

## We've got the tools to help you do more than just pass the class . . . with these resources, you can understand the concepts and truly succeed!

PLUS: This book's plentiful examples and problems—identified by a square and a triangle indicating that tutorials are available on video or online—help you learn to apply concepts to the world around you.

## Available to help you succeed:

Companion Website . . . helpful resources at your fingertips academic.cengage.com/math/mckeague

This convenient site features chapter-by-chapter online bitorial quigzes, a link to the Digital Video Companion (see below), a final exam, and more) Check inside your text for the card that entitles you to access.

Student Solutions Manual . . . useful, indispensable 0-495-38258-2

A great study partner! The Student Solutions Manual provides worked-out solutions to the odd-numbered problems in the text, and more importantly, it gives you step-by-step information on how each problem was solved.

## Digital Video Companion (DVC)

Author Pat McKeague is your guide for over 8 hours of step-by-step video instruction. The DVC contains helpful video lessons for each section of the book that include worked problems listed next to the viewing screen, allowing you to work them in advance.

To purchase any of the for-sale resources mentioned above, visit us online at academic.cengage.com/math or contact your college bookstore.

### Operations on Complex Numbers in Standard Form (8.1)

#### Addition

 $z_1 = z_1 + (a_1 a_2 + a_3) + (b_1 + a_2)^2$ . Additional partial or  $z_1$  or  $z_2$  in  $z_3$  may produce

#### C. & Terrorione

 $\Delta r = 2r + k\mathbf{a}_{2} + k\mathbf{a}_{3} + k\mathbf{a}_{4} = (2r + k\mathbf{a}_{3})$ 

Subtracts of guest with and a replacey with

#### A Salambaras A

die, wilder 1980 und 1946 all ist

In some function, viewfly and options group with the tiply two climanists

#### Commission

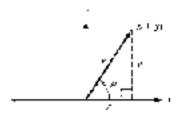

This extraction is S=G as  $\sigma=SL$  Their product is the real number  $\sigma'+S$ 

#### 50 00 m

Modernly discontinuous for and dimensional for A , i.e.,  $\beta \in \mathcal{C}(n)$  by the coupling of the experimental

#### Grapking Complex Numbers [82]

The proper of the symplete true for x = x + y (i.e. the unique types parents. In each type constant of the exempton x

#### Absolute Value of a Complex Number (4.2)

#### Argument of a Carepton Number [8.2]

The injection of the complex samples x = x + y for a treatment of positive angle than the gravity of the x = x + y for y = y for y = y. Then, the gravity is the configuration of y = y for y = y.

$$(a V - \frac{b}{a})$$
,  $(a V - \frac{b}{a})$ , and  $(a V - \frac{b}{a})$ 

#### Trigonometric Ferns of a Complex Number [8.2]

The complete number  $x \mapsto x + y i$  is written in higher methic flar rather is in well-exact.

$$\chi = R\cos\theta + 2\cos\theta \text{ (} = n\cos\theta \text{)}$$

where a fix the absorber value of a and Wie the regions and al-

#### Products and Quotients in Trigonametric Form (8.3)

$$g_{ij} = ipg_{ij} \cos(\epsilon_1 + \epsilon_2) + i \delta i \left( \epsilon_i + \epsilon_3 \right) + \epsilon_3 g_{ij} + \epsilon_4 g_{ij} + \epsilon_5 g_{ij} + \epsilon_6 g_{ij}$$

$$\frac{\delta_1}{2} = \frac{\delta_1}{\delta_2} (\log \delta \theta_1 - \theta_2) = \delta \delta \ln \left(\theta_1 - \theta_2\right) \left[ + \frac{\delta_1}{\delta_2} \sin \theta_1 - \theta_2 \right]$$

#### De Moivre's Theorem (\$.3)

1/2 < 0 of the R > 0 in L , and recomplete independent origination and for the main alone of them

$$\mathcal{L} = \mathcal{P}(\mathbf{x} \mathbf{x} \mathbf{x} \mathbf{y} \mathbf{x} \mathbf{x} + \delta \mathbf{x}_{\mathbf{x}} \mathbf{u} \mathbf{y} \mathbf{y}) + \mathcal{P}(\mathbf{x} \mathbf{x}_{\mathbf{y}} \mathbf{x} \mathbf{x}_{\mathbf{y}} \mathbf{x}_{\mathbf{y}})$$

#### Roots of a Complex Number [8.4]

The lab racts of the compact another

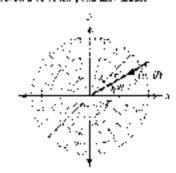

are oben No

$$\begin{aligned} & \operatorname{Max} + e^{i \lambda_n} \operatorname{cons} \left( \frac{3}{n} + \frac{360^n}{n} k \right) + e \operatorname{And} \left( \frac{3}{n} + \frac{340^n}{n} k \right) \\ & = e^{i \lambda_n} \operatorname{cons} \left( \frac{n}{n} + \frac{340^n}{n} k \right) \end{aligned}$$

where 
$$J = 0, 1, 2, ..., n = 1$$
.

#### Polar Coordinates (8.5)

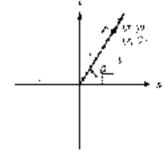

The collined purple, if he areas the over I that as receive bound the cospectiving the technical pile of large 12 in a gard of people in a 170% in one, fine the angest of one gold to be one proposed and according to the people of the people that the people of the peop

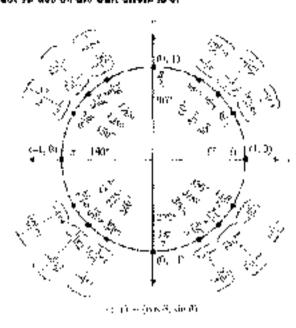

#### Polar Constinutes and Restangular Coordinates [85]

To vertice the relationable between point countries and retropular according to the point P with restricted at a coordinates  $(p, \gamma)$  and point p and itself into p  $(p, \gamma)$ .

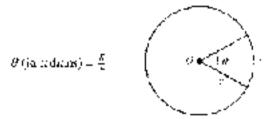

$$v = \frac{1}{2} \sqrt{(1 + y^2)}$$
, god teo  $A = \frac{y}{y}$ 

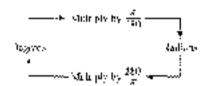

### Exact Values on the Built Chicle 13-3)

#### Radien Macoure (3.2)

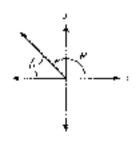

#### Converting Between Hadian's and Degrees [3.2]

#### Reference Asyles [3 1]

The reserves single  $\theta$  for any unsite  $\theta$  in standard position is the weights above angle  $\theta$  one, or  $d\mathbf{x}$  in terms of  $\theta$  and  $\theta$  and  $\theta$  are said.

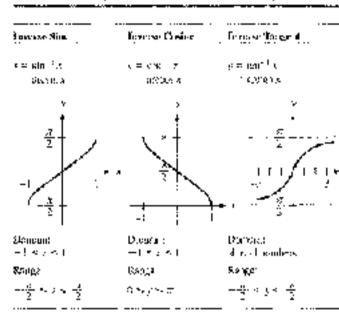

#### Inverse Triponometric Panctions (4.7)

(marrie Fim.: Clim)	Macrating.

in metals in a shortable halfween — m2 not true, and search whose source in the configuration — amount in the configuration of the configuration is a matter to a figurate the factor of the configuration in the configuration.

$$y = \omega e^{-1} \sin y = \cosh \omega$$
  $z = \exp y \sec \frac{\pi}{2} + y e^{-1} \frac{\pi}{2}$ 

The seconds, in its the large in history and in 10.2 and 1972 with two heapters in its x.

#### Ugiform Circular Metion [3.4, 3.5].

A poission a choice of entities  $\epsilon$  regress a discussor  $\epsilon$  on the circumstrated of the observe for an early  $\epsilon$  of case  $\epsilon$ .

Ar gular votation, Mr. See gga,  $\frac{a_1-\frac{b_1}{r}}{r} = \frac{a_1-rb}{r}$  Also of a Section  $\frac{a_1-\frac{b_1}{r}}{r} = \frac{1}{r}e^{\frac{b_1}{r}}$   $\frac{a_1-\frac{b_2}{r}}{r}e^{\frac{b_2}{r}}$ 

Air namaeála soba e

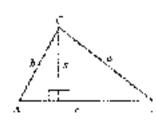

#### The Area of a Triangle 7.4;

$$T = \frac{1}{2} \text{ or size } A$$

$$T = \sqrt{a}(t + a)(t + b)(t - b)$$

$$\text{where } s = \frac{1}{2} (p + b) + s$$

$$= \sqrt{a}(t + b) \in C$$

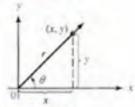

## DEFINITIONS, GRAPHS, AND IMPORTANT FACTS

## Definition I for Trigonometric Functions [1.3]

$$\sin \theta = \frac{y}{r}$$
  $\csc \theta = \frac{r}{y}$   
 $\cos \theta = \frac{x}{r}$   $\sec \theta = \frac{r}{r}$ 

$$\tan \theta = \frac{y}{x}$$
  $\cot \theta = \frac{x}{y}$ 

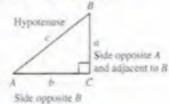

## Definition II for Trigonometric Functions [2.1]

$$\sin A = \frac{u}{c} \quad \csc A = \frac{c}{a}$$

$$\cos A = \frac{b}{c}$$
  $\sec A = \frac{c}{b}$ 

$$\tan A = \frac{a}{b}$$
  $\cot A = \frac{b}{a}$ 

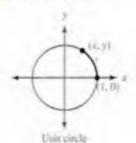

and adjacent to A

## Definition III for Trigonometric Functions [3.3]

$$\cos t = x$$
  $\sec t = \frac{1}{x}$ 

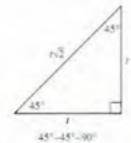

$$\sin t = y$$
  $\csc t = \frac{1}{x}$ 

$$\tan z = \frac{y}{x} \qquad \cot z = \frac{x}{y}$$

## Special Triangles [1.1]

## Trigonometric Functions of Special Angles [2.1]

ė	0-	$30^\circ = \frac{\pi}{6}$	45" = #	$60^\circ = \frac{\pi}{3}$	$90^{\circ} = \frac{\pi}{2}$
sin 0	$\frac{\sqrt{0}}{2}$	$\frac{\sqrt{1}}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{4}}{2}$
cos B	$\frac{\sqrt{4}}{2}$	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{1}}{2}$	$\frac{\sqrt{0}}{2}$
tan #	0	$\frac{\sqrt{3}}{3}$	Ť	$\sqrt{3}$	undefined

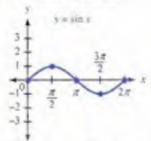

### Graphing Sine and Cosine Curves [4.2, 4.3]

The graphs of  $y = A \sin(Bx + C)$  and  $y = A \cos(Bx + C)$ , where B > 0, will have the following characteristics:

Amplitude = 
$$|A|$$
 Period =  $\frac{2\pi}{B}$  Phase shift =  $-\frac{C}{B}$ 

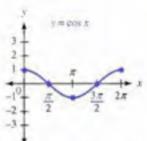

### Graphs of the Trigonometric Functions [4.1]

#### (Assume k is any integer)

Domain: All real numbers Range:  $-1 \le s \le 1$  Amplitude: 1 Period:  $2\pi$ 

Period:  $2\pi$ Zeros:  $x = k\pi$ 

Domain: All real numbers Range:  $-1 \le y \le 1$ Amplitude: 1 Period:  $2\pi$ Zeros:  $x = \frac{\pi}{2} + k\pi$ 

Domain: All real numbers  $x \neq \frac{\pi}{2} + k\pi$ 

 Range:
 All real numbers

 Amplitude:
 Not defined

 Period:
 π

 Zeros:
 x = kπ

Asymptotes:  $x = \frac{\pi}{2} + k\pi$ 

Domain: All real numbers  $x = k\pi$ Range: All real numbers Amplitude: Not defined Period:  $\pi$ Zeros:  $\pi = \frac{\pi}{2} + k\pi$ 

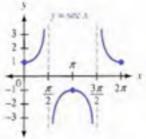

Asymptotes:  $x = k\pi$ 

Domain: All real numbers  $x \neq k\pi$ 

Range:  $y \le -1$  or  $y \ge 1$ Amplitude: Not defined Period:  $2\pi$ Zeros: None

Asymptotes:  $x = k\pi$ 

Domain: All real numbers  $x \neq \frac{\pi}{2} + k\pi$  Range:  $y \leq -1$  or  $y \geq 1$  Amplitude: Not defined Period:  $2\pi$  Zeros: None

Asymptotes:  $x = \frac{\pi}{2} + k\pi$ 

## Basic Identities [5.1]

	Basic Identities	Common Equivalent Forms
Reciprocal	$\csc \theta = \frac{1}{\sin \theta}$	$\sin \theta = \frac{1}{\csc \theta}$
	$\sec \theta = \frac{1}{\cos \theta}$	$\cos \theta = \frac{1}{\sec \theta}$
	$\cot \theta = \frac{1}{\tan \theta}$	$\tan \theta = \frac{1}{\cot \theta}$
Ratio	$\tan \theta = \frac{\sin \theta}{\cos \theta}$	
	$\cot \theta = \frac{\cos \theta}{\sin \theta}$	
Pythagorean	$\cos^2\theta + \sin^2\theta = 1$	$\sin^2\theta = 1 - \cos^2\theta$
		$\sin\theta = \pm \sqrt{1 - \cos^2\theta}$
		$\cos^2 \theta = 1 - \sin^2 \theta$
		$\cos\theta = \pm \sqrt{1 - \sin^2\theta}$
	$1 + \tan^2 \theta = \sec^2 \theta$	
	$1 + \cot^2 \theta = \csc^2 \theta$	

### Sum and Difference Formulas [5.2]

 $\sin (A + B) = \sin A \cos B + \cos A \sin B$   $\sin (A - B) = \sin A \cos B - \cos A \sin B$  $\cos (A + B) = \cos A \cos B - \sin A \sin B$ 

 $\cos (A - B) = \cos A \cos B + \sin A \sin B$   $\tan (A + B) = \frac{\tan A + \tan B}{1 - \tan A \tan B}$ 

 $\tan (A - B) = \frac{\tan A - \tan B}{1 + \tan A \tan B}$ 

## Double-Angle Formulas [5.3]

 $\sin 2A = 2 \sin A \cos A$ 

 $\cos 2A = \cos^2 A - \sin^2 A$  First form =  $2 \cos^2 A - i$  Second form =  $1 - 2 \sin^2 A$  Third form

 $\tan 2A = \frac{2 \tan A}{1 - \tan^2 A}$ 

### Cofunction Theorem [2.1]

 $\sin x = \cos (90^{\circ} - x)$ 

 $\cos x = \sin (90^\circ - x)$ 

 $\tan x = \cot (90^o - x)$ 

## Half-Angle Formulas [5.4]

$$\sin\frac{A}{2} = \pm\sqrt{\frac{1-\cos A}{2}}$$

$$\cos\frac{A}{2} = \pm \sqrt{\frac{1 + \cos A}{2}}$$

$$\tan \frac{A}{2} = \frac{1 - \cos A}{\sin A} = \frac{\sin A}{1 + \cos A}$$

#### Even/Odd Functions [4.1]

 $\cos(-\theta) = \cos\theta$  Even

 $\sin(-\theta) = -\sin\theta$  Odd

 $tan(-\theta) = -tan \theta$  Ode

## Sum to Product Formulas [5.5]

 $\sin \alpha + \sin \beta = 2 \sin \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2}$ 

 $\sin \alpha - \sin \beta = 2 \cos \frac{\alpha + \beta}{2} \sin \frac{\alpha - \beta}{2}$ 

 $\cos \alpha + \cos \beta = 2 \cos \frac{\alpha + \beta}{2} \cos \frac{\alpha - \beta}{2}$ 

 $\cos \alpha - \cos \beta = -2 \sin \frac{\alpha + \beta}{2} \sin \frac{\alpha - \beta}{2}$ 

### Product to Sum Formulas [5.5]

 $\sin A \cos B = \frac{1}{2} \left[ \sin \left( A + B \right) + \sin \left( A - B \right) \right]$ 

 $\cos A \sin B = \frac{1}{2} \left[ \sin \left( A + B \right) - \sin \left( A - B \right) \right]$ 

 $\cos A \cos B = \frac{1}{2} \left[ \cos \left( A + B \right) + \cos \left( A - B \right) \right]$ 

 $\sin A \sin B = \frac{1}{2} \left[ \cos \left( A - B \right) - \cos \left( A + B \right) \right]$ 

## Pythagorean Theorem [1.1]

### The Law of Sines [7.1]

 $\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$ 

or, equivalently.

 $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$ 

## The Law of Cosines [7.3]

 $a^2 = b^2 + c^2 - 2bc \cos A$ 

 $b^2 = a^2 + c^2 - 2ac \cos B$ 

 $c^2 = a^2 + b^2 - 2ab \cos C$ 

or, equivalently.

 $\cos A = \frac{b^2 + c^2 - a^2}{2bc}$ 

 $\cos B = \frac{a^2 - c^2 - b^2}{2ac}$ 

 $\cos C = \frac{a^2 + b^2 - c^2}{2ab}$

## PREFACE TO THE INSTRUCTOR

This Six is Edition of Teleconomers preciains the same formet and style as the previous editions, it is a standard right-triangle approach to trigonometry. Nearly every section is position we that it can be discussed in a typical 50-m and class sussign. The forms of the textbook is on understanding the defaution, and principles of trigonometry and their applications to problem solving. Exact values of the trigonometric functions are emphasized throughout the textbook.

The tero covers all the material usually taugh, for a isomometry. In addition, there is an appearable to: functions and lowerse functions and a second appendix to: excess mential and hogarithmic functions. The appendix sections can be used as a leview of topics that appears may already be fundified with, or they can be used to provide introductions that appears for the given the extension of the content of t

There are numerous calculator notes placed throughout the text to help students calculate values when appropriate. As there are army different models of graybing calculations, and each in stell tax. In own set of an inameda, we have trie. Its profit an overage of specific key many or command pages.

#### New to This Edition

**CONTENT CHANGES** The following list describes the major consent changes you will see in this Sinth Edition.

- Section 1.1: We have added a little more review of triangles.
- Section 1.2. The acolew of the rectangular consdinate system has been short-ened. The content on circles has been expanded and now follows the distance featurals. Several of the examples in this system have been replaced.
- Section 2.3. In response to user requests, we have revised our detraition of significant digits so that it is consistent with other disciplines soon as the mixtry
- Section 3.3. This section has been completely rewritten to emphasize the convector of function. We have also added content on domain and range. The material opened and even functions too local moved to Section 4.1.
- Chapter 4. The gradies proston, in Chapter 4 has been expanded to four sections, and we now cover the sine and coding lanctions hast. A unlikely graphing approach it volving framing a basic cycle has been incorporated but these sections.
- Section 4.5: Proviously Souther 4.4, we have selded restenial on using trigonometric functions as models with real data.
- Sertion (A: New exercises and an example were added for graphing plane on ses.
- Section 7.1: This section row includes a summary of the different cases and the method used in a diving of light enlargies.
- Chapter 3: We have increased the use of radians incoghout this chapter.

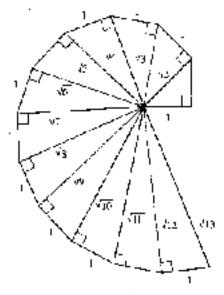

CHAPTER

# THE SIX TRIGONOMETRIC FUNCTIONS

Without Thales there would not cave been a Pythaetian - or numes Pythaetian; and wholen Pythagetas there would be thave been a Plato—or such a Plato. D. C. Smith

## INTRODUCTION

The history of mathematics is a spiral of knowledge passed down from one generation to snorther hach person in the history of mathematics is connected to the others along this spiral. In Trafy, around 500 s.c., the Pythagoreans discovered a relationship herwise the sides of any right to angle. That a scowery, known as the Pythagorean Theorem, is the foundation on which the Spiral of Roots shown in Figure 1 is but in The Spiral of Roots gives 0.50 way to visualize square roots of positive integers.

Pigent I

In Problem Set 1.1, you will have a change to construct the Sgiral of Roots yourself.

In Examples and Problem Sets throughout the chapter.

🤃 – Tutorie dvareblo omy dog

Totor a lensi able unine.

#### STUDY SKILLS FOR CHAPTER ?

At the hogomorphot the first how chapters of this hook year will head a Study Skills sets than in which we like the souls that are necessary for statement in tragendancery. If you have just completed an a potentials a societability, you have acquired most of those skills, it is easilitied some force some group have taken a mathiclass, you must pay access on to the sections on stady skills.

Elements a list of things you can do to develop effective study skills.

- Post Yourself on a Schedule. The government is that you spend two layers or immerant for every hour you are in class. Make a schedule for yourself, setting aside at least six hours a week to work on a governeity. Once you make the ached the stock to it. Contribut coincider your assignments and then stop. Use all the time you have set aside. If you complete an assignment and have time left over, read the next section in the book, are, work more problems. As the course progresses you may find that six hours a week is not enough time for you to master the mate left in this scores. If it takes you be against that the role ach your goals for this conce, then that's how moch time it takes. Trying to go, by with less will not work.
- 2 First Your Misfakes and Correct Them. There is note to studying trigonocters; than just working problems. You must always check your answers wint those in the back of the book. When you have made an intake, find out what it is and exacted it. Making mistakes is part of the mocress of having maternatics. The lary to dispovering what you do not understand can be bound by on recising what no trigonomy states.
- 3 Imitate Success. Your work should look like the work you see in this book and the work you in successful was "The state shown in solving problems in this book, were written by someone who has been successful in mathematics. The same is one of your igenual, a What work algorithm the poors of people who have been successful in mathematics.
- 4 Memorize Definitions and Identifies: You may think that memories, on it not necessary if you necessard a topic you are studying. In trigonometry, meaninession is especially important, in this tirst chapter, you will be presented with the definition of the six trigonometric functions that you will use throughout the rest of the course. We have seen many bright students energie with trigonometry samply because they did not memorize the definitions and identifies when they were first presented.

Right triangles are good mathematics; nurdels for chair lifes. In this section we review same important items from geometry, including eight triangles. Let's begin by looking at some of the semiloology associated with angles.

## Angles in General

An angle is formed by two rays with the same end point. The common end point to called the vertex of the apple, and the pass are called the vides of the angle.

In Figure 1 the vertex of easile  $\delta$  (theta) is labelled  $\Phi$ , and A and B are points on spen side of 9. Angle 9 can also be denoted by AkAB, where the latter associated with the vertex is written between the letter, associated with the profits on each sale.

We can think of 9 as having been formed by rotains side (M about the vertex to side OB. It this case, we call side OA the initial side of  $\ddot{a}$  and side OB the terminal viole (SEC)

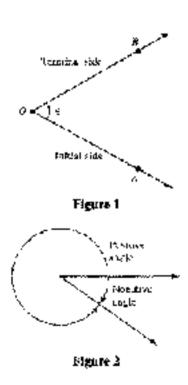

When the rotation from the initial side to the terminal side takes alone to equal tereleacherise direction, the may enforced its considered a positive englis. If the return on is in a clockwise direct on, the angle formed in Congestive angle (Figure 2).

## Degree Measure

One way to measure the size of salangle is with degree measure. The angle formes by rotating a ray through one complete revolution has a receivant of \$50 degrees, writton 350° (Piguro Pil.)

One degree (19), then its 145-90 of a fell recation. Likewise, 1809 is one-half of a full relation, and MP is leaff of that (or a quarter of a rotation). Angles that measure 901 are estiod right angles, while abgles that mensure 1901 are called strught region. Angles that measure between 01 and 90° are called as we argue, white angles that measure between 90° and 1°0° are called chase argues (see Figure 4).

If two ring as have a sum of 90°, then they are called complexion tory angles, and with any cach is the commitment of the other. Two angles with a formal 1901 are dalical mengar menderry any law

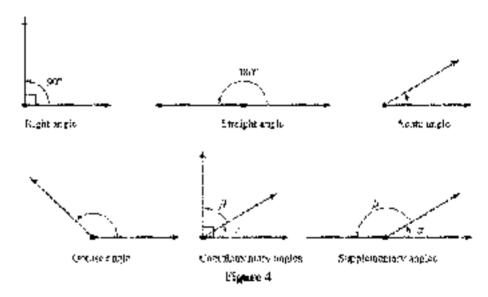

Car complete invidation in Wife'

Figure 5

Note: To be precise, we should say "two angles, the sum of the measures of which is 189", are called supplementary angles" because there is a difference between an angle and its measure. However, in this bodd, we will not always traw the distriction between an atgle and its measure. Many times we will refer to "angle  $\theta^{\pi}$  when we satisfy mean "the measure of angle  $\theta^{\pi}$ 

Notice The little against by the vertex of the right angle in Figure 4 is used to indicate that the angle is a right angle. Not will see this symbol often in the book.

Give the equipplement and the supplement of each angle.

a. 102 - 6, 1160° - 6, 9

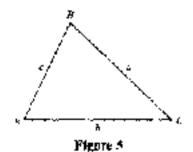

#### SOLUTION

- a. The complement of 49° is 50° since 10° × 50° 90°.
  The supplement of 50° is 140° since 40° + 140° 180°.
- **b.** The complement of 110° to  $-20^{\circ}$  since  $(10^{\circ} + (-20^{\circ})^{-1}95)^{\circ}$ . The supplement of 110° to 70° since  $110^{\circ} + 70^{\circ} = 180^{\circ}$ .
- **c.** The complement of  $\theta$  is  $90^\circ \theta$  since  $\theta + (90^\circ \theta) = 90^\circ$ . The supplement of  $\theta$  is  $180^\circ \theta$  since  $\theta + (180^\circ \theta) = 180^\circ$ .

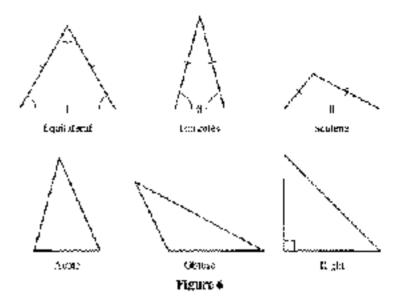

## Triangles

A triangle is a fined sided polygon. Every inlangle has three sides and three angles. We denote the angles (or various) with appetrate letters and the letagins of the sides with lowercase letters, as shown in Figure 5, to is standard province in mathematics to label the titles and angles so that a is apposite at a bapposite 8, and a is apposite C.

There are different types of triangles that are called according to the relative lengths of their sides of engles (Figure 6). In an equilateral triangle, all three sides are 0,1 count longth and all three angles are equal. An isoscolor triangle has two equal sides and two equal angles. If all the sides and angles are different, the triangle is called scalene. In an exact triangle, all three mighes are usual. An obtain triangle has one right angle.

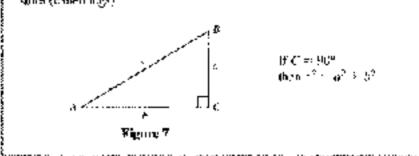

## Special Triangles

As we will see throughout this text, right triangles are very important to the rundy of trigonometry. In every right triangle, the longest side is called the hypatrause, and it is always opposite the right angle. The other two sides are called the legs of the right triangle. Because the sum of the angles in any triangle is 180%, the other two angles in a right triangle much be complementary, acute angles. The Pythagorean Theorem that we maniformed in the instruction to this obspice gives us the relationship that exigs among the sides of a right triangle. First we state the theorem.

### PYSHAGOGEART; #RODEAR

In any right manage, the square of the longer of the inegast sole (halled the hypotheres) as opinit to the sum or the squares of the longths or the other two subsides (orded logs).

Next we will prove the Pythagon an Theorem. Parties the proof proofers toking the ones of a triangle. In any triangle, the ones is given by the formal to

$$\Delta = a = \frac{1}{2} \text{(base)Xberight)}$$

16th the right triumgle shown in Figure 7, the base is 6, and the height is  $\sigma$ . Therefore the size, is  $\Delta = \frac{1}{2} n \delta s$ .

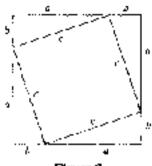

Figure 8

## A Proof of the Pythagorean Theorem

There are many ways to prove the Fythagorean Theorem. The Group Project at the end of this chapter introduces several of these ways. The method that we are offering here is based on the diagram shows in Figure 8 and the formula for the area of a triangle.

Figure 5 is constructed by talking the right triangle in the lower right corner and respecting it three times as that the final diagram is a square in which each side has length  $a \neq b$ .

To detire the relationarip between *a*, *b*, and *c*, we simply obtain that the area of the large replace is equal to the sum of the areas of the foot triangles and the inner square. To symbols we have

Area of large Area of leave Area of linear square triangles square 
$$\frac{1}{2} \frac{ab}{ab} = \frac{1}{2} \frac{1}{ab} \frac{ab}{ab} = \frac{a^2}{a^2}$$

We depend the left side using the formula for the square of a transmissi, from algebra. We simplify the right side by multiplying d with  $\frac{1}{2}$ .

$$a^2 + 2ab + b^2 - 2ab + c^2$$

Adding - Rab to each side, we have the reinflocatup we are often

$$a^2 + b^2 \ge c^2$$

Solve for a in the righ, triangle in Ugure 9.

**SOLUTION** Applying the Pythagonean Theorem gives us a quadratic equation to solve

$$(x + 7)^2 + x^2 = 33^2$$

$$x^2 + 34x + x^2 = 369$$

$$2x^2 + 34x + 39 = 359$$

$$2x^2 + 14x + 120 = 0$$

$$x^2 + 14x + 120 = 0$$

$$x^2 + 7x + 60 = 0$$

$$(x + 7)(x + 2) = 0$$

$$(x + 5)(x + 2) = 0$$

$$x = 5 + 0$$

$$x = 2 + 0$$

$$x = 3 + 0$$

$$x =$$

Curronly solution is z = 5. We cannot use x = -12 because x is the length of z side of a naggle ABC and therefore cannot be deposite.

**Note:** The longiths of the stees of the final global example Alan (S), E3, and 13. When sever the fluxer sudes in a might triangle and actuard anothers, these three members occurables a Principlesian brinds.

Sactor up the agreedwitten to this section gives the section oscillation in this section gives the sectional oscillation for the trouble characted (this incident flot) as 1, 179 foot and the length of the drawfull that the foot senial department is by a present country shall life.

**SOB LIBROW**. Figure 11: is a model of the Forest Particle charallit. A rider gets on the 1.6 at major A and exists at point B. The Jength of the  $100 \, \mathrm{kg} \, B$ .

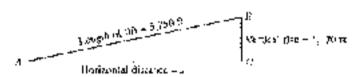

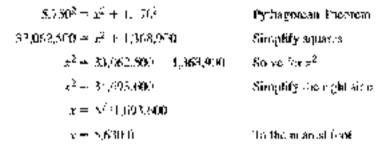

Figure 11

To find the horizontal distance povered by a person riving the chair lift we use the Pythogoroup Theorem:

Ngare 12

Figure 10

THE BOY-60Y-80Y TRIMINGLE

In they right triungle in which the two actic anglet are 50° and 60°, the long set side (the hypotenuse) is always twice the shartest side (the side opposite the 50° angle), and the side of medium length the side opposite the 60° angle) is always 1/13 times the shortest side (Figure 12).

Восеть видина не вез основни и не основните и восучествительной стория видения в общений видений в общений видений в общений в общений видений видений в общений видений виден

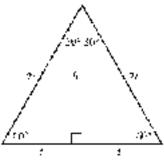

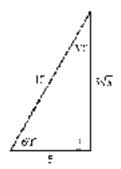

Figure 13

France 14

Morbs: The shortest side r is opposite the smallest sagle 30°. The isagest side 2z is opposite the largest angle 90°.

To writy the relationship between the sides in this triangle, we draw an equilateral triangle (one in which all three sides are equal) and labe, half the base with a (Figure 13).

The alreads h (the colored line) his easy the horse. We have two  $20^{\circ}$  60° 90° triangles. The longest side in each is 2t. We find that  $h > t\sqrt{3}$  by applying the Pythagoreta Theorem.

$$\frac{(3 + h^2 + (2i)^2)}{3 + \sqrt{3i^2 + j^2}} = \sqrt{3}$$

If the shortest side of a 30° 60° 90° triungle is 5, find the other two sides.

SCEUTION The longest side is 1.0 if wave the appears side), and the side appreciate the 60° angle as 5 √ 3 (Pigere 14).

A fudder is learning against a wall. The top of the ladder is 4 feet above the ground and the hotsom of the ladder makes an angle of 60° with the ground (Figure 15°. How long is the ladder, and how for from the wall is the bottom of the ladder?

**SCLUTION** The triangle formed by the bolder, the water and the ground is a 30°-40°-50° triangle. If we let expressed the distance form the horton of the laster to the wall, then the laster to the laster can be represented by 2x. The distance from the top of the laster to the ground is x \(\frac{1}{3}\), since it is appear to the 60° angle (Pigure 16). It is also given as 4 feet. Therefore,

$$x \sqrt{3} = 4$$

$$x + \frac{4}{\sqrt{3}}$$

$$= \frac{4\sqrt{3}}{3}$$

Retentialists the denomination  $\sigma$  in this polying the manner shows of denominates by  $\sqrt{3}$ .

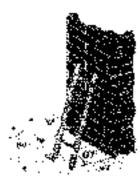

Figure 3.5

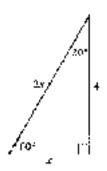

Figure 16

The distance from the boding of the ladder to the wall,  $x_i$  is 4 V 3/3 feet, so the length of the ladder,  $2x_i$  must be 8 V/3/3 feet. Note that these lengths are given by exact values. If we want a decistal approximation for them, we can replace  $\ge 3$  with 1.732 to obtain

$$\frac{6\sqrt{3}}{3} = \frac{4(1.752)}{3} = 25990$$
$$\frac{8\sqrt{3}}{3} \approx \frac{5(1.752)}{3} = 4.6190$$

Claberd-steel Morce. On a schenopic calculator, into assiculations could be done as in times.

$$\mathbf{8} \times \mathbf{3} [\mathbf{y}^{\top}] : \mathbf{5} \times$$

On a graphing calculator, he describition as done like this (fogure 3.3)

Some graphing convolues are consultness with rectain martions, such as the square cost fluction, but wormple, the iT-84 will automatically insert wheth parenthesis so TI-84 users should skip this bay three models do not require them, the the sake of classy, we will given include procedures throughour this parentheses throughour this parentheses with your model.

## PINCHASSISSION STRUMPOLE

If the two usets angles in a right thangle are both  $+5^\circ$ , then the two shorter sides (the logs) are equal and the langest side (the hypotenuse) is  $\sqrt{2}$  times as sangles the shorter sides. That is, if the shorter sides are of langer t, then the langest side has length  $t\sqrt{2}$  (Figure 1a)

Nigure 17

Figure 18

To verify to is retarior stop, we stoply note that if the two some angles are equal, then the sides opposite them are also equal. We apply the Pythagorem Theorem to find the langua of the hypotenuse.

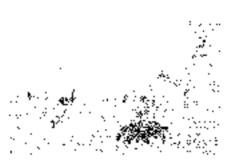

hypoteonic = 
$$\sqrt{r^2}$$
 i  $r^2$   
=  $\sqrt{2r^2}$   
=  $r\sqrt{2}$ 

EXAMPLE 6 19 A 10-Prot topo compacts the top of a cent pole to the ground. If the rote trackes on pagic of 45° with the ground, tind the length of the lent pule (Figure 19).

**SOLU : ION** Assuming their the test pose forms on angle of 99° with the ground, the following format by the style, for posts, and the ground is a 45°–45°–9° or angle (Fegure 30).

If we let disappead it the largeb of the remodels, then the length of the report in transion x, in  $x \le 2$ , it is also given as -0 fact. Therefore,

$$x = \frac{10}{\sqrt{2}} = 8\sqrt{2}$$

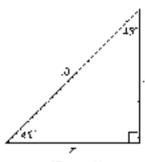

Figure 24

The larger of the feut policies 55% best. Again,  $5\sqrt{2}$  is the exact value on the length. of the feet pole. To find a decur altopproximation, we replace  $\sqrt{2}$  with 1,414 to obtain

$$5V^{2}t \approx 5(-414) = 7/17 \, \text{e}$$

#### GETTING READY FOR CLASS

After reading through the proceding section respond in your own words and in complete somences.

- What do we call the proof where two law come together to form an angle?
- In your own words, define complementary angles.
- In your own words, delete supplementary regard.
- th. Why is in innocepant to recognize  $30^{\circ}$  - $60^{\circ}$  – $60^{\circ}$  and  $43^{\circ}$  – $45^{\circ}$  – $60^{\circ}$  triangles?

## SECTION 1.2 THE RECTANGULAR COORDINATE SYSTEM

René Descurtes

The book Fite Cloving of the American Mind by Allan Bloom was published in 1987 and spen, mony weeks cathe bestseller list lathe book. Mr. Bloom recally being in a restancontributionable and overhearing a warter call another waiter a "Cartesian." He goes on to say that French grouple today detine themselves in terms of the glaid scylip of either Read Descrites (15:15–1660) of Blaise Pascal (10.23–1662). Followers of Descrites are sound into robin, of to as Cavareina. As a philosopher, Descentes in responsible to: the 4ator out "I shirtly the often I and" in mailstangibly. Descrites is credited with, an ong ethan things, the invention of the rectangular coordinate system in which we sometimes call the Contourn manufacture system. Until Descartes invented his contilinate system in 1637, algebra and yet onen y were areated as separate subjects. The rectangular condicate systems allows as to connect algebra and geometry by associating goometrical ages with abgeinaid equations. For example, every narrow, tical straight line (a general accoupprox a ) can be saided with an expansion of the form  $a \sim \mu p + L$  (at alpediant, conveyon. where wearth) are real, run being and a and y are variable othat we associate with the excepof a coordinate system. In this section we will review some of the concepts developed around the restaugustag countlin sections  $oldsymbol{a}$  in and  $oldsymbol{a}$  on two dimensions .

The reglacing (or Cartes) and contributes yellow is shown in Figure 1. The questionable to plane into Y-range anyther what are an integral Islangiah IV in a compare the continuous positive, the figure 1, we see that any point in quadrant I will have both continuous positive, the fix (4, +), to quadrant 0, the form is (-, +), for quadrant 11, the form is (-, +), and in quadrant IV is (-, +). Also, any point on the x-axis, will have

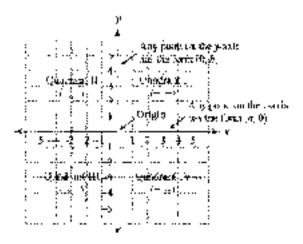

Figure 1

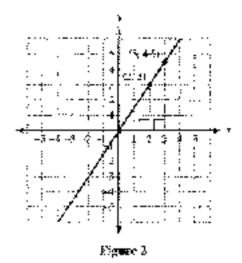

a yaccentelmate sat D (to has no vertical desplacement), and any people on the galaxis, will be an appropriate of the (no hypogental displacement).

## **Graphing Lines**

## **EXAMPLE 1** Chapt, the line $y = \frac{2}{3}z$

**SOLUTION** Because here in a force of the fine it point or in stope-increase from , we see that the stope of the line is  $\frac{1}{2} = 1.5$  and the princercept is 16. The graph the line, we begin at the terigin and use the slope to locate a second point. For every that we exverse to the right, the line will use 1.5 times. If we traverse 2 units to the right, the line will rise 3 units, giving us the point (2, 3). On if we traverse 3 units to the right, the line will rise 4.5 units visiting the roots (3, 4.5). The graph to the line is shown in Figure 2.

Notice in Example 1 that the points (2, 5) and (3, 4.5) excite two similar right triangles whose corresponding sides are in proportion. That is,

$$\frac{45}{5} = \frac{3}{5}$$

is general, for any position,  $\phi$  on the bias other (from the origin), the ratio y/z will always be equal to the satio  $\frac{d}{dz}$  which is the plage of the line.

## USING TELE

W799 - 100, \$377,90

We can use a graphing calculated to verify that for any polon judger man the origin) on the graph of the time  $y = \frac{\pi}{2} x$ . the graph of the y coordinate to the x coordinate will always be equivalent to the slope of  $\frac{\pi}{2}$ , or 1.5 as a desirral.

Define this function of  $Y_1 = 3\sqrt{2}$ . To count the graph shown in Figure 3, jet the window variables so that  $-6 \approx x \le 6$  and  $-6 \approx y \le 6$ . (By this, we mean that  $X_{\rm DE} \cong -6$ .  $X_{\rm TEA} \cong 6$ . Year -6. Year -6. And -6. We will assume that the scales for both axes,  $X_{\rm SC}$  and  $Y_{\rm SC}$ , are set to 1 caloss notes either than the origin itself feature to move the conserve any point on the one other than the origin itself.

affigure 3). The correct coordinates are stored to the variables x and v. If we check the ratio yet, the result should be the slope of 1.5 at shown in Figure 4. Try this for several different coints to see that the ratio is always the same.

## Graphing Parabolas

Renall from your algebra classes that any parabola that opens up or down can be described by an equation of the form

$$y = \omega(x = h)^2 + K$$

Like wise, any equation of this form will have a graph dust is a parabola. The highest or lowest point on the parabola is called the ventra. The coordinates of the ventex que (a, its files value of a determines how wade or natural the parabola will be and what or it opens upward in discussion.

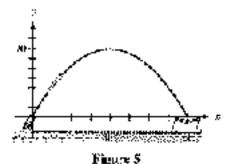

Smith, In, The Bullett was shot from a carnon. As a human exprosibility in reached a leight of 79 feet before landing in a net 160 feet from the cannon. Sketch die graph of his part, and then find the equation of the graph.

SECTS: Although quadratic forcetions are ust, portraced as a study of trigonometry.

Will example involuces the Element
Conform will theme that constitutions for professions for professions for professions, where the constitutions for professions, where the constitutions are constituted.

**SOLUTION** We assume draw the path taken by the human cannot ball is a parabola. If the origin of the coordinate system is at the opening of the cannot, then the not that calcook him will be at 160 on the x-axis. Figure 5 shows a graph of this path.

Because the convents a pageboruliwe know that the equation will gave the good

$$y = a(r - a)^2 + k$$

Because the vertex of the paralods is at (50, 70), we can fill in two of the three constants in our equations, pixing as

$$p = \mu(\tau - 00)^2 - 70.$$

To find a we note that the limiting point will be  $C(M, \mathbb{C})$ . Substituting the coordinates of this toing this waterion, we solve for a.

$$0 = \alpha(160 - 80)^2 - 79$$

$$0 = \alpha(60)^2 + 30$$

$$0 = 6400a + 70$$

$$0 = -\frac{70}{6400} = -\frac{7}{640}$$

The education that describes the path of the human carmorball is

$$y = -\frac{7}{640}(x - 80)^2 - 70 \text{ for } 0 \le x \le 160$$

#### USING TEST

To send y that the expection from Example 2 is correct, we compared the parallels and check the vertex and the scintarcepts. Chaple the equation using the window sealings shown below.

$$0 \le x \le 150$$
, sould = 20);  $0 \le y \le 80$ , scale = 10.

Use this appropriate examination your calculator to find the marginum point on the graph (Figure 6), which is the roctex. Then evaluate the function at  $a \approx 0$  and again at  $a \approx 15$  a territy the printercepts (Figure 7).

Note: There a carry of flerent and delived graphing dak station, and each model has its own set of commands. For example, to perform the previous steps on a FI-84 we wonth press. End. CALC and use the maximum and value commands. On a FI-bo. It is the FMAN and EVAL commands found in the GRAPH mene. Because we have no way of knowing which model of calculation you are working with, we will generally award movining specific key income or command notices throughout the amainder of this book. Check your calculate, manual to find the appropriate command for your particular model.

Figure 6

Figure 7

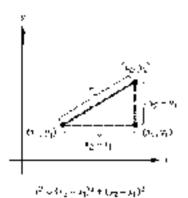

## The Distance Formula

Our next definition gives us a formula for finding the distance between any two points on the condinate system.

#### THE DISTANCE FORMULA

The distance between 2000 two points  $(x_1, x_1)$  and  $(x_2, x_3)$  are rectarged a constitute especialists were by the foreigns.

$$\mathbf{r} = \nabla^2 (\mathbf{r}_2 + \mathbf{r}_2)^2 + (\mathbf{r}_2 + \mathbf{r}_3)^2$$

 $r \approx \sqrt{(\kappa_2 + r_1)^2 + (\rho_2 + r_2)^2}$ 

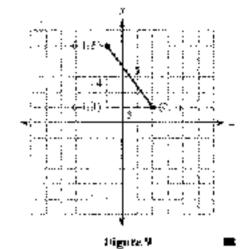

Figure 8

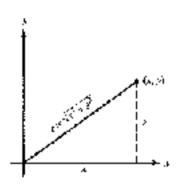

he distance formula can be derived by applying the Pythagorean Theorem to the right mis tylla in Pigum 8. Secause a is a di trance, a 🗈 🛈

Find the distance herween the tolins (+1, 5) and (2, 1).

**SQLUTION** If makes no difference which of the points we call  $(x_0, y_0)$  and which we call  $(\omega_{k})_{k}$  becomes this distuice will be the value between the two points regard. less (Menue 9).

$$r = \sqrt{(2 + (-1))^2 + (4 + 5)^2} + \sqrt{2^2 \cdot 5 \cdot (-6)^2} + \sqrt{9^2 \cdot 3 \cdot 16} + \sqrt{25} = 5$$

Ligate 10

Find the distance from the origin to the point (... y).

SOLUTION. The coordinates of the caigin are (0, 0). As shown in Figure 10, applying the distance framula, we have

$$\mathbf{z} = \nabla^2 (\mathbf{z} = \mathbf{0})^2 + (\mathbf{r} = \mathbf{0})^2$$

$$+ \nabla^2 \mathbf{z}^2 + \mathbf{r}^2$$

## Circles

Because of their perfect symmetry, circles have been used for shouldends of years in many discipliness, including and science, and religious. One example is Stonehenge is 4.500-year old site in England. The arrangement of the stones is based on a circular plan that is thought to have both religious and astronomical អវិទ្ធាល់ពីនិសាសន

A chigh is defined as the set of all points in the plane that are a fixed distance. from a given fixed point. The fixed distances is the maltes of the circle, and the fixed point in called the newton. If we let  $t \ge 0$  be the radius, (k, k) the denset, and (x, y) replies resent any point on the circle, then (x, y) is rightly from (x, z) as Figure 11 illustrates. Applying the distance formula, we have

$$\sqrt{(y-h)^2+(y-k)^2}=r$$

Squaring both sines of this constant great the formula for a circ at

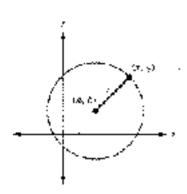

Figure 11

#### ECCATION OF A CHICLE

The equation of a circle with center (k,k) and tadius r>0 is given by the formula

$$(x-k)^2 + (y-k)^2 = r^2$$

**N** the center is at the origin so that (h,k)=(0,0), this simplifies to

$$x^2+y^3-x^2$$

**EXAMPLE 6.** Verify that the points  $\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$  and  $\left(-\frac{\sqrt{3}}{2}, -\frac{1}{2}\right)$  and  $\left(-\frac{\sqrt{3}}{2}, -\frac{1}{2}\right)$  both he run nimits or title is a content of the origin.

**SOLUTION** Because r = 1, the equation of the shalle is x' + y'' = 1. We exact each grain by showing that the root dinates satisfy the chiralities.

$$\begin{aligned} \mathbf{E} &= \mathbf{x} - \frac{\mathbf{t}}{\sqrt{2}} | \mathbf{set}_{\mathcal{A}} = \frac{1}{\sqrt{2}} &\qquad \mathbf{ff} &= \mathbf{x} = -\frac{\sqrt{3}}{2} | \mathbf{set}_{\mathcal{A}} = -\frac{1}{2} \\ \mathbf{Hern} &= \mathbf{x}^2 + \mathbf{y}^2 - \left(\frac{\mathbf{t}}{\sqrt{2}}\right)^2 + \left(\frac{\mathbf{t}}{\sqrt{2}}\right)^2 &\qquad \mathbf{Hern} &= \mathbf{v}^2 + \mathbf{v}^2 - \left(-\frac{\sqrt{3}}{2}\right)^2 + \left(-\frac{\pi}{2}\right)^2 \\ &= \frac{1}{2} + \frac{1}{2} &\qquad \qquad \mathbf{s} = \frac{1}{4} + \frac{1}{4} \end{aligned}$$

The graph of the oil the and the two paints are show pain Figure 12,

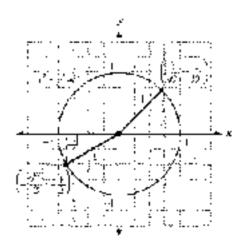

Figure 12

The circle  $x^2 = y^2 + 4$ , from Example 5 is called the wave cross-brownse as radius is . As you will are at eath to an experient part of cus of the 4c -where that we will give in 6 harder 4.

Figure 13

for graph the circle x' + y' = 1 on a graphing calculator, we must first explain yo

$$y' = i - x'$$
$$y = 2 V^{C'} + x'$$

Because of the itt sign, we see that a birdle is really the union of two senables filter riens. The positive expare soot represents the too built of the clark and the regative. aguage more represents the hortom half. Define there function, separately (Figure 15).

When you graph hoth functions, you will probably use a circle than a not quite. round and tension provinces the attacks (Figure 11). Gesting rid of the gaps can be tricky, and it regulates a good upder winding of how your calculator world. However, we can easily once the efficie appear rested using the zoom square commonl. ## Angles in Standard Position

#### DEPORTSON

As angle is said to hote manuard position it it a putial side is along the positive. s-as is and its wester is at the origin.

Fagure 16

尼文本代表主义 数元。Draw an angle of 45° in soundard perities and find a soin, on the temmoal side.

**SOLUTION** If we draw 45° in standard position, we see that the terminal side is: along the line v = x in quadrant 1 (figure 15). Because the terminal side of 45° lies doing the diag a = a in the limit quadrant say point on the terminal side will have positive coordinates that settialy the equation v = x. Here are some of the points desc do jest that.

$$(\sqrt{2}, \sqrt{2}]$$

$$-\left(\frac{1}{2},\frac{1}{2}\right)$$

$$-(\sqrt{2},\sqrt{2})=\left(\frac{1}{2},\frac{1}{2}\right)=\left(\frac{7}{8},\frac{7}{8}\right)$$

#### WODASSEASY

If angle 5 is in standard possible and the terrained side of 0 lies in quarkant in them we say if lies in quadrant I and we abbut viste it like these if

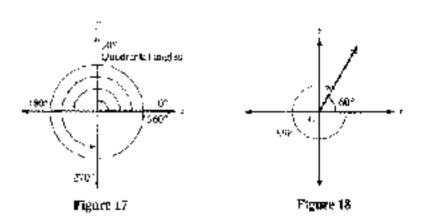

$$\theta \in \Omega$$

months of the service of the employer of the end of the present of the present party property (1997) and the present of the pr

Likewise:  $\theta \in \text{QUI means } \theta$  is in smaldary relation with its terrolical  $\epsilon$  de in quadiant II.

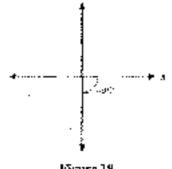

If the terminal side of an angle in standard position lies along one of the exact then that are it is called a condensate angle. For example, so angle of 90° frame to 334 identification would be a quadrantal angle, because the terrolinal aide wordd lie along the positive y axia. Likewica, 270° in standard position is a conditional angle because the terminal side would lie along the negative yexist .632are 17x

Two nugles in standard position with the same tenninal ride are called cotoms. nel angles. Figure (8 shows that 60° and +300° are contentinal angles when they me in around nothing. Notice that these two angles differ by 160°. That is  $50^{\circ} - (-300^{\circ}) = 360^{\circ}$ . Covermitted angles always differ from each other by some multiple of 360%.

**建设施制设施** 注意 Prenk 190° in standard position and and two positive angles and two negative angles that are coreaning with ~90%

**SOLUTION** Figure 19 shows +90° in standard position. To first a cotential angle, we coust a wouse a full revolution in the postation of faction of the negative discrito a

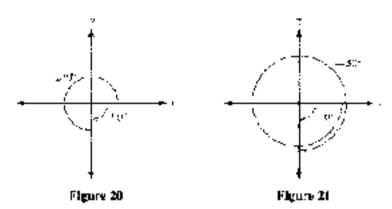

15gpre 19

One revelation in the positive direction.	$-90^{\circ} + 360^{\circ} - 270^{\circ}$
A second revulation in the positive direction:	$276^{\circ} + 360^{\circ} = 636^{\circ}$
One revolution in the negative divide on:	$90^{\circ} - 960^{\circ} + 450^{\circ}$
A second recolution in the negative do section	$-450^{\circ} - 360^{\circ}810^{\circ}$

Thus, 970° and 630° are two positive angles noteanized with  $\sim 50°$  and  $\sim 450°$  and  $\sim 840°$  are two organized angles acteorization that with  $\sim 30°$ . Figures 7° and 21 says two of descernings.

Next: There are actually un infinite number of angles that are extentional with  $-90^\circ$ . We can find a cotentions angle by adding or subtracting 350° any number of times. If we let kibe any integer, then the angle  $-90^\circ + 360^\circ k$  will be cotentiand with  $-90^\circ$ . For example, if k=2, then

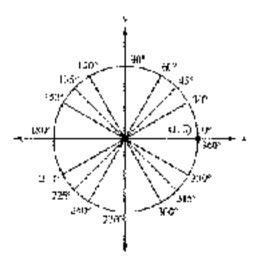

$$-90^{\circ} + 360^{\circ}(2) = -90^{\circ} + 720^{\circ} = 680^{\circ}$$

is a enterminal ungle as shown previously in Example 7.

**SOLUTION**: For any integer *k*, (20° ): 369 k will be constrained with 420°.

The diagram in Figure 22 shows some of the more common positive angles, We will see these angles often. Each origin is in standard position. Next to the remainal side of each angle is the degree exercise of the angle. To simplify the diagram, we have need each of the terminal sides one way long by thewing the most to the terminal sides one way long by thewing the most to the terminal sides one way.

### DEFINITION : TRIGONOMETRIC FUNCTIONS

In this section we begin one work with trigonometry, the formal analy of trigonomctry dates back to the Greeks, when it was used mainly in the design of checks and calendars and in assignation. The prigonometry of that period was achories: in nature, as it was based on measurement of area and obords associated with spheres. Unlike the trigonometry of the Greats, our introduction to trigonometry takes alsee on a restangular coordinate system. It researms dacif with angles, time aggreeats, and points in the plane

The definition of the transmission of the china that begins this service is one of Three ReSultines we will take like as, it is the most important definition in the back. What should you do with it? Memorize it. Remainner in nothernables, sefer tions are airmaly accepted. That is, unlike theorems, there is no proof avere sted with a definetions we samply scoop them colorly as they are written income verticing, and then use. There. When you are introduced with this section, Balance that you have membrated this tiest definition. It is the most tablishle thing you can do for yourself at this point in your sinery of trigonizately.

#### DEFINITION :

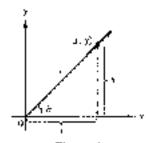

If 9 is an angle in standard position, and the point (x, y) is any point on the terminal side of 9 other than the origin, then the six trigonometric functions of angle 9 are defined as follows:

Function		ABOTEVMENT		ikilinitien
The sine of 9	-	8:5 B	-	·
The cosing of 9		നമ ർ		<u>x</u>
The tingenc of #	-	102 E	·	γ (ε ÷ <b>0</b> ι
The cottangent of 5	-	4.3. E	-	$\frac{\pi}{2} (3 \neq 0)$
The secure of a	-	and #	-	( (± <del>+</del> )(
Mes measured of #		ese #	-	$\frac{f}{2} \left( i \phi \neq 0 \right)$

where  $x^2 + y^2 = x^2$ , or  $x = \nabla x^2 = y^2$ . Thus is, x is, the distance from the original x, (x, y),

 $with the delta (in Fig. 1) = f_{ij} + f_{ij} + g_{ij} +$ 

As you can see, the six trigonometric functions are simply names given to the six coesticle ratios that can be made from the numbers x, y, and x as shown in Figure 1 in particular, notice that  $\tan \theta$  can be interpreted as the stope of the line corresponding to the terminal side of  $\theta$ . Both that b and set  $\theta$  will be undefined when  $x \neq 0$ , which will occur any time the terminal side of  $\theta$  coincides with the p-axis. If p when notices  $\theta$  will be nodelined when y = 0, which will occur any time the terminal side of  $\theta$ , which will occur any time the terminal side.

Pigure 1

Figure 2

**EXAMPLE** 1. ... Find the six trigonometric functions of  $\theta$  it  $\theta$  is to startland position and the point (-2,3) is  $\phi$ , the terminal side of  $\theta$ .

minal side of 0 councides with the reaxist.

**SOLUTION** We begin by making a diagram showing  $\theta$ , ( $\sim$ 2, 3), and the distance r from the origin to ( $\sim$ 2, 3), as shown in Figure 2.

Applying the definition for the six trigonometric functions using the values x = -2, y = 3, and  $x = \sqrt{13}$ , we have

$$x = 2, y = 3, \text{ and } x = \sqrt{1}$$

$$x = 2, y = 3, \text{ and } x = \sqrt{2}$$

$$x = \sqrt{1 + y}$$

$$-\sqrt{2}$$

$$-\sqrt{2}$$

$$\cos \theta = \frac{x}{x}$$

$$\cos \theta = \frac{y}{x}$$

$$\sin \theta = \frac{y}{x} = \frac{3}{3f(1)} \qquad \cos \theta = \frac{x}{2} = \frac{\sqrt{15}}{3}$$

$$\cos \theta = \frac{x}{x} = -\frac{y}{\sqrt{15}} \qquad \sec \theta = \frac{x}{x} = -\frac{\sqrt{15}}{2}$$

$$\tan \theta = \frac{y}{x} = -\frac{3}{2} \qquad \cot \theta = \frac{y}{y} = \frac{2}{3}$$

Next we to already when we expect the requires  $3\sqrt{3}$  distribution and had in the denominates, we exhalf a mitorative the denominator, or this case, by multiplying the momentum and the personalization by  $\sqrt{12}$ .

$$\frac{1}{\sqrt{12}} = \frac{1}{\sqrt{13}} \cdot \frac{\sqrt{12}}{\sqrt{12}} = \frac{p\sqrt{13}}{13}$$

In this moments, it is sometimes convenient to use  $3\sqrt{19}/3$  , and at other times it is exsist to use  $3\sqrt{12}$ . For more delta agree not to rationalize any denominators unless we are told to do so

# EXAMPLE 2. Mud the sine and posine of 45'.

**SQLUTION** According to the definition given earlier, we can find air '0" and  $\cos 45^{\circ}$  if we show a point (x,y) on the terminal side of  $45^{\circ}$ , when  $45^{\circ}$  is in semidard position. Figure  $3 \gg a$  diagrams of  $45^\circ$  in standard position. Because the terminal aids of 45° lies glong the line  $\tau = \pi$ , any point on the terminal side will have equal goordinates. A correctiont point to use is the point (1, 1). (We say it is a convenient point baceause the coordinates are easy to work with A

Because 
$$x=1$$
 and  $y=1$  and  $y=\frac{\sqrt{x^2+y^2}}{x^2+y^2}$ , we have  $x=\frac{\sqrt{y^2+y^2}}{\sqrt{x^2+y^2}}$ 

Substituting these values for any and authorized finition for seal and ensuring we have:

$$\sin 45^n = \frac{y}{x} = \frac{1}{\sqrt{2}}$$
 and  $\cos 45^n = \frac{x}{x} = \frac{1}{\sqrt{2}}$ 

SOLUTION. Apply we used in fact a point on the terration strie of 270%. From Figure 4, we see that  $\theta$  is complicatisfile of 27% lies along the negative y-axis.

A convenient point on the term and side of 270° is  $\Theta_0 \in \Gamma_0$  Sharefore,

$$r = \sqrt{x^2 + y^2}$$

$$= \sqrt{6^2 + (-1)^2}$$

$$= \sqrt{3}$$

$$= 1$$

We have x = 0, y = -1, and y = 1. Here are the six origonometric sames for

$$\sin 270^{4} = \frac{y}{x} = \frac{-1}{1} = -1 \qquad \qquad \csc 270^{5} = \frac{x}{y} = \frac{1}{4} = -1$$

$$\cos 270^{6} = \frac{x}{x} = \frac{0}{1} = 0 \qquad \qquad \sec 270^{5} = \frac{x}{x} = \frac{1}{0} = \text{andefined}$$

$$\tan 200^{6} = \frac{y}{x} = \frac{-1}{0} = \text{andefined} \qquad \cot 270^{6} = \frac{x}{x} = \frac{0}{-1} = 0$$

Note that tap 270° and sec 270° are updefined since fivision by 0 is updefined.

We can use Highre I to get some idea of how large or small each of the six trigonometric raties coight be based on the relative sizes of at a color, as illustrated in the next example.

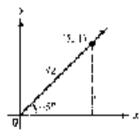

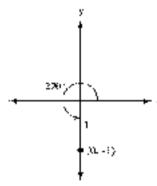

Figure 3

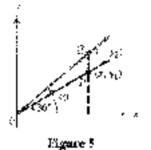

Alignate 4

Which will be greater that 30' or rain 40'? Blow large could not a be?

**SOLUTION** In Figure 5 we have chosen points P and Q on the transinal sides of 30° and 40° so that the p-coordinate is the same for both points. Because  $40^\circ > 30^\circ$ , we can see that  $y_2 > y_1$ . Therefore, the ratio  $y_2/r$  must be greater than the ratio  $y_1/r$ , and so that  $40^\circ > \tan 30^\circ$ .

As  $\theta$  continues to increase, the terminal side of  $\theta$  well got strenger and steeper. Because tun  $\theta$  can be interpreted as the slope of the terminal side of  $\theta$ , can  $\theta$  will become larger and larger. As  $\theta$  nears  $S\theta'$ , the terminal side of  $\theta$  will be almost vertical, and its stope will became exceedingly large. Theoretically, there is no limit to to have large tun  $\theta$  can be.

## Algebraic Signs of Trigonometric Functions

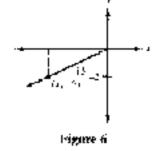

The algebraic sign. If or -1 of each of the six tragogometric functions will depend on the quadrant is which  $\theta$  testimates. For example, in quadrant t all six Liquinosetric functions are positive terminally,  $\rho$ , and r are all positive. In quadrant 11 only sin  $\theta$  and one t are residue to analysis of all the ratios, t each of the rone quadrants.

**SQLUTION** Recause  $\sin\theta = -3/13$  we know the ratio of your striple is -5/13. We can forly facility facilities the 13 and use these various of y and x to find x. Figure 6 shows S or standard mosthest with the norm on the forming suite of S having a y-coordinate of S.

**Possitive** We are that saying that if  $y'v \leftarrow -N(B)$ , then y must be  $-\Lambda$  and x negative. Its We know from eigensta that there are many pairs of attraites where save is -S(B), as a just -N and B. Our definition for some and one iso, become, we savies we can encourage point the true terminal sade of B in time and B and  $C \in B$ . However, because the above ye positive two energy assume a the negative sign with y.

For tanking, we use the land that  $x^2 = y^2 \pm z^2$ 

$$x^{3} \stackrel{?}{=} y^{2} = r^{3}$$

$$x^{3} + (-5)^{3} = 13^{3}$$

$$x^{3} + 7^{6} + 169$$

$$x^{3} = 4.64$$

$$x = \pm 12$$

Is a the parabox 12 or ~12?

Become 5 terminates in quantum 311, we can a my point on its term paint de will have a negative a-coordinate: therefore,

$$z \approx -12$$

Using x = -12, y = -5, and r = 15 in  $m_1$  milginal definition, we have

$$\cos \hat{p} = \frac{\pi}{r} = \frac{32}{13} = -\frac{12}{13}$$

má

$$\sup_{x \in \mathbb{R}} 0 = \frac{y}{x} = \frac{y}{-12} < \frac{y}{12}$$

As a final note, we should empresize that this migroup revior (unclions of a rangle are independent of the observe of the point (x,y) on the terminal side of the angle. Figure 7 shows an anylor  $\theta$  in semidard position.

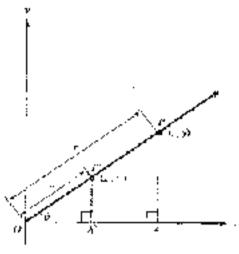

Figure 7

P shifts P(x, y) and P(x, y') are both points on the formant such of  $\theta$ . See suse to angles P(OX) and POX are of following gloss, the representating suchs are perpenticust. That is,

$$\sin\theta = \frac{y^r}{r} + \frac{y}{r} = \cos\theta = \frac{y^r}{r^r} + \frac{x}{r} = \sin \phi = \frac{y^r}{r^r} + \frac{y}{r}$$

#### GETTING READY FOR CLASS

- 75. Finally, if the point  $(x_1 + 3)$  is on the tensional side of  $\theta$  and  $\sin \theta = -3/5$ .
- **70.** Find viii the point  $(5, \gamma)$  is on the terminal side of  $\theta$  and  $\cos \theta \approx 5.13$ .

# section 1.4 INTRODUCTION TO IDENTITIES

Figure which from the work you have done in a genru that on expression such as  $\sqrt{e^2+9}$  erms. 4 to a replified further receive the square root of a sum at not equal to the square root of the aquere roots. (In other words, if would be a restate to write  $\sqrt{e^2+9}$  as  $x \in 3$ .) However, expressions such as  $\sqrt{e^2+9}$  excluding the frequently enough in mathematics that we would like to find expressions equivalent to the introduction of the root of the rest and the rest and the key to rewriting expressions such as  $\sqrt{e^2+9}$  in a most emission from which we will show in fiver on the

Helioth we togeth sur in hodination to affinitions, we need to review without connected from antiferror to and algorithm.

In eigebra, statements such as  $2x \to x + 1$  x,  $x^2 \to x + x + y$ , and  $\frac{x}{2x} = \frac{x}{4}$  are control startines. They are is an trick because they are train for all replacements of the vanishing or which they are determined.

Next the  $\frac{d}{ds}$  is not explicit or  $\frac{1}{s}$  when s is 0. Thus, subtributed  $\frac{s}{ds} = \frac{1}{s}$  is still an exactly, however, suggest as time to s is values of a for which  $\frac{s}{ds}$  is defined

The eight has congresseence elements we will work with another section are all derived brain our detailing of the ingenerating fractions. Because many ingenerative introductions between one than one loops, will highly the basic elementy treat and then give the most concern equivalent loops of that monity.

## Reciprocal Identities

Our definition for the sittle and coverant functions indicate that they are reciprocallothat is:

$$\cos \theta = \frac{1}{\sin \theta} \qquad \text{because} \qquad \frac{1}{\sin \theta} = \frac{1}{\sqrt{e}} = \frac{r}{2} = \cos \theta$$

Moreo We can also write this same relationship between  $\sin\theta$  and  $\cos\theta$  in another form as

$$\sin \theta = \frac{1}{\csc \theta}$$
 because  $\frac{1}{\csc \theta} = \frac{1}{\epsilon/\epsilon} = \frac{1}{\epsilon} = \sin \theta$ 

The figure identity we wrote,  $\cos\theta = 1$  win  $\theta$ , is the basic identity. The second one,  $\sin\theta = 1$  one  $\theta$ , is an equivalent form of the first.

From the precisiting discussions and from the definition of  $\cos \theta$ , see  $\theta$ ,  $\tan \theta$ , and  $\cot \theta$ , it is apparent that see  $\theta$  is the reciprocal of  $\cos \theta$ , and  $\cot \theta$  is the reciprocal of  $\cos \theta$ . Table 1 has three basis reciprocal identities and their common equivalent forms.

3	FABLE 1/ (MA) SA	<b>an</b> weedowy

The exemples that follow show some of the ways in which we use inear reciprocal identifies.

## EXAMPLES.

1. It san 
$$\theta \approx \frac{3}{\beta}$$
 , there can  $\theta = \frac{5}{\beta}$  , becomes

$$\cos \theta = \frac{4}{\sin \theta} = \frac{1}{35} \approx \frac{5}{3}$$

2. Those 
$$\theta=-\frac{\sqrt{3}}{2}$$
 , then we  $\theta=-\frac{2}{\sqrt{2}}$ 

 $(\textit{Remember:}\ \mathsf{Recupity} \mathsf{cals}\ \mathsf{always}\ \mathsf{have the same algebraic sign}\ )$ 

3. If fair 
$$\theta=2$$
, then  $\cos\theta=\frac{\pi}{2}$  ,-

**4.** If every 
$$\theta = a$$
 there air  $\theta = \frac{1}{a}$ .

5. If see 
$$\theta=1$$
, then  $\cos\theta=1$  (1 is its two reciprocal).

6. If 
$$\cot \theta = -1$$
, then  $\tan \theta = -1$ .

#### Ratio Identities

There are two ratio identities, one for one  $\theta$  and one for cot  $\theta$  (see Table 3).

# EXAMPLES :

- **8.** If  $\sin \theta = \frac{3}{5}$ , then  $\sin^2 \theta = \left(\frac{3}{5}\right)^3 = \frac{9}{25}$
- $\Psi_{i} \text{ if } \cos \theta = -\frac{1}{2} \cdot \text{thrap } \cos^{2} \theta = \left(-\frac{1}{2}\right)^{\frac{1}{2}} = -\frac{1}{8}$

#### Pythagorean Identifies

To derive our first Pythagorean identity, we start with the relationship among a  $\gamma_1$  and Alas as year in the definition of six 0 and sex 0.

$$x^2 + y^2 = e^t$$

$$\frac{x^2}{x^2} + \frac{y^2}{x^2} = 1$$
Divide the bugh by  $e^t$ 

$$\left(\frac{A}{a}\right)^2 = \frac{\left(\frac{b}{a}\right)^2}{\left(\frac{b}{a}\right)^2} = 1$$
 Property of exponents

$$(\cos\theta)^2 + (\sin\theta)^2 = 1$$
 Definitions of  $\sin\theta$  and  $\cos\theta$   
 $\cos^2\theta + \sin^2\theta$  . Notation

Talls that line is, our first Pythingorean Mantity, We will use it many times throughout. the book. It is passes that, for any angle  $\theta$ , the sum of the equates of  $\sin \theta$  and gos  $\theta$  is atways .

There are two very apertal equivalent forms of the first Pythagorean Identity. One form occurs when we solve  $\cos^4 \theta + \sin^2 \theta = 1$  for  $\cos \theta$ , and the other form is the result of solving for sin €

Solving to, cost/ we have

$$\cos^2\theta = \sin^2\theta = 1$$

$$\cos^2\theta = 1 = \sin^2\theta \qquad \text{Add } = \sin^2\theta \text{ to both sides}$$

$$-\cos\theta = 1 \text{ V} = \sin^2\theta \qquad \text{Take the sequence root of both sides}$$

Similarly, solving for sin digitors is:

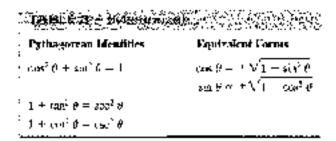

Surjugatively Pythagogeon identity is derived from the first Pythagogeon identity,  $\cos^2\theta + \sin^2\theta = 1$ , by dividing both sides by  $\cos^2\theta$ . Here is that the jordion.

$$\begin{aligned} \cos^2\theta &\sim \sin^2\theta = 1 & \text{First Pothanorean identity} \\ &\frac{\cos^2\theta + \sin^2\theta}{\cos^2\theta} \sim \frac{\cos^2\theta}{\cos^2\theta} & \text{Divide each side by cos}^2\theta \\ &\frac{\cos^2\theta}{\cos^2\theta} + \frac{\sin^2\theta}{\cos^2\theta} \sim \frac{1}{\cos^2\theta} & \text{Write the left side as two fittenons} \\ &\left(\frac{\cos\theta}{\cos\theta}\right)^2 \approx \left(\frac{\sin\theta}{\cos\theta}\right)^2 + \left(\frac{\sin\theta}{\cos\theta}\right)^2 + \left(\frac{\cos\theta}{\cos\theta}\right)^2 & \text{Property of exponents} \\ & i \sim \tan^2\theta + \sec^2\theta & \text{Ratio and acciproral identities} \end{aligned}$$

This few expression,  $1/4 \sin^2 \theta = \sec^2 \theta$ , is not seroud Pythagorean identity. It antive a root third, and had, Pythagorean identity, we proceed as we have earlier but instead of dividing each size by  $\cos^2 \theta$ , we divide by  $\sin^2 \theta$ . Without showing the work involved in doing so, the result is

$$1 + \cos^2 \theta - \csc^2 \theta$$

We sustingfize our decivations in Table 3.

Notice the  $\Delta$  sign in the equivalent forms, it occurs as part of the process of taking the square root of both sides of the preceding equation. (Remainder: We would obtain a similar result in absolute if we solved the appearion of -3 to get  $r\sim 2.3$ .) In Example 10 we will see how to degree in the  $\Delta$  sign.

EXAMPLE 10: If sin 0 = 3% and 6 tent instes in QD, food cos J and ray 0.

**SOLUTION** We begin by using the identity  $\cos \theta = \pm \sqrt{1 + \sin^2 \theta}$ . First, we may a secide whether  $\cos \theta$  will be positive to personal ivertible builty. We great out

that  $\theta$  remains on  $Q\Pi$ , so we know that one  $\theta$  muot be negative. Therefore

$$\cos \theta = -\nabla (1 + \sin^2 \theta)$$

New we can substitute the given value of sin 0.

If 
$$\sin \theta = \frac{5}{5}$$
  
the identity  $\cos \theta = \sqrt{-\frac{5}{3} \frac{n^2 \theta}{25}}$   
because  $\cos \theta = \sqrt{1 + \left(\frac{5}{2}\right)^2}$   
 $= \sqrt{1 + \left(\frac{5}{2}\right)^2}$   
 $= \sqrt{\frac{16}{25}}$   
 $= -\frac{4}{5}$ 

To find tan 5, we use a ratio identity.

$$tot \theta = \frac{\sin \theta}{\cos \theta}$$
$$= \frac{36}{-4.5}$$
$$= \frac{3}{4}$$

If  $\cos \theta = 1/2$  and  $\theta$  terminates in QIV, that the remaining trigonometric ratios for  $\theta$ .

**SOLUTION**. The first, and easiest, earloan find is see if because it is too recignosal of cos it.

$$\sec \theta = \frac{1}{\cos \theta} = \frac{4}{3/2} = 1$$

Next we find  $\sin \theta$ . Using one of the equivalent forms of our hydrogorean isomorp, we have

$$\sin\theta \triangleq \pm \sqrt{1 + \cos^2\theta}$$

However if terminates on  $\mathbb{Q}(V,s)$  in  $f^{n}$  will be negative. This gives in

sin 
$$\theta = -\sqrt{1 - (\frac{1}{\sqrt{2}})^2}$$
 Substitute  $\frac{1}{2}$  for  $\cos \theta$ 

$$= -\sqrt{1 - (\frac{1}{\sqrt{2}})^2}$$
 Substitute  $\frac{1}{2}$  for  $\cos \theta$ 

$$= -\sqrt{1 - \frac{1}{4}}$$
 Subtract
$$= -\sqrt{\frac{3}{4}}$$
 Subtract
$$= \frac{\sqrt{3}}{2}$$
 Take the square root of the numerator and denominator expansion.

Now that we have  $\sin \theta$  and  $\cos \theta$ , we can find  $\sin \theta$  by using a ratio identity.

$$\tan \theta = \frac{\sin \theta}{\cos \theta} = \frac{-\sqrt{3}/2}{1/2} = -\frac{\sqrt{3}}{2} \cdot \frac{2}{1} = -\sqrt{5}$$

Cot  $\theta$  and esc  $\theta$  are the reciprocals of ten  $\theta$  and sin  $\theta$ , respectively. Therefore,

$$\cos\theta = \frac{1}{\tan\theta} = -\frac{1}{\sqrt{3}}$$

$$\cos\theta = \frac{1}{\sin 5} = -\frac{2}{\sqrt{5}}$$

Here are all six ratios together:

$$\frac{\sqrt{3}}{\sin \theta} + \frac{\sqrt{3}}{2} = \csc \theta = \frac{2}{\sqrt{3}}$$

$$\cos\theta = \frac{1}{2} \qquad \quad \cos\theta = 2$$

$$\frac{1}{22\pi} < -3 \log_{10} = -\beta T = -5 \log_{10}$$

As a final note, we should mention that the eight basic identities we have believed here, along with their equivalent forms, are very responsing in the study of triggerenteary. It is exceptial that you apendoize them. It may be a poor idea to grantice writing them from the more until you can write each of the eight, and then equivate at forms, perfectly. As time green by, we will increase our lest of identities, so you will want up keeping with them as we go whing.

#### 200 GETTING READY FOR CLASS

After reacting them ghave, encouling scatters, respond to your own words and in de**m**iniste senteneau.

# MORE ON IDENTITIES

The forms we will could to this section are an extension of the work we did with from ties in Grouper 1.4. We can use the eight basic identities we introduced in the performs section to rewrite or samplify comin convessions. If will be helphy be this point regard bette all ready begins to member to these identities.

The birst topic involves writing any of the six to go constant functions in leases of any of the others, it #6% look at an engingle.

SOLUTION. When we say we write had his intern in forms of six it, we move that we want to write an expression that is equivalent to tan # but insolves no trigonometric function other than  $\sin \theta$  . Let s begin by  $v_{MN}g$  a strict identity to write  $tan \theta$  in: terms of up (fight cost):

$$\lim f^{p} \mapsto \frac{\sin \theta}{\cos \theta}$$

Now we need to replace the  $\theta$  with an expression theoleting only  $\sin \theta$ . Since  $\cos \theta = \pm \sqrt{(1-\sin^2\theta)}$ 

$$\tan \theta = \frac{\sin \theta}{\cos \theta}$$

$$= \frac{\sin \theta}{\sin \sqrt{1 - \sin^2 \theta}}$$

$$= \frac{\sin \theta}{-\sqrt{1 - \sin \theta}}$$

This fast exercision is equivalent to san 8 and is serimen in terms of sin 0 only. (In a problem, like this, it is okey to include numbers and algebraic symmetri with similar.)

Here is another example.

While Set 8 and 6 in Lines of sin 8 and clos 6, and then since We.

**SOLUTION** Since set  $\theta = 15$  as  $\theta$  and  $\tan \theta = s$ , 10 cos  $\theta$ , we have

$$\sec \theta \tan \theta = \frac{1}{\cos \theta} + \frac{\sin \theta}{\cos \theta}$$
$$= \frac{\sin \theta}{\cos^2 \theta}$$

The next examples above how we man injuriate to igonometric expressions using algebraic techniques.

**EXAMPLE 3** And 
$$\frac{1}{\sin \theta} = \frac{1}{\cos \theta}$$

**SOLUTION** We can add these two expressions in the same way we would add  $\frac{1}{2}$  and  $\frac{1}{4}$ —by time finiting a least common denominator (LCD), and then writim each expression again with the LCD for its denominator.

$$\frac{1}{\sin \theta} + \frac{1}{\cos \theta} = \frac{1}{\sin \theta} \cdot \frac{\cos \theta}{\cos \theta} + \frac{1}{\cos \theta} \cdot \frac{\sin \theta}{\sin \theta} \qquad \text{The LCD is } \sin \theta \cos \theta$$

$$= \frac{\cos \theta}{\sin \theta \cos \theta} + \frac{\sin \theta}{\cos \theta \sin \theta}$$

$$= \frac{\cos \theta + \sin \theta}{\cos \theta \cos \theta}$$

# EXAMPLE 4 Multiply (sin + 1 Tigain # S)

**SOLUTION** We analogy these two expressions in the same way we would mealigy (x+2)(x-3), an armoral general books, this find of intelligibilities is accomplished using the FGL method.)

$$(\operatorname{man} U + 2) \sin \theta = \mathbf{N} + \sin \theta + \sin \theta + 2 \sin \theta = 0$$
$$= \sin^2 \theta + 3 \sin \theta = 10$$

In the introduction to Section 1.4, we mandifund that (Agonometric identities we the key to writing the expression  $\nabla \mathcal{A} + v$  without the agree cost symbol. Our next example shows how we do this using a trigonometric substitution.

Simplify the expression  $\nabla x^2 + 9$  as neach as possible after substituting 3 as  $\theta$  for x.

**SOLUTION** Our givel is to write the expression  $\sqrt{\gamma^2 - 9}$  without a square root by first making the substitution x = 3 to:  $\theta$ .

If 
$$x = 3 \tan \theta$$
 then the expression  $\sqrt{x^2 + 9}$  becomes  $\sqrt{(5 \tan \theta)^2 + 9} = \sqrt{9 \tan^2 \theta + 9} = \sqrt{9 \cot^2 \theta + 1} = \sqrt{9 \cot^2 \theta} = \sqrt{9 \cot^2 \theta}$ 

$$= \sqrt{9 \cot^2 \theta}$$

$$= \sqrt{9 \cot^2 \theta}$$

$$= 3 \tan \theta$$

Number 1. We coust not the analytic value syn hol nation we know that see  $\theta$  is positive. Remove for, in algebra,  $\nabla a^2 = a$  on y when a is positive or zero. If  $\theta$  is possible that a is regarding, then  $\nabla a^2 = s\theta$ . In Section 4.7, we will see how the according to the service x and  $\theta$  if then by removing the absence value symbol.

Nexts 2. After exacting through (seatople 5, you may be wondering if it is nathernatically demost to make the substitution  $x = t \tan \theta$ . A fee all, a can be any risal number because  $x^2 \in S$  will are tysible positive. (*Remarkber: We want to arrived triving the* square control a negative member.) How do we know that any majorirable can be well-by as  $\beta$  to all two wall take date of thesm. Section 4.4 by showing that for any trainingers, there is a syline of 0 between 1915 and 457 for which g = 3 for  $\theta$ .

In the examples that to low, we want to use the eight pasic inforthings we developed in Section 1.4, along with some techniques from eligibra, to show that some more complimated, dentifies are true.

Show that the following statement is true by transforming the left side into the right side

**SOLUTION** We begin by writing the left side in terms of air  $\theta$  and  $\cos \theta$ .

$$\cos\theta \sin\theta = \cos\theta \cdot \frac{\sin\theta}{\cos\theta}$$

$$= \frac{\cos\theta \sin\theta}{\cos\theta}$$

$$= \sin\theta$$

$$= \sin\theta$$
Duride as the cos  $\theta$  contained to the cos  $\theta$  contained to

Because we have specedied in transforming the 3cft side into the right size, we have show: that the statement cos 0 tail  $\theta = \sin \theta$  is an identity.

Prove the identity ( $\sin \theta + \cos \theta$ )<sup>2</sup> = 1 ± 2 six  $\theta \cos \theta$ .

**SOLUTION** Tet's agree to prove the identifies in this postion, and the problem act. lant follows. By Charleson by the left side into the right yeld. In this case, we begin by expanding  $(\sin\theta) \in \cos\theta/2$ . (Be no tiber from a goate,  $(a+b)^2 + a^2 + \lambda ab + b^2$ .)

$$(\sin \theta + \cos \theta)^2 = \sin^2 \theta + 2\sin \theta \cos \theta + \cos^2 \theta$$

$$\approx 4 \sin^2 \theta + \cos^2 \theta + 2 \sin \theta \cos \theta$$

Steamar ge terms

$$\approx 1.1.2 \sin 5 \cos \theta$$

Pythogoman identity 🖚

We should ancebure that the anality to prove intentities in the manifesty is not alsony's obtained innucleatedy. It is easily out mean total of practice. The more you work at it, the basic goes will become at it, in the mountaine, if you are having trouble. charge first to see that you have morninged the eight basic intentities—reciprocal. rates Pythagraman, and there equivalent forms (-as given as Section 4.4)

#### GETTING READY FOR CLASS

#### SUMMARY

#### CXAMPLES

We will use the many in this glob manufactor of the rotates being acrosswed, whenever ut is appropriate.

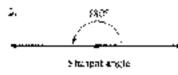

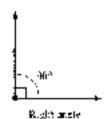

The market to because is next to each hearing indicates the section in which that topic is discussed.

#### Angles [1.1]

An angle is formed by two rays with a common end point. The common and robot is called the vertex, and the says are called sides, of the angle. If we think of an angle as being formed by testing the initial side about the vertex to the terminal side, then a commercifically size rotation gives a positive stage, and a clockwise rotation gives a require rangle.

de la latica is a right transple with C = 90°, and Ma = 4 and , = 5 the

If can be of a 41°-41°-70° chargin is 5, that sho other top to also 5 and the hympothese in 5.4°s.

#### Degree Measure [1.1]

There are  $960^\circ$  and full constant, This present, at 1° is  $\frac{1}{360}$  of  $\pi$  full potation.

An angle that measures 90° is a right ringle. An angle that measures 180° is a consight angle. Any  $\phi$  that measure between 0° and 90° are called across anchor, and angles that measure between 90° and 180° are called ranges angles. Complementary ringles have a sum of 50°, and anotherwise ringles have a sum of 150°.

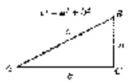

Зиружиельный авьюч

#### Pyflogorean Theorem [1.1]

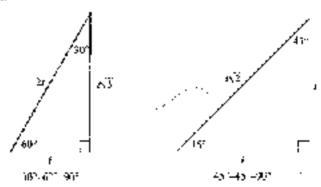

In any right mangle, the square of the longth of the longer wide (the *hypotenesic*) is equal to the sum of the squares of the longths of the other two sides (*lega*).

#### Special Triangles [L.D.

In any aight mangle, in which the two source angles are 190° and 64°, the langest side (the hypotenise) is always hardenne sharelest side (the side approximation  $(60^\circ \text{ gargies})$ ) and the side of predium length (the side approximation  $(60^\circ \text{ gargies})$ ) is always  $(60^\circ \text{ gargies})$ . The shortest side:

If the harvacuse angles in a light triangle are both 45°, then the two shower sides (the legs) are equal and the langest side (the hypoteonise) is  $\sqrt{2}$  singles as long as the shorter sides.

#### Distance Formula [1.2]

The distance r between the points  $(\mathbf{a}_1, \mathbf{y}_2)$  and  $(\mathbf{a}_2, \mathbf{y}_2)$  is given by the formula.

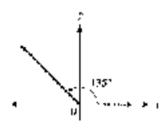

$$\tau = \sqrt{(s_2 + r_1)^2 + (s_2 + s_3)^2}$$

• The  $\lambda$  occurs have sen (2,2) and (-2,4):

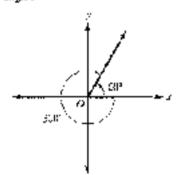

Đ.

5. 1999 in standard position is

 $R = 2P \circ m! + 2i\theta^2 \circ n \circ constant all angles.$ 

 17(--3, 4) is on the remaining side of 6, alon

204

$$\operatorname{vir} \theta = \frac{4}{5}, \qquad \operatorname{var} \theta = \frac{5}{4},$$

$$\operatorname{vir} \theta = \frac{1}{5}, \qquad \operatorname{var} \theta = \frac{5}{4},$$

$$\operatorname{vir} \theta + \frac{4}{5}, \qquad \operatorname{vir} \theta = \frac{5}{2},$$

#### Circles [3,2]

A circuit is defined as the set of all points to the plane that are a fixed distance (the sadius) from a given fixed point (the reager). If we let r>0 be the callins and (k,k) the Let then the equation for a circle is given by the formula

$$((x-y)^2+(y-\xi)^2+y^2$$

. . .

#### Standard Position for Angles [1,2]

At angle is said to be an standard position of its vertex is at the long in and its textal outers along the positive versas.

## Caterminal Angles [1:2]

I was angles to standard position with the same term as uside a  $\pi$  collect approximation global Coefficient angles always differ from each collect by whose multiple of 3900.

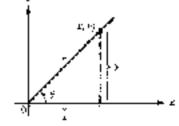

## Trigonometric Functions (Belinition I) [3,3]

If  $\theta$  is an angle in standard position and (x,y) is any point on the terminal side of  $\theta$  (other framiths only rights)

$$\sin \theta = \frac{y}{r} \qquad \cos \theta = \frac{x}{y}$$

$$\cos \theta = \frac{x}{r} \qquad \sec \theta = \frac{r}{x}$$

$$\cos \theta = \frac{y}{r} \qquad \cot \theta = \frac{y}{y}$$

where  $x^2+x^2=x^2$ , or  $x=\nabla_x x^2+y^2$ . Thut is, x is the distance from the origin to Let y).

(A) Which  $\theta \geq 0$ , and  $c_0$ ,  $b \geq 0$ , then  $\theta$  must combinate in QL

If  $\sin \phi > 0$ , and  $\cos \theta < 0$ , then  $\theta$  , much technique to  $\theta$  .

If sin 4 ≤ 0, and one 9 ≤ 0, then it is not term instead QBI.

If sm # < 9, und one # > 0, then # noise terminate in QIV.

#### Signs of the Trigonometric Functions [1.3]

The algorithm signify  $\phi$  on  $\phi$ , of the six to generate the functions depend on the quadrant by which  $\theta$  forminates.

## GROUP PROJECT

#### THE PYTHAGOREAN THEOREM

In a right sugged visuage, the area of the equate on the hapotenesse is the sum of the areas of the squares on the other new sides.

Theorem of Pothagonas

Objectives To prove the Pythagorean Thiorem using several different geometric approperties.

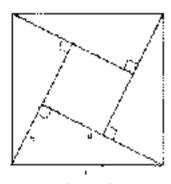

figure i

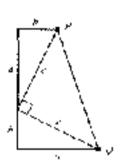

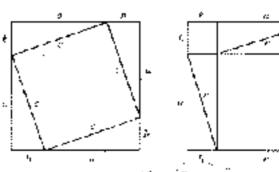

Figure 3

Although the Buby online appear to have had an interpretabiling of this reinforcing a thousand years before Pythogorus, his name is associated with the rheorem to take he was the first to provide a proof. In talk project you will provide the details for several proofs of the theorem.

- 1. The diagram shown in Figure 1 was exactly the Hinde continuousless Bhrakers to prove the theorem in the 13th century. His grout consisted only of the diagram and the word "Beholds" Use this righte to derive the Pythogoreus Theorem. The right trungle with sides a, b, and c has been repeated three times. The area of the large equive is equal to the sum of the meno of the four triangles and the area of this sonal equation is the center. The key to this serivation is in finding the length of a side of the small appears. Once you have the equation, simplify the right side to obtain the theorem.
- 2. The second proof enertified to ferroes president farmes Gerffeld, is based on the diagram shown in Figure 2. Use this figure to derive the Pythingorean Theorem. The right triangle with a deap. b, and c has been repeated and a third triangle created by placing a line segment between points P and G. The area of the entire figure to empere d) is equal to the sum of the creas of the three triangles. Once you have the creation, samplify both sides and there isolate e<sup>2</sup> to obtain the theorem.
- A For the third "proof," consider the two squares arows in Figure 3. North squares are of the same size, so their areas which he equal. Winto a paragraph explaining how this diagram serves as a "visual proof" of the Pythago can become. The key to this aryoment is to receptable of what the two squares have in common.

#### STUDY SKILLS FOR CHAPTER 2

The quarte at the beginning of Lib chapter swinforces the feed for, success in matter number from practices. We proctice nigoconactry by working problems. Working problems is probably the single most important thing you can do to achieve excession or in a gunometry.

If you have successfully on upleted Chapter 4, then you have made a good start at descriping the study skills necessary to succeed in all most of study skills necessary to succeed in all most of study skills from Chapter. Some are a quarting from of the skills from Chapter 1, while others are new or this objector.

- 1 Continue to Set and Keep a Schedule Sumetimes we find sudents do well in Chapter I and then become geographically. They will spend less three with their homework. Don't do it. Keep of the super schedule.
- 2 Continue to Memorize Definitions and Important Facts. The important facts of the posterior definitions in this charter are close for migrosometric rances in right triangles. We will point here on as we progress through the chapter.
- 3 List Difficult Problems Begin to make Late of problems that give you the most difficulty. These are the problems that you are to restedly making mistaces with. Try to spend a few misutes each yav reworking some of the problems from your list. Once you are able to work these problems successfully, you will have much more confidence going into the peat exam.
- 4 Begin to Develop Confidence with Word Problems. It seems that the main difference between people who are good at working word problems and chose who are not, is confidence. People with confidence know that no matter how long it takes them, they will exemple by saying to then selves, "I'll never be able to work this problem." If you are in the second category, then instead of letting yourself that you can lich word problems, that you don't like them, or that they be not good for anything anyway, decides to do whatever it takes to master them. As Arisande said, it is practice that produces excellence. For any practice means working problems. (its of problems.)

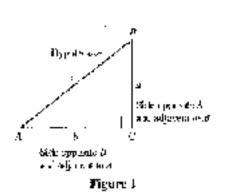

Specialization of the contract of the contract

# BECTION 2.1 DEFINITION II: RIGHT TRIANGLE TRIGONOMETRY

The word trigonometry is derived from two Greek words: no passen, which translates as energie, and ther row, which means measure. In gonemotry, then, is triumgle measure. In this section, we will give a second definition for the trigonometric functions that is, in fact, based on "triangle measure." We will define the trigonometric functions as the ratios of sides in right triangle. As you will see, this new definition does not contilet with the definition from Chapter I for the trigonometric functions.

#### DEFINITION II

If (right)  $d \in ABC$  is a right triangle with  $C = 90^\circ$  (Figure 1), then the x  $\mu$  trigonous tracking x for A are defined as full two

 $\cos A = \frac{\text{side udiacent } A}{\text{hypotent so}} = \frac{A}{c}$   $\cot A = \frac{\text{side approximat } A}{\text{side adjacent } A} = \frac{a}{c}$   $\cot A = \frac{\text{side adjacent } A}{\text{side approximat } A} = \frac{b}{a}$   $\cot A = \frac{\text{hypoteneous}}{\text{side adjacent } A} = \frac{c}{a}$ 

voor in vertreel in de noorde et troegen, et oan de naar de verde en

 $xoA = \frac{\text{sine approxima}}{\text{hypotentiae}}$ 

Triangle ABC is a right triangle with C = 994. If a = 6 and a = 10, find the materiage functions of A.

**SOLUTION** . We hegge by moving a diagram of 4RI (Figure 2), and then are the given incremation and the Pythagonian Theorem to solve for b

Now we write the six higonometric first conset Austing a = 6, b = 8, a.d. = 10.

$$\sin A = \frac{a}{a} + \frac{6}{10} + \frac{3}{5} \qquad \cot A + \frac{a}{a} + \frac{5}{3}$$
$$\cos A + \frac{b}{a} = \frac{8}{10} + \frac{7}{5} \qquad \sin A = \frac{a}{1} + \frac{5}{4}$$
$$\tan b = \frac{a}{b} + \frac{6}{8} + \frac{3}{4} \qquad \cot A = \frac{b}{a} + \frac{4}{3}$$

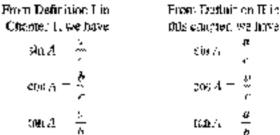

Use Definition the explain why, for any some suggests it is impossible for an  $\theta=2$ .

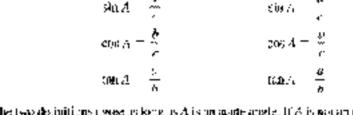

**SOLUTION** 15 acces à acres, we can insignine  $\theta$  as  $\theta$  e later or angle of some right triangle. Then we would have

Because the hypotentials is always the longest side of a right triangle, the demonstrator of this ratio is larger than the numbrator, forging the ratio to have a value lass than it. Therefore, it is not possible that this range could be equal to 2.

Now that we have done a counter of examples using our new periodian, let's see how out now dofinition compares with Definition I from the psychous enarger. We ean place tiens triangle AAC on a regargator poordinate averam so that 4 is in glandard. position (Figure 3). We from note that a point on the terminal state of A is (a, a).

The two dominitions agree to long as  $\Lambda$  is on neath angle. If  $\Lambda$  is not an oct to angle them Definition (I does an apply, because in right (Gangle ABC, A must be an acute right).

Here is a corner definition that we will need before we can take Definition Herry fuction.

Nine and avaine are cofunctions, as are tangent and cotunge at and sugar tandcosts and. Wit say sinous the columns on of costeed bald online is the end action. or aithe.

errigio es capa de la como de la presención de la constanta de la como de figura de la como de la c

Now let's see of at rappers when we apply Definition II to B is right triangle ABC.

$$\sin B + \frac{\sin c \text{ opposite all hypercourse}}{\ln \text{hypercourse}} = \frac{a}{c} = \cos A$$

$$\cos B = \frac{\sin c \text{ opposite } B}{\ln \text{post rose}} + \frac{a}{c} = \sin A$$

$$\sin B = \frac{\sin c \text{ opposite } B}{\sin c \text{ opposite } B} = \frac{b}{a} = \cos A$$

$$\cos B = \frac{\sin c \text{ opposite } B}{\sin c \text{ opposite } B} = \frac{a}{b} = \cos A$$

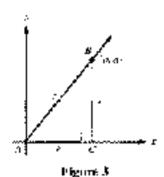

$$\sin C = \frac{\sin c \text{ opposite } B}{\sin c \text{ opposite } B} = \frac{a}{b} = \cos A$$

$$\cos B = \frac{\ln \text{opposite } B}{\sin c \text{ opposite } B} = \frac{a}{b} = \cos A$$

$$\cos B = \frac{\ln \text{opposite } B}{\sin c \text{ opposite } B} = \frac{a}{b} = \cos A$$

$$\cos B = \frac{\ln \text{opposite } B}{\sin c \text{ opposite } B} = \frac{a}{b} = \cos A$$

As you can see in 10 gars 4, every to gonometric transpose of 4 is equal to the addinguion of B. That is,  $such = \cos B$ , set  $A = \csc B$ , and  $\cos A = \cot B$ , to reme a ters. Become if and it are the wrote augles in a tight triangle, they are always compomuon ary engles, that is, their sources obvoys 9.7° What we actually bases here is

**NOTE:** Loc plobs to a micronic rene se til efterhægne ser reference to the complement. Proprié the sens 1460. Registration is used. call by a selection was required by presidence violential to the Assite Co the same of the complementary stage. In 1923, 3 January Grade, shortegard Critical colored with National Contract abbroxisted as now every by John Mestocia 1633.

another property of trigonometric functions. The nine of an angle is the cosine of its complement, the securit of an angle is the obsecurit of its complement, and the tappear of an angle je the cutangent of his complement. Gr, in symbols:

if 
$$A \approx B = 90^\circ$$
, then 
$$\begin{cases} \sin A = \cos B \\ \sec A = \csc B \\ \tan A = \cot B \end{cases}$$

and so un.

We generalize this et cossible with the following theorems.

#### DOMESTICATION (HEDBREW)

A truggerametric function of an angle is always equal to the column ten or the complement of the angle

karawa wa antao wa natao, wantao, wa katao wa na a paoje natao kao ngipino wa ginjero ng goda iping kan gipino

By clarify this further, if two angles are considerioritary, such as 407 and 50°, Some hisponometric function of each is equal to the cofits those of the other. That is,  $\sin 40^\circ + \cos 50^\circ$ , see  $40^\circ + \cos 50^\circ$ , and  $\tan 400^\circ + \cot 50^\circ$ .

**主义とは、** Fill in the Dianks so that even expression becomes a true statement

**SOLUTION** Using the theorem on cofunctions of complementary angles, we fill in the blanks of follows:

because sine and cosine are collerations and

$$60^{\circ} + 30^{\circ} + 20^{\circ}$$

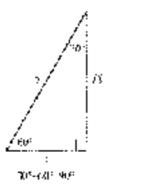

because imagent and covarigent are confidentions and

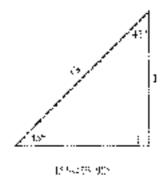

$$y + (90^{\circ} - y) = 90^{\circ}$$

e. 
$$860.75^{\circ} = 680......15^{\circ}$$

because secont and cosecant are polarieties; and  $75^{\circ} \pm 15^{\circ} = 30^{\circ}$ 

For our next application of Definition 17, we need to recall the two special trian. gles we introduced in Chapter 1. They are the 30°-60°-90° triangle and the 45°-45° 90° triangle. Figure 5 shows both of these triangles for the case in Which tte shortest side is 1te = 1).

L'igure 5

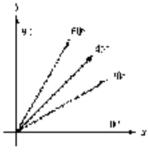

Using these two openial triangles and Derinition II, we can find the trigonomestile functions of 30% 45%, and 67%. For example,

$$\sin 50^{\circ} = \frac{\text{side apposite }60^{\circ}}{\text{syndemed}} = \frac{\sqrt{3}}{2}$$

$$\cos 45^{\circ} = \frac{\text{side saljacent } ^45^{\circ}}{\text{typotenase}} = \frac{1}{\sqrt{2}}$$

If we were to common finding the sine, cosing, and tempent for these special angles (Figure 5), we would obtain the results summarized in Table 1, Because we will be urking these values so frequently, you should elther memorize the special idengles in Figure 5 (pravious page) or the information in Table 1

Flerice 4

	iven Lead	A HOUSE	
. 4	sên fr	See (F	tso 6
W>	1 2	V3 2	1 — <u>√</u> 5 √5 — 3
350	$\frac{1}{\sqrt{2}} = \frac{\sqrt{2}}{2}$	$\frac{1}{\sqrt{2}} = \frac{\sqrt{2}}{7}$	1
50"	√9 31	] 2	Vθ

Table 1 is called at able of exact values to a very set in from a table of approximate values. Lates in this charior we will work with a calculator to obtain nanies of approximate values

Example 1 (see the exact values from either owner 5 or Table 1 to show that the following one true.

5. 
$$\cos^2 80^\circ + \sin^2 80^\circ + 1$$
 b.  $\cos^2 45^\circ + 1$ 

**a.** 
$$\cos^2 30^{\circ} + \sin^2 30^{\circ} = \left(\frac{\sqrt{3}}{2}\right)^{\circ} + \left(\frac{1}{2}\right)^{\circ} = \frac{1}{4} + \frac{1}{4} + 1$$

**b.** 
$$\cos^2 45^\circ + \sin^2 45^\circ = \left(\frac{1}{\sqrt{2}}\right)^2 + \left(\frac{1}{\sqrt{2}}\right)^2 = \frac{1}{2} = \frac{1}{2} = \frac{1}{2} = 1$$

EXAMIFE 1 Let a 1 30° and p 11 45° in each of the expressions that hollow, and then simplify each expression as much to possible.

a. 
$$2 \sin x = 2 \sin 40^{2} + 3 \left(\frac{1}{2}\right) + 1$$

**b.** 
$$\sin 2y = \sin 2(49^{\circ}) = \sin 50^{\circ} = 1$$

(. 
$$4 \sin (3x - 90^\circ) \approx 4 \sin [3(9F) - 9F] \approx 4 \sin F = 4(9) \approx 9$$

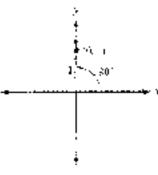

Figure 7

As you will see as we progress through the book, there are times when it is appropriate it use Deliminon II for the ingonometric functions and times when it is name appropriate to use Deliminon I. To illustrate, suppose we wanted to find six 5,  $\cos \theta$ , and  $\tan \theta$  for  $\theta = 90^\circ$ . We would not be able to the Definition II because we can't traw a right triangle in which one of the array angles is  $90^\circ$ . Instead, we would thew  $90^\circ$  in standard position, locate a point on the terminal side, and use Definition I to 9 at  $\sin 90^\circ$ ,  $\cos 90^\circ$ , and  $\sin 90^\circ$ . Figure 7 illustrates thus.

A point on the terminal side of  $90^\circ$  is (0, 1). The distance from the origin to (0, 1) is 1. Therefore, x=0, y=1, and x=1. From Definition I we have

$$\sin 90^\circ = \frac{p}{r} = \frac{1}{l} = 1$$
 
$$\cos 90^\circ = \frac{x}{r} = \frac{0}{l} = 0$$
 
$$\cos 90^\circ = \frac{p}{r} = \frac{1}{0}, \text{ which is 9nd-clined}$$

This is similar manner, using the point (1, 0) we can show that  $\sin\theta^*=0$ ,  $\cos\theta^*=1$ , and  $\tan\theta^*=0$ .

To conside any section, we take the information just obtained for 0° and 90°, along with the exact values in Table 1, and summation them in Vaide 2. To make the information in Table 2 a little excise to memorize, we have written some of the exact values differently than we usually do. For example, in Table 2 we have written as  $\sqrt{4}$ , 0 as  $\sqrt{6}$ , and 1 as  $\sqrt{4}$ .

# SECTION 2.2 CALCULATORS AND TRIGONOMETRIC FUNCTIONS OF AN ACUTE ANGLE

go this section, we will see here evile labers can be used to find approximations for reignoconstructioned gos of angles between 41° and 91°. Before we began our work with colors laters, we need to look at degree monorages in more data.

We preciously defined I degree (T\*) to be  $\frac{1}{260}$  or a full rotation. A cogree itself can be broken down buffer. If we divide IT usion 60 equal parts, each one of the rards scatter—minute, denoted 31. Uncompate as  $\frac{1}{60}$  of a degree, we offer words, form are 60 minutes in every degree. The occurrence unit of angle measure is a second. One second, T\*, is  $\frac{1}{60}$  of a minute. There are 61 vectores in every minute.

$$(20 \times 40^{\circ}) = 60 = (20) \cdot \left(\frac{1}{50}\right)^{\circ}$$

$$1^{n} \approx 80^{n} \qquad \text{if} \qquad \mathbb{P} = \left(\frac{1}{80}\right)^{n}$$

Table 4 shows how to sead angles written in degree measure.

**SOLUTION** Multiplying 0.20 by 60, we have the number of minutes equips and (√0.25°).

$$27.23^{\circ} = 27^{\circ} + 0.23^{\circ}$$
$$= 27^{\circ} + 0.25(60^{\circ})$$
$$= 27^{\circ} + 15$$
$$= 27^{\circ} + 15^{\circ}$$

Of course in actual practice, we would not show all of those staps. They are shown here simply to indicate why we multiply only the decreast part of the decimal legree ov 60 to phange to degrees and primates.

Cascopia territores. Most scientific and graphing calculators have keys that let you enter angles in degrees, mir utes, and suconds format (DMS) or in technal degrees. (DD). You may also have keys or commands that let you exceed from one formation the lifetime Tigues 1 shows now Examples 1 through 3 might look whos solved on a TI-84 graphing calculator. Consult your calculator's mountal to see how this is done with your particular model.

l'igare I

Change 10° 15' to decimal degrees,

**SOLUTION** We have to revenue the process we used by Example 5, to charge 151 mia decimal, we maspilivine by All.

$$10^{6} \ 45^{7} = 15^{6} + 48^{7}$$

$$= 10^{6} + \left(\frac{45}{40}\right)^{6}$$

$$= 10^{6} + 9.75^{7}$$

$$= 16.75^{7}$$

The process of converting brain and tent; between declinial degress and degrees. and not notes can become grove complication when we tive decided regarders with more digits or when we consent to degrees, minutes, and seconds. In this book, most of the angles written in decimal degrees will be written to the nearest tenth or, at most the nearest interfed in. The angles written in degrees, triumes, and see, ads will tarely  $g_{ij}$ several the minutes column.

Table 2 lifes the most common conversions between decimal degrees and minutes.

### section 2.3 -SOLVING RICHT TRIANGLES

The first Ferria wheel was designed and built by American engineer George W. G. Ferris in 1803. The diameter of this wheel was 250 feet. It had 36 ears, each of which hele 40 passangers. The top of the wheel was 254 feet above the ground. It took

20 min, tes to complete one revolution. As you will see as we proceed through the book, trigonometric functions can be used to model the metion of a rider an a Ferris wheel. The mode, can be used to give information about the position of the rider at any time during a ride. For instance, in the last example to his section, we will use Definition II for the trigonomeous functions to find the height a ride, is above the ground at certain positions on a Ferris wheel.

In this section, we will use Definition II for trigonomenic functions of an acute angle, along with our calculators, to find the missing parts to some right misurales. Before we begin, however, we need to talk about significant digits.

#### DEFINITION

The number of significant night (or agrees) as a number is found by counting as the digits from left or right beginning with the first nonzero digit on the left. When no decoral point is present training zeros are not considered a guideant.

According to this definition,

0.042 has two significant digits 0.005 has one significant digit 20 5 has three significant digits 6.000 has four a guiffeant digits 9.500, has four significant digits 700 has one significant digit

Notes In actual practice it is not always possible to tell how many significant digits an integer like 700 has. For instance, if exactly 700 people signed on to take history at your school, then 700 has three significant digits. On the other hand, if 700 is the result of a calculation in which the answer, 700, has been rounded to the oranget tent then it has two significant digits. There are ways to write integers like 700 so that the number of significant digits can be determined exactly. One way is with scientific notation. H. wever, to simplify things, in this book we will assume that measurements (other transangles) written without decimal points have the laway possible number of significant digits. In the case of 700, that number is one. For angles, we will assume that all a gle measures written as integers are accurate to the nearest degree.

The relationship between the accuracy of the sides of a triangle and the accuracy of the angles in the same triangle is shown in Table 1.

Accuracy of sides	Accuracy of Angles
Two significant digits	Normal degran
Three significant, (Bgits	Neurset ID minutes or tenth of a degree
Tour significant digits	Neurest inframe or hundrenth of a degree

We are now ready to use Definition II to so, xe -ight triangles. We solve a light triangle by using the information given about it to find all of the mission sizes and angles, in all of the examples and in the Problem Set that follows, we will assume that C is the right angle in all of our rate in large  $e_{ij}$ , these otherwise potent.

Unless stated otherwise, we round our tasswers so that the number of significant digits in our anythes matches the number of significant digits in the least significant at inher given in the original problem. Also, we round our answers only and not any of the numbers in the informatiste stops. Finally, we are susceptible values of the trigonometric functions to four a guificant digits simply to avoid clustering the pare with long discinal numbers. This does not mean that you should stop halfway through a problem and round the values of in gonometric functions to four sign, icans digits before conducting.

de production de composite de la companyation de la

In right miangle ABC,  $A=40^\circ$  and z=12 tentimaters. Find a, b, and b.

**\$CLUTION** We begin by making a diagram of the slossion (Figure 1). The diagram is very important because it less as visualize the relation-hip between the given information we are solded to find.

To find B, we use the fact that the sum of the two scars angles in any right triangle  $9.5^\circ$ 

To find a, we can use the formate (in ain 4.)

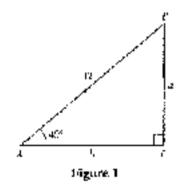

$$\operatorname{Sid} A \cong \frac{a}{c}$$

Multiplying both sides of this formula by a and then substituting in terr given values of  $\nu_1$  and  $\nu_2$  we have

There is most officer one why to limit ou

Using on  $A=\frac{b}{c}$  , we have —— that ig the Pythagarova Thousan, we have

$$b = a \cos A$$
  $c^2 + a^2 + b^2$   
 $= 12 \cos(40^\circ)$   $b = \sqrt{c^3 + a^2}$   
 $+ t2(0.7600)$   $+ \sqrt{12^2 + (7.7)^2}$   
 $b = 9.2 \text{ err}$   $= \sqrt{144 + 99.29}$   
 $= \sqrt{84.74}$   
 $a = 5.2$ 

In Example 2, we are given two sides and asked as fine the remaining parts of a right triangle.

Example 2.77 and b=3.41. Find the remaining side and angles.

**SOLUTION** Figure 2 is a diagram of the minogle. We can find A by uting the formula for table.

$$tun A = \frac{\alpha}{\kappa}$$

$$= \frac{2.72}{3.41}$$

$$tan A = 0.8006$$

Nove to fine A, we use a cafculator.

$$A = am^{-1} (0.8966) = 38.7^{\circ}$$

Near we find B.

$$B = 90.0^{\circ} - 4$$
  
= 90.0° - \$8.7°  
$$B = 51.3°$$

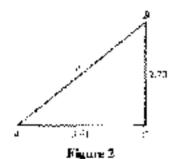

Notice we are quanting each paging, the nearest reside of a degree since the sides we were trip, only give there significant display.

We can find a using the Pythagoesta Ellevoran or one of our trigogrametric fitnetions. Let't start with a trigogrammetric function.

If 
$$\sin A = \frac{a}{c}$$
  
Then  $c = \frac{a}{\sin A}$  Distriply each side by it then divide each side by  $\sin A$   
 $= \frac{2.73}{\sin 38.7^{\circ}}$   
 $= \frac{2.73}{0.625^{\circ}}$   
 $= \pm 37$  To the consignificant dig(t)

Allaring the Bythingoniaes Blowers multivolethram the same search

(f) 
$$c^2 = c^2 + b^2$$
  
then  $c = \sqrt{a^2 + b^2}$   
 $= \sqrt{(2.73)^2 + (3.41)^2}$   
 $= \sqrt{13.005}$   
 $= 4.35$ 

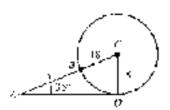

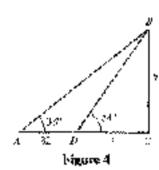

Figure 3

The circle in Figure 3 to a fix center at C and a radius of 18 inches. If this agle 4 *BC* is a right triangle and 4 is 35°, find x, the distance from A to 8.

**SOLUTION** In triangle  $\Delta DC$ , the side optosite A is 18 and the hypotemise is x = 18. We can use  $\sin A$  to write an equation that will allow us to solve for a.

Sie Bor = 
$$\frac{88}{x + 18}$$
  
 $(x + 88) \sin 350 = 18$  Multiply code self-by  $x + 18$   
 $x + 18 = \frac{18}{\sin 350}$  Divide each self-by a nilian  $\frac{18}{\sin 350}$  Surplead if there each side  $\frac{18}{0.0736}$  is  $\frac{18}{0.0736}$ . To two significant charts

the information in Proper 4 by solve for x, the distance between D and C.

**SOI UPION**. To find it will write the equipments, each of two biovotance the variables x and y. Then we solve each equipment for y and set the two expressions for y equal to each other.

Two consists from 
$$S^{-2} = \frac{h}{x}$$
  $\Rightarrow h = x \sec 50^\circ$  Solve each expect  $x$  and  $h$  
$$\begin{cases} \tan 38^\circ + \frac{h}{x} + \frac{h}{12} \Rightarrow h = (x + 32) \sec 38^\circ & \text{for } h \end{cases}$$

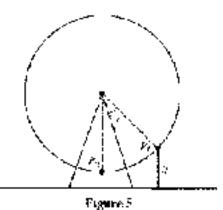

Setting the two expressions for a equal to each other pieces as an equal in that is volves only in

Therefore

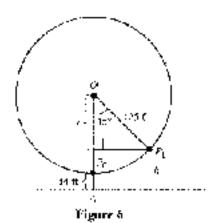

In the introduction to this section, we gave some of her two associated with the host Persia wheel, Figure 5 is a couplified model of their forms which, If this the central angle monad as a order moves from position  $P_0$  to position  $P_0$ , and the ciden's height above the ground I when I is I in

**SOLUTION**. We know there the naturalisation to this section that the dame is of the tool forms where two 250 feet, which precise the estimates 120 me. The action to the top of the which was 254 feet above the gas and, the destance from the ground to be too town if the which was 24 feet (the distance to the operations the destination of the which). The form a night integral, we show a horizontal time from P<sub>1</sub> to the exciton, but considering the center of the which O with P<sub>0</sub>. This information is shown in Fig. (4.5).

The key to solving this problem is recognizing that x is the difference between  $\partial t$  (the distance from the center of the wheel to the ground) and k. Because  $\partial A$  is 139 feet (the radius of the wheel plus the distance between the bottom of the wheel and the ground:  $25 \sim 14 = 150$ ), we have

$$x = 139 - x$$

We use a positionation write as equation that contains  $\hat{n}$ .

$$\cos 95^{\circ} = \frac{10^{\circ}}{325}$$
$$= \frac{139}{125}$$

Solving for 8 are have

If S = 45%, a given an projection  $P_T$  is  $\frac{1}{2}$  of the way, around the wheel. At that point the order is approximately S1 feet above the proposal.

#### **⋙** Getting ready for class

After reading through this preceding section, respond in your own words and in complete screeness.

- I low do you deferrence the enougher of sugnificant degree on a member?
- b. Explain the relationship between the securacy of the sides and the area bey of the mades in a triangle.
- e. In right triang a AaC, angle A is AC. Now do you find the measure of angle AC
- 4. In right triangle AIM ] angle A is 401 and side a is 32 continuators. How for you find the length of size a?

#### PROBLEM SET 2.3

Froblems I through (4 refer to righ, triangle A&C with C = 90°, Begin each problem by crowing a picture of the triangle with both the given and caked for information labeled appropriately. Akin, write your answers for angles in decimal degrees.

- &. It MA = 425 and a = 15 ft, find a.

- "It set B = -7 with  $\theta$  in CHII.

#### EXTRAINING THE CONCRETS

 Herman Cammonball IndExample 7 of Section 1.2, we found the equation of the path of the human cannot ball. At the 1997 Washington County Fair to Oregon, Payed Small, In: The Burket, was shot from a causion. As a language comportedly, he reached a height of 70 feet before landing in a new 160 feet from the cannon. In that example we liet id 8 e equation that describes has path is

$$\nu = - \frac{7}{640} (z - 30)^2 + 70 \text{ for } 0 \le x \le 160$$

Craps this squality rusing the wind, w

$$0 \le y \le 190$$
, again  $-20$ ,  $0 \le y \le 30$ , scale  $-10$ 

Then worns in on the crowe bear the origin until the graph has the approximate of a straight See, Usa TRACR in the coverdinates of any point on the graph. This point defines an approximate right triangle (Figure 15). Use the triangle to find the anale between the campon and the nonizontal.

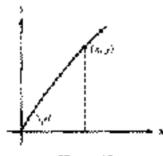

Figure 16

4. Human Camauabad. To get a better estimate of the angle described to Probfrom 73, we can use the table feature of your calculation Prom Figure 15, we see that for any point (x, y) on the curve,  $\theta \approx \tan y$  (now). Define functions  $Y_0$  and  $Y_2$ as shown in Figure 15. Then set up your table so that you can input the follow ing values of x:

$$x \approx -0.5$$
,  $t$ ,  $0.5$ ,  $0.1$ ,  $0.01$ 

Based on the results, what is the angle between the common and the barksonrel?

# Alar S

Pigure I

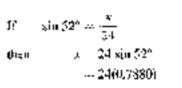

### SECTION 2.4 APPLICATIONS

As necessioned in the introduction to this chapter, we can use right intracte digenometry to so, we are altered problems, such as problems involving topographic maps. In this section we will see how this is done by inching at a number of applications of right talengle trigogrammetry.

The two equal sides of an isosceles triangule are calling continueters. If each of the two equal angles measures 52°, find the longer of the base and for allifieds.

**SOLUTION** As isoscoles of angle is any changle with two equal sizes. The angles opposite the two equal sides are called the base angles, and they are always equal. Figure 1 shows a nature of our isoscoles triangle.

We have labeled the altitude in We can shilve for a using a sine ratio.

19 cm Romefed to 2 significant digns.

We have labeled half the base with y. To solve for y, we can use a desine ratio.

If 
$$\cos 32^2 = \frac{\sqrt{2}}{24}$$
  
then  $y = 24 \cos 32^2$   
 $= 24(0.6157)$   
 $= 15 \text{ cm}$  To two significant digits

This base is 2y = 2(15) = 30 cm.

For our next applications, we need the following definition:

#### DEFINITION

An angle measured from the horizontal up is called an *angle of elevation*. An angle measured from the horizontal down is called an *engle of depression* (Figure 3).

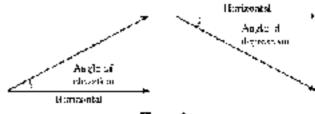

Figure 2

Fiber language of digitation and depression are always considered positive negles. Also, if an observer positioned at the vertex of the angle messs an object in the direction or the nonhorizontal side of the angle, then this side is sometimes called the  $\theta(x,y)$  of the observer.

The 1% flations Suppose casts a stanton 43 flat of long, to the mounts! It makes what is the angle of elevation of the sea those the up of the shapes?

SOLUTION We begin by making a desgram of the situstion (edges 3).

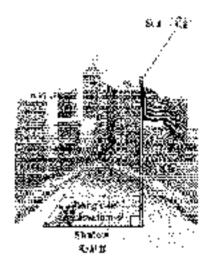

Figure 3

If we let  $\theta \approx$  the angle of elevation of the sun, then

$$\tan \theta = \frac{6.0}{-3.0}$$
$$\tan \theta = 1.7442$$

which means  $\theta = \text{ran} \mathbb{T}^2(1,7442) \approx 60^\circ 10^\circ$  to the secrept 10 inherest.

A men climbs 233 meters up the side of a pyramed and finds that the angle of depression to his starting point is 22.6°. How high of the ground is bo?

**SOLUTION** Again, we bugin by multing a diagram of the situation (Figure 4). If n is the height above the ground, we can solve for musing a sine ratio.

If 
$$\sin 52.6^\circ = \frac{\pi}{2.13}$$
  
then  $\sin 52.6^\circ = 21200.79461$   
 $= 169 \text{ m}$  To 5 significant digital

The main is 160 meters above the ground.

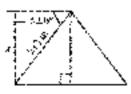

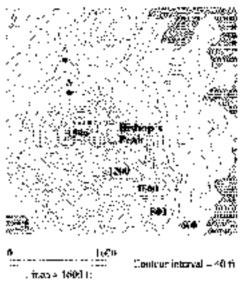

Figure 4

Figure 3 shows the appropriate map we mentioned in the introduced to this chapter. Suppose States, and Anny are climbing Bishop's Peak. States is at position S, and Anny is at position A. Find the angle of elevation from Anny is States.

**NOTE** Country, all day it shows one considered to be significant. The fix 1400 misses 1000, which contains 4 mgo. Statut Lynna.

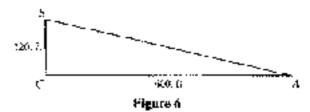

Figure 5

**SCLUTION** To solve 2is problem, we have to use two pieces of information from the fegand on the map. First, we need to find the hadizontal distance between the two people. The legend indicates that I inch in the man corresponds than a chiral notice tall distance of 1,000 feet. If we ancesnote the distance from Array to Staney with a rule, we find it is  $\frac{1}{2}$  inch. Multiplying this by 1,000, we have

$$\frac{3}{8} \cdot 1,000 - 600$$
, fi

which is the separt swismutal distance from Amy to Supeys.

Next, we asset the certical disqueet State via above A. iv. We find this by charaing the number of contour rate, valv between them. There are three, From the legand on the map we know that the elevation of anges by 40 feet between a iv two conteer lines. Therefore, 8 meet is 120 feet above Appy, Figure 6 shows a triangle that notiels the information we have so for.

The angle of clavation from Array to Stadey is angle A. To find At, we weathy langer tradic.

$$\tan A = \frac{120.}{600.} = 0.2$$

 $\Lambda \sim \tan \tau^{-1}(0.2) - 11.3\%$  . To the induced that, of a degree

Army must book up at 10.72 from straight about to see Shooy

Our next applications are concerned with what is called the  $h_t$  goals of a  $h_t$  is used in tax, got on and surveying.

#### UNEANUEDU

The bearant of a like! is the cause angle formed by the cortic-south line and the line it. The notation used to designate the bearing of a line begins with N or S (for north or south), followed by the number of degrees in the angle, and endowith E or W (for east or west).

Pigate 7 в 10мв втом вкаттріву.

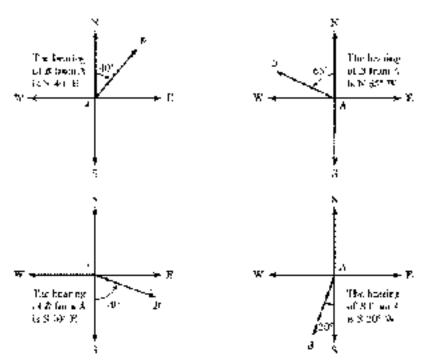

Figure 7

San Luis Obispo California, is (2 miles due north of Ordver Beach, what is the bearing of San Luis Obispo from Arroyo Grande's Change's

**SOLUTION** We are looking for the bearing of 5an Lana Grispo *from* Arroyo Grance, so we will put our N-S E W system on Arroyo Grande (Figure 8). Recall from geometry that when two parallel lines are crossed by a transversal, alternate interior angles are equal.

Now we can colve for thusing the tangent rains.

tan 
$$\theta = \frac{4.6}{12}$$
 tan  $\theta = 0.3633$   $\theta = \tan \theta$  (0.3833) = 21°. To the nearest degree

The bearing of 8st. Luis Obis porfront Arroya Grande is № 23° W.

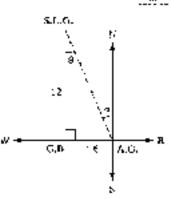

Figure 8

A briat proveds on accounts of best by NS2140' E for a distance of 238 miles. How many miles north and how many miles cost has the boat traveled?

SDAUTION: In the single as of the shasters we get one N-5-1:-W system at the book's starting point (Ciyuse 9).

Solving for a well district ratio and giwith a cosmic set of and semading out answers to three sign. Team digits, we have

$$\sin 5x^{2} 40^{2} = \frac{x}{255}$$

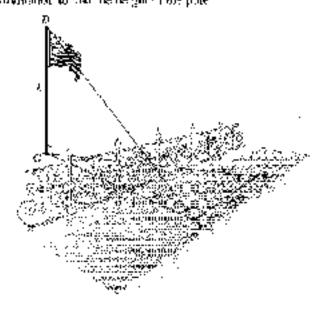

$$(\cos 5x^{2} 40) = \frac{y}{235}$$

$$(\tan x = 790)(7951) \qquad (\tan x = 436)(6055)$$

$$= 1885 \text{ in} \qquad -1885 \text{ in}$$

Traileding 236 miles on a time with nearing N 532 401 E will got you to the same place as it we have been 444 makes in with and there is \$9 miles east.

Figure 11 is a diagram that shows how these estimates the height of a flaggode. She can't measure the distance herwest herself and the flaggode one: By because things a force in the way. She she stands at point A. Doing the pole and backs the angle of elevation form point A to the top of the note to be \$1.77 inhim she force \$0.74 and wells: 25.00 feel to point At where she measures the angle between tempath and a line from A to the base of the pole. She finds that angle is \$4.57 it is this information to find, he height of the pole.

Titanine 16

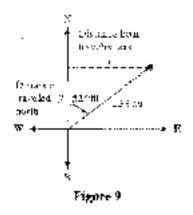

SOLUTION First we first a night manufe ABC with a larger cratic.

$$48.0 54.5^{\circ} = \frac{x}{25.0}$$

$$x = 25.0 \text{ tab } 34.5^{\circ}$$

$$= 25.0 (1.40) 19;$$

$$= 35.0487 \text{ f} 1$$

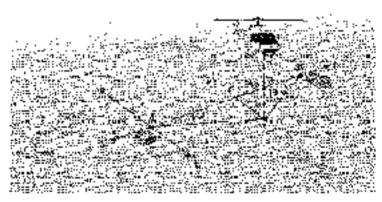

Without residing x, we use it is find h in right triangle ACD using another takent ratio.

Note that if it wereally for the feece, she could measure a directly and use just one triangle to fine the height of the flag rate.

A nelicopter is herering over the desert when it develops mechanised penhases and is forced in land. After landing, the risks added his pesudon to a pair of rader station is located to must again along a strength mad running, north and solute. The bearing of the helicipter from one station is S. 1911, and from the other it is 2.1911. After doing a new togstrouteless who stations one of the Newhesternstands the point in walk and west for 3.5 enters to teach the station. It this informations comes?

**SOLETION** Figure 11 is a throw-immersional pragram of the struction. The had-independs his struction of the had-independs his angular point. We said that algorithm The recan stations are at A and Theorem (by Proposition they as distinct point of the shortest distance from C to the road is due west of C toward point E. To see if the piles has the correct retornation, we must made, the distance from C to a

frigues 11

The radial stations are 25 miles apeat. This AB = 25, M we let AF = 16 then FB = 25 - 16. If we use consequent match in plungles: AFC and BFC, we will have massilves some work.

In triangle AFC 
$$\cot 13^{\circ} = \frac{x}{y}$$
  
So  $x = y \cot 13^{\circ}$   
In transfer EFC  $\cot 19^{\circ} = \frac{25 - x}{y}$   
So  $25 + x = y \cot 10^{\circ}$ 

Solving this equation for a we have

$$x = 25 + y \cos 19^\circ$$
 Ado = 25 to each size  
 $x = 25 + y \cos 19^\circ$  Multiply energiable by  $-1$ 

Next we secure two opioes of regual in each other.

$$x = \tau$$

$$y \cot 13^{\circ} = 25 - p \cot 19^{\circ}$$

$$y \cot 13^{\circ} + p \cot 19^{\circ} = 25$$

$$y = \frac{25}{\cot 13^{\circ} + \cot 19^{\circ}}$$

$$\frac{25}{4.3315 - 2.9042}$$

$$= \frac{25}{7.2357}$$

$$= 5.5 e^{\circ}$$
Add  $v \cot 19^{\circ} \cos e_{0}$  from each side

Pactor  $v$  from each term

Divide by the coefficient of  $v$ 

The information given to the pilot is contact.

#### MARGARIA GETTING READY FOR CLASS

After reading through the preceding section, respond in your own words and in complete generated

- in. What Is an above of elevation?
- the What is among elect depression?
- c. Flow do you define the bearing of line ()
- **d.** Draw a diagram that shows that point **B** is N 401 E from point A.

### PROBLEM SET 2

Show each of the following problems. In each case, he seed to make a diagram of the situation with all the given information labeled.

- Geometry The two expediation of an issued as triangle are each 42 continuators.
   If the base more sums 32 constructors, find the height and the measure of the two equal angles.
- Greatingthy: An equiforcial triangle (rank with all sixts) are some length) for an a triade or 4.3 mones. Find the length of the sides.
- 3. Coveredity. (See fungation) single empirical case is 25% continuously. If the characterist the basis is 10.4 continuously, what angles does the side of the conditions with the base (ringers 3.5)?
  - 4. Greeneding Enchargement of a relating in its 148 million class, while the longest sind its 278 millionators. Find the shorter sale of the manages and the angles the diagonal makes with the sines.

Figure 12

- 5. Length of an Exculator How long should an exculsion be if it is so make an angle of 53° with the floor and earry people a vertical distance of 21 feet between floors?
- 6. Height of a HB. 4 rood up a hill makes as angle of 5.4° with the horizontal. If the road from the bottom of the hill to the top of the hill is 2.5 miles long, how high is one fill?
- 7. Length of a Ruge A 73.5 from rape from the top of a cocur tent pole is anchored to the ground 45.2 feet from the fortum of the pole. What angle does the tope make with the pole? (Astrine the pole is perpendicular to the around.)
  - 3. Angly of a Lodden A ladder is learning agrees; the top of a 7.0 foor wall. If the bottom of the ladder is 1.5 feet from the wall, what is the angle between the ladder and the wall?
- 9. Angle of Rievation life 73.0 foor Engage errors a shedow 51.0 feet rong, wost is the angle of elevation of the sun (to the sources) tenth of a degree?
- 40. Angle of Elevation. If meaningle of elevation of the sett is 63.4° when a stiffning costs a shadow of 57.5 feet, what is the neight of the building?
- 7.11. Angle of Depression: A person clanding 150 centariseers from a narror notices that the angle of depression from his eyes to the bottom of the mirror is 10%, while the angle of elevation to the top of the mirror is 11%. Find the vertical dimension of the mirror (Figure 12).

#### FFV FWI PROBLEMS

Like following problems review material we obsered in Section 1,5.

Isopanic and enoughty (enough cost 9)?

Show that each of the fedlowing statements is true by transforming the fast side of each one into the right side.

**38.** 
$$\cos \theta \cos \theta \tan \theta = 1$$

39. 
$$\frac{380 \, \theta}{\sin \theta} = \cos \theta$$

49. 
$$(\mathbf{I} - \cos \theta)C + \cos \phi \mathbf{i} - \sin^2 \theta$$

**41.** 
$$\sec \theta = \cos \theta = \frac{\sin^2 \theta}{\cos \theta}$$

47. 
$$1 - \frac{\cos \theta}{\sec \theta} - \sin^2 \theta$$

#### EXTENSING YES CONCERYS.

43. One of the rights we discussed in this section was to treat phile plans. The process of making one of these maps is an interesting one. It involves social protography and different colored projections of the resulting plantographs. Research the process used to draw the contour lines on a repographic map, and then give a detailed corplanation of that process.

lágure 23

- 44. Albert lives in New Ordeans. At noon on a summer day, the angle of elevation of the sun is 84°. The window in Albert's room in 4.0 feet high and 6.5 feet wide. (See Plant: 23°)
  - a. Curbalists the area of the floor surface in Albert's seem that is illuminated by the our waves the might of elevation of the sun as 84°.
  - b. One winter cay, the ringle of alevation of the san outside Albert's window is 57°. With the illuminated area of the floor in Albert's room be greater on the senting day, or on the winter day?

## SECTION **2.5** - VECTORS, A GEOMETRIC APPROACH

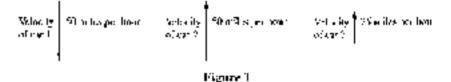

William Power Hamilton

By need accounts, the sizely of victors is based on the work of Irish mathematician Sir William Humilton (1805–1865). Hamilton was actually studying complex cumbers (a topic we will cover in Chapter S) when he made the discoveries that hel to what we new call yet ors.

Policy, vectors are treated both algebraically and geometrically. In this section, we will focus our attention on the geometric regression on of vectors. We will cover the algebraic approach later in the booth in Section 7.5. We begin with a discussion of vector a tarrities and segiar quartities.

Many of the quantities that describe the world around as have noth magnitude and direction, while others have only magnitude. Quantities that have magnitude and direction are called verses gueranists, while quantities with magnitude only arounded section. Some examples of vector quantities are force, velocity, and acceleration. For example, a car unveiling 50 miles per form one sough has a different velocity from an other car traveling due north at 50 miles per hour, while a filter car traveling at 25 mags per hour, while a filter car traveling at

One way to represent Feetin quantities grouperdually is with narrows. The circuiton of the arrow represents the direction of the yearon quantity, and the length of the arrow corresponds to the magnitude. For example, the velocities of the three cars we mentioned above could be represented to in Figure 1:

#### NOTATION

To distinguish between vectors and scalars, we will write the letters , sed to represent vectors with buildface type, such as U or V. (When y to write them on paper, put an arrow above iten) like this. U or V.) The magnitude of a vector is represented with absolute value symbols. For example, the magnitude of V is written |V|, Table 1 illustrates further.

TARREST CONTRACTOR	
Pophydian	The grandity is
v	s, veutou
įν	a within
AH .	a vegror
; <del>-</del>	a scal a
[   Y	the magnitude of vector $\boldsymbol{V}_{i,j}$ are an

#### Zero Vector

A worths having a magnitude of zero is called a seve where; and is denoted by  $\mathbf{0}$ . A zero waster has no defined direction

#### Equality for Vectors

The position of a vector in space is unmapped in. Two vectors are equivalent if they have the same manakade and direction.

In Figure 2,  $\mathbf{V}_1 = \mathbf{V}_2 \neq \mathbf{V}_3$ . The vectors  $\mathbf{V}_1$  and  $\mathbf{V}_2$  are equivalent because they have the same magnitude and the same direction. Notice also that  $\mathbf{V}_2$  and  $\mathbf{V}_3$  have the same magnitude but opposite directions. This means that  $\mathbf{V}_A$  is the opposite of  $\mathbf{V}_3$  or  $\mathbf{V}_2 = -\mathbf{V}_2$ .

#### Addition and Subtraction of Vectors

The same of the vectors  $\mathbf{U}$  and  $\mathbf{V}$ , services  $\mathbf{U} = \mathbf{V}$ , is cuited the sessificate vectors it is the vector that contains from the tail of  $\mathbf{V}$  to the sip of  $\mathbf{V}$  when the tail of  $\mathbf{V}$  is pisced at the tip of  $\mathbf{U}$  as attractable in Figure 5. Note that this diagram shows the resultant vector to be diagram as the paralleling rate that has 15 and  $\mathbf{V}$  as at pasted sides. This heing the case, we could also set the vectors by bothing the tests of  $\mathbf{U}$  and  $\mathbf{V}$  together for form adjacent aides of their same paralleling set, as shown in Figure 4. In either case, the resultant valetoms that the diagrams is a to and of  $\mathbf{U}$ .

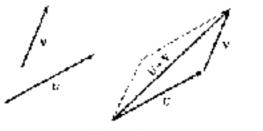

Figure 3

Phyure 4

To subtract one vector from another, we can add its opposite. That is,

$$\mathbf{U} - \mathbf{V} = \mathbf{D} + (-\mathbf{V}).$$

If U and V are the vectors shown in Figure 3, then their difference, U = V, is shown in Figure 5. Another way to find U = V is so put the tails of U and V together and then draw a vector from the tip of V to the tip of U, completing a triangle as shown in Figure 6.

1/2

Pigure 2

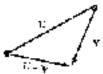

Figure 5

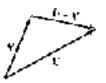

Figure 6

A local is crossing a given that some few north. The boost is pointed the cast and is moving through the water at 12 miles per hour. If he current of the moon is a constant, 5.1 miles per hour, find the second course of the boost through the water to two significant diagram.

SOLATION. Problems like this are a little difficult to coach the that there they are concurrenced. Even inough the cost is "headed" due cast, as it travels formula the water the water the water itself is moving confirmant, so it is at maily on a course that will take it east and a little routh.

It may help to analysis the first hour of the journey as a sequence of separate events. First, the boat tracely 12 miles directly across the toyer while the river remains still. We can represent his part of the pit by a vector pointing due east with augh tude 12. Then the boat turns off its augine, and we allow the river to flow while the boat remains s. If (although the boat will be can jed by the river). We use a vector pointing due porth with magnitude S. It to represent this second that of the jumpey. The end result is that each hour the boat travely both east and north (Figure 7).

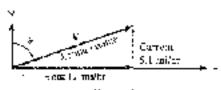

Figure 7

We line the strop of lengthship the

$$\tan \theta = \frac{13}{3.4}$$
 
$$\tan \theta = 2 \log \theta$$
 
$$\theta = \tan^{2} \left(2 \frac{34}{24}\right) \approx 6/2 \text{ To the nearest degree}$$

If we let Virepresent the set, allocates of the best, than we can deal the magnitude of Viusing the Pythagorean Traction or a trigonometric ratio. Using the Pythagorean Traction or a trigonometric ratio. Using the Pythagorean Theorem, we have

The actual course of the boot is 12 miles per norm at N 67° E. That is, the vector V, which represents the mostes of the boot with respect to the banks of the river, has a magnitude of 0.3 miles per horn and a direction of N 67° E.

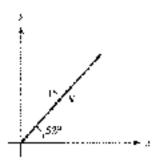

Figure 8

### Horizontal and Vertical Vector Components

In Example 1, we saw that V was the tarn of a vector polaring east (it is horizontal discretory and a second vector pointing porth (in a vertical discretory). Many times in its convenient to express a vector as the sam of a portizontal and vertical vector. To do so, we first specific pose a co-publicate system on the vectorial question to that the sail of the vector is at the origin. We call this standard position for a vector, Figure 3 shows a vector with magnitude 15 making on ontice of 52° with the horizontal.

Two horizontal and vertical vectors whose same is V are shown in Figure 9. Note that in Figure 9 we find the horizontal vector as  $V_{\tau}$  and the vertical on  $V_{\tau}$ . We call  $V_{\tau}$  the horizontal vector component of V and  $V_{\tau}$  the vertical vector component of  $V_{\tau}$ . We can find the magnificate of these vectors by using sine and occine ratios

$$\mathbf{V}_{\mathbf{v}} = \mathbf{V} [\cos 52^{\circ}]$$

$$= 15(0.5157)$$

$$= 7.2 \text{ for two significant, digit }_{\mathbf{v}}$$

$$= \mathbf{V} [\sin 52^{\circ}]$$

$$= 85(0.7980)$$

$$= 12 \text{ to two significant digits}$$

The human expandabilities from a common with an install velocity of 53 meson par hour at an engine of 645 from the herizontal. Find the magnitudes of the herizontal and rection vector components of the velocity vector.

Figure 9

SECRECITION Progres of is a draptom of the simpton.

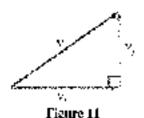

The magnificact of  $V_{\nu}$  and  $V_{\nu}$  is no legate of the significant degrit are as follows:

$$V_{\gamma}^{-} = 5 \cos AU$$

$$= 27 \sin b\tau$$

$$V_{\gamma}^{-} = 5 \cos 50^{\circ}$$

$$= 46 \cos b\tau$$

The number commonball has a hogizontal wellookly of \$7 hades per hour and an laided vertical velocity of 40 miles per hour.

Figure 15

The magnitude of a vector can have in each of she magnitude of  $\alpha$  bordward and vertical vector components (Figure 11).

By the Pathagorean Theorem we have

$$\|\mathbf{V}\| = \nabla \|\mathbf{V}_{\mathbf{v}}\|^2 + \|\widetilde{\mathbf{V}}_{\mathbf{v}}^{\mathrm{TC}}\|^2$$

**EXAMPLE 3.** An arrow is shot into the agree that its horizonal velocity is 25 feet per second sud its vertical velocity is 15 feet per second. Find the velocity of the arrow.

**SOLUTION** Figure 12 shows the velocity restin along with the engig of elevation of the velocity resum.

The magnitude of the velocity is given by

$$|\mathbf{V}| = \sqrt{25^2 - 15^4}$$

= 29 fbsec

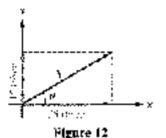

To the nearest whole number

We can find the angle of elevation using a rangery ratio.

$$\tan \theta = \frac{|\mathbf{V}_{s}|}{|\mathbf{v}|!} = \frac{3^{6}}{2\pi} = 0.6$$

 $6 = \tan^{-1}(0.6) = 31^{\circ}$  . To the restora degree

The arrow was stor into the air at 29 feet per second  $\phi$ , as angle of elevation of 31%.

### USINGS TO S

#### WEST THE STORM OF SUBSTITUTE

Most useping calculators have commands that can be used to find sile unguinate, angle, or components of a vector. Figure 13 shows how the PFRs and PFRy commands from the ANGLE ment are used on the TI-84 m find the portional and centural region components for the vector from Evanque 1. Make sure the calculator is set to decree up de.

In Figure 14 we found the inspiritude and direction for the vector from Example 5 using the REPs and REPB commands. Depending on the calculation you may have a single command that allows you to find both relates at once.

≱նցուս ՀՀ

$$= |\mathbf{t}_1| + |\mathbf{V}_y|$$
  
= 73 \(\dim\) 63° \(\times\) 97 \(\dim\) 35°  
= 85 \(\dim\)

Figure 16

#### Force

Another important vector quotity is *force*. We can loosely define force as a pash or inpull. The ratest intertive force in rear lives is the force of gravity that pulls us towards the content of the castin. The magnitude of this force is run weight the direction of this force is always wheight down toward the center of the on th.

Treague a 10-pound because dispose all rog on a coffice raisle. The force of gravity palls the sculpture downward with a force of magnitude. If pounds, At the semutive the table poshes the sculpture appayed with a force of magnitude. If pounds, The set result is that the sculpture symmetric mean desse the two torces, represented by vectors and to the zero vector (Figure 16).

Although there may be also y forces on agree an original at the same time, if the object is a administry, the same of the forces in, so be 0. I has same in so not sext determine.

#### DEFINITION STATIC EQUALIZATION.

When an object is stationary (at rest) we say it is to a state of wate equilibrate. When an object is in this state, the sum of the forces sessing on the object must be equal to the zero vector  $\mathbf{0}$ .

ig + Net Title CTs, Title (in provided in the CTs) (in provided in th

Change is 5 years old and weights 42.0 per uds. He is sufficient as a twing where his sister Staces pulls from and the swing back horizontally through an angle of 50.0° and then stope. Find the tension in the topes of the swing and the magnitude of the lance everted by Starsy (Figure 17 is a diagram of the sample of).

Digure 17

**SOF DITION.** As you can see from Jiggine 17, there are three toxics acting on Disarry (and the swing), which we have labeled **W**. **H**, and **T**. The teacher **W** is another the time of growth, pulling law toward the center of the earth. Its magnetide is  $|\mathbf{W}| = 42.0$  points, and its direction is struggle down. The vector **H** represents the towe with which Starry is pulling Daimy horizontally, and **T** is the force acting on Daimy in the direction of the sopes. We call this fixed the tension is the circulate of the sopes.

If we rearrange the vectors from the diagram in Pigure 17, we can get a bester picture of the situation. Since Stately is holding Danny in the position shown in Pigure 17, he is in a state of state equil-beaut. Therefore, the sum of the forces acting on him is 0. We add the three vectors W. H. and T using the tip-to-tail role as described on page 94. The resultant vector, extending from the tail of W to the tip of T, must have a length of 0. This means that the tip of T has to coincide with the tail of W, forming a right triangle, as shown in Figure 18.

The femalis of the sides of the right triangle shown in Figure 18 are given by the magnitudes of the sections. We use right triangle trigoconsectly to limit the magnitude of T.

$$\begin{array}{ccc} \cos 36.0^\circ &=& \frac{|W|}{|T|!} & & \text{Definition of cusine} \\ |T| &=& \frac{|W|!}{\cos 30.0^\circ} & \text{So we see } |T|! \\ & & \frac{42.0}{0.0660} & \text{The magnitude of $W$ is $42.0} \\ &=& 48.5 \text{ To three-significan, digita} \end{array}$$

Stuccy mast pull horizontally with a force of magnitude 24.2 pounds to hold Danny at an angle of 30.05 from vertices.

#### Work

One application of waters that is related to the concept of faces is work. Intaitively, work is a measure of the fattoriff easended when caseing an object by applying a force to it. For exemple, if you have ever had to pash a statled entermobile on it is heavy object, then you have experienced work. Work is extentional as the product of the magnitude of the torce and the distance the object of solved. A common writted measure for work is the first-pound (fi-fib).

#### DEFINITION WORK

If a constant force F is applied to an object and moves the object in a straight line a distance f in the direction of the force, then the wo k W performed by the force is W = |E| - d.

It is important to understasic that the definition or was sequines that the object move in the direction of the force. If this is not the case, then only part of the force may result when calculating the work. Dur rest example directaires this situation

and the control of the control of the engineering and the control of the control

A shipping clock pursues a heavy peckage across the thron. He applies a tome of 64 pounds in a demonstrated discrition, making an angle of 55" with the brokenest II the parkage is moved 25 tent. How much work is drue by the clock?

SD4 (ITION - A diagram of the problem is shown in Jugust 18

Herailse the parkage moves an a Logarontal distance, and not misse direction of the force, we must first find the assembliotheate that is directed horizontally. This will be the magnitude of the fundamental vector consponent of P.

$$|\mathbf{F}_4| = |\mathbf{F}| \cos 35^\circ = 64 \cos 35^\circ \mathbf{lb}$$

To find the work, we multiply this value by the distance the package moves.

1,300 foot-pounds of work are performed by the shipping clerk in maving the package.

#### REVIEW PROBLEMS

The problems that follow neview material we dovored in Section 1.3.

- 43. Drage 135° in standard postdom, locate a convenient point on the terminal slop, and then find sin 135°, cor 135°, and tag 135°.
- Draw = 270° in standard position, incare a convenient point on the terminal slow, and then flux sine, abstraction and langeaut of ~270°.
- 45. We define  $\theta$  and  $\cos\theta$  if gregory that side of  $\theta$  they along the line  $y \approx 2x$  to guadrant L
- 46. Pludish 5 and  $\cos \theta$  if the recoincuiside of  $\theta$  lies along the line  $y \in \mathbb{R}$  is  $|x| = x \ln q$ .
- 47. Wind x if the point  $(x_0-2)$  is on the term not side of  $\theta$  and  $\sin\theta = -\frac{1}{2}$
- 4b. Find yof the point ( (h,y) is on the learning Lade of  $\theta$  and  $\cos k + c$

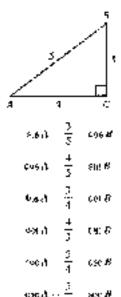

## CHARTER A

#### SUMMARY

EXAMPLES

-

 The values given in the table or collect exact trainer became they are not decimal approximation varyon recells find on a calculation.

#### Trigonometric Functions (Definition II) [2.1]

If triangle ABC is a right triangle with  $C = 90^\circ$ , then the six trigonometric functions for angle A are

$$\begin{array}{l} \sin A = \frac{s \text{ldc opposite } A}{\text{hypotenuse}} = \frac{a}{a} \\ \cos A = \frac{\sin c \cdot \text{adj-acout } A}{\text{hypotenuse}} = \frac{b}{a} \\ \cos A = \frac{\sin c \cdot \text{adj-acout } A}{\text{hypotenuse}} = \frac{b}{a} \\ \cos A = \frac{\sin c \cdot \text{adj-acout } A}{\text{side opposite } A} = \frac{b}{a} \\ \cos A = \frac{\sin c \cdot \text{adj-acout } A}{\text{side opposite } A} = \frac{b}{a} \\ \cos A = \frac{b}{\sin adj \cdot \text{acout } A} = \frac{b}{a} \\ \cos A = \frac{b}{\sin adj \cdot \text{acout } A} = \frac{b}{a} \\ \cos A = \frac{b}{\sin adj \cdot \text{acout } A} = \frac{b}{a} \\ \cos A = \frac{b}{\sin adj \cdot \text{acout } A} = \frac{b}{a} \\ \cos A = \frac{b}{\sin adj \cdot \text{acout } A} = \frac{a}{a} \\ \cos A = \frac{b}{\sin adj \cdot \text{acout } A} = \frac{a}{a} \\ \cos A = \frac{b}{\sin adj \cdot \text{acout } A} = \frac{a}{a} \\ \cos A = \frac{b}{\sin adj \cdot \text{acout } A} = \frac{a}{a} \\ \cos A = \frac{b}{\sin adj \cdot \text{acout } A} = \frac{a}{a} \\ \cos A = \frac{b}{a} \\ \cos A = \frac{b}{a}$$

#### Cofunction Theorem [2.1]

As trigonometric function of an angle is always equal to the offunction of its complement, in symbols, since the complement of x is  $90^\circ - x$ , we have

$$\sin x = \cos (90^\circ - x)$$
$$\cos x = \csc (90^\circ - x)$$
$$\tan x = \cot (90^\circ - x)$$

#### Trigonometric Functions of Special Angles [2.1]

	0.	30°	45	90'	99:
sir #	n	1 %	$-\frac{1}{\sqrt{2}}$ to $-\frac{\sqrt{7}}{2}$	<u>√1</u>	1
cos 0	1	$\frac{\sqrt{1}}{2}$	$\frac{1}{\sqrt{2}} \propto \frac{\sqrt{2}}{2}$	$\frac{1}{2}$	0
ten F	0	$\frac{1}{\sqrt{3}}$ or $\frac{\sqrt{9}}{3}$	1	$\sqrt{3}$	benilabnu

#### Degrees, Minutes, and Seconds [2.2]

There are  $360^\circ$  (degress) in one complete mostion,  $60^\circ$  (minimed in one degree, and  $60^\circ$  (seconds) in one crimbre. This is equivalent to saying 1 minute  $11^\circ_{10}$  of a begins, and 1 weak of  $1^\circ_{10}$  of a minute.

8. 
$$(74,3)^{\circ}$$
  $(43)^{\circ} = 3.5^{\circ}$   
 $= 747 - 6.1660^{\circ}$   
 $= 748 + 18$   
 $= 711.18$   
 $= 2148^{\circ} = 42^{\circ} = \left(\frac{48}{50}\right)^{\circ}$   
 $= 471 - 7.87$   
 $= 42.81$ 

#### Converting to and from Decimal Degrees [2.2]

To conven from decimal degrees to degrees and minute a multiply the flue ional part of the angle (that which follows the decimal point) by 60 to get minutes.

To convert from degrees and crimates to decimal degrees, divide minutes by 60 to get the fractional part of the angle.

## $\delta_{\rm e}$ . These surplets and single convention $\delta_{\rm e}$ in term upon

μ 21	~ .39°
a = 58	3 = 450

g = 2.77	A 9 27110
$\alpha\sim 4.3.87$	A 31 (2)
a = 69%	24.50

#### Significant Digits [2.3]

The number of significane digits (or figures, in a number is found by counting the number of digits from left to right, beginning with the first number digit on the left,

The relationship between the accuracy of the sides in a triangle and the accuracy of the angles in the same triangle is given below.

Accuracy of Sides	Am uracy of Angles
15-ம ஜீரர் இகை சிழ்க்க	Names (legal)
І песе яідпі, болет сід на	Vectost 10 ar nutes or territorit a degree
Pour significant digits	Nezrost mi nae ra hurdreith of a degree

# A region of state of the present of

#### Augle of Elevation and Angle of Depression [2.4]

An angle measured from the horizontal ordinated an angle of elevation. An angle measured from the horizontal down is called an angle of deprecious V in adversor positioned at the series of the angle views of object to the direction of the consocitations of the angle, then this side is sometimes of the fine of viole of the observer.

## Becomes 860° °

#### Direction [2,4]

One way to specify the direction of a line or vector is called *Instring*. The assarion used to pesignate bearing begins with N or S, followed by the number of degrees in the angle, and ends with E or W, as in S  $SC^*$  W.

#### If sies the revelop at full value per ignition and to the distribution for inprocessing with a contrar.

Welesity of the enr		50 m// w
	_	

#### Vectors [2.5]

Quantities that have both energy such and discosion are collect vertice quantities, where quantities that have only energe ductours as that invariant such as graphically by using arrows. The length of the arrow corresponds to the magnitude of the vector, and the discosion of the same corresponds to the discosion of the vector. In symbols, we denote the magnitude of sector  $\mathbf{V}$  with  $\{\mathbf{V}\}$ 

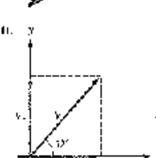

404

Addition of Vectors [2.5]

The sum of the vectors  $\mathbf{U}$  and  $\mathbf{V}$ , written  $\mathbf{U} + \mathbf{V}$ , is the vector that extends from the tail of  $\mathbf{U}$  to the tip of  $\mathbf{V}$  when the tail of  $\mathbf{V}$  coincides with the tip of  $\mathbf{U}$ . The sum of  $\mathbf{U}$  and  $\mathbf{V}$  is called the resultangment of

Horizontal and Vertical Vector Components [2.5]

The horizontal and vertical vector components of vector  $\mathbf{V}$  are the horizontal and vectoral vectors values such is  $\mathbf{V}$ . The horizontal vector component is denoted by  $\mathbf{V}_{s}$ , and the vertical vector component is denoted by

(Associate that the ordy lorge knoping Kelly from tolking backwards is the force lyler is possing with.)
- 30. Work: William palk his on also Hannah and Sarah on a stad by exerting a lines of 35 pounds on a cape at an angle of elevation of 48° (Figure 3). How much work is done by William in bulling the slad \$5 feet?

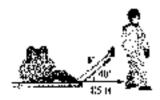

Figure 3

#### CHAPTE 2 GROUP PROJECT

#### THE 16"-75"-90" TRIANGLE

Objectives To find exact values of the six cogmodestic functions for  $15^\circ$  and  $75^\circ$  angles

In Section 2.1 we saw how to obesin exact values for the migrowmetric functions using two special mangles, the  $30^{\circ}-60^{\circ}-90^{\circ}$  triangle and the  $45^{\circ}-65^{\circ}-90^{\circ}$  triangle. In this project you will use both of these triangles to create a  $15^{\circ}-75^{\circ}-90^{\circ}$  triangle. Once your triangle is complete, you will be able to use into find additional exact values of the tripersoneric functions.

The dispracy shown in Figure 3 is called an Afflex recomple. It is named after a high school reacher. Doug Ailles, who that discovered it. Notice that the rectangle is exactivated from four triangles. The triangle in the middle is a 30°-60°-90° triangle, as 4 fixe triangle above it in the under right corner is a 45°-45°-90° to such.

- 1. Find the measures of the remaining four angles labeled A, B, C, and C.
- 2. Use your knowledge of a  $30^{\circ}$   $40^{\circ}$ - $90^{\circ}$  triangle to find sides r and h.
- 3. Now see your knowledge of a 15° 45° 90° prangle to find sides s and f.
- 4. Find a god d, sea then find sides a and b asing your values for sides c, d, d, and d.
- 5. Now that the diagram is complete, you should have a 45° 75° 90° minagle with all three sides intend. The this minagle to all in the rabbs below with expertained for each placement of function.

75°				<u> </u>		

6. The your calculator to check each of the values in your table. For example, find six 15° on your calculator and eacks sure it agrees with the value in your table. (You will need to approximate the value in your table with your edictiator about.)

#### arri 2 RESEARCH FROJECT

#### SHADOWY ORIGINS

fügure 1

The origins of the sine function are found in the tables of chords for a clock constructed by the Greek astronomassistan ternancians bilippareins and incismy. Now ever, the origins of the tangent and countries functions the trimarily with Arabic and Bianak authoromete. Caned the savara rects and analysis was their connection was not to the chord of a scrale but to the guession of a standal.

Research the origins of the usingent and countegent functions. What was the connection to smiddal? What other contributions did Arabic astronomers make to trigonometry. What a pure great or two about your bladuigs.

## RADIAN MEASURE

The grant book of nature and be reachedly by these, who know the large argulawhich it is written. And this temporage is in atherospics. Bottleri

#### INTEGRATION

The first cable can was built in San Francisco, California, by Alchew Smith Hallidie. It was completed on August 2. 1873. Today, three cable car lines remain in operation in San Francisco. The cars are propelled by long steet cables, haide the powerhouse, these cables are thiven by large 14-fext drive whoch, called theorem that fam at a rate of 19 resolutions per minute (Figure 1).

In this chapter we hardshipe a second type of angle measure that allows us to define manyon in terms of an are along the

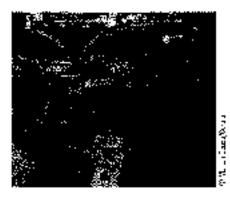

Figure 1

eircumference of a eircle. With radian measure, we can solve problems that involve angular speed such as revolutions per minute. For example, we will be able to use this information to determine the linear speed at which the cable controvels.

#### STUDY SKILLS FOR CHAPTER 3

The study skills for this chapter focus on getting ready pprox take an esam:

- 1 Getting Ready to Take an Exam Try to arrange your dealy study babin so that you have very finite studying to do the night refore your next exam. The next two goals will help you achieve goal number 1.
- 2 Review with the Exam in Mind. Review material that will be covered on the next exam every day. Your review should consist of working problems. Preferably, the problems you work should be problems from the list of difficult problems you have been recording.
- 3 Continue to List Difficult Problems. This study skill was started in the previous chapter. You should continue to list and rework the problems that give you the most difficulty. Use this list to study for the next exam. Your goal is to go into the next exam knowing that you can successfully work any problem from your list of hard problems.

in Example: and Problem Sec. Inroughout the chapter

 $\mathscr{C}=$  Tutorfal available on video

F = Tuccinal available and no.

4 Pay Attention to Instructions Taking a test is different from ching homework. When you take a test, the problems will be mixed up. When you do your homework, you usually work a number of similar problems, itematines students do very well on their homework, but became confused when they see the same problems on a test became day have not paid attention to the instructions on their homework.

## SECTION 3.1 REFERENCE ANGLE

In the previous chanter we found exact values for trigonomers of fractions of tentain a right for trigonomer (\*\* and 90\*). By using what are called *registerine trigon*, we can indicate values for trigonomers of microsis of angles outside the interval 0\* to 90°.

#### EVER INDICIONA

The reference number (sometimes collect related angle) for any angle  $\theta$  in standard position is the positive name angle between the terminal side of  $\theta$  and the state. In this book, we will denote the telephone angle for  $\theta$  by  $\theta$ .

ages where the constraints and the entire entire electric description of the graph graph particle of the constraints and

Note that, for this definition,  $\theta$  is above mositive and always between  $\theta'$  and  $90^\circ$ . That is, a reference in gla is above at a me applic.

Somether reference angle the earters the following angles

m 302

N. 1354

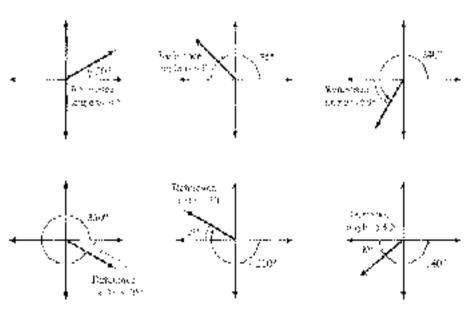

e. 240%

**d.** 350°

 $-230^{\circ}$ 

\$ -1401

**SOLUTION** We draw each angle in standard position. The reference angle is the positive acute angle formed by the terminal cide of the angle in question and the  $\tau$  state (Figure 1).

Figure, 1

We can generalize the results of fixarriple L as follows: If  $\theta$  is a positive angle between 0 and  $580^\circ$ , and

then 
$$\hat{\theta} = \theta$$
  
if  $\theta \in \mathbb{Q}\Pi$ , then  $\hat{\theta} = 180^\circ - \theta$   
if  $\theta \in \mathbb{Q}\Pi$ , then  $\hat{\theta} = \theta = 180^\circ$   
if  $\theta \in \mathbb{Q}\Pi$ , then  $\hat{\theta} = 360^\circ$   $\theta$ 

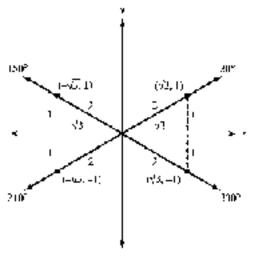

We can use our information on reference angles and the signs of the migratometric functions to write the following theorem.

#### REFERENCE ANGLE TAROSEM

A trigonomerric function of an angle and its reference angle are the same, except, perhaps, for a difference in sign.

We will not give a detail of proof of this theorem, but rather, justify if by example. Let's look of the smes of all the largies between C' and left? that have a reference angle of BC'. These engles are BC', BCC', BCC', and BCC' (Figure 2).

$$\sin 150^\circ = \sin 50^\circ = \frac{1}{2}$$
 hey differ in sign only 
$$\sin 210^\circ = \sin 330^\circ = -\frac{1}{2}$$

Pigure 2

As you can see, any saidle with a reference angle of 30" will have a sine of  $\frac{1}{2}$ , the sign, 1 or  $\frac{1}{2}$ , will depend on the quadrant in which the angle terminates. Using this discussion as justification, we write the following steps to find trigonometric functions of angles between 0" and 560".

- Step L. Find  $\hat{S}$ , the reference angle.
- Step 2. Determine the sign of the trigonometric function based on the quadrant in which 5 tempinates.

 $\Re s \rho \beta$ . Write the original disconnectric function of  $\theta$  in terms of the same trigonomial mestic function of \$...

Step 4. Find the minonemetric function of  $\theta_1$ 

## Find the exact value of Fin 240°.

SOLUTION The this example, we will list the steps just given as we use the m Fig.u+ 3 is a diagram, of the situation.

Step 1. We find  $\hat{m{\theta}}$  by subtracting  $180^\circ$  from  $\hat{m{\theta}}_i$ 

$$\hat{\theta} = 240^\circ - 180^\circ - 60^\circ$$

Stop 2. Since  $\theta$  terminates in quadrant III, and the sine function is negative in quadrant III, our answer will be negative. That is,  $x \in \theta$  ,

 $S(cp, \delta)$ . Using the results of Steps 1 and 2, we write

$$\sin 240^{\circ} = -\sin 60^{\circ}$$

Step 4. We finish by funding  $\sin 60^\circ$ .

a.u 2407 = 
$$-\sin 60^\circ$$
 Sine is negative in QIII:  

$$= -\left(\frac{\sqrt{2}}{2}\right) = \sin 60^\circ + \frac{\sqrt{2}}{2}$$

$$= -\frac{\sqrt{2}}{2}$$

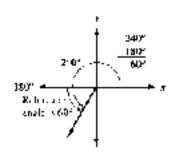

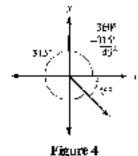

Figure 3

## EXAMPLE 345 Find the exact value of cm 3155.

**SOLUTION** The reference angle is  $260^{\circ} - 315^{\circ} - 45^{\circ}$ . Since  $315^{\circ}$  terminates in quarrant IV, its tanguar will be acquive (Figure 4).

tan 31
$$S^{+}=\tan 4S^{0}$$
 Because tangent is negative in QIV.

## September 1988 South the exact value of esci 1989.

SOLUTION The reference angle is 360° 300° - 60° (Figure 5). To find the exact value of esci 60°, we use the fact that cosecon, and sine are reciprocals.

Focoall from Section 1.3 that conforminal angles always differ from each robot by multiples of 300°. For example, 445° and 315° are approximal, as are 10° and 370° (Figure 6).

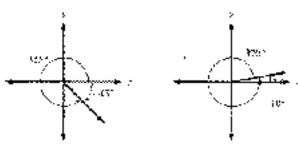

Figure 6

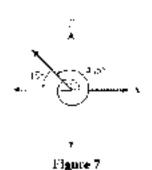

The tragonometric intentions of an angle had any angle cotomical to it are always egral. For sine and notice, are one wife this in symbols as follows:

for any integer 
$$k_t$$
 
$$\sin(\theta + 360^{\circ}k) = \sin\theta \qquad \text{and} \qquad \cos(\theta + 360^{\circ}k) = \cos\theta$$

To find values of trigonalmetric functions for an angle farger than 2600 or smaller than 60, we simply find an angle between 90 and 3600 that is experiment to it and then use the steps outlined in Examples 2 theorigh 4.

**SERECTION** By submoding 46% from 49%, we obtain 1.25°, which is automit at to 49%. The indexest singleton -5% as 45%. Actiuse 49% terminal is in good and 11, 45% is an isomorphism (Figure 1).

#### Approximations

To fine trigodomistral functions of angles that do not lend themselves to exact values, we use a casculation. To find an approximation for  $\sin \theta$ ,  $\cos \theta$ , or  $\tan \theta$ , we simply extend the angle and press the appropriate key on the calculator. Check to see that you can obtain the following values for sinc, one not and tangent of 250° and -160° on your calculator. (These answers are rounded to the nearest ten-thousandth.) Make sinc your calculator is set to degree mode.

$$\sin 250^{\circ} = -0.9397$$
  $\sin (-160^{\circ}) = -0.5420$   
 $\cos 250^{\circ} = -0.3420$   $\cos (-160^{\circ}) = -0.9397$   
 $\tan 250^{\circ} = 2.7475$   $\sin (-460^{\circ}) = 0.3640$ 

To find use 250%, see 230%, and east 250%, we must use the recipe eads of sin 250%, one part and 250%.

	Scientific Calculator	Coupling Calculator
$\exp 250^{\circ} = \frac{1}{\sin 250^{\circ}}$	250 (sin) [[//]	i (#) (si) ( 250 F (N ER
= -1.0642		
$460.550^{\circ} = \frac{1}{608.250^{\circ}}$	250 Los [1/g]	1 🖹 😅 🚹 250 🗓 [23] TUR

$\cos 250^\circ = \frac{1}{\tan 250^\circ}$	250 <u>tan</u> [1/c]	[-] [a3]   y   230   F   [SVIER
= 0.3740		

Next we are a calculator to find an approximation for  $\theta$ , given one of the impondmentic functions of  $\theta$  and the quadrant in which  $\theta$  remainstates. It do this we will need to use the  $\frac{||\hat{\theta}||_{2}}{||\hat{\theta}||_{2}}$ , and  $\frac{||\hat{\theta}||_{2}}{||\hat{\theta}||_{2}}$  keys, which we learn along earlier to Section 1.2. Is using one of these keys to find a reference angle, always enter a positive value for the disjonanterior function. (Remember: A reference angle is howest 0° and 90°, so all the digenometric functions of that any o will be positive.)

**Certaintenant Moreo.** Some coloutarions do not have a key labeled as  $\{s^i, s^i, T^i, Yming_i\}$  need to provide construction of keys, such as  $\{m_i\}$  wing  $\{m_i\}$  and  $\{m_i\}$  on  $\{2n_i\}$  on  $\{2n_i\}$  on .

**建义的**例 更多。 Nad  $\theta$  if size  $\theta = -0.5592$  and  $\theta$  to unsigness in QCD twite  $\theta^* < \theta < 0.569$ .

**SOLUTION** Fire, we find the reference angle using the  $[\sin^4]$ , key with the positive value 0.5593. From this, we get  $\delta=34^\circ$ . As shown in Pipere 8, the desired angle in QMI whose reference angle is 34° is

$$\ddot{\theta} = 130^{\circ} + \dot{\theta}$$
$$= 130^{\circ} + 36^{\circ}$$
$$= 216^{\circ}$$

If we wrought to like  $\omega^q$  the angles that term rupe in QRI and have a sine of -0.8590, we would write

$$\theta\sim 2140\pm 3607\delta$$
 — whose this was insegate

This gives us all angles coteaning With 234°.

Castenda our Pileron Phere is a fug difference between the singlites and the singlites. The join key can be used to find the value of the sing function for any angle. However, the row-se is not true with the singlite. For example, if you we also by fixample 6 by entering =0.5509 and using the singlites, you would not obtain the rangle 2147. To see stay this Lapton's you will have to wait until the cover inversable on occide functions in Chapter 4. In the meantime, to use a co-culator or this end of problem, use if to some the reference angle has town procure as we find in warrate 8.

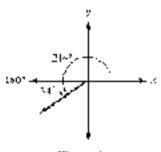

Figure 8

**EXAMPLE 2.** Find 9 to the nearest tenth of a degree if an  $\theta = -0.85\%$  and  $\theta$  tentinates in QIV with  $0^{\circ} < \theta < 360^{\circ}$ .

**SOLUTION** Using the **tan** key with the positive value  $0.85^{\circ}$  Ligites the reference range  $\hat{\theta} = 40.5^{\circ}$ . The desired angle in QIV with a relevance angle of  $40.5^{\circ}$  is

$$9 = 360^{\circ} = 40.5^{\circ} = 319.5^{\circ}$$

Again, if we want to list all angles in QPv with a range at of  $\pm 0.8541$ , we write

or include not only 319.51 but all angles cotenning with its

Find 5 of st)  $\theta = \frac{1}{2}$  and  $\theta$  formulates in QIII with  $\theta$  states a Sign

**SOLUTION**. Using our calculator, we find the inference angle to be  $30^\circ$ . The desired angle in QIII with the increasingle of  $30^\circ$  is  $130^\circ$  if  $30^\circ = 200^\circ$ .

**EXAMPLE** GOT Pine 0 to the nearest degree if  $\sec \theta = 0.8637$  and 0 (erminate) in QLV with 0.1<0.500.

**SOLUTION** To find the deference larger on a calculator, we must use the fact that see 3 is the reciprocal of  $\cos \theta$ . That is,

16 sec 
$$\theta = 3.8637$$
 then  $\cos \theta = \frac{1}{3.8637}$ 

From this last line we set that the keys to pressure

#### 

To the nearest degree, it exists tense angle is  $\hat{\theta}=75^\circ$ . Because we want  $\theta$  to reminate in QTV, we subtract  $0.5^\circ$  from  $560^\circ$  to  $p_0$ .

$$\theta = 3676 + 155 + 2857$$

We can obtain an iteration is calculated by ordering 285% thing its cosmotored than indiring the recommod or the result

#### SECTION $oldsymbol{3.2}$ - RADIANS AND DEGREES

If you high raph to the work you have done with functions of the force y = f(x) in your algebra class, you will see that the variables x and y were always had numbers. The trigonometric functions we have worked with so far have had the form y = f(y), where  $\theta$  is measured in degrees. To apply the knowledge we

NOTE of a right to the Hampy right of stills with the first printed assets the last research of soften into the little context of soften into an attention of soften in the property of soften for the first of the way absorbe first or calculated for its fagures.

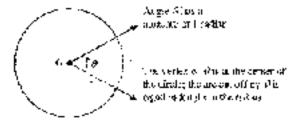

have about functions from algebra to our trigonometric functions, we need to write our angles as real transcers, not degrees. The key to doing this is called *malket* accounts.

Radian measure is a relatively new concept in the history of mathematics. The term various was first introduced by physicist James T. Thomson in examination questions in 1873. The introduction of radian measure will above us to do a number of useful things. For instance, in Chapter 4, we will graph for function  $y = \sin x$  as a nectangular about system. Where the ariths on the x and y axes are given by soil mathematical respectively as the arithment y = 2x + 3 or  $y = x^2$ .

To unders and the definition-for radian increase, we figure to recall first again extry to at a central englering enclosis at a 1985 with its vertex at the content of the diselec-Here is the delication for an energy with an ensure of I radian.

#### DEFINITION

This is rely, a central angle that cuts off on are equal in length to the stidius of this choic has a measure of 1 var/are (red). Pignus 1 illustrates this.

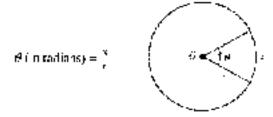

Dignoc I

 $\text{The properties of the prop$ 

To find the sadian measure  $n^*amp$  central angle, we must find how many radii are in the are  $\pi$  on a off, the do so, we divide the arc length by the sadius. If the radius is 2 centimeters and the god out off by central angle  $\theta$  is  $\theta$  centimeters, then the professional angle  $\theta$  is  $\theta$  centimeters. Then the professional definition:

#### DEFINITION FRADIAN MEASURE

If a courtal angle 0, in a circle of rating 1, cors off an arc of language state incasars of 0 in ordinas, is given by an affigure 2).

Ріедие 2

management and the common process of the subgroups from substantial content of the common designation of the content of the co

As you will see later in this section, one railing is equal to approximately 57.3%

A control length 6 controllers. What is the radian measure of C.7.

**SQI UTION** We have r = 3 cm unit g = 6 cm (Figure 5); therefore,

$$A \text{ (in reduce)} = \frac{v}{v}$$

$$= \frac{6 \text{ cm}}{3 \text{ cm}}$$

$$= 3$$
[Gaure 3

We say the radian measure of  $\theta$  is 2, or  $\delta = 2$  rad.

Clost is Decause radian measure is defined as a ratio of two lengths. We reconsidily in is a unitless measure. That is, radians are just real runders. To see only, look again at Example 1. Notice how the units of centimeters divide out, leaving the number 2 without any units. For this reason, it is common practice to confit the word radian when using radian measure. (To avoid confus ou, we will sometimes use the rein radian this book as if it were a unit.) If no units are showing, an angle is understood to be unless add in radians, with diagree measure, the deared symbol "must be written."

$$\theta=2$$
 includes the necessary of  $\theta < 2$  radians

$$heta=2^{n}$$
 — neums the measure of  $heta$  is 2 degrees.

To see the relationship between degrees and radians, we can compare the number of degrees and the number of radians in the full rotation (Figure 4).

The angle formed by one full initiation about the center of a circle of radius r will out off an arc equal to the directification of the circle. Since the circle since title enter if a circle of radius r is  $2\pi r$ , we have

9 measures one 
$$\rho = \frac{2\pi\pi}{\pi} = 2\pi$$
 The measure of  $\delta$  m radians is  $2\pi$ 

Because one All regation in degrees is \$50°, we have the following relationship between radians and degrees.

$$350^{\circ} = 3\pi \text{ rad}$$

Dividing both sides by 2 we have

$$1706 - \pi 100$$

Prof.e. We can did so find this conversion factor using the definition of et which to the ratio of the circumference to the diameter for any direle. Because

$$\pi = \frac{C}{2r} = \frac{\tau^C}{r}$$

by our definition of matign, measure  $\pi$  as the angle in radiant corresponding to an ordinary of ball the circumterage of the circle  $\Gamma$  herefore,  $\pi$  rad  $\Gamma$  180°.

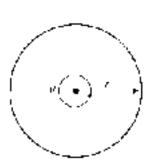

Figure 4

$$\sim 1 \left( \frac{180}{\pi} \right)^2$$

$$\simeq 1 \left( \frac{-80}{112} \right)^2$$

$$\simeq 57.7^2$$
To the correst reach

We see that I stadion is approximately  $57^\circ$  A station is much larger than a degree. Figure 5 lifternates the relationship between  $20^\circ$  and  $20^\circ$  radium.

Faure 5

Here are some further conversions between degrees and radius

#### Converting from Degrees to Radians

EXAMPLE 2 Convert 45° to radians.

**SOLUTION** Because  $1^a = \frac{\pi}{380}$  radians, and 45° is the same as 45(1°), we have

$$45^{\circ} + 45 \Big(\frac{\pi}{180}\Big) rad + \frac{\pi}{3} rad$$

as illustrated in Figure 1. When we have our answer in terms of a lost in a.4, so are writing an exact value. If we wanted a decimal approximation, we would substitute 3.14 for all

Except value 
$$\frac{\pi}{4} = \frac{3.14}{4} \approx 0.285$$
 Approximate value

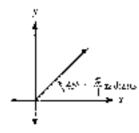

Figure 6

## Convert 450' to midian u

**\$OLUTION** As illustrated in Figure 7, multiplying by wit80 we have

$$450^{\circ} = 450 \left(\frac{-\tau}{180}\right) \text{ and}$$

$$= \frac{2\pi}{2} \text{ and}$$

$$= 7.85$$

$$= \frac{100^{\circ} - \frac{28}{2}}{100^{\circ}}$$
Figure 7

Couvert -78.41 to reduces. Round to the nearest long-feeling.

SOLUTION. We multiply by m/980 and then aperoviously asking a calculation

$$-7854^{\circ} = -78.4 \left(\frac{\pi}{186}\right) \text{ and } \approx 1.37 \text{ and}$$

Calcolate. Note Some tale for instance the stilling to concert angles from degree of excurs of radia measure, and vice versa. For example, Figure 8 shows how Evangles 5 and 4 could be done or a graphing on our attential is so to extinuously. Consult your cafes atministerial to see if your model is able to perform angle consections.

## - Laber of the second of the s

Mgary 8

#### Converting from Radians to Degrees

Convert white degrees.

**SOLUTION**. To consent from radians to degrees, we multiply by 1800s.

$$\frac{1}{2} (cod) = \frac{c}{c} \left( \frac{a}{180} \right).$$

Note that  $60^\circ$  is colice  $50^\circ$ , so 2(v.6) - w3 must be the radian equivalent of  $60^\circ$ . Figure 9 Must stes.

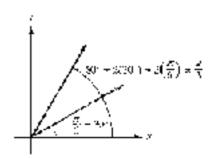

Figure 9

## EXAMPLE B. Consen 4m3 to degrees.

SOLUTION Middiplying by 180/or we have

$$\left(\frac{4\pi}{3}\right) (\text{red}) \approx \frac{4\pi}{3} \left(\frac{180}{5}\right)^2 = 149^\circ$$

Or, knowing that  $\pi G = G(0)$  we would write

$$\frac{4\pi}{2} = 8 \cdot \frac{\pi}{5} - 4(60^{\circ}) = 245^{\circ}$$

Note that the reference angle for the angle shown in Figure 10 can be given in either degrees of realisms.

In degrees: 
$$\theta = 240^\circ - 180^\circ$$

$$= \frac{4\pi}{2}$$
So radians:  $\theta = \frac{4\pi}{2} - \pi$ 

$$= \frac{4\pi}{2} + \frac{3\pi}{2}$$

$$= \frac{\pi}{2}$$
Figure 10

EXAMPLE X Convert 4 to degrees, some the respect forth of a degree

**SECLUTION** Remember that the units are showing, an angle is reduced at the pressured in radians. We makeply by 1800 a ned thes approximate using a catculates.

$$4.5 = 4.5 \left(\frac{380}{\pi}\right)^{9} \approx -287.5^{9}$$

Controllection Photos: Figure 11 shows how Pastropics 6 and 7 could be done on a graphery calculator that is so to degree needs. If your model is able to perform angle conversions, by this a carept is and make summyon can get the same values.

As a apparent from the providing examples, changing from digrees to indicate and rathers to degrees is simply a matter of equipplying by the appropriate control sum leators.

Maure 11

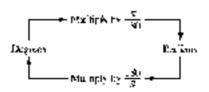

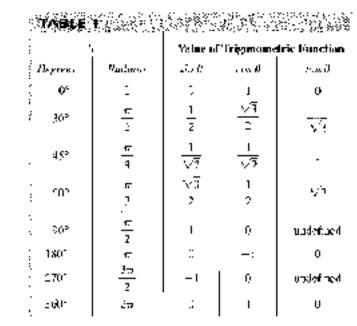

Table 1 (isplays the conversions between degrees and midians for the special angles and also summarizes the exact values of the sine, cosine, and tangent of these angles for your convenience. In Figure 12 we show each of the special angles in both degrees and radians for all four quadrants.

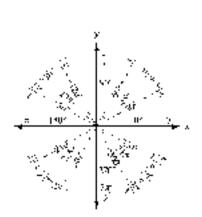

Figure 12

## EXAMPLE SEE Find tin 6.

**SOUUTION** . Because  $\pi/6$  and  $\theta 0^\circ$  are equivalent, so are their sines

$$\sin \frac{\pi}{6} = \sin 30^{\circ} = \frac{1}{2}$$

Cashouloncer Modes. To work this problem on a calculator, we must first set the calculator to radian mode. (Consult the manual that came with your calculator to see how to do this.) If your calculator does not have a key labeled on, use 3.1416. Here is the sequence to key in your calculator to work the problem given in Example 4.

## Scientific Colculator Graphing Calculator 3.1416 $|\cdot|$ 6 - sin $|\cdot|$ 5 o $|\cdot|$ $|\pi|$ $|\cdot|$ 6 $|\cdot|$ ENTER $|\cdot|$

SOLUTION Because 7::76 is just slightly larger than  $\sigma=6:$ 6::76, we know that 7::76 terminares in QIII and therefore his sine will be negative (Figure 13). The reference angle it

$$\frac{2\pi}{6} = \pi = \frac{7\pi}{6} = \frac{6\pi}{6} = \frac{\pi}{6}$$

The 1

$$1 \sin \left( \frac{2\pi}{5} \right) = 1 \left( -\sin \left( \frac{\pi}{5} \right) \right) = 1 \left( -\frac{\pi}{7} \right) = -2$$

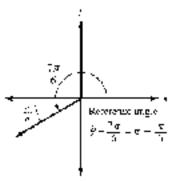

Figure 13

EXAMELE 10 Invalingly 4 am (Ar. ) in such an  $x=\pi \hbar$ 

SCHRITTERN - Substituting and his mand soon belong, we have

$$4 \sin\left(2 \cdot \frac{\pi}{6} + \pi\right) = 4 \sin\left(\frac{\pi}{3} + \pi\right)$$

$$= 4 \sin\left(\frac{4\pi}{3}\right)$$

$$= 4\left(-\sin\left(\frac{\pi}{3}\right)\right)$$

$$= 4\left(-\frac{\sqrt{3}}{2}\right)$$

$$= -2\sqrt{3}$$

EXAMPLE The In novigation, distance is no near ly more areal along a straight fine, but along a great direte because the Partir is round (Espure 14). The fremulti-like distance of the great continuous between two points  $P_i(IM_1,IM_1)$  and  $P_2(M_3, \ell N_2)$  where, countingles are given as deblodes and longer decomposition commission (file

$$\sin(dJ_0) \sin(dJ_0) + \cos(dJ_0) + \cos(dJ_0) \cos(dJ_0)$$

To overthis formulia, the bortodes and longitudes must be extensible angles to reduce. However, receil GPA (global perspecting system) mans give those provincies in depress and ramines. To use the formula this begin as converting from degrees to radians.

becomes that expression for the part of coordinates  $P_1(KX^{\alpha}, 22.000)$ , W 545-41 1770 classic PS/N + 6-94-96-95, W 535-29-260 records permanent on the country and Harbodys, respectively

SOLUTION: first, we may convert each angle to radians.

$$LR = 32^{\circ} 22.108^{\circ} = 32^{\circ} + \left(\frac{.22.108}{.00}\right)^{\circ}$$
$$\sim 37.3685^{\circ}$$
$$= 32.3685 \left(\frac{\pi}{180}\right) \text{ rad}$$
$$\sim 6.565 \text{ rad}$$

Waining sumillar steps for the other three nington, we have

$$LV_1 = 64^\circ 41$$
,  $081 \approx 1$ , 3 rad  
 $LT_2 = 13^\circ 04.8981 \approx 0.228$  rad  
 $LV_2 = 59^\circ 29.2631 \approx 1.06$  rad

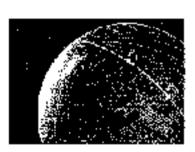

Figure 14

Rubstituting the angles into the expression and using a calculate to evaluate each Linonometrio funcciona de obtain

$$\sin \left( (LT_1) \sin \left( LT_2 \right) = \cos \left( LT_1 \right) \cos \left( LT_2 \right) \cos \left( LN_1 - LN_2 \right)$$

$$\Rightarrow$$
 (0.53.54)(0.2260) + (0.8446)(0.9741)(0.9960)

#### HEVIEW PROBLEMS

The problems that follow review material we covered in Section 1.3.

Find all six tragonoments functions of  $\theta_i$  if the green point is on the terminal side of  $\theta_i$ 

- **691.** Find the remaining trigonometric functions of  $\theta$ . If  $\sin \theta \simeq \frac{1}{2}$  and  $\theta$  remains in O.L.
- **162.** I and the remaining higeometric functions of  $\sigma_0$  if  $\cos\theta = -1/\sqrt{2}$  and  $\theta$  for manages in C/1
- **163.** Find the six origonometric functions of  $\theta$ , if the terminal side of  $\theta$  lies along the line y = 2x in OL
- **164.** Find the SIA original rate functions of  $\theta$ , if the terminal rate of  $\theta$  lies along the line x=2x in OIII.

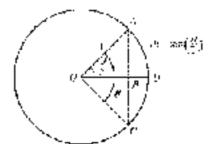

## SECTION 3.3 DEFINITION IN CIRCUIAR FUNCTIONS

: Hippoutchus

The origins of the trigonometric functions are security found in astronomy and the need to find the length of the chord subtended by the central angle of a circle. The Greek mathe problem Hipmarchus is believed to have been the first to produce a ruble of chords in 140 a.u., eaching him the founder of nilgonometry in the eyes of many. This table is essentially a ruble of values of the sins function, because the sine of a central angle on the unit challe is half the chord of twice the single (Hipman). In modern notation.

$$\operatorname{shord}(\mathcal{G}) = \operatorname{AC} = 2\operatorname{AB} = 2\operatorname{sin}\left(\frac{d}{2}\right)$$

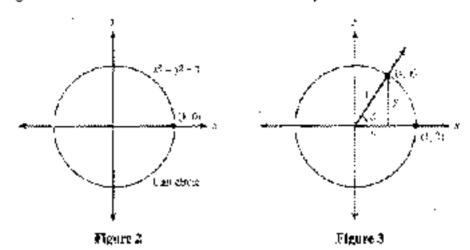

Plant I

The first explicit use of the sine as a function of an angle occurs in a table of halt-choods by the Hindu mathematicism one extronomer Acyablam around the year 510 to his work the depolation of the work indication was used too the helb-chood which was executedly shortened to simply functified. When the Acate translated the Acadebrage, they explaced for with the term piles, a meaningless word that sounded the same The word fills occurs into faith, meaning take, boston to hay. This was then take a naveland into Losin, as along, which later became rive in English.

In this section, we will give a third and find; definition for the trigonometric functions. Rather than give the new demission first and then show that it does not can that with our previous definitions, we will do the reverse and show that either of our first two definitions leads to conclusions that imply a fairel definition.

To begin, recall that the unit circle (Figure 2, is the circle with center at the oxigin and subject i. The extration of the unit circle in  $x^2 + y^2 = 1$ .

Suppose the terminal ande of angle  $\theta$ , in standard position, intersects the unit of the at point (x, y) as shown in Figure 3. Because the radius of the unit of the is 1, the distance from the origin to the point  $(x, y) \neq 1$ . We can use our first deficition for the tripopometric functions from Section 6.3 to write

$$\cos \delta = \frac{x}{x} = \frac{y}{1} = x$$
 and  $\sin \delta = \frac{y}{x} = \frac{y}{1} = y$ 

In other words, the ordered pair (x,y) shown in Figure 3 can also be written as  $\cos \theta$ ,  $\sin \theta$ ). We can arrive at this same reach by applying our second definition for the original protectic functions (from Section 2.1). Recause  $\theta$  is an acute angle in a right triangle, by Definition II we have

$$\frac{\log \theta - \frac{\sin \theta \sin \theta - \frac{\pi}{2}}{\log \cot \theta} - \frac{\pi}{2} = \pi}{\log \cot \theta \cos \theta} = \frac{\pi}{2} = \pi$$

$$\frac{\sin \theta - \frac{\sin \theta}{2} \cos \theta}{\ln \cot \theta \cos \theta} = \frac{\pi}{2} = \pi$$

As you can see, both of our first two definitions lead to the execusion that the point (x,y) shows in Figure 3 can be written as  $\cos \delta_y \sin \theta$ ).

Next, exceeded the length of the arc from (1,0) to (x,y), which we have labelled the figure 3-16  $\theta$  is the same limited by distinction

$$0 = \frac{s}{r} = \frac{t}{1} = 0$$

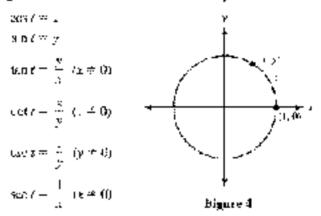

The length of the arc from (0,0) to (x,y) is exactly the same as the radium measure of angle w. Therefore, we can write

"Dave results give rise to a third deliniting for the ingenement in functional

#### DEFINITION &F CIRCULAR SUNCTIONS

If (x, y) is any point on the unit circle, and t is the distance from (1, 0) to (x, y) along the eigenenforces of the unit circle (Figure 4), then

economic in the property of the contraction of the

As we travel around the unit one a starting or (0,0), the points we come nerosa all have coordinates [cos t, sin  $\phi$ , where t is the distance we have traveled. (Note that t will be positive if we travel in the counterelockwise direction out negative if we travel in the closewise direction.) When we define the trigonometric functions this way, we call their completions when because of indirections ship to the number of the counterest of the counteres

Tigate 5 shows an ordered version of the unit one a with multiples of ar6 and or4 marked of the back regions gives in help degrees and subsets. The rather revenues of each angle is the sente as the distance from \$1.00 to the present on the terrateal side of the single, as measured along the circum from the help to be in to maximum contents of the single, as measured along the circum from the help to be in to maximum and since directions. The resemble and since the proof shows in the resemble and since respectively, in the associative angle or distance.

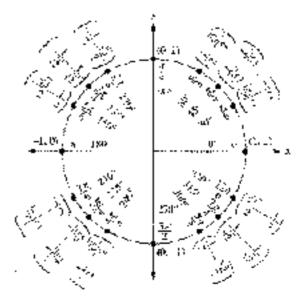

Figure 5

Figure 5 is netpoint in visualizing the relationships among the angles shown and the imponentation functions of those angles. You may want to mush a larger copy of this diagram years of. In the process of decay we you will become more limitian with the relationship between degrees and rather, and the exact values of the angles in the diagram. Keep in mind, hough, that you do not need to memorize this entire ligate. By using reference angles, it is really only thesessing to know the values of the circular functions to the quadratic angles and angles that terminate in QL.

Like Figure 5 to find the six trigonometric functions of Arrelia

**SOLUTION** We obtain cosine and sine directly from Figure 5. The other trigory-motric functions of 5556 are found by using the ratio and reciprocal identities, rather than the new definition.

$$\sin \frac{5u}{6} = u - \frac{1}{2}$$

$$\cos \frac{5u}{6} = u - \frac{\sqrt{3}}{2}$$

$$\sin \frac{5u}{6} = \frac{\sin (6\pi/6)}{\cos (5\pi/6)} - \frac{1/2}{-\sqrt{3}/2} = \frac{1}{-\sqrt{3}}$$

$$\cot \frac{5u}{6} = \frac{1}{\sin (5\pi/6)} = \frac{1}{-1/\sqrt{3}} = -\sqrt{3}$$

$$\cot \frac{5u}{6} = \frac{1}{\cos (5\pi/6)} = \frac{1}{-\sqrt{3}/6} = \frac{2}{-\sqrt{3}}$$

$$\cot \frac{5u}{6} = \frac{1}{\cos (5\pi/6)} = \frac{1}{-1/2} = 2$$

$$\cot \frac{5u}{6} = \frac{1}{\sin (5\pi/6)} = \frac{1}{1/2} = 2$$

**Example 14.** Use the unit circle to find all values of z between 0 and  $2\pi$  for which the  $z=\frac{1}{2}$ .

**SOLUTION** We look for all ordered pairs on the unit circle with an e-coordinate of  $\gamma$ . The angles, or distance  $\zeta$  associated with these points are the angles for which  $\cos r = \gamma$ . They are  $r = \pi/3$  or  $80^\circ$  and  $r = 5\pi/3$  or  $30^\circ$ .

#### USINGS

NAME OF THE STATE OF THE STATE

We can use Definition III to graph the unit could with a set of hardweine equations. We will cover parametric equations is a one describer Section 6.4. First, set your prophing rate date to become the inche and so rediscentials. Then define the following pair of functions (Figs. 4.6).

$$S(t) = \cos t$$
  
 $S(t) = \sin t$ 

Figure 6

Set the widdow marganities without

Graph the equations using the assem-aguine command. This will make the circle appear mutid and und like an of spec. Now you can seed the circle in anomaginess of mild. Two examples to find the size an acosine of mild transfer means, of two thought the modern mild. A hyper 19.

$$4\left(\frac{\pi}{12}\right) \approx \frac{4\pi}{42}$$
$$= \frac{\pi}{2}$$
$$\approx 1.027$$

Figure 7

We see that  $\cos{(\pi/3)} \approx 0.5$  and  $\sin{(\pi/3)} \approx 0.8600$  by the bearest represonsand(ii).

Reconse it is easier for a calculation to distillary angles exactly to degrees rather than in axious, it is sometimes beguind to graph the pair discloroung angles. Set your graphing calculates to degree made. Change the window servings so that  $0 \le 1 \le 300$  with scale -5. Graph the circle mate again. New when you have the graph, rath measurest represents 57.

We can use this graph to cooling on a results in Example 2. There should the unit circle unit the x-root finate is 6.5. The calculator shows us the rank two sixth points; at  $t = 60^\circ$  and  $a_{col} = 300^\circ$  (Figure 3).

Figure 8

EXAMPLE 3.44 Pind ten vill : corresponds to the point (--0.737, 0.675) on the unit time: Papers 9).

SOLUTION Using Definition III we have

$$\tan t = \frac{2}{x^2}$$

$$= \frac{0.675}{0.737}$$

$$= -0.916$$

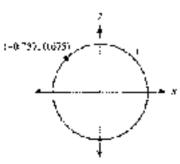

Figure 9

MCTE Createst of pixed altere (Millors) the graditional especial may explicit as with a fanctions, where it represents a delivation Million and yid Million feature (Chicy ten senith) here a fine has for a moral years that we of selection is belief divide as easy, in ligare 4.

Respendentiful a function is a valuable pairs cade classical of the domain with exactly one glement from the range. When, we see the statement  $y \sim \sin x$  it is plenting to the paration x = f(x), in the first if we assured to be precise, we would write  $g \sim \sin m)$ , fit visual terms, we can the total the sine function as a machine that assigns a valgh, out tot value to overly hap 4 value (Figure 10).

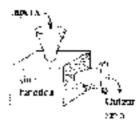

Figure 10

The faquety is arreal town to , while rounder had presented as a distance along the chiconference of the unit circle or an angle in radians. The input is four ally referred to as the *cognocient* of the fine con-

 $\frac{g_{\pi}}{2}$  to the first of the force of the argument of

the familiary, arefulae work of the bracken

SOLUTION: Because

$$\frac{9\pi}{4} = \frac{\pi}{2} - \frac{8\pi}{4} = \frac{\pi}{4} + 3\pi$$

the point on the unit exple corresponding to 9 #/4 will be the same as the point corresponding to 5/4 (Figure 1)), therefore,

$$\sin\frac{2\pi}{2} - \sin\frac{\pi}{2} - \frac{2\pi}{\sqrt{2}}$$

In terms of analos, we know this is true because \$459 and \$91 are entermined,

The function is the time function,  $9\pi/4$  is the argument, and  $4/\sqrt{2}$  is the value of the falacion.

For smaller other than she special angle sublewrite Figure 5, we can upo a galout Exact to evaluate the circular functions. It is important to remember that the circular functions are functions of mult numbers, so we prost always form fan an legiquer pe εκαίτειο κακές νέφου εφοί αστέρο έχα το έχειση (εμκ.

SOLUTION: Make sure your calculator is get to radian mode. Remoting to four decimal places, we have

$$\cot 2.37 = \frac{1}{420.2 \cdot 37}$$

$$\cdots = -1.0280$$

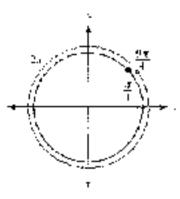

Figure 11

#### Domain and Range

Using Definition III we can find the domain for each of the circulal functions. Brevase any value of adderestions a rotation of the unit circle, the sine and cosine functions are always befored and therefore layer a doubt in all real numbers.

Because tan t=gh and sec t=1/a, the tangent and secar tifunctions will be called interval at t=0, which will occur at the points (0,1) and (0,-1). Looking limits of Figure 5 we see these points correspond to  $t=\sigma/2$  and  $t=3\pi/2$ . However, if we travel around the unit circle multiple times, in either a circlewise or counter Bookwise direction, we will uncounter these points again and again, such as when  $t=5\pi/2$  and  $t=7\pi/2$ , so  $t=-\pi/2$  and  $t=3\pi/2$ . All of these values differ from each other by some multiple of  $\pi$  because (0,t) and (0,-4) are proposite sides of the anit circle  $\pi$  belong about the again. Therefore, the tangent and secar functions are defined for all again an object t except  $t=\pi/2=k\pi$ , where k is any the sec.

In a similar manner, the covarigers and coverant functions will be undefined after r = 0, corresponding to the points (1, 0) or (-5, 0). To avoid either of these two positions, we must exceed the values  $t = k\pi$  for any integer  $\kappa$ . We summarize these results here:

#### DOMAINS OF THE CIRCLE AS FUNCTIONS

```
s.n.4, \cos r Add and purposes, \cos (-\infty, \infty)
san r, sec r Add real numbers except r = r/2 is for for any integer k
\cot r, \csc r All real numbers except r = k_0 for any integer k
```

In Chapter 4, we will execute die ranges of the errorier foliations in detail. For now, a well suffice to simply state the ranges so that we may begin becoming familiar with them.

#### RANGES OF THE CIRCULAR FUNCTIONS

```
\sin t_i \cos t_i = 1 - 1, 1

\tan t_i \cot t_i = \text{All real numbers, } \cot t_i \cot t_i = 1

\sec t_i \csc t_i = (-\infty, -1) \cup \{1, \infty\}
```

**EXAMPLE 6** · Determine which statements are possible for some real tambérs.

```
a. \cos x = 7 b. \cos x = \chi c. \tan \phi = 1000
```

#### 9010TION

- a. This statement is not possible because 2 is not within the range of the cosme function. The largest value cosm can assume is 1.
- This statement is also not possible, because usu is undefined and theselo e not equal to any real number.
- Thus statement is possible because the range of the tangent function is all real numbers, which certainly includes 1,900.

#### Geometric Representations

Insert on the case that definitions, we are reported the saltics where we trigger anichthe numbers geometrically as indicated in Figure 12. The diagram shows a print  $P(\mathbf{x},\mathbf{y})$  that is a units entire the point (1,1) on the exequently series of the limit career. Theoretone,  $\cos z = x$  and  $\sin z = y$ . Herearst friengle H(H) is similar to triongle A(H). we have

$$\frac{BR}{C\delta} := \frac{AF}{CA} = \frac{\sin x}{\cos x} = \cos x$$

iscourse  $\partial R \approx 1/2R$  is ognal to ran ). Notice that this wall be the slope of  $\partial P$ . Using a sum conargament in case by shown that  $CQ=\operatorname{const} GQ=\operatorname{csc}_{A}$  and  $GB=\operatorname{csc}_{A}$ 

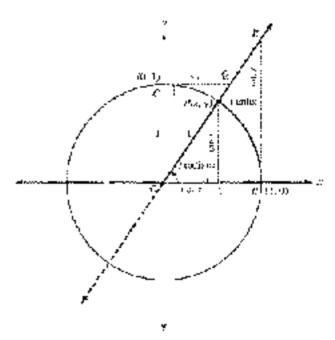

Figure 13

There are many concepts that can be visualized from Figure 12. One of the surreimportant is the variations that occur in air Liera Liaud ten Las Pitravels around the unit cantile. ## section ${f 3.4}$ . ARC LENGTH AND AREA OF A SECTOR

In Chapter 2, we miscussed some of the aspects of the riss Ferris wheel, which was built by George Perris in \$293. The first sepic we will cover in this section is are length. Our study of are length will allow us to find the distance traveled by a rider on a Perris whee, at any point during the ride.

In Section 3.2, we tough that if a central angle  $\theta$ , measured in addition in a circle of tradius, r outs off an are of length r, then the colationship between r, r, and  $\theta$  can be written as  $\theta = \frac{\pi}{2}$ . Figure 1 illustrates this.

If we multiply both sides of this equation by r, we will obtain it a equation that gives are length r in terms of r and  $\theta$ .

$$\theta = \frac{s}{r}$$
 Definition of radion measure

$$\mathbf{r} \cdot \mathbf{g} = \mathbf{r} \cdot \frac{\mathbf{f}}{r}$$
 Multiply both sides by  $r$ 

$$d\theta = 5$$

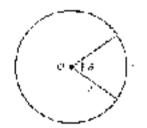

Figure 1

#### ARC LENGTH

If  $\theta$  (in radians) is a central angle in a circle with radius  $r_i$  then the length of the archaeoff by  $\theta$  is given by

<sup>8</sup> жылын жарын кыргыз тоонын кербеке<del>ттект</del> жашарынын жарыны боргын жарын кертийн жарын жарын жарын жарын жарын жа

Because r works be constant for a given circle, this formula tells us that the arclength is proportional to the central angle. An angle twice as large would out off an arc-twice as long. 9 b a.4 cs

Digare 2

Give the length of the arc out off by a central angle of 2 radians in a circle of radius 4.3 inetes.

**SOLUTION**. We have  $\theta=2$  and r=4.3 inches. Applying the formula  $s=r\theta$  gives us

$$s = r\bar{q}$$
  
= 4.5(2)  
= 8.5 inch s

ing etc. 2 allocates to a example.

Recall that the diameter of the wheel is a mode of Coorge Perris x Lemis wheel. Recall that the diameter of the wheel is 280 feet, and 5 is the central angle formed as a mode travels from his or harring all nestion  $P_{\rm b}$  to position  $P_{\rm b}$ , find the distance revealed by the modern b=455 and if b=1052.

**SDTUTION** The formula for ant length,  $x = i\theta$ , requires  $\theta$  to be given in radious. Since  $\theta$  is given in degrees, we must multiply if by  $\pi^0(90)$  to convert to ordious. Also, since the pracetor of the school is 250 tout, the radius is 125 tool.

$$f = nt$$

$$f = nt$$

$$= (25)45) \left( \frac{nt}{180} \right)$$

$$= \frac{(25)t}{4}$$

$$= (98) tc$$

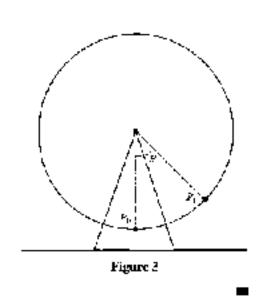

$$For \delta = (05^{\circ})$$

$$s = nt$$

$$= (25)(105) \left( \frac{nt}{180} \right)$$

$$= \frac{875t}{12}$$

$$(4.280)^{-1}$$

**EXAMPLE 3** The minute hand of a clock is 1.2 centimeters long. To two significant digits, how In does the tip of the minute hand nove in 20 minutes?

**SOLUTION** We have r=1.2 centimeters. It note we are looking for  $y_1$  we need to find  $\theta$ . We can use  $y_1$  proportion to find  $\theta$ . One complete station is 60 minutes and 2w radians, so we say  $\theta$  is to 2w as 20 minutes is  $\phi$  60 minutes, or

If 
$$\frac{d}{2\pi} = \frac{29}{69}$$
 that  $8 = \frac{9\pi}{2}$ 

Now we can find a

$$S = mt$$

$$= 1.9 \left(\frac{2\pi}{4}\right)$$

$$= \frac{2.4\pi}{4}$$

$$= 2.5 \text{ CO}$$
Significantly by the formula beautiful for the state of the s

Pagette 4 illustrates this example.

The tip of the nomite hand will wavel approximately 2.5 confirm ters comy 20 annuals.

If we are worsing with retainvely small central angles in discles with large suchiwe cannot the length of the intercepted and to approximate the length of the associated those. For example, Figure 5 shows a conscalangle of 1° in a finde of radius 1,806 feet along with the art and chood out off by 3°, diligate 5 is not diswn to scale.)

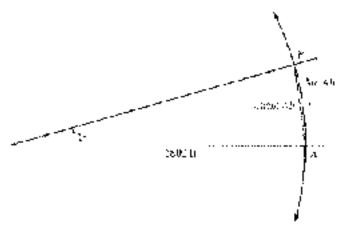

Figure 5

To find the length of art Aö, we convert 5 to radiate by multiplying by  $\pi/180$ . Then we apply the formula t = t0.

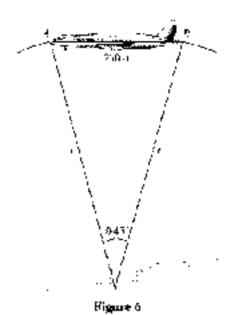

$$x = z\theta = 1.800(1) {\frac{z - x}{180}} = 30\pi \odot 110$$

If we had carried out the or cutation of are AB to a x electrical digital we would have obtained  $x \approx 31.159$ . The length of the chord AB is B. [155 so six significant digits (to and by using the law of sines, which we will cover in Chapter 7). As you can see, the first tive (Jgits to each number one the same, it seems reasonable than to appoint map the length of the length of are AB.

for our next example plustrates, we can also use the procedure just outlined in the reverse order to find the tardius of a stock by approximating are length with the length of the associated chart,

A person structure on the restly occides that a 747 inmholes thying overhead sublends an angle of 9.45 °. If the length of the jet is 230 feet, find its altitude to the nearest thousand feet.

**SETILLY FIGURE** The period is a magnitude of the setuding. The parameters we are someony with a nutritively small about the chieff with a larger ranner, we use the larger of the site plane (about AB in Figure 6) as an epotential about the single of the allocate AB, and it as an approximation of the site and the chieff of the plane.

Because 
$$s = r\theta$$
  
then  $r = \frac{s}{\theta}$   

$$= \frac{230}{0.45 \, (m^2 180)}$$
We multiply  $0.45^\circ$  by  $w(180)$   
 $= \frac{(30)(180)}{(0.45)(\pi)}$   
 $= 29,500 \, \%$ 
To the reserve thousand for

#### Area of a Sector

Next we want to derive the formula for the area of the aceter formed by a central angle  $\theta$  (Figure 7).

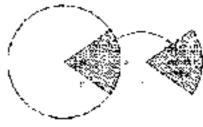

Figure 7

Area of sector 
$$\longrightarrow \frac{A}{2\pi^2} = \frac{C}{2\pi} \leftarrow \cdots$$
 Central language  $\delta$  area of chirle  $\longrightarrow \frac{A}{2\pi^2} = \frac{C}{2\pi} \leftarrow \cdots$  One (all position

We solve to 14 by multiplying both sides of the proportion by  $|m|^2$ 

$$m^2 \cdot \frac{d^2}{dr^2} = \frac{\theta}{2\pi} \cdot \sigma r^2$$
$$A = \frac{1}{2}r^2t.$$

#### AREA OF A SECTOR.

if  $\theta$  (in radions, is a central angle in a circle with ratios r, then the sees of the sector  $\theta$  ignire by formed by angle  $\theta$  as given by

$$A = \frac{1}{2} r^2 \theta \qquad (0 \text{ in radivities})$$

Figure 8.

TARRELE See Fract the area of the sector former by a termal angle of 1.4 redicts in a circle of radius 2.1 theory

**SOLUTION** We have r=2.1 maters and  $\theta=1.4$ . Applying the formula for A gives as

$$A = \frac{1}{2}r^2\theta$$

$$= \frac{1}{2}(2.1)\dot{\gamma}(1.4)$$

$$= 3.1 \text{ m/s}$$
To the nearest, can's

Becomes the Artial's encarante in square in the When  $r = 2.9 \text{ m}, r^2 = (2.9 \text{ m})^2 = 4.44 \text{ m}^2$ .

The state of established the state of the st

SOLUTION: We first convert 45: to radians.

$$\theta \sim 18 \left(\frac{25.5}{180.5} + \frac{5}{12}\right)$$

Then we substitute  $\theta = \pi v / 2$  and  $A = \pi / 3$  into the tormuly, for A and solve for n.

$$A = \frac{1}{2} P^{2} \theta$$

$$\frac{\overline{W}}{V} = \frac{1}{2} P^{2} \frac{\overline{W}}{V_{0}}$$

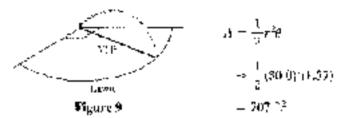

$$\frac{\sqrt{2}}{2} = \sqrt{2} e^2$$

$$r^2 = \frac{9}{3} \cdot \frac{24}{3}$$

Note that we need only use the positive square root of 8, since we know our radius must be measured with positive entry.

notice through 50° and project vater on 50.0 feet. To three algorificant digits, what area of laws is wasted by the soundless?

**SOLUTION** We have  $\delta \simeq 90^\circ \simeq \frac{9}{2} \simeq 5.97$  radians and  $r \sim 30.0$  feet. Figure 9 illustrates this example.

## WORKS - CELONG READY FOR CLASS

After making theoryth the preceding season, respond in your seas words and in complete sentences.

- a. What is the definition and formula for are length?
- The Whiteh is longer, the chord AB or the corresponding are  $AB \nearrow$
- e. What is a sector?
- d. With is the de inition and formula for the area of a sector?

- 58. Height of a Hill: A road up a hill in a key as angle of \$1 with the his ignitial. If the most drops the bottom of the hill to be sup of the hill is 2.5 miles long, how high is the hill?
- 59. Angle of Depression: A person asuding 5.2 feet from a mirror notices that the angle of depression from his eyes to the toutinn of the mirror is 15% white the angle of elevation to the top of the mirror is 12%. Pind the vertical cimension of the mirror.
- 60. Distance and Benzing A post travels on a course of bearing \$ 63°50′ in for 134 miles, flow many miles south and how many miles eas, has the brait traveled?
- 61. Geometry The height of a right circular cone is 35.5 centimeters. If the diameter of the base is 25.5 centimeters, what angle does the side of the cone make with the base?
- 62. Distance and Bearing. A strip leaves the learnor entrance and travels 5.5 miles to the direction N \*2" D. The captain then terms the ship 50° and travels abother 25 miles in the direction S 48° B. At that one, how far is the ship from the narbot entrance, and what is the bearing of the ship from the harbot entrance?
- 63. Angle of Depression. A man standing on the coof of a building 86.0 fee, shows the ground looks down to use building negationer. He finds the angle of depression to the coof of that building from the coof of his building to be 14.57, while the angle of depression from the roof of his building to the bottom of the building negation is 13.21. How call is the building negation?
- 6d. Hidgitt of a Tree. Two records docide to find the beight of a tree. They position themselves if feet aport in tipe very, and on the came side of, the tree. If they flad the dogles of elevation from the ground where they are starting to the top of the tree are 05° and 40°, how rull is the tree?

#### эхтририм; кан фомфекты

#### Apparent Diameter

As we meationed in this section, for small sented angles in circle's with large ratio, the interespt2d are and the chard are approximately the same langua. Figure 17 shows a largeon of a person looking at the moon. The use and the chord are essentially the some length and are both good approximations to the finitestar.

Jiggaze 17

In extremency the angle of all which an object is seen by the eye is called the *approximation research* in a object. Apparent character depends on the size of the object and its distance from the object and its distance from the object and its average that meets to the earth is 384,000 solometers. The distinction of the sum as 1,990,000 kilometers and its mean distance to the earth is 1900,000 solometers.

- 65. Calculate the apparent diameter of the moon so seen from the earth. Give your one-wer in both radians and degrees. Round earth to the nearest thousandth.
- **66.** Suppose you have a friend who is 6 feet tall. At want distance must your friend stand so that he or she has the same apparent diameter as the moon?
- **67.** The moon and the sum are, at first sight, about equal in size. How can you explain this apparent similarity in size even though the diameter of the sun is about 400 times greater than the diameter of the moon?
- 68. The distance between the earth and the moon varies as the moon travels its orbit around the earth. Accordingly, the appearant dismeter of the moon must also vary. The sins less distance between the earth and the moon is \$56,340 Litometers, while the greatest distance is 406,530 kills moters. I not the largest and smallest apparent dismeter of the moon. Round your answers to the nearest branchedth.

## 3.5 VELOCITIES

The specifications for the first Terris wheel indicate that one trip around the wheel undicate the first was a rider traveling around the wheel? There are a number of ways to answer this operation. The most intuitive medicate of the rate at which the rider is traveling around the wheel is what we call *literar valuation*. This turns of lines a velocity are triles per hour, feer per second, and so forth.

Another way to specify how fact their derits to veling around the wheel is with what we call angular velocity. Angular velocity is given as the amount of central angle though which the rider travels over a given unbount of time. The central angle swept out by a rider traveling trace around the wheel is 500°, or 7 m ordings. If one mip around the wheel takes 20 minutes, then the onen or velocity of girlder is

$$\frac{2\pi n_0 d}{20 \min} = \frac{\pi}{10} \text{ mg/min}$$

In this section, we will team more about angular velocity and thear velocity and the relationship between them. Let's was with the formal definition for the linear velocity of a point moving on the circulaterance of a zincle.

#### DEFINITION

If P is a point or larger effect of solids  $v_n$  and P moves a distance v on the circumference of the circle in an amount of time v, then the flavor velocity  $v_n$  of P is  $v_n$  with  $v_n$  the formula

$$v = \frac{\gamma}{I}$$

To calculate the linear velocity we simply divide distance traveled by time. It does not matter whether the object moves on a curve or in a straight line.

Find the linear velocity of the point.

**SOLUTION** Substituting s = 5 and z = 2 into the equation y = sa give s = sa

$$y = \frac{6 \text{ cos}}{2 \text{ sos}}$$
$$= 3.5 \text{ cm}/cc$$

Note in all the examples and problems in this section, we are assuming that the point or the circle moves with uniform circular motion. That is, the velocity of the point is constant.

#### DEFINITION

If P is a point moving with uniform a reutar metion on a circle of radius x and the time from the center of the circle through x sweeps out a central angle  $\theta$  in an amount of time t, then the *angular advantage* is time g, to if P is given by the formula

$$m = \frac{\theta}{\ell}$$
 where  $\theta$  is measured in radiums

3 seconds. Give the angular velocity of P.

**SOLUTION** Substituting  $\theta = 3\omega t$  and t = 5 into the equation  $\omega = 5h$  gives us

$$e = \frac{3\pi/4 \text{ rad}}{3 \text{ sec}}$$
$$= \frac{r}{4} \text{ net/sec}$$

**Note:** There are a number of equivalent ways to express the units of velocity. For example, the answer to Example 3 can be expressed in each of the following ways: they are all equivalent.

$$\frac{\pi}{4}$$
 regions per second =  $\frac{\pi}{1}$  rad/sec =  $\frac{\pi \operatorname{rad/anx}}{4 \operatorname{seconds}} = \frac{\pi \operatorname{rad}}{4 \operatorname{seconds}}$ 

Likewise, you can express the drawer to Prompte 1 in any of the following way  $\epsilon$ 

2.5 centimeters per second = 2.5 cm/sec = 
$$\frac{2.5 \text{ cm}}{1 \text{ sec}}$$

EXAMPLES "()" A bicycle wheel with a radius of 13.9 inches usus with an angular velocity of 3 radians per account. Find the distance traceled by a point of the bit we entire is 1 minute.

**SOLUTION** We have  $\omega = 3$  ratherwise records  $r \sim -3.0$  and as 60 seconds. First we find  $\theta$  as ing  $\omega = 80$ 

If 
$$m = \frac{\theta}{4}$$
then  $\theta = e$ ,  $r = CV \operatorname{mid}(\theta e)(60 \operatorname{sec})$ 
 $= 180 \operatorname{sad}$ 

In 5 nd the distincte (movied by the power in 6), sectorals, we use the formula  $\mu=\epsilon 0$  from pertion (3.4, read)  $\epsilon=10.0$  (other and  $\theta=100$ ).

It we want this result expressed in feet, we givide by 17,

$$x = \frac{2.340}{12}$$

$$= 195.3$$

A point on the tire of the bicycle will kneel 195 feet in a minute. If the bicycle were being finden under these confidence, the tides would used 195 feet in a attitude.

Figure 1 shows a line truck paraculate the shandler of a freeway restrict at one, block wall. The red light on the top of the nucleis 10 feet 1 and the wall and rotates throught one chamble revolution every 2 seconds. Find the explanations that give the lengths district from soft since a.

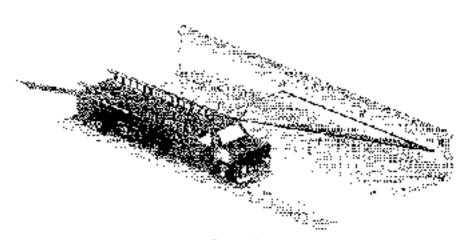

Figure 1

**SOLUTION** The angular velocity of the rotating red fight is

$$p_0 = \frac{H}{\epsilon} + \frac{2\pi \cos \theta}{2\cos \theta} = \pi \cos \theta \cos \theta$$

From right triungle ABC, we have the following relationships:

$$\tan \theta = \frac{d}{80} \qquad \text{and} \qquad \sec \theta = \frac{l}{10}$$

$$d = 10 \tan \theta \qquad l = 10 \sec \theta$$

Now, these equations give as d and l in terms of  $\theta$ . To write d and l in terms of l, we solve  $m = \theta d t$  for  $\theta \in \theta$  obtain h = u e = u t. Substituting this for  $\theta$  in each equation, we have d and d expressed in terms of t.

$$a = 10$$
 (a)  $\sigma t$  and  $I = 0$  (c) see  $\sigma t$ 

#### The Relationship Between the Two Velocities

To find the relationship between the two kinds of valueities we have developed so far, we can take the equation that relates are length and control angle measure,  $s \approx 69$ , and divide both sides by time, L

If 
$$s = m^2$$
  
then  $\frac{s}{s} = \frac{sb}{s}$   
 $\frac{s}{s} = \frac{s}{s^2}$ 

Tancar we usally is the proclact on the radius and the aregular velocity.

#### UNICAR AND AMOUSA'S VILOCITY

If a point is maying with uniform circular motion as a discle of radius  $\kappa$ , then she timear velocity  $\nu$  and angular velocity  $\nu$  of the point are related by the formula

English and announced the control of the second of the control of

As suggested by William McCluse of Orange Coast. Constructly College, a helptal analogy to visualize the relationship between linear and majular velocity as to imagine a group office skaters in had annot at months ice in a shalghi line, with half the chaters towing it one direction and the other half facing in the opposite direction. As the line of skaters intraces in a circular maxima, every skater is moving with the same angular velocity. However, in terms of linear velocity, the skaters near the center of the fine are barely moving of the the skaters may the ends of the linear noting very statistly herease they have to skaters a queck large, chelo to the same another.

Neste: When using this for only to relate the ar velocity to sogn or velocity, keep in and that the against velocity or most be expressed in rathing per and of time.

A phonograph record is turning at 45 revolutions par minute (spin). If the distance from the center of the record to a point on the edge of the record in 3 inches, find the original valority and the finear velocity of the point in fact per 1950-16.

**SOLUTION** The quantity 45 revolutions per minute is another way of expressing the rate at which the point on the record is anothing. We can obtain the angular value ity from it by remembering that one complete revolution is equivalent to 2**v** radius. If erefore,

Because has revolution is equivalent to 2et regions, the fraction

is just another form of the number. We call this kind of fraction a *convention factor*. Notice they the units of revolutions divide out in much the searchway that becomes factors divide our retion we reduce lessons in lowest terms, the convention factor allows us to convent facto nevel to end are not divided and retroited.

To find the timese velocity, we multiply to by the racins.

The connect N48 method per remains to local per associate. We than attention communities after relative latter (a translation) for a formation. There is not worked

$$9490 \text{ in Arran} = \frac{548 \text{ jac}}{1 \text{ mass}} + \frac{1 \text{ fo}}{2 \text{ pm'}} = \frac{8440}{12} \text{ (Mm in  $\sim 700.34 \text{ Mm sr})} = \blacksquare$$$

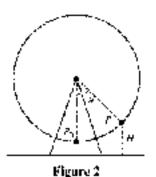

Estate: In hight of our provious singuistion aroundings, you may be wouldoing how we wont more (socialistical) radians (instruction of instruction). If the more per that codians are just sould not them and rechniquely links no muits. We sometimes write there as it may did for any much convenience, but one of the ansantages of radian unessure is that it does not introduce a new most light or a curations.

The Perris wileyl shown in Figure 2 is a model of the case we mentioned in the introduction a this section. If the diameter of the wheel is 250 feet, the distance from the ground to the bottom of the wheel is 14 feet, and one complete revolution takes 20 is immess find.

- The linear velocity, in titles per hom, of a person with groundle wheel.
- la. The i elight of the right in terms of the time it, where it is near a jest in minutes .

#### SOLUTION

a. We found the angular velocity in the introduction to this section. It is

$$\omega = \frac{\pi}{z W} \operatorname{rac} V \min$$

Next, we use the fermula r = re to find the finest velocity. That is, we makingly the angular velocity by the radius to find the linear velocity

$$r = r_0$$
  
=  $f(25)$ (c)  $\left(\frac{\pi}{10} \text{ mid/min}\right)$   
 $\sim 59.27 \text{ March (intermediate answer)}$ 

To convert to solves per bond, we use the faces that there are 60 minutes in 1 hours and 5.780 feet in 1 ratio.

$$\begin{array}{l} 39.27 \; \text{(Dimin)} = \frac{39.27 \, \text{(M}}{\text{pair}} + \frac{600 \, \text{mem}}{1 \; \text{fm}} + \frac{1.96 i}{5.280 \; \text{fg}} \\ = \frac{(3 \times 27)(10) \; \text{m}}{5.280 \; \text{fm}} \\ = 3.45 \; \text{mid/s} \end{array}$$

b. Suppose the person string on the wited in at position P<sub>1</sub> as shown in Figure 2. Ruses) on our work in Example 5 of Section 2.3, the reight, H, of the rider can be found from the central same 6 asing the emerica.

Because the angabat valocity of the wheet is  $\omega=\pi/10$  radians per monote, then assuming  $\theta$  is measured in radians we have

$$\omega = rac{\theta}{\ell}$$
 Definition of sign for volucity  $\theta = m\ell$  . With thy pollusides by  $\ell$   $\theta = rac{\pi}{10} \ \ell$  . Substitute  $a = \pi/10$ 

So

$$H = 139 - 125 \cos\left(\frac{\pi}{10}t\right)$$

This equation gives a site height of the rider strany into a where a subcounce in mention for in the heritaning of the ride. Later, in Seatton 4.5, we will intell tow to obtain this submany returns a single graphics, approach.

In gase a subject of subject we have standard as if the relative subject to the first within an increase and the course we know at a primary on the direction, in tagents that is been in an integer and the course at the excellence of the theorem where an example A territor where the example A territor where the theorem is a trade one of the whole the white and a matter one often where the three three the whole and a matter one often where the three three three which is a consequent with the recommendation of the order. #### MODELING A DOUBLE FERRIS WHEEL

Figure E

Objective: To find a model for the height of a rider on a double Forris wheel.

In 1939, John Countries invented the Engli double ferris wheel called a Sky Wheel, consisting of two smaller wheels spinning at the ends of a votating arm.

For this project, we will receled a double Forms which in this 50-5eet arm that is attinming of a rate of 3 covolutions per minute in a countrielled with disention. The content of the uses in 44 feet above the ground. The diameter of back whock is 62 feet, and the wheels form at a rate of 3 corolations for ia mitalia a elegerrika direction. A diagram of the situation, is shown in Figure 1. Miles the unidipaint of the unit, and  $\mathcal D$  is the cetter of the lower wheel. Assume the lider is in tially as point Picalthe wheet.

Determine the lengths of MO, SM, and MC.

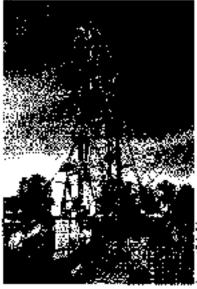

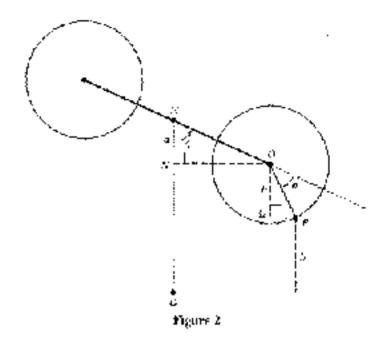

Figure 2 shows the local on of the rider after a short encount of tipps has  $p_{0}$  again. The arm has recated counterclock wise covered up angle 9, while the wheel has propered e netwike fluxuigh an angle & relative to the direction of the edge. Print P shows the current position of the rides and the helghr of the rides is a.

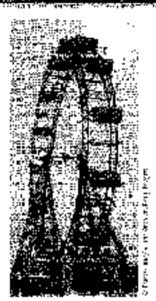

- Find angle QOP in terms of 9 and \$\phi\$.
- Use right biangle trightworks, so this lengths a said of and then the height of the sides h, in terms of 9 and go
- We know that the angular velocity of the arm is 3 revolutions per minute, and he angular velocity of the wheel is 5 revolutions per minute. The last step is to find the vadia i measure of angles  $\theta$  and  $\phi$  .
- 4 Let the the months of minutes that have passed since the ride begand Use the arms (an velocities of the arm and whee) to find  $\theta$  and  $\phi$  is, adjany in terms of t. Replace  $\theta$  and  $\phi$  in your answer from  $3 \exp 3 t$  sobtain the being h as a function of ដំពូខេខា (ភពភាពបានេះ)
- 5. Use this function of the did equiposition
  - as The height of the riper after 30 seconds have passed.

- 👺 🍕 Graph this function with your geathing calculates. Make sere you calculates is set to radian mode. Use the graph to find the following
  - as The maximum begult of the sides.
  - b. The minimum number of minimum required for the index to return to their origiinal position (point P in Pigues 1).

### CHAPTER 3 RESEARCH PROJECT

The Riegernal in Mean.

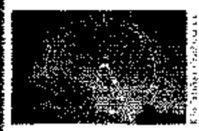

#### THE THIRD MAN

We're entired in Chapter 2 that the Pentis wheel called the Aresennel build in Vienne in 1857, is shill in operation today. A brechold that gives some statistics associated with it of Riesamad imitation that passengers filling it have at 3.5 feet per second. The Coson Well or movie 18 e Third More contains a second in which Ocson Welles the Riese and through one complete resolution. Wated. The Third More to you have the Riese and through one complete resolution. Wated. The Third More to you have the Riese and in operation. Then devise a method's Justin, the movie to estimate the angular velocity of the wheel. Give adaptable anchors of the movement are to arrive at your estimate. Finally, are soon results either to move or to displaye the element at the assenge strayel at 2.3 feet per second on the Riesemad.

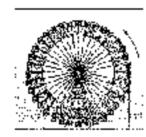

# GRAPHING AND INVERSE FUNCTIONS

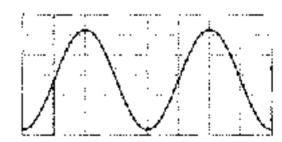

A page of shire music represents a picce of music; the music baself is what you get which the notes on the buge are being of bell ambed on a musical instrument. Kenni Devitor

#### MATERIAL

Trigonometric tractions are periodic tunctions because they in least all their range wallers at regular intervals. The olders on the Francis wheels we have been studying repeat their cositions around the wheel periodically as well. That is why bugonometric functions are good models for the motion of a riber on a librar wheel. When we are a rectangular coordinate system to plot the distance between the ground and a riber during a cide, we find that the shape of the graph matches results the shape of the graph of one of the trigonometric fine loss.

Outserve have a collected the motion of the rider with a trigonometric bracking we have a new sector histoernation; soo, a with which to investigate the median of the dider on the wheel.

#### STUDY SKILLS FOR CHAPTER 4

The study sky is for this disspect are seven attitude. They are points of view that joint reward success.

Be Focused, Not Distracted. We have stated a who begin their assignments by asking thems, lives, "Why are I taking the classiff if you are asking yourself size for questions, you are distracting yourself from doing the things that will produce the soulds you want in this course. Don't dwell on questions and ever on their a their assistances, and ever on their a their course, locus your energy see allocks inward success, taken than materiality yourself. If you went than materiality yourself. In my your goals.

sin Zan

sis. 📴 🗤 1

In Newtion 3.3 we introduced the circular functions, which define the six frigonometric durations as functions of real numbers, and investigated their domains. Now we will statch the graphs of these functions and determine their ranges.

### The Sine Graph

To graph the forction  $y = \sin x$ , we begin by making a able of values of a one y that satisfy the equation (Table 1), and then use the information in the table to shock the graph. To notice it easy or ourselves, we will let a take on values that are multiples of nR. As an aid in sketching the graphs, we will apprecimate  $RN\sqrt{2}$  with 0.7.

Granking each colleged pair and their connecting their with a smooth curve, we obtain the graph in Figure 1.

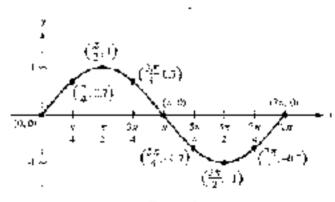

Figure 1

### Graphing y = sin x Using the Unit Circle

We can also obtain the graph of the since it median by using the unit circle deficition (Derinhiden III). Figure 2 shows a diagram of the unit circle we introduced earlier is Section 3.3. If the point (x,y) > t in its from (1,0) along the circumstenesses of the unit circle, there since x > t Therefore, if we start at the point (1,0) and that see second the unit circle (a distance of 2x units), we can find the value of x at the equation  $y > \sin z$  by simply the play mather the y-condinates of the points that are z units from (1,0).

recent. In Figure 2 we do using a differently founders are in Figure 1. There we in Figure 2 we do a. As represent the coordinate of a popular than order or, see let a be §se input where. The regularization is fire and the variable at in Figure 1 represents the same greathty as the variable and Figure 2.

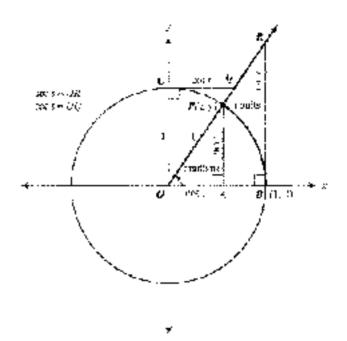

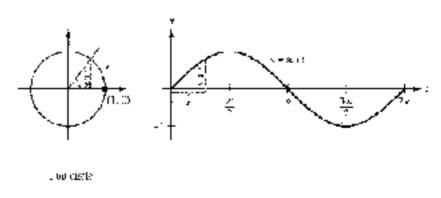

Figure 2

As t increases from 5 to m2, meaning P travels from (1, 0) in (0, 1) |v-s| in a capas. From 0 to t. As t continues in QII from m2 to m, a decreases from 1 back to 0.0 In QIII the length of argument AP increases from 0 to 1, but because it is located below the availst the y-condinate is negative. Since m increases from m > 3m2, a decreases from 0 to m > 3m2, a factorise from 0 to 0 to 0. Finally, as timperses from 0 to obtain a QIV, bringing P back on (1, 0), y increases from -1 back to 0. Figure 3 to estrates that the y-condinate of P for AP is used to expectate the graph of the x-reconstitutes as t-reconstant.

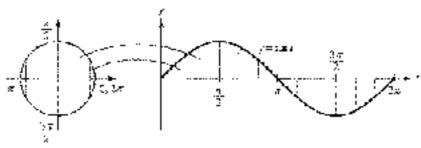

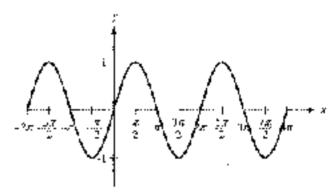

Figure 3

### Extending the Sine Graph

Figure 1 and 3 so, it show one complete cycle of  $y=\sin x$ . (In Figure , owe naveraged x is place of x, but you can see that the graph of  $y=\sin x$  the condition of the graph of  $y=\sin x$  to the alghi of  $x=2\pi$  by realizing that, once we go post  $x=2\pi$ , we will begin to name angles that are constructed, with steples between 0 and 3  $\pi$ . (Increase of this, we will start to sepect the values of  $\sin x$ . Likewise, if we let x take or values to the self of x=0, we will simply got the values of  $\sin x$ . Detween 0 and 2  $\pi$  in the town so ender. Figure 4 shows the graph of  $y=\sin x$  contains. Deposed the interval from x=0 and  $x=2\pi$ .

Biguer 4

The graph of  $y=\sin x$  gover goes above 1 or below - 1, repeats itself every  $2\pi$  upits on the x-axis, and crosses the x-axis a rank tiples of  $\pi$ . This gives rise to the fortowing three equivalents

#### DESINITION POSTOD

For any function y = f(x), the smallest positive number g for which

$$f(x \pm p) = f(x)$$
 for all x

is called the period of  $\hbar x_1$ .

Appendix Company of the Company of t

To the case  $x(y + \sin x)$  the period is 2x denotes  $x \approx 2x$  as the smallest positive number for which  $\sin x$   $(x + y) = \sin x$  for all x.

#### DEFINITION AMPLETUDE

If the greatest value of y is M and the less value of y is an identific amplitude of the graph of y is define, to be

$$A = \frac{1}{2}[M - m]$$

In the case of you stop, the amplitude is a hecause

$$\frac{1}{2} \left[ 1 + (-1) \right] + \frac{1}{2} (2) = 1$$

#### DEFINITION ZERO

A given of a function y = p(x) is any demosite value x = x for which f(x) = 0. If x is a  $x \neq x$  analog, then  $x \mapsto x$  will be an arisine resp. of the graph of  $x \mapsto f(x)$ .

in your discrimination of expressions of the contract and analysis of the contract and treatment which is a contract and a series of the contract and the contr

From the graph of  $y = \sin x$ , we see that the size function has an intivity notable of zeros, which are the values x = kx for any integer, it. These values w(t) be very  $x \in \operatorname{Soliton}$  but in Otherson 6 when we begin solving equations that involve algorometric borderons

So Section 3.5 has saw that the countin for the size function is all real morehest. Incases point P in Fig. 16.3 roust to on the unit did in, we have

$$-1 \le y \le 1$$
 which implies  $-1 \le \sin x \le 1$ 

This unions the sine function has a range of [-1, 1]. The sine of any angle can only be a value between -1 and 1 inclusive

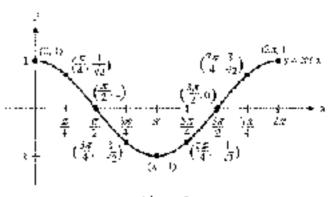

### The Cosine Graph

The graph  $\mu^* \gamma = \cos \alpha$  has the same general shape as the graph of  $\gamma = \sin \alpha$ .

### Skeadette ampli of the covar.

SIDELITIEN: We can arrive at the graph by making a table of convenient values of mostly (Table 2). Plotting points, we obtain the graph shown in Engine 5.

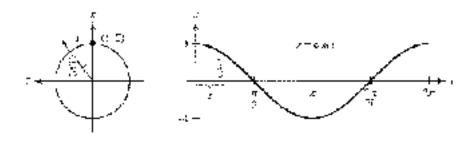

Digwe 5

We can generate the groups of the covern hardens using the  $\epsilon$  of circle just to we did from a size function. By Dichretion III, if the parall (n,y) is  $\epsilon$  under them (1,0) along the committees on of the materials, then  $\cos \epsilon = \epsilon$ . We sent at the point (1,0) and travely a constrained the unit circle, keeping roots of the recoordinates of the points that are  $\epsilon$  units from (1,0). To help visualize how the  $\epsilon$ -coordinates generate the

desine graph, we have related the anti-circle  $e^{i\phi^{*}\phi}$  on the electivise so that we may expressed the seas relative so vertical have separately (Figure 6).

Districtly a (normal)

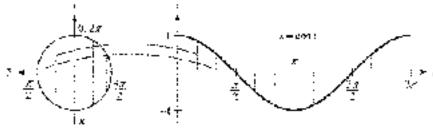

Figure 6

Foreigning this graph, is the regist of Parlam, to the Lett of A, we return the graph shown in Lagrane A. As this figure indicates, the period lamphends, and range of the cosmo function are the same as the the size hindren. The zeros on v-knowledge, or  $y = \cos x$  are the values  $x = \frac{\pi}{2} + E_X$  for any integer k.

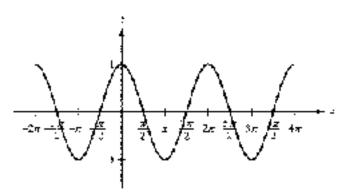

Figure 7

Chairculation Notes 'to graph one cycle of the sine or cosine function using your graphing executator in radian sacrds, define  $Y_1 = \sin(x)$  or  $Y_1 = \cos(x)$  and set your window variables so that

$$0 \le x \le 2\pi$$
, scale =  $\pi i 2$ ;  $-1.5 \le y \le 1.5$ 

To graph either function in degree mode, set your window voriables to

$$0 \le x \le 360, x ca'e = 90; -3.5 \le y \le 1.5$$

Figure 8 shows the graph of  $v = \cos x$  in degree mode with the trace feature builty used to observe ordered pairs along the graph.

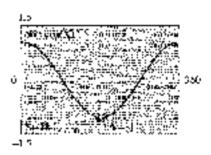

Figure #

### The Tangent Graph

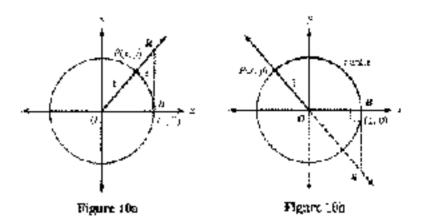

while a halfs some solutions to the equations  $y \cong \tan x$  between  $x \sim 0$  and  $x \sim \pi$ . From Newtonian 5.3 we know that the temperat function we the undefined at  $x \approx \pi/2$  because of that discount by each x by the 9 aboves the graph based on the information from table 3.

Because  $y = \tan x$  is undefined as  $x = \pi/2$ , there is no point on the graph with an x-coordinate of  $\pi/2$ . To help us respond to this, we have do we a decide vertical into through  $x \leftarrow \pi/2$ . This vertical time is ordered as *experimes*. The graph will never cross or such this line. If we were to calculate values of tank when x is very close to  $\pi/2$  (or very close to  $90^\circ$  in degree mode), we would find that tank y would become very large for values of x just to the left of the asymptote and very large to the negative direction for values of x just to the right of the asymptote, as shown by Table 4.

In series of the unit electe (Definision III), visualize segment BR in Figure 10, as tinensizes from 0 to  $\pi/2$ . When t=0, OP is borizon allered so BR=0. As tinenesses, BR grows in length, getting very large 0.5 tineness  $\pi/2$ . At  $t=\pi/2$ , OP is vertical and BR is no larger defined. The exact reverse impgens as tinensizes from  $\pi/2$  to  $\pi$  except that rose torulis negative because BR will be found below the  $\pi$ -axis (Figure 16b). As the ordinary through QIII, the values of tan t will be a repeat of the values we saw in QII. The same can be so die? QIV and QII.

We can also visite for land as the slope of OP. At P = 0, OP is bornoontal and the Slope size of the P revolts atom. The undermole forming bigg, you can see how OP gots very strop when the extension P. At  $\theta = m^2$ , OP is vertical and the slope is raif defined. As P travels ignorable QH the slopes pos. It negative, reaching a zero-slope once again pos or P in QHI and QPV, the slopes of OP will simply expect the values show OP and OP.

Extending the graph in Figure 9 to the log till of x and to the lest of 0, we obtain the graph shows in Figure 11. As this right in intotes, the period of  $y = \tan x$  is x. The targetal board on has no amplitude because there is no largest or smallest value of y cannot graph of  $y = \tan x$ . For this same wasto, the range of the targetal transition is at own minors x. Because tends  $y = \sin x/\cos x$ , the zeros for the targetal function are the same as fee the same, that is,  $x = \lambda x$  for any integer  $\lambda$ . The vertical asymptotes correspond to the zeros of the lossing function, which are  $x = \pi/2 + \cos x$  for any integer  $\lambda$ .

**Note:** Some instructions prefer to define the hadic cycle for the tangent function to be  $\ell + \pi/2$ , as shown in Figure 18. This allows the graph of a cycle to be drawn as a single, unbroken curve.

We have chosen to define the busin cycle over the interval [0, \$\phi\$], which will ensew us to graph \$\pi\$ in regenerable functions using a consistent approach.

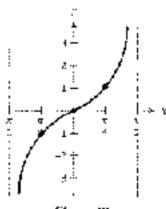

Figure 18

#### Even and Odd Functions

Recall from algebra the default cas no even and odd bucchins.

#### DESIGNATION

An exert fanction is a function for which

$$f(-\mathbf{r}) = f(\mathbf{r})$$
 for all  $\mathbf{r}$  in the domain of  $f$ 

the level of the control and the control and the control and the control of the control and th

The graph of an even hindren is symmetric about the years.

An even functions a function for which replacing x with -x feaves the expression that defines the direction acceptage. It is function as even then every since the prior (x,y) is on the graph, so is the point (-x,y). But the tendent  $x(y) = x^2 - x^2$  is an

$$f(-x) = (-x)^2 - x$$
$$= x^2 + 3$$
$$= f(x)$$

#### BEFINDINGS.

rives forcered scenes.

An odd familier is a function for which

$$f(-x) = -f(x)$$
 for all  $x$  in the domain of  $f$ .

The graph of an odd function is symmetric about the origin.

An aidd function is a function for which replacing a with - inchanges the sign of the expression that defines the time for - it a function is end, then every time take point (x,y) is on the graph, so is the point (-x,-y). The function  $f(x) = x^2 - x$  is an and function because

$$f(-x) = (-x)^2 + (-x)$$
$$= -x^2 + x$$
$$= -(x^2 + x)$$
$$= -y(x)$$

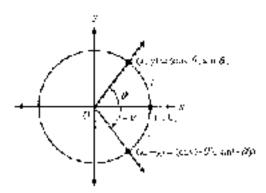

From the modernto it is apparent that sine is an old function and cosine is an even function. To begin to see that this is true, we locate  $\pi/6$  and  $-\pi/6$  ( $-\pi/6$  in observation) with  $44\pi/6$ ) on the unit times and notice that

$$\cos\left(-\frac{\pi}{6}\right) = \frac{\sqrt{3}}{2} = \cos\frac{\pi}{6}$$

स्त्राप्त

$$\sin\left(-\frac{\pi}{6}\right) = -\frac{1}{2} - -\sin\left(\frac{\pi}{6}\right)$$

We can pertendize this result by directing its angle  $\theta$  and its opposite  $-\theta$  in standard continuous the relabeling the points where their paratial sides intersect  $\theta$  consists with (x,y) and (x,-y), espectively. (Clarryce see from Figure  $-\theta$  why we label these new points in this way? That is, over a probe super that if (x,y) is only to sense, by on the equips.

Mgare 19

Fig. by  $\theta$  with curvale,  $\cos \theta = r$  and  $\sin \theta = g$ , so we have

$$\cos((\cdot\cdot\theta) = x = \cos\theta$$

indicating that corine is an even function and

$$\sin \left( -d \right) = -\epsilon - -\sin \theta$$

indicating that sine is an odd function.

New that we have established that side is an odd fraction and desire is an exerfunction, we can use minimum a and reciperate identities to find which of the other fragmometric binatures are even and which site with Federals Antonia fractions is there for the respond function.

## ESCAMPLE 3 200 Show that cosecutive an old function.

### Reflecting About the x-Axis

In the previous examples we only considered changes to the graph if the caefficient A was a positive number. To see how a negative value of  $\alpha$  affects the graph, we will consider the function  $\gamma=-2$  are x

**SOLUTION** Each value of y on the graph of  $y = -2\cos x$  will be the opposite of the ecoesponding value of y on the graph of  $y = 2\cos x$ . The result is that the graph of  $y = -2\cos x$  is the reflection of the graph of  $y = 2\cos x$  shout the exist. Figure 5 shows the extension of our enoughete cycle of  $y = -2\cos x$  to the interest  $-2\pi \le x \le 4\pi$ .

#### SUMMARY

The gradie of  $y = A\sin x$  and  $y = A\cos x$  will be reflected about the x-axis if A < 0. The amplitude will be |A|

m magaziara alabanya alah alah alah alah dari erengan yang bilan alah dari marang menggipi digipadan erene ere

#### Period

Up to this point we have considered the effect that a coemposit, which multiplies the trigonometric function, has on the graph. Now we will investigate what happens if we allow the upon translate to have a chefficient. Remember that he logist is formally called the argument of the function.

**SOLUTION** To see how the coefficient 2 in  $y = \sin 2x$  affects the graph, we can make a table in which the values of x are multiples of  $\pi/4$ . (Multiples of  $\pi/4$  are convenient because the coefficient 2 divides the 4 in  $\pi/4$  exactly.) Table 2 shows the values of a said y, while Figure 4 contains the graphs of  $y = \sin x$  and  $y = \sin 2x$ .

**NOTE** Remember that sin 2a maliy means sin (2a). The product 2a is the argument to the sine four ion.

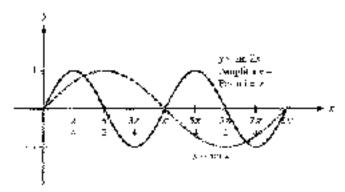

Figure 4

The graph of  $y = \sin 2x$  has a period of  $\pi$ . Figures through two complete cycles in  $2\pi$  units on the x-axis. Notice that doubling the argument  $\pi$  the function has the reverse effect of halving the period. This may be suspicing at first, but we can see the reason for  $\pi$  by looking at a basic cycle. We know that the sine function x impletes one cycle when the input value, or argument, varies between 0 and  $2\pi$ .

One explicit 
$$0 \le \text{automent} \le 2\pi$$

$$6 \le 2i \le 2n$$

The againment is 2:

Divide by 2 to isolate a

Because of the factor of L. the variable a only needs to reach to to complice one cycle.

thus shortening the period.

**SCILUTION** We begin by investigating the gilber that the coefficient of 3 in the agencies of the sine function will have only a cycle.

$$|t\rangle \leq argument \leq 2a$$

$$0 \le 3x \le 2x$$

The argument is 5x

$$0 \approx p \approx \frac{2m}{3}$$

Divide by 3 to isotore a

The period of the sine function will be one-said as long, its aid it akending the maps, we divide the length of the period, which is 2 of 2.000 kines 4 intervals of equal width.

$$\frac{2\pi 6}{4} = \frac{1}{4} \cdot \frac{2\pi}{3} = \frac{5}{6}$$

Starting with the beginning of the eyele at x=0, we must off the x-exist every  $\pi/6$  cm.s. The coordinates of these points will be

$$6. \quad 1 \cdot \frac{\pi}{6} = \frac{\pi}{6}, \quad 2 \cdot \frac{\pi}{6} = \frac{\pi}{3}, \quad 3 \cdot \frac{\pi}{6} = \frac{\pi}{2}, \quad 4 \cdot \frac{\pi}{6} = \frac{2\pi}{3}$$

Because we alrest vikings the cycle buries at 0 and rade at  $2\pi/3$ , we restly only used a compute the middle direct values.

Narroving that for the basic sine graph, a cycle begins and only on the z exist and crusses the x-axis halfway through, we exact the graph of  $p = \sin 3\pi$  as shown in Figure 3. The graph of  $p = \sin x$  is also shown for companions. Notice that  $p = \sin 3\pi$  completes these cycles in  $2\pi$  units.

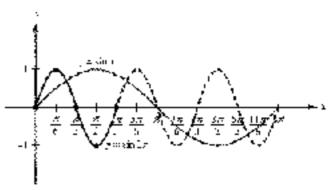

Figure 5

Take the transfer of the transfer of the second section of the se

SQUITSON. As before, we round by determining the correct road the coefficient of an one-largement of the costor back to wait base, an one cycle.

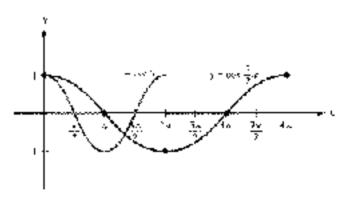

One cycle:  $0 \le \operatorname{arguniant} \le 2\pi$ 

$$0 \le \frac{1}{2} \pi \le 2\pi$$
 The argument is  $\frac{1}{2} \pi$ 

$$0 \le r \le 4\pi$$
 Mulfiply by ? to isolate a

The period of the cosine function will be  $4\pi$  ed as long. To aid in sketching the graph, we divide the tength of the period,  $4\pi$ , into 4 intervals of equal width.

Starting at x=0, we mark off the x-exis every  $\pi$  units. The coordinates of these points will be  $0, r, 2\pi$ ,  $3\pi$ , and  $4\pi$ . Figure 6 shows the graph, along with the graph of  $y=\cos x$  for conqualisms. Notice that  $y=\cos \frac{1}{2}x$  contributes over all by the in  $2\pi$  units.

Figu. + 4

In general, for  $v = \sin Bv$  or  $y = \cos Bv$  to complete one cycle, the product its mass, vary from 0 to  $2\pi$ . Therefore

$$0 \le Bx \le 2\pi \qquad x' = 0 \le x \le \frac{2\pi}{\mu}.$$

The period will be  $2\pi k \theta$ , and the graph will complete B cycles in  $2\pi$  units. We seem marks all of the information gathered from the provious examples as follows:

#### AMPLITUDE AND PERIOD FOR SINE AND COSINS

 and Period =  $\frac{2\pi}{R}$ 

Роск мары — и и и положение именьки од наменение и не живали и удину интерперици и сели и и и и и учила еко фе

NOTE: We are no just "lauvice" the regarder out of the argument. The progress is conference of rock! I are tight to stop up to be a value the finance of the body when a population is into hood. From a some in section, we instead just they we have about the area of the transment. That is, we also not the same in a section.

In the situation where  $0 \le 0$ , we can use the properties of even and odd functions to rewrite the function so that H is positive. For example

$$y = f \times \alpha (-2x)$$
 — as eight valent to  $y = -4 \sin (fx)$  because size is an orld fraction.

In the next two examples, we use this information also a singularity and packed to graph one complete cycle of a sine and cosine curve and then extract these graphs to cave, more than the one cycle. We also sake this opportunity to introduce a smalled of drawing the graph by constructing a "frame" for the basic cycle.

$$\frac{15\pi}{5} = \frac{15\pi}{2} \approx 4 \cos\left(-\frac{2}{5}s\right) \ln s = \frac{15\pi}{2} \approx 1 \approx \frac{15\pi}{4} \ .$$

SOLUTION - Because councils as event himdren,

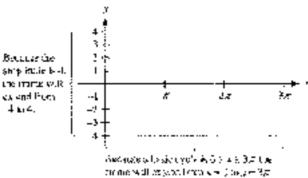

$$y = \left[4\cos\left(-\frac{2}{3}z\right) + 4\cos\left(\frac{2}{3}z\right)\right]$$

Charleman Prome

The amplitude is A as  $-A \approx y \approx A$ . We use the neuplature to determine the position of the upper and lower sides of a frame that will not as a boundary for a basic sycle. Next we identify one complete excla

Orweych: 
$$0 \le \frac{2}{3} x^{-\alpha} 2\pi$$
 
$$0 \le \pi \le 3\pi \qquad \text{Mal.phy by } \frac{5}{2} \text{ to isolate } x$$

The endpoints of the cycle give us the position of the left and right sides of the frame. Figure 7 shows now should done.

Pigue 7

**PROOF** We say I haloy find the period by a which g to by  $a = \frac{1}{2}$ 

$$\frac{2\pi}{g}=\frac{2\pi}{3}=3\alpha$$

This after stage of over going of each less continuous appropriation the most section.

#### Subdivide the Prame

The period is  $3\pi$ . Dividing by 4 gives us  $3\pi/4$ , so we will mark the x axis in increments of  $3\pi/4$ . We already know where the cycle begins and ends, so we compute the three middle values:

$$1 \cdot \frac{3\pi}{4} = \frac{3\pi}{4}$$
,  $2 \cdot \frac{2\pi}{1} = \frac{3\pi}{2}$ ,  $3 \cdot \frac{2\pi}{4} = \frac{9\pi}{4}$ 

Weld, side our frame in Figure 5 into four equal sections, making the axis accordingly. Figure 3 shows the result.

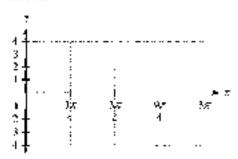

Figure 8

#### Graph One Cycle

Now we use the frame to plot the key points that will define the shape of one complete cycle of the graph, and then grow the graph itself (Figure  $\theta_1$ ).

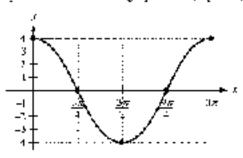

Figure 9

#### Extend the Graph, if Necessary

The copyrial problem asked for the graph on the interval  $-\frac{15\pi}{2} \le c \le \frac{15\pi}{2}$ . We calculate graph in the might by adding its that quartered a screenly graph of the help, we adding another complete cycle (which is keet the graph  $\alpha = 2\pi t$ ) and then add the last  $\eta$  and  $\tau$  of the last  $\eta$  and  $\tau$  of the last cycle forms the  $-2\pi t$ . The final graph is shown in Figure (i)

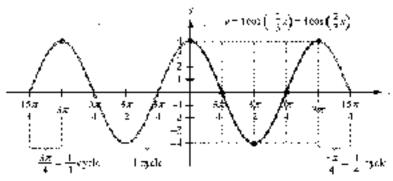

Figure 10

SOLUTION Because care is no ed: Arcetion;

$$y = 2 \operatorname{sign}(-\pi c) = -2 \operatorname{sign}(\pi c)$$

The amplitude is -2 = 2. The range will be  $-2 \le p \le 2$ . Next we showlift one complete eyels.

One cycle: 
$$0 \le \pi r \le 2\pi$$

Divide by a to explate a

The period is 2. Dividing this by 6, we will mark the x-rais every  $\frac{1}{2}$  unit. Giving 11 shows the harmone we have constructed for one by the and the key points. Her such of the negative argu, we must remember that the y-approximate be neithered about the x-axis.

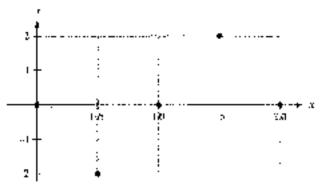

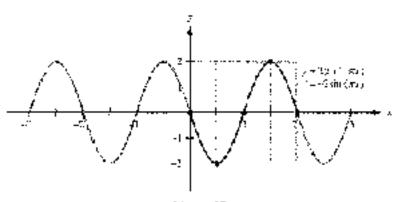

Figure 11

The final graph is shown in Figure 12. We extend the graph to the right by adding the first balk of a second (reflected) by  $\omega$ . On the left, we add another consolide by  $\omega$  (which takes the graph to -2), and then add the East half of an additional cycle to reschibe 5.

# SECTION 4.3 VERTICAL TRANSLATION AND PHASE SHIFT

In the previous section, we considered what hoppons to the graph when we allow for a coefficient (a real righer) with a since or cosmo burchen. We will conclude our study of the graphs of these two mechans by more righting the effect coincid by more ring a term (that is, adding on subtracting a murber) in the equation of the function. As we are used, the addition of a term organs a translation, in which the position, but not share, of the graph is changed.

#### Vertical Translations

Recall from algebra the relationship herwean the graphs of  $y = x^2$  and  $y = x^4 + 3$ . Figures 1 and 2 show the graphs, [The graph of  $y = x^4 + 3$  bas the same chaps at the graph of  $y = x^4$  but it would not write the graph of  $y = x^4$  but it would be moved up two a tits. In general, the graph of  $y = x^2$ , but it would be moved up two a tits. In general, the graph of y = y(x) + x is the graph of y = y(x) is an element of y = y(x) and the model up two a tits. In general, the graph of y = y(x) + x is the graph of y = y(x) is an element of properties an algorithm of the manufactor is a preparative number, the manufactor is down.

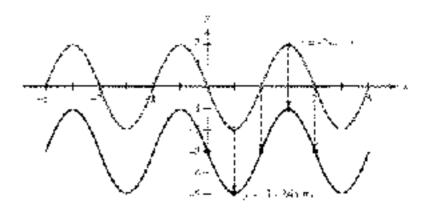

Skeich die graph of v = +3 + 3 sin and

SOLUTION By comiting the function slight y

$$y = -3 = 2 \sin n\omega = -2 \sin n\omega = 3$$

we see that y = 3 - 2 singlet will have a graph that is blant as 1.0 that of y = -2 singlet, such as 1 points on the graph will be suited downward three units. Using the result of Example 8 in the previous sections we show then y point 3 units downward to obtain the graph shows in Figure 3.

Notice how the vertical translation has changed the range as well. By submarting 3 units the original range [-2,2] becomes [-5,+1].

Figure 3

In our next example we allow how to graph a trigorometric function involving a vertical first station directly. Necessar, the size and essine functions are contest distant the x-axis, we can shift the taxis first and then skelph the graph as a shall.

The Local Section 1997, was former short the photost or the continue to the photost of the continue to the photost of the continue to the cont

$$A = 139 - 25 \cos\left(\frac{\pi}{10}t\right)$$

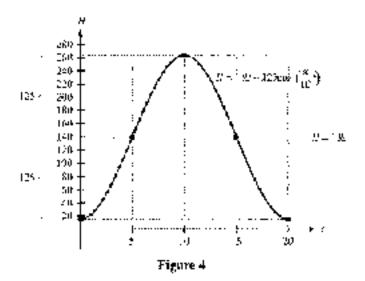

when the the minimum minutes in the heighning of a ride. Coupling complete cycle of this function.

**SOLUTION**. The term 1 is incheases that the enemic graph is travelabed FW units agreed. We lightly draw the district beginning to a : 1% to set in place of the eases, and then provided as normal.

The amplified is 11%, and there is a mill action about the reason due to the registry of the

One cycle: 
$$0.9 \pm \frac{\pi}{100} \approx 2\pi$$
  
 $0.66 \approx 20$  Multiply by  $\frac{10}{\pi}$ 

The person is 20. Dividing 20 by 4, who will mark the mass satisficated soft 5. Using a rectangle to frame the cycle, we then swetch in the graph as shown in Figure 4. Notice that we recessive 125 units above and below the line  $H\simeq 156$  to creare the traine and that we must remembe to plot points for a cycle that is reflected.

#### SUMMARY

The peoples of  $y + k + \sin x$  and  $y + k + \cos x$  will be translated vectorally k only operate if  $k \ge 0$ , so k much downward if  $k \le 0$ .

#### Phase Shift

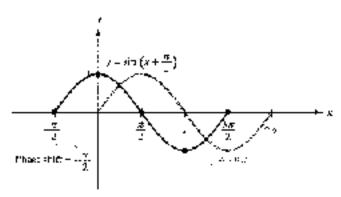

If we add a term to the argument of the function, the graph will be translated in a horizontal direction instead of a vertical direction as nonconstrated to the near grample.

**EXAMPLE 3.** Graphy = 
$$\sin\left(x + \frac{\pi}{2}\right)$$
 if  $\frac{\pi}{3} \le x \le \frac{3\pi}{2}$ .

**SOLUTION** Because we have not graphed a requation of this turn before, it is a good idea to begin by making a table (1964-1). In this case, multiples of  $\pi/2$  will be the max, convenient replacements to  $\pi$  in the table. Also, if on start with  $\pi \to -\pi/2$ , our first value of variable 0.

State Carried Colors (States			
:	т	$y + \sin\left(z + \frac{w}{3}\right)$	$(e_i a)$
:	-7-2	$y + \sin\left(-\frac{\pi}{2} + \frac{\pi}{2}\right) = \sin\theta + \delta$	$\left(-\frac{N}{2},0\right)$
	:	$y = \sin\left(11 - \frac{\pi}{3}\right) = \sin\left(\frac{\pi}{3}\right) = 1$	(0, 1)
;	<u>π</u>	$p = \sin\left(\frac{\pi}{2} + \frac{\pi}{2}\right) = \sin(\pi - 0)$	$\left(\frac{\pi}{2},0\right]$
?	æ	$y = \sin\left(\pi + \frac{\pi}{2}\right) = \sin\left(\frac{3\pi}{2}\right) = -1$	( <b>a</b> ₅ −1)
:	3 <del>.7</del> 2	$y = \sin\left(\frac{3\pi}{2} + \frac{\pi}{2}\right) = \sin(\pi - 1)$	$\left( \frac{3\pi}{2}, c \right)$

Graphing these points and over drawing the size onever first connects them gives us the graph of  $y = \sin x + \pi/2$ ), as shown in Figure 5. Figure 5 also includes the graph of  $y = \sin x$  for reference; we are trying to discover how the graphs of  $y = \sin x + \pi/2$  and  $y = \sin x$  differ.

Hgury 5

It seems that the graph of  $y=\sin(x+\pi/2)$  is the leaf  $\pi/2$  or its to the leaf of the graph of  $y=\sin x$ . We say the graph of  $y=\sin(x+\pi/2)$  has a phase whith of  $x=\pi/2$ , where the negative sign indicates the shift is to the left times regative direction).

We can see why the graph was shifted to the left by locking at how the extra term officers a pasic cycle of the sine function. We know that the sine function countletes one cycle when the input we may or argument, varies between 0 and  $1\pi$ .

One type 
$$m=0 \le \log n$$
 ment  $\le 2\pi$  
$$0 \le x = \frac{\pi}{2} \le 2\pi \qquad \text{The argument is } x + \frac{\pi}{2}$$
 
$$\frac{\pi}{2} \le x \le \frac{3\pi}{2} \qquad \text{Stimmer } \frac{\pi}{2} \text{ to isotate } x$$

Notice that a cycle with now begin at  $e = -\pi v 2$  instead of at zero, and with end at  $3\pi/2$  instead of  $2\pi$ , which agrees with the graph in legate 5. The graph has simply shifted  $\pi f$ . Broke to the left. The place which is the value of f at which the hase cycle heights, which will always be the left value in the above inequality refer a new breezest detect.

**Example 6.** Supplementary of 
$$y = \cos\left(x - \frac{7}{6}\right)$$

**SOLUTION** There are no additional coefficients present so the amplitude is 1 and the period is  $2\pi$ . The regarding the argument will conse a horizontal translation. We consider a basic cycle:

Che cycle: 
$$0 \le x + \frac{\pi}{6} \le 2\pi$$
 
$$\frac{\pi}{6} \le x \le \frac{14\pi}{6} \qquad \text{Add } \frac{\pi}{6} \text{ to symbic } x$$

A cycle will begin at  $x = nP_0$  and end at  $x = 10\pi/6$ . Notice that the period has not changed, because

$$\frac{13a}{6}$$
  $\frac{a}{6} = \frac{12a}{6} = 2\pi$ 

. Wording  $2\pi$  by 4, we get  $\pi/2$ . To make the tracks, we begin at  $r = \pi/6$  and add increaseds of  $\pi/2$  as follows:

$$\frac{\pi}{6} - \frac{\pi}{7} = \frac{4\pi}{6} = \frac{2\pi}{3}$$

$$\frac{\pi}{6} - 2 \cdot \frac{\pi}{6} - \frac{\pi}{6} - \pi - \frac{7\pi}{6}$$

$$\frac{\pi}{6} + 3 \cdot \frac{\pi}{2} = \frac{10\pi}{6} = \frac{4\pi}{3}$$

We cray a firm the and then sitted the graph of one complete cycle as shown in digute 6. You may find it equies to draw the graph if you let each equate on your graph pages represent 17/6 units. (In the horizontal direction). Then each rick mark on the class of Figure 6 corresponds to one square on your paper.

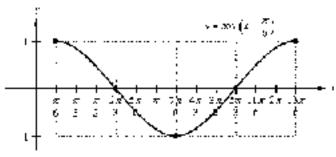

Figure 6

#### SUMMARY

The graphs of  $p \sim \sin (a + F)$  and  $q = \cos (a + B)$  will be translated invitable tally h units to the right if F > 0 or h units to the left if h < 0. The value of  $\mu$  is called the Paras chilk

and the company were the company of the company of

Next we look at an example that involves a some parties of a period charge and a place shult.

**SOLUTION**. The aniphicode is 4. The reasons vertical measter on house to must be: I as been added to or selected from the cosine function. We determine the period and phase of it from a basic cycle.

One cycle 
$$0 \le 2x + \frac{3m}{2} \le 2\pi$$
  
 $\frac{3m}{2} \le 2x \le \frac{7m}{2}$  Add  $\frac{3m}{2}$  first
$$\frac{3m}{2} \le x \le \frac{7n}{2}$$
 Divide by 2

A cycle will begin at  $n=3\pi M$ , so the phase shift is  $3\pi M$ . To find the period, we can subtract the left and right endpoints of it elevate

Period = 
$$\frac{7\pi}{4}$$
 =  $\frac{3\pi}{4}$  =  $\frac{4\pi}{4}$  +  $\pi$ 

on equivalently, divide  $2\mathbf{w}$  by B=2

Forted = 
$$\frac{2\pi}{B}$$
: =  $\frac{2\pi}{3}$  =  $\pi$ 

Dividing the period by 6 gives us  $\pi/4$ . To mark the x axis, we begin at  $x = 2\pi/3$  and add increments of  $\pi/4$  as follows:

$$\frac{3\pi}{4} - \frac{\pi}{4} - \frac{6\pi}{4} = \sigma \qquad \frac{3\pi}{4} - 2 \cdot \frac{\pi}{4} \approx \frac{3\pi}{4}$$
$$\frac{3\pi}{4} \div 3 \cdot \frac{\pi}{4} \approx \frac{6\pi}{4} - \frac{3\pi}{2}$$

We draw a frame and then sketch the graph of one complete cycle lpha shown in Figure  $\lambda$  .

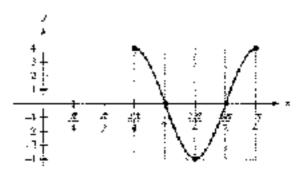

Figure 7

Because the siginal problem asked it is the graph on the interval 0 to a to 2 to, we extend the prophily the right by adding the first quarter of a second cycle. On the left, we add the last three closures of an additional cycle to reach 0. The first graph is shown in Figure 8.

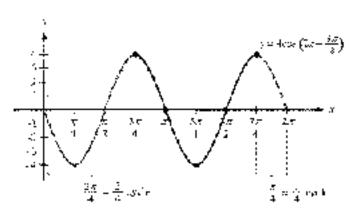

Figure 8

In general, then  $y = \sin \theta h$  is C(t) for  $y = \cos \theta h$ , C(t) to notable t we again, the quantity  $\theta h = C$  thus many from 0 to  $1\pi$ . Therefore, a standing D>0.

$$0 \leq R_{0} \leq C \leq 2\pi \qquad |\theta| = -\frac{C}{R} \leq r \leq \frac{2\pi + C}{R}$$

The phase shift will be the left end point of the cycle, or -C/B. If you find the difference between the end points, you will see that the period is  $20^{\circ}B$  as before

#### PERIOD AND PHASE SHIFT FOR SINE AND COSINE

If C is any real number, and  $B \ge 0$  then the graphs of  $y = \sin(Bx - C)$  and  $y = \cos(Bx + C)$  with have

Period 
$$\sim \frac{2\pi}{3}$$
 and Prase soft  $-\frac{C}{B}$ 

Another motived of determining the normal and phase shift is so receive the home than the aggreent linear like  $B_i^*v = b$ ) instead of combined as  $B_i^*v \in C$ . Let instead as a surjection from Haussphoft we have

$$y = 4\cos\left(2x - \frac{4\pi}{2}\right) + 4\cos\left(2\left(x - \frac{4\pi}{4}\right)^{3}\right)$$

which is accomplished by foresting n n the coefficient of 2. We can now easily in entity that B = 2 and  $b = 3 m^4$ 

Before working a that example that ties everything together, we summarize all of the internation we have no vested about the graphs of the sine and cosine functions.

#### GAAPHING YAS SIME AND COSING PUNCTIONS

The graphs of y = k + A sin  $(B(x + h_i))$  and y = k + A cas (B(x + h)), where B > 0, will have the following characteristics:

Amplitude = 
$$[A]$$
 Period =  $\frac{2\pi}{it}$ 

Phase shift = 
$$h$$
 Volties has taking  $y = h$ 

In add≱log, if 4 <. Othe graph will be reflected about the x axis,</p>

**SOLUTION** First, we rewrite the function by focktring out the one liciting of wa

$$y = 3 + 5\sin\left(\pi x + \frac{\pi}{4}\right) = 3 + 5\sin\left(\pi\left(x + \frac{1}{4}\right)\right)$$

magnetic resources of the company of

In this case, the values are A=-5,  $B=\pi$ , S=-169 and k=5. This gives us

Amplitude = 
$$(-5) = 5$$
 Period =  $\frac{2\pi}{37} = 2$ 

Phase shift = 
$$\frac{1}{3}$$
 Vertical translation = 3

To verify the period and phase shift, and to help sketet the graph, we examine one eye  $\epsilon$ .

One gode: 
$$0 \le \pi x + \frac{\pi}{4} \le \chi \pi$$

$$-\frac{\pi}{4} \le \pi x \le \frac{7\pi}{4}$$
 Subtrict  $\frac{\pi}{4}$  int
$$-\frac{\pi}{4} \le x \le \frac{7}{1}$$
 30 olds by  $\pi$ 

First ing the period by 4 gives  $\frac{1}{2}$ , so we will more  $\Re z$  as as in increments of  $\frac{1}{2}$  and  $\arg w$  in  $x = -\frac{1}{4}$ . Notice that our frame for the cycle (Figure 9) has been shifted upwind 3 and w have placed the key points to account for the z-mix refrection. The graph is shown in Figure 10.

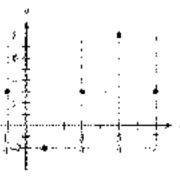

Figure 9

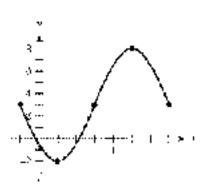

Figure 10

## USING

#### wedterwij i join.

A graphing on cultipor can be used to verify the graph of a trigonometric function that has been drawn by hand. For example, to verify the graph in Figure 10, set your calculator to rad an mode, define

and set the window variables to match the characteristics for the cycle that was drawn test the viewing rectangle to agree with the rectangle shown in the figure)

$$-0.25 \le x \le 1.75$$
, scale =  $0.25$ ;  $-2 \le y \le 8$ .

If for drawing is correct, we should see one cycle of the sine function that exactly tils the screen and matches our graph perfectly. Frigure 11 shows the result.

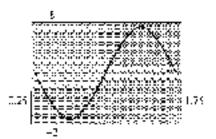

Figure 11

#### WESEPART GETTING PEADY FOR CLASS

After reading through the preceding section, respond in your own words and in complete sentences

- **a.** How does the term  $\frac{\pi}{2}$  affect the graph of  $y = \min\left(x + \frac{\pi}{2}\right)$ ?
- h. How does the term  $\frac{\pi}{2}$  affect the gia th of  $y = \sin\left(x \frac{\pi}{2}\right)$ :
- c. How do you find the period for the graph of  $y A \sin(Bx + C)$ ?
- **d.** How do you find the phase shift for the graph of  $y = A \sin (Rx + Q) \mathbb{I}$

#### PROBLEM SET 4.3

Graph one complete cycle of each of the following. In each case, labe, the axer accurately and identify the vertical manklation for each graph.

1. 
$$y = 2 + \sin x$$

3. 
$$x = -5 + \cos x$$

**6.3 5.** 
$$y = 3 - \sin x$$

**7.** 
$$y = \frac{1}{2} - \cos x$$

2. 
$$y = 4 + \sin x$$

4. 
$$y = 1 + \cos x$$

$$6. y = 6 - \sin x$$

**6.** 
$$y = -\frac{3}{2} - 205$$

Graph one can detergorie of each of the following: In each cave, taket the axes acagearety and identify the samplitude, period, and vertical translation for each graph

▶ 
$$?$$
 9.  $y = 4 + 4 \sin 2x$ 

11. 
$$y = -1 + \frac{t}{2} \cos 3t$$

12. 
$$\alpha = 1 + \frac{1}{3} \sin 3x$$

Graph one complete cycle of each of the following. In each case, label the area zacurguel visa al igientific the priese gloft for each group o

$$\mathbb{P} \cong \mathbf{13.} \ y = \sin\left(y + \frac{\pi}{2}\right)$$

$$\mathbf{i4.}\ y = \sin\left(x = \frac{\pi}{5}\right)$$

$$15. \ y = \sin\left(x = \frac{n}{n}\right)$$

$$16. y = \sin\left(x - \frac{1}{6}\right)$$

17. 
$$y = \sin\left(y + \frac{\pi}{3}\right)$$

**18.** 
$$y = \sin\left(x - \frac{\pi}{3}\right)$$

$$19.5 \approx \cos\left(x - \frac{\pi}{2}\right)$$

$$20. \ y + \cos\left(x + \frac{a}{2}\right)$$

$$21. \ y = \cos\left(x - \frac{2}{3}\right)$$

22. 
$$y = \cos\left(x - \frac{p}{2}\right)$$

His coth equation, identify the amplitude, period, and those shift. Then label the sours accordingly and skatch one complete cycle of the curve.

Fig.23. 
$$x = \sin(2x + \pi)$$

**24**. 
$$y = \sin(2x + \omega)$$

$$2S_{n,N} = \operatorname{sign}\left(nn + \frac{\pi}{2}\right)$$

**26.** 
$$y = \sin\left(\pi x = \frac{\pi}{2}\right)$$

$$27. \ y = -\cos\left(2x + \frac{\pi}{2}\right)$$

**38.** 
$$y = -\cos\left(2\pi + \frac{y}{2}\right)$$

29. 
$$y = 2 \sin \left(\frac{1}{2} \mathbf{a} + \frac{\pi}{2}\right)$$

200. 
$$y = \frac{1}{2} \cos \left( \frac{1}{2} x + \frac{27}{5} \right)$$

$$34. \ y = \frac{1}{2} \cos \left( 2x - \frac{m}{2} \right)$$

32. 
$$y = \frac{6}{3} \cos \left(3x + \frac{\pi}{2}\right)$$

$$\Re (y + 3 \sin \left(\frac{\pi}{3} x - \frac{\pi}{3}\right))$$

$$34. \ v = 1\cos\left(\frac{4}{3}\pi - \frac{\pi}{3}\right)$$

Use your answers for Problems 23 this sage 26 for reference, and grat home complete evals of each of the following equations:

$$p \leq 35, \ \gamma > 1 + \sin \left( 2 \chi - \pi \right)$$

$$37. y = -3 + \sin\left(rx + \frac{x}{\lambda}\right)$$

**36.** 
$$y \ge 3 + \sin\left(\pi x + \frac{\pi y}{y}\right)$$

**39.** 
$$y = 2 - \cos\left(2x + \frac{\pi}{2}\right)$$

**40.** 
$$y = -3 + \cos\left(2\varepsilon - \frac{\pi}{2}\right)$$

Graph one complete cycle of each of the following. In each case, label the axes decurriely and identify the Amplitude, period, vertical translation, and phase shift for ժամե չտորի,

**42.** 
$$y = -2 + 3\cos\left(\frac{1}{2}x + \frac{\pi}{2}\right)$$
 **42.**  $x = 3 - 2\sin\left(\frac{1}{2}x + \frac{\pi}{2}\right)$ 

**42.** 
$$\tau = 3 - 2 \sin \left( \frac{1}{2} (x - \frac{7}{2}) \right)$$

**43.** 
$$y = \frac{5}{3} = \frac{1}{2} \sin(3x \pm \pi)$$

**44.** 
$$y = \frac{2}{3} = \frac{2}{3} \cos(3x - \pi)$$

Graph each of the following equations over the give rimewal. It each ease, be suit to label the axes so that the aim ditude, period, we that the aim and place shift are easy to read.

Fig. 45. 
$$y = r \cos \left(2x - \frac{\pi}{2}\right), -\frac{\pi}{4} \le x \le \frac{3\pi}{2}$$

$$46. \quad y = 5 \sin \left(2x - \frac{\pi}{3}\right), -\frac{5\pi}{6} \le x \le \frac{7\pi}{6}$$

47. 
$$\mathbf{v} = -\frac{2}{3} \sin \left( 3x - \frac{\pi}{2} \right), \quad \pi \le \mathbf{r} \le \pi$$
  
48.  $\mathbf{v} = -\frac{3}{4} \sin \left( 3x - \frac{\pi}{2} \right), \quad \frac{\pi}{2} \le \mathbf{x} \le \frac{3\pi}{2}$ 

49. 
$$y = \frac{3}{2} + 3 \cos \left( \pi s - \frac{\pi}{4} \right) + 2 \le x \le 2$$

50. 
$$y = 7 - \frac{1}{4} \cos \left( \pi v + \frac{9\pi}{2} \right), \quad \frac{1}{4} \le r \le \frac{15}{4}$$

- 51. Oscillating Spring A mass strached to a spring oscillates upward and downward. The length L of the spring after a seconds is given by the function L = 1.5 3.5 cos (2πt), where L is measured in continueters (Figure 12).
  - a. Sketch the graph of this function for  $0 \le t \le 5$ .
  - h. What is the tene hathe spring when it is suggisherium?
  - c. What is the length the spring when it is shonest?

  - c. What is the length the spring when it is shortest?
  - d. What is the length the spring when it is langest?

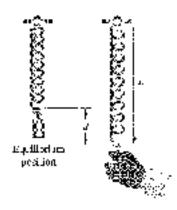

where  $\phi$  is called the *phose angle* of the oscillation, or slupply the phase.

- **53. Sound Wave** The obtillations in oir pressure representing the sound wave for a musical tone can be modeled by the equation  $y = 0.05 \sin (500\pi + 10\pi)$ , where v is the sound pressure in pascals after taccords.
  - u. Sketch the graph of one complete cycle of the sound wave.
  - b. What is the phase angle?
- 54. RLC Circuit. The destric current in an ALC directit can be modeled by the equation y = 2 cos (2007 0.644), where y is the current in milliamps after accounts, at Sketch the graph of one complete eyele of the current.
  - h. What is the phase angle?

#### SEMILAR CROCLEMS

The following problems review material we dovered in Section 3.4.

55. Are Length. Find the length of are out off by a central angle of #% rapians in a circle of bulies 10 centimeters.

Dignar 12

- 56. Are Length. Few long is the are our off by a central angle of 90° in a circle with radius 22 confinedars?
- ATC Trangth. The minute hand of a clock is 2.6 centime are long. How for does the top of the encourse hand travel in 20 minutes?
- 58. Are Congith. The hour hand of a clock is 2 inches, ong. New for does the tip of the hand travel in 5 hours?
- 59. Redfine of a Cárelo. Find the restincted a circle in a or strat angle of 6 call are outstant of a more in the gth 4 test.
- 60. Radius of a Circle To a circle is a control angle of TRSY of two Historian of length. Circles Thad the radius of the circle.

## SECTION 4.4 THE OTHER TRIGONOMETRIC FUNCTIONS

The same techniques that we used to graph the sine and entire functions can be used with the other four trigonometric functions.

### Tangent and Cotangent

Craph y = 3 tail σ δir +π = x = m

**SCHOTION** Although the tangent coes not have a defined anothere, we know from our work in the previous sections that the factor of 3 w.1 eight an of the generalizes. That is, for the same is, the value of y in y = 3 (and will be those those the corresponding value of y in  $y = \tan \theta$ .

To sketch the group of one cycle, remember this a cycle begins with any-intercept, has the vertical as yang ofe in the nickle, and early with any-intercept. At  $x=\pi/4$ , the normal p-value of 1 mark be tripled, so we plot a point at  $(\pi/4, \beta)$ . For the same reason we plot a point at  $(3\pi/4, -2)$ . Figure 1 shows a camplete cycle for  $y=\beta$  can a (we have included the graph of y=0 take for comparison).

The original problem asked for the graph on the interval  $-\pi \leq x \leq \pi$ . We extend the graph to the left by adding a second complete cycle. The final graph x shown in Figure 2.

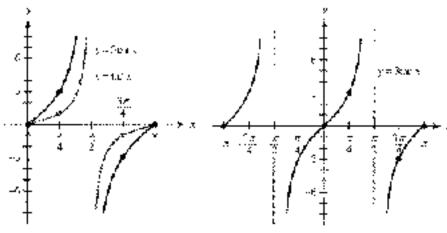

Figure i

Figure 2

In Specien 1.5, we found that the expression  $\sqrt{x^2} = 9$  could be rewritten without a square root by making the substitution x = 3 can  $\theta$ . Then we noted that the substitution itself was questionable because we did not know at that time if every real number a could be written as  $3 \tan \theta$ , for some value of  $\theta$ . As you can see from the graph in Figure 2, the range for  $y = 3 \tan \theta$  is all matribess. This means that any was an above can indeed be written as  $3 \tan \theta$ , which confirms the writing of the variation.

Graph one complete cycle of  $y=\frac{1}{2}$  cost ( - 2c).

SOLUTION Because the cottangent is an odd function.

$$y = \frac{1}{2} \exp\left(\pm 2x\right) = -\frac{1}{2} \exp\left(2x\right)$$

The factor of  $-\frac{1}{2}$  will have all of the y coordinates of  $p = \cos(2x)$  and estate on p axis reflection. It addition, there is a coefficient of 2 in the organism. To see how this will affect the period, we definity a complete space. Remainder that the period of the options in the option is m, not 2m.

One cycles 
$$0 \le \log \max \le \pi$$
  $0 \le 2x \le \pi$  The argument is  $2x \le \frac{\pi}{2}$  Divide by 2 to isotate  $x$ 

The period is  $m^2$ . Dividing this by 0 gives us  $m/\delta$ , so we will mark the racking increasenus of  $m/\delta$  starting at n=0

6. 
$$1 \cdot \frac{\pi}{2} = \frac{\pi}{2}$$
,  $2 \cdot \frac{\pi}{2} = \frac{\pi}{2}$ ,  $3 \cdot \frac{\pi}{3} = \frac{3\pi}{3}$ ,  $4 \cdot \frac{\pi}{4} = \frac{\pi}{2}$ 

The busic cycle of a cotongent graph begins with a vertical enymptote has an a intercept in the modific, and ends with another vertical enymptote (see Table 6, Section 4.1). We can sketch a frame to help plot the key points and draw the anymptotes, much no we did with the sine and cosine functions. The difference is that the appearance lowers describe frame do not indicate maximum and minimum values of the graph but are only used to define the position of two key points. Figure 3 shows the result.

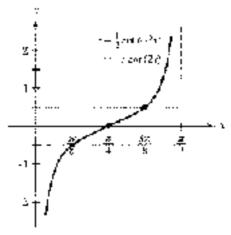

Figure 3

First our next example, we look at the graph of one of the equations we found in Example 4 of Section 3.5.

Figure 4 shows a line truth parked on the shoulder of a flewary near to a long block wall. The first light on the top of the truck is 10 Feet been the wall and to sites through our complete resolution every 2 seconds. Grant the fluorities that gives the bragginal in times of the 7 from the 1987 will.

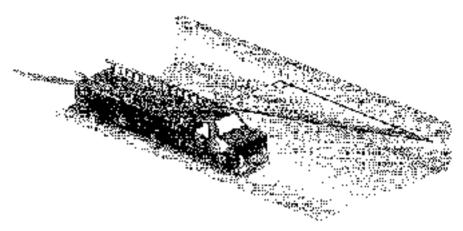

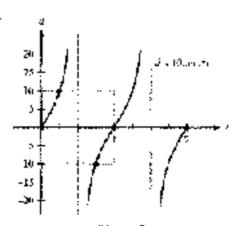

Figure 4

**SOLUTION** From Brample 4 of Section 5.5 we know that d = 10 as  $(\pi s)$ . We must make p at 1 of the p-r lines of the basic temporal function by 10. Also, the coefficient of  $\pi$  will of ange the period.

One cycle:  $0 > ar \approx \pi$ 

0 N s N B Divide by m to leolate a

The period is 1. Dividing by 1 gives no  $\frac{1}{4}$ , so we mark the reaxis in increments of  $\frac{1}{4}$ . The graph is shown in Figure 5. Because the original problem uses for the graph from z=0 to z=2, we extended the graph by adding an additional cycle on the right.

Pigmen 5

Figure i extrappe we include a veg, calling quiting and a Hase shift. Although there are a list of details to begin mark of the steps are recally identical to distance we presented in the previous section.

## Can be expressed by $= 3 - 2 \tan \left( \frac{x}{x} + \frac{x}{8} \right)$ .

**GOLUTION** The first term e(3) will shift the graph vertically 3 units apward. The factor e(2) will double the y-crossinates of  $y = \tan x$ . To determine the phase shift and period, we check one cycle.

One eyeld: 
$$0 \le \frac{x}{3} + \frac{\pi}{8} \le \pi$$

$$-\frac{\pi}{8} \le \frac{x}{3} \le \frac{7\pi}{3} \qquad \text{Subtract } \frac{\pi}{8}$$

$$-\frac{\pi}{4} \le_3 < \frac{3\pi}{2} \qquad \text{Moltiply by 2}$$

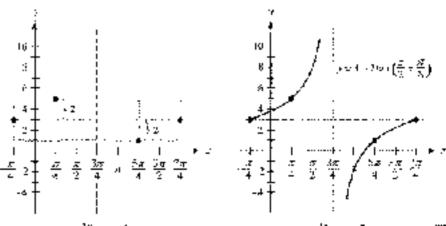

A cycle will begin at  $-\omega A$ , so the graph is shifted  $\omega A$  units to the left. This also for a using phase shift is  $-\omega A$ . To find the period, we compare the difference between endpoints to, the cycle.

Period 
$$= \frac{7\pi}{4} = \left(-\frac{\pi}{4}\right) = \frac{8\pi}{4} = 2\pi$$

Dividing the period by 4 pives as n/2, so we mark the coasis at intervals of n/2 beginning with x=mn/4 as to cose (we only need to find the three mindle coints).

$$-\frac{\pi}{4} + \frac{\pi}{2} + \frac{\pi}{4} = -\frac{\pi}{4} + \frac{2}{2} + \frac{\pi}{2} = \frac{3\pi}{4} = -\frac{\pi}{4} + \frac{2}{2} + \frac{\pi}{2} = \frac{5\pi}{4}$$

A cycle will begin and end with a intercepts at  $g \approx -\pi/4$  and  $g \approx 7\pi/4$  (on the shifted axis). These will be a vertical asymptote at  $g \approx 1\pi/4$  diagues 6 shows the key points, and the final graph is given in kinguin 7.

Pigaze 6

Elpure 7

We summarize the characteristics for the targett and colument as we did for the size and cosine functions. The derivation of these formulas is similar, except that a period of  $\pi$  is used.

## PERSON AND PRANCING CONTANCING AND COTAMBENT

If C is any real number and  $R \ge J$  then the graphs of  $y = \tan(Rx + f_s)$  and  $y = \cot(Rx + f_s)$  will have

$$\text{Period} = \frac{\pi}{ft} \qquad \text{and} \qquad \text{Phase, shirt} = -\frac{C}{ft}$$

Business are a recommendation of the second r

We can also a write the irraction by factoring so that the engineers ranks like u(x) is instead of combined as dx = 0. Let restance a sing the function from transport three forces.

$$p = k + 2 \operatorname{den} \left( \frac{\pi}{2} + \frac{\pi}{8} \right) = 3 + 2 \operatorname{den} \left( \frac{\pi}{3} \left( \mathbf{x} + \frac{\pi}{4} \right) \right)$$

Note it is appearent that  $ii = \frac{1}{2}$  and  $6 \approx -9/4$ 

## Graphing the tringent and cotangent functions

The graphs of y = k + A can (B(x + h)) and y = k + A can (B(x + h)), where  $B \ge 0$ , will have the following characteristics:

$${\tt Period} = \frac{\pi}{B} \qquad {\tt Phuse shift} = h \qquad {\tt Vertical must account} = k$$

In addition,  ${}^i_{ij}(t)$  is the factor by which the hasic graphs are capunded or contracted vertice;  $y_i$  if A < 0 the graph will be reflected about the states.

in a consistent of the property of the contract of the contrac

## Secant and Cosecant

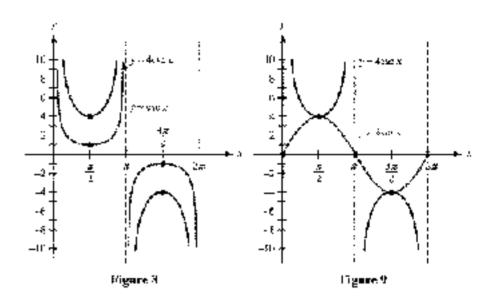

Secause the secapt and cosecant are reciprocals of the cosme and sine, respectively, there is a natural relationship between their graphs. We will take a frozenge of this relationship to maph the secant and cosecant functions by first traphing a corresponding cosme or sine function.

## **アルスの利用を**影響 Graph one complete cycle of s = 4 osc ::

**SOLUTION** The sector of 4 well expose the graph obly  $\pm$  osc viscotically by realizing all of the y-depositiones for times larger largues bishows the resulting graph of one cycle has well as the displace 0 + 0 tent for association.

In Fig. 76 if we have instructed the graph of  $y = 4 \sin x$ . Notice how the sine graph, for a source, denotes the behavior of the coveron, graph. The graph  $\sin y = 4 \cos x$  has a

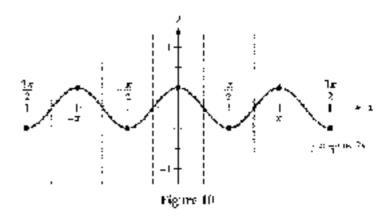

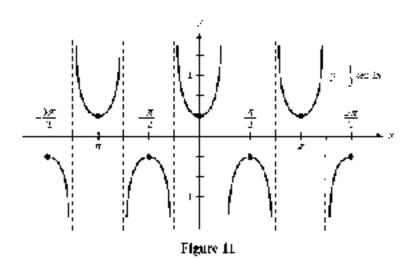

vertical paying rote wherever you'd statut croases the analysished a zero. Furthermore, the highest and lowest points on the sine graph tell as where the two key points on the case, and graph are, in the remaining examples we will use a sine of cosme graph as an old in sketching the graph of a cosecult or second function, respectively.

Graph 
$$y = \frac{1}{2}$$
 see  $2x$  for  $-\frac{11}{2} \le x \le \frac{17}{2}$ .

**SCH\_UTION**. We begin with the graph of  $y = \frac{1}{3}\cos 2x$ , which wall have a paraphtida of  $\frac{1}{2}$  and  $\frac{1}{2}$  period of x. Figure 1.0 shows the graph for  $\frac{1}{2}x = 1 = \frac{1}{2}x$ . The cents of the cosme graph correspond to the vertical asymptotes of the second y, apply and the peaks and valleys of the positive graph correspond to the valleys and teaks of the second graph, respectively.

The graph of  $y = \frac{3}{3}$  sec  $2\pi$  is shown in Figure 13. Notice that the range of the function is  $y \le -\frac{1}{7}$  or  $y \ge \frac{1}{7}$ .

**Example 1.** Church one cycle of y=-1 . Acso  $\left(\frac{\pi^{n}}{2}-\frac{3\pi}{4}\right)$ .

SCLUTION First, we also to the graph of

$$y=-1-3 \text{ an} \left(\frac{\pi x}{2}-\frac{3\pi}{4}\right)$$

These is a vertical translation of I unit bownward. The amplitude is 5 and there is a reflection about the a-axis. We eleck one cycle.

One cycle: 
$$0 \leq \frac{\pi x}{2} + \frac{9\pi}{4} \leq 2\pi$$
$$-\frac{3\pi}{4} \leq \frac{\pi x}{3} \leq \frac{5\pi}{4} \qquad \text{Surjead} \quad \frac{3\pi}{4}$$
$$-\frac{3}{2} \leq x \leq \frac{5}{2} \qquad \text{Multiply by } \frac{2}{\pi}$$

The phase shift is  $-\frac{1}{6}$  and the period is 4. The graph of one cycle is shown in Figure 12 to Using the graph of the together tax shown in Figure 13.

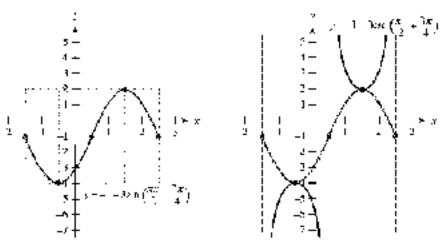

Figure 12

Figure 13

In graphing the securit and descent functions, the period, phase shift, and vortical translation are identical to those for the sine and desine, for this mason, we do not provide a separate summary of the characteristics for these two finestens.

#### P= GETTING READY FOR CLASS

## FINDING AN EQUATION FROM ITS GRAPH

in this secretor, we will reverse what we have done in the previous secritors of this chapter and produce an equation that describes a graph, racked that a graph that desorthes an equation, Let's kraif with no example from algebra.

Find the equation of the line shown in Figure 1.

Pigure 2

**SOLUTION** If from algebrance know that the expands of any straight time (except). a vertical one) can be written in slepe-interespt form as

Whole is its the stope of the fact, and business into the pl

Reconstruction for the Cognitive Lemmas A is the polynomial A , we know the point recept A as ABut find the slope of the face, we find the ratio of the vertical change on the borrounted. change between any two points on the line (sometimes called nise/nin). From Figure F. an sea that investigates -175. Beenfore,  $m \approx -167$ , the representation of our time most be

$$y = -\frac{1}{2}x + 3$$

One cycle of the groups of a trigonomenic America, is shown in Pigure 2. Find an equation to much the graph.

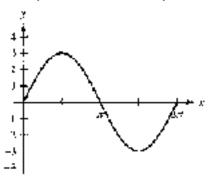

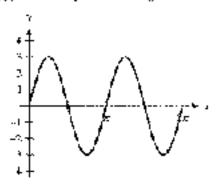

Figure 2

SOF UTION. The graph most alose y reserubles a vine conversion an simplicade of 3, period 3st, and no phase shift 1 he equation is

$$y = 3\sin x$$
  $y \le x \le 2\pi$ 

AMPLE 3.44 found an explation of the graph shown in Ogure 3.

higgins 3

SOLUTION Again, the graph most closely matches a sine curve, so we know the equation will have the form

$$y = L + A \sin \left( P(x = h) \right)$$

From Figure 5, we see that the amplitude is 5, which means that A = 3. There is no phase shift, not is there any pert call trans attented the graph. Therefore, both h and h

To find B. we untice that the period is we Because the formula for the period is 2a/B, we have

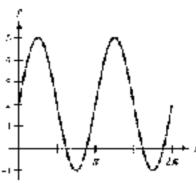

$$\psi = \frac{2n}{3}.$$

which means that dies 2. Or responsion a set for

$$y = 0$$
 3 sm  $(z(x - 1))$ .

which simplifies by

Figure 4.

l'igure 4

SOLUTION: The graph in Lights 4 has the santa shape (amplitude general, and phase shift) as the people vector in Topica 3. In addition, at his timilers on a vertical short up of two artists therefore, this equation is

$$y = x + 5 \cos 2x$$
 for  $0 \le y \le 2\pi$ 

Place in equation of the graph attown in Figure 5.

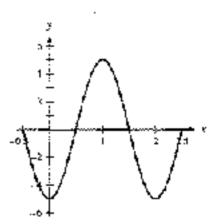

Figure 5

**SOLUTION** If we look or the graph from r=0 to s=1, it looks like a coding carrye than not been redemed about the appairs. The general from for a costne curve to

$$y = k + A \cos (2(x - b))$$

From Figure 5 we see that the couplitude is 5. Because the graph has been collected about the x axis  $\Lambda=-5$ . The period is 2, giving us on equation to solve for S:

Period 
$$\frac{2\pi}{g}$$
 2  $\Longrightarrow$   $\theta$   $\pi$ 

Tracte is no horizontal of vertical translation of the curve (if we assume it is a cosine curve), so h and k are both fl. An equation that describes this graph is

$$y = -5 \cos \pi x$$
 for  $-0.5 \le x \le 2.5$ 

In Brancoles 2 through 4, a size function was the most conjural choice given the appearance of the graph, and tris resulted in the simplest equation possible. We could also have used a cosine function, but it would have required us to consider additional factors, such as a phase shift.

I likewise, we could use a slee function for the graph in Matemple 5 instead of a cosine function. As a sine curve, we see that a cycle begins  $a_{1,k} = 0.5$ . This would require that we include a phase shift of  $0.5 = \frac{1}{2}$ . Then we would have A = 5,  $B = \frac{1}{2}$ , and A = 0, giving us

$$y = 0 + S \sin \left( \pi \left( x + \frac{1}{2} \right) \right)$$
$$S \sin \left( \pi x + \frac{\pi}{2} \right)$$

If we use a reflected sine function), then A = -5 and a cycle begins at -0.5 above would give us a phase which of  $-\infty$  so

$$y = 0 - 5 \sin \left( \pi \left( x + \left( -\frac{9}{2} \cdot \right) \right) \right)$$
$$= -5 \sin \left( \pi x + \frac{\pi}{2} \right)$$

As you can see, there are many premise equations we could find to represent the graph of a trigonometric function. The point is not to overwhelm you with too many choices but to let you know that there is more than one at meet answer for each of these problems. Whether you choose a sine function or a ensite function, you should be able to find an equation that works. In making your choice, are what seems most "hat wall to you, and by to keep the equation exploses prescribe.

### USING TECHNOLOGY

#### VERSON OF THE ONO DISTRICT MODICS

With a graphing calculation we can easily verify that the equation, or model, too the graph in Figure 5 is correct Tirs), set your calculator to odd in mode, and then define

Set the window winable: to match the given graph:

$$-0.5 \le x \le 2.5$$
, scale = 0.5;  $-6 \le y \le 6$ 

If nonequation is correct, the graph drawn by our adoubtor should be identical to the graph provided. Because the graph shown in Figure 5, as the same as the graph in Figure 5, our equation must be correct.

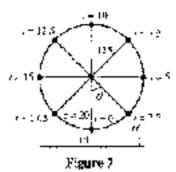

Figure 6

In our next example, we use a table of wases for two variables to obtain a graph. Those the graph, we had the equation.

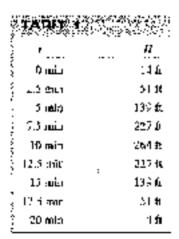

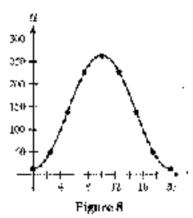

encountered in Thapters 2 and 3 is shown in Figure 7. Recall that the distinctor is 250 feet and it a dates through one consider expolation every 20 roun, tes

First marks a table that shows the index is length: U above the ground for each of the time values of U shows in Figure U. Then graph the arriced pairs indicated by the above two the graph to find at equation that graph is a function of U.

**FACH LITRIPIN**. Here is the wearanting we use to find the within of H for each of the given values of x. When t=0 and t=0, the rotor is at the hotfors of the which, let the above the ground. When t=10, the rotor is at the top of the wheel, which is 264 hed above the ground. At times t=0 and t=10, the rotor is given with the content of the white, which is 19 that three the ground. The other must values of H and round using agin it angle in generality as we and in Naction 2.1. Public 1 shows our comparending policies (shows and H).

If we graph the points it, if) on a reconstation conditate system and then connect them with a smooth curve, we produce the diagram shown in higher 8. The curve is a cosine curve that has near reflected about the 1 axis and then shifted up vertically.

The curve B a cosine curve, so the equation will have the form:

$$H \cap g = A \cos \left(B(x + b)\right)$$

To find the equation for the curve of Figure 8, we must find values for 0.4 4.4 and 4 We begin by finding a. Sections the curves tens out in 0, the phase shift is 0, when gives us

The amplitude, half the difference between the highest point and the lowest paint on the graph, titles to 125 (also equal to the middles of the wheal). However, because the graph is a reflected cas no curve, we have

$$A = -123$$

The period is 20 minutes, so we find at with the equation

$$20 - \frac{2\pi}{B} \Rightarrow B - \frac{\pi}{10}$$

The amount of the vertical translation,  $\kappa_i$  is the distance the center of the wheel is  $m_i^*$  the ground. Therefore,

$$E = 139$$

The equation that gives the beight of the sider at any digo i during the pide is

$$H = 139 - 125 \cos\left(\frac{\pi}{\log r}\right)$$

Notice that this equation is identical to the one we thinked in Example 6 of Section 5.5.

Many real life the tomena are periodic in nature and can therefore be available very effectively using trigonometric functions. Our last example Musingues how this can be done.

Nacimiento in Colifornia, Find the equation of a physician of function to use as a second for that date. Source: Nacimiento Winor Supply Project: Report on Reconstituted Unit of Lake Nacionals)

**SOLUTION** A graph of the data is shown in Figure 9, where y is sho averago attendance and x is the assess, with a mill processionality or Jama; y.

## signor 4.6 Graphing combinations of functions

In this section, we will coupl expand us of the form  $y = y_1 + y_2$ , where  $y_1$  and  $y_2$  are algebraic to intigenomes to functions of  $y_2$ . For instance, the equation  $y_2 = z_1 + z_2$  are the throughput of as the xum of the two for cities  $y_1 = 1$  and  $y_2 = \sin z$ . That is:

if 
$$y_1 = z$$
 one,  $y_2 = \sin z$   
then  $y = y_2 = y_3$ 

Using this kind of reserving, the graph of  $y=1+\sin x$  is detained by adding each value of  $y_2$  in  $y_3=3$ . Graphically, we can show this by adding the values of  $y_1$  from the graph of  $y_2$  at the corresponding values of  $y_1$  from the graph of  $y_2$  at the corresponding values of  $y_1$  from the graph of  $y_2$  4 Signer 1). Liv  $x_1 > 0$ , then  $y_1 + y_2$  will be above  $y_1$  by a distance equal to  $y_2$ . If  $y_2 < 0$ , then  $y_1 + y_2$  will be above  $y_1$  by a distance of rail to the step of  $y_2$ .

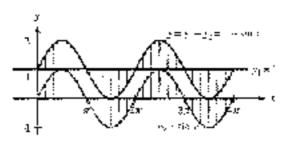

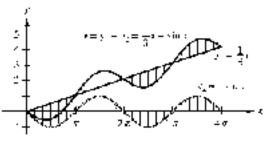

Figure 1

Although in acoust practice your may not draw to the little vertical lines we have shown here, they do seves the purpose of allowing us to visitalize the idea of adding the p-recordinates on our graph to the nonrespooring proceed cases on another graph.

**EXAMPLE** 1888 Graph 
$$y = \frac{1}{2}x$$
 sin a between  $x = 0$  and  $y = 1\pi$ .

**SOLUTION** We can think of the equation  $y = \frac{1}{3}x = \sin x$  as the sum of the equations  $y = \frac{1}{3}x$  and  $y_2 = -\sin x$ . Craphing each of these two equations on the same set of sees and then adding the values of  $y_2$  to the corresponding values of  $y_1$ , we have the graph shown in Figure 2.

Pigure 2

For the rest of the examples in this section, we will not show the year of times a sed to visualize the process of odding  $\rho$  coordinates. Sometimes the graphs become two confusing to read when the vertical lines are included in as the idea behind the vertical lines that is important, not the lines themselves.

## Greph y = 2 sin x 1 cos "x for x between y and 4m

**SOLUTION** We can think of y as the sum of y<sub>1</sub> and y<sub>2</sub>, where

$$y = 2 \sin x$$
 and  $y_2 = \cos 2x$ 

The grapus of y ,  $p_N$  and  $y = y_1 = p_N$  are shown in Figure 3.

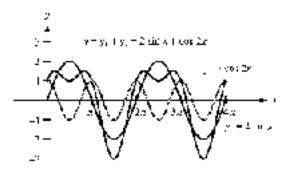

Figure 3

#### LICE PATER

#### TOW TURN IT IS A CATTURED THE

Although a graphing calculator can easily graph the two tion  $y=2\sin x+\cos 2x$  in Example 2 without using the methods described in this section, it can also be used to mintours them. Set your calculator to radian mode and caree the following three line flores:

$$Y_1 = 2 \sin((\phi_1 Y_2 + \cos(2\phi_1 - \mathbf{a}) \mathbf{d}) - Y_2 + Y_1 + Y_2$$

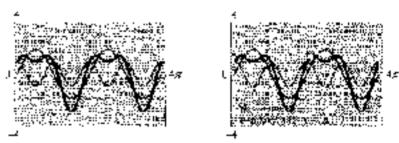

Figure 4

If you'r call oil-for has the airthfy to seridifferent graphing styles, set the lefel function for to graph to fite normal style, the second has for the Ye in the doll style, and the shard function Ye in the hold style. Fag no 4 shows flow the innorms would be defined on a PI-44. Now see you'r window variables so that

$$11 \le n \le 4\pi$$
, scale  $= m_1 + 4 \le n \le 4$ 

When your graph the himserins, your reductions street should look semilar to higher 5. For any going district graph (Yr) indicates the district we should travel above on the ow the normal graph (Yr) in order to look of the bold graph (Yr).

Notice first the period of the hyperion  $y=2\sin x+1\cos 2x$  is  $2\pi$ . We can also see that the function is at a minimum when the individual component functions  $y_1=\frac{\pi}{2}\sin x$  and  $y_2\approx\cos 2x$  are both at their minimum values of -2 and -1. Here  $y_1=y_2$  is by this runnimum when will be (-2)=(-1)=-1. However, the maximum values of  $x_1$  and  $y_2$  do not occur simultaneously, so the maximum of  $y=2\sin x+1$  occ 2x is not so easily determined. Using the appropriate command on the calculation we find that the maximum value is 1.5, as shown in Figure 6.

Neare 5

### PROBLEM SET 4.6

Use addition of propordiories to sketch the graph of each of the following between  $\rho$  in Bradiu in 4a.

• 1. 
$$y = 1$$
 sin  $x$ 

$$3, \ y = 1 + \cos x$$

5. 
$$y = 3 - 2 \sin x$$

$$T_{n,y} \sim \frac{1}{2} |\mathbf{v}| + \cos x$$

$$\mathbf{9}, y = \frac{1}{2}\mathbf{x} + \cos x$$

19. 
$$\gamma = \frac{1}{3}x - \cos x$$

Statch the graph of each equation from c = 0 to z = 3

Shotel the graph from x=0 to  $x\simeq 4\pi$ .

**F13.** 
$$y = 3 \sin x - \cos 2x$$

15. 
$$v \approx 2 \sin v + \cos 2v$$

16. 
$$y = 7 \cos x - \sin 2x$$

$$200c_{10} = 368 \text{ y} + 363.2x$$

**21.** 
$$y = \cos x : \frac{1}{x} \sin 2x$$

**12.** 
$$y = \sin x : \frac{1}{2} \cos 2x$$

23. 
$$y = \sin x - \cos x$$

**14.** 
$$g = \cos x = \sin x$$

- 25. Make a cable using galpicles of problems between 0 and for to help sketch the graph of process x.
- 26. Sherch the graph of you a cost of
- User your graphing calculater to graph each of the following perwoon x = 0 and x = 4x. The sach race, show the graph of ya. ys. and y = y, ...ys. (Make gare your calculator is set to radio, mode.)

27. 
$$y + 3 + 4 \sin x$$

29. 
$$y = x + \cos x$$

30. 
$$y = x - 8 m x$$

31. 
$$y = x + \cos x$$

$$32 y = \cos x - 2\sin x$$

33. 
$$y = 268.2x + 2669.3x$$

34. 
$$y = \sin 2x + 2\sin 2x$$

35. In Example 5 we stated that a equare wave can be represented by the Powier series.

$$f(x) = \sin(\pi x) + \frac{\sin(5\pi x)}{5} + \frac{\sin(5\pi x)}{5} + \frac{\sin(7\pi x)}{7} + \cdots + 0 \le x \le 2$$

Use your graphing esteurates to graph the following pertial sums of this series

$$a. f(x) = \sin (\pi x) + \frac{\sin (3\pi x)}{2}$$

$$\mathbf{b}.|f(x)| = \sin(xx) \div \frac{\sin(3\pi x)}{x} + \frac{\sin(5\pi x)}{5}$$

$$c. f(x) = \sin(\pi x) + \frac{\sin(3\pi x)}{2} + \frac{\sin(5\pi x)}{5} + \frac{\sin(7\pi x)}{7}$$

$$\mathbf{d},\ f(x) = \sin\left(mx\right) \div \frac{\sin\left(3\pi x\right)}{2} = \frac{\sin\left(3\pi x\right)}{2} \div \frac{\sin\left(7\pi x\right)}{2} \div \frac{\sin\left(9\pi x\right)}{2}$$

96. The waveform shown in Figure 12, called a manufacth more, can be represented by dig Fourier agrics.

$$f(\chi) = \operatorname{sin}(\pi\chi) + \frac{\sin(2\pi\pi)}{\pi} + \frac{\sin(2\pi\pi)}{\pi} + \frac{\sin(4\pi\pi)}{\pi} + \cdots + 0 \le x < 0.$$

Use your graphing calculation or graph this fallowing partial stress of this secure

a. 
$$f(x) = \sin(6\pi x) + \frac{\sin(2\pi x)}{2}$$

$$t_{K}(f(x) = ax (e-x)) := \frac{\sin(i2\pi x)}{2} + \frac{\sin(i2\pi x)}{3}$$

$$c_{1}/(1.6) \approx \sin\left(\pi x\right) + \frac{\sin\left(2\pi x\right)}{2} + \frac{\sin\left(3\pi x\right)}{5} + \frac{\sin\left(4\pi x\right)}{4}$$

$$\mathbf{d}_{1}f(\mathbf{x}) \approx \sin\left(\pi\mathbf{x}\right) + \frac{\sin\left(2\pi\mathbf{x}\right)}{2} = \frac{\sin\left(3\pi\mathbf{x}\right)}{4} + \frac{\sin\left(4\pi\mathbf{x}\right)}{2} = \frac{\sin\left(3\pi\mathbf{x}\right)}{4}$$

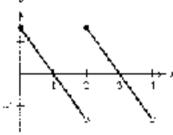

Figure 12

#### NEWIEW PROBLEMS

The following problems review material we covered in Section 3.5

- 37. Linear Velocity in point making on the circumstreads of a circle covery 3 feet every 20 seconds. Find the linear velocity of the point.
- 38. Linuar Velocity: A point is moving on the circumference of a circle. Every 90 seconds the point covers 15 continuous. Find the linear velocity of the point.
- 39. Are Laugth A point is moving with a linear valuatty of 20 tost per second on the prounderence of a circle. How far does the point move in a minute?
- 40. Are Length: A point ingress at 65 meters per second on the circumference of a circle. How far does the point travel in 1 minute?
- 41. Are Length: A point is moving with an angular velocity of 3 radians per second on a circle of radius 6 meters. How far times the noise wavel in 10 seconds?
- Angular Velocity: Convert 30 revolutions per tribute (rpm) to angular velocity in radians per except.
- Assigniar Valuety Convert 120 rays utlook per minute to negative valuety in radion; set second.
- 4.L. Unear Velocity A point to regarding an 5 resolutions deniminate on a citate of radius 5 highes. What is the liquear velocity of the coint?
- 45. rang Length. How the does the big of a EO centimeral mitrate hand on a clock proved in 2 hours?
- 46. Aire Length 1809 for 40es the tip of an 8 commencer boundard on a clock travel in 1 say?

# 3. A.

## SECTION 4.7 INVERSE TRIGONOMETRIC FUNCTIONS

In Chapter 2, we oncountered situations in which we needed to find an engle given a value of one of the trigocometric functions. This is the reverse of what a reignor metric function is designed to be. When we by to use a function in the reverse direction, we are really using what is the ed from work of the function. We togin this section with a brief reverse of the invesse of a finer on. If this is a new mile for you, a stone thorough presents, or of functions and inverse finer on, is provided in Appendix A.

First, let no review the define ion of a function and its inverse.

#### DEFORTION

A function is a rejector trappermensate that prove eathre ement of the domain with exactly one element for orthograph. That is, a function is a set of orders. I aims in which up two different ordered pairs have the same first coordinate.

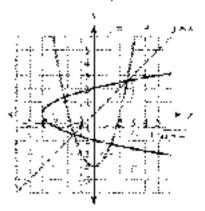

The taysyon of a function by found by intend anging the coordinates in each concerd paint that is an element of the function

With the inverse, the domain and range of the function favor switched roles. To find the equation of the inverse of a faturation, we simply excluding world y in the equation and then solve for y. For example, to find the inverse of the function  $y \in \mathbb{Z}^2 \times \mathbb{R}$ , we would proceed take this:

The inverse of 
$$y = x^2 + 4$$
 as  $x = y^2 + 4$  Backlings  $x$  and  $y$  or  $y^2 + 4 = x$  Add 4 or both sides  $y = \pm \sqrt{x + 4}$  Take the square two, of both sides

The inverse of the function  $y = x^2 + 4$  is given by the equation  $y = \pm \sqrt{x + 4}$ 

The graph of  $y=x^2+\pm is$  a perabola that observe the x-exists i-2 and 2 and has its vertex at (0, -4). To graph the inverse, we take each point on the graph of  $y+x^2+4$ , incredeling that at aid y-coordinates, and then plot the resulting point. Figure 1 shows both graph is Motice that the graph of the inverse is a reflection of the graph of the original function about the fine y=x.

Մահայրա Մ

Proof Physical we see that the inverse of  $y=x^2-4$  is not a horal one because the graph at y=V' is 4 does not pass the vertical one test. For the inverse to also not a fraction, the graph of the original function must pass the kontround line test. Proof-tions with this protectly are called university one functions. It is humanously to one-ho-one, then we know its inverse with be a function as well.

### INVERSE FUNCTION NOTATION

If y = f(x) is a present same function, then the inverse of f(x) also a function and can be denoted by  $u = f^{-1}(x)$ ,

remain in the control of the great remaining of the property of the control of th

Because the graphs of all six disconnection functions do not pass the horizontal line test, the inverse relations has been functions will not be functions themselves. However, we will see that it is provide to define an inverse that is a function if we restrict the original origin operator function in certain angles. In this section, we will light our discussion of inverse in genometric functions us the inverse; of the three major functions, since cosice, and targett. The other three inverse biportometric functions can be inverse biportometric functions can be inverse biportometric functions.

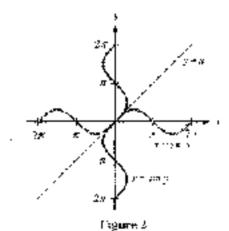

#### The Inverse Sine Relation

To find the anyone of  $y = \sin x$ , we interchange x and y to obtain

This is the equation of the inverse sine relation.

To graph  $x = \sin y$ , we simply reflect the graph of  $y = \sin x$  above the line x = x, as known in Figure 3.

As you can see from the graph,  $s = \sin y$  is a relation but not a frontier. For every value of a in the domain, these are many values of y. The graph of  $x = \sin y$  hills the vertical line lest.

#### The Inverse Sine Function

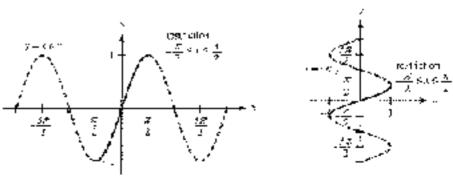

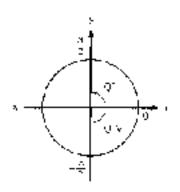

Figure 3

From 4

It is apparent from Figure 4 that if  $x = \sin y$  is restricted to the interval  $-\pi/2 \approx y \approx \pi/2$ , then each value of x heaveen -1 and 1 is a sociated with exact y one value of y, and we have a function rather than just a relation. The equation  $x = \sin y$ , regether with the restriction  $-\pi/2 \approx y \approx \pi/2$ , forms the inverse sine function. To designate this function, we use the following negation.

The inverse site function will recoming an angle foreston in the old who, inchesion, are as an ing to PBN or QI.

#### MOTAGON

The notation used to indicate the inverse sine fitnet on is as follows:

Notation	Meaning
$y=\sin^{-1}x.\piy=\cos\sin x$	$x = \sin y$ and $-\frac{\pi}{2} \le y \le \frac{\pi}{2}$

In want  $r \in \mathbb{N}$  the angle between  $-\pi R$  and  $\pi R$  and when whose simply x.

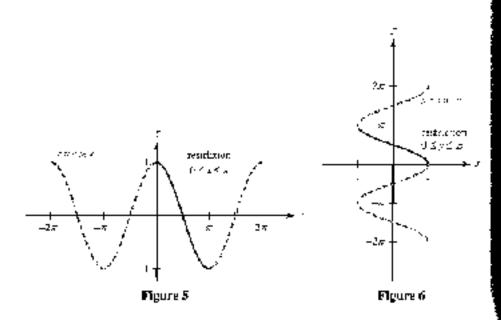

**Note:** The notation  $\sin^{-1}x$  is not to be interpreted as meaning the reciprocal of  $\sin x$ . That is,

$$\sin^{-1} z \neq \frac{1}{\sin z}$$

If we want the reciprocal of  $\sin x$ , we use  $\cos x$  or  $(\sin x)^{-1}$ , but never  $\sin^{-1}x$ .

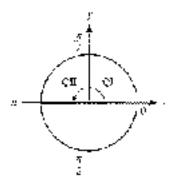

### The Inverse Casine Function

JUST as word to for the sine function, we must first  $\alpha$  be which that z can assume with the cosmological function in order to satisfy the horizontal fine less. The inferred we must of it this  $0 \le z \le \pi$ . Figure 5 shows the graph of  $y = z \cos z$  with the restricted intervaling modes looses the graph of order receives addition  $z = z \cos z$  with the restricted interval after the environer has been inflected about the thic  $y = \pi$ .

The equation  $x + \cos y$  together with the restriction  $0 \le y \le x$ , found the inverse cost section. To designate this function, we use the following notation.

The macroscocus hacker with 14 an arough the analysis of a hoise consecusing to 31 or QE.

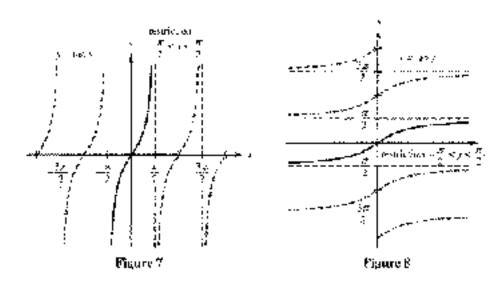

#### NOTATION

The notation used to indicate the mesonal cosmodimentom is as follows:

Notation	Macring
$v=\cos^{1/2}\lambda(\sigma)v=arccises$	$\mathbf{v} = \mathbf{c}_1 \mathbf{c}_2 \mathbf{c}_3 \mathbf{c}_4 \mathbf{c}_3 \mathbf{c}_4 \mathbf{c}_3 \mathbf{c}_4 \mathbf{c}_5 \mathbf{c}_5$
At mosticip is the angle between 0	and an inclusive, whose prairies is n

### The Inverse Tangent Function

For the tangent function, we instruct the values that x can assume to the interval  $x/2 < x \le x/2$ . Figure 7 shows the graph of  $y = \tan x$  with the restricted interval. Figure 8 shows the graph of the inverse relation  $x = \tan y$  with the restricted interval after it has been reflected about the line y = x

The equation  $v \approx \tan y$  degeners with the restriction  $v \approx 2 \le y \le n Z_0$  for results inverse, language function. On designation as the triangles we use the following notation:

The inventorargum terration of Lecture on any observation of an institution consequential to QCF or QF

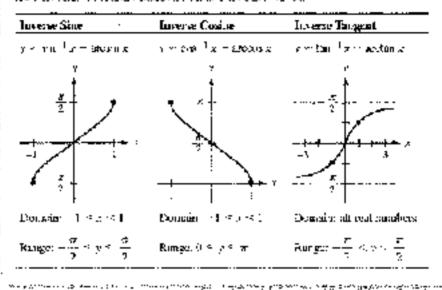

#### NOTATION

The notation used to indigate their vorse tangent function is as follows:

Nestation	Mestaing	
$y = \log^{-1}(x \cos y + x \cos x) x$	y = tan y and	7 < 5 < 7
following yis the day obstween	and and whose tangent is a	

To list timerose, flore are the three leverse degramments functions we leave neson of labory with the dismann, religyl, and graph to heads

### INVERSE TRIGONOMOTERO FUNCTIONS

19al subtractions without its my a calculator or tables.

$$a_n \le n^{-1} \cdot \frac{1}{2}$$

$$\mathbf{a}_{n} \leq \mathbf{n}^{-1} \left( \frac{1}{2} - \mathbf{b}_{n} \operatorname{suppost} \left( -\frac{\sqrt{3}}{2} \right) \right) = \mathbf{c}_{n} \operatorname{tan}^{-1} \left( -1 \right)$$

$$c_{\varepsilon} (tan^{-1}) (-1)$$

### SOLUTION

In Example 5 of Section 1.5, we simplified the expression  $\sqrt{\epsilon^2} + 2$  using the reignment to substitution  $\epsilon = 3$  for #40-chaninate the apone that We will now see how to simplify the result of that example further by removing the absolute value symbol.

\*\* Tensorie Carinda (C. S. opt by Flace 9 (Fit in the fit of for some carindonic)

**SOLUTION** Because  $\theta = \tan i - \frac{\pi}{3}$ , we know from the extration of the horizon tangent function and  $-\frac{\pi}{2} \le \theta \le \frac{\pi}{2}$ . For any single  $\theta$  within this late rate saw  $\theta$  will be a positive value. Therefore,  $\frac{1}{2} \sec \theta = \sec \theta$  and we can simplify the express on

$$\mathbf{a}_{n} \sin \left( \sin \frac{1}{2} \right)$$

b. 823 <sup>1</sup> (855 1357)

### SOLUTION

**3.** From Example 13 we know that  $\sin \frac{\pi}{2} = \frac{\pi}{6}$  . Therefore,

$$\sin\left(\sin^{-1}\left(\frac{1}{2}\right) + \sin\left(\frac{\pi}{6}\right) = \frac{1}{2}$$

**b.** Because our 13.5°  $\pm \frac{1}{2\sqrt{3}}$ ,  $\sin^{-1}(\sin 10.5^\circ) = \sin^{-1}(\frac{1}{2\sqrt{3}^\circ})$  with the the coasts  $\times$  $-30^{\circ}$  (5.9) if 90° for which son  $y=\frac{1}{\sqrt{2}}$  . The magnetic satisfying this requirement 18 y 44 45 No.

$$\sin^{-1}\left(\sin 100^{\circ}\right)=\sin^{-1}\left(\sqrt{2}\right)=45^{\circ}$$

More Notice in Example 4a than the tearlift of 177 is the some as the value that appeared in the continal exponestion. Because  $y = \sin x$  and  $y = \sin^{-1}x$  are inverse. functions, the one function with ") add" Metacrona performed by the other, gifts more details on this property of inverse functions, see Appendix A. ("the reason this sacce theorem did not both run the apple 40 is that the original augic 1964 is not within the assistance domain of the sine lanction and is therefore outside the range of the inverse since function. In a sense, the functions in fractuple 40 are not really inverses because we did not choose an input within the seared upon interval for the sime fasicilio ...

# Simplify that $\left((\tan x\right) : \Gamma = \frac{\pi}{2} < x < \frac{\pi}{2}$ .

SCILUFICIAL Home so was souther the restricted demain for the tangent function the two functions are inverses. Whatever value the langual function assigns to is the inverse rangent i metion will reverse him received and return for original or ne of a. So, by the property of inverse functions,

$$(a\mathbf{h}^{-1})(a\mathbf{m}, \mathbf{v}) = \mathbf{v}$$

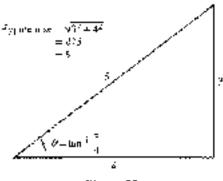

# white a star of the star of th

**SOLUTION** We begin by leading  $\theta = \tan^{-1} (\frac{\lambda}{2} t_{\perp}) (\text{Remember, } \tan^{-1} \pi \text{ is the angle})$ whose tangent is v.) Then we have

With 
$$-\tan^{-1}\frac{3}{4}$$
 , there can  $J=\frac{3}{4}$  and  $0^{\circ} \in \theta < 9.5^{\circ}$ 

We ear drew a triangle in which one of the sente angles is 0 (\*ingure 11), the ause. from  $\theta = \frac{2}{3}$  , we take the like state appearing 5 with 3 and the state adjacent to  $\theta$  with  $\Phi$ . The hyperim use as for red by applying the Pythagorean Thorron.

Piguae 11

from Lagues 11, we find  $\sin \lambda$  using the ratio of the safe opposite  $\ell'$  for the apparences.

$$\sin\left(\tan^{-1}\left(\frac{3}{4}\right)\right) = \sin h = \frac{2}{5}$$

Calculation (Note: If we want to do the same problem with the aid of a calculator, the segrence would look like this:

### Scientific Calculator

### Graphing Calculator

$$3 \left[ \left[ \frac{1}{2} \right] + \left( \frac{1}{2} \right) \left[ \frac{1}{2} \left( \frac{1}{2} \right) \right] \left[ \frac{1}{2} \left( \frac{1}{2} \right) \right]$$

The display would need the which is  $\frac{3}{4}$ .

Afthough it is a lot easier to use a calculator on proteins like the one in Wastuple 6, seeding it without a case that a wall be of more new to you in the future.

White the expression: you (cos" z) as an equivalent expression in a only.

SOLUTION Water 6 Line 1.2. The r

$$\lim_{t\to\infty} \theta \mapsto x + \frac{x}{1}$$
 and  $0 \le \theta \le w$ 

We can visitable the problem by discoung tomal actual position with term that sale in either Q1 or Q11 (Figure 17). Let  $P=\{c,y\}$  be a point on the Fermi of side of 3. By Definition 1,  $\cos \theta = \frac{2}{r}$ , so a most be equal to 1. We can find y by applying the Pythagorean Stream. Notice that  $y \neq 0$ , be a positive value in entre, quadrant.

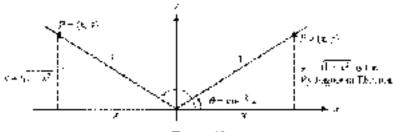

Figure 12

Recause  $\sin \beta = \frac{3}{2}$ .

sin toos 
$$f(s) = \sin \theta = \frac{\sqrt{1-\pi^3}}{1} + \sqrt{1-s^2}$$

This result is valid whether a is positive (5 terminates in Q1) or negative [9 renmantes of QT).

### REVIEW, PROBLEMS

The problems that follow review uniterial we covered in Sections 4.2 and 4.3.

Graps each of the following equations over the increase; interval, Balance to label the 7- and y-axes so that the singuoide and period are easy to see.

**57.** 
$$y = 4 \sin 2x$$
, one complete cycle

88. 
$$y = 2 \sin -x$$
, one complete cycle

**90.** 
$$y = 3 \cos \pi x, -2 \le x \le 4$$

**91.** 
$$y = -3\cos\frac{\pi}{2}x_1 + 2\pi \le \pi \le 6\pi = -92$$
,  $y = -3\sin 2x_1 + 2\pi \le x \le 2\pi$ 

**92.** 
$$y = -3 \sin 2x_0 - 2\pi \simeq x \simeq 2\pi$$

Graph one complete cycle of each of the following equations. Be sure to label the meand y-axes so that the amplitude, period, and phase shift for each graph are cary of soc.

93. 
$$y = \sin\left(x - \frac{\pi}{4}\right)$$

$$94. \ \ \rho = \sin\left(x - \frac{\pi}{5}\right)$$

$$95, y = \cos\left(2\pi - \frac{\pi}{2}\right)$$

$$96. \ y = \sin(2x - \pi)$$

**97.** 
$$y = 3 \sin \left(2x - \frac{\pi}{3}\right)$$

$$38. \ y = 3 \cos \left(2x - \frac{\pi}{3}\right)$$

### SUMMARY

### **EXAMPLES**

### 1. Temade

$$\sin x + 3\pi' = \sin x$$

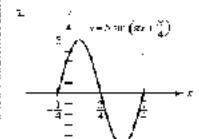

chalterian is come is periodic with period 2a. Likowski Leonie

$$tan(t, |1/\pi) = tan(t)$$

the Lorencopy of his was periodic with period a

Periodic Functions [4,1]

A function  $y \in f(x)$  is said to be periodic with period v if p is the smallest positive. number such that f(x-p)=f(x) for all x in the contain of f.

$$A = \frac{1}{3}(S - (-S)) = \frac{1}{3}(\Omega C) = 5$$

### Amplitude [4.1, 4.2]

The areplifieds A of a curve is helf the absolute value of fee difference between the largest value of y, denoted by M. and the smallest value of y, denoted by but

$$A = \frac{1}{2} \left| M - m \right|$$

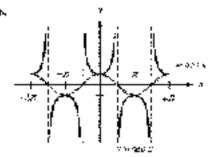

### Hasic Graphs [4.1]

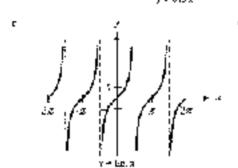

The g with f(y+z) is a small g+z of z and both particles with partial  $2\pi$ . The coupling trake of each graph (s. ). The sine, curve present formingh **0** or the gravity, while the cosmula inverses intough Londle, 25 kis.

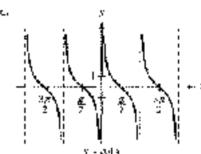

The graphs of  $y = \cos x$  and  $y = \cot x$  are also periodic with period  $2\pi$ . We graph them by using the fact that they are reciprocals of sine and cosine. There is no largest or smallest value of  $\pi$ ,  $x_0$ ,  $x_2$  say the sevent and cosecant curves have no simplicates.

The graphs of  $y \in \mathbb{R}$  and  $y \in \mathrm{cot} x$  are periodic with period m. The rangent curve passes through the origin, while the cotangent is undefined when x is 0. There is no amplifiedly for either graph.

### Para Miteration of Junction.

$$\begin{array}{rcl} \operatorname{tor}(x) & & \frac{\operatorname{dia}}{\operatorname{tor}(x)} & & \\ & & -\operatorname{dia} & \\ & -\operatorname{dia} &$$

### Even and Odd Functions (4.1)

An exceptate live is a binor on too which

$$f(-\epsilon) = f(\epsilon)$$
 but als  $\epsilon$  in the domain  $\epsilon$ :  $f$ 

and at odd janutum is a fraction for which

$$f(-x) \leftarrow f(x)$$
 for all  $x$  in the domain of  $f$ 

Consider as an extenditural transfer and leave as an order hundrenn in best as a

$$x \mapsto (-\mathbf{d}') = x \mapsto S$$
 Cover, is an ever function.

× r≼t

$$\sin (1/\theta) = -\sin \theta$$
 Some is an odd beschen.

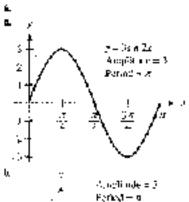

The graph of an even murchoods symmetric about the y-bods, and the graph of an odd. Burghen is symmetric about the origin.

### 5. The proper shift for the graph to Expense a transport

### Phase Shift [4:3]

The parts of by those and or cosmologice is the distance the name buy moved right or bit from the name  $y = \sin x$  or  $y = \cos x$ . For example, we usually disable of the graph of  $y = \sin x$  as starting at the magnetic way graph another size cover that starts in x/4, then we say thus cover has a phase shift of x/4.

Phase series

 $y = 3s \cdot a\left(2x + \frac{\pi}{s}\right)$ 

### Graphing Sine and Cosine Curves [4.2, 4.3]

The graphs of  $y = A \sin Bx + C \text{ and } y = A \cos (Bx + C)$ , where B > 0, will have the following characteristics:

Arap chale 
$$1 > A$$
 Pariod  $2 \frac{2\pi}{B}$  Phosp shift  $2 = \frac{C}{B}$ 

To graph one of these curves, we continue to fracts for one cycle. To make the perkist we solve  $0 \cong \mathcal{B}_2 + C \otimes 2\pi$  for a to find where the cycle will begin and end the left codes of will be the phase abid. We then find the period on a dividual thy  $4 \times 6\pi$  actions value to mark off four equal indices to us on the axists. We use the amplet do not mark off values on the perkist. Finally, we sketch in over a supplier cycle of the curve in questions keeping in a one that if A is negative, the purpose of a malbed of about the association.

### Vertical Translations [4.3]

At dark a constant k in a insymmetric rethrict on formula as the graph vertically notice above. For example, the graph of  $x \sim x - A$  and (Ab + C) will have the sense all apertamphatic, persons, proceeds in ordinal velocity and indicated as  $y \approx A \sin (Bx + C)$  but well by translated k and a sectionally brose the graph of  $y \approx A$  san (Bx + C).

# 

### Graphing by Addition of y-Coordinates [4.6]

To graph equations of the force  $y = y + y_0$ , where  $y_1$  and  $y_2$  are algebraic or organization functions of x, we graph  $y_2$  appeared by on the same coordinate system and then add the two graphs to obtain the graph of y.

# $\boldsymbol{N} = \mathbf{E}(\mathbf{a}) \mathbf{h}$ at the regions of the tracks a calculator.

30. Write an equivalent expression for sin (cos (fa) that involves a only.

### CHARTER 48 GROUP PROJECT

### MODELING THE SUNSPOT CYCLE

From top reaction, inservations, which I have reported excite year in this proceed it enjances that there is a certain period only in the approximation of managents and this through come in or and name probable from the results of this year...

Harmich Schwabe, 343

Objective: To find a smusou all model for the average annual supspot number using report data.

Sunspots have been observed and member for thousands of years. Some of the comhest observations were, made by Chinese as remarkeds. Further observations were, made following the revention. This to escape in the Lift confury by a member of astion omers impliciting Go deep and W. hard Lengthel. In wever, it was the German astion omers before the Softwahe who, in severaing for evidence of other planets between Measury and the Soft, first observed an apparent periodic cycle in sanspot activity.

Table 1 provides the average annual sunspot immitted for each year between 2576 and 1996.

÷						
	Vent	Samspot Maraker	Yes	Suisspor Number		
	1478	s2 5	1989	137.6		
:	1979	55.4	29;	142.6		
:	1950	151.6	1991	145.7		
	149.1	140.4	1892	94.3		
:	1952	115.9	1,979	54.6		
٠	1953	56.6	291	29.0		
	1994	45 9	1995	17.2		
	1965	ነ። ያ	1995	4.6

:	1987	29.4	998	e4.3		
	2461	700.7				

- Serich a graph of the data, fisting the year along the horizontal asid and the supagot number along the vertical axis.
- 2. Using the data and your graph from Questirn 1, find an equation of the form y = k + R sin (B(x + n)) or y = k + R cos (B(x + h)) to make the graph, where a is the year and y is the sure-polinumber for that year. Explain how you determined one values of k, R, B, and k, the show supporting with.
- 3. According to your model, what is the length of the sunspot cycle (in years)! In 1849, Raddiph Wolf determined the length of the sunspot cycle to so 11.3 years. How does your value compare with bin?
- 4. Use your model to gred at the sunspet sumber for 2001. How tools your prediction compare with the actual value of 41. ?
- 2. Using your graphing culculated make a souter plot of the data from the table. Then graph your model from Quantions 2 along with the data. How well does your model fit the data? What could you do to try to improve your model?
- (ii) If your graphing esticulator is capable of consputing a locat-squares sinuscidal regression modes, and it to find a second model for the data. Coapabiles, sets especially along with year little model. How do it of company.

### THE 4 RESEARCH PROJEC

Achema Kosksich Wett

### THE SUNSPOT CYCLE

Asthorigh index associates made regular observations of supports, it was the Switch astronomer. Reducton Wolf that devised the first universal method for counting satisfies. The daily support number, summatimes at the the Wolf in Junear, to lows a periodic cycle. Wolf character the length of this wyole to be about 11.1 years.

Research the estimated Rodolph Woll and the Sintepet cycle. Why do incident astronomers consider the length of the sunspet cycle to be 22 years? What are some of the effects that the samplet cycle classes here on Earth? Write a purpostiph or two obtaint your findings.

# IDENTITIES AND FORMULA

lviatuernaŭes, nghuy vienvau, postessas not only truth, but sopreme beauty Bertrano Hussol

### JESTE CONSTITUTE

Although it doesn't look like it. Figure 1 shows the graphs of ever furnations, namely

$$y = \cos^2 x$$
 and  $y = \frac{1 - \sin^2 x}{3 \sin^2 x}$ 

A though these two functions, now ignite different from one profile. They are in from the same function. This means that, for all values of x,

$$\exp^{i \frac{1}{2} \frac{1}{2}} = \frac{1 - \sin^{2} x}{1 + \sin^{2} x}$$

This has expression is the 640% and identifies are one of the topics we will study in this chapter,

### STUDY SKILLS FOR CHAPTER 5

The study skills for this chapter froms on the way you approach new distations in markematic). The flust study skill is a point of view you note about your natural histories for what does and these it work in markematics. The second study skill gives your away of testing your instincts.

- Don't Let Your Intuition Fool You. As you become more experienced and migre suggession in markematical your will be able to their your markematical you will be able to their your markematical in turion. For now industry, it can get in the way of your outress. For example, if you ask in beginning algebra, student to expand the left, many will write of a bit, which is linearized, in or generatery, or first glange in may seem than a statement such as sin (A = B) = sin A + sin B is true. However, intoo is false, as you will see in this chapter.
- 2 Test Properties You Are Unsure Of Promume to time you will be in a sit aution in which you would like to apply a property or rule, but you are not sure it is time. You can always set a property or statement by substituting numbers for variables. For instance, we always have statement that rewrite (x + 5)<sup>2</sup> us x<sup>2</sup> + 9, thinking that the two expressions are considered. The fact that the two expressions are not equivalent becomes obvious when we substitute 10 for x in each one.

When 
$$x = 10$$
, the expression  $(x = 3)^2$  is  $(10 = 3)^2 = 13^2 = 16$ .)  
When  $x = 10$ , the expression  $x^2 + 9 = 10^2 + 9 = 100 + 9 = -109$ .

Similarly, there may oning a time whon you are wondering if  $\sin 2A$  is the same as  $2 \sin A$ . If you by  $A = 30^\circ$  in each expression, you will find out quickly that the two expressions are not the same.

When 
$$A=50^\circ$$
, the expression  $\sin 2A + \sin 2(30^\circ) + \sin 60^\circ + \frac{\sqrt{3}}{2}$   
When  $A=30^\circ$ , the expression  $2 \sin A + 2 \sin 30^\circ + 2 \cdot \frac{1}{2} + 1$ 

When you test the equivalence of expressions by substituting numbers for the variable make it easy on yourself by choosing furniters that are easy to work with as well dishave.

e komment i sa taman mananga mananga mengangan mengalah banda banda bandan perganah mengangan mengangan mengan

If is not good proclass to this governal after or instinction every new saturation in mathematics. I you have any doubt about generalizations you are making, lest those by replacing periations with numbers and simplifying.

# segrion 5/1 - PROVING IDENT TIES

We began precently contribes in Chapter — in this section, we will extend the sents we did in that phapter to include proving more complicated identities. For review, Table 1 lists the basic identities and some of their more importance; invalent forms.

	Reside ful en titles	Cammen Equivalent Forms
Recipiocal	cap S == 1 sub <del>d'</del>	:in ♥ = 1 === ♥
	$\max_{t \in \mathcal{C}} f_t \approx \frac{1}{a_t c_t} \frac{1}{b_t}$	$\cos \theta = \frac{1}{\sin \theta}$
	ene5 1 ωπθ	$\tan \theta = \frac{1}{\cos \theta}$
Ratin	$\tan \theta = \frac{\sin \theta}{\cos \theta}$	
	$\cos \theta \approx \frac{\cos \theta}{\sin \theta}$	
Pythagorean	$\operatorname{and}(\theta)=\operatorname{dist}(\theta)\otimes 1$	$\sin^2\theta = 1 + \cos^2\theta$
		and $\theta \in (2 \nabla^2 I  + eca^2 H)$
		$\cos^2\theta = 1 - \sin^2\theta$
		$\cos\theta \approx 15/1 + \sqrt{1 + \sqrt{3}}$
	$1 = t e^{2} \theta = \kappa e^{2} \theta$	
	$1+\cos^2\vartheta=\gcd^2\vartheta$	

for imes . The last two digetagraphs are one can be derived from  $\cos^2 t$  . Figure  $t \gg t$ by dividing such side by  $\cos \hat{x} \, \hat{x}$  and  $\sin \hat{x} \, \theta$  respectively. For example, if we divide such as  $d \approx 40a^2 R$  . I what R = 1 by  $\cos^2 \theta$ , we have

$$\frac{\cos^2\theta + \sin^2\theta}{\cos^2\theta} = \frac{1}{\cos^2\theta}$$

$$\frac{\cos^2\theta}{\cos^2\theta} - \frac{\sin^2\theta}{\cos^2\theta} = \frac{1}{\cos^2\theta}$$

$$\frac{\cos^2\theta}{\cos^2\theta} - \frac{\sin^2\theta}{\cos^2\theta} = \frac{1}{\cos^2\theta}$$

$$- \sin^2\theta = 2\omega^2\theta$$

To derive the last Pythagorean identity, we would need to divide both sites of  $\cos^2 \theta = \sin^2 \theta = \cos \sin^2 \theta$  to obtain  $1 \le \sec^2 \theta = \csc^2 \theta$ .

The rest of this section is concerned with using the basic identities (or their equivalont forms) first i stod, slong with our klassidadge of algebra, or prove or can destricted

Rocall that an identity in prigonometry is a statement that two expressions are equal for all replacements of the variable for which each expression is defined. To prove (or verify) a trigonometric identity, we use trigonometric substitutions and algebraic manipulazinas to either

- F. Transform the right sale of the identity into the left side, or
- Transferre the kell sale of the natiobly into the egict sole.

That mach thing to remember in probling fakerlithets as the seock emission of the Million ributhity suparately. We then it would be use programfact from atgebra that is no valuable. soles of the electrify—like the architen projecty of equality, i.e. do so would be its assume that the two sides are equal, which is what we are frying to as Ablish. We are not allowed to treat the problem as an equation.

We prove identities to develop the shally of transitions one trigonometric expression, into enotice. When we encounted problems in other courses has require the techniques used to ben'ly identities, we usually find that the selution to these problems hanges on those femalisms, tage essions outsining higher metric formations induces complicated cop expires. In these cases, we do not usually have an equal sign to work with.

### EXAMPLE Will Prove sin South = cos A.

PROOF. To prove this elects y, ex. transfers: the fett a denote the right side.

Sin 
$$\theta$$
 cos  $\theta$  is in  $\theta$ . Ratio identity

$$\Rightarrow \frac{\sin \theta \cos \theta}{\sin \theta}$$
Multiply
Thous  $\theta$ 
Divide the common factor  $\sin \theta$ 

In this example, we have transformed the left site into one right side. Remember, we verify identities by transforming one expression into mother.

**PROOF** We can begin by applying the distributive property to the right side to multiply through by sin x. Then we can obar go the right side to an equivalent expression involving only tin x and costs:

$$\begin{aligned} \sin x &(\sec x + \cot x) = \sin x \sec x + \sin x \cot x & \text{Multiply} \\ &= \sin x - \frac{i}{\cos x} + \sin x + \frac{\cos x}{\sin x} & \text{Recip most and satisfies} \\ &= \frac{\sin x}{\cos x} + \frac{i}{\cos x} & \text{Multiply} \\ &= \frac{\sin x}{\cos x} + \frac{\cos x}{\cos x} & \text{Multiply} \end{aligned}$$

$$= \frac{\sin x}{\cos x} + \frac{i}{\cos x} + \frac{\cos x}{\sin x} & \text{Multiply}$$

$$= \frac{\sin x}{\cos x} + \frac{i}{\cos x} + \frac{\cos x}{\sin x} & \text{Ratio identity}$$

In this care, we treatformed the right side into the left side.

Before we go on to the next extended, let's introduce gualet, we that duty be useful in learning flow to prove ideal ties.

### QUIDI UNICE FOR REQUIRE BOTH TOTALS

- k. It is usingly heal to seros on the gappe complicated side heal.
- Lookt for higomometric substructions involving the casic identities that may had a simplify things.
- 3. Look for a general operations, such as adding a serious, the distributive cooperty or factoring, that may simplify the add you are working with or that will at teast, each to an expression that will be easier to simplify.
- If you cannot think of anything also to do obange everything to sines and cosines and see if that belos
- Assess keep an eye on the side you are not wo bring with to be an eyes act working toward it. There is a certain sense of discotion that accompanies a successful poor!

Probably the best advice is to remember that those are simply gordetness. The best vary to become preficient at proving trigonometric identities is to practice. The more identities you creve, the more you will be able to preve and the more contident you will become. Don't be affixed to stop and start oner if you don't seem to be grating anywhere. With most identities, there are a number of different proofs that will lead to be some result. Some of the preofs will be longer than others.

Prove 
$$\frac{\cos(t + \sin^4 t)}{\cos^2 t} = 1 - \tanh t$$

**PROOF** In this example, factoring the demonstrate on the left side will reduce the exponents there from 4 to 2.

$$\begin{split} \frac{\cos^2 r - \sin^4 r}{\cos^2 r} &= \frac{(\cos^2 r - \sin^2 r)\cos^2 r - \sin^2 r!}{\cos^2 r} &= \frac{\ln(\cos^2 r - \sin^2 r)}{\cos^2 r} \\ &= \frac{\ln(\cos^2 r - \sin^2 r)}{\cos^2 r} &= \Pr{\text{Pythagiste an identity}} \\ &= \frac{\cos^2 r}{\cos^2 r} - \frac{\sin^2 r}{\cos^2 r} &= \frac{\log \sin r}{\ln r} \\ &= \frac{\cos^2 r}{\cos^2 r} - \frac{\sin^2 r}{\cos^2 r} &= \frac{\log \sin r}{\ln r} \end{split}$$

**PROOF** We begin this proof by applying an abstract form of the Pythagorean identity to the right side to write  $\sin^2\theta$  as  $1-\cos^2\theta$ . Then we factor  $1-\cos^2\theta$  as the difference of two equates are reduce to lowest terms.

$$\frac{\sin^2 \theta}{1 - \cos \theta} = \frac{(1 + \cos^2 \theta)}{1 - \cos \theta}$$
 Pythogorean identity
$$\frac{(1 + \cos \theta)(1 + \cos \theta)}{1 + \cos \theta}$$
 Factor
$$= 1 + \cos \theta$$
 Reduce

### 47. 19. 4 (1) 25.72 07.049

You can use young aplining indeveloped to decide if an elevation is an ideating of all in the expressions are indeed equal for all delined values of the variable, then they should practice ideatical graphs. Although this does not constitute a proof, it does give shoup evidence that the ideatity is true.

We can verify the identity in Evanque 4 by bething the expression on the left as a function Y1 and the extression on the right as a second function Y2. If your calculation is confined with d. Ferent graphing styles, so, the stelle of Y2 so that you will be shift to this regulable the second graph. I can the first (In Figure 1, we have each the papth style on a TI \$4 for the second function.) Also, be one ray an admission is set to pull in mode, Set your windows variables so that

Fjynne 1

When you graph the functions, your calculator serger, should look similar to Figure 2. (the small circle is a result of the path style in action). Observe that the two graphs are identies).

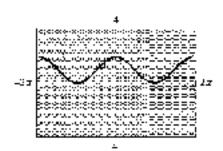

Figure 2

If your calculation is not equipped with different growthing styles, it may be diffient to tell if the scenne graph really on neides with the first. In this case you can trace the graph, and switch between the two functions at several points to convince yourse for that the two graphs are indeed the same.

# S EXAMPLE 5 Trove ton x 1 cot x

**PROOF.** We begin this proof by writing the refit side in terms of a majord covar. Then we samplify the left side by finding a common renominator in order to add the resorting fractions.

$$\begin{array}{lll}
\cos x + \cos x = \frac{\sin x}{\cos x} + \frac{\cos x}{\sin x} & \text{Changes to sines and} \\
&= \frac{\sin x}{\cos x} + \frac{\sin x}{\sin x} + \frac{\cos x}{\sin x} + \frac{\cos x}{\cos x} & \text{LCD} \\
&= \frac{\sin^2 x + \cos^2 x}{\cos x \sin x} & \text{Add fractions} \\
&= \frac{1}{\cos x + \sin x} + \frac{1}{\sin x} & \text{Pythagorean adentity} \\
&= \frac{1}{\cos x} + \frac{1}{\sin x} & \text{Write as separate} \\
&= \cos x \cos x & \text{Reciprocal identities} & \\
\end{array}$$

**EXAMPLE 6** (1) Prove 
$$\frac{\sin \alpha}{1 + \cos \alpha} + \frac{1 + \cos \alpha}{\sin \alpha} = 2 \cos \alpha$$
.

**PROOF** The element denominator for the left side of the equation is sin a (1-1 cas a). We multiply the flow traction by (sin asylating) and the second

fraction by  $(1 \pm \cos \alpha)(0.0 \pm \cos \alpha)$  to produce two equivalent inschools with the same contained.

$$\frac{\sin \alpha}{1 + \cos \alpha} + \frac{3 + \cos \alpha}{\sin \alpha} + \frac{\cos \alpha}{\sin \alpha} + \frac{1 + \cos \alpha}{\sin \alpha} + \frac{1 + \cos \alpha}{3 + \cos \alpha}$$

$$= \frac{\sin^2 \alpha - (1 + \cos \alpha)^2}{\sin \alpha (1 + \cos \alpha)} + \frac{\sin^2 \alpha - 1 + 2\cos \alpha + \cos^2 \alpha}{\sin \alpha (1 + \cos \alpha)} + \frac{2 + \cos \alpha}{\sin \alpha (1 + \cos \alpha)} + \frac{2 + \cos \alpha}{\sin \alpha (1 + \cos \alpha)} + \frac{2}{\sin \alpha (1 + \cos \alpha)} + \frac{2}{\sin \alpha (1 + \cos \alpha)} + \frac{2}{\sin \alpha (1 + \cos \alpha)} + \frac{2}{\cos \alpha} + \frac{2}{$$

$$= \frac{1 + \sin t}{\cos t} = \frac{\cos t}{1 - \sin t}$$

**PROOF** The key to proving this identity requires that we multiply the numerator and floromizator on the right side by  $z \mapsto \sin z$ . This is similar to rationalizing the date minator.)

$$\frac{\cos t}{1 + \sin t} = \frac{\cos t}{1 + \sin t} = \frac{\text{Multiply nonsertor and}}{\text{denominator by } (1 + \sin t)} = \frac{\cos t \cdot 1 + \sin t}{1 + \sin t} = \frac{\cos t \cdot 1 + \sin t}{1 + \sin t} = \frac{\cos t \cdot (1 + \sin t)}{\cos^2 t} = \frac{\cos t \cdot (1 + \sin t)}{\cos^2 t} = \frac{1 + \sin t}{\cos t} = \frac{1 + \sin t}{\cos t}$$
Reduce

Such that at would have been piss as easy forms to verify this identity by multiplying the numerator and decrementation on the left side by the single-

In the previous examples, we have concentrate; our methods for porving that a statement is an adentity, menting that the two dispressions are equal for all explorations of the variable for which each expression is defined. To show that a statement is not as independently is recally anothering or AB we must do us find a single value of the variable for which ench expression is behind; but which makes the statement take. This is known as finding a connectionable.

Ŵ.

Example By Show that call ( ) we'd = coff theel this and an electric cylindric according a constitution with the

**SCHIETION**. Here we not  $\theta$  is undefined for  $\theta=\log_{\theta}$  where k is only integer, we must observe some other value of  $\theta$  as a no inferior angle. Using  $\theta=\pi/4$ , we find

$$\cos^2\frac{\pi}{4} = \cos^2\frac{\pi}{2} \ge \cot^2\frac{\pi}{4} \cos^2\frac{\pi}{2}$$

$$\left(\cos\frac{\pi}{4}\right)^2 = \left(\cot\frac{\pi}{4}\right)^2 \ge \left(\cot\frac{\pi}{4}\right)^2 \left(\cot\frac{\pi}{4}\right)^2 \left(\cot\frac{\pi}{4}\right)^2$$

$$= \left(1\right)^2 + \left(\frac{1}{\sqrt{2}}\right)^2 \ge \left(1\right)^2 \left(\frac{1}{\sqrt{2}}\right)^2$$

$$= 1 + \frac{1}{2} \ge 1 - \frac{1}{2}$$

$$= \frac{3}{2} + \frac{1}{2}$$

Whemhere,  $mr^2 > 0$  and  $\theta \neq em^2 \theta$  and  $\theta$  when  $\theta = \pi/\Theta$  is the statement is a substitute.

# USIN-5

DISCHARGE OF REPORTED SPECIAL FUELD

In the previous Using Yeehnology section on pages 250–260 we saw that a graphing on calculate can be used to determine whether an equation appears to be an electrity or both. Using this approach with Example 8, we denue.

$$f: \leftarrow (\operatorname{con}(x))^{-2} - (\operatorname{con}(x))^2$$
and 
$$f: \leftarrow (\operatorname{con}(x))^{-2} \operatorname{con}(x)^2 \qquad \text{(both an of)}$$

As single in Fig. its 3, the two graphs are not dentited so we expect this equation is not an intentity. To find a counterexample, verifly choose any value of the consideration where the two graphs do not everlap in larger 4 we as to used the establishment or real rate each expression of task. You can see how the coursess one give extrement togeths.

Provisional identity.

**9.3.** 
$$\csc \theta + \sin (-\xi) = \frac{\cos^2 \theta}{\sin \theta}$$

93. 
$$\cos \theta + \sin (-\theta) = \frac{\cos^2 \theta}{\sin \theta}$$
 91.  $\sec \theta - \cos \theta = \frac{\sin^2 \theta}{\cos \theta}$ 

## SUM AND DIFFERENCE FORMULAS

The expressions i in (4 + B) and cos(A + B) occur frequency enough in mathematic Les that it is neglessary to final expressions equivalent to teem that involve sines and costness of single angles. The most obvious question to begin with is

The asswer is not Substituting almost a m gain of numbers for n and B in the formula: ゆ組 yield a false statement, 八a 1 gottifterexcumple, we can ict / ー 391 and # 1 905 in the phove formulin and then simplify each side.

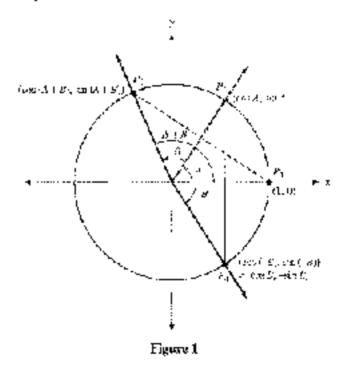

an 
$$(30^{\circ} - 60^{\circ}) \stackrel{?}{\sim} \sin 30^{\circ} - \sin 60^{\circ}$$
  

$$\sin 900^{\circ} A = \frac{1}{2} : \frac{\sqrt{3}}{2}$$

$$= \frac{1}{2} : \frac{\sqrt{3}}{2}$$

The formula just doesn't work. The usact question is, what one the formula: for (A + B) and  $\cos(A + B)$ . The above to that question is what this section is all about 1 at some by densy by the formula for one (A + B).

We begin by drawing angle A in standard position and then adding B to it. Next we arraw -B in standard position. Figure 1 throws these angles in relations in the unit circle. Note that the points on the unit circle through which the terminal sides at the angles  $A_i \to B_i$  and -B take have been labeled with the times and occurs of those angles.

To derive the formula for  $\cos(A+B)$ , we simply have to see that k ago:  $F_1F_2$  is equal as length  $F_1F_2$  promptopolyty, they are chards on off by equal counts' angles.)

$$P: P_2 = P_2 P_4$$

Squaring both sales gives to

$$\langle P_1 P_2 \hat{p} \rangle = \langle P_2 P_2 \hat{p} \rangle$$

Now, applying the Sistance furnishes we have

$$[\cos(tA+B)+1]^2+[\sin(tA+B)+t_0]^2+(\cos tA+\cos B)^2+(\sin tA+\sin B)^2$$

Fet's wall this Equation 6. Taking the laft side of Equation 1, expanding it, and show simplifying by using the first Pythogorous identity gives us

Light Sade of Eigenhore I.

$$\cos^2(A + B) = 2 \cos(A + B) = 1 - \sin^2(A + B)$$
 Expendisposes  
=  $-2\cos(A + B) = 2$  Pythsypical identity

rapplying the same two suspents the right side of Equation 1 gives us Right Side of Equation 1

$$\cos^2 A = 2\cos A \cos B \in \cos^2 B + \sin^2 A + 2\sin A \sin B + \sin^2 B$$
  
=  $-1\cos B \cos B + 7\sin A \sin B + 3$ 

Equating the simplified we signs of the left and right sides of Equation 1 we have

$$-2\cos(A+B) - 2 = -2\cos(A\cos B + 2\sin A\sin B - 2$$

Adding -2 to both sides and then dividing both sides by -2 gives be the doubted we are office.

$$\cos\left(A+B\right)=\cos\left(a\cos B+\sin A\right)\sin B$$

This is the first florable has seedes objectionables for original mention functions of the sails of difference of two angles. It agos: be meno, load, the fore we delive the others. led's look at some of the ways we can use out that ill mads.

**SOLUTION** We wrow 751 as  $15^\circ \pm 30^\circ$  and then apply the formula for cns(A + B)

$$\begin{aligned} \cos 75^{\circ} &= \cos \left( \frac{15^{\circ}}{2} + \frac{30^{\circ}}{2} \right) \\ &= \cos 45^{\circ} \cos 30^{\circ} + \sin 45^{\circ} \sin 30^{\circ} \\ &= \frac{\sqrt{2}}{2} \cdot \frac{\sqrt{3}}{2} + \frac{\sqrt{2}}{2} \cdot \frac{4}{3} \\ &= \frac{\sqrt{2} - \sqrt{3}}{4} \end{aligned}$$

Note If you completed the Chapter 3 Comp Project, compare your value of cos 75° from the project with nur result in Example 1. Convince yourself that the two values are the same.

**SOLUTION** Applying the formula for the (A + B), v is have

Notice that this is use a gewinete, original We attendy above that if two engles are cotamitinal, thus it are cosing one cond. I and  $x - 2\pi$  and x are cotamit al. With we do se close here is scrowd thus to be thue within tetratory a Eusend of the definition of сочіле.

**SOLUTION** We apply the formula for  $\cos (k + E)$  in the reviews three confirming the way we applied it in the first two easinples.

$$\cos 2x = \sin 3x \sin 2x = \cos (3x \pm 2x)$$

Tiken is the recovation of the formula (a,c), (A = B). If reverses the formula for  $\cos(A + B)$  and the formula for each odd Hardons.

$$cos(A - B) = cos(A + (-B))$$

$$= cos(A + cos(A)) - sin(A + cos(B))$$

$$= cos(A + cos(B)) - cos(B + cos(B))$$

$$= cos(B + cos(B)) - cos(B + cos(B))$$

$$=$$

The only difference in the formulas for the expansion of  $\cos(A+B)$  and  $\cos(A+B)$  is the sign between the  $\cos(4\cos A)$ . Here are both formulas.

$$\cos (A + B) \approx \cos A \cos B + \sin A \sin B$$
$$\cos (A + B) = \cos A \cos B + \sin A \sin B$$

Again, both formulas are important and should be memorized

# EXAMPLE 4.5. Show that cox (50° = 4) = 4/n A.

**SOLUTION** We will need this  $f_i$  much when  $p_i$  derive the formula for  $\sin(3+R_i)$ 

case 
$$(90^{\circ} \oplus A) = \cos 90^{\circ} \cos A + \sin 90^{\circ} \sin A$$
  
 $\approx 0 + \cos A + 1 + \sin A$   
 $\approx \sin A$ 

Note that the Control is we just derived is not a new formula. The sanctes 90° × At and A are complement any procless, and we already know by the Cofunction Theorem arom Chapter 2.0 or the sine of an angle is always equal to the cosine of its complement. We conto also suite it this way:

$$\sin(90^\circ - A) = \cos A$$

We can use this intermation to derive the formula for an (A + B). To inderstand this derivation, you must recognize that A + B and BC = (A + B) are complementary makes.

The same of an angle is the cosine of its complement 
$$= \cos |9C' - A - E|$$
 Regrespy within brackets 
$$= \cos |(9C' - A) - B|$$
 Regrespy within brackets

Now we called using the formula for the desire of a difference.

$$= \cos \left(90^{\circ} - A\right) \cos B + \sin \left(90^{\circ} - A\right) \sin B$$
$$= \sin A \cos B + \cos A \sin B$$

This gives as an expansion formula for  $\sin \phi t = B t$ .

$$\operatorname{sch}(A \cap B) = \operatorname{sch}(A \operatorname{cov} B + \operatorname{cov}(A \operatorname{sch}))$$

This is the forms a for the side of a sum. In find the forms is for  $\sin(A+B)$ , we write A+B as A+(-B) and proceed as follows:

$$\sin (A = B) = \sin [A + (-B)]$$

$$= \sin A \cos (-B) + \cos A \sin (-B)$$

$$= \sin A \cos B + \cos A \sin B$$

This gives us the forecase for the sine of a difference.

Chaple 7 -- 4 sin Selects 3c + 4 cos 5c sin Select 10 cos ... 3c ... 3c from a -- 3c ... 3c .

**SOLUTION** To project the equation in the form  $y \in A$   $\sin Bx_0$  we factor 4 from each term on the right and then apply the diametric for  $\sin (A + B)$  to the neuralizing expression to write it as a single trigonometric function.

The graph of y=4 s  $(2\pi)$  will have an amplitude of 4 and a period of  $2\pi/2 \approx \pi$ . The graph E shown in Figure 2.

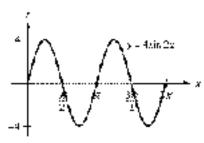

Figure 3

Fig. 1 and the exact value of sec. (7)

**SOLUTION** We have to write #712 in terms of two numbers for which the mach values are known. The numbers #73 and #74 with wors because their difference is #7.2.

$$\sin\frac{\pi}{4\lambda} = \sin\left(\frac{\pi}{3} - \frac{\pi}{4}\right)$$

$$= \sin\frac{\pi}{3}\cos^{2}\frac{\pi}{4} - \cos\frac{\pi}{3}\sin\frac{\pi}{4}$$

$$= \frac{\sqrt{3}}{2} \cdot \frac{\sqrt{2}}{2} - \frac{1}{2} \cdot \frac{\sqrt{2}}{2}$$

$$= \frac{\sqrt{6} - \sqrt{2}}{4}$$

First is the same above: we obtained in Figure 1.1 when we mand the exact value of  $\cos 75^\circ$ . It should be, though, because  $\sqrt{12} = 15^\circ$ , which is the contribution of  $5^\circ$ , and the cosine of an angle is equal to the sate of its complement.

**TEXAMPLE 7.** So if sin  $A = \frac{3}{5}$  with A in QI and  $\cos B = -\frac{3}{15}$  with B in QIII, find  $\sin (A + B)$ ,  $\cos (A + B)$ , and  $\tan (A + B)$ .

**SOLUTION** We have sin A and loss N. We need to find one A and sin B before we can apply any of our formulas. Some equivalent forms of our first Pythagorean identity will bely here.

sitt 
$$A = \frac{2}{5}$$
 with  $A$  at  $\mathbb{Q}I$ , then
$$\cos A = \pm \sqrt{1 - \sin^2 A}$$

$$= -\sqrt{1 - \left(\frac{3}{5}\right)^2} \qquad A \in \mathbb{Q}I$$
, so too  $A$  is positive
$$= \frac{4}{5}$$

Figs.  $B=-\frac{\pi}{3}$  with B in QIII, then

$$\sin B = \pm \sqrt{1 + \cos^2 B}$$

$$= -\sqrt{1 + \left(-\frac{5}{4}\right)^2}$$

$$= \frac{12}{13}$$

$$= \frac{12}{13}$$

We have

$$\sin \alpha = \frac{3}{2} \qquad \sin \beta = -\frac{12}{13}$$
$$\cos A = \frac{4}{4} \qquad \cos F = -\frac{3}{4}$$

Thurston,

$$\sin (A - B) = \sin A \cos B + \cos A \sin B$$

$$= \frac{3}{5} \begin{pmatrix} -5 \\ -13 \end{pmatrix} + \frac{4}{3} \begin{pmatrix} -12 \\ -13 \end{pmatrix}$$

$$= \frac{63}{65}$$

$$\cos (A - B) + \cos A \cos B + \sin A \sin B$$

$$= \frac{4}{5} \left( -\frac{5}{13} \right) + \frac{3}{5} \left( -\frac{12}{13} \right)$$

$$= \frac{6}{65}$$

$$\tan (A - B) = \frac{\sin (A + B)}{\cos (A + B)}$$

$$= \frac{6365}{1665}$$

Notice also that A = B must terminate in QIV because

$$\sin(A + B) \le 0$$
 and  $\cos(A + B) > 0$ 

White working Grough the last part of Example 7, you may have wondered if there is a separate formula formula (A = B), (More likely, you me hoping there is after Thane 1s, and it is derived from the formulas we already have.

$$\tan (A + B) = \frac{\sin (A + B)}{\cos (A + B)}$$
$$= \frac{\sin A \cos B + \cos A \sin B}{\cos A \cos B} = 4.1 A \cos B$$

To be able to write Pis last line in terms of tangents only, we must divide numbers as and descending by  $\cos A \cos B$ .

$$= \frac{\frac{\sin A \cos B}{\cos A \cos B}}{\frac{\cos A \cos B}{\cos A \cos B}} = \frac{\cos A \sin B}{\cos A \cos B}$$
$$\frac{\cos A \cos B}{\cos A \cos B} = \frac{\tan A + \tan B}{1 + \tan A \tan B}$$

The formula for  $\log (A + S)$  is

$$\operatorname{tgn}(01 \sim P) = \frac{\operatorname{tfen}(0)}{1 + \operatorname{tan} A} \operatorname{tan} B$$

Because rangem is an odd function, the formula for (an (A + B)) will look like this:

$$to a (A, -B) = \frac{t \ln A - t \ln B}{1 - \sin A \tan B}$$

**EXAMPLE B** (201) Tr  $\sin A = \frac{2}{3}$  with A in QI and  $\cos B = -\frac{2}{13}$  with B in QI1, that for (A + B) by using the formula

$$\lim_{A \to B} (A - B) = \lim_{A \to B} A = \lim_{A \to B} B$$

$$= \lim_{A \to B} A = \lim_{A \to B} B$$

**EOLUTION** Che angles A and B as given here are the same ones used grey ously in frample 7. Looking over fixample 7 again, we find that

$$\operatorname{tgn} A = \frac{\sin^2 A}{678A} \quad \text{and} \quad \operatorname{tgn} B = \frac{544 B}{688 B}$$

$$= \frac{3}{14} \quad = \frac{12}{13}$$

$$= \frac{12}{13}$$

$$= \frac{12}{13}$$

$$= \frac{12}{13}$$

$$= \frac{12}{13}$$

Therefore.

$$\frac{\tan (A + B)}{1 + \tan A} = \frac{\tan A + \tan B}{1 + \tan A \tan B}$$

$$= \frac{\frac{2}{7} - \frac{12}{5}}{-\frac{2}{4} \cdot \frac{12}{5}}$$

$$= \frac{\frac{15}{10} + \frac{48}{20}}{1 - \frac{9}{5}}$$

$$= \frac{63}{3}$$

$$= \frac{63}{16}$$

which is the same rosal two obtained previously

### common detting ready for class

After reading through the preceding section, respond in your own words and in complete tentences.

**a.** Why is it necessary to have sum and difference formulas for sine, cosine, and tangent?

- b. Write joth the sum and the difference figure as for tosine
- e. Write both the sum and the difference formulas for sine.
- d. Write both the sum and the difference formulas for rangent.

### REMENT ERDRIGNE

The problems in a Hotlaw nemero server of we describe Section 4.2. Coupling complete upon 3.3 each of the for inways:

68. 
$$y = 4 \sin \lambda v$$

$$\mathbf{MT}_{\mathbf{x}_{-},\mathbf{y}} = (0.810 \, \frac{1}{2})^{2}$$

**68.** 
$$y = 5 \text{ an } \frac{1}{3}$$

70 
$$y = c n \epsilon / k \pi c$$

72. 
$$y = \sec 3x$$

7.5. 
$$y = \frac{1}{2}\cos 3x$$

$$74. \ y \approx \frac{1}{2} \sin 3\alpha$$

$$75. \ v = \frac{i}{2} \sin \frac{i\pi}{2} x$$

**76.** 
$$y = 2 \sin \frac{\pi}{2} c$$

# BIC 30N 5.3 DOUBLE-ANGLE FORMULAS

We will begin this section by deriving the formaliss for sin 5.4 and  $\cos 2A$  using the formulas for sin 4.4  $\pm B$ ) and  $\cos (4. \pm B)$ . The formulas we derive for  $\sin 2A$  and  $\cos 2A$  are called  $double \cdot angle$  formulas. Here is the period, on of the formula (or sin) 2A

The last line gives us our first double-angle formula.

$$\sin 2\delta = 2 \sin A \cos A$$

The first thing to notice about this formula is that it indicates the 2 in air 24 around be factored exit and written so a coefficient. That is,

As example, if A=30 f,  $\sin 2\cdot 30^n=\sin 60^n+\sqrt{3}\sqrt{2}$  , which is not the same as  $2\sin 50^n+3(\frac{1}{2})=1$ 

**SOLUTION** To apply the formula for sin (24), we saled first find con A. Becques A terromane. In Olf, the A is negative,

eas 
$$A = \pm \sqrt{3 + \sin^2 A}$$
  
 $= -\sqrt{1 + \left(\frac{3}{5}\right)^2}$   $A \in \mathbf{QL}$ , so  $\cos A$  is negative  $= -\frac{4}{5}$ 

Now we one apply the formula for sin 2.4

$$\sin 2A = 2 \sin A \cos A$$
$$= 2 \left( \frac{3}{5} \right) \left( -\frac{4}{5} \right)$$
$$= -\frac{24}{25}$$

We can also use our new formula to expand the work we did previously with identities

# **Prove** (sin # ± cos 5 i<sup>2</sup> = ... + s.π 25.

### PROOF

$$\begin{aligned} (\sin\theta + \cos\theta)^2 &= \sin\theta - 2\sin\theta\cos\theta + \cos^2\theta & \text{ Lineard} \\ &= a + 2\sin\theta\cos\theta & \text{ Pythagonalo identity} \\ &= a + \sin2\theta & \text{ Double-angle identity} \end{aligned}$$

**EXAMPLE** 3.4. Prove 
$$\sin 2\epsilon = \frac{2 \cot x}{1 + 2 \cot^2 x}$$

### PROOF

$$\frac{2 \cot z}{1 + \cot^2 x} = \frac{2 \cdot \frac{\cos z}{\sin x}}{1 + \frac{\cos z}{\sin^2 z}}$$

$$\frac{2 \sin z \cot z}{4 \ln z + \cos z}$$

$$\frac{2 \sin z \cot z}{4 \ln z + \cos z}$$

$$\frac{2 \sin z \cot z}{4 \ln z + \cos z}$$

$$\frac{2 \sin z \cot z}{2 \sin z \cot z}$$
Pythageresis identity
$$\sin 2z$$
Double-single identity

There are forms of the disable-angle formula for e.o. 24. The first involves both sur. A and c.o. A. the second involves only cos. A. and the third involves only sin. A. Here is how we obtain the three formulas.

$$\cos 2\beta = \cos (A + A) \qquad \qquad \text{Write } 2A \Rightarrow A + A$$
$$\cos A \cos A = \sin A \sin A \qquad \text{Sum Countly}$$
$$= \cos^2 A = \sin^2 A$$

To write this last formula in terms of  $\cos A$  only, we substitute  $1 - \cos^2 A$  for  $\sin^2 A$ .

$$\cos 2A = \cos^2 A + (1 + \cos^2 A)$$
$$= \cos^2 A + 1 + \cot^2 A$$
$$= 2 \cos^2 A + 1$$

To write the formula in terms of sin A only, we substitute  $1 = \sin^2 4$  for  $\cos^2 A$  in the last 1 no above.

$$\cos 2A = 3 \cot^2 A$$
= 3(1 + \sir^4 A) + 1  
= 3 + 3 \sir^4 A + 1  
= 1 + 2 \sir^4 A

If are are the three forms of the couple ongle formula for cas 24.

cos 
$$2A = \cos^2 a + \sin^2 A$$
 First form  
=  $2\cos^2 A + 1$  Second form  
=  $1 - 2\sin^2 A$  Third form

Which form we choose will depend on the circumstances of the problem, as the next three examples all starte.

**EXAMPLE** 4.88 If 
$$\sin A = \frac{1}{\sqrt{5}}$$
, lind  $\cos 2A$ .

**SOLUTION**—In this case, because we can given sin **A**, applying the third form of the formula for cos **2A** will give us the suswer more quickly than applying cline, of the other two forms.

cas 
$$24 = 6 - 2 \sin^2 \theta$$
  

$$= 1 - 2 \left( \sqrt{5} \right)^2$$

$$= 1 + \frac{2}{5}$$

$$= \frac{1}{5}$$

**PROOF** We can write sess that as cost (7 - 2a) and apply our durbue-sately domesta. Because the right side is written unternal of costs on y, we will also so the second force of our double-single formula for one 3.4.

$$\begin{array}{lll} \cos 4x + \cos (? \cdot 7z) \\ + 2 \cos^2 2x - 1 & \text{Double-major formula} \\ + 2 (2 \cos^2 x - 1)^2 \cdot 3 & \text{Double-major formula} \\ + 2 (4 \cos^4 x - 4 \cos^2 x - 1) - 1 & \text{Square} \\ + 8 \cos^2 x + 6 \cos^2 x + 2 - 1 & \text{Distailbase} \\ + 8 \cos^2 x - 8 \cos^2 x + 1 & \text{Samptify} \end{array}$$

# **EXAMPLE 2** (Cuple) 3 - 6 sin - 5 decor - 9 L : 2 x,

**SCILUTION** . Depend the imposture of the form p = A gos  $Br_1$  we tackly 3 times as 8 form on the right selected their apply the feature b loss can 2A to the recommission processes b, when b is a single tragonometric function.

The graph of y=3 cos 2x will have an amplitude of 3 and a period of  $2\pi/2=\pi$ . The graph is shown in Figure 1.

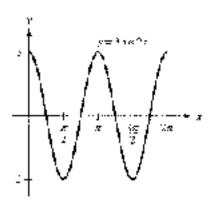

Figure 1

PROOF

$$\frac{1 + \cos 2\theta}{\cos 2\theta} = \frac{1 + (1 - 2\sin^2 \theta)}{2 \sin \theta \cos \theta}$$
 Pouble angle formula:
$$= \frac{2 \sin^2 \theta}{2 \sin \theta \cos \theta}$$
 Simplify numerator
$$= \frac{\sin \theta}{\cos \theta}$$
 Divide out common tactor?  $\sin \theta$ 

$$= \tan \theta$$
 Ratio identity

We end this section by deriving the formula for tan LA

$$\begin{array}{c} \tan 2A = \tan (A + A) \\ = \frac{\sin A + \sin A}{3 + \tan A} \\ = \frac{2 \cos A}{1 + \sin A} \end{array}$$

Our double angle farantia for an 24 is:

$$\frac{1}{2} \tan 2A = \frac{2 \sin A}{1 + \tan^2 A}$$

NOTE (Or control if you already know the value of stated and rost 2a letter your our hard tan 21 usturg to a ratio ofe outsy

$$au(E) = \frac{dE/ET}{cov(2N)}$$

# **EXECUTE: E** Simplify $\frac{2 \log 2.5^{\circ}}{1 + \log^2 15^{\circ}}$ .

SOLUTION The expression has the same form as the right side of our doubleangle formula for tail 24. Therefore,

$$\frac{1 \tan 18^{o}}{1 - \tan^{2} 15^{o}} = \tan (2 - 15^{o})$$
$$= 6 \sin 30^{o}$$
$$= \frac{1}{3.05}$$

If x=3 tan  $\theta$ , write the expression helical in terms of

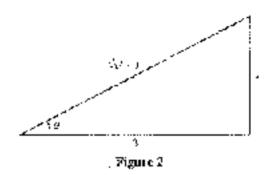

$$\frac{\theta}{2} + \frac{\sin 2\theta}{4}$$

SOLUTION: Reserve fute for the first furnishment, we need to write this terrors of x. To also x, we so so so the count on x + 3 in  $\theta$  for  $\theta$ .

$$\begin{array}{ll} 0! & 3 \cos \theta + x \\ \cos \theta & -\frac{x^2}{3} \\ \cos \theta & \theta + \tan^{-1} \frac{\pi^2}{3} \end{array}$$
 and 
$$\theta = \tan^{-1} \frac{\pi^2}{3}$$

Next, because the inverse suggest function can take on values only retween  $-\pi^2/2$  and  $\pi^2/2$  we can vasualize if by consump a right manage to which  $\theta$  is one of the attaining tagles. Because ran  $d \approx \pi^2$ , we light the side opposite 5 with a and the side at atom in  $\theta$  with  $\theta$ .

By the Pythegorean Theorem, the hypotentials of the thangle in Figure 2 grapt has  $\sqrt{x^2+9}$ , which means  $\sin b = o^3 e(x^2+9)$  and  $\cos \theta = 3V\sqrt{x^2+9}$ . Now we are trady to simply  $\frac{1}{2}$  and substitute to solve our problem.

$$\frac{\theta}{t} + \frac{\sin 2\theta}{\theta} = \frac{\theta}{2} + \frac{2 \sin \theta \cos \theta}{4}$$

$$= \frac{\theta}{2} + \frac{\sin \theta \cos \theta}{2}$$

$$= \frac{1}{2} \cot \theta \cos \theta$$

$$= \frac{1}{2} \left( \cos^{-1} \frac{\pi}{3} + \frac{\pi}{\sqrt{x^2 + 9}} + \frac{3}{\sqrt{x^2 + 9}} \right)$$

$$= \frac{1}{2} \left( \tan^{-1} \frac{\pi}{3} + \frac{\pi}{\sqrt{x^2 + 9}} \right)$$

Note that we do not have to use absolute value symbols when we multiply and simplify the square notes in the second to the last line above recause we know that  $x^2 = 9$  is always positive.

#### REVIEW PROFESAS

The proNems that follow review material we obsered in Sections 4.3 and 4.6. Graph such at the following from z=0 to z=0 .

65. 
$$y = 2 = 2 \cos x$$

**66.** 
$$y - 2 = 2 \cos x$$

67. 
$$y = 3 = 3 \cos x$$

**68.** 
$$y = 3 = 3 \cos x$$

$$690 \ y = 108 \ x + \frac{1}{2} \sin 2x$$

**70.** 
$$y = \sin x + \frac{\pi}{2}\cos 2x$$

Graph each of the following from a=0 at a=8.

71. 
$$y = \frac{1}{2}x + \sin wx$$

$$-72, \ \ n=n+\sin\frac{\pi}{2}x$$

# SECTION 5.4 HALF-ANGLE FORMULAS

In this section, we will derive formulas for  $\sin\frac{A}{2}$  and  $\cos\frac{A}{2}$ . These formulas are called nelf-axely formulas and are derived from the fourthe-angle formulas for  $\cos 2A$ .

In Section 5.3, we developed three ways 5; write the formula for cos 24, two of which were

ore 
$$24 + 2\sin^2 4$$
 and  $\cos 24 + 2\cos^2 A + 1$ 

The choice of the letter we use to denote the angles in these fermious is arbitrary, so we can use a histration! At

$$\cos 2x = 1 + 2 \sin^2 x$$
 and  $\cos 2x = 2 \cos^2 x = 1$ 

Let us expliance his extinction from formula and xetyp for single

1 = 
$$\frac{2}{2}\sin^2 x = \cos 2x$$
 Hapfings sides  
=  $3\sin^2 x = -1 + \cos 2x$  April 1 in born sides  

$$\sin^2 x = \frac{1 - \cos 2x}{2}$$
 Divide both sides by  $-2$   

$$\sin^2 x = \pm \frac{2}{3} \frac{1 - \cos 2x}{2}$$
 Take the square option to the sides

Because every value of x can be written as  $\xi$  on some other number  $\delta$ , which replace a with  $\delta Q$  1 has a equivalent to saying  $dx = \delta$ .

$$\sin\frac{\lambda}{2} = i \frac{\sqrt{1-\cos \alpha}}{\sqrt{1-2}}$$

This last expression is the half-angle formula. For  $\sin\frac{\lambda}{2}$ . To fine the half-angle formula for  $\cos\frac{A}{2}$ , we solve  $\cos2\lambda=2\cos^2x=1$  for  $\cos\lambda$  and then rectine a with A/2 (and 2x with A). Without showing the steps involved in this process, term is the result.

$$\cos\frac{A}{2} = \pm \sqrt{\frac{1-\cos A}{2}}$$

In both half-angle formulas, the sign in front of the radical,  $-\infty +$ , is determined by the quadrant in which A/2 terminates.

**EXAMPLE** 4.3.2 If 
$$\cos A = \frac{3}{5}$$
 with 370° <  $A < 350$ °, find  $\sin \frac{A}{2}$ ,  $\cos \frac{A}{2}$  and  $\cot \frac{A}{2}$ 

SDI UTION Threst of all, we determine the question for which All formulation.

In QII, since is positive, and occurs is asymive. Using the half angle formulas, we have

$$\sin \frac{A}{2} = \sqrt{\frac{1 + \cos A}{2}} \qquad \cos \frac{A}{2} = -\sqrt{\frac{1 + \cos A}{2}}$$
$$= \sqrt{\frac{1 + 3/5}{2}}$$
$$= \sqrt{\frac{1}{5}}$$
$$= -\sqrt{\frac{1}{5}}$$
$$= -\frac{1}{\sqrt{3}}$$
$$\cos \frac{A}{2} = -\sqrt{\frac{1 + \cos A}{2}}$$
$$= -\sqrt{\frac{1 + 3/5}{2}}$$
$$= -\sqrt{\frac{2}{3}}$$
$$= -\frac{2}{\sqrt{3}}$$

Now we can use a sabe ideality to find that  $\frac{A}{2}$ .

$$\tan \frac{A}{2} = \frac{\sin \frac{A}{2}}{\cos \frac{A}{2}} = \frac{\frac{1}{\sqrt{3}\sqrt{3}}}{\frac{2}{\sqrt{3}\sqrt{3}}} = -\frac{1}{2}$$

**EXAMPLE 2.** At  $\sin A = -\frac{iA}{3}$  with  $180^{\circ} < A < 270^{\circ}$ , that the six trigonometric functions of AD

**SOLUTION**. To use the held-ragge formulas, we need to itsi cond. Becomes  $A \in Q(0)$ , cos A is arguing, so

c.s 
$$A = \pm \sqrt{3} = \sin^2 A$$
  

$$= -\sqrt{z + \left(-\frac{12}{13}\right)}$$
 We use the pagetive square root because one  $A$  is negative 
$$-\sqrt{\frac{35}{169}}$$
 
$$= -\frac{5}{13}$$

A sup  $A/\Delta$  remainables in QIII because

$$\begin{array}{ll} c'' & = -i80\% < A <: 270\% \\ cent & = \frac{-80\%}{2} <: \frac{A}{2} <: \frac{2.00\%}{2} \\ & = -90\% < \frac{A}{2} <: 185\% & = -85 \frac{A}{2} \subseteq \mathbb{Q} \% \end{array}$$

In QII, time is positive and course is negative. The holf angle formation give us

$$\sin \frac{A}{y} = \pm \sqrt{\frac{1 - \cos A}{2}} \qquad \cot \frac{A}{y} = \pm \sqrt{\frac{1 - \cos A}{2}}$$

$$= \pm \sqrt{\frac{1 - 4 \cdot 5/43}{2}} \qquad = -\sqrt{\frac{4 + (-5/43)}{2}}$$

$$= -\sqrt{\frac{9}{13}} \qquad = -\sqrt{\frac{4}{13}}$$

$$= \pm \frac{3}{\sqrt{13}} \qquad = -\frac{2}{\sqrt{43}}$$

Now that we have sine and cosine of A/2, we can apply the ratio identity for tangent to find ten  $\frac{A}{2}$ .

$$\tan \frac{A}{2} = \frac{\sin \frac{A}{2}}{\cos \frac{A}{2}} = \frac{\frac{3}{\sqrt{12}}}{\frac{7}{\sqrt{12}}} = \frac{3}{2}$$

Next, we sprily conreceptoral identaties to find cross and secard, and colongent of AAL

$$\cos \frac{A}{2} = \frac{1}{\sin \frac{A}{2}} \qquad \sec \frac{A}{2} = \frac{1}{\cos \frac{A}{2}} \qquad \cot \frac{A}{2} = \frac{1}{\sin \frac{A}{2}} = \frac{1}{\sin \frac{A$$

In the provious two examples, we found to  $\frac{A}{b}$  by using the ratio of  $\sin\frac{A}{b}$  to  $\cos\frac{A}{b}$ . There are founding that allow us to find to  $\frac{A}{b}$  directly from and and  $\cos \lambda$ . In Example 7 of Section 5.3, we proved the following identity:

$$\cos\theta = \frac{1 + \cos 2\theta}{\sin 2\theta}$$

If we let  $t=\frac{A}{2}$  in this identify, we also in a horizon for tan  $\frac{A}{2}$  that imposes only  $\sin A$  and east A. Here it is,

$$\tan\frac{A}{2} = \frac{1 + \cos A}{\sin \delta}$$

If we multiply the numerator and denominator of the right eide of this formula by  $1-\cos A$  and simplify the result, we have a second to made for  $\tan \frac{A}{A}$ 

$$\cot \frac{A}{a} = \frac{\sin A}{1 - \cos A}$$

# EXAMPLE 3 1 Had tag 15

**SOLUTION** Receive  $15^\circ = 3072$  we can use a half-engic formula to find for  $15^\circ$ .

$$fan 15° = fan \frac{30°}{7}$$

$$= \frac{1}{\sin 30°}$$

$$= \frac{1 - \cos 30°}{\sin 30°}$$

$$= \frac{1 - \frac{30°}{2}}{1}$$

$$= \frac{1 - \frac{30°}{2}}{1}$$

Chapt 
$$y = 4\cos^2\frac{x}{2}$$
 from  $y = 0$  for  $x = 4\pi$ .

**SOLUTION** Applying our half angle formula for  $\cos \frac{d}{2}$  to the right side, we have

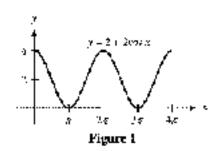

$$y = 4 \cos^2 \frac{x}{y}$$

$$= 4 \left( 2 \sqrt{\frac{1 + \cos x}{2}} \right)^2$$

$$= 4 \left( \frac{1 + \cos x}{2} \right)$$

$$= 2 + 2 \cos x$$

The graph of p = 2 - 2 describes an amplitude of 2 and a variety matrix store 2 matrix upward. The graph is shown in Figure 1.

# **EXAMPLE 5.19** Processes $\frac{x}{2} = \frac{\sin x}{2 \sin x}$

**PROOF** We can use a half-rangle formula to the left side. In this case, because we have  $\sin^2(\omega Z)$ , we write the half-rangle formula without the square mot sign. After that we multiply the numerator and denominator on the left side by tank because the light side has  $\sin x$  in both the numerator and the denominator.

$$\frac{\sin^2\frac{\pi}{2}}{2} = \frac{1 - \cos \pi}{2}$$

$$= \frac{\tan \pi}{1 \sin \pi} = \frac{1 - \cos \pi}{2}$$

$$= \frac{\tan \pi}{1 \sin \pi} = \frac{1 - \cos \pi}{2}$$

$$= \frac{\tan \pi}{1 \cos \pi} = \frac{1 - \cos \pi}{2 \cos \pi}$$

$$= \frac{\tan \pi}{2 \cos \pi} = \frac{1 - \cos \pi}{2 \cos \pi}$$

$$= \frac{\tan \pi}{2 \cos \pi} = \frac{1 - \cos \pi}{2 \cos \pi}$$

$$= \frac{\tan \pi}{2 \cos \pi} = \frac{1 - \cos \pi}{2 \cos \pi}$$

$$= \frac{1 -$$

### GETTING READY FOR CLASS

A last reading through the proceeding section, respond in your own words and in complete sentences.

- a. From what other formulas are half-angle formulas derived?
- its What is the form als for sin (A/2)I
- What is the formula for ons (4/2)\*
- d. What are the two Critarias for fore (4/2)?

- 1. If  $0'' \le A \le 90''$  then A/2 terminates its which quadratiff
- 2. 注册的村本 A C EB):then A P to mountex in which gradeon?
- $A_{\rm c}$  if  $180^{\circ} < A < 270^{\circ}$ , then A62 formulates in which quadrant?
- If 2.40° < 4. < 1602, 1505 A/2 formulates in which quadrant?</li>
- 5. If 4800 < 4 < 2700, then is gin (477) residue of negative?
- **b** If  $C^{*}U^{*} \le A \le C(\Omega^{*})$  then is one (s, 2) positive or proprietion.
- Three or false. If sin A is positive, then set (4/2) is provide as well.
- X. True of false. Highes A is negative, then cos (ACI) is negative as well.

Note: For the following problems, assume that all the given angles are in simplest Name, so that at  $\lambda$  is in QEV good may assume that  $070^\circ < \lambda < 250^\circ$  .

if  $\cos A = \frac{1}{2}$  with A in QeV find

$$9. \sin \frac{A}{2}$$

$$50,\ \cos\frac{A}{2}$$

$$\Omega_{\rm c} \cos \frac{\lambda}{2}$$

**55.** 
$$\cos^4 h = \frac{1}{4} + \frac{\cos 2\theta}{2} + \frac{\cos^3 2\theta}{4}$$

$$56.4 \times 10^4 H \simeq 10^{-12} \cos 20^{-1} \cos^2 2 H$$

#### BEVIEW PROBLEMS

The following problems records in Alexandrian or converted in Section 4 . Reviewing these positions will help given with the mass section.

Involunte, wethors it king a calculatement abids.

57. Sin 
$$\left(\arg\sin\frac{3}{5}\right)$$

58. 
$$\cos\left(\arcsin\frac{35}{54}\right)$$

With an expectation) depressions that involves were y

$$\mathbf{ML}...\sin\left(\tan^{-1}x\right)$$

fig. gos 
$$(\tan^{-1} x)$$

66. Chiph 
$$y = \cos^{-1} x$$

#### EXTENDING THE COMORPYS

$$d \sim \cos^{-1} \left[ \sin \left( LT_1 \right) \sin \left( LT_2 \right) + \cos \left( LT_1 \right) \cos \left( LT_2 \right) \cos \left( LT_2 \right) \right]$$

An attenue formula first can be used is

$$d = 2 \sin^{-1} \left( \sqrt[4]{\sin^2 \left( \frac{d \Delta t_1}{2} \frac{d \Delta t_2}{2} \right) + \cos \left( t / \tau_1^2 \cos \left( t / \tau_2 \right) \right) \cos^2 \left( \frac{t / \Delta t_2}{2} \frac{d \Delta t_2}{2} \right) } \right) \right)$$

Prove that by setting these two expressions equal to one a nother, the result is an identity.

# ${f 5.5}$ . ADDITIONAL IDENTITIES

There are two rangingous to this section, noting which rely on the work we have doing previously with ideacties and formulas, in the first part of this can mi, we will extend our work on identities to include problems that invoke inverse trigor constitutions, he the second gars, we will use the formulas we obtained for the sine and cosine of a sum or difference to write some rew forms (as involving sums and products.

### Identities and Formulas Involving Inverse Functions

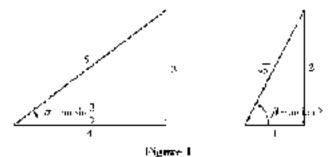

The solution to our first example combines our knowledge of inverse trigonometric functions with our formula for  $\sin(\phi)=B$ )

Example 1000 Evaluate sin (ares n ) -- arctan 2) without using a culator

**SOLUTION** We can simplify things somewhat if we let  $\alpha = \arcsin \frac{1}{2}$  and  $\beta = \arctan 2$ .

$$\sin\left(\max_{\beta} \frac{3}{5} + \arctan 2\right) = \sin_{\beta}(\alpha + \beta)$$
$$= \sin(\alpha \cos \beta) + \cos(\alpha \sin \beta)$$

Drawing and inhelling a triangle for  $\alpha$  and another for  $\beta$ , we have

From the manufestic Figure 1, we have

$$\sin \alpha = \frac{3}{8} \qquad \sin \beta = \frac{2}{\sqrt{\epsilon}}$$

$$\cos \alpha = \frac{4}{8} \qquad \cos \beta = \frac{2}{\sqrt{\epsilon}}$$

Substituting these recorders into

gives as

$$\frac{3}{5} \cdot \frac{1}{\sqrt{5}} = \frac{4}{5} \cdot \frac{2}{\sqrt{5}} = \frac{11}{5\sqrt{5}}$$

Coloratertor Morce To ejeck our unswer for Example 1, using a calculator, we would use the following someone:

#### Scientiffi Calculater.

$$3 \pm 5 + [s_0 e^{-i}] \pm 2 [tac^{-i}] + [sin]$$

### Graphing Calculation

$$\left|\left\langle n\right|\left(\left|\left\langle s,n\right\rangle\right|\left(\left|\left|\left\langle \frac{1}{2}\right|\right|\right)\right)\left(1\right)\right|\left|\left\langle n\right\rangle\right|\left(\left|\left\langle 2\right|\right|\right)\right|+\left|\left\langle 2\right|\right|\left(\left|\left\langle 2\right|\right|\right)\right|+\left|\left\langle 2\right|\right|\left(\left|\left\langle 2\right|\right|\right)\right|$$

The display would show 0.9839 to four decimal places, which is the decimal approximation of  $\frac{11}{|\mathcal{S} \cup \mathcal{S}|}$  It is appropriate to check your work on problems like this by using your calculator. The concepts are best understood, bowever, by working through the explainable without using a calculator.

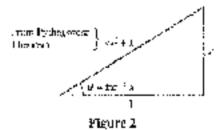

Here is a similar example involving caverse trigocontests functions and a souther angle identity.

Write sin (2 tan 1 x) as an equivalent expression involving only x. (Assume x is positive.)

**SOLUTION** We begin by letting  $9 = \lim_{n \to \infty} x_n$  which means

$$\tan\theta=\pi=\frac{\gamma}{\epsilon}$$

Onew a right triangle with an acute angle of  $\theta$  and take the opposite side with x and the adjacent side with 1 Then the entire of the side opposite  $\theta$  to the side adjacent at  $\theta$  is x = x.

Prints 14 years 7, we have

$$\det\theta = \frac{1}{\sqrt{x^2 + y}} \qquad \text{and} \qquad \cos\theta = \frac{1}{\sqrt{x^2 + y}}$$

There by e.

$$\begin{array}{lll} \sin\left(2\tan\left(\pi x\right)\right) & \sin\left(2\theta\right) & \text{States into the proof of } \\ & = 2\sin\theta\cos\theta & \text{Double-single identity} \\ & = 2\cdot\frac{\pi}{\sqrt{\pi^2+1}} \cdot \frac{1}{\sqrt{\pi^2+1}} & \text{Proof largue 2} \\ & = \frac{2\pi}{\pi^2 \times 2} & \text{Materpheation} \end{array}$$

To conclude our work with identities in this chageer, we will review some additional fractions that contain those and modules of sines and country.

### Product to Sum Formulas

If we add the formal a for  $\sin (A - B)$  to the formula for  $\sin (A - B)$ , we will executally arrive at a formula for the product  $\sin A \cos B$ .

$$\begin{array}{ll} \sin A \cos B + \cos A \sin B = \sin (A + B) \\ \sin A \cos B + \cos A \sin B = \sin (A + B) \\ 2 \sin A \cos B & -\sin (A + B) + \sin (A + B) \end{array}$$

Divising both sides of this peaks by 2 gives us

$$\sin A \cos B = \frac{1}{2} (\sin (A + B) + \sin (A + B)) \tag{1}$$

By similar methods, we can derive the formula that follow.

$$\cos A \sin B = \frac{1}{2} [\sin (A + B) + \sin (A + B)] \tag{2}$$

$$\cos A\cos B \approx \frac{1}{2}[\cos (A+B) + \cos (B+B)] \tag{3}$$

$$\sin A \sin A \sin A + \frac{1}{2} [\cos (A + B) + \cos (A + B)]$$
 (4)

These four product formulas are of use in calculus. The reason they are useful is that they indicate how we can conven a procedual is a sum. In calculus, it is sometimes much soster to work with sums of trigonometric functions than it is to work with products.

**製造機能を表現しま**ない。Verify product formula (3) for 4 = 30° and 5 = 100°.

**SOLUTION** Substituting  $A \sim 30^{\circ}$  and  $B = 120^{\circ}$  is to

Let 
$$A$$
 lets  $B > \frac{1}{2}[\mathbf{c}, \infty(A \pm B) \pm \cos(A \pm B)]$ 

we lake

$$\begin{split} \cos 30^{\circ} \cos 120^{\circ} &= \frac{1}{2} [\cos 130^{\circ} - \cos x) \cdot [90^{\circ}y] \\ &= \frac{\sqrt{x}}{2} \cdot \left( -\frac{y}{2} \right) + \frac{1}{2} \left( -\frac{\sqrt{y}}{2} + 5 \right) \\ &= -\frac{\sqrt{y}}{4} = -\frac{\sqrt{y}}{2} \end{split} \quad \text{A true statement}$$

Write 10 cts 5x sin 2x as a sun or difference.

**SOLUTION** Product forms a (2) is appropriate for sole spinssion of the form  $\cos A \sin B$  if we substitute  $A = 5 c \cot B + 3 c$ , then

10 cos fig site 
$$3x \simeq 10 \cdot \frac{1}{9} [\sin (5x - 3x) - \sin (5x + 3x)]$$
  
  $\simeq 5 (\sin 8x - 3) \cos 2x$ 

### Sum to Product Formulas

By some simple manipulations we can change our product form an into sum for thirds, if we take the formula to  $\sin A \cos B$ , exchange codes, and then mustiply through by 2 we have

$$\sin(iA + B) \sim \sin(iA + B) = 3\sin A\cos B$$

if We let a = A + B and  $\beta = A + B$ , then we can solve for A by adding the left sides and the right effect.

$$A + B = \alpha$$

$$A + B = \beta$$

$$2A = \alpha + \beta$$

$$A = \frac{3}{2} \frac{-\beta}{2}$$

By subtracting the express on for  $\beta$  from the expression for  $\alpha$ , we have

$$R = \frac{R - \Omega}{2}$$

Writing the equation  $\sin(A+B)$  is air (A+B) in  $\mathbb{C}$  and A one B in Lemma of A and B gives us non-first sum formula:

$$\sin \alpha + \sin \beta - 2 \sin \frac{\alpha + \frac{1}{2} \sin \alpha}{2} \cos \frac{\alpha}{3} \frac{f^{4}}{2}$$
 (5)

Similarly, the following cant formulae can be derived from the other product formulas:

$$\sin n = \sin \beta + 2\cos^{-2} \frac{\beta}{2} \sin^{-2} \frac{\beta}{2} \qquad (6)$$

$$1 - \cos \alpha + \cos \beta = 2 \cos \frac{\sin \beta}{2} \cdot \cos \frac{\alpha - \beta}{2}. \tag{7}$$

$$\cos \alpha + \cos \beta = -2\sin\frac{\alpha + \beta}{2}\sin\frac{\alpha + \beta}{2}$$
 (8)

Ven ty countries with 18 - 90° and 3 - 90°.

**SOLUTION** We substitute  $\alpha = 30^{\circ}$  and  $\beta = 50^{\circ}$  into sum formade (7) and simplify each side of the resulting equation.

$$\begin{aligned} \cos 30^{6} + \cos 90^{6} &= 2 \cos \frac{40^{6} + 90^{6}}{2} \cos \frac{40^{6} - 90^{6}}{2} \cos \frac{40^{6} - 90^{6}}{2} \cos \frac{40^{6} - 90^{6}}{2} \cos (50^{6}) &= 2 \cos 60^{6} \cos (50^{6}) &= \frac{\sqrt{3}}{2} - 6 - 2 \left(\frac{4}{\sqrt{2}}\right) \left(\frac{\sqrt{3}}{2}\right) \\ &= \frac{\sqrt{3}}{2} - 6 - 2 \frac{\sqrt{3}}{\sqrt{2}} - \frac{\sqrt{3}}{2} &= A \text{ sue statement.} \end{aligned}$$

**PROOF** Applying the formulas for  $\cos \alpha = \cos \beta$  and  $\sin \alpha + \sin \beta$  to the right side and then simplifying we arrive at  $-\cos \alpha$ .

$$\frac{\cos 3x + \cos x}{\sin 3x + \sin x} = \frac{-2 \sin \frac{5x + x}{2} - \frac{3x + x}{2}}{2 \sin \frac{5x + x}{2} - \cos \frac{3x + x}{2}}$$
Sum to product forestates
$$= \frac{-2 \sin 2x \cos x}{2 \sin 2x \cos x}$$
Simplify
$$= \frac{-2 \sin 2x \cos x}{2 \sin 2x \cos x}$$
Simplify
$$= \frac{-2 \sin 2x \cos x}{2 \sin 2x \cos x}$$
Simplify
$$= \frac{-2 \sin x}{2 \sin 2x \cos x}$$
Simplify
$$= \frac{-2 \sin x}{2 \sin 2x \cos x}$$
Simplify

### Proving Identities [5.1.]

An identity in bigonometry is a statement that two expressions are equal for all applicaments of the variable for which each expression is defined to prove a regord-metric identity, we use trigonometric unbritances and algebraic matrix, above as either

- 1. Transform the right side rato the left side, or
- 2. Transform the k-fl side into the sight side.

Remarkler to work on each side separately. We do not want to use properties from alped in that have been sides of the identity—like the addition property of expedity.

## Sam and Difference Formulas (5.2)

$$\sin \left( A \cap B \right) = \sin A \cos B + \cos A \sin B$$

$$\sin \left( A \cap B \right) = \sin A \cos B + \cos A \sin B$$

$$\cos \left( A \cap B \right) = \sin A \cos B + \sin A \sin B$$

$$\cos \left( A \cap B \right) = \cos A \cos B + \sin A \sin B$$

$$\tan \left( A \cap B \right)$$

$$\tan A \cos B$$

$$\tan \left( A \cap B \right) = \frac{4 \sin A + \sin B}{1 + \sin A \tan B}$$

$$\tan \left( A \cap B \right) = \frac{4 \sin A + \sin B}{1 + \sin A \tan B}$$

If all k = (you're n in () , than

## GROUP PROJECT

Figure 1

### COMBINATIONS OF FUNCTIONS

**Objective:** To write  $\mathbf{v} = a \sin \theta x + b \cos \theta x$  as a single trigonometric function.  $y = A \sin(Bx + C)$ .

The GPS (global positioning systems allows a person to locate their position of ywhere in the world. To determine position, a GPS receiver downloads a signal that contains nevigation data from a NAV&TAR satellite (Figure 1) and performs a series of culculations asses us a data. Several of the calculations require writing the sum of a sine and ensine function as a single sine function. In this project you will least how this is done.

In Example - of Section 4.6 we showed how we could prach the function.  $y = \sin x + \cos x$  by existing y-coordinates. We observed that the resulting graph. appeared to have the share of a sine function.

醛 E. Granti 🔻 – sin a 🗧 cos a with sour grapting calculates. Use your cotanisable to had the coordinates of a right point on the graph and allow peint (you can use you. 1. (ACt: Reg. on your catendator may have special community for finding assimum and aginic properties). First an equation of the grapt in the form  $v = A \sin(Bv + C)$  by the tip, these controls present solutions of A, B, and C. Check your equiption by grapping 1. The two graphs should be nearly identical.

To find an equation for this graph using an algebraic moshed, we need to find a way to write  $y = a \sin Bx + b \cos Bx$  as  $y = 4 \sin kBx + C_B$ . Thus is, we would like to find values of A, B and C so that the equation a sin Bx = b ons Bx = A sin (Bx = C) is an identity. Because the value of B will be the same for both for crime, we only need to time values for A and C

- **2.** First, we will assume a sin  $Bx = \lambda \cos Bx = A \sin (Bx + C)$ . Express the right side: of this equation as a sum rating a sum identity, fin order for the resulting equation to he are Mangiot, explain who in order the goal that A goal C = a and A sign C > b.
- 3. Solve for A in terms of a stall busing the Pythagorean identity.

$$\sin^2 C = \cos^2 C = 1$$

Assume  $\alpha$  is not inve. To find the value of  $C_i$  we simply need to find an angle នរដ្ឋាន្តប្រពៃជ្ជ ស្ថាន ប្រាស្ត្រាវាងរ

$$\operatorname{Sin} C = \frac{1}{A}$$
 and  $\operatorname{coe} C = \frac{1}{A}$ 

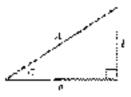

Figure 2

- Figure 2 shows a visual way to remember the selectional ips between n, h, A,  $\mu$  of C. You just have to remember to choose single C so that its tenerised side fies in the context addition.
- 4. Write v = sinta ·· cos x in the form v = A s a (B) + C v Prist identify the values of x, b, and B. Then solve for A and C using the results from Question 3. How ones do's equation of improve with the one you found in Question 19.
- 5. Graph your equation from Question 4 and compare it with he graph of v = sin v + coe τ. The two graphs 3-cold to identical?

# SECTION 5.1 SOLVING TRIGONOMETRIC EQUATIONS

The solution set for an equation is the set of all no above that, when used in these of the variable, grade the equation that we true for every epistement of the variable for which it is defined. Must equation, nowever, are not identifies. They are only true for exercine values of the variable. For example, the solution of equation  $4x^2 + 5 = 0$  is  $\begin{bmatrix} 1 & 3 \\ 2 & 3 \end{bmatrix}$  becomes these are the only two problem that when exact in place of a sort the equation true of a soft and the equation of a soft and the equations of a soft and the equations.

It algebra, the first kind of equations you beamed to solve were linear for first degree) equations in one variable. Solving does, equations was accomplished by applying two insportant properties the addition property of equality and the maintainer, property of equations, here two properties were started as follows:

### ADDITION PROPERTY OF COLLECTY

For any three algebraic expressions A, B, and C

iii 
$$\triangle = B$$
  
then  $A + C = B + C$ 

in words: Adding the same quantity to both sides of w equation will not along the solution set.

Болута повы, учения военця учение и на направитель, потрав следу пиване учения вывольных одинация в на учение

#### ROBOLETTIC (COA) BORE PROPOSITORY OF EACHDALITY

11 
$$B = B$$
  
then  $BC = BC$ 

The wareful in Ministry young forth racket of an explaining by the same increasing quentity and inchange the solution so

, we write a variety = white variety = yhite variety was a variety with the variety of the variety was and the variety was a v

Here is an example that shows how we use these two properties to solve a major experience one variable.

**東京本が投**続を10世 Solve Sr + 7 = 2a + 5 for x.

SOLUTION

$$\begin{array}{ll} 2a \pm 7 + 2a = 5 \\ 2a \pm 7 + 2a = 5 \\ 2a \pm 7 + 2a = 5 \\ 2a \pm 12 \\ 2a \pm 12 \\ 2a \pm 2a = 4 \end{array} \qquad \begin{array}{ll} Add = 2a \text{ to each side} \\ Add = 7 \text{ to each side} \\ Add = 7 \text{ to each side} \\ Add = 7 \text{ to each side} \end{array}$$

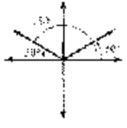

Notice in the last sect we decid just as easily have divided both sides by 2 instead of multiplying both sides by  $\frac{1}{2}$ . Division by a number and multiplication by its oxtiprocar ans equivations premations.

The process of adving trigonometric equations is very similar to the process of solving algebraic equations. With trigonometric equations, we look for values of an anote that will make the equation into a true statement. We usually begin by activitie for a epocific trisionometric function of that angle and their use the concepts we have developed earner to find the angle. Here are some examples that iff, seate this groce, we

In Digrees	Do Akadiansa				
$r = i\Theta^{\circ}$ or $r = 15^{\circ}$	$\gamma \approx \frac{\sigma}{6} - \alpha^2 - \alpha^{10} \cdot \frac{5 \sigma}{6}$				

Because the sine function is periodic with period  $2\pi$  (or 360%), only angle coper minal with  $x = \pi/6$  (or 30%) on  $x = 5\pi/6$  (or 150%) will a stripe a spington of the equation. For any integer it, appling 20st for 360° a) will rear 1 in a capeacoust langle. Therefore, we can reprosent all solutions to the equation as follows:

.—	Hu Degrees	In Regiens
}	x = 85° + 300°X	$\chi = \frac{\pi}{6} + 2kn$
	5 4 15H1 - 1440S	$\alpha_{ij} = a = \frac{a_{ijj}}{6} + 2k_{ij}$

### STEETING COMMISSIONS INCLUDED GOT DE

We can solve the equation in Example 2 using a graphing calculator. If we define the left side of the captation as fluiding it is then the solutions of the equation will be the x-matricages of this function. We examplifying refer to these values as gavey.

Set your calculator to decree mode and dating  $Y_1 = 2 \sin(x_1 + 1)$ . So, your window variables so that

$$0 \le n \le 360$$
, som  $n = 90$ ;  $-4 \le y \le 4$ , sould  $= 1$ 

florault the flores on a druse the sport-priate cours and on your calculated to find both zeros. From Figure 3 we see that the solutions between 0° and 360° are  $x = 30^{\circ} \text{ and } x = 150^{\circ}$ .

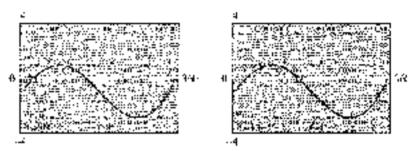

Figure 3

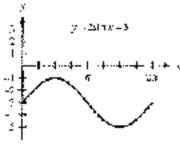

Solve  $2\sin\theta + 3 = 0$ , if  $0^{1/2} \theta \le 360^{1}$ .

SOUUTION: We ten, in by volving for sin #.

$$2 \sin \theta = 3 = \theta$$
  
 $2 \sin \theta = 3$  Add 3 to both sides  
 $4 \cos \theta = \frac{3}{2}$  Divide both sides by ?

Because  $\sin \theta$  is between -1 and  $\epsilon$  too all values of  $\theta$ ,  $\sin \theta$  can never be  $\frac{1}{\epsilon}$ . Therefose, there is no scholen to our equal cal-

To justify co. conclusion further, we can graph  $y = 2 \sin a = 3$ . The graph is a sise corve with amplitude I that has been shalled down B units vertically. The groub ly aliewe in Figure 4. The graph does not cross the readis, so there is no solution to But equation 2  $\sin x = 3 + 0$ .

Digure 4

Find all degree solutions to  $c(c, (r) - 25^\circ) = -\frac{1}{\sqrt{2}}$ 

**SOLUTION**. The reference eagle is given by  $\cos^{-1}(-P\sqrt{2}) = 4S^{n}$ . Because the costant function is negative in QII or QIF, the expression  $A_{\rm c}=25^{\circ}$  mas, by

coterminal with 15° or 225°. Therefore,

$$A = 25^{\circ} + 1.55^{\circ} + 360^{\circ} A$$
 or  $A = 25^{\circ} + 225^{\circ} + 360^{\circ} A$ 

for any integer k. We can now solve for A by solding 25° to both slaigh.

$$A = 25^{\circ} + (35^{\circ} + 360^{\circ})$$
 or  $A + 25^{\circ} + 235^{\circ} + 360^{\circ})$   
 $A = 160^{\circ} + 360^{\circ})$   $A = 250^{\circ} + 360^{\circ})$ 

# USINGS

### Particle 1209 Production with the District Configuration in Configuration

We can solve the expresses in Exempto 4 with a graphing calculation by defining the expression on each side of the equation as a function. The solutions is the equation with bother evalues of the princip where the two graphs intersect.

Net your calculator of degree mode and define Ya m cos ( $x \sim 2n$ ) and Yz  $m \approx 2n\sqrt{2}$ . Not your exposure variables so that

$$0 \le x \le 460$$
, scale =  $9(x - 2) \le y \le 7$ , scale =  $1$ 

Graph from functions and use the appropriate common term your calculation to find the coordinates of the two intersection points. From Eighte 5 we set that the two intersection  $t=250^\circ$ 

Figure 5

# 

SOLUTION: We can solve for sin 9 to police rapidlitie variable terms on the left, sole and all the conseast terms on the right side of the equation

$$3 \sin \beta + 7 = 7 \sin \theta + 4 \sin \beta + 2 = -4$$

$$-4 \sin \beta + 2 = -4$$

$$-4 \sin \theta + 7$$

$$\sin \theta = -\frac{1}{4}$$
And 2 so each side
$$\sin \theta = -\frac{1}{4}$$
Divide each side by  $-4$ 

We have not interposits at the ungle whose since is  $\frac{1}{4}$ , as we must use a catentator to find the reference angle

$$\hat{g}=g_{\mathbf{in}}^{-1}\left(\frac{1}{4}\right)\approx (4.5)$$

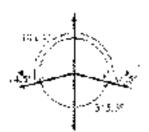

Figure 6

We find that the scotte angle whose since is acan so to  $\frac{2}{4}$  is  $14.5^\circ$ . Therefore, the reference angle is  $14.5^\circ$ . Because since in egative,  $\theta$  with terminate in QEI or QEV (Figure 6).

Note: Unless directed otherwise, let's agree to write all approximate degree some done to our eigendons in declinal degrees to the nessest tends of a degree and all approximate radia; solar my to the meaners hundrelite.

Calculator Mote Remember, because of the restricted values on your calculation, if you use the  $\frac{|\sin t|}{|\sin t|}$  key with  $\frac{|t|}{|t|}$  your calculator will display approximately  $-30.5^\circ$ , which is not within the descret interval for Example 5. The best vay to proceed is to that find the reference angle using  $\frac{|t|}{|t|}$  with the positive value  $\frac{1}{|t|}$ . Then not the rest of the calculations based on the quadrants that the angle terminates in

The next kind of trigonometric equation we will adve is quadratic in form. In algebra, the two twost counties methods of softing quadratic equations are factoring and applying the quadratic formula. Here is an example that reviews she factoring method.

## So ve 2r4 - So m 5 fbru.

**SOLUTION**. We begin by unaling the equation in standard form  $\phi$ ) on the right sides appropriate powers of the varighteory the left sides. We then factor the left side and set each factor against  $\phi$ .

$$\begin{aligned} 2x^2 & \circ 9x = 3 \\ 2x^2 & \circ 9x + 3 = 0 & \text{Sign...and down} \\ (2x + 1)(x + 5) & = 0 & \text{Find an} \\ 2x + 1 & = 0 & \text{or} \quad x + 5 = 0 & \text{Soft each factor to } 0 \\ x & = \frac{1}{7} & \text{or} \quad x = 5 & \text{Soft each transfer equations} \end{aligned}$$

The two subplicas,  $x = \frac{1}{2}$  and y = 5, and the only two similar sittle is 9 the brighted equation.

# Experience Solve Constr. Rose to 100 de 4 2 m.

**SOLUTION** This equation is the equation from Example 6 with  $\cos z$  in place of z. The fact that  $0 \le z \le 2\pi$  indicates we are to write our counters in radians.

$$2\cos^2 t = 9\cos t = 5$$

$$2\cos^2 t = 9\cos t = 5 = 0$$
Standard form
$$(2\cos t + 1\sec t = 5) = 0$$
Fustor
$$2\cos t + 1 = 0$$
or
$$\cos t = 5 = 0$$
So, which shows to 0
$$\cos t = \frac{1}{2}$$
or
$$\cos t = 5$$
Tableta cos t

Figure ?

The liest result,  $\cos t = -t$ , gives over neglicities angle of

$$\hat{\theta} = \cos^{-1}(1/2) = \pi/3$$

Bosonso con l'is regetive, a mass terminate in Qff or LfF (Liguet 1). Pharefore,

$$x + x = m/3 + 2m/3$$
 or  $x = x + m/3 + 4m/3$ 

This record result, one z = 5, hiss no solution. For any value of z, cos z minst be be tween -1 and 1. It can research 5.

# 

**SOLUTION**. The equation is already in randord form, if we try in factor the left side, however, we find it does not factor. We group use the gradinglic formula, (i) a quadratic formula states that the populations to the equation:

$$\sigma x^2 + hx + c = 0$$

will be

$$\tau = \frac{-\partial f}{\partial a} \sqrt{b^2 - 4aa}$$

In our case, the coefficients at h, and a are

$$a = 2$$
,  $b = 2$ ,  $c = -1$ 

Using these numbers, we can solve for  $\sin \theta$  as follows:

$$\sin 5 = \frac{-2 - \sqrt{4} - 4(2)(-1)}{5(2)}$$

$$= \frac{-2 \cdot 1 \cdot \sqrt{12}}{4}$$

$$= \frac{-2 + 2\sqrt{3}}{4}$$

$$= \frac{-\frac{1}{4} + \sqrt{3}}{4}$$

Using the approximation  $\sqrt{3} = 1.7321$ , we arrive at the following decimal approximations for sat  $\theta$ :

$$\sin \theta = \frac{-1 + 1.752}{2}$$
 or  $\sin \theta = \frac{-4 - 1.7521}{2}$   
 $\sin \theta = 0.5661$  or  $\sin \theta = 1.3661$ 

We will and obtain dry solutions from the second expression, s in  $\theta \sim 1.360$ ), because  $\sin \theta$  must be between >1 and 1. For  $\sin \theta = 0.360$ , we use a calculation to find the angle whose sine is nearest to 0.0661. Thus angle is approximately 0.37 to dim, and it is the reference angle for  $\theta$ . Since  $\sin \theta$  is positive,  $\theta$  must terminate in QI or QII (Figure 8). Therefore,

Flamre S

$$\theta = 0.37$$
 or  $\theta = \pi - 0.37 = 2.77$

- 66. Use a half angle formula to fine cos 15°.

#### TRIGONOMETRIC EQUATIONS INVOLVING SECTION MULTIPLE ANGLES

In this section, we will consider et us, one that contain moltrale angles. We will usu most of the same techniques to salve those equations that we have used in the past We have to be careful at the test step, however, when our constions contain muriple sugges. Here is an example.

SOLUTION: The elimetical carbot be a highlight further. The reference any role given by  $\cos^{-1}(Q^2D_0) + 3e^{i\phi}$  . Decaying the descriptions have a positive in  $Q\log Q/V$ Index pression  $2\theta$  must be colorional with 0.0 or 0.30 . Becaling for any in egy t t

all solutions will have the firm

$$2\theta = 30^{\circ} + 360^{\circ} 4$$
 or  $2\theta = 330^{\circ} + 360^{\circ} 4$   $\theta = \frac{130^{\circ}}{2} + \frac{360^{\circ} 4}{2}$   $\theta = \frac{130^{\circ}}{2} + \frac{360^{\circ} 4}{2}$   $\theta = 165^{\circ} + 160^{\circ} 4$ 

Reconserved were asked only for values of  $\mu$  between 00 and 360%, we substitute the appropriate integers in place of k.

For all renor values  $\alpha(1,5)$  will 660 excisate the cover referral.

 $197 \pm 1209 \pm 9939$ 

## USING ASSESSED ASSESS

To so, we the equation in the tigge 1 graphically, we can use the intersection of graphs method that was introduced in Section 6.1. Set poor prophical calculates or degree movie, and then define each side of the exercise as an intrinse. For time.

$$Y_1 = \cos(2x), Y_2 = \sqrt{3}/2$$

Graph the two functions using the following window settings:

$$0 \le x \le 300$$
, scale  $\sim 30$ ,  $-4.5 \le y \le 1.5$ , scale  $\sim 1$ 

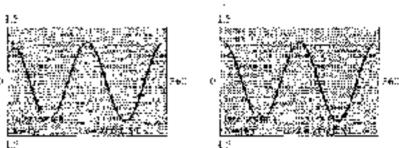

Because the period of ymmoos  $2n \approx 300\%2 \pm 1.80\%$ , we can see that two cycles of the cooline function occur perween  $0^{\circ}$  and  $360^{\circ}$  (Figure 1). Within the first cycle there are two intersection points. Using the appropriate intersection command, we find that they programmes of these points are  $x = 35^{\circ}$  and  $x = 165^{\circ}$  (Figure 3)

Figure 3

Id51 + 1551 ± 3035

3667

Higure?

Because the period  $\theta$  (S0), the next peix of interaction points flocated as the second cycle) in four d by adding 190° to each of the above values (Figure 3). Use the intersection command on your calculator to verify that the test solutions occur at  $x = 195^\circ$  and  $x = 345^\circ$ .

that all solutions is ten 3v = 1 at v is necessarily radius, with exact values

**SDECTION** Pass we had a reduce of 4v in the interval  $0 \le 3 g \le \infty$  that causty  $4 a \cdot 3 v = 1$ , and then we take on an display of m because the period of the tangent function as m. After that, we simply divide by  $3 \cdot c$  solve for c

In the factor 
$$3x = \frac{\pi}{2}$$
 with  $x = \frac{\pi}{3}$  with  $x = \frac{\pi}{12}$  and  $x = \frac{\pi}{3}$  . Divide by 3

Note that  $k \to 0, 1$ , and k will give us all values of a between 0 and a that satisfy to the in 1 (largers 4).

where 
$$t = 0$$
 where  $t = 1$  where  $t = 5$   $x = \frac{2\pi}{12}$   $y = \frac{\pi}{2} + \frac{\pi}{3} = \frac{3\pi}{12}$   $y = \frac{\pi}{3} = \frac{15\pi}{4}$  .

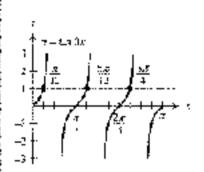

Figure 4

Solve sin Paras a  $+ \cos 7\epsilon \sin \gamma = \frac{1}{\sqrt{5}}$  of  $5 \le \epsilon \le 2\epsilon$ .

**SOLUTION**. We can simplify the left side by using the formula for s in  $(A \oplus B)$ .

$$\sin 2x \cos x = \cos 2x \sin x - \frac{1}{\sqrt{2}}$$

$$\sin 2x \cos x = \frac{1}{\sqrt{2}}$$

$$\sin 3x = \frac{1}{\sqrt{2}}$$

First we for dials possible volations for zo

$$3x = \frac{\pi}{4} \pm 2k\pi$$
 or  $3x = \frac{3\pi}{2} \pm 2k\pi$  is a sury integral  $x = \frac{\pi}{12} \pm \frac{2k\pi}{3}$  or  $x = \frac{\pi}{2} - \frac{2k\pi}{3}$  (D) vide by 3

To find above solutions that the his the interval  $0 \le z \le 2\pi$ , we let k take on values of 0, 1, and 2. During somestable in the following solutions (Figure 5):

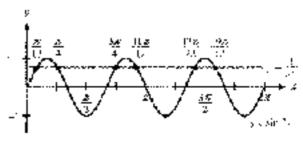

Figure 5

**EXAMPLE C** Pius al. volntions to 2 s nº 30 · sin 00 · 1 · 0, il 0 is

**SOLUTION** We have an expertion that is queries? it is sin 30. We have and solve as respail.

$$2 \sin^2 3\theta + \sin 3\theta + = 0 \qquad \text{Standarf form}$$

$$(3 \sin 3\theta + 1) \sin 3\theta + (1) = 0 \qquad \text{Factor}$$

$$2 \sin 3\theta + 1 = 0 \qquad \text{or} \qquad \sin 3\theta = 1 = 0 \qquad \text{Set factors to } 0$$

$$\sin 4\theta = \frac{1}{2} \qquad \text{or} \qquad \sin 5\theta = 1$$

$$3\theta - 210^{\circ} + 360^{\circ} x \qquad \text{or} \qquad 3\theta + 360^{\circ} x \qquad \text{or} \qquad 3\theta + 90^{\circ} + 360^{\circ} x$$

$$\theta = 70^{\circ} + 120^{\circ} x \qquad \theta = 110^{\circ} + 120^{\circ} x \qquad \theta = 30^{\circ} + 120^{\circ} x$$

**EXAMPLE 2.** Find all so hatoms in radions ( $2r \cos^2 3r = 1$ 

**SOLUTION**. Taking the square monof both side, we have

 $\sin 3x = 11$  Square root of both aides

The period at the range of function is so, so we have

$$3x = \frac{\pi}{4} + k\pi \qquad \text{or} \qquad 3x = \frac{3\pi}{4} - k\pi$$
$$x = \frac{\pi}{12} + \frac{k\pi}{3} \qquad \text{or} \qquad x = \frac{\pi}{4} + \frac{k\pi}{3}$$

**SOLUTION** We have solved this emphtion before in Section 6.2. Detects a secand solution.

$$\sin\theta + \cos\theta = 1$$

$$(\sin\theta + \cos\theta)^2 = 1^2 \qquad \text{Square both sides}$$

$$\sin^2\theta + 2\sin\theta\cos\theta + \cos^2\theta = 1 \qquad \text{Expand loft side}$$

$$-2\sin\theta\cos\theta + 1 = 1 \qquad \sin^2\theta + \cos^2\theta = 1$$

$$-2\sin\theta\cos\theta = 0 \qquad \text{Add } -1 \text{ to both sides}$$

$$-\sin2\theta = 0 \qquad \text{Double the plotted in the point sides}$$

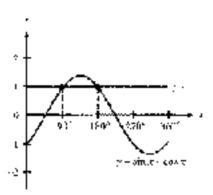

$$\sin2\theta = 0 \qquad \text{Mathaply both a dos by } -1$$

The stree fraction is zero for 0° or 180°. Therefore, the extre-sion 28 m as the concruinals with either of these. For any irreger k, we can represent all solutions more concisely as

$$26 = 7^{\circ} + 360^{\circ}$$
,  
 $26 = 1862^{\circ}$ ,  
 $6 = 30^{\circ}$  s.

We were asked only for values of  $\theta$  in the interval  $\theta^* \cap \theta \in 3800$ . Choosing k = 0, 1, 2, or 3 we have  $\theta = 0^\circ$ , 95°, 180°, or 070°. For all other walkes of k,  $\theta$  will fall outskácitce given i nacyal.

Here our first step of vortex in graning holds sake and the equation, we assist a decay at the present at sometimes to see at they enterly the original expertion. Throughout grown as softwards  $\theta = 0.005$ , which where two various are excrusived at an experiment of a softward  $\theta = 0.005$ . The other two various are excrusived at an experiment.

Pigare 6

Is Section 4.5 we found that the gyerage monthly patentaines at Lake Natimiento could be modeled by the function

$$y = 197.50 \approx 18.550 \cos\left(\frac{\pi}{6}x + \frac{5\pi}{6}\right), = 0 \approx 7 \approx 12$$

where x is the month. With x=1 conresponding to H annry. Use this model to determine the percentage of the year that the average attendance is at least 25 000.

**SOLETFOR** To begin, we will find the values of a for which v is exactly 25,000. It; do say we must solve the equation

19.450 + 18.550 
$$\cos\left(\frac{\pi}{6}x - \frac{5\pi}{6}\right) = 25,000$$

Mest we isolate the trigonometric function

19.450 : 13.350 see 
$$\left(\frac{\pi}{6}|z| - \frac{5\pi}{6}\right) \approx 25.000$$
  
13.550 see  $\left(\frac{\pi}{6}|z| - \frac{5\pi}{6}\right) \approx 5.550$   
 $\cos\left(\frac{\pi}{6}|z| - \frac{5\pi}{6}\right) \approx 0.2990$ 

The reference angle is  $\cos^{-1}(0.2992) \approx 1.17$  radians. The desired is positive in QI and QIV, so we have

$$\frac{a}{8} x = \frac{5\pi}{6} = 1.27 \qquad \text{or} \qquad \frac{7}{6} x = \frac{5\pi}{6} = 2\pi - 127$$

$$\frac{a}{6} x = 3.39 \qquad \frac{5\pi}{6} x = 5.06$$

$$\frac{\pi}{6} x = 7.44 \qquad \frac{\pi}{6} x = 7.66 x$$

$$\frac{\pi}{6} x = 14.47$$

Figure 7

Find solution x = 14.52 is outside the given interval  $0 \le x \le 12$ . However, because the period is 12, adding as subtracting any multiple of 12 to 14.57 will give another solution 12 to x + 14.57 = 12 + 2.57. Contable solution within the given releval.

uniform at this say, we should a yield be at few 2h,000 between x = 2.57 and x = 7.43. Finducially, This gives us

$$(43)$$
  $(2.57 \pm 4.55)$  months

.-.

$$\frac{1.8^{\circ}}{12} = 1.405 = 40.5 \text{ s} \approx 150 \text{ year}$$

#### SAME OF CHITING READY FOR GLASS

# SECTION

# PARAMETRIC EQUATIONS

Un to this point we have had a muniber of encounters with the Ferris wheel publicant In Sections 3.5 and 4.5, we were able to find a firm tion that gives the rider's reliable above the ground at any time / during the ride. A third way to derive this foretients with promoving amuzinos, which we will study in this section.

Heal's begin with a mode, of the grant when both by George Fe. is. The Jignete, of this wheel is 250 feet, and the leatons of the wheet sits 14 feet shows the ground. We can apper impose a cuordische system on Jun medel, so that the migic of the coordinate system is at the center of the wheel. This is shown in Figure 1.

it leure l

Figure 2

Choosing one of the cagnisques in the flust quadrant as the point (x,y), we draw a line from the categorie the carriage. Then we draw the right turingle shown in Figure 2. From the triangle we have

$$\cos i \approx \frac{\pi}{125} \Rightarrow i \approx 125 \cos i$$

$$\sin \tau = \frac{y}{125} \cos y = 125 \sin \tau$$

The two equations on the right are called year award eager nows. They show a such p as forcition of a third varieties, suched the co*nsumes* of Joth number we substitute for a given are an confered pair  $(\cdot,\cdot,\cdot)$  . If we graph table of these professed gains on a restangular coordinate system, the restricting course is called a plane reserve.

 $A_i$  you would expect, the plane costs for this provides this metric equations is: a circle with a rabbos of 125 fixet, contexted at the ceigile. We demonstrate this in the following example:

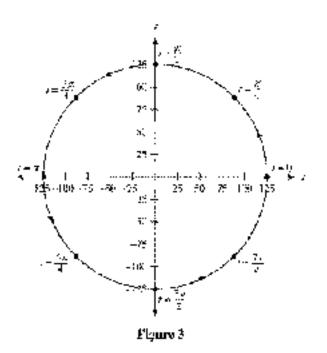

Graph the plane curve defined by the percuretric equations  $z \sim 125$  etc. and  $y \sim 125$  sin at

SCLOTION: We can find points on the graph by thousing values of a and using the two equations to find corresponding values of a goal of Pable 1 shows a number of ordered pairs, which we obtained by letting the different multiples of m4.

## USING THE BOOKS

您要见你可以您 更多而吸收的预约 在你没见你你不能

We can use a gradifying calculate to graph the place curve for a set of percunction equations. For instance to gradiente also curve a Example 1, set you calculator to radien mode and parametric code. Define the parametric equations as shown in Fraction 4, and set your window as follows:

To assist the circle Took right, quaph the equations the rights we we make the circle Took right. The result is shown in Figure 5.

For sea the calendation, we can trace the circle and follow the curses as the parameter: more axes (Figure 6). We can also evaluate the equations for any given value of the parameter. Figure 7 shows how this usigns look for  $r = 3\pi/4$ . Notice that the coordinates match our results in Table 1.

Figure 6

Rigere 7

## Eliminating the Perameter

Legits go back to our obgainst secret parameters a quahants and solve comors rand single

$$x = 175 \cos t \Rightarrow \cos t = \frac{x}{125}$$

$$y=135\sin t\cos \sin t=\frac{\hbar}{125}$$

Substituting the expressions above the costraint singulation die Pythagorean Manrity and  $x + \sin x = 1$ , we have

$$\left(\frac{x}{12S}\right)^2 + \left(\frac{1}{12S}\right)^3 = 1$$

$$\frac{x^2}{12x^2} + \frac{x^2}{12S^2} \approx 1$$

$$x^2 + x^2 \approx 12S^2$$

We see again this last causaion as the expansion of a circle with a realist of £25 and content time or gin. What we have done is climinate the presunctor the obtain an expansion in just a sase y whose graph we recognize. This precess is respectively our for managing the parameter. Note that I gives us further justification that the graph of our set of community equations is a circle.

Figure 1. Some state of  $\pi$  is the parameter I from the parameter

**SOLUTION** Again, we will use the identity  $\cos^2 z + \sin^2 z + 1$ . Before we do so, however, we must solve the first equation for  $\cos t$  and the second equation for  $\sin t$ .

$$x=2\cos t = \cos t = \frac{x}{3}$$

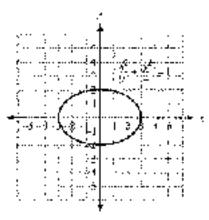

$$y = 2 \sin t \Rightarrow x \Rightarrow t = \frac{t}{2}$$

Substituting a/3 and p/2 for new road singuists for first Pythagonya ridenaty gives us

$$\left(\frac{x}{3}\right)^{1/2} + \left(\frac{x}{2}\right)^{1/2} = 1$$

$$-\frac{x^2}{2}+\frac{\lambda^2}{4}\sim 1$$

which is the equation of an ellipse. The center is at the origin, the x-intercepts are i and -3, and the v-intercepts are 2 and -2. Figure 3 shows the graph:

Pigure 8

Elimi, are the parameter inform the parametric equations  $x=3-\sin x$  and  $y=\cos x=3$ ,

**SOLUTION** Subsing the flex quantion for sign and the second equation for cost, we have

$$\sin x - x = 3$$
 and  $\cos x = y + 2$ 

Substituting these expressions for sind and execution the Pollagorean identity cires as

$$(x - 3)^2 + (y - 3)^2 + 0$$

which is the equation of a circle with a radius of 1 and center at (3, -2). The graph of this circle is shown in Figure 9.

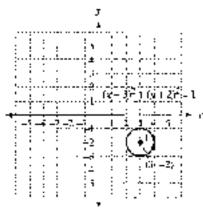

Figure 9

Highlights the parameter of the parameter of the parameter of equations  $a=3+2 \sec z$  and  $y=2+4 \tan z$ .

**SOLUTION** The this case, we so we for sect and task!, and those use the identity  $\tan^2 z = \sin^2 z$ .

$$x = 3 - 2 \sec t \Rightarrow \sec t = \frac{x - 3}{2}$$
$$y = 2 + 4 \tan t \Rightarrow \cot t = \frac{y - 1}{2}$$

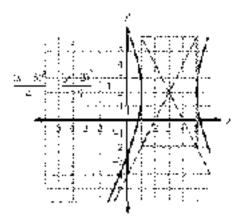

90

$$1 + \left(\frac{x - 2}{4}\right)^2 = \left(\frac{x - 3}{2}\right)^2$$

or

$$\frac{(x-3)^2}{4} = \frac{(x-2)^2}{16} =$$

This is the equation of a hyporbola. Figure 10 shows the graph.

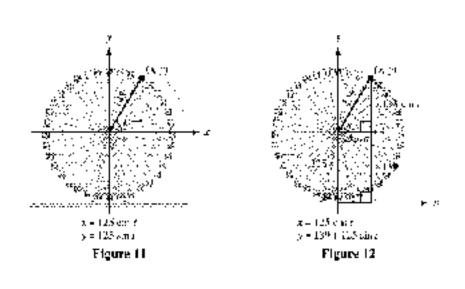

Pigure 14

#### Making Our Models More Realistic

Let's go pack to our lieurs wheel model from the beginning of this section. Our wheel has a radius of 175 feet and sits 14 feet above the ground. One trip around the wheel takes 20 minutes. Figure 11 shows this model with a coordinate system separameter: with its origin at the center of the wheel. Also shown are the transmittine equations that describe the path of someone riding the wheel.

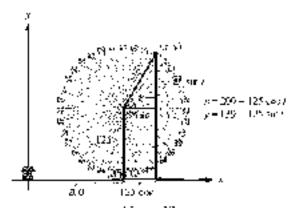

Our model would be more that should be as so was a consiller ground, below the wisch. We can accomplish this very easily by newing every rung up in 9 to at 1.2 m local for the radius and are her 14 too. For the who of a begin above the great of). Ingline 12 shows our new graph results a new soil of personalization criticisms.

Note: It is assume there is a heightness in 200 tool to the left thir wheel. If we want to /so the licked breath as our stanting point, we can move our graph to the right 200 tool. Figure 10 shows this moved, along on a the corresponding set of parametric equations.

NOTE: We can solve this less say of squate or for the hand similate per

$$dim = \frac{3 - 179}{27}$$

Using these results in our Py lingurs in identity,  $a_1a_2^2 = 4n^2 r = 1$ , we have  $(r = 200)^2 + (r = 39)^2 = 127^2$  which we recognize as the equation of a circle with content 2008, 109 and  $r_2$  disc. 25

biggine 13

It's just that easy. If we want to translate our gradie hosticintally, we simply add the translation emission to our conjugacion for a linkeway, vertical translations are occurrently in by adding to our expression for y.

Continuing to improve our model, we would like the oder on the offset to start their ride at the factor of the wheel. As an ning their radius, we accomplish this by subtracting  $\pi/2$  from tightness as

$$v = 200 \pm 125 \cos \left( r - \frac{\pi}{2} \right)$$

$$\nu \simeq 139 \pm 125 \, \sin\left(t - \frac{\pi}{2}\right)$$

Finally, one trip process the wheel takes 20 minutes, no we can write our equations in terms of time 17 by using the proportion

$$\frac{1}{2\pi} = \frac{7}{20}$$

Softime for two hate

$$\varsigma = \frac{r}{10}\,\mathrm{T}$$

Substituting this expression for a interior parametric cents; one we have

$$x = 200 - 425 \cos\left(\frac{\pi}{10}7 - \frac{\pi}{2}\right)$$

$$\rho \approx 137 \approx 925 \sin \left( \frac{27}{10} T + \frac{27}{2} \right)$$

These has equations give us a very accurate model of the paintaken by sun cone siding on this Perris wheal. To graph these obtailons on one graphing calculation, we can use the following worthost

Radian mode 
$$0 \approx Y \approx 10.$$
 |  $0 \approx 4 = 1$   
|  $0 \approx x \approx 300$ , scale = 20  
|  $0 \approx 0 \approx 300$ , scale = 20

Using the soons square continued, we have the graph shows in Figure 14, Fagure 15 shows a trace of the graph. Sanitag around this graph is versus the position of the roller at each minute of the 20-monate ride.

Figure 14

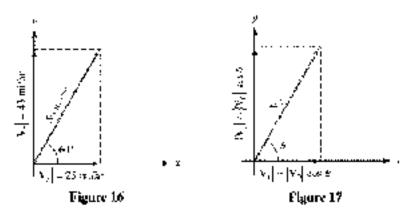

Figure 15

#### Parametric Equations and the Human Cannonball

In Section 2.5, we found that the horizontal variousbutt, when shot from a cambon at 50 miles per laser of  $60^\circ$  from the horizontal, will have a horizontal vertectly of 25 miles per horizontal an initial vertical velocity of 43 miles per near (Figure 16). We at a generatize this so that a horizontal commontally if shot from a cambon of  $|V_{\theta}|$  access per nour at the angle of elevation  $\theta$ , will have a horizontal speed of  $|V_{\theta}|$  access per nour and an initial vertical speed of  $|V_{\theta}|$  sin  $\theta$  whiles per hour  $|\theta|$  game 17).

Neglecting the resistance of sin, the only force stating on the human canountall is the force of gravity, which is an acceleration of 32 fee, per second squared cases of the earth, Because the canonicall's noticental speed is constant, we can find the distance traveled often (seconds by simply modify, ying speed are sinter.)

The distance trusted horizontally ober a seconds is

To find the cannonball's vertical distance from the cannon after a seconds, we use a formula from physical

$$y=(|\mathbf{V}_{0}|\sin 3\,\kappa + \frac{\pi}{2}g^{-k})$$
 where  $g\approx 32$  ft/sec<sup>2</sup> (the secoleration of gravity on Earth)

This gives us the following set of parametric equations:

$$y = (\{\mathbf{V}_0\} \cos \mathbf{P})t$$
$$y = (\{\mathbf{V}_0\} \sin \mathbf{\theta})t + 16\mathbf{r}^2$$

The value case describe the path of a langer consistent k of 4 from a car not at a special of  $\{V_k\}$ , at an angle of k degrees from the fourth. So that the parts will agree,  $\Psi_k$  consist by its tabeging consistent k in a const.

Compared the party of the party of the property of the transfer commental of the mutual trained of the comments to the party of the comments of the party of the comments of t

**SEDEUTION** . The position of the carminabell at finit t is described paint or modify by transity as given by the equal the share. To use this cognitions, we must first constitutional experiment to first non-second

$$M_{\rm critical}/m_{\rm fit} = rac{50\,{
m mi}}{{
m km}} \times rac{5,280\,{
m ft}}{1\,{
m mi}} \times rac{4\,{
m km}}{3.600\,{
m sec}} \simeq 73.0\,{
m pb/sec}$$

Substituting 73.5 for  $|V_0\rangle$  and 60° for  $\theta$  gives us parametric equations that together dose figurity of the burnari communically.

$$x = (73.3 \cos 60)^{\circ}y$$
  
 $y = (73.3 \sin 60)^{\circ}y = 16x^{\circ}$ 

First setting the calculator to degree and parametric modes, we then set up on Toneton is (Figure 15) and window as follows:

Degree mode: 
$$0 \le z \le 6$$
,  $\sup = 0.1$   
 $0 \le y \le 160$ ,  $\sup = 20$   
 $0 \le y \le 80$ ,  $\sup = 20$ 

The graph is shown in Figure 19.

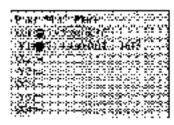

Figure 18

#### 『紫堇翠》 - GETTING READY FOR CLASS

After reading through the preceding section, respond in your own words and in complete sentences.

- g. What are parametric congricus?
- **b.** What trigonometric identity do we use to eliminate the parameter t from the conscious  $x=3\cos t$  and  $y=2\sin t$ ?
- c. What is the host step in eliminating the tarameter afform the equations x=3=a in t and  $y=\cos t=2?$
- d. Low do you convert 50 males per nour into an equivalent quantity in feet per second?

#### PROBLEM SET 8.4

Graph the plane curve for each pair of parametric educations by plinting points, and indicate the phenomenon your graph using amous

$$1_{t+1} + 3 \cos t$$
,  $t + 3 \sin t$ 

$$2 \cdot x + 2 \sin x_0 + \lambda \cos x$$

$$3x_1x + 2 + \sin t$$
,  $y + 3 + \cos t$ .

$$-4 \cdot x = 3 \cos t + 3 \cdot y = 3 \sin t + 1$$

$$5x_0 = 3 \sec t_0 z + 3 \tan t$$

$$||\mathbf{b}_{x}||_{2} = 3\cos x$$

$$P_{n,0} = c \log 2b_{n,0} = \sin t$$

$$8. x = \cos 2t x + \cos t$$

Eliminate the parameter / from each of the following and then sketch the graph of the plane only of

**9.** 
$$x = \sin t$$
,  $y = \cos t$ 

10. 
$$x = -\sin x, y = \cos x$$

**№11.** 
$$x = 3 \cos x, y = 3 \sin x$$

12. 
$$a = 2 \cos t_{\rm co} + 2 \sin t$$

$$% 13. |x = 2 \sin 4. y = 4 \cos r$$

15. 
$$x = 2 + \sin x$$
,  $y = 0 + \cos x$ 

**17.** 
$$x = \sin x - 2$$
,  $y = \cos x - 3$ 

**8.19.** 
$$u = 0 = 2 \sin t$$
,  $y = 0 = 2 \cos t$ 

**2L** 
$$a = 3\cos t = 3$$
,  $y = 3\sin t = 1$ 

14. 
$$x = 0 \sin x x = 4 \cos x$$

**16.** 
$$x = 3 = \sin r$$
,  $y = 2 + \cos z$ 

**18.** 
$$x = \cos x = 0$$
,  $y = \sin x + 2$ 

**20.** 
$$x - 2 = 3 \sin t$$
,  $y - 1 + 5 \cos t$   
**22.**  $x - 4 \sin t = 5$ ,  $y - 4 \cos t = 5$ 

Eliminate the parameter f in each of the following:

▶ 27. 
$$x = 2 + 3 \tan t$$
,  $y = 4 + 3 \sin t$ .

29. 
$$x = rack / 1$$
,  $y = 4m :$ 

$$M_{\rm b} x + \sin x y + \sin x$$

33. 
$$x = 3 \sin 2 y + 2 \sin x$$

**24.** 
$$y = \tan t$$
,  $y = \cos t$ 

**26.** 
$$y = 3$$
 (a):  $i, y = 5$  (30):  $i$ 

**28.** 
$$x + 3 = 5$$
 (and  $x, y + 2 + 5$  such

**50**. 
$$z = \cos 2\theta$$
,  $y = \cos 2\theta$ 

32. 
$$z = \cos i$$
,  $y = \cos i$ 

34. 
$$x = 2 \sin k y = 4 \sin t$$

38. Ferris Wheel The Perris wheel mill in Vierna in 1897 has a dismeter of 197 feet and sits 12 feet above the ground. If rollites in a counterbackwise directions, making one complete revolution every 15 minutes. Like parametric equations to effected the path of a moor on this which Place your coordinate. system so that the origin of the coordinate system is on the ground below the Soften in the whool, for wind to be up with parametric equations that will give you the position of the molet every menute of the ride. Chapt your test its on a утартину сайылыкт.

6. Fermis Wheel A frams when I main if Drossus was built in St. Leans in 1986. It has a champton of 165 feet and sits 9 feet above the ground. It rotates in a counerolooksvike direction, making tota complete revolution, every 1.5 minutes. Use parametric equations to model the path of a rider on this wheel. Place your countrials, system so that the origin of the coordinate system is on the ground 100 are no the left of the wheel. You want to end up with pasimetric equations hat will give you the position of the rider every second of the ride. Graph your residus on a graphing dalcidator.

g. 27. Human Caunonball Guath the parametric equations in Example 5 and the s find the maximum beight of the connocted, the maximum distance traveled forizonfully, and the time at which the rannouball hits the net. (Assume the bane) of the cannon and the net are the same distance above the ground.)

ூர், 78. Human Cannonball. A homan camerchall is fired from a caanon with an initial velocity of 50 miles per hour. On the same screen on your calculator, around the withs taken by the calmonball if the angle between the cannot, and the horizonali is 20°, 30°, 40°, 50°, 60°, 70°, aud 80°.

#### REMIEW PROBLEMS

The problems that follow review in trenal we covered in Sections 4.7 and 5.5. Eval. trare each expression.

$$39. \quad \text{Ain}\left(\cos^{-1}\frac{1}{2}\right) =$$

41. 
$$\sin \left( \tan^{-1} \frac{1}{2} \right) d \sin^{-1} \frac{1}{4}$$

**40.** 
$$\sin \left( \sin^{-1} \frac{1}{3} \right)$$

**42.** 
$$\cos\left(\sin^{-1}\frac{2}{3}\right) = \cos^{-1}\frac{1}{3}$$

48. Write 
$$\sin 4x - \sin 4x$$
 as a product.

#### EXTENDING THE CONCESS'S

49. For an NBA regulation basket fourt, the hoop is 10 feet above the ground, and the horizontal distance from the center of the hoop to the free throw line is 13.75 feet. In naking a free throw. Shaquille O'Neal releases the ball approximately 8.5 feet directly above the free throw line (see Figure 20). The ball traches the center of the hoop 0.9d second late.. The path of the ball can be described by the parametric equations.

$$\mathbf{x} = (-\mathbf{V_0} - \cos \theta)t$$
  
 $\mathbf{y} = (-\mathbf{V_0} - \sin \theta)t = 16t^2 + 8.5$ 

where x is the distance (in flet) a sycled herizontally and y is the height (in feet) of the ball above the ground's security after the ball is released. Find the initial speed  $\|\mathbf{V}_{T}\|$  and the angle  $\theta$  at which the baskethall is thrown.

#### Solving Simple Trigonometric Equations [6.1]

We solve trigonometric equations that are theat in times or ons a by applying the properties of equatity developed in algebra. The two most important properties from algebra are stated as follows:

Addition Property of Equality

For any three algebraic expressions A, B, and C,

If 
$$A = B$$
  
then  $A = C = B = C$ 

Multiplicanon Property of Equality

For any three algebraic expressions A, B, and C with  $C \neq 0$ ,

If 
$$A = B$$
  
ther  $AC = BC$ 

To solve a trigonometric equation that is anadratic in  $\sin x$  or  $\cos x$ , we write it in standard form and then factor thoruse the quadratic formula.

#### 2. Solve if $0 \le v < 100c$ .

$$\begin{array}{cccc} \cos 2\theta + 3 \sin 5 + 2 = 0 \\ 1 & \cos^2 \theta & 3 + 2 \sin 5 & 2 & 0 \\ 2 \sin^2 \theta + 3 \sin \theta & 3 + 1 + 0 \\ (2 \sin \theta - 4) \cos \theta & 1 & \sin \theta \\ 2 \sin \theta & 4) \cos \theta & 1 & \sin \theta \\ & \sin \theta + \frac{1}{2} & \sin \theta + 3 \\ & \theta + 3 \cos \theta & 1 & \cos \theta \end{array}$$

#### 3. Salar

$$\begin{aligned} \sin \lambda x \cos x &= \cos k x \cos k + \frac{1}{2} - \frac{1}{\sqrt{2}} \\ &= -\frac{1}{2} - \frac{1}{\sqrt{2}} \\ 2x &= \frac{1}{4} - 2k\pi - \cos \beta x = \frac{k_0}{4} + \frac{1}{2} 2xx \\ \lambda &= \frac{1}{4} - \frac{1}{2} \cos x - \frac{\pi}{4} - \frac{2k\pi}{4} \end{aligned}$$

# 4. Plimpatte de parameter et et he exposition $v = 0 + v \sin t$ and $y = v \cos t$ $v = \Delta v \cos t$ .

$$(x_1 + G^2 + y_1 + x_2^2 + 1)$$
  
is slid in the equation of  $f \in G$  with a  
radius of 1 and content  $f \in G$ .

#### Using Identities in Trigonometric Equations [6.2]

Standings it is necessary to use identities to make this account to substitutions where solving equations. Mostities are astably stop red if the equation contains more than one tripp respective function or if the point by using a double angle identity to episce as 2h with  $1 = 2 \sin^3 \theta$ . Doing see a vesses a quadratic equation in sin  $\theta$ . Writely we call in standard for it and solve by factoring.

#### Equations Involving Multiple Angles [6.3]

Semicismos the expansions we solve in trigonometry reduce to equations that exertain realitiple angles. When this occurs, we have to be control in the last side that we do not leave out any solutions. First we find all solutions as an expression rayching k, where k is an integer. Then we choose appropriate values for k to obtain the desired solutions.

#### Parametric Equations [6,4]

We not the covariance of prime (x,y) and described apparently by two equations of the forms  $\tau = f(t)$  and y = g(t), then the two equations are defined parameters repeated as a filter the parameters t the way in graph the p-and curve. We set of p-instance in the parameters t the way in graph the p-and curve. A table of values and pice points. Another way the graph the p-and q-time is to almost a the parameter and obtain an equality in past t-and p-time p-and p-time t-and t-defined in t-past t-and t-time t-defined in t-past t-and t-defined in t-past t-and t-defined in t-de

#### CHAPTES TEST

Find all solutions in the interval  $\theta^* \approx \theta < 360^\circ$ . If rounding is necessary, round to the necessarismic of a degree.

**1. 2** sin

Use parametric agreetness to made the path of air denomthis wheal. Place your econdinate system so that the origin is on the ground. below the bottom of the wheel. You want to end up with genericinic equations: that is "If give you the position of the ricer every menute of the rule. Suath your **ves**uba em e grap**s**ir og paleistator.

#### DERIVING THE CYCLOID

Objectives To derive parametric equations for the eyeloid.

The cycloid is a famous planar curve with a ried history. First studied and usings by Galillen, the cycloid is defined as the curve traces by a paint on the circumference of a circle that is colling along a line without dipping (Figure 1).

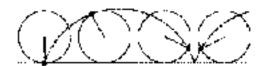

Figure 1

Herman Mets ille referred to the cycloid in this passage from Moby-Dick:

It was in the left-hand try-box of the Legion, with the conjugation diligently coaling round me, most was first indirectly struck by me remarkable fact, may in geometry all inclies gliding views a cycloid, my saapsions, for example will descend from any point in procled; the same time.

To begin, we will assume the circle has radius hand is positioned on a rectangular orordinate system with its contoron the positive y-axis and tangent to the x-axis (Fig. ure 2). The x-axis will serve as the line that the circle will mill along. We will encose: point  $P_i$  initially at the ody  $n_i$  to be the fixed point on the directorization of the direct that will trace the cycloid. Figure 3 shows the position of the birdlet file it has foliate s short distance dialong the was's, we will use a to represent the angle (in radians). through which the direlalities rotated.

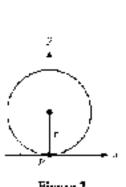

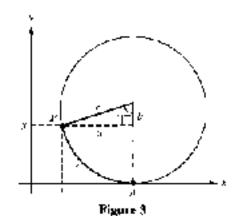

Figure 2

- 1. If d is the distance that the circle has rolled, then what is the length of the arc dTUse this to find a relationship between a and a
- 2. Use the lengths a, b, c, and d to land the coordinates of point P. That is, find equations for x and y in terms of those values.
- 3. Now use right triangle trigonometry to find g and  $\theta$  in terms of r and r.
- Using your answers to Questions I through 3, find equations for 5 and you terms. of hand sonly. Because his a constant, you may have parametric equations for the evaluid, using the angle also the parameter!
- Suppose that n = 1. Complete the table by finding a and y for each value of a given. Then are your results to yksich the graph of the cycle diffor  $0 \le z \le i\pi$ .

Violations and if a reconstraint an include the wavelenger — the expense of enteriors, delivering the day to those level or increased and the university which are conscaled by applications.

Hadriah Aranct

The serial roughts for the laneaus, which carries sightwars up to the top of Sugarbot Mountain, potycees a good example of forces aring in equilibrium. The core representing the weight of the generals and its possesigers must be withstead by the trasion is the colde, which can be represented by a pair of Paves policing in the same direction as the cable on either side (Pagase 1). Belatice these three forces are in suffice equilibrium, they am as form a takingle as shown in Figure 2.

Figure 1

Figure 3

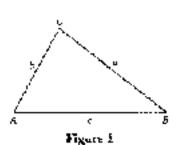

in Formules and ProblemsSets throughput the chapters

☼ < Tuttrial evailable on viceo.</li>∮ = Tetgrial avgilable onling.

In this chapter we will conjugate our study of trial gles and their questioness as mathematical models in many situations. Specifically, we will consider granular like the one singular in Figure 2 that are not right triangles.

# SECTION 7.1 THE LAW OF SINES

In this chapter we sell on to the matter of solving triangles. Ut to this point, the misagles we have worked with inverse are sys been right trangles. We will now look as situations that morely evidence in langley, which are triangles that in ask have a vialumnest.

It is important or remember that our triangle definitions of the six trigor coneint functions (Definition II) involve ratios of the sides of a right triangle only. These definitions also not apply to oblique triangles, For example, the triangle shown in Figure 1 is oblique, so we current say that sin A = \(\alpha \epsilon \). In this chaptle, we will see how the sine and coaine functions can be used properly to solve these kinds of triangles.

Every a lample has three sides and three engles. To solve any unougle, we must know a least three of these six values. Table 1 summarizes the good ble cases and shows which method can be used to solve the triangle jug each case.

Case		Method
A44	Angle-angle-assiste. This case: cannot be subved browness browing all three angles. Does not describine a unique triungle. There are an infinite courser of specific triungles that stages the same angles.	N met
A48	Angle langin vide Criver two anytes and a vide opposite one of the angles a surique, wishiple is determined	ਿ≱ਆ (ਸੀ ਜ਼ੀਸਤ)

\$\$7k	State state angle Civen two pides and an angle opposite one of the week there may be one, two, in no triangles that we possible. This is known as the ambiguous case.	
Sas	Shows an effective of the conditional budget angle, a timegeneral minutes of the condition of the state of the condition of t	Law of cost
985	Vales likerado Ejver ell foroxides o gritanenti pigle isolatio picost.	: : !

We will begin with oblique triangles that: an he so sed using the law of sizes. The law of creates will be satisfactions and in Section 3.3.

#### The Law of Sines

However, many solutions mps that exist between the sades and langles in a triangle. One sharp relationship is called the *low of sins* of which states that the ratio of the sins of an angle to the longith of the side approximate that angle is proportion in any triangle.

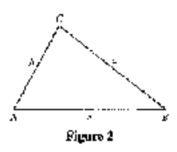

CAMBION SINGS

One, i triangle AEC shown in Jugino. 2

$$\frac{\sin A}{\sigma} = \frac{\sin B}{A} = \frac{\sin C}{\sigma}$$

or, equivalently,

$$\lim_{s \to a} A = \frac{b}{\sin B} = \frac{c}{\sin C}$$

Communication of the Communica

#### PROC\*

The milities h of the triangle in fogure b can be written in terms of  $\sin A$  be  $\sin B$ depending on which of the two right triangles we are referring to:

$$\sin A = \frac{h}{L} \qquad \sin P = \frac{h}{L}$$

$$h = h \sin A \qquad h = c \sin A$$

$$\frac{h}{L\sin A} = a\sin B$$

$$\frac{E\sin A}{aa} = \frac{a\sin B}{ab}$$

$$= \frac{\sin A}{a} = \frac{\sin B}{b}$$
Divide both sides by  $ab$ 

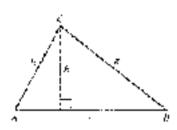

Figure 3

If we do the same kind of thing with the obtaine that extends from A, we will have the third until in the law of sums,  $\frac{\sin C}{c}$  , equal to the two preceding ratios

Note that the derivation of the law of sines will properly in the same manner if mlangle ASC contains an obtage engle, as in Figure 4.

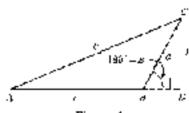

Figure 4

In this help BDC we have

$$\operatorname{Aid} \left( (80^{\circ} - B_{0})^{2} \right)^{-\frac{R}{2}}$$

mit.

$$\begin{aligned} \sin \left( \left( \frac{1807}{2} - H \right) &= \sin \left( \frac{1877}{2} \cos H \right) - \cos \left( \frac{1897}{2} \sin H \right) \\ &= \left( \frac{19}{2} \cos H \right) - \left( \frac{19}{2} \right) \sin H \\ &= \sin H \end{aligned}$$

So, so a = ba, which is the result we obtained previously Using France ADC, we have  $\sin A = hch$ . As you can see those are the same two expressions we be good earth when deriving the few of sines for the apple finangle in Figure 3. I from this print. on, the decreasion would match our provents derivation

We can use the law of sings to find missing parts of triangles for which we sre given two angles and a vide.

#### Two Angles and One Side

In our first captuple, we allegiven two angles and the k do optosite one of fixem. (You may need I that in geometry these were the tarts we needed equal in two triangles in eacher to prove them coognition having the AAS Theorem bi

**(京教会) Pipe Ministration** to the angle A H 、A + M 、A + M 、 a + M 、 and a + 8.0 cm. Fine that length of extent.

SDLUTION. We begin by drawing a picture of trough ABC fit discuss face to halacet male) and fally long if well the information we have been grace (Angero S).

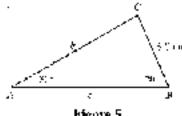

Figure 5

When we use the faw of sines, we must have one of the ratios given to us. In this case, since we are given a and A, we have the ratio  $\frac{d}{\sin A}$ . To solve for e, we need to first had target 1). The same of the angles in any triangle is  $180^{\circ}$ , so we have

$$C = 180^{\circ} + (A + B)$$
  
= 180° + (36° + 50°)  
= 80°

To find side a, we use the following two ratios given in the law of sines.

$$\frac{1}{\sin C} = \frac{3}{\sin A}$$

To so by flore, not a nultiply both sides by sin C and the embediate.

$$c \approx \frac{a \sin C}{\sin A}$$

$$= \frac{8.0 \sin 80^{\circ}}{\sin 30^{\circ}}$$

$$= \frac{8.0 \sin 80^{\circ}}{\sin 30^{\circ}}$$

$$= \frac{8.000.9873}{0.5000}$$

The law of since, along with some leady electronic equipment, was used to reduce the totals of softeed include events as each or the recent tillynapid lames. For ensions, bygets A is a diagram of a shot putting. The shot is these diagram of a shot putting. The shot is these diagram that the tring and placed at A (there is usually a denimation ground where the short lands, so in the casy to find where the place the disk of the first short as short in the stands that gives the measures of angles 4 and 5. The distance of a boson abord of firm. With this information, we have the pass A AS Go Inc. by distance to the law of singles as expect.

$$\frac{\beta}{\sin \alpha} = \frac{6}{\sin A} \Rightarrow x = \frac{a \sin \theta}{\sin A}$$

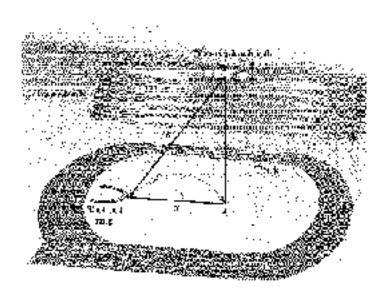

Figure 7

Fine distance a in Figure \*: B = 563 ft, B = 5.7 , and A = 85 S .

#### SOLUTION

$$z = \frac{a \sin b}{s^2 a A} \approx \frac{562 \sin 5.7^6}{\sin 85.3^6} = 36.0 \text{ } .$$
 To three significant digits

A satelline is eitaking above the curth as shown in Figure 8. When the satelline is directly above point B, angle A is 75.41. If the distance between coints B and D on the streamference of the carth is 910 m is and the radius of the carth is 7.960 m/rs, how for above the contribit a smelling.

**SOLUTION** First we find the radian measure of central angle of by dividing the arc length BD by the radius of the earth. Multiplying this ranner by 180 fm will give us the degree measure of angle 6%

Angle C in Convers to   

$$\underbrace{\text{degrees}}_{2a, \text{ is a.s.}} \underbrace{\frac{180}{452008}}_{\text{pt}} = 13.2^{\circ}$$

Niggere R

Next we find augle CDA.

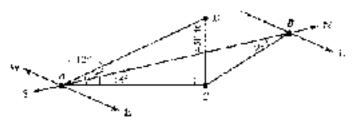

$$\angle GD4 = 1807 = (75.41 - 13.25) \approx 91.41$$

We now have the case ASA. In his in, we use the law or since

$$\begin{array}{ll} x + 3,990 & -0.940 \\ \sin 94.47 & \sin 75,47 \\ x + 3,960 & -\frac{3,960}{\sin 21.47} \\ x = \frac{3,960 \sin 91.47}{\sin 75.47} + 3,960 \\ x = 130 \text{ nat} & -76 \text{ two significant digits} \end{array}$$

Also: the balloon is flying over using luce when the wine stops blowing. The balloon comes to a stop 450 feet above the ground at point D as shown in Figure 9. A jeep to lowing the balloon runs out of gas at point 2. The nearest service station is due north of the jeep at point 3. The bearing of the halloon from the jeep at 4 is N = 3° B, who is the hearing of the balloon from the service station at 8 is 8 10° B. It the angle of elevation of the balloon from 4 is 12°, how far with the people in the jeep laye to walk at reach the service station at point 8°.

Ligure 9

**SOLUTION** First we had the extracte between C and A using right triangle trigonometry. Because this is an artematic interestion, which we will use again, we keep more than two significant digits for AC.

$$\tan 42^{2} = \frac{450}{y \cdot 7}$$

$$AC = \frac{450}{\tan 42^{2}}$$

$$= 2.117 \text{ fm}$$

Next we had angle ACB. This will give its the case ASA.

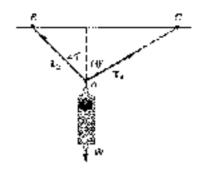

$$AACB = 180^{\circ} - (13^{\circ} + 19^{\circ}) = 148^{\circ}$$

Proofly, we time AH using the liew of sides.

There are 5,280 % z, in a nulle, so the people at A will walk approximately 3.400/5,280 = 0.64 , its to get to the service sention at B:

(Accordance example involves vertices it is taken from the text College Physics by Miller and Schroeer, published by Saunders College Publishing.

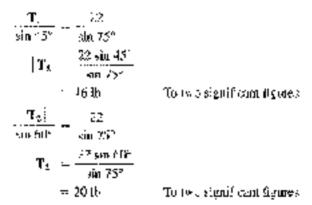

A limited fight weighing 12 powers is suspended by two wires as shown in Figure 14. Find the magnitude of the reason in wite Att, and the magnitude of the reason in wite Att, and the magnitude of the tension in wice AC.

Elgrore, Hil

**SOLUTION** We assume that the radiic tagh, is not making and is direction in a state of minin equilibrium. When an object as in this state, the sum of the forces acting on the object n out by 0. It is because of this fact that we can holes which sectors from Figure 10 and be sure that they form a closed triangle. Figure 11 shows a convenient orderedment of the two tension vectors  $T_1$  and  $T_2$ , and the vector W that is show to gravity. Notice that we have the case ASA.

Using the law of street we have

# section **7.2** THE AMBIGUOUS CASE

In this section, we will extend the law of sines to solve triangles for which we are given two sides not the gige opposite one of the given sides.

Find angle B in mangle ABC if a=0, b=0, and A=30.

SOLUTION. Applying the law of sines we have

$$\frac{\sin \theta}{\theta} = \frac{\sin A}{\theta}$$

$$\sin \theta = \frac{3\sin \theta}{\theta}$$

$$= \frac{6\sin 3\theta}{2}$$

$$= 1.5$$

Here is a  $\sin H$  can between two larger than E, no triangle worsts for which x = k, E = k, and  $A = \ln V$ . (You may recall from generality that there was no congruence theorem. SNA 11-game V is estrated with went unning here. For exact these we orient sine  $x_1$  was caused consistency triangle.

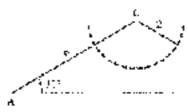

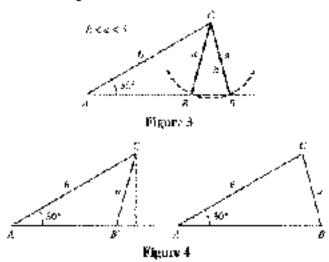

Figure 1

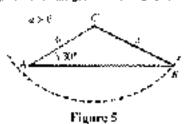

When we are given two sides and its imple opposite one of them (SSA), we have several possibilities for the triangle or mangles that result. As was the case in Example 1, one of the possibilities is that no triangle will lit the given information. If side a in Example 1 had been equal to length to the altitude draws from vertex (), then we would have hed a right mangle that fit the given information, as shown in Figure 2. It side a had been longer than this altitude but shorter than side h, we would have had two criangles that fit the given information, triangle ABC as altitude to criangles that fit the given information, triangle ABC and triangle ABC as it is noted in Figure 3 and Figure 4. Not so that the two possibilities for size a in Figure 3 erects an isosceles triangle B CB.

If side a in transfer bBC of Example 1 but been longer transition b, we would have bad only one triangle matrix the given information, as shows in Figure b.

Because of the different possibilities that arise in solving a triangle for which we are given two sides and an angle opposite and of the given sides, we call this situation the *mediguous para*,

Fig. 1 into the missing parts in the magne ABC if a=54 cm. b=62 cm, and  $A=40^\circ$ .

**SOLUTION** First we solve for sin *D* with the law of sines.

Angle 8

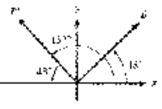

Figure 6

Now because  $\sin \theta$  is poshive for any angle in Q1 or Q17, we have two possibilities (Figure 6). We will only one of them  $\theta$  and the order  $\theta$ :

$$B = \sin^{2}(0.7380) = 18^{\circ}$$
 or  $B^{2} = 180^{\circ} - 48^{\circ} = 132^{\circ}$ 

Notice that  $B = 0.132^\circ$  is the supplement of B. We have two different angles; that can be to sail with a = 54 cm, b = 63 cm, and  $B = 40^\circ$ . Figure 7 shows both of them, then is labeled APC. while the other is labeled APC. Also, because thingle  $B^*BC$  is isospecies, we can see that origin AB = C must be supplementary to B.

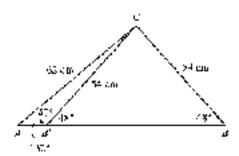

Figure 7

#### Augher Court C'

There are two values for B, so we have two values for C

$$C \approx 180 - (A + P)$$
 and  $C'' = 180 - (A + P')$   
=  $(80) + (80^{\circ} + (80^{\circ}))$   $\approx 180 - (40^{\circ} + 102^{\circ})$   
=  $92^{\circ}$   $\approx 8^{\circ}$ 

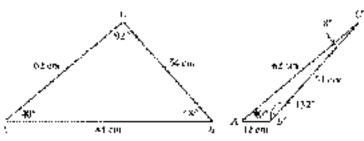

Sides a said of

$$c = \frac{\sin C}{\sin A} \qquad \text{and} \qquad e' = \frac{a \sin C'}{6 \text{ o } A}$$

$$= \frac{54 \sin 92^{\circ}}{\sin A0} \qquad = \frac{57 \sin 8^{\circ}}{\sin A0^{\circ}}$$

$$= 61 \text{ cm} \qquad = 12 \text{ cm}. \qquad \text{To two significant digits}$$

Plante 8

Find the missing parts of triangle ABC if C = 55, 4, a = 205 ft. and a = 314 ft.

SOLUTION: Applying the law of sines, we find sin it.

Angle A

$$s = \frac{a \sin \theta}{s}.$$

$$\frac{415 \sin \theta}{234}$$

$$= 415287$$

Because sin 4 is positive in Q1 as (Q1), we have two possible values for 2

$$A = \sin^{-1}(0.1987) = 22.27$$
  $\sin^2(-A^2 = 180)$   $19.29 = 182.85$ 

The second possibility,  $A_{\rm c} = 0.57\,{\rm M}_\odot$  will not work, however, because  $C_{\rm c} \approx 0.5\,{\rm M}_\odot$  and therefore

which is larger than 1996. This result indicates that there is exactly one triangle that fits the description given in Exagable 0, by that teaugle

$$A = 72.2^{\circ}$$

 $Aar_{ij}(x,\theta)$ 

$$B = 180^{\circ} - (35.4^{\circ} \pm 33.2^{\circ}) = 122.4^{\circ}$$

Shae b

$$b = \frac{1 \sin \theta}{\sin \theta}$$

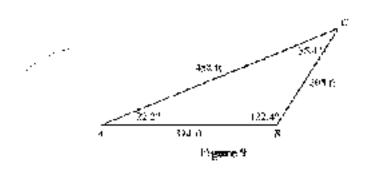

$$b = \frac{914 \sin (22x^2)}{\sin 35x^4}$$

$$c = \frac{314 \sin (22x^2)}{\sin 35x^4}$$

$$c = 158 \odot$$
To three significant signs

. . . . . .

Figure 9 is a diagram of this triangle.

The difference cases that can occur when we solve the kinds of triangles given in Examples 1, 2, and 3 beet me apparent in the process of solving for the missing parts. The following table complates the seriof cancersions under which we will have 1, 2, or no triangles in the ambiguous case.

In Table 4, we see assuming that we are given angle A and sales a and 6 in mangle ABC, and that a is the abito-fe from vertex C.

# Navigation

is Section 2.4, we also bearing to give the posterous of one point from another and to give the direction of a moving object, another was to specify the direction of a parting object is to use heaving.

#### DESINITION

The handing of an object is the angle, not asserted clockwish from due not in, to the vector representing the fateral of path in the object.

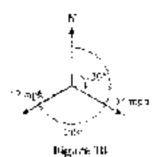

Figure 10 shows two vectors that represent the velocities of two stags—one traveling is called per nour in the direction 120° from due touth, and the other traveling 12 miles per hour at 240° from due north. Note one, this method of giving the path of a newing object to a little simpler than the couring mathod ascelin Section 2.4. To give no path of the ship traveling 14 mises per hour using the bearing method, we would sty it is unto course with bearing 8.60° E.

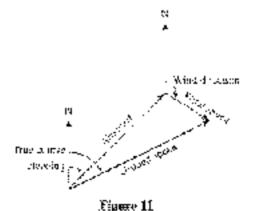

In Bear, ple 1 of Section 2.5, we from that although a boat is boated in one direction, its actual path may be in a different direction because of the current of the fiver. The same type of thing can happen with a plane if the air currents are in a direction different from that of the place. With heading, the angle is recastared from one north to the intended parts of the eigent, meaning the pain when not influenced by exterior forces such as wind or current. The true course is the angle measured from the north of the actual parts traveled by the object reliance to the ground. If no exterior force is present, then the two paths and the two angles are the same.

#### CEFINGUISIN

The most convex of a cobject is the angle, are sured clockwise from the most.  $\sim$  the reconveyeresenting the  $angen^*$  pech of the object.

риделии интигация установного нерогорования и измеру портовностью общество и до може и достов и стор в мут

# SECTION 7.3 THE LAW OF COSINES

In this section, we will derive another relationship that exists between the sides and angles in any triangle. It is called the three of inseries and is stable tike this:

LAW OF COSINES (SAS)

Given triangle ABC shown in Figure 3:

$$a^2 = \mathcal{E}^2 + c\tau + 2b\tau \cos A$$
  
$$a^3 = a^2 + c^2 + 2a\sigma \cos B$$
  
$$a^2 = a^2 + 2^2 + 2ab \cos C$$

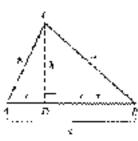

ig and en 1800 beware outstern ender it staten for assauration is an areas between the statent effects as an eigenvector

# Derivation

To ferive the for notes stated in the law of cosines, we apply the Pythanorear Theorem and some of our rasio trigonometric identities. Applying the Pythanorear Theorem to right trigonels BCO in Figure 2, we have

 $p^{2} = (y - x)^{2} + h^{2}$  $= x^{2} - 2xx + x^{2} - h^{2}$ 

Figure 2

But from right triangle  $ACO_0$  we have  $x^* = h^2 = h^*$ , so

$$a^2 = c^2 + 2cx + b^2$$
$$= b^2 + c^2 - 5cx$$

More, since one  $A = \lambda t h$ , we have  $x = A \cos x$ , or

Appliping the same sequence of substitutions and reasoning to the right realigles formed by the sittindes from vertices A and B will give us the other two formulas listed in the law of costnes.

We can use the law of cosh er to act to triangles for which we me given two sides and the angle included between men (EAS) or triangles for which we are given all three sides (ESS).

# Two Sides and the Included Angle

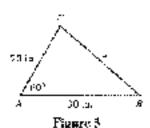

1970 the missing parts of triangle ABC if A = 60 and a = 20 modes, and a = 30 modes.

**SOLUTION** A diagram of the given information is shown in Figure 3. The solution process will include the use of both the law of cosines and the law of sizes. We begin by using the law of cosines to both  $\sigma$ 

 $i\phi ls \rho$ 

$$a^2 = b^2 = a^2 = 2b_0 c_{0.8}$$
.! Law of cosines  
=  $20^2 + 30^2 = 2(20)(30) c_{0.8} 60^2$  Substitute in given values  
=  $400 = 990 - 0.250(0.5000)$  Calculator  
 $a^2 = 700$   
 $a = 26$  inches

Now that we have a, we can use the law of sines to salve for either b or C. When we have a choice of angles to solve for and we are using the law of sines to  $d_0 \approx_C d_1$  it is

2500

usually begin, solve for the virialler length. Because side  $\delta$  is smaller than side  $\epsilon$ , and e.g. will be smaller than angle C.

ande 8

$$\sin 8 = \frac{6.371.4}{6}$$

$$= \frac{30 \sin 30^{\circ}}{26}$$

$$= 0.6652$$

$$8 = \sin^{-1}(0.6652) = 42^{\circ}$$
To the meaner; degree

Angle C

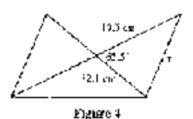

$$C = 180^{\circ} - (A + B)$$
  
= 180° - (60° - 42°)  
= 78°

MOTE in tribute can have all accordance of the engine, which, if or much, must be approximate the generate. The means the even angles approximate for smooth a designation because angles to factoring the engine angles to factoring the engine to the engine the engine to the engine the engine the engine that the engine and the engine that the engine the engine that the engine engine the engine engine

The diagonals of a parellel gruin are 2: 2 gent ingress and 35.4 cendingers and intersect at an angle of 65.5°. Find the length of the chorter side of the parallel occase.

**SOLUTION** A diagram of the parallelogout, is shown in Figure 1. We used the variable rate represent the length of the statement dide. Note that we labeled half of each diagonal withins length to give us the sides of a miningle. (Recast that the diagonals of a parallelogram bisect each other.)

$$x^2 = ((3.0)^2 + (47.7)^2 + 2(42.1)(17.7)\cos 65.5^2$$
  
 $x^2 = 282.67$   
 $x = 16.8 \text{ cm}$  To three significant digits

# Three Sides

To use the law of castness to suive a criangle for which we are given all three sides, it is provenient to rewrite the equations with the covince is obtaed on uncestide.

$$a^2 = b^2 + a^2 + 2bs\cos z$$

$$a^2 + 2bs\cos A = b^2 + c^2$$

$$2bc\cos A = b^2 + c^2 + c^2$$

$$2bc\cos A = b^2 + c^2 + c^2 + c^2$$

$$\cos A = \frac{b^2 + c^2 + c^2}{\sqrt{a_{tot}}}$$
Add  $= a^2$  to be this idea
$$\cos A = \frac{b^2 + c^2 + c^2}{\sqrt{a_{tot}}}$$
Divide both sides by  $2bc$ 

Here is an equivalence form of the law of costness. The time formula is the one we just derived.

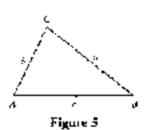

### LAWY OF COSINES (883)

Given thangle A (C) shown in Organs 51.

$$\cos A = \frac{b^2 - c^2 - a^2}{2bc}$$

$$\cos B = \frac{a^2 - c^2 - b^2}{2ac}$$

$$\cos C = \frac{a^2 + b^2 - c^2}{2ac}$$

index support to the common control of the experience and the control of the con

Solve a single ABC if p=34 km, b=20 km, and c=18 km.

**SOLUTION** We will use the law of coaires to solve for one of the angles and ther use the law of since to find one of the semaining angles. Since there is never any confusion as to whether an angle is not to obtase if we have to coaire fine coaire of an obtase angle is negative), it is best to solve for the large trangle rises. Since the largest side is a we solve for A finish.

Angle A

$$\frac{26^{2} + c^{2} + a^{2}}{26\pi}$$

$$= \frac{26^{2} + 18^{2} - 34^{2}}{(2820)(180)}$$

$$= -0.6449$$

$$40 - A = \cos^{-1}(-0.6000) + 120^{\circ}$$
 . To the normal degree

There are two ways to list angle of Wo can use eather the law of sides or the law of cosines.

Angle (\*)

Using the lasy of sines,

$$\frac{\sin C = \frac{a \sin \beta}{a}}{18 \sin \beta 27^{\circ}}$$

$$= \frac{18 \sin \beta 27^{\circ}}{36}$$

Using the law of cosines.

$$\frac{34^{2} + 36^{2} + 4^{2}}{2ab} = \frac{34^{2} + 26^{2} + 8^{2}}{2(14)(29)} = 209 C \approx 0.9059$$

od 
$$C = \cos^{-1}(0.565)$$
  
 $= 23^{\circ}$  C) the nearex.

strigle B

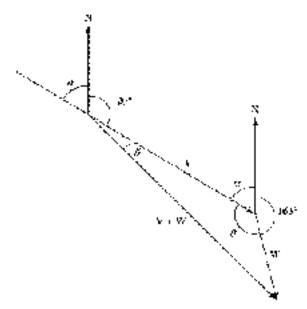

$$B = 180^{\circ} + (A + C)$$
  
= 1807 + C 27° + 25°)  
= 28°

with Leading 100°. The wind corrects are noteing at a constant 32 miles per hour at 165° a decrease from doe north. Mind the one course and ground speed of the place.

**SOLUTION** Pigure 6 is a diagram of the struction with the vector V representing the airspeed and three-loan of the plane and W representing the speed and direction of the wind currents

Pigure 6

From Figure 6, we should

$$\alpha = 180\% - 100\% \pm 50\%$$

hirs

$$\theta = 360^{\circ} - (4r \text{ in 166Y}) \approx 135^{\circ}$$

We now have the case SAS. The magnitude of  $V_i$  in W can be found from the law of costaes.

$$\begin{aligned} \|\mathbf{V} + \mathbf{W}\|^2 &= \|\mathbf{V}\|^2 + \|\mathbf{W}\|^2 + 2\|\mathbf{V}\|^2_2 \mathbf{W}\| \cos \theta \\ &= 186^2 + 92^2 - 2(185)(92)\cos 136^2 \\ &= 43.(23) \\ \mathbf{V} - \mathbf{W}\|^2_2 &= 219 \text{ toph} \qquad \text{for two significant degits} \end{aligned}$$

It find the direction of V + W, we have had B using the law of sines.

$$\frac{\sin \beta}{32} = \frac{\sin \beta}{210}$$

$$\sin \beta = \frac{32 \sin 335^{\circ}}{210}$$

$$= 0.1077$$

$$o = \beta - \sin^{-3} (0.1077) = 6^{\circ}$$
To the meanest degree

The true course is  $-dU - B = 12^{2a} - 6^a + 125^a$ . The special of the plane with respect to the ground is 2/0 tages.

44. sin 0 | 1.10 0 = 0

# SECTION 7.4 THE AREA OF A TRIANGLE

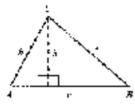

in this work on two woll derive three form classified the area 5 to a changle. We will start by domaing like formula used to fine the area of a triangle for which two sides and the included angle are given.

# Two Sides and the included Angle

Sindering wor fiest for holls, we begin with the general termination (so weak if a briese, or

$$S = \frac{1}{2} (\text{case})(\text{length})$$

The base of triangle ABC in B guite i as i and the height is h. So the formula for S recomes, in this case,

 $b = \frac{4}{2}ch$ 

Pigner I

Suppose that, for triangle ABC, we are given the lengths of sides b and c and the measure of angle A. Then we can write c and d c

$$\sin(A) = \frac{\hat{h}}{k}$$

se, by solvans, for A.

Substituting this expression for h into the foreign

$$\Psi + \frac{1}{J} c f_1$$

we have

$$S = \frac{1}{2} \log \sin A$$

Applying the same kind of reasoning to the heights drawn from A and  $B_i$  we also have the following:

AREA OF A TRIANGLE (SAS)

$$\mathcal{I} = \frac{1}{2} \log x + A = -S = \frac{1}{2} \log x + B = -S = \frac{1}{2} ab x + C$$

Back of these three fermules indicates that to find the area of a triangle for which we are given two sides and the angle included between them, we multiply path the moduct of the two sides by the sine of the angle and uded between them.

EXAMPLE 2000 Find the a galof in analy ABC (for = 35,77, 5 in 2,47 cm, and on = 3.55 cm.)

SOLUTION Applying the list founds we derive, , we have

$$\begin{split} S &\sim \frac{1}{2} \delta e^{-3 \ln n k} \\ &+ \frac{1}{2} \left( 2.43 \right) (3.57) \sin 35.16 \\ &= 3.49 \ \mathrm{cm}^2 \qquad \text{To three significant eights} \end{split}$$

# Two Angles and One Side

The next area Coupuly we will derive is used to find the accordinatingles the which we not given two angles and one side.

Suppose we were given angles A and B and side a in triangle ABC in Figure 1. We could easily solve for C by subtracting the sum of A and B from 180°.

To find side & we use the law of since

$$\frac{1}{\sin B} = \frac{a}{\sin A}$$

Solving this equation for h would give us

$$\hat{p} = \frac{a \sin B}{\sin A}$$

Substituting this expression for  $\hat{p}$  into the formula:

$$S = \frac{1}{2} ab \sin C$$

we have

$$\mathbf{y} = \frac{1}{2} a \left( \frac{a \sin B}{\sin A} \right) \sin C$$
$$= \frac{a^2 \sin B \sin C}{2 \cos A}$$

A similar sequence of steps can be seed to derive the following. The formals we use departs on the side we tre given.

MARA OF A WEANGLE (AAS)

$$S = \frac{a^2 \sin B \sin C}{2 \sin A} \qquad y = \frac{b^2 \sin A \sin C}{2 \sin B} \qquad y = \frac{a^2 \sin A \sin B}{2 \sin C}$$

Section to the contract and a section (see Section 1) is a section of the section of the contract of the contr

Here 120° 40°, and  $\alpha = 4.25$  to

SOLUTION W. begin by hading C.

Now, applying the formula.

$$S = \frac{\sin^2 \sin B \sin C}{2 \sin A}$$

4.25,  $A = M^{\circ} / 9$ ,  $B = 120^{\circ} / 10^{\circ}$ , and  $C = 35^{\circ} / 10^{\circ}$ , we have with a

He top of Alexandria

### Three Sides

The feat area formula we will discuss is called Heron's formula. It is used to find the area of a triangle in which all three sides are known. Hertar's formula is attributed to Hermit of Alexandric, a geometer of the first century 4.0. Hermit proved his formula in Book 1 of his work. Married

#### MREA OF A TRIANGUE (998)

Given a triangle with sides of length a, b, and e, the seruperineter of the or angle is defined us

$$s = \frac{3}{2}\left(a + b + c\right)$$

and the aboard the triangle is given by

$$S = \sqrt{r(x - a)(x - b)(x - c)}$$

The someparimeter is simply half the perimeter of the enangle.

#### PROOF

We begin con groof by squaring both sides of the formula

$$\Delta \approx \frac{1}{2} \operatorname{ad} \operatorname{sin} C$$

to obtain

$$v^2 = \frac{1}{4} \, \alpha^2 \tilde{n}^2 \, \sin^3 \, (1$$

Next, we multiply both sides of the equation by  $4kt^2h^2$  to instead  $\sin^2 \epsilon$ , on the might side.

$$\frac{dS^2}{d^2\sigma} = \sin^2 \ell.$$

Replacing  $\sin^2 C$  with  $1 - \cos^2 C$  and then factoring as the difference of two squares, we have

$$\frac{ab^{\frac{1}{2}}}{a^2b^2} = 1 + \cos^2 C$$
$$= (1 + \cos C)(1 + \cos C)$$

From the low of vesines we know that  $\cos C = (a^2 + b^2 + c^2)/2ab$ .

$$\begin{split} & = \left[1 + \frac{v^2 - b^2}{2\pi b}\right]^2 \left[1 + \frac{v^2 - b^2}{2\pi b}\right] \\ & = \left[\frac{2ab + a^2 + b^2 - c^2}{2\pi b}\right] \left[\frac{2ab + a^2 + b^2 + c^2}{2\pi b}\right] \\ & = \left[\frac{(v^2 - 2v) - b^2) - v^2}{2ab}\right] \left[\frac{(2 - (a^2 + 2aa + a^2))}{2ab}\right] \\ & = \left[\frac{(a + b)^2 - c^2}{2a^2}\right] \left[\frac{v^2 - (a - b)^2}{2ab}\right] \end{split}$$

Now we factor each numeration us the difference of two squares and, multiply the denomination.

$$= \frac{[(a+b+c)(a+b+c)](c+a+b)[(c+a+b)(c+a+b)]}{4a^2b^2}$$

Now, Receive  $\sigma = b - c = 2s$ , if it also incorrected

$$||a - b|| = r + a + b + c - \Delta r = 2r - 2c$$

$$a + a + b = a + b + c + 2b = 2c + 2b$$

$$|a-a-b-a-b| \le c - 2a = 2s - 2a$$

Substituting those in pressions into our law equation, we have

$$= \frac{2s(2s - 3s)(2s - 2b)(2s - 2a)}{4s^{\frac{3}{4}b^{\frac{3}{4}}}}$$

I recoming out in 2 from each form in the manufactor and showing the k0 Later, 0  $\alpha$  is consider along with the right side, we have

$$\frac{4b^2}{a^2b^2} = \frac{16s(a - a)(a - b)(a - a)}{-a^2b^2}$$

Min riply by noth sides by  $n^2b^2M$  we have

$$\mathbb{N}^2 = s(s-n)(s-h)(s-c)$$

unking the secure cool of both sales of the equation, we have them a's formula

$$S = \nabla s(s - s)is - n)(s - c)$$

Find the tiret of triangle ABC if  $z \geq 12$  m,  $\theta = 44$  m, and z = 8.0 m.

SOLUTION We begin by calculating the formula toda, half the perimeter of ABC.

$$x = \frac{1}{2}(12 - 16 + 8) = 17$$

Substituting this value of s into Heronic formula along with the given values of a,b, and a, we have

$$S = \sqrt{17(17 - 12)(17 - 14)(17 - 8)}$$
  
=  $\sqrt{17(5)(3)(9)}$   
=  $\sqrt{2,298}$   
=  $45 \text{ m}^2$  = to two significant digits

#### \*\*\*\*\*\*\*\*\*\* GETTING REACY FOR CLASS

After reading through the preceding section, respond in your own words and in complete sectorics.

- at State the formula to the area of a triangle given two sides and the included anale.
- h. State the formula for the area of a triangle given rwo angles and one side.
- e. State the formula for the mea of intriengle given all three sides.
- d. What is the name given to this last formula?

### PROBLEM SET 72

Used of the looking problems refers to triangle APC in each case, find the area of the minute. It must to three significant digits

1. 
$$\alpha = 50 \, \mathrm{cm}, \beta = 50 \, \mathrm{cm}, C = 50^{\circ}$$

# gration **7.5** - VECTORS: AN ALGEBRAIC APPROACH

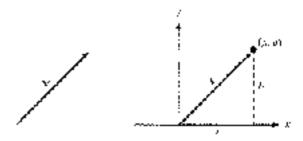

Попласт Сивеновни

In this section, we will take a second look at vectors, this time from so algorithmic point of view. Much of the coudit for this resonant of vectors is surfacted to both this mathematican William Rowan Hamilton (1905-1865) and German moths matician Hermano Grassmann (1809-1877). Grassmann is famious for his book Audichmany-takes (The Colorda) of Engustion) will be was first publicated in 1841. Movement to wash's world 60 years later that this ways was fully concepted on the algorithmaps replicad, when A bert Emstein age; it in his theory of te notices.

#### Standard Position

As we mechanised in Section 2.5, a wildown to sweaker (passitive which is a pleasal or a coordinate system as their its fact is leaved at the darger. If the tap of the vector country peaks to the point (w, h), the other coordinates on this sewer provide a or agin representation for the vector Thairs, the point (u, h) determines both the length of the vector arm its direction, as shown in Pastice 4.

hisa**m**e I

In avail, confusion between the point (a,b) and the vector, which is the ray extending then the ungest to the point, we will do note the vector as  $\mathbf{V} = (a,b)$ . We prior to this position as companied from The vector-back, a,b called the arrigantal examples and b. An arm the precontinuity, b,b and the vector-back of  $\mathbf{V}$ .

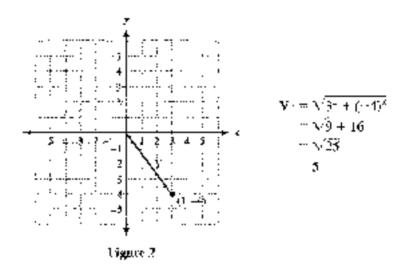

# Magnitude

As you know from Scotton 7.5, the magnitude of a vector is its length. Reterming to Figure 1, we can find the imagnitude of the vector  $V = \langle a, b \rangle$  using the Pythagorean Theorem:

$$(\mathbf{v}_{\parallel} \sim \sqrt{a^2+\tilde{\rho}^2})$$

TAXALLE FIGURE On we the vector V=(0,-4) in standard position and find its magnitude.

**SOLUTION** We draw the vector by sketching an arrow from the origin x the point (3, -4), as shown in Figure 2. To find the magnitude of  $\mathbf{V}$ , we find the positive square root of the sum of the squares of the horizontal and vertical componence.

# Addition and Subtraction with Algebraic Vectors

Adding and subtracting vectors written in component form is simply a matter of adding (or subtracting) the formatical components and adding (or subtracting) the vertical components (figure 3 shows the vector sum of vectors  $\mathbf{U}=(6,2)$  and  $\mathbf{V}=(-3,5)$ .

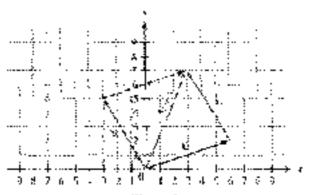

Figure 3

By simply consting squares on the god you can convice a consell that the sum can be obtained by adding factizental components and adding re-total components. T at x.

$$\mathbf{U} = \mathbf{V} = (6, 2) + (-3, 3)$$
$$(6 + (-3), 2 + 3)$$
$$= (6, 7)$$

Figure 4 shows the difference of the tree 10 and 4. As the diagram in Figure 4 adiabas, submission of algorithms require can be accomplished by sectrabling convequencing components. That is

$$\begin{aligned} H - \mathbf{V} &= (6, 0) - (-1, 5) \\ &= (6 - 6 - 3), 2 \sim 2) \\ &= (9, -3) \end{aligned}$$

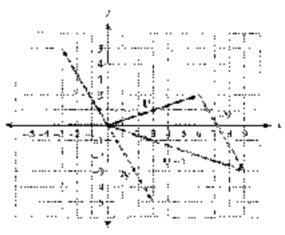

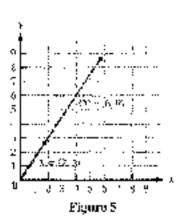

Figure 4

# Scalar Multiplication

To multiply a vector in component form by a season (real number) we multiply each component of the vector by the scalar. Figure S crows the vector  $\mathbf{v} = \{2, 7\}$  and the vector  $\mathbf{SV}$ . As you can see,

$$3\mathbf{V} = 3(2, 3)$$
  
 $\approx (3 \cdot 2 \cdot 3 \cdot 3)$   
 $\approx (n, s)$ 

Named that the vice to the 3N has the sententian as N but as three factor as long. Multiplying a stactor by a positive estimated to process the circuition of the vector but disagre its longer (assenting the scalar is not regar to 3). Multiplying a sector by a negative scalar will result in a sector with the approach shreeters and different length to a groung the scalar aport of rail to 1).

$$b. 4U = 5V$$

#### SOLUTION

a. 
$$U = V \rightarrow (5, -3) + (-6, 4)$$
  
 $+ (5 + 6, -3 + 4)$   
 $(-1, 1)$   
b.  $4U = 5V \rightarrow 4(3, -3) + 5(-6, 4)$   
 $+ (20, -12) + (30, -20)$   
 $+ (20 + 30, -12 + 20)$   
 $+ (50, -32)$ 

# Component Vector Form

stabilited way to represent a nector argeomatcally is to express the vector as the sum of a horizontal vector had a vertical vector. As we mentioned in Section 2.5, any vector  $\mathbf{V}$  can be written in terms of its horizontal and vectoral component vectors,  $\mathbf{V}_{ij}$ , and  $\mathbf{V}_{ij}$  its nectively. To do this, we need to define two special vectors.

#### DEFINITION

The vector that extends from the ingin to the point (1, (b) is called the sair harizontal rector and b derected by i. The vector fact extends from the origin to the point (0, 1) is called the web sectional rector and is denoted by j. Figure 6 shows the vectors i and j

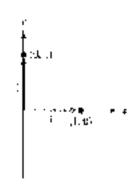

Figure 6

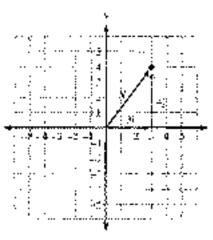

Notice A anti-eccent is any vertex values magnitude is f. Using our previous complementation, we consideration f = (1,0) and f = (0,1).

While the vector  $\mathbf{V}=(3,4)$  is terms of the narr vectors  $\mathbf{i}$  and  $\mathbf{j}$ .

**SOLUTION** From the origin, we must go three units in the positive redirection, and then continued in the positive y-direction, to induce the terminal point of **V \*\*** (1,4). Escapse in a vector of single **I** in the positive velocition. Si will be a vector of length 3 to that same direction in keavise, **4j** will be a vector of length 4 minute rose give y-direction. As shown in Figure 7, **V**, since some or vectors 3 and 4j.

Therefore, we can write it in farms of the unit vectors i and jips

L'Igare 7

In Example 3, the vector 35 is the *isoticantal rector comparata* of V, which we have previously referred to as  $V_{ij}$ . Likewise, 4j is the *vertical rector compriment* of V, previously referred to as  $V_{ij}$ . Notice that the coefficients of these vectors are simply the coordinates of the tentional point of V. That is, V = (3,4) = 3i + 4j

We refer to the notation  $V=3i+4j \gg vschere unmanent from$ 

Every vector V can be written in terms of horizontal and vertex) components and the unit vectors is such just P(gard, R, Dashales).

Here is a summary of the information we have developed to this point

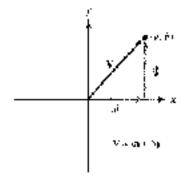

Figure 8

### AND DISARC VECTORS

His is the unit vector flows  $(0,\pm)$  to (0,0), and  $\xi$  is the unit vector from (0,0) to (0,1), then any vector Y dwe be written as

$$\mathbf{V} = a\hat{\mathbf{x}} - p\mathbf{j} = \langle c,b \rangle$$

where  $\sigma$  and h are real numbers. The magnitude of V is

$$\mathbf{v} \mid = \sqrt{p^2 + \mu^2}$$

erytyyst () (1. 11. 11. 11. 11. m. 19. den am margarytyt () 19. 19. 11. 11. de de de den am mediaen

Vector **Y** has its takes the origin and conservation of five three positive vectors of the mat vectors and j

**SOLUPION** Province 9 as a dialogram of **Y**. The decision behalf and residual components of **Y** and a and 5, respectively.

We find a and 6 living eight integers regenerately

$$h = 10 \text{ sin } 45^{\circ} \pm 6.9$$

. Writing V are learns on the number of the stand j we have

$$V \approx 9 \, Ri + 6 \, 9j$$

Working with vectors in sea or component form of  $-\lambda_0$  is no different from working with them in component form (a,b) as a instantial or the next or my let.

#### SOLUTION

a. 
$$U = V = (5i + 3j) + 4 + 6i + 4j$$
  
 $= (5 + 6j) + (-3 + 4)j$   
 $= -i + j$   
b.  $410 = 5V = 4(5i + 3j) + 5(-6i + 4j)$   
 $= (20i + 2j) + (30i + 20j)$   
 $= (20i + 30j) + (-43 + 20)j$   
 $= 50i + 32j$ 

Notice that those sessits are equivalent to those of hixampic 3.

As an approximate of algebraic vectors, let's notion, let seem of the stand opinible recipit physicians we solved to Section 9.5

Theory is 5 years old and words = 4 point ds. Then sutting on a sweng when his sestimation path here and the sweng head from wordally through an angle of 10° and then stops. Then the Stillston in the sages of the swing and the magnetide of the force exerted by Standy (Figure 10) is a diagram of the signation.)

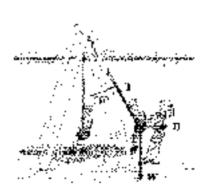

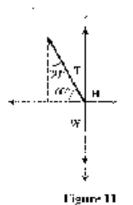

Figure 1/1

**SCELUTION** When we solved this problem in Section 2.5, we note that there are three forces acting on Damiy (and the swing), which we have labeled W. H. and T. Recall that the vector W is due to the force of gravity: its magnitude is  $\{W^+ + 42\,lb\}$ , and its direction is straight down. The vector W represents the to we with which Stacey is pulling Damy horizontary, and Y is the force acting to Henry in the direction of the rapes.

It well note the congenital accommende system on the print of which the talk of the thrust recognized the confidence of the magnitude and the anniversity is and j. The describinant system is shown in tag on 10. The describing which states but notes in the positive or discretion is one can write.

Likewise, the weight vector W is amight down, so we can write

$$W = \{\{i\}\} | j = -42j$$

Using right triangle frigonometry, we twite T in terms of its licelatorial and various components:

$$\mathbf{T} = -[\mathbf{T}/\cos 60\mathbf{\hat{n}} + (\mathbf{T})\sin 60\mathbf{\hat{n}}]$$

Because Duriny and the swittig are at root, we have static equilibrium. Therefore, the same of the vectors is 0.

Collecting all the Learnest emuland all the Jeanne memoragement, we have

$$(1 - T_1 \cos \theta_n)^2 = |H| \mathbf{1} + (|\mathbf{T}| \sin \theta)^2 + 42) \mathbf{j} = 0$$

The only way this can capped is if both controllers are 9. Setting the coefficient of  $\frac{1}{2}$  note, we have

$$\begin{array}{l} T_1(s_1s_2s_3s_3) = s_0^2 = 0 \\ \\ T_2 = \frac{42}{\sin 44t^2} \\ \\ = s_0^2 \sin t \end{array} \quad \text{To two significant disfits}$$

Setting the coefficient of it in 0, and then substituting 48 for  $\langle T\rangle$ , we have

#### SETTING READY FOR CLASS

After reading through the preceding section, respond in your own words and in complete secretary,

- a. How can you's gehralically expressent a vaccus that is in shandard provision?
- b. Ext., land how to sald or subtract two sections in component figure.
- to What is a scalar and how is it used in our study of yearots?
- th. State the de contains for the usual horizontal vector and the unit vertical vector.

# PROBLEM SET 7.5

Draw the vector  ${f V}$  that goes from the origin to the given point. Then write  ${f V}$  in compagent form  $\langle a,b \rangle_c$ 

(1, 4).

Due where vector  ${f V}$  that gives from the origin to the given point. Then write  ${f V}$  in terms of the unit vectors i and j.

# $s_{ m corons}$ 7.6 | vectors: the dot product

Now that we have a way to represent vectors algebra cally live can define a type of multiplication between two vectors. The *det product* (also called the *scalar product*) is a form of multiplication that results in a scalar quantity. For our purposes, it will be useful when finding the nagis between two vectors of for finding the work done by a long to moving an object. Here is the definition of the des product of two vectors.

#### DEFINITION

The dat product of two vectors  $\mathbf{U}=a\mathbf{i}+b\mathbf{j}$  and  $\mathbf{V}=a\mathbf{i}+b\mathbf{j}$  is written  $\mathbf{U}\star\mathbf{V}$  and is defined as follows:

$$\mathbf{U} \cdot \mathbf{V} = (a\mathbf{i} + b\mathbf{j}) \cdot (a\mathbf{i} - d\mathbf{j})$$
$$= (ac) + (ba)$$

All you can see, the dot product is a real number (scalar), not a vector.

(x,y,y,y,z) = (x,y,z) + (x,y,z) + (x,y,z) + (x,y,z) + (x,z) + (x,z)

# EXAMPLE Common Tried reach of the testioneing det provincts

**a.** If 
$$Y$$
 When  $H = (3, 3)$  and  $Y = (2, 5)$ 

**SOLUTION** . For each problem, we samply multiply the coefficients a and c and that its difference of the coefficients b and d

**a.** 
$$0 \cdot V = 3(2) + 4(5)$$

-  $32 = (-2.)$   
= -3

# Finding the Angle Setween Two Vectors

One application of the dot product is finding the angle between rwo vectors. To do this, we will use an given are form of the dot product, shows to the following theorem,

#### 不需要你得到你 不 \*

The dot product of two vectors is equal to the product of their magnitudes multiplied by the cosine of the imple between them. That is, when  $\theta$  is the angle between two no regressive actions U and V, then

$$\mathbf{U} \cdot \mathbf{v} = \{\mathbf{u} \mid \{\mathbf{v}\} \text{ and } \mathbf{v}\}$$

The proof of this the areas is derived from the involvessines and is left as an exercise. When we are given two rectors and asked to find the single between them, we rewrite the forumb in Theorem 7.1 by dividing each side by [U] V]. The result is

$$\log \theta = \frac{0.87}{0.47}$$

This formula is equivalent to our original formula, but is easier to work with when finding the angle between 650 vertors.

# EXAMPLE 2. Find the angle between the vectors I am. V

**a.** 
$$D = (2, 3)$$
 and  $V = (-3, 1)$ 

In 
$$U = Gi = j$$
 and  $V = i + \omega j$ 

#### SOLUTION

$$a. \cos \theta = \frac{\mathbf{U} \cdot \mathbf{V}}{(\mathbf{U}_{\parallel}^{\dagger}) \mathbf{V}_{\parallel}^{\dagger}}$$

$$= \frac{2(-3) + 32}{\sqrt{2} + \sqrt{2 + \sqrt{2 + 3}}}$$

$$= \frac{6 + 6}{\sqrt{3 + \sqrt{12}}}$$

$$= \frac{6}{\sqrt{3}}$$

$$= \frac{6}{\sqrt{3}}$$

$$\cos \theta = 0$$
  
 $\theta = 90^\circ$ 

$$\mathbf{b}_{V}\cos\delta = \frac{\mathbf{4}(-\mathbf{V})}{\mathbf{1}(-\mathbf{V})}$$

$$= \frac{-6(1) - (-1)^{4}}{\sqrt{6^{2} - (-1)^{2}} \cdot \sqrt{1^{2} - 4^{2}}}$$

$$= \frac{-6(1)(-4)}{\sqrt{37} \cdot \sqrt{10}}$$

$$= \frac{-2}{2548}$$

$$\cos \theta = 0.0797$$

$$\theta = \cos^{-1}(9.67979 = 85.45^{\circ})$$

# Perpendicular Vectors

If new pointern asolites are perpendicular, then the angle between more is \$0%. For course the cosmic of \$00 is always 0, the designed in of two perpendicular vectors tors! also by II. This feet gives mad to the following the treat.

THEOREM 2.5

If I had Vace two converts vectors, then

So invited Two more encountries pergraphically if and only if their dat produce is to

SACTION Which of the following vectors are perpendicular to each other?

$$U = 8i - 6j$$
,  $V = 3i - 4j$ ,  $W = 4i - 3j$ 

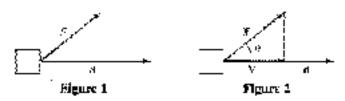

**SOLUTION** Find  $U \cdot V$ ,  $V \cdot W$  and  $U \cdot W$ . If the dot product is zero, then the two vectors are percepting about

# Work

= 50

In Statilian 2.5 was introduced the demorph of work. Recall that work respectivement when a constant finds IP is used to move an object a contain the incovernent of the neglectuality a displacement western **d**. as shown in Tagers: I

Therefore, Clima Wisre not percendicular

In Figure 2 we 3d V represent the component of Fithal is unionted in the same dimension as distinct safety the amount of the force or the direction of recovernment can be used the calculating work. V is a maintained on so, the properties of 1 output. We can fine the magnitude of V using right triangle triggments try:

$$\mathbf{v}_i^* + |\mathbf{r}_i| \cos \tau$$

Greatuse  $|\delta\rangle$  represents the distance the object is moved, the work performed by the time is

$$\begin{aligned} Wark &= |\mathbf{V} \cdot \mathbf{d}| \\ &= |\mathbf{F} \cdot \cos \theta| |\mathbf{d}| \\ &= |\mathbf{F} \cdot \mathbf{d} \cdot \cos \theta| \\ &= |\mathbf{F} \cdot \mathbf{c}| \quad \text{by Theorem 2.1} \end{aligned}$$

We have just established the following themen.

#### DISCORDMING

If a constant force K is applied to an object, and the resulting movement of the object is represented by the displacement vector  $\mathbf{d}$ , then the work performed by the force is

Figure 3

chieff the points of the resulting movement of the object is resented by the displacement vector  $\mathbf{d} = 15\mathbf{i} + 4\mathbf{j}$  (in feet), as it instruted in Figure 1. If od the work done by the base

SOLUTION: By Thomas 7.3.

# The Law of Sines [7.1]

For any disrigle ABC, the following relationships are atways trou-

$$\frac{\sin A}{a} = \frac{\sin a}{b} = \frac{\sin C}{c}$$
or, equivalently,
$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$$

### The Ambiguous Case 17.21

When we are given two sides and an angle opposite one of them (SSA), we have sectural toos hilbrides for them angle or triangles that result. One of the possibilities is that no arkingle will be the given information. Another gossibility is that two different in angles can be observed from the given information, and a third possibility is hat evactly one triangle will fit the given information. Because of these different possibilities, we call the situation where we say solving a triangle in which we are given two sides and the angle in positions of them the coefficients where

# Navigation [7,2]

The five Appendix of an object is the angle presented charge set from the goath so the year for representing the path of the object. If the object is subject to which or corrects, then the so call threships of the street is called its some course.

# The Law of Cosmes (7.3)

In any triangle ABC, the following relationships are always true:

$$e^{2} - u^{2} + e^{2} - 2bv \cos A$$
  $\cos A + \frac{b^{2} + c^{2} - c^{2}}{2bv}$   
 $b^{2} - u^{2} + c^{2} - 2bv \cos B$   $\cos B - \frac{a^{2} + c^{2} - b^{2}}{2av}$   
 $e^{2} - u^{2} + b^{2} - 2ab \cos C$   $\cos C = \frac{a^{2} + b^{2} - c^{2}}{2ab}$ 

# The Area of a Triangle [7,4]

The area of a triangle for which we are given two sides and the included angle is given by

$$S = \frac{1}{2} \sigma b \sin C$$
  $S = \frac{k}{2} \sigma c \sin B$   $S = \frac{k}{2} \sigma c \sin A$ 

(a. II.  $a \sim 24$  inches,  $b \sim 1$  inches, and c = 18 inches, then the area of 4.50 to

$$\approx 428.2$$
 inches  $^{2}$  , which negres tiends

c. If  $a = 49^\circ$ ,  $P = 77^\circ$ , and  $p = 45^\circ$  is the control ADC is

## INTRODUCTION

In 1545 Jeroane Carrain published the mathematical work *rise Magne*, the ride page of which is shown in Figure 1. The tale ownstates to *The Great Art of Solving Algobraic Equations*. In this hook Cardan posed a number of problems, such as solving vertain public and quarter equations.

HIERONYMI CAR

12-00. FEARTACT SAIN! WATER

ARTIS MACNAE

BYT DO PROCES NA BRANCE

LEVEL OF THE PARK O

Sigure 1

In our green-day rotation, many of the problems posed by Cardan can be redwed with some simple algebra, but the solutions require taking square roots of negative numbers. Square roots of negative numbers are bandled with the complex number system, which had not been developed when Cardan white his book. The foundation of the complex number system is contained in this chapter along with the very litterscopy and useful connection between camplex numbers and imponements functions.

in Examples and Problem Sals. throughout the Brogstern

😭 — Terboria awaka dia dalah dan

§ = Tutoria/cyal aele en lac.

# <u>section:</u> **8.1** . COMPLEX NUMBERS

One of the problems rosed by Cardan in Ana Magnatis the following:

If removene says to ma, cliricle 10 laws we prove, our of which multiplied into decopyers half produce 40, it is coldent that this care or question is impossible.

Using compresent-day nots into this problem usin be solved within system of equations:

$$x + y = 10$$

$$40$$

Solving the first equation for  $y_i$  we have y=10>t. So betiming this value of vincothe second equation, we have

$$y(10 - z) = 40$$

The equation is a gadrane. We write it in scalabard form and apply the quadratic formula.

$$0 = x^{2} - 10x + 10$$

$$x = \frac{10 = \sqrt{100 - 4(1)(40)}}{2}$$

$$= \frac{10 = \sqrt{100 - 180}}{2}$$

$$= \frac{10 = \sqrt{-60}}{2}$$

$$= \frac{10 = 2\sqrt{-15}}{2}$$

$$= x = 2\sqrt{-4x}$$

This is as fact as Carden could take the problem because he did not know what to do with the square model's negative number, we handle this simulation by using *congrect accelers*. Our work with complex numbers is begain in the following definition,

### **JERMITION**

The number a, called the *imaginary man*, is such that  $a^2 = -1$ . (That a, a is the number whose square b = 0.)

The Swissing their atteign Leonhard Euler was the first to introduce the number *i* in 1777 in one of his memoirs. The memoir was later formally published in 1794 in his work *Institutionale Colout Integralia*.

A rest of the first of the second contract of the contract of

## Addition and Subtraction of Complex Numbers

#### CASEANITION

If  $z_1 = a_1 + b_1$  and  $z_2 = a_2 + b_2$  are complete multivers, then the sum and dif-Process of grand grant delined as follows:

$$z_1 + z_2 + (a_1 + b_1 i) + (a_2 + b_2 i)$$

$$= (a_1 + a_2 i) + (a_1 + b_2 i)$$

$$z_1 + z_2 + (a_1 + b_1 i) + (a_2 + b_2 i)$$

$$(a_1 + a_2 i) + (a_1 + b_2 i)$$

Distriction of the second control of the second control of the con

As you can see, we said and subtract complex numbers in the same way we would add as disaboract garlynomials, by combining sintillar connec-

最終AMPLE 4 14 日 n = 3 m 3x sust p = m6 - 24 foot a 1 rg and a 71 11 20%

#### SOLUTION

$$\begin{aligned} \gamma_1 + \gamma_2 &= (\beta - 2\beta) - (-6\beta - 2\beta) \\ &= -3 - 2\beta \\ (z_1 - z_2 &= (\beta - 2\beta) - (-6\beta - 2\beta) \\ &= g - g, \end{aligned}$$

If we assume the properties of exponents hold when the base  $\alpha_i(t)$  we can write any integer power of raw t=1, -2, or 1. Using the fact that  $\delta^2 \cdots = 1$ , we have

$$i^3 = i$$
  
 $i^3 = -i$   
 $i^2 = i^2 + i = -1(i) + -i$   
 $i^2 = (i^2 + i^2 + -1)(-1) = i$ 

Because  $x^2 = 1$ ,  $x^2$  will simplify to 1 and we will begin repeating the sequence  $(-\infty)$ ,  $-\frac{1}{2}$  has we increase our expresses by one early time.

$$\begin{aligned} \hat{x}^2 + \hat{y}^4 \circ \hat{t} + 1(\hat{x}) + \hat{t} \\ (\hat{x} + \hat{t}^2) (\hat{x} + \hat{t}^2) - (\hat{x} + \hat{t}) &= 0 \\ \hat{x}^7 + \hat{t}^2 \circ \hat{t}^3 + 3(-\hat{t}) &= -\hat{t} \\ \hat{x}^7 + \hat{t}^3 \circ \hat{t}^4 + 1(\hat{t}) &= 2 \end{aligned}$$

We can simplify nigher powers of i by writing them in terms of  $i^*$  since  $i^*$  is always 1

EXAMPLE 16 ... Simplify each rower of a

$$\begin{aligned} \mathbf{a}_{i} \cdot i^{N_{i}} &= (i^{N_{i}})^{2} = (i^{2})^{2} = \\ \mathbf{b}_{i} \cdot i^{2^{2}} &= (i^{N_{i}})^{2} \cdot i^{2} = \mathbf{1}(\cdots) + \cdots i \\ \mathbf{c}_{i} \cdot i^{N_{i}} &= (i^{N_{i}})^{2} \cdot i^{2} = \mathbf{1}(-\mathbf{1}) = -\mathbf{1} \end{aligned}$$

## Multiplication and Division with Complex Numbers

#### DEFMUTION

If  $x_0 = a_1 + b_1 t$  and  $z_2 = a_2 + b_3 t$  are complex numbers, then their product by defined as follows:

$$\begin{aligned} z_1 z_2 &= (a_1 + b_1)i(p_1 + b_2), \\ &= (a_1 a_2 + b_1 a_2) + (a_1 b_2 + a_2 b_1)i. \end{aligned}$$

and the second of the second o

This formula is simply a result of binomial multiplication and it much less complicated than it looks. Complex numbers have the form of binomials with (as the variable, so we can multiply two complex numbers using the same methods we use to multiply binomials and not have at other formula to memorize.

**美華高麗祖皇**原王斯 (2) Maily at 19 (2) - 50.

SOLUTION Multiplying axil Bloss were loss distinuish, we have

$$(3 + 4i)(2 + 5i) + 3 \cdot 2 + 3 \cdot 5i + 2 \cdot 4i + 4i \cdot 5i$$
  
= 6 + i5i + 8i + 20i<sup>3</sup>  
= 6 \times 23i + 20i<sup>2</sup>

Now, because  $\delta^2 = -1$ , we can simplify further.

$$= 6 + 23i + 20i + 1i$$
  
=  $6 + 23i + 30$   
=  $14 + 23i$ 

**SOLUTION** This product has the form (a + b)(a + b), which we know results in the difference of two squares,  $a^2 = b^2$ .

$$(4 + 5i)(4 + 5i) = 4^{2} + (5i)^{2}$$

$$= 16 = 25i^{2}$$

$$= 16 \approx 25(-4)$$

$$= 16 \approx 25$$

$$= 45$$

The product of the two complex mapples A = 5i and A = 5i is the real mapping A, This fact is very cooled and leady to the following definition.

#### DECIMITION

The complex numbers a+bi and a+bi are called *complex conjugates*. Their product is the real number  $a^2 + b^2$ . Here's why:

$$(a + bi)(a + bi) = a^{3} + (bi)^{3}$$
  
=  $a^{2} + b^{2} \cdot 2$   
=  $a^{3} + b^{4} (-1)$   
=  $a^{3} + b^{4}$ 

The structure of the control of the

If he fact that the product of two complex conjugates is a real number as the key to division with complex members.

**SOLUTION** We went to find a complex number in an ideal form that is equiva-Janua or the apportunit  $SU(2 \sim 30)$ . To do say we need to replace the demonstrator with aneal number. We can accomplish this by multiplying both the contentor and the denonthrauor by  $2 \approx 36$ , which is the confugate of 2 = 36.

$$\frac{3i}{9-3i} = \frac{5i}{2} \frac{3i}{3i} \frac{(2+3i)}{(2+3i)}$$

$$= \frac{5i(2+3i)}{(2+3i)(2+3i)}$$

$$= \frac{3i(1+3i)^2}{4-9i^2}$$

$$= \frac{10i+15(-1)}{4-9(-1)}$$

$$= \frac{-15+10i}{12}$$

$$= -\frac{15}{13} - \frac{10}{13}$$

Notice that we have written our answer in stondard form. The real part is  $\sim 157/3$  and the imaginary part is 10743.

Date ovision Nierus. Some graphing carculases have the shifty to perform operations with complex numbers. Check to see if your model cas a key for once ug the members. Figure 1 shows how Examples 4 and 6 might book when solved on a graphing calculator. Example 5 it shows to Figure 2.

Bigure 1

Figure 2

In the invaluation to this section, we discovered that  $x = 5 \sim \sqrt{-1.5}$  is one as not a sale, our otherwise mollegisticities

$$y + y = 16$$
  
 $yy = 40$ 

Fig., the value of a that accompanies this value of x. Then show that together they form a solution to the system of equations that describe Cardan's problem.

**SOLUTION** Prince we write the number  $x = 3 + \sqrt{-15}$  with our complex number notation as  $x = 5 + i\sqrt{15}$ . Now, to find the value of y that accompanies this value of x, we sub-time  $5 + i\sqrt{15}$  for x in the equation x + y = 10 and solve for y:

When 
$$x = 5 + \ell \sqrt{15}$$
  
then  $x \div y = 10$   
becomes  $5 - i\sqrt{\ell 5} + y = 10$   
 $y = 3 \cdot \ell \sqrt{15}$ 

All, we have test to do its show that these values of a and problety the record espeadors,  $x_0 = 10$ . We go so by substitution:

If 
$$\chi = 5 + i \sqrt{15}$$
 and  $y = 5 + i \sqrt{15}$  the equation  $y = 5 + i \sqrt{15}$  because:  $(3 + i \sqrt{15})(3 + i \sqrt{15}) = 40$   $35 + i \sqrt{15}(3 + 40) = 40$   $25 + i \sqrt{15} = 40$   $25 + i \sqrt{15} = 40$   $40 + 40$ 

Because that their statement is a true statement, our two expressions for a and y together form a solution to the equation.

# SET OF 8.2 TPIGONOMETRIC FORM FOR COMPLEX NUMBERS

As you know, the questione formula,  $x = \frac{-h^{-2}\sqrt{h^2 + 4m_c}}{2a}$ , can be used to shave

any quadratic equation in the form  $m^2 + k_0 = c + 0$ . In this brook  $A_{SL}(M_{COM})$ , Describe Conden gives a similar formula that can be used to active certain outlier equations. Here it is in our contribut

$$\mathbf{then} \qquad \mathbf{x}^2 = n\mathbf{x} - \mathbf{b}$$

$$\mathbf{then} \qquad \mathbf{x} = \sqrt{\frac{b}{2} + \sqrt{\left(\frac{b}{2}\right)^2 + \left(\frac{a}{3}\right)^2}} + \sqrt{\frac{b}{2} + \sqrt{\left(\frac{b}{2}\right)^2 + \left(\frac{a}{3}\right)^2}}$$

This for null ris to own as Carda i's forgoda, In his book, Cardan attempts to use his formula to us se the equation

$$e^{2} = 150 - 4$$

Due equation can the form  $x^2 = ax + b$ , where a = 13 and b = 4. Substituting these values for a and b is Contact's formula, we have

$$\begin{aligned} \mathbf{v} &= \sqrt{\frac{3}{2} + \sqrt{\frac{4\sqrt{2}}{(2)^2 + \left(\frac{15}{3}\right)^3}}} - \sqrt{\frac{5}{2} + \sqrt{\frac{4\sqrt{2}}{2} + \left(\frac{15}{3}\right)^3}} \\ &= \sqrt{\frac{5}{2} + \sqrt{4 + 105}} + \sqrt{\frac{5}{2} + \sqrt{4 + 105}} \\ &= \sqrt{\frac{2}{2} + \sqrt{-\left(\frac{15}{2}\right)}} + \sqrt{\frac{5}{2} + \sqrt{-125}} \end{aligned}$$

Carrier confident go any further than this because he diffelt know what to do with  $\sqrt{-12}$ . In fact, he wrote:

I have some or enquire after the occurrent to recision problems for which you be regiven me no any ven one of which converms the cube equal to an unknown plus a number. I have certainly grapped that role, but when the cube of one-third of the confident of the unknown is greater in value than the equation of one-half of the number, then, is appears, I cannot make it jet has the equation.

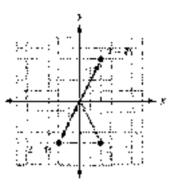

Notice in this formula that if  $(a/2)^3 > (b/2)^3$ , then the result will be a negative number lasses the smalle most.

In this sertion, we will take the first step in I ading cube roots of complex numbers by learning that to write conceley numbers in what is called observations from Before we do so, let's look at a definition that will gloss as a visual representation for reaction analysis.

### DEFINITION

The graph of the complex number x + yx is a vector (arrow) that detends from the trigin out to the point (x, y).

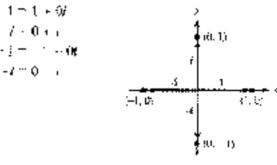

higure i

Genth each counter number 2 + 44 + 2 + 44 and 2 - 46

**SOLUTION**. The graphs are shown in Figure 1. Natice how the graphs of  $2+4\ell$ and 2-40, which are conjugated have symmetry good than as is, and that the graphs of 2 + 4t and -2 + 4t, which are opposites, here symmetry about the origin.

最高ない。 Graph De complex numbers 1, 1, -4, and -1.

SIDELET CON. Block and the few exemples numbers sention in structural form.

**Пр**агь 2

The graph of each is above in Figure 2.

If we write a real number us a complex number in sandard form, its graph will fall on the x-axis. Therefore, we call the x usin the mediants when we are graphing done ptex numbers, Likewise, because the imaginary numbers i and -i last on the y execuwe call the y axis the *magnetry may when* we are graphing complex numbers.

#### DEFINITION

The absolute velocity manufact of the complex in order z = r + y/is the disis seen from the origin to the point  $(\pi, \pi)$ . If this distance is denoted by  $\pi$ , then

$$r + |z|^2 + |x + y|^2 + \sqrt{x^2 + y^2}$$

Compared to the control of the contr

Find the modulus of each of the complex numbers 58, 7, and 3 - 48.

SOLUTION Writing each comber in standard form and then applying the definition of lunguilus, we have

For 
$$z = 5i = 0 + 5i$$
,  $r = |z| = |0 + 5i| = \sqrt{0^2 + 5^2} = 5$ .  
For  $z = 7 = 7 + 5i$ ,  $r = |z| = |7 + 5i| = \sqrt{7^2 + 6^2} = 7$ .  
For  $z = 3 + 1i$ ,  $r = |z| = |3 + 7i| = \sqrt{3^2 + 4^2} = 3$ .

#### DET!NIT:OM

The organism of the complex number z = x + yi, concluding (2), is the smallest possible angle # from the positive real axis to the graph of a

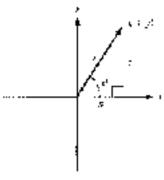

Figure 3

Figure 3 if two rates the relationships between the complex number  $g = x + y t_0^2$  is gright and the produlus sland arguingers  $\theta$  of g. From Flyare 3 we sea that

$$\sin\theta = \frac{\beta}{\beta} \qquad \text{or} \qquad \mathbf{y} = c \sin\theta.$$

We can use this information to write a in terms of half di-

$$z = x + yi$$

$$= r \cos \theta + (r \sin \theta)x$$

$$= r \cos \theta + r \sin \theta$$

$$= r (\cos \theta + i \sin \theta)$$

This last expression is collect the *integrandmental force* for a which can be althrevioled as n dis  $\theta$ . The formal definition follows:

#### DESINATION

 $f(z) = x + y_0$  is a complex periber in standard form, then the unique contents John Bor a Digwon by

With can borrison back and posts in tween Marchine force and important the form by name the relation steps that however

From 
$$y = x + yi = y(\cos \theta - x \sin \theta) = y \cos \theta$$
,  $y = \sqrt{y^2 + y^2}$  and  $\theta$  is such that  $\cos \theta = \frac{x}{2}$ ,  $\sin \theta = \frac{y}{2}$ , and  $\tan \theta = \frac{x}{2}$ 

, and which is a first of the control of the contro

Western -- 1 for the generality and

**SOLUTION** We have x = -1 and y = 1, therefore,

$$r = \sqrt{(-2)^2 - 1^2} = \sqrt{3}$$

Angle 5 is the smallest positive angle for which

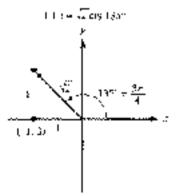

$$\cos \theta = \frac{\pi}{F} = -\frac{1}{\sqrt{2}}$$
 and  $\sin \theta = \frac{\pi}{F} = \frac{\pi}{\sqrt{2}}$ 

Thosadara, 6 must be 135° or 3/71 radians.

Using these values of r and  $\theta$  in the formula for trigonometric form, we have

$$z = r(\cos\theta + t\sin\theta)$$
$$= \sqrt{2}(\cos 135^{\circ} + t\sin 135^{\circ})$$
$$= \sqrt{2} \cos 135^{\circ}$$

In radians,  $g \in \sqrt{3}$  as  $(2\pi M)$ . The graph of g is shown in Figure 4.

Mgars 4

EXAMPLE 5 Write : = 2 cis 60° in standard form

**SOLUTION** Using exact values for cos 60° and all 60°, we have

$$z = 2 \cos 60^{\circ} + t \sin 60^{\circ}$$

$$= 2(\cos 60^{\circ} + t \sin 60^{\circ})$$

$$= 2(\frac{1}{2} + t \frac{\sqrt{3}}{2})$$

$$= 1 + t \sqrt{3}$$
Figure 5

The gradulofic is shown in Figure 5.

As you can see, converting from trigor ametric form to standard form is usually more direct than converting from standard form to tragonometric form

## **HERET**LES PROPERTIES USINGRADA

Jener Berthambaren P. FORM

Most graphing calculators are able to concert a consplex namber recovery standard form (social times called *rechargator form*) and (opponionative form falso called *pulor*) form). For example, on a Ti-84 we could salve Example 4 using the sits and sauge commands found in the MATH CPX menu, as shown in Figure 6. On a TF-96, the conversion community are found in the CPLX mana. Figure 7 shows how these coassmands could be used to work Evan place 4 and 5. The countless number -1 + i is entened as an ordered pair [-1,1), and 2 vis  $40^\circ$  is entened as  $(2\angle 6i^\circ)$ . In both cases, we have set the culculator to degree mode.

Figure 6

Figure 7

Check the numbed for your model to see if your calculator is able to convert conplex numbers to trigunometric form. You may find the commands listed in the cultur. under polar coordinates (we will explore polar coordinates later in this chapter),

LANGE ENGINEER In the introduction to this section, we regultimed two complex numbers that ferrome Cardian had difficulty with 2 + V + .21 and 2 - № 121. Write cach of these numbers in or conometric form.

SCILUTION | Parst we write them as complex anabers

$$2 + N = 121 + 2 + 137$$

$$2 - \sqrt{-(2)} + 2 = -4i$$

The tree place of reach is

$$r = \sqrt{2^2 + 10^2} = \sqrt{125 + 85/8}$$

I., we have  $an \theta = 11/2$  and  $heta \in \mathbb{Q}^n$  Using a calculator and coincing to coc2the means 4 numerical it of a degree, we first that  $\theta = \tan^{-1}(6.5) - 79.7.2$  Theostero,

$$2.1.117 + 85/8(\cos 29.00 \cdot 1 + \sin 20.00^{\circ})$$
  
= 85/8 \tau 29.000

for t = 0.15, we have  $tan \theta = -1.75$  and  $\theta = QIM_{\rm ign} angles <math>t = a600 - a9.76\% =$ ?ND NBC to the relative bundhe?th of a degree. Therefore,

#### EXTENSING THE CONCEPTS

 With the publication of Ars Magna, a dispute trase between Cardan and at other. mathematicism usuald Tartaglia. What was that dispute? In your opinion, who was at fault?

Tartaelia

# PRODUCTS AND QUOTENTS IN TRIGONOMETRIC FORM

Mininglication and division with complex our obers becomes a very simple process when the numbers are written in a governative part. Let's saite the rule for finding the product of two complex entribers written in tagonometric form as a theorem and three prove the theorem.

TODOPESA (MUSTIFSACATION)

И

$$g_1 = v_1(\phi \otimes i k_1 + i \otimes i \otimes k_2) = v_1 \otimes i \otimes \nu_1$$

असार!

$$z_2 = c_2(\cos\theta_0) + (\sin\theta_0) = c_2 \cos\theta_0$$

the flow complex instribute in trigonometric form, then their product,  $g_{\rm PM} \approx$ 

$$\begin{aligned} \eta_i z_i &= \{ m_i(\cos\theta_1 - i\sin\theta_2) | \log(\cos\theta_2 + i\sin\theta_3) \} \\ &= \epsilon_i m_i [\cos\theta_1 + i\sin\theta_2] + i\sin\theta_1 + i\sin\theta_2 \} \\ &= \epsilon_i m_i \sin\theta_1 + iig_1 \end{aligned}$$

 In second. To multiply two complex numbers in trigonometric form multiply absolute values and add angles

. Baran Bar

#### PROOF

We begin by annihiplying algebraically. Then we simplify our product by using the sum formulas we introduced in Section 5.2.

$$\lim_{n \to \infty} + ||y_1(\cos \theta_1 + i\sin \theta_1)||p_2(\cos \theta_2 + i\sin \theta_2)||$$

$$\lim_{n \to \infty} ||y_2(\cos \theta_1 + i\sin \theta_2)||$$

 $\exp(\cos \theta + \cos \theta_2 + I \cos \theta_1 \sin \theta_2 + I \sin \theta_1 \cos \theta_2 + I \sin \theta_1 \sin \theta_2)$ 

$$t_2 r_1 [\cos \theta_1 \cos \theta_2 + i \theta_2 \cos \theta_1 \sin \theta_2 + \sin \theta_2 \cos \theta_2] \sim \sin \theta_1 \sin \theta_2$$

 $= g_1 r_2 [\cos \theta_1 \cos \theta_2 + \sin \theta_1 \sin \theta_2] + [(\sin \theta_1 \cos \theta_2 + \cos \theta_1 \sin \theta_2)]$ 

$$-i g r_1 |\cos(\theta_1 - \theta_2) + i \sin(\theta_1 - \theta_2)$$

This completes our proof. As your can see, to enablish two complets no above in tipong set in form, we multiply absolute values,  $r_1r_2$ , and odd apples,  $\theta_1 \neq \theta_2$ .

Z PARTER TO Spirit the product of Seis 40° and 5 eis 10°.

SOLUTION: Applying the form- la linen our theorem on products, we have:

$$(3 \cos 49^\circ)(5 \cos 4.5) = 3 \cos (40^\circ + 10^\circ)$$
  
= 15 \cis 513

if and the product of  $z_1=1.4$  PeV and  $z_2=-3\sqrt{14}$  in span and first, and then write  $z_1$  and  $z_2$  in algorometric room and find their productings in

\$DLUTION - Leaving each complex number in wardard form and moltiplying we have

$$s_{142} = (1 \pm i\sqrt{3})(-\sqrt{3} \pm i)$$
  
=  $-\sqrt{3} \pm i - 3i \pm i^2\sqrt{3}$   
=  $2\sqrt{3} \pm 2i$ 

Coanging go and gs to trigonometric form and multiplying tooks like this:

$$z_1 \leftarrow i + i \sqrt{3} = 2i \cos 60^\circ + i \sin 60^\circ;$$
 $z_2 = -\sqrt{3} + i = 5 \cos 60^\circ + i \cos 6150^\circ;$ 
 $z_1 z_2 = \{2i \cos 60^\circ + i \cos 60^\circ\} \{2i \cos 150^\circ + i \sin 150^\circ\} \{4\cos 210^\circ + i \sin 210^\circ\}$ 

To our upone our five products, we consist our product and inguished the foreign to sistedend form

$$4(\cos 310^{\circ} + i \sin 210^{\circ}) = 4\left(-\frac{\sqrt{3}}{2} + \frac{1}{2}i\right)$$
$$= -2\sqrt{3} - 2i$$

As you can see, so the methods of our oplying complex much its produce the same absolu

Abrillani da Maivez

The next theorem is an extension of the work we have come so far with infiriplication. It is named exten Abraham de Afoivre, who published the formula in a
puper in 1722. De Moivre was born in thivore but emigrated to London to avoid
religious persecution. A though he was a competent manientational as a foreigned
he was maddle to attain a post at a solver sity and had to case a fixing as a private
total of mathematics. De Moivre made sign liquid root fluid not give a formal moof
of suclytic geometry and the theory of probability. We will not give a formal moof
of the theorem.

#### DE MONVARIS PREDARM

If  $y = r(\cos\theta + r\sin\theta) = r\cos\theta$  is a complex number in trigodometric form, and u is an integer, then

$$z^{\mu} = \frac{1}{2}(\cos\theta + i \sin\theta)^{\mu}$$
  
=  $e^{\mu}(\cos\phi + i + i \sin\phi)$   
=  $e^{\mu}\cos\phi\theta$ 

Production of the contract of

The second continues of the charges of

The theorem scenns reasonable after the work we have done with multiplication. For exemple, if v is 3.

$$[r(\cos\theta + i\sin\theta)d^2 \approx r(\cos\theta + i\sin\theta) \cdot r(\cos\theta + i\sin\theta)$$

$$\approx r \cdot r(\cos(\theta + i\theta) + i\sin(\theta + i\theta))$$

$$\approx r^2(\cos\theta + i\sin\theta)$$

# EXAMPLE Sind (1 + 7)\*\*

**SOLUTION** First we write 's in trigoremetric family

$$1 - I = \sqrt{2} \left( \cos \frac{|F|}{2} + I \sin \frac{|\sigma|}{4} \right)$$

Then we are de Main "'s 'theorem to raise this expression to the 10th power.

$$(1 + \epsilon)^{13} = \left( \sqrt{2} \left( \cos \frac{\theta}{4} + i \sin \frac{\omega}{4} \right) \right)^{10}$$

$$= 6\sqrt{2} i^{10} \left( \cos 10 - \frac{2\pi}{3} + i \sin 10 - \frac{\pi}{4} \right)$$

$$= 92 \left( \cos \frac{5\pi}{3} + i \sin \frac{5\pi}{3} \right)$$

who have as a simplify to

$$33\left(\cos\frac{\pi}{2} + i\sin\frac{\pi}{2}\right)$$

becomes voil and 5 to 2 are constrained, in Standard forth, our would is

That is,

$$(1 \pm i)^{10} = 32i$$

Multiplication with complex numbers in trigunometric form is accomplished by multiplying absolute values and adding angles, so we should expect that division is accomplished by dividing absolute values and subtracting angles.

#### GUETORERA (LUVISACIA)

11

$$q \approx \pi_1(\cos\theta_1 + i\sin\theta_1) + i\sin\theta_1$$

4000

$$z_2 = r_2(\cos\theta_2)! / \sin\theta_3) = r_1 \operatorname{cls} \theta_2$$

we two complex combers in higher-theory form, then their quotient,  $\phi/\phi_0$  is

$$\begin{split} \frac{\varepsilon_1}{\varepsilon_2} &= \frac{m(\cos\theta_1 + i\sin\theta_2)}{r_3(\cos\theta_2 + i\sin\theta_3)} \\ &= \frac{c_1}{r_2}[\cos(\theta_1 + \theta_2) + i\sin(\theta_1 + \delta_2)] \\ &= \frac{d_2}{r_2}\cos(\theta_1 - \theta_2) + i\sin(\theta_1 + \delta_2)] \end{split}$$

المراجع ووووروه والمتحارب ووالمحار والمراجع والمتحار والمتحار والمتحار والمحارب والمحارب والمتحار والمتحار

#### PROOF

al ableto.

As was the case with division of complex numbers to standard from the inquiristent in this proof is multiplying the numerator and denominates of our quotient by the conjugate of the demonstrator.

$$\begin{split} \frac{r_1(\cos\theta_1+i\sin\theta_2)}{r_2(\cos\theta_2+i\sin\theta_2)} &= \frac{r_1(\cos\theta_1+i\sin\theta_2)}{r_2(\cos\theta_2+i\sin\theta_2)} + \frac{(\cos\theta_2-i\sin\theta_2)}{(\cos\theta_2+i\sin\theta_2)} \\ &= \frac{r_1(\cos\theta_1+i\sin\theta_2)}{r_2(\cos\theta_2+i\sin\theta_2)} + \frac{(\cos\theta_2-i\sin\theta_2)}{(\cos\theta_2+i\sin\theta_2)} \\ &= \frac{r_1(\cos\theta_1+i\sin\theta_2)}{r_2(\cos\theta_1+\cos\theta_2+i\sin\theta_2)} \\ &= \frac{r_1(\cos\theta_1+i\sin\theta_2)}{r_2} + \frac{r_1(\cos\theta_1+i\sin\theta_2)}{(\cos\theta_1+i\sin\theta_2)} + \frac{r_2(\cos\theta_1+i\sin\theta_2)}{(\cos\theta_1+\cos\theta_2+i\sin\theta_2)} \\ &= \frac{r_1(\cos\theta_1+i\sin\theta_2)}{r_2} + \frac{r_2(\cos\theta_1+i\sin\theta_2)}{(\cos\theta_1+i\sin\theta_2)} + \frac{r_2(\sin\theta_1+i\sin\theta_2)}{(\sin\theta_1+i\sin\theta_2)} + \frac{r_2(\sin\theta_1+i\sin\theta_2)}{(\sin\theta_1+i\sin\theta_2)} \\ &= \frac{r_2(\cos\theta_1+i\sin\theta_2)}{r_2} + \frac{r_2(\cos\theta_1+i\sin\theta_2)}{(\cos\theta_1+i\sin\theta_2)} + \frac{r_2(\sin\theta_1+i\sin\theta_2)}{(\sin\theta_1+i\sin\theta_2)} + \frac{r_2(\sin\theta_1+i\sin\theta_2)}{(\sin\theta_1+i\sin\theta_2)} \end{split}$$

Find the quotient when  $20\cos 75^\circ + i\sin 75^\circ$ ) is 2-vided by  $4(\cos 40^\circ - )\sin 40^\circ$ 

**SOLUTION**. We disable according to the formula given in our decirculation (which is

$$\frac{20(\cos 75^\circ + i\sin 75^\circ)}{4(\cos 40^\circ + i\sin 20^\circ)} = \frac{20}{4}[\cos (75^\circ - 40^\circ) + i\sin (75^\circ + 40^\circ)]$$
$$= 5(\cos 75^\circ + i\sin 35^\circ)$$

The property of the property

SOLUTION Dividing in words of form, we have

$$\frac{24}{37} = \frac{1 + i\sqrt{3}}{\sqrt{2} + i}$$

$$= \frac{1 + i\sqrt{3}}{\sqrt{2} + i} \cdot \frac{\sqrt{3}}{\sqrt{3}} \cdot \frac{i}{i}$$

$$= \frac{\sqrt{2} + i + 3i + i^2\sqrt{2}}{3 + 1}$$

$$= \frac{2\sqrt{3} + 2i}{4}$$

$$= \frac{\sqrt{3}}{3} \cdot i \cdot \frac{1}{3}i$$

Change ag 2s and 25 to trigge canetaic form,

$$g_1 = 1 + 7\sqrt{3} + 2 \operatorname{civ} \left( \frac{\pi}{4} \right)$$

$$z_2 \leq \sqrt{3} + i = 2 \cos \frac{\pi}{6}$$

and cividing again, we have

$$\frac{z}{z_2} = \frac{2 \cos \left( \sin \theta \right)}{2 \cos \left( \sin \theta \right)}$$
$$= \frac{3}{5} \cos \left( \frac{\pi}{3} - \frac{\pi}{6} \right)$$
$$= 1 \sin \left( \frac{\pi}{6} \right)$$

which, in starolars, fence, is

$$\frac{\sqrt{3}}{2} + \frac{1}{2} \langle$$

### GETTIMG READY FOR CLASS

At that thire, how far is the boot from Motto Rock?
  - 7th. **Longile** A tent pale is held in place by two guy wires on opposite sides of the pole. One of the guy wites makes an angle of 43.3" with the ground and is 10.1 feet long. How long is the other guy wire if it makes an engle of 34.5° with the creund\*

- 71. True Course and Speed A plane is flying with an disacced of 170 miles per tions with a bending of 1 (2). The wind currents are a constant 28 miles per hour in the direction of due north. Pind the true course and ground speed of the plane.
  - Geometry If a namifologram has sides of 23 continuouss and 22 continuouss. that meet at an angle of  $M_{\odot}$ , how long is the longer diagonal?

# ROOTS OF A COMPLEX NUMBER

What is it about mathematics dust draws some people toward it? In many cases, it is the fact that we can describe the world around as with marks maries; for some people. n athematics gives a descen picture of the work, in which we live, in other cases, the estrection is within its thems it is it is fulfilled by it is come people, in a height estimates it well is attractive regardless of its connection to the real world. What you will find in this section is something in this second category. It is a property that real and complex numbers corrain that is, by itself, surprising and attractive for people who erjoy mathematics. It has to do with roots of real and complex numbers.

If we solve the equation  $x^2=25$ , our potentions with be equate mass of 25. (Tike wise, if we so very i=8, our solutions will be at bounds of 8. Further, the solutions to  $x^4=81$  with 5 for  $\pi = 0.00$  to  $\pi = 0.00$ .)

Without thowing the work involved, here are not solutions to these there equal tenes:

Ligisation	Nother Comme		
$\tau^- = 2^\circ$	-5 sed 5		
a <sup>0</sup> = K	$\lambda = 1 + (\sqrt{5}, and + 1)/\sqrt{3}$		
.t = \$1	$-2\sqrt{3} + 3t$ , and $3t$		

The number 13 sus two square roots, 8 just three cube roots, and 91 has four fourth roots. As we proposes through this pertion, you will see that the numbers we used in the equations given are unimportant, every real (in exceptes) number has exactly two square mosts, three cube notes, and four fourth roots. In their every real (or complex) number has exactly a distinct with mosts, a surprising and attractive fact about non-bers. The key to find up these roots is trigonometric form for complex numbers.

Suppose that z and  $\omega$  are complex numbers such that  $\omega$  is an web root of z. Then is,

$$w = \hat{\nabla}_{\lambda}^{*}$$

If we take both sides of this last equipplot to the 4th power, we have

Now suppose  $\sigma = m\cos\theta + i\sin\theta$ ) and  $\mu = \mu(\cos\theta + i\sin\theta)$ . Substituting these expressions into the equation  $\mu^2 = 0$ , we have

[steps 
$$\alpha + i \sin \alpha \eta]^2 = at\cos \theta + i \sin \theta$$
]

We can rewrite the left side of this last equation using the Moivre's Theorem.

$$s^{\alpha}(\cos \pi \alpha) = i \sin \pi \alpha$$
 =  $\pi(\cos \theta + i \sin \theta)$ 

The only way the 25 PVC expressions can be equal to if their about the values are exact and their highes are cotermized.

Absolute Values Angles

Equal Columbial

$$s^a = r$$
  $m\alpha = \theta + 350^{\circ}\lambda$  Listony otogen

Solving for a undire, we have

$$v = e^{i \pi v} \qquad \quad \alpha \simeq \left| \frac{\theta + \pi}{\theta} \right| \frac{360^{\circ} h}{\theta} \simeq \frac{\theta}{\theta} \div \frac{360^{\circ}}{\theta} k$$

To summarize, we find the nth roots of a complex number by first finding the test with root of the absolute value (the modules). The angle for the first root will be  $\theta / s$ , and the angles for the remaining roots are found by adding analogies of 360% / s. The values for  $\theta$  will range from 0 to s=1, because when  $h=\eta$  we would be adding

$$\frac{360^{o}}{2} \cdot p = 360^{\circ}$$

water would be experience with the first sage.

NOTE in its agradient, renings 3601

#### THEOREM (BOOTS)

The with costs of the complex attantion

$$g \sim r(\cos \theta + i \sin \theta) + r \cos \theta$$

and given by

$$\begin{aligned} w_k &= r^{1/2} \left| \cos \left( \frac{\theta}{n} + \frac{960^n}{9} k \right) \ge k \sin \left( \frac{\theta}{n} + \frac{100P}{R} k \right) \right| \\ &= r^{1/2} \operatorname{elg} \left( \frac{\theta}{R} + \frac{3(\theta Y)}{n} k \right) \end{aligned}$$

 $w_{10}(a,b): 0,1,2,...,a=t$ .

**電波高級機能に**乗り、Parel the 4 lot till easily 21 g = 156xas 612 1 r vin 202)。

SCHLUFF (CIN). According to the formula given in our theorem on mons, the 4 fourth. soots will be

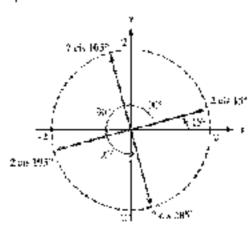

and the Control of th

$$w_k = 16^{1/4} \left[ \cos \left( \frac{60^\circ}{4} + \frac{360^\circ}{4} k \right) + i \sin \left( \frac{60^\circ}{4} + \frac{390^\circ}{4} k \right) \right] \qquad k = 0, 1, 2, 3$$
$$= 2 [\cos \left( 15^\circ + 90^\circ k \right) + i \sin \left( 15^\circ + 90^\circ k \right)]$$

Replacing R with 3. . , 2, and 3, we have

$$w_0 = 2(\cos x + 5^\circ + i \sin 15^\circ) = 2 \cos 15^\circ$$
 when  $k = 0$   
 $w_1 = 2(\cos x + 65^\circ + i \sin 10^\circ) = 2 \cos x + 65^\circ$  when  $k = 1$   
 $w_2 = 2(\cos x + 95^\circ + i \sin 195^\circ) = 2 \sin x + 95^\circ$  when  $k = 2$   
 $w_3 = 2(\cos x + 265^\circ + i \sin 285^\circ) = 2 \sin 285^\circ$  when  $k = 3$ 

Pills interesting to note the emphical sciationarip absorptificat from mets, as littletrated in Figure 1. Recause the modulus for each noof is 2, the reminal soint of the vector used to regardent each mot lies on a whole of radius 2. The vector representing the first root makes an angle of  $\theta m + \beta^*$  with the positive z-axis, then each following that has a vector that is costed an additional  $360\%\pi = 50^\circ$  is the constant tools. Wise discusion from the records now, Recease the fraction 460% agreemes out complete evolution decided into a equal parts, the will reads of a complete a maker with always he expose with simbuffed around a circle of racture  $r^{th}$ .

Eiguu∻ I

Figure 2

Consideration Newton If we use a graphing calculator to solve Excession 1, we will only get one of the 4 fourth mots. Figure 2 shows the result with the values oxinded to four decimal places. The complex number given by the calculator is an approximation of 2 cis 15°.

Once application of finding costs is an activing countin equations, as our new examples. Bushings

# EXAMPLE 2: Solve x2 - 0

**SOLUTION** Adding I to each side of the equation, we have

$$g^{g} = -1$$

The solutions to this equation are the cube took of -1. We plie silv know that one of the cube roots of -1 is -1. There are two other complex cube roots to we in first that there, we write -1 in ariginal metric form and then apply the formalia from our theorem is roots. Writing -1 is alignmentate form, we have

$$-3 = 1.768 \pi + (\sin \pi)$$

The 3 cube spots are given by

$$|\omega_i| = \left| \frac{1}{2} \operatorname{sin} \left( \frac{\omega_i}{\beta} + \frac{2\pi}{\beta} \cdot \hat{x} \right) + i \operatorname{sin} \left( \frac{\omega_i}{\beta} + \frac{2\pi}{\beta} \cdot \hat{x} \right) \right|$$

where k=0,1, and 2. Replacing k with 0,1 and 2 and then sumplifying each result, we have

$$m_1 = \cos \frac{\pi}{3}$$
 is  $i \sin \frac{\pi}{3} = \frac{1}{2} - \frac{\sqrt{3}}{2} i$  when  $b = 0$ 

$$w_i = cos(m + ison(m + ison))$$
 when  $k = k$ 

$$w_2 = \cos \left( \frac{3\pi}{5} + \sin \frac{3\pi}{3} \right) = \frac{1}{2} + \frac{\sqrt{5}}{2}, \quad \text{when } k = 2$$

The graphs of these three mets, which are evenly speed around the unit circle, are shown in Figure 3.

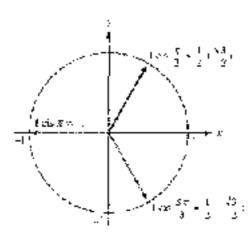

Figure 3

Note that the two took placements are a trijugates. Let a chook man we by defining it

$$\begin{aligned} \mathbf{w}_{\mathbf{q}}^{A} &= \left( \cos \frac{\pi}{3} + i \sin \frac{\pi}{3} \right)^{A} \\ &= \cos (\mathbf{x}) b \cdot \frac{\pi}{3} + i \sin \pi + \frac{\pi}{3} \\ &= \cos \pi + i \sin \pi \\ &= -1 \end{aligned}$$

You may have not cod that the count on its Example 3 cm be solved by algebraic methods. Let's solve  $x^3+1=0$  by factoring and compare our results to those in Example 7. (Faccolf the formula for factoring the sum of two cubes as follows:  $a^3+a^2+(a+b)ta^2=ab+b^2$ .)

$$x'+1=0$$
 
$$(x+1)(y^2-x+1)+60 = -40 \cos x \cos x \sin x+1=0 = -x^2-x+1 \approx 0 = -5 \pi i (actors capital to 0)$$

the first equation goes as  $z \leftarrow -1$  for a solution z o solve the second equation, we use the quadratic formula.

$$c = \frac{-(-1) \pm \sqrt{(-1)^2 - 4(1)(1)}}{2(1)}$$
$$= \frac{4 \pm \sqrt{-3}}{2}$$
$$= \frac{4 \pm i\sqrt{2}}{2}$$

This bish expression grows us two scientists, they are.

$$x = \frac{1}{2} = \frac{\sqrt{3}}{2} x$$
 and  $x = \frac{1}{2} = \frac{\sqrt{3}}{2}$ .

As year one see, the thind so offices we found in Example 7, is no proportionary graph that their solutions for the sample Proportion of solving the equation  $e^{i\phi}(1,1)$ : () depends on the oblight to factor the left side of the equation. The oblightest on the trightness can be satisfied in the rightness of the oblightness of the ob

# **SET Solve the equation** $x^2 + 2\sqrt{3}x^2 + 4 = 0$ .

**SELUTION**. The equation is quadratic in  $x^2$ . We can solve for  $x^2$  by applying the quadratic forms is.

$$\frac{2\sqrt{3} \pm \sqrt{3} - 4(1)(4)}{2}$$

$$= \frac{2\sqrt{3} \pm \sqrt{4}}{2}$$

$$= \frac{2\sqrt{3} \pm 2(1)}{2}$$

$$= \sqrt{3} \pm 3(1)$$

The two volutions for  $x^i$  are  $\nabla S + i$  and  $\nabla S - i$ , which we write in engonometric formulas follows:

$$\mathbf{v}^2 = \nabla (\mathbf{\hat{3}} + \mathbf{\hat{5}})$$
 or  $\mathbf{x}^2 = \nabla (\mathbf{\hat{3}} + \mathbf{\hat{5}})$   
 $\sim 2(\cos 30^{\circ} + (\sin 30^{\circ}))$   $\sim 2(\cos 320^{\circ} + (\sin 330^{\circ}))$ 

Now each of these expressions has two square reots, each of which is a solution to run original equation

When 
$$x^2 = 2(\cos 30^\circ + 1 \sin 20^\circ)$$

$$x = 2^{3/4} \left[ \cos \left( \frac{30}{2} + \frac{360^{\circ}}{2} k \right) + 2 \sin \left( \frac{350^{\circ}}{2} + \frac{360^{\circ}}{2} k \right) \right] \quad \text{for } k = 0 \text{ and } 3$$

$$= \sqrt{2} \cos k5^{\circ} \qquad \text{when } k = 0$$

$$= \sqrt{2} \cos k95^{\circ} \qquad \text{when } k = 1$$

When 
$$x^2 + 2(\cos 3.00^{\circ} + x \sin 3.00^{\circ})$$

$$x = 2^{1/2} \left[ \cos \left( \frac{330^{\circ}}{2} - \frac{360^{\circ}}{2} k \right) + i \sin \left( \frac{330^{\circ}}{2} + \frac{360^{\circ}}{2} k \right) \right] \cos k = 0 \text{ and } 1$$
$$= 1\sqrt{2} \sin 168^{\circ} - \text{ when } k = 0$$
$$= \sqrt{2} \cos 368^{\circ} - \text{ when } k = 1$$

Using a calculation and mumicing to the meatest footbacklib, we can write a control attentional most objects of these flam settlements.

## PROBLEM SET 8 4

Hitse two square soots for each of the following complex numbers. It are your substrates in impenormatic form. Its each case, graph the two roots.

$$\delta_{n}/\delta_{n}^{2}\sin\frac{2\pi a}{\delta}$$

Ping the two square some for each of the following complex runniters. Write your passwers to translate form.

$$86 - 3 + 37\sqrt{3}$$

Find three cabe roots for each of the following complex numbers. Leave your inovers in trigonometric form:

$$15. 3/(q; 2R)^{\circ} + i \approx 310^{\circ})$$

Solve cach equation.

23. 
$$\tau^4 = 27 = 0$$

24. 
$$x^3 + 8 = 0$$

25. 
$$z^1 - 16 = 0$$

26. 
$$x^4 + 3.83 = 0$$

27. Find the Clouth vector of 
$$z=i$$
 fraces  $\frac{2\Psi}{3}+i$  sin  $\frac{2\pi}{3}$ ). Write each root in standard form.

**28.** Find the 4 fourth roots of 
$$g = \cos \frac{4\pi}{4} + i \sin \frac{4\pi}{3}$$
. Leave your growers in origonal securic form.

Safee gach of the following equations, Leave your solutions in a gopometric form,

$$34. x^2 + 2x^2 + 4 = 0$$

$$35, x^4 + 2x^2 + 2 = 0$$

36. 
$$x^2 + 2x^2 + 2 = 0$$

#### REVIEW PREB. 5M3

The problems that tollow review graterial we povered in figure one 4%, 4, 4, against

Chaptions recipion on the given life half

$$(37, (\mathfrak{g})_{\mathrm{loc}}) = 2 \operatorname{sign} (-2 \operatorname{d} \mathfrak{g}, 0) \leq \lambda \leq 2 \mathrm{d}$$

, then 
$$y = + \lambda \cos x + 3x$$
, then  $x > 7x$ 

Graph one complexe cycle of each of the following:

**39.** 
$$y = -\cos\left(2x + \frac{2}{2}\right)$$

40. 
$$v = -\cos\left(2x - \frac{\pi}{2}\right)$$

**4**£. 
$$v = 3 \sin \left( \frac{\pi}{3} x + \frac{\pi}{5} \right)$$

**42.** 
$$y = 3 \cos\left(\frac{\pi}{3}x + \frac{\pi}{3}\right)$$

Find the acta of usangle ABC if

**43.** 
$$A \approx 56.2^\circ$$
,  $b = 2.6^\circ$  cm, and  $c = 3.84$  cm.

**44.** 
$$B = 21.8^{\circ}$$
,  $a = 44.7$  cm, and  $c = 22.2$  cm

**45.** 
$$a = 2.5$$
 ft.  $b = 3.4$  ft. and  $c = 4.5$  ft.

EXTENDING THE CONDEPTE

$$z = \sqrt[4]{2 + 112} + \sqrt[4]{2 - 116}$$

Let's assisted that the cube roots shown above are complex conjugates. If they are, then we can simplify the work by nothing that

$$a = \sqrt[6]{2 + 11i} + \sqrt[6]{2 + 11i} = a + ba + a + bi = 2a$$

which must that we simply double the real part of each case cost of 2+11 into the solutions to  $x^3=(5x+4.$  Now, to end our work with Coulon, and the 3 cube roots of 2+11. Then, using the desession above, use the 5 cube roots to solve the equation  $x^3=15x+4.$  Write year answers accurate to the recrest thousandth.

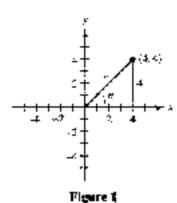

Cordun

# SECTION 8.5 POLAR COORDINATES

By In this possilian our study of taggle-centry, whose-series have given the position of a point in the place, within exact mideign for confidences. That is, we give the position of points in the place relative to a sol of perpendicular axes, to a way, the restanguish count nate system is a map that to a sol of perpendicular axes, to a way, the restanguish count nate system is a map that to a sol of perpendicular axes, to a way, the restanguish count nate system. For example, to lead the point whose address is (2,1), we start at the one of example, to lead the point whose address is (2,1), we start at the one other ways to get to the point (2,1). In particular, we can travel NS units on the terminal side of an angle in standard position. This type of map is the basis of what we call point (2,0), where x is a directed distance on the terminal side of vanished position angle  $\theta$ .

A point lies at (4, 4) on a mode ngalat conordinate system. (institute a difference polar reconfinates (x, 0).

**SHE UTION** . We want to reach the same point by reasoning curves on the temporal value of a standard position angle  $\theta$ . Figure 1 shows the point (4,4), along with the distance curve angle  $\theta$ .

The triangle Parmed is  $6.45^{\circ}.45^{\circ}.90^{\circ}$  right transpla. The triangle r is  $4\sqrt{2}$ , and  $\theta$  is  $45^{\circ}$ . In contargation coordinates, the address of our point is (4,4). In poten coordinates, the address is  $(4\sqrt{2},45^{\circ})$  or  $(4\sqrt{2},\pi/4)$  using radiant.

Now let's formalize our ideas about polar coordinates.

The foundation of the polar coordinate system is a ray called the *polar rain*, whose initial point is called the *pola* (Figure 2). In the polar coordinate system, points are named by ordered parts [r, 8] in which r is the directed distance from the polar at the terminal side of an angle if, the initial side of which is the polar axis. If the terminal side of 8 has been rotated to a counterefockwise direction trem the polar axis, then 0 is a positive angle. Otherwise, it is a regative angle, for example, the point (n, 88) as 5 and 5 from the polar teng a ray that has been existed 30° from the polar axis, as shown in 19 gard 3.

To simplify matter, in this book we place the pole at the origin of our rectangular coordinate system and take the polar axis to be the rewritive a usis.

The circular grids used in Example 2 are be pful when graphing points given in polar coordinates. The fines on the grid are moltiples of  $15^\circ$  or #/2 radians, and the circles have radii of 1,2,3,4,5, and 6.

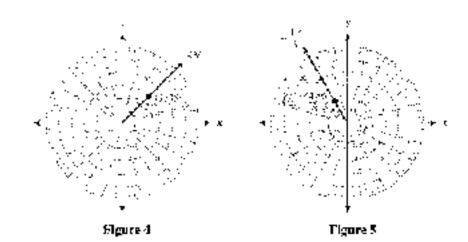

Graph the points (3, 45°), (2,  $-4\pi/3$ ), (-4,  $\pi/3$ ), and (5, 210°) on a polar coordinate system.

**SOLUTION** — So graph (A,  $4N^2$ ), we becate the point that is 3 units from the original long the term hall side of  $4N^2$ , as shown in Figure 4. The point (2,  $-4 \pm 63$ ) is Amailian along the term hall side of  $-4 \pm 67$ , as Higher 5 indicates.

Figure 3

As yet that we from Figures 4 and 5, if  $\nu$  is positive, we locate the coint  $(\nu, \theta)$  along the terminal side of 9. The most two points we will graph large negative call est of  $\nu$ .

To graph a point  $(r, \theta)$  in which r is negative, we look for the point that is runits in the appearing direction and classed as the committal side of  $\theta$ . That is, we extend analytical flat role that is directly appeared the terminal side of  $\theta$  and locate the point r units along this ray.

To graph i=4,  $\pi/5$ ), we first extend the terminal side of 6 through the m-gin to greate a ray in the opposite discretion. If an we focate the point that is 4 miles from the origin along this ray, as shown in Figure 6. The terminal side of 5 has been drawn in Figure 2 and the ray coinning in the opposite discretion is shown in red.

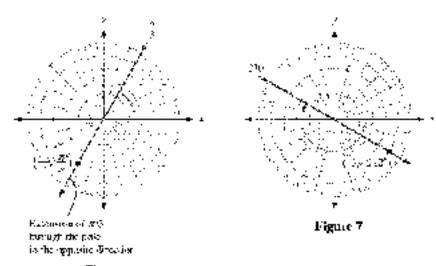

Figure 6

For graph (-N, -300), we leave for the point that is humbs from the origin along the ray to the appear of direction of -200 (Figure 7).

In rectangular controlleds, each point in the plans, is normed by a unique ordered paint (i, y). That is, no point each be named by two different ordered pairs. Ethic same is not in one points named by polar coordinates. As Teacapte 3 (Gostrates, the polar exemples) at a point are not uneque.

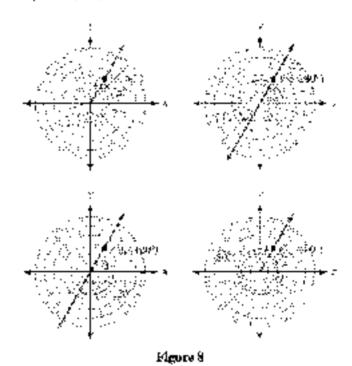

Care there exhand pass that name the same point as G, 50°.

**SOLUTION** As Figure 8 illuminates, the points  $(-3, 2.10^{\circ})$ ,  $1 \cdot 3, -120^{\circ})$ , and  $(3, -500^{\circ})$  all cause the point  $(3, 60^{\circ})$ . There are somely an infinite number of ordered pairs that name the point  $(3, 60^{\circ})$ . Any angle that is extension. With  $60^{\circ}$  will have set terms of size pair, through  $(3, 60^{\circ})$ . Therefore, all points of the form

will name the great (3, h0°). Also any angle that is entermined with 540° curbe u ed with a value of r=-3, so all points of the form

$$(-3.240^{\circ} \pm 360^{\circ})$$
 . At is any integer

will name the point (3, (60°)).

Note: In Evan ple 3, compare the ordered pairs (3, 90° and (3,  $\pm 300°$ ), Because  $60° = 360° = \pm 300°$ , we can see that if 360° is subtracted from 6,  $\epsilon$  will be of the same sign. The same will be true if 360° is added to 8. However, if 180° is added on subtracted,  $\epsilon$  with the ordered pairs  $(\pm 3, \pm 245°)$  and  $(\pm 3, \pm 120°)$ , since  $50° \div 180° = 240°$  and  $60° = 180° = \pm 20°$ .

# Polar Coordinates and Rectangular Coordinates

To deduce the selectionship between polar coordinates and normagatization of latter, we consider a point x with serifacilities covariantes  $(x,\theta)$  and posts coordinates  $(x,\theta)$ .

To convert back and froth between polar and extraogram containness, we sumply use the relationalities that exist arrows x, y, z, and 0 in Figure 9.

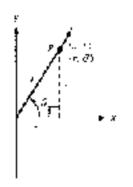

Figure 9

TO CONVERT SECTANGULAR COORDINAIRS TO POLAR COORDINATES

Ler

$$x = \pm \sqrt{x^2 + y^2}$$
 and  $\tan \theta = \frac{y}{1}$ 

where the sign of r and the choice of  $\theta$  place the point  $(r,\theta)$  in the same qualitant as  $(r,\gamma)$ .

TO CONVERT POLAR COORDINATES TO RECTANGULAR COORDINATES

Let

The modess of conventing to the langular coordinates is simply a matter of substituting r and  $\theta$  into the preceding equations. To convert to polar coordinates, we have to choose  $\theta$  and the sign of r so the point  $(r, \theta)$  is in the same quadrant as the point (x, r).

# Convert to excantiolar coordinates.

$$\mathbf{a}_{n}(d_{n}(d)) = \mathbf{b}_{n}\left(-\nabla \Sigma_{n}\frac{\Delta \eta}{4}\right) = \mathbf{c}_{n}\left((-2\beta^{n})\right)$$

**SOLUTION** To conven them polar coordinates to testangular coordinates, we substitute the given values of r and  $\theta$  into the equations

Here as, the consversions are calds point along with the graphs in both metalligister and polar colors rates.

$$5. \quad c = 4 \cos(3)^{2}$$

$$= 4 \left( \frac{\sqrt{3}}{2} \right)$$

$$= 7\sqrt{3}$$

$$= 4 \sin 30^{\circ}$$

$$= 4 \left( \frac{1}{2} \right)$$

$$= 2$$

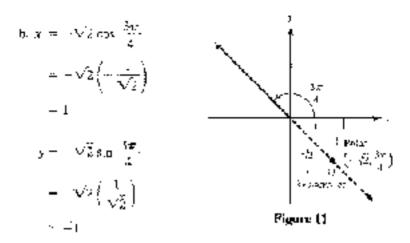

$$\frac{3 \sin 30^{\circ}}{3 \cos 30^{\circ}}$$

$$= 2 \cos(3)^{\circ}$$

$$= 3 \cos(3)^{\circ}$$

Nigure 10

The point  $(2\sqrt{3},2)$  in sectangular contditions is equivalent to (4, 30°) in pulse occurationairs. Figure 10 illustrates.

The point (1, -1) is converged a coordinates is equivalent to  $(-\sqrt{2}, 3\pi/4)$  in polarical admirates. Figure 31 allowards

c. 
$$v = \frac{1}{2}\cos x^{\alpha/2}$$
  
= 3(0)  
= 0  
>  $v = 3\sin 200^{\alpha}$   
= 3(-1)  
= -3

The point (0, -3) is recompular conditions as equivalent to  $(3, 270^\circ)$  in total constitutes. Figure 10, illustrates.

Figure 12

## EXAMPLE 5 Convert to polar coordinates.

$$a_{r}(0,3) = b_{r}(-2,0) = r + (1,8^{2})$$

#### SOLUTION

Received a is Usually in B, we have

$$r = 2\sqrt{9 \pm 9} + 13\sqrt{2}$$
 and  $6n\theta - \frac{3}{5} - 1$ 

Herease (3, 2) is in (0), we can choose  $r = 3\sqrt{2}$  and  $5 = 45^\circ$  (or n/4), as shown to thight 13. Remember, there are an intraite in index of indicated pasts in polar coordinates that came the point (3, 3). The point  $(3\sqrt{2}, 45^\circ)$  is just one of the r. So muchly, we choose r and 0 to that r is positive and 5 is between  $0^\circ$  and  $360^\circ$ .

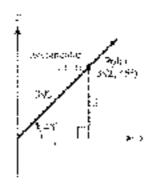

Figure 13

b. We have  $x = -2 \cos \theta = 0$ , so

$$x=\pm\sqrt{4}$$
 ,  $0\pm\pm2$  , and  $t=\frac{0}{\pm3}\pm0$ 

Because t=2, 0) is on the negative  $\pi$  scale, we can choose r=2 and  $\theta=180^\circ$  (or  $\pi$ ) to get the point (2,180) ). Figure 11 illustrates.

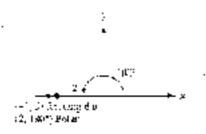

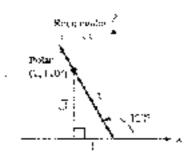

Figure 14

c. Because 
$$x = -\tan y = \sqrt{3}$$
. We have 
$$x = \pm \sqrt{1} \sqrt[3]{3} = \pm 2 \qquad \text{and} \qquad \tan \theta = \frac{\sqrt[3]{3}}{4}.$$

For annu. ( -1,  $N^{(2)}$ ) as an QH, we can fix  $x \in \mathbb{R}$  and  $t \in 120$  (or  $2\pi/3$ ). In palge coordinates, thu panel is  $(J, \mathbb{R}^2, \mathbb{C})$ . Figure 15 directives.

Digure 15

CAlculator Note: If we use the <u>lase</u> key od a calculates (set to degree mode) to find the angle 6 in Egan plg St. we will get

$$\theta = \tan^{-1}(\cdots \sqrt{3}) = -(0)^{n}$$

This would place the terminal side of  $\theta$  is QIV. To locate our point in QII, we could use a suggetime value of  $\tau$ . The total coordinates would then by  $(-2^{\circ} + 60^{\circ})$ .

## USING COLUMN

DOB PRAKA DARTHONIA POLIA A PARKETAK PERMENDIA. Biologia

In Section 8.2 we manakoned that count graphing ediculators are able to consent a complex number between standard from and trigo consents from The same is our factor repting ordered pairs between rectangular consultantes and polar consultrates. In fact, excepting estimates the kept some consequency are seen...

### Equations in Polar Coordinates

Equations in polar contributes have saorbles band  $\theta$  instead of a set y. The conversions we used to change ordered pairs  $t_0 \omega_0$  point about sates to sectorize the coordinates  $\theta$  of the same size was the same size as

to conven back and forth between equations given in polar contributes and those in rectabigit ar coordinates.

Change +2 = 9 am 26 to real angular en ordinates.

**SOLUTION** Before we entire, rate to their disrequiation of page 19, we may use a double-spigle admitty to write ain 26 in terms of six 6 and cos 3.

$$r^2 = 9 \sin 2\theta$$

$$r^2 = 9 \cdot 2 \sin \theta$$
 result

$$r^2 = 9 - 2 \sin \theta \cos \theta$$
 Doe ble-angle identity

$$r^2 = 1\hat{s} \cdot \frac{r}{r} \cdot \frac{r}{r}$$

Substitute for for 
$$\sin\beta$$
 and we for  $\cos\theta$ 

$$r^2 = \frac{18\pi r}{r^2}$$

$$e^2 = 16 \, \rm pc$$

$$e^4 = 18xy$$
  
 $(e^2 + y^2)^2 = 18xy$ 

Change x 1 y + 4 to polar count nates.

SOLUTION Because x in yook 6 and 0 milks in 8, we have

$$r \cos \theta = r \sin \theta = 1$$

$$e(pon(\theta) + g \ln S) = 4$$

$$r = \frac{4}{60M^{3/3} \text{ ND } R}$$

Divide both sides by over \$1.50.0

The last equation gives us him terms of 5.

#### EQUATIONS IN POLAR COORDINATES star pw **8.6** HEIR GRAPHS

Archinedes

More than 2,000 years and, Audining dos describes a persons stanting at a point and morning out along a half-line at a constant rate. The endpoint of the half-line was archored at the initial point and was rataring about it at a constant care also. The curve, called the spiral of Architectes, est is shown in Figure 1, with a cortangular coordurate system superimposed on a so that the origin of the courdinate system coinoides with the mitial point on the corve.

Magario 1

In rectangular coverdinates, the ecostion that describes this ecove is

$$\sqrt{x^3 - y^2} = 3 \cosh^{-1} \frac{y}{x}$$

If we were to superimpose a notar edead rate system on the curve in Figure 1, instead of the nectangular coordinate system, then the equation in polar coordinates that deso thes the curve would be simply.

As you can see, the equations for some curves are best given in terms of polar coordir at≅si

In this section, we will consider the graphs of polar equations. The solutions to these equations are ordered pairs  $(r, \theta)$ , where r and  $\theta$  are the polar coordinates we defined in Section 8.5.

SOLUTION. We can find ordered pairs ( ; 5) that satisfy the equation by makeungle table. Table it is a little different from the ones we made for rectangular. coordinates. With polar coordinates, we substitute convenient values for 9 and then use the equation to find corresponding values of a Let's use multiples of 30° and 45° foc à .

<u> </u>	r = 6 siu ∂	<u> </u>	(1.€)
Ús.	$r = 6 \sin  0\rangle = 0$	0	(0, 0%
304	$r=8 \sin 30^{\circ}=3$	2	(3, 30%)

364F	$c = h \sin ih \Omega^{n} = 0$	li .	(0.380)

Notice if we were in continue past  $250^\circ$  with values of  $\theta$ , we would a inply start or repeat sec values of a we have strong obtained, because on  $\theta$  is periodic with genind  $350^\circ$ .

Probling their point on a polar coordinate system and their crowing a smooth curve month there, we have the graph in Figure 2.

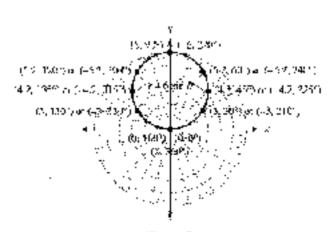

Figure 2

## USING

#### CALL THE THE TRANSPORT A DRIVEN WELL THE CONTRACT A POST

A graphing calculator may be used to create a while of values for a palar equation, her example, to make a rable for the equation in Example 3, that sat the calculator to degree made and polar mosts. Define the function m = 6 six M. Set up your table to automatically generate values starting at M = 0 and using an increment of  $-\frac{MN}{N}$  (Figure 7). On some calculators, this is done by setting the independent variable to Automate.

Figure 4

Now display the tuble and you should see values similar to those shows in Figure 4. Scroll down the table to see additional pairs of values (Figure 5).

l'igane 4

Figure 5

Could we have found the grisph of r = 6 sin  $\theta$  in like upfor 1 without making a sable? The conversion year, there are a compress for early stondows. One way is durant out of several independent conditions and see if we recognize the graph from the rectangle of a squarkors. We begin by reproduct with  $\theta$  with  $\rho$  r.

ALL CARESTON CONTRACTOR OF CONTRACTOR CONTRA

$$r = 6 \sin \theta$$
 $r = 6 \frac{r}{r}$ 
 $r = \sin \theta = \frac{r}{r}$ 
 $r^2 = 6 v$ 
Multiply both vides by  $r^2 = r^2 + 6 v$ 

The equation is now written in terms of rectangular coordinates. If we add -6y is both sides and then complete the square casy, we will obtain the rectangular equation of a circle with center at (0,3) and a todius of 3.

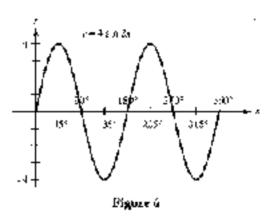

$$x^2+y^2+6y=0 \qquad \text{Add } -6y \text{ to both sides}$$
 
$$x^2+y^2+6y+9=9 \qquad \text{Complete the square only by solding 9 to both sides}$$
 
$$x^2+(y+3)^2=5^2 \qquad \text{Standard form for the equation of a circle}$$

This method of graphing, by changing to recrangular coordinates, works well only in some cases. Many of the equations we will ancounter in polar coordinates do not have graphs that are recognizable in rectangular form.

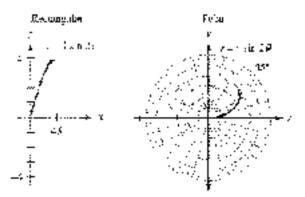

In Example 1, we will look at neighbor method of graphing polar equations that those not depend on the use of a table

**SOLUTION** One way to visualize the relationship between t and  $\theta$  as given by the equation  $t\approx 4$  on 2t as to sketch the graph t=t=1 on 2t on a rectangular coordinate system. (We have been using degree measure for our angle, in polar coordinates, so we will abel the x-axis for the graph of t=t sin 2t in degrees maker than tadiate as we reachly do.) The graph of t=t sin 1t will have an amplitude of t and a period of  $360^\circ/2 = 180^\circ$ . Figure 6 shows the graph of t=t and t=t be over 0° and 360°.

As you can see in Figure 6, as a goes from  $0^\circ$  to  $45^\circ$ , yights from 0 to 4. This means that, for the equation r=4 sin 26, as  $\theta$  goes from  $0^\circ$  to  $45^\circ$ , r will go from 0 out to 4. A diagram of this is shown in Figure 7.

Pigure 7

As a continues from 45° to 90°, a decreases from 4 down to 0. Lasewise, as 5 retates through 45° to 90°, a will decrease from 4 down to 0, as draggon of this is shown.

it the inch. The numbers it and  $\lambda$  is frequent associate the croker in which those each noise or the graph are crosses.

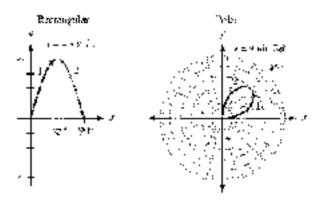

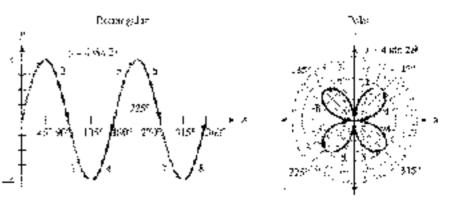

Figure 8

If we contains to remeat in this material, we will obtain a good sketch of the graph of r=4 din 29 by watching how r is affected by changes in x on the graph of  $y=1 \sin 2x$ . Table 3 smartarizes this sufcontained, and Figure 9 constituting the graphs of both  $y=4 \sin 2x$  and  $x=4 \sin 2x$ .

#### Powers of t [8.1]

It is as an integer, those there is longer to sumptification (-1,-1) or 1

#### Graphing Complex Numbers [8.2]

The graph of the complex matrices  $g = (c_1 - pres)$  be arrow (sector) that extends free: the larger to the point  $(\alpha, \dot{\alpha})$ 

#### Absolute Value of a Complex Number [8.2]

The *absolute varies* (or *incluster*) of the complex number  $s = x + y_0$  is the distance from the origin to the point (x,y). If this distance is denoted by x, then

$$r = (r + \frac{1}{2} | r - yt) = \sqrt{\epsilon^2 - y^2}$$

#### Argument of a Complex Sumber [8.2]

The  $x_{ij}$  and  $x_{ij}$  of the complex number  $z \mapsto x + y \hat{x}$  is the smallest positive angle from the positive  $x_i x_i$  is to the graph of  $z_i$ . If the argument of  $z_i$  is denoted by  $\theta$ , then

$$\sin\theta = \frac{y}{x_1} \qquad \cos\theta = \frac{x}{x} \qquad \quad \text{and} \qquad \quad \tan\theta = \frac{y}{x}$$

#### Trigonometric Form of a Complex Number [8.2]

The complex on often  $\xi>\pi(\theta)$  pair written is taigenometric form when it is written as

$$\chi = d \cos \theta + I \sin \theta + \omega \cos \theta$$

where z is the absolute value of z and  $\theta$  is the argument of z.

### Products and Quotients in Trigonometric Form [8.3]

If  $g_1 = \eta(\cos\theta_1 + i\sin\theta_2)\cos\theta_2 = \log\cos\theta_2$  in this in  $\theta_2$  can see equiplication and  $g_2$  in this case this form, then their product is

$$\tau_{\rm I} g_{\rm I} = r_{\rm I} r_{\rm I} r_{\rm I} g_{\rm I} g_{\rm I} \left(\theta_1 + \theta_2\right) + \left(\sin\left(\theta_1 + \theta_2\right)\right] = r_{\rm I} r_{\rm I} \sin\left(\theta_1 + \theta_2\right)$$

and their querient is

$$\frac{2q}{2p} = \frac{r_0}{r_0^2} \left[ \cos \left( 9r + \theta r_0 + t \sin \left( \theta r_0 + \theta \rho \right) \right) \right] = \frac{q}{r_0^2} \left[ \sin r \theta r_0 + \theta \rho \right]$$

$$z^{(0)} = (A^{1/2})^{(1)} \cos (440 - 36)^{(1)}$$
$$= 32 \cos 3600^{\circ}$$

 The Bitaba room of  $\zeta = A_{ij}(x) \cdot B(x + y) \cdot g(x) \wedge (y)$ والمعانج

$$m_2 = 3^{10} \cos \left( \frac{300}{3} + \frac{3687}{5} \right)$$

$$-1.5 \cos 300 - 120 HeV$$

where A = 0, 1, 0. Threlis.

$$\sigma_0 = 2(\cos 20^{\circ} + 1 \sin 20^{\circ})$$

$$n_s = 76 \cos 2000 = 6 \sin 70000$$

#### Da Moivre's Lheorem [8.3]

We write a  $\theta = t\sin\theta$  is a complex notable into go constrictions are will an effective **ջ**ա, մեստ

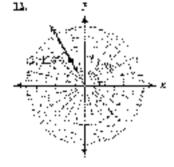

$$z^{\alpha} = z^{\alpha}(z) \mathbf{v} \cdot \mathbf{v} \theta + i \sin n\theta = z^{\alpha} z \sin n\theta$$

#### Roots of a Complex Number [8.4]

The  $\kappa$  countries of the complex number  $z \sim \epsilon(\cos\theta) \leq i \sin\theta$ ) are given by the forшл⁴а

$$\begin{aligned} w_k &= r^{0a} \left[ \cos \left( \frac{\theta}{a} + \frac{360^a}{n} k \right) + (\sin \left( \frac{\theta}{a} + \frac{360^a}{a} k \right) \right] \\ &= r^{0a} \cos \left( \frac{d}{a} + \frac{360^a}{s} k \right) \end{aligned}$$

where k = 0, ..., 2, ..., n = k. If using tadface, seplace 360° with 2m.

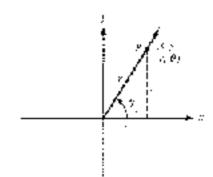

#### Polac Coordinates 18.51

The extered pair  $(r, \theta)$  names the point that is r units from the origin along the terminal vide of angle  $\theta$  in standard position. The coordinates r and  $\theta$  are said to be the policy cased lastics of the point they make:

#### 13. Chiles, (+1/2, 15/1) a. nautuugutloh ayaané wat sa

### Polar Coordinates and Rectangular Coordinates [8.5]

To derive the relationship between golds, consolirates and routingular two climates, we consider a polar P with rectangular proordinates (x, y) and polar could nates (y, t).

$$y = \frac{1}{2}\sqrt{y^2 + y^2}$$

$$\tan \theta = \frac{y}{x}$$

$$x = \cos \theta$$

$$y = \cos \theta$$

H. Change n - y = 4 to polar over3 sees.

### CHAPTER **8**% GROUP PROJECT

#### INTERSECTIONS OF POLAR GRAPHS

**Objective:** To find the points of intersection of two polar graphs.

Our July 16, 1994, Comet P/Shoemaker-Levy 9 collided with Impact (Figure 1). Poternal collisions between planets and connets are found by identifying any intersection purply in their orbits. These orbits are typically described using pulsa equations.

In Sections 8.5 and 8.6 we learned about the polar coordinate system and frow to graph equations in polar coordinates.

Figure 1

One of the things we might need in it row zhou; the graphs is if they pave any points of improved on to this project you will learn new to find these points

First, we will find the points of intersection of the graphs of the point equations r=1 and  $r=1-\cos\theta$ .

We can approach the problem as a system of two equations in two variables.
 Using the substitution method, we can replace via the second equation with the value I (from the first equation) to obtain an equation in just one variable;

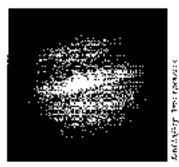

$$1 = 1 + \cos \theta$$

Solve this constitution for  $\theta$ , if  $0 \approx \theta \approx 2\pi$ . Then use your values of  $\theta$  to find the corresponding values of  $\theta$ . Write your results as ordered pairs  $(\epsilon, \theta)$ 

2. Verify your results from Questian 1 graphically. Skritch the graph of both equations on the same polar coordinate system. How many points of intersection are the/of/ Did you find them all using the substitution method in Question 12.

Next, we will find the points of intersection of the graphs of the polar equations r=3 singularly z=3 : senith.

- 3. Use the substitution implied to find any polyter of intersection for the two equations, if  $0 \sim 6 < 2 \pi$ . Write your results as defered pairs  $(\rho, \theta)$ ,
- 4. Verify your require graphically, Skare! the graph of both equations on the same polar coordinate system. How many polars of intersection are the e<sup>-1</sup> Dic you find them all using the substitution method in Question 3?
- **5. Show that the pote r=0 does satisfy each equation for some value of \theta**

- 🐼 6. Use your graphing calculator to graph both et tui tons. Make sure your calculator is see to polar mode, is diana, and to graph equations elembareassarily. Watch carefully as the graphs are drawn (at the same time) by your calculator. Did you notice any significant differences in New the intersection points occur? Write a small paraeraph describing what you observed.
  - Based on your observations of the graphs, try to explain why you were not able. to find one of the intersection points using the substitution method. You may find it help ful to keep in mind that each point in the plane has more than one thintogant representation in polar ecordinates. Write your explanation in a garagasph certwo.

Girclamo Cardano

#### COMPLEX NUMBERS

As was measuraged in the fattoduction to this obtainer, Jecture Cardan (Girofolia) Continuodi was quable to solve certa a equadons because he did not know bow to intrespess the agrance most of a negotive number. His work set the stage for the arrival: of complex numbers.

Research are history of complex numbers. How were the works of Rules. Botthe Ji. Jean Robert Argand, Leenhard Euler, and Abraham de Moivre significant in the development of complex numbers? Write a paragraph or two about your šic@**in**eo

## REVIEW OF FUNCTIONS

W 8 Arrajon

### TANKO DE LE HEN

In the United States, Long-ets time is assistly the issue in derive of degrees Pollet afficial however, most Bern te an extention perfect of the revision temperature in 4, years Colonies. In the Linkness some compare tures meaning the however to be system.

(A <b>TOMAR</b> ORE CONTROL OF SECURITY

:	0	32	
Š	25	77	
:	·10	101	
:	120	212	

The orbit rankling between these two systems of temperature great preparations between the worker in the formulating equations.

$$E = \frac{9}{5}C \pm 32$$

Every temperature measures in 1C is associated with a mitque measure in "F. We call this kind of retationship a function, for this appendix we with review the concept of a function, and see how in many cases a function may be "reverses."

## arc:

### SECTION A.1 INTRODUCTION TO FUNCTIONS

#### 713 Lolg Wanter

MARD PIREONAl substitution of the control of the co

The all shown in the margin appeared in the help wanter, section of the sood news paper the day we were writing this section of the book. We can use the information in the aid to start an informal discussion of our next appear futctions.

#### An Informal Look at Functions

To begin with, suppose you have a job that pays \$7.50 per hour and that you work anywhere from 0 to 40 hours per week. The emount of money you make in one week depends on the number of hours you work that week. In mathematics we say that you weekly carries are a *hourses* of the number of hours you work. If we let the

valuable in represent literits and the variable yregress of the restroy you make, then the relatingship between mandly can be written as

$$y = 7.5y$$
 for  $0.6 + 6.40$ 

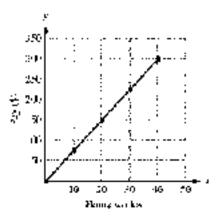

EXAMPLE (F.)

Conserved a table and graph, or the function

$$y = 7.5x$$
 for  $0 \le x \le 40$ 

**SOLUTION** Table 1 gives some of the paired data that satisfy the equation  $y \approx 7.5 x$ . Figure 1 is the graph of the equation with the restriction  $0 \le x \le 40$ .

Hours		
Waked	Hule	Pay
2"	y ≈ 7.5x	y
ſI	y = 7.5(0)	0
£O:	y = 7.5(14)	15
20	y = 7.5(27)	.50
30	$\mu = 7.5(30)$	225
40	y = 1.5(43)	300

Pignor: 1

The encounter y = 7.5a with the sestriction  $0 \le a \le 40$ , Table 1, and Figure 1 are three ways or describe the same relationship between the runn proof landar year while in the week and whose proof for that week. In all three, we have explicit of x, and then use the function rate to cannot valves of y.

## USING

Book and the street was been been been been

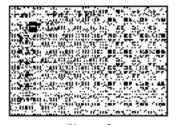

Figure 2

To create the table and graph for the function v = 7.5v in Example 1 using a graphing calculator, first define the function as  $Y_1 = 7.5v$  in the equation editor (Fagure 2). Set up your table to automatically generate values starting at x = 0 and using an increment of 10 (higher 3). On some calculators, this is done by sating the independent variable to Auto. New display the table and you should see values similar to those shown in Figure 1.

l'igure 5

Pigme 6

### Domain and Range of a Function

We begin this discussion by maying and the number of hours worked during the week. was from 0 to 10 is a these are the volues that plant abound. From the fine graph in Figure 1, we see that the values of pronge from 0 to 500. We call the complete set of values that a compassions the altered of the line tion. The volues that are addigned to y are called the stange of the function.

**SOLUTION** From the previous discussion we have

Domain = 
$$[x \mid 0 \text{ at } x \approx 10]$$
  
Range in  $[y \mid 0 \text{ at } y \approx 300]$ 

#### A Formal Look at Functions

What is apparent from the proceding discussion is that we are working with paired. data. The sofutions to the equation  $y \in ZX_0$  are pairs of numbers, and the points on the line graph in righter a come from parted data. We are now sendy for the form it definition of a function.

#### DEFINITION

A flavorger is a rule that rails each element in one set, called the *normal* , with equally important hour a second set, called the course.

THE SECRETARY CONTRACTOR CONTRACTOR SECRETARY CONTRACTOR CONTRACTO

In other words, a function is equal for which exect import is paired with exactly one ellipset.

#### Functions as Ordered Pairs

The function rule y = 7 for from kinample 1 provinces undered pairs of numbers (x,y). The same thing happens with all hims must fine numbers rule produces ordered pairs of numbers. We use his result to write an alternative definition to a how slear.

#### AUTURNATIVE DEFINITION

A. Section is a set of proceed poins in which no two different ordered poins have the same first coordinate. The set of all first coordinates is called the *domain* of the function. The set of all second coordinates is called the range of the function.

The restriction on that coordinates in the differentive definition keeps to from a significant number in the default to more than one number in the name.

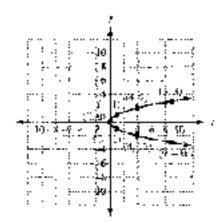

#### A Relationship That Is Not a Function

You rowy be wondering it may sale of paired data but to quality as functions. The answer is yes, as the next example reveals.

Sketch the graph of  $x = y^{\lambda}$  and determine if this relational epists a function.

**SD!** (**STIGIN**) Without going into much detail, we graph the equation  $x = y^2$  by finding a studies of ordered pairs that satisfy the equation, plotting these points, then drawing a smooth curve that connects them. A table of values for a and y that satisfy the equations of lows, along with the x, apt, of  $y = y^2$  shown is Figure 7.

نا	<u></u>
1	1
4	ί

-1	3
4	2
9	3
à	3

Ligan, 7

As you can see times looking at the table and the graph in It gives t, several contained pairs where graphs I can the cause have expressed but two directs, such as (1,1) and (1,-1), (4,2) and (4,-2) and (9,1) and (8,-1). The rolat outship is therefore and amortion.

Proclassity are relationships apecarized by undered points, whether they are functions or not, we include the following two definitions

#### DEFORM RANG

A softeney is a sale that pairs each element, in one so a called the damain, with one or quote that as is (compared as exemply at table).

CONTINUES CONTINUES CONTINUES CONTINUES DE CONTINUES DE CONTINUES CONTINUES

#### AUGERNATIVE DECIMITION

A relation is a set of ordered pairs. The set of all this coordinates is the chemies of the relation. The set of all second coordinates is the range of the relation.

COLD CONTROL OF LOCAL MATERIAL COLD CONTROL COLD CONTROL CONTR

Here are spring facts that will help clarify the distinction between relations and functions.

- Any rule dramase, gas members from one set to numbers is another set is a relation. If the rule makes the assignment set that not input has respective one conjust, then just also a function.
- Any set of ordered pairs is a relation. If none of the first exceedingtes of those ordered print is repeated, the set of ordered pairs is about function.
- Every function is a relation.
- 4. Not every relation is a function.

#### Vertical Line Test

Look at the graph above to Pipere 7. The residu this graph is the graph of a relation, but not of a firethern, is that some points on the graph base the same first econdinates—for example, the points (1,2) and (1,-2). Furthermore, any time two points on a graph have the same first coordinates, those points and, the on a vertical line. This allows us to write the following test that uses the graph to determine whether a relation is also a function.

#### MERCHAL LINE DESIG

it is verticated time, crosses the graph of a relation in more than one place, the relation parametrises for a junction. If no vertical line gots by found that crossess a graph so more than eart place, then the graph is the graph of a function.

бор должном изветту удельномова утпутенти на коспружение и неметиту в крети маже для изветдения извется в

Graph y = x. Use the graph to determine whether we have me graph of a function. State the dense, in and range.

**SOLUTION** We let  $\mu$  take on values of -3, -3, -3, -2, -4, 0, 4, 2, 3, and 3. The corresponding values of  $\nu$  are shown in the table. The graph is shown in Figure 8.

		Figure 8

Received no vertical limit can be frome that crosses the graph in more than that pract,  $y = \{v_1, v_2, v_3\}$  beneficial. The domain is affine eliminate. The tangents  $\{v\} v \geq 0\}$ .

#### **Function Notation**

Lock return to the discussion that in read and us in timetops. If a job pays (7.56 per four the working team into 46 limits a work, then the amount of energy y carried in one week as a function of the enroller of hours worked in little exact relationship between classification of its worker.

Reconsented account of money contactly depends on the immer of funes removed as two collections dependent probable and to the independent variable. For her trace, if we let firepresent all the occupied pairs medically by the contributions then we can write

$$f = \left[ (x, y) \mid y = 7.5 \text{ and } 0 \le x \le 4 \text{ } \right]$$

Once we have named a function with a letter, we can use an alternative partition superpresent the dependent variable y. The alternative actation for p is f(x), it is read "f(x)" and one to used instead of the variable y when whiching with functions. The section p and the paration f(x) are equivalent—that is

$$y \sim 7.5x \iff f(x) \sim 7.5x$$

When we use the notation f(z) we see as agfunction according. The benefit of using function notation is that we can write more information with freez synabols that we can by using just the variable p. For example, asking how much manaly a person will see by for weaking 20 hours is simply a matter of setting for f(20). Without function notation, we would have to say "find the value of p that corresponds to a value of p = 20." To illustrate further, using the variable p we can say by is 150 when

this VBT (I sing the inviation f(x) we similly say "f(20) = 0.50" hat hexpression and states that you would emp 5150 for working 20 hours.

Name: Some students the solution of hims can as one causes. Values of a zer put into the maximize, which transforms them into values of f(x), which then are output by the monthing.

 $11/(2n) = 3x^2 + 2x + 1$ ,  $4\cos(f(0), f(0), aux)(f(-2)$ .

**SOLUTION** Because  $f(x) = 3x^2 + 2x + 1$ , we have

$$f(\mathbf{4}) = 3(0)^{7} + 2(\mathbf{4}) + 1 \qquad \Rightarrow 0 \Rightarrow 5 + 4 \Rightarrow -1$$

$$f(A) = 3(B)^{2} + 2(3) + 1 \Rightarrow 2x + 6 + 1 \Rightarrow 72$$

$$f(-2) = 3(-2)^{2} + 2(-2) + 1 = (2 + 4 + 1) = 7$$

In Exemple 3, the function f is defined by the equation  $f(x) = 5x^2 + 5x + 1$ . We could just an easily have said  $y = 3x^2 + 2x + 1$ , that is, y = f(x). Saying f(-2) = 7 is exactly the same an eaving f is 7 when x is -2.

### Function Notation and Graphs

We can visualize the relation of p between x and f(x) on the graph of the function. Figure 9 shows the graph of f(x) = 2.5x along with two additions, fine segments. The homeoutst, the segment two-spones to x = 25x and the vertical time segment two-spones to f(20). (Note that the domain is restricted to  $0 \le x \le 40x$ ).

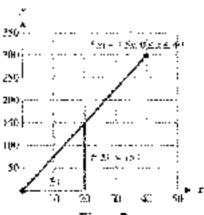

Figure 9

#### Using Function Notation

The Snall example in this section shows how to use and integret function nominon.

A painting is purchased as an investment for \$125. If its value there are continuously so that it doubles every 5 years, then its value is given by the foreston.

$$V(t) = 125 \cdot 2^{45}$$
 for  $t \ge 0$ 

where t is the monthly of years a near the painting was perchased, and V(t) is at with the relations  $\lambda$  in that V(0) and V(10), and explains which they have.

**SOLUTION** The expressions V(S) is the value of the painting when  $t \in S \supseteq y$  can alter it is paintfessed). We calculate  $V(S) \supseteq y$  is before ing S. For t in the equation  $V(t) = V(S) \supseteq Y^{(S)}$  becomes our week.

$$V(5) = 125 \cdot 2^{10} = 325 \cdot 2^1 = 125 \cdot 2 = 250$$

In wordy: After 5 years, the painting is worth \$150.

The explanation (610) is the value of the painting often 10 years. To find this purple the substitute 10 for a judge equations

$$\sqrt{10}$$
 125  $\cdot$  2<sup>703</sup> = 125  $\cdot$  2<sup>3</sup> = 125 | 4 | 503

to wordy. The value of the painting 10 years after it is purchased is \$500.

The fact that V(5) = 3.50 means that the extinued pair (5, 250) belongs to the function V. Likewise, the fact that V(10) = 500 tells us that the ordered pair (10, 500) is a member of function V.

We can generalize the discussion at the end of Example 6 this way:

$$(a,b) \in f$$
 : if and only if  $f(s) = \theta$ 

#### PARTIES ABOUT FOR CLASS

After reading through the preceding seet on, respond in your own words and in  $\cos$  plate southness.

- a. What is a function?
- b. What is the vertical line to a?
- Psp pile w tattyou are calculating when your find (12) for a given him tion f.
- **d.** If  $f(\lambda) = 3$  for a function  $f_i$  what is the relationship between the numbers 2 and  $\beta$  and the graph of  $f^{\alpha}$

#### PROBLEM SET A.

For each of the following relations, give the comain and range, and indicate which are also functions:

- B. Br., 35, 62, 50, 68, 13
- 5(3, 1), (5, 7), (2, 3).

$$\mathbf{R} = \{(-1,0), (1,0), (2,-5)\}.$$

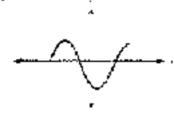

**4.** 
$$((0, -3), (-1, 5), (3, 2))$$

$$5 = ((7, -1), (3, -1), (7, 4))$$

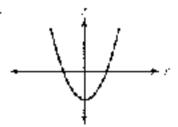

**6.** 
$$\{(5, -2), (0, -2), (5, -1)\}$$

Store whether each of the following graphs represents a Fraction

## THE INVERSE OF A FUNCTION

The following diagram (Figure 1) shows the rest: further takes to school. He leaves his larger and an vest? mides easy, and then to possieft and drives 2 ranges north. When he terroes soluted to drive frome, he drives the same two sec nexts but to the reverse order and the apposite direction; that by he downs 2 names south think tight, and drives 3 miles was a Whan he arrives home from school, he is zight where he started. His rouge home "undees" his ron e to school, teaping bior where he begon.

Figure 1

As you will see, the relationship between a function and its inverse function is send in to the setationship between lastin's cone from Louis to school and his contributes shoul to lange.

Supprise the function flis gives by

$$T = \{(1,4), (2,5), (3,6), (4,7)\}$$

The inverse of f is obtained by leversing the order of the coordinates in each undereduction f. The inverse of f is the relation given by

$$y = 1, 4, 4, 5, (5, 2), (6, 3), (7, 4)$$

It is obvious that f is domain of f is now the range of g, and the range of f is considerable description f, g. Every function (or relation) has an inverse than a contained from the original function by interchanging the connectness g lead, ordered pair.

#### DEFINITION

The fraction of a relation is found by interchanging the good chapter in each ordered painting is an element of the relation. That is, if (a,b) is an element of the relation, then (b,a) is an element of the inverse.

was a consequence provide a consequence and a set of the consequence and the set of the consequence and th

Suppose a fraction f is defined with a requestion unstead of a first chardenest g has We can obtain the emission of the toverse of f by intercharging the m e or r and g in the equation for f.

The bank has f is Lebius f by f(x) = 2x + 3, this flow equation that Apreciates the inverse of f

**SOLUTION** Because the inverse of f is obtained by interchanging the compensate of all the ordered pairs beconging to f and each occurred pair in f satisfies the equation f = 2x = 3, we simply exchange x and y in the equation f = 2x = 3 to get the formula for the inverse of f.

$$x \sim 2y = 3$$

We now solve this equation forly in terms of all

$$x - 3 = 2y$$

$$\frac{x+3}{2} = y$$

$$y = \frac{x-3}{2}$$

The last line gives the equation that defines the inverse ob f. Let s occupans the graphs of f and its inverse (see Figure 2).

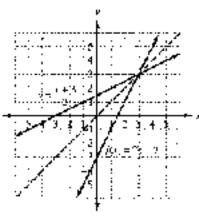

Figure 2

The graphs of f and its inverse have symmetry about the line y = x. We say that the graph of the inverse is a *reflection* of the graph of f about the line y = x. This is a reasonable result because the one function was obtained from the other by interchanging x and y in the equation. The ordered rains (a, h) and (h, u) x whys have symmetry about the line y = x.

#### SYMMETRY PROPERTY OF INVESTR

The graph of the inverse of a relation (or function) we have ideation of the graph of the original relation (or function) about the line v=r

e ereret is distribution in construction de la company de la company de la company de la company de la company

**Craph the function**  $y = x^2 + 2$  and its inverse. Give the equation for the inverse.

**SOLUTION** We can obtain the graph of the inverse of  $y = x^2 - 0$  by girching  $y = x^2 - 2$  by the tianal methods and then reflecting the graph about the time y = x (Figure 3).

The equation that corresponds to the inverse of  $y=x^2+2$  is obtained by interchanging x and y to get  $x\sim y^2+2$ .

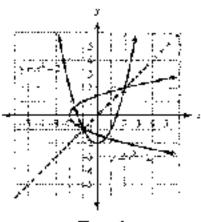

we can solve the equation  $x = y^2 - 2$  for yith terms of x as follows:

$$x = y^2 - 2$$

$$x = 2 + y^2$$

$$y = 2 \text{ for } x = 2$$

#### Figure 3

## USING A CONTROL OF THE PROPERTY OF THE PROPERT

#### CONTRACTOR ARE HAVE AND ARE

One way to graph a function and its inverse is notes: accurate equations, which we cover in more detail in Section (.4. To graph the herefold  $y=y^2-2$  and its inverse from that tiple 2. Let xA your graphing calculates to partitional checks. Then xA for the law twenty xA of ya matrix expositions (in graph 6).

$$\mathbf{x}_1 = \mathbf{y}_1 \mathbf{Y}_1 = \mathcal{C} - \mathbf{y}_1$$

Not the weather to nation on that

Lyraph the limit removing the colorisequare community, Year graph should leak separate legs to  $\Sigma$ 

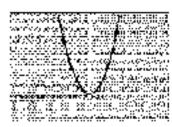

Figure 5

Figure 6

To gas plattic inverse, we need to interchange the roles of x and y for the original function. This is easily done by defining a new set of parametric equations that is just the reverse of the pair given above:

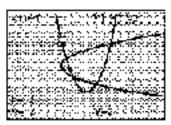

$$Xs = r^2 - 2r Ys = t$$

Press GRAPH again, and you should now see the graphs of the origins! farsetion and its inverse (Figure 5). If you arecome any point on either graph, you can alternate

Pigure 4

be, ween the two curves to see how the coordinates of the corresponding ordered puint compute. As Figure 7 if ustrates, the coordinates of a point on one graph are reversed for the other snaph.

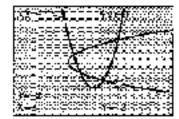

Figure 7

Comparing the graphs from Examples 1 and 2, we observe that the inverse of a function is not always a function. In Example 1, both fund its inverse have graphs that are nonce tical straight lines and therefore both remesent functions. In Example 2, the inverse of function f is not a function because a vertical line  $\phi$ , sees it in not a than one place.

#### One-to-One Functions

We can distinguish termeen those functions with inverses dan are also functions and those functions with inverses (hat me not functions with the following definition.

#### DEFINITION

A function is a *over-to-one fraction* of every element in the range comes from exactly one element in the domain.

water the control of the control of

This definition indicates that a one-to-one function will yield a set of ordered pairs in which no two different ordered pairs have the same second coordinates. For example, the function

$$f = \{(2, 3), (-1, 3), (5, 8)\}$$

is not or e-to-one because the element 3 in the range comes from he h/2 and -1 in the domain. On the other hand, the function

$$g = [(5, 7), (3, -1), (4, 2)]$$

is a one-to-one function because every element in the range comes from only one element in the domain.

#### Horizontal Line Test

If we have the graph of a function, we can determine if the function is one-to-one with the following test. If a horizontal line crosses the graph of a function in more than one place, then the function is not a one-to-one function because the points

an which the horizontal file crosses the graph with the points with the same vectoritizates by different recondinates. Therefore, the function will have an element in the range (the y-populatione) that context from more than one element in the domain (the reportionates).

#### Functions Whose Inverses Are Functions

Because one-to-one functions do not repest second excedinates, when we reverse the order of the ordered pairs in a one-to-one function, we obtain a relation in which no two ordered pairs have the same first coordinate—by definition, this relation must be a function. In other words, every one of one function has an inverse that is itself a function. Both, so of this, we can use simption notation to represent that inverse

#### INVERSE SUNCTION HOTATION

If y = f(x) is 3 one-to one function, then the inverse of f is also a function and can be denoted by  $y = f^{-1}(x)$ .

Service of the commence of the

To distance, it. Swangle 1 we found the invarse of f(x) = 2x + 3 was the fodo tion  $y = \frac{x+3}{2}$ . We can write this reverse function with reverse function notation as

$$f^{-1}(k) = \frac{\sqrt{k}}{2} \cdot \frac{3}{2}$$

However, the energies of the figuration is, it cample 2 is not itself after ridge, we see that not see abstraction  $f^{-1}(s)$  to represent it.

**SOLUTION** To find the inverse for g, we begin by explacing g(x) with g to obtain

$$y = \frac{x - 4}{x - 2}$$
 The oxiginal function

to tend an explainted to the inverse, we exchange a and y.

$$x = \frac{y-4}{y-2}$$
 The inverse of the original function

Now we an dipfy each side by  $v \in \mathcal{F}$  and then solve for v.

why 
$$(2) = y - 4$$
  
wy  $(2y = y - 4)$  This includes a property  $(y - y) = 2\pi - 6$  Collect all limits continuingly on the left side  $(y - x) = 2\pi - 4$  Teacher y freet each term on the LSI side  $(y - \frac{2\pi - 6}{x - 1})$  This side each mater by  $x - 1$ 

Here is the walk of p<sup>(1)</sup> there is a represent the redifferes of fighthally, the Hington substance of the test of control of the decimal asset of the test of the personal field in the test of the t

Records our original function is one-to-one, as verified by the graph in Figure 5, its inverse is also a function. Therefore, we can use inverse function potation to write

$$\chi^{-1}(e) = \frac{2\pi - 4}{2\pi - 1}$$

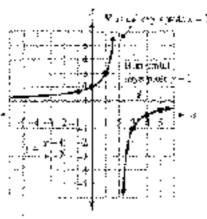

Figure N

As we meathered in the introduction to this specimal case of the important relationships between a function and its inverse is that an inverse "unders," or everses, whatever become were performed by the function. The post example Hustrates this property of inverses.

Use the Caracter  $f(x) = \sqrt{x-2}$  and its overse function  $f(x) = \sqrt{x-2}$  and its overse function  $\int_0^1 f(x) + x^2 + 2 \log x$  and the distributing,

**a.** 
$$f(10) = [6, f^{-1}f(10)] = g, f^{-1}f(0)$$

#### SOLUTION

**a.** 
$$f(10) \sim \sqrt[3]{10 - 2}$$
  
 $\sqrt[3]{5}$   
 $\therefore 2$ 

The function figures an input of (6) and globals is result of 2.

5. 
$$f^{-1} f(10) = f^{-1}(2)$$
 Since  $f(10) = 2$   
=  $(2)^3 \sim 2$  Replace x with  $2 \ln x^2 + 2$   
=  $6 \cdot 12$   
=  $40$ 

The saverse  $f^{-1}$  takes the origin, of 2 from f and fundoes? the steps perfermed by  $f_i$  with the and result that we return to our original input value of  $\{0\}$ 

$$c. |f^{-1}(f(x))| = f^{-1}(\sqrt{x + 2})$$

$$= \sqrt{x + 25^2 + 2}$$

$$= (x + 25 + 2)$$

$$= x$$

We see that when  $f^{-1}$  is applied to the corput of f, the actions of f will be reversely returning as to our original input x.

Example 4 Allustrates and their important property between a function and its involve

If y = f(x) is a one-to-one function with inverse  $y = f^{-1}(x)$ , then for all x in the describe of  $f_x$ 

$$f^{-1}[f(x)] = x$$

and the all over the disturbing of  $f^{-1}$ .

$$f(f^{-1}(x)) = x$$

### Functions, Relations, and Inverses— A Summary

Here is a summary of some of the things we know about functions, relations, and their inverses:

- 1. Every firms now is a reinform but not every relation is a function.
- Bivery function has an inverse, but only one to one fitbolious have inverses that are size functions.
- The denoting of a tone, on its the range of its inverse, and the range of a function is the denoting of its inverse.
- 4. If y = f(x) is a choice function, then we can use the notation  $y = f^{-1}(x)$  to regresent its inverse function.
- 5. The graph of a function and its inverse have symmetry about the fine  $y\equiv x$ .
- **6.** If (a, b) belongs to the force on f then the geint (b, a) belongs to its inverse.
- 7. The inverse of f will fund of expressions should to a performed by  $f_i$

#### ##### GETTING READY FOR CLASS

After boding through the protecting section, respect on your own worsts and in complete sections?

- a. What is the inverse of a function?
- b. What I) the re-artonahip heroses; the graph of c function and the graph of its loverse?
- $\alpha$  -couples in why only introduced type times have the track, has and a set  $\alpha$  and
- d. Describe the vertical time test, and explain the difference between the vertical line test and the formanian line test.

### PROBLEM SET

# EXPONENTIAL AND LOGARITHMIC FUNCTIONS

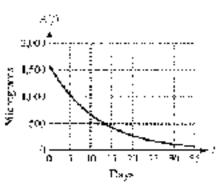

Mathematics is the abstract key which turns the both of the physical universe. John Polkinghorno

#### (National)

If you have had any problems with or had testing done on your thyroid gland, then you may have come in contact with radioactive feding-131. Like all radioactive elements, iodine-131 decays assurably. The half-life of indine-131 is 8 days, which means that every 8 days a sample of iodine-131 will decrease to half-of its original amount. Table 1 and the graph in Figure 1 show what happens to a 1,670-microgram san ple of iodine-131 over time.

higgare 1

The fluretian represented by the information in the table and Figure 1 is

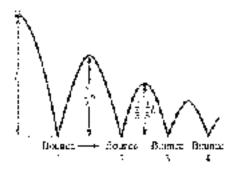

$$\beta(t) = 12600 \cdot 2^{-\sqrt{3}}$$

It is one of the types of functions we will study in this appendix

# SECTION **B.1** EXPONENTIAL FUNCTIONS

If ordain the directive case of now exponential functions because we can core down the being its allowed by a fournery ball. When a ball insular merganic is inacquette his deeppeal from any being the first beauty of will true his being that its  $\frac{1}{3}$  or the longer above the second bounce will true by  $\frac{1}{3}$  of the being that its above merganisms of the first bounce will true by  $\frac{1}{3}$  of the being that the large bounce, and so small second respectively.

Flame 1

If the ball is diripped militally from a beight of 1 preter, then during the time bounce it will much a height of  $\frac{1}{4}$  motor. The beight of the second bounce, well reach 1 of the height resonance the fitsy bounce. The constraint height of any bounce is  $\frac{1}{4}$  of the height of the previous bounce.

initial height. 
$$b=1$$

Bennes 2:  $b=\frac{2}{3}(1)+\frac{2}{3}$ 

Bennes 2:  $b=\frac{2}{3}\left(\frac{2}{3}\right)\approx\left(\frac{2}{3}\right)^3$ 

Bennes 3:  $b=\frac{2}{3}\left(\frac{2}{3}\right)\approx\left(\frac{2}{3}\right)^3$ 

Bennes 4:  $b=\frac{2}{3}\left(\frac{2}{3}\right)^2+\left(\frac{2}{3}\right)^3$ 

Frames 4:  $b=\frac{2}{3}\left(\frac{2}{3}\right)^2=\left(\frac{2}{3}\right)^3$ 

This less to a from as naponicable in factor. We do skey all exponential first this application with the full bying deficition.

#### DEFINITION

An approximately have love is any function that can be written in the form

$$f(x) = bx$$

where h is a positive real question other than 1.

had not include wing it as expensional indufum

$$f(\mathcal{O} + 2^n) = y + 2^n = f(\mathcal{O} + \left\lceil \frac{1}{2} \right\rceil^n)$$

The first step to be covering function with expendential functions of percent is  $\infty$  and some values for specific expenses of the covering

If the exponential functions / and g are defined by

$$f(x) = 2^x$$
 and  $g(x) = 3^x$ 

the: n

$$f(9) = 2^{6} + 1 \qquad g(7) = 1^{6} + 3$$

$$f(1) = 2^{4} + 2 \qquad a(1) = 5 + 3$$

$$f(2) = 2^{4} + 4 \qquad g(2) = 5^{4} + 9$$

$$f(3) = 2^{6} + 3 \qquad g(3) = 5^{2} + 9$$

$$f(-1) = 2^{-1} = \frac{1}{2} \qquad g(-1) = 2^{-1} = \frac{1}{4^{3}}$$

$$f(-2) + 2^{-7} = \frac{1}{2^{3}} = \frac{1}{4} \qquad g(-2) = 2^{-7} = \frac{1}{4^{3}} = \frac{1}{2}$$

$$f(-3) = 3^{-7} = \frac{1}{2^{7}} = \frac{1}{8} \qquad g(-2) = 2^{-1} = \frac{1}{2^{3}} = \frac{1}{27}$$

In the incidention to this appendix we individed that the hardlife of iodine 134 is 8 days, which recess that every 8 days a sample of todine 131 will recrease to fulf of its original another if we start with Appricational altodine 134, then after a may the sample will contain

$$A(a) = A_0 \cdot 2^{m/N}$$

raidrograms of indice 15...

A patient is administered a 1,200 microgram dose of indine-131. How much indine-131 will be in the patient's system after 10 days and after 10 days?

**SCLUTION** The self-of amount of section-131 in  $A_0 = -2001$  so the finish at given two uncount left in the parks the system after things in

$$A(6) = 1,200 \cdot 2^{-88}$$

After Didays, the amount of the pulson's system is

$$A(100) = 1,7001 \cdot 2^{-10.38}$$
$$= 1,7001 \cdot 2^{-10.38}$$
$$= 504.5 \text{ arg}$$

After 16 days, the amount self is the patient's system is

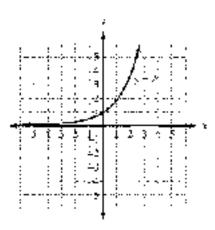

$$\begin{aligned} A(19) &= 1900 \cdot 2^{-100} \\ &= 1900 \cdot 2^{-2} \\ &= 1000 mg \end{aligned}$$

We will now turn our attention to the graphs of exponential functions. Because the notation was executed use when graphing, and y = f(x), for convenience we will write the exponential functions at

**EXAMPLE** 4. Sketch the graph of the exponential function y=2.

SOLUTION: He git a results of Evan plant, we have the following table. Graphand the ordered point give nin the table and connecting them with a smooth curve, we have the graph of  $y = 2^{n} s$  own in Figure 2.

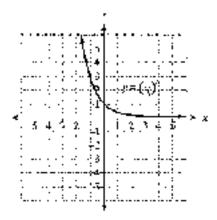

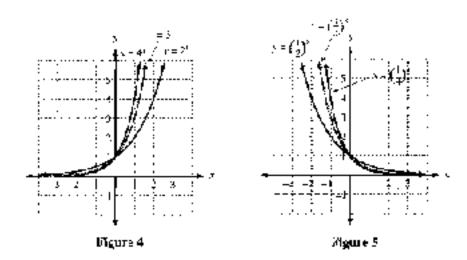

Figure 3

The granks of all exponential functions have two things in common. (1) each  $c_{ij}$  (see the y-axis gt (0, 1) because  $S^{ij} = 1$ , and (2) note carrolless the x-axis **b**ecause  $b^{\prime\prime}=0$  is in possible due to the restrictions on I .

Figures 4 and 5 show some families of exponential curves to help you become more familier with them on an intuitive level

Among the many applications of exponential functions are the applications having to do with interest bearing acronate. Here are the details.

#### COMPOUND INTEREST

If P dollars are deposited in an account with amount interest rate r, compounded is times per year, then the amount of money in the account after a years to given by the formula

$$AQ) = P\left(1 + \frac{r}{n}\right)^{n}$$

and and the control of the control o

Suppose you deposit \$500 in an account with an amutal interest rate of 8% compounded quarterly. If ref an equation that gives the amount of money in the account after I years. Then find the amount of money in the account after 5 years.

**SCILUTION.** First we note that P = 500 and v = 0.05. Interest that is compounded quarterly is compounded 4 times a year, g wing us v = 4. Substituting these numbers into the procediting formula, we have our function

$$A(z) = 500 \left(1 - \frac{0.03}{4}\right)^2 = 500(1.02)^9$$

To find the arroger of all et 5 years, we let a 1.5.

$$A(5) = 500(1.02)^{4.5} = 500(1.02)^{10} \approx $742.97$$

Our answer is found on a calculator and then rounced to the nearest cent.

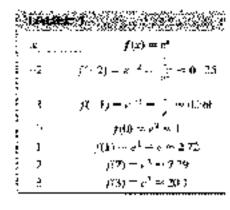

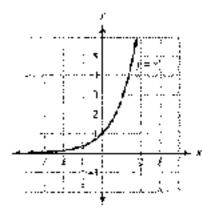

### The Natural Exponential Function

A commonly occurring exponential function is based on a special marker we benote with the letter e. The number e is a number like  $\pi$ . It is implient and occurs in many formulas that describe the world around no. Like  $\pi$ , it can be approximated with a decimal number. Whereas  $\pi$  is approximately 3.1416, e is approximately 2.7183. (If you have a calculator with a key labeled  $\frac{1}{2}\frac{1}{2}$ , you can use it to find e in order average approximation of a). We exact give a more precise defination of the number e without using some of the tapics saught in caretins. For the work we are going to the with the number e, we only need to know that it is an irrational number that is approximately 2.7183.

Table I and Figure 6 show some values and the graph for the reservicespace of a function.

$$y = f(x) = e^x$$

Fleuredi

Fine common application of instance exponential functions is with enterestbearing some risk in Example 5 we write dividle the formula.

$$A = P(x) = \frac{x \cdot y}{x \cdot y}$$

which gives the excent foll training to an account if  $\ell'$  rollars are deposited for a years at annual interest rate r, component a times per year. In J comple 5 the untabet of compounding periods was 4. What would happen if we let the number of compounding periods become larger and larger so that we compounded the interest every tay shere every from these every second, and so on? If we take this as fac as it can go we end up compounding the interest every numbers. When this happens, we have an account with interest that is compounded as country, and the landson of money in such as account depends on the outlier r.

#### CONTINUOUSLY COMPOUNDED INTEREST

It P docume are reposited in an absolute with another interest rate is compounded, continuously, then the amount of money in the account after typics is given by the formula.

$$A(t) = Pe^{tt}$$

Suppose you deposit 1500 in an account, with an annual inversitate of \$% compounded continuously. Find an equation that gives the universit of money in the ecocumt after a years. Then find the amount of money in the account uffer 5 years

SOLUTION. The interest is compounded continuously, so we use the formula  $A(t) = R^{rt}$ . Substituting P = 500 and r = 0.68 into this formula we have

$$A(t) = 500e^{0.68}$$

A frai 5 years, this account will contain.

$$\Delta(5) = 500e^{0.655} - 500e^{0.4} = 5045.91$$

to the newestice of Compare this result with the enswer to Pagaintle 5.

1999	Artiic fil., Clikenbin	6.7

Although the sizes of the numbers in the table do not seem it be very different, the measure of the serrog of the carriag sket they measure out be very different. For example, the 1986 Sea Phineisco cardiquake was more than 10 times stranger than the 1996 cardiquake in Colombia. The reason bearing this is that the Richter scale is a logarithmic scale. In this section, we start our work with logarithms, which will give you an understanding of the Richter scale. Let's begin

As you know from your work in the provious aret on, equations of the form

$$v = b^a$$
  $h > 0, h \neq 0$ 

are called expendential functions. Every expendential function is a pro-sp-one function; therefore, it will have an inverse that is also a function. Because the equation of the inverse of a function can be obtained by exchanging a and y in the equation of the ediginal following, the inverse of an exponential Junction must have the form

$$x = b^{p}$$
  $b > 0, b > 1$ 

Now, this tast equation is acqually the equation of a togetitional function, as the following dofinition lactocates:

#### DEFINITION

The equation  $y = b \log x$  is read  $\frac{\pi}{2}y$  is the *logarithen* to the base b of  $x^n$  and is equivalent to the equation

$$z = b^a = b > 0, b \neq 1$$

In arrows, who the exponent to object bits raised in order to get a,

**Notation** When an equation is in the form  $x = b^n$ , it is said to be in *exponential*. forms. On the other hand, if an equation is in the form  $y = \log_2 x$ , it is exact to be in logarlihade jore.

Dible 1 shows some equivolent statemente walten in tean forms.

7	TABLE	ĽØ.	
ċ	Exponential Form		Lagar.ltmic Form
	$3 = 2^{s}$	***	$\log_2 8 = 3$
:	25 <b>–</b> 5 <sup>2</sup>	13	$\log_3 76 = 7.$
;	$0.6 = 1.7^{-1}$	<del></del>	$loa_0 \cdot 0.1 = -1$
:	$\frac{1}{2} \approx T^{-2}$	حنے	$\Re g_2 \stackrel{\mathbb{I}}{\underset{\mathbb{R}}{\longrightarrow}} \sim -2$
:	v → ±'	⇔	$\log_2 \epsilon = \epsilon$

**SOLUTION** In exponential form the equation looks like this:

$$\label{eq:symmetry} g = 3^{1/2}$$
 or 
$$\label{eq:symmetry} g = \frac{1}{2}$$

The gollation is 🕁.

SQLUTION Again, we use the definition of Expaltions to write the equation in expensatiol form.

liaking the cube root of both sides, we have

The solution is  $\sqrt[4]{4}$ .

SOLUTION. We write the equation again in exponential forms

Because both 4 and 8 can be written as powers of 2, we write them in turns of poware of 2:

$$\mathbb{S}_5 = (\mathbb{S}_2),$$

$$2^3-2^{36}$$

The only way the left and right sides of this last line can be equal is if the exponents ere egeal—that is, if

$$7 = 31$$

$$3r = x = \frac{2}{3}$$

The colorion is  $\frac{2}{3}$ . We observe as to lower

$$ag_8 4 = \frac{2}{3} \iff 4 = 8^{3/3}$$

$$4 = (\sqrt[3]{6})^2$$

$$4 = 2^2$$

$$4 = 4$$

The solution checks when used in the original contains

#### **Graphing Logarithmic Functions**

Graphing logarithmic functions can be come using the graphs of exponential functions and the fact that the graphs of inverse functions have symmetry about the line y=z. Here's an example to illustrate.

SOUDT: ON. The equation  $v = \log_2 x$  is, by definition, equivalent to the exponential equation.

which is the constant of the inverse, of the hipeties.

We simply reflect the graph of  $y=2^{n}$  about the line  $z\sim x$  at page the graph of  $x\sim 2^{n}$ , which is also the graph of  $y=\log x$ . (See Figure 1.)

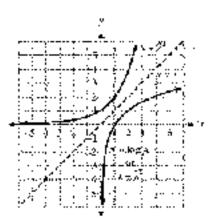

Figure 1

It is apparent from the graph that  $v = \log_2 v$  is a function because an vertical line will convert a graph in more than one place. The same is true for all agasidable equations of the form  $y = \log_2 v$ , where b is a positive number other flow t. Note also that the graph of  $v = \log_2 v$  will always appear to the right of the waxis, meaning that v if always be positive in the equation  $y = \log_2 v$ .

## US(NEXTEXABLE FOR THE

#### SEAPOUND (ROADET) MICH UNDTONG

higute 2

As demonstrated in Fixame k-4, the congraph the logarithmic function  $y = \log_2 x$  as the inverse of the exponential function  $y = 2^n$ . From graphing calculator most likely has a command to do this 10 rst, define the exponential function as  $x = 2^n$ . To see the line of symmetry define a second function x = x. Set the window variables so that

$$-6 \le x \le 6, -6 \le y \le 6$$

and use your zoom-square commuted to grada both functions. You graph should look similar to the one shows in Figure 2. Now use the appropriate command to graph the inverse of the exponential  $\mathbf{f}_{0}$ , and defined as  $\mathbf{Y}_{1}$  (Figure 3)

Pignre 3

### Two Special Identities

If this a positive real number other than I, then each of the following is a consequence of the Refinition of a togetithm:

(1) 
$$b^{\log n} = x$$
 and (2)  $\log b^n = x$ 

The justifications for these identities are similar. Let's consider only the first one. Consider the equation

$$\mathbf{v} = \log \mathbf{x}$$

By definition, it is aquivalent to

$$x = y_2$$

Substituting  $\log_2 x$  for y in the last line gives as

The next examples in this sention show how these two special properties out be used to simplify expressions involving logar thms.

EXAMPLE SYT Simplify 25%

**SOLUTION** Using the first property,  $2^{\log t} = 3$ 

############ Simplify 15419 10000.

SOLUTION 1000 to so have not as 100

$$\begin{array}{c} \log_{10} (0.005 \pm 1) _{\rm CE} - 0^{+} \\ --4 \end{array}$$

Sampledy Log かけン・,カチュ)

**SOLUTION** Because 51 m 6, we have

$$\log_{\mathbb{R}} b = \log_{\mathbb{R}} b^{3}$$

Simplify Ug 1 (b > 0, b \times 1).

**SOLUTION** Because  $1 = b^2$ , we have

$$\begin{aligned} \log_{\mathbb{R}} 1 &= \ln g_k \, \theta^k \\ &= 0 \end{aligned}$$

**SOLUTION** Because  $\log_5 5 - 1$ ,

$$\begin{array}{ll} \log_4 (\log_3 5) + \log_4 1 \\ = 0 \end{array}$$

#### Application

As we mentioned in the introduction to this section, one application of locarithms is in measuring the magnitude of on earthquake, till an earthquake has a chock wave Fulmes greater than the smallest shock wave that can be measured on a setsmograph. (Rigazo 4), then the congritude 37 of the earthquaks, as measured on the Richter scale. is given by the formula.

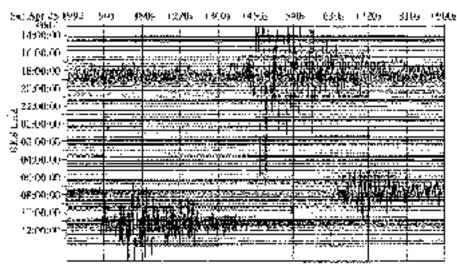

$$\mathcal{H} = \log_{\mathcal{H}} T$$

(When we talk about the size of a shock wave, we are talking about its amplitude. The amplitude of a wave is pull the difference between its nighest point and its lowest point.)

To illustrate the discussion, an earthquake that produces a shock wave that is 10,000 times greater than the smallest shock wave measurable on a suismograph will have a magnitude M on the Righter scale of

$$M = \log_{10} 10.000$$
 = 1

Paguro 4

If an exchange whose a magnitude of M=5 on the Richter state, when can you say about the size of its smock wave?

**SOLUTION** . Fo creaves this question, we plut M=5 into the formula  $M=\log_{10}T$  to obtain

$$5 = \log_{10} T$$

Writing this equation in exponential form, we have

$$T = 10^6 = 100,000$$

We can say that an earthquake that measures 5 on the Richter scale has a shock wave 190,000 times greater than the smallest shock wave measurable an a seismograph.

From Example 10 and the disc tasken that preceded it, we find that the earthquake of magnitude 5 has a shock were that is 10 times greater than an earthquake of magnitude 4 because 100,000 is 10 times 10,000.

# SECTION B.3 PROPERTIES OF LOGARITHMS

of we scarch for the word decided in Mecrosoft Booksholf 95, we find the following definition:

A user word to express relative affections to resort or intensity, usually between two wounter on electric against equal to we true the comment logarithm of the rains of the true levels.

lighter I shows the decided rating associated with neighbor of common sounds

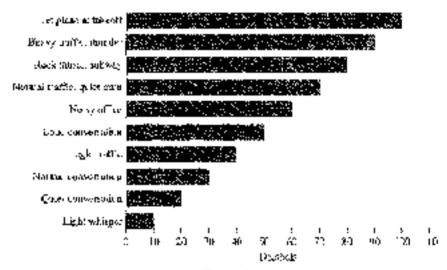

Figure 8

The precise definition for a decibel is

$$D \approx 10 \, P_{\rm ZR} \left( \frac{I}{I_0} \right)$$

Where I is the intensity of the sound heregoneasured, and  $a_0$  is the refersity of the locational distance of the sound. (Sound intensity is related to the amplitude of the sound wave that models the sound and is given in units of waits per meter<sup>2</sup>.) In this section, we will see that the proceeding formula can also be western as

$$D = \{0\}\log_{10}I = \log_{10}I_{C}$$

The rules we use to reasist expressions containing logarithms are called the properties of including logarithms. There are taken in them.

For the to traving three properties,  $x_i y_i$  and b are all positive real numbers,  $b \approx 1$ , and a is any small number.

#### PROPERTY 1

er an altriga (altriga Megerer er er er er er alla altriga Megerer egener er er et alla Arga<mark>al (Argaal) (altrig</mark>

In wards: The logarithm of a phastics to the run of the logarithms.

#### PROPERTY 9

$$\log_{\sigma}\left(\frac{s}{v}\right) = \log_{\sigma} x + \log_{\sigma} y$$

Валетие тор тор учен, протор до и изгласават в отности по тор пред при пристительниции не пред доздажава во

In words: The logarithm of a guoteen is the difference of the logarithms.

PROPRESSY OF

$$\log_2 x' = n \log_2 x$$

In words: The fogunition of a milimber cassed to a proper is the product patchet power and the logarithm of the milimber.

#### PROOF OF PROPERTY 1

High valipmently 1, we simply apply the liest identity for ingential is given in the preceding section.

$$\rho_i^{\text{log}}(x) = \frac{1}{C_i} \sum_{i=1}^{n} (\rho_i^{\text{log}}(x) \rho_i^{\text{log}}(y) \log_i x) = \frac{1}{C_i} \log_i x - \log_i x$$

This limit and bid expressions are a partial the bases and the same on the expressions  $\log_2 \pi_2$  and  $\log_2 \pi$  in  $\log_2 \pi$  and m the equation of Diameters.

The proofs of properties 2 and 3 proceed in much the same manager, as we will omit them here. The examples that follow show how the three properties can be used:

Lypano logo is using the properties of logorithms

**SOLUTION** Applying property 2, we can write the quotient of Expland a in terms of a difference:

$$\log_2\frac{2xy}{2}=\log_23xy+\log_2x$$

Applying property 1 to the product 3ay, we write it in terms of addition

$$\log_2 \frac{3\pi p}{2} = \log_3 3 + \log_3 x + \log_3 y + \log_3 z$$

EXAMPLE 2.1. Expand, using the properties of logarithms:

$$\log_2 \frac{\sqrt{4}}{\sqrt{y} \cdot z^4}$$

SOLUTION. We write  $\sqrt{\gamma}$  as  $\pi^{1/2}$  and apply the properties:

$$\begin{split} \log_2 \frac{\sqrt{2}}{\sqrt{y^2 + x^2}} & = \log_2 \frac{y^2}{y^{1/2} + 2} & = \log_2 \frac{y^{1/2}}{y^{1/2} + 2} \\ & = \log_2 x^2 + \log_2 (y^{1/2} + z^2) & \text{Property 2} \\ & = \log_2 x^2 + \log_2 y^{1/2} + \log_2 z^2) & \text{Property 1} \\ & = \log_2 x^2 + \log_2 y^{1/2} + \log_2 z^2 & \text{Remove parentheses} \\ & = 4\log_2 x - \frac{1}{2}\log_2 y - 3\log_2 z & \text{Property 3} \end{split}$$

We can ulab use the three properties to write an expression in expended form as just i se logarithen.

$$2 \log_{20} a \sim 3 \log_{10} b \sim \frac{1}{12} \log_{10} c$$

**SOLUTION** We begin by applying property 3:

2 
$$\log_{10} a + 3 \log_{10} b + \frac{2}{\pi} \log_{10} a$$
  
 $= \log_{10} a a^2 + \log_{10} b^3 + \log_{10} a^{23}$  Property 3  
 $= \log_{10} (a^3 \cdot b^3) + \log_{10} a^{23}$  Property 1  
 $= \log_{10} \frac{a^2 b^2}{a^{23}}$  Property 2  
 $= \log_{10} \frac{a^2 b^2}{a^{23}}$   $e^{125 \cdot a^2} e^{12}$ 

be properties of logarithms along with the debration of log mithras are useful in softeng openions that towelse arganithms

SOLO: IOM: Applying preparty I to the left side of the equation allows us to write it as a single soguritima:

$$log_1(x + 2) = log_2 x = 3$$
  
 $log_2[(x + 2) = 30] = 3$ 

The feat line can be written in extendinal form using the definition of logarithms:

$$(\epsilon+2)(\epsilon)\sim 2^2$$

Solve as escale

In the previous section we noted the fact that a in the empression  $y = a \cos x$  cannot be a negative number. Because substitution of x = -4 into the original equation gives

$$\log_2(-2) + \log_2(-4) = 3$$

which contains logarithms of negative numbers, we called use -4 as a solution. The solution on  $\mathbb{R} \cdot \mathbb{R}$  .

- **52.** Decided Formula in the decided formula  $D=10\log_{10}\left(\frac{L}{L_0}\right)$ , the threshold of leavings  $t_0$  as

$$k = 10^{-15} \text{ mats/meter}^2$$

Substitute  $10^{-12}$  for  $s_0$  in the decided formula, and then show that it simplifies to

$$\Omega = 10(\log_{\mathrm{H}} x + 12)$$

Cartent :

# SECTION B.4 COMMON LOGARITHMS AND NATURAL LOGARITHMS

Acid sam was first discovered in the 1966s To Gene Likensy and the range. In each, who, studied the farrage caused by acid rain to Hubbard Brook in New Hampshire. As left rain is sain with a pH of field and below. As you will see as you want your cary lineagh it is seet on, tH is defined in terms of common logarithms—was of the topules we prevent or this section. So, when you are finished with this section, you will have a more detailed knowledge of off and acid rain.

### Common Logarithms

Two kinds or regardhess occur more irrequently than other leganthess. Lagardhuis with a teste of 10 are very continued because our near her system is a base-10 astudio ayatem. For this reason, we call base-10 logarithus constant logarithms.

#### DETENSITION

A common logarithm is a logarithm with a base of 10. Because common togeradams are need to despice the it is contouring in order to save time, to omit notating the bases it at me,

$$\log_{10}\pi + \log_{10}\pi$$

When the base is not shown in is assumed to be 10.

Control of the Contro

Commons logarithms of prevers of 10 are simple to evaluate. We need easy tengence that  $\log 10 + \log 2 10 \approx 1$  and apply the third property of logarithms:  $\log x^2 = \pi \log x$ .

$$\begin{aligned} \log 1.000 &= \log 10^4 &= 3 \log 10 &= 3(3) &= 3 \\ \log 1.00 &= \log 10^4 &= 2 \log 10 &= 2(1) &= 2 \\ \log 10 &= \log 10^4 &= 1 \log 1(1) &= 1(1) &= 1 \\ \log 1 &= \log 10^3 &= 0 \log 1(1) &= 0(1) &= 0 \\ \log 0.1 &= \log 10^{-1} &= -1 (\log 10 &= -2(1)) &= -1 \\ \log 0.01 &= \log 10^{-2} &= -3 (\log 10 &= -2(1)) &= -2 \\ \log 0.00 &= \log 10^{-3} &= -3 (\log 10 &= -3(1)) &= -5 \end{aligned}$$

To find compage Buganithers of remakers that are not process of 10, we use a called colorly with a (log) key.

Check the Alboving logarithms to be sare you know how to use your calculator. (These arrowers have been councied to the nearest ten-day semeths).

> $\log 7.02 \approx 0.3463$  $300 \cdot .59 = 0.1430$ loc 6.00 = 0.7782.  $\log 9.90 \approx 0.9996$

SOLUTION Flog 2,760 ~ 3,4409.

**SOLUTION** We are looking for the number whose logarithm is 3,8774. On a scientific calculation, we enter 3.8774 and press the key labeled 10%. On a graphing calculator we press [10]\* Jirsu then 3,877°. The result is 7,540 to four significant digits. Here a tyby:

1f 
$$\log x = 3.8771$$
  
then  $x = 10^{38771}$   
 $\approx 7.540$ 

The number 7.540 is called the quallogarthhubor first and <math>top of 3.9774. That is, 7.540. is ibs number whose logarithm is 3.8771.

MANAGE 5 10ad a # Egg a -- - 2.4179.

SOLUTION: Using the 107 key, the result is 0.00381.

11 log 
$$x = -2.4 \text{ pg}$$
  
there  $= -2.4 \text{ pg}$   
 $= -2.4 \text{ pg}$ 

The articleg of 1074 f79 is 0.00382; theths, the Digarithm of 0.00782 is 1 2 ti 79.

#### Applications

The visits by, we formed that the imaginity le 58 of an earth, revise than produces a should wave. Theretal arte in them the some root shock warms bulleton be encreased on a sense  $p_{ij}$  and  $p_{ij}$ 

given by the formula.

$$M = \log_{10} T$$

We can atwrite this formula always our shorthand a pratern for common logaritaries as

$$M = \log T$$

The Nav. Property of earthquake of 1906 is estimated to have measured 8.7 on the Richter scale. The San Percentily earthquake of 1971 measured (16 on the Richter scale. Find 7 for each earthquake, and then give some indication of 2000 earth successful and 1971 earthquake.

SOLUTION For the 1906 cartiquake

If 
$$\log T = 8.3$$
,  $\det T = 10^{1.5} \approx 2.00 \times 10^{5}$ 

Mu the 1971 carthquake:

If the 
$$T\sim 6$$
 %, then  $T\sim 10^{6.5} \approx 3.98\times 10^{6}$ 

Dividing the corolest set of T and madising our answer to the reduct while number, we have

$$\frac{240.1 \times 10^6}{3.98 \times 10^6} \sim 50$$

The shock cases for the 1906 exchangles was approxing study 50 fm as stronger than the shock wave for the 1971 employable.

In chamistry, the plb of a solution is the persons of the activity of the solution. The definition for the philipspherical propriet is flagger, is

$$pB = m \log |B|^2$$

where [447] is the hydrogen job coarser mailing. The sampe for pH is from 0 to 14 (Figure 1). Polle water, a remonstration can, base pH of 7 to addit solution, our residency will have a pH less than 7, and an alkadian solution, pack as a manuscal, has a pH above 7.

Figure I

Normal rainwater has a pH of 5.6. What is the hydrogen iten content ration in normal painwater?

**SOLUTION** Substituting S.6 for pH in the formula  $gH = \log fR^{(1)}$ , we have

$$5.6 = -\log [HT]$$
 Substitution  
 $\log [H,T] = -5.6$  Isolate the logaration  
 $[H,T] = 10^{-5.6}$  We note exponential forms  
 $\sim 2.5 \times 10^{-6}$  males par like. Answer in separation contain

The hydrogen concentration to a sample of sold rain known to kill that is  $7.2 \times 10^{-3}$  moles, por first. Find the pS of one, as id now to nearest tenth.

**SQLURION** Substituting  $3.2 \times 10^{16}$  for [0.1] in the formula [0.1] . Fog [0.1], we have

#### Natural Logarithms

#### DEFINITION

A massed log-orithmist at quantilant with a back of a. The catagod logarithm of a is then use to true that is,

is 
$$\chi = \log_{n} x$$

 $S = \{ (a,b,b) \in \{ (a,b) \in A, (b,b) \in A, (b$ 

The presinge storep shown in Figure 2 contains one of the two special identifies we mentioned ever until in this chapter, but smed in terms of natural ingandana.

Kingpre 2

We can assume that all can properties of exponents and logarithms hold for expressions with a hase of a because alls a test number. Here me come examples intended so make you users familiar with the attender a grid natural logarithms.

Simplify each of the following expressions.

g. In 
$$a > b$$
 — In exponential factors  $e^{b} \sim a$ 

**d.** In (i) 
$$= 0$$
 In a quantity if  $q_{ij}q_{ij}e^{it} = 1$ 

$$e_{\nu}/Je(\nu^{\lambda}=\beta)$$

Use the properties of logarithms at expand the captus size in  $4e^{2x}$ .

SOLUTION - The properties of logarith as hold turnshoral logarithms, so we have

$$\ln A e^{\frac{\pi}{4}} = \ln A + \ln e^{\frac{\pi}{4}}$$
$$= \ln A + \ln A + \ln A + \ln A = 0$$
$$= -1$$

# 17 n 2 m 0.6931 and in 3 = 1.0980, find

#### SQUUTION

**a.** Because  $6 - 2 \cdot 3$ , using Property I to pagarithms we have

c. Su S

$$\begin{array}{r} \ln 6 + \ln (2 \cdot 5) \\
+ \ln 2 \cdot \ln 5 \\
+ 0.6931 + 1.0986 \\
+ 6.7917
\end{array}$$

**b.**  $W_{i,j}$  and 0.5 as  $\frac{1}{2}$  and approximate, openly 2 for imparish the gives as

$$\ln 0.3 = \ln \frac{1}{2}$$

$$= 6 \cdot 1 + \ln 2$$

$$= 0 - 0.6931$$

e. Writing  $8 \approx 2^5$  and applying property 3 for logarithms, we have

10,000	
.3000.0639	

What comper does the expression  $\left(1+\frac{1}{r}\right)^{r}$  scent to approach as a gets larger and targer?

## SECTION B.5 EXPONENTIAL EQUATIONS AND CHANGE OF BASE

For items into ved in exponential growth, the time is takes for a quantity to double is called the soulding time. For example, if you issuest \$5,000 in an account that pays 5% cannot interest, compounded quarterly, you may want to know how long it will take for your mounty to double in value. You can find this foulding that if you can solve the constitut

$$10.0000 - 5.0000 \pm 0.0025 s^4$$

As you will see as you progress through this section logarithms are the key to solving equations of this type.

Logarifinas are very surjectant in solving equations in which the variable appears as an implicant. The equation

is an example of one such equation. Equations of this form are called *exponential* constitues. Because the quantities 5° and 12 are equal, so are their common logarithms. We began our solution by mking the logarithm of both sides:

$$\log 5^4 = \log 1.2$$

We now apply property 5 for logarith its,  $\log x^2 = x \log x$ , to turn a from an extended into a coefficient:

$$x \log 5 = \log -2$$

Dividing both sides by log 5 gives us

If we want a decimal approximation to the solution, we can find  $\log 12$  and  $\log 5$  or a calculator and divide:

The example to problem makes the thirst

$$9^{2} = 12$$
 $\log 3^{2} = \log 12$ 
 $\log 5^{2} = \log 12$ 
 $\log 5^{2} = \log 5$ 
 $= \frac{1.0792}{0.6690}$ 
 $\approx 1.5439$ 

Here is another example of solving an exponential explation using logaridy to

**SOLUTION** Taking the logarithm of Each sides and then we sing the exponent (2n + 1) as a coefficient, we proceed as follows:

his by a cafeedator, whiche write a detimet approximation to the answer:

$$x = \frac{(0.1761 - 1)}{2(0.3973 - 1)}$$

$$\approx \frac{1}{2}(0.8418 - 1)$$

$$= \frac{1}{2}(-0.1560)$$

$$\approx -0.0794$$

Buggill from Section B. 3 that if you make and offers in any consist with as assess interest only in that is compared will be indeed a year, there if years later the assessment of money in that an agent will be

$$\lambda = P \bigg( 1 + \frac{r}{a} \bigg)^a$$

Line for the same toward that yields 5% underest compounded once a year?

**SCHUTTON** Substitute P=5.009, r=0.05, u=1, and A=10.000 into our formula, we have

$$15.000 - 5.000\chi - 0.55\chi'$$
  
 $.75000 = 5.00001.153\chi'$   
 $.2 \sim (6.00\chi)$  Divide by 0.006

If it is an extremental equation. We solve by taking the logaliting of both sides.

Dividing bering idea by log \$.05, we have

$$1 = \frac{\frac{\log 2}{\log 1}}{\log 1}$$

$$= 14.2$$

It takes a little over 14 years for \$5,000 to double if it earns 5% interest per vero: compounded once a year.

There is a fourth property of logarithms we have not vecous desed. This last property allows us to change from one base to another and is therefore called the change-of-bass property.

## PROPERTY & COMANGE OF BABBS

If a and b are both positive numbers often than 1, and if a > 0, then

$$\begin{array}{ccc} 3 a_{0,\alpha} : & \frac{\log_{\delta} a}{\log_{\delta} a} \\ & & \uparrow \\ & \text{vance} & \text{Resc $\delta$} \end{array}$$

. . . . . . . . . .

<sup>🖟</sup> tradition control of the configuration of the control of the configuration of the control of

The longarishmost the left safe has a case of a good back located my on the right side have a case of it. This although to change from back a to any owner back it that is a positive number other than 1. Here is a good of projectly 4 for longeridings.

#### PROOF

We begin by writing the identity

$$e^{\log_2 x} + \omega$$

Taking the logarithm base b of both sides and writing the exponent  $\log_{10} x$  as a coefficient, we have

$$(\operatorname{sg}_n p)^{\operatorname{sg}_n r} = \log_n x$$
  
 $(\operatorname{log}_n x \log_n a) = \log_n x$ 

Dividing noth sides by  $\log_A g$ , we have the desired result:

$$\begin{split} \frac{\log_{2} x \log_{2} x}{\log_{2} x} &= \frac{\log_{2} x}{\log_{2} x} \\ \log_{2} x &= \frac{\log_{2} x}{\log_{2} x} \end{split}$$

We can use this perpeny to find logistratus we could not exposs a computation can calculators—that is, organishes with hoses (after that Hi  $t\sigma$  x. The most example illustrates the use of this property

**SOLUTION** We also not have base 5 logarithms us our calculators, so we can clung this capression is an equivalent expression that contains only base 10 logarithms:

$$\log_k 24 = \frac{\log 24}{\log_k 8} \qquad \text{Projectly 4}$$

Don't be confused. We shall not pily strop the having we changed to have it. We could have sentian the fast bine black than

$$\operatorname{segs} 24 = \frac{\log_{10} 24}{\log_{10} 8}$$

Processor collectations, we worth

$$cg_{9}/24 \approx \frac{1.3302}{0.0034}$$
  
 $\approx 1.5303$ 

## Application

Suppresentation the population in Carm. (city is 32,000) in the beginning of 1997 and than the chry cowacti castures that the physication size 7 years later can be estimated by the equations

$$P = 32.000 k^{0.35*}$$

Approximately when will the city have a population of 500,000-

**SOLUTION** We substitute 501000 for P in the equation and ablve for m

to solve the drap call on to dill we particise the liabilitiest logishism of each selec-

In 1.5625 — In 
$$e^{i\omega t}$$
  
 $= 0.057$  to  $e^{i\omega t}$  Procedy 3 for segarithms  
 $= 0.057$  Because in  $e^{i\omega t}$   
 $e^{i\omega t} = \frac{\ln k \cos 25}{0.05}$  Divide each side by 0.05  
 $e^{i\omega t} = \frac{4}{100} e^{i\omega t}$ 

We can estimate that the p. palation will reach 50,000 toward the cat of 2002.

## USINGENZO

#### EDAY OF CHARACTER AND BOTH A PROPERTY

We can solve the quantion  $50.005 \sim 32,500e^{0.00}$  for a Evangele 4 with a graphing calculation by defining the captess on on each size of the obtained as  $\pi$  function. The solution  $\mu$  the regarding will be the along the point where the two graphs in errors,

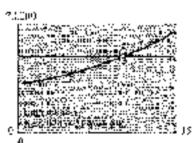

First define h, h coss  $Y_2 = 50000$  and  $Y_2 = 30000 e^{(0.058)}$  as shown in Figure 1. Set year equation variables so that

$$P = \sqrt{\pi (150.0)} \le 6 \le 2000000$$
, while = 140000

Graph both functions, then use the appropriate element as your subsulator to find the coordinates of the intersection point. From Figure 2 we are that a coordinate of this point is  $r \approx 8.93$ .
