butabarbital, butalbital, chlorpropamide, cimetidine, codeine, cyheptamide, diazoxide, diflunisal, diphylline, disopyramide, ethchlorvynol, gentisic acid, glutethimide, heptabarbital, hexobarbital, ibuprofen, indomethacin, ketoprofen, mefenamic acid, mephenytoin, methaqualone, methsuximide, methyprylon, morphine, naproxen, nirvanol, oxphenylbutazone, phenacetin, phensuximide, phenylbutazone, procainamide, salicylamide, salicylic acid, sulfamethoxazole, sulindac, tolmetin, trimethoprim, vancomycin
Noninterfering: amikacin, gentamicin, meprobamate, netilmicin, quinidine, tetracycline, tobramycin, valproic acid
Interfering: methyl salicylate

KEY WORDS
serum

SAMPLE
Matrix: blood
Sample preparation: Prepare an SPE cartridge by plugging the end of a 1 mL disposable pipette tip with glass wool and adding about 100 mg Chromosorb P/NAW. Add 50 μL plasma then 50 μL 10 μg/mL tolylphenobarbital in 200 mM HCl to the SPE cartridge, let stand for 2 min, elute with 1 mL chloroform:isopropanol 6:1. Evaporate the eluate to dryness under a stream of nitrogen at 30°, reconstitute the residue in 100 μL mobile phase, inject a 15 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Supelcosil-LC-8
Mobile phase: MeCN:water 20:80
Flow rate: 3.3
Injection volume: 15
Detector: UV 208

CHROMATOGRAM
Retention time: 13.80
Internal standard: tolylphenobarbital (7.57)
Limit of detection: 50-100 ng/mL

OTHER SUBSTANCES
Extracted: theophylline, caffeine, barbital, ethosuximide, primidone, carbamazepinediol, phenacemide, methyprylon, nirvanol, phenobarbital, chloramphenicol, butabarbital, carbamazepine epoxide, mephenytoin, pentobarbital, amobarbital, carbamazepine, glutethimide, phenytoin, methaqualone
Noninterfering: acetaminophen, amikacin, amitriptyline, clonazepam, cyclosporine, desipramine, diazepam, digoxin, disopyramide, gentamicin, imipramine, lidocaine, methotrexate, N-acetylprocainamide, netilmicin, nortriptyline, procainamide, quinidine, salicylic acid, sulfamethoxazole, tobramycin, trimethoprim, valproic acid, p-hydroxyphenobarbital, vancomycin

SAMPLE
Matrix: blood
Sample preparation: Mix plasma with an equal volume of MeCN, centrifuge at 10000 g, dilute supernatant with an equal volume of water, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 110 × 4.7 5 μm PartiSphere C18 (Whatman)
Mobile phase: MeCN:15 mM pH 7.0 phosphate buffer 30:70
Flow rate: 0.8
Injection volume: 50
Detector: UV 270 following post-column reaction. The column effluent flowed through a 6 m × 0.25 mm ID crocheted coil of PTFE tubing irradiated by an 8 W low-pressure mercury lamp to the detector.

CHROMATOGRAM
Retention time: 8.7

OTHER SUBSTANCES
Extracted: aprobarbital, butethal, pentobarbital

KEY WORDS

SAMPLE
Matrix: blood, CSF, gastric contents, urine
Sample preparation: 200 μL Serum, urine, CSF, or gastric fluid + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, backflush the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine HCl and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES
Column: A 40 μm preparative grade C18 (Analytichem); B 75 × 2.1 pellicular C18 (Whatman) + 250 × 4.6 5 μm C8 end-capped (Whatman)
Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 20 min.
Column temperature: 50
Flow rate: 1.5
Detector: UV 220

CHROMATOGRAM
Retention time: 12.82
Internal standard: heptanophenone (19)

OTHER SUBSTANCES

Extracted: acetaminophen, allobarbital, azinphos, barbital, brallobarbitone, bromazepam, butethal, caffeine, carbamazepine, carbaryl, cephaloridine, chloramphenicol, chlordiazepoxide, chlorothiazide, chlorvinphos, clothiapine, cocaine, coomassie blue, desipramine, diazepam, diphenhydramine, dipipanone, ethylbromphos, flufenamic acid, formothion, griseofulvin, indomethacin, lidocaine, lorazepam, malathion, medazepam, midazolam, oxazepam, paraoxon, penicillin G, pentobarbital, prazepam, propoxyphene, prothiophos, quinine, salicylic acid, strychnine, sulfamethoxazole, theophylline, thiopental, thioridazine, trimethoprim

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 200.5

SAMPLE
Matrix: solutions
Sample preparation: Evaporate a solution in water, MeOH, or diethyl ether to dryness, add a 3-fold molar excess of triethylamine, add 0.5-3 mL MeCN, add a 3-fold molar excess of N-chloromethyl-4-nitrophthalimide, heat at 60° for 1 h, inject an aliquot. (Preparation of N-chloromethyl-4-nitrophthalimide is as follows. Suspend 130 g 4-nitrophthalimide in 80 mL 40% formaldehyde solution, add 200 mL water, reflux for 4 h, filter while hot, N-(hydroxymethyl-4-nitrophthalimide crystallizes on cooling (cf. J. Am. Chem. Soc. 1922, 44, 817). Mix a suspension of 2.26 g N-hydroxymethyl-4-nitrophthalimide in 10-15 mL ether with a suspension of 2.1 g phosphorus pentachloride in 10-15 mL ether, after 10 min heat on a water bath, cool in an ice-salt mixture, add ice-water dropwise with shaking, filter to obtain N-chloromethyl-4-nitrophthalimide, dry under vacuum (cf. Chem. Ber. 1959, 9, 1258).)

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 1-10 μg/mL solution in water, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Hypersil SCX/C18
Mobile phase: MeCN:25 mM pH 3 Na_2HPO_4 50:50
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: k' 1.17

OTHER SUBSTANCES
Also analyzed: amitriptyline, barbital, benzoic acid, butabarbital, clomipramine, clonazepam, desipramine, diazepam, flurazepam, furosemide, imipramine, nitrazepam, phenobarbital, phenol, phenolphthalein, pindolol, propranolol, resorcinol, salicylic acid, terbutaline, xylazine

KEY WORDS
effect of mobile phase pH on capacity factor is discussed

Walshe,M.; Kelly,M.T.; Smyth,M.R.; Ritchie,H. Retention studies on mixed-mode columns in high-performance liquid chromatography, *J.Chromatogr.A*, **1995**, *708*, 31–40.

SAMPLE
Matrix: urine
Sample preparation: 500 μL Urine + N-ethylnordiazepam + chlorpheniramine + 100 μL buffer, centrifuge at 11000 g for 30 s, inject a 500 μL aliquot onto column A with mobile phase A, after 0.6 min backflush column A with mobile phase A to waste for 1.6 min, elute column A with 250 μL mobile phase B, with 200 μL mobile phase C, and with 1.15 mL mobile phase D. Elute column A to waste until drugs start to emerge then elute onto column B. Elute column B to waste until drugs started to emerge, then elute onto column C. When all the drugs have emerged from column B remove it from the circuit, elute column C with mobile phase D, monitor the effluent from column C. Flush column A with 7 mL mobile phase E, with mobile phase D, and mobile phase A. Flush column B with 5 mL mobile phase E then with mobile phase D. (Buffer was 6 M ammonium acetate adjusted to pH 8.0 with 2 M KOH.)

HPLC VARIABLES

Column: A 10 × 2.1 12-20 μm PRP-1 spherical poly(styrene-divinylbenzene) (Hamilton); B 10 × 3.2 11 μm Aminex A-28 (Bio-Rad); C 25 × 3.2 5 μm C8 (Phenomenex) + 150 × 4.6 5 μm silica (Macherey-Nagel)
Mobile phase: A 0.1% pH 8.0 potassium borate buffer; B 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid; C MeCN:buffer 40:60 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.); D MeCN:buffer 33:67 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.); E MeCN:buffer 70:30 (Buffer was 6 mM KH_2PO_4 containing 5 mM tetramethylammonium hydroxide, and 2 mM dimethyloctylamine, pH adjusted to 6.50 with phosphoric acid.)
Column temperature: ambient (column A), 40 (columns B and C)
Flow rate: A 5; B-E 1
Injection volume: 500
Detector: UV 210, UV 235

CHROMATOGRAM

Retention time: k' 1.0
Internal standard: N-ethylnordiazepam (k' 2.1), chlorpheniramine (k' 5.9)
Limit of detection: 300 ng/mL

OTHER SUBSTANCES

Extracted: diazepam, phenylpropanolamine, phentermine, amphetamine, phenmetrazine, lidocaine, ephedrine, pentazocine, methamphetamine, desipramine, nortriptyline, diphenhydramine, methadone, imipramine, flurazepam, amitriptyline, morphine, codeine, hydromorphone, hydrocodone
Interfering: caffeine, cotinine, benzoylecgonine, oxazepam, phenobarbital, nordiazepam

KEY WORDS

column-switching

SAMPLE

Matrix: urine
Sample preparation: 2 mL Urine +1 mL 500 mM pH 5.5 phosphate buffer, add to an Extrelut 3 SPE cartridge, let stand for 10 min, elute with 15 mL dichloromethane:isopropanol 95:5. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue in 100 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 4 × 4 5 μm Lichrospher 100 RP8
Column: 250 × 4 5 μm Lichrospher 100 RP8
Mobile phase: Gradient. MeCN:10 mM pH 4.4 phosphate buffer from 30:70 to 40:60 over 8 min, maintain at 40:60 for 6 min, to 30:70 over 1 min
Flow rate: 1
Injection volume: 20
Detector: UV 212

CHROMATOGRAM

Retention time: 13.0
Limit of detection: 150 ng/mL

OTHER SUBSTANCES

Extracted: barbital, allobarbital, butabarbital, phenobarbital, pentobarbital
Noninterfering: acetaminophen, aspirin, amitriptyline, buprenorphine, caffeine, carbamazepine, chlorpromazine, desipramine, dextromethorphan, doxepin, ephedrine, fenfluramine, imipramine, lidocaine, loxapine, meperidine, methadone, methaqualone, naloxone, naltrexone, nic-

otine, orphenadrine, oxycodone, papaverine, pentazocine, phendimetrazine, phenmetrazine, phentermine, phenylpropanolamine, phenytoin, primidone, procaine, promethazine, propoxyphene, propyphenazone, theobromine, theophylline, trazodone, triflupromazine, trimethoprim, trimipramine

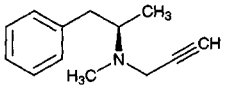
Selegiline



Molecular formula: $C_{13}H_{17}N$
Molecular weight: 187.28
CAS Registry No.: 2323-36-6, 14611-51-9
Merck Index: 8569

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 207.5

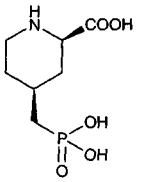
Selfotel



Molecular formula: $C_7H_{14}NO_5P$
Molecular weight: 223.17
CAS Registry No.: 110347-85-8

SAMPLE

Matrix: urine

Sample preparation: 50 μL Urine + 25 μL 100 μg/mL IS in water + 1 mL buffer, vortex for 5 s, add 100 μL reagent, vortex for 10 s, let stand for 1.5 min, add 200 μL 100 mg/mL iodoacetamide in MeCN, vortex for 15 s, let stand for 1.5 min, add 500 μL 2 mg/mL 9-fluorenylmethyl chloroformate in acetone, vortex for 20 s, let stand for 2 min, add 5 mL ether, vortex for 1 min, repeat the ether wash. Remove traces of organic solvent from the aqueous layer with a stream of nitrogen, vortex the aqueous layer for 2 s. Remove a 50 μL aliquot and add it to 500 μL mobile phase, inject a 50 μL aliquot onto column A and elute to waste with mobile phase A, divert the fraction containing selfotel and the IS onto column B, after 2 min remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B. (Prepare buffer by dissolving 15.5 g boric acid in 500 mL water, adjust pH to 9.5 with NaOH. Prepare reagent by adding 32 μL 3-mercaptopropionic acid to 1 mL 50 mg/mL o-phthalaldehyde in MeCN. Primary amino acids are removed by derivatization with o-phthalaldehyde/3-mercaptopropionic acid.)

HPLC VARIABLES

Column: A 75 × 4.6 5 μm Inertsil ODS-2; B 250 × 4.6 10 μm Chiralcel OD-R

Mobile phase: A MeCN:100 mM pH 2.50 phosphate buffer 35:65; B MeCN:100 mM pH 2.00 phosphate buffer 35:65

Column temperature: 30

Flow rate: A 0.5 for 16 min, to 2.0 over 0.3 min, maintain at 2.0 for 18.4 min, return to 0.5 over 0.3 min; B 0.5

Injection volume: 50

Detector: F ex 262 em 314

CHROMATOGRAM

Retention time: 19.2, 22.0 (enantiomers)

Internal standard: cis-4-(phosphonoethyl)-2-piperidinecarboxylic acid (CGS 20005) (36 (first eluting peak))

Limit of quantitation: 250 ng/mL

KEY WORDS

derivatization; chiral; column-switching

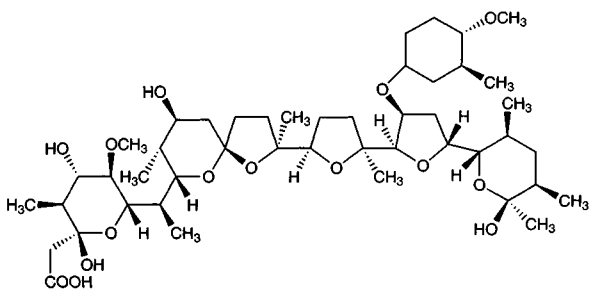
Semduramicin

Molecular formula: $C_{45}H_{76}O_{16}$
Molecular weight: 873.09
CAS Registry No.: 113378-31-7, 119068-77-8 (sodium salt)
Merck Index: 8587



SAMPLE

Matrix: tissue

Sample preparation: Condition a 200 mg BondElut LRC C8 SPE cartridge with 5 mL MeCN, 5 mL MeOH, add 5 mL water, do not allow to dry. Condition a 500 mg BondElut LRC silica SPE cartridge with 5 mL chloroform and 5 mL isooctane:dichloromethane 50:50, do not allow to dry. Vortex 1.25 g homogenized liver with 7.5 mL MeOH:water:ammonium hydroxide 80:20:1 for 3 min, heat at 55° for 1 h, centrifuge at 4000 rpm for 5 min, decant the supernatant, rinse the tube with 1-2 mL MeOH. Combine the rinse and the supernatant and evaporate them to 2-3 mL under a stream of nitrogen at 55°, add 5 mL water, vortex, sonicate for 5 min, add to the C8 SPE cartridge, rinse the tube with 1-2 mL water, add the rinse to the C8 SPE cartridge, wash with 3 mL water, wash with 1 mL MeOH:water 25:75, elute with 5 mL ethyl acetate, evaporate to dryness under a stream of nitrogen at 55°, reconstitute with 6 mL isooctane:dichloromethane 50:50, vortex, sonicate for 5 min, add to the silica SPE cartridge, rinse the tube with 1.5 mL isooctane:dichloromethane 50:50, add the rinse to the SPE cartridge, wash with 2.5 mL isooctane:dichloromethane 50:50, wash with 1 mL ethyl acetate, elute with 5 mL dichloromethane:MeOH 90:10, evaporate to dryness under a stream of nitrogen at 55°, reconstitute with 150 μL isooctane:ethyl acetate 60:40, vortex, sonicate for 2 min, inject a 75 μL aliquot.

HPLC VARIABLES

Guard column: 20 mm long 40 μm LC-Si (Supelco)
Column: 250 × 4.6 Zorbax silica
Mobile phase: Isooctane:ethyl acetate:glacial acetic acid:triethylamine:MeOH 35:65:0.4:0.2:0.1 (At the end of each day flush column with isooctane:ethyl acetate 40:60 for at least 3 h.)
Flow rate: 0.6
Injection volume: 75
Detector: UV 522 following post-column reaction. The column effluent mixed with the reagent pumped at 0.3 mL/min and the mixture flowed through a 15 m × 0.25 mm ID stainless steel coil at 95 ± 1° to the detector. At the end of each day flush the pump with MeOH for at least 3 h. (Prepare reagent by cautiously adding 20 mL concentrated sulfuric acid to 500 mL EtOH, cool to room temperature, add 30 g vanillin dissolved in 500 mL EtOH, mix, protect from light, prepare every other day.)

CHROMATOGRAM

Retention time: 11.3
Limit of detection: 25 ng/g

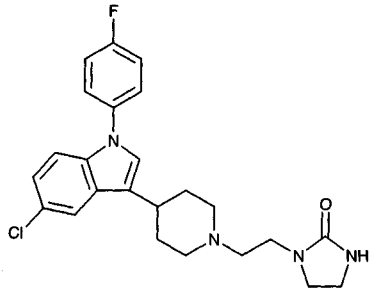
Sertindole



Molecular formula: $C_{24}H_{26}ClFN_4O$
Molecular weight: 440.95
CAS Registry No.: 106516-24-9
Merck Index: 8611

SAMPLE

Matrix: blood

Sample preparation: Condition a 200 mg Bond Elut C8 SPE cartridge with two 2 mL portions of MeCN, three 3 mL portions of MeOH, and two 2 mL portions of water. Briefly vortex 1 mL (human), 500 μL (dog), 200 μL (rat), or 100 μL (mouse) plasma with 50 μL 100 ng/mL IS in EtOH and 10 mM pH 8.5 dibasic potassium phosphate as required for sample transfer. Add to the SPE cartridge, wash with three 2 mL portions of water, and with three 1 mL portions of MeCN, dry with vacuum for 1-2 min. Elute with two 1 mL portions of MeOH:glacial acetic acid 98:2, evaporate the eluate to dryness under a gentle stream of air or nitrogen at 25-35°. Reconstitute the residue with 50 μL mobile phase, centrifuge at 3000 rpm for 5 min, maintain extract at 5° or less until injection, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: guard cartridge
Column: 150 × 2.1 5 μm YMC basic (YMC Inc., Wilmington, NC)
Mobile phase: MeCN:100 mM ammonium acetate 42:58 adjusted to pH 6.8 with glacial acetic acid
Flow rate: 0.4
Injection volume: 20
Detector: MS, Sciex API III, positive ion mode at 450°, nebulizing gas nitrogen 80 psi, auxiliary gas nitrogen at 2-3 mL/min, curtain gas nitrogen at 1.8 mL/min, m/z 441-113

CHROMATOGRAM

Retention time: 3.9
Internal standard: Lu-26-009
Limit of quantitation: 100 pg/mL

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

SPE; plasma; human; rat; dog; mouse; pharmacokinetics

REFERENCE

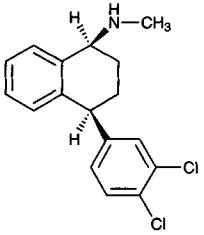
Sertraline



Molecular formula: $C_{17}H_{17}Cl_2N$
Molecular weight: 306.23
CAS Registry No.: 79617-96-2, 79559-97-0 (HCl)
Merck Index: 8612
Lednicer No.: 4 57

SAMPLE

Matrix: blood, tissue, vitreous humor
Sample preparation: Blood, vitreous humor. Mix 1 mL sample with 500 ng IS, add 500 μL 2% pH 9.5 sodium tetraborate and 8 mL n-butanol:hexane 5:95. Extract for 30 min, centrifuge. Remove the organic layer and add it to 200 μL 0.2% orthophosphoric acid. Extract for 30 min, inject a 30 μL aliquot of the aqueous layer. Tissue. Mix 500 μL liver homogenate with 5.0 μg IS, add 500 μL 2% pH 9.5 sodium tetraborate and 8 mL n-butanol:hexane 5:95. Extract for 30 min, centrifuge. Remove the organic layer and add it to 400 μL 0.2% orthophosphoric acid. Extract for 30 min, inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 150 × 3.9 5 μm NovaPak-Phenyl
Mobile phase: MeCN:10 mM KH_2PO_4 55:45, adjusted to pH 3.0
Flow rate: 1.5
Injection volume: 30
Detector: UV 214

CHROMATOGRAM

Internal standard: pentazocine
Limit of quantitation: 100 ng/mL (blood), 2.5 μm/g (liver)

OTHER SUBSTANCES

Extracted: pimozide

KEY WORDS

liver

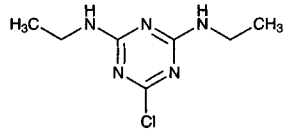
Simazine



Molecular formula: $C_7H_{12}ClN_5$
Molecular weight: 201.66
CAS Registry No.: 122-34-9
Merck Index: 8681

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation.

Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 220.5

CHROMATOGRAM
Retention time: 15.752

KEY WORDS
whole blood

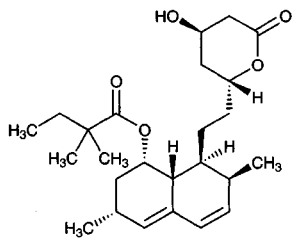
Simvastatin

Molecular formula: $C_{25}H_{38}O_5$
Molecular weight: 418.57
CAS Registry No.: 79902-63-9
Merck Index: 8686



SAMPLE
Matrix: blood
Sample preparation: Condition a 2.8 mL 500 mg Bond Elut C8 SPE cartridge with 2 mL MeOH and 2.5 mL water. Condition a 3 mL 200 mg Bond Elut C18 SPE cartridge with 1.5 mL MeCN and 2 mL water. 1 mL Plasma + 2.5 ng IS, mix, add to the C8 SPE cartridge, wash with 2 mL MeCN:water 10:90, wash with 1 mL MeOH:water 30:70, wash with 2 mL MeOH:water 60:40 (the ring-opened active metabolite elutes in this fraction), elute with 2 mL MeCN, add 100 μL 20 mM potassium carbonate to the eluate, evaporate to dryness under reduced pressure at 40° (this hydrolyses the lactone), dry under vacuum for more than 30 min, reconstitute with 100 μL 10 mM 1-(bromoacetyl)pyrene in DMF, add 100 μL 10 mM 18-crown-6 in DMF, mix, let stand at room temperature for 30 min, add 2 mL MeCN:triethylamine 90:10, add to a 10 mL 100 mg Bond Elut LRC PBA SPE cartridge, wash with 4 mL MeOH, wash with 2 mL MeCN, elute with 2 mL MeCN:propylene glycol 60:40, dilute the eluate with 1 mL water, add to the C18 SPE cartridge, wash with 2 mL MeCN:water 70:30, elute with 3 mL MeCN. Evaporate the eluate to dryness, reconstitute the residue in 300 μL MeCN:water 70:30, inject a 150 μL aliquot onto column A and elute to waste with mobile phase A, after 12.5 min elute column A onto column B with mobile phase A, after another 5 min remove column A from the circuit and elute column B with mobile phase B, monitor the effluent from column B. Flush column A with MeOH then re-equilibrate with mobile phase A for 6 min. (The procedure can also be modified to determine the active metabolite.)

HPLC VARIABLES
Column: A 150 × 4.6 5 μm Bondesil CH (Varian); B 150 × 4.6 5 μm Capcell Pak C18 UG 120 (Shiseido)

Mobile phase: A MeOH:water 80:20; B MeCN:water 80:20
Column temperature: 40
Flow rate: 1
Injection volume: 150
Detector: F ex 360 em 430

CHROMATOGRAM
Retention time: 27.5
Internal standard: 2-ethyl-2-methylbutanoate ester analog of simvastatin (31)
Limit of detection: 20 pg/mL

Sodium nitroprusside

$Na_2[Fe(CN)_5NO]$

Molecular formula: $C_5FeN_6Na_2O$
Molecular weight: 261.92
CAS Registry No.: 14402-89-2, 13755-38-9 (dihydrate)
Merck Index: 8794

SAMPLE
Matrix: blood
Sample preparation: 100 μL Whole blood or plasma + 100 μL 3 M perchloric acid, mix, let stand at 0° for 5 min, centrifuge at 8000 g for 5 min. Remove a 150 μL aliquot of the supernatant and add it to 250 μL 1 M K_2HPO_4, mix vigorously, centrifuge for 8000 g for 5 min, inject a 20 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 150 × 4 Asahipak BEST 502Q
Mobile phase: 100 mM pH 6.0 Acetate buffer containing 300 mM sodium perchlorate
Flow rate: 0.5
Injection volume: 20
Detector: F ex 583 em 607 following post-column reaction. The column effluent mixed with 5 mM dithiothreitol in 50 mM pH 9.0 Tris-HCl buffer containing 5 mM EDTA pumped at 0.1 mL/min and this mixture flowed through a 4.5 m × 0.5 mm ID coil at 90°. The effluent from this coil mixed with 0.5% Chloramine T in water pumped at 0.1 mL/min and flowed through a mixing coil. The effluent from this coil mixed with reagent pumped at 0.1 mL/min and this mixture flowed through a mixing coil to the detector. (Reagent was a mixture of 1.5 g barbituric acid, 15 mL pyridine, 3 mL concentrated HCl, and 82 mL water. Nitroprusside is reduced to cyanide with dithiothreitol. The cyanide is converted to cyanogen chloride with chloramine T, the cyanogen chloride reacts with the pyridine to form pent-2-en-1,5-dial, and this compound reacts with barbituric acid to form the fluorescent 5,5'-(1,3-pentadiene-1-yl-5-ylidene) dibarbituric acid.)

SAMPLE
Matrix: formulations
Sample preparation: Inject an aliquot of the solution.

HPLC VARIABLES
Column: 300 × 3.9 10 μm phenyl (Waters)
Mobile phase: MeCN:buffer 30:70 (Buffer was 10 mM KH_2PO_4 and 5 mM tetrabutylammonium hydroxide adjusted to pH 7.1 with phosphoric acid.)
Flow rate: 2
Injection volume: 50
Detector: UV 210

CHROMATOGRAM
Retention time: 6
Limit of quantitation: 10 μg/mL

OTHER SUBSTANCES
Simultaneous: degradation products, ferricyanide, ferrocyanide

KEY WORDS
stability-indicating; injections; 5% dextrose

Somatomedin

Molecular weight: 7649
CAS Registry No.: 67763-96-6
Merck Index: 8862

SAMPLE
Matrix: blood
Sample preparation: Prepare a 240:10 serum:concentrated formic acid mixture, let stand for 1 h at room temperature or 37°, filter (0.22 μm) or centrifuge at 12000 g for 5 min, inject a 200 μL aliquot of the filtrate or supernatant.

HPLC VARIABLES
Guard column: 100 × 7.5 10 μm TSK 2000 SW (Toyo Soda)
Column: 600 × 7.5 10 μm TSK 2000 SW (Toyo Soda)
Mobile phase: 100 mM Ammonium formate adjusted to pH 3.0 with concentrated formic acid
Flow rate: 0.7
Injection volume: 200
Detector: UV 280 or bioassay

CHROMATOGRAM
Retention time: 14

KEY WORDS
serum; SEC; human; rat

SAMPLE
Matrix: cell suspensions
Sample preparation: Centrifuge cells in modified Eagle's medium containing 10% fetal bovine serum, 20 mM L-glutamine, 50 U/mL penicillin, and 50 μg/mL streptomycin at 2500 g, to each 1 liter of supernatant add 390 g ammonium sulfate, dissolve, let stand overnight, centrifuge at 4° at 10000 g for 30 min. Dissolve the precipitate in 25-30 mL 50 mM pH 7.8 ammonium bicarbonate, purify 40-50 mL aliquots on a 1000 × 50 column of Sephacryl S-300, elute with 50 mM pH 7.8 ammonium bicarbonate buffer at 0.7 mL/min at 4°, adjust pH of eluate to 6.5 with acetic acid, inject a 10-15 mL aliquot at 0.5 mL/min.

HPLC VARIABLES
Column: 250 × 4.6 7 μm Aquapore RP-300 C8 (Brownlee)
Mobile phase: Gradient. MeCN:buffer from 0:100 to 20:80 over 10 min, to 60:40 over 75 min. (Buffer was 100 mM pH 6.5 ammonium acetate, pass through a C18 Sep-Pak to remove impurities.)
Flow rate: 0.5 (?)
Injection volume: 10000-15000
Detector: UV 280

CHROMATOGRAM
Retention time: 40

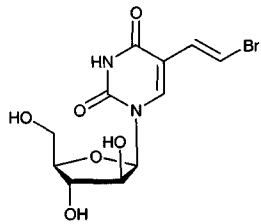
Sorivudine

Molecular formula: $C_{11}H_{13}BrN_2O_6$
Molecular weight: 349.14
CAS Registry No.: 77181-69-2
Merck Index: 8875



SAMPLE
Matrix: blood

Sample preparation: 250-500 μL Serum + 100 μL 10 μg/mL IS in water, add 5 mL MeCN while mixing, centrifuge. Remove the supernatant and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 1 mL mobile phase, filter (0.45 μm), inject an aliquot of the filtrate.

HPLC VARIABLES

Guard column: 37-53 μm silica gel (Whatman)
Column: 250 × 4.6 5 μm alkyl phenyl (ES Industries)
Mobile phase: MeCN:MeOH:buffer 15:5:80 (Buffer was 50 mM ammonium acetate adjusted to pH 5.0 with glacial acetic acid.)
Flow rate: 1
Injection volume: 50
Detector: UV 295

CHROMATOGRAM

Retention time: 12.5
Internal standard: 1-β-D-arabinofuranosyl-E-5-(2-chlorovinyl)uracil (10)
Limit of quantitation: 20 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

protect from light; serum; pharmacokinetics

SAMPLE
Matrix: blood
Sample preparation: Evaporate 100 (?) μL 10 μg/mL atenolol in MeOH in to the bottom of a tube, add 500 μL plasma, add 200 μL 1 M pH 9.3 carbonate buffer, add 6 mL ethyl acetate, shake for 4 min, centrifuge at 1000 g for 4 min. Remove the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue with 2 μL 1 M pH 9.3 carbonate buffer and 200 μL 0.005% R-(-)-1-(1-naphthyl)ethyl isocyanate in chloroform (prepared fresh daily), vortex for 15 s, let stand at room temperature for 1 h, evaporate to dryness with a stream of air, add 200 μL MeCN:water 39:61, vortex for 10 s, let stand at room temperature for 1 h, inject a 10 μL aliquot on to column A and column B in series and elute with mobile phase. Column A is subsequently removed from the circuit and backflushed with MeCN:water 50:50 for 3 min, with MeCN for 12 min, with MeCN:water 50:50 for 7.5 min, and with mobile phase for 7.5 min (this is very unclear in the paper).

HPLC VARIABLES
Column: A 75 × 3.9 4 μm Nova-Pak C18; B 100 × 8 4 μm Nova-Pak C18 Radial Compression
Mobile phase: MeCN:water 39:61
Flow rate: 1.5
Injection volume: 10
Detector: F ex 280 em 320

CHROMATOGRAM
Retention time: 23 (+), 26 (-)
Internal standard: atenolol (13)
Limit of quantitation: 10 ng/mL

OTHER SUBSTANCES
Noninterfering: metabolites, N-desisopropylpropranolol, 4-hydroxypropranolol, labetalol, 4-methylpropranolol, metoprolol, oxprenolol, pindolol, practolol, propranolol, propranolol glycol, timolol

KEY WORDS
plasma; chiral; pharmacokinetics; derivatization; column-switching

SAMPLE

Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18

Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)

Column temperature: 30

Flow rate: 0.8

Injection volume: 50

Detector: UV 229

CHROMATOGRAM

Retention time: 3.58

Limit of detection: <120 ng/mL

SAMPLE
Matrix: blood, tissue
Sample preparation: Plasma, whole blood. Condition a Bond-Elut C8 SPE cartridge with MeOH and water. Mix plasma or whole blood, IS, and 50 mM pH 9 borate buffer, add to the SPE cartridge. Wash with water and MeCN. Elute with MeOH. Evaporate the eluate to dryness and reconstitute in 400 μL mobile phase. Inject a 50μL aliquot. Tissue. Homogenize (Braun micro-dismembrator) 100 mg tissue with 100 μL IS solution and 400 μL water while frozen in liquid nitrogen, thaw, rinse twice with 250 μL 1 M pH 3 potassium phosphate buffer. Centrifuge at 2740 g at 20° for 20 min, separate supernatant (S1). Extract pellet with 1 mL MeOH for 15 min with sonication. Centrifuge at 20° for 10 min, evaporate the supernatant to dryness under a stream of nitrogen at 40°. Reconstitute residue in 500 μL 15 mM pH 3 potassium phosphate buffer add to S1, centrifuge. Suck sample slowly through a Bond-Elut C8 SPE cartridge. Wash twice with water, elute twice with 200 μL MeOH, evaporate the eluate to dryness under a stream of nitrogen at 40°. Reconstitute in 500 μL mobile phase. Inject a 50 μL aliquot.

HPLC VARIABLES
Guard column: 17 × 4 5 μm Spherisorb C6
Column: 150 × 4.6 5 μm Spherisorb C6

SAMPLE
Matrix: blood, urine

Sample preparation: 1 mL Plasma + 200 μL 2.5 μg/mL S-(-)atenolol + 660 μL 2 M perchloric acid, shake briefly, centrifuge at 2000 g for 5 min. Remove 1 mL of the supernatant and adjust the pH to 9 with 1 mL 2 M Tris-HCl buffer and 250 μL 2 M NaOH, add 5 mL chloroform: isopropanol 75:25, vortex for 1 min, centrifuge at 2000 g for 10 min, repeat the extraction. Combine the organic layers and dry them over about 3 g anhydrous sodium sulfate, evaporate to dryness under a stream of nitrogen, reconstitute with 200 μL saturated sodium carbonate solution, add 200 μL 40 μL/mL (-)-menthylchloroformate in MeCN (prepare fresh daily), vortex for 30 s, add 1 mL water, add 2 mL chloroform, vortex for 1 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness, reconstitute the residue in 100 μL mobile phase, centrifuge for 5 min, inject a 40 μL aliquot. Urine. Dilute 1 mL (?) urine 20 times with blank urine, add 200 μL 7.5 μg/mL S-(-)atenolol, adjust the pH to 9 with 1 mL 2 M Tris-HCl buffer, add 5 mL chloroform:isopropanol 75:25, vortex for 1 min, centrifuge at 2000 g for 10 min, repeat the extraction. Combine the organic layers and dry them over about 3 g anhydrous sodium sulfate, evaporate to dryness under a stream of nitrogen, reconstitute with 200 μL saturated sodium carbonate solution, add 200 μL 40 μL/mL (-)-menthylchloroformate in MeCN (prepare fresh daily), vortex for 30 s, add 1 mL water, add 2 mL chloroform, vortex for 1 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness, reconstitute the residue in 100 μL mobile phase, centrifuge for 5 min, inject a 40 μL aliquot.

HPLC VARIABLES

SAMPLE
Matrix: blood, urine

Sample preparation: Condition a 500 mg Sep-Pak C18 SPE cartridge with 3 mL MeOH and 3 mL 200 mM sodium tetraborate. Dilute urine 10 times with 200 mM sodium tetraborate. Briefly vortex 1 mL plasma with 500 μL saturated pH 9.3 sodium tetraborate. Add 1 mL diluted urine or 1.5 mL diluted plasma to the SPE cartridge, wash with 2 mL 20 mM sodium tetra-

borate, wash with 2 mL water, wash with 1 mL dichloromethane, elute with 5 mL isopropanol. Add 100 μL 100 μg/mL isoamyl p-hydroxybenzoate in MeCN:water 10:90, 100 μL 4 mg/mL 2,3,4,6-tetra-O-acetyl-β-D-glucopyranosyl isothiocyanate in MeCN, and 100 μL 10 mM pH 8.0 $(NH_4)_2HPO_4$ to the eluate, heat at 50° for 3 h, evaporate to dryness under reduced pressure, reconstitute with 200 μL mobile phase, inject a 40 μL aliquot.

HPLC VARIABLES
Guard column: Guard-Pak Resolve C18 (Waters)
Column: 150 × 4.6 5 μm STR ODS II (Shimadzu)
Mobile phase: MeCN:20 mM pH 4.6 $(NH_4)H_2PO_4$ 40:60
Column temperature: 25
Flow rate: 1
Injection volume: 40
Detector: UV 225

CHROMATOGRAM
Retention time: 11.4 ((-)-R), 14.3 ((+)-S)
Internal standard: isoamyl p-hydroxybenzoate (25.5)
Limit of quantitation: 220 ng/mL (urine), 22 ng/mL (plasma)

SAMPLE
Matrix: blood
Sample preparation: Condition a 3 mL C18 SPE cartridge (J.T. Baker) with 3 mL MeOH, 2 mL 20 mM sodium dioctylsulfosuccinate (slowly!), and 3 mL 20 mM pH 5.6 citric acid, do not allow to go dry. 2 mL Plasma + 8 mL water + 625 μL MeOH, adjust pH to 5.2-5.7 with about 60 μL 1 M HCl, vortex for 30 s, centrifuge at 2500 g for 10 min, remove the supernatant, resuspend the solid in 3 mL 20 mM pH 5.6 citric acid, centrifuge. Combine the supernatants and add them to the SPE cartridge at 1-2 mL/min, wash with two 3 mL portions of 20 mM pH 5.6 citric acid, allow to go dry. Centrifuge the SPE cartridge at 3000 g for 15 min, dry with a stream of nitrogen for 20 min, elute with 3 mL MeOH at 2 drops/s. Evaporate the eluate to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 2 mL 10 g/L sodium bicarbonate containing 100 μL/L 1-methylpyrrole, vortex for 30 s, add 3 mL 12 mg/mL 2-naphthalenesulfonyl chloride in MeCN (prepare just before derivatization), vortex for 30 s, heat at 100° for 15 min, cool to room temperature, add 1 mL n-butyl chloride, vortex twice for 20 s, centrifuge at 1500 g for 5 min. Remove 2 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 1 mL n-butyl chloride, vortex for 30 s, centrifuge at 2500 g for 10 min, inject a 50 μL aliquot onto column A and elute to waste with mobile phase A, after 8 min divert the effluent from column A containing spectinomycin onto column B, after 2 min remove column A form the circuit, elute column B with mobile phase B, monitor the effluent from column B. Backflush column A with mobile phase A for 15 min.

HPLC VARIABLES
Column: A 10 × 2.1 40 μm pellicular silica + 100 × 3 5 μm Chromspher silica glass cartridge (Chrompack); B two 100 × 3 5 μm Chromspher silica glass cartridges in series (Chrompack)
Mobile phase: A Dichloromethane:MeCN:ethyl acetate:acetic acid 75:7.5:1.8:0.425; B Dichloromethane:MeCN:ethyl acetate:acetic acid 100:20:3.6:0.85
Flow rate: A 0.4; B 0.6
Injection volume: 50
Detector: UV 250

CHROMATOGRAM

SAMPLE
Matrix: blood
Sample preparation: Condition a 3 mL High-hydrophobic C18 SPE cartridge (J.T. Baker) with 3 mL MeOH, 2 mL 20 mM sodium dioctyl sulfosuccinate (homogenize before use, pass slowly through cartridge), and 4 mL 20 mM pH 5.6 citric acid buffer, do not allow to go dry. 2 mL Plasma + 8 mL water + 625 μL MeOH, adjust pH to 5.2-5.7 with ca. 60 μL 1 M HCl, vortex for 30 s, centrifuge at 2500 g for 10 min, remove the supernatant, rinse the residue with 3 mL citric acid buffer, centrifuge. Combine the rinse and the supernatant and add them to the SPE cartridge at 1-2 mL/min, wash with two 3 mL portions of citric acid buffer, allow to run dry. Centrifuge the SPE cartridge at 3000 g for 20 min then dry it in a stream of nitrogen for 20 min, elute with 4 mL MeOH, evaporate the eluate to dryness under a stream of nitrogen at

room temperature, reconstitute with 1 mL MeOH:water 20:80, vortex, centrifuge at 2500 g for 10 min, inject a 50 μL aliquot of the supernatant.

HPLC VARIABLES

Guard column: 10 × 4.6 cation-exchange (Phase-Sep)
Column: 250 × 4.6 5 μm Spherisorb SCX
Mobile phase: MeCN:100 mM pH 2.6 sodium sulfate 20:80
Flow rate: 1.5
Injection volume: 50
Detector: F ex 340 em 460 following post-column reaction. The column effluent mixed with reagent A pumped at 0.25 mL/min and reagent B pumped at 0.75 mL/min and the mixture flowed through a 2.2 m × 0.5 mm i.d. coil at 70°. The effluent from the coil was mixed with reagent C pumped at 1 mL/min and this mixture flowed through a 1.7 m × 0.3 mm i.d. PTFE coil at 25° to the detector. Reagent A was prepared by adding 10 mL sodium hypochlorite solution (13% active chlorine) and 10 mL 100 mM pH 7.0 potassium phosphate buffer to 980 mL water. Reagent B was 400 mM pH 10.2 boric acid buffer prepared by dissolving 24.4 g boric acid and 20.0 g KOH in 1 L water. Reagent C was prepared by adding 10 mL 80 mg/mL o-phthaldialdehyde in EtOH and 1 mL 2-mercaptoethanol to 990 mL 300 mM pH 10.2 boric acid buffer. (The 300 mM pH 10.2 boric acid buffer was prepared by dissolving 18.55 g boric acid and 15.0 g KOH in 1 L water.)

CHROMATOGRAM

Retention time: 9
Limit of quantitation: 60 ng/mL

KEY WORDS

SAMPLE

Matrix: bulk
Sample preparation: 10 mL 250 μg/mL Spectinomycin solution in buffer + 10 mL 10 mg/mL 2-naphthalenesulfonyl chloride in MeCN containing 200 μg/mL methylprednisolone acetate (prepare fresh daily), shake, heat at 100° for 10 min, cool to room temperature, make up to 50 mL with mobile phase, shake vigorously for 10 min, centrifuge at <300 g for 3-5 min, inject a 40 μL aliquot of the organic layer. (Buffer was 4.2 g/L sodium bicarbonate containing 100 μL/L 1-methylpyrrole.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm LiChrosorb SI-60
Mobile phase: Butyl chloride:THF:ethyl acetate:isopropanol:acetic acid 86:3.7:3:2.5:5 (Butyl chloride was 50% water-saturated.)
Flow rate: 1
Injection volume: 40
Detector: UV 254

CHROMATOGRAM

Retention time: 10
Internal standard: methylprednisolone acetate (18)
Limit of detection: 4.2 ng

OTHER SUBSTANCES

Simultaneous: actinosapectinoic acid

KEY WORDS

derivatization; normal phase

REFERENCE
Tsuji,K.; Jenkins,K.M. Derivatization of secondary amines with 2-naphthalene-sulfonyl chloride for high-performance liquid chromatographic analysis of spectinomycin, *J.Chromatogr.*, **1985**, *333*, 365–380.

SAMPLE
Matrix: solutions
Sample preparation: Prepare an aqueous solution, inject an aliquot.

HPLC VARIABLES
Guard column: 43 × 4.2 Perisorb RP-8 (Merck)
Column: 250 × 4.6 LiChrosorb RP-8
Mobile phase: 0.1% Acetic acid containing 20 mM sodium heptanesulfonate and 200 mM sodium sulfate
Flow rate: 2
Injection volume: 15
Detector: F ex 350 em 450 following post-column reaction. The column effluent mixed with 10 mM sodium hypochlorite in 400 mM pH 10.4 potassium borate buffer pumped at 0.5 mL/min and the mixture flowed through a 2 m × 0.5 mm i.d. PTFE coil at 100° and was mixed with the reagent pumped at 0.5 mL/min. This mixture passed through a 2 m × 0.5 mm i.d. PTFE coil at ambient temperature to the detector. (The reagent was prepared by adding 10 mL 80 mg/mL o-phthalaldehyde in 95% EtOH to 1 L 400 mM boric acid solution containing 2 mL 2-mercaptoethanol adjusted to pH 9.7 with KOH, then adding 1 g/L Brij. (Proc. Nat. Acad. Sci. USA 1975, 72, 619).)

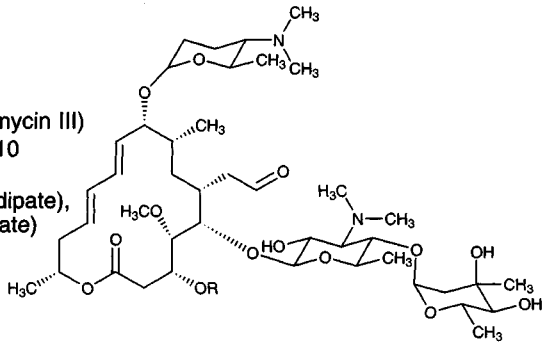
Spiramycin

Molecular formula: $C_{43}H_{74}N_2O_{14}$ (Spiramycin I), $C_{45}H_{76}N_2O_{15}$ (Spiramycin II), $C_{46}H_{78}N_2O_{15}$ (Spiramycin III)
Molecular weight: 843.07 (Spiramycin I), 885.10 (Spiramycin II), 899.13 (Spiramycin III)
CAS Registry No.: 8025-81-8, 24916-50-5 (I adipate), 24916-51-6 (II diacetate), 24916-52-7 (III diacetate)
Merck Index: 8904



Spiramycin I R = H
Spiramycin II R = $COCH_3$
Spiramycin III R = $COCH_2CH_3$

SAMPLE

Matrix: tissue
Sample preparation: Condition a 1 mL 100 mg Bond-Elut diol SPE cartridge with 1 mL chloroform (Caution! Chloroform is a carcinogen!). Mix 2 g minced muscle tissue with 800 μL water. Stir, vortex for 1 min at maximum speed, let stand for 15 min. Add 2 mL pH 8 buffer, mix briefly, add 10 mL chloroform. Stir at 100 rpm for 15 min, centrifuge at 4000 g for 10 min, discard the aqueous layer, filter the chloroform layer through glass wool. Add the filtrate to the SPE cartridge, wash with 500 μL chloroform, dry under vacuum, elute with three 200 μL portions of MeOH:100 mM ammonium acetate 50:50, inject a 200 μL aliquot of the eluate. (Buffer was 33.46 g K_2HPO_4 and 1.046 g KH_2PO_4 in 1 L water.)

HPLC VARIABLES

Guard column: 4 × 4 5 μm C18
Column: 125 × 4 5 μm Lichrospher RP18
Mobile phase: Gradient. A was MeCN. B was MeOH. C was 0.1% trifluoroacetic acid in water. A:B:C from 20:20:60 to 25:55:20 in 10 (?) min
Flow rate: 0.5
Injection volume: 200
Detector: MS, HP Model 5989 A, desolvation chamber 60°, source 280° and 300° in negative and positive chemical ionization mode, respectively, with methane as reagent, quadrupole 100°, particle beam nebulizer helium 345 kPa, scan m/z 475.3-684.4 in NCI and 843.5-684.4 in PCI

CHROMATOGRAM

Retention time: 5.2
Limit of detection: 50 μg/kg

OTHER SUBSTANCES

Extracted: erythromycin, josamycin, tilmicosin, tylosin

SAMPLE

Matrix: tissue
Sample preparation: Condition a 500 mg Bond Elut SCX SPE cartridge (Varian) with 5 mL MeOH and 10 mL 100 mM pH 4.4 KH_2PO_4 buffer. Homogenize 5 g tissue with 100 mL MeOH: 0.3% metaphosphoric acid 30:70 at high speed for 2 min, filter through 2 mm Hyflo Super-Cel coated on a suction funnel (when filtering liver or kidney add several grams of Hyflo Super-Cel to the homogenized solution before filtration). Evaporate the filtrate to ca. 20 mL under

reduced pressure at 45°, add to the SPE cartridge, wash with 10 mL distilled water and 5 mL 100 mM pH 8.9 K_2HPO_4 buffer, elute with 10 mL MeOH, evaporate the eluate to dryness under reduced pressure at 45°, dissolve the residue in 1 mL MeCN:50 mM pH 4.5 NaH_2PO_4 buffer 30:70, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Puresil 5C18 (Waters)
Mobile phase: Gradient. A:B from 60:40 to 0:100 over 16 min. A was buffer. B was MeCN:buffer 40:60 (Buffer was 2.5 g KH_2PO_4 dihydrate and 0.65 mL 85% phosphoric acid dissolved in 1 L distilled water, pH 2.5.)
Column temperature: 35
Flow rate: 1
Injection volume: 10
Detector: UV 232 for 9 min, UV 287 for 2 min, UV 232 for 4 min

CHROMATOGRAM
Retention time: 3.23
Limit of detection: 50 ng/g

OTHER SUBSTANCES
Extracted: josamycin, leucomycin (kitasamycin), mirosamicin, tylosin

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a Bond-Elut C18 SPE cartridge with two 2.5 mL portions of MeOH and two 2.5 mL portions of water. Condition a Bond-Elut CN SPE cartridge with two 2.5 mL portions of MeOH and two 2.5 mL portions of hexane. Plasma. 1 mL Plasma + 100 μL 1 μg/mL IS in water + 1 mL water, add to the C18 SPE cartridge, wash with two 1.5 mL portions of water, wash with 1 mL MeOH:water 40:60, elute with two 1 mL portions of MeCN. Evaporate the eluate to dryness under reduced pressure, reconstitute the residue in 100 μL ethyl acetate, add 1.5 mL hexane, mix, add to the CN SPE cartridge, wash with 2 mL hexane, elute with two 750 μL portions of MeCN. Evaporate the eluate to dryness under reduced pressure, reconstitute the residue in 200 μL mobile phase, inject a 100 μL aliquot. Urine. 1 mL Urine + 1 mL IS in water, add to the C18 SPE cartridge, wash with two 1.5 mL portions of water, wash with 1 mL MeCN:water 35:65, elute with two 1 mL portions of MeCN. Evaporate the eluate to dryness under reduced pressure, reconstitute the residue in 100 μL ethyl acetate, add 1.5 mL hexane, mix, add to the CN SPE cartridge, wash with 2 mL hexane, elute with two 750 μL portions of MeCN. Evaporate the eluate to dryness under reduced pressure, reconstitute the residue in 200 μL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES
Column: 125 × 4.9 5 μm Spherisorb S5 ODS1
Mobile phase: MeOH:water 65:35, pH adjusted to 3.4 with phosphoric acid (plasma) or Gradient. MeOH:water acidified to pH 3.4 with phosphoric acid from 55:45 to 65:35 over 10 min (concave curve). (urine)

Flow rate: 2
Injection volume: 100
Detector: UV 254

CHROMATOGRAM
Retention time: 3.0 (plasma), 8.3 (urine)
Internal standard: 16α,17α-epoxyprogesterone (7 (plasma), 14 (urine))
Limit of quantitation: 31.25 ng/mL (urine), 6.25 ng/mL (plasma)

OTHER SUBSTANCES
Extracted: metabolites, canrenone

KEY WORDS
plasma; pharmacokinetics; SPE

SAMPLE

Matrix: urine

Sample preparation: Buffer urine to 4.9 by mixing with an equal volume of pH 4.9 200 mM sodium phosphate buffer. Inject a 40 μL aliquot onto column A with mobile phase A, after 3 min backflush the contents of column A onto column B with mobile phase B and start the gradient. At the end of the run re-equilibrate for 10 min.

HPLC VARIABLES

Column: A 20 × 4 5 μm Hypersil octadecylsilica ODS; B 200 × 4.6 5 μm Shiseido SG-120 polymer-based C18

Mobile phase: A water; B Gradient. MeCN:buffer from 7:93 to 15:85 over 3.5 min, to 50:50 over 8.5 min, maintain at 50:50 for 11 min (Buffer was 6.9 g $NaH_2PO_4.H_2O$ in 1 L water, pH adjusted to 3.1 with phosphoric acid.)

Flow rate: 1

Injection volume: 40

Detector: UV 230

CHROMATOGRAM

Retention time: 21.8

Limit of detection: 1000 ng/mL

OTHER SUBSTANCES

Extracted: acetazolamide, amiloride, bendroflumethiazide, benzthiazide, bumetanide, caffeine, carbamazepine, chlorothiazide, chlorthalidone, clopamide, dichlorfenamide, ethacrynic acid, furosemide, hydrochlorothiazide, metyrapone, probenecid, triamterene, trichlormethiazide

KEY WORDS

column-switching; optimum detection wavelengths vary for each drug

REFERENCE

SAMPLE

Matrix: urine

Sample preparation: 5 mL Urine + 50 μL 100 μg/mL 7-propyltheophylline in MeOH + 200 μL ammonium chloride buffer + 2 g NaCl, extract with 6 mL ethyl acetate by rocking at 40 movements/min for 20 min and centrifuging at 800 g for 5 min, repeat extraction, combine organic layers, evaporate to dryness at 40° under a stream of nitrogen. Reconstitute in 200 μL MeCN: water 15:85 and inject 20 μL aliquots. (Ammonium chloride buffer was 28 g ammonium chloride in 100 mL water with the pH adjusted to 9.5 with concentrated ammonia solution.)

HPLC VARIABLES

Column: 75 × 4.6 3 μm Ultrasphere ODS

Mobile phase: Gradient. MeCN:100 mM ammonium acetate adjusted to pH 3 with concentrated phosphoric acid. From 10:90 to 15:85 over 2 min to 55:45 over 3 min to 60:40 over 3 min. Kept at 60:40 for 1 min, decreased to 10:90 over 1 min and equilibrated at 10:90 for 2 min.

Flow rate: 1

Injection volume: 20

Detector: UV 240

CHROMATOGRAM

Retention time: 7.8

Internal standard: 7-propyltheophylline (4.5)

Limit of detection: 100 ng/mL

OTHER SUBSTANCES

Extracted: xipamide, bumetanide, acetazolamide, amiloride, bendroflumethiazide, buthiazide, benzthiazide, canrenone, caffeine, clopamide, chlorthalidone, cyclothiazide, diclofenamide, ethacrynic acid, furosemide, hydrochlorothiazide, morazone, piretanide, polythiazide, probenecid, torsemide, triamterene

Interfering: mesocarb

SAMPLE

Matrix: urine

Sample preparation: Direct injection into column A with mobile phase A for 1 min then back flush onto column B with mobile phase B.

HPLC VARIABLES

Column: A 20 × 2.1 30 μm Hypersil ODS-C18; B 250 × 4 Hypersil ODS-C18

Mobile phase: A Water; B Gradient. MeCN:buffer 15:85 for 1.5 min then to 80:20 over 8 min. Keep at 80:20 for 2.5 min then re-equilibrate with 15:85. (Buffer was 50 mM NaH_2PO_4 + 1.4 mL propylamine hydrochloride per liter adjusted to pH 3 with concentrated phosphoric acid.)

Flow rate: 1

Injection volume: 50

Detector: UV 230

CHROMATOGRAM

Retention time: 10.8

Limit of detection: 20 ng/mL.

OTHER SUBSTANCES

Simultaneous: bumetanide, ethacrynic acid, acetazolamide, amiloride, bendroflumethiazide, chlorthalidone, cyclothiazide, furosemide, hydrochlorothiazide, probenecid, triamterene

REFERENCE

SAMPLE

Matrix: urine

Sample preparation: Inject 50 μL urine on to column A and elute to waste with mobile phase A, after 1.5 min elute the contents of column A on to column B with mobile phase B and start the gradient.

HPLC VARIABLES
Column: A 20 × 2.1 30 μm Hypersil ODS-C18; B 125 × 4 5 μm HP-LiChrospher 100 RP 18
Mobile phase: A water; B Gradient. MeCN:water from 0:100 to 60:40 over 3 min, maintain at 60:40 for 3.5 min
Flow rate: 1
Injection volume: 50
Detector: UV 230

CHROMATOGRAM
Retention time: 7.2
Limit of detection: 20 ng/mL
Limit of quantitation: 70 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, canrenone (UV 300)
Simultaneous: bendroflumethiazide, chlorthalidone, hydrochlorothiazide

KEY WORDS
column-switching

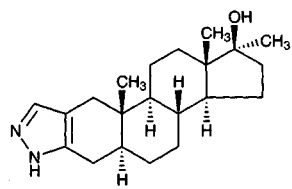
Stanozolol



Molecular formula: $C_{21}H_{32}N_2O$
Molecular weight: 328.50
CAS Registry No.: 10418-03-8
Merck Index: 8951
Lednicer No.: 1 174

SAMPLE
Matrix: formulations
Sample preparation: Weigh out amount of powdered tablets equivalent to 3.36 mg stanozolol, add 20 mL EtOH:100 mM HCl 70:30, stir magnetically filter, repeat extraction. Combine the filtrates and make up to 50 mL with EtOH:100 mM HCl 70:30. Remove a 5 mL aliquot and add it to 1 mL 115 μg/mL 4-acetylbiphenyl in MeOH, make up to 10 mL with MeOH, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 300 × 4 10 μm Hypersil RP-18
Mobile phase: MeOH:50 mM $(NH_4)H_2PO_4$ 85:15
Flow rate: 1
Injection volume: 10
Detector: UV 230

CHROMATOGRAM
Retention time: 5.3
Internal standard: 4-acetylbiphenyl (4.2)

KEY WORDS
tablets

REFERENCE

SAMPLE
Matrix: formulations
Sample preparation: Oils. 1 mL Sample + 25 mL MeOH:water 90:10, shake vigorously for 5 min, centrifuge, inject a 10 μL aliquot of the supernatant. Tablets. Grind a tablet to a fine powder, add 25 mL MeOH, sonicate for 5-10 min, filter (0.45 μm), discard first 5 mL of filtrate, inject a 10 μL aliquot of the remaining filtrate. Suspensions (aqueous). Make up 5 mL to 50 mL with MeOH, filter (0.45 μm), discard first 5 mL of filtrate, inject a 10 μL aliquot of the remaining filtrate.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Zorbax ODS
Mobile phase: MeOH:water 75:25
Flow rate: 1.5
Injection volume: 10
Detector: UV 240

CHROMATOGRAM
Retention time: 16.4
Limit of detection: 5 μg/mL

OTHER SUBSTANCES
Simultaneous: nandrolone propionate, methenolone acetate, testosterone propionate, aspirin, caffeine, formebolone, benzyl alcohol, testolactone, cortisone, fluoxymesterone, norethindrone, oxandrolone (UV 210), boldenone, ethisterone, methandrostenolone, nandrolone, norgestrel, testosterone, dehydroepiandrosterone (UV 210), mibolerone, methyltestosterone, methandriol (UV 210), norethindrone acetate, calusterone, mesterolone (UV 210), norethandrolone, benzyl benzoate, trenbolone acetate, nandrolone acetate
Interfering: testosterone acetate, oxymetholone

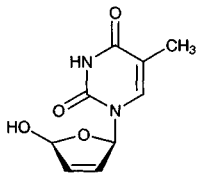
Stavudine



Molecular formula: $C_{10}H_{12}N_2O_4$
Molecular weight: 224.22
CAS Registry No.: 3056-17-5
Merck Index: 8958

SAMPLE
Matrix: amniotic fluid, blood
Sample preparation: Condition a 3 mL Bond Elut C18 SPE cartridge with 2 mL MeOH and two 2 mL portions of water. 100 μL Plasma or amniotic fluid + 20 μL 10 μg/mL 3-hydroxyacetamidophenol in water, mix, add to the SPE cartridge, wash with two 2 mL portions of water, elute with 2 mL MeOH. Evaporate the eluate to dryness under reduced pressure, reconstitute with 100 μL MeCN:50 mM pH 3.3 ammonium phosphate buffer 6:94, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: Gradient. A was MeCN:50 mM pH 3.3 ammonium phosphate buffer 6:94. B was MeCN:50 mM pH 3.3 ammonium phosphate buffer 25:75. A:B from 100:0 to 0:100 over 17 min, maintain at 0:100 for 5 min, return to initial conditions over 3 min, re-equilibrate for 17 min.
Flow rate: 1
Injection volume: 50
Detector: UV 266

CHROMATOGRAM
Limit of quantitation: 200 ng/mL

OTHER SUBSTANCES
Extracted: antipyrine

KEY WORDS
monkey; plasma; pharmacokinetics; SPE

Stearic acid

Molecular formula: $C_{18}H_{36}O_2$
Molecular weight: 284.48
CAS Registry No.: 57-11-4
Merck Index: 8959

SAMPLE
Matrix: bulk
Sample preparation: Dissolve 2 mmoles stearic acid in 10 mL diethyl ether, add 10 mmoles 1-benzyl-3-p-tolyltriazene in 5 mL diethyl ether, stir at 36° for 3 h, cool, wash with two 5 mL portions of 10% HCl, wash with two 5 mL portions of 10% sodium carbonate, dry over anhydrous magnesium sulfate, evaporate to dryness, prepare a solution in mobile phase, inject an aliquot. (Synthesis of 1-benzyl-3-p-tolyltriazene is as follows. Stir 50.2 g p-toluidine in an ice/salt bath, add a mixture of 250 g crushed ice and 140 mL concentrated HCl, slowly add a solution of 46.8 g potassium nitrite in 150 mL water over 1-2 h until a positive starch/KI is obtained (stop addition 1-2 min before each test), stir for 1 h, allow to warm to 0°, adjust pH to 6.8-7.2 with cold concentrated sodium carbonate solution to give a solution of p-toluenediazonium chloride (Org.Syn., Coll.Vol. V, 797). Stir 107 g benzylamine in water in an ice/salt bath and slowly add the diazonium solution, extract with ether, recrystallize 1-benzyl-3-p-tolyltriazene from diethyl ether:n-hexane 50:50 to give yellow crystals (mp 77°) (Berichte 1888, 21, 1016). (Caution! 1-Benzyl-3-p-tolyltriazene explodes when heated to 90-100°!))

HPLC VARIABLES
Column: 1830 mm long Corasil II
Mobile phase: Heptane:chloroform 50:50
Detector: UV 254

OTHER SUBSTANCES
Also analyzed: heptadecanoic acid, palmitic acid

SAMPLE
Matrix: bulk
Sample preparation: Dissolve 3 μmole compound in 125 μL dichloromethane, add 125 μL 72 mM O-(p-nitrobenzyl)-N,N'-diisopropylisourea in dichloromethane, heat at 80° for 2 h, cool, inject an aliquot. (Synthesis of O-(p-nitrobenzyl)-N,N'-diisopropylisourea is as follows. Mix 15.3 g 4-nitrobenzyl alcohol, 12.6 g diisopropylcarbodiimide, 10 mg copper(II) chloride, and 10 mL DMF, let stand at room temperature for 96 h, remove the solvent by distillation (45°/10 mm Hg), dissolve the residue in petroleum ether (bp 40-80°), chromatograph on a 200 × 30 column of aluminum oxide, elute with petroleum ether until the eluate does not turn moistened litmus paper blue. Remove the petroleum ether under reduced pressure to give O-(p-nitrobenzyl)-N,N'-diisopropylisourea as yellow crystals (mp 42° (softening after 38°)) (Liebigs Ann. Chem. 1965, 685, 161).

HPLC VARIABLES
Column: 250 mm long 5 μm MicroPak silica
Mobile phase: Hexane:chloroform 80:20
Detector: UV 254

CHROMATOGRAM
Limit of detection: 4 pmole

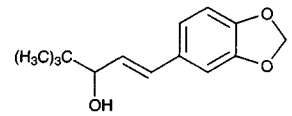
Stiripentol



Molecular formula: $C_{14}H_{18}O_3$
Molecular weight: 234.29
CAS Registry No.: 49763-96-4

SAMPLE
Matrix: blood
Sample preparation: 300 μL Blood + 15 μg piperonyl alcohol + 3 mL ethyl acetate, extract, centrifuge at 3000 rpm for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue with three 50 μL portions of anhydrous toluene, add 2 μL triethylamine, add 0.5 μL di-n-butyltin dilaurate, add 5 μL phenyl isocyanate, let stand overnight at room temperature, add EtOH, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Bakerbond DNBPG chiral

Mobile phase: Hexane:isopropanol 95:5
Flow rate: 2
Detector: F ex 290 em 355

CHROMATOGRAM
Retention time: 6.4 (S), 7.3 (R)
Internal standard: piperonyl alcohol (9.0)
Limit of detection: 8 ng/mL

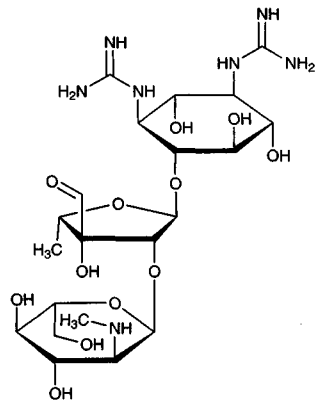
Streptomycin

Molecular formula: $C_{21}H_{39}N_7O_{12}$
Molecular weight: 581.58
CAS Registry No.: 57-92-1, 3810-74-0 (sulfate)
Merck Index: 8983



SAMPLE
Matrix: blood
Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 20 mL MeOH and 20 mL water. 400 µL Serum + 2 mL buffer + 100 µL 100 µg/mL dihydrostreptomycin sulfate in water, add to the SPE cartridge, wash with 2 mL water, centrifuge at 2300 g for 5 min, elute with 5 mL MeOH. Concentrate the eluate to 200 µL under vacuum at 30°, add 200 µL mobile phase, inject a 100 µL aliquot. (Buffer was 50 mM sodium 1-hexanesulfonate and 25 mM Na_3PO_4, pH adjusted to 2.0 with phosphoric acid.)

HPLC VARIABLES
Guard column: 30 × 4.6 10 µm Spheri-10 RP-8 (Brownlee)
Column: 250 × 4 5 µm LiChrosorb RP-18
Mobile phase: MeCN:buffer 8:92 (Buffer was 3.76 g sodium 1-hexanesulfonate and 9.50 g $Na_3PO_4.12H_2O$ in 900 mL water, adjust pH to 3.0 with phosphoric acid, make up to 1 L with water.)
Column temperature: 55
Flow rate: 1
Injection volume: 100
Detector: UV 195

CHROMATOGRAM
Retention time: 18
Internal standard: dihydrostreptomycin (20)

Limit of detection: 2000 ng/mL

KEY WORDS
serum; SPE

SAMPLE

Matrix: milk, tissue

Sample preparation: Tissue. Condition a 5 mL 500 mg 40 μm Bakerbond aromatic sulfonic acid SPE cartridge with 5 mL water. Homogenize (Polytron Model PT 10/35) 5 g tissue with 10 mL 3.6% perchloric acid for 10-15 s, shake horizontally for 5 min, centrifuge at 2000 g for 5 min, add the supernatant to the SPE cartridge at 2 mL/min, wash with 3 mL water, allow to dry, elute with 9 mL buffer. Add 500 μL 200 mM 1-hexanesulfonic acid in water and 150 μL perchloric acid to the eluate, make up to 10 mL with water, filter (0.45 μm), inject a 2 mL aliquot of the filtrate on to column A and elute to waste with mobile phase A, after 5 min elute the contents of column A on to column B with mobile phase B, after 5 min remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B. Milk. 10 g Milk + 3 mL 3.6% perchloric acid, shake horizontally for 30 s, centrifuge at 2000 g for 5 min. Add the supernatant to 70 μL 5 M NaOH and 500 μL 200 mM 1-hexanesulfonic acid, make up to 10 mL with water, filter (0.45 μm), inject a 2 mL aliquot of the filtrate on to column A and elute to waste with mobile phase A, after 5 min elute the contents of column A on to column B with mobile phase B, after 5 min remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B (J. AOAC Int. 1994, 77, 765). (Prepare the buffer by dissolving 33.46 g K_2HPO_4 and 1.05 g KH_2PO_4 in 1 L water, pH 8.0. At the end of each day wash with MeCN:water 50:50 at 1.5 mL/min for 10 min.)

HPLC VARIABLES

Column: A 40 × 4.6 5 μm Inertsil C8; B 250 × 4.6 5 μm LC8-DB (Supelco)

Mobile phase: A 10 mM 1-Hexanesulfonic acid adjusted to pH 3.3 with acetic acid; B MeCN: water 17:83 containing 10 mM 1-hexanesulfonic acid and 400 μM 1,2-naphthoquinone-4-sulfonic acid, adjust pH to 3.3 with acetic acid

Flow rate: A 1; B 1.5

Injection volume: 2000

Detector: F ex 347 em 418 (tissue) or ex 365 em 418 (milk) following post-column reaction. The column effluent mixed with 500 mM NaOH pumped at 0.5 mL/min and the mixture flowed through a 2 mL reaction coil (Pickering, Mountain View CA) at 50° to the detector. (At the end of each day wash the post-column reaction system with 1% acetic acid for 10 min and with water for 10 min.)

CHROMATOGRAM

Retention time: 22

Limit of detection: 10 ppb

OTHER SUBSTANCES

Extracted: dihydrostreptomycin

KEY WORDS

post-column reaction; column-switching; SPE; pig; cow; muscle; kidney

SAMPLE
Matrix: tissue
Sample preparation: Condition a 6 mL 500 mg Bond Elut Certify II SPE cartridge with 3 mL MeCN, 1 mL water, and three 1 mL aliquots of buffer B, do not allow to dry. Homogenize (Ultra Turrax TP 18/10) 8 g Kidney or meat, 5 mL buffer A, and 1 mL 85% trichloroacetic acid in water for 6 s, centrifuge at 5000 rpm for 3 min, add 2 mL dichloromethane, mix for 6 s, centrifuge at 5000 rpm for 5 min. Remove a 7 mL aliquot of the supernatant and add it to 900 μL 4 M NaOH, blend, centrifuge at 4000 rpm for 5 min. Remove the upper layer and add it to 900 μL 500 mM phosphoric acid, adjust the pH to 5.5-5.8 with 1 M NaOH or 500 mM phosphoric acid, add 2.5 mL buffer B, add to the SPE cartridge at 1 mL/min, rinse out the tube with 1 mL buffer A, add the rinse to the SPE cartridge, wash with two 5 mL portions of buffer A, suck dry for 2 s after each wash, wash with three 5 mL portions of 25% ammonia, suck dry for 2 s after each wash, wash with two 1 mL portions of water, suck dry for 2 s after each wash, wash with 1 mL water, suck dry for 10 s, elute with two 1 mL portions of 20% formic acid in MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 60°, reconstitute the residue in 200 μL MeOH, mix for 3-4 s, evaporate to dryness, reconstitute with 400 μL buffer A, add 200 μL chloroform, mix vigorously for 10 s, centrifuge for 3 min. Filter (Costar Spin X with 0.22 μm nylon membrane) the aqueous layer while centrifuging at 5600 g for 2 min, inject a 25 μL aliquot of the filtrate. (Prepare buffer A by dissolving 4.45 g sodium 1-heptanesulfonate and 1.8 g Na_2HPO_4 in 750 mL water, adjust pH to 5.9 with 5 M phosphoric acid, adjust pH to 5.5 with 500 mM phosphoric acid, make up to 1 L with water, adjust pH to 5.5 with 500 mM phosphoric acid. Prepare buffer B by dissolving 13.35 g sodium 1-heptanesulfonate and 1.8 g Na_2HPO_4 in 750 mL water, adjust pH to 5.9 with 5 M phosphoric acid, adjust pH to 5.5 with 500 mM phosphoric acid, make up to 1 L with water, adjust pH to 5.5 with 500 mM phosphoric acid.)

HPLC VARIABLES
Guard column: 20 × 4.6 5 μm Supelcosil LC-ABZ + Plus
Column: 150 × 4.6 5 μm Supelcosil LC-ABZ + Plus
Mobile phase: MeCN:buffer 30:70 (Prepare buffer by dissolving 8.65 g sodium octanesulfonate and 110 mg potassium 1,2-naphthoquinone-4-sulfonate in 750 mL water, make up to 1 L with water, filter (0.45 μm), adjust pH to 3.24 with 1 mL acetic acid.)
Column temperature: 31
Flow rate: 0.6 for 0.5 min, 0.9 for 4 min, 0.6 for 9 min
Injection volume: 25
Detector: F ex 375 em 412 following post-column reaction. The column effluent mixed with 300 mM NaOH pumped at 0.3 mL/min in a 1.2 μL vortex mixer (Kratos PCRS 520) and the mixture flowed through a 15 m × 0.5 mm ID knitted coil at 40° and a room temperature heat exchanger to the detector.

CHROMATOGRAM

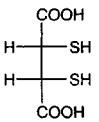
Succimer



Molecular formula: $C_4H_6O_4S_2$
Molecular weight: 182.22
CAS Registry No.: 304-55-2
Merck Index: 9034

SAMPLE

Matrix: solutions

Sample preparation: 100-200 μL Solution + 1.75-1.85 mL buffer + 50 μL reagent (final volume 2 mL), purge head space with nitrogen, shake at room temperature in the dark for 5 min, add 2 mL dichloromethane, shake for 10 s, centrifuge for 2 min. Remove the aqueous phase and adjust the pH to 7 with 15 μL 6 M HCl, inject a 20 μL aliquot. (Buffer was 100 mM pH 8.0 ammonium bicarbonate purged with nitrogen for at least 1 h before use. Reagent was 40 mM bromobimane in MeCN.)

HPLC VARIABLES
Guard column: 45 × 4.6 10 μm Ultrasphere IP C18
Column: 250 × 4.6 5 μm Ultrasphere IP C18
Mobile phase: Gradient. A was 20 mM tetrabutylammonium bromide in MeOH. B was 20 mM tetrabutylammonium bromide in water. A:B 55:45 for 11 min, to 75:25 in 1 min, maintain at 75:25 for 7 min, return to initial conditions over 1 min, re-equilibrate for 15 min.
Flow rate: 1
Injection volume: 20
Detector: F ex 356 em 450

CHROMATOGRAM
Retention time: k' 2.55

OTHER SUBSTANCES
Simultaneous: 4-sec-butyl-5-ethyl-2-thiobarbituric acid, 2,3-dimercaptopropane-1-sulfonic acid, N-(2,3-dimercaptopropyl)phthalamidic acid, 2-mercaptoethanesulfonic acid, mercaptosuccinic acid, sodium sulfite

KEY WORDS
protect from light; derivatization

REFERENCE
Maiorino,R.M.; Weber,G.L.; Aposhian,H.V. Fluorometric determination of 2,3-dimercaptopropane-1-sulfonic acid and other dithiols by precolumn derivatization with bromobimane and column liquid chromatography, *J.Chromatogr.*, **1986**, *374*, 297–310.

SAMPLE
Matrix: urine
Sample preparation: 50 μL Urine + 900 μL buffer + 50 μL reagent, stir under nitrogen for 45 min, add 50 μL 80 mM monobromobimane in MeCN, let stand under nitrogen in the dark for 10 min, add 2 mL dichloromethane, extract for 15 s, centrifuge for 2 min, repeat extraction. Remove the aqueous phase and add 5 μL 6 M HCl, inject a 20 μL aliquot. (Buffer was 100 mM ammonium bicarbonate purged with nitrogen for 1 h. Reagent was 50 mM dithiothreitol in nitrogen-purged water.) [Procedures for electrolytic reduction and reduction with sodium borohydride are also described.]

HPLC VARIABLES
Column: 150 × 4.6 5 μm Spherisorb ODS RP-18
Mobile phase: Gradient. A was 20 mM tetrabutylammonium bromide in MeOH. B was 20 mM tetrabutylammonium bromide in 10 mM pH 4.1 acetate buffer. A:B 47.5:52.5 for 12 min, to 90:10 over 5 min, maintain at 90:10 for 7 min, re-equilibrate at initial conditions for 11 min.
Flow rate: 1
Injection volume: 20
Detector: F ex 356 em 450

CHROMATOGRAM
Retention time: 10

KEY WORDS
pharmacokinetics; derivatization

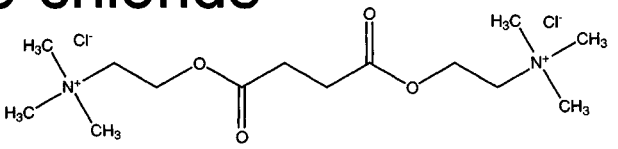
Succinylcholine chloride

Molecular formula: $C_{14}H_{30}Cl_2N_2O_4$
Molecular weight: 361.31
CAS Registry No.: 71-27-2, 6101-15-1 (dihydrate), 55-94-7 (bromnide), 541-19-5 (iodide)
Merck Index: 9044



SAMPLE
Matrix: formulations
Sample preparation: Inject a 10 μL aliquot.

HPLC VARIABLES
Column: 250 × 0.26 silica A (Perkin-Elmer)
Mobile phase: MeOH:water:500 mM tetramethylammonium sulfate 65:25:10
Flow rate: 1
Injection volume: 10
Detector: UV 214

CHROMATOGRAM
Retention time: 5.1
Limit of detection: 100 μg/mL

OTHER SUBSTANCES
Simultaneous: degradation products, choline, methyl p-hydroxybenzoate, succinic acid, succinylmonocholine

KEY WORDS
injections; saline

REFERENCE
Schmutz,C.W.; Mühlebach,S.F. Stability of succinylcholine chloride injection, *Am.J.Hosp.Pharm.*, **1991**, *48*, 501–506.

SAMPLE
Matrix: solutions
Sample preparation: Prepare a solution in saline, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 μBondapak C18
Mobile phase: MeOH:buffer 40-60 (Buffer was 20 mL Low-UV PIC B-7 (Waters) diluted with 480 mL water (10 mM 1-heptanesulfonic acid).)
Flow rate: 1
Injection volume: 20
Detector: UV 210

CHROMATOGRAM
Retention time: 7.8

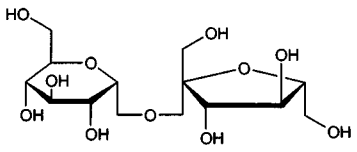
Sucrose



Molecular formula: $C_{12}H_{22}O_{11}$
Molecular weight: 342.30
CAS Registry No.: 57-50-1
Merck Index: 9051

SAMPLE
Matrix: beverages, plants
Sample preparation: Beverages. Dilute 50-fold, filter (0.22 μm), inject an aliquot of the filtrate. Plants. Heat 1 g barley leaves and 10 mL EtOH:water 80:20 at 100° in a sealed tube for 15-30 min. Evaporate the liquid phase to dryness, reconstitute with water, pass through Analytichem trimethylaminopropyl and cyclohexyl SPE cartridges, inject an aliquot.

HPLC VARIABLES
Column: 300 × 6.5 Sugar-Pak I (Waters)
Mobile phase: water
Column temperature: 70
Flow rate: 0.4
Injection volume: 10
Detector: F ex 360 em 470 following post-column reaction. The effluent from the column passed through a 75 × 3.8 reactor containing Dowex 50 W × 2 sulfonic-acid type styrene divinylbenzene copolymer at 100° and mixed with 30 mM benzamidine in 1 M KOH pumped at 1 mL/min. This mixture flowed through a 530 μL reaction coil (Varian PCR-1) at 100° to the detector.

CHROMATOGRAM
Retention time: 15.30
Limit of detection: 22 pmole

OTHER SUBSTANCES
Extracted: dextrose, fructose

KEY WORDS
barley; SPE

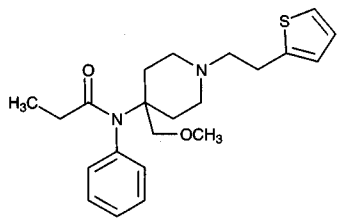
Sufentanil



Molecular formula: $C_{22}H_{30}N_2O_2S$
Molecular weight: 386.56
CAS Registry No.: 56030-54-7, 60561-17-3 (citrate)
Merck Index: 9056
Lednicer No.: 3 118

SAMPLE
Matrix: blood, urine
Sample preparation: 50 μL Plasma or urine + 50 μL 4 M NaOH + 100 μL MeCN + 500 μL n-hexane, vortex for 30 s, centrifuge at 2000 rpm for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 30°, reconstitute the residue in 100 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 100 × 8 4 μm Nova pak cyano
Mobile phase: MeCN:5 mM pH 3.2 phosphate buffer 70:30
Flow rate: 2.5
Injection volume: 50
Detector: UV 214

CHROMATOGRAM
Retention time: 7.08
Limit of detection: 5 ng/mL

OTHER SUBSTANCES
Extracted: fentanyl, alfentanil

KEY WORDS
plasma

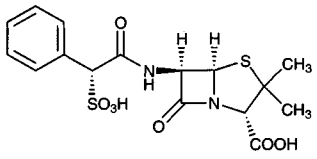
Sulbenicillin



Molecular formula: $C_{16}H_{18}N_2O_7S_2$
Molecular weight: 414.46
CAS Registry No.: 41744-40-5
Merck Index: 9059

SAMPLE
Matrix: blood
Sample preparation: Condition a Bond Elute-Certify II SPE cartridge with 5 mL MeOH:10% LiCl 40:60, 2 mL MeOH, and 2 mL water. Mix 500 μL plasma with 2 mL 50 mM ammonium acetate, add 100 μL 100 μg/mL carbenicillin in water. Add the mixture to the SPE cartridge, draw it through the cartridge under vacuum, wash with 3 mL MeCN:500 mM acetic acid 50:50 and 2 mL MeOH:100 mM ammonium acetate 50:50, elute with 1mL MeOH:10% LiCl 40:60. Inject a 40 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Cosmosil C18-AR (Nacalai Tesque Co., Kyoto)
Mobile phase: MeOH:50 mM ammonium acetate 10:70
Flow rate: 0.9
Injection volume: 40
Detector: UV 254

CHROMATOGRAM
Internal standard: carbenicillin
Limit of detection: 500 ng/mL

OTHER SUBSTANCES
Noninterfering: probenecid

KEY WORDS
plasma; pharmacokinetics; SPE

REFERENCE

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a Bond Elut-SAX SPE cartridge with 2 mL MeOH and 2 mL water. Mix 500 μL plasma or diluted urine with 5 mL 50 mM ammonium acetate and 100 μL 100 μg/mL carbenicillin in water. Add the mixture to the SPE cartridge, draw it through the cartridge under vacuum, wash with 3 mL MeCN:500 mM acetic acid 50:50 and 2 mL MeOH:100 mM ammonium acetate 50:50, elute with 500 μL MeOH:10% LiCl 40:60. Inject a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Cosmosil C18-AR (Nacalai Tesque Co., Kyoto)
Mobile phase: MeOH:50 mM pH 7.0 phosphate buffer 10:80

Flow rate: 0.9
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Internal standard: carbenicillin
Limit of detection: 500 ng/mL

OTHER SUBSTANCES
Interfering: probenecid

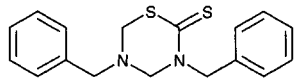
Sulbentine



Molecular formula: $C_{17}H_{18}N_2S_2$
Molecular weight: 314.48
CAS Registry No.: 350-12-9
Merck Index: 9061

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 1 mg/mL solution in MeOH, inject an aliquot.

HPLC VARIABLES
Column: 125 × 4 5 μm LiChrospher 60 RP-Select-B (A) or 125 × 3 5 μm LiChrospher 60 RP-Select-B (B)
Mobile phase: MeCN: pH 2 trifluoroacetic acid 55:45
Flow rate: 1 (A) or 0.5 (B)
Detector: UV 290 (A), UV 240 (B)

CHROMATOGRAM
Retention time: 11.3 (A), 12.1 (B)

OTHER SUBSTANCES
Simultaneous: cloxyquin, chlorphenesin, naftifine, tolnaftate, degradation products

REFERENCE

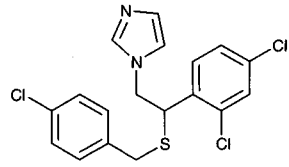
Sulconazole



Molecular formula: $C_{18}H_{15}Cl_3N_2S$
Molecular weight: 397.75
CAS Registry No.: 61318-90-9, 61318-91-0 (nitrate)
Merck Index: 9062
Lednicer No.: 3 133

SAMPLE

Matrix: blood
Sample preparation: 400 μL Plasma + 400 μL water + 50 μL 100 μg/mL miconazole in MeOH + 100 μL 1 M KOH + 6 mL hexane:dichloromethane 50:50, shake for 3 min, centrifuge at 4000 rpm for 6 min. Remove the upper organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 100 μL MeOH, inject a 25 μL aliquot.

HPLC VARIABLES

Guard column: 80 × 4 CoPell ODS
Column: 300 × 4 μBondapak C18
Mobile phase: MeCN:10 mM pH 8.0 NaH_2PO_4 buffer 66:34
Flow rate: 2
Injection volume: 25
Detector: UV 229

CHROMATOGRAM

Retention time: 7
Internal standard: miconazole (10)
Limit of quantitation: 500 ng/mL

KEY WORDS

plasma; dog; pharmacokinetics

REFERENCE

Fass,M.; Zaro,B.; Chaplin,M.; Matin,S. Reversed-phase high-pressure liquid chromatographic analysis of sulconazole in plasma, *J.Pharm.Sci.*, **1981**, *70*, 1338–1340.

SAMPLE

Matrix: formulations
Sample preparation: Dissolve 0.5 g cream containing 1% sulconazole nitrate in 5 mL THF, add fluocinonide, dilute to 100 mL with MeOH, inject a 25 μL aliquot onto column A with mobile phase A and allow components to elute from column A to column B for 7 min. After 7 min remove column A from circuit, monitor effluent from column B. Back-flush column A with mobile phase B for 3 min, equilibrate column A with mobile phase A for 5 min before next injection.

HPLC VARIABLES

Column: A 30 × 4.6 10 μm Partisil-10-ODS-3; B 70 × 2.1 Whatman Co:Pell ODS + 250 × 4.6 10 μm Partisil-10-ODS-3
Mobile phase: A MeCN:water:acetic acid 48:51:1 containing 10 mM $KClO_4$; B MeOH:THF 75:25
Flow rate: A 1.5; B 1
Injection volume: 25
Detector: UV 236

CHROMATOGRAM

Retention time: 16
Internal standard: fluocinonide (12.5)

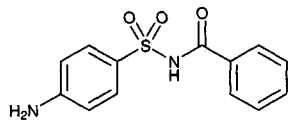
Sulfabenzamide



Molecular formula: $C_{13}H_{12}N_2O_3S$
Molecular weight: 276.32
CAS Registry No.: 127-71-9
Merck Index: 9065
Lednicer No.: 2 112

SAMPLE
Matrix: milk, urine
Sample preparation: Urine. Filter (Rainin glassfiber microfilter and Rainin 0.45 μm nylon-66 filter), inject an aliquot. Milk. Filter (Rainin glassfiber microfilter), inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm YMC-Pack ODS-AQ (YMC)
Mobile phase: MeOH:buffer 6:94 pH adjusted to 3.0 (Buffer was 70 mM in sodium dodecyl sulfate and 20 mM in NaH_2PO_4.)
Column temperature: 40
Detector: UV 254

CHROMATOGRAM
Retention time: 8.56

OTHER SUBSTANCES
Extracted: sulfacetamide, sulfadiazine, sulfadimethoxine, sulfamerazine, sulfamethazine, sulfamethoxypyridazine, sulfamonomethoxine, sulfaquinoxaline, sulfathiazole, sulfisomidine

KEY WORDS
human; cow; micellar liquid chromatography

SAMPLE

Matrix: solutions
Sample preparation: Inject a 20 μL aliquot of a solution in MeOH:water 50:50.

HPLC VARIABLES

Guard column: 4 × 4 LiChrospher 5 μm 100 RP-18
Column: 250 × 4 5 μm Spherisorb ODS2
Mobile phase: MeCN:buffer 20:80 (Prepare buffer by dissolving 3.85 g ammonium acetate in 950 mL water, ad just pH to 4.00 with acetic acid, make up to 1 L with water.)
Column temperature: 35
Flow rate: 1

Injection volume: 20
Detector: UV 550 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.2 mL/min and the mixture flowed through a 25 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 20 mg/mL ammonium sulfamate in water pumped at 0.2 mL/min and this mixture flowed through an ice-cooled 200 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 4 mg/mL N-(1-naphthyl)ethylenediamine hydrochloride in water pumped at 0.2 mL/min and this mixture flowed through a 60 cm × 0.33 mm ID coil to the detector. (Reagent was 800 mg sodium nitrite dissolved in 150 mL water and 50 mL concentrated HCl.)

CHROMATOGRAM
Retention time: 8.8
Limit of detection: 2 ppb

OTHER SUBSTANCES
Simultaneous: sulfacetamide, sulfachloropyridazine, sulfadiazine, sulfadimethoxine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfamethoxypyridazine, sulfanilamide, sulfapyridine, sulfathiazole

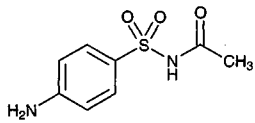
Sulfacetamide



Molecular formula: $C_8H_{10}N_2O_3S$
Molecular weight: 214.25
CAS Registry No.: 144-80-9, 127-56-0 (Na salt), 6209-17-2 (Na salt monohydrate)
Merck Index: 9067
Lednicer No.: 1 123

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 100 μL 6% trichloroacetic acid, vortex for 1 min, add 1 mL MeCN, centrifuge at 2500 g for 10 min. Remove the supernatant and add it to 5 mL dichloromethane, vortex for 1 min, shake for 10 min, centrifuge, inject a 100 μL aliquot of the aqueous phase. Analyze for free ceforanide by centrifuging serum at 3000 rpm for 20 min through an Amicon micropartition system with YMT membranes, 200 μL ultrafiltrate + 20 μL 1 mg/mL sulfacetamide, inject a 100 μL aliquot.

HPLC VARIABLES
Column: 250 mm long C18 (Alltech)
Mobile phase: MeOH:100 mM pH 4.0 sodium acetate buffer 10:90
Flow rate: 2
Injection volume: 100
Detector: UV 254

CHROMATOGRAM
Internal standard: sulfacetamide

OTHER SUBSTANCES
Extracted: ceforanide

KEY WORDS
plasma; pharmacokinetics; sulfacetamide is IS

SAMPLE
Matrix: eggs, milk, tissue
Sample preparation: Milk. Centrifuge at 2000 g and freeze at -20° to remove the cream. Mix a 5 mL aliquot with 5 mL saline solution and add 1 mL 1% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24"long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Meat. Blend 10 g homogenized meat with 20 mL saline, centrifuge, remove a 10 mL aliquot of the clear upper phase and add it to 1 mL 1% sodium azide (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Eggs. Dilute 10 g homogenized whole egg with 10 mL saline, add 3 mL 10% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B.

HPLC VARIABLES
Column: A 60 × 4 50-100 μm XAD-4 (Rohm & Haas); B 250 × 4.6 7 μm Cp TM-Spher C18 (Chrompack)

Mobile phase: MeCN:50 mM pH 6.85 sodium acetate buffer 12.5:87.5
Detector: UV 450 following post-column reaction. The column effluent mixed with 1.5% p-dimethylaminobenzaldehyde in 17% phosphoric acid and the mixture flowed through a 7.5 m × 0.5 mm ID knitted PTFE coil to the detector.

CHROMATOGRAM
Retention time: k' 1.0
Limit of detection: 5-10 ng/g

OTHER SUBSTANCES
Extracted: dapsone, sulfachlorpyrazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfaquinoxaline, sulfathiazole, sulfatroxazole
Noninterfering: chloramphenicol, trimethoprim
Interfering: sulfanilamide, sulfaguanidine

KEY WORDS
post-column reaction; meat; column-switching; dialysis

SAMPLE
Matrix: formulations
Sample preparation: Powder tablets or pills. Weigh out an amount of powdered tablets or pills or capsule contents, dissolve in 5 mL EtOH, dilute with 150 mM HCl containing 40 mM sodium dodecyl sulfate. Dilute suspensions or drops with 150 mM HCl containing 40 mM sodium dodecyl sulfate. Filter solutions if necessary. 10 mL Solution in 150 mM HCl containing 40 mM sodium dodecyl sulfate + 1 mL 100 mM sodium nitrite, let stand for 5 min, add 1 mL 300 mM sulfamic acid, let stand for 10 min, add 500 μL 30 mM N-(1-naphthyl)ethylenediamine dihydrochloride, make up to 25 mL with water, inject an aliquot.

HPLC VARIABLES
Guard column: 35 × 4.6 C18 (Scharlau)
Column: 125 × 4.6 5 μm Spherisorb ODS-2 C18
Mobile phase: Pentanol:50 mM sodium dodecyl sulfate 2.4:97.6, pH adjusted to 7 with 100 mM phosphate buffer
Flow rate: 1
Injection volume: 20
Detector: UV 490

CHROMATOGRAM
Retention time: 4
Limit of detection: 200 ng/mL

OTHER SUBSTANCES
Simultaneous: sulfadiazine, sulfaguanidine, sulfamerazine, sulfamethizole, sulfamethoxazole, sulfanilamide, sulfathiazole
Noninterfering: benzocaine

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Polytron) 10 g ground tissue with 40 mL acetone, centrifuge at 2800 g for 5 min, filter (paper) the supernatant. Homogenize (Polytron) the residue with 20 mL acetone for 1 min, centrifuge, filter. Combine the filtrates and add 60 mL 125 mM HCl, wash twice with 50 mL portions of n-hexane, add 10 mL 1 M pH 5.2 acetate buffer, adjust pH to 5.0-5.1 with 5 M NaOH, extract with 60 ml and 40 mL portions of ethyl acetate, combine the organic layers, evaporate to about 2 mL under reduced pressure at 45°C, add about 15 mL EtOH, evaporate to dryness under reduced pressure at 50°, reconstitute immediately with 5-7 mL dichloromethane. Add to an 85 mm long column of silica gel made up in dichloromethane, rinse the flask twice with 1-2 mL portions of dichloromethane, add the rinses to the column, elute with 40 mL acetone:dichloromethane (60:40), elute to waste until the acetone front (visible against a dark background) is about 10 mm from the end of the column, collect the remaining eluate (Mitt. Gebiete. Lebensm. Hyg. 1990, 81, 522). Add 150 μL 10 μg/mL sulfaben-

zamide to the eluate, evaporate to dryness under reduced pressure at 45°, reconstitute the residue in 300 μL MeOH:water 50:50, filter (0.45 μm), inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 4 × 4 LiChrospher 5 μm 100 RP-18
Column: 250 × 4 5 μm Spherisorb ODS2
Mobile phase: MeCN:buffer 20:80 (Prepare buffer by dissolving 3.85 g ammonium acetate in 950 mL water, ad just pH to 4.00 with acetic acid, make up to 1 L with water.)
Column temperature: 35
Flow rate: 1
Injection volume: 20
Detector: UV 550 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.2 mL/min and the mixture flowed through a 25 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 20 mg/mL ammonium sulfamate in water pumped at 0.2 mL/min and this mixture flowed through an ice-cooled 200 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 4 mg/mL N-(1-naphthyl)ethylenediamine hydrochloride in water pumped at 0.2 mL/min and this mixture flowed through a 60 cm × 0.33 mm ID coil to the detector. (Reagent was 800 mg sodium nitrite dissolved in 150 mL water and 50 mL concentrated HCl.)

CHROMATOGRAM

Retention time: 4
Internal standard: sulfabenzamide (8.8)
Limit of detection: 2 ppb

OTHER SUBSTANCES

Extracted: sulfachloropyridazine, sulfadimethoxine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfamethoxypyridazine, sulfanilamide, sulfapyridine, sulfaquinoxaline, sulfathiazole
Interfering: sulfadiazine

SAMPLE

Matrix: blood, milk

Sample preparation: 1 mL Serum or milk + 4 mL MeCN, vortex, centrifuge at 1000 g for 15 min. Remove the supernatant and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 50 μL water, mix vigorously, add 1 mL MeCN, centrifuge at 1000 g for 10 min. Remove the upper layer and evaporate it to dryness, reconstitute the residue in 1 mL 10 ng/mL p-aminobenzoic acid in 0.01% trichloroacetic acid, centrifuge at 1000 g for 10 min. Remove a 500 μL aliquot of the clear layer and add it to 100 μL 1 mg/mL fluorescamine in acetone (prepared fresh each day), mix for 1 min, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 10 μm Nova-Pak C18
Mobile phase: MeCN:10 mM KH_2PO_4 30:70
Flow rate: 1
Injection volume: 50
Detector: F ex 390 em 475

CHROMATOGRAM

Retention time: 6.5
Internal standard: p-aminobenzoic acid (5.5)
Limit of detection: 0.1 ng/mL

OTHER SUBSTANCES

Extracted: sulfadimethoxine, sulfamethazine, sulfamethoxazole, sulfamonomethoxine, sulfathiazole

KEY WORDS

cow; serum; derivatization

Tsai,C.-E.; Kondo,F. Liquid chromatographic determination of fluorescent derivatives of six sulfonamides in bovine serum and milk, *J.AOAC Int.*, **1995**, *78*, 674–678.

SAMPLE

Matrix: blood, tissue

Sample preparation: Plasma. 500 μL Plasma + 100 μL 30 μg/mL sulfamethazine (sulfadimidine) in EtOH + 150 μL 3% trichloroacetic acid in EtOH + 100 μL EtOH, vortex, freeze at -20° for 5 min, centrifuge, freeze at -20° for 10 min, centrifuge through a Spin-X filter tube, inject a 10 μL aliquot of the supernatant. Tissue. 1-3 g Tissue + 3 (muscle) or 6 (liver) μL 1 mg/mL sulfamethoxazole in EtOH + 2 (liver) or 3 (muscle) mL 0.7% trichloroacetic acid in acetone, mix in Whirlmixer, sonicate for 10 min at 40°, add 2 mL 10 mM pH 6 Na_2HPO_4, sonicate for 5 min, add 100 μL 500 mM NaOH, add 9 (muscle) or 10 (liver) dichloromethane, mix thoroughly for 1 min, centrifuge at 2240 g for 5 min. Remove 6 mL of the organic layer and evaporate it to dryness at 40° under a stream of nitrogen. Dissolve the residue in 400 (muscle) or 800 (liver) μL MeCN:10 mM pH 2.8 phosphate buffer 20:80, sonicate, extract with 1 mL hexane. Sonicate the aqueous phase for 1 min, centrifuge through a Spin-X filter tube, inject a 10 μL aliquot of the supernatant.

HPLC VARIABLES

Guard column: 20 × 4.6 5 μm Supelcosil LC-18 DB
Column: 250 × 4.6 5 μm Supelcosil LC-18 DB
Mobile phase: MeCN:buffer 23:77 (plasma) or 20:80 (tissue) with 0.1% triethylamine added (Buffer was 25 mM sodium phosphate and 20 mM sodium 1-hexanesulfonate, pH adjusted to 2.8 with 5 M phosphoric acid.)
Flow rate: 0.9
Injection volume: 10
Detector: UV 270

CHROMATOGRAM
Retention time: 6 (plasma), 7 (tissue)
Internal standard: sulfamethazine (sulfadimidine) (8), sulfamethoxazole (18)
Limit of quantitation: 30 ng/g (liver), 25 ng/mL (plasma), 15 ng/g (muscle)

OTHER SUBSTANCES
Simultaneous: trimethoprim

KEY WORDS
plasma; fish; salmon; trout; muscle; liver

Hormazabal,V.; Rogstad,A. Simultaneous determination of sulfadiazine and trimethoprim in plasma and tissues of cultured fish for residual and pharmacokinetic studies, *J.Chromatogr.*, **1992**, *583*, 201–207.

SAMPLE
Matrix: blood, urine
Sample preparation: Dilute 1 mL urine with 5 or 10 mL water. 1 mL Serum, plasma, or diluted urine + 200 μL 1 M pH 6.8 KH_2PO_4 buffer + 6 mL ethyl acetate, vortex for 3 min, centrifuge at 2400 g for 5 min. Remove 5 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 200 μL 30 μg/mL sulfadimethoxine in mobile phase, inject an aliquot.

HPLC VARIABLES
Guard column: 25-40 μm LiChroprep Si 60 (Merck)
Column: 250 × 4 10 μm LiChrosorb Si 60
Mobile phase: Dichloromethane:MeOH:ammonia 80:19:1
Flow rate: 1.5
Injection volume: 20
Detector: UV 289

CHROMATOGRAM
Retention time: 6.7
Internal standard: sulfadimethoxine (3.7)
Limit of detection: 100 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, N-acetylsulfadiazine, trimethoprim

KEY WORDS
normal phase; serum; plasma; pharmacokinetics

REFERENCE
Ascalone,V. Assay of trimethoprim, sulfadiazine and its N4-acetyl metabolite in biological fluids by normal-phase high-performance liquid chromatography, *J.Chromatogr.*, **1981**, *224*, 59–66.

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 200 μL Plasma + 200 μL MeCN, centrifuge at 3000 g for 5 min, inject a 50 μL aliquot of the supernatant. Urine. Centrifuge urine at 3000 g, dilute the supernatant with 5 volumes of 0.6% acetic acid, inject a 50 μL aliquot.

HPLC VARIABLES
Guard column: 15 × 4.6 8 μm C8 (Meyvis, Bergen op Zoom, Netherlands)
Column: 150 × 4.6 8 μm Dynamax 60 Å C8 (?) (Rainin)
Mobile phase: Gradient. A was MeCN. B was 0.5% acetic acid containing 0.5 g/L ammonium acetate, pH 3.3. A:B from 0:100 to 10:90 over 5 min, to 18:82 over 13 min, return to initial conditions over 1 min, re-equilibrate for 4 min.
Flow rate: 1.5
Injection volume: 50
Detector: UV 273

CHROMATOGRAM
Retention time: 12.70
Limit of quantitation: 310 ng/mL (plasma), 800 ng/mL (urine)

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
human; monkey; plasma; pharmacokinetics

REFERENCE

Isolation, identification and determination of sulfadiazine and its hydroxy metabolites and conjugates from man and Rhesus monkey by high-performance liquid chromatography, *J.Chromatogr.B*, **1995**, *670*, 111–123.

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 8.375

KEY WORDS
whole blood

SAMPLE
Matrix: cell cultures
Sample preparation: Condition a cyclohexyl-bonded silica Bond-elut SPE cartridge with 2 mL MeOH and 2 mL water. Centrifuge cell cultures at 6000 g at 4° for 15 min, add 100 μL supernatant and 100 μL 2 μg/mL sulfamerazine to the SPE cartridge, wash with 1 mL water, elute with 1.5 mL MeOH. Evaporate the eluate to dryness under a stream of air at 60°, reconstitute the residue in 100 μL water, vortex, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 100 × 4.6 5 μm ODS Hypersil

Mobile phase: MeOH:10 mM pH 2.5 phosphate buffer 5:95 containing 40 mM tetrabutylammonium bromide
Flow rate: 2
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 6
Internal standard: sulfamerazine (7.5)
Limit of detection: 100 ng/mL

OTHER SUBSTANCES
Extracted: p-aminobenzoic acid, trimethoprim, dibromopropamidine isethionate

KEY WORDS
SPE

SAMPLE
Matrix: eggs, honey, milk
Sample preparation: Honey. Dissolve 1 g honey in 10 mL water, homogenize, filter (0.45 μm), inject a 50 μL aliquot. Milk, eggs. 5 mL Milk or 0.4 g lyophilized eggs + 10 mL trichloroacetic acid solution (so as to give a final trichloroacetic acid concentration of 3%), homogenize, centrifuge at 5000 rpm for 5 min. Re-extract the residue with 10 mL 3% trichloroacetic acid. Combine the aqueous phases and make up to 25 mL with trichloroacetic acid solution, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Spherisorb ODS-2
Mobile phase: Gradient. MeCN:water 3:97 for 5 min, to 40:60 over 15 min, return to initial conditions over 1 min, re-equilibrate for 10 min. (Wash column with MeCN:ethyl acetate 5:95 at the end of each day.)
Flow rate: 1
Injection volume: 50
Detector: UV 260

CHROMATOGRAM
Retention time: 12
Limit of detection: 30 ng/mL

OTHER SUBSTANCES
Extracted: sulfaguanidine, sulfamethoxazole, sulfapyridine, sulfathiazole

REFERENCE
Viñas,P.; López Erroz,C.; Hernández Canals,A.; Hernández Córdoba,M. Liquid chromatographic analysis of sulfonamides in foods, *Chromatographia*, **1995**, *40*, 382–386.

SAMPLE
Matrix: eggs, milk, tissue
Sample preparation: Milk. Centrifuge at 2000 g and freeze at -20° to remove the cream. Mix a 5 mL aliquot with 5 mL saline solution and add 1 mL 1% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Meat. Blend 10 g homogenized meat with 20 mL saline, centrifuge, remove a 10 mL aliquot of the clear upper phase and add it to 1 mL 1% sodium azide (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Eggs. Dilute 10 g homogenized whole egg with 10 mL saline, add 3 mL 10% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B.

HPLC VARIABLES
Column: A 60 × 4 50-100 μm XAD-4 (Rohm & Haas); B 250 × 4.6 7 μm Cp TM-Spher C18 (Chrompack)
Mobile phase: MeCN:50 mM pH 6.85 sodium acetate buffer 12.5:87.5
Detector: UV 450 following post-column reaction. The column effluent mixed with 1.5% p-dimethylaminobenzaldehyde in 17% phosphoric acid and the mixture flowed through a 7.5 m × 0.5 mm ID knitted PTFE coil to the detector.

CHROMATOGRAM
Retention time: k' 2.0
Limit of detection: 5-10 ng/g

OTHER SUBSTANCES
Extracted: dapsone, sulfacetamide, sulfachlorpyrazine, sulfadimethoxine, sulfadoxine, sulfaguanidine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfanilamide, sulfaquinoxaline, sulfathiazole, sulfatroxazole
Noninterfering: chloramphenicol, trimethoprim

KEY WORDS
post-column reaction; meat; column-switching; dialysis

SAMPLE
Matrix: eggs, milk, tissue
Sample preparation: Milk. Homogenize 3 g milk and 500 μL 30% trichloroacetic acid, centrifuge at 5000 rpm for 5 min. Remove the aqueous phase and extract the residue with 4 mL 3% trichloroacetic acid. Combine the aqueous layers and make up to 10 mL with trichloroacetic acid, filter (0.45 μm), inject a 50 μL aliquot. Fish, eggs. Homogenize (Ultra-Turrax) 3 g fish or 4 g eggs with 4 mL 3% trichloroacetic acid, centrifuge at 5000 rpm for 5 min. Remove the aqueous phase and extract the residue with 4 mL 3% trichloroacetic acid. Combine the aqueous layers and make up to 10 mL with trichloroacetic acid, filter (0.45 μm), inject a 50 μL aliquot.

HPLC VARIABLES
Guard column: 5 μm Spherisorb ODS-2
Column: 150 × 4.6 5 μm Spherisorb ODS-2
Mobile phase: Gradient. MeCN:water 3:97 for 5 min, to 40:60 over 15 min, return to initial conditions over 1 min, re-equilibrate for 10 min. (At the end of each day wash with MeCN: ethyl acetate 5:95.)
Flow rate: 0.5
Injection volume: 50
Detector: F ex 302 em 412 following post-column reaction. The column effluent mixed with reagent 1 pumped at 0.25 mL/min and with reagent 2 pumped at 0.25 mL/min and this mixture flowed through a 2.5 m × 0.8 mm i.d. PTFE coil at 40° to the detector. (Reagent 1 was 10 mM o-phthalaldehyde in EtOH:700 mM phosphoric acid 2:98. Reagent 2 was 20 mM β-mercaptoethanol in EtOH:700 mM phosphoric acid 2:98.)

CHROMATOGRAM
Retention time: 20
Limit of detection: 16 ng/mL

SAMPLE
Matrix: formulations
Sample preparation: Powder tablets or pills. Weigh out an amount of powdered tablets or pills or capsule contents, dissolve in 5 mL EtOH, dilute with 150 mM HCl containing 40 mM sodium dodecyl sulfate. Dilute suspensions or drops with 150 mM HCl containing 40 mM sodium dodecyl sulfate. Filter solutions if necessary. 10 mL Solution in 150 mM HCl containing 40 mM sodium dodecyl sulfate + 1 mL 100 mM sodium nitrite, let stand for 5 min, add 1 mL 300 mM sulfamic acid, let stand for 10 min, add 500 μL 30 mM N-(1-naphthyl)ethylenediamine dihydrochloride, make up to 25 mL with water, inject an aliquot.

HPLC VARIABLES
Guard column: 35 × 4.6 C18 (Scharlau)
Column: 125 × 4.6 5 μm Spherisorb ODS-2 C18
Mobile phase: Pentanol:50 mM sodium dodecyl sulfate 2.4:97.6, pH adjusted to 7 with 100 mM phosphate buffer
Flow rate: 1
Injection volume: 20
Detector: UV 490

CHROMATOGRAM
Retention time: 9
Limit of detection: 20 ng/mL

OTHER SUBSTANCES
Simultaneous: sulfacetamide, sulfaguanidine, sulfamerazine, sulfamethizole, sulfamethoxazole, sulfanilamide, sulfathiazole
Noninterfering: benzocaine

SAMPLE
Matrix: milk
Sample preparation: 500 μL Milk + 2 g C18 material + 10 μL MeOH + 10 μL 12.5 μg/mL sulfamerazine in MeOH, let stand for 1 min, grind with a glass pestle until homogeneous, place in a 10 mL syringe barrel plugged with filter paper, place filter paper on top, compress to 4.5 mL with a plunger, restrict column outlet with a 100 μL pipette tip, wash with 8 mL hexane, remove excess hexane with positive pressure, elute with 8 mL dichloromethane, elute excess dichloromethane with positive pressure. Evaporate the eluate under a stream of nitrogen, dissolve the residue in 100 μL MeOH and 400 μL 17 mM orthophosphoric acid, sonicate for 5-10 min, centrifuge at 13600 g for 5 min, filter supernatant (0.45 μm), inject a 20 μL aliquot. (C18 material was Analytichem 40 μm 18% load endcapped. Add 22 g to a 50 mL syringe barrel wash with 2 column volumes of hexane, 2 volumes of dichloromethane, and 2 volumes of MeOH, vacuum aspirate until dry.)

HPLC VARIABLES
Column: 75 × 4 3 μm Supelcosil LC-18
Mobile phase: MeCN:17 mM orthophosphoric acid 10:90
Column temperature: 45

Flow rate: 1 for 5 min then 2 for remainder of run
Injection volume: 20
Detector: UV 270

CHROMATOGRAM
Retention time: 2.5
Internal standard: sulfamerazine (3)
Limit of detection: 62.5 ng/mL

OTHER SUBSTANCES

SAMPLE
Matrix: saliva

Sample preparation: 1 mL Saliva + 1 mL MeCN + 400 mg potassium carbonate, vortex for 1 min, centrifuge at ≥1000 g for 10 min. Remove the upper MeCN layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 200 μL mobile phase, vortex, inject a 40 μL aliquot.

HPLC VARIABLES
Column: 125 × 4.6 5 μm RP-18 (Brownlee)
Mobile phase: MeOH:buffer 15:85 (Buffer was 50 mM $NaHPO_4$ (sic) containing 10 mM sodium 1-hexanesulfonate and 7.2 mM triethylamine, adjusted to pH 3.0 with phosphoric acid.)
Flow rate: 1
Injection volume: 40
Detector: F ex 395 em 470 following post-column reaction. The column effluent mixed with reagent pumped at 0.3 mL/min and the mixture flowed through a 4.8 m × 0.7 mm ID PTFE coil at 60° to the detector. (Prepare reagent by dissolving 400 mg fluorescamine in 250 mL MeOH, add 1 mL 2-mercaptoethanol, add 250 mL mobile phase.)

CHROMATOGRAM
Retention time: 5.66
Internal standard: sulfadiazine

OTHER SUBSTANCES
Extracted: sulfapyridine
Noninterfering: N-acetylsulfapyridine, 2-amino-3-phenyl-1-propanol, 5-aminosalicylic acid, amphetamine, furosemide, levallorphan, metoprolol, riboflavin, salicylic acid, sulfasalazine, viloxazine

---

KEY WORDS
post-column reaction; sulfadiazine is IS

SAMPLE
Matrix: tissue
Sample preparation: Condition a 500 mg Chromabond SA cation-exchange SPE cartridge (Macherey-Nagel) with 6 mL hexane, dry under vacuum for 10 min, condition with 6 mL dichloromethane:acetone:acetic acid 50:50:2, do not allot to go dry. Homogenize (Polytron) 10 g sample with 60 mL dichloromethane:acetone 50:50 for 30 s, rinse the apparatus with 2-3 mL dichloromethane:acetone 50:50, centrifuge the mixture at 2500 rpm for 10 min. Filter (cotton wool) the supernatant and wash it through with a little dichloromethane:acetone 50:50, add 5 mL acetic acid to the filtrate, mix, remove one tenth of this mixture and add it to the SPE cartridge at 2 mL/min, do not allow the SPE cartridge to run dry, wash with 5 mL water, wash with 5 mL MeOH, dry under vacuum for 10 min, pass gaseous ammonia through the SPE cartridge until the acid is neutralized (when air is passed through the cartridge moist pH paper should turn blue), elute with 3 mL MeOH at 1-2 mL/min, carefully evaporate to dryness under reduced pressure (100 mbar) at 40°, reconstitute with 500 μL initial mobile phase, centrifuge, inject a 50 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 125 × 4 5 μm LiChrospher 100 RP-18
Mobile phase: Gradient. A was MeCN:20 mM pH 5 sodium acetate buffer 5.5:94.5. B was MeCN:EtOH:20 mM pH 5 sodium acetate buffer 50:10:40. A:B from 100:0 to 0:100 over 32 min (concave gradient), return to initial conditions over 4 min, re-equilibrate at initial conditions for 10 min.
Flow rate: 0.8
Injection volume: 50
Detector: UV 270, F ex 395 em 495 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.3 mL/min and this mixture flowed through a 2.3 m × 0.5

mm ID coil in a cooled ultrasonic bath to the detector. (Prepare reagent by dissolving 25 mg fluorescamine in 25 mL MeCN and adding 75 mL buffer and 200 μL mercaptoethanol. Buffer was 20 mM NaH_2PO_4 adjusted to pH 3 with 1 M phosphoric acid.)

CHROMATOGRAM
Retention time: 10
Limit of detection: 0.5-5 ppb

OTHER SUBSTANCES
Extracted: sulfachlorpyridazine, sulfadimethoxine, sulfadoxine, sulfaguanidine, sulfamerazine, sulfamethazine (sulfadimidine), sulfamethizole, sulfamethoxypyridazine, sulfanilamide, sulfapyridine, sulfathiazole

SAMPLE
Matrix: tissue
Sample preparation: Cut tissue into small pieces and homogenize in blender. 20 g Homogenized tissue + 200 μL 10 μg/mL methyl p-aminobenzoate in water + 60 mL acetone:chloroform 50:50, shake vigorously on a mechanical shaker for 10 min, centrifuge at 3000 g for 10 min, filter (Whatman No. 41 paper) supernatant, repeat extraction. Combine the extracts, if the extract is not clear centrifuge at 3000 g for 10 min and discard the aqueous layer, evaporate to an oily residue at 45° under reduced pressure, add 5 mL MeCN to flask, let stand for 10 min, remove MeCN layer, add 5 mL hexane and 5 mL MeCN, shake, centrifuge at 3000 g for 10 min, remove

the MeCN layer, add 5 mL MeCN to the hexane layer, shake, centrifuge at 3000 g for 10 min, remove the MeCN layer. If hexane layer is not clear centrifuge at 3000 g for 10 min and remove the clear portion. Add 400 μL 15% trichloroacetic acid to the hexane layer, shake gently for 10 min, centrifuge at 3000 g for 10 min. Evaporate the MeCN layers, transfer the oily residue to a small flask with 3 mL hexane, add the aqueous trichloroacetic acid layer, shake gently for 10 min, centrifuge at 3000 g for 10 min. Discard the hexane layer, add 100 μL saturated aqueous sodium citrate solution to the aqueous layer, mix, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm RP 18 (Brownlee)
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: Gradient. A was 1% aqueous acetic acid. B was MeCN:water 80:20. A:B from 90:10 to 60:40 over 20 min, return to initial conditions over 5 min, re-equilibrate for 5 min.
Flow rate: 1.5
Injection volume: 50
Detector: UV 450 following post-column reaction. The column effluent mixed with the reagent pumped at 0.5 mL/min and the mixture flowed through a 7 m × 0.25 mm i.d. coil of stainless steel tubing to the detector. (Prepare reagent by dissolving 1 g p-dimethylaminobenzaldehyde in 30 mL MeCN, make up to 100 mL with 5% trichloroacetic acid in water.)

CHROMATOGRAM

Retention time: 9.1
Internal standard: methyl p-aminobenzoate (18.6)
Limit of detection: 20 ng/g

OTHER SUBSTANCES

Extracted: sulfamerazine, sulfamethazine (sulfadimidine), sulfamethoxypyridazine, sulfapyridine, sulfaquinoxaline

Bui,L.V. Liquid chromatographic determination of six sulfonamide residues in animal tissues using postcolumn derivatization, *J.AOAC Int.*, **1993**, *76*, 966–976.

SAMPLE

Matrix: tissue
Sample preparation: Homogenize (Polytron) 10 g ground tissue with 40 mL acetone, centrifuge at 2800 g for 5 min, filter (paper) the supernatant. Homogenize (Polytron) the residue with 20 mL acetone for 1 min, centrifuge, filter. Combine the filtrates and add 60 mL 125 mM HCl, wash twice with 50 mL portions of n-hexane, add 10 mL 1 M pH 5.2 acetate buffer, adjust pH to 5.0-5.1 with 5 M NaOH, extract with 60 ml and 40 mL portions of ethyl acetate, combine the organic layers, evaporate to about 2 mL under reduced pressure at 45°C, add about 15 mL EtOH, evaporate to dryness under reduced pressure at 50°, reconstitute immediately with 5-7 mL dichloromethane. Add to an 85 mm long column of silica gel made up in dichloromethane, rinse the flask twice with 1-2 mL portions of dichloromethane, add the rinses to the column, elute with 40 mL acetone:dichloromethane (60:40), elute to waste until the acetone front (visible against a dark background) is about 10 mm from the end of the column, collect the remaining eluate (Mitt. Gebiete. Lebensm. Hyg. 1990, 81, 522). Add 150 μL 10 μg/mL sulfabenzamide to the eluate, evaporate to dryness under reduced pressure at 45°, reconstitute the residue in 300 μL MeOH:water 50:50, filter (0.45 μm), inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 4 × 4 LiChrospher 5 μm 100 RP-18
Column: 250 × 4 5 μm Spherisorb ODS2
Mobile phase: MeCN:buffer 20:80 (Prepare buffer by dissolving 3.85 g ammonium acetate in 950 mL water, ad just pH to 4.00 with acetic acid, make up to 1 L with water.)
Column temperature: 35
Flow rate: 1
Injection volume: 20
Detector: UV 550 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.2 mL/min and the mixture flowed through a 25 cm × 0.33 mm ID coil. The

effluent from this coil mixed with ice-cold 20 mg/mL ammonium sulfamate in water pumped at 0.2 mL/min and this mixture flowed through an ice-cooled 200 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 4 mg/mL N-(1-naphthyl)ethylenediamine hydrochloride in water pumped at 0.2 mL/min and this mixture flowed through a 60 cm × 0.33 mm ID coil to the detector. (Reagent was 800 mg sodium nitrite dissolved in 150 mL water and 50 mL concentrated HCl.)

SAMPLE

Matrix: tissue

Sample preparation: Condition a 3 mL Bond Elut propylsulfonic acid strong cation exchange SPE cartridge with 4 mL MeCN, 16 mL 200 mM phosphoric acid, and 4 mL MeCN. Homogenize (Ultra-Turrax T-25 with S25N dispersing tool) 10 g chopped fish and 10 mL mobile phase at 16000 rpm for 1 min, add 90 mL MeCN, shake at low speed on shaker, centrifuge at 1500 rpm for 10 min, remove the supernatant, add 30 mL MeCN to the solid, shake, centrifuge, decant the supernatant. Combine the supernatants, add 100 mL water, add 2 mL diethylene glycol, add 60 mL dichloromethane, shake for 3 min, remove the organic layer, repeat the extraction with 40 mL dichloromethane. Combine the organic layers and evaporate in a rotary evaporator at 65° to 2-3 mL, add 3 mL dichloromethane, add to the SPE cartridge, rinse flask with MeCN:dichloromethane 60:40, add rinse to the SPE cartridge, rinse flask with 5 mL MeCN, add rinse to the SPE cartridge, wash with 2 mL MeCN:200 mM phosphoric acid 10:90, elute with 5 mL MeCN:200 mM phosphoric acid 10:90, inject a 10 μL aliquot of the eluate. (Do not allow SPE cartridge to go dry at any time.)

SAMPLE

Matrix: tissue

Sample preparation: Homogenize (Ultra-Turrax) 3 g ground tissue with 30 mL chloroform for 2 min, centrifuge at 3000 g for 5 min, filter (paper). Remove a 10 mL aliquot of the filtrate and add it to 1 mL 3 M HCl, vortex for 1 min, centrifuge at 2000 g for 5 min. Remove a 250 μL aliquot of the aqueous layer and add it to 250 μL 3.8 M sodium acetate, add 100 μL 1 mg/mL fluorescamine in MeCN, vortex, let stand at room temperature for 20 min, inject a 20 μL aliquot. (Sodium acetate should be a highly pure grade.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Nucleosil 120 C18
Mobile phase: MeCN:20 mM pH 4 NaH_2PO_4 34:66 containing 20 mM sodium octanesulfonate
Column temperature: 30
Flow rate: 1.2
Injection volume: 20
Detector: F ex 405 em 495

CHROMATOGRAM

Retention time: 8
Limit of detection: 3 ng/g

OTHER SUBSTANCES

Extracted: sulfadimethoxine, sulfamethazine, sulfaquinoxaline

KEY WORDS
derivatization; chicken; muscle

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Ultra-Turrax T-25 with S25N dispersing tool) 10 g chopped fish and 10 mL mobile phase A at high speed for 30 s, add 90 mL MeCN, shake at low speed on shaker, centrifuge at 1500 rpm for 10 min, remove the supernatant, add 30 mL MeCN to the solid, shake, centrifuge, decant the supernatant. Combine the supernatants, add 100 mL water, add 2 mL diethylene glycol, add 60 mL dichloromethane, shake for 3 min, remove the organic layer, repeat the extraction with 40 mL dichloromethane. Combine the organic layers and evaporate in a rotary evaporator at 65° to ca. 2 mL, wash into a smaller tube with two 2 mL portions of MeOH, concentrate to about 1 mL with a stream of nitrogen at 65°, dilute to 4.5 mL with 200 mM phosphoric acid, add 5 mL hexane, vortex, centrifuge for 15 min, discard upper hexane layer. Dilute the lower aqueous layer to 5 mL with 200 mM phosphoric acid, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: C18
Column: 150 × 4.6 3.5 μm Symmetry C18 (Waters)
Mobile phase: Gradient. A was MeCN:MeOH:2% acetic acid in water 5:10:85. B was MeCN:MeOH:2% acetic acid in water 25:10:65. A:B from 100:0 to 0:100 over 25 min, maintain at 0:100 for 5 min.
Flow rate: 1
Injection volume: 20
Detector: F ex 400 em 495 following post-column reaction. The column effluent mixed with 500 μg/mL fluorescamine in MeCN:MeOH:2% acetic acid 52.5:5:42.5 pumped at 0.2 mL/min and the mixture flowed through a 10.7 m × 0.4 mm i.d. coil of PTFE tubing at 70° to the detector.

CHROMATOGRAM
Retention time: 6
Limit of quantitation: 1 ng/g

OTHER SUBSTANCES
Extracted: sulfachloropyridazine, sulfadimethoxine, sulfadoxine, sulfamerazine, sulfamethazine, sulfamethizole, sulfamethoxazole, sulfamethoxypyridazine, sulfamonomethoxine, sulfanilamide, sulfapyridine, sulfaquinoxaline, sulfathiazole

SAMPLE
Matrix: water
Sample preparation: Adjust 50 mL wastewater to pH 6.6 with acetic acid, add 5 mL 1 mg/mL niacin in 0.5 mM HCl, add 50 mL ethyl acetate, shake vigorously for 5 min, let stand for 1 min, transfer the ethyl acetate layer to a flask, extract the residual aqueous layer with two 20 mL portions of ethyl acetate. Combine the organic layers and evaporate them at 90° to about 500 μL, dissolve the residue in 5 mL 10 mM HCl, make up to 50 mL with water, inject an aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Inertsil ODS-2 (Vercopak)
Mobile phase: MeOH:buffer 20:80 (Buffer was 100 mM sodium acetate adjusted to pH 6.6 with 10 mM acetic acid.)
Flow rate: 1
Injection volume: 20
Detector: UV 260

CHROMATOGRAM
Retention time: 4
Internal standard: niacin (3.3)

OTHER SUBSTANCES
Extracted: sulfathiazole, sulfamethazine, sulfacetamide, sulfamethoxazole, sulfamerazine, sulfamonomethoxine

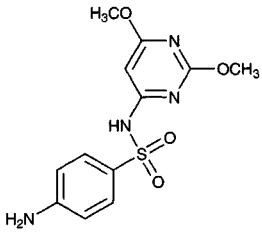
Sulfadimethoxine



Molecular formula: $C_{12}H_{14}N_4O_4S$
Molecular weight: 310.33
CAS Registry No.: 122-11-2
Merck Index: 9073
Lednicer No.: 1 125

SAMPLE

Matrix: blood
Sample preparation: Condition a 3 mL Bond Elut C8 SPE cartridge with 3 mL MeOH and 3 mL 50 mM pH 3.4 oxalate buffer. 1 mL Plasma + 1 mL 50 mM pH 3.4 oxalate buffer + 50 μL MeOH:water 50:50, mix, add to the SPE cartridge. Wash with 3 mL 50 mM pH 3.4 oxalate buffer, 1 mL MeOH:water 20:80, and 2 mL hexane:ether 80:20. Elute with two 1 mL portions of MeOH:25% ammonia solution 99:1. Evaporate the eluate to dryness under a gentle stream of nitrogen at 30°. Dissolve the residue in 250 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 20 × 3.9 5 μm Symmetry C18 (Waters)
Column: 250 × 4.6 5 μm Symmetry C18 (Waters)
Mobile phase: MeCN:MeOH:water 25:10:65 containing 1% triethylamine, adjust to p 5.6 with phosphoric acid
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 240

CHROMATOGRAM

Internal standard: sulfadimethoxine

OTHER SUBSTANCES

Extracted: pyrimethamine, sulfadoxine
Simultaneous: acetaminophen, 4-chlorophenylbiguanide, cycloguanil, proguanil, quinine, sulfadiazine

SAMPLE
Matrix: eggs, milk, tissue
Sample preparation: Milk. Centrifuge at 2000 g and freeze at -20° to remove the cream. Mix a 5 mL aliquot with 5 mL saline solution and add 1 mL 1% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water

pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Meat. Blend 10 g homogenized meat with 20 mL saline, centrifuge, remove a 10 mL aliquot of the clear upper phase and add it to 1 mL 1% sodium azide (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Eggs. Dilute 10 g homogenized whole egg with 10 mL saline, add 3 mL 10% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B.

HPLC VARIABLES

Column: A 60 × 4 50-100 μm XAD-4 (Rohm & Haas); B 250 × 4.6 7 μm Cp TM-Spher C18 (Chrompack)
Mobile phase: MeCN:50 mM pH 6.85 sodium acetate buffer 12.5:87.5
Detector: UV 450 following post-column reaction. The column effluent mixed with 1.5% p-dimethylaminobenzaldehyde in 17% phosphoric acid and the mixture flowed through a 7.5 m × 0.5 mm ID knitted PTFE coil to the detector.

CHROMATOGRAM

Retention time: k' 5.0
Limit of detection: 5-10 ng/g

OTHER SUBSTANCES

Extracted: dapsone, sulfacetamide, sulfachlorpyrazine, sulfadiazine, sulfadoxine, sulfaguanidine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfanilamide, sulfaquinoxaline, sulfathiazole, sulfatroxazole
Noninterfering: chloramphenicol, trimethoprim

KEY WORDS

post-column reaction; meat; column-switching; dialysis

SAMPLE
Matrix: milk
Sample preparation: 5 mL Milk + 100 μL concentrated HCl, sonicate for 15 s, centrifuge at 3000 g for 10 min, wash the precipitate with 2 mL water, centrifuge. Combine the aqueous layers and add 5 mL hexane, mix, centrifuge at 1500 g for 1 min, repeat the hexane wash. Evaporate the aqueous layer to dryness at low pressure, reconstitute with MeOH, centrifuge, evaporate the supernatant to dryness, reconstitute the residue with 3 mL water, inject a 50-500 μL aliquot on to column A and elute to waste with mobile phase A, after 3 min elute the contents of column A on to column B with mobile phase B and start the gradient, elute with mobile phase B and monitor the effluent from column B.

HPLC VARIABLES
Column: A 30 mm long 10 μm RP-18; B 150 × 4.6 5 μm Spherisorb ODS-2
Mobile phase: A 100 mM Ammonium acetate buffer or 1% formic acid (?); B Gradient. A was 100 mM ammonium acetate buffer or 1% formic acid (?). B was MeCN:water 70:30 containing 100 mM ammonium acetate or 1% formic acid (?). A:B from 100:0 to 80:20 over 0.5 min, maintain at 80:20,for 1 min, to 25:75 over 10 min.
Flow rate: 1
Injection volume: 50-500
Detector: UV 254 or MS, Finnigan TSQ 70 triple quadrupole, Finnigan TSP source and interface, interface 80-85°, source 250°, manifold 70°, collision gas argon 0.4 mTorr, collision energy 40-50 eV

CHROMATOGRAM
Retention time: 12.1
Limit of detection: 400 pg (LC-SIM), 5-20 ng (MS-scan), 2 ng (UV)

OTHER SUBSTANCES
Extracted: sulfachloropyridazine, sulfadiazine, sulfamerazine, sulfamethazine, sulfamethizole, sulfanilamide, sulfapyridine, sulfathiazole
Interfering: sulfaquinoxaline (distinguish by MS)

SAMPLE
Matrix: milk
Sample preparation: Sonicate (Branson Model 200 ultrasonic cell disruptor with a microtip probe) 50 mL milk for 2 min, cool to room temperature. Remove a 5 mL aliquot and add it to 25 mL dichloromethane:chloroform 75:25, invert 20 times, vortex horizontally at high speed for 15 s, centrifuge at 3300 g at 10° for 10 min. Remove 10 mL of the organic layer and evaporate it to just dryness under a stream of nitrogen at 32°, reconstitute the residue in 5 mL hexane, vortex for 30 s, add 1 mL 100 mM KH_2PO_4, shake briefly by hand, shake mechanically horizontally for 15 min, inject a 200 μL aliquot of the lower aqueous layer.

HPLC VARIABLES
Guard column: 50 mm long LC-18-DB (Supelco)
Column: 300 × 4.6 LC-18-DB (Supelco)
Mobile phase: MeOH:100 mM KH_2PO_4 40:60
Column temperature: 35
Flow rate: 1
Injection volume: 200
Detector: UV 269

SAMPLE

Matrix: tissue

Sample preparation: Condition a 500 mg Chromabond SA cation-exchange SPE cartridge (Macherey-Nagel) with 6 mL hexane, dry under vacuum for 10 min, condition with 6 mL dichloromethane:acetone:acetic acid 50:50:2, do not allow to go dry. Homogenize (Polytron) 10 g sample with 60 mL dichloromethane:acetone 50:50 for 30 s, rinse the apparatus with 2-3 mL dichloromethane:acetone 50:50, centrifuge the mixture at 2500 rpm for 10 min. Filter (cotton wool) the supernatant and wash it through with a little dichloromethane:acetone 50:50, add 5 mL acetic acid to the filtrate, mix, remove one tenth of this mixture and add it to the SPE cartridge at 2 mL/min, do not allow the SPE cartridge to run dry, wash with 5 mL water, wash with 5 mL MeOH, dry under vacuum for 10 min, pass gaseous ammonia through the SPE cartridge until the acid is neutralized (when air is passed through the cartridge moist pH paper should turn blue), elute with 3 mL MeOH at 1-2 mL/min, carefully evaporate to dryness under reduced pressure (100 mbar) at 40°, reconstitute with 500 μL initial mobile phase, centrifuge, inject a 50 μL aliquot of the supernatant.

HPLC VARIABLES

Column: 125 × 4 5 μm LiChrospher 100 RP-18

Mobile phase: Gradient. A was MeCN:20 mM pH 5 sodium acetate buffer 5.5:94.5. B was MeCN:EtOH:20 mM pH 5 sodium acetate buffer 50:10:40. A:B from 100:0 to 0:100 over 32 min (concave gradient), return to initial conditions over 4 min, re-equilibrate at initial conditions for 10 min.

Flow rate: 0.8

Injection volume: 50

Detector: UV 270, F ex 395 em 495 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.3 mL/min and this mixture flowed through a 2.3 m × 0.5 mm ID coil in a cooled ultrasonic bath to the detector. (Prepare reagent by dissolving 25 mg fluorescamine in 25 mL MeCN and adding 75 mL buffer and 200 μL mercaptoethanol. Buffer was 20 mM NaH_2PO_4 adjusted to pH 3 with 1 M phosphoric acid.)

CHROMATOGRAM
Retention time: 28
Limit of detection: 0.5-5 ppb

OTHER SUBSTANCES
Extracted: sulfachlorpyridazine, sulfadiazine, sulfadoxine, sulfaguanidine, sulfamerazine, sulfamethazine (sulfadimidine), sulfamethizole, sulfamethoxypyridazine, sulfanilamide, sulfapyridine, sulfathiazole

SAMPLE
Matrix: tissue
Sample preparation: Blend 3 g meat with 30 mL chloroform for 2 min in a Polytron homogenizer, shake for 10 min, centrifuge at 1600 g for 5 min, filter (5A filter paper). Add 5 mL filtrate to 1 mL 3 M HCl, shake for 10 min, centrifuge at 1600 g for 5 min. 250 μL Aqueous layer + 250 μL 3.5 M sodium acetate solution, vortex, add 100 μL 0.2% fluorescamine in acetone, vortex, let stand for 20 min at room temperature, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Chemcosorb 5-ODS-H
Mobile phase: MeCN:2% acetic acid 5:3
Column temperature: 55
Flow rate: 1
Injection volume: 10
Detector: F ex 405 em 495

CHROMATOGRAM
Retention time: 14.5
Limit of detection: 0.005 ng/g

OTHER SUBSTANCES
Simultaneous: sulfisomidine, sulfamethoxazole, sulfamerazine, sulfadiazine, sulfamonomethoxine, sulfamethazine (sulfadimidine), sulfaquinoxaline

KEY WORDS

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Polytron) 10 g ground tissue with 40 mL acetone, centrifuge at 2800 g for 5 min, filter (paper) the supernatant. Homogenize (Polytron) the residue with 20 mL acetone for 1 min, centrifuge, filter. Combine the filtrates and add 60 mL 125 mM HCl, wash twice with 50 mL portions of n-hexane, add 10 mL 1 M pH 5.2 acetate buffer, adjust pH to 5.0-5.1 with 5 M NaOH, extract with 60 ml and 40 mL portions of ethyl acetate, combine the organic layers, evaporate to about 2 mL under reduced pressure at 45°C, add about 15 mL EtOH, evaporate to dryness under reduced pressure at 50°, reconstitute immediately with 5-7 mL dichloromethane. Add to an 85 mm long column of silica gel made up in dichloromethane, rinse the flask twice with 1-2 mL portions of dichloromethane, add the rinses to the column, elute with 40 mL acetone:dichloromethane (60:40), elute to waste until the acetone front (visible against a dark background) is about 10 mm from the end of the column, collect the remaining eluate (Mitt. Gebiete. Lebensm. Hyg. 1990, 81, 522). Add 150 μL 10 μg/mL sulfabenzamide to the eluate, evaporate to dryness under reduced pressure at 45°, reconstitute the residue in 300 μL MeOH:water 50:50, filter (0.45 μm), inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 4 × 4 LiChrospher 5 μm 100 RP-18
Column: 250 × 4 5 μm Spherisorb ODS2
Mobile phase: MeCN:buffer 20:80 (Prepare buffer by dissolving 3.85 g ammonium acetate in 950 mL water, ad just pH to 4.00 with acetic acid, make up to 1 L with water.)
Column temperature: 35
Flow rate: 1
Injection volume: 20
Detector: UV 550 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.2 mL/min and the mixture flowed through a 25 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 20 mg/mL ammonium sulfamate in water pumped at 0.2 mL/min and this mixture flowed through an ice-cooled 200 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 4 mg/mL N-(1-naphthyl)ethylenediamine hydrochloride in water pumped at 0.2 mL/min and this mixture flowed through a 60 cm × 0.33 mm ID coil to the detector. (Reagent was 800 mg sodium nitrite dissolved in 150 mL water and 50 mL concentrated HCl.)

CHROMATOGRAM
Retention time: 15.5
Internal standard: sulfabenzamide (8.8)
Limit of detection: 2 ppb

OTHER SUBSTANCES
Extracted: sulfacetamide, sulfachloropyridazine, sulfadiazine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfamethoxypyridazine, sulfanilamide, sulfapyridine, sulfaquinoxaline, sulfathiazole

KEY WORDS
post-column reaction; muscle; liver; kidney; SPE

SAMPLE
Matrix: tissue
Sample preparation: Condition a 3 mL 500 mg Sep-Pak SPE cartridge with 20 mL MeOH and 20 mL water. 5 g Homogenized tissue + 40 μL 20 μg/mL sulfaethoxypyridazine in water + 25 mL chloroform, shake mechanically for 2 min, centrifuge at 3000 g for 5 min, remove the supernatant and separate the layers. Add the aqueous layer to the residue and repeat the extraction. Combine the chloroform layers and add 10 mL 10% NaCl in 100 mM NaOH, shake vigorously for 1 min, remove the upper aqueous layer and centrifuge it at 1500 g for 10 min. Remove 8 mL of the upper aqueous layer and add it to 10 mL 1 M pH 6 NaH_2PO_4, vortex for 20 s, add to the SPE cartridge, wash with 20 mL water, elute with 1 mL MeCN. Evaporate the eluate to dryness under a stream of nitrogen at 50°, reconstitute in 2 mL mobile phase, vortex for 20 s, heat at 50° for 5 min, cool, filter (Gelman Acrodisc 0.45 μm), inject a 20-50 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Spherisorb C18 ODS
Mobile phase: MeCN:10 mM pH 4.6 ammonium acetate 28:72
Flow rate: 1.2
Injection volume: 20-50
Detector: UV 265 or MS, VG TRIO 2 quadrupole, ion source 189°, capillary jet 320

CHROMATOGRAM
Retention time: 23.0
Internal standard: sulfaethoxypyridazine (12.8)
Limit of detection: 10 ng/g

OTHER SUBSTANCES
Extracted: sulfachloropyridazine, sulfadiazine, sulfadoxine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfamethoxypyridazine, sulfathiazole

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Ultra-Turrax T-25 with S25N dispersing tool) 10 g chopped fish and 10 mL mobile phase A at high speed for 30 s, add 90 mL MeCN, shake at low speed on shaker, centrifuge at 1500 rpm for 10 min, remove the supernatant, add 30 mL MeCN to the solid, shake, centrifuge, decant the supernatant. Combine the supernatants, add 100 mL water, add 2 mL diethylene glycol, add 60 mL dichloromethane, shake for 3 min, remove the organic layer, repeat the extraction with 40 mL dichloromethane. Combine the organic layers and evaporate in a rotary evaporator at 65° to ca. 2 mL, wash into a smaller tube with two 2 mL portions of MeOH, concentrate to about 1 mL with a stream of nitrogen at 65°, dilute to 4.5 mL with 200 mM phosphoric acid, add 5 mL hexane, vortex, centrifuge for 15 min, discard upper hexane layer. Dilute the lower aqueous layer to 5 mL with 200 mM phosphoric acid, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: C18
Column: 150 × 4.6 3.5 μm Symmetry C18 (Waters)
Mobile phase: Gradient. A was MeCN:MeOH:2% acetic acid in water 5:10:85. B was MeCN:MeOH:2% acetic acid in water 25:10:65. A:B from 100:0 to 0:100 over 25 min, maintain at 0:100 for 5 min.
Flow rate: 1
Injection volume: 20
Detector: F ex 400 em 495 following post-column reaction. The column effluent mixed with 500 μg/mL fluorescamine in MeCN:MeOH:2% acetic acid 52.5:5:42.5 pumped at 0.2 mL/min and the mixture flowed through a 10.7 m × 0.4 mm i.d. coil of PTFE tubing at 70° to the detector.

CHROMATOGRAM
Retention time: 23.5
Limit of quantitation: 1 ng/g

SAMPLE
Matrix: solutions
Sample preparation: Prepare a solution in mobile phase, inject a 25 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Zorbax-Sil
Mobile phase: Dichloromethane:MeOH:1 M perchloric acid 100:9:0.4
Flow rate: 0.8
Injection volume: 25
Detector: UV 254

CHROMATOGRAM
Retention time: 7.4

OTHER SUBSTANCES
Simultaneous: amodiaquine, chloroquine, dapsone, desethylchloroquine, dihydroquinidine, dihydroquinine, primaquine, proguanil, pyrimethamine, quinidine, quinine, sulfalene, sulfamethoxazole
Interfering: mefloquine

KEY WORDS
normal phase

SAMPLE
Matrix: solutions
Sample preparation: Prepare a solution in mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Nucleosil 5C18
Mobile phase: MeCN:10 mM pH 5.6 phosphate buffer 8:92
Flow rate: 1
Injection volume: 20
Detector: UV 270

CHROMATOGRAM
Retention time: 56.0

OTHER SUBSTANCES
Simultaneous: N-acetylsulfisomidine, sulfachloropyridazine, sulfadimethoxine, sulfamethazine (sulfadimidine), sulfamethoxypyridazine, sulfamonomethoxine, sulfisomidine, sulfisoxazole

REFERENCE

SAMPLE
Matrix: tissue
Sample preparation: Condition a 500 mg Chromabond SA cation-exchange SPE cartridge (Macherey-Nagel) with 6 mL hexane, dry under vacuum for 10 min, condition with 6 mL dichloromethane:acetone:acetic acid 50:50:2, do not allot to go dry. Homogenize (Polytron) 10 g sample with 60 mL dichloromethane:acetone 50:50 for 30 s, rinse the apparatus with 2-3 mL dichloromethane:acetone 50:50, centrifuge the mixture at 2500 rpm for 10 min. Filter (cotton wool) the supernatant and wash it through with a little dichloromethane:acetone 50:50, add 5 mL acetic acid to the filtrate, mix, remove one tenth of this mixture and add it to the SPE cartridge at 2 mL/min, do not allow the SPE cartridge to run dry, wash with 5 mL water, wash with 5 mL MeOH, dry under vacuum for 10 min, pass gaseous ammonia through the SPE cartridge until the acid is neutralized (when air is passed through the cartridge moist pH paper should turn blue), elute with 3 mL MeOH at 1-2 mL/min, carefully evaporate to dryness under reduced pressure (100 mbar) at 40°, reconstitute with 500 µL initial mobile phase, centrifuge, inject a 50 µL aliquot of the supernatant.

HPLC VARIABLES
Column: 125 × 4 5 µm LiChrospher 100 RP-18
Mobile phase: Gradient. A was MeCN:20 mM pH 5 sodium acetate buffer 5.5:94.5. B was MeCN:EtOH:20 mM pH 5 sodium acetate buffer 50:10:40. A:B from 100:0 to 0:100 over 32 min (concave gradient), return to initial conditions over 4 min, re-equilibrate at initial conditions for 10 min.
Flow rate: 0.8
Injection volume: 50
Detector: UV 270, F ex 395 em 495 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.3 mL/min and this mixture flowed through a 2.3 m × 0.5 mm ID coil in a cooled ultrasonic bath to the detector. (Prepare reagent by dissolving 25 mg fluorescamine in 25 mL MeCN and adding 75 mL buffer and 200 µL mercaptoethanol. Buffer was 20 mM NaH_2PO_4 adjusted to pH 3 with 1 M phosphoric acid.)

CHROMATOGRAM
Retention time: 24
Limit of detection: 0.5-5 ppb

OTHER SUBSTANCES
Extracted: sulfachlorpyridazine, sulfadiazine, sulfadimethoxine, sulfaguanidine, sulfamerazine, sulfamethazine (sulfadimidine), sulfamethizole, sulfamethoxypyridazine, sulfanilamide, sulfapyridine, sulfathiazole

KEY WORDS
post-column reaction; muscle; kidney; SPE

SAMPLE
Matrix: tissue
Sample preparation: Condition a 3 mL 500 mg Sep-Pak SPE cartridge with 20 mL MeOH and 20 mL water. 5 g Homogenized tissue + 40 µL 20 µg/mL sulfaethoxypyridazine in water + 25 mL chloroform, shake mechanically for 2 min, centrifuge at 3000 g for 5 min, remove the supernatant and separate the layers. Add the aqueous layer to the residue and repeat the extraction. Combine the chloroform layers and add 10 mL 10% NaCl in 100 mM NaOH, shake vigorously for 1 min, remove the upper aqueous layer and centrifuge it at 1500 g for 10 min.

Remove 8 mL of the upper aqueous layer and add it to 10 mL 1 M pH 6 NaH_2PO_4, vortex for 20 s, add to the SPE cartridge, wash with 20 mL water, elute with 1 mL MeCN. Evaporate the eluate to dryness under a stream of nitrogen at 50°, reconstitute in 2 mL mobile phase, vortex for 20 s, heat at 50° for 5 min, cool, filter (Gelman Acrodisc 0.45 μm), inject a 20-50 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Spherisorb C18 ODS
Mobile phase: MeCN:10 mM pH 4.6 ammonium acetate 28:72
Flow rate: 1.2
Injection volume: 20-50
Detector: UV 265 or MS, VG TRIO 2 quadrupole, ion source 189°, capillary jet 320

CHROMATOGRAM

Retention time: 10.4
Internal standard: sulfaethoxypyridazine (12.8)

OTHER SUBSTANCES

Extracted: sulfachloropyridazine, sulfadiazine, sulfadimethoxine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfamethoxypyridazine, sulfathiazole

KEY WORDS

cow; pig; muscle; liver; SPE

SAMPLE

Matrix: tissue
Sample preparation: Homogenize (Ultra-Turrax T-25 with S25N dispersing tool) 10 g chopped fish and 10 mL mobile phase A at high speed for 30 s, add 90 mL MeCN, shake at low speed on shaker, centrifuge at 1500 rpm for 10 min, remove the supernatant, add 30 mL MeCN to the solid, shake, centrifuge, decant the supernatant. Combine the supernatants, add 100 mL water, add 2 mL diethylene glycol, add 60 mL dichloromethane, shake for 3 min, remove the organic layer, repeat the extraction with 40 mL dichloromethane. Combine the organic layers and evaporate in a rotary evaporator at 65° to ca. 2 mL, wash into a smaller tube with two 2 mL portions of MeOH, concentrate to about 1 mL with a stream of nitrogen at 65°, dilute to 4.5 mL with 200 mM phosphoric acid, add 5 mL hexane, vortex, centrifuge for 15 min, discard upper hexane layer. Dilute the lower aqueous layer to 5 mL with 200 mM phosphoric acid, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: C18
Column: 150 × 4.6 3.5 μm Symmetry C18 (Waters)
Mobile phase: Gradient. A was MeCN:MeOH:2% acetic acid in water 5:10:85. B was MeCN:MeOH:2% acetic acid in water 25:10:65. A:B from 100:0 to 0:100 over 25 min, maintain at 0:100 for 5 min.
Flow rate: 1
Injection volume: 20
Detector: F ex 400 em 495 following post-column reaction. The column effluent mixed with 500 μg/mL fluorescamine in MeCN:MeOH:2% acetic acid 52.5:5:42.5 pumped at 0.2 mL/min and the mixture flowed through a 10.7 m × 0.4 mm i.d. coil of PTFE tubing at 70° to the detector.

CHROMATOGRAM

Retention time: 15
Limit of quantitation: 1 ng/g

OTHER SUBSTANCES

Extracted: sulfachloropyridazine, sulfadiazine, sulfadimethoxine, sulfamerazine, sulfamethazine, sulfamethizole, sulfamethoxazole, sulfamethoxypyridazine, sulfamonomethoxine, sulfanilamide, sulfapyridine, sulfaquinoxaline, sulfathiazole

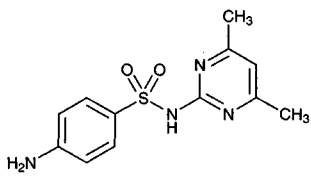
Sulfamethazine



Molecular formula: $C_{12}H_{14}N_4O_2S$
Molecular weight: 278.33
CAS Registry No.: 57-68-1
Merck Index: 9083
Lednicer No.: 1 125

SAMPLE

Matrix: blood
Sample preparation: 500 μL Plasma + 150 μL 3% trichloroacetic acid in EtOH + 100 μL EtOH, vortex, freeze at -20° for 5 min, centrifuge, freeze at -20° for 10 min, centrifuge through a Spin-X filter tube, inject a 10 μL aliquot of the supernatant.

HPLC VARIABLES

Guard column: 20 × 4.6 5 μm Supelcosil LC-18 DB
Column: 250 × 4.6 5 μm Supelcosil LC-18 DB
Mobile phase: MeCN:buffer 23:77 with 0.1% triethylamine added (Buffer was 25 mM sodium phosphate and 20 mM sodium 1-hexanesulfonate, pH adjusted to 2.8 with 5 M phosphoric acid.)
Flow rate: 0.9
Injection volume: 10
Detector: UV 270

CHROMATOGRAM

Retention time: 8
Internal standard: sulfamethazine (sulfadimidine)

OTHER SUBSTANCES
Simultaneous: sulfadiazine, trimethoprim

KEY WORDS
plasma; fish; salmon; trout; sulfamethazine is IS

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: Condition a 100 mg Bond Elut 40 μm C18 SPE cartridge with 2 mL MeOH and 2 mL pH 7.4 phosphate buffer. Add 1 mL plasma to the SPE cartridge, wash with 2 mL pH 7.4 phosphate buffer, elute with 250 μL MeOH, add 750 μL pH 6.4 phosphate buffer to the eluate, mix, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 4 × 4 5 μm Lichrospher RP18
Column: 125 × 4 5 μm Lichrospher RP18
Mobile phase: MeOH:50 mM pH 6.4 phosphate buffer 25:75
Column temperature: 35
Flow rate: 0.9
Injection volume: 20
Detector: UV 262, UV 292

CHROMATOGRAM
Retention time: 4.5
Limit of detection: 1.1 μg/mL
Limit of quantitation: 3.7 μg/mL

OTHER SUBSTANCES
Extracted: metabolites, acetylsulfamethazine

KEY WORDS
plasma; sheep; SPE; pharmacokinetics

SAMPLE
Matrix: blood, culture media, microsomal incubations, urine
Sample preparation: Plasma, urine, culture medium. 0.3 (Plasma, urine) or 2.5 (culture medium) mL sample + 1 mL 500 mM pH 4.5 acetate buffer + 20 mg limpet acetone powder (from Patella vulgata, Sigma), heat at 37° for 3 h, add 60 μL 4 M NaOH, add 1 mL 500 mM pH 6.0 phosphate buffer, add 200 μL 90 μg/mL sulfadimethoxine in MeOH:water 15:85, saturate with solid anhydrous ammonium sulfate, add 4 mL diethyl ether:dichloromethane:isopropanol 60:40:0.5, extract, centrifuge at 500 g for 10 min, repeat the extraction with 3 mL diethyl ether:dichloromethane:isopropanol 60:40:0.5. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 1 (urine) or 0.2 (plasma) mL mobile phase, inject a 20 μL aliquot. Microsomal incubations. Microsomal incubation + 1 mL 500 mM pH 6.0 phosphate buffer + 200 μL 90 μg/mL sulfadimethoxine in MeOH:water 15:85, saturate with solid anhydrous ammonium sulfate, add 4 mL diethyl ether:dichloromethane:isopropanol 60:40:0.5, extract, centrifuge at 500 g for 10 min, repeat the extraction with 3 mL diethyl ether:dichloromethane:isopropanol 60:40:0.5. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 1 (urine) or 0.2 (plasma) mL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 10 × 4 5 μm Hypersil ODS RP-C18
Column: 100 × 4 5 μm Hypersil ODS RP-C18
Mobile phase: MeOH:50 mM pH 6.67 phosphate buffer 10:90
Flow rate: 0.8
Injection volume: 20
Detector: UV 265

CHROMATOGRAM
Retention time: 16.5
Internal standard: sulfadimethoxine (28)
Limit of detection: 50 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
plasma; goat; rat

SAMPLE
Matrix: blood, eggs
Sample preparation: 1 mL Serum or 1 g homogenized egg + 4 mL MeCN, vortex, centrifuge at 3000 rpm for 15 min. Remove the supernatant and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 50 μL water, mix vigorously, add 1 mL MeCN, centrifuge at 3000 rpm for 15 min. Remove the upper layer and evaporate it to dryness, reconstitute the residue in 1 mL 0.01% trichloroacetic acid, centrifuge at 3000 rpm for 15 min. Remove a 500 μL aliquot and add it to 100 μL 1 mg/mL fluorescamine in MeCN (freshly prepared), shake, let stand for 1 min, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 10 μm Nova-Pak C18
Mobile phase: MeCN:10 mM KH_2PO_4 30:70
Flow rate: 1
Injection volume: 50
Detector: chemiluminescence following post-column reaction. The column effluent was mixed with reagent pumped at 0.5 mL/min and the mixture flowed to the detector. (Reagent was 1 mM bis[2-(3,6,9-trioxadecanyloxycarbonyl)-4-nitrophenyl] oxalate (Wako) and 300 mM hydrogen peroxide in MeCN.)

SAMPLE
Matrix: blood, urine, tissue
Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 5 mL dichloromethane and dry for 15 min under a gentle stream of nitrogen. Mix 5 g minced tissue or 0.5-2 mL plasma

or 0.2-1 mL urine (adjusted to pH 6.5-7.0 with 250 mM acetic acid) with 20 mL dichloromethane, vortex for 30 s, centrifuge at 2000 g for 10 min. Filter the supernatant, dry over glass wool and anhydrous sodium sulfate, weigh the filtered extract. Add the sample to the SPE cartridge, elute with 6 mL 50 mM pH 10 phosphate buffer, collect the first 4 mL eluate, weigh, mix, inject a 100 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 3 30 μm Perisorb C8 (Chrompack)
Column: 200 × 3 5 μm Chromspher C18
Mobile phase: MeCN:pH 5.3 ammonium acetate buffer 22:78
Flow rate: 0.5
Injection volume: 100
Detector: UV 261

CHROMATOGRAM

Limit of detection: 10 ng/g (tissue), 50 ng/mL (urine, plasma)

OTHER SUBSTANCES

Extracted: metabolites

SAMPLE

Matrix: bulk, solutions, tissue

Sample preparation: Oil. Mix 200 μL oil with 100 μL 10 ng/mL sulphamerazine and dilute with 2 mL hexane. Extract with 1 mL 10 mM hydrochloric acid. Mix 200 μL acid layer with 100 μL MeCN, inject a 25 μL aliquot. Solutions. Directly inject an aliquot, use fluorescence or UV detection. Tissue. A. 5 g Tissue + IS + 25 mL 5% acetic acid in ethyl acetate, homogenize for 1 min, centrifuge at 3000 rpm for 5 min. Repeat this procedure. Decant supernatant onto NH2 and SCX SPE cartridges in series. Discard NH2 cartridge. Wash SCX cartridge with 5 mL water, wash with 10 mL acetone, wash with 10 mL MeCN. Elute with 10 mL MeOH:ammonia 50:50. Blow-down extract to dryness, add 2 mL 10 mM hydrochloric acid. Add 100 μL 2 mg/mL fluorescamine to a 200 μL aliquot, mix well and wait for 20 min. Inject a 10 μL aliquot, use fluorescence detection. B. Homogenize tissue in dichloromethane, dry with sodium sulfate, centrifuge at 1600 rcf for 5 min. Mix supernatant with hexane, add to an activated silica SPE cartridge. Dry SPE cartridge with nitrogen, elute with MeOH. Evaporate MeOH and reconstitute with 1 mL pH 6.5 mobile phase. Inject an aliquot, use UV detection.

HPLC VARIABLES

Column: 100 × 5 4 μm NovaPak C18

Mobile phase: MeCN:buffer 20:80 (Buffer was 77 mg ammonium acetate in 800 mL water)

Flow rate: 1

Injection volume: 25

Detector: F ex 405 em 495, UV 270

CHROMATOGRAM

Retention time: 6.8

Internal standard: sulphamerazine

OTHER SUBSTANCES

Extracted: metabolites

SAMPLE

Matrix: eggs, milk, tissue

Sample preparation: Milk. Centrifuge at 2000 g and freeze at -20° to remove the cream. Mix a 5 mL aliquot with 5 mL saline solution and add 1 mL 1% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Meat. Blend 10 g homogenized meat with 20 mL saline, centrifuge, remove a 10 mL aliquot of the clear upper phase and add it to 1 mL 1% sodium azide (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Eggs. Dilute 10 g homogenized whole egg with 10 mL saline, add 3 mL 10% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B.

HPLC VARIABLES

Column: A 60 × 4 50-100 μm XAD-4 (Rohm & Haas); B 250 × 4.6 7 μm Cp TM-Spher C18 (Chrompack)
Mobile phase: MeCN:50 mM pH 6.85 sodium acetate buffer 12.5:87.5
Detector: UV 450 following post-column reaction. The column effluent mixed with 1.5% p-dimethylaminobenzaldehyde in 17% phosphoric acid and the mixture flowed through a 7.5 m × 0.5 mm ID knitted PTFE coil to the detector.

CHROMATOGRAM

Retention time: k' 6.3
Limit of detection: 5-10 ng/g

OTHER SUBSTANCES

Extracted: dapsone, sulfacetamide, sulfachlorpyrazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfaguanidine, sulfamerazine, sulfamethoxazole, sulfanilamide, sulfaquinoxaline, sulfathiazole, sulfatroxazole
Noninterfering: chloramphenicol, trimethoprim

KEY WORDS

post-column reaction; meat; column-switching; dialysis

SAMPLE

Matrix: feed
Sample preparation: Blend 10-100 g feed with 200 mL chloroform:MeOH 75:25 for 3 min, filter through 25 mm Celite 545, re-extract residue with 200 mL chloroform:MeOH 75:25, add 50 mL chloroform:MeOH 75:25 to the residue, filter this mixture, wash the filter cake with several small portions of chloroform:MeOH 75:25. Evaporate the filtrate on a steam bath with a current of air to about 100 mL. Shake the organic layer with 50 mL 10% NaCl in 100 mM NaOH for 1 min, wash the aqueous phase with two or three 50 mL portions of chloroform (until wash is colorless), add 10 mL 1 M KH_2PO_4 solution to the aqueous phase, extract with three 50 mL portions of chloroform. Combine the extracts and filter them through a 25 mm layer of sodium sulfate, evaporate most of the filtrate on a steam bath with a current of air, evaporate the remainder with a current of air. Take up the residue in 100 mL MeOH, remove a 20 mL aliquot, evaporate most on a steam bath with a current of air, evaporate the remainder with a current of air, dissolve the residue in 100 μL MeOH, make up to 10 mL with MeCN:water 25:75, filter (0.45μm), inject a 20 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:buffer 25:75 (Buffer was 0.5% acetic acid and 0.05% sodium 1-octanesulfonate.)
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 5.5

OTHER SUBSTANCES

Simultaneous: carbadox

SAMPLE
Matrix: feed, premix
Sample preparation: Shake premix or ground feed with 150 mM HCl in MeOH:water 25:75 for 1 h, dilute with 150 mM HCl in MeOH:water 25:75 to achieve a sulfonamide concentration of 5.5 μg/mL, filter (glass fiber), inject an aliquot.

HPLC VARIABLES
Guard column: 50 × 2 30-40 μm Perisorb RP-18
Column: 250 × 4.6 10 μm Partisil ODS-3
Mobile phase: MeOH:2% acetic acid 35:65
Flow rate: 1
Injection volume: 200
Detector: UV 450 following post-column reaction. The column effluent mixed with reagent pumped at 0.5 mL/min and the mixture flowed through a 3 m × 0.5 mm ID coil of PTFE tubing to the detector. (Prepare reagent by dissolving 3 g dimethylaminobenzaldehyde in 100 mL glacial acetic acid, add 60 mL MeOH, add 40 mL water, mix well.)

CHROMATOGRAM
Retention time: 6
Limit of quantitation: 1.65 μg/mL

KEY WORDS
post-column reaction

SAMPLE
Matrix: formulations
Sample preparation: 1 mL Suspension + 100 mL MeOH:water 60:40, shake mechanically for 15 min, make up to 200 mL with MeOH:water 60:40, filter (0.45 μm silver membrane, Selas Corp.). Evaporate a 1 mL aliquot of the filtrate to dryness under a stream of nitrogen, reconstitute with 1 mL 200 μg/mL acetanilide in MeCN, inject a 4 μL aliquot.

HPLC VARIABLES
Column: 300 × 4 10 μm μBondapak C18
Mobile phase: MeCN:water 20:80
Flow rate: 1
Injection volume: 4
Detector: UV 254

CHROMATOGRAM
Retention time: 7.5
Internal standard: acetanilide (11)

OTHER SUBSTANCES
Simultaneous: sulfadiazine, sulfamerazine, sulfanilamide, sulfanilic acid
Noninterfering: erythromycin ethylsuccinate

KEY WORDS
oral suspensions; suspensions

REFERENCE

SAMPLE
Matrix: milk
Sample preparation: 500 μL Milk + 2 g C18 material + 10 μL MeOH + 10 μL 12.5 μg/mL sulfamerazine in MeOH, let stand for 1 min, grind with a glass pestle until homogeneous, place in a 10 mL syringe barrel plugged with filter paper, place filter paper on top, compress to 4.5 mL with a plunger, restrict column outlet with a 100 μL pipette tip, wash with 8 mL hexane, remove excess hexane with positive pressure, elute with 8 mL dichloromethane, elute excess dichloromethane with positive pressure. Evaporate the eluate under a stream of nitrogen, dissolve the residue in 100 μL MeOH and 400 μL 17 mM orthophosphoric acid, sonicate for 5-10 min, centrifuge at 13600 g for 5 min, filter supernatant (0.45 μm), inject a 20 μL aliquot. (C18 material was Analytichem 40 μm 18% load endcapped. Add 22 g to a 50 mL syringe barrel wash with 2 column volumes of hexane, 2 volumes of dichloromethane, and 2 volumes of MeOH, vacuum aspirate until dry.)

HPLC VARIABLES
Column: 75 × 4 3 μm Supelcosil LC-18
Mobile phase: MeCN:17 mM orthophosphoric acid 10:90
Column temperature: 45
Flow rate: 1 for 5 min then 2 for remainder of run
Injection volume: 20

Detector: UV 270

CHROMATOGRAM
Retention time: 4.5
Internal standard: sulfamerazine (3)
Limit of detection: 62.5 ng/mL

OTHER SUBSTANCES
Simultaneous: sulfamethoxazole, sulfanilamide, sulfathiazole, sulfadiazine, sulfisoxazole, sulfadimethoxine

REFERENCE

SAMPLE
Matrix: milk
Sample preparation: Wash filter paper with 5 mL chloroform:acetone 2:1, discard filtrate. Extract 10 mL milk with 50 mL chloroform:acetone 2:1 by shaking for 4 min with periodic venting, let stand for 5 min, repeat extraction with 25 mL chloroform:acetone 2:1. Filter the organic layers, wash the filter paper with two 5 mL portions of chloroform:acetone 2:1. Evaporate the filtrate just to dryness under reduced pressure at 32 ± 2°, reconstitute the residue with 1 mL 13.6 g/L KH_2PO_4, vortex for 1 min, add 5 mL hexane, vortex for 1 min, let stand for 2 min, vortex for 1 min, let stand for at least 15 min, filter (2 μm) the aqueous layer, inject a 100 μL aliquot of the filtrate

HPLC VARIABLES
Guard column: 20 mm long Supelco guard column
Column: 250 × 4.6 LC-18-DB (Supelco)
Mobile phase: MeOH:13.6 g/L KH_2PO_4 12:88
Column temperature: 35
Flow rate: 1.5
Injection volume: 100
Detector: UV 265

CHROMATOGRAM
Retention time: 26.6
Limit of detection: 1.7 ppb
Limit of quantitation: 3.6 ppb

OTHER SUBSTANCES
Extracted: sulfadiazine, sulfamerazine, sulfamethizole, sulfanilamide, sulfapyridine, sulfathiazole

KEY WORDS
cow

SAMPLE
Matrix: milk
Sample preparation: 5 mL Milk + 100 μL concentrated HCl, sonicate for 15 s, centrifuge at 3000 g for 10 min, wash the precipitate with 2 mL water, centrifuge. Combine the aqueous layers and add 5 mL hexane, mix, centrifuge at 1500 g for 1 min, repeat the hexane wash. Evaporate the aqueous layer to dryness at low pressure, reconstitute with MeOH, centrifuge, evaporate the supernatant to dryness, reconstitute the residue with 3 mL water, inject a 50-500 μL aliquot on to column A and elute to waste with mobile phase A, after 3 min elute the contents of column A on to column B with mobile phase B and start the gradient, elute with mobile phase B and monitor the effluent from column B.

HPLC VARIABLES
Column: A 30 mm long 10 μm RP-18; B 150 × 4.6 5 μm Spherisorb ODS-2
Mobile phase: A 100 mM Ammonium acetate buffer or 1% formic acid (?); B Gradient. A was 100 mM ammonium acetate buffer or 1% formic acid (?). B was MeCN:water 70:30 containing 100 mM ammonium acetate or 1% formic acid (?). A:B from 100:0 to 80:20 over 0.5 min, maintain at 80:20,for 1 min, to 25:75 over 10 min.
Flow rate: 1
Injection volume: 50-500
Detector: UV 254 or MS, Finnigan TSQ 70 triple quadrupole, Finnigan TSP source and interface, interface 80-85°, source 250°, manifold 70°, collision gas argon 0.4 mTorr, collision energy 40-50 eV

CHROMATOGRAM
Retention time: 8.5
Limit of detection: 400 pg (LC-SIM), 5-20 ng (MS-scan), 2 ng (UV)

OTHER SUBSTANCES
Extracted: sulfachloropyridazine, sulfadiazine, sulfadimethoxine, sulfamerazine, sulfanilamide, sulfapyridine, sulfaquinoxaline, sulfathiazole
Interfering: sulfamethizole (distinguish by MS)

SAMPLE

Matrix: tissue
Sample preparation: Cut 20 g tissue into small pieces and add to 25 mL dichloromethane, let stand for 20-30 min with frequent stirring with a glass rod, filter through glass wool, repeat extraction twice more. Combine the dichloromethane layers and shake with 10 mL 1.5 M sulfuric acid for 15 min. Remove the aqueous phase and add it to 10 mL dichloromethane, shake for 10 min, discard the organic phase, repeat the wash, add 1 mL 10% K_2HPO_4 to the aqueous phase, add 3 mL 40% NaOH, mix well, allow to cool, adjust pH to 5-6 with 1.5 M sulfuric acid or 40% NaOH, add 5 mL dichloromethane, extract for 15 min, repeat the extraction. Pass the organic layers through anhydrous sodium sulfate, evaporate to 1 g on a hot plate at 60-70° (in a hood!), inject a 10 μL aliquot. For confirmation of sulfamethazine add 1 mL MeOH to the extract, add 2 drops acetic anhydride, heat at 80-90° on a hot plate until acetic acid fumes are no longer seen, reconstitute with 1 g dichloromethane, inject a 10 μL aliquot.

SAMPLE
Matrix: tissue
Sample preparation: Blend (Waring blender) 10 g tissue and 150 mL chloroform:acetone 50:50 at low speed for 5 min, filter homogenate through 3-4 g Celite (previously washed with 25 mL acetone), rinse blender with acetone, add rinse to filter. Add 10 mL 1 M HCl to the filtrate and evaporate to 5-7 mL under reduced pressure at 40-45°, wash residue with 75 mL hexane. Extract hexane layer twice with 5 mL 1 M HCl. Combine all the aqueous layers and wash with 15 mL dichloromethane. Rinse apparatus with water and add the rinses to the aqueous layer, add 25 mL saturated trisodium citrate to the aqueous layer, adjust pH to 5.8-5.9 with 2 M NaOH, extract the aqueous layer four times with 15 mL portions of dichloromethane. Combine the extracts and evaporate them to dryness under reduced pressure at 40-45°, dissolve residue in 10 mL buffer, add to XAD-2 column, rinse flask three times with 15 mL portions of water, add rinses to column, rinse flask with 100 mL water, add rinse to column, rinse flask with 100 mL MeOH, add rinse to column, collect the MeOH eluate, remove residual MeOH with nitrogen pressure. Add 10 mL 1 M HCl to the eluate, evaporate to dryness under reduced pressure at 40-45°, reconstitute with 8 mL mobile phase, inject a 20 μL aliquot. (Buffer was 3.40 g KH_2PO_4 and 3.55 g Na_2HPO_4 in 1 L water, pH 6.8. Prepare XAD-2 column as follows. Wash (at 60-65 mL/min) 5 kg Amberlite XAD-2 resin in a 1200 × 110 column with water, 3 gallons acetone, 2 gallons MeOH, and 25 gallons water, remove fines by successive decantations, store in water. Prepare a 130 × 15 column of washed resin and wash with 250 mL water. Note that XAD-2 column step is not necessary for fat samples.)

SAMPLE
Matrix: tissue
Sample preparation: Condition a 500 mg Chromabond SA cation-exchange SPE cartridge (Macherey-Nagel) with 6 mL hexane, dry under vacuum for 10 min, condition with 6 mL dichloromethane:acetone:acetic acid 50:50:2, do not allot to go dry. Homogenize (Polytron) 10 g sample with 60 mL dichloromethane:acetone 50:50 for 30 s, rinse the apparatus with 2-3 mL dichloromethane:acetone 50:50, centrifuge the mixture at 2500 rpm for 10 min. Filter (cotton wool) the supernatant and wash it through with a little dichloromethane:acetone 50:50, add 5 mL acetic acid to the filtrate, mix, remove one tenth of this mixture and add it to the SPE cartridge at 2 mL/min, do not allow the SPE cartridge to run dry, wash with 5 mL water, wash with 5 mL MeOH, dry under vacuum for 10 min, pass gaseous ammonia through the SPE cartridge until the acid is neutralized (when air is passed through the cartridge moist pH paper should turn blue), elute with 3 mL MeOH at 1-2 mL/min, carefully evaporate to dryness under reduced pressure (100 mbar) at 40°, reconstitute with 500 μL initial mobile phase, centrifuge, inject a 50 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 125 × 4 5 μm LiChrospher 100 RP-18

Mobile phase: Gradient. A was MeCN:20 mM pH 5 sodium acetate buffer 5.5:94.5. B was MeCN:EtOH:20 mM pH 5 sodium acetate buffer 50:10:40. A:B from 100:0 to 0:100 over 32 min (concave gradient), return to initial conditions over 4 min, re-equilibrate at initial conditions for 10 min.
Flow rate: 0.8
Injection volume: 50
Detector: UV 270, F ex 395 em 495 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.3 mL/min and this mixture flowed through a 2.3 m × 0.5 mm ID coil in a cooled ultrasonic bath to the detector. (Prepare reagent by dissolving 25 mg fluorescamine in 25 mL MeCN and adding 75 mL buffer and 200 μL mercaptoethanol. Buffer was 20 mM NaH_2PO_4 adjusted to pH 3 with 1 M phosphoric acid.)

CHROMATOGRAM
Retention time: 20
Limit of detection: 0.5-5 ppb

OTHER SUBSTANCES
Extracted: sulfachlorpyridazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfaguanidine, sulfamerazine, sulfamethizole, sulfamethoxypyridazine, sulfanilamide, sulfapyridine, sulfathiazole

SAMPLE
Matrix: tissue

Sample preparation: Cut tissue into small pieces and homogenize in blender. 20 g Homogenized tissue + 200 μL 10 μg/mL methyl p-aminobenzoate in water + 60 mL acetone:chloroform 50:50, shake vigorously on a mechanical shaker for 10 min, centrifuge at 3000 g for 10 min, filter (Whatman No. 41 paper) supernatant, repeat extraction. Combine the extracts, if the extract is not clear centrifuge at 3000 g for 10 min and discard the aqueous layer, evaporate to an oily residue at 45° under reduced pressure, add 5 mL MeCN to flask, let stand for 10 min, remove MeCN layer, add 5 mL hexane and 5 mL MeCN, shake, centrifuge at 3000 g for 10 min, remove the MeCN layer, add 5 mL MeCN to the hexane layer, shake, centrifuge at 3000 g for 10 min, remove the MeCN layer. If hexane layer is not clear centrifuge at 3000 g for 10 min and remove the clear portion. Add 400 μL 15% trichloroacetic acid to the hexane layer, shake gently for 10 min, centrifuge at 3000 g for 10 min. Evaporate the MeCN layers, transfer the oily residue to a small flask with 3 mL hexane, add the aqueous trichloroacetic acid layer, shake gently for 10 min, centrifuge at 3000 g for 10 min. Discard the hexane layer, add 100 μL saturated aqueous sodium citrate solution to the aqueous layer, mix, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm RP 18 (Brownlee)
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: Gradient. A was 1% aqueous acetic acid. B was MeCN:water 80:20. A:B from 90:10 to 60:40 over 20 min, return to initial conditions over 5 min, re-equilibrate for 5 min.
Flow rate: 1.5
Injection volume: 50
Detector: UV 450 following post-column reaction. The column effluent mixed with the reagent pumped at 0.5 mL/min and the mixture flowed through a 7 m × 0.25 mm i.d. coil of stainless steel tubing to the detector. (Prepare reagent by dissolving 1 g p-dimethylaminobenzaldehyde in 30 mL MeCN, make up to 100 mL with 5% trichloroacetic acid in water.)

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Polytron) 10 g ground tissue with 40 mL acetone, centrifuge at 2800 g for 5 min, filter (paper) the supernatant. Homogenize (Polytron) the residue with 20 mL acetone for 1 min, centrifuge, filter. Combine the filtrates and add 60 mL 125 mM HCl, wash twice with 50 mL portions of n-hexane, add 10 mL 1 M pH 5.2 acetate buffer, adjust pH to 5.0-5.1 with 5 M NaOH, extract with 60 ml and 40 mL portions of ethyl acetate, combine the organic layers, evaporate to about 2 mL under reduced pressure at 45°C, add about 15 mL EtOH, evaporate to dryness under reduced pressure at 50°, reconstitute immediately with 5-7 mL dichloromethane. Add to an 85 mm long column of silica gel made up in dichloromethane, rinse the flask twice with 1-2 mL portions of dichloromethane, add the rinses to the column, elute with 40 mL acetone:dichloromethane (60:40), elute to waste until the acetone front (visible against a dark background) is about 10 mm from the end of the column, collect the remaining eluate (Mitt. Gebiete. Lebensm. Hyg. 1990, 81, 522). Add 150 μL 10 μg/mL sulfabenzamide to the eluate, evaporate to dryness under reduced pressure at 45°, reconstitute the residue in 300 μL MeOH:water 50:50, filter (0.45 μm), inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 4 × 4 LiChrospher 5 μm 100 RP-18
Column: 250 × 4 5 μm Spherisorb ODS2
Mobile phase: MeCN:buffer 20:80 (Prepare buffer by dissolving 3.85 g ammonium acetate in 950 mL water, ad just pH to 4.00 with acetic acid, make up to 1 L with water.)
Column temperature: 35
Flow rate: 1
Injection volume: 20
Detector: UV 550 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.2 mL/min and the mixture flowed through a 25 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 20 mg/mL ammonium sulfamate in water pumped at 0.2 mL/min and this mixture flowed through an ice-cooled 200 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 4 mg/mL N-(1-naphthyl)ethylenediamine hydrochloride in water pumped at 0.2 mL/min and this mixture flowed through a 60 cm × 0.33 mm ID coil to the detector. (Reagent was 800 mg sodium nitrite dissolved in 150 mL water and 50 mL concentrated HCl.)

SAMPLE

Matrix: milk

Sample preparation: 5 mL Milk + 100 μL concentrated HCl, sonicate for 15 s, centrifuge at 3000 g for 10 min, wash the precipitate with 2 mL water, centrifuge. Combine the aqueous layers and add 5 mL hexane, mix, centrifuge at 1500 g for 1 min, repeat the hexane wash. Evaporate the aqueous layer to dryness at low pressure, reconstitute with MeOH, centrifuge, evaporate the supernatant to dryness, reconstitute the residue with 3 mL water, inject a 50-500 μL aliquot on to column A and elute to waste with mobile phase A, after 3 min elute the contents of column A on to column B with mobile phase B and start the gradient, elute with mobile phase B and monitor the effluent from column B.

HPLC VARIABLES

Column: A 30 mm long 10 μm RP-18; B 150 × 4.6 5 μm Spherisorb ODS-2

Mobile phase: A 100 mM Ammonium acetate buffer or 1% formic acid (?); B Gradient. A was 100 mM ammonium acetate buffer or 1% formic acid (?). B was MeCN:water 70:30 containing 100 mM ammonium acetate or 1% formic acid (?). A:B from 100:0 to 80:20 over 0.5 min, maintain at 80:20,for 1 min, to 25:75 over 10 min.

Flow rate: 1

Injection volume: 50-500

Detector: UV 254 or MS, Finnigan TSQ 70 triple quadrupole, Finnigan TSP source and interface, interface 80-85°, source 250°, manifold 70°, collision gas argon 0.4 mTorr, collision energy 40-50 eV

CHROMATOGRAM

Retention time: 8.4

Limit of detection: 400 pg (LC-SIM), 5-20 ng (MS-scan), 2 ng (UV)

OTHER SUBSTANCES

Extracted: sulfachloropyridazine, sulfadiazine, sulfadimethoxine, sulfamerazine, sulfanilamide, sulfapyridine, sulfaquinoxaline, sulfathiazole

Interfering: sulfamethazine (distinguish by MS)

KEY WORDS

cow; column-switching

SAMPLE

Matrix: solutions

Sample preparation: Inject an aliquot of a solution in MeOH.

HPLC VARIABLES

Column: 300 × 3.9 μBondapak C18

Mobile phase: MeCN:water:acetic acid 12.5:86.5:1

Flow rate: 1.6

Injection volume: 10

Detector: UV 254

CHROMATOGRAM

Retention time: 9.5

OTHER SUBSTANCES

Simultaneous: sulfabenzamide, sulfacetamide, sulfachlorpyridazine, sulfadiazine, sulfadimethoxine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfanilamide, sulfapyridine, sulfisoxazole

SAMPLE

Matrix: tissue

Sample preparation: Condition a 500 mg Chromabond SA cation-exchange SPE cartridge (Macherey-Nagel) with 6 mL hexane, dry under vacuum for 10 min, condition with 6 mL dichloromethane:acetone:acetic acid 50:50:2, do not allot to go dry. Homogenize (Polytron) 10 g sample with 60 mL dichloromethane:acetone 50:50 for 30 s, rinse the apparatus with 2-3 mL dichloromethane:acetone 50:50, centrifuge the mixture at 2500 rpm for 10 min. Filter (cotton wool) the supernatant and wash it through with a little dichloromethane:acetone 50:50, add 5 mL acetic acid to the filtrate, mix, remove one tenth of this mixture and add it to the SPE cartridge at 2 mL/min, do not allow the SPE cartridge to run dry, wash with 5 mL water, wash with 5 mL MeOH, dry under vacuum for 10 min, pass gaseous ammonia through the SPE cartridge until the acid is neutralized (when air is passed through the cartridge moist pH paper should turn blue), elute with 3 mL MeOH at 1-2 mL/min, carefully evaporate to dryness under reduced pressure (100 mbar) at 40°, reconstitute with 500 µL initial mobile phase, centrifuge, inject a 50 µL aliquot of the supernatant.

HPLC VARIABLES

Column: 125 × 4 5 µm LiChrospher 100 RP-18

Mobile phase: Gradient. A was MeCN:20 mM pH 5 sodium acetate buffer 5.5:94.5. B was MeCN:EtOH:20 mM pH 5 sodium acetate buffer 50:10:40. A:B from 100:0 to 0:100 over 32 min (concave gradient), return to initial conditions over 4 min, re-equilibrate at initial conditions for 10 min.

Flow rate: 0.8

Injection volume: 50

Detector: UV 270, F ex 395 em 495 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.3 mL/min and this mixture flowed through a 2.3 m × 0.5 mm ID coil in a cooled ultrasonic bath to the detector. (Prepare reagent by dissolving 25 mg fluorescamine in 25 mL MeCN and adding 75 mL buffer and 200 µL mercaptoethanol. Buffer was 20 mM NaH_2PO_4 adjusted to pH 3 with 1 M phosphoric acid.)

CHROMATOGRAM

Retention time: 18

Limit of detection: 0.5-5 ppb

OTHER SUBSTANCES

Extracted: sulfachlorpyridazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfaguanidine, sulfamerazine, sulfamethazine (sulfadimidine), sulfamethoxypyridazine, sulfanilamide, sulfapyridine, sulfathiazole

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Ultra-Turrax T-25 with S25N dispersing tool) 10 g chopped fish and 10 mL mobile phase A at high speed for 30 s, add 90 mL MeCN, shake at low speed on shaker, centrifuge at 1500 rpm for 10 min, remove the supernatant, add 30 mL MeCN to the solid, shake, centrifuge, decant the supernatant. Combine the supernatants, add 100 mL water, add 2 mL diethylene glycol, add 60 mL dichloromethane, shake for 3 min, remove the organic layer, repeat the extraction with 40 mL dichloromethane. Combine the organic layers and evaporate in a rotary evaporator at 65° to ca. 2 mL, wash into a smaller tube with two 2 mL portions of MeOH, concentrate to about 1 mL with a stream of nitrogen at 65°, dilute to 4.5 mL with 200 mM phosphoric acid, add 5 mL hexane, vortex, centrifuge for 15 min, discard upper hexane layer. Dilute the lower aqueous layer to 5 mL with 200 mM phosphoric acid, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: C18
Column: 150 × 4.6 3.5 μm Symmetry C18 (Waters)
Mobile phase: Gradient. A was MeCN:MeOH:2% acetic acid in water 5:10:85. B was MeCN:MeOH:2% acetic acid in water 25:10:65. A:B from 100:0 to 0:100 over 25 min, maintain at 0:100 for 5 min.
Flow rate: 1
Injection volume: 20
Detector: F ex 400 em 495 following post-column reaction. The column effluent mixed with 500 μg/mL fluorescamine in MeCN:MeOH:2% acetic acid 52.5:5:42.5 pumped at 0.2 mL/min and the mixture flowed through a 10.7 m × 0.4 mm i.d. coil of PTFE tubing at 70° to the detector.

CHROMATOGRAM
Retention time: 10
Limit of quantitation: 1 ng/g

OTHER SUBSTANCES
Extracted: sulfachloropyridazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfamethoxypyridazine, sulfamonomethoxine, sulfanilamide, sulfapyridine, sulfaquinoxaline, sulfathiazole

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Ultra-Turrax T-25 with S25N dispersing tool) 10 g chopped fish and 10 mL mobile phase A at high speed for 30 s, add 90 mL MeCN, shake at low speed on shaker, centrifuge at 1500 rpm for 10 min, remove the supernatant, add 30 mL MeCN to the solid, shake, centrifuge, decant the supernatant. Combine the supernatants, add 100 mL water, add 2 mL diethylene glycol, add 60 mL dichloromethane, shake for 3 min, remove the organic layer, repeat the extraction with 40 mL dichloromethane. Combine the organic layers and evaporate in a rotary evaporator at 65° to ca. 2 mL, wash into a smaller tube with two 2 mL portions of MeOH, concentrate to about 1 mL with a stream of nitrogen at 65°, dilute to 4.5 mL with 200 mM phosphoric acid, add 5 mL hexane, vortex, centrifuge for 15 min, discard upper hexane layer. Dilute the lower aqueous layer to 5 mL with 200 mM phosphoric acid, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: C18
Column: 150 × 4.6 3.5 μm Symmetry C18 (Waters)
Mobile phase: Gradient. A was MeCN:MeOH:2% acetic acid in water 5:10:85. B was MeCN:MeOH:2% acetic acid in water 25:10:65. A:B from 100:0 to 0:100 over 25 min, maintain at 0:100 for 5 min.
Flow rate: 1
Injection volume: 20
Detector: F ex 400 em 495 following post-column reaction. The column effluent mixed with 500 μg/mL fluorescamine in MeCN:MeOH:2% acetic acid 52.5:5:42.5 pumped at 0.2 mL/min and the mixture flowed through a 10.7 m × 0.4 mm i.d. coil of PTFE tubing at 70° to the detector.

CHROMATOGRAM

Retention time: 16
Limit of quantitation: 1 ng/g

OTHER SUBSTANCES

Extracted: sulfachloropyridazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfamerazine, sulfamethazine, sulfamethizole, sulfamethoxypyridazine, sulfamonomethoxine, sulfanilamide, sulfapyridine, sulfaquinoxaline, sulfathiazole

SAMPLE

Matrix: water
Sample preparation: Adjust 50 mL wastewater to pH 6.6 with acetic acid, add 5 mL 1 mg/mL niacin in 0.5 mM HCl, add 50 mL ethyl acetate, shake vigorously for 5 min, let stand for 1 min, transfer the ethyl acetate layer to a flask, extract the residual aqueous layer with two 20 mL portions of ethyl acetate. Combine the organic layers and evaporate them at 90° to about 500 μL, dissolve the residue in 5 mL 10 mM HCl, make up to 50 mL with water, inject an aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Inertsil ODS-2 (Vercopak)
Mobile phase: MeOH:buffer 20:80 (Buffer was 100 mM sodium acetate adjusted to pH 6.6 with 10 mM acetic acid.)
Flow rate: 1
Injection volume: 20
Detector: UV 260

CHROMATOGRAM

Retention time: 7.7
Internal standard: niacin (3.3)

OTHER SUBSTANCES

Extracted: sulfathiazole, sulfamethazine, sulfacetamide, sulfadiazine, sulfamerazine, sulfamonomethoxine

KEY WORDS

wastewater

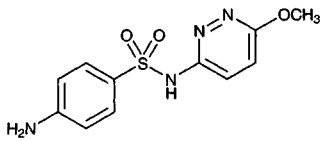
Sulfamethoxypyridazine



Molecular formula: $C_{11}H_{12}N_4O_3S$
Molecular weight: 280.31
CAS Registry No.: 80-35-3, 2577-32-4 (sodium salt)
Merck Index: 9087

SAMPLE

Matrix: milk
Sample preparation: Mix 5 mL milk with 20 μL 12 M HCl, sonicate, add 25 mL ethyl acetate, extract using a rotary shaker (REAX 2, Heidolph) for 10 min. Centrifuge at 1500 g for 5 min, evaporate 20 mL of the ethyl acetate extract to dryness, dissolve the residue in 10 mL 1 HCl. Wash the aqueous phase with 10 mL dichloromethane, adjust to pH 5.5 with 900 μL 10 M NaOH and 5 mL 1 M pH 6.0 KH_2PO_4, extract with two 10 mL portions of dichloromethane. Evaporate the organic layer to dryness, dissolve the residue in 2 mL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 150 × 3.9 5 μm Novapak C18 (Waters)
Mobile phase: MeCN:10 mM pH 6.6 ammonium acetate 10:90
Flow rate: 1
Injection volume: 50
Detector: UV 265

CHROMATOGRAM

Limit of detection: 10 ng/mL

OTHER SUBSTANCES

Also analyzed: sulfadimethoxine (UV 271), sulfadimidine, sulfadoxine (UV 271)

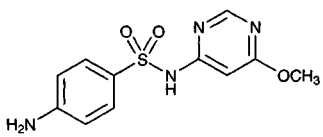
Sulfamonomethoxine



Molecular formula: $C_{11}H_{12}N_4O_3S$
Molecular weight: 280.31
CAS Registry No.: 1220-83-3

SAMPLE

Matrix: blood, tissue
Sample preparation: Blood. Filter serum through a 0.45 μm syringe filter with a cellulose acetate membrane, inject a 50 μL aliquot of the filtrate. Tissue. Add 1 mL MeCN:THF 95:5 to 1 g muscle, homogenize with a Pencil Mixer (Iuchi, Japan) for 2 min, centrifuge at 1500 g for 5 min, filter the supernatant through a syringe filter unit, inject a 20 μL aliquot of the filtrate.

HPLC VARIABLES

Guard column: 20 × 4.6 5 μL Hisep shielded hydrophobic phase precolumn (Supelco)
Column: 150 × 4.6 5 μL Hisep shielded hydrophobic phase (Supelco)
Mobile phase: MeCN:buffer 15:85 (Buffer was 50 mM citric acid:200 mM pH 2.5 Na_2HPO_4 buffer containing 10 mM tetra-*n*-butyl ammonium bromide 85:15.)

Flow rate: 1
Injection volume: 20-50
Detector: UV 265

CHROMATOGRAM
Retention time: 9.5
Limit of detection: 50 ng/mL (serum), 100 ng/mL (muscle)

OTHER SUBSTANCES
Extracted: oxolinic acid, miloxacin

KEY WORDS
fish; muscle; serum

SAMPLE
Matrix: eggs, milk, tissue
Sample preparation: Milk. Centrifuge at 2000 g and freeze at -20° to remove the cream. Mix a 5 mL aliquot with 5 mL saline solution and add 1 mL 1% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Meat. Blend 10 g homogenized meat with 20 mL saline, centrifuge, remove a 10 mL aliquot of the clear upper phase and add it to 1 mL 1% sodium azide (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Eggs. Dilute 10 g homogenized whole egg with 10 mL saline, add 3 mL 10% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column

A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B.

HPLC VARIABLES

Column: A 60 × 4 50-100 μm XAD-4 (Rohm & Haas); B 250 × 4.6 7 μm Cp TM-Spher C18 (Chrompack)

Mobile phase: MeCN:50 mM pH 6.85 sodium acetate buffer 12.5:87.5

Detector: UV 450 following post-column reaction. The column effluent mixed with 1.5% p-dimethylaminobenzaldehyde in 17% phosphoric acid and the mixture flowed through a 7.5 m × 0.5 mm ID knitted PTFE coil to the detector.

CHROMATOGRAM

Retention time: k' 1.0

Limit of detection: 5-10 ng/g

OTHER SUBSTANCES

Extracted: dapsone, sulfachlorpyrazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfaquinoxaline, sulfathiazole, sulfatroxazole

Noninterfering: chloramphenicol, trimethoprim

Interfering: sulfacetamide, sulfaguanidine

KEY WORDS

post-column reaction; meat; column-switching; dialysis

SAMPLE

Matrix: eggs, milk, tissue

Sample preparation: Milk. Homogenize 3 g milk and 500 μL 30% trichloroacetic acid, centrifuge at 5000 rpm for 5 min. Remove the aqueous phase and extract the residue with 4 mL 3% trichloroacetic acid. Combine the aqueous layers and make up to 10 mL with trichloroacetic acid, filter (0.45 μm), inject a 50 μL aliquot. Fish, eggs. Homogenize (Ultra-Turrax) 3 g fish or 4 g eggs with 4 mL 3% trichloroacetic acid, centrifuge at 5000 rpm for 5 min. Remove the aqueous phase and extract the residue with 4 mL 3% trichloroacetic acid. Combine the aqueous layers and make up to 10 mL with trichloroacetic acid, filter (0.45 μm), inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 5 μm Spherisorb ODS-2

Column: 150 × 4.6 5 μm Spherisorb ODS-2

Mobile phase: Gradient. MeCN:water 3:97 for 5 min, to 40:60 over 15 min, return to initial conditions over 1 min, re-equilibrate for 10 min. (At the end of each day wash with MeCN:ethyl acetate 5:95.)

Flow rate: 0.5

Injection volume: 50

Detector: F ex 302 em 412 following post-column reaction. The column effluent mixed with reagent 1 pumped at 0.25 mL/min and with reagent 2 pumped at 0.25 mL/min and this mixture flowed through a 2.5 m × 0.8 mm i.d. PTFE coil at 40° to the detector. (Reagent 1 was 10 mM o-phthalaldehyde in EtOH:700 mM phosphoric acid 2:98. Reagent 2 was 20 mM β-mercaptoethanol in EtOH:700 mM phosphoric acid 2:98.)

CHROMATOGRAM

Retention time: 10

SAMPLE
Matrix: perfusate
Sample preparation: 1 mL Perfusate + 1 mL 1 M phosphoric acid + 10 mL ethyl acetate:isopropanol 90:10, vortex for 3 min, centrifuge. Remove the organic layer and evaporate it to dryness, reconstitute the residue in 150 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 4 μm Novapak phenyl in a Z-module radial compression module
Mobile phase: MeOH:buffer 4:96 (Buffer was 25 mM K_2HPO_4 + 5 mM tetrabutylammonium + 5 mM triethylamine, pH adjusted to 6.8 with concentrated phosphoric acid.)
Flow rate: 3
Injection volume: 20

Detector: UV 264

CHROMATOGRAM
Internal standard: sulfanilamide

OTHER SUBSTANCES
Extracted: acipimox

KEY WORDS
sulfanilamide is IS

SAMPLE

Matrix: tissue

Sample preparation: Condition a 500 mg Chromabond SA cation-exchange SPE cartridge (Macherey-Nagel) with 6 mL hexane, dry under vacuum for 10 min, condition with 6 mL dichloromethane:acetone:acetic acid 50:50:2, do not allot to go dry. Homogenize (Polytron) 10 g sample with 60 mL dichloromethane:acetone 50:50 for 30 s, rinse the apparatus with 2-3 mL dichloromethane:acetone 50:50, centrifuge the mixture at 2500 rpm for 10 min. Filter (cotton wool) the supernatant and wash it through with a little dichloromethane:acetone 50:50, add 5 mL acetic acid to the filtrate, mix, remove one tenth of this mixture and add it to the SPE cartridge at 2 mL/min, do not allow the SPE cartridge to run dry, wash with 5 mL water, wash with 5 mL MeOH, dry under vacuum for 10 min, pass gaseous ammonia through the SPE cartridge until the acid is neutralized (when air is passed through the cartridge moist pH paper should turn blue), elute with 3 mL MeOH at 1-2 mL/min, carefully evaporate to dryness under reduced pressure (100 mbar) at 40°, reconstitute with 500 µL initial mobile phase, centrifuge, inject a 50 µL aliquot of the supernatant.

HPLC VARIABLES

Column: 125 × 4 5 µm LiChrospher 100 RP-18

Mobile phase: Gradient. A was MeCN:20 mM pH 5 sodium acetate buffer 5.5:94.5. B was MeCN:EtOH:20 mM pH 5 sodium acetate buffer 50:10:40. A:B from 100:0 to 0:100 over 32 min (concave gradient), return to initial conditions over 4 min, re-equilibrate at initial conditions for 10 min.

Flow rate: 0.8

Injection volume: 50

Detector: UV 270, F ex 395 em 495 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.3 mL/min and this mixture flowed through a 2.3 m × 0.5 mm ID coil in a cooled ultrasonic bath to the detector. (Prepare reagent by dissolving 25 mg fluorescamine in 25 mL MeCN and adding 75 mL buffer and 200 µL mercaptoethanol. Buffer was 20 mM NaH_2PO_4 adjusted to pH 3 with 1 M phosphoric acid.)

CHROMATOGRAM

Retention time: 3.75

Limit of detection: 0.5-5 ppb

OTHER SUBSTANCES

Extracted: sulfachlorpyridazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfaguanidine, sulfamerazine, sulfamethazine (sulfadimidine), sulfamethizole, sulfamethoxypyridazine, sulfapyridine, sulfathiazole

KEY WORDS

post-column reaction; muscle; kidney; SPE

SAMPLE

Matrix: tissue

Sample preparation: Homogenize (Polytron) 10 g ground tissue with 40 mL acetone, centrifuge at 2800 g for 5 min, filter (paper) the supernatant. Homogenize (Polytron) the residue with 20 mL acetone for 1 min, centrifuge, filter. Combine the filtrates and add 60 mL 125 mM HCl, wash twice with 50 mL portions of n-hexane, add 10 mL 1 M pH 5.2 acetate buffer, adjust pH to 5.0-5.1 with 5 M NaOH, extract with 60 ml and 40 mL portions of ethyl acetate, combine the organic layers, evaporate to about 2 mL under reduced pressure at 45°C, add about 15 mL EtOH, evaporate to dryness under reduced pressure at 50°, reconstitute immediately with 5-7 mL dichloromethane. Add to an 85 mm long column of silica gel made up in dichloromethane, rinse the flask twice with 1-2 mL portions of dichloromethane, add the rinses to the column, elute with 40 mL acetone:dichloromethane (60:40), elute to waste until the acetone front (visible against a dark background) is about 10 mm from the end of the column, collect the remaining eluate (Mitt. Gebiete. Lebensm. Hyg. 1990, 81, 522). Add 150 µL 10 µg/mL sulfabenzamide to the eluate, evaporate to dryness under reduced pressure at 45°, reconstitute the residue in 300 µL MeOH:water 50:50, filter (0.45 µm), inject a 20 µL aliquot.

HPLC VARIABLES

Guard column: 4 × 4 LiChrospher 5 μm 100 RP-18
Column: 250 × 4 5 μm Spherisorb ODS2
Mobile phase: MeCN:buffer 20:80 (Prepare buffer by dissolving 3.85 g ammonium acetate in 950 mL water, ad just pH to 4.00 with acetic acid, make up to 1 L with water.)
Column temperature: 35
Flow rate: 1
Injection volume: 20
Detector: UV 550 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.2 mL/min and the mixture flowed through a 25 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 20 mg/mL ammonium sulfamate in water pumped at 0.2 mL/min and this mixture flowed through an ice-cooled 200 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 4 mg/mL N-(1-naphthyl)ethylenediamine hydrochloride in water pumped at 0.2 mL/min and this mixture flowed through a 60 cm × 0.33 mm ID coil to the detector. (Reagent was 800 mg sodium nitrite dissolved in 150 mL water and 50 mL concentrated HCl.)

CHROMATOGRAM

Retention time: 3
Internal standard: sulfabenzamide (8.8)
Limit of detection: 2 ppb

OTHER SUBSTANCES

Extracted: sulfacetamide, sulfachloropyridazine, sulfadiazine, sulfadimethoxine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfamethoxypyridazine, sulfapyridine, sulfaquinoxaline, sulfathiazole

KEY WORDS

post-column reaction; muscle; liver; kidney; SPE

SAMPLE

Matrix: tissue
Sample preparation: Homogenize (Ultra-Turrax T-25 with S25N dispersing tool) 10 g chopped fish and 10 mL mobile phase A at high speed for 30 s, add 90 mL MeCN, shake at low speed on shaker, centrifuge at 1500 rpm for 10 min, remove the supernatant, add 30 mL MeCN to the solid, shake, centrifuge, decant the supernatant. Combine the supernatants, add 100 mL water, add 2 mL diethylene glycol, add 60 mL dichloromethane, shake for 3 min, remove the organic layer, repeat the extraction with 40 mL dichloromethane. Combine the organic layers and evaporate in a rotary evaporator at 65° to ca. 2 mL, wash into a smaller tube with two 2 mL portions of MeOH, concentrate to about 1 mL with a stream of nitrogen at 65°, dilute to 4.5 mL with 200 mM phosphoric acid, add 5 mL hexane, vortex, centrifuge for 15 min, discard upper hexane layer. Dilute the lower aqueous layer to 5 mL with 200 mM phosphoric acid, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: C18
Column: 150 × 4.6 3.5 μm Symmetry C18 (Waters)
Mobile phase: Gradient. A was MeCN:MeOH:2% acetic acid in water 5:10:85. B was MeCN:MeOH:2% acetic acid in water 25:10:65. A:B from 100:0 to 0:100 over 25 min, maintain at 0:100 for 5 min.
Flow rate: 1
Injection volume: 20
Detector: F ex 400 em 495 following post-column reaction. The column effluent mixed with 500 μg/mL fluorescamine in MeCN:MeOH:2% acetic acid 52.5:5:42.5 pumped at 0.2 mL/min and the mixture flowed through a 10.7 m × 0.4 mm i.d. coil of PTFE tubing at 70° to the detector.

Molecular weight: 249.29
CAS Registry No.: 144-83-2, 127-57-1 (Na salt monohydrate)
Merck Index: 9108
Lednicer No.: 1 124

SAMPLE
Matrix: blood
Sample preparation: Inject a 5 μL aliquot of serum directly.

HPLC VARIABLES
Column: 100 × 4.6 5-10 μm Silicalite (by sieving Silicalite, 3M Co.(?))
Mobile phase: Gradient. MeCN:20 mM pH 6.9 phosphate buffer from 5:95 to 20:80 over 2 min, to 25:75 over 2 min, to 30:70 over 4 min, to 50:50 over 2 min, maintain at 50:50 for 10 min (A) or MeCN:20 mM pH 6.9 phosphate buffer 20:80 (B)
Flow rate: 1
Injection volume: 20 (A), 5 (B)
Detector: UV 254

CHROMATOGRAM
Retention time: 14.5 (A), 2.06 (B)

OTHER SUBSTANCES
Extracted: acetaminophen (A), barbital (A), carbamazepine (A,B), phenobarbital (A), phenytoin (A), primidone (A)

KEY WORDS
serum

Ambrose,D.L.; Fritz,J.S. High-performance liquid chromatographic determination of drugs and metabolites in human serum and urine using direct injection and a unique molecular sieve, *J.Chromatogr.B*, **1998**, *709*, 89–96.

SAMPLE
Matrix: blood

Sample preparation: Extract 250 μL plasma with 1 mL 1 M pH 4.7 sodium acetate and 5 mL chloroform (Caution! Chloroform is a carcinogen!), evaporate to dryness under nitrogen at 40°, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Supelco LC-8
Mobile phase: MeOH:50 mM pH 7 sodium dihydrogen orthophosphate 16:84
Flow rate: 1.3
Detector: UV 260

CHROMATOGRAM
Limit of quantitation: 100 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
plasma; pharmacokinetics

REFERENCE
Awni; W.M.; Braeckman; R.A.; Locke; Ch.S.; Dubé; L.M.; Granneman; G.R. The influence of multiple oral doses of zileuton on the steady-state pharmacokinetics of sulfasalazine and its metabolites, sulfapyridine and *N*-acetylsulfapyridine, *Clin.Pharmacokinet.*, **1995**, *29*, 98–104.

SAMPLE
Matrix: saliva
Sample preparation: 1 mL Saliva + 148 ng sulfadiazine + 1 mL MeCN + 400 mg potassium carbonate, vortex for 1 min, centrifuge at ≥1000 g for 10 min. Remove the upper MeCN layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 200 μL mobile phase, vortex, inject a 40 μL aliquot.

HPLC VARIABLES
Column: 125 × 4.6 5 μm RP-18 (Brownlee)
Mobile phase: MeOH:buffer 15:85 (Buffer was 50 mM $NaHPO_4$ (sic) containing 10 mM sodium 1-hexanesulfonate and 7.2 mM triethylamine, adjusted to pH 3.0 with phosphoric acid.)
Flow rate: 1
Injection volume: 40
Detector: F ex 395 em 470 following post-column reaction. The column effluent mixed with reagent pumped at 0.3 mL/min and the mixture flowed through a 4.8 m × 0.7 mm ID PTFE coil at 60° to the detector. (Prepare reagent by dissolving 400 mg fluorescamine in 250 mL MeOH, add 1 mL 2-mercaptoethanol, add 250 mL mobile phase.)

CHROMATOGRAM
Retention time: 7.32
Internal standard: sulfadiazine (5.66)
Limit of detection: 5 ng/mL

OTHER SUBSTANCES
Noninterfering: N-acetylsulfapyridine, 2-amino-3-phenyl-1-propanol, 5-aminosalicylic acid, amphetamine, furosemide, levallorphan, metoprolol, riboflavin, salicylic acid, sulfasalazine, viloxazine

SAMPLE

Matrix: solutions

HPLC VARIABLES

Column: 250 × 4.6 Zorbax RX

Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.

Column temperature: 30

Flow rate: 2

Detector: UV 210

OTHER SUBSTANCES

Also analyzed: acepromazine, acetaminophen, acetophenazine, albuterol, aminophylline, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, aprobarbital, aspirin, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, benzotropine, benzphetamine, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, danazol, danthron, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine, eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isocarbostyril, isocarboxazid, isoniazid, isoproterenol, isoxsuprine, ivermectin, ketamine, ketoprofen, kynurenic acid, levorphanol, lidocaine, lorazepam, lormetazepam, loxapine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin, mephobarbital, mepivacaine, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, methyltestosterone, methyprylon, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine, phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, pyrilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, salicylamide, salicylic acid, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfasoxizole, sulindac, tamoxifen, temazepam, testosterone, tetracaine, tetracycline, tetramisole, thebaine, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tolmetin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, trimethoprim, tripelennamine, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

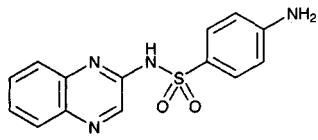
Sulfaquinoxaline



Molecular formula: $C_{14}H_{12}N_4O_2$
Molecular weight: 300.34
CAS Registry No.: 59-40-5
Merck Index: 9109

SAMPLE

Matrix: blood, tissue
Sample preparation: Slurry 6 g alumina (alumina B Akt. I, ICN Biomedicals) in MeCN:MeOH 60:40, add to a 300 × 15 column, wash with 30 mL MeCN:MeOH 60:40. Homogenize (Niti-on Bio-mixer BM-2) 5 g chopped tissue or plasma with 25 mL MeCN for 2 min, wash twice with 20 mL portions of MeCN, filter (cotton plug), wash filter with 30 mL n-hexane saturated with MeCN, add 30 g anhydrous sodium sulfate to the filtrate, let stand at room temperature for 30 min, filter (cotton plug), add 30 mL isopropanol to the filtrate. Evaporate the filtrate to dryness at 35°, reconstitute with 5 mL MeCN:MeOH 60:40, sonicate, add to the column, wash with 35 mL MeCN:MeOH 60:40, elute with 35 mL MeOH:water 75:25. Add 10 mL isopropanol to the eluate and evaporate it to dryness at 40°, reconstitute with 1 μg/mL chloramphenicol in MeCN:200 mM KH_2PO_4 15:85 containing 5 mM sodium 1-hexanesulfonate, filter (Gelman Ekikurodisk 13 CR), inject a 20 μL aliquot of the filtrate.

HPLC VARIABLES

Column: 250 × 4.6 L-column ODS (Chemicals Inspection and Testing Institute, Tokyo)
Mobile phase: MeCN:10 mM pH 5.0 phosphate buffer 21:79
Column temperature: 40
Flow rate: 1
Injection volume: 20
Detector: UV 270

CHROMATOGRAM

Retention time: 20.7
Internal standard: chloramphenicol (18.8)
Limit of detection: 3 ng/g

OTHER SUBSTANCES

Extracted: N^4-acetyl sulfaquinoxaline
Simultaneous: acetylsulfadiazine, acetylsulfadimethoxine, acetylsulfamethazine, acetylsulfamethoxazole, acetylsulfamonomethoxine, amprolium, diaveridine, ethopabate, furazolidone, nalidixic acid, nitrofurazone, ormetoprim, oxolinic acid, pyrimethamine, sulfachloropyridazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfamethazine, sulfamethoxazole, sulfamonomethoxine, thiamphenicol, trimethoprim

KEY WORDS

chicken; muscle; liver; kidney; skin; plasma; SPE

REFERENCE

Takahashi,Y.; Sekiya,T.; Nishikawa,M.; Endoh,Y.S. Simultaneous high-performance liquid chromatographic determination of amprolium, ethopabate, sulfaquinoxaline, and N4-acetylsulfaquinoxaline in chicken tissues, *J.Liq.Chromatogr.*, **1994**, *17*, 4489–4512.

SAMPLE

Matrix: blood, urine
Sample preparation: Plasma. Add 300 μL acetone slowly while vortexing to 100 μL plasma, centrifuge at 1700 g for 4 min. Remove 100 μL of the supernatant and evaporate it to dryness under a stream of nitrogen at 65°, reconstitute the residue in 200 μL mobile phase, inject a 20-100 μL aliquot. Urine. 500 μL Urine + 500 μL 3 M pH 6 acetate buffer, mix, extract with 4 mL dichloromethane. Remove 0.5-1.5 mL of the organic layer and evaporate it to dryness, reconstitute the residue in 200 μL mobile phase, inject a 20-100 μL aliquot.

HPLC VARIABLES

Guard column: 40 × 3.2 30-40 μm Perisorb C18 (Merck)
Column: 250 × 4.6 10 μm Hibar II C18 (Merck)
Mobile phase: MeOH:200 mM pH 7 KH_2PO_4/Na_2HPO_4 35:65
Flow rate: 1.7
Injection volume: 20-100
Detector: UV 252 (plasma), UV 360 (urine)

CHROMATOGRAM

Retention time: 3.6
Limit of detection: 100 ng/mL (urine), 250 ng/mL (plasma)

OTHER SUBSTANCES

Extracted: metabolites, N-acetylsulfaquinoxaline

KEY WORDS

rabbit; plasma; pharmacokinetics

SAMPLE

Matrix: eggs, milk, tissue
Sample preparation: Milk. Centrifuge at 2000 g and freeze at -20° to remove the cream. Mix a 5 mL aliquot with 5 mL saline solution and add 1 mL 1% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Meat. Blend 10 g homogenized meat with 20 mL saline, centrifuge, remove a 10 mL aliquot of the clear upper phase and add it to 1 mL 1% sodium azide (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Eggs. Dilute 10 g homogenized whole egg with 10 mL saline, add 3 mL 10% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B.

HPLC VARIABLES

Column: A 60 × 4 50-100 μm XAD-4 (Rohm & Haas); B 250 × 4.6 7 μm Cp TM-Spher C18 (Chrompack)
Mobile phase: MeCN:50 mM pH 6.85 sodium acetate buffer 12.5:87.5
Detector: UV 450 following post-column reaction. The column effluent mixed with 1.5% p-dimethylaminobenzaldehyde in 17% phosphoric acid and the mixture flowed through a 7.5 m × 0.5 mm ID knitted PTFE coil to the detector.

CHROMATOGRAM

Retention time: k' 6.2
Limit of detection: 5-10 ng/g

OTHER SUBSTANCES

Extracted: dapsone, sulfacetamide, sulfachlorpyrazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfaguanidine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfanilamide, sulfathiazole, sulfatroxazole

Noninterfering: chloramphenicol, trimethoprim

KEY WORDS
post-column reaction; meat; column-switching; dialysis

REFERENCE

SAMPLE
Matrix: milk
Sample preparation: Wash filter paper with 5 mL chloroform:acetone 2:1, discard filtrate. Extract 10 mL milk with 50 mL chloroform:acetone 2:1 by shaking for 4 min with periodic venting, let stand for 5 min, repeat extraction with 25 mL chloroform:acetone 2:1. Filter the organic layers, wash the filter paper with two 5 mL portions of chloroform:acetone 2:1. Evaporate the filtrate just to dryness under reduced pressure at 32 ± 2°, reconstitute the residue with 1 mL 13.6 g/L KH_2PO_4, vortex for 1 min, add 5 mL hexane, vortex for 1 min, let stand for 2 min, vortex for 1 min, let stand for at least 15 min, filter (2 μm) the aqueous layer, inject a 100 μL aliquot of the filtrate

HPLC VARIABLES
Guard column: 20 mm long Supelco guard column
Column: 250 × 4.6 LC-18-DB (Supelco)
Mobile phase: MeOH:13.6 g/L KH_2PO_4 30:70
Column temperature: 35
Flow rate: 1.5
Injection volume: 100
Detector: UV 265

CHROMATOGRAM
Retention time: 18.1
Limit of detection: 1.1 ppb
Limit of quantitation: 2.4 ppb

OTHER SUBSTANCES
Extracted: sulfachloropyridazine, sulfadimethoxine, sulfamethazine

KEY WORDS
cow

SAMPLE
Matrix: milk
Sample preparation: 5 mL Milk + 100 μL concentrated HCl, sonicate for 15 s, centrifuge at 3000 g for 10 min, wash the precipitate with 2 mL water, centrifuge. Combine the aqueous layers and add 5 mL hexane, mix, centrifuge at 1500 g for 1 min, repeat the hexane wash. Evaporate the aqueous layer to dryness at low pressure, reconstitute with MeOH, centrifuge, evaporate the supernatant to dryness, reconstitute the residue with 3 mL water, inject a 50-500 μL aliquot on to column A and elute to waste with mobile phase A, after 3 min elute the contents of column A on to column B with mobile phase B and start the gradient, elute with mobile phase B and monitor the effluent from column B.

HPLC VARIABLES
Column: A 30 mm long 10 μm RP-18; B 150 × 4.6 5 μm Spherisorb ODS-2
Mobile phase: A 100 mM Ammonium acetate buffer or 1% formic acid (?); B Gradient. A was 100 mM ammonium acetate buffer or 1% formic acid (?). B was MeCN:water 70:30 containing

100 mM ammonium acetate or 1% formic acid (?). A:B from 100:0 to 80:20 over 0.5 min, maintain at 80:20,for 1 min, to 25:75 over 10 min.
Flow rate: 1
Injection volume: 50-500
Detector: UV 254 or MS, Finnigan TSQ 70 triple quadrupole, Finnigan TSP source and interface, interface 80-85°, source 250°, manifold 70°, collision gas argon 0.4 mTorr, collision energy 40-50 eV

CHROMATOGRAM
Retention time: 12.2
Limit of detection: 400 pg (LC-SIM), 5-20 ng (MS-scan), 2 ng (UV)

OTHER SUBSTANCES
Extracted: sulfachloropyridazine, sulfadiazine, sulfamerazine, sulfamethazine, sulfamethizole, sulfanilamide, sulfapyridine, sulfathiazole
Interfering: sulfadimethoxine (distinguish by MS)

KEY WORDS
cow; column-switching

SAMPLE
Matrix: tissue
Sample preparation: Cut tissue into small pieces and homogenize in blender. 20 g Homogenized tissue + 200 μL 10 μg/mL methyl p-aminobenzoate in water + 60 mL acetone:chloroform 50:50, shake vigorously on a mechanical shaker for 10 min, centrifuge at 3000 g for 10 min, filter (Whatman No. 41 paper) supernatant, repeat extraction. Combine the extracts, if the extract is not clear centrifuge at 3000 g for 10 min and discard the aqueous layer, evaporate to an oily residue at 45° under reduced pressure, add 5 mL MeCN to flask, let stand for 10 min, remove MeCN layer, add 5 mL hexane and 5 mL MeCN, shake, centrifuge at 3000 g for 10 min, remove the MeCN layer, add 5 mL MeCN to the hexane layer, shake, centrifuge at 3000 g for 10 min, remove the MeCN layer. If hexane layer is not clear centrifuge at 3000 g for 10 min and remove

the clear portion. Add 400 μL 15% trichloroacetic acid to the hexane layer, shake gently for 10 min, centrifuge at 3000 g for 10 min. Evaporate the MeCN layers, transfer the oily residue to a small flask with 3 mL hexane, add the aqueous trichloroacetic acid layer, shake gently for 10 min, centrifuge at 3000 g for 10 min. Discard the hexane layer, add 100 μL saturated aqueous sodium citrate solution to the aqueous layer, mix, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm RP 18 (Brownlee)
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: Gradient. A was 1% aqueous acetic acid. B was MeCN:water 80:20. A:B from 90:10 to 60:40 over 20 min, return to initial conditions over 5 min, re-equilibrate for 5 min.
Flow rate: 1.5
Injection volume: 50
Detector: UV 450 following post-column reaction. The column effluent mixed with the reagent pumped at 0.5 mL/min and the mixture flowed through a 7 m × 0.25 mm i.d. coil of stainless steel tubing to the detector. (Prepare reagent by dissolving 1 g p-dimethylaminobenzaldehyde in 30 mL MeCN, make up to 100 mL with 5% trichloroacetic acid in water.)

CHROMATOGRAM

Retention time: 26.0
Internal standard: methyl p-aminobenzoate (18.6)
Limit of detection: 30 ng/g

OTHER SUBSTANCES

Extracted: sulfadiazine, sulfamerazine, sulfamethazine (sulfadimidine), sulfamethoxypyridazine, sulfapyridine

SAMPLE

Matrix: tissue
Sample preparation: Homogenize (Polytron) 10 g ground tissue with 40 mL acetone, centrifuge at 2800 g for 5 min, filter (paper) the supernatant. Homogenize (Polytron) the residue with 20 mL acetone for 1 min, centrifuge, filter. Combine the filtrates and add 60 mL 125 mM HCl, wash twice with 50 mL portions of n-hexane, add 10 mL 1 M pH 5.2 acetate buffer, adjust pH to 5.0-5.1 with 5 M NaOH, extract with 60 ml and 40 mL portions of ethyl acetate, combine the organic layers, evaporate to about 2 mL under reduced pressure at 45°C, add about 15 mL EtOH, evaporate to dryness under reduced pressure at 50°, reconstitute immediately with 5-7 mL dichloromethane. Add to an 85 mm long column of silica gel made up in dichloromethane, rinse the flask twice with 1-2 mL portions of dichloromethane, add the rinses to the column, elute with 40 mL acetone:dichloromethane (60:40), elute to waste until the acetone front (visible against a dark background) is about 10 mm from the end of the column, collect the remaining eluate (Mitt. Gebiete. Lebensm. Hyg. 1990, 81, 522). Add 150 μL 10 μg/mL sulfabenzamide to the eluate, evaporate to dryness under reduced pressure at 45°, reconstitute the residue in 300 μL MeOH:water 50:50, filter (0.45 μm), inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 4 × 4 LiChrospher 5 μm 100 RP-18
Column: 250 × 4 5 μm Spherisorb ODS2
Mobile phase: MeCN:buffer 20:80 (Prepare buffer by dissolving 3.85 g ammonium acetate in 950 mL water, ad just pH to 4.00 with acetic acid, make up to 1 L with water.)
Column temperature: 35
Flow rate: 1
Injection volume: 20
Detector: UV 550 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.2 mL/min and the mixture flowed through a 25 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 20 mg/mL ammonium sulfamate in water pumped at 0.2 mL/min and this mixture flowed through an ice-cooled 200 cm × 0.33 mm ID coil. The

effluent from this coil mixed with ice-cold 4 mg/mL N-(1-naphthyl)ethylenediamine hydrochloride in water pumped at 0.2 mL/min and this mixture flowed through a 60 cm × 0.33 mm ID coil to the detector. (Reagent was 800 mg sodium nitrite dissolved in 150 mL water and 50 mL concentrated HCl.)

CHROMATOGRAM
Retention time: 17
Internal standard: sulfabenzamide (8.8)
Limit of detection: 2 ppb

OTHER SUBSTANCES
Extracted: sulfacetamide, sulfachloropyridazine, sulfadiazine, sulfadimethoxine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfamethoxypyridazine, sulfanilamide, sulfapyridine, sulfathiazole

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Ultra-Turrax T-25 with S25N dispersing tool) 10 g chopped fish and 10 mL mobile phase A at high speed for 30 s, add 90 mL MeCN, shake at low speed on shaker, centrifuge at 1500 rpm for 10 min, remove the supernatant, add 30 mL MeCN to the solid, shake, centrifuge, decant the supernatant. Combine the supernatants, add 100 mL

water, add 2 mL diethylene glycol, add 60 mL dichloromethane, shake for 3 min, remove the organic layer, repeat the extraction with 40 mL dichloromethane. Combine the organic layers and evaporate in a rotary evaporator at 65° to ca. 2 mL, wash into a smaller tube with two 2 mL portions of MeOH, concentrate to about 1 mL with a stream of nitrogen at 65°, dilute to 4.5 mL with 200 mM phosphoric acid, add 5 mL hexane, vortex, centrifuge for 15 min, discard upper hexane layer. Dilute the lower aqueous layer to 5 mL with 200 mM phosphoric acid, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: C18
Column: 150 × 4.6 3.5 μm Symmetry C18 (Waters)
Mobile phase: Gradient. A was MeCN:MeOH:2% acetic acid in water 5:10:85. B was MeCN:MeOH:2% acetic acid in water 25:10:65. A:B from 100:0 to 0:100 over 25 min, maintain at 0:100 for 5 min.
Flow rate: 1
Injection volume: 20
Detector: F ex 400 em 495 following post-column reaction. The column effluent mixed with 500 μg/mL fluorescamine in MeCN:MeOH:2% acetic acid 52.5:5:42.5 pumped at 0.2 mL/min and the mixture flowed through a 10.7 m × 0.4 mm i.d. coil of PTFE tubing at 70° to the detector.

CHROMATOGRAM
Retention time: 24.5
Limit of quantitation: 5 ng/g

OTHER SUBSTANCES
Extracted: sulfachloropyridazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfamerazine, sulfamethazine, sulfamethizole, sulfamethoxazole, sulfamethoxypyridazine, sulfamonomethoxine, sulfanilamide, sulfapyridine, sulfathiazole

SAMPLE

Matrix: eggs, milk, tissue

Sample preparation: Milk. Centrifuge at 2000 g and freeze at -20° to remove the cream. Mix a 5 mL aliquot with 5 mL saline solution and add 1 mL 1% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Meat. Blend 10 g homogenized meat with 20 mL saline, centrifuge, remove a 10 mL aliquot of the clear upper phase and add it to 1 mL 1% sodium azide (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B. Eggs. Dilute 10 g homogenized whole egg with 10 mL saline, add 3 mL 10% sodium azide solution (Caution! Sodium azide is highly toxic! Do not discharge to the plumbing system!). Dialyze (24" long cellulose acetate "Type C" membrane, Technicon, New York) an 8 mL aliquot against water pumped at 0.6 mL/min, pass the dialysate through column A to waste, after 10 min stop the dialysis and elute column A to waste with water, after 24 min backflush the contents of column A onto column B with mobile phase, after 5 min remove column A from the circuit, elute column B with mobile phase, monitor the effluent from column B.

HPLC VARIABLES

Column: A 60 × 4 50-100 μm XAD-4 (Rohm & Haas); B 250 × 4.6 7 μm Cp TM-Spher C18 (Chrompack)

Mobile phase: MeCN:50 mM pH 6.85 sodium acetate buffer 12.5:87.5

Detector: UV 450 following post-column reaction. The column effluent mixed with 1.5% p-dimethylaminobenzaldehyde in 17% phosphoric acid and the mixture flowed through a 7.5 m × 0.5 mm ID knitted PTFE coil to the detector.

CHROMATOGRAM

Retention time: k' 3.5

Limit of detection: 5-10 ng/g

OTHER SUBSTANCES

Extracted: dapsone, sulfacetamide, sulfachlorpyrazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfaguanidine, sulfamethazine, sulfamethoxazole, sulfanilamide, sulfaquinoxaline

Noninterfering: chloramphenicol, trimethoprim

Interfering: sulfamerazine, sulfatroxazole

KEY WORDS

post-column reaction; meat; column-switching; dialysis

SAMPLE

Matrix: milk

Sample preparation: 500 μL Milk + 2 g C18 material + 10 μL MeOH + 10 μL 12.5 μg/mL sulfamerazine in MeOH, let stand for 1 min, grind with a glass pestle until homogeneous, place in a 10 mL syringe barrel plugged with filter paper, place filter paper on top, compress to 4.5 mL with a plunger, restrict column outlet with a 100 μL pipette tip, wash with 8 mL hexane, remove excess hexane with positive pressure, elute with 8 mL dichloromethane, elute excess dichloromethane with positive pressure. Evaporate the eluate under a stream of nitrogen, dissolve the residue in 100 μL MeOH and 400 μL 17 mM orthophosphoric acid, sonicate for 5-10 min, centrifuge at 13600 g for 5 min, filter supernatant (0.45 μm), inject a 20 μL aliquot. (C18 material was Analytichem 40 μm 18% load endcapped. Add 22 g to a 50 mL syringe barrel wash with 2 column volumes of hexane, 2 volumes of dichloromethane, and 2 volumes of MeOH, vacuum aspirate until dry.)

HPLC VARIABLES

Column: 75 × 4 3 μm Supelcosil LC-18
Mobile phase: MeCN:17 mM orthophosphoric acid 10:90
Column temperature: 45
Flow rate: 1 for 5 min then 2 for remainder of run
Injection volume: 20
Detector: UV 270

CHROMATOGRAM

Retention time: 2
Internal standard: sulfamerazine (3)

Limit of detection: 62.5 ng/mL

OTHER SUBSTANCES
Simultaneous: sulfamethoxazole, sulfanilamide, sulfadiazine, sulfamethazine, sulfisoxazole, sulfadimethoxine

KEY WORDS
matrix solid-phase dispersion

SAMPLE
Matrix: milk
Sample preparation: Wash filter paper with 5 mL chloroform:acetone 2:1, discard filtrate. Extract 10 mL milk with 50 mL chloroform:acetone 2:1 by shaking for 4 min with periodic venting, let stand for 5 min, repeat extraction with 25 mL chloroform:acetone 2:1. Filter the organic layers, wash the filter paper with two 5 mL portions of chloroform:acetone 2:1. Evaporate the filtrate just to dryness under reduced pressure at 32 ± 2°, reconstitute the residue with 1 mL 13.6 g/L KH_2PO_4, vortex for 1 min, add 5 mL hexane, vortex for 1 min, let stand for 2 min, vortex for 1 min, let stand for at least 15 min, filter (2 μm) the aqueous layer, inject a 100 μL aliquot of the filtrate

HPLC VARIABLES
Guard column: 20 mm long Supelco guard column
Column: 250 × 4.6 LC-18-DB (Supelco)
Mobile phase: MeOH:13.6 g/L KH_2PO_4 12:88
Column temperature: 35
Flow rate: 1.5
Injection volume: 100
Detector: UV 265

CHROMATOGRAM
Retention time: 10.3
Limit of detection: 1.0 ppb
Limit of quantitation: 2.2 ppb

OTHER SUBSTANCES
Extracted: sulfadiazine, sulfamerazine, sulfamethazine, sulfamethizole, sulfanilamide, sulfapyridine

KEY WORDS
cow

SAMPLE
Matrix: milk
Sample preparation: 5 mL Milk + 100 μL concentrated HCl, sonicate for 15 s, centrifuge at 3000 g for 10 min, wash the precipitate with 2 mL water, centrifuge. Combine the aqueous layers and add 5 mL hexane, mix, centrifuge at 1500 g for 1 min, repeat the hexane wash. Evaporate the aqueous layer to dryness at low pressure, reconstitute with MeOH, centrifuge, evaporate the supernatant to dryness, reconstitute the residue with 3 mL water, inject a 50-500 μL aliquot on to column A and elute to waste with mobile phase A, after 3 min elute the contents of column A on to column B with mobile phase B and start the gradient, elute with mobile phase B and monitor the effluent from column B.

HPLC VARIABLES
Column: A 30 mm long 10 μm RP-18; B 150 × 4.6 5 μm Spherisorb ODS-2
Mobile phase: A 100 mM Ammonium acetate buffer or 1% formic acid (?); B Gradient. A was 100 mM ammonium acetate buffer or 1% formic acid (?). B was MeCN:water 70:30 containing

100 mM ammonium acetate or 1% formic acid (?). A:B from 100:0 to 80:20 over 0.5 min, maintain at 80:20,for 1 min, to 25:75 over 10 min.
Flow rate: 1
Injection volume: 50-500
Detector: UV 254 or MS, Finnigan TSQ 70 triple quadrupole, Finnigan TSP source and interface, interface 80-85°, source 250°, manifold 70°, collision gas argon 0.4 mTorr, collision energy 40-50 eV

CHROMATOGRAM
Retention time: 6.9
Limit of detection: 400 pg (LC-SIM), 5-20 ng (MS-scan), 2 ng (UV)

OTHER SUBSTANCES
Extracted: sulfachloropyridazine, sulfadiazine, sulfadimethoxine, sulfamerazine, sulfamethazine, sulfamethizole, sulfanilamide, sulfapyridine, sulfaquinoxaline

SAMPLE
Matrix: tissue
Sample preparation: Condition a 500 mg Chromabond SA cation-exchange SPE cartridge (Macherey-Nagel) with 6 mL hexane, dry under vacuum for 10 min, condition with 6 mL dichloromethane:acetone:acetic acid 50:50:2, do not allot to go dry. Homogenize (Polytron) 10 g sample with 60 mL dichloromethane:acetone 50:50 for 30 s, rinse the apparatus with 2-3 mL dichloromethane:acetone 50:50, centrifuge the mixture at 2500 rpm for 10 min. Filter (cotton wool) the supernatant and wash it through with a little dichloromethane:acetone 50:50, add 5 mL acetic acid to the filtrate, mix, remove one tenth of this mixture and add it to the SPE cartridge at 2 mL/min, do not allow the SPE cartridge to run dry, wash with 5 mL water, wash with 5 mL MeOH, dry under vacuum for 10 min, pass gaseous ammonia through the SPE cartridge until the acid is neutralized (when air is passed through the cartridge moist pH paper should turn blue), elute with 3 mL MeOH at 1-2 mL/min, carefully evaporate to dryness under reduced pressure (100 mbar) at 40°, reconstitute with 500 µL initial mobile phase, centrifuge, inject a 50 µL aliquot of the supernatant.

HPLC VARIABLES
Column: 125 × 4 5 µm LiChrospher 100 RP-18
Mobile phase: Gradient. A was MeCN:20 mM pH 5 sodium acetate buffer 5.5:94.5. B was MeCN:EtOH:20 mM pH 5 sodium acetate buffer 50:10:40. A:B from 100:0 to 0:100 over 32 min (concave gradient), return to initial conditions over 4 min, re-equilibrate at initial conditions for 10 min.
Flow rate: 0.8
Injection volume: 50
Detector: UV 270, F ex 395 em 495 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.3 mL/min and this mixture flowed through a 2.3 m × 0.5 mm ID coil in a cooled ultrasonic bath to the detector. (Prepare reagent by dissolving 25 mg fluorescamine in 25 mL MeCN and adding 75 mL buffer and 200 µL mercaptoethanol. Buffer was 20 mM NaH_2PO_4 adjusted to pH 3 with 1 M phosphoric acid.)

CHROMATOGRAM
Retention time: 15
Limit of detection: 0.5-5 ppb

OTHER SUBSTANCES
Extracted: sulfachlorpyridazine, sulfadiazine, sulfadimethoxine, sulfadoxine, sulfaguanidine, sulfamerazine, sulfamethazine (sulfadimidine), sulfamethizole, sulfamethoxypyridazine, sulfanilamide, sulfapyridine

KEY WORDS
post-column reaction; muscle; kidney; SPE

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Polytron) 10 g ground tissue with 40 mL acetone, centrifuge at 2800 g for 5 min, filter (paper) the supernatant. Homogenize (Polytron) the residue with 20 mL acetone for 1 min, centrifuge, filter. Combine the filtrates and add 60 mL 125 mM HCl, wash twice with 50 mL portions of n-hexane, add 10 mL 1 M pH 5.2 acetate buffer, adjust pH

to 5.0-5.1 with 5 M NaOH, extract with 60 ml and 40 mL portions of ethyl acetate, combine the organic layers, evaporate to about 2 mL under reduced pressure at 45°C, add about 15 mL EtOH, evaporate to dryness under reduced pressure at 50°, reconstitute immediately with 5-7 mL dichloromethane. Add to an 85 mm long column of silica gel made up in dichloromethane, rinse the flask twice with 1-2 mL portions of dichloromethane, add the rinses to the column, elute with 40 mL acetone:dichloromethane (60:40), elute to waste until the acetone front (visible against a dark background) is about 10 mm from the end of the column, collect the remaining eluate (Mitt. Gebiete. Lebensm. Hyg. 1990, 81, 522). Add 150 μL 10 μg/mL sulfabenzamide to the eluate, evaporate to dryness under reduced pressure at 45°, reconstitute the residue in 300 μL MeOH:water 50:50, filter (0.45 μm), inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 4 × 4 LiChrospher 5 μm 100 RP-18
Column: 250 × 4 5 μm Spherisorb ODS2
Mobile phase: MeCN:buffer 20:80 (Prepare buffer by dissolving 3.85 g ammonium acetate in 950 mL water, ad just pH to 4.00 with acetic acid, make up to 1 L with water.)
Column temperature: 35
Flow rate: 1
Injection volume: 20
Detector: UV 550 following post-column reaction. The column effluent mixed with ice-cold reagent pumped at 0.2 mL/min and the mixture flowed through a 25 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 20 mg/mL ammonium sulfamate in water pumped at 0.2 mL/min and this mixture flowed through an ice-cooled 200 cm × 0.33 mm ID coil. The effluent from this coil mixed with ice-cold 4 mg/mL N-(1-naphthyl)ethylenediamine hydrochloride in water pumped at 0.2 mL/min and this mixture flowed through a 60 cm × 0.33 mm ID coil to the detector. (Reagent was 800 mg sodium nitrite dissolved in 150 mL water and 50 mL concentrated HCl.)

CHROMATOGRAM

Retention time: 4.5
Internal standard: sulfabenzamide (8.8)
Limit of detection: 2 ppb

OTHER SUBSTANCES

Extracted: sulfacetamide, sulfachloropyridazine, sulfadiazine, sulfadimethoxine, sulfamerazine, sulfamethazine, sulfamethoxazole, sulfamethoxypyridazine, sulfanilamide
Interfering: sulfapyridine

SAMPLE

Matrix: tissue
Sample preparation: Condition a 3 mL 500 mg Sep-Pak SPE cartridge with 20 mL MeOH and 20 mL water. 5 g Homogenized tissue + 40 μL 20 μg/mL sulfaethoxypyridazine in water + 25 mL chloroform, shake mechanically for 2 min, centrifuge at 3000 g for 5 min, remove the supernatant and separate the layers. Add the aqueous layer to the residue and repeat the extraction. Combine the chloroform layers and add 10 mL 10% NaCl in 100 mM NaOH, shake vigorously for 1 min, remove the upper aqueous layer and centrifuge it at 1500 g for 10 min. Remove 8 mL of the upper aqueous layer and add it to 10 mL 1 M pH 6 NaH_2PO_4, vortex for 20 s, add to the SPE cartridge, wash with 20 mL water, elute with 1 mL MeCN. Evaporate the eluate to dryness under a stream of nitrogen at 50°, reconstitute in 2 mL mobile phase, vortex for 20 s, heat at 50° for 5 min, cool, filter (Gelman Acrodisc 0.45 μm), inject a 20-50 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Spherisorb C18 ODS
Mobile phase: MeCN:10 mM pH 4.6 ammonium acetate 28:72

Flow rate: 1.2
Injection volume: 20-50
Detector: UV 265 or MS, VG TRIO 2 quadrupole, ion source 189°, capillary jet 320

CHROMATOGRAM
Retention time: 4.9
Internal standard: sulfaethoxypyridazine (12.8)

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Ultra-Turrax T-25 with S25N dispersing tool) 10 g chopped fish and 10 mL mobile phase A at high speed for 30 s, add 90 mL MeCN, shake at low speed on shaker, centrifuge at 1500 rpm for 10 min, remove the supernatant, add 30 mL MeCN to the solid, shake, centrifuge, decant the supernatant. Combine the supernatants, add 100 mL water, add 2 mL diethylene glycol, add 60 mL dichloromethane, shake for 3 min, remove the organic layer, repeat the extraction with 40 mL dichloromethane. Combine the organic layers and evaporate in a rotary evaporator at 65° to ca. 2 mL, wash into a smaller tube with two 2 mL portions of MeOH, concentrate to about 1 mL with a stream of nitrogen at 65°, dilute to 4.5 mL with 200 mM phosphoric acid, add 5 mL hexane, vortex, centrifuge for 15 min, discard upper hexane layer. Dilute the lower aqueous layer to 5 mL with 200 mM phosphoric acid, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: C18
Column: 150 × 4.6 3.5 μm Symmetry C18 (Waters)
Mobile phase: Gradient. A was MeCN:MeOH:2% acetic acid in water 5:10:85. B was MeCN:MeOH:2% acetic acid in water 25:10:65. A:B from 100:0 to 0:100 over 25 min, maintain at 0:100 for 5 min.
Flow rate: 1
Injection volume: 20
Detector: F ex 400 em 495 following post-column reaction. The column effluent mixed with 500 μg/mL fluorescamine in MeCN:MeOH:2% acetic acid 52.5:5:42.5 pumped at 0.2 mL/min and the mixture flowed through a 10.7 m × 0.4 mm i.d. coil of PTFE tubing at 70° to the detector.

CHROMATOGRAM
Retention time: 6.5
Limit of quantitation: 1 ng/g

SAMPLE
Matrix: water
Sample preparation: Adjust 50 mL wastewater to pH 6.6 with acetic acid, add 5 mL 1 mg/mL niacin in 0.5 mM HCl, add 50 mL ethyl acetate, shake vigorously for 5 min, let stand for 1 min, transfer the ethyl acetate layer to a flask, extract the residual aqueous layer with two 20 mL portions of ethyl acetate. Combine the organic layers and evaporate them at 90° to about 500 μL, dissolve the residue in 5 mL 10 mM HCl, make up to 50 mL with water, inject an aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Inertsil ODS-2 (Vercopak)
Mobile phase: MeOH:buffer 20:80 (Buffer was 100 mM sodium acetate adjusted to pH 6.6 with 10 mM acetic acid.)
Flow rate: 1
Injection volume: 20
Detector: UV 260

CHROMATOGRAM
Retention time: 5.5
Internal standard: niacin (3.3)

OTHER SUBSTANCES
Extracted: sulfamethazine, sulfacetamide, sulfamethoxazole, sulfadiazine, sulfamerazine, sulfamonomethoxine

KEY WORDS
wastewater

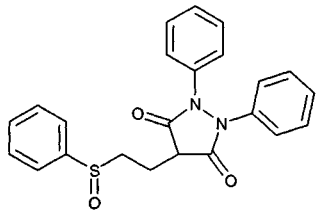
Sulfinpyrazone



Molecular formula: $C_{23}H_{20}N_2O_3S$
Molecular weight: 404.49
CAS Registry No.: 57-96-5
Merck Index: 9121
Lednicer No.: 1 238

SAMPLE
Matrix: bile, blood
Sample preparation: Plasma, urine, or bile + 50 μL 100 μg/mL fenbufen in MeOH + 2 mL 1 M HCl + 5 mL chlorobutane:1,2-dichloroethane 80:20, extract, centrifuge. Remove the organic layer and add it to 400 μL 100 mM NaOH, shake for 5 min, centrifuge, inject a 200 μL aliquot of the aqueous layer.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeOH:100 mM pH 5.6 phosphate buffer 50:50
Flow rate: 1.6
Injection volume: 200
Detector: UV 254

CHROMATOGRAM
Internal standard: fenbufen

OTHER SUBSTANCES
Extracted: metabolites

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 200 μL 42 μg/mL naproxen + 500 μL MeCN, shake gently, centrifuge at 10000 g for 2 min. Remove the supernatant and dilute with an equal volume of water, inject a 50-200 μL aliquot.

HPLC VARIABLES
Guard column: Bondapak C18/Corasil
Column: 115 × 8 5 μm Radial-Pak C18 (Waters)
Mobile phase: MeCN:20 mM pH 7.0 phosphate buffer 26:74
Flow rate: 2
Injection volume: 50-200
Detector: UV 254

CHROMATOGRAM
Retention time: 7
Internal standard: naproxen (4.5)
Limit of detection: 100 ng/mL

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: ibuprofen
Noninterfering: lidocaine, metoprolol, propranolol

KEY WORDS
plasma; pharmacokinetics

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 1 mL Plasma + 10 μg naproxen + 1 mL 1 M HCl + 500 μL 20 mg/mL sodium sulfite + 4 mL dichloromethane:1-chlorobutane 75:25, shake for 15 min, centrifuge at 2000 g for 10 min. Remove 3 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 37°, reconstitute the residue in 100 μL 2% sodium sulfite, vortex, inject a 10 μL aliquot. Urine. 500 μL Urine + 500 μL water + 25 μg naproxen + 1 mL 1 M HCl + 500 μL 20 mg/mL sodium sulfite + 4 mL dichloromethane:1-chlorobutane 75:25, shake for 15 min, centrifuge at 2000 g for 10 min. Remove 3 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 37°, reconstitute the residue in 100 μL 2% sodium sulfite, vortex, inject a 10 μL aliquot.

HPLC VARIABLES
Guard column: 25 × 4 35-50 μm Bondapak C18 Corasil
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: Gradient. A was MeCN:100 mM ammonium acetate 22:78. B was MeCN. A:B from 0:100 to 100:0 over 15 min (Waters convex curve 7), re-equilibrate for 5 min.
Flow rate: 2
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 5.86
Internal standard: naproxen (9.85)
Limit of detection: 500 ng/mL (urine), 100 ng/mL (plasma)

OTHER SUBSTANCES
Extracted: metabolites
Simultaneous: antipyrine, phenprocoumon
Noninterfering: ampicillin, aspirin, azlocillin, cimetidine, cotinine, digoxin, heparin, hippuric acid, lidocaine, methaqualone, metoprolol, mezlocillin, neostigmine, nicotine, pindolol, procainamide, propranolol, quinidine, salicylamide, salicylic acid, secobarbital, theobromine, theophylline, uric acid, ascorbic acid, vitamin B, warfarin

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. Evaporate 50-100 μL 100 μg/mL butyl 4-hydroxybenzoate in MeOH into the bottom of a glass tube using a stream of air at 30°, add 500 μL plasma, add 500 μL 600 mM HCl, add 6 mL 1-chlorobutane:chloroform 50:50, shake mechanically for 20 min, centrifuge at 1400 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of air at 30°, reconstitute the residue in 1 mL EtOH:water 50:50, inject a 10-20 μL aliquot. Urine. Evaporate 50-100 μL 100 μg/mL butyl 4-hydroxybenzoate in MeOH into the bottom of a glass tube using a stream of air at 30°, add 500 μL urine, add 500 μL 600 mM HCl, add 6 mL 1-chlorobutane:chloroform 50:50, shake mechanically for 20 min, centrifuge at 1400 g for 10 min. Remove the organic layer and add it to 500 μL 500 mM pH 4.5 citrate buffer, shake for 5 min, centrifuge at 1400 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of air at 30°, reconstitute the residue in 1 mL EtOH:water 50:50, inject a 10-20 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Lichrosorb RP-8
Mobile phase: EtOH:10 mM pH 2.5 citrate buffer 48:52
Column temperature: 40
Flow rate: 1
Injection volume: 10-20
Detector: UV 254

CHROMATOGRAM
Retention time: 4
Internal standard: butyl 4-hydroxybenzoate (6)
Limit of quantitation: 100 ng/mL (urine), 25 ng/mL (plasma)

OTHER SUBSTANCES
Extracted: metabolites

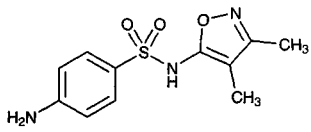
Sulfisoxazole



Molecular formula: $C_{12}H_{13}N_3O_3S$
Molecular weight: 267.31
CAS Registry No.: 127-69-5, 4299-60-9 (diolamine)
Merck Index: 9125
Lednicer No.: 1 124

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 200 μL Plasma + 400 μL 0.2 μg/mL N^4-acetylsulfamethoxazole in MeOH, vortex for 10 s, centrifuge at 2000 rpm for 10 min. Remove the supernatant and evaporate it to 100 μL under a stream of nitrogen, inject a 50 μL aliquot. Urine. 100 μL Urine + 200 μL 12 μg/mL N^4-acetylsulfamethoxazole in MeOH, vortex for 10 s, centrifuge at 2000 rpm for 10 min, inject a 10 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 250 × 4.6 10 μm Lichrosorb RP-18 Hibar II
Mobile phase: MeOH:water:glacial acetic acid 32:68:0.06, pH adjusted to 4.7 with 4 M NaOH
Flow rate: 1.2
Injection volume: 10-50
Detector: UV 254

CHROMATOGRAM
Retention time: 6.5
Internal standard: N^4-acetylsulfamethoxazole (11.5)
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES
Extracted: acetylsulfisoxazole

KEY WORDS
plasma

SAMPLE
Matrix: formulations
Sample preparation: Tablets. Weigh out ground tablets to contain 500 mg sulfisoxazole, add 25 mL MeOH, shake mechanically for 30 min, make up to 100 mL with MeOH, filter. Remove a 5 mL aliquot of the filtrate and add it to 15 mL 1 mg/mL sulfabenzamide in MeOH, mix, make up to 100 mL with MeOH, inject an aliquot. Injections, ophthalmic solutions. Measure out amount containing 200 mg sulfisoxazole, make up to 200 mL with MeOH. Remove a 25 mL aliquot and add it to 25 mL 1 mg/mL sulfabenzamide in MeOH, mix, make up to 100 mL with MeOH, inject an aliquot. Ointments. Weigh out ointment containing 50 mg sulfisoxazole, add 25 mL MeOH:water 50:50, wash twice with 50 mL portions of n-heptane. Extract the n-heptane layers three times with 25 mL portions of MeOH:water 50:50. Combine all the MeOH:water layers and add 50 mL 1 mg/mL sulfabenzamide in MeOH, mix, make up to 200 mL with MeOH, inject an aliquot.

HPLC VARIABLES
Column: 300 × 3.9 μBondapak C18

Mobile phase: MeCN:water:acetic acid 22.5:76.5:1
Flow rate: 1.5
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 7
Internal standard: sulfabenzamide (8)

OTHER SUBSTANCES
Simultaneous: sulfacetamide, sulfachlorpyridazine, sulfadiazine, sulfadimethoxine, sulfamerazine, sulfamethazine, sulfamethizole, sulfamethoxazole, sulfanilamide, sulfapyridine

SAMPLE

Matrix: bile, blood, gastric contents, urine

Sample preparation: Plasma. 300 μL Plasma + 40 μL 300 μg/mL indomethacin in borate buffer + 1 mL MeCN, vortex for 30 s, centrifuge at 3500 rpm. Remove the supernatant and evaporate it to 100 μL under a stream of nitrogen at 50°, inject a 20 μL aliquot. Urine, bile, gastric fluid. 300 μL Urine, bile, or gastric fluid + 100 μL 5 M NaOH, let stand at room temperature for 15 min, adjust the pH with 100 μL 28.3% phosphoric acid, add 40 (urine), 25 (bile), or 6 (gastric fluid) μL 300 μg/mL indomethacin in borate buffer, add 1 (urine, bile) or 1.5 (gastric fluid) mL MeCN, vortex for 30 s, centrifuge at 3500 rpm. Remove the supernatant and evaporate it to 100 μL under a stream of nitrogen at 50°, inject a 20 (urine), 35 (bile), or 40 (gastric fluid) μL aliquot. (Borate buffer was 12.4 g boric acid and 10 mL 1 M NaOH made up to 1 L with water, pH 7.2.)

HPLC VARIABLES

Guard column: Microguard reverse-phase (Bio-Rad)

Column: 100 × 8 Radial-PAK C18 in a radial compression module

Mobile phase: MeCN:buffer 70:30 (Buffer was 6.8 g/L KH_2PO_4 adjusted to pH 3.0 with 85% phosphoric acid.)

Flow rate: 2

Injection volume: 20-40

Detector: UV 340

CHROMATOGRAM

Retention time: 6

Internal standard: indomethacin (13)

Limit of quantitation: 500 ng/mL (urine, bile, gastric fluid), 250 ng/mL (plasma)

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 300 μL Plasma + 1 mL 6 μg/mL indomethacin in MeCN, vortex for 30 s, centrifuge for 5 min. Remove the supernatant and evaporate it to 200 μL under a stream of nitrogen, add 400 μL MeCN:50 mM KH_2PO_4 adjusted to pH 3.0 with phosphoric acid 40:60, vortex, inject an aliquot. Urine. 300 μL Urine + 100 μL 5 M NaOH, vortex, let stand for 15 min at room temperature, add 100 μL phosphoric acid, vortex, add 1 mL 6 μg/mL indomethacin in MeCN, vortex for 30 s, centrifuge for 5 min. Remove the supernatant and evaporate it to 200 μL under a stream of nitrogen, add 400 μL MeCN:50 mM KH_2PO_4 adjusted to pH 3.0 with phosphoric acid 40:60, vortex, inject an aliquot.

HPLC VARIABLES
Column: reverse phase
Mobile phase: Gradient. MeCN:50 mM KH_2PO_4 adjusted to pH 3.0 with phosphoric acid from 40:60 to 60:40 over 10 min.
Detector: UV

CHROMATOGRAM
Retention time: 3.0
Internal standard: indomethacin (6.8)
Limit of detection: 100 ng/mL

SAMPLE
Matrix: blood
Sample preparation: Mix 1 mL plasma with 4 mL 500 mM NaOH, 2 g NaCl and 1 micro.L 100 μg/mL tiapride in MeOH. Add 10 mL MTBE, shake for 10 min and centrifuge at 850 g for 10 min. Remove the solvent layer, mix with 2.5 mL 100 mM HCl shake and centrifuge at 850 g for 10 min. Remove the aqueous layer, add it to 1 mL 500 mM NaOH, 1.5 g NaCl, and 2 mL MTBE, shake for 10 min and centrifuge. Remove the solvent layer and evaporate to dryness under a stream of nitrogen. Reconstitute the residue in 50 μL MeCN and inject a 10 μL aliquot.

HPLC VARIABLES
Column: 150 × 2.1 5 μm Hypersil silica
Mobile phase: MeCN:100 mM ammonium acetate 94:6
Column temperature: 40
Flow rate: 0.4
Injection volume: 10
Detector: UV 240; MS, Hewlett-Packard Model 59980A, particle beam nebulizer helium 35 psi, solvation chamber 60°, Model 5989A, negative ion chemical ionization mode, reagent gas methane at 1 torr, source 250°, m/z 339

CHROMATOGRAM
Retention time: 12.9
Internal standard: tiapride (11.0)
Limit of quantitation: 5 ng/mL (UV), 10 ng/ml (MS)

KEY WORDS
plasma; pharmacokinetics

SAMPLE

Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18

Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)

Column temperature: 30

Flow rate: 0.8

Injection volume: 50

Detector: UV 235

CHROMATOGRAM

Retention time: 3.47

Limit of detection: <120 ng/mL

KEY WORDS

whole blood; plasma; interferences may occur–compounds (all of which are extracted) elute in this order tenoxicam; iproniazid; methocarbamol; methotrexate; caffeine; nialamide; colchicine; cytarabine; benzoylecgonine; acetaminophen; diazoxide; dacarbazine; sulfinpyrazole; flumazenil; sulpride; morphine; atenolol; toloxatone; terbutaline; albuterol; phenobarbital; ranitidine; tiapride; phenol; chlormezanone; aspirin; metformin; ritodrine; codeine; sultopride; amisulpride; naltrexone; lisinopril; benzocaine; nizatidine; nalorphine; mephenesin; naloxone; sotalol; carteolol; procainamide; carbamazepine; bromazepam; nalbuphine; nadolol; procarbazine; dihydralazine; omeprazole; strychnine; acebutolol; glutethimide; chlorpropamide; glipizide; triazolam; prazosin; flunitrazepam; clonazepam; metoclopramide; melphalan; estazolam; tolbutamide; ephedrine; clonidine; pindolol; clobazam; minoxidil; disopyramide; nitrazepam; dextromethorphan; tofisopam; zopiclone; debrisoquine; sulindac; alprazolam; cycloguanil; lorazepam; methaqualone; ketamine; piroxicam; metoprolol; nifedipine; quinine; mephentermine; prilocaine; pentazocine; oxazepam; tiaprofenic acid; quinidine; celiprolol; ajmaline; yohimbine; lidocaine; secobarbital; viloxazine; mepivacaine; meperidine; doxylamine; labetalol; temazepam; amodiaquine; benperidol; droperidol; hydroxychloroquine; zolpidem; ketoprofen; alminoprofen; cicletanine; moclobemide; chloroquine; cocaine; timolol; nomifensine; ticlopidine; acenocoumarol; vindesine; mexiletine; dipyridamole; trazodone; pipamperone; pyrimethamine; benazepril; vincristine; metapramine; chlordiazepoxide; oxprenolol; warfarin; clorazepate; flecainide; phencyclidine; thiopental; fenfluramine; metipranolol; triprolidine; naproxen; buprenorphine; verapamil; buspirone; tianeptine; midazolam; bupivacaine; carbinoxamine; loprazolam; cetirizine; chlorpheniramine; moperone; cibenzoline; medifoxamine; astemizole; vinblastine; nicardipine; bisoprolol; diltiazem; glibornuride; reserpine; aconitine; nitrendipine; diazepam; mianserin; ramipril; haloperidol; tetracaine; alprenolol; acepromazine; glibenclamide; chlorophenacinone; doxepin; nimodipine; diphenhydramine; cyclizine; histapyrrodine; phenylbutazone; demexiptiline; clozapine; proguanil; trifluperidol; medazepam; cyamemazine; bumadizone; suriclone; propranolol; acepromazine; dothiepin; dextromoramide; fenoprofen; dextropropoxyphene; loxapine; betaxolol; propafenone; promethazine; thioproperazine; methadone; amoxapine; quinupramine; opipramol; cyproheptadine; brompheniramine; mefenidramine; protriptyline; flurbiprofen; tetrazepam; zorubicin; prazepam; alimemazine; loperamide; imipramine; desipramine; levomepromazine; hydroxyzine; niflumic acid; penbutolol; fluvoxamine; pimozide; daunorubicin; indomethacin; maprotiline; tropatenine; etodolac; fluoxetine; amitriptyline; nortriptyline; tioclomarol; diclofenac; mefloquine; trimipramine; chlorambucil; lidoflazine; ibuprofen; floctafenine; alpidem; loratadine; chlorpromazine; clomipramine; carpipramine; thioridazine; fentiazac; clemastine; mefenamic acid; fluphenazine; prochlorperazine; penfluridol; bepridil; terfenadine; trifluoperazine

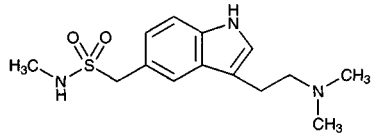
Sumatriptan



Molecular formula: $C_{14}H_{21}N_3O_2S$
Molecular weight: 295.41
CAS Registry No.: 103628-46-2, 103628-48-4 (succinate)
Merck Index: 9172
Lednicer No.: 5 108

SAMPLE
Matrix: blood
Sample preparation: Condition a 50 mg Isolute CBA SPE cartridge (Hengoed, UK) with full column volumes of MeOH and water. Apply 1 mL plasma to SPE cartridge, wash with two column volumes of water. Dry SPE cartridge under vacuum. Elute with one column volume of 1% ammonia in MeOH. Evaporate eluate to dryness under vacuum at 50°, reconstitute the residue in 150 μL mobile phase, vortex, inject an aliquot.

HPLC VARIABLES
Guard column: Brownlee Newguard C2 (Anachem, UK)
Column: 100 × 4 5 μm cyano-propyl column (Capitol HPLC, UK)

Mobile phase: MeOH:40 mM pH 5.3 potassium phosphate buffer 60:40
Flow rate: 1
Injection volume: 50
Detector: E, ESA Coulochem 2, Model 5020 guard cell, Model 5011 analytical cell, detector 1 + 450 mV, detector 2 + 850 mV, guard cell + 900 mV

CHROMATOGRAM
Retention time: 6.1
Internal standard: sumatriptan succinate

OTHER SUBSTANCES
Extracted: naloxone

KEY WORDS
plasma; SPE; sumatriptan is IS

SAMPLE
Matrix: blood
Sample preparation: Condition a 3 mL Lichrolut C18-Select B SPE cartridge with 3 mL MeOH and 3 mL water. Mix 100 or 300 μL plasma with 500 μL 40 ng/mL IS in MeOH:water 50:50, add 800 μL MeOH, vortex, centrifuge at 15000 rpm for 10 min. Evaporate the supernatant to dryness under a stream of nitrogen at 40°, reconstitute the sample in 1 mL MeOH:water 10:90. Add 1 mL of the sample to the SPE cartridge, wash with 5 mL water, wash with 3 mL MeOH:water 20:80, elute with 2 mL MeCN containing 10% 1 M HCl, evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue in 300 μL mobile phase, inject a 30 μL aliquot.

HPLC VARIABLES
Column: 150 × 2 4 μm Nova-Pak C8
Mobile phase: Gradient. A was MeCN:20 mM ammonium acetate 10:90. B was MeCN:20 mM ammonium acetate 80:20. A:B from 80:20 to 20:80 over 20 min, re-equilibrate at initial conditions for 10 min
Column temperature: 35
Flow rate: 0.5
Injection volume: 30
Detector: MS, Finnigan MAT SSQ-700 or TSQ-7000, API, ESI, 4.8 kV needle, +5.8 V to the capillary, +44.6 V to the tube lens, source 230°, m/z 339

CHROMATOGRAM
Internal standard: MDL 74,967

OTHER SUBSTANCES
Extracted: MDL 74,721, naratriptan

KEY WORDS
plasma; rabbit; SPE; pharmacokinetics

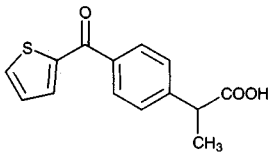
Suprofen



Molecular formula: $C_{14}H_{12}O_3S$
Molecular weight: 260.31
CAS Registry No.: 40828-46-4
Merck Index: 9180
Lednicer No.: 2 65

SAMPLE

Matrix: blood
Sample preparation: Adjust pH of plasma to 3 with phosphoric acid. 100 µL Plasma + 300 µL IS in MeCN, mix, centrifuge. Remove the supernatant and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 300 µL MeCN:water 25:75, inject an aliquot.

HPLC VARIABLES

Guard column: 15 × 2.1 C18 (Brownlee)
Column: 150 × 4 5 µm Axxiom C18
Mobile phase: MeOH:10 mM pH 5.1 sodium acetate 37.5:62.5
Flow rate: 1
Detector: UV 295

CHROMATOGRAM

Retention time: 12.9
Internal standard: 5-(4-methoxybenzoyl)-1,4-dimethyl-1H-pyrrole-2-acetic acid (MCN 2967, R.W. Johnson) (11.1)
Limit of detection: 100 ng/mL

OTHER SUBSTANCES

Extracted: metabolites, glucuronides

KEY WORDS

cow; plasma

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 100 μM solution in buffer, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 100 × 4.6 column containing riboflavin binding proteins (Prepare as follows. Add riboflavin to saturate protein of egg yolk, homogenize with 3 volumes buffer, centrifuge, add the supernatant to a 500 × 30 column of DEAE-cellulose (Whatman) equilibrated with buffer, wash extensively with buffer to remove bound protein, elute riboflavin binding proteins (RFBP) with buffer containing 200 mM NaCl (RFBP has intense yellow color, absorption at 455 nm). Purify RFBP on a Sephadex G-100 column with 50 mM pH 7.5 Tris-HCl buffer as eluent, remove the bound riboflavin by extensive dialysis at pH 3.0. Add 4.5 g N,N-disuccinylimidyl carbonate to 3 g Nucleosil 5NH2 slurried in MeCN, filter, wash with MeCN, wash with 50 mM pH 7.5 phosphate buffer. Suspend 300 mg RFBP in 50 mM phosphate buffer, add the activated silica, mix gently for 2 h using a rotary evaporator, filter, wash with sterile water, wash with isopropanol:water 1:2, pack in a 100 × 4.6 column.) (Buffer was 100 mM pH 5.3 sodium acetate.)
Mobile phase: 50 mM pH 5.5 KH_2PO_4
Flow rate: 0.8
Injection volume: 20
Detector: UV

CHROMATOGRAM
Retention time: k' 8.27

OTHER SUBSTANCES
Simultaneous: flurbiprofen, isradipine, ketoprofen, nimodipine

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 3.02

KEY WORDS

whole blood

SAMPLE
Matrix: blood, urine
Sample preparation: Blood. Add 25 μL 10 μM IS , 250 μL 500 mM sodium hydroxide, and 5 mL ethyl acetate to 500 μL plasma, shake for 10 min, centrifuge at 1100 g for 10 min. Keep at -30° until the aqueous phase is frozen. Evaporate the organic phase to dryness under a stream of nitrogen at 40° for 45 min, reconstitute in 300 μL mobile phase, vortex for 30 s, centrifuge at 1100 g for 1 min and at 13000 g for 15 min. Take a 100 μL sample from the middle and inject. Urine. Add 25 μL 100 μM IS, 250 μL 500 mM sodium hydroxide, and 5 mL ethyl acetate to 500 μL plasma, shake for 10 min and centrifuge at 1100 g for 10 min. Keep at -30° until the aqueous phase is frozen. Evaporate the organic phase to dryness under a

stream of nitrogen at 40° for 45 min, reconstitute in 900 μL mobile phase and vortex for 30 s. Inject a 100 μL aliquot.

HPLC VARIABLES
Guard column: LiChrospher 60 RP-select B
Column: 250 × 4 5 μm LiChrospher 60 RP-select B
Mobile phase: MeCN:200 mM pH 4.0 acetate buffer 13:87 (Buffer was 16.406 g sodium acetate in 1 L water, pH adjusted to 4.0 with 60% perchloric acid.)
Column temperature: 30
Flow rate: 1.25 for 16 min, 2.5 for 24 min
Injection volume: 100
Detector: F ex 330 em 365

CHROMATOGRAM
Retention time: 32.93 (blood), 31.71 (urine)
Internal standard: 1,2,3,4,-tetrahydro-9-acridanone (Aldrich) (30.39 (blood), 29.30 (urine))
Limit of detection: 2 nM (blood), 80 nM (urine)

SAMPLE
Matrix: diffusate, tissue
Sample preparation: Homogenize (Polytron PCU-2) 150-200 mg skin and diazepam with 4 mL chloroform, repeat homogenization, filter (phase-separating paper) extracts. Make the residue alkaline with 2 mL 10% NaOH, extract twice with 4 mL portions of chloroform, wash the extracts twice with 2 mL portions of water, filter (phase-separating paper) the organic layer. Combine all the chloroform layers and evaporate them to dryness under a stream of air, reconstitute the residue in 1 mL mobile phase, filter (microfilter), inject an aliquot.

HPLC VARIABLES
Guard column: 20 × 4 40 μm ODS (Valco)
Column: 150 × 4.6 5 μm Spherisorb ODS-I
Mobile phase: MeCN:water 52:48 containing 10 mM octanesulfonic acid and 1% acetic acid, pH 3.5
Flow rate: 1
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 7.7
Internal standard: diazepam (6.0)
Limit of detection: 5 μg/g

OTHER SUBSTANCES

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a 3 mL Recipe C18 SPE cartridge with 2 mL MeCN and 2 mL water adjusted to pH 3.0 with sulfuric acid. 1 mL Blood or urine + 10 μL 1 μg/mL IS in MeCN:water 70:30 (pH 3.0) + 2 mL MeOH:1 M zinc sulfate 70:30, vortex for 20 s, centrifuge at 2000 g for 2 min, add the supernatant to the SPE cartridge, wash with 2 mL water, dry cartridge, elute with 400 μL MeCN:pH 3.0 water 90:10, inject a 99 μL aliquot.

HPLC VARIABLES
Column: 150 × 3.9 5 μm Spherical C18 (Waters)
Mobile phase: MeOH:water 90:10
Flow rate: 0.4
Injection volume: 99

Detector: MS, Hewlett-Packard 5989 A quadrupole, type 59980 B particle-beam interface, chemical ionization, reagent gas methane, electron multiplier 2646 V, particle-beam interface 55°, ionization source 250°, quadrupole 100

CHROMATOGRAM
Retention time: 5.2
Internal standard: 32-O-acetyltacrolimus (6.4)
Limit of quantitation: 200 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
SPE

REFERENCE

SAMPLE
Matrix: bulk, formulations
Sample preparation: Bulk. Dissolve 25 mg tacrolimus in 300 μg/mL heptyl p-hydroxybenzoate in EtOH + 25 mL water, let stand for 6 h at room temperature, inject a 10 μL aliquot. Capsules. Extract 10 capsules with 300 μg/mL heptyl p-hydroxybenzoate in EtOH, centrifuge at 1660 g for 10 min, dilute an aliquot of the supernatant with an equal volume of water, let stand for 6 h at room temperature, inject a 10 μL aliquot. Ampules. 2.5 mL Ampule solution + 22.5 mL 300 μg/mL heptyl p-hydroxybenzoate in EtOH + 25 mL water, let stand for 6 h at room temperature, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 TSKgel ODS-80TM (TOSOH)
Mobile phase: THF:isopropanol:water 2:2:5
Column temperature: 50
Flow rate: 0.8
Injection volume: 10
Detector: UV 220

CHROMATOGRAM
Retention time: 10
Internal standard: heptyl p-hydroxybenzoate (14.5)

OTHER SUBSTANCES
Simultaneous: degradation products

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL cyano-bonded silica (J.T.Baker) SPE cartridge with 1 mL MeOH and three 1 mL portions of water. Mix 100 μL serum with 500 μL water. Add to the SPE cartridge and allow to pass through by gravity. Wash three times with 1 mL potions of water and with 1 mL MeOH:water 50:50. Elute with 1 mL MeOH containing 1 mL/L triethylamine. Evaporate the eluate under a stream of nitrogen at 40°, reconstitute the residue in 100 μL mobile phase. Inject a 20 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Zorbax cyano bonded silica
Mobile phase: MeCN:MeOH:phosphate buffer 23:37:40, adjusted to pH 3.5
Column temperature: 45
Flow rate: 0.8
Injection volume: 20
Detector: UV 241

CHROMATOGRAM
Retention time: 5.57
Internal standard: tamoxifen

OTHER SUBSTANCES
Extracted: amiodarone, desethylamiodarone, bepridil, L8040 (Sanofi Recherche), trifluoperazine
Simultaneous: aprindine, bromocriptine, captopril, carbamazepine, chlorpromazine, diltiazem, dimefline, dipyridamole, disopyramide, flecainide, flurazepam, furosemide, imipramine, labetalol, miconazole, nifedipine, norverapamil, procainamide, propafenone, propranolol, quinidine, tocainide, trifluoropromazine, verapamil, warfarin

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL phenyl SPE cartridge with five 1 mL portions of MeCN, 1 mL water, and 1 mL 2.5 mL/L triethylamine in 50 mM pH 3.0 phosphate buffer. 980 μL Plasma + 30 μL MeOH:water 50:50 + 1 mL MeCN, vortex for 1 min, centrifuge at -10° at 2500 g for 1 h. Remove a 1.6 mL aliquot of the supernatant and add it to 400 μL 2% heptanesulfonic acid in 50 mM pH 3.0 KH_2PO_4/phosphoric acid buffer, add to the SPE cartridge, wash with two 100 μL portions of MeCN:buffer 80:20, wash with 50 μL 25 mM sulfuric acid, elute with five 100 μL portions of MeCN:buffer 80:20. Evaporate the eluate to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 100 μL MeCN:buffer 70:30, inject a 10-30 μL aliquot. (Buffer was 5 mM heptanesulfonic acid in 50 mM pH 3.0 phosphate buffer.)

HPLC VARIABLES
Guard column: 20 × 4.6 10 μm Si-100-S Phenyl (BST, Budapest)
Column: 250 × 4.6 10 μm Si-100-S Phenyl (BST, Budapest)
Mobile phase: MeCN:buffer 75:25 (Buffer was 50 mM pH 3.0 KH_2PO_4/phosphoric acid buffer containing 5 mM heptanesulfonic acid and 300 μL/L triethylamine. Temperature of MeCN was 60° and temperature of buffer was 80°.)
Flow rate: 1.2
Injection volume: 10-30

Detector: F ex 257 em 378 following post-column reaction. The column effluent flowed through a 10 m × 0.3 mm ID knitted PTFE coil irradiated by a mercury lamp at 254 nm to the detector.

CHROMATOGRAM
Retention time: 7.03
Internal standard: tamoxifen

OTHER SUBSTANCES
Extracted: panomifene

SAMPLE
Matrix: microsomal incubations
Sample preparation: 2 mL Microsomal incubation + 4 mL MeOH:DMSO 80:20, vortex, centrifuge at 2000 g for 20 min, inject a 100 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Res Elute-BD (Varian)

Mobile phase: MeOH:500 mM ammonium acetate 70:30
Flow rate: 1
Injection volume: 100
Detector: UV 280, MS, VG Quattro BQ tandem quadrupole, API electrospray, capillary 380 V, high voltage electrode 3.78 kV, source 150°, lens 1 and lens 2 80-85 V, positive ion mode, column flow split 1:6 before entering MS, m/z 372

CHROMATOGRAM
Retention time: 51
Limit of detection: 0.2 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
mouse; liver

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.
Column temperature: 30
Flow rate: 2
Detector: UV 210

OTHER SUBSTANCES
Also analyzed: acepromazine, acetaminophen, acetophenazine, albuterol, aminophylline, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, aprobarbital, aspirin, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, benzotropine, benzphetamine, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, danazol, danthron, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine, eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isocarbostyril, isocarboxazid, isoniazid, isoproterenol, isoxsuprine, ivermectin, ketamine, ketoprofen, kynurenic acid, levorphanol, lidocaine, lorazepam, lormetazepam, loxapine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin, mephobarbital, mepivacaine, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, methyltestosterone, methyprylon, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic

acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine, phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, pyrilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, salicylamide, salicylic acid, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfanilamide, sulfapyridine, sulfasoxizole, temazepam, testosterone, tetracaine, tetracycline, tetramisole, thebaine, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tolmetin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, trimethoprim, tripelennamine, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

SAMPLE

Matrix: tissue

Sample preparation: Condition a 3 mL Bond-Elut C2 SPE cartridge with 2 mL MeOH and 2 mL water. Dismembrate (Mikro-dismembrator, Braun, Germany) 50 mg tissue in liquid nitrogen, re-suspend in 1 mL DMSO. Centrifuge at 3000 rpm for 10 min. Add the supernatant to the SPE cartridge, wash with 1 mL water, 1 mL MeOH:water, and 1 mL MeCN. Elute with 1 mL MeOH:1 M NaCl 95:5. Dry eluate under a stream of nitrogen, reconstitute with 400 μL MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 10 mm C18 (Waters)
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeOH:1% pH 9.0 triethylamine 89:11
Flow rate: 1.2
Injection volume: 20
Detector: UV 265

CHROMATOGRAM

Retention time: 11.00
Limit of detection: 20 ng/g

OTHER SUBSTANCES

Extracted: metabolites, cis-tamoxifen

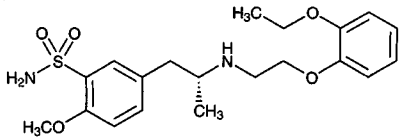
Tamsulosin



Molecular formula: $C_{20}H_{28}N_2O_5S$
Molecular weight: 408.52
CAS Registry No.: 106133-20-4, 80223-99-0 ((±) HCl), 106463-17-6 ((R), HCl), 106463-19-8 ((S) HCl)
Merck Index: 9217

SAMPLE

Matrix: bile, microsomal incubations, urine
Sample preparation: Bile, urine. Inject a 50-200 μL aliquot bile or urine. Microsomal incubations. Mix 1 mL microsomal incubation with 5 mL ethyl acetate, inject an aliquot.

HPLC VARIABLES

Column: 150 × 4.0 5 μm Nucleosil C18
Mobile phase: Gradient. A was 100 mM pH 4.5 KH_2PO_4. B was MeCN:100 mM pH 4.9 KH_2PO_4 20:80. A:B 100:0 for 5 min, to 0:100 over 60 min, maintain at 0:100 for 60 min
Column temperature: 27
Flow rate: 1
Detector: UV 275; Radioactivity

CHROMATOGRAM

Retention time: 80

OTHER SUBSTANCES

Extracted: metabolites

SAMPLE

Matrix: blood
Sample preparation: Add 1 mL saturated sodium bicarbonate solution and 100 μL 2.5 μg/mL IS in water to 1.5 mL plasma, extract with 5 mL ethyl acetate. Remove the organic layer and add it to 2.5 mL 400 mM HCl. Shake, centrifuge, and discard the organic layer. Add 2 mL saturated sodium bicarbonate solution to the aqueous layer and extract again with 5 mL ethyl acetate. Evaporate the organic layer to dryness under reduced pressure, reconstitute the residue with 50 μL 100 mM sodium bicarbonate. Add 100 μL 5 mg/mL dansyl chloride in acetone. Heat at 35° for 90 min. Add 5 mL distilled water and extract with 5 mL diethyl ether. Evaporate the organic layer to dryness at 45°, reconstitute the residue with 60 μL mobile phase. Inject a 20-50 μL aliquot.

HPLC VARIABLES

Column: 250 × 4 Nucleosil SI100-5 (Chemco, Japan)
Mobile phase: MeOH:benzene 1:100 (Caution! Benzene is a carcinogen!)
Injection volume: 20-50
Detector: F ex 352 em 500

CHROMATOGRAM

Internal standard: amosulalol
Limit of quantitation: 500 pg/mL (human), 1.0 ng/mL (rat, dog)

KEY WORDS

plasma; human; rat; dog; pharmacokinetics; normal phase; derivatization

Taurine

Molecular formula: $C_2H_7NO_3S$
Molecular weight: 125.15
CAS Registry No.: 107-35-7
Merck Index: 9241

SAMPLE
Matrix: amniotic fluid
Sample preparation: 200 μL Amniotic fluid + 800 μL MeOH, mix, centrifuge. 200 μL Supernatant + 80 μL pH 9.5 sodium borate + 60 μL reagent, mix, let stand for 3.5 min, add 25 μL 0.5 M HCl, mix, dilute 1:4 with 50 mM pH 7.0 sodium acetate buffer, inject a 20 μL aliquot. (Prepare reagent by dissolving 50 mg o-phthaldialdehyde in 4.5 mL MeOH, add 500 μL pH 9.5 sodium borate, add 50 μL 2-mercaptoethanol.)

HPLC VARIABLES
Guard column: 10-20 × 4 C18
Column: 300 × 3.9 5 μm NovaPak C18
Mobile phase: Gradient. MeOH:50 mM pH 7.0 sodium acetate buffer from 15:85 to 20:80 over 30 min, to 35:65 over 15 min, to 75:25 over 25 min, maintain at 75:25 for 5 min, return to initial conditions over 5 min.
Column temperature: 40
Flow rate: 1
Injection volume: 20
Detector: F ex 330 em 450

CHROMATOGRAM
Retention time: 50

OTHER SUBSTANCES
Extracted: alanine, 2-aminoadipic acid, 2-aminobutyric acid, 3-aminobutyric acid, 4-aminobutyric acid, arginine, asparagine, aspartic acid, citruline, glutamine, glutathione, glutatic acid, glycine, histidine, homoserine, 5-hydroxylysine, isoleucine, leucine, lysine, methionine, ornithine, phenylalanine, saccharopine, serine, threonine, tryptophan, tyrosine, valine

KEY WORDS
derivatization

SAMPLE
Matrix: amniotic fluid, blood, CSF, urine
Sample preparation: Plasma. Condition a 100 mg Bond Elut SCX (propylbenzenesulfonic acid, H^+ form) SPE cartridge with 1 mL 50 mM HCl, 1 mL MeOH, 2 mL water, and 1 mL 50 mM HCl. 100 μL Plasma + 100 μL 250 μM norleucine in 100 mM HCl + 10 mg solid sulfosalicylic acid + 800 μL acetone or MeOH, mix, centrifuge, add a 50 μL aliquot to the SPE cartridge, wash with 2 mL water, elute with two 500 μL portions of MeOH:water:triethylamine 40:40:20, dry the eluate under vacuum, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 20 min, evaporate to dryness

under vacuum, reconstitute with 100 μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot. Dried blood. Add 25 μL 250 μM norleucine in 100 mM HCl to a 6 mm filter paper disc containing dried blood, add 100 μL MeCN, let stand for 30 min, centrifuge, remove a 75 μL aliquot of the supernatant, evaporate to dryness under reduced pressure, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 2 min, evaporate to dryness under vacuum, reconstitute with 50 μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot. Amniotic fluid, CSF. Mix amniotic fluid or CSF with an equal volume of 250 μM norleucine in 100 mM HCl, filter (Centrifree 10000 MW cutoff) while centrifuging at 2200 g. Evaporate a 50 μL aliquot of the ultrafiltrate to dryness under vacuum, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 20 min, evaporate to dryness under vacuum, reconstitute with 50 (CSF) or 100 (amniotic fluid) μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot. Urine. Dilute urine with water to a creatinine concentration of 1 mM, mix an aliquot with an equal volume of 250 μM norleucine in 100 mM HCl, filter (Centrifree 10000 MW cutoff) while centrifuging at 2200 g. Evaporate a 50 μL aliquot of the ultrafiltrate to dryness under vacuum, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 20 min, evaporate to dryness under vacuum, reconstitute with 100 μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 Pico-Tag amino acid column (Waters)
Mobile phase: Gradient. A was MeCN:70 mM pH 6.55 sodium acetate 2.5:97.5. B was MeCN:MeOH:water 45:15:40. A:B 100:0 for 13.5 min, to 97:3 (step gradient), to 94:6 over 10.5 min (Waters curve 8 (slightly concave)), to 91:9 over 6 min (Waters curve 5 (slightly convex)), to 66:34 over 20 min, maintain at 66:34 for 12 min, to 0:100 over 0.5 min, maintain at 0:100 for 4 min, return to initial conditions over 0.5 min.
Column temperature: 46
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 13.82
Internal standard: norleucine (55.07)

OTHER SUBSTANCES

Extracted: α-alanine, alanine, alloisoleucine, β-aminoadipic acid, 4-aminobenzoic acid, gamma-aminobutyric acid, β-amino-n-butyric acid, gamma-amino-n-butyric acid, 4-aminohippuric acid, β-aminoisobutyric acid, 4-aminophenylacetic acid, α-aminophenylacetic acid, 3-amino-3-phenylpropionic acid, δ-amino-n-valeric acid, ammonia, anserine, arginine, asparagine, aspartic acid, aspartylglucosamine, carnosine, citrulline, cystathionine, cysteic acid, cysteine, cysteine-homocysteine (mixed disulfide), cystine, ethanolamine, ethionine, ethylamine, galactosamine, glucosamine, glutamic acid, glutamine, glutathionine (oxidized), glycine, glycylglycine, glycylhistidine, glycylleucine, glycylphenylalanine, glycyltyrosine, histidine, homoarginine, homocitrulline, homoserine, homocystine, 3-hydroxyanthranilic acid, 3-hydroxykynurenine, hydroxyproline, isoleucine, kynurenine, leucine, levodopa, lysine, methionine sulfone, methionine, 3-methylhistidine, 1-methylhistidine, ornithine, phenylalanine, phosphoethanolamine, phosphoserine, proline, sarcosine, serine, serotonin, threonine, tromethamine, tryptophan, tyrosine, valine
Noninterfering: cadaverine, 2-phenylethylamine

KEY WORDS

derivatization; SPE; ultrafiltrate; plasma; dried blood

SAMPLE
Matrix: blood
Sample preparation: Mix plasma with an equal volume of 5% trichloroacetic acid, centrifuge at 12000 rpm for 5 min. Evaporate the supernatant to dryness, reconstitute with 2-methoxyethanol:0.15 N pH 2.65 sodium citrate 7:93, inject an aliquot.

HPLC VARIABLES
Column: 150 × 4 ISC-07/S1504 Li type (strongly acidic cation-exchange resin of styrene-divinylbenzene copolymer with 10% crosslinkage) (Shimadzu)
Mobile phase: Gradient. A was 2-methoxyethanol:0.15 N pH 2.65 sodium citrate 7:93. B was 0.3 N pH 10.0 sodium citrate. C was 200 mM NaOH. A:B:C from 100:0:0 to 95:5:0 over 50 min, to 85:15:0 over 20 min, to 75:25:0 over 10 min, to 55:45:0 (step gradient), maintain at 55:45:0 for 15 min, to 50:50:0 over 10 min, to 40:60:0 (step gradient), to 30:70:0 over 20 min, to 10:90:0 (step gradient), maintain at 10:90:0 for 15 min, to 0:0:100 (step gradient), maintain at 0:0:100 for 5 min. (Parameters are approximate.)
Column temperature: 38° for 40 min, 52° for 65 min, 55° for 20 min, 58° for 10 min, 38° for 50 min
Flow rate: 0.4
Detector: F ex 348 em 450 following post-column reaction. The column effluent mixed with the reagent solution pumped at 0.2 mL/min and the mixture flowed through a 200 × 0.5 stainless steel or PTFE coil at 55°. The effluent from the coil mixed with the fluorescence solution pumped at 0.2 mL/min and flowed through a 2 m × 0.5 mm stainless steel or PTFE coil at 55° to the detector. (Prepare reagent solution by adding 400 μL NaOCl solution (chlorine concentration 10%) to 1 L buffer, discard after 2 weeks. Prepare fluorescence solution by adding 15 mL EtOH containing 1.6 g o-phthalaldehyde and 2.0 g N-acetyl-L-cysteine and 4 mL 10% Brij 35 in water to 980 mL buffer, discard after 1 month. Buffer contained 384 mM sodium carbonate, 216 mM boric acid, and 108 mM potassium sulfate, pH 10.0.)

SAMPLE
Matrix: blood
Sample preparation: Add 100 μL 200 mg/mL 5-sulfosalicylic acid in EtOH to a 1 mL tube, evaporate EtOH at 50° overnight, add 200-500 μL plasma, vortex, freeze in liquid nitrogen, store at -70°, thaw, centrifuge at 4° at 3000 g. 5 μL Supernatant + 20 μL water + 5 μL 1 mM norvaline in water + 90 μL reagent, mix thoroughly, incubate at room temperature for 3 min, add 50 μL neutralizing buffer, inject a 3 μL aliquot. (Prepare reagent stock solution by dissolving 25 mg o-phthalaldehyde in 500 μL MeOH, add 4.5 mL 100 mM pH 10.0 borate buffer, add 25 μL 3-mercaptopropionic acid. At the start of each day prepare reagent by diluting 1 part of stock solution with 20 parts 100 mM pH 10.0 borate buffer. Neutralizing buffer was 400 mM KH_2PO_4 containing 10 mL/L triethylamine.)

HPLC VARIABLES
Guard column: 10 × 2 Chrompack reverse phase
Column: 100 × 4.6 3 μm Microsphere C18 (Chrompack)
Mobile phase: Gradient. A was buffer:water:THF 50:50:0.2. B was MeOH:MeCN:buffer 35:15:50. A:B from 98:2 to 75:25 over 3.5 min, to 56:44 over 1.7 min, to 48:52 over 1.7 min, to 0:100 over 3.1 min, reset to initial conditions over 1 min.
Flow rate: 1.5
Injection volume: 3
Detector: F ex 230 em 389 (cut-off filter)

CHROMATOGRAM
Retention time: 7.6
Internal standard: norvaline (10.3)
Limit of quantitation: 5000 nM

OTHER SUBSTANCES
Extracted: amino acids

KEY WORDS
plasma; derivatization

SAMPLE
Matrix: blood, CSF
Sample preparation: Plasma. For each volume of plasma add 4 volumes of MeOH, centrifuge at 11600 g for 5 min. Remove a 10 μL aliquot and add it to 5 μL phthaldialdehyde/β-mercaptoethanol derivatizing reagent (Fluoraldehyde, Pierce) (use fresh reagent), allow to react at room temperature for 1 min, add 100 μL THF:100 mM sodium acetate 5:95 adjusted to pH 7.2 with glacial acetic acid, inject a 20 μL aliquot. CSF. Add an equal volume of MeOH to the CSF, centrifuge at 11600 g for 5 min. Remove a 10 μL aliquot and add it to 5 μL phthaldialdehyde, allow to react at room temperature for 1 min, add 100 μL THF:100 mM sodium acetate 5:95 adjusted to pH 7.2 with glacial acetic acid, inject a 20 μL aliquot.

HPLC VARIABLES
Guard column: 10 × 3 Spherisorb 5 ODS
Column: 50 × 4.6 Spherisorb 5 ODS
Mobile phase: Gradient. A was THF:100 mM sodium acetate 5:95 adjusted to pH 7.2 with glacial acetic acid. B was MeOH:THF 95:5. A:B from 10:90 to 0:100 over 13 min (sic), maintain at 0:100 for 4 min, return to initial conditions over 1 min.
Column temperature: 43
Flow rate: 1.5
Injection volume: 20
Detector: F (wavelengths not specified)

CHROMATOGRAM
Retention time: 0.5 (Asp), 0.7 (Glu), 1.2 (Taurine), 1.5 (Ser), 1.8 (Gln), 2.2 (His), 2.3 (Gly), 3.0 (Thr), 3.1 (Asn), 3.2 (Ala), 3.3 (Arg), 3.8 (Tyr), 5.2 (Met), 5.4 (Val), 5.8 (Trp), 6.0 (Phe), 5.5 (Ile), 5.7 (Leu), 8.3 (Orn), 8.5 (Lys)
Limit of detection: 10 nM

OTHER SUBSTANCES

SAMPLE
Matrix: blood, food, peptides, plants, tissue
Sample preparation: Hydrolyze peptide with 6 M HCl containing 0.2% 3,3'-thiodipropionic acid at 110° for 24 h, evaporate to dryness, reconstitute with 50-200 μL 0.1% HCl containing 0.2% 3,3'-thiodipropionic acid. Homogenize (Ultra-Turrax) 0.1-1 g food, tissue, plant material, lyophilized plasma, or lyophilized tissue in 10 mL 250 nM IS in 100 mM HCl containing 0.2% 3,3'-thiodipropionic acid at 20000 rpm for 2 min, sonicate for ≤30 min, centrifuge at 5000 g for 20 min, discard fat layer, filter (Millipore ultrafiltration insert (MW cutoff 5000) prewashed with 200 μL 100 mM HCl containing 0.2% 3,3'-thiodipropionic acid) 3 mL supernatant while centrifuging at 3500 g for 1 h. Mix 20 μL deproteinized sample (or 10 μL peptide hydrolysate) with 180 μL buffer, vortex, add 200 μL reagent, mix, heat at 70° for 15 min with mixing at 1 min and 12 min, cool in an ice bath for 5 min, centrifuge at 10000 g for 10 s, add 400 μL diluent, mix thoroughly, centrifuge at 15000 g for 5 min, inject a 10 μL aliquot of the supernatant. (Prepare buffer by dissolving 630 mg sodium bicarbonate in 40 mL water, adjusting pH to 8.6 with NaOH, and making up to 50 mL with water. Prepare reagent by sonicating 40 mg dabsyl chloride in 10 mL acetone for 10 min, then filtering into brown vials and storing at -20°. Prepare diluent by mixing 50 mL MeCN, 25 mL EtOH, and 25 mL mobile phase A.)

HPLC VARIABLES
Guard column: present but not specified
Column: 150 × 3.9 4 μm Novapak C18
Mobile phase: Gradient. A was DMF:9 mM NaH_2PO_4 containing 0.16% triethylamine, adjusted to pH 6.55 with phosphoric acid. B was MeCN:water 80:20. A:B 92:8 for 2 min, to 80:20 over 5 min (Waters convex curve 5), to 65:35 over 28 min (Waters concave curve 7), to 50:50 over 10 min, to 0:100 over 21 min, maintain at 0:100 for 11 min, return to initial conditions over 0.5 min, re-equilibrate for 12.5 min.

SAMPLE
Matrix: blood, tissue, urine

Sample preparation: Urine. Adjust urine to pH 7 with 2 M NaOH or 2 M HCl, dilute 5 (human) or 100 (rat) fold with water. Remove a 1 mL aliquot and add 10 μL triethylamine and 20 mg freshly powdered 3,5-dinitrobenzoyl chloride, shake vigorously on a mechanical shaker for 10 min, add 100 μL 2 M HCl, centrifuge at 1200 g for 5 min. Remove a 200 μL aliquot of the supernatant and dilute it to 5 mL with water, inject a 10-100 μL aliquot. Whole blood. Add 7 volumes of water to whole blood, mix, add 1 volume of 10% sodium tungstate dihydrate solution, mix, add with shaking 1 volume of 333 mM sulfuric acid, shake vigorously (J. Biol. Chem. 1919, 38, 81), centrifuge at 1200 g for 10 min. Remove a 1 mL aliquot of the supernatant and add 10 μL triethylamine and 20 mg freshly powdered 3,5-dinitrobenzoyl chloride, shake vigorously on a mechanical shaker for 10 min, add 100 μL 2 M HCl, centrifuge at 1200 g for 5 min. Remove a 200 μL aliquot of the supernatant and dilute it to 5 mL with water, inject a 10-100 μL aliquot. Tissue. Liver or heart + 7 volumes of water + 1 volume 10% sodium tungstate + 1 volume 330 mM sulfuric acid, homogenize (Potter-Elvehjem, glass pestle), centrifuge at 1200 g for 10 min, dilute 2 (liver) or 5 heart) fold with water. Remove a 1 mL aliquot and add 10 μL triethylamine and 20 mg freshly powdered 3,5-dinitrobenzoyl chloride, shake vigorously on a mechanical shaker for 10 min, add 100 μL 2 M HCl, centrifuge at 1200 g for 5 min. Remove a 200 μL aliquot of the supernatant and dilute it to 5 mL with water, inject a 10-100 μL aliquot.

SAMPLE

Matrix: blood, tissue, urine

Sample preparation: Urine. Centrifuge at 4° at 2500 g for 10 min, add 25-100 μL urine to the SPE column, discard the first 25-100 μL eluate, elute with 4 mL water, add 100 μL 100 μM homoserine to the eluate, add an equal volume of the reagent, let stand for 1.5 min, inject a 5-10 μL aliquot. Liver. Homogenize (polytron) 350-450 mg frozen liver in 4 mL 200 mM sulfosalicylic acid at 4°, centrifuge at 4° at 2500 g for 10 min, add a 25 μL aliquot to the SPE column, elute with 4 mL water, add 100 μL 100 μM homoserine to the eluate, add an equal volume of the reagent, let stand for 1.5 min, inject a 5-10 μL aliquot. Serum. 100 μL Serum + 100 μL 200 mM sulfosalicylic acid, mix at 4°, centrifuge at 4° at 11500 g for 2 min, add a 50 μL aliquot of the supernatant to the SPE column, discard the first 50 μL eluate, elute with 4 mL water, add 100 μL 100 μM homoserine to the eluate, add an equal volume of the reagent, let stand for 1.5 min, inject a 5-10 μL aliquot. Hepatocytes. 500 μL Cell suspension + 500 μL 200 mM sulfosalicylic acid, mix at 4°, centrifuge at 4° at 11500 g for 2 min, add a 200 μL aliquot of the supernatant (or 100 μL of the centrifuged medium) to the SPE column, elute with eight 500 μL aliquots of water, add 100 μL 40 μM homoserine to the eluate, add an equal volume of the reagent, let stand for 1.5 min, inject a 5-10 μL aliquot. (Prepare SPE columns as follows. Wash 100 g 100-200 mesh Dowex 1-X4 (anion-exchange, Cl- form) with three volumes of water to remove fines then with 250 mL 1 M HCl until pH was above 2.5. Wash 100 g 100-200 mesh Dowex 50W-X8 (cation-exhange, H+ form) with three volumes of water to remove fines then with 500 mL 4 M HCl in three washings then with 250 mL 1 M HCl. Prepare a column in a Pasteur pipette with 0.5 mL Dowex 1-X4 on top of 1.5 mL Dowex 50W-X8, wash

with 12 mL water. After use regenerate with 12 mL 1 M HCl. Prepare reagent by adding 40 mg o-phthalaldehyde in 800 μL EtOH and 40 μL 2-mercaptoethanol to 10 mL buffer, dilute the mixture with an equal volume of water. Buffer was 3.1 g boric acid in 90 mL water adjusted to pH 10.4 with 5 M NaOH and made up to 100 mL.)

HPLC VARIABLES
Guard column: 4 × 4 LiChrospher

HPLC VARIABLES
Column: 200 × 3 5 μm Chromspher ODS-2 C18 (Chrompack)
Mobile phase: Gradient. A was 50 mM pH 7.0 sodium phosphate buffer. B was MeOH:THF:water 50:20:30. A:B from 25:75 to 0:100 over 75 min.
Flow rate: 0.5
Injection volume: 50
Detector: F ex 420

CHROMATOGRAM
Retention time: 40

OTHER SUBSTANCES
Simultaneous: amino acids

KEY WORDS
derivatization

REFERENCE
Koning,H.; Wolf,H.; Venema,K.; Korf,J. Automated precolumn derivatization of amino acids, small peptides, brain amines and drugs with primary amino groups for reversed-phase high-performance liquid chromatography using naphthalenedialdehyde as the fluorogenic label, *J.Chromatogr.*, **1990**, *533*, 171–178.

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Kontes micro-ultrasonic cell disrupter) 1-5 mg rat pineal tissue in 200 μL water, add 200 μL 2% picric acid in water (Caution! Picric acid is toxic and explosive when dry!), let stand at room temperature for 5 min, add to the column, rinse the container with three 200 μL portions of water, add the rinses to the column, add 1 mL water to the column, lyophilize the eluate, reconstitute with 100 μL water. Mix an aliquot of this solution with an equal volume of the reagent, let stand for 1 min, inject a 2-6 μL aliquot. (Prepare the column by making a 25 mm layer of Bio-Rad 200-400 mesh 50W-X8 (hydrogen form)ion-exchange resin in a 5 mm diameter column, add a 25 mm layer of 100-200 mesh Bio-Rad AG 1-X8 (chloride form) ion-exchange resin on top of this, wash with 10 mL water just before use. Prepare the reagent by dissolving 20 mg o-phthalaldehyde in 400 μL EtOH, adding 20 μL 2-mercaptoethanol, and adding 10 mL 500 mM pH 10.3 borate buffer. Dilute 1:10 with water before use.)

HPLC VARIABLES
Column: 300 × 3.9 μBondapak alkyl phenyl
Mobile phase: MeOH:buffer 42.75:57.25 (Prepare by mixing A:B in the ratio 43:57. A was prepared by dissolving 6.9 g $NaH_2PO_4.H_2O$ in water, adjusting pH to 5.3 with 5 M NaOH, and making up to 1 L with water. B was prepared by dissolving 6.9 g $NaH_2PO_4.H_2O$ in 250 mL water and making up to 1 L with MeOH.)
Flow rate: 2
Injection volume: 2-6
Detector: F ex 360 em 455

CHROMATOGRAM
Retention time: 4
Limit of quantitation: 600 pg

OTHER SUBSTANCES
Noninterfering: cysteic acid, hypotaurine, phosphoethanolamine

KEY WORDS
rat; pineal; SPE; derivatization

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Polytron for >10 mg; Kontes micro-ultrasonic cell disrupter for <10 mg) tissue with 40 volumes 25 μg/mL β-aminoisobutyric acid in EtOH:water:glacial acetic acid 75:20:5, centrifuge at 4° at 25000 g for 20 min. Remove a 50 μL aliquot of the supernatant and evaporate it to dryness under reduced pressure, suspend the residue in 100 μL 100 mM sodium bicarbonate by sonicating or vortexing, add 200 μL 1.25 mg/mL dansyl chloride in acetone, vortex, heat at 90° for 30 min, centrifuge at 5000 g for 20 min, inject a 4 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 75 × 4.6 3 μm Ultrasphere ODS
Mobile phase: MeCN:water:phosphoric acid 13:87:0.15
Flow rate: 1
Injection volume: 4
Detector: UV 254

CHROMATOGRAM
Retention time: k' 1.26
Internal standard: β-aminoisobutyric acid (k' 9.25)
Limit of quantitation: 10 pmole

OTHER SUBSTANCES
Extracted: amino acids, urea
Interfering: asparagine, methionine

KEY WORDS
rat; brain; derivatization

SAMPLE
Matrix: tissue, dialysate
Sample preparation: Homogenize (Kontes micro-ultrasonic cell disrupter) rat brain with 100 μL 50 mM ice-cold perchloric acid and 10 ng homoserine for 5 s, centrifuge at 4° at 13000 g for 5 min, filter (0.2 μm) the supernatant. Mix 25 μL of the filtrate from the tissue or dialysate (Ringer's) with 50 (tissue) or 12.5 (dialysate) μL working reagent, let stand for 2 min, inject an aliquot. (Prepare the reagent stock solution by dissolving 27 mg o-phthalaldehyde in 1 mL MeOH, add 5 μL β-mercaptoethanol, add 9 mL 100 mM pH 9.3 sodium tetraborate, discard after 5 days. Prepare the working reagent by diluting 1 mL stock solution with 3 mL 100 mM sodium tetraborate, let stand for 24 h before use.)

HPLC VARIABLES
Column: 80 × 4.6 3 μm C18 HR-80 (ESA)
Mobile phase: MeOH:water 28:72 containing 100 mM Na_2HPO_4 and 0.13 mM disodium EDTA adjusted to pH 6.00 (tissue) or pH 6.40 (dialysate) with phosphoric acid. (Prepare by dissolving 14.2 g Na_2HPO_4 and 50 mg disodium EDTA in 720 mL water, add 280 mL MeOH, adjust pH. Recycle mobile phase.)

Flow rate: 1.2
Injection volume: 20
Detector: E, ESA Model 5100A coulometric, model 5011 dual electrode analytical cell preceded by a 0.2 μm carbon filter at -0.4 V and +0.6 V

CHROMATOGRAM
Retention time: 9
Internal standard: homoserine (3.5)

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1-10 mL plasma or urine to the affinity column, wash with 1 mL buffer, elute with three 500 μL portions of 1.5% ammonium hydroxide. Add 100 μL 18% HCl to the eluate, inject a 170 μL aliquot. (Affinity columns consisted of 0.5 mL D-alanyl-D-alanine-ε-aminocaproyl Sepharose CL-6B stored in 100 mM pH 8.5 Tris buffer containing 0.004% sodium merthiolate, equilibrate with buffer before use. After use wash with 5 mL buffer containing 0.004% sodium merthiolate, store at 4°. Buffer was 50 mM NaH_2PO_4 containing 200 mM NaCl adjusted to pH 7.5 with 1 M NaOH. Prepare the column material by coupling D-alanyl-D-alanine to activated CH-Sepharose 4B using ε-aminocaproic acid according to the manufacturer's instructions. 30 mg D-Alanyl-D-alanine in 5 mL 100 mM sodium bicarbonate buffer containing 500 mM NaCl (pH 8) was coupled to 3 mL gel in 1 h, block unreacted ester groups with 1 M ethanolamine hydrochloride at pH 9 for 1 h, wash repeatedly with 100 mM pH 4 sodium acetate buffer containing 500 mM NaCl and 100 mM pH 8 tris-HCl buffer containing 500 mM NaCl (Appl. Biochem. Biotechnol. 1985, 11, 101.).)

HPLC VARIABLES
Guard column: 30 × 4.6 5 μm Nucleosil C18
Column: 100 × 4.6 5 μm Nucleosil C18
Mobile phase: Gradient. A was 10 mM pH 4.9 NaH_2PO_4. B was MeCN:10 mM pH 4.9 NaH_2PO_4 50:50. A:B 78:22 of 0.5 min, to 47:53 over 44 min, maintain at 47:53 for 2 min, to 0:100 over 1.5 min, maintain at 0:100 for 5 min, return to initial conditions over 2 min, re-equilibrate for 5 min.
Flow rate: 1.3
Injection volume: 170
Detector: UV 240

CHROMATOGRAM
Retention time: 9.1 (A3), 28.8 (A2-1), 31.6 (A2-2), 32.8 (A2-3), 37.1 (A2-4), 38.0 (A2-5)
Limit of detection: 100 ng/mL (A2-2)

OTHER SUBSTANCES
Noninterfering: acebutolol, acetaminophen, aspirin, atenolol, benfluorex, chlorazepam, clofibrate, diazepam, furosemide, hydrochlorothiazide, nitrazepam, oxprenolol

KEY WORDS
plasma; SPE; pharmacokinetics

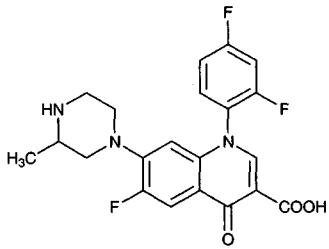
Temafloxacin



Molecular formula: $C_{21}H_{18}F_3N_3O_3$
Molecular weight: 417.39
CAS Registry No.: 108319-06-8, 105784-61-0 (HCl)
Merck Index: 9284
Lednicer No.: 5 125

SAMPLE
Matrix: bile, blood, urine
Sample preparation: Dilute urine 1:20. Dilute bile 1:10. 500 μL Serum, diluted urine, or diluted bile + 3.2 mL dichloromethane, vortex, rotate at 20 rpm for 10 min, centrifuge at 1000 g for 10 min. Remove 3 mL of the lower organic phase and add it to 200 μL 100 mM NaOH, rotate at 20 rpm for 10 min, centrifuge at 1000 g for 10 min, inject a 20 μL aliquot of the aqueous layer.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Ultrasphere C18
Mobile phase: MeCN:buffer 19:81, pH adjusted to 2 with 14.6 M phosphoric acid (Buffer was 10 mM NaH_2PO_4 containing 5 mM tetrabutylammonium bromide.)
Flow rate: 2
Injection volume: 20
Detector: F ex 275 em 450

CHROMATOGRAM
Retention time: 3
Limit of detection: 100 ng/mL (bile), 200 ng/mL (urine), 10 ng/mL (serum)

OTHER SUBSTANCES

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. Mix equal volumes of plasma and 100-500 ng/mL IS in MeCN: 75 mM pH 7.4 phosphate buffer containing 0.5% sodium dodecyl sulfate 30:70, filter (Amicon Centrifree with YMT membrane) while centrifuging at less than 1000 g for 20 min, inject an aliquot of the ultrafiltrate. Alternatively, mix 400 μL plasma and 400 μL 500 mM pH 7 phosphate buffer, add 6 mL dichloromethane:EtOH 90:10, shake slowly horizontally for 10 min, centrifuge in a refrigerated centrifuge at 900 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of air at 50-60°, reconstitute the residue in mobile phase, inject an aliquot. Urine. Dilute urine 20-100 fold with mobile phase containing IS, inject an aliquot. Hydrolyze conjugates by heating urine in 1 M NaOH at 60° for 30 min, neutralize, dilute 20-100 fold with mobile phase containing IS, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 7 μm Adsorbosphere HS C18
Mobile phase: MeCN:water 53:47 containing 40 mM phosphoric acid, 10 mM NaH_2PO_4, 0.2% sodium dodecyl sulfate, and 5 mM N-acetylhydroxamic acid
Flow rate: 1.5
Injection volume: 50
Detector: F ex 280 em 389 (or UV 280, Antimicrob. Agents Chemother. 1991, 35, 436)

CHROMATOGRAM
Retention time: 7.5
Internal standard: 1-(4-bromophenyl)-6-fluoro-1,4-dihydro-7-(4-methyl-1-piperazinyl)-oxo-3-quinoline carboxylic acid (A57084) (8.5)
Limit of quantitation: 1 ng/mL (extraction), 10 ng/mL (ultrafiltrate)

OTHER SUBSTANCES
Extracted: metabolites

SAMPLE
Matrix: blood, urine
Sample preparation: 1 mL Serum or 500 μL urine + 500 μL 1 M ammonium acetate + 5 mL dichloromethane, shake vigorously for 10 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 500 μL MeOH:thionyl chloride 90:10, heat at 60° for 30 min, evaporate to dryness under a stream of nitrogen at 40°, add 500 μL 500 mM sulfuric acid, add 1 mL hexane, shake vigorously for 10 min, centrifuge for 5 min. Remove the aqueous layer and add it to 1 mL 2 M sodium carbonate and 3 mL ether, shake vigorously for 10 min, centrifuge for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 20 μL 2 mg/mL (S)-(-)-N-1-(2-naphthylsulfonyl)-2- pyrrolidinecarbonyl chloride in dichloromethane, add 5 μL triethylamine, let stand at room temperature for 10 min. Evaporate to dryness under a stream of nitrogen, reconstitute the residue in 500 μL dichloromethane, inject a 50 μL aliquot. (No details of synthesis of chiral reagent given in paper.)

HPLC VARIABLES
Column: 150 × 4.6 Zorbax SIL
Mobile phase: Hexane:methyl acetate:MeOH:aqueous ammonia 150:100:10:1
Flow rate: 0.8
Injection volume: 50
Detector: UV 280

CHROMATOGRAM
Retention time: 18.5 (S), 19.5 (R)
Limit of detection: 5 ng/mL

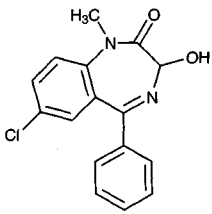
Temazepam



Molecular formula: $C_{16}H_{13}ClN_2O_2$
Molecular weight: 300.74
CAS Registry No.: 846-50-4
Merck Index: 9285
Lednicer No.: 2 402

SAMPLE
Matrix: bile, blood, gastric contents, tissue, urine
Sample preparation: Chop 5-g tissue and homogenize (Ultra Turrax T25) at 8500, 9500, 13500, 20500, and 24000 rpm for 1 min each. Add homogenate to 20 mL water. Dilute blood, urine, gastric contents, and bile four times with water. Mix 4 mL sample with 10 μL 1 mg/mL prazepam and 1 mL pH 7.4 phosphate buffer, vortex briefly, add 4 mL diethyl ether and mix for 15 min (Spiramix 10, Denley, UK). Separate the organic layer, add 4 mL diethyl ether to extraction sample, mix. Evaporate combined organic layers to dryness under a stream of dry air at 50°. Purify extracts by partition between 1 mL MeCN and 2 mL heptane, separate MeCN layer, evaporate it to dryness, reconstitute the residue in 100 μL MeOH and inject a 20 μL aliquot of the solution.

HPLC VARIABLES
Guard column: 20 × 4.6 5 μm Apex II ODS
Column: 150 × 4.6 5 μm Apex II ODS
Mobile phase: MeCN:MeOH:10 mM phosphoric acid:10 mM Na_2HPO_4 40:20:36:4
Flow rate: 1
Injection volume: 20
Detector: UV 240

CHROMATOGRAM
Retention time: 4.8
Internal standard: prazepam (14.5)
Limit of quantitation: 100 ng/mL

SAMPLE
Matrix: blood
Sample preparation: 200 mg Extrelut + 400 µL blood + 100 µL 50 µg/mL IS in MeOH, mix, let dry at room temperature for 1-2 h. Add to a 30 × 4.6 stainless steel extraction column, extract with carbon dioxide:ethyl acetate 95:5 at 2 mL/min, 65°, and 300 psi. for 10 min, collect by expansion into MeOH. Dry the collected extract at 65° under nitrogen. Reconstitute the residue in 50 µL mobile phase. Inject a 20 µL aliquot. Condition ca. 10 g Extrelut in a 10 mL plastic syringe with dichloromethane. Add 250 µL 5% ammonia to the top. Mix 900 µL blood with 100 µL 50 µg/mL IS in MeOH. Add 1 mL pH 4 phosphate buffer and 250 µL 5% ammonia solution, mix thoroughly, add to the extraction column. After 5 min elute with diethyl ether under the influence of gravity. Collect 8 mL eluate, evaporate to dryness at 65° under nitrogen. Reconstitute the residue in 180 µL mobile phase, inject a 20 µL aliquot.

HPLC VARIABLES
Guard column: 20 × 4.6 5 µm Hypersil ODS
Column: 250 × 4.6 5 µm Hypersil ODS

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 10 μL 1 mg/mL etoposide in MeOH + 5 mL chloroform, rock gently for 15 min, centrifuge. Remove 4.5 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, dissolve residue in 50 μL MeOH, vortex, centrifuge for 5-10 min, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeOH:water 60:40
Flow rate: 1-1.2
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 7.5
Internal standard: etoposide (5)
Limit of quantitation: 500 ng/mL

KEY WORDS

SAMPLE
Matrix: blood
Sample preparation: Mix plasma or serum with an equal volume of proteinase K, let stand for 10 min. (Alternatively, heat serum or plasma with an equal volume of 1 mg/mL subtilisin A at 50° for 15 min.) Inject 1.6 mL hydrolyzed blood or filtered serum on to column A with mobile phase A at 1 mL/min, backflush column A with mobile phase A to waste for 2 min at 2 mL/min, backflush the contents of column A on to column B with mobile phase B, after 30 s remove column A from the circuit, elute column B with mobile phase B, monitor the effluent from column B. (Clean column A by backflushing with MeOH at 2 mL/min for 3 min then forward flush with water at 1 mL/min for 2 min.)

HPLC VARIABLES
Column: A 2 × 4.6 10 μm PRP-1 divinylbenzene-styrene copolymer (Hamilton); B 125 × 4 10 μm LiChrosorb RP-18
Mobile phase: A water; B MeOH:water 55:45
Flow rate: A 1-2; B 1
Injection volume: 1600
Detector: F ex 230 em 328 following post-column extraction. The column effluent mixed with dichloroethane pumped at 0.6 mL/min, the mixture flowed through a 2 mm i.d. glass reactor (Technicon) to a phase separator (Technicon (J.Chromatogr. 1979, 185, 473)) with a PTFE insert and 0.3 mL/min of the organic phase flowed through the detector.

CHROMATOGRAM
Retention time: 8

OTHER SUBSTANCES
Extracted: etoposide

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 12.733

KEY WORDS
whole blood

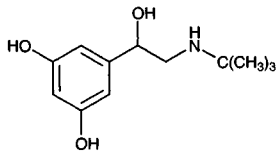
Terbutaline



Molecular formula: $C_{12}H_{19}NO_3$
Molecular weight: 225.29
CAS Registry No.: 23031-25-6, 23031-32-5 (sulfate)
Merck Index: 9302

SAMPLE
Matrix: blood
Sample preparation: Condition a Bond-Elut C18 SPE cartridge with MeCN and water. 1 mL Plasma + 1 mL 20 mM pH 9.0 Na_2HPO_4, mix, add to the SPE cartridge, wash with 5 column volumes of water, dry the SPE cartridge for 5 min, wash with 3 mL dichloromethane:n-butanol 97:3, elute with two 1 mL portions of 0.09% HCl in MeCN, evaporate the eluate to dryness under a stream of nitrogen at 37°, dissolve the residue in 300 μL mobile phase, inject a 200 μL aliquot. (To hydrolyze 3-O-metaproterenol sulfate mix 1 mL plasma and 200 μL 2 μg/mL terbutaline sulfate, add 1 mL 6% trichloroacetic acid, vortex, centrifuge at 1000 g for 15 min. Remove the supernatant and add it to 200 μL 2 M HCl, heat at 65° for 90 min, cool, adjust pH to 10 with 400 μL 2 M carbonate buffer, proceed as above.)

HPLC VARIABLES
Column: 250 × 4.9 5 μm Spherisorb C8
Mobile phase: MeCN:buffer:water 4:1.5:94.5
Flow rate: 1.8
Injection volume: 200
Detector: F ex 200 em 300 (cut-off filter)

CHROMATOGRAM
Retention time: 14.8
Internal standard: terbutaline

OTHER SUBSTANCES
Extracted: metaproterenol

KEY WORDS
SPE; plasma; terbutaline is IS

SAMPLE
Matrix: blood
Sample preparation: Condition a Bond Elut Si SPE cartridge by washing twice with 1 mL MeOH, twice with 1 mL water, and once with 1 mL 100 mM pH 9.2 K_2HPO_4. Add 1 mL plasma + 100 μL 500 ng/mL atenolol in water, wash twice with 1 mL water, centrifuge at 1000 g for 5 min, elute with 1 mL MeOH. Evaporate MeOH to dryness at 40° under a stream of air and dissolve residue in 200 μL mobile phase, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Spherisorb S5 SCX
Mobile phase: MeOH:MeCN:water 40:40:20 containing 0.2% perchloric acid (apparent pH 1.7)
Flow rate: 1.5
Injection volume: 100
Detector: F ex 200 no emission filter

CHROMATOGRAM
Retention time: 7
Internal standard: atenolol (13)
Limit of detection: 2500 ng/mL

OTHER SUBSTANCES
Extracted: albuterol
Noninterfering: aminophylline, beclomethasone, cloprednol, dexamethasone, fenoterol, ipratropium bromide, methylprednisolone, orciprenaline, prednisolone, reproterol, rimiterol, salmeterol, sodium cromoglycate, theophylline

Flow rate: 0.7-1
Injection volume: 20
Detector: UV 278

KEY WORDS

chiral; α = 1.28 for enantiomers

REFERENCE

Cleveland,T. Pirkle-concept chiral stationary phases for the HPLC separation of pharmaceutical racemates, *J.Liq.Chromatogr.*, **1995**, *18*, 649–671.

SAMPLE

Matrix: solutions
Sample preparation: Inject an aliquot of a 200 μM solution in MeOH.

HPLC VARIABLES

Column: 100 × 4.7 7 μm Hypercarb (Shandon)
Mobile phase: MeOH containing 5 mM N-benzyloxycarbonylglycyl-L-proline and 4.5 mM NaOH
Column temperature: 17
Injection volume: 20
Detector: UV 270

CHROMATOGRAM

Retention time: k' 3.6 (first enantiomer)

KEY WORDS

chiral; α = 1.17

REFERENCE

SAMPLE

Matrix: solutions

HPLC VARIABLES

Column: 250 × 4.6 5 μm Supelcosil LC-DP (A) or 250 × 4 5 μm LiChrospher 100 RP-8 (B)

Mobile phase: MeCN:0.025% phosphoric acid:buffer 25:10:5 (A) or 60:25:15 (B) (Buffer was 9 mL concentrated phosphoric acid and 10 mL triethylamine in 900 mL water, adjust pH to 3.4 with dilute phosphoric acid, make up to 1 L.)
Flow rate: 0.6
Injection volume: 25
Detector: UV 229

CHROMATOGRAM
Retention time: 5.62 (A), 3.27 (B)

OTHER SUBSTANCES
Also analyzed: acebutolol, acepromazine, acetaminophen, acetazolamide, acetophenazine, albuterol, alprazolam, amitriptyline, amobarbital, amoxapine, antipyrine, atenolol, atropine, azatadine, baclofen, benzocaine, bromocriptine, brompheniramine, brotizolam, bupivacaine, buspirone, butabarbital, butalbital, caffeine, carbamazepine, cetirizine, chlorcyclizine, chlordiazepoxide, chlormezanone, chloroquine, chlorpheniramine, chlorpromazine, chlorpropamide, chlorprothixene, chlorthalidone, chlorzoxazone, cimetidine, cisapride, clomipramine, clonazepam, clonidine, clozapine, cocaine, codeine, colchicine, cyclizine, cyclobenzaprine, dantrolene, desipramine, diazepam, diclofenac, diflunisal, diltiazem, diphenhydramine, diphenidol, diphenoxylate, dipyridamole, disopyramide, dobutamine, doxapram, doxepin, droperidol, encainide, ethidium bromide, ethopropazine, fenoprofen, fentanyl, flavoxate, fluoxetine, fluphenazine, flurazepam, flurbiprofen, fluvoxamine, furosemide, glutethimide, glyburide, guaifenesin, haloperidol, homatropine, hydralazine, hydrochlorothiazide, hydrocodone, hydromorphone, hydroxychloroquine, hydroxyzine, ibuprofen, imipramine, indomethacin, ketoconazole, ketoprofen, ketorolac, labetalol, levorphanol, lidocaine, loratadine, lorazepam, lovastatin, loxapine, mazindol, mefenamic acid, meperidine, mephenytoin, mepivacaine, mesoridazine, metaproterenol, metformin, methadone, methdilazine, methocarbamol, methotrexate, methotrimeprazine, methoxamine, methyldopa, methylphenidate, metoclopramide, metolazone, metoprolol, metronidazole, midazolam, moclobemide, morphine, nadolol, nalbuphine, naloxone, naphazoline, naproxen, nifedipine, nizatidine, norepinephrine, nortriptyline, oxazepam, oxycodone, oxymetazoline, paroxetine, pemoline, pentazocine, pentobarbital, pentoxifylline, perphenazine, pheniramine, phenobarbital, phenol, phenolphthalein, phentolamine, phenylbutazone, phenyltoloxamine, phenytoin, pimozide, pindolol, piroxicam, pramoxine, prazepam, prazosin, probenecid, procainamide, procaine, prochlorperazine, procyclidine, promazine, promethazine, propafenone, propantheline, propiomazine, propofol, propranolol, protriptyline, quazepam, quinidine, quinine, racemethorphan, ranitidine, remoxipride, risperidone, salicylic acid, scopolamine, secobarbital, sertraline, sotalol, spironolactone, sulfinpyrazone, sulindac, temazepam, terfenadine, tetracaine, theophylline, thiethylperazine, thiopental, thioridazine, thiothixene, timolol, tocainide, tolbutamide, tolmetin, trazodone, triamterene, triazolam, trifluoperazine, triflupromazine, trimeprazine, trimethoprim, trimipramine, verapamil, warfarin, xylometazoline, yohimbine, zopiclone

Molecular formula: $C_{19}H_{24}O_3$
Molecular weight: 300.40
CAS Registry No.: 968-93-4
Merck Index: 9321
Lednicer No.: 1 160

SAMPLE
Matrix: blood, urine
Sample preparation: 500 μL Plasma or urine + 25 μL 10 μg/mL testosterone in MeOH + 4 mL dichloromethane, shake for 15 min, centrifuge at 2000 g for 5 min. Remove the lower organic layer and evaporate it to dryness under a stream of air at 40°, reconstitute the residue in 150-300 (plasma) or 300-500 (urine) μL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES
Guard column: 70 × 3 30-38 μm Co:Pell ODS
Column: 250 × 4.6 5 μm Zorbax C8
Mobile phase: MeCN:0.1% acetic acid 40:60
Flow rate: 1.2

Injection volume: 100
Detector: UV 242

CHROMATOGRAM
Retention time: 9.2
Internal standard: testosterone (13.6)
Limit of detection: 20 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
plasma; pharmacokinetics

REFERENCE
Pascucci,V.L.; Yeager,R.L.; Sherins,R.J.; Clark,R.V.; Gallelli,J.F.; Chatterji,D.C. Quantitation of testolactone and 4,5-dihydrotestolactone in plasma and urine using high-performance liquid chromatography, *J.Chromatogr.*, **1983**, *277*, 79–85.

SAMPLE
Matrix: formulations
Sample preparation: Tablets. Weigh out finely-powdered tablets equivalent to about 50 mg testolactone, add 30 mL MeOH, shake vigorously for 30 min, make up to 50 mL with water, mix well, filter. Remove a 20 mL aliquot of the filtrate and mix it with 20 mL 1 mg/mL propylparaben in MeOH, make up to 100 mL with MeOH, mix, inject a 10 μL aliquot. Suspensions. Measure out an amount of suspension equivalent to about 100 mg of testolactone, add 60 mL MeOH, make up to 100 mL with water, mix well, filter (if necessary). Remove a 20 mL aliquot and mix it with 20 mL 1 mg/mL propylparaben in MeOH, make up to 100 mL with MeOH, mix, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 10 μm RP-8 (Brownlee)
Mobile phase: MeOH:water 55:45
Flow rate: 1.75
Injection volume: 10
Detector: UV 240

CHROMATOGRAM
Retention time: k' 1.89
Internal standard: propylparaben (k' 4.78)
Limit of detection: 0.1% (of testolactone)

OTHER SUBSTANCES
Simultaneous: impurities, degradation products, benzyl alcohol, 11-deoxycortisol, progesterone, testosterone

KEY WORDS
tablets; suspensions

SAMPLE
Matrix: formulations
Sample preparation: Oils. 1 mL Sample + 25 mL MeOH:water 90:10, shake vigorously for 5 min, centrifuge, inject a 10 μL aliquot of the supernatant. Tablets. Grind a tablet to a fine powder, add 25 mL MeOH, sonicate for 5-10 min, filter (0.45 μm), discard first 5 mL of filtrate, inject a 10 μL aliquot of the remaining filtrate. Suspensions (aqueous). Make up 5 mL to 50 mL with MeOH, filter (0.45 μm), discard first 5 mL of filtrate, inject a 10 μL aliquot of the remaining filtrate.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Zorbax ODS
Mobile phase: MeOH:water 75:25
Flow rate: 1.5
Injection volume: 10
Detector: UV 240

CHROMATOGRAM
Retention time: 2.9
Limit of detection: 5 μg/mL

OTHER SUBSTANCES
Simultaneous: fluoxymesterone, norethindrone, oxandrolone (UV 210), boldenone, ethisterone, methandrostenolone, nandrolone, norgestrel, testosterone, dehydroepiandrosterone (UV 210), mibolerone, methyltestosterone, methandriol (UV 210), norethindrone acetate, calusterone, mesterolone (UV 210), norethandrolone, trenbolone acetate, benzyl benzoate, nandrolone acetate, testosterone acetate, stanozolol, oxymetholone, nandrolone propionate, methenolone acetate, testosterone propionate
Interfering: aspirin, caffeine, formebolone, benzyl alcohol, cortisone

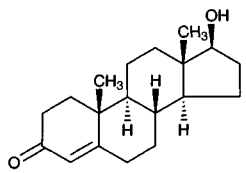
Testosterone



Molecular formula: $C_{19}H_{28}O_2$
Molecular weight: 288.43
CAS Registry No.: 58-22-0, 53608-96-1 (17-chloral hemiacetal), 58-20-8 (17β-cypionate), 315-37-7 (enanthate), 668-56-4 (nicotinate), 5704-03-0 (phenylacetate), 57-85-2 (propionate), 5874-98-6 (ketolaurate)
Merck Index: 9322
Lednicer No.: 1 172

SAMPLE
Matrix: blood
Sample preparation: Condition a Bond-Elut C18 SPE cartridge with MeOH and water. Add 500 μL plasma to the SPE cartridge, wash with 2 mL water, wash with 2 mL MeOH:water 20:80, elute with two 500 μL aliquots of MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 50 μL MeOH:water 20:80, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 100 × 1 5 μm Hypersil ODS
Mobile phase: MeCN:MeOH:water 25:25:50
Flow rate: 0.1
Injection volume: 20
Detector: UV (wavelength not given)

CHROMATOGRAM
Retention time: 6
Limit of detection: 2 ng/mL

OTHER SUBSTANCES
Extracted: androstenedione, 20α-hydroxy-4-pregnen-3-one, 17α-hydroxyprogesterone, norethindrone, progesterone

KEY WORDS
microbore; rat; plasma; SPE

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a Bond-Elut C18 SPE cartridge with two 500 μL portions of MeOH and two 500 μL portions of water. 1 mL Plasma or urine + 1 mL water, add to the SPE cartridge, let stand for 2 min, wash with two 1 mL portions of water, wash with two 1 mL portions of MeOH:water 10:90, elute with 1 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute with 50 μL dry benzene (Caution! Benzene is a carcinogen!), add 5 mg potassium carbonate, add 50 μL 200 mM salicylic acid chloride in dry benzene, add 50 μL 250 mM 18-crown-6 in dry benzene, shake, heat at 70° for 1 h, cool, centrifuge, evaporate to dryness under a stream of nitrogen, reconstitute with 100 μL mobile phase, inject a 20 μL aliquot on to column A and elute to waste with mobile phase A, after 8 min elute the contents of column A on to column B with mobile phase B, elute with mobile phase B, monitor the effluent from column B. (Prepare salicylic acid chloride by stirring 27.5 g freshly distilled thionyl chloride in 30 mL dry benzene at 0° (Caution! Benzene is a carcinogen!), protect the reaction with a calcium chloride drying tube and a nitrogen atmosphere, add 25 g sodium salicylate, stir at 0° for 1 h, remove solvent by vacuum distillation, take up the residue in 50 mL dry petroleum ether, stir for 15 min, centrifuge. Remove the petroleum ether layer and evaporate it to give salicylic acid chloride.)

HPLC VARIABLES
Column: A 5 × 4 35-40 μm RP8 Perisorb (Merck); B 100 × 4.6 Spheri 5 RP8

Mobile phase: A MeOH:water 30:70; B MeOH:water 70:30 containing 2 g/L lithium perchlorate trihydrate and 2 mL/L glacial acetic acid
Flow rate: A 0.8; B 1
Injection volume: 20
Detector: E, LKB (Bromma) 2143, glassy carbon electrode +1.0 V, palladium reference electrode

CHROMATOGRAM
Retention time: 10
Limit of quantitation: 12.5 ng/mL

OTHER SUBSTANCES
Extracted: androsterone

KEY WORDS
derivatization; plasma; SPE; column-switching

REFERENCE

SAMPLE
Matrix: solutions
Sample preparation: Dissolve in MeOH at a concentration of 100 μg/mL, inject a 5 μL aliquot.

HPLC VARIABLES
Guard column: 70 × 2.1 CO:Pell ODS
Column: 300 × 3.9 Bondex C18 (Phenomenex)
Mobile phase: MeOH:water 85:15
Flow rate: 1
Injection volume: 5
Detector: UV 254

CHROMATOGRAM
Retention time: 4.5 (testosterone), 6 (testosterone acetate), 8 (testosterone propionate), 13 (testosterone benzoate), 19 (testosterone enanthate), 21 (testosterone cypionate)

OTHER SUBSTANCES
Simultaneous: boldenone acetate, nandrolone propionate, boldenone benzoate, nandrolone phenylpropionate

REFERENCE
Noggle,F.T.,Jr.; Clark,C.R.; DeRuiter,J. Liquid chromatographic and mass spectral analysis of the anabolic 17-hydroxy steroid esters, *J.Chromatogr.Sci.*, **1990**, *28*, 263–268.

SAMPLE
Matrix: solutions
Sample preparation: Inject an aliquot of a 100 μg/mL solution in MeOH.

HPLC VARIABLES
Guard column: 70 × 2.1 Whatman CO:Pell ODS
Column: 300 × 3.9 Bondex C18
Mobile phase: MeOH:water 70:30
Flow rate: 1
Injection volume: 5
Detector: UV 254

CHROMATOGRAM
Retention time: 8

OTHER SUBSTANCES
Simultaneous: methyltestosterone, nandrolone, methandrostenolone, boldenone, danazol, fluoxymesterone

REFERENCE
Noggle,F.T.,Jr.; Clark,C.R.; DeRuiter,J. Liquid chromatographic and spectral analysis of the 17-hydroxy anabolic steroids, *J.Chromatogr.Sci.*, **1990**, *28*, 162–166.

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 150 × 6 5 μm Shim-pack CLC-ODS
Mobile phase: MeOH:THF:water 26:18:56
Column temperature: 48
Flow rate: 1
Injection volume: 20
Detector: UV 240

CHROMATOGRAM
Retention time: 11.5

OTHER SUBSTANCES
Simultaneous: cortisone, estriol, cortisol, corticosterone, 11-deoxycortisol, androstenedione, prednisone acetate, 11-deoxycorticosterone, 17α-hydroxyprogesterone, dexamethasone acetate, estradiol, estrone, progesterone

REFERENCE

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 0.5 mg/mL solution in MeOH, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 150 mM phosphoric acid and 50 mM triethylamine. B was MeCN: water 80:20 containing 150 mM phosphoric acid and 50 mM triethylamine. A:B 100:0 for 2.2 min then to 0:100 over 30 min.
Column temperature: 30
Flow rate: 2
Injection volume: 5
Detector: UV 210

CHROMATOGRAM
Retention time: 22.9 (testosterone), 30.7 (testosterone propionate)

OTHER SUBSTANCES
Simultaneous: acetaminophen, aprobarbital, butabarbital, chlordiazepoxide, chloroxylenol, chlorpromazine, clenbuterol, cortisone, danazol, doxapram, fluoxymesterone, mefenamic acid, methyltestosterone, nicotine, oxazepam, phentermine, phenylpropanolamine, progesterone, sulfamethazine, sulfanilamide, tranylcypromine, tripelennamine
Interfering: (with testosterone) diflunisal, estrone

KEY WORDS
details for purification of triethylamine in paper

REFERENCE

SAMPLE
Matrix: tissue
Sample preparation: 1 g Tissue + 10 mL Chloroform:MeOH 2:1, homogenize for 1 min (Polytron setting 5), filter, rinse tube with an additional 10 mL chloroform:MeOH, filter, combine filtrates, add 4 mL water, vortex for 1 min, centrifuge at 600 g for 10 min. Remove organic layer and dry it under air at 40°. Reconstitute with 200 μL MeOH, add to an activated Sep-Pak C18 cartridge, wash tube onto cartridge with 200 μL MeOH, elute with 5 mL each 0, 25, 50, 75, 100% MeOH, collect 5 mL fractions, inject a 100 μL aliquot of each fraction. (Elutes in 75% MeOH fraction.)

HPLC VARIABLES
Guard column: in line guard column
Column: 80 mm long 10 μm μBondapak C18 radially compressed
Mobile phase: MeCN:water 45:55
Flow rate: 3
Injection volume: 100
Detector: UV 254

CHROMATOGRAM
Retention time: 5.05
Limit of quantitation: 1000 ng/g

OTHER SUBSTANCES
Simultaneous: methyltestosterone

KEY WORDS

SAMPLE
Matrix: tissue
Sample preparation: Dry pack 60 × 8 mm glass columns with 250 mg Carbopack B (200-400 mesh) and 60 × 4 mm glass columns with 50 mg Amberlite CG-400 I (100-200 mesh). Wash Carbopack column with 5 mL MeOH, 15 mL dichloromethane:MeOH 70:30, and MeOH:water 85:15. Wash Amberlite column with 3 mL 0.5 M NaOH, 8 mL dichloromethane:MeOH 70:30, 1 mL water, and 3 mL 1 M HCl. Repeat this cycle 4 times. Finally pass through 20 mL 50 mM NaOH then 1 mL water. Keep column in water. (Process converts Amberlite to OH form.) Homogenize 1 g of tissue in 5 mL MeOH, sonicate 5 min, centrifuge at 6000 rpm for 10 min. Add another 5 mL MeOH to pellet and repeat. Combine supernatants, make up to 6.8 mL with MeOH, add 1.2 mL water. Pass through Carbopack column, wash column with 2 mL MeOH: water 85:15 then 2 mL MeOH, elute column with 8 mL dichloromethane:MeOH 70:30. Pass eluate onto Amberlite column, add 1 mL MeOH to column, collect all eluates from column,

evaporate to dryness under nitrogen at 40°, take up in 200 μL MeOH:water 50:50, add 25 μL 10 μg/mL p-chlorophenol, inject 50 μL aliquot.

HPLC VARIABLES
Guard column: 20 × 4.6 5 μm Supelguard LC-18
Column: 250 × 4.6 5 μm Supelco C18
Mobile phase: Gradient. MeCN:water from 40:60 to 65:35 in 30 min
Flow rate: 1.2
Injection volume: 50
Detector: UV 242

CHROMATOGRAM
Retention time: 11
Internal standard: p-chlorophenol (7)
Limit of detection: 1 ng/g

OTHER SUBSTANCES
Simultaneous: trenbolone, progesterone

KEY WORDS
muscle; liver; chicken; ox; SPE

SAMPLE
Matrix: blood
Sample preparation: 100 μL Plasma + 100 μL 20 μg/mL propentofylline + 8 mL dichloromethane, shake for 20 min, centrifuge at 2500 rpm for 20 min. Remove 7 mL of the organic layer and evaporate it to dryness under nitrogen or at 60°. Dissolve residue in 200 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 6 Shimpack CLS-ODS (Shimadzu)
Mobile phase: MeCN:MeOH:0.5 mM phosphoric acid 23:20:57
Column temperature: 40
Flow rate: 1.5
Injection volume: 20
Detector: UV 290

CHROMATOGRAM
Internal standard: propentofylline

KEY WORDS
plasma; rat

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 313

CHROMATOGRAM
Retention time: 6.16
Limit of detection: <120 ng/mL

KEY WORDS

SAMPLE

Matrix: blood, urine

Sample preparation: Urine. Adjust pH of urine to 5 before freezing. Adjust pH of 5 mL urine to 9.5 with borax buffer, extract twice with 7 mL portions of dichloromethane. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 60°, reconstitute the residue in 1 mL MeOH, inject a 20-100 μL aliquot. Blood. Adjust pH of 4 mL plasma or whole blood to 9.5 with borax buffer, extract twice with 7 mL portions of dichloromethane. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 60°, reconstitute the residue in 0.2-2 mL MeOH, inject a 125 μL aliquot.

HPLC VARIABLES

Column: 10 μm Radial Pak C18

Mobile phase: MeCN:16.5 mM triethylamine 85:15, pH adjusted to 3 with concentrated phosphoric acid

Flow rate: 2

Injection volume: 20-125

Detector: UV 288

CHROMATOGRAM

Internal standard: tetracaine

Limit of detection: 10 ng/mL (urine), 1 ng/mL (plasma)

OTHER SUBSTANCES
Extracted: procaine

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 312.8

CHROMATOGRAM
Retention time: 13.69

KEY WORDS
whole blood

SAMPLE
Matrix: eggs, tissue
Sample preparation: Prepare a metal chelate affinity chromatography (MCAC) column by adding 1.5 mL of thoroughly mixed Chelating Sepharose Fast-Flow suspension in EtOH:water 20:80 (Pharmacia) to a 150 × 10 glass column, allow to drain, wash with three 2 mL portions of water, add 2 mL 10 mM copper(II) sulfate in water, wash with two 2 mL portions of water. Condition an SBD-RPS extraction membrane (3M Company, St. Paul, MN) with 2 mL MeOH and 2 mL 100 mM HCl. Add 20 mL 100 mM pH 4.0 sodium succinate buffer to 3 g pig kidney, pig muscle, cow liver, or whole chicken egg, vortex for 1 min and shake for 10 min on a horizontal shaker. Add 20 mL MeOH, sonicate for 5 min and centrifuge at 2666 g for 10 min at 4°. Filter the supernatant through a Whatman 541 filter paper. Add the clear supernatant to the MCAC column. Wash sequentially with 2 mL 100 mM sodium succinate buffer, 2 mL water, 2 mL MeOH, 2 mL water, and with 500 μL McIlvaine-EDTA-NaCl buffer. Elute with 3 mL McIlvaine-EDTA-NaCl buffer and adjust the eluate to pH 1.3 with 400 μL 4 M HCl. Add the eluate directly to the extraction membrane to prevent crystallization of EDTA. Wash the membrane with 1 mL 100 mM HCl and elute with four 250 μL portions of MeOH:25% ammonia 97:3, evaporate the eluate to dryness under the nitrogen at 40°. Reconstitute the dry residue with 250 μL 10 mM oxalic acid in water, vortex, sonicate. Inject a 100 μL aliquot. (The sodium succinate buffer was 100 mM succinic acid, pH adjusted to 4.0 with 10 M NaOH. Prepare the McIlvaine buffer by dissolving 12.9 g citric acid monohydrate and 10.9 g Na_2HPO_4 in 1 L water. The McIlvaine-EDTA-NaCl buffer was 100 mM EDTA and 500 mM NaCl in McIlvaine buffer. Protect all solutions from light.)

HPLC VARIABLES
Guard column: 5 × 3.0 PLRP-S (Polymer Laboratories)
Column: 250 × 4.6 8 μ PLRP-S (Polymer Laboratories)
Mobile phase: Gradient. A was 10 mM oxalic acid in water adjusted to pH 2.0 with 4 M HCl. B was MeCN. A:B from 85:15 to 60:40 over 16 min.
Flow rate: 1
Injection volume: 100
Detector: F ex 406 em 515 following post-column reaction. The column effluent mixed with reagent pumped at 1 mL/min and the mixture flowed through a 600 μL reaction coil to the detector. (Reagent was 5% zirconyl chloride octahydrate in water stored at 4°.)

CHROMATOGRAM
Retention time: 13.5
Limit of detection: 1.20 ng/g (pig kidney), 0.49 ng/g (pig muscle), 1.01 ng/g (cow liver), 0.23 ng/g (chicken egg)
Limit of quantitation: 3 ng/g (pig kidney)

OTHER SUBSTANCES
Extracted: chlortetracycline, doxycycline, oxytetracycline
Also analyzed: demeclocycline

SAMPLE
Matrix: eggs, tissue
Sample preparation: Condition an Anagel-TSK Chelate-SPW column with 25 μL 50 mg/mL copper sulfate in water and 500 μL. Homogenize 2 g sliced chicken liver with 1.2 mL 1 M pH 4 citrate buffer and 12 mL ethyl acetate for 1 min. Homogenize 2 g sliced tissue with 1.2 mL 1 M pH 5 citrate buffer and 12 mL ethyl acetate for 1 min. Shake 2 g blended egg with 1.2 mL 1 M pH 5 citrate buffer and 12 mL ethyl acetate for 15 min. Centrifuge the mixture at 11000 rpm for 10 min, decant the supernatant, reextract the residue with two 12 mL portions of ethyl acetate. Add 10 g anhydrous sodium sulfate to the combined supernatants, swirl, let stand for 5-10 min, filter (Whatman 1PS phase-separating filter paper). Evaporate the filtrate to dryness or to an oily residue on a rotary evaporator under reduced pressure at 40°, reconstitute the residue in 2 mL MeOH by vortexing, filter (0.2 μm syringe filter). Add 1.5 mL of the filtrate to the Anagel column at 0.36 mL/min, wash with 500 μL water, 500 μL MeOH, and 500 μL water. Elute the contents of the Anagel column onto the analytical column with mobile phase A, after 11 min remove the Anagel column from the circuit, elute column B using gradient elution of mobile phase A:B, monitor the effluent from column B. (Prepare 1 M pH 4 or 5 citrate buffer as follows: dissolve 192 g citric acid in approximately 800 mL water, adjust pH value with 1 M NaOH and make up to 1 L with water.)

HPLC VARIABLES
Guard column: 5 × 3 PLRP-S
Column: 150 × 4.6 5 μm Polymer Labs PLRP-S
Mobile phase: Gradient. A:B 100:0 for 11 min, to 0:100 in 10 min, maintain at 0:100 for 10 min. A was buffer. B was MeCN:MeOH:buffer 25:10:65. (Buffer was 100 mM KH_2PO_4 containing 10 mM citric acid, and 10 mM EDTA).
Flow rate: 1
Injection volume: 1500
Detector: UV 350

SAMPLE

Matrix: milk

Sample preparation: Fill a disposable polypropylene column (Bio-Rad Econo-Pac column) with Chelating Sepharose Fast Flow (Pharmacia) and condition it with 10 mL water, 1.5 mL 100 mM copper sulfate, and 100 mL water. Condition a 6 mL SupelClean ENVI-Chrom P SPE cartridge with 2 mL MeOH and 5 mL water. Homogenize 10 g tissue with 20-30 mL 100 mM pH 4 succinic acid buffer. Centrifuge the homogenate at 2000 g at 10° for 15-20 min. Add the supernatant to the metal chelate affinity column, wash sequentially with 5 mL 500 mM NaCl, 10 mL water, 10 mL MeOH, 10 mL water, and 3 mL McIlvaine buffer, discard the clear effluent. Elute with 8 mL McIlvaine-EDTA-NaCl buffer. Add the eluate to the SPE cartridge under gravity, rinse the column with 2.5 mL water, add the rinse to the SPE cartridge. Wash the SPE cartridge with 2.5 mL water. Dry the SPE cartridge by drawing air through it for 2-3 min. Elute with 5 mL MeOH. Evaporate the eluate to dryness under nitrogen at 40-50°, dissolve the residue in 1 mL water. Inject a 100 μL aliquot. (McIlvaine buffer was 500 mM NaCl and 100 mM EDTA (Carson, M.C. J. AOAC Int. 1993, 76, 329).)

SAMPLE

Matrix: milk, tissue

Sample preparation: Wash column A with 20 mL 5 mg/mL aqueous copper sulfate and column B with 100 mL acetone, 100 mL MeOH, and 100 mL water. Sonicate 10 mL milk or 10 g sliced tissue with 40 mL pH 4.0 succinate buffer for 3 min. (Buffer was 5 g succinic anhydride in 1 L water adjusted to pH 4.0 with 1 M NaOH.) Homogenize for 2 min (Ultra-Turrax), centrifuge at 12000 and 24000 rpm for 5 min, filter the supernatant through a Whatman 541 filter paper. Repeat extraction with 40 mL and 20 mL portions of succinate buffer, load the combined filtrates onto column A. Wash column A with 10 mL water, 30 mL MeOH, and two 10 mL portions of water. Elute tetracycline fraction with 40 mL pH 4.0 succinate buffer containing 100 mM disodium EDTA. After elution wash column A with 10 mL pH 4.0 succinate buffer containing 100 mM disodium EDTA. Load 50 mL combined eluate from column A onto column B, wash with two 100 mL portions of water and elute with 100 mL redistilled MeOH, discard the first 10 mL eluate. Evaporate eluate to a small volume on rotary evaporator at 40° and transfer to pear-shaped flask with three 2 mL portions of redistilled MeOH. Add 100 μL 5% β-mercaptopropionic acid in MeOH, evaporate MeOH under reduced pressure at 40°, reconstitute the residue in 500 μL mobile phase, vortex for 15 s and sonicate for 30 s, inject a 10 μL aliquot. (Column A was a 200 × 20 chelating Sepharose column. Prepare column as follows. Thoroughly mix 5 mL chelating Sepharose suspension (Pharmacia AB), place it in a 200 × 20 glass column, let settle to a 15 mm bed height. Remove liquid excess and load the column by passing 20 mL 5 mg/mL copper sulfate through it. Vortex the column after first 10 mL to remove bubbles, then pass 15 mL pH 4.0 succinate buffer through the column. Wash the column with 20 mL water after use, store in MeOH:water 20:80 at 4°. Column B was a 200 × 20 Amberlite XAD-

2 resin column. Prepare as follows. Wash Amberlite resin sequentially with 100 mL MeOH and 100 mL water, place the resin in a 200 × 2 0 glass column to 100 mm bed height.)

SAMPLE
Matrix: tissue
Sample preparation: Condition a 6 mL 500 mg Bond-Elut C8 SPE cartridge with 6 mL MeOH, 6 mL water, and 2 mL buffer A. Condition a 6 mL SPE cartridge containing 3 g wet XAD-2 resin with 10 mL MeOH, 10 mL water, and 2 mL buffer B. Homogenize (Ultra-Turrax) 2 g tissue with 20 mL succinate buffer for 1 min, centrifuge at 30 897 g for 15 min, filter (Whatman No. 1 paper) the supernatant, dilute 12 mL filtrate with 6 mL buffer B. For sheep liver add the diluted filtrate to the C8 SPE cartridge, wash with 10 mL buffer A, wash with 2 mL water, elute with 6 mL MeOH. For cow kidney add the diluted filtrate to the XAD-2 cartridge, wash with 14 mL buffer A, wash with 2 mL water, elute with 6 mL MeOH. Inject 25 μL 50 mg/mL copper sulfate and 500 μL water onto column A then load 1.5 mL of the eluate from the SPE cartridge at 0.36 mL/min onto column A. Wash to waste with 500 μL water, 500 μL MeOH, and 500 μL water then elute the contents of column A onto column B with mobile phase A. After 11 min remove column A from the circuit and elute column B with a linear gradient of A:B from 100:0 to 0:100 over 10 min, maintain at 0:100 for 10 min, re-equilibrate to 100:0.

Monitor the effluent from column B. (Buffer A was 100 mM KH_2PO_4 containing 3 g/L pentanesulfonic acid. Succinate buffer was 60 g succinic acid in 1 L water adjusted to pH 4.0 with 1 M NaOH. Buffer B was 37.2 g disodium EDTA and 3 g pentanesulfonic acid in 1 L succinate buffer.)

HPLC VARIABLES
Column: A 10 × 6 10 μm Anagel-TSK-Chelate-SPW (Anachem); B 5 × 3 5 μm Polymer Labs. PLRP-S + 150 × 4.6 5 μm Polymer Labs. PLRP-S
Mobile phase: A was buffer. B was MeCN:MeOH:buffer 25:10:65. (Buffer was 100 mM KH_2PO_4 containing 10 mM citric acid and 10 mM EDTA.)
Injection volume: 1500
Detector: UV 350

CHROMATOGRAM
Retention time: 23
Limit of detection: 10 μg/kg

OTHER SUBSTANCES
Extracted: chlortetracycline, demeclocycline, oxytetracycline

KEY WORDS
SPE; sheep; cow; liver; kidney; column-switching

SAMPLE
Matrix: tissue
Sample preparation: Condition a 6 mL 500 mg C18 SPE cartridge with 20 mL MeOH and 20 mL water. Mix 5 g tissue with 20 mL buffer, homogenize for 30 s, rinse probe twice with 2 mL buffer into the centrifuge tube. Shake for 10 min at high speed and centrifuge at 2500 g for 10 min. Remove the supernatant. Add 20 mL buffer to the tissue plug, shake for 10 min at high speed and centrifuge at 2500 g for 10 min. Remove the supernatant and repeat all steps as described above with 10 mL buffer. Combine the supernatants from all three extractions, centrifuge at 2500 g for 20 min, filter (GF/B paper). Rinse the centrifuge tube twice with 2 mL portions of buffer and filter. Add the filtrate to the SPE cartridge, rinse the flask twice with buffer and add the rinses to the SPE cartridge, wash with 20 mL water, dry the cartridge by drawing air through it, elute with 6 mL 1.26 g/L oxalic acid dihydrate in MeOH, dilute the eluate to 10 mL with water, filter, inject a 60 μL aliquot. (Prepare the buffer (McIlvaine-EDTA buffer) as follows. Mix 1 L 21.0 g/L citric acid monohydrate with 625 mL 28.4 g/L disodium hydrogen phosphate, adjust pH to 4.0 with 100 mM HCl or 100 mM NaOH, add 60.5 g disodium EDTA dihydrate, mix until the solid dissolves.)

HPLC VARIABLES
Column: 250 × 4.6 5 μm C8
Mobile phase: MeCN:MeOH:10 mM oxalic acid 15:20:65
Flow rate: 1.5
Injection volume: 10-60
Detector: UV 350

CHROMATOGRAM
Retention time: 5.9
Limit of detection: 1.5 ng

OTHER SUBSTANCES
Extracted: chlortetracycline, tetracycline

SAMPLE
Matrix: fruit, vegetables
Sample preparation: Prepare a cleanup column by placing 4 g Florisil, 1 g activated charcoal, and a 20 mm layer of anhydrous sodium sulfate in a 400 × 10 glass column, wash with 40 mL toluene, wash with 40 mL toluene:MeCN 99:1. Homogenize 25 g chopped fruit or vegetable with 70 mL MeOH at high speed for 3 min, filter, homogenize solid with 30 mL MeOH, filter. Combine the filtrates and add them to 60 mL toluene and 300 mL 10% NaCl in water, shake well for 3 min, let layers separate. Dry the organic layer by passing it through 20 g anhydrous sodium sulfate in a 20 mm diameter column, concentrate to about 5 mL under reduced pressure at 80°, add to the cleanup column, elute with 40 mL toluene:MeCN 99:1. Evaporate the eluate just to dryness under reduced pressure at 80°, reconstitute with 1 mL MeOH, inject an aliquot. (Reflux activated charcoal (20-40 mesh) with 1 M HCl for 4 h, wash with water until the washings are neutral, dry at 95-100° (J.Assoc.Off.Anal.Chem. 1983, 66, 1013). Heat 60-100 mesh Florisil at 200° for 24 h, cool, add 4% water, mix thoroughly, store in a sealed jar (J.Assoc.Off.Anal.Chem. 1983, 66, 1003).)

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: Gradient. MeCN:water from 62:38 to 78:22 over 32 min (Waters curve 6).
Column temperature: 50
Flow rate: 1.5
Detector: UV 206

CHROMATOGRAM
Retention time: 13.08
Limit of detection: 50 ng/g

HPLC VARIABLES
Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.
Column temperature: 30
Flow rate: 2
Detector: UV 210

OTHER SUBSTANCES
Also analyzed: acepromazine, acetaminophen, acetophenazine, albuterol, aminophylline, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, aprobarbital, aspirin, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, benzotropine, benzphet-

amine, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, danazol, danthron, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine, eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isocarbostyril, isocarboxazid, isoniazid, isoproterenol, isoxsuprine, ivermectin, ketamine, ketoprofen, kynurenic acid, levorphanol, lidocaine, lorazepam, lormetazepam, loxapine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin, mephobarbital, mepivacaine, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, methyltestosterone, methyprylon, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine, phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, pyrilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, salicylamide, salicylic acid, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfanilamide, sulfapyridine, sulfasoxizole, sulindac, tamoxifen, temazepam, testosterone, tetracaine, tetracycline, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tolmetin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, trimethoprim, tripelennamine, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

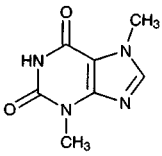
Theobromine



Molecular formula: $C_7H_8N_4O_2$
Molecular weight: 180.17
CAS Registry No.: 83-67-0
Merck Index: 9418
Lednicer No.: 1 423

SAMPLE
Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 204

CHROMATOGRAM
Retention time: 3.79

KEY WORDS
whole blood

SAMPLE
Matrix: food
Sample preparation: Place 25 g homogenized potato (washed or peeled) in a separating funnel, add 20 mL saturated aqueous NaCl solution and extract with three 50 mL portions of dichloromethane. Dry organic layers over anhydrous sodium sulfate and evaporate to dryness under reduced pressure. Reconstitute the residue in 1 mL dichloromethane and spot four 400 μL portions of this solution on a 200 × 200 mm × 250 μm thick silica 60 TLC plate (Merck). Develop with chloroform:triethylamine 100:5 then with MeOH:chloroform 5:100 (Caution!

Chloroform is a carcinogen!), remove the area containing thiabendazole and shake with 400 μL MeOH, centrifuge. Dilute solution to 2.5 mL with MeOH, filter (0.45 μm), inject an aliquot of the filtrate.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Supelcosil LC18

SAMPLE
Matrix: food
Sample preparation: Raw potatoes. Weigh out 23.0-25.5 g potato peelings or flesh macerated in a domestic food processor (Magimix 4000) for 1 min, homogenize with 60 mL dichloromethane and 70 g anhydrous sodium sulfate (Silverson mixer-emulsifier) for 1 min. Decant the supernatant through glass fiber filter (Whatman GF/A), repeat extraction with three 40 mL portions of fresh dichloromethane, filter homogenate through a suction Buchner funnel, wash with two 15 mL portions of dichloromethane. Dry the combined filtrate and washings with anhydrous sodium sulfate, re-filter and evaporate to near dryness on a rotary evaporator at 35°. Dissolve the concentrate in 100-200 mL MeOH (peelings), or 5-25 mL MeOH (flesh), filter the extract through a 0.45 μm nylon membrane (Micron Separation Inc.) and inject an aliquot. Baked potatoes. Mix 29.89-51.85 g baked peelings or 50 g baked flesh with 80-100 g anhydrous sodium sulfate before maceration for 2 min. Homogenize with 80 mL dichloromethane for 2 min, decant the supernatant through a glass fiber filter (Whatman GF/A), repeat extraction with two 70 mL portions of fresh dichloromethane, filter homogenate through a suction Buchner funnel, wash with two 15 mL portions of dichloromethane. Dry the combined filtrate and washings with anhydrous sodium sulfate, re-filter and evaporate to near dryness on a rotary evaporator at 35°. Dissolve the concentrate in 100-200 mL MeOH (peelings), or 5-25 mL MeOH (flesh), filter extract through a 0.45 μm nylon membrane (Micron Separation Inc.) and inject an aliquot.

SAMPLE
Matrix: food
Sample preparation: Condition a 3 mL 500 mg Sep-Pak Vac Silica SPE cartridge with 10 mL MeOH and 10 mL ethyl acetate. Condition a 3 mL 300 mg Bond Elut PRS cartridge with 10 mL water and 10 mL MeOH. Place the Sep Pak Vac Silica cartridge on top of the Bond Elut PRS cartridge. Citrus fruit. Slice and homogenize citrus fruit with a mixer. 5 g Aliquot of sample + 20 g anhydrous sodium sulfate + 1.5 g anhydrous sodium hydrogen phosphate + 30 mL ethyl acetate, blend at high-speed, centrifuge at 3100 rpm for 8 min, remove the supernatant. Re-extract with 20 mL ethyl acetate, combine the supernatants. Add the crude extract to the double SPE cartridge, allow to pass at ca. 1 mL/min, wash with 5 mL ethyl acetate, remove the Sep-Pak Vac Silica cartridge. Wash the second SPE cartridge with 10 mL MeOH and 10 mL 100 mM NaCl, elute with 10 mL mobile phase, inject a 20 μL aliquot. Banana. 10 g Homogenized sample + 40 g anhydrous sodium sulfate + 50 mL ethyl acetate, extract as described above. Re-extract with 30 mL ethyl acetate, combine the supernatants. Add the crude extract to the double SPE cartridge, allow to pass at ca. 1 mL/min, wash with 5 mL ethyl acetate, remove the Sep-Pak Vac Silica cartridge. Wash the second SPE cartridge with 10 mL MeOH and 10 mL 100 mM NaCl, elute with 10 mL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm TSKgel ODS-80Ts (TOSOH, Japan)
Mobile phase: MeCN:MeOH:water 40:30:30 containing 10 mM sodium 1-tridecanesulfonate, adjusted to pH 2.5 with phosphoric acid
Flow rate: 1
Injection volume: 20
Detector: UV 225

CHROMATOGRAM
Retention time: 5.5
Limit of detection: 100 ng/g (citrus fruit), 50 ng/g (banana)

SAMPLE
Matrix: fruit
Sample preparation: Condition a 10 mL 500 mg Bond-Elut PRS LRC cartridge with 10 mL MeOH:water 80:20 containing 1% phosphoric acid, 3 mL MeOH, and 5 mL ethyl acetate. Homogenize unwashed, divided citrus fruit with dry ice. Mix 5 g citrus homogenate with 5 mL pH 8 buffer (Fisher Scientific). Adjust the pH to about 8.0 with 200 mM NaOH. Add 25 mL ethyl acetate, shake for 15 min, centrifuge at 2500 rpm for 15 min. Mix a 15-20 mL aliquot of the ethyl acetate extract with 4 g anhydrous sodium sulfate, shake manually for 5 s, add more sodium sulfate if the ethyl acetate is not clear. Add 10 mL of the dry extract to the SPE cartridge, wash with 5 mL ethyl acetate, air dry the SPE cartridge under vacuum, elute with 9.8 mL elution solution, dilute the eluate to 10 mL with elution solution, inject a 50 μL aliquot. (Elution solution was 100 mM KH_2PO_4 in MeCN:water 70:30.)

HPLC VARIABLES
Column: 125 × 4.6 5 μm PartiSphere SCX (Whatman)

Mobile phase: MeOH:buffer 25:75 (Prepare buffer as follows. Dissolve 13.6 g KH_2PO_4 in 1 L water, add 500 mL MeCN, shake, dilute to 2 L with water. Adjust pH to about 3.4 with phosphoric acid.)

SAMPLE
Matrix: milk
Sample preparation: Condition a 3 mL Bond Elut silica SPE cartridge with 2 mL dichloromethane. 10 g Milk + 5 mL 1 M sodium carbonate, mix, add 150 mL ethyl acetate, add 1 mL 10 mg/mL BHT in ethyl acetate, blend (tissuemizer) at high speed for 5 min, add 10 g anhydrous sodium sulfate, blend for 1 min, let settle for 2-3 min, filter (No. 41 paper), add another 150 mL ethyl acetate to the sodium sulfate, blend for 2 min, filter. Combine the filtrates and evaporate them to dryness under vacuum. Rinse out flask with two 10 mL portions of hexane and two 10 mL portions of 1 M phosphoric acid. Combine rinses, shake vigorously for 2 min, extract the hexane layer with two 10 mL portions of 1 mL phosphoric acid. Combine all the aqueous layers and wash them with 5 mL hexane, adjust the pH to 8-9 by slowly adding about 9 mL 10 M KOH (use an ice bath), add 50 mL ethyl acetate, shake vigorously for 2 min, repeat extraction. Filter the organic layers through 40 g anhydrous sodium sulfate, wash the sodium sulfate with 25 mL ethyl acetate. Combine the organic layers, add 200 μL 10 mg/mL BHT in ethyl acetate, evaporate to dryness under vacuum. Take up the residue in two 3 mL portions of dichloromethane and add them to the SPE cartridge, wash with 5 mL dichloromethane, elute with 5 mL dichloromethane:MeOH 75:25. Evaporate the eluate to dryness under nitrogen, reconstitute in 1 mL mobile phase, vortex, filter (0.2 μm), inject an aliquot.

HPLC VARIABLES
Guard column: 30 × 4.6 pellicular C18 (Alltech)
Column: 250 × 4.6 5 μm Hypersil ODS

SAMPLE
Matrix: tissue
Sample preparation: Condition a 2.8 mL 500 mg 40 μm 60 Å Bond Elut silica SPE cartridge with 2 mL dichloromethane. 10 g Minced tissue + 5 mL 1 M sodium carbonate + 150 mL ethyl acetate + 1 mL 10 mg/mL BHT in ethyl acetate, blend (Waring) at high speed for 5 min, add 80 g anhydrous sodium sulfate, blend at low speed for 1 min. Decant the organic layer and filter it (No. 41 paper), add 150 mL acetone to material remaining in blender, blend at low speed for 2-3 min, filter, wash solid with 10 mL EtOH. Combine all the filtrates and evaporate them to dryness under vacuum at 30-35° (beware of bumping). Rinse out flask with two 10 mL portions of hexane and two 10 mL portions of 1 M phosphoric acid, combine rinses, shake vigorously for 2 min, allow to separate for 10 min, extract the hexane layer twice more with 10 mL portions of 1 M phosphoric acid. Combine all the aqueous layers and wash them with 10 mL hexane, adjust the pH of the aqueous layer to 8.5 ± 1.0 by slowly adding about 9 mL 10 M KOH while using an ice bath. Extract twice with 50 mL ethyl acetate (2 min shaking),

pass ethyl acetate layers through 40 g anhydrous sodium sulfate, wash the sodium sulfate with 25 mL ethyl acetate. Combine the ethyl acetate layers, add 200 μL 10 mg/mL BHT in ethyl acetate, evaporate to dryness under vacuum at 30-35° (beware of bumping). Rinse out flask with three 3 mL portions of dichloromethane, add rinses to the SPE cartridge, wash with 5 mL dichloromethane, elute with 5 mL dichloromethane:MeOH 75:25. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 1 mL mobile phase, vortex, filter (0.2 μm), inject a 50 μL aliquot.

HPLC VARIABLES
Guard column: 30 × 4.6 Brownlee RP-18 Spheri-10 MPLC
Column: 250 × 4.6 5 μm C18 (Alltech)
Mobile phase: MeOH:buffer 53:47 (Buffer was 1.15 g $(NH_4)H_2PO_4$ in 950 mL water, adjust pH to 7.0 with dilute ammonia, make up to 1 L with water.)
Flow rate: 1
Injection volume: 50
Detector: UV 298

CHROMATOGRAM
Retention time: 10

OTHER SUBSTANCES
Extracted: oxfendazole, mebendazole, metabolites
Simultaneous: chloramphenicol
Noninterfering: amprolium, chlortetracycline, erythromycin, levamisole, morantel, oxytetracycline, phenothiazine, sulfadimethoxine, sulfamethazine, sulfaquinoxaline

SAMPLE
Matrix: vegetables
Sample preparation: Condition a 10 mL 500 mg Bond Elut LRC, PRS (propylsulfonic acid) SPE cartridge with 10 mL conditioning solution, 3 mL MeOH, and 5 mL ethyl acetate. Homogenize with an equal amount of water. 10 g Potato homogenate or 20 g sweet potato homogenate + 20 mL ethyl acetate, shake on a reciprocating shaker for 10 min, centrifuge at 2500-3000 rpm for 15 min, repeat the extraction, add the ethyl acetate layers to the SPE cartridge, wash with 5 mL ethyl acetate, dry the SPE cartridge under vacuum, elute with 9.8 (potato) or 4.8 (sweet potato) mL elution solution, make up to 5 (sweet potato) or 10 (potato) mL with elution solution, dilute with mobile phase if necessary, inject a 50 μL aliquot. (Prepare conditioning solution by mixing 40 mL water and 2 mL 85% phosphoric acid, make up to 200 mL with MeOH. Prepare elution solution by dissolving 2.8 g KH_2PO_4 in 100 mL water, add 60 mL MeCN, make up to 200 mL water.)

HPLC VARIABLES
Column: 125 × 4.6 5 μm PartiSphere SCX (benzenesulfonic acid) (Whatman)
Mobile phase: MeCN:buffer 25:75, adjusted to pH 3.4 with 85% phosphoric acid. (Prepare mobile phase by dissolving 13.6 g KH_2PO_4 in 1 L water, add 500 mL MeCN, make up to 2 L with water, adjust pH to 3.4 with 85% phosphoric acid.)
Column temperature: 25
Flow rate: 1
Injection volume: 50

SAMPLE
Matrix: blood
Sample preparation: Hemolyze whole blood by freezing at -20° for 20 min, thaw, homogenize. Add a 200 μL aliquot of hemolyzed blood or serum to 200 μL chilled 10% perchloric acid, let stand below 4° for 15 min, centrifuge at 10000 g for 1 min. Remove a 200 μL aliquot of the supernatant and add it to 1.8 M sodium acetate containing 600 mM NaOH, mix, filter (Costar filter unit) while centrifuging for 30 s, inject a 20 μL aliquot of the filtrate.

HPLC VARIABLES
Guard column: present but not specified
Column: 110 × 4.7 Partisphere 5 C18 (Whatman)
Mobile phase: Gradient. A was 15 mM citric acid adjusted to pH 4.2 with 50% ammonium hydroxide, prepare fresh each day. B was 100 mM formic acid containing 4% diethylamine, pH

3.2. A:B from 90:10 to 50:50 over 2.5 min, to 5:95 over 0.5 min, maintain at 5:95 over 3.5 min, to 95:5 over 0.5 min, maintain at 95:5 for 3 min.
Flow rate: 1
Injection volume: 20
Detector: F ex 365 em 435 following post-column reaction. The column effluent mixed with the reagent pumped at 0.2 mL/min and the mixture flowed through a 90 cm × 0.5 mm ID PTFE coil to the detector. (Prepare reagent by dissolving 100 mg potassium ferricyanide in 120 mL 3 M NaOH.)

CHROMATOGRAM
Retention time: 7.6
Limit of quantitation: 2 nM

SAMPLE
Matrix: formulations
Sample preparation: Pulverize tablets if necessary. Add tablets to 100 mL 5 mM pH 4.5 potassium phosphate buffer, sonicate at 75 W for 2 min, cool to room temperature, make up to 200 mL with buffer, filter (0.45 μm), inject a 10 μL aliquot of the filtrate.

HPLC VARIABLES
Column: 250 × 4.6 10 μm LiChrosorb NH2 aminopropyl
Mobile phase: MeCN:5 mM KH_2PO_4 87:13 (Wash column with MeCN:water 10:90 at the end of the day.)
Column temperature: 25
Flow rate: 2
Injection volume: 10
Detector: UV 210

CHROMATOGRAM
Retention time: 3.5

OTHER SUBSTANCES
Simultaneous: pantothenic acid, riboflavin, niacinamide, pyridoxine

KEY WORDS
tablets

REFERENCE
Hudson,T.J.; Allen,R.J. Determination of pantothenic acid in multivitamin pharmaceutical preparations by reverse-phase high-performance liquid chromatography, *J.Pharm.Sci.*, **1984**, *73*, 113–115.

SAMPLE
Matrix: formulations
Sample preparation: Tablets without iron. Grind 5 tablets to a fine powder, add 10 mL monothioglycerol and 800 mL buffer, sonicate for 30 min, add 150 mL MeOH, make up to 1 L with buffer, filter (GF/C paper), discard first few mL, remove a 10 mL aliquot, make up to 25 mL with mobile phase, inject an aliquot. Tablets with dioctyl sodium sulfosuccinate. Grind 5 tablets to a fine powder, add 10 mL 2-monothioglycerol and 1 g barium chloride, make up to 1 L with buffer, stir vigorously for 30 min, filter (GF/C paper), discard first few mL, inject an aliquot. Capsules with iron. Contents of one capsule + 5 mL 2-monothioglycerol + 2 mL glacial acetic acid + 75 mL buffer, sonicate for 5 min, make up to 100 mL with buffer, stir vigorously for 30 min, filter (GF/C paper), add 300 mg cupferron, stir for 10 min, let stand for 1 h at room temperature, filter (GF/C paper), let stand for 30 min, filter again (if necessary), discard first few mL, inject an aliquot. (Buffer was 48 mL glacial acetic acid and 10 mL triethylamine in 1

L water, adjust pH to 3.6 ± 0.05 with acetic acid or triethylamine, make up to 1.7 L with water.)

HPLC VARIABLES
Column: 100 × 8 Radial Pak A C18 (Waters)
Mobile phase: MeOH:buffer 15:85 (Buffer was 2.20 g sodium heptanesulfonate, 100 mg EDTA, 48 mL glacial acetic acid, and 10 mL triethylamine made up to 1.7 L with water, adjust pH to 3.6 ± 0.05 with acetic acid or triethylamine.)
Flow rate: 2
Injection volume: 10
Detector: UV 280

CHROMATOGRAM
Retention time: 9

OTHER SUBSTANCES
Simultaneous: niacinamide, riboflavin, pyridoxine, ascorbic acid (UV 254)

KEY WORDS
multi-vitamin; protect from light; tablets; capsules

SAMPLE
Matrix: formulations
Sample preparation: Dilute injections with water, inject a 50 μL aliquot. Dissolve tablets or capsule contents in water (warm if necessary), filter (0.5 μm PTFE), inject a 50 μL aliquot of the filtrate. (Dissolve tablets or other formulations containing proteinaceous material in water at 60°, add 5% trichloroacetic acid (to pH 4.4), filter, inject a 50 μL aliquot.)

HPLC VARIABLES
Guard column: pellicular Corasil
Column: 10 μm μBondapak C18
Mobile phase: Gradient. A was prepared by dissolving 1 g sodium dioctylsulfosuccinate in 170 mL MeOH, add 10 mL concentrated formic acid, make up to 800 mL with water, adjust pH to 2.5 with 1 M KOH, make up to 1 L. B was prepared by dissolving 1 g sodium dioctylsulfosuccinate in 450 mL MeOH, add 10 mL concentrated formic acid, make up to 800 mL with water, adjust pH to 4.6, make up to 1 L. A:B 100:0 for 19 min then 0:100 (step gradient) or A:B from 100:0 to 0:100 over 25 min (concave curve 9), maintain at 0:100 for 3 min, return to initial conditions over 2 min.
Flow rate: 1.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 31 (step gradient), 24 (curve gradient)

OTHER SUBSTANCES
Simultaneous: folic acid (UV 280), niacin, niacinamide, pyridoxamine (UV 280), riboflavin, pyridoxine (UV 280), ascorbic acid (UV 280)

KEY WORDS
injections; capsules; tablets

SAMPLE
Matrix: rice
Sample preparation: Heat ground rice with at least 10 volumes of 100 mM HCl at 95-100° for 30 min with frequent mixing, cool, dilute to a thiamine concentration of 200 ng/mL with 100 mM HCl, adjust the pH of a 65 mL aliquot to 4.0-4.5 with about 5 mL 2 M sodium acetate, add 5 mL 10% takadiastase in water, heat at 45-50° for 3 h, adjust pH to 3.5, make up to 100 mL with water, filter (paper) (AOAC Official Methods of Analysis, 1990, 1049), centrifuge at 3500 rpm for 20 min, inject a 25 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 150 × 4 Nucleosil 5 C18
Mobile phase: 10 mM NaH_2PO_4 containing 150 mM sodium perchlorate, adjusted to pH 2.2 with perchloric acid
Column temperature: 55
Flow rate: 0.6
Injection volume: 25
Detector: F ex 375 em 435 following post-column reaction. The column effluent mixed with 0.1% potassium hexacyanoferrate(III) in 12% NaOH pumped at 0.6 mL/min and this mixture flowed through a 30 cm × 0.8 mm ID stainless steel coil at 55° to the detector.

SAMPLE
Matrix: rice
Sample preparation: Grind rice to pass 30-mesh screen. Stir 3 g ground rice and 50 mL MeOH: 100 mM HCl 40:60 with a glass rod until homogeneous, reflux for 30 min, vortex for 1 min, sonicate for 20 min, centrifuge at 3000 g for 20 min, filter (0.45 μm) the supernatant, inject a 5 μL aliquot of the filtrate.

HPLC VARIABLES
Column: 250 × 4.6 Zorbax TMS
Mobile phase: 10 mM NaH_2PO_4 containing 500 mM sodium perchlorate adjusted to pH 2.5 with 3 M perchloric acid
Column temperature: 55
Flow rate: 0.4

Injection volume: 5
Detector: F ex 375 em 435 following post-column reaction. The column effluent mixed with reagent pumped at 0.4 mL/min, the mixture flowed through a 300 × 0.8 stainless steel mixing coil to the detector. (Reagent was 0.1% potassium hexacyanoferrate(III) in 15% NaOH.)

CHROMATOGRAM
Retention time: 8

SAMPLE

Matrix: tissue

Sample preparation: Homogenize (motor-driven glass homogenizer) 100 mg tissue with 300 μL 5% trichloroacetic acid at 4°, centrifuge at 4° at 5000 g for 1 h. Wash the supernatant with 3 volumes of water-saturated diethyl ether for 1 h. Remove an 80 μL aliquot of the aqueous phase and add it to 50 μL reagent, mix for 5-10 s, inject an aliquot 1 min after the addition of the reagent. (Prepare reagent by mixing 50 μL 10 mg/mL potassium ferricyanide with 2.5 mL 15% NaOH, store in the dark, discard after 1 day.)

HPLC VARIABLES

Guard column: 4.2 × 3.2 30-44 μm 201RP (Vydac)
Column: 150 or 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: Gradient. MeOH:25 mM pH 8.4 phosphate buffer 10:90 for 1 min, to 100:0 over 3 min, maintain at 100:0 for 2 min, return to initial conditions over 2 min.
Flow rate: 1
Injection volume: 20
Detector: F ex 390 em 475

CHROMATOGRAM

Retention time: 4.2 (thiamine triphosphate), 4.5 (thiamine pyrophosphate), 5 (thiamine monophosphate), 6 (thiamine)
Limit of detection: 0.05 pmole

SAMPLE
Matrix: blood
Sample preparation: 500 μL Serum or plasma + 100 μL MeOH + 1 mL 70 mM pH 6.4 phosphate buffer + 5 mL n-pentane, shake vigorously for 10 min, centrifuge at 1500 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 200 μL mobile phase, vortex for 1 min, inject a 5 μL aliquot.

HPLC VARIABLES
Column: Nucleosil 5 C8
Mobile phase: MeCN:buffer 35:65 (Buffer was 0.2 mM phosphoric acid containing 0.175 mM KH_2PO_4.)
Flow rate: 1.2
Injection volume: 5
Detector: UV 290

CHROMATOGRAM
Retention time: 12
Internal standard: thiamylal

OTHER SUBSTANCES
Extracted: thiopental

KEY WORDS
serum; plasma; cow; human; comparison with capillary electrophoresis; thiamylal is IS

REFERENCE
Meier,P.; Thormann,W. Determination of thiopental in human serum and plasma by high-performance capillary electrophoresis-micellar electrokinetic chromatography, *J.Chromatogr.*, **1991**, *559*, 505–513.

SAMPLE
Matrix: blood
Sample preparation: Mix serum with an equal volume of 1 M pH 5.0 phosphate buffer, add IS, add 3 mL ethyl acetate, rotate for 10 min, centrifuge at 3500 rpm for 5 min. Remove 2 mL of the organic layer and evaporate it to dryness, reconstitute the residue in 200 μL mobile phase, inject a 10-20 μL aliquot.

HPLC VARIABLES
Column: 150 × 6 Shim-pack CLC-ODS (Shimadzu)
Mobile phase: MeOH:10 mM pH 5.0 sodium phosphate buffer 60:40
Flow rate: 1
Injection volume: 10-20
Detector: UV

CHROMATOGRAM
Internal standard: 5-(p-methylphenyl)-5-phenylhydantoin
Limit of quantitation: 1 μg/mL

KEY WORDS
serum; rat; pharmacokinetics

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL 50 mg Bond Elut C18 SPE cartridge with two 1 mL portions of MeOH and two 1 mL portions of 10 mM KH_2PO_4. 100 μL Serum + 50 μL 25 μg/mL n-propyl p-hydroxybenzoate in water + 500 μL 10 mM KH_2PO_4, add to the SPE cartridge, wash with two 1 mL portions of water, elute with 300 μL MeOH. Evaporate the eluate, reconstitute in 100 μL EtOH:water 50:50, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 75 × 4.6 TSK-gel ODS 80TM
Mobile phase: EtOH:10 mM KH_2PO_4 15:85 containing 17 mM β-cyclodextrin (Suspend 17 mmoles β-cyclodextrin in 150 mL EtOH, make up to 1 L with 10 mM KH_2PO_4.)
Column temperature: 25

Flow rate: 0.9
Injection volume: 50
Detector: UV 288

CHROMATOGRAM
Retention time: 37 (S(-)), 39 (R(+))
Internal standard: n-propyl p-hydroxybenzoate (25)
Limit of detection: 50 ng/mL

OTHER SUBSTANCES
Noninterfering: muscle relaxants, benzodiazepines

KEY WORDS
serum; chiral; SPE

REFERENCE

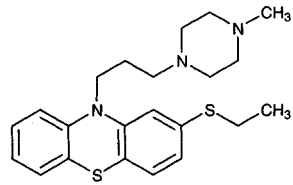
Thiethylperazine



Molecular formula: $C_{22}H_{29}N_3S_2$
Molecular weight: 399.62
CAS Registry No.: 1420-55-9, 52239-63-1 (maleate)
Merck Index: 9449

SAMPLE

Matrix: blood

Sample preparation: 3 mL Serum + 3 mL diluted Titrisol (pH 10 borate buffer, Merck) + 4 mL heptane:isoamyl alcohol 97:3, shake thoroughly for 15 s, centrifuge at 2500 g for 5 min. Remove the organic phase and add it to 1.5 mL 50 mM sulfuric acid containing 0.1% $Na_2S_2O_2$, mix for 15 s, centrifuge at 2500 g for 10 min. Remove the aqueous phase. Repeat the extraction and back extraction. Combine the aqueous phases and add them to 1.5 mL 2 M pH 9.1 glycine buffer, add 200 µL n-hexane:isoamyl alcohol 97:3, vortex for 25 s. Remove the organic phase and evaporate it to dryness in a desiccator, reconstitute in mobile phase, inject an aliquot.

HPLC VARIABLES

Column: 300 × 3.9 10 µm µBondapak C18
Mobile phase: MeCN:water:acetic acid 65:35:3 containing 10 mM dodecyl hydrogen sulfate
Flow rate: 2
Detector: UV 257

CHROMATOGRAM

Retention time: 13
Internal standard: thiethylperazine

OTHER SUBSTANCES

Extracted: perphenazine

Noninterfering: alimemazine, biperidine, carbamazepine, chlorpromazine, clomipramine, diazepam, dihydroergotamine, disulfiram, dixyrazine, haloperidol, levomepromazine, nitrazepam, orphenadrine, promethazine, propiomazine, thioridazine, trimipramine, vitamins

KEY WORDS
serum; thiethylperazine is IS

REFERENCE

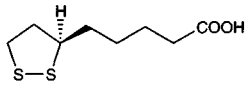
Thioctic acid



Molecular formula: $C_8H_{14}O_2S_2$
Molecular weight: 206.33
CAS Registry No.: 62-46-4, 1200-22-2 (d-form), 1077-28-7 (dl-form), 1077-27-6 (l-form), 2319-84-8 (sodium salt)
Merck Index: 9462

SAMPLE
Matrix: solutions
Sample preparation: Mix 200 μL of a solution in MeOH:water 10:90 with 150 μL 20 mM tetrahexylammonium bromide in 100 mM pH 7.0 phosphate buffer and 100 μL 4.2 mg/mL 2-bromoacetyl-6-methoxynaphthalene in acetone, sonicate for 3 min, let stand for 22 min, add 150 μL 4.5 μg/mL IS in MeCN, sonicate at room temperature for 1 min, inject a 50 μL aliquot. (Prepare 2-bromoacetyl-6-methoxynaphthalene by stirring equimolar amounts of 2-acetyl-6-methoxynaphthalene (Janssen Chimica, Belgium) and phenyltrimethylammonium tribromide in THF at room temperature for 3 h (Phosphorus and Sulfur 1985, 25, 357), purify by column chromatography on silica gel with chloroform:petroleum ether 50:50 (mp 109-112°) (Chromatographia 1992, 33, 13).)

HPLC VARIABLES
Column: 250 × 4.5 Hypersil 5 ODS
Mobile phase: MeCN:MeOH:water 37.4:30.6:32
Column temperature: 35
Flow rate: 1.1
Injection volume: 50
Detector: F ex 300 em 460

CHROMATOGRAM
Retention time: 16.5
Internal standard: n-hexanoic acid 6-methoxynaphthacyl ester (?) (Dissolve 2 mmole n-hexanoic acid and 1 mmole 2-bromoacetyl-6-methoxynaphthalene in 10 mL anhydrous MeCN, add 500 μL triethylamine, heat to 60° for 30 min, cool, add 30 mL water, extract three times with 10 mL portions of diethyl ether. Combine the organic layers and wash them with 5% sodium bicarbonate solution, wash three times with 10 mL portions of water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from MeOH/water

to give 6-methoxynaphthacyl ester of n-hexanoic acid (mp 79-80°) (J. Pharm. Biomed. Anal. 1993, 11, 761) (19)

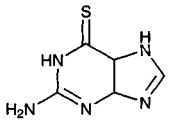
Thioguanine



Molecular formula: $C_5H_5N_5S$
Molecular weight: 167.19
CAS Registry No.: 154-42-7, 5580-03-0 (hemihydrate)
Merck Index: 9473
Lednicer No.: 2 464

SAMPLE
Matrix: blood
Sample preparation: Plasma. 1 mL Plasma + 1 mL cold 2 M perchloric acid, mix, centrifuge at 4° at 48000 g for 20 min. Remove a 1 mL aliquot of the supernatant and adjust to pH 10-12 with 150 μL 4 M KOH, let stand at 4° for 2 days. Adjust the pH of the supernatant to 2-3 with 150 μL 1 M HCl, centrifuge at 700 g for 10 min, inject an aliquot of the supernatant.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeOH:buffer 10:90 (Buffer was 10 mM acetic acid adjusted to pH 3.5 with 5 M NaOH. Flush column daily with MeOH:water 50:50.)
Flow rate: 2
Injection volume: 100
Detector: UV 340

CHROMATOGRAM
Retention time: 4
Limit of detection: 800 nM

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
plasma; pharmacokinetics

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 100 μL 400 mM NaOH + 1 mL 0.3% phenylmercuric acetate in ethyl acetate + 3 mL diethyl ether, shake on a tumble mixer for 10 min, centrifuge for 5 min. Remove the organic layer and add it to 500 μL 100 mM HCl, whirlmix for 2 min, centrifuge for 5 min, discard the organic layer, evaporate traces of organic solvent under a stream of nitrogen at room temperature for 15 min, add 10 μL 3 mg/mL dithioerythritol in water, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4.6 LiChrosorb 10 RP-18
Mobile phase: Isopropanol:water 3:97 containing 13.80 g/L $NaH_2PO_4.H_2O$, 200 μL/L 85% phosphoric acid, 60 mg/L dithioerythritol, and 500 mg/L sodium octanesulfonate, pH 3.6-3.7
Flow rate: 1.5
Detector: F ex 295 em 380 following post-column reaction. The column effluent mixed with 8 mM potassium chromate in 500 mM HCl pumped at 0.16 mL/min and with air flowing at 0.32 mL/min and the mixture flowed through a single mixing coil. The effluent from this coil mixed with 1.6% sodium metabisulfite pumped at 0.16 mL/min and this mixture flowed through a single mixing coil. The effluent from this coil mixed with 4 M ammonium hydroxide pumped at 0.23 mL/min and this mixture flowed through a double mixing coil to a debubbler. The liquid effluent from the debubbler flowed to the detector.

CHROMATOGRAM

Retention time: 8
Internal standard: 6-thioguanine

OTHER SUBSTANCES

Extracted: 6-mercaptopurine

Matrix: blood
Sample preparation: Whole blood, serum. 500 μL Blood or serum + 500 μL buffer + 200 μg phenolphthalein + 5 mL dichloromethane, rotate, centrifuge. Remove the organic layer and evaporate it to dryness, reconstitute the residue in 300 μL MeOH, inject a 20 μL aliquot. (Prepare buffer by mixing 500 mM KH_2PO_4 and 500 mM Na_2HPO_4 to obtain a pH of 5.5.)

HPLC VARIABLES
Column: 250 × 4.6 10 μm RP-8
Mobile phase: MeOH:water 60:40
Flow rate: 2
Injection volume: 20
Detector: UV 290

KEY WORDS
whole blood; serum

SAMPLE
Matrix: blood
Sample preparation: 50 μL 25 μg/mL 5-Ethyl-5-p-tolylbarbituric acid in MeOH added to 150 × 10 mm glass centrifuge tube and blow dry under a stream of nitrogen, add 500 μL plasma, add 5 mL dichloromethane, mix on rotary mixer for 5 min, centrifuge. Remove organic layer, evaporate to dryness under nitrogen, take up in 500 μL mobile phase, inject a 40 μL aliquot.

HPLC VARIABLES
Guard column: 50 × 4 μBondapak C18 Corasil B
Column: 300 × 4 5 μm μBondapak C18
Mobile phase: MeOH:10 mM potassium phosphate adjusted to pH 4.40 ± 0.05 with 150 mM phosphoric acid 50:50
Flow rate: 1.7
Injection volume: 40
Detector: UV 284

CHROMATOGRAM
Retention time: 8.90
Internal standard: 5-ethyl-5-p-tolylbarbituric acid (UV 212) (4.62)
Limit of detection: 500 ng/mL

OTHER SUBSTANCES
Extracted: pentobarbital (UV 212)

Simultaneous: acetaminophen, amobarbital, barbital, butalbital, butabarbital, caffeine, carbamazepine, phenacetin, phenobarbital, phenytoin, secobarbital, theobromine, theophylline, vinbarbital

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: Condition a 100 mg Bond-Elut C8 SPE cartridge with 2 volumes of MeOH, 2 volumes of water, and 1 volume of 100 mM pH 5.59 Sörensen's phosphate buffer. 200 μL Plasma + 10 μL 1 mg/mL sodium secobarbital in EtOH, add to the SPE cartridge, wash with 1 volume of water, elute with 250 μL MeOH. Evaporate the eluate to dryness under vacuum, reconstitute in 50 μL MeOH, inject an aliquot.

HPLC VARIABLES
Guard column: 10 μm Guard-Pak C18 (Waters)
Column: 100 × 8 10 μm Radial-Pak C8 (Waters)
Mobile phase: MeOH:THF:100 mM pH 7.72 Sörensen's phosphate buffer 28:16:52 containing 5 ng/mL sodium thiopental
Flow rate: 2.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 8.54
Internal standard: secobarbital (6.38)
Limit of quantitation: 250 ng/mL

OTHER SUBSTANCES
Extracted: methohexital, pentobarbital
Noninterfering: ketamine

KEY WORDS
plasma; dog; pharmacokinetics; SPE

SAMPLE
Matrix: blood
Sample preparation: 100 μL Serum + 100 μL buffer + 1.5 mL IS in 5% isopropanol in chloroform, vortex for 30 s, centrifuge. Remove the organic layer and evaporate it to dryness under a stream of air at room temperature, reconstitute the residue in 100 μL mobile phase, inject a 6-10 μL aliquot. (Buffer was 13.6 g KH_2PO_4 in 90 mL water, pH adjusted to 6.8 with about 3 mL 10 M NaOH, made up to 100 mL.)

HPLC VARIABLES
Guard column: 20 × 4.6 Supelguard LC-1 (Supelco)
Column: 250 × 4.6 5 μm Supelcosil LC-1 (Supelco)
Mobile phase: MeOH:MeCN:buffer 17.5:17.5:65 (Buffer was 2.72 g KH_2PO_4 in 1.9 L water, pH adjusted to 6.3 with about 2 mL 1 M NaOH, made up to 2 L.)
Flow rate: 2
Injection volume: 6-10
Detector: UV 285

CHROMATOGRAM
Retention time: 7.87
Internal standard: 3-isobutyl-1-methylxanthine (3.15)

OTHER SUBSTANCES
Extracted: acetaminophen, amobarbital, barbital, caffeine, carbamazepine, chloramphenicol, ethosuximide, mephobarbital, methsuximide, pentobarbital, phenobarbital, phenytoin, primidone, secobarbital, theophylline
Also analyzed: acetanilide, N-acetylcysteine, N-acetylprocainamide, ampicillin, aspirin, butabarbital, butalbital, chlorpropamide, cimetidine, codeine, cyheptamide, diazoxide, diflunisal, diphylline, disopyramide, ethchlorvynol, gentisic acid, glutethimide, heptabarbital, hexobarbital, ibuprofen, indomethacin, ketoprofen, mefenamic acid, mephenytoin, methaqualone, methsuximide, methyl salicylate, methyprylon, morphine, naproxen, nirvanol, oxphenylbutazone, phenacetin, phensuximide, phenylbutazone, procainamide, salicylamide, salicylic acid, sulfamethoxazole, sulindac, tolmetin, trimethoprim, vancomycin
Noninterfering: amikacin, gentamicin, meprobamate, netilmicin, quinidine, tetracycline, tobramycin, valproic acid

KEY WORDS
serum

SAMPLE
Matrix: blood
Sample preparation: 100 μL Plasma + 100 μL MeCN, vortex for 10 s, let stand for 10 min, vortex for 10 s, centrifuge at 12000 g for 2 min, inject a 20 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 150 × 6 5 μm Shim-pack CLC-ODS (Shimadzu)
Mobile phase: MeCN:water 55:45
Flow rate: 1.2
Injection volume: 20
Detector: UV 288

CHROMATOGRAM
Retention time: 4.5

OTHER SUBSTANCES
Extracted: thiamylal
Noninterfering: acetaminophen, allopurinol, amikacin, amobarbital, amphotericin B, ampicillin, aspirin, barbital, caffeine, carbenicillin, chloramphenicol, chlorpromazine, cimetidine, cisplatin, cyclophosphamide, cyclosporin A, cytarabine, dactinomycin, doxorubicin, droperidol, ethosuximide, 5-fluorocytosine, 5-fluorouracil, furosemide, gentamicin, hexobarbital, ketamine, ketoconazole, 6-mercaptopurine, metharbital, methotrexate, miconazole, mizoribine, pentobarbital, phenobarbital, procainamide, secobarbital, tegafur, vancomycin

SAMPLE
Matrix: blood
Sample preparation: Vigorously shake equal volumes of plasma and MeCN, centrifuge at 10000 g for 3 min, inject a 20 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 110 × 4.6 PartiSphere C8 (Whatman)
Mobile phase: MeCN:120 mM pH 6.2 phosphate buffer 50:50
Flow rate: 1
Injection volume: 20
Detector: UV 270 following post-column reaction. The column effluent flowed through a 6 m × 0.25 mm ID crocheted PTFE coil irradiated with a Sylvania G8-T5 lamp at 254 nm to the detector.

CHROMATOGRAM
Retention time: 4.25
Limit of detection: 200 ng/mL

OTHER SUBSTANCES
Extracted: pentobarbital

KEY WORDS
post-column reaction; post-column photochemical derivatization; plasma

SAMPLE
Matrix: blood
Sample preparation: 200-500 μL Whole blood + 1 mL 100 mM pH 7.5 phosphate buffer, vortex for 1 min, add 7 mL n-hexane:diethyl ether 50:50, add 50 μL 100 μg/mL secobarbital in EtOH:water 75:25, shake for 15 min, centrifuge at 4° at 2000 g for 15 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 37°, reconstitute the residue in 100 μL mobile phase, vortex, inject a 5-20 μL aliquot.

HPLC VARIABLES
Column: 100 × 3 5 μm Nucleosil C18
Mobile phase: MeCN:water 32:68
Flow rate: 0.3
Injection volume: 5-20
Detector: UV 254

CHROMATOGRAM
Retention time: 13
Internal standard: secobarbital (9)
Limit of detection: 10 ng/mL

OTHER SUBSTANCES
Extracted: pentobarbital

KEY WORDS
whole blood; pharmacokinetics

SAMPLE
Matrix: blood, tissue
Sample preparation: Tissue. Homogenize tissue with 2 volumes of water. 1 mL Homogenate + 300 μL 1 mg/mL phenolphthalein in MeOH + 1 mL buffer + 10 mL dichloromethane, rotate, centrifuge. Remove the organic layer and add it to 3 mL 100 mM NaOH, rotate, centrifuge. Remove the aqueous layer and acidify it with 1 mL 1 M HCl, extract with 10 mL dichloromethane. Remove the organic layer and evaporate it to dryness at 40°, reconstitute the residue in 300 μL MeOH, inject a 20 μL aliquot. Blood. 500 μL Whole blood + 500 μL buffer + 200 μL 1 mg/mL phenolphthalein in MeOH + 5 mL dichloromethane, rotate, centrifuge. Remove the organic layer and evaporate it to dryness at 40°, reconstitute the residue in 300 μL MeOH, inject a 20 μL aliquot. (Buffer was prepared by mixing 500 mM Na_2HPO_4 with 500 mM KH_2PO_4 to pH 5.5.)

HPLC VARIABLES
Column: 250 × 4.6 10 μm RP-8 (Hewlett-Packard) or 260 × 4.6 10 μm Spherisorb C18
Mobile phase: MeOH:water 60:40
Flow rate: 2
Injection volume: 20
Detector: UV 290

CHROMATOGRAM
Retention time: 5.97
Internal standard: phenolphthalein (2.96)
Limit of quantitation: 1 μg/mL

OTHER SUBSTANCES
Simultaneous: carbamazepine, pentobarbital (UV 210)
Noninterfering: amobarbital, butabarbital, glutethimide, meprobamate, methaqualone, methyprylon, phenobarbital, phenytoin, secobarbital

SAMPLE
Matrix: formulations
Sample preparation: Dilute equal volume 10 mg/mL propofol and 25 mg/mL thiopental injections 1:200 with water, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Zorbax SB
Mobile phase: MeCN:buffer 45:55 (Buffer was 10 mM KH_2PO_4, adjusted to pH 4.0 with 10% phosphoric acid.)
Flow rate: 1
Injection volume: 20
Detector: UV 235

CHROMATOGRAM
Retention time: 4.9

OTHER SUBSTANCES
Simultaneous: propofol

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Brinkman Polytron Model PT 10/35) 0.5-1.5 g tissue in 3 mL 70 mM pH 7.4 Sorensen's phosphate buffer with 10 s bursts while chilling with ice. 0.2-1 mL Plasma or tissue homogenate + 1 mL 70 mM pH 6.3 Sorensen's phosphate buffer + 50 μL 20 μg/mL thiamylal in MeOH:water 50:50 + 5 mL pentane, shake at 40 cycles/min for 10 min, centrifuge, freeze in dry ice/acetone. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 200 μL MeCN:water 25:75, inject a 100 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 10 μm C18 (Alltech)
Mobile phase: MeCN:4 mM potassium phosphate buffer 50:50, pH 4.0
Flow rate: 1.2
Injection volume: 100
Detector: UV 290

CHROMATOGRAM
Retention time: 5.5
Internal standard: thiamylal (6.5)
Limit of detection: 10 ng/mL
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES
Simultaneous: amobarbital, heptabarbital, hexobarbital, methohexital, pentobarbital, phenobarbital, secobarbital

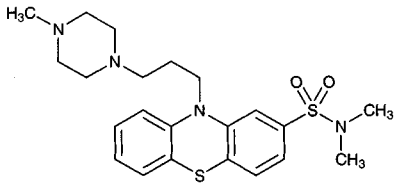
Thioproperazine



Molecular formula: $C_{22}H_{30}N_4O_2S_2$
Molecular weight: 446.64
CAS Registry No.: 316-81-4, 2347-80-0 (dimethanesulfonate)
Merck Index: 9494

SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 266

CHROMATOGRAM

Retention time: 7.47
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 265.3

CHROMATOGRAM

Retention time: 15.212

Molecular formula: $C_{21}H_{26}N_2S_2$
Molecular weight: 370.58
CAS Registry No.: 50-52-2, 130-61-0 (HCl)
Merck Index: 9497
Lednicer No.: 1 389

SAMPLE

Matrix: blood
Sample preparation: 1-5 mL Plasma + 1 mL 1 M NaOH + hexanes, extract for 30 min, centrifuge. Remove a 9 mL aliquot of the organic phase and evaporate it to dryness at 30° under a stream of nitrogen. Dissolve the residue in 100 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 10 μm Micropak CN (Varian)
Mobile phase: MeCN:5 mM ammonium acetate 90:10
Flow rate: 2.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM

Retention time: 29.5
Limit of detection: 10 ng/mL

OTHER SUBSTANCES

Simultaneous: acetophenazine, amitriptyline, benztropine, butaperazine, carphenazine, fluphenazine, promethazine, haloperidol, imipramine, mesoridazine, nortriptyline, orphenadrine, piperacetazine, promazine, chlorpromazine, thiothixene, trifluoperazine, triflupromazine, trihexyphenidyl, trimeprazine, metabolites

KEY WORDS

plasma

Liquid chromatographic assay of phenothiazine, thioxanthene and butyrophenone neuroleptics and antihistamines in blood and plasma with conventional and radial compression columns and UV and electrochemical detection, *J.Chromatogr.*, **1982**, *231*, 361–376.

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 2 mL water + 2 mL 2 M NaOH, mix well, add 10 mL heptane:isoamyl alcohol 99:1, shake slowly on a reciprocating shaker for 15 min, centrifuge at 5-10° at 1207 g for 5 min. Remove 8.5 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 60°, reconstitute the residue in 250 μL MeCN:water 60:40, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm LC-PCN (cyano) (Supelco)
Mobile phase: MeCN:20 mM pH 4.5 KH_2PO_4 60:40
Column temperature: 40
Flow rate: 2
Injection volume: 50
Detector: UV 229 or E, IBM Model 230, Model 3892 glassy carbon electrode, 1000 mV vs saturated calomel electrode

CHROMATOGRAM

Retention time: 8.5
Internal standard: thioridazine

OTHER SUBSTANCES
Extracted: chlorprothixene

KEY WORDS
plasma; thioridazine is IS

REFERENCE
Brooks,M.A.; DiDonato,G.; Blumenthal,H.P. Determination of chlorprothixene and its sulfoxide metabolite in plasma by high-performance liquid chromatography with ultraviolet and amperometric detection, *J.Chromatogr.*, **1985**, *337*, 351–362.

SAMPLE
Matrix: blood
Sample preparation: Condition a Varian AASP C18 SPE cartridge with 1 mL MeOH and 1 mL water. Mix 500 μL serum with 500 μL 200 mM phosphoric acid (pH was ca. 2.3), let stand for 5 min, add 400 μL to the SPE cartridge, wash with 1 mL water, wash with 1 mL MeCN:water 1:1, elute cartridge with mobile phase for 30 s directly onto the analytical column.

HPLC VARIABLES
Column: 250 × 4 5 μm Spherisorb ODS-2 Superpac
Mobile phase: MeCN:MeOH:buffer 25:50:25, pH was 4.1. (Buffer was 4.5 mL 85% orthophosphoric acid and 4.5 mL triethylamine in 1 L water.)
Flow rate: 1
Detector: UV 254

CHROMATOGRAM
Retention time: 10.95
Limit of detection: about 0.2 μM

OTHER SUBSTANCES
Simultaneous: metabolites, clonazepam, nitrazepam, flunitrazepam, lorazepam, oxazepam, alprazolam, haloperidol, diazepam, zuclopenthixol, protriptyline, nortriptyline, maprotiline, promethazine, imipramine, amitriptyline, levomepromazine, trimipramine, chlorpromazine, clomipramine, perphenazine, fluphenazine, prochlorperazine
Noninterfering: carbamazepine, phenytoin

KEY WORDS
serum; SPE

REFERENCE
Svensson,C.; Nyberg,G.; Soomägi,M.; Mårtensson,E. Determination of the serum concentrations of thioridazine and its main metabolites using a solid-phase extraction technique and high-performance liquid chromatography, *J.Chromatogr.*, **1990**, *529*, 229–236.

SAMPLE
Matrix: blood
Sample preparation: 1 mL Serum + 25 μL 25 μg/mL promethazine in MeOH + 100 μL 2 M NaOH + 4 mL hexane:ethyl acetate 1:1, rotate at 60 rpm for 5 min, centrifuge at 2000 g for 10 min. Remove the organic layer and evaporate it to dryness at 40° under a stream of air, reconstitute with 250 μL mobile phase A, vortex for 20 s, inject a 120 μL aliquot onto column A with mobile phase A. Collect the effluent corresponding to the thioridazine peak, add 25 μL 25 μg/mL thiothixene in MeOH, vortex for 20 s, evaporate to dryness at 50° under a stream of nitrogen, reconstitute in 250 μL mobile phase B, inject a 120 μL aliquot onto column B with mobile phase B.

HPLC VARIABLES
Column: A 15 × 3.2 Alltech RP-18 guard column + 250 × 4.6 5 μm Supelcosil LC18-DB; B 250 × 4.6 5 μm Spherisorb Chiral 1 (phenylmethylurea)
Mobile phase: A MeOH:MeCN:water:1 M ammonium hydroxide 500:350:150:3, adjusted to pH 6.7-8.0 with 6 M HCl; B Hexane:dichloromethane:MeOH:1 M ammonium acetate in MeOH 450:450:100:0.075

Flow rate: A 1; B 1
Injection volume: 120
Detector: A UV 263; B UV 263

CHROMATOGRAM
Retention time: 7.4 (A), 9 (B) (+), 10 (-)
Internal standard: A promethazine (5.8); B thiothixene (4)
Limit of detection: 12.5 ng/mL
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES
Simultaneous: desipramine, nortriptyline, amitriptyline, imipramine, clozapine, maprotiline, chlordiazepoxide, thiothixene, mesoridazine, sulforidazine, fluoxetine
Noninterfering: flurazepam, methylphenidate, ephedrine
Interfering: chlorpromazine

KEY WORDS
serum; chiral

Jortani,S.A.; Poklis,A. Determination of thioridazine enantiomers in human serum by sequential achiral and chiral high-performance liquid chromaqtography, *J.Anal.Toxicol.*, **1993**, *17*, 374–377.

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 500 ng pipothiazine + 400 μL 2 M NaOH + 4 mL diethyl ether:hexane 75:25, shake for 20 min, centrifuge at 2800 g for 5 min. Remove the organic layer and add it to 1.2 mL 100 mM HCl, shake for 15 min, centrifuge. Remove the aqueous layer and add it to 200 μL 2 M NaOH, extract twice with 2 mL portions of diethyl ether:hexane 75:25. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 40°, reconstitute the residue in 120 μL isooctane:dichloromethane:MeOH 83:10:7, inject a 100 μL aliquot on to an 8 mm dia column of 5 μm silica (Waters Z-module radial compression) protected by a guard column of the same material, and elute with isooctane:dichloromethane:MeOH 83:10:7 at 2.2 mL/min (detector F ex 262 em 458). Collect the fraction at 2.3 min containing thioridazine and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute with 125 μL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Cyclobond I 2000 ac β-acetylated cyclodextrin (Astec, Whippany)
Mobile phase: MeCN:buffer 16:84 (Buffer was 1% triethylamine adjusted to pH 3.0 with orthophosphoric acid. Wash column with MeCN:water 90:10 at the end of each day.)
Flow rate: 1.2
Injection volume: 100
Detector: F ex 262 em 458

CHROMATOGRAM
Retention time: 17.9 (R), 19.7 (S)
Internal standard: pipothiazine (9.4 min on achiral system)
Limit of quantitation: 60 ng/mL (chiral), 15 ng/mL (achiral)

KEY WORDS
plasma; chiral; normal phase; achiral

SAMPLE
Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 264

CHROMATOGRAM

Retention time: 13.43
Limit of detection: <120 ng/mL

KEY WORDS

SAMPLE

Matrix: blood, tissue
Sample preparation: Blood or serum. 1 mL Blood or serum + 1 μg cianopramine + 1 mL water, vortex, add 1 mL 200 mM sodium carbonate, vortex, add 6 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 100 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer. Liver homogenate. 0.5 mL Liver homogenate + 10 μg cianopramine + 500 μL 2% sodium tetraborate + 8 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 400 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm RP-18 Newguard (Applied Biosystems)
Column: 100 × 4.6 5 μm Brownlee Spheri-5 RP-18
Mobile phase: MeCN:100 mM NaH_2PO_4:diethylamine 40:57.5:2.5
Flow rate: 2
Injection volume: 30
Detector: UV 220

CHROMATOGRAM

Retention time: 77.76
Internal standard: cianopramine (8.93)

OTHER SUBSTANCES

Simultaneous: amitriptyline, amoxapine, benztropine, brompheniramine, chlorpheniramine, chlorpromazine, clomipramine, cyproheptadine, desipramine, diphenhydramine, dothiepin, doxepin, fluoxetine, haloperidol, imipramine, loxapine, maprotiline, meperidine, mesoridazine, methadone, metoclopramide, mianserin, moclobemide, nomifensine, nordoxepin, norfluoxetine, norpropoxyphene, northiaden, nortriptyline, pentobarbital, pheniramine, promethazine, propoxyphene, propranolol, protriptyline, quinidine, quinine, sulforidazine, thiothixene, tranylcypromine, trazodone, trihexiphenidyl, trimipramine, triprolidine

Noninterfering: dextromethorphan, norphetidine, phenoxybenzamine, prochlorperazine, trifluoperazine

KEY WORDS

serum; whole blood; liver

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 262.9

CHROMATOGRAM

Retention time: 17.168

KEY WORDS

whole blood

SAMPLE
Matrix: solutions

HPLC VARIABLES
Guard column: 30 × 2.1 Spheri-5 RP-8
Column: 220 × 2.1 Spheri-5 RP-8
Mobile phase: Gradient. A was 0.08% diethylamine and 0.09% phosphoric acid in water, pH 2.3. B was MeCN:water 90:10 containing 0.08% diethylamine and 0.09% phosphoric acid. A:B 95:5 for 2 min, to 0:100 over 15 min (?), maintain at 0:100 for 5 min.
Column temperature: 50
Flow rate: 0.5
Detector: UV 200

CHROMATOGRAM
Retention time: 16.2

OTHER SUBSTANCES
Simultaneous: mesoridazine, promazine, thiothixene, chlorpromazine, trifluoperazine
Also analyzed: amitriptyline, amphetamine, chlordiazepoxide, desalkylflurazepam, desipramine, desmethyldoxepin, diazepam, diethylpropion, doxepin, ephedrine, fenfluramine, flurazepam, imipramine, methamphetamine, norchlordiazepoxide, nordiazepam, nortriptyline, oxazepam, phentermine, phenylpropanolamine, prazepam

REFERENCE
Rainin Catalog, C1-94, **1994**, p. 7.24.

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 1 mg/mL solution in MeOH, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Lichrosphere cyanopropyl

Mobile phase: Carbon dioxide:MeOH:isopropylamine 90:10:0.05
Column temperature: 50
Flow rate: 3
Injection volume: 5
Detector: UV 220

CHROMATOGRAM
Retention time: 5.38

OTHER SUBSTANCES
Simultaneous: benactyzine, buclizine, hydroxyzine, perphenazine, amitriptyline, desipramine, imipramine, nortriptyline, protriptyline

KEY WORDS
SFC; pressure 200 bar

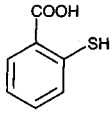
Thiosalicylic acid



Molecular formula: $C_7H_6O_2S$
Molecular weight: 154.19
CAS Registry No.: 147-93-3
Merck Index: 9498

SAMPLE

Matrix: blood, urine
Sample preparation: Plasma. 1 mL Plasma + 50 μL 500 ng/mL mefenamic acid or indomethacin + 1 mL 100 mM HCl + 10 mL dichloromethane, rotate for 10 min, centrifuge at 1500 g for 15 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 45°. Redissolve the residue in mobile phase, inject a 20 μL aliquot. Urine. 50 μL Urine + 1 mL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 75 × 4.6 3 μm Supelcosil LC-8
Mobile phase: MeCN:50 mM phosphoric acid 45:55
Flow rate: 1
Injection volume: 20
Detector: UV 235

CHROMATOGRAM

Retention time: 2.2
Internal standard: mefenamic acid (8) or indomethacin (5)
Limit of detection: 50-250 ng/mL

OTHER SUBSTANCES

Simultaneous: naproxen, flunixin, ethacrynic acid, phenylbutazone

KEY WORDS

plasma

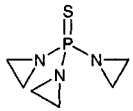
Thiotepa



Molecular formula: $C_6H_{12}N_3PS$
Molecular weight: 189.22
CAS Registry No.: 52-24-4
Merck Index: 9805

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 2.2 mL water, add 3 mL to an Extrelut 3 SPE cartridge, let stand for 15 min, elute with chloroform. Collect the first 8 mL of effluent, evaporate to dryness under a stream of nitrogen at 20°, reconstitute the residue in 500 µL 1-propanol. Remove a 100 µL aliquot and add 10 µL reagent, heat at 80° for 30 min, cool in an ice bath, add 400 µL taurine solution, add 400 µL OPA solution, let stand for 10 min, inject a 20 µL aliquot. (Reagent was prepared by mixing equal volumes of 80 mM sodium sulfide solution and 100 mM disodium EDTA, prepare fresh daily. Taurine solution was 0.2 mM taurine in 100 mM pH 8.0 phosphate buffer. OPA solution was 0.3 mM o-phthalaldehyde in 100 mM pH 8.0 phosphate buffer.)

HPLC VARIABLES
Column: 250 × 4 5 µm LiChrosorb RP-18
Mobile phase: MeCN:100 mM pH 5.7 phosphate buffer 28:72
Flow rate: 1
Injection volume: 20
Detector: F ex 340 em 440

CHROMATOGRAM
Retention time: 17.0
Limit of detection: 10 mg/mL

OTHER SUBSTANCES
Extracted: metabolites, TEPA

KEY WORDS
rabbit; plasma; SPE; derivatization; pharmacokinetics

SAMPLE
Matrix: blood
Sample preparation: Condition a Bond Elut C18 SPE cartridge with 10 mL MeOH and 10 mL water. Add 1 mL plasma to the SPE cartridge, wash with 10 mL water, wash with 1 mL MeCN: water 20:80, elute with 1 mL MeCN. Evaporate the eluate to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 500 μL 20% MeCN, filter (0.22 μm), inject a 100 μL aliquot. (Use preservative-free heparin when collecting blood.)

HPLC VARIABLES
Column: 250 × 4.6 5 μm Spherisorb ODS II
Mobile phase: MeCN:water 20:80
Flow rate: 1
Injection volume: 100
Detector: UV 200

CHROMATOGRAM
Retention time: 11.4
Limit of quantitation: 25 ng/mL

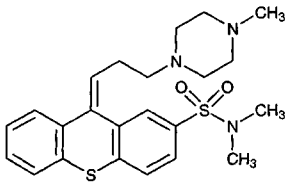
Thiothixene



Molecular formula: $C_{23}H_{29}N_3O_2S_2$
Molecular weight: 443.63
CAS Registry No.: 5591-45-7, 22189-31-7 (HCl dihydrate), 49746-09-0 (Z HCl dihydrate), 58513- 59-0 (HCl), 49746-04-5 (Z HCl)
Merck Index: 9503
Lednicer No.: 1 400

SAMPLE
Matrix: blood
Sample preparation: 10 mL Plasma or whole blood + 1 mL 1 M NaOH, extract twice with 10 mL hexane for 30 min. Remove the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 1 mL 100 mM HCl, add 5 mL chloroform, vortex for 1 min, centrifuge. Remove a 4.5 mL aliquot of the organic layer and evaporate it to dryness, reconstitute the residue in 100 μL mobile phase, inject a 50 μL aliquot. (It is implied, but not explicitly stated in the paper, that this extraction procedure works for this compound.)

HPLC VARIABLES
Column: 10 μm Micropak CN (Varian)
Mobile phase: MeCN:20 mM ammonium acetate 90:10
Flow rate: 2.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 10.0
Limit of detection: 10 ng/mL

OTHER SUBSTANCES
Simultaneous: acetophenazine, amitriptyline, benztropine, butaperazine, carphenazine, chlorpromazine, fluphenazine, haloperidol, mesoridazine, nortriptyline, orphenadrine, piperacetazine, promethazine, thioridazine, trifluoperazine, triflupromazine, trihexyphenidyl, trimeprazine
Interfering: promazine, imipramine

KEY WORDS
plasma; whole blood

SAMPLE

Matrix: blood

Sample preparation: 1 mL Plasma + 100 μL 100 ng/mL trifluoperazine dihydrochloride in 50 mM HCl + 200 μL concentrated ammonium hydroxide + 7 mL n-pentane:isopropanol 95:5, shake horizontally for 30 min, centrifuge at 2000 g. Remove the top organic layer and add it to 2 mL 100 mM perchloric acid, agitate for 10 min, centrifuge. Remove the aqueous layer and add it to 200 μL concentrated ammonium hydroxide, add 6 mL n-pentane:isopropanol 95:5, agitate for 30 min, centrifuge. Remove the top organic layer and evaporate it to dryness under a stream of nitrogen at 45°, reconstitute the residue in 50 μL MeCN, inject a 20-40 μL aliquot. (Clean glassware scrupulously by soaking overnight in 50 mL/L Contrad (Curtin Matheson), rinse several times with water, and air dry.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Ultrasphere cyano

Mobile phase: MeCN:10 mM pH 2.5 KH_2PO_4 60:40

Flow rate: 2.5

Injection volume: 20-40

Detector: E, Environmental Science Associates Coulochem Model 5100A, Model 5100 guard cell +0.85 V (between pump and injector), Model 5010 analytical cell +0.8 V, preanalytical cell +0.3 V

CHROMATOGRAM

Retention time: 6.4

Internal standard: trifluoperazine dihydrochloride (8.2)

Limit of detection: 0.2 ng/mL

OTHER SUBSTANCES

Simultaneous: amitriptyline, amoxapine, chlorpromazine, desipramine, doxepin, haloperidol, imipramine, loxapine, mesoridazine, nortriptyline, pheniramine, phenylephrine, prochlorperazine, promazine, promethazine, trazodone, trimeprazine, tripelennamine

Noninterfering: diazepam, diphenhydramine, ethopropazine, fluoxetine, nordiazepam, oxazepam, phenylpropanolamine, pseudoephedrine

Interfering: fluphenazine, perphenazine, thioridazine, triflupromazine

SAMPLE

Matrix: solutions
Sample preparation: Make up a solution in mobile phase, inject a 120 μL aliquot.

HPLC VARIABLES

Guard column: 15 × 3.2 Alltech RP-18 guard column
Column: 250 × 4.6 5 μm Supelcosil LC18-DB
Mobile phase: MeOH:MeCN:water:1 M ammonium hydroxide 50:35:15:0.3, adjusted to pH 6.7-8.0 with 6 M HCl
Flow rate: 1
Injection volume: 120
Detector: UV 263

CHROMATOGRAM

Retention time: 5.6

OTHER SUBSTANCES

Simultaneous: chlorpromazine, amitriptyline, clozapine, chlordiazepoxide, thioridazine, mesoridazine, sulforidazine, fluoxetine
Noninterfering: flurazepam, methylphenidate, ephedrine
Interfering: desipramine, nortriptyline, imipramine, maprotiline

SAMPLE

Matrix: solutions

HPLC VARIABLES

Guard column: 30 × 2.1 Spheri-5 RP-8
Column: 220 × 2.1 Spheri-5 RP-8
Mobile phase: Gradient. A was 0.08% diethylamine and 0.09% phosphoric acid in water, pH 2.3. B was MeCN:water 90:10 containing 0.08% diethylamine and 0.09% phosphoric acid. A:B 95:5 for 2 min, to 0:100 over 15 min (?), maintain at 0:100 for 5 min.
Column temperature: 50
Flow rate: 0.5
Detector: UV 200

CHROMATOGRAM

Retention time: 14

OTHER SUBSTANCES

Simultaneous: mesoridazine, promazine, chlorpromazine, trifluoperazine, thioridazine
Also analyzed: amitriptyline, amphetamine, chlordiazepoxide, desalkylflurazepam, desipramine, desmethyldoxepin, diazepam, diethylpropion, doxepin, ephedrine, fenfluramine, flurazepam, imipramine, methamphetamine, norchlordiazepoxide, nordiazepam, nortriptyline, oxazepam, phentermine, phenylpropanolamine, prazepam

REFERENCE

Rainin Catalog, C1-94, **1994**, p. 7.24.

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 1 mg/mL solution in MeOH, inject a 5 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Lichrosphere cyanopropyl
Mobile phase: Carbon dioxide:MeOH:isopropylamine 94:6:0.03
Column temperature: 50
Flow rate: 3
Injection volume: 5
Detector: UV 254

CHROMATOGRAM
Retention time: 8.3

OTHER SUBSTANCES
Simultaneous: trifluprομazine, carphenazine, methotrimeprazine, promazine, perphenazine, chlorprothixene, deserpidine, reserpine
Also analyzed: acetophenazine, ethopropazine, promethazine, propiomazine

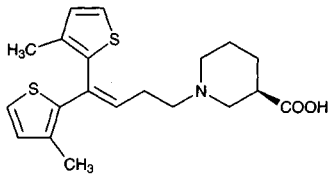
Tiagabine

Molecular formula: $C_{20}H_{25}NO_2S_2$
Molecular weight: 375.56
CAS Registry No.: 115103-54-3
Merck Index: 9557



SAMPLE
Matrix: bulk
Sample preparation: Weigh out approximately 50 mg tiagabine, add 5 to 10 drops of MeOH, make up to 25 mL with isopropanol, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Chiracel-OD (Daicel)
Mobile phase: EtOH:hexane:isopropanol:trifluoroacetic acid 6:80:14:0.5
Flow rate: 0.8
Injection volume: 10
Detector: UV 260

CHROMATOGRAM
Retention time: 10.1 (S(+)), 14.2 (R(-))

KEY WORDS
chiral

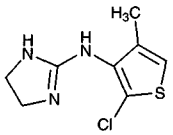
Tiamenidine



Molecular formula: $C_8H_{10}ClN_3S$
Molecular weight: 215.71
CAS Registry No.: 31428-61-2, 51274-83-0 (HCl)
Merck Index: 9558
Lednicer No.: 3 137

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 150 × 4.6 12 μm 1-myristoyl-2-[(13-carboxyl)-tridecoyl]-sn-3-glycerophosphocholine chemically bonded to silica (Regis)
Mobile phase: MeCN:100 mM pH 7.0 phosphate buffer 20:80
Flow rate: 1
Detector: UV 254

CHROMATOGRAM
Retention time: k' 2.72

OTHER SUBSTANCES
Also analyzed: acebutolol, alprenolol, antazoline, atenolol, betaxolol, bisoprolol, bopindolol, bupranolol, carteolol, celiprolol, chloropyramine, chlorpheniramine, cicloprolol, cimetidine, cinnarizine, cirazoline, clonidine, dilevalol, dimethindene, diphenhydramine, doxazosin, esmolol, famotidine, isothipendyl, ketotifen, metiamide, metoprolol, moxonidine, nadolol, naphazoline, nifenalol, nizatidine, oxprenolol, pheniramine, phentolamine, pindolol, pizotyline (pizotifen), practolol, prazosin, promethazine, propranolol, pyrilamine (mepyramine), ranitidine, roxatidine, sotalol, timolol, tramazoline, tripelennamine, triprolidine, tymazoline, UK-14,304

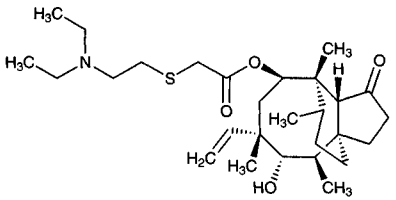
Tiamulin



Molecular formula: $C_{28}H_{47}NO_4S$
Molecular weight: 493.75
CAS Registry No.: 55297-95-5, 55297-96-6 (fumarate)
Merck Index: 9559

SAMPLE
Matrix: feed
Sample preparation: 50 g Milled feed + 250 mL 1% sodium carbonate + 250 mL hexane:ethyl acetate 75:25, homogenize (Silverson) for 1 min, centrifuge at 2000 rpm for 5 min. Remove a 10 mL aliquot of the upper solvent layer and add it to 10 mL 0.1% tartaric acid, rotate for 1 min, centrifuge at 2000 rpm for 5 min, inject a 0.4-3 mL aliquot of the aqueous layer.

HPLC VARIABLES
Column: 200 × 4.6 5 μm Hypersil-ODS
Mobile phase: MeCN:MeOH:1% ammonium carbonate 30:60:20
Flow rate: 1.5
Injection volume: 400-3000
Detector: UV 250

CHROMATOGRAM
Retention time: 12
Limit of detection: <5 μg/g

OTHER SUBSTANCES
Noninterfering: furazolidone, monensin, sulfadimidine

REFERENCE
Howard,D.; Cowen,T. Determination of tiamulin hydrogen fumarate in animal feeds using high-performance liquid chromatography, *Analyst*, **1982**, *107*, 319–323.

SAMPLE
Matrix: feed, formulations, premix
Sample preparation: Premix. 5 g Premix + 250 mL 1% sodium carbonate, shake for 30 min, add 250 mL hexane:ethyl acetate 75:25, shake for 1 h, shake vigorously by hand for 15-20 s, let stand until layers separate (centrifuge if necessary). Remove a 10 mL aliquot of the upper organic layer and add it to 30 mL 0.1% tartaric acid, shake gently horizontally for 30 s, inject a 50 μL aliquot of the lower aqueous layer. Formulations. Weigh out 660 mg formulation, add 100 mL water, shake or sonicate for 1 h, filter (44 μm) an aliquot, inject an aliquot of the filtrate (J. AOAC Int. 1993, 76, 447). Feed. 50 g Feed + 250 mL hexane:ethyl acetate 75:25 + 250 mL 1% sodium carbonate, shake in an orbital shaker at 250 rpm for 1 h, let stand for 1 h, centrifuge the supernatant at 1500 rpm for 15 min. Remove a 75 mL aliquot of the upper organic layer and add it to 5 mL 0.1% tartaric acid, shake gently horizontally for 30 s, repeat extraction twice more, combine the aqueous layers, inject a 50 μL aliquot of the lower aqueous layer (J. AOAC Int. 1993, 76, 449).

HPLC VARIABLES
Guard column: CO:PELL ODS
Column: 250 × 4.6 5 μm Hypersil ODS (premix, feed) or 300 × 3.9 10 μm C18 (formulations)
Mobile phase: MeCN:MeOH:1% ammonium carbonate 30:60:25 (Pass mobile phase through a column of 200-425 mesh Adsorbosil silica (Alltech) before injector. Periodically wash column with 60 mL MeOH:1% acetic acid and 30 mL MeOH, then re-equilibrate with mobile phase.)
Flow rate: 1.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 7

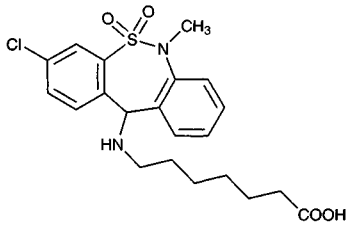
Tianeptine



Molecular formula: $C_{21}H_{25}ClN_2O_4S$
Molecular weight: 436.96
CAS Registry No.: 66981-73-5
Merck Index: 9560

SAMPLE

Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18

Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)

Column temperature: 30

Flow rate: 0.8

Injection volume: 50

Detector: UV 269

CHROMATOGRAM

Retention time: 5.40

Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, tissue, urine

Sample preparation: Plasma, urine. Centrifuge urine at 900 g. 2 mL Plasma or centrifuged urine + 1 mL 50 (plasma) or 500 (urine) mM pH 7.0 phosphate buffer + 100 μL 10 μg/mL IS in water + 10 mL heptane:octanol 98:2 containing 5 g/L tetraheptylammonium bromide, shake for 10 min, centrifuge at 900 g for 10 min. Remove an 8 mL aliquot of the upper aqueous phase and add it to 200 μL MeOH:170 mM acetic acid 10:90, shake on a rotary agitator at 10 rpm for 5 min, centrifuge at 900 g for 5 min, inject a 50 μL aliquot of the aqueous phase. Brain. Homogenize (Ultra Turrax) 1 g brain tissue and 2 mL 50 mM pH 7.0 phosphate buffer for 30 s, vortex for 15 s, centrifuge. 2 mL Supernatant + 1 mL 50 mM pH 7.0 phosphate buffer + 100 μL 10 μg/mL IS in water + 10 mL heptane:octanol 98:2 containing 5 g/L tetraheptylammonium bromide, shake for 10 min, centrifuge at 900 g for 10 min. Remove an 8 mL aliquot of the upper aqueous phase and add it to 200 μL MeOH:170 mM acetic acid 10:90, shake on a rotary agitator at 10 rpm for 5 min, centrifuge at 900 g for 5 min, inject a 50 μL aliquot of the aqueous phase.

HPLC VARIABLES

Column: 150 × 4.6 5 μm Hypersil ODS

Mobile phase: MeCN:buffer 45:55 (Buffer was 2.7 g/L sodium pentanesulfonate adjusted to pH 3.0 with phosphoric acid.)

Flow rate: 1.3

Injection volume: 50

Detector: UV 220

CHROMATOGRAM

Retention time: 4.5

Internal standard: (dihydro-10,11-dibenzo[a,d]cycloheptenyl-5-amino)-7-octanoic acid (Servier Labs) (6.0)

Limit of detection: 10 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

Simultaneous: bromazepam, clobazam, clonazepam, clorazepate, desmethyldiazepam, flunitrazepam, lorazepam, nitrazepam, oxazepam, triazolam

Noninterfering: clomipramine, desipramine, desmethylclomipramine, imipramine, medazepam, meprobamate, nortriptyline, protriptyline, tetrazepam, trimipramine

Interfering: amineptine, diazepam

KEY WORDS

plasma; human; rat; brain; pharmacokinetics

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the

organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 206.4

SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. 2 mL Plasma + 50 μL 50 μg/mL IS in MeOH + 250 μL 1 M HCl + 5 mL diethyl ether, mix, centrifuge at 1100 g for 10 min. Remove the organic phase, repeat the extraction, combine the organic extracts, evaporate under nitrogen at 40°, reconstitute the residue in 200 μL mobile phase, vortex, inject a 20 μL aliquot. Urine. 1 mL Urine + 250 μL 1 M HCl + 50 μL IS + 5 mL diethyl ether, rotate for 15 min. Remove the organic layer, add 1 mL 1% sodium hydrogen carbonate, vortex for 1 min. Remove the organic layer and evaporate it under nitrogen at 40°, reconstitute the residue in 200 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 100 × 3 5 μm Nucleosil
Mobile phase: MeCN:water:acetic acid 40:59.4:0.6

Column temperature: 35
Flow rate: 0.8
Injection volume: 20
Detector: UV 310

CHROMATOGRAM
Retention time: 2.7
Internal standard: feprazone (8.3, UV 245))
Limit of quantitation: 100 ng/mL (plasma), 500 ng/mL (urine)

OTHER SUBSTANCES
Noninterfering: alclofenac, diclofenac, fenoprofen, flunixin, flurbiprofen, ibuprofen, indomethacin, naproxen, oxyphenbutazone, phenylbytazone, piroxicam

KEY WORDS
plasma; pharmacokinetics

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 17.653

KEY WORDS
whole blood

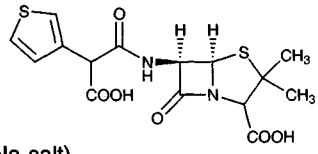
Ticarcillin



Molecular formula: $C_{15}H_{16}N_2O_6S_2$
Molecular weight: 384.43
CAS Registry No.: 34787-01-4, 4697-14-7 (di Na salt), 74682-62-5 (Na salt)
Merck Index: 9568
Lednicer No.: 2 437

SAMPLE

Matrix: bile, blood, urine
Sample preparation: Serum. 0.5 mL serum + 0.5 mL MeCN mix in 7 mL tube on vortex mixer; shake by rotation (20 rpm) 10 min; centrifuge 10 min 1000 g; transfer supernatant to another tube, add 7 aliquots dichloromethane; equilibrate 10 min; shake by rotation (20 rpm) 10 min; centrifuge 10 min 1000 g; inject aliquot of upper aqueous layer. Urine. Centrifuge urine and dilute 1:20. Bile. Centrifuge bile and dilute 1:10

HPLC VARIABLES

Column: 75 × 4.6 3 μm octadecylsilane
Mobile phase: 36:64 MeCN:10 mM citrate buffer adjusted to pH 2 with HCl
Flow rate: 1
Injection volume: 5
Detector: UV 214

CHROMATOGRAM

Retention time: 1.6
Limit of detection: 100 ng/mL

OTHER SUBSTANCES

Also analyzed: ampicillin, azlocillin, aztreonam, cefmenoxime, cefoperazone, cefsulodin, cefotaxime, ceftazidime, ceftriaxone, cloxacillin, desacetylcefotaxime, mezlocillin, penicillin G, piperacillin

KEY WORDS

serum

SAMPLE

Matrix: blood
Sample preparation: 350 μL Serum + 150 μL 150 μg/mL temocillin in water + 250 μL 400 mM HCl + 3.5 mL chloroform:n-amyl alcohol (3:1), mix for 5 min, centrifuge for 5 min. Remove the organic layer and add it to 350 μL 10 mM pH 7.0 phosphate buffer, mix for 5 min, centrifuge for 5 min, inject a 20 μL aliquot of the upper aqueous layer.

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeOH:buffer 15:85 (Buffer was 100 mM ammonium acetate adjusted to pH 4.0 with glacial acetic acid.)
Flow rate: 1.8
Injection volume: 20
Detector: UV 242

CHROMATOGRAM

Retention time: 6.8
Internal standard: temocillin (5.4)

OTHER SUBSTANCES
Simultaneous: cefoxitin
Noninterfering: acetaminophen, acetazolamide, allopurinol, amikacin, ampicillin, azlocillin, caffeine, cefamandole, cefoperazone, cefotaxime, cefsulodin, ceftazidime, ceftizoxime, chloramphenicol, chlorpromazine, clindamycin, dicloxacillin, 5-fluorocytosine, flurazepam, gentamicin, methicillin, metronidazole, mezlocillin, moxalactam, nafcillin, penicillin, phenobarbital, piperacillin, procainamide, rifampin, sulfamethoxazole, theophylline, thienamycin, tobramycin, trimethoprim, vancomycin
Interfering: cefuroxime, cephalothin

KEY WORDS
serum

SAMPLE
Matrix: blood, urine
Sample preparation: Serum. 200 μL Serum + 200 μL 10 M urea, mix, filter (Amicon MPS-1 micropartition system with Amicon YMT membranes) while centrifuging at 1500 g for 10 min. Add 200 μL of the ultrafiltrate to 200 μL reagent and heat at 60° for 10 min, cool to room temperature, inject a 30-90 μL aliquot. Urine. Dilute urine 10-fold with water, filter (0.45 μm acrylate copolymer). Add 200 μL of the filtrate to 200 μL reagent and heat at 60° for 10 min, cool to room temperature, inject a 30-60 μL aliquot. (Prepare reagent by dissolving 13.81 g 1,2,4-triazole in 60 mL water, add 10 mL 2.7 mg/mL mercury(II) chloride in water, adjust pH to 9.0 ± 0.05 with saturated NaOH, make up to 100 mL with water.)

HPLC VARIABLES
Column: 150 × 4.6 5 μm Develosil ODS-5 (Nomura Chemicals)
Mobile phase: MeCN:buffer containing 5 mM tetrabutylammonium bromide and 5 mM sodium thiosulfate 1:1.8 (Prepare the buffer by dissolving 14.32 g $Na_2HPO_4.12H_2O$ and 6.240 g $NaH_2PO_4.2H_2O$ in 1 L water then diluting 100-fold.)
Column temperature: 40
Flow rate: 1
Injection volume: 30-90
Detector: UV 328

CHROMATOGRAM
Retention time: 4.5
Limit of detection: 1 μg/mL (urine), 100 ng/mL (plasma)

OTHER SUBSTANCES
Interfering: carbenicillin

KEY WORDS
serum; derivatization; ultrafiltrate; pharmacokinetics

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 200 μL Plasma + 500 μL 2 μg/mL cefoperazone in MeCN, vortex for 20 s, centrifuge at 3000 rpm for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 200 μL mobile phase, inject a 10-15 μL aliquot. Urine. Inject a 102-20 μL aliquot directly onto the column.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Adsorbosphere C18

Mobile phase: MeCN:water:orthophosphoric acid:10% tetramethylammonium chloride 30:69.6:0.1:0.3
Flow rate: 1
Injection volume: 10-20
Detector: UV 205

CHROMATOGRAM
Retention time: 8.8
Internal standard: cefoperazone (6.8)
Limit of detection: 1000 ng/mL (urine), 500 ng/mL (plasma)

OTHER SUBSTANCES
Noninterfering: xanthines, aspirin, acetaminophen, cephalosporins, penicillins

KEY WORDS
plasma; pharmacokinetics

SAMPLE
Matrix: milk
Sample preparation: Condition a Bond Elut C8 SPE cartridge with 5 mL MeOH and 5 mL water. 20 mL Milk + 1 mL 1 M oxalic acid, heat at 60° for 10 min, centrifuge for 10 min, remove the supernatant and add it to 20 mL water and 400 μL tributylamine, shake well, add to the SPE cartridge, wash with two 2.5 mL portions of water, elute with 2.5 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen, extract the residue with three 100 μL portions of 50 mM pH 6.0 potassium phosphate buffer, filter (0.2 μm), inject an aliquot of the filtrate. (Buffer was 545 mL 100 mM citric acid, 455 mL 200 mM Na_2HPO_4, and 74.4 g EDTA, adjust to pH 4.5 with ammonium hydroxide, make up to 2 L with water.)

HPLC VARIABLES
Column: 250 × 4.6 10 μm Lichrosorb RP-8
Mobile phase: MeOH:50 mM pH 6.0 potassium phosphate buffer 35:65
Flow rate: 1
Injection volume: 200
Detector: UV 210 or Charm II assay

OTHER SUBSTANCES
Extracted: amoxicillin, cefadroxil
Simultaneous: ampicillin, ceftiofur, cephapirin, cloxacillin, dicloxacillin, nafcillin, oxacillin, penicillin G

KEY WORDS
SPE

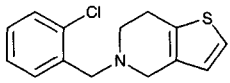
Ticlopidine



Molecular formula: $C_{14}H_{14}ClNS$
Molecular weight: 263.79
CAS Registry No.: 55142-85-3, 53885-35-1 (HCl)
Merck Index: 9569
Lednicer No.: 3 228

SAMPLE
Matrix: blood
Sample preparation: Condition a 1 mL Bond Elut C18 SPE cartridge (Varian) with 1 mL MeOH and 1 mL 10 mM NaOH. Add 50 μL 10 μg/mL IS in MeOH and 1 mL 1 M NaOH to 1 mL plasma, vortex, add to SPE cartridge, wash with 4 mL MeOH:10 mM NaOH 50:50, dry by sucking air through the cartridge, elute with 500 μL ethyl acetate, evaporate the eluate to dryness under a stream of nitrogen at 37°, dissolve the residue in 200 μL mobile phase, inject an aliquot.

HPLC VARIABLES
Guard column: 30 × 4 BST Rutin 10 C18 (Bio-Separation Technologies, Hungary)
Column: 250 × 4 BST Rutin 10 C18 BD (BST Rutin C18 is equivalent to Hypersil BDS C18)
Mobile phase: MeCN:MeOH:10 mM pH 4 NaH_2PO_4 buffer 40:40:20
Flow rate: 1
Injection volume: 50
Detector: UV 215

CHROMATOGRAM
Retention time: 11
Internal standard: 5-(2,4-o-dichlorobenzyl)(-4,5,6,7-tetrahydrotieno-[3,2-c] pyridine (18)
Limit of quantitation: 10 ng/mL

KEY WORDS
plasma; SPE

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol:n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 234

CHROMATOGRAM
Retention time: 4.91
Limit of detection: <120 ng/mL

KEY WORDS
whole blood; plasma; interferences may occur–compounds (all of which are extracted) elute in this order tenoxicam; iproniazid; methocarbamol; methotrexate; caffeine; nialamide; colchicine; cytarabine; benzoylecgonine; acetaminophen; diazoxide; dacarbazine; sulfinpyrazole; flumazenil; sulpride; morphine; atenolol; toloxatone; terbutaline; albuterol; phenobarbital; ranitidine; tiapride; phenol; chlormezanone; aspirin; metformin; ritodrine; codeine; sultopride; amisulpride; naltrexone; lisinopril; benzocaine; nizatidine; nalorphine; mephenesin; naloxone; sotalol; carteolol; procainamide; carbamazepine; bromazepam; nalbuphine; nadolol; procarbazine; dihydralazine; omeprazole; strychnine; acebutolol; glutethimide; chlorpropamide; glipizide; triazolam; prazosin; flunitrazepam; clonazepam; metoclopramide; melphalan; estazolam; tolbutamide; ephedrine; clonidine; pindolol; clobazam; minoxidil; disopyramide; nitrazepam; dextromethorphan; tofisopam; zopiclone; debrisoquine; sulindac; alprazolam; cycloguanil; lorazepam; methaqualone; ketamine; piroxicam; metoprolol; nifedipine; quinine; mephentermine; prilocaine; pentazocine; oxazepam; tiaprofenic acid; quinidine; celiprolol; ajmaline; yohimbine; lidocaine; secobarbital; viloxazine; mepivacaine; meperidine; doxylamine; labetalol; temazepam; amodiaquine; benperidol; droperidol; hydroxychloroquine; zolpidem; ketoprofen; alminoprofen; cicletanine; moclobemide; chloroquine; cocaine; timolol; nomifensine; ticlopidine; acenocoumarol; vindesine; mexiletine; dipyridamole; trazodone; pipamperone; pyrimethamine; benazepril; vincristine; metapramine; chlordiazepoxide; oxprenolol; warfarin; clorazepate; flecainide; phencyclidine; thiopental; fenfluramine; metipranolol; triprolidine; naproxen; buprenorphine; verapamil; buspirone; tianeptine; midazolam; bupivacaine; carbinoxamine; loprazolam; cetirizine; chlorpheniramine; moperone; cibenzoline; medifoxamine; astemizole; vinblastine; nicardipine; bisoprolol; diltiazem; glibornuride; reserpine; aconitine; nitrendipine; diazepam; mianserin; ramipril; haloperidol; tetracaine; alprenolol; acepromethazine; glibenclamide; chlorophenacinone; doxepin; nimodipine; diphenhydramine; cyclizine; histapyrrodine; phenylbutazone; demexiptiline; clozapine; proguanil; trifluperidol; medazepam; cyamemazine; bumadizone; suriclone; propranolol; acepromazine; dothiepin; dextromoramide; fenoprofen; dextropropoxyphene; loxapine; betaxolol; propafenone; promethazine; thioproperazine; methadone; amoxapine; quinupramine; opipramol; cyproheptadine; brompheniramine; mefenidramine; protriptyline; flurbiprofen; tetrazepam; zorubicin; prazepam; alimemazine; loperamide; imipramine; desipramine; levomepromazine; hydroxyzine; niflumic acid; penbutolol; fluvoxamine; pimozide; daunorubicin; indomethacin; maprotiline; tropatenine; etodolac; fluoxetine; amitriptyline; nortriptyline; tioclomarol; diclofenac; mefloquine; trimipramine; chlorambucil; lidoflazine; ibuprofen; floctafenine; alpidem; loratadine; chlorpromazine; clomipramine; carpipramine; thioridazine; fentiazac; clemastine; mefenamic acid; fluphenazine; prochlorperazine; penfluridol; bepridil; terfenadine; trifluoperazine

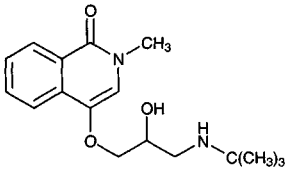
Tilisolol



Molecular formula: $C_{17}H_{24}N_2O_3$
Molecular weight: 304.39
CAS Registry No.: 85136-71-6
Merck Index: 9579

SAMPLE

Matrix: aqueous humor, blood, vitreous body
Sample preparation: Aqueous humor, vitreous body. Mix 200 µL aqueous humor or vitreous body with 20 µL 1 M HCl and 300 µL 100 µg/mL o-ethoxybenzamide in MeOH. Centrifuge at 12000 g for 15 min and inject a 50 µL aliquot of the supernatant. Plasma. Mix 700 µL plasma with 300 µL 2 M perchloric acid and centrifuge at 12000 g for 15 min. Shake 800 µL supernatant with 200 µL 5 M NaOH and 6 mL chloroform for 15 min, centrifuge at 650 g for 15 min. Remove a 5 mL aliquot of the organic layer and mix with 100 µL 100 µg/mL o-ethoxybenzamide in MeOH, evaporate under reduced pressure. Dissolve residue in 250 µL MeOH: phosphate-buffered saline 20:80, inject an aliquot.

HPLC VARIABLES

Column: 150 × 4.6 Cosmosil 5 C18-P
Mobile phase: MeOH:50 mM NaH_2PO_4 37:63
Flow rate: 1
Injection volume: 50
Detector: F ex 315 em 420

CHROMATOGRAM

Internal standard: o-ethoxybenzamide

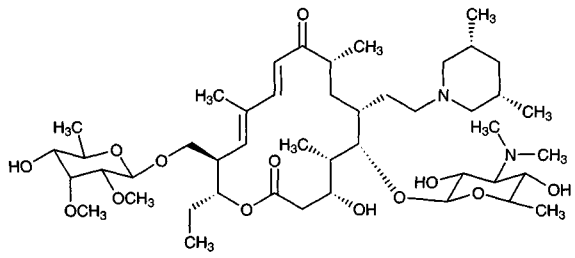
Tilmicosin

Molecular formula: $C_{46}H_{80}N_2O_{13}$
Molecular weight: 869.15
CAS Registry No.: 108050-54-0
Merck Index: 9580



cis-form

SAMPLE

Sample preparation: Condition a 1 mL 100 mg Bond-Elut diol SPE cartridge with 1 mL chloroform (Caution! Chloroform is a carcinogen!). Mix 2 g minced muscle tissue with 800 μL water. Stir, vortex for 1 min at maximum speed, let stand for 15 min. Add 2 mL pH 8 buffer, mix briefly, add 10 mL chloroform. Stir at 100 rpm for 15 min, centrifuge at 4000 g for 10 min, discard the aqueous layer, filter the chloroform layer through glass wool. Add the filtrate to the SPE cartridge, wash with 500 μL chloroform, dry under vacuum, elute with three 200 μL portions of MeOH:100 mM ammonium acetate 50:50, inject a 200 μL aliquot of the eluate. (Buffer was 33.46 g K_2HPO_4 and 1.046 g KH_2PO_4 in 1 L water.)

HPLC VARIABLES

Guard column: 4 × 4 5 μm C18
Column: 125 × 4 5 μm Lichrospher RP18
Mobile phase: Gradient. A was MeCN. B was MeOH. C was 0.1% trifluoroacetic acid in water. A:B:C from 20:20:60 to 25:55:20 in 10 (?) min
Flow rate: 0.5
Injection volume: 200
Detector: MS, HP Model 5989 A, desolvation chamber 60°, source 280° and 300° in negative and positive chemical ionization mode, respectively, with methane as reagent, quadrupole 100°, particle beam nebulizer helium 345 kPa, scan m/z 677.4-869.6 in NCI and 869.6-679.4 in PCI

CHROMATOGRAM

Retention time: 5.7
Limit of detection: 50 μg/kg

OTHER SUBSTANCES

Extracted: erythromycin, josamycin, spiramycin, tylosin

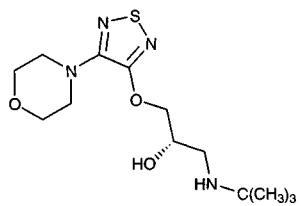
Timolol



Molecular formula: $C_{13}H_{24}N_4O_3S$
Molecular weight: 316.42
CAS Registry No.: 26839-75-8, 91524-16-2 (hemihydrate), 26921-17-5 maleate
Merck Index: 9585
Lednicer No.: 2 272

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a 3 mL 500 mg Bakerbond C18 SPE cartridge with 2.5 mL MeOH and 2.5 mL water. Urine. 200 µL Urine + 800 µL 100 mM pH 7.4 phosphate buffer + 100 µL 50 mM HCl + 100 µL 20 ng/mL IS in 50 mM HCl, mix. Add to the SPE cartridge. Wash with 2.5 mL 100 mM pH 10.6 K_2HPO_4, then with 2.5 mL water. Elute with 2.5 mL MeOH, evaporate the eluate to dryness at 50°. Reconstitute in 100 µL MeCN:MeOH:0.1% TFA 27:7:66 sonicate for 20 min, inject an aliquot. Plasma. 1 mL Plasma + 100 µL 50 mM HCl + 100 µL 20 ng/mL IS in 50 mM HCl + 2 mL 100 mM pH 10.6 K_2HPO_4, mix. Add to the SPE cartridge. Wash with 2.5 mL 100 mM pH 10.6 K_2HPO_4 and with 2.5 mL water. Elute with 2.5 mL MeOH,

evaporate the eluate to dryness under reduced pressure at 50°. Add 20 μL 1% pyridine in THF to the residue, vortex, add 40 μL 20% phosgene in toluene, heat at 85° for 2 h. Remove the excess reagent under nitrogen, reconstitute the residue in 100 μL MeCN:MeOH:0.1% TFA in water 36:6:58, sonicate for 20 min. Inject an aliquot. (Phosgene reacts with the hydroxy and secondary amino groups of timolol to form the oxazolidinone derivative.)

HPLC VARIABLES
Guard column: 20 Supelco Pelliguard LC-CN
Column: 50 × 4.6 3 μm Spherisorb CN
Mobile phase: MeCN:MeOH:0.1% TFA in water 45:5:50
Flow rate: 0.5
Injection volume: 10-50
Detector: MS, Sciex API IIIplus triple quadrupole, nebulizer 500°, nebulizing gas air 80 psi, curtain gas nitrogen, collision gas argon 50 eV, multiplier 3500 V, positive mode ionization

CHROMATOGRAM
Retention time: 5.53
Internal standard: N-isopropyl timolol (4.88)
Limit of quantitation: 200 pg/mL (plasma), 50 ng/mL (urine)

KEY WORDS
plasma; urine; dog; SPE; pharmacokinetics; derivatization

REFERENCE

SAMPLE

Matrix: solutions

Sample preparation: Mix a 100 μL of a 10 μM solution in MeCN:water:triethylamine 50:50:0.1 with 100 μL 1 mM (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in MeCN, heat in the dark at 65° for 1.5 h, inject an aliquot. (Synthesis of (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene from EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate: benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 $60F_{254}$ TLC plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei. Cool a solution of 16.4 g (S)-(-)-1-benzyl-3-pyrrolidinol in 164 mL pyridine to +5°, add 19.35 g p-toluenesulfonyl chloride, stir at +10° for 48 h, evaporate to dryness, chromatograph using dichloromethane: acetone 95:5 to obtain (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine (mp 68°). Heat a solution of (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine in 200 mL anhydrous DMF to 65°, add 33.5 g sodium azide (Caution! Sodium azide is highly toxic!), stir at 60° for 7 h, filter, evaporate the filtrate to dryness under reduced pressure, dissolve the residue in ethyl acetate, wash twice with water, dry over anhydrous magnesium sulfate, evaporate to obtain (3R)-3-azido-1-(phenylmethyl)pyrrolidine as an oil. Add 3.5 g 10% palladium on carbon under nitrogen to a solution of 7.05 g (3R)-3-azido-1-(phenylmethyl)pyrrolidine in 34.8 mL 1 M HCl in water and 245 mL EtOH, hydrogenate at atmospheric pressure for 30 min, add 3.5 g catalyst, hydrogenate for 2 h, filter, add 34.8 mL 1 M HCl to the filtrate, evaporate to dryness under reduced pressure, take up the residue in 70 mL EtOH, filter, evaporate the filtrate to dryness under reduced pressure, repeat this operation twice, crystallize with the minimum amount of EtOH to obtain (3R)-3-aminopyrrolidine dihydrochloride (J. Med. Chem. 1992, 35, 4205). 3R-(+)-aminopyrrolidine is also reported to be available from Tokyo Kasei. Add 100 mg 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to a stirred solution of 200 mg 3R-(+)-aminopyrrolidine in 20 mL MeCN at 0-10°, stir at room temperature for 30 min, remove the MeCN by evaporation under reduced pressure, dissolve the residue in 50 mL 5% HCl, wash 3 times with 50 mL portions of ethyl acetate, adjust the pH of the aqueous solution to 13-14 with 5% NaOH, extract 6 times with 50 mL portions of ethyl acetate. Combine the organic layers and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane to obtain (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as orange crystals (mp 96-98°) (Analyst 1992, 117, 727). Add 100 μL thiophosgene in 10 mL benzene (Caution! Benzene is a carcinogen!) to 100 mg (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in 100 mL acetone, reflux for 1 h, remove the solvent by evaporation under reduced pressure, suspend the residue in 100 mL water, extract 4 times with 25

mL portions of benzene. Combine the extracts and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane:benzene 1:2 to obtain (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylamino-sulfonyl)-2,1,3-benzoxadiazole as yellow crystals (mp 160-170° d) (Analyst 1995, 120, 385).)

HPLC VARIABLES

Molecular formula: $C_{22}H_{16}Cl2O_4S$
Molecular weight: 447.34
CAS Registry No.: 22619-35-8
Merck Index: 9594

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 μm NovaPack C18

Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 312

CHROMATOGRAM

Retention time: 9.41
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

SAMPLE
Matrix: formulations

Sample preparation: Tablets. Powder tablets, weigh out amount equivalent to about 30 mg, add 100 mL MeOH, sonicate for 5 min, filter. Add a 2 mL aliquot of filtrate to 5 mL of 100 μg/mL ketoconazole in MeOH, make up to 25 mL with MeOH, inject 20 μL aliquot. Cream. Condition a 500 mg Bond-Elut diol cartridge with 6 mL dichloromethane. Weigh out cream equivalent to about 5 mg of drug, add 30 mL dichloromethane, sonicate for 3 min, make up to 100 mL with dichloromethane, filter. Add a 2 mL aliquot to the cartridge, wash with 2 mL dichloromethane:methanol 4:1, wash with 2 mL dichloromethane, elute with 3 mL MeOH:buffer 85:15. Add eluate to 0.5 mL 100 μg/mL ketoconazole in MeOH, make up to 5 mL with MeOH, inject 20 μL aliquot. (Buffer was 50 mM triethylamine adjusted to pH 7.0 with phosphoric acid.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Spherisorb CN
Mobile phase: THF:buffer 30:70 (Buffer was 50 mM triethylamine adjusted to pH 3.0 with phosphoric acid.)
Flow rate: 1
Injection volume: 20
Detector: UV 230 [Enhanced sensitivity with photoreactor (Beam Boost model C6808 with 10 m × 0.3 mm reaction coil) followed by UV detection at 270 nm.]

CHROMATOGRAM

SAMPLE

Matrix: solutions
Sample preparation: Mix 10 μL 12 mM reagent in MeCN with 20 μL of a 30 μM solution of tiopronin in 2 mM Na_2EDTA containing pyridine (final concentration 1%), heat at 50° for 60 min, inject a 10 μL aliquot. (Reagent was 4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole [R-(-)-DBD-PyNCS], available from Tokyo Kasei (TCI America, Portland, OR). Synthesis is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene from EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a

solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, was h, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 60F254 TLC plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). DBD-F can also be purchased from Tokyo Kasei. Cool a solution of 16.4 g (S)-(-)-1-benzyl-3-pyrrolidinol in 164 mL pyridine to +5°, add 19.35 g p-toluenesulfonyl chloride, stir at +10° for 48 h, evaporate to dryness, chromatograph using dichloromethane:acetone 95:5 to obtain (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine (mp 68°). Heat a solution of (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine in 200 mL anhydrous DMF to 65?, add 33.5 g sodium azide (Caution! Sodium azide is highly toxic!), stir at 60° for 7 h, filter, evaporate the filtrate to dryness under reduced pressure, dissolve the residue in ethyl acetate, wash twice with water, dry over anhydrous magnesium sulfate, evaporate to obtain (3R)-3-azido-1-(phenylmethyl)pyrrolidine as an oil. Add 3.5 g 10% palladium on carbon under nitrogen to a solution of 7.05 g (3R)-3-azido-1-(phenylmethyl)pyrrolidine in 34.8 mL 1 M HCl in water and 245 mL EtOH, hydrogenate at atmospheric pressure for 30 min, add 3.5 g catalyst, hydrogenate for 2 h, filter, add 34.8 mL 1 M HCl to the filtrate, evaporate to dryness under reduced pressure, take up the residue in 70 mL EtOH, filter, evaporate the filtrate to dryness under reduced pressure, repeat this operation twice, crystallize with the minimum amount of EtOH to obtain (3R)-3-aminopyrrolidine dihydrochloride (J. Med. Chem. 1992, 35, 4205). 3R-(+)-Aminopyrrolidine is also available from Tokyo Kasei. Add 100 mg 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to a stirred solution of 200 mg 3R-(+)-aminopyrrolidine in 20 mL MeCN at 0-10°, stir at room temperature for 30 min, remove the MeCN by evaporation under reduced pressure, dissolve the residue in 50 mL 5% HCl, wash 3 times with 50 mL portions of ethyl acetate, adjust the pH of the aqueous solution to 13-14 with 5% NaOH, extract 6 times with 50 mL portions of ethyl acetate. Combine the organic layers and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane to obtain (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as orange crystals (mp 96-98°) (Analyst 1992, 117, 727). Add 100 μL thiophosgene in 10 mL benzene (Caution! Benzene is a carcinogen!) to 100 mg (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole in 100 mL acetone, reflux for 1 h, remove the solvent by evaporation under reduced pressure, suspend the residue in 100 mL water, extract 4 times with 25 mL portions of benzene. Combine the extracts and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane:benzene 1:2 to obtain (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole as yellow crystals (mp 160-170° d) (Analyst 1995, 120, 385).)

HPLC VARIABLES

Column: 150 × 4.6 5 μm ULTRON VX-ODS (Shinwa Chemicals, Japan)

Mobile phase: MeCN:water containing 0.1% TFA 30:70 (A) or Gradient. C was MeCN containing 1% (v/v) TFA. D was water containing 1% TFA. C:D from 15:85 to 30:70 over 20min, to 40:60 over 30 min, maintain at 40:60 for 15 min (B)

Flow rate: 1

Injection volume: 10

Detector: F ex 455 em 568 (A), MS, Finnigan-MAT LCQ, ESI capillary temperature 275°, capillary voltage 3V, source voltage 4.8 kV, source current 100 μA, collision gas helium, positive ion mode, m/z 200-900 (B)

SAMPLE
Matrix: solutions
Sample preparation: Mix 20 μL of a 30 μM solution in 2 mM disodium EDTA containing 1.5% pyridine with 10 μL 12 mM R-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-nitro-2,1,3-benzoxadiazole in MeCN, let stand for 40 min, inject a 10 μL aliquot. (Synthesis of (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-nitro-2,1,3-benzoxadiazole, (R)-(-)-NBD-PyNCS, is as follows. Cool a solution of 16.4 g (S)-(-)-1-benzyl-3-pyrrolidinol in 164 mL pyridine to +5°, add 19.35 g p-toluenesulfonyl chloride, stir at +10° for 48 h, evaporate to dryness, chromatograph using dichloromethane:acetone 95:5 to obtain (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine (mp 68°). Heat a solution of (3S)-3-[(4-tolylsulfonyl)oxy]-1-(phenylmethyl)pyrrolidine in 200 mL anhydrous DMF to 65°, add 33.5 g sodium azide (Caution! Sodium azide is highly toxic!), stir at 60° for 7 h, filter, evaporate the filtrate to dryness under reduced pressure, dissolve the residue in ethyl acetate, wash twice with water, dry over anhydrous magnesium sulfate, evaporate to obtain (3R)-3-azido-1-(phenylmethyl)pyrrolidine as an oil. Add 3.5 g 10% palladium on carbon under nitrogen to a solution of 7.05 g (3R)-3-azido-1-(phenylmethyl)pyrrolidine in 34.8 mL 1 M HCl in water and 245 mL EtOH, hydrogenate at atmospheric pressure for 30 min, add 3.5 g catalyst, hydrogenate for 2 h, filter, add 34.8 mL 1 M HCl to the filtrate, evaporate to dryness under reduced pressure, take up the residue in 70 mL EtOH, filter, evaporate the filtrate to dryness under reduced pressure, repeat this operation twice, crystallize with the minimum amount of EtOH to obtain (3R)-3-aminopyrrolidine dihydrochloride (J. Med. Chem. 1992, 35, 4205). 3R-(+)-aminopyrrolidine is also reported to be available from Tokyo Kasei. Add 100 mg 4-fluoro-7-nitro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to a stirred solution of 200 mg 3R-(+)-aminopyrrolidine in 20 mL MeCN at 0-10°, stir at room temperature for 30 min, remove the MeCN by evaporation under reduced pressure, dissolve the residue in 50 mL water, extract 4 times with 80 mL portions of ethyl acetate. Combine the organic layers and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane to obtain (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-nitro-2,1,3-benzoxadiazole as dark red crystals (mp 178-181°) (Analyst 1992, 117, 727). Add 100 μL thiophosgene in 10 mL benzene (Caution! Benzene is a carcinogen!) to 100 mg (R)-(-)-4-(3-aminopyrrolidin-1-yl)-7-nitro-2,1,3-benzoxadiazole in 100 mL acetone, reflux for 1 h, remove the solvent by evaporation under reduced pressure, suspend the residue in 100 mL water, extract 4 times with 25 mL portions of benzene. Combine the extracts and wash them with 20 mL water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize from hexane:benzene 1:2 to obtain (R)-(-)-4-(3-isothiocyanatopyrrolidin-1-yl)-7-nitro-2,1,3-benzoxadiazole as red crystals (mp 165-170°) (Analyst 1995, 120, 385).)

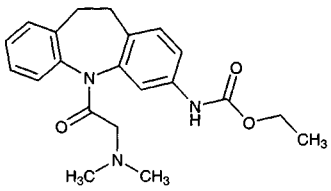
Tiracizine



Molecular formula: $C_{21}H_{25}N_3O_3$
Molecular weight: 367.45
CAS Registry No.: 83275-56-3

SAMPLE

Matrix: blood
Sample preparation: Add 1.5 mL MeCN to 500 μL serum, centrifuge, evaporate the supernatant to dryness, redissolve the residue in 200 μL water. Inject onto column A, wash with MeCN:water 10:90 or MeOH:water 20:80 for 20 min, backflush the contents of column A onto column B with mobile phase, elute with mobile phase, monitor the effluent from column B.

HPLC VARIABLES

Column: A 25 × 4 25 μm pore diameter 6 nm LiChrospher RP-18 ADS (Merck); B 125 × 4 5 μm endcapped LiChroCART HPLC-cartridge RP-18 (Merck)
Mobile phase: MeCN:50 mM pH 4 K_3PO_4 buffer 27:73
Column temperature: 40
Flow rate: 1
Injection volume: 200
Detector: UV 242, UV 230

CHROMATOGRAM

Retention time: 8.1

OTHER SUBSTANCES

Extracted: celiprolol, metoprolol, talinolol, oxprenolol, metabolites

KEY WORDS

serum; column-switching

REFERENCE

SAMPLE

Matrix: blood, urine
Sample preparation: Serum. 500 μL Serum + 500 ng talinolol + 1.5 mL MeCN, mix, centrifuge at 9000 g for 5 min. Remove the supernatant and evaporate it to dryness under reduced pressure, reconstitute the residue in 250 μL water, inject a 200 μL aliquot on to column A and elute to waste with mobile phase A, after 4 min backflush the contents of column A on to column B with mobile phase B, elute with column B, monitor the effluent from column B. Urine. Inject a 50 μL aliquot of urine on to column A and elute to waste with mobile phase A, after 4 min backflush the contents of column A on to column B with mobile phase B, elute with column B, monitor the effluent from column B.

HPLC VARIABLES

Column: A 30-40 μm Perisorb A (Merck); B 125 × 4 LiChroCART RP18 (Merck)
Mobile phase: A water; B MeCN:50 mM pH 4 phosphate buffer 27:73
Flow rate: A 1.4; B 1
Injection volume: 200
Detector: UV 230

CHROMATOGRAM

Internal standard: talinolol
Limit of quantitation: 200 ng/mL (urine), 10 ng/mL (serum)

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
serum; pharmacokinetics; column-switching

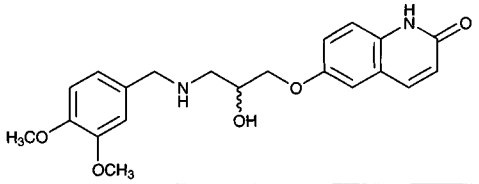
Toborinone

Molecular formula: $C_{21}H_{24}N_2O_5$
Molecular weight: 384.43
CAS Registry No.: 143343-83-3



SAMPLE
Matrix: blood, tissue, urine
Sample preparation: Plasma, tissue. Mix plasma or homogenized tissue samples with MeOH: MeCN 50:50, sonicate, centrifuge at 1800 g for 5 min. Remove the supernatant, re-extract the residue 4 times. Combine the supernatants and lyophilize. Reconstitute the residue in mobile phase (A:B 50:50), inject an aliquot. Feces. Mix fecal homogenate with MeOH/water, extract 6 times, combine the supernatants and lyophilize. Reconstitute the residue in mobile phase(A:B 50:50), inject an aliquot. Urine. Inject urine directly or lyophilize and reconstitute in mobile phase (A:B 50:50), inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 Develosil ODS-5(Nomura, Japan)
Mobile phase: Gradient. A:B from 100:0 to 90:10 over 20 min, maintain at 90:10 for 10 min, to 70:30 over 10 min, to 50:50 over 5 min and back to 100:0 over 0.1 min. A was MeCN:MeOH: water:acetic acid 5:5:90:0.5. B was MeCN:MeOH:water:acetic acid 25:25:50:0.5.
Column temperature: 30
Flow rate: 1
Detector: F ex 355 em 405

CHROMATOGRAM
Retention time: 40

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS

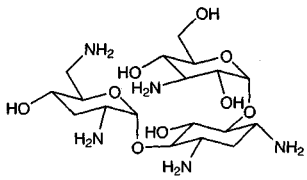
Tobramycin



Molecular formula: $C_{18}H_{37}N_5O_9$
Molecular weight: 467.52
CAS Registry No.: 32986-56-4, 79645-27-5 (sulfate)
Merck Index: 9628

SAMPLE

Matrix: blood
Sample preparation: Condition a Bond-Elut C18 SPE cartridge with 2 column volumes of MeOH and 2 column volumes of water. 50 μL Serum + 25 μL 2 M pH 10.3 Tris buffer + 100 μL 10 μg/mL sisomicin in MeCN, vortex, centrifuge at 15000 g for 1 min. Remove the supernatant and add it to 30 μL 250 mg/mL 2,4,6-trinitrobenzenesulfonic acid in MeCN, vortex, heat at 70° for 30 min. Add 700 μL wash solution then 200 μL sample to the SPE cartridge, wash with 3 column volumes of wash solution, elute with 300 μL MeCN, inject a 50 μL aliquot of the eluate. (Prepare wash solution by adding 10 mL 1 M K_2HPO_4 to 90 mL water, add 100 mL MeOH, adjust pH to 8.5 with phosphoric acid.)

HPLC VARIABLES

Column: 250 × 4.6 Ultrasphere octyl
Mobile phase: MeCN:buffer 70:30 (Buffer was 6.8 g/L KH_2PO_4 adjusted to pH 3.5 with phosphoric acid.)
Column temperature: 50
Flow rate: 3
Injection volume: 50
Detector: UV 340

CHROMATOGRAM

Retention time: 3
Internal standard: sisomicin (4)
Limit of detection: 1200 ng/mL

OTHER SUBSTANCES

Simultaneous: gentamicin
Noninterfering: acetaminophen, acetazolamide, N-acetylprocainamide, amikacin, amobarbital, ampicillin, amitriptyline, caffeine, cefamandole, cefoxime, cefoxitin, cephalothin, clindamycin, chloramphenicol, chlordiazepoxide, diazepam, erythromycin, ethosuximide, glutethimide, imipramine, kanamycin, methaqualone, moxalactam, nafcillin, nitrofurantoin, penicillin G, pentobarbital, phenobarbital, phenytoin, primidone, procainamide, quinidine, salicylic acid, secobarbital, tetracycline, theophylline, vancomycin

KEY WORDS

serum; derivatization; SPE

SAMPLE

Matrix: blood
Sample preparation: Condition a Bond Elut C18 SPE cartridge with 1 mL MeCN and 1 mL MeCN:20 mM pH 8 phosphate buffer 10:90. 100 μL Serum + 400 μL water + 500 μL 10% sulfosalicylic acid, vortex, centrifuge. Remove 60 μL supernatant and add it to 240 μL MeCN and 300 μL o-phthalaldehyde reagent, add to SPE cartridge, rinse in with 300 μL rinse + 100 μL MeCN:20 mM pH 8 phosphate buffer 10:90, wash with 500 μL MeCN:20 mM pH 8 phosphate buffer 10:90, elute with 440 μL MeCN, add 40 μL water to eluate, vortex, inject a 25 μL aliquot. (o-Phthalaldehyde reagent was 200 mg o-phthalaldehyde in 2 mL MeOH + 400 μL 2-mercaptoethanol. Mix with 1 g boric acid in 38 mL water adjusted to pH 10.4 with 450 g/L KOH, store under nitrogen at 4°.)

HPLC VARIABLES
Column: 150 × 4 MicroPak SP C8 (Varian)
Mobile phase: MeCN:20 mM pH 6.5 phosphate buffer 48:52
Flow rate: 2
Injection volume: 25
Detector: F ex 340 em 450

CHROMATOGRAM
Retention time: 8.4
Limit of detection: 10 pmol

KEY WORDS
serum; SPE; derivatization

SAMPLE
Matrix: blood, dialysate, urine
Sample preparation: Plasma. Condition a 3 mL Baker cyanopropylsilane CN SPE cartridge with 2 mL MeOH, 2 mL water, and 2 mL buffer. 1 mL Plasma + 100 μL 100 μg/mL dibekacin in water, vortex for 15 s, add 1 mL buffer, vortex for 15 s, centrifuge at 3100 g at 4° for 7 min, add to SPE cartridge, wash with 500 μL water, wash with 250 μL mobile phase, elute to dryness. Elute with 250 μL mobile phase, inject an aliquot of the eluate. Urine, dialysate. Dilute 1:100 with water, add 100 μL 100 μg/mL dibekacin per 1 mL of sample, mix well, inject a 100 μL aliquot. (Buffer was 0.94 g sodium hexanesulfonate in 300 mL water, add 500 μL glacial acetic acid, dilute to 500 mL with water.)

HPLC VARIABLES
Guard column: 10 × 4.6 5 μm Hypersil C18
Column: 150 × 4.6 5 μm Hypersil C18
Mobile phase: MeOH:buffer 10:90 (Buffer was 3.76 g sodium hexanesulfonate + 28.4 g sodium sulfate in 2 L water, acidify to pH 3.4 with 2 mL glacial acetic acid.)
Column temperature: 25
Flow rate: 1.1
Injection volume: 100
Detector: F ex 338 em 418 (bandpass filter) following post-column reaction. The column effluent mixed with the reagent pumped at 0.4 mL/min and the mixture flowed through a 3 m × 0.05 mm i.d. knitted PTFE reaction coil at 25° to the detector (Derivatizing reagent was 0.4 g o-phthalaldehyde in 3 mL MeOH added to 390 mL buffer, add 2 mL β-mercaptoethanol, make up to 500 mL with water, store at 4°. Buffer was 1 M pH 10.4 borate from equal volumes of 1 M KOH and boric acid.)

CHROMATOGRAM
Retention time: 13
Internal standard: dibekacin (17)

OTHER SUBSTANCES
Simultaneous: isepamicin, kanamycin, gentamicin, netilmicin

KEY WORDS
post-column reaction; SPE; plasma

SAMPLE
Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 13.393

KEY WORDS
whole blood

SAMPLE

Matrix: blood

Sample preparation: 500 μL Plasma + 25 μL 10 μg/mL acebutolol in water + 200 μL 1 M NaOH + 5 mL chloroform, vortex for 30 s, centrifuge at 1800 g for 5 min. Remove the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue in 200 μL 0.05% S-(+)-1-(1-naphthyl)ethylisocyanate in chloroform, vortex for 30 s, evaporate to dryness under reduced pressure, reconstitute with 200 μL chloroform, inject a 50-175 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 Partisil 5 silica
Mobile phase: Hexane:chloroform:MeOH 60:38:2
Flow rate: 2
Injection volume: 50-175
Detector: F ex 220 em 345

CHROMATOGRAM

Retention time: 3.5 (S), 4.5 (R) (tentative assignment)
Internal standard: (±)-acebutolol (14.9 (R), 16.5 (S))
Limit of detection: 25 ng/mL
Limit of quantitation: 250 ng/mL

KEY WORDS

plasma; derivatization; chiral; pharmacokinetics

SAMPLE

Matrix: blood

Sample preparation: 100 μL Serum or plasma + 100 μL 500 mM sodium carbonate + 100 μL 15 μg/mL N-propionylprocainamide in water, vortex for 5 s, add 0.5 (procainamide) or 1 (tocainide) mL dichloromethane, vortex for 30 (procainamide) or 60 (tocainide) s, centrifuge at

9500 g for 1 min. Remove the lower organic layer and add it to 200 μL 10 mM HCl, vortex for 15 s, centrifuge, inject a 20 μL aliquot of the aqueous layer.

HPLC VARIABLES
Column: 100 × 5 NovaPak cyano HP radial compression
Mobile phase: MeCN:buffer 10:90, final pH adjusted to 6.0 (Buffer was 5 mM acetate buffer containing 0.05% triethylamine.)
Flow rate: 1.5
Injection volume: 20
Detector: UV 280

CHROMATOGRAM
Retention time: 3.1
Internal standard: N-propionylprocainamide (6.1)
Limit of detection: 2 μg/mL

OTHER SUBSTANCES
Extracted: N-acetylprocainamide, procainamide
Simultaneous: disopyramide, lidocaine, mexiletine, quinidine
Noninterfering: carbamazepine, desmethyldoxepin, digoxin, doxepin, ethosuximide, lithium, phenobarbital, phenytoin, primidone, propranolol, theophylline, valproic acid

KEY WORDS
serum; plasma

SAMPLE
Matrix: solutions
Sample preparation: Mix 20 μL of a 1 mM solution in MeOH or water with 50 μL pH 8 borate buffer and 50 μL 18 mM 2-(6-methoxy-2-naphthyl)-1-propyl chloroformate in acetone, vortex, let stand at room temperature for 30 min, add 100 μL 10 mM trans-4-hydroxy-L-proline in water, mix, let stand for 2 min, add 2 mL dichloromethane, vortex for 30 s. Remove the organic layer and evaporate it to dryness under reduced pressure, reconstitute the residue in 100 μL mobile phase, inject an aliquot. Prepare 2-(6-methoxy-2-naphthyl)-1-propyl chloroformate as follows. Stir 1.5 mmoles lithium aluminum hydride in THF, slowly add 2 mmoles (S)-naproxen in 20 mL anhydrous THF, reflux for 1 h, evaporate most of the solvent, cautiously add water with stirring, acidify with 6 N HCl, extract three times with diethyl ether. Combine the organic layers and dry them over anhydrous sodium sulfate, evaporate to dryness, chromatograph on silica gel with dichloromethane:MeOH 100:2 (flash chromatography), evaporate eluate to dryness, dry under vacuum over KOH to give 2-(6-methoxy-2-naphthyl)propanol as a white solid (mp 92-3°). Stir 0.5 mmoles 2-(6-methoxy-2-naphthyl)propanol and 0.5 mmoles triethylamine in 10 mL dry toluene at 0°, add 1 mL 20% phosgene in toluene (Caution! Phosgene is highly toxic, perform reaction in a chemical fume hood!) (Fluka), stir for 4 h, filter, evaporate to dryness under reduced pressure, dry under vacuum to give 2-(6-methoxy-2-naphthyl)-1-propyl chloroformate (mp 60°). Store under vacuum over phosphorus pentoxide at room temperature.)

HPLC VARIABLES
Column: 250 × 4 5 μm Zorbax-SIL
Mobile phase: n-Hexane:isopropanol 100:1.5
Flow rate: 1.5
Injection volume: 100
Detector: UV 230, F ex 270 em 365

CHROMATOGRAM
Retention time: k' 15.7 (S-(+)), k' 16.9 (R-(-))

OTHER SUBSTANCES

Büschges,R.; Linde,H.; Mutschler,E.; Spahn-Langguth,H. Chloroformates and isothiocyanates derived from 2-arylpropionic acids as chiral reagents: synthetic routes and chromatographic behaviour of the derivatives, *J.Chromatogr.A*, **1996**, *725*, 323–334.

SAMPLE
Matrix: solutions
Sample preparation: Mix 300 μL of a 30 μM solution in dichloromethane with 10 μL 20 mM 1-(6-methoxy-2-naphthyl)ethyl isothiocyanate in anhydrous dichloromethane and 50 μL 0.1% triethylamine in dichloromethane, vortex thoroughly, heat at 50° for 1.5 h, inject an aliquot. (Synthesize 1-(6-methoxy-2-naphthyl)ethyl isothiocyanate as follows (protect from light). Dissolve 500 mg (S)-(+)-naproxen in 50 mL dry toluene, slowly add 5 mL freshly distilled thionyl chloride, reflux for 1 h, evaporate to dryness under vacuum, dry the acyl chloride (mp 87.5°) under vacuum over KOH for 2 days. Dissolve 0.5 mmoles acyl chloride in 5 mL acetone, stir at 0°, add 0.6 mmoles sodium azide dissolved in ice water, stir at 0° for 30 min, add 10 mL ice-cold water, filter, dry solid in a desiccator under vacuum. Dissolve the solid in 1 mL toluene

or dichloromethane (dried over 3 Å molecular sieve), reflux for 10 min, evaporate, store resulting isocyanate (mp 51°) under vacuum over a desiccant. Dissolve 0.5 mmole isocyanate in 5 mL acetone, add 20 mL 8.5% phosphoric acid, heat to 80° for 1.5 h, adjust to pH 13, extract with diethyl ether:dichloromethane 4:1. Wash the organic layer twice with water, dry over anhydrous sodium sulfate, evaporate to dryness, dissolve in 1 mL toluene, evaporate to give the amine from naproxen as crystals (mp 53°) (Pharm.Res. 1990, 7, 1262). Dissolve 1 mmole 1,1-thiocarbonyldiimidazole in 15 mL ice-cold chloroform, stir at 0°, add dropwise 1 mmole of the amine dissolved in 10 mL chloroform, stir at room temperature for 1.5 h, evaporate to dryness, reconstitute with carbon tetrachloride (Caution! Carbon tetrachloride is a carcinogen!), filter, evaporate the filtrate to dryness, store the resulting oil in a desiccator, purify on a short silica gel column with dichloromethane:light petroleum 50:50 to give 1-(6-methoxy-2-naphthyl)ethyl isothiocyanate as a slightly yellow liquid (store in the freezer under argon).)

HPLC VARIABLES
Column: 250 × 4 5 μm Zorbax ODS
Mobile phase: MeOH:water 70:30

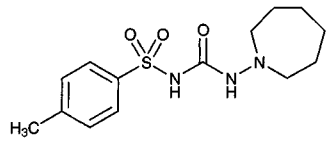
Tolazamide



Molecular formula: $C_{14}H_{21}N_3O_3S$
Molecular weight: 311.41
CAS Registry No.: 1156-19-0
Merck Index: 9644
Lednicer No.: 1 241

SAMPLE

Matrix: blood
Sample preparation: 500 μL Serum + 500 μL 5-(p-methylphenyl)-5-phenylhydantoin in chloroform + 500 μL pH 4.5 sodium acetate buffer + 5 mL dichloromethane, shake horizontally for 5 min, centrifuge at 3000 g for 3 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 80 μL MeOH, vortex, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 10 μm Lichrosorb C-18
Mobile phase: MeOH:pH 5.6 acetate buffer 52.3:47.7
Flow rate: 2
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 5.5
Internal standard: 5-(p-methylphenyl)-5-phenylhydantoin (7.5)
Limit of quantitation: 1000 ng/mL

KEY WORDS

serum; pharmacokinetics

SAMPLE

Matrix: blood
Sample preparation: 2 mL Serum + 2 mL water + 200 μL 1 (?) M HCl + 200 μL 2.5 μg/mL glibornuride in MeOH + 7 mL diethyl ether, mix, centrifuge at 2000 rpm for 5 min. Remove 6.5 mL of the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 500 μL 2 mg/mL dinitrofluorobenzene in butyl acetate, heat at 120° for 1 h, cool, evaporate to dryness under a stream of nitrogen, reconstitute the residue in 150 μL mobile phase, inject a 120 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Spherisorb ODS 2
Mobile phase: MeCN:0.4% aqueous phosphoric acid 75:25
Column temperature: 40
Flow rate: 1.2
Injection volume: 120
Detector: UV 360

CHROMATOGRAM

Retention time: 7.3
Internal standard: glibornuride (5.8)
Limit of detection: 40 ng/mL

OTHER SUBSTANCES

Extracted: chlorpropamide, glipizide, glyburide (glibenclamide), tolbutamide

KEY WORDS
serum; derivatization

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 200 μL 2 M HCl + 2 mL diethyl ether, vortex for 30 s, centrifuge at 1500 g for 5 min, freeze in dry ice for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 35-40°, reconstitute the residue in 100 μL mobile phase, vortex for 30 s, inject a 25-50 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.1 10 μm Versapack C18 (Alltech)
Mobile phase: MeCN:10 mM orthophosphoric acid 50:50
Flow rate: 1
Injection volume: 25-50
Detector: UV 230

CHROMATOGRAM
Retention time: 8.2

OTHER SUBSTANCES
Extracted: chlorpropamide, gliclazide, glyburide (glibenclamide), glipizide, tolbutamide
Simultaneous: sulfamethoxazole, N-acetylsulfamethoxazole
Noninterfering: trimethoprim

KEY WORDS
plasma

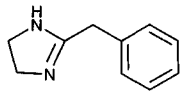
Tolazoline



Molecular formula: $C_{10}H_{12}N_2$
Molecular weight: 160.22
CAS Registry No.: 59-98-3, 59-97-2 (HCl)
Merck Index: 9645

SAMPLE

Matrix: blood
Sample preparation: 50 μL Serum + 50 μL 2.5 μg/mL clonidine in 10 mM HCl + 50 μL 3 M NaOH + 1.5 mL n-butyl chloride:isopropanol 95:5, vortex 60 s, centrifuge at 2500 rpm (20 cm) for 2 min. Freeze in dry ice/isopropanol for 20 s and remove organic phase. Add 100 μL 50 mM phosphoric acid to organic phase, vortex 60 s, centrifuge at 2500 rpm (20 cm) for 2 min, remove organic layer, inject 25 μL aliquots of aqueous layer.

HPLC VARIABLES

Guard column: 20 × 4.6 5 μm Supelcosil LC-PCN
Column: 150 × 4.6 5 μm Supelcosil LC-PCN
Mobile phase: MeCN:buffer 40:60 (Buffer was 10 mM KOH/H_3PO_4, pH 3.0.)
Column temperature: 35
Flow rate: 2
Injection volume: 25
Detector: UV 214

CHROMATOGRAM
Retention time: 3.7
Internal standard: clonidine
Limit of detection: 50 ng/mL

OTHER SUBSTANCES
Noninterfering: amikacin, ampicillin, dopamine, furosemide, gentamicin, heparin, morphine, pancuronium

KEY WORDS
serum

SAMPLE
Matrix: blood, urine
Sample preparation: 50-100 μL Serum or urine + 30 μL 1 (serum) or 100 (urine) μg/mL naphazoline + 250 μL buffer + 5 mL dichloromethane, shake mechanically for 20 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 35°, reconstitute the residue in 100 (serum) or 500 (urine) μL 20 mM pH 3.75 KH_2PO_4, vortex for 15 s, inject a 10 (urine) or 90 (serum) μL aliquot. (Buffer was 100 mM potassium hydrogen carbonate and 100 mM potassium carbonate, pH 10.0.)

HPLC VARIABLES
Guard column: 50 × 2 Co:Pell ODS
Column: Resolve C18 (Waters)
Mobile phase: MeCN:buffer 40:60 (Buffer was 20 mM KH_2PO_4 adjusted to pH 3.75 with 85% phosphoric acid.)
Flow rate: 1.2
Injection volume: 10-90
Detector: UV 210

CHROMATOGRAM
Retention time: 7
Internal standard: naphazoline (10)
Limit of detection: 100 ng/mL

OTHER SUBSTANCES
Noninterfering: acetaminophen, N-acetylprocainamide, carbamazepine, chloramphenicol, desipramine, digoxin, disopyramide, dopamine, ethosuximide, gentamicin, imipramine, lidocaine, methotrexate, phenobarbital, phenytoin, primidone, procainamide, propranolol, quinidine, salicylic acid, theophylline, valproic acid

SAMPLE
Matrix: formulations
Sample preparation: Mix 5 mL nasal solution and 10 mL 500 μg/mL tolazoline hydrochloride in MeOH:water 40:60, make up to 50 mL with MeOH:water 40:60, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.1 RSIL C18 (RSL, Eke, Belgium)
Mobile phase: MeOH:water 40:60 containing 20 mM sodium 1-octanesulfonate and 10 mM N,N-dimethyloctylamine, pH adjusted to 3.0 with orthophosphoric acid

Column temperature: 25
Flow rate: 1
Injection volume: 10
Detector: UV 220

CHROMATOGRAM
Retention time: 2.5
Internal standard: tolazoline

OTHER SUBSTANCES
Simultaneous: degradation products, antazoline, coumazoline, lidocaine, naphazoline, oxymetazoline, prednisolone, sulfadimidine, sulfanilamide, sulfathiazole, tenaphtoxaline, tetrahydrozoline, tramazoline, xylometazoline

SAMPLE

Matrix: blood

Sample preparation: 1 mL Serum + 200 μL 1 M HCl + 10 μg glyburide + 5 mL toluene, shake gently for 15 min, centrifuge at 1500 g for 3 min. Remove the organic layer and evaporate it to dryness, reconstitute the residue in 25 μL 6 mg/mL dinitrofluorobenzene in n-butyl acetate (prepare fresh each week, store at 4° in the dark), heat at 120° for 30 min, evaporate to dryness, reconstitute with 50 μL mobile phase, inject a 25-50 μL aliquot. Alternatively, filter (Amicon YMT membrane, 30000 MW cutoff) 200 μL 100 mM NaOH while centrifuging at 4°, rinse filter with 500 μL water, filter 1 mL serum in the same unit while centrifuging at 4° at 2500 g for 1.5 h. Remove a 700 μL aliquot of the ultrafiltrate, add 200 μL 1 M HCl, add 10 μg glyburide, add 5 mL toluene, shake gently for 15 min, centrifuge at 1500 g for 3 min. Remove the organic layer and evaporate it to dryness, reconstitute the residue in 25 μL 6 mg/mL dinitrofluorobenzene in n-butyl acetate (prepare fresh each week, store at 4° in the dark), heat at 120° for 30 min, evaporate to dryness, reconstitute with 50 μL mobile phase, inject a 25-50 μL aliquot.

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 200 μL 2 M HCl + 2 mL diethyl ether, vortex 30 s, centrifuge at 1500 g for 5 min, freeze in dry ice for 5 min. Decant ether layer and evaporate it to dryness under a stream of nitrogen at 35-40°. Reconstitute extract in 100 μL mobile phase, vortex 30 s, inject 25-50 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.1 10 μm Versapack C18
Mobile phase: MeCN:10 mM orthophosphoric acid 50:50
Flow rate: 1
Injection volume: 25-50
Detector: UV 230

CHROMATOGRAM
Retention time: 7.67
Limit of quantitation: 1000 ng/mL

OTHER SUBSTANCES
Simultaneous: glyburide, gliclazide, chlorpropamide, glipizide, tolazamide
Noninterfering: trimethoprim, sulfamethoxazole

KEY WORDS
plasma

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 500 μL water + 500 μL 100 mM HCl + 3 mL dichloromethane, mix for 15 s, centrifuge. Remove an aliquot of the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 50 μL MeOH, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 1000 × 8 10 μm radial pak C18 (Waters)
Mobile phase: MeOH:0.2% acetic acid 60:40 adjusted to pH 6.7 with 1 M NaOH (Wash with MeCN at 1 mL/min for 20 min at the end of each day.)
Flow rate: 0.8
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: 11
Internal standard: tolbutamide

OTHER SUBSTANCES
Extracted: chlorpropamide

KEY WORDS
plasma; tolbutamide is IS

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 229

CHROMATOGRAM
Retention time: 3.95
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 0.5 mL 1 M HCl + 10 mL dichloromethane, shake 10 min, centrifuge at 1000 g for 5 min. Remove the organic phase and evaporate it to dryness under a stream of nitrogen at 40°. Reconstitute with 200 μL mobile phase, inject 10-30 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.5 Partisil 10 ODS-3
Mobile phase: MeOH:water:phosphoric acid 700:300:1
Flow rate: 2.5
Injection volume: 10-30
Detector: UV 220

CHROMATOGRAM

Retention time: 3.2
Internal standard: tolmetin

OTHER SUBSTANCES
Simultaneous: ibuprofen, tolmetin is IS

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 90 μL 1 M HCl + 20 μL 1 mg/mL p-phenylphenol in MeCN, vortex for 10 s, add 6 mL benzene:tert-butyl alcohol 90:10 (Caution! Benzene is a carcinogen!), shake mechanically for 20 min, centrifuge at 2000 g for 15 min. Remove the organic layer and evaporate it to dryness under a stream of air at 40°, reconstitute the residue in 200 μL mobile phase, sonicate for a few s, inject an aliquot.

HPLC VARIABLES
Guard column: 40 × 4.6 30-40 μm Perisorb RP-18
Column: 150 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeCN:50 mM KH_2PO_4 48:52, pH adjusted to 4.7 with 8.5% phosphoric acid
Flow rate: 0.5 for 5 min then increase to 0.7 over 1 min, after another 4 min increase to 1.0 over 1 min
Injection volume: 20
Detector: UV 313

CHROMATOGRAM
Retention time: 6.5
Internal standard: p-phenylphenol (11)
Limit of quantitation: 50 ng/mL

OTHER SUBSTANCES
Extracted: Med 5, Med 15, metabolites
Noninterfering: sulindac, naproxen, indomethacin, flufenamic acid, ibuprofen, aspirin

KEY WORDS
plasma; rat

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 200 μL 100 mM pH 4 sodium acetate, extract twice with 5 mL diethyl ether. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 50°, reconstitute the residue in 200 μL water, inject an 80 μL aliquot.

HPLC VARIABLES
Column: 150 × 3.9 4 μm Novapak C18
Mobile phase: MeCN:1 mM pH 3 phosphoric acid 32:68
Flow rate: 1
Injection volume: 80
Detector: UV 313

CHROMATOGRAM
Retention time: 11
Internal standard: tolmetin

OTHER SUBSTANCES
Extracted: ketorolac

KEY WORDS
plasma; pharmacokinetics; tolmetin is IS

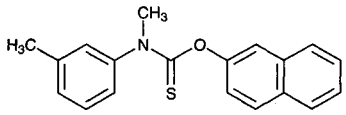
Tolnaftate



Molecular formula: $C_{19}H_{17}NOS$
Molecular weight: 307.42
CAS Registry No.: 2398-96-1
Merck Index: 9656
Lednicer No.: 2 211

SAMPLE
Matrix: blood, tissue
Sample preparation: Skin. Homogenize 100-200 mg skin with 3 mL 1.15% KCl, add 3 mL naphthyl phenylacetate in dichloromethane (?), add 3 mL dichloromethane, agitate for 10 min, centrifuge at 3000 rpm for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in mobile phase, inject a 10 μL aliquot. Whole blood. 200 μL Whole blood + 200 μL water, mix, add 3 mL naphthyl phenylacetate in dichloromethane (?), add 3 mL dichloromethane, agitate for 10 min, centrifuge at 3000 rpm for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in mobile phase, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Nucleosil C18
Mobile phase: MeOH:water 80:20

KEY WORDS
whole blood; skin; mouse; pharmacokinetics

REFERENCE
Szeman,J.; Ueda,H.; Szejtli,J.; Fenyvesi,E.; Watanabe,Y.; Machida,Y.; Nagai,T. Enhanced percutaneous absorption of homogenized tolnaftate/β-cyclodextrin polymer ground mixture, *Drug Des.Deliv.*, **1987**, *1*, 325–332.

SAMPLE
Matrix: formulations
Sample preparation: Solutions. Measure out amount containing 10 mg tolnaftate, dilute to 100 mL with MeCN:water 80:20, dilute 10 fold with MeCN:water 80:20, filter (0.45 μm), discard the first 1-2 mL, inject a 20 μL aliquot of the filtrate. Aerosol liquids. Discharge aerosol into a container, warm at 25° until propellant dissipates, dilute a 1 mL aliquot to 100 mL with MeCN: water 80:20, filter (0.45 μm), discard the first 1-2 mL, inject a 20 μL aliquot of the filtrate. Powders. Weigh out amount containing 5 mg tolnaftate, add 50 mL MeCN:water 80:20, shake mechanically for 15 min, make up to 100 mL with MeCN:water 80:20, let stand for 15 min, dilute an aliquot 5 fold with MeCN:water 80:20, filter (0.45 μm), discard the first 1-2 mL, inject a 20 μL aliquot of the filtrate. Aerosol powders. Discharge aerosol into a container, heat at 25° under a current of air to remove propellant, weigh out amount containing 5 mg tolnaftate, add 50 mL MeCN:water 80:20, shake mechanically for 15 min, make up to 100 mL with MeCN: water 80:20, let stand for 15 min, dilute an aliquot 5 fold with MeCN:water 80:20, filter (0.45 μm), discard the first 1-2 mL, inject a 20 μL aliquot of the filtrate. Creams, gels. Weigh out amount containing 5 mg tolnaftate, add 50 mL MeCN:water 80:20, shake mechanically for 15 min, make up to 100 mL with MeCN:water 80:20, let stand for 15 min, dilute an aliquot 5 fold with MeCN:water 80:20, filter (0.45 μm), discard the first 1-2 mL, inject a 20 μL aliquot of the filtrate.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeCN:water 80:20 containing 500 μL/L phosphoric acid, pH 2.4
Flow rate: 1
Injection volume: 20
Detector: UV 257

CHROMATOGRAM
Retention time: 5

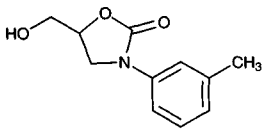
Toloxatone



Molecular formula: $C_{11}H_{13}NO_3$
Molecular weight: 207.23
CAS Registry No.: 29218-27-7
Merck Index: 9659

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 238

CHROMATOGRAM

Retention time: 3.35
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 204

CHROMATOGRAM

Retention time: 14.107

KEY WORDS

whole blood

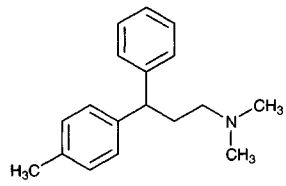
Tolpropamine



Molecular formula: $C_{18}H_{23}N$
Molecular weight: 253.39
CAS Registry No.: 5632-44-0
Merck Index: 9662

SAMPLE

Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 125 × 4.9 Spherisorb S5W silica
Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7
Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM

Retention time: 3.3

OTHER SUBSTANCES

Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzphetamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, buclizine, bufotenine, bupivacaine, buprenorphine, butacaine, butethamate, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorpromazine, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene, dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, lofepramine, loxapine, maprotiline, mecamylamine, meclophenoxate, meclozine, medazepam, mephentermine, mepivacaine, meptazinol, mepyramine, mesoridazine, metaraminol, methadone, methamphetamine, methapyrilene, methdilazene, methotrimeprazine, methoxamine, methoxyphenamine, methoxypromazine, methylephedrine, methylergonovine, methysergide, metoclopramide, metopimazine, metoprolol, mianserin, morazone, nadolol, nalorphine, naloxone, naphazoline, nicotine, nifedipine, nomifensine, nortriptyline, noscapine, orphenadrine, oxeladin, oxprenolol, oxymetazolin, papaverine, pargyline, pecazine, penbutolol, pentazocine, penthienate, pericyazine, perphenazine, phenadoxone, phenampromide, phenazocine, phenbutrazate, phendimetrazine, phenelzine, phenglutarimide, phenindamine, pheniramine, phenmetrazine, phenomorphan, phenoperidine, phenothiazine, phenoxybenzamine, phentolamine, phenylephrine, phenyltoloxamine, physostigmine, piminodine, pimozide, pindolol, pipamazine, pipazethate, piperacetazine, piperidolate, pipradol, pirenzepine, piritramide, pizotifen, practolol, pramoxine, prazosin, prenylamine, prilocaine, primaquine, proadifen, procainamide, procaine, prochlorperazine, procyclidine, proheptazine, prolintane, promazine, promethazine, pronethalol, properidine, propiomazine, propranolol, prothipendyl, protriptyline, proxymetacaine, pseudoephedrine, pyrimethamine, quinidine, quinine, ranitidine, rescinnamine, sotalol, tacrine, terazosin, terbutaline, terfenadine, thenyldiamine, theophylline, thiethylperazine, thiopropazate, thioproperazine, thioridazine, thiothixene, thonzylamine, timolol, tocainide, tolycaine, tranylcypromine, trazodone, trifluoperazine, trifluperidol, trimeperidine, trimeprazine, trimethobenzamide, trimethoprim, trimipramine, tripelennamine, triprolidine, tryptamine, verapamil, xylometazoline

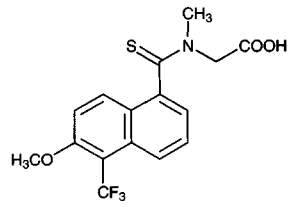
Tolrestat



Molecular formula: $C_{16}H_{14}F_3NO_3S$
Molecular weight: 357.35
CAS Registry No.: 82964-04-3
Merck Index: 9663
Lednicer No.: 4 56

SAMPLE
Matrix: blood, tissue
Sample preparation: Serum. 1 mL Serum + 4 mL 1 M HCl + 10 mL isopropyl ether (Caution! isopropyl ether readily forms explosive peroxides!), agitate mechanically for 15 min, centrifuge at 1500 rpm for 10 min. Remove 8.5 mL of the upper organic phase and add it to 1 mL 100 mM pH 11.0 glycine buffer, agitate mechanically for 15 min, centrifuge at 1500 rpm for 10 min. Remove 800 μL of the aqueous phase and add it to 20 μL 2.5 M phosphoric acid, inject a 50-150 μL aliquot. (For increased sensitivity use 2 mL serum and 500 μL glycine buffer.) Tissue. Homogenize (all-glass, Kontes) 50-100 mg lens or nerve tissue with 3 mL isotonic saline. 2.5 mL Homogenate + 4 mL 100 mM phosphoric acid + 10 mL isopropyl ether (Caution! isopropyl ether readily forms explosive peroxides!), agitate mechanically for 30 min, centrifuge at 1500 rpm for 15 min. Remove 9.0 mL of the upper organic phase and add it to 1 mL 100 mM pH 11.0 glycine buffer, agitate mechanically for 15 min, centrifuge at 1500 rpm for 10 min. Remove 800 μL of the aqueous phase and add it to 20 μL 2.5 M phosphoric acid, inject a 50-150 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Hypersil ODS
Mobile phase: MeCN:100 mM pH 6.0 phosphate buffer 30:70
Column temperature: 50
Flow rate: 1.1
Injection volume: 50-150
Detector: UV 226

CHROMATOGRAM
Retention time: 6.4
Limit of detection: 25 ng/mL (2 mL serum), 200 ng/mL (1 mL serum), 50 ng/g (tissue)

OTHER SUBSTANCES
Extracted: rotamer
Noninterfering: acetaminophen, diazepam, glyburide, hydrochlorothiazide, indomethacin, niacin, phenobarbital, phenytoin, propoxyphene, salicylic acid, tolbutamide
Interfering: dicoumarol, phenylbutazone

KEY WORDS
rat; dog; human; serum; sciatic nerve; lens

REFERENCE
Hicks,D.R.; Kraml,M. Determination of tolrestat, a novel aldose reductase inhibitor, in serum and tissues, *Ther.Drug Monit.*, **1984**, *6*, 328–333.

SAMPLE
Matrix: bulk

Sample preparation: Prepare a 100 μg/mL solution in MeCN:buffer 35:65, inject a 5 μL aliquot. (Buffer was 10 mM phosphoric acid adjusted to pH 7.0 with 10 mM ammonium hydroxide.)

HPLC VARIABLES
Column: 150 × 3.9 5 μm Resolve octadecylsilane (Waters)
Mobile phase: MeCN:THF:buffer:40% tetrabutylammonium hydroxide in water 20.5:18.5:61.5:0.3 (Buffer was 50 mM $(NH_4)H_2PO_4$ adjusted to pH 3.5 with 50 mM phosphoric acid.)
Flow rate: 1
Injection volume: 5
Detector: UV 229

CHROMATOGRAM
Retention time: 4.6
Limit of quantitation: 0.05% (of tolrestat)

OTHER SUBSTANCES
Simultaneous: impurities

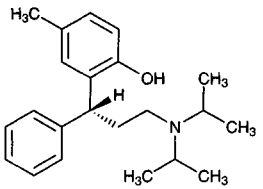
Tolterodine



Molecular formula: $C_{22}H_{31}NO$
Molecular weight: 325.49
CAS Registry No.: 124937-51-5

SAMPLE
Matrix: blood
Sample preparation: Mix plasma or serum with two volumes of acetone, centrifuge. Remove the supernatant, wash the pellets with two portions of acetone:20 mM pH 4.5 ammonium acetate 50:50, evaporate the combined supernatant and pellet extract to dryness, dissolve the residue in MeOH:20 mM pH 4.5 ammonium acetate 10:90. Inject a 100 μL aliquot.

HPLC VARIABLES
Guard column: 20 × 4.5 Supelco PKB 100
Column: 150 × 4.5 Supelco PKB 100
Mobile phase: Gradient. A was MeOH. B was 20 mM pH 4.5 ammonium acetate. A:B from 10:90 to 20:80 in 5 min, from 20:80 to 45:55 in 30 min, from 45:55 to 100:0 in 5 min, maintain at 100:0 for 10 min
Flow rate: 1
Injection volume: 100
Detector: UV 280

CHROMATOGRAM
Retention time: 29

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
dog; mouse; serum; plasma

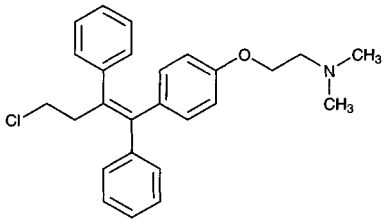
Toremifene



Molecular formula: $C_{26}H_{28}ClNO$
Molecular weight: 405.97
CAS Registry No.: 89778-26-7, 89778-27-8 (citrate)
Merck Index: 9688
Lednicer No.: 5 33

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 10 mL hexane:n-butanol 98:2, vortex for 1 min, centrifuge at 1000 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 37°, reconstitute the residue in 300 μL MeOH, filter (0.2 μm). Place the filtrate in a quartz cuvette, irradiate with a mercury vapor lamp (15 W, peak wavelength 254 nm, General Electric No. G15T8) for 2 min (Caution! Protect personnel from UV radiation with aluminum foil shielding!), inject a 100 μL aliquot of the irradiated sample.

HPLC VARIABLES

Column: Ultrasphere ODS C18
Mobile phase: MeOH:water:triethylamine 92.9:7:0.1 (At the end of each day wash column with MeOH at 2 mL/min for 30 min.)
Flow rate: 2
Injection volume: 100
Detector: F ex 266

CHROMATOGRAM

Retention time: 6.03
Limit of detection: 8 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

plasma; UV irradiation; derivatization

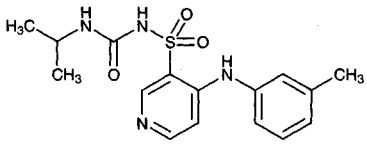
Torsemide



Molecular formula: $C_{16}H_{20}N_4O_3S$
Molecular weight: 348.43
CAS Registry No.: 56211-40-6
Merck Index: 9690
Lednicer No.: 5 82

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 100 µL IS solution, mix, adjust pH to 4.5 with dilute HCl, add 4 mL ethyl acetate,, vortex for 1 min, centrifuge at 3000 rpm for 5 min, adjust pH of aqueous phase to 5, repeat extraction. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 40°, reconstitute the residue in 1 mL pH 10.2 buffer, add 4 mL ether, vortex, centrifuge. Acidify the aqueous phase to pH 4.5 and add 4 mL ethyl acetate, vortex, centrifuge. Remove the organic layer and evaporate it to dryness, reconstitute the residue in 100 µL MeOH, inject a 2 µL aliquot. (Prepare IS solution by dissolving 30 mg IS in 10 mL 100 mM sodium bicarbonate solution, adjust pH to 7, make up to 25 mL with water.)

HPLC VARIABLES
Column: 250 × 2.6 ODS
Mobile phase: MeOH:water 30:70
Flow rate: 1
Injection volume: 2
Detector: UV 290

CHROMATOGRAM
Internal standard: 1-isopropyl-3-[[4-(4'-chloro-3'-trifluoromethylphenylamino)pyridine]-3-sulfonyl]urea (JDL 487)

KEY WORDS
plasma; pharmacokinetics

REFERENCE

SAMPLE
Matrix: blood
Sample preparation: Condition a C2 SPE cartridge (Analytichem) with 1 mL MeOH and 1 mL 500 mM phosphoric acid. Condition a sulfonylpropyl ion-exchange SPE cartridge (Analytichem) with 1 mL MeOH and 1 mL 75 mM HCl. Add 1 mL plasma to the C2 SPE cartridge, add 50 µL 10 µg/mL IS in water, add 500 µL 500 mM phosphoric acid, air dry for 10 s, wash with 300 µL 500 mM phosphoric acid, elute with 1 mL MeOH:water 50:50, evaporate to dryness at 60° in a vortex evaporator for 30 min, reconstitute with 1 mL 75 mM HCl, add to the sulfonylpropyl SPE cartridge, wash with 1 mL dichloromethane, air dry, elute the contents of the SPE car-

tridge on to the column with mobile phase, after 5 min remove the SPE cartridge from the circuit.

HPLC VARIABLES
Guard column: C18
Column: 250 × 4.6 5 μm Nucleosil C18
Mobile phase: Gradient. MeCN:100 mM pH 4.5 KH_2PO_4 14:86 for 8 min, 30:70 for 3.5 min, 21:79 for 8.5 min (sic), 40:60 for 2 min, 21:79 for 10 min, 14:86 for 6 min (step gradients).
Column temperature: 45
Flow rate: 1.3
Detector: UV 290

CHROMATOGRAM
Retention time: 18.2
Internal standard: 1-isopropyl-3-[[4-(3'-trifluoromethylphenylamino)pyridine]-3-sulfonyl]urea (28.0)
Limit of quantitation: 10 ng/mL

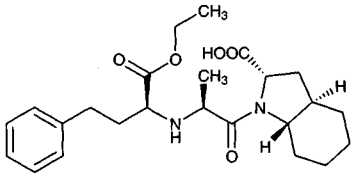
Trandolapril



Molecular formula: $C_{24}H_{34}N_2O_5$
Molecular weight: 430.54
CAS Registry No.: 87679-37-6, 87679-71-8 (trandolaprilat)
Merck Index: 9703

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 206.4

CHROMATOGRAM
Retention time: 16.993

SAMPLE
Matrix: formulations
Sample preparation: Tablets. Weigh out powdered tablet containing aminocaproic acid, dissolve in 100 mL water, filter (0.45 μm). Mix a 5 mL aliquot of the filtrate with 10 mL 5 mg/mL dansyl chloride in acetone and 10 mL 400 μg/mL tranexamic acid in buffer, let stand in the dark at room temperature for 30 min, add 2 drops ethanolamine, mix, let stand at room temperature for 15 min, make up to 50 mL with acetone:water 50:50, mix, inject an aliquot. Injections, syrup. Weigh out amount of injection or syrup containing 250 mg aminocaproic acid, dilute with 100 mL water, dilute an aliquot 5-fold with water. Mix a 5 mL aliquot with 10 mL 5 mg/mL dansyl chloride in acetone and 10 mL 400 μg/mL tranexamic acid in buffer, let stand in the dark at room temperature for 30 min, add 2 drops ethanolamine, mix, let stand at room temperature for 15 min, make up to 50 mL with acetone:water 50:50, mix, inject an aliquot. (Prepare buffer by dissolving 550 mg anhydrous sodium carbonate in 300 mL water, add 300 mL acetone, mix.)

HPLC VARIABLES
Guard column: C18 (Alltech)
Column: 150 × 4.6 5 μm Econosphere C18
Mobile phase: MeOH:water:acetic acid:triethylamine 60:38:1.5:0.5
Flow rate: 1.5
Injection volume: 20
Detector: UV 335

CHROMATOGRAM
Retention time: 6.5
Internal standard: tranexamic acid

OTHER SUBSTANCES
Simultaneous: aminocaproic acid

KEY WORDS
derivatization; tablets; injections; syrup; tranexamic acid is IS

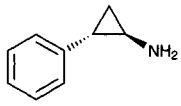
Tranylcypromine



Molecular formula: $C_9H_{11}N$
Molecular weight: 133.19
CAS Registry No.: 155-09-9, 13492-01-8 (sulfate)
Merck Index: 9708
Lednicer No.: 1 73

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 1 mL 100 mM NaOH + 3 mL n-hexane, shake for 20 min, centrifuge for 10 min. Remove 2 mL of the organic layer and evaporate it to dryness using a vacuum centrifuge, reconstitute the residue in 500 μL 100 μg/mL (S)-(+)-benoxaprofen chloride in dried dichloromethane, let stand at room temperature for 30 min, inject a 10 μL aliquot. (Synthesis of benoxaprofen chloride is as follows. Dissolve 600 mg benoxaprofen in 50 mL toluene, slowly add 5 mL freshly-distilled thionyl chloride, reflux for 30 min, evaporate to dryness, recrystallize benoxaprofen chloride from dichloromethane.)

HPLC VARIABLES
Column: 250 × 4.6 7 μm Zorbax-Sil
Mobile phase: Cyclohexane:dichloromethane:THF 50:10:10
Flow rate: 1
Injection volume: 10
Detector: F ex 312 em 365

CHROMATOGRAM
Retention time: 9.0 (S-(-)), 10.7 (R-(+))

OTHER SUBSTANCES
Extracted: amphetamine
Interfering: methamphetamine

KEY WORDS
plasma; derivatization; normal phase; chiral

SAMPLE

Matrix: blood, tissue
Sample preparation: Blood or serum. 1 mL Blood or serum + 1 μg cianopramine + 1 mL water, vortex, add 1 mL 200 mM sodium carbonate, vortex, add 6 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 100 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer. Liver homogenate. 0.5 mL Liver homogenate + 10 μg cianopramine + 500 μL 2% sodium tetraborate + 8 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 400 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm RP-18 Newguard (Applied Biosystems)
Column: 100 × 4.6 5 μm Brownlee Spheri-5 RP-18
Mobile phase: MeCN:100 mM NaH_2PO_4:diethylamine 40:57.5:2.5
Flow rate: 2
Injection volume: 30
Detector: UV 220

CHROMATOGRAM

Retention time: 1.43
Internal standard: cianopramine (8.93)

OTHER SUBSTANCES

Simultaneous: amitriptyline, amoxapine, benztropine, brompheniramine, chlorpheniramine, chlorpromazine, clomipramine, cyproheptadine, desipramine, diphenhydramine, dothiepin, doxepin, fluoxetine, haloperidol, imipramine, loxapine, maprotiline, meperidine, mesoridazine, methadone, mianserin, nomifensine, nordoxepin, norfluoxetine, norpropoxyphene, northiaden, nortriptyline, pheniramine, promethazine, propoxyphene, propranolol, protriptyline, quinidine, quinine, sulforidazine, thioridazine, thiothixene, trazodone, trihexyphenidyl, trimipramine, triprolidine
Noninterfering: dextromethorphan, norphetidine, phenoxybenzamine, prochlorperazine, trifluoperazine
Interfering: moclobemide, pentobarbital, metoclopramide

KEY WORDS
serum; whole blood; liver

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 1 mL Plasma + 1 mL pH 11 sodium borate buffer, extract with 2.5 mL diisopropyl ether:EtOH 100:1.5 (Caution! Diisopropyl ether readily forms explosive peroxides!). Remove 2 mL of the organic layer and evaporate it to dryness under reduced pressure at room temperature, reconstitute the residue in 200 μL 10 μg/mL S-flunoxaprofen chloride, let stand at room temperature for 1 h, add 20 μL MeOH, evaporate to dryness, reconstitute with dichloromethane, inject a 5-50 μL aliquot. Urine. 1 mL Urine + 1 mL 50 mM NaOH, extract with 2.5 mL diisopropyl ether:EtOH 100:1.5. Remove 2 mL of the organic layer and evaporate it to dryness under reduced pressure at room temperature, reconstitute the residue in 200 μL 10 μg/mL S-flunoxaprofen chloride, let stand at room temperature for 1 h, add 20 μL MeOH, evaporate to dryness, reconstitute with dichloromethane, inject a 5-50 μL aliquot. (Prepare S-flunoxaprofen chloride as follows. Dissolve 1 mmole S-flunoxaprofen in 25 mL toluene, add a trace of DMF (J.Chromatogr. 1990, 528, 55), add 2.5 mL thionyl chloride, reflux for 30 min, remove solvent by evaporation, dry the residue under vacuum over KOH, recrystallize from dichloromethane (mp 73°).)

SAMPLE

Matrix: solutions

Sample preparation: Mix a 50 μL aliquot of a solution in MeOH:triethylamine 99:1 with 20 μL 0.1% FLOPIC in dry toluene, vortex briefly, let stand at room temperature in the dark for 30 min, add 50 μL 1% ethanolamine in MeOH, let stand at room temperature for 15 min, evaporate to dryness under reduced pressure, reconstitute with 100 μL mobile phase, sonicate for 30 s, inject a 20 μL aliquot. (FLOPIC is (-)-(S)-flunoxaprofen isocyanate; synthesis is as follows. Dissolve 1 g (+)-(S)-flunoxaprofen in 30 mL acetone, cool to 0°, add a solution of 500 μL triethylamine in 2 mL acetone dropwise, add a solution of 370 μL ethyl chloroformate in 2 mL acetone dropwise, stir at 0° for 15 min, add a solution of 250 mg sodium azide in 1 mL water dropwise (Caution! Sodium azide is highly toxic!), stir for 1 h, pour into 60 mL ice water, stir for 10 min, filter, wash the solid with two 50 mL aliquots of ice-water, dry under reduced pressure to obtain flunoxaprofen azide. Dissolve 100 mg flunoxaprofen azide in 3 mL dry toluene, reflux for 10-15 min, cool to room temperature, filter. Evaporate the filtrate to dryness under reduced pressure and dry under reduced pressure to obtain FLOPIC as a crystalline solid (mp 93-94°), store in a desiccator under reduced pressure.)

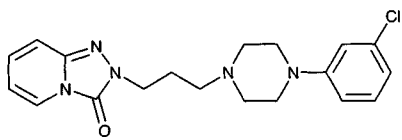
Trazodone



Molecular formula: $C_{19}H_{22}ClN_5O$
Molecular weight: 371.87
CAS Registry No.: 19794-93-5, 25332-39-2 (HCl)
Merck Index: 9712
Lednicer No.: 2 472

SAMPLE
Matrix: blood
Sample preparation: Automated SPE by ASPEC system. Condition a C18 Clean-Up SPE cartridge (CEC 18111, Worldwide Monitoring) with 2 mL MeOH then 2 mL water. 1 mL Plasma + 1 mL 400 ng/mL protriptyline in water, vortex, add to column, wash with 3 mL water, wash with 3 mL 750 mL/L methanol. Elute with three aliquots of 300 μL 0.1 M ammonium acetate in MeOH. Add 0.5 mL 0.5 M NaOH and 4 mL 50 mL/L isopropanol in heptane to eluate, mix thoroughly. Allow 5 min for phase separation. Remove upper heptane phase and add it to 300 μL 0.1 M phosphoric acid (pH 2.5), mix, separate, inject a 100 μL aliquot of the aqueous phase.

HPLC VARIABLES
Guard column: LC-8-DB (Supelco)
Column: 150 × 4.6 LC-8-DB (Supelco)
Mobile phase: MeCN:buffer 35:65 (Buffer was 10 mL/L triethylamine in water adjusted to pH 5.5 with glacial acetic acid.)
Flow rate: 2
Injection volume: 100
Detector: UV 228

CHROMATOGRAM
Retention time: 3.0

Internal standard: protriptyline (4)

OTHER SUBSTANCES

Extracted: acetazolamide, amitriptyline, chlordiazepoxide, chlorimipramine, chlorpromazine, desipramine, dextromethorphan, diazepam, encainide, fluoxetine, flurazepam, hydroxyethylflurazepam, ibuprofen, imipramine, lidocaine, maprotiline, methadone, methaqualone, mexiletine, midazolam, norchlorimipramine, nordiazepam, norfluoxetine, nortriptyline, norverapamil, pentazocine, promazine, propafenone, propoxyphene, propranolol, protriptyline, quinidine, temazepam, trimipramine, verapamil

Noninterfering: acetaminophen, acetylmorphine, amiodarone, amobarbital, amphetamine, bendroflumethiazide, benzocaine, benzoylecgonine, benzthiazide, butalbital, carbamazepine, chlorothiazide, clonazepam, cocaine, codeine, cotinine, cyclosporine, cyclothiazide, desalkylflurazepam, diamorphine, dicumerol, ephedrine, ethacrynic acid, ethanol, ethchlorvynol, ethosuximide, furosemide, glutethimide, hydrochlorothiazide, hydrocodone, hydroflumethiazide, hydromorphone, lorazepam, mephentermine, meprobamate, methamphetamine, metharbital, methoxsalen, methoxyphenteramine, methsuximide, methylcyclothiazide, metoprolol, MHPG, monoacetylmorphine, morphine, normethsuximide, oxazepam, oxycodone, oxymorphone, pentobarbital, phencyclidine, phenteramine, phenylephrine, phenytoin, polythiazide, primidone, prochlorperazine, salicylic acid, sulfanilamide, THC-COOH, theophylline, thiazolam, thiopental, thioridazine, tocainide, trichloromethiazide, trifluoperazine, valproic acid, warfarin

Interfering: diphenhydramine, doxepin, fentanyl, flecainide, haloperidol, nordoxepin

SAMPLE
Matrix: blood, gastric contents, tissue, urine
Sample preparation: Blood, stomach contents. 1 mL Postmortem blood or stomach contents + 500 μL 1 M potassium carbonate + 8 mL n-hexane:ethyl acetate 7:3, extract on a rotary mixer for 8 min, centrifuge at 2500 rpm for 8 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, dissolve the residue in 100 μL mobile phase, inject a 50 μL aliquot. Urine. 1 mL Urine + 200 μL concentrated HCl, heat at 100° for 1 h, cool, adjust pH to 9.5-10 with KOH pellets and 1 M potassium carbonate, add 8 mL n-hexane:ethyl acetate 7:3, extract on a rotary mixer for 8 min, centrifuge at 2500 rpm for 8 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, dissolve the residue in 100 μL mobile phase, inject a 50 μL aliquot. Tissue. Add tissue to an equal volume isotonic saline, homogenize with an Ultra-Turraz mixer, remove a 2 g aliquot, add 8 mL n-hexane:ethyl acetate 7:3, extract on a rotary mixer for 8 min, centrifuge at 2500 rpm for 8 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, dissolve the residue in 100 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES
Guard column: 10 × 2.1 Chrompack pellicular reverse phase
Column: 100 × 3 5 μm Chromspher C8
Mobile phase: Gradient. MeOH:water containing 0.125% isopropylamine from 30:70 to 75:25 over 15 min
Flow rate: 0.7
Injection volume: 50
Detector: UV 230

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 211.1

CHROMATOGRAM
Retention time: 12.683

KEY WORDS
whole blood

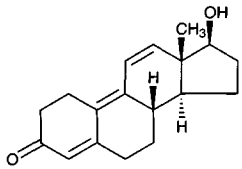
Trenbolone



Molecular formula: $C_{18}H_{22}O_2$
Molecular weight: 270.37
CAS Registry No.: 10161-33-8, 10161-34-9 (acetate)
Merck Index: 9716

SAMPLE

Matrix: bile, feces

Sample preparation: Condition a Bond-Elut CN SPE cartridge with 4 mL chloroform and 5 mL petroleum ether. Feces. 10 g Feces + 100 μL β-glucuronidase (type H2 Helix pomatia, Sigma) + 25 mL 200 mM pH 5.5 sodium phosphate buffer, let stand overnight at room temperature or heat at 37° for 4 h, add 60 mL MeOH, shake for 1 h, centrifuge at 4° at 2000 g for 10 min. Remove 50 mL of the supernatant and evaporate it to dryness under reduced pressure at 40°, reconstitute the residue in 10 mL buffer, add 10 mL MTBE, shake vigorously for 1 min, centrifuge at 4° at 2000 g for 10 min, repeat the extraction. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 40°, reconstitute the residue in 3 mL diethyl ether, sonicate, add 3 mL petroleum ether (bp 40-60°, add to the SPE cartridge, rinse flask with 1 mL aliquots of petroleum ether:diethyl ether 50:50, add the rinses to the SPE cartridge, wash the SPE cartridge with 3 mL petroleum ether, wash with 4 mL petroleum ether:chloroform 50:50, elute with 4 mL chloroform, evaporate he eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue in 500 μL MeOH, sonicate, add 2 mL isotonic PBS, vortex. Apply the mixture to an immunoaffinity column (preparation details in paper), wash with 3 mL water, elute with 3 mL EtOH:water 70:30. Evaporate the eluate to dryness under a stream of nitrogen at 70°, reconstitute the residue in 100 μL MeCN, sonicate for 10 min, add 100 μL water, vortex, inject a 50 μL aliquot. Bile. 5 mL Bile + 50 μL β-glucuronidase (type H2 Helix pomatia, Sigma) + 12.5 mL 200 mM pH 7.0 sodium phosphate buffer, let stand overnight at room temperature or heat at 37° for 4 h, add to an Extrelut 20 column, let stand for 20 min, elute with two 20 mL portions of diethyl ether (let column run dry between each addition of ether), evaporate to dryness under reduced pressure at 30°, reconstitute the residue in 3 mL diethyl ether, sonicate, add 3 mL petroleum ether (bp 40-60°, add to the SPE cartridge, rinse flask with 1 mL aliquots of petroleum ether:diethyl ether 50:50, add the rinses to the SPE cartridge, wash the SPE cartridge with 3 mL petroleum ether, wash with 4 mL petroleum ether:chloroform 50:50, elute with 4 mL chloroform, evaporate he eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue in 500 μL MeOH, sonicate, add 2 mL isotonic PBS, vortex. Apply the mixture to an immunoaffinity column (preparation details in paper), wash with 3 mL water, elute with 3 mL EtOH:water 70:30. Evaporate the eluate to dryness under a stream of nitrogen at 70°, reconstitute the residue in 100 μL MeCN, sonicate for 10 min, add 100 μL water, vortex, inject a 50 μL aliquot. (Buffer was 100 mM pH 12.5 glycine-NaOH containing 100 mM NaCl.)

HPLC VARIABLES

Column: 125 × 4 LiChrosorb RP-18 endcapped
Mobile phase: MeCN:100 mM ammonium acetate 45:55
Flow rate: 1
Injection volume: 50
Detector: MS, Vestec Model 201A thermospray, electron beam 250 μA, electron multiplier 1600 V, source block 260°, tip heater 260°, lens assembly 135°, vaporizer probe 190°, m/z 271, SIM

CHROMATOGRAM

Retention time: 4 (17α-trenbolone)

SAMPLE

Matrix: bile, tissue, urine

Sample preparation: Urine. 50 mL Urine + 6 g Amberlite XAD-2, mix for 15 min, transfer settled Amberlite XAD-2 to a 100 × 9 glass column, wash with 10 mL water, dry under a stream of nitrogen, elute with 25 mL MeOH:ethyl acetate 50:50. Evaporate eluate to dryness at 50° and take up residue in 2 mL 250 mM pH 4.8 acetate buffer. Add 50 μL Helix pomatia juice containing a minimum 40 U/mL β-glucuronidase and 20 U/mL arylsulfatase and incubate at 37° for 2 h. Add 4 drops 6 M HCl and 20 mL ethyl acetate, mix for 15 min, remove water layer, incubate ethyl acetate layer at 37° for 1 h, wash with two 3 mL portions of 10% $NaHCO_3$, wash with 3 mL water. Evaporate to dryness, dissolve in 70 mL MeCN:water 5:95, analyze a 53 mL aliquot. Bile. 3 mL Bile + 2 mL 250 mM pH 4.8 acetate buffer + 50 μL Helix pomatia juice containing a minimum 40 U/mL β-glucuronidase and 20 U/mL arylsulfatase, incubate at 37° for 2 h. Add 4 drops 6 M HCl and 20 mL ethyl acetate, mix for 15 min, remove water layer, incubate ethyl acetate layer at 37° for 1 h, wash with two 3 mL portions of 10% $NaHCO_3$, wash with 3 mL water. Evaporate to dryness, dissolve in 70 mL MeCN:water 5:95, analyze a 53 mL aliquot. Liver, kidney. Add 80 mL 100 mM pH 9.5 Tris buffer containing 20 mg subtilopeptidase A (11.6 U/mg) to 20 g minced sample, incubate at 60° for 3.5 h, filter over glass wool, add 6 g Amberlite XAD-2 to the filtrate, mix for 15 min, transfer settled Amberlite XAD-2 to a 100 × 9 glass column, wash with 10 mL water, dry under a stream of nitrogen, elute with five 10 mL portions of MeOH. Evaporate eluate to dryness and take up residue in 2 mL 250 mM pH 4.8 acetate buffer. Add 50 μL Helix pomatia juice containing a minimum 40 U/mL β-glucuronidase and 20 U/mL arylsulfatase and incubate at 37° for 2 h. Add 4 drops 6 M HCl and 20 mL ethyl acetate, mix for 15 min, remove water layer, incubate ethyl acetate layer at 37° for 1 h, wash with two 3 mL portions of 10% $NaHCO_3$, wash with 3 mL water. Evaporate to dryness, dissolve in 70 mL MeCN:water 5:95, analyze a 53 mL aliquot. Meat. Add 80 mL 100 mM pH 9.5 Tris buffer containing 20 mg subtilopeptidase A (11.6 U/mg) to 20 g minced sample, incubate at 60° for 3.5 h, filter over glass wool, add 6 g Amberlite XAD-2 to the filtrate, mix for 15 min, transfer settled Amberlite XAD-2 to a 100 × 9 glass column, wash with 10 mL water, dry under a stream of nitrogen, elute with five 10 mL portions of MeOH. Evaporate eluate to dryness and take up residue in 70 mL MeCN:water 5:95, analyze a 53 mL aliquot. Condition column A with 20 mL water then add 53 mL sample, flush column A with 10 mL water. Condition column B with 10 mL water. Elute column A onto column B with 20 mL water containing 250 μg/mL norgestrel and 5% MeCN. Switch column B into circuit with column C and elute with mobile phase. Recondition column A with MeOH:water 70:30.

HPLC VARIABLES

Column: A 10 × 10 immuno precolumn (with immunoglobulin G immobilized on cyanogen bromide-activated Sepharose 4B, prepared as J.Chromatogr. 1988, 452, 419-433); B 10 × 2 Chrompack reverse phase column; C Chromsep reverse phase guard column (Chrompack) + 100 × 3 5 μm Chromspher glass column

SAMPLE
Matrix: tissue
Sample preparation: Condition a 500 mg Bond Elut silica SPE cartridge with 5 mL EtOH and 5 mL cyclohexane. Homogenize 5 g tissue with 11 mL 40 mM pH 4.1 sodium acetate buffer. Add 500 μL 17 mg/mL β-glucuronidase (type H-5) in acetate buffer, mix. Incubate at 37° overnight. Mix with 5 mL 2 M aqueous tris(hydroxymethyl)aminomethane. Fill an Extrelut cartridge with 25% of an Extrelut 20 sachet, mix the remainder of the sachet with the sample and add it to the cartridge. Rinse the sample tube with 15 mL butan-2-ol:hexane 5:95 and add the rinse to the cartridge. Elute with 100 mL butan-2-ol:hexane 5:95. Extract the eluate with two 10 mL portions of MeCN. Evaporate the combined MeCN extracts to dryness after adding two 2 mL portions of heptane. Reconstitute the residue with 2 mL cyclohexane. Add to the SPE cartridge Wash the tube with two 2 mL and two 1 mL portions of cyclohexane. Add to the SPE cartridge. Wash with 2 mL cyclohexane. Elute with 5 mL acetone:cyclohexane 25:75. Evaporate the eluate and redissolve the residue in 400 μL MeOH and 3.6 mL 85° water. Cool to room temperature and add to an immunoaffinity column (Randox Laboratories, UK). Complete the transfer with three 1 mL portions of hot water, cooled before adding to the column. Wash with 2 mL 1 mM pH 10 carbonate buffer, elute with 4 mL MeOH:water 70:30. Dilute the eluate with 12 mL water. Inject a 4 mL aliquot onto column A and then backflush the contents of column A onto column B with mobile phase. Monitor the effluent from column B.

HPLC VARIABLES
Column: A Chromspher (type R2) (Chrompack); B 200 × 3 5 μm Chromspher C18 (Chrompack)
Mobile phase: MeCN:water 35:65
Flow rate: 0.5

Injection volume: 4000
Detector: UV 340

CHROMATOGRAM
Retention time: 8 (β epimer), 9 (α epimer)
Limit of detection: 100 pg/g

OTHER SUBSTANCES
Extracted: nandrolone

SAMPLE
Matrix: tissue
Sample preparation: Dry pack 60 × 8 mm glass columns with 250 mg Carbopack B (200-400 mesh) and 60 × 4 mm glass columns with 50 mg Amberlite CG-400 I (100-200 mesh). Wash Carbopack column with 5 mL MeOH, 15 mL dichloromethane:MeOH 70:30, and MeOH:water 85:15. Wash Amberlite column with 3 mL 0.5 M NaOH, 8 mL dichloromethane:MeOH 70:30, 1 mL water, and 3 mL 1 M HCl. Repeat this cycle 4 times. Finally pass through 20 mL 50 mM NaOH then 1 mL water. Keep column in water. (Process converts Amberlite to OH form.) Homogenize 1 g of tissue in 5 mL MeOH, sonicate 5 min, centrifuge at 6000 rpm for 10 min. Add another 5 mL MeOH to pellet and repeat. Combine supernatants, make up to 6.8 mL with MeOH, add 1.2 mL water. Pass through Carbopack column, wash column with 2 mL MeOH: water 85:15 then 2 mL MeOH, elute column with 8 mL dichloromethane:MeOH 70:30. Pass eluate onto Amberlite column, add 1 mL MeOH to column, collect all eluates from column, evaporate to dryness under nitrogen at 40°, take up in 200 μL MeOH:water 50:50, add 25 μL 10 μg/mL p-chlorophenol, inject 50 μL aliquot.

HPLC VARIABLES
Guard column: 20 × 4.6 5 μm Supelguard LC-18

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Waring blender) tissue at full speed for 2 min, lyophilize, grind. Extract with supercritical carbon dioxide at 60° at 400 atmospheres with a 20 cm × 21

μm restrictor for 1 h, collect the extract in 1 mL MeOH cooled to 5°. Evaporate the MeOH to dryness under a stream of nitrogen, reconstitute the residue in 100 μL MeCN:MeOH:20 mM ammonium formate 15:15:70, inject an aliquot. Alternatively, vortex 5 g ground tissue with 10 mL 40 mM sodium acetate, adjust pH to 4.2-4.7 with glacial acetic acid, add 100 μL β-glucuronidase (Sigma), heat at 37° for 8 h, add 20 mL MeCN, vortex for 30 s, centrifuge at 5000 rpm for 20 min. Remove a 30 mL aliquot of the supernatant and add it to 8 mL hexane and 2 mL dichloromethane, rotate for 3 min, centrifuge at 2000 rpm for 2 min. Remove a 15 mL aliquot of the middle layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 1 mL dichloromethane, inject an aliquot.

HPLC VARIABLES

Column: 50 × 4.6 5 μm Supelcosil
Mobile phase: Gradient. MeCN:MeOH:20 mM ammonium formate from 2.5:2.5:95 to 47.5:47.5:5 over 19 min.
Flow rate: 1
Injection volume: 20
Detector: UV 245 or MS, Sciex TAGA 6000E tandem triple quadrupole, APCI

CHROMATOGRAM

Retention time: 9.8
Limit of detection: 100 ppb

OTHER SUBSTANCES

Extracted: dexamethasone, diethylstilbestrol, medroxyprogesterone, melengestrol acetate, triamcinolone acetonide, zeranol

KEY WORDS

cow; muscle; liver; SFE

REFERENCE

Huopalahti,R.P.; Henion,J.D. Application of supercritical fluid extraction and high performance liquid chromatography/mass spectrometry for the determination of some anabolic agents directly from bovine tissue samples, *J.Liq.Chromatogr.Rel.Technol.*, **1996**, *19*, 69–87.

SAMPLE

Matrix: urine
Sample preparation: 10 mL Urine + glucuronidase/sulfatase (Helix pomatia), incubate at 37° for 1 h, extract twice with 5 mL diethyl ether, add 225 μL water and evaporate ether under nitrogen, add 400 μL MeOH, inject a 250 μL aliquot of this mixture.

HPLC VARIABLES

Guard column: 75 × 2.1 Corasil C18
Column: 150 × 4.6 5 μm Hypersil ODS
Mobile phase: MeOH:water 60:40
Flow rate: 2
Injection volume: 250
Detector: UV 240

CHROMATOGRAM

Retention time: 4.5
Limit of detection: about 6 ng/mL

OTHER SUBSTANCES

Simultaneous: 17α-methyltestosterone, zeranol, trans-diethylstilbestrol, medroxyprogesterone, nandrolone

KEY WORDS

cow

REFERENCE
Jansen,E.H.; Both-Miedema,R.; van Blitterswijk,H.; Stephany,R.W. Separation and purification of several anabolics present in bovine urine by isocratic high-performance liquid chromatography, *J.Chromatogr.*, **1984**, *299*, 450–455.

SAMPLE
Matrix: urine
Sample preparation: Hydrolyze 1 mL urine with glucuronidase/sulfatase (from Helix pomatia, IBF; purified by gel filtration on Sephadex G-25M) at 37° for 2 h, cool, extract with ether. Remove the organic layer and evaporate it to dryness, reconstitute the residue in 250 μL mobile phase, inject a 200 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Hypersil silica
Mobile phase: Isooctane:EtOH 97:3 for 8 min then 60:40 for 2 min to clean column
Flow rate: 2
Injection volume: 200
Detector: UV 350

CHROMATOGRAM
Retention time: 2.25 (trenbolone acetate), 6.2 (17β-trenbolone), 7.0 (17α-trenbolone)
Limit of detection: 1-2 ng/mL

OTHER SUBSTANCES
Extracted: metabolites, triendione

KEY WORDS
cow; normal phase

REFERENCE
Jansen,E.H.J.M.; Zoontjes,P.W.; van Blitterswijk,H.; Both-Miedema,R.; Stephany,R.W. Fast high-performance liquid chromatographic screening method for the presence of trenbolone and its major metabolite in urine of slaughter cattle, *J.Chromatogr.*, **1985**, *319*, 436–439.

SAMPLE
Matrix: urine
Sample preparation: Adjust pH of 1 mL urine to 5,2 with 500 mM acetic acid, add 375 μL purified enzyme, heat at 37° for 1 h, cool, add to an immunosorbent column (preparation details in paper), wash with two 1 mL portions of water, wash with 5 mL water, elute with 5 mL EtOH:water 40:60. Evaporate the eluate to 800 μL under a stream of nitrogen, make up to 1 mL with water, extract with 6 mL diethyl ether. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 200 μL mobile phase, inject a 180 μL aliquot. (Enzyme was suc d'Helix pomatia (Industrie Biologique Francaise) purified by gel filtration on Pharmacia PD-10.)

HPLC VARIABLES
Column: 150 × 4.6 5 μm LiChrosorb diol
Mobile phase: Isooctane:EtOH 95:5
Flow rate: 2
Injection volume: 180
Detector: UV 350 (with confirmation by TLC)

CHROMATOGRAM
Retention time: 6.1 (17β- and 17α-trenbolone)
Limit of detection: 2 ng/mL

KEY WORDS
cow

SAMPLE
Matrix: urine
Sample preparation: Add urine to an Amberlite XAD-2 column, elute with MeOH, add eluate to a column of neutral alumina (activity 1, Merck), elute with EtOH:water 96:4 (unconjugated), elute with water (sulfates), elute with 40 mM pH 6.0 citrate-phosphate buffer (glucuronides). Hydrolyze conjugates with β-glucuronidase/sulfatase (Helix pomatia, Serva), extract with ethyl acetate, evaporate the organic layer under reduced pressure, reconstitute the residue with MeOH, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4 5 μm Zorbax ODS
Mobile phase: Gradient. A was MeOH:water 10:90. B was MeCN. A:B from 85:15 to 63:37 over 10 min (concave gradient, Waters curve 8), maintain at 63:37 for 10 min, to 0:100 over 5 min.
Flow rate: 1
Detector: UV 340 or radioactivity

CHROMATOGRAM
Retention time: 33 (17β-trenbolone), 35 (17α-trenbolone)

OTHER SUBSTANCES
Extracted: metabolites, trendione

KEY WORDS
tritium labeled; SPE

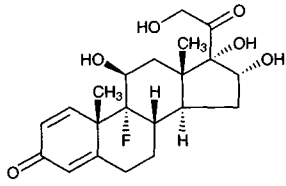
Triamcinolone



Molecular formula: $C_{21}H_{27}FO_6$
Molecular weight: 394.44
CAS Registry No.: 124-94-7, 76-25-5 (acetonide), 1997-15-5 (acetonide disodium phosphate), 31002-79-6 (benetonide), 5611-51-8 (hexacetonide), 67-78-7 (diacetate), 4989-94-0 (furetonide), 989-96-8 (21-(dihydrogen phosphate)
Merck Index: 9727
Lednicer No.: 1 201; 2 302

SAMPLE
Matrix: blood
Sample preparation: Add 100 μL MeOH and 50 μL 1 μg/mL fluocortolone in MeOH to 1 mL plasma. Add 500 μL 100 mM NaOH and 2 mL dichloromethane, shake for 10 min, centrifuge at 2500 g for 10 min, evaporate a 1.9 mL aliquot of the supernatant under a stream of nitrogen at 45°. Reconstitute the residue in 50 μL MeOH, inject 17 μL aliquot.

HPLC VARIABLES
Guard column: 10 × 4 5 μm LiChrospher RP 18
Column: 250 × 4 5 μm Lichrospher RP 18
Mobile phase: MeOH:THF:water 110:2.5:100
Flow rate: 1

Injection volume: 17
Detector: UV 252

CHROMATOGRAM
Internal standard: fluocortolone
Limit of quantitation: 600 pg/mL

OTHER SUBSTANCES
Extracted: hydrocortisone

KEY WORDS
plasma

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 215.8

CHROMATOGRAM

Retention time: 8.705

KEY WORDS

whole blood

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 20 μL 2.5 μg/mL norprazepam in MeOH + 50 μL buffer + 6 mL diethyl ether:dichloromethane 2:1, agitate, centrifuge. Remove the organic phase and evaporate to dryness under vacuum at 45°, dissolve the residue in 50 μL MeOH, inject a 20 μL aliquot. (Prepare buffer as follows. Solution A was 6.18 g boric acid + 7.46 g KCl in 100 mL water. Solution B was 10.6 g sodium carbonate in 100 mL water. Mix 63 mL solution A and 37 mL solution B and adjust pH to 9.5.)

HPLC VARIABLES
Column: 150 × 4.6 5 μm Nova Pak C18
Mobile phase: MeCN:MeOH:buffer 23:13:64 (Buffer was 94 mL 200 mM NaH_2PO_4 + 6 mL 200 mM Na_2HPO_4, adjusted to pH 5.0 with 100 mM HCl.)
Flow rate: 1.3
Injection volume: 20
Detector: UV 242

CHROMATOGRAM
Retention time: 14.9
Internal standard: norprazepam (18.6)
Limit of quantitation: 30 ng/mL

OTHER SUBSTANCES
Simultaneous: alprazolam, bromazepam, chlordiazepoxide, clonazepam, diazepam, estazolam, flumazenil, flunitrazepam, loflazepate, lorazepam, nitrazepam, norflunitrazepam, oxazepam
Noninterfering: acepromazine, aceprometazine, amylobarbital, aprobarbital, barbital, brallobarbital, butalbital, caffeine, carbamazepine, chlorpromazine, cyclobarbital, ethosuximide, heptabarbital, hexobarbital, loprazolam, medazepam, midazolam, pentobarbital, phenobarbital, phenytoin, prazepam, secobarbital, theophylline, thiopental, vinylbarbital
Interfering: tofizopam, clobazam

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: 1 mL Serum + 25 μL 1 μg/mL triazolam in toluene + 75 μL 0.1% ammonium hydroxide, vortex 30 s, add 5 mL methylene chloride + 5 mL toluene, shake 15 min,

centrifuge at 177 g for 10 min. Remove aqueous layer and freeze residual aqueous layer in dry ice-acetone for 30 s. Decant organic layer, dry under nitrogen at 50°, vortex residue with 200 μL mobile phase, inject a 125 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm C18 (Supelco)
Mobile phase: MeOH:buffer 40:60 (Buffer was 1 mM phosphate and 3 mM hexyltriethylammonium phosphate in water at pH 7.4.)
Column temperature: 35
Flow rate: 2
Injection volume: 125
Detector: UV 221

CHROMATOGRAM
Retention time: 30
Internal standard: triazolam
Limit of detection: 1 ng/mL

OTHER SUBSTANCES
Extracted: alprazolam

SAMPLE
Matrix: blood
Sample preparation: 3 mL Plasma + 30 μL 10 μg/mL triazolam in water, mix 1 min, allow to stand for 15 min at room temperature, add to 3 mL Extrelut SPE cartridge and allow to soak in for 10 min, elute with 20 mL dichloromethane. Evaporate eluant at 30° under reduced pressure, take up residue in 1 mL MeCN:water 5:95, stand for 15 min, centrifuge at 14000 g for 2 min, remove supernatant. Inject a 250 μL aliquot of the supernatant onto column A with mobile phase A and elute to waste, after 7 min forward flush the contents of column A onto column B with mobile phase B, after 0.47 min remove column A from circuit and elute column B with mobile phase B, monitor the effluent from column B. When not in use flush column A with mobile phase A. Between injections clean column A with two injections of 250 μL MeCN.

HPLC VARIABLES
Column: A 30 × 2.1 10 μm MPLC cartridge PRP-1 (Kontron); B 100 × 4.6 MPLC cartridge 5 μm RP-8 Spheri-5 (Kontron)
Mobile phase: A 1 L water + 20 mL MeCN + 50 μL phosphoric acid (pH 3.2); B MeCN:buffer 40:60 (Buffer was 1 L water + 20 mL MeCN + 50 μL phosphoric acid (pH 3.2).)
Flow rate: A 0.3; B 1
Injection volume: 250
Detector: UV 230

CHROMATOGRAM
Retention time: 7.0
Internal standard: triazolam

OTHER SUBSTANCES
Extracted: alprazolam
Simultaneous: bromazepam, oxazepam, lorazepam, diazepam
Interfering: clobazam

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 5 mL chloroform, vortex for about 15 s, centrifuge at 0-5° at 800 g for 15 min. Remove the organic layer and add it to 3.5 mL 5 M HCl, vortex for 15 s, centrifuge at 0-5° at 800 g for 15 min. Remove a 4 mL aliquot of the organic layer and dry it over 200 mg anhydrous calcium sulfate (Drierite), vortex, centrifuge at 0-5° at 800 g for 5 min. Remove a 3.8 mL aliquot of the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature in an acid-washed vial, reconstitute the residue in 120 µL water, vortex, centrifuge at 0-5° at 11000 g for 5 min, inject a 100 µL aliquot of the supernatant.

HPLC VARIABLES
Guard column: 37-50 µm C18/Corasil
Column: 300 × 3.9 10 µm C18 (Waters)
Mobile phase: MeOH:THF:water 10:0.1:89.9 containing 1 mM sodium 1-octanesulfonate, pH adjusted to 3.0

Flow rate: 2
Injection volume: 100
Detector: UV 210

CHROMATOGRAM
Retention time: 10.8
Limit of detection: 1 μg/mL

OTHER SUBSTANCES
Noninterfering: dichlorvos

KEY WORDS
plasma

SAMPLE
Matrix: formulations
Sample preparation: 1 g Paste + 75 mL MeOH, sonicate for 15 min, shake for 1 min, sonicate for 5 min, shake for 30 s, cool to room temperature, make up to 100 mL with MeOH, centrifuge an aliquot at 2000 rpm for 10 min. Mix 2 mL supernatant with 2 mL 200 μg/mL methyl paraben in MeOH, make up to 25 mL with MeCN:water:phosphoric acid 20:80:1, filter (Millipore 0.6 μm polyvic), inject a 10 μL aliquot of the filtrate.

HPLC VARIABLES
Guard column: 70 × 2.1 CO:PELL ODS
Column: 250 × 4.6 Partisil-5 ODS-3
Mobile phase: MeCN:buffer 20:80 (Buffer was 720 mL 1.38 g/L $NaH_2PO_4.H_2O$ + 80 mL 1.42 g/L Na_2HPO_4.)
Flow rate: 1.5
Injection volume: 10
Detector: UV 200

CHROMATOGRAM
Retention time: 6.69
Internal standard: methyl paraben (15.71)

OTHER SUBSTANCES
Simultaneous: oxfendazole

KEY WORDS
horse; paste

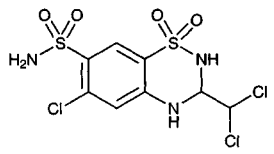
Trichlormethiazide



Molecular formula: $C_8H_8Cl_3N_3O_4S_2$
Molecular weight: 380.66
CAS Registry No.: 133-67-5
Merck Index: 9754
Lednicer No.: 1 359

SAMPLE

Matrix: blood
Sample preparation: 3 mL Plasma + 1 mL 10 mM NaOH + 1 mL 2 μg/mL bendroflumethiazide in 10 mM NaOH + 2 mL 10 mM HCl, mix, add 10 mL diethyl ether, shake gently on a platform shaker for 15 min, centrifuge at -10° at 2200 g for 15 min, freeze in dry ice/acetone. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 70° for 45 min (these conditions are required to remove residual benzyl alcohol that is present as a preservative in the heparin), reconstitute the residue in 50 μL 10 mM NaOH, vortex for 25 s, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: Isopropanol:water:acetic acid 17:82:1
Flow rate: 2
Injection volume: 20
Detector: UV 269

CHROMATOGRAM

Retention time: 3.7
Internal standard: bendroflumethiazide (14.4)
Limit of detection: 10 ng/mL

KEY WORDS

plasma; silanize glassware; pharmacokinetics

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 225.2

CHROMATOGRAM
Retention time: 14.907

KEY WORDS
whole blood

SAMPLE

Matrix: urine

Sample preparation: 2 mL Urine + 0.5 g solid buffer I (pH 5-5.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and vortex it with 2 mL 5% aqueous lead acetate for 10 s, centrifuge at 600 g for 5 min, remove and keep organic phase. 2 mL Urine + 0.5 g solid buffer II (pH 9-9.5), vortex 15 s, add 4 mL ethyl acetate, agitate for 10 min, centrifuge at 600 g for 5 min. Remove organic layer and combine it with previous organic layer. Evaporate to dryness at 50° under a stream of nitrogen, reconstitute in 300 μL 50 μg/mL β-hydroxyethyltheophylline in MeOH, inject 5 μL aliquot. (Solid buffer I was KH_2PO_4:Na_2HPO_4 99:1, solid buffer II was $NaHCO_3$:K_2CO_3 3:2.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm HP Hypersil ODS (A) or HP LiChrosorb RP-18 (B)

Mobile phase: Gradient. MeCN:buffer from 15:85 at 2 min to 80:20 at 20 min (Buffer was 50 mM NaH_2PO_4 containing 16 mM propylamine hydrochloride, adjusted to pH 3 with concentrated phosphoric acid.)

Flow rate: 1

Injection volume: 5

Detector: UV 230, UV 275

CHROMATOGRAM

Retention time: 11.1 (A), 12.0 (B)

Internal standard: β-hydroxyethyltheophylline (3.7 (A), 4.4 (B))

Limit of detection: 1000 ng/mL

OTHER SUBSTANCES

Extracted: furosemide, metolazone, amiloride, acetazolamide, chlorothiazide, hydrochlorothiazide, quinethazone, triamterene, hydroflumethiazide, chlorthalidone, dichlorphenamide, methyclothiazide, benzthiazide, cyclothiazide, polythiazide, bendroflumethiazide, ethacrynic acid, bumetanide, probenecid, spironolactone, canrenone, flumethiazide

Noninterfering: acetaminophen, aspirin, caffeine, diflunisal, fenoprofen, ibuprofen, indomethacin, methocarbamol, naproxen, phenylbutazone, sulindac, tetracycline, theobromine, theophylline, tolmetin, trimethoprim, verapamil

Matrix: blood

Sample preparation: 10 mL Plasma or whole blood + 1 mL 1 M NaOH, extract twice with 10 mL hexane for 30 min. Remove the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 1 mL 100 mM HCl, add 5 mL chloroform, vortex for 1 min, centrifuge. Remove a 4.5 mL aliquot of the organic layer and evaporate it to dryness, reconstitute the residue in 100 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 10 μm Micropak CN (Varian)
Mobile phase: MeCN:20 mM ammonium acetate 90:10
Flow rate: 2.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM

Retention time: 9.3
Limit of detection: 10 ng/mL

OTHER SUBSTANCES

Extracted: amitriptyline, butaperazine, carphenazine, chlorpromazine, fluphenazine, promazine, promethazine, trimeprazine
Simultaneous: acetophenazine, benztropine, haloperidol, imipramine, mesoridazine, nortriptyline, orphenadrine, piperacetazine, thiothixene, trifluprom azine, trihexyphenidyl

KEY WORDS

plasma; whole blood

SAMPLE

Matrix: blood

Sample preparation: 1 mL Plasma + 100 μL 50 mM HCl + 200 μL concentrated ammonium hydroxide + 7 mL n-pentane:isopropanol 95:5, shake horizontally for 30 min, centrifuge at 2000 g. Remove the top organic layer and add it to 2 mL 100 mM perchloric acid, agitate for 10 min, centrifuge. Remove the aqueous layer and add it to 200 μL concentrated ammonium hydroxide, add 6 mL n-pentane:isopropanol 95:5, agitate for 30 min, centrifuge. Remove the top organic layer and evaporate it to dryness under a stream of nitrogen at 45°, reconstitute the residue in 50 μL MeCN, inject a 20-40 μL aliquot. (Clean glassware scrupulously by soaking overnight in 50 mL/L Contrad (Curtin Matheson), rinse several times with water, and air dry.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Ultrasphere cyano

Mobile phase: MeCN:10 mM pH 2.5 KH_2PO_4 60:40

Flow rate: 2.5

Injection volume: 20-40

Detector: E, Environmental Science Associates Coulochem Model 5100A, Model 5100 guard cell +0.85 V (between pump and injector), Model 5010 analytical cell +0.8 V, preanalytical cell +0.3 V

CHROMATOGRAM

Retention time: 8.2

Internal standard: trifluoperazine dihydrochloride

OTHER SUBSTANCES

Extracted: thiothixene

Simultaneous: amitriptyline, amoxapine, chlorpromazine, desipramine, doxepin, haloperidol, imipramine, loxapine, mesoridazine, nortriptyline, pheniramine, phenylephrine, prochlorperazine, promazine, promethazine, trazodone, trimeprazine, tripelennamine

Noninterfering: diazepam, diphenhydramine, ethopropazine, fluoxetine, nordiazepam, oxazepam, phenylpropanolamine, pseudoephedrine

Interfering: fluphenazine, perphenazine, thioridazine, triflupromazine

KEY WORDS

plasma; trifluoperazine is IS

SAMPLE

Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18

Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)

Column temperature: 30

Flow rate: 0.8

Injection volume: 50

Detector: UV 260

CHROMATOGRAM

Retention time: 19.78

Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 µm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 258.2

CHROMATOGRAM
Retention time: 17.747

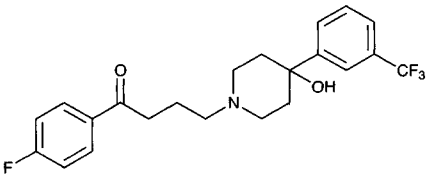
Trifluperidol



Molecular formula: $C_{22}H_{23}F_4NO_2$
Molecular weight: 409.42
CAS Registry No.: 749-13-3, 2062-77-3 (HCl)
Merck Index: 9813
Lednicer No.: 1 306

SAMPLE

Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 µm NovaPack C18

Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 247

CHROMATOGRAM

Retention time: 6.61
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM

Retention time: 21.638

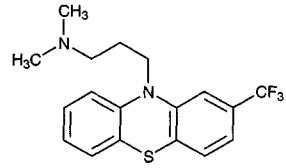
Trifluprom azine



Molecular formula: $C_{18}H_{19}F_3N_2S$
Molecular weight: 352.42
CAS Registry No.: 146-54-3, 1098-60-8 (HCl)
Merck Index: 9814
Lednicer No.: 1 380

SAMPLE

Matrix: blood
Sample preparation: 10 mL Plasma or whole blood + 1 mL 1 M NaOH, extract twice with 10 mL hexane for 30 min. Remove the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 1 mL 100 mM HCl, add 5 mL chloroform, vortex for 1 min, centrifuge. Remove a 4.5 mL aliquot of the organic layer and evaporate it to dryness, reconstitute the residue in 100 μL mobile phase, inject a 50 μL aliquot. (It is implied, but not explicitly stated in the paper, that this extraction procedure works for this compound.)

HPLC VARIABLES

Column: 10 μm Micropak CN (Varian)
Mobile phase: MeCN:20 mM ammonium acetate 90:10
Flow rate: 2.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM

Retention time: 6.6
Limit of detection: 10 ng/mL

OTHER SUBSTANCES

Simultaneous: acetophenazine, amitriptyline, benztropine, butaperazine, chlorpromazine, fluphenazine, haloperidol, imipramine, mesoridazine, nortriptyline, orphenadrine, piperacetazine, promazine, promethazine, thioridazine, thiothixene, trifluoperazine, trihexyphenidyl
Interfering: carphenazine, trimeprazine

KEY WORDS

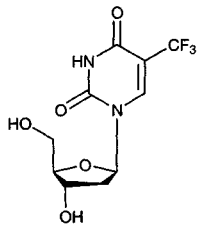
Trifluridine



Molecular formula: $C_{10}H_{11}F_3N_2O_5$
Molecular weight: 296.20
CAS Registry No.: 70-00-8
Merck Index: 9816

SAMPLE

Matrix: aqueous humor, tissue, vitreous humor
Sample preparation: Minced cornea or 100 μL aqueous humor or vitreous humor + 75 μL 200 mM pH 3.88 sodium acetate buffer + 25 μL 8.2 μg/mL 3-methylthymidine in water, mix, add 1.5 mL ethyl acetate, swirl-mix for 1.5 min, centrifuge at 300 g for 5 min, repeat the extraction. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in mobile phase, inject an aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeCN:10 mM pH 3.88 acetate buffer 12.5:87.5 containing 1 mM sodium hexanesulfonate
Flow rate: 1.3
Injection volume: 20
Detector: UV 254

CHROMATOGRAM

Retention time: 5.1
Internal standard: 3-methylthymidine (4.1)
Limit of detection: 50 ng/mL

OTHER SUBSTANCES

Simultaneous: bacitracin, chloramphenicol, flurbiprofen, scopolamine, sulfamethoxazole
Noninterfering: antazoline, atropine, cyclopentolate, dexamethasone, dipivefrin, epinephrine, epinephryl borate, erythromycin, fluorometholone, homatropine,hydrocortisone acetate, naphazoline, neomycin, phospholine, polymyxin B, procaine, proparacaine, tetracycline, timolol, tropicamide
Interfering: sulfacetamide

KEY WORDS

rabbit; cornea

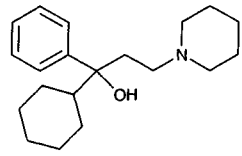
Trihexyphenidyl



Molecular formula: $C_{20}H_{31}NO$
Molecular weight: 301.47
CAS Registry No.: 144-11-6, 52-49-3 (HCl)
Merck Index: 9823
Lednicer No.: 1 47

SAMPLE

Matrix: blood
Sample preparation: 10 mL Plasma or whole blood + 1 mL 1 M NaOH, extract twice with 10 mL hexane for 30 min. Remove the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 1 mL 100 mM HCl, add 5 mL chloroform, vortex for 1 min, centrifuge. Remove a 4.5 mL aliquot of the organic layer and evaporate it to dryness, reconstitute the residue in 100 μL mobile phase, inject a 50 μL aliquot. (It is implied, but not explicitly stated in the paper, that this extraction procedure works for this compound.)

HPLC VARIABLES

Column: 10 μm Micropak CN (Varian)
Mobile phase: MeCN:20 mM ammonium acetate 90:10
Flow rate: 2.5
Injection volume: 50
Detector: UV 254

CHROMATOGRAM

Retention time: 7.3
Limit of detection: 10 ng/mL

OTHER SUBSTANCES

Simultaneous: amitriptyline, benztropine, butaperazine, carphenazine, chlorpromazine, fluphenazine, haloperidol, imipramine, mesoridazine, nortriptyline, orphenadrine, piperacetazine, promazine, promethazine, thioridazine, thiothixene, trifluoperazine, triflupromazine, trimeprazine
Interfering: acetophenazine

KEY WORDS

plasma; whole blood

SAMPLE

Matrix: blood
Sample preparation: 1 mL Plasma + 100 μL 200 ng/mL IS in MeOH + 1 mL 50 mM pH 10 borate buffer, vortex briefly, add to an Extrelut 3 SPE cartridge, let stand for 5 min, elute with 15 mL hexane:dichloromethane 50:50. Add the eluate to 3 mL 50 mM sulfuric acid, mix for 10 min, centrifuge at 3000 g for 10 min. Remove the aqueous layer and add it to 6 mL hexane:dichloromethane 50:50, wash for 5 min, centrifuge. Make the aqueous layer basic with 150 μL 28% ammonia, extract twice with 3 mL hexane:dichloromethane 50:50. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 60°, reconstitute the residue in 100 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 30 × 4.6 5 μm Spherisorb cyano
Column: 250 × 4.6 5 μm Ultrasphere cyano
Mobile phase: MeCN:buffer 60:40 (Buffer was 50 mM KH_2PO_4 adjusted to pH 6.5 with 28% ammonia.)

Flow rate: 1
Injection volume: 20
Detector: E, 5100 A Coulochem, 5020 guard cell 1.00 V, 5011 analytical cell, detector 1 0.55 V, detector 2 0.80 V, output of detector 2 is monitored

CHROMATOGRAM
Retention time: 20.1
Internal standard: methylrisperidone (R68808) (14.3)

OTHER SUBSTANCES
Extracted: chlorpromazine, clomipramine, cyamemazine, desipramine, droperidol, flunitrazepam, haloperidol, pipamperone, risperidone
Noninterfering: alprazolam, bromazepam, carbamazepine, chlorazepate, diazepam, diphenylhydantoin, estazolam, ethylbenzatropine, oxazepam, phenobarbital, triazolam, valproic acid
Interfering: imipramine

KEY WORDS

SAMPLE
Matrix: blood, tissue
Sample preparation: Blood or serum. 1 mL Blood or serum + 1 μg cianopramine + 1 mL water, vortex, add 1 mL 200 mM sodium carbonate, vortex, add 6 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 100 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer. Liver homogenate. 0.5 mL Liver homogenate + 10 μg cianopramine + 500 μL 2% sodium tetraborate + 8 mL hexane:1-butanol 95:5, gently agitate for 30 min, centrifuge at 2500 g for 5 min. Remove the organic layer and add it to 400 μL 0.2% phosphoric acid, agitate gently for 30 min, centrifuge for 5 min. Remove the organic layer and inject a 30 μL aliquot of the aqueous layer.

HPLC VARIABLES
Guard column: 15 × 3.2 7 μm RP-18 Newguard (Applied Biosystems)
Column: 100 × 4.6 5 μm Brownlee Spheri-5 RP-18
Mobile phase: MeCN:100 mM NaH_2PO_4:diethylamine 40:57.5:2.5
Flow rate: 2
Injection volume: 30
Detector: UV 220

CHROMATOGRAM
Retention time: 18.96
Internal standard: cianopramine (8.93)

OTHER SUBSTANCES
Simultaneous: amitriptyline, amoxapine, benztropine, brompheniramine, chlorpheniramine, chlorpromazine, clomipramine, cyproheptadine, desipramine, diphenhydramine, dothiepin, doxepin, fluoxetine, haloperidol, imipramine, loxapine, maprotiline, meperidine, mesoridazine, methadone, metoclopramide, mianserin, moclobemide, nomifensine, nordoxepin, norfluoxetine, norpropoxyphene, northiaden, nortriptyline, pentobarbital, pheniramine, promethazine, propoxyphene, propranolol, protriptyline, quinidine, quinine, sulforidazine, thioridazine, thiothixene, tranylcypromine, trazodone, trimipramine, triprolidine
Noninterfering: dextromethorphan, norphetidine, phenoxybenzamine, prochlorperazine, trifluoperazine

KEY WORDS
serum; whole blood; liver

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

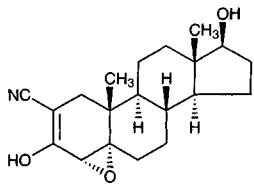
Trilostane



Molecular formula: $C_{20}H_{27}NO_3$
Molecular weight: 329.44
CAS Registry No.: 13647-35-3
Merck Index: 9827
Lednicer No.: 2 158

SAMPLE
Matrix: blood
Sample preparation: 100 µL Plasma + 200 µL 200 mM pH 4.3 acetate buffer, vortex for 1 min, add 10 mL 2.5 ng/mL ethisterone in diethyl ether, mix on a rotary shaker, centrifuge at 10000 g for 10 min. Remove the organic layer and add it to 1-2 g anhydrous magnesium sulfate, mix on a rotary shaker, centrifuge, evaporate the organic layer to dryness under reduced pressure at 35-40°, reconstitute the residue in 150 µL mobile phase, sonicate for 5 min, inject a 100 µL aliquot.

HPLC VARIABLES
Column: 250 × 4.9 Spherisorb S5 ODS2
Mobile phase: Dioxane:pH 5.0 Sorenson's buffer 52:48 (Caution! Dioxane is a carcinogen!)
Flow rate: 1
Injection volume: 100
Detector: UV 255

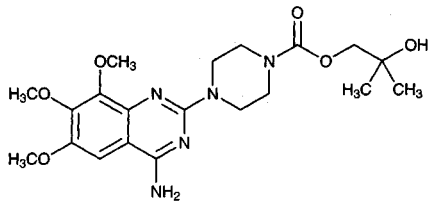
CHROMATOGRAM
Retention time: 5.6
Internal standard: ethisterone (12)
Limit of detection: 50 ng/mL

OTHER SUBSTANCES
Extracted: ketotrilostane

KEY WORDS
rat; plasma; pharmacokinetics

REFERENCE
McGee,J.P.; Palin,K.J.; Shaw,P.N.; Potter,C. High-performance liquid chromatographic analysis of trilostane and ketotrilostane in rat plasma, *J.Chromatogr.*, **1991**, *567*, 282–287.

Trimazosin



Molecular formula: $C_{20}H_{29}N_5O_6$
Molecular weight: 435.48
CAS Registry No.: 35795-16-5, 53746-46-6 (HCl monohydrate)
Merck Index: 9828
Lednicer No.: 2 382

SAMPLE

Matrix: blood
Sample preparation: Place 50 µL of a 100 µg/mL solution of doxazosin in MeOH into the bottom of a tube, evaporate to dryness under a stream of nitrogen at 37°, add 1 mL whole blood, mix thoroughly, add 5 mL diethyl ether, shake for 10 min, centrifuge at 2000 rpm for 5 min, freeze in acetone/dry ice. Remove the organic layer and add it to 100 µL 50 mM sulfuric acid, shake for 10 min, centrifuge at 2000 rpm for 5 min, inject a 20 µL aliquot of the aqueous layer.

HPLC VARIABLES

Column: 250 × 4 5 µm Spherisorb ODS
Mobile phase: MeOH:water 55:45 containing 10 mM pentane sodium sulfate and 9 mM tetramethylammonium chloride, adjusted to pH 3.4 with glacial acetic acid
Flow rate: 1.8
Injection volume: 20
Detector: F ex 254 em 400 (cut-off filter)

CHROMATOGRAM

Retention time: 5.5
Internal standard: doxazosin (9)
Limit of detection: 1 ng/mL

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

whole blood; pharmacokinetics

REFERENCE

Hughes,M.A.; Meredith,P.A.; Elliott,H.L. The determination of trimazosin and its metabolite CP23445 in whole blood by high performance liquid chromatography using fluorescence detection, *J.Pharmacol.Methods*, **1984**, *12*, 29–34.

SAMPLE

Matrix: solutions

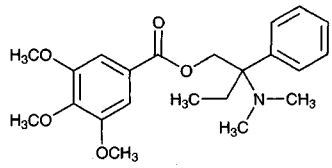
HPLC VARIABLES

Column: 125 × 5 5 µm Spherisorb C8
Mobile phase: MeCN:water 25:45 containing 5 mM dibutylamine
Flow rate: 2
Detector: F ex 346 em 340 (filter)

REFERENCE

Ferry,D.G.; Caplan,N.B.; Cubeddu,L.X. Interaction between antidepressants and α 1-adrenergic receptor antagonists on the binding to α 1-acid glycoprotein, *J.Pharm.Sci.*, **1986**, *75*, 146–149.

Trimebutine



Molecular formula: $C_{22}H_{29}NO_5$
Molecular weight: 387.48
CAS Registry No.: 39133-31-8, 34140-59-5 (maleate)
Merck Index: 9829

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 213.4

CHROMATOGRAM

Retention time: 14.588

KEY WORDS

whole blood

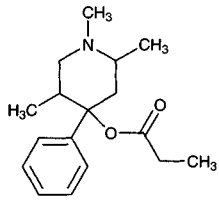
Trimeperidine



Molecular formula: $C_{17}H_{25}NO_2$
Molecular weight: 275.39
CAS Registry No.: 64-39-1
Merck Index: 7968

SAMPLE

Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 125 × 4.9 Spherisorb S5W silica

Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7
Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM

Retention time: 2.8

OTHER SUBSTANCES

Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzphetamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, buclizine, bufotenine, bupivacaine, buprenorphine, butacaine, butethamate, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorpromazine, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene, dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, lofepramine, loxapine, maprotiline, mecamylamine, meclophenoxate, meclozine, medazepam, mephentermine, mepivacaine, meptazinol, mepyramine, mesoridazine, metaraminol, methadone, methamphetamine, methapyrilene, methdilazene, methotrimeprazine, methoxamine, methoxyphenamine, methoxypromazine, methylephedrine, methylergonovine, methysergide, metoclopramide, metopimazine, metoprolol, mianserin, morazone, nadolol, nalorphine, naloxone, naphazoline, nicotine, nifedipine, nomifensine, nortriptyline, noscapine, orphenadrine, oxeladin, oxprenolol, oxymetazolin, papaverine, pargyline, pecazine, penbutolol, pentazocine, penthienate, pericyazine, perphenazine, phenadoxone, phenampromide, phenazocine, phenbutrazate, phendimetrazine, phenelzine, phenglutarimide, phenindamine, pheniramine, phenmetrazine, phenomorphan, phenoperidine, phenothiazine, phenoxybenzamine, phentolamine, phenylephrine, phenyltoloxamine, physostigmine, piminodine, pimozide, pindolol, pipamazine, pipazethate, piperacetazine, piperidolate, pipradol, pirenzepine, piritramide, pizotifen, practolol, pramoxine, prazosin, prenylamine, prilocaine, primaquine, proadifen, procainamide, procaine, prochlorperazine, procyclidine, proheptazine, prolintane, promazine, promethazine, pronethalol, properidine, propiomazine, propranolol, prothipendyl, protriptyline, proxymetacaine, pseudoephedrine, pyrimethamine, quinidine, quinine, ranitidine, rescinnamine, sotalol, tacrine, terazosin, terbutaline, terfenadine, thenyldiamine, theophylline, thiethylperazine, thiopropazate, thioproperazine, thioridazine, thiothixene, thonzylamine, timolol, tocainide, tolpropamine, tolycaine, tranylcypromine, trazodone, trifluoperazine, trifluperidol, trimeprazine, trimethobenzamide, trimethoprim, trimipramine, tripelennamine, triprolidine, tryptamine, verapamil, xylometazoline

SAMPLE
Matrix: blood
Sample preparation: 10 mL Plasma or whole blood + 1 mL 1 M NaOH, extract twice with 10 mL hexane for 30 min. Remove the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 1 mL 100 mM HCl, add 5 mL chloroform, vortex for 1 min, centrifuge. Remove a 4.5 mL aliquot of the organic layer and evaporate it to dryness, reconstitute the residue in 100 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 10 μm Micropak CN (Varian)
Mobile phase: MeCN:20 mM ammonium acetate 90:10
Flow rate: 2.5
Injection volume: 50
Detector: UV 254 or E, Bioanalytical Systems LC4A, glassy carbon electrode +0.9 V, Ag/AgCl reference electrode

CHROMATOGRAM
Retention time: 6.6
Limit of detection: 0.1 ng/mL (electrochemical)

OTHER SUBSTANCES
Extracted: amitriptyline, butaperazine, chlorpromazine, fluphenazine, promazine, promethazine, thioridazine, trifluoperazine
Simultaneous: acetophenazine, benztropine, haloperidol, imipramine, mesoridazine, nortriptyline, orphenadrine, piperacetazine, thiothixene, trihexyphenidyl
Interfering: carphenazine, triflupromazine

SAMPLE
Matrix: blood
Sample preparation: Plasma. 1-5 mL Plasma + 1 mL 1 M NaOH, extract with mixed hexanes for 30 min, centrifuge. Remove a 9 mL aliquot of the hexane layer and evaporate it to dryness under a stream of nitrogen at 30°, dissolve residue in 100 μL mobile phase, inject a 50 μL aliquot. Whole blood. 10 mL Whole blood + 1 mL 1 M NaOH, extract with 15 mL mixed hexanes for 1 h. Remove an aliquot of the hexane layer and evaporate it to dryness, reconstitute the residue in 1 mL 100 mM HCl, extract with 5 mL chloroform by vortexing for 1 min, centrifuge. Remove a 4.5 mL aliquot of the chloroform layer, evaporate to dryness, dissolve in 10 μL mobile phase, inject an aliquot.

HPLC VARIABLES
Column: 10 μm Micropak CN
Mobile phase: MeCN:5 mM ammonium acetate 90:10 (vary ammonium acetate concentration to achieve best separation)
Flow rate: 2.5
Injection volume: 10-50
Detector: UV 254 or E, Bioanalytical Systems LC-4A, glassy carbon electrode +0.9 V, Ag/AgCl reference electrode

CHROMATOGRAM
Retention time: 17.0
Limit of detection: 0.1 ng/mL (E), 10 ng/mL (UV)

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 µm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 255

CHROMATOGRAM
Retention time: 8.35
Limit of detection: <120 ng/mL

SAMPLE

Matrix: blood, CSF

Sample preparation: 200 μL Serum, plasma, or CSF + 300 μL reagent. Flush column A to waste with 500 μL 500 mM ammonium sulfate, inject sample onto column A, flush column A to waste with 500 μL 500 mM ammonium sulfate, elute the contents of column A onto column B with mobile phase, monitor the effluent from column B. (Reagent was 8.05 M guanidine hydrochloride and 1.02 M ammonium sulfate in water.)

HPLC VARIABLES

Column: A 30 × 2.1 40 μm preparative grade C18 (Analytichem); B 250 × 4.6 10 μm Partisil C8

Mobile phase: Gradient. A was 50 mM pH 4.5 KH_2PO_4. B was MeCN:isopropanol 80:20. A:B 90:10 for 1 min, to 30:70 over 15 min, maintain at 30:70 for 4 min.

Column temperature: 50

Flow rate: 1.5

Detector: UV 280 for 5 min then UV 254

CHROMATOGRAM

Retention time: 7.53

Internal standard: heptanophenone (19.2)

OTHER SUBSTANCES

Extracted: acetazolamide, ampicillin, bromazepam, caffeine, carbamazepine, chloramphenicol, chlorothiazide, diazepam, droperidol, ethionamide, furosemide, isoniazid, methadone, penicillin G, phenobarbital, phenytoin, prazepam, propoxyphene, pyrazinamide, rifampin, trimethoprim

KEY WORDS

plasma; serum; column-switching

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30
Detector: UV 253.5

Molecular formula: $C_{21}H_{28}N_2O_5$
Molecular weight: 388.46
CAS Registry No.: 138-56-7, 554-92-7 (HCl)
Merck Index: 9839
Lednicer No.: 1 110

SAMPLE
Matrix: blood
Sample preparation: 2 mL Serum or plasma + 100 μL 10 μg/mL trimethobenzamide in MeOH + 1 mL buffer + 10 mL n-butyl chloride:isopropanol 95:5, shake for 10 min, centrifuge at 500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of air at 40°, reconstitute the residue in 200 μL chloroform and 200 μL 25 mM HCl, vortex for 10 s, centrifuge at 500 g for 3-5 min, inject a 50-60 μL aliquot of the upper aqueous layer. (Buffer was 630 mL of a solution containing 1 M boric acid and 1 M KCl + 370 mL 1 M sodium carbonate, adjust pH to 9.0.)

HPLC VARIABLES
Column: 250 × 4.6 5 μm cyanopropyldimethylsilyl (PCN) (Supelco)
Mobile phase: MeCN:0.06% phosphoric acid 15:85 containing 0.01% octylamine (After analysis wash out system with MeCN:water 20:80.)
Flow rate: 2
Injection volume: 50-60
Detector: UV 254

CHROMATOGRAM
Retention time: 5.5
Internal standard: trimethobenzamide

OTHER SUBSTANCES
Extracted: encainide
Simultaneous: dipyridamole, oxazepam
Noninterfering: amiodarone, caffeine, chloral hydrate, chlordiazepoxide, diazepam, ethosuximide, flecainide, lidocaine, methadone, mexiletine, nicotine, phenobarbital, phenytoin, primidone, procainamide, propranolol, quinidine, tocainide, tricyclic antidepressants

KEY WORDS
plasma; serum; trimethobenzamide is IS

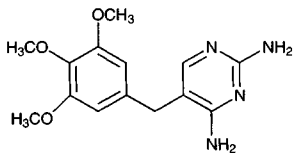
Trimethoprim



Molecular formula: $C_{14}H_{18}N_4O_3$
Molecular weight: 290.32
CAS Registry No.: 738-70-5
Merck Index: 9840
Lednicer No.: 1 262

SAMPLE

Matrix: blood
Sample preparation: Add 1.5 mL MeCN to 500 µL serum, centrifuge, evaporate the supernatant to dryness, redissolve the residue in 200 µL water. Inject onto column A, wash with MeCN:water 10:90 or MeOH:water 20:80 for 20 min, backflush the contents of column A onto column B with mobile phase, elute with mobile phase, monitor the effluent from column B.

HPLC VARIABLES

Column: A 25 × 4 25 µm pore diameter 6 nm LiChrospher RP-18 ADS (Merck); B 125 × 4 5 µm endcapped LiChroCART HPLC-cartridge RP-18 (Merck)
Mobile phase: MeOH:20 mM pH 4 phosphate buffer 38:62
Column temperature: 40
Flow rate: 1
Injection volume: 200
Detector: UV 245, F ex 270 em 389

CHROMATOGRAM

Retention time: 1.9

OTHER SUBSTANCES

Extracted: triamterene

KEY WORDS

serum; column-switching

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 205.2

CHROMATOGRAM
Retention time: 8.282

SAMPLE

Matrix: blood, feces, urine
Sample preparation: Plasma. Condition a SPICE ODS SPE cartridge (Analtech) with 7.5 mL MeOH and 7.5 mL buffer. 1 mL Plasma + 1 mL buffer, add to SPE cartridge, wash with two 2.5 mL portions of buffer, dry under vacuum, elute with two 2.5 mL portions of MeOH:triethylamine 99:1. Evaporate the eluate to dryness under reduced pressure, reconstitute with 1 mL mobile phase, inject a 200 μL aliquot. Feces. Condition a SPICE ODS SPE cartridge (Analtech) with 7.5 mL MeOH and 7.5 mL water. Add dithiothreitol to feces (final concentration 1 mM), add an equal volume of water, add to SPE cartridge, wash with two 2.5 mL portions of MeOH:water 12.5:87.5, dry under vacuum, elute with two 2.5 mL portions of MeOH:triethylamine 99:1. Evaporate the eluate to dryness under reduced pressure, reconstitute with 1 mL mobile phase, add dithiothreitol (final concentration 1 mM), inject a 200 μL aliquot. Urine. Dilute 1:10 to 1:100 with 15 μM IS in mobile phase, inject an aliquot. (Buffer was 1.5% acetic acid adjusted to pH 5.5 with ammonium hydroxide.)

HPLC VARIABLES
Guard column: 5 μm ODS (Brownlee)
Column: 250 × 4.6 5 μm Ultrasphere ODS
Mobile phase: MeCN:50 mM NaH_2PO_4:acetic acid 17:82.2:0.8 adjusted to pH 5.5 with triethylamine
Column temperature: 20
Flow rate: 1
Injection volume: 200
Detector: E, Bioanalytical Systems LC-4A, 0.6 V or UV 254

CHROMATOGRAM
Retention time: 40
Internal standard: N,N-diethyl-5,7-dimethoxytryptamine hydrogen oxalate (35)
Limit of quantitation: 20 nM (feces), 50 nM (plasma, urine)

SAMPLE
Matrix: blood
Sample preparation: 1 mL Serum + 200 μL 10 μg/mL protriptyline in water + 200 μL 80 g/L $NaHCO_3$ + 5 mL hexane, vortex for 15 s, centrifuge for 5 min. Remove the hexane layer and evaporate it in a stream of nitrogen at 60°. Reconstitute in 100 μL mobile phase, vortex for 15 s, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 300 × 4 10 μm μBondapak CN
Mobile phase: MeCN:MeOH:5 mM phosphate buffer 60:15:25, adjusted to pH 7.0
Flow rate: 2
Injection volume: 50
Detector: UV 254

CHROMATOGRAM
Retention time: 2.33
Internal standard: protriptyline (12.20)
Limit of detection: 6 ng/mL

OTHER SUBSTANCES
Extracted: imipramine, doxepin, amitriptyline, desmethyldoxepin, nortriptyline, desipramine, chlorpromazine, procainamide, thioridazine, propranolol, propoxyphene, disopyramide, maprotiline
Noninterfering: caffeine, theophylline, salicylic acid, chlordiazepoxide, methaqualone, diazepam, acetaminophen
Interfering: trifluoperazine

KEY WORDS
serum

SAMPLE
Matrix: blood
Sample preparation: Evaporate 200 μL 1 μg/mL clomipramine in MeOH into a tube, add 2 mL plasma, add 2 mL pH 10 Titrisol buffer (Merck), add 8 mL diethyl ether, shake for 15 min, centrifuge at 2800 g for 5 min. Remove the organic phase and shake it with 100 μL 50 mM phosphoric acid for 15 min, centrifuge at 2800 g for 10 s. Remove the aqueous layer and vortex it with 2 mL diethyl ether for 10 s, centrifuge at 2800 g. Discard the organic layer and inject a 10-50 μL aliquot of the aqueous layer.

HPLC VARIABLES
Column: 300 × 3.9 10 μm μBondapak C18
Mobile phase: MeCN:25 mM KH_2PO_4:water 45:50:5
Flow rate: 1
Injection volume: 10-50
Detector: UV 254

CHROMATOGRAM
Retention time: 10.10
Internal standard: clomipramine (13)
Limit of detection: 4-5 ng/mL

OTHER SUBSTANCES
Extracted: imipramine, desipramine
Noninterfering: norclobazam, triazolam, monodesmethyltrimipramine, flunitrazepam, alimemazine, alprazolam, amineptine, caffeine, carbamazepine, citalopram, desmethylflunitrazepam, diazepam, dibenzepine, estazolam, ethyl loflazepate, indalpine, loprazolam, lorazepam, meprobamate, nitrazepam, nordiazepam, nortriptyline, oxazepam, viloxazine

Interfering: amitriptyline, clobazam, levomepromazine

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: Condition a Bond Elut C-18 SPE cartridge twice with MeOH and twice with water. 500 μL Serum + 50 μL 1 μg/mL N-propionylprocainamide in 2.5 mM HCl, add to SPE cartridge, wash with 2 volumes water, wash with 2 volumes 0.1 M acetic acid, wash with 1 volume MeOH:2.5 mM HCl 10:90. Add 200 μL 10 mM acetic acid and 5 mM diethylamine in MeOH to column, let stand 1 min, elute under vacuum, repeat, evaporate eluents to dryness under nitrogen at room temperature, reconstitute in 100 μL mobile phase, inject a 40 μL aliquot.

HPLC VARIABLES
Guard column: Pelliguard LC-CN (Supelco)
Column: 150 × 4.6 5 μm Supelcosil LC-PCN
Mobile phase: MeCN:MeOH:10 mM pH 7.0 phosphate buffer 58:14:28
Flow rate: 1.2
Injection volume: 40
Detector: UV 254

CHROMATOGRAM
Retention time: 6.9
Internal standard: N-propionylprocainamide (6)
Limit of quantitation: 25 ng/mL

OTHER SUBSTANCES
Extracted: amitriptyline, desipramine, doxepin, imipramine, nortriptyline, protriptyline
Simultaneous: atropine, butalbital, chlorpromazine, maprotiline, methadone, norpropoxyphene, phenylpropanolamine, prochlorperazine, promethazine, propranolol, quinidine, trifluoperazine, trimeprazine
Noninterfering: acetaminophen, allopurinol, amikacin, amoxapine, amytal, bretylium, caffeine, carbamazepine, carisoprodol, chloramphenicol, chlordiazepoxide, chlorpropamide, clonazepam, codeine, diazepam, disopyramide, droperidol, ethinamate, ethinamate, ethosuximide, fluphenazine, flurazepam, furosemide, gentamicin, haloperidol, hydrochlorothiazide, hydroxyzine, ibuprofen, kanamycin, lidocaine, loxapine, meperidine, mephobarbital, meprobamate, methaqualone, methotrexate, morphine, nafcillin, naloxone, neomycin, perphenazine, phenacetin, phenobarbital, phenytoin, prazepam, primidone, procaine, propoxyphene, reserpine, salicylamide, salicylic acid, secobarbital, spironolactone, theophylline, thiopental, thioridazine, tobramycin, valproic acid, verapamil
Interfering: hydroxyamitriptyline, procainamide

SAMPLE

Matrix: blood

Sample preparation: Automated SPE by ASPEC system. Condition a C18 Clean-Up SPE cartridge (CEC 18111, Worldwide Monitoring) with 2 mL MeOH then 2 mL water. 1 mL Plasma + 1 mL 400 ng/mL protriptyline in water, vortex, add to column, wash with 3 mL water, wash with 3 mL 750 mL/L methanol. Elute with three aliquots of 300 μL 0.1 M ammonium acetate in MeOH. Add 0.5 mL 0.5 M NaOH and 4 mL 50 mL/L isopropanol in heptane to eluate, mix thoroughly. Allow 5 min for phase separation. Remove upper heptane phase and add it to 300 μL 0.1 M phosphoric acid (pH 2.5), mix, separate, inject a 100 μL aliquot of the aqueous phase.

HPLC VARIABLES

Guard column: LC-8-DB (Supelco)
Column: 150 × 4.6 LC-8-DB (Supelco)
Mobile phase: MeCN:buffer 35:65 (Buffer was 10 mL/L triethylamine in water adjusted to pH 5.5 with glacial acetic acid.)
Flow rate: 2
Injection volume: 100
Detector: UV 228

CHROMATOGRAM

Retention time: 5.9
Internal standard: protriptyline (4)

OTHER SUBSTANCES

Extracted: chlordiazepoxide, chlorimipramine, chlorpromazine, desipramine, dextromethorphan, diazepam, diphenhydramine, doxepin, encainide, fentanyl, flecainide, fluoxetine, flurazepam, haloperidol, hydroxyethylflurazepam, ibuprofen, imipramine, lidocaine, maprotiline, methadone, methaqualone, mexiletine, midazolam, norchlorimipramine, nordiazepam, nordoxepin, norfluoxetine, nortriptyline, norverapamil, pentazocine, promazine, propafenone, propoxyphene, propranolol, protriptyline, quinidine, temazepam, trazodone, verapamil

Noninterfering: acetaminophen, acetylmorphine, amiodarone, amobarbital, amphetamine, bendroflumethiazide, benzocaine, benzoylecgonine, benzthiazide, butalbital, carbamazepine, chlorothiazide, clonazepam, cocaine, codeine, cotinine, cyclosporine, cyclothiazide, desalkylflurazepam, diamorphine, dicumerol, ephedrine, ethacrynic acid, ethanol, ethchlorvynol, ethosuximide, furosemide, glutethimide, hydrochlorothiazide, hydrocodone, hydroflumethiazide, hydromorphone, lorazepam, mephentermine, meprobamate, methamphetamine, metharbital, methoxsalen, methoxyphenteramine, methsuximide, methylcyclothiazide, metoprolol, MHPG, monoacetylmorphine, morphine, normethsuximide, oxazepam, oxycodone, oxymorphone, pentobarbital, phencyclidine, phenteramine, phenylephrine, phenytoin, polythiazide, primidone, prochlorperazine, salicylic acid, sulfanilamide, THC-COOH, theophylline, thiazolam, thiopental, thioridazine, tocainide, trichloromethiazide, trifluoperazine, valproic acid, warfarin

Interfering: acetazolamide, amitriptyline

Constanzer,M.; Chavez,C.; Matuszewski,B. Development and comparison of high-performance liquid chromatographic methods with tandem mass spectrometric and ultraviolet absorbance detection for the determination of cyclobenzaprine in human plasma and urine, *J.Chromatogr.B*, **1995**, *666*, 117–126.

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 1 mL Plasma + 100 μL MeOH + 1 mL 200 mM pH 9.8 carbonate buffer + 5 mL hexane, rotate for 15 min, centrifuge at 3000 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 300 μL mobile phase, inject a 150 μL aliquot. Urine. 1 mL Urine + 1 mL β-glucuronidase (7200 Fishman Units) in 20 mM pH 6.5 phosphate buffer, heat at 37° for 24 h, add 100 μL 10 M NaOH, add 5 mL hexane, rotate for 15 min, centrifuge at 3000 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 50°, reconstitute the residue in 300 μL mobile phase, inject a 150 μL aliquot.

HPLC VARIABLES
Guard column: 20 mm long C18 base-deactivated silica (BDS) (Keystone)
Column: 250 × 4.6 5 μm C18 base-deactivated silica (BDS) (Keystone)
Mobile phase: MeCN:buffer 50:50 (plasma) or 43:57 (urine) (Buffer was 0.085% phosphoric acid adjusted to pH 6.5 with triethylamine.)
Flow rate: 1
Injection volume: 150
Detector: UV 229

CHROMATOGRAM
Retention time: 10.5 (plasma), 12.8 (urine)
Internal standard: trimipramine

OTHER SUBSTANCES
Extracted: cyclobenzaprine

KEY WORDS
plasma; trimipramine is IS

REFERENCE
Constanzer,M.; Chavez,C.; Matuszewski,B. Development and comparison of high-performance liquid chromatographic methods with tandem mass spectrometric and ultraviolet absorbance detection for the determination of cyclobenzaprine in human plasma and urine, *J.Chromatogr.B*, **1995**, *666*, 117–126.

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 15.943

KEY WORDS
whole blood

SAMPLE
Matrix: solutions
Sample preparation: Prepare a 10 μg/mL solution in MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 125 × 4.9 Spherisorb S5W silica
Mobile phase: MeOH containing 10 mM ammonium perchlorate and 1 mL/L 100 mM NaOH in MeOH, pH 6.7
Flow rate: 2
Injection volume: 20
Detector: E, LeCarbone, V25 glassy carbon electrode, + 1.2 V

CHROMATOGRAM
Retention time: 3.2

OTHER SUBSTANCES
Also analyzed: acebutolol, acepromazine, acetophenazine, N-acetylprocainamide, albuterol, alprenolol, amethocaine, amiodarone, amitriptyline, antazoline, atenolol, azacyclonal, bamethan, benactyzine, benperidol, benzethidine, benzocaine, benzoctamine, benzphetamine, benzquinamide, bromhexine, bromodiphenhydramine, bromperidol, brompheniramine, brompromazine, buclizine, bufotenine, bupivacaine, buprenorphine, butacaine, butethamate, chlorcyclizine, chlorpheniramine, chlorphenoxamine, chlorprenaline, chlorpromazine, chlorprothixene, cimetidine, cinchonidine, cinnarizine, clemastine, clomipramine, clonidine, cocaine, cyclazocine, cyclizine, cyclopentamine, cyproheptadine, deserpidine, desipramine, dextromoramide, dextropropoxyphene, dicyclomine, diethylcarbamazine, diethylpropion, diethylthiambutene, dihydroergotamine, dimethindene, dimethothiazine, diphenhydramine, diphenoxylate, dipipanone, diprenorphine, dipyridamole, disopyramide, dothiepin, doxapram, doxepin, doxylamine, droperidol, ephedrine, ergocornine, ergocristine, ergocristinine, ergocryptine, ergometrine, ergosine, ergosinine, ergotamine, ethopropazine, etorphine, etoxeridine, fenethazine, fenfluramine, fenoterol, fentanyl, flavoxate, fluopromazine, flupenthixol, fluphenazine, flurazepam, haloperidol, hydroxyzine, hyoscine, ibogaine, imipramine, indapamine, iprindole, isothipendyl, isoxsuprine, ketanserin, laudanosine, lidocaine, lofepramine, loxapine, maprotiline, mecamylamine, meclophenoxate, meclozine, medazepam, mephentermine, mepivacaine, meptazinol, mepyramine, mesoridazine, metaraminol, methadone, methamphetamine, methapyrilene, methdilazene, methotrimeprazine, methoxamine, methoxyphenamine, methoxypromazine, methylephedrine, methylergonovine, methysergide, metoclopramide, metopimazine, metoprolol, mianserin, morazone, nadolol, nalorphine, naloxone, naphazoline, nicotine, nifedipine, nomifensine, nortriptyline, noscapine, orphenadrine, oxeladin, oxprenolol, oxymetazolin, papaverine, pargyline, pecazine, penbutolol, pentazocine, penthienate, pericyazine, perphenazine, phenadoxone, phenampromide, phenazocine, phenbutrazate, phendimetrazine, phenelzine, phenglutarimide, phenindamine, pheniramine, phenmetrazine, phenomorphan, phenoperidine, phenothiazine, phenoxybenzamine, phentolamine, phenylephrine, phenyltoloxamine, physostigmine, piminodine, pimozide, pindolol, pipamazine, pipazethate, piperacetazine, piperidolate, pipradol, pirenzepine, piritramide, pizotifen, practolol, pramoxine, prazosin, prenylamine, prilocaine, primaquine, proadifen, procainamide, procaine, prochlorperazine, procyclidine, proheptazine, prolintane, promazine, promethazine, pronethalol, properidine, propiomazine, propranolol, prothipendyl, protriptyline, proxymetacaine, pseudoephedrine, pyrimethamine, quin-

idine, quinine, ranitidine, rescinnamine, sotalol, tacrine, terazosin, terbutaline, terfenadine, thenyldiamine, theophylline, thiethylperazine, thiopropazate, thioproperazine, thioridazine, thiothixene, thonzylamine, timolol, tocainide, tolpropamine, tolycaine, tranylcypromine, trazodone, trifluoperazine, trifluperidol, trimeperidine, trimeprazine, trimethobenzamide, trimethoprim, tripelennamine, triprolidine, tryptamine, verapamil, xylometazoline

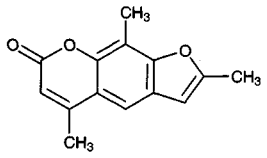
Trioxsalen



Molecular formula: $C_{14}H_{12}O_3$
Molecular weight: 228.25
CAS Registry No.: 3902-71-4
Merck Index: 9864
Lednicer No.: 1 334

SAMPLE
Matrix: aqueous humor, blood, tissue, vitreous humor
Sample preparation: Homogenize skin in 1 M pH 9.0 sodium borate buffer. 2 mL Whole blood, skin homogenate, aqueous humor, or vitreous humor + 5 mL 1 M pH 9.0 sodium borate buffer, mix, add 16 mL n-hexane:isopropanol 95:5, shake on a reciprocating shaker at 70-80 strokes/min for 30 min, centrifuge at 1020 g for 20 min. Remove 10 mL of the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 50 μL EtOH, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 300 × 4 Micropak MCH-10 reverse-phase
Mobile phase: Gradient. MeCN:water (not otherwise specified)
Flow rate: 2
Injection volume: 10
Detector: UV 254

SAMPLE

Matrix: solutions

Sample preparation: Dissolve in MeOH:water 1:1 at a concentration of 50 μg/mL, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 300 × 3.9 10 μm μBondapak C18

Mobile phase: MeOH:acetic acid:triethylamine:water 50:1.5:0.5:48

Flow rate: 1.5

Injection volume: 10

Detector: UV 254

CHROMATOGRAM

Retention time: 6

OTHER SUBSTANCES

Simultaneous: thonzylamine, pheniramine, chlorpheniramine, brompheniramine, phenindamine, phenyltoxamine, clemizole

SAMPLE

Matrix: solutions

Sample preparation: Prepare a 0.5 mg/mL solution in water, inject a 5 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 150 mM phosphoric acid and 50 mM triethylamine. B was MeCN: water 80:20 containing 150 mM phosphoric acid and 50 mM triethylamine. A:B 100:0 for 2.2 min then to 0:100 over 30 min.
Column temperature: 30
Flow rate: 2
Injection volume: 5
Detector: UV 210

CHROMATOGRAM

Retention time: 7.3

OTHER SUBSTANCES

Simultaneous: acetaminophen, aprobarbital, butabarbital, chlordiazepoxide, chloroxylenol, chlorpromazine, clenbuterol, cortisone, danazol, diflunisal, doxapram, estrone, fluoxymesterone, mefenamic acid, methyltestosterone, nicotine, oxazepam, phentermine, phenylpropanolamine, progesterone, sulfamethazine, sulfanilamide, testosterone, testosterone propionate
Interfering: tranylcypromine

KEY WORDS

details for purification of triethylamine in paper

REFERENCE

SAMPLE

Matrix: solutions

HPLC VARIABLES

Column: 250 × 4.6 Zorbax RX
Mobile phase: Gradient. A was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 1 L water. B was 10 mL concentrated orthophosphoric acid and 7 mL triethylamine in 200 mL water, make up to 1 L with MeCN. A:B from 100:0 to 0:100 over 30 min, maintain at 0:100 for 5 min.
Column temperature: 30
Flow rate: 2
Detector: UV 210

OTHER SUBSTANCES

Also analyzed: acepromazine, acetaminophen, acetophenazine, albuterol, aminophylline, amitriptyline, amobarbital, amoxapine, amphetamine, amylocaine, antipyrine, aprobarbital, aspirin, atenolol, atropine, avermectin, barbital, benzocaine, benzoic acid, benzotropine, benzphetamine, berberine, bibucaine, bromazepan, brompheniramine, buprenorphine, buspirone, butabarbital, butacaine, butethal, caffeine, carbamazepine, carbromal, chloramphenicol, chlordiazepoxide, chloroquine, chlorothiazide, chloroxylenol, chlorphenesin, chlorpheniramine, chlorpromazine, chlorpropamide, chlortetracycline, cimetidine, cinchonidine, cinchonine, clenbuterol, clonazepam, clonixin, clorazepate, cocaine, codeine, colchicine, cortisone, coumarin, cyclazocine, cyclobenzaprine, cyclothiazide, cyheptamide, cymarin, danazol, danthron, dapsone, debrisoquine, desipramine, dexamethasone, dextromethorphan, dextropropoxyphene, diamorphine, diazepam, diclofenac, diethylpropion, diethylstilbestrol, diflunisal, digitoxin, digoxin, diltiazem, diphenhydramine, diphenoxylate, diprenorphine, dipyrone, disulfiram, dopamine, doxapram, doxepin, dronabinol, ephedrine, epinephrine, epinine, estradiol, estriol, estrone, ethacrynic acid, ethosuximide, etonitazene, etorphine, eugenol, famotidine, fenbendazole, fencamfamine, fenoprofen, fenproporex, fentanyl, flubendazole, flufenamic acid, flunitrazepam, 5-fluorouracil, fluoxymesterone, fluphenazine, furosemide, gentisic acid, gitoxigenin, glipizide, glunixin, glutethimide, glybenclamide, guaiacol, halazepam, haloperidol, hydrochlorothiazide, hydrocodone, hydrocortisone, hydromorphone, hydroxyquinoline, ibogaine, ibuprofen, iminostilbene, imipramine, indomethacin, isocarbostyril, isocarboxazid, isoniazid, isoproterenol, isox-

suprine, ivermectin, ketamine, ketoprofen, kynurenic acid, levorphanol, lidocaine, lorazepam, lormetazepam, loxapine, mazindol, mebendazole, meclizine, meclofenamic acid, medazepam, mefenamic acid, megestrol, mepacrine, meperidine, mephentermine, mephenytoin, mephesin, mephobarbital, mepivacaine, mescaline, mesoridazine, methadone, methamphetamine, methapyrilene, methaqualone, methazolamide, methocarbamol, methoxamine, methsuximide, methyl salicylate, methyldopa, methyldopamine, methylphenidate, methylprednisolone, methyltestosterone, methyprylon, metoprolol, mibolerone, morphine, nadolol, nalorphine, naloxone, naltrexone, naphazoline, naproxen, nefopam, niacinamide, nicotine, niacin, nifedipine, niflumic acid, nitrazepam, norepinephrine, nortriptyline, noscapine, nylidrin, oxazepam, oxycodone, oxymorphone, oxyphenbutazone, oxytetracycline, papaverine, pargyline, pemoline, pentazocine, pentobarbital, persantine, phenacetin, phenazocine, phenazopyridine, phencyclidine, phendimetrazine, phenelzine, pheniramine, phenobarbital, phenothiazine, phensuximide, phentermine, phenylbutazone, phenylephrine, phenylpropanolamine, piperocaine, prazepam, prednisolone, primidone, probenecid, progesterone, propiomazine, propranolol, propylparaben, pseudoephedrine, puromycin, pyrilamine, pyrithyldione, quazepam, quinaldic acid, quinidine, quinine, ranitidine, recinnamine, reserpine, resorcinol, saccharin, albuterol, salicylamide, salicylic acid, scopolamine, scopoletin, secobarbital, strychnine, sulfacetamide, sufadiazine, sulfadimethoxine, sulfaethidole, sulfamerazine, sulfamethazine, sulfamethoxizole, sulfanilamide, sulfapyridine, sulfasoxizole, sulindac, tamoxifen, temazepam, testosterone, tetracaine, tetracycline, tetramisole, thebaine, theobromine, theophylline, thiabendazole, thiamine, thiamylal, thiobarbituric acid, thioridazine, thiosalicylic acid, thiothixene, thymol, tolazamide, tolazoline, tobutamide, tolmetin, tranylcypromine, triamcinolone, tribenzylamine, trichloromethiazide, trifluoperazine, trihexyphenidyl, triprolidine, tropacocaine, tyramine, verapamil, vincamine, warfarin, yohimbine, zoxazolamine

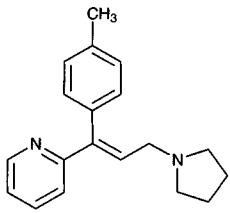
Triprolidine



Molecular formula: $C_{19}H_{22}N_2$
Molecular weight: 278.40
CAS Registry No.: 468-12-4, 6138-79-0 (HCl monohydrate), 550-70-9 (HCl)
Merck Index: 9877
Lednicer No.: 1 78

SAMPLE

Matrix: blood
Sample preparation: 1 mL Serum + 250 µL 10% KOH + 5 mL ether, vortex, centrifuge. Remove ether layer and add it to 100 µL 0.5% phosphoric acid, vortex, centrifuge, remove most of ether layer and discard it, remove traces of ether by nitrogen at room temperature for 2-3 min, inject all of aqueous layer.

HPLC VARIABLES

Column: Waters CN reverse-phase radial compression
Mobile phase: MeCN:buffer 27:73 (Buffer was 75 mM pH 3.0 phosphate buffer containing 20 mM dibutylamine and 50 ng/mL triprolidine.)
Flow rate: 1
Injection volume: 100
Detector: UV 229

CHROMATOGRAM

Retention time: 3.6
Internal standard: triprolidine

OTHER SUBSTANCES

Simultaneous: hydroxyzine

KEY WORDS

serum; triprolidine is IS

SAMPLE

Matrix: blood
Sample preparation: Condition a 200 mg Bond Elut C8 SPE cartridge with 4 mL MeOH and 4 mL 100 mM pH 5 ammonium acetate. 1 mL Plasma + 1 mL 100 mM HCl, add to the SPE cartridge, wash with 2 mL MeOH:water 30:70, elute with 4 mL MeOH:1 M HCl in MeOH 97:3. Evaporate the eluate to dryness under a stream of nitrogen with gentle heating, reconstitute the residue in 200 µL mobile phase, filter (0.45 µm), inject an aliquot.

HPLC VARIABLES
Guard column: 5 μm Spherisorb C18
Column: two 150 × 4.5 5 μm Econosphere C8 columns in series
Mobile phase: MeCN:buffer 22:78 (Buffer was 100 mM ammonium acetate containing 6 mM n-heptylamine, adjusted to pH 2.5 with perchloric acid).
Flow rate: 0.9
Detector: F ex 300 em 490

CHROMATOGRAM
Limit of quantitation: 3 ng/mL

OTHER SUBSTANCES
Extracted: metabolites (UV 290)

KEY WORDS
dog; plasma; SPE; pharmacokinetics

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 13.133

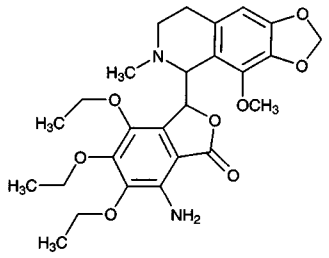
Tritoqualine



Molecular formula: $C_{26}H_{32}N_2O_8$
Molecular weight: 500.55
CAS Registry No.: 14504-73-5
Merck Index: 9894

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 214.6

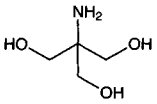
Tromethamine



Molecular formula: $C_4H_{11}NO_3$
Molecular weight: 121.14
CAS Registry No.: 77-86-1
Merck Index: 9902

SAMPLE
Matrix: amniotic fluid, blood, CSF, urine
Sample preparation: Plasma. Condition a 100 mg Bond Elut SCX (propylbenzenesulfonic acid, H^+ form) SPE cartridge with 1 mL 50 mM HCl, 1 mL MeOH, 2 mL water, and 1 mL 50 mM HCl. 100 μL Plasma + 100 μL 250 μM norleucine in 100 mM HCl + 10 mg solid sulfosalicylic acid + 800 μL acetone or MeOH, mix, centrifuge, add a 50 μL aliquot to the SPE cartridge, wash with 2 mL water, elute with two 500 μL portions of MeOH:water:triethylamine 40:40:20, dry the eluate under vacuum, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 20 min, evaporate to dryness under vacuum, reconstitute with 100 μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot. Dried blood. Add 25 μL 250 μM norleucine in 100 mM HCl to a 6 mm filter paper disc containing dried blood, add 100 μL MeCN, let stand for 30 min, centrifuge, remove a 75 μL aliquot of the supernatant, evaporate to dryness under reduced pressure, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 2 min, evaporate to dryness under vacuum, reconstitute with 50 μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot. Amniotic fluid, CSF. Mix amniotic fluid or CSF with an equal volume of 250 μM norleucine in 100 mM HCl, filter (Centrifree 10000 MW cutoff) while centrifuging at 2200 g. Evaporate a 50 μL aliquot of the ultrafiltrate to dryness under vacuum, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 20 min, evaporate to dryness under vacuum, reconstitute with 50 (CSF) or 100 (amniotic fluid) μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot. Urine. Dilute urine with water to a creatinine concentration of 1 mM, mix an aliquot with an equal volume of 250 μM norleucine in 100 mM HCl, filter (Centrifree 10000 MW cutoff) while centrifuging at 2200 g. Evaporate a

50 μL aliquot of the ultrafiltrate to dryness under vacuum, add 10 μL MeOH:1 M sodium acetate:triethylamine 40:40:20, dry under vacuum at 70 mTorr, reconstitute with 20 μL MeOH:triethylamine:water:phenylisothiocyanate 70:10:10:10, let stand at room temperature for 20 min, evaporate to dryness under vacuum, reconstitute with 100 μL MeCN:5 mM pH 7.4 sodium phosphate buffer 5:95, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 300 × 3.9 Pico-Tag amino acid column (Waters)
Mobile phase: Gradient. A was MeCN:70 mM pH 6.55 sodium acetate 2.5:97.5. B was MeCN:MeOH:water 45:15:40. A:B 100:0 for 13.5 min, to 97:3 (step gradient), to 94:6 over 10.5 min (Waters curve 8 (slightly concave)), to 91:9 over 6 min (Waters curve 5 (slightly convex)), to 66:34 over 20 min, maintain at 66:34 for 12 min, to 0:100 over 0.5 min, maintain at 0:100 for 4 min, return to initial conditions over 0.5 min.
Column temperature: 46
Flow rate: 1
Injection volume: 20
Detector: UV 254

CHROMATOGRAM
Retention time: 34.47
Internal standard: norleucine (55.07)

OTHER SUBSTANCES
Extracted: α-alanine, alanine, alloisoleucine, β-aminoadipic acid, 4-aminobenzoic acid, gamma-aminobutyric acid, β-amino-n-butyric acid, gamma-amino-n-butyric acid, 4-aminohippuric acid, β-aminoisobutyric acid, 4-aminophenylacetic acid, α-aminophenylacetic acid, 3-amino-3-phenylpropionic acid, δ-amino-n-valeric acid, ammonia, anserine, arginine, asparagine, aspartic acid, aspartylglucosamine, carnosine, citrulline, cystathionine, cysteic acid, cysteine, cysteine-homocysteine (mixed disulfide), cystine, ethanolamine, ethionine, ethylamine, galactosamine, glucosamine, glutamic acid, glutamine, glutathionine (oxidized), glycine, glycylglycine, glycylhistidine, glycylleucine, glycylphenylalanine, glycyltyrosine, histidine, homoarginine, homocitrulline, homoserine, homocystine, 3-hydroxyanthranilic acid, 3-hydroxykynurenine, hydroxyproline, isoleucine, kynurenine, leucine, levodopa, lysine, methionine sulfone, methionine, 3-methylhistidine, 1-methylhistidine, ornithine, phenylalanine, phosphoethanolamine, phosphoserine, proline, sarcosine, serine, serotonin, taurine, threonine, tryptophan, tyrosine, valine
Noninterfering: cadaverine, 2-phenylethylamine

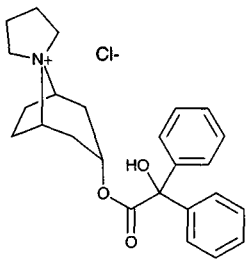
Trospium chloride



Molecular formula: $C_{25}H_{30}ClNO_3$
Molecular weight: 427.97
CAS Registry No.: 10405-02-4
Merck Index: 9918

SAMPLE

Matrix: blood, urine

Sample preparation: Plasma. 5 mL Plasma + 1 mL 1 M NaOH, heat at 140-145° for 105 min, cool to 40°, add 200 μL 25% HCl, mix, centrifuge at 5000 g for 10 min, heat at 120° for 10 min, cool, centrifuge. Remove a 5 mL aliquot and add it to 500 μL reagent 1, mix. Remove a 5 mL aliquot and add it to 4.8 mL chloroform, shake vigorously for 3 min, centrifuge at 6000 g for 30 min. Remove a 4 mL aliquot of the organic phase and add it to 2.3 mL 100 mM HCl, shake vigorously, centrifuge at 5000 g for 10 min. Remove a 2 mL aliquot of the aqueous layer and add it to 2 mL MeOH, evaporate to dryness under reduced pressure, add MeOH, evaporate to dryness under a stream of nitrogen at 80-90°, repeat process several times with 10-11 mL MeOH total, add 200 μL 10 mg/mL benoxaprofen chloride in dry MeCN, heat at 140-145° for 30 min, evaporate to dryness under reduced pressure, add 1 mL ethyl acetate, add 1.2 mL water, shake mechanically for 5 min, centrifuge at 5000 g for 10 min, discard the organic layer, wash the aqueous phase again with 1 mL ethyl acetate. Evaporate the aqueous phase to dryness under reduced pressure, reconstitute with 100 μL MeCN:water 31:69, inject a 20 μL aliquot. Urine. 5 mL Urine + 1 mL 1 M NaOH, heat at 140-145° for 90 min, cool, add 200 μL 25% HCl, add 600 μL reagent 2, shake, centrifuge at 5000 g for 10 min. Remove a 5 mL aliquot and add it to 4.8 mL chloroform, shake vigorously for 3 min, centrifuge at 6000 g for 30 min. Remove a 4 mL aliquot of the organic phase and add it to 2.3 mL 100 mM HCl, shake vigorously, centrifuge at 5000 g for 10 min. Remove a 2 mL aliquot of the aqueous layer and add it to 2 mL MeOH, evaporate to dryness under reduced pressure, add MeOH, evaporate to dryness under a stream of nitrogen at 80-90°, repeat process several times with 10-11 mL MeOH total, add 200 μL 10 mg/mL benoxaprofen chloride in dry MeCN, heat at 140-145° for 30 min, evaporate to dryness under reduced pressure, add 1 mL ethyl acetate, add 1.2 mL water, shake mechanically for 5 min, centrifuge at 5000 g for 10 min, discard the organic layer, wash the aqueous phase again with 1 mL ethyl acetate. Evaporate the aqueous phase to dryness under reduced pressure, reconstitute with 100 μL MeCN:water 40:60, inject a 20 μL aliquot. (Trospium chloride is hydrolyzed to nortropane-8-spiro-1'-pyrrolidinium chloride (which is also a metabolite) and this compound is derivatized with benoxaprofen chloride. Reagent 1 was a mixture of 98.7 mg dipicrylamine containing 50% water, 10 mL 100 mM NaOH, and 600 mg anhydrous sodium carbonate. Reagent 2 was a mixture of 32.9 mg dipicrylamine containing 50% water and 10 mL 100 mM NaOH. Prepare dipicrylamine as follows (Caution! Dipicrylamine is potentially explosive and highly toxic, store moistened with 50% water!). Add 50 g 2,4-dinitrodiphenylamine to 420 g nitric acid (36° Bé., 52%, d 1.33) heated to 62° over 2 h, heat at 62-90° for another 3 h, cool, filter, wash the product until it is free of acid, dry to obtain 2,2',4,4'-tetranitrodiphenylamine as a yellow solid (mp 187.4°). Add 50 g tetranitrodiphenylamine over 1 h to 500 g of a mixture of equal parts 92% sulfuric acid and 93% nitric acid at room temperature, after 4.5 h add to a large volume of ice water, filter, recrystallize the product from acetone to obtain dipicrylamine (2,2',4,4',6,6'-hexanitrodiphenylamine) as yellow crystals (mp 242.9°) (J.Am.Chem.Soc. 1919, 41, 1013). Prepare benoxaprofen chloride as follows. Dissolve 600 mg benoxaprofen in 50 mL dry toluene, slowly add 5 mL thionyl chloride (freshly distilled from linseed oil), reflux for 30 min, evaporate to dryness, recrystallize from dichloromethane (if necessary) to give benoxaprofen chloride (mp 91.5°) (J. Chromatogr. 1984, 310, 167).)

HPLC VARIABLES

Column: 125 × 4.6 5 μm Nucleosil C8 (plasma) or 125 × 4.6 5 μm LiChrosorb RP-8 (urine)
Mobile phase: MeCN:water 31:69 (plasma) or 40:60 (urine) containing 80 mM NaCl, 31 mM choline chloride, and 10 mL/L 1 M HCl
Column temperature: 55 (plasma), 50 (urine)
Flow rate: 2
Injection volume: 20
Detector: F ex 313 em 370

CHROMATOGRAM

SAMPLE
Matrix: blood
Sample preparation: 50 μL Serum + 10 μL water + 50 μL 10% sodium tungstate:335 mM sulfuric acid 50:50, vortex for 15 s, centrifuge at 12800 g for 2 min, inject a 30 μL aliquot of the supernatant.

HPLC VARIABLES
Guard column: 50 mm long C18
Column: 250 × 4.6 10 μm μBondapak C18
Mobile phase: MeOH:7.5 mM tetrabutylammonium hydrogen sulfate 10:90
Flow rate: 1.8
Injection volume: 30
Detector: UV 229

CHROMATOGRAM
Retention time: 10.0
Internal standard: d-tubocurarine chloride

OTHER SUBSTANCES
Extracted: gallamine
Noninterfering: barbiturates, alcuronium, metocurine, neostigmine, edrophonium

KEY WORDS
serum; rat; tubocurarine is IS

REFERENCE
Ramzan,I.M. Determination of the neuromuscular blocking drug gallamine in rat serum using high-performance liquid chromatography, *J.Chromatogr.*, **1987**, *417*, 428–433.

SAMPLE
Matrix: blood
Sample preparation: 250 μL Plasma + 250 μL picric acid (1:50 dilution of saturated picric acid solution) + 250 μL metocurine solution + 250 μL water + 2.5 mL dichloromethane:isopropanol 85:15, vortex for 15 s, centrifuge at 1500 g for 10 min. Remove the organic phase and evaporate it to dryness at 40° under a stream of nitrogen, reconstitute the residue in 150-250 μL MeCN: water 40:60, centrifuge at 1500 g for 4 min, inject a 20-100 μL aliquot.

HPLC VARIABLES
Column: 150 × 3.9 μPorasil
Mobile phase: MeCN:2 mM sulfuric acid 50:50
Flow rate: 2
Injection volume: 20-100

Detector: UV 210

CHROMATOGRAM
Retention time: 3.7
Internal standard: metocurine (5.3)
Limit of detection: 20 ng/mL

OTHER SUBSTANCES
Also analyzed: atracurium, alcuronium

KEY WORDS
plasma

SAMPLE
Matrix: blood
Sample preparation: 10 mL Blood + 1 mL 1 M pH 2.5 KH_2PO_4 + 1 mL 3% perchloric acid + 12 mL dichloromethane, rotate for 20 min, centrifuge at 1520 g for 15 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 200 μL mobile phase, inject an aliquot.

HPLC VARIABLES
Guard column: 25 mm long CN guard column
Column: 250 × 4.6 Spherisorb S5 CN
Mobile phase: MeCN:100 mM pH 5 phosphate 50:50
Column temperature: 40
Flow rate: 1.5
Detector: UV 214 or E, BAS LC-4B, LC-17A thin-layer flow cell, working glassy carbon electrode (W1) +0.65 V, quantitating glassy carbon electrode (W2) +1.05 V, Ag/AgCl reference electrode and auxiliary electrode

CHROMATOGRAM
Internal standard: d-tubocurarine

OTHER SUBSTANCES
Extracted: vecuronium
Noninterfering: atropine, apresoline, haloperidol, fentanyl, labetalol, thiopental, atracurium, diazepam

KEY WORDS
tubocurarine is IS

SAMPLE
Matrix: blood
Sample preparation: Condition a Bond-Elut CBA cation-exchange SPE cartridge with 3 mL MeOH, 3 mL water, 1 mL 50 mM pH 9.0 borate. Add 250 μL plasma to SPE cartridge, wash with 3 mL water, wash with 1 mL 50 mM pH 3.0 NaH_2PO_4, wash with 1 mL water, wash with two 500 μL portions of MeOH, elute with two 500 μL portions of acidified MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 45°, reconstitute the residue in 200 μL MeOH:MeCN:water 30:15:55 adjusted to pH 3.4 with 1 M phosphoric acid, inject a 70 μL aliquot. (Acidified MeOH was 833 μL HCl in 100 mL MeOH.)

HPLC VARIABLES
Column: 100 × 4.9 5 μm octyl Spherisorb
Mobile phase: MeOH:MeCN:buffer 30:15:55 adjusted to pH 3.4 with 1 M phosphoric acid (Buffer was 10 mM sodium octanesulfonate and 1.5 mM dibutylamine.)
Flow rate: 2.5
Injection volume: 70
Detector: UV 272

CHROMATOGRAM
Retention time: 5
Internal standard: D-tubocurarine

OTHER SUBSTANCES
Extracted: bretylium

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a 100 mg Bond Elut SPE cartridge with 2 mL water and 1 mL MeOH. Add 1 mL plasma or 10 mL urine to the SPE cartridge, wash with 2 mL water, wash with 1 mL MeCN:water 50:50, elute with 300 μL MeCN:buffer 50:50, inject an aliquot. (Buffer was 12 g NaH_2PO_4 and 1.2 mL concentrated phosphoric acid in 100 mL water.)

HPLC VARIABLES
Column: 250 × 4.6 10 μm C18 (Waters)
Mobile phase: MeOH:buffer 80:20 (Buffer was 1.44 g sodium lauryl sulfate and 2.5 mL glacial acetic acid in 1 L water.)
Flow rate: 1.4
Detector: UV 280

CHROMATOGRAM
Retention time: 7.2
Internal standard: d-tubocurarine

OTHER SUBSTANCES
Extracted: alcuronium

KEY WORDS
SPE; tubocurarine is IS; plasma

REFERENCE
deBros,F.; Okutani,R.; Inada,E.; Lawrence,K. Determination of alcuronium in plasma and urine by high-performance liquid chromatography, *J.Chromatogr.*, **1990**, *529*, 449–454.

SAMPLE
Matrix: urine
Sample preparation: Condition a 100 mg silica gel SPE cartridge (Analytichem) with 2 mL ethyl acetate, 2 mL MeOH, and 2 mL water. Lyophilize 40 mL urine, reconstitute with 10 mL 100 mM pH 5.0 acetate buffer, centrifuge at 5000 g for 15 min. If desired, incubate a 3 mL aliquot with 10 μL of a solution containing 500 U/μL glucuronidase and 26.4 U/μL sulfatase (Sigma), heat at 37° overnight, freeze. Lyophilize 3 mL aliquots of hydrolyzed or unhydrolyzed solutions, reconstitute with 2 mL water, add 10 μL 2.8 mg/mL D-chondocurarine in water. Remove a 200 μL aliquot and add it to the SPE cartridge, wash with 2 mL water, wash with 500 μL MeOH, elute with two 1 mL portions of mobile phase, inject an aliquot of the eluate.

Alternatively add 10 μL 60 ng/mL D-chondocurarine in water to 1 mL urine, add this mixture to the SPE cartridge and proceed as above.

HPLC VARIABLES

Guard column: 20 × 4.6 10 μm C18 (Rainin)
Column: 150 × 4.6 5 μm ODS-IP (Beckman)
Mobile phase: MeOH:water:dibutylamine phosphate solution 19.8:79.1:0.1, adjust pH to 2.5 with 1 M NaOH (Prepare dibutylamine phosphate solution by cautiously adding 32 g dibutylamine to 250 mL concentrated orthophosphoric acid.)
Flow rate: 1.5
Injection volume: 200
Detector: UV 204

CHROMATOGRAM

Retention time: 7.5
Internal standard: D-chondocurarine (10)
Limit of detection: 15 ng/mL

KEY WORDS

SPE

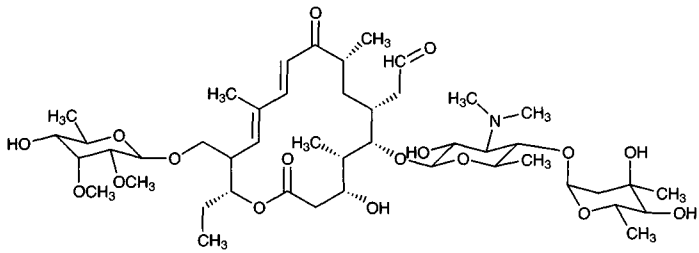
Tylosin

Molecular formula: $C_{46}H_{77}NO_{17}$
Molecular weight: 916.11
CAS Registry No.: 1401-69-0
Merck Index: 9963



SAMPLE

Matrix: blood, tissue
Sample preparation: Blend 25 g tissue with 3 volumes of water (muscle) or 200 mM pH 2.2 phosphate buffer (liver, kidney). Add 32 (tissue) or 30 (serum) mL MeCN slowly with vigorous swirling to 8 mL tissue homogenate or 10 mL serum, let stand for 1 min, decant through a glass wool plug. 20 mL Filtrate + 20 mL water + 30 mL dichloromethane, shake vigorously, repeat extraction. Combine the organic layers and evaporate them to near dryness under reduced pressure at 40-50°, reconstitute the residue in two 3 mL portions of MeOH and transfer to a small tube. Evaporate to dryness under reduced pressure, reconstitute with 1 mL MeCN and 1 drop of water, add 3 mL petroleum ether (bp 30-60°), vortex for 10 s, discard petroleum ether layer, repeat wash, remove traces of petroleum ether under reduced pressure, adjust volume to 0.2-1 mL with MeCN, inject an aliquot.

HPLC VARIABLES

Column: 300 × 4.6 10 μm Micropak MCH-10-N-Cap C18
Mobile phase: MeCN:MeOH:5 mM $(NH_4)H_2PO_4$ 60:30:10, 65:30:5, or 70:25:5 or MeCN:MeOH:4 mM $(NH_4)H_2PO_4$ 72:20:8 (tissue) or MeCN:MeOH:2 mM $(NH_4)H_2PO_4$ 75:20:5 or 75:18:7 (serum)
Flow rate: 1.5-2
Injection volume: 200
Detector: UV 280

CHROMATOGRAM

Limit of detection: <100 ppb

SAMPLE

Matrix: feed
Sample preparation: Mix 25 g feed with 100 mL MeOH:100 mM pH 4.0 phosphate buffer 50:50, shake for 1 h, centrifuge at 2500 rpm for 5 min, gently add several mL of the supernatant to the top of a dry column containing 3 mL acidic alumina (J.T. Baker), discard the first 2 mL and collect the next 2-4 mL, inject a 20 μL aliquot. (Prepare 100 mM pH 4.0 phosphate buffer as follows. Dissolve 16.73 g anhydrous K_2HPO_4 and 523 mg anhydrous KH_2PO_4 in water and dilute to 1L with water.)

HPLC VARIABLES

Guard column: 10 × 4.6 5 μm Econosphere C8
Column: 150 × 4.6 5 μm Econosphere C8
Mobile phase: Gradient. MeOH:buffer from 40:60 to 60:40 over 12 min, maintain at 60:40 until no other peaks elute (ca. 2 min), re-equilibrate at 40:60 for 5 min. (Prepare buffer as follows. Dissolve 5 g tetramethylammonium chloride in water, add 5 mL glacial acetic acid, make up to 1 L with water.)
Flow rate: 1.5
Injection volume: 20
Detector: UV 280

CHROMATOGRAM

Retention time: 7.4 (tylosin B), 9.3 (tylosin-urea adduct), 10.7 (tylosin A),
Limit of quantitation: 4 μg/g

Undecylenic acid

Molecular formula: $C_{11}H_{20}O_2$
Molecular weight: 184.28
CAS Registry No.: 112-38-9, 557-08-4 (Zn salt)
Merck Index: 9983

SAMPLE

Matrix: blood
Sample preparation: Perform all operations with the exclusion of light. Evaporate 240 μL derivatization solution into a vial, add 400 μL 50 mM pH 7.0 phosphate buffer, add 100 μL

Mobile phase: Gradient. A was dichloromethane:MeOH 90:10. B was hexane. A:B from 10:90 to 90:10 over 18 min, return to initial conditions over 2 min.
Flow rate: 1
Detector: UV 280

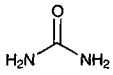
Urea



Molecular formula: CH_4N_2O
Molecular weight: 60.06
CAS Registry No.: 57-13-6
Merck Index: 10005

SAMPLE
Matrix: blood
Sample preparation: Dilute serum 200-fold with water. Add 50 μL 40 μg/mL uracil solution to 1 mL diluted serum, inject a 10 μL aliquot.

HPLC VARIABLES
Column: 150 × 6.0 5 μm Sumipax ODS C-212 (Sumika Chemical Analysis Service, Japan)
Mobile phase: MeOH:water 15:85
Flow rate: 1
Injection volume: 10
Detector: MS, Finnigan MAT Model TSQ 700, APCI source 250°, vaporizer 400°, discharge current 5 μA, m/z 61, 62 and 113

CHROMATOGRAM
Retention time: 3.0 (^{12}C-urea, ^{13}C-urea)
Internal standard: uracil (3.7)
Limit of quantitation: 200 μg/mL (^{12}C-urea), 2 μg/mL (^{13}C-urea)

KEY WORDS
serum

REFERENCE
Tanigawa,T.; Mizo-oku,Y.; Moriguchi,K.; Suzuki,T.; Osumi,T.; Odomi,M. Simple and rapid quantitative assay of 13C-labelled urea in human serum using liquid chromatography-atmospheric pressure chemical ionization mass spectrometry, *J.Chromatogr.B*, **1996**, *683*, 135–142.

SAMPLE
Matrix: blood
Sample preparation: Inject a 500 μL aliquot of serum ultrafiltrate onto a 50 × 4.6 column packed with immobilized urease, let stand at room temperature for 10-15 min, inject another 100 μL ultrafiltrate to force ultrafiltrate into the 10 μL sample loop, inject this aliquot. (Prepare the urease column by suspending 1 g Eupergit C (epoxyacrylic resin granules, Röhm Pharma, Weiterstadt, Germany) in 2.5 mL 4 mg/mL urease (EC 3.5.1.5, Type IV, Jack Beans, Sigma) in water, filter after 1 h (Analyst 1984, 109, 147), suspend in water, slurry pack in a 50 × 4.6 column. The enzyme converts serum urea to ammonium ions which are then detected by the HPLC system. Wash column with pH 7 phosphate buffer after use, store in the refrigerator.)

HPLC VARIABLES
Column: 250 × 4.6 Wescan cation-exchange (Bio-Rad)
Mobile phase: Dilute phosphoric acid, pH 2.28

SAMPLE
Matrix: blood, urine
Sample preparation: Dilute 100 (serum) or 1000 (urine) fold with water, filter (0.2 μm), adjust pH to 10-11 with KOH, add a 2 mL aliquot to the SPE column, discard the first 1.5 mL eluate, inject a 10 μL aliquot of the next eluate fraction. (Prepare the SPE column by adding 50-100 mesh Dowex 1-X2 strongly basic anion exchange resin to a Pasteur pipette (40 mm bed depth), add a few mL water to the column.)

HPLC VARIABLES
Guard column: 60 × 2 C18
Column: 150 × 3 5 μm Spherisorb ODS-2
Mobile phase: 50 mM pH 6.9 potassium phosphate buffer containing 5 mM sodium octylsulfonate
Flow rate: 0.5
Injection volume: 10
Detector: F ex 340 em 455 following post-column reaction. The column effluent passed through a 60 × 2 immobilized urease solid-phase reactor and then mixed with the reagent pumped at 0.5 mL/min. The mixture flowed through a coil of 0.2 mm i.d. PTFE tubing (volume 600 μL) to the detector. (Prepare reagent by dissolving 24.7 g boric acid in 1 L water, adjust pH to 10.2 with KOH, add 10 mL 80 mg/mL o-phthalaldehyde in EtOH, add 1 mL mercaptoethanol, store under nitrogen at 4°, stable for at least 1 week. Prepare the solid-phase reactor by treating 10 μm LiChrospher SI 500 with 3-aminopropyltriethoxysilane, couple urease (urea amidohydrolase EC 3.5.1.5, U-2000 (Sigma)) to the silica using 25% glutaraldehyde solution. Slurry the urease-silica in water and pack the reactor with 10 mM pH 6.9 potassium phosphate buffer at 110 bar for 15 min (J. Chromatogr. 1985, 325, 255). To maintain reactor performance flush system for 30 min with 50 mM pH 6.9 potassium phosphate buffer containing 5 mM EDTA every 2 weeks. Store reactor at 4° when not in use.)

SAMPLE

Matrix: bile, blood, feces, gastric contents, tissue
Sample preparation: Condition a Sep-Pak C18 cartridge with 2 mL 720 mM MeOH in water and 6 mL 100 mM pH 7.0 potassium phosphate buffer. Serum. 200 μL Serum + 1 mL MeCN, mix, sonicate for 10 min, centrifuge at 17000 g for 15 min. Remove a 600 μL aliquot of the supernatant and evaporate it to dryness under a stream of nitrogen at 75°, reconstitute with 5 mL 100 mM pH 7.0 potassium phosphate buffer. Add to the SPE cartridge at 0.5 mL/min, wash with 2 mL 40 mM MeOH in water, elute with 4 mL 720 mM MeOH in water, filter (0.45 μm), evaporate the filtrate to dryness, reconstitute with 50 μL 250 μM lauric acid in MeOH, add 50 μL 1.8 mM KOH in MeOH, evaporate to dryness under a stream of nitrogen at 75°, reconstitute with 100 μL 10 mM 4-bromomethyl-7-methoxycoumarin in MeCN containing 5 mM dicyclohexyl-18-crown-6, let stand at room temperature for 35 min, inject an aliquot. Liver. Homogenize (glass homogenizer) liver in 1 mL 720 mM EtOH in water, add 2 mL 720 mM EtOH in water, heat at 75° for 15 min, centrifuge at 17000 g for 10 min, remove the supernatant, extract the residue twice more. Combine the supernatants and evaporate them to dryness at 75°, reconstitute with 5 mL 100 mM pH 7.0 potassium phosphate buffer. Add to the SPE cartridge at 0.5 mL/min, wash with 2 mL 40 mM MeOH in water, elute with 4 mL 720 mM MeOH in water, filter (0.45 μm), evaporate the filtrate to dryness, reconstitute with 50 μL 250 μM lauric acid in MeOH, add 50 μL 1.8 mM KOH in MeOH, evaporate to dryness under a stream of nitrogen at 75°, reconstitute with 100 μL 10 mM 4-bromomethyl-7-methoxycoumarin in MeCN containing 5 mM dicyclohexyl-18-crown-6, let stand at room temperature for 35 min, inject an aliquot. Bile. Dilute 20 μL bile with 10 mL 100 mM pH 7.0 potassium phosphate buffer. Add 1 mL to the SPE cartridge at 0.5 mL/min, wash with 2 mL 40 mM MeOH in water, elute with 4 mL 720 mM MeOH in water, filter (0.45 μm), evaporate the filtrate to dryness, reconstitute with 50 μL 250 μM lauric acid in MeOH, add 50 μL 1.8 mM KOH in MeOH, evaporate to dryness under a stream of nitrogen at 75°, reconstitute with 100 μL 10 mM 4-bromomethyl-7-methoxycoumarin in MeCN containing 5 mM dicyclohexyl-18-crown-6, let stand at room temperature for 35 min, inject an aliquot. Gastric juice. Dilute 1 mL gastric juice with 9 mL 100 mM pH 7.0 potassium phosphate buffer, sonicate for 10 min. Add 1 mL to the SPE cartridge at 0.5 mL/min, wash with 2 mL 40 mM MeOH in water, elute with 4 mL 720 mM MeOH in water, filter (0.45 μm), evaporate the filtrate to dryness, reconstitute with 50 μL 250 μM lauric acid in MeOH, add 50 μL 1.8 mM KOH in MeOH, evaporate to dryness under a stream of nitrogen at 75°, reconstitute with 100 μL 10 mM 4-bromomethyl-7-methoxycoumarin in MeCN containing 5 mM dicyclohexyl-18-crown-6, let stand at room temperature for 35 min, inject an aliquot. Feces. Dilute 1 g feces with 9 mL MeOH, mix thoroughly, sonicate for 10 min, centrifuge at 17000 g for 10 min. Remove a 1 mL aliquot of the supernatant and evaporate it to dryness, reconstitute with 5 mL 100 mM pH 7.0 potassium phosphate buffer. Add to the SPE cartridge at 0.5 mL/min, wash with 2 mL 40 mM MeOH in water, elute with 4 mL 720 mM MeOH in water, filter (0.45 μm), evaporate the filtrate to dryness, recon-

stitute with 50 μL 250 μM lauric acid in MeOH, add 50 μL 1.8 mM KOH in MeOH, evaporate to dryness under a stream of nitrogen at 75°, reconstitute with 100 μL 10 mM 4-bromomethyl-7-methoxycoumarin in MeCN containing 5 mM dicyclohexyl-18-crown-6, let stand at room temperature for 35 min, inject an aliquot.

SAMPLE

Matrix: bile, formulations

Sample preparation: Bile. Condition a 200 mg Bond Elut C18 SPE cartridge with 5 mL MeOH and 5 mL water. Condition a 500 mg Bond Elut SAX SPE cartridge with 5 mL MeOH, 5 mL water, and 5 mL MeOH. 50 μL Bile + 5 mL 50 mM pH 7.5 phosphate buffer, vortex, add to the C18 SPE cartridge, wash with 5 mL MeOH:40 mM pH 4.3 acetate buffer 40:60, wash with 10 mL water, elute with 2 mL MeOH. Add the eluate to the SAX SPE cartridge, elute with 3.5 mL MeOH, collect all the effluent from the cartridge (J. Pharm. Biomed. Anal. 1990, 8, 235). Evaporate to dryness under a stream of nitrogen, reconstitute with 2 mL MeOH, sonicate at 40° for 3 min, filter (0.2 μm). Add a 500 μL aliquot of the filtrate to 50 μL 0.01% KOH in MeOH, evaporate to dryness, reconstitute with 200 μL MeOH:water 10:90, sonicate at 40° for 3 min, add 300 μL 20 mM tetrahexylammonium bromide in 100 mM pH 7.0 phosphate buffer, add 50 μL 2.1 mg/mL 2-bromoacetyl-6-methoxynaphthalene in acetone, sonicate at 40° for 10 min, add 50 μL 43.6 μg/mL IS in MeOH:water 75:25, add 300 μL MeCN, sonicate at room temperature for 1 min, inject a 50 μL aliquot. Formulations. Powder capsule contents, weigh out amount containing about 25 mg compound, add 100 mL MeOH (water for bile acid salts), stir for 10 min, filter, dilute the filtrate 10-fold with water (or MeOH:water 10:90 for bile acid salts). Evaporate 50 μL 0.01% KOH in MeOH in to a tube, add a 200 μL aliquot of the diluted filtrate, add 300 μL 20 mM tetrahexylammonium bromide in 100 mM pH 7.0 phosphate buffer, add 50 μL 2.1 mg/mL 2-bromoacetyl-6-methoxynaphthalene in acetone, sonicate at 40° for 10 min, add 50 μL 43.6 μg/mL IS in MeOH:water 75:25, add 300 μL MeCN, sonicate at room temperature for 1 min, inject a 50 μL aliquot. (Prepare 2-bromoacetyl-6-methoxynaphthalene by stirring equimolar amounts of 2-acetyl-6-methoxynaphthalene (Janssen Chimica, Belgium) and phenyltrimethylammonium tribromide in THF at room temperature for 3 h (Phosphorus and Sulfur 1985, 25, 357), purify by column chromatography on silica gel with chloroform: petroleum ether 50:50 (mp 109-112°) (Chromatographia 1992, 33, 13).)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Hypersil RP-18

Mobile phase: Gradient. For bile use MeCN:water 60:40 for 10 min, to 80:20 over 10 min, maintain at 80:20 for 25 min, return to initial conditions over 5 min. For formulations use isocratic MeCN:water 78:22.

Flow rate: 1

Injection volume: 50

Detector: F ex 300 em 460

CHROMATOGRAM

Retention time: 18 (gradient), 7 (isocratic)

Internal standard: 6-methoxynaphthacyl ester of valproic acid (23 (gradient), 10.5 (isocratic))

Limit of detection: 1-2 pmole

OTHER SUBSTANCES

Extracted: chenodiol, cholic acid, deoxycholic acid, glycochenodeoxycholic acid, glycocholic acid, glycolithocholic acid, glycoursodeoxycholic acid, lithocholic acid

SAMPLE
Matrix: blood
Sample preparation: Condition a BondElut SPE cartridge with 5 mL EtOH and 5 mL water. 100 μL Serum + 250 ng deoxycholic acid 12-propionate + 1 mL 500 mM pH 7.0 phosphate

buffer, mix, add to the SPE cartridge, wash with 2 mL water, wash with 1 mL 1.5% EtOH, elute with 2 mL 90% EtOH. Evaporate a 400 μL aliquot of the eluate, add 100 μL 2 mg/mL 1-anthroyl nitrile in MeCN, add 0.16% quinuclidine in MeCN, heat at 60° for 20 min, add 50 μL MeOH, evaporate under nitrogen. Dissolve the residue in 1 mL 90% EtOH, add to a 18 × 6 100 mg column of PHP-LH-20 Sephadex at 0.2 mL/min, wash with 1 mL 90% EtOH, elute with 5 mL 100 mM acetic acid in 90% EtOH (free bile acids), elute with 5 mL 200 mM formic acid in 90% EtOH (glycine-conjugated bile acids), elute with 5 mL 300 mM pH 6.3 acetic acid-potassium acetate in 90% EtOH (taurine-conjugated bile acids). Evaporate each fraction, dissolve the residue in 100-200 μL MeOH, inject a 5-10 μL aliquot. (Preparation of PHP-LH-20 Sephadex is as follows. Suspend 75.7 g Sephadex LH-20 in 200 mL dichloromethane using a glass stirring rod (not a magnetic stirrer) for 30 min, add 19 mL boron trifluoride ethyl etherate, after 15 min add 50 mL 35% epichlorohydrin in dichloromethane at 1-2 mL/min (Caution! Epichlorohydrin is a carcinogen!), stir for another 30 min, filter, wash with EtOH, dry chlorohydroxypropyl Sephadex LH-20 at 50° (J.Chromatogr. 1971, 59, 45). Stir 27.2 g chlorohydroxypropyl Sephadex LH-20 in 100.5 mL piperidine at room temperature for 30 min, add 5.74 g KOH in 302 mL MeOH, heat at 50-60° for 3 h with occasional shaking, filter, wash with EtOH:water 50:50, wash with 200 mM acetic acid in EtOH:water 70:30, wash with EtOH:water 90:10 until washings become neutral, store in EtOH:water 90:10 (Clin. Chim. Acta 1978 87 141). Prepare 1-anthroyl nitrile as follows. Dissolve 50 g benzanthrone in 500 mL concentrated sulfuric acid with gentle warming, pour this solution cautiously into 4 L hot water with vigorous stirring. Boil the suspension and slowly add 200 g chromium(VI) oxide (Caution! Chromium oxide is a carcinogen and highly corrosive!), after 6 h cool the mixture, filter, wash the precipitate with hot water. Dissolve the precipitate in dilute ammonia and precipitate with acid, crystallize from boiling concentrated nitric acid to give anthraquinone-1-carboxylic acid (Ber. 1924, 57, 1775). Warm, on a water bath, anthraquinone-1-carboxylic acid in dilute ammonia with twice the amount of zinc dust, when the reaction has ceased (30 min ?) filter the reaction the reaction mixture, add HCl to the filtrate to obtain anthracene-1-carboxylic acid as yellow needles, recrystallize from EtOH (mp 245°) (Ber 1897, 30, 1118). Stir 1 g anthracene-1-carboxylic acid in 15 mL anhydrous dichloromethane, add 2 mL oxalyl chloride, reflux for 1 h, evaporate to give 1-anthroyl chloride as an oily residue. Dissolve 1-anthroyl chloride in 15 mL dichloromethane, add 3 mL trimethylsilyl cyanide, add 1 mg zinc iodide, stir at room temperature for 2 h, evaporate to dryness, recrystallize from hexane/dichloromethane to give 1-anthroyl nitrile as orange-yellow needles (mp 164-5°) (Anal.Chim.Acta 1983, 147, 397).)

SAMPLE
Matrix: solutions
Sample preparation: Sample + 400 μL 5 mM DBD-PZ + 70 mM diethylphosphorocyanidate in MeCN, react for 6 h, inject a 1 μL aliquot. (Synthesis of 4-(N,N-dimethylaminosulfonyl)-7-N-piperazino-2,1,3-benzoxadiazole (DBD-PZ) is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene form EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10°

(use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 $60F_{254}$ tlc plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei (TCI America, Portland OR). Add 123 mg 4-(N,N-dimethylaminosulfonyl)-7-fluoro-2,1,3-benzoxadiazole in 20 mL MeCN dropwise to 129 mg piperazine in 20 mL MeCN at room temperature, stir for 30 min, evaporate under reduced pressure, dissolve residue in 50 mL 5% HCl, wash three times with 20 mL ethyl acetate, discard ethyl acetate extracts, adjust pH of aqueous solution to 13-14 with 5% NaOH, extract five times with 50 mL ethyl acetate, combine extracts, wash with 20 mL water, dry over anhydrous sodium sulfate, evaporate under vacuum to give 4-(N,N-dimethylaminosulfonyl)-7-N-piperazino-2,1,3-benzoxadiazole as orange crystals (mp 121-2°).)

Vasopressin

Molecular formula: $C_{46}H_{65}N_{15}O_{12}S_2$
Molecular weight: 1084.25
CAS Registry No.: 9034-50-8
Merck Index: 10073

SAMPLE

Matrix: blood
Sample preparation: Condition a 1 mL Analytichem weak cation-exchange (carboxymethylhydrogen form, CBA) SPE cartridge with 1 mL 1% trifluoroacetic acid in MeOH, 1 mL MeOH, and 2 mL water. Add 1 mL plasma to the SPE cartridge, rinse the tube with 1 mL water, add the rinse to the SPE cartridge, wash with 1 mL 1% trifluoroacetic acid in water, wash with 2 mL water, wash with 2 mL MeOH, elute with 2 mL 1% trifluoroacetic acid in MeOH. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue in 100 μL MeOH:buffer 50:50, inject a 5-75 μL aliquot. (Buffer was 5.7 g monochloroacetic acid, 2.0 g NaOH, and 0.2 g disodium EDTA in 1 L water, pH 3.2.) [Procedure was not necessarily validated for this compound.]

HPLC VARIABLES

Column: 250 × 2 5 μm Ultrasphere octyl
Mobile phase: Gradient. A was MeOH containing 10 mM sodium octanesulfonate. B was buffer containing 10 mM sodium octanesulfonate. A:B from 45:55 to 70:30 over 30 min, maintain at 70:30 for 1 h. (Buffer was 5.7 g monochloroacetic acid, 2.0 g NaOH, and 0.2 g disodium EDTA in 1 L water, pH 3.2.)
Column temperature: 60
Flow rate: 0.3
Injection volume: 5-75
Detector: F ex 390 em 470 following post-column reaction. The column effluent mixed with 400 mM NaOH pumped at 0.15 mL/min and 0.05% ninhydrin pumped at 0.05 mL/min and the mixture flowed through a 12 m × 0.33 mm i.d. reaction coil at 70° to the detector.

CHROMATOGRAM

Retention time: 17
Limit of detection: 100 fmole

OTHER SUBSTANCES

Extracted: adrenocorticotropin, angiotensin I, angiotensin II, angiotensin III, atrial natriuretic peptide, bombesin, bradykinin, gonadorelin (LHRH), somatoliberin

KEY WORDS

plasma; SPE; post-column reaction

SAMPLE

Matrix: blood
Sample preparation: Condition a 100 mg Bond Elut C8 SPE cartridge with 4 mL MeOH and 4 mL water, do not allow to run dry. Immediately after preparation add 12 μL 8 M acetic acid to each 1 mL of plasma. 1 mL Acidified plasma + 4 mL 100 mM HCl, add to the SPE cartridge, wash with 4 mL MeCN:0.1% trifluoroacetic acid 10:90, elute with 1.5 mL MeCN:0.1% trifluoroacetic acid 60:40. Evaporate the eluate to dryness under reduced pressure, reconstitute with 10 mM ammonium acetate containing 0.1% bovine serum albumin, inject a 500 μL aliquot (of pooled extracts).

HPLC VARIABLES

Column: 300 × 4 10 μm μBondapak C18

Mobile phase: Gradient. MeOH:10 mM pH 4.15 ammonium acetate from 15:85 to 55:45 over 40 (?) min
Flow rate: 1
Injection volume: 500
Detector: UV 210

CHROMATOGRAM
Retention time: 23

SAMPLE
Matrix: blood, tissue
Sample preparation: Condition a Sep-Pak ODS SPE cartridge with MeOH. Homogenize 500 mg tissue with 6 mL 100 mM pH 7.4 Tris buffer. Acidify a 2 mL aliquot of plasma or tissue homogenate with 200 μL 1 M HCl, add to the SPE cartridge, elute with 3 mL MeOH over 3 min, elute with 2 mL over 1 min. Evaporate the eluate to dryness under a stream of air at 37°, reconstitute the residue in 200 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 280 × 5 Dynamax 300-A C8 (Rainin)
Mobile phase: MeCN:water 20:80 containing 0.1% trifluoroacetic acid, 50 mM heptanesulfonic acid and 30 mM triethylamine, pH adjusted to 2.5 with Na_2HPO_4
Flow rate: 1
Injection volume: 20
Detector: UV 200-400

CHROMATOGRAM
Retention time: 6.89 (arginine vasopressin)
Limit of detection: 1 ng

OTHER SUBSTANCES
Extracted: lypressin, oxytocin

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 10 μm Kromasil (Alltech)
Mobile phase: MeCN:pH 7 phosphate buffer 20:80
Flow rate: 2
Detector: UV 254

CHROMATOGRAM
Retention time: 3 (8-arginine vasopressin)

OTHER SUBSTANCES
Simultaneous: oxytocin

REFERENCE
Supelco Catalog, **1993**, p. 525.

SAMPLE
Matrix: tissue
Sample preparation: Condition a Bond Elut C18 SPE cartridge with 3 mL water and 3 mL MeCN (in this order ?). Homogenize 400 mg brain tissue with 2 mL 100 mM HCl, add 20 μL 10 μM IS, add 2 mL acetone, mix, centrifuge at 2450 g for 15 min. Remove the supernatant and add it to 220 μL 1 M sodium bicarbonate and 500 μL 100 mM disodium EDTA, centrifuge at 2450 g for 15 min. Remove the supernatant and evaporate it to remove the acetone, dilute the aqueous residue with 2 mL water, add to the SPE cartridge. wash with 1 mL water, wash with 3 mL 100 mM HCl, wash with two 3 mL portions of dichloromethane, wash with 1 mL water, wash with 2 mL 100 mM pH 8.0 phosphate buffer, wash with 2 mL water, elute with 2 mL MeCN:100 mM pH 2.3 phosphate buffer 70:30. Evaporate the eluate under reduced pressure, make up to 400 μL with water, inject a 100 μL aliquot.

HPLC VARIABLES
Column: 200 × 4 5 μm TSKgel ODS-120T (Tosoh)
Mobile phase: Gradient. A was MeCN:300 mM pH 2.3 sodium phosphate buffer:water 1:20:79. B was MeCN:300 mM pH 2.3 sodium phosphate buffer:water 60:20:20. A:B from 90:10 to 55:45 over 33 min, maintain at 55:45 for 7 min, to 0:100 (step gradient), maintain at 0:100.
Flow rate: 1
Injection volume: 100
Detector: F ex 325 em 435 following post-column reaction. The column effluent mixed with 2 mM benzoin in 1.6 M KOH containing 700 mM 2-mercaptoethanol and this mixture flowed through a 15 m × 0.33 mm ID PTFE coil at 76 ± 1°. The effluent from this coil mixed with 500 mM Tris containing 2.1 M HCl pumped at 0.4 mL/min and this mixture flowed to the detector.

CHROMATOGRAM
Retention time: 19.1
Internal standard: [D-Phe^{11}]-neurotensin (40.0)
Limit of detection: 4.4 pmole

OTHER SUBSTANCES
Extracted: bradykinin, dynorphin 1-8, gonadorelin, kallidin, leucine enkephalin-Arg, methionine enkephalin-Arg-Gly-Leu, methionine enkephalin-Arg-Phe, α-neoendorphin, β-neoendorphin, neurotensin, substance P

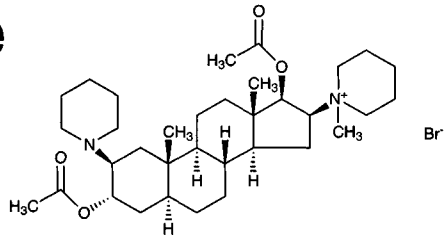
Vecuronium bromide

Molecular formula: $C_{34}H_{57}BrN_2O_4$
Molecular weight: 637.74
CAS Registry No.: 50700-72-6
Merck Index: 10075



SAMPLE
Matrix: bile, blood, perfusate, tissue, urine
Sample preparation: Condition a 1 mL Bond-Elut C18 SPE cartridge with 1 mL MeOH:MeCN 2:1 and 1 mL water. Acidify 1 mL plasma with 150 μL 1 M NaH_2PO_4. Homogenize liver, centrifuge. Dilute 1 μL urine or bile to 1 mL with 100 mM pH 3 NaH_2PO_4. Add 20-200 ng IS to 1 mL acidified plasma, liver homogenate supernatant, diluted urine, diluted bile, or liver perfusate, add to the SPE cartridge, wash with 1 mL water, wash with 1 mL 100 mM pH 3 NaH_2PO_4, elute with 400 μL mobile phase, discard first 100 μL eluate, inject a 200 μL aliquot of the remaining eluate.

HPLC VARIABLES
Column: 150 × 3.9 4 μm Nova-Pak C18
Mobile phase: Dioxane:water 20:80 containing 100 mM NaH_2PO_4 and 0.44 mM 9,10-dimethoxyanthracene-2-sulfonate, pH adjusted to 3 with phosphoric acid. (Caution! Dioxane is a carcinogen!) (After each series of analyses flush column with 200 mL MeOH then re-equilibrate with 120 mL mobile phase.)
Flow rate: 1
Injection volume: 200

Detector: F ex 380 em 452 following post-column extraction. The column effluent mixed with dichloroethane pumped at 1.6 mL/min and the mixture flowed through a 1 m × 0.25 mm i.d. stainless steel coil to a phase separator (Anal. Chim. Acta 1987, 192, 267) then the organic phase flowed through the detector.

CHROMATOGRAM
Retention time: 13
Internal standard: 1-(3α,17β-diacetoxy-2β-piperidino-5α-androstan-16β,5α-yl)piperidine(16)
Limit of detection: 5 ng/mL

KEY WORDS

SAMPLE
Matrix: cell culture media, microsomal incubations
Sample preparation: 250 µL Sample + 20 µL 50 µg/mL IS + 6 mL diethyl ether, vortex in shaker for 20 min, centrifuge at 4000 g for 20 min. Remove a 5 mL aliquot of the organic layer, add 250 µL 100 mM HCl, vortex in an overhead shaker for 20 min, centrifuge at 4000 g for 20 min, discard the organic phase, inject a 40 µL of the aqueous phase.

HPLC VARIABLES
Column: 150 × 8 4 µm Nucleosil 100-3 C8
Mobile phase: MeCN:MeOH:buffer 28:5:67, adjusted to pH 4.2 with 1 M HCl (Prepare the buffer by dissolving 0.71 g NaH_2PO_4 and 2 g 1-heptanesulfonic acid sodium salt in 1 L water.)
Column temperature: 51
Flow rate: 1.7

Injection volume: 40
Detector: F ex 280 em 310

CHROMATOGRAM
Retention time: 19
Internal standard: norverapamil (7)
Limit of quantitation: 200 nM

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
liver

REFERENCE

SAMPLE
Matrix: cells
Sample preparation: Add 20 μL 33% silver nitrate solution to a suspension of 2×10^6 cells, agitate for 10 s, sonicate for 20 min (Bransonic 52, Vel, Belgium), add 140 μL MeCN, vortex for 5 min, cool at 4° for 30 min, centrifuge at 10000 g for 30 s, add 200 μL 200 mM pH 3 phosphate buffer, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 7 μm Hibar LiChrocart RP 18 (Merck)
Mobile phase: MeCN:buffer 35:65 (Buffer was 200 mM KH_2PO_4 containing 0.2% triethylamine, adjusted to pH 3.0 with 200 mM orthophosphoric acid.)
Flow rate: 1
Injection volume: 50
Detector: UV 237

CHROMATOGRAM
Retention time: 12.4
Internal standard: altretamine (6.2)
Limit of detection: 8 pmol
Limit of quantitation: 27 pmol

OTHER SUBSTANCES
Extracted: daunorubicin, doxorubicin, vincristine, S 9788

KEY WORDS
human; cells; epidermoid carcinoma

SAMPLE
Matrix: hepatocyte cultures, microsomal incubations
Sample preparation: Add 20 μL 50 μg/mL IS and 6 mL diethyl ether to 250 μL hepatocyte culture or microsomal incubation, shake for 20 min, centrifuge at 4000 g for 20 min. Remove 5 mL of the organic phase and add it to 250 μL 100 mM HCl. Shake for 20 min and centrifuge at 4000 g for 20 min. Inject a 40 μL aliquot of the aqueous phase.

HPLC VARIABLES
Column: 150 × 8 4 μm Nucleosil 100-3 C8

Mobile phase: MeCN:MeOH:buffer 28:5:67, adjusted to pH 4.2 with 1 M HCl (Buffer was 710 mg sodium dihydrogen phosphate and 2.0 g 1-heptanesulfonic acid sodium salt in 1 L distilled water.)
Column temperature: 51
Flow rate: 1.7
Injection volume: 40
Detector: F ex 280 em 310

CHROMATOGRAM
Retention time: 18
Internal standard: D 600 (Knoll AG, Germany) (16.5)

OTHER SUBSTANCES
Extracted: metabolites

SAMPLE
Matrix: urine
Sample preparation: Condition a 7 mm/3 mL 3M Empore C8 SPE disc (Varian Associates, CA) with 500 μL MeOH and two 500 μL portions of water. Mix 500 μL urine, 50 μL 400 ng/mL IS in MeOH:water 50:50, and 500 μL 30 mM pH 10 phosphate buffer. Add to the SPE disc. Wash twice with 500 μL water, twice with 500 μL MeCN:water 30:70, elute with two 500 μL portions of MeOH, apply full vacuum for a few seconds. Evaporate to dryness at 60°. Reconstitute the residue in 250 μL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES
Guard column: NewGuard C18
Column: 250 × 4.6 10μm Chiralcel OD-R CSP
Mobile phase: MeCN:200 mM sodium perchlorate 40:60
Flow rate: 0.8
Injection volume: 100
Detector: F ex 230 em 312

CHROMATOGRAM
Retention time: 21.8 (R-), 24.2 (S-)
Internal standard: (+)-glaucine (16.5)
Limit of quantitation: 3 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

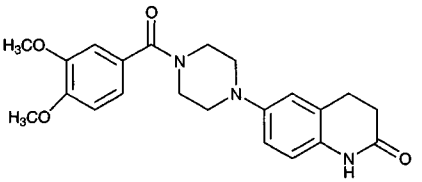
Vesnarinone



Molecular formula: $C_{22}H_{25}N_3O_4$
Molecular weight: 395.46
CAS Registry No.: 81840-15-5
Merck Index: 10105
Lednicer No.: 5 122

SAMPLE
Matrix: blood, microsomal incubations, urine
Sample preparation: Condition a 3 mL 200 mg UCT C18 (United Chemical Technologies, Bristol PA) SPE cartridge with 2 mL MeOH, 2 mL 10 mM ascorbic acid, and 2 mL 80 mM ammonium acetate solution. 500 μL Microsomal incubation + 500 μL MeOH, mix, centrifuge at 9500 g for 10 min. Add 100 μL supernatant from the microsomal incubation, 500 μL plasma, or 50 μL urine to 50 μL MeOH and 50 μL 1 μg/mL IS solution, vortex, add 1 mL 50 mM ammonium acetate, vortex for 30 s, centrifuge at 3000 rpm for 10 min. Add the mixture to the SPE cartridge, wash with 2 mL 50 mM ammonium acetate and 2 mL n-butyl chloride. Dry the cartridge under a light vacuum, elute with three 1 mL portions of MeOH:6 M acetic acid:10 mM ascorbic acid 95:2:3. Evaporate the eluate to dryness under a stream of nitrogen, reconstitute the residue with 500 μL mobile phase, inject an aliquot.

HPLC VARIABLES
Column: 45 × 4.6 5 μm Ultrasphere ODS
Mobile phase: Gradient. A was MeCN:0.1% acetic acid 2.5:97.5. B was MeCN:0.1% acetic acid 80:20. A:B from 100:0 to 0:100 over 7 min.
Detector: MS, PE Sciex API III, turbo ion spray interface in MS/MS mode, liquid nitrogen nebulizer auxiliary gas, ultrahigh purity nitrogen, argon curtain gas and collision gas

CHROMATOGRAM
Internal standard: OPC-8192 (Otsuka Pharmaceutical, Japan)
Limit of detection: 200 ng/mL (plasma), 500 ng/mL (urine)

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
plasma; SPE; pharmacokinetics

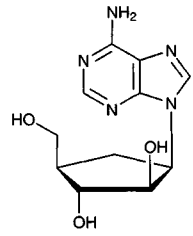
Vidarabine



Molecular formula: $C_{10}H_{13}N_5O_4$
Molecular weight: 267.24
CAS Registry No.: 5536-17-4, 24356-66-9 (monohydrate), 29984-33-6 (phosphate), 71002-10-3 (sodium phosphate)
Merck Index: 10113
Lednicer No.: 4 122

SAMPLE

Matrix: aqueous humor, blood, urine
Sample preparation: Plasma. Filter (Amicon CF25 or CF50A Centriflo membrane cones) plasma while centrifuging at 100 g for 1 h. 160 μL Ultrafiltrate + 20 μL 20 μg/mL IS in water + 20 μL 100 mM pH 6.3 sodium acetate buffer, mix, inject a 10 μL aliquot. Urine. Filter (Schleicher and Schüll paper No. 497) urine, dilute the filtrate with water, inject an aliquot. Aqueous humor. Inject directly.

HPLC VARIABLES

Column: 150 × 3.7 Aminex A-28 (equilibrate in 2 M sodium acetate for 24 h before use) (Bio-Rad)
Mobile phase: 7.5 mM pH 6.4 Sodium borate buffer containing 2.5 mM sodium acetate
Column temperature: 60
Flow rate: 0.5
Injection volume: 10
Detector: UV 254

CHROMATOGRAM

Retention time: 6.5
Internal standard: 8-aminoarabinosyladenine (9.0)

OTHER SUBSTANCES

Extracted: metabolites, adenosine, 9-β-D-arabinofuranosylhypoxanthine

KEY WORDS

plasma; ultrafiltrate

REFERENCE

SAMPLE
Matrix: blood, CSF, urine
Sample preparation: Add pentostatin to blood samples to prevent deamination. Dilute urine 1:10 with water. 200 μL Serum, CSF, or diluted urine + 20 μL isoamyl alcohol + 50 μL chloroform, vortex for 30 s, centrifuge at 20931 g for 10 min. Remove the aqueous layer and add it to 1 mL cold acetone (0°), vortex for 10 s, centrifuge for 5 min. Remove the supernatant and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue in 50 μL water, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm LiChrosorb RP-8
Mobile phase: MeCN:buffer 4:96 (Buffer was 5 mM sodium pentanesulfonate, pH 7.2.)
Column temperature: 40
Flow rate: 1
Detector: UV 250

CHROMATOGRAM
Retention time: 6.65
Limit of detection: 2.5 μg/mL (urine), 500 ng/mL (serum, CSF)

OTHER SUBSTANCES
Extracted: metabolites, pentostatin
Noninterfering: chlorothiazide, cytosine arabinoside, guanine arabinoside, hydroxyzine, kanamycin, metaproterenol, nystatin, penicillin G, phenobarbital, prednisone, sulfamethoxazole, theophylline, trimethoprim, uracil arabinoside

SAMPLE
Matrix: blood, urine
Sample preparation: Centrifuge plasma or urine at 1000 g at 4° for 10 min. Add 1 mL supernatant to 1 mL 12% trichloroacetic acid (in an ice bath), mix thoroughly, let stand for 15 min, centrifuge at 4° at 1000 g for 30 min. Remove the supernatant and extract it four times with water-saturated diethyl ether, discard the ether extracts. Remove traces of ether from the aqueous layer by heating it at 65° with intermittent suction, cool. Remove 500 μL of the aqueous layer and add it to 200 μL 40 mM chloroacetaldehyde in 28 mM pH 5.1 sodium acetate buffer. Heat at 80° for 40 min, cool, extract four times with 1 mL portions of water-saturated diethyl ether, discard the ether extracts. Heat the aqueous layer at 65° with intermittent suction to remove traces of ether, cool. Dilute urine preparation 1:9, do not dilute plasma preparations, inject a 50 μL aliquot.

HPLC VARIABLES
Guard column: 20 × 4 μBondapak C18/Corasil
Column: 250 × 4.6 Spherisorb S5 ODSII octadecyl
Mobile phase: Gradient. A was 20 mM sodium tetraborate decahydrate adjusted to pH 7.7 with 4.4 N phosphoric acid. B was MeOH:20 mM sodium tetraborate decahydrate adjusted to pH 7.7 with 4.4 N phosphoric acid 30:70. A:B from 100:0 to 0:100 over 15 min, maintain at 0:100 for 5 min, return to initial conditions, re-equilibrate for 5 min.
Flow rate: 1
Injection volume: 50
Detector: F ex 315 em 415

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 3 Partisil XS 10/25 C8
Mobile phase: MeCN:buffer 5:95 (Buffer was 800 mL 75 mM sodium borate and 200 mL 10 mM $(NH_4)H_2PO_4$, pH adjusted to 6.03 with boric acid.)
Flow rate: 1
Detector: UV 254

CHROMATOGRAM
Retention time: 20

OTHER SUBSTANCES
Simultaneous: metabolites, adenosine, 9-β-D-arabinofuranosylhypoxanthine, 2'-deoxyadenosine, 2'-deoxyinosine, inosine

REFERENCE

SAMPLE
Matrix: solutions
Sample preparation: Inject a 50 μL aliquot.

HPLC VARIABLES
Column: 250 × 4 5 μm Hypersil ODS
Mobile phase: MeOH:buffer 5:95 (Buffer was 50 mM pH 3.0 phosphate containing 0.4 mM sodium 1-heptanesulfonate.)
Column temperature: 40
Flow rate: 1
Injection volume: 50
Detector: UV 270

CHROMATOGRAM
Retention time: 9.4
Internal standard: vidarabine

OTHER SUBSTANCES
Simultaneous: cytarabine, uracil arabinoside
Noninterfering: allopurinol, cephalosporins, ciprofloxacin, diazepam, metoclopramide, mitoxantrone, ondansetron

KEY WORDS
vidarabine is IS

REFERENCE

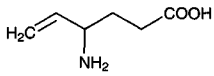
Vigabatrin



Molecular formula: $C_6H_{11}NO_2$
Molecular weight: 129.16
CAS Registry No.: 60643-86-9
Merck Index: 10114

SAMPLE

Matrix: blood
Sample preparation: 50 μL Serum + 50 μL 100 μg/mL in MeOH:water 10:90 + 1 mL MeOH, vortex, centrifuge at 200 g. Mix 2 volumes of supernatant with 1 volume of reagent, let stand for 1 min, inject a 10 μL aliquot. (Reagent was 10 mL 30 mg/mL o-phthaldialdehyde and 200 μL 2-mercaptoethanol made up to 50 mL with 400 mM pH 9.5 borate buffer.)

HPLC VARIABLES

Column: 150 × 4.6 5 μm Microsorb C18
Mobile phase: MeCN:MeOH:10 mM orthophosphoric acid 30:10:60
Flow rate: 2
Injection volume: 10
Detector: F ex 370 em 418-700 (filter)

CHROMATOGRAM

Retention time: 5.6
Internal standard: gamma-phenyl-gamma-aminobutyric acid (13.1)
Limit of detection: 80 ng/mL
Limit of quantitation: 540 ng/mL

OTHER SUBSTANCES

Noninterfering: carbamazepine, carbamazepine epoxide, ethosuximide, phenobarbital, phenytoin, primidone, valproic acid

KEY WORDS

serum; derivatization

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: 500 μL Serum + 500 μL IS solution + 1 mL MeCN, vortex for 5 min, centrifuge for 15 min. Mix 6 μL buffer, 6 μL reagent, and 6 μL supernatant, let stand for 1 min, inject the whole amount. (Prepare IS solution by dissolving 100 mg gamma-phenyl-gamma-aminobutyric acid and 10 mg 1-(aminomethyl)cycloheptane acetic acid in 500 mL MeCN and 500 mL water. Prepare buffer by dissolving 15.5 mg boric acid in 500 mL water and adjusting to pH 9.5 with concentrated NaOH. Prepare reagent by mixing 100 mg o-phthaldialdehyde, 9 mL MeOH, 1 mL buffer, and 100 μL mercaptoethanol.)

HPLC VARIABLES

Column: 250 × 4 5 μm BANsil C18 (ASMT, Enger, Germany)
Mobile phase: Gradient. A was MeCN:MeOH:0.1% pH 2 phosphoric acid 10:10:80. B was MeCN:MeOH 50:50. A:B 90:10 for 1 min, to 30:70 over 25 min, maintain at 30:70 for 3 min, return to initial conditions over 0.1 min, re-equilibrate for 3.9 min.
Column temperature: 40
Flow rate: 1
Injection volume: 18
Detector: F ex 235 em 435

CHROMATOGRAM

Retention time: 19.9

Internal standard: gamma-phenyl-gamma-aminobutyric acid (Marion Merrel Dow) (23.4), 1-(aminomethyl)cycloheptane acetic acid (Gö-3609, Parke Davis) (28.3)
Limit of detection: 100 ng/mL
Limit of quantitation: 1 μg/mL

OTHER SUBSTANCES
Extracted: gabapentin

KEY WORDS
derivatization; serum; degas mobile phase continuously with helium

REFERENCE
Juergens,U.H.; May,T.W.; Rambeck,B. Simultaneous HPLC determination of vigabatrin and gabapentin in serum with automated pre-injection derivatization, *J.Liq.Chromatogr.Rel.Technol.*, **1996**, *19*, 1459–1471.

SAMPLE
Matrix: blood, urine
Sample preparation: Add 50 μL serum or urine (diluted between 1:50 and 1:200) to 1 mL MeOH containing 3.4 μg γ-phenyl-γ-amino-n-butyric acid, vortex for 15 s, centrifuge at 2000 g for 10 min, mix 6 μL of the supernatant with 3 μL reagent, inject an aliquot. (Reagent was 10 mL 30 mg/mL o-phthaldialdehyde and 200 μL 2-mercaptoethanol made up to 50 mL with 400 mM pH 9.5 borate buffer (Ther. Drug Monit. 1991, 13, 251).)

HPLC VARIABLES
Column: 125 × 3 5 μm Superspher 60 RP-Select B (Merck)
Mobile phase: Gradient. A was MeCN. B was 20 mM KH_2PO_4 buffer. A:B from 22:78 to 37:63 in 12 min, from 37:63 to 55:45 in 6 min, from 55:45 to 80:20 in 1.5 min, maintain at 80:20 for 2 min
Column temperature: 35
Flow rate: 0.7
Detector: F ex 230 em 455

CHROMATOGRAM
Retention time: 10.3
Internal standard: γ-phenyl-γ-amino-n-butyric acid (14.8)
Limit of detection: 500 nM

OTHER SUBSTANCES
Extracted: gabapentin

KEY WORDS
derivatization; serum

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 100 μL Plasma + 20 μL 400 μg/mL IS in water + 200 μL MeCN + 100 μL 30 μM copper chloride, centrifuge at 800 g for 15 min. Remove the supernatant and add it to 200 μL buffer 1 and 200 μL 2 mg/mL dansyl chloride in MeCN, vortex for 5 s, heat at 50° for 15 min, cool to room temperature, wash with 1 mL diethyl ether. Extract the aqueous phase with ethyl acetate. Wash the ethyl acetate layer with 1 mL water. Evaporate the ethyl acetate layer to dryness under a stream of nitrogen at 35°, reconstitute the residue in 2-4 mL mobile phase, inject a 50-100 μL aliquot. Urine. 10 μL Urine + 100 μL water + 20 μL 400 μg/mL IS in water + 200 μL MeCN + 100 μL 15 μM copper chloride, vortex for 5 s, add 200 μL buffer 2, add 200 μL 2 mg/mL dansyl chloride in MeCN, vortex for 5 s, heat at 50° for 15 min, cool to room temperature, wash with 1 mL diethyl ether. Extract the aqueous phase with ethyl acetate. Wash the ethyl acetate layer with 1 mL water. Evaporate the ethyl acetate layer to

dryness under a stream of nitrogen at 35°, reconstitute the residue in 2-4 mL mobile phase, inject a 50-100 μL aliquot. (Buffer 1 was 25 mL 200 mM boric acid and 20 mL 50 mM sodium borate made up to 100 mL, pH 8.45 ± 0.05. Buffer 2 was 50 mL 400 mM boric acid and 20 mL 125 mM sodium borate made up to 100 mL, pH 8.05 ± 0.05.)

HPLC VARIABLES
Column: 250 × 4.6 6 μm Zorbax C8
Mobile phase: MeCN:dioxane:500 mM orthophosphoric acid 35:15:50 (Caution! Dioxane is a carcinogen!)
Flow rate: 1
Injection volume: 50-100
Detector: F ex 345 em 418 (cut-off filter)

CHROMATOGRAM
Retention time: 8.8
Internal standard: gamma-aminobenzenebutanoic acid (13.5)
Limit of detection: 10 μg/mL (urine), 500 ng/mL (plasma)

KEY WORDS
plasma; derivatization; dog; pharmacokinetics

REFERENCE

SAMPLE
Matrix: bulk
Sample preparation: 2.6 mg Vigabatrin + 250 μL 200 mM sodium bicarbonate, stir for 2 min, add 250 μL 65 mg/mL N-(tert-butoxycarbonyl)-L-leucine-N-hydroxysuccinimide ester (N-t-Boc-L-leucine N-hydroxysuccinimide ester) in THF, stir for 30 min, evaporate to dryness under a stream of nitrogen, reconstitute with 200 μL trifluoroacetic acid, let stand at room temperature for 5 min, evaporate to dryness under a stream of nitrogen, reconstitute with 10 mL mobile phase, inject an aliquot.

HPLC VARIABLES
Column: 250 × 4 10 μm LiChrosorb RP-8
Mobile phase: MeCN:50 mM pH 7 phosphate buffer 4:96
Flow rate: 2
Injection volume: 100
Detector: UV 210

CHROMATOGRAM
Retention time: 4 (R-(-)), 17.5 (S-(+))
Limit of detection: 0.1% (of major enantiomer)

KEY WORDS
chiral; derivatization

REFERENCE

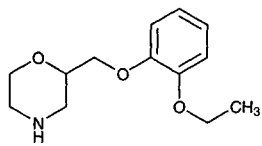
Viloxazine



Molecular formula: $C_{13}H_{19}NO_3$
Molecular weight: 237.30
CAS Registry No.: 46817-91-8, 35604-67-2 (HCl)
Merck Index: 10116
Lednicer No.: 2 306

SAMPLE
Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES
Column: 300 × 3.9 4 µm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8
Injection volume: 50
Detector: UV 222

CHROMATOGRAM
Retention time: 4.49
Limit of detection: <120 ng/mL

KEY WORDS

SAMPLE

Matrix: blood, urine

Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)

Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.

Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)

Injection volume: 10-30

Detector: UV 200.5

CHROMATOGRAM

Retention time: 10.993

KEY WORDS

whole blood

SAMPLE
Matrix: blood, urine
Sample preparation: 1 mL Serum or urine + 1 mL 66 mM pH 7 phosphate buffer + 3 (serum) or 5 (urine) mL diethyl ether, rotate at 20 rpm for 30 min, centrifuge at 1000 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 37°, reconstitute the residue in 120 μL MeOH:pH 2 HCl 20:80, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 250 × 4 5 μm cyano (SGE)
Mobile phase: MeCN:water 55:45 containing 40 mM ammonium acetate, pH adjusted to 3 with HCl
Flow rate: 1
Injection volume: 50
Detector: UV 268

CHROMATOGRAM
Retention time: 4.4

Internal standard: vinblastine

OTHER SUBSTANCES
Extracted: vinorelbine (navelbine)
Noninterfering: aminoglycoside antibiotics, analgesics, carbamazepine, digitoxin, furosemide, glycopeptide antibiotics, β-lactam antibiotics, phenytoin, quinidine, quinolone antibiotics, salicylic acid, theophylline

KEY WORDS
vinblastine is IS; serum

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. 1 mL Plasma + 100 μL MeOH + 8 mL diethyl ether, shake for 10 min, centrifuge at 900 g for 10 min, freeze at -20° for 45 min. Remove 7 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 35-40°, reconstitute the residue in 250 μL mobile phase, wash twice with 1 mL hexane, inject a 100 μL aliquot of the aqueous phase. Urine. Centrifuge urine at 900 g. 1 mL Urine + 100 μL MeOH + 500 μL 100 mM pH 7.0 NaH_2PO_4 + 8 mL diethyl ether, shake for 10 min, centrifuge at 900 g for 10 min, freeze at -20° for 45 min. Remove 7 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 35-40°, reconstitute the residue in 250 μL mobile phase, wash twice with 1 mL hexane, inject a 100 μL aliquot of the aqueous phase.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Nucleosil C18
Mobile phase: MeCN:MeOH:buffer 8:50:42 (Buffer was 0.1% NaH_2PO_4 containing 400 mg/L heptanesulfonate and 300 mg/L EDTA, adjusted to pH 3.0 with 1 M phosphoric acid.)
Flow rate: 1.1
Injection volume: 100
Detector: E, Chromatofield Model Eldec 103, glassy carbon electrode 0.93 V, Ag/AgCl reference electrode

CHROMATOGRAM
Retention time: 4.5
Internal standard: vinblastine

OTHER SUBSTANCES
Extracted: vinorelbine (navelbine)
Simultaneous: acetaminophen, aminophylline, amiodarone, carbocysteine, dextropropoxyphene, diclofenac, doxycycline, glafenine, indomethacin, morphine, noramidopyrine, propoxyphene
Noninterfering: acetylcysteine, albuterol, alizapride, amitriptyline, amoxicillin, aspirin, bromazepam, bromhexine, caffeine, clavulanic acid, clomipramine, clorazepate, diazepam, diprophylline, floctafenine, loperamide, lorazepam, methylprednisolone, metoclopramide, prednisolone, ranitidine, theophylline

KEY WORDS

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 220.5

CHROMATOGRAM
Retention time: 13.765

KEY WORDS
whole blood

SAMPLE
Matrix: cells
Sample preparation: Add 20 μL 33% silver nitrate solution to a suspension of 2×10^6 cells, agitate for 10 s, sonicate for 20 min (Bransonic 52, Vel, Belgium), add 140 μL MeCN, vortex for 5 min, cool at 4° for 30 min, centrifuge at 10000 g for 30 s, add 200 μL 200 mM pH 3 phosphate buffer, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 7 μm Hibar LiChrocart RP 18 (Merck)
Mobile phase: MeCN:buffer 35:65 (Buffer was 200 mM KH_2PO_4 containing 0.2% triethylamine, adjusted to pH 3.0 with 200 mM orthophosphoric acid.)
Flow rate: 1
Injection volume: 50
Detector: UV 237

CHROMATOGRAM
Retention time: 4.9
Internal standard: daunorubicin (4.0)
Limit of detection: 4 pmol
Limit of quantitation: 13 pmol

OTHER SUBSTANCES
Extracted: altretamine, doxorubicin, verapamil, S 9788

KEY WORDS
human; cells; epidermoid carcinoma

SAMPLE
Matrix: plants
Sample preparation: Freeze leaves with liquid nitrogen, air dry, grind to a fine powder. Mix 0.5 g powder and 2 mL MeOH, sonicate for 30 min, allow to settle, decant the liquid, repeat extraction. Combine the extracts and filter (0.45 μm) them, inject a 10 μL aliquot of the filtrate.

HPLC VARIABLES
Column: 100 × 4.6 3 μm Microsorb C18
Mobile phase: Gradient. MeCN:buffer 15:85 for 2 min, to 40:60 over 58 min, maintain at 40:60 for 5 min, to 95:5 over 5 min, maintain at 95:5 over 5 min. (Prepare buffer by mixing 2 mL trifluoroacetic acid and 1 mL triethylamine in water, make up to 1 L with water, adjust pH to 2.4 with ammonium hydroxide.)
Injection volume: 10
Detector: UV 274

CHROMATOGRAM
Retention time: 40.7

OTHER SUBSTANCES
Extracted: ajmalacine, tetrahydroalstonine, tryptamine, vinblastine, vincamine, yohimbine

KEY WORDS
leaves

SAMPLE
Matrix: tissue
Sample preparation: Lyophilize tissue for 24 h, pulverize in a mortar, mix. Weigh out 25-50 mg tissue, add 5 mL 100 mM HCl, sonicate for 30 min, add 5 mL MeCN dropwise with continual vortexing, centrifuge for 30 min. Remove the supernatant and evaporate it under a stream of nitrogen at 60° to remove MeCN, add 10 mL buffer, ad 5 mL chloroform, shake for 30 min, centrifuge. Remove 4 mL of the organic layer and evaporate it to dryness under a stream of nitrogen at 30°, reconstitute the residue in 500 μL dichloromethane, inject a 100 μL aliquot. (Buffer was 400 mM pH 3 phosphate buffer containing 50 mM octylsulfate. Silanize all glassware with Surfasil (Pierce).)

HPLC VARIABLES
Guard column: 30 × 4 5 μm LiChrosorb CN
Column: 250 × 4 5 μm LiChrosorb CN
Mobile phase: MeCN:40 mM pH 3 phosphate buffer 60:40
Flow rate: 1
Injection volume: 100
Detector: UV 220

CHROMATOGRAM
Retention time: 15.60
Limit of detection: 10 ng/g

OTHER SUBSTANCES
Extracted: vinblastine

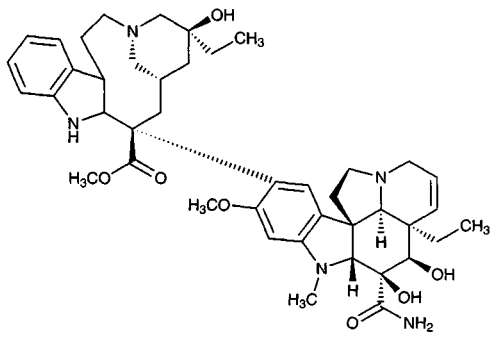
Vindesine



Molecular formula: $C_{43}H_{55}N_5O_7$
Molecular weight: 753.94
CAS Registry No.: 53643-48-4, 59917-39-4 (sulfate salt)
Merck Index: 10125

SAMPLE

Matrix: blood

Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 µL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 µL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 µm NovaPack C18

Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)

Column temperature: 30

Flow rate: 0.8

Injection volume: 50

Detector: UV 270

CHROMATOGRAM

Retention time: 4.92

Limit of detection: <120 ng/mL

Merck Index: 10131

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85: 15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 200.5

CHROMATOGRAM
Retention time: 16.583

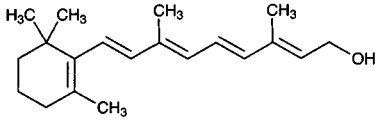
Vitamin A



Molecular formula: $C_{20}H_{30}O$
Molecular weight: 286.46
CAS Registry No.: 68-26-8
Merck Index: 10150

SAMPLE
Matrix: blood
Sample preparation: 2 mL Serum + 2 mL EtOH + 10 mL hexane, mix for 30 s, centrifuge at 3000 rpm for 5 min, store the hexane layer at 15°, repeat the extraction with 10 mL hexane. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute with 200 µL isopropanol, inject a 20 µL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 µm TSKgel ODS-80Ts
Mobile phase: Gradient. EtOH:water 80:20 for 11.5 min then 87:13 (step gradient)
Column temperature: 40
Flow rate: 1
Injection volume: 20
Detector: F ex 340 em 460

CHROMATOGRAM
Retention time: 7.5

OTHER SUBSTANCES
Extracted: vitamin E (F ex 298 em 325)

KEY WORDS
serum

SAMPLE
Matrix: blood
Sample preparation: Mix 100 μL serum with 200 μL MeCN and 10 μL 20 mM ascorbic acid, centrifuge at 16000 g for 5 min. Mix the supernatant with 200 μL water, inject a 2 μL aliquot. (Protect all solutions from light.)

HPLC VARIABLES
Column: 50 × 0.18 3 μm ODS-AQ (YMC, Wilmington, NC) (The separation capillary column was formed from fused-silica capillaries (Polymicro Technologies, Phoenix) by inserting a small 50 μm I.D. capillary ca. 15 mm into a larger 180 μm I.D. capillary and fixed by applying epoxy (No. 353ND, Epoxy Technology, Billerica MA). A glass filter paper frit (Whatman GF/A) was inserted into the larger capillary and forced against the smaller capillary with a stream of isopropanol. The stationary phase was suspended in 3 mL isopropanol and pumped into the larger capillary until a 50 mm bed was formed. The larger and smaller diameter capillaries extended no more than 100 and 16 mm from the frit, respectively.)
Mobile phase: MeCN:MeOH:water 65:2.5:32.5 containing 1% tetrabutylammonium perchlorate, adjusted to pH 5.0 with acetic acid and 174 mM sodium acetate
Flow rate: 0.004
Injection volume: 2
Detector: E, carbon-fiber working electrode +900 mV, Ag/AgCl reference electrode (details of preparation in paper)

CHROMATOGRAM
Retention time: 11
Limit of detection: 38 pg/mL
Limit of quantitation: 70 fmol

Schäfer Elinder,L.; Walldius,G. Simultaneous measurement of serum probucol and lipid-soluble antioxidants, *J.Lipid Res.*, **1992**, *33*, 131–137.

SAMPLE
Matrix: blood
Sample preparation: 20-500 μL Serum + 2 volumes EtOH + 1 mL ethyl acetate + 4-7 μL of a solution containing 16 mg/mL tocopheryl acetate, 2-3 μg/mL canthaxanthin, and 10 μg/mL retinoic acid, vortex for 30 s, centrifuge for 30 s, extract the pellet twice with 0.5-1 mL portions of ethyl acetate, extract the pellet with 0.5-1 mL hexane. Combine the supernatants, add 500 μL water, vortex, centrifuge. Remove the upper organic layer and evaporate it to dryness under a stream of argon, reconstitute the residue in 100 μL MeOH:dichloromethane 2:1, inject a 10-90 μL aliquot.

HPLC VARIABLES
Guard column: C18 (Upchurch)
Column: 300 × 3.9 5 μm Resolve C18 (Waters)
Mobile phase: MeCN:dichloromethane:MeOH:1-octanol 90:15:10:0.1
Flow rate: 1
Injection volume: 10-90
Detector: UV 325

CHROMATOGRAM
Retention time: 4
Internal standard: tocopheryl acetate, canthaxanthin, retinoic acid

OTHER SUBSTANCES
Extracted: beta carotene (UV 450), carotenoids (UV 450), vitamin E (UV 290)

KEY WORDS
protect from light; serum

REFERENCE

Barua,A.B.; Kostic,D.; Olson,J.A. New simplified procedures for the extraction and simultaneous high-performance liquid chromatographic analysis of retinol, tocopherols and carotenoids in human serum, *J.Chromatogr.*, **1993**, *617*, 257–264.

SAMPLE

Matrix: blood
Sample preparation: 100 μL Serum + 100 μL retinyl hexanoate in MeOH, extract three times with 200 μL portions of hexane. Combine the hexane layers and evaporate them to dryness under a stream of argon, reconstitute the residue in 50 μL isopropanol:dichloromethane, inject a 20 μL aliquot.

HPLC VARIABLES

Column: 5 μm Resolve C18 (Waters)
Mobile phase: MeCN:dichloromethane:MeOH:n-butanol 90:15:10:0.1 containing 0.1% ammonium acetate
Flow rate: 1
Injection volume: 20
Detector: UV 300

CHROMATOGRAM

Internal standard: retinyl hexanoate

KEY WORDS

serum; comparison with capillary electrophoresis

REFERENCE

Ma,Y.; Wu,Z.; Furr,H.C.; Lammi-Keefe,C.; Craft,N.E. Fast minimicroassay of serum retinol (vitamin A) by capillary zone electrophoresis with laser-excited fluorescence detection, *J.Chromatogr.*, **1993**, *616*, 31–37.

SAMPLE

Matrix: blood
Sample preparation: 500 μL Serum or plasma + 500 μL EtOH containing 4.27 μM retinyl acetate and 0.31 μM echinenone, rotamix for 30 s, add 2 mL n-hexane, rotamix for 30 s, centrifuge at 2000 g for 2 min, repeat extraction with 2 mL n-hexane. Combine the organic layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in 50 μL THF, make up to 200 μL with EtOH, inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 50 × 4.6 5 μm Spherisorb ODS1
Column: 250 × 4.6 5 μm Spherisorb ODS1
Mobile phase: Gradient. A was MeCN:MeOH 20:80 containing 100 mM ammonium acetate. B was 100 mM ammonium acetate in water. A:B from 90:10 to 100:0 over 12 min, maintain at 100:0 for 10 min, re-equilibrate at initial conditions for 5 min
Flow rate: 2
Injection volume: 50
Detector: UV 325 for 7.5 min, UV 292 for 5.5 min, then UV 450

CHROMATOGRAM

Retention time: 4.37
Internal standard: retinyl acetate (5.96), echinenone (15.15)
Limit of detection: 0.35 μM

OTHER SUBSTANCES

Extracted: β-carotene, cryptoxanthin, lutein, lycopene, vitamin E

KEY WORDS

plasma; protect from light; serum

REFERENCE

Zaman,Z.; Fielden,P.; Frost,P.G. Simultaneous determination of vitamins A and E and carotenoids in plasma by reversed-phase HPLC in elderly and younger subjects, *Clin.Chem.*, **1993**, *39*, 2229–2234.

SAMPLE
Matrix: blood
Sample preparation: 200 μL Plasma or serum + 200 μL 850 ng/mL retinyl acetate in EtOH, mix for 1 min, add 1 mL 0.4 g/L BHT (2,6-di-tert-butyl-4-methylphenol) in n-hexane, shake on a mechanical shaker for 10 min, centrifuge at 2000 g for 5 min, remove 800 μL of the supernatant, evaporate to dryness at 40° under a stream of nitrogen, reconstitute in 100 μL MeCN:THF:MeOH 68:22:7, inject a 15 μL aliquot.

HPLC VARIABLES
Guard column: 15 × 3.2 7 μm Lichrosorb RP18
Column: 250 × 4.6 5 μm Nucleosil 100-5 C18
Mobile phase: MeCN:THF:MeOH 68:22:7 made up to 100 with 1% ammonium acetate
Flow rate: 1.5
Injection volume: 15
Detector: UV 325 for 3 min, UV 450 for 1.9 min, UV 290 for 2.5 min, UV 470 for 4.6 min, UV 450 for 3 min, then UV 325 for rest of run

CHROMATOGRAM
Retention time: 2.5
Internal standard: retinyl acetate (2.7)
Limit of detection: 10 ng/mL

OTHER SUBSTANCES
Extracted: β-carotene, vitamin E (α-tocopherol), lutein, lycopene, α-carotene, zeaxanthin, trans β-carotene, δ-tocopherol

KEY WORDS
plasma; serum; protect from sunlight

REFERENCE
Bui,M.H. Simple determination of retinol, α-tocopherol and carotenoids (lutein, all-*trans*-lycopene, α- and β-carotenes) in human plasma by isocratic liquid chromatography, *J.Chromatogr.B*, **1994**, *654*, 129–133.

SAMPLE
Matrix: blood
Sample preparation: 500 μL Plasma + 1 mL IS in EtOH, vortex for 30 s, add 5 mL water, add 7.5 mL n-hexane, add 300 μL 2 M HCl, rotate for 10 min, centrifuge at 1250 g for 8 min. Remove the organic layer and evaporate it at room temperature under a stream of nitrogen. Dissolve the residue in 100 μL mobile phase, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Spherisorb S5W
Mobile phase: n-Hexane:isopropanol:acetic acid 200:0.7:0.135
Flow rate: 0.9
Injection volume: 50
Detector: UV 350

CHROMATOGRAM
Retention time: 25
Internal standard: Ro 15-1570 (22)
Limit of detection: 10 ng/mL

OTHER SUBSTANCES
Simultaneous: 13-cis-retinoic acid, trans-retinoic acid

KEY WORDS
plasma; normal phase

Meyer,E.; Lambert,W.E.; De Leenheer,A.P. Simultaneous determination of endogenous retinoic acid isomers and retinol in human plasma by isocratic normal-phase HPLC with ultraviolet detection, *Clin.Chem.*, **1994**, *40*, 48–51.

SAMPLE
Matrix: blood
Sample preparation: 200 μL Serum + 200 μL nonapreno-β-carotene and retinyl butyrate in EtOH, vortex for 10 s, add 1 mL hexane, vortex for 30 s, centrifuge at 1500 g for 5 min. Remove 900 μL of the hexane layer and evaporate it to a waxy or glassy consistency (not dryness) under vacuum, dissolve in 100 μL EtOH, add 100 μL MeCN, vortex, filter (0.45 μm), inject a 30 μL aliquot.

HPLC VARIABLES
Column: 1540 × 4.6 5 μm Ultramex C18 (Phenomenex)
Mobile phase: MeCN:EtOH 50:50 containing 0.1 mL/L diethylamine
Column temperature: 29
Flow rate: 0.9
Injection volume: 30
Detector: UV 300

CHROMATOGRAM
Retention time: 2.66
Internal standard: nonapreno-β-carotene (9.5, UV 450), retinyl butyrate (3.5, UV 300)
Limit of detection: 17 nM

OTHER SUBSTANCES
Extracted: β-carotene, vitamin E (α-tocopherol), lutein, zeaxanthin, β-cryptoxanthin, lycopene, α-carotene, retinyl linoleate, retinyl oleate, retinyl palmitate, retinyl stearate

KEY WORDS
serum; use gold fluorescent lamps; hold sample at 4° before injection

Retinol, α-tocopherol, lutein/zeaxanthin, β-cryptoxanthin, lycopene, α-carotene, trans-β-carotene, and four retinyl esters in serum determined simultaneously by reversed-phase HPLC with multiwavelength detection, *Clin.Chem.*, **1994**, *40*, 411–416.

SAMPLE
Matrix: blood
Sample preparation: 200 μL Serum + 2 mL diluting agent (amber tube), mix for 10 s, add 5 mL n-hexane, vortex for 30 s, centrifuge at 1600 g at 4° for 5 min. Remove the organic phase and concentrate to < 1 mL under vacuum below 30°, evaporate the rest of the solvent under nitrogen, dissolve the residue in 25 μL MeCN:MeOH 2:1, mix for 30 s, centrifuge at 8000 g for 1 min, inject a 20 μL aliquot. (Diluting agent was MeCN:100 mM ammonium acetate 25:75, pH adjusted to 5.5 with acetic acid.)

HPLC VARIABLES
Column: 150 × 4.6 5 μm Chemcosorb 5-ODS-H
Mobile phase: MeCN:MeOH:100 mM ammonium acetate 46.7:23.3:30, pH adjusted to 7.0
Column temperature: 50
Flow rate: 1
Injection volume: 20
Detector: UV 340

CHROMATOGRAM
Retention time: 31.9
Limit of quantitation: 0.5 ng/mL

OTHER SUBSTANCES
Simultaneous: 13-cis-retinoic acid, all-trans-retinoic acid

KEY WORDS
serum

SAMPLE
Matrix: formula, reference material
Sample preparation: 10 g Zero-control reference material (ZRM) powder + 50 g hot water, mix. 6.5 g Reconstituted ZRM or 3.5 g concentrated commercial formula + 10 mL boiling isopropanol, mix, add 7.5 g anhydrous magnesium sulfate to the ZRM and 4 g to the concentrated commercial formula, mix thoroughly, add 25 mL hexane:ethyl acetate 85:15, add 1 mL 360 .micro g/mL BHT, mix, homogenize (Polytron) for 1 min, filter through 60 mL coarse-porosity fritted glass filter using vacuum, wash with two 15 mL portions of hexane:ethyl acetate 85:15. Re-extract with 20 mL hexane:ethyl acetate 85:15 and 5 mL isopropyl alcohol, homogenize for 1 min, filter through 60 mL coarse-porosity fritted glass filter using vacuum, wash with two 15 mL portions of hexane:ethyl acetate 85:15. Mix the combined filtrate with 500 mg anhydrous magnesium sulfate, evaporate to dryness, add 15 mL hexane to the residue, filter (0.45 μm nylon) using vacuum, wash with three 7 mL portions of hexane, evaporate to 1 mL with nitrogen at 45°, dilute to 10 mL with hexane, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Lichrosorb Si 60
Mobile phase: Hexane:isopropanol 99.875:0.125
Flow rate: 1
Injection volume: 50
Detector: F ex 325 em 470

CHROMATOGRAM
Retention time: 3.4 (vitamin A palmitate)
Limit of quantitation: 300 ng/mL

OTHER SUBSTANCES
Also analyzed: vitamin E

KEY WORDS
normal phase; soy-based infant formula

REFERENCE
Chase,G.W.,Jr.; Long,A.R.; Eitenmiller,R.R. Liquid chromatographic method for analysis of all-rac-α-tocopheryl acetate and retinyl palmitate in soy-based infant formula using a zero-control reference material (ZRM) as a method development tool, *J.AOAC Int.*, **1998**, *81*, 577–581.

SAMPLE
Matrix: formulations

Sample preparation: Reconstitute 28 g milk based infant formula with ca. 145 g 78-80° water, mix thoroughly. Add 15 mL boiling isopropanol to 6.5 g reconstituted infant formula, mix thoroughly. Add 7.5 g magnesium sulfate, 30 mL hexane:ethyl acetate 85:15 and 1 mL BHT. Homogenize mixture for 1 min, filter through a coarse porosity glass filter by vacuum, wash the magnesium sulfate cake with two 15 mL portions of hexane:ethyl acetate 85:15. Repeat the extraction with 5 mL isopropanol and 15 mL hexane:ethyl acetate 85:15. Add 1 g magnesium sulfate to the combined filtrate and evaporate it to dryness under nitrogen. Dissolve the residue in 10 mL hexane, filter (0.45 μm), evaporate to a volume of less than 5 mL at 45°. Dilute to 10 mL with mobile phase. Inject a 50 μL aliquot.

SAMPLE

Matrix: formulations
Sample preparation: Tablets, capsules. Add 5 crushed tablets or the contents from 5 capsules to 10 mL DMSO, add 15 mL hexane, shake at 60° for 45 min, centrifuge at 3000 rpm for 10 min, remove hexane layer, add 15 mL hexane, vortex for 5 min at room temperature, remove hexane layer, repeat hexane extraction three more times, combine all hexane layers, filter, make up to 100 mL with hexane, dilute if necessary, inject a 100 μL aliquot. Syrup. 10 mL Syrup + 10 mL DMSO + 15 mL ether:hexane 10:90, vortex for 5 min, remove hexane layer, repeat extraction four more times, combine the extracts, evaporate with nitrogen until the ether is removed, filter, make up to 100 mL with hexane, dilute if necessary, inject a 100 μL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 3 μm amino bonded phase (Chromatography Sciences Co.)
Mobile phase: Hexane:isopropanol 99:1
Flow rate: 1-2
Injection volume: 100
Detector: UV 265

CHROMATOGRAM

Retention time: 12 (13-cis), 13 (9-cis), 14.5 (all-trans)

OTHER SUBSTANCES

Simultaneous: cholecalciferol (vitamin D3), ergocalciferol (vitamin D2)

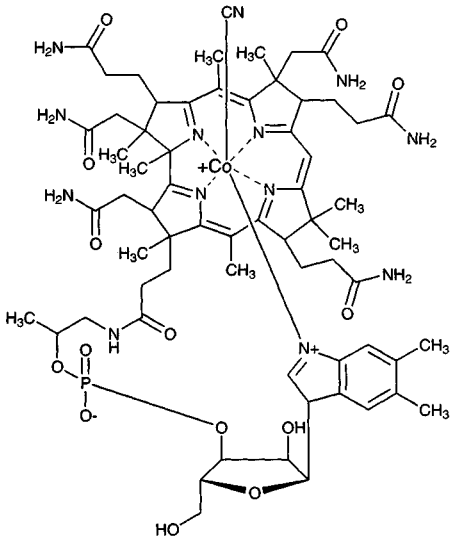
Vitamin B12

Molecular formula: $C_{63}H_{88}CoN_{14}O_{14}P$
Molecular weight: 1355.38
CAS Registry No.: 68-19-9
Merck Index: 10152



SAMPLE

Matrix: blood, feces

Sample preparation: Feces. Condition a Sep-Pak C18 SPE cartridge with 2 mL MeCN and 6 mL water. 1 g Feces + 3 mL buffer, rotate at 4° for 24 h, centrifuge at 19000 g for 1 h. Remove 3 mL of the supernatant and add cadmium acetate to a concentration of 200 mM, let stand for 2 h, add four volumes of EtOH preheated to 80°, mix vigorously, heat at 80° for 20 min, cool in an ice bath, centrifuge at 2000 g for 10 min, remove the supernatant, mix the precipitate with two volumes of cold EtOH:water 80:20, centrifuge. Combine the supernatants and evaporate them to dryness under reduced pressure at 40°, reconstitute the residue in 2 mL water, add to the SPE cartridge, wash with 12 mL water, elute with 6 mL t-butanol:water 20:80, evaporate the eluate to dryness, reconstitute with 2 mL 1% acetic acid, add to the Amberlite XAD2 column, wash with 12 mL 1% acetic acid, wash with 12 mL MeOH:1% acetic acid 10:90, elute with 30 mL MeOH:1% acetic acid 50:50, lyophilize the eluate at -80°, reconstitute with 2 mL water, filter (0.2 μm), lyophilize, reconstitute with 300 μL 1% acetic acid, inject a 250 μL aliquot. Plasma. Condition a Sep-Pak C18 SPE cartridge with 2 mL MeCN and 6 mL water. Add cadmium acetate to a concentration of 200 mM, let stand for 2 h, add four volumes of EtOH preheated to 80°, mix vigorously, heat at 80° for 20 min, cool in an ice bath, centrifuge at 2000 g for 10 min, remove the supernatant, mix the precipitate with two volumes of cold EtOH:water 80:20, centrifuge. Combine the supernatants and evaporate them to dryness under reduced pressure at 40°, reconstitute the residue in 2 mL water, add to the SPE cartridge, wash with 12 mL water, elute with 6 mL t-butanol:water 20:80, evaporate the eluate to dryness, lyophilize the eluate at -80°, reconstitute with 2 mL water, filter (0.2 μm), lyophilize, reconstitute with 300 μL 1% acetic acid, inject a 250 μL aliquot (Meth. Enzymol. 1986, 123, 3). (Buffer was 100 mM pH 7.4 sodium phosphate buffer containing 5 U/mL aprotinin, 0.02 mM phenylmethylsulfonyl fluoride, 3 mM sodium azide, and 0.05% Triton X100. Prepare Amberlite XAD2 column as follows. Suspend 30 g resin in 50 mL acetone, filter, wash with 50 mL acetone, dry at 80°, suspend in 200 mL MeOH, allow to settle, discard the supernatant, repeat 2-4 times until supernatant is clear, suspend in 100 mL MeOH, fill a 330 × 8 glass column to a bed height of 40 mm (Meth. Enzymol. 1986, 123, 3).)

HPLC VARIABLES

Column: 250 × 5 5 μm LiChrospher RP18 glass column
Mobile phase: Gradient. A was 85 mM phosphoric acid adjusted to pH 3.0 with triethanolamine. B was MeCN. A:B from 90:10 to 50:50 over 20 min.
Flow rate: 0.5
Injection volume: 250
Detector: UV 365

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30

Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 207.5

CHROMATOGRAM
Retention time: 3.777

KEY WORDS
whole blood

SAMPLE
Matrix: formula, milk
Sample preparation: Mix 8.0 g powdered infant milk with 10 mL water to it. Mix the diluted powder or 10.5 g liquid infant milk with 1 g solid trichloroacetic acid, shake thoroughly with magnetic stirring for 10 min, centrifuge at 1250 g for 10 min, add 3 mL 4% trichloroacetic acid to the solid residue, mix thoroughly for 10 min, centrifuge, discard the solid phase. Combine the two acid extracts and make up to 10 mL with 4% trichloroacetic acid, filter (0.45 μm), inject an aliquot of the filtrate.

HPLC VARIABLES
Guard column: 5 μm Tracer Spherisorb ODS 2 C18 (Teknokroma, Spain)
Column: 250 × 4.6 5 μm Tracer Spherisorb ODS 2 C18 (Teknokroma, Spain)
Mobile phase: MeOH:buffer 15:85 (Buffer was 5 mM octanesulfonic acid and 0.5% triethylamine, pH 3.6.)
Flow rate: 1
Injection volume: 20
Detector: UV 261 for 6 min, UV 287 for 2 min, UV 290 for 5 min, UV 282 for 3 min, UV 268 for 3.5 min, UV 361 for 20.5 min, UV 246 for 20 min

CHROMATOGRAM
Retention time: 22
Limit of quantitation: ≤300 ng/mL

Injection volume: 15
Detector: UV 325 for 3 min, UV 450 for 1.9 min, UV 290 for 2.5 min, UV 470 for 4.6 min, UV 450 for 3 min, then UV 325 for rest of run

CHROMATOGRAM
Retention time: 6.3
Internal standard: retinyl acetate (2.7)
Limit of detection: 200 ng/mL

OTHER SUBSTANCES
Extracted: β-carotene, vitamin A (retinol), lutein, lycopene, α-carotene, zeaxanthin, trans β-carotene, δ-tocopherol

KEY WORDS
plasma; serum; protect from sunlight

REFERENCE
Bui,M.H. Simple determination of retinol, α-tocopherol and carotenoids (lutein, all-*trans*-lycopene, α- and β-carotenes) in human plasma by isocratic liquid chromatography, *J.Chromatogr.B*, **1994**, *654*, 129–133.

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 2 mL EtOH, vortex for 3 min, add 3 mL hexane, vortex for 5 min, centrifuge at 1500 g for 10 min, repeat extraction with 3 mL hexane. Combine the hexane layers and wash with 2 mL MeOH:water 9:1. Remove the upper organic layer and filter (0.45 μm) it, evaporate to dryness under a stream of nitrogen, reconstitute the residue in 33.4 μL EtOH, inject a 5 μL aliquot.

HPLC VARIABLES
Guard column: ODS
Column: 125 × 4 5 μm LiChrospher 100 RP-18 or 100 × 2.1 3 μm Spherisorb ODS-2
Mobile phase: Gradient. A was MeOH:water 99:1. B was MeOH:THF 70:30. A:B 100:0 for 2 min, 5:95 for 3.5 min, 0:100 for 4.5 min, re-equilibrate for 2 min (step gradients).
Flow rate: 1.5 (125 × 4 column) or 0.2 (100 × 2.1 column)
Injection volume: 5
Detector: UV 284

CHROMATOGRAM
Retention time: 5 (125 × 4 column), 6 (100 × 2.1 column)
Limit of detection: 2.8 ng (100 × 2.1 column), 106.3 ng (125 × 4 column)

OTHER SUBSTANCES
Extracted: retinyl palmitate (UV 328), vitamin D3 (cholecalciferol) (UV 265), vitamin K1 (UV 250)

KEY WORDS
cow; plasma; protect from light; degas stock solutions with helium; narrow bore

REFERENCE
Gomis,D.B.; Escotet Arias,V.J.; Fidalgo Alvarez,L.E.; Gutiérrez Alvarez,M.D. Simultaneous determination of vitamins D3, E and K1 and retinyl palmitate in cattle plasma by liquid chromatography with a narrow-bore column, *J.Chromatogr.B*, **1994**, *660*, 49–55.

SAMPLE
Matrix: blood
Sample preparation: 200 μL Serum + 200 μL nonapreno-β-carotene and retinyl butyrate in EtOH, vortex for 10 s, add 1 mL hexane, vortex for 30 s, centrifuge at 1500 g for 5 min. Remove 900 μL of the hexane layer and evaporate it to a waxy or glassy consistency (not dryness) under vacuum, dissolve in 100 μL EtOH, add 100 μL MeCN, vortex, filter (0.45 μm), inject a 30 μL aliquot.

HPLC VARIABLES
Column: 1540 × 4.6 5 μm Ultramex C18 (Phenomenex)
Mobile phase: MeCN:EtOH 50:50 containing 0.1 mL/L diethylamine
Column temperature: 29
Flow rate: 0.9
Injection volume: 30
Detector: UV 300

CHROMATOGRAM
Retention time: 4.60
Internal standard: nonapreno-β-carotene (9.5, UV 450), retinyl butyrate (3.5, UV 300)
Limit of detection: 460 nM

OTHER SUBSTANCES
Extracted: β-carotene, vitamin A (retinol), lutein, zeaxanthin, β-cryptoxanthin, lycopene, α-carotene, retinyl linoleate, retinyl oleate, retinyl palmitate, retinyl stearate

KEY WORDS
serum; use gold fluorescent lamps; hold sample at 4° before injection

REFERENCE
Sowell,A.L.; Huff,D.L.; Yeager,P.R.; Caudill,S.P.; Gunter,E.W. Retinol, α-tocopherol, lutein/zeaxanthin, β-cryptoxanthin, lycopene, α-carotene, trans-β-carotene, and four retinyl esters in serum determined simultaneously by reversed-phase HPLC with multiwavelength detection, *Clin.Chem.*, **1994**, *40*, 411–416.

SAMPLE
Matrix: blood
Sample preparation: 1 mL Serum + 2.5 mL EtOH, mix for 5 min, add 5 mL n-hexane, mix vigorously, centrifuge at 2000 g for 5 min, repeat extraction with 3 mL n-hexane. Combine the n-hexane layers and evaporate them to dryness under a stream of nitrogen, reconstitute the residue in dichloromethane, inject an aliquot.

HPLC VARIABLES
Guard column: μBondapak C18 Guard-Pak + 50 mm long C18 ODS(4) (Shimadzu)
Column: 250 × 4.6 5 μm Vydac 201 TP 54 C18
Mobile phase: MeOH:MeCN 90:10 (Every 100 injections wash column with MeOH:MeCN:dichloromethane 8:1:1.)
Flow rate: 1
Detector: UV 291

CHROMATOGRAM
Retention time: 6.9

OTHER SUBSTANCES
Extracted: beta carotene (UV 451), vitamin A (UV 324)

KEY WORDS
serum

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a Lichrolut RP-18 (Merck) SPE cartridge with 3 mL MeOH and 3 mL water. Mix 40 μL plasma or 100 μL urine with twice the volume of MeCN for 2 min, add 100 μL water, centrifuge at 3500 rpm for 15 min, evaporate the supernatant under nitrogen at 45° to remove the organic solvents, add slowly to the SPE cartridge, discard the effluent, elute with 3 mL MeOH. Evaporate the eluate to dryness under a stream of nitrogen at 45°. Reconstitute the residue with 500 μL MeOH containing 3.5 μg/mL IS. Inject a 10 μL aliquot.

HPLC VARIABLES
Column: 220 × 4.6 5 μm Spherisorb RP-18
Mobile phase: MeCN:MeOH 70:30
Flow rate: 1.5
Injection volume: 10
Detector: UV 290

CHROMATOGRAM
Retention time: 7.78 (vitamin E), 8.79 (vitamin E acetate)
Internal standard: anthraquinone (1.89)
Limit of detection: 5 ng

OTHER SUBSTANCES
Extracted: vitamin A

KEY WORDS
plasma; SPE

SAMPLE
Matrix: food
Sample preparation: Melt 5 g margarine at 40° and homogenize it. Mix 20 g infant formula with 20 g water at 50°. Cut 5 g broccoli, mix in a homogenizer, freeze dry for 48 h at -40°, grind to a fine powder, mix 5 g in 30 mL water. Add 25 mL 600 g/L KOH to 5 g sample. Add solid KOH to the suspension until the KOH concentration is 60% (w/v). Add 15 mL EtOH to each 5 mL portion, shake. Add 25 mg ascorbic acid per gram, mix, flush with nitrogen, heat at 80° for 40 min. Immediately cool to room temperature. Add water to make EtOH:water ratio 0.3. Add 100 mL n-hexane:ethyl acetate 90:10, shake, let layers separate. Extract the aqueous phase with two 100 mL portions of n-hexane:ethyl acetate 90:10. Combine organic phases, wash with 100 ml water until the washes are neutral. Filter the organic phase through phase separating filter paper (S&S 597 HY, Schliecher and Schuell, Germany). Evaporate the filtrate under reduced pressure, dissolve the residue in hexane containing 20 mg/L 2,6-di-tert-butyl-4-methylphenol, inject a 30 mL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Lichrosorb Diol
Mobile phase: n-Hexane:MTBE 94:6
Column temperature: 23
Flow rate: 1
Injection volume: 30
Detector: F ex 295 em 330

CHROMATOGRAM
Retention time: 11.5 (α), 18.5 (β), 21.0 (γ), 30.5 (δ)
Limit of detection: 100 ng/mL

OTHER SUBSTANCES
Extracted: 2-tert-butyl-4-hydroxyanisole, di-tert-butyl-4-methylphenol, plastochromanol-8, tocodienol, tocomoneols, tocotrienols

SAMPLE
Matrix: formula
Sample preparation: Reconstitute 28 g milk based infant formula with ca. 145 g 78-80° water, mix thoroughly. Add 15 mL boiling isopropanol to 6.5 g reconstituted infant formula, mix thoroughly. Add 7.5 g magnesium sulfate, 30 mL hexane:ethyl acetate 85:15 and 1 mL BHT. Homogenize mixture for 1 min, filter through a coarse porosity glass filter by vacuum, wash the magnesium sulfate cake with two 15 mL portions of hexane:ethyl acetate 85:15. Repeat the extraction with 5 mL isopropanol and 15 mL hexane:ethyl acetate 85:15. Add 1 g magnesium sulfate to the combined filtrate and evaporate it to dryness under nitrogen. Dissolve the residue

in 10 mL hexane, filter (0.45 μm), evaporate to a volume of less than 5 mL at 45°. Dilute to 10 mL with mobile phase. Inject a 50 μL aliquot.

HPLC VARIABLES
Column: 250 × 4.6 5 μm Lichrosorb Si 60
Mobile phase: Hexane:isopropanol 99.5:0.5
Flow rate: 1
Injection volume: 50
Detector: F ex 285 em 310

CHROMATOGRAM
Retention time: 2.7 (α-tocopheryl acetate), 10.1 (γ tocopherol), 17.3 (δ tocopherol)
Limit of detection: 3.14 ng/mL

KEY WORDS
infant formula; normal phase

SAMPLE
Matrix: fat spread products, margarine
Sample preparation: Melt two sticks of margarine at 45°. Homogenize spreads without warming. Weigh 5.0 g sample. Add 40 mL hexane-BHT and sonicate with intermittent mixing. Rinse side with 10 mL hexane-BHT, add 3 drops of Tween 80, 3 g anhydrous magnesium sulfate (1g for each mL of water content/1g magnesium sulfate) and vortex. Stand for ≥ 2 h. Filter by medium porosity fritted glass filter. Wash with hexane-BHT. Filtrate dilute to 100 mL with hexane-BHT. Pipet 1.0 mL and dilute to 50 mL with hexane-BHT. Inject an 20 μL aliquot.

HPLC VARIABLES
Guard column: 5 μm LiChrosorb Si 60
Column: 250 × 4.6 5 μm LiChrosorb Si 60
Mobile phase: n-Hexane:isopropyl alcohol 99.1:0.9
Flow rate: 1.0
Injection volume: 20
Detector: F ex 290 em 330

SAMPLE

Matrix: margarine, spreads

Sample preparation: Sonicate 5.0 g homogenized margarine or spread with 40 mL 0.1% BHT in hexane with intermittent mixing until sample has dissolved. Rinse sides of flask with 10 mL 0.1% BHT in hexane, add 3 drops Tween 80, add 3 g anhydrous magnesium sulfate (1 g for each 1 mL of water content plus 1 g extra), mix, let stand for ≥ 2 h. Filter (medium porosity fritted glass filter) and wash the filter with 0.1% BHT in hexane, dilute the filtrate to 100 mL with 0.1% BHT in hexane. Dilute a 1.0 mL aliquot to 50 mL with 0.1% BHT in hexane, filter (0.45 μ m). Inject an 20 μL aliquot.

HPLC VARIABLES

Guard column: 5 μm LiChrosorb Si 60

SAMPLE
Matrix: milk
Sample preparation: Add 500 mg ascorbic acid, 50 mL EtOH, and 10 mL 60% KOH to 25 g liquid or reconstituted powdered milk under a nitrogen stream, stir overnight at room temperature. Extract with three 50 mL portions of n-hexane and two 25 mL portions of n-hexane by shaking for 2 min each. Combine the n-hexane extracts, wash with 50 mL portions of water containing a few drops of phenolphthalein until the aqueous phase appears colorless, add 1 g butylated hydroxytoluene, filter through a Whatman No.1 filter containing 20 g anhydrous sodium sulfate, concentrate the filtrate under reduced pressure at 40°, reconstitute with 10 mL MeOH, filter (0.45 μm), inject an aliquot of the filtrate.

HPLC VARIABLES
Guard column: Tracer Spherisorb ODS 2 C18
Column: 250 × 4.6 5 μm Tracer Spherisorb ODS 2 C18 (Teknokroma, Spain)
Mobile phase: MeCN:MeOH:water 1:95:4
Injection volume: 20
Detector: UV 323 for 14 min then UV 292

CHROMATOGRAM
Retention time: 20
Limit of detection: 300 ng/mL
Limit of quantitation: 400 ng/mL

SAMPLE
Matrix: silicone oils
Sample preparation: Condition a 1 g Si Bond-Elut SPE cartridge with 5 mL n-hexane. Mix 1 g silicone oil with 2 mL dichloromethane, vortex for 2 min, centrifuge at 3000 g. Withdrawn the supernatant, repeat this procedure twice, filter (0.45 μm), heat the filtrate at 50°, expose to a stream of helium for 30 min. Add 2.5 μg retinol acetate, 2.5 μg α-tocopherol acetate, and 25 μg BHT. Add the mixture to the SPE cartridge, elute with 500 μL MeOH, inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 4.6 5 μm Zorbax C8
Mobile phase: Gradient. A was MeCN:200 mM ammonium acetate 72:25. B was MeOH:water 95:5. A:B 100:0 for 10 min, to 0:100 over 1 min, maintain at 0:100 for 14 min
Flow rate: 2 for 10 min then 1.5
Injection volume: 20
Detector: UV 210

CHROMATOGRAM
Retention time: 16
Internal standard: α-tocopherol acetate (18)
Limit of detection: 604.9 ng/mL
Limit of quantitation: 2.016 μg/mL

OTHER SUBSTANCES
Extracted: cholesterol (UV 210), retinal (UV 350), retinoic acid (UV 350), retinol acetate (UV 350), vitamin A (UV 350)

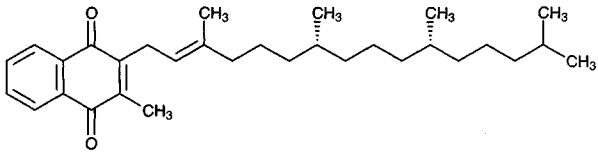
Vitamin K1



Molecular formula: $C_{31}H_{46}O_2$
Molecular weight: 450.71
CAS Registry No.: 84-80-0
Merck Index: 7536

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 50 ng IS + 1 mL 0.9% NaCl + 3 mL isopropanol + 10 mL n-hexane, mix by inversion at 20 rpm for 1 h, centrifuge at 1000 g for 10 min. Remove the upper layer and evaporate it to dryness under reduced pressure at room temperature, reconstitute the residue in 1 mL MeOH, inject a 50 μL aliquot.

HPLC VARIABLES
Column: 100 × 3 5 μm Hypersil MOS
Mobile phase: MeOH:water 92.5:7.5 containing 30 mM sodium chlorate (Continuously bubble oxygen-free nitrogen (presaturated with mobile phase) through the mobile phase reservoir.)
Flow rate: 0.9
Injection volume: 50
Detector: F ex 320 em 420 following post-column reaction. The mobile phase flowed through an electrochemical cell with coulometric reduction at -400 mV to the detector.

CHROMATOGRAM
Retention time: 10
Internal standard: vitamin $K_{2(30)}$ (17)
Limit of quantitation: 1 ng/mL

KEY WORDS
post-column reaction; plasma; protect from light

REFERENCE

Determination of (endogenous) vitamin K_1 in human plasma by reversed-phase high-performance liquid chromatography using fluorometric detection after post-column electrochemical reduction. Comparison with ultraviolet, single and dual electrochemical detection, *J.Chromatogr.*, **1984**, *305*, 61–72.

SAMPLE

Matrix: blood

Sample preparation: 0.5-1 mL Plasma + 20 μL 87.5 ng/mL IS in EtOH + 2 mL EtOH + 6 mL hexane, mix, centrifuge at 3500 g for 5 min. Remove the upper hexane layer and evaporate it to dryness at 30° in a vortex-type evaporator, reconstitute the residue in hexane, add to a Sep-Pak silica SPE cartridge, wash with 8 mL hexane, elute with 8 mL hexane:diethyl ether 97:3, evaporate the eluate to dryness in a vortex-type evaporator, reconstitute with 1 mL hexane, add 4 mL reagent, add 5-10 mg zinc metal, vortex for 2 min, centrifuge, discard the hexane layer. Remove the lower (MeCN) layer and evaporate it to dryness, reconstitute the residue in 6 mL hexane and 2 mL water, vortex, centrifuge. Remove the upper hexane layer and evaporate it to dryness under a stream of air at 60°, reconstitute the residue in 250 μL mobile phase, inject a 100 μL aliquot. (Reagent was 70 mM zinc chloride in MeCN:acetic 97:3.)

HPLC VARIABLES

Column: 250 × 4.6 5 μm Hypersil-ODS

Mobile phase: MeOH:dichloromethane:buffer 80:20:0.5 (Buffer was 2 M zinc chloride containing 1 M sodium acetate and 1 M acetic acid.)

Flow rate: 1

Injection volume: 100

Detector: F ex 248 em 418 (longpass cut-off filter) following post-column reaction. The column effluent flowed through a 20 × 3.9 column packed with 200 mesh zinc particles (to remove oxygen and reduce the vitamin K) to the detector.

CHROMATOGRAM

Retention time: 9.5

Internal standard: dihydro-vitamin K_1 (10.5)

Limit of detection: 50 pg/mL

OTHER SUBSTANCES

Extracted: vitamin K_1 epoxide

KEY WORDS

plasma; SPE; post-column reaction; pharmacokinetics

Retention time: 6.7 (cis), 7.7 (trans)

KEY WORDS
protect from light; normal phase; SPE

REFERENCE
Tanner,J.T.; Barnett,S.A.; Mountford,M.K. Analysis of milk-based infant formula. Phase IV. Iodide, linoleic acid, and vitamins D and K: U.S. Food and Drug Administration-Infant Formula Council: Collaborative study, *J.AOAC Int.*, **1993**, *76*, 1042–1056.

SAMPLE
Matrix: formula, milk
Sample preparation: Dissolve 3 g infant formula or milk powder in 15 mL warm water with thorough mixing. 15 mL Ready-to-use formula or prepared solution + 5 mL buffer + 1 g lipase (Type VII from Candida cylindracea, 700-1500 U/mg, Sigma), shake mechanically for 5 min, heat at 37° with sonication for 2 h (shake vigorously every 20 min), cool, add 10 mL EtOH: MeOH 95:5, add 1 g potassium carbonate, add 1 mL 100 μg/mL cholesteryl phenylacetate in hexane, add 15 mL hexane, shake mechanically for 7 min, centrifuge for 5 min, repeat extraction with 15 mL hexane. Combine the organic layers and evaporate a 25 mL aliquot to near dryness under reduced pressure at 40°, reconstitute the residue in 100 μL hexane inject the whole amount into a 100 × 8 5 μm Resolve silica radial compression column (Waters) with a Guard-Pak silica precolumn (Waters) eluted with hexane:isopropanol 99.9:0.1 at 2 mL/min, monitor effluent at UV 269, collect the fraction between 2 and 4.5 min (then purge column at 8 mL/min for 30 min). Evaporate the fraction to dryness under a stream of nitrogen, reconstitute the residue in 200-500 μL isopropanol, inject a 20-50 μL aliquot. (Buffer was 800 mM KH_2PO_4 adjusted to pH 8.0 with NaOH.)

HPLC VARIABLES
Guard column: Guard-Pak C18
Column: 100 × 8 5 μm Resolve C18 radial compression (Waters)
Mobile phase: MeOH:isopropanol:ethyl acetate:water 45:35:14.5:13.5 (After IS elutes purge column with MeOH:ethyl acetate 50:50 for 10 min, re-equilibrate for 5 min.)
Flow rate: 2
Injection volume: 20-50
Detector: UV 269, UV 277

CHROMATOGRAM
Retention time: 26
Internal standard: cholesteryl phenylacetate (43)
Limit of detection: 5 ng/g
Limit of quantitation: 50 ng/mL

REFERENCE

SAMPLE
Matrix: milk

Sample preparation: 500 μL Milk + 50 μL 54 ng/mL IS in EtOH + 10 μL 200 mg/mL albumin + 200 μL water containing 50 mM sodium taurocholate, 100 mM calcium chloride, and 150 mM NaCl, sonicate (titanium probe MSE Scientific Instruments) for 2 min (30 s on, 30 s wait) in an ice bath, add 1.2 mL 3.4 mg/mL crude lipase (porcine pancreas Type II (EC 3.1.1.3), Sigma), in 200 mM pH 7.7 Tris buffer, shake at 37° at 100 strokes/min for 45 min, add 4 mL EtOH, add 2 mL water, add 200 μL 50 g/L ammonium hydroxide, add 7.5 mL n-hexane, vortex for 2 min, inject an aliquot of the hexane layer on to a 200 × 4.6 5 μm RSIL column (RSL, Eke, Belgium) and elute with n-hexane:diisopropyl ether 98.5:1.5 at 0.85 mL/min (Caution! Diisopropyl ether readily forms explosive peroxides!), collect the fraction containing vitamin K and the IS, evaporate to dryness, reconstitute with 75 μL MeOH:ethyl acetate 96:4, inject a 50 μL aliquot.

HPLC VARIABLES

Column: 150 × 3.2 5 μm RoSIL HL (RSL, Eke, Belgium)
Mobile phase: MeOH:ethyl acetate 96:4 containing 2.25 g/L tetramethylammonium octahydridotriborate (Alfa)
Flow rate: 0.7
Injection volume: 50
Detector: F ex 325 em 430 following post-column reaction. The column effluent flowed through a 5 m × 0.5 mm i.d. knitted PTFE coil at 80° to the detector (the phylloquinone is reduced).

CHROMATOGRAM

Retention time: 7
Internal standard: a structural analog of phylloquinone with one more isoprene unit (Hoffman-La Roche) (11)
Limit of detection: 0.035 ng/mL
Limit of quantitation: 0.08 ng/mL

KEY WORDS

protect from light; post-column reaction

REFERENCE

SAMPLE

Matrix: milk
Sample preparation: Condition a Sep-Pak silica SPE cartridge with hexane. Treat 25 (?) mL milk with 2.5 g lipase at 37° for 90 min, treat with alcoholic NaOH for 15 s, extract twice with 50 mL portions of hexane. Evaporate the hexane extract, reconstitute with 5 mL hexane, add to the SPE cartridge, wash with 4 mL hexane, elute with 4 mL hexane:ether 96:4, inject an aliquot of the eluate.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm RP18 (Brownlee)
Column: 220 × 4.6 5 μm OD-224 RP18 (Brownlee)
Mobile phase: MeOH:water 99:1 containing 2.5 mM acetic acid/sodium acetate
Flow rate: 1.25
Injection volume: 10
Detector: E, EG & G PAR Model 400, MP 1304 glassy carbon series dual electrode, E1 (upstream) -1100 mV, E2 (downstream) +700 mV (Condition electrodes for 30 min at E1 -1200 mV and E2 +1500 mV at the start of each day.)

CHROMATOGRAM

Retention time: 19
Limit of detection: 3.1 ng

OTHER SUBSTANCES

Noninterfering: vitamin A, vitamin E

KEY WORDS

SPE

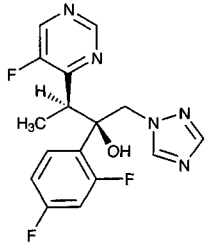
Voriconazole



Molecular formula: $C_{16}H_{14}F_3N_5O$
Molecular weight: 349.32
CAS Registry No.: 137234-62-9

SAMPLE

Matrix: blood
Sample preparation: Mix 700 μL plasma with 300 μL IS in 20 mM pH 6.5 ammonium phosphate buffer, inject an 800 μL aliquot of the mixture onto column A and elute to waste with mobile phase A, after 4 min divert the effluent from column A onto column B. After 8 min elute the contents of column B onto column C with mobile phase B, after 1 min remove column B from the circuit, elute column C with mobile phase B, monitor the effluent from column C. (Flush column B with MeOH at 0.8 mL/min when not in line with column A.)

HPLC VARIABLES

Column: A 100 × 10 Sephadex G-25 superfine Pharmacia HR 10/10 column (Pharmacia Biotech, UK); B 10 × 2.1 37.5 μm Whatman pellicular ODS; C 10 × 3.2 5 μm Spherisorb ODS2 + 250 × 4.6 5 μm Spherisorb ODS2
Mobile phase: A 20 mM pH 6.5 ammonium phosphate buffer; B MeCN:buffer 42:58 (Buffer was 100 mM tetramethylethylenediamine solution adjusted to pH 7.0 with 85% phosphoric acid.)
Flow rate: A 1; B 0.8
Detector: UV 255

CHROMATOGRAM

Retention time: 11.51
Internal standard: (αR,βS)-α-(2-chlorophenyl)-5-fluoro-β-methyl-α-(1H-1,2,4-triazol-1-ylmethyl)-4-pyrimidineethanol (UK-115 794) (13.55)
Limit of quantitation: 5 ng/mL

OTHER SUBSTANCES

Noninterfering: acetaminophen, didanosine, prednisolone, rifampicin, zidovudine

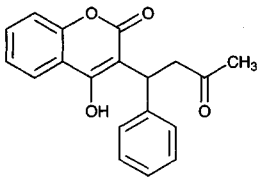
Warfarin



Molecular formula: $C_{19}H_{16}O_4$
Molecular weight: 308.33
CAS Registry No.: 81-81-2, 129-06-6 (sodium salt)
Merck Index: 10174
Lednicer No.: 1 131

SAMPLE

Matrix: blood
Sample preparation: Add 1 mL 2 M HCl, 100 μL 10 μg/mL diclofenac in 10:90 isopropanol: hexane, and 5 mL ether to 0.5 mL human plasma. Shake vigorously for 10 min and centrifuge at 4° at 1200 g for 10 min. Remove a 4 mL aliquot of the organic layer and evaporate it to dryness using a centrifugal vacuum evaporator at 50° for 30 min. Reconstitute residue with 200 μL isopropanol:hexane 10:90 and inject a 40 μL aliquot.

HPLC VARIABLES

Guard column: 50 × 4.6 Chiralcel OD
Column: 250 × 4.6 10 μm Chiralcel OD
Mobile phase: Isopropanol:acetic acid:hexane 18:0.5:81.5
Column temperature: 25
Flow rate: 1
Injection volume: 40
Detector: UV 312; circular dichroism detector (Model J-720, Jasco, Tokyo)

CHROMATOGRAM

Retention time: 13.1 (R), 25.3 (S)
Internal standard: diclofenac (9.6)
Limit of detection: 20 ng/mL (R), 40 ng/mL (S)

OTHER SUBSTANCES

Simultaneous: hydroxywarfarin
Noninterfering: acetaminophenon, aspirin, baraprost, captopril, cilostazol, diltiazem, dipyridamole, disopyramide, furosemide, ibuprofen, ketoprofen, metoprolol, ticlopidine
Interfering: indomethacin

KEY WORDS

plasma; chiral; pharmacokinetics

SAMPLE

Matrix: blood
Sample preparation: Condition a Bakerbond C18 SPE cartridge with 2 mL MeOH and 2 mL 1 M HCl. Mix 300 μL plasma with 2 mL 1 M HCl. Add to the SPE cartridge, wash with 2 mL HCl, elute with 2 mL MeOH. Concentrate the eluate to 25 μL under a stream of nitrogen, dilute with 85 μL mobile phase, centrifuge at 16000 g for 15 min. Inject a 100 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 Pirkle covalent (R, R) Whelk-O 1 (Regis)
Mobile phase: MeCN:0.5% glacial acetic acid 40:60
Flow rate: 1
Injection volume: 100
Detector: UV 313

CHROMATOGRAM
Retention time: 13.6 (S), 15.8 (R)
Internal standard: ethylwarfarin (16.5 (S), 18.5 (R))
Limit of quantitation: 250 ng/mL

OTHER SUBSTANCES
Simultaneous: amiodarone, aspirin, diclofenac, furosemide, ibuprofen, isosorbide dinitrate, lisinopril, phenytoin, tolbutamide

KEY WORDS
plasma; chiral; SPE

SAMPLE
Matrix: blood, tissue
Sample preparation: Condition a silica Sep-Pak SPE cartridge also containing 2 g sodium sulfate (?) with 5 mL MeOH and 5 mL cyclohexane. Mix 3 mL blood or crushed tissue with 1 mL 20 μg/mL IS, adjust to pH 3-4 with 0.5 M sulfuric acid, extract three times with 10 mL MeOH: chloroform 10:90 (Caution! Chloroform is a carcinogen!). Evaporate at 40°, re-dissolve the residue in 5 mL cyclohexane, sonicate and centrifuge three times. Remove a 5 mL aliquot of the top layer, evaporate at 40°. Reconstitute the residue in 5 mL cyclohexane. Add to the SPE cartridge, elute with 5 mL MeOH, evaporate at 40°, reconstitute the residue in MeOH, inject an aliquot.

HPLC VARIABLES
Column: 200 mm long μBondapak C18
Mobile phase: MeOH:0.8% acetic acid 80:20
Flow rate: 1
Injection volume: 10
Detector: UV 280

CHROMATOGRAM
Retention time: 4.5
Internal standard: N,N-diphenylbenzidine (9.3)
Limit of detection: 25 ng/mL

OTHER SUBSTANCES
Extracted: bromadiolone, brodifacoum, coumarin, coumatetralyl

KEY WORDS
SPE; plasma; heart; lung; liver; kidney; spleen

SAMPLE
Matrix: blood, urine
Sample preparation: Plasma. Mix 500 μL plasma with 30 μL MeOH, 50 μL 6 M hydrochloric acid and 3 mL diethyl ether, vortex for 30 s, centrifuge at 2000 g for 10 min, evaporate ether layer in a 45° water bath under a stream of nitrogen. Reconstitute the residue in 100 μL MeOH and inject a 20 μL aliquot. Urine. Mix 200 μL urine with 20 μL 6 M hydrochloric acid, 40 μL MeOH and 8 mL diethyl ether, vortex for 30 s, evaporate to dryness in a 45° water bath under a stream of nitrogen. Reconstitute the residue in 100 μL mobile phase and inject a 20 μL aliquot.

HPLC VARIABLES
Column: 150 × 3.9 10 μm μBondapak C18 (plasma), 150 × 3.9 5 μm Resolve Spherical C18 (urine)

Mobile phase: MeCN:buffer 38:62 (Buffer was 10 mM potassium dihydrogen phosphate adjusted to pH 3.0 with phosphoric acid.)
Flow rate: 1.5
Injection volume: 20
Detector: F ex 229 em 389

CHROMATOGRAM
Retention time: 9
Internal standard: warfarin

OTHER SUBSTANCES
Extracted: furosemide
Simultaneous: quinidine, sulfamethoxazole
Noninterfering: carbamazepine, cimetidine, diazepam, disopyramide, fluvoxamine, furosemide metabolite, meclofenamate, metoclopramide, phenobarbital, phenylbutazone, phenytoin, ranitidine, theophylline, trimethoprim

KEY WORDS
plasma; warfarin is IS

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 205.2

CHROMATOGRAM
Retention time: 20.358

KEY WORDS
whole blood

SAMPLE
Matrix: bulk

Sample preparation: Mix 100 μmol warfarin, 1 mg 4-(N,N-dimethylamino)pyridine, 200 μL triethylamine, and 1 mL dichloromethane, completely flush the vessel with nitrogen and cap it. Add dropwise 45 μL (S)-(+)-α-methoxy-α-(trifluoromethyl)phenylacetyl chloride (ACROS, Fairlawn NJ) via a syringe. Stir at room temperature for 3 h. Add 20 mL dichloromethane and 30 mL 100 mM pH 6.0 phosphate buffer. wash the organic layer twice with 30 mL portions of phosphate buffer, extract aqueous layer twice with 30 mL portions of dichloromethane. Dry the combined organic extracts over sodium sulfate, filter through a 2 g zirconia. Evaporate solvent in vacuum, re-suspend residue in THF. Inject a 0.1 μL aliquot.

HPLC VARIABLES

Column: 50 × 4.6 2.5 μm Hp-C/ZrO2 (The carbon-coated zirconium particles were prepared by chemical vapor deposition. Pass heptane through a zirconium dioxide particles in a tube furnace at ca. 700° and at reduced pressure (15-10 Torr) for 1.5 hour. Rinse particles with THF, extract particles with toluene in Soxhlet extractor.)
Mobile phase: THF:water 45:55
Column temperature: 30
Flow rate: 1.0
Injection volume: 0.1
Detector: UV 254

SAMPLE

Matrix: eggs
Sample preparation: Add 2 g anhydrous sodium sulfate to 5 g egg white or yolk. Extract twice with 15 mL acetone:diethyl ether 90:10. Homogenize for 5 min, centrifuge at 10000 g at -8° for 5 min, evaporate combined supernatants to dryness at 40°. Reconstitute dried extract with 3 mL MeCN. Wash twice with 3 mL hexane and centrifuge at 10000 g at -8° for 5 min. Discard hexane phase, evaporate MeCN phase to dryness under a stream of nitrogen in a 40° dry bath. Reconstitute with 1 mL mobile phase and filter it through a 0.45 μm filter. Inject a 50 μL aliquot.

HPLC VARIABLES

Guard column: 4.6 × 4.0 5 μm LiChroSpher 100 RP-18E
Column: 125 × 4.6 5 μm LiChroSpher 100 RP-18E
Mobile phase: MeOH:ammonium acetate triethylamine buffer 62:38 (Prepare buffer as follows. Mix 3.85 g ammonium acetate, 2 mL glacial acetic acid and 2 mL triethylamine in water, adjust to pH 5.2 with glacial acetic acid and make up to 1 L with water.)
Flow rate: 1.0
Injection volume: 50
Detector: UV 281

KEY WORDS
plasma; SPE; pharmacokinetics

REFERENCE
Oddie,C.J.; Jackman,G.P.; Bobik,A. Measurement of xamoterol in plasma and urine by high-performance liquid chromatography, *J.Chromatogr.*, **1984**, *308*, 370–375.

SAMPLE
Matrix: bulk
Sample preparation: Dissolve 10 μmole compound (as free base or hydrochloride) in 500 μL MeCN, add 250 μL 5% sodium carbonate (for hydrochlorides only), add 500 μL 100 mM reagent in MeCN, vortex for 1 min, heat at 60° for 2 h, add 100 μmole L-proline, heat at 60° for 30 min. Remove a 100 μL aliquot and dilute it with mobile phase, neutralize with acetic acid, inject a 10 μL aliquot. Prepare the reagent ((R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate) as follows. Add 0.7 mL carbon disulfide to 6 mL (1R,2R)-(-)-1,2-diaminocyclohexane, 12 mL water, and 12 mL EtOH, heat the oil bath to 80°, add 2.8 mL carbon disulfide dropwise (making sure that the product does not start to precipitate), when addition is complete reflux for 1 h, acidify with 500 μL 5 M HCl, reflux for 12 h, cool, filter, wash the solid with a little cold EtOH to give trans-4,5-tetramethyleneimidazolidine-2-thione as a white fluffy solid (mp 148-150°) (Tetrahedron 1993, 49, 4419). Stir 7.97 g 3,5-dinitrobenzoyl chloride in 30 mL dichloroethane at 50°, add a solution of 6 g trans-4,5-tetramethyleneimidazolidine-2-thione in 120 mL dichloroethane containing a catalytic amount of 4-(dimethylamino)pyridine over 15 min, reflux for 2 h, remove the crystals of (R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate by filtration, evaporate the filtrate to dryness and dissolve the residue in 60 mL dichloroethane, reflux for 16 h to obtain more (R,R)-N-(3,5-dinitrobenzoyl)-2-aminocyclohexylisothiocyanate (mp >250°, $[\alpha]_{546}$ = -133° (c = 1) in MeCN).

HPLC VARIABLES
Column: 125 × 4 5 μm Lichrospher 60 RP Select B
Mobile phase: MeCN:20 mM ammonium acetate 55:45
Flow rate: 1
Injection volume: 10
Detector: UV 254

CHROMATOGRAM
Retention time: k' 1.13, k' 2.27 (enantiomers)

OTHER SUBSTANCES
Also analyzed: acebutolol, alprenolol, atenolol, carazolol, carvedilol, formoterol, methamphetamine, metipranolol, metoprolol, nifenanol, nitrilo atenolol, oxprenolol, pindolol, propranolol

KEY WORDS
derivatization; chiral

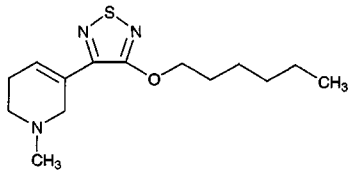
Xanomeline



Molecular formula: $C_{14}H_{23}N_3OS$
Molecular weight: 281.42
CAS Registry No.: 131986-45-3, 141064-23-5 (oxalate), 152854-19-8 (tartrate)
Merck Index: 10190

SAMPLE
Matrix: microsomal incubations
Sample preparation: Condition a 500 mg C18 Bond-Elut SPE cartridge with MeOH and water. Mix 2 mL microsomal incubation with 4.5 mL ice-cold MeOH, centrifuge at 4000 g for 10 min, dilute the supernatant with 15 mL water. Add a 2 mL aliquot to the SPE cartridge, wash with

2 mL water, elute with 2 mL MeOH:25% aqueous ammonia 96:4, evaporate the eluate to dryness under reduced pressure, reconstitute with mobile phase, inject an aliquot.

HPLC VARIABLES
Column: 100 × 4.6 3 μm ChromSpher Si (Chrompack)
Mobile phase: n-Heptane:2-propanol:water:25% ammonia 90:10:0.075:0.075 (A) or n-heptane:2-propanol:MeOH:25% ammonia 50:50:10:1 (B)
Detector: UV 295; MS, VG TRIO 1000, particle beam interface at 50°, helium at 25-30 psi, ion source 200°, positive ionization mode, electron current 150 μA, electron energy 70 eV

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
normal phase; rat; liver; SPE

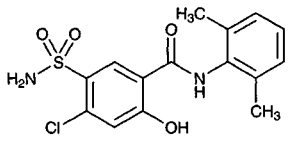
Xipamide



Molecular formula: $C_{15}H_{15}ClN_2O_4S$
Molecular weight: 354.81
CAS Registry No.: 14293-44-8
Merck Index: 10212
Lednicer No.: 2 93

SAMPLE
Matrix: blood
Sample preparation: 1 mL Plasma + 10 mL dichloromethane:2-propanol 75:25, shake for 10 min. Centrifuge at 2000 g for 10 min at 4°. Remove the organic phase and evaporate it to

dryness under a stream of nitrogen at 50°. Reconstitute the residue in 200 μL mobile phase, mix for 10 s. Centrifuge at 6500 g for 10 min. Inject a 40 μL aliquot of the supernatant.

HPLC VARIABLES
Guard column: 4 × 4 5 μm LiChrospher 100 RP-18
Column: 250 × 4 5 μm Supelcosil LC-18 (Supelco)
Mobile phase: n-Propanol:buffer 5:95 (Buffer was 50 mM sodium dodecyl sulfate in 10 mM pH 5.8 sodium phosphate buffer.)
Flow rate: 1.3
Injection volume: 40
Detector: UV 225

CHROMATOGRAM
Retention time: 8.58
Internal standard: xipamide

OTHER SUBSTANCES
Extracted: albuterol, atenolol, chlorthalidone

KEY WORDS
plasma; xipamide is IS

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 218.1

SAMPLE
Matrix: tissue
Sample preparation: Condition a Sep-Pak C18 SPE cartridge with 5 mL MeOH and 5 mL water. Homogenize kidney with a kitchen grinder. Weigh out a 5 g sample and add 20 mL MeCN with continuous gentle mixing, mix vigorously on a vibromixer at 1500 rpm for 30 s, sonicate for 2 min, centrifuge at 4000 g for 5 min. Mix 7.5 mL sample extract and 40 mL 10% NaCl and add to SPE cartridge, wash with 1 mL 10 mM sulfuric acid, wash with 2 mL air, elute with 2 mL acidic MeCN. Place eluate in a washed tube and evaporate to 300 μL at 70° under a stream of nitrogen, mix gently, add 1 mL n-hexane, mix on a vibromixer for 30 s, centrifuge at 2000 g, inject a 50 μL aliquot of the aqueous phase. (Acidic MeCN was 1 mL 50 mM sulfuric acid and 100 mL MeCN. The washed tube was prepared by rinsing with concentrated ammonia, water, and acetone and drying under a stream of nitrogen.)

HPLC VARIABLES
Guard column: 10 × 2.1 37-50 μm Bondapak C18
Column: 300 × 3.9 Bondapak C18
Mobile phase: MeCN:water 55:45 containing 2.46 g/L anhydrous sodium acetate, pH adjusted to 6.5 with acetic acid
Flow rate: 1.2
Injection volume: 50
Detector: UV 240

CHROMATOGRAM
Retention time: 6.5
Limit of detection: 4 ng/g

OTHER SUBSTANCES
Extracted: azaperol, carazolol, acepromazine, azaperone, haloperidol, propiomazine, chlorpromazine

SAMPLE
Matrix: tissue
Sample preparation: Condition a Bond-Elut C18 SPE cartridge with 5 mL MeOH and 5 mL water. Cut pig kidney or liver into small pieces and homogenize. 5 g Homogenate + 10 mL MeCN, shake, vortex for 30 s, sonicate for 3 min, vortex for 30 s, sonicate for 3 min, centrifuge at 10000 g for 20 min. Add 7.5 mL supernatant + 40 mL 10% NaCl to the SPE cartridge at about 1 mL/min, do not allow cartridge to dry out, wash with 850 μL 10 mM sulfuric acid, dry with air, elute with 3.5 mL acidic MeCN. Evaporate the eluate to dryness under a stream of nitrogen at 50°, reconstitute the residue in 300 μL 10 mM sulfuric acid, vortex briefly, add 1 mL hexane, vortex for 30 s, centrifuge at 2000 g for 5 min, inject an aliquot of the aqueous layer. (Acidic MeCN was 1 mL 50 mM sulfuric acid in 100 mL MeCN.)

HPLC VARIABLES
Guard column: Hypersil 5 μm SAS C1
Column: 250 mm long 5 μm Hypersil SAS C1
Mobile phase: MeCN:water 50:50 containing 0.77 g/L ammonium acetate
Flow rate: 2
Detector: E, ESA Model 5100A Coulochem, first electrode +0.4 V, second electrode (which was monitored) +0.7 V, Model 5020 guard cell after pump but before injector at +0.75 V

CHROMATOGRAM

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Tissuemizer) 20 g kidney and 70 mL chloroform at medium-high speed for 1-1.5 min, rinse blade with 5 mL chloroform, centrifuge at 1800 rpm for 10 min, filter (glass-fiber) supernatant, repeat extraction, rinse filter with 30 mL chloroform. Combine filtrates, add 1 mL 1 M HCl, evaporate to dryness under reduced pressure at 55°, add 25 mL MeOH, evaporate to dryness, reconstitute with 25 mL petroleum ether, add to Celite column, rinse flask with three 10 mL portions of petroleum ether, add rinses to column, rinse flask with two 50 mL portions of petroleum ether:MeOH 98.5:1.5, add to column, discard all effluent, elute with two 50 mL portions of MeOH. Evaporate eluate to dryness under reduced pressure at 55°, reconstitute with 25 mL MeOH, evaporate to dryness, reconstitute with 4-10 mL mobile phase, filter (0.45 μm), inject a 50 μL aliquot. (Petroleum ether was water saturated. Prepare Celite column as follows. Slurry 250 g Celite 545 and 800 mL HCl:water 50:50, heat on a steam bath with occasional stirring for several hours, allow to settle, pour off liquid, add 800 mL HCl: water 50:50, slurry, heat on a steam bath for several hours, allow to settle, decant liquid, wash with water until pH is neutral, wash with 250 mL MeOH, wash with 250 mL n-hexane, wash with 250 mL petroleum ether, heat on a steam bath to remove residual solvent, dry at 105°. Blend 2 g acid-washed Celite and 0.5 mL water, add to a 300 × 22 column, blend 3 g Celite and 1 mL 1 M HCl, add to the column.)

Column: 150 × 4.1 RSIL C18 (RSL, Eke, Belgium)
Mobile phase: MeOH:water 40:60 containing 20 mM sodium 1-octanesulfonate and 10 mM N,N-dimethyloctylamine, pH adjusted to 3.0 with orthophosphoric acid
Column temperature: 25
Flow rate: 1
Injection volume: 10
Detector: UV 220

CHROMATOGRAM
Retention time: 40

OTHER SUBSTANCES
Simultaneous: degradation products, antazoline, coumazoline, lidocaine, naphazoline, oxymetazoline, prednisolone, sulfadimidine, sulfanilamide, sulfathiazole, tenaphtoxaline, tetrahydrozoline, tolazoline, tramazoline

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 250 × 4.6 5 μm Supelcosil LC-DP (A) or 250 × 4 5 μm LiChrospher 100 RP-8 (B)
Mobile phase: MeCN:0.025% phosphoric acid:buffer 25:10:5 (A) or 60:25:15 (B) (Buffer was 9 mL concentrated phosphoric acid and 10 mL triethylamine in 900 mL water, adjust pH to 3.4 with dilute phosphoric acid, make up to 1 L.)
Flow rate: 0.6
Injection volume: 25
Detector: UV 229

CHROMATOGRAM
Retention time: 12.68 (A), 7.16 (B)

OTHER SUBSTANCES
Also analyzed: acebutolol, acepromazine, acetaminophen, acetazolamide, acetophenazine, albuterol, alprazolam, amitriptyline, amobarbital, amoxapine, antipyrine, atenolol, atropine, azatadine, baclofen, benzocaine, bromocriptine, brompheniramine, brotizolam, bupivacaine, buspirone, butabarbital, butalbital, caffeine, carbamazepine, cetirizine, chlorcyclizine, chlordiazepoxide, chlormezanone, chloroquine, chlorpheniramine, chlorpromazine, chlorpropamide, chlorprothixene, chlorthalidone, chlorzoxazone, cimetidine, cisapride, clomipramine, clonazepam, clonidine, clozapine, cocaine, codeine, colchicine, cyclizine, cyclobenzaprine, dantrolene,

desipramine, diazepam, diclofenac, diflunisal, diltiazem, diphenhydramine, diphenidol, diphenoxylate, dipyridamole, disopyramide, dobutamine, doxapram, doxepin, droperidol, encainide, ethidium bromide, ethopropazine, fenoprofen, fentanyl, flavoxate, fluoxetine, fluphenazine, flurazepam, flurbiprofen, fluvoxamine, furosemide, glutethimide, glyburide, guaifenesin, haloperidol, homatropine, hydralazine, hydrochlorothiazide, hydrocodone, hydromorphone, hydroxychloroquine, hydroxyzine, ibuprofen, imipramine, indomethacin, ketoconazole, ketoprofen, ketorolac, labetalol, levorphanol, lidocaine, loratadine, lorazepam, lovastatin, loxapine, mazindol, mefenamic acid, meperidine, mephenytoin, mepivacaine, mesoridazine, metaproterenol, metformin, methadone, methdilazine, methocarbamol, methotrexate, methotrimeprazine, methoxamine, methyldopa, methylphenidate, metoclopramide, metolazone, metoprolol, metronidazole, midazolam, moclobemide, morphine, nadolol, nalbuphine, naloxone, naphazoline, naproxen, nifedipine, nizatidine, norepinephrine, nortriptyline, oxazepam, oxycodone, oxymetazoline, paroxetine, pemoline, pentazocine, pentobarbital, pentoxifylline, perphenazine, pheniramine, phenobarbital, phenol, phenolphthalein, phentolamine, phenylbutazone, phenyltoloxamine, phenytoin, pimozide, pindolol, piroxicam, pramoxine, prazepam, prazosin, probenecid, procainamide, procaine, prochlorperazine, procyclidine, promazine, promethazine, propafenone, propantheline, propiomazine, propofol, propranolol, protriptyline, quazepam, quinidine, quinine, racemethorphan, ranitidine, remoxipride, risperidone, salicylic acid, scopolamine, secobarbital, sertraline, sotalol, spironolactone, sulfinpyrazone, sulindac, temazepam, terbutaline, terfenadine, tetracaine, theophylline, thiethylperazine, thiopental, thioridazine, thiothixene, timolol, tocainide, tolbutamide, tolmetin, trazodone, triamterene, triazolam, trifluoperazine, triflupromazine, trimeprazine, trimethoprim, trimipramine, verapamil, warfarin, yohimbine, zopiclone

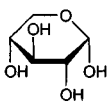
Xylose



Molecular formula: $C_5H_{10}O_5$
Molecular weight: 150.13
CAS Registry No.: 58-86-6
Merck Index: 10220

SAMPLE
Matrix: beverages, juice, milk
Sample preparation: Orange juice. Dilute orange juice 100-fold with water, filter (Millipore HV, 0.45 μm), dilute filtrate 10-fold, inject an aliquot. Beverages. Dilute soft drinks 1000-fold with water, inject an aliquot. Milk. Dilute 5 mL milk to 100 mL with mobile phase, filter (Millipore HV, 0.45 μm), dilute filtrate 50-fold, inject an aliquot.

HPLC VARIABLES
Guard column: 30 × 4.6 Cation H (Bio-Rad)
Column: 300 × 3.8 9 μm HPX 87-H Aminex (Bio-Rad)
Mobile phase: 10 mM Sulfuric acid
Column temperature: 50
Flow rate: 0.5
Injection volume: 40
Detector: E following post-column reaction, Hewlett-Packard 1049A programmable electrochemical detector, Metrohm detector cell, cuprous oxide working electrode +550 mV, glassy carbon auxiliary electrode, Ag/AgCl (3 M KCl) reference electrode. The column effluent mixed with 200 mM NaOH pumped at 0.4 mL/min, the mixture flowed through a 220 × 0.8 single-bead string reactor packed with 0.6 mm glass beads to the detector. (Prepare cuprous oxide electrode as follows. Stir 300 mg conductive carbon cement (Gerhard Neubauer, Munster), 60 mg cuprous oxide (Fluka), and 300 μL acetone until a thick paste forms as the acetone evaporates. Pack

conductive carbon cement into the base of a 3 mm diameter cavity carbon paste electrode base (Metrohm), allow to dry, polish with dry emery paper (grade 2/0, Oakey), remove surface layer with an acetone-soaked tissue, pack the paste into the cavity, allow to dry overnight, polish with dry emery paper (grade 2/0), 3 μm imperial micro finishing film sheet (3M), 0.3 μm imperial micro finishing film sheet (3M), and 0.05 μm alumina particles on a Buehler pad, sonicate for 2 min in water (Anal. Chim. Acta 1995, 300, 5).)

CHROMATOGRAM
Retention time: 11.25
Limit of detection: 0.9 μM

OTHER SUBSTANCES
Also analyzed: arabinose, cellobiose, dextrose, fructose, fucose, galactitol, galactose, galacturonic acid, lactose, lactulose, lyxose, maltose, mannitol, mannose, myo-inositol, raffinose, rhamnose, ribose, sorbose, sucrose

KEY WORDS
orange juice; soft drinks; post-column reaction; fruit

SAMPLE
Matrix: blood
Sample preparation: 100 μL Serum + 500 μL MeOH, shake for 1 min, centrifuge at 10000 rpm for 1 min, inject a 10 μL aliquot of the supernatant.

HPLC VARIABLES
Column: 300 × 4 Aminex A-27
Mobile phase: 500 mM Boric acid adjusted to pH 8.7 with KOH
Flow rate: 2
Injection volume: 10
Detector: F ex 357 (low-pressure mercury lamp) em 436 (420 nm cutoff filter) following post-column reaction. The column effluent mixed with the reagent pumped at 0.5 mL/min and the mixture flowed through a 10 m × 0.8 mm ID stainless steel coil at 150° to the detector. (Reagent was 20 g boric acid and 20 g ethanolamine in 1 L water.)

CHROMATOGRAM
Retention time: 20
Limit of quantitation: 5 nmoles

OTHER SUBSTANCES
Extracted: dextrose, fructose, galactose, maltose, ribose

SAMPLE
Matrix: solutions

HPLC VARIABLES
Column: 160 × 4 8 μm DAX8 anion-exchange resin, sulfate form (Durrum Chemical Co.) (Regenerate resin outside the column by washing 10 g resin with 400 mL water, 400 mL 500 mM NaCl at 50°, water, 0.5 N sodium sulfate at 50° (until a negative chloride test is obtained), water, and EtOH:water 95:5. Slurry pack below 70° with mobile phase at 1.14 mL/min.)
Mobile phase: EtOH:water 87.6:12.4
Column temperature: 88
Flow rate: 0.57
Injection volume: 5-100
Detector: UV 562 following post-column reaction. The column effluent mixed with the reagent pumped at 0.3 mL/min and the mixture flowed for 5 min through a coil of 0.3 mm ID PTFE at 100° to the detector. (Prepare reagent by mixing equal volumes of solution A and solution B, the mixture is stable for at least 1 month. Solution A is 1 g of copper sulfate pentahydrate and 3.7 g aspartic acid in 1 L water. Solution B is 38 g sodium carbonate decahydrate and 2 g sodium bicinchoninate (Pierce Chemical Co.) in 1 L water.)

CHROMATOGRAM
Retention time: 83
Limit of detection: <500 pmole

OTHER SUBSTANCES
Simultaneous: arabinose, dextrose, digitose, fructose, fucose, galactose, 2-d-galactose, 6-d-glucose, gulose, lyxose, mannose, 3-O-methylglucose, rhamnose, 2-d-ribose, ribose, sorbose, tagatose

SAMPLE
Matrix: solutions
Sample preparation: 10 μL EtOH containing sugars + 110 μL EtOH:acetic acid 99.9:0.1 + 100 μL Fmoc-hydrazine in MeCN, mix, heat at 65° for 3 h, cool to room temperature, dilute with EtOH or EtOH:acetic acid 99.9:0.1, inject an aliquot. (Prepare Fmoc-hydrazine as follows. Dissolve 100 mg 9-fluorenylmethylchloroformate in 25 mL MeCN, add this solution dropwise with stirring to 1 mL hydrazine hydrate (Caution! Hydrazine hydrate is a carcinogen!), stir for 30 min, evaporate under reduced pressure, use the crude product or recrystallize from EtOH or MeCN (mp 173-5°). Prepare a solution of Fmoc-hydrazine in MeCN so that the hydrazine:sugar ratio is 10:1.)

HPLC VARIABLES
Column: 150 × 4.6 5 μm Zorbax ODS

Mobile phase: Gradient. A was MeCN:water 27:73 containing 80 mM acetic acid. B was MeCN:water 30:70 containing 80 mM acetic acid. A:B from 100:0 to 0:100 over 30 min.
Flow rate: 1
Detector: F ex 270 em 320

CHROMATOGRAM
Retention time: 15
Limit of detection: 0.1 pmole

OTHER SUBSTANCES
Simultaneous: fructose, galactose, lactose, maltose, mannose, ribose

KEY WORDS
derivatization

Del Nozal,M.J.; Bernal,J.L.; Hernandez,V.; Toribio,L.; Mendez,R. Purpald (4-amino-3-hydrazino-5-mercapto-1,2,4-triazole) as a reagent for post-column derivatization of neutral monosaccharides in high pressure liquid chromatography, *J.Liq.Chromatogr.*, **1993**, *16*, 1105–1116.

SAMPLE
Matrix: solutions
Sample preparation: Mix a 50 μL aliquot of a 500 μM saccharide solution in MeCN:water 30:70 with 50 μL 10 mM reagent in MeCN and 100 μL 0.5% trichloroacetic acid in MeCN, heat at 65° in the dark for 3 h. Remove a 50 μL aliquot of the reaction mixture, add 200 μL water, add 200 μL ethyl acetate, mix, centrifuge at 3000 rpm for 2 min, repeat the ethyl acetate wash twice more. Dry the aqueous layer under reduced pressure, reconstitute with 200 μL MeCN, inject an aliquot. (Synthesis of reagent, R-(+)-DBD-ProCZ, is as follows. Dissolve 0.5 g magnesium sulfate heptahydrate and 6 g NaOH in 60 mL water, throughout the reaction keep the

flask at about 20° with cold water cooling, add 15 mL 30% hydrogen peroxide, add 75 mL MeOH, add 12.1 g powdered benzoyl peroxide in one go, stir for 10 min, pour into 150 mL 20% sulfuric acid, extract three times with 50 mL portions of chloroform, determine peroxybenzoic acid concentration by iodometric titration (Tetrahedron 1967, 23, 3327). Slowly add 110 mL 1 M peroxybenzoic acid in chloroform to 7 g 2,6-difluoroaniline dissolved in 100 mL chloroform, stir at room temperature, when reaction is complete (iodometric titration) wash with 2% sodium thiosulfate, wash with 5% sodium carbonate, wash with water, dry over anhydrous sodium sulfate, evaporate to dryness under reduced pressure, recrystallize 2,6-difluoronitrosobenzene from EtOH (mp 108.5-109.5). Stir 8.5 g 2,6-difluoronitrosobenzene in 85 mL DMSO at room temperature and add a solution of 3.91 g sodium azide in 85 mL DMSO dropwise, let stand for about 1 h, add to a large volume of water, extract with ether, dry the extracts over anhydrous sodium sulfate, evaporate to dryness under reduced pressure and distil to give 4-fluoro-2,1,3-benzoxadiazole as a colorless oil (bp 83°/12 mm Hg) (J.Chem.Soc.(C) 1970, 1433). Add 11 mL chlorosulfonic acid dropwise to 3 g 4-fluoro-2,1,3-benzoxadiazole in 10 mL chloroform at 0-10° (use a calcium chloride drying tube), stir at room temperature for 1 h, reflux for 2 h, cool, slowly pour into ice water, remove the organic layer, extract the aqueous layer with chloroform, combine the organic layer, wash, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, take up the residue in 5 mL benzene (Caution! Benzene is a carcinogen!), chromatograph on a 150 × 30 column of silica gel (100-200 mesh Kanto Chemical) with n-hexane:benzene 50:50, evaporate the appropriate fractions to give 4-(chlorosulfonyl)-7-fluoro-2,1,3-benzoxadiazole (CBD-F) as pale yellow needles (mp 64-66°) (Anal. Chem. 1984. 56, 2461). Stir 0.76 g CBD-F in 70 mL MeCN at 0-10° and add 1 g dimethylamine hydrochloride in 10 mL 100 mM pH 10 borax dropwise, adjust pH to 5 with 1 M HCl, concentrate to about 10 mL under reduced pressure, extract three times with 200 mL portions of diethyl ether, wash with water, dry over anhydrous magnesium sulfate, evaporate under reduced pressure, chromatograph on a 500 × 20 column of silica gel with chloroform, isolate the appropriate fraction and re-chromatograph on the same column with ethyl acetate:benzene 1:2 to give 4-(N,N-dimethylaminosulfonyl)-7-fluoro- 2,1,3-benzoxadiazole (DBD-F) as white needles (mp 124-125°) (yield = 1% !). On a Merck no. 5714 $60F_{254}$ tlc plate eluted with chloroform DBD-F has Rf 0.32 and lies between two other reaction products (Analyst 1989, 114, 413). It is also reported that DBD-F can be purchased from Tokyo Kasei. Add 100 mg DBD-F in 10 mL MeCN to 47 mg R-(+)-proline in 20 mL 250 mM pH 11.5 sodium carbonate solution, stir at room temperature for 30 min, wash with ethyl acetate, adjust the pH of the aqueous layer to 1-2 with 2 M HCl, extract three times with 30 mL ethyl acetate. Combine the extracts and evaporate them under reduced pressure, recrystallize from benzene/ethyl acetate to give R-(+)-4-(N,N-dimethylaminosulfonyl)-7-(2-carboxypyrrolidin-1-yl)-2,1,3-benzoxadiazole (DBD-Pro) as yellow needles (mp 187-9° d) (Analyst 1989, 114, 1233). Suspend 55 mg (R)-(+)-DBD-Pro in 55 mL anhydrous diethyl ether at 0°, add 110 mg phosphorus pentachloride, stir at 5° for 1 h, filter quickly, evaporate to dryness under reduced pressure, dry under vacuum over phosphorus pentoxide for 12 h to give R-(+)-4-(N,N-dimethylaminosulfonyl)-7-(2-chloroformylpyrrolidin-1-yl)-2,1,3-benzoxadiazole (DBD-Pro-Cl) as yellow crystals (mp 116-17°) (Analyst 1993, 118, 759). Add 130 mg DBD-Pro-Cl dissolved in 25 mL anhydrous benzene dropwise to 100 mL MeOH containing 70 mg hydrazine hydrate, stir for 30 min at room temperature, evaporate under reduced pressure, recrystallize from ethyl acetate:MeOH 90:10 to give R-(+)-4-(2-carbazolylpyrrolidin-1-yl)-7-(N,N-dimethylaminosulfonyl)-2,1,3-benzoxadiazole (R-(+)-DBD-ProCZ) as orange crystals (mp 107-109°) (Anal. Proc. 1994, 31, 265).)

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of

maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 220.5

CHROMATOGRAM

Retention time: 11.51

KEY WORDS

whole blood

SAMPLE

Matrix: cell cultures
Sample preparation: Extract 5 g cell culture with 20 mL MeOH with sonication for 10 min, repeat extraction twice. Evaporate extracts to dryness under reduced pressure, reconstitute in 100 mL 10 mM HCl, filter, adjust pH to 6 with 10 mM NaOH, inject a 5-100 μL aliquot.

HPLC VARIABLES

Column: 250 × 4 10 μm Armsorb-300-C8 (Armchrom, Yerevan, Armenia)
Mobile phase: Gradient. A was MeCN:water 10:90 containing 0.1% trifluoroacetic acid. B was 0.1% trifluoroacetic acid in MeCN. A:B from 100:0 to 50:50 over 50 min.
Flow rate: 0.8
Injection volume: 5-100
Detector: UV 280

CHROMATOGRAM

Retention time: 21

OTHER SUBSTANCES

Extracted: ajmaline, ajmalicine, reserpine, raucaffricine, serpentine

SAMPLE

Matrix: plants
Sample preparation: Freeze leaves with liquid nitrogen, air dry, grind to a fine powder. Mix 0.5 g powder and 2 mL MeOH, sonicate for 30 min, allow to settle, decant the liquid, repeat extraction. Combine the extracts and filter (0.45 μm) them, inject a 10 μL aliquot of the filtrate.

HPLC VARIABLES

Column: 100 × 4.6 3 μm Microsorb C18

Mobile phase: Gradient. MeCN:buffer 15:85 for 2 min, to 40:60 over 58 min, maintain at 40:60 for 5 min, to 95:5 over 5 min, maintain at 95:5 over 5 min. (Prepare buffer by mixing 2 mL trifluoroacetic acid and 1 mL triethylamine in water, make up to 1 L with water, adjust pH to 2.4 with ammonium hydroxide.)
Injection volume: 10
Detector: UV 274

CHROMATOGRAM
Retention time: 16.25

OTHER SUBSTANCES
Extracted: tetrahydroalstonine, tryptamine, vinblastine, vincamine, vincristine
Interfering: ajmalacine

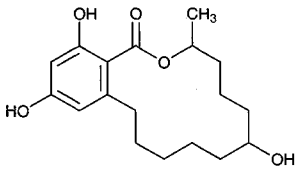
Zeranol



Molecular formula: $C_{18}H_{26}O_5$
Molecular weight: 322.40
CAS Registry No.: 26538-44-3, 55331-29-8
Merck Index: 10251

SAMPLE
Matrix: blood
Sample preparation: Hydrolyse serum or plasma with β-glucuronidase and sulfatase, extract with diethyl ether. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at room temperature, reconstitute the residue in 40 μL buffer, add 100 μL 1.5 mg/mL dansyl chloride in acetone, shake vigorously for 30 s, heat at 100° for 5 min, inject a 20 μL aliquot. (Prepare buffer by adjusting the pH of 4 g/L sodium bicarbonate in water to 10.5 with 5 M NaOH.)

HPLC VARIABLES
Column: 250 × 2.6 PAH-10 C18 (Perkin-Elmer)
Mobile phase: Gradient. MeCN:water from 60:40 to 95:5 over 15 min (Perkin-Elmer curve 1), maintain at 95:5 for 10 min. (Flush column with MeCN at 0.1 mL/min overnight.)
Flow rate: 1
Injection volume: 20
Detector: F ex 335 em 540

CHROMATOGRAM
Retention time: 11.5
Limit of detection: 80 ng

OTHER SUBSTANCES
Extracted: diethylstilbestrol, estriol, estrone, hexestrol, zanone, zenone

KEY WORDS
derivatization; cow; sheep; plasma; serum; LOD is too high for practical detection of compounds in serum and plasma.

SAMPLE
Matrix: tissue

Sample preparation: Homogenize 2.5 g tissue with 10 mL acetone for 20 s, sonicate for 5 min, centrifuge at 3200 rpm. Decant the supernatant into a silanized tube. Add 8 mL acetone to the pellet and repeat the extraction. Combine the supernatants. Add to a 5 mL pipette tip containing 1.5 g alumina (80-200 mesh, Brockman activity 1) followed by an Econo-Column filled with 1.0 g AGMP-1 resin (Bio-Rad), allow to pass through by gravity. Wash with four 1 mL portions of acetone:water 95:5. Remove the alumina column, wash the ion-exchange column with 1 mL acetone:water 95:5, elute with four 1 mL portions of 10% acetic acid in acetone. Evaporate the combined eluates to dryness with nitrogen at 40°. Add 500 μL water to the residue, extract twice with 2 mL potions of ether. Combine the ether layers and evaporate them to dryness. Reconstitute the residue in mobile phase B. Inject a 20 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Supelco silica
Mobile phase: Gradient. A was hexane. B was MeOH:hexane:2-propanol 45:40:15. A:B from 100:0 to 60:40 over 15 min.
Flow rate: 2.0
Injection volume: 20
Detector: UV 280

CHROMATOGRAM

Retention time: 11.54
Limit of detection: 10 ng

OTHER SUBSTANCES

Extracted: diethylstilbestrol, estradiol
Simultaneous: estrone, zeralenol, zeralanone, zeralenone

KEY WORDS

chicken; muscle; normal phase; SPE

SAMPLE

Matrix: tissue
Sample preparation: Homogenize (Tekmar Model 3412-A20) 80 g ground tissue and 160 mL MeOH at medium-high speed for two 1 min intervals, centrifuge at 1500 rpm for 10 min, remove the supernatant, rinse apparatus with two 10 mL portions of MeOH. Combine the organic layers and evaporate them to 25 mL under a stream of nitrogen, adjust pH to 5.0 ± 0.2 with 20% acetic acid, add 4 mL freshly prepared β-glucuronidase solution in water (1 mg/mL, Type B-1, 500 000 U/g, Sigma), add 5 mL chloroform, mix by swirling, heat at 37° for 12-16 h, cool, add 45 mL chloroform, shake for 10 s, pass organic layer through 30-35 g anhydrous sodium sulfate (prewashed with 30 mL chloroform), extract aqueous layer with 50 mL chloroform, pass organic layer through sodium sulfate, wash sodium sulfate with two 5 mL portions of chloroform. Combine the chloroform layers and add 10 mL 2 M NaOH, shake vigorously for 30 s, discard organic layer, wash aqueous layer with two 50 mL portions of chloroform. Adjust the pH of the aqueous layer to 10.6-10.8 with 19-20 mL 1 M sodium bicarbonate solution, extract three times with 25 mL portions of chloroform, pass extracts through 30-35 g anhydrous sodium sulfate (prewashed with chloroform), wash sodium sulfate with 10 mL chloroform, evaporate chloroform layer to dryness under reduced pressure at 40°, reconstitute with 2 mL MeOH, inject a 25 μL aliquot.

HPLC VARIABLES

Column: 150 × 3.9 5 μm Nova-Pak RP-C18
Mobile phase: MeOH:buffer 50:50 (Buffer was 90 mM sodium acetate containing 10 mg/L EDTA adjusted to pH 6.9 with acetic acid.)
Flow rate: 1
Injection volume: 25
Detector: E, Bioanalytical Systems LC4B-17D, glassy carbon electrode +0.90 V, Ag/AgCl reference electrode

CHROMATOGRAM
Retention time: 20
Limit of detection: 100 pg

OTHER SUBSTANCES
Extracted: zearalanone, β-zearalenol, zearalenone

KEY WORDS
chicken; cow; muscle; liver

SAMPLE
Matrix: tissue
Sample preparation: Dry pack 60 × 8 mm glass columns with 250 mg Carbopack B (200-400 mesh) and 60 × 4 mm glass columns with 50 mg Amberlite CG-400 I (100-200 mesh). Wash Carbopack column with 5 mL MeOH, 15 mL dichloromethane:MeOH 70:30, and MeOH:water 85:15. Wash Amberlite column with 3 mL 0.5 M NaOH, 8 mL dichloromethane:MeOH 70:30, 1 mL water, and 3 mL 1 M HCl. Repeat this cycle 4 times. Finally pass through 20 mL 50 mM NaOH then 1 mL water. Keep column in water. (Process converts Amberlite to OH form.) Homogenize 1 g of tissue in 5 mL MeOH, sonicate 5 min, centrifuge at 6000 rpm for 10 min. Add another 5 mL MeOH to pellet and repeat. Combine supernatants, make up to 6.8 mL with MeOH, add 1.2 mL water. Pass through Carbopack column, wash column with 2 mL MeOH: water 85:15 then 2 mL MeOH, elute column with 8 mL dichloromethane:MeOH 70:30. Pass eluate onto Amberlite column, wash with 1 mL MeOH, 1 mL 1 M HCl, elute with 2 mL 30 mM HCl in MeCN:MeOH 20:80. Evaporate eluate to dryness with nitrogen at 40°, take up in 100 μL MeCN:MeOH:THF:10 mM KH_2PO_4 adjusted to pH 3.0 with phosphoric acid 22:8:13:57, inject 50 μL aliquot

HPLC VARIABLES
Guard column: 20 × 4.6 5 μm Supelguard LC-18
Column: 250 × 4.6 5 μm Supelco C18
Mobile phase: MeCN:MeOH:THF:10 mM KH_2PO_4 adjusted to pH 3.0 with phosphoric acid 21: 7:12:60
Flow rate: 1.5
Injection volume: 50
Detector: E, Coulochem 5100A, detector 1 0.05 V, detector 2 0.60 V

CHROMATOGRAM
Retention time: 12
Limit of detection: 1 ng/g

OTHER SUBSTANCES
Simultaneous: taleranol, zearalenol, zearalenone

KEY WORDS
muscle; liver; chicken; ox

SAMPLE
Matrix: tissue
Sample preparation: Homogenize (Waring blender) tissue at full speed for 2 min, lyophilize, grind. Extract with supercritical carbon dioxide at 60° at 400 atmospheres with a 20 cm × 21 μm restrictor for 1 h, collect the extract in 1 mL MeOH cooled to 5°. Evaporate the MeOH to dryness under a stream of nitrogen, reconstitute the residue in 100 μL MeCN:MeOH:20 mM

ammonium formate 15:15:70, inject an aliquot. Alternatively, vortex 5 g ground tissue with 10 mL 40 mM sodium acetate, adjust pH to 4.2-4.7 with glacial acetic acid, add 100 μL β-glucuronidase (Sigma), heat at 37° for 8 h, add 20 mL MeCN, vortex for 30 s, centrifuge at 5000 rpm for 20 min. Remove a 30 mL aliquot of the supernatant and add it to 8 mL hexane and 2 mL dichloromethane, rotate for 3 min, centrifuge at 2000 rpm for 2 min. Remove a 15 mL aliquot of the middle layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 1 mL dichloromethane, inject an aliquot.

HPLC VARIABLES
Column: 50 × 4.6 5 μm Supelcosil
Mobile phase: Gradient. MeCN:MeOH:20 mM ammonium formate from 2.5:2.5:95 to 47.5:47.5:5 over 19 min.
Flow rate: 1
Injection volume: 20
Detector: UV 245 or MS, Sciex TAGA 6000E tandem triple quadrupole, APCI

CHROMATOGRAM
Retention time: 11.3
Limit of detection: 100 ppb

OTHER SUBSTANCES
Extracted: dexamethasone, diethylstilbestrol, medroxyprogesterone, melengestrol acetate, trenbolone, triamcinolone acetonide

Matrix: solutions

HPLC VARIABLES
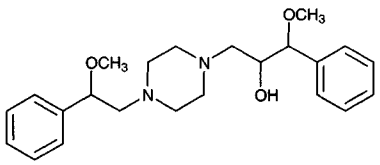
Column: TSK G-3000SW (Toyo Soda)

Mobile phase: 10 mM pH 7.9 ammonium bicarbonate containing 30 mM NaCl
Flow rate: 1
Detector: UV 254, UV 280

REFERENCE

Maeda,H.; Ueda,M.; Morinaga,T.; Matsumoto,T. Conjugation of poly(styrene-co-maleic acid) derivatives to the antitumor protein neocarzinostatin: pronounced improvements in pharmacological properties, *J.Med.Chem.*, **1985**, *28*, 455–461.

Zipeprol



Molecular formula: $C_{23}H_{32}N_2O_3$
Molecular weight: 384.52
CAS Registry No.: 34758-83-3, 34758-84-4 (2.HCl)
Merck Index: 10303

SAMPLE

Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 µL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) µL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES

Guard column: 20 mm long Symmetry C18
Column: 250 × 4.6 5 µm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 205.2

CHROMATOGRAM

Retention time: 13.45

KEY WORDS

whole blood

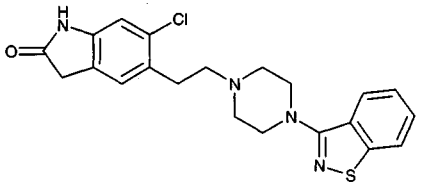
Ziprasidone



Molecular formula: $C_{21}H_{21}ClN_4OS$
Molecular weight: 412.94
CAS Registry No.: 146939-27-7, 138982-67-9 ($H_2O.HCl$)
Merck Index: 10304

SAMPLE

Matrix: blood, feces, urine
Sample preparation: Serum. 5 mL Serum + 10 mL MeCN, mix, centrifuge, wash the pellet with 2 mL MeCN, combine the supernatants, concentrate, reconstitute the residue with 200 μL mobile phase, inject an 80 μL aliquot. Urine. Condition a Sep-Pak C18 cartridge. 10 mL Urine + pH 5.0 acetate buffer, add to the SPE cartridge, wash with water, elute with MeOH, evaporate to dryness. Reconstitute the residue with 200 μL MeOH:ammonium acetate 20:80, inject an 80 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm YMC basic
Mobile phase: Gradient. MeOH:20 mM pH 5.0 ammonium acetate 10:90 for 10 min, to 80:20 over 50 min, maintain at 80:20 for 7 min, return to initial conditions over 8 min, re-equilibrate for 10 min.
Injection volume: 80
Detector: UV; Radioactivity, β-RAM; MS, Perkin-Elmer Sciex API III, ion spray interface at 6000 V, collision gas argon, collision energy 25 eV

CHROMATOGRAM

Retention time: 48
Limit of quantitation: 0.5-50 ng/mL (serum)

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

SPE; serum; pharmacokinetics; radiolabeled

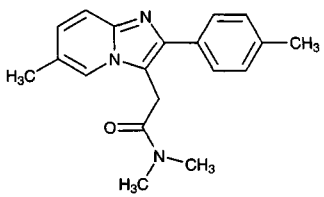
Zolpidem



Molecular formula: $C_{19}H_{21}N_3O$
Molecular weight: 307.40
CAS Registry No.: 82626-48-0, 99294-93-6 ((+)-tartrate (2:1))
Merck Index: 10321
Lednicer No.: 4 162

SAMPLE

Matrix: blood
Sample preparation: Mix 2 mL plasma, 2 mL pH 9.2 carbonate buffer, and 4 mL hexane:dichloromethane 4:3, centrifuge at 3000 rpm for 10 min. Remove the upper organic phase and evaporate it to dryness under a stream of air. Reconstitute the residue with mobile phase. Inject a 100 μL aliquot.

HPLC VARIABLES

Column: 300 × 4.6 5 μm C18 Spherisorb ODS-2
Mobile phase: MeOH:THF:buffer 30:65:5 (Buffer was 10 mM potassium dihydrogen phosphate containing 0.1% triethylamine, adjusted to pH 2.6 with orthophosphoric acid.)
Flow rate: 0.8
Injection volume: 100
Detector: UV 305

CHROMATOGRAM

Retention time: 5.5
Limit of detection: 20 ng/mL

OTHER SUBSTANCES

Extracted: zopiclone
Simultaneous: acepromazine, alprazolam, amisulpiride, amitriptyline, clobazam, clotiazepam, cyamemazine, desipramine, diazepam, flunitrazepam, haloperidol, imipramine, levomepromazine, lormetazepam, midazolam, nitrazepam, nortriptyline, prazepam
Interfering: bromazepam, lorazepam, niaprazine

KEY WORDS

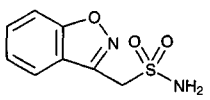
Zonisamide



Molecular formula: $C_8H_8N_2O_3S$
Molecular weight: 212.23
CAS Registry No.: 68291-97-4
Merck Index: 10323
Lednicer No.: 4 130

SAMPLE

Matrix: blood
Sample preparation: 100 μL Plasma + 250 μL 500 mM pH 4.5 NaH_2PO_4 + 50 μL 40 mg/mL IS in MeOH + 7 mL dichloroethane, vortex for 1 min, let stand for a few min. Remove the organic layer and filter (Whatman No. 1 paper) it, evaporate the filtrate to dryness under a stream of air in a warm water bath, reconstitute the residue in 50 μL mobile phase, inject a 20 μL aliquot.

HPLC VARIABLES

Guard column: 10 × 4.4 30-38 μm CO:Pell ODS
Column: 250 × 4.4 Hypersil 5 MOS
Mobile phase: MeCN:buffer 58:100 (Buffer was 50 mL 1 M NaOH and 58 mL 1 M acetic acid made up to 1 L with water.)
Flow rate: 1.5
Injection volume: 20
Detector: UV 280

CHROMATOGRAM

Retention time: 4
Internal standard: 3-sulfamoylmethyl-6-fluoro-1,2-benzisoxazole (5)
Limit of quantitation: 900 ng/mL

OTHER SUBSTANCES

Simultaneous: carbamazepine, carbamazepine 10,11-epoxide, carbamazepine 10,11-diol
Noninterfering: acetaminophen, acetazolamide, N-acetylprocainamide, ampicillin, caffeine, cefuroxime, cimetidine, chloramphenicol, clobazam, desmethylclobazam, desmethylsuximide, ethosuximide, mefenamic acid, metronidazole, naproxen, paraxanthine, pentobarbital, phenobarbital, phenytoin, primidone, procainamide, salicylic acid, sulfamethazine, sulfamethoxazole, sulthiame, theophylline, thiopental

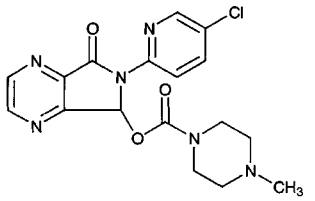
Zopiclone



Molecular formula: $C_{17}H_{17}ClN_6O_3$
Molecular weight: 388.81
CAS Registry No.: 43200-80-2
Merck Index: 10324

SAMPLE

Matrix: blood
Sample preparation: Condition a 500 mg Bond Elut LRC C2 SPE cartridge with 2 mL MeOH, 2 mL MeCN:water:trifluoroacetic acid 80:20:0.1, and 5 mL Tris buffer. Mix 100 µL 100 ng/mL IS with 2 mL 50 mM Tris buffer adjusted to pH 7.5 with concentrated HCl and 500 µL plasma. Add sample to the SPE cartridge and draw through by vacuum at 2 mL/min. Wash with 20 mL Tris buffer, dry with vacuum for 1 min. Elute with 2 mL MeCN:water:trifluoroacetic acid 80:20:0.1, evaporate the eluate to dryness under a stream of nitrogen at 40°. Reconstitute the residue in 1 mL MeOH, vortex for 40 s, centrifuge at 3000 rpm for 15 min, decant the supernatant, evaporate to dryness. Reconstitute the residue in 200 µL mobile phase, vortex for 20 s. Inject a 50 µL aliquot.

HPLC VARIABLES

Guard column: 4 µm Nova-Pak phenyl Guard-Pak
Column: 300 × 4.6 5 µm C18 Spherisorb ODS-2
Mobile phase: MeOH:THF:buffer 30:65:5 (Buffer was 10 mM potassium dihydrogen phosphate containing 0.1% triethylamine, adjusted to pH 2.6 with orthophosphoric acid.)
Flow rate: 0.8
Injection volume: 100
Detector: UV 305

CHROMATOGRAM

Retention time: 4.5
Limit of detection: 20 ng/mL

OTHER SUBSTANCES

Extracted: zolpidem
Simultaneous: acepromazine, alprazolam, amisulpride, amitriptyline, clobazam, clotiazepam, cyamemazine, desipramine, diazepam, flunitrazepam, haloperidol, imipramine, levomepromazine, lormetazepam, midazolam, nitrazepam, nortriptyline, prazepam

SAMPLE

Matrix: blood, gastric contents

Sample preparation: 1 mL Whole blood or gastric contents + 50 µL 400 µg/mL IS in MeOH + 1 mL EtOH + 5 drops 1 M pH 9 potassium carbonate + 2 mL water + 8 mL n-hexane:MTBE 25:75, rotate for 15 min, centrifuge at 2500 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen, reconstitute the residue in 100 µL mobile phase, inject a 50 µL aliquot.

HPLC VARIABLES

Column: 150 × 4.6 5 µm Hypersil BDS C18

Mobile phase: Gradient. A was MeCN:MeOH:1.5 M ammonium acetate:water 10:10:3:77. B was MeCN:MeOH:1.5 M ammonium acetate:water 40:40:3:17. A:B from 95:5 to 50:50 over 20 min.

Flow rate: 1

Injection volume: 50

Detector: UV 230

CHROMATOGRAM

Retention time: 15.6

Internal standard: N-allylnormetazocine (Sigma) (9)

OTHER SUBSTANCES

Extracted: pentazocine

KEY WORDS

whole blood

SAMPLE

Matrix: blood, tissue

Sample preparation: Blood. 1 mL Whole blood + 10 µL 8.5 µg/mL IS in MeCN + 300 µL saturated pH 9 borate buffer + 3 mL n-butyl chloride, vortex for 2 min, centrifuge, repeat the extraction. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 40°, reconstitute the residue in 100 µL MeCN, inject a 10-30 µL aliquot. Tissue. Stir

10 g homogenized liver tissue, 40 mL Tris buffer, and 10 mg Subtilisin-Carlsberg protease at room temperature overnight, filter through glass wool. 1 mL Homogenate + 10 μL 8.5 μg/mL IS in MeCN + 300 μL saturated pH 9 borate buffer + 3 mL n-butyl chloride, vortex for 2 min, centrifuge, repeat the extraction. Combine the organic layers and evaporate them to dryness under a stream of nitrogen at 40°, reconstitute the residue in 500 μL hexane, extract with two 1 mL portions of MeCN. Combine the MeCN layers and evaporate them to dryness, reconstitute the residue in 100 μL MeCN, inject a 10-30 μL aliquot. (Prepare Tris buffer by dissolving 121 g Tris in 1 L water, adjust pH to 7.0 with concentrated sulfuric acid.)

HPLC VARIABLES

Column: 220 × 4.6 5 μm Spheri 5 silica
Mobile phase: MeCN:buffer 60:40 (Prepare buffer by dissolving 1.15 g $(NH_4)H_2PO_4$ in 1 L water and adding 1 mL triethylamine, pH 6.8.)
Flow rate: 1
Injection volume: 10-30
Detector: UV 305

CHROMATOGRAM

Internal standard: 6-(6-chloro-2-quinolyl)-7-[(4-methyl-1-piperazinyl)carbonyloxy]-6,7-dihydro [5H]pyrrolo[3,4-b]pyrazine-5-one
Limit of detection: 50 ng/g

KEY WORDS

whole blood; liver

SAMPLE

Matrix: blood, urine
Sample preparation: Condition a 1 mL BondElut C18 SPE cartridge with one column volume of 1 M HCl, with 2 column volumes of MeOH, and with 1 column volume of water. Hemolyze 1 mL blood with 500 μL water, centrifuge. Add 250 μL 250 ng/mL harmane hydrochloride in 200 mM NaH_2PO_4 and 1 mL serum or hemolysate or 500 μL urine to the SPE cartridge at 1 mL/min, wash with 2 column volumes of water, wash with two 500 μL aliquots of MeCN (drain completely after each wash), elute with 250 μL MeOH:35% perchloric acid 99:1 (remove the final portion of eluate by centrifuging for 20 s), inject a 10 (urine) or 25 (serum) μL aliquot of the eluate.

HPLC VARIABLES

Guard column: 15 × 3.2 7 μm RP-18 (Applied Biosystems)
Column: 150 × 4.6 5 μm Ultrasphere ODS C18
Mobile phase: MeCN:0.1% tetramethylammonium perchlorate 17:83, adjusted to pH 3.8 with 10% perchloric acid
Flow rate: 1.8
Injection volume: 10-25
Detector: F ex 320 em 520, UV 305

CHROMATOGRAM

Retention time: 12.2
Internal standard: harmane (8.3)
Limit of quantitation: 2 ng/mL (serum, F), 10 ng/mL (urine, F)

OTHER SUBSTANCES

Extracted: metabolites
Noninterfering: acetaminophen, atenolol, barbiturates, benzodiazepines, chlordiazepoxide, fluoxetine, imipramine, metoprolol, nadolol, paroxetine, salicylic acid

KEY WORDS

serum; SPE

SAMPLE

Matrix: formulations
Sample preparation: Grind tablets to a fine powder, weigh out amount equivalent to 5 mg zopiclone, add 40 mL 100 mM HCl, sonicate for 15 min, cool to room temperature, make up to 50 mL with 100 mM HCl, filter (1.6 μm glass fiber, Whatman GF/A), inject a 20 μL aliquot of the filtrate.

HPLC VARIABLES

Column: 125 × 4 5 μm LiChrospher-60 RP Select B
Mobile phase: MeCN:THF:buffer 18:1:81 (Buffer was 3.4 g monosodium hexane sulfonate and 7.0 g $NaH_2PO_4.2H_2O$ in 1 L water, pH 4.55.)
Column temperature: 25
Flow rate: 1.5
Injection volume: 20
Detector: UV 303

CHROMATOGRAM

Retention time: 7.5
Limit of detection: 0.05% (of zopiclone)

OTHER SUBSTANCES

Simultaneous: degradation products, impurities
Noninterfering: excipients

KEY WORDS

protect from light; tablets; rugged; stability-indicating

SAMPLE
Matrix: urine
Sample preparation: Dilute urine 5-fold with 50 mM pH 8.4 phosphate buffer. 1 mL Diluted urine + 100 μL 20 μg/mL suriclone in EtOH + 10 mL dichloromethane:isopropanol 95:5, shake gently for 5 min, centrifuge at 2000 g for 10 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 37°, reconstitute the residue in 120 μL EtOH, inject a 100 μL aliquot on to column A and elute to waste with mobile phase A, after 11.5 min elute the fraction containing zopiclone on to column B, after 1.5 min backflush the contents of column

B on to column C with mobile phase B, elute with mobile phase B, monitor the effluent from column C. (Chiral separation of metabolites can also be achieved by collecting the fractions containing the metabolites (20.5 to 25.5 min and 46.5 to 55.5 min) on column B then chromatographing them on column C.)

HPLC VARIABLES

Column: A 150 × 4.6 5 μm Nucleosil cyanopropyl; B 60 × 4 5 μm Kromasil silica (Informatiques & Technologies); C cellulose carbamate guard column + 250 × 4.6 5 μm cellulose carbamate (Société Française Chromato Colonne)
Mobile phase: A Hexane:EtOH:MeOH 80:5:15 containing 0.18% MeOH:diethylamine 99.9:0.1 and 0.05% water; B Hexane:EtOH:MeOH:diethylamine 55:30:15:1
Column temperature: 35 (column C only)
Flow rate: A 0.7; B 1.2
Injection volume: 100
Detector: F ex 305 em 470

CHROMATOGRAM

Retention time: 20 (-), 25 (+)
Internal standard: suriclone (18 (on column A only))
Limit of quantitation: 10 ng

OTHER SUBSTANCES

Extracted: metabolites

KEY WORDS

chiral; column-switching; pharmacokinetics; heart-cut

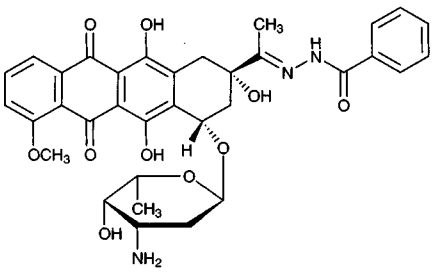
Zorubicin

Molecular formula: $C_{34}H_{35}N_3O_{10}$
Molecular weight: 645.67
CAS Registry No.: 54083-22-6, 36508-71-1 (HCl)
Merck Index: 10326



SAMPLE

Matrix: blood
Sample preparation: 2 mL Whole blood or plasma + 2 mL buffer + 5 mL chloroform:isopropanol: n-heptane 60:14:26, shake gently horizontally for 10 min, centrifuge at 2800 g for 10 min. Remove the lower organic layer and evaporate it to dryness under vacuum at 45°, reconstitute the residue in 100 μL mobile phase, centrifuge at 2800 g for 5 min, inject a 50 μL aliquot of the supernatant. (Buffer was saturated ammonium chloride solution 25% diluted with water, adjusted to pH 9.5 with 25% ammonia solution.)

HPLC VARIABLES

Column: 300 × 3.9 4 μm NovaPack C18
Mobile phase: MeOH:THF:buffer 65:5:30 (Buffer was 0.68 g/L (10 mM (sic)) KH_2PO_4 adjusted to pH 2.6 with concentrated orthophosphoric acid.) (At the end of each session wash the column with water for 1 h and MeOH for 1 h, re-equilibrate for 30 min.)
Column temperature: 30
Flow rate: 0.8

Injection volume: 50
Detector: UV 234

CHROMATOGRAM
Retention time: 8.10
Limit of detection: <120 ng/mL

KEY WORDS

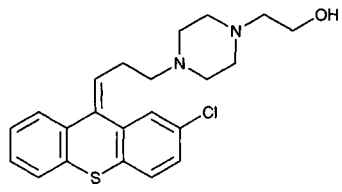
Zuclopenthixol



Molecular formula: $C_{22}H_{25}ClN_2OS$
Molecular weight: 400.97
CAS Registry No.: 53772-83-1
Merck Index: 2455

SAMPLE

Matrix: blood
Sample preparation: 2 mL Serum + 25 ng IS + 300 μL EtOH + 100 μL 7 M NaOH + 8 mL hexane:isopropylamine 99.9:0.1, shake for 15 min, centrifuge at 2400 g for 5 min. Remove the organic layer and add it to 2 mL 100 mM HCl, shake for 15 min, centrifuge for 5 min. Discard the organic layer and add 200 μL 7 M NaOH and 4 mL hexane:isopropylamine 99.9:0.1 to the aqueous layer, shake for 15 min, centrifuge for 5 min. Remove the organic layer and evaporate it to dryness under a stream of air at 30°, reconstitute the residue in 1 mL hexane, evaporate, reconstitute with 100 μL hexane:isopropylamine 99.9:0.1, inject a 70 μL aliquot.

HPLC VARIABLES

Column: 250 × 4.6 5 μm Spherisorb S5W silica
Mobile phase: n-Heptane:isopropanol:concentrated ammonia:water 85:15:0.4:0.2
Flow rate: 1
Injection volume: 70
Detector: UV 254

CHROMATOGRAM

Retention time: 7.5
Internal standard: 4-[3-(2-chloro-7-trifluoromethylthioxanthen-9-yl)propyl]-1-piperazineethanol (Lu 9-215) (6.5)
Limit of detection: 0.5 ng/mL

OTHER SUBSTANCES

Extracted: trans(E)-isomer, metabolites
Simultaneous: estazolam
Noninterfering: amitriptyline, biperiden, imipramine, nortriptyline, orphenadrine, procyclidine
Interfering: benzodiazepines

KEY WORDS

serum; rat; dog; human; pharmacokinetics; normal phase

REFERENCE

SAMPLE

Matrix: blood
Sample preparation: Condition a 3 mL Bond Elut Certify SPE cartridge with 2 mL MeOH and 2 mL 100 mM pH 6.0 phosphate buffer, do not allow to dry. 1 mL Whole blood + 6 mL 100 mM pH 6.0 phosphate buffer, vortex, sonicate, centrifuge, add the supernatant to the SPE cartridge, wash with water, wash with 1 mM pH 3.3 acetic acid, dry under suction, wash with 2 mL acetone:chloroform 50:50, elute with 3 mL freshly prepared ethyl acetate:ammonia 98:2. Evaporate the eluate under a stream of nitrogen at 40°, reconstitute in 50 μL MeOH, inject a 10 μL aliquot.

HPLC VARIABLES

Column: 125 × 4 5 μm Asahipak ODP-50
Mobile phase: MeCN:50 mM ammonium acetate 85:15
Flow rate: 0.6
Injection volume: 10

Detector: MS, Finnigan MAT TSQ 700 tandem quadrupole, Finnigan MAT TSP-2 interface, collision gas argon 3.0 mTorr, collision offset -17.5 V, repeller 70 V, vaporizer 130-5°, source 200°, filament off, multiplier 1500 V, dynode power 15 kV, scantime 1.20 s, MSMSC factor 0, monitor 316–271. (The effluent from the column was mixed with 50 mM ammonium acetate pumped at 0.6 mL/min. The mixture flowed to the detector.)

CHROMATOGRAM
Retention time: 3.40
Limit of detection: 2 ng

OTHER SUBSTANCES
Extracted: chlorprothixene, flupenthixol, thiothixene

KEY WORDS
whole blood; SPE

SAMPLE
Matrix: blood, gastric contents, tissue, urine, vitreous humor
Sample preparation: Homogenize tissue with 4 volumes water. Extract 3 mL Blood, gastric contents, urine, vitreous humor, or homogenized tissue with 1.5 mL saturated pH 9.5 ammonium chloride buffer and 5 mL chloroform:2-propanol:n-heptane 25:10:65 for 10 min. (Caution! Chloroform is a carcinogen!). Centrifuge at 3500 g for 10 min, evaporate the organic layer at 45°. Reconstitute with 30μL MeOH. Centrifuge at 10000 g for 5 min, remove 20 μL of the supernatant, inject an aliquot.

HPLC VARIABLES
Column: 150 × 2 4 μm NovaPak C18
Mobile phase: MeOH:2mM pH 3 ammonium acetate buffer 90:10
Flow rate: 0.2
Injection volume: 2
Detector: MS, PE Sciex API 100 double quadrupole, nebulizing gas nitrogen at 1.6 mL/min, curtain gas nitrogen at 1.08 mL/min, sprayer electrode +4.5 kV, electron multiplier +2.4 kV, m/z 100-450

CHROMATOGRAM
Retention time: 14.95 ((Z)-cis), ((E)-trans)

KEY WORDS
liver; kidney; lung; brain; skeletal muscle; comparison with HPLC/UV

SAMPLE
Matrix: blood, gastric contents, tissue, urine, vitreous humor
Sample preparation: Homogenize tissue with 4 volumes water. 3 mL Blood, gastric contents, urine, vitreous humor, or homogenized tissue + 4 μg IS, extract with 1.5 mL saturated pH 9.5 ammonium chloride buffer and 5 mL chloroform:2-propanol:n-heptane 25:10:65 for 10 min. (Caution! Chloroform is a carcinogen!). Centrifuge at 3500 g for 10 min, evaporate the organic layer at 45°. Reconstitute with 30μL MeOH. Centrifuge at 10000 g for 5 min, remove 20 μL of the supernatant, inject an aliquot.

HPLC VARIABLES
Column: 300 × 3.9 4 μm NovaPak C18
Mobile phase: MeOH:THF:10 mM pH 2.6 KH_2PO_4 buffer 65:5:30

Flow rate: 0.8
Injection volume: 7
Detector: UV 228

CHROMATOGRAM
Retention time: 8.98 ((Z)-cis), 10.21 ((E)-trans)
Internal standard: prochlorperazine
Limit of detection: 7 ng/mL

KEY WORDS
liver; kidney; lung; brain; skeletal muscle; comparison with HPLC/MS

SAMPLE
Matrix: blood, urine
Sample preparation: Condition a 1 mL Bond Elut CN with 2 mL MeCN and 2 mL water. Add 2 mL plasma or urine to the SPE cartridge, wash with 2 mL water, elute with MeCN:n-butylamine 90:10. Evaporate the eluate to dryness under a stream of nitrogen at 40°, reconstitute the residue in 200 μL mobile phase, inject a 100 μL aliquot.

HPLC VARIABLES
Column: 120 × 4.6 Spherisorb S5 CN
Mobile phase: MeCN:200 mM pH 6.5 potassium phosphate buffer:water 36:5:59 containing 6 mM dodecyl-N,N,N-trimethylammonium bromide
Column temperature: 40
Flow rate: 1
Injection volume: 100
Detector: F ex 260 em 435 following post-column photolysis with a low-pressure 8 W mercury UV light in a 5 m × 0.5 mm i.d.coil of PTFE tubing

CHROMATOGRAM
Retention time: 9
Limit of detection: 0.05 ng/mL

OTHER SUBSTANCES
Extracted: metabolites

KEY WORDS
protect from light; plasma; SPE; post-column photochemical derivatization

REFERENCE
Hansen,B.B.; Hansen,S.H. Determination of zuclopenthixol and its main N-dealkylated metabolite in biological fluids using high-performance liquid chromatography with post-column photochemical derivatization and fluorescence detection, *J.Chromatogr.B*, **1994**, *658*, 319–325.

SAMPLE
Matrix: blood, urine
Sample preparation: Add 1 mL whole blood or urine to Toxi-Tube A (Toxi-Lab, Irvine CA), add 3 mL water, mix by gentle inversion for 5 min, centrifuge at 1500 g for 5 min. Remove the organic layer and evaporate it to dryness under a stream of nitrogen at 40°, reconstitute the residue with 50 μL MeCN:water 50:50, vortex for 10 s, centrifuge at 7500 g for 2 min, inject a 10 (urine) or 30 (blood) μL aliquot. (The detector wavelength shown is the wavelength of maximum absorbance. This will not necessarily be the optimal wavelength for the separation. Multiple wavelengths from 200-350 nm can be scanned using a diode-array detector. Otherwise, 220 nm may be a reasonable choice for initial work. Matrix may interfere.)

HPLC VARIABLES
Guard column: 20 mm long Symmetry C18

Column: 250 × 4.6 5 μm Symmetry C8 (Waters)
Mobile phase: Gradient. A was 50 mM pH 3.8 sodium phosphate buffer. B was MeCN. A:B 85:15 for 6.5 min, 65:35 for 18.5 min, 20:80 for 3 min (step gradient), re-equilibrate at initial conditions for 7 min.
Column temperature: 30
Flow rate: 1 for 6.5 min, to 1.5 over 18.5 min, maintain at 1.5 for 3 min (re-equilibrate at 1.5 mL/min)
Injection volume: 10-30
Detector: UV 206.4

CHROMATOGRAM
Retention time: 16.325

KEY WORDS
whole blood
