FOREWORD

So many people all over the world have been touched and impressed by the research and findings of the work of Dr. Masaru Emoto. His groundbreaking first book, *The Message from Water*, awakened us to the simple but profound connection between our thoughts and the effect they have not only on our own bodies, but on water itself. Wow! What a novel idea.

This information gave me a new respect for water. I began blessing with love every glass of water I drank. Labels appeared on my faucets, showerhead, garden watering cans, the toilets, every other water source I had, and all the many bottles of water I carried everywhere.

I heard more and more from others who were using Dr. Emoto's information to expand and change their own work to include respect for water. It was only a natural progression to gather this information into a book to share with the world.

Dr. Emoto has taken all that he knows about the magic of water and utilized the current brilliant minds of people from the scientific, health, and spiritual worlds, combined with the mythological realms, to give you the most comprehensive study of water and its powers. Personally, I think *The Healing Power of Water* may be his best work to date. If you want to know, for instance, the myths of water (such as the healing power of the waters at Lourdes), you can read that section of the book. You can also discover what scientists say comprises the structure of water. For me, I jumped right to the information pertaining to health. How often have we heard the advice to drink eight glasses of water a day? These chapters delve deeper into the questions of water and its power to heal.

Dr. Emoto and I have visited with each other on a number of occasions, most recently at my 80th birthday party. At that lovely celebration, he presented me with a beautifully framed photograph of a magnificent water crystal, which had been formed out of the words *You can heal your life*. It brought tears of joy to my eyes to see what a beautiful water crystal looked

like based on the title of my best-selling book. I've always believed in the healing power of words, and this very learned gentleman presented this very simple lady with a precious gift. I will treasure it always.

You have in your hands Masaru Emoto's latest endeavor, *The Healing Power of Water*, and it's my honor to be writing this Foreword. Dr. Emoto's work has sparked a revolution! It's heartening to have so many authors studying and sharing their thoughts about the healing power of water. I hope you find what you are looking for in these pages.

— Louise L. Hay

You can heal your life crystal.

INTRODUCTION

I first had the idea of freezing water and photographing the crystals thus formed in 1994. Since then, several books have come out on my work, featuring both visual images of water crystals and the insights that I've gained from my research. These volumes have been translated into many languages, and I regularly travel all over the world to give lectures about my experiences with water. And every time, I'm touched anew by how people can *intuitively* relate to the images of the water crystals.

For both my colleagues and myself, this last decade has involved years of intensive development and research. Although the technique of water-crystal photography has to be further refined to meet the strict demands of the scientific community, it's inspiring to witness the interest with which the pictures are examined and the immediate understanding of their meaning at a lay level. We hope that you, too, will gain a new awareness of the wonderful and miraculous world of water.

Masaru Emoto

WATER: THE HEALER IN US

Why are we so fascinated by water? Since the beginning of time, it has been seen as a symbol of the soul and regarded as the *prima materia*, the

prime substance, of the universe. Life itself developed out of the sea, the human fetus is surrounded and protected by the amniotic fluid, and our body consists of at least 70 percent water—the examples could go on and on.

Water as a physical substance possesses some of the features that made life possible on Earth. We all learned about its anomalies in our physics classes. For instance, frozen water is lighter than the liquid. Without this quality, rivers would freeze completely from top to bottom in winter; but because a lighter, protective layer of ice forms on the surface, creatures can still exist underneath.

Water also has the ability to levitate. It can flow against gravity, as in the case of artesian springs and wells. The healing power of water from these sources, for both external and internal use, has been known for generations.

In my book *Die Antwort des Wassers (Water Knows the Answer)*, I described the amazing journey of one drop of water. I'd like to look at this journey once again, but from a different point of view, using it as an analogy for human life.

EVERYTHING IS IN A STATE OF CHANGE

In Buddhism and Shintoism, two religions that have significantly influenced our way of thinking in Japan, reincarnation is an absolutely integral component. This idea of cyclic development, of spiraling, corresponds well with the journey of a drop of water. A drop might start its journey as water, then evaporate, changing its form. It's still water, but it's not the same as before. However, the same knowledge, the same information, is still there. The same applies even when it's frozen.

I would say that the process of evaporating is equivalent to dying. Then we, too, change our shape, our form. The body dissolves, but the information that the soul has acquired—all the experiences and everything that we've learned—is maintained. Now the soul sets out on its own journey. It develops further and matures until it's time for it to incarnate again on Earth—just as the water drop rises as steam, falls back as a raindrop out of a cloud, trickles away into the earth, and after a very long

time (100 to 1,000 years), appears again on the surface of the earth as an artesian spring.

We don't know exactly what processes a drop of water goes through inside the earth before the astonishing power of levitation finally sets in and it rises up hundreds of feet. But we do know that artesian springs have enormous healing power.

WATER-CRYSTAL PHOTOGRAPHY

For many years now I've been studying the healing power of water. I was the first scientist in Japan to use a device that made it possible to transfer vibrations into this substance. Thanks to this water, which was charged with "healing" information, many people who came to see me in my practice were restored to health.

Water has played a central role in my life for a long time. I've often noticed that as long as we're receptive and open, we can often uncover very valuable clues in even the smallest things around us. This happened to me one day when I read: "No two snow crystals are the same." Of course, I'd learned that as a child in school. I knew that each snowflake was unique. But at that very moment, the sentence had a completely new meaning to me. Suddenly I realized that the snowflake state revealed the individual face of each water drop, and that it might be possible to take photographs of it. My hypothesis was that the ice crystals would give me information about the *state* of the water. This idea gripped me—I wanted to freeze water and then try to take pictures of the crystals. So I rented a high-resolution microscope and started some experiments with the assistance of a young researcher from my company.

Two long months went by with no results whatsoever, but one day my radiant co-worker presented me with the first photo of a water crystal. Looking back now, it seems a miracle that we even managed to get pictures, considering the conditions under which the experiment was first carried out!

We started by putting a single drop of water in each of the 50 petri dishes we'd prepared. We then froze them at a temperature of -13° F and took

pictures under the microscope of the crystals that had formed. The temperature in the laboratory where we took the photographs was constantly kept at 23° F; even so, the average lifetime of a crystal under the microscope was just two minutes because of the light that was needed—this had a warming effect, which melted the subject.

In my other books, I've already explained that we normally chose just one out of some 50 pictures. Usually we decided on one that was representative of the shape that appeared most frequently.

THE MEMORY OF MEMORY

When Water freezes, its molecules systematically connect and form the nucleons of a crystal; it becomes stable when it has the structure of a hexagon. Then it starts to grow and a visible crystal appears. This is the natural course of the procedure. However, if unnatural information is forced upon it, it's not able to form a harmonic hexagonal crystal.

Above: This is how the crystal pictures are produced. The temperature is kept constant at -5° C in the laboratory. The photo must be taken very fast, because the beautiful crystal structure only lasts for two minutes.

Once our initial hypothesis had been confirmed by the data, I started to investigate water from different places. Our experiments went well and we managed to produce reliable pictures. The question we asked ourselves was: *Do water crystals look different under different circumstances?*

All my expectations were surpassed. The photographs clearly showed that depending on its origins (that is, whether it came from a natural spring or from the kitchen tap), water would take on a completely different shape. This was visible proof that not all water was the same—it reacted to the “experiences” it went through during its journey and stored that information. Water from a spring formed breathtakingly beautiful regular hexagons, while water from the lower course of a river or from a dam hardly achieved a complete crystal. The most shocking results came from chloride-ridden drinking water. It can be really painful to see water that has been mistreated in such a way if you know what marvelous crystals natural water can form. . . .

This picture shows a water crystal, which was “given a soul” by labeling it with the word *thanks*. The result is this beautifully formed crystal.

This crystal was formed after the water has seen the picture with the jumping dolphins. The dolphin has a similar—or even higher—intelligence than the human being, and it's said that dolphins can heal us.

In light of these experiments, we can say that water has a memory. Each molecule of it carries some information, and when we drink it, that data becomes part of our body. Looking at these pictures, ask yourself: “Which information do I want to take in?”

WATER LISTENS TO MUSIC

One day, Dr. Ishibashi, the chemist and scientist who took the photographs of the water crystals, came to see me and asked, “What if we played some music to the water?” I found the idea terrific and that's how some of the most impressive pictures came into being (see the following photos).

Schubert's interpretation of "Ave Maria." This picture shows a very beautiful, symmetric crystal, which radiates deep love.

Water listens to *Swan Lake* by Tchaikovsky and a crystal is formed with delicate branches, reminiscent of swans' necks.

This water listened to the CD *Message from Water*. If you look into the center, you can see another small crystal trying to form itself.

Crystals responding to the *Four Seasons* music.

Above: Spring: The plants starting to sprout.

Right, top to bottom: Summer: They reach full blossom, Autumn: The seeds have developed and start to drop from the plant, Winter: The seeds rest hidden away in the winter. It's the time for retreat and silence.

The Beatles, “Yesterday”: A beautiful crystal has formed. The structure of the turtle shell shows that this music strengthens the immune system.

“Edelweiss” from *The Sound of Music*: *Edelweiss* means “precious white.” In correspondence with this name, a very clear white crystal has formed. The center seems like a mirror.

The method was fairly simple: A small bottle of distilled water was placed between two loudspeakers, and music was then played. We discovered that if we knocked gently on the bottle before and after playing the music, we got clearer pictures.

We chose classical music for our first attempts and later on used popular contemporary music. Our choices ranged from Gregorian chants and Buddhist sutras to heavy metal. We also experimented with healing melodies. We discovered, for example, that some pieces of music supported the immune system. Sound is vibration, so we now know that water is able to react to vibrations and can store them in its own very specific way. You can find out more about this in my other books.

When we started to act on the idea of playing music to water, we abandoned our role as passive observers for good.

IS WATER ABLE TO READ?

This question seemed absurd at first. However, I had the idea of showing some Japanese characters to water. In Japan, we think that every single word possesses a soul. I'll try to explain this by means of an example. Let's take the word *gratitude*. When I say it, I haven't just given sound to a string of phonemes, but have expressed a meaning and a feeling. We believe that a word possesses this power of transmission because it has a share of the word soul and is its messenger or, more accurately, its representative. By saying "Thank you," I step into resonance with this word *soul* and vibrate in unison with it. And, as I'd expected, water shown a range of different Japanese characters formed completely different crystals.

THE WORD SOUL AND MORPHOGENETIC FIELDS

I'm always fascinated to see how ancient wisdom is being rediscovered by some brave scientists of our time. Biologist Rupert Sheldrake speaks about a morphogenetic field, in which all information is stored in the shape of vibrations. The morphogenetic field for "Thank you" is increased if somebody says the words—or just even thinks them. The stronger a morphogenetic field, the easier it becomes for everybody else to say those particular words and the more likely it is that this will happen.¹

An example of this is the phenomenon of the hundredth monkey, as first observed in the late 1950s on a northern Japanese island. A group of behavioral scientists observed that monkeys on the island would wash their potatoes before they ate them. It's likely that one of them started it by chance, and then others copied its behavior. They must have found out that the taste of a washed potato was far better than one that hadn't been cleaned. Eventually, there were 100 monkeys on that island who were eating in this fashion. Then something fascinating happened: Suddenly, monkeys on another island started to wash their potatoes; but they didn't start one by one, as had been the case on the first island, but all at once, as if the animals on the first island had told them about their discovery. However, there had been no contact between the two groups.

This phenomenon can be used to explain the theory behind the morphogenetic field. Through the behavior of the first group of monkeys, a field of vibrations was created that contained the information "Washed potatoes taste good." At a certain critical mass (the hundredth monkey), the field developed an intensity that allowed others to have a share in this information.

Above: This water was given a label with the word demon. Judge for yourself how this word affected the water.

*Right, top to bottom: Om Namah Shivaya is a Sanskrit mantra. This beautiful crystal looks like a mandala. Next: This crystal was formed using a label with the words “This is really beautiful.” One can wholeheartedly agree! Last: **Power:** Here you can see that power on its own can’t achieve anything—no ordered crystal structure has formed.*

Soul: This crystal grew very fast and shows a spectacular play of colors.

Water with the label “bad luck.” A very weak crystal has formed, which is trying unsuccessfully to bring itself into balance.

Lucky: This is perfect beauty and harmony. Like a fine-cut diamond. Maybe harmony is a necessity for luck. . . .

In the same way that actions originate a morphogenetic field, so do words; and each word makes its own individual contribution. We can imagine this as similar to a hologram in which every single piece describes the whole picture.

A professor from Yale University wanted to test Rupert Sheldrake's theory. He put together a range of Hebrew words and a similar number of meaningless, invented words. He then mixed these two sets and showed them to some students, one word at a time. (None of the subjects could speak Hebrew.) He asked them to try to guess the meaning of each word and didn't tell them that some of them were totally meaningless.² With the Hebrew words, there was a statistical approximation of the correct meaning, while it was obvious (by means of the statistical distribution of the answers) that the students had used guesswork on the words without any meaning. This was a confirmation of Sheldrake's theory of the morphogenetic field, or what I described as the "word soul."

I believe it's this word *soul*, this vibrational information, that the water reads and tunes in to. The results of this tuning in are then visible in the different water crystals. Actually, we can see the pattern of vibration of the specific word soul, and it feels to me as if a window opens up and we can get a glimpse of the universe.

THE POWER OF THE WORD SOUL

When we're thinking a thought and give it energy by imagining it as real or speaking it, we're storing the pattern of vibration in the water of our bodies, and it shows as the corresponding vibration all around us and further out, beyond our physical selves. In this way, we influence our surroundings and others react to it, so we receive the appropriate feedback that again reinforces both our vibrations and the morphogenetic field. This shows how important it is to think and speak with purity of intent.

My esteemed teacher Dr. Nobuo Shioya made me aware of this a long time ago; and now, thanks to the water-crystal images, we can actually see it in solid form. In his book, *Der Jungbrunnen des Dr. Shioya (Dr. Shioya's Fountain of Youth)*, Dr. Shioya describes the three "correct states of mind" that can help each of us live a happier life. Although very ill from birth, he developed a breathing technique that he combined with visualization. This method of "creative power thoughts and correct breathing" made it possible for him to live a healthier and longer life. From his 60th birthday onward,

he really started to rejuvenate. For example, he won a golf tournament at the venerable age of 100 years.

The healing hands of the mother: This powerful crystal shows a slight pink coloring. Pink is assigned to love and the energy of friendliness, which comes from the heart. It's also said that this color helps activate the life energy.

Giving birth: This picture shows that giving birth is more than simply delivering a baby. It feels as if a decision has been made to weave its own pattern of life. This picture shows a dynamic, developing movement.

DR. SHIOYA'S THREE GOLDEN RULES

Dr. Shioya's three correct states of mind are fundamental attitudes that are easy to adopt and can bring about an enormous change in our everyday life. Their meaning and use will become even more apparent in the light of our knowledge about the power of the word soul.

Dr. Nobu Shioya: With the help of his simple method of “creative power of the thoughts and the right way of breathing,” it’s possible to rejuvenate the body and mind.

1. *Be positive.* It’s proven that positive thoughts influence our physical health. For example, they can strengthen the immune system. This state of mind isn’t an instruction to lead a “better” life (in a religious or moral sense), but a powerful aid to maintaining good health in both body and mind. By having a positive attitude and being open to all situations, we’re prepared to recognize opportunities and take them. This has nothing to do with superficial politeness or trite “seeing life through rose-tinted glasses”—quite the opposite, actually. Instead of focusing just on the negative, we look at *both sides* of the proverbial coin. By doing so, we learn to recognize the possibilities available to us.
2. *Don’t forget to say thank you.* Gratitude can be a core feeling, and it’s important to always remind ourselves of it. Awareness generates

energy. If we're consciously grateful, we send out corresponding vibrations and attract similar vibrations. This means that we'll find ourselves in more and more situations where we have a good reason to give thanks. Anyone who lacks this basic attitude should turn their attention to things they can be grateful for, however small they are. Some people might claim that there's absolutely nothing in their lives that falls into this category, but actually we can give thanks that we are alive every day.

3. *Don't nag*. If we find fault with everything instead of being grateful, these thoughts and feelings become vibrations that are sent out and in turn attract situations that will lead to more nagging. Thoughts such as *I'm in trouble, I don't like this, I can't do it, This is hard, or This is laborious* will attract difficult, unpleasant, hard, and laborious situations.

The water-crystal images show us the effect on water of, for example, the word *fool* or a phrase like "We have done this really well." The same vibration is created when we say to somebody, "You are a fool." This isn't just a statement per se; by uttering the words we create, or rather reinforce, the negative vibration, and thus the very pattern of behavior. These disharmonic patterns of vibration are "stamped" on water in general and on the bodily waters of the person in question.

This is the effect of the word *fool*. Water can't form a crystal structure if words are hurtful and belittling.

The main reason why I always argue that we should praise our children (and friends and colleagues) is because we thereby reinforce their positive qualities. I'm certain that we'd all benefit from this kind of consciousness in speech and thought, especially as words and thoughts that are aimed at somebody else always have an impact on us first. If I were to give out the word *fool* into the world, my own system would be filled with this vibration first and would come into step with its disharmonic content.

The time-honored principle "Do unto others as you would have them do unto you" acquires a completely new meaning in the light of the theory of the morphogenetic field. Even the most self-centered person has the ability to speak, act, and think considerately—and should do so, because it should be clear by now that we are responsible for what happens to us.

Another mental habit that hinders self-development is the practice of running ourselves down, both verbally and internally. Every one of us has the ability (and perhaps I should also say the *duty* to ourselves) to speak and act in such a way that nurtures, rather than poisons, our microcosm. I'm always saddened by the realization that so many people invest so much of their inner energy running themselves down both verbally and internally, just because something didn't happen in the way that they'd hoped. By doing this we don't create the flow of positive energy that can help us learn from our mistakes. If we look at water crystals, the message is clear: We poison ourselves with all this negative chatter.

The time is now ripe to put this realization into practice and break the habit of a lifetime. It's not my intention to preach here: Water itself speaks a distinct and clear language. Life isn't really that complicated, and we all carry that knowledge inside ourselves; we just have to rediscover it. The pictures of the water crystals can help us in the search for our own truth. They can guide us.

THE NEW HEALING POWER: THE DIALOGUE WITH WATER

The healing power of water and its ability to carry information has been known for centuries, and many therapies have been based on this knowledge. What's new is that these "hidden" properties can now be made visible. The information carried by the water can be seen as a picture, and this changes our view of it from a mere chemical molecule into a living creature.

In former times there was nothing unusual in holding conversations with nature and nature spirits, even in the Western world. Nowadays, our increasingly mechanistic view of things prevents us from acknowledging these organic perceptions, even if they come into our consciousness. Nothing can be what it's not allowed to be.

The water-crystal images act as mediators between those of us who are still caught in this mechanistic view of the world and the holographic reality. By "holographic" I mean that you can see the whole of the picture in every part. The images of the water crystals are ambassadors, giving us an insight into the real connections of the universe.

People want to feel safe—that's why a clear philosophy of the life of the world was developed. A new age has now come into being. We can no longer close ourselves to a broader philosophy of life, and we can now find that longed-for safety at a higher level. If we learn how to tune in to this elevated vibration, we can become one with it.

Water is a very honest mirror. The pictures of the water crystals show clearly the effects that different environmental factors have on living systems. But what these images show as well is that we're not helplessly exposed to these negative influences. Through love and gratitude, we have the ability to improve our world. By thinking and feeling "love and gratitude," we can actively put a healing process into motion.

When we look at the water-crystal pictures of negative ideas, the numinous fear that most of us feel disappears. Instead, we empathize with the malformed water. It didn't choose to suffer in such a manner. In this way, a new state of mind comes into being inside us. We want to do something good for the water and, consequently, for ourselves. We're not at war anymore with the pollution of negativity. Conflict just produces more harmful energy, which in turn gives rise to more adversity. We don't want to close our eyes to the negative—on the contrary, we're visually and

intellectually aware of it—but we use love and gratitude to transform it in a positive way.

From this it follows that we have the ability to take an active part in the creation of our world. This realization gives us not only power but also responsibility. We are no longer helpless “playthings.” What kind of existence do we want to create? What do we want to put into being? *Each* of us is called on to answer this basic question in thought, word, and deed. If I yearn for peace but nag and scold and condemn all the time, then how can my dream come into being, either in myself or anywhere else?

The pictures of the water crystals stimulate our imagination. We’re so controlled by the left side of our brain, but images affect the right side, and many have the effect of mandalas. I would have preferred to show only beautiful photos, but I thought it was also important to give the left part of the brain some good stuff to ponder, and therefore to question old thinking patterns. In this way the pictures of the water crystals have an effect on our whole mental structure. Simply reading something is one-sided, as is just looking at pictures. It’s only from the combination of both that new realizations can grow and be put into practice in our everyday lives. These images carry a message that reaches us at the mental, soul, and physical levels through the water in our bodies that vibrates in harmony with them.

Like children going through the “Why?” phase of development, we, too, can ask water everything that’s important to us. In this way we can gain an insight into reality as it truly is. Water is a messenger— it brings us information about the world and the universe.

LIFE IS MOVEMENT

Ancient wisdom shows itself clearly in the crystals. Water from a free-flowing river creates incredibly beautiful shapes. If we examine the formations from the stagnating area of a dam, we don’t find any crystal structures—the pictures here are similar to looking through a hole dug in a swamp. By not being allowed to flow, water loses its vitality, its charisma. It’s cut off from the river of life. And the same applies to us as human

beings: It's vital for us, too, to move with the universal current. Each stagnation brings a dying off.

We know this at a physical level. For example, when the blood becomes too thick and clots form in our arteries and veins, the risk of a heart attack or stroke increases. We know this at an emotional level, too. If a person is holding on to a feeling—say, grief—he or she will one day stiffen with the pain. The same happens mentally, as there are those who become rigid with fear, dogma, and prejudice. The water crystals show us very clearly how we should live—what's good for the water in nature is also good for that element in our bodies. Being in constant motion at all levels contributes significantly to our well-being.

By doing this, we're not only helping ourselves, but also water in general. By giving the water in our bodies the necessary attention, we honor the water of Earth, too, because everything is connected. We're aquatic beings, and I can't stress enough the importance of becoming aware of it. The consequence should be that we treat the gift of the universe respectfully and attentively and honor its wisdom.

OFFERING LOVE AND GRATITUDE TO WATER

I firmly believe that it's our duty as human beings to contribute to the healing of the earth and its waters. For many of us this has been a need for a long time. Now we know that together we can make big things happen, as the law of the hundredth monkey teaches us.

One of the most important messages that we receive from the water crystals is that each of our thoughts, words, and actions represents information that we send out. Our consciousness has a real influence on water, which becomes particularly powerful when many of us become one and aim for the same goal. In this lies the power of joint prayer. Let's use this energy to give love and gratitude to water.

Let's declare July 25 of each year a "World Day of Love and Thanks to Water." We'll start this event with a ceremony to send out our feelings to the life-giving liquid and in this way gradually raise our consciousness. Take part in it on your own or with others, and direct your thoughts and

prayers to water. Every single person counts; each loving word matters. All drops that are treated with love and respect carry those vibrations out into the world.

To increase the power of the message, I suggest sending out the vibrations three times during the day, say at 7 A.M., 1 P.M., and 7 P.M. (your local time). Please direct love and thanks to water at one or all of these times and pass this information on to all those who are interested.

How you arrange the ceremony is completely up to you. You can say prayers from your own religion, or you can do a visualization. I, for instance, imagine silver/golden light filling water and the earth and flowing out of the heart of each and every person.

In addition to this World Day of Love and Thanks to Water, let's send out our affection and gratitude at the same times on the 25th of each month. By doing so, you're also benefitting yourself: You're lifting your own vibration. And by thanking the water that, for example, runs over your hands while you're washing up, you're appreciating the same substance in your body, in your cells. In that way you're contributing actively to your own well-being.

The health of each and every person is one of my most heartfelt wishes. But an even more important desire is for healing the natural world, Earth, and humanity as a whole. My dream is one of world peace, and I know that I'm not alone in this.

NOTES

1. The morphogenetic field, or morphic resonance, is a name given to a form of action at a distance proposed by Rupert Sheldrake. However, the idea that vision is a two-way process has been held by a great many minds in the past. The theory states that things of the same “form” tend to “resonate” with each other, so that, for example:

When crystals of a newly synthesized chemical substance, for example a new kind of drug, arise for the first time they have no exact precedent, but as the same compound is crystallized again and again, the crystals should tend to form more readily all over the world, just because they

have already formed somewhere else. (Rupert Sheldrake, *The Presence of the Past*, HarperCollins, 1988)

This concept defies, among other things, the theory of special relativity—all crystals, all over the universe, regardless of distance in space/time, will be affected.

The theory of the morphogenetic field, first conceptualized by developmental biologists (beginning in the mid-1980s), seems to be accumulating evidence that it's closely linked to the quantum gravitational field:

- A. The field pervades all space.
- B. The field interacts with all matter and energy, irrespective of whether or not that matter/energy is magnetically charged.
- C. And, most significantly, the field is what's known mathematically as a “symmetric second-rank tensor.”

All three properties are characteristic of gravity, and it was proven some years ago that the only self-consistent nonlinear theory of a symmetric second-rank tensor field is, at least at low energies, precisely Einstein's general relativity. Thus, if the evidence for A, B, and C becomes validated, we can infer that the morphogenetic field is the quantum counterpart of Einstein's gravitational field.

2. See the Website www.co-intelligence.org/P-moreonmorphgenicflds.html for more information on Gary Schwartz's experiment with Hebrew words.

PART I

SCIENTIFIC PERSPECTIVES

INTRODUCTION

Anyone who can remember their science lessons—whether in chemistry, physics, or biology—may recall that water was largely ignored or taken for granted as an inert, simple substance with the formula H_2O . Of course it had a few other properties, such as a boiling point of $100^{\circ}C$, and a unique way of expanding and contracting as it froze and unfroze. We knew it as central, not only to all life on Earth, but also to the planet's many geological processes. The unspoken message was: *That's just the way things are—no need to ask why!*

In recent years, a few brave scientists, risking ridicule and ruin, have been pioneers in discovering a whole new world with respect to the properties of water. Among the first of these was the French immunologist Jacques Benveniste, who attempted to prove that water had memory and could retain information about complex chemicals, even if there was no trace left of them. This was seen as scientific heresy, and for his trouble, Benveniste was dismissed from his job, and his laboratory was closed down. He died in 2004, but his conclusions proved so intriguing that many claim to have successfully repeated his experiments.

Other scientists followed in his footsteps, and some of the most distinguished of these have contributed to this book. In most cases, the authors have done much to simplify technical papers so that lay readers can follow them, and it's well worth a little extra time and effort to digest the contents. Having done so, you, the reader, will see something amazing—the beginnings of a whole new understanding of the world and life on it, going far beyond the limitations of the current materialist scientific era. In this new vision, thought and consciousness profoundly affect not only the structure of water, but also many other substances, even playing a critical role in the way DNA decodes itself in new life. We stand at the dawn of a new era, one that will profoundly change not only science, but also our spirituality, and indeed our whole culture.

I'm profoundly honored that my own books have been able to reach out to a wider readership around the world, demonstrating the power of thought, prayer, and intention to change water for the benefit of us all.

— **Masaru Emoto**

CHAPTER 1

PSYCHOENERGETIC SCIENCE: EXPANDING TODAY'S SCIENCE TO INCLUDE HUMAN CONSCIOUSNESS

by William A. Tiller, Ph.D.

Psychoenergetic science is an expansion of today's conventional science, which for 400 years has dealt with the following metaphorical reaction equation:

Psychoenergetic science deals with this expanded reaction equation:

Experience shows that human consciousness readily manipulates **information** of all kinds (numbers to sums, language letters to make words and sentences, jigsaw-puzzle pieces to make maps and pictures, and symbols to make equations) to produce order out of disorder([1-5](#)). From our psychoenergetics research, which is outlined in the first part of this article, we have discovered a second, unique level of physical reality that is quite different from our normal electric atom/molecule level. This new level functions in the physical vacuum within the “empty” space between the fundamental particles that make up atoms and molecules. The stuff of this physical vacuum consists of magnetic information waves; and we've observed that the physics of this new level is modulatable by the human mind, intentions, and consciousness in general.

About eight years ago, we discovered a reliable, repeatable procedure for lifting the electromagnetic symmetry state of a room or other large space higher than that of our normal atom/molecule level to one wherein commercial instrument measurements became capable of accessing these two unique levels of physical reality. In addition, this procedure allowed us to tune this large space so that a specific intention could be manifested in that place via the physics of this vacuum level of physical reality. From our research, we have found that a specific material property consists of two parts: one from the electric atom/molecule level of physical reality (which is all our normal world can presently measure), and one from the magnetic information wave level of physical reality. The instrumentally accessed magnitude of this second contribution depends on the magnitude of a special coupling coefficient material connecting these two levels. This coupling coefficient can be of negligible magnitude, as in our normal level of physical reality, or, via utilizing the aforementioned intention procedure, can be caused to be of large magnitude. We have utilized this new procedure to:

1. Substantially change the pH of the same type of water in equilibrium with air either up or down by one full pH unit (~100 times our measurement accuracy)
2. Increase by ~25% ($p < 0.001$) the in vitro thermodynamic activity of a specific human liver enzyme, alkaline phosphatase
3. Increase by ~20% ($p < 0.001$) the in vivo [ATP]/[ADP] ratio in the cells of fruit-fly larvae so that they would be fitter and have a much shorter (~20% at $p < 0.001$) development time to the adult fly stage; here, ATP is the energy storage molecule in all cells while ADP is its chemical precursor

In addition to the foregoing, we've discovered that humans, and perhaps all vertebrates, have their acupuncture meridian/ chakra system at this higher electromagnetic symmetry state, so humans have the basic capability to do what our intention-device does—though perhaps not to such a significant degree unless they're at a master or avatar level of self-

development. We hoped to be able to convert our detection device into a stand-alone engineered system for use as an individual or group biofeedback device to enhance individual (or group) self-development to higher and higher levels of inner self-management.

Finally, in the second part of this article, I provide a brief theoretical overview of what controls ice-crystal shape during the freezing of water, both without and with the application of human intention.

PART I: KEY BACKGROUND EXPERIMENTAL DATA

References 7 to 9 cover my psychoenergetics research books over the past 35 years. In the first contribution,⁷ the work clearly showed that human consciousness could enhance the radiation spectra of the human biofield sufficiently to have a robust impact on a wide variety of physical processes. Table 1 provides a summary of these key experimental findings. The second contribution⁸ covers the period from 1997 to 2001, and Table 2 provides a summary of our key experimental findings during that period.

TABLE 1: SUMMARY OF KEY EXPERIMENTAL FINDINGS FROM “SCIENCE AND HUMAN TRANSFORMATION”

1. A highly developed human biofield can alter the properties of materials and the functioning of devices so as to reveal deeper levels of nature not anticipated from our normal, everyday observations. The radiations from such levels of nature pass through materials that are optically opaque to EM radiations in the visible range.
2. Non-EM emissions from the biofields of normal humans, when modulated by their attention and directed intention, can enhance or not enhance electron microavalanches in a simple gas discharge device, depending upon the actual focus of the humans’ intention.
3. Some humans emit bursts of subtle energy from various body chakras; and via a subtle energy/electrical energy conversion process

involving the acupuncture meridian system, large voltage pulses appear both on the body and at sites remote from the body.

4. When focusing on the heart with loving intent, the human EKG becomes harmonic at the baroreflex frequency, 0.14 hertz, where the heart entrains the brain, and simultaneously all the other major electrophysiological systems of the body. In this heart-entrainment mode of functioning, body-chemical production becomes healthier, and focused intent can psychokinetically influence molecular structures both inside and outside the body.
5. Most young children perceive both EM and subtle energies. Lens and prism experiments indicate that the latter travel at velocities, $v > c$, the EM light velocity, and speed up on entering denser matter.
6. Dowsing is a natural human body response mechanism for those who give it meaning, wherein the unconscious communicates valuable information to the conscious via involuntary small muscle movements or the creation of localized heat patterns.

TABLE 2: SUMMARY OF KEY EXPERIMENTAL FINDINGS FROM “CONSCIOUS ACTS OF CREATION”

1. Human consciousness, in the form of a specific intention, can be imprinted into a simple, low-tech electronic device from a deep meditative state by highly inner self-managed humans. Such a device, now called an IIED (intention imprinted electrical device), can act as an effective surrogate to robustly influence a unique target experiment in physical reality.
2. The four unique target experiments studied involved (a) an inorganic material (water) with property changes 100 times larger than measurement accuracy, (b) an organic in vitro material with property changes of $\sim 20\%$ at $p < 0.001$, and (c) a living in vivo material with property changes of $\sim 20\%$ at $p < 0.001$, both of the latter having a built-in control.

3. A unique intelligence was present in an IIED after imprinting so that the measured material property changes were (a) always in the direction of the IIED's intention imprint and (b) always specific to the particular IIED utilized.
4. An unshielded IIED in the electrically "off" state, and physically separated from a UED (unimprinted electrical device) in the electrically "off" state by ~100 meters, still has a communication channel available to it for transferring the imprint statement to the UED within a week. Thus, the carrier for such information exchange is not conventional electromagnetism.
5. This new field, although not EM, can be dissipated through EM-leakage pathways. Thus, wrapping an IIED in aluminum foil and storing it in an electrically grounded Faraday cage prolongs its lifetime of effective use (~3 months before reimprinting is required).
6. Placing a specific IIED in a room and turning it on "conditions" the room to a state wherein Item 2 in this table naturally manifests. Without the presence of this "conditioned" state in the room housing the target experiment equipment, these material property changes don't occur.
7. One characteristic of a "conditioned" space is that a DC magnetic field polarity effect on the pH of water occurs. Such an effect is thought to require the accessing of magnetic monopoles, a property usually associated with a higher EM gauge symmetry state than our normal, everyday reality. Such a higher EM gauge symmetry state is also a higher thermodynamic free energy per unit volume state.
8. Another characteristic of a "conditioned" space is the spontaneous appearance of material property oscillations of very large amplitude (air and water temperature, pH, electrical conductivity of water, etc.) that are (a) global throughout the room, (b) all exhibit the same Fourier spectral components, and (c) all are in the frequency range $\sim 10^{-2}$ to 10^{-3} hertz.

9. A third important characteristic of a “conditioned” space is that it’s sensitive to the presence of an active IIED at separation distances of at least ~150 feet. Oscillations generated in the locale of the IIED spontaneously appear (at high correlation coefficient) in a “conditioned” space but not in an unconditioned space.
10. If the degree of “conditioning” in a space is low and the IIED is removed from the space, the “conditioning” decays slowly with a time constant of ~1 month. If the degree of “conditioning” in a space is sufficiently high, the IIED can be completely removed from the space and stored properly and the level of “conditioning” in the room doesn’t appear to change (at least for 1–2 years).
11. The cause of the air temperature oscillations in a “conditioned” space near an apparent source was shown not to depend upon movements of the air molecules in the space, but rather thought to depend on changes at the vacuum level of physical reality.
12. Removal of the apparent air temperature oscillation source revealed that this vacuum level “phantom” source had a very slow relaxation time (~1–2 months) back to zero amplitude.
13. While in the phantom temperature oscillation source mode of reality, abrupt changes in the orientation of a large natural quartz crystal placed in the initial source region showed abrupt changes in overall oscillation wave shape, amplitude, and frequency. Thus, a quartz crystal appears to be a type of “tuner” for this vacuum-source behavior.
14. In a “conditioned” space, spontaneous and abrupt shifts in computer monitoring behavior of a random number generator (RNG) occurred from time to time for no apparent reason.
15. Experimenter effect, specific materials effects, and specific device effects appeared, in the short term, to alter the “tuning” of the oscillations in a conditioned space.

This particular body of work showed that human consciousness, in the form of a specific and detailed intention, could be imprinted into a very simple electronic device from a deep meditative state and then this processed device (now called an IIED, intention imprinted electrical device) could act as a surrogate for the specific intention and thereafter robustly influence a specifically designed target experiment in full accord with the intention imprinted therein. Figure 1 illustrates the general behavior for four distinctly different target experiments.

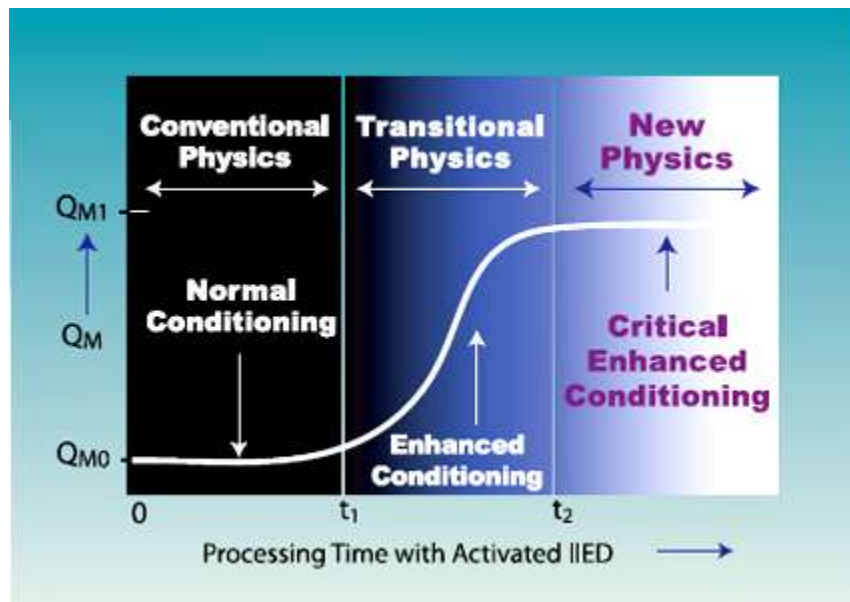

Figure 1: Q_M (some generalized physical measurement) vs. IIED processing time (length of time a space experiences a process leading to enhanced coupling)

Surprisingly, it was found that placing this IIED ~100 meters from a physically identical but unimprinted device, with both in the electrically switched-off state, didn't inhibit transfer of the specific intention imprint from the IIED to the unimprinted device within less than a week. This implies that a new information channel, other than conventional Maxwellian electromagnetism (EM), is present in nature for such an information change to occur. This new information carrier appears to be one that's modulatable by human intent. The basic process of electrically turning on an IIED in a given laboratory space causes this space to be "IIED-conditioned" in such a way as to allow the instrumentation present in that space to access another level of physical reality after an ~3 month

period of such space conditioning. The particular material property targeted by the specific intention imbedded in the device varies over time according to Figure 1 and the following equation:

$$Q_M = Q_{P1} + \infty_{\text{eff}} Q_{P2} \quad (2)$$

In Equation 2, Q_M is the total instrumentally measured value of the property, Q_{P1} is the normal value, Q_{M0} , in Figure 1, Q_{P2} is the expectation value for this second level of physical reality while ∞_{eff} is the coupling coefficient between these two unique levels of physical reality. Relative to Figure 1, $\infty_{\text{eff}} Q_{P2}$ is $(Q_{M1} - Q_{M0})$, the intention magnitude of property change imprinted into the particular IIED. A fully IIED-conditioned laboratory has been observed to exhibit several characteristic signatures:

1. $Q_{P2}(t)$ is responsive to the polarity of a DC magnetic field placed close to the pH-measuring instruments; i.e., Q_{P2} (north-pole up) – Q_{P2} (south pole up) $\neq 0$ as it should for our normal reality (Q_{P1}) because there only magnetic dipoles are present. To yield such an experimental result, magnetic monopoles must also be present and instrumentally accessible.
2. Temporal material property oscillations of very large magnitude appear for $\text{pH}(t)$, $\sigma(t)$, $T_W(t)$, and $T_A(t)$, (where σ = electrical conductivity, T_W is water temperature and T_A is air temperature) are (a) global throughout the room, (b) all exhibit the same Fourier spectral components, and (c) all components are in the frequency range $\sim 10^{-2}$ to 10^{-3} hertz.
3. The $T_A(t)$ oscillations (magnitude $\sim 3^\circ\text{C}$) were shown, via a forced convection experiment, not to be due to any natural convection process in the room's air and remained for weeks to months after the supposed source of the oscillations had been removed from the experimental space.

4. For these phantom $T_A(t)$ oscillations, it was observed that when a large natural quartz crystal was placed with its c-axis pointing upwards in the initial “source” location, it just increased the $T_A(t)$ amplitude slightly and sharpened the spatial $T_A(t)$ profile somewhat. However, when the crystal was rotated 90° so that its c-axis was in the horizontal plane and aligned with the row of thermistors, there was an immediate inversion of the wave shape with reduction of the wave amplitude by a factor of $\sim 2-3$ and an increase of the wave frequency by a factor of $\sim 3-5$.

From these four main experimental observations, it was deduced that such phenomena weren't associated with the electric atom/molecule level of physical reality, but rather the coarse physical vacuum level of reality; i.e., from within the space unoccupied by the nucleons making up the atoms and molecules. Further, it was deduced that magnetic monopoles were intimately involved with the material nature of this coarse physical vacuum level of reality.

Reference 9 was our third major psychoenergetics contribution, and its contents cover the period ~ 2001 through 2004. Table 3 provides a summary of the key experimental findings collected in reference 9. This work largely focused on replication by others of the $\Delta\text{pH} = +1$ units experiments at several laboratories in the U.S. and Europe. Initially, three laboratories (Payson, Missouri, and Kansas) with such IIEDs were utilized; and each had a control site, containing identical pH-measurement equipment plus a UED (no IIED), located within ~ 2 to 20 miles of the IIED site. This experimental replication of the original Minnesota results³ was successfully achieved. At these three sites $\Delta\text{pH}(t)$ grew exponentially with time to levels significantly above the normal theoretical value. However, at their control sites, the same type of behavior occurred, indicating that a macroscopic, room temperature information entanglement process occurred between the IIED sites and their UED sites.

Next, the Baltimore and Bethesda sites were initially used as control sites for the three IIED sites; and within ~ 2 months, the same large increase in ΔpH with exponential time-dependence for $\text{pH}(t)$ occurred at these sites. Finally, the U.K. and Milan site (three months later) were initially used as

control sites for the system; and within three weeks for the U.K. site and one week for the Milan site, $\text{pH}(t)$ was exponentially increasing with time and ΔpH reached ~ 1 pH units. Now the information entanglement process between sites had been proven to reach $\sim 6,000$ miles.

TABLE 3: SUMMARY OF KEY EXPERIMENTAL FINDINGS FROM SOME SCIENCE ADVENTURES WITH REAL MAGIC

1. The original Minnesota water pH results have been substantially replicated by others.
2. At all remote IIED sites, the digitally recorded pH for purified water in equilibrium with air increased exponentially with time, with the ΔpH increasing cycle by cycle of water change until it reached ~ 1.0 pH units.
3. At all control sites (non-IIED sites), the same type of pH-behavior was observed via an information entanglement process except that (1) for below-ground sites, ΔpH achieved ~ 1.7 pH units and (2) for well-above-ground sites, ΔpH achieved only ~ 0.8 pH units.
4. This information entanglement process between IIED and non-IIED control sites of the overall experimental system occurred over distances from ~ 2 miles to $\sim 6,000$ miles. The carrier wave for this information transfer couldn't have been electromagnetic.
5. A litmus paper pH-detector only responded to the purely chemical level of the H^+ content present in the water, while digital pH-detectors responded to both this level plus an information level associated with the H^+ content.
6. All sites, both IIED and non-IIED, exhibited substantial values of $\Delta\Psi'_{\text{H}^+} = \Psi'_{\text{H}} - \eta_{\text{H}^+}$ after a short time, indicating a raised thermodynamic-free energy per unit volume for all sites.
7. The time required to reach $\Delta\text{pH} \sim 1.0$ pH units appears to be less for below-ground control sites than for aboveground control sites and

also appears to be relatively independent of distance.

8. Strong experimenter and equipment potentization effects were noted.
9. The optimum reimprinting time for an IIED presently appears to be ~3 months.
10. Mu-metal screening does not shield water from this new information entanglement field.
11. For humans, and perhaps all vertebrates, bioelectromagnetism is quite different from Maxwellian electromagnetism, because the human acupuncture meridian system is observed to be at an EM gauge symmetry level where magnetic monopole charge is experimentally accessible.
12. A laboratory space and equipment raised to an EM gauge symmetry state wherein magnetic monopole currents are experimentally accessible is found to be a very sensitive detector of subtle energy emissions by humans (subtle energies are defined as all those beyond the energy aspects of the accepted four fundamental forces).
13. Large bursts of subtle energy emissions during healing steps in humans located in a “conditioned” laboratory act analogously to earthquakes with reverberating aftershocks that last for a long time. Thus, the detailed character of the laboratory’s energy signature is significantly altered for a long time (greater than three months).

For those remote sites at ground level, the experimental data yielded $\Delta\text{pH}_\infty = +1$ pH unit; for those remote sites located three stories above ground level, only $\Delta\text{pH} = +0.8$ pH units occurred; and for those remote sites below ground level (in a basement), $\Delta\text{pH} = +1.7$ pH units occurred. Whatever this new type of energy is, it prefers to travel through the ground rather than through the air, in opposition to EM energy, which prefers to travel through the air.

During this replication experiment, we discovered both a theoretical and an experimental procedure for measuring $Q_{p2}(t)$ in Equation 2 for the hydrated proton and labeled it the magnetic monopole contribution to the magnetoelectrochemical potential energy for the hydrated proton $\Delta\Psi'_{H^+}$.⁴ Continuous values for this magnetic monopole contribution were determined for all sites, IIED and control, in the overall experimental system with initial magnitudes in the $\sim\pm 5$ me V to ± 40 me V range. By mid-2005, some of these values had grown to the ~ 80 me V range.

Finally, to close out this section, simple physical chemistry instruments located in an IIED-conditioned laboratory appear to be very sensitive detectors of biofield emissions from humans; and via kinesiological testing, various muscle groups were all shown to exhibit DC magnetic field polarity effects. This indicates that in all humans, and probably in all vertebrates, the acupuncture meridian/chakra system is at a significantly higher EM gauge symmetry level than the rest of the body. This means that human bioelectromagnetism is different from Maxwellian EM. This also means that the human mind can modulate this higher EM gauge state carrier wave, which is probably what is presently called Qi (Chi), and this in turn can thermodynamically drive all varieties of processes at the electric atom/molecule level of the physical body.

THEORETICAL MODELING

The current formal description of quantum mechanics (QM) is completely inadequate to account for any psychoenergetic phenomenon.⁹ However, if one assumes the simultaneous existence of particle and wave properties for physical matter, all QM phenomena can be quantitatively calculated and yield good agreement with experiment. Simultaneous QM and relativistic behavior calculations for the de Broglie particle/pilot wave concept yield the following¹⁰:

$$v_p v_w = c^2 \quad (3)$$

Here, v_p = the particle velocity, v_w is the velocity of the wave components making up the total pilot wave, and c is the velocity of

electromagnetic (EM) light. Since relativity theory requires that $v_p < c$, always, Equation 3 requires that $v_w > c$ always. In order to avoid complications with relativity theory, these superluminal velocity wave components were dubbed “information waves” because it was thought that such waves could not transport energy. However, Equation 1b and the surrounding discussion indicate that this isn’t correct. Adding item 7 of Table 2, we’ve labeled these waves as “magnetic information waves,” which leads to the conundrum of how slower-than-light electric particles can interact with faster-than-light magnetic information waves to create the particle/pilot wave entity, a major cornerstone of QM. My resolution to this conundrum has been to postulate the existence of a substance called deltrons, from a domain beyond spacetime, that can travel both more slowly and more quickly than c . The slower-than- c portion of the deltron spectrum can interact with the electric particles while the faster-than- c portion of the deltron spectrum can interact with the magnetic information waves. This situation is illustrated in Figure 2, where one sees that meaningful interaction can occur across the light barrier via deltron-deltron interactions.

Figure 2: Illustration of deltron sheaths around both $v < c$ and $v > c$ moieties. Deltron-deltron interaction produces the coupling between such moieties.

Thus, the simplest component in physical reality is the electric particle/deltron/magnetic information wave complex. This is proposed to be the basic building block for all physical substances. The proposed new RF for meaningfully viewing such substances is (1) a duplex RF consisting of two reciprocal four-dimensional subspaces (one of which is spacetime) that is (2) embedded in the three higher dimensional domains of emotion (9D), mind (10D), and spirit (11D and above). Two illustrative representations of this new multidimensional RF are presented in Figures 3 and 4. The deltrons of the revisited de Broglie particle/pilot wave concept are proposed to be a natural moiety of the emotion domain, and they also constitute the coupler substance between the two levels P₁ and P₂ of physical reality.

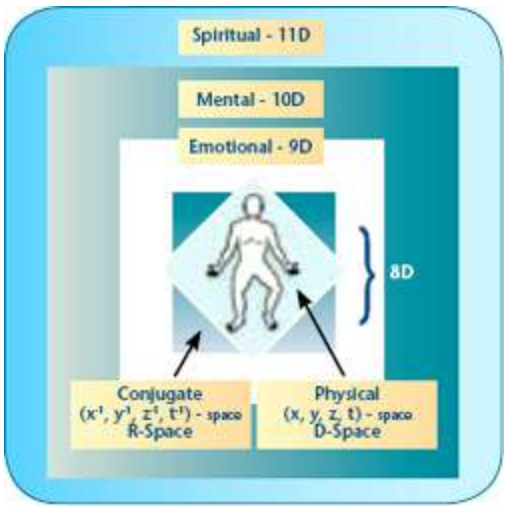

Figure 3: A structural representation of our RF with the duplex space in the center. Counting the duplex space as a unique member of the general 8-space, our RF is eleven-dimensional.

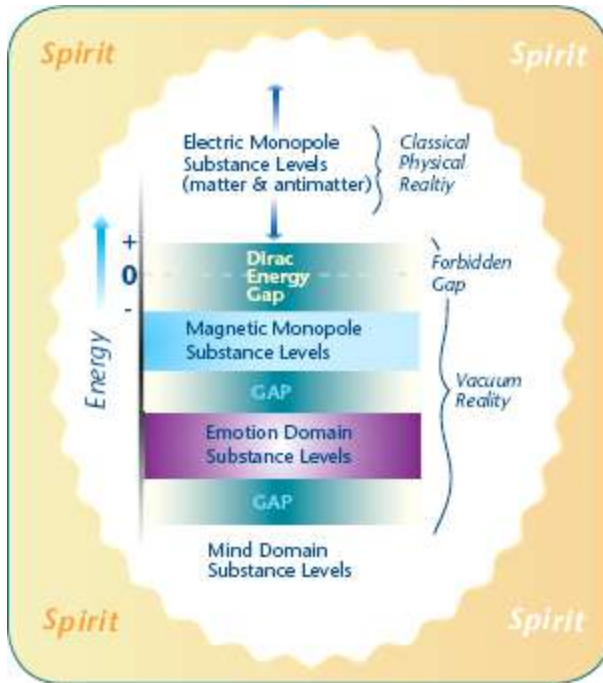

Figure 4: An energy-level diagram embracing both classical physical substances and “unseen” vacuum substances.

Using this proposed multidimensional RF, Figure 5 is the proposed mechanism for explaining how an IIED both (1) conditions a space so that ∞_{eff} in Equation 1, is of a significant magnitude and (2) tunes the space so that a specific material property of Level P₂ changes in magnitude to conform to the specific intention.

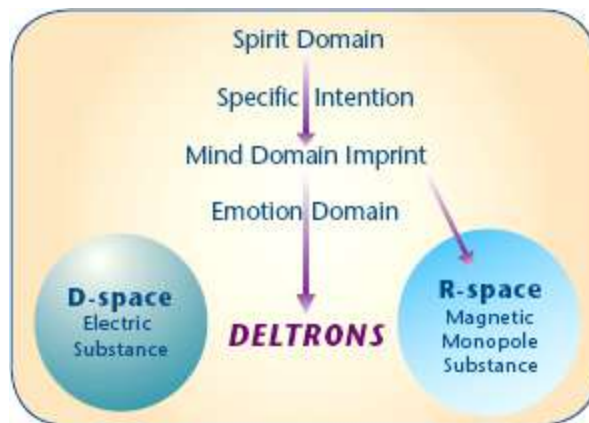

Figure 5: An intention imprint from the domain of spirit imprints a pattern on the domain of mind which, in turn, via a diffraction process, is thought to both activate deltrons and imprint a conjugate

pattern on reciprocal space. The deltron enhancement couples this intent pattern to drive the atom/molecule processes in this level of physical reality.²

Here, the specific intention is generated at the level of spirit and is imprinted as a specific pattern on the domain of mind which, in turn, via a diffraction process, is proposed to both activate deltrons and imprint a conjugate pattern on reciprocal space. The deltron activation couples this intent pattern to drive the electric atom/molecule processes at the P1 level of physical reality. This has been a very, very brief overview of our recent psychoenergetic science perspective; an order of magnitude of additional material on this subject can be found by perusing references 7 through 9.

PART II: SOME CONVENTIONAL SCIENCE, WITH REGARD TO CRYSTALLIZATION FROM AQUEOUS SOLUTIONS

To illustrate what fields of science and what general knowledge must be brought to bear for a reliable analysis of a crystal growth problem, a brief overview will be given here to indicate what controls a crystal's shape during unconstrained crystallization of water. For a more expanded view, the reader should explore references 11 to 13. For this "overview," we will be satisfied with a phenomenological description of the most important simultaneous processes involved in terms of "lumped" material parameters. Table 4 indicates the different areas of study necessary to be considered with the minimum number of involved materials parameters, macroscopic variables, and system constraints.

TABLE 4: CRYSTALLIZATION VARIABLES AND PARAMETERS

Area of Study	Boundary-value problems	Material parameters	Interface variables	Macroscopic variables	Constraints
Phase equilibria		$\Delta H, T_0, k_0, m_L$		$T_L (C_\infty)$	
Nucleation		$N_0, \Delta T_C$		\dot{t}	
Solute partitioning	Diffusion equation (C)	D_s, D_L, k_i	$C_i, T_i(C_i), V, S$	C_∞	
Fluid motion	Hydrodynamic equation (u)	ν	δ_c	u_∞	C_∞
Excess solid free energy		$\gamma, \Delta S, \Sigma_i \gamma_i^f, \Sigma_i N_i^f$	T_f		\dot{t}
Interface attachment kinetics		μ_1, μ_2	T_i		
Heat transport	Heat equation (T)	$K_s, K_L, \mu_s, \alpha_s$		T_∞	
Interface morphology	Perturbation response & coupling equations				
Defect generation	Stress equation				

ΔH is the latent heat of fusion, T_0 is the melting temperature of solvent, k_0 is the solute distribution coefficient, m_L is the liquidus slope, N_0 is a parameter related to area of nucleation catalyst surface, ΔT_C is a parameter related to potency of nucleation catalyst, k_i is the interface partition coefficient, D is the solute diffusivity, ν is the kinematic viscosity, γ is the solid-to-liquid interfacial energy, ΔS is the entropy of fusion, γ_i^f is the fault energy, N_i^f is the number of faults of type I, μ is a parameter related to interface attachment kinetics, K is the thermal conductivity, and α is the heat diffusivity.

The conventional macroscopic variables that one either sets or controls are (1) the water chemical composition, C_∞ , (2) the water cooling rate, \dot{t} , and (3) the shape of the container holding the fluid. Let us proceed with the process description by stages.

1. As the liquid is being cooled, we need to know the magnitude of the thermodynamic driving force for solid formation ΔG at any bath temperature T . This can be expressed as

$$\Delta G = f_1 [\Delta H, T_L (C_\infty)] \quad (4a)$$

where f_1 refers to the appropriate mathematical functional relationship between the latent heat of fusion, ΔH , and the liquidus temperature $T_L(C_\infty)$. Thus we see that phase equilibria data is one prerequisite. The material parameters needed for this area of study are listed and defined in Table 4.

- As the bath undercooling, ΔT , increases with time, t , we need to know the undercooling at which particles of solid begin to form and also their density. Thus we must evaluate the nucleation frequency I , which can be most simply expressed as

$$I = f_2(N_0, \Delta T_C, \dot{T}, t, C_\infty) \quad (4b)$$

where f_2 represents the appropriate functional relationship, N_0 is the number of atoms in contact with the foreign substrates that catalyzes the nucleation event, and ΔT_C is a parameter that defines the potency of the catalyst (the undercooling at which solid formation is initiated).

- When the crystal illustrated in Figure 6 begins to grow at some velocity V , solute partitioning will occur at the interface since the equilibrium concentration of solute in the solid C_S is different from the concentration in the liquid at the interface.

Left: Illustration of a crystal growing from a super-cooled liquid. *Right:* The important temperatures in a growth process. The magnitudes of the temperature differences indicate the degree of solute diffusion, capillarity, kinetic, or heat transport control.

Thus the concentration of solute in the liquid at the interface C_i must be determined and can be represented by a functional relationship of the form

$$\frac{C_i}{C_\infty} = f_3 (v, k_i, D, \delta_C, S^*, t) \quad (4c)$$

where k_i refers to an interface solute partition coefficient that is generally different from k_0 the phase diagram value, D is the solute diffusion coefficient, δ_C refers to the solute boundary layer thickness at the crystal surface, and S^* refers to the shape of the crystal.

4. In order to evaluate δ_C in Equation 4c, it is necessary to consider the hydrodynamics of the fluid. The fluid will generally exist in some state of motion, whether the driving force is applied by external means or arises naturally due to density variations in the fluid. We can consider the fluid far from the crystal-liquid interface to be moving with some relative stream velocity u_∞ due to the average fluid body forces. The fluid motion will aid in the matter transport of solute away from the crystal into the bulk liquid and cause a lowering of C_i . We find that δ_C can be expressed as

$$\delta_C = f_4 (V, v, D, S^*, u_\infty, t) \quad (4d)$$

where v is the kinematic viscosity of the fluid.

5. The portion of the total undercooling consumed in driving the solute transport ΔT_S is given by:

$$\Delta T_S = T_L(C_\infty) - T_L(C_i) \quad (4e)$$

Because the growing crystal is small in size, has curved surfaces, and often contains nonequilibrium defects, the solid contains a higher free energy than the solid considered in generating a phase diagram that we use as our standard state in the overall treatment. Thus the equilibrium

melting temperature for such a solid is lowered by an amount ΔT_E compared to that for the equilibrium solid. We find that the portion of the total undercooling consumed in the production of nonequilibrium solid ΔT_E can be expressed as

$$\Delta T_E = T_L(C_i) - T_E(C_i) = f_s(\gamma, \Delta S, S^*, \Sigma_i, \gamma_i^f, \Sigma_v, N_i^f) \quad (4f)$$

where $T_E(C_i)$ is the equilibrium interface temperature for interface liquid concentration C_i , γ is the solid-liquid interfacial energy, ΔS is the entropy of fusion, γ_i^f is the fault energy for defects of type i , and N_i^f is the number of type i . (See Figure 7.)

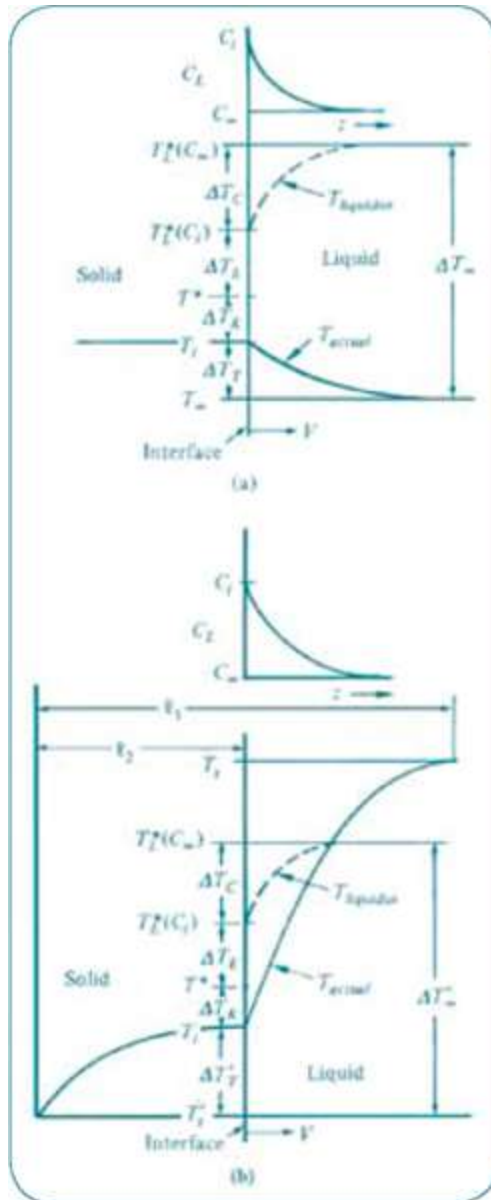

Figure 7: Solute and temperature distributions plus key temperatures for (a) unconstrained crystallization and (b) constrained crystallization.

6. Next, because the crystal is growing, a departure from the equilibrium temperature ΔT_K must exist at the interface in order to produce a net thermodynamic driving force for molecular attachment to the growing solid. At sufficiently large departures from equilibrium, the molecules can attach at any interface site and lower the free energy of the system. However, at small departures from equilibrium, molecular attachment at random interface sites generally leads to an increase in the free

energy of the system; and thus, such interface attachment will not occur as a spontaneous process. Rather, in such an instance molecules become a part of the solid only by attachment at layer edge sites on the interface, and one must consider the various mechanisms of layer generation on the crystal surface. The portion of the total undercooling consumed in driving this interface process ΔT_K can be expressed as

$$\Delta T_K = T_E(C_i) - T_i = f_6(V, \mu_1, \mu_2, S^*, t) \quad (4g)$$

where T_i is the actual interface temperature and where μ_1 and μ_2 are lumped parameters needed to specify the interface attachment kinetics for the various attachment mechanisms.

7. Finally, since the crystal is growing, it must be evolving latent heat and the interface temperature T_i must be sufficiently far above the bath temperature T_∞ to provide the potential for heat dissipation to the bath. That portion of the total undercooling consumed in driving the heat dissipation, ΔT_H can be expressed as

$$\Delta T_H = T_i - T_\infty = f_7(K, \alpha, \Delta H, V, S^*, t) \quad (4h)$$

where K refers to the thermal conductivity and α refers to the thermal diffusivity. The foregoing has been a description of the subdivision of the total bath undercooling, ΔT , into its four component parts, i.e.,

$$\Delta T = \Delta T_S + \Delta T_E + \Delta T_K + \Delta T_H \quad (4i)$$

Equation 4i is called the “coupling equation” and illustrates the fact that these four basic elements of physics enter every crystal growth situation and are intimately coupled through this constraint. However, for different materials, certain components of Equation 4i tend to dominate the phase transformation. In the growth of metal crystals from a relatively pure melt, $\Delta T_H \sim \Delta T$ so that this case is largely controlled by heat flow. During the growth of an oxide crystal from a melt of steel, e.g., $\Delta T_S \sim \Delta T$, so that the growth is largely diffusion-

controlled. During the growth of a polymer crystal from a well-fractionated polymeric melt, $\Delta T_K \sim \Delta T$ and the growth is largely controlled by the kinetics of interface attachment. Finally, during the growth of a lamellar eutectic crystal, $\Delta T_E \sim \Delta T/2$ and the growth is to a large degree controlled by the excess free energy of the solid (due to the formation of α/β phase boundaries).

By considering Figure 8, which is a plot of crystal growth velocity as a function of time, we find that at small times ΔT_E in Equation 4i dominates the crystal's growth and thus plays an overriding role in its initial morphology.

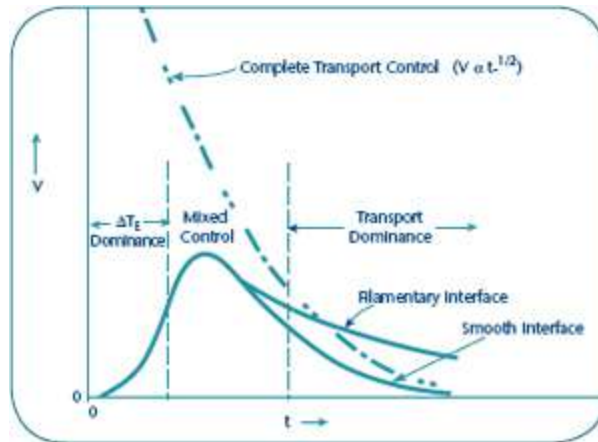

Figure 8: Schematic of particle growth velocity V versus time t , illustrating the regions where various mechanisms are dominant.

At large times ΔT_S and ΔT_H in Equation 4i dominate the crystal's growth and lead to very different morphologies. At intermediate times all four factors play significant roles in the shape adopted by the crystal.

There is little doubt that crystal morphology plays a significant role in the resultant crystal perfection, and that this morphology is largely determined by the subtle interplay of the factors already discussed. However, the prediction of crystal shape with time is a problem that only recently can be solved in any general way. This arises because the problem thus far stated is, in general, not completely specified. Knowing V and S^* , C_i and T_i can

be completely determined in terms of C_∞ and T_∞ , respectively; and ΔT_S , ΔT_E , ΔT_K , and ΔT_H are completely determined in the general mathematical sense. However, we don't know either V or S^* . If $S^*(t)$ is specified, Equation 4i can be used to determine $V(t)$. We are in need of an additional condition to completely specify the problem and thus provide simultaneous prediction of both $V(S)$ and $S^*(t)$.

We shall find that our extra condition is generated by considering the response of the growing crystal to shape perturbations. It can be easily shown that the various elements of the interface will always be subjected to fluctuations in ΔT and in its component ΔT_i 's. Thus, given sufficient time we should always expect that shape distortions will have a finite probability of forming on the crystal surface and that the crystal will evolve to that shape which is most stable in the environment that allows such perturbations. With the addition of our perturbation response equation in the general form

$$V^*(S) = f_g(S^*, \Delta T_S, \Delta T_E, \Delta T_K, \Delta T_H) \quad (4j)$$

the most stable crystal shape, S^* , and the corresponding growth velocity at various points on the crystal surface, V^* , may be evaluated from equations 4i and 4j. From the experimental side of the picture, unconstrained crystallization of water containing various solutes has been well studied via the conventional variables since the late 1950s with cinemaphotography used to see the ice-crystal morphological changes depending on the variable changes invoked. In particular, the entire range of crystal morphologies shown in reference 6 has been observed for constant ΔT and T by adjusting both the concentration and type of added solute and ΔT_C , the undercooling at which the ice-crystal nucleation is initiated. Thus, one can conclude that, in reference 6, one is dealing with the normal crystallization process perturbed perhaps somewhat by the human consciousness invoked.

In the first section of this chapter, our IIED-experiments clearly confirmed robust effects of human intention on various processes of physical reality. Some of this psychoenergetic effect has been shown to be directly correlated with the raising of the thermodynamic free-energy state

of the system when the two unique levels of physical reality, P_1 and P_2 , become significantly coupled together. In addition, a quantitative measure of this change has been demonstrated using an H^+ ion probe.¹⁴ If such a coupled system was generated in the Emoto experiments, then this would alter the thermodynamic driving force, ΔG , up or down for the water-crystallization process; and one could expect significant changes thereby. However, before jumping to such a conclusion, there is an experimental difficulty that first must be resolved.

In the Emoto experimental protocol,⁶ one starts with a cold chamber at $0^\circ\text{C} - \Delta T_\infty$ where ΔT_∞ is presumed to be sufficiently large that most if not all of his water samples are well below their liquidus temperature and thus should eventually freeze. However, one can't be completely sure of this because he doesn't specify C_∞ and the solute type/types. Nevertheless, let us presume that ΔT_∞ is sufficiently large that ΔT_∞ is greater than $\{0^\circ\text{C} - \Delta T_\infty(C_\infty) - \Delta T_c\}$ so his samples will all freeze. Let us suppose that he uses a tray with 25 water-sample holders at room temperature well above 0°C and places them into his cold chamber. The water samples will begin to lose heat to the chamber so they cool at a rate \dot{T} , which slows down with time. At a melt undercooling of ΔT_c , they begin to nucleate ice crystals, probably on the top surface of the water (because the heat transfer rate is greatest there). These small crystals will float, because water expands upon freezing; and the value of N_0 becomes important here in determining the ultimate crystal size and perfection. To determine if there is a significant correlation between ice-crystal morphology and a written intention message pasted on the tray, one would need to see more than 20 of the 25 cups providing the same crystal morphology, and in a repeatable way. If this level of replicability or better isn't achieved, one shouldn't take the result to be a very significant one. As a more refined experiment, one should start with purified water and add a specific solute to a concentration, C_∞ , and let this be the sample water for the written messages. In addition, between uses, the sample tray should be heated to a temperature well above room temperature and vacuum dried so that all previous ice fragments are removed from microscopic crevasses in the tray.

CONCLUSIONS

1. Information is the connecting bridge between energy and all forms of consciousness.
2. Experiments associated with IIED conditioning of laboratory spaces have led to the discovery of a second unique level of physical reality beyond our normal electric atom/molecule level of physical reality.
3. Experiments carried out in an IIED-conditioned space allow digital measuring instruments to gain accessibility to this new magnetic vacuum information wave domain, so that any material property measurement magnitude is now given by Equation 2 of the text.
4. If ∞_{eff} in Equation 2 is negligible, then these two domains of physical reality are uncoupled so the property magnitude is unchanged from that given by standard experimentation in an “unconditioned” space. If ∞_{eff} is of significant magnitude ($\sim 0.1 < \infty_{\text{eff}} < 1$), then applied human consciousness can modulate a physical property magnitude either upwards or downwards relative to that observed for an “unconditioned” space.
5. The human acupuncture meridian/chakra system is experimentally found to be at the same EM symmetry state as an IIED-conditioned space, so focused human intent can either temporarily or continuously increase the magnitude of ∞_{eff} into the significant range.
6. Standard science of crystallization theory for our normal electric atom/molecule level of physical reality shows that all ice-crystal morphologies displayed in the Emoto research have been reproduced earlier by others.
7. For similar research carried out in an IIED-conditioned space, a new, additional, contribution labeled “the magnetoelectrochemical potential contribution” needs to be added to the thermodynamic free-energy driving force, ΔG , for the water-to-ice phase transition, which will, in

turn, alter the form of the dominant ice-crystal morphology observed during this phase transition.

8. This author has not yet seen in the Emoto research clear proof of a strong correlation between a written intention statement and specific ice-crystal morphology result.

CHAPTER 2

THE STRUCTURE OF LIQUID WATER: ITS RELEVANCE TO HOMEOPATHY, ULTRADILUTE SOLS (OR COLLOIDS), AND IMPRINTED WATERS

by Rustum Roy

ABSTRACT

Water is the single most important material for the existence and support of human life and health. It has been almost totally neglected by post-World War II biochemical medicine, in spite of the latter's incredibly generous research budgets. The signal failure of such research—as demonstrated daily in its outcome statistics and the U.S. healthcare system's unenviable track record as the leading vector of death among all illnesses—is in no small measure due to the peculiar shortsighted focus on organic biochemistry, which has no place in the study of the role of water in human health.

This unique relationship—water and health—has been emphasized in many concrete and symbolic ways in virtually every ancient tradition. The scientific study of water has been carried out so far by the chemistry community, with an approach emphasizing the molecular level of structure. According to a recent major review, physicists and materials scientists find water to exist in a nearly infinite set of structures, which are uniquely labile, changeable among themselves.

The core argument of this paper is that the materials-science literature establishes that common highly covalent liquids, including water, exist in many, many very different structures, even thermodynamically stable ones.

The paper establishes the *plausibility* of causing structural changes in water—imprinting it, so to speak—by many common vectors, which include not only temperature and pressure, but also epitaxy, succussing, electric and magnetic fields, and the like, and possibly human intention. Among these are three specific vectors used in the preparation of homeopathic remedies:

1. Epitaxy, a phenomenon very little known even by scientists but used daily worldwide in materials technologies, which involves the transference of structural information (not any composition whatsoever) from one solid (or liquid) to a liquid
2. Succussing, which can generate substantial pressures that are known to change the structure of similar liquids
3. The creation of nanobubbles, which would be distributed as in a colloid (like milk) and definitely change the structure

This argument demolishes the 150-year-old argument used against homeopathy—that since the compositional dilution is beyond the Avogadro limit and has excluded any of the original molecules of the additives, there can be no difference between the succussed remedy and the original water. Water *can* be changed in structure without any change in composition.

INTRODUCTION

The entire field of water-structure research by scientists—so far, conducted essentially only by chemists—has focused largely on its composition and, within that, the composition and structure of “molecules” or small oligomers, and often not even on *liquid* water at all. There has been almost no state-of-the-art research on the 3-D structure or arrangement of the units in space. This has resulted in a neglect of the most directly connected science of (inorganic) materials and physics. In addition, of course, insofar as the structure of water relates to human health, it has also led to the total exclusion of the human mind and spirit (an absolute part of the reality of a whole person).

A new and comprehensive view of the structure of water from the materials-science perspective was published only in December 2005 by Roy, Bell, Tiller, and Hoover (RBTH). This paper is the major source of data for this essay and contains dozens of useful references to which the reader is referred. This essay attempts to point out the links, in less technical terms than that paper, to various procedures or interventions involving water in whole-person healing. It does not provide any research or data to validate any particular approach or healing procedure related to water.

HOW THIS REDUCTIONIST SCIENCE FITS INTO THE WHOLIST PERSPECTIVE OF THIS BOOK

This book is concerned with a vast range of observations on healing by various procedures, agencies, practices, and so on— especially those involving water. Regrettably, in an era dominated by fundamentalism (defined very accurately simply as the conviction that *only my way* leads to truth), some in the scientific community have taken on the coloration of the religious fundamentalists whom they vigorously oppose. But science is the very antithesis of a guarantee of the permanent truth of our *current* views. Its accurate motto is, of course, that taken from the Protestant Reformation: *semper reformanda* (“always changing”). As scientists, we *know* that our truth may always be improved upon or incorporated into a larger truth with some new discovery. Indeed, every topflight scientist hopes to achieve exactly that: to replace or improve a major paradigm by their new insights.

Let me start by citing my own experience to show how pervasive within communities of science—much closer to the heartland of real science than statistical medicine—this proto-fundamentalism is. In the late 1940s, my department head in geosciences at Penn State warned me not to be misled by the American geological establishment. This entire body, he warned me, had rejected Alfred Wegener’s nearly 20-year-old proposal of continental drift. With all the fervor of Southern preachers, the gurus of American geoscience derided Wegener’s view as absurd. Yet, slowly but surely, over a decade or two, their views were totally washed away by the tidal wave of

more and more facts. Without any fanfare or public mea culpa, one “certainly correct” theory was abandoned and another one installed! Scientific “truth” changes, and true scientists worldwide celebrate its ability to do so.

Here’s another example: Within the next decade, the controversy was all about the volcanoes on the moon. When my graduate student Frank Dachille wrote a rather simple, rambling book, *Target Earth*, proposing that the moon was actually pockmarked not by volcanoes but by craters caused by meteor impact, I was advised by leaders of the nation’s major geological professional society to dismiss him from the university! Such a believer in the absurd, they advised me, should not be allowed to get a degree, even though his research with me was totally unrelated to the moon. Ten years later, meteorite impacts on both moon and Earth were a very hot research topic of—yes, the very same orthodox scientists. *Sic transit!*

One community within science, inorganic chemistry, has monopolized the study of the “structure” of water. The biomolecular medical establishment has paid no attention to it. Hence essentially zero scientific work has been done on healing and water by the conventional medical establishment. On the other hand, those intimately involved with human beings in healing—such as Florence Nightingale with her insistence on cleanliness and washing, and Hahnemann and his nearly pure water remedies—have had profound effects on large populations, even on the medical establishment in the case of Nightingale! Today, it’s finally possible to revive more objectively the question of the efficacy of various water-based healing vectors suggested by traditional practices.

In my 60 years of work at the cutting edge of materials science, I’ve always worked with one common approach: Find the most interesting observations, “wild facts,” as William James called them, or “useful truths,” in the words of Ben Franklin (see the Bibliography), which are unexplainable by current theories and hence spurned by almost all scientists. Go after those areas. I did, and I ran across several key data that had this in common: They were all involved with water.

I’ll start here with the most provable data, testable by normal medical procedures: the extraordinary antibacterial (and antiviral) effects obtained with ultradilute metallic sols (or colloids), especially of silver. A sol is merely a permanent suspension, just like, say, milk, of very fine particles of

a different solid or liquid. For anyone advocating the possibility of producing profound health effects with (essentially) pure water, the easy demonstration of such effects is the use of such a silver sol or colloid (easily found in any health-food store) made up of roughly 1 ppm (or one part per million atomic concentration) of metallic particles in the 10 nm range. This is the best proof or “existence theorem” for attention-focusing by the less informed. In any assemblage of petri dishes containing the usual range of test bacteria, the antibacterial effects of these ultradilute sols can be demonstrated in minutes and compare favorably with the best antibiotics. How can essentially pure water do this?

The range of these effects has been and is being demonstrated worldwide, most relevantly these days in the battlefields of Iraq and Afghanistan. This remarkable fact is never reported in the mass media. Most startling to this author is the connection of this water and silver and electric current to some of the most significant medical issues today: the regeneration of human limbs (fingertips), as demonstrated by Becker and Flick many years ago.

If a sol of silver at a 1 ppm concentration can do this, can the structure of different spa waters, and hence their health effects, be different because of the influence of the structurally different suspended particulate colloidal mineral matter? Can radiation—whether electric fields from megavolt overhead wires or microwave magnetic fields—change and even leave an imprint on water? Detailed scientific papers from Japan present data on just such possibilities. In contrast with the multitrillion-dollar sales power of the pharmaceutical industry and a \$30 billion annual research budget for National Institutes of Health (NIH) alone, however, the research in this area receives essentially zero funding.

It will be seen in the RBTH paper that there is no doubt whatsoever that water near our ambient conditions has several different structures. By far the biggest of the scientific issues remaining concerns the *kinetics of change* of one such structure or large cluster to another.

THE ABSOLUTE IMPORTANT OF “STRUCTURE”

This book is about the relation of water to human healing. Water is the largest component of the human body. But what is it about this liquid that can make it a healing vector?

First, of course, water, being the amazing solvent that it is (because of its extraordinarily high dielectric constant), does take into solution a great deal of the other materials that come into contact with it. This fact has tended to emphasize the composition—the “purity,” if you will—of the water as its most important descriptor. *That’s the problem.* Composition, especially slight changes of it, is rarely important in altering the properties of a liquid or solid. One reason is that all such variations are incremental, continuous, and slight. But changes in structure can be dramatic. One example will do to make my point: The element carbon exists in many solid forms, including graphite and diamond, meaning that the nearly softest and the hardest (so far) materials on the planet have an identical composition. Here we have *exactly* the same composition of matter, easily transformed from one structure—in milliseconds—to the other, with this incredible difference in properties. So if you’re interested in water, you’ll have to pay attention to its *structure*.

The paper and this essay start by distinguishing the way materials scientists and chemists define the term *structure*. Essentially, all previous literature on water structure has been dominated by chemists, who equate the term with the identification of the *molecular species* present in the vapor, in the liquid, at its surface, or in some specific environment. Literally dozens of such molecular species have been identified, calculated, or inferred. For hundreds of precise illustrations of proposed structures of the H₂O molecule and the assumed dimers, trimers tetramers, and on and on, the gold standard of references is the Website maintained by Professor Martin Chaplin in London (see Bibliography).

Since nearly 100 percent of the literature deals with the size and shape of the *building blocks* of the condensed matter (liquid), what’s studied very little is the materials scientist’s approach to the structure of condensed matter—the *arrangement* of these building blocks in 3-D space. The two views can be sharply distinguished by using this analogy: Consider the radical differences between the structure of *the building blocks* and *the building itself*. One doesn’t describe the structure of Notre Dame or the Taj

Mahal by saying that they consist of limestone, sandstone, or marble blocks and giving details of the size and shape of these blocks. We know that the structure of these buildings is of the whole, not of the parts. Or consider the pieces or blocks in a Lego set (= molecules) (the chemists' approach) and the "structure" of the house or car or plane (= clusters) that a child builds with the same blocks.

This materials-science approach to the structure of a liquid— any liquid of course—is extremely difficult here, simply because water is a liquid. That means that the units or building blocks do not repeat in any periodic manner in their 3-D arrangement. This periodic-arrangement state is the property of virtually all of Earth's inorganic matter—99.99 percent of it! The units are crystalline. The aperiodic state—the *noncrystalline state*, also called, imprecisely, the "glassy state"—which is the common structure of *all* liquids, poses a nearly insuperable barrier to the main scientific tools for determining structure—all the diffraction methods, x-ray, electrons, neutrons—and water's low viscosity doesn't help. Of course there are other techniques—spectroscopies of all kinds—but they are poor substitutes for diffraction. Also, there are enormous resources available by analogy from the extensive 100-year research on the structure of glasses and other liquidlike phases, especially those of SiO_2 , with its close similarity to H_2O . The nearly ubiquitous structural heterogeneity in similar covalently bonded *liquids*, even of *elements* (such as S, Se, Te, and the like), is also a major hint of the possibilities for a variety of structures in water, however long they last.

Very useful lessons can be learned about the structure of water from the enormous literature on SiO_2 and silicate minerals and glasses. These are slowly being rediscovered. The first major learning is that most common glasses are highly heterogeneous in structure, consisting of 5–50 nm clusters with different structures. Another little-known example is the effect of pressure on liquid structures such as the thoroughly studied SiO_2 -glass, which shows the change of properties and structures with pressure in SiO_2 and related glasses. (These data are largely from my own laboratories in the 1960s and 1970s and the references are all in the Roy, Bell, Tiller, Hoover 2005 paper.)

In the same vein, by the 1980s the most experienced analysts of the structure of glasses had concluded that they nearly all exhibited a mixture of different structures at the few nanometer level. Most glasses—especially those containing SiO_2 , with its close similarity to H_2O —therefore were nanoheterogeneous, consisting of islands of different structure. Glassy water exhibits a whole range of properties very similar to glassy silicates. There is little reason, therefore, to doubt that liquid water carries at least some of the vestiges of this fundamental nanoheterogeneity.

THE KEY ARGUMENT LINKING STRUCTURE TO HEALTH VECTORS

What's presented here simply points out the unchallenged fact that the criticism—nay, ridicule—heaped on homeopathy and “structured” water by chemists is, in fact, itself based on an egregious error caused by a simplistic understanding of the properties of liquids. The critics' argument is, in sum total: The only way to change the properties of water is to add some solute. It is assumed that water can only be changed by controlling the nature and concentration of the solute. This is, of course, sheer heresy to materials scientists, and known to be inaccurate by all informed scientists. The central principle of materials science is that properties are determined largely by *structure* (at every level, from nano to macro) and *not composition*, as described above and illustrated by the diamond/graphite example. This

phenomenon is true of virtually all solids, though not with such spectacular differences as diamond and graphite.

EFFECTING STRUCTURAL CHANGE

We have thus disposed of the 200-year-old mistaken argument; it remains only to establish that even in H₂O it's possible and plausible that such structural changes can be effected. That's what the Roy, Bell, Tiller, Hoover paper attempts. It makes no contribution at all to whether or not homeopathic or ultradilute sol remedies work in the clinic or not.

Three well-known phenomena in materials research are utilized to demonstrate the plausibility of structural change in water: (1) epitaxy, (2) pressure, and (3) nanobubbles.

EPITAXY

A key insight from common experience in materials science that may be relevant to understanding the structure of water and what can affect it easily is “epitaxy.” This term doesn't appear even in most technical dictionaries, but the phenomenon is very well known, studied, and used in dozens of everyday technologies in materials science. Yet, besides the plausible differences in nanostructure, it has *never* been invoked directly in the literature on the various healing traditions, including homeopathy, or in the use of different healing spas, which may have waters with *suspended* (not in solution) mineral matter.

Epitaxy is the transmission of structural information from the surface (hence *epi*) of one material (usually a solid) to another (usually a liquid). Subtleties of terminology appear in various papers, but it's the template of the structure—that is, the information—that's definitely transferred. Recent examples of the subtleties of information that can be so transferred can be found in the literature cited at the end of this essay. *No matter* is transferred in this “imprinting.” Hence, the traditional hackneyed criticism of homeopathy—the discussions of “concentrations of solutes above or below

Avogadro's limit"—are totally irrelevant. By providing a specific structure as a template (usually solid but sometimes liquid), one can induce an entire body of liquid to precipitate or crystallize in that preselected structure or morphology. The seeding of clouds is caused by epitaxial growth of crystalline ice or water on a substrate of AgI, which has the same crystal structure. Seeding and epitaxial growth of semiconductors are universally practiced in major modern technology. Information and "memory" are transmitted from the seed or substrate to the liquid phase, which can completely control the structure of what's formed from it. No chemical transfer whatsoever occurs.

In homeopathy, a specific active agent is added to the liquid (water or water + ethanol). The relevant question is, in what ways can the active agent change, affect, or imprint the liquid? Those unfamiliar with materials science assume that it is only by its presence in solution (as atoms, ions, or molecules) that an "active agent" can affect a liquid. They're wrong. Here again we return to the *structure*, not the *composition*, for explanations. Obviously, the structure of water *can* be influenced by that of solids with which it's in contact.

These, then, are the first well-established learnings from materials science—structural nanoheterogeneity within liquids and the role of epitaxy in propagating structural information without involving composition. In addition to the above, materials scientists deal extensively with other phenomena which are certainly possible, and probably major, factors in the structure of water.

SUCCESSING: GREATING HIGH PRESSURE AND NANOBUBBLES

Pressure, after temperature, is of course the most important of the intensive thermodynamic variables in deciding what structure is stable and/or will form. Pressure is well known to have profound effects on crystalline H₂O. Some 13 different crystalline H₂O structures are known in modest p-t space. In a series of papers in the 1960s, we've already shown that it's well known that all glasses (frozen liquids) change structure (and

their density and refractive index properties) continuously with pressure. Such densified structures survive easily in the oxides studied, which are much more viscous. A reasonable extrapolation will show that under the “normal” succussing procedures, very respectable pressures (say in the 10 kbar range) will be generated on the very small size water droplets that must form. Reasoning from analogy with similar (that is, covalent) liquids, there will, quite reasonably, be many different structures of water formed both by pressures generated in succussing and possibly others in some combination with the epitaxy on any additives.

Finally, the succussing process must necessarily also produce a range of sizes of bubbles in the liquid. The size distribution of the bubbles will certainly include some nanobubbles—that is, nanosize inclusions of gaseous O₂, N₂, CO₂, possibly the active ingredient, and so on. Some of these bubble sizes will no doubt be well below the colloid range, and therefore a colloidal suspension of water + gaseous (or liquid) inclusions would be formed. These could be quite stable for very long periods and would certainly affect the structure of the liquid water.

OTHER VARIABLES RELEVANT TO STRUCTURED WATERS AND SOLS

In addition to these major important variables, which can affect the stability and determine the structure of water, there are the other very common variables: magnetic and electric fields. While such fields contribute very little to the stability of most materials, they become profoundly important when these effects can interact with or be “locked into” a material in, for example, ordered domains or regions that are present in very common ferroelectric or ferromagnetic materials. Indeed, our own very recent work has demonstrated the most spectacular changes in, and even destruction of, the crystal structures of common inorganic phases by magnetic fields of a few gauss at microwave frequencies (see Bibliography). These results were totally unexpected and are still unexplained by the world’s leading theorists.

MATERIALS SCIENCE DATA FROM HOMEOPATHIC LITERATURE

These data and insights from the physical sciences are followed by the increasing data from several researchers in the homeopathic literature, adducing evidence on the effects of various materials-science variables, including weak magnetic fields, which fit very well with our models.

The book by Bellavite and Signorini (see Bibliography) summarizes much of their own work and that of others who have already approached the same problem from the stance of homeopathy. Various investigators have previously proposed a model for the structure of water involving formation of aggregates of water molecules or water clusters, possibly seeded by—but not requiring—the continued presence of molecules from the original source substance (for example, zwitterions or clathrates). Others have proposed the involvement of a coherent electromagnetic radiation field within the solvent that contributes order to the molecular motion. Emerging data on the structure and thermodynamics of water provide a rationale for revisiting the role of the solvent in storing and transmitting the information of homeopathy-prepared agents. The reader is referred again to the paper to avoid overloading on jargon.

SUMMARY OF THE CURRENT VIEW OF THE STRUCTURE OF WATER

The short description of the structure of water that emerges today is that H₂O liquid is indeed a nanoheterogenous statistical- mechanical distribution mainly of several molecular species including both oligomers and polymers and a minority of monomers. The structure is easily affected by epitaxial effects, pressure during succussing, and also the formation of colloidal nanobubbles. This distribution is very labile; and all the intensive and extensive variables, including magnetic and electric fields, can cause substantial changes in the distribution, and hence the structure, and hence the properties. In simple terms: Liquid water consists of a changing aggregate of islands of different size and shape in an arrangement that can easily be changed.

CONNECTIONS TO HUMAN INTENTION ON HEALING

So, finally, what of the possible effects of human intention on water, such as those of Dr. Emoto? The huge amount of solid data on the amazing reality and importance of the expectation effects (EE) (inaccurately labeled by the mystifying and wholly unnecessary term “placebo”) in *all* human healing transactions, including the highest high-tech procedures, certainly entitles any scientist to hypothesize about the possibility of various modes of human-intention effects on healing.

Dr. Emoto’s work appears to confirm this possibility in a graphically attractive way, as does Stephan Schwartz’s work on water in healer’s hands using I-R spectroscopy. The Qi Gong master Dr. Yan Xin’s classic demonstration of the change of the structure of water as measured in a Raman spectrometer from a distance of hundreds of meters to 7,000 kilometers is part of this database. With the amassing of a wide range of data from different fields, it’s certainly fair to conclude that our understanding of the healing potential of water is, to use the title of a book by the really great physician-healer Lewis Thomas, today’s *Youngest Science*. We know it has a bright future. What we need now is to pursue it—carefully, bearing in mind the power of human intention, and with the goal of fairness.

CHAPTER 3

WATER: ITS CLINICAL AND SCIENTIFIC DEPTHS

by Cyril W. Smith

SUMMARY

Coming from a background in radar and physics, and while working on electromagnetic effects in enzymes and living systems, I became involved in the diagnosis and therapy of patients hypersensitive to their electromagnetic environment. This led to research on the physics of water, its memory for frequencies, and the use of dowsing as a scientific instrument; the results led to a basis for homeopathy and acupuncture. Frequency was the relevant parameter throughout. Acupuncture meridians have characteristic frequencies naturally present on them. Where there's a connection to the autonomic nervous system (ANS), additional frequencies characteristic of the ANS appear. The presence of these frequencies in the whole body field of a person indicates which systems are under stress. A study of techniques for writing, reading, and erasing frequencies in water gave results of practical value. Logic-gate operations with frequency were shown to be possible in spatial arrangements of water and sensitive enough for nerve impulse trains to control biocomputing. Theoretical work cited predicts domains of phase coherence as a normal property of water. Measurements involving these suggest that the Emoto ice-crystal patterns may start on coherence domains and indicate frequency patterns within.

INTRODUCTION

Since 1973, I've been involved in experimental research on the interactions of electromagnetic fields with biomaterials and living systems. This included my cooperation with the late Professor Herbert Fröhlich, FRS, a theoretical physicist at Liverpool University whose centenary was celebrated recently. One early conclusion from this work was that there were unusual magnetic field effects in water and in living biological systems and that these were only explicable in terms of 20th-century physics, not 19th-century physics. These effects involved highly complex systems that could become interconnected through sharing frequencies that had become synchronized in phase (that is, become coherent). This could happen over distances that might span many molecules; but, as we were dealing with quantum systems, distance might be an irrelevance.

HYPERSENSITIVE PATIENTS

My involvement in the diagnosis and therapy of patients hypersensitive to their electromagnetic environment began in 1982 at the request of Dr. Jean Monro in London. Working with her electrically hypersensitive patients and those of Dr. W. J. Rea in Dallas, Texas, gave me an insight into the extremes of sensitivity and speeds of reaction of hypersensitive patients whose regulatory systems had failed, particularly when they were exposed to electromagnetic fields and frequencies.

Such patients have a long history of ongoing hypersensitivities to many chemicals and/or foods and particulates. They may react within seconds to something in their surroundings to which they happen to be hypersensitive. This includes their electromagnetic environment; and here, frequency is the important factor. Any frequency (from circadian rhythms to light) may be clinically significant.

One important result from this clinical work was finding that the effects on patients of environmental electromagnetic fields, chemicals, or homeopathic potencies could be reproduced with frequency-imprinted water. For example, water in flame-sealed glass ampoules was imprinted with frequencies through the glass with no possibility of any chemical

contamination. Patients reacted to this even if the water was frozen. This showed us that the basis of homeopathy must be frequencies in water.

The frequencies that affect these patients are often those that occur naturally on the acupuncture meridians. These are rather like microwave links running through the body originating as coherence between adjacent cells in the embryo. Enough water remains in a specimen of a tissue even after staining and fixing as a microscope slide for frequency measurements to be made, and these correlate well with the natural frequencies found on the acupuncture meridians (and chakras) regarded by Traditional Chinese Medicine as connecting to these organs. Chemicals (except 100 percent halogen-saturated ones) have a characteristic frequency signature resulting from their interaction with traces of hydrogen-bonded water.

THEORETICAL

Preparata and Del Giudice at the University of Milan did a theoretical investigation of the properties of coherence in condensed matter—which is anything that’s not a gas. Their model for water is the same as for all other coherent condensed-matter systems. Namely, there are two parts: one *incoherent*, comprising water molecules oscillating at random (as in steam, but more densely packed); and the other *coherent*, consisting of domains of *coherence*, within which all the water molecules oscillate synchronously (in phase) with the frequency of a very large electromagnetic field that develops spontaneously within the domain. This resembles what happens in the laser, but it doesn’t need any energy “pumping.” Predictions from their theory are in good agreement with the experimentally determined values for physical constants of liquid water.

The “classical electromagnetic field” is the basis of electronics and radio; it describes oscillations whose phase is well defined (coherent) but for which the number of particles (quanta, photons) carrying the energy is undefined. A “quantum field” has uncertainty in both its phase and the number of particles involved, and this uncertainty is determined by the Heisenberg Relation. The more the uncertainty is taken up by fluctuation in the number of particles, the more perfect the phase coherence becomes.

For any wave, its velocity of propagation equals its frequency multiplied by its wavelength. Within a coherent system such as water, the range of the coherence (coherence length) becomes the constant quantity instead of the velocity. This makes frequency proportional to velocity apparently without restriction, so long as one remains within the coherence length. Such a system can support many velocities (even greater than the velocity of light) with frequencies in proportion; and because these no longer have absolute values, the system has become *fractal*. The same patterns and effects can occur in many different parts of the electromagnetic spectrum. It's this that connects frequencies characteristic of chemical, technical, and biological systems together. If there weren't a duality between the chemical bond and frequencies, spectroscopic analysis would be impossible. This is why a pattern of frequencies can mimic a chemical exposure for hypersensitive patients and trigger their reactions.

IMPRINTING, READING, AND ERASING

Clinically significant information can be imprinted into a vial of water by *succussion*, which is sharply banging it on a surface. This is what creates a homeopathic *potency*. Frequency information from a patient's body can be collected similarly, and this often reveals stress on acupuncture meridians.

IMPRINTING

Imprinting can occur through the glass of a vial containing water by immersing it in frequency-imprinted water. Otherwise, water placed near a source of frequencies (an oscillator and coil, or a chemical or a potency) can be imprinted by a strong magnet or a toroid (ring) of a ferrite material. A sequence of seven voltage pulses will also make an imprint; a mobile phone may do this on dial-up.

READINGD

William Tiller has described work with memory chips imprinted by healers. Although healing can be imprinted, it is also possible to imprint stress. When I visited the laboratory of Jacques Benveniste shortly after the *Nature* inquisition had left, I was able to find by dowsing all the glassware (in a box on the top shelf of the store), the bench, and the incubator that had been used through the stress left behind. It's easy for a person who has the capability of a healer and knows how to do so to affect sensitive living systems such as those Benveniste was using. I told him to trash everything or treat it as if contaminated with radioactivity in order to get his laboratory clean again.

I've shown that the basic arithmetical operations can be performed on frequencies imprinted into water and that the basic reversible logic gates and their operations can be implemented. Nerve impulses should be able to control computing operations in living systems, making biocomputing a possibility.

ERASING

A water imprint is erased by briefly shielding it from the Earth's (geomagnetic) field, such as by placing it inside a steel box. Heating imprinted water alters the imprint, which may become "hidden." It can be recovered by the application of certain frequencies, which include those of the heart acupuncture meridian and chakra. The heart meridian frequency is on the Schumann Band, a geophysical resonance in the upper atmosphere under which life evolved. Another such frequency is the microwave resonance of molecular hydrogen. Medications can be made acceptable to sensitive patients by canceling their chemical signatures.

WATER'S FREQUENCY MEMORY

Frequencies in water and living systems present a very great measurement problem. Clinically, they may be anywhere in the electromagnetic spectrum. These aren't frequencies of "classical" electric or magnetic fields, but rather frequencies of "quantum" fields, which must be converted to the former for measurement with instruments. Information is carried as the frequency of the A-field component, which was originally a mathematical necessity arising from the fact that a magnetic field was found in closed loops. Eventually, it was shown theoretically by Aharonov and Bohm and later experimentally that this component of the magnetic field (called the magnetic vector potential) did actually exist and could produce interference effects.

DOWSING

To measure frequencies in water, I had to develop the dowsing techniques I'd initially devised for the diagnosis of reactions in very hypersensitive patients—persons incompatible with technology, period! This was the only technique able to cover the frequency range and sensitivity required. I later extended it to the detection of resonances in water, allergen dilutions, and homeopathic potencies. I've detected the frequency signature of salt (sodium chloride) to a concentration of about 0.3 ppm by weight in water.

My dowsing measurements agree with instrumentation where this has been possible. Their internal consistency is good. Mind-body interactions make "double-blinding" difficult, if not impossible. The dowsing reaction must involve the heart or pericardium acupuncture meridians; if either is joined to a wire, all dowsing response is lost. A magnetic A-field reverses the dowsing response as it does for the Aharonov-Bohm effect. Since a frequency can be measured in less than the time for a single cycle, its measurement must involve a phase comparison between the left and right arms. (See also Chapter 8.)

FREQUENCY MEASUREMENTS

There are several possibilities for objective frequency measurements. Electrodes immersed in water and connected to the input of a very sensitive amplifier or signal analyzer can detect an imprinted frequency in the kilohertz region if the water is excited by that frequency. A possible physical mechanism for this is that charges entering coherent water from an electrode must do so as charge-pairs; this reduces the number of charges at the water/electrode interface, thereby increasing the electrical resistance. The small “offset” current that flows into an amplifier detects this as a voltage.

Gariaev, in Moscow, has developed a special laser in which two beams are polarized perpendicular to each other. The beams interact with molecular structures, which produce optical rotation, resulting in the emission of radio frequencies. In his experiments with homeopathic potencies, a control solution showed no bio-information, while a D12 potency of platinum gave him peaks at 2.2 kHz and 4.5 kHz. Subsequently, I prepared a D12 potency of platinum and measured by dowsing the three frequencies: 2.301 kHz, 4.455 kHz, and 2.57 MHz. The last was obviously his radio frequency, and the others its modulation. I’ve detected similar resonances imprinted on water using light from an LED.

Elia and co-workers in Naples have carried out an extensive study on aqueous solutions subjected to successive dilutions and succussions. The heat of mixing with acids or bases differs between untreated water, dilute solutions, homeopathic potencies, and frequency-imprinted water. Although his microcalorimetry can confirm a single frequency imprint, it is at present too slow to measure a whole spectrum of frequencies.

IN THE FAR-INFRARED

When working toward a theory for “memory” effects in water, I looked at my measurements of the chemical hexane; this is a more volatile relative of the octane used for gasoline rating. With at least 14 ppm of water present, hexane gave a chemical frequency signature. Since it only has a spectrum in the far-infrared (FIR), this was the only region in which water could interact

with it. Furthermore, I noted that of the very many water lines in this region, just a few [28 μm (357 cm^{-1}), 47 μm (213 cm^{-1}), and 78 μm (128 cm^{-1})] could become coherent enough to use in a water-vapor laser. I concluded that these should be able to provide the necessary coherence for water “memory” and was able to calculate hexane frequency signatures from these spectra.

When the same calculation was applied to pairs of these FIR lines in the absence of any hexane, this gave the measured frequencies of water. When a frequency was imprinted onto water, the FIR frequencies were replaced by two sidebands proportional to the imprinted frequency. Because of coherence, this is a *fractal* effect, and corresponding sidebands appeared in many parts of the electromagnetic spectrum.

A THEORETICAL BASIS FOR POTENTIZATION

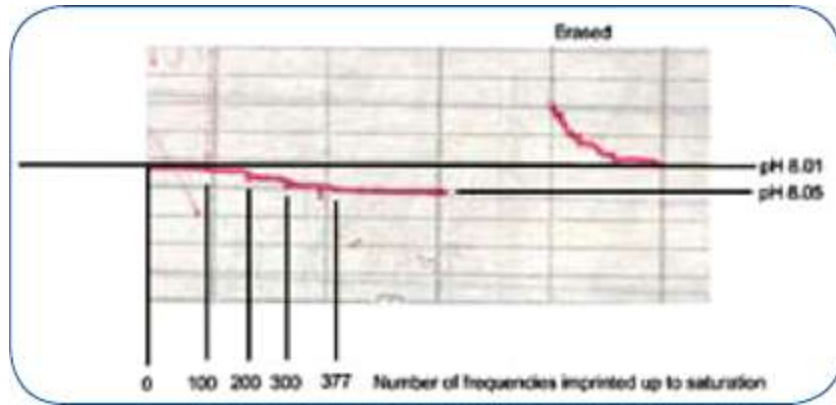

When water was imprinted and then serially diluted, the original frequency disappeared, to be replaced by that frequency multiplied by the dilution ratio; but not all dilution ratios would do this. Some gave no frequencies. This provided a theoretical basis for the potentization of homeopathic remedies, which I demonstrated as follows. Water was imprinted with the complete pattern of frequencies previously determined for thyroxin of potency D15. This was further potentized by conventional serial dilutions and succussions. The frequencies measured for each synthesized potency were exactly the same as those for the potencies prepared from the “mother tincture” of thyroxin. Yet, my synthesized potencies had started from nothing but water. Importantly, there was no discontinuity at potency D24, which is the dilution at which not one molecule of the original substance should remain (Avogadro’s number). This is where the chemists have to give up!

SHIELDING AND ERASURE

As already mentioned, it was during attempts to measure frequency imprints in water by instrumentation and in work with electrically hypersensitive patients and with homeopathic potencies that it was found that a potency or a water imprint would be erased if the geomagnetic field was shielded from it briefly with a steel box. Erasure must occur when the thermal energy is able to break up order due to magnetic energy. The water erasure threshold is about 1 percent of the Earth's magnetic field; the exact numbers imply a domain of phase coherence 53 mm in diameter. This threshold is independent of the imprinted frequency over at least the 13 decades from 10^{-4} Hz to 10^{+9} Hz. One microliter of water (acid or neutral) is needed to take up the imprint of a single frequency; but, if the water is alkaline, more is needed. The concentration of coherent domains in random water can be estimated from the number of imprints possible; the pH (acid/alkali) effect supports the involvement of protons.

In 1983, my laboratory showed that living systems can respond to magnetic resonance (NMR) conditions at geomagnetic field strengths. This high sensitivity allows one to speculate that a frequency might be retained in water if the magnetic resonance precession of the protons can be synchronized to any applied frequency and that they can generate an internal magnetic field that exactly satisfies the proton NMR conditions locally within their coherence domain. This condition turns out to be independent of the frequency to be remembered. Such a process would be stable unless a domain was thermally broken up by reducing the stabilizing geomagnetic field.

A 53 mm diameter domain contains more than enough protons to generate the magnetic field required to satisfy NMR conditions. The statistical fluctuation in the number of protons involved determines the bandwidth of the frequency imprint. This comes to about one part in a million (1 second at 1 MHz or 12 days at 1 Hz) and is consistent with the time needed for imprinting a frequency onto water by contact.

Change of pH on Frequency Imprinting: This chart recording shows that the pH of a solution of sodium hydroxide at pH 8.01 increased to pH 8.05 at memory saturation, which occurred after 377 separate imprinted frequencies. Erasure returned the pH to the initial value. An increase in pH corresponds to the removal of H⁺ ions and the generation of an equal number of OH⁻ ions. The number of protons involved in this pH change for a single frequency imprint is sufficient to generate a local magnetic field to satisfy proton-NMR conditions independent of the imprinted frequency. Thus, imprinting a frequency into water may create a proton coherence that is sufficient to store that frequency. (Chart speed: 10min/div)

ICE PATTERNS

The ice patterns obtained by Dr. Masaru Emoto are reported to have been taken at magnifications of 100–200, where the microscope's field of view would be about 200–100 μm . They have a size and symmetry consistent with originating from a segment of the surface of a coherence domain about 50 mm diameter, the size I calculate from the water-memory erasure condition. These ice patterns are consistent with being a representation of frequency patterns within a domain. In 1989, we found that water frozen in a static magnetic field showed distinctive ice-crystal patterns directed at right angles to the magnetic field. There were also frequency-dependent effects from alternating magnetic fields. Therefore, ice-crystal patterns nucleated by coherent frequencies within a coherence domain remain at least a possibility.

CONCLUSION

Details relating to the contents of this chapter are to be found in the books I've listed in the Bibliography.

Finally, I'd like to recall the myth of Achilles and the tortoise, in which the choice of the wrong paradigm precluded the possibility of ever finding a solution to the point at which Achilles overtook the tortoise. For water, the appropriate paradigm is quantum physics. Ignore it, and make progress at tortoise speed.

CHAPTER 4

WATER: NATURAL'S MIRACLE — BEYONDS SCIENTIFIC EXPLANATION

by Dolly Knight and Jonathan Stromberg

A part from the many well-researched properties of water, which make it unique as the life supporter of this planet, there is one ability of water that mainstream science has tried to ignore and deny: the “memory of water” phenomenon. This phenomenon lies beyond the accepted level of scientific inquiry, and little effort has been made by conventional research institutes to understand it. However there are exceptions, and an exciting new understanding of the marvelous properties of water is emerging.

VIBRATIONAL IMPRINTING

Various researchers, such as Professor Jacques Benveniste, Dr. Wolfgang Ludwig, David Schweitzer, and Masaru Emoto, have provided clear proof that water acts as a liquid tape recorder and is able to receive, store, and transmit electromagnetic vibrations. Because water molecules have a positive and negative pole, they behave like little magnets. They attach themselves to their neighboring molecules and form clusters of several hundred molecules. These clusters are very sensitive structures and are impressionable by vibrational influences. This is what gives water the ability to store information.

This is closely linked to homeopathy, where a substance is diluted so many times that eventually there's virtually no molecule of the original substance left, yet it still has an effect. Homeopathy works because of the

cluster ability to store vibrational imprints. Every substance and element has its own individual vibrational pattern, a bit like an energy blueprint. If one carries out the homeopathic process of diluting and succussing, the vibrational pattern of the remedy material becomes locked into the cluster structure of the carrier water. When you take this homeopathically prepared remedy, the cluster structure is transferred to the body, and you react to the vibrational pattern of the original substance from which the remedy was prepared.

This phenomenon was shown to occur under rigid scientific conditions by Jacques Benveniste in France in the late 1980s and was confirmed by researchers at five different universities. It caused quite a stir and subsequently a cover-up by the mainstream scientific community.

If water is this susceptible to vibrational imprinting, does it also take on the imprints of environmental pollutants and chemicals with which it has been in contact, and transfer them to us when we drink it?

Unfortunately, this seems to be the case. In Germany, Wolfgang Ludwig has carried out tests that show that not only does the *physical* pollutant have a damaging effect, but so does the *water* that has been exposed to the pollutant, because the cluster structure has taken on the vibrational imprint of the pollutant.

This has huge ramifications for us. Basically, conventional water and sewage treatment systems are not adequate. They may remove the *physical* pollutants and produce tap water that's chemically clean. However, the cluster structure of the water is completely unaffected by the treatment and will still convey the vibrational pattern of toxins and chemicals to the human body.

IMPLOSION

However, all is not lost, thanks to the intriguing work of the Austrian forester Viktor Schauberger (1885–1958). He had ample opportunity to study the workings of nature in unspoiled Alpine forests. Being an extremely intuitive man, very much in tune with the natural world, he soon developed ideas and theories regarding nature, and particularly water, that

were in conflict with conventional scientific understanding. Early on, he discovered that there was an underlying principle governing all natural processes. He called this “implosion.”

Schauberger became a prolific writer and inventor. His inventions were linked to water supply, natural river regulation, agriculture, propulsion, and energy generation, and were all based on implosion. He’s very important to us in that he pointed out a new way of looking at nature and exciting new possibilities—if nature’s true workings could be really understood and copied in a technological sense.

Implosion is a suctional process that causes matter to move inward, not outward, as in the case of explosion. This inward (centripetal) motion doesn’t, however, follow a straight (radial) path to the center, but a spiraling, whirling path. This is called a *vortex* and is the secret of nature. Bathwater, when emptied, flows through the plug hole in this spiraling vortex fashion. Water will always try to follow the path of least resistance. This is what the vortex is enabling it to do. It’s reducing resistance by curving inward more and more, thereby avoiding the confrontational resistance of straight motion.

The vortex motion, which also causes a drop in temperature and increase in density, is paramount for water to stay healthy and disease free. Natural water courses are naturally spiraling and meandering, and the water in them forms whirls and eddies, which are vortices. In nature there are virtually no straight forms; and whenever possible, vortices, spirals, and curves are produced to reduce resistance. Yet in conventional technology, explosion, combustion, and straight motion are employed, all of which increase resistance and temperature and are fundamentally against nature. Realization of this caused Schauburger to proclaim emphatically: “Our technologists are moving matter incorrectly. Their technologies and interference with nature are detrimental to us and our planet.”

RE-ENERGIZING WATER

After researching Viktor Schauburger for a couple of years, we were convinced that he had something very important to impart to humanity.

Sadly, not a lot of work has been carried out in the last few decades on developing practical applications for his ideas. So we started full-time research in September 1997 and developed an implosion machine. In this machine, water is made to form very powerful vortices. We found that water undergoing this process of implosion was developing a rhythmically pulsating field of energy, which comprised the full spectrum of etheric colors. During this process, it was brought back to its natural vibrant energetic state and regained its life force. This energetic charge turned out to be permanent and didn't diminish after the implosion process was completed.

We further discovered that when filled into particular shapes, this imploded water transferred its energy to samples of ordinary non-energized water until they reached the same level of charge as the imploded water. The imploded water was resonating ordinary water in a similar fashion to the way one tuning fork picks up the vibrations of another, the difference being that on the etheric level, the vortical dynamics and vibrations are perpetual.

After building the implosion machine, we developed a spiraling copper device called the "Vortex Energiser," in which we filled our imploded water. We found that placing this Vortex Energiser onto the domestic water mains resonated the tap water flowing past, thereby charging it up with life force or etheric energy. The benefits of energizing ordinary tap water in this way are varied: The clarity and taste of the water improve—the water is more palatable and less hard; the taste and smell of chlorine are much reduced or even eliminated; lime-scale deposits become soft and are eventually removed; bathing in energized water is a reviving experience, leaving skin supple and soft; fresh food and cut flowers washed with or placed in the water last longer.

Perhaps most important, by reclustered water and at the same time energizing it in this way, we believe that we're superimposing a natural vibrational pattern onto a pattern of man-made contaminants, thereby deleting the memory of the water's abused past.

THE CENTRE FOR IMPLOSION RESEARCH

The CIR was founded in December 1997 by Dolly Knight, MBBS, GCHM, and Jonathan Stromberg, BSc, MSc, DIC, FGS. We believe everyone has a duty to do whatever they can to improve our ailing planet's environmental condition. Our aim is to develop technologies that are simple and pollution free and work in harmony with nature.

For further information please contact:

CHAPTER 5

SNOW, IT HAS SIX EDGES

by Maximilian Glas

It was deep in the winter of 1611 when the mathematician and astronomer Johannes Kepler crossed over a bridge in Frankfurt and fine snowflakes drifted down onto him, “all in the form of the hexagon with feathered rays,” he wrote. “It is always like this when it starts to snow—snowflakes always form hexagonal stars—and there must be a definite reason for it. If it happens by chance, why don’t they form heptagons or pentagons. . . .?”¹

Around 400 years ago, nobody knew how matter was constructed, how crystals grew, or what inner laws the formation of crystals followed. Kepler was the first person in the modern age to seriously think about the subject and to develop a coherent model. It would be another 300 years before the Munich physicist Max von Laue proved this model correct. Fortunately for us, Kepler wrote down his reflections in 1611. He not only handed down a pioneering thought, but one that made it easy to understand why all snow crystals (and respectively ice or water crystals) form symmetries based on the number 6, and this leads us to the fascinating pictures from Masaru Emoto.

Kepler dedicated his Latin script *De nive sexangula* (About the hexagonal snow) to Counsellor Knight Wackher von Wackenfels, a well-known philosopher, as a “New Year’s gift.” He wanted to delight the enthusiastic nihilist with a present that came as close as possible to “nothingness”: just a little star formed out of snow, along with a few thoughts about it. In these thoughts, Kepler pondered on how the little star could have grown and concluded that it would have very slowly condensed out of the steam in the air.

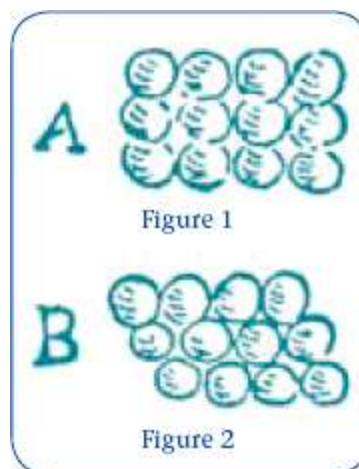

THE MEANING OF FORM

Kepler's thoughts regarding form were: "Only that which forms a boundary in itself has a form, because the boundaries shape the forms."

That is clear, but why a hexagon of all forms? Kepler continued:

It needed further consideration as to what was at work here. Was the form innate or produced from the outside? Was the hexagonal figure necessitated by the material out of which it was formed, or by its own nature, which was either the prototype of beauty which lies in a hexagon or due to the aim of this figure.²

So, inner or outer necessity—a clear, beautiful train of thought! After this, Kepler developed the concept of the construction of "solid bodies" from minute units, which ideally should possess a spherical form. That means that he had the first vision of what's today called an atom. He also had an understanding of the order of the spheres. He assumed that the order was level, and there were layers over layers, which is what formed the crystal. This is still the current view. He concluded that at least two possibilities existed: that the order of the spheres formed a square (A) or a triangle (B). He even illustrated this:

In a second sketch, he showed the spatial construction: Layer A (with a sphere) is placed on layer B, and this then on C, and so on. Finally, a pyramid is formed by four equilateral triangles—therefore a tetrahedron—which shows threefold symmetry, and that has to be the architectural basis for constructing "snow stars."

Obviously, Kepler didn't know the construction of water molecules at that point and so wasn't able to foresee the necessity of the sixfold (not threefold) symmetry, but in any event it can be derived from the threefold symmetry.

All in all, this was a stroke of genius! Kepler had described the construction of snow crystals in nearly the same way that it would be today. And all this 400 years ago, without the model of an atom, without developed crystallography, and without the help of technical instruments. Crystals are still described today as a three-dimensional spatial grid made up of spherical particles (atoms). And, as mentioned at the beginning, Max von Laue was able to confirm the structure of crystals through x-ray experiments in 1912.

In the case of water, the crystal structure is determined by the shape and form of the H_2O molecule. Contrary to what Kepler expected, the spherical density is less than he showed in his second sketch, but is formed of a looser group of molecules, which are ordered as a tetrahedron and combine to form little rings of six:

The sketch shows a small section of the crystal structure of ice and puts it in the context of the hexagon. It also explains why ice has a bigger volume than water and consequently is lighter and able to float on water: As ice, there's relatively a lot of space between the individual components; in the fluid state, water is denser. Around two to four million water molecules of this structure are needed to be able to build around 0.039 inches (1 millimeter) of one edge of an ice crystal. The connection of the H_2O molecules in the crystal grid is made through hydrogen bridges, which also play an important role in the formation of clusters.

IT BEGINS WITH A SEED

As easy as it might seem to understand the inner structure of ice crystals, in the living process of growth many different things can occur; and those change and shape the outer form of the finished crystals. Ice crystals can look completely different depending on what happened during the growth process.

At first this starts very simply. As Kepler discovered in 1611 on the bridge in Frankfurt, water begins to condense at some point. That means that steam forms fine droplets, which slowly crystallize and harden in low temperatures according to the “construction plan” already described.

In order for a crystal to be able to form, a “seed” is needed: a tiny unit of the grid on which the water molecules can settle, layer upon layer. Such a

seed can come from pure water, which in low enough temperatures develops spontaneously into a droplet and afterward into a crystal seed with a regular internal construction. But fine floating dust particles in the air can also trigger the formation of an ordered crystal structure.

Once such a seed has been formed, there's nothing to stop it from growing. Layer upon layer of water molecules settle on it in all directions—but not in all directions to the same degree. Depending on pressure and the temperature of the atmosphere, this can be very different. If the process is taking place at great heights and in low temperatures, most of the crystals assume an elongated form, often appearing as very long, fine ice needles, but always with a hexagonal cross section. On the sketch (see Figure 4), this is the top part. The upper end of the crystal is able to develop even more surface area.

More is shown in this sketch. If the conditions aren't very icy, but there's still thick frost, six mainly flat lateral slabs will develop; below, one can see an ice-crystal cup, a form that can be seen in the ice caves of the Alps (sometimes at enormous heights). The last form is a snowflake as we all know it. These are just the simple basic forms—what nature creates out of these is unique.

ENORMOUS FREEDOM OF CREATIVITY

Every single ice crystal is unique. Even with millions of crystals, no two will be identical. A pair might look like identical twins, but they'll never be exactly the same. This is because every single one comes from heaven to Earth in its very own way. On their journey, these crystals pass through different layers of air, each with different pressure, temperature, humidity, and pollution; and the falling snowflakes react to every small change.

Let's consider how a clean crystallized hexagonal ice-slab leaves the clouds and starts its journey down to Earth. If it passes through a warmer layer of air, the edge of the slab will get loose; if it goes through a colder layer, new crystal layers may be taken up. Sometimes this can happen quickly, sometimes slowly; sometimes the growth phases are long,

sometimes extremely short; sometimes there's more humidity in the air, sometimes less.

We all know from experience how different these crystals can turn out to be. In the never-ending process of growth and dissolution, the most bizarre shapes can form. Everything is possible. If at one point it gets too warm, the crystals will dissolve completely before reaching Earth, and it will start to rain. Sometimes the droplets will cross layers of ice and become fine hailstones, and so on. There are no limits to nature's imagination.

This variety has always been a source of fascination and several people have tried to "collect" these ice crystals. This is much harder than with other minerals, due to the temperatures involved, although it's just possible with the help of photography. The craziest collection belonged to the American W. A. Bentley. He built himself a special slab-camera and spent winter after winter on a mountain in Vermont, taking pictures of thousands of snow crystals. In 1931 a book of 2,453 of his ice-crystal pictures was published.³ A selection of these follows.

Snow-crystals photographed by W.A. Bentley.

So much for the rather conventional scientific descriptions of the development of ice crystals. These are always related to pressure, temperature, and other outer conditions. Masaru Emoto's research has introduced a new aspect, a mental and spiritual one, as he has shown that the subtle energies and vibrations of thoughts, words, and sounds obviously have an impact on the growth of crystals— quite a radical thought for the more orthodox mineralogist. The path of progress here, as in science generally, has been toward investigating ever-smaller sizes and ever-finer energies. It would be wrong to think that this path isn't being blocked by outdated dogma. But maybe these ice crystals will inspire us, as they did Kepler 400 years ago, to revise our concept of the world.

PART II

HEALTH AND
HEALING PERSPECTIVES

INTRODUCTION

The scientific section of this book described the remarkable properties of water as discovered by scientists in recent years. This portion takes these discoveries and builds on them, showing how we can use water in many ways to maintain our health and fight disease. It will be seen that water does this in two interconnected ways: through its well-known physical properties, and through its more hidden spiritual qualities.

The human body is composed of around 85 percent water, which performs many life-sustaining tasks. For example, it supports complex biochemical reactions, provides structural support for cells, and is the major component in blood and all other body fluids. Also very important, it eliminates dangerous waste products from every part of the organism. These processes all rely on water's physical properties. From my own and other scientists' work with water and water crystals, I'm convinced that there's a profound interaction between our thoughts (and perhaps those of people around us) and the water in our bodies. Positive thoughts affect the molecular structure of bodily water, and thus the health and well-being of the entire organism. This theme is central to all the papers in this section. They advance original and important insights into the value of water for healing, and have all been written by experienced health practitioners who have been pioneers of new ideas and information.

An important paper here is on dowsing—the use of divination to find water. This ancient technique, still in constant use around the world, demonstrates yet more of the astonishing powers of water—in particular, the ability to make itself felt from a distance, and from under many layers of rock.

I hope that you'll make use of the ideas and suggestions in these papers for your own well-being and for that of your friends, family, and communities.

CHAPTER 6

WATER AS A SOURCE OF HEALTH

by Petra Bracht, M.D.

Water is essential to our well-being, but its powerful beneficial effect on our health can all too often go unacknowledged. Because all metabolic processes need fluids, it's of huge importance that the "primeval sea" in which the cells swim is always in sufficient supply. To get a better understanding of the crucial role water plays in our health, it's important to consider the physiological processes behind illness and well-being.

WHAT MAKES PEOPLE ILL?

Most people think that illness comes from outside and out of the blue, almost as if an enemy is there lying in wait for the right opportunity to launch an attack. In the Middle Ages, evil ghosts and demons were blamed. Today these have been replaced by fungi, viruses, and bacteria. Contrary to orthodox medical belief, however, each illness has its origin in our psyche; hence, its nature isn't material. What manifests at the physical level (that is, the symptoms) is the body's effort to fight illness; and it's at this level that we can positively influence the "dis-ease" process, as the physical self has infinite potential to secure the support of its 80 billion cells.

All simple illnesses can be seen as the body's attempt to dispose of "rubbish" (for example, through a cold or skin impurities) or to kill undesired substances through increasing the body temperature. It's only if the body has been abused for many years or if extremely toxic substances have made their way into it that this maintenance mechanism breaks down.

Then we start having problems with our health and illness breaks out, and in time it might become chronic.

Although germs are present all the time in the body, they very rarely trigger noticeable symptoms if there's a healthy immune system. This process is similar to cancer in that in nearly every human body cancer cells arise repeatedly on a daily basis. Yet some people get cancer, while others don't. Why is this? Here too the immune system plays a decisive role. So the question is, how can we strengthen our immune system?

First of all, if our metabolism is functioning properly, it will guarantee optimal support for all our cells. An optimal metabolism also means optimal elimination of waste material and harmful substances. But how can we exert a positive influence on our metabolism? What can we do to ensure it helps maintain us in the best of health?

MEGALOPOLIS, THE CITY OF THE BODY

Can you imagine a crowd of 80 billion people? A megalopolis, a concentration of several big cities into one megacity? Probably not. There are some six billion people alive on our planet today, but nearly 80 billion cells in the body are in communication with each other every single second. A protective wall—the skin—encloses our city, where “people”—cells—of all kinds live together. Food and other materials are mainly brought in from outside, although some food is produced within the protective wall by the body's own chemical factory.

Transport within the city is provided by water. The main part of the incoming material is delivered by a river that runs through the city, then this cargo is unloaded and distributed. The waste material is loaded onto ships farther down the river, which leave the city with the current. A very clever distribution system within the city ensures that everything arrives where it's needed. An equally well-thought-out disposal system carries everything that's no longer needed outside so that there's no accumulation of toxic waste.

So how, in such an organized city, can people still die of starvation, buildings collapse, or stinky wastelands (germ beds) develop and threaten a

whole quarter? The answer is very simple: If you supply this city with inferior building materials or block its main transport routes, you basically turn off its water supply. However, as long as the city is provided with everything that it needs and enough water is available, everything will work smoothly.

Each person is such a perfectly functioning city. We all have the best infrastructure that anyone could ever design. None of the most modern supercomputers can match it, but far too few people are aware that it's only through the continued supply of good-quality water that all these processes run smoothly.

INNER MOVEMENT

Everything, even the smallest process inside us, is based on movement. That's why we function best when in motion. This is true for our immune system, the inner organs, the cardiovascular system, the musculoskeletal system, the nerves, the lymphatic system, the brain, and the emotions. We can influence a whole range of metabolic processes through movement. Let's have a closer look at what happens during these metabolic processes.

The raw materials and tools that the body needs to function properly are carbohydrates, fat, protein, vitamins and enzymes, trace elements, minerals, and fiber. These have to be taken in and transported to the part of the body where a specific process happens. At this "building site," new cells are constructed, as are hormones, enzymes, protein, certain vitamins, and much more. All these are produced in the body's own laboratories. Old cells, meanwhile, die off and are recycled. Waste material is produced, which is discharged with the help of special detoxification organs (kidneys, intestines, skin, and lungs). Now you start to get an idea of how much is going on in your body every second of your life.

The means of transport that makes all this possible is water. Our body has a very complex network of "pipes"—blood vessels—so that every cell can be supplied with the necessary materials. Obviously, the efficiency of the system depends on the condition of the network. Many factors have an

impact on the smooth running of the organization, but there's one that's fundamental: movement. This is the primary secret of life.

Movement is life; stagnation is death! The driving force behind all movement is our muscular system. The muscles ensure that blood, lymph, and all other bodily fluids are transported throughout the body and support the work of the heart. Moving the body is therefore beneficial for the heart. Movement stimulates circulation; and as a result our pipes are "flushed out," all the cells are supplied with oxygen, all the nutrients reach their "place of work," the detoxification organs run at top speed, and all the necessary hormones and enzymes are produced.

When everything is moving along so well, something phenomenal happens: Our body starts to notice that the pipes could actually be bigger and that more pipes would ensure an even better supply, or perhaps that certain areas have not been supplied at all. The body gives immediate instructions to begin the necessary building work. The existing vessels get bigger, new ones are added, and the network is extended. The bones get stronger, and the cartilage and vertebrae get thicker so that they're able to take the additional strain. The organs are refurbished so that they can work more efficiently. The improved supply also explains why the bones of a person who does physical exercise heal more quickly than those of someone who doesn't. Just to give you an idea of the scale of the process, muscles that move have a circulation rate 200 times higher than those that remain at rest. This means that those cells will be 200 times better supplied with building materials and oxygen, and waste will be discharged 200 times faster.

It's hard to imagine, but if all the body's blood vessels were laid end to end, they would be about 60,000 miles in length and would circle the Earth more than twice. These vessels are our body's highways.

We could look around the "building site" of our body for hours and find endless new adjustments being made, all triggered by our movements. These can only take place, however, if there is enough water, in the form of blood, to flush through the 60,000 miles of blood vessels.

Movement in our body is better described as "perpetual motion." Once it has started, the system responds by moving more and more. If it's activated every day, this will trigger a dance of joy in the body. Outer activity will also bring about easier inner movement. If there's no movement, the heart

will simply maintain its most basic rate—sadly, a condition that most people live with today, without even knowing it. The system that’s most affected in this case is the body’s oxygen supply. If you don’t lead an active life, your body is just getting an emergency supply, and your cells are “gasping for breath.” Many important illnesses—such as circulation problems, headaches, impotence, and insomnia—arise through a poor supply of oxygen. And for a proper amount, you need water.

A HUMAN BEGIN IS A WATER BEGIN

Movement, satisfaction, and good food are the main prerequisites for health, which goes hand in hand with beauty. Natural, healthy beauty starts inside the body. If everything is in good order on the inside, it will be on the outside, too. Your skin will be healthy, because there will be no need for waste products to be brought to the surface for elimination. Therefore, the condition of the skin, the outer loveliness, mirrors the inner beauty. If your body contains enough water, for example, your skin will be smooth and elastic and your eyes bright. Your body will be functioning at its optimal level. The water content in babies is often as much as 75 percent, but this will continually decrease with age. Unfortunately, it’s not unusual to find levels of under 50 percent in adults. Even young people show low levels of water.

WATER AS TRANSPORT

Water is the main means of transport not only for all the materials that are required by the cells, but also for all the cells’ waste substances. If the transport network isn’t functioning properly because of a lack of water, waste isn’t taken away, but left behind. In medical terminology, this is a “deposit.” Physicians talk, for example, about the uric acid crystals that trigger a gout attack, and a person is described as “calcified” when part of their brain has become a salt deposit. Deposits may also collect in the blood

vessels over a period of time until one day they trigger a heart attack, stroke, or lung embolism.

HOW AND WHAT SHOULD YOU DRINK?

Many people think that they have done their duty by drinking four pints of water per day. But only a few individuals manage to accomplish this; and those who do drink the recommended amount of water often do so in a way that's very ineffective, because pouring several pints of water into the body, say, twice a day, once in the morning and once in the evening, isn't a very sensible thing to do. Such a large amount can't be used properly and will just pass through the body. It's far more sensible to drink water throughout the day. This then has enough time to trickle through the blood vessels into the spaces between the cells and from there into the cells themselves.

The water we drink should be as soft as possible. Nobody would expect their washing machine to use hard, calcified water. Just as soft water is more effective for washing clothes because it can penetrate more deeply into the fabric, so it's more effective for our body, as it can reach even the most remote corners. Therefore, you should drink still, soft water with only traces of calcium and minerals.

This is contrary to current opinion, which recommends exactly the opposite. Ads for "healing" waters particularly emphasize the high concentration and number of different minerals they contain. The culmination of this is fitness drinks with a high mix of minerals. However, more and more therapists now agree that too much of a good thing can have a negative effect. They share the opinion that minerals that haven't been taken in through the biological bond can't be used to optimal effect, which means they're actually not available to the cells. On the contrary, it's often impossible for the body to dispose of these surpluses, and so they accumulate in the space between the cells. In the longer term, this may result in a system overload and the metabolic processes becoming dangerously restricted.

Above: Fresh spring water that originates at the bottom of a mountain. A shining vibrant crystal has formed, which expresses the original power and beauty of nature.

PURE WATER FOR A LONG LIFE

There's an old Chinese phrase that's often found in ancient texts: "water of long life." This kind of water was collected, with immense effort, from the high mountain region and was only available to the upper classes. It was either rainwater or "dew-water" from melted snow. It was pure, having been cleansed naturally through evaporation or rainfall. Unfortunately, this process can no longer take place—today there are many particles in the atmosphere that pollute rainwater.

According to traditional Chinese wisdom, the health benefits of pure water were far-reaching. Although this belief is easy to understand from a biophysical point of view, it meets with resistance from conventional medicine.

Two arguments are often put forward against the consumption of pure water. The first is osmotic pressure. This is demonstrated by putting animal cells into pure water in a reagent glass. The cells blow up till they finally burst, because fluids with different part concentrations have the tendency to reach the same concentration. So more and more water goes into the cells until the cell wall isn't able to cope with the growing pressure and bursts. The opponents of the pure-water theory assume that the same would actually happen in the human body. This is of course a mistake, as the conditions aren't the same. Water begins its journey in the mouth; and right

from the start, it's no longer pure. Furthermore, the deeper it goes into the body, the more polluted it becomes. This cleansing effect is what gives the result the Chinese describe: a longer life.

The second argument against the consumption of pure water is that it washes precious minerals out of the body, causing a deficiency. Earlier on, however, we saw how water with a strong mineral or calcium content created deposits in between the cells, hindering the metabolism. Flushing these deposits out of the body is exactly why we need to drink pure water. Furthermore, the body measures precisely the levels of minerals it discharges—it doesn't give up those that it needs. If necessary, it will go so far as to take back through the skin minerals that have been dispersed through perspiration. (This was discovered by Japanese scientists who were examining athletes.) This means that the argument against drinking pure water is actually the very reason why it's beneficial for health.

If only it wasn't serious, this might even be funny—in the U.S. and in many Asian countries, pure or distilled water is on sale in supermarkets, and in Thailand it's even marketed with the slogan: "This water is good for your health!" At the same time, in Germany and other European countries, medical students learn that it can be dangerous, perhaps even life-threatening.

In my own family, we've drunk pure water for more than ten years for the good of our health; my husband consumes nearly six pints a day. He's in good health and very fit. By the way, did you know that coffee and tea made out of distilled water taste much better, and that it also makes good beer and baby food?

WHERE CAN I GET PURE WATER?

If you live in a country where you can't buy pure water, then you can make it yourself. To do this, you can either filter or distill water through evaporation. In fact, evaporation is the way nature itself cleanses water. The only difference is that in nature it's cold distillation, and at home it's hot distillation.

In the hot-distillation process, water is heated to the point of evaporation and then spirals its way back down into liquid form. The impurities are left behind in the container in which the water has been heated. This is actually a good test for your tap water. Fill a big cooking pan from your faucet, and let it evaporate. Afterward, have a look at the residue in the bottom of your pan. If you live in a congested area or somewhere with very hard water, this experience should be enough to make you start drinking pure water immediately!

In the steam-distillation process, the order of hydrogen and oxygen molecules in the water is changed, and as a result it can lose its beneficial “information.” To counteract this, it’s a good idea to put the distilled water out in the sun, shake it, stir it, or even play it pleasant music. In this way you load it with positive intent.

The alternative is filtering. There are many ways to do this, but all of them have the same problem as vacuum cleaners: On one hand, the filter must be fine enough so that no dirt can get through, but on the other hand it must be coarse enough so that it doesn’t get blocked by the dirt it picks up. A lot of the filter systems on the market claim to have struck such a balance, but who knows what, if any, minerals are getting through? And water without any minerals at all would be what they call “dead water”—that’s why the filters on our taps don’t remove all the minerals.

What are the criteria for “living” water anyway? Is water from fruit alive? Is fresh spring water alive, because it forms beautiful crystals? We can certainly say that it isn’t the existence of minerals that determines the vitality of water, but the information that’s contained in the water. And this can’t be viewed on the material level alone. We should consider the etheric energy of water here, not just the way impurities and minerals are filtered out of it.

Those who want to purify water thoroughly, however, can do this through the reverse-osmosis procedure. Here water runs through a very fine filter membrane. The pores of this are so small that the purity of the water is as good as when it’s distilled. Reverse-osmosis filters can be connected to the main pipes from under the kitchen sink. Then, to revitalize your distilled water, you can use one of the methods described earlier.

Above: Distilled water that has been shown the movie *Life*. The water seems animated and formed a beautiful crystal.

EATING WATER IS BETTER THAN DRINKING IT

The best possible way for the body to get water is out of fruits and vegetables. In this way, all minerals, trace elements, and vitamins are easily available, as well as all the other plant substances that have benefited humankind for millions of years. Water that's consumed in this manner reaches the blood more slowly and evenly and at the same time that the minerals are offered in the biological bond. Therefore, the body is able to use both water and minerals much more effectively. Thus, the best way to provide your body with water is to eat it.

It's not difficult to do. The water content of most fruit and vegetables is over 90 percent. For melons, oranges, and grapes, it's as high as 98 percent. Therefore, "eat" water whenever you can—that way, "drinking" becomes a real pleasure. A fruit salad or an apple makes a delicious snack and helps you stay healthy as well.

Cooking and frying dehydrate food, so the best way to eat fruits and vegetables is as fresh as possible. Fish and meat also lose water when cooked; and the higher the temperature, the greater the water loss. That's why we should try to cook our food at the lowest temperature possible. This has also the advantage of improving the taste.

Above: Eat fruits that are as fresh as possible.

AND DON'T FORGET—DRINK A LOT!

If for the last decade you've been drinking far too little water, or have drunk it in such a way that your body hasn't been able to use it properly, the consequences will become more and more apparent in the second half of your life. The very sad fact that older people often don't cook for themselves anymore and tend to rely on ready-made meals, which often have minimal water content, also contributes to the water shortage they experience.

So why not turn this around and make a positive change? The older you get, the more water you should drink and the more fresh food you should eat. This will help keep you physically and mentally agile well into old age.

COLONIC IRRIGATION: CLEANSING AND DETOXING WITH WATER

Thousands of years ago, enemas were used to enhance the healing process. Today the same process is used, but with a completely different technique. Colonic hydrotherapy, which was developed for U.S. astronauts, is able to clean the colon thoroughly and hygienically. The flush effect enables the removal of all the old decaying material—fecal matter—which can lead to recurrent poisoning. Through the osmotic process, it's also

possible to reach and remove toxic substances beyond the colon quickly and easily, without any side effects. This process can have dramatic results—in some cases, hay fever and migraines have disappeared completely after just one treatment. Former smokers also experience fewer withdrawal symptoms.

The colon has a huge (approximately 3,230 square foot) interface with the interior of the body. With colonic irrigation, metabolic residues and toxic waste matter can be taken up by the water that has been introduced into the colon, and thus eventually leave the body through the rectum. If your lifestyle needs to be healthier, having this “internal shower” once or twice a year will give you a much-needed opportunity to cleanse yourself of metabolic residues and enable you to experience the healing power of water.

CHAPTER 7

WATER: THE FUSION OF SCIENCE AND SPIRIT

by Dr. Darren R. Weissman

Conscious living, I've learned, begins with understanding the true power of water, as documented through the research of Dr. Masaru Emoto. The power of water exists in its ability to flow effortlessly, no matter what its environment. Water takes on the shape of its container, moves continually in swirling motions, or is effortlessly guided by the banks of a river. As life itself, it's always moving, changing from one state to another, vibrating and resonating at different frequencies. It has the potential to carve a path through a mountain, squeeze through the smallest opening, and, when heated, evaporate into thin air. Water is as mysterious as the infinite universe itself. It holds the secrets of all life. One drop may contain the blueprint for the cure of every disease known to humankind.

The human body is estimated to be between 70 and 90 percent water. Each cell, organ, and system of the body consists of specific percentages of water; and the flow of that water determines whether the body expresses itself in optimal health or in symptoms of imbalance or disease.

The late F. Batmanghelidj, M.D., a renowned physician, researcher, and author of *Your Body's Many Cries for Water*, discovered the profound benefits water has on the physiological functions of the body. He wrote:

From the new perspective of my 22 years of clinical and scientific research into molecular physiology of dehydration . . . I can safely say the 60 million Americans with hypertension, the 110 million with chronic pains, the 15 million with diabetes, the 17 million with asthma, and the 50 million with allergies . . . all waited to get thirsty. Had they realized water [was] a natural antihistamine and a more effective diuretic, these people would have been saved the agony of their health problems.

This article will outline the healing power of water and how the subsequent fusion of science and spirit gave birth to The LifeLine Technique.

DR. EMOTO'S WORK AS A CATALYST

It was the groundbreaking water-crystal research of Dr. Emoto that demonstrated the essence of water's power—its *consciousness*— and the instantaneous impact our thoughts, words, and actions have on its molecular structure. Because every element, cell, organ, and system of the human body is composed of water, we now understand that emotions affect the health of the body in the same way that the water in the crystal research was affected.

Dr. Emoto's work was the catalyst for The LifeLine Technique, which makes it possible for us to *understand* what the body is *saying* when it speaks to us in symptoms. Incorporating aspects of 14 natural healing modalities, The LifeLine Technique is based on the ancient arts of Chinese and Ayurvedic medicines, as well as on years of empiricism, documented research, and biomedical evidence. Through the use of a kinesiological reflex (muscle test), a LifeLine practitioner is able to translate, harmonize, and facilitate the release of emotions trapped within the subconscious mind, thereby enabling the body to heal on a core level. Coupled with healthy lifestyle choices—such as the quantity, quality, and frequency of water, food, rest, and exercise and owning your power—The LifeLine Technique awakens people to the power of living consciously.

My journey to awakening to The LifeLine Technique was the culmination of every experience, teacher, and patient with whom I worked. Each modality I learned and used provided another piece of the puzzle I was constructing in an effort to find the link that would ultimately help my patients heal at the deepest of levels. When it all finally came together, the missing link turned out to be Dr. Emoto. His discovery of the secret life of water forever changed my view of the body's healing potential.

I want to share a portion of my journey with you. During the summer of 1998, my cousin Rob Morgan worked as an intern in my office in

preparation for becoming the first deaf chiropractor ever to graduate from the Palmer College of Chiropractic. After a full day of observing patients, Rob turned to me and held up his hand in what I was to learn meant “I love you” in sign language.

“I love you.”

I was amazed by the warm, powerful, and peaceful feeling I experienced as Rob held up his hand. Intrigued by this sensation, I asked him to hold his arm up as I assessed different reflex points on his body using a muscle test. (A muscle test uses an indicator muscle or involuntary reflex to evaluate the balance or integrity of the nervous system. If the muscle becomes weak when pressed, it’s signaling the presence of an imbalance within the body or that its integrity is somehow being compromised.) I found a weak reflex point when I checked Rob’s body, but when I held my hand in the “I love you” sign mode, the reflex in his arm instantly became stronger. I didn’t realize then the significance of that moment. It would take another three years for all of the pieces of the puzzle to fall into place.

The breakthrough came in the form of an e-mail from a friend containing a picture of one of Dr. Emoto’s water crystals—love and gratitude.

Dr. Emoto's water crystal "Love and gratitude."

When I saw that photograph, it was the first objective representation of what I already knew in my heart to be true—that love and gratitude have the power to heal. That picture became the catalyst for me to link together the experience I had with the “I love you” sign mode and the 12 years of experience I had as a holistic physician trained in chiropractic healing, acupuncture, homeopathy, applied kinesiology (AK), total body modification (TBM), neuro-emotional technique (NET), neuro-linguistic programming (NLP), neuro-modulation technique (NMT), Chinese energetic medicine, natural healing, and aspects of many other forms of energy healing. The result was one unified system that I named “The LifeLine Technique.”

Inspired and empowered by Dr. Emoto's work, I've since conducted experiments utilizing a dark-field microscope and live blood-cell analysis to evaluate and document before and after treatments with The LifeLine Technique. These experiments have conclusively demonstrated an instantaneous change in the molecular structure of blood and a dissipation or total elimination of the patient's original symptoms.

Before: A nine-year-old boy with the symptoms of severe migraine headaches.

After: Using the power of Infinite Love and Gratitude released his subconscious feelings of anger toward his parents because of their divorce.

Before: A 32-year-old woman with the symptoms of fibromyalgia.

After: Using the power of Infinite Love and Gratitude released the subconscious feelings of grief she had internalized for three years following the death of her mother.

Before: A 40-year-old woman whose attempts to become pregnant had been unsuccessful.

After: Using the power of Infinite Love and Gratitude released the subconscious belief that her age made it impossible for her to get pregnant. She had a baby 11 months later.

Before: A 42-year-old man with the symptoms of acid reflux.

After: Using the power of Infinite Love and Gratitude released subconscious thoughts of shame related to a family situation.

Before: A 53-year-old woman with symptoms of insomnia.

After: Using the power of Infinite Love and Gratitude released subconscious fears about her future provoked by the reorganization of the company where she worked.

THE TRIUNE BRAIN

While the catalyst for my awakening to The LifeLine Technique was Dr. Emoto's water research, its genesis incorporated the work of three other renowned scientists: Dr. Paul MacLean, Dr. Candace Pert, and Dr. Bruce Lipton, whose research further reinforced the hypotheses put forward by Dr. Emoto.

There's a direct link between the brain research of Paul MacLean, M.D., the former director of the National Institute of Mental Health's Laboratory of Brain Evolution and Behavior in Poolesville, Maryland, and Dr. Emoto's water research. The brain is nearly 90 percent water; therefore, its function is directly impacted and influenced by the makeup of that water.

More than 50 years ago, Dr. MacLean, considered to be one of the world's greatest neuroscientists, hypothesized that the skull held not one brain, but three. He referred to this as "the triune brain theory." He noted in his research that the three brains operated like "three interconnected biological computers." He referred to these three brain centers as the neocortex, the limbic system, and the reptilian brain. MacLean believed that each of these was connected by nerves to the other two, but each seemingly operated as its own system with distinct capacities. He considered the harmonious flow of "the triune brain" to be of primary importance for the optimal functioning and health of an individual.

Let me give you a brief description of the function of the triune brain:

- The **neocortex** is the storehouse of higher cognitive functions such as rational thinking and creative expression. This is the part of the brain that separates human beings from other species. It houses our free will, our ability to choose or take action in any given moment.
- The **limbic system** is a storehouse of short-term memory, emotion, attention, instincts, feeding, fighting, fleeing, and sexual behavior. It will trigger a hypnotic state/reptilian response as a means for survival when an overwhelming experience occurs.
- The **reptilian brain**'s purpose is purely survival. It's rigid, obsessive, compulsive, ritualistic, and paranoid. It maintains and regulates all bodily functions ranging from heart rate and respiration to metabolism, immunity, and hormones. There's no conscious choice when a function of the reptilian brain is occurring.

According to the triune brain theory, unification of the three brains enables the electrical frequency of thoughts, feelings, and beliefs to be integrated into behavior. It had previously been assumed that the neocortex, which was believed to be highest level of the brain, dominated the other, lower levels. However, Dr. MacLean's research demonstrated that the limbic system, which *rules emotions*, had the tendency to hijack the higher mental functions whenever necessary for survival, inhibiting emotions from being processed by the neocortex.

In each and every moment, the body receives its instructions for adaptation and regulation from the reptilian brain. These functions are governed via the law of cause and effect. The reptilian brain doesn't have the capacity to learn, only survive. This process is purely mechanistic, and the body isn't able to differentiate between reality and imagination. When a trauma is triggered that's trapped within the limbic brain, a reptilian reaction causes the body to respond as if it were experiencing the situation for the first time. Dr. Emoto's research helps us appreciate how certain emotions can create a physical breakdown in the molecular structure of the water comprising each of the cells within the body. This makes it difficult for the physical life force to flow efficiently.

The body won't break free of reacting in a survival-like fashion until the trauma is processed consciously. From my work with The LifeLine Technique, I've concluded that the limbic system serves as a stopgap, preventing traumatic or shocking experiences from being processed by the neocortex. Instead, the traumatic experience waits to be released, nudging and reminding the body of the unprocessed emotions by "speaking" with symptoms.

Healing and transformation occur when traumatic experiences and emotions are processed to the neocortex, which occurs during sleep, while the eyes are going through rapid eye movement (REM) cycles. This signal of information to the neocortex facilitates a short-term memory to be processed into long-term memory, enabling a person to learn a lesson from a traumatic experience and consequently to live in the present moment.

The LifeLine Technique uses aspects of eye movement desensitization and reprocessing (EMDR) to break limbic-reptilian holding patterns. Using The LifeLine Technique Flow Chart, which has laserlike accuracy, the process is a fast, safe, and non-content way to reconnect to and process emotions. The beauty of the technique is that a person doesn't need to express openly the painful, scary, or challenging emotions; they need only *think* them. When they do, the cells in their body are impacted in the same way that Dr. Emoto's work has demonstrated that water is influenced by its environment.

PROCESSING EMOTIONS ON A MOLECULAR LEVEL

How the body processes emotions has also been studied on a molecular level by Candace Pert, Ph.D. Dr. Pert, a noted researcher and pharmacologist and the author of the books *Molecules of Emotion* and *Everything You Need to Know to Feel Go(o)d*, has proven that neuropeptides—the specific chemicals triggered by emotions—are thoughts converted into matter. *Webster's New World College Dictionary* defines emotions as "complex reactions with *both mental and physical* manifestations" (emphasis mine). Dr. Pert's research discovered that emotions reside in the body and physically interact with cells and tissues.

Integrating Dr. Emoto's research with Dr. Pert's discovery of neuropeptides demonstrates the connection between our emotions and our health.

My research has shown me that when emotions are expressed—which is to say that the biochemicals that are the substrate of emotion are flowing freely—all systems are united and made whole. When emotions are repressed, denied, or not allowed to be whatever they may be, our network pathways get blocked, stopping the flow of the vital feel-good, unifying chemicals that run both our biology and behavior.

It's interesting to note that emotions compete for the same receptor sites as heroin. Just as heroin is extremely addictive, so the selectivity of emotional receptors helps us appreciate the addictive quality that dramas have in people's lives. We begin to crave particular emotional experiences as a way of feeding subconscious addictions. So our identity is created by the "network pathways" of emotional addictions.

Just as detoxifying a person from heroin too quickly can be life-threatening, so awakening a person to consciousness without the heightened perception, functional tools, and simple strategies to face the pain, fear, and other challenges of life can inhibit them from being open to change.

Using The LifeLine Technique, we're now able to locate specific neuropeptides blocking the network pathways. By targeting specific traumatic events, limiting beliefs, and symptoms within the subconscious mind and body, we're able to recreate the exact environment of trauma. Once targeted, the intention and frequency of Infinite Love and Gratitude is used while the LifeLine practitioner holds their hand in the sign language mode of "I love you." This process harmonizes and releases the network pathways within the mind and body by affecting the molecular structure of water that makes up each of the cells within the body. Once harmonized and released, the pathways are open, the mind is present, and the body's self-healing capacity takes over.

THE ROLE OF BELIEF

Dr. Bruce Lipton, a cellular biologist and the author of the book *The Biology of Belief*, is the next link in the fusion of science and spirit. His

work documents the connection between perception and health. As a result of the research of Drs. Lipton and Emoto, we're now able to recognize and document how the perception of our environment is created by our beliefs. Furthermore, with The LifeLine Technique, we've been able to interpret the exact meaning of symptoms and stress—the language of the subconscious mind—to help us reconnect to what we at one time didn't have the tools or strategies to process. The genetic potential of being able to harmonize limiting beliefs will forever change the way we view genetic processes.

Dr. Lipton set out to discover the brain of a cell. Interestingly, individual cells are like mini-oceans, being composed primarily of water. Dr. Lipton's intention was to find out how perception impacted the function of a cell. He began the process by studying deoxyribonucleic acid, more commonly known as DNA.

DNA was discovered in the early 1950s. This scientific advance was the result of the Nobel Prize-winning work of two scientists, Dr. James Watson and Dr. Francis Crick, based on the initial research done by Dr. Rosalind Franklin. Since that time, scientists have discovered many ways for using the information gleaned from DNA, from genetic fingerprinting to identifying criminals. At the heart of their work has been the belief that DNA is the *brain* of a cell. According to this belief, if people have the genetic makeup for breast cancer, inflammatory bowel disease, or bipolar disorder, they'll eventually develop that disease. As a consequence, some women are having complete bilateral, radical mastectomies without any physical sign of cancer due to a genetic evaluation of their DNA.

The tragedy, as Dr. Lipton's research has documented, is that DNA is *not* the brain of the cell. Dr. Lipton conducted tests in which he removed the nucleus of a cell containing the DNA. He hypothesized that if DNA were the brain of a cell, something very predictable would happen when it was removed—the cell would die instantly, just as a person would die if their brain were removed. Just the opposite occurred: The cell lived. Dr. Lipton then began to remove the individual components of a cell one at a time until he found the specific anatomical part that resulted in instantaneous death. He discovered that the brain of a cell was its protein receptors.

Protein receptors are very thin membranes that function like a cell-phone antenna, sending messages directly to the nucleus. They're not only on the outside of a cell and the nucleus, but also in our senses—that is, the rods

and cones in our eyes and the cilia (hairs) in our nose and ears. All of our sensory receptors are made of protein. And in an antenna-type fashion, protein picks up the vibratory frequencies of sound and light and sends the signals to our brain. Depending upon the message, the brain then sends a signal down the spinal cord to specific areas of the body.

When the protein receptors on the outsides of individual cells receive the information via *neuropeptides*, they send a signal to the nucleus, where the messages are encoded. From that encoding, the protein *creates* the DNA for a specific cell so that it will adapt to its environment. The nucleus, according to Dr. Lipton's research, is in fact the reproductive system of a cell—it is the center of a cell's ability to regenerate.

Dr. Lipton's exhaustive studies also sought to find out how a cell responds to stimuli, in a similar fashion to the way the brain reacts to the senses. He wanted to know how the liver, lungs, or intestines react to what's going on in the external environment. What he discovered, as explained in his book, was the link between beliefs and the state of health: "Cellular biologists now recognize that the environment (external universe and internal physiology), and more importantly our perception of the environment, directly controls the activity of our genes."

When it comes down to it, we'll only perceive what we believe, and our beliefs have a direct impact on the molecular structure of the water that makes up every cell, organ, and system of our body. Dr. Emoto's water-crystal research mirrors how the perception of the "external universe" directly impacts the molecular structure of water, the same water that makes up the "internal physiology" of the body.

The LifeLine Technique creates a conscious awareness of both the "external environment" and the "internal physiology" by harmonizing and releasing limiting beliefs trapped within the subconscious mind. Water's molecular structure is enhanced as our consciousness begins to expand. Not until the subconscious is made conscious are we able to choose or take action based on what we're truly experiencing in any given moment. The ramifications are infinite. Creating inner peace makes it possible to create world peace.

INFINITE LOVE AND GRATITUDE

Using a symptom as the portal, the LifeLine practitioner is able to use the LifeLine Flow Chart to discover the specific subconscious emotional patterns of disconnection and instantly harmonize these imbalances with the frequency of Infinite Love and Gratitude. As with Dr. Emoto's water-crystal research, these profound words have a direct influence on the molecular structure of the body. Defining "Infinite Love and Gratitude" helps us appreciate why.

From time and the cosmos to the cycle of the seasons and life itself, the universe is infinite. It's forever expanding and undefined. Therefore, as a being of the universe, your mind possesses the nature and potential of the infinite. The infinite universe and mind are the great frontier, the endless entity of boundless mystery. Acknowledging your connection to the infinite universe and the infinite mind is fundamental to understanding the unlimited potential that you possess. This view is magnified to infinity by the core truth that you're a spiritual being having a human-being experience. By "be-ing," you experience the infinite essence and wonder of life.

It has been said that there are only two true emotions, love and fear. All other feelings are an extension of these two. However, love takes precedence, for it's only when love is absent that fear is present.

The experience of fear is a gift. True fear happens in a moment of danger and then is immediately released. It's a survival mechanism that's governed by the reptilian brain. The end result of living a life in a constant state of fear is victimization and suffering. Louise L. Hay, the author of many best-selling books, including *You Can Heal Your Life*, is the matriarch of teaching people to love themselves. She has helped millions around the world with this simple yet profound concept. She so eloquently states, "If you change your thoughts, you change your reality." As Dr. Emoto has demonstrated, choosing to love, accept, and forgive unconditionally is universally the most powerful healing energy.

We give thanks to individuals or experiences that we value. However, what about the painful, scary, and challenging people and experiences in our lives? By embracing them with the "attitude of gratitude," we're acknowledging them as having worth. Value gives life meaning, and with

meaning we're able to transcend victimization and suffering. The most powerful people throughout all of history have endured the most difficult situations. A belief structure that every challenge is an opportunity for growth or a vehicle for spiritual awakening empowers a person to move through life in a heroic fashion. We all have the capacity to be heroes—to move through the painful and scary experiences of life with faith, courage, and determination—and to trust that everything happens for a reason, even if we don't understand the meaning in the moment. It all begins with the power of Infinite Love and Gratitude.

For the past five years, I've been teaching seminars internationally to both laypersons and healing-arts professionals. The philosophy of The LifeLine Technique is simple to understand. It combines the best of natural-healing modalities into a unified system that transforms the core emotions trapped within the subconscious mind. Just like the transformation of distilled water into various crystals, the change occurs instantaneously within the mind and body. We continue to document The LifeLine Technique and the power of Infinite Love and Gratitude with live blood-cell analysis and have repeatedly found that both a person's perception of their environment and the function of their internal physiology are transformed.

Let me share an example in which the documentation was provided by the patient's medical doctor, with before and after reports. In the summer and early fall of 2003, a patient I'll refer to as "Alice" began experiencing uterine bleeding and abdominal pains. The lower area of her stomach was also protruding. At first Alice, who was 51 at the time, thought she might be pregnant. Instead, a gynecological exam and subsequent biopsies revealed three ovarian cysts and a fibroid tumor the size of a grapefruit. The masses were all found to be benign.

Alice came to see me shortly after the diagnosis. I knew that with The LifeLine Technique we would be able to determine the *root* cause of why her subconscious mind was using the *symptoms* of a fibroid tumor and ovarian cysts to communicate. But to help facilitate the healing process, Alice had to take responsibility. I discussed with her the importance of following the Five Basics of Optimal Health—the proper quantity, quality, and frequency of water, food, rest, and exercise and owning her power.

As we continued to work together, the abdominal bleeding and pain ceased, and ultrasound and sonogram tests showed that the masses were

shrinking. Despite that, Alice's gynecologist believed that they should be surgically removed.

On the day that Alice was scheduled to have the cysts removed, the operating room was overbooked. After waiting eight-and-a-half hours for the surgical appointment, she chose to leave the hospital. She later told me that she accepted the opinion of her doctor; however, she'd been to a LifeLine seminar and knew in her heart that her body had the power to heal itself.

During a subsequent treatment using The LifeLine Technique, Alice's subconscious mind revealed a limiting belief being held in her root chakra dating back to the age of 12 and associated with the emotions of regret, guilt, and fear. I asked her to pay attention to what *immediately* came to mind when I said those words aloud. This is what she told me:

Immediately, my thoughts went back to the time I was awakened by an argument between my parents. It was the first time I'd ever heard them raise their voices to each other. The next thing I knew, my father was standing above me with a knife raised over my head. But when he looked me in the eye, he stopped. He attacked my sister instead, stabbing her to death in front of me. . . .

I thought my father hadn't hurt me because I'd looked him in the eye; and I believe that if I'd awakened my sister, she, too, might still be alive. I always felt guilty that I survived and my sister didn't. Subconsciously, I felt remorse, guilt, regret, and fear for not having the courage and presence of mind to wake her up.

Reflecting on my experience of the treatment with The LifeLine Technique, I came to accept and appreciate the strength and purpose of lives such as my sister's that were so unfairly and suddenly cut short. As a result of the treatment, I've experienced an inner sense of peace and confidence and now resolve to forgive myself, and commit on a much deeper level to my well-being in all areas of my life and relationships.

Over the next nine months, Alice made conscientious efforts to follow the Five Basics of Optimal Health and continued weekly treatments. In August 2005, tests indicated that her uterus had returned to normal size and that all of the masses were gone.

RECONNECTING TO OUR POWER

The LifeLine Technique consciously reconnects us to the power of our thoughts, feelings, and choices. If you have the belief that everything is an

opportunity, no matter how challenging or difficult, your mind will send that positive charge to the water that makes up the molecular structure of the cells in your body.

It's common to think, *If I can just find the right person/job/other external solution, then everything will be just fine.* However, if we don't change ourselves, we'll continue to repeat the same relationships, financial challenges, and health issues over and over again. Not until we become conscious of the limiting beliefs and the emotions that are trapped within the survival aspects of our subconscious mind will we begin to recognize that other choices exist. These patterns are the language of the subconscious mind that can now be easily understood and transformed with The LifeLine Technique and the power of Infinite Love and Gratitude. The LifeLine Technique demonstrates the healing power of water and quantifies the limitless potential all people possess to heal, find inner peace, and create harmony in their environments.

The LifeLine Law of Transformation and Creation states: Emotions transform energy; energy creates movement; movement is change; and change is the essence of life. It's the *fear* of change that keeps people stuck in patterns of victimization and suffering. The process of healing is a spiritual path, the evolutionary journey to awakening your spirit. Dr. Emoto's research has courageously paved the way for the fusion of science and spirit.

CHAPTER 8

DOWSING FOR WATER

by Sig Lonegren

Today, dowsing is used for many different purposes—health, earth energies, oil, archaeology, and many more. However, by far the most important target for diviners is water. Until recently in Britain, a liter of water cost more than the same amount of gas in the U.S.! Many feel that the major battles of the 21st century won't be over oil, but over an even more basic commodity: water.

Hydrologists explain that all water comes from the sky as rain and then goes through the well-known cycle of falling on the land, going into rivers and flowing into lakes and oceans, where it evaporates up to the skies, only to fall again as rain. This is called “secondary water,” because it's used over and over again. Dowsers find that in addition to this source, there's another one. It's “primary water” that comes from deep in the earth and is the result of the chemical processes going on down there. For example, when you mix an acid and a base (especially under heat and pressure), you get a salt plus water. And where does this primary or “juvenile” water go when under heat and pressure? It moves away, toward the surface, through any crack it can find. It gathers to form enormous underground rivers deep in the bowels of the earth; and when it finds a crack in the ceiling, it goes upward again in what American dowsers call a “dome” and British dowsers call a “blind spring.” When it very occasionally reaches the surface, it's called a “geyser.” But in most cases, its upward journey is halted upon reaching an impermeable layer (such as clay), and so it spreads out laterally as veins. From above, this looks like a spider with an odd number of legs.

Most holy wells come from this primary water. In addition to H₂O, many of them have other elements mixed in as well. At the Chalice Well in

Glastonbury, England, for example, the water is called “chalybeate.” While it runs clear, it’s full of iron. Across the road, the White Spring is full of calcium [see Chapter 17].

Well above the timberline and only a short distance from the top of Mount Katahdin in Maine, where the sun first hits the United States each morning, is a spring of water. Above it is only hard rock. So where does that water come from? It can’t be rainwater percolating down from above. It’s primary water, and it comes from way below the base of that impressive mountain. The message here is that while we’re facing a critical shortage of secondary water around our planet, there are ample supplies of primary or juvenile water that dowsers can find for us.

No dowser hits water 100 percent of the time, but there are water-well dowsers in California who consistently have success year after year between 85 and 95 percent of the time. Not only can they tell their clients exactly where to put the drill bit in, but how deep they’ll have to go and how many gallons a minute they’ll get!

Dowsing is a practice that enhances our intuition and can connect us to sources of information that can’t be found through rational methods. Until relatively recently in our history, diviners were burned at the stake. But one form of divination was judged too important to include in this witch hunt, and that was water dowsing. Despite sometimes being referred to as “water witching,” it was just too valuable a skill to wipe off the face of Europe, as happened with so many other uses of this ancient art.

It’s only within the past half-century that these other applications have been rediscovered. And it’s amazing how many of them are also directly connected to veins and domes of primary water. For example, domes of primary water are found underneath all ancient sacred sites. This was first noted by Reginald Allendar Smith, who worked for the British Museum and in 1925 became the Trustee Representative on the Ancient Monuments Board for England. After he retired in the 1930s, he was one of the first to publish articles in the *British Society of Dowsers Journal* stating that he had dowsed water under all of the ancient sacred sites that were also attracting the attention of ley hunters. (One can commit any heresy after retiring!) According to the theory of ley lines, the water is yin, and the energy leys—six- to eight-foot wide straight beams of energy that cross at power centers directly over the yin veins or domes of water—are yang.

Likewise, information about many archaeological sites can be enhanced by seeing their relationship—or lack thereof—to water. For example, most Bronze Age hut circles in Britain weren't built over primary water.

In terms of health, German dowsers found in the 1920s that certain houses had a high incidence of cancer—*Krebs Häuser* (cancer houses). And under these houses, but not their neighbors', they found crossings of underground veins of water.

It seems that it is the *flow* rather than the water itself that's associated with many forms of degenerative disease. Drinking-water dowsers, who open themselves up to these energies, can frequently be seen wearing copper bracelets to help ease the pain of arthritis. Many alternative-health practitioners find that all their work can be undone if their patient goes home after a treatment and sleeps over underground water crossings. Again, it's the flow that seems to cause the problems. (Primary water, once it reaches the surface of the earth, is usually perfectly fine to drink.)

So underground water plays an important part in many areas of dowsing. It can contribute to contracting disease, and it can enhance the possibility of connection with the numinous at sacred spaces; but it's the ability to find good sources of primary water that will be dowsers' major contribution to the 21st century.

CHAPTER 9

LISTENING TO WATER

by Miranda Alcott

Sharing water with the firefighters, EMTs, police officers, and chaplains at what was left of the World Trade Center after September 11 created some of the most sacred moments of my life.

What brought us all together was a few simple bottles of water available at designated spots on the site. I wondered if anyone standing around the flats of bottled water in exhausted silence was aware of the healing properties of the liquid they were holding. They were replenishing what had been lost due to extreme stress in their already fatigued bodies. They took giant trusting gulps as we stood amid the rubble and body parts. Were they drinking to quench their thirst . . . or to put out their emotional flames?

I'm a crisis responder, intuitive healer, and counselor with a master's degree in spiritual psychology. But most important, I'm a listener. Together with my service hearing/crisis intervention canine, Whisper, in my daily practice I work with people who are confronting some form of crisis in their lives. They may have deep issues—recent or sudden deaths in their families, exposure to mass critical incidents, diagnoses of terminal illness, and life-direction decisions—or the simple yet overwhelming physical toll of everyday stress.

My work allows me to experience many different energetics in places and with those I go to help. Many of the things I observe aren't visible to most people. I'm able to experience, listen, and see energetic fields, colors, frequencies, and vibrations that most others aren't aware of.

I do this by using what's currently referred to as a *holographic paradigm*, which includes *quanta*, or small groupings of energy. These groupings in turn make up atoms that resonate at individual frequencies. At an

infinitesimal level of existence, energetically, we're all a part of the whole; but each atom's frequencies are so unique that every one of us carries a very individual energetic "snowflake." What I experience are the different "signatures" that constitute the fields that permeate and surround each of us and, in fact, all living organisms.

Some of these energetic "nets" of wavelike structures appear as diaphanous forms that make themselves visible to me in a floating manner. They can be created by many events—violent crime, a natural disaster, or simply by the laughter of children. Some result from simple tones of music, which put on a light show the likes of which can only be rivaled by the aurora borealis. (There are more complete examples in my soon-to-be-published book, *An Extraordinary Journey Through an Ordinary World*.) Other energies I see are those that are working 24/7 to keep our bodies running at top efficiency. "Looking" at these energetic forms and fields, in combination with the energetic directives I receive, allows me to access the information from which I work.

My conscious association with water has been going on for quite some time. At two and a half years old, I watched one morning as a pool of water reached up to help a bird rinse its feathers. And early in my life I noticed that although most animals drank lots of water, there were some people who didn't drink much, if any. I didn't understand this, and for a very long time couldn't imagine refueling my body without water's presence. I watched water around these individuals, but didn't see any answers until years later in my private practice, when I noticed that the people who spoke of the mental, physical, emotional, or spiritual abuses in their lives were the same ones who usually wouldn't open the bottle of water I offer at the beginning of each session.

In observing my clients' interactions with the water offered, I saw that there were some who accepted it as a social gesture, some who fondled it in contemplative moments, and some who drank the entire bottle as soon as they could get the top off. When I would ask how they felt about interacting with the water, each of them seemed to hold the belief that drinking, ingesting, or holding it would, at that moment, somehow intensify their own issues. I also noticed that some would begin their de-stressing processes almost as soon as they were offered the water. From then on, I used water as

an active participant when called out into the field for my crisis-response work.

One of my earliest experiences with water out in the field was during an emergency response at our local airport. I saw a woman in physical distress who had fields of faintly colored energy surrounding her body. These colors were rapidly fading in and out. The closer I got to her, the more I felt my blood sugar lower. She was holding a foam cup filled with what I assumed was juice, as the energies rolling off the surface of the cup were of a pale organic orange. As I got closer to her, I noticed that the cup was filled with water. How could water, which normally emits many colors, be emitting only one color? The woman's energetic field was so faint and mottled that I quickly called a nurse over.

Later that afternoon the nurse sought me out to tell me that the woman was a diabetic and had been experiencing a diabetic collapse. The water had been reflecting what she'd needed earlier: orange juice.

WATER AS HEALER

The effects of water's presence in our lives are so obvious that many of us take them for granted, yet we've all noticed how excited children become when they interact with this substance. It also has its own character. Have you ever noticed, when entering an empty room, that if there's a pitcher of water in it, you don't feel alone?

We take water with us everywhere these days. When we're hiking or exercising, we carry bottles of it for regeneration and rejuvenation. We're created in water, bathe in it, cleanse wounds with it, and can die when we don't have enough of it. With roughly two-thirds of our planet covered by water and our bodies containing similar proportions of it, is it any wonder that it's such an amazing conduit for our thoughts, energies, and healing?

Nature provides so many ways for us to live more easily if we can only be more sensitive to what surrounds us, and animals can be such great teachers for us all. Recently, I stood in the high mountains of New Mexico while the lightning-filled charcoal clouds announced a coming storm. As the ions increased, I watched a beautiful coal-black stallion prancing to

discharge the intensity of the electromagnetic energy. He did this by tossing his head, arching his tail, and bucking himself off the ground, breaking the build-up of static electricity. He instinctively knew what he needed to do in order to release the accumulation of the converging energies. When the rain clouds broke, he calmed, and water soothed his body.

I believe that we have a primordial relationship with water as our earliest parent—one of the life forces from which we sprang. It can be so comforting, while also having an uncanny ability to reflect emotions. The reason for this, as I understand it, is that thoughts are energy, which creates vibrations. These can have color and distinct forms, all of which I see. There are also more hues than we perceive with our eyes, including what I call “colorless colors.” When water’s healthy, I experience it as a glowing liquid light that hums. Vibrations give me information, and once I have that, I wait for an energy flow, or “energetic directive,” to see how I’m supposed to help.

As a listener, I naturally pay attention to most beings. In April 2003, my service dog, Whisper, reacted very strongly to the photographs of water crystals that Dr. Emoto was displaying during one of his presentations in Los Angeles. She reacted to both his crystal images and to the vibrations of his tuning fork. Whisper is a healer in her own right, and she was deeply affected by the communication that she saw in Dr. Emoto’s pictures. Her reaction was one of surprise, as she looked at the huge images displayed on the screen. I watched her as she stared at each slide, appearing to communicate with some of the images. At one in particular, she sat upright and was visibly moved. I was deeply touched by the photographs; and it occurred to me then, after so many years of working with water, how patient it is with us all.

Dr. Emoto gave me his card, and when Whisper and I saw him speak once again in Santa Fe several months later, he asked us to participate in his next book. We were thrilled!

The following December, Dr. Emoto came to one of my evening intuitive presentations. I asked anyone wishing to work with me to choose one of the bowls of water located in the back of the room. They were instructed to place their most pressing issue or question, in thought form, into the kindness of the water.

Above: Miranda with her dog, Whisper.

A red-haired woman of about 35 gave me her first name, handed me her bowl of water and stood off to my side, motionless. After a few moments, the vibrational patterns and colors in the water became apparent to me. I watched as its energetic field made clear what she needed to know. The surface of the liquid was acting like a screen, reflecting her inner confusion, deep fear, and physical illness. I could see by looking at the energies surrounding her body that this physical illness was manifesting itself as tension in her musculoskeletal system: bones, muscles, and joints.

As I worked with her nonverbally, I could see that the energy, colors, and vibrations emanating from her body were becoming more vibrant. I then verbally relayed to her what was taking place currently in her life. As I spoke to her about how she could dispel her physical issues, she and the water began to take on more of each other's properties, appearing more and more similar. A woman and a bowl of water, which had started as two distinctive elements, were now experiencing an energetic exchange.

Being hearing impaired, I use a sign language interpreter. With the lights in my eyes I couldn't see the woman's face, so I looked at my interpreter to see if she had any questions or needed to say anything. My interpreter had no signs for me, so I continued.

I saw that the woman's body was wrapped in fields of fearful emotional energies. They were encasing her chest area and causing some restrictive breathing patterns. In checking for any kind of genetic illness, I saw that the

tightness in her chest came from a current emotional situation, which was the cause of her fear.

Happily, she remained receptive for the entire time I worked with her, and I could see the colors and energies surrounding her body shifting. Simultaneously, so were the energies and colors of the bowl of water. Her innate self-altering processes were affecting the water inside her body, which in turn was resonating with the water in the bowl. Even though she was no longer physically holding the bowl, they were inextricably connected. The water revealed that her life would be taking a new direction and that her deep fear of this change was contributing to her physical illness. I let her know that it was imperative that she understand that her illness was very possibly of her own creation. She thanked me and wept as she returned to her seat.

Several weeks later I crossed paths with the woman again. She told me that she'd always been unable to deal with stress and had recently been hired for a new job and was feeling very uncertain if it would end up taking over her life. She said that after I worked with her, the pain in her joints had stopped and the tension in the rest of her body had been released. She told me that ever since that night, she has never looked at water in the same way.

At another one of my evening presentations, a man in his late 40s came and stood next to me in silence and handed me his bowl of water. What I saw in it was that he wanted to know what was wrong with his health. I could see that he was incredibly tense, with ruddy fields of opaque energy, which pointed to his health condition possibly being chronic. When I suggested that spending time floating in water might help him, the look on his face was one of disdain as he returned to his seat.

Several months later, in a local market, his wife introduced herself and told me how grateful she was that they'd come that evening. She said her husband had been going to doctors who'd prescribed several medications and told him that unless he took them, he'd become very sick. The man hadn't listened to them and hadn't taken the drugs. Although he was fairly certain that water couldn't help him in any way, either, his wife told me that after my presentation, he'd gone home and spent considerably more time floating in their pool. A few months later when he went for his next medical appointment, the doctor was pleased to see that his blood pressure had dropped significantly and commended him on finally taking the prescribed

medication. As his wife tells it, her husband just laughed and said, “Actually, all I did was float in water.”

The “floating man” and the union between the red-haired woman and the small bowl of water reminded me of the small bottles of water in the large hands of those men at Ground Zero. But what was the water actually doing for the people at Ground Zero? Watching as they used it to rinse the dust from their masks and the grime from their eyes and tilted their heads back to take a drink, I saw that each of them went into a place that was soothing for them. Whether that was a precious memory of their family, a special vacation, or their kids’ faces, water had become a portal to a rare moment of reprieve from their horrific surroundings. Taking a simple drink had created a sacred moment with a great healer.

EXERCISE TO FACILITATE LISTENING TO WATER

If you’d like to connect with the healing power of water, just sit quietly for a moment and “hear” its sound. In your mind’s eye, see a form of water that you enjoy experiencing: a breezy mountain lake, a reflection of fall leaves in a puddle, a large rushing river, a beautiful city fountain, a salty ocean, a desert monsoon sky, or a high-mountain snow pool. Watch these images in your head. Can you feel the changes inside you as the water in your body “recognizes” the vision of the water that you’re seeing? What are you physically experiencing as these elements resonate with each other? Is the rhythm of your body altering slightly?

In your stillness, what can you hear water telling you? Become quiet and still and allow your entire body to “listen” to its whispers. Whatever it has told you is very powerful guidance. What you do with this wisdom depends on what your commitment to your life is.

Once you’ve received your gift, you’ll continue to hear the flow of water as it gently takes a place in your heart. Don’t be surprised if your dreams also bring you healing messages from water.

CHAPTER 10

THE WATERS OF LIFE

by Carrie Jost

Water is a mystery—a mystery we can feel when we yearn to be by the sea, a river, or a lake when the weather is hot. Its presence balances the heat and reminds us that all life began in water. It speaks to our bodies. Within those bodies are the counterparts of the waters of Earth: the oceans of salty water that bathe every cell; the rivers and streams, which direct the three major fluids to the parts of the body that need them; the lakes and pools of the organs, which hold the reservoirs and inform the senses. Just like Earth, we, too, are 75 percent water.

Water is feminine. It curves and moves in spirals, vortexes, and figure eights. It's also in a state of constant motion. If it becomes still, it stagnates and attracts the energy of decay and disease. The water within our bodies is also in constant motion, moving in the same ways as that of the Earth. Water is both life giving and life sustaining.

Water is able to grow and expand. It's also able to dissolve and expel solid particles. It's important that it has the ability to cleanse and purify itself. A lively mountain stream can expel the dissolved particles from a rotting sheep within 150 yards.

ENERGY IN MOTION

We begin our lives in a sac of water, a warm ocean that's constantly rocking the new life within it. The fetus is at one with this sea, nurtured and supported through the waters of the mother's womb. This is the baby's first experience of receiving information, which is transmitted via the

surrounding waters and the fluids along the umbilical cord. It's apparent to me from my healing work with clients that the mother's feelings are also transmitted through this medium. Trauma and shock will unsettle the fetus, while love, acceptance, and other positive feelings will nurture it.

Over the years, it has become clear that water is affected by the subtlest of vibrations, including emotional states. Blessed water is at the heart of many spiritual traditions and is known to have healing properties. Now we have the findings from Emoto's work to show us visually the direct effect that emotions have on water—they change its structure. Positive thoughts and feelings create the most beautiful of frozen pictures, while negative ones result in distortion and discoloration. This is water receiving and transmitting information at an emotional level.

Emotion, or “e-motion,” can be seen as energy in motion. Water in the body—whether it's the great ocean that bathes every cell; the rivers of blood, lymph, and cerebrospinal fluid; the little streams of the capillaries and minor nerves; or the great lakes of the stomach and the pools of the eyes—can stop functioning optimally if there isn't enough of it or if it becomes too still. [See Chapter 6.] When our emotions are unacknowledged or unexpressed, they, too, can become stuck and suppressed in a part of the body. [See Chapter 7.] They may consolidate into thoughts or belief systems, which then become patterns of thinking and behaving. From my experience, this is likely to occur in the fluids of the body and may result in disease, chronic conditions, and illness. We know from the work begun by Louise L. Hay that many biochemical problems and disease states have an emotional aspect that has often gone unrecognized.

DEHYDRATION

What happens when we become dehydrated? Dr. Fereydoon Batmanghelidj says that in his experience, “It is chronic water shortage in the body that causes most diseases of the human body.” When we lack water, we lose our vital connection with this life-giving substance, and the result is stress in our physical systems. All the fluids of the body become affected, the information transmission is scrambled, and we no longer work efficiently on all levels. Without sufficient water, we’re not allowing the fluid intelligence of life to nurture and sustain us.

For example, when we’re learning new things, the brain uses up a lot of water by connecting to what it already knows, adding the fresh information, and attempting to make conscious what may at first be beneath consciousness. Drinking extra water helps hugely in the learning process. This has been tried in schools and other learning environments with great success.

The nervous system, including the brain, operates in the cerebrospinal fluid. If this part of the body is lacking in water, then the brain and nervous system go into a stressed state. Anxiety, panic, tension, difficulty with learning, and even clumsiness can result. Ironically, the stress itself can cause further dehydration, as the nervous system needs more water to cope with any new situation.

We can apply our understanding of water in a metaphorical way to the fluids of the body. We can easily check if a person is dehydrated by using kinesiological muscle testing. This can tell us the location of the problem, how it’s affecting the system, and the trigger that set it off in the first place. Old traumas, shock, ongoing emotional states, and other difficulties may all trigger imbalances.

A young woman came to see me because she was suffering from anxiety, panic attacks, and asthmatic breathing. I found that she wasn’t dehydrated overall. She knew the value of drinking six or seven glasses of water a day. She knew not to count tea, coffee, and fruit juice as water, since the body treats them as food. Nevertheless, we found that her nervous system was dehydrated. For some reason, her body wasn’t absorbing water in this area. Using kinesiology, I tracked the source of the problem and we found that the trigger was a trauma in her family some years before. She remembered

that her asthma had started then (this condition can be one of the signs of dehydration in the body).

A potent approach to healing is to witness the trigger, accept it, and then find the appropriate energy technique to restore balance, health, and vitality. Here, we used energy techniques to restore the young woman's nervous system to a state of full hydration. She didn't even need to drink any more water than before. After the treatment, her anxiety and panic decreased and her wheeziness disappeared. She was able to move forward in her life, leaving the trauma behind her.

THE WATER ELEMENT

When water spirals, it's making the movement of creation. All growth takes place in a spiral. Watch a fern unfurl, a bean grow out of the ground, or the petals of a rose unfold, and you'll see this spiraling motion in operation.

The DNA in the center of each of our cells is a spiral—a double helix that carries our inheritance. Ancestral influences are passed on through it and also through the water element, according to ancient Chinese tradition. The emerging science of epigenetics is now showing us that we not only inherit physical traits (such as size, eye color, and tendencies toward particular diseases), but also emotional states. These are often held in the

water element and in particular in the kidney meridian, one of the paths of energy that run through the body.

A young man came to see me wanting to be more confident and to take the next step on his path in life. He found it hard to think positively about himself and felt held back by his anxiety about change. We discovered that his DNA and kidney meridian were low in energy. (Kidney energy problems often manifest as anxiety or fear.) Muscle testing showed that he'd inherited an emotional pattern from his father, and that it reached back in his ancestry for 16 generations. The pattern was one of anxiety and fear about change and moving on in life—exactly what he was experiencing. He also recognized this in his father. An additional pattern from his mother, who'd been anxious about giving birth to her son, was also affecting his kidney energy.

By working with the energy of the kidney meridian, we were able to restore balance to the DNA and the water element, and then hydration became optimal in every system in the young man's body. Now free of the pattern of fear and anxiety, he found a spiritual teacher, made changes in his way of life, and began to feel good about himself.

The water element in many ancient traditions is the one that relates to nourishing and nurturing. In the Native American tradition, Father Sun brings his love and passion to Mother Earth, who receives this; and together they give birth to their daughter Water, a Goddess and the Spirit of the plants, who brings life and beauty to the earth. It seems that we in the West have forgotten the ancient stories and the beauty of honoring the balance of nature that we can still see in other cultures.

The first acupuncture point on the kidney meridian on the bottom of the feet is called "Bubbling Spring." It's a major point for energy input. When we walk, this part of the foot acts as a pump and encourages the waters of the body to move. It's natural for them to circulate and, as already mentioned, if they become too still, they turn stagnant. To encourage movement, we can walk, run, or do whatever activity we enjoy. Figure eights will spiral the body's waters into motion and energize them. So by circling the body, we can enhance our flexibility and the flow of our waters. Belly dancers know this!

A woman who was having eye problems, with fuzzy sight and a slight gritty feeling in her eyes, came to a seminar I gave about kinesiological

ways of working with water. I see the eyes as two of the lakes in the body. For a lake to stay healthy, it needs a throughput of water. So we muscle checked and found that figure eights would be a helpful remedy for this woman. She rolled her eyes in a sideways “eight” movement, and then went on to move both her eyes and her neck in this way for a short time. Afterward, her sight became clear, her eyes looked brighter, and the gritty feeling disappeared.

THE MEMORY OF WATER

“I know it in my waters” is an old saying. It may be accurate, when we consider that water has a memory. It recalls what it’s like to be healthy and strives for this state of perfection in its motion. It also remembers subtle energies that have passed through it.

The memory is actually a vibration. This can be very powerful— when information in the form of a vibration is introduced into the body, it can bring about healing to the entire system. Homeopathy works in this way, using the power of water to absorb and retain information that has been shaken into it. Flower essences, pioneered by Dr. Edward Bach, work in a similar manner, using the vibration of flowers in water to trigger self-healing. [See Chapter 20.]

The waters in the body are always ready to receive information from the environment. We continually receive and give out information through our sensory organs and also through our chakra system (the word *chakra* from the Sanskrit for *wheel*). These wheels of energy are vortexes, which are linked to the nervous and hormonal systems. They act as gateways from the subtle realms to the physical and from the body to the environment. In this way, we’re connected to all life.

The common factor here seems to be water. As we bring information into our bodies, our fluids pick up the data and send them to the relevant part of the system. Messages will also be sent out to the world around us. This will give us a particular kind of reception from the people we’re with. Within the body, a similar system is in operation. Here, our waters are affected by the signals we give ourselves. Messages of love, appreciation, or kindness

will affect us in a positive way, while negative feedback will eventually cause problems with our well-being.

Over the years of working in the field of natural therapies, I've become more and more aware of the importance of water. It's an obvious factor in creating and maintaining health and well-being. Increasing research, including that outlined above, has pointed out that the way we treat water, in the world and within our bodies, is significant both for our own health and that of the planet.

We're all looking for vitality, happiness, and good health; and we have an ally: water. Once we acknowledge this and recognize its nurturing and healing powers, we can begin to feel it working for and with us. Water ties us all to each other and to every other life form on Earth. We could begin by feeling connected to each part of ourselves.

WATER TIPS

- Drink six to ten day—more if you're learning, and more if you're stressed.
- If drinking a minimum of six glasses a day, take some salt to balance the water.
- Start the day with one or two glasses of water to flush the system and bring new life to your day.
- Drink deeply to energize and feed the water element in your body.
- Sip slowly to detox and cleanse.
- Hold the water in your mouth for a few seconds to encourage absorption.
- Dechlorinate tap water by letting it stand in a jug— the chlorine will evaporate.

- Energize water by stirring it, blessing it, or using a water-energizing device.
- Move your internal water pump: Run, walk, move your ankles, and do any other foot or leg movement that you enjoy.
- Get a foot massage.
- Circle the body—move in figure eights with your eyes, head, hips, and shoulders.
- Heal scars by moving your hand in a figure eight over them.
- Talk kindly to yourself (and your inner waters) with appreciation, respect, and acceptance.
- Speak to others in the same way.

PART III

SPIRITUAL AND
MYTHOLOGICAL
PERSPECTIVES

INTRODUCTION

Water has been revered over thousands of years for its powerful spiritual qualities. In the following chapters, we'll see how this respect is a common theme in many of the world's religions, and how water is used both for sacramental purposes and in stories for teaching the faith.

Animism is the oldest spiritual path, dating back to the earliest times, and José Luis Stevens's paper gives a glimpse into an era when the spirits of local rivers, lakes, and seas were universally revered. Their help and guidance were essential to early humans' very survival in a dangerous world.

Starhawk continues in a similar vein, with her deep understanding of paganism and its rituals.

Other authors explore how water is central in many major religious traditions, including Hinduism, Christianity, and Judaism. All have the common theme of the powerful cleansing and purifying properties that water possesses and its centrality in the processes of redemption and forgiveness, as well as initiation into faith.

The spirit of place, especially important for understanding spirituality and water, is also a concept that several of these papers have in common. In many cultures, ancient and modern, the powers of water are believed to be especially strong in certain locations—such as the sacred river Ganges in India, one drop of which is said to cleanse the soul of all karma. In the same vein, Doreen Virtue describes the goddesses and presiding female saints of Lourdes and other holy places, Richard Beaumont writes about the Roman spa of Bath in England, and William Bloom explores the Chalice Well of Glastonbury.

Maril Crabtree's essay ends this section (and the book) practically and inspiringly, with a range of ideas and rituals for readers to try themselves, from simply drinking a glass of water or taking a shower with awareness and appreciation, to techniques for healing illness.

What's most astonishing about this collection of essays is the remarkable unity that so many diverse traditions display in their perception of water over countless ages. Surely this alone would be enough to provoke scientific inquiry into the nature of water. In fact, science itself has recently added its own vast body of discoveries about water and its centrality to the life of this planet.

It should now become clear that the scientific and the spiritual qualities are simply two sides of the same coin. So, for example, just as water can store memories and be influenced by thoughts and feelings, so it's also able to use this absorptive property to remove and cleanse negative emotions and their effects from people and leave them prepared to move on in their lives. This is an aspect widely used in religion; the indigenous cultures of South America use waterfalls to this end, while the Hindus of India bathe in their sacred rivers, especially the Ganges.

We can hope that in time, all modern societies will come to honor water and its spirit as much as ancient traditions have done through the ages. That's certainly my desire and intention.

CHAPTER 11

WATER IN CHRISTIANITY

by Alan Walker

The Bible begins and ends with images of water. At the beginning of creation, “darkness was upon the face of the deep, and the spirit of God moved upon the face of the waters” (Genesis 1:2). At the end of time there will be a new heaven and new Earth. There will be no more sea, but “a pure river of water of life, clear as a crystal” (Revelation 22:1) will flow from God and quench the thirst of all who drink from it (Revelation 22:17).

In the mythological worldview of the Old Testament, water stands for the primeval chaos that God must overcome to begin His work of creation. The sky (or “heaven”) is a “dome” in the midst of the waters, separating the ones above from those below (Genesis 1:6–8). Then the waters below are gathered together in one place so that dry land might appear, and so the sea and the earth are created (Genesis 1:9–10).

We hear echoes elsewhere in the Hebrew scriptures of a primordial battle between God and sea monsters: “You divided the sea by your might; you broke the heads of the dragons of the waters. You crushed the head of Leviathan” (Psalm 74:13–14).

God’s work of creation, therefore, hasn’t destroyed the primeval chaos, but pushed it back. The sea is set limits, and the waters are ordered to stick to them (Proverbs 8:29); but they still pose a threat. Humans are aware that their lives are, as it were, suspended over the brink. Not surprisingly, the biblical writers looked forward to a time when this threat would be removed — when “God will punish Leviathan the fleeing serpent, Leviathan the twisting serpent, and he will slay the dragon that is in the sea” (Isaiah 27:1) — and saw a dry ocean as a sign of the final establishment of God’s rule on Earth.

In the meantime, God keeps the waters under control so that those “who went down to the sea in ships, doing business on the mighty waters . . . saw the deeds of the Lord, his wondrous works in the deep” (Psalm 107:23–4).

When God despairs of the wickedness of humankind and resolves to undo His creation, He does so by unleashing the waters in a flood, allowing only Noah and his family to survive (Genesis 6–7). Later, when the Israelites are escaping from Egypt, God separates the waters of the Red Sea to allow them to cross and releases them to destroy the Egyptians (Exodus 14–15).

Of course, for the most part, water appears in the ordinary sense of the word in the Old Testament as an essential element for drinking and washing, particularly so for a people living in or on the edge of a desert. Paradise was portrayed as an oasis, and water was also used to depict the blessings that came from God: “Let justice roll down like waters, and righteousness like an ever-flowing stream” (Amos 5:24).

In the New Testament, Jesus begins his ministry in the wilderness of Judea by being baptized by John in the river Jordan (Matthew 3). *Baptism* originally simply meant to “dip” or “immerse” in water. In the 1st century, the Jews had a ceremony of “proselyte baptism,” which was an initiation ritual for converts to Judaism. John says his baptism is “for repentance” (Matthew 3:11), and he understands it as preparation for an imminent fresh intervention by God in the world.

Christians believe that moment arrived with the Incarnation—the entry of the Son, the second person of the Trinity, into the world as a man. By sharing our human nature, God makes it possible for us to “participate in the divine nature” (2 Peter 1:4). By dying and rising again, Jesus Christ conquers death and offers a share in his risen life to all who identify with him through faith and are baptized.

Christian baptism, therefore, has a much broader and more profound meaning than that of John. It’s not simply a ceremony marking entry into the Christian community in the way that circumcision marks a boy’s membership to the Jewish people, and it’s far more than a “naming” ceremony.

Baptism is a mystical participation in the death and resurrection of Christ. The candidate goes under the water, “drowning” to his or her old life, and is then dramatically drawn out into a new kind of existence.

Christians believe that the church isn't simply an association of like-minded people, but is the very "body of Christ," which, in another mode, burst out of the tomb at Easter. In the early church, baptisms were principally conducted at Easter to reinforce this connection.

In the baptismal liturgy, the water is blessed with words that call attention to the place of water in the history of salvation:

Father, we give you thanks and praise for your gift of water in creation; for your Spirit, sweeping over the waters, bringing light and life.

You delivered Noah from the waters of destruction; you divided the waters of the sea, and by the hand of Moses you led your people from slavery into the Promised Land.

In water your son Jesus received the baptism of John. . . . In it we are buried with Christ in his death. By it we share in his resurrection.

May your holy and life-giving Spirit move upon these waters. Restore through them the beauty of your creation. . . . Drown sin in the waters of judgement.

Now sanctify this water that . . . they may be cleansed from sin and born again. . . . (*Common Worship: Christian Initiation*, 2006)

The meaning of baptism as a "drowning," clear when performed as an immersion, has been obscured by the practice of baptism by "affusion" (pouring) or "aspersion" (sprinkling) and by the use of bowl-like fonts. Similarly, this has also encouraged a misplaced emphasis on the aspect of "cleansing" in baptism, which is confusing (even distressing) when the candidate is an infant.

Christians understand baptism to be a washing away of "original sin," the condition of being alienated from God, which is characteristic of all humanity and mythologically inherited from their first parents, Adam and Eve. This is possible precisely because the human Christ has paid the penalty for sin in his death on the cross and made possible again the fellowship humanity enjoyed with God in the Garden of Eden.

Baptism is described in Christian theology as a *sacrament*, that is to say, "an outward and visible sign of an inward and spiritual grace" (*Book of Common Prayer*). It's an "effective" sign, one that actually brings about what it signifies, by which God works invisibly within us.

Sacraments are not magical. They're not at the disposal of men and women who happen to know the words or how to perform the actions. They work because part of humanity is being restored to its proper relationship with God, and so to its intended dignity and status. They belong to a redeemed space within the "fallen" world.

In the language of the gospels, this space was called the “kingdom” of God and was actualized when Christ lived on Earth and “went about among us.” The miracles that he performed may be interpreted as signs of the kingdom “overflowing” into mundane reality. Interestingly, the first of these was the transformation of water into wine at the wedding feast in Cana (John 2:1–11).

Wine itself is, of course, pregnant with meaning in Christianity. At the Last Supper, Jesus identifies wine with his own blood and instructs his disciples to share wine in memory of him until they’re reunited in heaven (Matthew 26:26–29). The next day, Good Friday, they see blood and water flowing from his side when it’s pierced by a Roman soldier’s spear to confirm that he has truly died on the cross (John 19:34).

To this day, when Christians meet to remember Jesus, a little water is mingled with the wine that is to “become” his blood. As the priest does this, he whispers one of the “secret” prayers: “By the mystery of this water and wine, may we share the divinity of Christ as he humbled himself to share our humanity.” The wine represents the divinity, the water the humanity. In the Eucharist—the mystic supper—Christians have a foretaste of the divine life that’s promised to them and prefigured in the turning of water into wine at the marriage feast.

We’re to understand the occasion when Jesus “walks on water” (Matthew 14:22–33) in a similar way. The miracle is not a display of power in which Jesus bypasses the laws of nature, nor is it a “natural” act that the eyewitnesses failed to understand (such as that Jesus was actually walking on submerged ice). What the disciples are witnessing is a manifestation of the world as it’s meant to be and was before the Fall, a world where the forces of nature and humanity are in harmony with one another. Jesus even encourages Peter to follow him onto the sea as a foretaste of the restored creation.

There are other occasions in the gospels in which water plays a central role and illuminates important aspects of Christian teaching. At Jacob’s Well, Jesus asks a Samaritan woman who’s drawing water if she could give him a drink. When she expresses surprise for “religious” reasons (Jews normally had no dealings with Samaritans), Jesus tells her that if she’d known who he was, she would have asked *him* for a drink and would have received in return “living water”: “Everyone who drinks of this [well] water

will be thirsty again, but those who drink of the water that I will give them will never be thirsty” (John 4:13–14).

He isn’t simply using a metaphor in which water represents faith. Jesus is pointing to a time when the elements, along with the whole of creation, will be restored. Christianity doesn’t reject the material world or consider it as in opposition to the spiritual. Everything God made is “good” (Genesis 1:31); although everything, too, has been affected by humanity’s disobedience.

At the Last Supper, Jesus “poured water into a basin and began to wash the disciples’ feet” (John 13:5). He tells them, “Unless I wash you, you have no share in me” (John 13:8), thus making a connection with baptism. The next day, his life will be poured out like water on their behalf. Then he instructs them to “wash one another’s feet” (John 13:14) because “sharing” in him isn’t an individual but a social experience. Salvation in Christian terms isn’t an escape from the world, but a call to the service of others. A ceremony of the washing of feet is performed each year in Christian churches at the beginning of the Maundy Thursday liturgy. In England, it was for centuries the custom of the monarch to wash the feet of some poor people on that occasion and to give them a small gift of money. Today the Queen still gives gifts of “Maundy money.”

In the early centuries of the church beyond the New Testament period, water came to play an important role in worship and devotion. The theological rationale for “holy water” was that as Jesus had been sinless and in no need of “washing,” his presence in the Jordan had the effect of sanctifying the water. The water of the Jordan is today considered by many Christians to have a sacred character, and bottles of it are sought after. Members of the English royal family have been baptized in Jordan water since the time of the Crusades.

There’s evidence that water was blessed in Egypt in the 3rd century for use in exorcisms and in curing illness, and since the 4th century it has been the custom in the Eastern churches to bless water on the feast of the Epiphany in memory of Jesus’ baptism by John. This water is made available to members of the church to bless their homes and possessions and to drink in time of illness or special need. On one of the following days, a visit is made to bless the sea or a nearby river or lake as a sign of the redemption of all creation through Christ. Sometimes a wooden cross is

placed in the water. A blessing of the Thames from Southwark Bridge has been revived in recent years by Anglicans in London.

In the West, holy water is first recorded as being used in the 6th century for the dedication of a church. This water was mixed with wine, salt, and ashes.

Today, holy water is often found in a stoup at the entrance to churches for the faithful to dip a finger in before making the sign of the cross. It's used to sprinkle the congregation at the beginning of the principal Sunday service or on other occasions as a reminder of their baptism. During the year, the harvest gifts or the Christmas tree, for example, are sprinkled to "set them apart" from ordinary use; and any appropriate object or place may be blessed in the same way.

In Christianity, neither places nor the natural elements are endowed with any intrinsic supernatural or spiritual power, but because of the Christian belief in the inherent goodness of creation, any natural source of water has the potential to be considered holy "by association."

One of the best-known examples is Lourdes in France, where the Virgin Mary appeared to Bernadette Soubirous in 1858 and instructed her to uncover a spring, which would have healing properties [see Chapter 16]. Another is the Holy Well at Walsingham in England, where a spring of water gushed up at the site of the Virgin Mary's appearance to Richeldis de Faverches, the lady of the manor, in 1061. Today pilgrims receive the water there in three ways: as a drink (for the health of the body), with the sign of the cross (for the soul), and in the cupped hands (for the spirit).

Nevertheless, because God is not only a transcendent reality beyond the world He has made but also an immanent reality active within it, many Christians would accept that a variety of times, places, and materials have the potentiality of revealing the mystery of God. However, they'd always affirm that in any encounter, it's God Who takes the initiative. He's never at our disposal; He's always a God of surprises.

CHAPTER 12

MIKVAH: GATEWAY TO PURITY

by Rivkah Slonim

In the beginning, there was only water. A miraculous compound, it's the vivifying force of all life as we know it. But it is more. For these very same attributes—water as source and sustaining energy—are mirrored in the spiritual. Water has the power to purify, restore, and replenish life to our essential spiritual selves.

Jewish tradition relates that after being banished from Eden, Adam sat in a river that flowed from the garden as part of his attempt to return to his original perfection. To this day, water in a *mikvah* pool is used as a means of purification.

The world's natural bodies of water—its oceans, wells, and spring-fed lakes—are mikvahs in their most primal form. They contain waters of Divine source and thus, Jewish tradition teaches, the power to purify. Created even before the world took shape, these bodies of water offer a quintessential route to consecration. However, they may be inaccessible or dangerous, and there may be additional problems of inclement weather and lack of privacy. Jewish life therefore necessitates the construction of mikvah pools, and indeed this has been done by Jews of every age and circumstance.

To the uninitiated, a modern-day mikvah looks very much like a miniature swimming pool. Its ordinary appearance, however, belies the complex web of laws that surround its construction and its primary place in Jewish life and law. The mikvah offers the individual, the community, and the nation of Israel the remarkable gift of purity and holiness. No other religious structure or rite can affect the Jew in this way and on such an essential level.

The mikvah's extraordinary power has held sway since the dawn of time. Before the revelation at Sinai, all Jews were commanded to immerse themselves in preparation for coming face to face with God. In the desert, the famed well of Miriam served as a mikvah, and Aaron and his sons' induction into the priesthood was marked by immersion in it. In Temple times, the priests and any other Jew who wished to enter the House of God had to first immerse themselves in a mikvah. On Yom Kippur, the Jewish day of atonement and most sacred of all days, the high priest was allowed entrance into the Holy of Holies, the innermost chamber of the Temple, which no other mortal could enter. This was the zenith of a day that involved an ascending order of services, each of which was preceded by immersion in the mikvah.

The primary uses of the mikvah today date back to the dawn of Jewish history and cover many elements of Jewish life. The most important and general usage is for purification by the menstruating woman within a framework known as *taharat hamishpachah*, family purity. Briefly, from the onset of a woman's menses until after immersion in a mikvah, which takes place seven days after the cessation of her menses, the woman and husband are prohibited from expressing their love for each other in a physical manner.

The observance of family purity and immersion in the mikvah within that framework is a biblical injunction of the highest order. While most see the synagogue as the central institution in Jewish life, Jewish law states that constructing a mikvah takes precedence over building a house of worship. Jewish married life, and therefore the birth of future generations in accordance with Jewish law, is possible only where there is access to a mikvah. It's clearly no exaggeration to state that the mikvah is the touchstone of Jewish life and the portal to a Jewish future.

In primitive societies, menstruating women were a source of consternation and fear. Peace could be made with menstruation only by ascribing it to evil and demonic spirits and by the adaptation of a social structure that facilitated its avoidance. Viewed against this backdrop, the Jewish rhythm in marriage is perceived by many as a throwback to archaic taboos, a system rooted in antiquated attitudes and a ubiquitous form of misogyny. In truth, family purity is a celebration of life and our most

precious human relationships. It can be understood most fully within the larger concept of ritual purity and impurity.

Judaism teaches that the source of all *taharah*, “purity,” is life itself. Conversely, death is the harbinger of *tumah*, “impurity.” All types of ritual impurity—and the Bible describes many—are rooted in the absence of life or some measure—even a whisper—of death.

When stripped to its essence, a woman’s menses signals the death of potential life. Each month, a woman’s body prepares for the possibility of conception. The uterine lining is built up rich and replete, ready to serve as a cradle for life in anticipation of a fertilized ovum. Menstruation is the shedding of the lining, the end of this possibility. The presence of potential life within fills a woman’s body with holiness and purity. With the departure of this potential, impurity sets in, conferring upon the woman a state of impurity or, more specifically, *niddut*. Impurity is neither evil nor dangerous, and it isn’t something tangible. It’s a spiritual state of being, the absence of purity, much as darkness is the absence of light. Only immersion in the mikvah, following the requisite preparation, can change it.

The concept of purity and impurity as mandated by the Bible and applied within Jewish life is unique. It’s often difficult for the contemporary mind to relate to the notion and view it as relevant. In ancient times, however, *tumah* and *taharah* were central and determining factors. The status of a Jew, whether ritually pure or impure, was at the very core of Jewish living. It dictated and regulated a person’s involvement in all areas of ritual. Most notably, *tumah* made entrance into the Holy Temple impossible.

There were numerous types of impurities that affected Jews, regarding both their life and Temple service, and a commensurate number of purification processes; but mikvah immersion was the culmination of the purification rite in every case. Even for the ritually pure, ascending to a higher level of spiritual involvement or holiness necessitated immersion in a mikvah. As such, the institution of mikvah took center stage in Jewish life.

In this post-Temple period, the power and interplay of ritual status has all but vanished, relegating this dynamic to obscurity. There is, however, one arena in which purity and impurity continue to be pivotal. In this connection only does there continue to be a biblical mandate for mikvah immersion—and that’s regarding human sexuality. Lovemaking signals the possibility

and potential for new life, the formation of a new body, and the descent from heaven of a new soul. In their fusing, man and woman become part of something larger; in their transcendence of the self, they draw on, and even touch, the Divine. They enter into a partnership with God; they come closest to taking on the Godly attribute of creator. In fact, the sacredness of the intimate union remains unmitigated even when the possibility of conception doesn't exist. In the metaphysical sense, the act and its potential remain linked.

Human sexuality is a primary force in the lives of a married couple; it's the unique language and expression of the love they share. A strong relationship between husband and wife is not only the backbone of their own family unit, but is integral to the world at large. The blessings of trust, stability, continuity, and, ultimately, community all flow from the commitment they have to each other and to a joint future. In reaffirming their commitment in their intimacy, the couple adds to the vibrancy and health of their society and to the fruition of the Divine plan: a world perfected by humans. As such, they're engaged in the most sacred of pursuits.

In this light, it becomes clear why marital relations are often referred to as the holy temple of human endeavor. And entrance to the holy always was, and continues to be, contingent on ritual purity. Immersion in the mikvah is the gateway to the holy ground of conjugality.

There are other important usages of the mikvah as well. Mikvah is an integral part of conversion to Judaism. New pots, dishes, and utensils must be immersed in a mikvah before they may be used. The mikvah concept is also the focal point of the purification rite of a Jew before being laid to eternal rest and the soul ascending on high. Finally, Jewish men also use the mikvah on various occasions for the purpose of heightened purification. With the exception of conversion, however, these uses are all customary.

Immersion in a mikvah effects a change in status; more correctly, an elevation in status. Utensils that could heretofore not be used can, after immersion, be utilized in the holy act of eating as a Jew. A woman who from the onset of her menses was in a state of *niddut*, abstaining from sexual relations with her husband, may be reunited with him after immersion in the ultimate holiness of married intimacy. Men or women in Temple times, who were precluded from services because of ritual

defilement, could, after immersion, enter the House of God. The case of the convert is most dramatic. The individual who descends into the mikvah as a Gentile emerges from beneath its waters as a Jew.

So the mikvah personifies both the womb and the grave, the portals to life and the afterlife. In both, the person is stripped of all power and prowess. In both there's a mode of total reliance, complete abdication of control.

Immersion in the mikvah can be understood as a symbolic act of self-abnegation, the conscious suspension of the self as an autonomous force. The person immersing signals a desire to achieve oneness with the Source of all life, God. Immersion indicates the abandonment of one form of existence to embrace one infinitely higher. It's thus described not only in terms of purification, revitalization, and rejuvenation, but also—perhaps primarily—as rebirth.

CHAPTER 13

WATERS OF THE WORLD

by Starhawk

One morning I was meditating beside a beautiful lake in Vermont, listening for whatever messages the water might have for me. “All water is connected,” the lake said. “All water is in constant communication with all other water. The waters of the world are one—one consciousness, holding the world in liquid embrace. What you do to any part of the waters affects them all.”

I am a Pagan, someone who practices the ancient Earth-based religions that have roots in pre-Christian traditions of Europe and the Middle East. For Pagans, water is one of the four sacred elements—earth, air, fire, and water—with the fifth, the spirit, honored as the center of the sacred circle. These things are revered because they’re the basis of life. We begin every ritual by honoring and invoking them, and end every ceremony by thanking them and bidding them good-bye, reminding ourselves again and again of our deep dependence on the natural world.

To say that water is sacred has both spiritual and practical implications. If we honor water spiritually, we must also treat it with respect in very ordinary ways. The land I live on, in the coastal mountains of western Sonoma County, California, is a place of water extremes. In the winter, we can get 80 to 100 inches of rain, which often comes in torrents. Hillsides wash away, and nearby rivers flood. We learn to respect water’s power to carve, to change, to undermine, and to rage—and we know that every structure we build, every road we lay, and every bridge and crossing we construct must be designed to respect and channel water’s flow, or we risk immense damage to the land.

The salmon and steelhead trout, keystone species of these hills, depend on clean gravel in running streams and deep summer pools in order to reproduce. The health of the hills and forests, in turn, depends on the salmon, who, as they migrate back from the sea and swim upriver to their birth streams to spawn and die, return nutrients that have washed downstream to the soil and the trees. But a century and a half of logging, gravel mining, and road building has silted much of the gravel and dried up the summer pools. To hold water sacred, we must cherish the salmon and work to repair the damage.

Water also teaches us to be *humble*—a word that shares a root with “humus” and means “close to the earth.” For our greatest allies in cleansing and healing water are the most humble things on Earth—bacteria, fungi, beneficial microbes, and plants. Gray-water systems provide habitat for these creatures, who obligingly eat pathogens. Sewage can be treated in constructed wetlands or “living machines” that mimic nature’s own ways of cleansing water, sending it through a sequence of living communities of bacteria, algae, plants, and fish.¹

Conserving water and creating systems to heal and clean it are practical prayers. We’ve also created rituals that honor water’s powers of cleansing and connecting. For many years, Reclaiming, my extended spiritual community, has practiced a simple ritual we call “Waters of the World.” We collect water—from sacred springs and from our household taps, from significant places and from the sites of significant events—and combine it when we come together in ritual, often keeping a bowl of it on the altar so that it becomes infused with our energy. Then, when we separate, we each take a small amount. Some of us carry it with us wherever we go, using it to make offerings to the earth and to give back to the spirits of any place where we collect more water.

This ritual began more than two decades ago as a response to fear and despair. It was in 1980, shortly after Ronald Reagan was elected President of the United States, when our circle met for the winter solstice. We held an all-night vigil and spoke about our deep fear that the new regime would undermine hard-won environmental protections and might even lead us into nuclear war. We decided to hold a larger ritual on February Eve, the feast of

Brigid, who is the ancient Celtic goddess of the holy well and sacred flame and presides over smithcraft, poetry, and healing.

We began with a simple cleansing ritual. We divided the gathering of about 100 people into small groups and gave each a bowl of salt water. We asked the groups to pass the bowls counterclockwise—the direction of banishing and releasing— giving each person a chance to speak about the places in their lives where they felt powerless and to imagine the feelings as a muddy stream flowing into the bowls. Then we sang, chanted, and poured our spiritual energy into the bowls to transform the energy locked up in hopelessness and despair. Salt—a crystal—helps bind and focus energy.

When we could see the bowls glowing with light and feel the energy shifting, we passed the bowls clockwise, letting each person dip their

fingers into the water to take back some of the transformed energy and speak about where in their lives they felt power, love, and hope.

This water-cleansing ritual is one I've often used in personal meditation when my thoughts and emotions were churning with anger or stress. I've used it in groups, placing a bowl of salt water in the center of a group in conflict and asking people to speak their frustrations and bitterness into the bowl, then raising power to cleanse and transform the energy so that it can be taken back. In all these rituals we focus on honoring the energy locked up in anger or grief or resentment, seeing it not as something negative to be gotten rid of, but as something potentially strong, powerful, and positive that has gotten stuck and stagnant and needs to be released to flow more freely.

That first despair ritual led us into action to stop the building of an unsafe nuclear power plant and protest the development and testing of nuclear weapons. Brigid's feast became a time for us to do rituals to strengthen our commitment to act in the world to protect what was sacred to us: the elements that sustain life; the human and plant and animal communities that depend on them; and those real but intangible qualities—freedom, justice, compassion, and love—that infuse life with spirit.

One year, we decided to create Brigid's well—a big punch bowl filled with waters from special places. My friend Luisah Teish is a Yoruba Priestess of Oshun, the river *orisha*, or “spirit power.” When I was traveling once, I asked Teish what I could bring back for her, and she said, “Water.” So I began collecting water from special places, and that gave us the idea to create the well. We added water from many places that were important to us, from sacred springs and wells and from our homes, and saved some back at the end of the ritual. Now, more than two decades later, our Waters of the World contain water from every continent and ocean, even from Antarctica, from sacred rivers and Brigid's well and from the many political actions we've done to save and preserve water. They're a living embodiment of the message I heard from the lake—that all water is one.

In recent years, the issue of protecting water has become a central one for me and many of my friends. In today's world, water is seen as a commodity to be bought, sold, privatized, and hoarded for profit. More than a billion people lack access to safe drinking water.

“Tell me about your home. . . . Who owns the water?”
“Nobody owns it. You can’t own water, where I come from.”
“Somebody’s got to own it. . . . Somebody always does.”
“We believe there are Four Sacred Things that can’t be owned . . .
water is one of them . . . because they belong to everybody.
Because everybody’s life depends on them.”
“But that would make them the best kind of thing to own. . . .”²

That scrap of dialogue from my 1993 novel, *The Fifth Sacred Thing*, expresses the heart of the conflict. It’s estimated that the resource wars of the 21st century will center on water. If we hold water sacred, if we want to preserve it as a source of peace, fertility, and life—not a ground for conflict—we must be active in establishing and protecting access to it as a human right.

With a loose group of spiritually based activists that we call the Pagan Cluster, I’ve many times taken part in demonstrations and protests to protect water rights. We dress in blue and carry puppets or rivers of cloth suspended on sticks to represent a Living River. In April 2001, we took part in demonstrations against the Free Trade Area of the Americas, an international trade agreement that would have privatized water across three continents. We danced and chanted through a haze of tear gas, bringing the free spirit of water to the gates of power, along with the Cochabamba Declaration, written by the people of that Bolivian city who in January of 2000 took back their water supply from privatization by rebelling, filling the streets, and shutting down the city for two weeks until the government relented. Their eloquent and poetic statement became, for us, a sacred document:

THE COCHABAMBA DECLARATION

For the right to life, for the respect of nature and the uses and traditions of our ancestors and our peoples, for all time the following shall be declared as inviolable rights with regard to the uses of water given us by the earth:

1. Water belongs to the earth and all species and is sacred to life, therefore the world's water must be conserved, reclaimed and protected for all future generations and its natural patterns respected.
2. Water is a fundamental human right and a public trust to be guarded by all levels of government, therefore it should not be commodified, privatized or traded for commercial purposes. These rights must be enshrined at all levels of government. In particular, an international treaty must ensure these principles are noncontrovertible.
3. Water is best protected by local communities and citizens who must be respected as equal partners with governments in the protection and regulation of water.

Peoples of the earth are the only vehicle to promote earth democracy and save water.³

All water is one. Whenever we're working to protect, heal, and respect water in practical ways and advocating the rights of every human being to clean water, or honoring water through ritual and ceremony and connecting with its deep spiritual healing and cleansing powers, we're acknowledging and celebrating the deep unifying life force that sustains us. Our practical and political efforts give our prayers strength and integrity; our prayers and rituals sustain our spirits for the hard work of service, healing, and action.

CHAPTER 14

THE SPIRIT OF WATER IN THE WORLD OF SHAMANISM

by José Luis Stevens, Ph.D.

INTRODUCTION

In the course of my life, I've been most fortunate to study and work closely with elders and men and women of knowledge from several shamanically oriented tribal cultures. I've witnessed extraordinary healings and methods of communicating with the elements that radically challenged my university-bred beliefs about the nature of reality and gave me insight into the possibilities that I'd been trained to screen out by my traditional Western education. In particular, I've observed what a unique and central place the element of water has in the teachings and beliefs of these extraordinary peoples.

In this article, I'll focus on three tribes with a shamanic base from diverse locations in the world, yet ones that well represent the universal shamanic understandings about the nature of water and its properties. First, I'll present a simple introduction to shamanism and then a description of the Shipibo culture from the Peruvian Amazon and the centrality of water in their world. Next, I'll look at the Huichol tribe from rugged central Mexico and examine some of their most profound insights into the nature of the spirit of water. Finally, I'll compare this with how the Tuvan people from Mongolia understand and relate to water in their traditional shamanic culture.

A BRIEF EXPLANATION OF ANIMISM AND SHAMANISM

Animism is the world's most ancient set of spiritual beliefs regarding the nature of reality and is now seeing an upswing of interest in every continent. Its premise is that everything in the universe is alive and highly conscious and has a uniquely intelligent soul.

Animism is based on the belief that the world consists of overlapping energy fields and that underlying the visible world is the spirit world, the origin of all power, energy, and vitality. Consequently, animists believe that invisible forces or spirits can affect physical elements such as water, fire, air, earth, plants, animals, and people. Animistic cultures believe in showing the utmost respect to the spirits in everything—whether they be clouds, rocks, winds, springs, or birds of prey—as all are participants in the greater community of life.

While animism refers to the beliefs of the members of a tribe or community at large, shamanism is a specialty developed within that society by certain individuals. It requires acquired skills, knowledge, and natural talents. However, it's not a religion because it has no structured hierarchy or set of dogmas; rather, it's a set of special techniques for manipulating energy and power.

Shamans specialize in diagnosing and healing illness and suffering, divining and prophesying, journeying to other worlds through trance states to seek knowledge to gain control over spirits, and gathering and storing power through techniques and practices associated with nature. They're known to make special use of trance to manipulate and control the weather, speak with the spirits of plants and animals, and conduct strenuous ceremonies for fertility, healing, and sorcery. Without the ancient practice of shamanism, it's unlikely that humans would have survived prehistoric times, as it includes many practical techniques designed to solve everyday problems and to aid survival in the world's harshest environments.

The word *shaman* comes from the language of the Tungus people in Siberia and was initially used by anthropologists to describe the unique practices and experiences of shamans in that culture. Today the term has grown in popular usage to include similar customs in cultures all over the world.

The practice of shamanism is remarkably similar from continent to continent, even though in many cases there has been little or no contact between the shamans of the Amazon, the Andes, the steppes of Asia, Africa, Australia, Europe, Polynesia, and all of North America. Shamans from all over the planet say that this similarity is a result of their cross-cultural use of deep trance to access the *axis mundi*, the universal tree of life, an invisible highway leading to all locations in the world.

Common to all shamanic cultures and peoples is the central importance of the spirit of water, for without it there would be no plants and animals, and it's from these that shamans learn some of their most cherished secrets. It's through their alliance with these totems that they gather much of their power to create, manipulate, and thus control reality.

THE RELATIONSHIP OF THE SHIPIBO TO WATER

The Conibo-Shipibo are a combined tribe of approximately 30,000 people living in the Peruvian Amazon around the Ucayali river system, one of the two main sources of the Amazon. Theirs is truly a world of water; and from it they derive their primary food staples, the fish and many of the plants they rely on for survival. Their lifestyle and beliefs are typical of many of the varied tribes in the Amazon region. However, they're considered the ones with the greatest knowledge of shamanic practices, and therefore many shamans of other tribes study with them to learn their potent sorceric skills, as well as their powerful *icaros*, sacred songs for healing and controlling the elements. For the last 15 years, my wife, Lena, and I have been traveling to their jungle homeland to study and train with the Shipibo elders Doña Juana, Don Carlos, and Don Niko; and from them and their families we've gained some understanding of the importance of water in their cosmology and how they interact with it in ceremony and healing.

According to them, the Shipibo (for short), a shamanically based culture, believe that Roni, the giant anaconda, created the world using the pattern on its back to manifest the patterns in all the forms of reality, including the human body, the land, the sky, the waters, and all the plants and animals. Roni makes its home in the rivers of the Amazon, the lifeblood and

transportation system for all jungle tribes in this region of the world. The Shipibo are most grateful to Roni for providing this grand-patterned landscape, and thus they focus on discerning the energetic designs in everything around them through the traditional use of *ayahuasca*, a mixture of plants that when cooked and taken in ceremony produces powerful insights and visions regarding the vibrating subatomic structures of the elements, the plants, and the animals. For thousands of years, through their ancestral use of *ayahuasca*, they've seen and learned the intricate patterns and the songs woven into every aspect of life. This gives them the power to communicate with, learn from, and command the powers of everything around them—including the powerful spirit of water.

I've seen how they reproduce these beautiful patterns on textiles, on the walls of their buildings, and even on their skin in the form of vegetable-dyed tattoos for protection, healing, and gaining knowledge. Among the countless specific designs they reproduce are the patterns for the sun, the earth, the plants, and of course the spirit of the water. In healing practices, they specifically use the patterns of the water to purify and cleanse the body of unwanted foreign intrusions.

According to Don Carlos, the Shipibo believe that each object has its original pattern and that these patterns can in turn carry others within them. The pattern for water is especially capable of carrying other designs in a way that's similar to a boat transporting people or cargo. He tells me that since the human body consists mostly of water, it's a strong vehicle for carrying other patterns, sometimes positive ones and at times negative. The negative patterns, resulting from other people's fearful or angry thoughts and from plants and animals that have been disrespected, can throw the physical or emotional body out of balance and thus create illness, depression, or other disharmonious states. These alien patterns can be extracted and replaced with the positive songs representing the designs of beneficial plants, animals, and elements.

Song for the power of water

Song of the water spirits for protection

The patterns for water and its infinite variations are also used to promote prosperity and abundance for individuals who are having trouble manifesting what they want in their life. This pattern may be tattooed on their skin, using temporary plant dyes, or placed around their shoulders in

the form of an embroidered shawl. It might even be worn as an article of clothing, such as a skirt; and it could be painted on the side of their boat.

Variations of the pattern for water may involve the design for a good catch while fishing; for learning from the powerful spirits of the river dolphins; for protection from Roni the water anaconda; and the motifs for springs, waterfalls, pools, rain, clouds, and rainbows.

For the Shipibo, as with most shamanic cultures, water is considered a great power, a *poderio*, a force that embodies spirits that may be helpful or harmful. Reproducing its patterns and the designs, then, is a way of showing respect for them and harnessing the power inherent within them. For example, by wearing the design for the spirit of the river, someone might then navigate safely upon it and fish from it with success. In other words, the Shipibo have learned to become that with which they wish to be in harmony.

According to Don Niko, mermaids and dolphins are particularly powerful water spirits that can be asked for help in a variety of situations. He says that the ancient shamans used to dive into the river and commune with these spirits, learning songs from them and gathering the wisdom they chose to share. He says that today this is mostly a lost art and that therefore these water spirits create problems because people no longer show them honor or respect.

Nevertheless, during ayahuasca ceremonies, it's not unusual for the participants to experience the spirit of the river coursing through the veins and organs of the body, washing, cleaning, purifying, and protecting. The result is a roaring sensation or a rushing sound of water in the ears that may last for hours.

During one such ceremony in the jungle, my visions enabled me to meet the loving spirit of a specific river in the Amazon. It told me that we had met very long ago and that it had been my totem many times before. This spirit told me its name and explained that it had been with me all my life and had taught me many things while protecting me from dangers. I suddenly recalled the many years I had been a river rafter safely navigating the rapids in the Grand Canyon and in many difficult rivers in California, Colorado, Idaho, and Alaska. I recalled a song that I'd spontaneously begun to sing about the river being my friend during a rafting trip down the Salmon River in Idaho many years prior. This brought tears to my eyes, and

I realized that this river spirit was indeed my old friend and that I owed it respect for its protection and assistance. The river spirit told me that I could call upon it anytime by experiencing it coursing through my body, and it would help me in any way it could as long as I told it what I wanted.

On another occasion I went for a walk in the jungle with a friend. We found a big pool with a waterfall pouring into it, and we both stood underneath the falls—I briefly, but he for a long while. Later that day, he wasn't feeling too well. That night in ceremony I overheard the *ayahuasquero* (shaman conducting the ceremony) explain to my friend that he'd stood under a waterfall for too long and had taken on too much of its spirit, and that was why he was feeling sick. The shaman explained that the spirit was benevolent but that my friend had simply absorbed an excess of it in his body. He performed an extraction, sucking out the excess of the pattern for that water spirit, and my friend's health was restored. I was truly amazed that the shaman had been able to detect exactly what had happened, given that we hadn't told him about the incident.

During healing ceremonies, I've witnessed Doña Juana and many of her fellow Shipibo healers filling small basins with a little bit of water, which they then cast extractions into, often by spitting or vomiting foreign objects into the bowls. They then visually study the extractions floating in the water in order to diagnose the problem. Afterward, they toss the water away. They see the water as a great cleanser and purifier, and never is a healing ceremony conducted without its benevolent presence.

On numerous occasions I've seen the Shipibo healers sing icaros (those sacred songs derived from the patterns of nature) into a glass or bottle of plain water, and the patient is then instructed to drink a little of the water all day long or over a period of days. Again, the understanding is that water is a medium in which prayers and songs can be held and then carried into the patient's original healthy pattern. The water itself has its own structured design, but may also carry additional patterns sung into it, designs that are beneficial to the recipient.

For the Shipibo, all forms of water are powers to learn from and work with. Doña Juana is an elder Shipibo woman with great knowledge of the icaros passed down to her through generations of ancestors. She tells me that her greatest ally is the spirit of rain, which she can call forth with her icaros to purify and cleanse the land. I've heard her sing an icaro for rain

and bring in a thunderstorm within a half hour. Such practices aren't by any means exclusive to the Shipibo people, of course, but are to be found all over the Amazon and, for that matter, anywhere shamans use their skills. Having water as an ally in its varied forms is part and parcel of shamanic practice everywhere.

THE HUICHOLS'S RELATIONSHIP TO WATER

Let's now shift our focus the Shipibo people and move it north to Central Mexico to become acquainted with the powerful Huichol people and their understanding of the power of water. The Huichols live in the states of Jalisco and Nayarit, in a harsh mountain range stretching from the interior of Mexico to the Pacific Ocean. Numbering about 20,000, they are one of two tribes in Mexico who've managed to preserve their original culture from destruction at the hands of the Spanish invasion. They have strong shamanic roots with a rich tradition of collecting peyote, which they ingest during multiple day and night ceremonies and rituals.

The Huichols, like all shamanic cultures, honor the spirits of nature and call upon them during healing and fertility ceremonies. Fundamental to their cosmology is the Pacific Ocean, one of their primary *poderios*, the great powers they work with. They call the spirit of the sea *Tatei Haramara*—*Tatei* for “our Mother Goddess,” and *Haramara* for “sea.” During their annual pilgrimages to the Pacific Ocean, they deliver sacred objects (*objetos sagradas*), often arrows embedded with prayers that they then cast into the sea or bury nearby. Upon returning to their villages, they carry seawater with them in bottles for sprinkling on their fields and for use in ceremony.

For ten years, Lena and I studied intensively with a Huichol *maracame* (shaman) named Guadalupe Candelario, until his death in 1999. Over the course of that time, we participated in numerous ceremonies and learned a great deal about the importance of water in the Huichol culture. Guadalupe explained to us that the Huichols, being mostly dry farmers, rely on the sea for the clouds and weather systems that bring rain to water their crops of maize and squash in the arid mountain ranges they call home. According to

him, Huichols believe that salamanders are helping spirits who act as midwives to the four Rain Mother Goddesses, especially the one of the east, *Tatei Nariwami*. The salamanders' job is to assist nature by directing the clouds to release their rain in specific places over the land. In their exquisite yarn paintings and beadwork, the Huichols typically depict the rain goddesses as a powerful coiled serpent or as heavy storm clouds out of which millions of tiny snakes descend, symbolizing the life-giving rain.

Yarn painting with snakes

The Huichols often depict serpents as middlemen between humans and the spirit world and use them to represent a deep intuitive knowledge of nature, especially water. Turtles are emissaries of *Tatei Nariwami* as well. Their job is to cause the waters to flow, purifying and replenishing ponds, springs, and small bodies of water.

Springs containing *Kuutsala*, beneficial healing waters, are especially sacred to the Huichols, and are important pilgrimage stops for extensive ceremonies. From these springs they obtain the waters they later use in ceremony to purify, cleanse, and revitalize. One of their most sacred

springs, *Tatei Matinieri* (“Where our mother is”) lies en route to the sacred peyote fields of central Mexico, a destination all Huichols strive to reach during their lifetime.

Huichol yarn painting depicting water or rain

Guadalupe, like all indigenous peoples, considered water to be the sacred source of life. Without it, he said, nothing on this Earth would be able to survive. He often sang to the spirit of water to thank it for its many gifts; invoke its life-giving waters; and invite its ability to transform, cleanse, and heal.

During ceremonies, I often witnessed Guadalupe placing a small jar of seawater on the altar to bring the spirit of the sea into the ceremony and make her available to all participants. According to him, during the course of an all-night ceremony, the open bowl of water absorbs the songs and prayers chanted by the *maracames*, the shamans presiding over the ceremony. In the morning, Guadalupe would dip a deer-tail wand into the seawater and drip it onto the crowns of our heads and our foreheads, cheeks, wrists, and throats. This, he told me, was meant to both purify us and to embed the prayers and songs of the ceremony into us. In the breezy, freezing dawn light after a sleepless night of smoke, wind, and chanting, the

water drops would feel amazingly refreshing. They were like ice trickling down the face and hands as the sun began to bathe the desert in its golden glow.

As with the Shipibo, the Huichols use water as a medium to transport prayers and healing songs into the body of the patient. I've seen Guadalupe pass eagle and hawk feathers over a *hayurame*, an open bottle of water, then sing into it and instruct the patient to drink it as a *remedio* (remedy) throughout the day or over a period of days. He told us that water is friendly to people and supports the transfer of prayers (intentions) and healing energies from other allies, such as the eagle, sun, moon, or stars. Interestingly, other Huichols can tell the difference between plain, unconsecrated water and water into which prayers have been introduced. They can actually see little lights and energy particles dancing in the treated water, whereas the average person can see no difference whatsoever. Most amazing, the Huichols can pick out the prayer water every time.

For Huichols, water isn't a separate or a dead thing, nor is anything in nature isolated. All *poderios* work together, overlapping their energy fields to produce a balanced world where humans, plants, animals, and elements can be in harmony. For example, the Huichols believe that human beings were created by Spirit to be like flowers with blossoms (the crown of the head) open to the sun, supported by a strong vertical stalk (the spinal column). This beautiful flower is, of course, kept alive by an ample supply of water, as all plants are. For this reason, Huichols dress like colorful flowers, the men wearing wide-brimmed hats like gorgeous blossoms in full bloom. They're fond of pouring water onto the crown of the head in ceremony—not to get rid of original sin, as Christians do in baptism, but to introduce life-giving energy to that sacred opening in the head.

TUVAN SHAMANIC UNDERSTANDINGS OF WATER

Now we shift our focus all the way around the world to Mongolia in the northern Asian steppes, where many groups—including Tuvans, Buryat, Hamnigan, Darkhad, Tsaatan, Hotgoit, Urianhai, and the Halh—practice the ancient tradition of shamanism. In particular, our focus will be on the

Tuvans, a society of approximately 235,000 people, perhaps most famous for their traditional art of throat singing. Although as of this time I haven't had the opportunity to visit Mongolia personally, I've been able to learn from those who have training in the Tuvan form of shamanism. Their beliefs are remarkably similar to the traditions I have more direct experience with and have already described.

Tuvan shamanism has its origins in the Stone and Bronze Ages, when survival was difficult and specialized tools and practices were needed to cope with a dangerous and hazardous environment. The fact that the Tuvans' shamanic practice has survived to this day is testament to its practicality, effectiveness, and resilience even in the face of attempted eradication at the hands of the Communists and organized religions. (The Buddhist religion, however, didn't attempt to eliminate it, but rather accommodated it in its practices and beliefs. Buddhism continues to be practiced alongside shamanism to this day.)

Early shamans from this region crossed the Bering Strait during the ice ages and began their migrations into North, Central, and South America. Thus, it's understandable that shamanic insights about the power of water are so similar in such diverse regions of the world.

Tuvans believe that every lake or river has its own spirit keeper or guardian who protects that place and is in charge of the animals and plants living there. They believe that if drawn into alliance through proper respect, these guardian spirits have the ability to protect people living nearby or those who happen to be traveling through the area. The Tuvans believe that guardian spirits of the waters are able to understand the languages of humans and that by speaking or singing directly to them, one can obtain their protection and goodwill.

Like most shamanic peoples, they understand that guardian spirits must be complimented and honored if they're to become good human allies. They erect a small hut (*ovaa*) made of stones and branches on the riverbank near fords in order to house their offerings to the guardian spirits there. (This is similar to the Huichols' temples that contain sacred objects at pilgrimage sites.) Inside, they place sacred stones, crafts, textiles, and blessed objects as forms of sacrifice. This is often carried out prior to attempting to cross the river in order to ensure the safe passage of all the travelers.

The subjects of the Tuvans' songs are usually the elements of nature: the wind in the grasses, ripples on a body of water, rain-laden clouds, and so on. On one occasion, I witnessed traveling throat singers, singing to reproduce the spirit of rain clouds on the distant horizon. They told me that the idea was to make a connection with that element and communicate with it via deep-throated sounds. Thus, like the Shipibo and the Huichols, the Tuvans connect with the spirits of water through their singing practice. By bonding deeply and forming resonance with the water, they honor it and receive its gifts.

The Tuvans hold springs to be especially sacred and consider the trees and plants that grow there to be guarded by the spirit keeper of the spring. Particularly unusual trees growing in these places—ones with double trunks, gnarled survivors of harsh weather, and those clearly struck by lightning—are called “shaman trees” and are given special honor. Under them, the Tuvans perform their ceremonies honoring the springs and asking for their protection and healing gifts. Around such springs, especially medicinal ones, hunting is forbidden in order to keep from offending the guardian of that place, whose protection is extended to the animals there.

Like shamans in many parts of the world, Mongolian shamans practice the shamanic journey, inducing trance states with the use of skin drums. They train for these experiences by stimulating the imagination until it becomes a powerful and useful tool to travel with. Often the trance journey begins at the sacred spring, the entrance point for the three worlds of the spirit realm. As the drumming begins, the shaman imagines himself entering the water of the spring, meeting with the guardian spirit there and communicating his intention or destination. The guardian of the waters then accompanies the shaman on an extensive and sometimes perilous path through underground waterways to a distant landscape where knowledge may be found or power garnered in order to perform healing or a task.

Through the use of this technique, the shaman may meet other powerful spirits, do battle with them, retrieve lost souls, or see into the future. The return journey is typically back through the waterways and out of the spring again. Other shamans may use cave entrances or shaman trees as points of entry into the spirit realm, but entering water is a particularly effective method.

Guided by a woman trained in Tuvan shamanism, I was able to journey via a spring and the underground waterways to discover the answer to an important question about my health. The guardian of the waters I encountered was a beautiful, tall woman who directed me to the shore of a river, where I was led to a small cave and given guidance about my condition. After offering thanks, I returned to the shore, plunged into the river, and went back through the rapidly flowing channels of underground water to the spring where I began the journey. As a result, my health was restored. Tuvan shamans align themselves with, and draw their power from, particular spirits and become specialists in those elements. Some are more connected with mountains while others are focused on the spirit of water, either in the form of small springs or large bodies such as broad rivers and big lakes. Interestingly, given my own experience, the spirit of water among the Tuvans is typically feminine, and therefore appears to the shamans who work with her as a tall woman with long arms. Sometimes the spirit also appears in the form of a large snake, similar to Roni, the anaconda spirit of the Shipibo.

One of the jobs of the Tuvan shaman is to see that bodies of water are protected from pollution by people. Casting waste or garbage into water is seen as disrespectful and may arouse the ire of the water guardian of that place. For the Tuvans, as with the Shipibo, the spirits of water can be helpful and protective or may be dangerous if not handled properly. Healing often has to do with maladies and illnesses that have come from being careless around sacred bodies of water. On the other hand, the guardian spirit of water can be called upon to free someone of illness, depression, or bad luck. Tuvan shamans understand that these cures may not last forever, so repeat ceremonies may be needed every year or two to continue benefiting from the help of the spirit. In this way, the water spirits are continually honored, and the tradition is perpetuated. Likewise, the shamans understand that their work with spirit through ceremony is a necessary and ongoing practice in order to keep the world in balance.

In this short article, I've touched on the deepest understandings of three different cultures regarding the properties of water. Although remote from

one another geographically, all three cultures have remarkably similar beliefs about the nature of water. The Shipibo, the Huichols, and the Tuvans all:

- See water as the giver of life
- Hold water to be sacred
- View water as alive and guided by spirits
- Understand water to be a vehicle or medium of transport for other energies
- Sing to water to make a deep connection and resonance with her
- Use water to heal, purify, and cleanse in ceremony
- Form an alliance with water for assistance and power
- Make offerings of sacred objects to honor water
- Recognize that disrespect toward water can cause negative consequences
- Acknowledge that water has a deep structure that reflects the patterns in nature

If we were to expand our study to include thousands of other shamanically based tribes in the world, we would discover similar if not identical beliefs.

CHAPTER 15

WATER LORE AND RITUAL IN WORLD MYTHOLOGY

by Terri Windling

Water comes up from the ground, water comes down from the sky. Water comes into our bodies, water comes out of our bodies. All life is communicated through water. Nature talks to itself through the medium of water. We are born in water. We are of water.”¹

— TOM BLUE WOLF

From my Devon village in the west of England, it’s a short distance through winding green lanes to the once-independent kingdom of Cornwall—a land of mysterious standing stones, crumbling Celtic ruins, and ancient stories. On a bright, clear day near the summer solstice, a friend and I made a sacred pilgrimage to the Cornish countryside. We went seeking an ancient magic that lies beneath the surface of the rolling hills: water magic, pooled in half-forgotten holy wells and springs . . . found in myths and legends not only in the British Isles, but all around the world.

A mile or so past the village of Callington, we parked at the edge of a farmyard and followed an overgrown footpath to Dupath Well. Like many of the holy wells of Cornwall, the spring that runs through Dupath Well is believed to have been a sacred site to Celtic peoples in the distant past, its older use now overlaid with a gloss of Christian legend. At one time, this spring may have been surrounded by a grove of oak, rowan, and thorn—trees sacred to the druids and practitioners of other animist religions.

In 1510, a group of Christian monks claimed the Dupath site for their own use, enclosing the spring in a small well house made out of rough-hewn granite. This was the common fate of many pagan sacred sites in the

British Isles. Unable to dissuade the local people from visiting their holy places, Christian missionaries simply took them over—building churches where standing stones once stood; erecting baptisteries over sacred springs; and cutting down groves of oak, rowan, and thorn in a new god’s name. One can still find numerous holy wells buried all over the British countryside, many of them now named for saints and associated with their miraculous lives. But scratch the surface of these legends and older stories emerge like a palimpsest—stories of fairy creatures, the knights of Arthur, and the old gods of the land.

Inside the tiny chapel-like building erected over Dupath Well, the holy water pools in a shallow trough carved from a single granite slab. The air feels thick, heavy with shadows, with silence, with the ghosts of men and women drawn to this spot over hundreds of years. The stones are worn where these people once knelt and prayed to the Virgin Mary, or to the Goddess of the Sacred Springs. At the bottom of the trough lie a few copper coins—the modern custom of making wishes being not so very different from the pagan practice of throwing pins into a well to ask for blessings. I watch as my companion places an offering of wildflowers by the water—an equally ancient practice recalling a time when it was the land itself our ancestors worshiped, prayed to, and thanked for the gift of life.

ANCIENT WATER MYTHS AND RITUALS

Today, with clean water piped directly into our homes and largely taken for granted, it takes a leap of imagination to consider the greater importance of water to those who fetched it daily from the riverside or village well. Deeply dependent on the local water source for their crops and animals, our ancestors had a natural reverence for those places where good, pure water emerged like magic from the depths of the earth. As a result, water has played a role in myth, folklore, and sacred rites in cultures all around the globe, particularly in arid lands where the gift of water is most precious.

CREATION MYTHS

According to a Blackfoot creation myth, in the beginning there was a great womb containing all of the animals, including Old Man. One day the womb burst, and all creation was underwater. Old Man and the animals emerged floating on a large raft. Old Man suggested that Beaver dive down and try to bring up some mud. Beaver was gone a very long time, but still he couldn't reach the bottom of the water. Loon tried, Otter tried, but the water was just too deep for them. Finally little Muskrat tried. He was gone so long that he was nearly dead when they pulled him onto the raft again, yet he clutched a precious bit of mud in one of his little claws. From this mud, Old Man formed the land that emerged from that great ocean of water, and then he created all of the peoples, trees, and plant life upon it.

“Hylas and Water Nymphs” by John William Waterhouse

We find variations of this “diver motif” myth not only throughout North America but also in cultures around the world, including Buriat cosmology, Finnish folktales, and the Hindu *Paranas*.

WATER GOODDESSES AND NATURAL SPIRITS

Many cultures associate water with women—with the Great Goddess, or several goddesses, or a variety of female nature spirits. The !Kung of Botswana, for example, attribute the mythic origin of water to women and therefore grant all women special power over water in all its forms. All-mother, in an Aboriginal myth from northern Australia, arrived from the sea in the form of a rainbow serpent with children (the Ancestors) inside her. She made water for the Ancestors by urinating on the land, creating lakes, rivers, and water holes to quench their thirst.

The “living water” (running water) of springs and natural fountains is particularly associated in ancient mythological systems with women, fertility, and childbirth. Greek wells and fountains were sacred to various goddesses and had miraculous powers, such as the fountain at Kanathos, in which Hera regained her virginity each year. Greek springs were said to be the haunts of water nymphs, elemental spirits shaped like lovely young

girls. (The original meaning of the Greek word for *spring* was “nubile maiden.”)

In Teutonic myth, the wild wood-wife (a kind of forest fairy) who loves the hero Wolddietrich is transformed into a human girl when she’s baptized in a sacred fountain.

The Norse god Odin seeks wisdom and cunning from the fountain of the nature spirit Mimir. He sacrifices one of his eyes in exchange for a few precious sips of the water.

In Celtic legend, the salmon of knowledge swims in a sacred spring or pool under the shade of a hazel tree; the falling hazelnuts contain all the wisdom of the world and are swallowed by the fish.

RITUAL WASHING

Ritual washing in water or immersion in a pool has been part of various religious systems since the dawn of time. The priests of ancient Egypt washed themselves in water twice each day and twice each night. In Siberia, ritual washing of the body—accompanied by certain chants and prayers—was a part of shamanic practice. In Hinduism, *ghats* are traditional sites for public ritual bathing, an act by which one achieves both physical and spiritual purification [see Chapter 19]. In a strict Jewish household, hands must be washed before saying prayers and before any meal, including bread. In Islam, mosques provide water for the faithful to wash before each of the five daily prayers. In the Christian tradition, baptism is described by Saint Paul as “a ritual death and rebirth which simulates the death and resurrection of Christ.” [See Chapter 11.]

FLOOD MYTHOLOGY

In numerous stories, Earth itself is reborn after catastrophic floods. In Greek legend, Zeus sends a flood in which all perish except Deucalion and his wife, who manage to survive by floating in a chest for nine days and nights. Landing on Mount Parnassus, they wisely make a prompt sacrifice

to Zeus. The god instructs the obedient couple to throw handfuls of stones over their heads. These turn into a new, better race of men and women, who repopulate the planet.

In Welsh myth, the lake of Llŷon overflows and drowns the British Isles. One couple escapes in a mastless boat filled with animals like Noah's Ark and lands on dry land at last in Prydain, or modern Wales.

In Persian tales, the world is filled with wicked creatures ruled by the demon Ahriman. An angel, Tistar, comes to Earth three times as a man, a horse, and a bull. Each time he brings ten days and nights of heavy rain, flooding the globe. After several pitched battles with Ahriman, Tistar prevails and the demons are driven from the world; but their poison, flushed from the land, causes the oceans to turn to salt.

In Norse myth, the blood of the ice giant Ymir, who's slain by Odin, causes a massive flood, wiping out most of the ice-giant race. Ymir's body becomes the earth, and his salty blood forms the oceans upon it, creating the world that humankind has inhabited ever since.

India, Africa, Russia, and Tibet—all have ancient tales of monumental floods, after which the blessed (or just plain lucky) members of the human race start anew.

REGENERATION THROUGH WATER

The idea of regeneration through water is echoed in tales around the world about fountains and springs with miraculous powers. The native peoples of Puerto Rico, Cuba, and Hispaniola all told tales of a magical Fountain of Youth located somewhere in the lands to the north. So pervasive were these stories that in the 16th century, the Spanish conquistador Ponce de León actually set out to find it once and for all, equipping three ships at his own expense. He found Florida instead.

One Native American story recounts how the Fountain of Youth is created by two hawks in the netherworld between Heaven and Earth. But this fountain brings grief, as those who drink of it outlive their children and friends, and eventually it's destroyed.

In Japanese legends, the white and yellow leaves of the wild chrysanthemum confer blessings from Kiku- Jido, the chrysanthemum boy who dwells by the Fountain of Youth. These leaves are ceremonially dipped in *sake* to assure good health and long life.

“A mermaid” by John William Waterhouse

In the Alexander romances, Alexander sets off to find the fabled Fountain of Life in the Land of Darkness beyond the setting sun. The prophet Khizr is his guide, but the two take separate forks in the road and it’s Khizr, not his master, who finds the fountain, drinks the water, and obtains knowledge of god. Khizr is still venerated in modern India in both Hindu and Muslim traditions. In Muslim practice, he’s honored by lighting lamps and setting them on little boats afloat on rivers and ponds.

To the Celtic people of the British Isles, certain waters were deemed to have healing properties and thus were under divine protection. The famous hot spring at Bath (Aquae Sulis) was dedicated to the goddess Sulis, who was linked from Roman times with one of the Romans’ own goddesses to become Sulis Minerva. The Romans built a temple on the site, and a magnificent public bathhouse that still stands today [see Chapter 18].

Chalice Well in Glastonbury is reputed to be among the oldest of the continually used holy wells in Europe; archaeological evidence suggests it

has been a sacred site for at least 2,000 years [see Chapter 17].

WATER RITES

The standing stones and circles of Britain are generally found near wells or running water, attesting to the importance of water in pagan religious rites. With the spread of Christianity, a concerted effort was made to stamp out the older animist religions, which attributed divinity to nature. In the 5th century, a canon issued by the Second Council of Arles stated unconditionally that if, in the territory of a bishop, “infidels” lit torches or venerated trees, fountains, or stones, and the bishop neglected to abolish this usage, he was guilty of sacrilege.

Despite the destruction of ancient holy sites, pagan beliefs proved harder to eradicate. By the 7th century, Pope Gregory decided on a new approach and instructed Saint Augustine to convert sacred sites to Christian use. Pagan wells became holy wells, and churches were built upon them or beside them—yet the old ways must have persisted, for in the 10th, 11th, and 12th centuries, a stream of edicts was issued denouncing the worship of “the sun or the moon, fire or flood, wells or stones or any kind of forest tree.”

Over time, however, pagan and Christian practices slowly blended together. Wells named after Christian saints were celebrated with festivals and rites on old pagan holy days in ways that wouldn’t have been unfamiliar to “heathen” people. On the Isle of Man, for instance, holy wells are still frequented on August 1, a festival called *Lugnasad* (a day once sacred to the Celtic god Lugh). August 1 is *Lammas* in the Christian calendar, but the older name for the holiday was still in use on the Isle of Man until the 19th century. In Scotland, the well at Loch Maree is dedicated to Saint Malrubha; but its annual rites, involving the sacrifice of a bull, an offering of milk poured on the ground, and coins driven into the bark of a tree, are clearly more pagan in nature.

SACRED WELLS

The custom of “well dressing” is another Christian rite with pagan origins. During these ceremonies (still practiced in Derbyshire and other parts of England), village wells are decorated with pictures made of flowers, leaves, seeds, feathers, and other natural objects. In centuries past, the wells were “dressed” to thank the patron spirit of the well and request good water for the year to come; now the ceremonies generally take place on Ascension Day, and the pictures created to dress the wells are biblical in nature.

As Christian tales were attached to the springs and wells, they became as colorful as any to be found in pagan folklore. Wells were said to have sprung up where saints were beheaded or had fought off dragons, or where the Virgin Mary appeared and left small footprints pressed into the stone. Wells dedicated to Saint Anne were called “granny wells” (because, as the mother of the Virgin Mary, she was the grandmother of Christ), and particular powers concerning fertility and childbirth were attributed to them.

Up until the 19th century, the holy wells of Britain and Europe were still considered to have miraculous properties and were frequently visited by those seeking cures for disease, physical deformity, or mental illness. Other wells were famous for offering prophetic information—generally determined through the movements of the water, leaves floating upon the

surface, or fish (or eels) swimming in the depths. At some wells, the water was drunk from circular cups carved out of animal bone, an echo of the cups carved out of human skulls by the ancient Celts. Pins (usually bent), coins, or bits of metal were common offerings. Rags tied to trees around the holy well were another tradition dating back to pagan times. The cloth was symbolic of ill health or misfortune left behind as one departed.

Some wells, known as “cursing wells,” were rather less beneficent. Curses were made by dropping special cursing stones into the well, or the victim’s name written on a piece of paper or a wax effigy. At the famous cursing well of Ffynnon Elian, in Wales, one could arrange for a curse by paying the well’s guardian a fee to perform an elaborate cursing ritual. A curse could also be removed at this same place for a somewhat larger fee.

In the mid-19th century, Thomas Quiller Couch became interested in the history of sacred wells in Britain; he spent much of his life wandering the wilds of his native Cornwall, seeking them out. Extensive notes on this project were discovered among his papers after his death; and in 1884 *The Ancient and Holy Wells of Cornwall* was published by his daughters, the Misses M. and L. Quiller Couch.

More recently, folklorist and photographer Paul Broadhurst revisited the sites documented by Quiller Couch; and in 1988 he published *Secret Shrines: In Search of the Old Holy Wells of Cornwall*, an informative guide to the many sacred wells still to be found in the Cornish countryside.² In addition to holy sites dedicated to Celtic goddesses and Christian saints, Broadhurst discovered crumbling old wells half-buried in ivy, bracken, and briars inhabited by spirits somewhat less exalted: the piskies (fairies) of Cornish folklore. Wells under the protection of the piskies are not to be trifled with, for they’ll take their revenge on any who dare to disturb their homes. A farmer once decided to move the stone basin at Saint Nun’s Well (also known as Piskey’s Well), with the intention of using it as a water trough for his pigs. He chained it to two oxen and pulled it the top of a steep hill, whereupon it broke free of the chains, rolled downhill, made a sharp turn right, and settled back into its place. One of the oxen died on the spot, and the farmer was struck lame. This rather enchanted-looking well can still be found in the beautiful part of Cornwall between Liskeard and Looe.

WATER FAIRIES

All running water, not just spring water, can prove to be the haunt of fairies, for crossing over (or through) running water is one of the ways to enter their realm. Here in Devon and Cornwall, one still finds country folk who avoid running water by dusk or dark, for the spirits who inhabit water can be troublesome, even deadly. The water spirit of the River Dart, for instance, is believed to demand sacrificial drownings, leading to the well-known local rhyme: “Dart, Dart, cruel Dart, every year she claims a heart.”

The water wraith of Scotland—thin, ragged, and invariably dressed in green—haunts riversides by night to lead travelers to a watery death. In the border country between Scotland and England, the Washer by the Ford wails as she washes the grave clothes of those who are about to die. This frightening apparition is similar to the dreaded *Bean-Sidhe* (Banshee) of Irish legends. The *Bean-nighe* is a similar creature found in both Highland and Irish lore, a dangerous little fairy with ragged green clothes and webbed red feet. (Yet if one can get between the *Bean-nighe* and her water source, she’s obliged to grant three wishes and refrain from doing harm.)

Jenny Greenteeth specializes in dragging children down in stagnant pools. The Welsh water leaper (*Llamhigyn Y Dwr*) is a toadlike creature who delights in tangling fishing lines and devouring any sheep who fall into the river. The *fideal* is a fairy who haunts lonely pools and hides herself in the grasses by the water; the *glai stig*, half woman and half goat, tends to lurk in the dark of caves behind waterfalls. The *loireag* of the Hebrides is a gentler breed of water fairy, although as a connoisseur of music even she can prove dangerous to those who dare to sing out of tune.

In Ireland, a fairy woman known as the Lady of the Lake bestows blessings and good weather to those who seek her favor; in some towns she’s still celebrated (or propitiated) at midsummer festivals. Her name recalls the Welsh Lady of the Lake who gave King Arthur his sword and now guards his body as he sleeps in Avalon.

Brittany, on the west coast of France, also claims to be the home of the Lady of the Lake. The Château de Comper, where she’s said to have lived and raised Sir Lancelot, still stands near the old Forest of Paimpont (called *Broceliande* in Arthurian lore), a magnificent manor house of golden stone, crumbling romantically at the edges. Nearby is a lake whose origin is

attributed to Morgan Le Fay, located in the mysterious Val sans Retour (Valley of No Return).

Chalice Well in Glastonbury is one of several sites where the Holy Grail is reputed to be hidden. At the foot of ancient Glastonbury Tor is a lovely garden where one can drink the red-tinged water of the well—colored, according to legend, by the blood of Christ carried in the Grail [see Chapters 8 and 17].

Although the well's association with Arthur may be, as some Arthurian scholars suggest, a legend of recent vintage, archaeological excavations in the 1960s established the site's antiquity—and the place manages to retain a tranquil, mystical atmosphere despite its transformation from sacred site to tourist attraction. One often finds small offerings in the circle around the well's heavy lid: flowers, feathers, stones, small bits of cloth tied to a nearby tree . . . remnants of ancient pagan practice carried down through the centuries.

THE ROLE OF WATER TODAY

In modern times, we generally view such practices as quaintly (or foolishly) superstitious; we dismiss our early ancestors as ignorant savages who worshipped natural phenomena because they lacked the rationality of science. Yet a look at the animist religions that still thrive in many cultures around the globe indicates that this may be a simplistic view of nature-based religions [see Chapter 14]. Rather than focusing on the hocus-pocus of the supernatural (as they're often portrayed), such religions are rooted in the natural world, celebrating and regulating the relationships between humankind, other species, and the land that sustains us all.

In America, animism runs through the indigenous religions of the land. Various springs, wells, and pools are sacred to Native American tribal groups; and in such holy places one finds offerings similar to those by Chalice Well: feathers, flowers, stones, sage, tobacco, small carved animal forms, scraps of red cloth tied to trees, and other tokens of prayer. The Native American sweat-lodge ceremony uses water sprinkled over red-hot rocks to create the steam that's called the "breath of life." The lodge itself is

the womb of Mother Earth, in which one is washed clean, purified, and spiritually reborn. In Native American church ceremonies, a pail of “Morning Water” is traditionally carried and prayed over by a woman before being sent sunwise around the circle to be shared by all. Water is sacred through its absence in the four-day Sundance ceremony, or the ritual of Crying for a Vision. After four days without water (or food), the first drop on the tongue is a potent reminder to be thankful for this precious gift from Mother Earth.

Tom Blue Wolf of the Eastern Lower Muscogee Creek Nation speaks of the central importance of water, particularly at a time when water tables worldwide are diminishing at alarming rates:

Once upon a time, the Chattahoochee River was known to the people here as the source of life. Every morning we would go to the water and fill ourselves with gratitude, and thank the Creator for giving us this source of life. We would honor it throughout the day. At that time, water was known as the Long Man. It came from a place that has no beginning, and went to a place that had no end. But now, for the first time in the history of our people, we can see the end of water.³

Mythologist Michael Meade takes note of the ancient symbolism of water, and its vital role in our lives today:

Of the elements—which some people count as four, and others count as five—water is the element for reconciliation. Water is the element of flow. When water goes missing, flow goes missing. The ancient Irish used to say that there were two suns in the world. One you see rise in the morning. The other is very deep in the Earth, and it’s called the black sun or inner sun. It’s a hot fire in there; no one knows how hot. The Earth is roughly 70 percent water because of that hidden sun inside. When the water goes down, the Earth heats up too much—part of the global warming that’s happening everywhere. It happens inside people also, because people are like the Earth. People are 70 percent water, like the Earth, and people have a hidden sun—or else we wouldn’t be 96° when it’s 40° outside. Everyone in the world is burning, and the water in the body keeps that burning from becoming a fever. What happens literally also happens emotionally and spiritually, so when people forget how to carry water and how to use water to reconcile, you get an increasing amount of heated conflict, as we’re seeing around the world today. . . . In many cultures it’s the elders who carry the water, because elders are the peace-bringers. When a culture can’t remember or imagine peace on its streets or how to negotiate peace, it means its elders have forgotten what to do, how to carry water.⁴

The following evocative words come from a film about Chief Seattle, depicting the forced transfer of Suquamish lands to the U.S. government in 1855:

The shining water that moves in the streams and rivers is not just water, but the blood of our ancestors. If we sell you our land, you must remember that it is sacred. Each ghostly reflection in the clear water of the lakes tells of events and memories in the life of my people. The water's murmur is the voice of my father's father. The rivers are our brothers. They quench our thirst. They carry our canoes and feed our children. So you must give to the rivers the kindness you would give any brother . . . This we know: the Earth does not belong to man, man belongs to the Earth.⁵

I'm reminded here, at Dupath Well, that I, too, have distant ancestors who didn't consider themselves greater than the land on which they lived; didn't take good, pure water for granted; and who knew humans belonged to the earth.

An old English folklorist told me once that nature spirits would live in a well, a spring, a lake, or a grove of trees only as long as they were remembered and addressed respectfully. If the spirits were neglected, they'd leave the place; the land would feel soulless and dead henceforth. Remembering this, I dropped a pin into the brown water of Dupath Well. The well house stands near a farmyard. I could hear the traffic of the roads nearby, and yet somehow the spot still seemed timeless, magical—and very much alive. I cupped my hands, drank from the well, and whispered, “Thank you,” as I left. I couldn't even tell you now who exactly I was addressing—a nature spirit, a well fairy, a Celtic goddess, or the earth itself. And yet, in that ancient place, I swear that someone was listening.

CHAPTER 16

LOURDES AND OTHER HEALING WELLS AND SPRINGS ASSOCIATED WITH GODDESSES AND FEMALE SAINTS

by Doreen Virtue, Ph.D.

Of the four earthly elements, water and earth have long been considered feminine, while air and fire are regarded as masculine elements. Women, as childbearers, are associated with the life-giving flow of rivers, streams, springs, and wells. Cross-culturally, water is a symbol of fertility and prosperity. So it's logical that our ancestors built water-based shrines in honor of divine feminine goddesses and female saints.

Archaeologists have discovered water wells with spiritual and religious themes dating back to the late Bronze Age, which are reputed to have healing properties. The root word for *well* is *wella*, *wielle*, or *waella*, which in Old English means "natural spring" or "moving water." So a healing well could be a thermal spring, or the head of a river or stream. Rivers named for healing goddesses are abundant throughout Europe, including the Danube, which was named for the Celtic Mother Goddess Danu; and the Seine, named for the Gallo-Roman healing goddess Sequana.

Healing wells and springs are found worldwide, but are particularly abundant in Europe. Ireland reportedly has more than 3,000 healing wells. Many of these are dedicated to Brigit, a healing goddess who was later adopted and canonized by the Catholic church.

The most famous healing spring is undoubtedly Lourdes in southern France, dedicated to Mother Mary. Scientists have verified 66 healings at Lourdes, and an estimated 50 unverified healings per month are reported.

Another famous healing spring is in Bath, England. This 10,000-year-old shrine was originally erected in honor of the Roman goddess Minerva, and later became dedicated to the Celtic water goddess Sulis [see Chapter 18].

Many healing wells were created during pre-Christian eras. They were dedicated to Hindu, Roman, Celtic, Egyptian, Mayan, and other goddesses (and occasional gods) to appease and appeal for favors, healings, divination, and protection. During the Crusades, many European wells were rededicated to saints. Roman and Celtic wells dedicated to the goddess Coventina were converted into “wishing wells.” The previous Roman practice of throwing sacrificial animals into the well to win Coventina’s favor was replaced with tossing in coins or floating votive candles to elicit good luck.

Specific wells and their associated goddesses and saints gained reputations as having healing specialties. Many of these locations were attributed with miraculous abilities to heal eyesight, which some believe had to do with the vitamin and mineral content of spring water. Others were reputed to restore fertility, heal toothaches, skin diseases, and other illnesses and injuries.

I've personally visited several healing wells dedicated to goddesses and saints. Each time, I've noticed intense feelings of positive energy near these waters. Going to the well (known as a "grotto") at Lourdes was a particularly powerful experience for me. Standing near the water felt as intense as being in a room filled with magnets drawing impurities out of my body, mind, and emotions. I witnessed people wheeled on gurneys and saw their beaming smiles as their nurses bathed them in the sacred waters. I brought home some Lourdes water and gave bottles to friends, one of whom reported the immediate healing of an injury after she'd splashed the water on it.

Studies on the properties, effects, and electrical fields of Lourdes and other healing wells have been conducted by scientists. Dr. Enzo Ciccolo, a biologist at the University of Milan, collected water from wells where Mother Mary apparitions had been sighted, including Lourdes, Medjugorje in Croatia, Fatima in Portugal, and Montichiari and San Damiano in Italy.

Dr. Ciccolo placed small quantities of these Marian waters (named for Mother Mary) into normal tap water. The tap water's pH, conductivity, and redox potential were immediately modified by the addition of the Marian water. Researcher A. Ansaloni also found that tap water's pH level reduced with the addition of one part Lourdes water to 400,000 parts tap water. In addition, Ansaloni discovered that Lourdes water slowed the decay of chlorine in water, no matter how small of a sample of Lourdes water was added to the chlorinated water.

Dr. Ciccolo noted that after people bathed in Lourdes water, it became cloudy, as if the bather had detoxified into it. A study of the residue in the water revealed that the pathogens were neutralized:

A photoelectronic spectroscopy revealed that all frequencies of light were present in that sample of water, a phenomenon which usually never occurs in water. In fact, it was precisely this perfect, extraordinary and powerful set of frequencies which prevented the pathogenic germs from reacting and becoming harmful.¹

Other scientists have measured Lourdes water using a Bovis scale, which detects life-force energy. Using the earth's energy as a baseline, a substance with fewer than 6,500 Bovis energy units is considered to have a negative or life-detracting charge. Between 6,500 and 8,000 units is thought to be

neutral; and 8,000 and above is positive or life affirming. Lourdes water has been measured at 500,000 Bovis energy units.

Interestingly, the particles of negative substances spin clockwise, while positively charged particles spin counter-clockwise. Goddess traditions teach that feminine energy spins to the left or counterclockwise.

Dr. Ciccolo also experimented with water from Medjugorje, Croatia, another healing shrine devoted to Mother Mary, adding small quantities of its water to solutions of sodium chloride, albumin, and cupric chloride and comparing these mixtures to control samples. The Medjugorje samples crystallized into more finely divided filamentary patterns than the control solutions. Dr. Ciccolo noted that the crystallized patterns resembled those that had been observed in samples treated by healers' bioenergy and by magnetic fields.

In other words, water from healing wells associated with Mother Mary is structurally different from other water. Marian water stores the heartfelt prayers and the loving energy associated with Mother Mary and the angels. The studies show that this energy is transferable to ordinary water.

The ancient practice of seeking health through water while invoking the loving help of a goddess or saint remains a popular practice. Between five and six million people visit Lourdes annually. Thousands drink from or swim in the River Ganga, which Hindus regard as the embodiment of Ganga Ma, Saravati, Lakshmi, and other healing goddesses [see Chapter 19]. The ancient Hindu *Vedas* prescribe running water as the means of carrying away physical pollution to attain health.

The universality of visiting healing wells associated with goddesses and saints shows that it's more than a religious practice. The magnetic appeal of healing wells seems to be deeply ingrained. Perhaps it's a human instinct to seek our Divine Mother when we need comfort and healing.

CHAPTER 17

CHALICE WELL, GLASTONBURY

by William Bloom, Ph.D.

The English landscape is known for its rolling and soft beauty and for its unexpected and spectacular vistas. You may turn a corner or reach a peak and suddenly, unfolding far into the distance, is a long and intriguing view. One of the greatest of these vistas can be found when you travel south from Bristol and Bath in the west of England. As you pass over the top of the Mendip Hills, before you stretches the large plain of the Mid-Somerset Levels. This is a flat landscape some 15 miles across, which at several points in its history has been covered in water—and may be again. At the center of this flatland is an island whose most prominent feature is a dramatic 500-foot hill with a tower upon its summit. This is Glastonbury.

Also known as the Isle of Avalon, it's one of the most sacred landscapes in Europe. It's the burial place of King Arthur and Queen Guinevere, and the Holy Grail is said to be hidden here. It was a major center of Druidic and pre-Christian spirituality. In the shape of the isle can be found the form of a great goddess, while a vast zodiac can be seen in the landscape surrounding it, carved into the contours of the land. It's the site of the earliest of Christian churches founded, so the legend goes, by Jesus' uncle, Joseph of Arimathea. This small church evolved to become the greatest abbey in all Christendom. The Isle of Avalon, also called the Isle of Glass, was also said to be the capital city of the fairie realm, a great claim for a country known as Angel-Land or England.

The island of Glastonbury is made up of several hills. Three of them are well known: Wearyall Hill, Chalice Hill, and the Tor. Each of these has a very different shape and atmosphere. Wearyall is long and slim, like a fish, and is known as a place that's good for peace and reflection. Chalice Hill is

soft and round, shaped like a breast or pregnant womb, and holds an atmosphere of healing. The Tor is masculine and dramatic, accentuated by its tower; and its energy is powerful and dynamic. People often comment on how these three hills and their characters reflect the trinity found in many spiritual traditions.

The small town of Glastonbury itself sprawls on the island overlit by these hills, its inhabitants divided into those who honor the spirituality of the landscape—I'm one of them, and lucky enough to live on the side of Wearyall Hill—and those who live there as if it were any other small country town.

One of Glastonbury's most intriguing features is to be found in the valley between Chalice Hill and the Tor, down which runs a small road. Near the bottom of this road, on the right side toward Chalice Hill, there's a lovingly tended public garden, the main feature of which is the Chalice Well, previously known as Blood Spring. On the other side of the road, in a nondescript building, is the White Spring.

The waters for each of these two springs have unique sources, and their chemical content is completely different. I've lived in Glastonbury for 30 years and am fascinated by the polarity and paradox of these two wells. Their contrast is so great that many people who visit Chalice Well Gardens—for nurture, inspiration, and meditation—may not even know that the White Spring exists at all.

The water of Chalice Well, Blood Spring, is good for the health. It has an iron content similar to that of human blood, and the flow runs strong and consistently even in periods of drought. As the water surfaces out of the earth, the way in which it's contained and then channeled has been lovingly constructed by human intervention over many centuries. The actual source of the water, the well itself, is capped by a large lid, on which is the ancient symbol of two interlinking circles, the *vesica piscis*. The water then runs through a lion's head, down through some shallow baths for healing, through a Steiner-inspired flow form and into a large pool, again in the shape of the *vesica piscis*. The surrounding gardens are tended by men and women sensitive to the elements of nature, the Green Man, Pan, and the Goddess, as well as to the fairies, nature spirits, and landscape energies.

Chalice Well

The White Spring, however, has a certain chaos surrounding it; and the human involvement often seems harsh, in my opinion. This may, of course, be totally appropriate—a perfect balance.

Many people have a simple relationship with Chalice Well. They just love it and are grateful for its peace. They quench their thirst and enjoy the atmosphere of the flowing water and the garden's nature spirits. My relationship with the well is more complex. The whole landscape of Glastonbury is filled with symbolism and meaning. For many of its citizens, it's like living inside a pack of tarot cards, each aspect of its landscape filled with metaphor and significance. What then is the role of Chalice Well? How intriguing that it flows with blood between the polarities of Chalice Hill and the Tor. Is this the blood of Christ from the hidden grail? From the Goddess?

The water comes from a deep, powerful, consistent source. Sometimes I imagine this to be the heart of a great dragon miles below in the earth. But why does the creature release some of its blood here? What's the connection? It's interesting to sit in the garden and contemplate the origins of the flow, deep in the earth. Water is alive—not just in its molecular and subatomic structure, but also in the forms it takes. Rivers, lakes, seas, oceans, wells, and springs are all beings in their own right. Who is this

being who surfaces at Chalice Well? Of course, this type of question is well asked of any body of water, but first the enquirer must pause and form a relationship with the water.

I often wonder what Blood Spring looked like before any human being had begun to organize it. Its geology isn't rocky or hard. I imagine there was mud and bubbling. It would have spread into the surrounding grassland, and then perhaps channeled away in several directions—uncontrolled, free, and natural.

To the human eye, concerned with a civilized aesthetic sensibility, the messiness of mud and an endless oozing and spreading may seem unattractive compared to the form of a well-tended garden. But it's good for people to play with mud and experience the primal sensations of life. There's no tended garden in a mother's womb, but the environment is luscious and perfect. So sometimes a primal part of me feels a haunted loss when I encounter the neatness and containment of the well and its gardens. But I also recognize the practical need for easier access to the water. I understand why Blood Spring transformed into Chalice Well; and in general, I appreciate the beauty of gardens created by humanity in rapport with nature.

There is, however, another issue for me. It has to do with spirits. I wonder, when the Blood Spring waters were first contained and channeled, whether people offered prayers and ceremonies to ask permission of the spirits of the water and of the land. I wonder whether the great creature who's the whole form and being of this powerful source was ever courted. At every successive stage of the well's construction down the centuries, did the builders have the sensitivity and courtesy to continue these ceremonies and communications of permission and gratitude?

When I first encountered Chalice Well many years ago, ceremonies weren't happening; and the first Warden of the Well, whom I knew, wasn't a happy man. The atmosphere of the gardens was strained. Over recent decades, however, the culture of the custodianship has transformed into one that's attuned to and respectful of the nature spirits, the earth energies, and the life of the water itself. Instinctively and lovingly, ceremonies and communications are happening today; and the governing community of the well is generally, I gather, harmonious. There has been a healing here of the relationship between humans and the spirits of this water. To me, the spirits

of this water seem happy now. There's still perhaps some healing needed in the bigger picture and in the relationship with White Spring, but I feel confident that this will come, too.

All this is a lesson, one that's echoing through this entire book: We need to reawaken our care for and relationship with nature and the elements. Without us, the elements flow, explode, emerge, cycle, recycle, die, and are reborn. This is the dance of life. With water, it's all so visible and touchable—the movement, the play, and the power. We love water, but meaningful love is always love in action.

CHAPTER 18

THE DREAMING POOL OF BATH

by Richard Beaumont

Looking earthward, the densely wooded valley couldn't have concealed the ancient river snaking through it. Closer inspection of the serpentine bend would have revealed to prehistoric people a truly awesome sight: clouds of steam billowing out from England's only three hot springs. Mingled with the steam would have been the pungent smell of minerals. The ground soft and boggy, the night sky illuminated by stars playing hide-and-seek through the steam, the sounds of woodland creatures screeching and scratching near and far—it would have been like a dream, an entrance to another world, an underworld, a magical place of initiation. . . .

A MAGICAL HISTORY

In almost two decades of researching mind, body, and spirit subjects, I've encountered many interesting and wonderful people, places, and techniques for self-discovery. One of the strangest encounters followed my interview with Margaret Marion Stewart of the Springs' Foundation.

Margaret was a guide to the Bath springs: Cross Bath Spring, the Hetling Spring, and the King's Spring. She gave guided tours of the Cross Bath. R. J. Stewart, author of *Waters of the Gap*,¹ had told her about the origins of the springs. His research had shown them to be a pre-druidic sacred place, oracular mystery school, and underworld initiation center.

According to Celtic legend, in the 9th century B.C., a chieftain called Bladud was expelled from court because his leprosy made him so ill that he

was unable to rule. He became a swineherd instead. One day he followed a scabby pig to the springs and watched as it wallowed in the hot mud and emerged with its pink complexion restored. He plunged in himself and was cured. (The pig is the cult animal of Ceridwen, the goddess of the cauldron of inspiration and immortality.) Bladud is believed to have set up the first academy at the Bath springs around 800 B.C.; and the arts, astronomy, mathematics, astrology, prophecy, divination, and necromancy were taught there.

Margaret told of a legendary place referred to by the Greeks that was beyond Hyperborea, beyond the north wind. It was a triangular island that had two crops a year and hot springs gushing at the center. She felt sure that these were the Bath springs. Reinforcing the Greek connection, there are stories that druids from Bath taught Pythagoras.

The area around the springs would have been sacred, with the public possibly only accessing it at festival times connected with the eightfold calendar. The pre-Roman Celtic culture would have been matriarchal and matrilineal; the sun would have been regarded as feminine, the hot springs as waters from the womb of the Goddess. A volunteer for the Springs' Foundation said, "I really believe it's sacred." She also revealed that since being involved with the spring, "I've felt completely protected. When I have difficulties in my life, I go to the spring, and things work out." This Goddess spirituality is undoubtedly of considerable importance to some in Bath.

During an excavation of the springs in the late 1970s, pre-Roman artifacts were discovered—coins and offerings going back 7,000 years. There were also the remains of the walls the Romans had built around the springs. They paid homage to the local deity by calling the site *Aquae Sulis* (Waters of Sulis) in honor of the Celtic goddess Sulis (*sulis* means "an opening," "an orifice," "an eye," or "a gap"). They built a temple there, incorporating the ancient Celtic site, and dedicated it to Sulis Minerva. (Minerva is the nearest equivalent Roman goddess to Sulis, a goddess of wisdom, healing, and war.)

West of the larger King's Spring, linked to it by a sacred grove, lies the Cross Bath. Margaret's sense of its function was that it was an inner sanctuary. An earlier excavation had revealed part of an altar stone dedicated to Aesculapius, the Greco-Roman god of healing, who presided

over *aesculapia*, dream healing temples, where people had a ritual bath and then slept nearby. (Evidence of sheltering cubicles has been discovered under what's now a modern shopping center.) They would have discussed their dreams with the resident therapists of the Romano-Celtic period—a sort of early form of psychoanalysis.

From medieval times to the 18th century, the Cross Bath was known as *Balneum Crucis* (Bath of the Cross). It was part of a pilgrimage route between the Glastonbury and Malmesbury abbeys. The pilgrims would carry a life-sized replica of the cross and stop at certain points on the journey. One of the stopping places was the nearby Saint John's Hospital, built by the Knights Templar in 1174. At the time, it was a hospitality place, but such spots eventually became known as hospitals because so many travelers were sick. At the Cross Bath, the pilgrims would have a ritual bath in the healing waters before going on refreshed.

It's also reported that many queens visited the Cross Bath over the years, including Queen Mary; and the town itself became known as Royal Bath in the early 17th century when James I's queen, Anne of Denmark, visited, bathed, and soon conceived. An 18th-century author of a guide to the baths suggested that the waters might well act as a miraculous cure for infertility.

Bath became a fashionable resort of Georgian England under Beau Nash, the legendary master of ceremonies; and in 1822 a doctor with a lucrative practice treating wealthy neurotics in the town said the water was a sovereign cure for “rheumatic, gouty, and paralytic afflictions, in all those disorders originating from indigestion and acidity of the stomach, bilious and glandular obstructions, hypochondriac and hysterical afflictions.” By that time, many townsfolk were making a living off the waters, providing cures ranging from cups of steaming water to hot water enemas, selling souvenirs, housing invalids, or carrying them in “Bath chairs” through the streets.

In the 1970s, that all stopped. In 1976, the National Health Service stated that plunging patients into the miraculous water was no more effective than turning on a hot tap, and in 1978 tragedy struck. The water at the King's Spring was found to be polluted, and a girl died of a meningitis-related illness. Bathing ended overnight, and visitors to the Roman baths museum were warned against touching the water.

DREAMS OF INTERVENTION

In 1979, Margaret Stewart started a campaign to reopen the Cross Bath for bathing. The effort gained considerable momentum . . . and then the dreams began.

In one dream, Margaret found herself inside the Cross Bath surrounded by many nonhuman “inner plane” beings. Her sense of privilege at being there amidst so many magnificent creatures turned to dismay and embarrassment as the largest of these beings told her that she was to stop her campaigning and that the baths were meant to be closed at that time. She contacted all the protesters and ended the process the next day.

On reflection, she believed that the baths needed to be closed for a period of inner purification. In the time since bathing had been prohibited, there'd been a change in the springs' temperature. The three springs are all from the same aquifer in oolitic limestone (nonsulfurous, nonvolcanic). The Cross Bath Spring is the deepest at 1.8 miles and used to be the coolest, at 103°F; the Hetling Spring was the hottest at 120°F; the King's Spring was 115°F. Today all the springs have a similar temperature around 111°F.

A recent mineralogical analysis of the hot springs has shown that all the thermal water contains sodium, calcium, chloride, and sulfate ions in high concentrations. Although there are some small variations, allowing for changes in analytical methods, the composition has remained constant over the past century.

When a borehole was put into the King's Spring (the source of the largest volume of water) to get amoeba-free water, Margaret formed the Springs' Foundation to stop plans to cap the Cross Bath Spring and take water from the King's Spring borehole and pump it into the Cross Bath. As each of the springs comes up from different fissures, they each have slightly different mineral constituents; and Margaret wanted to retain the integrity of the Cross Bath water. As a result of her action, another borehole was made into the Cross Bath Spring's source to provide amoeba-free water to the Cross Bath.

The Springs' Foundation has since seen modern-day pilgrims from all over the world find their way to the Cross Bath and feel blessed.

I'd come to Bath to report on a story about Margaret's fears that the springs might be tapped off and replaced by ordinary heated water from the

main water supply. As I listened to her talk about the importance of protecting the site, I remember letting my right hand play in the hot water. It felt thick and strangely “pregnant” with life. It made my fingers tingle.

Four hours later, Margaret was still talking—about the strange dreams that had brought her to be a protector of the site, about unusual winds that had thrown the planners’ only redesigns into the water, and about the sudden illnesses that had afflicted the key proponents of the unwanted refurbishment. Having failed to bring the “interview” to a polite end, I took the only option available: I abruptly informed her that I was leaving and, with her voice still echoing behind me, walked away. What I’d imagined would be a pleasant hour-long interview had turned into a four-hour experience of extraordinary mania.

By now I was feeling very strange, and the world around me was echoing this, becoming somehow dreamlike and viscously fluid in a most disconcerting way. As I walked to my car, the night seemed darker than it should have been against the lights of the city.

Upon returning home, I felt an uncharacteristic need to go directly to sleep. What I didn’t realize at the time was that I, too, had been affected by the water and was about to experience its power—whether I wanted to or not.

THE GREEN MAN

As soon as I lay down, my entire body seemed leaden; and I fell into a deep, deep state. I could smell waterweeds and see many light-bodied nature spirits wafting around me, almost as if they were preparing the ground for something. A sense of timelessness pervaded the room. As the “dream” began to take a dark turn, I found myself unable to move. Earthy, troll-like characters gathered around me in a circle, their solid frames immovable and glistening with a pale bluish-green light. All these beings were strangely, intimately, familiar to me. They seemed almost like cousins or family: I “knew” which tribe they belonged to, and I “knew” each one of them and they were dear to me; yet I hadn’t seen them for longer than I could remember.

Then, with slow methodical progress, a being of immense size and power—ancient beyond my comprehension—came toward us. Imagine a grizzly bear 100 times bigger than any bear you’ve ever seen, but with an almost human articulation to him. He had to bend down to see me; I was so small in comparison to him. His face seemed as far away as the clouds, but his presence permeated everything. I could feel his breath on my face, and he snorted like a horse. He, too, was familiar, but I’d never before had his attention focused on me alone. It was overpowering. He turned his head from side to side as if trying to understand what I was doing there.

When he spoke, everything around us moved; and the wind of his words flew over my head. It was almost deafening, and yet somehow silent at the same time. It pervaded my whole body. I was “told,” wordlessly, but in no uncertain terms, that I had a job to do; and there was no backing out of it. I felt his eyes see right through to my essence. He seemed immortal, immensely wise, and as compassionate as one would be to a creature far lower on the evolutionary chain who’d gotten lost. I also can’t forget a feeling of deep sadness emanating from him. I’ve never felt so “merely” human, so puny, so completely out of my depth.

I woke with a start, soaked with sweat. I felt tiny and insignificant beside such an ancient power. The entire room seemed different and unfamiliar to me. There was no comfort, no assurance that I’d simply had a dream. My reality seemed entirely insubstantial in comparison to what I’d just experienced. I knew with absolute certainty that there was nowhere on Earth where he couldn’t find me. It was daylight; I’d “slept” for ten hours, but it felt like 15 minutes.

I got out of bed and the sense of urgency was so great that I called Margaret even before getting dressed. At first it was hard to speak—my voice seemed disconnected from my body, as if I were an actor using a foreign accent—but I now felt a connection to her, knowing that we’d both encountered the same beings. And I had compassion for her, as she was connecting with them on a regular basis. It was no wonder that she’d become so fixated on being a guardian of the waters. She’d seen hundreds of people receive healing from the springs, and knew intimately the powers behind that wonder.

I told her that I was going to run the story and was just calling to check a few details. In the long conversation that ensued, she added yet more

information about the complexities of water analyses, microbiological filtering systems, and town-council plans for redevelopment of the springs. I knew I had to pull it all together—premonitions, mythology, history, excavations, water analysis, the lot. I didn't dare cross the ancient being I'd just met.

The result of my labor is in print for all to see.² I felt driven throughout the writing of the piece and never lost the strange sense of being in the flow of the fates. As soon as I'd finished the article, I walked toward my kitchen through an enclosed passageway, hearing something calling me. There, for the first and last time in the three years I lived on those premises, I met a huge frog. Its loud croaking filled the sealed corridor, and a tingle went down my spine. The force of nature had sent a messenger. The spell had been completed; the job was done.

THE MYSTERY OF WATER

In our current study of water, especially with Dr. Emoto's discovery of the effect of thought and prayer upon water crystals, there are two paradigms at work, and they don't necessarily mix. On the one hand, there's science, with its reliance on neutral, objective evidence and logical conclusions. But there's also the mystical experience of those in touch with natural forces, which defies logical definitions, as its interpretations are both universally applicable and yet subjectively personal.

We know that water holds memory. It's also the requisite for all life on this planet. Dr. Emoto's work has demonstrated the effect of our consciousness on water, but what if water isn't simply the receptively inert medium his studies demonstrate? If it can indeed become altered by the consciousness directed at it, isn't it also possible that it could contain and project a more evolved consciousness? Certainly I believe that we should include in our studies of water an investigation into the shamanistic practices upheld even today in the more remote areas of the world, where water blessings still hold their power and human understanding isn't regarded as the pinnacle of awareness.

In our scientific attempts to define and understand matter, we may well have become blind to a direct, more potent way of perceiving the world around us. Can we truly claim to have a fully comprehensive understanding of life without incorporating the experiences of the countless mystics who point to a paradigm beyond intellectual understanding?

THE CURRENT DAY

My meeting with Margaret Stewart took place in 1998. Much has happened since that time. The council's plan for the redevelopment of the springs met with years of bitter wrangling. Petitions were signed for and against it. There was strong local opposition, which led to the threat of legal action against the local authority and the developers, but the case was settled out of court. An uneasy truce was established, giving residents priority access and reduced prices to the restored Georgian Cross Bath. Construction work on the project began and Thermae Bath Spa finally opened in August 2006.³ Margaret eventually came around to the idea of the refurbishment of the Cross Bath on the basis that "the Goddess is getting a facelift."

Roman baths in Bath, England

The development, which eventually cost \$43 million (£23 million), around 50 percent more than its original budget, is certainly impressive. The new spa, the only one in Britain where visitors are able to bathe in

naturally heated mineral water, is a combination of new-build and refurbishment. A 1920s swimming pool was demolished to make way for the central cubic structure, composed of glass and the city's signature yellow stone, and designed by architects Nicholas Grimshaw and Partners.

At the top of the complex is the open-air pool. Below that is a floor with steam rooms containing fluted pillars around a central device where spa goers can walk into a mist of scented steam lit by state-of-the-art fiber optics. There are also treatment rooms, a gym for yoga and Pilates, and a big thermal pool at the bottom.

Healing claims for the waters persist. The Thermae Development Company, Dutch operators of the spa complex, state:

Sufferers [of all ailments], from sports injuries to rheumatic pains, sinus-related ailments to skin problems, will find healing properties in the spa waters. Bath's reopened spa, taking water from a very pure source, will be a relaxed, sociable environment contributing to the well-being of all users—a much-needed resource in today's very busy and very stressful world.

All the bathing facilities in the spa complex use natural spring water cooled to 91.5°F. Sand filtration, enhanced UV, and minimal chlorine dosing for residual disinfection are the only treatment requirements.

Whether you choose to align to the sacredness of this ancient place or not, the fact remains that it's once again active in the 21st century, a time when we need all the magic we can get.

NOTES

1. R. J. Stewart, *Waters of the Gap: Mythology of Aquae Sulis*, Bath: Bath City Council, 1981.

2. The article appeared in the Summer 1998 edition of *Kindred Spirit* magazine, issue 43.

3. Margaret seems to have succeeded in making the city council aware of the need for guardianship, as its Website now states that it's the guardian of the baths.

CHAPTER 19

MOTHER GANGES INDIA'S SACRED RIVER

by Elizabeth Puttick, P.h.D.

Verily, Ganga is the path to heaven of those that have bathed in her current.

— FROM THE *MAHABHARATA*

The story of the Ganges, from her source to the sea, from old times to new, is the story of India's civilization. . . .

— JAWAHARLAL NEHRU

SACRED WATER IN HINDUISM

Hinduism is the world's oldest religion, rooted in a reverence for nature and the interconnectedness of life that's largely missing in Western culture. In an animistic society, nature is alive with spirit—literally animated. Every rock, tree, and stream has its own spirit, which humans can perceive and communicate with. Oblations may be offered in return for blessings. Over time, in a development that Westerners call *polytheism*, the most important spirits became personified as gods and goddesses, with greater powers requiring more elaborate propitiation rituals. Water has been an object of worship from time immemorial, and among the most worshipped deities are Indra (king of heaven and god of rain), Varuna (god of water) and the river goddesses.

Over the last few millennia, Hinduism has evolved through many different stages and manifestations, becoming more urbanized and

“sophisticated,” but nature gods and goddesses are still worshipped in the villages. Even in urban society, they remain vital spiritual and artistic forces.

For the purity-conscious Hindu social system, in which pollution is inevitably accumulated on a daily basis, water plays a central role in both domestic and public rituals. Water is a purifier, life giver, and destroyer of evil; it cleanses, washing away impurities and pollutants. In most Hindu families, it's considered auspicious to keep a vial of *Ganga jal* (sacred water from the Ganges) in the house. This is used to purify the body, household objects, and rooms. Bathing or sprinkling oneself with water is the customary way to rid oneself of impurities when entering the house, before eating, and on many other occasions.

Water is also important in rites of passage. Newborn babies are sprinkled with water in a ritual similar to Christian baptism [see Chapter 11]. Brides take a ceremonial bath similar to the Jewish *mikvah* [see Chapter 12], while the groom has his feet washed by his prospective brother-in-law. The last rite of life is to place drops of sacred water (preferably *Ganga jal*) in the dying person's mouth.

Water is also essential to temple ritual. Every temple has its own sacred wells and tanks, and both priests and worshippers bathe before entering the sanctum. Statues of the gods are immersed in water before installation; and daily libations of water, or flowers and leaves soaked in holy water, are offered to gods, *rishis* (saints), and ancestors. Water may also be sipped during prayers and invocations.

To Hindus, all water is sacred, but rivers are particularly venerated on account of the purifying quality of running water. Water absorbs pollution; but moving, flowing, or falling water has a great cleansing power that carries impurities away. This power can be utilized by sprinkling water over your head or taking a dip in a running stream—rituals that remove most kinds of daily contamination. The current of a river changes constantly, but in the body of the river dwells a spirit who controls the flow of the water. River spirits are propitiated and deified as goddesses.

GANGA MA: SACRED RIVER AND GODDESS

Map of the Ganges from source to sea

There are seven sacred rivers in India, of which the holiest is the River Ganges (Ganga). Its source is high up in the Himalayas—India’s holiest mountains—in a glacial cave. For over 1,500 miles, it flows through the plains and cities of northeastern India, joining the sacred river Jumna (Yamuna) at Allahabad before eventually merging into the Bay of Bengal. Mythologically at least, the Ganges courses way beyond its earthly boundaries to the realm of *moksha*—spiritual liberation.

Satellite image of Ganges delta

The Ganges has been held sacred for millennia and is repeatedly invoked in sacred Hindu texts, including the Vedas, Ramayana, and Mahabharata. In

an ancient society that depended on the seasonal monsoons for its agricultural needs, the perennial nature of the Ganga was literally a godsend. Personified as *Ganga Ma*—Mother Ganges—the river is revered as a powerful goddess who embodies the cardinal virtue of purity, cleansing the sins of the faithful and aiding the dead on their path toward heaven:

Ganga is Righteousness in liquefied form. She is energy also running in a liquid form over the earth. . . . The very mother of the heavens, she has sprung from the highest mountain for running over the plains and conferring the most precious benefits on all creatures of the earth. She is the highest cause of all things; she is perfectly stainless. She is as subtle as Brahma.¹

Ganga devi on lotus

There are many versions of the Ganges creation myth, but in most stories she transforms herself into a river and flows out of the big toe of the god Vishnu; or perhaps she manifests herself the hair (or ear) of the great god Shiva (“Salutations to Lord Shiva who holds Ganga in His matted hair”), or even the mouth of the silver cow Gomukhi. Ganga’s heavenly origin and descent to Earth makes her an effective intermediary between the two worlds of humans and gods. Images of Ganga on a crocodile and Yamuna on a tortoise flanked the doorways of early temples. Entering the temple, devotees were symbolically cleansed by the purifying waters of these two rivers.

The Goddess Ganga seated on a crocodile

BATHING IN THE GANGES

In cities along the river, daily dips are an important ritual among the faithful. Many cities are considered sacred and have become pilgrimage sites for people from all over the world: Gangotri, at the river's source; Sagar Island, where it flows into the sea; Varanasi (formerly Benares), the holiest city of all, one of the world's major pilgrimage centers and the most auspicious place to die; and Allahabad, where the Ganga and Jamuna meet, the site of the most important festival in the Hindu religious calendar, *Kumbh Mela*, where millions of pilgrims from all over the globe gather for the bathing ritual.

Many Hindus believe that water from the Ganga can heal sickness of body and soul and cleanse the soul of all past karma. *Ganga jal* is often used to anoint the forehead of someone who's ill, and is drunk with one's last breath to take the soul to heaven. Even a single drop of Ganges water, carried by the wind over a great distance, is believed to cleanse a lifetime's sins. "By seeing, touching, and drinking the waters of Ganga, or even by applauding Ganga, hundreds and thousands of sinful men became cleansed of all their sins" (from the Mahabharata).

Ganges ghat

Bathing, immersion in the river itself, is even more purifying. Hindus may travel great distances to scatter the ashes of their relations in the waters of the Ganga, with the aim of helping them attain a better rebirth, and ultimately freedom altogether from samsara (the cycle of death and rebirth).

Even more desirable is to be cremated in Varanasi, the most sacred city on the Ganges: It's been said that "Death, which elsewhere is polluting, is here holy and auspicious." People travel from all over India and even internationally to spend their last days in Varanasi. The river is lined with ghats (stone platforms with steps leading to the water), where the funerals are held, and the pyres burn nonstop.

POLUTION AND PURITY

There's a paradox at the heart of Hinduism, which reveres nature but isn't a "nature-loving" culture in the Western sense. Gardens and parks are often left untended, even in wealthy suburbs, and animals may be neglected or mistreated. Yet while mangy curs wander the streets looking for scraps, cows still have right of way and hold up the traffic with impunity. Plants may wither, unwatered under the burning sun, while flower garlands adorn honored guests and idols. The implications of this contrast between belief

and practice have ironic and tragic consequences in the ritual use and abuse of India's sacred rivers.

As a mother, Ganga is tangible, accessible, and all-accepting: No one is denied her blessing. However, though her devotees revere her, they don't always treat her with the love and respect she deserves in return for her many blessings.

While the spiritual purity of the Ganges has remained unchallenged for millennia, her physical purity has deteriorated to the point where she has become one of the most polluted rivers on Earth. Many of the world's rivers are contaminated through human exploitation, but the Ganges has suffered particularly—partly as a consequence of what could be called “spiritual exploitation.” Thousands of sick people with open wounds and festering ulcers bathe in the river daily to get healed, and these numbers swell into the millions during festivals, which also puts tremendous strain on the antiquated sewage system.

Dying in Varanasi takes the impurity out of death, but at the cost of putting pollution into the river. Some 40,000 cremations are performed there each year, and many more take place on other sites along the river. Most funerals are carried out on wood pyres that don't reduce the body to ashes; but the remains are thrown into the water regardless, to be fought over by dogs and vultures. The thousands more who can't afford cremation have their bodies simply thrown into the Ganges. It's an all-too-common sight to see partially burnt corpses floating down the river, along with the carcasses of thousands of dead sacred cows and assorted household rubbish.

Sacred ritual is only one source of pollution. The Sacred Land Film Project has produced a report on the Ganges, based on extensive scientific research, which identifies the main source of contamination as organic waste—sewage, trash, food, and human and animal remains. Around a billion liters of untreated raw sewage are dumped in the Ganges each day, along with massive amounts of agricultural chemicals (including DDT), industrial pollutants, and toxic chemical waste from the booming industries along the river. The level of pollution is now 10,000 percent higher than the government standard for safe river bathing (let alone drinking). One result of this situation is an increase in waterborne diseases, including cholera, hepatitis, typhoid, and amebic dysentery. An estimated 80 percent of all

health problems and one-third of deaths in India are attributable to waterborne illnesses.

Wildlife is also under threat, particularly the river dolphins. They were one of the world's first protected species, given special status under the reign of Emperor Ashoka in the 3rd century B.C. They're now a critically endangered species, although protected once again by the Indian government (and internationally under the CITES convention). Their numbers have shrunk by 75 percent over the last 15 years, and they have become extinct in the main tributaries, mainly because of pollution and habitat degradation. However, at least in one stretch of the river, numbers are rising, owing to the efforts of the "Dolphin Man," Dr. Sandeep Behera from World Wildlife Fund India.

There have been various projects to clean up the Ganges and other rivers, led by the Indian government's Ganga Action Plan, launched in 1985 by Rajiv Gandhi, grandson of Jawaharlal Nehru. Its relative failure has been blamed on mismanagement, corruption, and technological mistakes, but also on lack of support from religious authorities. This may well be partly because the Brahmin priests are so invested in the idea of the Ganga's purity and afraid that admission of its pollution will undermine the central role of water in ritual, as well as their own authority. There are many temples along the river, conducting a brisk trade in ceremonies, including funerals, and sometimes also the sale of bottled Ganga jal. The more traditional Hindu priests still believe that blessing Ganga jal purifies it, although they're now a very small minority in view of the scale of the problem.

One famous environmental campaigner is Dr. Veer Bhadra Mishra, a Hindu priest who's also a civil engineer. He approaches pollution from both a scientific and a spiritual perspective, and has proposed an alternative sewage-treatment plan for Varanasi that's compatible with the climate and conditions of India. His "Clean Ganga" campaign is currently trying to persuade India's central government to adopt the plan, so far without success.

Dr. Mishra describes the importance of protecting this sacred river: "There is a saying that the Ganges grants us salvation. This culture will end if the people stop going to the river, and if the culture dies the tradition dies, and the faith dies." Mishra feels it important to find new language for the

river that respects the Hindu worldview and veneration of the Ganges. To tell a Hindu that Ganga—goddess and mother—is “polluted” or “dirty” is an insult, suggesting that she’s no longer sacred. Instead, it needs to be made clear that human action, not the holy river herself, is responsible: “We are allowing our mother to be defiled.” This approach has stimulated grassroots involvement in the clean-up effort and is transforming the work for environmental preservation into a model for cultural and religious preservation as well.

A MIDDLE WAY: INTEGRATING SCIENCE AND SPIRITUALITY

It’s unknown how many people have been healed by bathing in the Ganges. Clearly, it’s hazardous, and drinking the water is even riskier, although most bottled Ganga jal is either strictly processed and filtered or issued with a warning not to drink it. My Indian guru used to mock the “credulous fools” who drank the water direct from the river, but many pilgrims—including some Westerners who might be expected to be smarter—gulp it down enthusiastically. As a result, they often contract hepatitis, typhoid, or cholera. There’s a belief that Indians are less likely to get sick than Westerners on account of their faith, but the virological explanation is that they do become ill but manifest fewer symptoms because their bodies have suppressed the reaction.

On the other hand, there are stories of “miraculous” cures. It’s hard for the rational, skeptical Western mind to believe that the power of the mind can overcome the effects of such an enormous range and volume of pollutants, although we know that the placebo effect has great potency. However, there have been some very persuasive experiments demonstrating

the power of prayer and intention in healing, and it seems likely that the collective faith of so many millions of pilgrims could have a transformative therapeutic effect—both on the water and on the human body.

It would be interesting to conduct experiments on Ganges water in the footsteps of Dr. Emoto to determine how far blessing and thanking the water could alter its condition, both at sacred sites along the river and on bottled Ganga jal sold for ritual purposes. One exciting, radical implication of Dr. Emoto's findings is a democratization of the process of working with energy and bestowing blessings. His results indicate that any person with a pure heart and clear intention can trigger a transformative effect on water crystals, thus undermining the need for priestly ritual and intervention. If human consciousness can truly affect the structure of water—as the evidence clearly demonstrates—then we all have the power to heal, whether we're ordained or not.

I think it's important to find a middle way between the extremes of hard-nosed scientific materialism and ungrounded, gullible spirituality. Having lived in India for years, I've witnessed and experienced the literal ill effects of unclean water, which is a major risk to personal and public health. In my opinion, environmental campaigners like Veer Bhadra Mishra and Vandana Shiva and charities such as WaterAid, which save the lives and improve the health of millions of poor people, do more good—physically, environmentally, and spiritually—than businesses (including temples) peddling “holy water” at the “very small price” of \$35 a bottle to wealthy pilgrims and tourists. I can't accept that a drop of Ganga jal cancels all your karmic debts. Attaining merit surely requires a more muscular effort—a more engaged spirituality.

I'd like to give the last word to Dr. Veer Bhadra Mishra, who has done so much to publicize the crisis, provide practical solutions, and integrate the opposing philosophies—and has been recognized on the United Nations Environmental Program's Global 500 Roll of Honor, as well as honored as a *Time* magazine “Hero of the Planet.” For Mishra, the Ganga represents the meeting point where two worlds combine. He describes the world of scientific thought as being one bank of the river, and the deeply spiritual world, one alive with a limitless pantheon (“I would say there are as many gods and goddesses as people who live in India”) as the other bank. And, he says, they're both equally important:

We have to clean all the rivers, and only then our hearts will be happy. . . . It cannot be clean just by technology, just by setting up the right kind of infrastructure, there has to be an intermixing of culture, faith, science and technology. We have that kind of living relationship with the river. You [Western societies] have the best technology. So both the societies need to interact with each other to take care of these rivers.

NOTES

1. Quotations on the sanctity the Ganges are taken from the Anusasana Parva, Section XXVI of the *Mahabharata*, translated by Sri Kisari Mohan Ganguli (Indypublish.com, 2004).

CHAPTER 20

WATER, THE MOON, AND THE SOUND OF THE PLANETS

by Sayama

There's a strong interaction between water and the moon, which is very apparent in the phenomenon of tides. The gravitational pull of the moon exercises a similar effect on the human body, since as much as 70 percent of it is water.

This knowledge was gathered by ancient cultures and kept by some indigenous tribes, and has recently been rediscovered and scientifically supported by our modern high-tech civilization. We live in very interesting times, where the gap between intuitive perception on the one hand and rational realization on the other is starting to close.

In nearly all cultures, the moon embodies the feminine principle and is related to the emotional world and the human spirit. Because of this, it can be seen as a symbol of intuition and emotional perception. The sun, on the other hand, embodies its opposite, the masculine principle, and is the symbol of reason, intellect, and rational scientific realization. From these two complementary opposites, holistic perception comes into being. It takes place in the human heart, and it's nurtured and carried by love.

ALL IN EVERYTHING

We live in a universe in which all is mirrored in everything, and all is contained in everything. A single cell of the human body contains all the information about the whole of the body; and in turn the human body

contains all the information about our planet, our solar system and, most likely, the entire universe. This holistic philosophy of life was already described more than 2,000 years ago in the words of the Chinese sage Lao-tzu: “One can know the whole world without having ever stepped out of one’s door.”

Another very beautiful metaphor about water can be found in the I Ching (The Book of Changes), in which water represents one of the eight primal energies. It’s described as always flowing and filling out all places and hollows. It’s not afraid of any current or waterfall and yet it always stays faithful to its original flowing character. In the Chinese tradition of the five elements—water, wood, fire, earth, and metal—each element is related to a specific organ, sense organ, and mental and emotional qualities, as well as colors and healing sounds.

The element of water corresponds in this case to the color blue; the kidney and bladder; and the ear, with its sense of hearing.

Water responding to the color blue.

HEALINGS SOUNDS

At this point it’s worth mentioning Masaru Emoto’s water crystals and the vital role that water plays in our body. As the water crystals showed

different reactions according to their exposure to sound, so our body, too, reacts directly to sound.

Music and sound therapy, which has become more and more popular in the past few years, uses this power purposefully and with positive results. Often the music comes from the traditional instruments of indigenous people or ancient cultures. Personally, I find that the most fascinating musical instruments in this context are the Tibetan sound bowls that originate in the Himalayas. These bowls are traditionally made of seven different metals, each vibrating at a different frequency.¹ Long ago, these metals were each assigned to a corresponding celestial body in the solar system:

- Gold: sun
- Silver: moon
- Mercury: Mercury
- Copper: Venus
- Iron: Mars
- Tin: Jupiter
- Lead: Saturn

Before being worked according to a formula that has been kept as secret as a precious recipe, each metal is placed for three days under the light of a full moon in order to absorb its energy.

The origin of the Tibetan sound bowls is lost in the mists of time, but they could date as far back as 7,000 years. It's believed that the Buddha used sound bowls some 2,600 years ago to accompany his meditation practice. Nowadays, they're still being played in Himalayan monasteries and in many parts of Asia to calm and clear the mind and focus thoughts and feelings during meditation, and also as an accompaniment during

religious ceremonies. In the Western culture of the 20th and 21st centuries, they've found a place not just in music and sound therapy, but also in healing practices such as sound massage, sound journeys, and sound baths.

Playing the Tibetan sound bowls is quite easy. They produce a multilayered sound that's rich in overtones. Out of the interaction of many sound bowls, a range of attractive "soundscapes" comes into being, which harmonizes mind, body, and soul and opens up the heart. Experience has also shown that the bowls can balance the brain hemispheres and cleanse and revitalize the body's energy at the cellular level.

VIBRATIONS OF LIFE

Meditation practice supported by the sound bowls will enhance body-mind-spirit harmony in unison with the core principles of the universe.² How can we make the most of this wonderful realization and use it for health, well-being, and creative self-development?

The most beautiful and creative way would be to get a sound bowl and play it yourself, place it on your body, or feel its harmonious vibration in your aura. You can also experience the feel-good factor through a sound massage or a sound bath administered by somebody else. For most people, the easiest method is to make use of a CD.³ That way you can have a sound massage or a sound bath any time you wish in familiar and comfortable surroundings just by lying between the speakers of a stereo system. In all of these methods, the body, mind, and spirit react immediately in harmony with the sounds; and the high percentage of water in our body starts to form beautiful crystalline structures.

I've also experimented with another method, which I use regularly because it has a very positive effect on me. I place a glass bottle of good spring water directly into a sound bowl (I recommend that you place a piece of cloth underneath the bottle so that no discord arises between the metal and glass), and I let the water absorb the vibrations for a few minutes. I choose a specific planetary sound according to whether I wish to go on a journey of self-discovery or initiate a healing process. Afterward, the water tastes softer and full of energy and, above all, absorbs the strength of the

planet. I've experienced lovely results with these "planet essences." Their effect is similar to the Bach flower remedies—they're gentle yet powerful transformational tools and can be combined with other essences.

If you don't have a sound bowl at home, you can place the bottle of water between a stereo's speakers and let it absorb the vibrations. The CD *Chakra Sounds* features all 13 sounds of the solar planets and gives clear instruction as to how to manufacture your own planet essences.

Let's conclude by looking at water as an "information warehouse." When we drink water, we don't just take in fluids, but also the vibrations of life and nature, because water stores information throughout its infinite cycle. Spring water that's healthy contains "memories" of the leaves and blossoms on which it fell as rain, of the minerals and stones that it trickled through. It contains the vibration of the wind, the sea, the sun, and potentially the whole Earth's ecosystem. It reminds us of our origin and our evolution from a one-cell organism to a full-fledged human being.

Unfortunately, this is no longer true of tap water in most big cities. Because of various chemical treatments and the pressure inside the faucets, the water seems to lose its strength and information. Also, in recent times, more and more cell-phone transmitters have been erected on top of water towers and tanks. These have completely destroyed water's crystal structure, and the fluid has taken on artificial frequencies that are totally lacking in creativity. Luckily, however, thoughts and words such as *love* and *gratitude* have the power to neutralize those vibrations and "resuscitate" water's original attributes [see Chapter 7].

I've experimented with different methods: For example, sometimes I play nature sounds to tap water (rain, birds, the sound of rippling streams, and so forth) and then put the water in a jug with crystals (such as amethyst or rose quartz). Then I place the jug on a picture of a natural landscape—be it mountains, sea, or forest—to restore to this "sad" water its original information and vitality. The CD *Sacred Healing Waters* is ideal for this purpose, because water's journey from rain to spring to river to sea is set to music played on sound bowls, gongs, and bamboo flutes, which are mainly tuned to the sounds of the moon, the sun, Earth, and Venus.

NOTES

1. There are a number of different types of Tibetan bowls. When you play them, you can hear a variety of tones and overtones. All the notes can bring out similar vibrations in the body. You can place them around a person's body or on different chakras. This is like receiving a sound massage. As well as the seven different metals, there are also bowls made from quartz crystal. You can get a lot from recordings of these bowls, but nothing is like hearing them live. The different sounds affect different parts of your body—the sound “AA” impacts your heart, for example, while the sound “EE” vibrates in your head, around your pineal gland.

2. For those who wish to go more deeply into this topic, I recommend the CD *Chakra Sounds* and the book *Chakren im Wassermanzeitalter (Chakras in the Age of Aquarius)*.

3. The Sayama CDs *Sacred Healing Waters* and *Sacred Healing Touch* (both available from www.realmusic.com) are recommended here because they've been produced mainly with sound bowls, gongs (tuned into planetary sounds), and nature sounds in excellent 24 bit, 96 kHz sound quality and therefore do justice to the sensitivity of the human ear. The majority of people who were muscle-tested (via kinesiology) for these CDs showed positive results.

CHAPTER 21

RITUALS FOR CELEBRATING THE SACRED GIFT OF WATER

by Maril Crabtree

The sacred energies of water are a source of healing, guidance, inspiration, illumination, and spiritual wisdom for our life journeys—sometimes in marvelous and mystical ways. Water can be used to celebrate everything from the mundane to the extraordinary, alone or with a group, on holidays or any day.

To use the sacred energies of water in rituals and ceremonies, remember that everything in the energy realm begins with intention. Take a moment to align your intention with the cosmic consciousness—that space within and without where everything is interconnected. From that space, call in the sacred energies of water to assist you in accomplishing what you intend.

In my work as a hands-on energy healer and spiritual coach, the energy of intention plays an important role. Water becomes my ally; after every healing session I join my client in drinking water that carries its pure vibration to enhance the goals of the healing.

When you become aware of water's gifts, you can bring your intention to the water you use in your everyday life and create rituals for those uses. Most of us bathe or shower on a frequent basis. Why not pause just before turning on the shower or climbing into the bath and give thanks for this gift that cleanses, refreshes, and renews not only the body but also the mind and spirit? Take another moment to silently create whatever intention you wish — an intention for serenity as you go through your day, for example. You'll then be ready to receive the benefits of water at a much deeper level as you immerse yourself in it.

Receiving the benefits of water can, in and of itself, be your intention as you go through your day. Whether you drink from a water fountain or your own bottle, be mindful as you sip. In your mind's eye, see the fluid hydrating and replenishing all the cells in your body. You can also carry an atomizer of water with you. When you feel stressed or upset, take a moment to spray the air just above your head and lift your face to receive the droplets of water. In doing so, you'll be giving a self-administered blessing to your body and spirit—and those around you will also be thankful!

We'll explore other examples below, but don't be afraid to create your own rituals to meet your desires and needs.

WATER FOR HEALING AND CLEANSING

Soft candlelight and music surrounded four women seated in comfortable chairs, their eyes closed, their bare feet in tubs of warm water, looks of bliss on their faces. Four other women sat, one in front of each partner, rhythmically cleansing, massaging, and applying lotions to the feet.

The women were participating in the ancient ritual of foot washing. They took their time with it. Each washer focused fully on the woman in front of her, giving her feet loving attention in complete silence.

"It was heavenly," one woman said afterward. "I was surprised that I enjoyed giving the foot washing as much as receiving it. After a while, my hands seemed to merge completely with the foot I was working on—I simply disappeared into it."

Others agreed. Before the ritual, we'd invoked the healing presence of water; and afterward we all felt relaxed, refreshed, and transformed in a way that connected us with more than hands and feet. Use this ceremony with your partner, your best friend, or a small group to enhance well-being for everyone.

One friend discovered that she had lung cancer and used water's healing gifts to help herself. Each day, after taking time to focus her intention, she drank water from a glass with the words *healed, whole, and grateful* taped to it. As she drank, she visualized the water going to the cancer cells and

transforming them, then floating them out of her body. “The water tastes different,” she said. “It becomes my ally in healing.”

A woman with breast cancer used two water rituals. First, whenever she could, she went to the ocean and lay back in the water, arms open to signify that she embraced all the healing the universe had to offer. She visualized the sea flushing the cancer cells out of her body. Although natural water may feel better, you can do this ritual in a swimming pool, an indoor exercise pool, or even in your own bathtub. The important thing, again, is to align your intention and then create a strong vision of water flushing away those damaged cells.

This woman’s second ritual involved other people. Inspired by Dr. Emoto’s research, and knowing that the body is at least 70 percent water, she invited her friends to come and write positive affirmations on her camisoles and T-shirts. She also invited them to bring their own favorite pieces of clothing and write whatever messages of self-love they wished. In a rainbow of colors written with waterproof pens, the words *dance*, *celebrate life*, *sexy*, *love*, and *gratitude* graced her camisoles and T-shirts at the end of the evening. “Now, whenever I get dressed,” she said, “I feel the healing power of those words lying next to my skin.”

The healing benefits of water can bring a true sense of community by connecting and uniting those with a common purpose. In the midst of our women’s circle sat a large crystal bowl filled with water. This water, our leader said, represented the tears of our sisters everywhere, and the loss of life and dignity women experience all over the world through being treated as less than equal.

One by one, each woman sat next to the bowl, speaking words of solidarity and support to their unknown, unseen sisters. As we spoke, many of us added our own tears to those in the bowl. At the end of the ceremony, we carried our sacred water outside and poured it into a nearby stream, adding it to the waters that nourish the earth.

WATER TO CELEBRATE LIFE PASAGES

When Mark and Melissa fell in love, they felt like soul mates. They were so grateful for having found each other that they decided to marry at Thanksgiving and asked me to plan their wedding. A simple water ritual at the heart of the ceremony provided everyone with the opportunity to give the couple a special blessing. A large pitcher of water stood next to an empty bowl. One by one, friends spoke words of blessing, pouring water from the pitcher into the bowl as they did so.

At the end of the ritual, the bowl was filled with clear, sparkling water containing all the blessings. The couple poured some of the water into two goblets and, looking into each other's eyes, drank it, while I spoke of how these mingled blessings would strengthen their love. They took the rest of the water home with them, bottled some of it to freeze and drink on their first anniversary, and poured the remainder into the garden they'd planted together.

You can adapt this ceremony for births, bar mitzvahs, birthdays, graduations, memorial services, and other life transitions. Use it to create blessings and prayers for harmony, world peace, or for any other intention a group wishes to express.

CONNECTING WITH THE WHOLENES OF WATER

Listen to the sounds of water: the whoosh of ocean tides, the tinkle of fountains, and the steady musical drip of gentle rain. Feel the liquid against your skin: smooth and silky or pounding and prickly, enveloping you in a womb of buoyancy. See how water sparkles in sunlight, how a rushing creek foams and curls against the stones, how a deep lake looks still and bottomless. Smell the ocean-salt tang, the brine of old rivers, and the fresh scent of waterfalls.

To celebrate water is to take pleasure in and honor its sounds and smells and textures and faces. Sift through your water memories: What stands out? Do you remember the first time you went into the ocean, bobbing joyfully and merging more and more with each wave? Perhaps someone gave you a dipperful of cold well water on a summer day. Did you revel in taking a long shower after walking several hours on a dusty trail? Have you watched

a breathtaking waterfall as it cascaded down a cliff? What messages did you receive from your experiences with water? As you relive those memories with gratitude and appreciation, in the quiet of your room or in your own heart space, you're celebrating the sacred gift of water.

Anytime you want to experience the energy of that blessing, close your eyes. Picture that shimmering lake or those crashing ocean waves. Let their sounds and textures come alive for you. Soon you'll be floating in harmony with the universe.

Let sacred water be your guide and teacher to help you flow through life with the ease of a river, with the strength of a waterfall, and with the abundance of an ocean.

ABOUT THE AUTHOR

Masaru Emoto was born in Yokohama, Japan, in July 1943. He's a graduate of the Yokohama Municipal University's Department of Humanities and Sciences with a focus on international relations. In 1986, he established the IHM Corporation in Tokyo. In October of 1992, he received certification from the Open International University as a doctor of alternative medicine. Subsequently, he was introduced to the concept of micro-cluster water in the U.S., and Magnetic Resonance Analysis technology. The quest thus began to discover the mystery of water.

He undertook extensive research of water around the planet, not so much as a scientist, but more from the perspective of an original thinker. At length he realized that it was in the frozen crystal form that water showed us its true nature. He continues with this experimentation and has written a variety of well-received books in Japanese as well as the seminal *The Message from Water* (Volumes I, II, and III), published bilingually. He also wrote *The Hidden Messages in Water*, *The Healing Power of Water*, and *The True Power of Water*.

ABOUT THE CONTRIBUTORS

MIRANDA ALCOTT

Miranda Alcott is a crisis responder, intuitive healer, and counselor who works with her service hearing/crisis intervention canine, Whisper. She has a master's degree in spiritual psychology and uses her awareness of energetic fields, colors, frequencies, and vibrations to help those who are confronting crisis in their lives.

RICHARD BEAUMONT

Richard Beaumont cofounded *Kindred Spirit* magazine in 1987 and has been its editor-in-chief for almost two decades. His investigations into the mind, body, and spirit have led him on countless investigations and resulted in him writing more than 100 articles. Recently he was on a live television broadcast of BBC4's *The World* program discussing the film *What the Bleep Do We Know!?*, which contains key references to Dr. Emoto's work. He has interviewed Dr. Emoto and filed several articles on the mysteries of water in the magazine. He's currently the director of the national organization for the dissemination of information on the Human Design System, which studies the genetic imprints behind incarnation. See www.humandesign.info.

WILLIAM BLOOM, PH.D.

William Bloom is one of the U.K.'s most experienced teachers, healers, and authors in the field of holistic development. His background includes a doctorate from the LSE, 2 years of spiritual retreat living amongst the Saharan Berbers in the High Atlas Mountains, 30 years on the faculty of the

Findhorn Foundation, and being cofounder and director for 10 years of the Saint James's Church Alternatives program in London. He's a meditation master; and his books include the seminal *The Endorphin Effect* (Piatkus Books, 2001), *Working with Angels* (Piatkus Books, 1999), *Psychic Protection* (Piatkus Books, 1996) and most recently *Soulution: The Holistic Manifesto* (Hay House, 2004). He's currently heading up several projects to ground holistic spirituality into mainstream U.K. society. He lives in Glastonbury with his family.

PETRA BRACHT, M.D.

Petra Bracht is a physician who also works with natural remedies. She writes for a variety of medical journals and has published a book. She spent eight years lecturing on health and diet at the Johann-Wolfgang-Goethe University in Frankfurt and is currently a visiting lecturer. She appears regularly as a health expert on a variety of German television programs.

MARIL CRABTREE

Maril Crabtree is a writer, editor, energy healer, and spiritual coach. She's the editor of four anthologies of personal essays, meditations, and rituals on the impact of the four elements, including *Sacred Waters: Stories of Healing, Cleansing and Renewal* (Adams Media, 2005). You may contact her through her Website: www.sacredfeathers.com.

MAXIMILIAN GLAS

Maximilian Glas fell in love with stones at the age of ten and has been loyal to this love ever since. He studied mineralogy and became cofounder and editor-in-chief of the mineral journal *Lapis*. He has written numerous articles on the subject and organizes mineralogical exhibitions.

CARRIE JOST

Carrie Jost has been working with kinesiology since 1987. She has trained in many of the kinesiological approaches, psychotherapy, a variety of bodywork methods, and shamanic healing. She's currently head of the School of Creative Kinesiology in the UK, working with individuals and running training courses for practitioners who use kinesiology to help people find their way forward in life by dealing with the issues that get in the way. She brings her love of this work to everything she does.

DOLLY KNIGHT AND JONATHAN STROMBERG

Dolly Knight holds degrees in medicine and homeopathy and has cared for and helped many people and animals since the age of three. Jonathan Stromberg holds a bachelor of science in environmental geology and a master of science in engineering geology and is a fellow of the Geological Society. Together, they founded the Centre for Implosion Research in the UK in 1997. Both are members of the Scientific and Medical Network.

SIG LONEGREN

Sig Lonegren was taught to dowse over 45 years ago by his mother. He has a master's degree in the study of sacred space, is a past trustee of the American Society of Dowsters, and presently serves as vice president of the British Society of Dowsters and as a trustee at Chalice Well in Glastonbury. He's the author of three books on dowsing.

ELIZABETH PUTTICK, PH.D.

Elizabeth Puttick is a sociologist of religion and Indologist. She's the author of *Women in New Religion* (Macmillan/St. Martin's Press, 1997), numerous scholarly papers, and contributions to various books and

encyclopedias on world religions, including the *Encyclopedia of Hinduism* (RoutledgeCurzon, 2007). Her spiritual path took her to India, where she traveled extensively and lived in an ashram for five years. Nowadays, she runs a literary agency in London (www.puttick.com).

RUSTUM ROY

Throughout his 60-year career, Rustum Roy has interwoven both world-class science and the reformation of theology and the practice of religion. He's at once a distinguished research scientist and a social activist, a societal reformer, and a champion of whole-person healing (or CAM). He currently holds professorships at Penn State, Arizona State, and the University of Arizona covering those fields. His work has been recognized by his election to five separate National Academies of Engineering/Science: the U.S., Sweden, India, Japan, and Russia. He has had the Order of the Rising Sun with Gold Rays conferred on him by the Emperor of Japan.

One of the key founders of the first major interdisciplinary field in the Western world's academia—materials research—he played the same role for the field of science, technology, and society. He has also been involved—usually as the only scientist—with cutting-edge reform of the Christian church. He has given the prestigious Hibbert Lectures in London and served on the Pope's Nova Spes Committee on Science and Religion, a field on which he has written and lectured for 50 years.

SAYAMA

“Sayama” Richard Hiebinger was born in 1964. He worked for several years in the field of music therapy with mentally handicapped children and for the last 15 years has been involved with sound therapy and holistic practices (Tai Chi, Qi Gong, meditation, energy work, and aromatherapy) to harmonize mind, body, and spirit with the aim of developing the human creative potential. He founded the record label Sayama-music in 1991 and has published numerous CDs, including *Sacred Healing Waters* and *Sacred*

Healing Touch (both available from www.realmusic.com). His work is characterized by sensitive arrangements from different cultures of the world and by being in tune with the sounds of the planets as developed by H. Cousto. He regularly gives concerts and leads seminars.

RIVKAH SLONIM

Rivkah Slonim is the education director at the Chabad House Jewish Student Center in Binghamton, New York, and an internationally known teacher, lecturer, and activist. She travels widely, addressing the intersection of traditional Jewish observance and contemporary life, with a special focus on Jewish women in Jewish law and life. During the last two decades she has lectured in hundreds of locations across the United States and abroad, counseled individuals, and served as a consultant to educators and outreach professionals. She's the editor of *Total Immersion: A Mikvah Anthology* (Jason Aronson, 1996) and *Bread and Fire: Jewish Women Find God in the Everyday* (Urim, 200). She and her husband are the parents of nine children.

CYRIL W. SMITH

Cyril Smith was born in London in 1930 and worked on radar from 1947. He was a research fellow at Imperial College London in 1956, working on medical x-ray imaging. From 1964 until early retirement in 1989, he was lecturing at Salford University, where his research activities included instrument technology, medical electronics, dielectric liquids, and the electromagnetic effects in living systems and water. In 1973, he commenced his 18 years of cooperation with Herbert Fröhlich, FRS. In 1982, he began his involvement with the diagnosis and treatment of EM hypersensitive patients. He was secretary of the Dielectrics Society from 1972 to 1983. In 1990, his seminal book *Electromagnetic Man*, co-authored with Simon Best, was published. He continues to be active in research and writing.

STARHAWK

Starhawk is the author of ten books on Goddess religion, Earth-based spirituality, and activism, including *The Spiral Dance*; *The Fifth Sacred Thing*; and her latest, *The Earth Path* (HarperSanFrancisco). She teaches permaculture design with a focus on Earth-based spirituality, organizing, and activism in her Earth Activist Trainings. A committed activist for global justice and the environment, she travels globally, teaching, lecturing, and training.

JOSÉ LUIS STEVENS, PH.D.

José Luis Stevens is the president and cofounder (with Lena Stevens) of Power Path Seminars, an international school and consulting firm dedicated to the study and application of shamanism and indigenous wisdom to business and everyday life. He's based in Santa Fe, New Mexico.

José completed a ten-year apprenticeship with a Huichol *maracame* (shaman) in the sierras of central Mexico. In addition, he's studying intensively with Shipibo shamans in the Peruvian Amazon and with Pacos in the Andes in Peru.

He's a licensed psychotherapist, life coach, and teacher with more than 35 years of experience, and is the author of ten books and numerous articles, including *The Power Path* (New World Library, 2002), *Secrets of Shamanism* (Avon Books, 1988), and *Praying with Power* (Watkins, 2005).

WILLIAM A. TILLER, PH.D.

William A. Tiller, professor emeritus, Stanford University's department of material science and engineering and fellow to the American Academy for the Advancement of Science, is the discoverer of a second, unique level of physical reality—a new energy manifesting in nature. In his conventional science field, he has published more than 250 scientific papers, three books, and several patents. In parallel, for the past 30 years, he has been pursuing

serious experimental and theoretical study of the field of psychoenergetics, which he thinks will become a very important part of “tomorrow’s” physics. In this new area, he has published, to date, an additional 100 scientific papers and three seminal books: *Science and Human Transformation: Subtle Energies, Intentionality and Consciousness*; *Conscious Acts of Creation: The Emergence of a New Physics*; and *Some Science Adventures with Real Magic*. He currently directs the William A. Tiller Foundation for New Science in Arizona (www.tiller.org) and was a featured scientist in the movie *What the Bleep Do We Know!?*

DOREEN VIRTUE, PH.D.

Doreen Virtue is a fourth-generation metaphysician and clairvoyant doctor of psychology who works with the angelic, elemental, and ascended-master realms. Doreen is the author of numerous best-selling books and products, including the internationally best-selling *Healing with the Angels* book and card deck. She’s been featured on *Oprah*, CNN, *Good Morning America*, and in newspapers and magazines worldwide.

Doreen teaches classes related to her books and frequently gives audience angel readings. For information on her products, workshops, message-board community, or to receive her free monthly e-newsletter, please visit: www.angeltherapy.com.

ALAN WALKER

Alan Walker is an Anglican priest and a lecturer in world religions for Florida State University (London Study Center). His publications include *Prayer for Everyday Living* (Godsfield Press, 2003) and *Vacations for the Spirit* (Godsfield Press, 2004). He’s a regular contributor to BBC radio.

DR. DARREN R. WEISSMAN

Darren R. Weissman earned his bachelor of science degree in human biology at the University of Kansas and his doctor of chiropractic medicine degree at the National College of Chiropractic. He received additional intensive training in acupuncture, homeopathy, and other forms of energy medicine in Sri Lanka. Dr. Weissman's other postgraduate studies have included many other forms of energy healing. He's the developer of The LifeLine Technique, an advanced holistic system that discovers, releases, and interprets the root cause of physical symptoms and stress—emotions trapped within the subconscious mind. An internationally renowned lecturer, his mission is world peace through inner peace.

TERRI WINDLING

Terri Windling is a writer, painter, folklorist, and the director of the Endicott Studio for Mythic Arts (www.endicott-studio.com), an organization dedicated to creative arts inspired by myth, folklore, and fairy tales. She has published more than 40 books, including mythic novels (*The Wood Wife* and others), children's books (such as *The Winter Child*), and anthologies of magical fiction (*The Green Man: Tales from the Mythic Forest* and more). Her articles on myth and mythic arts have appeared in numerous magazines, journals, and books, including *The Oxford Companion to Fairy Tales*. She has won seven World Fantasy Awards, the Mythopoeic Award, and the Bram Stoker Award; and she appeared on the short list for the Tiptree Award. Windling divides her time between Devon, England, and a winter retreat in the Arizona desert.

New York Times Bestselling Author

The Secret Life of Water

masaru emoto

“With his simple but far-reaching message, Masaru Emoto has made an important contribution to global efforts for peace and harmony.”

**—Anthony Robbins, author of
*Awaken the Giant Within and Unlimited Power***

From its arrival on earth to the vast areas it traverses before emptying into the sea, water holds all the knowledge and experience it has acquired. As phenomenal as it may seem, water carries its whole history, just as we carry ours. It carries secrets, too.

In *The Secret Life of Water*, bestselling author Masaru Emoto guides us along water's remarkable journey through our planet and continues his work to reveal water's secret life to humankind. He shows how we can apply its wisdom to our own lives, and how, by learning to respect and appreciate water, we can better confront the challenges that face the twenty-first century—and rejuvenate the planet.

“As with Galileo, Newton, and Einstein, Dr. Emoto's clear vision helps us see ourselves and our universe differently.”

—Marcus Laux, N.D., editor of *Naturally Well Today*

© HARMON, LTD.

Dr. Masaru Emoto is an internationally renowned Japanese researcher, lecturer, and bestselling author. He is a graduate of the Yokohama Municipal University's Department of Humanities and Sciences with a focus on international relations, and he received certification as a Doctor of Alternative Medicine from the Open International University.

The universe, silence, a world stretching into all eternity

They came here from far away—hundreds and thousands of clumps of ice—moving through outer space. After a long journey through the expanse between planets and stars, the grand journey is about to come to an end.

The earth, emerald-green, shining brightly

As the ice approaches earth, it enters the atmosphere and begins to break up, gradually becoming smaller, spreading out, and then finally falling to the ground.

Clouds, ornaments in the sky, art evolving moment by moment

When the ice granules fall to a certain point, they become a fine curtain of mist and spread out in the sky, creating a white carpet above the earth. A cloud is born.

Rain, ice granules falling down on plants, gently providing moisture

Rain falls, bringing nourishment to the earth—forests, fields, flowers. The water sinks into the ground only to emerge ages later as springwater.

River, splashing, sparkling, flowing magnificently

At first a muddy stream, the water eventually becomes a river flowing through the meadows—waterways, carrying life within.

Sandy beach, blue sky, sparkling ocean reflecting the sun, white waves

Aeons ago, this is where it all began. The ocean gave birth to life and life emerged on land, creating a new day—the birth of bustling culture.

Morning mist, droplets flowing down the veins of green leaves

Water, in its most pure and beautiful form, rises up in the cool air of the forest morning, creating a mist.

Beside the water well, nice and cool, the laughing of children

The children share a watermelon. Plants take their moisture from the ground, providing us with sweet fruit. Water from the well is cold and delicious.

Industry, chimneys, black smoke, discarded plastic bottles

Somewhere along the way, we have forgotten how to show our appreciation for water. Water from the ground is polluted, and water from our taps no longer tastes good, so we resort to water in plastic bottles.

A new century, a new war, hope and despair

Perhaps the pollution of water is nothing more than the pollution of the human soul. Modern society has gone as far as we can go. What is to come of us now?

Ice crystals, shining diamonds, a new hope, the beginning of a new adventure

INTRODUCTION

Starting with my first collection of water-crystal photographs, *Messages from Water* [*Mizu kara no dengen*] (Vibration Kyoikusha, 1999), I have come to realize that these water books have a strange and wonderful power. They have wings of their own and go beyond my own familiar boundaries to distant lands, where they have an enormous impact. They force people to experience a different way of seeing things, and I am often invited to speak to the people who have been touched by these books.

I sometimes feel like I'm being guided by the spirit of water. I feel like I can see and even talk to this spirit, which I see as water droplets shining brightly in the air. The droplets join together to form clouds, disappearing just as fast, all for my entertainment.

Even though I now feel like I am being guided by the spirit of water, my first conscious interaction with water was not at all pleasant. In Yokohama, Japan, where I grew up, my family lived on a plateau near the ocean. It was only a short walk down a slope to the water's edge. When the tide went out, the shallow shore was left uncovered for miles, making it a great place to hunt for various types of clams. But at high tide, the scene was completely different.

I must have been six or seven when the sea swallowed me up one day. I had gone out swimming with the boy next door, who was two years older than I.

We had gone out farther than we should have, and I suddenly began bobbing up and down, gasping for air. It was the first time I had experienced anything like it. I was only ten meters from land, but my feet didn't touch the bottom. I panicked and started waving my arms and kicking my feet. But the more I panicked, the more I sunk, and soon I started to swallow water. I thought that was going to be the end of me, but a small boat approached and pulled me out of the water.

When I went home and told my mother what had happened, she gave me some advice based on her own ability to swim and her understanding of water. “You can float if you just give in,” she said. She told me that if I let the water lift me instead of trying to resist it, it would pick me up and carry me.

These words have stuck with me over the years. Since that time, I have tried to let myself go with the flow as I gently move in the direction that I wish my life to take me.

Now whenever I go swimming in the ocean or a pool, I like to just lie on my back and let myself be carried in the arms of water. And it’s times like that more than any other that I feel the presence of the spirit of water in the form of shining droplets.

I feel quite confident in saying that the reason I came up with the idea of freezing water and taking photographs of the crystals was that I desired to go with the flow of life. The spirit of water came to my aid, guiding me to live the life that I now live. The spirit has led me and guided me over the years, teaching me the many things I need to know, culminating in the publication of my book *The Hidden Messages in Water*.

Shortly after its publication, readers began sending me letters of appreciation. Their kind words have helped to create a wonderful flow for me to give myself up to. Most of the letters expressed appreciation and also amazement in seeing the truth of nature revealed through water crystals.

One woman wrote, “Of all the books that I have read in my life, this is the most wonderful. Thank you so much for this book—it’s as if it were surrounded by light. I will treasure it for the rest of my life.”

Another message read, “To see truth revealed in such a visible way is truly surprising, amazing, and convincing. This book made me realize that the effects brought about by ancient teachings, prayer, and religion are not simply superstitions and random ideas, but effects based on the truths of the universe.”

Another wrote, “My seventy-six-year-old father told me, ‘Of all the books people have recommended to me, this is the only one I’m glad I read.’ Thank you for this book that has changed my perspective on life.”

In fact, if we were to take the energy from all these messages and make a crystal, I am certain that it would be a beautiful one.

This is the work of the water crystals. I find that those who are attracted by the beauty of crystals become connected and then they resonate with each other. Like when a single leaf falls onto the surface of water, a quiet and soft but certain wave is spreading out as a result of water’s secret life being revealed to mankind.

The response has been the same all over the world. I have met with people from Germany, Switzerland, Austria, Holland, England, France, Italy, America, Canada, Costa Rica, Uruguay, Ecuador, Brazil, Australia, South Korea, the Philippines, and Taiwan, where I have given lectures. In June 2002, I was invited by the Greek Orthodox Church to join a luxury-cruise seminar tour on the Adriatic Sea along with religious leaders and scientists from around the world. Symposiums were held in Greece, Albania, Montenegro, Slovenia, Croatia, Italy, and other ports of call. Called the International Symposium on Religion, Science, and the Environment, the event was being held for the fourth time. I had been invited just three months before the symposium by one of the organizers of the symposium, a Greek woman whose daughter had showed her the collection of crystal photographs. The emotions of the many people who saw the crystal photographs reached behind the individual and resulted in a flow of wonderment from one person to another that has now become a flowing river.

There’s another way to express the response to the water-crystal books. It’s as if the water crystals have brought moisture back to the dried-up souls of those who live in the harsh conditions of modern society. They have replenished the brilliance of life to individuals and society. More than anything else, the photographs have succeeded in starting an enormous movement that is taking place among people around the world.

The act of living is the act of flowing. If a dam is built in a river to stop its flow, the river will die. Likewise, if the flow of blood gets dammed up somewhere in our bodies, it will mean the end of life.

The same is true for cities and countries. I was recently blessed with the opportunity to lecture to a large audience in Berlin. As you know, Berlin is a city that was once divided in two by a wall. I told the audience that just as water should remain free to flow, in no way should a city or a country be divided. The splitting of Berlin in 1961 resulted in a great hardship, loss of homes, and loss of dreams.

Then, twenty-eight years later, the wall was torn down and, like water allowed to flow freely, millions of people began to come and go of their own free will. The people emulated the flow of water, a principle of nature. And the reason is that people are mostly water.

About 70 percent of our bodies are water. This is the case for adults of all races, and it is why people should not be divided by political strategies and ideologies. Just like water, people must always be allowed to flow freely.

When I finished speaking to the audience, I noticed that a change had come over the hall. It was like a feeling spread over all of us. A wave of people stood up and started clapping. Their souls had been touched by my message, and the result was a wave of emotion that encompassed the hall, creating an ever-larger wave that would expand to others.

The desire for peace and prayers of love cannot be contained within borders. Differences in skin color or language are easily overcome when hearts resonate together, creating a new flowing wave.

A small adventure beginning with a tiny little water crystal has spread to people all over the world, creating a growing movement. The water crystals have resonated with something pure and holy deep within the souls of the people who see the photographs. Hearts have been opened, and love, gratitude, and a hope for peace have spilled out, opening the way for a new adventure.

Through this book and through these crystal photographs, I hope to convey the power of prayer.

When water is exposed to certain expressions—“You’re cute,” “You’re beautiful,” “Love and gratitude”—a beautiful crystal results when the water is frozen. What does this really mean for us? The thoughts in our hearts have an impact on all life and in the creation of our world tomorrow.

A wondrous power resides within the human soul. We hear all the time that our actions are a result of our thoughts, and this principle is truly demonstrated in how water forms crystals according to what influences it has been exposed to.

But the power to affect action with thought is a double-edged sword. If people desire to see the destruction of the world, then that is what will result.

A lot has happened in our world since people have become aware of the water crystals. Gigantic buildings—symbols of civilization and prosperity—have collapsed before our eyes. New wars have erupted. We have seen sadness give birth to anger, and anger create more sadness, creating a cycle that encompasses the world around us. Some people cry, some look down in despair, and some look up in prayer. We must use the power within us to keep our thoughts focused on the good around us and not on the forces of destruction.

We are at a point in human history when we most need to rediscover some important truths that we have somehow forgotten. In fact, this might be our last chance. And this is the lesson that I feel water crystals are trying to teach us.

My research into crystals began with the desire to get even one tiny step closer to understanding the universe, but that has now led to the evolution of a broad field of study for me.

I have seen the effect that bright smiles of people throughout the world and expressions of emotion can have on the formation of beautiful crystals. But you may ask, can world peace occur from mere water crystals? It is my

desire to take the first step in that direction and then one more and then another and on and on toward that end.

As I continue my conversation with water, the crystals continue to teach me many lessons: the importance of living in tune with the rhythm of life and the flow of nature, leaving the earth beautiful for future generations; love; and prayer. All of these various messages have been included in this book. I could be no happier than to find that it has had a positive influence on all those who have picked it up.

Finally, I would like to express my appreciation to Beyond Words Publishing, my English-language publisher of *The Hidden Messages in Water* and *The True Power of Water*, and all others who have helped in various ways, and also my staff at IHM who endured many hours in a refrigerated room taking pictures of crystals.

CHAPTER ONE

Tune in to the Hado of Happiness

What comes to mind when you think about happiness?

Do you think about love coming true for you? Perhaps the moment of birth of a son or a daughter? A job well done? Or a time you remember lying in the green grass and gazing up at the blue sky? The answer is different for everyone. We all have our own image of what happiness is. But all of us want to live a life filled with happiness.

I know of only one way to do this, and that is to align yourself with the hado of happiness. As I described in my book *The True Power of Water*, hado is the subtle energy that exists in all things.

All that exists in the universe vibrates at a unique frequency. So if you emit a hado of happiness, then you can be sure that the universe will respond with happiness. What do you need to do to align yourself with the hado of happiness?

Part of the problem is that it's hard to know what happiness really is. Perhaps there was a time when you thought you were happy, but then you realized that it was only an illusion. Or maybe you believed that a blissful relationship was finally within your reach only to compare what you had with someone else and see your dream castle crumble in the sand and be washed away.

On a trip to Germany, my daughter, who now lives in the Netherlands, told me about one of her friends who had lived in East Germany before the Berlin Wall came down. The construction of the Berlin Wall was a time of great sadness for the people of Germany, but my daughter's friend said that despite the city being divided, life on the east side of the wall went on basically as normal. In fact, a sense of contentment came from knowing that

no one had to worry about what others were thinking because everyone was poor.

But when the wall finally came down and the people in the eastern part of the city were now suddenly able to obtain everything that the western part of the city had to offer, problems began. The more new, shiny things they saw, the more they wanted. But the easterners were basically still poor, so the result was a lot of unsatisfied needs. Some even longed for the days before the wall came down when people were poor and prices low.

It seemed as if the country had first been torn apart and then put back together all without regard for the will of the people. Of course the fall of the Berlin Wall is one of the most jubilant moments of modern history, but we have to admit that even this wonderful turning point had its repercussions.

When we start to compare our happiness with that of others, we soon start resonating with the hado of unhappiness. As long as we search for happiness from the outside, then it's unlikely that true happiness can ever be found.

Return to Bliss

The search for happiness is ultimately and simply a search for self. You can go searching for it in distant lands, but you'll only find it in the palm of your hand.

Think back far enough in your life and you'll probably remember a time when you felt innocent bliss. Your life had meaning and you were so busy living that time was forgotten. Then adulthood set in and you put those things away and locked the door. Perhaps you have even forgotten where you put the key.

But those happy feelings are not gone for good. With a little effort, you can open the door and take out those things that you thought were forever a part of your past. When you are true to your self and search for what you really want to be and do, your life will once again begin to flow.

In your job, in your play, and in your love, you need to return to the starting point to find the bliss. When you do this, you will soon realize that your life has changed. You'll first feel a renewed sense of health and well-being. This is because the bliss within you will purify the water that flows through your body. If we were to take a picture of such water, the resulting crystal would most certainly astound us.

One treatment suggested for people with cancer is “life-purpose treatment.” By finding a purpose in life—giving speeches, climbing a mountain, laughing—the immune system is revitalized and the cancer often goes into remission. It's now common knowledge in the medical community that your mind has an enormous impact on your body. Filling your body with the hado of bliss is the very best secret for living a healthy life.

This state of bliss is also the key to expanding what we can do. We all know that if you enjoy something, then you usually excel at it. Yukio Funai, a famous business consultant in Japan who has provided advice to some three thousand companies, advocates an effective method for strengthening the abilities of companies and individuals. He calls this method the “strength-development method,” and it simply involves focusing on the strengths of the company or the individual and working to expand those strengths. Weaknesses are not even considered. The result is that the strengths become stronger and the weaknesses take care of themselves.

For example, if you run a store, it's easy to focus all your attention on how to move the products that aren't selling well. But most stores will have a product that's a strong seller. For a boutique, it may be a particular style of dress; if they can focus their attention on that dress, then sales of that product and other products as well will increase. For a business to succeed, it needs to focus on what is selling well, what's most effective, and what they do best.

We see this concept reflected in the hydroponics method of growing vegetables, which makes it possible to harvest ten thousand tomatoes from a single tomato plant. How, might you ask, is such a thing possible? The answer is surprisingly simple: create a good environment for growing tomatoes.

Plants, of course, grow in soil, but with hydroponics farming, the roots grow in water infused with the nutrition that a plant requires. And because the plant doesn't need to use up energy to push its way through the soil, the roots can grow at will and easily find all the necessary nutrition. In this way, the tomato plant is able to take advantage of all its hidden potential. I remember visiting an experimental farm operated by agronomist Shigeo Nozawa, the inventor of the hydroponics method, a few years before he died and seeing the tomato plant he had grown. To put it lightly, I couldn't believe my eyes.

The same thing applies to us as humans. When you find what you do best and realize that this is where you need to focus your attention, then you will be well on your way to returning to bliss. It won't be long before you sense that your life is undergoing a change. If you know someone, perhaps a child, who is focused on a sport or a certain aspect of study, then you need to provide nourishment in the form of encouragement and compliments. This will help the person become even more focused and more determined.

A good illustration of what can result from the right words can be seen in the formation of water crystals. When water is exposed to the words "You have to do it," the result is never a well-formed crystal. This also goes for words like "You fool," and the worst, "It's no good." Perhaps it's time to take these words out of your vocabulary. Fill it instead with words like "Thank you," "Let's do it," "I love you," "Beautiful," and "Well done." Make these warm and beautiful words the ones you use the most.

The words that make beautiful crystals from the water that flows through your body are the words that fill you with a gentle feeling of peace. And that is when you will be able to expand on your abilities and go about each day with passion and bliss.

In my previous book, I explained how we put cooked rice in three glass jars, and to one of the jars we said "Fool!" To another we said "Thank you." And we simply ignored the rice in the third bottle. The rice that was told "Thank you" fermented and had quite a nice fragrance. The rice that was told "Fool!" darkened and rotted. The rice that was ignored turned black and emitted a highly repugnant smell.

However, that's not the end of the story. I took these same jars of rice to an elementary school, and the students said "Thank you" to the rice in all three containers. It wasn't long before the rice in all three containers fermented and started to emit a pleasant smell—even the rice that had spoiled.

This indicates that even that which is dying and decaying can be brought back to life by caring attention, kind words, and positive thoughts.

Shinichiro Terayama, a former director of the Japan Holistic Medical Society, is a testament to this. Terayama spent his career as an impassioned businessman, and before that he had kidney cancer. He started making it a habit to wake up early and go to the rooftop of his condominium to greet the rising sun. As he watched the morning sun each day, he began to realize that life is a gift, and the words "Thank you" started coming out of his mouth. Without turning his eyes from his cancer, he instead spoke words of appreciation to the cells, and the result was that they began to recover. The cancer receded until he was declared cured.

The ability of the spoken word to give life is much more powerful than we can imagine. A ten-year-old girl conducted an experiment similar to the rice experiment but instead used sunflower seeds. On the seed envelope, the flowerpots, and the watering can, she wrote the words "Thank you" for one and "Fool" for the other, and then she spoke these words to the respective seeds as she took care of them each day.

The plant exposed to "Thank you" grew tall with full, lush leaves. In sharp contrast, the plant exposed to "Fool" had a deformed stem and wrinkled leaves. When we looked at the plants through a microscope, we saw that the leaves of the plant exposed to "Thank you" were dense, while the other plant had leaves that appeared weak and frail.

This may well indicate the presence of consciousness in plants, accounting for this striking difference in the two plants raised by the young girl. I learned about this experiment when the mother of the young girl wrote me a letter, which she ended with a question: *What would happen if this same thing applied to raising children?*

One way to look at words is to consider them the switch for turning on or off the vibration of everything in the universe. Or perhaps words can be thought of as a remote control that has the power to reach anywhere.

Humans are the only animals capable of using words, and this allows us to align our wavelength with anything and everything that exists in the universe. And it's instantaneous. Our words and our thoughts can go anywhere and to everyone in the instant they come forth.

Experiences of unexplainable coincidences are too common to be ignored. Perhaps you have dreamed about someone and later found out that they had died. Perhaps you've thought about someone from your past and then you get a call from that person. It's happened to all of us. And the cause of this phenomenon can be found in the vibration of thoughts.

I once conducted the following experiment. I filled a jar with plain water from the tap at my office in Tokyo, and then I put it on my desk. Since the water came from the city water-works system and contained chlorine, attempts to make crystals from the water failed.

I then asked for the help of five hundred people located throughout Japan. At the same time on the appointed day, they all sent positive thoughts to purify the water on my desk and then sent the message "Thank you" to the water.

As expected, the water changed and was able to form beautiful crystals. The chlorinated water from the tap had changed to pure water.

How could this have happened? I think you know the answer. The thoughts and words of five hundred people reached the water without regard for the borders of time and space.

And in the same way, the vibration of your thoughts at this very moment is having a certain effect on the world. If you understand this, then you can also understand that you already hold in your hands all the keys you need to change your life.

There Is Value in Unhappiness

We can learn another thing about happiness from the perspective of hado: Life is not all happiness. As long as there is life, there will be sadness. All our high hopes can be easily deflated, but another way to look at this is to realize that unhappiness is the path on the way to happiness.

We exposed water to the words “happiness” and “unhappiness.” As expected, the water exposed to “happiness” formed beautiful round crystals that would make a precious ring. But what about crystals formed from water exposed to “unhappiness”? We expected to find deformed and broken crystals, but the crystals were rather beautiful hexagonal crystals that looked like they had been cut in half. It looked as if the water was trying its best to form crystals. It would seem, then, that unhappiness is not really the opposite of happiness. Unhappiness, in fact, is the process required for the creation of happiness.

Happiness and unhappiness are like two ends of the same rope, and sometimes you hold one end of the rope and everything goes your way, and other times you have the other end of the rope and nothing goes your way.

Such is life. We all want to be happy every day and never have to experience sadness. How unnatural that would be! Like the waves that rise and fall, if water never falls, then it could never rise or flow ahead.

For every happiness in life, there is another side. When you’re in love, every day is filled with anticipation and joy, but accommodating another person in your life may require that you sacrifice your free time, your money, and your space. And you can almost be sure that after a fight, you’ll find yourself thinking that you’d be better off alone. The elation felt when you buy the car of your dreams seldom lasts as long as the car. Each new scratch in the paint and each time you fork out money to maintain the car will chip away at your initial happiness.

You can never own only one side of a coin. If you want to find happiness, then you have to be ready to accept what comes with it. Such is the fate of all those who live in this world.

But we can still have hope and look forward to the future. In fact, do you think you would be able to have hope if everything went exactly as you

wanted it to? Your ability to be happy no matter what and no matter when depends entirely on what's going on in your heart.

A Thankful Heart Is the Way to Happiness

Why do people go through life looking for happiness? Dogs and cats look for food and comfort, but they certainly don't go to all the trouble that people do in their continual search for happiness. I suppose the reason is that we are the only ones who can align ourselves with the hado of happiness.

Many years ago, I had a discussion with Dr. Ravi Batra, a well-known international economist, and he said something that has stuck with me:

Why do you think people continually search for happiness? The reason is because we people have a link to unlimited existence. But many of us make a serious mistake. We set up conditions for happiness based on riches and fame, momentary pleasures, and things that are limited and always changing.

There are those who are rich beyond most of our imaginations, and yet they continue to want more as they strive in vain to find happiness. The reason it's in vain is because they are looking to find unlimited happiness in limited money and riches.

Unless we can become one with the unlimited existence, we will never find true happiness. This requires that we raise our consciousness.

All that can be seen with the human eye is of this limited world. Sooner or later, the material trappings will end, and as long as that is how we define happiness, our hearts will always feel hollow.

Of course I understand that casting aside all desire is not possible or even advisable. In fact, desire is not what's preventing us from finding happiness. An appropriate amount of desire is needed to make people strive for something better, and it's what made it possible for human society to rise to its current level. The problem arises when we become slaves to our desires. Our modern society operates on the ability to stir up desire in the masses.

It's no easy task to find happiness in a society established on insatiable desire. So what is it that we need to do to escape never-ending desire and find happiness? The answer is to have a thankful heart.

More than ever, we live in a time when love and appreciation is truly needed. And I think the right ratio for appreciation and love is 2:1—the exact ratio of hydrogen to oxygen in the H₂O molecule!

We have seen where words of appreciation and love result in crystals of indescribable beauty. There are no conditions needed for appreciation. We can be thankful for life and for our freedom to move about.

When you align your soul with the hado of appreciation and love, a small drop of happiness will seep into your heart and spread throughout your body. This will link you to the vibration of happiness, and happiness will become a part of your daily life. And this is the secret for finding happiness right now wherever you are.

The Invisible World of Hado

Water crystals are just one aspect or face of the universe. Water changes its appearance at will as it attempts to speak to us concerning the formation of the cosmos. It is in itself a temporary world formed within a severe environment.

We can peer into this temporary world when we photograph crystals. To take the photographs, we collect water and place drops in fifty petri dishes. We then freeze them at minus 25 degrees centigrade and let them cool for two and a half hours, during which time they form tiny round clumps of ice. We then peer at the ice at five degrees below zero at a magnification of 200 times. The crystals appear for only two minutes under the microscope. During that time, the tiny water crystals form hexagonal patterns and then melt just as quickly as they appear.

In just a few precious moments, the door to a new dimension is opened, giving us a glimpse into a fantasy world. People who see photographs of these crystals are fascinated by their wondrous beauty. Like the

kaleidoscope that we remember looking into as a child, we are suddenly carried away into another world, if only for a brief moment.

This world we enter is the invisible world of vibration, or hado. Three key words are helpful to understand hado. The first is *frequency*. The entire universe is vibrating at a particular and unique frequency. Frequency can be modeled as waves, a fact easily supported by quantum mechanics. All matter is frequency as well as particles. What this means is that rather than considering something a living organism or a mineral, something we can touch or something we can see, everything is vibrating, and vibrating at a unique and individual frequency. But that is still not all, for the words we speak, the words we write, paintings, and photographs all emit their own frequencies as well.

You may have heard of blind people who are able to “see” colors. When they hold something in their hands, they are able to *feel* the color. They know if something is a warm color or a cool color, a strong color or a pale color. Similar to how we feel the temperature and texture of an object, these people are able to feel the color through their skin. They are receptive to the unique frequency emitted by different colors.

The same applies to written words. People with psychic powers reportedly can read a word by touching it while their eyes are closed, and some say they can read letters still sealed in an envelope. If you consider the concept of hado, you might consider that there is the possibility of this being more than a parlor trick.

But why would the formation of crystals be affected by a word written on a piece of paper and placed around a beaker of water for a few hours, or a photograph placed under a beaker for twenty-four hours? The answer, I believe, is that water is capable of feeling hado from the source and memorizing it.

The second word helpful in understanding hado is *resonance*. Resonance is made possible when there is a sender of hado information and a receiver of the information. Say you make a call to someone you want to talk to. Unless that person picks up the receiver, there will be no conversation. Without a receiver, information cannot be sent. A Japanese expression *aun*

no kokyu, or “in-breath and out-breath,” means a state where subtle synchronization occurs when we do things together. This also refers to a relationship between a sender and a receiver.

When there is a match in vibrations, resonance occurs. We can observe the phenomenon of resonance in various aspects of daily life. For example, if you have feelings of hatred toward someone, there is a good chance that this person feels the same way about you. Likewise, if you have positive feelings toward someone, that person will sense those feelings even if you don't express them in words. What we feel in our hearts has a strange way of being relayed to other people.

The third word helpful for understanding hado is *similarity*. The macro world we know is a symbol, an expansion of the micro world. The nine rotating planets in our solar system are the macro version of the electrons circulating around the atomic nucleus, and what is going on within the human body is a miniaturization of what is going on in the grandeur of nature.

We can also say that this is an aspect of the fractal theory. When you look at a tree, you can see that the tips of the branches divide and spread out much in the same way that the first branches of the tree divide and spread out. In other words, because the tree is formed in the same way as the branches, the tree forms a single silhouette, which is sometimes called a fractal structure. The fractal structure can be seen in various aspects of nature: in the ocean coast, in the churning of a river, and in the formation of clouds.

This is also the case with water crystals. Why do water crystals form hexagonal shapes? When the molecules of water join together, the hexagonal shape is the most stable. Of course, such hexagonal structures are too small to see, but when these small structures join together, they form a larger hexagonal shape. In other words, the placement of molecules too small to see and the formation of crystals that we can see through our microscopes are in compliance with the fractal structure.

So by observing the micro world, we can increase our understanding of the macro world; likewise, by observing macro phenomenon, we can learn more about the micro world.

These three key words— *frequency*, *resonance*, and *similarity* —will give you a better understanding of hado. Another important aspect of hado is flow. The Buddha, knowing that flow is a fundamental principle of the universe, said that all things are in flux and nothing is permanent. Water is a good example of this. Water is always flowing with life, purifying what it encounters as it travels. It carries with it the nourishment necessary for sustaining life while also carrying away impurities, giving life to all.

All life flows with the flow of water. Even your life is in constant flow with water. In fact, even the cycle of birth and death complies with this single principle. Circulation is indeed the law of nature.

But there is one form of life that insists on breaking this law of nature: humankind. The desire for more, pride, and the insistence of one ideology over another all serve to block the flow. This is the cause of many of the problems that we find ourselves facing in these troubled times. War that begets greed, tragedy that begets loathing, pollution that begets apathy. These are distortions or blockages of the natural ways of nature.

Many of the problems that we have not even started to solve require careful resolve and bold action. And what will be necessary for us to arrive at solutions? The answer is circulation. This is the key that we need to open the floodgates to a new day for the human race—finding happiness, spreading love, restoring peace, and protecting this jewel called Earth. It all begins with circulation, and it is water that will show us the way. I invite you to begin the journey:

Let's listen carefully. Let's listen to the voice of water.

And steep ourselves in the fantasy world created by water crystals.

Someday we will return to water and become a part of the natural flow.

Filled with amazement, your heart and your step will be lightened.

Such a feeling will show you the most beautiful sight you've ever seen.

There's no need to resist the flow.

No need to be afraid of moving forward.

And the reason is that you are water.

CHAPTER TWO

Water's Healing Melody

If you find yourself feeling down, overwhelmed by the daily grind, or offended by an unkind word or act, then I suggest you try something: simply look at water. Walk to the edge of a nearby pond or a stream and cast your eyes on the gentle waves reflecting the sun. If it's raining, find a puddle and watch the raindrops make rings that appear and disappear. Or while you are washing dishes at the sink, gaze at the geometric creations made as the light from the window mingles with water cascading downward.

I recommend this because you will discover that water takes you to another world where you will feel the water within being washed clean; you will be able to return to who you really are. You have just forgotten for a while that you are water. As you let the water flow gently through your mind and your body, it will heal you at your core.

The flow of water has much to teach us. In fact, the act of living is the act of flowing. It's almost as if the water within your body has a desire to flow. In the same way, your soul must also flow. When your soul is allowed to flow, you feel a burden lifted from your weary body, for the soul and the body are simply two sides of the same coin.

If you have been offended, forgive the offender. And if you feel oppressed for your own offenses against others, forgive yourself. Forgiveness opens up the path for you to naturally and freely flow toward your future.

The universe holds something potentially wonderful for you at each passing moment of life. Open yourself to the good things flowing toward you and you will be able to reach out and welcome a wonderful future into your bosom. If you can't get over a broken heart no matter how hard you try, the last thing you can do is go back and change the past. But there always

remains the possibility that the flow of life will take you to a place more wonderful than you could have hoped for. Every second of life is a new crossroads with new possibilities. If you can realize this, you can free yourself from your burdens, you will see how trivial your problems are, and you will no longer need to be tied to the past.

Water teaches us how to live, how to forgive, how to believe. If you open your ears to the possibilities in life, you may just be able to hear the sound of the pure water that flows through your body even now. It is the sound of your life—a melody of healing.

Water Is Part of the Rhythm of Life

The water flowing within us is part of the water flowing through nature and part of the rhythm of life being played out throughout the universe.

In Europe and other parts of the world, it has long been said that the moon rules over water. The ocean's tides are directly affected by the movements of the moon. Perhaps low and high tides are the most visible response to the moon, but wherever life is to be found, there is certain to be a link to the movement of the moon. The clam feels the gravitational pull from the moon and opens its shell at high tide. The breeding cycle of the sea urchin is exactly in line with the lunar cycle. And seagulls come to shore to lay their eggs almost always on the evening of a full moon, for reasons other than the increased light.

We could hardly expect that human bodies, consisting of 70 percent water, would be the exception. More babies are born when there is a full moon, as any midwife will tell you. The female reproductive cycle is in time with the moon's. Many people with sharpened sensitivities say they are energized on nights when the moon is full. Full-moon energy is linked to insanity and stories of werewolves. Even the word *lunatic* comes from the root *lunar*.

It makes perfect sense that most of the ancient cultures of the world have relied on the lunar calendar to measure time. The lunar calendar, which is closely aligned with the cycle of life, was an important tool for planting and harvesting crops. When our rhythm is in line with the movement of the

moon, we can more easily align to the flowing of the water within us. This is nothing less than living life to the beat of the drum played by the rhythm of nature. It is also a piece of wisdom mostly lost on modern man.

Similar to the lunar calendar is the thirteen-month calendar used by the Mayans, which is somewhat different from the lunar calendar. I learned about Dr. Jose Arguelles and his wife, Lloydine, who have made it their cause to print copies of this calendar and spread its use throughout the world. They believe that if the calendar is used on a global scale, then people will start to live within the rhythm of nature, thus opening paths that lead to solutions for many of the problems faced by modern society.

According to this calendar, the new year starts on July 26. When the 365 days of the year are divided by 28, the days in each month, you get 13 months. And one extra day. On the Mayan calendar, this extra day of the year was called “the day out of time.” All work was laid aside, prayers were offered, and prosperity was celebrated with laughter and dance.

While changing to a lunar-based calendar may not be practical or desirable for everyone, we can attune to the moon and the rhythm of life in our own ways. The human body is a tiny universe of its own. Being in tune with this grand universe within allows us to fully experience the energy flowing from the cosmos. When we return to living as one with the universe, we will rediscover the simplicity and spontaneity we were intended for and that was intended for us.

The number of people in the world searching for inner healing is vast, and it may include you. Perhaps the reason is because the environment we have created for ourselves has evolved too fast, and now we find ourselves in a world of pain and fatigue of our own creation. How do we save ourselves from it? Listen to the melody flowing from the world around you. When you can feel this rhythm flowing within the water that makes up your being, then you will become one with the water crystals. This is the life that so many of us are searching for. It’s the healing experience that we know deep in our souls is waiting for us. Everyone is searching for healing.

Music as a Healing Force

Alan Roubik is an American pianist who has based his musical career on the principle that music has the ability to heal. In addition to being a performer, Alan is a music producer for television commercials and films, and he also has his own recording company. His piano music has no rival in clarity: many who listen to it say that they feel like their bodies become transparent.

Alan had an experience when he was a young boy which convinced him that music has the power to heal, and since that time, he has based his career on writing music for healing. He started playing the organ at age three as a child prodigy, and from the age of nine, he focused on the piano and on writing and performing. But in his teen years his life took a sudden change. He injured the ulnar nerve in his right arm during physical-education class at school, making it painful and nearly impossible to move his fingers.

For several months, he was unable to play the piano. The muscles in his fingers began to weaken. It seemed as if the road to his future had suddenly come to an insurmountable impasse, and the realization that he would likely lose the music which he loved so much sent him into a deep depression. He tried thinking about other futures, but he always found himself sitting in front of the piano.

And then one day, perhaps in utter desperation, he put his hands on the keyboard and let whatever was in his heart come out. Alan says that what he felt at that moment was something like happiness in his fingers. He could feel the life energy flowing through his hands and the resonance between the sound of the piano and the movement of his fingers.

Alan's hands began to recover almost immediately, and it wasn't long before he was able to play as good as before—or even better.

I first met Alan in 1995 through an introduction by the scientist who had invented the Magnetic Resonance Analyzer (MRA), a hado measuring instrument that is capable of measuring minute vibrations. With the cooperation of this scientist, we asked Alan to compose music that would express the healing powers of hado. We wanted to have healing music that would be capable of boosting the body's immune system.

When the score was completed and recorded, we exposed water to it, and as might have been expected, crystals formed from the water were exceedingly beautiful and delicate—typical of healing characteristics.

When we showed photographs of the crystals to Alan, he said that he was surprised to see that all the crystals formed were identical to the images he had in his mind when he was composing the music.

Alan is one of many artists who is highly aware that music is a form of healing. But we also know that the classical music from the past, famous jazz pieces, and folk music from the corners of the world also have the ability to heal in their own individual ways.

I exposed water to classical music from various composers and then took photographs of the resulting crystals. Then we took hado measurements of the photographs with the MRA. The results revealed the hado—emotional and physical—affected by the music. Some of these results I shared in *The True Power of Water*. Here are two additional findings:

Wagner’s “Ride of the Valkyries”

Emotional hado: Self-pity

Physical hado: Alleviation of indirect pain

Debussy’s “Prelude to ‘The Afternoon of a Faun’”

Emotional hado: Environmental stress

Physical hado: Alleviation and prevention of back problems

What this all means is that good music has the ability to guide us on the path of healing. It seems that this is especially the case with classical music, which has stood the test of time. When water is exposed to this music, my research has found that the water becomes energetic, and beautiful crystals are formed.

Music is also a representation of the time and environment in which the music was composed. If you look back on different periods in history,

you'll find that different periods are characterized by certain music. This is because the types and degrees of stress that society experiences change with the times and require healing. This results in the creation of music that harmonizes with the frequency prevalent in society.

Consider the jazz that came out of New York beginning in the 1940s. Toru Yazawa, a member of a popular band in Japan known as Alice, once shared with me a brief history of jazz.

Jazz got its start with the blues sung and played by African-Americans. When this music was combined with the brass bands of New Orleans, the result was the vivid and liberal genre known as New Orleans jazz. The jazz of this period was mostly simple three-chord melodies, which is why it sounds simple and blissful.

Over time, the center of jazz moved to New York, and in the years after the end of World War II, a new form of jazz called modern jazz started to emerge. Modern jazz consists of complicated chords. Sounds that would normally create a roar were combined, and then other sounds are piled on top of each other, resulting in the uniquely gloomy, avant-garde feel of modern jazz.

During that time, New York City, as well as the whole United States, was experiencing uneasiness and anxiety over the emergence of the Soviet Union and other threatening enemies, creating the atmosphere that led to the Korean and Vietnam wars. Those who lived in New York, a melting pot of different people, in that particular time were experiencing a type of stress never felt before. Perhaps, simpler music (three-chord) was needed for healing simpler human relations, while more complex music was needed for healing more complex human relations. Simply put, music, in addition to being art and providing entertainment, is more than anything a form of healing.

Healing with Hado

As I mentioned in my book *The True Power of Water*, I am keenly interested in the field of hado medicine. Hado medicine focuses on the

underlying cause of the symptoms of illness, in contrast to the medical practices which require that we take pills or undergo surgery to deal with symptoms of disease. Hado medicine deals with the unique vibration of the illness itself. I can say with certainty that the day will come when hado medicine is widely accepted. Most people today go to the drugstore to find solutions for their ailments, but perhaps one day instead of getting a prescription of medicine, you will get a prescription of music to heal what's ailing you. Such a day may not be as far away as you think.

All symptoms of illnesses vibrate at a unique frequency. By knowing the frequency, it is possible to overlap the exact opposite wavelength on top of the symptom's wavelength; thus, the frequency of the illness is dissipated and the symptoms are alleviated. This is already in practice to some degree with treatment for Parkinson's disease and other neurological illnesses.

Hado medicine not only deals with the specific body part where symptoms are located; it also helps to alleviate the real cause behind the sickness, which is often negative emotions. For example, if a person is experiencing liver problems, then we will also almost always find that the person has anger issues. The wavelength generated by anger is the same as the wavelength generated by the molecules of the cells that make up the liver, so the wavelengths of anger and the liver are in tune with each other. In the same way, the emotion of sadness is in tune with the blood, and so sad people tend to be easily plagued by leukemia and hemorrhage-type strokes. Continued irritability damages the nervous system, often leading to pain, sensitivity, and stiff muscles in the lower neck and shoulders.

An important aspect of hado medicine is that the human body is considered to be a universe of its own. Our bodies consist of some 60 trillion cells, each carrying out its specialized responsibility while simultaneously harmonizing with other cells in a wonderful way to make us who we are. The organs, nerves, and cells of the body have their own unique frequency. The body is like a grand orchestra consisting of the harmonization of various sounds. When something goes wrong somewhere in our body, there is discord with one of the sounds. And when even one sound is out of pitch, the entire composition is not as it should be.

A dentist named Kazumasa Muratsu has seen significant results with patients he has treated based on the perspective that teeth are nothing less than organs of the body. In one instance, one of his patients was unable to clench her hands for many years, but when Dr. Muratsu removed the metal fillings on her upper teeth and adjusted her bite, she regained full use of her hands. She also found that she no longer suffered from chronic pain in her lower back and her right leg.

This indicates that teeth have an effect on the entire body, and complications with teeth can influence the rest of the body in totally unpredictable ways. Dr. Muratsu, in fact, says that the teeth are one part of the core control center of the body.

But modern medicine sees the human body as a machine consisting of various independent parts, and the healing they provide deals only with taking care of the particular defect of the particular part that's gotten out of order. But if one symptom is attended to and followed by something failing elsewhere in the body, then true healing has not really taken place. Hado medicine is all about dealing with the health of the entire body, which is why the word *healing* and not "curing" is more appropriate.

Other Forms of Hado Medicine

We can see that hado medicine holds tremendous promise, but I don't want to give you the impression that this technology is anything new. The principles were well known by the ancient cultures and incorporated into their daily lives. In fact, there have been many cases where the wisdom of the distant past has been reexamined to discover that the applications are still valid in our day.

The use of flower essences is one ancient method of healing that has paved the way for hado medicine. The energy and vibration of flowers is transferred to water, and by drinking this water, the patient receives both physical and mental healing benefits. You might postulate that during the transferring process, it is the actual components of the flower that are dissolved in the water, but actually it is only the vibration that gets

transferred. Therefore, a chemical analysis of flower essence will detect only water.

The science of flower essence was established by a British bacteriologist named Dr. Edward Bach. He developed essences known as Bach Flower Remedies, which can now be found throughout the world. In fact, flower essence therapy has expanded to incorporate the characteristics of individual countries. A popular form of flower essence in Japan is called Findhorn flower essence. In northern Scotland, near Loch Ness Lake, there is a community called Findhorn where people from all over the world have come together to live and participate in events and workshops related to living as one with nature and finding one's true way through life.

Marion Leigh introduced flower essence therapy at Findhorn. She is a woman whose smile has the brilliance of flowers. I interviewed Marion when she came to Japan several years ago. She told me,

Our bodies serve as a tool for accomplishing spiritual missions. In order to carry out our mission, we need to release the warped feelings and emotions—fear and grief, sadness, suspicion, impatience, weaknesses, and apathy—that form a block between the spirit and the body.

Such emotions become the cause of many of the symptoms that we experience. Our modern medicine is for the most part unable to deal with the roots of our illnesses, but this is an area where flower essence has proven to be effective.

According to Veda philosophy from India, there are seven places on the human body called chakra points that serve as the portals for unseen energy to enter the body. It is said that flower essence makes use of these chakras to heal certain ailments and parts of the body, depending on the characteristics of the flower. The gorse flower prevalent around the area of Findhorn has a vibration of joy and passion and can be used to effectively deal with a lack of energy, depression, and the weakening of the immune system. Scottish primrose is a symbol of peace and is used to calm and harmonize during times of fear or panic. The cherry blossom can be made into an essence that has the ability to return you to your inner path. It can effectively be used to help you overcome negative patterns of thinking and

feelings of inferiority that weigh you down, while helping you to regain feelings of love and compassion.

To make your own flower essence, go outside on a bright and sunny morning and collect flowers. Cut each flower at the stem, being careful not to touch the flower itself with your hand. Then put the flowers in a container filled with fresh and pure water and set it in the sun. In about four hours, the essence of the flower will be transferred to the water. You can add a little brandy to make the water last longer. Store the water in glass bottles, and as you use it, dilute it even more with water. As needed, put a few drops on your tongue. Your body and soul will feel the effect without the typical side effects of modern medicine.

I decided to see what would happen if I diluted such essence and made crystals. The crystals that resulted were all very beautiful, not unlike the flowers themselves.

Vibration is something you can't see with the naked eye, which is why it is difficult to verify the positive effects of hado healing using modern analysis and medical examinations. However, we shouldn't be too quick to say that there can be no benefits without scientific verification. Many recognized home remedies do in fact make use of the principle of vibration. Homeopathy, as a form of vibration-based medicine, has the ability to heal the body by using vibrational water.

Homeopathy is a medicine in which "like cures like." To treat an illness, the poison that causes the symptom is diluted with water by 10 to the power of 10, and sometimes even by 10 to the power of 600 or more. The poison, diluted to almost an incomprehensible level, is then given to the patient.

Lacquer, for example, often causes a rash when it comes in contact with skin, but when a homeopathic remedy is made using lacquer, it can be used to treat rashes and skin injuries. Freshly cut onions cause tears and a runny nose, but a homeopathic remedy made with onions is good for treating colds, hay fever, and some allergies that have symptoms of teary eyes and a runny nose. This is referred to as "the law of similars."

Homeopathy got its start when a German doctor named Samuel Hahnemann noticed that the essence of the bark of the cinchona calisaya, which is used to treat malaria, brings on symptoms of malaria when extracted and taken orally. Hahnemann developed his theory of homeopathy and announced it in the early part of the nineteenth century; thereafter homeopathy gradually spread throughout Europe and the United States. This was a completely new type of medicine, and it was widely prescribed because of the noticeable benefits.

By the middle of the nineteenth century, more than four hundred homeopathy clinics existed; even physicians to the royal family in England started practicing homeopathy in 1830. In America, homeopathy was so popular by around 1900 that one in five physicians specialized in it. But then medical associations began to form with the intention of getting rid of homeopathy practices. Such organizations, hand in hand with pharmaceutical companies, brought enormous pressure to bear, and soon homeopathy was forgotten.

This is just one more example of how the most beneficial things often receive the most negative pressure. But while homeopathy was once cast aside, it is again starting to regain its former reputation. Homeopathy is now taught in thirty or more medical schools in England, and state-operated hospitals now specialize in it. In France, homeopathic remedies can be purchased at the neighborhood drugstore; about 10 percent of German doctors are homeopathic physicians. In recent years, a homeopathy medical association has been established in Japan, and more and more people are becoming aware of the benefits of this practice.

Healing Comes in Unexpected Forms

Two hundred years ago homeopathy was recognized as an effective form of medicine, and many people over the years can testify to its effectiveness. But it goes mostly unrecognized by modern medicine. I know of one well-known scientific journal that has featured article after article supporting the benefits of homeopathy, but the articles, often published with a note of derision from the editor, have gone mostly ignored.

Many in the scientific community would say, “We know that a lot of people use it, but there is no scientific proof for the benefits of homeopathy.” If homeopathy had no benefits, don’t you think it would have been forgotten a long time ago?

I will be the first to admit that saying that water has the ability to read and memorize information turns scientific common sense on its head. But such unscientific phenomenon are more common than we may think.

Dr. Teruo Higa, a professor at Ryukyu University in Okinawa, has been striving to spread the use of a form of organic bacteria he developed called Effective Microorganism (EM). EM is a liquid formed from bacteria. It has been shown to be perfectly safe—even beneficial—for people and the environment. When EM is applied to soil, the result is a bountiful crop without the use of chemicals or synthetic fertilizers. When used to treat polluted water, the water becomes drinkable. It can even be used to treat the dioxin resulting from the burning of refuse.

While Dr. Higa was doing research on EM, he had a strange experience. He poured the EM liquid in a ceramic container, poured it out, and then cleaned the container, but the properties of EM persisted. He washed the container repeatedly, but he couldn’t get rid of the EM properties. He tried to sterilize the container with high heat, but even that failed to eliminate the EM properties.

This gave Dr. Higa an idea. He transferred the EM into a new ceramic container. At 700 degrees centigrade, a temperature that certainly would allow no life form to survive, the bacteria survived and became baked into the ceramic. This goes against scientific common sense, but EM ceramic has proven to work and now has various uses in the home (such as water treatment and building materials), in the environment, and in agriculture.

We can say that this is another indication of hado science. All matter has its own hado, and water relays this information. The molecules of water carry messages like the magnet of a computer disk. Hado can be either beneficial for life or harmful for life. But even if the vibration is good for life, if water—the mediator—is impure, the hado will not be relayed correctly.

Dr. Higa asserts that in nature there exists both a flow of revival and a flow of destruction. For example, if a piece of fruit is left sitting, it will soon rot and emit a foul smell. This is the flow in the direction of destruction. But fermentation is the flow of revival. Fermentation is a process that creates sauerkraut, yogurt, bean-paste soup, soy sauce, cheese, liquor, and many other foods. Both fermenting and rotting are the work of microorganisms, but they are not the same.

EM is a collection of microorganisms that do the work of revival. When EM is added to the soil, it enhances the power of existing microorganisms; the result is high-quality vegetables without chemicals or synthetic fertilizer. EM is completely safe for humans, and it doesn't deplete the soil.

In contrast, consider chemicals and synthetic fertilizers. Chemicals do eliminate harmful insects, and synthetic fertilizers do ensure bigger crops. But their use kills even the good insects along with all the microorganisms that would normally enrich the soil. Chemicals provide instant gratification, but the long-term and lasting result is destruction of the soil. In fact, much of the farm soil now in use is, according to most definitions, lifeless. We alone have the power and responsibility for restoring the cycle of nature.

Many aspects of our modern society appear to be in destruction mode. For the pursuit of momentary pleasure and convenience, the cyclical laws of nature have been ignored and replaced by the convenience of use-once-and-throw-away.

And we are beginning to hear the groaning from our tortured planet. We are at a point when we must realize that if we want to continue to call this planet our home, we need to change—not the planet, but ourselves.

We have to stop being agents of destruction and start becoming agents of revival. The slogan “From a destructive-type human being to a revival-type human being” may be added to our list of slogans by which we will live from now on.

One of the most beautiful sights you'll find in Japan is a group of tiny islands not far from Hiroshima. Starting in 1998, the people who lived on

the islands got together and decided they had to do something about the polluted water that surrounded them. Batches of EM were made and distributed to each home by volunteers with instructions to put it in their drains. The results were immediate and unmistakable. The clumps of sludge along the shore disappeared and schools of fish began to return. There are now octopuses and abundant clams, something that had existed only in the memories of the oldest inhabitants. The area is known for its seaweed crop, and when EM was added to the water used to wash off the harvested seaweed inland, sludge in the ditches and waterways was soon gone, and even the seaweed quality improved.

A nearby village called Akitsucho heard about the success, and they also distributed EM for free to the villagers, and again the effects were immediate. The waterways became clean, frogs returned, and clams started appearing in the once-barren bay.

The waters near Akitsucho produce some of the best oysters in Japan. When the town's residents put clods of dirt containing EM into the oyster beds, the quality of the ocean water improved, resulting in bigger and better crops than in recent memory. The use of EM spread quickly along the coast, culminating with the formation of the Seto Inland Sea Environment Conservation Council in 2002.

The people along the coast have taken the first important step to restore the revival and circulating type of society. Healing isn't only about the recovery of our own physical health. We need to think about the healing of the land, the rivers, the oceans, and the planet in its entirety.

But what does healing the planet really mean? The answer is a return to the circle of life—the circulation of resources, of water, and of life. That is our responsibility as occupants of this delicate and crystal-like planet.

CHAPTER THREE

Cycles of Water, Cycles of Life

According to a theory first proposed by Luis Frank at Ohio State University, and confirmed by NASA and the University of Hawaii, water arrived on this earth after traveling through space. In every minute of the day, about twelve comets, some as heavy as 100 tons, fall to earth. These comets are made up mostly of ice. When the ice reaches the atmosphere, it forms clouds and eventually falls to earth in the form of rain to fill the ocean. And since we are mostly water, in a sense we all come from outer space.

You've probably gone outside on a clear night to lie on your back and look up at the stars. Did you ever experience a feeling like nostalgia, maybe memories of long ago? When you gaze at the heavens, your soul is taken back in time millions and billions of years. Do you ever get the feeling that you yourself are somehow floating up there in the cosmos, like a planet of one? It makes a lot of sense that we would be so eternally and universally enchanted by the heavens.

From the time when Yuri Gagarin, the Russian cosmonaut, first broke the earthly shackles in 1961, and Neil Armstrong made one giant leap for mankind, the possibility that you and I might someday make the journey ourselves has steadily become more of a reality.

Scientists currently have their sights set on Mars. NASA is already working on concrete plans to send a manned spaceship to Mars, paving the way for people like you and me to become aliens on a distant planet.

But traveling to Mars presents several challenges, and here again, the solution may well be found in water. Among the risks of space travel is the weakening of muscle and bone due to the lack of gravity, not to mention the mental stress of spending long periods in isolation. Cosmic radiation is another problem. Space is filled with radiation from distant universes as

well as from the solar flares of the sun, which can be especially harmful. Safe space travel requires close observation of the sun and a way to escape the intense radiation as needed. Such a place would need thick and sturdy walls.

One way that NASA is addressing this obstacle is by working on building a room in a spaceship with walls made of columns of water. The water could be used for consumption and for preparing water-based foods—and for protection. When a solar flare occurs, the water in the columns would act as a shield for the voyagers until the danger passes.

Because the weight of a spaceship must be kept to a minimum, only a limited amount of water can be carried. The average person uses about 180 liters of water a day; on a space vessel, this amount can be reduced to 3 liters. But even that small amount would add up quickly for a crew on a long journey. This is where recycling of water becomes an important issue. Systems are now being developed to effectively recycle the water used for drinking and bathing and even to recycle sweat and urine.

When the NASA probe *Odyssey* touched down on Mars in May 2001, they discovered that large volumes of water existed in the form of ice just beneath the planet's surface, meaning that water existed on the surface of the planet at some period in the distant past. If this frozen water can be used, then it opens up the possibility that this planet can be made green like our own so that people can someday inhabit it. Work is now moving ahead to make this a possibility.

In 1996, NASA conducted an experiment on Devon Island in Canada to simulate life on Mars. The experiment studied biological scenarios, living conditions, and telecommunications. The temperature on Devon Island is low and the land is barren, not unlike the environment of Mars. Scientists were studying the feasibility of space colonization, but there are other implications of the experiment. Our planet is deteriorating at a rapid rate, and no one has a definitive solution for global warming, overpopulation, starvation, pollution, and water shortages. It makes one wonder how long our own planet will remain friendly and inhabitable. Will we someday be faced with the realization that the only way we will survive as a species is by moving to a distant planet such as Mars? It is no small problem.

Understanding water's remarkable journey to and through our planet may bring us closer to the answers we are searching for.

The two-minute life span of a water crystal is revealed through photographs.

The drama of life is played out in just two minutes, between the time the crystal forms and when it disappears.

A small white granule forms on the tip of the frozen water droplet. In a brief moment, a crystal jewel appears under the microscope and then melts away.

Words are reflected in the water.

We showed words to water in a glass beaker.

Happiness

A crystal of almost perfect shape is formed, like an exquisitely cut diamond. Perhaps this tells us that balance is an important condition for happiness.

Unhappiness

This faint and weak crystal is out of balance and appears as if it is only partially formed. Unhappiness is not the opposite of happiness—it's what we experience on the way to happiness.

Hang in there.

Just the way you are.

“Hang in there” results in a rather tight and shrunken crystal. But “Just the way you are” results in a unique shape that seems to be stretching out, just as these words let an individual expand.

You're beautiful.

Try to be beautiful.

“You’re beautiful” results in a beautiful, natural crystal. “Try to be beautiful” is slightly deformed. This indicates that praise yields better results than pressure.

Like

Hate

The word “Like” seems to take on the shape of a joyous heart, and “Hate” results in a hollow image, almost appearing to suffocate.

Power

Helplessness

“Power” created a crystal that was unique but jumbled; not every problem can be solved with power. “Helplessness” results in a hollow-looking crystal robbed of its power.

Innocence

Doing things with innocence perhaps gives you the greatest power to accomplish them. The crystal became too large to fit inside the frame, and so we decreased the magnification to take this picture.

Thank you

You idiot!

Thank you and You idiot!

When the two words in the top two photographs from my previous book were combined, the result was a thin half-formed crystal. This might indicate that the power of “Thank you” is stronger than “You idiot!”

“Thank you” in Malaysian

“Thank you” in Tagalog

“Thank you” in Portuguese

As in my previous book, we looked at the results of “Thank you” in various languages. The crystal for Malaysian was especially unique. “Thank you” in various languages has different nuances, resulting in highly distinctive crystals.

War

Peace

The crystal resulting from “War” was taken two months before September 11, 2001. The crystal looks almost as if a jet plane crashed into it. The word “Peace” creates a crystal resembling people coming together in harmony.

New York City, September 11, 2001

The events of September 11, 2001, shocked the world. The water formed a crystal like a terrible nightmare.

Coexistence

Competition

The word “Coexistence” resulted in a crystal formed by two crystals, and the word “Competition” created a surprisingly beautiful crystal. This may indicate that wholesome competition is a positive thing.

Peace of mind

“Peace of mind” created an expansive crystal. Perhaps this is what people in these hectic times need more than anything else. This is a photograph you might want to put in your pocket and carry around with you.

The god of happiness and wealth

The god of poverty

In Japan, the Shinto religion observes hundreds of deities; these are two of them. The top crystal is full and round, while the bottom one is pointed. I interpret the message to mean that if you live your life harshly like the pointed tip in the bottom picture, happiness and wealth may not come.

Marital love

This crystal may represent the relationship dynamic at work when one partner is caring and the other needful. Of course, it's best when each partner takes turns caring for the other.

Goods and capital

Oil

These are some of the forces that move the modern economy. They are not bad in and of themselves, but when balance is lost, chaos results.

Hemp

As I discuss in [chapter 5](#), hemp has great potential and can be used to make various products, like food and clothing, with its good vibration.

Healing melodies that touch the heart

This music has the power to heal, as seen in the formation of beautiful crystals.

Alan Roubik's "Keys to My Heart" (1-6)

Alan is doing research into the healing effects of music, and crystals formed while being exposed to his music are all beautiful. This attests to his music's healing influence.

Mendelssohn's "Wedding March"

This crystal results from the joyful wedding march. The crystal brings to mind a flower in full bloom, resembling a beautiful bride.

Wagner's "Ride of the Valkyries"

Sarasate's "Zigeunerweisen"

These are two composers from the second half of the nineteenth century. Although the motifs are different, both crystals shine with a brilliant healing effect.

Albinoni's Adagio

Schubert's "Ave Maria"

The first crystal is the reflection of a mournful melody, while the second one, reflecting "Ave Maria," is a balanced crystal that appears to be overflowing with love.

"Edelweiss," from *The Sound of Music*

Edelweiss in German means "noble white," and so appears the crystal. We can imagine a glass mirror within the crisp white crystal.

“Amazing Grace”

This famous prayerful gospel hymn from America created a striking crystal full of grandeur and reverence.

A Celtic folk song

We played a song sung by Enya, who is an Irish singer of Celtic spirit. The resulting crystal was pure, innocent, and white, just like her voice.

“Rokudan,” traditional Japanese melody played on the koto

“Hyojo Etenraku,” ancient Japanese court music

These two pieces of traditional Japanese instrumental music we played to water yielded beautiful and orderly crystals, indicating overlapping tones of koto (above) and orderliness of the court music (below).

“Crane and Turtle,” traditional Japanese kouta song

“The Green of Pine,” traditional Japanese nagauta song

These pieces are traditional Japanese vocal music. It was interesting to see a turtle-like shape as the title indicates (above). “The Green of Pine” is a song about a beautiful prostitute.

The power of prayer can change the world.

Crystals produced before and after prayers were offered for the water and the world are dramatically different, as can be seen from these examples.

Water prayed for by five hundred people

At the same time, five hundred people from all over Japan said a prayer of love for the water. It was normal tap water, which does not usually form crystals due to the chlorine, but the water formed beautiful crystals. Feelings of love have an instantaneous effect, no matter the distance or the source of the water.

A Sanskrit prayer

This crystal resulted from a prayer to Shiva. The pattern, as balanced and orderly as a mandala, is divine indeed.

Before prayer, Lake of Lucerne

After prayer, Lake of Lucerne

We offered a Swiss Lutheran prayer at Lake of Lucerne. The crystal formed after the prayer resulted in a marked difference.

Before prayer, Lake Zurich in Switzerland

After prayer, Lake Zurich in Switzerland

At Lake Zurich in Switzerland, the crystal formed before the prayer was deformed, but the one formed after was gorgeous.

Before prayer, Bahamas

After prayer, Bahamas

We clasped our hands around a cup of water on the table and spoke to the water with feelings of prayer, resulting in a completely different crystal.

Before prayer, Uchi Lake, Oklahoma

During prayer, Uchi Lake, Oklahoma

After prayer, Uchi Lake, Oklahoma

We gathered people who lived near Uchi Lake in Oklahoma and had them offer a prayer for the water. It's easy to see how the crystal changed from the prayer.

Water's Adventures on Planet Earth

Imagine you have just returned from a trip into space. You step off your vessel onto our green planet and find yourself standing in a deep green forest. Rays of light filter through the trees towering above you. Fallen leaves soften the ground, and deep-green moss envelops the trunk of a fallen tree. Ferns cover the ground all around you. The sounds of life permeate the air—the flapping of wings, the calling of birds, and the wind whistling through the trees and shaking the leaves. As you take a deep breath of cool air and let the scents of pristine nature fill your body, you have a deep realization that this is your planet and your birthright. And that is why you must love it and why you do.

You now see water trickling out between rocks, forming a pool of water. You cup your hands together and drink. You feel the energy of the earth filling your soul, and you know it's because of all that water has experienced in its secret life.

Where did this water, arising from the bosom of the earth, come from? Think for a moment about the earth as water has experienced it. Arriving

from the cosmos in the form of clumps of ice, water fell from the sky upon mountains and forests to give moisture to the trees. That first droplet of dew on a leaf is water in its infancy. From there it begins a journey of unforeseen adventures on our planet. After water falls in the form of rain, what happens next?

A good portion of rainwater—one-third of all that falls—seeps into the ground where it's absorbed by plants, again to be evaporated into the atmosphere. In evergreen forests, as much as ten tons of water will evaporate from a square hectare (approximately 2 1/2 acres) in the first few moments after a downpour.

The water will then rise into the air as mist that drifts among the trees, or it will rise even higher to form clouds. Water in the form of mist will sometimes take another path. When the temperature drops below the freezing point, the mist touches down on the leaves and flowers and forms a thin white layer of ice on the plants and the ground.

It's hard to find anything more beautiful than dew on flower petals and leaves. Clear, crystal-like dew is loved by the plants. A single drop of dew falls off the tip of a sprouting leaf on a branch and make its descent, through the forest canopy, and lands on the back of a frog. Thus, in the forest morning, water spreads itself about in multiple forms to shower love on the frog and the new sprout—and to be loved in return. Just as a mother instinctively loves her newborn, water in infancy is loved by all of nature.

After falling as rain or forming as dew onto the ground, what is water's next destination? Some water will be taken in by the roots of plants and then evaporate again into the atmosphere, but much more will seep slowly into the ground and begin an incredibly long leg of the total journey. Its main path will be the infinite number of secret tunnels under our feet.

The ground is filled with spaces of air, such as the tiny tunnels created by creatures out of our sight: earthworms, centipedes, spiders, beetles, bugs, mites, countless microorganisms, along with moles, rabbits, and other animals. All these creatures serve to soften the soil by opening spaces in the ground in every direction. Spaces between rocks and sand, and openings

left by melted ice, rotted roots, dehydrated soil, and cracked stones, all serve as possible pathways for water on its incredible journey.

Water moves through layers of sand and clay and bedrock. Its journey downward is unwearied and profound. Depending on the hardness of the ground, it's not uncommon for water to move as little as 30 centimeters in a year's time.

Deep within the earth, when water finally reaches hard clay or bedrock, the droplets of water come together and flow into streams, sometimes becoming rivers or lakes such as those that exist above the ground and have names we know.

From the time when water left on this journey through the ground early in its infancy, it has gained experience and knowledge and has formed a personality depending on its path in life, much as a person's personality is formed by his or her journey. Water that has experienced coal, for example, has knowledge of calcium and magnesium, which is why we call it hard water. And water that has experienced granite is mostly left unchanged by minerals and is known as soft water.

Eventually, water learns all it can from the ground and is ready for the next stage in life. Out of darkness, it moves upward, toward the light above ground, and then after untold adventures and experiences, water emerges into the light.

From the ground's crevices rises water, cold and pure. From a tiny spring, water merges with other water fallen fresh from the sky and water permeating the soil to form a small stream that makes its way downward until, eventually, a river is born.

The river builds momentum and eats away at layers of soil and ground as the flow slowly widens and deepens, like a bright-eyed child emerging from infancy. The river becomes strong enough to carve away at a mountain or even to create a canyon. But the carving away of hard rocks and ground is not accomplished by water alone; most of this work is accomplished by the gravel and sand caught up in the flow of the water. These small particles carried along by water carve away at the surrounding land and bring in even

larger rocks and stones, building enough strength to eventually carve away even the largest of stones.

The river begins to develop characteristics that give the river its reputation. While one river becomes dark brown from the earth it carries with it, another one flows clear and pure, and still another roars downward, smashing against rock and stone.

In its downward journey, water witnesses a great deal. It might witness salmon migrating upstream. Deer, bears, squirrels, and other creatures gather on its banks to quench their thirst. And trees brought down by a storm might even alter its flow.

The river eventually comes to gentler reaches, and now it flows gently as it winds along like an enormous snake crawling boldly across a plain. Never satisfied with its current course, the river will continue to change, at one point widening and letting sediment accumulating into a sand-bank, and then later narrowing to grind its way past stone.

If we could see the passage of ages in seconds, we would see just how much rivers turn and twist over time. Most rivers plot their courses so slowly that it defies human measurement, but there are some that shift relatively quickly. The Mississippi River, for example, has been known to shift by more than 20 meters in a single year.

After a river has shifted, the sand and soil it carries often accumulates and forms natural banks. Then a flood will come and wash away the bank, pushing the sediment onto the flat land. These floodplains become fertile land that gives birth to civilizations.

The Egyptian empire arose along the fertile floodplain of the Nile. So while floods are considered natural disasters, they also provide land with nourishment that civilizations require to establish themselves and grow.

When water encounters human beings, it has even more to witness. An old man crossing a bridge, a young girl on her bicycle, a couple sitting and watching the river flow. Ever slowly and ever gently, the river watches children playing in the park on its banks and a father and son playing catch.

The river, now in its twilight years, becomes ever more gentle as it inches toward the sea. Then the moment comes when it finally touches the sea, and the flowing of water finally comes to an end.

All the sediment carried by the water is then dropped into the estuary of the river. The result is the formation of a delta. The Ganges, the Mississippi, and the Amazon rivers have all formed great broom-like deltas at the points where they enter the ocean. What must have started as a small sand-bank eventually grew into a great expanse of land, creating a new and spacious coastline. These fertile deltas form some of the greatest agricultural regions in the world—the final gift that water has to offer humankind before, at the end of its life, it gives itself up to the ocean.

But this is not really the end of life for water, for the ocean is also teeming with life, and together with all the creatures of the sea, water is even now just beginning. In the process of eternal rebirth, water is there to give us a full account of all its wisdom and experience. In a cycle that we would count as eternity, water travels the path from above the earth to the tips of mountains and to the depths of the ocean, carrying life within its bosom and linking everything together in perfect balance.

As water makes its journey through life, it becomes a witness to all of life on earth, becoming itself the flow of life.

For the second collection of water-crystal photographs in this book, we took photographs of water collected at various points along water's cycle, from the source to the bottom reaches of rivers. We also exposed water to various photographs of nature and plants to see how the water would reveal itself through crystals. Within the crystals can be seen the reflection of life.

Let Water Flow

Much of human history has been set along the banks of rivers. The great cultural hearths of civilization have all developed along the banks of rivers—the Nile, the Tigris and Euphrates, the Indus, and the Yellow River. And wherever explorers have traveled, they searched for water along their way.

From the days of the horse-drawn carriage to the automobile, rivers have observed the workings of our race. Today people continue to walk along the banks of rivers, talking with friends, looking at the flowing water, and speaking their hopes and dreams.

But now, armed with technology and knowledge, we work to change the very flow of water under the belief that the result will yield great benefits for humankind. And we have succeeded. Or so it would seem.

In 1971, construction on the Nile River of the Aswan High Dam, 3.6 kilometers across and 110 meters high, was completed. Its construction had required the relocation of the enormous and ancient Temple of Abu Simbel, along with 100,000 people who lived in the area. The completion was met with cheers of joy. Mankind had finally conquered the Nile, putting an end to a long history of flooding while also producing enough electricity for a quarter of Egypt's population.

But gradually it became clear what the river really had provided. After being dammed, the Nile was no longer capable of nourishing the once-fertile farmland at the delta. Irrigation systems were implemented, and for the first time chemical fertilizers were used. Irrigation raised the salt density and deteriorated the quality of the topsoil. Puddles and pools of water formed on the delta, becoming a breeding ground for harmful insects and causing great harm to nearby residents. The delta plain itself has even started to sink. Scientists soon noticed that the fish population in the dam was becoming infected with mercury as the water from the mountain valleys drained into the dam. Plant life buried by the dam became the perfect breeding ground for bacteria; as this bacteria absorbed the mercury in the ground, it became a highly toxic bacteria containing methylmercury. The density in the ecosystem steadily rose until it entered the bodies of fish in alarming amounts.

The annual flooding of the Nile may have made life along its shores difficult for humans, but it was an integral part of the life cycle for many other creatures. The dam squelched the vast ecosystem that nature had taken hundreds of thousands of years to form.

Similar effects are seen in other parts of the world when rivers are dammed. In Canada, high levels of mercury have been found in hair samples of the Cree Indians living around the James Bay and Peace River since the lake where they fished was dammed up to make a reservoir for generating electricity. This same phenomenon can be seen in other parts of Canada as well.

These are examples of what can happen when we choose to block or change the flow of water.

The time has come for us to put on the brakes and think. Always keep in mind water's pure, natural journey, and you will see how we as humans fit into this delicate cycle of life. We are part of the flow, and we need to respect it. We have seen how water shows its love by showering its gifts onto flowers, trees, birds, insects, and all the small creatures of nature as it flows along its path. In return, water is loved by all of nature.

It's time that we return to the cycle. When you have learned to love nature from the bottom of your heart, then you too will be ready to be loved by nature.

The earth knows how to answer our most earnest prayers. When you pray, the earth responds. Then love spreads to all life and to water.

CHAPTER FOUR

The Wonder of Hado: Explaining the Inexplicable

“Long ago at the top of a distant mountain lived an old shaman . . .” So began a tale told to me by an old aborigine with a white scraggly mustache and a face darkened by time. He’s in his late eighties, but no one, not even himself or his family, knows his exact age. Wisdom and knowledge accumulated over the decades is as deep as the wrinkles in his face.

I was on my first lecture trip to Australia in August 2002 when I was introduced to Eric, the aborigine elder. We met at a restaurant, and I presented him with a collection of my photographs of water crystals. He looked at it slowly and intently, and then he began to tell me an ancient tale passed down for generations.

This evil shaman lived at the top of Mount Ridge in the northern region now known as New South Wales. A river runs down the mountain, and the shaman lived near the upper reaches of the river.

One day she looked down on the river valley and saw all the happy people who lived along the banks of the river. The sight of all this happiness filled her heart with resentment, and she copied her thoughts into the water. She filled the river with spite and the desire that only she would be happy.

She also blocked up the river so only a trickle of water reached the people. The riverbed where pure water once freely ran became filled with filth. The people who lived along the banks of the river soon became sick, and thievery, bickering, and fighting became rampant because of the evil thoughts copied into the water by the shaman.

Years of pain and sorrow passed. Then one day a young shaman in the valley went for a walk with his dog. The dog chased after a kangaroo it saw, and the shaman waited for a long time for his dog to return. When the dog

finally returned, he was dripping wet with pure water, not the foul water from the river.

Wanting to know where the pure water came from, the young shaman followed his dog up the mountain to the doorstep of the evil shaman's house. Nearby, the young shaman saw where the pure water of the river had been blocked.

The young shaman turned the evil shaman into water, and in a moment she was washed down by the river. They say that the rugged fissures at the far reaches of the river were caused by the evil shaman clawing at the edges, trying to save herself from being washed out to sea.

Just in time, she grabbed hold of a big rock. The young shaman spoke to her and said, 'I will save your life if you change your ways. Stay where you are now and promise to work for the good of people.'

The evil shaman promised to do so, and she became a large tree growing on top of the rock. The people along the riverbank were finally able to go back to living happy and peaceful lives. The old shaman, in the form of a tree, stood along the river to warn the people to stay away from the dangerous ledges.

Listening to Eric's story, I was surprised to hear the phrase "copied into the water." I then realized that this was in complete accordance with the principle of hado. I would never have imagined that this phrase would be found within a story handed down from generation to generation for thousands of years. But I should have realized that the more years one has lived, the more likely one is to know that such things are possible.

It was quite unexpected that I would hear such a story about water in such a distant corner of the world. Like the myths and fables of other countries and cultures, those of the aborigines in Australia are rich in truths about the universe and the ways in which life should be lived.

From the fable told by the elder, we learn that water must always flow. When the flow is stopped, then the river will die. We also learn that

jealousy and greed have the power to destroy that which is good—an appropriate message for the times we live in.

Yet another lesson is that water has the ability to read emotions and to spread the hado of such emotions to the rest of the world. In other words, the messages that water carries throughout the world depends on each one of us, for better or worse.

For our ancestors, fantasy, science, and theology were all one and the same. And the way to pass on the truths of the world to future generations was through stories. Such stories were based on an understanding of the invisible laws that govern the visible world.

The advanced medical practitioners were the shamans who prayed for and healed the afflicted. Such is the role of water crystals. In fact, my journey toward water-crystal research was born out a desire to heal.

I was first introduced to the strange and wonderful world of hado more than fifteen years ago. I had just set up my company, IHM (originally International Health Medical, now International Hado Membership), and was importing a low-frequency medical device used to alleviate pain from the United States. My contact in the States was a biochemist named Dr. Lee H. Lorenzen. I learned that Dr. Lorenzen's wife had been quite ill. He had done all he could think of to restore her health, but nothing seemed to work. He finally decided to consider water.

He formed a team of scientists specializing in electronics and physics with the goal of developing the best water possible. They started their research with the proposition that water had the ability to transfer information. I heard from Dr. Lorenzen that they had actually found this water. Then one day I had the opportunity to see for myself what the water could do.

Under the bright blue skies of California, I was playing golf with Dr. Lorenzen and two of the researchers working with him when my left ankle started to ache from an old rugby injury. The other three noticed that I was limping and were concerned.

When we finally got back to the clubhouse, one of the men handed me a small plastic container with water in it. They instructed me to apply the water to the area around my ankle. I knew on one level that water couldn't remove pain, but I also knew that it couldn't hurt either, so I applied the water to my swollen ankle.

To my amazement, my foot no longer hurt when I walked on it, nor even when I stretched it out. I couldn't help but become interested in this strange water.

In Japan at that time, there was widespread interest in various types of water that claimed to be good for the health, so I signed a contract to introduce this technology to Japan, and I invited Dr. Lorenzen and the two researchers to seminars in three of the largest cities in the country.

At all three locations, perhaps because there was no charge to get in, the halls were overflowing with people. But I soon learned that the explanation of water's healing abilities was far too difficult for most people to grasp. I myself could hardly understand what the scientists were describing. Some people got up and left partway through; many others nodded off in their chairs. It was pretty much a disaster.

Afterward, I reflected on what went wrong. I realized that water is essential to human life in so many ways, and yet we really don't understand much about it. Around that time when I was still thinking about what to do next, I heard something that made sense to me: "Science is based on first forming a hypothesis and then using instruments and technology to prove the hypothesis."

Then it hit me. All sorts of instruments and technology can be used to analyze chemicals and other materials, so why isn't there anything that can be used to analyze water? I wasted no time in calling Dr. Lorenzen to ask him to look for a device of some type that we could use to analyze water. This led to my encounter with the MRA device that analyzes and transfers hado.

Since bringing this device to Japan in 1987, I have had the pleasure of working with as many as 15,000 people who have come to me with

concerns about their health. I have written more than ten books about hado and the many miraculous cases I witnessed.

Over the years, scores of people have tried to imitate this hado machine and have made similar devices to analyze hado, creating a type of hado fad in Japan. Vast numbers of people have become interested in learning about the unseen world of hado. This movement has the energy to take us into a new age and open the door to a new stage of our evolution.

Understanding hado gives us a better understanding of how our world works, and it also gives us hope for the future. I sometimes even think that knowing the possibilities of hado is like possessing a golden lamp that can make the impossible possible. Then at other times, I feel that the more I understand hado, the more there is to understand about what's going on around us.

Photographing Crystals Is a Subjective Science

To gain the understanding and support of as many people as possible, I have approached my research as scientifically as possible. But we can't forget that not everything can be understood by research or science. The photographs of water crystals present to us a majestic fantasy world, but this is a fantasy world that has much to teach us, for sometimes fantasy is the best way to get a clear picture of reality.

When water is frozen, the same crystal will never appear twice, just as there are no two snowflakes that are exactly alike. When I show slides of crystals at lectures, I am often asked, "If no two crystals are alike, how do you choose one particular crystal photograph?"

It's a good question. Of course it would be impossible to show you all the hundreds of photographs we take of all the crystals, but then again, I don't see why this should cause grave concern. It would be like looking at an encyclopedia of animals and questioning how the picture of one particular dog could possibly represent all the different dogs of that species. When I choose a photograph for a collection, I make a choice based on the

photograph of the crystal that most accurately represents the crystals made under a certain set of circumstances.

In *The True Power of Water*, I briefly described how we photograph water crystals. I'd like to add more details to that explanation. If we are testing the effects on water of words, photographs, or music, we begin with distilled water and then expose the water to whatever influence we are testing for the appropriate amount of time. If we are testing water from a source such as a lake, we do not expose it to any outside influence, such as words or music. We simply use the water as is.

To photograph water crystals, we put 0.5 cc of water into about fifty petri dishes using a syringe. Then we freeze the petri dishes to minus 25 degrees centigrade and take photographs through a microscope. Of course, the result is never fifty similar crystals in the fifty petri dishes.

When we have the photographs, we divide them into eight categories: beautiful, rather beautiful, hexagonal pattern, radial pattern, lattice pattern, indefinite pattern, collapsed pattern, and no crystal formation.

This classification helps to give us a general idea of the type of crystals formed. Let's take, for example, the crystals made from water collected from the Honmyo River shown on pages 185–186. When we took water from the river before it runs into the Isahaya Bay in the Ariake Sea, we found that the crystals were broken and no complete hexagonal crystals formed. The results were as follows:

Beautiful: 0
Rather beautiful: 0
Hexagonal pattern: 0
Radial pattern: 2
Lattice pattern: 6
Indefinite pattern: 29
Collapsed pattern: 2
No crystal formation: 11

This shows us that no crystal formations appeared in eleven of the petri dishes, and when crystals did form they were broken. There was a not a

single crystal that could be considered beautiful. Based on this, we then chose a crystal that we felt best represents the array of samples—an indefinite pattern, in this case.

Let's next look at the example of crystals formed from water collected near the source of the Honmyo River. The results were as follows:

Beautiful: 2
Rather beautiful: 4
Hexagonal pattern: 0
Radial pattern: 4
Lattice pattern: 8
Indefinite pattern: 29
Collapsed pattern: 3
No crystal formation: 0

In this case, we chose a beautiful crystal to represent the sample. Of course, there were only two beautiful crystals in the sample of fifty. But when such crystals appear from a sample, there are also usually many crystals that are classified as rather beautiful, hexagonal pattern, radial pattern, and lattice pattern. This indicates that there are many formations that are in the process or have the potential to make beautiful crystals.

Considering that crystals easily form from this particular sample of water, we can justifiably choose a beautiful crystal to represent the sample. I admit that the selection process is not strictly in accordance with the scientific method, but simply put, we choose the crystal that best represents the entire sample instead of simply one from the most common category.

And the whim of the person doing the selecting certainly comes into play. When making the selection for a collection of crystal photographs, it is best if one person chooses all the photographs for consistency, which is why all the photographs in this book were selected by me.

In fact, the crystals in the photographs that we take are affected by such factors as the environment, the timing, and even the personality and thoughts of the photographer. This is not unlike the uncertainty principle of quantum mechanics. The uncertainty principle was first put forth by a

Germany physicist named Werner Heisenberg, and it is said to have completed the science of quantum mechanics. The theory says that each time you look at electrons, they move in a different way. In other terms, the very act of observing results in a differing movement of the electrons, making observation impossible.

The reason for this is that human observation requires light, and when electrons are exposed to light electrons, the electrons are disrupted, making their direction impossible to predict. This means that we know very little about what is going on in the world around us. When this theory was first presented to the scientific community, it apparently came as quite a shock.

The same principle applies to water. It changes its form completely depending on the person doing the observing. Water's reaction will differ depending on whether the heart of the observer is filled with appreciation or with anger, and this difference is reflected in the formation of the crystals.

Another factor that makes the observation of crystals even more difficult is that the form changes moment by moment for the two-minute life of the crystal. The crystal will look quite a bit different depending on when the shutter is pushed. Uncertainty truly is a factor in everything in our world.

The sun rises in the morning and sets in the evening. That is one thing we can count on. But if you consider the long history of the universe, this phenomenon is something that has continued for only a short time, and it's something that won't go on forever. After some five billion years, the sun will gradually expand and eventually consume the earth. And that too is just a part of the process that the sun which lights our world today is going through. What's a mere five billion years of earth time when talking about the forever time of the universe?

The methods employed to photograph water crystals might not pass everyone's definition of being scientific, and there is a degree of uncertainty involved. In fact, there is much about the world of hado that is murky and that cannot be explained by the black-and-white standards of statistical analysis.

But when you think about it, all any scientist can do anyway is lift up one small corner of the veil that covers the truth of this world and then try to express it with words that the general population can stretch their minds around.

Everything Emits Hado

Another question that I'm frequently asked is, "How could exposing water to a picture or words possibly result in crystals that are so different from each other?" Even I must admit that this is a difficult question to answer.

I first got the idea of exposing water to words and photographs before I even thought about taking photographs of water crystals. I was experimenting with the hado machine I mentioned previously. When people suffering from health problems came to my office for consultation, I would test and analyze their hado and recommend water as one treatment. The water would be infused with hado to counteract their illness. If they were too ill to leave their bed, I would print out the person's name and then test the hado from the name. Or I would test the hado of their photograph. The scores of instances where the ill person healed convinced me that even photographs have their own hado. (To read more about these cases, please refer to *The True Power of Water*.)

You might refer to this hado as something like a desire. There are people, but not many, who are able to detect the hado emitted by photographs and thus are able to sense if a missing person is dead or alive from a photograph in the newspaper. Even people who would never admit to believing in such special powers may experience having a premonition and then later learn that their premonition was valid. An acquaintance of mine said he remembered reading about a mountain climber who had reached the top of Mount Everest. When he looked at the picture of the climber, he sensed that the climber was no longer alive. Not long after, he heard on the news that that the climber was lost and presumed dead. It's hard to deny that somewhere buried deeply within the human consciousness, there is a hidden power—perhaps intuition—to sense what has happened despite the barriers of time and distance.

This same thing can also be said of words. There's an ancient belief in Japan that each individual word has its own spirit, which makes it possible for messages to be transferred and information relayed.

When water is exposed to words such as "Thank you" and "You idiot!" we can see that the water accurately captures the characteristics of these words. But when words are spoken to water, the meaning of the words changes significantly with the speaker's intonation and inflection. The words "You idiot!" can have completely different meanings depending on whether they're said with deep-felt hatred or in jest. But with words written on paper, the way the word is said is not a factor, and the pure energy of the word is able to reveal itself in the formation of the crystal.

No matter how often or how deeply you consider it, it remains remarkable—almost unbelievable—that the messages of water are able to pass through the barriers of time and space.

The fact that a photograph contains information indicates that consciousness is involved. When you see a photograph of a landscape and think it's beautiful, or a picture of a friend that brings back old memories, the photograph is appealing to your consciousness. In the same way, an ID photo serves as ID because of the awareness that the picture represents the actual person.

A psychology professor at Yale University conducted an experiment a while back. He chose several words from Hebrew, and then he simply made up an equal number of words. Next he mixed all the words together, showed them to subjects who didn't know Hebrew, and had them guess the meanings of the words. The subjects, of course, did not know that half of the words were fake. The result was that there were significantly more right guesses for the Hebrew words than for the made-up words.

This experiment serves as support for the theories of Dr. Rupert Sheldrake, a scientist who believes that the words which people have used for ages form "morphic fields" for perception of the meaning of such words. So someone who has never seen a word can guess its meaning with an unexpected degree of accuracy. The morphic field is not anything you can

see with the eyes, and it's not an energy that can be measured. It might best be described as another world invisible to the eye.

With the formation of a morphic field, there's an increased likelihood that something which happens twice will happen again. This same process can be seen in the unfolding of history. The words that have already been spoken somewhere in the world are somehow easier to learn.

To illustrate this idea, let's look at an example. On a visit to Germany a while back, I heard an amazing story. A doctor had collected blood samples from several patients and stored them. The doctor said he was able to identify what the patient was ailing from by just looking at his or her blood sample.

The samples were sealed and stored to keep them from being contaminated or altered. But two years later, when the physician reexamined the patients and the previous samples, he noticed that the components of the blood had changed, and not just randomly. The two-year-old blood was now changed to the same components as the recently reexamined blood. In other words, if a patient was sick two years previously and then healthy after, the two-year-old blood changed to be that of a healthy person, and vice versa. The doctor then went on to conduct two thousand more experiments and to publish the results.

I met another doctor, a man in his eighties, in Germany who had conducted a similar experiment. He had used a pendulum to conduct diagnoses by taking a drop of blood from the patient's finger and soaking it into a piece of paper. He said that he could use the same bloodstain throughout the treatment of the patient, because it continued to change in appearance according to the patient's condition. In other words, a bloodstain from two years ago could be used to diagnose the current condition of the patient.

The scientific explanation for this? I do not know.

How can we interpret the principles of hado? Think about the three terms we discussed in the first chapter of this book concerning hado.

First, hado is vibration. All human beings are in a state of vibration, and the condition of an individual can be understood by examining the vibration of a blood sample from that person.

Second, hado is resonance. Blood taken from a person two years ago remains in resonance with the person's hado today, changing to match the current status of the blood flowing through the veins now.

And third, hado is similarity. For all hado, there is a miniature and a macro version, and these versions resonate with each other. In the experiments done in Germany, my interpretation is that the blood sample is a miniature version of the sample's body, changing in unison with the body from whence it came.

About seven decades ago, a scientist named Harold Saxton Burr laid much of the basic foundation for the science of hado. Burr was a renowned professor of anatomy at Yale University. In his attempt to understand the mysteries of life, he gave us the term *L-field* or *life field*. Since all the cells within our bodies are replaced over a period of six months, why do we keep being reborn as the same person over and over?

Like a mold used to make Jell-O, an invisible force enables this to happen, he believed, and he called it the "life field." He believed that since the life field is an electrical field in nature, it could be measured, and he even developed his own measuring device using a voltage indicator and an electrode. He discovered that the measurements he took varied with the way the subject was feeling. He got higher voltage readings from subjects who were feeling blissful, and lower voltage readings from those feeling depressed.

It seems that his device was a forerunner for the MRA device that I use to analyze hado. By entering various code numbers into the device, it's possible to identify the part of the body that matches the code. When a certain part of your body is suffering, emotional hado is inevitably involved. By using the codes, such emotional hado can also be measured and classified.

In his book *Blueprint for Immortality: The Electric Patterns of Life*, Dr. Burr wrote that someday it will be possible to pinpoint even the emotions of people using millivolts.

Anyone who has worked very much with vibration has noticed at least one thing: the soul is affected by anything, and it *affects* everything. Both your body and the things that go on around you—and even the world that you live in—is created by your soul. It's something that I have observed over and over. There is so much power within you.

Perhaps we do live in a world of uncontrollable and unpredictable chaos. We really don't know what's going to happen from one moment to the next.

But this chaos is also of your own creation. Chaos is brimming over with myriad amounts of energy. After all, before heaven and earth, before there was a universe moving in order, there was just one thing: chaos.

So if you feel lost, disappointed, hesitant, or weak, return to yourself, to who you are, here and now.

And when you get there, you will discover yourself, like a lotus flower in full bloom, even in a muddy pond, beautiful and strong.

CHAPTER FIVE

Our World and Our Water Are Changed by Prayer

When I was a child, I had a recurring nightmare. The ground shook beneath my feet, and a volcano spewed out red-hot lava. The ocean turned into a huge wave that enveloped everything, knocking over houses and buildings like blocks, and all the people ran about screaming as the earth moaned.

There was a time when it seemed like I had this dream every night. I'm no longer bothered by the dream. In fact, it stopped when I published my first book of water crystals. But I suspect I have seen the dream thousands of times over the years. Sometimes it scared me so much that I jumped out of bed wide awake and ready to run for my life. To this day, I still don't know the meaning of the dream or why I saw it over and over. I know it was just a dream, but that scene of hell still lurks in my memory as if it were real.

The turn of the century seemed to be a time of particular uncertainty and instability. One of the outcomes was a greater interest in spiritual matters. Yes, we survived July 1999, the month when Nostradamus said the world would be destroyed, and 2000 came and went without all our computers turning against us. While many people can recall a feeling that something dreadful was about to happen, many others believed that we stood at the brink of a period in human history when all the knowledge and wisdom of the ages just might culminate to create a golden age. And those who didn't have such a feeling at least hoped for such a future. But the hopefulness wasn't to last long.

September 11, 2001, came and nothing was the same. The flames of war ignited in the Middle East, Afghanistan, Iraq, and Israel. The first page of our new hope-filled century was stained with blood. Then came the devastating Indian Ocean tsunami in December 2004 and Hurricane Katrina in 2005. And I recalled the nightmare of my childhood.

There have always been people who believe the end of the human race, the destruction of the world, and global catastrophe are imminent. I don't believe such a bleak future is waiting for us, and I've always tried to take a stand against such negative predictions. The reason for my optimism is that I feel that the words engraved in our hearts might just have an effect on the direction in which the world is moving.

But I must admit that it sometimes does seem that the world is taking the steps which will lead straight to the destruction of the human race. No matter how positive you try to be, it's hard to ignore the fact that we are faced by an avalanche of problems of our own creation.

With the global population expected to explode by 1.5 times in the next fifty years and four times in the next one hundred years, with rapid industrialization, with the condition of the environment deteriorating at a rapid pace, our survival is uncertain. Some reports say that a temperature increase of between 4 and 6 degrees centigrade within one hundred years will increase the ocean level by 80 to 150 centimeters and flood much of the land we currently inhabit.

And there's no guarantee that the change will be gradual. Large islands in the South Seas are already now slipping into the ocean. The rising of the oceans combined with a tsunami similar to the one we just witnessed could wipe out many of the great cities and entire civilizations in some parts of the world. Instable weather patterns are another concern. Unusual downpours and droughts are wreaking havoc with the world's food supply.

I sometimes wonder if the recurring dream I saw a child wasn't more than just a child's dream. What could we possibly do to change this course even slightly? One solution is to change the way we live and the structures and systems that form society.

Environmental Concerns

In [chapter 3](#), I discussed the destructive repercussions of blocking the flow of water. We see the same results when we interfere with the delicate circle of life that forms ecosystems.

One of the first warning bells was the book *Silent Spring* by Rachel Carson, who revealed that pesticides such as DDT pollute the water and push entire species of birds and fish to the brink of extinction. *Silent Spring* told the story of how the insecticide dieldrin was sprayed in and around Sheldon, Illinois, in order to eradicate the Japanese beetle in that area and stop its northern progression. The chemicals seeped into the ground, killing or driving out all the beetles and other insects. After eating the insects or bathing in the polluted water, the death of robins, pheasants, and starlings came next, followed by the deaths of squirrels, rabbits, and then 90 percent of farm cats. Even sheep could not escape the fatal effects of the chemicals.

Carson also revealed the impact of the chemicals on the salmon and trout in rivers, and the rising cancer rate in humans. But all this didn't stop the state and federal governments from spraying stronger and stronger insecticides for years to come.

As expected, her work earned protests from the agricultural industry. They made fun of the book and labeled her a hysterical woman. But when Carson appeared in the press to defend herself, her logic and her dignity made an even deeper impression on the viewers. Eventually this led to the government being forced to admit that she was right. Carson's good judgment and courage reaches beyond her time and has just as much to teach us today. Her book should be required reading for anyone living in these times.

Carson sounded an early warning about the potential risks of pollution, but she also warned us about the chain effect that results when a link of the circle of life is broken. We have already seen where the removal of bugs or weeds by chemical means can lead to the extinction of a vast area of other forms of life, including the microorganisms that live in the soil. And when the soil has died, then the perpetual use of chemicals becomes necessary to continue farming.

Once the natural circle of life is broken, putting it back together is next to impossible. Some forty years have passed since Rachel Carson first warned us about the effects of pesticides. Have we seen any improvement in the situation? In advanced countries, at least, the use of DDT, dieldrin, and other chemicals that Carson warned us about have been banned and for the

most part discontinued. But deplorably, these chemicals are still sold to other countries that haven't banned them yet.

In our pursuit for profit and convenience, we have closed our eyes to the cycle of life that has formed over the aeons. So much of what we do threatens to end this cycle and create a new cycle of waste and destruction.

Ever-Increasing Materialism

Do you ever get the feeling that society in general and you in specific are moving at a faster pace than ten or twenty years ago? It's not likely that the hands of our clocks have sped up, but our perception of time certainly has.

Imagine that the world is an enormous spinning top. We'll call it the "top of materialistic culture." As culture develops and we acquire more and more, the top gets bigger and bigger. This is how life goes in our materialistic state. Each year, sales have to increase, incomes have to rise, and economies have to expand. We're made to think that staying the same or slowing down will lead to recession, depression, and failure. Goals achieved lead to the setting of higher goals and requirements to work ever harder and faster. Ever loyal, we have labored diligently to expand the size of the spinning top.

And we at the edge of this top must travel an increasingly wider distance to make one rotation. While a small top might complete a rotation in one second, a top twice as large—or a thousand times larger—would take much longer to go around once. While a small top may rotate a few centimeters per second, a larger top may travel a few meters.

The speed of the hands on your clock are going at the same speed, but the rate at which change takes place is speeding up, and perhaps someday this spinning top will go so fast that we'll no longer be able to hang on. How can we slow down this spinning top?

I know of only one way, and that is to cast aside our fast-paced, materialistic lifestyles. In other words, our continued sojourn on this planet will require that we pack lighter. It's just that simple.

You may believe that you can get more accomplished in less time if you live your life in over-drive, but for most people it ends up meaning working harder and harder in a job they like less and less.

As society expands and infrastructures become more complicated, the role of the individual is increasingly delegated to a miniscule piece of a vast machine; feeling powerless to make a difference, people resign themselves to doing what they are told to do and nothing more. But the greatest steps forward can often be made by becoming smaller instead of bigger, by going slower instead of faster.

Within an organization, workers are able to expand their abilities only to the limits of the box within which they function. In many large companies with compartmentalized divisions, the scope of most people is limited to the task at hand. With only a small role to perform within a large box, the importance and value of each role is minimal, as is the employee's perspective and need to develop his or her abilities. But when the size of the box that people function within is reduced, the role of the people within the box becomes more important and valuable, and knowing this, most people will strive to expand their skills and abilities. They get to know their co-workers, communication improves, and motivation increases. Ideas that were formerly obscured by the complexities of the big organization would emerge and innovations would revolutionize the organization. Young employees in the company would see hope and be motivated by their unlimited potential to move up in the company. The concept that smaller is better applies not only to companies. These same results could be seen in governments and all other organizations in society.

A Changing Sentiment

More and more people are beginning to understand that bigger and faster is not necessarily better. It is becoming clearer that continually piling unreasonable greed and demand on top of each other leads to destruction rather than success. It's not unusual to see financial institutions, construction companies, and retailers fighting for their survival. We might even say that the destruction of the World Trade Center was symbolic of a broader change taking place in our society. Of course the terrorist attacks

were a heinous crime, but one reason the twin towers in New York were targeted by the terrorists was because they were a symbol of the global economy and one of the most enormous building complexes ever built. I believe that its collapse has played a role in moving us humans toward the theory of E. F. Schumacher, who advocates “Small is beautiful” in his new economics with humans in its center.

Many people today are coming together to form communities beyond the typical definitions of neighborhood and village. In Europe, the United States, Australia, and other parts of the world, communities are forming with the aim of living peacefully with the environment. These communities take various forms, but they all have the basic goal of separating themselves from consumer-based lifestyles and becoming self-sufficient. Another aspect of this trend is the slow-food movement and the rising voice against the drive for standardization promoted by globalism.

In recent years, we’ve also heard talk of new regional currencies and the drive to implement systems that return to focusing on the exchange of goods and labor of equal value instead of the continual expansion of speculation that is going on now. This is another way that we are returning to the fundamentals of the concept of community.

A Natural, Renewable Alternative to Oil

One thing that these new old concepts of community have in common is concern for the environment. For a long time, oil has been a source of major concern and conflict for the world. Most world economies are powered by oil, as are many of the wars going on in the world. And that’s to be expected. Energy is at the foundation of all cultures. We owe our comfortable lifestyles to our ability to procure sufficient amounts of it. We can keep the neon lights on all night. There’s always a store open nearby to feed our hunger and our desire of the moment.

But what will happen to us when the last drop of oil is used up? The lights will go out and our appliances will be useless. But it won’t matter because we won’t be able to transport food to our tables. The foundation supporting us is frail indeed.

If it's not cramping our style today, then we tend to think it's a problem for someone else. But now in times of abundance is when we should be laying the foundation for the survival of future generations. We need to be looking for something to replace oil and the oil-based products that we so rely on.

One possible alternative that has caught my attention is hemp. Nature provides for us in many wonderful ways, so we should look to nature first for solutions to our challenges. The hemp plant can provide many of the things that humankind requires in order to survive on this planet.

From its stalk, paper, cloth, and even plastic can be produced. Four times more paper can be made from an acre of hemp than from an acre of trees. The cloth made from hemp is much more gentle on the skin than chemical-soaked cotton, not to mention that hemp is three to four times more efficient than cotton as a crop.

From the seed and stalk of the hemp, diesel fuel, methanol, and ethanol can be obtained without the by-products of sulfur that causes acid rain and air pollution. Ford Motors has even made a car with a plastic body made from hemp that runs on hemp fuel.

Hemp can also become an ideal source of human nourishment. The fruit of the hemp plant provides the same amount of protein found in soybeans, and it is easy to digest. It also contains essential amino and fatty acids.

The hemp seeds can also be used to make a healthy oil. *Huo Ma Ren* is the Chinese name for it, and it is widely used as herbal medicine. Its medical uses are numerous. Possible derivative products include an antibiotic, antidepressant agent, pain reliever, and headache medicine. It's also reported to have shown dramatic results in the treatment of cancer, AIDS, rheumatism, and skin rashes. Hemp can also be used to make shampoos and cosmetics because of its moisturizing characteristics.

Another feature that makes hemp attractive is its rapid growth rate. In 110 days, the plant will reach a height of two or three meters, making it possible to harvest several crops in a single season. In Japan, it's said that ninjas would use hemp to improve their jumping skills. When the plant first

started to grow, they could easily jump over the top of it, but as it grew taller day by day, it required more and more effort and skill to clear.

As the hemp plant grows, it converts carbon dioxide into oxygen at a faster rate than almost any other plant. The amount of carbon dioxide taken in by hemp is pound for pound three to four times more efficient than deciduous leaves.

From a hado perspective, hemp is good for the environment because it has positive hado. In fact, hemp's high rate of vibration is what enables it to grow so quickly. It is a gift of nature that could come to our rescue just when we need it.

Hemp is woven into the fabric of America's history. It's said that without hemp to make ropes and sails, Columbus would have never been able to make the trip across the ocean. Even the Declaration of Independence is written on hemp paper. You could even find hemp growing on George Washington's farm.

Unfortunately, there are misconceptions about hemp because of its relation to marijuana, or cannabis, which is illegal in many parts of the world. Despite this, there has been a grassroots reawakening in recent years to the potential uses of hemp. In July 2001, the Hemp Car, a biodiesel car running on fuel from the seed of the hemp plant, left Washington D.C. and started on a trip across America to promote the benefits of hemp as a resource. The efforts to attract attention to this amazing new source of fuel were going well until the news was buried by the events of September 11.

In Japan as well, a hemp car also crossed the country in 2002. A man named Yasunao Nakayama has made it his life's calling to promote the use of hemp. He says that he sees hemp as essential for the survival of the human race.

As a teenager, Nakayama-san came close to drowning and had a near-death experience. The young man found himself surrounded by light in another world where people were going about their lives. He saw a plant with beautiful leaves and recognized a wonderful sense of healing coming from

the plant. When he came to, the experience made him think in a deep way about the purpose of life.

Several years had passed when Nakayama-san encountered the plant that he had seen in his out-of-body experience. There was no doubt in his mind that this was the plant which would help him understand the mysteries of life and the universe. The plant of course was hemp, and since that time, Nakayama-san has made the study of hemp his life's work.

Japan's version of the hemp car left a small city in the northern tip of Japan with its destination the Heitate Shinto shrine in Kumamoto prefecture. In place of gas in the diesel engine, hemp oil was used. This biodiesel fuel emits no sulfur dioxide and only one-third the amount of toxic smog emitted by petroleum fuel.

During his journey, Nakayama-san visited many places related to hemp, including the hemp road of Japan that served as the network tying together an ancient self-sustaining society. In ancient days in Japan, many trade routes linked the country. Along with routes for salt, sugar, silk, and other products, there were also routes for transporting hemp. If you drive the hemp road you can see the traces that ancient Japan had an abundant self-sustaining society, which was based on a solar worship.

The Shinto Religion and Hemp

On its long journey through Japan, the hemp car made stops at the many Shinto shrines in Japan where hemp is considered to have special significance. Their ultimate destination, the Heitate Shrine, is considered the oldest shrine in Japan; even its name comes from the ancient Japanese word for hemp.

From ancient times, hemp played an important role in Shinto beliefs and practices. It was considered to have many powers, including the power to purify and cast out evil spirits. I suspect that one reason the ancients revered cannabis so much was its rapid rate of growth, indicating a high vibration rate. This enabled it to drive out evil, impurity, and other forms of low vibration.

Hemp's many uses in the temples include the braided ropes around sacred trees and the bell rope used to wake the gods at the entrance of the shrine. At the Ise Temple, the most sacred of all Shinto shrines, ancient cannabis is preserved along with the sacred mirror, serving as emblems of the body of Amaterasu, the founding Goddess of Japan. A sacred Amaterasu talisman is referred to as the shrine cannabis, and each year ceremonies take place according to the sacred "cannabis calendar."

The ancient Shinto religion of Japan can be described as a religion of vibration. It has no founder, no teachings, no sacred writings, and no ceremonies or practices with the aim of causing an awakening or rebirth. Shintoism is mostly about raising the vibration rate to drive out negative forces, thus creating holy spaces. It is said that the sites for ancient temples were chosen in areas of pristine nature that emitted a high energy level.

Shinto does not claim one founder or one god. Mountains, rivers, oceans, animals, trees, and flowers are all gods, and along with people, all elements of a single, unified universe. The soul of Shintoism is harmony. In nature, nothing is inferior and nothing is superior. All things are given a role and responsibility, and one part of the universe serves all other parts by best being who and what it is.

Perhaps the bountiful and beautiful nature of Japan had something to do with the emergence of such a concept. With the beauty, colors, sounds, and scents of four distinct seasons, the Japanese have become sensitive to the nature around them, making it possible to see multiple gods within nature and leading to the formation of a culture that promotes the richness and sacredness of vibration.

When Prayer Touches Water

The Shinto prayers referred to as *norito* are for the purpose of creating vibration, which will link us to the sacred. I have previously written that the hado from a certain type of voice can have the effect of prayer in healing. I have had many experiences with praying over water with the locals in places such as Lake Biwa (the largest lake in Japan); in Lucerne, Switzerland; on the shores of Lake Zurich; in the Bahamas; and in other

parts of the world. In every case, there was a striking difference in the crystals made from water collected before the prayer and after the prayer, and the subsequent crystals were always beautiful and glorious.

Words spoken from a heart filled with prayer takes on the form of hado, and this leads to a new world being eternally created. Your world becomes different when things are created in a whole new way. The Shinto prayer is not a prayer to the One and Only but a prayer to myriad holy beings. What could we mean by myriad holy beings? From the perspective of hado, it is possible to form an idea.

Consider the fact that there are some sounds that can be perceived by the human ear and others that cannot. The highest sound that humans can hear is about 20 kilohertz, but there are certainly sounds that exist in a higher range than that, and we refer to this sound level as ultrasound. The same concept can be applied to light. The light spectrum visible to the human eye has an electromagnetic wave of between 380 and 780 nanometers, and anything outside of this range cannot be seen. But electromagnetic waves above 780 nanometers do exist.

This principle applies to all our senses—or perhaps we should say that what we can feel with our senses is only a small part of our world. The blind bat uses ultrasound that the human ear cannot hear to avoid hitting cave walls. A dog can distinguish between scents that are beyond our detection. Many animals have almost supernatural abilities.

Considering these facts, it would not be too much of a stretch of the mind to say that there are types of consciousness and life forms that are beyond our limited ability to sense. Perhaps it would not be so strange to believe in the existence of higher-frequency consciousness without a physical body like ours. If there is such a being, I suspect that it may exist in a parallel universe with our own world.

When a vibration is doubled, it is possible to create a new set of sounds one octave higher. And with each case of doubling, the octave goes higher and higher until we reach a set of sounds too high for the human ear to hear.

In the same way, rocks, grass, animals, and people all vibrate at their own rate and in octaves we are in tune with, and so it shouldn't be too difficult to surmise the existence of an equivalent frequency in octaves that are off our own scale of sensitivities. Within this line of theory, perhaps we can then come up with a description of the gods of all of creation. Perhaps we can form a link between ourselves and a higher being. The method I speak of is, of course, prayer.

Our Common Consciousness

No one I personally know has seen the face of a deity, although I realize there are people who say they have had this experience. All we can do is gather evidence and consider it. By considering it based on the principles of hado, I believe considerable progress is possible in this realm.

If you examine any culture—ancient or modern—you'll find that everyone has somehow arrived at a concept of deity. Genetic engineers, physicists, and other scientists who have reached to the edges of their fields become enraptured by the magnificence and order of nature and thus become convinced of some unseen hand at work in the creation. My own path to this understanding was shown to me by water crystals. Water has shown me in a very real way how prayer can change the world.

No one particular religion has been able to secure the exclusive rights for the power of prayer. No matter who we are, we all have the ability to take advantage of this amazing and wonderful power. Once you realize this, you will then be filled with the desire to help others realize this as well. More and more people are resonating with this understanding, and this could result in a more wonderful future for humankind.

In my presentations, I mention that I have another interpretation of Einstein's theory of relativity represented by the formula $E=mc^2$: c represents consciousness; m represents mass (the number of people); and when the number of people with an awakened consciousness founded in the desire to make the world a better place increases, the result is an exponential increase in E , or energy.

Earlier in this book, I talked about Professor Hideo Higa, who developed the unique micro-organism EM. He explained to me that within the world of microorganisms, 10 percent of microorganisms are harmful. But there are also only 10 percent of beneficial microorganisms. He refers to the remaining 80 percent as wait-and-see microorganisms. They watch until either the good or the bad microorganisms emerge as the victors, and then they join the stronger of the two.

I find that there is a correlation to what goes on in human society. Within our society, there are people, about 10 percent, who have the ability and feel the call to make this world a better place. But many of these people have not yet become aware of their destiny. I am quite sure that as more and more of these people awaken and begin to employ their consciousness in prayer and action, the vast majority of the population—about 80 percent—will then also join their numbers.

The Water within Us

We are well into the twenty-first century, and blood continues to be shed. Especially painful to watch is the conflict between Palestine and Israel. How much life will have to be destroyed by ethnic fighting and holy war? Without an end to this horrendous conflict, it is hard to imagine a peaceful future for any of us. But it appears as if the hatred and loathing has over centuries slowly entered the very DNA of the two sides.

I was once thinking about this when I suddenly realized the close relationship between DNA and water. DNA is structured by two chains in a spiral formed by a hydrogen bond. The consciousness of our ancestors is passed from one generation to the next through blood—the *water* that circulates throughout our bodies. And the water that flows through the bodies of the Jews and Palestinians comes mostly from the Jordan River. The Jordan River flows southward from northern Palestine and connects the Sea of Galilee with the Dead Sea, forming the eastern border of Palestine. Along its way, it provides much of the water necessary for sustaining life in the region.

The power of prayer has the ability to reach far distances of space and time. Through the photographs of water crystals, I have strived to help people from around the world understand the power and wonder of prayer, and I have encouraged people everywhere to pray for peace in the world. I decided that I would ask people to join together on a particular day to send hado of love and peace to the Sea of Galilee, which flows into the Jordan River. The people who drink its water would receive this hado, and their bodies would be filled with beautiful energy. Can you just imagine the possibilities for peace?

Before I set the date, I discovered something quite surprising. Another name for the Sea of Galilee is Lake Kinneret, and *kinneret*, in Hebrew, is the word for *harp* —the shape of the Sea of Galilee. And it also happens that Lake Biwa is named after the *biwa*, a traditional harp-like instrument in Japan. Could the similarity be more than a coincidence?

I decided to set the day for the special prayer for July 25, 2003. As I mentioned in [chapter 2](#), this day is very important on the thirteen-month calendar used by the Mayans. It is called “the day out of time,” the one extra day on the Mayan calendar.

Even in this modern age, perhaps we have the spirit of this day buried within us. I intend to work toward making this an international day of prayer for expressing love and appreciation for water.

A year prior to the date I set for sending hado to the Sea of Galilee, I established what I call the Project of Love and Thanks to Water. This was a project aimed at unifying the souls of people from around the world and raising consciousness on July 25, 2003.

My first efforts focused on expanding the circle of people willing to participate in the prayer. I asked everyone I knew to do the following: On the 25th of each month, either at 7:25 in the morning or 7:25 in the evening, face a body of water and express your love and appreciation. You could do this anywhere, such as your kitchen or your bedroom. A glass of water would suffice. Gently say to the water, “I love you” and “Thank you.” As you do this, imagine the power of love and appreciation flowing through you into all of the water of the world.

All water, even the glass of water, is connected to all the rest of the water in the rest of the world. The hado of love and appreciation that you release will become streams of brilliant gold and silver light in the flowing water and reach out to the entire world, ultimately covering it in light. The result will be a testimony of the healing and harmonizing of our planet.

Water carries within it your thoughts and your prayers. And as you yourself are water, no matter where you are, your prayers will be carried to the rest of the world.

So, pray. Pray for the victims of meaningless wars and landmines, for orphaned children, for the sick and the bedridden. There is much you can do from now on, and even a lot you can do at this very moment.

I recall that horrible recurring dream I saw as a small child. It wasn't warning me about my fate to witness the gloom and doom of the human race. It was teaching me what I must do in life. But it wasn't a lesson for me alone. It was for you and for everyone else who reads this book: Fill your soul with love and gratitude. Pray for the world. Share the message of love. And let us flow as long as we live.

EPILOGUE

We are now approaching the end of this journey of water together. What discoveries did you make along the way? Water has a secret life. It shows us how to find happiness. It reveals the meaning of the love of nature. It shows us the path that humankind must take to find the answers we seek.

Water Is Life

James Lovelock, a professor of biophysics, put forth the Gaia Theory, the concept that the world is all one life form, an active self-regulating system. The environment on the earth is kept at a certain level so as to make life possible. The volume of oxygen in the atmosphere is always about 20 percent no matter where you go. Plant life produces oxygen through photosynthesis, and animals breathe out carbon dioxide. The atmosphere works to maintain the temperature within a set range. So even though the seasons may change, we manage to keep our body temperature fairly constant. They say that 3.5 million years have passed since the birth of life, and while the sun may be gradually heating up, the temperature on earth has been maintained within a range to make life possible. The world operates in perfect balance

Indeed, this planet is like one life form. And what is it that gives life to this living planet? Water, of course. Water makes it possible for plants to grow, to produce oxygen, and to maintain life. But we all realize that this balance of life is now becoming ever more perilous. We are even playing with the balance of the atmosphere.

Water Is Beauty

Water's long journey began when it arrived on this planet in the form of lumps of ice from the far reaches of the universe. From there arose all the diverse forms of nature and life that now cover the surface of this planet.

And from that point, human civilization arose, and the life of each individual was born.

From water emanates all beauty: the colorful grandeur of nature, the green meadows, the silk strings of rain, the clouds that filter golden sunshine, the rainbow-filled skies, and the expansive sea, blue in gradation the deeper you go. Rays from the sun dance on the surface, reflecting off ocean plants and coral below. Fish of every color swim in schools that expand and contract again as if by magic. It is art, a grand performance, at its finest.

And then there's the crystals of water. Like pearls of the highest grade, finely carved by nature—almost like grand chandeliers.

The work of nature is far beyond the aspirations of the greatest artists. And the amazing thing is that it's no accident. It's all the result of a distinct intention, a hidden master plan. Its creation requires a level of intent and determination that we are incapable of understanding, much less mimicking.

So then, we must ask, who? Kazuo Murakami, professor emeritus at Tsukuba University in Japan, has used the term “something great.” It is an existence that has put its signature on each one of the some sixty trillion cells of our bodies, each containing enough genetic information to fill thousands of books thousands of pages long. It is this “something great” that has brought order to the universe and that keeps it moving in order.

It was through such a consciousness that water was brought to this earth. It was brought to this earth for the creation of beauty.

Water Is a Mirror

Water reflects the human soul. If you say “Thank you” to water, it will be reflected in the formation of beautiful crystals overflowing with gratitude in return. If the hearts of those who live on the planet are contaminated, then the earth as well will become that way.

Very little pure water—only 3 percent of our total water—remains on the earth, and the amount suitable for human use is declining at alarming rates.

Of all the water on the earth, the amount that falls from the skies and runs into the oceans is incredibly small. Almost all the water on earth is saltwater in the oceans, while most of the drinkable water is frozen in glaciers at the top of the tallest mountains. Compared to all the water that runs into the oceans, the amount available for our use is a tiny fraction, about 1/10,000th of all the water on the earth.

The outlook of the human race could be perceived as becoming more and more gloomy. The population is rising at a rapid rate, and even the groundwater, the source of last resort, is now becoming polluted. The pollution of water is the pollution of our very soul, and unless we change our consciousness, we will never be able to restore water to its pristine form.

Water Is Prayer

Water comes to earth as the answer to our prayers, and that process continues even now. What prayer, you ask? The prayer that life will be born, breathe, and take root. The prayer that nature will prosper, expand, and cradle what the native people call the “circle of life.” The prayer that intelligence will emerge and civilizations will form to protect the earth and spread love and gratitude.

Why do you think it is that when water is shown the words “love and gratitude” such spectacular crystals form? The answer is that words are a form of prayer. When something is in line with the principles of nature and it interacts with water, the result is the formation of beautiful crystals. This is because nature itself is the result of prayer. Prayer is also the true nature of human beings. All races of people over time have had the element of prayer. Even in these present days when science reigns supreme, we still pray. What heart doesn't pray when a sick child clutches to life or when a loved one is far away?

Water is given to answer our prayer for life, for evolution, and so human beings can look toward water and offer their prayers. Human beings are essentially crystals formed upon this earth. And that is why we have the

responsibility to protect the earth by protecting our water. And the first step we can take is to return prayer to our lives. I offer you a poem about water:

You are water and the wisdom of water you know.

So just allow yourself to flow,

And then the wonder grows ...

Your soul will reach beyond the seas,

With harmony on prayers of peace ...

Never stopping, never halting, bravely water flows ...

Brightly and boldly into the cosmos, for water knows.

Springwater and dam water

We journeyed down the Kumano River to collect water samples along the cycle of water. At the southernmost tip of Honshu Island in Japan, the Kii Peninsula and Kumano Mountains protrude out into the ocean. From this land where nature gods are said to live in Japanese lore, we collected water and from it produced crystals.

Dew on a low, striped bamboo on a mountain trail

Springwater at the foot of a mountain

Water flowing into a river

We began our journey from an altitude of 1,800 meters and collected water from a low, striped bamboo leaf. Such droplets eventually spring from the ground and form streams that lead to rivers.

Dam water

A stream merging with a river

One kilometer downstream from the dam

The crystals formed from the dam water lack any momentum. However, a kilometer away from the dam, beautiful crystals are once again possible. The stream eventually merges with the main river.

A flowing river and blocked-off water

At the edge of the Ariake Sea where the Honmyo River empties into Isahaya Bay, a land-reclamation project is taking place, despite protests from local citizens. We collected river water from the source to the reclamation area.

At the source of the river

Upper reaches of the river

At the source, the water creates an almost transparent crystal, and water from the upper reaches of the river revealed a breathtaking crystal.

Water flowing through the city

Water right before it reaches the bay

Pond in a planned land-reclamation area

As the water moves along, it becomes polluted until crystal formation becomes difficult or even impossible. At the land-reclamation site where the water has been diverted, the puddle water resulted in a tragic-looking crystal. When water is prevented from flowing, it dies.

Three faces shown by the river

The Fuji River flows through a plain at the foot of Mt. Fuji. We made crystals at the upper reaches, midstream, and lower reaches of the river.

Upstream (Metori Yusui springwater)

Midstream

Downstream

The springwater from the upper reaches creates a crystal that looks like a beautiful pearl. In the midstream, where the water runs through a rural area, a deformed crystal is formed. At the lower reaches of the river, the water becomes cleaner.

Japanese water collected at several locations

The difference in crystals formed from city water and water from springs, waterfalls, lakes, and rivers is profound.

Doryuonotaki Waterfall, Yamanashi prefecture

Towada Lake, Tohoku

Doryuonotaki Waterfall is close to the Fuji River. It resulted in a well-formed crystal. Water from Towada Lake in northern Japan has some

degree of pollution, but the crystal was relatively well-balanced.

Hotarunosato springwater, Niigata prefecture

Sumida River, Tokyo

This crystal from Hotarunosato, which means “home to the firefly,” created tiny light-like crystals, as might be expected. Sumida River, one of the main rivers in Tokyo, is now cleaner than it has been in years, but it is still not clean enough to form a crystal.

Crystals from water shown photographs of nature

We took pictures of crystals formed by water that had been shown photographs such as flowers and natural scenery.

A photograph of cherry blossoms

A photograph of a lotus flower

The water was shown a photograph of a fox in the lush forest under-growth. The resulting crystal is bright and sharp but perhaps a little melancholy also.

The photograph is of a tree silhouetted against a crescent moon at dusk. The unique crystal formed seems to mimic the shape of the tree.

The brilliant autumn leaves in the photograph created a crystal that appears to be formed by leaves before they have fallen from the trees.

This photograph of an ancient tree on Yakushima Island resulted in a large, unique crystal that seems to be teeming with life.

Crystals formed by water shown names of various religions

We exposed the water to the names of the world's five major religions.
What might you expect?

Buddhism

Buddhism was the only religion to result in a crystal with a hollow center. Perhaps this indicates the pathway to the next life, per the Buddhist teachings of reincarnation. It is a beautiful and well-balanced crystal.

Christianity

The tips of the crystal seem similar to Christmas trees. The fine detail and shape remind us of the religious ornaments of churches of the Middle Ages.

Judaism

The commandments of Judaism are said to be strict, but this crystal is certainly gorgeous and unconstrained. The overlapping layering of the crystal is also unique.

Islam

This also resulted in a beautiful crystal, perhaps indicative of the religion's comprehensive doctrine.

Hinduism

This crystal hexagon is almost perfectly geometrical, as if you were peering into a kaleidoscope.

The power to heal is the power of life.

We tested Effective Microorganism (EM), a patented microorganism being promoted in Japan in various products, which has the ability to cleanse the environment, along with flower essence and aroma oil.

Water with EM added to it

EM is made from a microorganism good for the environment and health. Just a small amount diluted in water resulted in a crystal teeming with vitality.

Findhorn flower essence

Gorse flower

Scottish primrose

Cherry blossom

These are photographs of crystals made with the vibration of flowers. They all resemble beautiful, blossoming flowers. The finely detailed crystals seem to have a healing effect.

Iona pennywort

Valerian flower

Elderflower

All of these crystals are charmingly beautiful. Just looking at these pictures may make you feel your mind and body heal.

The vibration of aroma oil reflected in water

Chamomile

The vibration of aromatherapy oil was transferred to water using a device that transmits hado. The result is a crystal almost identical to the flower itself.

Fennel

This crystal is influenced by fennel flower essence. Like blossoms floating in the water, the crystal is a brilliant representation of the flower.

Love and Thanks in three languages

The crystals formed when water is exposed to Love and Thanks seem to express all that is beautiful in the world. We compared the results in English, German, and Japanese.

Love and Thanks (English)

Love and Thanks (German)

The two crystals look almost identical. Maybe this indicates that love and thanks have the same vibration no matter what the language. These are words that can be understood by everyone in the world.

Love and Thanks (Japanese)

Everything begins and ends with love and thanks. Wouldn't it be wonderful to live each day with the beauty of this crystal within your heart?

Rainwater from Tokorozawa in Japan, three years previous

Tokorozawa on the outskirts of Tokyo was known as a dioxin-polluted waste dump.

Rainwater from Tokorozawa in Japan, present

Thanks to the efforts to clean and improve the area by the local citizens, the rainwater has changed, as evidenced in the most recent photo.

“With thanks to all our readers”

Water and the Expanding Circle of Peace

INTRODUCTION

The Positive Energy of Love and Gratitude

What comes to mind when you think of water? Oceans and rivers? Perhaps rain, or the water you drink every day? About 70 percent of this planet that we call home is covered with water, and about 70 percent of the human body is water. Without water, we would not be able to exist, and neither would the earth exist as we know it. Water is as important as it is irreplaceable.

Over the years, I have taken photographs of crystals made by freezing water. But I don't always take pictures of crystals as I find them. I often first expose the water to written words, freeze it, and then compare the various crystals that result.

Different water samples may appear to be all the same, but when one sample is exposed to positive words such as "Thank you" and another sample is exposed to negative words such as "Stupid," the two samples form distinctly different types of crystals. The "Thank you" crystals are balanced and well formed, while the "Stupid" crystals are deformed and broken. The energy of words is reflected in the formation of crystals, and depending on the words, the crystals are either beautiful or unsightly.

Since our bodies consist of 70 percent water, we can infer from the crystals that the water within us also contains the energy of words. It is perhaps not a stretch to think this way, because we often use words such as *thick*, *thin*, *heavy*, and *clean* to describe blood. If you think about water in terms of its quality, then it is easier to understand the energy contained within water.

What can we do to purify all the water within our bodies? I have explained that showing water good words results in the creation of beautiful crystals, and that's the answer. Simply use good words on a daily basis. People whose language is filled with expressions such as "Thank you" and "I love you" have water within them that is pure and beautiful, and likewise, people who use negative expressions such as "You idiot!" and "It's no good" can expect that the water within them will be deformed and distorted.

I am often asked, "What words did you use to create the most beautiful crystal you've ever photographed?" And my answer without hesitation is always, "Love and gratitude." The crystal on the cover of this book happens to be such a crystal. When water is exposed to the words "love and gratitude," it is filled with the most joy. If you look at the crystal on the cover, you'll see why I say this. When you continually think thoughts of love and gratitude, you simply cannot help but be changed. These thoughts will change the water within you, and the result will most certainly be a changed you.

In this book, I will focus on these words—*love and gratitude*—and share some of my ideas for using water's unique role of transporting vibration and resonance to help you welcome change and live a more positive and happy life.

The Balance between Love Given and Gratitude Received

What do you think is the most essential energy necessary for sustaining human life? Love and gratitude, of course. The most important form of energy that we have on this earth is the ability to love someone wholly and purely and to be filled with gratitude when someone rescues us from the edge of despair. You can probably remember a time or two when the energy of love and gratitude has come to you just when you needed it. They are essential forces in our lives.

You might wonder why I didn't show water the words "love" and "gratitude" separately. It was a whim that made me show both words combined, and the resulting crystals were noticeably different. Here's my explanation for why these crystals are the most beautiful: Love is the energy that we give to others, and gratitude is the love that we receive from others. In other words, the greatest form of energy results from the harmony between the energy of giving and the energy of receiving.

To apply this lesson to our own lives, if we hope to use this powerful energy as a guiding force, then just the energy resulting from only giving is not enough, and neither is the energy resulting from only taking. Only when love and gratitude are combined and balanced will they create a beautiful life for us, just as the combination moves

the earth and the universe.

Words Are Vibration

When you look at water crystals formed from pure water and crystals formed from impure water, there isn't an easily discernable difference. So if it is not the type of water, what influences crystal formation? The answer is vibration.

Words are a form of vibration. The Bible states, "In the beginning was the Word," and the Japanese have a saying that, roughly translated, means, "Words bring both good and ill fortune." Words and language are an integral part of our collective history.

The words we use evolve over great expanses of time, not unlike the process of evolution evident in nature. Of all the words that have evolved over time, *love and gratitude* are the most beautiful, in my opinion. We all live in pursuit of these virtues. Love and gratitude create the harmony found in all of nature. This harmony is a force so powerful that it is quite likely beyond our ability to understand. Even if we appear to be seeing chaos in the details, the overall effect is one of harmony.

Therefore, while you may not experience an immediate result when you disrupt the balance of love and gratitude, the negative effects will ultimately catch up with you. Pain and sorrow often result. There are times when, due to a lack of love and gratitude, the harmony of the entire human race is thrown into chaos by natural disasters such as earthquakes or tsunamis. My theory is that disastrous phenomena are the result of disruptions in the energy of love and gratitude.

Some might say that this is a preposterous idea. It is true that this theory lacks solid scientific backing, but the starting point for all science can be found in fantasy and dreams. The preposterous idea of yesteryear is the proven science of today. We can never hope to understand the world unless we practice unlimited thinking.

I hope that each person who picks up this book will become aware of the energy of love and gratitude that he or she possesses and then spread that knowledge to others. Those people will be likewise affected and share their experience with even more people. Knowing the power of love and gratitude has the potential to bring happiness to the people around you—and even to all the people of the world.

Join me in exploring the power of words and vibration, and the energy of love and gratitude, in the following pages of this book.

CHAPTER ONE

The Relationship Between Words and Water

I've already explained that when water is exposed to good words, good crystals result. So if you make it a habit to use positive words, then the water within your body and the water around you will become beautiful and clean, and health and well-being will result. This might sound like the conclusion of the book, but I have only just begun. Let's take a closer look at water and the meaning of our words.

Perhaps you have thought that the words you use day in and day out are tools to enable you to communicate with others. That's true, but they have another valuable function. Words contain the element of vibration, which plays a vital role in the grand scheme of nature.

The water that I experiment with to make crystals is nothing more than ordinary mineral water. However, when the individual water samples are exposed to different written words, the resulting crystal from each sample is quite different, depending on the vibration of the word. We can learn two things from this result.

The first thing is that while water may look the same on the surface, when we consider water's molecular makeup, we can see that it is capable of displaying a vast array of expressions. We might even say that water is like two people who look identical on the surface but are completely different inside. I have found that you can take any two healthy-looking people, and one might have a healthy mind and spirit, while the other has a fatigued mind and organs. Water crystals show us that, because appearances can be deceiving, it is helpful not to rely on ordinary means to look at something. Instead we need to turn our focus to the inside.

As an example, I often see young women diligently drinking copious amounts of water for their health and beauty. Perhaps they would see better results if they focused on purifying the water that makes up 70 percent of their body by using positive words and thoughts. This, I believe, is the best and quickest way to internal beauty and to physical vitality.

The second lesson that the water-crystal photographs teach us is that no matter how pure and tasty the water you drink, careless words and thoughts have the chance to destroy the beautiful crystals that might have formed. Crystals formed from even the purest water available change daily, depending on the environment and the words that it's exposed to in every moment. Keeping your words positive will keep the water within you pure and beautiful.

The Sounds of Nature

So what are words? I was raised in Japan by parents who spoke Japanese, and that's why I speak Japanese. But if, for example, I was separated from my parents soon after birth and raised by Chinese parents, then my mother tongue would, of course, be Chinese. In other words, no matter how much Japanese blood runs through my veins, it's not going to affect my language or the way I speak. Language is learned and not passed down through our DNA.

If we consider the biblical Adam and Eve, who taught them language? Since they had no earthly parents to teach them, I believe that they learned the first language of humankind by listening to the various vibrations and sounds created by nature.

Nature's sounds are indeed numerous. Just consider all the different sounds made by water in a stream as it flows. At the source, the water *bubbles* out of the ground, and then it *trickles* down and joins other creeks to become a *rushing* stream and perhaps even a *roaring* river that *plunges* over falls. The water may eventually form an expansive river that *hums* slowly toward the sea. With each subtle change in the environment, the sound of water changes as it moves along.

A sudden and radical change in nature, such as an earthquake, volcanic eruption, or tidal wave, is also revealed by sound. The ancient people were more attuned to nature than we are, and they knew what it was telling them. When someone heard the sound of water about to rush over the banks, he or she would need to tell others so they could escape to high ground, and the best way to do it was by imitating the sound of the river. By continuing to listen, they would be able to tell when the rain had stopped and the water had retreated. Likewise, they would have wanted to communicate this to others and to indicate that it was safe to return.

Coincidentally, the word in Sanskrit for "sound" is *Nada-Brahman*. *Nada* means "wide river" and *Brahman*

means “the source,” indicating the concept that sound is at the source of the river. My name, Emoto, also happens to mean “source of the river” in Japanese, so I guess it would only make sense that I would travel around the world spreading the message of water.

In any case, the sounds of nature come in many forms. Some are pleasurable sounds while others are mournful, and our distant ancestors understood this from what they experienced on a daily basis. They also understood the sounds of calmness, heat, cold, frustration, comfort, large animals, small animals, and males and females. And through imitation, the sounds of nature became our sounds—and our eventual language. See for yourself: Listen to water in a creek, river, lake, or ocean and try to hear the similarities between nature’s sounds and our own words.

Differences in Environment Account for Different Words

When you think about the role that nature plays in the formation of language, it makes you wonder if there were ancient words that could not be replaced—words so fundamental to a language that they should not and must not be replaced due to the connection to the unchanging principles of nature.

Yet our world contains many different languages. How did this happen?

The principles that exist in nature exist *everywhere* in nature and always have and always will, but the form of nature changes depending on factors in the environment such as temperature and humidity. This accounts for the differences in languages spoken by different peoples. Japanese, for example, has a large array of descriptive words, which may be a result of a generally homogeneous ethnic group being spread from the frigid northern part of the country to its tropical southern tip. And with distinct seasons throughout most of Japan, the weather is in a constant state of flux. Japan is a country blessed with bountiful nature, filling the air with a rich variety of sounds that would, over time, have become the source of an equally rich variety of words, including those used in distinctive forms of Japanese poetry such as haiku and tanka.

By contrast, the tongue of the Ainu, a distinctive and small minority group living in the most northern part of Japan, includes very few words, although they do have some 160 words to describe water. The part of Japan where most of the Ainu live is known for its many streams and lakes and heavy precipitation. These aspects of nature each have distinctive sounds—sounds that over the years evolved into words.

No matter where you go in the world, nature emits sounds with vibrations distinctive to the particular location and environment, accounting for the many different languages spoken by the various peoples of the earth.

The Formation of Crystals Using Different Languages

Unpleasant and pleasant phenomena witnessed by the ancients were expressed by words that conveyed the nature of the phenomena, i.e., ugly words or beautiful words. And by extension, water exposed to beautiful words forms beautiful crystals, while ugly words form ugly crystals. This should be expected, considering that words came from the sounds or vibrations of nature. The ability to distinguish between the fearful sounds, gentle sounds, enjoyable sounds, and worrisome sounds of nature, and the desire to communicate with others, is where language all began.

But here’s something you might not expect. When water is exposed to a word from Japanese, German, English, Korean, or any other language with the same meaning, crystals similar in appearance are formed. “Thank you” and its equivalent expression in Japanese, “Arigato,” despite being completely different words, look surprisingly similar as crystals. Why would different words, albeit with similar meanings, have this effect on crystals?

We already know that differences in nature result in the formation of different words. While the sound of the pig in English is *oink-oink*, the sound in Japanese is something like *bu-bu*. While the English-speaking rooster goes *cock-a-doodle-doo*, the Japanese rooster’s morning call sounds more like *ko-ke-ko-ko*. The reason for the differences is that the way people who grew up in Japan hear a sound is ever so slightly different from the way people born and raised in a different country perceive that same sound. The pigs and chickens of one country are not that different—perhaps not any different—from the animals found in another country, but the way a culture hears these sounds is different.

Although words of different languages may look and sound different, they are all formed according to the principle of nature. So regardless of the language, when water is exposed to words with similar meanings, the crystals formed are similar.

We Are One with the Universe’s Vibrations

The Japanese word for “cosmos,” *uchu*, supposedly came from the sounds the stars make. Perhaps the English word “cosmos” was formed based on the same sound. Although there are many different words for the cosmos, there is only one cosmos, and all the different words are perhaps nothing more than different ways of hearing the same thing.

Knowing that words come to us from the vibrations of the universe should help us to see that we are all one. Going about your life with this understanding is completely different from going about your life thinking only of yourself. Being concerned only with the short term is no way to live. Perhaps worrying only about the immediate future is the best some people can do. But when you have worried yourself sick over the immediate future it's important to broaden your perspective and see that the sky is all one and that we are all one with the sky and the cosmos.

Today more and more people seem to feel lost. Young people no longer know what to do with their future. The reason for this feeling of aimlessness and confusion is that the world we have created seems artificial. In this consumer society where everything we see was made by someone else besides us, what's real is what's natural: the sun, the moon, the stars, and plant and animal life. We gain perspective when we consider these natural wonders. All of us who feel lost can find direction by remembering that we all feel the universe's vibrations and by taking comfort in the common roots of our language.

Changing Yourself with Your Words

Think about the words you use day in and day out. Your words and the way you use them have an important influence on what kind of life you live. This isn't a discovery that's going to catch anyone by surprise.

Words are vibrations, and when our bodies, with all the water coursing through them, are exposed to good words, we cannot help but experience health and well-being. And in the same way, bad words and their bad vibrations will predictably have a negative effect on our bodies, so we should not be surprised when destructive words destroy.

So much can ride on a single word. That's why your life's outcome depends on how you use words and how you relate to their meaning each and every day. More so today than in the past, we are surrounded by negative words on the radio, on television, and in conversation with others. While some negative language used for humor may not be so bad, much of the language we use, and even many of the new words and expressions that enter our language through modern culture, are negative in their vibration.

It is within our power to shift our shared lexicon to the positive. You can start with yourself.

CHAPTER TWO

Improving Your State of Mind with Crystals

Let's take a closer look at some crystals. Look through the crystal photographs in this book and ask yourself which is the most beautiful. The crystal that you think is the most beautiful is the symbol of what you most desire. That is what your heart is searching for and what it wants to resonate with. If, for example, you think the "exhilaration" crystal is the most beautiful, then exhilaration is what you need in your life. You can choose to wake up in the morning and go about your life with exhilaration, even feeling exhilarated by what you eat. If you live your life that way for seven to ten days, you can be sure that your life will become more exhilarating. At that time you can open this book and again ask yourself which crystal you find the most beautiful. Maybe then you'll choose the "hope" crystal, in which case you would go about your daily life with hope being your predominant thought and feeling.

Place your selected crystal's picture in a spot where you can look at it several times a day. Frame or stand the photograph where you can see it out of the corner of your eye as you go about your day. Every time you gaze at it, you will align with the vibrations of love and gratitude, and you will achieve the feeling you desire. You might want to put the "You're beautiful!" crystal next to your mirror as a reminder to appreciate yourself. Or perhaps place the "love and gratitude" crystal near the bathtub where you wash away your fatigue and worries. Surrounding yourself with water-crystal photographs brings a ray of sunshine into your life.

You can change your life by looking at the crystal photographs. No two photographs of crystals are exactly the same. And maybe this is one reason why these photographs have the power to relax and heal. They are one of a kind, and so offer a unique vibration. Even simply having them nearby will create vibrations with which you can resonate.

Let the precious water within your heart become like beautiful crystals. That is where all change begins.

Words of Energy for Achieving Dreams

What is the true message of individual words? What message is hidden in words that can change your life? You can find clues to the answer to these questions and others in water crystals.

The crystal on page 36 was taken after the water was exposed to "I can do it." Solid and beautiful, the crystal seems to be telling us that if we believe we can do something, we can find a way to make it happen, even if it seems impossible. So if your boss says to you, "It's a really tough job, but I'd like you to do it," the outcome will depend on whether you say "I can do it" to your boss and yourself.

Saying words out loud creates the energy you need to accomplish the task in a focused and efficient way. Even if you're all alone when you say it, the water within your body will respond to this powerful affirmation and provide just the right support to get the task done.

In Japanese, words have a spirit. Thinking about words as having a spirit may help us understand their power. One thing I have noticed through research and life experience is that you can better use the spirit of words to help you achieve your dreams by using the past tense. In other words, it's even better to say "I did it" than "I can do it." Saying the same thing as if it has already happened seems to bring about an especially strong level of energy to any effort.

The next time you embark on a goal, try saying, "I did such and such" rather than "I can do such and such." Speaking in the past tense when faced with a difficult task can make all the difference.

By contrast, if you think you can't do something, you'll probably be right, no matter how easy the task may actually be. This seems to be the message of the "I can't do it" crystal found on page 37. "I can do it" results in a beautiful crystal, while "I can't do it" results in a distorted crystal. However, if you make an effort, you can see in the distorted crystal the possibility of a beautiful crystal forming. If you maintain a strong desire, then the people around you will come to your aid. The worst thing you can do is say, "I can't do it."

Why is it that negative statements such as "I can't do it" and "I won't do it" result in deformed crystals? I'm convinced from my research that it is because these concepts are not found anywhere in nature. The power that created our planet and our universe incorporated perfect and complete harmony and purposefulness. Everything that

exists is in a constant state of recirculation. A leaf, for example, falls to the ground and returns to the soil to provide nourishment to the tree from whence it came. Such an environment, where everything has a purpose, leaves no room for vibrations of “I can’t do it.”

Words of Encouragement to Others for Yourself

When you’re thinking about attempting a goal for the first time and you lack confidence, the words “You can do it” have special significance. But when you’re venturing into unknown territory, other people are unlikely to give you this encouragement. Instead you might hear, “You’re not serious?” or “You don’t really think you can do it, do you?” At a time when you need all the confidence you can muster, such words have a negative effect on both the person who hears them and the person who says them.

This is closely related to the main theme of this book: the power and resonance of words. For example, *love and gratitude*: We do know that love comes from the inside and spreads out, and that gratitude is the feeling felt by the receiver of this vibration. However, as I mentioned previously, the person who receives love and feels confidence will then be in a position to emit love, and in this way, love and gratitude spread throughout the world with the vibration of this beautiful energy.

So when you say to someone, “You can do it,” you have done a great service not only to that person but also to yourself. When the response is something like, “When you say that, it makes me feel like I really can do it, and I will,” then the energy will come back to you and the can-do vibration will fill you with confidence.

Now, if you had instead said, “Are you sure?” then what would happen? The other person’s confidence would be crushed, filling the space with negative vibrations, and you, likewise, would be filled with uncertainty. This is why, whenever you can, it makes more sense to speak positive words than negative words. Another case in point can be found by looking at the crystal on page 39: “Everything is going to work out.”

It seems to form two crystals. Perhaps we can see the overlaying of the feelings of the person who says the words and the person who hears them. You can imagine someone saying, “I know you’re worried, but I’m behind you so give it a try.”

Any words that give positive energy to another are certain to result in positive energy for the giver. Try this out at home, with your co-workers, and with your friends—you’ll surely see results. If your words shine a light on those around you, you won’t have to walk in the dark.

The Rewards of Making Others Happy

The crystals formed by “happiness” and “dislike” on pages 40 and 41 form an interesting contrast. The “happiness” crystal looks somewhat like a happy crab with hornlike formations on its hexagonal body. The “dislike” crystal looks similar to the “happy” crystal, but it appears as if it was squashed in its growth process.

To explore the differences, let’s consider for a moment what makes people feel the happiest. Of course, we are happy when we are paid a compliment or given a gift. But I suspect that most people are happiest when they do something for someone that causes happiness for that person. There’s nothing that makes me happier than to see a happy face and to know that this person looks that way because of me.

This, again, is a phenomenon of the love and gratitude that I’ve mentioned. What’s happening is that the feeling of gratitude which the receiver has toward the giver changes form and becomes love. When you understand the happiness that comes from giving, the circle of happiness around you will spread.

The Japanese word for “happiness” is *ureshii*, which is written with a Japanese character formed by two parts. The first means “woman” and the second means “good fortune.” Perhaps the ancients who created the writing system used in Japan knew something about how important it is to make other people, and maybe women in particular, happy. And in fact, the crab-looking crystal seems to resemble a smiling woman.

However, the “dislike” crystal looks like the face of someone who has taken a bite of something bitter. As long as you look at people in such a way, you will continue to dislike them. But if you make a special effort to smile at the people you dislike, you’ll soon sense that your feelings of dislike are dissipating.

Certainly there are some people whom I don’t much care for, but I know that I shouldn’t carry feelings of dislike within me. It only hurts me in the end. So what can we do to get rid of negative feelings? Here’s my suggestion. If you harbor feelings of dislike toward someone, that person will likely also have negative feelings toward you. If you can think that the cause for the dislike lies within you and ponder how that person might be feeling toward you, then you’re halfway to solving the problem.

The next step is to think about how you might be responsible for the different vibrations within that person and then to approach that person again with your negative feelings in check. You might be surprised to discover that all your dislike for that person has suddenly disappeared. Also, if you find yourself in a situation where you’re alone

with someone you dislike, bring a third party into the meeting. I've found that while two people might result in a conflicting frequency, a third person often brings everyone's energy into harmony.

Instead of giving up on improving relations with someone you dislike, try the methods I've mentioned and you might just surprise yourself with a change of heart.

Be Generous with Compliments

Any type of compliment helps create a beautiful crystal. The crystal created by "You tried hard" on page 44 is beautiful and perhaps a little restrained. Let's say that a child needs to study for an hour, but after thirty minutes you can see that he or she can study no more. You say, "You tried hard." What would the child think as a result of this encouraging statement? *I thought I would get in trouble for studying only thirty minutes, but I actually got complimented. If I study more, I might get complimented even more.*

So even a half-compliment can do much more to encourage someone than other expressions such as "Try harder" and "Keep at it." Expressions such as these usually result more in pressure than encouragement. While verbal pressure might result in more study time, it's not likely to result in more motivation. Crystals created by complimentary words seem to support this deduction.

This doesn't just go for children. Instead of telling co-workers and family members to work harder, you can compliment them for trying hard. You will be doing them the favor of energizing the water within them.

This strategy is especially important when you are in a leadership position. When you want improvement, you could demand it directly. However, often a more effective approach is to compliment first and then suggest what could be improved. For example, "You did a nice job. I like what you've done. But maybe you could ..." While we often say that a leader leads by example, it's important not to underestimate the power of words.

For an example of what happens when you criticize, look at the crystal on page 44 made by "It's hopeless." Perhaps you know someone who has a habit of saying, "It's hopeless," or "It's not going to work out." Their words create their future, and every possibility they encounter will have a negative outcome.

There are some people who can take bad news and use it to give them the energy they need to try even harder. For most of us, the best we can do is to avoid bad news. Negative information relays negative vibration, often resulting in a negative chain reaction that at times can lead to a fight, a crime, or perhaps even a war—all things that should be avoided when possible.

But ask yourself this: Why do so many people get enjoyment from watching mean-spirited television shows and hearing malicious gossip about celebrities? What they really get out of this is bad vibration rather than any true enjoyment. When you expose yourself unnecessarily to unhappy vibration, you put your own happiness at risk.

Wouldn't it be much wiser to wish happiness for others as much as you wish happiness for yourself? If everyone did this, the world would indeed be a wonderful place.

Finding Your Natural State of Wellness and Enjoyment

Water crystals also teach us about returning to our natural state: enjoying life and experiencing wellness.

Take a look at the "energetic" crystal on page 42. This healthy and well-balanced crystal seems to be telling us the importance of being healthy and energetic. When we make that choice, we fill the water within our bodies with energy. The "exhaustion" crystal on page 43, on the other hand, looks tired and worn out. When you say you're tired, the water within your body responds accordingly.

The Japanese word for "energetic," perhaps also translated as "health," is written with two characters: 元気. The first means the "source" or "origin," and the second refers to "energy" or "spirit." Our original state is health, and it's only natural that we return to this state and be healthy. If we are not healthy, then we have, somewhere along the way, gotten out of rhythm. For human beings, this energy or natural state of health is the starting point, and it's the point to which we need to continually return. Keep a photograph of the "energetic" crystal close by to help bring you back to your natural state of wellness.

When I exposed water to the word "enjoyment" to make the crystal on page 45, I anticipated a lively and vibrant crystal, but the crystal is actually quite conservative and basic. Perhaps this crystal is telling us that enjoyment is something that's quite normal, something that should catch no one by surprise. "Enjoyment," as well as "energetic," produced a surprisingly typical crystal, and why should we think these elements aren't a typical part of our daily life?

The act of living itself is an act of enjoyment. Some might argue, "That's not true. Life is full of pain." But think about this: At the moment of conception within your mother's womb, one of between 100 million and 400 million sperm was the one to fertilize your mother's egg. That already makes you an exceptional being to begin with. Now you, as the chosen one, carry the responsibility to live and enjoy life to the fullest.

The most natural life we can live is the one that is most enjoyable—and also the one that is best for our bodies. Here’s an interesting way I look at it from my Japanese point of view.

The word for “enjoyment” in Japanese is written with the character 楽. If you add an element or “radical” that means “grass” to the top of this character, then the resulting character becomes “medicine”: 薬. And medicine is what is used to restore the body and mind to a state where enjoyment is once again possible. The “grass” radical at the top refers to nature, and so we might also deduce that when you live close to nature, your body will be healthier and better able to enjoy life. Nature, water, and our natural state of wellness and enjoyment are forever linked.

Keep On Dreaming

When you look at the “Dreams come true” crystal on page 45, you’ll see that it looks somewhat like the “enjoyment” crystal, although it is considerably more complex. This seems to indicate that our dreams are of a different dimension, accounting for the multiple layers seen in the crystal.

Human beings have evolved over the ages in order to achieve their dreams, and this is our natural evolution. Having a dream pushes you forward. Take a moment and think about your dream. It might be a big dream or a little dream. Maybe it’s a dream that others would laugh at. Don’t worry about what others think. Strive for your dream, and when you accomplish it or even a small part of it, celebrate! You will now be able to move ahead with more confidence than before, and soon you’ll find your next dream, and on it goes.

When I was a small boy, I told my friends that my dream was to become the Secretary General of the United Nations. That’s not the direction I pursued in life, but that dream still occupies a corner of my mind. Perhaps it’s the water within my body that remembers it, and perhaps that’s why I have created two opportunities in the last few years to give speeches at the United Nations.

Your body remembers your dreams, which is why it is important to speak your dream. It will help you find the way to make the impossible possible. If all the people around the globe speak their dream of world peace, ten years from now that heretofore unachievable dream will be closer to being a reality.

CHAPTER THREE

Understanding Vibration and Resonance

In this chapter, we will take a further look at the way our words vibrate and resonate between ourselves and others. Let me first explain more about vibration, the force that moves us.

The Vibration of Existence

When we think about the factors necessary for survival, at the top of the list will come breathing, and in order to breathe, we need oxygen. We also need water, food, and sleep. Without an almost constant supply of these elements, survival would be impossible. What do these elements all have in common? The answer is energy.

We are talking about this same energy when we say things like, “I don’t seem to have any energy.” If we really didn’t have any energy, we wouldn’t be able to survive, and neither would anything else that exists on this planet. Whether we’re sitting, standing, working, or playing, everything we do requires energy. In order to regain the energy lost through activity, we need sleep. And so the sustenance of life requires a constant and consistent combination of oxygen, water, food, and sleep.

We can’t talk about energy without talking about vibration. Without vibration, we would be unable to create energy. Vibration is what makes it possible for everything to exist. All that exists is in a state of vibration, and this is the source of energy.

Vibration, the Energy of Life

Imagine an object vibrating. Perhaps you can almost hear the sound of it moving back and forth. Scientists tell us that everything vibrates, and thus everything emits sound—even the pebble lying alongside the road, even though you might pick it up and hear nothing.

The human ear is capable of hearing sounds within the range of approximately 15 to 20,000 hertz. One hertz is equivalent to one vibration per second. Human beings cannot hear anything with a vibration higher or lower than that range. So just because you can’t hear a sound doesn’t mean a sound isn’t being made. As long as a little pebble exists alongside the road, it is vibrating, and that vibration is making sound, no matter how small.

This concept was perhaps better understood by the ancients than by the people of today. A Buddhist saying speaks of Kannon, the goddess of mercy and compassion, as being capable of seeing all and feeling all. All existence is vibration and sound, and vibration is life itself. Without vibration, we would not exist.

The Japanese write the word “life” using the character 命. At the top of the character, you can see a roof, and under the roof is a person sleeping, symbolized by a horizontal line. Under the sleeping person are two symbols that, when combined, refer to “tapping.” We might compare this to the creation of vibration and, thus, the formation of life.

This life force that makes our existence possible is the same life force that makes possible the existence of the pebble alongside the road. To say that something exists is to say it vibrates, and everything that vibrates has life.

Vibration by Way of Water

We now understand that without vibration, it would be impossible for us to live, but since when was simple survival enough? Human beings differentiate themselves from other life forms by seeking a quality of life and happiness in addition to survival. And that leads us on the search for what makes us happy.

I have found in my studies that the phenomenon of resonance causes happiness. Resonance is simply the act of vibration resulting in more vibration. It requires the interaction of two complementary objects or energies. These energies are referred to in the Chinese culture as *yin* and *yang*, or light and dark—or, as I believe, love and gratitude. The love given and the gratitude returned resonate with each other through the vibration of giving and the gratitude of receiving.

Perhaps when you were a child you conducted an experiment using two tuning forks. When one tuning fork is

struck to make a vibrating sound, the other tuning fork placed nearby starts to make the same sound. This is resonance, and in order for it to work, the two objects need to have the same number of vibrations; they need to be on the same frequency. If the two tuning forks are of different frequencies, no matter how hard you strike one, it won't have any effect on the other.

It's not hard to see why something vibrates when you strike it, but it takes some thinking to understand why one object vibrates when you strike a completely separate object. It's a simple experiment, but it is eloquent in expressing the fundamental characteristics of energy.

Let me explain this more thoroughly. If vibration is energy, then resonance is the reverberation of energy, and resonance is thus capable of relaying energy. When you shout in a tunnel, you can hear your voice echoing. This is also a form of resonance. In order for resonance to be created in the tunnel, you need to shout first. In other words, energy cannot be relayed unilaterally. It requires the resonance of two elements, elements such as two friends, parent and child, or husband and wife.

The energy that is all around us wasn't always there. It is the resonance from earlier times passed down to us today. When we trace the energy back to the beginning of this resonance, we will reach the point at the very moment when this universe was created, that very first vibration. Who made this vibration? It was the creator of this universe, however you refer to this being or force. At the moment of the universe's conception, the creator made the first vibration. When this vibration met with vibrations of the same frequency, resonance resulted and energy was created. The vibration continued to resonate and create energy. Thus, the creator used the medium of resonance to create this universe.

Something was required to transmit the energy of resonance necessary for creation, and that substance was water. Water was instrumental for forming and sustaining life, just as it is today. Think of water as a train that transports vibration. Without sufficient water, the energy of vibration will not be able to flow throughout the body. Since vibration is the source of energy, energy would have no way to enter the body without water, and death would be not far behind.

This may not be the way everyone sees it, but more than ten years of research and water-crystal photography has convinced me that water's role is to transport vibration—energy—to the body. More and more people recently seem to be coming to this way of thinking.

Water is not only critical for sustaining life, but it is also necessary for keeping a good outlook on life. I have observed that people who are dehydrated soon lose their sense of humor. It so happens that the words "humor" and "humidity" come from the same Latin word. Even the ancients understood that with sufficient water, people are lighthearted and can enjoy humor, but humor wanes when humidity dwindles. In fact, when humidity drops by 50 percent, life is no longer sustainable. The vibration carried by water is nothing more or less than energy. If we only have half as much water as we need, we'll only have half as much energy as we need, and at that level, we'll not only be unable to resonate, we'll also be unable to vibrate.

By understanding that life is vibration, you'll also see that life after death is possible. Because vibration is life, life does not require a body in order to continue. Think of the body as little more than a tuxedo or dress that you rent for a short period of time. You'll need to return your tuxedo or dress when the time is up, but that fact alone does not mean the end of vibration. The soul, freed of the body, continues to vibrate, making life eternal.

In the next chapter, I'll explain how the principle of resonance can be applied to your daily life to improve your communication, relationships, and health.

CHAPTER FOUR

Using Resonance in Your Daily Life

Perhaps the greatest role that water plays in sustaining life is the transportation of vibration, and the greatest role of vibration is resonance. Resonance is not possible in a vacuum; for people to resonate, they require someone with the same vibration.

Resonance can occur among unrelated people without them even knowing. The British biologist Rupert Sheldrake gives us an example of how written or spoken words can have an effect on other unrelated people all over the world. According to his theory of “morphic resonance,” when a person begins something new, if it’s good and wholesome then the words of that person will go to other people who have similar consciousnesses.

To study this theory, he divided fans of the hugely popular and difficult *London Times* crossword puzzle into two types: those who worked on the puzzle as soon as they got it on Saturday evening, and those who waited until later to do it. The people who waited until later to work on the puzzle did significantly better than those who worked on it right away.

Perhaps what was happening was that when someone filled in a word, the vibration of the word blended into the fabric of the universe and then was attracted to people who resonated with the same appreciation for crossword puzzles. The phenomenon of resonance affects us all, wherever we are.

While we often resonate with people we aren’t even aware of, we resonate on a daily basis with people directly connected to our lives—friends and loved ones. Through this resonance, love and gratitude are exchanged, and energy is created. Because resonance is similar to communication, fully understanding it will help you improve your relationships and communication in all aspects of life.

Resonance for Better Communication

Perfect resonance would make the ideal relationship possible, but people will inevitably have different frequencies. If two people vibrate on vastly different frequencies, it will soon become evident that they need distance between them, and that will take care of the problem. However, when two people’s frequency is only slightly different, then it can cause all sorts of problems.

You see this phenomenon at play in many relationship problems among in-laws. The frequencies of a husband and a mother-in-law, for example, are probably not so different, since they both, at the very least, share a love for the same person. But sometimes even small differences in frequency can create disharmony. The same thing can occur in relationships between co-workers and acquaintances.

To help you get over hurdles in these kinds of relationships, think about a piano keyboard. It consists of black and white keys, each one essential to the formation of the keyboard, just as everything in our world is essential. When played together, some of the keys result in harmony, while other keys of different values result in a sound that is quite unpleasant. For example, the sounds of *do* and *mi*, *do* and *fa*, and *do* and *so* are able to create resonance. But *do* and *re*, sounds that are close to each other, result in a disharmonious sound.

Like the harmonious chords of *do-mi-so*, when people talk with others with whom they naturally resonate, the result is harmony. But what should you do when you have to be with someone with whom you don’t resonate, say a co-worker or mother-in-law? Try adding another person to the mix. When two people just don’t seem to be able to communicate, another person can help harmonize the energies.

Another way to improve relationships is to align your frequency with the frequency of the person you don’t get along with. How? Stand in the shoes of that person and try to see the world through his or her eyes. In order to do that, you need to know that person rather well. If you know someone’s interests, family situation, and past, then you can put yourself in that person’s place and see why he or she is thinking and behaving that way. With the passing of time, people grow and change, and someone you initially rejected might eventually seem not so bad. Consciously and continuously put yourself in the same frequency as another in order to resonate with them. When you become capable of that, then you will be able to share love and gratitude with that person, and the relationship can be mutually fulfilling and nourishing.

By becoming fully aware that your vibration is a living thing, you can become far more skilled at getting along in the world.

Friendship and Resonance

As you can see on page 90, water crystals that were formed by being shown the word “friend” were extremely beautiful and reflected happiness. Moreover, when we look at the concept of “a circle of friends,” we observe that when you make one friend, then, one by one, you make more friends.

Your friends are like a mirror in which you can see a reflection of yourself. By extension, if you notice particular good points in your friends, it’s quite possible that you are lacking these “good points” in yourself. Your friends exist for the important purpose of assisting your growth.

If you are able to express yourself freely on a variety of issues with friends, then it can be said that you are “open.” If you are not open to having discussions with friends about a wide variety of matters, then you are closing yourself off from receiving new knowledge and wisdom. How about making a fresh start today? Henceforth, start to think of your friends as a mirror in which you are able to see your own reflection, and be open to freely exchanging ideas, emotions, and knowledge.

I count myself lucky to have friends who are older than me, friends who are about the same age, and friends who are younger than me. In my organization, there are members of the staff with whom I associate and whom I consider to be my friends. Generally, I am the kind of person who is quick to make new friends regardless of age. I receive energy from these new friends because of the phenomenon of resonance, and this energy helps me continue living in a healthy manner.

Having a huge number of friends is not so important; the main thing is to have high-quality friendships with any number of people you feel comfortable with. This is what makes people happy. I feel that the most important condition of friendship is to be able to hold heart-to-heart discussions with your friends. The ability of people to talk and share ideas with each other is of critical importance, and I feel that people who are unable to do so become part of the cause of various social problems. Finally, in order to bring meaning to your discussions with friends, you need to possess compassion and kindness. Then you will experience the full benefits of energy resonance.

It’s Important to Resonate with Other People, Not with Electromagnetic Fields

It seems that something has been changing in the world in recent times: there are people who seem impossible to resonate with, despite one’s best efforts—such as the type of person who chooses to sit in front of the television and become reclusive, and as a result becomes adverse to communicating with or relating to others.

A major reason for this type of behavior can be found in the electromagnetic fields around us. There can be no doubt that the diverse electromagnetic fields have a negative impact on human beings. Cell phones, televisions, computers, and other electronic devices surround us all the time. When people have weakened immune systems, the electromagnetic fields they surround themselves with may be strong enough to alter their consciousness.

Let’s look at the relationship between the human nervous system and computers. The building blocks for computer systems are *0s* and *1s*, and these two digits are used to provide all the instructions required by the computer to operate. In other words, it is like a world of *yes-no* choices. When we are constantly exposed to the electromagnetic fields of computers, our bodies and our nervous systems begin to harmonize with the machines. Take a look at the photographs on page 98 to see the effects of these devices on water.

The human nervous system is formed by a vastly diverse number of building blocks, making it possible for us to express a vast range of emotions, including even the level of love and gratitude. However, when our bodies begin to harmonize with the electromagnetic field emitted by computers, all sorts of things can happen. Most notably, we lose our ability to harmonize with other people around us. Perhaps you know someone who spends an unhealthy amount of time in chat rooms and mail messaging and have witnessed this phenomenon firsthand.

I venture to say that electromagnetic fields are like synthetic spirit. I believe that the spirit of these machines has the potential to attach to our own spirit and drain us of our energy and health. If you find yourself feeling less energetic than you used to be or than you would like to be, first consider the electromagnetic fields created by the electronic devices around you. Whenever the vibration within your body becomes weak, there will be an equivalent weakening of your health and your energy. If you want to increase your energy, look at what’s giving you energy—in other words, what you are resonating with. For the well-being of ourselves and the planet, it is critical that we seek to harmonize with other people rather than with the electronic devices that are so ubiquitous in our lives.

Achieving True Love

It is one thing to lack resonance with a co-worker or acquaintance, but falling out of resonance with your own life is

another matter entirely. Two people fall in love and form a relationship so close they think it will last forever, but then one or both partners change and sweetness turns to bitterness. In time the relationship ends. It can happen to the best of couples.

When one person changes and the other is unable to detect the change, disharmony is sure to follow. The way to prevent this from happening is simply to continually strive to understand the other person's feelings. Keeping your frequencies aligned depends on striving to see things from your partner's point of view—to change together. If you still find you are unable to resonate with your partner, try putting some space between yourselves. With the distance you need, you may discover who you really are and find how you want to live your life. And then eventually you might be able to return to the situation as before and live in harmony by maintaining your identity and the right amount of space.

To sustain any close relationship, to achieve true love, you need to understand the relationship between love and gratitude and to be willing to show more love and more gratitude.

Loving continually is the secret of happiness—in a relationship, in your career, in yourself. The reason I can say this is because my greatest happiness comes when I give love to someone and they respond with simple gratitude. Love is a feeling of caring and compassion toward the entirety of our world—everyone and everything. Love is sending out vibrations of caring and compassion. Love is the ability to sympathize and empathize with others in a way that makes them a little bit happier.

For some, love and gratitude doesn't get expressed easily. If this sounds like you, even starting out by faking it is all right. Simply saying the words "love and gratitude" more often or writing them in a place where you can see them is a positive step. You might try writing "love and gratitude" on your coffee mug; each time you look at it, you will feel that energy. Do anything you can do to expose yourself to the vibration of love and gratitude.

Once you give love and gratitude a chance to take hold in your own heart, you will be able to experience the joyousness of resonating love and gratitude with others.

CHAPTER FIVE

Water Crystals Can Bring Forth Your Potential

Photographs for Positive Change

We have already seen how resonance results in harmonious vibration and an increase in positive energy. I frequently have the opportunity to meet with people who say to me, “I want to change.” As you already understand from the various photographs of water crystals, positive words result in positive change, and we can also conclude that if we wish to make a positive change within ourselves, we will need to change the purity of the water within our bodies.

Perhaps you’ve seen card decks printed with positive messages. The idea is to pick a card from the deck each morning and then live your life in accordance with the card’s message that day. In this same way, I encourage you to look at one of the positive photographs in this book each morning or to use the *Water Crystal Oracle* that I have created (see www.beyondword.com).

In this chapter, we’ll look at each crystal and explore the meaning of words and how the meaning is reflected in the crystals. We’ll see how each crystal has its own distinct character and unique beauty.

The Amazing Power of Unconscious Words

What do you say to *yourself* each day when you look into the mirror? What words are stirring within your soul? How many of us say such things as “I’m so beautiful” or “I’m really charming”?

Take a look at the crystal at the top of page 47 and you’ll see the effect that words such as “beautiful” and “charming” can have. Perhaps you’re used to using these words when referring to others, but these are also words that you can say to *yourself*. Keep on talking like that and soon the water within you will change and you will become a truly beautiful person from the inside out.

Now consider the crystal at the bottom of page 47. This crystal appears isolated and ignored. In another experiment conducted with rice, we discovered that rice which was ignored spoiled more rapidly than rice which was exposed to words of scorn. From this, we can deduce that apathy about your body, face, or personality cannot help but have a negative effect. Apathy will spoil the water within us, and from the inside out, the cells will age and deteriorate at an accelerated rate. But if you wish to slow down this process, then become aware of your absolute beauty and appreciate and love every body part, from the top of your head to the tips of your toes.

Just as words have the power to generate energy, so does the casual gaze. When someone looks at you in a positive way, it can do wonders for the way you feel, while being ignored seems to suck the energy from you. In the same way, when you look at yourself in a positive way, you will feel positive energy fill your body, while ignoring yourself will have the opposite effect. If you can see the beauty within yourself, that’s the direction in which you’ll move. But if all you can see is what you think makes you unattractive, then that is what you’ll become more like.

The Power of Desire

As a child, I once made a hundred wishes. Upon those fulfilled dreams of a child, I have built the dreams that I now have as an adult. It is important to have big dreams and to desire with passion. By having big dreams, you will meet the people you need to meet, have the experiences you need to have, and your capacity will rise to the level of your dreams. The bigger your dream, the bigger your capacity will be.

I’m quite sure that everyone who has met with some degree of success in his or her life could tell you something similar to this. Expressions such as “I want this to happen” or “I want to do that” are born of the abilities that you already have. There isn’t anything you can honestly wish for that isn’t somehow possible.

Have the biggest dreams possible. Big dreamers live bold and full lives. They may get discouraged at times, but they soon succeed. Perhaps this is what the “hope” crystal on page 48 is telling us. One unique thing about this crystal is that it formed and grew at an incredibly fast speed, telling us that hope, even a little hope, will lead to more hope and more possibilities.

Wouldn't it be wonderful to live in such a way that your hopes and dreams continually expand and branch out? I encourage you to place the photograph of this crystal in a place where you can see it as you go about achieving the dreams within your heart.

The Meaning of Dreams

Water that was shown the word "dream" formed a crystal with a beautiful seven-sided shape (see page 35). To me, this seven-point crystal symbolizes a bridge to the fourth dimension, or the future. I believe that dreams possess an unusual dimensional aspect—namely, that they are between the third and fourth dimensions. In other words, they suggest the future but are not a full representation of the fourth dimension. For this reason, I say that they are part of a 3.5 dimensional world, and the seven-point water crystals formed by "dreams" are also part of this world. The world inhabited by the souls of the departed is also made up of 3.5 dimensions.

We always dream, but the dreams themselves are illusory and often fade into nothingness soon after we awaken. These imprecise, seven-sided water crystals formed by being exposed to "dreams" are part of an in-between world. If we look at phenomena from the world of 3.5 dimensions, these phenomena might also serve as a kind of blueprint for a new future.

Let me explain: In Japan it is believed that dreams transcend limitations of time and space. Through our dreams, we are able to receive communications from previous ages and from our own previous lives. Dreams, then, are a form of reference material that provide us with an almost godlike capacity to understand the future.

Lately in my dreams I see the world coming to an end. Because our dreams give us access to memories from previous generations, we have been given the appointed mission of not allowing the same bad things from the past to be repeated. These dreams give me the resolve to change the direction that civilization is headed.

On this point, through water, an appeal is being made for world peace. Through your dreams, you are able to guide yourself. If you have good dreams, those are the kinds of things that will come to pass. When you experience a bad dream, it should be your hope that the contents of that dream will not come to pass. If the terrible things that you dreamt about are actually coming true, then it is up to you to avoid those undesirable things as you go about your daily life. Because it is good that happy occurrences take place, you should set your life's compass to move in a positive direction.

What I am suggesting here is that dreams give us the opportunity and power to control what we do. We can use this power for positive change in the world. This is the belief system that currently guides my life.

Vocalizing Your Dreams for Stronger Effect

How often do you express positive words rather than just letting them float in and out of your consciousness? The water crystals show us the effect that the simple act of vocalizing good words can have.

When we compare water that has been exposed to words only and water exposed to music, the water exposed to music forms into a crystal much faster. Water exposed for only about thirty minutes to music will form crystals that reflect the music, but the formation of the crystal affected by a written word requires at least one day of exposure. It makes sense: music creates and relays considerably more vibration than that created by writing.

To understand the strength of vibration, think about the volume of a speaker. Music is like a speaker turned to high volume, relaying vibration in a direct way. When I previously suggested that you look at yourself in the mirror and compliment yourself, I suggested that you speak out loud instead of just thinking the thoughts, and that also is a direct way of relaying vibration. Perhaps you think that saying "I love you" or "I respect you" to yourself in the mirror just isn't something you could actually do, but I can promise you that people who are capable of changing themselves for the better are all capable of this simple task. When you become accustomed to this, you'll be able to make changes within yourself that, while not initially noticeable, will nonetheless be real through the water within your body.

Let's take another look at the "ugly" crystal on page 47, which effectively reveals what the word "ugly" can do to us. Considering that just thinking "ugly" has this effect, can you imagine the effect it can have on you when you vocalize it? Avoid casting judgment on yourself, other people, or other things by calling them "ugly."

Despair Is the Beginning of Hope

Life is full of mistakes and failure. We sometimes think that everything that can go wrong usually does—the person you love rejects you, the place where you wanted to work doesn't hire you. If you thought about ending your life every time you failed, life would be short indeed.

But let's look at the crystal formed by the word "despair" on page 48. The formation could hardly be called a crystal. This experiment resulted in one or two scrawny crystals, but that was all. What could this be telling us? I

think the message is that despair is the beginning of hope. Of course, you experience great sadness at times of despair, but it's also an opportunity to go back to and start again with a clean slate. It's the starting point of *new* hope.

Crystals teach us that by looking at despair in this way, we can soften the pain even a little.

Clasping Hands as a Source of Energy

When water was exposed to “clasping hands,” it formed one of the crystals shown on page 49. Think for a moment about why people clasp their hands. No matter what the culture or religion, people clasp their hands together when asking something of the creator or of other people.

A ritual of the ancient Japanese religion of Shinto is to face the sun at about 4:30 in the morning, lifting up your arms and bringing your hands together as if you were absorbing the light into your soul. It is a way of gathering energy. By bringing the hands together, a simple form of energy from resonance forms and expands and enters your body.

Consider the character that the Japanese use to write “sound”: 音. Pronounced *oto*, this character is actually formed of two simple characters, the top part meaning “to stand” and the bottom part meaning “sun.” So it would seem that the people of long ago understood well the relationship between the vibration of sound and the sun.

Of course, modern science has now shown us that light is waves—vibration, if you will—and the source of our energy. And so it's not hard to imagine why people of ancient times faced the sun in the morning and asked to be a vessel of its energy by clasping their hands together.

The Power of Adoration

Is there someone for whom you feel adoration? If there's not, then I would like to encourage you to find such a person. Just looking at someone you adore has a purifying effect. Being around that person raises your spirits and causes you to sit just a little bit straighter.

The crystal influenced by the word “adoration” on page 49 is indicative of the love and respect that a child feels toward his or her parents, or the love and respect shared by an elderly couple.

The crystal influenced by the word “eternal,” also on page 49, is formed around a distinctive hexagonal shape that appears as if it could go on forever. As I mentioned previously, if you consider that life is vibration, then it's not hard to understand how life can go on forever. The experience we know as death can define the extent of our physical life, but our vibration can go on resonating for eternity, regardless of what happens to flesh and bone.

The Power of Your Name

Write down your name and take a look at it—a really good look. Your name has the power for good or evil and the power to influence what road you choose in life. Now with a feeling of gratitude, take another look at your name, and you will then be able to feel something new—energy you've never felt before.

Not long ago in Japan, news was made by a father who tried to name his child “Devil.” Although some argued that parents have the right to give their children any name they choose, the city refused to accept the name, and instead of taking it to court, the father backed down. When we exposed water to the word “devil,” the result was the deformed crystal on page 83. By contrast, when water was exposed to the word “angel,” the result was a beautiful formation of tiny crystals in a circle.

Japanese names are usually written with characters that express a trait the parents would like to instill in their children. Here is one of my favorite names: 真理. Pronounced *Mari*, this name means “truth.” One of the crystals on page 83 was formed after being exposed to this name, and you can see the beautiful results.

The most common character in Japanese names is the character for “harmony”: 和. This character, which formed the crystal on page 83, seems to form a circle, so perhaps it's more than a coincidence that this character is closely related to the word for “circle.” Peace is often symbolized by a circle, and so this crystal with its complex formations seems to be telling us about the importance of peace in our troubled world.

Compliment Yourself for a Change

Compare the two crystals on page 85, which were formed after being exposed to “You're beautiful!” and “You're becoming beautiful.” I have already mentioned the importance of complimenting yourself, but instead of complimenting yourself every day with the same words, try to find a new compliment for each new day. The effect will be slightly different each day as you evolve into a new person. New cells are continually being formed within our bodies, and by changing the words you praise yourself with, you can have a surprising amount of influence over how you change. It may be easier than you think to reset your life and become the person you truly want to be.

Next look at the crystal formed by “unhappiness” on page 88. Everyone knows people who are always complaining about how miserable their life is, but this crystal seems to be telling us just how destructive this word can be. Telling people how unhappy you are can bring little good, so instead let people know when you’re happy.

Positive Words Come Back to You

Now let’s look at the crystals formed by “You did well,” “That’s no good,” “affection,” and “hate” on pages 86 and 87. As you can clearly see, the photographs of the crystals influenced by “That’s no good” and “hate” aren’t pleasant to look at. What this shows is that the positive and negative images of words are clearly reflected in water. I’d like to encourage you to use words with positive images as often as possible. Positive words have the power to give positive vibrations to the people around you, and those same positive vibrations will eventually return to the source. Something similar can be said for negative words: After having a negative influence on those around you, the negative vibrations return to you to create a vicious cycle of negative vibration.

When you look at the crystal formed by “rage and murder” on page 87, perhaps you can imagine a masked person in hiding suddenly attacking an unsuspecting person. Some of the worst crystal formations that I’ve seen are those formed by words having to do with abuse and violence. Perhaps what we can learn from this is that when you seek to do harm or damage to others, you are at the same time inflicting similar harm or damage upon yourself.

Now consider the “Let’s do it” and “Do it” crystals on page 89. While the “Let’s do it” crystal is strikingly beautiful, the “Do it” crystal is somewhat similar to the crystal created by “devil.” As I implied in an earlier chapter, the concept of “Do it” does not exist anywhere in nature. All we know about nature tells us that things happen naturally rather than being forced, and we would be doing ourselves a favor if we avoid using expressions such as “You have to” and “You’d better.” A more attractive alternative is to value the true nature and spontaneity of yourself and others.

Sharing Your Feelings and Yourself

Everyone will agree that the crystal formed by the word “soul” on page 90 is indeed beautiful. The Japanese word for “soul,” pronounced *tameshii*, is written in two parts, like this: 魂. The part on the left side looks like this: 魂. This side of the character means “to speak,” while the part on the right, taken alone, means “evil spirit.” While it is said that silence is golden, keeping your feelings bottled up inside is certainly not recommended. In fact, it may be wise to be wary of people who refuse to share their feelings with you. I have found time and time again in my research of water crystals that the combination of crystal photographs and Japanese characters gives surprising insight into the nature of words.

Making the Most of Positive Words

Consider the different crystals formed by the words “Thank you” and “I’m sorry” on page 92. The different formations are to be expected, considering that we use these two expressions in different circumstances. In the same respect, we choose the words we use depending on how we feel day by day and moment by moment.

As we go about our busy lives, how can we find the time to take advantage of the power of positive words? One possibility is to write or even tattoo good words on your body, but I, for one, have a hard time believing that tattoos are a positive thing. Instead of the body gaining power from the words written on it, I’m concerned that the body might actually become dependent on the power of such words. An old Japanese ghost story tells about a man who writes sutras all over his body to protect himself from devils. But he forgets to write sutras on his ears, so the devils bite them off, illustrating the fallible nature of writing on ourselves when we should be thinking about how we can incorporate these good words as part of our souls. Covering your body with the words *love* and *gratitude* is not nearly as effective as daily making the choice to go about your life with your heart filled with *love* and *gratitude*.

But instead of having only certain words as your constant mantra, I encourage you to consider, for each situation you face, what positive words would match. If you are experiencing something unpleasant, then you can think of a positive word or expression for that situation and focus that word or expression on the water within your body.

As we have seen, the expression “I’m sorry” creates quite a beautiful crystal. We can all think back to a situation where we should have used these words. If this is something you can relate to, I encourage you to look at the “I’m sorry” crystal, speak the offended person’s name, and say, “I’m sorry.”

The crystal on page 93 formed by the words “peace of mind” is stable and steady. It’s not hard to feel peaceful vibrations from this lovely crystal. When you feel troubled or ill at ease, such as when you have an important interview or face a new challenge, look at this photograph and let the peaceful vibration calm your soul.

The Soothing Vibration of Sutras

There are many ways to calm yourself; two popular ways are to keep a diary and to chant. That both of these activities relate to words is, I think, no coincidence. When we exposed two well-known Buddhist sutras to water, the result was the beautiful crystals on page 97. The sutras are known for a lovely chant-like vibration, and so this is the result we expected. It seems to me that the sutras form a conduit to the energy of the universe.

As you may know, there are seven chakras or “energy points” located along the body, from the top of the head and down through the spine, with each chakra having its own frequency. I believe that sutras, like the chakra at the top of the head, serve as portals for the energy of the universe. If you’ve ever heard the chanting of sutras, you’ll know how simple and minimal the sounds are. But perhaps that is what makes them so powerful.

Recently in Japan, stage performances of sutra chants have been quietly gaining popularity. At one such performance by sixty monks, I placed some samples of water on the stage, resulting in the crystal formations on page 97. The soothing effects of these chants are evident in the pure, delicate crystals.

Loving Others Begins with Loving Yourself

The series of “love” photographs on pages 94 to 96 were very telling about the nature of love. In the “self-love” crystal, you can almost see hands clasped together as if in prayer in all four directions, forming what appears to be a high-energy crystal. This indicates just how important it is to love yourself for who you are. The concept of self-love is not easy to grasp, but think about it in terms of vibration and resonance: without your own positive vibration, you will be unable to help others vibrate. Simply put, it’s impossible to love another unless you can first love yourself.

Let me give you an example of what I mean. Let’s say that there’s a 440-hertz tuning fork. If it’s just standing there, there’s not enough vibration to be audible by the human ear. But if you sing “Ah!” at this level the tuning fork will begin to vibrate. By sharing your vibration, you have restored the tuning fork—you have brought it back to life through an act of sharing. In this case, we might even say that the act of singing “Ah!” is a loving act.

Each one of us has an important responsibility to give love in the way that only a human can. Of course everything emits vibration, but not the continuous and conscious vibration that humans can. And we have another quality that makes us special: as human beings, we are capable of resonating with everything else in our world. We can resonate with all the sounds in the octave as well as with higher and even lower octaves. Perhaps you can’t quite sing the *la* sound of a high octave, but you can resonate with that *la* using one from a lower octave. And this is why we are capable of resonating with and giving energy to anything and everything that is.

Neither the tree nor the flower is capable of independent vibration, but by speaking to a plant, you can breathe vibration and energy into its fibers. If you doubt this, just ask anyone who loves spending time with their plants. They’ll tell you that they don’t just take care of their plants, they speak to them. Understanding the principles of vibration and resonance may help give understanding to the unexplainable.

Capable of making all vibrations, the human being has a special place with the creator and has special powers to affect the world we live in. We have the power of thought and the power of free will, and thus the power to make whatever sound we desire, and in this we have the power to be a force for change.

But to give energy to the world around us, we must first have energy within us. You can’t give someone something that you don’t already have. So to have love in your life, begin by respecting, appreciating, and caring for yourself. When you feel secure in your self-love, then and only then will you be ready to share your love and your life with someone else. All successful unions begin with the love of your *self*—not with your love of someone else.

The Power to Make Others Happy

Now take a look at the “spousal love” crystal on page 94. The crystal appears to have two layers, with the smaller one encompassed by the larger one. This perhaps indicates that the secret of a good relationship is that the two are not the same: symbiosis does not require that one be dominant and the other subservient. The ability to reverse roles as needed is an indication of a healthy relationship, one upon which the love of family can be created.

The “family love” crystal on page 95 shows a group of three formations, perhaps indicative of grandparents, parents, and children living together in harmony. It’s rather uncommon nowadays to find three generations living under one roof, but even if families live apart, they can still be of one heart. Grandma and grandpa don’t need to be forgotten. If you take your children to see their grandparents, then your own children will probably do the same when you become the grandparent. The message from the crystal is that the family unit in its fullness—in the past, present, and future—is the combination of three.

When you have love for your family, then it is possible to love your neighbor. The “neighborly love” crystal on page 95 creates a beautiful image of harmony. And after you have become capable of love for your neighbor, you can next love your country.

The “love of country” crystal on page 96 looks as if it’s sitting on a larger crystal in the background, indicating

how our identity is closely related to the country of our origin. You can't help but feel sorry for the millions who have been forced by the dishevelment of these troubled times to give up their homeland. Perhaps the little crown off to the side on this crystal indicates that governance is required for countries to go on existing.

And then, after love of country, you are capable of love for humanity. The "love for humanity" crystal on page 96 seems to be an especially well-balanced and beautiful crystal. This is an important crystal because this type of love will help us solve the problems of war, famine, and worldwide disease.

These six crystals of love are all built on the love of self. If you'd like to have a part in spreading love to the world, then you must first love yourself deeply and completely. Some people might think that they already focus too much on their own needs, but that's actually a good starting point. You will soon realize that having self-love is not being self-centered. Self-love is the energy required for loving another person, your family, your neighbor, your country, and all your fellow human beings.

Moving toward Peace

As I mentioned previously, water that was shown the characters for "peace" formed crystals in a shape that looked like the joined crystals formed when water was shown the words "love and gratitude" (see page 35). I feel this means that when "love" harmonizes with "gratitude," you get "peace."

If thoughts of peace are not coming into your heart, you should recall love and gratitude, especially the latter. Being thankful brings you love; being thankful even helps create love within your being. When you heap love on top of thanks, your soul will be at peace.

Peace must be created first by individuals. In this way, peace will spread to your family. This sense of peace, in turn, evolves into love that permeates a region, an entire nation, and finally the entire world. It is you, yourself, who becomes peace. In order to accomplish this you need to pile thanks on top of love.

I believe that our planet is sick. When people take ill, the weakest parts of their body develop symptoms of illness. People who experience weakness in their throat often eventually develop a disease in their throat. The same holds true for other organs of the body. People with weak lungs are prone to developing a lung disease just as people with a weak stomach are more likely to develop a stomach condition.

Our planet works in much the same way. Earth is like a diseased patient who is sorely in need of medical assistance. For example, look at Afghanistan, Iraq, Israel, the Indian Ocean, Pakistan, Thailand, and Mexico's Yucatan Peninsula. In all of these places, disastrous conditions in the form of wars, earthquakes, tidal waves, and hurricanes are occurring. It is as if the planet's immune system is weak and losing cellular matter as a result.

Why are these things happening? One by one, the earth's harmony is being seriously tampered with. Only through the phenomenon of resonance are the vibrations of energy's essence able to give us beautiful, peaceful energy.

At this time, "harmony" and "peace" are missing in our world. As long as we continue destroying "harmony," the planet is going to experience more and more natural disasters and war. As for us residents of this planet, make no mistake that the conditions of life are going to become tougher and tougher unless we do something to reverse the course.

I am Japanese and must never forget the ancient spirit of my native land, originally called Yamato before it became known as Japan. The Japanese word for "harmony," 和 (pronounced "wa"), makes up half of the Japanese word for "peace," 平和 (pronounced "heiwa"). This character 和 ("harmony") is also seen regularly as part of the ancient word for Japan, 大和 "great harmony" (usually pronounced "Yamato"). In daily Japanese, "harmony" 和 is widely used to represent "Japan" or "Japanese" (food, language, style, architecture and the like). In all these ways, the symbol for "harmony," 和, permeates Japanese life. I feel that it is my task to dispatch this message to the world: "Get back in harmony." The starting point for this endeavor is to create harmony. Bring harmony back to your marriage, bring harmony to your family, and bring harmony to the people in your neighborhood. With this kind of thinking, we can create the foundation for a world that is more and more harmonious.

It is difficult to create world peace by yourself. And yet, by creating harmony within the lives of individuals a broader, more profound harmony will develop, step by step, in our world. When this kind of thinking comes naturally to you, you will be able to make a large contribution to peace.

CHAPTER SIX

Living with Clean Water: Finding Peace and Comfort

Energy Giving Energy

Living life to its fullest requires a considerable degree of positive energy, and to harbor this positive energy within yourself requires resonance. The resonance that I refer to comes from aligning yourself with the resonance of love and gratitude while also emitting vibrations of love and gratitude.

That is easily said, but how do we actually make it a part of who we are and what we do? In this chapter, we'll look at some of the specific ways that you can live life within this positive energy without being distracted by the negative stress that so easily besets us.

I have already mentioned that to vibrate in a positive way requires that you resonate with someone else's positive vibrations. Resonance is what we use to share our energy with each other. In the same way, when we align our words and thoughts to the grand principles of nature and the will of the creator, we can experience positive vibration and happiness. This energy makes us feel alive and full of energy. But when we are out of alignment with this energy, we soon feel stressed and depressed. Of course, the foundation for the grand principles of the universe and the will of the creator is nothing less than love and gratitude.

By giving vibration—energy—to those around us, we give them love. This, the intentional sharing of the energy of love is something that all human beings are uniquely capable of. Positive words have the power to give energy to the receiver while also having the same effect on the giver.

When a person is loved, the natural result is gratitude, and when gratitude and love exist together in the same sphere, the natural result is resonance. When a sick child is nursed back to health by the love of his or her parents, feelings of gratitude result. And then when the roles are reversed, the child, out of gratitude, cares for the parents with love, as the loving giver becomes the grateful receiver.

The Difference between Negative and Positive People

We are all capable of emitting beautiful healing vibrations. These are the vibrations that loving mothers and fathers send to their children.

As I have mentioned before, water, as the ultimate transmitter, is capable of capturing and relaying anything and everything. So if there's something that's not right about the water within your body, you will be unable to receive the positive vibrations that surround you. If the container of water is deformed, the vibration will also be deformed.

A negative person hears positive words as negative. Perhaps you know someone like that. We can easily surmise that the very structure of the water of such a deformed thinker is also deformed. Such people are incapable of enjoying what is right and good about the world, and they have an enormous capacity for creating a dark cloud on the most positive of happenings, serving as an illustration of the importance of good water.

When people have caved in to the stresses of society and daily life, their vibration becomes distorted, and even the kindest of words will have little or no effect on them. When you've reached that point, it becomes difficult to improve the water within yourself on your own. But if you open your eyes, you'll realize that there are people all around you who are able and willing to share their positive energy with you. If you are able to share your love, then I hope you will be willing to do so. Love is one thing you never have to worry about running out of.

When you have made it a habit to extend a loving hand to those around you, whenever you find yourself down and discouraged, loving hands will raise you up.

The Same Wavelength

Think about when you last picked up a little baby. Did you find yourself speaking in a soft, gentle voice? No matter what language you speak or what culture you're from, we all speak to babies in the same way. The reason, simply put, is because we are aligning ourselves with the vibrations of the baby. We all subconsciously understand that a baby's vibration is short, resulting in the soft sounds that all babies make, and when we align ourselves with this

vibration, we make similar sounds.

Perhaps you have also realized that your voice and manner of speaking change depending on whom you talk to. When I talk to someone, I intentionally try to speak in a way that will put me in harmony with that person. But even the vibrations of any one person will change depending on the mood of the moment, as revealed by the speed and pitch of the voice.

I suspect that you have experienced times when your vibration has been in harmony with someone else's. You might have come away from such an experience saying, "We just seemed to resonate." This is something that we do at an instinctive level, so unless you think about it, you might not even be aware that it's happening.

When you align your voice with the vibration of the other person, you can choose what note on the scale you are going to use. If you wish to comfort a friend suffering from a broken heart, are you going to choose *do-mi-so* or *do-fa-la*? You might say, "Heartbreak opens the doors for something new," or maybe, "Better things await you." But whatever you say, you'll speak it in gentle, loving tones.

When you talk to a person in distress, they may vibrate in all the possible notes on the musical scale, but you can use kind and loving words to create the opposing notes to offset the negativity. Perhaps the highest compliment you can pay to someone is to say that they have the ability to see things from another's position. Such people are capable of listening, showing they understand, and then saying the words that make the other person realize that it's not the end of the world. That's what resonating with another means.

If you know someone who seems cold and uncaring, consider that they may just be poor at putting themselves in the position of others and aligning themselves with others' vibrations. You may have sought comfort from such a person only to come away feeling worse than ever. It's simply impossible to comfort others if you can't feel their feelings and align yourself with their vibration.

A Beauty Treatment That Requires Neither Time nor Money

To feel something that stirs your emotions each day is the way to find the energy for a full and rewarding life.

Emotion is motion, which makes it no coincidence that the phenomenon of resonance is the combination of emotion and movement. By resonating with someone, we experience powerful vibration—powerful energy, if you will. And the deeper the emotion, the more clear and pure are the vibrations that we experience.

I often give lectures, and when those lectures go well, I know that there was resonance between myself and the audience, that I have in some way stirred their emotions. I've stirred emotions when what I have said has entered the listener's mind as energy and memory. It happens when the way I see the world becomes the way another person sees the world.

The level of enjoyment, vitality, and meaning of each day is directly related to the degree that we allow our emotions to be stirred by what goes on around us.

Shizue Kato, a well-known women's rights activist, was asked by a newspaper reporter on her hundredth birthday what her secret to longevity was. "Get excited about something at least ten times a day," she replied. "It's exciting to wake up in the morning and realize you're still alive and breathing. It's exciting to have something really delicious for breakfast. It's exciting to see a beautiful morning glory blooming outside. You can get emotional about the charity of the warm sunshine and the blessings of the falling rain. If you just take the time to look around and see even the most insignificant of things, you'll realize that the world is full of things to get emotional about." These are words to live by, indeed.

For Better-Tasting Water

We want to purify the water within our bodies, but we also want to make the water that we drink as pure as possible. Here's an easy way to do that: before you take a drink of water, pause a moment and look at it. With warm, benevolent feelings, say "Thank you" to the water, and then drink it. I do this throughout the day, whenever I take a drink of water, and it makes a noticeable difference.

As I've mentioned previously, vocalizing words strengthens the vibration, so saying "Thank you" to water before drinking it results in a change in water's taste. The moment you say "Thank you," the positive vibration needed for beautiful crystals begins. The vibration spreads to the water in the atmosphere, forming an expanding ring of vibration that your body feels. Water is water, whether it's in a cup, in the atmosphere, or in your body; they are fundamentally linked. The water outside of you resonates with the water within you.

Daily Fulfillment through Water

Ask yourself how conscious you are of water as you go about your daily life. If you're like most people, you probably don't consider it much. I'd like to give you a few suggestions for making water a conscious part of your

life.

First, when you wake up in the morning, take a cup that is labeled with the words “Love and gratitude” and fill it with water. Then, with reverence in your heart, drink the water. After drinking the water, face the sun. The sun is a source of special energy. Just as the ancients of Japan did in the earliest days of Shinto spiritualism, place your hands together and face the sun so as to take in its energy. I also recommend placing your hands together in gratitude before you eat.

Morning is a hectic time for most of us, but I encourage you to make your mornings more relaxing and leisurely. Take time to enjoy the flowers along the way. A Japanese saying goes that if one of the tea leaves in your morning tea stands upright in your cup, you’ll have good luck that day. But maybe the luck will come to the one who takes the time to consider the leaves in the teacup. If you think having a hectic morning is a natural way to start the day, try getting up thirty minutes earlier—not to do more but to do less.

To make your morning more relaxing, think of nature right when you wake up. Greet your pet if you have one or water a plant and say something to it. (“I love you” is always a good choice of words.) When you make a habit of this, the plant will grow to be strong and healthy. But often when we become ill and are unable to give a plant positive energy, the plant will dry up and die—that’s how important the phenomenon of resonance is. Learning to slow down and take your time in the morning will reveal to you the strength of this power.

Now for your evening routine: taking a long, hot bath can be a good way to relax your body and mind after a stressful day. Close your eyes and feel the vibration of water all over your body. Fill your soul with appreciation for the water. The ideal temperature for bathwater is around 104 to 107 degrees Fahrenheit. Heat is a result of vibration, and so covering your body in water of this temperature can be extremely comforting, helping you to expel fatigue and negative vibrations.

Hot springs throughout the world are desired for their ability to aid in relaxation, and one of the things that make them so enjoyable is the vibrational effect of the water. The vibration enters your body and pushes out the negative vibration, resulting in the formation of a healthy and vibrant metabolism.

There’s so much that water does for us: it warms our bodies, replenishes the dry parched throat, and carries away our waste without ever a complaint. When you think about all the things that water does for us, how can you not help but be filled with gratitude?

It shouldn’t be a stretch of the imagination to understand why taking a nice, warm bath can feel akin to what a baby feels like when cradled in its mother’s arms. If you begin to see the water in your bathtub as amniotic fluid, it can make the experience all the more relaxing.

At home in your own bath, you might try various bath salts. And if there’s a baby in the house, I recommend writing the words “love and gratitude” on the baby’s toy. After your bath and before you go to bed, take a drink of love and gratitude in the form of water. Then place your hands together in thanks for your pets, your plants, and your loved ones.

Perhaps you have your own routine for relaxing at night, but I like to listen to relaxing music as I drift off to sleep. This, I believe, helps the water within me return to its pristine, beautiful origin as the stress of the day leaves my body. Near your bed, have access to different types of music—classical, jazz, anything—to help you relax from the particular stresses of the day.

Avoiding Stress-Induced Illnesses

Too much stress leads to illness, which is why you should aim to make every morning and evening relaxing. Stress arises when the vibration that you should be experiencing becomes deformed. Deformed vibration builds up, and the result is ultimately and inevitably illness.

A great variety of vibrations exist within our bodies, and the stresses of daily life often change them slowly and gradually. When the change first begins at the subatomic level, there are no outward signs, but as the change reaches the molecular and cellular levels, symptoms begin to appear. If the stress continues, then the change in vibration will move from the cells to the organs, health will deteriorate, and death will loom. The messenger that carries this deterioration is, of course, water.

As mentioned, vibration is maintained by the phenomenon of resonance. There is nothing stronger or purer than the resonance of two positive vibrations. You can stay healthy and happy by freeing yourself from stress and finding pure resonance created by pure vibration. You can do this by taking time for any activity that helps you forget your troubles and experience moments of quiet peace. Finding moments of peace helps you put your life back together, consciously purify the water within you, and begin to live the life you want to live.

Use the energy you get when talking to a friend to neutralize negative vibrations, or enjoy a massage or some other relaxation technique to calm yourself and get back on your feet. Taking a bus or train ride can help you relax,

too. Let the rumbling of the journey rock and lull you—it might be just the vibration you’ve been looking for. You might want to do some experimenting to find a type of music that helps you relax. Water will hear the music and be purified by its positive effects.

The Nature of Electromagnetic Fields

I mentioned in a previous chapter the danger of too much exposure to electromagnetic fields. (See page 98 for photographs of water exposed to various electromagnetic fields.) While we do not need to throw away our cell phones and become obsessed with avoiding electromagnetic fields, it’s important that we keep our words and thoughts centered around love and gratitude.

We can’t live without cell phones, microwave ovens, televisions, and computers; living with electromagnetic fields just seems to come with the territory. Almost every little thing we do in this modern world seems to require the generation of electromagnetic fields. Understanding their nature will help you get electromagnetic fields to work for you. And that involves making love and gratitude a part of everything you think and do.

It’s not essential that you unplug the television, but you can choose to watch only good and wholesome programs. Your computer is fine where it’s at, just as long as you use it as a positive tool. Go ahead and use your cell phone, but don’t use it to carry on negative or angry conversations.

How about your microwave oven? This device uses microwaves to vibrate the atoms of the food at a rapid enough rate to cause the food to heat up, and to assume that this has an effect on your nervous system requires no great leap of logic. Microwaves are of course designed so as to have only a minimal effect on us, but the water within the heated food has recorded the effect of the microwaves, and you can’t help but wonder if it is the best thing to consume.

If you would rather not get rid of your microwave, then I suggest that you use your microwave with love and gratitude. The best thing you can do is to say “I love you” to the food as it heats up; another, less proactive, measure is to simply place “love and gratitude” stickers on the microwave containers.

Likewise, we need to be conscious of the way we use the Internet. You may be surprised to learn that the words you write in e-mails and text messages have a stronger effect on your body than the words you use in conversations and letters. This is because the vibration of the human nervous system is actually on the same level as the vibration of electronic communication systems such as e-mail and chatrooms. When you write something by hand or print something, the vibration is not fine enough to resonate with your nervous system, limiting the effect that the vibration can have on you. But writing involving electronic fields harmonizes perfectly with the vibration of your nervous system, resulting in the formation of resonance and making it possible for an e-mail or text message to have an enormous effect on your brain and body.

Words carried on electronic waves have the power to go right to the core of the receiver, having a devastating and lasting effect. By contrast, sending warm words of praise can have a positive effect on the well-being of the receiver. If you have something negative to say about someone, e-mail is not the place to do it. Companies are used to getting complaints from clients through e-mail, and many people have received a rebuke from a superior in the form of a text message, but if you wish to limit the harm caused by your negative vibrations, then reserving these kinds of messages for face-to-face meetings is always a good idea. If you feel it’s easier to express your true feelings through e-communication, then try to express yourself with positive and encouraging messages.

Voice communication via cell phone also deserves attention. Unlike the old telephones connected by cable, cell phones use electronic fields, and thus they, too, are a matter of concern. Positive conversations on your cell phone are one thing, but when the discussion turns dark, the danger can range from anything from a harmed relationship to serious physical damage.

Normal words spoken face-to-face with no particular harmful effect can become a damaging weapon through a cell phone. The potential damage of harsh and hateful words communicated by cell phone should be enough to make us all careful about the words we use when we talk on these devices. It is but one more reason to try to keep your thoughts and words positive at all times.

Freedom from Negative Emotions

When you think about negative emotions in light of what we know about vibration, it isn’t hard to realize how and why irritation, frustration, and envy can be detrimental to your health. Anger and excitement raise the rate of vibration in your body and lead to an abnormal physical condition. Anger, for example, can be especially hard on your liver. In Eastern medicine, the close relationship between the emotion of anger and the liver has been accepted as common knowledge for centuries; it is well known that anger will destroy the cells of the liver, explaining why people suffering from cirrhosis and hepatitis tend to have hot tempers.

Sadness can be harmful to the cells of the hippocampus in the brain, increasing the risk of Alzheimer's. Sadness can also affect the blood and lead to leukemia and other blood-related illnesses. Envy can damage the thyroid gland.

Why an emotion can have an effect on a particular organ of the body can be explained by the differing wavelengths caused by each emotion. Day in and day out, our emotions vibrate the atoms and molecules within our bodies. It may be hard to avoid all negative emotions, but with love and gratitude you do have the ability to neutralize all the negative emotions you may experience. When you feel the onset of a negative emotion, then in your mind, just imagine the opposite emotion.

If, for example, you feel pangs of resentment and you don't want that emotion to harm your health, take refuge in the emotion of gratitude, the opposite of resentment. Gratitude can neutralize resentment because they are both on the same wavelength—on the negative side is resentment, and on the positive side is gratitude. But if someone has resentment for you, then responding to that person with gratitude requires the fiber and fortitude that most of us don't have. When in the heat of such a situation, I suggest that you form an image of someone for whom you do feel gratitude. When you get a call from someone who can make your blood boil, think of the pleasant face of someone you know, and soon you'll free yourself from the negative feelings and be able to fill your heart with gratitude.

Keep the recommendations of this chapter in mind and you will be well on your way to making water a conscious part of every day.

CHAPTER SEVEN

Love and Gratitude and Saving the World

Free Energy: One Measure of Love and Two Measures of Gratitude

Let me explain how we can improve the water outside our bodies through the power of crystals of love and gratitude. As I mentioned previously, the act of improving the water within our bodies is at the same time the act of improving the water that covers our planet. So once you love and appreciate the water inside yourself, you can help improve the water of the world.

When we consider water atoms, then we can easily see the role that water plays on our planet. Water has two hydrogen atoms and one oxygen atom, in other words, H₂O. Whenever I consider this chemical formula for water, I cannot help but think of the relationship between love and gratitude, with love being oxygen and gratitude being hydrogen.

There can be no flame without oxygen, and without flame there can be no heat. And without oxygen, life would come to a quick end. So without love, or oxygen, the continuation of life would not be possible. When on the receiving end of love, an extra dose of gratitude is always appropriate. In response to one part love, two parts gratitude forms the balance of life.

When it comes to energy, the structure of one part love and two parts gratitude creates a type of *free energy*. Let me explain: Let's say that I try to tell something to someone. If the other person resonates or gains an understanding of what I'm trying to say, then his or her heart will be stirred and the person will begin to vibrate. And when that happens, they will be open to receiving love at a deep level. The vibration from that person will spread to others, as the receiver of the vibration of love becomes the giver of the vibration of love. Another way of saying this is that one part love becomes two parts of vibration, and this is the basic concept of vibration.

But that is not the end of free energy. Free energy spreads out and the vibration goes on and on. I recently had an interesting experience that illustrates this. On February 6, 2005, I started a lecture tour that would take me from Santa Monica, California, to Hawaii. Two days before the first seminar, only about half of the tickets had been sold, but on the day of the seminar, the tickets started to sell. We soon realized that many more people wanted to come than what we had planned on. What caused this? It was the energy of a few individuals widening and spreading to others. The result was a sold-out event, with many in the audience experiencing love and gratitude when it had been initiated by just a handful.

Water as a Divine Messenger

As we already know, water responds with beautiful crystals when we expose it to positive words, and the opposite is true as well, but let's take a closer look at the mechanism from a different perspective.

To understand the complex nature of the existence of our universe and our own existence in that universe, we need a model in order to make any progress. My model consists of four parts: the creator (vibration), water (messenger), crystals (blueprint), and phenomena (matter and physical bodies).

Water crystals can be described as little blueprints for the design of our world. We can also make the assumption that when the creator set about to create this universe, the first project was the creation of water—the messenger, if you will, needed to deliver the architect's intention. The next question is, what is intention? I like to think that it is love and gratitude. I believe that before the universe was created, there was first a concept, a prelude to conception that could be described as the concept of love and gratitude. And perhaps this is why these two words create crystals more beautiful than any others.

Now let's look at the role water plays in the delivery of this intention. The ancient Greek philosopher Thales said that water is the basic building block of all matter. It's hard to disagree with this, but I'd like to express this concept in a slightly different way, while risking the possibility that some might find my description a little too religious for their tastes.

Of all of the creator's creations, water is unique. It is a type of conductor that can link the various dimensions of

creation. Extending this metaphor, we can say that half of the body is in this third-dimensional world, and half is in a higher-level dimension.

The creator, also being in a higher dimension, is a being of matter and light that vibrates at an inconceivably fast rate. And when you think about it in that way, it shouldn't be hard to consider this divine being as the Sun or the Light of our world who created this world in order for us to have a place where we would be able to grow and develop to prepare for a higher dimension.

The creator saw that a physical body would facilitate the process of growth and development, and so water, entrusted with divine intention, was sent down, and it materialized into the first crystal. And then another crystal was formed, and then another, until intention formed life in all the diversity we know today. So Thales did get it right when he said that all comes from water, but perhaps I like to say that water is the messenger of the intention from the source of all existence. Understanding this helps you see how words can affect the formation of water.

When we show a word to the water—the divine messenger—if the word is a word of the divine, then the water will respond with a “yes,” or beautiful, crystal, and if it is not, the response is a “no,” or deformed, crystal.

However, in the last few decades, we have been facing a serious problem that threatens the underpinnings of the model I have described. The speed at which technology has developed in recent years has had results that are negative and against the natural and divine laws given to us. Harmful and destructive words, the harmonizing with electronic devices, and our disassociation with nature all threaten to disrupt the balance needed to maintain our planet and our existence on it. The corruption of words has become the corruption of country, the corruption of our planet, and perhaps worst of all, the corruption of our souls.

Stemming the Tide of Negativity

If love and gratitude retreat from the world, they will be replaced by negative vibration. In this age, the weakening of love and gratitude in one part of the world can become the cause for wars and disasters on the other side of the planet.

The decline of love and gratitude takes place in war zones like the Middle East, but it reaches beyond the battlefield and makes the I'm-the-only-one-who-matters belief the norm of our age. The decay within the soul seeps out to disrupt the world in ways we can hardly imagine or understand. And water, the mirror of the soul, the messenger of the creator, feels this and knows all, and this includes the imbalance that prevails all around us.

Water forms the world we live in and the universe the world exists in, creating a cosmic soup, if you will. Air, atmosphere, and light are all water in one form or another, but water all the same. Starting from the outer core of our planet to the very center, each layer contains water in either large or small amounts, and that, pretty much alone, is what accounts for their differences.

Since water permeates our entire planet and everything on it, the water of the world cannot help but reflect the decline that takes place within a human soul, as revealed by the formation of beautiful crystals and not-so-beautiful crystals.

The people who lived on earth for millions of years in a balanced relationship with water now worship power, profit, and self-interest. And none of this goes on without being noticed by water. The natural disasters in the world may actually be a little less natural and a little more man-made than we care to think. I realize that convincing a geologist of the relationship between what goes on in your heart and what goes on under the ground is no easy task, but that doesn't stop me from believing that the natural disasters of our age may be nothing more than the buildup of pressure within your heart rather than between continental plates.

Human Consciousness and Disasters

You don't have to go back far in history to find a time when the human population on the planet was much smaller than it is now. On the first day of the Christian era (1 A.D.), the population is estimated to have been about 200 million people, and the figure rose gradually and steadily until 1900, when it reached 1.5 billion. And then from 1900 to 2000, the population exploded, reaching and exceeding 6 billion.

When people were still rare on the planet, the effect of the consciousness of a single person on the water of the earth was probably insignificant, but as the population expanded, perhaps starting from around 1850 when the population exceeded a billion, the negative and evil consciousness of humankind began to be reflected in natural disasters around the planet. Now, with the population exceeding 6.5 billion, perhaps we should not be so surprised by all the fighting and wars going on around us. If 6.5 billion people continue to think the way they do now, we'll be lucky if the planet lasts another twenty years.

The risks our planet faces are not only of the sudden kind. The environment of our planet is moving closer to a planet-wide crisis that is fast approaching the point of no return.

Heat is vibration. You probably already know that heat results when atoms vibrate, and that explains how a microwave oven is able to create a sudden burst of heat. What will happen as the temperature of the planet increases at the current rate? After the temperature rises an average of 2 degrees centigrade, life will still be sustainable, but if it goes up two more degrees, then the earth will no longer be able to provide the environment and food necessary to sustain human life.

It's said that the planet's temperature has already risen 2 degrees in the last hundred years, causing massive melting at the North and South Poles, and it's now expected that the temperature will rise three degrees in the coming one hundred years.

Think about your own body temperature, especially how you feel when you have a fever. There's not an exact parallel between the planet and the human body, but if the planet's temperature does rise as expected, then we will all be living on a very sick planet indeed.

Ourselves and our planet both require stable vibration in order to survive. The vibration that compensates for a loss of love and gratitude can come in the form of a pistol, a bomb, or perhaps terrorism—all negative and abnormal vibration used to rule the world. The war in the Middle East and all the other wars going on around the planet are excessive vibration, leading to the acceleration of the burning up of our planet. It is also the mechanism for the disruption of the water that covers our planet, leading to earthquakes, tsunamis, floods, typhoons, hurricanes, and droughts.

The Process of Self-Realization

Despite the negative outlook we're faced with, all hope is not yet lost. There are things we can do even now. We just have to follow the example of the natural world.

In the microscopic world, 10 percent of the microbes are generally considered bad, and 10 percent are considered good. The remaining 80 percent are neutral. This might have parallels in our own world. The battle for the survival of our planet is between the 10 percent working to destroy it and the 10 percent working to save it. When the 10 percent making up the good population win, then the neutral 80 percent will join them, and so that's why there is still hope. It is this 10 percent of the population that I hope to reach with my message of love and gratitude.

And here's why I think we can win: When the same number of good and bad microbes come together, the good microbes win.

This perspective is also supported by an experiment with water crystals.

When we put two labels—one saying "Thank you" and one saying "You fool!"—on water samples, the result was always the beautiful gratitude crystals. So if ten out of every one hundred people in the world open their eyes to love and gratitude, the planet can be saved.

The earth is the way it is because that is the way the creator made it. It and all the living creatures on it are designed with the ability to return to the point where all is well and right. Every life has a degree of pain and suffering, but there is nothing that is too negative to teach us something.

No matter who you are, there'll never be a shortage of people who come along to ruin your perfect day. That can either bring you down, or it can provide you with an opportunity to learn from responding with love and gratitude. And after you've learned all you need to learn, then you will be ready to graduate from this school of tribulation. And that is what life on earth is.

At three separate times, three different people with spiritual powers have told me that I've been reborn 700 times on this planet. This is nothing to brag about when you consider that it might mean I've failed to graduate 700 times. I'm now attempting to live my life to its fullest so I don't have to wait another lifetime to go to the next level beyond. I try my best to keep love and gratitude in my heart and to share positive vibration with those around me. I hope that you have been inspired by this book and will join me.

EPILOGUE

Water and the Expanding Circle of Peace

On May 26, 2005, I gave a lecture on the energy of love and gratitude at the United Nations in New York City. The lecture was part of a twelve-part seminar based on themes related to spiritualism, the first of its kind ever for the United Nations.

This opportunity came to me by way of Ida Urso of Italy, who chaired the Spiritual Dimensions of Science and Consciousness Subcommittee of the NGO Committee on Spirituality, Values and Global Concerns. Ida had read and resonated with my book *The Hidden Messages in Water*. When she asked me to give a lecture, she said, and I'm paraphrasing, "The way the United Nations and the NGO see the world plays an important role in achieving the UN goals, but there will be very few people in the audience who realize that. As long as we are attached to outdated paradigms, we will never be able to find new solutions. To achieve our goals and to move humankind from a culture of war to a culture of peace, we need to promote the importance of spirituality—the importance of love and kindness. We would like Dr. Emoto to speak on the energy of compassion formed by one part of love and two parts of gratitude."

Of course I accepted her invitation and was able to make considerable progress in showing some of the most important people and greatest thinkers in the world how to create free energy combining one part love and two parts gratitude. The experience reminded me that without a fundamental change in our paradigm, we will never overcome the many serious challenges that we face in our day. It also convinced me that this combination of love and gratitude, a product of twenty years of research and experience into water and vibration, could be used as the yardstick for the creation of a new paradigm and new values throughout the world.

Had it not been for the publication of my books, I would have not been nearly as far down the road on my journey as I am now. The books led to a lecturing tour starting in March 2000 that has made it possible for me to reach even more people around the globe. In this book, I have tried to include the information that people have resonated with the most in lectures given in over three hundred cities over the last six years. I hope it will serve as a kind of primer to help more and more people understand the function and importance of vibration.

I encourage you to frequently revisit the crystal photographs and reread just a section a day. Imagine beautiful words and recall the beautiful crystals created by these words. That's enough. Just love and gratitude. And if you never forget this as you go about your daily life, your life will be one of happiness and joy.

These photographs were taken from water frozen after being placed in four different glass containers with the words taped to the sides. It's easy to see how such positive words would yield these beautiful crystals.

Approach new adventures with a feeling of self-confidence. What you need to do to succeed will become clear. If you have a vision, then there's little else to worry about.

You can't if you think you can't. If you keep on trying and don't give up, you might discover that people around you will come to your aid when you need it the most.

This crystal seems to be beaming with reassurance, like a child full of innocent buoyancy.

It looks like someone has told this crystal that it's good to try and that a helping hand is always nearby.

With six legs and two eyes, doesn't this crystal resemble a crab with a joyful face?

The difference between this crystal and the “happiness” crystal is striking. It looks like this crystal has bitten into something bitter. When you harbor thoughts of dislike, then dislike is internalized. A smile is the best thing to give to those you dislike.

Your health comes from within, and it is affected by your words. If you want to make the water within your body as vibrant as this crystal, then it is important to tell yourself, “I feel great!”

Even saying "exhaustion" makes the water within your body look worn and withered. If you find yourself saying this out of habit, try shifting your thinking.

Words of encouragement always seem to form beautiful crystals. This crystal is well formed, but it appears a little restricted.

Negative words have an immediate, disastrous effect on crystals. Think twice before exposing yourself to negative thoughts.

You might expect the "enjoyment" crystal to be more playful and energetic, but this appears to be a rather solid geometric crystal. For water, enjoyment is a completely natural state. You might say that truth can be found in enjoyment.

Dreams form a world of their own, and so it seems that this crystal has created a multi-layered shape with rings and light orbiting around it, possibly indicating a dream come to life.

"You're beautiful!" said repeatedly to water yielded this crystal.

"Your beautiful!" said sometimes to water yielded this crystal.

"Isolate, ignore"

Crystals receive even more damage from being ignored than from being exposed to degrading words.

"Beautiful"

"Ugly"

Even thinking of yourself or someone else as ugly rather than beautiful can cause considerable damage.

"Hope"

The “hope” crystal appears to have first been tiny, and then it grew into a big and beautiful crystal. Hope can grow and expand with age and experience. The “despair” crystal seems to have created two hexagonal crystals, possibly indicating that new hope can be found within despair.

Do you know someone who can have a healing effect on you just by being nearby? “Adoration” results in an untainted crystal full of life. The “eternal” crystal creates a well-formed hexagonal crystal, almost as a symbol of eternal resonance. “Clasping hands” creates a crystal that appears willing to share its energy.

“Mom” takes a softer bundle of a shape than “Dad.”

Compared to “home cooking,” “convenience foods” does not even cause the water crystals to form a hexagonal shape.

The crystal formed by the word “truth” has a mysterious beauty. Albert Einstein said, “The most beautiful experience we can have is the mysterious.” Harmony is all-encompassing, and a circle seems to be forming in this crystal when the word “harmony” is shown to it.

"Angel"

"Devil"

In contrast to the "devil" crystal, the "angel" crystal seems to be formed by an array of tiny crystals linked together.

"You're pretty" spoken repeatedly to water

"You're stupid" spoken repeatedly to water

Instead of exposing water to written stimulus, for these two crystals we repeated the expressions over and over. Spoken words seem to have the same effect as written words, which makes sense considering they both emit energy, or vibration.

We tried changing the words we used just a little. The result was a gradual change in the crystal, suggesting that we are reborn with each new day.

The "You did well" crystal is indeed beautiful, while the "That's no good" crystal failed to form. By using positive words, you'll spread good vibrations to those around you, and those good vibrations will eventually return to you.

While the "affection" crystal appears open and emerging, the "hate" crystal seems to be closed in. The formation from "rage and murder" creates an image of someone hiding and waiting to attack.

"Happiness"

"Unhappiness"

"Happiness" resulted in a refined and highly detailed crystal. The second crystal makes it clear why "unhappiness" is a word that should be avoided.

"Let's do it."

Here we have two vastly different crystals, reflecting the distinctly different energies of these two phrases.

The Japanese character for "soul" is created by combining one character that means "to speak" with another that means "evil spirit," indicating the importance of expressing yourself precisely.

Water crystals formed by the word "friend" were extremely beautiful and reflected happiness. Moreover, when we look at the concept of "a circle of friends," we observe that when you make one friend, then, one by one, you make more friends.

These phrases both created beautiful crystals, indicating that good words resonate and bring about positive results.

These two crystals indicate the importance of sincere gratitude and apology. If there is someone to whom you should apologize but have not, look at the "I'm sorry" crystal, say the offended person's name, and say, "I'm sorry." Apologizing within your heart is the next best thing to apologizing in person.

This word created a beautiful and stable crystal. The Japanese character for "peace of mind" is represented by a woman beneath the roof of a home, indicating the role that women can have in creating a calm and stable environment.

The crystal created by "self-love" is packed full of energy. Perhaps you can see hands raised in prayer in all directions. The "spousal love" crystal appears to be a smaller crystal protected by a larger one.

The "family love" crystal appears to consist of three layers of water crystals, perhaps indicating grandparents, parents, and children. The "neighborly love" crystal seems to shine with harmony.

The "love of country" crystal seems to be supported by a larger crystal in the background. It is interesting that a small crownshaped crystal formed off to the side. The "love for humanity" crystal is a beautiful geometrical formation.

Exposing water to Buddhist sutras resulted in the formation of beautiful crystals, explaining why writing and reading sutras has a soothing effect.

I placed samples of tap water on a stage where sixty Buddhist monks were chanting and recorded this remarkable change in crystal formations.

Water heated in a microwave oven

Water left sitting in front of a computer for four hours

Water labeled "love and gratitude"
heated in a microwave oven

Water labeled "love and gratitude" left
sitting in front of a computer

All of the water exposed to electromagnetic fields received some damage, but the words "love and gratitude" counteracted some of the negative effects.

The Hidden Messages in Water

Masaru Emoto

This book has the potential to profoundly transform your world view. Using high-speed photography, Dr. Masaru Emoto discovered that crystals formed in frozen water reveal changes when specific, concentrated thoughts are directed toward them. He found that water from clear springs and water that has been exposed to loving words shows brilliant, complex, and colorful snowflake patterns. In contrast, polluted water, or water exposed to negative thoughts, forms incomplete, asymmetrical patterns with dull colors. The implications of this research create a new awareness of how we can positively impact the earth and our personal health.

I N T R O D U C T I O N

More than ten years have passed since I began taking photographs of frozen ice crystals.

For years before that I had conducted research into the measurement of wave fluctuations in water, but when I started learning about crystals, I discovered that water expresses itself in a vast variety of ways.

I learned that these photographs of crystals are filled with much wisdom for us. In contrast to tap water, natural water displays a beautiful array of crystals—even more so when the natural water is exposed to beautiful music. There are also fascinating differences generated in the crystals when the water is shown different words, such as “gratitude” or “stupid.” These crystals are filled with lessons concerning how we should—and must—live our lives.

In June 1999, I published a collection of photographs in a book called *The Messages of Water* from a small publishing company that I called Hado Kyoikusha (Wave Fluctuation Publishing). Although this book was self-published and not intended to be sold in the large bookstores, word of mouth resulted in it becoming a bestseller.

INTRODUCTION

This is something that almost never happens in the publishing industry. I was filled half with amazement as this was happening right in front of my eyes, and half with appreciation for the many people who took the time to tell others about the book.

In order to share my book with more people, I had all the Japanese explanations translated for an English version. This led to further successes, and I began receiving requests from Switzerland and other countries throughout the world to give lectures.

The publishing of these crystal photographs, with the many messages that they have for the world, couldn't have come at a more appropriate moment in history, and it may well be a sign of the times that so many people are receptive of these messages. I thank God that I have been given the opportunity to work in this capacity.

I understand that some people have difficulty with the word or concept *God*. The main focus in this book is water. And the more you understand water, the more difficult you will find it to deny the existence of a god. I'd like you to think about your feelings on this topic as you look through the crystal photographs found herein.

When I was first asked to write this book for Sunmark Publishing in Japan, I immediately knew that there were many marvelous things inside me that I wanted to write about, and when I told this to Nobutaka Ueki, President of Sunmark Publishing, he said that was what

INTRODUCTION

he wanted me to focus on. He even sent along a subordinate, Ryuya Saitou, to hear my lectures in Switzerland.

Now that the book is finished, I am filled with a sense of satisfaction. This book has given me a "stage" from which to speak to you about the "fluctuation" theories that I have studied for more than a decade, and also about my own experiences, my research based on the observation of human behavior, and my own thoughts concerning the cosmos.

I wish to take this opportunity to express my appreciation to Shinji Tanigawa, president of Kokoro Inc.; Naoki Uchiki, Chief Editor of Sunmark; Tatsuya Saito; and also to the people who I interviewed for this book.

I also owe appreciation to Tetsuya Taguchi, past president of Nichirei Ice Inc., who provided much of the water that I used to make the crystals introduced in this book.

Thank you to Beyond Words Publishing for publishing this book in English, so that more people around the world can read about our relationship with water.

I must not forget to offer my gratitude to all the readers of this book. And, finally, I must say thank you and pay my respects to the water of the cosmos.

Thank you.

The history of the world is a vast and complex subject, encompassing the lives and actions of countless individuals and the events that have shaped our planet. From the dawn of civilization to the present day, the human story is one of constant change and evolution. The study of history allows us to understand the forces that have driven our progress and the challenges we have overcome. It provides a context for the events of our time and helps us to see the patterns and trends that have shaped our world. The history of the world is a testament to the resilience and ingenuity of the human spirit, and it is a source of inspiration and guidance for the future.

P R O L O G U E

As you begin reading this book, I'd like to ask you to evaluate your life. More specifically, I'd like you to ask yourself if you are happy.

Of course, your definition of happiness will depend upon who you are—but do you have a sense of peace in your heart, a feeling of security about your future, and a feeling of anticipation when you wake up in the morning? If we can call this happiness, then would you say that at this moment you are happy?

I think I can safely say that not many people will be able to reply with a resounding yes. Most people are unable to say that their life is everything they had hoped it would be. What is it that causes us so much pain? What is going on in the world that prevents so many people from simply being happy?

It seems to me that we are living in an age of chaos. Chaos describes a condition of confusion, indicative of the unorganized matter that existed before the creation of the cosmos.

Simply by going about our lives, we find ourselves worn out and fatigued. Newspapers and television bombard us with information, and at work we face

PROLOGUE

problems and misunderstandings. The sources of our problems seem numerous and overwhelming.

This is likely to be a fact of life no matter where in the world we go. This tiny planet of ours is covered with economic conflict, domestic discord, ethnic prejudice, environmental distress, religious wars, and every other type of problem imaginable. And all the bad news about people suffering, people enjoying the suffering, people getting richer, people getting poorer, the oppressed and the oppressors, reaches us within a matter of seconds from the opposite side of the globe.

Who, might we ask, is responsible for all this suffering? The world is becoming an ever more divided, estranged, and complicated place to live. We are already up to our necks in chaos, but the world's troubles seem to be getting deeper and deeper.

One thing we all have in common is that we are looking for a way out. Everyone is looking for an answer—and it is an answer so simple and effective that it has heretofore eluded us.

So what is the cause of all this chaos? What is at the center of it all? Whatever it is, it is pushing the world away from harmony and towards discord.

PROLOGUE

Perhaps this is an inevitable phenomenon. Though we all belong to the same species, if we live in different places and in different skin ways, the way we think is bound to be different.

And to make matters worse, most people have difficulty accepting things that are unlike the things around them. The result is a neverending process of troubles and suffering. It would seem that as long as people are people, any solution proposed is certain to come up short.

And so now we are back where we started. Can there ever be a single solution that can apply to all people on the globe, that everyone can be convinced of, and that is so simple that everyone can understand it?

In fact, I have found the answer, and it is just this: The average human body is 70 percent water.

We start out life being 99 percent water, as fetuses. When we are born, we are 90 percent water, and by the time we reach adulthood we are down to 70 percent. If we die of old age, we will probably be about 50 percent water. In other words, throughout our lives *we exist mostly as water*.

From a physical perspective, humans are water. When I realized this and started to look at the world from this perspective, I began to see things in a whole new way.

First, I realized that this connection to water applies to all peoples. Therefore, what I am about to say applies to everyone, all over the world.

PROLOGUE

I believe I am also starting to see the way that people should live their lives. So how can people live happy and healthy lives? The answer is to purify the water that makes up 70 percent of your body.

Water in a river remains pure because it is moving. When water becomes trapped, it dies. Therefore, water must constantly be circulated. The water—or blood—in the bodies of the sick is usually stagnant. When blood stops flowing, the body starts to decay, and if the blood in your brain stops, it can be life threatening.

But why does blood become stagnant? We can see this condition as the stagnation of the emotions. Modern researchers have shown that the condition of the mind has a direct impact on the condition of the body. When you are living a full and enjoyable life, you feel better physically, and when your life is filled with struggles and sorrow, your body knows it.

So when your emotions flow throughout your body, you feel a sense of joy and you move towards physical health.

Moving, changing, flowing—this is what life is all about.

If we consider that before we became human beings, we existed as water, we get closer to finding the answer

PROLOGUE

to the basic question of what a human being is. If we have a clear understanding of water, we will better understand the human body, and even unlock the mystery of why we were born and exist as we do.

So just what is water? Your first answer might be that it is a life force. If we lose 50 percent of the water in our bodies, we can no longer maintain life. Water, carried by blood and bodily fluids, is the means by which nourishment is circulated throughout our bodies. This flow of water enables us to live active lives. Water serves as the transporter of energy throughout our body.

This transport of energy is similar to a freight car that moves throughout the body. If the body is clogged and soiled, then the cargo in the freight car will also become filthy, and so it is essential that water always remain clean.

More now than in the past, the medical community has begun to see water as a transporter of energy, and it is even being used in the treatment of illness. Homeopathy is one such field where the value of water is recognized.

Homeopathy originated in Germany in the first half of the nineteenth century with the work of Samuel Hahnemann (1791–1843), but its roots go back to the father of medicine, Hippocrates (c. 460–c. 370 BC), who wrote down many treatments similar to those

promoted by homeopathy. In a word, these pioneers of medicine taught us to “treat like with like, fight poison with poison.”

For example, if someone is suffering from lead poisoning, symptoms can be alleviated by drinking water with the minutest amount of lead in it—an amount ranging 1 part in 10^{12} (one trillion) to 1 part in 10^{400} !

At this level, the matter no longer for practical purposes remains in the water, but the *characteristics* of the matter do remain, and this forms the medicine for treating lead poisoning.

Homeopathy proposes that the greater the dilution, the greater the effectiveness. The logical conclusion is that the denser the poison in the body, the higher should be the dilution ratio.

Another way to express this idea is that, instead of the *effect* of the matter being used to get rid of the symptoms, the information *copied* to the water is being used to cancel out the information of the symptoms from the poison.

So water has the ability to *copy* and *memorize* information. We may also say that the water of the oceans has memories of the creatures that live in the ocean. The earth’s glaciers may well contain millions of years of the planet’s history.

Water circulates around the globe, flowing through our bodies and spreading to the rest of the world. If

PROLOGUE

we were capable of reading this information contained in the memory of water, we would read a story of epic proportions.

To understand water is to understand the cosmos, the marvels of nature, and life itself.

I have studied water for many years. The realization that water has the ability to copy information has changed my life. After making this discovery in America, I brought it back with me to Japan, and have since used the information-copying function of water to help people recover their health.

At that time, however, doctors would not even consider the possibility that water by itself had healing capabilities. I was and am fully convinced that water is able to memorize and transport information, but this suggestion has been met with complete rejection by the medical community.

In 1988, the French scientist Jacques Benveniste undertook an experiment to test the basic principles of homeopathy. He diluted a medicine with water to the point where the medicine was no longer detectable by clinical means, and then he discovered that this dilution had the same effect on patients as the undiluted medicine.

A year after he submitted his results to the British scientific journal *Nature*, they were finally published, along with the comment that the results of the experiment were doubtful and without any physical proof. The hypothesis has remained buried and forgotten ever since.

Whenever someone comes along with research and experiments that turn the scientific community on its ear, the reaction, to one degree or another, is usually the same. I long wondered if it might be possible to find physical evidence of the ability of water to memorize information—might there be some way of seeing it with the physical eye?

When your heart is open to possibilities, you start to notice small things that can lead to enormous discoveries. And one day I casually opened a book to words that jumped off the page: "No two snow crystals are exactly the same."

Of course, I had learned this same thing in elementary school. The faces of all the snowflakes that have fallen on the earth for millions of years have all been different. However, I read this sentence as if it had a completely different meaning because my heart was open and receptive to its message. The next moment I thought, *If I freeze water and look at the crystals, each one will look totally unique.* And that moment marked my first step on an adventure into a new and unexplored world. My plan was to freeze water and take pictures of the crystals.

PROLOGUE

It's my nature not to want to sit on a fresh idea. I immediately asked a young researcher in my company to start experimenting, but this was a field that no one knew anything about. There was nothing to assure us that our efforts would eventually pay off. Oddly enough, I never doubted that they would. I knew with certainty that my hypothesis was correct and that the experiments would go well—I *just knew it*. I usually suffer from a critical shortage of perseverance, but this time I refused to give up.

My first step was to lease an extremely accurate microscope and look at water frozen in a kitchen refrigerator. However, since the photographs were taken at room temperature, the ice would soon melt. It took us quite some time before we were able to get any photographs of crystals.

Late each evening, I would take the young researcher to dinner and try to encourage him. I told him that I only expected him to do his best.

After two months of experiments, we finally succeeded in getting one photograph. The water gave us a photograph of a beautiful hexagonal crystal. I was filled with excitement when the researcher came to me with the news.

I now have a large walk-in refrigerator where the temperature is maintained at -5°C (23°F) for experimenting, but it all started with that first photograph.

PROLOGUE

Considering the method we used and what I know now, it was quite miraculous that we were able to get that first photograph at all.

What you really know is possible in your heart is possible. We make it possible by our will. What we imagine in our minds becomes our world. That's just one of many things that I have learned from water.

The crystal photographs that I started taking proved to be extremely eloquent in expressing the world. I found within them a profound philosophy. Crystals emerge for only twenty or thirty seconds as the temperature rises and the ice starts to melt. The truths of the cosmos take shape and become visible, if only for a few moments. This short window of time gives us a glimpse into a world that is indeed magical.

Let me explain how I go about taking photographs of crystals.

I put fifty different types of water in fifty different Petri dishes. (I used one hundred during the first few years.) I then freeze the dishes at -20°C (-4°F) for three hours in a freezer. The result is that surface tension forms drops of ice in the Petri dishes about one millimeter across. The crystal appears when you shine a light on the crown of the drop of ice.

PROLOGUE

Of course, the result is never fifty similar crystals, and sometimes no crystals at all are formed. When we graphed the formation of the crystals, we realized that different water formed different crystals. Some of them were clearly similar, some were deformed, and in some types of water, no crystals at all formed.

First I looked at the crystals of tap water from different locations. The water of Tokyo was a disaster—not a single complete crystal was formed. Tap water includes a dose of chlorine used to sanitize it, utterly destroying the structure found in natural water.

However, within natural water, no matter where it came from—natural springs, underground rivers, glaciers, and the upper reaches of rivers—complete crystals formed.

My efforts to photograph ice crystals and conduct research began to move ahead. Then one day the researcher—who was as caught up in the project as I—said something completely out of left field: "Let's see what happens when we expose the water to music."

I knew that it was possible for the vibrations of music to have an effect on the water. I myself enjoy music immensely, and had even had hopes of becoming a professional musician as a child, and so I was all in favor of this off-the-wall experiment.

At first we had no idea what music we would use and under what conditions we would conduct the

PROLOGUE

experiment. But after considerable trial and error, we reached the conclusion that the best method was probably the simplest—put a bottle of water on a table between two speakers and expose it to a volume at which a person might normally listen to music. We would also need to use the same water that we had used in previous experiments.

We first tried distilled water from a drugstore.

The results astounded us. Beethoven's Pastoral Symphony, with its bright and clear tones, resulted in beautiful and well-formed crystals. Mozart's 40th Symphony, a graceful prayer to beauty, created crystals that were delicate and elegant. And the crystals formed by exposure to Chopin's Etude in E, Op. 10, No. 3, surprised us with their lovely detail.

All the classical music that we exposed the water to resulted in well-formed crystals with distinct characteristics. In contrast, the water exposed to violent heavy-metal music resulted in fragmented and malformed crystals at best.

But our experimenting didn't stop there. We next thought about what would happen if we wrote words or phrases like "Thank you" and "Fool" on pieces of paper, and wrapped the paper around the bottles of water with the words facing in. It didn't seem logical for water to "read" the writing, understand the meaning, and change its form accordingly. But I knew from

the experiment with music that strange things could happen. We felt as if we were explorers setting out on a journey through an unmapped jungle.

The results of the experiments didn't disappoint us. Water exposed to "Thank you" formed beautiful hexagonal crystals, but water exposed to the word "Fool" produced crystals similar to the water exposed to heavy-metal music, malformed and fragmented.

Further experimenting showed that water exposed to positive expressions like "Let's do it!" created attractive, well-formed crystals, but that water exposed to negative expressions like "Do it!" barely formed any crystals at all.

The lesson that we can learn from this experiment has to do with the power of words. The vibration of good words has a positive effect on our world, whereas the vibration from negative words has the power to destroy.

Learning about water is like an exploration to discover how the cosmos works, and the crystals revealed through water are like the portal into another dimension. As we continued with our experiments in taking photographs of crystals, we found that we were setting

PROLOGUE

out to climb the stairs toward an understanding of the profound truths of the cosmos.

I particularly remember one photograph. It was the most beautiful and delicate crystal that I had so far seen—formed by being exposed to the words "love and gratitude." It was if the water had rejoiced and celebrated by creating a flower in bloom. It was so beautiful that I can say that it actually changed my life from that moment on.

Water had taught me the delicacy of the human soul, and the impact that "love and gratitude" can have on the world.

In Japan, it is said that words of the soul reside in a spirit called *kotodama* or the *spirit of words*, and the act of speaking words has the power to change the world. We all know that words have an enormous influence on the way we think and feel, and that things generally go more smoothly when positive words are used. However, up until now we have never been able to physically see the effect of positive words.

Words are an expression of the soul. And the condition of our soul is very likely to have an enormous impact on the water that composes as much as 70 percent of our body, and this impact will in no small way affect our bodies. People who are in good health are also generally in good spirits. Indeed, a healthy spirit most comfortably resides in a healthy body.

PROLOGUE

Out of desire to help as many people as possible remain or become healthy, I had worked for years taking care of the sick. And the more afflicted people that I see, the more I become convinced that illness is not just an individual problem, but a result of the deformation of society as a whole.

Unless something is done about the deformed world that we live in, and unless we can heal the wounded soul, the number of people suffering from physical illnesses will not decline.

So what are the deformities of the world? These are the deformities of the soul, and such deformities have an impact on the cosmos itself. Just as a drop in a pond creates a ripple that spreads out endlessly, the deformity of even one soul spreads throughout the world, resulting in global deformities.

But all is not lost—there is hope. There is salvation, and it's called "love and gratitude."

The earth is searching. It wants to be beautiful. It wants to be the most beautiful that it can be. Earlier I said that we could define the human being as water. I am quite certain that the water in the people who look at the photographs of crystals undergoes some form of change.

And I have found the most beautiful crystal of all—the one created by "love and gratitude." This is supposedly what all the world's religions are founded on, and

PROLOGUE

if that were true, there would be no need for laws. You already know the answer. "Love and gratitude" are the words that must serve as the guide for the world.

Water teaches in a very clear way how we must live our lives. The story of water reaches from every individual cell to encompass the entire cosmos. I hope that you will feel the same anticipation and excitement that I felt as I discovered the unfolding of this drama.

2

C H A P T E R O N E

Of What Is the Universe Made?

Understanding the fact that we are essentially water is the key to uncovering the mysteries of the universe. If you reexamine the world around you from this new perspective, you will start to see things as you have never seen them before.

The various events that unfold throughout a person's life are events reflected in water. The individual and society make up one enormous ocean; by adding our individual drops to this ocean, we participate in the formation of society.

I wanted as many people as possible to hear the message that water has for us, and so I decided to publish the

photographs of the ice crystals. This act was only a small drop, but it created a ripple that resulted in an ever-expanding wave that has had enormous impact on my life, and the lives of many others.

I first published my photographs in 1999, six long years after I started out on this unusual venture. During those first six years, a mountain of photographs had accumulated and was just sitting there in my office.

To prepare the photographs for publication, I tried to put them in some sort of order, and as I did so I started to realize that there was a story unfolding before my eyes. I began to realize that there was a grand and marvelous story that each individual crystal was trying to tell me.

As soon as I latched onto the idea of publishing my photographs, I talked to several publishers about my idea, but no one seemed interested. Rejection didn't change my determination to have my photographs published, and so I decided that I would publish them on my own. But I soon realized that though I could afford to have the photographs printed and bound into a book, the restrictive distribution system in Japan wouldn't allow me to have the books sold in bookstores.

This seemed like a formidable obstacle, but I just decided not to worry about it. When the completed books arrived, we packed up the books for the few

hundred friends and acquaintances who had reserved copies and sent them off. Not long after sending off these first copies, a strange thing started to happen. We started getting reorders from the people who had reserved copies. They had told their friends and acquaintances about the book, and those people had told others. Some people bought five or even ten copies and distributed them to their friends. It indeed seemed like the drop in the pond had become a fast-spreading ripple.

My expectations quickly expanded, and I next wanted people around the world to know what was in this book of photographs, and so I had a translation company translate all the explanations into English. Happily, people from around the world did see the book: Shizuko Ouwehand, a woman who would later serve as my interpreter, sent the book to friends in Europe and America, and this resulted in invitations from people who had seen the photographs to visit those countries and present lectures. Over the years, I have been blessed with opportunities to visit Switzerland, Germany, Australia, the Netherlands, Italy, England, the United States, Canada, and many other countries to introduce the crystals to the people of the world.

Everything seemed to happen at just the right time. People are looking for a way to make sense of this

world of chaos that we find ourselves in. This photograph album became a small but meaningful drop that created a ripple, which has since spread throughout the world.

I would like here to introduce only a small portion of the photographs that I have taken. Some of them are included in the work *The Messages of Water*, and some from the second collection of photographs called *The Messages of Water II*, and other photographs were taken especially for this book. You yourself will be able to clearly see the effect that words, photographs, and music can have on water.

These photographs were seen by Japanese as well by people from around the world, many of whom sent me letters with their opinions and thoughts. The pebble that I threw into the pond had indeed created a large ripple that now started to come back to me.

I was astounded to see that so many people were impressed by the effect that the energy of human consciousness and words had on the formation of ice crystals, despite the fact that this idea—that words and thoughts have the power to change water and other substances—may certainly seem like far-out religion or philosophy.

(Text continues on page 37.)

We showed words to water

We wrapped a piece of paper with words typed on it
around a bottle of water.

Love and gratitude

This crystal is as perfect as can be. This indicates that
love and gratitude are fundamental to the phenomenon
of life in all of nature.

Thank you (Japanese)

We showed words meaning "thank you" in different languages, always resulting in crystals that were beautiful and complete.

Thank you (English)

Thank you (Chinese)

Danke (German)

Merci (French)

Thank you (Korean)

Crazie (Italian)

You fool! (Japanese)

You fool! (English)

You make me sick. I will kill you. (Japanese)

When words that indicated harm to humans were shown to the water, no crystals formed. It even appears that the words "You make me sick" created the shape of a man with a gun.

Angel (Japanese)

Satan (Japanese)

The word "angel" resulted in a ring of small crystals linked together, while the word "Satan" formed a crystal with a dark lump in the center as if ready to attack.

Let's do it! (Japanese)

Do it! (Japanese)

"Let's do it!" creates a lovely shape, while "Do it!" creates a crystal similar to that created by the word "Satan." This might indicate that force and commands are alien to the principles of nature.

I'm sorry (Japanese)

This shows what a simple "I'm sorry" can result in. Perhaps the reason the crystal is blurred is because a simple "I'm sorry" can sound more sincere than a more elaborate apology.

Wisdom (Japanese)

Wisdom (English)

Weisheit (German)

The word "wisdom" in various languages created beautifully formed crystals. This may indicate that wisdom is a basic principle of nature throughout the world.

A test conducted at an elementary school

Here are some photographs taken after children at a Japanese elementary school spoke to the water, and also one photograph of water that was ignored.

You're cute

You fool

The children said different things to different bottles of water. When the children said "You're cute" to the water, cute crystals formed, but "You fool" had the opposite effect.

When the children said "You're beautiful" a few times

When the children said "You're beautiful" several times

When the water was ignored

When the water was told "You're beautiful" several times, it resulted in crystals more well-formed than when the water was only told this a few times. The crystal formed by the ignored water was the least complete.

What does the face of the cosmos look like?

Here are photographs of crystals made from water exposed to the word "cosmos" in Japanese, English, and German, and also a crystal formed using a photograph of the earth.

Cosmos (Japanese)

Cosmos (English)

Kosmos (German)

All three crystals are similar, with clearly formed crystals. It appears that the principles of the cosmos transcend language differences.

When shown a photograph of the Earth

The crystal is beautiful, but we can't help but notice that it is a little deformed. If not for this deformity, it would be as beautiful as any complete crystal.

What happens when water is exposed to music?

The following crystal photographs were produced when glass bottles of water were placed between two speakers.

Beethoven: Symphony No. 5

Beethoven: Symphony No. 6 ("Pastoral")

Beethoven's music resulted in fanciful crystals with great detail and exactness, creating a healing effect.

Mozart: Symphony No. 40

This beautiful crystal reflects the beauty of this piece of music. The crystal seems to indicate the unreserved way that Mozart lived his life.

"Air on the C string"

This flowing melody by Bach (in the famous arrangement for violin and piano) is well represented by this crystal.

Chopin: Etude in E major

Chopin: Prelude in D flat major

Piano music seems to create droplet-like crystals.

Tchaikovsky: *Swan Lake*

The top crystal indicates a swan, while the rainbow colors of the bottom crystal seem to represent the light of hope, perhaps affected by the story of *Swan Lake*.

The Beatles: *Yesterday*

The orthodox form was unexpected. Perhaps this is a result of this song being a favorite throughout the world.

Elvis Presley: *Heartbreak Hotel*

As if to mimic the song, the crystal is divided into two parts.

Bud Powell: *Cleopatra's Dream*

Modern jazz from the 1950s created this beautiful crystal, indicative of the healing qualities of this music, created during a period of turmoil.

Heavy-metal music

This is the result of loud music full of angry and vulgar lyrics. The result is similar to that created by "You fool!" indicating that water responds more to words than to music.

Spring

Autumn

Summer

Winter

Vivaldi: Four Seasons

The four seasons are well represented by these crystals: the blossoming of spring, the flowery summer, the promise of new life in mature fall, and the quiet steadiness of winter.

I found a little autumn (from a Japanese nursery song)

Red dragonfly (from a Japanese nursery song)

The words "I found a little autumn" resulted in a small crystal with grains that look like fallen leaves, and the crystal resulting from "Red dragonfly" could be interpreted as six dragonflies with their petal-like wings spread open.

Blooming tangerine trees on a hill

The color of this crystal changed every ten seconds, showing that water also breathes. Perhaps the changing of the center to red indicates the changing color of the tangerine.

Harmful effects of electromagnetic waves

Samples of distilled water and water shown the words "love and gratitude" were placed next to televisions, computers, and mobile telephones, and heated by microwave ovens.

Television

Computer

The water samples shown "love and gratitude" on the left created more complete crystals than the distilled water samples on the right. This would indicate that moderation is needed with televisions and computers.

Mobile telephone

Microwave oven

The distilled water heated in the microwave resulted in a crystal similar to that created by the word "Satan," and the water exposed to the mobile telephone can't be much better for your body.

Water shown a wholesome television show

This beautiful crystal is made from water shown a program about the mysteries of life, showing that the danger of electromagnetic waves changes with the content of the information.

Some unusual crystals

On the following pages are photographs of crystals made from lake water that has been prayed over; water shown the name of Amaterasu, the Shinto sun goddess; and water shown images of crop circles, dolphins, and ground water right before and after an earthquake.

Lake water before and after a Buddhist healing prayer

A priest repeated a healing prayer facing the lake. The first crystal before the prayer looks like a distorted face, but the crystal formed after the prayer looks like a light shining from the galaxy.

Water shown the name of the Amaterasu goddess

This crystal looks like a beautiful mirror or perhaps the outline of the sun. In addition to being beautiful, it radiates with grandeur or even holiness.

A crystal shown the photograph of a crop circle

Water from a washbasin at the East entrance
of the Heitate Shrine in Kumamoto prefecture

The crystal shown a crop circle looked like a UFO. The water from Japan's oldest shrine resulted in a crystal that resembles the shape of the character in Japanese that means "gratitude."

Water shown a photograph of a dolphin

Dolphins are said to be as intelligent as or more intelligent than human beings, and are said to have healing powers. This noble crystal seems to radiate with healing.

Ground water right before and after an earthquake in Shimane Prefecture, and later in the same place

Before the earthquake, no crystals were formed, as if the water were predicting the earthquake. As time passed after the earthquake, the ability of the water to form crystals returned.

While some water resulted in crystals of grandeur, as if to symbolize all the beauty of this world, the crystals formed from other water were deformed or nonexistent, as if to tell us something about the dark recesses dormant within the soul.

When I give lectures, I use slides to show my photographs of ice crystals. The reactions to these slides are quite varied. I often hear people gasp in surprise and sometimes even see them shed tears. I have discovered that a single drop of water can have various ripple effects on an individual.

Manuela Kihm, the person who first invited me to give a lecture in Switzerland, expressed her feelings this way when she reacted to the photographs:

We can see the wonder of the water crystal photographs with our own eyes. As a result, our consciousness makes a rapid leap. This awakening of the consciousness happens almost instantly. The fact that things that we have thought and felt can be seen with our eyes accelerates this change.

Another Swiss participant responded,

Through the photographs, I could see that the energy of our consciousness and words can

change things that we can actually see with our eyes. This is the first and only way that this elusive energy can be viewed. We don't believe what we can't see, but the ice crystals show us everything—it's no longer about whether you believe or disbelieve. Using this method, anyone can conduct their own experiment and prove it for themselves.

And a Japanese reader wrote,

Water is not just another substance—it is the life force of majestic nature. It made me once again realize the mysterious ability of water to cleanse and give life to all living. I can see that the soul, feelings, and vibration have an effect on the formation of ice crystals, and through this I can feel the importance of the soul and words. This information is extremely wonderful and uniquely impressive.

It appears that ice crystals are closely and permanently linked to the human soul. When I think about why ice crystals have spoken to so many people, I know that it is because they contain the key to the mysteries of the universe, and this key can unlock the consciousness required to understand the proper order of the universe, and our role in it.

Water is the mirror of the soul. It has many faces, formed by aligning itself with the consciousness of human beings. What gives water its ability to reflect what is in people's souls? In order to answer that question, I would first like to make sure that you understand this fact: Existence is vibration.

The entire universe is in a state of vibration, and each thing generates its own frequency, which is unique. All that I have to say in this book is based on this one fact. My years of research into water have taught me that this is the fundamental principle of the universe.

It can be said in just three words, but for people who have never heard them, these are very difficult words to understand.

You might think, *Existence is vibration? Even this table? This chair? My body? How can everything that can be seen and touched be vibration?* It is indeed difficult to believe that things that you can pick up with your hands and examine—things like wood, rocks, and concrete—are all vibrating.

But now the science of quantum mechanics generally acknowledges that substance is nothing more than vibration. When we separate something into its smallest parts, we always enter a strange world where all that exists is particles and waves.

Let's imagine that you could reduce your body to microscopic size, and that you set off on an exploration

to discover the secrets of this universe called *you*. You would soon see that each thing consists of nothing more than atoms, each atom being a nucleus with electrons rotating around it. The number and shape of these electrons and their orbits give each substance a particular set of vibrational frequencies. You would discover that whatever the substance, nothing is solid. Instead there is only a nucleus surrounded by an endlessly rotating wave.

Everything is eternally moving and vibrating—on and off, at an incredible speed.

According to the *Hanyashingyo*, the Buddhist *Wisdom and Heart Sutra*, "That which can be seen has no form, and that which cannot be seen has form." We can now say that this strange contradiction, spoken ages ago by the Buddha, has been proved true by modern science.

Our eyes can see objects, but they can't see vibration. However, I'd like you to ask yourself if you haven't had an experience similar to the following:

You are talking with someone in a room, and the mood is warm, friendly, and free-flowing. Then another person enters the room. The moment they open the door, you notice a change in the atmosphere, and now instead of warmth filling the room, the space is encased in a dark and cold mood.

You look at the new arrival's face and see a haggard expression and humped-over shoulders, someone who

looks like they are just tired with life. What could be the cause of this pain? Maybe a broken heart, a mistake at work, or just general disgust with life—I'll leave it up to you. What I want you to think about is why the mood in the room changed the moment that the door was opened.

Human beings are also vibrating, and each individual vibrates at a unique frequency. Each one of us has the sensory skills necessary to feel the vibrations of others.

A person experiencing great sadness will emit a sadness frequency, and someone who is always joyful and living life fully will emit a corresponding frequency. A person who loves others will send out a frequency of love, but from a person who acts out evil will come a dark and evil frequency.

This same principle also applies to objects and locations. For example, there are locations where accidents frequently happen, locations where businesses succeed, and locations that create happiness. And you might have heard about a jewel that brings tragedy to successive owners.

This applies not only to physical objects, but the various phenomena that go on in the world also emit characteristic frequencies. A change in the energy of the atmosphere results in lightning and storms. Intense energy will result in natural disasters, but we need to

realize that these are not evil events. If we consider the enormous amount of evil energy being blown away, perhaps we should actually be appreciative of lightning and storms.

For another illustration, think about the fact that people around the world enjoy coming together to celebrate. When people gather, wear special clothes, sing and dance, and are festive, the result is that stagnant and evil vibrations are dissipated and joyous vibrations are created.

All things vibrate, and they vibrate at their own frequencies. When you understand this, you will significantly broaden your understanding of the universe. With this understanding, your eyes will open to things you have never seen before—things previously pushed to the back of your consciousness—and these discoveries and feelings will give new life to your soul.

The fact that everything is in a state of vibration also means that everything is creating sound.

This doesn't mean that we can hear every sound, although there are some people who apparently hear the voices of trees and who can communicate with plants. Whether we can hear the sound or not, we can say that the unique frequency of all objects can be interpreted as sound.

It is said that the human ear is generally capable of hearing frequencies from approximately 15 Hz to

20,000 Hz (Hz, or Hertz, indicates the number of cycles of the repetitive waveform per second). Actually, it's a good thing that our ears have such limits—otherwise we probably wouldn't be able to sleep at night.

The natural world is indeed well designed—everything is in balance. And as sound is created, there is a *master listener* to receive the sound: water.

Let me ask you to think about why crystal formation would be affected by music, and why completely different results would be reached depending on the spoken and written words water was exposed to. The answer is found, again, in the fact that everything is vibration. Water—so sensitive to the unique frequencies being emitted by the world—essentially and efficiently mirrors the outside world.

Music and spoken words are vibration, they are easily understood and interpreted by just about anyone. Sounds like the chant created by a human voice at a Buddhist funeral create a healing frequency.

But how can we interpret the phenomena of crystal formation being affected by words written on paper and shown to water? The written words themselves actually emit a unique vibration that the water is capable of sensing. Water faithfully mirrors all the vibrations created in the world, and changes these vibrations into a form that can be seen with the human eye. When water is shown a written word, it receives it as

vibration, and expresses the message in a specific form. (You might think of letters as being a visual code for expressing words.)

But what, fundamentally, are words? The Old Testament states, "In the beginning there was the Word." This would mean that before the creation of the universe, there existed "the Word." My interpretation of this is that "the Word" created human beings, and human beings then learned *words* from nature.

In primeval times, when people lived within nature, they needed to protect themselves, and so they were sensitive to the frequencies and sounds generated by nature, in order to detect danger before it could sneak up on them.

The sound of the wind blowing, the sound of water flowing, the sound of an animal walking through the grass—the ability to understand these sounds and relay them to others using one's voice was required for survival. It is likely that these attempts at language were simple messages of a few words, but with the development of culture and accumulation of experience, our vocabulary expanded.

Why, then, are the languages that people speak so diverse? This is quite easy to understand if you consider that language is learned from the vibrations of the natural environment. The natural environment varies greatly with location, and each environment will create

different vibrations. The volatile weather climate of Europe and the humid islands of Asia all create different vibrations that flow out of nature. In Japan, there are four distinct seasons, and so the Japanese language reflects this with a beautiful lexicon of weather-related words.

Water exposed to the words "Thank you" formed beautiful geometric crystals, no matter what the language. But water exposed to "You fool" and other degrading words resulted in obviously broken and deformed crystals.

According to the Bible, before the Tower of Babel all people spoke the same language. Perhaps this is telling us that even though location and natural environment differ, the fundamental principles of nature are the same.

We can surmise that when a complete geometric crystal is formed, water is in alignment with nature and the phenomenon we call life. The crystals do not form in water that has been polluted by the results of our failure to remember the laws of nature. When we tried taking photographs of crystals from Tokyo's tap water, the results were pitiful. This is because the water is sanitized with chlorine, thus damaging the innate ability of water to form crystals.

When water freezes, the particles of water link together to form the crystal nucleus, and when the

nucleus grows in a stable way into a hexagonal shape, a visible water crystal appears; but when information in conflict with nature is present, an incomplete crystal will be formed.

The words *gratitude* and *love* form the fundamental principles of the laws of nature and the phenomenon of life. Therefore, water in its natural form is required to create the hexagonal form. By contrast, words such as "You fool" do not exist in nature and are instead unnatural elements created by people. Words that revile, harm, and ridicule are the result of the culture created by humans.

It's likely that only vibrations of love and gratitude appear in nature, and observation of nature shows this to be true. The trees and plants show respect for each other by the way they live in harmony. This also applies to the animal kingdom. Even lions only kill when hungry, and never at random. The plants in the shadows of the trees do not complain, and the animals do not try to take more food than they require.

In an article in the March–April 1989 issue of the American scientific journal *21st Century Science and Technology*, Warren J. Hamerman wrote that the organic matter that forms human beings generates a frequency that can be represented by sound at approximately forty-two octaves above middle C (the note near the center of the piano keyboard). The modern standard

for middle C is approximately 262 Hz, so this means that the sound reaches roughly 570 trillion Hz. Since Hz means vibrations per second, this indicates that human beings vibrate 570 trillion times a second, a number that exceeds the imagination and indicates incredible and wonderful hidden potential.

It is difficult to conceive forty-two octaves, but just realize that the frequency of the human being is immensely diverse and unparalleled. The human being holds a universe within, filled with overlapping frequencies, and the result is a symphony of cosmic proportions.

When I talk to people about vibration and frequency, I use what I like to call the "*Do-re-mi-fa-so-la-ti* theory." This simple theory just means that the frequency of everything in the cosmos can be summarized in seven parts—*do, re, mi, fa, so, la, and ti*.

The universe consists of an uncountable number of things ranging from the lowest to the highest frequency. It might help to imagine keys aligned in order on a piano keyboard, starting from the lowest sound. If you press down on the white keys, you will hit *do, re, mi, fa, so, la, and ti*. When you move up the keyboard one octave, from one *do* to the next, the frequency doubles. In other words, the doubling of frequencies divided into seven parts is *do, re, mi, fa, so, la, and ti*. Therefore, the repeating of these seven sounds expresses all sound from the lowest to the highest.

But what enlightenment can be obtained by seeing frequency as sound?

The most important revelation is that of resonance. Sounds of the same frequency resonate. This can be understood by making use of a tuning fork, a Y-shaped instrument used to tune the pitch of an instrument or voice.

When a tuning fork is hit with a rubber hammer, creating a *la* sound, and a singer responds with a *la*, the tuning fork and the voice create a single frequency sound wave. This is called resonance. When one side creates a frequency and the other responds with the same sound, they resonate. It's said that likes attract, and so it would appear that vibrations attract and interact with each other.

With some careful observation, you'll see that this same phenomenon is going on all around you. A dog walking along the street may not respond to other animals it passes but will be very responsive to a dog on the other side of the street. Dogs will often howl when they hear the sound of a siren, and this could also be a type of resonance.

And we see this in human relationships: people who generate similar frequencies are attracted to each other, resulting in friendship. Certain people remain uninterested in each other, no matter how physically close they may be. However, if someone you don't like

approaches you and you react, this also means that you are resonating in some way with that person.

The greatest secret of Japanese martial arts is referred to as "winning without fighting." This essentially means avoiding resonating with the enemy. To fight and win results in resonance with the enemy, and so the level of the relationship is very low.

When frequencies are fundamentally incompatible, they cannot resonate. We cannot accept what is fundamentally different from us.

However, an interesting fact is that resonance can result even when frequencies are not identical. This happens, for instance, when the frequency is doubled. Playing the *la* key on the piano at 440 Hz and the *la* key an octave lower at 220 Hz creates quite a pleasant resonating sound, and responding to a tuning fork with a sound one octave lower also creates nice resonance.

When the frequency difference is twofold, fourfold, eightfold, and so on—or one-half, one-quarter, and so on—the result is resonance. The principle of this relationship extends to infinity. No matter how distant the frequencies, resonance will result if one of the two numbers is a multiple of the other. We can also say that for every sound on each level there is a resonating sound on every other level.

When you think about it, people are attracted to Christ, Buddha, and others who emit a high level of

vibration, but we also find ourselves attracted to the low-level outlaws of society (such as Bonnie and Clyde). This may seem like an inconsistency, but it can be explained by the fact that people resonate with others on various levels. Perhaps this dichotomy is a natural part of life.

It might help our understanding in this area to consider how to interpret, from a vibration-frequency perspective, the phenomenon of two people falling in love.

Love is one type of resonance. If, for example, you have a frequency-level capability of 10, you will resonate with others on that same level, or perhaps with someone on a level a little higher, say 12.

When people resonate and fall in love, they rise to their highest level of capability. If a person with a capability of 10 who has only been using 5 parts of that capacity falls in love with someone with a level of 12, then he or she will naturally make use of the level-10 capability and show an increase in frequency.

When you are in love, you perform better at work, and the work that you do (and often your environment) may well change without you realizing it. People who continue to do superior work well into old age are almost inevitably in love. Of course, this love is not limited to romantic love. It also can include a loving respect and attraction towards other people. Love has the effect of raising our frequency level and

making us shine. Wouldn't it be wonderful if we could be in love for a lifetime?

Most of the objects found in nature emit stable frequencies. Each sparrow sounds basically the same (though the sparrows themselves might recognize slight differences), and the sounds made by dogs or cats do not have a great deal of variation. By contrast, the human being is able to make full use of the *do, re, mi, fa, so, la, ti* scale to create beautiful melodies. Wouldn't you agree that this is indeed a marvelous ability?

Humans are the only creatures that have the capacity to resonate with all other creatures and objects found in nature. We can speak with all that exists in the universe. We can give out energy and also receive energy in return. However, this ability is a two-edged sword. When people act out only on their own greed, they emit an energy that serves to destroy the harmony within nature.

The defiling of our earth is the result of an unremitting hunger for convenience and the fulfillment of greed, initiated by the industrial revolution. This has led to lifestyles of mass consumption that seriously threaten the global environment.

We have embarked on a new century, a time in history when we must make serious changes in the way that we think. Only the human can resonate with the

rest of the world, and this is why it is so essential that we change our thinking, so we can live in harmony with nature and not go on destroying the earth. What vibration we give to the earth and what kind of planet we create depends on each one of us as individuals.

How will you choose to live your life?

If you fill your heart with love and gratitude, you will find yourself surrounded by so much that you can love and that you can feel grateful for, and you can even get closer to enjoying the life of health and happiness that you seek. But what will happen if you emit signals of hate, dissatisfaction, and sadness? Then you will probably find yourself in a situation that makes you hateful, dissatisfied, and sad.

The life you live and the world you live in are up to you.

CHAPTER TWO

The Portal into a Different World

Now I'd like to ask you to put down this book, pour a glass of water, and place it on the table before you. (Or, if that's not possible, imagine that you have done it.)

What do you see in the glass?

You can see the room that you're in, the scenery from the window, and the overall feeling around you—all recorded by the water.

Water is something so common that we seldom pause to think about it. Although we drink it, wash with it, and cook with it every day of our lives, few people spend much time seriously thinking about water. But there is probably nothing more mysterious.

One of the most mysterious things about water is the simple fact that ice floats in it. When other substances move from the liquid to the solid state, the density of the molecules and atoms that form the solid increases, and the substance becomes relatively heavier. However, water particles align in a very regulated way, with many large spaces between them. When ice returns to water, the particles become hundreds of thousands of times more active. As the particles become more active, the spaces fill in, making the liquid form of water denser and heavier than the solid form.

Water is at its heaviest at 4°C (39°F). This is the temperature at which the active water particles fill the empty spaces of the molecular structure. As the temperature increases, the particles become even more active, which then lowers the density.

For this reason, no matter how cold the temperature is above a lake (or other such body of water), the temperature at the bottom remains stable at 4°C . The result is that the living creatures of the lake are able to survive long winters under the ice.

If water behaved like other substances, and ice sank to the bottom, then what would happen? For one thing, we would probably not be here. Every time the temperature dropped, the bottoms of the lakes and oceans would become solid ice, and all living creatures would die.

Due to the fact that ice floats, even when the surface of water becomes covered in ice, the environment below the ice allows life to go on.

Water also has the unique ability to dissolve other substances and carry them away. Think about how much matter can be dissolved into water, and how difficult it is to return water to its original pure state. At semiconductor plants and chemical factories, special water purifiers are used to secure water that is extremely pure, but as soon as this water is placed in a container made of plastic (or most other substances), impurities begin to dissolve. Maintaining water in a completely pure state is extremely difficult. It will not surprise you to learn that even tap water and water from streams that look perfectly clear contains many impurities and minerals.

This ability of water to dissolve other substances creates a type of "soup of life" that supplies the oceans with the necessary nutrients that enable life. This *soup* became the birthplace of all living creatures on the earth.

Indeed, water is the force that creates and gives life. Without water, particles wouldn't mix together or circulate. Water created chaos on the earth and it also gave birth to order—resulting in a planet overflowing with life.

It is an ancient belief that where there is water there is life. In Japan, a place where water rose up from

the ground was considered to be sacred and to have high energy levels, making it the ideal spot for erecting a shrine. Other spots were also designated as sacred because of the "path of energy" they emitted, and such spots were almost inevitably found to be above underground water.

Water is the mother of life, while also being the energy for life. This is possible because of the unique characteristics of water.

My investigation into the mysteries of water makes me think that water is something not of this earth.

Why do you think there is so much water on the earth? Most explanations say that when the earth was formed some 4.6 billion years ago, water turned to steam, evaporated, and formed rain that fell on the earth, resulting in the creation of the oceans.

But it all started with the birth of the sun. Lumps of gas came together and started rotating, forming a red ball. The remaining dust and gasses came together and formed the earth and the other planets in the solar system. At this time, the earth was still a ball of burning magma that contained hydrogen. As the magma cooled, the hydrogen evaporated into the newly formed atmosphere.

But not all scholars agree with this theory, and some offer radically different alternatives. One such scholar is Louis Frank of the University of Iowa, who

has proposed that water arrived on this planet in the form of lumps of ice from outer space.

Professor Frank began his investigation when he became puzzled by the fact that satellite photographs showed black spots; he reached the conclusion that these black spots were small comets that were falling to earth.

These mini-comets are actually balls of water and ice weighing a hundred tons or more, and falling into the earth's atmosphere at a rate of about twenty per minute (or ten million per year). The theory is that these balls of ice bombarded the earth forty billion years ago, creating the seas and oceans, and this same phenomenon continues today.

As the earth's gravity pulls these ice comets into the atmosphere, the heat of the sun evaporates them and turns them into gas. As they fall fifty-five kilometers from outer space, the gas particles mix with the air in the atmosphere and are blown about, falling to the earth as rain or snow.

A few years ago, an announcement by NASA and the University of Hawaii that Dr. Frank's theory does have credibility was widely publicized by the media, but there are still many scientists who refuse to accept this new way of looking at the world.

If this new approach were to gain widespread credibility, it would require many of the books in the world's

libraries to be rewritten. It would have an impact on almost all of the scientific theories related to life on this planet, such as the origin of man and Darwin's theory of evolution.

It is universally accepted that there can be no life without water, and if we accept that water, the source of all life, was sent from outer space, then logic leads us to the conclusion that all life, include that of human beings, is alien to this planet.

But if we go along with this theory of water being extraterrestrial, then perhaps we can better understand the many unusual characteristics of water.

Why does ice float? Why is water able to dissolve so much? Why is a towel able to soak up water, seemingly in defiance of the laws of gravity? From the standpoint that water is not of this world, these and other mysteries surrounding water may seem a little less difficult to understand.

Water from outer space—it might seem a little too farfetched. But doesn't it also tickle your imagination? After water has completed its long journey through the cosmos, it begins its next phase of travels on our planet.

The lumps of ice arrive on earth, and then they become clouds and eventually fall to the earth as rain or snow. The water then washes the mountains, seeps into the ground becoming rich in minerals, and then

rises to the surface again. From rivers to oceans, the sun evaporates water and returns it to the atmosphere to once again form clouds.

This water, and the minerals that it carries through this cycle, are what make life possible. The carbon dioxide in the atmosphere melts into the oceans and enables photosynthesis, creating a perfectly balanced ecological system.

The ocean is where the first speck of life emerged, some 3.8 billion years ago. The speck evolved into algae capable of photosynthesis, resulting in the first supply of oxygen. This oxygen, interacting with ultraviolet rays from the sun, encased the earth in a protective vale called the ozone layer.

Then, some 420 million years ago, life took its first step out of the water, and freed itself from the depths of the ocean with the help of oxygen and the ozone layer.

The birth of our humanoid parents is believed to have taken place only 20 million years ago in Africa. If we consider the earth's 4.6 billion year history as constituting one "year," the human being was born at eight o'clock in the evening on the final day—all made possible by the formation of oxygen and the ozone layer.

And the force that created life and allowed life to evolve was, of course, water. Water was able to do this because it has the unique ability to dissolve the required

nutrients for life and carry them from the mountains and rivers into the oceans.

So next we ask ourselves if this grand drama of life is just an accident. When we think of the plot that began at a time so distant in the past as to tax our imaginations—the birth of life on this planet, leading to the creation of a perfect system that enabled evolution—we cannot help but feel that a grand intention was somehow involved.

Kazuo Murakami, professor emeritus of Tsukuba University, received global attention for interpreting the oxide DNA code called *renin*. His take on this question is that the more you understand DNA, the more you are forced to admit that some hand played a role in the recording of so much minute and elaborate information in such small spaces. The term he uses to describe this existence is *something great*.

The grand drama of water and life cannot be explained if we exclude the existence of *something great*. Even now the storyboard continues to unfold, in accordance with the scenario written by the grand intentions of the cosmos.

What information did ancient water bring with it when it left outer space and fell to earth? We can assume that it carried the program needed for the development of life. And now I hope you are beginning to get a clearer image of what life is all about.

Water that falls from the sky takes scores or sometimes hundreds of years to seep into the ground and become groundwater. Joan S. Davis of the Zurich Technical University has conducted research into river water for some thirty years in Switzerland, and she refers to it with the expression *wise water*. By contrast, she refers to water that has recently fallen as *juvenile water*.

In the process of falling to the earth, seeping into the ground, and then emerging, water obtains information from various minerals and becomes *wise*.

After thirty years as a professor, Joan has retired from the university, and now conducts her own research. At a symposium in Switzerland, I had the honor of giving a presentation alongside her. The focus of her research is water processing. The current system of supplying water through long pipes results in water that is not extremely healthy for the body. When water is exposed to high pressure and flows straight through pipes, the water clusters break down, letting minerals escape.

And so Joan has focused her attention on finding simple ways to supply healthy water to large numbers of people, including the poor. One of her suggestions is to use crystals: when small ice crystals are introduced into water, the minerals in the water are retained, resulting in water that grows healthier crops. She has also conducted research into improving the quality of

water using magnets, and designing water taps to give circular movement to the water. She wants to know how natural movement can be introduced into the way water is supplied.

Joan has the following to say about her research:

I have heard from many people with interest in your research into ice crystals. I think that this research will give people some important suggestions. One suggestion is to give more respect to water. Another is to become aware that water responds to even delicate energy. I also want to let scientists and officials know that there is almost no protection currently being provided for water.

I feel that my research can be used in the fields of health and medical care. There is not much interest in the importance of the physical characteristics of water. For example, it is said that mineral water is good for you, but there are few people who know that the minerals of mineral water can cause hardening of the arteries. Also, mineral water that is carbonated has a high acidity, making it unhealthy for the body. In any case, we need to avoid water that comes in a bottle and replace it with naturally flowing water. Water wants to be free.

Joan also relayed the following:

The important thing is that we recover our desire to treat water with respect. In our modern culture, we have lost our attitude of respect for water. In ancient Greece, people paid true respect to water, and many Greek myths are based on the protection of water. But then science appeared, and rejected these myths because they were not scientific. Water lost its mystique and became just another substance that technology could clean up as necessary. We sometimes say, "Purified water is not pure." Water processed in treatment plants is not the water that forms beautiful crystals. What water requires is not purification but respect.

These wise words are the result of many years spent observing water. It was extremely encouraging to have such an accomplished scientist express interest in my research into crystals, out of respect for water.

And finally, Joan gave me the following advice:

If you are able to establish the physical foundations for your theories concerning ice crystals, you will be able to make an announcement to the world as very convincing research here,

since Switzerland is highly recognized throughout the world for its research into water.

This was indeed encouraging for me at a time when I was planning to establish a center in Switzerland to promote my research into water.

Water records information, and then while circulating throughout the earth distributes information. This water sent from the universe is full of the information of life, and one way to decipher this information is through the observation of ice crystals.

When I see the many beautiful crystals formed from water, I get the feeling that I'm looking at the materialization of life before my eyes. The crystals that are formed when water is shown positive words are simply beautiful. The response of water to *love* and *gratitude* is nothing less than grandeur. These positive words give spirit to water, which materializes it, to reveal life at its fullest.

I also have the impression that the act of looking at water crystals is an act of creating life. This is because when we look at the crystals, the water changes its appearance moment by moment. Your gaze has a special energy of its own, and while a gaze of good intentions will give courage, an evil gaze will actual take it away.

A family that subscribed to our magazine conducted an interesting experiment. They put rice in two

glass jars, and every day for a month said "Thank you" to one jar and "You fool" to the other, and then they tracked how the rice changed over the period. Even the children, when they got home from school, would speak these words to the jars of rice.

After a month, the rice that was told "Thank you" started to ferment, with a mellow smell like that of malt, while the rice that was exposed to "You fool" rotted and turned black.

I wrote about this experiment in the book that I published, and as a result hundreds of families throughout Japan conducted this same experiment for themselves. Everyone reported the same results. One family tried a variation of the experiment: like the others, they said "Thank you" to the first bottle of rice and "You fool" to the second bottle, and then they prepared a third bottle of rice that they simply ignored.

What do you think happened? The rice that was ignored actually rotted before the rice that was exposed to "You fool." When others tried this same experiment, the results were again the same. It seems that being ridiculed is actually not as damaging as being ignored.

To give your positive or negative attention to something is a way of giving energy. The most damaging form of behavior is withholding your attention.

I think that this experiment has the potential to teach us a very important lesson. We must take care to

give our children our attention, and to talk with them. Speaking words of kindness and love should begin from the time of conception.

Treating your houseplants gently—looking on them kindly, and speaking words of praise—will help to make them healthy and alive. This also applies to pets and even insects.

Through this book, I hope that many more people will gain respect for water and look at water in a kinder way. The result will be that water will produce more beautiful crystals, and in this way we will be participating in the creation of a small but beautiful world.

I have no doubt that God greatly enjoys his work and wants to give us the same ability that he has—the ability of creation. Then he will look down upon us with gentle eyes, as we use our free agency to choose how we will use this ability.

The memory of life arrived on this earth carried by the soul of water. From this memory, life awoke, the human being emerged, and finally you and I were born. And now once again we look at water and breathe life into it. Your consciousness, awareness, and good will, and your smile from a feeling of love, all give new life to water and result in the creation of a new and glorious universe.

CHAPTER THREE

Consciousness Creates All

Since becoming entranced by the wondrous powers of water, I have been blessed with the opportunity to see and conduct experiments on many types of water from around the world. Each sample of water from a different part of the world has its own unique and beautiful characteristics.

I have also seen with my own eyes how the water of the world is becoming polluted. The World Trade Organization has stated that the twentieth century started with wars for oil, but that in the twenty-first century we will see wars for water.

I mentioned that there is no tap water in Japan that is capable of forming complete and whole crystals, due to the use of chlorine. Chlorine, introduced at the beginning of the twentieth century in London, has been used in Japan for more than fifty years now.

In contrast to tap water, the water from springs, the upper reaches of rivers, and other such natural sources creates beautiful crystals. However, most of the water that is now emerging from the ground fell from the clouds more than fifty years ago—about the time that industrialization began in Japan.

Pollution of rainwater has reached a global scale. I tried to take photographs of crystals formed using tap water from a city in Japan which had been polluted with dioxin, but I couldn't get the water to produce even a shadow of a crystal. Industrial waste circulates, polluting water as it goes, and spreading toxins throughout the world.

But there is hope. The people of the city with the dioxin-polluted water have become very interested in protecting their water, and now each year it is becoming easier and easier to form crystals.

Pollution originated within our own consciousness. We started to think that we wanted a bountiful and convenient lifestyle at any cost, and this selfishness led to the pollution of the environment that now affects every corner of the globe.

We have seen through the crystal photographs that water is the mirror of our souls. What do our souls look like—and how should they look? These are questions that can also be answered by water.

In what direction are we headed? What is our role in protecting this planet? Such questions can only be considered when we recognize the greatness of the human being. Perhaps it is time that we stop seeing the human being as the evil agent. I think we underestimate the innate abilities that we each have. We have enormous power.

Scientists estimate that there are between 108 and 111 elements. (I suspect that the number is 108—for reasons which I'll explain.) Thus far, 90 elements have been verified in the human body—of all the creatures alive, only the human body contains so many elements. But I suspect that there are still elements left to be discovered within us (or that we will obtain the remaining elements as we evolve, moving closer to becoming complete human beings).

The more evolved creatures contain a greater array of elements. Compared with human beings, plants contain far fewer elements, and what is the result of having fewer elements? We can deduce that fewer elements means a smaller capacity for emotions. Other animals can feel pain, but it's most likely that only humans (and other animals close in evolution to

humans) are capable of the higher emotions of sadness and passion.

If we consider that the human body is a universe within itself, it is only natural to conclude that we carry within us all the elements. According to Buddhism, the human being is born with 108 earthly desires (such as confusion, attachment, jealousy, and vanity), which torture us throughout our lives. I think it is logical to conclude that these 108 earthly desires have counterparts in the 108 elements.

In fact, the first vibration-detection device that I introduced to Japan went a long way toward proving this. The device was capable of measuring the unique vibrations emitted around us and then transcribing them into water. I was able to measure the vibrations coming from many different people, and I realized that the negative vibrations that we emit correspond to the vibrations emitted by the various elements.

For example, the vibrations created by irritation are equivalent to those of mercury, by anger to those of lead, and by sadness and sorrow to those of aluminum. In the same way, uncertainty is related to cadmium, despair to steel, and stress to zinc.

In recent years, it has been pointed out that the use of aluminum pans and cooking utensils may be a contributing factor in Alzheimer's disease. If this is true, then it is likely that it is because aluminum has the same

vibrational frequency as sadness, and so the sadness and sorrow of old age calls out to aluminum, leading to the onset of Alzheimer's.

Joan Davis, the water scientist in the previous chapter, related the following interesting episode:

A physicist conducted an experiment in which he studied how the positions of the stars affected water. Using water containing various minerals, he tested how easily paper soaked up the water when the stars were in certain positions.

What he found was that when Saturn has a large influence on Earth, lead responded by being soaked up by the paper, while other elements such as copper, silver, and steel showed little or no response.

We can deduce from this that there is a close connection between Saturn and lead. Metals resonate the emotions and moods of people, and so the next logical deduction is that Saturn is closely related to the emotion of anger.

Perhaps the relationship between the constellations and personality talked about by astrologers and others may have something to do with the relationship with metals.

This is a very meaningful theory for me, especially since I have my own ideas about the relationship between the 108 earthly desires and the elements. The number of planets in the solar system is 9, a number that when multiplied by 12 gives us 108. Using the periodic table, we may someday be able to identify which planets correlate to which elements.

Even as I wrote the draft for this book, I saw a television program that said all the elements on earth were created by the high heat of a star exploding in distant outer space. Just one more interesting piece of the puzzle.

Throughout our lives, we will be subject to the 108 earthly desires, but how should we deal with these negative emotions that seem so impossible to avoid? Knowing how to deal with these negative feelings is the same knowledge that we need to get along well in this life. So what should we do if we find our minds full of anger, sadness, envy, or other negative thoughts?

We first need to understand that is not possible or necessary to rid ourselves of our emotions. There isn't anyone who is completely free from negative thoughts. We all carry within us a memory of our ancestors from the distant past, beginning with the awakening of the first human being, and we are all destined to inherit a portion of their negativity.

However, it is indeed painful to be unable to free ourselves from constant negative thoughts and feel-

ings that eat away at our souls. If only for a moment, how can we go about freeing ourselves from all of the negativity?

Based on the principles of vibration, the answer is very clear. All we need to do is emit the emotion that is opposite to the negative emotion. By combining two opposite waves, the negative emotion disappears.

A few years back, a university in Japan developed a method for erasing sound with sound. They would create one noise that would serve to erase the unwanted noise, and thus create a quiet space (for example, around a telephone). By identifying the wavelength of the unwanted noise, the researchers were able to create the exact opposite noise and broadcast it from speakers, completely wiping out the sound in a specific area. This same method has already been used to negate the noise made by automobile engines.

There are parallels to this principle for human emotions. For every negative emotion, there is an exactly opposite positive emotion. The following list contains emotions that create opposing frequencies:

hate	gratitude
anger	kindness
fear	courage
anxiety	peace of mind
pressure	presence of mind

The fact that two opposite emotions issue the same wave is significant for two reasons. First, like Jekyll and Hyde, we all have two faces. You probably are aware that people with short tempers tend to be quick to cry, and that it's not uncommon for someone who everyone sees as being a good person to suddenly commit a crime. We frequently hear about a man who is kind and gentle to his girlfriend, but who becomes threatening and violent as soon as she talks about leaving him.

While there is no one who hasn't an evil bone in their body, there is also no one who is totally evil to the core. The fact that someone harbors opposing emotions simply makes them human.

If you have been made sick by the emotion of hate, then you need to look for healing in the emotion of appreciation.

But even if you know this, it still may be difficult to fill your heart with gratitude if it is already filled with hate for others. At such times, it might be helpful to rely on the services of a healer. Perhaps it is possible that the miracle water of Lourdes in France, which is said to have healing powers, is filled with the feelings of appreciation of the Mother Mary. As a result, people who have been made ill by the vibrations of hate can be miraculously healed by drinking this holy water.

This is the same principle involved in homeopathy. Why, when a poison is diluted in water to the point

where it can no longer be physically detected, does the previously toxic solution then become therapeutic? When the substance itself is gone, and all that is left is the information from the vibration, both poison and medicine become the same.

Logically thinking, medicine is not good for the body. It may alleviate symptoms and get rid of pain, but medicine can also become a powerful poison.

Medicine that gets rid of pain happens to have the opposite vibrational frequency of the targeted pain. By mixing various substances together in a lab, you'll be able to find the frequency that you are looking for. When you inject the substance into a mouse and get the desired effect, you can then try giving the substance to humans.

When the medicine enters the body and stops the pain, the vibrations from the combined substances stop, and the various substances return to their original states, in which they emit their original vibrations. However, if these vibrations happen to damage other cell structures, then harmful side effects will result.

Medicine is useful in the treatment of illness, but we don't really understand why medicine works. When you look at medicine from the standpoint of vibration, you get a totally different picture. For example, during an operation the damaged vibrational frequency is treated with a much more powerful frequency. Let's say

that you fall from a building and hit the ground. At the moment of impact, your body's frequency increases many hundreds of times, creating an obviously critical situation. Dramatic and sudden changes in the body's frequency result in great pain and damage. In such cases, treatment must involve equal or stronger frequencies to be effective—often having to do with the scalpel. Sharp instruments, by nature, have a high frequency, and it's the surgeon's job to use such instruments to cut into the body and return the patient's frequency to normal.

In my opinion, a doctor who treats the human body must first be a philosopher. In the past, the doctor was the community shaman or priest, exhorting people to follow the laws of nature, live their lives correctly, and make use of the healing powers found in nature.

If doctors were to treat not only the sick parts of the body but also the human consciousness, then I think we would see a great reduction in the need for doctors and hospitals. People with ailments would go to their nearby philosopher, for help in understanding the mistakes they have made, and then go home determined to live a better life. It may well be that the physicians of the future will be more like counselors than the doctors we have today.

I have talked with many people about their health problems, and I have come to see that ailments are

largely a result of negative emotions. If you can erase the cause of such emotions, you have an innate capacity to recover from illness. The importance of being positive cannot be underestimated.

Positive thinking will strengthen your immune system and help to set you moving towards recovery—a fact that the medical community is starting to wake up to. For instance, there is a doctor who treats his cancer patients with mountain climbing. Giving people a reason to live boosts their spirits and their immune systems.

There is also an increase in interest in holistic medicine—not only treating the symptoms of the illness, but overseeing the patient's lifestyle and psychological well-being. In fact, doctors have recently formed an organization, called the Japan Holistic Medical Society, to promote this type of medicine in Japan.

The days of believing only that which can be seen by the naked eye have passed, and we are now starting to open our eyes to the importance of the soul. It's a move in the right direction, and I think it will become the way the majority thinks within this century.

The human body is essentially water, and consciousness is the soul. Methods that help water to flow smoothly are superior to all other medical methods available to us. It's all about keeping the soul in an unpolluted state. Can you imagine what it would be

like to have water capable of forming beautiful crystals flowing throughout your entire body? It can happen if you let it.

Among all medicines, there are none with the healing powers of love. Since I came to this realization, I have continued to tell people that *immunity is love*. What could be more effective at overcome negative powers and returning vitality to the body?

However, I have recently felt the need to change my terminology. I now know that it is not love alone that forms immunity, but love and gratitude. I became convinced of this from the following experiment.

I heated water in a microwave oven and then attempted to see the impact of the magnetic field on crystals. I used two types of water: distilled water, and water from the tap shown the words *love* and *gratitude*. The crystals formed from the distilled water were deformed and incomplete, but the water shown the words *love* and *gratitude* formed complete crystals. In other words, *love* and *gratitude* were able to make the water immune to the damaging effects of the magnetic field.

I have mentioned that water shown the words *love* and *gratitude* forms the most beautiful crystals. Of course the word *love* alone has the ability to create wonderful crystals, but *love* and *gratitude* combine to give the crystals a unique depth and refinement, a diamond-like brilliance.

I also discovered that the *love* and *gratitude* crystals actually look more like the *gratitude* crystals than the *love* crystals. What this indicates is that the *gratitude* vibration is more powerful and has a greater influence. Love tends to be a more active energy, the act of giving oneself unconditionally. By contrast, gratitude is a more passive energy, a feeling that results from having been given something—knowing that you have been given the gift of life and reaching out to receive it joyously with both hands.

The relationship between love and gratitude may be similar to the relationship between sun and shade. If love is the sun, gratitude is the moon. If love is man, gratitude is woman.

So then what does it mean to say that the passive energy of the shade or gratitude is stronger than love? When I was thinking about this question, I stumbled upon an interesting concept, which became an important clue to answering the question concerning how we can and should live our lives.

What is the relationship between love and gratitude? For an answer to this question, we can use water as a model. A water molecule consists of two hydrogen atoms and one oxygen atom, represented by H_2O . If love and gratitude, like oxygen and hydrogen, were linked together in a ratio of 1 to 2, gratitude would be twice as large as love.

I suggest that having twice the amount of gratitude as love is the balance we should strive for. At a seminar, after I had mentioned this in my presentation, two young women came up to me and said, "We were very impressed. Weren't you saying that people have one mouth for speaking and two ears for listening?"

"That's right—that's absolutely right!" I exclaimed, and I knew that I had become a little wiser.

When we observe the natural world, we can see that the passive energy has greater strength. The fish of the sea produce enormous numbers of eggs, but not all of them hatch. Only a small portion reach the stage where they hatch, while the remaining eggs are offered as food to other creatures.

Have human beings lived in a ratio of two parts gratitude and one part love? I suspect that the exact opposite is true.

Of course, the grandeur of love cannot be denied, and most people do have a general understanding of the power of love. However, we have been raised in a culture where all our focus is placed on the energy of love, while the other side of the formula receives little attention.

The focus of the human race has been drawn away from that which cannot be seen, and towards the obvious physical world. And in order to make as much of this physical world our own as possible, we have cut

down forests and fought back deserts in an effort to insure the supreme domination of our culture.

Such advancements by human society may indeed be the result of love—for our families and our countries—but as long as we continue to live our lives based on this strategy, there will be no end to conflict. The history of the twentieth century was the history of fighting and warfare.

Perhaps we are finally beginning to see that the direction we are moving in leads nowhere. We have sacrificed too much in order to secure the riches of life. Forests have been destroyed and clean water lost, and we have cut up and sold the earth itself.

What the world needs now is gratitude. We must begin by learning what it means to have enough. We need to feel gratitude for having been born on a planet so rich in nature, and gratitude for the water that makes our life possible. Do we really know how wonderful it is to be able to breathe a big breath of clean air?

If you open your eyes, you will see that the world is full of so much that deserves your gratitude.

When you have become the embodiment of gratitude, think about how pure the water that fills your body will be. When this happens, you yourself will be a beautiful, shining crystal of light.

CHAPTER FOUR

The World Will Change in but a Moment

Do you know where you can obtain really good water?

Perhaps at the foot of the Swiss Alps, or maybe at the North or South pole? It's not hard nowadays to find bottled water claiming to be the best in the world, but can good water really be purchased?

Water is not simply about H₂O. No matter how natural or pure the water you drink, without a pure soul, it will not taste good.

Let me ask you: How clear is your soul? Are you weighed down by trouble at work? What about family problems? Is your consciousness troubled? If it is,

then you may find that the water you drink tastes plain and dull.

After you've enjoyed participating in a sport or other exercise, water—even just tap water—tastes delicious and refreshing. In other words, it's what's inside you that counts the most.

I know it sounds like I'm saying that it's all in your mind, but what I'm actually trying to say is that when you drink water with a feeling of gratitude the water itself is physically different than when you drink the same water with clouded feelings in your soul.

Our emotions and feelings have an effect on the world moment by moment. If you send out words and images of creativity, then you will be contributing to the creation of a beautiful world. However, emitting messages of destruction, you contribute to the destruction of the universe.

If you become aware of this, you will no longer be able to speak words of anger to those around you, or blame others for your own mistakes and weaknesses. You have the capacity to change the world within a moment. All you must do is make a simple choice. *Are you going to choose a world of love and gratitude, or a tortured world filled with discontent and impoverishment?* The answer will depend on your attitude at this very moment.

According to the teachings of Buddhism, everything in the world is constantly changing, and nothing

ever changes. Speaking from the principles of vibration, the energy of vibration must go on forever in continuous motion.

Understanding that everything exists in this one moment will give hope and light to your life. You no longer need to be troubled by the past, and can know that the future can be anything that you *will* it to be. You, as you are, in this very moment hold the key to everything.

If you want to see how much of an impact your consciousness can have on the world, I suggest that you conduct a little experiment by playing a game we'll call "cloud erasing." I want you to try to erase clouds using the power of your thoughts.

On a partially clear day, look up in the sky and target just one cloud, maybe one not too large. Your thoughts are very important in playing this game, and so it's important to believe that the cloud will disappear, but you shouldn't try too hard. Focusing too hard will actually have the effect of preventing your energy from being sent out.

When you are ready, imagine an invisible beam of energy being sent from your consciousness towards the cloud, breaking it into pieces. See in your mind how the laser-beam targets the entire cloud and not just one part.

Then say, in the past tense, "The cloud has disappeared"; at the same time, say to the energy (again in

the past tense), "Thank you for doing that." If you follow these steps, I'm sure that the cloud will start to thin out and disappear in a matter of minutes.

As this shows, human consciousness can have an enormous impact on the world around us. Clouds consist of water in the gaseous state, and so it responds especially quickly to our will.

Traditionally speaking, anyone who says that consciousness has an effect on the physical world risks certain ostracization for being unscientific. However, science has progressed to a point where the failure to understand consciousness and the mind limits our understanding of much of the world around us.

Quantum mechanics, certain psychological theories (such as the flow talked about by Jung), and genetic engineering have all taught us that there is a world other than the one we know so well. You can't see this other world with your eyes, and you can't touch it with your fingers. It's a world in which time itself does not exist.

The famous quantum theorist David Bohm has called the world available to our senses the "explicate order," and the existence within, the "implicate order." He envisions that everything that exists in the explicate order has been enfolded in the implicate order, and each part of the explicate order includes all the information of the implicate order.

This may be difficult to understand, but what he is saying is that every part of the universe contains the information of *all* the parts of the universe. In other words, within an individual—and even within a single cell—exists all the information of the universe.

The information of the universe includes *time*. In other words, the fact that you exist in the here-and-now is included in the information of the universe, along with all present, past, and future information. So the changing of the entire world in a moment isn't just a fantasy.

But let's think about *this* moment for a moment. How can we interpret it using physical science? David Bohm explained that an aspect of the universe within is projected into each moment in time, creating the present. The next moment in time is also a projection of a different aspect, and so on. In other words, with each moment, a different world is being shown to us. However, one momentary world will have an impact on the next momentary world, and so it appears to us as one continuous world.

Based on this theory, the world is changing every moment, and being created anew. Our consciousness has a role to play in this creation of the world. If you become aware of this, I suspect that your life will never be the same.

I've talked about some complicated things, and may have caused some confusion. But if we reconsider

crystals, it will help to answer many questions. This world is changing moment by moment, and water is the first to recognize the change.

I mentioned that I made a device for measuring vibration, and used it to better understand water. On the afternoon of the invasion of Iraq at the onset of the first Gulf War, I measured the vibration of the tap water in Tokyo, and found an unusually sharp increase in the values of vibrations produced by mercury, lead, aluminum, and other substances harmful to the human body. There seemed to be no apparent explanation for this; at first I suspected that there was something wrong with my equipment, but repeated measurements indicated otherwise. It wasn't until the following day, when I read the newspaper, that I made the connection. News of the start of the Gulf War covered the front page. It's been said that the weight of the bombs dropped on this first day of war was equivalent to all the bombs dropped throughout the Vietnam War.

In Japan, thousands of miles from the Middle East, I was able to measure the vibrations from harmful substances at almost the exact time that war broke out. You might ask, *Is this really possible?*

Of course, the harmful by-products of the bombs in the Middle East weren't immediately transported to Japan. However, the harmful vibrations of the bombs being dropped on one side of the earth did reach the

corners of the earth immediately. These vibrations spread out beyond the limits of time and space.

I suspect that vibrations exist not in our three-dimensional world, and not in the unseen world of a different dimension, but in a middle world. When something occurs on the earth, in no matter what world, water is the first to detect it and relay this new information to us.

At the time of the Gulf War, I hadn't yet started taking photographs of crystals, but if I had taken photographs, I'm sure they would have been very interesting.

Let me give you one more example in which vibrations had an immediate impact on the physical world. In this case, the power of prayer was used to purify water.

At Fujiwara Dam in central Japan, we had a Shinto priest of the Shingon Sect named Houki Kato repeat an incantation. When I first met him, he showed me two photographs that made a lasting impression, and so I wanted to see for myself what was recorded in the photographs. One of the photographs had been taken before an incantation, and the other after; the second photograph showed a remarkable difference—the water was considerably clearer.

The power of the incantation had come from the *spirit of words*, and so it is possible that the energy from the *spirit of words* had purified the water in the lake. In

order to verify this, I wanted to take photographs of crystals formed from water before and after such an incantation.

The priest stood on the edge of the lake and performed the incantation for about an hour, all of which I videotaped. After the incantation, the priest and I conversed; within fifteen minutes, my crew called me over.

"This is incredible! The water is getting clearer right in front of our eyes," someone said. And it was absolutely true. You could clearly see that the water was becoming more and more transparent as we looked at it. We were even able to make out the foliage at the bottom of the lake, which had been hidden by the cloudy water.

We next took photographs of crystals. The crystals made with water from before the incantation were distorted, and looked like the face of someone in great pain. But the crystals from water taken after the incantation were complete and grand. Within one hexagonal shape there was a smaller hexagonal shape, all enclosed by a halo-like pattern of light.

Of course, it did take some time after the incantation for the water to become clear, indicating that changes in substances that can be seen with the naked eye are somewhat gradual. But there is no doubt that the vibrations of prayer are relayed to nearby objects in an immediate way, affecting the nearby water. This was

a physical phenomenon that can't be explained unless we accept that another world exists within the one we call our own.

But the story doesn't end there. A few days after this experiment, an incident was reported in the press. The body of a woman was found in the lake, and when I heard about this I remembered the crystals created from the water before the prayer, and remembered how the crystals had looked like a face in agony.

Perhaps through the crystals, the spirit of this woman was trying to tell us something. I would like to think that her suffering was alleviated in part by the incantation.

There is another world in addition to the one that we live in. When looking at our world from that world, we can see things that we cannot see now.

Dr. Rupert Sheldrake of England is a researcher who focuses on furthering the understanding of a new worldview, in association with this world that we cannot see. After receiving a doctorate in biochemistry from Cambridge University, he served as a lecturer in biochemistry and biology at Cambridge, while also serving as a Fellow of the Royal Society.

Dr. Sheldrake's theory is outlined in a book that he wrote more than twenty years ago, but the scientific journal *Nature* dismissed the book by saying that it should be burned. Despite this rejection, his theory

reached the hearts of many, and research into his theory continues. What was it that drew so much attention?

It's often said that if something happens twice it will happen again. Perhaps you have found it strange that accidents and crimes tend to happen in series. Looking at history and social trends, you can see that over long periods of time, events do generally repeat themselves. How can we explain this strange repetition of events? Dr. Sheldrake attempted to use scientific means to find an answer.

Scientists normally approach objects that they can't see with their eyes by using reductionism to isolate a physical phenomenon. However, Dr. Sheldrake took an entirely different approach.

According to his theory, when the same thing repeats itself, a *morphic field* is formed, and resonance with this morphic field increases the likelihood that the event will happen again. A morphic field is not energy-based information, but more like a blueprint for building a house.

We can see this as an example of resonance theory. Dr. Sheldrake has proposed that events are also capable of resonating in the same way that sound resonates. He refers to the location where such events take place as the morphic field, and the phenomena of repeated similar events as *morphic resonance*.

Although his theory was quickly dismissed by *Nature*, the announcement of his theory was taken seriously by the more open-minded, resulting in serious discussion. There is no doubt that Dr. Sheldrake has departed from the existing paths laid out by science, but you have to admit that his theory goes a long way toward explaining mysteries that traditional science has been unable to deal with.

During typical discussions of such mysteries, the talk often turns to glycerin crystals. For the first forty or so years after glycerin was discovered, it was generally accepted that it didn't form crystals. Then one day at the beginning of the nineteenth century, a drum of glycerin en route from Vienna to London suddenly started to crystallize.

A short time later, in a completely different location, another batch of glycerin also crystallized. This crystallization began to spread, and now it is generally accepted that glycerin forms crystals when temperatures drop below 17°C (63°F).

So what should we make of this?

When the crystals first formed (for whatever reason), a morphic field was created, and eventually all glycerin, in compliance with the morphic field, started to form crystals. This type of phenomenon has occurred in many other substances as well. Despite all the randomness in the world, once a substance begins

to form crystals, then it often becomes common for it to form crystals thereafter.

Not too many years ago, a television station in England decided to conduct a public experiment to see if they could test the validity of Dr. Sheldrake's theory of morphic resonance. They first prepared two paintings: both looked like random patterns, but within one was hidden the figure of a woman wearing a hat, and within the other a man with a mustache. The figures were designed such that it was impossible to see them.

The experiment took place in three steps. First, before the live program, a group of participants were asked to identify what they saw in the paintings. Second, during the program, the secret of the painting of the man with the mustache was revealed. Third, after the program, another group of participants, who weren't allowed to watch the program, were likewise asked to identify the paintings.

What do you think the results were? The second group did a far better job than the first in identifying the man with a mustache. The experimenters did their best to account for all possible factors, such as removing the data from viewers in countries other than England and Ireland, but the results still showed that the second did three times better than the first.

This experiment tells us that when someone becomes aware of something, other people also tend to

become aware. It was the effect of the morphic field that led to the remarkable increase in correct responses.

According to Dr. Shel Drake, DNA isn't the only reason that people in the same family share similar features—morphic resonance also plays a part. Dr. Shel Drake's theory also helps us to understand so-called coincidences (referred to as "synchronicity"), and the phenomena of group consciousness (collective memory) and archetypal patterns.

The important thing about Dr. Shel Drake's theory is that once the morphic resonance has spread, it extends to all space and all time. In other words, if a morphic field is formed, it will have an instantaneous impact on all other locations, resulting in an instantaneous worldwide change.

When I first heard about Dr. Shel Drake's theory, I couldn't contain my interest, because my research into water crystals was nothing less than an attempt to express the resonance of the morphic field in a way that can be seen with the naked eye.

When I first attempted to take photographs of crystals, I had no success at all for the first two months, but once I was able to capture the first photograph, other researchers also started to succeed. Perhaps this is also a result of morphic resonance.

I first learned about Dr. Shel Drake's work from a bestselling book in Japan, called *Why Does That Occur?*

by Eiichi Hojiri, but I became truly interested when I saw Shel Drake in a television documentary called *Six Scientists of Interest*. Four years later, as luck would have it, I had the opportunity to meet Dr. Shel Drake during a lecture tour of Europe. A friend who attended the seminar happened to know Shel Drake's wife, and so I found myself invited to their home in London.

I was pleased to learn that he already knew about my research into water crystals; he said, "At least once every week I get a letter from someone telling me about you." I had many questions for Dr. Shel Drake, but he was also extremely interested in my work, and as it turned out he had as many or more questions for me.

He also shared the following with me:

I have conducted research into living organisms and their behavior but not water; and so I'm not that familiar with water. However, it's likely that in the future there will be connections between my research and your research into water crystals.

The area that I'm most interested in is the effect that observation has on the observed. There are people who know when someone is looking at them from behind. I want to do research to try and express this in a statistical way.

There's a risk that the documentation on this research will be subjective, so I'm wondering if we can't use water in the experiment. I'm going to try to take photographs of crystals and see how water changes under various conditions, such as when the water is ignored, and when it is observed by people with special talents, normal people, and then extremely evil people.

This sounded remarkably similar to the experiment in which the rice in the ignored bottle rotted faster than the rice in the bottles exposed to "Thank you" and "You fool." When I told him about this experiment, he became even more interested, and he suggested that if I tested the effect of just looking at water, it would be easier to get results than using rice (which involves the complicated growth process of microbes).

Dr. Shel Drake currently has a strong interest in the phenomena of telepathy. He conducted an experiment to find out if dogs showed a response when their masters started to head home. Using video equipment to make observations, he has been able to verify this phenomenon in more than two hundred cases.

I would like to pass on to you a message that I received from Dr. Shel Drake:

Our lives are made possible by the movement of an unseen energy. Therefore, I would hope that we'll always be aware of this and pay attention to those around us and the things going on around us. This is something that is very important. This is because the act of looking at something has an effect on it. Everyone seems to be aware of this, but we don't put it into practice. In the home, parents need to pay attention to their children. It's the same thing.

Focusing your attention—on anything—serves as an expression of love. Dr. Shel Drake is on the leading edge of this study of the impact of consciousness on objects, and so his words come with special significance.

If we combine the lessons that water teaches us with the theories proposed by Dr. Shel Drake, we go a long way toward unlocking the many mysteries of our world. Each one of us has a magical ability to change the world. We have all been granted the power of creation by God. If we use this power to the maximum, we will be able to change the world in but a moment.

For people who see no end to their worries and suffering, this perspective should come as considerable comfort. You—yes *you*—have the ability to change the world!

Everything in the world is linked. Whatever you are doing now is being done by someone else at the same time. So what type of morphic field should we be interested in creating? Are we creating fields of pain and viciousness, or are we creating a world filled with love and gratitude?

Whenever you sit in front of water and send out messages of love and gratitude, somewhere in the world, someone is being filled with love and gratitude. You don't need to go anywhere. The water right in front of you is linked to the all the water in the world. The water you're looking at will resonate with water everywhere, and your message of love will reach the souls of all the people of the world.

We can cover the world in love and gratitude. This will become a glorious morphic field that will change the world. It's not about time and space; now, here, wonderful and marvelous things are possible.

Note: The following color photographs on pages 101 to 132 are referred to in chapter 5, page 133.

Faint, illegible text, likely bleed-through from the reverse side of the page.

Water shown photographs of natural scenery

We placed a jar of water on photographs of beautiful scenery, then photographed the crystals that formed. We see here how water responded to the photographs.

Sun

The crystal, resulting from exposure to the photograph of the sun, is large and beautiful, not unlike the sun itself.

Mt. Fuji

The symbolic mountain of Japan. Perhaps incidentally, the crystal looks as though it were being enveloped by the first rays of morning.

Rocky Mountains

The tips of the Rocky Mountains, the backbone of North America, are covered in glaciers. The crystal also looks like it is encased in snow.

Victoria Falls

An enormous waterfall in Zimbabwe. As if to represent the plunging water, the crystal is formed of broad columns.

Stonehenge

Stonehenge, the giant stone structure in England, is built on a site of high energy, and the crystal also appears full of energy.

Coral reef

All three of the crystals are unique, but formed of smaller detailed crystals. Their form and color does seem somewhat similar to the beautiful and life-filled corals of the ocean.

African savanna

The crystals seem to represent the finite and nurturing foliage of the savanna.

Rainforest, Southeast Asia

This rainforest, overflowing with life, protects an ecological system dating back millions of years. The crystal appears to be formed by a steady and finite balance.

Machu Picchu, Peru

Small yet beautiful like a diamond, the crystal reminds us of the glory of the Inca Empire.

A pool in Yellowstone

This is a beautiful, clear-blue pool in Yellowstone National Park. The crystal is indicative of the stunning color of a fine jewel.

Heitate Shrine

The oldest in Japan, the Heitate Shrine was mostly unknown until a few years ago when this area was identified as the location of mythological stone gates. The crystals look like two gates being opened.

Water exposed to music of the world

The music from the various cultures of the world has similarly various rhythms and melodies. Water captures these characteristics and reveals them to us through crystals.

Tibetan Buddhist chant

The detailed interlocking crystal indicates strength, somewhat like the temples of Tibet.

Arirang (Korean folk song)

Ketjak (music of Bali)

Arirang is a sad song about lovers being separated, and the crystal seems to indicate a broken heart. Ketjak produced a detailed crystal, making us see why music can heal the soul.

Brazilian music

Both crystals are in the shape of stars. They seem to be telling us that moving your body and singing in a loud voice serves to strengthen your immune system.

Argentine tango

Both crystals formed unique pair crystals, indicating a dancing couple. It's fun just to look at them!

Gospel music

The form seems to represent the desires of people to resonate with God. Music from around the world has the capacity to heal.

Polka from Czechoslovakia

Beer-keg polka from Austria

Czechoslovakia and Austria, although distant from each other, form similar-looking crystals.

Yodeling from Austria

Tyrolean lullaby from Austria

These crystals are also unique. The top crystal reminds one of a mouth yodeling, while in the center of the lower crystal we can see what appears to be a child.

Tap water of the world

Due to water treatment methods, it's difficult to form crystals using tap water from almost anywhere in the world. Perhaps it is time that we cooperate, and learn from each other how to better care for our water.

Paris

London

Tokyo

Water crystals fail to form, a result of using substances that harm the natural life-giving force of nature.

Rome

Venice

Bern

Even in Venice, the city of water, crystals failed to form in the tap water. Crystals just barely formed from the water of Bern in Switzerland.

Washington D.C.

New York

Surprisingly, the water of some large cities in the United States formed beautiful crystals. This may be the result of efforts to protect water, such as the use of cedar tanks in Manhattan.

Vancouver

Sydney

The water from Vancouver produced relatively complete crystals, perhaps because of the bountiful supply of water in the Rocky Mountains. The water from Sydney resulted in a surprisingly deformed crystal.

Bangkok

Hong Kong

Macao

It seems that the water of Asia is at least as bad as that of many cities in Europe and America.

Buenos Aires

Manaus

These crystals are from two cities in South America. Manaus is located on the banks of the bountiful Amazon River, in Brazil. Beautiful crystals came from the water of Buenos Aires.

The beautiful glory of natural water

Well-formed and jewellike crystals were formed from natural water from glaciers, springs, and rivers.

Spring water from Saijo, Hiroshima

This detailed crystal looks like a beautiful ornament made of silver. Some of the best-tasting water (and sake) in Japan comes from Saijo.

Sanbu-ichi Yusui spring water from Kita-koma-gun, Yamanashi prefecture

The crystal seems to shine like the sun. Melted snow runs off Yatsugatake peaks and seeps into the ground to emerge as spring water. This is an expression of the true beauty of nature.

Spring water from Chuzenji Lake

Spring water from Chuzenji Lake, treated with chlorine

The top crystal was made using spring water at a hotel on the banks of Chuzenji Lake. Chlorinating the water, at the instructions of the local government, resulted in a marked change, as shown in the bottom crystal.

Lourdes spring water

Fontana di Trevi

The water of Lourdes spring in France appears similar to the crystal formed from water shown the word "angel." The crystal from the Fontana di Trevi in Italy is unique, and appears similar to the gold coins that people throw in the fountain.

Tasmanian spring water

New Zealand groundwater

Spring water from a diamond-rich area of Tasmania produced crystals that look like little diamonds. The groundwater of New Zealand also created beautiful crystals.

South Pole

Columbia Glacier, Canada

At the South Pole, snow from thousands of years has become hardened, resulting in the sturdy-looking crystal at the top. The water for both crystals was made from snow on the surface, and so it did include a small amount of modern-day pollution.

Tenderfoot Lake, Wisconsin

A lake near Mount Myohyang, North Korea

I gathered the water from Tenderfoot Lake at the bottom of a ravine. The water from North Korea was the first I received from that country, and the result was a beautiful and fanciful crystal.

Lake Brienz

Lake Maggiore

These crystals are from water that I gathered myself in Switzerland. It's not surprising that the crystals came from Switzerland, the water capital of Europe.

CHAPTER FIVE

A Smile That Fills the World

Wanting as many people as possible to know about the wonderful mysteries of the universe as revealed through water crystals, I published the collection of my water crystal photographs in Japan, but I actually got a larger response from Europe. It seems that a ripple effect in people's souls resulted, which spread at a speed far faster than I could have imagined.

What could it be that caught the interest of so many people in so many different countries? I think that when a person looks at the photographs of water crystals, a physical change takes place in the water

within that person's body. Water has a message for the world: *The world is linked together by love and gratitude.*

Love and gratitude are fundamental principles of nature. At the end of its long journey through the cosmos, water arrived on the earth with love and gratitude in its bosom. This love and gratitude created the first inkling of life, and then provided the tender nurturing required for growth. Looking at the water crystal photographs awakens a primeval memory contained deep within the water in each of our cells.

The message of water is love and gratitude.

Review the photographs of crystals found on pages 101–132 of this book. These images reflect our beautiful world. The photographs indicate the change in water resulting from scenery and music from around the world, and include a comparison between tap water and natural water.

As mentioned in the first chapter, the world first learned about my work through my first collection of photographs of water crystals. This was made possible by the efforts of Shizuko Ouwehand, a Japanese woman with Dutch citizenship, who now serves as my interpreter.

Through the introduction of a common acquaintance, Shizuko visited my office less than a month after this collection of photographs was first published in Japan, and I showed her a copy of the book.

The moment she looked at the photographs, I could tell that she was impressed. Right then and there, she purchased seventy-seven copies, which she sent to friends and acquaintances in the Netherlands, Switzerland, Germany, the United States, Australia, and other countries.

Not long after sending out the books, she started getting a flood of responses in return. It was as if the crystals were exactly what so many people were looking for—what these difficult times that we live in require. Shizuko subsequently invited me to give a presentation at a small annual seminar that she holds in Zurich, Switzerland, entitled "Looking for Human Jewels."

A week after this event, there was to be a major annual gathering; with Shizuko's assistance I would have the opportunity to lecture before several reporters, and to be interviewed for articles in a few magazines. The result would be an enormous wave of interest in and understanding of my work.

One of the people behind this major event was Manuela Kihm, another person who saw the collection of photographs and became enchanted. She sent the following message:

I have two children, and I know that there's a completely different effect when you speak to

children with love and when you just order them. It's the difference between "Let's do it," and "Do it." I also clearly understand that this is felt in each one of our cells.

In our daily lives, water crystals teach us very important things. Every day we are surrounded by magnetic fields. We find it impossible to live without computers. But we can clearly see that there is a great difference between being unaware of the risk of magnetic fields and being aware and careful. I was very impressed.

After seeing the photographs, Manuela invited me to give a seminar that she would organize. She first talked to the environmental agency of a small town called Sanglant about a lecture on the theme of water and the environment, but they said they couldn't help because the topic was too delicate. She then turned to those more open to spiritual matters, and gathered groups of people who had a desire to explore that which cannot be seen with the naked eye. All those who heard about the water crystals were visibly impressed and inspired.

Thanks to Manuela's efforts, in the course of a week I gave presentations in three cities in Switzerland, and I returned to Japan knowing that there were vast num-

bers of people with a desire to learn more about what I was doing.

Manuela's first invitation was followed by many others, and wherever I have spoken on the topic of water crystals, the response has been marvelous. I have had the opportunity to make many trips to Europe to give lectures and presentations at halls overflowing with people with a personal and professional interest in water.

The ensuing articles in magazines led to further interest abroad, and as more and more people showed interest in the collection of photographs, I was flooded with requests to give lectures and presentations.

Information about my work spread from Europe to the United States, where I was invited to speak at Harvard, and also at a "free school" in the suburbs of Boston, attended by children who did not fit into the American society stained by guns, drugs, and violence. It was probably this sensitivity of the students that made them more receptive to information about water crystals. I'm quite sure that the students left with the realization that saying unkind words causes damage to water as well as to other people. I imagine with a smile that they returned home that day and told their parents not to say things like "Do your homework!" or "Clean your room!"

But this is just one more aspect of the resonance phenomenon. As people who have had their tender

souls damaged in some way learn about water crystals, the message of water spreads ever more quickly around the world.

Perhaps we can also say that this is the result of people searching for answers during these troubled times. I have no doubt that water crystals will become a common focal point for people all over the world who are trying to make sense of chaos.

My visits to Germany, Switzerland, the Netherlands, England, France, Italy, Canada, and the United States have given me the opportunity to meet and correspond with many others around the world who are also conducting research into water. Perhaps because water is so mysterious, the approaches are varied and unconventional.

All this interest in water means that symposiums and other gatherings are always being held around the world, making me quite busy—sometimes too busy. The symposium in Switzerland has since been held twice more in Lucerne, and it is likely to continue to grow and become more international as time goes by. I have also participated in symposiums in Australia and England.

I first wondered how much interest there would be in water in Europe and other countries, but now I know that other countries have as much or more interest than Japan. I remember hearing about a group of Japanese

visiting Zurich Lake. The lake was so beautiful that one of the participants asked the Swiss tour guide, "Why isn't there any trash at all around?" The guide, who took it for granted that the lake would be clean, didn't know quite how to reply, and instead asked the Japanese, "Why do you ask such a question?"

Wherever I go, I take slides of the water crystal photographs, and then I show audiences the crystals formed from their own local water. When they hear my message and see the slides, Europeans are visibly surprised and impressed. Such forthright responses indicate that they have a high consciousness concerning water.

However, my research is limited when I make crystals in Japan, and so people have requested that I open a research facility in Europe. In response I have begun to talk about a concept that has been floating around in my head for a long time.

The concept is grand and unique—I want to create a research facility that is itself in the shape of a hexagonal water crystal. The laboratory for studying water crystals will be located at the center, and six other laboratories will be located around the center to study other subjects and fields of science: physics and mathematics, biology and medicine, astronomy and oceanography, philosophy and religion, and chemistry and engineering. Each of the labs will focus on 18 categories of research, for a total of 108.

I have been thinking about this for a long time, prompted when I started to think about why the environment of the earth is in such a bad state, why people are so confused, and why our civilization is such as it is. Pondering these questions led me to the conclusion that it is a result of the combination of, first, pride and corruption in the scientific community, and second, those in authority consciously allowing and encouraging the formation of such a society.

Of course, there are scientists who have their own will, and work according to their own consciousness. However, when we consider the condition of society, we realize that there are really very few who have conducted their activities with a mind to perpetuating the human race and cleansing this planet that we occupy.

This does not describe, for example, scientists at the beck and call of those in authority in Japan who insist that water must be tainted with chlorine, resulting in an overall decay of society.

Of course, scientists aren't the only ones responsible for the problem. The foundations of society have become so weak that it is no longer possible for a handful of scientists to change the deplorable direction in which we are headed.

How can we change direction, and do something to significantly improve the depressing state of affairs that permeates the scientific community? I think we

must start by changing the environment and systems related to the scientific community.

In the laboratory that I have in mind, the local community will come together to support scientists, who will focus on their own field and also interact with scientists of other interests, giving them a wide perspective from which to structure their courses of research. The community will also help secure the necessary financing and other assistance that individual researchers are currently unable to obtain on their own. I expect that the result will be discoveries and advances that will truly contribute to the future of the earth and humankind.

I have an image of the researchers gathering at the central cafeteria for discussion during their morning and midday meals, and in the evening announcing the results of their research.

Of course, there are a great many obstacles that must be overcome to make this dream a reality, but I now feel that the first step has been taken.

No matter what your intentions, announcing them is an important step. I can say this with confidence based on many years of experience in business. From the time when I was a child, I was always telling people what I was thinking and what I wanted to do, and I was constantly being told that I talked too much. But the simple act of saying something is a way to gather

energy towards you. Especially when you say something to other people, energy flows in your direction and helps you to achieve your aims.

If you express your intentions, the realization of those intentions will follow. Of course, I'm not proposing that you make irresponsible statements—it's important to say what you really feel inside. Your word is your promise, so when you say something you must have the determination to commit yourself. Letting other people know your intentions also often leads to the arrival of required assistance from unexpected sources.

Words have their individual and unique vibrational frequencies, and we've already seen how words have energy that influences the universe. The words from your mouth have a power of their own that influences the entire world. We can even say that the words that teach us about nature are the words of the Creator.

I know a man who has proven the power and benefits of words, using his own body. Nobuo Shioya is a man who I am proud to call my master. He is 101 years old, but his back is straight and he appears strong and healthy to anyone who sees him. Even now, he stands for one or two hours to give lectures several times a year. He also practices his golf swing every day, and goes to the course once a week. His ability to maintain his health is nothing less than miraculous.

Master Shioya says that his secret for health is his own unique breathing method. This method involves breathing in until air fills the lungs, providing oxygen to the entire body, while thinking about the energy of the universe gathering around him and providing him with invigorating energy. This method also indicates to us the power of affirmations. Master Shioya recommends that at the end of his breathing exercise, you say the following affirmation: "The infinite power of the universe *will* be concentrated and bring true peace to the world." This statement is a type of prayer, but what is important is his strong determination expressed by the word *will*.

According to Master Shioya, there are ghostly particles that cannot be seen by the means of today's science because they exist on the border between the third and fourth dimensions. Words spoken with determination have a strong power that gathers these ghost particles, making it possible to accomplish things in the three-dimensional world.

In September 1999, I had the opportunity to actually feel the power of words as expressed by Master Shioya. On this day, approximately 350 people had gathered on the banks of Lake Biwa, Japan's largest lake. I had gathered the group together in an attempt to clean the lake. There's an old saying in Japan that when the water of Lake Biwa is clean, the water of all

Japan will be clean. Another purpose of the gathering was to pray for peace for the entire world as we entered the new century.

Under the direction of Master Shioya, who was 97 at the time, this large crowd joined forces in an affirmation for world peace that brought our voices and hearts together. Our chants could be heard around the entire lake, and there was a special feeling that made our spines tingle.

Just a month after this event took place, a strange thing happened to Lake Biwa. The newspapers reported that the putrid algae that appeared each year and caused an unbearable stench had not appeared that year.

If you don't understand the principles of the *spirit of words*, this happening will indeed seem strange, but we know that this spirit of words has the power to influence all of existence and change the world almost immediately. I have no doubt that the spirit of words generated from the determined prayers for world peace had the affect of cleansing the water in the lake in only a matter of moments. Another important point is the fact that 350 people gathered and chanted together. The combined will of so many people acted as a force to change the universe.

I sometimes use Einstein's theory of relativity ($E = MC^2$) to explain this principle. This formula has an

additional important meaning. The general understanding is that $E = MC^2$ means "energy equals mass times the speed of light squared." However, we can also interpret C as *consciousness* instead of the speed of light. Since M represents mass, we can interpret it as the number of people consciously focused.

This interpretation was taught to me by Professor Hoang Van Duc, a scholar of psychoimmunology born in Vietnam. More than ten years ago, when I invited him to attend a seminar I was holding in Japan, he mentioned in casual conversation that the " C " of $E = MC^2$ referred not to the speed of light, but to consciousness. This perspective made a deep and lasting impression on me; later, when I was thinking about vibration and how people should live their lives, I suddenly recalled those words.

Almost a century has passed since Einstein announced this formula to the world. There is no way of knowing if Einstein himself considered the possibility of C representing consciousness, but since everything in the universe is relative, you can't say that it is a mistake to see the formula in this new way.

It is said that people make use of at most 30 percent of their abilities, but if we can increase our abilities by just 1 percent, then this amount, according to the formula, will be squared, doubling the amount of energy. If people around the world were all to increase their

consciousness at the same time, the difference in energy would be enormous.

If we fill our lives with love and gratitude for all, this consciousness will become a wonderful power that will spread throughout the world. And *this* is what water crystals are trying to tell us.

I have just described how the earnest prayer and thoughts of a group of people were able to cleanse the water of a lake, but those who have seen the photographs of the crystals should not be surprised by the fact that our thoughts have the ability to change water. Several years back, I had a desire to take another step toward establishing the scientific foundations for my theories, but I wasn't quite sure how to go about it. I found the hint I was looking for one day when I happened to open the newspaper. The headline that captured my eye spoke of the ability to use ultrasound to decompose dioxin in water. The article reported on the development of a technology to expose water to 1,100 kHz of ultrasound, creating tiny air bubbles that decompose dioxin and other deadly toxins when they burst.

When I read this article, I couldn't contain my excitement. I knew that I had finally found a way to analyze the energy from the spirit of words. When the 350 people gathered on the banks of Lake Biwa to chant and pray for world peace, it is possible that they also created 2,000 kHz of ultrasound. Ultra-

sound is in the range that cannot be detected by the human ear, so they didn't create this ultrasound with their voices. However, it is possible, based on the principle of resonance of tuning with the same sounds in different octaves, that the conditions were right for creating ultrasound.

It must be said that the power of the spirit of words is indeed marvelous, but if we combined the ultrasound technology for purifying water with water vibration technology, the effect on water would be much greater.

For example, after water polluted with industrial chemicals is treated with ultrasound, it could then be treated in a second process with vibration. When polluted water is exposed to 1,100 kHz of ultrasound, the chemicals are decomposed when the air bubbles break up; although the toxins have decomposed, they are still there. To rid the water of these toxins, it is necessary to expose the water to information with the opposite vibrational frequency of the toxins.

Using just one of these two methods may not be sufficient, but by combining them it may be possible to completely rid the water of any harmful pollutants. And it might just be possible to use this same combined technology to get rid of the harmful substances within our own bodies.

What does the future hold for research into water crystals? To answer this question, we need to think

more about how much scientific recognition this research will receive. When I show the photographs at my lectures abroad, I'm bombarded with a variety of questions. For example: What are the differences in crystal formation when the water is exposed to digital versus analog music? What about live music? In order to answer such questions, I need to continue research and conduct more tests under a variety of circumstances.

Another important issue is test repeatability. Many times we have seen that crystal formation depends on the observer's consciousness. When water samples are put into Petri dishes—we usually make fifty samples—the resulting crystals differ, depending on how the water is handled and on the thoughts of the researcher. And the condition of the fifty samples of water changes moment by moment.

It may be practically impossible to control all of these factors to the point where we can say scientifically that all conditions are equal. However, our approach has been to get as close to these conditions as possible, by using the most accurate scientific methods available.

Our efforts include the use of blinds to remove the possibility of change from the researchers' thoughts. We do this because we don't want the thought that the water being told "Thank you" will produce a more

beautiful crystal than that being told "You fool" to have an impact on the results. We label the sample dishes with letters of the alphabet, and don't reveal which water is which until after the results have been seen. We hope that this method will remove the effect of the researchers' thoughts as much as possible.

For each of the fifty dishes, we make graphs showing the number of crystals in each dish that are considered beautiful, hexagonal, incomplete, and so on. For each pattern, we establish a coefficient, and give number values to the crystals. This gives us a clear picture of the characteristics of the crystals in each individual sample, and we then can classify the samples into the categories of beautiful, hexagonal, and so forth. Then we choose one crystal to photograph that best represents the characteristics of that particular sample.

Water crystals change depending on the thoughts and even the health of the observers. To account for this, we have several experienced researchers observe the samples. The intention of our research is to use these methods to discover the messages that are contained in this most delicate of messengers.

Perhaps one area in which research into water crystals can be most helpful is the prediction of earthquakes. It is believed that water is capable of detecting a forthcoming earthquake earlier than any other substance.

I envision a time when water samples will be taken from groundwater daily, and by observing the changes in crystal formation, we will detect changes in the earth's crust. When an earthquake takes place, we can compare photographs of crystals made from water taken before and after the earthquake. By accumulating data on the crystals leading up to the earthquake, we will be able to find similarities, and ultimately be able to use this information to predict future earthquakes.

Having lost my grandparents and an aunt on my mother's side in a terrible earthquake in 1923, and considering the pain and destruction caused by the earthquake that hit Kobe in 1995, I can personally say that being able to use water crystals to predict earthquakes would be an enormous contribution to humankind.

It is also quite possible that this technology could someday be used to predict other forms of destruction, such as storms, floods, epidemics, and even the planning of a secret attack from a hostile country.

I am also working on finding a way for everyone, with or without scientific equipment and knowledge, to take photographs of crystals. With the use of new materials, it appears that this will be possible in the not-too-distant future. We are looking at super-thermoconductive materials that are twenty times more efficient than normal thermoconductive materials, making it possible to freeze water at room temperature;

it will no longer be necessary to take photographs in a special room cooled to -5°C (23°F). Researchers are now developing a device based on this technology that will allow anyone to take crystal photographs almost anywhere.

I suspect that water crystal technology will in the future be shared by all humankind. However, this could also be a double-edged sword. Used correctly, water has the potential to bring unlimited glory and happiness to humankind, but such technology can also be used for gain, or to cause harm.

Our bodies are mostly water, and so life cannot continue without it. But we cannot forget that water also has the potential to wash away civilization and cause destruction. It all depends on what's in our souls. The human soul has the potential to bring happiness to the world, but also to bring pain. This is a fact that water crystals clearly reveal.

So how can we go about finding our path in life? I have constantly stressed the importance of love and gratitude. Gratitude is the creator of a heart filled with love. Love leads the feelings of gratitude in the right direction. As the water crystals show us, gratitude and love can spread throughout the world.

We all have an important mission: To make water clean again, and to create a world that is easy and healthy to live in. In order to accomplish our mission,

we must first make sure that our hearts are clear and unpolluted.

Over the centuries, humankind has constantly robbed from the earth, and left it ever more polluted—the history of which is recorded by water. Now, water is beginning to speak to us. Through water crystals, it is telling us what we need to know.

Starting today, we must begin to carve out a new history. Water is carefully and quietly watching the direction that we take—the direction that *you* take at this very moment—and watching over us all.

I only ask that you listen to and absorb what water has to say—to all of humankind, and to you.

E P I L O G U E

I sincerely hope that we can continue this wonderful discovery of water, and of the universe.

When I first heard that water constantly continues to arrive on the earth from the distant reaches of the universe, I was filled with wonderment. I began to think that if water continued to arrive at this pace, the earth would soon be flooded.

From ancient times, the human race has constantly been subject to damage and destruction caused by water. Almost all cultures of the world have a story of a great flood, and there is even scientific evidence that indicates that the earth was once covered in water. We cannot completely discount Noah and the great flood, and the tales of the civilization of Atlantis and the Mu continent lost to the sea.

The saying that history repeats itself is ultimately true, and so even now there exists the risk that water will arrive from space and once again cover our planet. This event may still be a thousand or ten thousand years in the future, but perhaps it is not too early to take action to ward off this disaster. Even now we frequently hear about floods in all parts of the world.

But once, when I found myself fretting about this possibility, another completely different thought came to me. Everything that exists in the universe is parallel. The micro world is a faithful reproduction of the macro world, and the universe is an enormous mandala (which means "circle" in Sanskrit). This way of thinking leads us to the conclusion that everything that takes place in the universe also takes place within our own bodies.

The human body requires the circulation of water, and we can conclude that this is what the universe also requires. If large volumes of water flow in only one direction, toward the earth, the circulation of water in the universe will ultimately come to a standstill. Water arrives on the earth and then ultimately returns to the far reaches of the universe on an unending marvelous journey. The water on this planet will someday set off on the outer leg of its journey into the cosmos.

But what does the fact that water is constantly arriving on the earth mean for us? Perhaps the earth is not the only destination for these lumps of water. But while there may be other stopovers, no other planet we know about has the necessary conditions required to pool water. If we compare the solar system to the human body, I suspect that the earth plays the role of the liver.

Each day, your liver filters two hundred liters of water and sends this purified water to the other organs

in your body. Considering this, it's not hard to imagine that the earth plays the vital role of purifying the water circulating in the solar system, and then returning it to the universe.

Then whose responsibility is it to purify this water that has arrived on the earth? It is ours, humankind's. And this is because we are ourselves water. Having been born here, we all have the responsibility to purify the water on the earth.

As I ponder the long and marvelous journey that water takes through the universe, I find myself thinking about such things as the origin and future of humankind. But if we consider that we are water, then the answer to many of these mysteries becomes clear. Water makes up 70 percent of our bodies, and there is little doubt that the information in the water goes a long way in the formation of our personalities.

I have often heard cases of people injured in automobile or other accidents, who, while receiving blood transfusions, saw images of places they had never been, or had memories of a past that wasn't theirs. Sometimes transfusions have even been known to cause a change in personality.

It could be that the events we experience throughout our lives become memories recorded by water, which remain in our bodies, and may be what we call the soul.

EPILOGUE

There are still many questions left unanswered about the soul, rebirths, and the existence of spirits, but I suspect that the day will someday come when many of these questions will be answered by scientific means—using water.

Where does our soul come from? We have seen the possibility that it comes from the distant universe, carried by water.

So we ask next, what is in store for the soul? Since we are water itself, some day all our memories of experiences on this planet will be launched into space. And our responsibility before this happens is to become pure water on this earth.

To make this possible, we must first and foremost live life to the fullest. Our consciousness is what will purify water, and through this we send messages of beauty and strength to all life.

Wouldn't it be wonderful if we could cover the world in the most beautiful of water crystals?

How do we go about this? The answer is love and gratitude. I'd like to ask you to take another look at the beauty of the crystals. If all the people of the world can have love and gratitude, the pristine beauty of the earth will once again return.

We live our short lives on this planet and then we set out on a journey into the universe. I'm not sure how this process works, but we can leave this up to the laws

EPILOGUE

of the universe. Of course, when we make this journey we will not be in our current physical form, but in the form of water or mist.

When my soul is ready to set out on its journey to the cosmos, I fully intend to call out to everyone and say, "We're off to see the universe! Let's go to Mars!"

A B O U T T H E A U T H O R

Masaru Emoto was born in Yokohama in July, 1943. He is a graduate of the Yokohama Municipal University's department of humanities and sciences, with a focus on International Relations. In 1986 he established the IHM Corporation in Tokyo. In October of 1992 he received certification from the Open International University as a Doctor of Alternative Medicine. Subsequently he was introduced to the concept of micro-cluster water in the United States, and Magnetic Resonance Analysis technology. The quest thus began to discover the mystery of water.

Dr. Emoto undertook extensive research into water around the planet, not so much as a scientific researcher but more from the perspective of an original thinker. At length he realized that it was in the frozen crystal form that water showed us its true nature. He continues with this experimentation, and has written a variety of well-received books in Japanese, as well as the seminal *Messages from Water*, published bilingually. He is married to Kazuko Emoto who shares his passion and is head of Kyoikusha, the publishing arm of his company. They have three children.

ABOUT THE AUTHOR

Masaru Emoto's self published books, *The Message from Water volumes 1 and 2*, are available in English with Japanese subtitles from Source Books & Sacred Spaces.

The Power of Appreciation

The Key to a Vibrant Life

Authors: Noelle C. Nelson, Ph.D.
and Jeannine Lemare Calaba, Psy.D.

\$14.95, softcover

Research confirms that when people feel appreciation, good things happen to their minds, hearts, and bodies. But appreciation is much more than a feel-good mantra. It is an actual force, an energy that can be harnessed and used to transform our daily life—relationships, work, health and aging, finances, crises, and more. *The Power of Appreciation* will open your eyes to the fabulous rewards of conscious, proactive appreciation. Based on a five-step approach to developing an appreciative mind-set, this handbook for living healthier and happier also includes tips for overcoming resistance and road-blocks, research supporting the positive effects of appreciation, and guidelines for creating an Appreciators Group.

Forgiveness

The Greatest Healer of All

Author: Gerald G. Jampolsky, M.D.

Foreword: Neale Donald Walsch

\$12.95, softcover

Forgiveness: The Greatest Healer of All is written in simple, down-to-earth language. It explains why so many of us find it difficult to forgive and why holding on to grievances is really a decision to suffer. The book describes what causes us to be unforgiving and how our minds work to justify this. It goes on

to point out the toxic side effects of being unforgiving and the havoc it can play on our bodies and on our lives. But above all, it leads us to the vast benefits of forgiving.

The author shares powerful stories that open our hearts to the miracles which can take place when we truly believe that no one needs to be excluded from our love. Sprinkled throughout the book are Forgiveness Reminders that may be used as daily affirmations supporting a new life free of past grievances.

The Art of Thank You

Crafting Notes of Gratitude

Author: Connie Leas

\$14.95, hardcover

While reminding us that a little gratitude can go a long way, this book distills the how-tos of thank-yous. Part inspirational, part how-to, *The Art of Thank You* will rekindle the gratitude in all of us and inspire readers to pick up a pen and take the time to show thanks. It stresses the healing power that comes from both giving and receiving thanks and provides practical, concrete, and inspirational examples of when to write a thank-you note and what that note should include. With its appealing and approachable style, beautiful gift presentation, charming examples, and real-life anecdotes, *The Art of Thank You* has the power to galvanize readers' resolve to start writing their all-important thank-you notes.

Summit Strategies

Secrets to Mastering the Everest in Your Life

Author: Gary P. Scott

\$13.95, softcover

Picture your hands raised in a victory pose. No one but you, enjoying your moment, your victory lap, your knockout, your achievement, your crowning glory—your EVEREST!

From wherever you stand right now, *Summit Strategies* can help you reach your own personal summit. Through riveting accounts of lessons learned on the world's most perilous mountains, international mountain guide Gary Scott offers sure-footed wisdom that will guide you, step by step, until you are prepared to take on any life challenge.

Path of the Pearl

Discover Your Treasures Within

Author: Mary Olsen Kelly

\$16.95, hardcover

The pearl and its legendary mystical, restorative, and healing powers have ignited imaginations for centuries. *Path of the Pearl* captures the strength of this enduring symbol by using the pearl as a metaphor for personal growth. A pearl oyster, invaded by an irritant it can't expel, turns adversity into a glowing iridescent work of nature's art. This book acknowledges and celebrates the similar path shared by women, particularly in midlife.

Science/Health

"*The Hidden Messages in Water* is magnificent. Through his genius photography and superb scientific skill, Dr. Masaru Emoto has created a book that is truly a mystical treasure. His contribution to research in spiritual consciousness is positively masterful."

— Caroline M. Myss, author, *Sacred Contracts* and *Anatomy of the Spirit*

"As with Galileo, Newton, and Einstein, Dr. Emoto's clear vision helps us see ourselves and our universe differently. Science and spirit unite, resulting in a profound and undeniable quantum leap in how we view our world, and how we can reclaim our health and create peace."

— Marcus Laux, ND, Editor, *Naturally Well Today*

"Dr. Emoto's work with water beautifully illustrates the healing power of love and gratitude. These building blocks of appreciation support our well-being in body, mind, heart, and soul. *The Hidden Messages in Water* is a most valuable contribution to the creation of a positive future for our world."

—Noelle C. Nelson, Ph.D., co-author, *The Power of Appreciation*

The Hidden Messages in Water introduces the revolutionary work of internationally renowned Japanese scientist Masaru Emoto, who has discovered that molecules of water are affected by our thoughts, words, and feelings. Since humans and the earth are composed mostly of water, his message is one of personal health, global environmental renewal, and a practical plan for peace that starts with each one of us.

THE
Shape of Love

DISCOVERING WHO WE ARE, WHERE WE
CAME FROM, AND WHERE WE'RE GOING

This cutting-edge new work, by the author of the *New York Times* bestseller *The Hidden Messages in Water*, presents a revolutionary understanding of life and consciousness and provides answers to the most profound questions of existence.

Introduced in the bestselling *The Hidden Messages in Water* and the hit cult film *What the Bleep Do We Know?*, the groundbreaking work of Japanese scientist Masaru Emoto captured the popular imagination and launched a worldwide movement. Using high-speed photography, Dr. Emoto discovered that crystals formed in frozen water are affected by our thoughts, words, and feelings. Since humans and the earth are composed mostly of water, his findings have far-reaching ramifications for individuals, for human society, and for the global environment.

In *The Shape of Love*, Dr. Emoto shares new images from his research and for the first time draws out the significant lessons of his work. In a clear, conversational style, he interprets the messages hidden in his extraordinary photographs and explains how his discoveries can help us find answers to these eternal questions: Where did we come from? Why are we here? Where will we go after we die? Providing a new way of looking at

P R E F A C E

My first book on water, *Messages from Water*, was published in June 1999, and new readers continue to discover it year after year. In fact, it has been (or is in the process of being) translated into fourteen languages. My later title *The Hidden Messages in Water* was a collection of water crystal photographs; in that book I kept verbal explanations to a minimum so as to encourage readers to explore their own interpretations and sensibilities. It worked. The book spread by word of mouth throughout the world, like widening rings on water.

The Hidden Messages in Water was also intended to be a collection of messages about how to live: the messages I had learned from water through my research on *hado* (magnetic resonance) and water over fifteen years. With that purpose in mind, the book included many of my thoughts and inspirations.

The Hidden Messages in Water made the best-seller list in Japan and many other countries, and that success gave me courage and confidence. The book ended as follows: "When my soul is ready to set out on its journey to the cosmos, I fully intend to call out to everyone and say 'We're off to see the universe! Let's go to Mars!'" The widespread acceptance of my books encouraged me to pursue what I had wanted to write on for some time—that is, my thoughts on the eternal themes of human beings: Where did we come from? Why are we here? Where will we go after we die?

At the same time, Ms. Yumiko Toyoshima of the Tokuma Shoten Publishing Company really wanted me to write a book on the subject. But I hesitated because the number of requests for my seminars was rapidly increasing, and I was also already committed to some other writing projects. Furthermore, this book had a very tight schedule,

giving me little time to write on these lofty, eternal themes. But Ms. Toyoshima's enthusiasm eventually made me agree to undertake this book, despite my extremely busy schedule. That was in the early summer of 2003. In the end, by twice confining myself to a hotel room, I managed to finish writing.

The reader may find shortcomings, but this book was meant to convey my thoughts on this subject. I believe that these themes by their very nature require all human beings to think about them on their own. It will be a great pleasure for me to hear criticisms and opinions from readers.

I must acknowledge the efforts of Ms. Toyoshima of Tokuma Shoten, who oversaw the entire publishing process of this book in Japanese. I thank her for putting it into such a wonderful form.

Masaru Emoto

THE
SHAPES
OF
LOVE
IN
WATER

HOPE

There is an expression, "The heart is filled up with hope."

The water crystal depicted in Figure 1 might bring to mind an image of a child's chest filled with hope; his or her dreams are growing and growing. Note how the tips of the crystal seem to be growing farther out and the beautiful hexagon at its core. To have hope, people need a solid base, such as the one seen in this photograph. The source of the base is paternal and maternal love and education. In looking back at my life, I realize my mother's love enabled me to continue to hope to become a man who could contribute to world peace. I am grateful for her plentiful love.

THE
SHAPE
OF
LOVE

2

Figure 1. The tips of this crystal seem to be growing farther out, just like the image of the word. Let us be the source of hope for others.

I was the youngest of four children, and I received my mother's full attention. My brothers did very well at school. Because I was the youngest child, not too much was expected of me. So I was brought up without many restrictions. After I married, my wife became the the bulwark of my life, just as my mother had been. Both my mother and my wife are like a big ocean that surrounds me

THE
SHAPES
OF LOVE
IN WATER

3

in a relaxing way and lets me swim freely. I am grateful to these two women for enabling me to think that I can help build a unified world.

I hope that women who become mothers develop great love within themselves. Perhaps those who fully received maternal love in childhood find it easier to warmly love their children when they become mothers.

More and more women these days seem to feel uncomfortable in relationships of mutual dependence. If you are one of them, I hope you find someone you feel comfortable with. If you wish deeply in your heart, I am sure your wish will be granted.

Others may not like the person you choose to depend on. However, you and that person may be on the same wavelength, and that will make you feel at ease. Such a person may be near you, and may be of the same gender.

Dependence requires getting closer to someone, and this requires courage. I am positive that you can find someone you feel natural and comfortable with to build such a relationship. Once you become comfortable with depending on someone else, you will be able to let others depend on you.

With such great love, which allows others to depend on you, you can expect to become a source for giving hope to people around you.

By looking at the photograph of the water crystal of "hope," you may remember the mother ocean. The memory of the expansive, vast sea may remind you of a state of being surrounded by great love.

When I first saw the picture, I was reminded of my mother's love and of my wife's love, and I felt my love toward them redouble. I felt very much encouraged.

PURPOSE AND DESPAIR

If someone were to ask you, "What do you live for?" how would you respond? Even now I am unable to give an immediate answer. Why? Because the purpose of life changes over time. Try to remember: What did you live for when you were twenty, thirty, or forty? You are very likely to find that it has changed. The life purpose we choose is not necessarily always beautiful and noble.

The water crystal in Figure 2 shows a beautiful hexagon. It indicates the positive nature of what

Figure 2. The outer, feather-like parts have sparkling spots. Is your life purpose something sparkling for you?

makes us feel that life is worth living. What is noticeable in this crystal is that the outer, feather-like parts have sparkling spots. They are unique to this crystal. Perhaps the purpose of life is something that shines on us.

Please take a moment to remember when you found the purpose of your life. When something takes your breath away, when amazement gives you

goose bumps, and when an excitement makes you restless, your heart is thrilled. The purpose of life may be found through encountering thrilling experiences; such an encounter is what shines for you.

The purpose of life may further fortify your strengths, or it may complement your weaknesses. If you can develop your strengths more, you will be radiant and feel a greater purpose in life.

As for weaknesses, you might find yourself naturally drawn to something that helps resolve them. As we humans have a sense of balance, we tend to be attracted to what we feel is lacking in ourselves. When you encounter what you were looking for, you will probably find brilliance in it. Thus it will become your life purpose.

An encounter with a person, an encounter with a meaningful job, a dream that you want to chase for the rest of your life—all of these are leading you toward your purpose in life.

On the other hand, when we give up all hope, our immune system weakens, and our natural healing power diminishes.

Initially, I didn't think that water would make a crystal after being shown the word "despair." However, the crystal in Figure 3 looks like the making

Figure 3. This crystal teaches us that any despair has hope within it. It is a sign of hope. In the world of water, there is no such thing as total despair.

of a hexagon. It may be saying that any despair has hope within it. I didn't want to show you the pictures that were too distorted, so I picked a relatively good-looking one.

The water crystal in Figure 3 seems to have shrunk. We, too, shrink when we despair. We stoop down and turn in upon ourselves. However, when

we say we despair, feeling despair amounts to perhaps 80 percent, while the remaining 20 percent is our dormant hope.

Though small, a sign of hope does come through in this crystal. In the world of water, I don't believe there is such a thing as total despair because water circulates. Water can pass from one form to another and finally come back to its beauty. So, too, can we humans.

Even when we feel we are at the bottom of despair, we have latent faculties that bounce us back to life and allow us to find the purpose to live again.

THANKS TO (OKAGESAMA)

Strangely, the water crystal in Figure 4 has a shadow. I was surprised because water seemed to capture the word *okagesama* ("thanks to" in Japanese, or more literally "thanks to the shadow of"). Among the water crystal photographs I took, one was shaped like an elephant's trunk and one like the rope ornament of a shrine. I realize that water has a mystical power to show its surroundings.

Figure 4. *Okagesama* (thanks to the shadow of) is a unique and beautiful Japanese expression of gratitude. As the word indicates, a shadow appeared in this crystal. It's a mysterious phenomenon, isn't it?

Maybe we could say that water is a blueprint of reality. I sincerely think that you can find the systems of the universe in this blueprint.

An important Buddhist text, the Heart Sutra, states, "Form is emptiness; emptiness is form." I take this to mean something that exists is in fact void (emptiness) and void does in fact exist. A shadow is certainly empty. Therefore, I believe that

a shadow must have a high potential within itself to create something anew. It is a wonder to me that *okagesama* is an expression used exclusively by the Japanese. It is a beautiful phrase that everybody knows in Japan. The feeling of gratitude contained in *okagesama* gives off positive energy to others and transforms itself into love in their hearts. It would be splendid for people to frequently exchange such a beautiful expression. Have you said *okagesama* lately?

YOU FOOL

"In the beginning was the Word," says the Bible. There is no doubt that words have a strong influence on people. The same is true with water; after being exposed to the words "you fool," water has never formed beautiful crystals.

In the beginning, the world probably had only beautiful and creative words. Thus it must have been filled with creative energies to produce new things. Then the words with negative energies appeared, for example, "you fool" and "no good."

The crystal depicted in Figure 5 gives us the impression of a swirling typhoon with the force to

Figure 5. This crystal tells us about the destructive power that negative words carry. Negative words are hurtful not only to humans but also to animals and plants.

destroy everything. Looking at this crystal makes me wonder if saying "you fool" to someone has a similar effect on that person's heart, making it corrupt and ugly like the crystal in this photograph. Simultaneously, the person who calls others

names is inevitably tainted by the same negative influence. Words affect our heart and create vibrations. A good vibration creates good energy; a bad vibration amplifies bad energy.

Happiness will never come from a negative and destructive phrase such as this one. Your words have the potential to change everything.

CONFIDENCE

The crystal in Figure 6 makes me realize that confidence is created by the accumulation of experiences. Overconfidence, or behaving with too much confidence not backed up by solid practices, is merely a pretense and bound to be exposed sooner or later. True confidence comes from trusting yourself as well as others. That is how one attains real, unswerving confidence. Having been shown the word "confidence," the water creates a crystal with a complete and beautiful shape. Ideas that have positive energies produce beautiful crystals. We've all heard the saying "Silence is golden." Silence—"no talk but act"—is often valued as a virtue among the Japanese. However, I myself tend

Figure 6. A complete and beautiful crystal resulted from the word "confidence." "Self-trusting," as the word may be defined, has a positive energy.

to "talk and act." I believe that confidence can be built by taking responsible actions after you have announced what you are going to do.

Those who wish to gain confidence may want to look at this water crystal photograph frequently and always have it on hand, perhaps by carrying it in a breast pocket, placing it in a pocketbook, or putting it up on the wall.

True confidence is generated by behaving responsibly. All of your experiences, whether successes or failures, will turn into confidence that will support you and help you shine.

I LOVE YOU

The water that was shown the phrase "I love you" made a big, dynamic crystal, as seen in Figure 7. This crystal also had a very large, beautiful base. When a person says to someone, "I love you"—for example, a mother to her child, a husband to his wife, or a wife to her husband—the one who hears the words will shine beautifully. Compared with crystals that were formed after water was shown the phrase "love and thanks" (which I'll discuss later), this one, having been shown "I love you," seems less restricted. I wonder if it has something to do with the present progressive form used in Japanese for "I love you": "I *am* loving you."

In love, agape (unconditional, self-sacrificing love) is often compared with eros (passionate love

Figure 7. This crystal has the expansive feel of growing farther out. By continually being shown "I love you," water yields crystals that grow bigger and shinier.

with sensual desire). I believe that eros is changeable while agape is not. Thus eros can generate more energy. When eros changes into agape, vast love will wrap you in gentle warmth.

Westerners frequently use the expression "I love you," whereas the Japanese don't. Japanese men in middle age or older tend to be especially shy about expressing their love for someone, and may do so only on very rare occasions. I was no exception until about ten years ago, but now I often say it to my employees and family members. Some

people say, "Love doesn't have to be expressed in words." For those who have the vibration of divinely pure consciousness, it may be a different story, but most of us ordinary folks are better off verbalizing it.

Of course, the accompanying emotion is important. Water does not respond in beautiful crystals when "I love you" is communicated obligatorily and carelessly. So the best way of saying "I love you" would be to do so naturally and wholeheartedly, when the moment and the emotion arise.

Of course, I hope that women also feel comfortable saying "I love you," without worrying that they are imposing themselves on others. To children, sweethearts, husbands, and friends, women should freely express it. When you say these words, the water inside of you is affected by beautiful radiance.

TOUCHED

The crystal in Figure 8 shows a shape of hands in prayer in one of its outer parts. I believe that people feel touched when their prayers come true, or when their latent desire or hope is fulfilled. I won-

Figure 8. "Touched" implies "feeling grateful and moving." It is a base for a resonance phenomenon. Let's cherish our feeling of being "touched," no matter how small it may be.

der if this is why the shape of prayer appeared in this water crystal. As indicated in the two Japanese characters (*kanji*) that mean "touched"—"feel" and "move"—the word has a strong power to affect our hearts.

Without having experiences of "being touched," people find it difficult to live with vigor and health.

Mrs. Suzue Kato, who lived to be 104 years old, used to say, "Live each and every day having ten 'touched' experiences." Even busy people, I hope, will have at least three "touched" experiences in a day—in the morning, during the day, and in the evening.

One of the most moving experiences I have ever had since I started to take photographs of water crystals was when I saw the picture of a water crystal from Fujiwara Dam. We had initially gone to the dam to collect a sample; the water looked very dirty, as it contained impurities such as bacteria. I couldn't believe my eyes when I saw the picture of an amazingly beautiful crystal. At the time I had no idea why we could take such a beautiful picture. Later it occurred to me that the crystal might have been formed at the level of subatomic particles that we cannot see even with an electron microscope. Yet somehow we were able to capture the picture of it.

Between the soul of the person who took the picture and the intrinsically exquisite energy of the water, there must have been a beautiful phenomenon of resonance. Thus it was possible for us to take the wonderful picture of the water crystal. It was a moving experience for me to understand

this. I was also touched by the fact that such a beautiful picture came about due to some power beyond the natural world.

Do you know the character Jean Valjean in *Les Misérables*? He is a criminal who one night steals silver from a church. When the police take him back to the church the next day, the bishop protects Valjean by telling the police that he gave the silver to him and proceeds to hand him some silver candleholders, too. Valjean feels as if he's been struck by lightning. The goodness starts to grow in him. Actually, I would say that what is awakened in him is the innate goodness that has quietly remained within him together with other qualities such as truth and beauty.

As you probably know, after Valjean has this experience, he lives a wonderful life and does many things to help others. I would think that the bishop, who has had such an impact on Valjean, would also receive substantial energy of gratitude in return.

Touching experiences such as these aren't confined to great works of literature, however: they can be found in our daily lives. One example for me was when my company went bankrupt with a 100 million yen—about \$1 million—debt. We had a

family council that included all of my brothers, and they said, "It will be very difficult to clear such a big debt. You should declare personal bankruptcy and divorce your wife." I felt half-resigned and thought I had no other choice but to accept their advice. In reality, I didn't have the energy to argue. However, my wife decidedly said, "I will not divorce him. I know he can get back on his feet again." For the next seven years, she worked as a saleslady for an insurance company, and we lived off her income. She made it possible for me to focus on working hard to repay my debt.

Perhaps "touching" is an act of love. It is a great gift from the soul for those who live their lives wholeheartedly.

FAMILY LOVE

The crystal in Figure 9 seems to tell us that the ideal family involves three generations—grandparents, parents, and children. I feel that the most beautiful part of this crystal is the faint layer in the background that supports the other two layers. I believe this layer represents grandparents. They are big, but they are not forward. They seem to

Figure 9. This is a unique crystal formed as if showing a family of three generations—grandparents, parents, and children. Family love that gives us strength lasts forever.

shine for their children and grandchildren from the back. What an admirable way of life they are demonstrating!

Modern society seems to give the cold shoulder to grandparents. I don't know how this came about, but it saddens me. This water crystal reminds us of the fact that the parents' and children's generations exist because of grandparents. Although

each individual's life is finite, life keeps going forever, from generation to generation in a family. Whether we notice or not, the love of our family, a love that asks nothing in return, is always there to give us great strength.

BENEVOLENCE

Benevolence is a kind of love that symbolizes the affection of parents for their children. The crystal in Figure 10 also shows multiple layers. Behind the one in the foreground, which is growing bigger, there is a larger structure that seems to support the one in front with unstinting love.

Personally, I treasure this word, "benevolence." My father died at the age of fifty-seven, when I was a sophomore in college. He was poor, but he lived frugally to raise his children and send them to college. He was a very loving family man. As far as I know, he had never met his biological parents. He was the illegitimate child of a village headman's daughter in Gigu (which is in the middle of Japan) and a schoolteacher. Soon after his birth, he was abandoned at a brothel. Three months later, the Emoto family adopted him, and

Figure 10. This crystal reminded me of my father. He didn't make himself stand out, but he looked after his children lovingly and with a big heart.

he was raised by loving foster parents. However, his foster mother passed away when he was five years old.

His foster father married another woman, who was also nice, but my father started to feel somewhat uncomfortable after his stepbrothers were born. When he grew up and got a job, he requested a transfer to Tokyo, where he met the woman who was to become my mother.

Until he received the family registration document that he needed in order to marry, my father never knew that he was adopted and that his biological parents were elsewhere. He was shocked and decided to look for his biological mother; after much searching he was able to discover her whereabouts. He visited her husband's family, but he wasn't allowed to meet her. I believe that because he had such a background, he wanted to choose a family-oriented lifestyle. Thanks to my father's choice, my siblings and I grew up very happily, receiving plenty of love from our parents. The inscription on my father's tombstone reads "Lived in benevolence." This is the phrase that we, his children, selected for him. In looking back, I feel his life was a demonstration of this important virtue.

Two

WHO
ARE
YOU?

It has been seventeen years since I first became involved in studying water. During that time—and especially over the past nine years, since I started to take photographs of crystals—water has taught me many things. I learned things about myself, family, work, society, nation, world, universe, energy, life, diseases, the afterlife, and nature. I became quite knowledgeable, and I want to share the important matters I learned from water with as many people as possible.

Thus I walk around the world as if I were a missionary in the Middle Ages or a street preacher in Japan. I wonder if, thanks to modern transportation, I could have done as much work in three years by myself as they did in a hundred years.

Yet I still don't feel that I have walked enough.

I still don't feel that I have talked enough. I wish to continue my journey. However, I have learned from the great Zen priest and poet Ikkyu—his name literally means "a short rest" in Japanese—that it is no good to rush things. I shall take a rest here so that I can organize and write down what I learned from water. I shall pour what is in me onto paper. As I empty my head, I anticipate water's further teachings. I anxiously look forward to my head being filled with delightful knowledge again. With a water refill, I can get back to my enjoyable journey. Till then, please stay with me for a while.

WHO ARE YOU? I AM WATER

Some years back a philosophical novel, *Sophie's World* by Jostein Gaarder, made best-seller lists around the world. In the book there is a question: "Who are you?" Since my childhood, I've asked myself the same question many times. I've wondered who I was and why I was here.

In high school I often discussed these questions (rather naively, I must say) with friends in my literary circle. Our talks would go on late into the night. Alongside these discussions I would read

many of the great literary works of Japan and other countries, checking books out of the school library one after another. Among the books I read that had a big impact on me were Fyodor Dostoyevsky's *The Idiot*, Leo Tolstoy's *War and Peace*, and Victor Hugo's *Les Misérables*. But when I went to college, I had different priorities, and I wound up joining the rugby club. Rugby was a lot of fun, and I put all my spare energy into it, so much so that I completely forgot about the questions I had asked earlier in my life. Then I went out into the world.

In the twenty-five years after college, I was an unremarkable workaholic, never resisting or questioning anything about Japan's capitalistic society—the rapid economic growth, the bubble economy that followed, and finally the bursting of the bubble. Eventually, I was beaten and burned out. Though I wasn't conscious of it then, I now see that I had to live an intense life with many ups and downs.

As you might imagine, at this time I was far from asking myself a question such as "Who am I?" My life continued to take twists and turns, but as I worked hard, I was blessed with meeting interesting people.

Eventually, I became independent and started

a small trading company (IHM), which imported medical devices from the United States. It began to change my life completely, and I returned to the frame of mind where I would ask the question "Who am I?"

Now I can clearly answer that question: "I am water." Why and how did I arrive at this answer? I will explain it in the subsequent sections about my work and the events that followed.

WATER AND VIBRATION

I became aware that I am water when my company shifted the products it handled from medical devices to water. For some reason, I was given a great business break dealing with water. I became fascinated by this opportunity, as if I were destined for this work. Because I lacked a background in chemistry and natural science, I began an intense study of water from the perspective of my favorite field, literature.

My inquiry led me to understand that water had a *hado* (vibratory) nature. As a result of this realization, I imported a device for measuring magnetic resonance (*hado*). I then measured the

properties of water using the device, developed a product called *Hado* Water, and established a therapeutic method called *Hado* Water Therapy.

Having achieved remarkable results with *Hado* Water, I wrote a book titled *Hado Jidai eno Jyomaku* (The Prelude to the *Hado* Age) in 1992, six years after my water investigations had commenced.

Although the book was written by an unknown author and published by a small press, it was well received and much talked about, thanks to the introduction and recommendation by Mr. Yukio Funai, chairman of Funai Consulting. It was the first book to introduce the concept of *hado* to the general public.

However, soon after the book was published, disturbing phenomena involving cult groups (including Aum Shinrikyo) became widely discussed in Japan. Some people even started to talk about *hado* in association with them. Moreover, others interpreted *hado* in their own way and introduced many dubious *hado* products to the market.

Like quantum mechanics, *hado* should have been understood as an important science that clarified the root of all phenomena. However, partially due to the efforts of some scientists and

authorities, it failed to become accepted in this way.

For that reason I was compelled to find a straightforward way to have the general public understand this essential and fundamental concept. The invisible world of *hado* must be made visible somehow. How could I do it? I contemplated it day after day, even while I was sleeping.

The idea that finally came to me, as you might have guessed, was to freeze water and take pictures of the crystals, as if they were snowflakes.

TAKING PICTURES OF FROZEN WATER CRYSTALS

It was in July 1994 that the idea hit me. I happened to be reading a Japanese translation of *The Day That Lightning Chased the Housewife: And Other Mysteries of Science* by Julia Leigh and David Savold. At one point they discuss the wonderful fact that no two snowflakes are identical. As I read it, I thought, "I've got it. Snow is water! I must be able to see water crystals if I freeze water."

Immediately, I put the idea into practice at my

company. After two months of struggles, we finally succeeded in taking the first photograph of a water crystal. We went on to perform many experiments, and I indeed learned many things from water. What I learned went into my books, including *Messages from Water*, *The Hidden Messages in Water*, *Kessho Monogatari* (Crystal Story), *Mizuwa Kataru* (Water Talk), and *The True Power of Water*.

My hope to see *hado* take root has progressed just to the first stage, but it was realized nonetheless. *Hado* has become a term that many readers of my books understand and use. This work has also taught me even more important things, some of which cause a sort of cultural shock to many people when I share them.

THE RATIO OF WATER IN A HUMAN BODY

Let's get into the core subject: Why are we water? As you know, 70 percent of the human body is water. Of course, the percentage differs depending on age; the younger the person is, the higher the percentage. For example, a newborn baby's body is more than 80 percent water. When a human life

THE
SHAPE
OF
LOVE

34

begins as a fertilized egg, the percentage of water is about 96 percent. On average, the percentage of water in an adult's body is 70 percent. It goes down to about 60 percent when a person reaches sixty years of age. As we grow older, the percentage of water in our bodies is further reduced, and the skin wrinkles more. In Japanese, a person with young and fresh skin is described as *mizumizushii hito* (a person full of water). (Incidentally, the next-highest atom is carbon, which counts for 10 percent, followed by nitrogen at 2.4 percent.)

When the amount of water in the body drops below 50 percent, the physical body ends its life. My mother had a long life and lived to be ninety-three years old. In the last five years of her life, her body became smaller and smaller. Shrinking must have been her genes' strategy to keep her body's water level above the required 50 percent. By understanding the relationship between age and the amount of water in the body, one can see why water is considered the source of life.

Because water is the single largest component in human beings, we can say we are water. Please remember this point, as it will be the premise for understanding the rest of this book.

Let me repeat: "We are made up of water."

WHO
ARE
YOU?

35

Three

THE
BEGINNING
OF
LOVE

THE ESSENTIALS FOR ALL BEINGS

The earth's environment is filled with wonders. Why are we always surrounded by oxygen, water, and moderate temperatures? How does our planet constantly move in an orbit? It is indeed amazing.

What's more, a vast number of beings exist on earth. There are more than six billion people; domesticated animals such as dogs, cats, cattle, horses, sheep, pigs, and chickens; wild animals such as monkeys, raccoons, foxes, deer, bears, lions, tigers, panthers, giraffes, elephants, camels, kangaroos, and snakes; birds such as sparrows, peacocks, hawks, and butcher-birds; and insects such as ladybugs and other beetles. Additionally,

there are reptiles, small creatures like earthworms and microbes, fish, sea creatures, plants, and minerals.

There are so many beings on this earth that it's impossible to list them all. Why are there so many? How were they born? Why do they exist? Only God knows the answers to these questions. Yet even though there are so many beings, they all have one thing in common. Every one of them has energy. From another point of view, we could say, "Everything is made by energy." In other words, all beings need energy. What, then, is that energy?

WHAT WAS THE BEGINNING OF ALL?

Let me tell you the conclusion first: energy means vibration. All beings are made up of atoms, and all atoms vibrate at their core. Each and every thing is vibrating. Yes, I mean everything—a dog, a cat, and a computer. Also, I mean a book, a plant, clothes, shoes, and perfume, as well as bread, rice, and everyday dishes.

Things exist because of vibration. Therefore, vibration is energy. An atom, a vibrating atom, in-

variably makes a sound. A pebble at the roadside, too, is vibrating and making a sound. A beautiful tulip blooming in your garden is also making a sound. For that matter, even the book you are now holding is making a sound. Still, we cannot hear these sounds, because we are not designed to hear them.

The Divine that created human beings designed our hearing abilities within the range of 15 hertz (fifteen vibrations per second) to 20,000 hertz. This is called the range of audible sounds. The Creator must have made this arrangement so that we could sleep at night. What if we could hear the sounds that a bed or a pillow gives off constantly? Surely, we would have difficulty sleeping.

Another important point is that vibration means life. The Japanese character (*kanji*) for "life" has the symbol meaning "to beat" at its center. This character must have been developed to show that beating is necessary to continue life, because vibration means life. In another sense, life also means rhythm.

How are we informed of someone's death? A doctor takes the person's pulse and says, "I am sorry, but he is dead." Death is pronounced when the heart stops beating.

The issue of brain death is controversial. I do not believe that brain death is really death, nor do I think that someone in the vegetable state is dead. When the heart's beating or vibration stops, that is death. Unless the heart stops beating, or vibrating, a doctor cannot pronounce death.

From this point of view, we can say, "Everything in this world is alive." We tend to think that only the things that move and grow are living. If we take the view that vibration equals life, even a pebble at the roadside is decisively alive. Perhaps Kannon (the goddess of mercy in Buddhism) sees the world that way. Literally speaking, the name Kannon means "one who can observe all sounds"—not hear them, only observe or see all sounds. Thus, I suppose, she teaches that "all things have life; so love and respect them."

Then where does vibration come from? The Japanese character for "sound" has two parts: "to stand" and "the sun." The character points out that the source of energy is the sun. Not until the sun "stands" does a sound, or vibration, exist. The sun is the source of all energies. No wonder so many parts of the world have the practice of worshipping the sun, including Amaterasu Omikami (goddess of the sun) in Japan.

THE SECRETS OF VIBRATION (SOUND)

Since 1987, when I started to import magnetic resonance analyzers (MRAs), I have been a *hado* and water researcher. For the next ten years I devoted all my energies to making *hado* water and helping more than fifteen thousand people recover from illness.

When I published *Messages from Water* (which included the world's first water crystal photograph) in June 1999, I became more confident about my concept of *hado*, having seen many people appreciate what I had to offer in that book. Today many sad and confusing things are happening in the world. Thinking about what is going to happen next gives me some anxiety and fear. However, I believe that we can deepen our understanding of the world by simply understanding the nature of vibration (sound). Vibration has many secrets, and once we understand its nature, we will understand many things about life and human beings. My theory of vibration consists of three parts: resonance, purity, and similarity. The various phenomena in the world, I believe, can be understood by using

Figure 11. Tuning fork.

these three concepts. Allow me to explain them one by one.

GETTING ENERGIZED— RESONANCE

In musical terms, tuning means to put instruments into proper pitch, as needs to be done in an orchestra. A tuning fork is a device used for this purpose. The device has the shape shown in Figure II.

A tuning fork is made to give off a fixed tone when struck. The most commonly used tuning

Figure 12. Top: Resonate. Middle: Hit (below 261.5 hertz and 523 hertz). Bottom left to right on the keys: la, ti, re, mi, fa, la, ti. Bottom left to right below the keys: sol, do, sol, do.

fork is one of 440 hertz. (Lately, 442 hertz is a more common frequency for tuning. Due to the change in the earth's terrestrial magnetism, the tone our ears can hear most easily seems to be rising.)

As shown in Figure 12, 440 hertz is the sound of the first A note on a piano keyboard above middle C. The sound of 261.5 hertz is the middle C, and its multiple of two, 523 hertz, is the C one octave above. As for A, it goes from a low pitch of 27.5 hertz to higher pitches of 55, 110, 220, 440, 880, 1,760, 3,520 hertz, and so on.

Let's suppose we have two tuning forks of 440

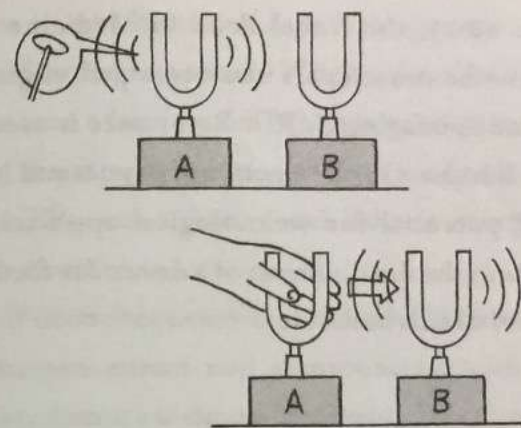

Figure 13. Top: Hit. Energy = vibration. Bottom: Energy from A to B. B continues to vibrate even after A is stopped.

hertz (Figure 13). When a tuning fork of 440 hertz is hit with a rubber hammer, we will hear the note A. When the fork is grabbed to stop the sound, the other tuning fork of 440 hertz, which is near the first one, will start to make the sound even though it is not hit. When both tuning forks have the same frequency, the second one invariably echoes automatically. This phenomenon is called resonance.

It is an awesome phenomenon, if you think about it. The second tuning fork is neither hit nor touched, but it starts to vibrate, even though it is made out of hard steel that has a large mass. This phenomenon is proof that energy is vibration.

In 2003, the Nobel Prize in Medicine was given to the two scholars who developed magnetic resonance imaging (MRI). Resonance is used in MRI. It is also a basic principle of physics and has a broad potential for technological application, such as in the development of a device for finding a school of fish in the sea.

ENERGY EXCHANGE—PURITY

Now let's switch one of the two tuning forks to 442 hertz and do the same thing as we did above. The tuning fork of 440 hertz is hit with a rubber hammer. This time, the second one does not seem to give off a sound. However, if we listen very carefully, we can hear a faint vibration. Though the sound is difficult to hear, the second tuning fork is resonating with the first one.

To our ears, the tone of 440 hertz sounds the same as that of 442 hertz. The difference is only 2 hertz, yet it makes a big difference in terms of resonance. In other words, the amount of energy produced drops significantly, and productivity goes down.

If we were to change the tuning fork of 442

hertz to 445 hertz and repeat the process, there would be no resonance. We would not be able to hear even a faint sound. When two things have exactly the same frequency, their resonance is perfect. They can enhance each other's energy in a pure manner.

If their frequency is absolutely the same, two items can attract and communicate with each other; distance is almost irrelevant. This phenomenon is called energy exchange. For example, some mobile phones can be used to call overseas, while others can't. The difference is due to the purity of the frequency transmitted by the phone.

The same is true with people's thoughts. When we tune in to the same thoughts or prayers together, we can expect to generate powerful energy. The world population is approximately 6 billion. How powerful can it be if 10 percent, or 600 million people, hope and pray for something wonderful?

VIBRATION (SOUND)—SIMILARITY

All things are vibrating; thus they have sounds. This means we can sort everything on a scale

according to its sound. The scale I mean is the musical scale of "do, re, mi, fa, sol, la, ti, do." On the keyboard of a piano, the black keys are halftones raised from do, re, fa, sol, and la in the key of C major. When halftones are included, we have twelve basic notes within an octave.

This means that we can recognize only twelve different kinds of sounds with our ears. Interestingly, there are twelve signs of the zodiac and twelve horary signs in Chinese astrology.

Let's take two tuning forks—in this case, one of 523 hertz (a higher "do" of C major) and the other of 261.5 hertz (a lower "do" of C major). When we hit the tuning fork of 523 hertz with a rubber hammer, the tuning fork of 261.5 hertz will resonate. The reverse is also true.

What does this mean? The tuning forks of two different frequencies resonate. A note of "do" on a musical scale resonates with any other "do." No matter how high or low the other "do" may be, as long as it is "do," it resonates. Notes that have the relationship of octave intervals resonate with each other. What does the relationship of octave inter-

vals mean? It's the relationship of notes in which each successive note has a frequency of vibration twice that of the previous, lower note.

For example, the notes that have the relationship of octave intervals of 100 hertz are 200, 400, 800, 1,600, 3,200, 6,400, 12,800, 25,600, 51,200, 102,400, 204,800, 409,600, 819,200 hertz, and so on. The numbers go on from the original number to ones multiplied by 2, 4, 8, 16, and so on.

I call this relationship "the similarity in vibration."

The important point here is that everything has a sound; therefore, we can say every phenomenon and every object has a relationship of similarity with something else. A simple example can be found in the relationship of a violin, a viola, a cello, and a contrabass.

In an atom, electrons circulate around the core. In the solar system, the planets circulate around the sun. These are other examples of the similarity relationship.

WHAT IS OUR SOURCE?

The existence of subatomic particles has been well known for some time. Dr. Masatoshi Koshiha, a Nobel Prize winner in 2002, and others have contributed to this knowledge. The size of a particle is as minute as $1/100,000,000$ of an atom, which is 0.1 nanometer (10^{-9} m). Naturally, the world of subatomic particles is invisible and inaudible to us. It is a world that most of us have difficulty understanding or even imagining.

Let's think about it, however. Does every phenomenon start big or small? Of course, the answer is the latter. In the case of us humans, our birth may be said to begin with a fertilized egg, when a mother's egg meets with a father's sperm. Do you know the size of the egg? It is currently thought to be 0.1 mm to 0.2 mm, a size that we can barely see with our naked eyes.

However, I believe that our start can actually be found at a much smaller state. That's right, we begin at the size of a subatomic particle. Everything begins at the subatomic particle level, the smallest unit recognized today. It is often said that we should go back to our origins when we get lost. It seems that today we are lost as a natural consequence of a ma-

terialistic development process. Now may be the time for us to go back to our origin as subatomic particles and reconsider which is the right path to take.

Some people may argue, "It certainly sounds all right in theory. But how much do we know about subatomic particles anyway? We hardly know them. How is it possible to think about the unknown world?"

The science of such a field is quantum mechanics. Roughly speaking, the conclusion that this science has arrived at so far is: "The world of quanta (subatomic particles) is chaotic, because the observation results vary depending on the observers."

I think of it differently. My idea is the concept of similarity that we have been discussing in this section. More specifically, it is the similarity of vibration. This concept leads to the idea of the human body as a microcosm.

I saw a wonderful videotape that led me to this idea. It was called *Powers of Ten* and produced for IBM more than twenty-five years ago. Easy-to-understand computer graphics presented visually the relationship of similarity between a human body and the cosmos. I believe you can now find

Figure 14.

this film on the Internet, and I highly recommend that you watch it.

Based on my memory of the film, I had a colleague at my company's laboratory make the drawing shown in Figure 14. Only recently have we begun to understand the size of subatomic particles. It is therefore amazing that the film had its origins fifty years ago in a 1957 essay by Kees Boeke.

As discussed earlier, everything, be it a particle or an atom, is vibrating and making a sound, and all sounds are included in the scale of "do" to "do." I have no hesitation in saying this, because there is no sound that is not included in the scale of do, re, mi, fa, sol, la, ti, do. (Of course, there are in-

between sounds, such as halftones between "do" and "re," but even these sounds are included in the scale.) Even the sounds in the world of subatomic particles are expressed along the scale of do, re, mi, fa, sol, la, ti, do.

When we accept the human body is a microcosm, we can no longer say that we don't understand the world of subatomic particles. If we view the human body in smaller and smaller increments, we can see that it goes from cell to molecule to atom and finally to subatomic particle. The smallest unit of consciousness and material is a subatomic particle.

Subatomic particles are influenced by our consciousness (positive thoughts, love, and gratitude), good water, and good music. If we shift our path toward deepening our understanding of the science of vibration, we may be able to go back to our origin.

LOVE MEANS GIVING A VIBRATION

Many people became interested in the method of showing words to water and taking pictures of

THE
BEGINNING
OF
LOVE

frozen water crystals after reading *Messages from Water*. Naturally, while many people accepted this unconventional method, many others were skeptical. What I most wanted to present in the book was the fundamental meaning of vibration. In *The Hidden Messages in Water* I wrote:

All things vibrate, and they vibrate at their own frequencies. When you understand this, you will significantly broaden your understanding of the universe . . . In the scientific world of quantum mechanics, it is common knowledge that substances are basically nothing more than vibration. When we look at a substance in an increasingly microscopic manner, we reach the mysterious world where everything is both particles and waves.

Suppose you have a microscopic body and you are off to explore how the universe is made. When you are reduced to the size of an atom, you will only see that electrons are revolving around atomic nuclei. An atom has its own unique frequency according to the number and configuration of electrons. Whatever it is, in the microscopic

"RESPECT"

A person you respect is perhaps one who has a lofty and generous heart.

"NO GOOD"

Negative words, including forceful expressions such as "Do it," can deny life in all its forms.

These words can prevent children from growing freely and easily.

"CLEAN"

This crystal seems to indicate that "clean" is one quality of a person who does not exaggerate his or her self-importance or show off. "Clean" describes someone who is honest.

"LOVE OF ONE'S NEIGHBORS"
"Neighbors both sides and three across" is a common Japanese expression. This crystal looks more like "neighbors both sides and six across." It is nice to have good neighbors with whom you can cooperate.

"PHILANTHROPY"

In the same way that philanthropy is felt to be universal, knowing no limits, so too this crystal grew out evenly, reaching in all directions.

"LOVE OF HUMANITY"

As the crystal depicting "love of one's neighbors" grows farther, it will become like this one. The shape is closer to perfection.

"BLIND LOVE"

Perhaps blind desperate love, in which one is grasping at straws, or love that is based on wishful thinking, is not true love. Here, with the center distorted, water did not yield a beautiful crystal.

"LOVE AND THANKS"

Interestingly, no other crystals formed after water was exposed to words are more beautiful than this one. This teaches us a very important lesson.

"I WILL KILL YOU"

The spiral in this frightening crystal resembles a snake lying in a coil.

"HONESTY"

This crystal seems to indicate past, present, and future. The center, representing the present, looks like a mirror that reflects things as they are.

"FRIENDSHIP"

Can you help friends when they are in the midst of hardship? Doing so is not always easy, but imagine how good it would be if we could help them without hesitation.

"LOVE OF SELF"

A person cannot love others without first loving him- or herself.

"DO IT!"

It seems no life-form wants to be forced to do something. To live by one's own will is the essence of life.

THE CHILDREN OF KITAKAWABE ELEMENTARY SCHOOL

Along with their families, the children of Kitakawabe Elementary School drew water from a nearby reservoir. Then these thirty people made a circle, clasped hands, and recited to the water: "Water, I love you." "Water, I thank you." "Water, I respect you."

Top: Before prayerful recitation.

Bottom: After prayerful recitation.

KIYOMASA WELL AT MEIJI SHRINE

Seeing a beautiful crystal like this one form in spring water from the middle of a city as large as Tokyo is rare. The water crystal shown here must be reflecting the devout prayers that men and women of all ages have offered while visiting this famous shrine.

THE SEA

Water that was exposed to "the sea" resulted in a crystal that rapidly grew into intricate shapes, in a way depicting the power of the changing sea of Nature itself.

SHOWING WATER "HADO"

All things are created by *hado* (vibration). The crystal here showed remarkable growth, almost as if it were making a large mandala.

"IMAGINE" BY JOHN LENNON

Playing this song resulted in a beautiful dreamy-looking crystal that it is not connected at its center. Perhaps "imagination" is something light and floating.

SENDING WORDS FROM ISRAEL TO TOKYO

The feeling of "love and gratitude" was sent from my seminar site in Israel to the tap water in a Tokyo office. We all recited, "Water, I love you. Water, I thank you. Water, I respect you." That message reached across space and resulted in this beautiful crystal.

world, you will feel everything is not solid, but moving waves. Everything is constantly vibrating and blinking at super high speed.

In the same book, I commented on the relationship between vibration and photographs of water crystals:

How should we explain that water changes its crystals after being exposed to the words written on paper? A written word itself has its own vibration, and water is sensitive to that vibration. Water can accurately copy the vibration of all things in this world and make invisible vibrations visible to our eyes. When water is shown a word written on paper, it catches the word's vibration and expresses the image in a specific shape.

Among the words that water was exposed to, "love and thanks" sparked the most beautiful response. In *The Hidden Messages in Water*, I explained it as follows:

The most beautiful crystal we have ever obtained was from the water shown the words

THE
BEGINNING
OF
LOVE

"Love & Thanks." Of course, "Love" alone results in a beautiful crystal. However, when both "Love & Thanks" together are shown, the water crystal added grace to beauty. As if it were a diamond, the crystal sparkled radiantly. Relatively speaking, the water crystal of "Love & Thanks" looked more like the crystal of "Gratitude" than that of "Love." It means that the water crystal reflected a more powerful and stronger influence of "Thanks" it received.

Love is a more active energy. Love is an act of giving heartfelt, unconditional affection. On the other hand, gratitude is a more passive energy—being thankful for something, or thankful for being allowed to live. In one of his poems, Housai Ozaki says, "No container I have, / With my hands I receive." As depicted in his poem, gratitude, I believe, is an act of receiving securely with both hands.

Love and thanks have the relationship of yin and yang. If love is the sun, gratitude is the moon. If love is male, gratitude is female.

WHAT IS OUR ROLE?

The topic of love and gratitude is my favorite, and I always include it in my talks. In general, people express feelings of wonder and acceptance. Lately, I have talked about it along the following lines: Love touches the other person's heart, and the other person responds in gratitude. Like an echo, these feelings move back and forth between people. In nature and the universe, this complementary relationship seems to exist. It is based on the phenomena I observed in my tuning-fork experiments.

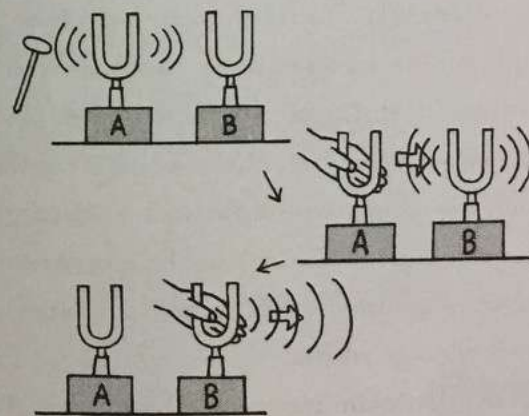

Figure 15. Top: Hit. Middle: Stop. Bottom: Echo phenomenon.

As shown in Figure 15, after tuning fork A of 440 hertz is hit with a rubber hammer, it is grabbed to stop its vibration. Then tuning fork B starts to vibrate. Tuning fork A transmitted the energy to tuning fork B.

Next, tuning fork B is grabbed to stop its vibration. Tuning fork A, which had stopped vibrating, now vibrates. This is the echo phenomenon. One tuning fork is hit, and then the other one vibrates and gives off a sound. The energy of vibration generated by A causes B to vibrate. Isn't the resonance between these two objects like a love-and-gratitude relationship?

Love is in all acts of cheering up others or giving them energy. Therefore, our role is to give energy to others. In other words, our role is to love everything. By doing so, we try to coordinate all things to be in harmony. I believe this is the way to live and this is the divine role we have been given to play on this globe. By making the most beautiful crystal when shown "love and thanks," water renders this concept visible.

All things, including human beings, are incapable of vibrating on their own, so let's give love to others unsparingly.

Four

THE
JOURNEY
OF
WATER

WONDERS OF WATER

No matter how small and powerless we may feel, as long as the energy we give off is pure and continuous, I believe we can change the whole universe at any given phase according to our will.

Why can water catch the vibration we give off in such a pure manner? Have you ever thought about what water is? Perhaps many would say, "No, I haven't, because water is water. It is such a common commodity." That's true. I myself had never thought about water until I became involved with it professionally. As you learn more about water, you will discover what a wondrous commodity it is. Suppose there is a glass of water in front of you. You put an ice cube in the water. The ice floats,

doesn't it? Like many others, you may not think much of it. However, it is truly wondrous.

Normally, the density of substances is higher—that is, heavier—in the solid state than in the liquid state. Therefore, with most substances, the solid doesn't float, but sinks in the liquid. Water, however, is different. Specifically, the density of water is said to be 1 g/cm^3 , whereas that of ice is 0.92 g/cm^3 .

Moreover, in general the density of a substance decreases as the temperature increases. The density of water, however, is highest—in other words, heaviest—at the temperature of 4°C .

Specific heat is the amount of heat required to raise the temperature of 1 g of a substance by 1°C . This is also more familiarly known as a calorie. The specific heat of water is the highest among substances. Also, the surface tension of water is so strong that it produces a capillary phenomenon. Among its many wondrous properties, water is an excellent solvent. Water can dissolve and carry most everything; there is no other substance that can do this.

While these properties are understood scientifically, the fundamental reasons for these behaviors have yet to be discovered. The one thing we

know is that these properties are very important to support life.

If ice were heavier than liquid water, it would cover the bottoms of the lakes and the seas in the polar regions. If seas and lakes were to freeze from the bottom upward, they would form a gigantic mass of ice, which would not allow the creation of life.

However, because water is heaviest at 4°C , the bottoms of the lakes and seas are maintained at 4°C even in the coldest weather. In terms of specific heat, water ranks the highest among substances. Water's boiling point of 100°C means that it is not easily vaporized. Because of this property, water shortage does not happen rapidly, and a sudden increase is prevented in body and earth temperatures. Water works wonderfully well in retaining heat (when a substance vaporizes, it requires heat).

Moreover, the surface tension of water is so strong that it produces capillary action. This means that water can go up to the tops of tall trees against the force of gravity. This property of water is indispensable to maintaining life. A good example of water's great dissolving ability is the blood in

our bodies. Because of water, in the form of blood, necessary nutrients (vibrations needed for each cell) can be distributed all over the body.

Indeed, water has many wondrous properties. Most of these properties are needed for the formation and maintenance of life. As I mentioned earlier, we still don't know why water has such properties. This reality seems to be reflected in the fact that this field has never produced a Nobel Prize winner.

We are water—and yet we hardly understand it. As a result, we don't know ourselves very well, either.

Maybe this is why, after tens of thousands of years of human history, we still engage in acts of war and killing which are against divine Providence. We need to understand water.

Other fields of science have made great progress. Now we need to collect all human intelligence to understand water, the source of life and the "one basic stuff for everything in nature," as the Greek philosopher Thales said. When our questions are answered, we will be able to understand ourselves. The first step is to know the origin of water.

My book *Hado no Shinri* (The Truth of *Hado*), published in 1994, is not yet available in English and so would not be familiar to readers of my other titles. Since the concepts presented in that book are the foundation for my current thinking, let me cite some relevant passages.

HOW LONG HAS WATER BEEN ON THE EARTH?

I have come to realize that we know almost nothing about water, the source of all life-forms on this planet. I have set forth the theory "water equals *hado*"; therefore, if we don't understand water, we don't understand *hado*, either.

Essentially, I thought that the mystery of water had been solved a long time ago. While I was contemplating deeply why water was so different from other substances and why it had such a complex and incomprehensible nature, I got an inspiration. It occurred to me that maybe the water on this earth came from another planet in the universe!

Later, I found the answer had already been

given by Dr. Louis A. Frank of the University of Iowa in his book *The Big Splash*. As a matter of fact, one of my staff members had given me a copy of the book a few months before I had my inspiration, saying, "This is a very interesting book. I hope you will read it." It ended up on my bookshelf.

The following is a brief biography of Dr. Frank.

Louis A. Frank was born in Chicago in 1938 and became professor of physics at the University of Iowa. Since his involvement in the calibration of the first U.S. lunar probe, he has been an experimenter or investigator for instruments on more than forty spacecraft. The types of instruments include those for energetic charged particles, plasmas, and auroral imaging, which led him to his recent discovery of comets.

Dr. Frank's accomplishments have put him on the cutting edge of plasma research and include the first direct measurements of the terrestrial ring current and of the polar cusp, the current systems in earth's magnetotail, the plasma tori at Jupiter and at Saturn, and global imaging of earth's auroral zones and atmosphere.

Dr. Frank was the first to observe with a scien-

tific instrument the belt of ions around the earth that is now known as the ring current. And he discovered the theta aurora.

Currently, Dr. Frank serves on various NASA space programs and is a member of the National Academy of Sciences, the American Physical Society, the American Astronomical Society, and the American Association for the Advancement of Science.

Dr. Frank is an active scientist and has many brilliant achievements. This well-known scientist, who used to hold conservative opinions, published his findings in *The Big Splash*. The promotional copy on the book cover of the Japanese version reads as follows: "Humans were born from the storms of small comets poured on earth."

Every minute, twenty small comets of about a hundred tons come into the earth's atmosphere. The comets that arrived on the earth over four billion years ago created the rivers, lakes, and oceans. The necessary materials for life were also brought by these comets. A temporary increase in the number of comets contributed to the Ice Age, when dinosaurs and other creatures died out. It's a long-awaited book by a world-renown physicist, in

which his new theory explodes the common knowledge on the origin of the earth.

Dr. Frank's new theory flatly denied the belief that water was on the earth all along. If it is correct, it will shake up today's physical chemistry, and it will inevitably lead to *hado* science.

At the time *Hado no Shinri* (The Truth of *Hado*) was published, Dr. Frank's theory (expressed in *The Big Splash*) was considered to be merely his personal opinion, and his book was published in the private sector, not within the scientific community. However, NASA officially announced this theory in May 1997. It was picked up by major news agencies such as the Associated Press and distributed widely throughout the world. In Japan, the news was broadcast by NHK (Japan Broadcasting Corporation) and was picked up by many national and local newspapers.

The following is an excerpt from an article that appeared in the evening edition of the *Asahi Shimbun* newspaper on June 2, 1997:

**NASA Observed and Announced:
Snowballs from the Universe,
Supplies for Seawater?**

On May 28, the National Aeronautics and Space Administration (NASA) announced that its polar satellite took pictures of numerous small astronomical bodies like snowballs falling into the atmosphere of the earth. These snowballs are small astronomical bodies with a diameter of around fifteen meters. Every day, thousands of them fly in and become parts of clouds as they get closer to the earth's surface. Considering the length of time since the birth of the earth, these astronomical bodies were possibly the source of seawater . . .

In 1986, Dr. Louis Frank of the University of Iowa claimed that water originated from the universe based on photographs taken by a U.S. satellite. His view was not widely accepted, due to lack of evidence.

Three months later, the Institute for Astronomy at the University of Hawaii made an an-

nouncement endorsing Dr. Frank's theory. On August 24, 1997, the morning edition of the *Mainichi Shimbun* newspaper reported as follows:

Comets Are the Mother of the Sea

The Institute for Astronomy at the University of Hawaii stated that their observation of the Hyakutake and Hale-Bopp comets yielded results in support of the theory that "the comets fallen to the earth are the source of seawater." The announcement was made at the General Assembly of the International Astronomical Union held in Kyoto on the twenty-third . . .

Mr. Junichi Watanabe, Section Chief, Public Information Office, National Astronomical Observatory of Japan, said, "It is very convincing that two comets yielded similar results. While all seawater may not be from comets, it can be said that comets played an important role in the formation of the sea."

SO WE ARE ALIENS

If water is, in fact, not a material intrinsic to earth, our biological origin and evolution must be explained quite differently from the way they are explained today. One thing regarded as absolutely true in today's science is that "no life can be born or maintained without water." I believe this is 100 percent correct, and no one would argue about it. If so, it can be said that all life-forms, including humans, have their origin outside of the earth.

Once this new theory of water origin is accepted, many fields—such as biology, anthropology, physics, astronomy, medicine, psychology, theology, chemistry, and pedagogy—will have to completely revise their textbooks. It will be too much to take for scientists who believe that water originated on earth, because it will undermine many of their accomplishments. Ignoring the new theory might be an easy solution. Despite the reports made by two authoritative sources, NASA and the University of Hawaii, no one seems to have dealt squarely with it.

However, by accepting the new theory, we have a chance to understand many inexplicable myster-

ies in our history. For example, there are the stories that continents such as Atlantis, Lemuria, and Mu existed but were lost underwater. Many under-sea ruins were discovered in the Sakishima Islands of Japan. Could they be the proofs of such stories? How authentic is the allegedly true history in the old Takeuchi documents and Heitate shrine of Mount Aso in Japan? How about a new theory regarding when the pyramids and the sphinxes were built? What is the true nature of the photon belt? If a catastrophe will come, when will it take place? These questions may be answered if we assume that human beings originated outside of the earth. By understanding this correctly, our alternatives will be expanded because our view of human history will shift from the earth to the universe.

I feel I have a role to play in this shift, because it will be difficult for scientists to take up such daring ideas within the framework of today's society. I am free; I have no constraints to worry about and no honor to be damaged. Even if others think I am crazy, I don't care. I just do not want to live my life without expressing what I think.

Even if my theory should turn out to be off the mark, it will not hurt anyone, as it has a positive nature. In such a case, I imagine that the Divine

would scold and forgive me, simply saying, "You careless man."

OUR TRUE HOME— THE BIG DIPPER

Let's start a fairy tale with the assumption that water came from the universe to the earth and resulted in the birth of human beings.

How did we come to this planet? I believe we came to earth on comets, as in the NASA report. Well, "on comets" may not be accurate. Perhaps I should say "in the form of water crystals in comets." A water crystal is like a phantom because it disappears at 0°C. With a microscope, we can see water crystals at temperatures between -15°C and 1°C. The shape of crystals is three-dimensional. I wonder if frozen water crystals are between three- and four-dimensional.

Water in liquid form is like a state where we humans are living, and water in crystal form is a state where we are spirit. Perhaps when water is transmitted, it is in a four-dimensional state. Somewhere in the universe, water is sent in the form of ice in a four-dimensional state. As it gets

closer to the earth, the temperature increases, and it assumes a three-and-a-half-dimensional state. When it arrives, it becomes liquid in a three-dimensional state.

As you know, water changes its form within the atmosphere on earth. These forms include haze, fog, hail, snow, cloud, sleet, ice, and liquid water. I think the changes that water goes through in the universe are far more numerous than we can imagine. In this vein, I even wonder if light could be a form of water.

The question is where in the universe we came from and why. I originally thought that we were exiles of the universe because we seem to have a hard time giving up our egos and sins. Let me cite the following, again from *Hado no Shinri* (The Truth of *Hado*).

ARE WE THE DESCENDANTS OF EXILES OF THE UNIVERSE?

Could we be the descendants of exiles of the universe? Could it be possible that our ancestors committed a crime on a faraway star in the universe?

Perhaps that star was like a utopia. Our ancestors, however, happened to develop ego, and committed a crime. According to the rule there, they were banished. Their destination was determined by the degree of their crime. Of course, there is no way of knowing where earth ranked. However, earth might have been for major criminals, because under the spell of gravity on earth it is impossible to escape.

Our ancestors were changed into ice and blasted off to earth. After an unimaginably long trip, they finally came close to earth like a comet and flew into the atmosphere. Naturally, the heat melted our ancestors in the form of ice, and they vaporized instantaneously. Then they became clouds and eventually arrived as rain on the earth's surface for the first time. After an unimaginably long time, they were born as human beings. As they lost all memories of the past, they had to start their lives all over again and build civilization.

Under the influence of gravity, which might have contributed to the formation of the yin and yang theory, we cannot get off earth so easily, and we are currently at the crucial moment. This story ends here.

Lately, however, I have developed a theory that

we are graduates from the school of the universe. I have grown uncomfortable with the earlier story that we are the descendants of exiles because of its negativity.

ARE WE GRADUATES FROM THE SCHOOL OF THE UNIVERSE?

What if we were sent to earth as missionaries, not as the descendants of exiles? Let me introduce another story, using myself as an example:

I was born on a star far, far away from the earth. The star was much more peaceful and advanced than the earth. The star had a missionary system, and everyone had to teach its precepts on the other stars or planets.

When I graduated from school, I perhaps wrote a thesis that said, "My mission is to go to earth to spread love." I received a passing grade and graduated from the school of the universe. A planetary rocket was launched to Japan, since I requested Japan to be my destination. As usual, all of my memories were erased, except for the necessary information to become a human, which was left in the crystals of ice. In terms of geophysics,

the distance between my home star and earth was enormous. Perhaps, due to a different dimension of time, I arrived at earth instantaneously.

On July 22, 1943, I made my first cry as a child of my parents, Hiroshi and Kazu Emoto. (The first cry of a newborn baby is 440 hertz—I remember having read it in a book. This cry may be a signal to let the home star know of a baby's safe arrival.)

I grew up in a loving environment, receiving my parents' deep love and understanding. The most important period is believed to be the first ten years of life, when cranial nerves fully develop and stabilize in a human. I was blessed with having good brothers, and my childhood was filled with the pleasures of a happy home, even though we were poor.

I was the youngest of my parents' four children. My parents, my father in particular, tended to be stricter with my brothers, but I was raised freely and easily. I am really grateful for the way my parents brought me up.

In my youth, I was a serious student who also very much enjoyed music and sports. I liked to play musical instruments, and I was clever with my hands, which made me a quick learner. This exper-

ience seems to have helped me later in my work with MRA, the *hado*-measuring device, which was like a musical instrument.

After I went into the world, I worked very hard. My hard work resulted in both successes and failures. For the first twenty-five years, I experienced many ups and downs. I made my wife, who is my business partner as well, go through hardships, including a bankruptcy with a large debt and so many other difficulties that I cannot list them all here. She cheered me up by saying that these are the results of trying to be "right and just."

In retrospect, I now realize that these hardships were touchstones leading me to my current work. During those twenty-plus years, I stood at the crossroads many times. When I had to decide to go right or left, I made my choices based on what was "right and just." As if it were a game, I chose right or left at each intersection and came to the place where MRA and *hado* technology were.

After all, I hadn't forgotten my thesis upon graduating from the school of the universe. My work has just begun, but I feel that I have reached the door of the house of my destination. I knocked at the door, and the door opened smoothly. I feel I am in the first room.

I have no idea how many more rooms there are, but I feel excited, like the leader of an expedition team. My intention is to go as far as I can and to broadcast what I see to as many people as possible.

I keenly think about the importance of childhood upbringing. I owe the role I am playing now to my parents' unconditional love.

CHILDREN, THE GIFT FROM THE DIVINE

Let's continue the story of the graduates from the school of the universe. Since I was born on July 22, 1943, I must have arrived on earth during the fall equinox of 1942. So I graduated from the school of the universe about sixty-five years ago. My home star must also be constantly advancing. Therefore, even if the information I brought with me from the star were fully revealed, it is already sixty-five years old. (If I had an excellent antenna to receive up-to-date correspondence courses from my home star, it would be a different story, but I don't think I do.)

Let's think about the babies arriving today.

They graduated from the school of the universe some sixty years later than I did. They are awesome, because they exist on this planet with information potentially more advanced than we currently have.

What should those of us who came here earlier do for the newly arrived babies? They must also have written their theses. Therefore, we need to secure the environment so that the newly arrived will not forget their missions. Let's put our hopes in them. Let's trust them. Let's not force wrong education on them. Let's provide them with a comfortable and healthy environment. It is our role to prepare such a field for them. What specifically should we do? The following is my ten-point proposal for future education:

1. Let's remember that adults do not own a child, just because he or she is temporarily entrusted to them by the Divine.
2. Let's not compare our children with other children and worry about the differences.
3. Each child has written his or her own thesis. Each thesis is different and reflects its writer's personality. The role of an adult as a guardian

is to fully bring out the child's unique individuality.

4. The first ten years of the child's life are especially important, because cranial nerve cells keep developing during that time. By observing attentively, you will understand what the child wants or what his or her actions are for. Let's try to understand the child as much as possible. If we can't, let's not worry by ourselves. Let's find a support group and learn together.
5. Let's select our children's kindergarten and elementary school from the children's viewpoint, not from the parents'. When children are three or four years old, they can express their own opinions. The role of adults is to provide children with the correct information and alternatives, and let them make their decision.
6. Let's refrain from using negative expressions such as "don't" and "no good." Instead, let's use more positive expressions such as "let's" and "shall we." If we understand the princi-

ples of *hado*, we will know how much influence our words have on our children's positive thinking.

7. Let's treat a child not as a child but as a person with a sound personality, including consciousness and responsibilities.
8. Let's think together with a child when he or she asks "why?" Perhaps we won't be able to answer many of the questions, but it would be wonderful to make it a habit to learn and think with the child. Let's not make irresponsible remarks. Especially in the realm of natural sciences, let's study until we can answer the child's questions confidently.
9. Let's pay attention to the information coming by electromagnetic waves. But keep in mind that when the information is bad, children may receive fatally bad influences. Let's give children no violent TV programs and games.
10. It is important for adults to have their own clear understanding of sexuality (though it may be difficult to do so). If necessary, let's share our understanding with children with-

out flinching. The children's resolute attitude, more than what the parents say, will give them a good signpost.

ALL LIVES ALSO CAME FROM THE UNIVERSE

Water didn't exist on the earth in the beginning. If water is the source of everything, as Thales, a Greek philosopher, said, not only human beings but all other lives that require water have their origin somewhere in the universe. Of course, I have no way of knowing if it was the Divine who sent us to the earth. We weren't just sent to the desolate wild earth without water. Whoever it was had a kind heart to program the basic necessities in water so that we could live on this planet. Dogs may hold the key to evidence of some sort of divine intervention.

For example, unlike for many other animals, the Japanese character (*kanji*) for "dog" doesn't have a part indicating animals. According to a story I heard directly from Dr. Hoang Van Duke, a medical scientist originally from Vietnam and a

professor emeritus at the University of Southern California, what is implied in the Japanese character for "dog" is that Heaven (God) sent dogs to earth to have them help human beings and let them be good cooperators. As dogs are sent by Heaven, the Japanese character for "dog" resembles the character for "Heaven." The English word "dog" is "god" when reversed. I now totally believe this story.

Incidentally, other domestic animals that are said to have followed include horses, sheep, cattle, and rabbits, which also do not have a part indicating animals in their Japanese characters. Animals that do have the characters with a part indicating animals, such as cats, raccoons, and wolves, are said to have been changed from dogs later on for some reason.

I find Japanese *kanji* fascinating. Through studying how each character is developed, we may be able to accurately identify the origin of each letter and perhaps therein solve many of today's remaining mysteries.

For example, the Japanese character for "darkness" symbolizes enclosing a sound inside a gate. This perfectly reflects a concept of quantum me-

chanics. No matter how small a thing may be, as long as it has energy, it gives off a sound. Darkness must have been perceived as the world with no sound.

A lexicon of Japanese *kanji* begins with indexes for the left-hand side, the right-hand side, and the top parts of characters. In terms of animals, the list includes only a limited number of parts, such as dog, cattle, sheep, insect, boar, shellfish, horse, fish, and bird. The Japanese character for each of the other animals has one of these portions, and the remaining part of the character is something that indicates that particular animal's characteristics.

I believe these animals that became the parts in *kanji* are the ones that were sent to earth first; later in the process of evolution, the other animals were created.

THE MYSTERIOUS LIFE OF PLANTS

A little more than thirty years ago an interesting book titled *The Secret Life of Plants* was published in the United States. It became a best seller in America, its German edition sold more than a hundred

thousand copies, and in 1987 it was translated into Japanese. (Some of you may also remember the popular 1979 soundtrack Stevie Wonder composed for the film documentary based on the book.) I refer to this book because it includes a lot of data to support the idea that all life came from the universe. For example, plants respond to human consciousness, plants synchronize with certain people, and plants have personalities.

Some of the book's chapter titles are listed below, and we should seriously think about the book's contents and the results of the experiments described therein.*

- "Plants and ESP"
- "Plants Can Read Your Mind"
- "Plants That Open Doors"
- "Visitors from Space"
- "The Metamorphosis of Plants"
- "Plants Will Grow to Please You"

*In Japan, Akira Mikami actually put the concepts of the book into practice and wrote several highly respected books on this subject, including *Joint Research with Plants* and *Plants Warn Us*.

- "The Harmonic Life of Plants"
- "Plants and Electromagnetism"
- "Force Fields, Humans, and Plants"
- "The Mystery of Plant and Human Auras"
- "Soil: The Staff of Life"
- "Mind over Matter"

Many scientists started to pay attention to the unique informational abilities of plants, and now many of these once revolutionary ideas are commonly accepted as fact.

Unlike humans and animals, plants can't move. I don't think that plants feel stress about this fact. In terms of atomic compositions, I believe that plants are simpler beings than humans and animals.

Let's suppose one plant is made up of atoms A, B, C, D, and E, while another one is composed of B, E, F, G, and H. I have no doubt that plants have emotions, but I think different plants have different emotions.

The simpler atomic composition of a plant means its *hado* is purer and has stronger energy for

specific types of information. This may explain why plants have better communication abilities than humans and animals, and they can communicate with other plants on this planet as well as with the home base somewhere in the universe.

Due to excess stresses and pressures, we humans seem to have lost our ability to fully utilize our communication potentials, but I believe any of us can obtain necessary information through plants, as long as our intention is in accordance with the benevolence of the universe (love).

A STORY OF A PLANET

If humans, animals, and plants were sent here from the same star somewhere in the universe, the reasons and purposes must be the same for all beings.

The mission that all beings received must have been "to transform the wild earth into a friendly, peaceful, and plentiful planet." For this common purpose, I believe that the three parties were supposed to get along well and help one another. All beings were expected to live on earth by utilizing the soils and atoms that had been sent here in advance.

The first comers might have been heat-

resistant plants—for example, ferns. The information came in the form of rain and arrived on the ground. It resonated with certain kinds of atoms and manifested as ferns that had green leaves, for example. Through photosynthesis, a special ability given to them, ferns were made to absorb carbon dioxide, which was abundant on the surface of the earth, and to produce oxygen.

Because of the advance party's efforts over tens of thousands of years, the earth's environment became gentler. During this time, the atoms needed for synthesizing certain animals must have been cultivated. The sender then encoded the information about animals, perhaps microorganisms at first, into water and launched them to earth.

Many more years later, the planet's environment finally became suitable for humans. All of the 108 atoms were on earth at that time, and the temperature averaged around 30°C. The seas, rivers, lakes, and ponds were in place. There was now ample oxygen thanks to plant presence over tens of thousands of years. Then humans came to the earth accompanied by domestic animals.

The arrival of humans and animals was also needed for plants, because in order for the plants, which required carbon dioxide to survive, to con-

tinue to produce oxygen, they needed the beings that consumed oxygen.

Thus the soil, which existed on the earth from the beginning; the water, which came from far away in the universe; and the oxygen produced by plants were all in place on this planet. The issue then became how to maintain the balance of the four parties (humans, animals, plants, and soil) under the leadership of humans.

Naturally, humans must have come full of gratitude for the other beings—soil, plants, animals, and water—that created the environment where they could also exist. However, for some reason, humans lessened their gratitude as time passed and came to think only about themselves.

As a result, there is something wrong at this time. Unless we humans reconsider our origins, worse things are yet to come. I believe we are now at a turning point where we must choose our future direction.

HUMANS HAVE INNATE GOODNESS

Some readers will undoubtedly view what I have just described as totally absurd. They may want to

scold me, saying, "Outrageous! Don't talk nonsense!" Nevertheless, what I really wanted to convey is that most of us pay so little attention to our origins. I believe that we share a common desire to live humanely. If so, I believe it is important to continue our search for our origin and challenge ourselves to discover it.

As I said earlier, I initially thought we were the exiles of the universe. This was based on a view of human nature as fundamentally depraved. However, I changed my mind after the arrival of new theories, such as that about Indigo Children.* As I studied more about water through taking photographs of frozen water crystals, the new way of thinking became much clearer to me. I now have no doubt that we were sent here with missions and roles. It is a view of human nature as fundamentally good and is based on something I observed. No matter how polluted the lake or tap water looked initially, water responded to our thoughts and prayers. Even the water that previously produced only ugly crystals was able to form beautiful crystals when we sent it our pure thoughts and

*This is the name of a new type of children identified by Lee Carroll and Jan Tober in their 1999 book, *The Indigo Children*.

prayers. The beauty seemed to be a function of how pure our thoughts and prayers were.

I have observed this phenomenon in more than twenty cases and have included the results in my books: for example, the water at Fujiwara Dam after the prayer on the cover of the first volume of *Messages from Water*; the tap water of Tokyo after the children's prayer in the video version of the book; the water of Lake Picchu Cava in São Paulo, Brazil, after the prayer; and the water after five hundred *hado* instructors' simultaneous distant prayers.

These facts convinced me that all humans have innate goodness, because the water in the above circumstances was contaminated environmentally or by antiseptic chemicals and it would produce absolutely no crystal in normal circumstances, yet it created beautiful hexagons after the prayers. This reminded me of the Buddha's metaphor about lotus flowers.

As you know, lotuses grow in mud; however, they yield lovely blossoms. Using lotus flowers as a metaphor, the Buddha told us, "Even in the worst environment, people can still blossom beautifully."

As I have been saying, we are water. No matter how contaminated or dirty water may become, it

can still form exquisite crystals reflecting people's beautiful thoughts and prayers. What this implies is that we humans, too, can open our lovely flowers even in adverse circumstances. By meeting with beautiful minds and receiving their help, we can transform as Jean Valjean does after meeting the bishop with a merciful heart.

In other words, even an evil man is intrinsically good at the subatomic level. I now deeply believe this. Humans are affected at the atomic or molecular level, just as the environment is polluted especially at the molecular level.

So, with what missions were we, as good beings, sent to earth? Before I get into this subject, I would like to share my perspective on God and religions.

DOES GOD EXIST?

Growing up, I didn't know much about God and religions. I was raised in a family with no religious practices. Moreover, I grew up in a city and didn't learn much about everyday Buddhist rituals, either.

One thing I remember is attending Sunday school (a traveling church) provided by the occu-

pying forces right after World War II. I still remember some of the hymns I learned at that time. My motivation was the chocolate and cookies that I was given for attending the school.

So I never deeply thought about God. Even when I was a high school student naively discussing the big questions of life with my friends, we generally talked about philosophy, not about God and religions. It may be because of my attitude toward God and religions that the first twenty-five years of my working life were lacking God's blessings.

However, my attitude changed after I turned forty-five and became involved with *hado* and water. My thoughts particularly changed as I started *hado* consultations for those who suffered from diseases by using MRA, the *hado* measuring device, and transcribing the necessary information onto distilled water called "micro-clustered water." In ten years, I treated more than fifteen thousand people with *hado* water, and I got increasingly more accurate results as I gained more experience. During that time, I noticed that those who reflected upon themselves according to their religious teachings and deepened their understandings of the basics—love and gratitude—had a better improvement rate than those who didn't. Empiri-

cally, I came to realize that all diseases are derived from lack of love and gratitude at the DNA level, including karma from past lives. Thus I couldn't help but believe in the existence of the Divine.

I realized the following: Christ and Buddha were the sons of God. If a person strayed from their teachings, he or she would get sick. If the diseases turned very severe, the person would die. Death means the negation of being as a human. Therefore, as long as we want to live as human beings, we need to believe in the existence of the Divine and follow the teachings. The concept of God is love and gratitude.

From another perspective, I believe it is reasonable to assume the existence of the Divine.

"How was the universe—complex and subtle—created?" This is an eternal theme for humans to ponder. Perhaps it will remain an eternal question as long as we stay in the three-dimensional realm—as long as our soul stays in the physical body. Nonetheless, we shouldn't stop our quest for the answer, because I believe that our ultimate goal is to seek and find the answer. This is an exciting and interesting challenge. At the same time, answering this question will be more difficult than solving a

complex mathematical equation. I tend to think that the answer will turn out to be very simple when we finally figure it out.

I certainly hope that we can get as close to the truth as possible. I imagine finding the answer in this three-dimensional world would be more profound and exciting than in the otherworld. Such an experience might be called a true pleasure.

When we work on a difficult mathematical equation, it is sometimes easier to proceed if we assume the answer and work back to see if it is correct.

In this case, the variable x in our equation is God. Dr. Kazuo Murakami, professor emeritus at the University of Tsukuba, uses the term "Something Great" instead. "God" is not just a term we should use in a religious sense; rather, I believe, it should be included in scientific terminology as well.

Some people dislike and feel embarrassed to use the term "God." "Authoritative" scientists tend to be found in this group. They tend to remain in their specialized fields, rather than coordinating with others holistically. In such an environment, it is impossible to reach the most important truth.

So, in order to find the answer, we shall assume that God exists. The Bible and the Sutras, which contain the teachings of Christ and Buddha, respectively, will be our reference books.

I am sure that there are other great religions as well, but my knowledge is superficial even with the Bible and the Sutras. Therefore, I rely on the realm of my subconscious, which I believe exists somewhere in my brain. I feel that the realm is now getting quite close to the surface and within my reach, more so than with most people.

I suppose my experience of *hado* measuring and consulting for more than fifteen thousand people contributed to bringing my subconscious to the surface, as I was able to help these people bring their subconscious memories up. Additionally, water taught me a lot after I acquired the technology of water crystal photography. I am especially blessed in this respect.

In the next section, I would like to share my hypothesis (or fairy tale?). If it's contradictory to the teachings of the Bible, the Sutras, or other religious writings, I would very much appreciate the input of clergy and other religious scholars.

WHERE DID THE WORD COME FROM?

The Bible says that God created the universe in seven days. It also says, "In the beginning was the Word." I am not going to talk about the "seven days," but what does this reference to the Word mean?

For more than a decade, I conducted many experiments with water and took photographs of water crystals. The most amazing thing I observed about water was that when water was shown words, it responded positively to the positive words and negatively to the negative words. For example, water responded by forming beautiful crystals when it was exposed to "thank you." It responded horribly to "you fool." At first, I considered an experiment of talking to water. However, because of the great variance among people in talking, I adopted the method of typing a word on a sheet of paper and exposing it to water for one day and one night. Empirically, I had known that words had their own *hado* (vibrations).

The water's responses were the same when it was shown not only Japanese words but also words in other languages, such as English, German, Ko-

rean, and French. Naturally, many people who read my books or came to my seminars asked me why water responded in these ways. I usually explain it like this.

Since I was born in Japan and raised by Japanese-speaking parents, I speak Japanese fluently. If I were raised by a wolf, I would be speaking a wolf language, but not a single word in Japanese. The same is true for everybody.

For example, many people in Brazil have pure Japanese DNA. If their parents didn't teach them Japanese, they cannot speak Japanese. So the language is not in our DNA but something we learn after birth.

Then what about the first humans, let's say Adam and Eve? Who taught them words? Nature! They must have learned various vibrations and sounds from nature and started to imitate them to communicate with other humans. Great nature has all kinds of vibrations and sounds. For example, there are the roars of lions and tigers, which are dangerous to humans, and the calls of goats and rabbits, which have safe and gentle natures. Also, the sounds in nature include the murmur of streams and the rumbling of flooding water.

As humans accumulated many experiences

over a very long time, the function of the vocal cords developed proportionately. Thus humans gradually created words and increased their vocabulary.

With this line of thought, it is easier to understand why there are so many languages. It is because aspects of natural environments, such as temperature and humidity, differ depending on where people live. For example, the Japanese archipelago is long and narrow. The north end lies in the subarctic zone, and the south end is in the subtropical zone. It has four distinct seasons. Each season has a different climate. Thus I believe that Japanese has more kinds and greater numbers of words than most other languages.

On the other hand, in Siberia and Alaska the climates are cold, and the seasons don't vary very much. As a result, the natural environment tends to be more uniform than in a place like the Japanese archipelago. Therefore, I believe, the vocabulary of the languages developed in these regions is much smaller than that of Japanese. However, I have heard that Inuit has more than 170 words for ice. This is because there are many aspects of ice in the arctic. It also indicates that the words were developed from natural phenomena.

This essence of nature appears to be the same everywhere. In most countries, snakes are feared and detested, while almost all flowers are viewed as sweet and lovable. However, the difference in temperature and humidity influences frequencies. The climate in each region gives off a different frequency. Thus the difference in sounds resulted in the different names or words for the same plants or animals. For example, the sound of a pig is expressed "oink, oink" in English, but "boo, boo" in Japanese.

BEAUTIFUL WORDS CREATE BEAUTIFUL NATURE

As we analyze the development of languages, we realize an important concept about words. No matter what language it is, it is absolute. Words are not the result of random creations.

Of course, I am referring to the original languages that were developed when humans lived in nature. Their five senses must have been keen, as humans were at the mercy of nature, collected food in nature, and died in nature. Therefore, as discussed earlier, they must have made frantic efforts

to feel the indications and *hado* of nature, and over a very long time they built the words as their vocal cords developed.

Naturally, when we pronounce *uchu* (cosmos) in Japanese, it must resonate with the vibration of the universe. When things have the same frequency, they resonate. In other words, they exchange energies. In this manner, they converse.

For our ancestors, the *hado* of the universe they felt in Japan was *uchu*. Similarly, the *hado* of the universe must have sounded like *kosmos* to the ancient Greeks, "cosmos" to the ancestors of the Anglo-Saxons. It is expressed as *cosmos* in French, *cosmo* in Italian, *cosmos* in Spanish, *cosmos* in Portuguese, *kosmos* in Dutch, *Kosmos* in German, *kocmoc* in Russian, *cosmos* in Latin, and *yuzhou* in Chinese.

The word for the universe in many of these languages is very similar. As the universe is vast and something to be felt by looking up, there might not have been so many regional influences regarding this word in different languages.

Let's consider water, a very common substance. The word for water in different languages is *eau* in French, *acqua* in Italian, *agua* in Spanish, *água* in Portuguese, *water* in Dutch, *Wasser* in German, *aqua* in Latin, and *shuy* in Chinese.

Anyway, Japanese has the word *kotodama* (the spirit of languages). *Kotodama* does not refer to the spirit world; rather, it is a science that can be explained by the theory of quantum vibration.

In my seminar, I usually summarize the discussion above by saying that it underlines the importance of using correct and positive words in our daily lives.

Words are *hado* (vibration).

Words are the products of nature.

Therefore, beautiful words create beautiful nature.

Dirty words create dirty nature.

This is the essence of the universe.

WHAT WATER IS TELLING US

When we go back to the origin and explore how words were developed, we can better understand the biblical phrase "In the beginning was the Word." I think that the Word was made by God and

used by God. God must have thought to create a utopia on earth.

At first, several stars (seven stars)* were allotted to deliver the substances (atoms) to make the foundation of the earth in the form of meteorites. The meteorites collided with the earth, creating enormous energy that resulted in the formation of a large amount of magma at the core of the earth.

When the earth eventually became the size it is today, meteorites stopped flying in; but the earth was still a huge ball of fire and exploding gases. Observing the earth from high above, God created something and sent it to the earth to extinguish the fire and cool the heat down at just the right time. This was water. Every time God sent water to the earth, he gave water words and messages, which encoded his blueprint. Also, God designed water so as to store memories. Since the distance to the earth was great, God transformed water into ice, a more stable form, so that water could remember the messages. At this stage, God gave water the information about creating life later and the neces-

*More about this later.

sary wisdom for sustaining life in the form of vibrations, or words.

Right before water arrived on the earth, it woke up. It checked the entrusted messages that were in the form of crystals. Water crystals do not appear when the ice is very hard, that is, with a temperature lower than -15°C .

Upon its arrival on the earth, water worked on the atoms sent there in advance to create life phenomena. The base for the phenomena was hydrogen bonds, which enabled chemical reactions to take place.

According to God's plan, the first life-form was created. Now God decided to send his children with the basic concept of love and gratitude. What slipped God's mind was that he created the earth in three dimensions.

First, love was absolute; second, gratitude was relative; and the third thing needed was direction—for example, respect based on love and gratitude. This concept is founded on an ancient tradition in Japan—that of one, two, and three.

Of course, God noticed this missing element immediately and tried to add it to the basic design, but he had another idea. "It would not be so inter-

esting to make everything perfect from the beginning. Let's keep the earth as it is now. I will watch in which direction my children lead the earth."

The humans who were sent to the earth in the form of water crystals were confused, as they didn't know which way to go. After struggles, they started to learn their direction from nature. It was a natural consequence, as they had to find food in nature and live in harmony with nature.

Humans were not equipped with weapons. They could not fly, did not have the destructive power of dinosaurs, and could not run fast like cheetahs. Moreover, humans had neither sharp fangs like lions and tigers nor the ability to live in water like fish. What humans could do was limited to sharpening their five senses and using their wisdom. So they did.

The most reliable human sense was hearing. Humans listened carefully to the vibrations/sounds that nature gave off and learned which were safe and which weren't. When it was safe, they went out and looked for food. When it wasn't, they hid inside caves. They soon learned that it was more efficient

to work together as a group than to work alone. Thus they formed a community, an extension of their families.

To communicate with one another, they first used hand signs. However, the signs were not effective unless they were displayed within a visible distance. Next, they imitated and vocalized the sounds in nature. As their vocal cords developed over a very long time, they created words. In the beginning, the words were the copies of the vibrations/sounds in nature. The words created from great nature were themselves the words of God. Through great nature, I believe humans acquired the words of God. Thus they acquired the ability to converse with God.

OUR HOME STAR

Where does God reside?

Assuming that we are the children of God, I would think that God resides at the center of the universe. Although it is arguable where the center is, I would go with the thought of the North Star as the center.

One thing that puzzles me is that although the location of the North Star remains unchanged, it is said that the star has a cycle of twenty-six thousand years and is replaced by other stars.

Five thousand years ago the North Star was Thuban; in twenty-five hundred years it will be Errai in Cepheus; ten thousand years later it will be Deneb in Cygnus; thirteen thousand years later, it will be Vega in Lyra; and Polaris, currently in the Little Dipper, is expected to return as the North Star in twenty-six thousand years.

What should we make of this? Is it possible that God is on a rotation or shift system? I will save the exploration of these questions until later; for now let's think about where we came from.

I believe we came from the Big Dipper, which may sound startling; but the reason may be explained by my special attachment to the number 7.

Why do we have the seven basic notes?
(sound)

Why does a rainbow have seven colors?
(color)

Why are there seven days in a week? (time)

Why do we have the seven chakras in our bodies? (body)

I am sure you can think of many other examples associated with 7. For instance, we have many expressions in Japanese with the number 7, including lucky seven, the seven spring herbs, the seventh day after death ceremony, the forty-ninth (the square of 7) day after death ceremony, the seventh evening Star Festival (the seventh day of the seventh month), the seven downs and eight ups, seven lights, seven gods, seven misfortunes, seven changes, and seven mysteries. No doubt there are many mysterious expressions related to 7 in other languages as well. I am fascinated by the fact that the important elements for humans (sound, color, time, and body) are related to the number 7.

So when a friend of mine and I were talking about our origin, he said it must be the Big Dipper, seven stars. I was immediately convinced.

The Japanese character for "star" has two components—"day" and "coming into life." There must be a relationship between a birthday and the home star. By understanding the relationship between our

home star and the Big Dipper, we may be able to get closer to knowing whether this concept is correct.

As I've discussed previously, I believe that *kanji* contain very reliable information and that when we understand their meaning we can solve quite a few of our mysteries. When I reflect on *kanji*, I am convinced that ancient humans were able to solve the mysteries of the universe to a certain degree. This seems especially true when we consider that modern science has a history of approximately 150 years and that the ancient wisdom was developed over tens of thousands of years of human culture.

It may not be true of all ancient wisdom, of course, but the wisdom of Thales, Aristotle, and Plato, for example, is still highly respected today. They discovered the truth that underlies today's humanity more than two thousand years ago. Even the use of astrology to forecast a person's character and destiny has been common for more than five thousand years. Astrology does not show any sign of decline; rather, it seems to gain more popularity as it is taken up daily by TV programs and such. In general, the way of thinking and the customs that have lasted more than three thousand years are mostly dependable. Humans must not have been so shortsighted.

Five

THE
POWER
OF
PRAYER

PEOPLE'S THOUGHTS ARE
TRANSMITTED TO WATER

Our consciousness affects water. Our collective thoughts have an especially remarkable effect. They are like laser light that can reach even the surface of the moon. The following story is a miracle of water purification at Fujiwara Dam.

In late August 1997, I went to speak at the Kogakukan Hall of the Omi Jingu shrine at the invitation of the Lake Biwa Research Institute, a civic organization. The title of my talk was "Hado, Water, and Life."

There, I met Kato Hoki, an ascetic priest of Shingon Tantric Buddhism. He was the chief

priest at a temple in the city of Omiya. As if he had been waiting for me, he showed me two photographs. They looked like featureless scenic views of a lake, taken from the same place and from the same angle.

While showing me the pictures, Reverend Kato said to me, "These pictures were taken at the lakeside of Fujiwara Dam, Gunma Prefecture, on the same day. I have been practicing the religious asceticism of Shingon Tantric Buddhism for many years. As I was practicing, I noticed that my incantations and prayers seemed to result in purifying the water around me.

"So a few months ago, I went to the lake and performed the incantations and prayers for water purification for about one hour. There was a noticeable difference in water clarity before and after."

When I looked at the pictures more intently, I noticed an obvious difference. The lake water in the picture taken after the prayer looked much clearer.

"Wow! It's amazing! It's really amazing! But I can understand this, Reverend Kato. It is because of *hado* and the spirit of languages, isn't it?"

"Indeed, it is. My temple practices Shingon

Tantric Buddhism. 'Shingon' means exactly 'to convey the spirit of languages.' "

"Reverend, would you please take me to the site next time? By taking water crystal photographs before and after your ascetic practice, I believe we can confirm the difference more clearly."

"Of course! I will let you know when the date is set."

One and a half months later, Reverend Kato and I went to Fujiwara Dam accompanied by Mr. Sato and Mr. Mochizuki, who were in charge of water crystal pictures and videotaping. There was another person with us, K., who miraculously recovered from terminal cancer after Reverend Kato performed his incantations and prayers.

WORD ENERGIES

Fujiwara Dam seemed stagnant and gloomy. This man-made lake is not really a lake but a huge reservoir. The reservoir at Fujiwara Dam seemed to have the same problem as any other dam in Japan. Since there was almost no convection current, accelerated oxidation was adversely affecting the sur-

rounding natural environment. No beautiful autumn colors were reflected on the water's surface.

Reverend Kato chose a site and prepared for his ascetic practice. He put a branch of a *sakaki* plant at each of the four corners of the site and purified it with sake he had brought. Once the sacred space was created and purified, no one but the ascetic priest was allowed to be inside.

Slowly and solemnly, the priest started his practice. His rich and ringing voice gave no indication that he was seventy-two years old. With his fingers, he made various hand signs, and from time to time he shouted out briskly and loudly.

I noticed that his voice and the hand signs were directed not to the reservoir but to two glasses of water on a stand at his feet.

Immediately, I understood what he was doing. Perhaps he designated one glass of water as yang and the other as yin. By concentrating all his energy into the yin and yang waters, he was influencing the water in the reservoir through resonance. Thus the resonance effect started by the water in the glasses would give lively vibrations to the reservoir.

Reverend Kato's incantations and prayers lasted about one hour without a break, and his ascetic practice came to an end. I felt awed and deeply moved by watching the priest's solemn, wholehearted devotion. After a while, I said to him, "Reverend Kato, thank you very much. If you don't mind, I wish to ask you some questions about your practice." Like a professional interviewer, I held a microphone for our videotaping and asked many questions. Reverend Kato was not at all out of breath and humbly answered my questions. After about fifteen minutes of interviewing, Mr. Sato suddenly screamed, "Mr. Emoto, look at the lake! The water is clearing up rapidly. It is really amazing!"

Mr. Mochizuki also exclaimed, "Wow! Really great! It is so clear now that we can see the trees reflecting on the water. That reflection wasn't there before."

I turned my head toward the water, and I was stunned. A gentle breeze had now stopped; the ripples on the water were gone, too. The water surface was like a mirror reflecting the surrounding colorful scenery.

"Look, Reverend Kato. It's incredible, isn't it? When we came here, the lake surface had almost no reflection. It is so beautiful now. It's really great! I am awestruck."

Without showing any excitement, Reverend Kato smiled calmly and said, "Indeed. It is getting quite clear."

I thought to myself, "Well, I didn't expect it to be this great." Then I said to him, "Actually, I thought that if we took the samples of water before and after the prayer and took crystal photographs, we might be able to detect the difference, but it is so obvious to our own naked eyes that we do not need to do this to see what's changed. It is awesome. As I expected, the energy of the spirit of languages is verifiable. Thank you very much."

THE SECRET OF THE HEPTAGON WATER CRYSTAL

Three days later, my excitement grew even more, reaching a peak when Mr. Sato handed me the crystal pictures of the lake water samples taken before and after Reverend Kato's incantations and prayers. With trembling voice, he said, "President,

tremendous things have happened!" Normally he would have addressed me as "Chief," but then he excitedly used "President."

The photographs he handed me were indeed beyond my imagination. The water crystal picture before the prayer was horrible. Examined more closely, it looked like a woman struggling and suffering in despair. However, the other picture turned out to be beautiful. To my amazement, it was not a hexagon but a heptagon. We have never been able to take such a picture of a heptagonal crystal before. I wondered why this happened; soon I came to realize the reasons and developed a new hypothesis: Water is a pilot for all beings. When humans, who reside in the three-dimensional world, move to the otherworld, water alone can synchronize with the energy levels of their consciousness. Water is the only agent that does not interfere with humans and takes them to the other dimensions as they are. Therefore, in the three-dimensional world, water must change its physical properties variously; thus, it gives us hints for its functions. The ultimate aspiration of water in the solar system must be "light" itself.

In other words, we are originally the children

of light. Our goal for the moment is to go back to that status.

The heptagonal water crystal taught me this new hypothesis. This thought touched my heart and moved me almost to tears. It was a real honor and pleasure to meet with the Reverend Kato Hoki.

This experience led me to come up with a quixotic plan—purifying the water of Lake Biwa with the spirit of languages. This plan was carried out on July 25, 1999, and resulted in a wonderful phenomenon.

A month after the Fujiwara Dam experience, Mr. Sato called K., who had accompanied Reverend Kato and had subsequently heard dreadful news.

He communicated that a week after we went to Fujiwara Dam, the local TV station reported that a young woman's body had surfaced at the reservoir there. The next day, the murderer of the woman was arrested. I don't believe this is just a coincidence.

The water crystal picture before the prayer had indeed looked like the distorted face of a woman who was suffering. On the other hand, in the hep-

tagonal crystal picture, I saw a merciful face like that of Mahatma Gandhi.

This experience was very shocking. Since then, I have come to recognize the spiritual world and the spirit of languages. It feels uplifting and invigorating for me to think that the energy from the spirit of languages can influence all life-forms on earth. When it is based on true love and gratitude, the spirit generates unbelievably refined energy to affect all life on Gaia.

FROM ISRAEL TO TOKYO— BEYOND TIME AND SPACE

The first time I really prayed was more than thirty years ago, in front of a TV set. It was being reported that the *Apollo 13* spacecraft had had a serious explosion in one of its oxygen tanks while en route to the moon, and images of people all over the world praying for the three astronauts' safe return were being broadcast.

One of the scenes that stuck in my memory was

of Jewish people praying earnestly at the Wailing Wall. Following these people, I also prayed for the astronauts' safe return in my own way.

It might have been the first time that collective prayers had occurred worldwide, transcending races and religions. It must have been the power of these prayers that enabled the astronauts' miraculous return despite the one-in-three-million odds.

That experience of more than thirty years ago is one of the driving forces behind my promotion of international activities with prayer as the theme, although I had previously been indifferent to religions and religious education.

In July 2003, I visited Israel. Declaring July 25 as the day to offer our love and gratitude to all the water on earth, I visited the Jordan River to pray for world peace. There I decided to do a completely unexpected experiment.

My unscheduled experiment was to send love and gratitude from the seminar site near Lake Galilee to the tap water placed on my desk in my office in Asakusabashi, Tokyo. I truly wanted to see how water crystals would change before and after the participants offered spoken prayers. Having

had all the participants readily consent, I showed a slide picture of the glass of water on the desk in my office.

To the water, we recited and sent our words, "Water, I love you." "Water, I thank you." "Water, I respect you." We repeated these phrases three times. That's all the experiment involved.

I promised the audience I would show the result in five hours. Mr. Kizu, a researcher, was on standby in the laboratory in Tokyo; at midnight I sent him an e-mail to freeze the water. Shortly after, his e-mail response arrived: "I have just finished the preparation. I will be able to send you the result in three hours." It was 2:00 a.m. in Japan; 8:00 p.m. in Israel.

The time had come to show the participants the result. It was about 11:00 p.m. I said to the audience, "I have just received the picture that resulted from your cooperation. Let me show it to you."

Did the *hado* energy in the prayer and words of love and gratitude reach Tokyo more than twenty thousand kilometers away?

A beautiful water crystal appeared, although tap water in Tokyo had never formed crystals before. This is evidence of the power of prayer.

All things begin with consciousness. The world is made up of the consciousness of each and every one of us. If the earth is filled with the *hado* of ample love and gratitude, the world will manifest itself as love and gratitude.

A PRAYER

*When we were children,
No one taught us the importance of a prayer.
Not our mothers, fathers, grandmothers, grandfathers,
Nor schoolteachers.
During the war, they all must have prayed.
But they thought that the prayer was not heard,
Because they had atomic bombs, burned houses, loss of loved
ones.
So I, too, didn't pray until I was in my mid-fifties.
Well, when I was small, I did go to the Sunday school of the
occupying forces and I prayed, "Jesus, Jesus, please
make me a good child of yours,"
Since I knew I could get chocolate and sweets.
But after working with water for fifteen years,
I was taught.
"It was wrong. Prayers are really important."
What was wrong was how they prayed.*

*They prayed for winning the war.
They prayed for good fighting of their husbands, sons,
fathers, and brothers.
Prayers then were forced, too.*

*A prayer for destruction will never be heard,
Because water is a messenger.
Water carries only the prayers with love and gratitude.
This is proven by water crystals.
When we pray for our families' safety,
When we pray for our loved ones' health,
Our prayer is heard.
For us, all the people on the earth are important,
Because all of us are a family living on the earth.
So let's pray together for the peace of our family.
Let's pray for peace on earth.
Our prayer will surely be heard!*

THE ETERNAL THEMES OF HUMAN BEINGS

As discussed earlier, the most difficult questions that we need to find the answers to are: Where did we come from? Why are we here? Where will we go after we die? Nobody would disagree about that. In this book I have described my attempt to find the answers to these questions.

Has it been several million years since human beings came into existence? The recorded history of humanity goes back a few thousand years. Throughout human history, the teachings of philosophers such as Plato, Socrates, Chuang-tzu, and Lao-tzu and of religious beings such as Christ and Buddha have offered signposts for solving

these seemingly eternal mysteries. Although their teachings were expressed differently, they have all been respected as truth.

People today have difficulty believing unconditionally in the aspects of this world that exist only as mental or spiritual phenomena. People have a tendency to resist grasping the world in its entirety, and instead pick and choose the part of the teachings relevant to their own conditions and interpret that part according to their own needs. Contemporary tensions among religions, philosophies, and races seem to derive from these tendencies.

Fortunately or unfortunately (depending on how you look at it), I lacked a basic knowledge of religion and philosophy. On many occasions, I was faced with an important situation where I had to make a choice. Relying on my ethics and empathy, backed by the sense of justice that was growing inside me, I was able to make decisions and to live for more than sixty years without devoting myself to a specific religion or philosophy.

I am grateful for the happiness I feel in challenging myself to explore these questions at this stage of my life.

On the journey to reach this point, I had a fateful encounter with *hado* and water many years

ago and success in taking water crystal pictures starting a few years later, and I've accumulated many photographs since then. These experiences have taught me how to paint freely; the canvas was Masaru Emoto, myself, and it was white in terms of philosophical and religious background.

The painting style was representational, not abstract. Namely, it was a scientific method of taking photographs with microscope cameras. My work was immediately recognized by twenty-first-century leaders in healing and spirituality. It played a role in proving and endorsing what they had accomplished. These leaders then spread news of my work worldwide. In time my work was affirmed by those who had a faithful religious belief in the sincere pursuit of a life purpose.

Eventually, my work was supported by many women intuitively, rather than logically. They were the ones who gave birth to babies after carrying fetuses for 280 days, babies that began as tiny fertilized eggs of almost 100 percent water and became small humans with tens of trillions of cells. They were the ones who had DNA for such life bearing. After receiving great resonance worldwide, I am no longer just an ordinary man in his sixties. With this

realization, I ventured on a quest for answers to human beings' three eternal questions.

Let me summarize my working answers.

WHY DO WE HAVE THE ABILITY TO THINK?

Let me repeat: All life-forms cannot be born without water. Water was not intrinsic to this earth. It came from outer space, plunging through the earth's atmosphere in the form of ice in comets, which are still arriving. At this point, I am not going to discuss my views about what this phenomenon entails; I may be able to do so sometime in the future. Here it is sufficient to say:

1. Without water, no life has its birth.
2. Water came from the universe.
3. Therefore, all life, including humans, came from outer space.

The question then is: From where in the universe did we come? As discussed, I believe it to be

the Big Dipper. Of course, this belief is just the result of my own reasoning. I hope readers will contemplate where our true home is by relying on their own sensibilities.

Honestly, I am not familiar with astrology, *bagua* divination, Chinese astrology, or numerology. Among old fortune-telling practices, I believe we can find the keys to discover where our true home is. Combining our knowledge and wisdom and generating ideas together, we will be able to hit upon key words for such a discovery.

Wherever our true home may be, I feel confident about how we were sent here because of what I have learned from photographs of water crystals. I have seen a great many of these pictures and eventually came to realize that water is the blueprint of reality.

Let's take a look at the pictures in Figures 16–18. The top photograph was taken after exposing water to a picture of the Izumo shrine, the middle to a view of cherry blossoms, and the bottom to an image of an elephant. Please take another, closer look; you will notice the similarity between the shapes of water crystals and the shapes of actual items. If water is shown the picture of a person's face, I am sure it will form a crystal by capturing his or her characteristic

Figures 16–18. After water was exposed to the picture of the Izumo shrine, the shrine's sacred straw rope appeared. There was a pink color in the center of the one exposed to the image of cherry blossoms, and a trunk in the crystal shown the picture of an elephant.

features. The foundation of my belief is derived from studying water crystals and conducting tuning-fork experiments. As I mentioned earlier, the most beautiful crystal was formed after water was exposed to "love and thanks."

A water crystal may be showing us a mandala of vibration or a design of life phenomena. If so, then the fundamental concept of this planet called Gaia is love and gratitude. In other words, the earth was originally designed with the concept of love and gratitude. Humans are entrusted to maintain that concept. The act of love gives every being vitality. Giving vitality is the same thing as giving vibration. As seen in tuning-fork experiments, in order for us to give off vibrations, we have to vibrate first. That is an ability given to us humans. Why? The reason is that only we humans can freely sing "do, re, mi, fa, sol, la, ti, do." No other being can sing songs in the same way we humans can.

In other words, only humans can freely modulate the source of energy—vibration—and then send it off. This ability at freely modulating vibration also explains our ability to think. Why can humans, unlike other animals, think? I believe it is because humans have the ability to freely modulate and transmit vibrational information. This abil-

ity has manifested itself as our wisdom, history, and civilization.

There are numerous and elaborate kinds of vibrations. Evidence can be seen in the fact that no two snowflakes are identical despite countless snowfalls since ancient times.

When we come up with grand ideas, they often arrive with what's described as a "flash" or "shock." These expressions also point out that humans have numerous and elaborate vibrations. I believe this is because of the variety of atoms that make up human beings. In other words, I believe that humans are made up using all of the atoms in the world. Let me cite my explanation for that from my book *Hado Jidai eno Jyomaku* (The Prelude to the Hado Age).

ALL THINGS HAVE MENTAL VIBRATIONS

I feel I have come to the place where I was supposed to come. Once, when I measured the *hado* of a cut flower, it indicated the emotion of sadness, which was previously thought to be something only humans could feel. From this experience, I developed the following hypothesis:

Be it negative mental *hado* such as frustration, anxiety, worry, and anger or positive *hado* such as sympathy, trust, kindness, and confidence, when humans have these mental vibrations (*hado*), they are expressed as such emotions.

These vibrations are actually common to all beings. Perhaps not only humans but also all things, including plants and minerals, share these emotions. To put it most generally: the *hado* energy that is the source of all phenomena is derived from the mental (conscious) *hado*.

Based on this hypothesis, I have conducted experiments on various materials, including diamonds, drugs, food, water, and ceramics. The results all support my hypothesis.

All the materials tested displayed the same emotions as humans do. This finding led me to another daring idea. However, before getting into it, I have one more finding to share.

THE
SHAPE
OF
LOVE

GRUDGE AND GRATITUDE HAVE THE SAME HADO

Once I was invited to speak at the Intuition Study Group (led by Mr. Yukio Funai of Funai

Consulting), and since Dr. Ronald Weinstock, the developer of MRA, happened to be in Japan at that time, I made arrangements for him also to speak at the seminar. He told me the following story during our preparation meeting for the seminar: "*Hado* has two aspects—positive and negative. Within one *hado* [vibration], there are positive and negative, and they are expressed in two extremes. For example, paired feelings such as grudge and gratitude, anger and kindness, and sadness and joy share their *hado*. Depending on a given person's positive or negative field, the same *hado* can be expressed quite oppositely."

I admired his explanation, because I had seen many cases that endorsed his point. You may want to think about your own personality in this context; you will probably find that you, too, have these contradictions and dualities.

ONE HUNDRED AND EIGHT WORLDLY DESIRES AND ELEMENTS

My idea grew and grew, and reached its climax when I referred to the *Japanese Dictionary of Physics and*

TUNE IN
TO THE
VIBRATION
OF
LOVE

Chemistry and read about elements. The following was what I found:

Proposed by Boyle in the late seventeenth century, Lavoisier in the latter half of the eighteenth century, and others, elements became recognized with experimental bases. The number of elements discovered was about thirty then. Subsequently, many more elements were discovered as new metals were found and spectroscopic analysis and X-ray spectroscopic analysis came into use.

Next, new elements were discovered through nuclear reaction. Currently, 103 elements have been confirmed, from hydrogen, atomic number 1, to lawrencium, atomic number 103. Furthermore, an additional 5 new elements, from atomic numbers 104 through 109, excluding 108, were found through nuclear reaction.

When I saw that the total number of elements is 108, something flashed into my mind; I thought of the "108 worldly desires" that humans are said to have.

A SIGNPOST FOR NEW SCIENCE

Through the process described above, I developed another hypothesis: Each and every element that makes up all substances—humans, animals, and plants—has both positive (yang) and negative (yin) *hado*. Humans are made up of combinations of all 108 elements—the 103 elements in the periodic table and the 5 new elements. Other animals, plants, and substances have fewer elements.

For example, roses may be made up of combinations of thirty atoms. A joke goes, "A monkey is a human with three fewer hairs." Well, it may not be a joke after all; it may be implying that monkeys are made up of 105 elements, three fewer than humans.

Each element must have its intrinsic meaning in terms of *hado*. By analyzing elements using *hado* measuring devices such as MRA, we may be able to uncover the mysteries of humans and ultimately the mysteries of the universe. My intuition tells me hydrogen has the role of "information," oxygen that of "energy," and carbon that of "intelligence." I believe that each of the 108 elements has its own intrinsic role.

The concept of two fields, yin and yang, or

negative and positive, is the basic physical phenomenon in the universe, where condensation occurs through repeated attraction and repellency. When opposite fields collapse, everything loses stability and also collapses.

I am a little concerned that the newest among the 108 elements were discovered through nuclear reaction. I am anxious about whether the additional elements will disturb the balance of the universe.

In any event, I believe it is correct to say that the atoms that constitute the human body give rise to negative mental *hado*. In this vein, it is very important to eat the right foods. Foods are the only means by which our bodies are supplied with the necessary nutrients.

WHAT FOODS ARE TRULY GOOD FOR US?

As you know, the human body consists of as many as sixty trillion cells. Each cell has minutely different vibrations. To vibrate, cells need to resonate with something else—foods.

Because the cells of both our bodies and foods

are made up of atoms, they share the same materials, and may therefore be said to be of the same sort. Naturally, the cells of our bodies want to live continuously according to the order of our DNA or our will. In other words, they want to continue vibrating. As discussed earlier, a cell cannot continue to vibrate by itself. So it gives off an SOS signal saying, "Give me vibration." It is the signal "I am hungry."

Attending to the signals of our cells, we relieve them by eating, sending them food. Since each cell is very small, the food is made into tiny, even microscopic parts through the digestive process. Water, of course, is always there to escort the foods so that they can move smoothly during the entire progression.

Ultimately, foods become the different frequencies that the various cells need. Through resonance phenomena, vibrational energies are distributed according to cells' needs, and they are revitalized again.

When we think about the relationship between foods and our cells, it becomes clear that the purer this symbiotic relationship is, the more efficiently energy exchange occurs. So foods that have fre-

quencies that are very close to those of our cells are good for us.

Since we have sixty trillion cells, with many different needs, the best solution is a balanced diet with a wide variety of foods. In terms of energy, problematic foods are the ones with frequencies that are altered artificially, such as foods grown using chemical fertilizers and pesticides, foods containing artificial preservatives, and foods made with MSG.

When these foods are ingested constantly, our cells' physical properties will be altered, and this may trigger the development of cancers, incurable diseases, and mental disturbances. Suppose a cell gives off a certain signal when it gets weak. Then that cell can pick up a vibration that is similar but not exactly the same. This would inevitably result in the cell's properties being altered.

If you agree with what I have discussed in this section, I encourage you, especially if you are in a medical field or the food industry, to start studying vibrational nutrition. In the near future, I anticipate that technology will be developed to accurately measure the frequencies of each organ and each food.

TUNING IN TO THE HADO OF LOVE

When I wrote *Hado Jidai eno Jyomaku* (The Prelude to the Hado Age), I had yet to think of everything in terms of vibration. Currently, I view us humans as being equipped with many varieties of vibrations—that is, information—from our birth. I believe this is true because, as discussed earlier, every element has its intrinsic frequency, and our being made up of many elements gives us the ability to tune in to many different things.

For example, we can talk to beautiful flowers in the garden and cheer them up. Among the wild plants, we can find herbs and some plants that are edible. We are also good at tuning in to the frequencies of dogs and cats. Wherever we go, we can see people using a similar tone of voice to amuse babies.

Instinctively, we humans have the ability to tune in to others' frequencies. I believe this is possible because we share the same elements with them; we have their frequencies within ourselves.

We can directly give off vibrational energy that resonates with others, thereby revitalizing them. That energy is *love*. The recipient of the energy

sends off a pleasure energy in return. That energy is *gratitude*. In this manner, love and gratitude complement each other and generate energy efficiently. This is exactly the source of free energy.

Science should have stayed focused on an extension of this concept of love and gratitude, yet something went wrong somewhere, and this principle was forgotten.

Worldly desires came into play: the ambition for fame, material greed, hunger for power, jealousy, fear of death, and so on. With these desires interfering, it was difficult to generate free energy. We can easily develop destructive energies in the short run, but we have a hard time developing love-and-gratitude energy or renewable energies in the long run.

How did this happen? I believe it resulted from having people in power at different times who wanted control over society. They successfully utilized the negative vibrations of people's worldly desires.

There is no value in denying our past. Perhaps we should accept it as the course that we had no choice but to take, because denying our past is tantamount to denying our existence. What we need

to do is learn from the past and create the present and the future in a more hopeful way.

Returning to that important question, "Why are we here?," I share the following:

The role of humans is simply to give the vibration of love. As a natural consequence, the energy of gratitude will be generated. Thus the world will be balanced beautifully with these complementary energies.

Such energy is free, and it can continue forever, without drying up. The source of energy is water, H_2O . *H* represents gratitude, and *O* love. With one portion of *love* vibration and two portions of *gratitude*, energy will be created. Water is forever.

SOMETHING THAT CONTINUES FOREVER

We are water. We are vibration protected in water. The vibration collects atoms that were sent to the earth in advance and makes temporary "clothing" for us to wear. That clothing is our body. How we wear this clothing—with or without care—makes a

difference in terms of how long it will last, and so life span differs from person to person.

Another factor that affects our life span is the *hado* inherited from our ancestors. When our ancestors left unfinished many things that they had wished to do, negative genes were created, and the size of our atomic clothing was disturbed to a degree determined by these unfinished desires. This disturbance may result in a shorter life span. But when we feel love and gratitude, our clothes will be easily mended. The clothes will also be repaired when we complete our ancestors' unfinished jobs.

When we take off our temporary clothes (death), what will happen? I believe there are two paths: one is to cross the river Styx and go to the otherworld; the other is to go through the cycle of reincarnation. Those who cross the Styx will become a part of water recirculation in the universe, and they will be sent to the next destination. Through the water circulation in the universe, the order of life in other stars will be maintained. Wherever we go, humans exist like the sun, giving the energy of love unstintingly.

Those who cannot cross the Styx are flunked students in this earthly school that trains humans to be peacekeepers in the cosmos. They must re-

peat the schooling until they can graduate. In our time there are so many repeaters that it is difficult to get back into school again.

To sum up: Passing or failing the earthly school depends on how much we can feel and exercise love and gratitude at the level of the body, not just in the head. We humans are supposed to vibrate. Our being is our soul in temporary clothing made up of atoms. In other words, we are vibrating souls. We cannot continue to vibrate alone. Unless we receive resonating vibrations from others, we stop vibrating—that is, we truly *die*.

Conversely, as long as we have resonating vibrations, our vibrations will not stop; thus there is no death. The absolute condition for receiving resonating vibrations from others is *gratitude*. In other words, as long as our bodies have feelings of love and gratitude, our life—vibration/soul—will never disappear and will be eternal.

EPILOGUE

This book is my attempt to explain plainly the true meanings of love and gratitude that I learned from my study of frozen water crystal pictures.

In the series of experiments in which words were shown to water to see the changes in crystal formation, the most beautiful crystal resulted from exposing water to the words "love and thanks." A label with the words "love and thanks" was pasted on a water bottle and left there for twenty-four hours. The picture was taken thirteen years ago, and I have not seen a more beautiful crystal since.

I have been pondering why such a beautiful water crystal was formed after showing the water "love and thanks." I finally found my answer. Once I had it, I felt that I needed to share my findings with my readers. Meanwhile, the Tokuma Shoten Publishing Company had asked me to write a book; so I took the opportunity to satisfy both goals. It was a struggle for me. With a title such as *The Shape of Love*, I needed a suitable structure and writing style. In the past, people tended to think of me as "Emoto, the Hard-Liner." Therefore, I had trouble changing my style. With Ms. Toyoshima's support and advice, I managed to work up my thoughts into a book. Having just finished reading the final galley proof that Ms. Toyoshima sent me, I realize once again how difficult it is to write this kind of book. What I have written is new science, with the added burden of trying to present *hado* in an easy-to-understand manner. Since *hado* is invisible, I needed a miracle.

The other tool I used to explain *hado* was the tuning fork and its sound. Sound clearly is also invisible, which is why I needed illustrations to explain tuning-fork experiments. It was virtually impossible to convey sound resonance or echo phenomena with enough presence that readers would feel as if they were listening.

As a writer, I still have to keep training myself to write correctly, as I wish to tell the important truth to as many people as possible. It is hard work, but I intend to enjoy it at the same time.

Well, what did you think of the book? Was it easy to read? What else? Your honest feedback will be very much appreciated. Please send your comments to my Web site: www.hado.net.

In closing, I must confess one thing. While writing this book, I became very ill and was almost hospitalized. I still have a lingering cold. I often talk about the importance of love and gratitude and say that the best way to avoid illness is to feel love and gratitude, yet I myself became sick. Why? It is because my heart is not filled with love and gratitude. I understand the concept in my head, but my love and gratitude are not substantial enough to reach the core of my body. No wonder it took six years for me to understand the message of love and gratitude from water.

I pledge that I will put love and gratitude into practice, together with you. As my first step, I dedicate this book to my beloved wife with gratitude.

Faint, illegible text, possibly bleed-through from the reverse side of the page.

(continued from front flap)

such important issues as how we treat others and the earth itself, Dr. Emoto's findings encourage the positive actions that spell a better future for all.

A magnificent follow-up to *The Hidden Messages in Water*, *The Shape of Love* is a fascinating investigation into the intersection of science and spirituality and its impact on our lives and our world.

DR. MASARU EMOTO is a graduate of the Yokohama Municipal University and the Open International University as a doctor of alternative medicine. His previous book, *The Hidden Messages in Water*, has sold more than 600,000 copies worldwide. He lives in Tokyo and frequently travels to the United States to speak about his work.

Praise for Masaru Emoto's *New York Times* Bestseller,
The Hidden Messages in Water

"*The Hidden Messages in Water* is magnificent. Through his genius photography and superb scientific skill, Dr. Masaru Emoto has created a book that is truly a mystical treasure. His contribution to research in spiritual consciousness is positively masterful."

—Carolyn Myss, author of *Sacred Contracts* and *Anatomy of the Spirit*

"Half of the earth is water; our body is three-quarters water. Water represents the interface between the fourth dimension in which we live and the fifth dimensional sphere of our soul. Many studies have shown subtle effects of healers upon hydrogen bonding and infrared absorption of water. None of these scientific studies can compare with the beauty and clear messages shown by Dr. Emoto's elegant work. The impact of thought and beauty has never before been demonstrated so well."

—C. Norman Shealy, M.D., Ph.D., founding president of
the American Holistic Medical Association

"As with Galileo, Newton, and Einstein, Dr. Emoto's clear vision helps us to see ourselves and our universe differently. Science and spirit unite, resulting in a profound and undeniable quantum leap in how we view our world, and how we can reclaim our health and create peace."

—Marcus Laux, N.D., editor of *Naturally Well Today*

"Dr. Emoto's work with water beautifully illustrates the healing power of love and gratitude. These building blocks of appreciation support our well-being in body, mind, heart, and soul. *The Hidden Messages in Water* is a most valuable contribution to the creation of a positive future for our world."

—Noelle C. Nelson, Ph.D., coauthor of *The Power of Appreciation*

われています。なんだか人間とよく似ていますね。

そして、その水の大部分は「海」にあり、雲や霧になって空中を漂っている「水」もあれば、雨水、地下水、湖や沼、河川、高い山の万年雪、南極などの「氷」も、もともとは「水」です。

でも大切な水が、良い水なのか、悪い水なのか、人間の身体にとってはどうかとなると、研究機関か専門家でない限り、はっきりしたことはわかりません。私たちからみれば、どの水も同じようにみえますから。

水に含まれる情報の違いとはなんだろうか。なんとかそれを見ることはできないだろうか。

そんなとき、ふと、「まだ科学が解けない疑問」(ジュリア・ライ／ダヴィッド・サヴォルド編 晶文社刊)という本を読みました。この本には50項目くらいの謎があり、その中に「同じ形の雪の結晶はあるのか」という項目があげてありました。数100万年前から降り続けている雪の結晶は、全部違う……ということでした。

Introduction

Masaru Emoto, Water and HADO, which signifies the world of subtle energy related to consciousness, synonymous with "Chi" in Japanese

My encounters with the study of water when I became acquainted with Dr. Lee H. Lorenzen. Dr. Lorenzen was at that time 34 while I was 41. Dr. Lorenzen studied biochemistry at the University of California at Berkley and later became a water researcher, developing "micro-cluster water" (or Magnetic Resonance Water).

Since the encounter with Dr. Lorenzen, I had become attracted to the study of water and had begun wanting to know more about the properties of water. I wondered if there were any machines that could measure and see water. It was at this time that through Dr. Lorenzen, I encountered a machine that could measure HADO, called an MRA, Magnetic Resonance Analyzer. It was after this discovery that my research started to advance with increasing speed.

ひと目でわかる水の評価方法はないか

それまでに私は、なんとか水の違いを表わす方法はないものかと、悩んでいましたから、「ああ、これだ!」と思いつきました。

誰もがパッとひと目で見てわかるような、水の評価方法はないか……。

そんなところから考え出したのが「水の氷結結晶(以下結晶という)写真」です。この方法なら、知りたい水を凍らせてできる結晶を、写真に撮影すればいいのです。

水を凍らせて、その結晶を撮影したら、その水の情報が得られるのではないかと考えたのです。

苦労を重ねた末に、結晶写真を撮影し、拡大してスライドにすることができました。そして講演などに持って行くと、その美しさと不思議さに、コピーを頼まれることも多くなったのです。結晶写真の美しさと醜さが人を引き付けてくれました。

そのようなことが重なって、結晶写真に対する喜びと、神秘さをわかちあいたいという切なる願いから、この本の出版を企画しました。

身近な水の話

The MRA was used at that time in the USA for homeopathy (a popular drug therapy in Germany). The minute that I saw this machine, an idea flashed through my mind that it could be used in the study of "micro-cluster water" (Magnetic Resonance Water), so I brought it back to Japan as an instrument that could hopefully contribute to my research.

As a result, "HADO water" that transcribes HADO information by MRAs in micro-cluster water, that Dr. Lorenzen produced at my request, demonstrated that the physical condition of people can be improved by water.

I have introduced the use of the MRA and HADO in my literary works as listed below. Please refer to them for specific details.

As I began doing more research on water, I became interested in taking pictures of various frozen water crystals. Through these pictures, I have gained a great experience by seeing these faces of water. These pictures were so wonderful that I just had to show them, so I decided to edit them into this picture book, "The Message from Water".

Water, Humans and Earth

A human being appears on this earth physically for the first time when an ovum of the mother and sperm of the father meet each other and become a fertilized egg. At this time water accounts for about 95% of the fertilized egg, in other words, it is almost all water. The amount of water in a matured human body is 70%. No wonder it is said that the human body is made of water.

People live their lives surrounded by various kinds of water everyday until the day they die.

The earth is called the "Water Planet" and about 70% of its surface is covered with water. Isn't this somewhat similar to the human body? Most of the planet's water such as rainwater, underground water, lakes, marshes and rivers is in the sea. Some water floats in the air in the form of clouds or mist. Firm in high mountains and ice in Antarctic are also originally water.

As I went on with my research of water, I became unsure whether the precious water that I am working with was clean water or unclean water, or subsequently what it means to the human body. No one except for a water research institution or water research professionals really know the definite answer. Water, whatever it's makeup, appears the same to our eyes.

What is the difference in the information that each kind of water holds? Is there any possible way of seeing that?

While I was thinking about this, I came across a book titled, "THE DAY THAT LIGHTNING CHASED THE HOUSEWIFE" (Edited by Julia Leigh and David Savold, Shobun-sha Publisher). This book contains about 50 questions. Among them, there was a question that asked "Are there any snow crystals of the same shape?" The answer was that snow has been falling on earth for a few million years and each crystal has a different shape.

Can You Make Evaluations of Water in a Glance?

I had always wondered if there were methods of expressing the difference of water nature. And that was when it hit me that "This is it!"

That was what led me to make these "pictures of frozen crystals of water" (hereafter referred to as crystals). With this method, all I had to do was to take pictures of the crystals made by freezing water."

If I freeze water and take a picture of the crystals that form, I could obtain information about the water. That was the whole idea behind the experiment that I was about to start.

I enlarged my pictures of crystals into slides and brought them to my lectures. Since then, I started to get requests for copies of them because of their beauty and mysteriousness. The loveliness as well as ugliness of the crystal pictures attracted people. It was from these events and my earnest desire to share the joy and mysteriousness of crystals that I decided to publish this book.

Chapter 1 Story of Water in Daily Life

Water and Environmental Problems

We cannot think about the quantity of water that circulates this earth without thinking about environmental problems. To solve environmental problems we need the prevention of water contamination, resulting in higher purification levels of water. Water circulates in this world limitlessly and absorbs and dissolves all contaminants. Water is the source of life. If water is contaminated, all creatures would be denied of their existence. Considering these environmental situations, I continued to seek a way to clearly evaluate water.

Can the Water on the Earth Survive?

The tap water that we unconsciously use everyday, is one type of water that has many figures.

Most tap water is directly from rivers. River water is collected in a treatment plant to undergo sterilization and disinfection by chlorine. The water is then transported to each home through water pipes.

It has become common practice for home users in cities to attach a water purifier to the water faucet. Water in most cities is contaminated. How bad is the contamination and is it because the original river water is contaminated? Did it get contaminated on the way to the home water faucets?

How contaminated is natural spring water?

To go further back, how contaminated is the rain that falls from the sky contaminated? Does rainwater get contaminated impurities in the air although it is to be originally distilled on the earth?

Even scientific experiments and analyses of impurities and contaminants contained in each water sample seem to be partially a numeric magic.

Water is essential to our life, but when we think of it, it contains a lot of problems.

Which tap water is more contaminated, Tokyo or Osaka?

How about local cities in Hokkaido and Kyushu?

Is water in the rural areas really more pure?

The Chinese Character of Water

水という文字は……

水の結晶写真を撮影中、どの氷も写真のような状態を通過して水に戻ります。

水が凍って結晶になり、温度が上がって水に戻る寸前の一瞬、 -5°C から 0°C の間で、「水」という漢字とそっくりの姿を見せてくれます。昔の人はこのことを知って「水」という文字をつくったのでしょうか。漢字以外の文字については、この推理は当てはまりませんが……。

While taking pictures of water crystals, whatever kind of ice melts to water through the state shown in the picture.

When water freezes, it becomes crystallized. At the moment right before it returns to its water form (with a rise in temperature, between -5°C and 0°C) it creates a shape that is identical to the Chinese character for water. Did people in the ancient times know this and make the Chinese character for "Water" based on this information?

Other letters except Chinese ones may not be applied to this reasoning.

『結晶』は「水の顔」

結晶とは、原子あるいは分子が規則正しく配列している状態の個体で、雪や水晶のほかに、ダイヤモンドなどの天然の鉱物、食塩、化学調味料などにも結晶が見られます。

とくに雪は諸条件の重なりによって生まれることから、同じ顔をした結晶はひとつもありません。これは2人として同じ人間がいないことと似ています。

そして雪ばかりではなく、地球上のいろいろな水にも、独自の結晶構造があるはずだと考えました。

水の分子が結晶したとき、きれいな水はきれいな結晶をみせる。しかし汚染された水は美しく結晶しないのでは…と、そう思いついたのです。

1994年、早速実験にかかりましたが、なにしろいろいろな水を凍らせ、小さな壊れやすい結晶を、それも溶けないように顕微鏡のステージに乗せて、超特急で撮影する必

要があります。

まず、凍らせる水の量、シャーレの素材や容量、ドライアイスやクーラーも総動員しました。冷凍庫の庫内温度、冷却時間、実験用の冷蔵室の温度、顕微鏡観察倍率、ライトの当て方、レンズの絞りなど、実にさまざまな条件をひとつずつクリアしてはじめて撮影できます。

この実験に取り組んでから、満足のいく結晶写真が撮影されるまでに、2ヵ月という時間を要しました。この間、何百、何千枚というフィルムを無駄にしたことでしょう。

でも、最初に結晶写真を得たときの感動はえもいわれないものがありました。(14ページの写真)

なんでも最初の1枚が大切な意味をもつものです。

これに勢いを得て、冷凍庫と、カメラをセットした顕微鏡が入るような大きさの冷蔵室をつくり、そして『結晶写真撮影班』を結成しました。少しずつ写真を増やし、データを蓄積していきました。

Water Crystal Is the Face of Water

Crystal is a solid substance with orderly configured atoms and molecules. In addition to being in snow and crystallized quartz, crystals are also seen in natural minerals such as diamonds, table salt, and chemical seasoning like MSG.

In particular, because snow is formed under a variety of conditions, there are no crystals that have the same face (as is true with people's faces.)

This is due to the fact that for snow flakes to have the same crystal structure, the various types of water on the earth have to start out having the same crystal structures.

I had a theory. When a water molecule crystallizes, pure water becomes pure crystal, but contaminated water may not crystallize as beautifully? Well, at least I thought so.

In 1994, I immediately started my experiment. I needed to get each sample of water frozen. Then before they melted I had to place these small fragile crystals on the microscope stage to be photographed at a super high speed.

First of all, I had to get a full set of equipment: the required quantity of water samples to freeze, Petri dishes which material and volume are considered, dry ice and a cooler. Photographing the crystals could only be possible after meeting various conditions, the exact freezer temperature, specific times to be cooled, exact refrigerator temperature, microscopic observation magnification, how to light the object, and lens iris.

It took about 2 months before I was able to take a picture that I was satisfied with. During this period, I must have wasted a few hundreds or a few thousands of rolls of film.

However, it was a very impressive moment when I succeeded in taking my first picture of a water crystal.(Picture in page 14)

After that initial photograph, my experiment gained momentum. I then made a refrigerated room in which a small freezer and a microscope set with a camera could fit. After organizing a "crystal photographing group" my colleagues and I took pictures one by one and stored the data.

はじめて撮影に成功した結晶写真/マイクロクラスター水
The first successful crystal picture we took/Micro-cluster Water

新しい水の評価法の発見

水は変化が激しく、不安定なものです。調べたいと思うひとつの試料水を100個のシャーレに滴下し、冷凍庫に2時間入れておきます。できあがってくる結晶を捕え、顕微鏡を通し、200~500倍の倍率で撮影をします。

しかも、いろいろな結晶の中から平均的なものを得るために、考えられる限りの努力が続きました。

マイナス5℃に設定した冷蔵庫での撮影は、スタッフの体力を考えると、1回の作業はどうしても30分以内に限られます。

結晶写真の撮影については、完全に同じ結果、つまり同じ結晶は得られないわけですから、再現性という点では100点満点の結果ではありません。でもたとえば、格子状の結晶が多いとか、板状の結晶が多いなどの、はっきりと

した傾向が見られ、傾向性という面では、識別ができていると思っています。74ページに1回に1種類の試料水を100のサンプル用意し、凍らせて撮影したときの、いろいろな結晶写真を掲載しました。美結晶、六角、不定型、結晶なし、などにわかれますが、ある一定の傾向性が見られることがわかります。

われわれは結晶写真から多くのことを学びました。今までに、企業や有志の方などの協力も得て、世界各地、また、日本中の湧き水、雨水、河川、湖沼の水を凍らせて撮影することができました。

4年半で約1万枚の写真撮影、所蔵しています。

とくにこの写真集にご紹介した海外の水のほとんどは元・ニチレイアイス社長の田口哲也さん（「水の文化史～人と水のふれあいの歴史」冷凍食品新聞社刊の著者）が、世界中をくまなく歩いて採水してこられたものです。

Discovery of a New Water Evaluation Method

Water changes rapidly and is unstable. We dropped one sample of water to be tested on 100 Petri dishes and placed them in a freezer for 2 hours. We took the crystals out and put them under the microscope to be photographed at magnifications of 200-500 times.

In order to obtain an example of an average crystal we had to photograph as many samples, under as many conditions as we could think of. It's only physically possible for most people to last about 30 minutes (at the longest) while taking pictures inside a refrigerator set at 5°C below zero.

It is impossible to obtain identical crystal pictures. In other words, it is impossible to perfectly reproduce the same crystal twice. However, crystals can show a certain distinctive tendency called a grid crystal or laminar crystal structure. Crystals can be identified by this structural tendency. On page 74, there are pictures of crystals taken by freezing 100 samples at a time for 1 type of water. Although there are many examples of crystals in these samples such as beautiful crystals, hexagonal crystals, variable crystals, or no crystal, we can see that there is a certain tendency in all of the samples to form a grid crystal structure.

We learned many things from these pictures of crystals.

Thanks to the cooperation of several companies and volunteers hitherto, we were able to take pictures of spring water, rainwater, river water, lakes and marshes all across the world and in Japan.

We have photographed and stored about 10,000 pictures in 4 and a half years.

Most of the water from overseas shown in this picture collection was collected by Mr. Tetsuya Taguchi, the former President of Nichirei Ice Co., Ltd. who traveled all over the world and wrote "The Cultural History of Ice: Links between Man and Ice," published by the Reitou Shokuhin Journal.

水からの伝言

私たちスタッフが、実際に結晶写真を見るときは、最初の一枚の写真から教えられたように「六角形の整った結晶構造をしているかどうか」がもっとも重要です。経験から、結晶構造の欠けや崩れは、良い徴候ではないと思います。つまり、普通に眺めて、美しいと感じるかどうかが判断の基準です。

撮影のため、結晶のできる過程を何千回と見てきました。すると不思議なことに、水の「がんばる様子」を見たり感じたりするようになりました。

そして結晶写真は素晴らしい伝言を選んで、水が人間に何かを語りかけていると思いました。

これらの結晶写真はまさに「水の顔」でした。

水は基本的には「良い水になろう！ 良い水になりた

い！」と、けなげに努力していると思います。

そんな表情が伝わってきたのです。

水の結晶写真は、現代の科学的な水の分析方法とは少し離れるかもしれません。まったく違った角度からみた、水の評価方法です。

さらに、水の流れと人の行方と言われるように、水は決して定まることはありません。結晶として撮影されたものは、その日、その時の状態を表わしています。

従って、これを科学的レベルまで引き上げていくためには、毎日のように、いろいろな所で多くの人々の手によって、観測されなければなりません。

ともあれ、これはたぶん、世界ではじめての試みです。このような手法において、水にアプローチする方法もあるという提言として、水が見せてくれる「水の顔」に出会ってください。

A Message from Water

When our staff actually looks at the crystal picture, it is most important that they notice that it has a completed "hexagonal crystal structure", as we saw in the first picture. From our experience, we know that the chipping away and/or collapsing of crystal structures are not good signs. In other words, the judgment criteria is whether you can feel that it is beautiful or not by looking at it.

During the photographing, we observed the crystallization process a few thousand times. Then strangely, we came to feel and see the crystal trying to become "beautiful crystal figure" of water, and that crystal pictures carry wonderful messages. We felt that the water was trying to say something to us. We came to understand that these crystal pictures show different "faces of water".

Water, basically, is trying hard, bravely, to be a "Clear water! I want to be clear water!"

We felt such expression coming out from the crystals of water.

Pictures of crystallized water may deviate slightly from the information given by modern scientific water analysis. Our water evaluation method comes at the analysis from a completely different angle.

In addition, as is often quoted, "Flow of people as well as water is not stable." The pictures of the water crystals express the condition of that sample of water only in that very moment of that very day.

Therefore, in order to raise this analysis to a scientific level, the crystals must be observed on a daily basis at various locations and analyzed with many people's supports.

In any case, this is perhaps the first attempt of this kind in the world. We hope you will enjoy this introduction to a unique method of approaching the study of water, called the "Faces of water".

日本の水道水

水道水の結晶写真

現在の日本の上水道水に、塩素や塩素処理によるトリハロメタン、その他環境ホルモンの原因となる化学物質が含まれていることは、残念ながら周知の事実です。実際に大都市の水道水をそのまま飲むと、塩素臭が鼻につくこともあります。

水道水がまずい理由は、水道水となるダムや川などの元の水を、飲めるように殺菌するために消毒薬を加えたから……であることも、おそらく知られています。また「加えられた消毒薬は、人体に影響ありません」と説明されれば、黙ってうなづくしかありません。でも実際には多くの

人達が、浄水器を使って有害と思われる物質を取り除き、自分たちの身体を守っているのです。

地方や田舎へ行っても、日本の水道の普及率は、ほぼ100%。現在では地下水や井戸水を汲みあげて、直接飲用している人は本当にわずかです。

それに全国の水道水には、ある一定の基準があり、その基準をクリアしないと広く提供できないことが法律で定められています。

そこで各地の水道水を結晶にして撮影しました。一定の基準を満たしている水道水は、果たして全国どこでも同じような結晶になったのでしょうか。

Tap Water, in Japan.

Picture of Tap Water Crystals

Regretfully, it is a known fact that chlorine, chlorinated tri-halomethane and other chemical substances that are the causes of environmental hormones are found in the tap water of Japan. When we drink the tap water in major cities, we actually smell a chlorine odor.

We all know that this is one of the reasons why the tap water is not good. The water that comes from dams and rivers has disinfectants added to it to make it drinkable. And since it carries a sign saying, "Added disinfectants are not harmful to humans," we are supposed to believe that it is OK. Actually though, many people use water purifiers to remove the seemingly harmful substances that they instinctively know threaten their bodies.

The ratio of waterworks covering local and rural areas is nearly 100% in Japan. These days, only a small amount of people pump underground water or well water to use as drinking water.

There is a specific nationwide standard for tap water, and it is provided for by law that the water that doesn't satisfy these standards cannot be supplied to the public.

I decided to take pictures of tap water samples in their crystal forms. Do tap water samples that satisfy the national standards have the same kind of crystals no matter where the samples are found in Japan?

Sapporo City, Hokkaido

北海道・札幌市

札幌市は大都会ですが、郊外の環境は東京のそれと比べたら、まだまだ自然がそのままに残っています。この札幌市の水道水の水源は豊平川。それほど汚染されている川ではないのですが、水道水ではやはり、きれいな結晶を得ることはできませんでした。

でも、必死でまっとうな結晶になろうと努力しているようにも見えます。

Sapporo is a large city, but when comparing its suburban environment with the suburbs of Tokyo, the nature is more intact. The water source of the tap water in Sapporo comes from the Toyohira River. Although this river is not polluted as badly as some others, we could not obtain clear crystals from this tap water.

However, it seems that it is trying desperately hard to be a clean water.

Sendai City, Miyagi Prefecture

宮城県・仙台市

「杜の都」、水の美しい街として有名な仙台市ですが、水道水は……。これもまた、という感じです。

Sendai is famous as the "City of Forests", and it has beautiful water sources. But as for its tap water, it is the same as Sapporo's.

Kanazawa City, Ishikawa Prefecture

石川県・金沢市

北陸の都市で城下町。市内に浅野川、犀川が流れており、市内中央の兼六園は日本三銘庭園のひとつです。

しかし、水道水の結晶は……。

Kanazawa is the largest city in the Hokuriku district and is a castle town. The Asano River and the Sai River flow through the city, and Kenrokuen Park at the center of the city has one of the 3 famous gardens of Japan. However, the water is...

Shinagawa-ku, Tokyo

東京都・品川区

予想どおり東京の水は、良くないことを証明してしまったような写真です。

結晶化する予兆も見えません。大都会という環境のなかにある水の宿命なのでしょうか。

This picture seems to indicate that the water in Tokyo is not as good as we had expected.

This picture of Tokyo's tap water shows no sign of crystallization. Is this the fate of water in a metropolitan environment?

Nagoya City, Aichi Prefecture
愛知県・名古屋市

大都市の水道水としては珍しく、結晶になる一歩手前の姿がとらえられました（木曾川系水源）。

完全な六角形になるうとする水を阻害している要因は、いったいなんでしょうか。

Unexpectedly, we were able to capture its figure just before crystallization, rarely seen in tap water in large cities. The Water source is the Kiso River.

What is the factor that impedes a water crystal from forming a complete hexagon?

Kita-ku, Osaka City

大阪市・北区

大阪も「水の都」……でしたが、今では、水のまずさで定評のある都市に。

ただこの写真、かなりいびつですが結晶になろうとしています。しかも角には枝も見られ、発展願望が大。

Osaka used to be a "City of Water". But it has become a city famous for unpalatable water.

The sample of water from Osaka seems to be trying to crystallize, though it is significantly distorted. We can see branches at the corners which indicate that it is trying to becoming fully developed.

Katano City, Osaka Prefecture

かたの 大阪府・交野市

交野市は大阪市の北部、奈良と京都の県境にあります。

交野市の水道水は、6割を地下水を水源としているためか、とてもきれいな結晶がとれました。

そういえば、千利休がお茶をたてるときに、交野の水をわざわざ取り寄せて使ったとか……。

Katano city lies in the northern part of Osaka and on the prefectural border between Nara and Kyoto.

We were able to obtain a clear crystal from the tap water in Katano, since 60% of it comes from an underground water source. Come to think of it, Sen-no-Rikyu, a tea master and a founder of the Sen school of tea ceremony, used water from Katano to make tea.

Hiroshima City, Hiroshima Prefecture

広島県・広島市

川と橋の町、広島。原爆の洗礼を受けた町、広島。酒どころとして名高い西条もひかえていて、昔から水のおいしいところでした。必死で六角形になろうとしている結晶は、まるでやがて人の優しさと団結を表わしているようです。

Hiroshima, a city of rivers and bridges. Hiroshima, a city baptized by the atomic bomb.

Saijo is famous for its sake, and the water in this city has always been good since ancient times. The crystal that is trying hard to develop into a hexagon seems to be expressing the graceful kindness and solidarity of its people.

Fukuoka City, Fukuoka Prefecture

福岡県・福岡市

九州一の大都市・福岡。やはり都会の水道水で美しい結晶を得るのは無理なのでしょうか。結晶の半分ほどが何かに浸食されたような形ですが、結晶の名残りは見られます。

The largest city in Kyushu, Fukuoka. Is it an impossible task to try to obtain a clear crystal from a city tap water? About half of the crystals that we photographed seemed to have been eroded by something, but still there are traces.

Naha City, Okinawa Prefecture

沖縄県・那覇市

観光商業都市沖縄は、本土より1~2ヵ月早く桜が咲き、早めに梅雨も。大きな川はなく、水道水の水源地、雨水を溜めたものを利用しています。水や海を大切にする人々の気持ちが表わされているようです。

Okinawa is mainly a tourist and commercial city. On the island, the cherry blossom season arrives about 1 to 2 months earlier than on the mainland and their rainy season also comes earlier. There are no large rivers so the water source for their tap water comes from rainwater reservoirs.

This water crystal seems to express the people's warm feelings toward water and the sea.

海外の水道水

世界の水事情

所変われば品変わる……のたとえにあるように、水ほどその環境（文明、文化を含む）や風土によって変わるものはないでしょう。

そのため、WHO（世界保健機構）では、1984年に水質指針（ガイドライン）を作成しましたが、そのなかで「飲料水の安全判定の目安や処理目標としての基準は、各国がその国内状況（水事情、社会全体の環境レベル、技術力、経済力など）を勘案して決めるべきであり、指針はそのための基礎資料を提供するにすぎない」と注釈しているほどです。

Tap Water, Overseas

The Water Circumstances of the World

Each country has its own customs. Nothing else is changed so much by the environment and the natural features of the land (including civilization and culture) as is the water.

For this reason, the WHO (World Health Organization) created water guidelines in 1984. In these guidelines it is stated that "The standard for safety judgment of drinking water and criteria for treatment should be determined by each country giving consideration to its own domestic conditions (water circumstances, environmental level of the entire society, technical as well as economical power) and these guidelines are only provided as a basic material for that purpose." Therefore, the water purification method for tap water differs according to each country. In our country, a treatment system using mainly chlorine has been provided by the ministerial ordinance of each prefecture.

These pictures of tap water crystals from around the world were taken only from 6 large cities: London (UK), Paris (France), New York (USA), Vancouver (Canada), Buenos Aires (Argentina) and Manaus (Brazil). However, when compared with the pictures of Japanese tap water crystals, they were surprisingly more clear.

It seems that the reason is the difference in the degree of contamination of the water sources in each country, as well as the difference in the water treatment systems.

ですから、水道水の浄水処理方法は、各国によってまちまちなのですが、わが国では、主として塩素を中心とした処理システムが省令によって定められている、ということになります。

今回、ご紹介する外国の水道水の結晶写真は、紙面の都合で、ロンドン、パリ、ニューヨーク、カナダ、アルゼンチン、ブラジルの6都市だけです。しかし、日本の水道水の結晶写真と比較してみると、案外きれいなものが多いのです。

その理由は、それぞれの国の原水の汚染度の違い。そして、水の処理システムの違いにあるようです。

London, UK

イギリス・ロンドン

霧の都ロンドンの水道水です。
結晶というには程透い状態しか得ることはできませんでしたが、
日本の水道水と比べてみると、なんともいえません。

The tap water of London, a foggy city.
We could only obtain crystals that were not fully developed as was frequently the case in Japan.

Paris, France
フランス・パリ

セーヌ川の流れるパリの水道水です。
なかなか結晶するというにはいたりませんが、思っていたよりひどくはない……といったところでしょうか。

The tap water of Paris where the Seine River flows.
The sample did not crystallize easily but it was not as bad as we had expected.

New York, USA

アメリカ・ニューヨーク

アメリカ大陸の東海岸にあるニューヨークは、人種のつぼとされているとされていますが、水道水は日本の湧き水よりいい顔をしているものがあります。

ちなみに、ニューヨークの処理システムはフッ素、オゾン処理が中心ということです。

New York is located on the east coast of the North American Continent and is said to be the melting pot of races.

We can see that some of the tap water crystals have better faces than those of Japanese spring water.

In New York, tap water is usually fluorinated or ozonized.

Vancouver, Canada

カナダ・バンクーバー

アメリカ大陸西海岸、すぐお隣りはアメリカのシアトル。比較的暖かく住みやすいことから、日本人も多く住んでいます。水道水にしては美しい結晶を保持しています。

Vancouver is located on the west coast of the North American Continent. Seattle, Washington in the USA is just a few miles south from there. Because the weather is relatively warm and subsequently affords it's population a comfortable living climate, many Japanese people live in Vancouver. The crystals of the water here retained a beautiful crystalline shape especially for those of tap water.

Buenos Aires, Argentina

アルゼンチン・ブエノスアイレス

美しい結晶をみせてくれました。

こんな結晶写真が撮れると、日本の水道水の質の悪さが思われなくなりません。

しかし、旅先で飲んで安全かどうかは、また別の問題です。

The water here shows a beautiful crystal shape.

Pictures of these beautiful crystals remind us of how bad the Japanese tap water is.

Beautiful crystals, however, are one thing and safe drinking water while traveling is another.

Manaus, Brazil

ブラジル・マナウス

とても美しい結晶です。

美しく結晶する、水道水が飲める国の人々がうらやましい気はしますが、しかし、消毒基準が日本に比べて、それほど厳しくはないということですので、何とも言えません。

Very beautiful crystals.

The water crystallized beautifully. The people who live in countries where the tap water is drinkable are really very fortunate, but the disinfection criteria are not so exacting as those in Japan.

自 然界の水

滔々と……が水の自然な姿

「自然水」といいますが、どこからどこまでが「自然」なのか、その境界線はあいまいです。

「人間の影響が及んでいない水」といいかえれば、もはや地球上には「自然水」など残っていないかもしれません。水は私たち人類が生まれるずっと以前から、地球上に存在していました。そして水は、自然に、滔々と、循環するというサイクルを繰り返していました。

私たちは、その循環していた「自然」の水をちょっと拝借しているだけではなかったのでしょうか。

ちょっとお借りしていたつもりが、生活が便利になり、文化が発展すると同時に、あまりにもたくさんの水を使うようになり、その水を汚し続けることになってしまったよ

うです。そして自分たちで汚した水を「浄化」と称して塩素を入れて消毒し、「不自然」な水をつくり出してしまったのではないのでしょうか。

循環する水の浄化力

水は本来、自然なものです。水自身には、自然に自分を浄化する自浄作用がありました。

たとえば雨水が地面に染み込んで、地下水となる過程でろ過されることや、川や湖から蒸発して雲になることも浄化の一種です。シジミ、ハゼ、ボラなどの川と海の間で生きる生き物は、川の上流から流れてきたものを食べて生きています。だから河川は中流とくらべて、河口近くの水がなんとなく美しい結晶を見せてくれることも、自然の浄化といえるのではないのでしょうか。

Water in the Natural World

Water Flows Swiftly... is a Natural Figure of Water

We say "natural water", but to what degree is the word "natural" applied? In other words, the boundaries of the word natural are very vague. If we say that water "not influenced by humans" is natural water, then there may be no water left on earth that can be called natural.

Water existed on the earth long before humans emerged. It has repeated its swift circulation cycle naturally.

We were only borrowing circulating "natural" water.

We were just borrowing it, but because it became so convenient, we started using too much water as our human culture developed. As a result, we started polluting water before we put it back in circulation. This polluted water is then "disinfected" with chlorine, which we call purification, whereby creating "unnatural" water.

Purifying Power of Circulating Water

Water is originally natural and has the power to purify itself. For instance, when rainwater penetrates the ground, it is filtered through the soil and becomes part of an underground water source. Water also is filtered when evaporating from rivers and lakes to become clouds in the sky. These are just some of its natural processes of purification.

Creatures that live between the river and the sea, such as corbicula, goby and striped mullet, eat their food that is carried from upstream. Therefore, it can be said that as a result of this natural purification, the water near the river mouth would show beautiful crystals as compared to the water found mid-stream.

自然水はどこに？

大自然の循環サイクルの中では、つねに大きく浄化作用が働いているようです。

しかし現代では人間の営みのために、大量の農薬や化学肥料、各種の化学物質が土壌に染み込んでおり、雨水はそこをろ過装置として通過しています。したがって地下水や湧き水も汚染されていることになります。

また下水施設や生活雑廃水、工場廃液などを引き受けている河川の汚染はいうまでもなく、自動車の排気ガスや工場が吐き出す煤煙、産業廃棄物などのゴミを焼却する煙も汚染源ですし、原子力発電所もたくさんできています。

あらゆる状況下で汚染された大気。その大気の中を落ちてくる雨水も「酸性雨」となって、人間の汚染を受けています。

また湖や沼も大きく人の手が加わって、せき止められたり、埋め立てられたり、フタをされたり、つぶされたり、引越しまでさせられることもあります。

やはり、今や本当の意味での「自然水」を探すことは少なからず努力を要します。

この項では、一般的に「できるだけ人の手が加わっていない状態の水」として、日本国内を中心に、代表的な自然の湧き水や河川・湖沼の水、雨水などをとりあげ、その結晶写真を集めました。

Where Can You Find Natural Water?

Amidst the great circulation cycle of nature, purification is always happening on a large scale. However, today, due to the work of humans, a large amount of chemical substances have penetrated the soil through which rainwater filters. This means that underground water sources and spring water also are contaminated.

Not to mention the contamination that occurs when rivers take in waste water from sewage treatment facilities and plants, gray water, exhaust gas from automobiles, soot and smoke from plants and smoke from incinerating daily industrial waste materials are also contamination sources as well as many nuclear power plants that are being built.

Air is polluted under all kinds of conditions. Rainwater as "acid rain" is also subject to pollution by humans.

Lakes and marshes have been artificially reformed by damming, reclamation, covering, dissipating and even being forced to move.

It indeed requires effort to find "natural" water in the true sense of the word.

In this chapter, we will show a collection of pictures of the water crystals found in typical springs, rivers, lakes, marshes and finally in rainwater. Most of the samples are mainly gathered in Japan as "water not polluted by human hands."

湧き水

湧き水の自然な顔

日本全国から寄せられる湧き水の撮影は、非常に楽しいものです。

いくら撮影を続けても、さんたんたる状況に陥ってしまう水道水の結晶写真の結果とは、比べものにならないほど、ワクワクドキドキさせられます。

日本は国土の8割が山々におおわれています。先進国としては希少なほど自然の山林も多く残っていて、雨量も豊富で、清浄な水に恵まれた国なのです。

おかげで全国の至るところに湧き水も多く、古くから庶民の暮らしと密接に結びついていました。

しかし戦後の急速な都市開発と山林の人工的整備などにより、汚染のため使えなくなったり、枯渇してしまった湧き水もたくさんあります。

ところが最近になって、水道水の危険性が叫ばれ出し「ミネラルウォーター」ブームなどともあいまって、自然の湧き水に再びスポットが当たっています。

雑誌などの特集で「名水百選」が取り上げられ、その名水を求めて、何時間もかけて水を汲みに行く人もいます。全国で自然に湧き出ている水や地下水の中から選んだ結晶写真です。

さて自然の湧水たちは、どんな顔をして、どんなメッセージを伝えてくれるのでしょうか。

Spring Water

The Natural Face of Spring Water

These Photographs of spring water collected from all across Japan are very interesting.

Photographing was thrilling especially when compared with the depression that we felt while taking the pictures of the tap water crystals.

Mountains cover about 80% of Japan. Because of this we have an abundance of the natural mountains and forests not commonly seen in industrialized countries. We have plenty of rain and are blessed with pure water.

Since ancient times, this environment and our many natural springs have been closely related with the long and healthy life span of our rural people.

However, with rapid urban development and artificial development of mountains and forests, increased water supply accesses and drainage systems were built after World War II. Because of this, many sources of spring water became unusable due to contamination or due to simply drying up.

But recently, the community was alerted to the dangers of tap water and this (triggering a "mineral water" boom) has caused natural spring water to again draw attention.

"Selected 100 Water of Japan" has been featured in magazines. To seek such water sources, some people travel hours to the identified locations. These are pictures of selected natural spring water crystals.

Now, what kind of faces do the natural spring water and ground water have and what message do they convey?

Ryusendo Cave, Iwate Prefecture

岩手県・竜泉洞

120メートルの深さをもつ地底湖もある、鍾乳洞の近くに湧き出す水。一部が欠けてはいるものの、大きな力強さを感じます。地底湖の水は浸食されつつも必死で自然を守るようとしているよう。手遅れにならないうちに、地球をきれいに……と思います。

Water comes springing out near a limestone cave that holds an underground lake as deep as 120 meters in some places.

Although the crystal that is formed from this water is partially chipped, we feel a dynamic strength coming from its structure. The water from the underground lake seems to try to desperately preserve it's uncontaminated nature even if eroded. We believe that we must make the earth beautiful again, before it is too late.

Sanbu-ichi Yusui Spring Water, Nagasaka-cho, Kita-Koma-gun, Yamanashi Prefecture

さんぶいちゆうすい
山梨県北巨摩郡長坂町・三分一湧水

八ヶ岳の雪解け水を源とする「三分一湧水」からは、美しい結晶を得ることができました。均整のとれた六角形構造をベースに、それぞれの角から三本の枝が別々に伸びている様子は、湧き水をめぐってみんなが仲良く手をつないでいるように見えます。

From a sample that was made up of Sanbu-ichi Yusui spring water we were able to obtain a beautiful crystal. It is made up of snow water from Mt. Yatsugatake. Based on a well-balanced hexagonal structure, 3 branches stretch out from each edge of the crystal. This gives the impression of people holding hands together around the spring water.

Clear Water of Kobo, Kanagawa Prefecture

神奈川県・弘法こうぼうの清水

弘法大師由来のこの湧き水は、どんな日照りの年にも、枯れることがないといわれています。

観光センターなどで売られている商品は、酒やソバをはじめ、どれも名水をうたってあります。

結晶写真は、地下から湧き上がってくるような力強さを感じます。素晴らしい宝物を後世に残したいですね。

Originating from Kobo Daishi, this spring is said to never dry up even during a severe draught year.

The products sold at the local tourist centers, including sake and soba, advertise that they are made using water from this spring.

In looking at the picture of the crystal we feel a strong power that seems to come springing out from underground.

We do wish to hand down wonderful treasures to our future generations.

Kobo Spring Water, Fukuyama City, Hiroshima Prefecture

広島県福山市・弘法こうぼうの湧水

1200年ほど前、中国地方を巡っていた弘法大師が、奇病に悩む民衆を救済しようと杖で岩盤を打って湧き出したという水。

弘法の水という名前は、大師の全国行脚中に湧き出したという言い伝えとともに、いろいろな場所に残っています。

2種類の弘法の水はとてよく似ています。

スタッフもときどき間違えるほどです。

About 1,200 years ago, the great Buddhist teacher Kobo was travelling in the Chugoku region of Japan. There were many people in the region afflicted by a strange illness and to help them, Kobo hammered away the base rock with his staff in order to get at the natural water flowing underneath. This water was named Kobo Spring Water.

The name "Kobo Spring Water" is found in various places throughout Japan, where-ever natural hot waters sprang forth during Kobo's travels.

There are two very similar types of Kobo Spring Water. They are so similar that even our staff sometimes have trouble telling them apart.

Rumbling Water in Tenkawa Village, Yoshino-gun, Nara Prefecture

奈良県吉野郡天川村・ゴロゴロの水

山岳信仰と厳しい修行で名高い大峯山の登山道入り口にあり、鍾乳洞に湧き出る水の音がゴロゴロという音をたてて、反響することからこの名前がついています。洞窟から湧き出る神秘の水といわれています。

This name comes from the rumbling echoing sound that this spring makes. The spring lies in a limestone cave at the entrance of a mountain path in the Omine Mountains. The people of these mountains are famous for their worshipping practices and strict ascetic beliefs.

The water that gushes from the mouth of this cave spring is called mystic water for this reason.

Spring Water of Saijo, Hiroshima Prefecture

広島県・西条の湧水
さいじょう

標高500～700メートルくらいの高地周辺に広がった町は、水が美味しいことから酒どころとしても名高く、兵庫の灘、京都の伏見と並ぶ酒どころです。中心部分までしっかりと結晶しており、周囲にすき間無く広がった枝は見事です。

This town that sprawls in the highlands mountains 500 to 700 meters above sea level is famous as a sake brewing area because of its good water. It is as famous for sake as Nada in Hyogo Prefecture and Fushimi in Kyoto are. The crystal that this spring water forms is firm through the center and branches magnificently. It then spreads out fully leaving no empty space.

Ubuyama's Water, Kumamoto Prefecture

熊本県・^{うぶやま}産山の水

熊本県の北の端、大分県に接している地で、阿蘇山の北のふもとにある湧水です。
牧畜の盛んな町で、大野川の源流あたりにある名水百選のひとつ。
美しい結晶はひっそりと咲いた、花のよう……。

Ubuyama's water is a spring located at the northern end of Kumamoto Prefecture, which borders Oita Prefecture and lies at the foot of the Aso Mountain where cattle breeding is prosperous. It is also the home of the source of the Ono River, one of the "Selected 100 Waters of Japan".
This beautiful crystal is just like a delicate flower blossom.

Fountain in Lourdes, France

フランス・ルルドの泉

「聖ルルドの泉」は奇跡の泉といわれ、世界中から毎年400万人以上の人が集まります。愛の波動をもつ水、恨みを逆転させる水として有名です。集団意識としての良さを表わす……神秘的な輝きが感じられる不思議な結晶です。

"St. Lourdes' Fountain" is said to be a fountain of miracles. The water has HADO from love and it reverses hatred to love. More than 4 million people from every corner of the earth come to visit each year. This crystal expresses the merits of the collective consciousness. A mysterious crystal that gives off the feeling of mystical glory.

Hogget Diamond Spring Water in Tasmania, Australia

オーストラリア
タスマニア **ホグト・ダイヤモンド湧水**

オーストラリアの南東部のタスマニア地方は、古生代岩石地帯に属していて、オパールや工業用ダイヤモンドの採取が盛んだった場所。
キラキラと光るダイヤモンドのような結晶がとれたのも不思議です。

The Tasmania region is located at the south eastern end of Australia. The spring is located in a Paloozoic era rock formation where opal and diamond mining (for industrial use) once prospered.
It is no wonder that glittering crystals of diamonds were there.

Underground Water in Northern Island, New Zealand
ニュージーランド北島・地下水

海岸では海水浴、山に登るとスキーができるという、日本人が大好きな旅行地のひとつです。人の数より羊の数の方が多い国の地下水は、伝統を大切にす人々に守られ、受け継がれているようです。

This is one of the most popular tourist attractions for Japanese people. The climate is such that while the sea-coast offers warmth enough for swimming, the mountain provide the temperatures needed for skiing. The underground water of the country where the number of sheep exceed the number of people, is preserved and taken over by people who cherish tradition.

河川・湖沼

生活を支える水

山々や森に降った雨は、木々の栄養分となったり、地面に吸い込まれたりしながら、少しずつ集まって小さなせせらぎをつくります。せせらぎが太く、強い流れになり、川ができます。川は少しずつ大きなエネルギーをもつようになり、急な山の間を抜けていきます。その間に、栄養分の多い山の土を下流に運びます。

途中の地形に応じて、水がめの役割を果たす池や湖や沼になったりしながら……。

川は水を下流に運ぶことで、植物のみならず生き物を育み、平野に入ると、上流から持ってきた栄養分の多い土を供給しながら、田畑をうるおして進みます。

毎日、食卓に登場する食物の多くは、川の水の恵みな

しには、生育しないものばかりです。

日本にはいわゆる大河と呼ばれるような大きな川はあまりありませんが、河川や湖、池や沼などの数は豊富です。中でも河川は古くから生活に密着した存在で、飲用水としてはもちろん、田畑の灌漑用水や交通手段としても重要な役割を担ってきました。

私たちの暮らしと直結している河川の汚れは、とても気になることです。

都市を流れる河川の汚れはどんな具合でしょうか。

地方はどうでしょうか。

清流と呼ばれる川の結晶はどんな姿をしているのでしょうか。

それらの河川の源であり、水がめの役割を果たしている湖沼の結晶は、どんな顔を見せてくれるのでしょうか。

Rivers, Lakes and Marshes

Water that Supports Life

The rain that falls on the mountains and forests can become nutrition for trees or penetrate through the soil collecting to form small streams underground. With enough water these streams become wide and strong, forming a river. These rivers then gradually accumulate energy and water enough to pass through steep mountains, carrying with it the nutritious mountain soil.

In accordance with the terrain along the way, the water may form pools, ponds, lakes or marshes.

By carrying water downstream, the river nurtures creatures as well as plants. When the river enters a plain it enriches the fields as it advances ahead by depositing the fertile soil that it carried from upstream.

Most of the food put on our tables everyday could not have grown without the blessings of the river water.

In Japan we have no large rivers but we do have an abundant number of small rivers, lakes, ponds and marshes. Even these small rivers have been important to our people's lives since ancient times and have contributed in supplying drinking water, as well as providing a means of transportation and field irrigation.

The flow of the rivers that are directly connected with our lives are very important to us.

How is the contamination condition of rivers that flow through cities?

How are the conditions in the local areas?

What is the appearance of the water crystals of the rivers that we describe as limpid streams?

What kinds of images does the water crystal of the lakes and marshes, the source of rivers show?

Horobetsu River, Hokkaido

北海道・幌別川

北海道の中央から南へ、日高山脈の山すそから、海にそそぐ幌別川。美しい結晶はまるで花びらのよう……。日本にも、まだまだこんなに美しい結晶を見せてくれる川が残っていることに、改めて感謝したい気持ちです。

This river flows from central Hokkaido southwardly, through the foothills of the Hidaka Mountain range, on to the Horobetsu River and eventually into the sea. These beautiful crystals look just like flower petals.

I am impressed that there is a river still remaining in Japan that has so beautiful crystals.

Goshikinuma, Fukushima Prefecture

福島県・五色沼

ばんたい
磐梯高原の入り口に点在する沼で、水面の色が朱、藍、緑など五色に変わることから、この名前がついています。水面の色の变化は、沼の底にたまった沈殿物と、太陽光線の作用によるものと思われ
れます。雪解けの季節の水の結晶は美しく輝くようです。

The name originated from the look of the water's surface in the dotted marshes at the entrance of the Bandai Plateau. The surface of the water there can be seen by changing into 5 colors ranging from red and blue to green.

This change in color is thought to be affected by the deposits from the marsh bottom combined with the effects of solar rays. A water crystal glitters beautifully during the spring snow melting season.

上流 (十日町橋)
Upstream, Tekamachi-bashi

中流 (長岡)
Midstream, Nagaoka

下流
Downstream

Shinano River, Niigata Prefecture

新潟県・信濃川

長野県や新潟県をまたいで流れる信濃川の、上流、中流、下流の結晶写真です。
都市部に入ると、少しずつ汚染されていることがよくわかります。

Pictures of the water crystals found upstream, midstream and downstream in the Shinano River as it flows
across Niigata prefecture and Nagano prefecture.

You can see by the crystals, that the river gradually gets contaminated as it flows into an urban area.

Sumida River, Tokyo

東京都・隅田川

隅田川のほとりにはたくさんの桜が咲いて、人々が集まります。その桜の下を流れる川の本当の顔が、こんなふうだったら……ちょっと悲しいですね。何とも……という感じですが、川そのものは20~30年前よりはきれいになっています。

Cherry blossom trees bloom along the Sumida River attracting many people.

The actual crystallized face of the river water that flows beneath the cherry blossom trees, looks like this. Isn't it a little bit sad?

It is hard to say such a thing because it has actually become more beautiful now than 20 or 30 years ago.

上流源水/女取湧水
Upstream/Metori Yusu Spring Water

Fuji River, Shizuoka Prefecture

静岡県・富士川

富士川は中流域に大きな街があり、やはり汚染されているようです。ところが、河口付近ではおそらくその辺りに住む魚介類などの浄化作用によって、きれいな水の結晶になっています。水自身も、海に帰るときには美しい姿で……という意志があるようです。

There is a large city at the mid-stream points of the Fuji River, but that area also seems to be contaminated. But the water crystals found at the rivers mouth are clear because of the purifying affects of the fish and shells living in the vicinity.

This water crystal gives the appearance of having the intention of going back to the beautiful sea.

Ado River, Shiga Prefecture

あどがわ
滋賀県・安曇川

滋賀県の比良山から、北へ流れて、琵琶湖にそそぐ川。伝統民芸・京扇子の産地でもある高島の街を通過しています。美しい結晶は、日本古来の伝統工芸を守りながら……。でもこれが、琵琶湖に注いだ後には、どうなるのでしょうか。

The Ado river flows northward from Hira Mountain in Shiga Prefecture to the Biwako Lake. The river passes through the town of Takashima which is the production center of Kyosen, Japanese traditional fan of folk crafts. The beautiful crystal keeps the traditional work craft of Japan. How will this crystal's form change once it pours into the Biwako Lake?

Biwako Lake (South Area of the Lake), Shiga Prefecture

滋賀県・琵琶湖（湖南）

近畿の水がめ。日本の中心にある最大の湖、琵琶湖の水は残念ながら、このような状態です。滋賀県は早くから、限るみで合成洗剤の使用中止を呼びかけるなどの努力をしていますが、それでも琵琶湖の汚染は年々進んでいることを裏付ける、痛ましい姿の写真です。

The largest lake at the center of Japan and the water pool of the Kinki Region. Regrettably, the water of Biwako Lake seems to be like this. This crystal's structure supports the fact that the contamination of Biwako Lake is getting worse each year. This is the case, even though Shiga Prefecture has for many years been making efforts in its campaign against the usage of synthetic detergents. This is a picture of the water crystal's lamentable figure.

Yodo River, Osaka Prefecture

大阪府・淀川

近畿の平野全体を、杓ったりとうるおしながら南下し、大阪湾にそそぐ淀川。関西の主要な街々を通り、文字どおり生活全体を洗い流すような役目を負って流れてきた川。生活や人間関係の汚染をも抱えて、苦悶しているのかもしれない。

The Yodo River pours into the Bay of Osaka as it flows southward enriching the entire Kinki plain. The river passes through most of the major cities in Kansai and flows as if it literally has been given as the role of a general cleaning in its path. It must be suffering with the load of contamination accumulated from its daily life and all of the people that it touches.

Shimanto River, Kochi Prefecture (Midstream)

高知県・四万十川 (中流)

日本最後の清流と呼ばれる四万十川。美しい結晶で枝の部分に特徴があります。
ベースの六角構造の外側に六角形の枝が付き、その先からさらに小さな枝が伸びています。
中流でもこのような美しい結晶がとれますから、水を守ろうとする周辺住民の心意気を感じます。

The Shimanto River is referred to as the last clean stream in Japan. It creates a beautiful crystal which features in the branches.

At the outside of the basic hexagon structure, a hexagon branch is attached and from its edge another small branch stretches out.

This beautiful crystal was taken from the mid section of the river. Within its structure we can feel the spirit of citizens that lived along the river.

氷河

氷河・氷層の結晶にロマンを

地球上の氷は大きく分けて陸にある氷と、海にある氷の2種類があります。氷河とは、陸にある氷のうち、湖や河、凍った土の中にあるもの以外で、雪が降って長い間溜まって凍った氷のことをいいます。なかでも山の中腹にあって、とくに河のように見えるものを氷河と呼んでいます。

冬になって、雪が降り積もっては、また暖かくなって溶け出したところに、冬がくる……といったことを繰り返し、普通は数年以上、雪の量の少ない地方では100年以上もたって、万年雪の状態になっています。

Glacier

A Dream of Crystal of Glacier and Ice Stratum

Ice on the earth can be divided into roughly two types: ice on the land and ice on the sea. A glacier is located on land, located at places other than lakes, rivers, and frozen soil. A glacier forms from snow that has accumulated over a long period of time. Among glaciers in many places, one that locates at the middle slope of a mountain and that appears like a river is called glacier.

In the winter, snow accumulates rapidly into large piles that will become glaciers. Before the temperature becomes higher and starts to melt the snow, winter comes again. With the repetition of this cycle, normally, in more than a few years the glaciers turn to ice. For regions with little snow fall it takes more than 100 years for a glacier to form. Glaciers are labeled by where they occur geographically; such as, plateau glaciers, mountain glaciers, valley glaciers, suspension glaciers and mountain foot glaciers.

Glaciers have history. Glaciers have ice stratum in the same way that geological formations do. I have this big dream of taking a sample of these stratum some day so as to survey these ancient water crystals.

The pictures of glacial water crystals shown here are of those samples taken from the surface of the glaciers so are considered to be affected by the present global environment.

高原氷河、山地氷河、谷間氷河、懸垂氷河、山麓氷河などいろいろな姿形をしています。

氷河は歴史をもっています。

また氷河には「地層」と同じように「氷層」があります。いつかこれを取り出して、古代の地球の水の結晶を写真に撮って、調べてみたいという、大きなロマンを持っています。

ここに載せた氷河の水の結晶写真は表面から採取したもので、現在の地球環境の影響を受けているものと思います。

Antarctic Ice

南極の氷

南極探検隊の隊員の一人が持ち帰ってくれた、推定37万年前の氷の結晶です。きれいに整って、結晶の見本のような写真です。ただその他の自然水と比較してもとくに際立って美しいということもないので、当時と比べて今の自然水が極端に汚染されているわけではないことがわかり、ちょっとホッとしています。

This is a crystal of ice that one of the Antarctic expedition members brought back. It is estimated to be 370,000 years old. This crystal is very organized and is a perfect model of crystal formation. However, it is not as markedly beautiful as some other natural spring water crystals that we have seen. This means that today's natural water is not as contaminated as it was at one time in history. This is quite a relief.

Columbia Glacier, Canada

カナダ・コロンビア氷河

カナディアン・ロッキー山脈には、いくつもの氷河があります。
万年雪となった氷から取り出された水の結晶は、しっかり六角形は保っているのですが、大きく空いた中心からは、どんな伝言を受け取ればいいのでしょうか。

There are many glaciers in the Canadian Rocky Mountains.
This crystal of ice is extracted from firn, and maintains a firm hexagonal shape. What kind of message should be interpreted from the large void at the center of the crystal?

Mount Cook Glacier, New Zealand

ニュージーランド・マウントクック氷河

太平洋南西部、オーストラリアの南東部にある島国。北島と南島があって、北島の中央には活火山が連なり、南島には3,000メートルを超える山々が連なっています。その中に富士山とならぶ高さのマウントクックがあり、万年雪の氷河をもっています。その氷河の雪解け水の結晶写真です。

New Zealand is an island country located in the southwest Pacific Ocean, southeast of Australia. It is composed of North Island and South Island. In North Island's central area there is an active volcano that is still in good shape.

On the South Island, there are mountains that exceed 3,000 meters. Among them is Mount Cook which is as high as Mount Fuji and has glacier of firm. This is the picture of a crystal taken from the melting water of that glacier.

雨水

地球上を循環する雨水

雨は天から降ってきます。

1年中、ほぼ同じ土地に、ほぼ同じ量だけ、降っています。

この自然の約束にしたがって、人は作物をつくり、水を飲み、水を汲み、山の木々もうるおっています。

そして地球上の水は、空に昇って雨になり、地上に降ってくることで、まるで天然自然の浄水器を通ったように、浄化されているのです。

結晶写真を撮影してわかったことは、当然のことながら、どんなに立派な浄水器よりも、自然の循環による浄化の方が素晴らしいということ。

Rainwater

Rainwater that Circulates the Earth

Rain comes falling down from heaven.

All year round, the same amount of rain falls on the same land.

Because of this consistency, people can plan and grow crops, drink water, and pump water and trees in the mountains can have enough water.

The water of the earth becomes rain as it evaporates into the sky and then falls back to the ground. It is cleansed by passing through this natural water purification process.

What we learn from this crystal's picture is that of course, natural purification is much more effective than any mechanical water purifier, no matter how good.

Rain is the source of fresh water such as spring water, lakes, marshes and rivers.

We obtained this beautiful crystal from natural spring water.

The spring water that flows out onto the earth's surface passed through the natural filtering devices of soil and rocks when it fell as rain a few hundred years ago and penetrated into the ground.

The water then joins the spring water vein to flow out at a place that it feels is "the right place" and when it feels that it is "the right time".

What would the crystals look like for this rain which is the source of spring water?

We sampled rainwater and took a picture of the crystal.

Recently, there have been reports of damages due to environmental disruption. What is the water crystal difference between rain that falls on a densely populated urban area and rain that falls on a rural area?

Is there a difference between the rain that falls in the north or the south? Is there any difference between the rain that falls during different seasons at the same location?

湧き水や湖沼、河川などの真水のもとは、雨。

自然の湧き水からは美しい結晶が得られました。

今、地上に湧き出している湧き水は、おそらく何十、何百年以上も前に降った雨が、地中深く浸透する間に、多くの自然のろ過装置にあたる土や石の間をくぐり抜けてきたものです。そして水脈をつくり「ここぞ!」と思う位置に、また、「今だ!」という時期に湧き出ているのです。

そこで、湧き水のもとになる雨はどうでしょう。雨水を採取して結晶写真にしてみました。

環境破壊などの被害が指摘されています。人口の多い都市に降る雨と田舎に降る雨とでは、違うのでしょうか。

北と南、あるいは同じ土地でも季節によって違いはあるのでしょうか。

Biei-cho, Hokkaido

北海道・美瑛町

北海道のほぼ中央、美瑛町は「北の国から」のロケ地のひとつです。のどかな田園地帯に降る雨水は、悲しいかな……。北海道はとくにオゾン層破壊、酸性雨の被害が大きいとされていることを立証してしまったようです。

Located in the center of Hokkaido, Biei-cho was chosen as one of the locations for "Kita-no-Kuni Kara, From the Northern Country."

The crystals from the rainwater that falls on this quiet rural region are saddening.
Hokkaido seems to have had obvious damage caused by ozone layer depletion and acid rain.

Sendai City, Miyagi Prefecture

宮城県・仙台市

仙台の雨水からは、きれいな結晶が得られたかと思えば、形にもならない時があるなど、時期によって大きなバラツキが出ました。原因ははっきりしませんが、雨水はその時の大気の状態などによって、大きく影響されるデリケートなものようです。

The rainwater from the Sendai area sometimes showed beautiful crystals and sometimes showed those with an unshapely form. These were also great fluctuations in the crystals depending on the season.

This cause is not clear but rainwater seems to be very delicate and might have been affected by the condition of atmosphere at that time.

Kanazawa City, Ishikawa Prefecture

石川県・金沢市

古都金沢に降る雨からは、不思議な結晶が得られました。完全ではありませんが、六角形の結晶構造が見てとれます。

日本海側は太平洋側に比べて大きな工業地帯もなく、大気汚染の度合いが低いはずで、もう少し美しいものが撮れてもいいのに…と思ってしまいます。

From the rain that falls on the ancient city of Kanazawa, we obtained mysterious crystals. The crystal is not complete, but we can see a hexagonal crystal structure.

There aren't as many large industrial zones on the Japan Sea coast as there are on the Pacific Ocean coast, so it would follow that the air pollution level in this area would be lower. We feel that for this reason we should be able to obtain a beautiful water crystal from the Japan Sea coast than from the Pacific Ocean coast.

Tokorozawa City, Saitama Prefecture

埼玉県・所沢市

所沢の雨水を最初に撮影しはじめた（98年6月）頃は、公開をはばかれるくらいにおぞましい映像でした。ところが右の写真のように最近になってくればくるほど、結晶がきれいになってきています。所沢市民の環境問題に対する関心が深まるにしたがって、美しい結晶になっていると判断せざるをえません。がんばれ所沢！

When we first started taking pictures of the rainwater in Tokorozawa City (June, 1998), the crystal's structure was so miserable that we hesitated to make it public. However, as you can see in the right picture, the crystal has become clearer recently. We cannot help but believe that as the citizens of Tokorozawa became aware of their city's environmental problems, it has started showing very beautiful crystals.

Slick to it, Tokorozawa!

'99.10
October, 1998

'99.12
December, 1998

'99.2
February, 1999

Asakusa-bashi, Taiho-ku, Tokyo

東京都台東区・浅草橋

東京の真ん中にある浅草橋に降る雨でも、時には結晶を得られることがあります。
なかなか形の整ったきれいなものには出会えませんが、それでも水道水などと比べれば、自然の浄化作用の素晴らしさを感じます。

We were able to get crystals from the rain that fell on the Asakusa-bashi at the center of Tokyo.
It was hard to find shapely and beautiful crystals from this water, but even so, we can see the effects of the natural purifying power of rain water. This is especially evident as compared with the crystals found in tap water.

Fujisawa City, Kanagawa Prefecture

神奈川県・藤沢市

江の島を目の前に高級住宅地として歴史のある町。

ゆったりと、暮らしやすい土地柄で、風光明媚そのもの。しかし、この地の雨水は、まるで酸性雨によって六角形が溶けてメロメロになってしまったような気がしてしまいますが……。

Fujisawa is a historic city in front of Enoshima and a prestigious residential area.

The city has beautiful scenery, is comfortable and easy to live in. However because of acid rain, the rainwater crystal from this area melted away leaving no trace of a hexagonal shape.

Okazaki City, Aichi Prefecture

愛知県・岡崎市

名古屋市の隣り、岡崎市でも整った結晶を見ることはできませんでした。ある時期には結晶化しそうなものも見られるのですが、それを妨げる要因の方が強いようです。これらの写真からは「混沌」としたイメージや、水自身のもどかしさが感じられます。

We could not see an organized shape in the crystal taken from the rainwater in Okazaki City where is adjacent to Nagoya City. At one point we could see crystals that were close to formulating, but the factors that impeded their formation seemed to be stronger.

While looking at these crystals we felt the sense of chaos in the images. It is as if the water itself is irritated.

Nishi-ku, Osaka City

大阪市・西區

大阪市内のオフィス街で採取した雨水の中で、あえて一番きれいに撮れたものをご紹介します。やはり結晶に歪みはあります。きれいな結晶にはなっていませんが、結晶化しようとする意志は見えるようです。

From the rainwater that was sampled from the office quarters of Osaka City we find the most beautiful picture of a crystal.

There is a distortion in the crystal and it has not become fully developed but we can see its will to become crystallized.

Fukuyama City, Hiroshima Prefecture

広島県・福山市

瀬戸内海の海岸にある福山市は、空襲を受けたために戦後大開発をされた町です。六角構造の名残りは確認できるものの、どれも歪んでいたりと、亀裂が入っていたり。しかし、これらの写真からは、なんとなく「頑張っている」感じが伝わってきて、応援したくなるような結晶です。

Fukuyama City is located on the coast of the Seto Inland Sea. It was re-developed after the world war because it was destroyed by bombing.

We can identify remnants of a hexagonal structure, but most of the crystal structure is either distorted or cracked. From these pictures however, we can feel that it is "trying hard" to develop and we want to support its efforts.

Hakata-ku, Fukuoka City

福岡市・博多区

九州一の大都市・博多の雨水も、酸性雨の被害は免れられないようです。

結晶の形は少し歪んでいますが、六角形が見えるものもあれば、割った結晶が無残にも真っ二つに割れてしまったものも……。

水は市民に何を訴えているのでしょうか。

A crystal taken from a sample of the rain in Hakata, the largest city in Kyushu. Alas, this crystal could not seem to evade the damage done from acid rain.

The crystal shape is slightly distorted, but seems to be a hexagon and some of the clearer crystals have split in two. What is the water crystal trying to ask its city's citizens?

Kagoshima City, Kagoshima Prefecture
鹿児島県・鹿児島市

六角構造に枝が伸びている、不思議な姿のきれいな結晶が得られました。ほかの都市と比べても、希望がもてます。

桜島の火山灰は雨水の結晶にどのような影響があるのか、などと思います。

In this picture, we obtained the shape of a mystical figure imbedded in a clear crystal with branches stretching out from the hexagonal structure. As compared with the crystals from other cities, there is hope in this one. We could not help but wonder what affect the volcanic ashes of Sakurajima have on the surrounding rainwater?

第二章 変化する水の話

水が音を聴いているの!?

最近、百貨店の店頭などで「このピロシキは生地を発酵させる際、チャイコフスキーの名曲を聞かせて、美味しくまろやかに仕上げた音楽食品です」などという宣伝文句が掲げられ、行列ができています。また、もっとも科学的な分野といわれる医療の現場でも、最近、音楽療法の技術が取り入れられはじめています。

植物に意識があるという説もなかば公認されつつあります。植物を育てるとき「元気に育てね」とやさしく声をかけてあげると、「枯れてしまえ」などと嫌な言葉をかけるのとでは、生育状態に歴然とした差が出るそうです。

Chapter 2 A Story of Ever-changing Water

Water Listens to Sound?

Recently, we see advertisements such as "Our piroshki is now a 'musical food'." We tried to enhance its naturally mellow flavor by playing music composed by Tchaikovsky while it was fermenting." Out of curiosity, people lined up to buy this product. Also recently, music therapy technology is being introduced in medical institutions, which is said to be the most scientific field.

Additionally, theories saying that plants also have consciousness are becoming more public. When we grow plants by saying sweet things to them such as "Please grow up healthy" or alternately by saying mean things such as, "Go on and get withered", these theories say that the plants show a clear difference in their growing progressions.

These theories made us think,

The water contained in food and plants must be listening to music and words.

People can become joyous and encouraged when they listen to music, all because the water contained in their bodies goes through a change.

The vibrations of music and words transmitted through the air effects water more than any other element.

"The vibrations of music and words affect the water that is contained in plants and food." Furthermore, "good music and kind words must exert a positive effect on water."

Is there any way to demonstrate this theory? Pictures of crystals are wonderfully effective as a method to view the effect that music and words exert on water.

ここで考えました。

食物や植物の中に含まれている水が音楽や言葉を聴いているのではないかと。人が音楽を聴いて楽しんだり、元気づけられたりするということは、人の身体の中の水が変化したためではないかと考えたのです。

空気中を伝わってきた音楽や言葉の振動が、もっとも影響を与えるのは水なのではないでしょうか。

「音楽や言葉の振動が、植物や食品の水に影響を与えている」。さらに「良い音楽や良い言葉が、それらの水に良い影響を与えている」らしいと思いました。

これを何らかの形で実証することはできないか。音楽や言葉が水に与える影響を表現する方法としても、結晶写真は素晴らしい有効です。

水に音楽を聴かせてみる

▲音楽を聴かせて
Playing music to water

どうやって水に音楽を?!

ベースになる「基本の水」には、不純物がもっとも少なく、シンプルな結晶構造を持つ精製水を採用。ところが年を追って精製水そのものが、良い結晶をもたなくなってきました。お見せするのは、一部の良いものです。

まず基本の精製水の結晶写真をカメラに収め、その水に右上の写真の状態に音楽を聴かせた後、結晶にし撮影したものです。

「どのように音楽を聴かせるのがもっとも良いのか」「ジャンルは？ 時間は？ 音量は？ スピーカーとの距離は？」などなど。じつに細々とした実験方法が、さらに私たちを悩ませました。試行錯誤の結果、

★2つのスピーカーの間に精製水を置いて、通常程度の音量で、1曲完全に聴かせる

★精製水のビンの底を必ずよく叩き、一晩、置く

Playing Music to Water

How Do We Play Music to Water?

We selected distilled water as the base water to do our experiments on because it has a simple crystal structure with the least number of impurities. We did find that some distilled water tends to lose the ability to form well-structured crystals as recently. What you see here are only those samples started out having well formed crystals. First, we took pictures of basic distilled water then after playing music (under the conditions shown in the picture on the right) we crystallized them and took their picture again. "What is the best way to play music so that we get the optimum effects on the crystals?" "What should the genre of the music be? For how long? What is the volume? How long should the distance from the speaker to the crystals be?" We had to spend a lot of time planning our detailed experimentation methods. As a result of trial and error, we decided on the following procedures: Place the distilled water in between 2 speakers and play one piece of music at a normal volume. Tap the bottom of the distilled water bottle well overnight. Tap well again the next day before freezing the water to make crystals. Take pictures of the crystals.

We do not know if this is the best method or not, but we feel that it is the best method that we know at this present point in time. In particular, tapping the container well is a rather important component because when we neglected to do it the crystallization rate declined. By applying this tapping vibration, information seemed to be transmitted through the water causing the crystals to activate. Anyway, these are the pictures of the crystals that we saw as a result of such strenuous efforts. Because there is no crystal that is identical to another, we obtained different crystal forms each time we took a picture. The next page, confirms the similarities that can be found among pictures taken of 100 random samples. Following our music experiment we decided to see how water responds to words. We also challenged ourselves to conduct experiments to see how much water is affected by human consciousness. It felt like we were setting foot in a jungle that no one has ever explored before.

★翌日さらによく叩き、その水を凍らせて結晶を撮影……という手順を確立しました。

これがベストの方法かどうかはわかりませんが、現時点でのベターな方法と思われます。とくに「よく叩く」ということが結構重要で、これを怠ると結晶の出現率が低下するのです。振動を与えることによって、水に伝わってくる情報が活性化するらしいのです。とにかく、そうした試みの末に、撮影された結晶写真です。

また、結晶は2つと同じものがないということから、次に撮影するたびに違った結晶ができます。ですからサンプルは、100のサンプルの中からランダムに取り出したのです。類似性を確認してみてください。

音楽の次は「水に文字を見せる」ことを考えつきました。無謀を覚悟でチャレンジです。さらに人の意識で、どこまで水が変化するかという実験にも挑戦しました。

前人未踏のジャングルに行く気分です。

Similarity of Crystal Pictures

結晶写真の類似性

Pictures of the 100 Samples are Similar...

100のサンプルから撮影して得られる結晶写真は、よく似て……

▲ 94年11月頃、撮影した精製水 Distilled water photographed in around November 1994

▲ 96年3月頃の精製水の結晶写真
Crystal pictures of distilled water in around March 1996

▼ 96年3月頃に精製水に波動ミュージックを聴かせて撮影した結晶写真
Crystal pictures of distilled water after playing Hado music around March 1996

73ページ、右上の写真のようにセッティングし、音楽を聴かせて撮影した写真は、これまた見事な姿を見せてくれました。

基本の精製水・100のサンプルの結晶をそれぞれ撮影し、ランダムに選び出したものです。

A sample of water that we placed as shown in upper right picture on page 73 and then exposed to music showed some wonderful shapes.

The left hand pictures are of the crystals from 100 basic distilled water to select them at random.

左の写真は、上の基本の精製水に音楽、それも身体に心地よいヒーリングミュージック「Hado」CDを聴かせた水の結晶のいろいろ。

ひとつひとつのシャーレによって、結晶の形は違いますが、ご覧のように類似性は認められると思います。

In the left hand pictures are crystals of water that have been exposed with a playing of a healing music called "Hado". This music is known for its ability to relax the body. In each container the shape of the crystals differed, but as you can see, we think that there are also some similarities.

Beethoven's "Pastorale"

ベートーベン 「田園」

ベートーベンの作品を代表する交響曲のひとつで、明るく爽やかで楽しい曲です。
良い曲は水を活性化させ、成長を促進させることを裏付けるような美しい結晶です。

This is one of Beethoven's most famous symphonies and is a bright, fresh and joyous piece.
This beautiful crystal supports the fact that good music positively effects water.

Mozart's "Symphony No. 40 in G Minor"

モーツァルト 「交響曲第40番ト短調」

モーツァルト全文器曲のなかでも、つねに美しいものを追及する魂の唄……美への折りとも思える深い思いが込められた曲。聴く人の心を静かに癒してくれます。結晶は作曲者の気持ちを代弁するように、美しく、たおやかにできあがっています。

This symphony is a soulful song that seems to pursue beauty the most of any of the works of Mozart. A piece of deep thought that seems almost like a prayer to beauty. This music quietly heals the heart of its listeners. This crystal is so beautiful and graceful that it's as if it's speaking on behalf of the composer's feelings.

Bach's "Air for the G String"

バッハ 「G線上のアリア」

有名なヴァイオリン曲。ヴァイオリンの音色にうっとりして誘われるかのように、水の結晶も枝の部分が大きく伸びやかに成長しています。
結晶がなんとなく、楽しげに踊っているような印象さえ受ける写真です。

Through this famous violin piece, the crystal seems as if it has been enchanted by the sound of the music. The branches of the water crystal stretch out freely.

This picture gives the impression that the crystal is dancing merrily.

Bach's "Goldberg Variations"

バッハ 「ゴールドベルク変奏曲」

この曲はバッハがたいへんお世話になったゴールドベルク氏のために、感謝を込めて捧げた曲といわれています。基本の精製水と比べると、六角形の角からさらに別の六角形が成長している様子ははっきりとわかります。感謝の気持ちが成長を促進するとすれば、ちょっと哲学的ですね。

This music is said to have been dedicated to Mr. Goldberg, in appreciation for all that Bach owed him. As compared with the crystals formed from basic distilled water, here you can see that one hexagon is growing from the edge of another.

We could philosophize about the feelings of appreciation that are written into his piece and their ability to promote positive growth.

Chopin's "Farewell Song"

ショパン 「別れの曲」

ピアノ曲として有名で、メロディーを聴けば誰でも知っているお馴染みの曲です。そしてこの結晶を得たときほどびっくりしたことはありませんでした。「別れの曲」だからでしょうか、基本の結晶の形が見事に細分化され、まさしく「別れ別れ」になってしまいました。顕微鏡の倍率は同じなのに……です。

This is such a famous piano music piece that almost anyone can recall this music once they hear it. I have never been so astonished as I was when I obtained this crystal. Is it shaped the way that it is because it is effected by "Farewell Song"? The basic crystal shape is almost perfectly divided into small parts that have become "separated" from each other. This, despite the fact that the magnifying power of the microscope, is the same as it was in the other photos.

Healing Music, "Hado"

ヒーリングミュージック「Hado」

これは痛みをやわらげ、身体の免疫力を高めることを目的に、特別な技術を駆使してアメリカでつくられたヒーリングミュージックのCDを聴かせたものです。枝の部分が一ヨキニヨキと力強く伸びており、まるで栄養価の高いキノコのような美しい結晶写真になりました。実際にこの曲を聴いて、いろいろな生理的効果があったことが、多数報告されています。

This is a picture of a crystal of water that has been exposed to a CD (Composed by Alan Roobik) of healing music that was created in the USA. This music is said to make use of a special technology with the purpose of easing pain and enhancing physical immunity. The branch section of the crystal stretches out and becomes elongated. The resulting picture is beautiful, resembling a highly nutritious mushroom. We have received many reports from users that also felt various physiological effects by listening to this piece.

Tibet Sutra

チベットのお経

映画「セブン・イヤーズ・イン・チベット」の中でも流された、お経のCDを聞かせたもの。力強く、美しい結晶が撮れました。古くから伝えられているお経は、人々の魂に語りかけ、それを癒す強いエネルギーを持っているであろうことが確認できます。

This is a picture of crystal of water that formed after being exposed to a CD of the music from the sound track of the movie, "Seven Years in Tibet."

We were able to take a picture of a powerful and beautiful crystal. We can reaffirm the ancient knowledge that the Sutra talks to people's souls and has a strong positive energy that can heal people's feelings.

A Korean Folk Song, "Arian"

韓国民謡 「アリラン」

ご存じ、朝鮮の民謡。アリラン峠を越えて別れていく、恋人同士の別離の歌。
旅立つ男性を、残る女性が見送る……菅原都々子さんの歌を聴かせました。
なにか、つらく、切ない、胸の痛くなるような結晶ではありませんか。

This is a famous Korean folk song about two lovers who are forced to be separated as they cross the Arian mountain pass.

The girl sends off her departing lover with a song sung by Sugawara Tsuzuko.

Doesn't this crystal have a somewhat painful, sad and heartbreaking look?

Kawachi Folk Dance Song

「河内音頭」

河内地方で800年も伝承されている音頭。

現在活躍中の河内家菊水丸さんの提案で、彼の歌う河内音頭を聴かせた水の結晶です。

長い間、多くの人々によって歌い継がれている曲には、人を癒す力があるのではないのでしょうか。

A folk dance song handed down in the Kawachi region for more than 800 years.

This is a crystal of water that we exposed to Kawachi Folk Dance Song. This idea was suggested by Mr. Kawachiya Kikusumaru and was sung by himself.

For hundreds of years this music has been cherished and sung by many people and because of this it may have some healing power.

Just Like a Flowing River

「川の流れるように」

クラシックやヒーリングミュージックと比べて歌謡曲はどうでしょう。

昭和を代表する歌手、美空ひばりさんの「川の流れるように」。時を越えて歌い継がれる良い曲は、やはり良い気・波動をもっています。聴く人の心をほっとさせるような、均整のとれた美しい結晶です。でも、ぽっかりと空いた空洞は何を物語るのでしょうか。

How about trying popular music as compared with classical music and healing music? "Just Like a Flowing River" was sung by Misora Hibari, a famous singer of the Showa Era. When this timeless and wonderful piece is sung, there can be no doubts as to its positive energy and HADO. The crystal that formed is well balanced in a way that reflects the nostalgic feelings of the listeners.

But what is the meaning of the gaping hole?

Folk Song of Celtic Region, UK

イギリス・ケルト地方の民謡から

日本でも馴染みの歌手エンヤさんの曲は、「ガイア・シンフォニー第一番」にも使われていて、リラクゼーションなどのヒーリング効果があるとか。

どの曲も不思議な、独特の世界をもっています。

この写真はそれを証明するかのように、優しく繊細で美しい結晶をみせてくれました。

This music is sung by Enya who is well-known in Japan and elsewhere. We used the piece, "Gaia Symphony No.1," which is said to have the healing effects of relaxation. Each piece of her music has its own mystical unique world.

This picture shows a tender and delicately beautiful crystal.

Elvis Presley's "Heartbreak Hotel"
エルビス・プレスリー
「HEARTBREAK
HOTEL」

エルビス・プレスリーさんの「HEARTBREAK HOTEL」を聴かせたところ、3種類の結晶が撮れました。
上の写真は、まさしくハートが2つにわかれてしまったハートブレイクな写真。
右の写真は、それが融合しようとしている写真。
下の写真は、試練に絶えて、新たなハートの形成をしていると考えるのは、ちょっとセンチに過ぎるでしょうか？

Heartbreak Hotel by Elvis Presley

When we exposed the water to "Heartbreak Hotel" sung by Elvis Presley, we were able to obtain three types of crystals.

The picture, above, is a picture of a heart broken into two.

The picture, right, shows the two parts trying to fuse together.

The picture, below, shows a newly formed heart that overcame the difficult period. Do you think that this idea is too sentimental?

A Heavy Metal Music

あるヘヴィーメタルの曲

歌詞の内容は怒りがいっぱい。世の中を罵倒しているような曲です。基本の整った六角形の結晶構造が、見事にバラバラに壊れてしまっています。この曲に対して水は、はっきりとネガティブな反応を示したようです。ただしヘヴィーメタルが悪いというわけではなく、歌詞に問題があったと考えられますが、あくまでも一つの例です。

This music is filled with anger and seems to be denouncing the world. Subsequently, this crystal's basic well-formed hexagonal structure has broken into perfect pieces. The water seems to have reacted negatively to this music. We are not saying that heavy metal music is bad, only that there must have been a problem with the lyrics. This is merely an example.

A Popular Music in Japan

日本のあるヒット曲

若者に絶大な人気を誇るグループの曲で、ヒットチャートではいつも上位にありました。しかし結晶になると、六角構造が崩れてしまい、四角い無味乾燥の結晶になっています。ヒット曲が必ずしも良い結晶になる、というわけではない例としてご紹介します。

This is a song that is sung by a group who is very popular in Japan, and it is always at the top of the hit chart. However, when we look at the crystal, we can see its broken hexagonal structure and its subsequent square unattractive shape.

We are introducing this example only to show that hit music does not always contribute to the production of well-formed crystals.

ごはんを毎日 『ありがとう!』 『ばかやろう!』と声をかけた!

講演の席で、水に文字を見せる(90ページ参照)実験内容を発表しました。するとそれに呼応しておもしろい実験をしてくれた方がいます。

その実験とは、「普通に炊いたお米を2つの同じガラス容器に入れ、一方には『ありがとう』、もう一方には『ばかやろう』と言葉に出して毎日声をかけ、それを1ヵ月間観察する」というものでした。

小学生の子どもが2人、学校から帰ると毎日、ランドセルを放り出しては、瓶に貼った文字のとおり声をかけるという日課を1ヵ月続けました。そしてその結果、『ありがとう』と声をかけ続けたごはんは、半ば発酵状態となり、匂いを嗅ぐと芳醇な麹のような良い香りに。一方『ばかやろう』のごはんは真っ黒に変色して腐り、その臭いたるや……ひどいものでした。

Speaking "Thank you" and "You fool" to Rice Everyday

While presenting a speech on the experiment that we did with the effects of language on water (see page 90), one of the audience members told me that they were very impressed. At that time, this person also told me about an interesting experiment. This experiment involved placing cooked rice in two identical glass containers. Afterwards he/she talked to the rice everyday saying "Thank you" to one and "You fool" to the other. He/She did this for one month to see the results. Two elementary school children talked to the rice everyday for one month as soon as they came home from school. As a result, the rice that the children had said "Thank you" to, was nearly fermented and had a nice mellow malted rice aroma. The other bowl of rice that the children had said "You fool" to, had turned black and had rotted.

They said that its smell was disgusting beyond description.

Of course this is not an experiment that an official research institute did, so the result could have been just a coincidence. However, many people have done the same experiment and they showed the same results. Here, not only water but microbes seem to be involved. Microbes are just like us, they work hard if they are praised and become idle if they are abused.

It seems that by saying "Thank you" and "You fool", the microbes must have grouped into beneficial bacteria and disadvantageous bacteria.

もちろんこれはキチンとした研究機関が行った実験ではありませんから、たまたまそうなったと言われれば、それまでですが。その後、同じような実験をやってくれた人が何人も現われて、同じ結果となっています。

ここでは「水」だけでなく、微生物さんが深く関わっているようです。微生物さんも、われわれと同じでほめられれば良く働くし、けなされればふて寝をしようのでしょうか。

「ありがとう」「ばかやろう」と声をかけ続けたことで微生物は善玉菌と悪玉菌に分かれてしまったのではないかと思います。

水に文字を見せる

水が文字によって変化する？

水に音楽を聴かせるという私たちの試みに対して、水は想像以上の変化を見せてくれました。

そこで次に「言葉に対して水はどういう変化を見せるのか？」と考えました。ところが、言葉には響きがあります。たとえば「ばか！」と怒鳴るのと、「ばかねえ〜」と優しく言うのでは違うのではないかと思います。

それならということで「水に言葉 (= 文字) を見せる」という方法を考えました。それも、人の手書き文字ではなく、ワープロで打った一定の文字を瓶に貼りました。あとから考えても「水に文字を見せる」なんて、世間一般の常

識からは、はずれた発想だったかもしれませんが、撮影実験班は実行あるのみです。

ベースになる水は、音楽の時と同じ「基本の精製水」を使用。この水を2つに分けてガラス瓶に入れました。一方に「ありがとう」、もう一方には「ばかやろう」という文字をワープロで打った紙を貼りつけて、一晩放置。これを凍らせて写真撮影しました。

ところが水は言葉、文字によって、明らかな違いをみせてくれました。実験者には何も知らせず実験したり、実験者を変えてみても、同じような傾向が得られました。

Showing Letters to Water

Does Water Change after Showing Words to Water?

The water crystals showed various reactions to our attempts to expose them to music. So much so that we could not even have imagined the effects. Our next question lead us to ask, what kind of reaction does water show to words or to the sounds that words make? For instance, there is a great difference between angrily yelling "You fool!" and saying "You are a fool" in a gentle way.

So we decided to use language with our water samples. In other words, to "speak" to our water. We decided not to use handwritten words but rather words that were typed by a word processor. Looking back, our idea of speaking to water may have deviated from general common sense, but the photography team simply went on with the idea.

For the base water on which to experiment, we used basic distilled water. This was the same water that we used for experimenting with music. We divided this water sample into two parts and placed them into glass bottles. We then pasted a paper on one bottle that had "Thank you" typed on it. On the other bottle we put "You fool". We then left them both that way for one night. The next day we froze this water and took pictures of the crystals that formed.

What we found was that the two water samples showed conspicuous differences from each other. We did the experiments without giving any information to the experimenting team. We also changed the experiment staff and ran the tests again, but we obtained the same results both times.

Thank You
ありがとう

基本の精製水は「ばかやろう」と同じ水です。とても美しく均整のとれた形です。78ページの「ゴールドベルク変奏曲」を聞かせた結晶と見比べると、なんとなく形が似ています。「ゴールドベルク変奏曲」はバッハが感謝の意を表わすためにつくった曲でした。日本語のありがとうの語源は、有り難く存在している……というような意味をもっています。韓国語も英語もまた違った語源からきているのでしょう。

In this experiment we used basic distilled water and the words "Thank you" in the same way as we did in the "You fool" experiment. The crystal has a very beautiful, well-balanced shape. It has a similar shape as the crystal that was exposed to "Goldberg Variations" on page 78. "Goldberg Variations" was composed by Bach to express his gratitude. The word, "Thank you" in Japanese exists to help us express gratitude. Korean and English must have derived differently.

You Fool

ばかやろう

一晩中、瓶に貼りつけられた「ばかやろう」という文字を見ていた水です。87ページにあるヘヴィメタルの曲を聴かせた水の写真とたいへん似通っています。その曲は社会に対して「ばかやろう」と叫んでいるような歌詞でしたから、そうなるのかもしれませんが……。また同じ意味をもつ、英語の「You Fool」も貼ってみました。言葉の持つ語源によっても差がでてくるようです。

This is the water that had the word "You fool" on its bottle overnight. This is crystal is similar to the one from the water that was exposed to heavy metal music on page 87. The lyrics from the music were similar to saying "you fool" to society, so the consequence may have been the same. We also pasted the words, "You fool" in English to another bottle. It seems that there is difference in the etymology of words because we did not obtain the same results.

You Make Me Sick. I Will Kill You

You Make Me Sick. I Will Kill You
ムカツク・殺す

最近、若者がよく口にする言葉ですが、予想通り水の姿は醜態なものでした。結晶が融く歪み、潰れ、飛び散っている様子は、まさしく「ムカツク・殺す」そのもの。こういう言葉が横行する世の中は不気味です。なんとか……みんなの手で！

These are words that young people often use these days. Subsequently the shape of the water was as ugly as we had expected after we exposed the sample to these words. The crystal was distorted, imploded and dispersed. It really was a visual image of the words, "you make me sick" and "I will kill you." That we exist in a world where words like this are used rampantly is awe inspiring. We have to do something ourselves.

Love/Appreciation

愛・感謝

愛と感謝に含まれる人の意識

数多くの結晶写真を撮影してきましたが、当時ではこれほど美しい結晶は見たことがありませんでした。

やはり、この世の中で「愛と感謝」の気持ちに響くものはないということ。

「愛と感謝」を表現するだけで、身の回りの水、また身体の中の水がこんなに美しく変化してくれるのだったら…
””。

なんとか、日常の生活に生かされるといいですね。

また92ページの「Thank you」の結晶ともよく似ているのがうれしくなってしまいます。

People's consciousness contained in love and appreciation. We took pictures of numerous crystals from this sample but this was the very first beautiful crystal that we saw.

Indeed, there is nothing more important than love and gratitude in this world. Just by expressing love and gratitude, the water around us and in our bodies changes so beautifully. We want to apply this in our daily lives, don't we?

Strong resemblance to the crystal with the words, "Thank you" on page 92 was a happy coincidence.

愛 感謝

Love/Appreciation

魂
Sol

Soul/Demon

魂・鬼

魂という文字の「云」の部分を取ると鬼という字になります。人は言いたいことを言わないと鬼になってしまうということでしょうか。水は魂を認識し、形にして、われわれ人間に伝言してきました……。2枚の写真から、どんな印象を受け取ればいいのでしょうか。中心にハート型が見えると思うのは、考えすぎでしょうか。そして鬼は……。

We have the letter, soul by removing the left part of the letter (which means "telling"), demon. People become demons if they do not express their opinions. In this picture, the water crystal recognizes the word soul and give us humans this message. What kind of impression should we make from the two pictures? Is it exaggerating to see a heart shape in the center?

天使

Angel

天使
Angel

悪魔
Devil

Angel/Devil
天使と悪魔

いかがでしょうか……。

What do you think?

しょうね

Let's Do It

Let's Do It/Do It

しょうね・しなさい

「しなさい」という命令口調の言葉と、「しょうね」という呼びかけの言葉の持つ意味の差が出ました。ついなんとなく毎日使っている言葉ですが、気軽に乱用することはできませんね。話す相手に悪印象を与える意味が、こんなところにあったとは驚きです。

We wanted to see if a word that was commanding (such as, "Do it") and a word that was encouraging (such as, "Let's do it"), showed different results. These are words that we use everyday without thinking about it, but we should not abuse these words by using them too easily.

It is surprising to learn that meaning that give bad impression on the person you talk to existed in places like this.

きれい
Beautiful

Beautiful/Dirty

きれい・きたない

基本の水に「きれい」という文字を見せた水は美しい結晶に、「きたない」という文字を見せた水は、きたない結晶になってしまいました。私たちが考えている以上に、文字や言葉が水に対して、大きな影響力を持っていることを知らされる写真です。

The water that we exposed to the letters of "beautiful" developed a beautiful crystal and the water that we exposed to the word "Ugly" had ugly crystals. These pictures show, in more ways than we had imagined, that letters and words have a big influence on water crystals.

人の名前を水に見せたら……

感謝の気持ちを込めて

また、とんでもないことを思いついた……と、撮影スタッフはびっくりしたようでした。なぜ、人の名前を水に見せたかという点、こないさきつがありました。

ある会社の経営者だったM氏が、波動を知ってから、2人の子供たちと、社員が3人くらい波動を勉強するインストラクターになりました。そしてなんとなくギクシャクしていた家族の関係がとてうまくいくようになった……ということで、私の研究に対して、大きなご協力をいただきました。

このご好意に対して、どんなふうにお礼をしたらいいかと、ずっと考えていました。そんなとき、ふっと「M氏の愛」という文字のラベルをつくって貼り、結晶写真を撮ってみました。すると予想以上に、100枚そろって、とてもきれいな結晶写真が撮れました。

Showing Person's Name to Water

With Feeling of Gratitude

The photography staff was astonished when hearing of this idea. The reason why I decided to expose water to people's names is due to the following sequence of events.

When Mr. M, who was an executive of a company, learned about the properties of HADO two of his children and 3 employees became instructors in teaching the properties of HADO. Then their family relation, which was not going too well, improved. Because of this experience he was eager to cooperate in my research.

I had been wondering for sometime how I should thank him for his kindness. So, as a gift, I decided to paste a label on some samples of water that said, "Mr. M's love" and take a picture of the crystal that developed. Then, more than I had expected, all the 100 water samples developed into beautiful crystal pictures. I was so impressed that I put them in a frame and gave it to him as a present. Needless to say, it made him very happy. After that, I pasted the names of deceased people, the names of people who invited me to give lectures and names people who were on my mind.

I, myself am not devoted to any religion and some people cannot be distinguished whether they actually existed or their existence was just a myth.

もう、うれしくて、額に入れてプレゼントしましたら、とても喜んでいただきました。

それで今度は、お亡くなりになった人だったらいいかな……とか、たまたま講演に呼んでいただいて縁のある方や、気になる方を次々に試させていただきました。

私自身、宗教にはまったくこだわっていませんし、実在の人なのか、神話の人なのかわからないような人もいます……。

出口王仁三郎

Deguchi Onisaburo

Deguchi Onisaburo

でぐちおにさぶろう
出口王仁三郎

京都生まれで、出口ナオさんの娘さんとお結婚。新しい宗教の新しいかたちを考え、大本教を育てた方。力強い、独特のパワーを感じる結晶になりました。

Born in Kyoto, he married Deguchi Nao's daughter and created a religious association to try to raise the study of modern forms of religion.

Amatorasu Omikami
あまてらすおみかみ
天照大神

日本の神様の中心的存在「天照大神」。予想にたがわず素晴らしい結晶でした。それぞれの枝の部分が神事に使う「御幣（ごへい）」のようにも見え、結晶の中は神の霊として祭られる「神鏡」のよう。中心から、うっすらと光が差してくるようにも感じられます。また最初の撮影から10秒後の写真を見ると、中心に日輪とも思える形が現われ、神鏡があるように結晶が成長していったのです。

Amatorasu Omikami is the most important Japanese God. A beautiful crystal developed as we imagined that it would.

Each branch of the crystal looks like the pendant paper strips that a Shinto shrine uses in its divine services. The center of crystal looks like the Divine Mirror as the Shinto religion calls God's spirit. I can feel light slightly shining out from the center. The shape like the sun appeared in the center of the crystal taken after 10 seconds from the first one. The crystal was developing and it had the shape that looked like Divine Mirror.

撮影10秒後、成長する結晶
Developing crystal 10 seconds after photographing

Adolph Hitler

アドルフ・ヒトラー

大量殺戮を繰り返した「ヒトラー」の文字を見せた結晶は「ムカツク・殺す」の場合と似ています。しかしほんの数枚ですが、右のような写真も撮れました。結晶にはなっていませんが、結晶化しようとしている様子が感じられます。これを見ると世の中には根っからの悪人など存在せず、誰もが良心を持っている存在でないかと思え、希望が持てます。

The crystal of water to which we exposed to the name "Hitler," looks like that of the water that we exposed to the words "You make me sick" and "I will kill you" too. However, we also had a few pictures like those shown right (though the number was small). The sample did not form a complete crystal, but it seems like it is trying to crystallize. When we look at this, we can infer that there are no truly wicked persons in humans because everyone has conscience.

Molhor Teresa
マザーテレサ

世界中の人の応援を受けて、インドで一部の恵まれない人々のために、真誠の一生を送った方。ノーベル平和賞をうける栄誉を博しました。テレサさん、若いころにはこんなお顔だったかも……。

She is a person who devoted her life to the underprivileged people in India and has received support from all over the world for her efforts. She was also honored to be awarded The Nobel Peace Prize. Mother Teresa may have looked like this when she was young.

基本の水(精製水)
The basic (distilled) water

Placing Water on a Picture

水を写真の上に置いたら……

文字ではなく、水に写真を見せたらどうなるのかという実験です。
幼い子どもの笑顔の写真の上に、基本の水を置いて変化をみました。
結晶の枝の部分が大きく元気に伸びている様子は、見る人をホッとさせてくれます。

This is an experiment in which we exposed water to pictures instead of to words. We placed a picture of a toddler's smiling face on a sample of our basic distilled water. The branch part of the crystal stretches out energetically. People have commented that it gives them the impression of being relaxed.

Place water on the picture

基本の水(精製水)に無邪気な子どもの写真を見せたら
Water crystal after exposing the picture of the innocent child to the basic (disabled) water

Chapter 3 Masaru Emoto/The World of Water Spreads Afar

What Is HADO/Chi?

All substances are composed of combinations of atoms. Atoms are composed of electrons and an atomic nucleus. Because electrons are negative and the atomic nucleus is positive, electrons orbit around the atomic nucleus at an ultra high speed and emit unique, faint vibration waves. This is what we call HADO.

The HADO moves around at an intense speed by electrons electrically pulling against each other. This motion forms a pattern (Magnetic Resonance Field), of which there are not two alike. This is what is called "Chaos" in modern science.

There is regularity in the atomic nucleus level, but the elementary particle that is found in atoms has no regularity in modern science. The reason is that it changes according to the consciousness of observers, by the way they see things. The world of the neutrino is at the same consciousness level as that of human beings.

That is why the root level of matter depends on people's consciousness.

Despite the fact that HADO is a very important phenomenon, it has been neglected in the development of general science, simply because it is invisible. I am an outsider. I am not in a professional position. So I am actually at an advantage, and I could obtain the idea to try to put HADO energy into "a visible form by using water crystals as material and canvas."

When we apply the principle of the intensity of wave motion for instance, the health and stability of a creature's mind (good or bad) as well as the condition of the water can affect the process.

HADO is the minimum unit of invisible energy. Sound and electricity also have HADO.

Try to remember back to the tuning fork experiment that you did in your science class in junior high. You placed two tuning forks of the same frequency in line and then sounded one tuning fork. The sound was transmitted to the other tuning fork and resonated without making contact. This is called resonance.

This method of energy transmission through resonance is used in televisions, radios and cellular phones.

There are many things around us that actually make use of HADO technology.

「波動」を測定する機械「MRA」

それぞれの物質がもつ、固有のエネルギーパターンをコード化し、共鳴するかしないかを調べることによって、さまざまな波動の状態を測定することができる機械が、12年ほど前にアメリカで開発されました。波動の測定を可能にしたその機械の名前は、「MRA = Magnetic Resonance Analyzer (共鳴磁場分析器)」といます。

そしてそれを日本にはじめて持ち込んだのが、私こと江本壽です。

ここで「水が情報を記憶する」という技術と、私たちが研究してきた「波動」技術がドッキングしました。そして「波動と水」の研究をはじめて、すでに11年の歳月が過ぎ、11冊の本を出版し (6ページ参照)、なかにはベストセラーになるなどの経験もさせていただきました。

Measuring Machine of "HADO"

A machine, "MRA (Magnetic Resonance Analyzer)," which measures various states of HADO, encodes the unique energy pattern of each substance and checks whether it resonates or not, has been developed in the USA for the first time in the world 12 years ago.

This machine that makes the measurement of HADO possible is called the Magnetic Resonance Analyzer (MRA).

The saving/storing information and the wave motion technology that I had been doing research on united.

In the 11 years since I started my research on "HADO and Water," I have published 11 books, some of which have become best-sellers.

(Please refer to page 6.)

'Transcript Technology' that Changes Water Artificially

Development of Technology of Transcribing HADO

Mr. Yukio Funai, mentioned on page 133, added the spirit of love to water in his own way for transcription. I didn't think another layman like I could do such a thing.

HADO measuring instruments, including the MRA (currently, there are many types of HADO measuring instruments, including some domestic models), have HADO transcribing functions. The measurement first starts when the MRA puts out a faint resonance magnetic field, which is then transmitted to the subject and substances to be measured. Then the existence of resonance is checked. By amplifying the output of the measuring instrument HADO information can be transcribed.

The information is transcribed on to water because water has the highest retention capacity of information.

We also tried transcribing and photographing an immunity code (HADO information of normal immune strength) on to tap water and dam water with the MRA. After taking many crystal pictures we confirmed that crystals of water that have a high immune strength always have a firm tortoiseshell form.

It was made clear that when we transcribed the same information on to the same type of water, we obtained crystal pictures that had the same tendencies.

We were able to prove that a big change could be seen in pictures of water crystals that we had taken when no change was evident after the same crystals were studied through conventional scientific analysis methods.

We hear that trees at the upper reaches of the Amazon River are being logged for their potential cure-all effects as drugs. This transcription technology is approved by people. However, if those same people were to understand the effects of transcribing this kind of information, I know that it would help them to affect environmental protection laws. I wish such day will come soon.

品川区の水道水に 免疫情報を転写

東京の品川の水道水に、MRAで免疫のコード・波動情報を転写して、水の変化を撮影しました。左の基本の水は東京の水道水ですが、結晶にはほど遠いグロテスクな状態です。それが同じ水とは思えないほど明らかに変化しています。

このような変化が見られる理由としては、何らかのエネルギーが水に加わったと考えるのが自然です。それが私たちがいう「波動」。しかもMRAという波動測定器から発せられるエネルギーパターンには類似性があり、ある程度同じような形の結晶が得られるということも付け加えておきます。

たとえば免疫波動を転写して、何種類もの水で調べましたが、123ページのカルチャー200に見られるように、典型的な免疫の形である、素晴らしい亀の甲型の結晶が得られています。

免疫情報を入れる前の品川の水結晶
Tap water in Shinagawa before giving immune information

Transcribing Change and Immune Information on the Tap Water of Shinagawa-ku

We took a picture of change occurring in water by transcribing the HADO information of an immune code with the MRA on to a tap water sample from Shinagawa, Tokyo. The unaltered water on the left is the tap water of Tokyo. Its crystal formation is so grotesque. This second picture shows change to such an extent that it cannot be believed that it is the same water as was used for the first crystal.

It is natural to think that some kind of energy was applied to the water for such change to take place. This is what we call HADO. I would like to add that there is a similarity in the energy patterns emitted from a HADO measuring instrument, the MRA, as shown by the fact that the 2 crystals are of the same shape to a certain degree.

For instance, we transcribed an immune HADO, and did a survey using many types of water. As can be seen in culture 200 on page 123, we were able to obtain a wonderful tortoise-shell shaped crystal.

免疫情報を入れた後の品川の水
Tap water of Shinagawa after giving immune information

The Micro-cluster Water of Dr. Lee H. Lorenzen

All for His Wife

The person who first introduced me to the idea of doing research on water (and who I still receive guidance from) was Dr. Lee H. Lorenzen. He is a recognized authority who has directed his attention to the study of micro-clustered water's information retaining and storing capacities and has proven much of his research scientifically.

Dr. Lee H. Lorenzen is a son of an obstetrician and gynecologist. He was among the students who participated in the Marine College which is a college that provides courses to its students while they travel around the world for a few months. During the voyage, he fell deeply in love with another student (the daughter of Attorney General in the Reagan administration). They had their very first date in Kobe, Japan. They got married but his wife had been weak.

He tried to do everything that he could including visiting many hospitals in search a good doctor to treat her. She would not recover from her illness despite his efforts. One day his attention was directed to the fact that water accounts for 60 to 70% of the human weight.

How about changing the water in the body?

He started developing water for his beloved wife.

What is Micro-cluster Water?

Water normally is not composed of independent molecules, but rather they are hydrogen bonded to form small water particles called clusters.

When you align these water molecules and make them smaller it is called clustering.

Clustered water can easily make sharp turns and subsequently can reach far into the corners of the body. Its absorption power in the cells is very high.

Water that can be used in biology, science and agriculture is generally called "Functional water/HADO water."

As a result of our research, he has succeeded in making water more powerful circulating distilled water through a laser beam while adding a special magnetic field. He also established a method of printing and transcribing the information that a certain substance has.

In January, 1998 in the USA, a patent was obtained for water to which this information is transcribed, and it is called Micro-cluster water.

Water carries information and at the same time has a transporting role. So good water means "Micro-clustered water that can retain information is good for the body and transport the information to the necessary places." This is what we mean when we say, "Good water pervades in five viscera and six entrails".

With the development of this water by Dr. Lorenzen, his wife recovered her health.

"Micro-cluster water", developed by Dr. Lee H. Lorenzen, has undergone various clinical experiments with the cooperation of doctors in Mexico and USA, and is achieving many good results. If research in this field progresses, the 21st century will be an age where "Water lives in symbiosis with medicine."

Micro-cluster Water/Culture 200

マイクロクラスター水・カルチャー200

リー・H・ロレンツェン博士が開発した水のひとつ。コーカサス（ロシア南部）地方は世界的に長寿村として有名で、100歳を超える人々が多く住んでいます。長寿の要因のひとつと言われ、彼等が受飲している山羊の乳からつくった乳酸菌飲料の情報を転写したもの。この乳酸菌（ケフィア菌）は移動させると菌の性質が変わってしまうのですが、その情報だけを取り出して転写すれば、同じ効果が得られます。この情報を転写した水の結晶写真は、非常に形の整った基本的な亀の甲の形をしています。つまり免疫の形である六角構造で、情報をしっかり保持していることを現わしています。200倍に希釈して飲みます。

This is one of the kinds of water developed by Dr. Lee H Lorenzen. The Caucasus region of southern Russia is world famous as a region where many people live to an advanced age. There are many people there who are over 100 years old. This is a picture of water crystals transcribed with the information from a lactic acid drink made from goat milk that they habitually drink. This lactic acid (Kefia bacteria) changes its property when it is transferred, but if we take out only its information and transcribe it, we can obtain the same effect. A crystal picture of water transcribed with this information has a very organized and basic tortoise-shell shape. In other words, it is of a hexagonal structure, an immunized shape, and shows that it retains information well. For drinking, it is diluted by 200-fold.

Micro-cluster Water/Andes 400

マイクロクラスター水・アンデス400

アンデス（南米）地方に自生し、万病に効くという「キャッツクロー（=クラクラ）」という樹の樹液エキスの情報を、レーザー処理して転写した水の結晶写真です。

基本の水は蒸留水ですが、見事に整った美しい形に変化しています。

ちなみに400の意味は、400倍に希釈して飲む飲み方を示しています。

This is a picture of water to which the information of a resin extract called Cat's claw (Kurakura) is laser treated and transcribed. Cat's claw naturally grows in the Andes region of South America and is an effective treatment or panacea.

The initial water sample was a distilled water but its crystal has changed into an organized beautiful shape.

The word 400 means that for drinking it is diluted 400-fold.

埼玉県・ちちぶ湖 二瀬ダムの水に 波動情報を転写

現在のダムは、どこもよんだ水にアオコが多く、酸性化が進んでいます。ダムは、本来滔々と流れているはずの水を溜めているという不自然な状態にあります。

ここでは、ダムの周辺の生体系を壊し、酸性化したまま下流に流れていく水によって、周辺の汚染がすすみ、自然破壊に向かっていくしかありません。

とにかくダムの水を良くしたい……と思い、ダムの水に必要な波動情報を転写すると、美しい結晶がとれました。

大きな転写装置をつくり、発展させれば、ダムの水も良くなるはずだと確信しています。

ところで、ダムの結晶写真を撮影中に、思いがけない写真が撮れました。

次ページの写真は5秒ごとにシャッターを切ったものですが、連写をはじめたときの写真と、5秒後の写真で、緑の部分と赤い部分が、反転しています。

これがどういう意味をもっているのか、今のところよくわかりません。

将来への課題としたいと思っています。

ダムの源水
Source water in dam

転写後
After transcription

Transcription of HADO Information onto Futase Dam of Chichibu Lake, Saitama Prefecture

Most of the present dams are stagnant where many Aoko (blue green algae) live and acidification at these dams is progressing. The dam stops water from flowing swiftly, thus keeping the water in an unnatural state. This disrupts the ecosystem on the periphery of the dam. The water then flows down river in an acidified form, contaminating the vicinity and destroying nature.

While harboring earnest feelings for its improvement, we transcribed the necessary wave motion to the dam water. As a result we came out with a picture of a beautiful crystal.

We are confident that if we make and develop a large transcribing device we can improve dam water.

By the way, during the photographing of the dam crystal pictures we also came out with an unexpected picture.

The pictures on the next page were taken every 5 seconds and you can see that the first picture and the picture taken 5 seconds later have reversed red and green areas.

We do not know what this means but this will be a future topic of study for us.

フェンネル
Fennel

アロマオイルのもっている波動情報を、水に転写して凍らせ、結晶写真にしたものです。
アロマオイルになる前の、もともとの花によく似た結晶が得られ、とてもびっくりしました。
結晶というものは、その物質がもつ形の相似性といえるのかもしれない。

HADO information that aromatherapy oil contains was transcribed to a water sample and was frozen before taking the crystal's picture.
We were surprised to obtain a picture of a crystal that is similar to the look of the flowers that the different aroma oils were made from.
These crystals may resemble the shape of the substance.

フェンネル水の結晶写真
Crystal picture of Fennel water

人の意識で変わる水

水は人の意識を写す

「水に文字を見せる」という試みは、私たちの予想を超える成果をもたらしてくれました。ここまで、水に音楽を聴かせたり、文字を見せたり、名前を見せたりしてきて、非常に楽しい体験をすることができました。

この実験の成果によって、文字や写真という「形」によっても情報が伝えられるという仮説が得られたように思います。

結晶がここまで大きな、はっきりとした変化を見せてくれるとは予想できませんでした。水が情報を記憶し、伝えることができるということがわかってきたのです。

このような結果を得ると、どうしても人の意識が水にと

のような変化を与えるのだろうか……という領域に踏み込みたくなってきました。

それは、じつは4年前の悲しい、つらい出来事からスタートしました。あの阪神・淡路大震災の直後、私の手元に送られてきた神戸の水の結晶写真は、大いに人の意識を内在するようなものであったからです。その証拠に3ヵ月後には、同じ神戸の水が劇的に変わってしまったからです。

人の意識によって、変化した水の結晶写真をご紹介します。

Water Changed by People's Consciousness

Water Reflects People's Consciousness

Our attempt at exposing water to language had greater results than we had expected. So far, we had very interesting experiences with exposing water to music, to language and to names. With the results of this experiment, we were able to formulate a hypothesis that information can be transmitted through "Shapes" such as words and pictures.

We did not expect though, that the crystals would show such dramatic and clear changes. We have become aware that water stores and transmits information.

After obtaining results like this, we could not resist stepping into the territory of human consciousness? We wanted to find out what kind of change thought could cause.

The idea started after a sad and painful experience that we had four years ago. Immediately after the Great Hanshin-Awaji Earthquake, the crystal pictures of the water from Kobe had something greatly inherent in human consciousness. To prove this, 3 months afterwards, the water in Kobe changes greatly.

We would like to show the crystal picture changed by people's consciousness.

震災直後
Immediately after the Great Hanshin-Awaji Earthquake

震災3ヵ月後
3 months after the Earthquake

The Great Hanshin-Awaji Earthquake and Tap Water 阪神・淡路大震災と水道水

1995年1月17日、阪神・淡路地方を襲った大震災の3日後、神戸で採取した、たまたま出ていた水道水の結晶写真です。

震災直後の人々の「恐怖やパニック、深い悲しみ」を水がキャッチしたかのよう……。結晶はメチャクチャに壊れ、見る人の気持ちまでゾッとさせるような写真になりました。あまりの悲惨さに、公開はできないと思いました。

ところが3ヵ月後……。打ちのめされた神戸の人々に、世界中から援助の手が差し伸べられ、世界中の人が思いを寄せました。暴動が起きなかったことで、思いもかけず、日本人はすばらしいとさえいわれました。

山のように積み上げられたガレキのなかで、人々は人間のやさしさ、温かさを取り戻すことができた……。そんな思いや願いが重なる結晶です。

On January 17, 1995, the Great Hanshin-Awaji Earthquake occurred in Kobe. Three days afterwards we took pictures of the crystals found in the tap water in Kobe (that was available at that time). It is as if the water captured the fear, panic and deep sorrow of the people immediately after the earthquake. The crystals were completely destroyed. It was a picture that made people shudder.

We felt that we could not make this public because of the horror of its extreme misery.

However, 3 months after that... Helping hands and sympathy from all over the world were given to the people of Kobe. Also since no riots occurred the people of Kobe were praised by many people.

Although the rubble piled up high, people were able to restore their environment due the kindness and warmth of others. This crystal seems to have collected these feelings also.

500人の『愛の気・言魂(言霊)』 を受けた水

日本全国にいる500人の波動インストラクター（私が主催する波動学の卒業生たち）に手紙を出しました。

1997年2月2日午後2時、オフィスの私の机の上に、東京品川の水道水を入れたコップを置いておきます。それに対して、みなさんの想いを発信してください。

もちろん、この水が良い水になるように。「水がきれいになりました。ありがとうございました」という願いを込めて、各地から、同時刻に、愛の「気・言魂」を送ってください。

こうして、全国から愛の「気・言魂」を送ってもらった結果の結晶写真（右ページ参照）です。もちろん、物理的な変化は何ひとつ加えていません。

予想はしていたものの、これほど見事な変化を得られたことに対して、撮影班一同、感動を通り越して涙がこぼれそうになってしまいました。

▲元の水 東京品川の水道水 前日撮影
Original water

The picture of tap water in Shinagawa, Tokyo taken the day before

改めて協力していただいた全国の皆さんに感謝します。そして、人の想いのパワーは、距離に関係なく届くと思えるようになったのです。

Water with "Chi, Soul and Spirit" of 500 people

I sent letters to 500 HADO instructors across Japan (graduates of my HADO study). "At 2:00 on February 2, 1997, I will leave a cup containing the tap water of Shinagawa-ku on the table in my office. Please transmit your feelings to that water at the same time from all over Japan. Of course, for the water to become a clean water, please send "Chi and Soul" of love and the wish that the water should become clean. Thank you very much."

In this way, water received "Chi and Soul" from all over Japan. And this is the picture of crystal we obtained. (Please refer to the right page.)

Of course, no physical change was made.

We had not expected it but were able to obtain a clear change in the condition of the water. All of the staff were so impressed that they were almost ready to cry. We feel deeply appreciative of all those who cooperated with us from all over Japan. We started to feel that people's thoughts could be gathered regardless of how far apart they are.

500人の愛の気を受けた水の結晶
Water with "Chi, Soul and Spirit" of 500 People

船井氏の愛の気を受けた水

東京品川の水道水に、日頃からご理解をいただいている船井総合研究所の船井幸雄先生に、「愛の気」を加えていただいた水の結晶写真です。当然良い結晶がとれるという想いはありましたが、正直、もともと水道水だから……これほどきれいな結晶が得られるとは思っていませんでした。

この結晶は、それまでのどの映像よりも美しいものでした。人間の意識が、浄水器などの機械を使うより、はるかに素晴らしく、緻密で美しい結晶をつくる水に変化させることができたのです。

Water with Mr. Funai's "Chi of Love"

This is a picture of a crystal of a tap water sample from Shinagawa-ku, Tokyo, that Mr. Yukio Funai of Funai Consulting Co., Ltd., (a supporter of our research) applied "Chi of Love" to. I felt without doubt that we could obtain well-formed crystals. However, because it was originally only ordinary tap water, we did not really expect that we could obtain such a beautiful crystal.

This is called, "Water is the mirror of mind."

If this is possible, then it could also be possible to change controversial tap water to a beautiful crystal through the conscious thought of human beings. And this fact seems to indicate that our actions and words make water more beautiful and cleaner.

水は心を反映させる……「水は心の鏡」という昔からある言葉を証明する結晶写真になったと思います。

これが可能だとすれば、心配されている水道水を、それを扱う人の意識によって、ここまで美しい結晶ができる水に変えることも不可能ではありません。

そしてこのことは、人間がちょっとした行為や言葉で、水を美しく良い水にすることができるに違いないということも教えてくれているような気がします。

水と言魂について

人の意識と結晶

最後にひとつ。これは群馬県の上野原町にある藤原ダムで行われた、大宮市寿宝院の加藤宝喜住職の「言魂による水の浄化実験」の結果得られた結晶写真です。

日本では古くから、言葉に魂が宿るといわれ、言魂（ことだま）の考え方は広く浸透しています。

実験前のダムの水の結晶写真は、なんともおぞましい限りで、もたえくるしむ人の顔のようにも見えます。この日、加藤住職は、ダムのほとり、約1時間にわたって、加持祈祷の業を行われました。業が終了して、しばらくした後、その場に立ち合った私たちが肉眼でもわかるほど、ダムの水が見る見るキレイになりました。これを目のあたりにして、非常にびっくりし、たいへん感動しました。

さらに結晶写真ではどうだろうと、期待を込めて持ち返

祈禱前の藤原ダムの結晶写真
Water crystal of Fujiwara Dam before offering a prayer

って撮影したものが、表紙でもご紹介している結晶写真です。

今までにこれほど美しく、本当に光り輝くエネルギーを発している写真は見たことがありません。六角構造の中に、さらに小さな六角形があり、その回りを取り巻く光のオブジェは、オーラでもあり、中央の三日月型の部分は、まるで後光が差しているかのようでもあります。

人の意識に基づく言魂のエネルギーの計り知れないパワーを感じさせる写真であり、人間の愛や感謝に基づくエネルギーと水とが調和したとき、とてつもなく素晴らしいことが起こるのではないのでしょうか。

Water and Soul

People's Consciousness and Crystals

Lastly, this is a picture of a crystal of water obtained as a result of a water purification experiment "through soul" by Reverend Kato Hoki, the chief priest of Jyuhakuin Temple, Omiya City. The experiment was conducted at the Fujiwara Dam in Minakami-cho, Gunma Prefecture. In Japan, it is widely believed that the soul dwells in the spirit which is present in words.

The picture of the crystal of water before the experiment, is indeed horrifying and in fact has the appearance of the face of a person who is suffering great agony. The day of the experiment, Reverend Kato, performed a prayer practice for 1 hour beside the dam. Moments after the practice ended, the dam water became visibly beautiful. We observed this with our own eyes and were very astonished as well as very impressed. How does the crystal picture look? We took pictures of the crystals with great expectations and we obtained crystal pictures as beautiful as the one on the cover.

We have never seen a beautiful picture that emits brilliant energy as much as this one does. Amidst the basic hexagonal structure, there is also a small hexagon. This hexagon is an object d'art of light that is surrounded by an aura. The crescent portion at the center also seems to have a halo around it.

People say that this picture makes them feel an immeasurable amount of power and energy in their soul based on people's consciousness. When energy based on people's love and appreciation harmonizes with water, why should such a wonderful thing seem so unreasonable?

We Could Take a Heptagonal Crystal Picture

七角形の結晶写真が撮れました！

加藤住職の祈祷のときの藤原ダム水を滴下して撮影すると、ほとんどが表紙と前ページのような素晴らしい写真になりました。

さらにその中に数枚、不思議な写真が撮れました。その1つをご紹介します。

美しさの点では、表紙の写真にまさるものではありませんが、よく見ると、なんと六角形ではなく、七角形になっ

ているのです。今までに七角形の結晶は一度も撮れたことがありません。加藤住職は七弁財天さんをお願いをされたのだとか。

水はいろいろの伝言をもたらしてくれていますが、伝言を聴くわれわれ人間の方が、大いに勉強する必要があるようです。

We were taking pictures of the dripping water of Fujiwara Dam while Reverend Kato was giving prayers. During that shoot we obtained pictures of crystals as wonderful as those on the cover page.

Among them, we were able to obtain a few mysterious pictures of which this is one.

In terms of beauty, there is nothing that compares to the one on the cover. Take a close look and you will be astonished to find that it is not a hexagon but a heptagon. We had never been able to obtain a picture of a heptagonal crystal before this experience. Reverend Kato said he prayed to the Seven Benzaiten (Goddesses of Fortune).

Water has a variety of messages, but it seems that we have a lot to learn from messages we receive.

水は宇宙から来た？

水の不思議は深まるばかり

結晶写真による水の評価方法は、従来の科学的な分析評価法とはまったく違う視点からの新しいアプローチです。

そして実験を続けてわかったことは、「水」に関しては私たちはやはり、まだほとんど何もわかっていないということ。

疑問や課題がどんどん拡がっています。

まず地球上に存在する水。

この水はなぜあるのでしょうか。水の起源については、今まで謎に包まれていました。しかし宇宙探査が進んでくるに従って、かつて火星にも水があったらしいことも確認されています。水は少なくとも地球固有のものではなく、宇宙にくまなく存在することがわかってきたようです。

Water Came from the Space?

The Wonders of Water Become Even Deeper

Evaluating water by taking pictures of water crystals is a new approach that comes from a completely different viewpoint than that of the usual conventional scientific analysis and evaluation methods.

What we learned from these experiments is that we do not know anything about water.

More questions and issues pile up one after another.

Let's start with the questions about the water that exists on earth.

Why does water exist? The origin of water used to be wrapped in mystery.

As the space probe advances, it has already confirmed that water exists on Mars. We are starting to understand that water is not unique to earth but exists all over space.

▲1997年6月2日(月) 朝日新聞記事より
Article from the Asahi Shimbun, Monday, June 2, 1997

海の源は「星」だった

米のイェール大学研究所は、自ら採集した「ヘル・ボップ」と呼ばれる隕石から、水の起源は地球に落ちた隕石から来たという発見を明らかにした。隕石中の水素の同位体比率が、地球上のものと一致していることが、この発見の鍵となった。同研究所は、この発見が、地球の水の起源を明らかにする上で重要な一歩を踏み出したと見做している。

ハワイ大が発表
「重水素の率近い」

地球に落下、海水の源に

この発表については、地球に落ちてきた隕石が、地球の水の源であるという説が有力だと見られてきた。しかし、この説は、隕石中の重水素の比率が、地球上のものと一致していることが、この発見の鍵となった。同研究所は、この発見が、地球の水の起源を明らかにする上で重要な一歩を踏み出したと見做している。

▲1997年8月24日(日) 毎日新聞記事より
Article of the Mainichi Shimbun, Sunday, August 24, 1997

1997年のマスコミ報道より
「水は宇宙の果てから飛来した」

アメリカ航空宇宙局・NASAは1997年の5月「宇宙から、地球の大気に向けて雪の玉のような微小天体が無数に飛来しているとみられる現象を、はじめて観測した」と発表しました(139ページの右上の記事写真参照)。この発表はNHKのニュースや全国紙でも取り上げられました。

「この雪玉は直径10数メートルの小さい彗星のような天体とみられ、毎日数千も飛来するが、地表に近づくにつれて分解し、やがて雲の一部になる」……とあります。

つまり「宇宙から毎日、雨が降っている」ということです。この「宇宙からの雨」の量は年間にしても極くわずかな量ですが、地球の誕生から46億年間降り続いたとすれば、海の水の源になり得る量です。

さらに、この「宇宙からの雨」は有機物も含んでいて、これこそが地球上での生命誕生の源ではないか……とのこ

とです。同じような研究は同年8月にハワイ大学の天文台からも発表されています(右の記事写真参照)。

だとすれば、水の特異で不思議な性質の謎も解けてきます。水の起源が宇宙にあるとすると、現代の地球

の科学力だけでは解明できないのも無理はありません。人類にとって宇宙は、あまりにも大きく、私たちの想像を絶する世界ですから。裏を返せば、水をもっと深く研究することで、宇宙のこともわかるかもしれないのです。

なんだかワクワクしてきます。

Water Came Flying from the Ultimate Limits of Space* from a Press Report in 1997

"Water Came Flying from the Ultimate Limits of Space." From a Press Report in 1997 the National Aeronautics and Space Administration (NASA) announced in May, 1997, that "We observed for the first time a snowball-shaped microscopic heavenly body flying in numerous numbers toward the stratosphere of earth from space." (Refer to the picture of the upper right article on page 139.) This announcement was reported in the NHK news and in national newspapers.

"This snowball is deemed to be a heavenly body similar to a small comet with a diameter of about dozen meters. About few thousands of them come flying daily but as they come near the earth surface, they decompose and become a part of cloud". In other words, "Rain comes falling from space everyday." This yearly quantity of "Rain from space" may only be a small quantity, but if this has been going on for 4.6 billion years (since the origin of earth) it is large enough to be the source of the oceans.

Furthermore, this "Rain from space" contains an organic substance and this indeed must be the origin of the birth of life. Similar research has been announced by an astronomical observatory at the University of Hawaii on August in the same year. (Refer to the right picture.)

If this is true, the question of the unique and mysterious nature of water can be understood. If the origin of water is space, it is no wonder that its questions cannot be solved by the scientific powers that we have on earth. Space is too big for humans and it is an unimaginable entity. The truth of the matter is that, by researching water more deeply, we may be able to understand more about space. Just the thought is so exciting.

Postscript

What kind of impression did you get from the pictures of crystals?

I am sure that you were astonished to find out that water shows such a variety of crystals due to its environment. Some of you may have asked the question, "Is it true?" And some of you may have believed this without a doubt.

I published this picture book with an earnest intention to propose new ideas. Things that are attempted for the first time always elicit criticism and I published this book well aware of that fact. I think my work started from love for people and for the Earth.

All I ask for is for you to understand the great and secretive aspects of water.

If water originally did not exist on earth and came from far away in space, it means that our existence also have started in outer space.

No one could have any objections to our attempts to study water. In these experiments we have clung to water in an attempt to get more familiar with it, to harmonize with it and understand it. These are all very important things for humans to do.

Therefore, before I started my work I already had possessed one technique. Through practicing health consultation in the past, with a total of more than 10,000 people, I experienced the maintenance of health through water. For this reason, I developed a unique approach toward water. I had many deeply impressive feelings while systematizing and organizing this book.

What is the destination of this chaotic world. What is the origin and history of humans. And how will it be in future? These are issues which everyone must think about very seriously.

I feel that this picture book will serve as a concise text and valuable teaching tool in helping people to keep taking a closer look at water.

I hope that this book creates an opportunity for discussions about water to be raised all over the world and that other countries will join me in trying to do the same thing. To achieve this purpose, this book has been written in English as well.

We will continue publishing, 2nd edition and 3rd editions. I hope to receive opinions and responses from my readers so as to enable the lifting of this research to a higher scientific and philosophical level, and not let it end in mere self-satisfaction.

Lastly, I would like to express my deepest appreciation to Dr. Leo H. Lorenzen who helped to carve my way in my research.

To Mr. Kazunari Ishibashi, Mr. Seiya Sato, Mr. Jun Fumamura and all the old and new staff members of IHM who engaged in this research. To Mr. Tokujiro Kawasaki, a landscape photographer, who takes beautiful pictures of Mother Nature.

To Mr. Shinya Taguchi, the former president of Nichirei Ico Co. Ltd., whose lifework is the positive adjustment of overseas water. Thank you for sending me ice from all over the world.

And to the members of the International HADO Friendship and their HADO instructors, who always supported us in my research. To the staffs of Sun Create, headed by Ms. Tsuneko Narukage, who organized the crystal pictures, so wonderfully.

Masaru Emoto

編集後記

本書には1994年9月からスタートして、1999年4月までに撮影された結晶写真を掲載しました。

編集を引き受けてから、はじめて結晶写真を撮影する冷蔵庫を見せてもらいました。畳1枚分くらいの大きさの頑丈そうな冷蔵庫の片側に机、反対側に冷凍庫があり、その机の上に顕微鏡とくっついた状態のカメラがありました。

冷凍庫の中にはぎっしりとシャーレが詰まっています。

なにより印象的だったのは、冷蔵庫の前につり下げられた厚めの上下のダウンジャケット。もう桜も散って、春たけなわというのに、結晶写真班は年中「寒い、寒い」の連続で越冬が続く、とか……。

ものすごい数の結晶写真は、きちんとデータとして保管され、世の中のため、人類のために役に立つ日を待っています。

とはいえ、世界中で、水を入れたビンに「ありがとう」だとか、「天照大神」なんて、ワープロで打った紙を貼り付け

ようと発想する人は、江本勝氏ひとりだけでしょうね……などと言いつつ、この写真集の第2弾の企画をすすめる編集スタッフたちです。

はじめはふと思いついた……とのことですが、根底に積年の、水に対する深い思いがあつての研究は、素晴らしい仕事で、少しずつ実を結びつつあります。

これまでの「今は、誰にも理解されない……」という思いにさいなまれながらの実験は、並々ならぬ苦勞の連続だったと思います。が、案外、実際に撮影に携わるスタッフたちは、毎日、大きな驚きと感動をもって、誰も知らない世界に踏み込み続け、叫び声をあげて楽しんでいたのかもしれない。

多くの方々のご支援と協力によって、今では膨大な資料が蓄積されている様子には、大きく頭が下がります。楽しい仕事をさせていただいたことに深く感謝します。

Editor's Notes

This book contains pictures of crystals taken from September, 1994 to April, 1999.

After I had accepted the editing work, I first took my first look at the refrigerating room used for photographing the crystals. I saw a solid refrigerating room (about the size of 1 tatami mat), a desk, a freezer, and a camera with a microscope attached on top. The refrigerator was filled with Petri dishes. What was most impressive was the heavy down jackets and pants that were hung in front of the refrigerating room. The season had already turned to spring since it was night after the full blooming of cherry blossoms. The crystal photography staff kept on saying "It's cold, it's cold" all through the year. It was like spending winter in the Antarctic.

A numerous amount of crystal pictures were stored as data and are waiting for their turn to serve the world and mankind.

Who in the world, except for Emoto Masaru, would think of pasting papers typed with "Thank you", or "Amaterasu Omikami" on a bottle containing water. We all kept saying that. But now, it is us the staff, that are encouraging him to plan a second edition of this book.

He said it just came across his mind. Since his research was rooted on the deep feelings to water that he had accumulated over the years, he was very serious. Now it is gradually bearing fruit.

Up until now, the experiment that we carried out tormented us with feelings that we would never be understood by anyone. It was a hard effort for us. But I suppose the staff who were actually engaged in the photography were having the most fun. They screamed out astonishment and enthusiasm everyday as we stepped in to a world that no one else has ever explored.

I admire him for organizing and storing a tremendous amount of data with the support and cooperation of many people. I would like to express my gratitude to him for giving me this chance to do interesting work.

The Message from Water

Water, thank you today as well.

Written by Masaru Emoto

Born in Yokohama in July 1943.

Graduated from International Relationships Course, Department of Humanities and Sciences, Yokohama City University.

Established I.H.M. Co., Ltd. in 1986 after working for Chisan Co., Ltd. and Chubu Yomiuri Shimbun (Central HQ of the Yomiuri Shimbun at present).

Certified and licensed degree of doctor of alternative medicine from Open International University in October, 1992. Challenges mysteriousness of water after encountering MRA, Magnetic Resonance Analyzer and micro-cluster water in the USA.

Aims at research of various kinds of water, such as water in a human body, water in daily life, and water on the Earth from the point of personal aspect rather than scientific one. Continues creative experiments on the basis of belief that water crystals reflect the essence of water.

At present, President of I.H.M. General Research Institute, I.H.M. Co., Ltd., and I.H.M. International HADO Membership.

Wrote a number of books such as "The Prelude to the Hado Age" published by Sun Road Publishing Co., Ltd.

PREFACE

For seven years, I maintained one of the most popular physics websites. Those seven years working on the site provided me with the opportunity to consider some of the most challenging questions about fundamental reality. Some avenues which initially appeared promising turned out to be blind alleys, while other seemingly innocuous principles turned out to be surprisingly fruitful. This book presents some of the most important insights I gained over those seven years.

I am pleased to say the website gained high praise from some of the most famous names in physics, but I was always more heartened by some of the comments left by casual visitors to my site, especially those who felt I managed to make physics exciting, entertaining, and easy to understand. Hopefully this book can continue that trend.

The remarkable success of this book has led to a series of *Hidden In Plain Sight* books. If you enjoy this book, I am sure you will enjoy the other books in the series. The common theme which links all the books is that — at the fundamental level — we should expect our theories of Nature to become simpler, not more complicated. Hence, the explanations we seek are deceptively simple, and have been overlooked. They are truly hidden in plain sight.

the only thing that exists.

1

UNIFICATION

In our modern world, we have grown used to ever-increasing complexity. We perpetually have to upgrade our mobile phones to the latest version 5.0 with new features we never knew we wanted. We have to buy the latest television with hard-disk recording built-in, and a baffling remote control to match. It feels like it is just a matter of time before the internet becomes so complicated that it develops self-awareness, calls itself "SkyNet", and launches a thermonuclear war against humanity.

Complexity is seen as a virtue, a selling-point. Extra features are seen as a good thing. Are you not confused enough yet?

I want to strip my life back to simplicity. I have cancelled my Facebook account. I have organised my apartment, stripped it down to the basics and discarded all unwanted junk. By removing distractions, I hope it is going to allow me to concentrate. When you feel the complexities of life are getting you down, you have to strip your life back to simplicity.

We tend to think of simple things as more beautiful. They are more economical, with less waste, less superfluous clutter. If we clear our heads, we can see things more clearly. If we clear our heads, we can see the truth.

Nature also likes simplicity. Nature abhors waste, both in materials and in energy. Everything in Nature is done for a good reason. We see beauty in simplicity because we can see its underlying efficiency. We might recoil from seeing an ostentatious sofa because so much of its covering serves no purpose, the inefficiency of its design being antithetical to the beauty of Nature. However, when we see a sleek, lean, minimally designed chair we are instantly attracted to its spartan beauty (perhaps until we have to sit on it for a couple of hours).

Due to Nature's close affinity with simplicity, the advance of fundamental physics over the centuries could be seen very much as the pursuit of simplicity. As physics has progressed it has been found that more elegant, simpler theories have been found to be the best match for reality. It is very important to remember this when we do physics: ask yourself, are you making things simpler? If not, then think again. As Albert Einstein said: "Any intelligent fool can make things bigger and more complex. It takes a touch of genius — and a lot of courage — to move in the opposite direction."

In physics, one of the most successful ways of simplifying our explanations has been by reducing redundancy in those explanations. If we find we have two theories which explain two apparently different behaviours of Nature, we might find it possible to replace both those theories with a single theory which still manages to explain both of those behaviours. When this happens, the process is called *unification*. The resultant unified theory will be simpler than either of the two previous theories, as it reveals a deeper, underlying truth.

This process of unification always represents a landmark in physics. It is like drawing a line in the sand. It shows we have reached a new level of understanding — we will never have to go back to our previous level of ignorance. Unification is, in many ways, the ultimate goal of physics. If physics is ever to provide a complete understanding of the universe, then the last act which will be performed by the very final physicist will be an act of unification.

This book has a single goal, though it is highly ambitious. The aim of this book is to reveal a link — possibly a unification — between relativity and quantum mechanics at the deepest possible level: the fundamental level. This link is based on an extremely simple principle, a simple idea.

Simplicity is good. I like simplicity.

What unifies unifications?

As we start out on our quest, a good starting point might be to examine some of the major unifications in the history of physics. Maybe we can detect trends or similarities in their approach. Maybe we could adopt aspects of their approaches to aid our quest. With this in mind, what follows is an historical review of some of the major unifications in physics. Don't worry too much about following the details — any principles which are important for our discussion will be described in detail later in the book. For the time being, just get a feel for the history of unification.

We start in 1638 when Galileo, the man described as the father of modern science, published his *Discourse on*

Two New Sciences. Galileo realised that if you are travelling at a constant speed in a constant direction (for example, being a passenger on a steady train), you feel as if you are stationary. Galileo had the insight that it was fundamentally impossible to distinguish the two situations of moving and being stationary. To be precise, Galileo stated that there was no experiment you could possibly perform which could detect if you were stationary or moving at a constant velocity. This unification of "being stationary" and "moving at constant velocity" stands as the first of the great unifications in physics.

In 1665, a 22-year-old Isaac Newton wondered if the force which pulled apples from a tree was the same force which held planets in orbit. Again, we see a simple, brilliant insight, an imaginative leap. From Newton's clear vision, a description of the force of gravity emerged as the unifying theory for two behaviours which were previously considered to be unrelated.

Another unification occurred in the nineteenth century by the man widely acknowledged to have been the greatest experimental physicist of all time. In 1831, at London's Royal Institution, Michael Faraday demonstrated that if you push a magnet through a coil of wire, an electric current flows. Conversely, if you pass an electric current through a wire it can deflect a nearby magnetic compass. From this, Faraday deduced that electric currents create magnetic fields, and moving magnetic fields create electric currents. Thus was *electromagnetism* discovered, unifying electricity and magnetism. However, Faraday was no mathematician, and he lacked the mathematical language to describe his discovery.

The next unification was revealed by the Scottish physicist James Clerk Maxwell who — unlike Faraday — **was** a mathematician. Maxwell took Faraday's results and constructed four equations which described the connection between electric and magnetic fields. Maxwell showed that an electric field would generate a magnetic field, and, conversely, a magnetic field would generate an electric field in an oscillatory fashion. The result was a self-sustaining electromagnetic wave which travelled through space. After calculating the speed of this wave, Maxwell found it to be the same as the speed of light, and thus had a brilliant insight: light is a form of electromagnetic wave! Hence, here was another unification, this time linking the field of optics with electromagnetism.

The next series of unifications happened in the twentieth century and was supplied by Albert Einstein, whose work we will be considering in detail later in this book. From a young age, Einstein had wondered what would happen if you moved so fast that you caught up with a light beam. It would seem that you would view a stationary wave of light. However, Maxwell's equations seemed to indicate a constant speed of light — regardless of the motion of the observer. Hence, Maxwell's result for the motion of light did not agree with Newton's laws of motion. Einstein managed to combine Maxwell's result with Newton's laws — but only by radically altering our concept of space and time. His resultant *special theory of relativity* unified not only electromagnetism with mechanics, but also space with time. Also, through his famous formula which arose from special relativity, $E=mc^2$, Einstein launched us into the atomic age by unifying mass with energy.

Einstein was on a roll at that point, and, ten years later, after a great deal of extremely hard work, Einstein struck again. Einstein had the brilliant insight — which he called the happiest thought of his life — that the force experienced by an observer undergoing constant acceleration was indistinguishable from the force of gravity. This represented another unification, this time between gravity and accelerated motion. Conversely, if an object was in free-fall it would not feel any force of gravity — it would be as if it was floating freely in space. This meant that gravity did not exist as an entity in its own right: gravity was the curvature of space. Objects travelling in a straight line in curved space appear to be drawn towards the centre of curvature, and this is interpreted as the force of gravity. The resultant theory — the *general theory of relativity* — unified gravity with the geometry of space.

The next unification occurred shortly after the discovery of relativity. The newly-developed theory of *quantum mechanics* was not consistent with special relativity as it only considered particles which moved very slowly compared with the speed of light. In 1927, Paul Dirac combined special relativity and quantum mechanics to create the first quantum field theory. This theory was further refined throughout the twentieth century to become the greatest triumph of physics in recent years as the foundation of the standard model of particle physics. The shy Dirac was awarded the Nobel Prize in 1933, and his first instinct was to turn it down as it would generate unwanted publicity for himself — until he was persuaded that turning down the prize would generate a lot more publicity.

The last unification to date occurred in the 1960s when physicists started to consider the symmetry between a particle associated with the electromagnetic force (the *photon*) and the *weak nuclear force* (called the W^+ , W^- , and Z particles). Unification was achieved by importing an idea which was first used in studying the physics of metals and other solids: *symmetry breaking*. Physicists realised that all four particles would be massless (i.e., they were all symmetrical) at high energies (for example, the unimaginably high temperatures reached in the first moments after the big bang). However, as the energy decreased and the universe cooled, this symmetry would be broken and the particles would be free to take different values. The photon was left with no mass, but the W^+ , W^- , and Z particles all collected mass. For this reason, the weak nuclear force can only operate at short ranges and is weak, whereas

massless photons can bring us light from the stars. Hence, the two forces of electromagnetism and the weak nuclear force were, in fact, the same force behaving in two different ways at our everyday low energies. If it is sufficiently hot enough then the electromagnetic force and the weak force would merge into a single force. This was confirmed in the 1980s in CERN, the European laboratory for particle physics, when they recreated the temperature of the early universe and demonstrated the existence of the so-called *electroweak* force.

Considering general themes in all these approaches, one thing our historical study has revealed is that, in general, unification in physics is achieved by a single, imaginative idea. This might come from Newton pondering on an apple, or Einstein deciding that you could never catch up with a light beam: unification always requires one single, brilliant insight. Even in the case of the electroweak unification, with many physicists involved, it still required the inspired introduction of the symmetry breaking concept before unification could be achieved. It does not matter how much money or how many researchers you throw at the problem, unification is only ever achieved by a moment of inspiration. Unification is definitely not achieved by design-by-committee.

Also, the ideas by which unification is achieved are generally extremely simple ideas — anyone could understand these ideas. In fact, we could say that any unifying idea **has** to be simple. The idea of experiencing no gravity in a lift in free-fall, or catching up with a light beam, are simple ideas which anyone could understand. Similarly, Newton's idea connecting a falling apple with a planet held in orbit is a simple concept. It was as if these great unifiers picked-up on something which was under our noses all the time, something which was missed perhaps because it was too simple. Something hidden in plain sight. As Walter Isaacson said in his book *Einstein: His Life and Universe*, Einstein's approach was typical of his ingenuity: "He examined a phenomenon that was so very well-known that scientists rarely puzzled about it." Or as Nobel Prize-winning chemist Albert Szent-Györgyi said: "Scientific discovery consists of seeing what everyone else has seen, but thinking what no one else has thought."

The process of unification could be equated to a tree, with each theory being a leaf on the end of a twig. As we move back down the twig we eventually get to a junction point between two twigs: a point of unification. As we move further down, twigs merge into branches, and the branches merge into the trunk. As we continue to move further and further down the tree we find the number of branches gradually reduces as the process of unification reduces the number of redundant branches (theories). With each step, with each unification, our model of Nature becomes simpler.

The following diagram shows this tree of unification. The junction points of the branches represent points of unification. At each of those junction points, not only is the name of the unified theory shown, but also — in brackets — the name of the person(s) responsible for the unification.

But what will we find at the base of the tree? What is holding up the entire structure? As our progress down the tree has seen our model and our theories getting simpler, you would expect that at the ultimate base of Nature, we will surely find a principle which is simple, beautiful, and elegant. As the great physicist John Wheeler said: "To my mind there must be, at the bottom of it all, not an equation, but an utterly simple idea. And to me that idea, when we finally discover it, will be so compelling, so inevitable, that we will say to one another: 'Oh, how beautiful. How could it have been otherwise?'"

Relativity and quantum mechanics

The quest for one particular unification is dominating current research. As we enter the twenty-first century, we find the same two theories have dominated physics for a hundred years: the theories of general relativity and quantum mechanics. Both theories have been astonishingly successful and have been tested to remarkable accuracy. General relativity is our best theory of gravity, accurately describing the motions of planets, stars, and galaxies, and has correctly predicted the existence of black holes. Quantum mechanics is the force behind the laser and the transistor, and is therefore the force behind the computer revolution. Quantum mechanics is generally regarded as the most successful theory in the history of science. Nobody argues with either theory — they are both undoubtedly correct

The only problem is, they have absolutely nothing in common.

General relativity is the theory of "big stuff", describing the motion of planets and galaxies. Quantum mechanics is the theory of "little stuff", describing the behaviour of subatomic particles. For the most part, physicists only have

to use one or other of these theories, depending on the scale of their subject. For example, in order to study the motion of galaxies, they would use general relativity, in order to study the behaviour of particles, they would use quantum mechanics. So, because of the differences in the domain of application, this method of switching between the two theories — though not ideal — works perfectly well for most purposes.

However, we are interested in the quest to uncover the fundamental truth of Nature, and Nature surely does not use one theory for small objects and another theory for big objects. As far as Nature is concerned, objects are objects — the laws of physics apply equally to all objects. So at a deeper level, there must be a more elegant theory which applies to all objects, regardless of their size. It is the unearthing of this deeper theory — combining general relativity with quantum mechanics — which is the focus of much current research.

Einstein's theory of general relativity revealed that the very fabric of space itself can be curved in the presence of mass or energy. In the absence of mass or energy, space is "flat", it is uniform and without features. However, in the presence of mass or energy, the fabric of space is curved. This is a wonderful sweeping theory. One can imagine vast tracts of space being bent in a beautiful, smooth curve by a planet or star, like an interstellar ocean wave. And, just like an ocean wave, this glorious curve of space keeps moving and curving as the planets and stars are constantly in motion.

But what, exactly, is happening at the microscopic level during this curvature of space? What does space look like when we zoom in to examine this curvature in detail?

In the microscopic world, quantum mechanics takes over. Quantum mechanics predicts seething randomness at such small levels, with particles flashing into existence before their rapid annihilation. The resultant effervescent substance resembles foam rather than smooth space, and was given the name *spacetime foam* by John Wheeler. Theories which attempt to unify general relativity with quantum mechanics at this microscopic scale are called theories of *quantum gravity*.

String theory and loop quantum gravity

The two main approaches to finding a model of quantum gravity are string theory and loop quantum gravity. These two approaches are opposites in many ways (loop quantum gravity emerges from general relativity, string theory has a closer connection to quantum mechanics), but very similar in one important way. Both string theory and loop quantum gravity are based on the principle that the best way to analyse Nature is to discover the **structure** of the smallest components of reality.

String theory was first proposed by Yoichiro Nambu in 1970 while at the University of Chicago. When first introduced, the theory had more modest goals than it has now. The theory has been considerably expanded over the years, but the fundamental principles have been retained.

String theory considers particles as being composed of microscopic strings:

Closed string

Open string

As a closed string moves through space and time, it sweeps out the shape of a cylinder. These cylindrical shapes can simplify our understanding of the interactions between particles. As an example, the following diagram shows the interaction between an electron and a photon:

The shape of this interaction between elementary particles can then be viewed as a single string cylinder pinching itself and separating into two string cylinders:

The great attraction for theorists is that this stringy cylinder eliminates the infinities associated in dealing with the interactions of point particles. As can be seen in the two diagrams above, the particle interaction can be replaced by the much smoother string cylinder representation.

As we take successive snapshots in time, cross-sections through the string cylinder appear as microscopic loops which join and split in a smooth manner:

If these microscopic loops are sufficiently small, they can appear just like point particles. So the apparent interaction of point particles could actually be the splitting and joining of microscopic string loops.

Just as a guitar string can vibrate in many different ways to produce different notes, so can a loop of string have different modes of vibration to produce different types of particles. For a loop, a whole number of vibrations must fit around the string. Higher notes require more energy, so the particles would have greater mass. In this way, different particles — such as electrons and quarks — are just different vibrations of one of these tiny loops of string.

Much is made of the fact that string theory predicts a particle which appears to have the characteristics of the particle which is expected to carry the gravitational field. Even though such a particle has never been detected experimentally, it has already been given a name: the *graviton*. Such a particle would have to treat all objects in the same way — just as gravity is an attractive force for all objects. The fact that such a particle emerges naturally from string theory is often taken to mean that in string theory "gravity comes free". String theory's prediction of gravitons is one of the main selling-points of the approach.

This all sounds well and good, until you realise that string theory makes another prediction which is not so welcome, the prediction that space should have 10 or 11 dimensions. This is a blow, as we only see three spatial dimensions and one time dimension. This has forced the ingenuity of string theorists to come to the fore, as ways of tucking-up the extra dimensions into exotic structures have been suggested. However, having to resort to these kind of techniques is not really what you want in your simple, fundamental theory.

String theory is almost the only game in town when it comes to current theories of quantum gravity. However, there is one more proposal being worked on by a smaller community of researchers. *Loop quantum gravity* attempts to unify quantum mechanics and general relativity by applying the standard technique of "quantization" to Einstein's equations for general relativity. The key figures in this field are Lee Smolin of the Perimeter Institute near Toronto,

Carlo Rovelli of the University of the Mediterranean in Marseille, and Abhay Ashketar of Pennsylvania State University. We will be hearing some of these names throughout this book.

Loop quantum gravity's initial aims were less ambitious than those of string theory, being purely a theory of quantum gravity, with no attempt being made to predict the properties of elementary particles. However, this has changed in the latest version of the theory, which now does, indeed, predict the elementary particles. So the latest version of the theory is, like string theory, presented as a fully-fledged *theory of everything*. The main prediction of the theory is that space is not continuous but is instead quantized into discrete chunks: "atoms" of space. These chunks are the smallest possible units of volume, each approximately 10^{-99} cubic centimetres.

Neither of the approaches of string theory nor loop quantum gravity seems to be enjoying unqualified success at the moment, with progress being slow on all fronts. String theory has been getting a bad press as the theory which makes no testable predictions. Loop quantum gravity, however, boldly proposed a testable prediction that high-energy photons should travel slightly slower than low-energy photons, and this difference becomes measurable over long distances. However, in 2009, a gamma ray burst from deep space was analyzed and no speed difference could be detected.

There is a certain competitiveness/animosity between researchers in these two distinct fields, both groups being convinced of the correctness of their approach and the failings of the other approach. Such competitiveness should be healthy in theory, but it has not appeared to work out that way. This is not a golden age for physics.

A personal criticism of mine — which applies to both string theory and loop quantum gravity — is that neither theory has anything to say about the foundational problems of quantum mechanics. The foundational problems raise questions about the nature of reality at a very low level — before it is even observed. It is hard to even imagine what form reality takes before it is observed, so this might be considered more of a philosophical question by most scientists, and is sadly ignored by researchers, but it is still a problem at the very heart of reality which urgently requires a solution. We will be considering the foundational problems in Chapter Six which is dedicated to the question of quantum reality. No matter how long they are ignored, the foundational problems will not go away and will have to be tackled at some point. One of the proposals of this book is that a true linkage of quantum mechanics and relativity can only be properly achieved by obtaining a greater understanding of the foundational level.

The problem with structure

It was the Greek philosopher Democritus who first suggested that matter might be composed of indivisible "atoms" (meaning "uncuttable" in Greek). Democritus believed the properties of the atoms were determined by their shape, so water atoms were smooth and slippery, whereas iron atoms had hooks to bond closely together. His views might sound misguided, but, on the basis of what we now know about chemical bonding, it is actually a remarkably good analogy to reality.

Throughout the nineteenth century, successive experiments appeared to confirm the atomic nature of matter, until it became an accepted fact. But were the particles truly indivisible? In 1897, the physicist J.J. Thomson discovered the electron, revealing that there were smaller particles within the atom. In 1909, Ernest Rutherford directed alpha radiation at some thin gold foil, and found it was deflected. Rutherford interpreted this result as showing that there was a solid, positively-charged nucleus at the centre of every atom, surrounded by negatively-charged electrons.

The continuing subdivision of particles continued through the twentieth century with the discovery that protons and neutrons were each composed of three particles called *quarks*. Even though quarks are considered to be elementary particles, if history teaches us anything it is that particles which were once considered indivisible later reveal themselves to be composed of even more fundamental particles.

In answer to the question "What is a particle?", researchers in string theory would say elementary particles are actually composed of incredibly tiny strings, with average size of about a millionth of a billionth of a billionth of a billionth of a centimetre (called the *Planck length*). But this has just pushed the question of "What is a particle?" further back. We are now left with the question "What is a string?". We seem no nearer our goal in determining the ultimate bedrock foundation of reality.

In fact, this raises a potential weakness in all theories which believe Nature's secrets can be fully unlocked simply by examining the structure of the universe at increasingly smaller scales. The problem is: surely this "drilling" could just go on to infinity? How could it ever end? How would we ever know when we had reached the bedrock foundation of reality? As string theorist Brian Greene says in *The Elegant Universe*: "Another possibility, should strings fail to be the final theory, is that they are one more layer in the cosmic onion." Whatever structure we end up with, surely we will always be able to ask the question: "What is it made of?"

There is a famous (undoubtedly apocryphal) story which circulates in physics circles. A lecturer was presenting a

lecture on astronomy. At the end of the lecture, a little old lady got up and said: "What you have told us is rubbish. The world is really supported on the back of a giant turtle." The lecturer gave a superior smile before replying, "What is the turtle standing on?" "You're very clever, young man" said the old lady, "but it's turtles all the way down."

We are supposed to laugh at the little old lady, but actually the lady might well be correct: reality might well be composed of successive layers of structural "turtles". In which case, approaches based on analysing structure at ever-smaller scales have got serious problems.

String theory and loop quantum gravity are potential candidates for a so-called theory of everything. However, it is hard to see how a theory based on structure can ever be a theory of everything — there will always be the question "Why this structure rather than another structure?" String theory attempts to get round this problem by proposing a multitude of parallel universes (called a *multiverse*) with different string configurations dominating in each universe. But, at the end of the day, the question would always still arise: "Why strings?" Why should the string structure (or loops if you subscribe to the loop quantum gravity approach) be favoured over any other possible structure of the universe? I am not suggesting that either string theory or loop quantum gravity is wrong, I just do not see how either theory could ever represent the fundamental theory of reality.

The Nobel laureate Steven Weinberg has continued this rather pessimistic tone: "I have to admit that, even when physicists will have gone as far as they can go, when we have a final theory, we will not have a completely satisfying picture of the world, because we will still be left with the question 'why?' Why this theory, rather than some other theory?"

I do not share Weinberg's pessimism. Surely there must be an alternative to the inexorable "drilling"? In his book *Three Roads to Quantum Gravity*, Lee Smolin suggests a third approach to quantum gravity research. He describes how a handful of researchers are starting with general **principles** and are starting to build-up from those principles in order to logically deduce the laws of Nature. It is this third approach which is followed in this book.

In contrast to the "drilling down from structure" approach, we will be "building-up" from fundamental principles. In this way, we will be certain that we will encounter the fundamental bedrock of Nature — because we will be building-up from it. After all, you wouldn't build a skyscraper — or any edifice — from the top down: you would always start with bedrock and build up.

The principle of principles

The great advantage of theories based on principles is that they are not arbitrary (as opposed to theories based on structure). A fundamental principle (or *first principle*) appears obviously true. A fundamental principle contains the reason for its obvious correctness stated **within itself**. It is **axiomatic**. It is a self-contained entity, requiring no further explanation, validation, or support. A fundamental principle should appear so obvious that it would be impossible to conceive of a universe in which that principle is false. In this way, a principle is not arbitrary; instead it appears to represent a fundamental, unchanging truth which would have to be true in all conceivable universes. For this reason, a principle can form the very bedrock of the foundation of any true theory of everything.

This idea — that physics could be built up from deductive reasoning — has been considered for many centuries. In the seventeenth century, the philosopher Descartes proposed a system of physics based on reason. However, this methodology of logical deduction never gained a following, which I feel is a shame, as I believe the time is now right for it to play an important role in a physics in which experimental confirmation of theories is becoming ever-harder to achieve.

Our current particle accelerators can generate only a tiny fraction of the energy required to test theories of quantum gravity. The electroweak unification occurs with energies over 100 GeV (1 GeV is 1 followed by nine zeroes). The W and Z particles associated with electroweak unification have therefore been detected with our current accelerators which can reach energies of up to 14 TeV (1 TeV is 1 followed by 12 zeroes). However, the energies required to test quantum gravity will require energies of the order of the Planck scale of 1.22×10^{19} GeV (1 $\times 10^{19}$ is 1 followed by 19 zeroes). It might be many centuries before such an accelerator could be constructed, if ever. In the meantime, an alternative is the approach described in this book: an attempt to try to unify relativity and quantum mechanics by logical deduction from fundamental principles.

One of the great strengths of the approach of using general principles to derive theories is that there is no mention in principles of any particular structure or scale. Principles have such generality that they must apply to all physical processes in the universe, no matter if the underlying microscopic structure is strings or loops or any other arrangement. Also, as principles are completely invariant to scale, principles apply to the very small as much as the very large — they must apply to the realms of both quantum mechanics **and** relativity. For this reason, the method of building-up from principles is clearly ideally suited to the task of discovering a unification of relativity and quantum mechanics.

It must be admitted that there are pros and cons in the "building-up from principles" approach rather than the "drilling-down from structure" approach. The building-up approach means we have a solid bedrock in fundamentals, so we avoid the apparent arbitrariness of the drilling-down approach. However, it is that arbitrariness of the drilling-down approach that makes it so hard to duplicate. There are, for example, 19 numerical constants in the standard model of particle physics (known as *free parameters*), the values of which seem completely arbitrary. It is even conceivable that the universe could have been created with more or less than the three dimensions of physical space. It is hard to imagine how any approach which builds-up from obvious first principles is ever going to be able to capture that arbitrariness of structure. However, the "drilling-down" approaches seem to be having little success in this respect, either.

The question arises as to how much of the universe could have been created differently ("contingent"), and how much is a logical necessity. Our eventual goal is expressed clearly by Einstein: "What I am really interested in is whether God could have made the world in a different way; that is, whether the necessity of logical simplicity leaves any freedom at all." If a fundamental principle is true in every conceivable universe, then it would indeed possess a "logical simplicity" which would limit any freedom of design choices. By building-up from those fundamental principles we will make progress in discovering how many of the laws of Nature emerge as a result of logical necessity, and how many appear to require the assignment of arbitrary values.

Another reason to prefer theories based on principles is simply ... simplicity. At the ultimate base of Nature, we will surely find a principle which is beautiful and simple and obvious. The base of the tree would not only have to be simple, it would have to be "strong", for it would have to support the whole of the laws of Nature. The principle would have to be "strong" in the sense that it could clearly never be refuted (proved false). At the base, we would no longer expect to find a theory which could be derived from a more fundamental theory — because there could be no more fundamental theory. We would expect to find a principle, or, as John Wheeler suggested, an idea. But in order to reside at the base of the tree, it would also have to represent the end-of-the-line: a principle which was self-contained, a principle which required no further explanation, a principle which contained within itself the reason why it would be obviously true.

For our solution, we should be looking for something which is ultimately simple, and ultimately unified.

2

UNIVERSE

The universe.

The clue is in the title: "uni"-verse.

Uni-verse. Uni-fication.

The clue to unification is the universe itself.

"Uni" means "one". The universe is the one thing that exists. It is everything that exists.

In the time I have been working in physics, two themes have emerged to dominate my lines of thinking, two themes which appear to represent the underlying truth of our reality. Both of those themes appear to describe an aspect of the universe, revealing the structure of the universe to lie at the core of reality, and the properties of the universe being the key to obtaining ultimate unification.

Those two themes are both closely related to each other. The two themes provide two different ways of looking at the universe, but, together, they tell us the same thing. One theme is provided by quantum mechanics, and the other comes from relativity.

Connectedness

The first theme is "connectedness". Quantum mechanics tells us that there is no such thing as a completely isolated object: objects are connected. The impression of separateness is just an illusion.

It is possible for a particle to interact with another particle in such a way that the two particles form a single *entangled* quantum state. What this means is that the state of one particle is dependent on the state of the other particle in some way. Because of this dependency, it is a mistake to consider either particle in isolation from the other. Rather, we should combine the states and treat the result — both particles — as a single, entangled system.

For example, a light beam is composed of a stream of particles called photons. The direction of light's electric field is its direction of polarization. The polarization direction of a photon can be at any particular angle, for example vertical or horizontal. It is possible to generate a pair of entangled photons if, for example, a laser is shone at a crystal. In that case, a single photon can split to become two photons. Each photon produced in this way will always have a polarization orthogonal to the other photon. For example, if one photon has vertical polarization then the other photon must have horizontal polarization (this is due to the law of the conservation of angular momentum: angular momentum of the system before the split must equal the angular momentum of the system after the split).

So if two people each receive one of the entangled photons and each performs a measurement, they will find that the other person's photon has orthogonal polarization. This is not a big deal, you might think: there are two photons, and they have different polarizations. Whether they are separated by a great distance or not is irrelevant.

Well, in normal circumstances, you would be correct. But when we are dealing with quantum mechanics, objects can behave in quite counter-intuitive ways. As we shall see in Chapter Six, quantum mechanics tells us that before we take the polarization measurement of our photon, we have to consider the photon as having **both** polarizations, vertical **and** horizontal. Only after we measure the photon does it take a definitive value — either vertical **or** horizontal. So, if we are dealing with entangled photons, this means that the other entangled photon's polarization is only defined immediately after the measurement of its entangled partner. Bizarrely, this seems to indicate some instantaneous signalling through space, from one entangled photon to the other, saying "I've been measured — this is my value".

Einstein, in particular, was deeply unsatisfied with this result as *super-luminal* (i.e., faster-than-light) transmission of information is incompatible with the theory of special relativity. Special relativity states that the speed of light is a cosmic speed limit for transmission of information. However, it turned out that — in this case — Einstein appears to have been wrong, and the bizarre, counter-intuitive nature of quantum mechanics was correct. Einstein never accepted the implications of quantum mechanics. [\[1\]](#)

What this discussion of quantum entanglement really reveals, though, is that our human perception of objects being separated is not a match with the physical reality of the situation. Just because we can see no visual link between a pair of particles does not mean those particles are wholly separated. Indeed, quantum entanglement says

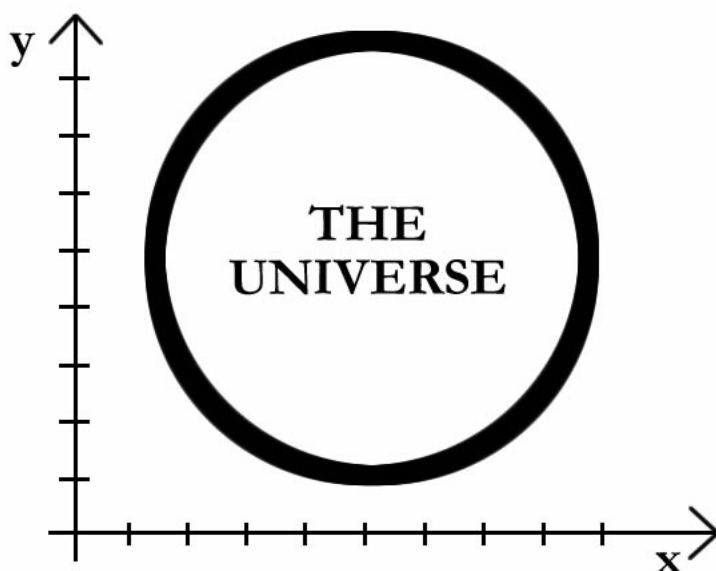

we should not consider objects as being separated at all: we should treat all objects as one object. The message from quantum mechanics is that we should treat the universe as one connected, entangled object.

The one and only

The second theme is that the universe is the only thing that exists. There is nothing apart from the universe. If the last theme — connectedness — was associated with quantum mechanics, then this theme is associated with relativity.

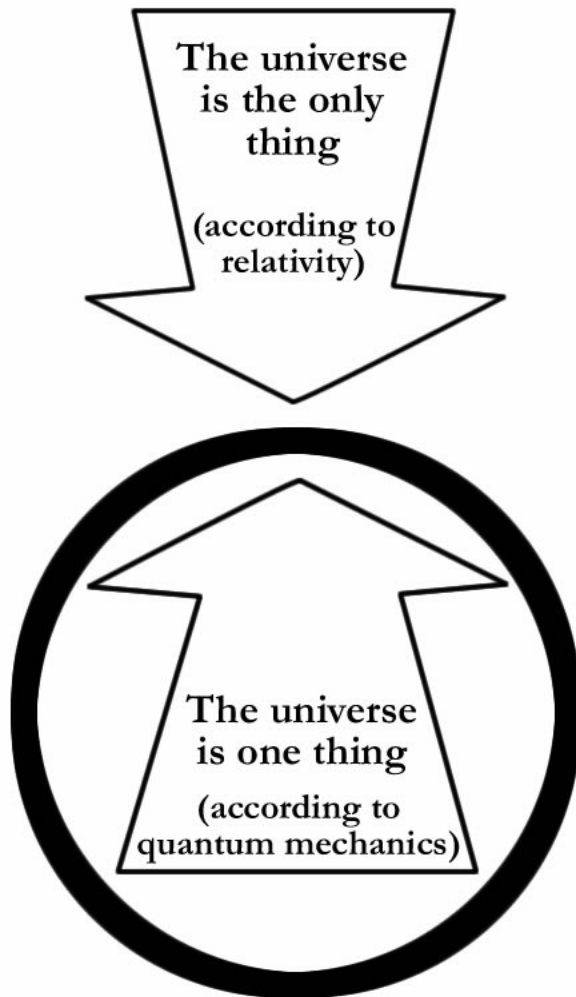

As the theory of loop quantum gravity has its basis in relativity, we might expect the loop quantum gravity team to provide us with insight into the implications of the universe being the only thing that exists — and this is what we find.

In his excellent book *Three Roads to Quantum Gravity*, Lee Smolin introduced a simple principle: **there is nothing outside the universe**. If we define the universe to be the sum total of absolutely everything that exists, then there can clearly be nothing "outside" the universe. This implies that there can be no absolute axes of space or time outside the universe.

This, in turn, means that the position of all objects in the universe can only be defined **relatively** in terms of all other objects in the universe. Because of this relative definition, we would expect to see the laws of Nature behaving in a relativistic manner. And this is, of course, what we do see in the theory of relativity. So relativity is telling us that there is nothing outside the universe: the universe is the only thing that exists.

It is as if quantum mechanics and relativity are both telling us the same thing in different ways. Quantum mechanics tells us that everything is connected as one object: the universe. And relativity tells us that the universe is the only thing that exists. Two ways of saying the same thing. It is as if quantum mechanics is on the inside of the universe, looking out, telling us the universe is connected. Whereas relativity is outside the universe, looking in, telling us the universe is the only thing that exists:

When the two great fundamental theories in physics are both telling you the same thing, albeit from different viewpoints, I think you should listen.

From these two different viewpoints of the structure of the universe, we obtain our definition of the universe:

u·ni·verse (yoo' nə-vûrs')

n.

1. The universe is one thing,
the only thing that exists.

That single definition of the universe combines part of the behaviour of both quantum mechanics and relativity. In this respect, it represents a very basic form of unification in itself.

There are two parts to this definition: "The universe is one thing" stresses the message of quantum mechanics, whereas "The only thing that exists" stresses the message of relativity. The two parts essentially mean the same thing, but together we get the first hints of possible unification to come. The theme of the universe is one of unity.

From this definition of the universe we can derive Lee Smolin's principle "There is nothing outside the universe". Obviously, if the universe is the only thing that exists, then there can be nothing outside it. For this reason, this

principle is obviously true. Moreover, this principle would have to be true in all conceivable universes — because there could be nothing outside **any** conceivable universe.

Hence we have at last found our fundamental principle, a principle which contains the reason for its obvious correctness stated **within itself**, a principle which is obviously true in all conceivable universes. So perhaps we have at last found John Wheeler's "utterly simple idea" which lies at the base of the tree. As John Wheeler said: "Oh, how beautiful. How could it have been otherwise?"

Lee Smolin referred to his principle as the "first principle of cosmology". We will see it is far, far more than that. Taking the role of our fundamental principle, we will discover that a remarkable proportion of the laws of Nature can be derived from this principle. The very fact that we can derive so many of the laws of nature by building-up from this principle will give us confidence that this is, indeed, the fundamental principle.

Absolutely no absolutes

Who, or what, is responsible for keeping the trains running on time? Fairly sensibly, you might suggest the train company is responsible, and this is surely the case. The train company has to maintain the tracks and the trains. It has to ensure the trains have enough fuel. It has to ensure the trains leave the station on time. Perhaps more fundamentally, it has to ensure the railway track extends the full distance between destinations!

But the train company is not the only entity which has responsibility for keeping the trains running on time: Nature has just as much responsibility. Nature has to ensure that its laws apply consistently to all objects. Nature has to ensure its laws do not drift over time. It is all well and good if the train company ensures its trains have enough fuel, but if Nature fails to ensure that the chemical reaction in the train engine produces enough energy, the train will not be going anywhere. Similarly, the train company can ensure its trains depart from the station at the correct time according to the station clock, but if Nature makes the clock run at a faster or slower rate then everyone will miss the train. Also, while it is essential that the train company ensures it has laid enough track to connect two destinations, if Nature allows any deviation in the length of the rails — such as a length contraction — the passengers are going to be stranded in the middle of nowhere.

Just as it is vital that Nature ensures the smooth-running of the railway, it is essential that Nature applies its laws in a consistent and unchanging manner to ensure the smooth-running of the entire universe. In this respect, Nature has a very responsible job, and it takes its responsibilities very seriously.

Now let us imagine Nature is expanding and diversifying its range of operations. It is going to use its profits from its highly-successful railway franchise and is going to move into the construction industry. Nature has bought a factory, and is going to supply a range of off-the-shelf, timber-framed "kit" houses which the customer puts together using only a screwdriver and some screws. [2]

In order to keep production costs down, the design is very simple: all the pieces of timber are one metre long. The construction of each house requires 1000 of these metre-long planks. So the job of Nature in this case, as factory boss, is to ensure that all the planks of wood produced by its factory are all precisely one metre long.

This raises some fundamental questions about the principle of measurement. For a start, it is vital to supply the *units* in which any measurement is made, e.g., metres, or kilograms. It is units which give our measurements meaning because units relate our measurements to some previously agreed-upon standard for some physical quantity.

For example, when we measure a plank of wood we are finding the relation between the wood and the marks on a measuring tape. Units provide the essential relational link between the unknown object being measured and the rest of the known world. And this will be a key theme in the later chapters of this book: giving property values to isolated objects is meaningless — property values arise through the interaction of an object with the rest of the universe. The length property of a plank of wood arises from its relationship with the measuring tape.

If we forget to give our measurements in units, or if we are not in agreement over which units we have both used to make our measurements, it is a recipe for disaster. For example, in 1999, the Mars Climate Orbiter space probe was intended to orbit Mars at a low altitude while mapping its surface. It was known that the probe could not get closer than 80 kilometres from the Martian surface or atmospheric stresses would rip it apart. However, the probe actually came within 57 kilometres of the surface and did, indeed, disintegrate. The crash investigators found that the cause of the error was due to the flight system software calculating thrust in metric units, while the ground crew were entering thruster data using imperial measures.

But probably the most notorious misuse (or absence) of units is from the 1984 rockumentary *This Is Spinal Tap*. In a famous sequence, lead guitarist Nigel Tufnel attempts to explain to a bemused reporter why his amplifier is louder than anyone else's because "Everyone else's amp only goes up to 10. This is 1 louder. This goes up to 11."

Let us return to consider the kit house company. If you remember, Nature — as company boss — has the task of producing 1,000 metre-long planks of wood. In order to do this, Nature has to measure the wood using a metre rule. Essentially, it is relating the wood to the known length of a single physical object (which, in the case of the metre, used to be the length of a platinum bar stored safely in a vault in France). This then becomes a standard of length on which everyone can agree. Everyone can relate their own measurements to this one physical standard stored in Paris.

The length of the platinum bar acts as an **absolute** standard: it has an independent existence, an independent reality. It is not dependent in any way on the people taking the measurement, or the objects being measured. It is as if the absolute standard has to exist entirely **outside** of the system which contains the object being measured, and the object performing the measurement. The platinum bar sealed in the vault in Paris is a good example of an absolute standard because it exists independently, entirely outside of the kit house factory.

Now try to imagine that the kit house factory is the entire universe, and it is completely under the control of Nature. You will be able to see why the seemingly innocuous statement "there is nothing outside the universe" has such tremendous implications. Nature can no longer access anything outside the universe — anything outside the factory. That means it can no longer access the absolute standard of the platinum bar in Paris. So the principle that "there is nothing outside the universe" reveals that all fundamental behaviour must take place in the absence of any absolute reference.

But, if you remember back to when Nature was in charge of running the railways, Nature takes its job very seriously and always does the best it can to keep the universe running smoothly. Even though Nature has lost access to its metre rule, **Nature always does the best it can with the tools available**. If Nature cannot use an absolute standard external to the universe, it can still use a standard of length which has to be defined in terms of objects **inside** the universe. This means if it wants to measure objects inside the universe, it can only make **relative** measurements, relative to other objects in the universe — the option of taking absolute measurements is not open to Nature.

What does this mean for Nature running its kit house factory? Remember, Nature has the job of producing 1,000 metre-long planks of wood, and its job has just got considerably harder because it has lost access to its metre rule. But Nature is going to do the best with the tools available: it is going to take relative measurements, relative to other objects in the "universe". To achieve this, Nature picks one plank at random and declares this to be its new standard length (perhaps humorously called the *plank length*?), and it then compares the other planks to this standard plank and proceeds to cut 999 planks to exactly the same size as this standard length. Of course, this means that the planks are no longer guaranteed to be one metre long, but at least all the planks will be the same size.

But, here is the really strange thing: even though the planks are not necessarily one metre long ... it doesn't matter! As long as all the planks are the same size, it is perfectly possible to construct the house. All the floors and walls and ceilings will fit together perfectly. The door will fit in the doorway, and the roof will fit with no problem.

Though, of course, there will be a side effect ...

Side effects

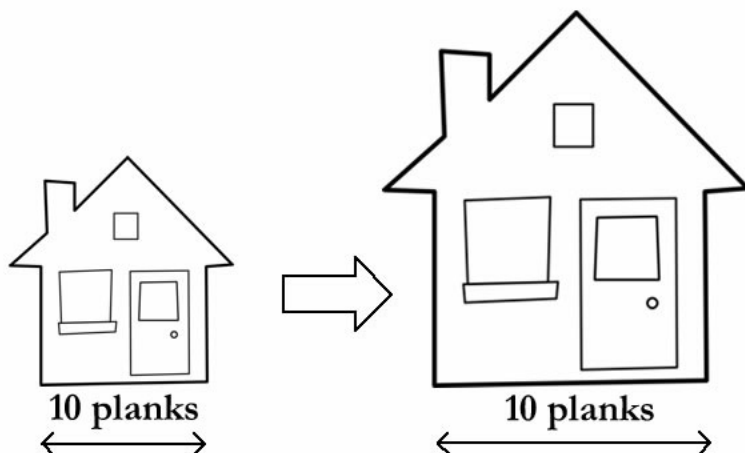

So we have just seen that Nature — even though it has been denied access to an absolute standard — has managed to produce its kit house by cutting 1,000 planks to the same standard length. This has necessarily been a relative measurement: each plank has been measured relative to another randomly-selected standard plank to ensure all 1,000 planks are the same size.

However, when the customer buys the kit, and constructs it using a screwdriver, he gets something of a shock.

While it is true that his house fits together perfectly — all the floors and walls and ceilings come together perfectly — he finds his finished house is twice the size of his neighbour's house — even though they bought the same type of kit house!

The reason for this discrepancy is fairly obvious: Nature was forced to use relative measurements — it was the only option open to Nature. While this resulted in a house which fitted together perfectly well, the size of the house could turn out to be any random size relative to other houses, depending on the random plank length which Nature picked as its standard length.

The final house is effectively selected at random from a virtually infinite range of sizes!

So being forced to use a relative system of measurement rather than having access to absolute standards is not a serious problem for the laws of Nature — systems can function perfectly well on that basis. But using a relative system of measurement can introduce unexpected, counter-intuitive behaviour which can appear weird.

So what kind of counter-intuitive behaviour do we experience in Nature due to this lack of absolutes?

In Chapter Six, which is dedicated to quantum mechanics, we will consider the counter-intuitive behaviour of quantum mechanics in detail, including the description of a famous experiment in which particles can apparently be in more than one place at once. But all the weird manifestations of quantum mechanical measurements can be described as being variations of a particular characteristic quantum behaviour: before measurement of a quantum property, we find the property appears multi-valued, and when we perform the measurement of the property we find we get a random value from a potentially infinite list of possibilities. **But this is exactly what we found with our kit house when we sold it to a customer!** When the customer has constructed his house, he finds his final house could be any size from a potentially infinite range of sizes, and the selection of the type of house he receives is random (depending on the length of the randomly-selected plank in the factory). **This has clear parallels with quantum mechanical behaviour!**

But there's more ...

Every customer, when he constructs his kit house will measure each plank of wood in his kit to be the same length. This length is therefore an invariant length for each customer. As we shall see later in this book, there is a parallel with the invariant speed of light: every observer in the universe measures the same speed of light — regardless of the motion of that observer. But, because we are forced to use a relative system of measurement, there will be a side effect in both cases. In the case of the kit house, the only way the customer will measure each plank of wood to be precisely one metre long (the standard invariant length) is if the customer's tape measure is also modified in size: the measurement units on the tape have to be modified. Similarly, each observer can only measure the same invariant speed of light if the observers' clocks are modified: **the observers' clocks must run at different rates — in fact, time itself must run at different rates for each observer!** This is Einstein's principle of special relativity. As we shall see later in the book, time itself moves at different rates for observers moving relative to each other.

So we have found a simple potential link between quantum mechanical behaviour, and the behaviour due to relativity. It is this link which will be explored in this book.

The reason why this relative behaviour appears weird to us is because we generally only deal with absolute measurements in our daily lives. When we go to buy clothes, we already know our own measurements according to a system of absolute units, and we know the clothes in the shop will also conform to that absolute system of units.

Hence, it is quite easy to find clothes which fit. This is only possible because the shop, the customers, and the clothes could be considered as forming a *closed system*, and the absolute standard measure (that metre of platinum in Paris) resides outside of that closed system.

At human scales, we have access to absolute measurements. We can access measuring tapes which provide us with absolute measurements of length, and speedometers which provide us with absolute measurements of speed. However, when we get to the extremes, when we get down to the most fundamental levels, Nature is pushed to the limit and all of the absolutes get progressively stripped away. That is when we start to see the inevitable side effects which are caused by the switch to relative measures.

Parallel universes

If we return to consider our principle that there is "nothing outside the universe", the question might be arising in the minds of some readers: "What about parallel universes? Surely, if such a thing existed, it would be outside our universe? In which case our presumed principle — that there is nothing outside the universe — would be wrong." This requires investigation.

Parallel universes are very much flavour-of-the-month in physics at the moment. The concept appears to offer an easy solution to some of the greatest current challenges in physics. It could be argued that this is not necessarily a good thing, and I would tend to agree.

At the current moment in time, fundamental physics has found itself in something of an impasse. Progress is slow, and there are several deep and troubling mysteries — with no obvious solution — on the horizon. These questions include the unknown composition of dark energy which is apparently responsible for the observed acceleration of the expansion of the universe. Another mystery concerns the apparent fine-tuning of some of the fundamental constants. It has recently been realised that if some of the fundamental physical constants of the universe were only slightly different then the existence of life in such a universe would have been impossible. The most notable example of this is the apparent fine-tuning of the *cosmological constant* which governs the expansion of the universe. It appears the cosmological constant has a tiny value, but is not zero. If the constant was much larger, the additional acceleration of the universe would have prevented stars and galaxies from forming. And if the value was much smaller, the universe would have collapsed back in on itself before life could have developed.

The principle of parallel universes offers a simple way out of this conundrum: just postulate the existence of a range of different universes, and a random mechanism by which the fundamental constants vary from universe-to-universe. Then it is possible to present a simple explanation as to why the constants are set to such fortuitous values in our universe: there is nothing special about our universe, we just happen to reside in a random universe in which the constants are set correctly.

However, the weakness of this so-called *anthropic reasoning* is that it can be used to predict anything, and a theory which predicts anything predicts nothing. It seems as though we are giving up finding a theory which unambiguously predicts the nature of the universe. As Brian Greene says in his book *The Elegant Universe*, this method has the capacity "to lessen our insistence on explaining why our universe appears as it does."

I am definitely not a fan of parallel universes, but we must consider the potential implications of them representing something "outside the universe". To answer this question, we will refer to a comprehensive review of parallel universes conducted by Max Tegmark. [\[3\]](#)

Theoretical parallel universes actually come in a variety of different flavours. The first type of parallel universe considered by Max Tegmark arises from the theory that space is infinite (this is by no means certain — space might be *closed* in which case it has a finite volume instead of being infinite). The theory states that if space truly is infinite, and uniformly filled with matter, then somewhere out there in the dark depths of space there is going to exist every possible structure. Hence, somewhere far, far away, beyond the limits of our visible universe, there exists a pink hippopotamus playing the trombone to Marilyn Monroe. It sounds like a joke, but this is actually a prediction of the theory. As Max Tegmark says: "Even the most unlikely events must take place somewhere."

As you can see, this theory makes some rather bold assumptions about the rather dubious physical quantity of "infinity". But, more importantly for this discussion, does this represent a separate "parallel universe" in any sense? This type of parallel universe is identified purely on the basis of its distance from our visible horizon. Basically, it is a long, long way away — that is the only distinguishing feature of this region of space. But Antarctica is a fairly long way away as well. Does this mean Antarctica is in a parallel universe? If not, then where do we draw the line? How far away has the region of space got to be before it is denoted as being a parallel universe?

Surely, this type of "parallel universe" has as much claim to being a parallel universe as Antarctica does: in other words, none whatsoever. A distant region of space is still part of our universe.

The next type of parallel universe we will consider is perhaps more in tune with the general conception of what a parallel universe should resemble — mainly through their rather clichéd use in popular science fiction. This concept of a parallel universe is of a completely separate realm of existence, distinguished by having its own completely distinct spacetime structure to that of our universe. This is the type of parallel universe much beloved of many a Star Trek episode, for example, the episode in which a transporter mishap swaps Captain Kirk and his companions for their evil counterparts from a parallel universe — the episode entitled *Mirror, Mirror* (I'm giving my age away, here).

Such a universe could theoretically exist on the other side of a black hole, the black hole providing a *wormhole* to another universe. Another possible source of this type of separate realm of existence is provided by the *Many Worlds* interpretation of quantum mechanics (which we will consider in detail in Chapter Six).

But, a universe which exists as a separate realm of existence, which can have no effect on the objects in our universe, and which itself can never be observed, surely does not exist — by definition. As Paul Davies says in his book *The Mind of God*: "There is something philosophically unsatisfactory about all those universes that go unobserved. To paraphrase Penrose, what does it mean to say that something exists that can never in principle be observed?"

However, to be honest, these distinctions are all irrelevant for our current discussion in this book. This is because we are completely at liberty to define the term "universe" as we wish, and we are choosing to define the term in the loosest possible manner as "the sum total of absolutely everything that exists". So if we decide that parallel universes exist — even though we can never observe or interact with them — then they are, by definition, part of the "universe".

The universe is defined as everything that exists. Whether or not this means the universe is composed of a subset of so-called "parallel universes" is irrelevant.

The universe is everything that exists. Therefore, there is nothing outside the universe. [\[4\]](#)

Hypotheses about the nature of reality which invoke parallel universes are very popular at the moment. These hypotheses certainly seem to infest popular science books. However, I would consider such hypotheses — which can, by definition, never be falsified — to be borderline unscientific. Not only that, but I would consider these hypotheses to be positively dangerous for science, for two reasons.

Firstly, as Brian Greene explained, invoking parallel universes makes the job of physics too easy. Instead of seeking theories which explain how the universe works, theories which make testable predictions, we end up with hypotheses which explain nothing. Absolutely anything can be explained by invoking anthropic reasoning: just say the laws of physics are different in each parallel universe, and we just happen to inhabit a universe in which the laws are set to those which we observe.

But, secondly, I feel parallel universe theories are dangerous because they are a distraction, a diversion, from focussing all our attention on the one universe we inhabit. The premise of this book is that there is one universe, and

that is all there is. The universe is a strange, beautiful, and surprising construct, and all the solutions we seek are contained within this universe — if we just direct our gaze at it instead of being distracted by fanciful hypotheses.

3

SPACE IS NOT A BOX

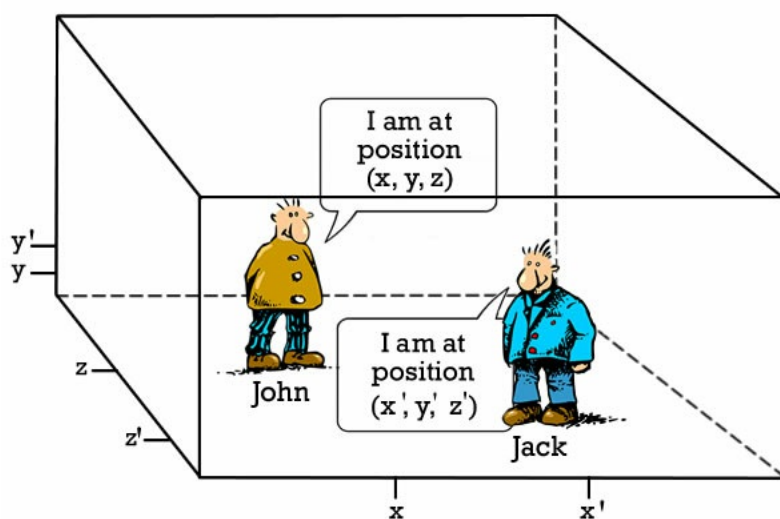

The discussion so far has focussed on the lack of absolutes in the universe. So now let us examine the implications of this lack of absolutes in space and time. This chapter is devoted to considering the implications of the lack of absolutes in space. The following two chapters will be devoted to considering its effect on our concept of time.

Let us start our analysis of how our everyday concept of space must be altered.

As soon as we ask about the nature of space we very quickly find it to be something about which we all have an intuitive notion, but which is very hard to define. And, unfortunately, space is one of those concepts about which human beings have very strongly-held preconceptions which are very hard to shake. Space is a concept with which we are all intimately acquainted, which we have known from birth. We all deal with space as we appear to move around "in" it all day long. Most people like space. They pay lots of money to get more of it, be it a bigger apartment or a bigger garden.

In this respect, space feels like a "real thing" — it costs money to buy. This is the picture we have of space. We know how it works, and we resent being told by logic or experiment that our personal, deeply-held concepts are wrong. This is a particular problem for space as it does, indeed, appear that our preconceived notions are very far from an accurate model of the reality. It turns out that space is not a "real thing" after all, so if you have spent a lot of money buying some recently, then maybe you should take it back to the shop!

Isaac Newton believed in the concept of absolute space, which meant it was possible to define the position of each point in three-dimensional space. Even if all the matter in the entire physical universe was removed, Newton believed absolute space would still exist as an entity in its own right — as if space was a three-dimensional box, and the physical universe was positioned at some point in the box. The position of any object could then be absolutely defined by some sort of measurement scales along the sides of the box:

This absolute view of space is perhaps the most intuitive picture of space. It feels very natural for us to imagine space in this way, and there was perhaps an evolutionary advantage in developing spatial awareness which modelled space along these lines.

So now, consider a little story. Recently, I decided I needed more room in my apartment, so this morning I made a start putting all my old books and CDs into storage. I bought four large transparent boxes, and I put most of my books into those boxes and slid them under my bed. It's a good solution — boxes are really good for storage. We have all lived our lives knowing that we can always put things into boxes for storage.

Now let us imagine Nature has seen us putting things into boxes and so Nature decides it wants to put things into boxes as well. Specifically, Nature decides it wants to put the universe into a box. But how can Nature find a box into which it can put the universe? The universe — by definition — is everything that exists. Therefore, all boxes must be **inside** the universe; there can be no boxes outside the universe. So Nature is stuck. Nature cannot find a box into which it can put the universe into storage. There are no boxes outside the universe. Nature will just have to move to a bigger apartment.

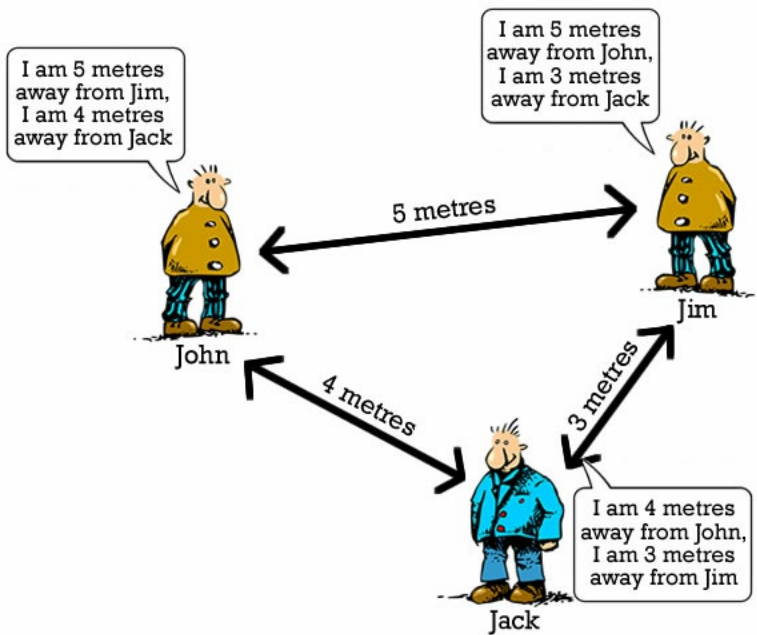

As we have just described, Newton believed absolute space would exist as a box in its own right, even if all the matter in the universe was removed. However, if there is nothing outside the universe then how can there possibly be a box external to the universe? There can surely be no system of coordinate axes outside the universe we can use to determine the absolute position of an object.

With this in mind, we find Newton had a competitor with different ideas, the great German mathematician and philosopher Gottfried Leibniz. The story of the competitiveness between Leibniz and Newton is fascinating. It certainly was not a friendly rivalry, with Newton giving an impression of being rather ego-centric. It is believed Leibniz discovered mathematical calculus a few years before Newton, though Newton disputed this, and much of Europe found it hard to believe that Leibniz could have discovered calculus independently of Newton. By the time of his death, Leibniz's reputation was in decline (Newton played a rather dubious role in this decline). However, Leibniz's reputation has been recently restored, and he is perhaps now held in higher esteem than was ever the case when he was alive.

Leibniz rejected Newton's idea of absolute space. Leibniz believed that space was defined only on a relative basis, with the position of objects being defined in terms of the position of other objects, not defined via some absolute coordinate system. If we state the distance between objects, then we define a geometry. We then get an impression of space emerging from those relationships, without space existing as an independent entity in its own right. If we removed the objects and their relationships, then space would not exist on its own. Due to this elimination of space as an entity in its own right, philosophers call this theory *eliminative relationalism*.

Leibniz had a famous debate via a series of letters to Samuel Clarke, an English supporter of Isaac Newton, between 1715 and 1716. Leibniz asked Clarke the hypothetical question: if the whole universe was moved ten feet to the left, how would we ever know? According to Newton, the two scenarios were distinctly different (positioned differently in absolute space), but for Leibniz, all the spatial relationships were maintained so the two situations were equivalent. Clarke found it hard to argue his position against Leibniz. Leibniz's argument for relative space was compelling.

The following diagram shows Leibniz's model of relative space — with space emerging as a result of the relationships between the men. Contrast it with the diagram of absolute space ("two men in a box") earlier in this chapter. Instead of each man having to store an (x, y, z) position property as was the case in absolute space, each man now has to store the distance between himself and each of his fellow men. This representation still maintains all of the information which was present in the absolute space example:

Do not be fooled by the diagram above of the three men in relative space appearing to be separated by some form of "distance" in "space" — this is just a weakness in the way the diagram is drawn. The men are not "in" space (as was the case in the earlier diagram showing them in absolute space). The arrows merely show the relationships between the men — they should not be considered as physical arrows with an extent in space. Remember, space does not exist as an entity in its own right: if all the matter in the universe was removed, there would be nothing left — no "space" left with an independent existence of its own. As Einstein said: "Spacetime is not necessarily something to which one can ascribe a separate existence, independently of the actual objects of physical reality. Physical objects are not *in space*, but these objects are spatially extended. In this way, the concept *empty space* loses its meaning." [5]

If there is nothing outside the universe — and, logically, there cannot be — then absolute space is clearly refuted: Leibniz was surely correct. We do, indeed, live in Leibniz's relative space, not Newton's absolute space. However, towards the end of the chapter we will see how Newton proposed a powerful counter-argument to Leibniz which led to Newton's idea dominating for two centuries.

Symmetry

We are probably all well-acquainted with the concept of symmetry, but perhaps have not given much thought to the question of why something is considered symmetrical. We are probably most familiar with geometrical symmetry, such as a snowflake:

If you were to rotate a snowflake by 60° then it would appear unchanged. This is because the snowflake is said to possess *rotational symmetry*. Similarly, if you were to view the snowflake in a mirror, it would look unchanged (*mirror symmetry*). So this gives us a better idea of how to define symmetry: if something remains unchanged after a transformation, it is said to possess symmetry.

Any type of transformation could reveal symmetries, not just rotations and mirrorings. For example, we might consider the transformation of *spatial translation*, in other words, simply moving an object to a different location. If an object is defined relative to an absolute axis incorporating a scale, then it is not possible to translate an object without changing the physical situation. This is how Newton's absolute space would function. Considering the following diagram (showing absolute space), if we were to move the ball from position 5 to position 7, then the physical situation would have altered from "the ball is at absolute position 5" to "the ball is at absolute position 7":

However, if the object is not defined relative to an absolute axis with a scale, then the object can be translated at will, and the physical situation will not be altered:

This is how relative space behaves.

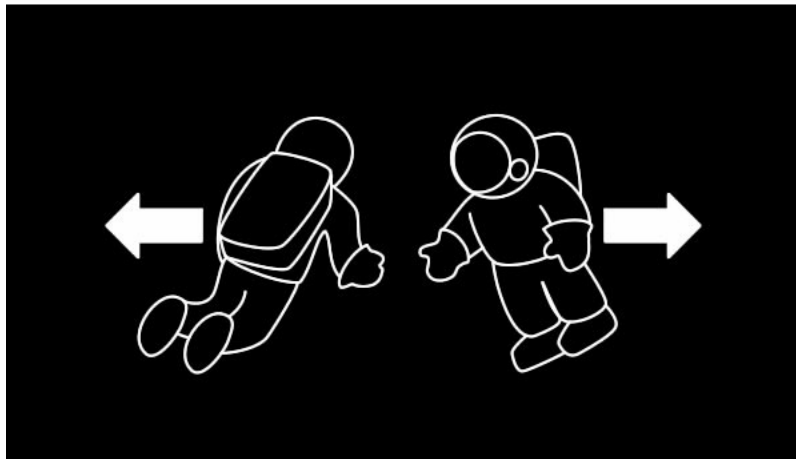

So, the nature of relative space ensures that all objects possess spatial translation symmetry. Fairly obviously, if you were to perform an experiment, and then perform the same experiment a second time but this time with the apparatus moved six foot to the left, you would get the same result. The experiment would be unchanged after the transformation of spatial translation. In fact, everything in the universe has spatial translation invariance. This is due to the lack of any absolute scale "outside the universe" to differentiate any particular position from any other

position.

So perhaps we could propose a deeper explanation for symmetry in physics: **symmetry reflects Nature's fundamental inability to distinguish between one physical situation and another**. If Nature is unable to distinguish between two situations, then we can transform one physical arrangement into another without altering the situation. This represents a symmetry.

As has been said earlier in this book, Nature always does the best it can with the tools available to it. However, Nature is limited by the lack of absolute scales available to it, which is why we see so many symmetries in the physical world. The concept of symmetry is extremely important in physics, and it will be a recurring theme throughout this book. Just remember that whenever you hear symmetry mentioned it is a result of Nature's inability to distinguish between physical situations.

Now let us consider another implication of symmetry on the laws of Nature. Imagine you are an astronaut, floating in the darkness of space. You are so far away from any planets or stars that all you can see is darkness. You feel completely stationary. Suddenly, on your right-hand side, you see a fellow astronaut floating towards you at a constant velocity. Your friend passes by you quite closely, before vanishing to your left-hand side into the darkness of space.

This story can be described from the point of view of the other astronaut, who will describe exactly the same experience as you — a symmetrical experience. The other astronaut felt completely stationary in space, he saw you appearing on his right-hand side floating by at a constant velocity, and it was you who drifted off into the darkness of space. So, the question arises: who was stationary and who was moving? Which of the two astronauts has the greater claim to be stationary?

In the hypothetical situation of absolute space, Nature could endow every particle with an (x, y, z) position property (just as it endows every particle with a momentum property, for example). Nature could then easily determine which astronaut was stationary and which was moving. Nature could tell that the stationary astronaut's position was unchanged, whereas the moving astronaut's position would be altered. As we discussed in the last chapter, though, Nature can only do the best it can with the tools available to it. Without access to absolutes of space, there is no way for Nature to distinguish if one astronaut is in uniform motion or if one is stationary. Hence, by definition, they are fundamentally in the same state of motion.

And if Nature cannot tell the two situations apart — uniform motion and stationary — then you will naturally feel the same experience in both situations. If you were sitting in an enclosed room in an office block, you would consider yourself to be stationary, but if you were sitting in an enclosed room in an ocean liner moving smoothly on a calm sea you might also consider yourself to be stationary — you would certainly feel as if you were stationary. [6]

This inability of Nature to distinguish types of motion forms the basis of Galileo's unification of "uniform motion" and "being stationary" known as *Galilean invariance*.

So here we have an example of a unification — the very first historical example of a unification — which is caused by Nature being unable to access absolute values. As discussed in the previous chapter, it is the belief of this book that the most pressing question in current physics — the unification of relativity and quantum mechanics — can also be achieved by realising that the two phenomena are both caused by Nature being unable to access

absolutes. There might be a wonderful symmetry here, if the general principle behind Galileo's first unification provides the solution for a modern unification.

The gravitational field

But how is this relative space defined? What determines the structure of space? What controls the motion of objects? This is achieved by an entity which permeates the universe: the *gravitational field*.

So what, exactly, is a field?

If we have an electric charge, either negative or positive, and we move it through a region of space, we will find it either attracts or repels any other electric charges around it, even without directly touching them. It appears the first charge can directly move a second charge, even if there is nothing in-between the charges, and the two charges are separated by a distance. It appears as if the first charge has an "invisible hand" some distance away from it which could instantaneously move the second charge. This is called *action-at-a-distance*.

A similar situation applies to the force of gravity. Newton realised that the force which pulled an apple from the tree was the same force which held the Earth in orbit around the Sun. Newton explained this force of gravity in terms of action-at-a-distance, as though the Sun extended a giant hand to hold the Earth in its orbit. But how can something move something else across the vacuum of empty space without touching it, or apparently directly influencing it in any way? Newton was certainly not happy with his own conclusion, as he revealed in a letter in 1692: "That gravity should be innate, inherent and essential to matter, so that one body may act upon another at a distance thro' a vacuum, without the mediation of anything else, by and through which their action and force may be conveyed from one to another, is to me so great an absurdity, that I believe no man who has in philosophical matters a competent faculty of thinking, can ever fall into it. Gravity must be caused by an agent acting constantly according to certain laws; but whether this agent be material or immaterial, I have left to the consideration of my readers."

Indeed, Newton's instincts were correct: action-at-a-distance does not appear to be an accurate picture of reality. Considering our electric charges again, we find any movement of the first charge is not instantly reflected by movement of the second charge (instantaneous communication being forbidden by special relativity). Instead, the influence of the first charge spreads out through space in all directions at the speed of light, taking time before it reaches the second charge. So, instead of action-at-a-distance, the accurate physical picture is of the first charge being the source of a *field* which extends out into space. The field is a continuous structure, which is defined at every point in space. When the first charge moves, it causes a disturbance in the electric field, and this spreads out through the field — as if you had dropped a rock into the sea, and the waves spread out over the water. Only when the disturbance reaches the other particles do they move accordingly (repelled or attracted).

In the case of the electric field described here, when we move a charged particle it creates a changing electric field. In turn, that changing electric field generates a magnetic field. That magnetic field generates an electric field, and so on in an oscillatory fashion. The resultant self-sustaining wave is an *electromagnetic wave*, and can carry energy across empty space. Visible light is a form of an electromagnetic wave, so we can certainly see types of fields: fields have a reality, they are not invisible figments of our imagination.

So a field is a structure which spreads through space, and when we put a particle in it, the particle feels a force. Hence, we could view gravity as a field — the gravitational field — which extends throughout all space and exerts a force on all particles. According to Newton's action-at-a-distance model, if the Sun disappeared then the Earth would instantaneously fly off into deep space, no longer held in place by the Sun's invisible hand. However, Einstein realised that such instantaneous action-at-a-distance was incompatible with special relativity which prohibited faster-than-light transfer of information. Instead, Einstein revealed that gravity should be explained in terms of a gravitational field, and the motion of the Earth around the Sun can be explained by the nature of the field in the immediate vicinity of the Earth. If the Sun disappeared, the Earth would continue to orbit the Sun's position for seven minutes, until the bad news reached the Earth via the gravitational field.

Einstein's insight occurred when he realised that an observer in a closed box undergoing constant acceleration would not be able to distinguish the force he was feeling from the force of gravity. Conversely, an observer falling freely in a closed box would experience no force of gravity. If a force can disappear purely because the point of view of the observer changes, then this means the force does not exist: it is dependent on the observer, it has no objective reality (i.e., not all observers experience it as real). It is not a real force. Therefore, Einstein realised gravity was just a fictitious force.

Not all forces are fictitious, and disappear with a change in the observer's perspective. As a comparison with the electromagnetic force, if an observer in a closed box has a particle with a positive electric charge, we could repel that positive particle using a positively-charged particle outside the box. However, we could then move the

observer's box away in the direction of the repulsion to make it appear as though no force was being applied. In this way, it would appear we could make the observer think that no electromagnetic force was being applied to his particle. So, does that mean the electromagnetic force is a fictitious force like gravity? No, because if the observer had a negatively charged particle as well as a positive charge, he would find the negative charge attracted to the external positive charge with increased force. So it is not possible to make the electromagnetic force disappear merely by moving the observer: the electromagnetic force is a real force, not a fictitious force like gravity. We can only deduce this about gravity because gravity has the same attractive force on all objects — unlike the electromagnetic force.

So if gravity is a fictitious force, what is the cause of the force we all feel due to gravity? To answer this, consider an object moving freely in space, without undergoing any acceleration. Such an object would tend to continue in a straight line in space (called a *geodesic*) and would not experience any force due to gravity. Only if a wall, or any solid object, was placed in its way to restrict its movement would the object feel the force we recognise as gravity. The observer would feel the solid object pushing back against him, restricting his progress. This is just how we feel when we are standing on the surface of the Earth. Our natural motion should be towards the centre of the Earth, but the planet's surface restricts our motion. The resultant force we feel, making us tired when we stand up on the surface, is interpreted as the force of gravity.

What determines the nature of the force which we interpret as gravity? Clearly, it is anything which modifies our straight line through space — anything which modifies the geometry of space. In other words, gravity is the curvature of space. As we continue in what feels to us like a straight line in space, if space is curved then our motion will be deflected. It is this deflection of motion which is interpreted as gravitational pull.

What could curve space? Well, we know that objects appear to be attracted to large masses, such as planets, by the force of gravity. This means that large masses must curve space around them so that an object, while proceeding in a straight line in curved space, is deflected toward the mass. A two-dimensional demonstration of the principle behind the curving of three-dimensional space involves placing a heavy ball in the middle of a rubber sheet. The weight of the ball deforms the sheet downwards. The heavy ball is supposed to represent a large mass, for example, the Sun. If we roll another smaller ball around the sheet, it will roll in circles around the indentation. If we consider the smaller ball to represent the Earth, we can see that its resultant motion effectively orbits the Sun.

After observing these orbits, you might come to the same conclusion as Newton that there is an attractive force between the objects, holding the Earth in an orbit. Whereas, all that is happening is the Earth is following a straight line in curved space.

The principle that the force of gravity is actually the curvature of space — with the curvature being caused by the presence of mass — forms the basis of Einstein's theory of general relativity.

Newton's bucket

Let's return to our discussion of absolute space earlier in this chapter. If you remember, Leibniz did not believe in the existence of absolute space. According to Leibniz, the positions of objects were only defined in relation to other objects. By extending this reasoning, we can see that — according to Leibniz — it should be possible to treat any object as stationary, with the rest of the universe moving around it.

However, Newton posed a counter-argument to Leibniz which effectively killed-off Leibniz's idea of relative space for two centuries. Newton's thought experiment is now known as *Newton's bucket*. Newton noted that the

surface of water spinning in a bucket would become concave, with the edges of the water rising up the sides of the bucket. Newton asked the question: relative to **what** is the water spinning? You might suggest the water is spinning relative to the environment and the objects surrounding the water, but if you consider the bucket (which is the water's most immediate environment) you will see that the water is spinning at exactly the same speed as the bucket. So the water is not moving at all relative to its immediate environment.

According to Leibniz, objects are only defined relative to other objects, and so it was just as valid to suggest the water was stationary and it was the rest of the world was spinning. This meant that Leibniz's argument could not explain the change in the shape of the surface of the water. If the water was stationary, why was its surface being deformed? Newton argued that if the water was not spinning relative to its immediate environment then it had to be spinning relative to absolute space, and its movement relative to absolute space was what was causing the deformation of the water surface. Leibniz was forced to admit defeat. Is our proposed concept of relative space in trouble?

However, in the mid-1800s, the Austrian physicist Ernst Mach presented an alternative to Newton's absolute space. Maybe the disturbance of the water in the bucket was not due to it spinning relative to absolute space, maybe it was because it was spinning relative to the rest of the world around it. Even though the water was not moving relative to the bucket, it was spinning relative to the ground, and the trees, and the sky. Wasn't this enough to determine that the water was spinning? Does Nature really need absolute space to tell it that the water is spinning when it has all these other clues?

In his book *The Fabric of the Cosmos*, Brian Greene presents a discussion of Mach's principle. Imagine you are an astronaut spinning in empty space, many millions of miles away from the nearest stars or planets. Clearly you would feel like you were spinning because of the acceleration you would feel. Your arms would splay outwards, and your tummy might feel funny. Newton would say you experience the spinning feeling because you are spinning relative to absolute space. Mach disagreed with Newton's notion of absolute space, and sided with Leibniz's concept of relative space. In that case, Mach argued, the only reason you feel you are spinning is because you can clearly see distant stars and planets around you, and so you are clearly spinning relative to the rest of the universe. According to Mach, the rest of the universe forms a reference by which Nature decides whether or not you are spinning. The motion could be determined relative to all the other masses in the universe — no absolute space was necessary.

The reciprocal nature of gravity

Einstein took Mach's idea and modified it by introducing the concept of the gravitational field. We might think of the gravitational field as being generated by all the masses in the universe. The field spreads throughout the length and breadth of the universe, and the astronaut knows he is spinning because he is accelerating relative to the gravitational field.

Even though Einstein's concept of a gravitational field superseded Mach's idea, this basic principle of Mach still holds true: in relative space, there is simply no alternative to defining position in terms of the other masses in the universe. So this principle inevitably applies to the gravitational field. Being unable to access any absolutes outside the universe, Nature is forced to make the gravitational field an entirely relational structure, i.e., not being defined in terms of the coordinates of absolute space **outside** the universe, but having to be defined in terms of the structures which exist **within** the universe. In other words, the gravitational field has to be defined in terms of the distribution of matter inside the universe — Nature has no option. This dependency explains why, when matter moves in the universe, the gravitational field is inevitably re-shaped.

Although this is a speculative theory, we should not be surprised to find that this inevitable dependency of the shape of the gravitational field on matter can result in a deformation of the gravitational field. In other words, we find mass curving space. The only alternative would be a gravitational field which was flat in all circumstances. However, such a structure would effectively perform a function identical to Newton's absolute space — and we have already refuted the notion of absolute space.

In his book *Time Reborn*, Lee Smolin described Einstein's justification for replacing Newton's theory of gravity by Einstein's theory of general relativity: "Einstein's point was that Newton's absolute space tells bodies how to move, but nothing is reciprocated; the bodies in the universe do not influence absolute space. Absolute space just is. In Einstein's theory of general relativity, the relationship between matter and geometry is reciprocal: Geometry tells matter how to move and, in turn, matter influences the curvature of spacetime."

Smolin is actually paraphrasing a famous quote by the great physicist John Wheeler: "Matter tells space how to curve, and space tells matter how to move."

Essentially, the necessity for relative space means space loses its regular rigid box-like structure, and instead

becomes a curved and distorted structure: space is not a box.

So once again we appear to have a side effect caused by Nature being fundamentally unable to access absolutes. Nature does the best it can with the tools it has available, and, for the most part, we do not notice any problems — space appears flat to us. Light appears to travel in straight lines. We only notice the side effects caused by the lack of absolutes when Nature is pushed to extremes, in this case, in the presence of extreme masses. The inevitable side effect in this case is a curving of space around those large masses. For example, if we look closely we will find that the direction of light is bent slightly as it travels round stars due to the curvature of space. We interpret this curvature of space — which appears to attract objects to large masses — as the force of gravity. Hence, gravity itself is shown to be a side effect of the lack of absolutes in the universe.

4

TIME IS NOT A CLOCK

Let us go back to 1905. We find a young Albert Einstein working as an assistant examiner in Bern patent office. Einstein had suffered recent disappointment. He had just finished a four year mathematics and teaching programme at the Zurich Polytechnic, but had failed to obtain an academic position. However, Einstein was not disheartened, and continued his personal research, despite the setbacks. His time at the patent office is often pictured as a dreary waste of time for the greatest mind in modern science, though it is more likely his job provided him with the financial support and freedom to pursue his own agenda which he likely would not have enjoyed in university. Einstein's friend, Abraham Pais, described Einstein's time at the patent office as "the closest he would ever come to paradise on earth".

Einstein spent his spare time trying to solve the most pressing physics problems of the day. In particular, he tried to solve a conundrum which had been troubling him from childhood: what would you see if you moved fast enough to catch up with a ray of light?

The Scottish physicist James Clerk Maxwell had just shown that light should be considered as being a type of electromagnetic wave. This posed a dilemma for physics. All types of known waves took the form of a disturbance in some type of underlying medium. For example, waves on the sea are a form of disturbance on water, while sound waves are a form of disturbance in air. But what medium carried light? Light was a disturbance of which medium? Physicists at the time called the proposed medium the *ether*. It was proposed that light took the form of a travelling wave of disturbance through the ether.

What form would this ether take? Sound waves require air, and there is obviously no air in space, but light can reach us from the distant stars. So the ether had to be a mysterious, invisible background substance which pervades the entire universe.

But Einstein was unhappy with the proposed ether idea. Galilean invariance stated that the laws of motion were the same in any uniformly moving environment — you could not conduct an experiment to determine if you were moving or not. However, if we introduce the idea of the ether it would be possible to perform an experiment to measure the speed of light and hence determine if you were stationary or moving: only if you were stationary with respect to the ether would you get the correct measure of the speed of light. So in many ways, the ether played the role of Newton's absolute space — a form of absolute coordinate system which spread throughout space. But we have already refuted the notion of absolute space.

It did not seem right to Einstein that the laws of motion were the same in any uniformly-moving environment, but the laws of electromagnetism should be different (different observers obtaining different values for the velocity of light). Furthermore, in another blow to the ether idea, Albert Michelson and Edward Morley performed a famous experiment in 1887 which failed to detect any trace of the ether.

In a brilliant flash of inspiration, Einstein decided that the only way out of this dilemma was to reject the notion of the ether and extend the principle of Galilean invariance to the whole of physics. He proposed his principle of relativity: all the laws of the physics (not just motion) are the same in all uniformly moving environments. It might seem quite an innocuous principle, but it had tremendous implications. That simple principle formed the basis of the theory of special relativity, and from that point on, our concept of space and time would be forever altered.

Once again, we find we can derive this result from our fundamental principle. Considering our discussion of the two floating astronauts in the previous chapter, we saw that Nature could not distinguish which astronaut was stationary and which was moving. This is due to Nature being unable to access any absolute reference scale "outside the universe" (remember: there is nothing outside the universe). No astronaut can claim to be preferred. The experience of both astronauts is identical. We saw that this principle is called Galilean invariance. It is due to this inability of Nature to access **any** absolute reference axes outside the universe which means that Galilean invariance must be extended to **all** of physics. This leads to the principle of relativity: all the laws of physics are the same for all observers, no astronaut can claim to be preferred, the experience of both astronauts is identical. Crucially, this means that both astronauts must measure the same value for the speed of light.

We shall now consider the implications of this invariance in the measured speed of light for all observers.

What time is now?

We are going to reveal the implications of Einstein's great insight by performing one of his famous thought experiments. Let us imagine we are riding on a train, and we have the latest technological marvel on our table: a light clock (there is no such thing in reality — it is purely a construct of our imagination). A light clock consists of two mirrors, and a pulse of light bounces backwards and forwards between the two mirrors at regular intervals. So this is what the light clock would look like if you were on the train:

It is, in principle, easy to use the light clock to measure time as we know the distance between the two mirrors and we know the speed of light. What is more, the light clock is wonderfully accurate as we know the speed of light is a constant.

However, we now ask the question, what would the light clock look like to someone standing on the platform at a station as the train passes by? As the train is moving, anyone standing on the platform would see the pulse of light having to travel further between each pulse as the pulse now has to travel diagonally. So, for an observer standing on the platform, this is what the light clock would look like at three separate moments:

So, for each "tick" of the light clock, it appears to the observer on the platform that the pulse of light has to travel a greater distance than is the case for the passenger on the train. But the principle of relativity tells us that the speed of light is measured to be the same speed in every uniformly moving environment. That would appear to indicate that the observer standing on the platform would see a longer time interval between ticks than the passenger on the train would see. In other words, the observer on the platform sees the clock on the train running slow.

As bizarre as it might seem, this is precisely what happens. But it is vital to stress at this point that this result has nothing to do with light or light clocks in particular. What applies to the light clock applies to any clock, or indeed any physical process. It is not only the light clock which runs slow, but — according to the observer on the platform — it is time itself which runs slow on the train!

This phenomenon of the slowing-down of time for observers in relative motion is called *time dilation*.

However, the principle of time dilation is often badly expressed as "moving clocks run slow". Such a statement is relativistically flawed, and only adds to confusion. Who is to say which clock is stationary, and which is moving? Remember, there is no such thing as absolute space, no fixed coordinate axes to determine which clock is stationary. It is true that an observer will see the clock of another observer — who is in relative motion — running slow. But exactly the same applies from the point of view of the other observer. Observer 1 will see the clock of observer 2 running slow, and, because of the symmetry of the situation, observer 2 will see the clock of observer 1 running slow as well.

"How can this be?", you might ask. "How can both observers see the clock of the other observer running slow?" Without going into too much detail, the answer is that we have to bring the clocks together for direct comparison. If both observers decelerate to a stop in the same way, and then come together again (in a symmetrical manner), then when both clocks are stationary in the same reference frame and are compared, they will both say the same time.

So, instead of summarizing time dilation as "moving clocks run slow", be careful to say "a clock which is moving relative to an observer will run slow relative to the observer's clock."

This is no mere theorizing. In 1971, Joseph Hafele and Richard Keating flew four highly-accurate caesium-beam atomic clocks twice around the world on a jet liner, first eastward, then westward. When they got back to base, they compared the time on the clock with the time on a clock which had remained at base. They found the clock which went around the world had run very slightly slower: just a few hundred billionths of a second less elapsed time, but this was perfectly in accordance with Einstein's theory.

The rate at which time passes appears to vary depending on the motion of the environment. It would appear that each observer, moving through the universe, has his own personal clock which tells his own personal time. How can this be?

Time is not a clock

Isaac Newton believed in the concept of absolute time, along very much the same lines as absolute space. Just as absolute space proposed one series of absolute coordinate axes for space, absolute time proposed one single measure of time for the entire universe. According to Newton, it is as if there exists an invisible clock, which only Nature can access. This clock forms the universal standard, and "ticks" at the same unvarying rate for all objects. According to Newton, all physical processes are controlled by this universal clock: "Absolute, true, and mathematical time, of itself and from its own nature, flows equably without relation to anything external". [7]

However, once again, Gottfried Leibniz took issue with Newton's concept of absolute time in just the same way as he had attacked his concept of absolute space. As with the case of absolute space, Newton believed that if all the matter in the entire physical universe was removed, the universal clock would still exist, ticking-away the absolute time. However, similar to the argument regarding absolute space, we can see that if there is nothing outside the universe then there can be no universal clock outside the universe providing this absolute time measure.

As Einstein's discovery of time dilation revealed, in the absence of the universal standard of absolute time, it is as though every object in the universe is now free to use its own personal clock, ticking at a different rate from every other person's clock.

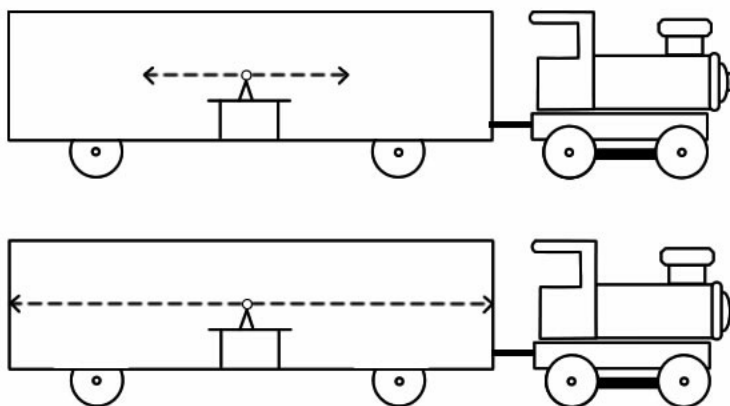

In the last chapter we saw how the lack of absolutes in space meant that Nature was unable to distinguish between objects which had been spatially translated. This led to a symmetry: if you performed the same experiment but moved it six feet to the left, you would get the same result. But if we see symmetry in space due to lack of absolutes, then we would surely expect to see a similar symmetry in time. And this is precisely what we do see. Just as we found spatial invariance, we now find time translation invariance: if you shift your entire experiment in time (perform the same experiment at a later date) then you will get precisely the same result.

Once again we find a symmetry caused by Nature's fundamental inability to distinguish between two physical situations.

Spacetime

Let us now consider another implication of the principle of relativity. Imagine in the precise centre of a carriage on a moving train there is a lamp standing on a table. When the lamp is turned on, an observer riding in the carriage will obviously see the light beam hit the front and rear of the carriage at precisely the same time.

So the following diagram shows the situation as seen by an observer riding in the carriage. As shown in the diagram, the observer sees the emitted light strike the front and the rear of the carriage at the same time:

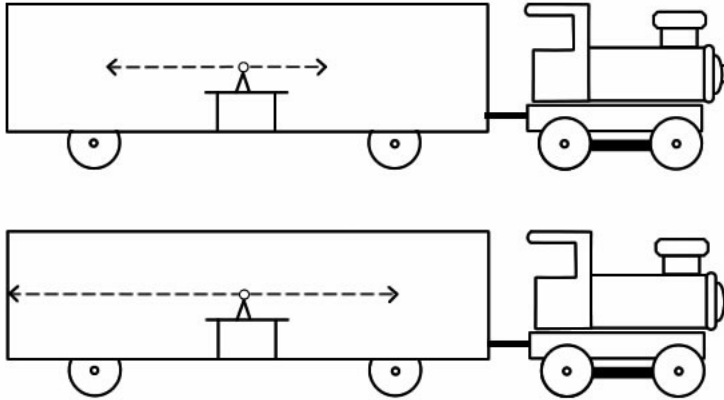

However, the situation is different for an observer standing on a platform watching the train pass by. According to the principle of relativity, all observers must get the same reading for the speed of light. So the observer on the platform will measure the same speed of light from the lamp on the train both in the forward and backward direction — despite the forward movement of the train.

In the time it takes the light to reach the ends of the carriage, the observer on the platform will see the rear of the

carriage advance in the forward direction, due to the forward motion of the train. This has the effect that the light will reach the rear of the carriage first.

So the following diagram shows the situation for an observer standing on the platform. As shown in the diagram, the observer sees the emitted light strike the rear of the carriage first:

At first glance, this might not appear particularly remarkable. We might expect that the forward movement of the train results in the light striking the rear of the carriage first. Indeed, we would expect precisely the same result if sound signals replaced the light signals. The difference with sound, however, is that sound travels through a medium — effectively an ether — and that ether is air. Light is different. As explained earlier, light requires no ether. Both the observer riding in the carriage and the observer standing on the platform will measure the same speed of light. The only conclusion we can draw — and it is a remarkable conclusion — is that the events which are simultaneous for the observer standing on the platform are not simultaneous for the observer riding in the carriage.

This result shows that events which are simultaneous for one observer are not necessarily simultaneous for another observer who is in relative motion. This extraordinary, counter-intuitive behaviour only becomes noticeable at speeds close to the speed of light. As was explained in Chapter Two, at human scales and at human speeds we do not experience the strange glitches of quantum mechanics and relativity. It is only when Nature is pushed to the limit that the complete lack of absolutes available to Nature starts to show, and we experience the strange, counter-intuitive side effects.

This so-called *relativity of simultaneity* means that the ordering of events can be different depending on your viewpoint. From my viewpoint, event A might happen before event B, whereas from your viewpoint event B might happen before event A, depending on our relative motion. As a result of this, when we are drawing events in space, it therefore makes no sense to attempt to draw all the events at a particular specified time, as different observers will disagree as to which events occurred at that time. The only way to unambiguously draw events in space is to add an extra time dimension onto a diagram of space, and then draw events in a block which incorporates both space and time. The resultant block of space and time is called *spacetime*.

The following diagram shows events (the black dots) in a block of spacetime (only two dimensions of space, x and y , are shown):

Spacetime is believed to be the most accurate representation of space and time. When considering the structure of space and time, we should treat the time dimension as being combined with the three spatial dimensions to form a four-dimensional spacetime. Although it sounds rather far-fetched, we in fact treat time as a fourth dimension every day. For example, when we arrange to meet someone, we not only have to say where (in space) we want to meet them but we also have to say when (in time) we want to meet them. So the meeting event is specified by four pieces of information: the three dimensions of space, and the one dimension of time.

It is hard for us to imagine time as the fourth dimension because, whereas objects are free to move in any direction in the space dimensions, they only move forwards in the time dimension. This makes it especially difficult for us to imagine time as a dimension as — psychologically — it seems so very different from the space dimensions. And, while we can visualize three orthogonal axes, it is simply impossible to visualize four orthogonal axes. However, if we overcome our psychological objections we find that time does, indeed, behave very much like the dimensions of space.

As we move about in space, we are also moving forward in time. This means we effectively navigate a path through spacetime called a *world line*. This is an important concept and we will be returning to this idea later:

It was Hermann Minkowski, one of Einstein's teachers, who first conceived of four-dimensional spacetime. Minkowski famously said: "Henceforth space by itself, and time by itself, are doomed to fade away into mere shadows, and only a union of the two will preserve an independent reality."

Invariants

In our light clock thought experiment, we have already seen how Einstein showed that time would pass slower for an observer who is in relative motion. It would appear that space and time are very much relative quantities, and the measure you get for these quantities depends on your viewpoint. However, when we combine space with time to form spacetime we find we get some joint quantities which do not depend on your viewpoint. Such quantities are called *invariants*.

An example of an invariant is the distance travelled by an observer in spacetime. In the following equation, the spacetime distance, s , is equated with the length of time measured by an observer, t , the spatial distance travelled by the observer, x , and the speed of light, c :

$$s^2 = (ct)^2 - x^2$$

It so happens that the spacetime distance travelled by an observer — as calculated by this equation — is invariant, i.e., all observers will agree on this distance.

What are the implications of this invariant spacetime distance? In order to answer that, let us consider two observers. One observer stays on planet Earth, while the other observer decides he wants to be an astronaut and announces his intent to travel to the edge of the solar system before returning to Earth. Both observers synchronize their watches before the astronaut starts on his journey. When the astronaut returns to Earth, the two observers compare their watches again.

You will note that the value for x^2 in the spacetime distance equation is negative. This means that the observer which covered the greater spatial distance will have the smaller distance in spacetime. In other words, the spacetime distance — which represents the amount of time experienced by an observer — will be smaller for the astronaut who went on the round-trip to the edge of the solar system. Less time will have passed for the astronaut than for the observer who remained on Earth.

This is precisely in accordance with Einstein's theory of time dilation: the moving astronaut's clock runs slow compared to the clock of the observer who remained on Earth. If the astronaut travelled far enough and fast enough he would have returned to find his friends had aged considerably, while he remained young.

What else can the spacetime distance equation tell us? Well, if our spatial distance, x , is zero, i.e., if we do not move through space, then the spacetime distance we travel is equal to ct . In other words, just by standing still we are all travelling through spacetime at the speed of c , the speed of light!

How absolutely bizarre, you might think. You might think that when you are standing still or sitting down, you do not feel as if you are travelling at all. Well, you do have the sensation, really: you feel as if you are travelling in time. You feel a kind of motion of the present moment, as the future becomes the past. Just by sitting down, you are travelling through spacetime at the speed of light (do not take this as an excuse to do less exercise).

So how should we interpret forward motion in the time dimension? It means you are getting older! That is how to interpret motion in the time dimension: the object doing the travelling in the time dimension gets older

This invariant quantity — that everyone is moving in spacetime at the same speed — gives us a different way to look at Einstein's theory of special relativity. When we combine space and time into spacetime, we find that all observers move through spacetime at the same speed. This means that if you see another object is moving at high speed relative to you, its speed through space is greater than yours. Hence, its speed through time must be less than yours. This is what you will find when you compare your clock with a moving clock: as the moving clock is travelling faster through space, it is travelling slower through time, i.e., time runs slower for the moving clock relative to your clock. Actually, if an object could move through space at the speed of light (as massless photons can), they would not move through time at all — all their speed would be motion through space, with no speed left to travel through time. For this reason, photons do not experience the passage of time at all.

As Brian Greene says in his book *The Elegant Universe*: "We now see that time slows down when an object moves relative to us because this diverts some of its motion through time into motion through space." This is time dilation expressed from the point of view of invariants: everyone's speed through spacetime is the same invariant quantity. In fact, Einstein did not originally want his theory to be called "relativity", he wanted it to be called "invariance", precisely for this reason.

So we now see that the speed of light is not actually the cosmic "speed limit" in the space dimensions it is usually portrayed to be. It is, in fact, the speed at which **everything** is travelling — in four-dimensional spacetime! So the next time that someone in the pub tells you that no one can travel at the speed of light, you can tell him that he is travelling at the speed of light right now!

The speed of light is no speed limit — it is the universal speed. Everything travels at the speed of light.

The invariant speed of light

So if all observers measure the same value for the speed of light, this appears to suggest that the speed of light is an absolute speed. So are there absolutes in the universe after all?

Well, it is still the case that in a relative universe everything must be defined relative to everything else in the universe. In that sense, the speed of light is perfectly analogous to the length of the planks of wood considered in Chapter Two (remember the "plank length" used to build houses). Everyone has a plank of wood the same length, and everyone measures the same size of their plank of wood (just as everyone measures the same speed of light). However, the plank length cannot be considered an absolute because if everyone's plank length doubled (or halved) nothing would change in the universe.

This suggests that while the speed of light is invariant (everyone agrees on the value), it not a true absolute: it is not like the metre rule in Paris, an absolute reference which resides outside the closed system. If there was a true absolute speed then velocities in the universe could be defined absolutely — not relatively. Hence, there would be no Galilean invariance in such a universe (as it would be possible to distinguish "stationary" from "uniform motion").

So, in order that every observer can measure the same speed of light, we have seen in this chapter that there must be an extraordinary side effect: the clocks of all the observers must run at different rates. In fact, time itself must run at different rates.

5

THE BLOCK UNIVERSE

In this chapter we will continue to consider the implications of there being no absolute axes of time outside the universe. The implications of this turn out to be so remarkable that this discussion may very well change your conception of time forever — I know it had that effect on me. I genuinely view time, and events in my life, in a different light now that I understand the full implications of the block universe model.

The path we will take will be purely logical, and our conclusions will be clear and unarguable. This makes it all the more remarkable that many professional physicists seem unaware (or choose to ignore) the implications of basic logic when applied to time. As Lee Smolin says in his book *Three Roads to Quantum Gravity*: "There are unfortunately not a few good professional physicists who still think about the world as if space and time had an absolute meaning."

It is time to spread a bit of logical light ...

How fast does time flow?

In the last chapter, we discovered how time is a relative notion. This is an inevitable consequence of our principle that there is "nothing outside the universe" — different observers in the universe can effectively have their own "clocks". Time appears to pass at different rates for different observers, relative to other observers.

Then, in our discussion of the relativity of simultaneity, we found it made no sense to attempt to draw all the events at a particular specified time, as different observers will disagree as to which events occurred at that time. We found that the only way to unambiguously draw events in space is to add an extra time dimension onto the diagram of space, and then draw events in a block which incorporates both space and time. Thus, we represent spacetime graphically as a block, and this is the most accurate way to think about space and time.

But there is another, quite fascinating, logical way to consider time which also suggests that we should consider spacetime as a block. We have all seen objects changing with time. We see cars driving down a road, or birds flying in the sky. In slightly more formal terms, what does this motion actually represent? It represents a change in the position of an object with respect to time. As time progresses, the object's position alters. We interpret this change in position as motion. Some objects move slowly with respect to time, some objects move quickly with respect to time.

Bearing this in mind, in 1951 the American philosopher D.C. Williams asked a simple question: "How fast does time itself move?"^[8] This might seem like a fairly innocuous statement, but it is far from easy to answer. We have discussed how we see objects moving with respect to time, but if time itself is moving, then is it moving with respect

to itself? This sounds nonsensical. Maybe we shall have to elaborate on what the movement of time actually means.

We all have an intuitive feeling of the passage of time. We feel the immediacy of a "now" moment as if it is the only real moment, we remember the past as "somewhere we have been", and we look to the future as "somewhere we are going". In this sense, it feels as if our "now" moment is moving through time, from the past to the future. The movement of the "now" point has the effect of turning the uncertain and malleable future into the fixed and unchangeable past.

So, if we are going to answer the question of "How fast does time itself move?" then it would appear we need to consider how fast the "now" point moves. If the "now" moves then it must move with respect to some time reference. So is time moving with respect to itself? Surely not. To say "Time moves at the rate of one second per second" is meaningless. Rather, the rate of time flow would have to be measured with respect to some secondary, external time reference. However, as we have discussed in earlier chapters, we know that there is no clock outside the universe, so there could not be any such external time reference. It is simply logically impossible for there to be a moving "now". The only logical conclusion we can draw is that time does not flow!

So what is the alternative? The alternative is to consider a universe in which all of time is laid-out (just as the space dimension is laid-out), and there is no moving "now". We would imagine this as a solid block of unchanging spacetime, containing all the events of all time. As there is no special "now", there is no distinction between past and future. Amazingly, this means that **all times are equally real**. The future and the past are just as real as the present!

If all times are equally real, then the times and events you remember earlier in your life are just as real as now: the current moment can have no particular claim to be a special moment in time. So, you remember that moment as a child when you fell off your bike and grazed your knee? That moment is just as real as the current moment — it can be said to exist just as much as the current moment. All times exist, all times are real.

This principle forms the *tenseless* theory of time. It is also called the *block universe* model because all of spacetime can be viewed as being laid-out as an unchanging, four-dimensional block. The block universe model can be considered the orthodox model of spacetime as it has its roots in special relativity and basic logic, and is the model of spacetime adopted by the vast majority of physicists.

I first became aware of the full, extraordinary implications of the block universe model in 2006 when I read a superb *Scientific American* article by Paul Davies entitled *That Mysterious Flow*. I suspect that for a lot of people — not just me — the article was a revelation. Paul Davies presented the argument against the conventional, intuitive notion of a moving "now" in a way which really made you stand up and take notice: "It makes sense to talk about the movement of a physical object, such as an arrow through space, by gauging how its location varies with time. But what meaning can be attached to the movement of time itself? Relative to what does it move? Whereas other types of motion relate one physical process to another, the putative flow of time relates time to itself. Posing the simple question 'How fast does time pass?' exposes the absurdity of the very idea. The trivial answer 'One second per second' tells us nothing at all."

A link to the original article is contained in the footnote. [\[9\]](#)

I reproduced Paul Davies's article on my website and got a tremendous response. The general consensus from the comments told me that the average scientific lay-reader was already well-acquainted with the idea of all of space and time being laid-out in a spacetime block (i.e., they were already well-acquainted with the notion of a four-dimensional spacetime — thanks to Einstein). However, they were still under the impression that there was a "now" moment which moved through this spacetime structure, turning the future into the past. Brian Greene also noted this general misunderstanding in his book *The Fabric of the Cosmos*: "A less than widely appreciated implication of Einstein's work is that special relativity really treats all times equally." It is this misunderstanding which I hoped to clarify — with the aid of Paul Davies's article. All of space and time is laid-out, yes, but there is no moving "now". All times are equally real.

According to the block universe scenario, the movement of time is just an illusion. "But", you might protest, "I clearly feel the current moment is special. The past seems distant and hazy, and the future is unknown. So the current moment is definitely special for me." Well, yes, but do not forget that this is precisely how you have felt at every other moment in your life. In 1980, you felt that the current moment was special, and the 1970s were the blurry past. In 1990 you felt that the current moment was special, and the 1980s were the blurry past. In 2000 you felt the current moment was special, and the 1990s were the blurry past. The way you are feeling now is precisely how you have felt at every other moment in your life. So, again, there is nothing to identify the current moment as special in any way.

It is as if there are multiple copies of you in existence at every point in time, and they are all equally real. Remember the discussion about your world line in the previous chapter. That is the accurate representation of reality: you exist as a world line across all times. Just considering yourself at the current moment does not reflect the true reality.

Are we *The Sims*?

David Deutsch provides an excellent description of the block universe model in Chapter Eleven of his book *The Fabric of Reality*. In fact, he comprehensively demolishes the generally-held view of time in favour of the block universe view: "The reason why the common-sense theory of time is inherently mysterious is that it is inherently nonsensical. It is not just that it is factually inaccurate. We shall see that, even in its own terms, it does not make sense ... Common sense frequently turns out to be false, even badly false. But it is unusual for common sense to be nonsense in a matter of everyday experience. Yet that is what has happened here."

Deutsch even considers the possibility that there might be an axis of time external to the universe by which we might answer the question "How fast does time flow?" Deutsch achieves this by considering the possibility that our universe might be a computer simulation, the simulation being performed by an advanced civilisation. If you have seen the movie *The Matrix*, you will be aware of a theory similar to this. In *The Matrix*, the advanced civilisation kept Keanu Reeves's character in a vat and fed his brain false stimuli to make it appear as if he was living in a completely false, simulated universe. The latest theories on this subject have attained a degree of scientific credibility, but they do not propose keeping anyone in a vat. Instead, these theories consider the possibility that our entire universe might be a simulated construct in a vast supercomputer run by an advanced civilisation (as if we were simulated characters in the computer game *The Sims*). The motivation behind such a simulation being just the same as why we enjoy playing games such as *The Sims*: for entertainment.

If we were in such a position, then there would be two axes of time: there would be our time axis as residents inside the simulated universe, and there would be another, entirely separate axis of time for the advanced civilisation performing the simulation — effectively outside our universe. The two axes of time need not run at the same rate, e.g., the advanced civilisation could be watching us go about our daily activities in slow motion.

It would then appear that we could provide an answer to the question "How fast does time flow?" We could say something like "Our time inside the universe flows at five seconds for each elapsed second of time outside the universe." In other words, although it is a nonsense to say that time flows at a rate of "one second per second", it would appear possible to say that time flows at a rate of "one second per external second, according to the time scale outside the universe."

Is this a way out of the logical certainty that we inhabit a block universe?

Well, no. Deutsch shoots down this theory as soon as he proposes it. He points to the fact that we would be just pushing the problem back from our simulated universe to the universe of the advanced civilisation. We may have avoided the problem "How fast does time flow?" in our simulated universe, but we are now left with the question "How fast does time flow?" in the universe of the advanced civilisation. We are no better off.

There is no way out: it is a logical certainty that we inhabit a block universe.

Eternal life

It might come as a surprise that this orthodox block universe view of time leads us to conclude that we possess a form of eternal life! This is a consequence of the principle that in the block universe model all periods of time are equally real. If a loved one dies, you might take some comfort from the knowledge that this period of time in which your loved one is dead has, in fact, no greater reality than the time when your loved one was alive. According to physics, it is just as valid to consider your loved one as alive as it is to consider them dead!

Einstein took comfort from this knowledge when his lifelong friend Michele Besso died. He wrote a letter consoling Besso's family: "Now he has departed from this strange world a little ahead of me. That means nothing. People like us, who believe in physics, know that the distinction between past, present, and future is only a stubbornly persistent illusion."

Of course, the flip-side is that you're already dead!

Free will

The idea that all of space and time is laid-out in one unchanging block might appear unsavoury to some people as it appears to deny the possibility of free will. This is because it appears we are unable to change the future, which is written in stone. This is not the first time that science has appeared to deny the possibility of free will: Newton's laws of motion seemed to imply a deterministic "clockwork universe", in which, once the initial conditions are set, the universe proceeds along a fixed path which cannot be altered. The arrival of quantum mechanics, though, implied that the universe is not totally deterministic. Quantum mechanics only supplies the probability of an event occurring. It is as if quantum mechanics decides which way the world is going to work by throwing a dice.

But does quantum mechanics actually provide you with more free will than Newton's clockwork universe? I fail to see how having your decisions controlled by a random dice throw somehow gives you more control than having your decisions controlled by a deterministic mechanism. It seems that the proponents of free will try to deny that their thought processes are controlled by fundamental physical processes at all, as somehow their thoughts are "above all that". Descartes, for example, believed that the human mind did not have to follow the physical laws of the universe. This is surely not the case. However you define free will it is surely controlled by the laws of Nature and fundamental physics.

The main problem is that "free will" has no proper scientific definition, and until it is given a proper definition it is simply impossible to analyse it scientifically to see if it is present or not. In the rather unscientific way that it is normally described, free will is "the ability to make decisions", and that is something we all clearly have. Whether the underlying universe is deterministic, or random, or a block universe, it makes no difference: we all have the freedom to make decisions. This is because "the ability to make decisions" is, again, not sufficiently defined scientifically. In this unscientific sense, the only way we could ever lose this ability to make decisions is if a drug was put in our drink to turn us into a zombie-like, suggestible state. So, in the absence of someone drugging your drink, I can definitely say, yes, you obviously have free will — you can obviously make decisions. The underlying laws of physics are irrelevant.

If you disagree, please present a clearer definition of "free will", a better definition than "the ability to make decisions". In the absence of such an alternative definition, relax — you obviously have free will.

The arrow of time

The block universe model tells us that all times are equally real, and the passage of time is just an illusion. It certainly feels like a very strong illusion, which is why it is sometimes so hard to accept the reality of the block universe. So what is causing this illusion of the passage of time?

The intuitive feeling we all experience is of a moving "now" which turns the future into the past. This seems to indicate a clear directionality of the movement of the "now" from the past into the future. There is a clear asymmetry in the time direction, most notably we can remember the past but the future is completely unknown. This asymmetry in our memory seems to be the main reason why we feel we are in motion in the forward time direction. Because we can remember the past, we feel that it is somewhere we have already been, and because we have no knowledge of the future we feel it is somewhere we have yet to visit. Hence, despite what the block universe model tells us, we feel we are moving in time — we feel the passage of time.

So the asymmetry of the time axis causes an apparent directionality to time. But what is the cause of this asymmetry? What is the cause of the so-called *arrow of time*?

The asymmetry is not just in our minds and memory. As we look around our world, we see wine glasses breaking, but we never see broken pieces of glass forming a wine glass. We see eggs breaking, but we never see a broken egg reforming. So there is asymmetry in the physical world along the time axis. This is particularly puzzling when you consider that physicists believe that almost all physical processes are reversible. There should be no fundamental reason why objects behave differently in the forward time direction to the backward time direction.

Instead of considering time, we should consider which processes appear to be irreversible. We should consider what a breaking wine glass and a breaking egg have in common. In both these cases, we see an increase in disorder. It would appear that it is much more likely that a system could change from a state of order into a state of disorder rather than vice versa. Indeed, this does appear to be the reason why we see an arrow of time.

The scientific term for the amount of disorder in a system is *entropy*. It is known that the entropy of a closed system increases with time, i.e., a system will gradually become more disordered over time. Hence, we see cars rusting (i.e., their molecules become more disordered), but we do not see rusting cars becoming new again. This principle that the entropy of a closed system increases with time is called the *second law of thermodynamics*.

The reason for this increase in entropy can be seen from a purely probabilistic argument: a system will have many more possible disordered states than ordered states, so a system which changes state randomly will most likely move to a more disordered state. It is really just a matter of likelihood. For this reason, the second "law" of thermodynamics is not really a "law" at all, certainly not an unbreakable law on the same basis as other physical laws — it is a statistical principle. In fact, it might be possible for a room full of randomly-distributed particles to re-order itself quite by chance so that all the particles end up in one corner of the room — it would just be incredibly unlikely.

While the second "law" of thermodynamics is "just" a statistical principle, it is a mightily powerful statistical principle. This is because the basis of the second law — that "disorder will increase" — seems so obvious, and seems to appeal to a fundamental, platonic principle of mathematics. For this reason, the second law manages to appear even more fundamental and unbreakable than the other physical laws, some of which (for example, the amount of electric charge on an electron) seem rather arbitrary in comparison. This fundamental strength of the second law was described well by the astrophysicist Sir Arthur Eddington: "If someone points out to you that your pet theory of the universe is in disagreement with Maxwell's equations, then so much the worse for Maxwell's equations. If it is found to be contradicted by observation — well, these experimentalists do bungle things sometimes. But if your theory is found to be against the second law of thermodynamics I can offer you no hope; there is nothing for it but to collapse in deepest humiliation."

I would consider this principle — that disorder will tend to increase — to be so strong that it would be "obviously true" in all conceivable universes. For this reason, I would consider the second law of thermodynamics to be one of those rarest of things: a true fundamental principle, a principle with the potential to be one of the foundation stones of the laws of Nature.

Ex nihilo solutions

To my mind, the disconnect between theoretical physics and basic logic about the subject of time is greatest in the field of cosmology. Cosmology is the study of the entire universe, including its origin. One of the most popular fields of study attempts to explain the origin of the universe by invoking quantum theory. The resultant theory is known as *quantum cosmology*.

According to quantum theory, there exists some unavoidable uncertainties at the base of reality. It turns out that the more accurately we measure a particular property of a particle, the less accurately we can know a different particular property. For example, the more accurately we measure the momentum of a particle, the less accurately we can know its position. One way of looking at this is to imagine that when we measure the properties of a particle we inevitably have to interfere with it in some way, for example, by forcing it to collide with another particle. This interference inevitably changes the property of the particle under investigation — by modifying its velocity, for example. This fundamentally limits the accuracy of the measurement.

Such pairs of properties — such as momentum and position — which behave in this way are called *conjugate variables*. The theory which expresses this uncertainty in conjugate variable values is called the *Heisenberg uncertainty principle*.

According to the uncertainty principle, another pair of conjugate variables is energy and time. This means there is a limitation on how accurately we can know the energy of a system at a given moment in time. Incredibly, this

means that for a short period of time, there can be energy produced in a vacuum in which all the matter has been removed. It is as if we can get something out of nothing! Even more incredibly, according to the mass-energy equivalence described by $E=mc^2$, this vacuum energy can be enough to produce a particle. It is as though the energy is "borrowed" from the vacuum, albeit for a very short period of time. These so-called *virtual particles* can appear out of nothing.

Quantum cosmology considers the possibility that one of these quantum fluctuations could have expanded extremely rapidly in a process known as *inflation*. The suggestion is that one of these fluctuations could have become our universe, blowing up like a balloon just a tiny fraction of a second after the big bang. Our universe would then have emerged from nothing! Theories which propose that our universe may have emerged from nothing in this manner are called *ex nihilo* solutions (*ex nihilo* being Latin for "out of nothing").

An *ex nihilo* solution which is very popular at the moment is based on the idea that the total energy of the universe can be calculated to be zero. That would be the only kind of universe that could come from nothing. The idea of the total energy of the universe being nothing might seem a strange idea as the universe contains matter, and we know through $E=mc^2$ that matter can be converted to energy. So how can the sum total of the energy in the universe be zero? This is possible if gravitational energy is considered to be negative. This requires explanation.

If objects are separated to infinity they feel no gravitational pull between themselves, so the gravitational energy of the system is zero in that case. But when those objects were initially clumped together, you had to put energy into the system to pull them apart. So if you have to put energy into a system just to get to a zero energy situation, this means the energy of the system when those objects were clumped together must have been negative.

So gravitational energy can be considered negative, and, if you actually do the arithmetic for the universe, you can show that the negative gravitational energy exactly cancels the positive energy due to the masses in the universe.^[10] Hence, the total energy of the universe is zero.

Once again, this result could actually be derived from our fundamental principle. If there is "nothing outside the universe" then it could never be possible to "stand outside" the universe and measure any value for the universe as a whole. This principle is expressed by Misner, Thorne, and Wheeler in their classic textbook *Gravitation*: "There is no such thing as the energy (or angular momentum, or charge) of a closed universe, according to general relativity, and this for a simple reason. To weigh something one needs a platform on which to stand to do the weighing." There can be no such platform outside the universe. Once again, we find that our fundamental principle ("there is nothing outside the universe") can be used to derive a remarkable proportion of the laws of Nature.

This result — that the total energy of the universe is zero — makes *ex nihilo* solutions very attractive. It really makes it appear as though the universe could just have emerged from nothing, and that is the reason why the universe exists at all. As Alan Guth, the discoverer of inflation, said: "It is rather fantastic to realise that the laws of physics can describe how everything was created in a random quantum fluctuation out of nothing."

But it is not all good news. Some questions have been raised as to whether it is valid to apply quantum reasoning — which is only ever used to describe behaviour inside the universe — to the universe itself. Our later analysis of quantum mechanics will appear to show that quantum mechanical behaviour arises from the interactions of objects within the universe. In which case, it would indeed be invalid to apply such reasoning to the universe itself.

But a more fundamental problem is that ... ***ex nihilo* solutions make no logical sense whatsoever!**

This conclusion is entirely a consequence of the block universe. In order to see this, first it has to be stressed that accepting the reality of the block universe is not an option. To disregard the implications of the block universe is not only to ignore the conclusions of special relativity, it is to ignore basic logic. Remember the logical argument based on "How fast does time pass?" It is logically absurd to state how fast time itself passes, and it is therefore logically absurd to consider we do not live in a block universe. We have a definite logical conclusion: the universe has a block universe structure.

And the implication of the block universe is that all times are equally real — no particular moment is preferred. The current moment of the universe is just as real as the first moments after the big bang. The entire spacetime block is laid-out as one unchanging structure. No time is dependent on any other time: all times are equally real, all times exist.

So to suggest that in some way that a particular moment of time, such as the time of the big bang, is somehow more important, more real, than other times makes no sense. The last moments of the universe are just as real as the moment of the big bang. And to suggest that the events of any particular moment are responsible for the existence of the universe is logical nonsense! No time depends on the existence of any other time. The universe is one unchanging block of spacetime. The last moments of the universe are just as important for the existence of the universe as is the time of the big bang.

This is surely an incredible conclusion. It has been derived logically, and so it is not open to rational argument. As such, it should be regarded as orthodox physics. And yet, not only is this result ignored by a large proportion of

cosmologists, it renders a large proportion of their research logically absurd.

It seems incredibly counter-intuitive to suggest the big bang is not the reason the universe exists, but this is what logic tells us. The big bang was a massively important event for objects **within** the universe. It explains why the universe takes the form it does. But it tells us nothing about why the universe exists at all.

Ex nihilo solutions make no logical sense. The events of the big bang are not the reason the universe exists. The universe exists as an unchanging spacetime block, the form of which is described by Stephen Hawking in this extract from his book *A Brief History of Time*: "If the universe is really completely self-contained, having no boundary or edge, it would have neither beginning nor end: it would simply **be**."

6

QUANTUM REALITY

We are now approximately halfway through this book. As we have concentrated mainly on relativity so far, this would seem like a good point to turn our attention to quantum mechanics.

As far as the general public is concerned, quantum mechanics has a bad rep. It is perceived as being the ultimate in inaccessible, esoteric theoretical physics, only to be understood by the likes of Sheldon from TV's *Big Bang Theory*.^[11] I think this is a tremendous shame as the basic principles of quantum mechanics are really remarkably straightforward. Perhaps physicists must bear part of the blame for not communicating this inherent simplicity to the general public. I do take a fair bit of personal pride in going the other way, identifying the fundamental principles which underlie a subject, and then expressing those principles as simply as possible.

I have always wanted to present the principles of quantum mechanics to a general audience in a form which differs from the approach of most popular science books. The general approach of most books is to start by describing the most bizarre and counter-intuitive examples of quantum mechanical behaviour. I am not quite sure as to what is the intention of this approach — maybe to get you into thinking "Ooh, isn't that difficult and weird!" This approach appears rather self-defeating to my eyes.

I have always felt that a better approach is to emphasize the fundamental logic which underlies quantum mechanical behaviour, which really is quite straightforward and can be described in a few sentences. Quantum mechanical behaviour would only be bizarre if it did not apply its rules consistently. On the contrary, quantum mechanics is totally consistent in applying the same underlying logic to all areas of application, and so should not be considered bizarre — perhaps "counter-intuitive" might be a better description. The presentation of quantum mechanics in this book will emphasize the logic, and de-emphasize the bizarre.

Another bugbear of mine about the presentation of quantum mechanics in the popular literature is that all too often it just becomes a history lesson, parading out the life-stories and achievements of the pioneers of the subject in chronological order. The result can resemble an episode of TV's *This is Your Life* rather than a popular science book. As truly great and heroic the achievements of those pioneers were, the important message to convey is the principles — not the personalities. I am going to try to get through this chapter without describing the story of a single pioneer of quantum mechanics. If you are looking for a book on the history of the subject, there are plenty on the market for you to choose from.

The logic of quantum mechanics

In general, we use our knowledge of quantum mechanics to predict the behaviour of systems. In the most general sense, this means predicting the result we will get when we measure some aspect of the system. So, in essence, quantum mechanics is all about measurement.

In order to explain the logic of quantum mechanical measurements, we need to consider the results of just three experiments. The first experiment we will consider tells us about the wave nature of light. It was first performed at the beginning of the 19th century by Thomas Young.

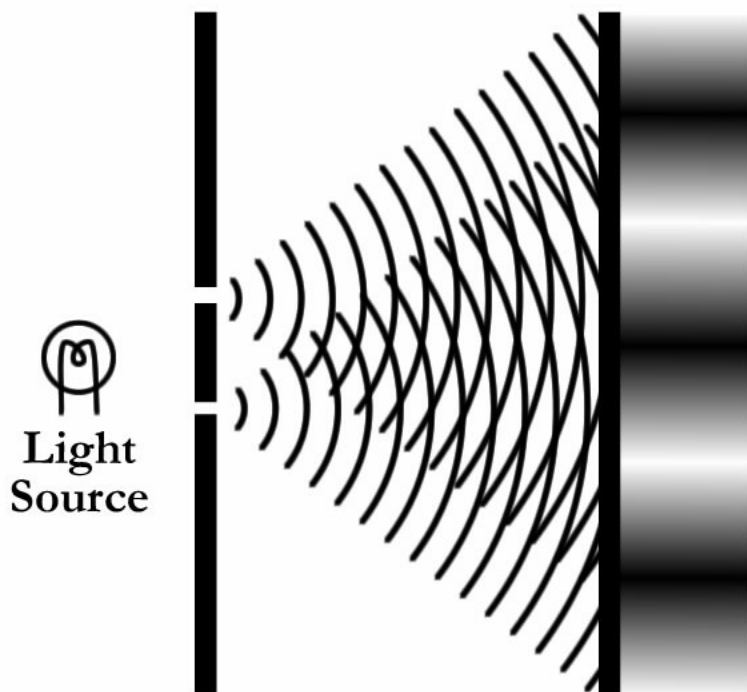

At the time, Newton's views on light were dominant. Newton believed light was "corpuscular" (made of particles), this conclusion being largely based on the observation that light moved in straight lines — just like any other matter in inertial motion. Thomas Young realised that this corpuscular model could not explain effects such as diffraction, which could only be explained if light behaved like a wave. So Young proposed an experiment which he believed revealed the true, wavelike nature of light.

In Young's experiment, a light source is in front of a board. Two narrow slits are cut into the board. Light can only pass through these two slits, and the light which passes through the two slits illuminates a screen behind the board.

The two light rays from the two slits meet at the screen. Due to the wavelike nature of light, the peaks and troughs of the light waves interfere with each other at this point. This means that, if we consider a single point on the screen, if the light wave from one slot has a peak in its waveform at that point, and if the light wave from the other slot also has a peak, then this represents constructive interference and there will be a bright spot on the screen. However, if there is a trough projected from the second slot, then this represents destructive interference: the trough from one slit

cancels-out the peak from the other slit. As a result, there will be a dark point on the screen.

Because of the variations in distance between the two slots and points on the screen, the resultant pattern shows both constructive and destructive interference. The result is a pattern of bright and dark lines being projected on the screen. The following diagram shows the experimental set-up, and the pattern of dark and bright lines being projected on the screen:

So Young's experiment clearly showed that light behaves as a wave. However, the next experiment shows that this does not capture the full description of the behaviour of light. The second experimental result we shall consider is the *photoelectric effect*, and it is here that quantum effects shall start to become noticeable.

Next time you are in a queue at the supermarket, take note that you are in the presence of the experiment which launched quantum theory. When you put your groceries on the rubber conveyor belt, and your onions trundle along towards the person on the till, you will notice the conveyor belt always stops before your groceries fall off the end of the belt. This is because your onions break a narrow beam of light. This beam of light hits a photoelectric sensor, which converts the light into an electric current. When the beam of light is broken, the electric current ceases, and the conveyor belt stops.

In the late 19th century, when the photoelectric effect was first discovered, it posed a great mystery. As we have seen in Tesco (or Walmart), the photoelectric effect generates a current when light shines on a metal plate. It was discovered that this current is caused by light knocking electrons from the metal surface. You might imagine that if the brightness of the light was increased, the energy of the emitted electrons would also increase, but this was not what was found. Instead, it was found that the energy of the emitted electrons depended only on the frequency of the incident light. For example, a current was generated when blue light was used (high frequency), but not red light (low frequency). In contrast, if the brightness of the light was increased, the energy of the emitted electrons did not

increase — there was just more of them. This posed a great mystery. Once again, it took Einstein to shed some metaphorical light on this particular problem.

Einstein proposed that light was made up of packets of energy, which are now known as photons. Brighter light did not have more energetic photons — it just had more of them. This explained why the energy of the emitted electrons was not dependent on the brightness of the light: an electron was knocked out of the atom by being hit by a single photon, the energy of the photon transferring to the kinetic energy of the electron. The number of photons (the brightness of the light) was irrelevant to the energy of the emitted electron. The only important factor was the energy of the single photon which hit the electron, and that was dependent only on the frequency of the light.

So Einstein revealed that light was "quantized" into particles — individual packets of energy. It was for this discovery — not relativity — that Einstein won his only Nobel Prize in 1922.

It is now believed that all of energy and matter follows this quantum structure and is composed of discrete "chunks" rather than being smoothly continuous. So this first conclusion of quantum theory tells us that the structure of reality is composed of discrete "bits".

On the basis of the two experiments we have considered so far, it appears that light can behave as both a wave and a particle, depending on the experiment that is performed. This might appear strange, but it is all due to the quantum mechanical behaviour of light. It is only by understanding this quantum mechanical behaviour that we can make sense of the behaviour of light.

The third and final experiment we will consider reveals all we will need to know about the logic of quantum mechanical behaviour. As Richard Feynman once said: "The double-slit experiment has in it the heart of quantum mechanics. In reality, it contains the **only** mystery of quantum mechanics."

The double-slit experiment is just Thomas Young's interference experiment (which we considered earlier), but with a slight modification. As we have just seen in the photoelectric effect, it appears that light is composed of particles called photons. In the double-slit experiment, the intensity of the light source is hugely reduced so that only a single photon is emitted at a time. In other words, at any point in time there is only a single photon travelling from the light source, through one of the two slits (we do not know which slit), before hitting the screen behind the board.

We perform this experiment many times, each time when a photon hits the screen it makes a mark. Over time, these marks accumulate. At the end of the experiment, when we investigate the pattern of marks, we find something extremely peculiar. The pattern of marks seems to follow the same pattern of light and dark areas that we found earlier in Young's wave experiment. But in Young's experiment, many billions of photons were being emitted at any moment, with the photons passing through **both** slits at the same time. The two waves of light from the two slits created the interference pattern. But when there was only one photon travelling in the experiment, how could the interference pattern be formed? To get an interference pattern we would need light to be passing through both slits, but a single photon cannot pass through both slits — a single photon cannot interfere with itself.

However, this appears to be what the double-slit experiment is telling us. The result of the experiment only makes sense if the single photon is, indeed, passing through both slits. It is as if the photon can be in more than one place at the same time.

So now we can present the conclusion of the double-slit experiment, and it really does — as Richard Feynman stated — capture the whole essence of quantum mechanics. As we stated at the start of this section, quantum mechanics is really all about measurements, and the double-slit experiment means we can capture the logic of quantum mechanical measurement in just two statements:

1) Before we measure certain properties of a particle (e.g., position, momentum) the particle behaves as though it has **all possible values** for that property.

2) After we have performed the measurement, we find the particle property takes only one of the possible values at random. It is fundamentally impossible to predict which value the property will take.

And that, basically, is all you need to know about quantum mechanics. Armed with these two statements, we can now make sense of the result of the double-slit experiment.

In the double-slit experiment, when the particle hits the screen, we are effectively making a measurement: we are measuring the position property of the photon. Before the photon hits the screen, though, the first statement of quantum mechanical logic states that the photon behaves as though it has all possible values for that measured property: we say the particle is in a *superposition* state. In other words, as the photon leaves the light source, it behaves as though it is in all possible positions. This does, indeed, mean that the photon appears to pass through both slits! Strange as it may seem, this is what quantum logic tells us: before measurement, quantum reality appears

to be in a multi-valued superposition. For now, just accept the logic, and be reassured that this quantum logic is applied consistently in all experiments.

The superposition state — in which all the various possibilities are superimposed on the particle — is a crucial and unexplained feature of quantum mechanics. In Chapter Eight I present a speculative explanation for this extraordinary behaviour: a logical rationale for the superposition state.

The second statement of quantum mechanical logic states that after we make the measurement, we find the value for the measured particle property is a single value selected at random. So, in terms of the double-slit experiment, this means that when the photon hits the screen and we measure its position, we find we get a single value — a single mark on the screen. But that appears to imply that the photon only went through one slot, not both. Strange as it may seem, just accept for now that this is what quantum mechanical logic tells us. Before measurement, the particle is in a superposition and behaves as though it passes through both slots, but, after measurement when the photon hits the screen, we find only a single, randomly-selected result.

The quantum casino

The first statement of quantum logic reveals that, before we make a measurement we have to consider a property of a particle to have all possible values. We saw this principle in action in the double-slit experiment when the particle appeared to pass through both slits.

But we have not yet considered the implications of the second statement of quantum logic. That states that, after we make a measurement, the property value is selected at **random** from all possible values. Quantum mechanical behaviour is actually starting to sound remarkably similar to a roulette wheel.

We could imagine a roulette wheel as being a device which determines property values during the process of taking a quantum mechanical measurement. When we considered the photoelectric experiment earlier, we came to the conclusion that reality was composed of discrete "bits": property values could only occupy discrete integer slots (e.g., 1, 2, 3) rather than taking completely continuous values (e.g., 1.342937492 ...). So the slots on the roulette wheel represent the only available property values.

When the ball is racing around the wheel, this represents the situation before the measurement is taken. With no idea of what the final result will be, it is as if we must consider the ball as potentially occupying any **and all** of the slots in the wheel (just as a photon in a superposition state is capable of being in more than one place at once, passing through the two slits).

When the ball comes to a rest, it is equivalent to taking a measurement of a property value — the value is the number of the slot in which the ball rests. There is a completely random choice of which value is selected — just like a real roulette wheel. However, the principles behind this randomness are different to that of a normal roulette wheel.

On a normal roulette wheel in a casino it is actually possible to predict (in theory) where the ball will land. If you can measure the precise speed at which the wheel spins, and you can measure the precise speed that the croupier throws the ball, then, by using our knowledge of classical physics and Newton's laws of motion it is theoretically possible to work out where the ball will finish. It is not easy, but it is possible.

The quantum casino works differently. In the quantum casino there is no way of calculating where the ball will land. In a normal casino, there would be a bouncer preventing you from making your measurements. You would be prevented from measuring the speed of the wheel. You would be prevented from measuring the speed of the ball. You would be prevented from seeing that information. Similarly, in the quantum world when we are measuring a

property of a particle we are fundamentally prohibited from digging deeper to analyse the quantum mechanism to try to predict the result. That is a fundamental limit on physics. We just have to accept that the result of the measurement we get will be random. We can never do any better. This is why we have to consider the quantum behaviour of Nature as being **fundamentally** random — because no deeper layer can ever be accessible to our analysis.

The only information we can extract from a system has to be obtained via measurement. In the double-slit experiment, the only information we can obtain is when we measure the photon position when the photon hits the screen. We have no more information about the earlier trajectory of the photon because we have performed no other, earlier measurements. For this reason, we have no deeper information about the photon's path: without taking measurements, that information is fundamentally hidden from us. Comparing with the roulette wheel, we can obtain no deeper information about the speed of the wheel or the speed of the ball in order to predict the result.

But, if we decide to take an earlier measurement to help our prediction, to remove the randomness, we fundamentally change the experiment. In the double-slit experiment, if we put any form of sensor on each of the slits to determine which slit the photon has passed through, we do indeed detect the photon passing through just one slit — not both. But this has the effect of destroying the interference pattern on the screen — we only see the interference pattern when the photon passes through both slits.

So quantum randomness is not a result of our ignorance of the situation. We cannot determine the behaviour of the system by attempting to reduce our ignorance by taking more measurements. If we take more measurements, we irretrievably alter the experiment.

This random behaviour reveals something very fundamental and remarkable about quantum mechanics: quantum mechanics only tells us the probabilities of a measurement outcome taking a particular value — quantum mechanics can never make an exact prediction about which value will result. This is because quantum mechanics is a statistical theory: it cannot accurately predict the outcome of a single measurement, it can only give the probabilities of outcomes when we make a series of measurements. You might think that is a major shortcoming of quantum mechanics, but actually it can be a very powerful tool to know the probability of an outcome, especially when you are dealing with millions of random events (as is the case with millions of particles). In that case, with millions of measurements being averaged, the randomness appears to vanish. No casino knows the outcome of each spin of the roulette wheel, but casinos know that probability is on their side. And you never see a poor casino!

Schrödinger's fridge

Clearly, our discussion of the double-slit experiment has raised some questions about the nature of quantum reality before observation. This also raises the more general question about what it is possible to say about everyday, human-scale reality (i.e., *macroscopic* reality) before we observe it. These questions can be summed-up by the example of the light inside the refrigerator.

Imagine you have a refrigerator whose door is closed. Your task is to find whether or not the light is on inside the fridge. In order to find out, you open the door of the fridge wide, and you can then tell that, yes, the light is definitely on inside the fridge.

However, I am sure you can see the flaw in this observation. The very act of observation (opening the fridge door) modified the object under observation (the light is turned on). It would appear there is no way of making the observation without modifying the object under observation.

Of course, at macroscopic scales it is always possible to modify the experimental set-up to obtain more information without significantly modifying the object under observation. For example, an additional light sensor could be placed inside the fridge, and this could communicate the state of illumination inside the fridge via a wireless connection. However, at the quantum level, this is simply not an option. As we discussed in the double-slit experiment, if we put any form of sensor on each of the slits to determine which slit the photon has passed through, we irretrievably modify the experiment. By adding a sensor to determine which slit the photon passed through, this has the effect of destroying the interference pattern on the screen.

The Copenhagen interpretation

If our fridge was a "quantum fridge" then we would be fundamentally prohibited from determining if the light was on or off before we open the door of the fridge. In that case, what can we possibly say about the reality of the fridge light before we open the door? It would seem that we are prevented from finding out what is going on before we

open the door.

In quantum mechanics, this limitation opens the possibility to create any number of different interpretations of what is happening to reality "behind the scenes" before we make a measurement. As long as your interpretation makes accurate predictions about the result **after** measurement, then you are free to make whatever interpretation you like about what happens **before** measurement. No one can claim that their interpretation is superior to your interpretation. As a result, there are many different interpretations of quantum mechanics.

The first interpretation of quantum mechanics was proposed by the discoverers of quantum mechanics in Copenhagen in the 1920s. This so-called *Copenhagen interpretation* was for many decades effectively the official interpretation, and was taught in schools and colleges as though the matter was settled, when, in fact, this is far from the case. As Murray Gell-Mann put it: "Niels Bohr brainwashed a whole generation of physicists into believing that the problem had been solved."

The Copenhagen interpretation is only interested with the results of experiments, i.e., the result we get when we make a measurement. So, according to the interpretation, we should simply not talk of the reality of the system before we make our measurement — it would be unscientific, the subject of philosophy, to consider that.

In taking this approach the Copenhagen interpretation neatly sidesteps any philosophical questions such as "Does the particle exist before we observe it?" But there is a price to be paid for this apparently neat tying together of the loose ends. In fact, there are a couple of unsatisfactory implications of this interpretation.

Firstly, the interpretation does not state what, exactly, constitutes an observation. This seems like a major shortcoming, especially when the act of observation is such an important factor in the Copenhagen interpretation. As we have seen in the double-slit experiment, before observation, a particle is in a superposition state, appearing to have all possible property values. However, after observation, the particle appears to have only a single property value. What possible process could cause this sudden "quantum jump"? This is called the *quantum measurement problem*, and its resolution remains a major challenge in quantum mechanics.

What does it take to produce an "observation"? Can a machine take an observation, or does it require a human being?

In his 1932 book *The Mathematical Foundations of Quantum Mechanics*, the great mathematician John von Neumann suggested that the consciousness of the experimenter is the last link in the chain which brings objects into reality during a measurement process: "There exist external observers which cannot be treated within quantum mechanics, namely human (and perhaps animal) minds, which perform measurements on the brain causing [quantum observation]."

So does it really take a conscious human being, performing an observation, to generate reality? Surely not. For example, a radioactive uranium nucleus buried in rock on a distant planet will decay to emit an alpha particle. It does not matter if a human observer looks at the rock or not. Einstein, who never accepted the implications of the Copenhagen interpretation, summed up the absurdity of the situation when he said: "Do you really think the moon isn't there if you aren't looking at it?"

As Carver Mead has said: "That is probably the biggest misconception that has come out of the Copenhagen view. The idea that the (human) observation of some event makes it somehow more 'real' became entrenched in the philosophy of quantum mechanics. Even the slightest reflection will show how silly it is. An observer is an assembly of atoms. What is different about the observer's atoms from those of any other object? What if the data are taken by computer? Do the events not happen until the scientist gets home from vacation and looks at the printout? It is ludicrous!"

In his statement about the unimportance of human consciousness in the act of observation, Carver Mead was probably influenced by the famous thought experiment of Schrödinger's cat. Erwin Schrödinger presented the tale of his cat in 1935 to reveal the shortcomings of the Copenhagen interpretation (which was dominant at the time), and, specifically, to reveal the absurdity of the idea that only human consciousness can produce an observation.

Schrödinger's cat is placed inside a sealed box. In the box with the cat is a sealed glass jar of poison. There is also a small piece of radioactive material. If the piece of radioactive material decays (the decay being dependent on quantum randomness), the poison is released and the cat dies. If the radioactive material does not decay, the cat lives.

According to the "human consciousness" interpretation, the reality of the radioactive decay is only determined when it is examined by a human being. This would mean that, until the box was opened and the radioactive material is examined by a human, we must consider the material to be in a superposition state of both "decayed" and "not decayed". We must therefore treat the cat as being in a state of both "dead" and "not dead"!

From this *reductio ad absurdum* argument, we have to conclude that human consciousness is not the only mechanism capable of making an "observation" and reducing a quantum superposition to a single value.

So how can we define an "observation" in a more general sense? An excellent definition can be found in the book *Quantum Enigma* by Bruce Rosenblum and Fred Kuttner: "Whenever any property of a microscopic object affects a macroscopic object, that property is 'observed' and becomes a physical reality." For example, when a microscopic photon hits the macroscopic screen in the double-slit experiment, then that will reduce the quantum superposition state of the photon to a single value (the single mark it leaves on the screen). This explains why we do not see bizarre quantum superpositions — such as a cat being both alive and dead at the same time — in the human-scale, macroscopic world. So as long as there is a macroscopic effect from a quantum entity, that object can be considered to be "observed" or "measured" — with no need for a conscious human observer.

But, note we have said nothing about the details of the physical process of observation. What actually occurs at the quantum level when an "observation" is made? For a detailed discussion of the act of observation, we must wait for the next chapter.

The Many Worlds interpretation

In a recent survey, the Copenhagen interpretation remains the most popular interpretation of quantum mechanics among physicists. However, in second place (and rising fast) we find the *Many Worlds interpretation* (MWI). The MWI was proposed by Hugh Everett in 1957, and might be regarded as the "parallel universes" interpretation. If you remember from earlier in this book, I am certainly not an advocate of theories based on parallel universes, and I do not believe they should be given the same credence as conventional theories.

The MWI attempts to solve the main two problems associated with the quantum measurement problem:

1) Before observation, a particle is in a superposition state of all possible values. During measurement, what causes the reduction of this state to a single value?

2) Before observation, we have many values. After observation, we only have a single real value. So what happened to all the other values that never became "real"?

According to the MWI, when we make an observation — for example, when the particle hits the screen in the double-slit experiment — the universe splits into a series of parallel universes. In each parallel universe, each possible value of the quantum superposition becomes real. For example, in the double-slit experiment, you will remember that the single photon appears to pass through both of the two slits. So when the particle hits the screen, the MWI proposes that the universe splits into two parallel universes. In one universe, the particle passes through one of the slits, and in the other universe, the particle passes through the other slit. As another example, in the case of Schrödinger's cat, when we open the box the universe splits into two: the cat is alive in one universe, and dead in the other.

This must necessarily mean that the entire universe splits — including you! Every time any measurement is made, you must split to make a duplicate of yourself, and that duplicate resides in a different parallel universe.

This simple (though extravagant) explanation appears to solve the two problems associated with the quantum

measurement problem given earlier. Firstly, it explains how a quantum superposition is reduced to a single value. The answer, according to the MWI, is that there is no reduction, no non-linear quantum "jump". All possible values of the quantum superposition become real after measurement, we just happen to inhabit one of those universes so it appears the particle only goes through one slot.

The MWI also explains the second problem associated with the quantum measurement problem: what happens to all the values of the superposition which do not become real? The answer, according to the MWI, is clearly that all values in the quantum superposition become real — in different parallel universes.

Throughout this chapter on quantum mechanics I have emphasized the philosophical questions about quantum reality before observation. Hence, the title of the chapter is "quantum reality" rather than "quantum mechanics". It is quite extraordinary how the so-called theories of everything — string theory and loop quantum gravity — say nothing at all about this crucial concept of quantum reality nor the measurement problem. This is all the more astonishing as it is my firm belief that the principle behind quantum reality plays the vital role in providing the link between relativity and quantum mechanics.

OBSERVING THE OBSERVER

In the discussion in the last chapter on quantum reality, we were left with a big question mark over the role of the observer. This is a major omission, as the observer plays such a central role in quantum mechanics. In order to resolve the quantum measurement problem, it seems essential to define the nature of the observer, and to determine what, exactly, occurs during an "observation".

In the Copenhagen interpretation, the role of the observer is to bring an object into reality. Before observation, the object appears to be in a peculiar, multi-valued superposition state, and it is only after observation that we find a single, well-defined reality. The role of the observer is clearly crucial in this case. As for defining the nature of the observer, as we discussed, it was believed at one point that only a conscious human observer was capable of performing an observation, though I think we can discount this theory.

In the Many Worlds interpretation (MWI), the role of observation is again crucial as it is the process of observation which causes the universe to split. However, the MWI claims to avoid the need for any non-linear quantum "jumping" during the observation process, as is required by the Copenhagen interpretation. According to the MWI, not only does the object under observation split into a different universe, but the observer also splits.

However, it is the belief of this book that the proponents of both the Copenhagen interpretation and the MWI did not fully appreciate the implications of a relative universe. The paradoxes which are associated with the quantum measurement problem only arise because a model of the universe is used which is not fully relational. By using a fully relational model of the universe, all the confusion about the quantum measurement problem can be eliminated — no need for the "quantum jumping" of Copenhagen, or the parallel universes of the MWI. Everything can be explained quite rationally and logically, in a single, relational universe.

Lost in space

Our first task is to get the definition of the "observer" and "observation" onto a firmer footing. Let us return to consider the example of the two astronauts, floating past each other in empty space. We initially considered this example in our discussion of relativity in Chapter Three. Imagine you are an astronaut, floating in the emptiness of space. On your right-hand side, you **observe** (note the emphasis) a fellow astronaut floating past you, travelling at a constant velocity. Your friend passes by you, before vanishing into the darkness.

Because Nature is unable to access any absolute axes of position, there is a perfect symmetry in this scenario. No astronaut can claim to be preferred. The experience of both astronauts is identical. Nature cannot assign a stationary position to one astronaut, and a moving position to the other — neither astronaut has a greater claim to be stationary. As a result, both astronauts feel stationary throughout.

So, here is an interesting thought. If, as we described, you **observed** the other astronaut throughout the scenario, then, due to the symmetry of the situation, it is obviously equally valid to state that the other astronaut observed you in precisely the same way throughout. Just as Nature could not assign one astronaut to be stationary and one moving, Nature clearly cannot assign one astronaut to be the "observer" and the other to be the "object under observation".

We are starting to see that — as far as Nature is concerned — there is simply no fundamental distinction between "observing" and "being observed". The distinction is purely a human invention.

You could replace the other astronaut with an unmanned spaceship floating past at constant velocity, and argue that the astronaut is capable of "observing" the spaceship, but it is impossible for the spaceship to "observe" the astronaut as the spaceship is not a conscious entity. However, in trying to preserve the distinction between "observing" and "being observed" in this way, you are having to reintroduce the notion of "conscious observation" which we considered and refuted in the last chapter on quantum mechanics. As far as Nature is concerned, it is just as valid for an inanimate object to observe a conscious object, as it is for a conscious object to observe an inanimate object.

Fundamental observation

To understand how Nature views the concept of "observation" we have to examine the lowest scale, the level of particles. We find that even at this fundamental level, Nature makes no distinction between "observing" and "being observed".

To show this, let us imagine we want to observe an electron to find out its current position. Essentially, this means we want to measure its position property. The obvious way to observe anything is to look at it. This works perfectly well for everyday macroscopic objects (for example, when you lose your keys), but does the principle still hold at the fundamental level of particles? Can you look at an electron, for example, to find where it is?

Well, it turns out that you can. The simplest way to detect the location of an electron is to shine a light on it. But, as we discovered in the previous chapter, at the fundamental level we find that light is made out of photons. When we hit the electron with a photon, the electron absorbs the photon (temporarily raising itself to a higher energy level) before emitting the photon again. So by attempting to observe the electron by using the photon, we inevitably disturb the object we want to observe.

At the fundamental level, all Nature consists of is interactions — collisions — between elementary particles. This can be seen in the following Feynman diagram which shows electromagnetic repulsion between two electrons. The two electrons come in from the left of the diagram, they exchange a photon between themselves (represented by the wavy line), and this has the effect of throwing them both off course, just like billiard balls:

We can simplify this diagram by hiding the nature of the collision (i.e., we are not interested in the behaviour of the photon), and just showing the deflection of the electrons when they collide:

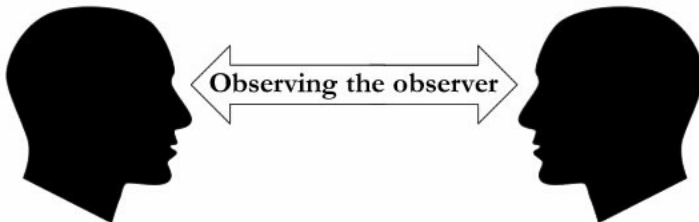

This diagram reveals the symmetry of the interaction. No particle can claim to be the "observer" with the other particle "being observed". Both particles are on an equal footing.

When we attempt to "observe" the electron using the photon, we inevitably disturb the electron — the supposed object "being observed". So the electron (the object "being observed") alters the course of the photon (the "observer") as we intended. But the photon ("the observer") also alters the course of the electron (the object "being observed") in a way which we did not intend. As a result of the symmetry of the situation, it is just as valid to say that the electron "observed" the photon as it is to say that the photon "observed" the electron!

As we discovered earlier in our discussion of the two floating astronauts, we again see that — at the fundamental level — as far as Nature is concerned, there is simply no fundamental distinction between "observing" and "being observed". The distinction is purely a human invention. Whenever you observe an object, it is just as valid to say that the object is observing you!

It is truly a case of the object under observation "observing the observer":

This symmetry reminds us of another symmetrical law, Newton's third law of motion: "Every action has an equal and opposite reaction". Essentially, if I press on a stone with my finger, the stone also presses onto my finger with a precisely equal and opposite force. Forces are interactions between two bodies, and those forces are always equal and directed in the opposite directions. Once again, this symmetry is caused by Nature's fundamental inability to distinguish between two situations: as far as Nature is concerned, your finger pressing on the stone is essentially equivalent to the stone pressing on your finger. Nature views your finger and the stone as just groups of atoms — it has no access to any absolute reference by which it could distinguish the two objects.

We are reminded of the two astronauts floating past each other in space: the experiences of both astronauts is identical. The observation made of the second astronaut by the first astronaut is equivalent to the observation made of the first astronaut by the second astronaut. Let us turn that into a general principle:

The observation of an object by an observer results in an equivalent observation of the observer by the observed object.

Maybe we should call this the "principle of the two astronauts"!

Of particular interest to quantum mechanics (in which it is impossible to measure a particle without modifying it):

The physical action on the observed object by the observer will be equal and opposite to the physical action

on the observer by the observed object (this is just a restatement of Newton's third law of motion: "Every action has an equal and opposite reaction").

Armed with these two principles, we now have a much greater understanding of what is involved during an "observation", and we are now in a position to reveal what really happens during a quantum mechanical observation. We can at last attempt to find a solution to the quantum measurement problem.

Environmental decoherence

Throughout this book we have emphasized that there is only one universe, and the universe should be treated as a single, connected object. We will now see that this provides the vital clue to solving the quantum measurement problem.

In order to understand the process of observation at the quantum level, and to solve the quantum measurement problem, it is essential to treat objects as being connected and interacting, rather than being isolated and independent. The key to solving the quantum measurement problem is to treat the object under observation and the measurement apparatus as a single, connected, interacting system. We not only have to consider the effect of the object under observation on the measuring apparatus (e.g., moving a dial on a meter), but we also have to consider the effect of the measuring apparatus on the object under observation.

We all have a natural, human bias to imagine objects under observation as isolated and independent of any measuring apparatus. This is because, at the human-scale, macroscopic level, when we measure an object we do not notice any significant change in the object under observation. For example, if we are measuring the air pressure in a tyre, we would use a pressure gauge — which inevitably results in a small quantity of air leaking out of the tyre. Hence, by measuring the pressure in the tyre, we are inevitably altering the object under observation (we are reducing the pressure in the tyre). However, the reduction in pressure would not be noticeable when compared with the overall pressure of the tyre — it would be an insignificant fraction. So at the macroscopic level, we simply do not have to worry about how our observations and measurements affect the object under observation.

This is not the case at the fundamental, quantum level. The Heisenberg uncertainty principle showed we cannot observe or measure an object without fundamentally altering it. At the quantum level, the effect of the measuring apparatus on the object under observation becomes unavoidable.

It was not until the 1970s that the effect of the role of the measurement apparatus on the object under observation was considered in detail. We have seen that a measurement apparatus is capable of reducing a quantum superposition state to reveal a single measured value, but there is nothing particularly special about measurement equipment which gives it this ability. A simple screen, for example, is capable of revealing the position of a photon in the double-slit experiment. As we quoted from the book *Quantum Enigma* earlier: "Whenever any property of a microscopic object affects a macroscopic object, that property is 'observed' and becomes a physical reality". In the 1970s, it was revealed that the general environment around a particle was capable of reducing the quantum superposition of a particle. The process by which this occurred was called *environmental decoherence*.

Essentially, the general environment (air molecules, photons, dust) performs the role of the measurement apparatus in that it betrays the position (or other property) of the particle under observation. It is the effect of the environment on the particle under observation which explains why we do not see quantum superpositions at the human scale.

So how does quantum decoherence work? For example, if we are measuring some property of a particle using a meter with a dial, how would the particle (in a multi-valued quantum superposition state) be reduced to a single-valued state? Where would the other interference states go?

The discussion in the previous section has given us a good basis for understanding what actually happens in an "observation". The key element was seen to be the symmetry of the observation. We have seen that any physical effect the object under investigation might have on the observing apparatus must be balanced by a symmetrical effect which the measurement apparatus has on the object under observation.

Considering the example of a single particle being measured by a meter, we are trying to measure the value of some property of a single particle — using a meter which is composed of billions of billions of particles. Straight away, we can see a clear asymmetry in the set-up — this is a clue as to why we get the result we see. However, let us ignore the discrepancy between observer and observed for the moment, and consider what happens to a single particle.

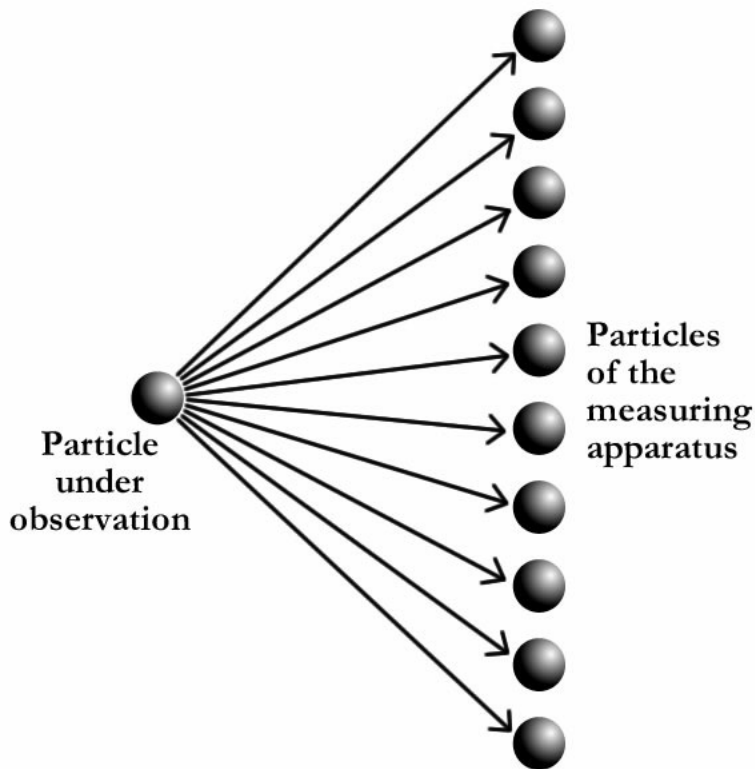

As we discussed in the previous section, when we attempt to measure a particle, it does not matter how big your measurement apparatus is, all measurements at the fundamental level have to be considered as interactions between

individual particles.

As far as Nature is concerned, at this level there is no distinction between the observer and the particle under observation. There is a perfect symmetry. There has to be a perfect symmetry. We have reached this conclusion by building-up from fundamental principles: this is caused by Nature being unable to access any absolute axes of position. No particle can claim to be preferred.

So now let us expand our model to consider the entire measurement apparatus. Clearly, this consists of vastly more particles, but the basic principle remains the same: all measurement must consist of symmetrical interactions between individual particles. The following diagram shows the first half of this symmetrical interaction — the effect of the particle under observation on each particle in the measurement apparatus:

Clearly, the effect of the single particle on each particle of the measuring apparatus is going to be small — those are small arrows I have drawn on the diagram above. The effect of the single particle is dissipated through all the billions of atoms in the measuring device and becomes effectively unnoticeable at the macroscopic level.

However, the interactions between particles has to be symmetrical. Each of those little arrows drawn on the diagram above has to produce a symmetrical reaction from each particle of the measuring apparatus back onto the single particle being measured. It is this combined reaction which is devastating for the single particle being measured:

The asymmetry of this arrangement shows that the impact of the measuring apparatus on the particle under observation is hugely larger and more significant than the impact of the particle under observation on any single particle of the measuring apparatus. The result of this huge impact is to reduce the superposition state of the particle under observation to a single, measured value.

The details of how this reduction of state is achieved is not so important (it is an active research topic, and there are various theories) — it is the asymmetry of the arrangement which is the important and decisive factor. However, it appears it is the randomness of the environment which destroys the regularity of the peaks and troughs (the *phase*) of the particle's wavelike nature. If we consider the double-slit experiment, for example, we only see the interference pattern on the screen (representing the particle's superposition state) if the regular *coherent* phases of the particle's waves are not disturbed. Any randomization of the phases causes the particle to *decohere* — the superposition interference terms dissipate unnoticed into the general environment. As Brian Greene said in his book *The Fabric of the Cosmos*: "Decoherence forces much of the weirdness of quantum physics to 'leak' from large objects since, bit by bit, the quantum weirdness is carried away by the innumerable impinging particles from the environment." For all intents and purposes, the interference effects have completely disappeared. The particle is reduced from a superposition state to a single-valued state.

Environmental decoherence provides a simple solution to the paradox of Schrödinger's cat. Long before the box is opened by the human observer, the environment inside the box (e.g., air molecules) has interacted with the radioactive material and "observed" it to discover if it has decayed or not. The state of the cat — either alive or dead, but not both — is set long before the box is opened.

Environmental decoherence also avoids the need for any non-linear quantum "jump" during the observation process. Previously, it had been believed that there was an unexplained jump between the particle's multi-valued

superposition state and the single-valued final measurement. Decoherence avoids this jump by revealing that all the interactions between the observed particle and the measuring apparatus are perfectly linear — no jumping required. Instead, the interference terms disappear due to the progressive influence of billions of particles as the particle under observation passes through the measuring apparatus. So there is a progressive filtering (of the interference terms) and amplification (of the eventual measurement). Niels Bohr referred to an "irreversible act of amplification". In this respect, the measuring device behaves very much like a radio receiver, picking out a signal on a single frequency and amplifying it, while simultaneously reducing the interference signals on all the other frequencies.

Though it appears that there is an instantaneous non-linear "jump" to particular defined state, it emerges that the process is, in fact, linear, and only appears like a sudden jump because of the sheer speed of the decoherence process. Decoherence is believed to happen in the region of 10^{-27} seconds, and is therefore one of the fastest processes known to science — but it is not instantaneous.

Experimental evidence for environmental decoherence is now emerging. In 1996, a team at the National Institute of Standards and Technology (NIST) in Boulder, Colorado isolated an atom from the environment by trapping it in an electromagnetic force field. Then, when they hit it with a laser beam they managed to force it into being in two places at once, separated by about a thousand times the diameter of an atom. Other teams based at the State University of New York and the Technical University of Delft managed to force an electric current to flow around a ring in opposite directions at the same time! [\[12\]](#)

So we now have the basis for an explanation for the quantum measurement problem. We can see why the measurement apparatus appears relatively unchanged, while the superposition state of the particle under observation is reduced. The key concept to remember is that we cannot treat particles as being isolated from the rest of the universe. We cannot consider the particle in isolation from the measurement apparatus. We have to consider the universe as a single, connected object.

Irreversibility

One of the features of quantum "jumping" is that it is irreversible. We only ever see quantum jumps in the forward time direction, from a superposition state to a well-defined state — never vice versa. This remains an unexplained mystery for some interpretations of quantum mechanics — such as the mystical Many Worlds interpretation — but can be simply explained in environmental decoherence.

There is nothing mystical about environmental decoherence — it is just a physical process like any other physical process. Hence, it comes under the remit of the second law of thermodynamics (remember back to our discussion of the arrow of time in Chapter Five). Indeed, the irreversibility of quantum jumping in the forward time direction — just like the irreversibility of a wine glass breaking in the forward time direction — is the greatest clue that increasing entropy is the underlying mechanism behind quantum jumping. Just like a wine glass breaking, or a car rusting, the entropy of a closed system will always increase with time. Likewise, when an isolated particle encounters a randomised environment, the effect of the environment will be to destroy the ordered coherent phases of the particle's wavelike nature. The regularity dissipates into the environment and can never be reformed — just like a broken egg.

Imagine you throw a rock in the sea off the coast of the United Kingdom. After the initial big splash, the ripples dissipate and apparently disappear. But of course, they have not really disappeared. The ripples have decreased in size as they have mixed and interfered with other waves, but they have not disappeared. Two weeks later, on the rocky shore of Tierra del Fuego off the Argentinean coast, one of the small waves washing to shore is maybe an imperceptible fraction of one micron higher because of that rock you threw.

So the ripples (interference terms) do not actually disappear. They dissipate into the environment and become effectively undetectable. It is certainly not possible to associate the microscopic change in the height of the wave in Tierra del Fuego with the rock you threw — there have been so many interactions with other waves along the way. In this sense, the process of decoherence is irreversible. We can't reverse the process to regenerate the initial interference components — they are gone for good. And even the "little ripple" echoes of the interference effects have become imperceptible due to interactions with the environment. Then, **for all intents and purposes**, the interference effects have completely disappeared.

THE QUANTUM RATIONALE

This is a book about reality. It is about *physical* reality. By limiting the term "reality" to mean physical reality we are immediately rejecting any notion that dreams, or ideas, have any form of reality — at least by our definition. Reality — in this book — refers to physical objects we can touch and hold. This means the material of reality is, essentially, matter.

Our definition of reality is also about *objective* reality, objects which everyone agrees are "real". This is to avoid any possible confusion with *solipsism* — the idea you are the only real consciousness in existence, and everyone else (and everything else) is just a figment of your imagination, a fictitious dream world — just like season eight of *Dallas*.

Though it can never be possible to disprove that you are living in a solipsistic world, we have to assume that we are not or else we have to accept that nothing is real and there is no point analyzing the universe around us. We have to continue our discussion on the basis that everyone's consciousness is equal, and that there is no "master consciousness" in which everything else exists only as a dream. If everyone agrees that an object is real, then we accept that it truly is real and is not just a figment of our imagination.

But this leaves the challenging question: what do we actually mean when we say something is "real"? We have an intuitive notion of what the word means which is satisfactory for our purposes, and we all use the term in our everyday vocabulary without thinking too deeply about the meaning of the word "real". But what, exactly, does it mean? What property does a "real" object have which determines its reality? How does something become real? Can an object become unreal? These are questions to which we cannot provide a satisfactory answer because we simply do not appear to have an answer to the question of what, precisely, does it mean to be "real" in the first place. We have to be careful to avoid using any linguistic terms — which might well be in common usage — without making sure those terms have clear definitions. If we are going to be serious about our quest to uncover the nature of reality, we had better make sure we know just what we mean by "reality".

David Deutsch in his book *The Fabric of Reality* suggested that real objects should "kick back". For example, if we kick a rock with our foot, the rock "kicks back" and stubs our toes. This suggests that if something is outside of our consciousness, and is able to interact with us, then it forms an independent, objective reality. I would agree with David Deutsch, and this is a good example of how we decide an object is real. But I believe his explanation of the example does not fully explain the underlying principle by which we define real objects — how we truly know that something is real when we kick it.

The key is that our reality is relative, not absolute. We define real objects in terms of other objects which we already consider to be real, or tangible. For example: "I know the apple is real because I can hold it in my hand". The apple's reality is defined in terms of the presumed reality of the hand. That is the best definition of physical reality we can ever possess, a rather circular definition.

We can see that the whole of reality is composed of a self-supported structure of relationships, objects which are

assumed to be real because they interact with other objects which are presumed to be real. There is an interconnectedness to reality, a unity. While this might seem like a very circular state of affairs, it is inevitable in a relative universe.

Reality is relative

In the previous chapter, we stressed the importance of the connectedness of the universe, and this provided us with a proposed solution to the quantum measurement problem in the form of environmental decoherence. This connectedness is, once again, an inevitable consequence of there being nothing outside the universe, and the resultant lack of absolutes available to Nature. This leads us to an extremely important conclusion: if there is nothing outside the universe, and no absolutes, then:

The properties of any particle — or any object — are determined by all the other objects in the universe.

This is an incredibly important principle, but it seems to be not generally realised. The universe is a relative structure: all properties of all objects are only defined relative to the other objects of the universe. With no absolutes available to Nature, there is simply no other way by which objects can be defined.

But what if Nature is unable to assign these relative property values? Imagine an object which is the only thing in existence — there is nothing else in the universe. What would it mean to assign property values to this isolated object? Surely, with no other objects in the universe, such property values would be meaningless. What is the point in assigning a certain mass to the object if it is unable to interact with other objects? What is the point in assigning a velocity value to the object if there is no other object by which that relative velocity could be measured? On their own, property values are meaningless. Amazingly, we see that properties do not describe the isolated object itself, **properties describe the relationships between objects** — they describe the effect we will see when that object interacts with other objects.

In an article entitled *What Is Real?* in the August 2013 edition of *Scientific American*, the philosopher Meinard Kuhlmann emphasizes this point: "A growing number of people think that what really matters are not things but the relations in which those things stand. We may never know the real natures of things but only how they are related to one another. What is the reason that we can know only the relations among things and not the things themselves? The straightforward answer is that relations are all there is." [\[13\]](#)

As the great Niels Bohr said: "Isolated material particles are abstractions, their properties being definable and observable only through their interactions with other systems."

Even though this seems like an extraordinarily important principle, I hardly ever see it mentioned. Lee Smolin is one of the few who appears to realise: "The fundamental properties of the elementary entities consist entirely in relationships between those elementary entities." And again: "A relational view requires that the properties of any one particle are determined self-consistently by the whole universe." [\[14\]](#)

A perfect example of this principle is provided by the recent discovery of the Higgs boson. It had always been believed that mass was an intrinsic property of a particle — a measure of the "amount of substance" in a particle. However, with the discovery of the Higgs boson it became clear that mass emerged as a result of the interactions between elementary particles and the Higgs field. In other words, mass arose from the relationships **between** particles — it is not an inherent property of an elementary particle.

Back in Chapter Two we considered the importance of units in our measurements. Units provide the essential relational link between the unknown object being measured and the rest of the known world. In the absence of any external absolute scale, the only way we can define an object's properties is by measuring it with equipment already located inside the universe, i.e., the object's properties are defined by its relationships with other objects inside the universe. The object's properties simply **cannot** be defined in any other way. Again, this shows that meaningful properties are not inherent in an object, but the meaning is determined by the other objects in the universe. For example, the length property of a plank of wood arises from its relationship with the measuring tape. Giving property values to isolated objects is meaningless — that would be equivalent to omitting units in your measurements and just saying "This goes up to 11".

This principle was described by Sir Arthur Eddington in 1932: "Length is necessarily relative. That is one of the results of Einstein's theory which has become almost a commonplace of physics; but it was a rather complicated kind of relativity that Einstein considered — relativity to the motion of our frame of reference. I am going to refer to another much more elementary relativity of length, viz. that length always implies comparison with a standard of length. It is only the ratio of lengths that enters into our experience. Suppose that every length and every distance in

the universe were suddenly to be doubled; nothing would seem altered. I do not think we could attach any meaning to the change."

The quantum rationale

We now have a principle that particle properties are defined solely by the relationships between the particle and the rest of the universe. By turning this principle on its head, we are led to a remarkable and important conclusion. If the rest of the universe is responsible for defining the properties of a particle, then **an object which is isolated from the rest of the universe must have completely undefined properties**. There would be no way for Nature to assign any property values — absolute or relative — to that object. The property values would be fundamentally undefined.

Let us reconsider a particle which is isolated from the rest of the universe, or has been generated as a new particle and has not yet interacted with the rest of the universe, i.e., it has not yet been measured or observed. What can we say about its properties? Once again, in the absence of absolutes, Nature is fundamentally unable to assign any absolute values to the particle. And, because the particle has not yet interacted with the rest of the universe to be measured or observed, Nature is unable to assign any relative values either. As discussed in the last section, all we can say about its property values is "They go up to 11", an essentially meaningless statement reflecting the fact that the particle's property values are undefined — they have no relation to the rest of the universe.

Before observation or measurement, the object must be like a blank sheet: it must be an undefined object with the potential to take **any** possible property values. So, before observation, the object must have a multi-valued form of reality — as is observed in quantum mechanical behaviour. It is only when the object interacts with the rest of the universe that its properties become progressively tied down to particular values.

This is precisely what we saw in the case of environmental decoherence. It is through interaction with the rest of the universe (via the measuring apparatus) that the properties of a particle become fixed. Before observation, the particle's properties are undefined.

So here, rather wonderfully, we have a rationale — an explanation — for the multi-valued nature of quantum behaviour before measurement (or observation). Here are the logical steps we followed to get to this conclusion:

- 1) Nature has no access to absolutes, so it is always fundamentally unable to assign absolute property values to a particle.
- 2) Therefore, particle properties are defined by the relationship of that particle with the rest of the universe.
- 3) Bearing this in mind, if we consider an isolated particle, or a newly-generated particle which has not yet been measured or observed, Nature has fundamentally no way of assigning any form of property values — absolute or relative — to the particle.
- 4) The properties of the particle are therefore fundamentally undefined — like a blank sheet. Its properties must have the potential to be any possible value.
- 5) The object must therefore have a multi-valued form of reality before it is observed. It is only after observation — when the object interacts with the rest of the universe — that the properties of the object become fixed.

So we now perhaps have an explanation for the apparently peculiar superposition state of objects before observation, an attempt to answer John Wheeler's question "How come the quantum?" We see that this behaviour is not so strange after all — it is, in fact, just what we should expect in a relational universe. And because we have come to this conclusion using a logical approach, we should expect this to be true in all possible universes: quantum mechanical behaviour is fundamental.

There have been many descriptions of the multi-valued nature of quantum reality, but these have always been presented as a *fait accompli* — an established fact, which should just be accepted at face value. For example, you may have read statements such as Murray Gell-Mann's *Totalitarian Principle*: "Everything which is not forbidden is compulsory". This describes quantum mechanical behaviour by saying that anything which is not forbidden can and must happen. However, statements like these do not explain **why** we see multi-valued behaviour. The rationale for multi-valued behaviour which has just been presented in this book is the first logical rationale for quantum behaviour I have read. It does not just seek to **describe** quantum mechanical behaviour, it seeks to **explain** it. It is seen that quantum mechanical behaviour is expected behaviour in a relative universe.

In the macroscopic, human world, we do not see quantum mechanical behaviour. Environmental decoherence has long since removed the quantum weirdness before it reaches the macroscopic scale. Just like the roulette wheel at the quantum casino, if you spin the wheel enough times (i.e., make many quantum measurements), the randomness inherent in quantum behaviour becomes unnoticeable. Nature always does the best it can with the tools available, and it generally does a very good job in hiding quantum mechanical behaviour from our eyes. However, when Nature is pushed to its limits, in single measurements at the smallest scales, the lack of absolutes starts to show through and we perceive the inevitable "glitches".

So, once again, we find bizarre behaviour in Nature arising as a **side effect** caused by the lack of absolutes. These side effects only start to show through at the extremes. In our discussion on relativity, we have seen these side effects emerge at extremes of speed, or in the presence of extremely large masses. We now see side effects occurring at extremely small scales.

Quantum magic

In the introduction to quantum mechanics in Chapter Six, I made it clear that I wanted to avoid emphasising the more bizarre aspects of quantum mechanical behaviour, and I hope I was successful in that respect. However, it is true that there are many aspects of quantum behaviour which do appear extremely counter-intuitive and, indeed, bizarre.

We have already considered the double-slit experiment in which a particle can apparently be in two places at one. It is also true that particles can spontaneously appear and disappear out of nothing — like a rabbit pulled out of a magician's hat. Now that we are armed with a greater understanding of quantum behaviour, can we start to make more sense of these impressive tricks from the quantum magician?

The double slit experiment is a classic example of the multi-valued nature of quantum reality, the particle being able to pass through both slits. In the discussion in this chapter, we have seen that this multi-valued behaviour is a consequence of the relative universe in which every particle must be defined in terms of its relations with the other particles of the universe. We naturally think of particle properties as being inherent in a particle, as though the particle would still have those properties if it was the only isolated object in the universe. However, when we change our mindset to accept the idea that particle properties only arise in relation to other particles, we find quantum behaviour begins to make a lot more sense, and we can then start to discover the secrets behind the quantum magician's tricks.

However, it is very hard to get out of the mindset that particle properties are not inherent in the particle. This is why quantum behaviour appears so mystifying. It is a principle employed by many human magicians. For example, the trick in which a rabbit is pulled from the magician's hat appears completely mystifying because you considered the hat to be an isolated object, with its own inherent properties. The magician did his best to divert your attention from the other objects around the hat, such as the table with the hole drilled into it through which the rabbit was passed into the hat. It is only by considering the hat's relation with the other objects in the environment that the mystery is solved — just as the effect of environmental decoherence is a solution to the puzzling quantum measurement problem.

Now let us perform a thought experiment to uncover the secrets of the quantum magician, and see how he manages to pull his particles out of a magic hat. Let us imagine — once again — that we want to measure the length of a plank of wood. Clearly, in order to obtain this measurement, we can only use objects already present inside the universe. This means we can only use the rulers, gauges, etc. which exist inside the universe. This dependency was described by Sir Arthur Eddington in his 1923 book *The Mathematical Theory of Relativity*: "Any apparatus used to measure the world is itself part of the world." There is no alternative way to obtain this reading. There is no absolute axis of length outside the universe which we could use to obtain an absolute, unequivocal reading.

So let us say we use our ruler to measure the object, and, according to the ruler, the object is one metre long. Now, bear with me on this, let's presume something really strange happens. Let's imagine every object in existence in our peculiar universe — apart from our plank of wood — bizarrely shrinks by 50%. We now find that our plank of wood has become two metres long — according to our ruler.

But this is to be expected, you might argue. There is nothing surprising here, you might say. The object has not really doubled in size, you might argue, it is merely our ruler which is giving an incorrect reading. The object was previously measured as being one metre long and, in the absence of any external influence acting on the object, it is always going to be one metre long. The property of being "one metre long" is an intrinsic, unvarying property of the object. At least, that is what you might argue.

Well, you would be wrong. Remember that any object in the universe can only be defined in terms of every other

object in the universe — Nature has no other way of defining the properties of an object. There is no absolute axis of size outside the universe to which Nature can refer. If the universe tells us the object has doubled in size then, **by definition, the object really has doubled in size!**

This is extraordinary, and we are left with an apparently bizarre conclusion which goes against all intuition. No force has acted on the object, and yet it has doubled in size. It is as though some self-contained internal magic of the object has made it change its state. It appears a property of the object — which we believed to be innate and unvarying — has been radically modified. We would naturally attribute this change in the object's state to some peculiar mechanism **inside** the object. Just as with the magician's hat, we would think the hat was magic, and try to understand what was special about the hat.

However, the secret to the trick does not lie with the hat, and it does not lie with the isolated particle. The secret to the trick is the environment: the hole drilled into the magician's desk, or the doubling of the scale of the universe. Even the very existence of the particle itself is dependent on the universe around it — if the universe says the particle does not exist then, by definition, it ceases to exist. There is no other external standard by which Nature can determine the existence of the particle.

It is all too easy to ignore the environment and concentrate on the single particle under observation, but it is only by considering the complete magician's set-up, and the relationship of the particle with the environment, that we can finally uncover the secrets of quantum magic.

Symmetry and quantum mechanics

To end this chapter's discussion on quantum mechanics, it is interesting to consider underlying connections between symmetry and quantum mechanics.

It is important to stress that it is not only measurements of space or time that must be taken as relative. As there is a complete absence of any absolutes — of any form — in the universe, this means that Nature cannot have access to absolute standards for **any** type of properties. This explains why the quantum formulation applies to all of Nature, describing all forms of particle properties, not just those associated with space and time.

Carrying on this thought, in our discussion on symmetry in Chapter Three we saw how the lack of absolutes available to Nature caused symmetries. As was explained then, symmetry reflects Nature's fundamental inability to distinguish between one physical situation and another. If Nature is unable to distinguish between two situations, then we can transform one physical arrangement into another without altering the situation. This represents a symmetry.

If reality is completely defined by relations then those relations are unchanged under a symmetry transformation. As the philosopher Meinard Kuhlmann (who was mentioned earlier in this chapter) explains: "In quantum mechanics as well as in Einstein's theory of gravitation, certain changes in the configuration of the world — known as symmetry transformations — have no empirical consequences. The transformations exchange the individual things that make up the world but leave their relations the same. By analogy, consider a mirror-symmetric face. A mirror swaps the left eye for the right eye, the left nostril for the right, and so on. Yet all the relative positions of facial features remain. Those relations are what truly define a face."

So if Nature has no access to absolute standards for particle properties, then we would expect to see similar symmetries in particle properties — and this is exactly what we do see. It has long been known that symmetry plays a remarkable role in particle physics. Different types of particles can be classified into groups, those groups exhibiting symmetries. The discovery of new particles has even been predicted because they are required to complete a perfect symmetry. From our discussion, it is clear that the cause of all this symmetry in particle properties is a result of the fundamental limitations on Nature due to the lack of absolutes, which results in Nature's inability to distinguish situations.

In Chapters Three and Four we considered relativity and we found that there was symmetry in the universe in both space and time (space and time translation invariance) due to the lack of absolute space or time. In this chapter we have considered the properties of the elementary particles and, again, we have found symmetry in their properties. On the basis of our analysis we can see that there is the same underlying cause for both types of symmetry: no absolutes means reality must be relative. This is a quite remarkable conclusion: an apparent unification of symmetries! Symmetries in space, time, and particle properties have the same underlying cause.

Now let us examine an example of particle property symmetry, the symmetry between positive electric charge and negative electric charge. The technical name for this symmetry is U(1) symmetry:

This symmetry arises because the property of positive charge is **defined** as the opposite of negative charge. The two properties — positive charge and negative charge — are defined in terms of each other, and in **no other way**. This is perhaps what we might have expected to find based on our discussion throughout this book. There is no absolute definition of any particle property: particle properties must be defined relative to each other.

Because these properties are defined solely in relative terms (and not in absolute terms), if every positively charged particle in the universe became negatively charged, and simultaneously every negatively charged particle became positively charged, then the overall situation would be unchanged — the universe would continue as if nothing had happened. This is because the relation between the charged particles (which is the only important measure) would be unchanged.

This means that we are essentially free to define "positive charge" differently at every point in space. However, Nature needs to have some way of ensuring that "positive charge" at one point in space is the same type of charge as "positive charge" at a different point in space — it needs to keep track throughout the universe. Otherwise, particle charges would be free to swap between positive and negative at random, and the result would be chaos (and would also break the law of conservation of energy [15]). The way Nature keeps track is to have a field passing through space, defining which type of charge is actually the definitive positive charge. This type of field is called a *gauge field*, and is a result of the perfect symmetry of elementary particles. For the case of electric charge, the gauge field is the electromagnetic field and is carried by photons.

To quote Robert Oerter from his book *The Theory of Almost Everything*: "Our inability to define the charge in any **absolute** [my emphasis] sense is the ignorance that gives rise to a quantum field: the photon field." So not only is particle symmetry due to Nature's inability to access absolutes, we now find that the electromagnetic field is also due to this restriction on Nature. The electromagnetic field allows Nature to keep track of charge in the same way that the gravitational field allows Nature to keep track of masses. In fact, it can be shown that all four fundamental forces (electromagnetic, strong, weak, and gravity) are a direct result of different types of gauge symmetry. [16]

As we have discussed, it has long been known that relativity is due to the absence of **absolute** space, and, as we have just found in the quote from Robert Oerter, it has been known that the quantum mechanical behaviour of gauge theory has been due to Nature's "fundamental inability to define the charge in any **absolute** sense". So here we have a quote describing the cause of relativity as being due to a lack of absolutes, and another quote describing the cause of quantum mechanical behaviour as also being due to a lack of absolutes. So why has this obvious connection between quantum mechanics and relativity not been identified earlier? It is not as though this is arcane knowledge hidden away in obscure scientific journals. Quite the opposite in fact: both of these quotes are taken from popular science books which you could find in your local bookstore. I am surprised that such an obvious link could have been overlooked for so long.

9

HIDDEN IN PLAIN SIGHT

In our study of quantum mechanics in Chapter Six, we considered the importance of the role of the observer in quantum mechanics. The role was of such significance that, at one time, it was even believed that a human consciousness was required to bring reality into existence at the quantum mechanical level. If quantum mechanics and relativity truly share a common root — as proposed in this book — we would expect relativity to exhibit a similar fundamental observer dependence. However, at first glance, it would appear this crucial observer dependence is not found in relativity. This belief is expressed in a quote from Lee Smolin in his book *Three Roads to Quantum Gravity* comparing Newton's view of the observer to Einstein's view: "The problem is that, while quantum theory changed radically the assumptions about the relationship between the observer and the observed, it accepted without alteration Newton's old answer to the question of what space and time are. Just the opposite happened with Einstein's general relativity theory, in which the concept of space and time was radically changed, while **Newton's view of the relationship between observer and observed was retained.**"

However, the more you think about it, the more you realise that "Newton's view of the relationship between observer and observed" was most certainly **not** retained in the theory of relativity. In fact, relativity is the very epitome of an observer-dependent theory!

Let's start by asking a simple question: how fast is the spaceship travelling in the following image?

Clearly, if there is "nothing outside the universe" then, in the absence of any absolute measurement scale outside the universe, we cannot assign any absolute speed to the ship — we have nothing to measure it against. We cannot assign a speed to the spaceship on which all observers in the universe will agree. In fact, the only way we can assign any numerical value to the speed of the ship is by giving up all hope on finding an absolute, observer-independent speed, and by considering its relative speed instead.

So, if we want to obtain a numerical value for the speed of the spaceship, we have to first define our observer:

In the previous image, we have defined a position for our observer and we can now obtain a value for the velocity of the spaceship — relative to our observer — which happens to be 600mph, travelling to the right.

However, according to Newton, the function of the observer was unimportant. In Newton's absolute space, it can be stated with certainty that the spaceship is moving at an absolute speed of 600mph. The role of the observer plays no part in determining the velocity of the spaceship. However, when the theory of relativity was proposed, the idea of absolute space was refuted. Let's say we make contact with the captain of the spaceship and ask him to "observe our observer". According to the captain, it is in fact our observer who is moving at 600mph, and, as no frame of reference is preferred in relative space, the captain must be considered to be just as correct as our initial observer. In relative space, if a spaceship is moving at 600mph relative to an observer, it is just as valid to say the observer is now moving at 600mph relative to the spaceship. In Newton's model, the observer is stationary, but in Einstein's model it is valid to say the observer has a relative speed of 600mph! To answer Lee Smolin, I would say that constitutes a rather severe modification of "Newton's view of the relationship between observer and observed"!

As I said earlier, relativity is the very epitome of an observer-dependent theory. And this point is vital to this current discussion: quantum mechanics and relativity are both observer-dependent theories.

Now let us imagine we have a second observer on a second spaceship travelling to the left at 400mph:

According to this second observer, the first spaceship is in fact travelling to the right with a relative velocity of 1000mph (the sum of 600mph + 400mph). So we now have two different observers who make two different measurements for the velocity of the spaceship. Our initial observer measures a value of 600mph, whereas our second observer (in the second spaceship) measures a value of 1000mph. This clearly shows how observer-dependent this velocity measurement really is.

We have seen that there can be no measurement of velocity without first defining an observer. To assign any form of velocity to an isolated object with no relation to the rest of the universe would be absolutely meaningless. Velocity is only defined relative to another object in the universe.

At this point, alarm bells should be ringing in your head — where have we heard a similar statement before? It is exactly the same principle as we revealed in the discussion of particle properties in the previous chapter: the properties of a particle are determined by its relationship with all the other objects in the universe. So now have uncovered the same principle underlying the properties of a particle and the measurement of relative velocity. Could this possibly be starting to sound like the start of another link between quantum mechanics and relativity?

But in our discussion of particle properties in the last chapter, we derived the result that objects which were isolated, or had never been measured, would have properties which would have to be in an undefined state, a strange multi-valued state. This led us to form a rationale for quantum mechanical behaviour. But this is surely not true for the spaceship's velocity — the spaceship's velocity is clearly not in a multi-valued state before observation.

Or is it?

As we have just seen in our previous illustration of measuring the spaceship's velocity, one observer measured the velocity of the spaceship at 600mph, while the other observer measured the velocity of the spaceship at 1,000mph — clearly a multi-valued reality! In the absence of absolute space, either velocity value — or both — is equally valid.

But having two different answers to our question "How fast is the spaceship travelling?" is not a very satisfactory answer. Can't we do any better? Can't we get an observer-independent, absolute value for the velocity of the spaceship — before any observer-dependent measurement is taken? Well, the standard answer is, no, in our universe only relative velocity has a meaning. But, you might say, that is totally unsatisfactory. Before any measurement is taken, the spaceship clearly has a velocity — we know it is moving. So why can't we determine its value before observation? Its velocity clearly has a reality before observation — why can't we assign a value to it?

Well, I suppose the best we could do is assign the spaceship with a **potential** velocity which has to take **any possible value** from zero up to the speed of light. For example, if the spaceship of the second observer in the previous example is travelling at a million miles an hour, we now find our measurement of the initial spaceship's relative speed is 1,000,600mph. With an infinity of potential observers in the universe, we could say that the before-measurement, observer-independent velocity of the spaceship is **any** possible value.

So let's recap:

1) Before measurement, we know the spaceship's velocity has a reality (we know the spaceship is moving), but we cannot assign a value to it.

2) If we want to obtain a measurement then we have to specify an observer as the measurement is completely observer-dependent.

3) But if we want to assign a velocity to the spaceship **before** observation we have to assign all possible velocity values to it.

So where have we heard a description like this before? **There are clear parallels with quantum mechanics!** Compare this with the situation of quantum mechanics:

1) In quantum mechanics, we know a particle has a reality before observation, but we cannot assign a value to its properties.

2) If we want to obtain a measurement then we have to specify an observer as the value is completely observer-dependent.

3) But if we want to assign a value to its properties before observation, we have to assign all possible values to it.

These three points are absolutely identical to the three points raised in our previous relative velocity scenario!

So clearly the two scenarios — relative velocity (which leads to relativity) and quantum mechanics — show astounding similarities. This is because quantum mechanics and relativity share the same underlying cause, a common root to their behaviour. And that common cause is a universe in which Nature is denied access to absolutes, a universe in which everything must be defined in terms of everything else, and in which all of reality is relative.

It might seem rather astonishing that no one has pointed out this incredibly simple link before. A startlingly obvious link between relativity and quantum mechanics due to the two theories having the same underlying cause. I believe this has gone unnoticed purely due to the quite stupendous simplicity of the solution — it has truly been hidden in plain sight.

Actually, when I say no one has pointed this out before, I must say that the loop quantum gravity researcher Carlo Rovelli has hinted at a connection: "Quantum state and values that an observable takes are relational notions, in the same sense in which velocity is relational in classical mechanics (it is a relation between two systems, not a property of a single system). I find the consonance between this relationalism in quantum mechanics and the relationalism in general relativity quite striking. It is tempting to speculate that they are related." [\[17\]](#)

CONCLUSION

In this book, an incredibly simple link has been suggested between relativity and quantum mechanics. By building-up from fundamental principles, it can be shown that both theories share a common root: the fundamental inability of Nature to access any absolutes in the universe.

Perhaps the reason why such a simple solution to the problem of unification could have gone unnoticed for so long is that the proposal depends on an explanation of the foundations of quantum mechanics. Sadly, with a few exceptions, there is little interest or research in foundational questions of quantum mechanics at the moment. This has not always been the case — the rapid progress in quantum mechanics in the early years of the twentieth century placed foundational questions at the forefront of research. However, in the current academic climate, foundational questions seem to be considered the remit of philosophy — not physics, and get precious little attention. As a relevant example, string theory and loop quantum gravity seem to have nothing to say about the quantum measurement problem — an absolutely fundamental component of quantum behaviour.

This is a great shame, because if the principle described in this book is even remotely accurate, it would appear that foundational questions have a vital role to play in uncovering the unification of relativity and quantum mechanics. It would appear true unification can only be found at a deeper level of analysis than is considered by current approaches which attempt to mesh relativity and quantum mechanics together at a higher level of reality. It is not my fault if people are looking for unification at the wrong level. If the work described in this book is correct, then until foundational questions are tackled head-on, there will be no unification.

This conventional approach to unification — of attempting to mesh relativity and quantum mechanics together at a high level — leaves me with a rather surprising thought. Surely, the first approach one should try when attempting to unify two theories should be to stand back and consider the **similarities** between the two theories. What do the theories have in common? This would seem the obvious approach. The commonality would then direct the researcher towards the unification. I like to think that this approach has been followed in this book, especially in the common link revealed in Chapter Nine. However, it seems this "obvious approach" of considering the similarities between the theories is not what has happened. Instead, there appears to have been something of a "brute force" approach to unification, attempting to weld the theories together. As far as I am aware, no one has bothered to stand back and say "What have these theories got in common?"

To those who would criticise the hypothesis described in this book on the basis that it is absurdly simple, I would simply direct them to the discussion in Chapter One which revealed how all unifications in physics have been based on incredibly simple ideas, ideas which can be understood by anyone. Indeed, based on the discussion in Chapter One, it was stated that any successful unification hypothesis **has** to be extremely simple — a criterion which is not met by string theory or loop quantum gravity. As Bruce Schumm says in his book on particle physics, *Deep Down Things*: "Physicists like to believe that, in its essence, the universe is guided by a small set of such beautiful organizing principles — principles free of complex hypotheses that do little more than telegraph our ignorance."

To criticise a unification hypothesis on the basis of it being overly-simplistic seems perverse to say the least!

Certainties and absolutes

I would like to finish the book with a few general discussion points which have been raised by the proposal.

As has been discussed throughout this book, at the human macroscopic scale, we are able to operate as though we have access to absolute scales of measurement. We can access measuring tapes and speedometers which apparently allow us to make absolute measurements of length and speed. However, what must be realised is that in a relative universe everything must be defined in terms of everything else in the universe — there are no genuine absolutes. This inevitably results in very circular definitions of measurements. Just like the example of the apple being held in the hand in Chapter Eight: "I know the apple is real because I can hold it in my hand", we find that the whole of reality is composed of a self-supported structure of relationships. In this case of the apple, we assume an object to be real because of its relationship with another object which we already presumed to be real: the hand.

So all the objects in the universe — at the macroscopic level — are connected in an endlessly complex mesh of

interrelationships. Everything supports everything else. This gives us the luxury of an impression of absolutes and certainties: our impression of reality might be an illusion, but that illusion is at least supported by the rest of the universe.

Considering the position of particles, for example, the relative nature of environmental decoherence means we get an impression of complete certainty as to the position of a particle. The environment — the universe around the particle — works together to provide an impression of certainty. However, as we delve deeper into the fundamentals of the universe, we find that self-supporting network is progressively stripped away. Eventually, we reach the fundamental layer when objects can be isolated from the rest of the universe. At this point, we say quantum mechanical effects are dominant, but what we really mean is that that mesh of certainty is completely stripped away. At this point, we see our macroscopic certainties and absolutes for what they really are: an illusion of the relative universe. We find certainties stripped away in the Heisenberg uncertainty principle. We find absolutes stripped away in similar fashion, leading to multi-valued behaviour.

Put simply, there are no such things as certainties and absolutes. In the mathematical world, yes, we can find these things, but not in the physical world.

When Nature is stripped naked, we find the emperor has no clothes (or certainties or absolutes). We call the result quantum mechanics.

As Sheldon Cooper has said: "Quantum physics makes me so happy. It's like looking at the universe naked."

Too Many Worlds

The universe is a structure of such elegance, simplicity, and economy that I can't help thinking that whoever first proposed the concept of multiple parallel universes did Nature a great disservice — that is to ignore the evident simplicity and economy of the universe. I am sure the proponents of parallel universes did it with the best intentions but, really, the damage has been done. It seems almost impossible to pick up a popular science book these days without reading how there exists a parallel universe in which a forty-foot gorilla has just won the Olympic gold medal in synchronised gymnastics.

Articles such as that must make great copy — and maybe good book sales — but the message of physics is one of economy and simplicity. In physics we find energy is minimized, structures are symmetrical, simpler explanations are preferred over more complex explanations. As William of Occam said: "Entities should not be multiplied unnecessarily". We should only add complexity to our explanations as a last resort, if there is no other solution available. At all times, the thrust of our drive should be towards simplification.

Ironically, by postulating the existence of multiple parallel universes, researchers are missing out on the analytical power of the principle that the universe is the one thing that exists. By saying that "everything that can possibly happen will happen", the theorists who advocate parallel universes are losing any constraints to their theories. Anything goes, basically. But, ironically, constraints can make our job much easier. Imagine you are an author, and you are seeking inspiration for a new book. You might sit down in front of your typewriter or word processor and stare blankly at a sheet, waiting for inspiration before you can get started. However, if you are commissioned to write a book about a certain subject — for example, a book about a kidnapping — that instantly gives you a start and gets your mind thinking along certain lines. Constraints help us in finding a solution. In fact, if the problem becomes completely constrained — your commission telling you the entire plot of the book — then the solution becomes completely obvious.

A theory that predicts everything predicts nothing — it is completely unconstrained. This makes our job of finding a solution much harder. By imposing fairly obvious constraints, such as saying there is nothing outside the universe, we make our job in finding a solution much easier, because then we realise that our solution must be found within the universe, and not in some parallel universe scenario. In the case of relativity and quantum mechanics, I believe it is the constraint that there is nothing outside the universe which, indeed, completely constrains the problem so the solution does, indeed, become completely obvious. I believe the results in this book show how the constraint leads directly to both quantum mechanics and relativity. This result could never have been derived if we had lazily jumped to the conclusion that we needed parallel universes to explain these phenomena.

We should not be lazy. We should seek to explain the universe on the basis of what we already know, not on the basis of some flight-of-fancy science fiction. Wild speculation does our quest more harm than good, and hinders our progress. The answers we seek are contained within the universe. The answers we seek are located much closer to home than we might imagine.

Reductionism and emergence

In its efforts to understand the universe, physics has always taken a *reductionist* approach. This means that research has progressed based on the principle that we can understand things by breaking them down — and analyzing — their smallest constituent parts. As an example, particle physics attempts to discover the smallest particles and the most basic forces. The belief is that the smaller the particle, the better your understanding of the physical world.

For many simple applications this approach works well. For example, analyzing the large-scale properties of materials on the basis of their particle chemistry (finding the strength of materials, the temperature at which they melt, etc.). However, for more complex applications this approach proves woefully inadequate. This is because many large-scale phenomena which result from the complex interaction of billions of particles could never be predicted purely by analyzing the properties of a single particle. In this way, the whole is greater than the sum of its parts.

One classic example of an emergent phenomenon is intelligence. You could never realise that such an extraordinary phenomenon could arise if you followed the reductionist approach of analyzing only a single brain neuron. A single neuron is just a simple switch, basically. There is no clue in the structure of a simple switch that it might lead to high-level brain function.

Throughout this book, it has been stressed that the properties of single particles should not be considered in isolation. Properties describe the relationship between objects and arise through the interaction of an object with the rest of the universe. This clearly shows that a reductionist approach is not suitable at the fundamental level.

If, for example, a single particle is moving, how can we define its velocity? Clearly, the velocity is not an inherent property of the particle, but, rather, it has to be defined relative to some other particle. So if we add an additional particle, we can now determine the velocity of the first particle relative to the second particle. But what quantitative result can we possibly get with just two particles? Not very much is the answer — we can just determine that the particles are moving relative to each other. In order to quantitatively measure that velocity, we need some standard measure of speed, and that means we need some more particles with which we can produce standards of distance and time, eventually forming meters and clocks. In fact, to get any useful meaning from our initial particle, we find we need more and more particles, introducing additional layers of meaning. So we see that properties of particles are not held in single particles, but rather those properties progressively **emerge** as the universe is built-up in layer-upon-layer of meaning.

In fact, this shows the importance of treating the universe as one object, with properties of particles only emerging when the universe is treated as a whole.

This realisation raises a problem for physics research which been firmly based on a reductionist model of the universe. The mathematics used by physicists is simply not up to the job of analysing a complex, emergent universe. The neat and simple equations used by physicists might be only suitable for analysing a "toy model" simplified version of the universe, which ignores the possibility of emergence, complexity, and chaos. These processes which can be simplified are called *computationally reducible*. As Stephen Wolfram has said: "Almost all of what traditional equation-based science has been doing is looking just at those computationally reducible parts." However, if the universe is truly computationally **irreducible** then it might be simply impossible to analyse it using simple equations. In fact, the only way to analyse it would be to create a computer with the same complexity as the universe itself!

The laws of Nature

In Chapter One, it was stated that one of the goals of this book was to determine how much of the universe could have been created differently, and how much is a logical necessity. The eventual goal was expressed by Einstein: "What I am really interested in is whether God could have made the world in a different way; that is, whether the necessity of logical simplicity leaves any freedom at all."

Because our approach was to build-up from fundamental principles, we could be sure that any result we discovered would have arisen from logical necessity. Rather astonishingly, we discovered that a remarkable proportion of the laws of Nature could be derived from our fundamental principle — that there is "nothing outside the universe". From the analysis, it appeared that both relativity and quantum mechanics could be derived from the fundamental principle, and so both these behaviours would appear to be fundamental, i.e., there would have to be quantum mechanical and relativistic behaviour in any conceivable universe. Not only that, we find we can derive the requirement for a gravitational field, symmetry in both space and time — and symmetry of particle properties, the

requirement that the total energy of the universe is zero, and the necessity of gauge fields. The fact that we can derive such a high proportion of the laws of Nature from our fundamental principle gives us great confidence that it is, indeed, the fundamental principle.

A remarkable proportion of the laws of Nature, therefore, could be considered to be necessary and not contingent. However, it remains true that it is hard to imagine how the arbitrary nature of the physical constants of Nature could ever be derived from fundamental principles. The 19 numerical constants in the standard model of particle physics, for example, appear to have values which are completely arbitrary.

To my mind, on the basis of this study, it appears that the major laws of Nature (quantum mechanics, relativity, the second law of thermodynamics, etc.) appear to be fundamental, derived from fundamental principles, and would necessarily have to apply to every conceivable universe. However, it is the remaining arbitrary free parameters which would appear to give the universe its actual form (the properties of the elementary particles, etc.), and it would appear that these values could not be derived from fundamental principles.

This problem is exacerbated by the fact that it appears the fundamental constants have fine-tuned values which have resulted in a "life-friendly" universe. The fashionable answer to this conundrum seems to be to resort to anthropic reasoning, and to suggest the constants are set to different values in different parallel universes. However, the central tenet of this book is that there is only one universe. In the analysis in this book, we have found that building-up from that principle has proved to be a wonderfully effective predictive tool, which suggests that the principle is correct. In which case, to find the solution to the apparent fine-tuning of constants we should restrict our search to solutions contained **within** the universe. I would agree with Lee Smolin from *Three Roads to Quantum Gravity*: "This first principle means that we take the universe to be, by definition, a closed system. It means that the explanation for anything in the universe can involve only other things that also exist in the universe."

The secrets we seek can all be found **within** the universe. We just have to look more closely — they are hidden in plain sight.

FURTHER READING

Three Roads to Quantum Gravity by Lee Smolin

Fascinating guide to the state-of-the-art, by one of the leading researchers in the field. Highly-relevant to this book.

The Theory of Almost Everything by Robert Oerter

A comprehensive and readable account of the development of the standard model of particle physics, including a useful exploration of symmetry.

Quantum by Jim Al-Khalili

The best introduction to quantum theory.

The Elegant Universe by Brian Greene

A thorough guide to string theory, unification, and quantum gravity.

The Fabric of the Cosmos by Brian Greene

Excellent guide to relativity, Mach's principle, and the gravitational field.

Introducing Time by Craig Callender and Ralph Edney

A guide to time, and the history and principles behind the block universe theory.

The Complete Idiot's Guide to String Theory by George Musser

Not really a guide to string theory — more a comprehensive and accessible introduction to all aspects of quantum gravity research.

Simply Einstein by Richard Wolfson

A comprehensive walkthrough of relativity.

The Mind of God by Paul Davies

Fundamental questions about why the universe is the way it is. Could the universe have been built differently?

The Trouble with Physics by Lee Smolin

A provocative and informative book.

Deep Down Things by Bruce A. Schumm

An excellent guide to particle physics which is more technical than Robert Oerter's book.

Introducing Quantum Theory by J.P. McEvoy and Oscar Zarate

The "Introducing" series of books are extremely well constructed.

New Theories of Everything by John D. Barrow

Deep consideration of the laws of Nature.

The Fabric of Reality by David Deutsch

Fascinating discussion of reality and the block universe model.

ACKNOWLEDGEMENTS

Several people have been a considerable annoyance during the writing of this book. Chris Parker and Steve Skelton have repeatedly pressed me to include teenage vampire love interest, while Paul Noonan's suggestion of offensive chapter titles has also been incredibly irritating.

However, I would like to thank Chris for all his help with the graphical layout, general comments and ideas, and proof-reading, and Paul for additional proof-reading.

Steve, unfortunately, was of little use.

9) CONCLUSION

PREFACE

This is my second book. I was absolutely delighted at the success of my previous book, *Hidden In Plain Sight*. If you bought my previous book, then thank you very much. If you have not already read *Hidden In Plain Sight* I can recommend it as some of the work in this book builds on the principles described within it.

The discussion and reasoning in this new book might appear to be extraordinarily simple. This is quite deliberate. As I explained in my previous book, I am convinced that the fundamental principles which underlie reality **must** be simple. The drive to uncover the fundamental truths of physics must surely be a drive toward simplicity.

After considering the link between quantum mechanics and relativity in my previous book, this book considers a possibly simple solution to the unsolved mysteries behind gravity, dark energy, black holes, and many other cutting-edge problems in current theoretical physics. My books are nothing if not ambitious!

I deliberately make my books fast-paced and easy to read, packed with only relevant information and no padding. So it's a book with a real big bang!

2. A serious situation or problem.

1

INTRODUCTION

As physics progresses along its path of unlocking the secrets of the universe, it might be thought that the number of unsolved problems would be reduced. However, this does not seem to be what is happening. Instead, the more we find out about the universe, the more problems we unearth. And the problems we discover seem deeper, more profound, and more insoluble than the problems we have just solved. This was summed-up by the great physicist John Wheeler: "We live on an island surrounded by a sea of ignorance. As our island of knowledge grows, so does the shore of our ignorance."

It has been suggested that the field of theoretical physics seems to be in less-than-superb shape at the moment. The main thrust of research towards a possible "theory of everything" is directed towards string theory. This may well eventually emerge to be the correct model of Nature, and a great deal of very clever people seem convinced by it, however, considering the amount of research effort which has been directed at this theory over more than four decades, it is hard to disagree that progress has been disappointing. But there appears to be a lack of diversity of alternative research.^[1] String theory has been called "the only game in town", and maybe that is the heart of the problem.

Meanwhile, the highly-publicised discovery of the Higgs boson by the Large Hadron Collider (LHC) seems to have created panic among particle physicists. You might find that surprising, after all, didn't they predict that the Higgs boson was there to be found? Well, yes, they did — and that's the problem. An experiment which just verifies your prediction tells you nothing new about reality. It so happens that the properties of the discovered Higgs boson were a particularly close match to those predicted. Eight billion euros to tell you something you already knew does not sound like good value for money. There is no hint in the LHC results of new directions for research, and hence there is no convincing motive to spend new money. This sounds very much like the end of the line. A lot of particle physicists are scared for their jobs.

It appears that the LHC has also brought bad news for string theory. The full name of string theory is "superstring" theory, with the "super" standing for "supersymmetric". According to supersymmetry (or SUSY), each elementary particle is paired with a superpartner particle. However, the LHC has not detected any of these predicted particles.

If I had to sum up the current state of theoretical physics, I would say it lacks direction. It appears that we have come to the end of a long road — and we have no map to tell us which direction to take next.

So where do we go from here? Well, if you are like me, you got interested in physics because you want answers. You want to get to the bottom of things. We want to know "why" things happen. However, most physics research is merely aimed at **describing** the phenomena of Nature — it is not aimed at answering fundamental questions of "why". Such questions would be considered the domain of philosophy, not physics.

A good example are the equations of general relativity, which describe gravity as emerging from the curvature of spacetime. These equations are clearly an improvement in accuracy over Newtonian gravity, but seem to get us no further along the road of explaining just **why** masses attract each other. Saying that masses follow straight lines in a curved spacetime does not answer the fundamental question of **why** objects follow a straight line in curved spacetime. We are just describing the phenomena — not explaining it.

And so many of these descriptions seem excessively complicated to my eyes, string theory in particular seeming to revel in excessive mathematical virtuosity. It seems as though we are moving away from a search for simplicity in favour of increasing complexity. Is this really the likely route to unlocking the secrets of the universe? I feel very strongly that as we dig deeper, and approach more fundamental levels, then our theories should actually become simpler and easier to understand. My books reflect this belief.

The majority of current research seems only interested in capturing the minutiae of the complexity of Nature — there is no consideration of the bigger picture. I would agree with Sir Patrick Moore, the sorely-missed presenter of the long-running BBC television programme *The Sky At Night*: "The one inescapable fact is that we exist, and so does the Sun, the stars, and the Earth, and everything else. And no one has yet explained how the matter came into existence in the first place. Which adds force, I think, to my own contention that **we are pretty strong on detail but we are still very weak on fundamentals.**"

In my series of books, I am trying to get to the bottom of things. By working with fundamental principles it appears we can get satisfactory answers to questions of **why** Nature behaves the way it does.

Simple solutions to big problems

We could list several of the most puzzling and important unsolved problems in current theoretical physics:

- The unification of quantum mechanics and relativity. The two dominant theories of physics remain stubbornly at odds with each other. However, it should be possible to combine them into a single, deeper theory.
- How can we make sense of the "weirdness" of quantum mechanics? What does it all mean?
- Dark matter. What is the mysterious substance which greatly exceeds the amount of normal mass in the universe?
- Dark energy. What unknown force is powering the acceleration of the expansion of the universe?
- The black hole information loss paradox. General relativity says that information can be lost in black holes, but, according to quantum mechanics, this should be impossible.
- Inflation of the universe. The theory which has been at the cornerstone of cosmology for thirty years has been found to be flawed. But any replacement theory has to be able to explain why the structure of the universe is so smooth.

The first two problems I have listed — the unification of quantum mechanics with relativity, and how to make sense of bizarre quantum mechanical behaviour — were considered in my previous book. I am pleased to say that this new book is going to propose a potentially simple solution to many of the remaining problems.

Forces

Why do things move?

That's a fairly profound question. Why do apples fall? Why do the planets orbit the Sun? Why do magnets attract pieces of metal? [\[2\]](#)

The general answer to the question of why things move would be to say that they have been acted-on by a force. It was Isaac Newton who first correctly identified the role of a force in producing motion. If a force is applied to a stationary object, then the object will start to move. The force acts to accelerate the object.

There are four fundamental forces: the electromagnetic force, the strong nuclear force, the weak nuclear force, and gravity. These are all *conservative* forces. A conservative force does not lose energy as it acts (hence, "conservative"). This means that if an object is moved in a closed loop by a conservative force, and thus returns to its starting position, the net work done is zero.

As an example of this feature of a conservative force, imagine throwing a stone directly upwards at a speed of ten miles per hour. The stone will gradually lose speed as it rises, and will come to a halt at a maximum height. The stone will gain speed as it descends and, when it passes your hand on the way down, it will again be moving at ten miles per hour. This conservation of the speed of the stone is due to gravity being a conservative force.

However, this will only be the case if we ignore the effect of air resistance, which is a form of friction. Friction is an example of a non-conservative force. Friction acts to slow the speed of the stone, to decrease the energy of the stone, and to dissipate that energy into the environment in the form of heat. For example, if you throw a stone up a sand dune at ten miles per hour, the stone will find the sand sticky due to friction, and when the stone passes your hand again on the descent, its speed will be considerably less than ten miles per hour. The energy of the stone will have been dissipated into the environment.

Conservative forces (i.e., forces without friction) are perfectly reversible. For example, if you made a video of snooker balls knocking into each other on a snooker table, and you reversed that video, it would still look like normal behaviour. Even when the action is reversed, you would still see balls hitting other balls and rebounding according to Newtonian mechanics. However, non-conservative forces are not reversible. This is because non-

conservative forces dissipate energy into the environment. Eventually, the snooker balls would slow to a halt due to the effect of friction. This is an irreversible effect.

The real reason behind the irreversible nature of non-conservative forces is due to a quantity called *entropy*. Entropy can be thought of as the amount of disorder or randomness in a system. We will be considering entropy in detail in Chapter Five, but for now all we need to know is that the entropy of a system will always increase, and can never decrease. This seems to make a lot of sense: a system tends to increasing disorder over time. For example, your glistening new car will wear-out over time as its atoms become increasingly disordered through wear and tear. The non-conservative force of friction converts energy into heat, which is the random motion of atoms. This randomness of heat means it has a high entropy. This is what introduces the irreversibility of friction: the second law of thermodynamics states that this increased randomness and disorder of the heat cannot be reversed. So just as your old car can never reverse its wear and tear to become shiny and new again, so a non-conservative force such as friction cannot be reversed.

The principle of least action

There is clearly a connection between forces and energy. This is because a moving object possesses *kinetic energy*. So a force which produces motion in an object actually transfers energy to that object.

As an example of the connection between energy and motion, consider dropping a ball from your hand. When the ball is in your hand, it stores *potential energy* within itself. Potential energy is the energy an object possesses purely due to its location. When the ball is held in your hand, its location is a certain height above the surface of the Earth, so the ball contains gravitational potential energy. This is not the only type of possible potential energy. For example, a stretched spring can contain elastic potential energy.

When you let go of the ball in your hand, it picks up speed. So the kinetic energy of the ball is increasing. However, it is falling closer to the surface of the Earth so its potential energy is decreasing. So the potential energy of the ball is being converted to kinetic energy as the ball accelerates ever faster.

There seems to be a balance here, in that the amount of potential energy in the ball is being reduced by precisely the same amount that its kinetic energy is increasing. This is what we would expect due to the law of conservation of energy which says that the total amount of energy in a closed system remains constant over time.

We could ask the question, why is there this conversion from potential energy to kinetic energy? After all, the total energy of the system is going to be unchanged. So, if that is the case, why does Nature bother doing the conversion from potential to kinetic energy? What is the point?

Well, that's a good question. And, as we shall see in this book, I think the answer holds an important key to understanding the universe. All we can really say at the moment is that Nature tries to reduce potential energy to its minimum possible value. This has been called the *principle of minimum potential energy*. Nature appears to have something of an obsession with reducing potential energy.

As an example of this principle, consider a soap bubble. A soap bubble is an extremely thin film of soapy water which contains a volume of air. That thin surface has elastic properties, so, like the spring example, we could consider the surface as having elastic potential energy. It turns out that the potential energy contained in the soap film is proportional to its surface area. Nature tries to reduce this potential energy to a minimum, so Nature tries to reduce the surface area to a minimum — bearing in mind that the bubble still has to enclose a certain volume of air. As a result, soap bubbles are spherical, a shape which represents the minimum possible surface area for a given volume.

So the shape of soap bubbles is determined by Nature trying to reduce potential energy. The resultant shape is an elegant, efficient curve — we do not find soap bubbles with wasteful, ostentatious corners and spikes. Nature abhors waste and complexity and will always prefer a smooth, simple, elegant solution — purely because Nature always tries to reduce potential energy.

In the field of mechanics (the science of moving bodies), it is known that this minimisation of potential energy, and its conversion to kinetic energy, is the key to analysing the movement of a system — no matter how complicated that system might be. If we consider a moving system, possibly composed of many parts, we can calculate the difference between the kinetic energy of the system minus its potential energy. This value is known as the *Lagrangian*.

We can calculate the Lagrangian of a moving system at any point in time to get a series of values. If we then sum all those values we get what is known as the *action*. The action is a very important concept which is often used by physicists, but is not very well known by non-physicists. The action is important for our purposes because it appears to tell us something very deep about the behaviour of Nature.

If we consider the action of our moving system over a period of time, we will find that the value of that action will always be the lowest possible value. It is as if Nature always moves objects so as to minimise the action. This very important and useful principle is called the *principle of least action*.

As an example, consider the following image of the trajectory of a ball which has been thrown:

I am sure you can tell that the ball will follow the smooth curve of the black line — it would never follow the irregular dotted line. Just as with the soap bubble example, Nature prefers smooth curves to wasteful twists and turns.

We can calculate the Lagrangian of the motion of the ball (remember: the Lagrangian is the difference between the kinetic energy and the potential energy) at each point, and then we can sum all of those points to calculate the action. The principle of least action tells us that the action will be the smallest possible value for the path taken by the ball. In this case, the smooth path taken by the ball results in the smallest action.

As another example, imagine you are a long-distance runner trying to decide on a strategy for your next race. You could start off very quickly, running the first half of the race very fast, and just trying to hang-on as you slow down in the second half of the race. Or else you could start more conservatively, running the first half of the race slower but putting in a sprint to run the second half faster. But, as any distance runner will tell you, the strategy which will result in the quickest finishing time is an even-paced race, running both halves of the race in the same time. So, once again, we find that the smooth trajectory with minimal variations is the most efficient strategy and wastes least energy. Just as the long-distance runner tries to minimise his energy output and so selects a smooth trajectory, so does Nature try to conserve energy and also selects the smoothest trajectories. This is analogous to the principle of least action.

We can use the principle of least action to predict how a system will behave. We know that the system will always move in such a way that the smallest action will result. This is a very useful way to analyse and predict the behaviour of a mechanical system. The Lagrangian approach is a very flexible approach which allows a variety of widely-differing systems to be analysed.

However, action remains something of a mystery. This was summed-up by Robert Matthews talking about action in a *New Scientist* article: "For reasons as yet utterly mysterious, this quantity stays as small as possible under all circumstances. Theorists are convinced that action must be incredibly important — so much so that the discovery of any new fundamental law prompts a race to work out the particular action needed to produce it. The trouble is that no one understands the principles behind Nature's infatuation with action." [3]

Might it be possible to uncover this principle behind "Nature's infatuation with action"? There seems to be some principle underlying Nature's obsession with the efficient reduction of potential energy. This principle seems to lie at the heart of motion in the universe, and therefore the evolving structure of the universe itself. As Robert Adair says in his book *The Great Design: Particles, Fields, and Creation*: "If Nature has defined the mechanics problem of the thrown ball in so elegant a fashion, might She have defined other problems similarly? So it seems now. Indeed, at the present time it appears that we can describe all the fundamental forces in terms of a Lagrangian. The search for Nature's One Equation, which rules all of the universe, has been largely a search for an adequate Lagrangian."

The principle of least action makes it clear that it is the balance (and imbalance) of energies which is the key factor in determining the motion of objects, and it is this balance of energies which we will be considering in the later chapters of this book.

Fundamental principles

Let's return to the fundamental question of why things move. In the 1973 film *The Rat's Death*, a woman slips over her child's toy, so she slaps the boy, the boy kicks the dog, the dog barks at the cat, so the cat pounces on a rat. So if we try to find an answer to the question "Why did the cat move?" we very quickly find ourselves moving progressively down a chain of cause and effect. Movement inspires other movement. We might then start to wonder what could possibly come at the end of the chain. What could possibly start this chain of causality, or does it simply progress forever, an infinite regression?

A similar question was asked in my previous book, *Hidden In Plain Sight*. In that book, we considered the unification of two different theories to create a simpler theory. For example, Michael Faraday unified electricity with magnetism to produce electromagnetism. The process of unifying theories was compared to moving down a tree, with twigs merging into branches, and the branches merging into the trunk. As we move down the tree, we find our theories getting fewer and simpler. The question then arose, what could possibly lie at the base of the tree? What could possibly hold up the entire structure? We would surely expect to find a principle which is simple and elegant. As John Wheeler said: "To my mind there must be, at the bottom of it all, not an equation, but an utterly simple idea. And to me that idea, when we finally discover it, will be so compelling, so inevitable, that we will say to one another: 'Oh, how beautiful. How could it have been otherwise?'"

The fundamental principle at the root of John Wheeler's tree would have to be strong in the sense that it could never be refuted — it had to be obviously correct. It would have to contain within itself the reason for its obvious correctness. It would have to be impossible to conceive of any universe in which it could not be true. For this reason, a fundamental principle could form the bedrock of any fundamental theory of the universe.

In my previous book, I decided that the principle that there was "nothing outside the universe" could be considered as being a fundamental principle. This is obviously correct: if the universe is defined as being everything that exists, then it could not be possible for anything to exist outside the universe — by definition.

Likewise, as we move down our chain of causality of moving objects, we seem to require some fundamental principle to lie at the base. From our earlier discussion of potential and kinetic energy it would appear that change of energy is intimately associated with the question of why things move, so we would probably expect our fundamental principle to have something to say about the balance of energies.

We will return to consider this point later on in the book.

Structure of chapters

The force of gravity plays a central role in this book. A fuller understanding of gravity will be seen to be the key to many problems in physics which appear mystifying at the moment.

Chapter Two provides coverage of our current knowledge of gravity, together with a history of how the main principles were discovered.

The importance of gravity in shaping the structure of the universe is a key aspect of this book, so Chapter Three will introduce cosmology, the study of the universe as a whole. We will be considering the main principles of the Big Bang theory, the shape of the universe, and the inflation hypothesis.

Chapter Four describes the mysterious dark matter and dark energy which seem to pervade the universe, dominating ordinary matter. Dark energy in particular is going to play a central role in the book.

Chapter Five will consider another mystery of the universe: black holes. The more we learn about black holes, the more important they appear to be. We will find out how they hold galaxies together. We will learn about the peculiar role of information and thermodynamics in black holes. We will discover how black holes seem to behave like holograms, and how the loss of information in black holes represents a tremendous paradox for physics.

In Chapters Six, Seven, and Eight we start to find potential solutions to all these mysteries. It appears that the problems of dark energy, the black hole information loss paradox, and many other problems associated with inflation could potentially be solved by a remarkable innovation.

2

GRAVITY

This is a book about gravity.

We are all well-acquainted with the force of gravity. Of all the four fundamental forces we only have to deal directly with gravity in almost all our daily activities. From an early age, we are taught that "things fall down". In this respect, we tend not to even think of gravity as a force — it is just a fact of life.

Gravity is, in many ways, an unusual force. Of the four fundamental forces, gravity is the only force which is always attractive for all objects. This is not the case with, for example, the electric force which treats negatively-charged and positively-charged objects differently (repels or attracts accordingly).

Another factor which separates gravity from the other fundamental forces is its extraordinary weakness. Out of the four fundamental forces, gravity is by far the weakest force. The force of gravity is actually a thousand million billion billion billion times weaker than the electromagnetic force. The Earth is a huge mass of six thousand billion billion tonnes, yet it is very easy to resist its gravitational pull on an object by, say, lifting an apple from its surface. All that mass, but the force is so weak. The reason behind the weakness of gravity is considered one of the great mysteries of modern physics.

However, even though it is the weakest force, gravity is the dominant force in the universe. It is gravity which holds the planets in orbit. It is gravity which forms the stars and galaxies and black holes. It is gravity which powers nuclear fusion in the Sun to produce our daylight. It is gravity which shapes the universe. So why should the weakest force turn out to be the dominant force in the universe?

Ironically, it turns out that gravity is the dominant force precisely because the other forces are so strong. The other forces are tied-up keeping particles bound together inside the atom. We do not realise the extraordinary forces which exist within the nucleus of each atom. We only truly realise the energy possessed by the strong nuclear force during a nuclear explosion. There is extraordinary energy inside an atom, but it is kept on a leash by the strongest of forces.

Considering the electromagnetic force, for example, the positive and negative electric charges are tightly-bound within atoms (electrons attracted to protons). Hence, the positive and negative forces are usually perfectly balanced. The net result is that the overall electric charge of most atoms is neutral. So, to an observer outside the atom, there is no overall electric charge detectable outside the atom — despite the great strength of the forces inside the atom. And there is no overall net electric charge of the universe.

Gravity is different. Gravity treats all objects in the same way, and is an attractive force for all masses. There is no concept of "positive" and "negative" charge for gravity. There is no such thing as "negative" mass — no objects fall upwards. Hence, even though gravity is a weak force, it is also a cumulative force, and when you consider how much mass there is in a star, for example, it is easy to see why gravity becomes so important.

Our best model of gravity is general relativity. This is a beautifully elegant theory which can be used to predict the trajectories of objects under gravity with great accuracy. The theory is one of the greatest achievements of the human intellect. The theory says that gravity is a by-product of the curvature of space caused by the presence of mass. But the theory has nothing to say about why this curvature occurs.

Out of the four fundamental forces, only gravity is not included in our best "theory of everything" — the standard model of particle physics. It is the weakest, dominant, always-attractive force, but it is also the most puzzling.

We really don't understand gravity.

A history of gravity

What is physics? Physics comes from the ancient Greek word *physika*, which means the science of natural things, and it is there in ancient Greece that our story begins.

In the fourth century BC, the Greek philosopher Aristotle asked the question: "Why do objects move toward the Earth?" His answer was that "Objects yearn to be united with the Earth". In other words, Aristotle did not imagine the existence of an attractive force, instead he imagined there was some intrinsic feature of an object which compelled it to move downward toward the centre of the universe, which was its natural place. The Greeks gave a name to this tendency: "gravity". However, Aristotle believed the sky was the natural place for light objects, which

explained why light objects floated upward. The Greeks also had a name for this light-hearted tendency: "levity".

Aristotle's ideas held sway for almost 2,000 years until Galileo challenged these notions. Copernicus had just shown that it was the Earth which revolved around the Sun — not vice versa. This indicated that the Earth was not the centre of the universe, as suggested by Aristotle. But when you drop an object, it does not fly to the Sun. This indicated that Aristotle's idea about objects always seeking to fall to the centre of the universe was wrong.

Aristotle also argued that heavy objects fell faster than light objects. Again, Galileo challenged Aristotle's ideas with a thought experiment. Imagine two balls dropped from a great height, one of the balls being significantly heavier than the other ball. According to Aristotle, the heavier ball would fall faster than the light ball. Galileo then wondered what would happen if the two balls were tied together by a rope. The obvious answer would be that the slow-falling ball would hold back the faster ball, and the resultant speed would be an average of the previous two velocities. However, according to Aristotle, the two balls joined together would represent a heavier object which would therefore fall faster than either of the balls previously fell individually. This appeared to be a logical flaw in Aristotle's argument. Galileo realised that the only way out of this problem would be if the two balls fell at identical speeds, i.e., the weight of an object does not determine how fast it falls.

Galileo is often called the "father of modern science" because he tested this hypothesis by experiments (supposedly dropping objects off the Leaning Tower of Pisa). This showed that, indeed, light objects and heavy objects both accelerated at the same rate when they fell, any difference in the rates of descent being due to air resistance.

This principle was dramatically demonstrated in 1971 when Apollo 15 mission commander David Scott dropped a geological hammer and a feather on the surface of the Moon. The lack of atmosphere meant a complete lack of air resistance, and both objects clearly fell at the same rate. (YouTube: "The Hammer and the Feather". Ignore the comment that the feather was made of lead and was clearly fake!)

Isaac Newton was born in the same year Galileo died.^[4] Legend has it that a 23-year-old Newton was looking at an apple tree in his estate in Woolsthorpe (the tree still stands) when he wondered if the force which pulled apples to the ground could also be responsible for holding the Moon in its orbit. Newton knew that the Danish astronomer Johannes Kepler had shown that the planets moved in elliptical orbits around the Sun. The speed of the planets as they orbited the Sun was such that a line connecting the planet to the Sun swept out an equal area in equal times:

Newton wanted to analyse this motion, but found the mathematics of the day was not sufficient. As a result, Newton invented calculus (he actually invented calculus at the same speed at which it is normally taught in schools). Using calculus, Newton could deduce the form of the law of gravity: "I began to think of gravity extending to the orb of the Moon, and having found out how to estimate the force with which a globe revolving within a sphere presses the surface of the sphere. From Kepler's rule of the periodical times of the planets, I deduced that the forces which keep the planets in their orbs must be reciprocally as the squares of their distances from the centres about which they revolve, and thereby compared the force requisite to keep the moon in her orb with the force of gravity at the surface of the Earth and found them to answer pretty nearly."

So in 1687, Newton published the *Principia*, which has become generally recognised as one of the most important books ever published. In the *Principia*, Newton presented his law of universal gravitation for the first time. He stated that every mass in the universe attracted every other mass by means of the force of gravity. This gravitational force

is proportional to the masses multiplied together, and inversely proportional to the square of the distance between the masses:

$$F = G \frac{m_1 m_2}{r^2}$$

where F is the gravitational force between two masses m_1 and m_2 , r is the distance between the centres of those masses, and G is the *gravitational constant*. The value of the gravitational constant has to be found from experiment.

Newton's formula for universal gravitation is still used today for calculations involving masses which are not too huge. It was Newton who revealed gravity to the world.

However, there was an aspect of universal gravitation which left Newton dissatisfied. The formula seemed to imply that there was an instantaneous force exerted by one mass on the other — despite the fact that the two masses could be separated by a great distance over the vacuum of empty space. There was no indication of any intermediary substance between the masses which might be used to transmit the force. Newton would have been happy if one of the masses had pulled the other mass by a mechanical means, for example, but this "invisible hand" stretching out over vast distances with nothing in between made no sense. As Newton said in a letter in 1692: "That gravity should be innate, inherent and essential to matter, so that one body may act upon another at a distance thro' a vacuum, without the mediation of anything else, by and through which their action and force may be conveyed from one to another, is to me so great an absurdity, that I believe no man who has in philosophical matters a competent faculty of thinking, can ever fall into it. Gravity must be caused by an agent acting constantly according to certain laws; but whether this agent be material or immaterial, I have left to the consideration of my readers."

This principle of Newton's "invisible hand" which can magically reach great distances in space is more generally called *action-at-a-distance*. Newton's instinct that action-at-a-distance was wrong eventually proved to be correct, but it took 200 years and Albert Einstein to provide an alternative.

General relativity

In 1907, when Einstein was sitting in his chair at the patent office in Bern, he had what he later called the "happiest thought of my life". Einstein imagined a person standing inside a stationary lift (or "elevator" in America) at the top of a tall building. Obviously such a person would feel the force of gravity. If, for example, the person dropped a ball then the ball would fall to the floor of the lift. But Einstein then imagined that the chain supporting the lift broke. As the lift fell many floors to the ground, the person inside the lift would not feel the force of gravity in any way. If, for example, the person tried to drop the ball again, the ball would not drop to the ground but instead it would just float in mid-air (relative to the person).

So Einstein realised that the force of gravity could be eliminated if the observer was accelerated in a particular way. This made Einstein believe that the force due to gravity and the force due to acceleration were equivalent. For example, if a person who is standing on the surface of the Earth (Figure a) in the diagram below) drops a ball, then the ball will drop to the ground under the force of gravity. This is different for an observer in a spaceship in deep space, far away from sources of gravity. If that observer drops a ball it will just float in mid-air. But if the spaceship is accelerated, as in Figure b) below, then a ball which is dropped will fall to the floor of the spaceship as if it is under the force of gravity:

Einstein realised that the force due to gravity was **completely equivalent** to the force experienced during acceleration. This is called the *equivalence principle*. For example, a spaceship might generate its own artificial gravity by continuously rotating, rotation being a form of acceleration. NASA's proposed long-duration space exploration vehicle, NAUTILUS-X, includes a centrifuge to generate artificial gravity for its six-person crew:

Remember that, according to the equivalence principle, the artificial gravity produced by the NAUTILUS-X centrifuge is **precisely equivalent** to conventional gravity. It is exactly the same thing.

Einstein then again imagined our spaceship in deep space undergoing acceleration. And he also imagined that there was a small window in the side of the spaceship through which light from a nearby star was entering the spaceship. According to the point-of-view of the occupant, the beam of light entering through the window appears to

curve to the floor as the spaceship accelerates (as the light crosses the spaceship, it moves closer to the floor as the spaceship accelerates upward).

The following image shows this curved beam of light inside the spaceship:

So, the acceleration appears to curve light. But the equivalence principle states that this situation of the spaceship undergoing acceleration is equivalent to the spaceship under the influence of gravity. Hence, Einstein realised that gravity would also curve light. This was a radical thought: as light is massless it was assumed that it would not be affected by gravity.

Einstein realised that this prediction that gravity bent the path of light provided a way to test general relativity. He stated that light from the stars would bend as it passed the Sun. In a 1911 paper, Einstein proposed an ingenious experiment to test this bending of light: "As the stars in the parts of the sky near the Sun are visible during total eclipses of the Sun, this consequence of the theory may be observed. It would be a most desirable thing if astronomers would take up the question."

If we jump forward in time at this point, we find it was not until May 1919 that the British astrophysicist Arthur Eddington travelled to the African island of Principe in order to test Einstein's theory. Eddington was going to take photos of the Sun during a solar eclipse, which, as Einstein had suggested eight years earlier, was the only occasion when photographs of the stars around the Sun would be possible.

Unfortunately, the weather was not good, and for many days the cloud cover threatened to prevent a clear view of the eclipse. The weather was no better on the day of the eclipse, May 29th. However, the clouds broke for just a few minutes to allow Eddington to capture sixteen photographs of the eclipse. Two of Eddington's photos showed the positions of the stars clearly enough to confirm the bending of starlight around the Sun, thus providing the first experimental confirmation of Einstein's theory.

Eddington announced his result at a joint meeting of the Royal Society and the Royal Astronomical Society in London. As he was leaving the meeting, Eddington was famously asked if it was true that only three people in the world understood the theory of general relativity. When Eddington delayed in answering, the reporter said: "Don't be so modest, Eddington", to which Eddington replied: "Not at all. I am just wondering who the third person might be."

When the news of Eddington's confirmation reached Einstein, he was delighted but not surprised. Einstein noted that had the result been different, he "would have been sorry for the dear Lord, since the theory is correct."

So as gravity treats all objects equally — including light — Einstein realised that the type of the object is irrelevant for interacting with the gravitational force. Instead, the critical factor was the nature of space itself, as the motion of all moving objects depends on the underlying shape of space.

Einstein realised this could only be explained if space itself was curved by large masses. The trajectory of an object in free-fall, attempting to travel in a straight line in space, would then be curved towards mass.

The time-honored way of demonstrating this curvature of space is to consider a two-dimensional experiment:

obtain a rubber sheet and place a large mass in the middle so that it deforms the sheet. A small ball will then "orbit" the central mass as if it was a planet orbiting the Sun:

Another attraction of considering gravity as being the curvature of space was that it introduced the concept of the gravitational force being represented by a *field*, in the same way that other forces — such as the electromagnetic force — is carried by a field. The great attraction of the field approach is that it provided an alternative to the Newtonian action-at-a-distance interpretation of gravity.

Einstein was in agreement with Newton that action-at-a-distance was unacceptable, but for a different reason to Newton. Einstein realised that action-at-a-distance implied instantaneous transmission of information over great distances — something forbidden by Einstein's theory of special relativity which did not allow anything to travel faster than light. The only alternative to action-at-a-distance was provided by a field in space.

We are probably best acquainted with the idea of field being emitted from a magnet. If you place a magnet under a sheet of paper and sprinkle iron filings over the paper, the field lines become obvious:

So we can imagine a field as being an invisible entity which spreads through space, an entity which has a direction and strength which is specified for every point in space. Instead of action-at-a-distance, which implies Earth reaching out over thousands of miles of empty space to hold the Moon in orbit, under the field approach we now consider Earth as sending out a *gravitational field*. The direction of the Moon's travel is only affected by the strength and direction of the gravitational field in the immediate vicinity of the Moon.

The field approach eliminates the problems associated with action-at-a-distance. Instead of an instantaneous connection between two masses, any disturbance in the field takes time to travel between the two masses — it is no longer instantaneous. Special relativity is no longer contradicted as the rippling distortion in the field travels at the speed of light, and no faster. If the Sun was to disappear, for example, the Earth would continue to orbit the last position of the Sun for seven minutes until the bad news reached the inhabitants of Earth via the gravitational field. At that point, the elimination of the Sun's gravitational field would result in the Earth spinning-off into space.

After his great intuitive realisation of 1907 about gravity being the curvature of space, Einstein spent many years trying to represent this curvature in mathematical form. He soon realised the mathematics describing the curvature of four-dimensional spacetime was beyond him, so he enlisted the help of his former classmate at the Zurich

Polytechnic, Marcel Grossmann (now a professor of mathematics), and the Italian mathematician Tullio Levi-Civita who had invented *tensors*, essentially a way of mathematically describing curvature of space.

In 1915, Einstein finally published the *general theory of relativity* which revealed how the curvature of spacetime depended on the distribution of mass and energy according to the following equation (don't worry about the details of the equation):

$$\begin{array}{ccc} \text{The curvature} & & \text{Mass-energy} \\ \text{of spacetime} & & \text{distribution} \\ \hline R_{\mu\nu} - \frac{1}{2}R g_{\mu\nu} & = & \frac{8\pi G}{c^4} T_{\mu\nu} \end{array}$$

The left-hand side describes the curvature of spacetime and is called the *Einstein tensor*. The right-hand side describes the distribution of mass-energy and includes the *stress-energy tensor*. The equation as written in this form is deceptively simple. It hides the fact that this actually represents ten complex, non-linear equations that are very hard to solve (we will be considering one solution — the very first solution which considers the field around a spherical mass — in Chapter Five which is about black holes).

However, when Einstein wrote down this equation, he realised it had a problem. It appeared to indicate a universe which would contract and completely collapse due to the mass contained within the universe.^[5] This was unacceptable to Einstein who — like most of his contemporaries — considered the universe to be a static structure which had existed forever. After all, the stars had shone in constant positions in the sky for the whole of recorded human history. The only solution Einstein could see was to introduce a new repulsive force which acted to counteract the contraction of the universe. So Einstein added a factor, Λ , which he called the *cosmological constant*:

$$R_{\mu\nu} - \frac{1}{2}R g_{\mu\nu} + \Lambda g_{\mu\nu} = \frac{8\pi G}{c^4} T_{\mu\nu}$$

 Cosmological constant

It is interesting that Einstein placed his correction factor on the left-hand side of the equation which describes the curvature of spacetime. He might have chosen to place his correction on the other side of the equation, thus modifying the predicted energy of space. In fact, as we shall see later, this latter approach is the one favored in modern cosmology.

So Einstein went ahead and added the cosmological constant to his equation. However, in the 1920s, Edwin Hubble considered the redshifts of galaxies beyond our Milky Way and discovered the universe was actually expanding. On hearing this news, Einstein realised his blunder in horror. An expanding universe had no need of a cosmological constant to keep it static. Einstein realised he could have predicted the expansion of the universe from his equations before Hubble discovered it from observation, a prediction which would have stood as one of the greatest in the history of science. As a result, Einstein called his introduction of the cosmological constant the "biggest blunder" of his life.

However, as we shall see later, recent observations have revealed that the expansion of the universe is actually

accelerating. This suggests the universe has a small but positive cosmological constant — so maybe Einstein was right after all!

Einstein's theory of general relativity remains our best theory of gravity — one hundred years after it was published. It has been tested many times, for example, to measure the deflection of light around the Sun, and it has always proved to be accurate.

So the general theory of relativity is undoubtedly accurate, and correctly models the curvature of spacetime. But there is nothing in the theory to explain **why** a large mass curves space. The equation captures the behaviour, but does not explain it.

But can we make an attempt to explain why spacetime is curved by mass? In other words, can we understand what gravity is, and why it exists at all. I believe we can, and in the later chapters of this book we will see why.

But for now we are going to move on to understand the effect of gravity on the universe as a whole.

3

COSMOLOGY

Cosmology is the study of the universe itself at the very largest scales. It considers the size and shape of the universe, the expansion of the universe, the beginning of the universe, and the eventual fate of the universe. It is distinct from astronomy which is the study of individual celestial bodies such as stars and planets, whereas cosmology is the study of the universe as a whole.

Cosmology does not focus on considering each individual star in the universe, which would be an impossible task for our current level of technology. Instead, cosmology operates by taking averages, for example, finding an average value for the density of the universe. Inevitably, this means cosmology is not a precise science, but fortunately the universe looks quite similar at very large scales so these approximations work surprisingly well.

It has to be said that until well into the 20th century, cosmology was not considered a proper science. It seemed to ask such profound questions — such as the origin of the universe — which did not seem to be the sort of questions which analytical science should be asking. Surely such questions should be the domain of metaphysics, and forever beyond the experimental reach of science? However, throughout the 20th century a series of observations about the origin of the universe and its expansion proved that these profound questions were not beyond scientific enquiry, and cosmology became established as a valid science.

The scale of the universe

Perhaps the most remarkable fact about the universe is its sheer scale. I do not think it is at all generally realised how extraordinarily vast the universe is. I believe this scale is important, and I would like to try to convey to you some feeling for this vastness. So in this section I will present some examples from astronomy.

I am sure you are aware that the Earth is one of eight planets orbiting the star that is the Sun. This forms the Solar System. But the Sun is just one star in our galaxy which is called the Milky Way (a galaxy is a collection of stars, gas, and dead stars such as black holes). The closest star to the Sun is Proxima Centauri which is 4.2 light years away, which means it would take light (which travels at the incredibly fast speed of 186,000 miles per second) 4.2 years to reach our nearest star.

It is a little bit hard to get our heads around the concept of a "light year" — it is not a measure of distance we use every day! Perhaps if I tell you that one light year is six million million miles you might get a better feel of the extreme distance involved.

Our galaxy is truly vast: 100,000 light years across. It is a spiral galaxy with four distinct arms (see the following diagram). The spirals are caused by the rotation of the galaxy:

All the famous constellations of stars in the night sky are found within our galaxy. The Sagittarius constellation is located near the galactic centre (we will be considering the importance of the galactic centre in the chapter on black holes). The Solar System is located about two-thirds of the way out from the galactic centre.

There are many other fascinating structures to be found within our galaxy, including spectacularly beautiful giant clouds of gas called nebulas which may be as much as 100 light years in diameter. You may have seen beautiful pictures from the Hubble Space Telescope of the Eagle Nebula, located 7,000 light years away in the Sagittarius Arm, which includes the "Pillars of Creation" in which stars are formed (<http://tinyurl.com/2wbzt9b>).

So, how many stars do you think there are in our Milky Way galaxy? A hundred million? A billion? Well, there are actually about 200 billion stars in our galaxy! When you think how large the distance is between individual stars, I hope this gives you an impression of how vast our galaxy is.

Now let us consider other galaxies. The nearest galaxy to our galaxy is the Andromeda galaxy. This is also a spiral galaxy and is located about 2.5 million light years away. Galaxies attract each other and orbit each other just as planets orbit a star. This clearly shows how gravity is the dominant force in shaping the universe.

The Milky Way and the Andromeda galaxy are the two largest galaxies in a group of about 50 galaxies known as the *Local Group*. Andromeda — just like the Milky Way — has its own series of satellite galaxies which orbit it. The Andromeda galaxy made the news in 2012 when it was announced that the mutual gravitational attraction between it and the Milky Way was so strong that Andromeda will collide with the Milky Way in about 4 billion years time.

So here is the big question: how many galaxies do you think there are in the universe in total? A million? A hundred million? You might be astonished to hear that there are **over 100 billion galaxies in the universe!** When you think how large galaxies are, and how far apart they are, I hope this gives you a feel for the truly staggering scale of the universe. This is perhaps something which is not generally realised: the universe is really incomprehensibly huge.

And this will be one of the themes of the later chapters in this book. The universe is of such a completely different scale to any of the objects we encounter in our everyday lives. The difference is so vast that the universe effectively represents a completely different type of object. Might it be possible that the laws of physics — which we know so well at human scales — work differently at the scale of the universe itself?

All will be revealed later.

Olbers' paradox

The paradox I am going to describe now is interesting because it shows how much of the nature of the universe it is possible to deduce just by pure thought alone.

Several centuries ago, when hardly anything at all was known about the structure of the universe, several astronomers were puzzled why the night sky should be dark. At the time, the universe was assumed to be static and infinite. However, if there were an infinite number of stars in the sky, then any straight line drawn from your eye into the deepest depths of space would be bound to hit the surface of a star at some point. In this respect, the stars were like trees in a forest: if there were enough trees in the forest then it would be impossible to see through the forest to the other side — your line-of-sight would be bound to hit a tree at some point.

So if your line-of-sight was bound to hit a star at some point, then this would appear to indicate that the entire night sky should be covered with light, as there would be no point that was not covered by a star. The fact that the night sky is dark was therefore something of a mystery, and this apparent paradox is called *Olbers' paradox*.

The most obvious solution to the paradox was that there was not an infinite number of stars in the universe, which would appear to indicate that the universe was finite in size. This would represent a major revision of the model of the universe. So just by thinking logically about the problem, we can make discoveries about the universe from our armchair.

You might be tempted to raise various objections about Olbers' paradox which might occur to you. For example, you might say that the distant stars are so far away that their light would be so dim when it reached Earth it would be undetectable. Hence, the sky would be mainly dark. This is a strong objection. It is true that distant stars are more dim. However, it is also true that distant stars appear to have a smaller surface area to our eyes. Because of this, for a certain sized region of the night sky, it is possible to fit more dim stars into an area than it is possible to fit bright stars. The overall effect is that any area of the night sky should have exactly the same brightness.

Another objection you might raise is that the distant stars might appear dim due to interstellar dust obscuring the light. However, this would not work as the dust would increase in temperature and would then radiate the same light as the stars.

So Olbers' paradox was an early pointer to indicate that the model of an infinite and static universe was flawed. A new model of the universe was required.

The Big Bang

Up until the 20th century the universe was assumed to be an eternal and unchanging structure: the so-called *Steady State theory*. However, our model of the universe changed when the world's largest telescope was completed in 1917.

The Hooker telescope is located in the Mount Wilson Observatory in the San Gabriel Mountains near Pasadena in California. At the time of its construction, it was the largest telescope in the world, a title it held for 30 years. A 4,000kg slab of glass was ground for five years to produce the 2.5 metre mirror.

The astronomer Edwin Hubble arrived at Mount Wilson in 1925 and used the telescope to examine the faint cloud-like objects which were believed to be nebulas. He revealed that these were not nebulas at all, but were in fact separate galaxies outside of our own galaxy.

Hubble went on to show that these galaxies were moving with respect to the Milky Way. The technique he used was discovered by Christian Doppler of Prague 100 years earlier. Doppler considered moving objects which emitted a sound of a constant wavelength. While it is true that the speed of the wave would not alter (we all know that the speed of light is a constant), the effect of the motion would be to "bunch up" the waves. In this way, an object moving toward an observer would appear to be emitting a sound of a higher pitch (the wavelength would be shorter), and an object moving away from an observer would appear to be emitting a sound of a lower pitch (the wavelength would be longer).

Doppler tested his theory on the flatlands of Holland, arranging for six trumpeters to ride outside a wagon on a steam train. The trumpeters emitted a constant middle C note. As the train passed the observers, the note was heard to rise and fall by a semitone. This change in wavelength is called the *Doppler shift*.

So it is possible to use the Doppler shift to determine if an object is moving towards you or away from you. Edwin Hubble examined the wavelengths of light from distant galaxies and found that they were shifted towards the longer, red end of the spectrum. Hence, the galaxies were said to have a *redshift*. This showed that the galaxies were moving away from us. This could mean only one thing: the universe was expanding.

From his observations, Hubble realised that the further away a galaxy was, the more it was redshifted. This meant that further objects were moving away from us at a faster speed. Hence, Hubble was able to express the relationship between the speed at which a galaxy was moving away, v , and its distance from us, d :

$$v = Hd$$

where H is called the *Hubble constant* (it is not really a constant — its value is known to have changed over time).

Now, here's a surprising thing. I am sure you are well aware of the law which says that nothing can travel faster than light. Well, strange as it may seem, it is actually possible for distant galaxies to be moving away from us faster than the speed of light. This is because the expansion of the universe is caused by the expansion of space itself (we will be examining this in more detail in the section on "The Shape of the Universe" later in this chapter). The cumulative effect of the expansion of space over vast distances means that distant galaxies can actually move away from us faster than the speed of light. The further apart galaxies are, the faster they are moving away from each other.

Bearing this in mind, we can obtain a value for the radius of the observable universe by considering the distance at which distant galaxies recede from us at a speed faster than the speed of light (and are hence invisible to us). If we put $v = c$ in the previous equation, we get a value for the distance:

$$R_H = \frac{c}{H}$$

where R_H is called the *Hubble radius*. We will be seeing this equation again later.

But if the universe is expanding, then that means if we look back in time then the universe was progressively

smaller. And if we look far enough back in time we find that the universe must have emerged from an extremely small space. Hubble had discovered that the universe was not eternal and unchanging: the universe had a beginning. There must have been a single point of creation from which everything burst into existence. This event is called the *Big Bang*.

The Big Bang occurred 13.7 billion years ago. During the first moments of the Big Bang, the universe expanded from an extremely hot and dense point which contained all the matter and energy of the universe. Just imagine the mass of 100 billion galaxies squeezed into the size of a single atom. The temperature of the universe in these early stages was 1,000 trillion trillion degrees Celsius. At this temperature, everything melts. The tiniest building blocks of matter — quarks — swirled around freely in this particle soup called *quark-gluon plasma*.

However, after the first millisecond of its existence, the universe had cooled to a relatively chilly ten quadrillion degrees Celsius. At this lower temperature, three quarks could bond together to form protons or neutrons. Amazingly, every single proton and neutron in existence today was formed in this first millisecond after the Big Bang.

At this stage, the universe was opaque, meaning that photons of light could not travel freely but kept colliding with free protons and neutrons. Imagine you are at the bottom of a dark lake — you could not even see your hand in front of your face. That is what the opaque era must have been like.

However, when 380,000 years passed, the temperature had cooled to 10,000K. Electrons were now travelling slowly enough to be pulled into orbit around atomic nuclei composed of protons and neutrons. Hence, atoms were formed for the first time. This is known as the *recombination era*. Photons were now free to travel freely without being constantly scattered by protons and neutrons. So at this point the universe became transparent.

The photons which were released at this moment can be detected even today as they form the cosmic microwave background (CMB) radiation. This radiation has cooled over the last 13.7 billion years and it now has a temperature of only 2.7K. However, this radiation is everywhere, and is even responsible for 1% of the "snow" noise which you used to see on old analogue televisions. It is amazing to think that the interference on your TV screen was emitted 13.7 billion years ago! When it was discovered by accident in 1964, the CMB was the strongest evidence in support of the Big Bang theory.

When we look out into space with our most powerful telescopes, we are effectively looking back in time. This is because we are looking at objects whose light has taken longest to reach us. The Hubble Space Telescope is capable of producing distant images of galaxies in the earliest stages of formation. Eventually, at the furthest distance, we find we are looking at the point when the universe was opaque, so we can look no further back in time. At that point, we are looking at the CMB — the furthest (and earliest) thing we can ever see.

The Wilkinson Microwave Anisotropy Probe (WMAP) was launched in 2001. It is located far enough away from the Earth to avoid the magnetic field or any other source of interference. Temperature measurements taken by WMAP of the CMB revealed it to be relatively smooth in all directions, with only small clumps and ripples (see following image).

These clumps and ripples at the dawn of time were extremely important, though, because they formed the seeds of the present-day structure of the universe. The gravitational attraction of the clumps pulled-in more mass, so the clumps grew to ever larger size, eventually becoming stars and galaxies.

Intriguingly, a paper was published in 2010 which revealed there was one remarkable feature clearly visible on the CMB.^[6] As the paper's authors explain: "Shortly after the WMAP sky maps became available, one of the authors noted that the initials of Stephen Hawking appear in the temperature map. Both the "S" and "H" are beautifully vertical in Galactic coordinates, spaced consistently. We pose the question, what is the probability of this occurrence?"

If we examine the image of the CMB, Stephen Hawking's initials can indeed be quite clearly seen (inside the white ellipse):

More recent results, most notably from the Planck space observatory in 2013, no longer show the Hawking initials, but other unexpected anomalies have been revealed.

The image below was produced from the Planck observatory and has two anomalous features enhanced. Firstly, the curved line shows asymmetry in the average temperatures revealing that the sky is slightly warmer in the south than in the north. This is the wonderfully-named "Axis of Evil". There is also a large cold spot (shown inside the ellipse). This has been called the Great Void of Eridanus as it is in the direction of the Eridanus constellation:

These are not the only anomalies to have been discovered recently. Only relatively recently has it become possible to map the positions of galaxies and galactic clusters in three dimensions. This has revealed peculiarities in their motion and positioning. Galaxies have a tendency to clump together in clusters and filaments, leaving large voids which are free of galaxies. This clustering introduces gravitational forces which pull galaxies out of their expected trajectories.

As was discussed earlier, our Milky Way galaxy is one of a number of galaxies which form the Local Group. It has been discovered that the Local Group is travelling at about 400 miles per second in the direction of the Virgo cluster of galaxies. This area to which so many galaxies are attracted is called the Great Attractor. The reason for this mass movement is unknown as the gravitational pull of the Virgo cluster is not powerful enough. This migration of galaxies has been called *dark flow*.

No one knows the reason for these anomalies. However, it is clear that the universe is not as smooth and featureless as had been believed.

The shape of the universe

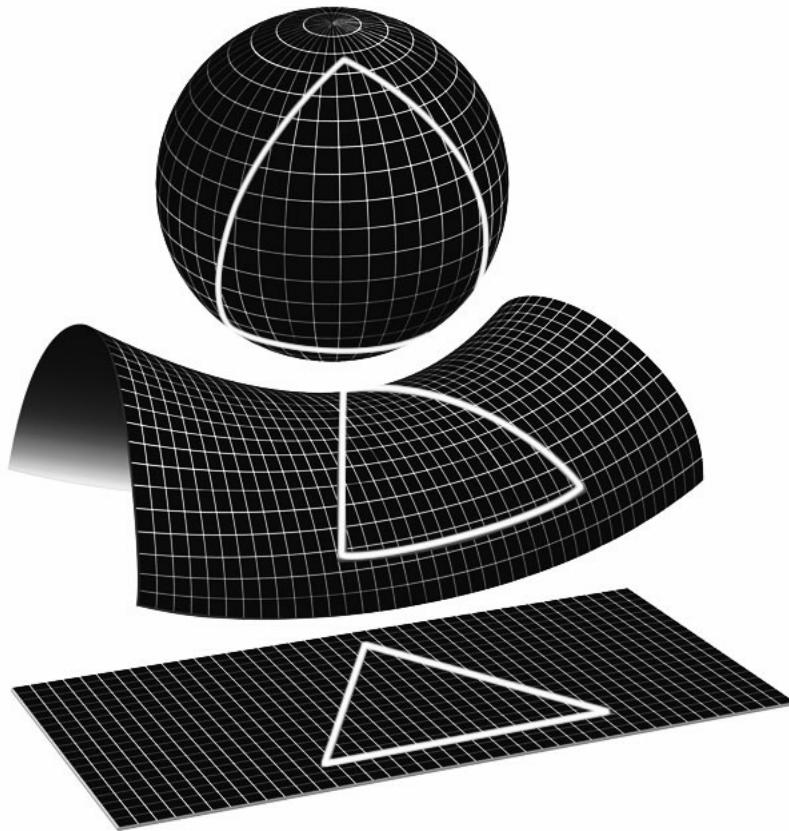

In our discussion of gravity in the previous chapter, it was explained how the presence of mass in general relativity curves space. Well, the universe obviously contains mass, so the universe must logically have some form of curvature. So it appears we can talk about the "shape" of the overall universe. What shape is the universe?

You might find it a bit strange talking about the "shape" of the universe, because you might think the universe doesn't have a shape — it just goes on forever, doesn't it? Surely it is inconceivable that the universe has an edge, like a wall, or a drop at the end which you fall off if you go too far? Well, maybe it is the case that the universe is infinite in size, but, surprisingly, it is also possible for the universe to be finite in size but still have no edge. Which situation is true depends on the shape of the universe.

If the density of mass in the universe is high enough then space can become so curved that it loops around on itself. Imagine space looped around in a circle as if it is the inside of a ping pong ball. You could travel forever around the inside of the ball but never reach an edge. It has also been called the "Pac Man" universe: you go out of one side of the game and come back in on the opposite side. This is the situation when the universe is finite in size but has no edge. This is called a *closed* universe. Imagine the universe as a "ball" of space.

The expansion of the universe is a unique form of motion. Normally, motion involves the movement of an object against a pre-existing background of space. But when the universe expands, it is not a case of the farthest galaxies flying away through pre-existing space. After all, there is nothing outside the universe, so that means there is no pre-existing space outside the universe, so what could the universe possibly expand **into**? No, what is actually expanding is this "ball" of space itself.

There are two other possibilities for the shape of the universe, depending on the density value. These possibilities are illustrated in the following images of three equilateral triangles drawn in the three different types of space:

The first example shows a closed universe, as if it was the inside of a ping pong ball. In this case, parallel lines eventually meet, and the sum of the angles of a triangle exceeds 180 degrees (although this would only be noticeable on vast triangles of cosmological scale).

The second example shows the case when the density is sufficiently small. This is called an *open* universe. Instead of space being closed, space diverges in an open universe as if it is drawn on a saddle. In this case, parallel lines eventually diverge, and the sum of the angles of a triangle is smaller than 180 degrees.

The last example shows a *flat* universe. In this case, the value of the density is a particular value so that space is neither closed nor divergent. The sum of the angles of a triangle is equal to 180 degrees.

Let us now try to analyze these three scenarios in more depth. At the end of the previous chapter we were introduced to Einstein's equation for general relativity, and it was explained how the equation is very difficult to solve. In fact, exact solutions have only been found when simplifying approximations have been made. For the case of the entire universe, the first exact solution was developed by the Russian physicist Alexander Friedmann in 1922. The solution was only possible if we make the simplifying assumption that the universe has a very similar consistency and structure throughout its entire volume. We say that the universe must be *isotropic*, meaning that the universe looks the same in all directions — no matter where you stand in the universe. [7]

Of course, you might argue that the universe is far from isotropic: there are different galaxies in different directions. However, with there being over 100 billion galaxies in the universe, the distribution of those galaxies is very equal, and the resultant texture of the universe at the largest scales is very smooth. The universe does indeed appear to be isotropic.

The following equation is the first of the two Friedmann equations. The equation is derived from Einstein's equation. It relates the curvature of the universe, k , to the density of the universe, ρ . So it can be used to derive the curvature of the universe if we know the density of the mass in the universe:

$$H^2 = \frac{8\pi G}{3} \rho - \frac{kc^2}{a^2}$$

In the equation, we have already met the Hubble constant, H . The only other term you might not recognise is the scale factor, a , which basically says how large the universe currently is. We won't be seeing this term again, so don't worry about it. You should be able to recognise every other term (including the gravitational constant, G , and the Hubble constant, H).

We would like to calculate the vitally-important density of a flat universe. This is because a flat universe is perfectly balanced between being open and closed. A flat universe has zero curvature, so to derive the equation for that universe we set the curvature, k , to zero in the previous Friedmann equation. When you multiply something by zero, that term disappears, so we are left with:

$$H^2 = \frac{8\pi G}{3} \rho$$

and if we reorganize the terms in this equation we get a formula for the density of a flat universe:

$$\rho = \frac{3H^2}{8\pi G}$$

This density value for a flat universe is perfectly balanced between being an open universe and being a closed universe. Hence, this is called the *critical density*. If the actual density of the universe is more than this critical

density then the universe is closed. If the actual density of the universe is less than this critical density then the universe is open.

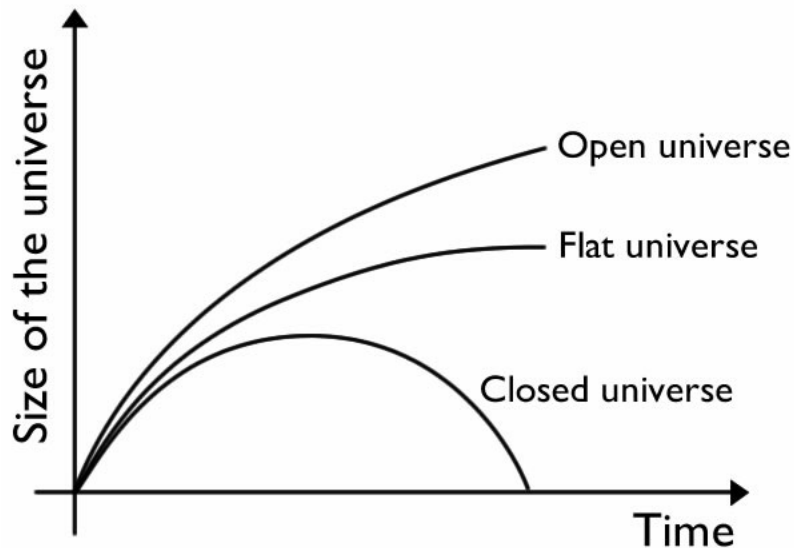

We will be seeing this vital equation again later.

But a flat universe contains matter, so how is it possible that a flat universe is not curved? Well, this is possible because the curvature of space (which pulls the universe inward) is perfectly balanced by the energy of the outward expansion of space. In the previous equation for the critical density, we can therefore see that the density depends on the rate of expansion of the universe described by the Hubble constant, H . If the universe is expanding faster, the critical density is larger.

So in a closed universe, the density of the universe is greater than the expansion energy given by the Hubble constant. This means that gravity will tend to pull the universe back together again. In the long run, this means that a closed universe is bound to eventually collapse. Even if a closed universe is currently expanding, gravity is bound to eventually win the day: the expansion will slow and eventually reverse, and the universe will collapse.

This is not the case in a flat or open universe. As was described earlier, in a flat universe the gravitational pull is perfectly balanced by the expansion energy: the expansion of the universe will slow down, but it will never collapse. In an open universe, the expansion energy is much greater and the universe keeps on expanding forever.

So the actual density of the universe — and its relation to the critical density — determines the eventual fate of the universe.

So is the universe actually closed, open, or flat? The evidence is obtained from the CMB radiation images which we considered in the previous section. The curvature of the universe makes it act like a magnifying glass, bending light and making distant objects either larger or smaller. If the universe was closed, distant clumps in the CMB would appear larger. If the universe was open, the clumps in the CMB would appear smaller. The fact that the clumps appear to be precisely the predicted size has resulted in NASA recently announcing: "We now know that the universe is flat with only a 0.5% margin of error."

This is really quite a remarkable result, and very unlikely to happen by chance. It requires the density of mass-energy of the universe to be set extremely precisely. If the density was slightly greater then the universe would have rapidly collapsed into a "Big Crunch". If the density was slightly less then the universe would have expanded too quickly for complex structures such as galaxies and stars to form.

So what could possibly be the reason behind this crucial flatness of the universe? One theory thinks it has a solution ...

Inflation

We have just seen that a flat universe is essential to the development of interesting structures such as stars and

galaxies (and therefore humans!). But this poses something of a mystery. Why should the universe be flat? Why is the density of the universe apparently fine-tuned to such a precise value? Why is the universe such an interesting place to live in, rather than just collapsing or flying apart? This is called the *flatness problem*.

In 1981, the American physicist Alan Guth believed he had found a solution. He proposed that in a tiny fraction of a second after the Big Bang, the universe expanded at an incredible rate. In just one hundred million trillion trillionth of a second the universe expanded from about the size of a subatomic particle to the size of a baseball. This period of incredibly rapid expansion is called *inflation*.

(It is proposed that the reason for this inflation is the negative pressure of the vacuum in the universe at that early stage. I won't go into detail about this at this point because we will be considering negative pressure in the next chapter.)

After this period of inflation, the universe is then predicted to expand at the normal, much lower expansion rate. But the period of inflation was enough to expand the universe to a much larger size than that predicted by the conventional Big Bang theory.

So how does this solve the flatness problem? Well, inflation works by smoothing and flattening the universe. If you imagine you have a rubber sheet full of ripples, as you stretch the sheet to a much larger size, the sheet becomes flatter and the ripples disappear. This is the effect inflation has on the universe.

If you are standing on a bowling ball, the curvature of the ball will be very obvious to you. However, if you expand that ball up to the size of the universe, then, at a local level, the ball will appear completely flat. The same principle applies to a universe that has undergone inflation. Inflation is proposed to have expanded the universe to a vastly larger size than the observable universe (at least a hundred sextillion times larger [8]). This means the part of the universe we can actually see is just the tiniest fraction of the entire universe. So, just like the blown-up bowling ball, our observable universe appears flat.

There is another reason why inflation is an attractive hypothesis. Let us consider two galaxies, positioned either side of the Earth, and both of them 9 billion light years from Earth. This means the distance between the galaxies is 18 billion light years. As the universe is only 13.7 billion years old, this means there has not been enough time for light to pass between the two galaxies. Essentially, they are isolated from each other. But when we look around the universe, we find it looks remarkably uniform, and the CMB temperature of all areas of the universe is remarkably similar. This is surprising because it appears that the temperature has had a chance to equalise, ironing-out any differences. However, because it is not possible for light to have travelled between the galaxies, it should not have been possible for this equalisation to occur. Heat could not have flowed from warmer regions of the universe to the cooler regions. We would expect to see a universe with far less uniformity than we observe. This is called the *horizon problem*.

Inflation presents a possible solution to the horizon problem because, once again, the stretching of the universe during the inflationary period has the effect of smoothing the universe. According to inflation, our observable universe represents only a small fraction of the total universe. Therefore, the region which has become our observable universe was actually a very small volume of the universe before inflation occurred, and the objects in that small volume could all communicate with each other. There was enough time for heat to flow from the warm regions to the cold regions and smooth-out any differences.

The inflation hypothesis has been widely accepted and has been incorporated into what is known as the "standard model of cosmology" which, like the standard model of particle physics, has about 20 free parameters (numbers which cannot be derived but have to be obtained by observation). However, the standard model of cosmology has nowhere near the same level of experimental verification. I recently read that the standard model of cosmology is a "triumph of modern physics". I am not convinced. I would describe it more as "a list of things we do not yet understand". It is also the case that, thirty years after it was first proposed, serious cracks are now starting to appear in the model of inflation.

In a 2011 *Scientific American* article, Paul Steinhardt — one of the developers of the inflation hypothesis — asked "Is the theory at the heart of modern cosmology deeply flawed?" (see <http://tinyurl.com/PaulSteinhardt>). According to Steinhardt, inflation would have to be fine-tuned to produce the smooth properties of the universe we observe today. Another strong criticism is that inflation should keep occurring throughout our universe: it is very easy to start inflation, but it is very difficult to stop it. Bubble universes are predicted to keep appearing in space. In fact, inflation predicts an infinite number of bubble universes will appear, with each bubble universe having different properties: some smooth, some highly non-uniform. So inflation is not such a predictive theory as had been assumed. In fact, a theory which predicts everything predicts nothing.

The simplistic original theory of inflation as proposed in the early eighties has been replaced by a theory which lacks predictive power, and seems fundamentally flawed. The opportunity is there for a new theory. In the later chapters of this book, a new, simple hypothesis will be presented for producing a flat universe.

4

DARK MATTER AND DARK ENERGY

The recent discovery of the Higgs boson represents the last piece of the jigsaw of the standard model of particle physics. The standard model was formulated in the late 1970s and it is one of the greatest achievements in the history of physics. It describes all of the known particles and their interactions. However, because the standard model does not describe gravity, it has been called the "theory of **almost** everything". Unfortunately, we have recently discovered that it is more like the theory of not very much at all.

We have discovered that the standard model only describes about 5% of the material of the universe.

To put it another way, we simply have no idea what the vast majority of the universe — 95% — is made of. In this chapter we will examine the mystery of the missing 95%. We will see that there are two components to the missing substance, and these are known as dark matter and dark energy.

This is what the universe is really made of.

Dark matter

In 1933, the Swiss astronomer Fritz Zwicky considered the motion of galaxies in the Coma Cluster (a large cluster which contains about 1,000 galaxies). He estimated the mass of the cluster by measuring its brightness, and, based on that mass, he predicted the motion of the galaxies on the edge of the cluster. Zwicky discovered that much of the required mass appeared to be missing. Though the nature of this missing mass was completely unknown, Zwicky gave the German name "dunkle materie" to the material, which translates to "dark matter". It is now believed that 90% of the mass of the Coma Cluster is in the form of dark matter.

Unfortunately, Zwicky was a difficult man to get along with (he was dubbed "borderline psychopathic" in a BBC documentary *Most Of Our Universe Is Missing*, available on YouTube). Zwicky referred to his colleagues as "spherical bastards" — because they were bastards no matter which way you looked at them. As a result, Zwicky's work was ignored for many decades.

However, in the 1970s, Vera Rubin of the Carnegie Institution of Washington had access to more accurate equipment and she used it to measure the speed of rotation of stars lying on the edge of spiral galaxies. She started by examining the Andromeda galaxy which, as was described in the previous chapter, is the nearest spiral galaxy to our own galaxy.

If you consider our solar system as an example, the outer planets orbit the Sun slower than the planets which are nearer the Sun. For example, Neptune, the farthest planet, takes 164 Earth years to orbit the Sun. And for galaxies as well, this is what we would expect. We would expect the stars on the edge of the galaxy to orbit the galactic centre at a slower speed than the stars nearer the centre.

However, this is not what Vera Rubin discovered. She discovered that the stars on the edge of the galaxy orbited the galactic centre in the same time as the stars nearer the centre. This meant the outer stars were travelling much faster than expected. Put simply, she discovered that the stars were orbiting too fast: the gravitational pull of the galaxy should not have been sufficient to hold the stars in orbit. Rubin's calculations revealed that galaxies must contain ten times more matter than is held in the visible stars. Eventually, other astronomers corroborated Rubin's result and it soon became accepted that most of the material in galaxies was dark matter. It appears that each galaxy resides inside a sphere of dark matter, and the radius of that sphere is approximately ten times the radius of the galaxy.

So just what is this mysterious dark matter? The first possibility is that it is just conventional matter, i.e., atoms composed of protons and neutrons. This would have to be in a form so that it does not emit any light (and is therefore "dark" and invisible). This might include black holes or very dense neutron stars. These type of bodies which are proposed to constitute dark matter are called MACHOs (Massive Astrophysical Compact Halo Object). However, MACHOs seem unlikely to be the solution to dark matter as they tend to be isolated objects, whereas it is known that dark matter is spread fairly evenly over a galaxy.

The opposite of being MACHO is to be a WIMP, so the other possibility is that dark matter is composed of WIMPs (Weakly Interactive Massive Particles). These would be new particles, not contained in the standard model.

These particles would have to be much more massive than protons, but would have to interact only minimally with ordinary matter — which makes them very difficult to detect. They could not radiate light or scatter it, so they could have no electric charge.

Several experiments to detect WIMPs are based deep underground in converted mine workings. The Large Underground Xenon (LUX) dark matter detector is located in a converted gold mine in the Black Hills of South Dakota, not far from Mount Rushmore. It is located underground to shield its detector from background radiation and cosmic rays. The idea is that most particles from space will interact with conventional matter in the earth and will not reach deep down through the rock — only the non-interacting WIMPs will fly straight through the earth to the detector.

The LUX detector is the most sensitive dark matter detector in existence. The detector consists of a two-metre tall titanium tank filled with liquid xenon. If WIMPs exist then they would be expected to occasionally collide with the xenon atoms in the tank. This would result in a burst of light which would trigger extremely sensitive light detectors.

However, initial results from LUX released in 2013 showed no evidence of dark matter collisions. As the LUX spokesman Richard Gaitskell said: "We saw nothing. We do not have a single dark matter candidate event." In fact, results were able to eliminate possible candidate results from earlier experiments by other dark matter detectors. So the nature of dark matter remains a mystery. As Richard Gaitskell went on to say: "We have entered the new millennium and yet we still have no idea what 95% of the universe is made of. Our level of ignorance is quite staggering, and it's one of the largest challenges we have right now."

It remains possible that there is yet another possible solution to the dark matter conundrum, and that is that dark matter might not exist at all ...

MOND

Mordehai Milgrom of the Weizmann Institute in Israel is not a fan of dark matter: "People who deal with dark matter will not stop by themselves — they will stop when the money stops. And this is what they will want to continue to do as long as they are given the chance and the resources to do it."

Milgrom believes that dark matter is not necessary to explain the flat rotation curves of galaxies. The extra gravity required can come instead from a modification to Newtonian gravity. Milgrom noted that stars on the edge of galaxies do not have to accelerate as much as stars near the galactic centre (this is because their radius of orbit is less curved). Milgrom's suggested modification to gravity is that an object which is undergoing less acceleration would experience a greater pull of gravity. This meant that stars would orbit at constant velocities, no matter their distance from the galactic centre. This theory was given the name MOND (Modified Newtonian Dynamics).

MOND has been criticised for violating the law of conservation of momentum — not something you really want in your theory. Also, recent observations of gravitational lensing (whereby light is seen to bend around galaxies) have lent further weight to the theory that dark matter really exists in its own right. The galactic cluster known as the Bullet cluster was formed when two clusters collided. As a result of this tremendous collision, measurements of gravitational lensing has revealed that the dark matter has been separated from the main mass of galaxies. This result cannot be explained by a modified theory of gravity such as MOND.

So dark matter remains a mystery for the time being. But what about the other puzzling constituent of the universe ...

Dark energy

As discussed in the previous chapter, it is known that the universe is very close to spatially flat. This spatial flatness is achieved when the mass-energy density of the universe is equal to the critical density (the formula for which we derived in the previous chapter). However, this raises a problem as the total amount of matter (including dark matter) is measured to be only 30% of the amount required to bring the density up to this critical density. As Ta-Pei Cheng says in his excellent textbook *Relativity, Gravitation, and Cosmology*: "The Friedmann equation requires a flat universe to have a mass-energy density exactly equal to the critical density. Yet observationally, including dark matter, we can only find less than a third of this value. Thus it appears that to have a flat universe we would have to solve a missing energy problem."

What could possibly account for the missing mass-energy? Even taking dark matter into account, it appears that a further 70% of our universe is missing!

So what is this missing 70%? It is generally stated that there must be a vast amount of energy in space which we

cannot detect, and even though we cannot detect it we know precisely the amount of this missing energy which exists: it is the amount required to raise the mass of the universe up to the critical density. So it is proposed that there is another invisible substance known as *dark energy* which pervades space, and makes up this missing 70% of the total mass-energy of the universe.

There is another reason why the dark energy hypothesis is popular. And that is because of a truly remarkable recent result ...

The accelerating expansion

In the 1990s it had been known for several decades that the universe began with the rapid expansion of the Big Bang. It was also believed that in the billions of years since the Big Bang, the sum total of mass and energy in the universe would have been attracted together due to gravity, and this would inevitably have the effect of slowing the expansion of the universe. So in the 1990s, two competing groups set out to determine the expected rate of deceleration of the universe. One group was the Supernova Cosmology Project based at the Lawrence Berkeley National Laboratory in California, and was headed by Saul Perlmutter. The other group was the High-Z Supernova Search based at the Mount Stromlo Observatory in Australia, and was headed by Brian Schmidt and Adam Riess. But how could it be possible for these teams to measure how much the expansion rate was slowing down?

The only way to do this would be to consider extremely distant objects, over 5 billion light years away, which would also have to be extremely bright so that their emitted light would be visible. What was needed was an object whose brightness was known and was constant. These objects which all have the same known brightness are called *standard candles*.

One type of celestial body perfectly fitted the role of a standard candle. A supernova is a star which has burnt all its fuel and undergoes a thermonuclear explosion, emitting a tremendous amount of energy (we will be encountering supernovas again in the next chapter on black holes). There are different types of supernovas. The particular type of supernova we are interested in is called a Type 1a supernova. These occur in white dwarf stars, which are old stars which are small and incredibly dense. These stars are stable as long as their mass remains below 1.4 solar masses (known as the Chandrasekhar limit). If they attain any additional mass, maybe from neighbouring stars, these stars undergo a nuclear explosion, exploding in just ten seconds, and releasing a tremendous amount of energy. Because these white dwarfs all have the same amount of mass before they explode — 1.4 solar masses — the resultant supernova explosions all have the same brightness. This means that Type 1a supernovas make perfect standard

candles for measuring the expansion of the universe.

Unfortunately, it is very difficult to find supernovas. They only burn brightly for three weeks, and in any given galaxy a supernova will explode without warning only once every 300 years. However, all is not bad news. With billions of galaxies in the observable universe, there are dozens of supernovas every night. So the international team had an ingenious idea. They took snapshots of thousands of galaxies, and then repeated those snapshots three weeks later. If any object in the second set of photos was considerably brighter than it could be recognised as a supernova. By scanning the entire sky in this method, the team were assured of a regular supply of supernovas. Perlmutter and his team dubbed this method "Supernovas on Demand".

The supernovas were then observed by the Keck telescope in Hawaii, and also by the Hubble Space Telescope. Because the brightness of the supernovas was precisely known, it was possible to determine how far away they were by measuring that brightness. So the distance to a supernova was determined by its brightness, and the speed at which it was moving away was determined by its redshift.

When the team plotted their results, they were puzzled. They found the plots of their supernovas deviated from the usual linear Hubble curve, but in a way which suggested that the expansion of the universe was accelerating — not decelerating! The graph showed that the expansion rate of the universe was smaller in the past, so that an object at a certain distance was not receding as fast as would be expected. The following diagram is typical of the sort of supernova plots (the black dots) they examined:

If you remember back to our discussion about the expansion of the universe in the previous chapter, you will recall that none of the available scenarios (open, closed, or flat universe) led to an accelerating expansion. In fact, in all three cases the rate of expansion of the universe was predicted to slow down. So this result came as a complete shock to the cosmology community. Saul Perlmutter, Brian Schmidt, and Adam Riess received the Nobel prize for this extraordinary discovery.

So what could possibly be causing this accelerated expansion of the universe? Intriguingly, a perfect candidate is Einstein's cosmological constant which we considered back in Chapter Two. If you remember, Einstein introduced the cosmological constant to prevent the collapse of the universe which was predicted by general relativity. The cosmological constant introduced a form of anti-gravity force which could hold the universe in a steady state. It was only when Edwin Hubble discovered the universe was expanding that Einstein realised his blunder.

Well, the cosmological constant can potentially do more than just hold the universe in a steady state: its anti-gravity force could be powering the expansion of the universe. But just what is this cosmological constant? Well, it might be the case that the cosmological constant is just another mathematical constant, with no obvious physical

cause. In other words, maybe Einstein was correct and we should adjust the form of his equation to include this additional constant. But physicists seem reluctant to modify the equation for general relativity, and would rather seek some additional physical cause which plays the same role as the cosmological constant.

It is currently believed that dark energy might be nothing more than the energy of empty space, otherwise known as the *vacuum energy*. That might sound very strange: how on earth can empty space have an energy? Well, it turns out that empty space is not so empty after all, and that is all due to the effect of quantum mechanics.

In quantum mechanics, the Heisenberg uncertainty principle says that there will always be a degree of uncertainty in how accurately we can know a combination of certain particle properties. You may have heard that the more accurately we determine the position of a particle, the less accurately we can know its momentum. For example, if we arrange for a particle to hit a screen, we can determine the particle's position with 100% accuracy, but we will have no way of knowing how fast the particle was travelling when it hit the screen — there is maximum uncertainty about its momentum.

There is a similar uncertainty about a particle's time and energy. This means there is a fundamental limit on how accurately we can measure the energy of a system at a given moment in time. Incredibly, this means that for a short period of time, there can be energy produced in empty space in which all the matter has been removed. Even more incredibly, according to the mass-energy equivalence described by $E=mc^2$, this vacuum energy can be enough to produce a particle! It is as though the energy is "borrowed" from the vacuum. These so-called "virtual particles" can appear out of nothing.

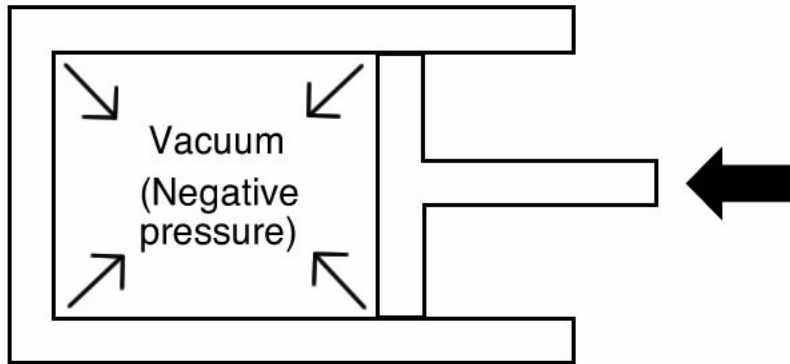

These virtual particles can only exist for a very short period of time before the energy debt has to be paid back. Very shortly after the particles appear, they annihilate each other and disappear again. However, for the period that the particles are in existence they generate a very small amount of energy in empty space: the vacuum energy, also known as *zero-point energy*.

You might find it hard to believe that empty space can contain energy. However, this has been experimentally proved by measuring the *Casimir effect*. The Casimir effect is quite a remarkable experiment in which two metal plates are placed very close to each other — just a few micrometres apart. Virtual particles pop in-and-out of existence between the plates, but because of the very small distance between the plates this introduces a limitation on the type of particles which can be produced. As a result, fewer virtual particles are produced between the plates than outside the plates. The resultant difference in pressure generates a small force which pushes the plates together. This force has been measured: virtual particles are a reality.

Interestingly, if you have two ships floating next to each other, they will gradually come together for a very similar reason to the Casimir effect. This is because only waves of a limited number of wavelengths can fit between the ships — the wavelengths of the waves outside the ships being unlimited. As a result of this inequality, there is a small pressure which forces the ships together.

Of course, as you might have predicted, the idea of empty space producing energy has attracted the attention of many inventors who believe they can harness this energy to produce power. Unfortunately, all their efforts are doomed to failure. Zero-point energy is the lowest amount of energy that can exist. If you try to draw-off that energy from a region of empty space — to produce warmth, for example — you will only end up heating the empty space with your own equipment as the energy of the vacuum is guaranteed to be less than the energy of any equipment you might attach to it.

Vacuum energy has a particular property which makes it very interesting from the point of view of explaining the accelerated expansion of the universe, and that property is *negative pressure*. If you consider the cylinder filled with a vacuum in the diagram below, it can be seen that the vacuum will inevitably try to pull the piston further into the cylinder (this is inevitable as the vacuum has the lowest possible energy). In this sense, we can consider the vacuum as having negative pressure (if the vacuum had positive pressure then it would be forcing the piston out of the cylinder):

Now let us consider a normal gas under normal positive pressure in the cylinder. The gas would tend to push the piston out of the cylinder (as might happen in a steam engine, for example). In which case, the gas has done work, and the energy contained in the gas is **reduced** as a result.

However, if we now consider our cylinder full of vacuum, as we have seen, the vacuum will tend to pull the piston in. If the piston moves out of the cylinder instead, then the energy contained in the vacuum is **increased** as a result (the opposite to the case of the gas with positive pressure).

So the vacuum energy can result in negative pressure. And this is very interesting, because pressure is a form of energy. General relativity predicts that not only is mass gravitationally attractive, but positive pressure is also gravitationally attractive. And so, quite incredibly, negative pressure is predicted to result in gravitational repulsion! As Alan Guth says in *The Inflationary Universe*: "According to general relativity, a positive pressure creates an attractive gravitational field, as one might guess. A negative pressure, however, creates a repulsive gravitational field."

So next time someone says that gravity is a force which is always attractive, you can correct them: negative pressure results in gravitational repulsion!

And this is why the vacuum energy is a candidate for the mysterious dark energy: the repulsive gravitational effects of negative pressure could be powering the expansion of the universe.

You might be wondering why the gravitational attraction due to the energy of the vacuum does not negate the gravitational repulsion due to the negative pressure. After all, Einstein showed that energy is equivalent to mass, so surely the vacuum energy should be gravitationally attractive. The answer is, yes, the vacuum energy **is** gravitationally attractive, but this does not completely cancel-out the gravitational repulsion. This is because the mass (attractive) and pressure (repulsive) elements affect the accelerated expansion of the universe differently.

In order to see this, we need to consider the second of the two Friedmann equations. This equation provides a formula for the acceleration of the expansion of the universe, which is given by:

$$-\frac{4\pi G}{3}(\rho + 3P)$$

Where ρ is the density (which we have seen before), and P is the pressure. We can see that the pressure term is multiplied by three. This is because, very unusually, all observers must measure the same energy and pressure of the vacuum — no matter how they are moving. As a result, this value of three is there purely because there are three dimensions of space! [9]

The repulsive component of the vacuum energy is therefore three times stronger than its attractive element. So the second Friedmann equation predicts an accelerating expansion.

But this all depends on the actual value of P . And that is where the problems really start ...

The biggest error in science

The required value for the vacuum energy is extraordinarily small — in the order of a millionth of a billionth of a joule per cubic centimetre. The effect has a cumulative effect over distance, so it must be extremely small or else the universe would be ripped apart over large distances. Even at the vast scales of the Milky Way, the effect is unnoticeable. The repulsive effect only becomes noticeable at the scale of the whole universe.

So we need an astonishingly small value for the vacuum energy. However, when attempts are made to calculate the amount of vacuum energy, the result is very different to that required to be the dark energy. In fact, the value for the vacuum energy is calculated to be an enormous figure: a trillion trillion trillion trillion trillion trillion trillion trillion trillion trillion trillion times larger than the observed value of dark energy density. And that's a lot of trillions! Famously, this has been called the "biggest error in the history of science". Vacuum energy is predicted to be far too large to be dark energy.

This sounds suspicious. The sums for this vacuum energy hypothesis simply do not add up. Not only do they not add up, they are astronomically wrong. It is possible that there is some mechanism which greatly reduces the vacuum energy, for example, the energy of different types of symmetrical particles might cancel each other out. But we would generally expect this cancelling mechanism to result in a zero vacuum energy, not a tiny value.

However, the problem with the necessary value of the vacuum energy is not that it is so much smaller than the predicted value. The problem is that it is set to a **particular** tiny value which results in an "interesting" universe. If the universe expanded at too fast a rate, galaxies would be unable to form. If the universe expanded too slowly, it would collapse back on itself before intelligent life could form. The amount of vacuum energy required is not just set to a much lower value than predicted, it is set to **just the right** much lower value than predicted. This gives an impression of fine-tuning of the vacuum energy.

There are more bizarre coincidences. The predicted density of dark energy in the universe is remarkably close to the density of matter in the universe. This is surprising as the density of matter reduces sharply as the size of the universe increases (the matter becomes more diffuse), whereas the dark energy density remains constant. The dark energy density remains constant purely because it is the energy of empty space: as the size of the universe increases, so does the amount of empty space. This apparent balance between the amount of mass and the amount of dark energy has been called the *cosmic coincidence problem*. This coincidence — this unlikely balance — appears to indicate that there is something very special about the current era.

In order to explain these apparent fine-tuning problems, the dreaded "multiverse" model has been introduced. A series of parallel universes are postulated with the vacuum energy being set to different values in each parallel universe. However, most physicists would find such an idea highly fanciful. They may even accuse it of being unscientific.

More bad news for the dark energy model was provided by the most recent observations of Type 1a supernovas from the Pan-STARRS observatory in Hawaii. The observations revealed that dark energy does not provide an accurate model for the observed expansion of the universe.^[10] Multiple experiments are now coming to the same conclusion. "This paper is now the third survey of distant supernovas that's coming to this conclusion," explains Adam Riess, who was introduced earlier for winning the Nobel Prize for the discovery of the accelerating expansion. "We can't just say this survey or that survey screwed-up. It could be that dark energy is more interesting in a way that actually we hope."

In the later chapters of this book, a simple alternative explanation for the acceleration of the expansion of the universe will be presented, an explanation which requires no fine-tuning of the vacuum energy to some bizarrely tiny value. I believe we are looking at the problem from the "wrong end". Instead of the setting of vacuum energy to a particular value which just coincidentally happens to produce an "interesting" universe, the hypothesis will be presented that such a universe is a fundamental necessity.

BLACK HOLES

Put simply, a black hole is an object of such extraordinary mass and gravitational pull that nothing can escape it — not even light. Just the name "black hole" conjures an image of a fearsome entity, dark and malevolent, stalking space ready to catch any unlucky passing object in its unbreakable grip. It seems like an object out of science fiction more than science fact. However, the existence of black holes is now a well-established reality.

Black holes are stars which have collapsed under their own weight. This can happen at the end of a star's lifetime. A star produces its energy via nuclear fusion, a process which fuses hydrogen nuclei together under immense temperature and pressure to become helium nuclei. The energy released is sufficient to overcome the immense gravitational force which continually tries to collapse the star. However, when a star burns off all its hydrogen fuel, it starts to collapse under its own weight. As a result of this extra pressure, the helium in the star starts to fuse. Energy is released, and the star expands in size to become a *red supergiant*. These are the largest stars in the universe, up to 1800 times the size of our Sun. Inside the red supergiant, progressively heavier and heavier elements are fused to produce energy. This process stops when iron is produced in the core. Iron is the equivalent of ash for nuclear fusion as it requires more energy to fuse iron than the process produces.

At this point, the red supergiant collapses and the outer layers of the star get blown off in a huge supernova explosion. A supernova is so bright that for a few days it can outshine all the other stars in a galaxy put together.

We considered how white dwarf stars explode as Type 1a supernovas in the previous section, describing how those supernovas make excellent standard candles. However, Type 1a supernovas never result in black holes — the exploding white dwarfs leave no remnant. The type of supernova we have described here, which start from red giants, are called core-collapse supernovas, otherwise known as Type II supernovas. These supernovas can leave behind a remnant at their centre, so only Type II supernovas can generate black holes.

What happens to the collapsing star now depends on how heavy the remnant is. For remnants of mass 1.5 to 3 times the mass of the Sun, the result of gravitational collapse after a supernova explosion can be a *neutron star*. Neutron stars are incredibly dense: six million tons to the cubic inch.

For even larger stars, if the mass of the remnant exceeds about three solar masses then the gravitational collapse can be unstoppable. In less than a second, the core of the star implodes from a ball about the size of the Earth to a ball about the size of a small city. And this implosion continues down to a small point. It is this point which becomes a black hole.

The black hole then increases in mass by attracting other mass from its surroundings. In this way, black holes can grow to possess extraordinary mass, and an extreme gravitational field to match.

The wonderfully evocative name "black hole" was coined by John Wheeler in 1967. However, surprisingly, we can trace the first proposals back to the eighteenth century.

The idea was suggested independently by the British geologist John Michell, and the French mathematician Pierre-Simon Laplace. By using Newtonian physics they considered the escape velocity of an object trying to break free of a gravitational field around a star or planet.

This means an object is propelled off the surface of the planet with a velocity, v , and that initial kinetic energy must be greater than (or at least equal to) the gravitational energy pulling it back to the planet.

In which case:

$$\frac{1}{2}mv^2 = \frac{GMm}{r_{esc}}$$

where m is the mass of the object trying to escape, M is the mass of the planet, and r_{esc} is the escape velocity (the left-hand side of the equation is the kinetic energy, the right hand side of the equation is the gravitational energy).

On rearranging the equation we find:

$$r_{esc} = \frac{2GM}{v^2}$$

For black holes, we put v equal to the speed of light, c , to indicate that any object trying to escape the clutches of a black hole would need an escape velocity faster than the speed of light (which is impossible, of course):

$$r_{esc} = \frac{2GM}{c^2}$$

This black hole radius calculated by the eighteenth century physicists remains an accurate formula still in use to this day.

Of course, light is not slowed down by gravity — light always travels at a constant speed. So light is actually trapped in a black hole by the extreme curvature of space.

This result of Michell and Laplace was ignored throughout the nineteenth century as it was not believed that light (which was known to be massless) was affected by gravity. It took the arrival of general relativity before the idea was revisited.

As we saw in the earlier chapter on gravity, merely from a thought experiment involving a window in a spaceship, Einstein was able to predict that gravity bent the path of light. This was a revelation: light might be massless, but it was still affected by gravity (gravity being the curvature of space itself). This again raised the possibility of an object whose gravitational pull was so strong that not even light could escape. Hence, from a mere thought experiment, Einstein predicted the existence of black holes. The existence of black holes is now an accepted fact in astrophysics — more evidence of the validity of general relativity.

Einstein's equations of general relativity published in 1915 were complex, non-linear, and very difficult to solve. In this respect, solving the equations is similar to solving non-linear equations of fluid dynamics, or weather prediction. Even to this day, exact solutions for Einstein's equations have only been found for very simplified models, with the solutions to more complicated situations only capable of being solved by number-crunching on extremely powerful computers. For example, it is now possible to simulate the results of black hole collisions using the Einstein equations and super-computers capable of performing one thousand billion calculations per second.

The very first exact solution to the equations was presented by Karl Schwarzschild just months after Einstein published his result. Schwarzschild used a simplified version of the Einstein equations to produce a *vacuum solution*, a solution for an empty space. This considered the curvature of empty space around a spherical mass, for example, a star. Further simplifications meant the star should not be rotating, and had no overall electric charge. These are considerable simplifications, but they did allow the equations to be solved.

The Schwarzschild solution predicted a black hole radius which is called the *Schwarzschild radius*. The value for this Schwarzschild radius is the same as that produced by the classical derivation for the black hole radius presented earlier:

$$r_s = \frac{2GM}{c^2}$$

Remember this formula. We will be seeing it again later.

Rather incredibly, Schwarzschild derived this solution while serving in the trenches for Germany in the First World War. Sadly, he was killed on the Russian front just months after publishing his result.

The Schwarzschild radius around the black hole is usually referred to as the *event horizon*. Once any object passes the event horizon into the black hole, it has passed the point of no return. It can never get out again.

If you were approaching a black hole in a spaceship, you might not even notice the moment you passed the event horizon. However, you have already signed your death warrant once you pass the event horizon. It is like falling over the edge of a waterfall on a river. There is no way you can swim back up. From that point on, you are doomed to be dashed on the rocks below.

As you pass further into the interior of the black hole, it is believed that the gravitational stresses on your body would increase. Your feet would be pulled into the centre faster than your head — a process given the wonderfully descriptive term *spaghettification*.

Although we can have no direct, certain knowledge of the behaviour of physics inside a black hole (we are fundamentally prohibited from obtaining information from inside a black hole), conventional theory suggests that material entering a black hole will continue to fall to the centre, which has become a region of unimaginable density. According to general relativity, at the very centre we will find that the density increases to an infinite amount, a point called a *singularity*. Current theories of quantum gravity say that the singularity would not occur in reality — it is only the shortcomings of our current theories which suggests singularities. This is because singularities are so distasteful to physicists: they are the point at which the laws of physics break down. When we find infinities emerging in theories it usually means that the theory is inaccurate, or has been pushed too far. Einstein never accepted black holes because he did not believe a singularity could occur. If we had the right theory, the singularity would surely disappear from our theory.

Bear this in mind, because we will be returning to this important point (and proposing a singularity-free theory) later.

Supermassive black holes

A black hole increases its mass by attracting other mass which surrounds it. In this way, the mass of a black hole can rise to an extraordinary value: as much as a billion times the mass of the Sun. These giants are called *supermassive* black holes.

There is believed to be a supermassive black hole at the centre of our galaxy called Sagittarius A*. This has a mass of about 4.3 million solar masses. Everything in our galaxy is spinning around this supermassive black hole at its centre. It is now believed that there is a supermassive black hole at the centre of every galaxy, its huge gravitational pull essentially holding the galaxy together. So while black holes have a reputation as fearsome objects of destruction, they actually play a vital role in shaping the universe and holding it all together.

While black holes do not themselves emit X-rays, material falling into a black hole gets heated by the extreme gravitational field and X-rays are produced. This material, which is external to the event horizon, forms an *accretion disk* of debris which orbits the black hole at great speed (the rings of Saturn are another example of an accretion disk).

As Eliot Quataert of Berkeley's Theoretical Astrophysics Center explains: "That picture that matter gets sucked into a black hole, that's one of the biggest confusions that's out there, partially because of science fiction like *Star Trek*, and things like that. For matter that's far away from a black hole it actually doesn't get sucked in: it's very much like the planets in the solar system going around the Sun. Things just go around and around and around and around."

It is believed that these accretion disks rotate at great speed and generate huge jets of matter which emerge from the polar regions of the black hole travelling at near to the speed of light. The radiation from these jets can be a thousand times more powerful than the luminosity of our entire galaxy, and these incredibly bright objects — the brightest objects in the entire universe — are called *quasars*:

It is ironic that the brightest objects in the universe are actually black holes!

It is so difficult to observe supermassive black holes because they are simply too far away and too small. Black holes are extremely compact. The black hole at the centre of our galaxy would appear about as big to us as an orange on the Moon. No conventional telescope based on Earth would be able to resolve such a small angular distance. The angular resolution of a telescope is proportional to the size of its aperture. So, in order to achieve the necessary angular resolution, a telescope has been created with an aperture the size of the entire planet Earth.

The *Event Horizon Telescope* has been constructed with the specific aim of observing the supermassive black hole at the centre of our galaxy. The telescope actually consists of a global network of seven radio telescopes, the data from which is combined to produce an image. It really is a telescope as big as the world.

The telescopes which form the Event Horizon Telescope tend to be based on the top of mountains, and include the James Clerk Maxwell telescope in Mauna Kia, Hawaii, the Atacama Pathfinder Experiment in Chile, the Pico Vileta Telescope high in the Spanish Sierra Nevada, and the South Pole Telescope in Antarctica:

The first images from the Event Horizon Telescope are due to be produced in 2016. The images of the behaviour of gravity in the most extreme situations will either provide the final confirmation of the correctness of Einstein's theory of general relativity — or provide the first evidence that the theory needs modification.

Black hole thermodynamics

You might be surprised to learn that a science developed to analyse 19th century steam engines is now our main tool in analysing black holes. The science of thermodynamics was established as a means for studying the heat and motion of steam engines. Thermodynamics considers the energy and motion of atoms, and the heat and pressure that motion produces. We are now finding that the fundamental principles behind thermodynamics have particular relevance to the mechanisms associated with black holes. As Jim Al-Khalili says in his excellent BBC documentary *Order and Disorder: Episode 1* (available on YouTube): "As unlikely as it sounds, steam engines held within them the secrets of the cosmos."

In the 19th century, Britain's Victorian industry led the world. That industry was based on the newly-invented steam engine. The expansion of the British Empire around the world was powered by the steam engine, allowing the construction of the railways and steam ships, and providing a huge boost to manufacturing. Britain emerged as the world's most powerful trading nation.

In the early 19th century, Britain's defeat of Napoleonic France motivated humiliated French scientists to learn more about steam power in an attempt to catch up with the British technological lead. The French engineer Sadi Carnot is known as the "Father of Thermodynamics". Carnot was determined to analyse how steam engines work. In 1824, he wrote the legendary *Reflections on the Motive Power of Fire*. Carnot realised that heat would flow from a hot source to cooler surroundings, and that flow could be harnessed to do work.

But it was only when the principle of atoms was proposed that we could really make sense of heat and motion. It was realised that heat was nothing more than the random motion of atoms. If the atoms move more vigorously, then the object heats up. This provides us with a greater understanding of how heat moves. If one corner of an object is hot, then that heat will spread through the object so that the entire object becomes one temperature. This is due to the

motion and collision of atoms within the object, but there is a deeper principle at work here to explain why the flow of heat works in only one direction.

If we have a small amount of gas molecules in one corner of a room, then, over time, that gas will spread over the entire space of the room. What is happening is that a very ordered state is changing to a very disordered state. When all the gas molecules were carefully positioned in the corner of the room, this represents an ordered state. Over time, when the room becomes full of randomly-moving molecules of gas, this represents total disorder.

This principle — that the state of a system will tend to move from order to disorder — is known as the *second law of thermodynamics*, and is one of the most important and fundamental principles in physics. It applies to all systems throughout the universe, from steam engines to black holes.

The second law of thermodynamics introduced a quantity of a system called its *entropy*. Entropy can be considered to be the amount of disorder in a system. The second law says that the entropy of a system only ever increase — it can never decrease. Essentially, the disorder of a system can only ever increase over time.

This principle — that disorder can only ever increase with time — seems so fundamental, so obviously correct, that the second law of thermodynamics is considered to be a completely unbreakable fundamental law of physics.

This one-way principle of entropy increase might remind you of a one-way property of a black hole. Can you think of anything about a black hole which always increases and can never decrease? Well, the mass of the black hole can only ever increase (nothing can ever leave a black hole). Which means the corresponding Schwarzschild radius — and, specifically, the associated area of the event horizon — can also only ever increase. Because of this similarity, in 1972, Jacob Bekenstein proposed that a black hole has entropy proportional to the area of its event horizon.

It might seem strange that we consider a black hole to have entropy at all. But, remember the second law of thermodynamics which says that entropy can only ever increase. It might appear that we can eliminate the entropy of matter by sending it into a black hole, in which case its entropy would appear to have gone for good. This sounds like a method for reducing entropy, which would break the unbreakable second law. So, to prevent the second law from being broken, the entropy of any mass entering the black hole gets added to the total entropy of the black hole. This is reflected in the increased area of the event horizon. In this way, entropy only ever increases.

Consideration of black hole entropy is perhaps the main tool we possess for analysing the properties and behaviour of a black hole. This area of study is called *black hole thermodynamics*.

Information and entropy

There is an important connection between the information contained in a system and the entropy of that system. A simple way to understand this is to imagine you are in a library, and there are ten different books on the table in front of you. Each book is about a different subject, and each book contains useful information. So each book can be clearly distinguished from any of the other books by means of the distinct useful information it contains.

Over time, however, the books start to decay. First the pages fade, then the paper rots. Eventually the whole book crumbles into a pile of dust. The entropy of each book has therefore massively increased. In fact, the entropy of each book is now at a maximum — they cannot get more disordered. All the useful information contained within each book has now been lost. The books can no longer be distinguished — all we are left with is ten piles of crumbly dust.

So as entropy increases, information is lost. If entropy is at a maximum, information is at a minimum, and if entropy is at a minimum then information is at a maximum. You might often read that "entropy is information" in the scientific literature. As we can see from our discussion, this is worse than misleading: it is simply wrong. Entropy is actually the **inverse** of information: entropy is a measure of information **loss**. We can consider entropy to be the amount of invisible information **lost or hidden from us**. As Seth Lloyd says in his book *Programming The Universe*: "Entropy, which is just invisible information, is also a measure of ignorance."

If we have a room full of gas, and we leave it for a while, the gas will all become the same temperature. At this point, the entropy of the gas is at a maximum. The molecules of the gas are flying around in a completely random manner. We cannot keep track of the individual gas molecules, so we can only describe the gas by a single value: its temperature. That single value is the only information we have left. At this point, we say the gas is in a random, *thermal state*, a state of maximum entropy.

Returning to consider our ten books, our definition of the amount of information that a book contains is rather dubious. We are saying that all the information in a book is contained in the letters and words of that book. We are, of course, unable to keep track of the position and motion of all the atoms in the books — that information is hidden from us. But Nature does not recognise letters and words. All Nature sees are the atoms and particles in the book. As

far as Nature is concerned, the fundamental information contained within the book is the position and velocities of the atoms which make up the book. And that amount of fundamental information is, of course, retained even when the books crumble into dust. The book still contains the same number of atoms. Those atoms still have the same number of velocities. Even when we dig down to the quantum level, the mathematics of quantum mechanics insists that all the information about elementary particles is conserved (this is called *unitarity*). So this introduces a very important principle: at the fundamental level, **information is always conserved**.

The holographic bound

Any information (e.g., contained in a book) entering a black hole is clearly going to become hidden information — we are never going to be able to read that book again. So that hidden information acts to increase the entropy of the black hole. This means a black hole can really be considered to be a store of hidden information.

As we saw in the previous section, Jacob Bekenstein proposed that the area of the black hole's event horizon was proportional to the entropy of the black hole. This means that the area of an event horizon is proportional to the information hidden inside the black hole. This is a surprising result: the information is proportional to area. More likely we would have expected information to be proportional to the volume of the black hole, after all, the amount of information stored in a book is proportional to the number of pages — not the area of its cover.

What is more, Bekenstein was able to extend his result to calculate the maximum information content of **any** region of space. His logic was ingenious:

- Consider some matter (and its associated information) enclosed in a sphere.
- Some mass is added to force the region to collapse to a black hole.
- The entropy of the resultant black hole is proportional to the area of its event horizon. This area is obviously smaller than the area of the original region.
- Entropy never reduces, so the entropy of the original region must have been less than the entropy of the black hole.
- So the maximum information content of any region of space is less than a black hole of equivalent radius.
- Therefore, the maximum information content of any region of space is proportional to the area of that region.

This result — that the maximum information content that can be held in a region of space is proportional to the area of that region — might appear surprising. Intuitively, we might consider the maximum information content to be proportional to the volume of that region. This result was realised by Jacob Bekenstein, and this limit on information content is called the *holographic bound*. In his book *The Black Hole War*, Leonard Susskind says this result is "profound and probably holds the key to the puzzle of quantum gravity."

I am sure you have encountered holograms before. There are holograms on most driving licenses and credit cards. They are the small shiny foil squares which seem to contain an image. Holograms are generated by splitting a laser into two beams: one beam illuminates the object, while the other beam shines directly on a photographic plate. As a result of the two beams, an interference waveform pattern is generated on the photographic plate. Inevitably, the pattern saved on the photographic plate appears completely scrambled, but when the photographic plate is illuminated again, the three-dimensional representation of the object is regenerated. So holograms reveal the general principle that a three-dimensional object can be accurately captured on a two-dimensional surface. This is what the holographic bound suggests about any region of space.

String theorists have latched onto the implications of the holographic bound and developed a theory which suggests that all the information in the universe is "painted" on the outer boundary of the universe (taking their lead from the assertion of the holographic bound that the maximum information content of the universe would be proportional to the area of its boundary). The theory suggests that you are a three-dimensional projection of a two-dimensional structure on the boundary of the universe. This is called the *holographic principle*.

However, Jacob Bekenstein is also sceptical of extending his principle to the entire universe: "My result is not applicable to horizons which are not event horizons." According to Bekenstein, the holographic principle could only apply if the universe itself was a black hole. And that surely could not be the case!

Or could it? We shall see in the later chapters. The answer might surprise you.

The black hole information loss paradox

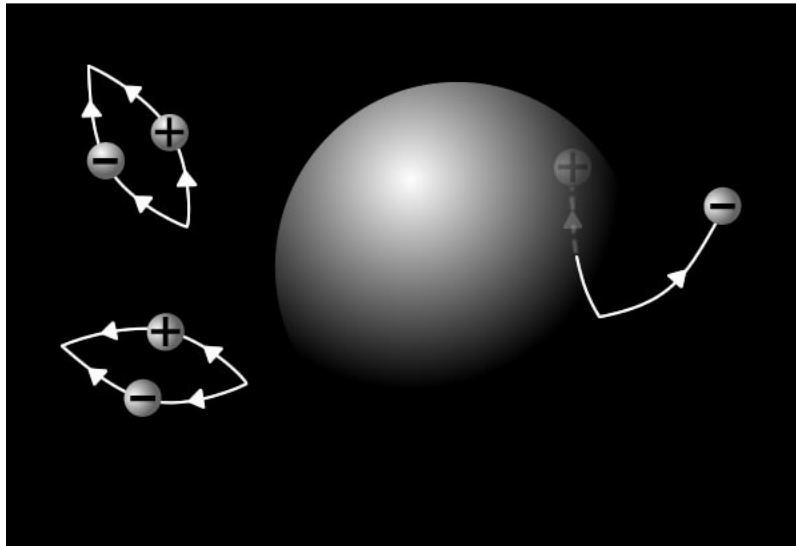

In 1972, when Bekenstein proposed that black holes had entropy, no one really knew what to make of the result. That all changed in 1974 when Stephen Hawking made his greatest discovery. Hawking realised that black holes not only have entropy, they also have an associated temperature. This might come as something of a surprise. It might be imagined that a black hole is completely cold and dark. If a black hole has a temperature, then that means it emits radiation. How on earth could that occur?

So far in our analysis of black holes, we have only considered the effects of general relativity. In order to understand black hole radiation, we need to also consider the effects of quantum mechanics.

If you remember from the discussion about the vacuum energy in the last chapter, quantum mechanics allows enough energy to be borrowed for a short period of time to create particles in empty space. These virtual particles have to be produced in pairs: a particle and its antiparticle. For example, an electron and a positron may be produced — but only for a very short period of time. Very shortly after the pair of particles appear, they have to annihilate each other.

Stephen Hawking realised that if a pair of virtual particles was produced at the event horizon of a black hole, one of the particles might be sucked into the black hole while the other particle remained outside. In this case, there would be no way that the particle inside the horizon could re-emerge. The particles would be incapable of annihilating each other. The particle which remained outside the horizon would be free to be emitted as *Hawking radiation*.

The diagram below shows some virtual particles (on the left) being created and annihilating each other. However, on the right-hand side we see one of the virtual particles being sucked into the black hole. The remaining particle is emitted as Hawking radiation:

As surprising as Hawking radiation may appear to be, it is even more surprising to realise that this will inevitably result in the evaporation of the black hole. If a black hole is radiating energy, then its mass will inevitably reduce (through $E=mc^2$). Eventually, the black hole evaporates to nothing.

The evaporation process is incredibly slow and weak, because the predicted temperature of a black hole is only a fraction of a degree above absolute zero. It would take billions of years before any black hole would disappear through evaporation. Nevertheless, the fact remains that every black hole will eventually evaporate.

When he announced his discovery of black hole radiation, Stephen Hawking dropped another bombshell. He announced that when a black hole finally evaporates, all the information that ever entered the black hole would have vanished as well. This is because the radiation was considered to be completely thermal — random — and could not be responsible for carrying any information away from the black hole.

This was such a bombshell because, as we considered earlier, quantum mechanics states that fundamental

information is always conserved. This principle is a cornerstone of physics. If information could genuinely be lost from the universe then this would represent a crisis in physics, and would cast doubt on our understanding of the basic principles of Nature. In essence, we have a clash between quantum mechanics which says that information must be conserved, and general relativity which says that nothing can come out of a black hole. So, we have our two great theoretical pillars which support the whole of physics, and, incredibly, one of them must be wrong — but we don't know which theory is wrong!

So physicists eagerly got to work trying to find a way out of what is now known as the *black hole information loss paradox*. The proposed solutions include:

- The radiation somehow manages to carry the information away from the black hole. However, the radiation has always been assumed to be thermal, i.e., completely random. There is no way for anything to leave the interior of a black hole.
- There is a microscopic remnant left behind after evaporation which includes all the information which has ever entered the black hole. This is generally considered impractical.
- The singularity forms a connection with a baby universe so that even when the black hole evaporates, all the information is maintained in the baby universe. Which is fine, but it effectively represents a loss of information in this universe.

None of these solutions is entirely convincing. However, one proposal has found widest acceptance, and we will consider it next.

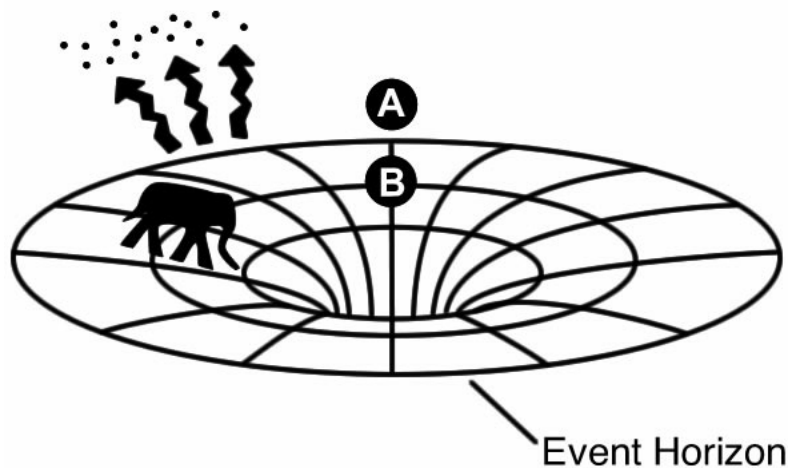

Black hole complementarity

The principle of black hole complementarity was proposed in 1993 by Leonard Susskind, Larus Thorlacius, and Gerard 't Hooft as a solution to the black hole information loss paradox. Complementarity avoids the paradox by suggesting that the information both enters the black hole and is **also** reflected at the event horizon. This appears to imply there are two copies of the information. How can this be true?

Well, it all depends on your point of view. When an observer falls through a black hole event horizon, he might not feel anything out of the ordinary to tell him he is irretrievably doomed. As he is in gravitational free-fall, Einstein's equivalence principle means he does not even feel the pull of gravity. However, for an observer outside the event horizon, the situation is different. To an observer outside the event horizon, the infalling object appears to slow down and stop at the horizon. Time itself appears to stop for the infalling object. This is because it becomes progressively more difficult for light to escape from the black hole. When the object reaches the event horizon, light can no longer escape and the object appears to freeze in time at the horizon.

So we have two different views of reality depending on where the observer is positioned. For an observer outside the event horizon, the infalling object appears to freeze at the horizon, but the experience of the infalling object is different as it notices no change as it passes the event horizon and continues unhindered toward its doom at the singularity.

The diagram below shows these two points of view. Observer A is outside the horizon, and sees the infalling object (usually chosen to be an elephant for some reason) freeze at the horizon. It is then broken down due to the temperature of the black hole and is radiated away into space. So the information is preserved in the radiation. Observer B is inside the event horizon and sees the object continue unhindered towards the singularity:

However, there is a problem with this Xerox machine at the event horizon. Quantum mechanics prohibits the precise copying of any object. If we could take a precise copy of a particle, for example, we could take one particle and measure its velocity, and we could take the copied particle and measure its momentum. Hence, we could know both the velocity and momentum of the particle — something prohibited by the Heisenberg uncertainty principle. This law prohibiting precise copying is called the quantum *no-cloning theorem*.

Black hole complementarity has a clever way of avoiding the no-cloning theorem. Each observer — observer A outside the horizon, and observer B inside the horizon — can only see one copy of the information. Observer A can see the information in the radiation, while observer B can see the information in the unharmed elephant. But, crucially, neither observer can see both copies of the information.

So black hole complementarity seemed like a very satisfactory solution to the information loss paradox. In 1997, Stephen Hawking had made a public bet with John Preskill that information was definitely lost in black holes. However, in 2004 Hawking announced that he was conceding the bet — so even Stephen Hawking was convinced that the information came out with the radiation. For winning the bet, John Preskill received a baseball encyclopedia from Stephen Hawking (because it was heavy and difficult to get information out of it).

However, it now appears that Hawking conceded the bet prematurely. In the summer of 2012, the physics community got very excited when a group of physicists based in California (Almheiri, Marolf, Polchinski, and Sully — collectively known as AMPS) realised there was a flaw in complementarity.

According to AMPS, the observer outside the event horizon could obtain his information about the infalling object from the emitted radiation. But the flaw in complementarity was based on the fact that the observer could then jump into the hole and catch up with the object itself. The observer would then have two copies of the information, and that breaks the no-cloning theorem.

The only way out of this paradox is, according to AMPS, that any object entering the black hole is no longer unaware of the moment it crosses the event horizon. The moment the object crosses the event horizon there has to be a dramatic instant incineration of the object by Hawking radiation. This appears to be the only way to ensure that the no-cloning theorem is not violated. The AMPS theory has obtained the nickname "firewalls" because of this.

But why should a firewall appear out of empty space? No one seems happy with this conclusion, not even AMPS. There have been a host of different papers published over the last few months, all arguing different viewpoints. There is no consensus of opinion. In fact, this area of research seems to be in a state of chaotic flux. Most of the papers seem to be tinkering around the edge of the event horizon, trying to save the old model. The information paradox seems to be as far away from being solved as it has ever been.

I think we can safely say the information loss paradox remains unresolved. As I said earlier, either quantum mechanics or general relativity must be wrong. I believe it is general relativity which requires modification. Later in this book we will be revisiting the paradox armed with a new theory, a theory which does away with the tinkering and proposes a radical reassessment of general relativity and our model of black holes.

6

THE SOAP BUBBLE UNIVERSE

So far in this book, the material has not deviated from orthodox physics and cosmology. At this point, I have to warn you that we are now going to take a different turn. Over the next few chapters, a startlingly original hypothesis will be presented. We will build toward the hypothesis in a logical manner, and I firmly believe the hypothesis has a firm grounding in orthodox physics. However, the nature of the hypothesis is inevitably far removed from the mainstream. If the hypothesis appears too far-out for your liking, I can only ask you to bear with me as we explore the remarkable implications and apparent success of the hypothesis. Clear evidence will be presented. I hope you will be won over.

Sometimes you can stare at a problem for too long that you become unable to see a solution. Sometimes you need a radically different way of looking at a problem.

Up to now, we have studied several of the greatest mysteries in physics. We have considered the mystery of gravity, the puzzling acceleration of the expansion of the universe, problems with the inflation hypothesis as a means of explaining the flat universe, undesirable singularities in black holes, the mystery of black hole entropy being proportional to the surface area of the event horizon, and the apparent loss of information in black holes. It is now time to present a single, simple, logical solution which we shall see has the potential to solve **all** these problems.

There is a remarkable result in physics that has been known for many decades. The result seems to point to something very important and profound about the universe, yet it appears that no one quite understands or knows what to do with the result. It is the principle that the universe has zero total energy.

But how on earth can the universe have zero total energy? The universe obviously contains mass, and we know through $E=mc^2$ that mass can be converted to energy. So how can the total energy in the universe be zero? In order to understand this, we have to think a little bit more about how the force of gravity works.

Consider two masses which are quite close together. If we try to separate those two masses, we will have to perform work against the force of gravity. In this respect, the force of gravity between the two masses functions very much like a spring, the spring (gravity) attempting to pull the two masses back together:

When you move the two masses apart, energy is stored in the gravitational field: energy is stored in the gravity "spring". The density of the energy is actually proportional to the square of the field. How can energy be stored in a spring? Well, just imagine a traditional clockwork wristwatch. When you wind the wristwatch, you transfer energy to the spring, and it is the spring which stores the energy. Slowly over time, the energy in the spring is released and can power the motion of the hands of the wristwatch. And it appears to be a very similar situation with gravity. When masses are pulled apart, energy is transferred to the "spring" of the gravitational field. Energy is stored in the field, and then over time that energy is released to generate motion, i.e., to bring the masses back together again.

But, when you think about it, you realise this "spring" of gravity does not behave like a normal spring. With a normal spring, the further apart you pull the two objects, the greater the force the spring exerts to pull the objects back together. So, with a normal spring, it becomes ever harder to pull the objects further apart. Gravity does not work like that. If you consider the equation for Newton's law of gravitation, you will see that the force between the masses reduces as the distance between the masses increases. This behaviour is therefore different to the behaviour of a mechanical spring, and it is very hard to imagine a spring behaving like that. The spring would have to be very hard to pull apart initially, but it would get progressively easier as you pull the masses further apart. In this respect, the "gravity spring" is a very peculiar type of spring.

But it is this peculiar behaviour of the gravity spring which enables the universe to have zero total energy. This is possible because the behaviour of the gravity spring means the gravitational energy contained within the spring (i.e.,

the energy contained within the gravitational field) can be considered to be negative energy.

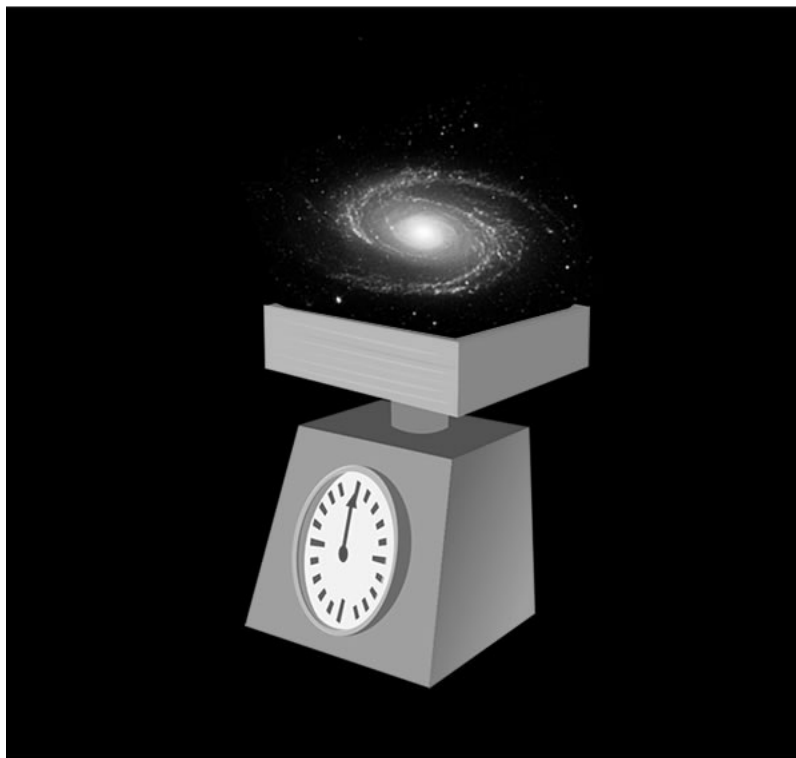

So how can gravitational energy be negative? Well, if objects are separated to infinity they feel no gravitational pull between themselves, so the gravitational energy of the system is zero in that case. But when those objects were initially clumped together, you had to put a lot of energy into the system to force them apart (remember: the gravity spring does not work like a normal spring — it is very hard to pull objects apart initially). So if you have to put energy into a system just to get to a zero energy situation, this means the energy of the system when those objects were initially clumped together must have been negative.

So gravitational energy is negative. But what is even more remarkable is that when we consider the actual data for the energy of the universe, the positive energy of the universe is precisely matched by the negative gravitational energy — giving a total energy for the universe of zero. As Richard Feynman said in one of his lectures on gravitation in the 1960s: "If now we compare this number (total gravitational energy M^2G/R) to the total rest energy of the universe, Mc^2 , lo and behold, we get the amazing result that $M^2G/R = Mc^2$ so that the total energy of the universe is zero. Why this should be so is one of the great mysteries — and therefore one of the most important questions in physics. After all, what would be the use of studying physics if the mysteries were not the most important things to investigate?"

So Richard Feynman considered the mystery behind the zero-energy universe to be "one of the most important questions in physics". Trusting his instincts, he knew this undoubtedly held the key to a principle of the greatest importance.

Perhaps there is a simple and profound way to realise that the total energy of the universe must be zero. And this method can be derived from our fundamental principle that there is "nothing outside the universe". This principle is beautifully expressed by Misner, Thorne, and Wheeler in their classic textbook *Gravitation*: "There is no such thing as the energy (or angular momentum, or charge) of a closed universe, according to general relativity, and this is for a simple reason. To weigh something one needs a platform on which to stand to do the weighing."

There can be no such weighing platform outside the universe — because there is nothing outside the universe. You could never put the universe on weighing scales to determine the total mass-energy of the universe:

Those who have suggested that there is a non-zero value for the total energy of the universe are surely committing a *category error*: taking laws which only apply to objects within the universe and applying those laws to the entire universe itself. These are entirely different circumstances, and cannot be compared.

What would a numerical value for the total energy of the universe actually mean? How could the energy be used? Obviously it could not be used to power anything outside the universe!

There is also a famous equation derived from general relativity called the Wheeler-DeWitt equation which suggests that the total energy of the universe is zero.

Another convincing argument that the energy of the universe is zero comes from the law of conservation of energy. By having a zero-energy universe, we find that energy is conserved over the period before and after the Big Bang. This might seem a very strange thing to say, after all, it would appear there was nothing at all in existence "before" the Big Bang, so how could energy possibly be conserved in comparison with the era after the Big Bang? Well, as Alan Guth explains in his book *The Inflationary Universe*: "If the creation of the universe is to be described by physical laws that embody the conservation of energy, then the universe must have the same energy as whatever it was created from. If the universe was created from nothing, then the total energy must be zero."

Basically, what this means is that the universe must have had zero energy before the Big Bang (as absolutely nothing was in existence), so the universe must also have zero total energy in the era after the Big Bang. This might sound like quite a trivial argument, and there is a fair amount of controversy about whether energy is necessarily conserved in general relativity, but I believe the argument is actually extremely convincing.

We can surely proceed with a fair degree of confidence that the total energy of the universe is zero. And because we have derived this result from our fundamental principle, we can be sure that this result must apply in all conceivable universes.

Now let's try and generate a few equations to describe this principle that the total energy of the universe is zero.

If we can consider gravitational energy to be negative, and we know from our fundamental principle that the total energy of the universe is zero, we can equate the total mass energy of the universe (obtained from $E=mc^2$) with the total gravitational energy:

$$M_U c^2 = \frac{GM_U^2}{R_U}$$

where R_U is the radius of the universe, M_U is the mass of the universe, c is the speed of light, and G is the gravitational constant.

You might recognise this equation as the equation referred to in the earlier quote from Richard Feynman.

Reorganising the terms in this equation leads us to a formula which appears to provide a means for determining the radius of the universe:

$$R_U = \frac{GM_U}{c^2}$$

This equation seems to be a quite remarkable formula: the ability to determine the radius of the universe from a combination of constants. It is as if the universe necessarily has to expand to this radius.

As I stated earlier, no one seems quite sure what to make of this result that the total energy of the universe appears to be zero. However, I believe this equation represents the first (but not the last) prediction of the zero-energy universe: it predicts the natural value of the eventual radius of the universe.

(The more foresighted reader is probably already realising that this necessitates a radical modification to the way the universe is predicted to expand — but more of that later.)

Note that, at this stage of the book, no particular force is being proposed as the reason for this expansion of the universe. That will come later. All that is being stated is that the universe necessarily has to expand to this radius: it is a logical necessity. This reflects a very important personal conviction I have. It is the **principle** which is

fundamental (in this case, the principle of the zero-energy universe). The force (i.e., the movement of objects) arises necessarily in order to satisfy the fundamental principle. So the force as such is not really fundamental — it is secondary. It is the principle which is fundamental. The fundamental principle is a statement which is obviously correct. The fundamental principle **must** be true.

According to the dark energy hypothesis, the vacuum energy will continue the expansion, and the expansion can potentially continue forever. However, if we allow the universe to continue to expand due to the presumed influence of the vacuum energy then, as the radius progressively increases, we will inevitably break Feynman's wonderfully mysterious equation for the zero-energy universe. And we are not going to allow that to happen — it is a fundamental principle.

So, for the purposes of this analysis, we are going to forget about the vacuum energy hypothesis for the expansion of the universe. We discussed the problems with the troublesome fine-tuned vacuum energy back in Chapter Four. The value of the vacuum energy would have to be an extraordinarily small fine-tuned value, and when we try to calculate the value we just get a silly result which is far too large. In reality, the value for the vacuum energy could be arbitrarily close to zero. So we are entitled to consider alternative explanations for the expansion of the universe. We are going to consider the situation in which the expansion of the universe is **not** due to the vacuum energy — instead it is due to the logical necessity that the total energy of the universe must be zero.

Returning to consider the previous formula for the necessary radius of the universe, the more eagle-eyed of you will recognise this resembles a formula which was introduced in the previous chapter: the formula for the Schwarzschild radius of a black hole:

$$r_s = \frac{2GM}{c^2}$$

What a surprise! Where did that come from? What has the radius of our universe got to do with the radius of a black hole? Well, actually, it is not so surprising to see the formula for the Schwarzschild radius appearing here. Remember how we derived the Schwarzschild radius by equating kinetic energy with gravitational energy? Well, we have arrived at this result in a similar manner by predicting that the total mass-energy of the universe should be equal to the gravitational energy, in order to produce a zero-energy universe. So we arrive at this equation when we consider the balance of energies. In the case of the black hole, the balance of energy is between an object trying to leave the hole, and the gravity which is pulling it back. Similarly, with the universe, we get a balance between the gravitational energy of the universe and the energy which is contained within the masses of the universe.

More and more we are discovering that the balance — and imbalance — of energies is the key to uncovering why objects move, and why the universe takes the form it does.

So a very nice analogy can be formed between the universe and a soap bubble! If you remember back to our analysis of a soap bubble in the introduction, we considered how the film of a soap bubble is elastic, and the potential energy of the surface is proportional to its area. Nature tries to minimise the potential energy, so the film tries to contract as far as possible, but this contraction is resisted by the outward pressure of the air within the bubble. Similarly for the universe, at the equilibrium distance we find a balance between the gravitational energy of the universe and its mass-energy. As the 19th century physicist Lord Kelvin said: "Blow a soap bubble and observe it. You may study it all your life and draw one lesson after another in physics from it."

Returning to consider our formula for the radius of the universe, let us replace our Newtonian derivation with the more accurate Schwarzschild formula which we derived earlier:

$$R_U = \frac{2GM_U}{c^2}$$

Is this result matched by observation? Does it provide an accurate value for the radius of the universe? In order to

check this equation, we substitute values for G , M_U , and c into the equation. We will take a value of 10^{54} kg for the mass of the universe. [11]

This gives us a predicted value for the radius of the universe, R_U , of 1.5×10^{27} m which compares reasonably well with the actual measured value of approximately 4.3×10^{26} m. There is a discrepancy, but, as I said earlier, cosmology is not an exact science and it is hard to get accurate measurements. So we can say that there is a fair degree of quantitative evidence that the hypothesis is correct: the radius of the universe has to expand to its Schwarzschild radius. The equation seems to work.

Can this accurate prediction of the radius of the universe really just be a coincidence? Surely not. As Feynman suspected, this equation is telling us something profound.

In fact, the data seems to indicate that the radius of the universe is rather less than its Schwarzschild radius. In other words, this seems to imply that the universe fits the criteria for a black hole! So is the universe really a black hole? We will return to consider this later.

The universe must be flat

So we have predicted that the radius of our universe should be equal to its Schwarzschild radius — and this compares with observation very well. But if the radius of the universe is equal to its Schwarzschild radius then we can make another prediction, and that is that the universe is spatially flat.

This is actually a well-established property of the Schwarzschild radius. If you remember in Chapter Five when we derived the Schwarzschild radius we considered the escape velocity of a particle. We found the escape velocity by equating kinetic energy with gravitational energy: a particle had enough energy — and only just enough energy — to leave the universe. This represents a flat universe. If the universe was closed, the particle would have looped back round into the universe again. If the universe was open, the particle would have left the universe at speed. So, again, it is all about the balance of energies.

Here is a bit of algebra which you should be able to follow.

Another way to show that the universe is flat at the Schwarzschild radius is to use the first Friedmann equation which we considered in Chapter Three. We saw there that the critical density of a flat universe (i.e., perfectly balanced between being open and closed) was given by:

$$\frac{3H^2}{8\pi G}$$

We also know from basic geometry that the volume of a sphere is given by:

$$\frac{4}{3}\pi r^3$$

so the volume of the spherical universe is:

$$\frac{4}{3}\pi R_H^3$$

where R_H is the Hubble radius, the radius of the observable universe.

So we know the density of a flat universe, and we know the volume of the universe. We can combine these two results to find the mass of a flat universe via mass = density \times volume:

$$M_U = \frac{3H^2}{8\pi G} \times \frac{4\pi R_H^3}{3}$$

Substituting for $H = c/R_H$ (as was discussed in Chapter Three):

$$M_U = \frac{3c^2}{8\pi G R_H^2} \times \frac{4\pi R_H^3}{3}$$

which, if you reorganise the terms of this equation and cancel a few terms, gives:

$$R_H = \frac{2GM_U}{c^2}$$

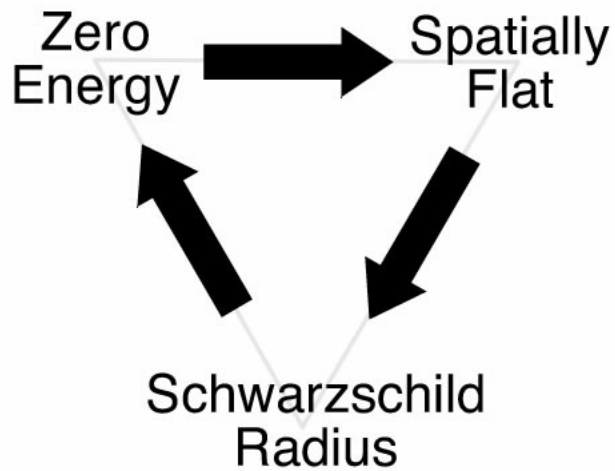

which is, once again, the formula for the Schwarzschild radius. So a flat universe has a radius equal to its Schwarzschild radius.

So we no longer need inflation to solve the flatness problem (as discussed in Chapter Three). If you remember, the flatness problem arises because it appears that the density of mass and energy is precisely fine-tuned to result in a flat universe. The radius of the universe is treated as a "free parameter", which means it could take any possible value. This leaves us with the problem of why the universe is flat, and the inflation hypothesis emerges as a possible solution.

If, however, we consider there to be a logical necessity for the total energy of the universe to be zero, then the radius of the universe has to be equal to its Schwarzschild radius. This means the radius of the universe is no longer a free parameter — the universe must expand to a certain value, and that value ensures a flat universe will result. So, effectively, our fundamental principle bypasses the fine-tuning problem, and we no longer need to introduce inflation as the reason for the flatness of the universe.

Generally, the fact that the radius of the universe is very close to its Schwarzschild radius, and the fact that the universe is spatially flat, is presented as a lucky coincidence. However, we can see from our fundamental principle — which predicts a zero-energy universe — that a flat universe with a radius equal to the Schwarzschild radius is to be expected. It is no lucky coincidence. It is as though the universe must logically and necessarily expand toward the

following scenario:

The hybrid expansion

Of course, if it is suggested that the universe will expand to a natural radius — like a soap bubble — then this clearly requires a radical modification to the existing model of cosmological expansion.

In the earliest stages of the universe, we could imagine the mass and energy of the universe being positioned in close proximity. Our analysis would suggest that, at this early stage, the total mass-energy of the early universe would be vastly greater than the gravitational energy contained in the field (gravitational energy is always negative — as we considered earlier — and at the time of the Big Bang with all matter so close together it would have been hugely negative):

This imbalance would result in a universe whose total energy would be far from zero. Nature could not tolerate such a thing — our fundamental principle says as much. There would be a logical necessity for the universe to rapidly expand until it reached the equilibrium point: the Schwarzschild radius. This initial acceleration is analogous to the situation believed to occur at the Big Bang.

Only after the universe has expanded to its Schwarzschild radius would the imbalance of energies be corrected:

So the hypothesis predicts a theory for the expansion of the universe which is a peculiar hybrid of the Big Bang theory and the Steady State theory. The expansion is predicted to accelerate from a point of great density until it reaches its Schwarzschild radius. Even when it reaches that point, the universe would continue to expand — probably for billions of years. However, once it passes the Schwarzschild radius it does start to decelerate. Eventually, the expansion would cease, and then reverse. The universe eventually settles at a constant radius. It really would be a "soap bubble" universe.

I do not believe anything similar to this hybrid expansion model has ever been suggested before. Undoubtedly, this is because it contradicts general relativity. As we saw in Chapter Three, general relativity either predicts a universe which collapses back in on itself or expands forever. The steady state position — with the universe remaining at a constant average radius — is unstable. However, the hypothesis presented in this book suggests that a stable equilibrium distance is not only possible, it is a certainty. We will consider the implications for general relativity in the next chapter.

It is time to present a new theory ...

GRAVITY REVISITED

In the previous chapter, we saw how there could well be a logical necessity for the universe to have zero total energy. This could only be achieved with the assistance of gravity. Gravity was considered to provide a form of negative energy which could balance the positive mass-energy in the universe. The combination of the logical necessity for zero energy together with the theory of gravity meant the universe expanded to a certain radius.

The simplest way to think about this is to compare the universe to a soap bubble. The elastic film of the bubble always tends to contract (analogous to gravity), whereas the air pressure in the bubble is always directed outward (analogous to the mass-energy in the universe). The bubble eventually settles down to an equilibrium radius at which the two energies are balanced.

Considering the universe, it appears we could combine the logical principle and the conventional force of gravity together to produce a theory of *modified gravity*. This modified theory of gravity would act to move the radius of the universe to its equilibrium distance.

As we shall see, what makes this theory of modified gravity so compelling is not just that we have derived it in a logical manner, but because simple solutions to so many of the most intractable problems in cosmology fall naturally out of the theory. We have already seen how the theory predicts a flat universe, without fine-tuning or inflation. We will later see the remarkable implications for dark energy and black holes.

In order to consider the behaviour of this theory of modified gravity, we are going to use the spring analogy. It would appear the theory of modified gravity, like a normal spring, now appears to have a natural extension at an equilibrium distance:

If a mass is moved, the spring is stretched. Energy is transferred to the gravity spring, so the balance of energy is upset. Gravity then works to restore the natural equilibrium distance. This effect reveals itself as an attractive force between the masses:

This would be, by far, the most common observed effect of gravity in the universe. For example, the Earth attracting the Moon, trying to drag the Moon back to the Schwarzschild radius of the Earth (which is a very small distance). However, by analogy with a normal spring, this "gravity spring" can also be compressed as well as stretched. If the mass is moved closer to the other mass so that it is inside the Schwarzschild radius, the balance of energy is disrupted once again, but this time in the opposite direction. Gravity again works to restore the natural equilibrium distance, but this time the effect would reveal itself as a **repulsive** force between the masses:

At this point, you might very well throw up your hands in horror at the prospect of modifying gravity. The theory of general relativity is regarded as one of the greatest achievements of the human intellect. It has been tested many times (remember Eddington's solar eclipse?) and always found to be perfectly accurate. So it might come as a surprise to find out that almost all physicists would agree that the theory of gravity has to be modified!

Gravity has to be modified — but only at the smallest scales. Though gravity is extraordinarily weak, at the smallest distances it is predicted to increase to a huge force. These distances are in the region of the Planck length, the smallest distance at which our laws of physics still hold. In order to accurately predict the behaviour of gravity at these distances, a new theory of quantum gravity will be required.

So gravity needs modifying at small scales, but at large scales it remains a fact that general relativity remains wonderfully accurate. This might be proving somewhat frustrating for a group of physicists who believe that the accelerating expansion of the universe might be explained by modifying gravity at large scales. If the large-scale theory of gravity could be modified to become repulsive at large distances then it could eliminate the need for the proposed dark energy. Sean Carroll expresses this in a video entitled *Dark Energy, or Worse: Was Einstein Wrong?* (available on YouTube): "We only ever infer the existence of dark matter and dark energy through gravity. We have been given a theory of gravity by Einstein — general relativity — which has been tested very precisely in the Solar System, but now we are applying it to regimes that are orders of magnitude away from that. How do we know that our theory of gravity works on those scales? Well, we don't. This is not a situation where professional cosmologists are trying to save Einstein's honour by saying that his theory must be right even though the data contradicts it."

However, general relativity has proven just too accurate at large scales. These theories suggesting modifying gravity at large scales have not achieved much success or acceptance.

The novel feature of the theory of modified gravity being presented here is that for almost every object in the universe the theory does not suggest that the large-scale behaviour of general relativity is modified in any way. This is essential. The long-distance behaviour of general relativity is too well established. On the contrary, for almost all objects in the universe the theory of modified gravity presented here suggests a modification of gravity at **small** scales, the distances where everyone agrees that modification is essential. This is because the theory modifies gravity at distances inside the Schwarzschild radius of an object, and for most objects in the universe that is an extremely small scale indeed.

To put this into context, the Schwarzschild radius for the Earth is approximately 9mm. To see the repulsive gravity effect in reality, all the mass of the Earth would have to be compressed to the size of a peanut, and even then the effect would only be detectable inside the peanut. The Schwarzschild radius for the Sun is 3km. The Schwarzschild radius for a human being is less than the radius of an atom. So this repulsive gravity is not an effect which is going to be easily detectable. In fact, for just about every object in the universe, gravity would only ever manifest itself as an attractive force and standard general relativity would apply.

However, for the universe as a whole, the story is very different. The Schwarzschild radius of the universe is the huge distance of 1.5×10^{27} m (calculated from the mass of 10^{54} kg) — a distance which is larger than the radius of the current observable universe. So the whole mass of the universe is contained within its Schwarzschild radius. This means that, for the universe as a whole, the repulsive effect becomes highly-significant. Gravity would act to expand the universe.

We discussed the vast scale of the universe in Chapter Three, and here we see why this vast scale is so important. This ingenious hypothesis presented in this book suggests that gravity should be modified only at small scales. However, the universe is so vast, so utterly beyond our comprehension, that, for the universe as a whole, the small-scale becomes large-scale. So for the universe itself — and only the universe itself — gravity acts as a repulsive force.

The accelerating expansion (revisited)

As we discussed in Chapter Four, at the largest cosmological scale we find the accelerated expansion of the universe which is commonly associated with the presence of the mysterious dark energy. But the simple and elegant theory presented in this book suggests that this repulsive gravity effect is to be expected for any object whose mass is entirely contained within its own Schwarzschild radius — and that includes the universe. So the accelerated expansion of the universe could possibly be explained by this wonderfully simple principle of gravity acting as a repulsive force inside the Schwarzschild radius.

In which case, we are provided with a simple explanation of why galaxies are accelerating away from each other: they are simple "falling away". Just as when you drop a rock, it accelerates under the pull of gravity, so these galaxies are basically "falling" under the pull of gravity, and accelerating in just the same way as a dropped rock.

As another interesting thought, the Big Bang has always been presented as an initial explosion. After that initial impetus, gravity is predicted to take over and progressively slow the expansion of the universe, gravity being predicted to always act as an attractive force. So this explosive Big Bang set matter and energy on an inertial trajectory, acting very much like a ballistic bullet being shot from a gun.

However, this proposed new model of a hybrid expansion does away with the immense initial explosion and considers a universe with a slower initial acceleration due to gravity. Instead of the bullet being fired from a gun, imagine the bullet being dropped from your hand. The initial speed of the bullet will be low, but the bullet will accelerate under the influence of gravity and — given enough distance — the bullet will end up moving as fast as the bullet which was fired from the gun.

Similarly for the universe, the expansion would start slowly, and progressively pick up speed. This slower take-off provides an opportunity for the equalisation of temperature throughout the universe, resulting in the uniform distribution we see today.

So this theory avoids the need for inflation to explain the flat universe (the flatness problem) and avoids the need for inflation to explain the uniformity of the universe (the horizon problem). It appears there is no need for inflation.

So maybe the total universe is not a hundred sextillion times larger than the visible universe after all (as predicted by inflation).

If you remember back to our discussion of the dark energy hypothesis, we encountered the "cosmic coincidence problem" (just one of the fine-tuning coincidences associated with the dark energy hypothesis). This suggested that we are living in a very special era because the amount of mass and the amount of dark energy appear to be closely balanced at the moment (dark energy is predicted to carry on powering the expansion of the universe until it dominates the amount of mass). However, the hypothesis presented in this book predicts a universe which settles down to a constant steady state — in which case there would be nothing special about the current era. It is just one more coincidence eliminated by the hypothesis.

As well as considering the predicted effect on the whole universe, it is also important to consider the effect of the theory on the largest objects which exist within the universe: galactic clusters. Galactic clusters are groups of about 50 galaxies held together by gravity, and they represent the largest known gravitationally-bound objects. For the theory of modified gravity proposed in this book to be correct, it is essential that gravity is shown to be an attractive (not repulsive) force for galactic clusters. In this sense, the theory proposed in this book is very much a falsifiable theory: if the theory predicts that gravity should be a repulsive force for galactic clusters, the theory would have to be rejected (it is considered a good thing for a scientific theory to be falsifiable).

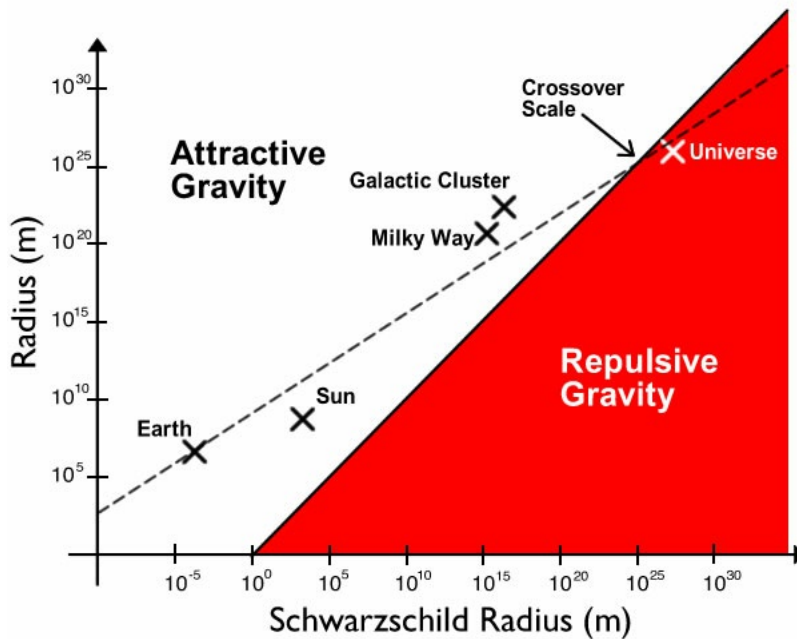

Fortunately, when we consider galactic clusters we find that the theory predicts gravity to be an attractive force. This is because the radius of a galactic cluster is in the order of 10^{22} m, and its Schwarzschild radius is much smaller at 10^{16} m. Hence, the theory has passed this test: galactic clusters are predicted to be held together by gravity.

All the galaxies within the cluster are predicted to attract each other according to conventional gravity. This is because the Schwarzschild radius of a galaxy is much smaller than the radius of the galaxy. The only objects which would exhibit gravitational repulsion would be those objects whose entire mass can fit inside their Schwarzschild radius.

The following graph shows the radius of various celestial bodies of different scales plotted against the Schwarzschild radius of those bodies. In this way, we can see if gravity is predicted to be an attractive or repulsive force for those bodies. The bodies all tend to lie very close to a straight line (shown dotted), as the bodies are all made of atoms and the line represents constant atomic density.

For most of the graph, the radius of the objects is greater than their Schwarzschild radius, and so gravity is an attractive force. However, in the shaded area, the radius dips to become less than the Schwarzschild radius, so gravity is predicted to be a repulsive force for these objects. Only the universe as a whole lies in this area, so only

the entire universe experiences repulsive gravity:

The point at which gravity switches from attractive to repulsive is called the *crossover scale*. For a successful theory which explains the acceleration of the expansion of the universe, it is generally accepted that the crossover scale should be in the region of the Hubble scale. From the previous graph, it appears the proposed crossover scale of approximately 10^{24} m would be absolutely perfect to explain the acceleration of the expansion.

This is by no means the only theory of modified gravity which attempts to explain the acceleration of the expansion by modifying general relativity. Let us consider what appears to be the leading modified gravity theory which is called the DGP theory, named after the surnames of the inventors, Dvali, Gabadadze, and Porrati.^[12] It is interesting to compare the predictions of the hypothesis presented in this book with the predictions of the DGP theory.

The DGP model is based on string theory. According to string theory, particles are composed of one-dimensional strings. But it is also possible for there to exist objects with a greater number of spatial dimensions. For example, a two-dimensional surface is called a *brane* (from "membrane"). Branes can have any number of dimensions. In particular, the string theory model suggests that our four-dimensional universe might be a brane inside a higher-dimensional space called the *bulk*. Other parallel universes might be separate branes inside the bulk.

This model has some interesting things to say about gravity. It proposes that the reason that gravity is such a weak force is because much of its power leaks out of our universe into the bulk. This leakage is not supposed to affect the other three fundamental forces which explains why they are so much stronger than gravity.

The DGP theory of modified gravity attempts to explain the accelerated expansion of the universe by proposing that gravity is weaker at very large distances. The theory proposes that the universe's four spacetime dimensions are on a brane which is actually in a five-dimensional space. At shorter distances, the four-dimensional term dominates which gives rise to the conventional strength of gravity. However, at very large distances, gravity leaks into the fifth dimension, explaining why it is a weaker force at cosmic scales.

However the crossover point in DGP theory at which gravity behaves differently was calculated to be only the size of the solar system, which is far too small. The DGP team suggest an ideal crossover scale for their theory would have been the vastly larger figure of 10^{21} m. As we have just seen, the crossover scale for the theory proposed in this book occurs at precisely the suggested scale. So the theory of modified gravity presented in this book more accurately models the universe than the most popular current theory.

So this is a really ingenious, simple theory, which matches available data. And this is not an *ad hoc* theory which has been invented to fit the data. On the contrary, we have derived this theory through a very simple logical thought

process, built-up from fundamental principles. We had no freedom to "fiddle" this theory. We discovered this theory — not invented it.

When I set out to construct this theory, I was only interested in seeing if a theory of gravity could be produced from the principle of the zero-energy universe. I had no idea that this "repulsive gravity" idea would pop-out, or that it would agree so closely with the observed acceleration of the expansion of the universe. This was a complete surprise.

Finally, I would like to end this chapter by recounting a funny true conversation I recently had with a friend of mine (who shall remain nameless!). I was explaining the principle of repulsive gravity, and I wondered what would happen to humanity if the force of gravity suddenly reversed so that all the objects on the face of the Earth flew upwards. I imagined us being trapped on the ceiling of our room — like in the *Poseidon Adventure*. My friend, though, had an ingenious solution to prevent himself flying upwards under reversed gravity: "There's no problem", he insisted, "You would just have to weigh yourself down with heavy weights!"

I hope you can see the flaw in my friend's logic.

8

BLACK HOLE UNIVERSE

Let us now turn our attention back to black holes.

In our analysis of black holes, we calculated that any object would become a black hole if all its mass was compressed to a smaller size than the Schwarzschild radius for that mass. At that point, the pull of gravity would become a one-way street and a singularity would inevitable occur. Well, that throws up an interesting scenario because the Schwarzschild radius of our universe appears to be larger than the radius of the universe. In other words, our universe fits the criteria for a black hole!

You might imagine that the density of the universe would not be enough to form a black hole. However, while it is true that small regions of space would require tremendous densities to form a black hole (Earth, for example, would have to be compressed to a 9mm radius), very large regions of space would require a far smaller density. For example, the average density of the region inside the event horizon of a supermassive black hole can be less than the density of water! This is because the Schwarzschild radius is proportional to mass, which is proportional to the cube of the radius. So as a region gets larger, its Schwarzschild radius increases at a much faster rate than its radius does. In fact, if you have a very large volume of mass at constant density, then it is **guaranteed** to become a black hole if the volume is large enough — **no matter how small the density!** [\[13\]](#)

This means that if we had a large volume of soft cotton wool, with a uniformly low density, it would collapse to form a black hole as long as the volume was large enough. Imagine a cotton wool black hole!

So people who say that the universe is arbitrarily large — or infinitely large — are surely saying that the universe has the characteristics of a region which will form a black hole. And certainly, if we consider the implications of inflation — which predicts a size for the entire universe which is a hundred sextillion times the size of the visible universe — then it would appear that such a universe would surely represent a black hole. This is what the equation tells us. To quote Steven Weinberg: "Our mistake is not that we take our theories too seriously, but that we do not take them seriously enough." That certainly seems to be the case here.

In this book, we have seen that a universe which reaches the size of its Schwarzschild radius is spatially flat. This would appear to indicate that a universe which is entirely contained within its Schwarzschild radius would be a closed universe. It is known that light cannot escape from a closed universe — just like a black hole. So there are clear parallels between a closed universe and a black hole, both in terms of their size and their behaviour.

When physicists consider this question of whether the universe is a black hole (which is not often), there appears to be a lot of skirting around the issue. Even though this appears to be a vitally important question, I get the impression that they feel uneasy about the possibility. I have seen criticisms that the universe cannot be a black hole because, of course, a black hole is defined to be a region inside a larger space, and there cannot be any larger space outside the universe. Though, of course, if you were an inhabitant of a black hole it would appear to you that your black hole was your entire universe, and there was no space outside. So I feel this is a very weak criticism.

But usually the conclusion is that the behaviour of matter inside the universe simply does not match the behaviour expected inside the event horizon of a black hole. Specifically, inside a black hole we would expect to find matter converging to a central singularity. However, in the universe, we find matter emerging **from** a central point.

So physicists make a comparison between our universe and a peculiar theoretical object called a *white hole*.[\[14\]](#) A white hole is like a time-reversed black hole. And, when you think about it, this makes a lot of sense. At the time of the Big Bang, the universe is believed to have been a point singularity, and from that time onwards matter was expelled from that singularity. In a black hole, matter is consistently attracted **to** the singularity — just the opposite of the Big Bang! Hence, the universe behaves as if it is a white hole, as if it was a black hole in reverse.

So the hypothesis of the universe being a black hole is usually rejected because, as I say, the behaviour of matter inside the universe simply does not match the behaviour expected inside the event horizon of a black hole. However — and this is a key point — **nobody knows what happens inside a black hole**. Nobody can ever know. It is impossible to get information out of a black hole, so no one knows what goes on inside a black hole.

But, as we have seen, the equations still point to the universe being a black hole. With this in mind, it would appear that when we look out on the universe, we are looking at the behaviour of matter inside a black hole. And rather than seeing matter collapsing towards a central singularity, we see space expanding outwards towards the Schwarzschild radius. I feel this is clear evidence that the hypothesis described in this book is correct. If the data

contradicts our model of gravity, we should not ignore the data — we should modify the model.

With this in mind, on the basis of the hypothesis that was proposed in the previous chapter, we can see that the reason matter is propelled from a point singularity in our universe is because of the predicted repulsive behaviour of gravity inside a black hole. We do not need to consider our universe as a time-reversed black hole, or "white hole" — it is simply our incorrect model of the behaviour of gravity inside a black hole which is reversed, not time itself being reversed.

Secrets of the black hole

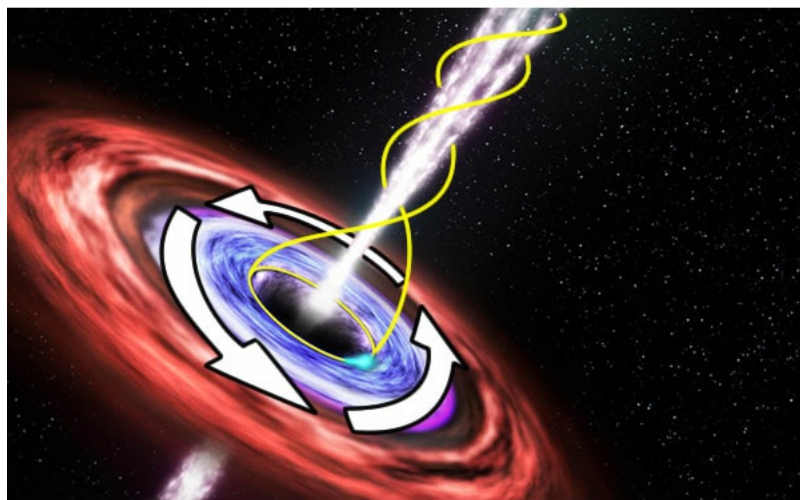

This modified behaviour of gravity has huge implications for all black holes. Outside the event horizon, the behaviour of a black hole would appear completely unchanged: mass would continue to be sucked to the event horizon, and the black hole would eventually evaporate on schedule. There would continue to be an extraordinarily high amount of total mass inside the event horizon of the black hole — together with an accompanying extraordinary gravitational pull. However, the behaviour of that mass inside the event horizon would be completely different. The hypothesis of this book predicts repulsive gravity inside the event horizon of a black hole. Inside the event horizon, repulsive gravity is repelling interior masses to the event horizon. Basically, gravity moves all mass to the Schwarzschild radius.

Note that the curvature of spacetime outside the event horizon is unaffected. To the exterior observer, the black hole interior would appear to be the same fearsome entity as before.

There are many remarkable features about this result. For a start, it appears to eliminate the singularity at the heart of the black hole. As we discussed in Chapter Five, if your physical theory has a singularity, it is a sign that your theory is wrong. Physics breaks down at a singularity. A theory with a singularity needs modification. Our current theory of black holes, derived from conventional general relativity, predicts the existence of singularities. However, the modified version of general relativity described in this book has the happy property of eliminating the singularity. The repulsive effect of gravity would fight against the tendency to collapse to a singularity.

Infinities do not occur in Nature. We have been too willing to accept the theory of singularities at the heart of black holes. The theory presented here has the unexpectedly pleasing side-effect of revealing why singularities — and associated infinities — would not occur inside black holes.

We can obtain another remarkable insight by considering a structure which we first encountered in Chapter Five: the quasar. It was explained how quasars are the brightest objects in the universe. A single quasar can outshine the combined brightness of all the other stars in its galaxy. So why are quasars so bright? It is believed that a quasar's radiation is generated by a black hole's accretion disk (the disk of matter at the event horizon) rotating at near the speed of light. Atoms in the disk are torn apart, creating a plasma of electrically-charged particles. The high-speed rotation of the disk also creates a magnetic funnel, and this funnel shoots the plasma out into space at tremendous speed — as shown in the following diagram:

This process of accelerating charged particles by using a magnetic field is essentially the same technique used by our modern particle accelerators (such as the LHC). The spinning accretion disk of a black hole is truly the universe's most powerful circular particle accelerator.

So now we see how the modified gravity hypothesis provides us with an insight as to why quasars are so astonishingly bright. According to the modified gravity hypothesis, **gravity acts to move all the mass of a black hole to its event horizon, in which case the mass of the accretion disk must be truly astronomical.** And the energy produced by such a massive disk rotating at nearly the speed of light would explain why a single quasar can outshine a million Suns.

We can obtain another insight about black hole behaviour from the modified gravity hypothesis. If you remember back to our discussion of the black hole information loss paradox in Chapter Five, you will recall the "firewalls" theory which suggests any infalling object has to be obliterated the moment it crosses the event horizon. This is in contrast with the "no drama" orthodox theory which predicts that the infalling observer will detect nothing out of the ordinary when he crosses the event horizon. According to AMPS, though (who proposed the firewalls theory), at the event horizon we will find this dramatic incineration process. But why should this dramatic region spring out of nowhere at the event horizon? A lot of physicists are uneasy about the firewalls proposal for that particular reason. However, as we can see, the modified theory presented in this book suggests that the mass of a black hole would all be concentrated at the event horizon. **Any incoming object would be obliterated on the event horizon when it hits the mass of the black hole, thus solving the information loss paradox.** The information of the object would be plastered around the mass at the event horizon, and emitted as Hawking radiation.

This aspect of the theory has similarities with the theory of *fuzzballs* based on string theory. According to the fuzzballs theory, there is no singularity inside a black hole. Instead, there is just a mass of strings, extending out to the event horizon. This is presented as a proposed solution to the information loss paradox as "the quantum information is not trapped at the centre but stays on the fuzzy surface and is emitted as Hawking radiation".^[15] This solves the information paradox in much the same way as the theory proposed in this book.

Most crucially, **this also explains why the entropy of a black hole — the trapped information — is proportional to the surface area of its event horizon.** This is due to all the mass (and, therefore, its information) being spread over the event horizon.

Clearly, this modified theory of gravity is an elegant solution to many of the most puzzling problems in physics and cosmology.

9

CONCLUSION

Let us travel back in time to 1859.

The French mathematician Urbain Le Verrier has examined the orbit of Mercury and discovered peculiarities: the orbit did not appear to agree with Newton's law of gravity. In order to explain this discrepancy, Le Verrier suggested that there was another small planet inside the orbit of Mercury which was dragging it off course. Le Verrier called this hypothetical planet "Vulcan". So, instead of suggesting that the law of gravity required modification, Le Verrier suggested that there was a physical cause behind the observation. However, despite the claims of several astronomers, the search for planet Vulcan drew a blank.

The solution to the peculiarity in the orbit of Mercury was only found when Einstein produced the theory of general relativity in 1915. So instead of there being a physical cause to the discrepancy, it was our theory of gravity which required modification.

Fast forward to the present day, and we find a very similar situation. Observations of the universe have revealed a discrepancy from the predicted behaviour: the expansion of the universe is accelerating. Physicists — like Le Verrier 150 years earlier — are once again loath to modify the theory of gravity. Instead, they are suggesting that there is a physical cause to this discrepancy: the existence of "dark energy". However, might it not be the case that the solution to the observed discrepancy could, once again, require a modification to the theory of gravity? This time, though, it would be general relativity requiring modification — not the Newtonian theory.

Maybe "dark energy" will turn out to be the new planet Vulcan?

In our discussion of the black hole information loss paradox, it was stated that either quantum mechanics or relativity must be wrong. There's no way round it. One of the two great theories of the 20th century **must** require modification. So which one is it going to be?

Well, after reading this book you now know which side of the fence I lie on. The suggestion is that general relativity requires a fairly subtle and ingenious modification. However, it is never going to be an easy task proposing a modification to one of the great theories. At first glance, it might appear that the challenge is to "prove Einstein wrong". However, this is not the case. Einstein did not prove Newton wrong. Both Einstein **and** Newton were correct. Einstein simply built on the theory of Newton to produce a more sophisticated, more accurate theory. Einstein's result had to agree with Newton's result in simple cases.

And this necessity to agree with previous theories is a challenge (a stumbling block?) for all theories of modified gravity: they have to agree with Einstein's proven theory. Theories of modified gravity which attempt to explain the accelerated expansion of the universe have all tried to modify gravity at large scales. The problem is, as you then move back to consider smaller scales you find your modified measurements deviating from those predicted by Einstein's theory. And Einstein's theory always gets it right. It is very hard to modify gravity at large scales for this reason. Einstein did such a good job.

The hypothesis of modified gravity presented in this book is really very ingenious because it avoids this drawback. Gravity is predicted to be modified only for objects whose entire mass is contained within their Schwarzschild radius. This eliminates almost every object contained within the universe! Ants, trees, planets, galaxies, galactic clusters, are all predicted to exhibit gravitational attraction precisely according to Einstein's theory. At long range, for every object, the hypothesis of modified gravity presented in this book is identical to Einstein's theory (an obvious exception is black holes, but more of that later).

However, the hypothesis predicts a modification to gravity at short range. Not all objects are affected: only objects whose entire mass is contained within their Schwarzschild radius are predicted to exhibit this repulsive gravity. Most importantly, the entire universe happens to be one of the very few objects affected. Hence, the acceleration of the expansion of the universe is predicted.

As a bonus, the hypothesis presents simple and elegant solutions to some of the greatest mysteries and paradoxes in cosmology. The universe is predicted to be necessarily flat — without inflation. Black holes (the only other objects whose mass fits entirely within their Schwarzschild radius) are no longer predicted to contain singularities, and a simple explanation is provided for black hole entropy being proportional to the area of the event horizon. The information loss paradox is also simply explained.

So this gives us a new way of looking at gravity. Gravity seems to play a much more central role in the universe

than is realised. If you asked the average person what gravity does, they would probably say it pulls apples off trees. If they were pushed a bit further, they might say it is the force responsible for holding the planets in orbit. And this is clearly the case. As an attractive force capable of spanning the width of galaxies and beyond, it is responsible for holding the universe together.

However, according to this hypothesis, gravity does not just "pull like mad" as if it is competing in a tug-of-war competition. Instead, we find gravity operating as more of a "positioning" force. Its behaviour is more subtle than we give it credit. Objects are positioned quite precisely at their Schwarzschild radius: it is all done with the precision of a surgeon. We might interpret this as a coarse attractive force, which is how it reveals itself to us for most of the time, but really gravity is so much more.

If the hypothesis described in this book is correct then one equation — for the Schwarzschild radius — controls the positioning of every object in the universe under gravity. It gives the universe its overall structure, from being the motivation behind the Big Bang, to powering the accelerating expansion of the universe and specifying its eventual radius. But it also holds the planets in orbit around the Sun, it forms galaxies, it controls nuclear fusion in stars, it describes the behaviour of black holes, and it pulls apples off trees. One force. One equation.

It is truly the equation of the universe.

FURTHER READING

The Black Hole War by Leonard Susskind

Very readable. How Leonard Susskind was delighted to prove Stephen Hawking wrong about the black hole information loss paradox — only for the recent firewalls theory to apparently prove that Susskind was wrong.

Black Holes and Time Warps by Kip Thorne

Everything you ever wanted to know about black holes can be found in this impressive book.

The Inflationary Universe by Alan H. Guth

Everything about inflation, by the man who invented it.

[11] The most common value for the mass of the universe is in the region of 3.3×10^{54} kg. However, this value includes the dark energy "fudge factor", as described back in Chapter Four. The dark energy value is included just to "balance the books" to produce a flat universe. We do not want to include this fudge factor in our calculations, especially as the theory introduced later in this book proposes an alternative to dark energy. So we will remove 70% of the mass of this dark energy universe to produce our value of 10^{54} kg.

INTRODUCTION

The date: October 1971.

Pan Am flight 106 from Washington's Dulles International Airport is taking off on its scheduled flight to London. To all outward appearances, this was just like any other flight. Passengers were fastening their seatbelts and preparing for the eight-hour trip as the flight stewardesses gave their safety drill. However, we can only imagine the puzzled looks on the faces of some of the travellers as they observed the extraordinary hand luggage of two of their fellow passengers.

For assistant professor of physics Joe Hafele and his colleague, the astronomer Richard Keating, this flight was to form a unique experiment. On the two seats in the middle aisle next to Joe Hafele, no passengers were seated. Instead, the seats were occupied by large cases of electronic equipment, approximately one metre high. These cases contained four highly-accurate caesium atomic clocks.

As part of an experiment, these clocks were being flown around the world. This was to be the first time that the effect of Einstein's theory of special relativity was to be measured using actual clocks. This experiment was going to reveal the true nature of time.

The following photograph shows Hafele and Keating with their clocks onboard the Boeing 747:

Hafele and Keating were attempting to test one of the great insights into the nature of time. For many centuries, philosophers had wondered about the nature of time, without making much progress. The main problem is that the nature of time is tied so closely to our own feelings of the passage of time that it is hard to move away from an intuitive, subjective notion of time to a more objective analysis. We all have our own internal notions of what constitutes time, but it is almost impossible to explain it. Saint Augustine described this dilemma when he said: "What then is time? If no one asks me, I know. If I wish to explain it to one that asketh, I know not."

In his *Critique of Pure Reason*, published in 1781, Immanuel Kant continued Augustine's theme by suggesting that space and time did not exist independently but were constructed by the human mind in order to make sense of the world around us. After all, if time is just a feeling — as Augustine suggested — then maybe it was all in the

mind? The French philosopher, Henri Bergson, even believed that this model of time in the human mind would not be present at birth and would have to be constructed via experience. So Bergson believed a newborn baby would not experience time at all! The baby would have to learn to create its own model of time in its head as it grew up.

These philosophical arguments — which seemed to suggest that time purely existed as a subjective notion in our heads — were swept away by Albert Einstein at the start of the 20th century. Einstein was greatly influenced by the philosopher-physicist Ernst Mach who was an advocate of *logical positivism*. According to logical positivism, physics should only make statements about phenomena which could be directly observed and measured. Using logical positivism as his guide, Einstein simply stated: "Time is what we measure with a clock". According to Einstein, there was no place in physics for philosophical musings about the nature of time — all that was important was what could be measured.

This statement of Einstein is particularly important because the theory of special relativity states that a clock which is moving will appear to run at a slower rate than a clock which is stationary. And, as Einstein stated that "Time is what we measure with a clock", this would appear to indicate that time itself runs slower for an observer who is moving relative to a secondary observer.

So this effect of *time dilation* is what Joe Hafele and Richard Keating were trying to measure on their round-the-world aeroplane journey. As Richard Keating said in an earlier interview: "I don't trust these professors who get up and scribble in front of blackboards claiming they understand it all because I've made too many measurements where they don't come up with the numbers they say. It always seemed to me that the best proof is to measure it."

Joe Hafele had been preparing notes for a physics lecture when he performed a brief calculation which showed that an atomic clock on board a commercial airliner should have sufficient accuracy to reveal the effect of time dilation. In order to perform this experiment, Hafele and Keating flew their four clocks around the world: once in the eastward direction, and then in the westward direction. The values on the clocks at the end of the journey were compared with the reference atomic time scale at the U.S. Naval Observatory.

It was found that the flying clocks lost time (aged slower) during the eastward trip, and gained time (aged faster) during the westward trip. The difference between east and west was due to the rotation of the Earth underneath the aeroplane. The variation in time was exactly as predicted by special relativity.

There was also an effect due to the altitude of the aeroplane. As we shall see later in this book, Einstein's theory of general relativity predicts that time passes faster in a weaker gravitational field — such as in an aeroplane cruising at altitude.

As Joe Hafele explained: "Suppose you lived for 100 years, and you spent your entire life on one of these aircraft flying around the world. You could expect to be younger than a person who did not do that by about one ten-thousandth of a second."

We will be considering special relativity and general relativity and the extraordinary effect of time dilation in detail in Chapter Six of this book.

A brief history of time

The very first clocks which were used by early humans were provided by Nature herself. It was clear that the rising and setting of the Sun occurred at regular intervals of one day (we now know this is due to the Earth's rotation on its axis). This regular marking of time provided an easy way to measure periods of time of significant length. The early Egyptians, for example, used the shadows of obelisks as clocks. The passage of the Sun across the sky during the day can also be subdivided into smaller time periods using sundials.

Another celestial clock was provided by the phases of the Moon. The proportion of the Moon illuminated by the Sun varies as the Moon orbits the Earth. The proportion of the Moon which appears to be illuminated when viewed from the Earth varies from 0% (new moon) to 100% (full moon). In between these two extremes we observe the characteristic crescent shapes of the Moon. As the Moon orbits the Earth once every 29.5 days, this regular cycle of lunar phases gave birth to another form of measurement of time: the month.

Finally, the orbiting of the Earth around the Sun — which provides us with the seasons — gave early humans the largest period by which time could be measured: the year. Most famously, the prehistoric standing stones at Stonehenge identify the exact time of the summer and winter solstices. It is easy to forget that one of the functions of Stonehenge was to be one of the earliest clocks.

Observe the similarity of the structure of Stonehenge to a clock face:

Ancient Greek astronomers observed the movement of the celestial bodies and tried to model the orbits of the planets using geometry. The Greek image of geometric perfection was the circle, so it was believed the planets should orbit in perfect circles. The Greeks, therefore, modelled the orbits of the planets by a series of concentric rotating transparent spheres, each planet being attached to one transparent sphere. As the spheres rotated, so the planets were observed to move. At the centre of the series of spheres lay the Earth, which was considered to be the centre of the universe. This was, therefore, a *geocentric* model.

However, detailed astronomical observations, such as those obtained by Hipparchus, showed that this geocentric model could not be accurate. The orbits of the planets were more complicated than the motions of concentric spheres. While the Moon, Sun, and stars moved in predictable trajectories, sometimes the planets would appear to reverse their direction in the night sky (so-called *retrograde* motion). In fact, the word "planet" is derived from the Greek word for "wandering star". In order to account for retrograde motion, the astronomer Ptolemy introduced the idea of *epicycles*.

For a planet, an epicycle was a smaller orbit contained within its usual orbit around the Earth. This allowed the planets to sometimes move backwards when viewed from Earth. An example of a planet moving on a epicycle is shown on the following diagram:

This all might appear unnecessarily complicated to our eyes now, but the geocentric model of the universe was generally accepted until the 16th century when the Polish astronomer Nicolaus Copernicus realised that the model could be greatly simplified by placing the Sun at the centre of the Solar System and having the planets (including the Earth) orbit the Sun. This formed the *heliocentric* model.

Copernicus's model was more elegant than the Ptolemaic model. It not only explained the retrograde motions of the planets but it also explained why the Earth experienced the seasons as it orbited the Sun once a year.

In the more general sense, the more recent development of the so-called *Copernican principle* states that no particular point in the universe (not just the Earth) can hold a privileged position in the universe. This heralds a move away from an absolute system of science and cosmology to a science which realises that no observer holds a privileged position, and that the universe is built on relative measures. The repercussions of the Copernican principle are rippling through science to this day, perhaps having its greatest impact in the theory of relativity: if no observer holds a privileged position, then all motion must be described relatively.

If you have read my previous two books you will know I have a firm conviction that the universe is built on fundamental principles — principles which are "obviously correct" and would have to be true in any conceivable universe. The Copernican principle is surely another of these fundamental principles: surely no point — and therefore no observer — holds a privileged position in any conceivable universe. In many ways, as you will see, this is a book which is based on the importance of the Copernican principle and all that it entails. We will encounter the Copernican principle again several times in the later chapters of this book, when it will be shown that it might possibly hold an important key to explaining the nature of time.

These astronomical measurements of time, such as the period of rotation of the Earth, remain extremely accurate measurements of time to this day. In fact, until 1967 the length of the second was defined in terms of the orbital period of the Earth (to be precise, it was defined as a fraction of the time taken for the Earth to orbit the Sun in 1900). However, as society became more complex, more accurate subdivisions of time were required.

In the Middle Ages, slow-burning candles with colour-coded wicks were used to mark time in monasteries. Elaborate water clocks (dripping taps, basically) could be found in wealthy households. However, it was the invention of the mechanical clock which really brought time to the masses. As great cities emerged throughout Europe, together with the rise of commerce and trading, there was a need to find some way to synchronise commercial activities throughout the city. Mechanical clocks were installed in the bell towers at the heart of cities, with the daily activity of the city being based around the various chimes. The first public clock was installed in Orvieto in Italy in 1307, and this innovation spread rapidly throughout the rest of Europe.

But while it was possible to synchronise the activities of a single city by using a bell tower, this was no way to synchronise the activities of multiple cities. Each city could operate to its own local time standard, which might be a completely different standard from that of another city (generally, noon in each city was set to the time when the Sun was at its highest point in that city). This meant even simple activities — such as organising a meeting between citizens of different cities — were fraught with difficulties. This failing became more pronounced with the coming of the industrial revolution.

The industrial revolution brought steam-powered railways, which connected many cities in a single network. The emergence of the railways made the introduction of a network-wide time standard essential in order for services to run efficiently (we will see in Chapter Three how this requirement for train synchronisation became a particular interest for a patent clerk working in Zurich).

As an example of the problems which were occurring, in 1841 in England, the Great Western Railway was extended to Bristol. However, passengers arriving at Bristol Temple Meads station were annoyed to find the trains were leaving eleven minutes early. The problem was because the trains were coming from London and were using London time. Bristol is 200 miles west of London so the Bristol sunrise is eleven minutes later than the London sunrise. Hence, Bristol time was eleven minutes behind London time. Some form of national time synchronisation was clearly necessary, requiring the most accurate clocks.

The necessary advance in accuracy had been provided many years earlier by Galileo. Supposedly, Galileo was in Pisa Cathedral when he observed the swinging motion of a large bronze lamp. The ever-inquisitive Galileo timed the swings using his pulse and found that the period of the swings was always the same — no matter how big was the length of the swing. So as the lamp lost energy, and the amplitude of the swing decreased, each swing still took the same amount of time. Galileo showed that the time taken for a complete swing of a weight on a pendulum was independent of both the size of the weight and the length of the swing, and was only dependent on the length of the pendulum (a pendulum one metre long swings once every second — the usual length of the pendulum in a grandfather clock).^[1] This allowed for great accuracy if the length of the pendulum was measured correctly. Previous mechanical clocks were only accurate to about 15 minutes a day. Pendulum clocks were accurate to about 15 seconds a day.

Pendulum clocks remained the most accurate standard for timekeeping for 270 years until the invention of the quartz clock in 1927. The most accurate pendulum clock, used as the US standard time until 1929, utilised a pendulum in a partial vacuum and had an error of only 10 milliseconds per day.

The great innovation of mechanical clocks was the *escapement*: a device which rocked backwards and forwards over a toothed wheel. The escapement allowed for the controlled release of energy at a regular rate. It consists of a toothed wheel with a rocking lever above it. As the lever rocks backwards and forwards, the toothed wheel advances by just one notch. This is responsible for the characteristic clockwork "ticking" sound:

This principle of the "tick" of a clock — the regular marking of small periods of time — is worth examining in detail. In this chapter we have considered a wide range of different types of clocks, from the Sun passing across the sky, to a swinging pendulum, and in the next section we will be considering the world's most accurate clock: the atomic clock. But there is one thing which all these different types of clock have in common, and that is that they all have a "tick". A tick is an oscillation — a recurring event — which must happen at a regular time interval. It is easy to see that a pendulum swings at a regular time interval, but even the Sun passing across the sky represents a "tick" which occurs at a regular time interval: once a day.

Ticks can be counted, and the result displayed on the output of the clock in order to produce a measurement of time.

But why is the regularity of the tick so important? You might feel this is a trivial and obvious question, but it is actually an important question whose answer leads us to an important insight into the nature of space and time.

Firstly, let us consider the implications for the nature of space.

If we perform an experiment, and make a note of the result, and then we move the experimental apparatus six feet to the left and perform the identical experiment again, we find we will get the same result. Likewise, if we measure the width of an object using a ruler, and then move the object twenty feet to the right and measure it again using the same ruler, we find we will get the same measurement for the width of the object. This principle that the laws of Nature work in exactly the same way no matter where the experiment is performed is called *space translation invariance*.

Now consider we perform the same experiment again, but instead of performing the experiment at a different location, we perform the experiment at a different **time**. As long as the experiment is identical, we find we will get the same result. Likewise, if we measure the duration of an event using a clock, and then we perform the identical experiment again at a later date we will find the duration of the event will be exactly the same. This principle that the laws of Nature work exactly the same no matter **when** an experiment is performed is called *time translation invariance*.

Because of space translation invariance, we must ensure that any measuring equipment we use to measure distances (e.g., a ruler) must also possess space translation invariance, i.e., it does not matter if we shift our ruler left or right — it will still give the same measurement. This means that the marks — the "ticks" — on our ruler must all be equally spaced.

And because of time translation invariance, we must ensure that any measuring equipment we use to measure time (e.g., a clock) must also possess time translation invariance, i.e., it does not matter if we perform the experiment sooner or later — the clock will give the same time measurement. So it is vital that the "ticks" of our clock are equally spaced and occur at regular time intervals because of time translation invariance.

If we now consider the regular arrangement of "ticks" on a 12-inch ruler:

and we bend that ruler around in a circle:

It becomes a clock face!

Space translation invariance results in equal ticks along a ruler, and time translation invariance results in equal ticks around the face of a clock.

This is not a trivial result. This similarity gives us the first hint of a deep connection between space and time, a connection which we will be exploring throughout this book.

The world's most accurate clock

Atomic clocks are the most accurate clocks ever built. As we have just discussed, any clock requires some regular oscillation ("ticks") which form its time standard. In an atomic clock, the time standard which is used is the time it takes for an electron to jump between orbits (energy levels) inside an atom. When electrons jump to a lower energy level, they produce electromagnetic radiation. This radiation might be in the microwave, optical, or ultraviolet region. The pattern of frequencies at which energy is emitted is called the *spectrum*. Each chemical element has a characteristic spectrum. For example, we can deduce the component elements of a star merely by looking at its light spectrum.

For a particular element, one of the frequencies in its spectrum can be selected as the "tick" of an atomic clock. As an example, one of the frequencies of the element caesium is frequently used in atomic clocks (remember, the atomic clock used in the Hafele-Keating aeroplane experiment was based on caesium). This "ticking" forms a particularly reliable time standard. Since 1967, the International System of Units (SI) has defined the second to be 9,192,631,770 ticks of a caesium atom (superseding the previous definition based on the orbit of the Earth around the Sun).

The most accurate atomic clocks in existence could have been used to measure the age of the universe to an accuracy of one second.

An interesting thought now might occur to us: we measure the accuracy of a clock by comparing its measurement with a more accurate clock. But atomic clocks are the most accurate clocks in existence. How can we possibly measure the accuracy of the world's most accurate clock? After all, we cannot determine its accuracy by comparing it with any other clock which is more accurate — no such clock exists!

Dr. Stefan Droste of the Max Planck Institute of Quantum Optics is part of a team which is developing a highly-accurate atomic clock in the optical range of frequencies (most atomic clocks use lower microwave frequencies). As Dr. Droste explains: "Time, as we know it, is based on caesium atomic clocks. These kinds of clocks have accuracies to the order of 1×10^{15} . The confidence in the time that clocks show is increased by comparing hundreds of clocks around the world with one another, and this is important since with only one single clock, you cannot know whether your clock is showing the correct time or not." [\[2\]](#)

So the answer as to how you measure the accuracy of the world's most accurate clock is that you build another clock — or a series of clocks — exactly like the first clock. You then run all of these clocks for a period of time and, at the end of that period, you see if the time measured by the clocks has varied from clock to clock. Though the variation will be small, it will not be zero — it can be measured. And that variation gives you a value for the accuracy of that particular type of clock over time.

This is essentially what Hafele and Keating did when they flew four atomic clocks around the world rather than just a single clock. By using multiple clocks it is possible to obtain a value for variation of accuracy in the experiment.

No atomic clock will ever be 100% accurate: there will always be some drift. The only truly accurate measure of time can be produced by a clock whose "tick" is based on the speed of light. Such a clock is called a *light clock*, and Einstein considered such a clock as the basis for his groundbreaking 1905 paper on special relativity.

The light clock is simply composed of two perfect mirrors which face each other, with a pulse of light bouncing between the two mirrors:

Each time the pulse bounces between the two mirrors represents one "tick" of the light clock. Unfortunately, no practical light clock has ever been built. If such a clock could ever be perfectly manufactured, it would instantly be recognised as the most accurate clock in existence. This is because the accuracy of that clock would be entirely based on the speed of light, and the speed of light is a fundamental physical constant the value of which is known not to vary with time.

However, the question then arises: how do we measure the accuracy of the light clock? How can we be absolutely certain that its accuracy does not drift over time? There would be no point using any other type of clock — a caesium atomic clock, for example — to measure its accuracy as no other clock could be as accurate as the light clock. The light clock, therefore, represents a time standard which can be unmatched by any other type of clock. The light clock is the clock by which all other clocks are judged.

Effectively, this means that all other clocks — every atomic clock, the clock by the side of your bed, your wristwatch — are subservient to the light clock. It is the light clock which decides if your wristwatch is running slow — there is no better standard than the light clock.

So instead of time defining the behaviour of a clock, the light clock essentially defines time!

This raises an interesting point because, as we shall see later in this book, the behaviour of a light clock is subtly different for a moving observer. So if a light clock effectively defines time, then **time itself must be modified for a moving observer!** This is precisely what Hafele and Keating confirmed in their round-the-world experiment. We will be returning to consider this point in detail later in the book.

But what is so special about the speed of light?

2

THE SPEED OF LIGHT

The next two chapters are going to describe a single, long journey. It is a journey which will commence at the very start of science. It is a journey which will take four hundred years and involve several of the greatest physicists in history. It is a journey which will end with an experiment which, if correctly analysed, will change everything you ever believed about reality.

However, every journey begins with a first step ...

The Galilean transformation

Galileo Galilei was born in Pisa in 1564. His father was a famous musician, and this highly-cultured family environment provided Galileo with the perfect opportunity to explore his talents. He was taught at the University of Pisa where he became fascinated by physics and mathematics.

In 1609, Galileo was in Venice when he heard of a new invention which allowed distant objects to appear as though they were close. Galileo managed to improve on the design of the invention and invited a group of merchants to climb St. Mark's bell tower for a demonstration. When Galileo unveiled his telescope, the merchants were delighted as it allowed them to spot trading ships arriving over the horizon forty miles away. As Venice was such a commercial hub at the time, this gave them a considerable advantage over their rivals.

The scene is shown below in a fresco by Bertini:

Galileo made a significant amount of money from the telescope, and continued to invent throughout his life. But Galileo's greatest contribution to the world of science was his *scientific method*. Before the scientific method was introduced, the proclamations of ancient philosophers such as Aristotle were accepted without question as representing the absolute truth about Nature. Galileo was one of the first scientists to challenge the wisdom of the ancients. Galileo's introduction of the scientific method allowed Nature to speak for itself.

Aristotle was no experimenter, and he relied too much on his preconceptions. Famously, Aristotle once proclaimed that women have fewer teeth than men. Because no one thought to check this proclamation of Aristotle, for a thousand years everyone believed that women have fewer teeth (women and men, of course, actually have the same number of teeth).

Aristotle's poor method of investigation was described by Bertrand Russell: "Aristotle maintained that women have fewer teeth than men. Although he was twice married, it never occurred to him to verify this statement by examining his wives' mouths."

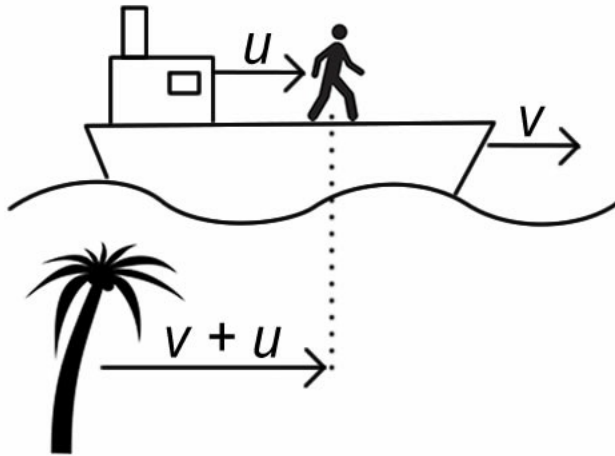

Galileo's scientific method replaced these dubious proclamations. Firstly, according to the scientific method, a hypothesis is proposed about some testable aspect of the natural world. Secondly, that hypothesis is checked through observation and experiment. Based on the result of the experiment, the hypothesis is either supported or rejected. Galileo performed many such experiments using apparatus such as wooden wedges and balls for testing his theories of motion. For introducing the world to the scientific method, Galileo is often referred to as the father of modern science.

However, Galileo got into trouble when he turned his telescope toward a wider horizon. The discovery of the four moons orbiting Jupiter — Io, Europa, Ganymede, and Callisto — suggested that the Earth was not the centre of the universe about which all celestial bodies orbited. By challenging the geocentric model of the Solar System, Galileo found himself accused of heresy and was placed under house arrest for the rest of his life.

It was while under house arrest that Galileo published his final book entitled *Discourse on Two New Sciences* (the two sciences being mechanics and the strength of materials). The book was the culmination of Galileo's work over

the preceding forty years. We are going to be considering two of the principles of motion described in the book. The first principle we will consider deals with the addition of velocities.

As Galileo was living in a world in which the ship was the dominant form of transport, he devised a maritime-themed explanation of his principle. Consider the following diagram. Imagine a ship is moving at a speed of v , and a man is walking on the ship at a speed of u (relative to the ship). Then from the shore (denoted by the palm tree) the speed of the walking man will be measured to be the sum of v and u :

This addition of velocities is called the *Galilean transformation*.

This principle is every bit as simple and intuitive as it might appear at first glance, but it took the innovative mind of Galileo to publish the principle for the first time. What is important to note is that when an object is emitted by a source — for example, a man firing an arrow from a bow — you have to add the velocity of the source to find the final velocity of the object. This might seem trivial to our eyes, but it represented a great insight in the 17th century.

The second principle of Galileo we will consider is the principle of *Galilean relativity*. Put simply, Galileo stated that if you were travelling in a straight line at a constant speed you would feel as if you were stationary. To be more precise, there would be no experiment you could perform which could reveal if you were either stationary or moving at a constant velocity. For example, if you are sitting in an aeroplane and you throw a ball straight up in the air, the ball will come straight back down into your hand. Even though the aeroplane is moving extremely fast, the ball will not rush to the back of the plane. So to all intents and purposes it feels as if you are stationary. Hence, Galilean relativity states that the laws of motion are the same for any observer in uniform motion.

We will be returning to consider this principle of Galilean relativity in the next chapter when we consider how Einstein imagined running alongside a ray of light.

Measuring the speed of light

Galileo performed an experiment for determining the speed of light by having two observers with lanterns face each other over a great distance. The lanterns had shutters which could be quickly opened and closed. When one of the observers saw a flash of light from the distant lantern, he had to reply by quickly flashing his own lantern. This rate of flashing of lanterns could be timed and, when combined with the distance between the two lanterns, it should have been possible to calculate a value for the speed of light.

However, when Galileo performed the experiment he found the time taken for the light to travel over a mile distance was virtually instantaneous. If the speed of light was not actually instantaneous then it certainly had to be extremely fast.

In 1676 the Danish astronomer Ole Romer showed that light does not travel instantaneously but instead has a finite speed. He obtained his measurement by observing the eclipses of Io — one of the moons of Jupiter. He noted that the time of the eclipse became earlier as Earth approached Jupiter, and became later as Earth moved away. Romer explained the difference in the eclipse timings as being due to the additional time which light took to reach the Earth. Romer presented his result to the French Academy of Sciences, announcing that the speed of light was

220,000 kilometres per second (this is actually 26% less than the true value which we now know is 299,792 kilometres per second).

In 1850, the French physicist Leon Foucault bounced a beam of light off a rotating mirror to a distant fixed mirror. When the beam of light reflected back to the rotating mirror, the mirror had rotated by a certain known amount. Hence, the light came off at a slightly different angle. From knowing the speed of rotation of the mirror and the angle at which the light was reflected, Foucault measured the speed of light to be 299,796 kilometres per second, which is just 0.001% greater than the actual value.

Maxwell's equations

Our journey now moves in a surprising direction, to consider the science of electricity and magnetism: *electromagnetism*.

Michael Faraday was the self-taught son of a blacksmith, but became an experimental physicist of the highest order. In 1831 in London, Faraday demonstrated to the Royal Society that a magnet moving through a coil of wire produces an electric current in that wire. This was the discovery of *electromagnetic induction*, and it is the same principle which allows modern power stations to produce electricity. The principle that a changing magnetic field produces a changing electric field is called *Faraday's law*.

Faraday's result was the inverse of an earlier result which was obtained by the French physicist Andre-Marie Ampere. Ampere showed that an electric current through a wire created a magnetic field. This became known as *Ampere's law*.

But it took a great mathematical physicist to combine these two results of Faraday and Ampere, thus revealing the remarkable underlying significance.

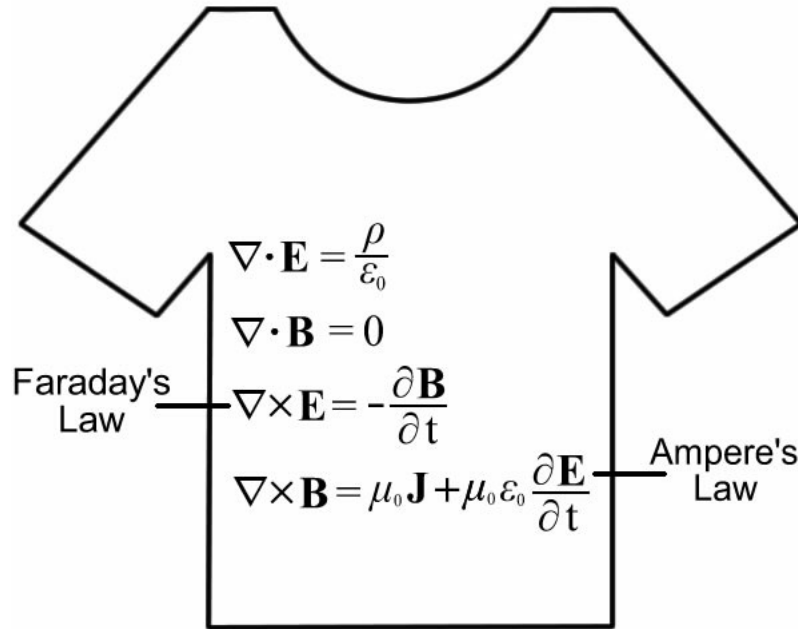

At the end of the 20th century, *Physics World* magazine conducted a poll of 100 leading physicists to discover who was considered to be the greatest physicist of all time. There was no surprise when Albert Einstein and Isaac Newton topped the poll, but in third place came a physicist who is largely unknown to the general public. His name was James Clerk Maxwell, and there is no doubt as to the esteem he is held in by physicists. According to Max Planck: "He achieved greatness unequalled." According to Einstein: "The work of James Clerk Maxwell changed the world forever."

James Clerk Maxwell was born in 1831. Maxwell regularly attended lectures at London's Royal Institution where he came into contact with Michael Faraday. Faraday had great experimental technique, but weak mathematical skills. Maxwell was able to use his own considerable mathematical skills to cast Faraday's Law into mathematical form, and to combine it with the result of Ampere. As a result of this, Maxwell produced four equations which described the laws of electromagnetism. The four equations — known as *Maxwell's equations* — were to have a tremendous impact on science and technology. In fact, they went a long way toward shaping the 20th century. The

equations allowed the development of power generation, electric motors, radio communication, television, computers, and many more new technologies which emerged in the 20th century. According to Richard Feynman: "From a long view of the history of mankind — seen from, say, ten thousand years from now — there can be little doubt that the most significant event of the nineteenth century will be judged as Maxwell's discovery of the laws of electrodynamics. The American Civil War will pale into provincial insignificance in comparison with this important scientific event of the same decade."

However, rather ironically, most people are probably now best-acquainted with Maxwell's four revolutionary equations because they often feature on a popular T-shirt design:

Maxwell's four equations describe the symmetry between electricity and magnetism, and they reveal some very interesting principles. Let us now consider the four equations.

The four equations can be best understood if we split the four equations into two groups, with each group containing two equations. The first group contains the first two equations shown on the T-shirt:

$$\text{a) } \nabla \cdot \mathbf{E} = \frac{\rho}{\epsilon_0}$$

$$\text{b) } \nabla \cdot \mathbf{B} = 0$$

What do these first two equations tell us? Well, these two equations are very similar, and they describe the amount of a field — electric or magnetic — which is emitted by a source. We can imagine a field as being an invisible entity which spreads through space. As an example, an electrically-charged particle such as an electron creates an electric field around itself. The electric field is invisible, and spreads throughout space. The field becomes stronger at distances nearer the electron, and weaker at distances farther from the electron. We can therefore consider the electron as being the "source" of the field.

On this basis, the first of the two equations — equation A in the previous diagram — says something quite simple. It simply says that the amount of electric field (signified by \mathbf{E} on the left-hand side of the first equation) coming out of a volume of space is proportional to the amount of electric charge contained within that volume (the amount of electric charge being signified by ρ on the right-hand side of the first equation). This makes a lot of sense: if we consider electric charge to be the "source" of the electric field, then the amount of electric field is proportional to the amount of electric charge.

The second of the two equations deals with the magnetic field — not the electric field. It says something rather similar to the first equation — but not quite identical. It simply says that the amount of magnetic field (signified by \mathbf{B} on the left-hand side of the second equation) coming out of a volume of space is equal to zero. So this is a rather different result to the first equation. If electricity and magnetism are so similar, then why should the total amount of magnetic field leaving a volume of space always be equal to zero?

The answer to this question is fascinating, and it is explained in a short video which I have recorded specially for this book. The video shows me explaining the solution by cutting-up an extremely large bar magnet — for reasons which are explained in the video.

I can recommend you watch the video available on YouTube at the following link:

<http://tinyurl.com/maxwellmagnet>

Here are some stills from the video:

I don't want to give away the plot of the video, but I can say that the video explains the answer to the question by considering the magnetic field lines around a bar magnet. It is easy to see the magnetic field around a magnet if you place the magnet under a sheet of paper and sprinkle iron filings over the paper:

As shown in the previous diagram, the magnetic field lines will loop from one end of the magnet (the north pole of the magnet) to the other end of the magnet (the south pole of the magnet). Therefore, if you have a magnet in a volume of space, any magnetic field leaving that volume of space will loop around and come back to the magnet again: what goes out, must come back. Hence, the net amount of magnetic field leaving a volume of space must be zero — and that explains the result described by Maxwell's second equation. So, in that respect, there is a clear difference between electric charge/field and magnetic charge/field.

But for the purposes of this book, and their relevance in calculating the speed of light, we are only interested in the second pair of Maxwell's equations:

$$\text{c) } \nabla \times \mathbf{E} = -\frac{\partial \mathbf{B}}{\partial t}$$

$$\text{d) } \nabla \times \mathbf{B} = \mu_0 \mathbf{J} + \mu_0 \epsilon_0 \frac{\partial \mathbf{E}}{\partial t}$$

These last two of Maxwell's equations represent Faraday's law and Maxwell's form of Ampere's law. The equation for Faraday's law (equation C in the previous diagram) states how the electric field, \mathbf{E} , is generated by a changing magnetic field, \mathbf{B} . And the equation for Ampere's law (equation D in the previous diagram) states the inverse: how the magnetic field, \mathbf{B} , is generated by a changing electric field, \mathbf{E} .

Maxwell's great stroke of genius was to realise that these two equations had the same form as the equation for a wave travelling through space. To see this, remember once again that the equations give us the following symmetrical results:

1. A changing magnetic field creates an electric field.
2. A changing electric field creates a magnetic field.

Hence, the magnetic field can generate the electric field, and the electric field can generate the magnetic field, and so on forever. The result is a self-sustaining wave of alternating electric and magnetic fields called an *electromagnetic wave*:

Maxwell realised that, according to his equations, the speed of the resultant wave could be determined by two electric and magnetic constants which had been determined by experiment. Hence, the speed of the wave, c , is given by:

$$c = \frac{1}{\sqrt{\mu_0 \epsilon_0}}$$

where the magnetic constant, μ_0 , has a numeric value of $1.25663706 \times 10^{-6}$, and the electric constant, ϵ_0 , has a numeric value of $8.85418782 \times 10^{-12}$. If you substitute these numeric values into the above formula (try this at home with your calculator), you will find you get a value for c of approximately 299,796,000 m/s. Incredibly, Maxwell realised that this was exactly the same speed as Leon Foucault had measured for the speed of light! So Maxwell made the inspired leap to deduce from this that light was a form of electromagnetic wave.

Visible light is not the only form of electromagnetic radiation. Depending on the wavelength, other types of electromagnetic radiation include radio waves, microwaves, infrared, ultraviolet, X-rays, and gamma rays. By discovering the fundamental form of all these different types of electromagnetic radiation, Maxwell brought about the development of radio and television, as well as many other modern technologies. According to Carl Sagan: "Maxwell's equations have had a greater impact on human history than any ten presidents."

But Maxwell's equations predicted some surprising properties of electromagnetic waves. Firstly, the equations as printed on the T-shirt in the earlier diagram are the equations for radiation through a vacuum containing no electric charges or electric currents (if electric charges or currents are present then the equations become more complicated). This is fine for our purposes as we are interested in the speed of light in a vacuum. However, this confused physicists at the time. All known waves up to that time were a form of disturbance in some underlying medium. For example, sound waves were a disturbance in air, and sea waves were a disturbance in water. But Maxwell's equations seemed to indicate that electromagnetic waves could travel through a vacuum containing no medium which could carry the waves. All experiments to detect an underlying substance — called the *ether* — drew a blank.

We now know that the ether does not exist, and electromagnetic waves can, indeed, travel through a total vacuum. After all, how else could light reach us from the stars across the intergalactic void?

It is interesting, at this point, to digress slightly and tell the story of what happened when I gave this book to a friend of mine for proof-reading. He took great exception to my description of the self-sustaining wave travelling through space, with the electric and magnetic fields oscillating off each other. His objection was based on the fact that it sounded like a form of perpetual motion and, as he stated with great certainty, there was no such thing as perpetual motion. Well, I had to break the bad news to my friend that this was, indeed, a form of perpetual motion and it is the reason why light from the stars can reach us across billions of light years. Indeed, if the light was not

intercepted by us it would continue on its merry way across the universe. So this is most certainly a form of perpetual motion — we do not see light slowing down! We do not see light running out of energy and coming to a stop. So the next time a man down the pub tells you that perpetual motion is impossible, just ask him when was the last time he saw a ray of light coming to a halt?

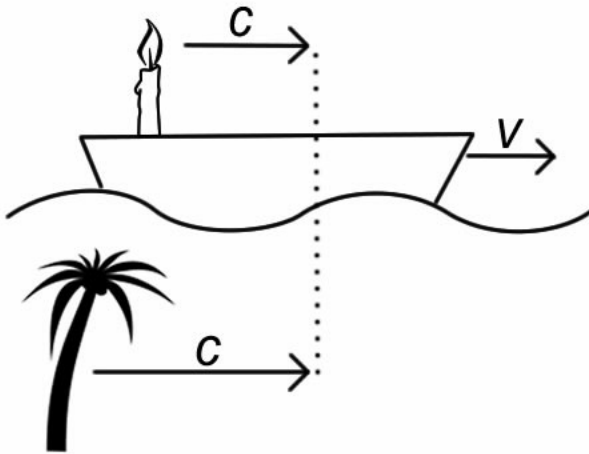

In fact, one of the themes of this book, which we examine in detail in the later chapters, is that if we are to achieve a fuller understanding of time then we will have to overcome our in-built bias against the principle of perpetual motion. As we will find, perpetual motion is all around us.

But, to return to the surprising properties of electromagnetic waves, let us consider again the formula for the speed of the wave:

$$c = \frac{1}{\sqrt{\mu_0 \epsilon_0}}$$

What is so truly astonishing about this result is that **it contains no term representing the speed of the source!** Remember back to our discussion of Galileo's principle of addition of velocities earlier in this chapter. It was explained how the velocity of the source would always have to be added to the velocity of an object to calculate the final velocity. However, Maxwell's formula for the speed of light does not say that the speed of the source has to be added. It is as if every observer would measure the same speed of light — regardless of the motion of that observer.

To show how bizarre this result really is, let us replace the man walking on the ship with a ray of light being emitted from a candle on the ship:

On the basis of Galileo's principle for the addition of velocities, we might expect the observer on the shore to measure a greater value for the speed of the ray of light than the ship-borne observer (the speed of light measured by the observer on the shore would have the speed of the ship added to it). However, as shown on the diagram, the result of Maxwell would appear to indicate that the observer on the ship and the observer on the shore would both measure the same value for the speed of the light emitted by the candle (i.e., the observer on the shore does not have to add the speed of the ship).

This result seems to contradict everything we intuitively understand about motion. But what are its full implications for reality?

3

SYNCHRONICITY

The date: June 1902.

Albert Einstein has moved to Bern having just accepted a job at the patent office. Together with his wife and young son he is living in an apartment at No. 49 Kramgasse (see <http://tinyurl.com/einsteinhouse> — the house is now preserved as a museum). Every morning when he left his apartment to go to work he would have turned left and walked past the world-famous clock tower at the end of his street.

As shown on the previous image, the clock tower displays a welter of temporal information. Underneath the main clock is an astronomical clock which displays the phases of the Moon. It also has a model of the Sun which moves around the dial to indicate the current time of sunrise and sunset. Every hour, a clockwork-powered automaton emerges at the top of the tower to strike the bell. This is the gilded figure of Chronos, the Greek god of time.

In 1902, the clock tower played a particularly important role as it was used as the official time keeper for the new railway station. Effectively, it supplied the official time standard for the city of Bern. Other cities were not necessarily synchronised with the time of Bern, so as trains passed the station at speed they would synchronise their clocks with the time seen on the clock tower.

As Einstein took his desk as a Technical Expert Class 3 at the patent office, he would use his considerable technical ability to consider the virtues and originality of the day's various patent applications. According to Walter Isaacson in his biography of Einstein, these patent applications included "dozens of new methods for synchronising clocks and coordinating time through signals sent at the speed of light."

From the complex and fascinating clock tower he passed each morning, to the various ingenious patent

applications he dealt with in his job, Einstein was surrounded by stimulating aspects of time and synchronisation.

Einstein was also well-informed about the latest developments in physics. When he was an undergraduate at the Zurich Polytechnic he became increasingly frustrated that the latest results about electromagnetism proposed by James Clerk Maxwell were not studied as part of the curriculum. This was because, since the age of 16, Einstein had imagined riding alongside a beam of light. What would you see? Would the light appear to be stationary? As we have seen, the latest result of Maxwell seemed to indicate that, no, the light would not appear to be stationary — you would still measure the same speed of light.

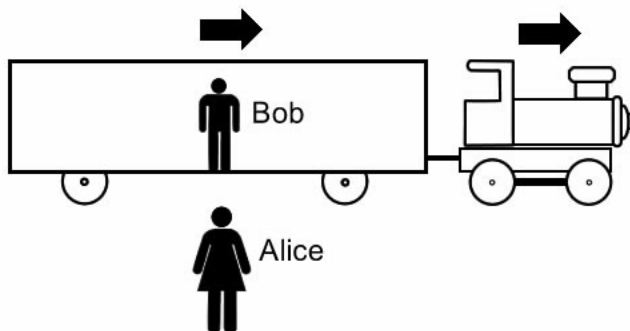

Einstein accepted the result of Maxwell — no matter how bizarre it seemed. If you remember back to the discussion of Galilean relativity in the previous chapter, you will remember how Galileo stated that the laws of motion were the same for all observers in uniform motion. By accepting that the speed of light was the same for all observers in uniform motion, Einstein extended Galilean relativity to cover all of the laws of physics — including the laws of electromagnetism. This became the *principle of relativity*: **the laws of physics are the same for all observers in uniform motion.**

I think the reason this principle might seem fairly reasonable to our eyes is because it seems a logical extension of the Copernican principle which was considered in Chapter One. The Copernican principle states that no point — and no observer — in the universe holds a privileged position. It certainly seems reasonable to assume that the laws of physics apply equally to all observers — the universe is a very equitable place.

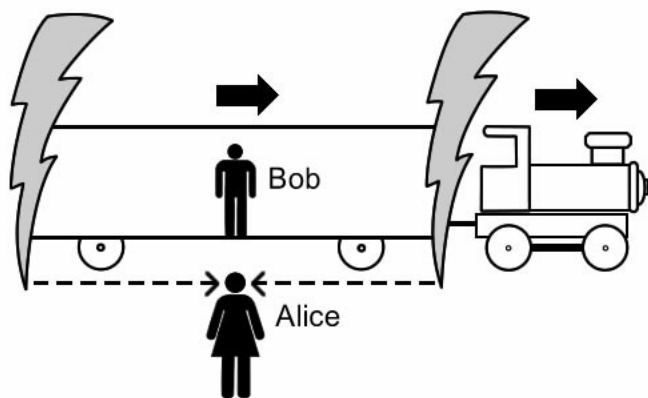

As part of Einstein's job at the patent office was to analyse patent applications to determine if they would be successful in the real world, a desk-bound Einstein would have had to construct imaginary "thought experiments" in his head to examine their potential. Einstein now applied this technique to analysing the implications of this observer-independent speed of light.

The thought experiment which will now be described is a mainstay of popular science books. We will be considering the experiment in more detail than usual as I believe most descriptions of the experiment do not describe it in sufficient detail. As a result, the essential extraordinary conclusion of the experiment is often missed.

We will consider a train travelling along a track at a constant speed. The train has a single carriage. Inside the carriage is Bob, who is standing in the middle of the carriage. Outside the carriage is Alice, who is standing on the station platform watching the train as it rushes by:

Next, something remarkable happens. At the brief moment when Bob is directly in front of Alice, Alice sees two bolts of lightning hit the track at the same time at precisely the position of the front and back of the carriage. The bolts conveniently leave marks on the track (so the positions can be found later), and they also leave marks on the front and back of the carriage:

Alice assumes the lightning bolts have hit the track at exactly the same time because she sees the light from the bolts reaching her at the same time (see the dashed lines on the previous diagram). But, from this observation, can Alice necessarily be certain that the lightning bolts actually hit the track at the same time? Alice realises that there are two factors which could have influenced this result and caused the light from the two bolts to reach her at the same time — even if the bolts did not hit the track simultaneously. Firstly, the distance from her position to each of the two lightning bolts was maybe not equal. So, to check this, Alice measures the distance between her position and the two marks on the railway tracks which were left by the two bolts. Alice finds the distance to each of the two marks is exactly the same. So that part of the experiment is satisfactory.

Secondly, Alice realises that maybe the speed of the light was not the same from each of the two bolts. Any inequality in the speed could have resulted in the light from the two lightning bolts reaching her at the same time — even if the bolts did not hit the ground simultaneously. However, Alice had installed equipment to measure the speed of light from each of the two bolts. Alice finds that, just as James Clerk Maxwell predicted, the speed of light was exactly the same from each of the two bolts.

So Alice is left with a surefire conclusion, a logical certainty: the two bolts really hit the ground simultaneously. The distance was the same, the speed of light was the same, and the light from both bolts reached her at the same time. It is therefore an absolute fact: both lightning bolts hit the ground at the same time.

Now let us turn our attention to Bob who is riding on the train. As the train continues its progress down the track at a constant speed, Alice observes Bob's situation. Bob continues to get closer to the point where one of the lightning bolts hit the track by the front of the carriage. Hence, he moves closer to the light coming from that point in front of him. In the process, he moves further away from the point on the track behind him where the other lightning bolt hit the track.

So in the next diagram we see the train which has moved to the right, and so Bob has moved closer to the lightning bolt near the front of the train:

Hence, the light from the lightning bolt in front of Bob reaches Bob first. Alice and Bob both agree on this fact.

So the light rays from the two bolts do not reach Bob simultaneously. But, from this, should Bob conclude that the lightning bolts did not strike the ground simultaneously? Of course not. Bob is no fool. Bob suspects this is merely an observational anomaly. He realises the train is moving. He realises the movement of the train is taking him nearer to the position of the front lightning bolt. Surely that is the only reason that light from the front lightning bolt reached him first. Bob realises that there is only one way to calculate if the lightning bolts really hit the ground simultaneously, and that is to perform a few measurements.

So firstly, just like Alice did, Bob measures the distances. Remember that the two lightning bolts conveniently left marks at the front and the back of the carriage. So Bob measures the distances from his standing position to the front and the back of the carriage and he finds both distances are the same. So that is certainly not the reason why light from the front bolt reached him first.

Bob is not too surprised about that, because Bob really suspects that it is the apparent speed of the light which is the culprit. After all, he knows he is on a moving train. His movement toward the position of the front lightning bolt would have surely resulted in a greater effective speed of light from that bolt. Fortunately, just like Alice, Bob had some accurate equipment installed for measuring the speed of light from both lightning bolts.

However, when Bob measures the speed of light from both bolts **he finds the speed is the exactly same!** This seems bizarre, but it is precisely in accordance with the prediction of James Clerk Maxwell who stated that all observers will measure the same speed of light. So Bob is left with something of a mystery, and he examines the evidence:

1. The distance to each source of light at the front and the back of the carriage is exactly the same.
2. The speed of light from each light source to Bob is exactly the same.
3. The light rays did not reach Bob simultaneously.

Bob is clearly left with only one logical conclusion: **the lightning bolts did NOT hit the ground simultaneously!**

This is the only conclusion available to Bob. It is simply a fact that the lightning bolts did not hit the ground at the same time. This is a statement of reality.

However, Alice was equally certain that the lightning bolts DID hit the ground at the same time. She performed exactly the same accurate measurements as Bob. For Alice, there is no doubt: it is simply a fact that the lightning bolts DID hit the ground simultaneously.

So who is right? Alice or Bob? The extraordinary truth is that they are both right — after all, they both proved their cases beyond logical doubt. As Sherlock Holmes said: "When you have eliminated the impossible, all that remains, however improbable, must be the truth." The only conclusion which is left to us is that **reality itself is different for both Alice and Bob!** In Alice's version of reality, the lightning bolts hit the ground simultaneously. In Bob's version of reality, the lightning bolts did not hit the ground simultaneously. Reality is a relative concept for the two observers. This extraordinary outcome of the experiment is called *relativity of simultaneity*.

This fundamental difference in the reality of two observers who are moving relative to each other is described by Heinz Pagels in his book *The Cosmic Code*: "Even after taking into account their relative motion and the finite speed of light they cannot agree which event 'really' took place first."

The relativity of simultaneity thought experiment which has just been described is often mistakenly presented as nothing more than an experiment in signalling, or time synchronisation. Worst of all, it is frequently presented as explaining what people "see", the observers seeing the light signals as simultaneous or not. But the experiment is not at all about seeing light signals. In fact, it is really nothing to do with light at all. What it reveals is something far more extraordinary, far more profound. It is not about what is **seen**, it is about what is **measured**. This is not about synchronisation — this is about the whole of reality. It shows that merely by moving relative to each other, two observers inhabit different realities. It is as if they inhabit two different universes.

And the events which occur in the experiment need not just be lightning bolts hitting a railway track, or lights flashing in a railway carriage. They could be a gunshot, or a star exploding, or the outbreak of war, or the assassination of a president. All aspects of reality are affected by this outcome.

The effect is imperceptible at speeds far less than the speed of light, but it is real nonetheless. If I am moving relative to you, then my reality is different to your reality.

In his book *The Emperor's New Mind*, Roger Penrose emphasizes this point by considering two people passing each other on the street at low speed. Because of the relativity of simultaneity, they will both have different conceptions of what is happening "now". While this effect is small, the effect increases with distance (as we shall

discover in the next chapter). If they consider what is happening at, say, intergalactic distances then the effect is very marked. Penrose considers one person walking in the direction of the Andromeda galaxy, while one person walks in the other direction. The person walking towards Andromeda will consider his "now" moment on Andromeda to be hours or days ahead of the other person. Penrose then considers a potential invasion of Earth by aliens living on Andromeda: "Even with quite slow relative velocities, significant differences in time-ordering will occur for events at great distances. Imagine two people walking slowly past each other in the street. The events in the Andromeda galaxy (the closest large galaxy to our own Milky Way) judged by the two people to be simultaneous with the moment that they pass one another could amount to a difference of several days. For one of the people, the space fleet launched with the intent to wipe out life on the planet Earth is already on its way; while for the other, the very decision about whether or not to launch that fleet has not yet even been made!"

This effect has been called the *Andromeda Paradox*. [3]

Of course, what is happening "right now" in a galaxy 2.5 million light-years from Earth is not of particular relevance as, even if the decision to launch the space fleet is made right now, it would still take millions of years for the fleet to reach Earth. We are in no immediate danger of alien invasion.

And so we come to the end of the long journey of the last two chapters. It is a journey which started 400 years ago in renaissance Italy at the dawn of modern science when Galileo proposed the principle of addition of velocities, and introduced the modern experimental method. It is a journey which required the mathematical prowess of James Clerk Maxwell who revealed the astonishing true nature of light. And it is a journey which has ended with the genius of Einstein whose thought experiment involving the speed of light revealed the true astonishing implications for reality.

4

SPACETIME

When the Black Death struck England in the year 1665 it must have seemed like the end of the world. The bubonic plague, carried by fleas on rats, had already killed a third of Europe's population. Once you were infected, the extremities of your body turned black (hence "Black Death"), and death almost surely resulted within four days.

The closure of Cambridge University during the plague forced a 23-year-old Isaac Newton to take refuge at his home in Woolsthorpe in Lincolnshire. It was while Newton was in forced isolation that he set his mind to produce his greatest work, the *Principia*, which laid down the basis of classical mechanics and Newtonian gravity, results still very much in use to this day. Indeed, it was by using only an understanding of Newtonian mechanics and gravity that NASA put the first man on the Moon in 1969.

The following image shows Isaac Newton as painted by William Blake in 1795:

In order to arrive at his laws of motion, Newton had to employ a precise definition of time. In the *Scholium* (introduction) to the *Principia*, Newton stated: "Absolute, true, and mathematical time, of itself and from its own nature, flows equably without relation to anything external."

So Newton believed in *absolute time*, which always operated as a background on which all objects changed. It was as if all objects danced to a single clock which controlled the entire universe. If no objects existed in the universe, this ultimate clock would still exist counting down its absolute time.

Newton had similar views on space. Newton believed that, even if all the matter was removed from the universe, there would still be the "box" of space by which all position could be measured. This was *absolute space*.

The proposal of absolute time and space was so important and successful for Newton's theories of mechanics because it created a pre-existing framework within which objects could move, and those movements could be analysed and predicted by Newton's laws of motion.

According to absolute time, we could imagine the current state of reality in the universe as being all those events that are "real" (i.e., currently happening) at the moment we snap our fingers. That might include the boy falling off his bike down the road, and a star exploding in the Andromeda Galaxy. All of these events taken together would represent the current state of the universe. And this current "now" moment would be determined by Newton's absolute "clock of the universe" — all objects in the universe would agree on the current absolute time:

Hence, we could represent the current "now" moment as being a single slice out of all time. In the previous diagram, the current "now" moment is indicated by the shaded slice. This "now" slice moves upwards in the time direction from the past to the future (only two dimensions of space are shown on the diagram instead of the usual three dimensions).

The slice represents all the events in the current universe (the events are denoted by the black circles). Only the events included in the "now" slice are "real" — they are the only events currently happening. The events of the past have already happened and are no longer real. The events of the future have not yet happened and are therefore not yet real. As the "now" slice moves upwards along the time axis at a speed determined by Newton's absolute clock, it turns the unreal future events into real current events, and those real current events are turned into unreal past events.

However, remember back to our discussion of Einstein's thought experiment in the last chapter. We discovered that Alice and Bob — who were moving relative to each other — could not agree on whether events occurred simultaneously. In other words, they disagreed about the reality (whether or not an event was happening) of certain events. If two observers cannot agree on the reality of events, then this poses a problem for Newton's view of the universe. Newton's view was based on a slice of events which were definitely real: only the events on the slice were real. But Alice and Bob can apparently not agree which events should be on the slice — they cannot agree which events are real. An event cannot be both real and unreal at the same time. How can this problem with Newton's view of the universe be resolved?

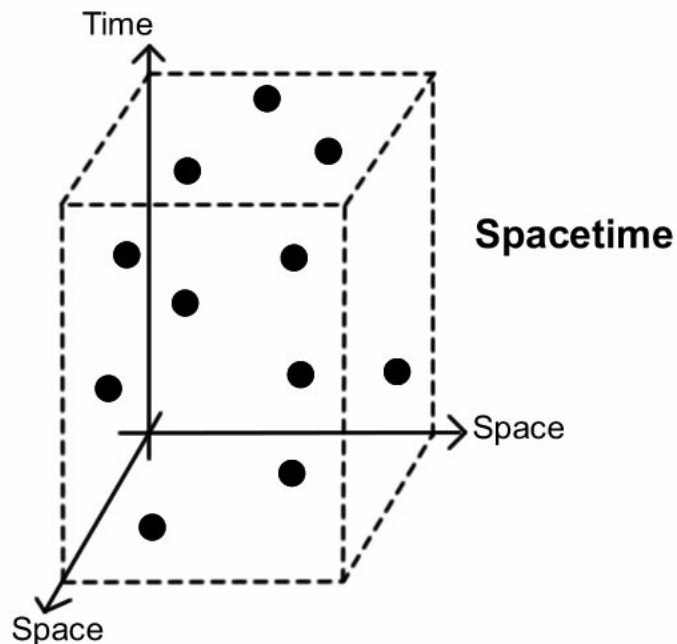

The resolution to this problem came from an unlikely source. In 1895, the English writer Herbert George Wells (better known as H.G. Wells) considered the possibility of treating time as a fourth dimension, and creating a machine which allowed the operator to move freely in that fourth dimension. After all, in our daily lives we can move in the three spatial dimensions — left/right, up/down, forward/backward — as we wish. Might it not be possible to imagine freedom to move in a fourth dimension as well? Wells' book *The Time Machine* based on this principle became the first book to popularise the concept of time travel and introduced the notion of time as a fourth dimension to the general public. We are now quite used to the idea of seeing time travel in popular fiction, so it is hard to imagine what an impact this idea must have had when presented to the public for the first time.

The following extract is H.G. Wells' description of time from *The Time Machine*. It is quite remarkable considering this was written twenty years before Einstein's great insight: [\[4\]](#)

"Clearly", the Time Traveller proceeded, "any real body must have extension in four dimensions: It must have length, breadth, thickness, and — duration. But we incline to overlook this fact. There are really four dimensions, three of which we call the three planes of space, and a fourth, time. There is no difference between time and any of the three dimensions of space except that our consciousness moves along it."

In truth, the idea of a fourth spatial dimension was tremendously fashionable toward the end of the 19th century. This was largely due to the efforts of popular writers such as Charles Hinton who took the latest mathematical ideas about geometry in higher-dimensional spaces and made them accessible to the general public. Another book of the time, *Flatland: A Romance of Many Dimensions* by Edwin Abbott Abbott, continued the popular trend of the time by considering how travel in extra spatial dimensions could allow liberation from conventional restraints. This idea of a liberating fourth dimension was adopted by modern artists who moved away from the restrictive one-point perspective system which portrayed the world as three-dimensional. This is especially noticeable in the perspective-free paintings of the cubists such as Pablo Picasso.

It was during this period, in this liberated environment, that Einstein's former mathematics teacher at the Zurich Polytechnic, Hermann Minkowski, took an interest in Einstein's work on relativity. Minkowski was impressed with Einstein's progress — and more than a little surprised: "It came as a tremendous surprise, for in his student days Einstein had been a lazy dog. He had never bothered about mathematics at all." Minkowski realised that an elegant explanation of Einstein's result could be provided if time was considered as a fourth dimension — just as H.G. Wells had earlier suggested. Instead of there being a single "now" slice of reality across the entire universe — as Newton had suggested — we had to consider all of time and space existing as one huge block-like structure. This is called *spacetime*.

In the previous diagram, Newton's "now" slice of time has vanished, and all the events (the black circles) are now portrayed as being "real".

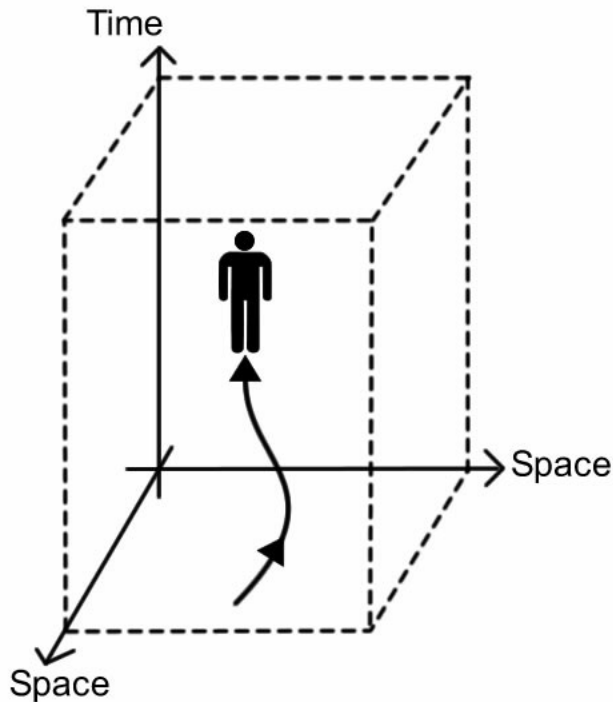

In principle, this presented the opportunity for time travel: if all times existed, and time was just another dimension, we could travel back to those times. This could not possibly have been the case in Newton's universe in which only the present moment was real.

It might at first appear strange to treat time as another dimension. Perhaps it helps to realise that we always give the position of events in terms of four dimensions: three dimensions of space and one of time. For example, we might arrange a meeting at the corner of two streets (providing the value of the spatial dimensions) at a certain time (providing the value of the time dimension). So events are inevitably defined in terms of four dimensions. You have been doing this all your life perhaps without realising it.

This approach, of treating space and time as dimensions of spacetime, starts to reveal the very close connection between space and time. For example, when we look at the stars we are essentially looking back in time. This is because we are looking at the stars as they were many years ago: the distances to the stars are so great that their light takes many years to reach us. Other profound connections between space and time will be considered in later chapters.

As we move around in space, we are inexorably moving forward in time. Hence, as we progress through our lives

we plot a path through spacetime which is called a *world line*. In the next diagram, the world line of Bob is denoted by the curved, directional line:

Every object moves forward in time, so every object has a world line. We might perceive an object at its single position "right now", but physics tells us that a more accurate representation of an object is as a world line through spacetime. This principle even applies to elementary particles which are portrayed in *Feynman diagrams* as lines rather than point particles.

This is one of the most important points of this book, as we shall see in later chapters. It is crucial to understanding the nature of time. Objects are not really points in space — they are truly lines in spacetime. Indeed, we ourselves exist as lines through spacetime, as if we are "stretched-out". Every atom and particle in our body exists as a line in spacetime — we just don't perceive it that way (for reasons we will discover in the next chapter).

At each point of the world line of an observer, there will be an associated plane — a slice of spacetime — which represents all the events which that observer considers "real" at that particular point in time. This is called the *plane of simultaneity* of the observer.

The plane of simultaneity of Bob is shown in the following diagram by the shaded plane. Note that, at any point along Bob's world line, **the plane of simultaneity is always perpendicular to Bob's world line**. It is a cross-section of spacetime at a particular time. It represents all the events that are real to Bob when Bob clicks his fingers "right now":

This resembles Newton's "now" slice of space, but it differs in the crucial fact that **this plane is defined solely in terms of a particular observer** — unlike Newton's slice of absolute time, it does not apply to all observers. That is where Newton went wrong: he took a result which applied only to himself, and assumed it applied to all observers. He believed that the time when he "clicked his fingers" represented the same absolute time for all observers in the universe. That is not the case. Newton's model of absolute time was a flawed concept.

If we have two observers — Alice and Bob — moving relative to each other (as in the train example in the previous chapter) their world lines through spacetime will be at angles to each other. However, their individual planes of simultaneity will always be perpendicular to their world lines. This is shown in the following diagram (showing Bob and Alice's separate planes of simultaneity):

As a result of these angled planes of simultaneity, Alice and Bob do not agree as to which events are real and which are unreal (which events are currently happening, which events are yet to happen, and which events have already happened). This explains how, in a spacetime in which all events are real, Alice and Bob only experience a "slice" of real events at any moment along their world lines.

The difference in the angles of their planes of simultaneity also explains how Alice and Bob can have vastly different experiences as to which events are real at great distances. This is due to their angled planes of simultaneity diverging greatly over vast distances (this is the reason for the Andromeda Galaxy paradox discussed in the previous chapter).

But to suggest that all events in the universe are "real" all the time sounds like crazy talk! Indeed, there remains some physicists who would not agree — even though the principle has a firm basis in special relativity. Is there any additional evidence that this is the case?

The block universe

While many readers of popular science books may be well aware of the concept of time as a fourth dimension, they perhaps still imagine the movement of a "now" moment which moves through the spacetime structure turning the future into the past. These readers are perhaps less aware of the other main conclusion of Einstein's thought experiment, which is, as we have seen, that all events — and therefore all times — are equally real. There is therefore no special "now" moment. As Brian Greene notes in his book *The Fabric of the Cosmos*: "A less than widely appreciated implication of Einstein's work is that special relativity really treats all times equally."

What this implies is truly quite staggering. It suggests that all times are real, every point of our life has the same level of reality. The time when you fell off a bike when you were a child is just as real as the current moment. And the moment of your birth is just as real as the moment of your death. In fact, all times really exist — the whole block of spacetime from the start of the universe to the end of the universe exists as one unchanging block. This is called the *block universe* model.

I considered the block universe model in depth in my first book, and I do not want to repeat myself, but it has to be mentioned here as it appears to be one of the few vitally-important genuine insights we can obtain about the

nature of time.

But, you might argue, you feel as though there is a moving "now" moment. Surely time is moving? Surely "now" is a special moment? Well, yes, you do feel a moving "now", but that is precisely how you have felt at every other moment of your life:

Time is not actually moving — there are just multiple copies of you stretched-out through spacetime. The moving "now" slice is just an illusion of human perception (which we will consider in the next chapter).

In the previous section I asked the question as to whether any additional evidence existed to back up the conclusion of special relativity that all times exist. And, indeed, it seems basic logic can prove the existence of the block universe model. This is because we can easily recognise that the concept of a moving "now" is logically inconsistent. Put simply, it makes no sense to ask the question: "How fast does time flow?" When we generally talk of the speed of moving objects, we give an answer which represents the change in position of the object **with respect to time**. However, when we talk about a moving "now" moment we are talking about the movement of time itself, and it makes no sense to talk about the speed at which time itself moves **with respect to itself**. To say that time moves at a rate of one second per second is absurd. The only logical conclusion is that time does not flow — all times are real.

So not only does special relativity tell us that we live in a block universe, basic logic tells us that it is undoubtedly the case.

The block universe in literature

If "killing your own grandfather" paradoxes are a favourite cliché of schlocky science fiction, then a more accurate and sophisticated model of time incorporating the block universe model can be found in more intelligent sci-fi literature. These thoughtful portrayals of the block universe present time as an unchanging, pre-existing block structure which can be accessed by beings possessing extraordinary powers.

As an example, Alan Moore's magnificent *Watchmen* graphic novel includes the character known as Doctor Manhattan. Doctor Manhattan is created when the physicist Dr. Jonathan Osterman is accidentally disintegrated when he is trapped in an Intrinsic Field Subtractor (the "intrinsic field" apparently being the force which holds all matter together). His body slowly reassembles itself into something greater: a blue-skinned super-being with control over matter at a subatomic level. Osterman is pressed into service by the U.S. government which gives him the name Doctor Manhattan (named after the Manhattan Project).

Doctor Manhattan is an almost omnipotent figure, and possesses the ability to perceive all times at once. It is as if Doctor Manhattan exists "outside the universe" and is in possession of a godlike overview of the entire block universe structure. As Doctor Manhattan explains: "There is no future. There is no past. Do you see? Time is simultaneous, an intricately structured jewel that humans insist on viewing one edge at a time, when the whole design is visible in every facet."

While Doctor Manhattan's character might appear rather distant and otherworldly, his realisation and description of the block universe is instructive and carries a message for all of us. All times exist equally — this is what science and logic tells us. Try and see the "whole design visible in every facet" rather than concentrating on "viewing one edge at a time" (i.e., the "now" moment). As you can tell, Alan Moore writes the Doctor Manhattan passages in *Watchmen* quite beautifully and poetically.

As another example of the use of the block universe model in quality literature, in 1969 the science fiction author Kurt Vonnegut released his most famous novel, *Slaughterhouse-Five*, now considered one of the finest novels of the twentieth century. *Slaughterhouse-Five* is the story of Billy Pilgrim who is abducted by aliens from the planet Tralfamadore. The aliens are friendly, and can see in four dimensions (i.e., including the time dimension). Hence, the aliens possess a similar godlike overview of spacetime to that enjoyed by Doctor Manhattan. The Tralfamadoreans see it as their duty to teach Earthlings about the true nature of time. As Billy Pilgrim recalls: "The most important thing I learned on Tralfamadore was that when a person dies he only **appears** to die. He is still very much alive in the past, so it is very silly for people to cry at his funeral. All moments, past, present, and future, always have existed, always will exist. The Tralfamadoreans can look at all the different moments just the way we can look at a stretch of the Rocky Mountains, for instance. They can see how permanent all the moments are, and they can look at any moment that interests them. It is just an illusion we have here on Earth that one moment follows another one, like beads on a string, and that once a moment is gone it is gone forever."

The Tralfamadoreans were able to see the true nature of objects (and people) stretched-out as world lines in spacetime, a continued existence from baby to old age: "Tralfamadoreans don't see human beings as two-legged creatures, either. They see them as great millipedes — with babies' legs at one end and old people's legs at the other."

As I said earlier in the chapter, this is an absolutely crucial point in this book: we do not exist as points in time, we are "stretched-out" as world lines from birth to death — like a millipede. This is the reality of our existence in spacetime. We will be seeing in later chapters why this is so important.

The Ulysses Pact

The implications of the block universe model really seem quite staggering. It states that you exist at all times: the past and the future are just as real as the current moment. So the question arises: how should you live your life in a block universe? Does an understanding of the block universe give you an advantage over other people (who don't read quality popular science books)? Should you behave differently?

Firstly, death should hold less fear. The block universe states that you exist at all times in your life, that you are alive at all times. True, the block universe model implies that the circumstance and time of your death has already been decided, but it also states that the moment of your death has no more importance than any other time of your life. You will remain alive at other times! This is no crank theory — this is an underappreciated implication of orthodox physics.

Einstein took comfort from this knowledge when his friend Michele Besso died. Einstein wrote a letter of consolation to Besso's family in which he stated: "Now he has departed from this strange world a little ahead of me. That means nothing. People like us, who believe in physics, know that the distinction between past, present, and future is only a stubbornly persistent illusion."

Michael Lockwood considers this principle in his book *The Labyrinth of Time*. He tries to console those who may have lost loved ones: "Einstein evidently believed that the spacetime view, when taken fully to heart, can provide comfort to the bereaved. A person who is not living **now**, but did or will live at other times, exists in just as substantial a sense as someone who does not live **here**, but only in some other **place**. Einstein is urging us to regard those living in times past, like those living in foreign parts, as equally **out there** in spacetime, enjoying the same flesh-and-blood existence as ourselves."

If all times are equally real, then this implies that those happy moments you have in your past are just as real as the current moment. That should be reassuring. It also suggests that we might live happier and more content lives if we lower the importance we give to the current moment. Downgrade the "now". Realise that the current moment is no more real than the past moments in your life. We are inundated with advertising slogans which try to persuade us to increase the importance we assign to the current moment: "Live for the day!" "Buy now, pay later!" Instead, resist these temptations. Do not "live for the day", live for all times. Realise that you exist at all times. Save for the future. Appreciate the past as being as real as the current moment.

It is, of course, easier said than done to apply less importance to the current moment. This is because our brain tends to place greater emphasis on obtaining immediate reward, rather than deferring that instant gratification in the hope of obtaining a greater reward at a later date. The neuroscientist David Eagleman considers this tendency in his book *The Brain*.

As an example, Eagleman considers the plight of American homebuyers who bought their homes before the financial crash of 2008. The homebuyers were attracted to the low interest rates over a trial period, without considering the possibility that those rates would rise significantly when the trial period ended. As Eagleman

explains: "What did this disaster have to do with competing networks in the brain? These subprime loans allowed people to obtain a nice house now, with the high rates deferred until later. As such, the offer perfectly appealed to the neural networks that desire instant gratification — that is, those networks that want things now. Because the seduction of the immediate satisfaction pulls so strongly on our decision making, the housing bubble can be understood not simply as an economic phenomenon, but also as a neural one."

Eagleman continues to explain the brain's attraction to the "now": "To the brain, the future can only ever be a pale shadow of the now. The power of now explains why people make decisions that feel good in the moment but have lousy consequences in the future: people who take a drink or a drug hit even though they know they shouldn't; athletes who take anabolic steroids even though it may shave years off their lives; married partners who give in to an available affair."

But, as it has just been explained, if we want to live successfully in a block universe then it is vital to realise that we exist at all times, and we should lower the importance we give to the current moment. In effect, that means we need to overcome our brain's natural desire for instant gratification. One method we might use to achieve that is described by David Eagleman and is called a *Ulysses Pact*.

In standard legal affairs, it is common to form a contract between two people which binds the actions of those people at a later date. A Ulysses Pact (which is also known as a *Ulysses Contract*) works on a very similar principle, but the two people which are bound by the contract are rather unusual: the contract is drawn-up between yourself ... and a future version of yourself.

The Ulysses Pact is named after Ulysses, the hero from ancient Greek literature (who was originally named Odysseus). On his way home after triumphing in the Trojan War, Ulysses realised his ship would be passing by the island where the Sirens lived. The Sirens were women who sang songs of such beauty that any sailor became instantly entranced, with the result that their ship became wrecked on the rocks. In order to resist the spell of the Sirens, Ulysses ordered his men to lash him to the mast of the ship so he would be unable to interfere with the ship's steering. In that way, Ulysses was restricting the behaviour of his future self.

In general, the goal of a Ulysses Pact is to bind your future self so that your future self will behave in some admirable manner. As an example, if you require extra motivation to go to the gym at a later date, you might arrange in advance for a friend to meet you there. The behaviour of your future self then becomes bound by the contract. As another example of a Ulysses Pact which I have found useful, I always end my books with a "Coming Soon" page which includes a picture of the cover of my intended next book (before I have written it) and its proposed title. I then feel obliged to write that book. It's a bind, but it works!

It is as if you are creating a legal contract between two people, but one of the two people is your future self. This, then, resembles the suggestion of the block universe model that there are multiple copies of yourself existing at all times. As David Eagleman says: "To make better decisions, it's important not only to know yourself, but **all your selves.**"

5

THE ARROW OF TIME

As we have just discussed, the block universe model suggests that all of spacetime exists as an unchanging block, with no special "now" moment. But, if that is the case, then why do we feel as though there **is** a "now" moment, which gives the current moment priority over the past and the future? In fact, not only do we feel a "now" moment, but we feel movement of that now moment from what we call "the past" to what we call "the future". So this seems to indicate a directionality in time. What is the origin of this directionality?

This directionality — this so-called *arrow of time* — is not just limited to our internal perception of the motion of time. External physical processes also exhibit a directionality in time. For example, we might see an egg breaking (in the forward time direction), but we never see a broken egg reforming itself. These considerations might seem trivial, but they pose serious questions for physics. This is because the laws of physics — certainly Newtonian mechanics — are *time symmetrical*, i.e., they work the same in the backward time direction as they do in the forward time direction. Consider, for example, shooting a movie of two balls colliding, with the first ball stopping and the second ball moving off at speed. If you played the movie backwards, the events would still make sense according to the laws of physics. This time, though, the second ball would come in reverse, strike the stationary first ball, and the first ball would then move off in reverse. Everything would happen perfectly in reverse, and it would look as though it was happening in the forward time direction.

So if the laws of physics are time-symmetrical, why do so many processes exhibit an arrow of time in the forward time direction?

Let us first consider the psychological aspects of this question.

The feeling of "now"

In the discussion of the block universe in the previous chapter, it was described how all times are equally real and there is, therefore, no special "now" pointer which moves through time at a certain speed and determines the current moment. Even though we derived this result in a logical manner, there still lingers a considerable amount of resistance to this model. The main reason I feel that many people have such a problem accepting the block universe model is not through any rational scientific basis, but because they instinctively feel a special "now" moment. This feeling is so utterly entrenched into our lives and psyche that it is an incredibly hard habit to break.

However, there is no place in physics for feelings. Physics is based on measurement and cold equations. Is it possible to produce any hard numerical measurement of this supposed "moving now"? No, of course it isn't — for the reason presented in the previous chapter: it simply makes no logical sense to try and measure how fast time flows. People might say with complete certainty that they feel the movement of a "now" pointer, but you will note that they never say precisely how fast it moves!

So why do we feel this motion of time, this so-called *psychological arrow of time*? The physicist James Hartle believes the answer does not lie with physics at all, but instead purely lies in human biology. Hartle has considered how the human mind processes information, specifically considering the mechanism of human memory.^[5] Hartle realised that a computer model of human memory could be constructed. The resultant model applied not only to humans, but also to processing units with computer memory such as robots. These generalised robots were given the name IGUS (Information Gathering and Utilizing Systems).

Here is a cute example of an IGUS. We'll be seeing him again later:

Hartle realised that the memory of an IGUS could be modelled as a series of computer registers:

In the preceding diagram, the IGUS mechanism is contained within the dashed rectangle. The ever-changing information about the outside world is denoted by a pack of cards (shown on the left of the diagram), with the top card changing with time. The latest information about the external world — the top card on the pack — is captured by the electronic eye of the IGUS. That information is stored in its first memory register, R_1 . As time passes, that information in register R_1 gets shuffled back further in memory into register R_2 , and the new latest information is captured into R_1 . So as each new piece of information comes in, the information which is already held in memory gets shuffled further and further back in the memory registers. Eventually, the information is shuffled out of the bank of registers completely, into the waste bin, and the information is lost ("forgotten").

Now, the important point here is that our brains **could** assign equal priority to each of these memory registers. It could say the contents of R_2 are just as important as the contents of R_1 , or it could even say that the contents of R_4 are **more** important than the contents of R_1 ! But that is not what happens in practice. In fact, any creature whose brain worked on the principle that the contents of R_4 were more important than the contents of R_1 would be quickly killed off through evolution. This is because such a creature would be perpetually living in the past. It would be acting according to the state of the universe a few seconds ago. Hartle gives the example of a frog trying to use its sticky tongue to catch a fly on a leaf. If the frog is operating based on the contents of R_4 then it will be considering the state of the universe a few seconds ago. By the time the frog sticks its tongue out to catch the fly, the fly will have long since flown.

So, instead, our brains assign greater importance to the contents of memory register R_1 . Evolution has shown that this is the most efficient way to catch flies. The brain still retains the contents of memory registers R_2 to R_4 , but it makes their contents appear "foggy" to us, to make it clear that these contents should not be regarded as being as important as the contents of R_1 . Hence, we call the contents of R_2 to R_4 "memories".

The brain retains the contents of R_2 to R_4 , and makes their contents available to us, because memories are useful for evolutionary purposes. But the brain emphasizes the importance of the contents of R_1 . If the brain really wanted to, it could raise the importance of the contents of R_2 to R_4 to the same level of importance as the contents of R_1 . Our memories would then be perceived as being just as real as the current moment. We would then be truly like the Tralfamadorians from *Slaughterhouse-Five*, viewing all past moments in time as being as equally real as the current moment.

How extraordinary! And perfectly legitimate within the laws of physics.

So the feeling of a special "now" moment is purely a construction of biology. Do not be fooled — this has nothing

to do with physics. Physics states that all times are equally real.

But it is interesting that this is how an IGUS (such as ourselves) can generate a "now" moment from the static block universe structure: it is purely an illusion of human perception.

This is why we do not see objects as continuous world lines in spacetime (like the Tralfamadorians). We only ever regard the true state of the universe as being the information which resides in the latest register R_1 . So we only ever see a cross-section of spacetime at one point "right now". In this respect, human perception fools us — it does not provide us with an accurate view of reality. As I stressed in the previous chapter, it is vital to understand that the correct view of reality is that objects exist as stretched-out world lines in spacetime.

The moving "now"

So, given that the universe has a static block universe structure, why does an IGUS feel the movement of this "now" moment? In other words, what is the reason for the psychological arrow of time? To answer this, you will notice that there is a clear directionality in the way the captured information passes through the IGUS memory registers: the information always passes from left to right, from register R_1 to register R_4 . It is always one-way traffic. This directionality results in an asymmetry in our memory: we can remember the past, but we cannot remember the future. This asymmetry is the reason we feel movement: we feel the past is somewhere "we have been" and the future is somewhere "we are going".

If we return to consider our cartoon character who lives in the block universe, we find that at each point in his existence he is able to remember his past, but is unable to remember his future:

So this asymmetry results in our cartoon character feeling a form of motion in time, directed from the past to the future. However, due to his existence at all times in the block universe model, there is no actual motion at all. The universe is a static block of spacetime.

This sensation of a "moving now" explains how humans can observe motion in an otherwise completely static block universe structure. The storage registers of our memory hold past states of our environment. As the data shuffles through our memory registers, we can compare the past state of the environment with the current observed state. Any change in the state of our environment would be interpreted as "motion" of the objects in the environment. So, even in a completely static block universe structure, human beings can obtain an impression of motion. There are probably good evolutionary reasons why we have developed a memory which works in this manner: it is undoubtedly a huge evolutionary advantage to be able to detect objects in motion. This is the reason why a tiger creeps slowly through the African Savannah when it is tracking its prey — it is because the visual system of a gazelle is attuned to detecting motion.

So what science and logic seems to be telling us is that the sensation we have of movement through time is nothing more than an illusion generated by our brains! You might find this very hard to accept, after all, surely our brains never fool us into believing that something which is static appears to be moving? Well, if you think that is the case, consider the following optical illusion:

You should be able to see motion in the image (Einstein's head moves).

So the brain clearly has a tendency to give an impression of movement in a situation which is completely static. There is much in physics which is counter-intuitive, and placing too much credence on the evidence of our own eyes — and our "feelings" — can hinder our progress to uncover the truth. We have to be careful only to analyse the available data, and not impose our own preconceptions on the result.

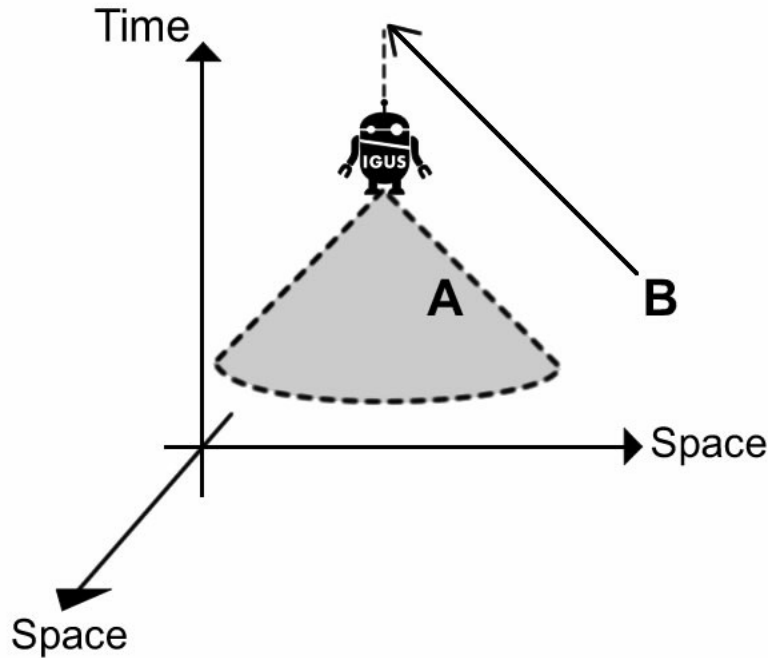

Why can't we remember the future?

So, as has just been described, the underlying reason as to why we experience a moving "now" moment is due to an asymmetry in our memory: we can remember the past, but we cannot remember the future. This asymmetry generates a feeling of movement: we feel the past is somewhere "we have been" and the future is somewhere "we are going". So, as we continue our analysis, it seems essential to try to understand the root cause of this asymmetry, which is: why can't we remember the future?

It might be imagined that the answer to this question is irretrievably locked in the maze of neurons in our head. The answer would appear to be a very personal matter, the result of individual brain chemistry. However, once again James Hartle's IGUS model casts light on the mystery by considering the laws of physics.

Any event which occurs in spacetime has a *light cone* associated with it. In this example, we will be considering the light cone for past events (there is also a corresponding light cone for future events). The past light cone contains every event which might possibly cause a particular event. Basically, the past event must have occurred close enough to the future event so that light had enough time to reach the future event. This allows the past event to have been the cause of the future event.

The past light cone for an IGUS is shown in grey in the following diagram:

The IGUS lies at the apex of the cone. Two events, A and B, are shown on the diagram. As can be seen, event A lies within the past light cone of the IGUS. This means that light (and, hence, information) from the event has had sufficient time to reach the IGUS. As far as the IGUS is concerned, event A is an event in its past. The IGUS possesses information about the event.

However, it can be seen that event B lies outside the past light cone of the IGUS. This means that light (and information) from event B has not had enough time to reach the IGUS. Light from event B will only reach the IGUS after some additional time has passed (see how the arrow from event B intersects the IGUS world line some time in the future of the IGUS). Hence, event B can be considered to lie in the future of the IGUS. As far as the IGUS is concerned, event B is a future event.

So why is the IGUS unable to remember the future? Well, James Hartle makes the rather obvious and brilliant insight that "One reason the robot doesn't remember the future is that it receives no information about it." There has been enough time for information from event A (the past event) to reach the IGUS, so information about that event has been captured into the memory registers of the IGUS. However, there has not been enough time for information from event B (the future event) to reach the IGUS. Information from event B has therefore not been stored in the IGUS memory registers. Whereas the IGUS can remember event A (the past event), it is unable to remember event B (the future event). **The IGUS is therefore unable to remember the future.**

So, far from being a matter of personal brain physiology, we discover that the reason we cannot remember the future is purely due to the physics of the external universe: we cannot remember the future because we have received no information from the future. And this is an important message: the boundary between the internal processes of our minds and the external processes of the universe is a very blurred boundary. Human beings are not the isolated entities we often imagine we are.

The thermodynamic arrow of time

This behaviour of light which has just been described — always travelling from the past to the future — appears to represent another directionality in time, another arrow of time. This behaviour is actually called the *radiative arrow of time*. There are in fact many different "arrows of time". For example:

- We have already discussed the *psychological arrow of time*, and examined why we feel the motion of time

from the past into the future.

- We have also considered the *radiative arrow of time*, and seen its importance in generating the psychological arrow of time.
- There is also a *quantum mechanical arrow of time*. If you read my first book, *Hidden In Plain Sight*, you will know that before we measure a property of a particle, the particle behaves as though it has **all** possible property values. However, when we measure the actual property of the particle, there is an apparent "quantum jump" to a particular value. This quantum jump always happens in the forward time direction.
- Another arrow of time is the *thermodynamic arrow of time*. Heat will always flow from a warm body to a cold body.

Interestingly, these seemingly unrelated arrows of time all have several features in common. Firstly, all of these arrows of time represent an **irreversible** process. In the psychological arrow of time, we feel movement in the forward time direction, but we cannot reverse our motion to feel as if we are travelling in the reverse time direction. In the radiative arrow of time, light travels in all directions away from a source and scatters randomly off objects, but scattered light is never observed converging back towards a source. In the quantum mechanical arrow of time, quantum jumps happen in the forward time direction, but can never happen in the reverse time direction. And in the thermodynamic arrow of time, heat flows from hot to cold, but the reverse process is never observed (the heat of a body at constant temperature does not spontaneously move to one corner of the body for no reason).

The second similarity between all of these arrows of time is that all of these irreversible processes happen in the same forward time direction.

So, these similarities lead us to quite an intriguing thought: might it be possible that all of these arrows of time have the same underlying cause? That would explain the similarities. In fact, it is indeed now the case that physicists believe that all of these arrows of time have the same cause. And, perhaps surprisingly, the underlying cause is believed to be the principle behind the thermodynamic arrow of time.

Thermodynamics is the theory of heat and motion ("thermo" + "dynamics"). Heat always flows from a hot substance to a cold substance, and this motion can be tapped — just like the motion of water can be tapped to drive a water wheel. This motion provides the energy for steam engines, for example. And it was during the era of the steam engine that the science of thermodynamics first appeared.

So why does heat always flow from hot to cold? Well, what is really happening is that the heat is moving from being concentrated to being dispersed. If you have two objects — one hot and one cold — and you connect them to form a single system, the eventual result will be a single system at the same temperature. In other words, heat has flowed from the hot object to the cold object in order to equalise the temperature of the two objects.

In 1865, the German physicist Rudolf Clausius observed this flow of heat and tried to express the motion in mathematical terms. He arrived at the following inequality:

$$\frac{dS}{dt} > 0$$

This inequality says that the rate of change of a measurable property, S , in a thermodynamic process is always greater than 0. In other words, the value of S always increases. Clausius gave a name to this peculiar property, S : he called it *entropy*. The inequality therefore states that the value of entropy always increases with time. This forms the *second law of thermodynamics*.

So at last this equation gives us a clear mathematical formulation for an arrow of time: it is the arrow of time captured in an equation! We are not talking about a subjective psychological arrow of time here — this is a measurable physical quantity which always increases with time.

However, despite the success of the laws of thermodynamics, in the middle of the 19th century no one quite understood what entropy was, or why it should always increase. In order to make sense of entropy, another conceptual leap was required. That leap was the acceptance of the existence of atoms.

At the time, the existence of atoms was still in doubt. However, if we consider objects to be made of atoms then

we can realise that heat is simply the random motion of atoms. The spread of heat through an object is then the spreading of this random atomic motion through the object.

The great Austrian physicist, Ludwig Boltzmann, realised that if we consider our world as being made up of atoms, we could obtain an understanding of entropy, and why it must always increase. If we have a system made up of atoms, we could consider those atoms to be in either an ordered state, or a totally random disordered state (this is not something you could do if you considered objects to be a continuous solid). Entropy could then be regarded as the amount of disorder, or randomness, of the atoms in a system. For example, if heat energy was in a very ordered state, confined to a few atoms vibrating at the edge of an object, that heat energy would tend to spread through the whole object. In other words, order would be lost: disorder increases. In the final state, all the atoms in the object would be randomly vibrating, so the whole object would be the same temperature, with no trace left of that initial ordered state. This would be a state of maximum disorder, maximum entropy.

Boltzmann produced an equation which allowed you to assign a value to entropy — the amount of disorder:

$$S = k \log W$$

This is Boltzmann's famous equation, engraved on his tombstone in Vienna.

The value for the W term in the equation is produced by examining a system and calculating how disordered is its current state. For example, a pack of 52 playing cards could be randomly shuffled into a huge number of different sequences. If, however, you found the pack perfectly ordered in sequence, ace to king in all four suits, then this would represent a very special, ordered state. And that sequence would represent a very small proportion of all the possible sequences. Hence, the W value would be very small for that perfect sequence — giving a very small entropy value in Boltzmann's formula.

In the case of maximum entropy, the pack would be completely disordered, and the W value would then be equal to the total number of possible sequences of the cards: a huge number.

So, by considering Boltzmann's formula, why should entropy always increase? Well, a system will have many more disordered states rather than ordered states. Consider the pack of playing cards again. If the entire pack of cards was ordered in sequence, that represents a very special, ordered state with low entropy. However, a pack of cards has many more disordered states. If the ordered pack was then randomly shuffled, it would most likely move to one of the disordered states — it would be highly unlikely to move to the ordered state. Because systems have many more disordered states than ordered states, a system which changes state randomly will tend to move to a more disordered state.

So this explains the thermodynamic arrow of time. It explains why an area of heat (random atomic motion) spreads, and never shrinks. And this principle — that disorder will spread — applies to all dynamic systems. It explains why we might see a china cup breaking into hundreds of disordered pieces, but we never see broken china pieces spontaneously reforming to form a cup. To quote Jim Al-Khalili from his BBC TV programme *Order And Disorder*: "Boltzmann's equation contains within it the mortality of everything, from a china jug, to a human life, to the universe itself."

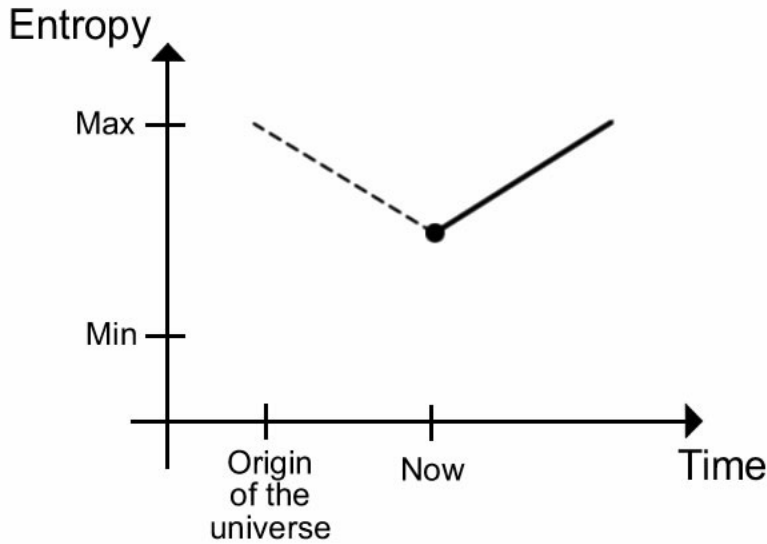

Loschmidt's paradox

However, we are not out of the woods yet. There is still a problem with our proposed solution to the thermodynamic arrow of time. If you remember back to the start of this chapter, it was described how the laws of physics are fundamentally time-symmetrical, i.e., they work the same in the backward time direction as in the forward time direction. So the laws of physics do not favour any direction of time — forward or backward. And, surprisingly, when we consider Boltzmann's solution we also find that no direction of time is preferred. Boltzmann's solution just says "a system that changes randomly will tend to become more disordered." But, if you consider the backward time direction, systems change just as much in the backward time direction as they do in the forward time direction. Again, no particular direction of time is preferred.

So change of entropy is fundamentally time-symmetrical. I do not think this point is widely appreciated.

Hence, it appears that we should find entropy increasing in the reverse time direction just as much as we observe entropy increasing in the forward time direction. This argument is called *Loschmidt's paradox*, named after Josef Loschmidt who was Ludwig Boltzmann's teacher.

Now let us apply Loschmidt's paradox to the whole universe. As change of entropy is fundamentally time symmetrical then that suggests that we should see entropy increasing as we look back in time from our current moment. This increase of entropy into the past is indicated by the dashed line in the following diagram:

Note the symmetry of the "V" shape. This is due to change of entropy being fundamentally time-symmetrical. However, this is, of course, not what we observe. Objects tend to have lower entropy in the past — not higher entropy as this diagram suggests. Consider a rusting old car, which will continue rusting into the future (i.e., increasing its entropy). However, if we look into the past we will find a sparkly new car with lower entropy. So as we look into the past we find objects with lower entropy — not higher entropy.

So why do objects have lower entropy in the past? This is due to the very special state of the universe when it was created. The universe was created with incredibly low entropy, and all the objects contained within the universe have been essentially falling apart ever since!

The following diagram shows the incorrect dashed line removed, and replaced with a line revealing the extremely low entropy at the origin of the universe. It shows the entropy value steadily increasing throughout the lifetime of the universe:

So why was entropy so incredibly low at the origin of the universe? We are not yet certain as to why that was the case, but a possible solution may be found from an unlikely source ...

Entropy and biology

There was a story in the news recently of a remarkable young girl from Montana called Gabby Williams. Gabby is 8 years old, but resembles a baby. The rate at which she is ageing has slowed to a snail's pace. Gabby is not the only person with this condition: there is a 29-year-old man from Florida who has the body of a 10-year-old, and a 31-year-old Brazilian woman has the body of a 2-year-old. This condition is so rare that doctors do not even have a name for it.

These remarkable people have come to the attention of a medical researcher called Dr. Richard Walker, now retired but currently based in St. Petersburg. Dr. Walker believes these people could hold the secret to immortality within their genetic structure. He refers to the process of ageing as "developmental inertia" (which is a very interesting term with particular relevance to physics — as we shall see later). Walker believes that it might be possible to identify an "off switch" for developmental inertia, and thus avoid the ageing process altogether.

However, if Dr. Walker is to achieve immortality he will have to overcome a fundamental biological limit. It appears that a human cell can only divide about 50 times. This limit on cell division is called the *Hayflick limit*. At the end of each strand of DNA there is a repeated sequence of molecules which act to stop the DNA from fraying — much like the piece of plastic on the end of shoelaces. With each cell division, this piece of "plastic" DNA shortens. So this behaves like a molecular clock, with each cell having a self destruct mechanism which is designed to limit life span. When the clock expires, the cell undergoes programmed cell death. The Hayflick limit is different for other animals: if you are lucky enough to be a Galapagos turtle your cells can divide about 110 times.

If Dr. Walker is right, it might be possible to circumvent the Hayflick limit. He realises that this would not necessarily lead to eternal life: he admits that a serious accident or disease is still going to kill you. However, if you can avoid getting run over by a car, or contracting ebola, it would appear that Dr. Walker does indeed suggest that living forever is a real medical possibility.

However, as Dr. Walker appears to have a preference for adopting physics terms in his research, perhaps someone might introduce him to the concept of what we might call "developmental entropy". Fundamentally, a human being represents a physical system which is inevitably prone to increasing entropy. In this respect, a human is no different from a rusting car, or a breaking egg. A human has to follow the unidirectional arrow of time from cradle to grave, as there is simply no way of circumventing the second law of thermodynamics. And the second law of thermodynamics certainly applies to cell division.

A mature human is made up of several trillion cells. When these cells become old and require replacing (e.g., skin

cells are constantly being shed), new cells can be produced by *mitosis*. Mitosis is cell division: one old cell can produce two identical daughter cells. It is essential that the DNA in the original cell is precisely copied to the two new daughter cells. However, during this copying of the DNA, it is possible for errors to creep into the copied DNA, and these errors can accumulate over time. Imagine taking a photocopy of an image, and then photocopying that photocopy, and then repeating the process many times. Eventually, you will find many errors creeping into your photocopied image so that it no longer resembles the original image.

Unfortunately, these accumulated errors in the DNA can produce cancerous cells. Cancer is generally described as the result of accumulated DNA errors, and the role of carcinogens (cancer-causing chemicals) is often listed as the main cause. However, we can clearly also view the accumulation of DNA errors as an inevitable result of increasing entropy. This explains why cancer is predominantly a disease of old age. As the cancer researcher Robert Weinberg explains: "Cancer is an inevitability the moment you create complex multicellular organisms and give the individual cells the license to proliferate. It is simply a consequence of increasing entropy, increasing disorder. If we lived long enough, sooner or later we would all get cancer." [6]

Interestingly, though, it appears that a certain strain of cancer can avoid the seeming inevitability of entropic damage. In Baltimore in 1951 some cancerous cells were removed (without permission) from a tumour in Henrietta Lacks. Scientists were stunned to discover that these cells were apparently immortal. Whereas normal human cells could survive for only a few days, these cells (known as HeLa, after the initial letters of Henrietta Lacks' name) could survive and replicate without limit. These immortal cells have been grown and distributed around the world, and have been used in countless experiments. Henrietta Lacks left a tremendous legacy to the medical world, and has undoubtedly saved many lives. In many laboratories around the world, Henrietta Lacks continues to live.

So how can HeLa cells be immortal? How can they avoid inevitable damage due to increasing entropy and damaged DNA during replication? Well, the truth is that even HeLa cells are subject to increasing entropy. Cell division in HeLa continues to damage the DNA and produce mutations, which results in new strains. It appears that absolutely nothing can escape the degradation due to the second law of thermodynamics.

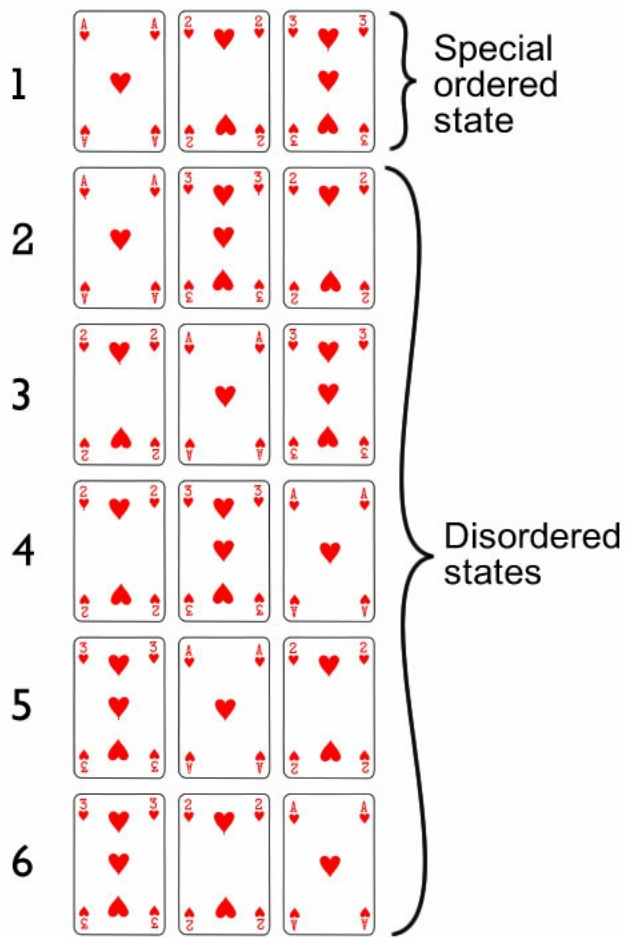

However, there is one example in which it might appear that life provides an exception to the inevitability of increasing entropy. Life has the ability to give birth to new life. And that new life, that new baby, appears perfect and untainted. So how can this apparent circumvention of the second law of thermodynamics be explained?

I do not believe the solution to this question which is generally presented is the correct solution. The usual explanation is that the second law only applies to closed systems, and a human being is not a closed system. A human interacts with its environment: it eats food, it expels waste. The food has grown under the Sun — itself a source of low entropy energy — and the expelled waste has high entropy. So the total entropy of a human system can be reduced through interaction with the environment.

However, as I say, I do not believe this is actually the correct explanation of how entropy is apparently massively reduced during the birth of a new human baby. In order to discover the correct solution, we need to consider *degrees of freedom*.

The number of degrees of freedom of a system is how many independent distinguishing values it possesses which are allowed to vary. That statement is not as complicated as it might sound. Once again, consider a pack of 52 playing cards which has been randomly shuffled. How do we identify one particular ordering of that pack of cards from the random ordering of a different pack of cards? Well, firstly, the two packs might have a different card as the top card in the pack. If the packs have a different top card, then that would certainly allow us to distinguish between the orderings of the two packs. However, if the two top cards are the same for both packs, we would then consider the second card in the packs. Basically, as I am sure you can see, there will be 52 different positions in the pack which will allow us to distinguish between the orderings of the two packs. We could therefore say that each pack has 52 degrees of freedom.

Now let us consider a pack consisting of only three cards: the ace, two, and three of hearts. This pack, therefore, has only 3 degrees of freedom, compared with the 52 degrees of freedom the pack had before. How many different random orderings of this three card pack are now possible? You can see from the following diagram that there are now only six possible different orderings:

One of the orderings — ordering number one at the top of the diagram — is the special, ordered state. But there are now only five other possible disordered states. This is a far fewer number of disordered states than was the case with the 52 card pack. This means the maximum W term (the number of possible disordered states) in Boltzmann's formula for entropy is smaller, and so maximum entropy is reduced.

Now let us return to consider the birth of a human baby. How is it possible that two, wrinkly, middle-aged, entropy-rich parents can create such perfect low-entropy offspring? Well, the degrees of freedom available for describing a baby are far fewer than those available for describing an adult human. Put simply, babies all tend to look quite similar to each other. They have fewer distinguishing features. It is not even possible to determine the sex of a baby from facial appearances.

The available degrees of freedom for describing the few cells of an embryo are even fewer. And — as with our three card pack of cards — fewer degrees of freedom means maximum entropy is reduced. Basically, it becomes impossible to produce a baby with high-entropy distinguishing features, such as wrinkles, or a moustache (unless you are very unlucky). Your baby is going to look pretty much like everyone else's baby. This explains how an ageing couple can produce perfect, low-entropy offspring.

The low entropy of the early universe is often presented as one of the great mysteries in physics. However, perhaps a simple comparison to a newborn baby can cast a light on this mystery.

Let us consider the universe and evaluate how many degrees of freedom it has. In how many ways could we distinguish between one state of the universe and a different state of the universe? Clearly, the number of different values needed to describe a universe is going to be an astronomically huge number. Hence, we could say that the universe has a staggeringly huge number of degrees of freedom.

But what about the first few seconds after the Big Bang? How many degrees of freedom would the universe have

had then? It is likely that the universe would have had far fewer degrees of freedom. The universe was much smoother, being composed of pure energy, with the elementary particles yet to emerge. This embryonic universe resembled a smooth blob, marred only by tiny quantum fluctuations, with few distinguishing features: a true baby universe.

We normally associate a smooth distribution with high entropy, but this is not the case if the smoothness is an inevitable consequence of few degrees of freedom — as is the case with a baby. All babies are smooth, but all babies have low entropy.

So this reduction in the degrees of freedom provides a reason as to why entropy was so low in the early universe. As Roger Penrose explains in his book *The Road to Reality*: "There is a common view that the entropy increase in the second law is somehow just a necessary consequence of the expansion of the universe ... There are comparatively few degrees of freedom available to the universe when it is 'small', providing some kind of low ceiling to possible entropy values, and more available degrees of freedom when the universe gets larger, giving a higher 'ceiling', thereby allowing higher entropies."

As the elementary particles emerged, the maximum possible entropy massively increased. The particles became free to interact via **all** the fundamental forces. One millisecond after the birth of the universe, the strong nuclear force acted to clump quarks together to form protons and neutrons. Gravity acted to clump all particles to form stars and galaxies. Distinguishing features emerged within the universe. But the underlying reason for the low entropy at the very start of the universe was surely the very few available degrees of freedom.

Just as with the universe, a newborn baby is relatively smooth and featureless. However, as the baby matures, it develops its distinguishing characteristics. The baby develops more degrees of freedom. It develops clearer facial definition, it grows tall or short, it develops wrinkles.

All these characteristics are what help to distinguish us from each other. Society views wrinkles negatively, but it is experience which gives us depth and makes us interesting. And so it is with the universe. The universe was born smooth and perfect, but it only became interesting when the wrinkles (stars, planets, life) started appearing. We become more interesting as we age for precisely the same reason that the universe became more interesting.

Unfortunately, the second law suggests the entropy of the universe will continue to increase until it reaches a maximum value of disorder. At that point, all the atoms of the universe will be in a random state, so the universe will all be a constant temperature. At this point, the universe has run down. Nothing will happen in the universe. This fate of the universe has been given the name *heat death*.

To quote Jim Al-Khalili from *Order And Disorder*: "The process of change and degradation is unavoidable. The Second Law says the universe itself must one day reach a point of maximum entropy, maximum disorder. The universe itself must one day die."

Our journey through life matches the journey of the universe. We inhabit a universe which was born as a perfect baby, has its most interesting years during the time it ages and becomes wrinkly, before dying of old age.

In this chapter we have seen it is impossible to define boundaries between ourselves and the external universe. We are all part of the one universe. So, in that sense, the universe is truly a living entity.

6

TIME AND RELATIVITY

If you remember back to Chapter Three you will recall a lengthy explanation of simultaneity: when events happen at the same time. It was explained how vital simultaneity was in shaping reality for different observers. In this chapter, I want to return to the subject of simultaneity and show how it is completely central to the topic of time.

If we think deeply about time and simultaneity, we can realise that all measurements of time are measurements of simultaneous events. For example, imagine I time a sprinter over a 100m race, and at the end of the race my stopwatch tells me 10 seconds have elapsed. What has actually happened in terms of time? Actually, all that has happened is that two pairs of simultaneous events have occurred. The first pair of simultaneous events was my stopwatch pointing to zero, and the race starting. The second pair of simultaneous events was the winning runner crossing the line and my stopwatch pointing to 10 seconds.

From the existence of these simultaneous events, we deduce something like: "The race took ten seconds", or "ten seconds of time passed". So we make it sound as if time is moving, or passing by, but really all we have is the existence of these two pairs of simultaneous events. There is nothing moving or dynamic here — there is just the existence of events.

Of course, you might want to sub-divide the race into smaller time intervals ("ticks") such as hundredths of seconds. But the same argument applies — you just end up with more simultaneous events. It is very much like frames of a movie: each frame of the movie represents a series of simultaneous events. If you have a sufficiently high frame rate then the scene appears to move. But all that really exists is a sequence of simultaneous events in each frame. All that really exists is the movie reel.

Einstein was well aware of this fact as he explained in his groundbreaking 1905 special relativity paper: "We have to take into account that all our judgements in which time plays a part are always judgements of simultaneous events. If, for instance, I say: 'That train arrives here at 7 o'clock', I mean something like this: 'The pointing of the small hand of my watch to 7 and the arrival of the train are simultaneous events.'"

So time itself is defined by simultaneous events. But, crucially, this means that anything that can affect the simultaneity of events can therefore affect time itself. Remembering back to our discussion of simultaneity involving Einstein's thought experiment about the moving train, it is clear just what can affect the simultaneity of events: motion! It was the motion of the train relative to the observer standing on the platform which affected which events Bob and Alice considered to be simultaneous.

So if simultaneity is affected by relative motion, then time itself must be affected by relative motion (remember: time itself is defined by simultaneous events). In that case, how might it be possible to generate quantitative

equations to reveal precisely how much the passing of time is modified for moving observers? To calculate this, we will now follow Einstein's workings by using only high-school mathematics (this adds weight to my contention that, as we get to the most fundamental levels of Nature, the mathematics should become simpler — not more complex).

In order to generate his equation, Einstein considered the light clock which we first encountered in Chapter One. This consists of a ray of light bouncing between two mirrors which are a distance L apart (see the following diagram). This light clock was placed on a train travelling at a constant velocity. The clock was oriented so that the direction the light travels was perpendicular to the direction of motion of the train.

Bob is once again travelling on the train, and his job is to measure the time taken for the ray of light to travel between the two mirrors. This time — according to Bob — was measured as t :

Then from distance = speed \times time we get:

$$L = ct$$

However, to Alice — who sees the train moving — it appears the ray of light has to travel a greater distance. This is due to the additional velocity of the train making the light travel in a longer, angled path (see the following diagram). Alice on the platform measures this new time for the light to travel between the two mirrors to be t' .

If the speed of the train is v , then the train travels a distance vt' in this time:

Referring to this second diagram, we see that the distance the light now has to travel (according to Alice) is D . Now, remember that all observers will measure the same value for the speed of light. So, according to Alice, the distance D is (from distance = speed \times time):

$$D = ct'$$

If we consider the path of the light as forming the hypotenuse of a right-angled triangle:

We can then apply Pythagoras's theorem to this triangle (you will remember that Pythagoras's theorem says that the square on the side of the hypotenuse is equal to the sum of the squares on the other two sides). So:

$$(ct')^2 = L^2 + (vt')^2$$

From the earlier equation, we know that:

$$L = ct$$

So substituting this value for L into the previous equation gives:

$$(ct')^2 = (ct)^2 + (vt')^2$$

Which gives:

$$c^2 t'^2 = c^2 t^2 + v^2 t'^2$$

Rearranging to get all the t and t' values on different sides:

$$c^2 t^2 = t'^2 (c^2 - v^2)$$

Dividing all terms by c^2 gives:

$$t^2 = t'^2 \left(1 - \frac{v^2}{c^2} \right)$$

Finally, taking the square root of both sides gives:

$$t = t' \sqrt{1 - \frac{v^2}{c^2}}$$

So here we have our final equation describing the phenomenon of time dilation. It shows that the rate that time passes for Bob on the train, t , is less than the rate that time passes for Alice on the platform, t' .

We can see from the equation that the rate at which time slows down for Bob on the train is given by:

$$\sqrt{1 - \frac{v^2}{c^2}}$$

So, if the train is travelling at 80% of the speed of light (it's an unusually fast train), we find time on the train slows down by a rate of:

$$\sqrt{1 - 0.8^2} = \sqrt{0.36} = 0.6$$

Which means that time for Bob on the train will pass at only 60% of the rate that time passes Alice on the platform.

Alice will actually age faster than Bob!

Interestingly, the formula for time dilation seems to indicate that the speed of light represents an ultimate speed limit for all objects in the universe (in the formula, if v was greater than c then we would have to take the square root of a negative number — and you can't do that). But why should the speed of light represent the ultimate speed limit? We will be returning to this question later.

The twin paradox

This principle of time dilation does seem to raise something of a puzzle. Consider a thought experiment involving two twins. One twin stays on Earth while the other twin gets in a spaceship and travels away at a speed close to the speed of light. When the spaceship turns around and returns to Earth, the twin who was in the spaceship finds that he has aged less than the twin who has remained on Earth. This is precisely in accordance with the expected time dilation.

However, the puzzle arises because surely all motion is relative. If that is the case it is just as valid for the twin on the spaceship to consider himself stationary, and the twin back on Earth to be moving at close to the speed of light. This principle of relative motion was expressed by Einstein who, when travelling by train from London to Oxford, asked the ticket inspector: "Does Oxford stop at this train?" Einstein was considering the train to be stationary, and the town to be moving.

So, if the twin on the spaceship considers himself to be stationary, surely he would expect the twin back on Earth to be the one who ages less? After all, it is now the twin on Earth who is doing the travelling.

This apparent paradox is called the *twin paradox*.

The resolution of the paradox comes from realising that the experiences of the two twins are not identical. To be precise, the twin on the spaceship experiences acceleration when he takes off, when he turns around, and when he returns to Earth. He would experience inertial forces due to this acceleration (we will be considering inertial forces in the next chapter). However, the twin who remains on Earth experiences no such acceleration.

Once it is realised that the situation is not symmetrical, the formula for time dilation produces the correct non symmetrical result for the ageing of the twins. [\[7\]](#)

Gravitational time dilation

In this section we will consider a different type of time dilation predicted by relativity: the slowing of time in a strong gravitational field.

In 1915, Einstein published his revolutionary theory of general relativity. General relativity explained the force of

gravity in terms of the curvature of space (or, more precisely, the curvature of spacetime). An object attempting to travel in a straight line in curved space would follow a curved path, and that deflection is interpreted as being due to gravity.

In a famous example, a large mass is placed in the middle of a rubber sheet, deforming the sheet in the same way that mass is known to curve spacetime:

A smaller mass will then appear to orbit the large mass in a circular path, although the smaller mass is really just trying to follow a straight line across a surface which is curved. As Einstein explained: "When a blind beetle crawls over the surface of a curved branch, it doesn't notice that the track it has covered is indeed curved. I was lucky enough to notice what the beetle didn't notice."

Because general relativity predicts the curving of space — the fundamental underlying structure of the universe — it predicts everything will be affected by gravity: even light. In the most extreme example, light is unable to escape from the intense gravitational field of a black hole. This is not due to "light slowing down" due to gravity — after all, light always travels at the speed of light. No, the light is trapped due to the extreme curvature of space at the black hole. Essentially, light would have to travel an infinite distance (due to the curvature of space) in order to escape from a black hole.

So the effect of a strong gravitational field is to curve space so that light has to travel a longer distance between two points than normal (just as a curved road between two points is longer than a straight route). However, we know that all observers have to measure the same speed of light. Therefore, if an observer is measuring the same speed for a light ray — even though it is having to travel a longer distance — then there is only one conclusion we can make: the observer's measuring clock must be running slow (we would obviously usually expect light to take a longer time to travel a greater distance). Hence, a clock runs slower in strong gravity.

This slowing of time in a strong gravitational field is called *gravitational time dilation*.

Hence, gravitational time dilation predicts that time will run faster at higher altitude (further away from the Earth's gravitational pull). With that thought in mind, let us return to the experiment we considered in Chapter One: the experiment in which Joe Hafele and Richard Keating flew four atomic clocks around the world. Because of the cruising altitude of the Boeing 747, gravitational time dilation predicted that the clocks would run slightly faster than clocks which remained at the U.S. Naval Observatory. The results were found to precisely match the predictions of general relativity, and were of similar magnitude to the additional time dilation predicted by special relativity (due to the speed of the aircraft).

Another example of gravitational time dilation is experienced by GPS (Global Positioning System) satellites. GPS satellites orbit 12,500 miles above the Earth's surface, hence our clocks on the surface of the Earth run slightly slower. The clock on the GPS satellite is therefore set to run 45 microseconds per day slower than usual in order to remain synchronized with clocks on Earth. Because of the nanosecond accuracy required by GPS, if this effect was not taken into account, positional errors would accumulate at the rate of ten kilometres per day.

Time travel

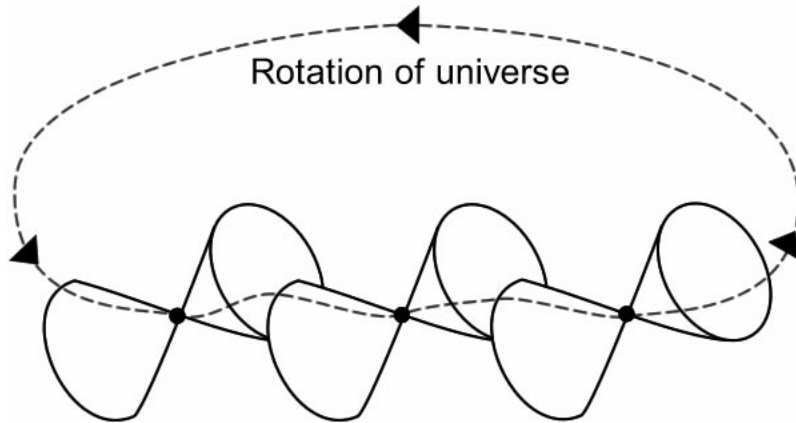

The equations of general relativity describe how spacetime can be curved by the presence of mass. The equations are complex, but precise solutions to the equations have been found for idealised situations in which simplifying assumptions can be made. When Einstein was working in the Institute for Advanced Study in Princeton in the 1940s, one of his colleagues — and best friends — was the great mathematical logician Kurt Gödel (we will be

meeting Gödel again in my next book, *Hidden In Plain Sight 4*). It was Gödel who discovered a solution to the equations of general relativity which first revealed the possibility of time travel to the past.

Gödel's solution was based on the phenomenon of *frame-dragging*. Frame-dragging occurs when a large mass rotates. In that case, general relativity predicts that spacetime in the immediate vicinity of the mass will be dragged around in a circle.

Gödel considered the frame-dragging which would occur in the hypothetical situation of the whole universe rotating. In that case, all of the spacetime in the universe would be dragged around, much like the rotational mixing of a sticky substance in a food mixing bowl. In that case, the future could be bent around so that it connected to the past. By travelling far enough into the future along your timeline, it would then be possible to travel to the past.

The following diagram (based on a diagram from Paul Nahin's book *Time Machines*) shows how future light cones would be tipped over by frame-dragging, so that the future can point into the past:

It is possible to use the frame-dragging phenomenon to design a time machine. In 1974, the American physicist Frank Tipler published quite specific design details for a time machine.^[8] No one had ever published such a paper in a prestigious physics journal before. Tipler's time machine proposal required a long, very dense cylinder rotating with a surface speed of at least half the speed of light. The resultant frame-dragging around the cylinder would result in a similar time loop to the one generated in Gödel's universe. As Tipler says at the end of his paper: "In short, general relativity suggests that if we construct a sufficiently large rotating cylinder, we create a time machine."

No one disputes Tipler's claim — it really is a blueprint for a time machine.

Another time machine proposal comes from a solution to the general relativity equations by Albert Einstein and Nathan Rosen. Their solution resembled a tube effectively providing a shortcut between two regions of spacetime. This was called the *Einstein-Rosen bridge*, though John Wheeler popularised the name *wormhole*:

By creating a shortcut in spacetime, wormholes raise the possibility of travelling great distances in space in a very short time. This possibility was explored in Carl Sagan's novel *Contact* (and later film of the same name). In the

book, a radio telescope in New Mexico receives a coded transmission from extraterrestrial beings. The decoded message forms instructions to build a vehicle which is used to transport five passengers through a wormhole to a planet near the distant star Vega — in merely a few seconds. After spending several hours on the alien planet, the travellers return to Earth to discover that only a few seconds have elapsed on Earth since their voyage began.

This plot hints that wormholes can also be used for travelling in time as well as space. Indeed, assuming that it is possible to create a traversable wormhole, it would be a fairly straightforward procedure to turn that wormhole into a time machine. The following procedure was described by Kip Thorne in his book *Black Holes and Time Warps*. A wormhole has two mouths and there is no obvious connection in space between the two mouths: if I step through one mouth of the wormhole, I immediately emerge out of the other mouth. With no obvious connection between the two mouths, the two mouths can be moved quite independently of one another. To turn our wormhole into a time machine, one mouth must be kept on Earth, while the other mouth is sent away on a spaceship at a speed approaching the speed of light (this is treating the wormhole mouth very much like one of the twins in the previous thought experiment). Time dilation ensures that time passes more slowly for the wormhole mouth travelling on the spaceship. So when the spaceship returns to Earth, if you walked through the wormhole on the spaceship, you would return to an earlier time.

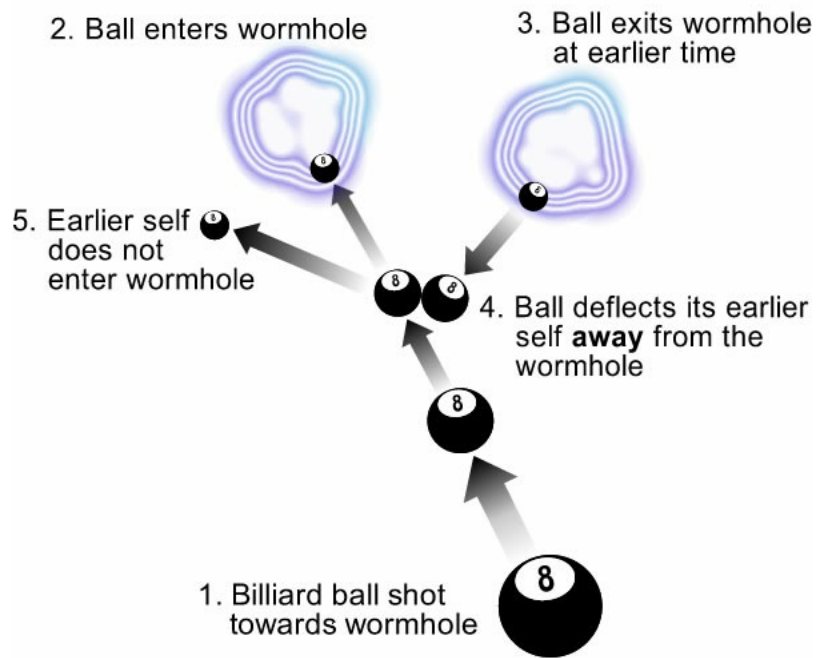

All these time machine proposals raise problems as they introduce the possibility of changing the past. If it is possible to change the past then that could potentially lead to the *grandfather paradox*. The grandfather paradox considers the possibility that you use a time machine to travel back in time to kill your own grandfather before you are conceived. However, if as a result of you murdering your grandfather, you are not conceived then you would not have been able to travel back in time. Hence, this results in a paradoxical situation.

From the point of view of this book, the ability to change the past poses a particular problem. All through this book, the block universe structure has been presented as a static, unchanging block of spacetime. There is no possibility of altering any aspect of the structure — it is as if it is carved in stone. However, if it is possible to travel back in time to change the past then this appears to disprove the whole block universe argument.

Fortunately, as we shall now see, the solution to the grandfather paradox also solves the apparent problem with the block universe model.

Another form of the grandfather paradox was proposed in 1990 by Joe Polchinski, then a professor of physics at the University of Texas. What was ideal about Polchinski's paradox was that it avoided any questions about human free will (would you really be able to kill your own grandfather?). Hence, the paradox could now be analysed purely from a physics viewpoint.

The reason Polchinski's paradox did not involve human free will was because it did not involve humans. Instead, it involved billiard balls. The paradox considered a billiard ball rolling along a billiard table and entering a wormhole mouth at the far end of the table. It is then possible for that billiard ball to travel back in time and emerge out of the second wormhole mouth. Polchinski's paradox considered the situation in which the second wormhole mouth was also positioned on the billiard table. What would happen if, when the billiard ball travels back in time and emerges out of the second wormhole mouth, it collides with its earlier self and deflects its earlier self away from the wormhole? It would appear the ball is prevented from entering the wormhole in the first place. This would result in a paradox very similar to the grandfather paradox. If the billiard ball is prevented from ever entering the wormhole because it is deflected, then it cannot emerge from the second wormhole mouth and deflect itself.

It would appear that this scenario would raise a clear paradox. It would also not be reconcilable with the block universe model. It would appear that such a scenario could not occur in reality. Does this mean wormholes cannot exist? Or that the block universe model is wrong?

Fortunately, it has been realised that it is possible to travel back to the past — and even affect past events — without introducing paradoxes. Consider the previous billiard ball example again. When the ball travels back to the past and emerges from the wormhole, it is possible that it deflects its earlier self **into** the wormhole, instead of **away** from it:

2. Ball enters wormhole

3. Ball exits wormhole at earlier time

4. Ball deflects its earlier self **into** the wormhole

1. Billiard ball shot **in wrong direction to enter wormhole**

There is now no paradox in this result. It is also a situation which can exist in a block universe: the past is affected, but events which have already occurred (i.e., set in stone in the block universe) have not been altered.

This principle in time travel — that only situations can occur which do not result in paradoxes — is called the *Novikov self-consistency principle*.

7

INERTIA

In this chapter we will be considering motion. There is an inextricable link between time and motion. Motion is defined as the variation in position of an object at different times. So without time, there can be no motion. It could also be argued that without motion, there can be no time. As Richard Wolfson describes in his book *Simply Einstein: Relativity Demystified*: "The study of motion is profound, for several reasons. First, motion is the source of all change. Imagine a world without motion: Earth stops rotating, so it's perpetual daytime. Atoms cease moving, so there's no chemistry — no release of energy. Nothing evolves, transforms, mutates, develops, or otherwise changes. What does it mean to move? It means getting from one place to another, and doing so in some time. Whatever else motion means, it involves passing through time and through space. **So motion holds the key to understanding time and space.**"

In this chapter we will be paying attention to a particular kind of motion called *inertial motion*. Inertial motion is the motion of an object which is not being acted-on by any force. The resultant inertial motion is actually very mysterious. For example, if you were travelling at constant velocity on a very smooth train, you could consider yourself to be in inertial motion. As a result, as long as the train is smooth enough, you would not feel as if you were travelling at all! So this clearly raises some fascinating and important questions about the nature of motion, and what it means to be "moving".

Inertial motion seems to be telling us something very profound about the nature of time and space. In the next chapter, it will become clear as to why inertial motion is so important for our understanding of time.

Perpetual motion

The Greek philosopher, Aristotle, wondered if there was a "natural state" of motion. As Richard Wolfson again explains, the natural state of motion would be a state which requires "no explanation — a state that an object naturally assumes unless something is explicitly done to it, like pushing or pulling it." To this end, Aristotle considered moving objects, such as a block of wood being pushed along a table, and saw that all such moving objects eventually came to a halt. Hence, Aristotle believed that any moving object would eventually slow down and come to a halt — unless it was acted upon by a constant force to keep it in motion.

From this observation, Aristotle believed he could deduce the natural state of motion. As Aristotle observed that it required a force to maintain an object in motion, he believed the natural state of motion was to be stationary. A stationary object is to be expected — it requires no explanation. Whereas if you see a moving object, you could reasonably seek an explanation, an answer to the question "What is making it move?"

Aristotle's argument regarding the natural state of motion was convincing, and remained dominant until Galileo performed his experiments of motion. According to Galileo: "Ignorato moto, ignorator natura", a Latin phrase which translates to "He who fails to understand motion, fails to understand Nature." We considered the principle of Galilean relativity in Chapter Two. It is Galilean relativity which introduced the world to the principle of inertial motion.

If you remember, Galilean relativity states that the laws of motion are the same for all observers who are moving at a constant velocity. There is no experiment you could perform to determine if you were stationary or moving at constant velocity.

It is this movement at constant velocity which is inertial motion. If it is impossible to distinguish between being stationary and being in inertial motion, then clearly an observer moving with inertial motion will feel stationary (otherwise it would be possible to detect the motion). So Galilean relativity reveals that an observer moving at constant velocity (inertial motion) will feel stationary.

It is the principle of Galilean relativity which is the reason why the geocentric model of the universe proved dominant for so long (rather than the heliocentric model being adopted). This is because the early astronomers were fooled by the undetectable inertial motion of the Earth. Because the Earth orbits the Sun at a constant, smooth velocity, and because the astronomers moved at the same rate as the Earth, they were fundamentally unable to detect its motion: they felt stationary. Indeed, the notion that the Earth orbits the sun would have appeared an absurd

suggestion to them. [9]

Galileo then considered Aristotle's concept of a natural state of motion. If you remember, Aristotle believed that the natural state of motion was to be stationary, as a moving object would tend to become stationary. However, Galileo performed an ingenious series of experiments which led him to a different conclusion. These experiments of Galileo are illustrated by the following diagrams:

As shown in Figure a), Galileo rolled a ball down a slope and discovered it rose to the same height up an opposite slope. As shown in Figure b), if Galileo increased the distance between the slopes, the ball still rose to the same height up the opposite slope — but it obviously had to travel further. As shown in Figure c), Galileo then reasoned that if there was no opposite slope, the ball would travel forever as it would be forever unable to reach the initial height up the slope.

Galileo's conclusion was remarkable. It suggested that an object moving horizontally in a straight line would continue indefinitely. At this point, you might raise an objection. Surely motion cannot continue indefinitely without continually providing some energy to the system? In raising this objection, maybe your instincts have been biased by some of the crazy designs for perpetual motion machines which are all doomed to failure.

It is certainly true that it is not possible to build a practical perpetual motion machine. Such a device would crank round a few times before seizing to a halt. The reason why all these machines fail is because they do not take into account the force of friction. Friction converts kinetic energy into heat energy which is radiated from the system. This loss of energy results in the inevitable slowing of the system.

However, if it could be possible to eliminate the force of friction from the system then the motion of the machine would indeed continue forever — as predicted by Galileo. For example, flywheels have been built which float on superconducting magnets (virtually frictionless) and are sealed in a vacuum to eliminate air resistance. These flywheels will keep spinning for a period (the so-called zero-load rundown time) of many years. If such a device could ever be made completely friction-free then it would, indeed, be a perpetual motion machine. In fact, electric currents (the flow of electrons) in superconducting materials can continue in motion indefinitely — a form of perpetual motion which is already with us.

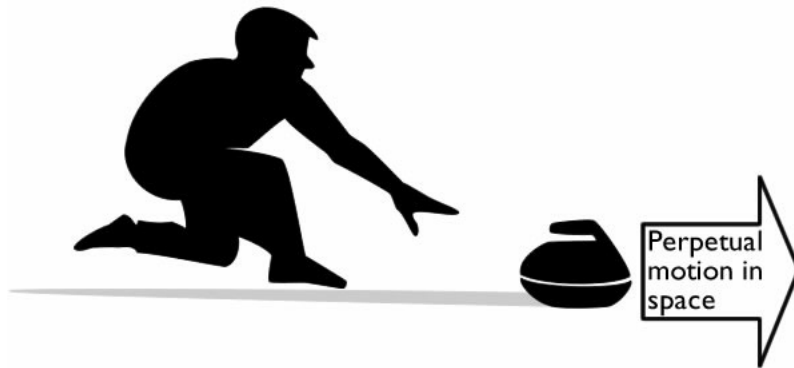

The notion of perpetual motion might seem very wrong and alien to us. Our worldview has been so shaped by all the tales of doomed perpetual motion machines that we instinctively discard any notion that perpetual motion — of any kind — might be possible. On the basis of this discussion, however, we find that **perpetual motion is not only possible, it is natural.**

Earlier in this section we considered Aristotle's argument that the natural state of motion was to be stationary — as it required no explanation. Now, however, we see that Galileo proved Aristotle to be wrong. As Richard Wolfson states in his book *Simply Einstein*, Galileo showed that "motion itself needs no cause or explanation ... motion is natural." According to Galileo, the natural state of motion is no longer being stationary — the natural state is motion at a constant speed in a straight line, in other words the natural state of motion is inertial motion. This is a hugely important result, and we will return to it later in this book:

The natural state of motion is not being stationary, it is constant velocity in a straight line (inertial motion).

This principle is called *inertia*. The discovery of inertia was Galileo's greatest contribution to physics.

You have probably seen the Olympic sport of curling, in which a granite stone is sent sliding across ice. The stone travels at low speed, but the almost frictionless ice ensures the stone hardly slows down at all. This is an excellent example of inertia. If we could imagine a perfectly frictionless form of ice then it is clear that the stone would travel at its low speed forever:

Galileo died in 1642, the same year that Isaac Newton was born. When Newton started as a student in Trinity College in Cambridge University he found that the curriculum was still dominated by the thinkings of Aristotle. Newton introduced the college to the new developments of Copernicus and Galileo.

Newton accepted Galileo's conclusions about the laws of motion, and built on them himself to produce his three laws of motion which form the basis of classical mechanics:

1. Every object in a state of uniform motion tends to remain in that state of motion (or remain at rest) unless an external force is applied to it.
2. Forces act to accelerate objects. The acceleration is proportional to the force which is applied, and inversely proportional to the mass of the object: $F=m \times a$
3. For every action there is an equal and opposite reaction.

Newton's first law of motion is just a restatement of Galileo's concept of inertia, and so the first law is often called the "law of inertia". The word "inertia" comes from the Greek word for "laziness", and we can see where this comes from. The definition of inertia is that an object likes to continue in its state of motion — be that moving or remaining stationary — unless a force acts on it.

Newton's three laws of motion defined our conception of mechanics for the next three hundred years.

Inertial mass and gravitational mass

Einstein's great talent was for identifying a simple, unifying link between two seemingly distinct effects. This talent was clearly shown when he realised that the force due to gravity was indistinguishable from the force due to acceleration. This led to the theory of general relativity (for details, see my previous book). This realisation allowed Einstein to unify two properties which, for centuries, had been considered to be distinct: inertial mass and gravitational mass.

The *inertial mass* of an object determines its resistance to acceleration, i.e., its inertia. Newton's second law of motion says that the acceleration experienced by an object is inversely proportional to the inertial mass of that object.

It might seem strange to us now, but after Newton published his laws of motion and his law of gravitation, it was considered that the inertial mass of an object might well be different from the mass of the object which attracted other objects: the *gravitational mass*. After all, the two effects — acceleration and gravity — were considered to be completely distinct effects. There was no obvious reason why the object might not behave differently when subjected to the two different forces.

Of course, when Einstein realised that the force due to gravity was completely equivalent to the force experienced during acceleration this removed the centuries-long distinction between gravitational mass and inertial mass. An object is now considered to have just one single value for its mass, and this is used for calculations of both acceleration and gravity.

However, experiments have continued to test if any difference between gravitational and inertial mass can be

detected. In 1885, the Hungarian physicist Roland Eötvös (pronounced "urt-vursch") proposed the most famous of these experiments, an experiment which is now known simply as the Eötvös experiment. The experiment uses a balance (called a *torsion balance*) on which masses are dangled on a piece of string which can rotate. The outward force on the masses (due to centrifugal force) would be dependent on the inertial mass. The downward force on the masses is dependent on the gravitational mass. The masses are carefully selected so that the string will not rotate if the inertial mass is precisely equal to the gravitational mass so that the effects cancel each other. The torsion balance at the University of Washington is so sensitive that it can tell if it has rained recently as the extra water in the soil has an increased gravitational pull on their equipment.

But there is a simpler way to test if inertial mass is equal to gravitational mass. Newton's laws of motion only deal with inertial mass, the second law stating that a force applied to an object will produce an acceleration according to $F=m_i \times a$, where m_i is the inertial mass. On the surface of the Earth, for a falling object, we can equate this force to the force of gravity:

$$m_i a = \frac{GMm_g}{R^2}$$

Where m_g is the gravitational mass, M is the mass of the Earth, and R is the radius of the Earth. If inertial mass equals gravitational mass then $m_i = m_g$, and the two terms cancel from the equation. We are left with a formula for the acceleration due to gravity on the surface of the Earth:

$$a = \frac{GM}{R^2}$$

There is no term in this formula which is dependent on the mass of the falling object — the only mass featured in this equation is the mass of the Earth. So this indicates that — if inertial mass really is equal to gravitational mass — all masses will fall at the same rate (just as Galileo demonstrated on the Leaning Tower of Pisa centuries ago).

So it is possible to test the equivalence of inertial and gravitational mass just by checking if all masses fall at the same rate, and this test can be performed with great accuracy. The Center of Applied Space Technology and Microgravity (ZARM) in the University of Bremen is dominated by a 146-metre-tall drop tower which provides 9.3 seconds of free-fall during which experiments can be performed. Many different fields of research use the weightless environment. Various masses have been dropped to see if they all fall at the same rate, and no discrepancy has been found:

In all these experiments, the inertial mass and the gravitational mass of various elements has been found to be identical to 13 decimal places. Almost certainly, no difference will ever be found.

Inertial forces

Consider a question, the answer of which might appear quite obvious at first glance, but is not as simple as it might appear. The question is: how do you determine that an object is moving? If you look out of your window, for example, you might see a bird flying past. It would appear easy to tell that the bird is moving. But why should the bird not consider itself to be stationary, and it is you who are moving? In other words, if motion is relative, how is it possible to tell what is stationary and what is moving?

In this case of the bird, it would appear that it is possible to tell that the bird is moving relative to the trees and buildings around it. In other words, both the bird and the observer could agree that the bird is moving relative to its **immediate environment**. So motion relative to the immediate environment would appear to be a way to definitively determine if an object is moving.

However, Newton raised an objection to this apparent importance of the immediate environment. He described an experiment in which a bucket containing water was spun at speed at the end of a rope. The water starts to spin within the bucket:

If all motion was relative, then we would be justified in considering the water to be stationary and the rest of the universe revolving around the water. However, the water does not behave as if it is stationary — the water surface becomes concave and climbs up the sides of the bucket (see the second bucket in the previous diagram). Somehow Nature can tell that the water is moving.

From our previous discussion about the bird outside your window, we can see that the obvious way to determine that the water is moving is to consider its motion relative to its immediate environment. However, the immediate environment of the water is the sides of the bucket, and the water is not moving at all relative to the sides of the bucket (the water is rotating at the same speed as the bucket). So the principle of using the immediate environment to determine the relative motion of an object is not applicable in all cases.

Newton took this result as being evidence for absolute space. According to Newton, absolute space permeates the universe and provides an absolute reference for motion. Nature can determine that the water is rotating relative to absolute space, and this is the reason the water rises up the sides of the bucket.

Newton's bucket argument was so convincing that absolute space was accepted as the true model of space for 200 years, until an alternative was provided by the Austrian physicist Ernst Mach in the late 19th century.

In his career, Mach contributed much to physics. You will recall the speed of supersonic aircraft being referred to as "Mach 1", "Mach 2". Those terms are named after Ernst Mach whose experiments in supersonic velocity included the definition of the *Mach number* — the ratio of a projectile's velocity to the speed of sound. But it is Mach's insights into the nature of space — and the cause of inertial forces — which interests us here.

Mach considered the conclusions Newton drew from his bucket experiment and decided Newton was too quick to disregard the effect of the environment. True, the water was not rotating with respect to the immediate environment, but there were many more objects in the environment than just the bucket. For example, there is the planet Earth, or the planets, or the fixed stars in the sky. And these distant objects would possess vastly more mass than the sides of the bucket. Maybe they were more influential? Maybe Nature could detect that the water was rotating relative to this more distant, hugely more massive environment?

So Mach considered the situation in which the sides of the bucket were much larger, more distant, possessing hugely more mass:

What would happen now when this massive bucket rotates with the water? As Mach wrote in *The Science of Mechanics* (1883): "No one is competent to say how the experiment would turn out if the sides of the vessel increased in thickness and mass until they were ultimately several leagues thick."

It is now believed that, if the sides of Mach's bucket really were sufficiently huge, spacetime would be dragged around inside the bucket at the same angular velocity as the water. As a result, the water inside the bucket would, indeed, **not** rise up the walls of the bucket. This is the frame-dragging effect (a phenomenon described in the previous chapter on time machines). NASA's Gravity Probe B satellite was sent into orbit in 2004 to see if it could detect frame-dragging of spacetime by the rotation of the Earth. The experimental equipment consisted of four extremely sensitive gyroscopes — the most perfectly spherical manmade objects ever created. Essentially, the Earth performed the role of Mach's huge bucket, and the four gyroscopes on the satellite performed the role of the water in the bucket, detecting any evidence of frame-dragging. In 2011 it was announced that the experiment had successfully measured frame-dragging due to the rotation of the Earth — the first time the effect had been detected.

So Mach believed that motion of an object could be defined relative to all the other masses in the universe, and this was the cause of inertia — the reason you feel a force when you are accelerated. Nature can detect the change in your velocity relative to all the other objects in the universe. As Mach was quoted as saying: "When the subway jerks, it's the fixed stars that throw you down."

Einstein was heavily influenced by the work of Mach. As with Mach, Einstein was also not convinced by Newton's concept of absolute space. However, this idea of Mach's — of the fixed stars billions of miles away having an instantaneous effect on your velocity — sounded far too much like Newton's instantaneous action-at-a-distance theory of gravity.

So Einstein proposed a gravitational field which spread throughout space. This gravitational field controlled the motion of masses. An object in free-fall would follow the field lines of this gravitational field. If an object was accelerated, it would cross the field lines of the gravitational field (essentially the definition of acceleration — a deviation from free-fall motion). Nature could then determine an object was being accelerated.

This, then, provides an explanation for the inertial force you experience when you are accelerated. The physicist John Stachel has coined the term *inertio-gravitational field* for this reason. Just as Einstein revealed the equivalence between gravity and acceleration, and the equivalence between inertial mass and gravitational mass, so the term "inertio-gravitational field" stresses that just the one field is responsible for both inertial and gravitational forces.

John Woodward, in a paper entitled *What is the Cause of Inertia?*, is in no doubt: "What is the cause of inertia? Gravity." [\[10\]](#)

Imagine you are a Grand Prix motor racing driver driving at speed around a tight corner. Your car — and your body in the cockpit — changes direction around the corner, and therefore it is deviating from the normal free-fall direction of travelling in a straight line. This means the car is crossing inertio-gravitational field lines: it is accelerating. However, your head is sticking out of the cockpit and wants to continue in free-fall inertial motion in a straight line down the road. The stress this causes in your body — as if your head is being pulled off — is the inertial force felt during acceleration.

The force the driver feels is often described in terms of *g-force*, maybe 3g, 4g, or 5g. A force of 1g is defined as being equal to the force due to the force of gravity, so the concept of g-force again reveals the link between gravity and inertia.

So the sideways force you feel as you drive around a corner at speed is actually the force of horizontal gravity!

But what determines the shape of the inertio-gravitational field? The curvature of the gravitational field is inevitably determined by all the other masses in the universe. After all, the distant stars may be billions of light-years away, but we are still affected by their gravity — as weak as it may be. All the masses in the universe are inevitably affected by the gravitational pull of all the other masses in the universe. So the strength and direction of the gravitational field at any point is determined by the distribution of masses in the rest of the universe.

In this way, general relativity is very much Machian in nature. In the absence of absolute space, the inertial forces you feel are inevitably controlled by the position and distribution of the fixed stars because these celestial bodies determine the shape of the inertio-gravitational field throughout the universe. Of course, the greatest influence on the gravitational field in our immediate vicinity is provided by the planet Earth. And the resultant force of gravity we feel directed towards the centre of this planet is usually the greatest inertial force we experience.

Unless you are a Grand Prix driver.

8

THE UNIVERSAL SPEED

In the course of the previous chapters, we have gained a working understanding of the phenomenon of time dilation. In Chapter Six we derived the formula to determine how time slows down for a moving object. This was based on the principle of relativity, the principle that all the laws of physics should be the same for all observers. In turn, that implies that the measured speed of light should be the same for all observers. We have noted that this reminds us of the Copernican principle: no observer holds a privileged position in the universe. No observer is special — all observers are equal. This seems very much like a fundamental principle which would necessarily be true.

However, there are several indications that we have not yet got to the bottom of the mystery of relativity. Specifically, the centrality of the speed of light in all this seems rather puzzling. Why should electromagnetic radiation (light) play a role in determining the passage of time? Why does the speed of light appear to represent an absolute speed limit for all objects in the universe? Is there perhaps some deeper principle at play here which we need to uncover?

In this chapter, we start to get some answers ...

The first thing we need to consider is how we might go about creating a mathematical model of spacetime. If we manage to create a mathematical model then we can analyse it and hopefully gain a deeper understanding of its properties.

But how on earth are we to combine measures of space and measures of time in order to create a model of a combined "spacetime"? To quote Brian Cox and Jeff Forshaw from their book *Why Does $E=mc^2$* : "If distance in space is measured in meters and distance in time in seconds, how can we even begin to contemplate combining the two. It is like adding apples and oranges, because they are not the same type of quantity."

The one piece of absolutely vital information we can use is that all observers — no matter how they are moving — must measure the same value for the speed of light. So, as speed represents a connection between distance and time, this could potentially provide the means for combining space and time into spacetime.

Imagine there is a flash of light at the origin of our coordinate system. In the following diagram, the path of light is shown by the dashed arrow coming from the origin.

The sphere of light in three-dimensional space will expand outwards and, after a period of time t , will have a radius of ct . Considering the diagram, and using Pythagoras's theorem extended to three dimensions, we get:

$$x^2 + y^2 + z^2 = (ct)^2$$

which gives:

$$x^2 + y^2 + z^2 - (ct)^2 = 0$$

The expression on the left hand side of this equation is very important. Because all observers will agree on the measured speed of light, all observers will agree on the value of this expression. Also, we see the expression combines measurements of both space and time. So this is a combination of space and time on which all observers can agree. The square root of the value of this expression is given the name *spacetime distance* (or the *spacetime interval*), though this "distance" value actually combines both space and time.

Now, this is where things start to get really interesting. Because, as described in the previous chapter, every observer in inertial motion considers himself to be perfectly stationary — it is all the other objects which are moving relative to you. Essentially, in the previous diagram, this means you are permanently placing yourself at the origin of the coordinate system and everything else in the universe is defined relative to your position. In the previous formula for spacetime distance, this means that your values for x , y , and z are all zero (because you do not move relative to yourself). But, if you consider the formula for spacetime distance, you will see that if x , y , and z are all set to zero then the value of the distance in spacetime does not become zero — it becomes equal to ct .

What does this mean? It means that even if you are perfectly stationary, the spacetime distance you travel is equal to ct , which is the speed of light multiplied by time. This can only mean one thing: even when you feel stationary,

you are moving in spacetime at the speed of light! In fact, in the next section we shall see that everything moves through spacetime at the speed of light.

At last, this is a remarkable result which seems to reveal a deep truth about the nature of time. As Brian Cox and Jeff Forshaw say in their book *Why Does $E=mc^2$* : "The statement that everything moves at the same speed through spacetime sounds rather profound."

Why can't you travel faster than light?

It might seem surprising to hear that all objects move through spacetime at the speed of light. After all, we obviously see various objects (cars, birds, etc.) moving around us at different speeds. However, crucially, note that these objects are moving at different speeds in **space** — not in **spacetime**. Once time is taken into account, and we consider the combined speed of these objects in a spacetime composed of both space **and** time, then we find that everything is moving at the same speed. As Brian Greene explains in his book *The Fabric of the Cosmos*: "The combined speed of any object's motion through space and its motion through time is always precisely equal to the speed of light."

How can this be? How can considering time as well as space make all the difference? Well, it is because of time dilation: an object which is moving relative to an observer will experience less time. So, to put it simply, **an object which is moving faster through space will move slower in time**. If an object is moving at a fixed speed — the speed of light — in spacetime then this effect is inevitable. After all, there is only enough speed to go round. If an object uses up the majority of its speed to travel through space, then it has less speed left over to travel through time.

As Brian Cox and Jeff Forshaw explain: "This newfound way of thinking about how things move through spacetime can help us get a different handle on why moving clocks run slow. In this spacetime way of thinking, a moving clock uses up some of its fixed quota of spacetime speed because of its motion through space and that leaves less for its motion through time."

So the principle that everything travels at the same speed in spacetime predicts time dilation: a reduction in measured time for a moving object. And if we calculate the amount of time dilation predicted by this principle we find it is exactly the same amount predicted by special relativity. However, this new, simple principle is surely the true principle which lies behind relativity.

This principle is explained in the following YouTube video *Why can't you go faster than light?* by Prof. Don Lincoln from Fermilab:

<http://tinyurl.com/lightlimit>

If the previous link is broken, then the following link should always work:

<http://tinyurl.com/lightlimit2>

At the start of this chapter, a couple of relativity-related questions were posed. It was wondered why electromagnetic radiation (light) should play a role in determining the passage of time. Also, it was wondered why the speed of light should appear to represent an absolute speed limit for all objects in the universe. It was suggested that there was maybe a more fundamental principle that we were missing that might provide the answers.

Well, now we have our more fundamental principle, and now we have our answers. **Everything** moves at the same speed in spacetime — not just light. There is nothing special about light. Light does not play a central role in determining the passage of time.

So why does light feature in most descriptions of special relativity? This is because light is unusual in that it has no mass. This means that light is free to travel at the maximum speed through space (mass normally acts to restrict speed through space). Hence, all of light's speed through spacetime is directed through space, and none of its speed is directed through time. As a result, light does not experience the passing of time.

This means that light's speed through spacetime is very obvious to our eyes — it is the same as its speed through space. So out of all the objects in the universe, only light appears to be travelling at this magical universal speed. Whereas, in fact, everything is travelling at this universal speed — in spacetime.

So the speed of light is not a universal speed limit at all, it is just the speed that everything is moving — in spacetime.

With this insight, I would suggest we no longer refer to objects travelling at the speed of light but instead we should refer to the *universal speed* — the speed at which everything travels in spacetime.

But, of course, this is not the whole story. The truth is surely that the true fundamental principle behind relativity is the Copernican principle. In spacetime, no point is preferred, no observer is special, and all observers move at the same speed in spacetime. Every object is treated exactly the same. Every object moves at exactly the same speed.

In human society, rich people can move faster by buying expensive cars and planes. However, physics recognises no such inequality. In physics, everyone — and every object — is equal. Everyone is treated the same. The laws of physics are the same for everyone. Everyone ages the same as entropy takes its toll equally. Under the laws of physics, everyone moves at the same speed in spacetime. You cannot buy a faster car to drive through spacetime more quickly. This is the true essence of the egalitarian Copernican principle.

The world of physics is a more equal world.

Sliding through time

Let us now consider an object which slows down as it travels through space. Its motion in spacetime is shown in the following diagram.

Initially, the object's speed arrow in spacetime is pointing to the right, showing that most of its speed is through space. However, as the object slows, its speed arrow in spacetime rotates anticlockwise so that less of its speed is through space, and most of its speed is through time:

So as you see objects slowing down or speeding up, what is actually happening is that their speed arrow in spacetime is rotating. But the actual speed of the object through spacetime is unaffected (the length of the speed arrow remains unchanged).

Now, this is interesting. Perhaps we can obtain further insights from this approach.

The principle that all objects move at the same, constant speed in spacetime is interesting. If they are moving at the same constant speed — never slowing down — then this sounds very much like a form of perpetual motion. Even when objects appear to be slowing down, all that is really happening is that their speed arrow is rotating in spacetime. And where have we heard about perpetual motion before? Well, in the last chapter on inertia it was revealed that the natural state of motion is perpetual motion. We now see this is true: the natural state of motion is perpetual motion in spacetime.

In the previous chapter, the example was presented of curling: if the ice was completely frictionless then the stone would continue its perpetual motion forever.

However, as the stone eventually slows (due to friction) its speed arrow rotates in the anticlockwise direction. Eventually, the stone appears to stop. However, the magnitude of the speed arrow in spacetime is unaffected, and the stone therefore continues to move **in time** at the universal speed. So what has really happened is that the inertial, perpetual motion of the stone in space has rotated to become inertial, perpetual motion in time.

So this gives us a tremendous insight. The motion we feel in time — the passage of time — is caused by our inertial motion in time! The principle which is causing our motion in time is the same principle which ensures the curling stone slides forever across frictionless ice. It is as if we are sliding through time!

Just as the perpetual motion of the curling stone across the frictionless ice is natural motion which requires no additional source of power, so our perpetual motion through time requires no additional power. It is the natural state of motion.

TIME AND ENERGY

Throughout this book, it has been found that by considering the motion of objects we have obtained insights into the nature of time. From considering curling stones on ice, to trains on railway tracks, we have discovered the similarity — and symmetry — between motion in space and motion in time. In this chapter we are going to consider two more related properties of objects in motion: their energy and momentum. We will see if these properties can provide further insights into the nature of time.

It was Rene Descartes and Isaac Newton who first identified the property of momentum of a moving object. Momentum is the property you get when you multiply the mass of an object with its velocity. For example, a heavy lorry moving fast would have a lot of momentum. So the formula for momentum is mass multiplied by velocity: mv .

Momentum does not just have a numerical value, it always has an associated direction. Essentially, this means that momentum is always represented by an arrow (an arrow has both a magnitude (length) and a direction). The correct technical term for such an arrow is a *vector*. Momentum is a vector quantity.

Perhaps the most interesting feature of momentum is that it is always conserved, which means the total momentum of a closed system does not change with time. In collisions, momentum can be transferred from one object to another, but if you add up all the momentum of all the objects you will find the total momentum before the collision is equal to the total momentum after the collision.

This principle that momentum is always conserved leads us to think that momentum represents some important underlying feature of Nature. We will see later just how important this is.

Momentum is even conserved in situations in which all the objects are initially stationary — such as an explosion. Imagine a stick of dynamite standing in a stationary position on a table. Nothing is moving, so the total momentum of that system is zero. When the dynamite explodes, fragments will shoot out at great speed to the left and right, and up and down. So it might appear that momentum is not conserved here because a stationary situation has transformed into a situation with a great deal of motion. However, remember that momentum is a vector quantity: it is represented by arrows. The momentum of a fragment which shoots out to the left can be represented by a vector of a certain length pointing to the left. Similarly, the momentum of a fragment which shoots out to the right can be represented by a vector of a certain length pointing to the right. If we add a vector pointing to the left with a vector pointing to the right then they cancel each other out and the sum total is zero. So if we correctly consider all the momentum of all the exploding fragments as vectors shooting out in all directions, we will find the sum total is again zero. So total momentum is conserved even in the case of an explosion.

But, here is an interesting thought. Imagine a car driving along a road at a constant speed. It clearly has momentum. It also clearly has an amount of kinetic energy, the energy associated with movement. We could tie a rope to the back of the car and, as the car pulls on the rope, it could make a windmill spin. So we could use the energy of the car to do work. This all makes sense and probably fits with your intuitive notion of momentum and energy.

However, as we discussed in the second chapter, we also know that all motion has to be relative — there is no such thing as absolute motion in the universe. With this in mind, imagine you are driving alongside the first car, and you choose a constant speed which precisely matches the speed of the first car. Now, as you look across to the first car, it no longer appears to be moving: it appears stationary. In fact, as far as you are concerned, the first car **is** stationary. With no observer having precedence in the universe, your viewpoint is just as valid as the viewpoint of any other observer. So, as far as you are concerned, the first car now has no momentum, and it has no kinetic energy. For example, if you have a windmill on your car, you could no longer use the energy of the first car to turn the blades of your windmill — the attached rope would be slack.

So this reveals that the momentum and kinetic energy of an object are completely observer-dependent, which might come as something of a surprise (it is something they don't tell you in school!). This also seems to point to a possible connection between momentum and energy, which we will discover shortly.

However, as we discussed in the previous chapter, everything travels at a constant speed in spacetime: the speed of light. Motion in space is really just a shadow of true motion in spacetime. So this observer-dependent impression of the momentum and energy of the car in space is not the whole story. To see the whole story we have to consider the motion of the car in spacetime — not just in space.

Once again, imagine you are driving alongside the first car, and you are driving at precisely the same constant speed as the first car. As you look across, the first car appears stationary. In fact, in your frame of reference, the first car **is** stationary. But, as we discussed in the previous chapter, we know that everything moves at the speed of light in spacetime. So what has effectively happened here is that — as far as you are concerned — the spacetime velocity vector of the car has rotated so that it no longer points in space, but now points only in time. In other words, the first car — which you see as stationary — must now be moving at the speed of light through time. This provides us with a general result: **a stationary object moves through time at the speed of light**. The only reason the object appears stationary to our eyes is because we are travelling through time at exactly the same speed!

But momentum is associated with motion (remember: momentum is mass multiplied by velocity). Admittedly, momentum is usually only associated with motion through space. However, in our new spacetime model, we might now reasonably ask what is the momentum of the car through time. The answer, fairly obviously, is that momentum is the mass of the object multiplied by its speed through time. So for a stationary object, momentum through time is given by the mass of the object multiplied by the speed of light: mc .

Now, this is interesting. The momentum through time of a stationary object is mc . What other property of a stationary object do we know? Well, Einstein showed in his famous equation $E=mc^2$ that the total energy of a stationary object (its *rest energy*) is equal to mc^2 . This indicates that if we consider the momentum of an object through time, and multiply that value by the speed of light, we obtain the total energy of that object. This seems to indicate that **we can consider energy to be momentum in the time direction**.

We can show this relationship between momentum and energy in a spacetime diagram. The following diagram takes into account an object's motion in both space and time. It has just been explained how we can consider energy to be momentum in the time direction, so the rest energy of a stationary object (mc^2) is drawn in the vertical direction. Momentum in space is drawn in the horizontal direction:

The total energy of a moving object is a combination of that object's motion through space (its momentum) and its motion through time (its rest energy). On the diagram, you can see that this total energy, E , is a combination of those two types of motion, and is shown by the diagonal arrow. It is clear that we can calculate the length of the arrow from Pythagoras:

$$E^2 = (mc^2)^2 + (pc)^2$$

This is a hugely-important equation called the *energy-momentum relation*. It reveals the relationship between energy, mass, and momentum, and it applies to absolutely everything in the universe, from a car driving along a road to the energy and momentum of light itself.

Let us consider some examples of the use of this equation. Firstly, if we consider a stationary object which has

mass — for example, a block of wood on a table — that object has no momentum in space so $p=0$ in this case, and the equation reduces to $E=mc^2$, the famous formula for the energy of a stationary object. So that is correct.

Let us now consider the other extreme, an object which is moving at the maximum speed through space: the speed of light. So what moves at the speed of light? The answer is in the question: light moves at the speed of light. Let us consider the particles which make up light which are photons. Photons are massless, which is the reason light can travel vast distances from the stars. So, for a single photon, $m=0$ in the equation, and the equation then reduces to $E=pc$, which is known to be the correct relationship between energy and momentum for a photon (yes, even though photons are massless they still have energy and momentum).

So the energy-momentum relation is correct for the two extremes, and for everything else in between.

Why does $E=mc^2$?

Let us now consider what we have discovered about the nature of energy, and, in particular, what we have discovered about $E=mc^2$.

$E=mc^2$ is perhaps the most famous equation in physics. As the amount of mass in this formula is multiplied by the incredibly huge value of the square of the speed of light, this formula reveals that a small amount of mass can be converted to a tremendous amount of energy. This is the principle behind nuclear power and nuclear weapons. As Andrew Steane says in his book *The Wonderful World of Relativity*: "This means that the total daily energy production of all the power stations in the world could in principle be obtained from just 14 kilograms of raw material."

How are we to make sense of this formula indicating that there is an equivalence between mass and energy? Some puzzling questions might include "How can an amount of mass at rest contain such a huge amount of energy?", and "Why does the speed of light feature so prominently in an equation linking mass and energy?"

Well, armed with the insights we have gained so far, we can now provide answers to these questions.

In the previous chapter it was shown that all objects travel at the speed of light in spacetime. This principle implies that all the spacetime speed of a stationary object must be directed through time: a stationary object moves through time at the speed of light.

So this, then, provides the answer to the mystery of $E=mc^2$. A stationary object is, in fact, far from stationary: it is speeding through time at the speed of light. It is this tremendous momentum in the time direction that results in a mass at apparent rest containing a huge amount of energy. As Richard Feynman said, this is "an energy that a particle possesses from its mere existence." [\[11\]](#)

And this reveals the secret as to why the speed of light appears in the famous equation linking mass with energy.

So, by considering all objects as moving at the speed of light through spacetime, we are shedding light on numerous mysteries. As Carl Brannen has said: "Various odd attributes of the theory of relativity, such as the huge amount of energy present in matter, and the impossibility of matter exceeding the speed of light, become natural consequences of a universal speed for all matter and energy." [\[12\]](#)

The antimatter connection

It is clear that there is an important connection between time and energy. Let us now further examine that connection by considering a few very simple thought experiments. These will reveal remarkable and simple logical connections between time, electric charge, energy, and the remarkable substance known as antimatter. Even though it might appear that the concepts of time, charge, energy, and antimatter are very complicated, the extraordinary simplicity of the following thought experiments will show that the connection is actually surprisingly simple and logical.

Firstly, let us consider two electrically-charged particles: a proton (which is positively charged) and an electron (which is negatively charged). The rule is that opposite charges attract, so in the following diagram we see motion of the electron towards the proton:

Now let us imagine exactly the same situation but with the direction of time being reversed (for example, we might have recorded a video of the previous example and are now playing the video in reverse):

As you can see in the previous diagram, with time being reversed, we see the motion in the opposite direction: we will now observe the electron moving away from the proton. Where there used to be an attraction, there is now a repulsion.

This might appear to be trivial and obvious because it is so simple, but actually it reveals a very fundamental symmetry between time and electric charge: it reveals that if we reverse the direction of time — and also reverse the electric charge of a particle — then the situation will be unchanged. [13]

So if we reverse the direction of time, we can apparently change a negatively-charged electron into a positively-charged electron. And that is very interesting, because we know that a positively-charged electron already exists and has been detected in experiments: it is called a *positron*. A positron is an example of *antimatter*. It is believed that every particle has a corresponding antiparticle which has opposite charge. The antiparticle is then an example of antimatter.

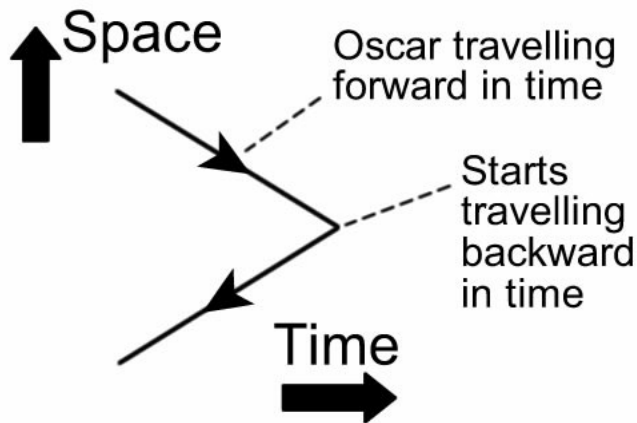

This principle (of reversed time producing antimatter) is described by Lisa Randall in her book *Warped Passages*: "Imagine a movie of a current of negatively-charged electrons travelling from one point to another. Now imagine running the movie in reverse. Negative charge would then travel backwards, or equivalently (so far as charge is concerned), positive charge would travel forwards. A current of positrons, the positively-charged antiparticles of electrons, produces this positively-charged forward-travelling current and therefore acts like a time-reversed electron current."

Antimatter is used as a common theme in science fiction, but it is most certainly a real substance and is even produced naturally in radioactive decay (a banana will produce one positron every 75 minutes or so). However, antimatter is very rare — and for good reason: when antimatter comes in to contact with normal matter they destroy each other, releasing a tremendous amount of energy in the form of gamma rays (high-energy light). In fact, antimatter releases more explosive energy than anything else in existence (an antimatter bomb would be 1,000 times more powerful than the atomic bombs dropped on Hiroshima and Nagasaki).

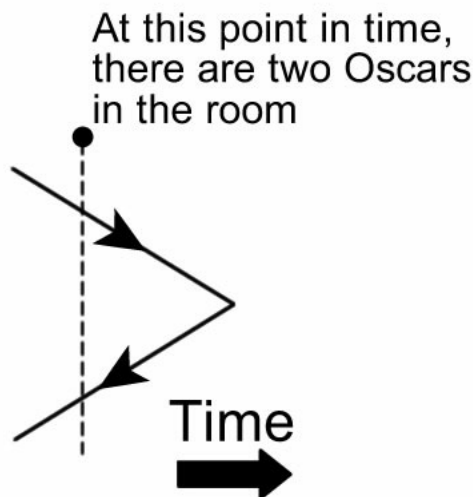

Now let us perform another simple thought experiment, which will reveal another highly-surprising connection between antimatter and reversed time. In this experiment we will discover just why matter and antimatter annihilate each other.

The following example is taken from a 1962 paper in the *Journal of Philosophy* written by the American philosopher Hilary Putnam.[14] The paper considers the strange adventures of a time traveller called Oscar Smith.

Let us examine the situation in more detail. The following diagram is a spacetime diagram showing the path of Oscar in space and time. We can see Oscar travelling forward in time, as he walks across the room. At a certain point, he starts travelling backward in time (the hands on his watch start to turn in reverse, for example) as he continues to walk across the room:

If we are an external observer, what would we see? Well, clearly — and remarkably — there would be a point in time (shown by the dotted line in the following diagram) when we observe two Oscars in the room! One of the Oscars would be travelling forward in time, and in a different position in the room we would observe the second Oscar travelling backward in time:

It is crucial to note that although there are two Oscars in the room at that point in time, they are in fact both the same man!

Now, we know from our previous analysis that a particle which is travelling backward in time is the antimatter equivalent of that same particle travelling forward in time. So can we consider the second Oscar — travelling backward in time — to be the antimatter equivalent of the first Oscar who is travelling in the forward time direction? Let us continue our analysis to see if this is the case.

What else do we observe in the room? Well, as time progresses, we observe the two Oscars moving closer together (the second Oscar moving backward in time, walking in reverse toward the first Oscar). You will then see from the spacetime diagram that when the two Oscars eventually meet, they do not appear to exist on the spacetime diagram after that point in time. It is as though they both vanish into thin air!

As Hilary Putnam says in his paper: "When the two systems merge, they are both annihilated".

So this does, indeed, resemble the behaviour of antimatter. Remember that when antimatter comes into contact with normal matter they both annihilate each other and cease to exist.

So, rather wonderfully, purely by considering two simple thought experiments we have managed to discover a connection between antimatter and reversed time, and we have found a simple explanation for the apparent annihilation of antimatter and normal matter. And I can assure you that this all represents orthodox scientific thinking (treating antimatter as the time-reversed equivalent of normal matter was first suggested by the great physicists John Wheeler and Richard Feynman).

It might be imagined that the connection between an exotic material such as antimatter and the direction of time, and the reason why antimatter annihilates normal matter would be an incredibly complex question. However, as we have seen, we can deduce the connection from some incredibly simple reasoning. I think this lends weight to my belief that — as we get to the lowest, fundamental levels of physics — we find physics gets simpler, not more complicated.

These insights into the behaviour of antimatter and time are intriguing. But what can they tell us about the existence of the universe itself?

The dawn of time

Fourteen billion years ago, the explosion of the Big Bang saw the universe expand from a point of extremely high density and pressure. All the material of the universe came into existence at this point. It is believed that matter and antimatter were created in perfect balance.

In our discussion of the arrow of time in Chapter Five, it was explained how the laws of physics work the same in the backward time direction as in the forward time direction: there is perfect symmetry along the time axis. If we are considering antimatter to be the time-reversed equivalent of normal matter then it is clear why matter and antimatter were created in perfect balance: there is a perfect symmetry in time.

However, we know that if matter and antimatter come into contact then they annihilate each other and all that is left is radiation. So why didn't the matter and antimatter present in the earliest moments in the life of the universe simply annihilate each other, just leaving us with a universe made of light?

Well, there was indeed a huge annihilation of matter by antimatter. But it does appear that there was a very slight imbalance in the annihilation process leaving us with a universe with a slight surplus of matter. No one knows why this slight imbalance occurs, but Einstein summed up the process: "For every one billion particles of antimatter there were one billion and one particles of matter. And when the mutual annihilation was complete, one billionth remained — and that is our present universe."

So, to sum up, it is clear that time plays an integral role in the existence of the universe. It appears that our universe needs time in order that a perfect balance can exist between the positive and the negative. We should be very glad that such a balance can exist, because it appears to be the reason that our universe can exist at all.

But we should also be glad that there was the slightest imbalance in the process of antimatter/matter annihilation, for if that imbalance had not been present then there would be no matter in our universe. And we would not exist.

It appears that balance in our universe is vital for its existence, but it is the slight imbalances that make it such an interesting place to live.

LAS VEGAS

It is the summer of 1975 in Portland, Oregon.

Straight-A physics student Norman Packard is wondering how he might make some easy money over the summer months. With this in mind, he has started reading a book called *Beat The Dealer* written by Edward Thorp. The book details how it can be possible to win at blackjack by counting the cards which have already been played. If enough cards can be remembered, it is possible to gain a small percentage advantage over the house. Packard has an excellent head for numbers, however, when he tried the card-counting method in a casino he found the results to be disappointing — leading eventually to losses.

Feeling despondent over his failure, Packard turned his attention to other games and had a brainwave: he could use his knowledge of physics to win at roulette. Specifically, he knew that the roulette wheel and ball had to move according to Newton's three laws of motion and his law of universal gravitation. If it was possible to measure the speed at which the ball was thrown and the speed at which the wheel was spun then it should be possible to predict the outcome.

Indeed, in his book *The Newtonian Casino*, Thomas Bass describes how a roulette wheel resembles the motion of planets under gravity: "The game of roulette, with a ball revolving around a spinning disk, resembles a model universe governed by the laws of Newtonian mechanics. Planetary ball circles solar disk until gravity sucks it out of orbit and pulls it down to stasis."

The following diagram shows the planets orbiting a spinning roulette wheel:

The first step was to determine the feasibility of the project. Was there enough predictability in the spin of a roulette wheel?

In order to determine this, Packard decided to measure the speed of the ball when it was thrown around the wheel. If there was too much unpredictable variation in the speed of the ball, the plan was not going to work. Packard went to real gaming tables in Las Vegas and clicked a hidden microphone in his hand each time the ball completed one revolution of the wheel. On returning to his hotel room, Packard played back the tape and measured the time between the clicks. In this way, Packard could determine not only the velocity of the ball, but could also calculate the amount the velocity decreased between each revolution. Crucially, Packard discovered that the deceleration of the ball was consistent: "As soon as you realise that there is this layer of predictability in the dynamics of the wheel and the ball then that opens the door to having the possibility to beat the game."

At this point, Packard knew the potential was there. But he also knew that a lot of work was required if he was to beat the casino. Packard called on the help of his best friend from childhood, Doyne Farmer, who was now a physics undergraduate at University of California, Santa Cruz. He managed to sell his idea to Farmer by emphasizing the intellectual aspects of the project. According to Packard: "I was interested in the intellectual interest of conquering

randomness, or understanding exactly what were the limits of randomness and predictability."

However, there was also another — less worthy — motivation: "It seemed like a great idea to rip off casinos, who get so much pleasure out of ripping off everyone else."

While the prediction of the particular winning number would be beyond their capabilities, Packard and Farmer aimed to predict the area of the wheel in which the ball would land. They divided the wheel into eight areas called *octants*, each octant containing about five numbers. Ironically, a great advantage was provided by the random arrangement of the numbers on the wheel. If the numbers in a particular octant on the wheel are considered, those numbers appear to be in a completely random arrangement when laid-out on the betting table. This meant it was going to be harder to detect their method.

First, Farmer went to the main supplier of roulette wheels in Nevada and obtained a casino-grade roulette wheel. It cost \$1,500 which represented the life savings of the two undergraduates. They arranged for the wheel to be shipped to Portland. However, at this point the FBI became suspicious and interviewed Farmer about his motives.

Farmer tried to convince the FBI that he collected roulette wheels, and he had no interest in using it for gambling. Instead, Farmer protested that this type of table — inlaid with twelve kinds of African wood — was merely a collector's item. Surprisingly, the FBI bought his story. However, unwilling to risk transporting the wheel again, Packard and Farmer based their experiment in Santa Cruz.

In order to accurately track the movement of the ball, a high-speed camera was rigged over the wheel. The forces acting on the moving ball could then be determined. As Farmer explained: "Roulette is a physical system, and if you can measure the initial position and velocity of the ball, and you know the forces acting on it, you should be able to predict what is going to happen." Analysis of the movie footage allowed them to accurately measure the ball's velocity and deceleration. The effect of friction and drag on the ball had to be determined. They could also measure *scatter* and *bounce*. Scatter occurred when the ball hit the diamonds on the sloping sides of the wheel, and bounce occurred when the ball hopped from cup-to-cup before finally coming to rest. The final program included a set of equations which resembled the equations used by NASA for landing spacecraft on the Moon.

But how could complex calculations be performed in the middle of a busy casino? Obviously, they had to be discreet. A small computer was required.^[1] For \$250 they obtained via mail order a development kit incorporating an 8-bit 6502 microprocessor, which was the same processor used by Apple computers at the time. The computer had access to 5K of RAM, while the program was squeezed into 4K of ROM. The computer was small enough to be hidden under one armpit, with the battery pack hidden under the other armpit. The computer was attached to a microswitch embedded in the sole of the shoe which allowed for data input. This switch was activated by the movement of the big toe.

The result of the calculation was transmitted to the player via three vibrating buzzers attached to the chest. In binary, the three vibrators could encode a digit from 1 to 8, (001, 010, 011, etc.), thus indicating on which octant the bet should be placed.

The first stage was to calculate some parameters which were specific to the table, such as the tilt of the table, and the rate at which the central rotor decelerated. Once this information was obtained, the only other variables depended on the particular croupier working that day. This included the speed at which the croupier threw the ball, and the speed at which the croupier spun the rotor. This information could be obtained by standing next to the table and capturing the data. When a point on the wheel passed, the microswitch in the shoe was clicked. By comparing two successive clicks, the speed of the rotor could be calculated. Similarly, two clicks were made when the ball passed, providing the speed at which the croupier threw the ball.

Once the wheel was spun, there was a window of just fifteen seconds to enter the data and make the calculation: two clicks for the wheel, and two clicks for the ball. After that fifteen seconds, the bet had to be made.

Taking the equipment to Las Vegas, the team favoured the older, faded casinos on Fremont Street such as the Golden Nugget, the Mint, and the Horseshoe Club. These were the first casinos to emerge in Las Vegas in the 1930s, before a New York gangster by the name of Bugsy Siegel built the Flamingo club. That was the start of the modern mega-casinos, now strung-out down the main Strip.

While clearly the computerized system was not completely accurate every time, over a period of time the system provided a big statistical advantage. For every dollar bet, \$1.44 was won.

However, this success was bound to draw the attention of the casino security. The increased tension caused the player to sweat excessively, and the increased conductivity resulted in the player receiving occasional electric shocks from the chest mechanism — which resulted in visible spasms. Bear in mind, though, that in the mid 1970s the personal computer was unheard of, and no one would have suspected that a player might be wearing such high-technology. Also, the team agreed never to win more than a few hundred dollars in any given session. For these reasons, the team managed to avoid detection.

One of the most successful evenings came at the Circus Circus casino. The casino's attractions included a flying trapeze over the main floor, and slot machines on a merry-go-round. On that night, a particularly predictable croupier spun the ball in a regular fashion, and the computer worked like a dream: "The predictions were right on target. Playing quarters, we recouped our losses and stacked several hundred dollars in chips in front of us. There was a gut rush of excitement in seeing everything fall into place. After all the time spent testing and troubleshooting it, the computer was finally up and running perfectly. I no longer had the slightest doubt. From that session, I knew the game of roulette had been beaten."

Overall, the team estimate they made about \$10,000. It was not a large sum — certainly not as large as they could have made. This is because the motivation of the team was the intellectual challenge of the scientific project, to see if it was possible for physics to beat the system. And in that sense, they were completely successful.

And afterwards in the bar, in celebratory mood, the team raised a toast ... to Sir Isaac Newton.

Doyme Farmer is now a professor and a specialist in probability theory at the Santa Fe Institute. Norman Packard now lives in Italy, researching and developing forms of artificial life.

In 1985 the law was changed in Nevada to make it a crime, punishable by up to ten years in prison, to use a computing device in a casino capable of predicting the outcome of a game.

The clockwork universe

The method of Packard and Farmer was successful because Newton's three laws of motion and his law of universal gravitation are completely *deterministic*: there is no mention of chance. Given the state of a system — the position and velocity of all its parts — its movement from that point on is, according to Newton, completely predictable and determined.

As the project team described in the book *The Newtonian Casino*: "Our basic idea was to determine the initial position and velocity for the ball and rotor. We then hoped to predict the final position of the ball in much the same way that a planet's later position around the Sun is predicted from initial conditions."

On this basis, the 18th century French mathematician and philosopher the Marquis de Laplace realised that, if complete knowledge was obtained of the position and velocities of all the objects in the universe, then the future could be forever predicted. The universe — and the future — would be completely determined: "We may regard the present state of the universe as the effect of its past and the cause of its future. An intellect which, at any given moment, knew all of the forces that animate Nature and the mutual positions of the beings that compose it, if this intellect were vast enough to submit the data to analysis, could condense into a single formula the movement of the greatest bodies of the universe and that of the lightest atom. For such an intellect nothing could be uncertain and the future, just like the past, would be present before its eyes."

This view became known as the *clockwork universe*. The image of the clockwork universe became the dominant model in physics for 200 years after Newton, and also influenced other areas of society. As Michael Mosley said in the BBC series *The Story of Science*: "The way that Newton had shown that a few universal laws could explain so much of the physical world inspired other intellectuals to look for universal laws that could explain human behaviour, politics, even history. Newton became a hero to revolutionaries who dreamt of utopian societies founded on reason."

The founding fathers of America decided that the laws and political institutions of their new country would be based on science and rational thought. There would be no place for monarchs and traditions. As Edward Dolnick says in his book *The Clockwork Universe*: "As they spelled out the design of America's political institutions, the founders clung to the model of a smooth-running, self-regulating universe. In the eyes of the men who made America, the checks and balances that ensured political stability were directly analogous to the natural pushes and pulls that kept the Solar System in balance." As Woodrow Wilson later wrote: "The Constitution of the United States has been made under the dominion of the Newtonian theory."

Thomas Jefferson installed a portrait of Isaac Newton in a place of honour in his home at Monticello, while Benjamin Franklin's favourite portrait (by the Scottish artist David Martin) showed him reading in front of a bust of Newton:

So, if the clockwork universe model suggests that the future is completely determined by the past, where does probability creep into the equation? If all events are determined with certainty, why are there casinos, and betting shops, and roulette wheels? The answer is that, in this situation, probability arises purely due to **ignorance**. Yes, if we were a super-being with complete knowledge of the position and velocity of every atom in the roulette wheel and the spinning ball, then the clockwork universe suggests we could predict the outcome with certainty. But we inevitably do not have complete knowledge. We only have limited knowledge. And it is as a result of this inevitable ignorance that we cannot predict the outcome of all events with certainty.

The clockwork universe was perhaps a reassuring concept. A universe without surprises, a universe in which progress was assured, a universe in which knowledge could increase without bound.

As we shall see, it was also proved to be completely wrong.

"What hath God wrought?"

The mid 19th century was a time of great confidence and certainty. Newtonian mechanics had brought the industrial revolution, and Britain and the United States had ridden the wave of the industrial revolution to become the two most powerful nations on Earth.

The industrial revolution was powered by steam. The steam engine powered manufacturing industry, and the steam train spanned continents. However, the steamship still took ten days to connect Britain and America, and this represented the fastest possible communication across the Atlantic. As a result, a group of the greatest scientific minds determined to reduce communication times by physically linking the two continents by a telegraph cable.

In 1844, the American inventor Samuel Morse transmitted the first message on the electronic telegraph. The message travelled down wires 38 miles connecting Washington and Baltimore. Considering this achievement took place during a period of such confidence and certainty, Morse's first message was ominously prophetic. The message simply read: "What hath God wrought?"

The scientific advisor of the transatlantic cable project was the Belfast-born William Thomson, who was known as one of the finest physicists of the age. Thomson had entered the University of Glasgow at the age of ten, and within two years he was publishing scientific papers. He became a professor of natural philosophy by the age of 22, and went on to make important contributions in the field of thermodynamics, playing an important role in establishing physics as a modern scientific discipline.

Thomson designed the transatlantic telegraph cable, improving the core of the electric cable and its insulation. The cable was planned to be laid from the iron steamship the *Great Eastern*. At 692 feet, this was the largest ship ever built, itself a symbol of the confidence and certainty of the era.

In 1866, the cable successfully linked Britain and America for the first time. *The Times* called the feat "The most wonderful achievement of this victorious century". For his role in this triumph, Queen Victoria knighted William Thomson who later became the first British scientist to enter the House of Lords where he became Lord Kelvin.

It was during this period that Lord Kelvin issued a famous quote which reflected the confidence and certainty of this period: "There is nothing new to be discovered in physics now. All that remains is more and more precise measurement."

This view of Lord Kelvin was certainly not isolated.^[2] In 1894, the American physicist Albert Michelson said: "The most important and fundamental laws and facts of physical science have all been discovered. Our future discoveries must be looked for in the sixth place of decimals."

However, Lord Kelvin's pronouncement could not have been more inaccurate. In the following twenty years — the first two decades of the 20th century — science was rocked to the core as the old certainties were swept away.

2

THE UNCERTAIN QUANTUM

Lord Kelvin must have been aware at the time of his pronouncement that there were three major mysteries involving radiation which still required an explanation. In this chapter, we will examine those three mysteries of radiation.

Firstly, if you take a metal bar (for example) and heat it to over 500 degrees Celsius, it will emit electromagnetic radiation: it will begin to glow. It will first become red hot, then it will become white hot. So there is a relationship between the temperature of the bar and the frequency of the emitted radiation (this is how potters used to determine the temperature of their kilns). At lower temperatures, radiation of a lower frequency is emitted (red visible light), whereas at higher temperatures, higher-frequency radiation of a brilliant blue-white colour is emitted.

However, when physicists tried to describe the relationship between temperature and frequency, they found a problem. The classical model agreed well at low frequencies, but it predicted ever-increasing emitted energy at high frequencies (ultraviolet and higher). This was because the model predicted that the power of the radiation was proportional to the square of the frequency of that radiation. Hence, as progressively higher frequencies were considered, the power of the radiation was predicted to rise to an infinitely large amount. This was known as the *ultraviolet catastrophe*.

At the turn of the 20th century, the German physicist Max Planck cast a new light on the mystery. However, things might have turned out differently. When he was 16 years old, Planck had been told by the physicist Philipp von Jolly that he should not study physics because "in this field, almost everything is already discovered, and all that remains is to fill a few unimportant holes." This revealed that the certainty of Lord Kelvin was also shared by other physicists. Planck replied that he did not want to discover anything new, he merely wanted to obtain a greater understanding of what was already known.

In order to solve the ultraviolet catastrophe, Planck took the radical step of suggesting that the emitted radiation was composed of tiny, indivisible packets of energy, with each packet being called a *quantum*. The energy of each packet was proportional to the frequency of the radiation:

$$e = hf$$

Where e is the energy of the emitted quantum, f is the frequency of the radiation, and h is Planck's constant. Planck's constant is equal to 0.000000000000000000000000006626, a very small number which has a huge importance. It appears in many important equations in physics.

This result indicated that the amount of energy emitted at a certain frequency was proportional to the number of packets of energy being emitted with that frequency.

Using this method, Planck was able to explain why the energy of the emitted radiation did not increase to infinity at higher frequencies: it would take too much energy to make a single quantum at those high frequencies. Hence, at high frequencies, there were simply fewer packets of energy being emitted.

On the 14th December 1900, Planck told his son that he may have made a discovery as important as those of Newton. Later that day, he presented his result to the Berlin Physical Society.

Quantum theory had been born.

However, Planck, like most physicists, believed the physical world was a continuum, with matter being composed of a smooth, continuous substance. This latest result of Planck, however, seemed to suggest that energy could be formed of discrete, discontinuous chunks. Planck was a conservative scientist who was not motivated to further consider the physical significance of his discovery. That would require a different experiment, and a scientist much more ready to consider revolutionary ideas. We have to move on to consider the second major mystery involving radiation: the *photoelectric effect*.

In 1899, the German physicist Philipp Lenard shone a bright light onto metal and discovered that the metal ejected electrons. According to the classical viewpoint, it would be expected that the ejected electrons would have

more energy if the light was brighter. However, this was not what was discovered. Instead, it was found that the energy of the ejected electrons was entirely independent of the intensity of the light. In fact, even very low intensity light was capable of ejecting electrons. Instead, the energy of the electrons was proportional to the frequency (i.e., the colour) of the incident light. For example, blue light (high frequency) ejects more energetic electrons than red light (low frequency).

This was a tremendous puzzle which could not be explained by the classical model. How could low intensity light be capable of ejecting electrons? Well, in his *annus mirabilis* ("miracle year") of 1905, Albert Einstein proposed a solution.

Einstein proposed that light was composed of packets of energy, with each packet having an energy equal to Planck's constant multiplied by the frequency of the light:

$$e = hf$$

Hence, this is precisely the same formula discovered five years earlier by Max Planck. This formula now made sense of the photoelectric effect. Low intensity light would be composed of few packets of energy, but the energy of each individual packet was only dependent on the frequency of the light. Hence, even a single packet of light could potentially eject an electron from metal, the energy of the light transferring to the kinetic energy of the electron. This explained how even low intensity light could eject electrons.

High intensity light was composed of many more of these packets of energy, but the energy of each individual packet remained only proportional to the colour of the light. Hence, increasing the brightness of the light did not increase the energy of the ejected electrons: you had to alter the colour of the light to do that.

So, while Max Planck could not understand the physical significance of his earlier result, Einstein's explanation of the photoelectric effect made the meaning clear: light energy really **was** quantized into discrete packets. Each packet of light energy was called a *photon*.

At first, there was considerable resistance to Einstein's theory of light particles. Planck, in particular, could not accept Einstein's theory. In 1913, Planck (and other supporters) wrote a letter of recommendation for Einstein's membership to the Prussian Academy of Sciences. The letter was full of praise, however, Planck included the following passage: "In sum, one can hardly say that there is not one among the great problems, in which modern physics is so rich, to which Einstein has not made a remarkable contribution. That he may have missed the target in his speculations, as, for example, in his hypothesis of the light quanta, cannot really be held too much against him, for it is not possible to introduce really new ideas even in the exact sciences without taking a risk."

However, the existence of the photon was soon experimentally confirmed, and Einstein received his only Nobel prize in 1921 for his discovery of the light quantum.

The third major mystery involving radiation considered the nature of the light emitted from different materials. When a substance is heated, it emits a light with a characteristic colour. For example, when salt (sodium chloride) is heated in a flame, it glows with a yellow colour. This explains the common yellow colour of sodium street lighting. Every chemical element has a different associated colour. If the light from a pure element is passed through a prism, the prism splits the light into its various constituent colours. This spread of colours is called a *spectrum*.

For white light, a rainbow effect is produced as white light contains all colours. However, each particular chemical element has a different spectrum, and it was found that the spectrum contains very sharp peaks in intensity at different light wavelengths. This means the spectrum contains very distinct bright coloured lines. It is as if each element has an identifying barcode. Hydrogen, for example, has four distinct lines in its spectrum. By analysing the light from stars in this manner, it is possible to identify the chemical composition of those stars.

These lines in the spectra of elements were surely revealing something important about the structure of atoms, but the mechanism by which these lines were produced was a mystery.

The stage was set for the entrance of a young Danish physicist who has been called the father of quantum physics: Niels Bohr. Bohr was undoubtedly the most important figure in the development of quantum theory. Bohr worked throughout his life to achieve the greatest understanding of quantum behaviour.

Bohr arrived at Manchester University in 1912 to work with Ernest Rutherford, who had just revealed crucial details of the structure of the atom. Rutherford had revealed that the atom consisted of a positively-charged nucleus — only one ten-thousandth the size of the whole atom — surrounded by a cloud of orbiting electrons. For obvious reasons, this was called the *planetary model* of the atom.

However, there were problems with the planetary model. According to classical physics, the orbiting electrons

should radiate energy before eventually spiralling into the nucleus (as an analogy, the Moon is losing energy and is therefore slowing down as it orbits the Earth). Bohr considered the previous discovery of Einstein — that light energy was quantized — to suggest that the energy of electrons in their orbits was quantized. This would mean that the electrons could only occupy special orbits with clearly defined energy levels. Hence, there could be no continuous drift towards the nucleus.

Bohr then realised that this could also provide an explanation for the spectral lines. Electrons which were orbiting further away from the nucleus would have higher energy than electrons orbiting nearer the nucleus. When an electron jumped (a *quantum jump*) from a higher orbit to a lower orbit, it would release a photon. Because of the law of conservation of energy, the energy of the photon would be equal to the energy lost by the electron. Hence, electron jumps between certain clearly defined orbits would result in a photon being emitted with a particular colour. This would explain the sharp lines in the spectrum.

The following diagram shows how electrons can jump between different energy levels in the hydrogen atom. The larger the jump, the greater the energy released, and so higher frequency light is produced. The diagram shows the frequency of the light produced for each quantum jump. This explains the four distinct lines in the visible spectrum of hydrogen.

In his final interview, Bohr expressed the difficulties he had faced in trying to determine the structure of the atom merely by considering its colour spectrum: "Just as if you have the wing of a butterfly, then certainly it is very regular with the colours and so on, but nobody thought that one could get the basis of biology from the colouring of the wing of a butterfly."

So all three mysteries associated with radiation could be solved by the realisation that energy can be quantised into packets. But what really made the new quantum theory so devastating was that it introduced uncertainty to science.

The uncertainty principle

In Germany, the young physicist Werner Heisenberg was working to develop a more detailed picture of quantum behaviour. He decided to ignore the classical model of the atom — the planetary model — thus ignoring anything that could not be directly observed. Instead, Heisenberg only considered the features that could be directly observed

and measured: the properties of the light emitted by the electrons as they jumped between two energy levels.

But there were many different orbits available for electrons to jump between. For example, an electron might jump from energy level E_3 to energy level E_1 , or from energy level E_5 to energy level E_2 . What was the best way to denote and analyse all these possible combinations?

When Heisenberg had an attack of hay fever, he retreated to Heligoland, a tiny pollen-free island off the German coast. It was in this distraction-free environment that Heisenberg made his great breakthrough. He plotted all the observed values in the form of a rectangular grid, known as a *matrix*.

In the following matrix, the energy emitted when an electron jumps from energy level E_2 to energy level E_1 is denoted by E_{21} , and so on. This single matrix, therefore, contains information about all the possible quantum jumps:

$$\begin{bmatrix} E_{11} & E_{12} & E_{13} & E_{14} & \dots \\ E_{21} & E_{22} & E_{23} & E_{24} & \dots \\ E_{31} & E_{32} & E_{33} & E_{34} & \dots \end{bmatrix}$$

Heisenberg realised that a matrix operation could be used to extract the quantum properties — such as the position or momentum — of a particle. If, for example, the position of a particle was to be calculated, a particular matrix for quantum position would be used. If momentum was to be extracted, then a different matrix would be used. [3]

However, Heisenberg realised that if matrices ("matrices" is the plural of "matrix") have to be used to determine quantum mechanical behaviour, then that would introduce a remarkable side-effect. This is because in order to extract a particular property of a particle (position or momentum), matrix multiplication would have to be used. And matrix multiplication behaves very differently from conventional multiplication.

In order to see why this is the case, let us consider a simple example. Here is an example of a matrix composed of two rows and two columns:

$$\begin{bmatrix} 2 & 4 \\ 7 & 3 \end{bmatrix}$$

We might ask how matrix multiplication (the multiplication of two matrices) might be achieved. For example, how could we multiply the following two matrices:

$$\begin{bmatrix} 2 & 4 \\ 7 & 3 \end{bmatrix} \times \begin{bmatrix} 5 & 6 \\ 1 & 5 \end{bmatrix}$$

We can multiply these two matrices by the following sequence of steps:

First, consider the first row of the first matrix and the first column of the second matrix (shown in the two dashed ellipses in the following diagram). Take the first number in the first row of the first matrix (which is 2) and multiply it by the first number in the first column of the second matrix (which is 5). This gives us our first intermediate result of 10 (we must remember this). Then take the second number in the first row of the first matrix (which is 4) and multiply it by the second number in the first column of the second matrix (which is 1). This gives us our second intermediate result of 4.

We add our two intermediate results (10 and 4) together to get the answer 14, and that number goes in the first position in our result matrix:

$$\begin{bmatrix} 2 & 4 \\ 7 & 3 \end{bmatrix} \times \begin{bmatrix} 5 & 6 \\ 1 & 5 \end{bmatrix} = \begin{bmatrix} 14 & \\ & \end{bmatrix}$$

To get our next entry in our answer matrix, once again we have to consider the first row of our first matrix, but now we consider the second column of the second matrix. We perform a similar series of steps to the first case, this time we need to calculate $(2 \times 6) + (4 \times 5)$ to give an answer of 32:

$$\begin{bmatrix} 2 & 4 \\ 7 & 3 \end{bmatrix} \times \begin{bmatrix} 5 & 6 \\ 1 & 5 \end{bmatrix} = \begin{bmatrix} 14 & 32 \\ & \end{bmatrix}$$

We continue in a similar fashion until we have filled all the positions in our result matrix. So here is the answer of our matrix multiplication:

$$\begin{bmatrix} 2 & 4 \\ 7 & 3 \end{bmatrix} \times \begin{bmatrix} 5 & 6 \\ 1 & 5 \end{bmatrix} = \begin{bmatrix} 14 & 32 \\ 38 & 57 \end{bmatrix}$$

You might want to check the steps yourself to make sure it is the correct answer. $(7 \times 5) + (3 \times 1) = 38$ and $(7 \times 6) + (3 \times 5) = 57$.

So matrix multiplication is fairly straightforward. But Heisenberg realised that if matrices have to be used to determine quantum mechanical behaviour, then that would introduce a remarkable side-effect. And that is because matrix multiplication is *noncommutative*.

Conventional multiplication is commutative in that it does not matter in which order the numbers are multiplied, the answer will be the same. For example, 7×5 will give the same result as 5×7 . However, matrix multiplication is noncommutative in that the ordering does matter. If the ordering of the matrices is reversed, the answer will be different.

In order to see this, here is the previous matrix multiplication with the two matrices in reverse order:

$$\begin{bmatrix} 5 & 6 \\ 1 & 5 \end{bmatrix} \times \begin{bmatrix} 2 & 4 \\ 7 & 3 \end{bmatrix} = \begin{bmatrix} 52 & 38 \\ 37 & 19 \end{bmatrix}$$

You will see that the final result matrix is different. You can run through the steps of the calculation yourself if you wish. Clearly, matrix multiplication is noncommutative: the ordering does matter.

Heisenberg realised that the noncommutative properties of matrix mechanics had startling consequences for quantum behaviour. It suggested that if the position of a particle was measured, and then the momentum of the particle was measured, a different result would be obtained than if the momentum had been measured first. The ordering of the measurements mattered. It was as if the measurement of the position of the particle irretrievably "poisoned" the following momentum measurement. The only way to obtain an accurate measure of the particle's momentum would be to measure its momentum first. But that seemed to imply that it was not possible to accurately know **both** a particle's position **and** momentum!

Heisenberg tried to make sense of this startling result by realising that, in order to measure some aspect of a system, we inevitably alter the system being measured in some small way. Our measurement can, therefore, never precisely reflect the true state of the system being measured. For example, if we test the air pressure of a tyre using a gauge, some air has to inevitably leak out of the tyre — thus reducing the pressure. Or, in the case of a particle, we can precisely measure its position by projecting it as a point onto a screen. But that inevitably reduces the particle's velocity to zero — so we cannot obtain a momentum measurement.

This startling result became known as the *Heisenberg uncertainty principle*. For the first time, it appeared that there were fundamental limits on human knowledge about the universe. At a stroke, the idea of the clockwork universe proposed by the Marquis de Laplace was erased: it could never be possible to obtain complete information about the position and velocity of all the particles in the universe, so it could never be possible to predict with certainty the future of the universe.

As Heisenberg said: "When we know the present precisely, we can predict the future' is as assumption — not the correct conclusion. Even in principle we cannot know the present in all detail."

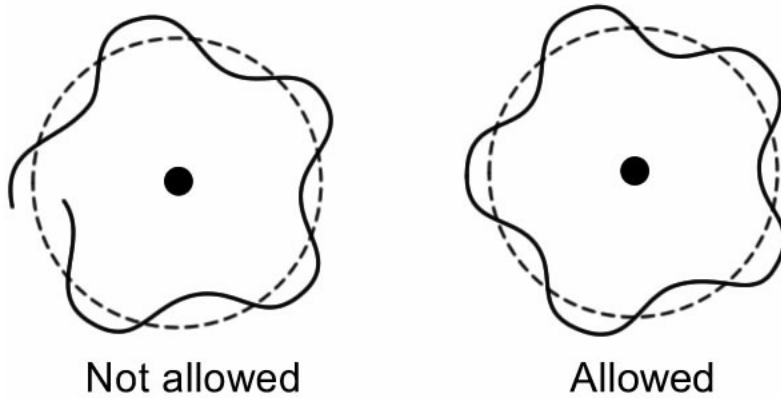

There was a limit on human knowledge. The old certainties were starting to unravel. From now on, the only certainty was uncertainty.

Schrödinger's waves

The development of Heisenberg's *matrix mechanics* was the first time that quantum theory represented a complete description of the quantum behaviour of a particle: the quantum equivalent of Newton's laws of mechanics. This complete theory became known as *quantum mechanics*.

However, matrix mechanics was difficult to use — most physicists had never used matrices before — and difficult to visualise. Adoption of the new technique was slow. So when Erwin Schrödinger presented a new method which substituted the use of waves instead of matrices the method swiftly proved popular (most physicists were familiar with waves, and the model was much easier to visualise). Schrödinger's method became known as *wave mechanics*. [4]

Remember that Bohr had shown that electrons could only occupy special orbits with clearly defined energy levels. Hence, there could be no continuous drift towards the nucleus. Schrödinger used a mathematical model of a wave as a tool for determining these allowed orbits of electrons. An electron orbit was modelled as a wave around the nucleus. An orbit was only allowed if a whole number of wavelengths fitted around the orbit:

This explained why only certain orbits with quantised energy levels were allowed. When an electron emitted a photon, it could move to a lower, allowed orbit:

This mathematical wave proposed by Schrödinger was called a *wavefunction*. But what did the wavefunction actually represent? Should it only be considered a mathematical tool which could be used for calculating the properties of particles, or did it actually represent some underlying physical wave which had not yet been detected?

The situation was made more complicated by the fact that the values of the wavefunction were *complex numbers*, meaning they had a "real" part and an "imaginary" part. Imaginary numbers are based on the square root of -1. As no real number squared can result in -1, this explained why these numbers were considered "imaginary". Only if the value was squared did the imaginary part disappear (if you square the square root of -1 then you are left with -1, which is a real number).

So the square of the value of the wavefunction represented something "real", something that could be measured in a laboratory. But what did the value represent? It was the German physicist Max Born who provided the incredible answer: the value of the square of the wavefunction represented the **probability** that the electron is found at a particular location. If the value of the wavefunction was larger at a particular location, there was more chance of finding the electron there when an attempt was made to measure its position. Crucially, before the measurement was made, it was simply impossible to obtain a more accurate fix on the electron's position. Before the measurement was taken, it was not possible to use more accurate equipment, or more precise mathematics, to precisely pin down the position of the electron. Before measurement, all that could be known was possibilities.

So this is what the great edifice of physics was finally reduced to: at the most fundamental level, it was only possible to talk about the probability of a particular event occurring. It was not possible to achieve greater certainty. The physicist was reduced to talking about likelihoods and chance, like a common gambling bookmaker.

Max Born's revelation of a fundamentally probabilistic universe meant the end of determinism. In a Newtonian deterministic universe, one event causes another in an entirely predictable manner. Quantum mechanics, however, revealed that the outcome of an event could only be considered in terms of probabilities.

In Chapter One we considered how probability — in a deterministic universe — was merely a product of ignorance. However, quantum probability was revealed to be a fundamental probability which was not a result of ignorance. As Manjit Kumar says in his book *Quantum*: "Quantum probability was not the classical probability of ignorance that could in theory be eliminated. It was an inherent feature of atomic reality. For example, the fact that it was impossible to predict when an individual atom would decay in a radioactive sample, amid the certainty that one would do so, was not due to a lack of knowledge but was the result of the probabilistic nature of the quantum rules that dictate radioactive decay."

Probability which is a result of ignorance can be eliminated. Quantum probability — which lies at the heart of all reality — was here to stay.

3

COPENHAGEN

Ernest Solvay was a Belgian industrialist and philanthropist who had made his fortune from developing a process for manufacturing sodium carbonate. The patents from the process provided Solvay with great wealth, and he used this money to fund a series of physics conferences in Brussels which attracted the greatest minds of the day.

Since the end of the First World War, Germany had been isolated and scientific conferences had excluded German scientists. However, in 1927 the king of Belgium announced that German scientists could be invited to the Solvay conference: "Seven years after the war the feelings which they aroused should be gradually damped down, a better understanding between peoples was absolutely necessary for the future, and science could help to bring this about."

The resulting 1927 conference entered the annals of physics legend by attracting 29 of the greatest physicists of all time, including 17 Nobel Prize winners. Among those attending the conference were Niels Bohr, Werner Heisenberg, Erwin Schrödinger, Max Born, Max Planck, and Albert Einstein.

The fortuitous timing of the 1927 Solvay event meant it occurred at precisely the time when the philosophical argument over the interpretation of quantum mechanics was at its height. In particular, the debates between the two geniuses of Bohr and Einstein are considered some of the most creative and ingenious in scientific history. According to the physicist John Wheeler: "In all the history of human thought, there is no greater dialogue than that which took place over the years between Niels Bohr and Albert Einstein about the meaning of the quantum." The philosopher C.P. Snow went deeper: "No more profound intellectual debate has ever been conducted."

On one side of the debate, Niels Bohr believed quantum mechanics provided a complete description of Nature at the microscopic level, in which case Nature was fundamentally governed by probabilistic processes. On the other side of the debate, Einstein believed that the current quantum theory was merely a temporary contrivance which would be replaced when a deterministic theory was uncovered.

In order to understand Bohr's viewpoint, let us return to the problem of quantum jumps of electrons orbiting the nucleus. When Ernest Rutherford first saw Bohr's revolutionary ideas about the quantum structure of the atom, he immediately raised a question: when does an electron know when to jump, and how does it decide where to jump? Reasonably enough, Rutherford wanted to know what underlying process controlled the quantum jumping: "Bohr's answer was remarkable. Bohr suggested that the whole process was fundamentally random, and could only be considered by statistical methods: every change in the state of an atom should be regarded as an individual process, incapable of more detailed description. We are here so far removed from a causal description that an atom may in general even be said to possess a free choice between various possible transitions."

If Bohr was correct, the implications were staggering: there was no "causal" description of the process, nothing should be considered as causing the quantum jumps. It was only ever possible to talk about the probability of an event occurring. This would imply that Nature, at its root, was random, and no deeper explanation could ever be produced.

Einstein, however, was far from convinced by this explanation. According to Einstein: "I find the idea quite intolerable that an electron exposed to radiation should choose **of its own free will**, not only its moment to jump off, but also its direction. In that case, I would rather be a cobbler, or even an employee in a gaming-house, than a physicist."

Einstein remained convinced that there had to be some underlying deterministic mechanism — hidden from our eyes — which was responsible for determining the timing and direction of the quantum jumps. In this respect, Einstein considered the current theory of quantum mechanics to be incomplete, merely a stop-gap until a more complete theory came along.

When Einstein arrived at the 1927 Solvay Conference he was initially reluctant to contribute his opinion, stating that he did not feel sufficiently knowledgeable about the latest developments in quantum mechanics. However, Einstein's diffidence disappeared when Heisenberg and Born issued a provocative joint statement: "We consider quantum mechanics to be a closed theory, whose fundamental physical and mathematical assumptions are no longer susceptible of any modification." Essentially, Heisenberg and Born were suggesting that quantum mechanics should be considered to be the final theory, and that the fundamental probabilistic nature of reality just had to be accepted. It was almost as if they were goading Einstein into making a response. In one of his most famous quotes, Einstein

replied: "God does not play dice with the universe".

From now on, Einstein would no longer be silent about quantum mechanics.

Einstein's box

During the day, the conference was conducted at the Solvay International Institute for Physics in Brussels. However, all of the participants at the conference were staying at the Hotel Metropole, and it was in the dining room of the hotel that most of the heated discussion occurred. Each morning, Einstein would arrive for breakfast armed with a new thought experiment which he believed revealed a flaw in the uncertainty principle. Einstein and Bohr would continue their discussions as they walked to the institute, and during breaks in the conference. Usually by dinner back in the Metropole, Bohr would reveal a flaw in Einstein's argument, thus saving the uncertainty principle and the prevailing interpretation of quantum mechanics.

However, one of Einstein's thought experiments was so ingenious that Bohr was stunned when he heard of it. Einstein asked Bohr to consider a box with a hole in its side (see the following superbly detailed diagram, actually drawn by Bohr himself). The hole has a shutter which can be opened or closed by a clock mechanism inside the box. The clock inside the box is synchronised with a clock outside the box in the laboratory. The top surface of the box is attached to a spring, and a scale at the side of the box means it is possible to determine the weight of the box.

At the start of the experiment, the box is weighed. At a certain point in time, the clock in the box opens the shutter and a photon of light escapes. After this point, if the box is weighed again then it is possible to determine the mass of the photon. Then, from Einstein's own equation, $E=mc^2$, it is possible to determine the energy of the emitted

photon. The time at which the photon was emitted is also known because it is the time at which the shutter opened. It therefore appears possible to know the energy of the photon and the time at which it escaped. But according to the uncertainty principle this should not be possible as time and energy are a pair of properties with a relation similar to position and momentum: the more accurately you know the time, the less accurately you should be able to know the energy. According to the uncertainty principle, you should never be able to know both time and energy with perfect accuracy.

This came as a tremendous shock to Bohr. Einstein's box seemed to undermine the uncertainty principle, and hence the whole edifice of quantum mechanics. As far as Bohr was concerned, it would be "the end of physics" if Einstein was correct.

As Einstein and Bohr walked back to the Hotel Metropole that evening, there was a spring in Einstein's step and a broad grin on his face as he felt he had at last defeated the uncertainty principle. Bohr, however, looked flustered as he struggled to keep up with the confident Einstein.

That evening it was noted that Bohr looked like "a dog who has received a thrashing". Bohr spent a sleepless night going over the experiment time and time again in his head. It was not until the early hours that Bohr believed he had found the flaw in Einstein's reasoning, and he managed to grab just a few hours sleep before confronting Einstein over breakfast.

Bohr realised that Einstein — in his rush to overthrow quantum mechanics — had forgotten the implications of Einstein's own theory of general relativity. General relativity predicted that a clock in a stronger gravitational field would run slower than a clock in a weaker gravitational field. Bohr realised that when the photon was emitted from the box, the spring attached to the top of the box would lift the box slightly higher in the Earth's gravitational field. This would result in the clock inside the box no longer being perfectly synchronised with the clock in the laboratory. Hence, it was no longer possible to obtain the time measurement with perfect accuracy. The uncertainty principle was saved.

When Bohr told Einstein of this solution to the problem over breakfast, it was Einstein's turn to look stunned. Once again, he had failed in his attempt to overthrow quantum mechanics.

From now on, Einstein gave up attacking the uncertainty principle as the weak spot of quantum mechanics. Instead, he turned his attention to the quantum model of reality itself, because it was here that quantum mechanics predicted some very strange things indeed.

Is the Moon there when no one is looking at it?

According to the interpretation of Niels Bohr, the uncertainty principle had revealed that it was no longer possible to consider the result of a scientific observation without also considering the effect of that observation on the object

being observed. In other words, it was no longer possible to draw a clear boundary between the observer and the object being observed: the effect of the observer became all-important.

With this in mind, Bohr argued that, before an observation or measurement was made, it was scientifically meaningless to talk about the properties of a particle. Bohr said: "It is wrong to think that the task of physics is to find out how Nature is. Physics concerns what we can say about Nature." In other words, it is only our observations which are real. It is meaningless to talk about objective reality in the absence of observation.

Before observation, Bohr insisted, all that existed was the wavefunction (which we considered in the previous chapter). The wavefunction was a mathematical tool for determining probabilities. The wavefunction represented a *superposition* of all possible states which would be possible after measurement. For example, the wavefunction can represent all the possible positions in which an electron might be discovered after a measurement is taken. After the measurement is taken, the wavefunction "collapses" so that only a single value is measured for the location of the electron. [5]

This interpretation of quantum mechanics became known as the *Copenhagen interpretation* (because Niels Bohr's institute of physics was in Copenhagen).

If you read my first book, you will know that this is, yet again, another example of the universe acting like a roulette wheel. Before observation, the state of the system must be considered as being in a superposition state: it acts as though it possesses a combination of all possible property values. The state of the system could then be represented by a roulette ball spinning around the wheel, possessing all possible values. But when an observation is taken, it is as if the roulette ball stops spinning and has to occupy a single value. It is at this stage that probability enters into quantum mechanics: you cannot predict where the ball will stop, you cannot predict what property value you will measure.

So we see that quantum theory cannot correctly predict the outcome of any single experiment! It can only provide the possibility of a particular outcome. This might seem a huge drawback of quantum mechanics. However, knowing the possibility of particular outcomes is an important tool if multiple measurements are made. In this sense, quantum mechanics is a statistical theory: it provides you with the probabilities of a certain result if multiple observations are taken.

It is frequently said that the Copenhagen interpretation implies that the act of observation somehow "creates reality", the motivation for this belief being Niels Bohr's assertion that it is scientifically meaningless to talk about the properties of a particle before observation. For Einstein, this belief was anathema. Einstein believed there had to be an objective reality in the absence of observation. In another famous quote Einstein said "I like to think that the Moon is there even if I am not looking at it."

Unfortunately, this frequently-repeated quote of Einstein has been partly responsible for the production of a number of pseudo-scientific books (and even movies) suggesting that quantum reality is somehow conjured into existence by human observation, or human consciousness. This is surely a complete fallacy, and is based on a lack

of understanding of the principles of quantum mechanics. As the physicist Carver Mead has said: "That is probably the biggest misconception that has come out of the Copenhagen view. The idea that the (human) observation of some event makes it somehow more 'real' became entrenched in the philosophy of quantum mechanics. Even the slightest reflection will show how silly it is. An observer is an assembly of atoms. What is different about the observer's atoms from those of any other object? What if the data are taken by computer? Do the events not happen until the scientist gets home from vacation and looks at the printout? It is ludicrous!"

In order to correctly understand the effect of observation at the quantum level, it must be realised that observation can never be responsible for making an object "real", for somehow conjuring it into existence. However, it is the case that the act of observation can have the effect of modifying some properties of an observed object. These properties of a particle — such as spin and location — which are subject to the quantum superposition principle are called *dynamic properties*. But a particle also possesses properties which are fixed and are not subject to the principles of quantum mechanics, such as a particle's electric charge. These properties are called *static properties*. The existence of static, unchanging properties whose values are known prior to observation indicates that the particle does, indeed, exist prior to observation. So quantum mechanics states that the Moon does indeed exist even if no one is looking at it.

So now in order to understand the intended meaning of the earlier Einstein quote, let us consider the quote in its entirety: "I think that a particle must have a separate reality independent of the measurements. That is, an electron has spin, location and so forth even when it is not being measured. I like to think the Moon is there even if I am not looking at it."

So we see from this full quote that Einstein was actually referring to certain **properties** of a particle, in particular its spin and location. He was not referring to the entire **existence** of the particle. So Einstein was merely suggesting that the Moon might be **located** somewhere else if he was not looking at it — he was not suggesting the Moon did not exist at all if he was not looking at it! Unfortunately, the latter part of the quote has been taken out of context and used to launch a pseudo-science industry.

Indeed, we should perhaps not find it too surprising that the act of observation can be responsible for modifying some properties of a particle. Our discussion of the uncertainty principle in the previous chapter considered the measurement of air pressure in a tyre using a gauge, a process which inevitably resulted in some air leaking out of the tyre — thus reducing the pressure. Hence, observation inevitably modifies the object being observed.

In that case, it would appear to be rather meaningless to talk about values of certain properties of a particle before observation. After all, the only way to measure the property value is to perform the observation — and the observation must inevitably alter the value of the property.

So to talk of a certain objective reality before observation clearly appears rather meaningless. Certainly, as we move down to the smallest quantum level, it should probably not be considered surprising that the effect of the observation on the object under observation would become very significant indeed.

So if it is clear that the act of observation inevitably affects the object under observation, this means that the observed object should never be considered as an isolated object. Instead, the observer and the observed object should be considered to be a single, combined system. An object cannot produce a property value without an observer, and an observer cannot produce a property value without an object to observe. It is only by considering a combined system that a property value can be produced.

So, if it requires a combined system to produce a property value, it makes no sense to talk of the property value of a single isolated object. Einstein insisted that there was an "objective reality" in the absence of observation. But if it requires the presence of an observer to **create** the property value, then it really makes no sense to talk of the objective reality of a single, isolated object. It is the combination of observer and observed object which generates reality.

However, Einstein continued to insist that there must be a fixed objective reality in the absence of observation. And, in 1935 Einstein showed he had one more trick up his sleeve, a trick which would shake quantum mechanics — and Niels Bohr — to the core.

The EPR paradox

In 1935, Einstein teamed-up with Nathan Rosen and Boris Podolsky to produce a landmark paper which came to be known as the EPR paper (after the initials of Einstein, Podolsky, and Rosen). The EPR paradox was another attempt by Einstein to show that quantum mechanics could not be a complete description of the workings of Nature.

The basis of the EPR paradox rested on the principle of entanglement. It is possible, under certain circumstances, for the properties of a particle to become correlated with the properties of another particle (i.e., the property values

of one particle are dependent on the property values of another particle). For example, an electron has a property called spin, which, if we measure it, we might find the spin to be either upward ("spin up") or downward ("spin down"). When we perform a measurement of electron spin in a particular direction (e.g., the vertical direction), we will only find one of these two states because spin is quantized into one of these two discrete states: it is like a roulette wheel with only two slots into which the ball can drop.

For example, it is possible to produce a pair of electrons using a method which ensures that each electron must have opposite spin to the other electron, i.e., if one electron is "spin down" then the other electron must be "spin up" (this is due to the law of conservation of angular momentum: total angular momentum of the system before the electrons are emitted must equal the total angular momentum of the system after the electrons are emitted). This pair of electrons are then said to be entangled: the property values of one electron is dependent on the property values of the other electron.

So if two people each receive one of the entangled electrons and perform a measurement of spin, they will find that the other person's electron has opposite spin. The following diagram shows two experimenters — Alice and Bob — each receiving one electron from a pair of entangled electrons, and, after measuring the spin, they discover it to have opposite spin to their partner's electron:

But, in the EPR paradox, Einstein realised that quantum mechanics predicted a problem with this picture. According to quantum mechanics, before the spin of an electron is measured that spin value is supposed to be in a multi-valued superposition state: a combination of all possible values, both "spin up" **and** "spin down". This is like the ball spinning around the roulette wheel, with **both** spin values being possible before the measurement is taken. Only after a measurement is taken does the electron possess a definite spin value (either "spin up" **or** "spin down"). So, for example, when Alice measures the spin of her electron and finds it to be "spin up", her electron is no longer in a multi-valued superposition state. It is as if the ball has stopped spinning around the roulette wheel and has dropped into a particular slot: the "spin up" slot.

But as soon as Alice's electron takes a definite value, this means that Bob's electron must also have a definite value — the opposite value: "spin down". So Alice measuring her electron and finding a definite spin value also has the effect of taking Bob's electron out of its superposition state and forcing it to take a definite spin value. It is as if Alice's measurement has an instantaneous effect on Bob's electron.

Einstein realised that quantum mechanics insisted that this effect of one particle onto the other particle must be instantaneous — even if the particles are separated by quite a distance. And here Einstein believed he had found a flaw in quantum mechanics, because Einstein's own theory of special relativity prohibited any such influence over distance acting faster than the speed of light. According to relativity, it was simply not possible for this instantaneous effect predicted by quantum mechanics.

This principle — that an object should only be influenced by its immediate surroundings, and cannot be influenced by some instantaneous effect from a distant object — is called *locality*.

As we have seen, Einstein had created several thought experiments before with the aim of revealing inconsistencies in the Copenhagen interpretation of quantum mechanics. However, each time Niels Bohr had been able to find a flaw in Einstein's argument, thus saving the day for quantum mechanics. This time, however, the situation was different. With the EPR paradox, Einstein had revealed a gaping hole in the Copenhagen interpretation.

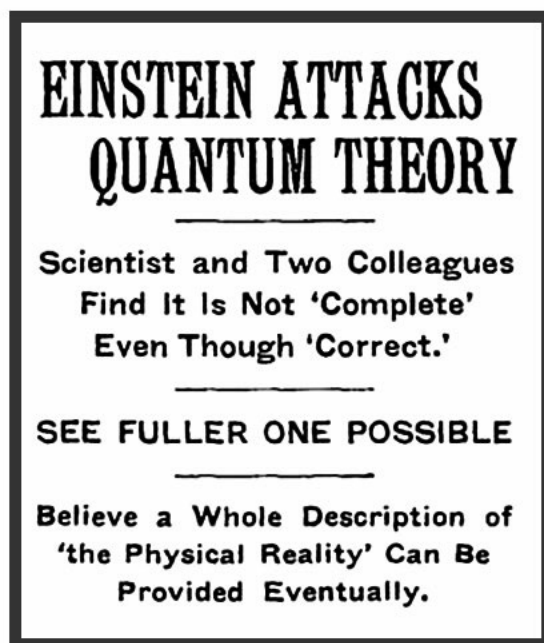

According to one of Bohr's colleagues: "The EPR onslaught came down upon us as a bolt from the blue. Its effect on Bohr was remarkable." Bohr abandoned all other work to try to find a solution to the paradox. Bohr worked day and night, becoming increasingly frustrated as he realised the subtlety of Einstein's argument. After six weeks, he presented his solution, but it was less than convincing. Bohr stated that the pair of entangled particles should not be considered separately, but should be considered as forming a single entangled system — even though the two particles might be separated by a considerable distance. Essentially, Bohr was stating that there **was** some form of instantaneous communication between the particles. However, the restriction that nothing can travel faster than light

was not broken because it was impossible to send information via this method: the outcome of the particle spin measurements was always random. As Brian Greene said: "Special relativity survived by the skin of its teeth."

Einstein was not satisfied with Bohr's reply, and had no time for this suggestion of instantaneous influences over great distances. Famously, Einstein said: "Physics should represent reality in time and space, free from spooky action at a distance."

Instead, Einstein believed that the answer to the paradox lay in the fact that the particles contained certain property values all along, but these values were hidden from our eyes (so-called *hidden variables*). So when Alice measures her electron and finds it is "spin up", there is no problem with Bob's measurement as Bob's particle knew it was "spin down" all along. In this way, no instantaneous action at a distance is required. The principle of locality would be preserved, but it would mean that the particles contained more information than quantum mechanics said they possessed.

If Einstein was correct, it would mean that quantum mechanics was not a "complete" description of reality. This announcement of Einstein made headlines around the world, such as this one from the *New York Times* on May 4th 1935:

Unfortunately, there seemed to be no way to distinguish between the viewpoints of Einstein and Bohr. Who was correct?

Bell's theorem

In the decades which followed, the theory of quantum mechanics brought one success after another, and it assumed its position as one of the bedrock theories in physics. Applications of quantum mechanics included semiconductors (leading to the computer age), and lasers (which introduced CDs and DVDs). For most physicists, the successes of quantum mechanics meant they were more than happy to use the basic equations to produce results, without spending too much time wondering about the philosophical interpretations. The discussions between Bohr and Einstein over EPR were largely forgotten.

However, in the 1960s, an Irish physicist by the name of John Bell became fascinated by the EPR paradox and decided to see if it was possible to design an experiment which could distinguish between the viewpoints of Einstein and Bohr. Instinctively, Bell felt that Einstein must be right — that there was an objective reality even in the absence of observation. Bell believed that the properties of particles had to have fixed values — even before those property values were measured. In an effort to prove Einstein correct, John Bell proposed an ingenious experiment.

As in the case of the EPR paradox, Bell's experiment required two experimenters to measure the spin value of two entangled particles. As with EPR, if one experimenter measures "spin up" then the other experimenter has to measure "spin down". According to the Copenhagen interpretation, after the spin of the first particle is measured, it is as if quantum entanglement works over a great distance to "pull" the spin of the second particle into the precisely opposite alignment. It does not matter how the spins of the particles were aligned before observation: after observation quantum mechanics "pulls" the spin of the second particle to point in precisely the opposite direction to the measured spin of the first particle.

Bell's brilliant innovation was to consider the situation when one of the detectors was not precisely aligned either up or down. What if the second detector is aligned at a 45° angle?

In that case, there would not be such a precise correlation between the results of the two experimenters. But the "pulling" effect of quantum mechanics (via quantum entanglement) ensures that there is still a surprisingly high level of correlation between the two results. In fact, according to quantum mechanics, the level of agreement between the two experimenters is predicted to be:

$$\frac{1}{2}(1 + \cos \theta)$$

where θ is the angle by which the second detector is offset. So for an offset angle of 45°, this formula predicts a level of agreement between the two experimenters of approximately 85% (if you want to check the maths, you can enter the 45° value into the previous formula to check you get 85%).

But what happens if quantum mechanics is incorrect? What if Einstein was right, and the particle spins have fixed values before observation?

In that case, there is no quantum manipulation at a distance, and the level of correlation between the two experimenters simply falls off linearly as the offset angle increases. An offset angle of 45° represents a quarter of the distance from 0° (100% correlation) to 180° (0% correlation). So, as there is a linear relation, an offset angle of 45° represents 75% correlation.

So, in the case of fixed spin values (i.e., the situation preferred by Einstein), we find there should be only a 75% probability of agreement between the two experimenters.

To sum up, if quantum mechanics is correct, we should expect an 85% level of correlation between the two experimenters. But if quantum mechanics is incorrect — and Einstein is right — we should expect to find a level of correlation no higher than 75%.

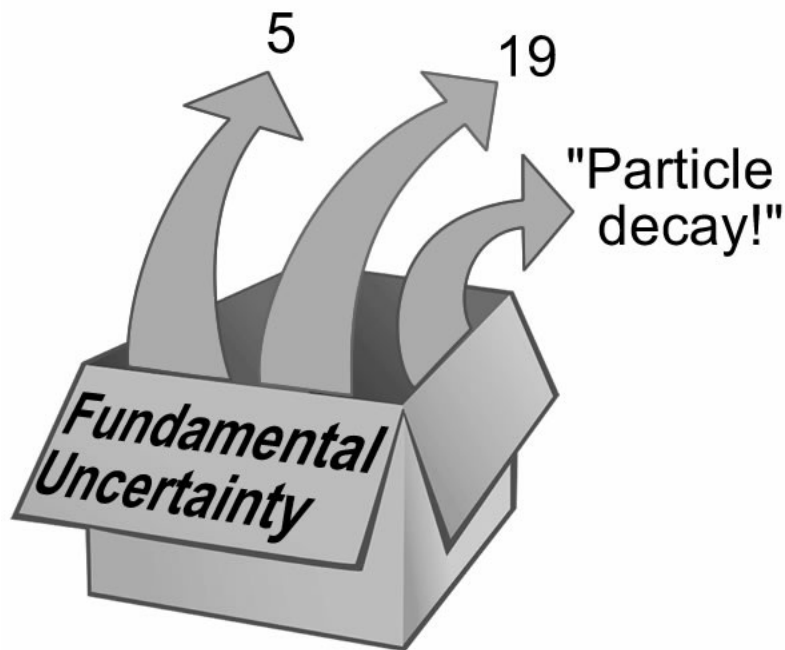

So it was in the early 1970s that several groups of experimenters started to test the level of correlation in entangled particles. When the results were analysed, the result was startling. It was shown that the level of correlation was, indeed, 85% — the value predicted by quantum mechanics. This was a higher value than the value which should have been possible (75%) if the particles had fixed property values. This meant that Bohr was right all along and Einstein was wrong: particles could not have fixed property values. There had to be some form of faster-than-light spooky signalling, the effect of which was to increase the correlation between the particles. This was an

astonishing result, which *Physics World* magazine called "the most profound discovery of science."

Unfortunately, John Bell died suddenly of a stroke in 1990. In that same year he had been nominated for a Nobel Prize for his discovery. Bell would probably have won the prize, but it is never awarded posthumously (which hardly sounds fair). However, for his work in revealing the true extraordinary nature of quantum mechanics, Bell is recognised as one of the greatest physicists of the 20th century.

Fundamental uncertainty

We will end this chapter with a discussion of a very important concept, a concept which will be repeated throughout this book. It is the concept of *fundamental uncertainty*. We encountered fundamental uncertainty earlier in this chapter with our discussion of the quantum roulette wheel. It was explained how the process of making a quantum measurement is like playing a game of roulette. However, there is fundamentally no way of determining where the ball will stop, no way of calculating the value in advance. We might illustrate fundamental uncertainty using the roulette wheel analogy, or we might simply express it by using a box which produces random numbers. There is no way of determining which number will be produced by the box, no cause we can detect, no hidden mechanism we can investigate, and there is no pattern to the numbers.

Essentially, this is "God playing dice".

The diagram also shows a command being issued for a particle to decay. Again, there is fundamentally no way to determine when this command will be issued: the timing is completely random.

However, this type of behaviour — this fundamental uncertainty — seems very alien to us. There is nothing in our human-level macroscopic world which behaves in this way. We only ever encounter outcomes which are clearly defined, effects uniquely determined by their causes. In our macroscopic world we are always able to dig deeper to find the cause of any observed behaviour. But at the lowest quantum level, this option of digging deeper is not available to us. It is called fundamental uncertainty because "fundamental" implies that there is no deeper layer.

And it is because this behaviour seems so alien to us that the possibility of this behaviour receives so much resistance, so much hostility. It is as if there is an inflexibility to accept that such behaviour could exist, as if people cannot "get their heads round it". As we have seen, even the great Albert Einstein seemed to have an inflexible resistance to the concept, a resistance which was to damage the remainder of his career.

It is perhaps the hardest task in physics — and the most important skill — to have a flexible mind capable of accepting ideas which appear counter-intuitive or which do not agree with everyday experience, such as the concept

of fundamental uncertainty. However, the skill is to only consider experimental data, the results of experiments, and **listen to Nature talking.**

So remember the name: fundamental uncertainty. It is a crucial concept which will crop up again in this book.

But why should Nature be behaving in such an unusual manner? Why do the laws of quantum mechanics work this way? It is interesting to present some speculation about why this might be the case.

In my first book, I asked the question as to why the laws of Nature take the form they do. It is a question which has been asked many times before, probably most famously when Einstein said: "What I am really interested in is whether God could have made the world in a different way; that is, whether the necessity of logical simplicity leaves any freedom at all." Do the laws of Nature arise from logical necessity? In other words, is it at all possible that the laws of Nature could have taken a different form? If that is not the case, if the laws could not have been any other way, then we would appear to have found a solution to our question of why the laws take the form they do.

Perhaps we can find an answer from the most remarkable moment in the history of the universe: the moment of the Big Bang, approximately 13.7 billion years ago. Our theories are not yet capable of predicting what precisely happened in the earliest moments of the existence of the universe, in the so-called *Planck epoch*, from 0 up to 10^{-27} seconds. However, if we wind the clock back, it is believed that the universe was compressed to a size smaller than an atomic nucleus, an incredibly hot and dense point. The condition of the universe at this moment is called the *boundary condition*. In order to be topical, I can quote Stephen Hawking's character at the end of the recently-released movie *The Theory of Everything*: "There ought to be something very special about the boundary conditions of the universe". Surely we can learn a lot from this condition.

If you read my first book, you will know that we should not treat the event of the Big Bang as the reason the universe exists (all times are equally real in a block universe: the last moments of the universe are just as real as the first moments). However, the very peculiar situation of the Planck epoch poses a tremendous challenge for classical deterministic physics. According to determinism, every effect has a clearly-defined unique cause. But if the universe did not exist before the Big Bang, then how can determinism link cause and effect over the period? Also, how can the classical law of conservation of energy possibly handle a situation in which no energy (before the Big Bang) is transformed into a great deal of energy (after the Big Bang)? Classical deterministic physics is inflexible in these matters. Determinism inevitably breaks down.

But if determinism breaks down, then indeterminism (in the form of quantum mechanics) is perfectly capable of stepping up to the mark. Quantum indeterminism breaks the strict laws of cause-and-effect. And, according to the uncertainty principle, it is even possible that a small amount of energy can spontaneously appear from empty space in a so-called quantum fluctuation, but only for a very short time. In fact, if you had to design a theory aimed at coping with the craziness of the earliest moments of the universe, you could not do much better than "anything goes" quantum mechanics.

So maybe at the lowest levels of reality there must be indeterminism and uncertainty, otherwise there could be no way that the universe could exist. Maybe every conceivable universe has to be fundamentally non-deterministic at its base level? Maybe this makes indeterminism and uncertainty a logical necessity in the laws of Nature.

We shall return to consider this point later in the book.

4

VIENNA

At the start of the 20th century, the city of Vienna was the capital of the Austro-Hungarian empire, a city of two million souls, and one of the most important centres of culture and philosophy in the world. The Austro-Hungarian empire consisted of 15 nations, and the citizens of those nations created a cultural melting-pot in Vienna. The city was a centre of the modernist movement, buzzing with the new ideas of psychoanalyst Sigmund Freud and philosopher Ludwig Wittgenstein who both chose to make the city their home. The centres of intellectual debate were the Viennese coffee houses, where arguments raged through the day. The clientele of the coffee houses included Adolf Hitler, Joseph Stalin, Leon Trotsky, and Sigmund Freud who were all living in the city within a few miles of each other. [6]

According to Professor Dave Cliff on his BBC TV programme *The Joy of Logic*: "Despite its grace and gentility, Vienna can lay justifiable claim — perhaps more than any other city — to be the birthplace of the modern. For it was here in art, design, philosophy, science, and psychology, that people most boldly challenged the tired conventions and assumptions of the 19th century."

I am the proud possessor of a postcard from Vienna dated 1904. It is a beautiful thing. The picture on the card gives a good impression of what street life must have been like in that era:

About this time, the University of Vienna commissioned a series of paintings for the ceiling of its great hall. The paintings were intended to celebrate the great recent technological and scientific advances, and the seemingly endless increase in knowledge. The artist they commissioned was Gustav Klimt. However, when Klimt presented his finished paintings to the professors of the university, they were shocked. Instead of a series of optimistic visions, Klimt presented a pessimistic, dark, hopeless view of naked men and women drifting aimlessly in voids.

This was certainly not what the professors wanted. The paintings seemed to challenge their view of a brave new world in which human knowledge would continue to boundlessly increase. Klimt's paintings were instantly rejected.

According to Professor Dave Cliff: "Klimt's paintings seemed to reject the fashionable notion that science and mathematics would provide us with complete knowledge founded on **absolute provable truth**." The emphasis on provable truth is important, because, as we shall see, it was the concept of provable mathematical truth which would later be severely challenged by one of the students of the University of Vienna.

The certainty of mathematics

What do we mean when we say a statement is "true" or "false"? Well, the statement might refer to some factual aspect of the material world, e.g., "The cat is on the mat". That statement could be evaluated as being either true or false by inspecting the mat and determining if the cat is sitting on it. In the field of logic, we would call a statement such as "the cat is on the mat" a *proposition*. A proposition is a statement which can be either true or false.

The rules of logic allows us to use reasoning to combine propositions. For example, we could combine the proposition "all men are mortal" with the proposition "Socrates is a man" to derive the proposition "Socrates is mortal". We can then say that we have used the rules of logic to **prove** that Socrates is mortal, and the steps we used to prove that proposition would be called a *proof*.

In mathematics, if a proposition is true and it is particularly useful or important, then it is called a *theorem*. Not only is a mathematical theorem true, but it will be true under all circumstances, in any conceivable world. This differs from a proposition about the material world. Propositions about the material world such as "the cat is on the mat" could conceivably be either true or false. We could certainly imagine an alternative world in which the other outcome is true (i.e., "the cat is **not** on the mat"). In mathematics, however, there is no uncertainty: a true proposition (theorem) would have to be true in any possible world.

So a mathematical proof is a valuable thing. It seems to reveal some insight into "the way things have to be". In his book *The Study of Mathematics*, Bertrand Russell said: "Mathematics takes us into the region of absolute

necessity, to which not only the actual world, but every possible world, must conform."

Let us consider an example of a theorem from geometry (geometry being a branch of mathematics). The Pythagorean theorem ("On a right-angled triangle, the square of the hypotenuse is equal to the sum of the squares of the other two sides") has at least 370 known proofs. However, only one proof would be required to establish the truth of the theorem.
