(c) & (d) This design is not as efficient as possible. If we were to confound a different interaction in each replicate this would provide some information on all interactions.

13–22. Please refer to the original reference for an analysis of the data from this experiment.

13–23. (a)  $I = ABCD$ . Alias Structure:

$$\begin{array}{lll} \ell_A = A + BCD & \ell_{AB} = AB + CD & \ell_{CE} = CE + ABD \\ \ell_B = B + ACD & \ell_{AC} = AC + BD & \ell_{AD} = AD + CB \\ \ell_C = C + ABD & \ell_{AE} = AE + BCD & \ell_{BD} = BD + AC \\ \ell_D = D + ABC & \ell_{BC} = BC + AD & \ell_{CD} = CD + AB \\ \ell_E = E + ABCD & \ell_{BE} = BE + ACD & \ell_{DE} = DE + ABC \end{array}$$

(b) design:  $2^{5-1} D = ABC$

$$\begin{array}{lll} \ell_A = 0.238 & \ell_{AB} = -0.024 & \ell_{BD} = 0.042 \\ \ell_B = -0.16 & \ell_{AC} = 0.0042 & \ell_{CD} = -0.024 \\ \ell_C = -0.043 & \ell_{BC} = -0.026 & \ell_{BE} = 0.1575 \\ \ell_D = 0.0867 & \ell_{AD} = -0.026 & \ell_{CE} = -0.029 \\ \ell_E = -0.242 & \ell_{AE} = 0.059 & \ell_{DE} = 0.036 \end{array}$$

Conclusion: assuming 3 and 4 factor interactions insignificant, factors  $A$  &  $E$  are important; possible also  $B$  and  $BE$ .
